The ECHA is managing the Registration, Evaluation, Authorisation and restriction of CHemicals (REACH) legislation processes for existing and new chemical substances to ensure consistency across the European Union. These REACH processes are designed to provide additional information on chemicals, to ensure their safe use, and to ensure competitiveness of the European industry.

European Commission (EC)
Web: http://www.europa.eu.int

Since the Seveso accident in northern Italy in 1977 contaminated a large area with a highly toxic dioxin, increasingly stringent measures have been taken by the European Commission to reduce the risks arising from the manufacture and disposal of chemical substances. Begun in 1986, the European Inventory of Existing Chemical Substances (EINECS) has similar objectives to those of the Toxic Substances Control Act (TSCA) of the United States. EINECS lists all marketed chemical products in the EU, enabling them to be subject to a general procedure for notification, evaluation, and control. The European Commission also maintains the Environmental Chemicals Data and Information Network (ECDIN) databank (http://ecdin.etomep.net). Searchable by chemical name of CAS number, ECDIN 'is designed as an instrument which will enable people engaged in environmental management and research to obtain reliable information on chemical products.'

European Commission, Joint Research Centre (JRC)
Web: http://ec.europa.eu/dgs/jrc/

The Joint Research Centre is a research-based policy support organization and an integral part of the European Commission. The JRC provides the scientific advice and technical know-how to support a wide range of EU policies. Its Institute for Health and Consumer Protection (IHCP) provides scientific support for the development and implementation of EU policies related to health and consumer protection. The IHCP carries out research to improve the understanding of potential health risks posed by chemicals, biocides, genetically modified organisms, contaminants released from food contact materials and consumer products. Of special interest are its Institute for Environment and Sustainability and Institute for Health and Consumer Protection. The latter supports work related to Chemicals (REACH) and biocides, modified organisms, cosmetics and animal welfare, consumer products, and food and food-contact materials. JRC's European Centre for the Validation of Alternative Methods (ECVM) promotes the scientific and regulatory acceptance of non-animal tests which are of importance to biomedical sciences, through research, test development and validation and the establishment of a specialized database service.

European Environmental Mutagen Society (EEMS)
Web: http://www.eems-eu.org/eems/default.csp

Members include industry and university laboratories and research centers. Promotes research in genetic toxicology and environmental mutagenesis. Affiliated with the Environmental Mutagen Society and International Association of Environmental Mutagen Societies. Publishes a journal entitled, *European Journal of Genetic and Molecular Toxicology*, a newsletter and other documents.

European Food Safety Authority (EFSA)
Web: http://www.efsa.europa.eu

EFSA's goals is to have a global presence and a recognized agency for risk assessment on food and feed safety, animal health and welfare, nutrition, plant protection and plant health. In the European food safety system, risk assessment is independent of risk management. EFSA as the risk assessor of the food science, produces scientifically valid opinions and advice to provide a sound foundation for European policies and legislation and supports the European Commission, European Parliament, and EU Member States in having effective and timely risk management decisions.

European Science Foundation (ESF)
Web: http://www.esf.org

Working on behalf of its principal stakeholders – the member organizations and thereby Europe's scientific community – ESF considers hundreds of research proposals for programs and awards each year; publishes a wide range of position papers and briefings; and organizes workshops, conferences, and symposia as key elements of its role in ensuring that the voice of European science is heard on major policy and other issues affecting Europe's scientific community.

European Society of Toxicologic Pathology (ESTP)
Web: http://www.eurotoxpath.org

ESTP's goals are to organize scientific annual meetings, obtain more visibility by authorities/agencies, actively promote toxicologic pathology, contribute to guidelines by comments and proposals, participate in scientific working groups (e.g. historical tumor control data), offer training courses in toxicological pathology and related fields, and collaborate with the other Societies of Toxicological Pathology. It publishes a journal entitled *Experimental and Toxicologic Pathology*.

European Society of Toxicology in Vitro (ESTIV)
Web: http://www.estiv.org/

ESTIV aims to promote in vitro toxicology, both scientifically and educationally, in all countries of Europe. Organizes INVITOX congress and publishes the journal *Toxicology In Vitro*.

EUROTOX (Federation of European Toxicologists & European Societies of Toxicology)
Web: http://www.eurotox.com/

EUROTOX aims to foster toxicology, both scientifically and educationally, in all countries of Europe. To this, EUROTOX organizes an annual scientific congress, workshops, and postgraduate training courses. Specific activities are organized by the EUROTOX Specialty Sections. EUROTOX is actively harmonizing toxicology education and training, having established the European Register of Toxicologists in 1994.

EXtension TOXicology NETwork (EXTOXNET)
Web: http://extoxnet.orst.edu/

This network is a cooperative effort among various universities (University of California at Davis, Oregon State University, Michigan State University, and Cornell University) to stimulate dialog on toxicology issues and to make toxicology information available. Various types of pesticide toxicology and environmental chemistry information are available, including discussions of toxicological issues of concern (TICs), toxicology newsletters, other resources for toxicology information, toxicology fact sheets, Pesticide Information Profiles, and Toxicology Information.

(U.S.) Federal Bureau of Investigation (FBI), FBI Laboratory Services
Web: http://www.fbi.gov/hq/lab/labhome.htm

FBI Laboratory personnel provide forensic examinations, technical support, expert witness testimony, and training, to federal, state, and local law enforcement agencies. Operational Response activities include Chemical Biological Sciences, Explosives, Evidence Response Team, and Hazardous Material Response.

(U.S.) Federal Emergency Management Agency (FEMA)
Web: http://www.fema.gov

On March 1, 2003, the Federal Emergency Management Agency (FEMA) became part of the U.S. Department of Homeland Security (DHS). The primary mission of the Federal Emergency Management Agency is to reduce the loss of life and property and protect the Nation from all hazards, including natural disasters, acts of terrorism, and other man-made disasters, by leading and supporting the Nation in a risk-based, comprehensive emergency management system of preparedness, protection, response, recovery, and mitigation.

Federation of American Societies for Experimental Biology (FASEB)
Web: http://www.faseb.org

The Federation of American Societies for Experimental Biology (FASEB) advances biological science through collaborative advocacy for research policies that promote scientific progress and education and lead to improvements in human health. Among the member societies are the American Physiological Society, American Society for Biochemistry and Molecular Biology, American Society for Pharmacology and Experimental Therapeutics, American Society for Investigative Pathology, and the American Society for Cell Biology.

Flavor and Extract Manufacturers Association of the United States (FEMA)
Web: http://www.femaflavor.org/

FEMA furthers the business interests of its members through a sound scientific program designed to promote the safe use of flavors, and fosters a global environment in which the flavor industry can create, innovate, and compete. Members include companies manufacturing and selling food flavors and extracts. The Expert Panel of the Flavor and Extract Manufacturers Association (FEMA) has served as the primary body for the safety evaluation of food flavorings for the flavor industry, and the public through its 'generally recognized as safe' (GRAS) assessment of flavoring substances.

Food and Agriculture Organization of the United Nations (FAO)
Web: http://www.fao.org

The FAO of the United Nations leads international efforts to defeat hunger by serving both developed

and developing countries. It also acts as a neutral forum where all UN member nations meet to negotiate agreements and debate policy. Further, it serves as a source of knowledge and information which helps developing countries and countries in transition modernize and improve agriculture, forestry, and fisheries practices and ensure good nutrition for all. FAO also undertakes reviews of hazards of food and food additives. FAO's Food Quality and Standards Service (AGNS) is committed to the enhancement of food safety and quality along the food chain at international, regional and national levels, with the aim of protecting consumers and promoting the production and trade of safe, quality food.

(U.S.) Food and Drug Administration (FDA)
Web: http://www.fda.gov

The FDA is responsible for protecting the public health by assuring the safety, efficacy, and security of human and veterinary drugs, biological products, medical devices, our nation's food supply, cosmetics, and products that emit radiation. The FDA is also responsible for advancing the public health by helping to speed innovations that make medicines and foods more effective, safer, and more affordable; and helping the public get the accurate, science-based information they need to use medicines and foods to improve their health.

The following centers operate under FDA.

Center for Drug Evaluation and Research (http://www.fda.gov/cder/)
The Center for Biologics Evaluation and Research (http://www.fda.gov/cber/)
The Center for Food Safety and Applied Nutrition (http://www.cfsan.fda.gov/)
The Center for Devices and Radiological Health (http://www.fda.gov/cdrh/)
The National Center for Toxicological Research (http://www.fda.gov/nctr)

(U.S.) Food and Drug Administration (FDA), National Center for Toxicological Research (NCTR)
Web: http://www.fda.gov/nctr

NCTR conducts peer-reviewed scientific research and provides expert technical advice and training that enable FDA to make sound science-based regulatory decisions and improve the health of the American people. The research is focused towards FDA's goals: (1) to understand critical biological events in the expression of toxicity and (2) to develop and characterize methods, and incorporate new technologies to improve the assessment of human exposure, susceptibility, and risk.

(U.S.) FDA Center for Food Safety and Applied Nutrition
Web: http://www.cfsan.fda.gov/list.html

The Center for Food Safety and Applied Nutrition (CFSAN) maintains a comprehensive intramural research program that provides the cornerstone for regulatory decisions, enforcement activities, and the development, implementation, or evaluation of CFSAN policies. Research knowledge plays a major role in reducing levels of foodborne illness in the United States and helps to ensure food safety and food defense, the safety of cosmetic products, and enhance the ability of consumers to make sound nutrition choices.

Friends of the Earth (FoE)
Web: http://www.foe.org

FoE is an environmental advocacy group with international affiliates worldwide. Topics addressed include toxic chemicals, nuclear hazards, groundwater contamination, pesticides, environmental policy development.

Genetic Toxicology Association (GTA)
Web: http://www.gta-us.org/

GTA's primary purpose is to promote the development of the science of genetic toxicology and to foster the exchange and dissemination of information concerning the field.

Green Media Toolshed
Web: http://www.greenmediatoolshed.org/

Makes available SCORECARD, which provides information on pollution problems and toxic chemicals.

Greenfacts
Web: http://greenfacts.org/

Greenfact's mission is to bring and share complex scientific consensus reports on health and the environment to non-specialists. Their objective is to become the preferred online source of scientific information for journalists, decision makers, stakeholders, teachers, and concerned individuals. They publish reports and digests in the field of emerging toxicological and environmental sciences areas (e.g., nanotoxicology, climate change, etc.)

Greenpeace
Web: http://www.greenpeace.org/international

Greenpeace is an independent global campaigning organization that acts to change attitudes and behavior, to protect and conserve the environment and to promote peace.

Hamner Institutes for Health Sciences
Web: http://www.thehamner.org

An independent non-profit toxicology research institute whose members include chemical, pharmaceutical, and other corporations. Activities include research related to human risk assessments of chemicals, e.g., development and validation of testing methods, development of data used in risk assessments, and the doctoral and postdoctoral training of toxicologists. Publishes a newsletter and other information-sharing documents, and also publishes its original research in peer-reviewed journals and elsewhere. Chemical Industry Institute of Toxicology (CIIT) and Institute for Translational Biomedical Sciences (ITBS) are two institutes under Hamner Institutes.

Harvard Center for Risk Analysis (HCRA)
Web: http://www.hcra.harvard.edu/

HCRA's research is focused broadly on developing risk, economic, and decision analysis methods that are well-grounded in the natural and social sciences. They use these methods to provide insights useful for informing real-world decisions. Their work draws on diverse disciplines including epidemiology, toxicology, environmental science and engineering, decision theory, cognitive psychology, applied mathematics, statistics, and economics. Areas of practical application include risks from air pollutants such as particulate matter, ozone, and mercury; conventional and toxic water and waste pollutants; and emerging issues such as nanomaterials and low-level pharmaceuticals in the environment.

Health Canada
Web: http://www.hc-sc.gc.ca

Health Canada is the federal government department responsible for helping Canadians maintain and improve their health, making Canada's population among the healthiest in the world based on longevity, lifestyle choices, and effective use of the Canada's public healthcare system. Health Canada conducts ongoing consultations with Canadians to determine how to best meet their long-term healthcare needs. Further, it communicates information about disease prevention to protect Canadians from avoidable risks. Additionally, it encourages Canadians to take an active role in their health, such as increasing their level of physical activity and eating well. The Health Canada website has relevant information related to environmental public health, health risk assessments, toxicology, air quality (indoor and outdoors), and water quality.

Health Effects Institute (HEI)
Web: http://healtheffects.org

HEI is a non-profit corporation chartered in 1980 as an independent research organization to provide high-quality, impartial, and relevant science on the health effects of air pollution. Typically, HEI receives half of its core funds from the US Environmental Protection Agency and half from the worldwide motor vehicle industry.

HERA (Human and Environmental Risk Assessments)
Web: http://www.heraproject.com/

A voluntary industry program to carry out human and environmental risk assessments on ingredients of household cleaning products.

In Vitro Testing Industrial Platform (IVTIP)
Web: http://www.ivtip.org

IVTIP is a forum of European companies with an active interest in in vitro testing to be used in regulatory/safety testing or to be used in the compound discovery and development process. They are also supportive of applying, where possible, the principle of the 3Rs: replacing, reducing, and refining animal testing. Their members represent companies in the chemical, cosmetics, and pharmaceutical sector.

INFOTERRA
Web: http://www.unep.org/infoterra/

INFOTERRA is the global environmental information exchange network of the United Nations Environment Programme. The network operates through a system of government-designated national focal points. An INFOTERRA national focal point is essentially a national environmental information centre usually located in the ministry or agency responsible for environmental protection. The primary function of each centre is to provide a national environmental information service.

Institute for Children's Environmental Health
Web: http://www.iceh.org/

The Institute for Children's Environmental Health (ICEH), founded in 1999, is a non-profit educational organization working to ensure a healthy, just, and sustainable future for all children. ICEH's primary mission is to foster collaborative initiatives to reduce and ultimately eliminate environmental exposures that can undermine the health of current and future generations.

Institute for Risk Research (IRR) and Network for Environmental Risk Assessment and Management (IRR-NERAM)
Web: http://www.irr-neram.ca/

IRR and NERAM are networks of expertise in risk management for the environment (NERAM) and risk in general (IRR). Both networks are funded by partners in industry and government as well as from research contracts, and sale of publications. All work done is peer-reviewed and published to ensure that all activities are

fully independent and of the highest quality. According to opportunities for support, the two networks sponsor conferences, workshops, and in-house research.

International Academy of Oral Medicine and Toxicology (IAOMT)
Web: www.iaomt.org

The IAOMT is a network of dental, medical, and research professionals who seek to raise the standards of scientific biocompatibility in the dental practice with information from the latest interdisciplinary research.

International Academy of Toxicologic Pathology (IATP)
Web: http://www.iatpfellows.org/

The purpose of the International Academy of Toxicologic Pathology (IATP) is to recognize and accredit highly accomplished toxicologic pathologists to ensure the competence and experience of professional practitioners whose work affects the public welfare throughout the world.

International Agency for Research on Cancer (IARC)
Web: http://www.iarc.fr

IARC's mission is to coordinate and conduct research on the causes of human cancer, the mechanisms of carcinogenesis, and to develop scientific strategies for cancer control. The Agency is involved in both epidemiological and laboratory research and disseminates scientific information through publications, meetings, courses, and fellowships.

International Association of Environmental Mutagen Societies (IAEMS)
Web: http://www.iaems.net/

The International Association of Environmental Mutagen Societies (IAEMS) is a global organization composed of 11 regional Environmental Mutagen Societies around the world. The IAEMS helps to sponsor a variety of international conferences.

International Association of Forensic Toxicologists (TIAFT)
Web: http://www.tiaft.org/

The aims of the association are to promote cooperation and coordination of efforts among members and to encourage research in forensic toxicology. The members come from the police force, medical examiners and coroners' laboratories, horseracing and sports doping laboratories, hospitals, departments of legal medicine, pharmacology, pharmacy, and toxicology.

International Association of Therapeutic Drug Monitoring and Clinical Toxicology (IATDMCT)
Web: http://www.iatdmct.org

IATDMCT's aims include promotion of knowledge and understanding of clinical drug analysis and interpretation of results, and encouragement of the effective application of therapeutic drug monitoring and clinical toxicology.

International Council of Chemical Associations (ICCA)
Web: http://www.icca-chem.org

The International Council of Chemical Associations (http://www.icca-chem.org/) is the global voice of the chemical industry, representing chemical manufacturers and producers. ICCA promotes and coordinates Responsible Care® and other voluntary chemical industry initiatives and has a central role in the exchange of information within the international industry and in the development of position statements on matters of policy. It is also the main channel of communication between the industry and various international organizations that are concerned with health, environment, and trade-related issues.

(The) International Council On Nanotechnology (ICON)
Web: http://icon.rice.edu

The ICON is managed by Rice University's Center for Biological and Environmental Nanotechnology. It promotes effective nanotechnology stewardship through risk assessment, research, and communication. The ICON Environmental, Health and Safety (EHS) Database is part of the Virtual Journal format and contains summaries (abstracts) and citations for research.

International Dose–Response Society Environmental Health Sciences Program
Web: www.dose-response.org

The International Dose–Response Society is dedicated to the enhancement, exchange, and dissemination of ongoing global research in hormesis, a dose–response phenomenon characterized by low-dose stimulation and high-dose inhibition.

Intergovernmental Forum on Chemical Safety (IFCS)
Web: http://www.who.int/ifcs/en

Concerned with the sound management of chemicals, the IFCS is a unique, over-arching mechanism to develop and promote strategies and partnerships among national governments, intergovernmental and non-governmental organizations. It contributes to the implementation of the Strategic Approach to International Chemicals Management (SAICM) and the

work of other chemicals-related international organizations and institutions.

International Fragrance Association (IFRA)
Web: http://www.ifraorg.org

Research and development, scientific findings, health and safety concerns as well as environmental protection are at the heart of IFRA's concerns. Together with the industry's scientific arm the Research Institute for Fragrance Materials (RIFM), IFRA ensures that the establishment of usage standards for fragrance materials is put into practice according to available scientific recommendations, and that all member companies comply with those Standards.

International Labour Organization (ILO)
Web: http://www.ilo.org

ILO's main aims are to promote rights at work, encourage decent employment opportunities, enhance social protection and strengthen dialog in handling work-related issues. ILO's SAFEWORK component is concerned with such areas of action as hazardous work, chemical safety, occupational safety and health, and drugs and alcohol. The International Occupational Safety and Health Information Centre (CIS) (http://www.ilo.org/public/english/protection/safework/cis/) is the knowledge management arm of SAFEWORK. CIS publishes the ILO Encyclopedia and the International Chemical Safety Cards, among other documents.

International Life Sciences Institute (ILSI)
Web: http://www.ilsi.org

ILSI is a non-profit scientific research and educational foundation sponsored by various food, chemical, pharmaceutical, and other companies. Headquarters are in Washington, DC with offices (branches) around the world. Issues covered include those in toxicology, animal pathology, risk assessment, water quality, the environment, food safety, and nutrition. Offices worldwide focus on issues of regional and country-specific importance. Includes the ILSI Health and Environmental Sciences Institute focusing on environmental issues. Publishes numerous books and other documents.

International Maritime Organization (IMO)
Web: http://www.imo.org

IMO's main task has been to develop and maintain a comprehensive regulatory framework for shipping and its remit today includes safety, environmental concerns, legal matters, technical co-operation, maritime security, and the efficiency of shipping. Has developed the International Maritime Dangerous Goods (IMDG) Code.

International Neurotoxicology Association
Web: http://www.neurotoxicology.org

Promotes research and awareness in the areas of neurotoxicology, and organizes international conferences in the broad areas of neurotoxicology.

International Programme on Chemical Safety (IPCS)
Web: http://www.who.ch/pcs

IPCS is a joint program of the World Health Organization, the International Labour Organisation, and the United Nations Environment Program. IPCS' major activities involve: Evaluation of chemical risk to human health (involving preparation and publication of chemicals assessments, development and harmonization of scientifically sound methods for chemicals assessment, and evaluating the safety of food components, constituents, additives and residues of pesticides and veterinary drugs); poisons information, prevention, and management; chemicals incidents and emergencies; and capacity building.

International Radiation Protection Association (IRPA)
Web: http://www.irpa.net/

IRPA is the worldwide association for members of affiliated national or regional associate societies. The purpose of IRPA is 'to provide a medium whereby those engaged in radiation protection activities in all countries may communicate more readily with each other and through this process advance radiation protection in many parts of the world.'

International Society for Environmental Epidemiology (ISEE)
Web: http://www.iseepi.org

Topics addressed by ISEE members include environmental exposures (e.g. air pollution, hazardous waste, metals, pesticides, radiation), health effects (e.g. cancer, cardiovascular disease, neurologic effects, reproductive effects), methodology (e.g. biomarkers, ecologic investigations, experimental design, exposure/dose assessment, meta-analysis, risk assessment, statistics), environment–gene interactions, and ethics and law.

International Society of Exposure Analysis (ISEA)
Web: http://www.iseaweb.org

The ISEA was established in 1989 to foster and advance the science of exposure analysis related to environmental contaminants, both for human populations and ecosystems. The membership promotes communication among all disciplines involved in exposure analysis, recommends exposure analysis approaches to address substantive or methodological concerns, and works to

strengthen the impact of exposure assessment on environmental policy. ISEA is considering changing its name to the International Society of Exposure Science (ISES).

International Society of Regulatory Toxicology and Pharmacology (ISRTP)
Web: http://www.isrtp.org/

The purpose of the ISRTP is to provide an open public forum for policymakers and scientists promoting sound toxicologic and pharmacologic science as a basis for regulation affecting human safety and health, and the environment.

International Society for the Study of Xenobiotics (ISSX)
Web: http://www.issx.org

The International Society for the Study of Xenobiotics (ISSX) is a scientific organization for researchers interested in the metabolism and disposition of xenobiotics. Facilitates and encourages the assembly, acquaintanceship, and association of scientists engaged in research in xenobiotic metabolism and in other related disciplines. Hosts an international meeting and workshops throughout the world.

International Society on Toxinology (IST)
Web: http://www.toxinology.org/

The International Society on Toxinology was founded in 1962 by a group of scientists and clinicians interested in advancing the science of toxinology. The purpose of the Society is to advance knowledge on the properties of toxins and antitoxins and to bring together scholars interested in these substances through a common Society. Publishes the journal, *Toxicon*.

International Union of Pure and Applied Chemistry (IUPAC)
Web: http://www.iupac.org

IUPAC serves to advance the worldwide aspects of the chemical sciences and to contribute to the application of chemistry in the service of mankind. As a scientific, international, non-governmental, and objective body, IUPAC addresses many global issues involving the chemical sciences, including toxicology and risk assessment.

International Union of Toxicology (IUTOX)
Web: http://www.iutox.org

IUTOX views itself as the voice of toxicology on the global stage, and the organization seeking to increase the knowledge base of toxicological issues facing humankind and to extend this knowledge to developing societies and nations. The mission of IUTOX is to foster international scientific cooperation among toxicologists, to promote global acquisition, dissemination, and utilization of knowledge in the science of toxicology, and to ensure continued training and development of toxicologists worldwide. IUTOX, as of January 2008, has 51 affiliated societies representing all six continents and over 20 000 toxicologists from industry, academia, and government as members.

Johns Hopkins University Center for Alternatives to Animal Testing (CAAT)
Web: http://caat.jhsph.edu/

Members include individuals and organizations interested in the development and validation of in vitro alternatives to the use of whole animals in toxicology. Mission includes fostering the development of scientifically acceptable in vitro and other alternatives for use in the development and safety evaluation of commercial and therapeutic products. Mission further includes catalyzing the validation of alternative methods and encouraging their use, where appropriate, while continuing to ensure the health of the public and to disseminate scientifically correct information about alternatives, their uses, advantages, and limitations.

(U.S.) National Academies
Web: http://www.nas.edu

The National Academies perform public service by bringing together committees of experts in all areas of scientific and technological endeavor. These experts serve pro bono to address critical national issues and give advice to the federal government and the public. Four organizations comprise the Academies: the National Academy of Sciences, the National Academy of Engineering, the Institute of Medicine, and the National Research Council. The Board on Environmental Studies and Toxicology (BEST) (http://dels.nas.edu/best/) is the National Academies' principal study unit for environmental pollution problems affecting human health, human impacts on the environment, and the assessment and management of related risks to human health and the environment.

(U.S.) National Agricultural Library (NAL), Department of Agriculture
Web: http://www.nal.usda.gov

The National Agricultural Library houses one of the world's largest and most accessible agricultural information collections and serves as the nexus for a national network of state land-grant and U.S. Department of Agriculture field libraries. The Food Safety Information Center would be of particular interest to toxicologists.

National Animal Poison Control Center (NAPCC)
Web: www.aspca.org/apcc

The ASPCA Animal Poison Control Center is dedicated to helping animals exposed to potentially hazardous substances by providing 24-hour veterinary

diagnostic and treatment recommendations. The center is committed to protecting and improving the lives of animals through toxicology educational programs and non-traditional research.

National Environmental Health Association (NEHA)
Web: http://www.neha.org

A professional society, whose mission is 'to advance the environmental health and protection professional for the purpose of providing a healthful environment for all.' NEHA produces the Annual Educational Conference (AEC) & Exhibition, and a number of technical workshops each year. In addition, it publishes the peer-reviewed *Journal of Environmental Health*, and offers environmental publications through its online bookstore.

National Institute for Chemical Studies (NICS)
Web: http://www.nicsinfo.org/

NICS helps communities manage safety, health, and environmental risks associated with the manufacture, storage, transportation, and disposal of chemicals.

(U.S.) National Institutes of Health (NIH)
(Also see other NIH listings)
Web: http://www.nih.gov

The NIH is a part of the U.S. Department of Health and Human Services. It is the primary Federal agency for conducting and supporting medical research. Composed of 27 Institutes and Centers, the NIH provides leadership and financial support to researchers in every state and throughout the world. The NIH institutes most closely related to the topics of toxicology and environmental health toxicology and environmental health research play some role in the activities of virtually every NIH institute, particularly the National Cancer Institute, the National Institute of Environmental Health Sciences, and the National Library of Medicine.

(U.S.) National Institutes of Health (NIH), National Cancer Institute (NCI)
Web: http://www.cancer.gov

The NCI, established under the National Cancer Institute Act of 1937, is the Federal Government's principal agency for cancer research and training. The National Cancer Act of 1971 broadened the scope and responsibilities of the NCI and created the National Cancer Program. Over the years, legislative amendments have maintained the NCI authorities and responsibilities and added new information dissemination mandates as well as a requirement to assess the incorporation of state-of-the-art cancer treatments into clinical practice. Among NCI's many laboratories are those devoted to human carcinogenesis, and comparative carcinogenesis.

(U.S.) National Institutes of Health, National Institute of Child Health and Human Development (NICHD)
Web: http://www.nichd.nih.gov

The NICHD, established by Congress in 1962, conducts and supports research on topics related to the health of children, adults, families, and populations. Its Developmental Biology, Genetics, and Teratology Branch conducts research on the genetic and teratogenic aspects of environmental factors on development.

(U.S.) National Institutes of Health, National Institute of Environmental Health Sciences (NIEHS)
Web: http://www.niehs.nih.gov

The mission of the NIEHS is to reduce the burden of human illness and disability by understanding how the environment influences the development and progression of human disease. The internal research arm of the NIEHS contributes to the understanding of biological and chemical processes, of the role of environmental agents in human disease and dysfunction, and the identification of the effect of environmental influences on the underlying mechanisms that lead to complex diseases. Its clinical research program seeks to use environmental exposures to strengthen the evidence that a given exposure is toxic, determine how such exposures affect disease etiology and progression, and identify molecular targets to determine susceptibility and develop health interventions. NIEHS also funds external environmental health sciences research. The National Toxicology Program is an interagency program housed at NIEHS whose mission is to evaluate agents of public health concern by developing and applying tools of modern toxicology and molecular biology. NIEHS offers a number of databases relevant to toxicology, including Chemical Effects in Biological Systems (CEBS).

(U.S.) National Institutes of Health (NIH), National Library Of Medicine (NLM), Division of Specialized Information Services (SIS)
Web: http://sis.nlm.nih.gov

The NLM, part of the National Institute of Health, provides extensive information and data management support and medical library and computer-based reference services for health professionals, libraries, researchers, educators, officials, managers, and administrators. NLM's Division of Specialized Information Services (SIS, http://sis.nlm.nih.gov/) creates information resources and services in toxicology, environmental health, chemistry, HIV/AIDS, and disaster management. SIS' Toxicology and Environmental Health Information Program (TEHIP) creates, organizes, and disseminates toxicology and environmental

health information, through an extensive set of free databases and other online products.

(U.S.) National Institute for Occupational Safety and Health (NIOSH)
Web: http://www.cdc.gov/niosh

NIOSH is in the U.S. Department of Health and Human Services and is an agency established to help assure safe and healthful working conditions for working men and women by providing research, information, education, and training in the field of occupational safety and health. NIOSH develops recommendations for occupational safety and health standards, conducts and funds research, develops information on safe levels of exposure to toxic materials and harmful physical agents and substances, and undertakes responsibilities under the Federal Mine Safety and Health Amendments Act of 1977.

(U.S.) National Oceanic and Atmospheric Administration (NOAA)
Web: http://www.noaa.gov

NOAA's broad activities range from alerting the public to daily weather forecasts and severe storm warnings to climate monitoring, fisheries management, coastal restoration, and supporting marine commerce. NOAA's Office of Response and Restoration provides scientific and technical support to prepare for and respond to oil and chemical releases.

National Pest Management Association, Inc.
Web: http://www.pestworld.org

The NPMA is a not-for-profit organization committed to the protection of public health, food, and property. The NPMA website is designed to serve as a comprehensive resource about bugs, rodents, pest control, and the professional pest management industry. The intended audience includes consumers, media, educators, and pest control professionals, and the website provides access to NPMA-led 'Pest World' blogs and podcasts. A companion website (www.pestworldforkids.org) is designed for teachers and students, and another website, (www.NPMApestworld.org) provides NPMA members with access to additional information.

National Pesticide Information Center (NPIC)
Web: http://npic.orst.edu

NPIC provides objective, science-based information about pesticides and pesticide-related topics to enable people to make informed decisions about pesticides and their use. NPIC is a cooperative agreement between Oregon State University and the U.S. Environmental Protection Agency.

National Registry of Environmental Professionals (NREP)
Web: http://www.nrep.org

NREP's mission is to promote legal and professional recognition of individuals possessing education, training, and experience as environmental managers, engineers, technologists, scientists, and technicians. Its professional affiliations include the Council on Licensure Enforcement and Regulation, International Association of Emergency Managers, World Safety Organization, and many other organizations including professional societies and colleges/universities. NREP holds workshops and provides a registry listing service for individuals in the environmental field who meet the minimum educational and training requirements.

National Research Council (NRC)
Web: http://sites.nationalacademies.org/nrc/index.htm

The NRC functions under the auspices of the National Academy of Sciences (NAS), the National Academy of Engineering (NAE), and the Institute of Medicine (IOM). The NAS, NAE, IOM, and NRC are known together as the National Academies. NRC's mission is to improve government decision making and public policy, increase public education and understanding, and promote the acquisition and dissemination of science, engineering, technology, and health knowledge. The core services involve collecting, analyzing, and sharing information and knowledge. The NRC develops consensus studies (comprehensive reports on major policy issues), conducts expert meetings and workshops, provides program and research management at the request of state and federal agencies, and administers several postdoctoral fellowship programs.

Natural Resources Information Council (NRIC)
Web: http://www.nric.info/

The NRIC facilitates the exchange of information among natural resource managers, information specialists, and librarians specializing in natural resources. Its members are from public (government organizations and academia) and private (non-governmental and consulting) organizations. The NRIC holds conferences and publishes a newsletter.

National Safety Council (NSC)
Web: http://www.nsc.org/

The NSC promotes safety in the workplace, in transportation, and in homes and communities. The National Safety Council serves as the nation's leading resource on industry trends, professional development, and strategies for advancing safety and health

programs and practices. The Council is active in converting injury research and trends information into injury prevention education, training, consultation, and advocacy leadership.

National Science Foundation (NSF)
Web: http://www.nsf.gov

The NSF is an independent federal agency created by Congress in 1950 'to promote the progress of science; to advance the national health, prosperity, and welfare; to secure the national defense…'. They fulfill their mission chiefly by issuing limited-term grants – currently about 10 000 new awards per year, with an average duration of 3 years – to fund specific research proposals that have been judged the most promising by a rigorous and objective merit-review system. Most of these awards go to individuals or small groups of investigators. Others provide funding for research centers, instruments and facilities that allow scientists, engineers and students to work at the outermost frontiers of knowledge.

National Technical Information Service (NTIS)
Web: http://www.ntis.gov

The NTIS is a U.S. Department of Commerce program that claims to be the largest central resource for government-funded scientific, technical, engineering, and business-related information. It provides for public sale reports of U.S. government-sponsored scientific, technical, engineering, and business-related information covering over 350 subject areas. The NTIS Database has over two million bibliographic records, and includes research sponsored by the U.S. and select foreign governments. The database includes research reports, computer products, software, video cassettes, audio cassettes, etc.

National Transportation Safety Board (NTSB)
Web: http://www.ntsb.gov

The NTSB is an independent U.S. Federal government agency promoting transportation safety through independent investigations and making recommendations aimed at preventing future accidents. It investigates every civil aviation accident in the U.S., and significant accidents in other modes of transportation such as in highway transportation, some railroad and marine accidents, and releases of hazardous materials in all forms of transportation.

National Wildlife Federation (NWF)
Web: http://www.nwf.org

The NWF is a collection of state and territorial conservation organizations with the mission 'to inspire Americans to protect wildlife for our children's future.' It has several regional field offices and numerous affiliated wildlife organizations. It issues news releases, factsheets, and reports, and the website provides access to several NWF-related blogs and NWF's online *Conservation Directory* which includes information about thousands of environmental groups around the world.

Natural Resources Defense Council (NRDC)
Web: http://www.nrdc.org

The NRDC was established in 1970 as a non-profit organization to provide legal assistance related to the preservation and conservation of natural resources. NRDC claims to be the nation's most effective environmental action group, combining the grassroots power of over one million members and online activists with the expertise of several hundred lawyers, scientists, and other professionals. NRDC has several offices in the U.S. and one in Beijing, People's Republic of China. As of mid-2008, NRDC's main priorities included: (a) curbing global warming, (b) moving America beyond oil, (c) saving wildlands across the Americas, (d) reviving our oceans, (e) stemming the tide of toxic chemicals, and (f) speeding up the greening of China. The NRDC website provides access to press releases, an e-newsletter, a bimonthly bulletin, blogs, and other information.

North American Association for Environmental Education (NAAEE)
Web: http://naaee.org/pages/index.html

The North American Association for Environmental Education (NAAEE) is a network of professionals, students, and volunteers working in the field of environmental education throughout North America and in over 55 countries around the world.

Oak Ridge Associated Universities (ORAU)
Web: http://www.orau.org

ORAU is a not-for-profit university consortium of about 100 member universities. The ORAU member universities share the objective of advancing scientific research and education by creating mutually beneficial collaborative partnerships involving academic institutions, government organizations, and industry. The emphasis is on developing and promoting partnerships with national laboratories, in particular the Oak Ridge National Laboratory (ORNL). ORAU operates as a federal contractor for the U.S. Department of Energy (DOE) by targeting the core areas of: (a) worker/public health and independent verification of environmental cleanup, (b) weapons of mass destruction national preparedness and emergency response, and (c) science education, workforce development, and scientific review programs.

Oak Ridge National Laboratory (ORNL)
Web: http://www.ornl.gov

Oak Ridge National Laboratory (ORNL) is a multiprogram science and technology laboratory managed under contract for the U.S. Department of Energy by several outside organizations over the years. As of 2008, the contractor is a not-for-profit company known as UT-Battelle, established to manage and operate the Oak Ridge National Laboratory for the U.S. Department of Energy. UT-Battelle is a limited liability partnership between the University of Tennessee and Battelle. Scientists and engineers at ORNL conduct basic and applied research and development to create scientific knowledge and technological solutions that strengthen the nation's leadership and abilities in key areas of science. ORNL has a rich history of toxicology research dating back to its inception as one of the laboratory facilities of the Manhattan Project. The Biosciences Division includes expertise and special facilities in mammalian genetics and genomics, computational biology, biophysics and biomedical technologies, and in toxicology and risk analysis. The Environmental Sciences Division (ESD) covers research, development of technologies, and performance of analyses to understand and assess responses of environmental systems at the environment–human interface and the consequences of alternative energy and environmental strategies.

Organisation for Economic Co-operation and Development (OECD)
Web: http://www.oecd.org
Web: http://www.oecdwash.org

The OECD brings together the governments of countries committed to democracy and the market economy from around the world to: (a) support sustainable economic growth, (b) boost employment, (c) raise living standards, (d) maintain financial stability, (e) assist other countries' economic development, and (f) contribute to growth in world trade. OECD's Chemical Safety program works on the development and co-ordination of environment health and safety activities internationally. One example of an OECD-led effort is the OECD (Q)SAR Application Toolbox, a software application intended to be used by governments, the chemical industry, and other stakeholders to fill gaps in (eco)toxicity data needed for assessing the hazards of chemicals. Another example is OECD's Working Party on Manufactured Nanomaterials, which has a 'sponsorship programme' in which countries share the testing of specific nanomaterials (MNs). Further, the eChemPortal is an OECD-led web-based gateway that provides direct free access to information on the properties of chemicals (physical-chemical properties, environmental fate and behavior, ecotoxicity, toxicity) as well as to hazard and risk assessments. It allows users to simultaneously search multiple databases, most of which are prepared for government chemical review programs. OECD's Environment Directorate provides governments with the analytical basis to develop policies that are effective and economically efficient, including through country performance reviews, data collection, policy analysis, projections and modeling, and the development of common approaches.

Pacific Northwest National Laboratory (PNL)
Web: http://www.pnl.gov

Battelle manages and operates the federal government's Pacific Northwest National Laboratory in Washington state. PNL's scientific missions include: (a) strengthening the U.S. scientific foundations for innovation, (b) increasing U.S. energy capacity and reducing dependence on imported oil, (c) preventing and counter terrorism related to Weapons of Mass Destruction, and (d) reducing the environmental effects of human activities and create sustainable systems. The William R Wiley Environmental Molecular Sciences Laboratory (http://www.emsl.pnl.gov/emslweb) focuses on integrated experimental and computational resources for discovery and technological innovation in the environmental molecular sciences to support the needs of DOE and the nation. Examples of toxicology-related efforts at PNL include the systems toxicology of nanomaterials, and the development of new environmental biomarkers.

People for the Ethical Treatment of Animals (PETA)
Web: http://www.peta.org/

PETA has more than two million members and supporters and is the largest animal rights organization in the world. It focuses its attention on situations involving the suffering of animals, and works through public education, cruelty investigations, research, animal rescue, legislation, special events, celebrity involvement, and protest campaigns.

Personal Care Products Council (PCPC)
(Formerly the Cosmetic, Toiletry and Fragrance Association, CTFA)
Web: http://www.personalcarecouncil.org/

The PCPC is the leading U.S. trade association for the cosmetic and personal care products industry. PCPC's mission is to enable its company members to continue developing and selling the safe, quality, and innovative cosmetic and personal care products. It offers services, products, and information on scientific, regulatory, and legislative developments in the personal care products industry. For example, its CosmeticsInfo.org website provides safety information about

cosmetic and personal care products, including their ingredients and how they are tested. PCPC's Cosmetic Ingredient Review (CIR) was established in 1976 with support of the U.S. Food & Drug Administration and the Consumer Federation of America. Although funded by the PCPC, CIR and the review process are independent from CTFA and the cosmetics industry. The CIR thoroughly reviews and assesses the safety of ingredients used in cosmetics in an open, unbiased, and expert manner, and publishes the results in the open, peer-reviewed scientific literature. The PCPC website offers a wide variety of online tools and services to members and non-members.

Pesticide Action Network North America (PANNA)
Web: http://www.panna.org

PANNA's mission is to combine science and community-led campaigns to force global phase outs of highly hazardous pesticides. Their work advances environmental justice, sustainable agriculture, and food sovereignty. Operates the PAN Pesticides Database.

Pharmaceutical Research and Manufacturers of America (PhRMA)
(Formerly the Pharmaceutical Manufacturers Association (PMA))
Web: http://phrma.org

PhRMA represents the leading pharmaceutical and biotechnology companies in the U.S. Its mission is to conduct effective advocacy for public policies that encourage discovery of important new medicines for patients by pharmaceutical/biotechnology research companies.

Physicians for Social Responsibility (PSR)
Web: http://www.psr.org

The PSR is a U.S.-based non-profit advocacy organization claiming to be the medical and public health voice for policies to stop nuclear war and proliferation and to slow, stop, and reverse global warming and toxic degradation of the environment. PSR's Environment and Health Program is: (a) pressing for policies to curb global warming, ensure clean air, and generate a sustainable energy future, (b) working to minimize toxic pollution of air, food, and drinking water and prevent human exposures to toxic substance, (c) urging awareness about the emerging links between chronic disease and environmental factors, (d) providing health professionals with resources that address the questions the health community has about environmental health, and (e) bringing health professionals valuable resources for colleagues and patients about our community's need for a safer, healthier environment.

(U.S.) Public Interest Research Groups (U.S. PIRG)
Web: http://www.uspirg.org

U.S. PIRG is the federation of state Public Interest Research Groups (PIRGs). It is an advocate for the public interest. U.S. PIRG's mission is to deliver persistent, result-oriented public interest activism that protects health, encourages a fair, sustainable economy, and fosters responsive, democratic government. The state PIRGs are independent, state-based, citizen-funded organizations that advocate for the public interest.

Rachel Carson Council (RCC)
(Formerly the Rachel Carson Trust for the Living Environment)
Web: http://www.rachelcarsoncouncil.com/ (Web site under development)

The RCC is a library with information at both scientific and public levels on pesticide-related issues. It produces publications about pesticide dangers and alternative pest controls, and also develops conferences and workshops.

Radiation Effects Research Foundation (RERF)
(Formerly the Atomic Bomb Casualty Commission)
Web: http://www.rerf.jp

RERF is a Japanese and U.S. not-for-profit scientific organization dedicated to studying the health effects of atomic bomb radiation, with a view toward contributing to the maintenance of the health and welfare of atomic bomb survivors and to the enhancement of the health of all mankind.

Research Institute for Fragrance Materials (RIFM)
Web: http://rifm.org/

The RIFM is an independent non-profit scientific organization. It generates, evaluates, and distributes scientific data on the safety assessment of fragrance raw materials found in perfumes, cosmetics, shampoos, creams, detergents, air fresheners, candles, and other personal and household products. Included among RIFM's efforts is the development of peer-reviewed 'fragrance monographs' published in *Food and Chemical Toxicology* and separately as updated sets in a RIFM compendium. RIFM's Database of Fragrance and Flavor Materials is the most comprehensive source worldwide of physical-chemical, toxicological, and eco-toxicological data, literature, and information on safety evaluation associated with known fragrance and flavor materials.

RESOLVE
Web: http://www.resolv.org

RESOLVE was established in 1977 as one of the first U.S. environmental dispute-resolution organizations,

and now operates internationally. RESOLVE provides a full range of alternative dispute resolution and consensus building services to individuals, organizations, and communities. Services include mediation of negotiated rulemaking, facilitation of workshops and public–private collaboratives, and conflict assessments for convening negations. RESOLVE maintains a section devoted to toxics and chemicals in the environment, which deals primarily with Superfund and related risk assessments to facilitate discussions and dialogs among stakeholders.

Resources for the Future, Center for Risk Management (RFF)
Web: http://www.rff.org

RFF calls itself the premier independent institute dedicated exclusively to analyzing environmental, energy, and natural resource topics, and was the first think tank devoted exclusively to natural resource and environmental issues. RFF scholars analyze critical issues concerning pollution control, energy policy, land and water use, hazardous waste, climate change, biodiversity, and the environmental challenges of developing countries. It publishes books, reports, a quarterly magazine, and other documents.

Science and Environmental Health Network (SEHN)
Web: http://www.sehn.org/

SEHN was founded in 1994 by a consortium of North American environmental organizations (including the Environmental Defense Fund, The Environmental Research Foundation, and OMB Watch) concerned about the misuse of science in ways that failed to protect the environment and human health. Since 1998, SEHN has been the leading proponent in the United States of the Precautionary Principle as a new basis for environmental and public health policy. SEHN has worked with issue-driven organizations, national environmental health coalitions, municipal and state governments, and several NGO/government teams to implement precautionary policies at local and state levels.

Scientific Group on Methodologies for the Safety Evaluation of Chemicals (SGOMSEC)

SGOMSEC was sponsored by the IPCS (International Program on Chemical Safety) within the World Health Organization (WHO), with the cooperation of United Nations Environment Programme (UNEP), International Labour Organisation (ILO), and the Scientific Programme on Problems of the Environment (SCOPE). The U.S. NIEHS and the European Commission have also contributed to SGOMSEC studies. The broad objective of SGOMSEC was to contribute to the reduction and prevention of risks caused to humans and non-human targets (ecosystems) by the introduction in the environment in increasing quantities of a large number of natural and man-made chemicals. This program was discontinued in late 2005 but the website has relevant toxicological publications and reports.

Scientists Center for Animal Welfare (SCAW)
Web: http://www.scaw.com

SCAW is a not-for-profit educational organization composed of research professionals dedicated to balancing animal welfare and excellence in basic and applied scientific inquiry. SCAW seeks to facilitate open discussion and helps craft solutions as well as promote best practices. It sponsors an educational Winter Conference and many seminars and workshops.

Sierra Club
Web: http://www.sierraclub.org

Founded in 1892 as one of America's first natural resources advice groups, the Sierra Club embraces a wide variety of issues that advocate the responsible use of the Earth's resources and ecosystems and to protect the quality of the environment. Provides extensive education and outreach campaigns at national and international levels. Its numerous chapters and several hundred affiliated groups in North America provide public information on a wide variety of environmental and natural resources topics, including those related to toxicology and environmental health.

Soap and Detergent Association (SDA)
Web: http://www.cleaning101.com

SDA is a not-for-profit organization representing North American manufacturers of household, industrial, and institutional cleaning products, their ingredients, finished packaging, oleochemical producers, and chemical distributors to the cleaning product industry. SDA's mission is to support the sustainability of the cleaning product and oleochemical industries, through research, education, outreach, and science-based advocacy. Activities include toxicology and regulatory issues.

Society for Chemical Hazard Communication (SCHC)
Web: http://www.schc.org

The SCHC is a non-profit organization with a mission to promote the improvement of chemical hazard communication, educate SCHC members on hazard communication issues, provide a forum for exchange of ideas and experiences, enhance the awareness of members and the general public of new developments in hazard communications, and to provide guidance and technical expertise to private, non-profit groups, and government organizations.

Society for Free Radical Biology and Medicine (SFRBM)
(Formerly The Oxygen Society)
Web: http://www.sfrbm.org/

Free radicals and reactive oxygen and nitrogen species now touch every biological and medical discipline. Efforts to counteract the damage caused by these species are gaining acceptance as a basis for novel therapeutic approaches, and the field of preventive medicine is experiencing an upsurge of interest in medically useful antioxidants and free radical scavengers. SFRBM fosters a balanced approach to understanding both the advantageous and deleterious properties of free radicals and reactive oxygen and nitrogen species.

Society for in Vitro Biology (SIVB)
(Formerly the Tissue Culture Association)
Web: http://www.sivb.org

The SIVB fosters the exchange of knowledge about the in vitro biology of cells, tissues, and organs from plants, humans, and other animals. It holds national and local conferences, meetings, and workshops, and supports teaching initiatives with educational institutions. Publications include a journal (*In Vitro Cellular and Developmental Biology* – separate animal and plant editions, and *Methods in Cell Science* (formerly *Journal of Tissue Culture Methods*)) and a newsletter (*In Vitro Report*).

Society for Risk Analysis (SRA)
Web: http://www.sra.org

SRA's scope includes risk assessment, risk characterization, risk communication, risk management, and policy relating to risk. Members include risk analysis professionals from varied areas, including human and environmental risk assessment. SRA publishes a peer-reviewed journal, *Risk Analysis*, which provides a focal point for new developments in risk analysis for scientists from a wide range of disciplines. The Society's website includes links to information about SRA, SRA's regional organizations and specialty groups, SRA's newsletter, job opportunities, and resources (speakers bureau, risk analysis glossary, academic programs, data, government agencies and laboratories, non-profit organizations, private sector consultants, providers of other information and materials, related societies and associations, and software providers).

Society of Environmental Journalists (SEJ)
Web: http://www.sej.org

Members include journalists, educators, and students. Its mission is to advance public understanding of environmental issues by improving the quality, accuracy, and visibility of environmental reporting. Publishes a newsletter *SEJournal*, and a biweekly 'TipSheet.' The Society of Environmental Journalists also offers TipSheet, WatchDog TipSheet, EJToday, Environmental Events Calendar and Useful Links via RSS News Feed.

Society of Environmental Toxicology and Chemistry (SETAC)
Web: http://www.setac.org

SETAC is a non-profit, worldwide professional society with the mission of supporting the development of principles and practices for protection, enhancement and management of sustainable environmental quality and ecosystem integrity. It promotes the advancement and application of scientific research related to contaminants and other stressors in the environment, education in the environmental sciences, and the use of science in environmental policy and decision-making. Members include professionals in the fields of chemistry, toxicology, biology, ecology, etc., promoting the use of multidisciplinary approaches to examine the impacts of chemicals and technology on the environment. It publishes a newsletter and other documents including a journal (*Environmental Toxicology and Chemistry*). SETAC also has offices in Europe, Asia/Pacificmailto:, and Latin America.

Society of Forensic Toxicologists (SOFT)
Web: http://www.soft-tox.org

SOFT members include practicing forensic toxicologists and others interested in promoting and developing forensic toxicology. The website contains annual meeting information, efforts to encourage training and research (including via SOFT-funded awards), employment opportunities, publications, and related links. SOFT publications include a newsletter and laboratory guidelines.

Society of Quality Assurance (SQA)
Web: http://www.sqa.org/newsite/public/pubhome.asp#

SQA is dedicated to providing a forum for information exchange and utilization of knowledge in research and regulatory quality assurance, promoting the profession through leadership and effective professional relationships, enhancing knowledge of regulatory and quality assurance concerns that impact research, and fostering the highest professional standards leading to growth, development, and recognition of the quality assurance profession worldwide.

Society of Toxicologic Pathologists (STP)
Web: http://www.toxpath.org

Members include toxicologic pathologists, veterinarians, physicians, and dentists interested in the pathological changes produced by pharmacological, chemical, and environmental agents. The principal aim is the

advancement of pathology as it pertains to changes elicited by pharmacologic, chemical, and environmental agents and factors that modify these responses. Publications include a newsletter and a journal (*Toxicologic Pathology*).

Society of Toxicology (SOT)
Web: http://www.toxicology.org

The Society of Toxicology is, perhaps, the premiere professional and scholarly organization of scientists from academic institutions, government, and industry representing the great variety of scientists who practice toxicology in the U.S. and abroad. The Society promotes the acquisition and utilization of knowledge in toxicology, aids in the protection of public health, and facilitates disciplines. The Society has a strong commitment to education in toxicology and to the recruitment of students and new members into the profession. Its official journal is *Toxicological Sciences*. SOT has numerous specialty sections, special interest groups, and regional chapters and a useful website including news and information on careers in toxicology.

Society of Toxicology of Canada (STC)
Web: http://www.stcweb.ca

The STC is a non-profit association whose objectives are to promote the acquisition, facilitate the dissemination, and encourage the utilization of knowledge in the science of toxicology. STC membership also includes membership in the Canadian Federation of Biological Societies (CFBS) and the International Union of Toxicology (IUTOX). It holds an annual symposium and members receive a newsletter providing a Canadian perspective on toxicological news. STC also develops public awareness initiatives, e.g., a Principles of Toxicology document and slide set.

Synthetic Organic Chemical Manufacturers Association (SOCMA)
Web: http://www.socma.org

SOCMA represents the U.S. batch, custom and specialty chemical industry. SOCMA committees include ones on chemical risk management, the environment, safety and security, and environmental, health, and safety performance improvement. Communication tools for members include several electronic newsletters, email Member Alerts, and an Internet portal (blog) that allows direct communication with SOCMA's President to discuss and debate topics, and podcasts on various topics. SOCMA manages several affiliated associations and consortia that address issues of common concern or interest to a particular sector of the chemical industry (e.g. chemical-specific or class of related chemicals or applications).

Teratology Society
Web: http://teratology.org

The Teratology Society is a multidisciplinary scientific society whose members study the causes and biological processes leading to abnormal development and birth defects at the fundamental and clinical level and appropriate measures for prevention. Several other societies with common interests meet in conjunction with the annual meetings of the Teratology Society, including the Neurobehavioral Teratology Society, Behavioral Toxicology Society, and Organization of Teratology Information Societies (OTIS).

Toxicology Education Foundation
Web: http://www.toxedfoundation.org

The Toxicology Education Foundation's purpose is to encourage, support, and promote charitable and educational activities that increase the public understanding of toxicology. TEF has developed and provides audiovisual materials for health professionals to use in presentations to the public in partnership with NIEHS and others in the private sector. The goal of the video 'Is It Safe?' is to empower the public to make good decisions about risk associated with every day products.

Toxicology Excellence for Risk Assessment (TERA)
Web: http://www.tera.org

TERA is an independent non-profit research and education organization with the mission of protecting public health by developing and communicating risk assessment information, sponsoring peer reviews and consultations, improving risk methods through research, educating the public on risk assessment issues, and providing sponsors and the public with independent and objective opinions. Specific activities of *TERA* include (a) the Verifiable Estimates for Risk Assessment (VERA) program, (b) compiling and freely distributing peer-reviewed risk values via the International Toxicity Estimates for Risk (ITER) database, (c) improving the process and efficiency of risk assessment, and increasing the capacity for developing risk information through the ARA, the Alliance for Risk Assessment, and RiskIE, the Risk Information Exchange, (d) conducting expert peer reviews and peer consultations of risk assessments and other information, (e) improving underlying methods for human and ecological risk assessment through research and publications, (f) education and training for the public and others on risk assessment issues, (g) public assistance and help for government agencies, and (h) improving the practice of risk assessment by independent, neutral, and objective guidance and advice.

Toxicology Forum (TF)
Web: http://www.toxforum.org

An international non-profit organization devoted to the organization of open dialogs among the various segments of society concerned with problems in toxicology. TF-sponsored meetings in the U.S. and Europe include experts from domestic and international government regulatory and health agencies, industry, academia, political policymakers, and public interest groups. The meetings promote discussion of a range of viewpoints on issues and topics that are unencumbered by a need to arrive at consensus.

United Nations (UN)
Web: http://www.un.org

The charter of the UN states its four main objectives of maintaining international peace and security, developing friendly relations among nations based on respect for the principle of equal rights and self-determination of peoples, achieving international cooperation in solving international problems of an economic, social, cultural, or humanitarian character and in promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion, and to be a center for harmonizing the actions of nations in the attainment of these common ends. Organizations which are part of the UN system, and which are relevant to toxicology research include the FAO, IAEA, ILO, UNEP, and WHO.

United Nations Environment Programme (UNEP)
Web: http://www.unep.org

UNEP, established in 1972, is the voice for the environment within the United Nations system. UNEP acts as a catalyst, advocate, educator, and facilitator to promote the wise use and sustainable development of the global environment. To accomplish this, UNEP works with a wide range of partners, including United Nations entities, international organizations, national governments, non-governmental organizations, the private sector and civil society. Along with the World Bank and the UN Development Programme, UNEP is an implementing agency of the Global Environment Facility, to help developing countries meet costs of measures designed to achieve global environmental benefits in six focal areas including ozone layer depletion, and persistent organic pollutants. In an effort to help reduce great disparities in scientific resources between developed and developing nations, a consortium of international institutions led by UNEP launched, in 2006, a new collaborative initiative called Online Access to Research in the Environment (OARE).

U.S. Nuclear Regulatory Commission (NRC)
Web: http://www.nrc.gov

The Nuclear Regulatory Commission (NRC) was created as an independent agency by the U.S. Congress in 1974. The goal was to enable the safe use of radioactive materials for beneficial civilian purposes while ensuring protection of people and the environment. The NRC regulates commercial nuclear power plants and other uses of nuclear materials (e.g., in nuclear medicine) through licensing, inspection, and enforcement of requirements. The NRC's regulatory mission covers: (a) reactors (commercial reactors for generating electric power, and reactors used for research, testing, and training), (b) materials (uses of nuclear materials in medical, industrial, and academic settings, and facilities that produce nuclear fuel), and (c) waste (transportation, storage, and disposal of nuclear materials and waste, and the decommissioning of nuclear facilities).

U.S. Occupational Safety and Health Administration (OSHA)
Web: http://www.osha.gov

The mission of the OSHA, within the U.S. Federal government's Department of Labor, is to save lives, prevent injuries, and protect the health of personnel in their workplace environments. OSHA develops and promulgates occupational safety and health standards, develops and issues regulations and guidelines, conducts inspections and investigations, and issues citations and imposes penalties for non-compliance with regard to health and safety standards.

Water Environment Federation
Web: http://www.wef.org

WEF researches and publishes information on wastewater treatment and water quality protection, provides technical expertise and training on issues including non-point source pollution, hazardous waste, residuals management, and groundwater; sponsors conferences and other special events around the world, and reviews, testifies, and comments on environmental regulations and legislation.

World Health Organization (WHO)
Web: http://www.who.int/en/

WHO sponsors a number of programs related to chemical safety, environmental health, and environmental pollution. The International Programme on Chemical Safety (IPCS), for example, established in 1980, is a joint programme of three Cooperating Organizations – WHO, ILO and UNEP, implementing activities related to chemical safety. WHO is the Executing Agency of the IPCS, whose main roles are to establish the scientific basis for safe use of chemicals, and to strengthen national capabilities and capacities for chemical safety.

WMD First Responders
Web: http://wmdfirstresponders.com/

This website was created to help improve the response capabilities of members assigned to civilian and military organizations and agencies that could respond to terrorist attacks or events involving the use of a weapon of mass destruction (WMD) (e.g., chemical, biological, radiological, nuclear, and explosive material). For the purpose of this website, first responders are members of emergency communications centers (ECCs), emergency medical services (EMS), fire, and rescue services; hazmat (HAZMAT) teams, law enforcement agencies; bomb squads, special weapons and tactics teams (SWAT), hospitals; public health; risk management; security, emergency and disaster management, transportation and public works, gas, water and electric companies, the American Red Cross, etc.

World Resources Institute (WRI)
Web: http://www.wri.org

WRI was founded in 1982 as an environmental think tank that goes beyond research to find practical ways to protect the Earth and improve people's lives. Its mission is to move human society to live in ways that protect the Earth's environment and its capacity to provide for the needs and aspirations of current and future generations.

World Wildlife Fund (WWF)
Web: http://www.worldwildlife.org/

WWF's mission is the conservation of nature. It claims to be the largest multinational conservation organization in the world with efforts in 100 countries. The WWF is supported by 1.2 million members in the U.S. and approximately five million around the world. Its efforts include: (a) protecting natural areas and wild populations of plants and animals, including endangered species, (b) promoting sustainable approaches to the use of renewable natural resources, and (c) promoting more efficient use of resources and energy and the maximum reduction of pollution.

Worldwatch Institute
Web: http://www.worldwatch.org

The Worldwatch Institute is an independent research organization performing fact-based analysis of critical global issues. Worldwatch focuses on the 21st century challenges of climate change, resource degradation, population growth, and poverty, and develops and disseminates data and innovative strategies for achieving a sustainable society. Worldwatch claims that its research is the gold-standard for sustainability analysis for decision makers in government, civil society, business, and academia.

SPECIAL GROUPS

Within some of the organizations listed previously, or separate from them, are a variety of groups functioning as ad hoc or standing committees or that serve in a coordinating, collaborative, advisory, or other special capacity. There are far too many to itemize fully; the following are among the foremost.

Environmental Protection Agency, Science Advisory Board (SAB)
Web: http://yosemite.epa.gov/sab/sabpeople.nsf/WebCommittees/BOARD

Established in 1978, the SAB is a public advisory group providing extramural scientific information and advice to the administrator and other officials of the EPA. The SAB is structured to provide balanced, expert assessment of scientific matters relating to problems facing the agency. Members of and consultants to the board constitute a distinguished body of scientists, engineers, and economists who are recognized, non-governmental experts in their respective fields. These individuals are drawn from academia, industry, and environmental communities throughout the United States and, in some cases, other countries. The board functions as a technical peer-review panel, conducting its business in public view and benefiting from public input during its deliberations. Among the SAB's standing committees, as of mid-2008, are the Ecological Processes and Effects Committee, Environmental Engineering Committee, Exposure and Human Health Committee, and the Radiation Advisory Committee.

Global Change Research Information Office (GCRIO)
Web: http://www.gcrio.org.
Web: http://www.ostp.gov/cs/nstc/committees-cenr

The GCRIO provides access to data and information on climate change research, adaptation/mitigation strategies and technologies, and global change-related educational resources. This is on behalf of various U.S. federal agencies involved in the U.S. Global Change Research Program (USGCRP).

National Council for Science and Environment (NCSE)
(Formerly the Committee for the National Institute for the Environment, CNIE)
Web: http://ncseonline.org/

The NCSE is a not-for-profit organization. Its mission is to improve the scientific basis for making decisions on environmental issues. It conducts programs that will increase the number and quality of people capable of bringing science to bear on the many environmental challenges facing the world through the successful operation of a National Institute for the

Environment (NIE). Its National Library for the Environment (http://www.cnie.org/nle/) provides free online access to environmental information. NCSE's *Encyclopedia of Earth* is an electronic reference about the Earth, its natural environments, and their interaction with society. The encyclopedia is a free, fully searchable collection of articles written by scholars, professionals, educators, and experts who collaborate and review each other's work.

National Institutes of Health, National Library of Medicine, Toxicology and Environmental Health Information Program (TEHIP)
Web: http://sis.nlm.nih.gov/enviro.html

TEHIP was originally established in 1967 as the Toxicology Information Program to create automated toxicology databases and to provide toxicology information and data services. The major program with the National Library of Medicine's Division of Specialized Information Services (SIS), TEHIP's scope has broadened to include environmental and occupational health. It now provides selected core information resources and services, facilitates access to national and international information resources, and strengthens the information infrastructure of toxicology and environmental health. Databases sponsored by TEHIP are described elsewhere in this book. Among the important committees falling under the auspices of TEHIP is the Hazardous Substances Data Bank (HSDB) Scientific Review Panel (SRP), a committee of experts drawn from the major subject disciplines within the HSDB's scope that ensures the scientific accuracy and quality of the file.

National Institutes of Health, Toxicology Study Sections
Web: http://cms.csr.nih.gov/PeerReviewMeetings/CSRIRGDescription/DIGIRG/SIEE.htm

The original Toxicology Study Section was established within NIH's Division of Research Grants (DRG) in 1958. Over time, the number of peer review panels (Study Sections) grew and there were six study sections mostly composed of toxicologists and pharmacologists within the NIH's Center for Scientific Review (CSR). These study sections reviewed applications for research and training for NIH institutes. In the early-to-mid 2000s, the CSR began reorganizing the Integrated Review Groups (IRGs) and individual Study Sections, and many of the toxicology-related study sections were eliminated. What remained were the NAL (Neurotoxicology and Alcohol) and XNDA (Xenobiotic and Nutrient Disposition and Action) study sections; however, in early 2008 a new Systemic Injury by Environmental Exposure (SIEE) Special Emphasis Panel (SEP) was created as a temporary standing SEP. The SIEE is a pilot program and it began reviewing applications submitted in June 2008. The performance of the SIEE will be critically reviewed after several review cycles and further changes could occur in future years.

National Nanotechnology Initiative (NNI)
Web: http://www.nano.gov/html/about/home_about.html

The NNI was established to coordinate Federal nanotechnology research and development and serve as a central locus for communication, cooperation, and collaboration for all Federal agencies that wish to participate. As of mid-2008, the NNI consists of the individual and cooperative nanotechnology-related activities of 25 Federal agencies with a range of research and regulatory roles and responsibilities. The goals of the NNI include: (a) advancing a world-class nanotechnology research and development program, (b) fostering the transfer of new technologies into products for commercial and public benefit, (c) developing and sustaining educational resources, a skilled workforce, and the supporting infrastructure and tools to advance nanotechnology, and (d) supporting responsible development of nanotechnology.

National Research Council, Board on Environmental Studies and Toxicology (BEST)
Web: http://www.dels.nas.edu/best/

The BEST is the (U.S) National Academies' principal study unit for environmental pollution problems affecting human health, human impacts on the environment, and the assessment and management of related risks to human health and the environment. BEST provides independent expert assistance to the federal government and advice to the nation on matters of science and technology affecting public policy on important environmental and ecological problems. The typical mechanism for achieving this goal is the deliberative process of study committees composed of experts from academic institutions and other organizations. Studies may be undertaken in response to requests from federal agencies or Congress, or they may result from the deliberations of board members in the strategic planning process. BEST addresses air and water pollution, solid and hazardous waste, toxicology, epidemiology, risk assessment, applied ecology, natural resources, and environmental engineering, economics, law, and policy. The oversight of BEST's program is provided by the National Research Council's Division on Earth and Life Studies. Information about BEST events, reports, current projects, and emerging issues is available via http://dels.nas.edu/best/reports.php/.

National Toxicology Program (NTP)
Web: http://ntp-server.niehs.nih.gov

The NTP is a U.S. interagency program with the mission to evaluate agents of public health concern by developing and applying tools of modern toxicology and molecular biology. The program was created to: (a) coordinate toxicology testing programs within the federal government, (b) strengthen the science base in toxicology, (c) develop and validate improved testing methods, and (d) provide information about potentially toxic chemicals to health, regulatory, and research agencies, scientific and medical communities, and the public The work is performed using an objective, science-based approach to deal with critical issues in toxicology using the best science available to prioritize, design, conduct, and interpret the results. The NTP consists of relevant toxicology activities of the National Institute of Environmental Health Sciences (NIH/NIEHS), the Centers for Disease Control and Prevention's National Institute for Occupational Safety and Health (CDC/NIOSH), and the Food and Drug Administration's National Center for Toxicological Research (FDA/NCTR). Primary scientific oversight is provided by the NTP Board of Scientific Counselors and its Technical Reports Review Subcommittee. The documents developed by NTP include the *Biennial Report on Carcinogens*, containing a list of all substances which either are known to be human carcinogens or may reasonably be anticipated to be human carcinogens and to which a significant number of persons residing in the United States are exposed. Also available are the *NTP Annual Plan* and the companion *Review of Current DHHS, DOE, and EPA Research Related to Toxicology.* NTP also issues many technical reports on its toxicology studies and short-term toxicity studies, as well as a management status report. As of 2008, the NTP is converting study reports into an electronic format which will be accessible from the website, and is loading study information into databases accessible for searching via the website. An example of NTP's research efforts is a broad-based research program to address potential human health hazards associated with nanoscale materials. The goal is to evaluate the toxicological properties of major nanoscale materials classes representing a cross-section of composition, size, surface coatings, and physicochemical properties.

National Toxicology Program (NTP), Interagency Center for the Evaluation of Alternative Toxicological Methods (NICEATM) and the Interagency Coordinating Committee on the Validation of Alternative Methods (ICCVAM)
Web: http://iccvam.niehs.nih.gov/

The NTP Interagency Center for the Evaluation of Alternative Toxicological Methods (NICEATM) administers the Interagency Coordinating Committee on the Validation of Alternative Methods (ICCVAM) and provides scientific and operational support for ICCVAM-related activities. The ICCVAM Authorization Act of 2000 (42 U.S.C. 285) established ICCVAM as a permanent interagency committee of the NIEHS under NICEATM. ICCVAM is composed of representatives from 15 Federal regulatory and research agencies that use, generate, or disseminate toxicological information. The Committee conducts technical evaluations of new, revised, and alternative test methods with regulatory applicability, and promotes the scientific validation and regulatory acceptance of test methods that more accurately assess the safety and hazards of chemicals and products and that refine, reduce, or replace animal use.

Toxic Substances Control Act (TSCA), Interagency Testing Committee (ITC)
Web: http://www.epa.gov/oppt/itc/

The TSCA ITC is an independent advisory committee to the EPA Administrator that was created in 1976 under section 4(e) of the Toxic Substances Control Act (TSCA). Sixteen U.S. government organizations are ITC members. The members nominate industrial chemicals to the ITC when their organizations need data that can be obtained through the ITC. Such data include unpublished production volume, use, exposure, monitoring, environmental fate, and ecological and health effects data. The ITC coordinates data needs for the nominated chemicals with those of other member organizations and determines if these chemicals should be: (a) added to the Priority Testing List and recommended or designated for testing, (b) deferred for testing and not added to the list, or (c) removed from the list. By coordinating federal data needs and establishing partnerships with manufacturers, importers, processors, and users, the ITC provides an infrastructure to obtain information on industrial chemicals.

United States Congress

Commerce, Trade, and Consumer Protection

The jurisdiction of this subcommittee of interest to toxicologists includes consumer affairs and consumer protection, consumer product safety (the Consumer Product Safety Commission), product liability, and motor vehicle safety.

Energy and Air Quality

The jurisdiction of this subcommittee of interest to toxicologists includes laws, programs, and government

activities affecting the U.S. energy policy, fossil energy, renewable energy resources, synthetic fuels, regulation of nuclear facilities, nuclear energy and waste, and the Clean Air Act.

Environment and Hazardous Materials

The jurisdiction of this subcommittee includes environmental protection, including the Safe Drinking Water Act and risk assessment matters, solid waste, hazardous waste and toxic substances (including Superfund and the Resource Conservation and Recovery Act (RCRA)), mining, oil, gas, and coal combustion wastes, and noise pollution.

Health

The jurisdiction of this subcommittee includes public health and quarantine, hospital construction, mental health and research, biomedical programs and health protection in general, food and drugs, and drug abuse.

United States House Committee on Energy and Commerce

Web: http://energycommerce.house.gov/

The following subcommittees will be of interest to the toxicology community.

United States Senate Committee on Environment and Public Works

The following subcommittees will be of interest to the toxicology community.

Clean Air and Nuclear Safety

The jurisdiction of this subcommittee includes the Clean Air Act, indoor air, and nuclear plant safety.

Private Sector and Consumer Solutions to Global Warming and Wildlife Protection

The jurisdiction of this subcommittee of interest to toxicologists includes global warming, fisheries and wildlife, the Endangered Species Act (ESA), and national wildlife refuges.

Public Sector Solutions to Global Warming, Oversight, and Children's Health Protection

The jurisdiction of this subcommittee of interest to toxicologists includes global warming, children's health protection. Yucca Mountain, and the National Environmental Policy Act (NEPA).

Superfund and Environmental Health

The jurisdiction of this subcommittee of interest to toxicologists includes Superfund and Brownfields, the Resource Conservation and Recovery Act (RCRA), the Toxic Substances Control Act (TSCA), the Emergency Planning and Community Right to Know Act (EPCRA), Persistent Organic Pollutants (POPs), environmental justice, and risk assessment.

Transportation and Infrastructure

The jurisdiction of this subcommittee of interest to toxicologists includes water resources, federal disaster relief programs, and green buildings.

Transportation Safety, Infrastructure Security, and Water Quality

The jurisdiction of this subcommittee of interest to toxicologists includes drinking water, chemical, wastewater security, the Clean Water Act, including wetlands, the Safe Drinking Water Act, ·invasive species, and transportation safety.

CHAPTER

63

Journals and Newsletters

FRED BERMAN

SCIENTIFIC JOURNALS

Scientific journals have a long and honorable history. Their beginnings generally date back to 1665, when the French *Le Journal des Scavans* and the English *Philosophical Transactions* (of the Royal Society of London) began publication within months of each other. General scholarly journals of this type, and later, journals in broad areas of science and medicine, were repositories of early toxicology papers. Scientific disciplines became, as they continue to become, more specialized, and toxicological literature gradually found its way into journals in areas such as medicine, chemistry, biology, industrial hygiene, and particularly pharmacology. The *Index-Catalogue of the Library of the Surgeon-General's Office, United States Army*, forerunner of the National Library of Medicine's *Index Medicus*, was first published in 1880. It listed books, journals, and theses published prior to that date and included the subject headings of 'Toxicology' and 'Poisons.' The preponderance of this early scientific literature was written in German, French, and English.

Some early journals devoted to toxicology were *Sammlung von Vergifiungsfaellen* (Germany, begun 1930, currently called *Archives of Toxicology*), *Farmakilogiia i Toksikologiia* (Russia, begun in 1938, currently called *Eksperimentalnaia i Klinicheskaia Farmakologiia*), and *Acta Pharmacologica et Toxicologica* (Denmark, begun in 1945, currently called *Pharmacology and Toxicology*). In the U.S., the journal *Toxicology and Applied Pharmacology*, begun in 1945, became one of the official journals of the United States Society of Toxicology, founded in 1961.

One might note that journal title changes are not an uncommon occurrence. The conceptual link between pharmacology and toxicology, as well as cross-disciplinary linkages that are apparent among journals concentrating, for example, on the environment and pollution, continue today and are therefore reflected in the literature. Specific examples include such journals as *Archives of Environmental Health*, known today as *Archives of Environmental and Occupational Health*, or the *Journal of Pharmacological Methods*, now titled the *Journal of Pharmacological and Toxicological Methods*. Today, toxicology continues to be spread across the broader scientific journal literature, although as this chapter demonstrates, there remain many journals that focus on toxicology in general or specialized terms. Entire journal titles are devoted to such areas as aquatic toxicology, biomarkers, immunotoxicology, molecular toxicology, neurotoxicology, and in vitro toxicology.

As with books, journals today are not limited to print media. Most journals are available on CD-ROM and online through the Internet, typically on their publishers' Web sites. Publishers may offer the entire text or selected portions of journal issues online. Alternately, they may keep readers up to date by providing online article abstracts or tables of contents. Many publishers also offer free individualized email alerting services that deliver customized tables of contents and/or alerts to recently posted articles within a selected area of research. At the least, journal publishers with web addresses provide descriptions of their journal titles and ordering information. The list of toxicology journals that follows lists URLs for journal or publisher websites, when available. Readers are encouraged to consult the website of a journal's publisher to learn more about what is offered via electronic access.

A recent development in scientific publishing has been the appearance of open access journals, which publish peer-reviewed articles that are free and available permanently online. In lieu of subscription fees, publishers' page costs are covered by per-article fees paid for by the authors or their supporting institutions. Examples of open access publishing include BioMed Central (http://www.biomedcentral.com), an open access publisher that offers over 150 free online journals, including toxicology journals, and PubMed Central (http://www.pubmedcentral.nih.gov), the U.S. National Institutes of Health free digital archive of biomedical and life sciences journal literature. Open-access toxicology journals, along with their URLs, are included in this chapter.

The periodicals in this chapter represent a selective list of scientific journals that focus on toxicology and related disciplines, such as risk analysis, occupational medicine, environmental health, and ecotoxicology. Many other journals that publish toxicological articles but whose thrust lies elsewhere are not included. Thus, although one of the journals in the list concerns immunopharmacology/immunotoxicology, the many other immunology titles, which may contain toxicology articles from time to time, are not included. At the end of the chapter is a brief list of related titles that include articles of bearing on toxicology.

Monograph series tend to be a nightmare in terms of bibliographic control. Are they books or are they journals? In the second edition of this book, such book series were included in the Journals chapter. Like journals, they are published on an ongoing basis, although usually not as frequently. However, in look and use, they are more like books, with individual volumes typically focusing on a single topic or a group of interrelated topics. Therefore, monograph series and other special serial publications are categorized as 'books' in the various subject chapters.

The journals that follow publish English-language articles exclusively or mostly. Foreign-language toxicology journals are cited in the individual country chapters later in this book. We have selected only titles that are currently being published. Closed (i.e., discontinued) titles are not included. Obviously some of these titles may be discontinued in the future, or change title, publisher, or place of publication. Vigilance is always necessary in keeping up with journals. Publishing industry takeovers compound the problem of identifying and locating journals. Dates, where available, represent the year (as accurate as we could find) that the journal, either under its current or previous title(s), was first published.

The list represents largely professional journals publishing technical and scientific articles. Magazines for general consumption only that carry articles related to toxicology and the environment are not part of this main list, although a number of them do an outstanding job of presenting current issues and controversies in easy-to-read and entertaining packages. Interestingly enough given the increasing consumer curiosity about health and science, some very fine professional journals in toxicology (e.g., *Environmental Health Perspectives*) and science (e.g., *Science*) have lately seen fit to devote a portion of their pages to just such general interest material.

To keep up with periodical titles – what's born, what dies, what changes – is not easy. Some helpful sources include:

- ***Pub List*** (http://www.publist.com). A comprehensive online directory of information on over 150 000 print and electronic publications and 8000 newspapers around the world. Free. Data come from sources such as 'Ulrich's International Periodicals Directory' and 'Editor and Publisher International year book.'
- ***Ulrich's Periodicals Directory.*** R. R. Bowker LLC, New Providence, NJ (http://www.csa.com/ulrichssupport). (Includes irregular serials and annuals.)
- ***Gale Directory of Publications and Broadcast Media.*** Tomson Gale, Detroit, MI (http://gale.cengage.com/).
- ***The Standard Periodical Directory.*** Oxbridge Communications, New York (For Oxbridge's excellent online resource Mediafinder, which locates journals, books, and newsletters, go to http://www.mediafinder.com).
- The **Library of Congress**' electronic catalogs (http://www.loc.gov).
- The **National Library of Medicine's** Public Access Catalog, 'Locator Plus (http://locatorplus.gov).
- ***NewJour.*** Electronic journals and newsletters available on the Internet (http://library.georgetown.edu/newjour/).

RESOURCES

Journals

Adverse Drug Reaction Bulletin (1966–)
Lippincott Williams and Wilkins, Philadelphia, PA
ISSN: 0044-6394
Web: http://www.lww.com

A bimonthly loose-leaf publication that typically presents a single article of clinical relevance on adverse effects of drugs.

Ambio (1972–)
Royal Swedish Academy of Sciences, Stockholm
ISSN: 0044-7447
Web: http://ambio.allenpress.com

Presents reports, synopses, and comments related to the sustainable use of natural resources, global change, and other general environmental issues.

American Journal of Industrial Medicine (1980–)
Wiley-Liss, New York
ISSN: 0271-3586
Web: http://www3.interscience.wiley.com

This distinguished journal covers a broad array of topics related to environmental and occupational health and is a good source for epidemiological studies.

American Journal of Pharmacology and Toxicology (2006–)
Science Publications, Vails Gate, NY
ISSN: 1557-4962
Web: http://www.scipub.org

Publishes articles on all aspects of pharmacology and toxicology.

Annals of the ICRP (1977–)
Pergamon Press, Oxford, UK
ISSN: 0416-6453
Web: http://www.elsevier.com

A review journal presenting the reports and recommendations of the International Commission on Radiological Protection, a group dedicated to providing guidance on the widespread use of radiation sources caused by developments in the field of nuclear energy.

Annals of Occupational Hygiene (1958–)
Elsevier Science, Oxford, UK
ISSN: 0003-4878
Web: http://www.oxfordjournals.org/

Published for the British Occupational Hygiene Society. This journal promotes all aspects of occupational and environmental hygiene and health. It is aimed at all who are interested in the effects of work on health. Occupational toxicology is one of the core subject areas represented.

Annual Review of Pharmacology and Toxicology (1961–)
Annual Reviews, Palo Alto, CA
ISSN: 0362-1642
Web: http://arjournals.annualreviews.org

In aggregate, this review series with extensive references presents an encyclopedic look at all aspects of toxicology and pharmacology. It has a subject index for the current volume and cumulative author and chapter title indices for volumes from the preceding 5 years.

Aquatic Toxicology (1981–)
Elsevier, Amsterdam
ISSN: 0166-445X
Web: http://www.elsevier.com

Publishes original scientific papers and reviews dealing with such broad topics as mechanisms of toxicity in aquatic environments, effects of agents on aquatic ecosystems, toxicant-induced alterations in organisms, and human health aspects of aquatic toxicology.

Archives of Complex Environmental Studies (1989–)
ACES Pub. Ltd., Tampere, Finland
ISSN: 0787-0396

An international interdisciplinary journal on health sciences, environmental sciences, and applied environmental technology.

Archives of Environmental Contamination and Toxicology (1973–)
Springer-Verlag, New York
ISSN: 0090-4341
Web: http://www.springerlink.com

A repository of research articles covering air, water, and soil contamination and pollution and their human health aspects, as well as the effects of deleterious substances in the total environment.

Archives of Environmental & Occupational Health (1960–)
Heldref Publications, Washington, DC
ISSN: 0003-9896
Web: http://www.heldref.org

Formerly the *Archives of Environmental Health*, this is the official publication of the Society for Occupational and Environmental Health. Publishes epidemiological, clinical, and experimental studies dealing with the effects of environmental agents on human health. Especially interested in the health significance of toxic waste, new energy technology and industrial processes, and the environmental causation of neurobehavioral dysfunction, birth defects, cancer, and chronic degenerative disease.

Archives of Toxicology (1930–)
Springer-Verlag, Berlin
ISSN: 0340-5761
Web: http://www.springerlink.com

This august journal with a long history aims to provide up-to-date information on the latest advances in

toxicology. Particular emphasis is given to studies relating to defined effects of chemicals and mechanisms of toxicity, including toxic activities at the molecular level in humans and experimental animals. Also devotes space to analysis, toxicokinetics, and forensic toxicology. It is the official journal of the European Society of Toxicology (EUROTOX) and publishes the proceedings of EUROTOX meetings as annual supplements.

Archives of Toxicology, Kinetics and Xenobiotic Metabolism (1993–)
ISSN: 0354-3854
Web: http://www.periodicals.ru/import

Toxicology Section of the Serbian Medical Society, Belgrade, Federal Republic of Yugoslavia

Devoted to the evaluation of data, methods, and opinions in the fields of toxicology, pharmacology, clinical pharmacology, and xenobiotic metabolism.

Atmospheric Environment (1967–)
Elsevier Science, Oxford, UK
ISSN: 1352-2310
Web: http://www.elsevier.com (1994–)
ISSN: 0960-1686 (Part A 1991–1993)
ISSN: 0957-1272 (Part B 1991–1993)
ISSN: 0004-6981 (1967–1989)

Covers all aspects of the interaction of people and ecosystems with their atmospheric environment. Includes such areas as air pollution research, air quality and its effects, dispersion and transport, deposition biospheric-atmospheric exchange, etc.

Basic & Clinical Pharmacology and Toxicology (1945–)
Nordic Pharmacological Society, Copenhagen
ISSN: 1742-7835
Web: http://www.blackwellpublishing.com

Continues *Pharmacology and Toxicology*, and before that, *Acta Pharmacologica et Toxicologica*. Publishes original scientific research in all fields of experimental pharmacology and toxicology, including biochemical, cellular, and molecular pharmacology and toxicology.

Biodegradation (1990–)
Kluwer Academic, Dordrecht, The Netherlands
ISSN: 0923-9820
Web: http://www.springer.com

Publishes papers on all aspects of science pertaining to the detoxification, recycling, amelioration, or treatment of waste materials and pollutants by naturally occurring microbial strains or associations or recombinant microorganisms.

Bioelectromagnetics (1980–)
Wiley-Liss, New York
ISSN: 0197-8462
Web: http://www.wiley.com

Journal of the Bioelectromagnetics Society, the Society for Physical Regulation in Biology and Medicine, and the European Bioelectromagnetics Association. Devoted to research on biological systems as they are influenced by natural or manufactured electric and/or magnetic fields.

Biomarkers (1996–)
Taylor & Francis, London
ISSN: 1354-750X
Web: http://www.tandf.co.uk

Subtitled *Biochemical Indicators of Exposure, Response and Susceptibility to Chemicals*. Includes papers on the development and validation of biomarkers and their use and interpretation. Contains original articles, short communications, and reviews.

Biomedical and Environmental Sciences (1988–)
Academic Press, Duluth, MN
ISSN: 0895-3988
Web: http://www.besjournal.com

An international journal with an emphasis on scientific findings in China, published under the auspices of the Chinese Center for Disease Control and Prevention. Publishes English-language articles dealing with biological and toxic effects of environmental pollutants on humans and other forms of life. Also publishes reports dealing with the entry, transport, and fate of natural and anthropogenic chemicals in the biosphere and their impact on human health and well-being.

BMC Clinical Pharmacology (2001–)
BioMed Central, London
ISSN: 1472-6904
Web: http://www.biomedcentral.com

An open access journal publishing original peer-reviewed research articles in all aspects of clinical pharmacology, including adverse drug reactions and toxicology.

Bulletin of Environmental Contamination and Toxicology (1966–)
Springer-Verlag, New York
ISSN: 0007-4861
Web: http://www.springer.com

Provides rapid publication of significant advances and discoveries in the fields of air, soil, water, and food contamination and pollution, as well as articles on

methodology and other disciplines concerned with the introduction, presence, and effects of toxicants in the total environment.

Birth Defects Research Part B: Developmental and Reproductive Toxicology (2003–)
Wiley-Liss, Inc. Hoboken, NJ
ISSN: 1542-9733
Web: http://www.wiley.com

An official publication of the Teratology Society, formerly published as *Teratogenesis, Carcinogenesis and Mutagenesis*. Provides original research and reviews in fields related to embryo-fetal development and reproduction. Part A of this journal is titled *Clinical and Molecular Teratology* and Part C is titled *Embryo Today: Reviews*.

Cancer Causes and Control (1990–)
Rapid Communications of Oxford, Ltd.
ISSN: 0957-5243
Web: http://www.springer.com

Reports on and stimulates new avenues of investigation into the causes, control, and subsequent prevention of cancer.

Carcinogenesis (1980–)
Oxford University Press, Oxford, UK
ISSN: 0143-3334
Web: http://www.oxfordjournals.org

A multidisciplinary journal publishing full-length papers and short communications in the areas of cancer biology, molecular epidemiology, cancer prevention, and carcinogenesis (including viral, chemical, and physical carcinogenesis, metabolism of carcinogens, and the formation, detection, identification, and quantification of environmental carcinogens).

Cardiovascular Toxicology (2001–)
Humana Press, Totowa, NJ
ISSN: 1530-7905
Web: http://www.humanapress.com

Publishes papers that elucidate the effects, molecular mechanisms, and signaling pathways of environmental toxicants on the cardiovascular system; reports on the detrimental effects of new cardiovascular drugs as well as the cardiovascular effects of non-cardiovascular drugs, anticancer chemotherapy and gene therapy; and reports safety and toxicological data on new cardiovascular and non-cardiovascular drugs.

Cell Biology and Toxicology (1984–)
Kluwer Academic, Dordrecht, The Netherlands
ISSN: 0742-2091
Web: http://www.springer.com

Official journal of the Societe Pharmaco-Toxicologie Cellulaire. Provides a rapid publication outlet for papers in the areas of cell biology and genetic, molecular, and cellular toxicology.

Central European Journal of Occupational and Environmental Medicine (1995–)
Occupational Health Foundation and National Institute of Occupational Health, Budapest, Hungary

Deals with health effects and prevention of work-related diseases, epidemiological studies, and experimental studies on occupational and environmental health effects.

Chemical Research in Toxicology (1988–)
American Chemical Society, Washington, DC
ISSN: 0893-228X
Web: http://pubs.acs.org

Published with the cooperation of the International Society for the Study of Xenobiotics. Includes articles, communications, invited reviews, and perspectives on structural, mechanistic, and technological advances in research related to the toxicological effects of chemical agents.

Chemico-Biological Interactions (1969–)
Elsevier, Shannon, Ireland
ISSN: 0009-2797
Web: http://www.elsevier.com

Subtitled *A Journal of Molecular and Biochemical Toxicology*, this is the official journal of the Hepatocyte Users Group of North America, publishing research reports, rapid communications, review articles, and commentaries that examine: the molecular aspects of cytotoxicity, carcinogenesis, mutagenesis, and teratogenesis; and the molecular mechanisms by which drugs exert their therapeutic or toxic effects.

Chemosphere (1972–)
Elsevier Science, Oxford, UK
ISSN: 0045-6535
Web: http://www.elsevier.com

Subtitled *Chemistry, Biology and Toxicology as Related to Environmental Problems*. Covers topics such as environmental fate of chemicals, ecotoxicology, atmospheric chemistry and global change, environmental chemicals and analysis, air and water pollution, toxicology and effects on humans, occupational hazards and exposure, and environmental technology.

Clinical Toxicology (1968–)
Taylor & Francis, New York
ISSN: 0731-3810
Web: http://www.tandf.co.uk

Formerly the *Journal of Toxicology. Clinical Toxicology*, an official publication of the American Academy of Clinical Toxicology and the European Association of Poisons Centres and Clinical Toxicologists. Publishes peer-reviewed scientific research related to advances in clinical toxicology.

Comparative Biochemistry and Physiology. Part C: Toxicology & Pharmacology (2001–)
Elsevier Science, New York
ISSN: 1532-0456 (2001–)
Web: http://www.elsevier.com
ISSN: 0742-8413 (1993–2000)
ISSN: 0742-8413 (1983–1993)

Publishes original articles concerned with chemical and drug action at different levels of organization; biotransformation of xenobiotics; mechanisms of toxicity, including reactive oxygen species and carcinogenesis; endocrine disruptors; natural products chemistry; and signal transduction.

Contact Dermatitis (1975–)
Munksgaard, Copenhagen
ISSN: 0105-1873
Web: www.blackwellpublishing.com

The official publication of the European Society of Contact Dermatitis, this journal is designed primarily for clinicians interested in various types of occupational dermatitis. This includes both allergic and irritant (toxic) types of contact dermatitis, occupational (industrial) dermatitis, and consumer's dermatitis from such products as cosmetics and toiletries.

Critical Reviews in Environmental Science and Technology (1970–)
CRC Press, Boca Raton, FL
ISSN: 1064-3389
Web: http://www.tandf.co.uk

An international forum for the critical review of current knowledge on the broad range of topics constituting environmental science.

Critical Reviews in Toxicology (1971–)
Taylor & Francis, Philadelphia, PA
ISSN: 1040-8444
Web: http://www.tandf.co.uk

Extensive up-to-date critical assessment of toxicology and related scientific disciplines.

Cutaneous and Ocular Toxicology (1982–)
Taylor & Francis, Philadelphia, PA
ISSN: 1556-9527
Web: http://www.tandf.co.uk

Formerly the *Journal of Toxicology. Cutaneous and Ocular Toxicology*, this is the official journal of the International Society of Ocular Toxicology (ISOT). Explores cutaneous and ocular irritation, sensitization, phototoxicity, and photoallergenicity of cosmetics, drugs, soaps, and other detergents, fragrances, textiles, preservatives, adhesives, environmental exposures, and occupational exposures.

Drug and Chemical Toxicology (1978–)
Marcel Dekker, New York
ISSN: 0148-0545
Web: http://www.tandf.co.uk

Publishes full-length research papers, review articles, and short communications relating to the broad spectrum of toxicological data relevant to risk assessment and harmful effects due to exposure.

Drug Metabolism and Disposition (1973–)
American Society for Pharmacology and Experimental Therapeutics (ASPET), Bethesda, MD
ISSN: 0090-9556
Web: http://www.aspet.org

An official publication of the American Society for Pharmacology and Experimental Therapeutics. Articles describe the results of original research on xenobiotic metabolism and disposition. Xenobiotics include therapeutic agents as well as environmental chemicals, and research may involve the use of in vivo or in vitro approaches, including cultured cells and heterologous expression systems.

Drug Metabolism and Drug Interactions (1988–)
Freund, London
ISSN: 0334-2190
Web: http://www.freundpublishing.com

Devoted to mechanisms by which drugs and other foreign compounds are metabolized; the mechanisms by which drugs may interact with each other as well as with biological systems; and the pharmacological and toxicological consequences of such metabolism and interaction.

Drug Metabolism Reviews (1972–)
Marcel Dekker, New York
ISSN: 0360-2532
Web: http://www.tandf.co.uk

Features critical, in-depth reviews dealing with the fate of xenobiotics (drugs and other foreign compounds) in any biological system.

Drug Safety (1990–)
ADIS International, Auckland, New Zealand
ISSN: 0114-5916
Web: http://www.ingenta.com

Aims to assist in the further development of the rational use of drugs, focusing on practical medical aspects

relevant to the diagnosis and treatment of acute poisonings and the recognition, epidemiology, management, and avoidance of adverse drug reactions.

EcoHealth (2004–)
Springer, New York
ISSN: 1612-9202
Web: http://www.springer.com

This journal arises from the merging of two complementary journals, *Ecosystem Health* and *Global Change and Human Health*. Focuses on human and wildlife health, and the integration of knowledge at the interface between ecological and human health sciences.

Ecotoxicology (1992–)
Springer, Netherlands
ISSN: 0963-9292
Web: http://www.springer.com

Publishes fundamental research on the effects of toxic chemicals on populations, communities, and terrestrial, freshwater, and marine ecosystems. Aims to elucidate mechanisms and processes whereby chemicals exert their effects on ecosystems and the impact caused at the population or community level.

Ecotoxicology and Environmental Safety (1977–)
Academic Press, Orlando, FL
ISSN: 0147-6513
Web: http://www.elsevier.com

Official journal of the International Society of Ecotoxicology and Environmental Safety. Publishes manuscripts dealing with studies of the biological and toxic effects caused by natural or synthetic chemical pollutants to ecosystems, whether animal, plant, or microbial.

Environment (1969–)
Heldref Publications, Washington, DC
ISSN: 0013-9157
Web: http://www.heldref.org

Offers authoritative analyses of key environmental issues via comprehensive articles, critical reviews of major governmental and institutional reports, book recommendations, commentaries, and news briefs.

Environment International (1978–)
Pergammon, New York
ISSN: 0160-4120
Web: http://www.elsevier.com

Subtitled, *A Journal of Environmental Science, Risk & Health*, it publishes articles that quantify the impact of chemical, biological, and physical contaminants in the human environment and addresses human impacts on the natural environment.

Environmental Dermatology (1994–)
Japanese Society for Contact Dermatitis, Nagoya, Japan
ISSN: 1340-4601
Web: http://www.fujita-hu.ac.jp/JSCD

The official journal of the Japanese Society for Contact Dermatitis. Publishes manuscripts covering the scope of environmental (daily life and occupational) dermatology from basic studies to pre-clinical and clinical studies.

Environmental Engineering Science (1997–)
Mary Ann Liebert, Larchmont, NY
ISSN: 1092-8758
Web: http://www.liebertpub.com

Publishes papers on environmental science topics that include development and application of fundamental principles toward solving problems in land, air, and water media.

Environmental Forensics (1999–)
Taylor & Francis, Philadelphia, PA
ISSN: 1527-5922
Web: http://www.tandf.co.uk

A forum for scientific investigations that address contamination within the environmental media of air, water, soil, and biota that is subject to law court, arbitration, public debate, or formal argumentation. The journal is an international, quarterly, peer-reviewed publication offering scientific studies that explore source, fate, transport, and human health and ecological effects of environmental contamination, with contamination being delineated in terms of chemical characterization, biological influence, responsible parties, and legal consequences.

Environmental Geochemistry and Health (1985–)
Springer-Verlag, Netherlands
ISSN: 0269-4042
Web: http://www.springer.com

Covers all aspects of applied environmental geochemistry, including pollution and the influence of the environment on plant, animal, and human life.

Environmental Health and Preventive Medicine (1996–)
Japanese Society for Hygiene, Sapporo, Japan
ISSN: 1342-078X
Web: http://www.nacos.com/jsh

Official journal of the Japanese Society for Hygiene. Devoted to the publication of papers on human health sciences related to biological, physical, chemical, medical, psycho-social, and other environmental factors.

Environmental Health Perspectives (1972–)
U.S. National Institute of Environmental Health Sciences, Research Triangle Park, NC
ISSN: 0091-6765
Web: http://www.ehponline.org

A very informative and well-designed journal serving as a forum for the discussion of issues in environmental health, including molecular studies related to environmental health and susceptibility. Includes perspectives, correspondence, commentary, news, and research articles, plus occasional supplements.

Environmental Management (1976–)
Springer-Verlag, New York
ISSN: 0364-152X
Web: http://www.springer.com

An international journal for decision-makers, scientists, and environmental auditors. Publishes research and opinion concerning the use and conservation of natural resources, the protection of habitats, and the control of hazards.

Environmental Modeling and Software (1986–)
Elsevier Science, New York
ISSN: 1364-8152 (1997–)
Web: http://www.elsevier.com
ISSN: 0266-9838 (1986–1996)

Publishes research articles, review papers, and short communications on recent advances in environmental modeling and software. Includes Environment Data News, available gratis online (http://www.uea.ac.uk/%7Ee870/envdata.html).

Environmental and Molecular Mutagenesis (1979–)
Wiley-Liss, New York
ISSN: 0893-6692 (1987–)
Web: http://www.wiley.com
ISSN: 0192-2521 (1979–1987)

Publishes original research papers on mutation and mutation-related topics, such as mechanisms of mutagenesis, environmental modification of DNA, repair of DNA damage, genetic and cytogenetic methods for studying genetic damage, mutagenicity screening, methods for estimating mutagenic hazards to humans, and epidemiological studies relating to environmental mutagens.

Environmental Monitoring and Assessment (1981–)
Kluwer Academic Publishers, Dordrecht, The Netherlands
ISSN: 0167-6369
Web: http://www.springer.com

Emphasizes technical developments and data arising from environmental monitoring and assessment, the use of scientific principles in the design of monitoring systems, and the use of monitoring data in assessing pollution risks to humans and the environment.

Environmental Pollution (1970–)
Elsevier Science, Oxford, UK
ISSN: 0269-7491(1987–)
Web: http://www.elsevier.com
ISSN: 0143-1471 (1980–1986)
ISSN: 0013-9327 (1970–1979)

An international journal addressing issues relevant to the nature, distribution, and ecological effects of all types and forms of chemical pollutants in air, soil, and water.

Environmental Research (1967–)
Academic Press, Orlando, FL
ISSN: 0013-9351
Web: http://www.elsevier.com

Subtitled *A Multidisciplinary Journal of Environmental Sciences, Ecology, and Public Health*. Publishes original reports describing studies of the toxic effects of environmental agents and conditions in humans and animals, including both experimental subjects and ecosystems. A true multi-disciplinary journal.

Environmental Science and Pollution Research International (1994–)
ECOMED, Landsberg, Germany
ISSN: 0944-1344
Web: http://www.ecomed.de

A wide-ranging look at a variety of issues relevant to the environment and toxicology.

Environmental Science and Technology (1967–)
American Chemical Society, Washington, DC
ISSN: 0013-936X
Web: http://pubs.acs.org

Covers a wide range of environmental disciplines via feature articles, environmental policy analysis, research watch, letters, research papers, communications, and critical reviews.

Environmental Sciences (1991–)
Scientific Publishing Division of MYU, Tokyo
ISSN 0915-955X
Web: http://www.myu-inc.jp/myukk/ES/index.html

Subtitled *An International Journal of Environmental Physiology and Toxicology*. Includes original research and reviews on the chemical characteristics of substances found in air, water, and soil and their biological and toxicological effects on plants, animals, and humans.

Environmental Toxicology (1986–)
John Wiley, New York
ISSN: 1520-4081 (1999–)
Web: http://www.wiley.com
ISSN: 1053-4725 (1991–1998)

Formerly called *Environmental Toxicology and Water Quality*. Devoted to the publication of papers on all aspects of environmental toxicology, including mechanisms, fate, and pathways; ecosystem impact assessment, water, air, and soil quality criteria; etc.

Environmental Toxicology and Chemistry (1982–)
SETAC Press, Pensacola, FL
ISSN: 0730-7268
Web: http://www.setac.org

The official journal of the Society of Environmental Toxicology and Chemistry. Divided into three sections: Environmental Chemistry, Environmental Toxicology, and Hazard/Risk Assessment.

Environmental Toxicology and Pharmacology (1996–)
Elsevier, Amsterdam
ISSN 1382-6689
Web: http://www.elsevier.com

Publishes results of studies concerning toxic and pharmacological effects of human and veterinary drugs and of environmental contaminants in animals and humans. Full-length papers, short communications, full-length reviews, and mini-reviews.

Food Additives and Contaminants (1984–)
Taylor and Francis, London
ISSN: 0265-203X
Web: http://www.tandf.co.uk

Includes articles relating to the detection, determination, occurrence, persistence, safety evaluation, and control of naturally occurring and man-made additives and contaminants in the food chain.

Food and Chemical Toxicology (1963–)
Elsevier Scientific, Exeter, UK
ISSN: 0278-6915 (1982–)
Web: http://www.elsevier.com
ISSN: 0015-6264 (1963–1981)

A continuation of *Food and Cosmetics Toxicology*. An international journal published in association with BIBRA (British Industrial Biological Research Association). Publishes papers reporting and interpreting original toxicological research, particularly studies presenting an understanding of the mechanisms that underlie toxic effects or improvements in methods for predicting adverse effects. Also includes brief communications, reviews, letters to the editor, abstracts from the literature, and a current awareness section.

Food and Drug Law Journal (1946–)
Food and Drug Law Institute, Washington, DC
ISSN: 1064-590X
Web: http://www.fdli.org

The official journal of the Food and Drug Law Institute. Papers on the progress of the law in the fields of foods, drugs, cosmetics, medical devices, and biologics.

Free Radical Biology and Medicine (1987–)
Elsevier Science, New York
ISSN: 0891-5849
Web: http://www.elsevier.com

The official journal of the Society for Free Radical Biology and Medicine. Features papers on chemical, biochemical, physiological, pathological, pharmacological, toxicological, and medical approaches to free radical research.

Free Radical Research (1985–)
Harwood Academic, Amsterdam
ISSN: 1071-5762
Web: http://www.tandf.co.uk

Publishes articles on the chemistry of free radicals, the production of free radicals by xenobiotics and biological systems, free radical damage to cells and tissues, and defense mechanisms against free radical damage.

Green Chemistry (1999–)
Royal Society of Chemistry, Cambridge, UK
ISSN: 1463-9262
Web: http://www.rsc.org

Covers all research that relates to a reduction in the environmental impact of chemicals, whether from improved production methods; formulation and delivery systems; the use of sustainable resources; use or recovery and recycling of waste; or product substitution. Includes life-cycle analysis, environmental risk analysis, and legislation.

Health Physics (1958–)
Williams and Wilkins, Baltimore, MD
ISSN: 0017-9078
Web: http://www.lww.com

Official journal of the Health Physics Society. Publishes manuscripts on the theoretical and applied fields of radiation protection, including ionizing and non-ionizing radiation.

Human and Ecological Risk Assessment (1995–)
Taylor & Francis, Philadelphia
ISSN: 1080-7039
Web: http://www.tandf.co.uk

Designed to enhance the communication and cooperation of professionals working on human risk assessment

with those in ecological risk assessment. Looks at such issues such as exposure assessment, hazard assessment, environmental fate assessment, epidemiology, animal extrapolation, risk management, and risk communication.

Human and Experimental Toxicology (1981–)
SAGE Publications, London
ISSN: 0960-3271
Web: http://www.sagepub.co.uk

The official journal of the British Toxicology Society. Papers are published on all aspects of experimental and clinical studies of functional, biochemical, immunologic, and pathological toxic processes and disorders in vivo and in vitro; on their causal mechanisms; on toxicity in human and animal patients; and on the treatment of toxicity.

Immunopharmacology and Immunotoxicology (1978–)
Taylor and Francis, New York
ISSN: 0892-3973
Web: http://www.tandf.co.uk

A forum for publication of clinical studies and research results in the areas of immunopharmacology and immunotoxicology. The basic theme deals with alterations of the immune system.

Indoor Air (1991–)
Blackwell Publishing, Copenhagen
ISSN: 0905-6947
Web: http://www.blackwellpublishing.com

Official journal of the International Society of Indoor Air Quality and Climate. Provides a forum for reporting original research results in the broad area defined by the indoor environment of non-industrial buildings.

Indoor and Built Environment (1992–)
SAGE Publications, Thousand Oaks, CA
ISSN: 1420-326X
Web: http://www.sagepub.co.uk

The journal of the International Society of the Built Environment. Topics covered pertain to the quality of the indoor and built environment and how these might affect the health, performance, efficiency, and comfort of people living or working there.

Industrial Health (1963–)
National Institute of Industrial Health, Kawasaki, Japan
ISSN: 0019-8366
Web: http://www.jniosh.go.jp

Covers research pertaining to prevention of occupational diseases and to the maintenance and promotion of workers' health.

Inhalation Toxicology (1989–)
Taylor and Francis, Philadelphia, PA
ISSN: 0895-8378
Web: http://www.tandf.co.uk

A key forum for international exchange of the latest advances in pulmonary toxicology. Topics include the pathogenesis and mechanism of lung disease, extrapolation of animal data to humans, effects of inhaled chemicals on the extrapulmonary system, innovative lung model systems for predicting human disease, aerosol science, and new inhalation exposure techniques.

International Archives of Occupational and Environmental Health (1930–)
Springer-Verlag, Berlin
ISSN: 0340-0131
Web: http://www.springer.com

Covers topics such as clinical and epidemiological studies on morbidity and mortality, studies relevant to the estimation of human health risks, human experimental studies on environmental health effects, and methods. Includes original articles, editorials, reviews, short communications, and book reviews.

International Journal of Environmental Health Research (1991–)
Taylor & Francis, Oxfordshire, UK
ISSN: 0960-3123
Web: http://www.tandf.co.uk

A quarterly publication devoted to rapid publication of research in environmental health. It considers the natural environment and health, the built environment and health, and communicable diseases.

International Journal of Environmental Studies (1970–)
Gordon and Breach, New York
ISSN: 0020-7233
Web: http://www.tandf.co.uk

Section A, Environmental Studies, covers areas such as ecology, occupational hygiene, industrial health, radiation, noise, pollution, environmental medicine, etc. *Section B, Environmental Science and Technology*, covers areas such as acid rain, air and water pollution control processes and technology, occupational health, water chemistry, etc.

International Journal of Occupational and Environmental Health (1995–)
Hanley and Belfus, Philadelphia, PA
ISSN: 1077-3525
Web: http://www.ijoeh.com

The official journal of the International Commission on Occupational Health. Publishes papers in the broad field of occupational and environmental medicine.

International Journal of Occupational Medicine and Environmental Health (1988)
Nofer Institute of Occupational Medicine and the Polish Association of Occupational Medicine, Lodz, Poland
ISSN: 1077-3525
Web: http://versita.com

Provides a good, largely European perspective on occupational medicine and environmental health.

International Journal of Radiation Biology (1959–)
Taylor and Francis, London
ISSN: 0955-3002
Web: http://www.tandf.co.uk

Focuses on the physical, chemical, and especially biological and medical effects of ionizing and non-ionizing radiation. Includes book reviews and meetings calendar.

International Journal of Toxicology (1982–)
Taylor and Francis, Washington, DC
ISSN: 1091-5818
Web: http://www.tandf.co.uk

Formerly titled *Journal of the American College of Toxicology*, this is the College's official journal. Offers papers on the toxicity of industrial chemicals, pharmaceutical agents, environmental contaminants, and other entities and explores their mechanisms of action or relevance to human health. Special issues are devoted to the Cosmetic Ingredients Review Expert Panel and the Acute Toxicity Data Report.

Journal of the Air and Waste Management Association (1955–)
Air and Waste Management Association, Pittsburgh, PA
ISSN: 1096-2247
Web: http://www.awma.org/journal

Presents papers of interest to professionals in the air pollution control and waste management fields.

Journal of Analytical Toxicology (1977–)
Preston Publications, Niles, IL
ISSN: 0146-4760
Web: http://www.jatox.com

Papers relate to the isolation, identification, and quantitation of potentially toxic substances and their biotransformation products in specimens of human, animal, or environmental origin.

Journal of Applied Toxicology (1981–)
John Wiley and Sons, Chichester, UK
ISSN: 0260-437X
Web: http://www.wiley.com

Areas of concern include the study of toxic effects of chemicals and materials in the fields of teratology, reproduction, mutagenesis, carcinogenesis, health, the environment, pathology, pharmacokinetics, and biochemical mechanisms, as well as epidemiology and analytical methods and alternatives to the use of animals.

Journal of the Association of Food and Drug Officials (1937–)
Association of Food and Drug Officials, York, PA
ISSN: 0898-4131
Web: http://www.afdo.org

The mission of the Association of Food and Drug Officials as reflected in its journal, is to further uniformity in the adoption and enforcement of food, drug, medical devices, cosmetics, and product safety laws, rules, and regulations.

Journal of Biochemical and Molecular Toxicology (1986–)
John Wiley and Sons, New York
ISSN: 1095-6670
Web: http://www.wiley.com

Contains original research papers, rapid communications, mini-reviews, and book reviews, all focusing on the molecular mechanisms of action and detoxification of exogenous and endogenous chemicals and toxic agents.

Journal of Environmental Biology (1980–)
JEB Foundation, Muzaffarnagar, India
ISSN: 0254-8704
Web: http://www.geocities.com/j_environ_biol

A research journal publishing original research and short research papers, as well as short reviews, dealing with environmental pollution and toxicology of plants and animals.

Journal of Environmental Health (1938–)
National Environmental Health Association, Denver, CO
ISSN: 0022-0892
Web: http://www.neha.org

Official publication of the National Environmental Health Association, presenting interesting feature articles, updates, news items, calendar, and career opportunities, all relating to environmental health.

Journal of Environmental Medicine (1999–)
John Wiley and Sons, Chichester, UK
ISSN: 1095-1539
Web: http://www3.interscience.wiley.com

Publishes original papers relating to environmental medicine and allied disciplines, focusing on the adverse effects on humans of external physical, chemical, and biological factors in the general environment, primarily from a medical standpoint. Emphasizes identification, prevention, diagnosis, and management of adverse health effects in humans, related to the physical and chemical contamination of outdoor and indoor air, soil, and water.

Journal of Environmental Monitoring (1999–)
Royal Society of Chemistry, Cambridge, UK
ISSN: 1464-0325
Web: http://www.rsc.org

Dedicated to assessing exposure and health risks through the latest developments in measurement science. Intended for environmental and health professionals in industry, officials from governmental and regulatory agencies, and research scientists interested in the environment.

Journal of Environmental Pathology, Toxicology and Oncology (1977–)
Begell House, New York
ISSN: 0731-8898
Web: http://www.begellhouse.com

Official organ of the International Society for Environmental Toxicology and Cancer. Publishes research on ecological effects on the structure and function of cells and tissues, with an emphasis on the environmental effects on carcinogenesis.

Journal of Environmental Quality (1972–)
American Society of Agronomy, Madison, WI
ISSN: 0047-2425
Web: http://www.agronomy.org

Deals with aspects of environmental quality in natural and agricultural ecosystems. Main sections are technical reports, reviews and analyses, short communications, and environmental issues.

Journal of Environmental Radioactivity (1984–)
Elsevier Science, Oxford, UK
ISSN: 0265-931X
Web: http://www.elsevier.com

Includes research and review papers on all aspects of the occurrence of radioactivity in natural systems.

Journal of Environmental Science and Health (1976–)
Taylor & Francis, Philadelphia, PA
ISSN: (Part A) 1093-4529
Web: http://www.tandf.co.uk
(Part B) 0360-1234
(Part C) 1059-0501

Part A, Toxic/Hazardous Substances & Environmental Engineering, covers science and engineering as applied to environmental problems. *Part B, Pesticides, Food Contaminants, and Agricultural Wastes*, focuses on such areas as analytical techniques applicable to residues, persistence, binding, translocation, biodegradation, fate, etc. *Part C, Environmental Carcinogenesis and Ecotoxicology Reviews*, covers environmental carcinogenesis, related broad aspects of other environmentally induced pathogenesis, and ecotoxicology.

Journal of Exposure Science and Environmental Epidemiology (1991–)
Nature Publishing Group, New York
ISSN: 1559-064X
Web: http://www.nature.com

Formerly the *Journal of Exposure Analysis and Environmental Epidemiology*, this is the official publication of the International Society of Exposure Analysis. Emphasis on exposure analysis includes: measurement and modeling; exposure mechanisms; molecular biomarkers; genomics, proteomics, and metabonomics; chemical, biological, and physical principles of human exposure analysis; occupational exposure studies; and population-based studies.

Journal of Food Protection (1977–)
International Association for Food Protection, Des Moines, IA
ISSN: 0362-028X
Web: http://www.foodprotection.org

Official publication of the International Association for Food Protection (IAFP), whose mission is to provide food safety professionals worldwide with a forum to exchange information on protecting the food supply.

Journal of Hazardous Materials (1975–)
Elsevier, Amsterdam
ISSN: 0304-3894
Web: http://www.elsevier.com

Deals with all aspects of hazardous materials arising from their inherent chemical or physical properties. *Part A: Risk Assessment and Management*, deals with the characterization of the harmful effects of hazardous materials. *Part B: Environmental Technologies*, addresses pollution control processes for solid, liquid and gaseous wastes as well as the remediation of soil and groundwater contamination.

Journal of Medical Toxicology (2005–)
University of Pennsylvania Press, Philadelphia PA
ISSN: 1556-9039
Web: http://www.upenn.edu/pennpress

The official print journal of the American College of Medical Toxicology. Focuses on the diagnosis, management, and prevention of poisoning and toxicity and other adverse health effects resulting from medications, chemicals, occupational, and environmental agents and biological hazards.

Journal of Nutritional and Environmental Medicine (1990–)
Taylor & Francis, London
ISSN: 1359-0847
Web: http://www.tandf.co.uk

Formerly the *Journal of Nutritional Medicine*. Focuses on studies of clinical relevance in areas such as toxicology, nutritional toxicology, chemical sensitivity, allergy, nutrition and reproductive function, antioxidants, nutritional supplementation, etc.

Journal of Occupational and Environmental Hygiene (2004–)
Taylor and Francis, Inc., Philadelphia, PA
ISSN: 1545-9624
Web: http://www.tandf.co.uk

A joint publication of the American Conference of Governmental Industrial Hygienists and American Industrial Hygiene Association, this journal succeeds the AIHA Journal and Applied Occupational and Environmental Hygiene. Publishes research and other articles concerning the recognition, evaluation, and control of potential occupational health hazards in the work environment and in the community.

Journal of Occupational and Environmental Medicine (1959–)
Lipincott Williams and Wilkins, Baltimore, MD
ISSN: 1076-2752
Web: http://www.joem.org

Official journal of the American College of Occupational and Environmental Medicine. A wide-ranging journal covering many areas related to occupational medicine and the environment.

Journal of Occupational Medicine and Toxicology (2006–)
BioMed Central, London
Web: http://www.occup-med.com

This is an open access online journal aimed at clinicians and researchers interested in the diagnosis, prevention, management, and analysis of occupational diseases, injuries, and disability, as well as in the promotion of health in workers, their families, and communities. Articles published include original research, reviews, short reports, methodology articles, case reports, commentaries, debates, and hypotheses.

Journal of Pharmacological and Toxicological Methods (1978–)
Elsevier Science, New York
ISSN: 1056-8719
Web: http://www.elsevier.com

Formerly published as *Journal of Pharmacological Methods*. Publishes original scientific papers arising from the development of new and/or existing methods of investigation used in pharmacology and toxicology.

Journal of Radiation Research (1960–)
Japan Radiation Research Society, Chiba, Japan
ISSN: 0449-3060
Web: http://www.jstage.jst.go.jp

Official organ of the Japan Radiation Research Society. Articles in a broad spectrum of radiation research areas.

Journal of Radiological Protection (1981–)
Institute of Physics Publishing, Bristol, UK
ISSN: 0952-4746
Web: http://www.iop.org

Official journal of the UK Society for Radiological Protection. Covers all aspects of radiological protection, including non-ionizing and ionizing radiation, dosimetry, biological effects, etc.

Journal of Toxicological Sciences (1976–)
Japanese Society of Toxicological Sciences, Sapporo, Japan
ISSN: 0388-1350
Web: http://www.jtoxsci.org

An official journal of the Japanese Society of Toxicological Science. A general toxicology journal with an emphasis on experimental animal studies.

Journal of Toxicology and Environmental Health (1975–)
Taylor & Francis, Washington, DC
ISSN: (Part A) 1528-7394
Web: http://www.tandf.co.uk
(Part B) 1093-7404

Considers articles on the toxicological effects of natural and anthropogenic environmental pollutants and their actions on intact organisms as well as in in vitro systems. Fields of special interest include carcinogenesis, mutagenesis, teratology, neurotoxicity, environmental factors affecting health, risk assessment, and other toxicological phenomena. In two parts, A and B. Part B is entitled *Critical Reviews*.

Management of Environmental Quality: An International Journal (2003–)
Bradford, UK

ISSN: 1477-7835
Web: http://www.emeraldinsight.com
Previously published as Environmental Management and Health
Web: http://www.emeraldinsight.com/0956-6163.htm

Examines environmental factors and their impact on ecosystems and strategies for remediation of environmental problems, with a view to reducing deleterious effects of human activities.

Molecular Carcinogenesis (1985–)
Wiley-Liss, New York
ISSN: 0899-1987
Web: http://www.wiley.com

Presents information describing investigations of molecular aspects of the mechanisms involved in chemical, physical, and viral (biological) carcinogenesis – in the forms of brief communications, research papers, and working hypotheses.

Mutagenesis (1986–)
Oxford University Press, Oxford, UK
ISSN: 0267-8357
Web: http://www.oxfordjournals.org

A multidisciplinary journal designed to bring together research aimed at the identification, characterization, and elucidation of the mechanisms of action of physical, chemical, and biological agents capable of producing genetic change in living organisms and at the study of the consequences of such changes.

Mutation Research (1964–)
Elsevier, Amsterdam
ISSN: 0027-5107
Web: http://www.elsevier.com

A group of journals related to mutagenesis, chromosome breakage, and related subjects. The journal presently consists of three different sections under the collective title of Mutation Research. The sections are titled: Fundamental and Molecular Mechanisms of Mutagenesis; Genetic Toxicology and Environmental Mutagenesis; and Reviews in Mutation Research. An allied volume, DNA Repair: Responses to DNA damage and other aspects of genomic stability, is editorially separate from *Mutation Research* but remains part of the full-set subscription.

Nanotoxicology (2007–)
Taylor and Francis Group, London
ISSN:1743-5390
Web: http://www.informaworld.com

Addresses human and environmental exposures, hazards and risks associated with the use and development of nano-structured materials, including 'materials with at least one dimension in the nanometer size range'. These nanomaterials include a range of materials generated for purposeful delivery into the body (food, medicines, diagnostics, and prosthetics), consumer products (e.g. paints, cosmetics, electronics, and clothing), and particles designed for environmental applications (e.g. remediation).

Neurotoxicity Research (1999–)
F.P. Graham Publishing, Mountain Home, TN
ISSN: 1029-8428
Web: http://www.fpgrahamco.com

Official journal of the Neurotoxicity Society. Reports both basic and clinical research on classical neurotoxicity mechanisms associated with neurodegeneration, necrosis, neuronal apoptosis, nerve regeneration and neurotrophin mechanisms, and related topics.

Neurotoxicology (1979–)
Elsevier Science, New York
ISSN: 0161-813X
Web: http://www.elsevier.com

Publishes peer-reviewed original research dealing with the effects of toxic substances on the nervous system of humans and experimental animals of all ages. Emphasizes papers dealing with the neurotoxic effect of environmentally significant chemical hazards, manufactured drugs, and naturally occurring compounds.

Neurotoxicology and Teratology (1981–)
Elsevier Science, New York
ISSN: 0892-0362
Web: http://www.elsevier.com

Sponsored by the Behavioral Toxicology Society and the Neurobehavioral Teratology Society. Presents original research reports of systematic studies in the areas of neurotoxicology and developmental toxicology in which the primary emphasis and theoretical content are on the nervous system and behavior. Includes brief communications and mini-reviews.

Occupational and Environmental Medicine (1994–)
British Medical Journal Publishing Group, London
ISSN: 1351-0711
Web: http://www.bmj.com

Formerly *The British Journal of Industrial Medicine*. Includes papers relevant to occupational and environmental medicine, including epidemiological studies and toxicological studies of chemicals of industrial, agricultural, and environmental importance.

Occupational Medicine (1951–)
Oxford University Press, Oxford, UK
ISSN: 0962-7480

Web: http://www.oxfordjournals.org

Designed to enhance the standards and quality of the practice of occupational medicine via original papers, reviews, viewpoints, book reviews, etc.

Particle and Fibre Toxicology (2004–)
BioMed Central, London
Web: http://www.biomedcentral.com

An open access journal for new scientific data, hypotheses, and reviews on the toxicological effects of particles and fibers, including their physico-chemistry, exposure measurement, and human health effects.

Pesticide Biochemistry and Physiology (1971–)
Elsevier, Amsterdam
ISSN: 0048-3575
Web: http://www.elsevier.com

Papers deal with the biochemistry and physiology of insecticides, herbicides, fungicides, acaracides, nematocides, rodenticides, and similar compounds – including non-lethal pest control agents – in terms of the biochemistry and physiology of both target and non-target organisms and the biochemical transformations of the agents themselves.

Pest Management Science (2000–)
John Wiley, New York
ISSN: 1526-498X
Web: http://www.wiley.com

Formerly titled *Pesticide Science*, this journal is published on behalf of The Society of Chemical Industry. It covers all aspects of research and development, application, use, and impact on the environment of products designed for pest control and crop protection.

Radiation and Environmental Biophysics (1963–)
Springer-Verlag, Berlin
ISSN: 0301-634X
Web: http://www.springer.com

Devoted to fundamental and applied issues in radiation research and biophysics, including the biophysics of ionizing and non-ionizing radiation, biological effects of physical factors, and risk assessment and modeling for radiation and environmental factors.

Radiation Research (1954–)
Academic Press, New York
ISSN: 0033-7587
Web: http://www.radres.org

Official journal of the Radiation Research Society. Publishes original articles, rapid communications, short communications, commentaries, and letters related to radiation effects and related subjects in the areas of physics, chemistry, biology, and medicine. Covers ionizing radiation; ultraviolet, visible, and infrared light; and microwaves, ultrasound, and heat.

Regulatory Toxicology and Pharmacology (1981–)
Academic Press, New York
ISSN: 0273-2300
Web: http://www.isrtp.org

Official journal of the International Society of Regulatory Toxicology and Pharmacology. Devoted to reports of significant developments, public opinion, scientific data, and ideas that bridge the gap between scientific information and the legal aspects of toxicological and pharmacological regulation.

Reproductive Toxicology (1987–)
Elsevier, New York
ISSN: 0890-6238
Web: http://www.elsevier.com

Features original research on the influence of chemical and physical agents on reproduction. In particular, seeks to link information on the application of in vitro, animal, and clinical research to the practice of clinical medicine.

Research Communications in Pharmacology and Toxicology (1996–)
PJD Publications, Westbury, NY
ISSN: 1087-1101
Web: http://www.pjdonline.com

Offers reviews, research articles, and letters in the fields of pharmacology and toxicology, including molecular and clinical studies.

Reviews of Environmental Contamination and Toxicology (1962–)
Springer-Verlag, New York
ISSN: 0179-5953
Web: http://www.springer.com

Continuation of *Residue Reviews*. Includes detailed review articles concerned with any aspect of chemical contaminants, including pesticides, in the total environment, in terms of toxicological considerations and consequences.

Reviews on Environmental Health (1972–)
Freund Publishing House, London
ISSN: 0048-7554
Web: http://www.freundpublishing.com

This quarterly periodical offers comprehensive reviews in the field of environmental health and disease. It deals with the physiological and psycho-sociological interrelationships between humans and their surroundings.

Risk Analysis (1981–)
Blackwell Publishing, Ames, IA
ISSN: 0272-4332
Web: http://www.blackwellpublishing.com

An official publication of the Society for Risk Analysis. Provides a focal point for new developments in risk analysis for scientists from a wide range of disciplines. It deals with health risks, engineering, mathematical and theoretical aspects of risks, and social and psychological aspects of risks, such as risk perception, acceptability, economics, and ethics.

SAR and QSAR in Environmental Research (1993–)
Gordon and Breach Science Publishers, Reading, UK
ISSN: 1062-936X
Web: http://www.tandf.co.uk

Papers cover fundamental and practical aspects of the structure–activity and structure–property relationships in the fields of environmental science, agrochemistry, toxicology, pharmacology, and applied chemistry. Focuses on emerging techniques for the building of SAR and QSAR models.

Scandinavian Journal of Work, Environment and Health (1975–)
Finnish Institute of Occupational Health, Helsinki, Finland
ISSN: 0355-3140
Web: http://www.sjweh.fi

Deals with topics concerning the interactions between work and health – such as occupational medicine, epidemiology, toxicology, hygiene, safety, physiology, psychology, ergonomics, and sociology.

Science of the Total Environment (1972–)
Elsevier, Amsterdam
ISSN: 0048-9697
Web: http://www.elsevier.com

Concerned with changes in the natural level and distribution of chemical elements and compounds that may affect the well-being of the living world, or represent a threat to human health. Emphasis is placed on applied environmental chemistry.

Soil and Sediment Contamination (1992–)
Taylor & Francis, Philidelphia, PA
ISSN: 1532-0383
Web: http://www.tandf.co.uk

Formerly the *Journal of Soil Contamination*, this is the main vehicle of communication of the Association for the Environmental Health of Soils (AEHS). Covers such areas as analytical chemistry, site assessment, environmental fate and modeling, remediation techniques, risk assessment issues, regulatory issues, and legal considerations.

Therapeutic Drug Monitoring (1979–)
Lippincott, Williams & Wilkins, Philadelphia, PA
ISSN: 0163-4356
Web: http://www.lww.com

Official journal of the International Association of Therapeutic Drug Monitoring and Clinical Toxicology. Publishes review articles on specific classes of drugs, case reports, technical notes, original research and continuing education articles, including articles detailing the factors that affect the rate and extent drugs are absorbed, metabolized, and excreted.

Toxicologic Pathology (1972–)
Taylor & Francis, Philadelphia, PA
ISSN: 0192-6233
Web: http://www.tandf.co.uk

An official publication of the Society of Toxicologic Pathologists. Papers focus on the multidisciplinary elements that constitute toxicologic pathology, including spontaneous and experimentally induced morphological and functional changes, environmental exposures, case reports, and risk assessment and investigative techniques.

Toxicological and Environmental Chemistry (1972–)
Taylor & Francis, Philadelphia
ISSN: 0277-0248
Web: http://www.tandf.co.uk

Devoted to the fundamental aspects of analysis, metabolism, general chemistry, and biochemistry of xenobiotic compounds and natural toxins as related to the environment and human health.

Toxicological Reviews (2003–2006)
Adis International, Auckland, New Zealand
ISSN: 1176-2551
Web: http://www.adisonline.com

Formerly known as *Adverse Drug Reactions and Toxicological Reviews*, this journal provides critical reviews on a variety of toxicological subjects, with an emphasis on the adverse effects of drugs and other chemicals on human health.

Toxicological Sciences (1998–)
Oxford University Press, Carey, NC
ISSN: 1096-6080
Web: http://www.oxfordjournals.org

This journal replaces *Fundamental and Applied Toxicology*, for many years one of the Society of Toxicology's official publications. It encompasses all aspects of toxicology.

Toxicology (1973–)
Elsevier Science, Shannon, Ireland
ISSN: 0300-483X
Web: http://www.elsevier.com

Publishes original scientific papers on the adverse effects of foreign agents on the health of humans, animals, and ecosystems. Emphasis is on toxic effects observed at relevant exposure doses that have direct impact on safety evaluation and risk assessment practices.

Toxicology and Applied Pharmacology (1959–)
Academic Press, New York
ISSN: 0041-008X
Web: http://www.elsevier.com

An official journal of the Society of Toxicology. Publishes original research pertaining to the action of chemicals, drugs, and natural products on the structure and function of animal (including human) cells and/or tissues. Considers papers on mechanistic approaches and those dealing with alternatives to the use of experimental animals.

Toxicology and Industrial Health (1985–)
SAGE Publications, London
ISSN: 0748-2337
Web: http://www.sagepub.co.uk

Deals with basic and applied research in toxicology, biochemical toxicology, genetic and cellular toxicology, and risk assessment associated with hazardous wastes and groundwater.

Toxicology Letters (1977–)
Elsevier, Amsterdam
ISSN: 0378-4274
Web: http://www.elsevier.com

An international journal for the rapid publication of short reports on all aspects of toxicology, especially mechanisms of toxicity.

Toxicology Mechanisms and Methods (2002–)
Taylor and Francis, Philadelphia, PA
ISSN: 1537-6516
Web: http://www.tandf.co.uk

A merger of *Toxicology Methods* (ISSN: 1051-7235) and *Toxic Substance Mechanisms* (ISSN: 1076-9188), covers subjects dealing with the mechanisms by which foreign chemicals cause toxic tissue injury, from molecular and cellular mechanisms of action to the consideration of mechanistic evidence in establishing regulatory policy. Chemical substances of interest include industrial compounds, environmental pollutants, hazardous wastes, drugs, pesticides, and chemical warfare agents.

Toxicology in Vitro (1987–)
Pergamon Press, Oxford, UK
ISSN: 0887-2333
Web: http://www.elsevier.com

An international journal produced in association with BIBRA and publishing research and reviews on the use of in vitro techniques for determining the toxic effects of chemicals and elucidating their mechanisms of action.

Toxicon (1962–)
Elsevier Science, Amsterdam
ISSN: 0041-0101
Web: http://www.elsevier.com

The official journal of the International Society on Toxinology, this journal focuses on toxins from animals, plants, and microorganisms.

Toxin Reviews (1982–)
Taylor & Francis, Philadelphia, PA
ISSN: 1556-9543
Web: http://www.tandf.co.uk

Formerly the *Journal of Toxicology. Toxin Reviews*, this journal brings together assorted papers related to toxins – their characteristics, activities, and mechanisms of action.

Veterinary and Human Toxicology (1977–)
Publication Office, Comparative Toxicology Laboratories, Kansas State University, Manhattan, KS
ISSN: 0145-6296

The broad field of toxicology is covered, with original research, case reports, field observations in domestic and wild animals and in humans, scientific reviews, documentation of unusual or controversial events, announcements and news items, and letters.

Waste Management (1980–)
Elsevier Science, Oxford, UK
ISSN: 0956-053X
Web: http://www.elsevier.com

Devoted to the presentation of hazardous, radioactive, and industrial wastes. Includes issues such as generation, prevention, control, treatment or detoxification, handling, and ultimate residual disposition.

Water, Air, and Soil Pollution (1971–)
Springer, Dordrecht, The Netherlands
ISSN: 0049-6979
Web: http://www.springer.com

Covers physical and biological processes affecting flora, air, water, and solid earth in relation to environmental pollution. Topics include sources, transport,

deposition, accumulation, disposition, and mitigation of acid precipitation; atmospheric pollution; heavy metals; water pollution; and effects of pollutants on human beings, vegetation, fish, aquatic species, microorganisms, animals, etc.

Water Environment Research (1930–)
Water Environment Federation, Alexandria, VA
ISSN: 1061-4303
Web: http://www.wef.org

Scope ranges from degradation of water resources and basic concerns of groundwater quality and pollution control to new methods for solving complex hazardous and toxic waste problems.

Xenobiotica (1971–)
Taylor and Francis, London
ISSN: 0049-8254
Web: http://www.tandf.co.uk

Subtitled *The Fate and Safety Evaluation of Foreign Compounds in Biological Systems*. Covers general xenobio-chemistry, molecular toxicology, and clinical pharmacokinetics and metabolism.

NEWSLETTERS

Newsletters are a valuable and timely means of communicating recent developments in toxicology and risk assessment. These include recent scientific advances and issues, upcoming meetings and documents, and other information. Newsletters may announce or comment on a wide variety of research and activities,

sometimes before journal publication or listing in traditional indexing, abstracting, and current awareness services. The contents of newsletters can vary greatly, as can the viewpoints of the editors, publishers, or sponsoring agencies or organizations.

Paper versions of newsletters are becoming fewer and fewer in number as they, and all other publication types, move to digital form on the Web. Companion information sources to newsletters, such as blogs and news feeds, are designed strictly for the Web. More information about these is available in this book's Internet chapter.

Virtually every professional organization, and the vast majority of other organizations, such as governmental, non-governmental, academic, and corporate ones publish and make available on the Web, what is either overtly called, or is, in effect, a newsletter. Many newsletters are transient or subject to change in name, frequency, Web URL, scope, etc. Rather than itemize them all here, readers are directed to the Organizations chapter of this book to find newsletters which are institutionally based. Indeed, often an organization's website's home page itself features news. A brief exploration on, or search of, an organization's website, should lead you to its newsletter. A few newsletter directories follow.

MediaFinder
Web: http://www.mediafinder.com/

An extensive database of U.S. and Canadian magazines, catalogs, newspapers, newsletters, and journals.

Newsletter Access
Web: http://www.newsletteraccess.com/

An extensive directory of independent newsletters online.

Newsletters ASAP
Web: http://www.gale.cengage.com/tlist/sb5115.html

Newsletters ASAP, a fee-based portal from Gale Cengage, offers timely information and expert perspectives found in today's most well-read and respected business and industry newsletters. Publications are full text and cover such topics as advertising, biotechnology, government, pharmaceuticals and more.

Below is a selection of newsletter-type online publications and alerting services not directly affiliated with a major toxicology organization, but which are relevant to toxicology and related fields.

Biological Effects of Low Level Exposure Newsletter
Web: http://www.belleonline.com/newsletters.htm

Bureau of National Affairs, Environmental Health and Safety Products
Web: http://www.bna.com/products/ens/

Publishes, among others, Air Pollution Control Guide, Chemical Regulation Reporter, Daily Environment Report, Environment Reporter, Job Safety and Health, Occupational Safety and Health Reporter, Toxics Law Daily, Toxic Law Reporter, and World Climate Change Report.

ChemAdvisory Newsletter
Web: http://www.chemadvisor.com/News_ChemADVISORY.aspx

Environmental Law Reporter
Web: http://www.elr.info

FDC Reports
Web: http://fdcreports.com/

Regulatory, legislative, and business news affecting the U.S. drug, biotechnology, medical device, non-prescription drug, nutritionals, and cosmetics industries.

FoodRegulation.com
Web: http://www.foodregulation.com

News about the regulation of food and pesticides.

GreenFacts
Web: http://www.greenfacts.org

A quarterly newsletter from the non-profit organization with the mission to develop publicly understandable summaries of scientific reports on toxicology-related and other topics.

National Capital Area Chapter, Society of Toxicology
Web: http://www.toxicology.org/isot/RC/ncac/newsletter.htm

A representative newsletter of the many geographically based ones published by SOT chapters.

Occ-Env-Med-L
Web: http://www.occhealthnews.net

A free, electronic, international forum for occupational and environmental medicine.

RiskWorld e-Newsletter
Web: http://www.riskworld.com/RiskWorld/enewsletter.htm

Although published infrequently as of mid-2008, the goal is to notify readers of significant new postings on the RiskWorld website (http://www.riskworld.com), itself a source for news and links to other risk-related sites.

Thomson West
Web: http://west.thomson.com

Environmental law news, including the Toxic Torts Litigation Reporter.

CHAPTER

64

General Interest and Popular Works

FREDERICK W. STOSS

INTRODUCTION

Prior to the publication of Rachel Carson's *Silent Spring*, there were few general interest or popular works found in library collections. The following five titles are among the oldest general-interest titles about toxicology or the broadly defined concepts of environmental or occupational health: *Consumers Can Protect Their Own Health* by Harold Aaron (1960, Greeley, CO: Council on Consumer Information); *What You Should Know about Poisons*, by Heinz Norden (1930, Girard, KA: Haldeman-Julius Publications), *Some types of industrial poisoning*, by Grace Potter (1929, Boston: The Consumers' League of Massachusetts); *The Practical Home Physician* by Henry M Lyman (1887, Albany, N.Y.: Selleck, Ross; reprinted in 1907, Chicago: Thompson) which included full and accurate directions for treating wounds, injuries, poisoning, and *The House and Its Surroundings* (1879, New York: D. Appleton and Company).

There are currently more than 850 book titles addressing the complex and often controversial issues related to toxicology and environmental or occupational health and medicine. There was a dramatic rise in the publication of books in the years immediately following the publication of *Silent Spring* in 1962 and more rapidly after the 1970s first Earth Day. Episodic peaks coincide with annual Earth Days and its subsequent major anniversary dates (10th, 20th, 25th, and 30th). The date of the first Earth Day in 1970 also occurs in a landmark year that saw the passage of major environmental laws, such as the National Environmental Policy Act and amendments to Federal environmental legislation (the National Environmental Policy Act, Clean Air Act, Clean Water Act, etc.). The year 1970 also marks the creation of the Environmental Protection Agency and the National Oceanic and Atmospheric Administration as part of a major reorganization of the U.S. Government. Clearly, the social awareness issue of the 1960s and 1970s sparked the interest of the public-at-large to environmental issues, which is reflected in the publication and retention of books in libraries.

General interest in and concerns about toxic chemicals and hazardous materials in the environment remains in the public spotlight, and stems from an already long-term awareness of living in a chemically contaminated world in the post-*Silent Spring*, post-Love Canal, post-Superfund, post-Bhopal, eras. Since the publication of the third edition of this book, additional factors have come into play to stimulate and sustain the public's fascination with toxic chemicals in the environment and the burgeoning publication of books targeted to a mass market of non-technical and non-scientific audiences:

- A continuing awareness of the location and management of hazardous and toxic wastes, and chemical discharges (legally regulated, accidental, and intentionally illegal) in areas racially, economically, socially, and politically disenfranchised has given rise to an intense examination of the concepts of environmental justice and ethics; however publication of work on this aspect of toxicology appears to be declining.
- The increased risks to children from exposure to chemicals in the environments where they live and play.
- Unabated worries related to drug and alcohol abuse among older children and teenagers.

There are a number of sources from which popular, general interest, and consumer-oriented monographs

about the environment, including those related to toxic chemicals and agents, environmental health and medicine, and hazardous materials can be located. The online or digital versions of bibliographic databases, such as *OCLC First Search* and *Books in Print* are among the most useful. Over the years a number of other publications serving as locators to the environmental literature (anthologies and bibliographic guides) have appeared. Select environmental anthologies serving as guides to the literature are provided here:

- *Resources for College Libraries* (New Providence, NJ: R.R. Bowker, Inc., 2006+)
- *Best Books for Academic Libraries* (Temecula, CA: Best Books, Inc., 2002–2003)
- *Literature and the Environment* by George Hart (Westport, Conn.: Greenwood Press, 2004)
- *Visions of the Land: Science, Literature, and the American Environment from the Era of Exploration to the Age of Ecology* by Michael A. Bryson (Charlottesville: University Press of Virginia, 2002)
- *Using the Biological Literature: A Practical Guide* by Diane Schmidt (NY: Marcel Dekker, 2002)
- *Getting Over the Color Green: Contemporary Environmental Literature of the Southwest* by Scott Slovic (Tucson: University of Arizona Press, 2001)
- *American Literary Environmentalism* by David Mazel (Athens: University of Georgia Press, 2000).

For locating relevant titles from before the year 2000, the following guides are suggested:

- *Environmental Literature: An Encyclopedia of Works, Authors, and Themes* by Patricia D. Netzley (Santa Barbara, CA.: ABC-CLIO, 1999
- *Reading the Earth: New Directions in the Study of Literature and Environment* by Michael P. Branch (Moscow, Idaho: University of Idaho Press, 1998)
- *Classics in Environmental Studies: An Overview of Classic Texts in Environmental Studies* by Nelissen, Nicolaas Johannes Maria Nelissen and Leo Klinkers (Utrecht: International Books, 1997)
- *Earth Works: Recommended Fiction and Nonfiction about Nature and the Environment for Adults and Young Adults* by Jim Dwyer (New York: Neal-Schuman Publishers, 1996)
- *Reading about the Environment: An Introductory Guide* by P.E. Jansma (Englewood, CO.: Libraries Unlimited, 1993)
- *Beacham's guide to environmental issues & sources* by Walton Beacham (Washington, DC: Beacham Publishing, Inc., 1993)
- *E for Environment: An Annotated Bibliography of Children's Books with Environmental Themes* by Patti K Sinclair (New Providence, NJ: R.R. Bowker, 1992)
- *The Island Press Bibliography of Environmental Literature* by Joseph Arthur Miller, Joseph Arthur (Washington, DC: Island Press, 1992)
- *In Praise of Nature* by Stephanie Mills and Jeanne Carstensen (Washington, D.C.: Island Press, 1990)
- *Teaching Environmental Literature: Materials, Methods, Resources* by Frederick O. Waage (New York: Modern Language Association of America, 1985).

Many of the classic works related to the body of writings called nature literature or environmental literature have served as models for an ever-growing number of monograph titles related to the topics associated with toxicology, environmental health, and environmental conditions in the places where we work, learn, live, and play. The flowing list of anthologies and collected works is useful for identifying relevant authors and titles of works from which these essays, excerpts, and other extractions are found:

- *Of Discovery and Destiny: An Anthology of American Writers and the American Land* by Robert C Baron and Elizabeth Darby Junkin (Golden, CO: Fulcrum, 1986)
- *The Literature of Nature: The British and American Traditions* by Robert J. Begiebing and Owen Grumbling (Medford, NJ: Plexus, 1990)
- *The Rolling Stone Environmental Reader* (Washington, DC: Island Press, 1992)
- *American Nature Writing* by John A. Murray (San Francisco, CA: Sierra Club Books, 1994, 1995, 1996, 1997, 1998; Oregon State University Press, 1999, 2000, 2001, 2002, 2003)
- The Norton Book of Nature Writing edited by Robert Finch and John Elder (NY: W.W. Norton Co., 1990); College Edition is a revised and enhanced with a field guide (NY: W.W. Norton Co., 2002)
- *The Best American Science and Nature Writing* whose series editor is Tim Folger (Boston, MA: Houghton Mifflin Co., 2000, 2002, 2003, 2004, 2005, 2006)
- *Visions of the Land: Science, Literature, and the American Environment from the Era of Exploration to the Age of Ecology*, written by Michael A. Bryson (Charlottesville, VA: University Press of Virginia, 2002)
- *The Environment and Society Reader* edited by R. Scott Frey (Boston, MA: Allyn and Bacon (Pearson Education), 2001).

THE IMPACT OF *SILENT SPRING* AND RACHEL CARSON – CELEBRATING CARSON'S 100TH BIRTHDAY

May 27, 2007 marked the 100th anniversary of the birth of Rachel Carson, whose impact on the environmental movement of the 1960s and 1970s has been

incalculable. Over the course of the five decades since she wrote one of the most important environmental books of all time, hundreds of books related to environmentalism have been published. Upon her death, Carson left a substantial bequest to the Sierra Club, including future royalties from sales of *Silent Spring*.

Silent Spring has seen scores of printings in hardcover and paper back, special anniversary, and special 'collector's editions.' It has been translated into dozens of languages, and has made a profound impact on the environment and ecology. There are scores of biographical works published about the life of Rachel Carson. Many of these are collective works of famous women scientists, writers, authors, environmental leaders, naturalists, and 'most important people.' Questia, a large online information service with one of the largest online collections of books and journals, librarians provide an evaluated listing of 13 books on Rachel Carson (see: http://www.questia.com/library/rachel-carson.jsp). There are three definitive biographical works on Carson worth noting: *Rachel Carson: Witness for Nature* by Linda J. Lear (New York: H. Holt, 1997), *The House of Life: Rachel Carson at Work* by Paul Brooks and Rachel Carson (Boston, Houghton, Mifflin, 1972, 1989), and *The Gentle Subversive: Rachel Carson, Silent Spring, and the Rise of the Environmental Movement* by Mark H. Lytle (New York: Oxford University Press, 2007).

Silent Spring soon became a metaphor for other issues related to toxic chemicals and other hazardous substances in the environment. In addition to serving as a muse for other authors and writers, Rachel Carson and her book spawned a new generation of literature with the same underlying theme propagated by Carson – human impacts on the environment and the need to inform the public. These works provide an extended corpus of the environmental literature from the mid-1960s to the present, and include a number of works written by Rachel Carson, and thought to have been lost, such as *Lost Woods: The Discovered Writing of Rachel Carson* (Boston, MA: Beacon Press, 1998), *Silent Spring Revisited* (Washington, DC: American Chemical Society, 1987), *Before Silent Spring: Pesticides and Public Health in Pre-DDT America* (Princeton, NJ: University Press 1975), and *War and Nature: Fighting Humans and Insects with Chemicals from World War I to Silent Spring* (New York: Cambridge University Press, 2001).

Houghton-Mifflin Publishers released in the months prior to the 100th anniversary of Rachel Carson's birth, a collection of essays, *Courage for the Earth: Writers, Scientists, and Activists Celebrate the Life and Writing of Rachel Carson* (Peter Matthiessen, Editor, Boston, MA: Houghton Mifflin, 2007). Contributors to this work include John Elder, Al Gore, John Hay, Freeman House, Linda Lear, Robert Michael Pyle, Janisse Ray, Sandra Steingraber, Terry Tempest Williams, and E. O. Wilson. Each writer provides a testimony to the stimulation provided by Carson and her writings, how they sustained an interest in the environment and launched a multi-generation movement calling for the protection of our environment and the natural resources found in and associated with the environments in which we live, work, and play.

CONTEMPORARY WORKS

Since the publication of the last edition of this book a significant improvement in access is the migration of information resources to digital, full-text content. Book literature has not escaped this aspect of the continuing digital revolution in which we are now deeply embedded. Google Book Search is one means of accessing books in their digital formats and allows users to search the full text of books of interest and learn where to buy or borrow them. In the late 1990s Google co-founders Sergey Brin and Larry Page were working on a research project supported by the Stanford Digital Library Technologies Project to make digital libraries work. Google is inspired by several digitization projects such as the Library of Congress American Memory Project, Project Gutenberg (http://www.gutenberg.org/wiki/Main_Page), the Million Book Project (http://www.archive.org/details/millionbooks), and the Universal Library (http://www.ul.cs.cmu.edu/html/) to deliver large volumes of digital information. E-books will continue to grow as does demands for easy access to information.

A search of *Google Book Search* allows searchers to see a portion of the book in the Snippet View or the Sample Pages View, which provides links to places where you can buy or borrow it. If a book is out of copyright, you may be able to display the Full Book View for full-text access to the title. It is suggested that if readers of this current work should include searches of *Google Book Search* to determine its status as a full-text online title, or from where items might be borrowed or purchased. For details about *Google Book Search* go to their website at http://books.google.com/. Here are, however, few general interest and popular books provided in ebook formats.

An amazon.com bookseller provides a somewhat robust search capability to identify electronic books and documents, but the offerings are at this time rather sparse. For instance, in a search for electronic content for items related to 'lead poisoning,' amazon.com provides links to 32 items, most of which are available for purchase from technical publishers. A similar situation is found among the 24 electronic

content items retrieved by searching the word, 'pollution.' Because of the nature of this genre of popular and general interest literature, publishers will dictate the availability of their books in electronic, full-text formats, based on market-driven conditions. It is best to consult individual publishers' websites to determine if a particular title is available in ebook format. It is anticipated that more titles may be moving to digital platforms in the coming years.

The single largest phenomenon relating book sales and distribution is the emergence of amazon.com as a major entity in the selling of books. While amazon.com does not have an impressive or robust search engine, it does provide a number of value-added services and features that are of tremendous interest to the book-buying community at-large: publisher's detailed marketing and promotional information, published and customer book reviews, a list of other books purchased by those buying a particular title (an interesting means to do relevancy searching!), availability of lower-cost used copies, the ability to sell a book to Amazon.com, and a variety of sorting options: titles in alphabetical order, price, publication date, relevance to search criteria, and average customer reviews.

Emergence of titles in the alternative, small, and independent presses (e.g., New Society Press, Island Press) indicates niche marketing of specialized topics by these smaller publishers, and a growing disinterest among the larger publishing houses in taking on the publication of more risky titles that may not provide the desired revenues to sustain these larger business units.

Works published by alternative presses often provide interpretations and perspectives of environmental conditions not adequately addressed by the mainstream 'mass media.' It is also noted that these alternative, non-traditional sources of information are the victims of poor bibliographic control and low profile in the marketplace. Identification and acquisition of alternative resources requires inventive use of the few bibliographic sources covering alternative resources, and has been noted in the library collection management literature by the implementation of creative techniques such as networking and 'cascading' to identify and obtain these resources (Anton 1994). Alternative presses in both electronic and print formats will continue to play a role in shaping the science research and public policy agendas well into the future (Weintraub 2000). *Alternative Publishers of Books in North America*, 6th Edition by Byron Anderson (Duluth, MN: Library Juice Press, 2006) is one of the most comprehensive directories of the smaller, alternative presses.

A small sampling, by title, of toxicology general interest and popular books published between 2000 and 2007 follows.

Applegate JS (2004)
Environmental risk
Aldershot, UK; Burlington, VT: Ashgate/Dartmouth

Ashton K, Green ES (2005)
The toxic consumer: Living healthy in a hazardous world (Green Essentials Living Guide Series)
White Church, Bristol, UK: Pukka Herbs

Babal K (2005)
Seafood sense: the truth about seafood nutrition & safety
North Bergen, NJ: Basic Health Publications

Bader W (2007)
Toxic bedrooms: your guide to a safe night's sleep
Topanga, CA: Freedom Press

Baillie-Hamilton P (2005)
Toxic overload: A doctor's plan for combating the illnesses caused by chemicals in our foods, our homes, and our medicine cabinets
New York: Avery

Baker S, Driver J (2001)
Residential exposure assessment: a sourcebook
New York: Kluwer Academic/Plenum

Baker-Laporte P, Elliott E, Banta J (2001)
Prescriptions for a healthy house: a practical guide for architects, builders, and homeowners

DEFINING A CORE LIST OF 'WIDELY HELD BOOKS' IN LIBRARIES

The following is a ranked list of books in descending order by the number of libraries (excluding public and private elementary and secondary schools) claiming them in their holdings as of January 2007. These data are reported to OCLC (Online Computer Library Center, 6565 Kilgour Place, Dublin, Ohio 43017-3395, http://www.oclc.org/). The WorldCat database is the backbone of the OCLC sytem. WorldCat contains more than 90 million records reported from more than 40 000 libraries worldwide. Full bibliographic descriptions and cataloging information is provided for books, serials, manuscripts, sound recordings, audiovisual materials, maps, music scores, and computer-readable files. WorldCat does not include information on individual articles, stories in journals, magazines, newspapers, or

book chapters. A Beta-version of a free, public, version of WorldCat is available at http://worldcat.org/.

The books represented below represent a core list of toxicology-related books that are of a popular, general interest nature. After the book's title, there is a parenthetic number, which is the total number of libraries reporting to OCLC that title. This ranking does not included additional records added or updated to the OCLC database since later 2006. For those widely held books published since 2000, only the title and number of holding libraries are provide, because their more complete record is in the above section.

As a point of reference, Rachel Carson's classic book, *Silent Spring* is provided a total of nearly 105 unique bibliographic records for all editions, languages, formats (print, large-print, books-on-tape, etc.) with more than 9100 individual library records determined by the OCLC database. The highest ranked toxicology-related books published according to this OCLC criteria are:

Barzilay JI, Weinberg WG, Eley JW (1999)
The Water We Drink: Water Quality and its Effects on Health (1331)
New Brunswick, NJ: Rutgers University Press

Bennett W, Goldfinger SE (1987)

CONSUMERS' ONE STOP RESOURCE: CHANNING BETE

Channing Bete Company (200 State Road, South Deerfield, MA 01373-0200; 1-800-499-6464; www.channing-bete.com) has some of the most widely distributed and read general-interest booklets produced. The company was started in 1936 as an advertising agency, founded by Channing L. Bete, Sr. Its trademark format and style is called Scriptography. It is easily recognized as a hybrid of a very easily read text for various ages and reading levels, and generally black and white illustrations, many of which appear as coloring-book-styled drawings or stylized, pencil drawings of a photograph. The text of these booklets is written in a distinctive easy-to-read style to foster interest and retention of the information provided.

Resources can be purchased in single issues or small quantities, but the Channing Bete publications are more often bought in large, bulk quantities for distribution en masse to a specific end user, client, or target audience. Custom printing of an organization's name, points of contact, etc., can also be added to such bulk shipments. Table-top and floor-stand style display racks are also available.

'Public Health' is one of the larger categories of publications with major sections devoted to Health Promotion: HIV/AIDS, STDs and Sexual Responsibility, Demand Management, Health Promotion, Nutrition, Smoking Prevention/Cessation, Poisoning Prevention, Lead Poisoning Prevention, Home and Family Safety; Disease Management: Diseases and Conditions, Pregnancy, Child Health, and Behavioral Health.

Examples of individual booklets pertaining to a broadly defined concept of toxicology and environmental and occupational health include the following (listed in alphabetic order):

- About Alcohol
- About Cocaine
- About Drugs
- Asthma in Children
- Be a Lead-Safe Family:
- Binge Drinking Can Be Deadly
- Children's Lead Levels – A Guide for Parents
- Coping with Chemotherapy
- 'Crack' Cocaine
- Crack Cocaine – What Everyone Should Know
- Drugs – The Wrong Choice
- Finding Health information on the Internet
- Good Health for All – About Your Public Health Department
- HIV, AIDS and Young People – Protect Your Health AND Your Future
- Keep Your Child Lead-Safe
- Keep Kids Safe from Lead – A Story for Parents
- Lead and Pregnancy
- Lead and Pregnancy – Protect Yourself and Your Baby
- Lead Hazards at Home Pop-Up Set
- Lead Poisoning
- Let's Learn about Alcohol: An Information and Activities Book
- Let's Learn about Spit Tobacco: An Information & Activities Book
- Marijuana and the Mind: Intoxication and Addiction
- My Book about Keeping Away from Poison
- My Book about Poison
- My Book about Staying Safe Around Lead
- Poison and You!
- Poison-Proof Your Home – For Your Child's Safety
- On Kicking Nicotine
- Pregnant? Don't Smoke
- Public Health – Working for a Healthy Community
- Quit Smoking for Baby and You
- Quit Smoking for Baby and You: A Self-Care Handbook
- Recovery from Alcohol or Other Drug Addiction
- Spit Tobacco
- Talking with Your Child about Alcohol and Drugs
- Women and Alcohol
- Your Child's Lead Test

TOXIC FICTION

Within the category of popular and general-interest works related to toxicology and environmental health are adult fictional works. Since the early 1970s, as the dangers of chemical and radiological wastes took to the headlines of newspapers worldwide, there has been an increase in the number of fictional works about toxic and chemical wastes. Library holdings data suggest fictional works dealing with hazardous wastes, toxic spills, poisonings, and disease outbreaks are popular offerings in public and many academic libraries. Your public librarian (and some college and university librarians) can assist in locating titles from this genre, such as Joseph Wambaughs' *Finnegan's Week* (New York: W. Morrow, 1993), *Sacred Clowns* by Tony Hillerman (New York: Harper Collins, 1993),

Don DeLillo's *Underworld* (New York: Alfred A. Knopf, 2004), and Joyce Carol Oates novel about Love Canal, '*The Falls*' (New York: Ecco, 2004; New York: Harper Perennial, 2005).

JUVENILE LITERATURE

Monographic literature with themes focusing on toxic substances, drugs and alcohol abuse, chemical wastes in the environment abound for younger audiences. There are both fictional and non-fictional works available for children generally at reading levels of middle school and above. While there can be educational value from all of these forms, the non-fictional works tend to be written for older children and come in the form of reference works, textbooks, and other monographs written specifically for age-appropriate investigation and information research. There are scores of titles from which to choose and it is strongly suggested to contact a school librarian or media specialist or a public librarian for assistance in finding such works as *Inhalants: The Toxic Fumes* by John R Glowa (New York: Chelsea House, 1986, 1996), *River Rats* by Caroline Stevermer (Fiction, San Diego: Harcourt Brace Jovanovich, 1992), *Toxic Waste: Clean-up, or Cover-up?* by Malcolm E Weiss (New York: Franklin Watts, 1984), and *The Chemo Kid* by Robert Lipsyte (Fiction, New York: Harper Collins). So popular is the genre of environmental and nature-themed books, that as of this writing, the Task Force on the Environment of the American Library Association is working to establish a national children's environmental book award for best fiction and non-fiction works.

CHAPTER

65

Technical Reports and Government Information

FREDERICK W. STOSS

INTRODUCTION

It is fitting to open this chapter with a comment on the life of one of the most important information innovators of the twentieth century, Alvin Weinberg, who died in October 2006 at the age of 91.

Weinberg was Director of Oak Ridge National Laboratory (ORNL) from 1955–1973 and led ORNL's R&D efforts in areas related to early research into the biological effects of radiation on human genetics. He was also leader in the research efforts on the environmental effects of pollution and ecological studies related to human influences on the environment.

It is here, however, that we pause to recognize Weinberg's critical role in directing U.S. government information policies, which are still being realized today. The tremendous surge of research in science, engineering, and medicine created a critical information overload, which was perceived as a threat to science and national security (dramatically realized in 1957 with launching of the first artificial satellite, *Sputnik*, into space by the Russians during the heightened years of The Cold War). Weinberg's panel found that scientists were 'being snowed under by a mound of undigested reports, papers, meetings, and books.' Scientists needed help in finding the buried gems.

Weinberg was a member of the President's Science Advisory Commission and in 1961 chaired the Kennedy Administration's Panel of Science Information. The report issued in 1963 by this commission, *Science, Government and Information: The Responsibilities of the Technical Community and the Government in the Transfer of Information; A Report* (also known as the 'Weinberg Report') emphasized the need to communicate scientific information to technical and lay audiences. The report's basic thesis was that the transfer of information was an integral and inseparable part of the research and development process and the government had a responsibility for assuring this information was readily available (U.S. GPO 1963).

The proposed solution was the creation of information centers, and the recommendation received broad acceptance. Nationally, more than 300 science information centers were formed to manage the scientific 'information revolution.' John Derek de Solla Price coined the term 'invisible college,' as a means to define communication and the sharing of technical information among peers (de Solla Price 1963). It was Alvin Weinberg who gave these 'colleges' their respective 'campuses' in which to grow, thrive, and intermingle.

A collection of Weinberg's papers is at a special website compiled by the U.S. Department of Energy's Office of Scientific and Technical Information (STI, see: http://www.osti.gov/featuredsites/weinberg.shtml). The historical significance of this unprecedented era of research expansion and its resulting growth of scientific and technical information are well-documented (Capshew 1992, Lesk 1995).

Since publication of the third edition of this book in 2000, there has been one event in history that has greatly affected the availability and dissemination of government information in the United States – the tragic events of the terrorist attack on the United State on September 11, 2001 with the deliberate hijacking

and crashing of commercial airplanes into the World Trade Center building, the Pentagon, and an aborted attack resulting in a crash-landing of United Flight 93 in a remote field in Pennsylvania and the subsequent anthrax attacks over the course of several weeks beginning on September 18, 2001. Letters containing anthrax spores were mailed to several news media offices and two Democratic U.S. Senators, killing five people and infecting 17 others. The crime remains unsolved. These events are still influencing heated debates in information and policy circles today, including the ongoing debates of the USA PATRIOT (Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism) Act (P.L. 107-56, signed by President George W. Bush on October 16, 2001) and its impacts on producing, providing, and disseminating government information.

There are numerous news stories and editorials (Gordon-Murnane 2002, Oder 2002, Ojala 2002, Pinell-Stevens 2003) and scholarly articles (Caidi 2005, Feinberg 2004, Hammitt 2005, Herman 2004, Jaeger and Burnett 2005, Lee 2003, Martorella 2006, Relyea 2004, Roberts 2004, Smock 2003) in the literature of librarianship and data and information management addressing this issue. It is well beyond the scope of this chapter to delve into the various (political, social, and cultural) ramifications of the direct and indirect effects of impacts of the terrorist attacks and the resulting 'war on terror,' other than alerting the reader to their monumental significance in the realm of access to U.S. government data and information.

The National Research Council provides an outstanding summary of the implication of this event in its report of interagency meetings held to discuss the implications of information and data sharing in the post-9/11 era. The following is taken from the introduction of the report's introduction, and sets the tone for its intent:

> The tragedy of September 11, 2001, the subsequent anthrax attacks, and ongoing terror threats internationally have markedly changed national and international security. As concerns about threats and terrorist activities have become global, so have the rapid transfer of information and communication. The confluence of the globalization of business and the revolution in information storage and transmittal has changed the landscape upon which to build national and international security. This requires a re-examination of the security measures developed during the days of the Cold War to assess whether those tools are still appropriate and to determine how they are affecting the current science and technology enterprises.
>
> (NRC 2007)

As a direct result of the threats of terror to the U.S., the National Strategy for Homeland Security and the Homeland Security Act of 2002 saw the creation of the Department of Homeland Security (DHS), providing the core for a national network of organizations and institutions to keep the U.S. secure from various natural and human threats. The Department of Homeland Security is made up of four major directorates: Border and Transportation Security, Emergency Preparedness and Response, Science and Technology, and Information Analysis and Infrastructure Protection, with the enveloping of other agencies, programs, and services related to toxicology (including biological and chemical warfare and agents), environmental health, and other safety and security linkages:

- Border and Transportation Security
- The Transportation Security Administration (Transportation)
- Animal and Plant Health Inspection Service (part) (Agriculture)
- The Emergency Preparedness and Response
- The Federal Emergency Management Agency (FEMA)
- Strategic National Stockpile and the National Disaster Medical System (HHS)
- Nuclear Incident Response Team (Energy)
- The Science and Technology
- CBRN Countermeasures Programs (Energy)
- Environmental Measurements Laboratory (Energy)
- National BW Defense Analysis Center (Defense)
- Plum Island Animal Disease Center (Agriculture)
- The Information Analysis and Infrastructure Protection (including the CIA, FBI, DIA and NSA)
- National Communications System (Defense)
- Energy Security and Assurance Program (Energy).

While the focus of this new department is on combating terrorist attacks against the United States, there are numerous reports dealing with preparedness for natural disasters (earthquake, hurricane, and other severe weather) and disasters of human origins; they have applicability to dealing with major incidents dealing with toxic threats or the threats of chemical and biological agents in the environment. Technical reports and documents from within this newly created department are widespread.

THE PLIGHT OF THE EPA LIBRARIES

A significant threat to the nation's environmental information infrastructure took place since the publication of the last edition of *Information Resources in Toxicology* with a proposed dismantling of the U.S. Environmental Protection Agency's library system.

Beginning in 2004 the EPA began what some have viewed as a much-needed restructuring of a large information network and what others look at as the attempt to severely eliminate a time-tested and trust source of environmental data, information, and literature.

Beginning October 1, 2006, EPA announced that they would transition to a new National Framework for the Headquarters and Regional Libraries (http://www.epa.gov/natlibra/Library_Plan_National_Framework081506final.pdf), which was released in August of 2006. The document describes a new model EPA will implement to ensure that Agency staff and the public receive quality library services.

Initial language of a June 23, 2007, report in the Senate Interior Appropriations Bill earmarked $2 million for EPA to restore publicly available library facilities in each region. Subsequent Congressional approval of this bill required the EPA's submission of a plan on how it will use funding to reopen facilities by December 31, 2007 (http://www.epa.gov/natlibra/documents/Library_Report_to_Congress.pdf). Subsequently, the Fiscal Year 2008 U.S. Environmental Protection Agency budget, approved in the omnibus budget bill, allocates $1 million to restore EPA's network of libraries. The EPA was required to provide Congress with a report regarding 'actions it will take to restore publicly available libraries to provide environmental information and data to each EPA region within 90 days of the enactment of this Act.'

The EPA Office of Environmental Information Report to Congress, EPA National Library Network Report to Congress (see http://www.epa.gov/natlibra/documents/Library_Report_to_Congress.pdf) was issued by the Agency on March 26, 2008. Among its provisions are the following items:

- Re-establish on-site libraries in Region 5 in Chicago, Region 6 in Dallas, Region 7 in Kansas City, and the consolidated EPA Headquarters Repository and Chemical Library in Washington, DC.
- Enable Regional EPA libraries to update their collections, facilities, and equipment to meet Network standards.
- Conduct a formal needs assessment for EPA library services to support future development.

A 56-page GAO report, Environmental Protection: EPA Needs to Ensure That Best Practices and Procedures are Followed When Making Further Changes to Its Library Network, GAO-08-304 EPA Libraries (see: http://www.gao.gov/new.items/d08304.pdf) GAO reviewed pertinent EPA policies, plans, and guidance and interviewed EPA officials and staff from each of the 26 libraries. GAO made four recommendations in this report aimed at best practices and procedures that EPA should follow when continuing to reorganize its library network.

GAO recommended that the Administrator of EPA continue the agency's moratorium on changes to the library network 'until the agency (1) develops a strategy to justify its reorganization plans; (2) improves its outreach efforts; (3) ensures sufficient oversight and control over the reorganization process, and continuously and consistently monitors the impact of the reorganization on EPA staff and the public; and (4) implements procedures that ensure that library materials are dispersed and disposed of consistently and in accordance with federal property management regulations. EPA agreed with the recommendations made in our report.'

WILL THE NATIONAL AGRICULTURAL LIBRARY BE NEXT?

The National Agricultural Library (NAL), supported by the U.S. Department of Agriculture is noted as the greatest agricultural library in the world. Its user base is as broad as is the agricultural community from the single-family farm to the corporate leaders of the Fortune 100 agro-business companies. The NAL budget has remained 'flat-lined,' but as the final paragraphs of this fourth edition are edited, NAL's budget is slated for drastic cuts in the Federal governments 2008 Fiscal Year, which began Oct. 1, 2008. The proposed cuts may 'curtail acquisition of new printed works, endanger preservation of its special collections, halt document delivery and turn a national library into a local one.' (Damrosch 2008).

In response to the proposed cuts, the American Library Association (ALA) and the Association of Research Libraries (ARL) sent a letter to the Honorable Rosa DeLauro, Chairwoman of the U.S. House of Representatives' Subcommittee on Agriculture, Rural Development, and Related Agencies, a part of the Committee on Appropriations, requesting necessary appropriations for the National Agricultural Library on March 20, 2008 (http://www.wo.ala.org/districtdispatch/wp-content/uploads/2008/04/letter_nalapprops.pdf). In the Washington Post special feature article, staff writer, Barbara Damrosch provides a concise statement concerning the plight of both the EPA's National Library Network and the National Agricultural Library:

> A library is a lot like a seed bank, in which the germ plasm of the world's plant varieties is preserved for future generations. Without this rich diversity of old seeds to draw on, the breeding of new plants capable of meeting future challenges can't be guaranteed. In addition, the seeds must be grown out from time to time to test their viability and to keep them adaptable to present conditions. The same is true of books. If no one reads them, puts their contents through the paces of real life and uses them to cultivate knowledge, the future will see a poor harvest indeed.
>
> (Damrosch 2008)

TECHNICAL REPORT LITERATURE

U.S. Government information can be an elusive entity with which to deal. It is a literature marked by technical reports, legislative and judicial hearings, public communication documents, brochures, pamphlets, official guidelines, regulations, and standards. Large university libraries are generally participants in the U.S. Federal Depository Library program, which the Government Printing Office (GPO) describes:

> The **Federal Depository Library Program** (FDLP) is by far the largest and best known of the Office of Information Dissemination (SuDocs). Established by Congress to ensure that the American public has access to its Government's information, this program involves the acquisition, format conversion, and distribution of depository materials and the coordination of Federal depository libraries in the 50 states, the District of Columbia and U.S. territories. The mission of the FDLP is to disseminate information products from all three branches of the Government to over 1,250 libraries nationwide. (http://www.gpoaccess.gov/fdlp.html)

Federal publications and other information products are generally available for free public use in Federal depository libraries throughout the United States. In addition to the publications, trained librarians are available to assist in their use. You can locate Federal Depository Libraries from the *GPO Access* site at www.gpoaccess.gov/libraries.html. A good source of Federal government information for children is *Ben's Guide to Government* for kids at bensguide.gpo.gov/.

In many cases such depository libraries provide users of their collections of government documents inventories of the major finding tools, bibliographic databases, Web compilations used to identify, locate, and retrieve government information (such as those at the University at Buffalo's Government Documents Collection in its Arts and Sciences Libraries; Smith 2007, Herman 2006). The following resources and information taken from the resources, product description pages (PDPs) are provided here as the primary finding tools to identify government information, including technical reports and government documents. Those items provided a '[P]-superscript' are resources freely available to the public at-large, while those resources provide a '[$]-superscript' are commercially available database for which subscription fees must be paid for individual or site-license use.

- The *CQ Electronic Library*[$] covers public policy issues & U.S. Congress news & analysis with policy content.
- *FirstGov*[P] (http://www.usa.gov/) is a major gateway site for one-stop shopping for government information, including many resources related to toxicology, environmental and occupational health and medicine, pollutants, chemical and radiological risks.
- *Government Periodicals Universe*[$] indexes journals and periodicals published by the U.S. government. *GPO Access*[P] (http://www.gpoaccess.gov/index.html) GPO Access is the home page of the Government Printing Office's Superintendent of Documents. That agency administers the Government Printing Office Depository Program whereby GPO forwards to depository libraries copies of government publications without charge. The depositories in turn agree to make the data available to the entire community.
- *LexisNexis Congressional*[$], formerly Congressional Universe, is a LexisNexis™ product that indexes and provides selected full texts of Congressional publications, regulations, laws, legislative histories, and background information on members of Congress.
- The *CIS Index* covers 1970 to present. Full-text coverage varies depending on publication (see above) and update schedules vary. Historical Full Text and Historical Indexes cover Congressional publications from 1789–1969.
- *Catalog of U.S. Government Publications* (U.S. Government Printing Office)[P] (http://catalog.gpo.gov/F) indexes U.S. government publications in all formats issued since 1976. GPO intends to add earlier documents in the future. The GPO Monthly Catalog, published by OCLC, is a commercial edition of the same.
- The *NTIS*[P,$] database (public access: http://www.ntis.gov/), compiled by the U.S. Department of Commerce, National Technical Information Service covers technical reports submitted for government-sponsored research and development projects. Also included are reports made available by various U.S. government agencies and some foreign governments.
- *THOMAS*[P] is a database of Congressional and legislative information including bills, the Congressional Record – proceedings and debates of Congress, Congressional reports, legislative histories, and public laws. Contains leads to most data published since 1989 are full text. Earlier resources are only cited.
- *TRIS (Transportation Research Information Services) Online*[P] provides access to more than 400 000 bibliographic records covering transportation research on air, highway, rail, and maritime transport, mass transit, and other transportation modes. Subjects included are regulations and legislation, energy, environmental and maintenance technology, operations, traffic control, and communications.
- *U.S. Government BOOKSTORE* (US Government Printing Office)[P] lists federal government publications available for sale from GPO. Claitor's Law

Books and Publishing Division also sells GPO documents at http://www.claitors.com/gpo.htm.

- *U.S. Government Manual* [P] is the official handbook of the Federal Government; the United States Government Manual provides comprehensive information on the agencies of the legislative, judicial, and executive branches. It also includes information on quasi-official agencies, international organizations in which the United States participates, and boards, commissions, and committees.

NATIONAL TECHNICAL INFORMATION SERVICE (NTIS)

Since the preparation and publication of the third edition of this book the NTIS database, provided by the National Technical Information Service, shows nearly 16 000 toxicology-related records entered. These entries reflect the mission of the NTIS database, which covers technical reports submitted for government-sponsored research and development projects. Also included are reports made available by various U.S. government agencies and some foreign governments. Major areas included are the physical sciences, technology, engineering, biological sciences, medicine and health sciences, agriculture and social sciences. Its print counterparts include Government Reports Announcements & Index (1971–1996), US Government Research & Development Reports (1965–1971), US Government Research Reports (1955–1964), and Bibliography of Scientific & Industrial Reports (1946–1954).

While the total number of toxicology-related technical reports inventoried in the NTIS database may seem impressive, it falls far short of previous decades' production of technical report literature. An analysis of the technical report literature recorded in the NTIS database from 1950 to 2007 was performed in the NTIS database on the Engineering Index platform, which includes a rather robust means to analyze the citations retrievals. Searches were conducted for three major subcategories of the toxicology report literature: 'toxicology' (toxic, toxics, toxicologic, toxicological, toxicological, toxicity or toxicities); environmental health, environmental medicine, occupational health, occupational medicine; and air pollution, water pollution, solid wastes pollution, pesticides pollution, radiation pollution, environmental control pollution. The combined total of these three subcategories was also done. Plotting the results of this comprehensive search over the period 1950 to 2007 is shown in Figure 65.1.

There remains much to be done in the analysis of this plot. However, if one takes into consideration the

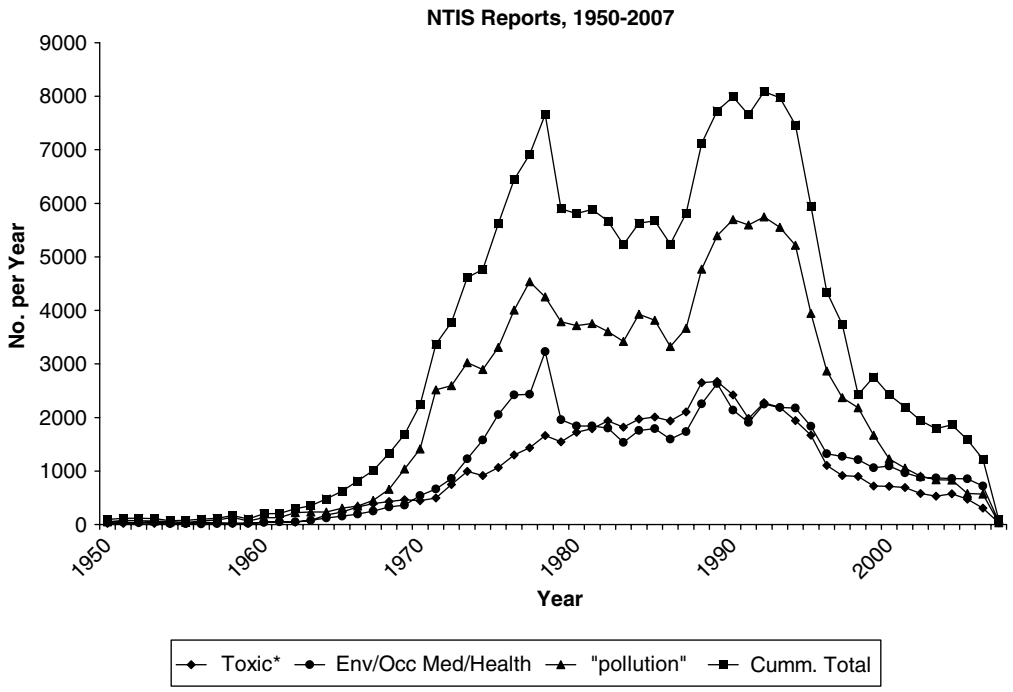

FIGURE 65.1 Toxicology-related report literature in the NTIS Database from 1950 to 2007

volume of Federal legislation related to the protection of the environments in which we work, play, and recreate, one easily can see the impacts that social and political change have on the production of technical information resulting from research and development programs and campaigns over time. These trends reflect funding priorities of political powers in Congress and the Executive Branch of the U.S. Government, research priorities within government agencies supporting various research and development projects, monitoring programs, and other factors that influence the production and capture of technical report literature by bibliographic utilities. The U.S. Government Accounting Office provides evidence that the steady declines noted in the above graph is part of a general trend across all NTIS full-text holdings:

> … in recent years, NTIS' repository has been growing at a slower pace – from about 56,000 reports published in 1995 to just over 10,000 published in 2000 (as of mid-November 2000). However, the Assistant to the Director of NTIS said that since about 75 to 80 percent of the reports in NTIS' collection for a given year are added in the years following the year of publication, the final number of reports for 2000 might increase significantly. Nevertheless, the Assistant to the Director of NTIS acknowledges that the total number of reports added to the repository in recent years has been declining.
>
> (U.S. Government Accounting Office 2001)

Figure 65.2 shows the production of journal articles retrieved from the *Chemical Abstracts* portion of the Chemical Abstracts Service's *SciFinder Scholar* database. Since there has not been such a precipitous drop in the publication of journal articles between the years 1995 to 2007 in the open scientific journal literature, it is safe to assume that a general decrease in publication may not be the cause of such a drop in the publication of technical report literature. An analysis of the Chemical Abstracts Services SciFinder Scholar database over the period of 1950 to 2007 for the concepts of toxicology, environmental health and occupational health covered in the journal literature shows an initial jump in the production of literature coincident to increased environmental awareness in the early to mid-1960s, with a steady first-order growth in the annual production of journal articles from about 2500 articles per year in the late 1960s to the early 1970s to more than 30 000 articles per year since 2000 (with the trend increasing in each year, except for a slight decrease in the year 2000).

Since the production of the third edition of this current book in 1999, the 20 most frequently contributing federal agencies, departments, and laboratories (including those of contractors and subcontractors) of toxicology-related technical reports are in ranked order (number of entries for each agency is provided in a parenthetic note) are:

- National Institute for Occupational Safety and Health, Washington, DC (495)
- Environmental Protection Agency Office of Water (252)
- Environmental Protection Agency Office of Emergency and Remedial Response (236)

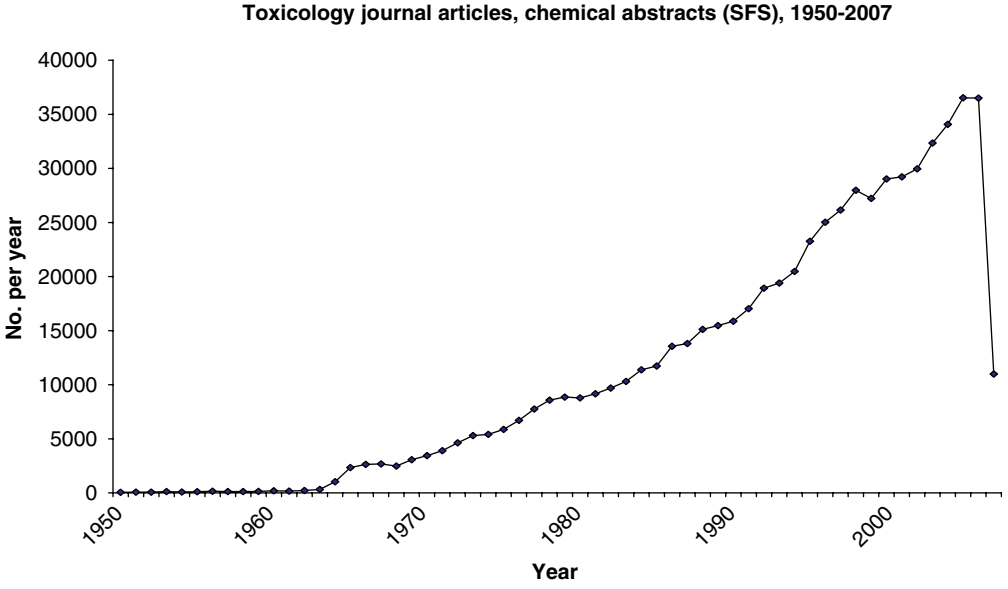

FIGURE 65.2 Publication of toxicology-related journal articles in Chemical Abstracts 1950–2007

- Agency for Toxic Substances and Disease Registry (213)
- Environmental Protection Agency Office of Air Quality Planning and Standards (189)
- Lawrence Livermore National Laboratory (Department of Energy) (161)
- Regscan, Inc. (150)
- Army Institute of Environmental Medicine (149)
- National Institute for Occupational Safety and Health (Cincinnati, OH) (148)
- National Park Service Water Resources Division (131)
- Environmental Protection Agency Office of Prevention, Pesticides and Toxic Substances (118)
- General Accounting Office (107)
- Environmental Protection Agency (Washington, DC) (106)
- Pacific Northwest National Laboratory (Department of Energy) (95)
- National Institute for Occupational Safety and Health (Pittsburgh, PA) (91)
- National Toxicology Program (88)
- U.S. Geological Survey (85)
- Edgewood Chemical Biological Center, Aberdeen Proving Ground (85)
- National Institute for Occupational Safety and Health Office of Surveillance, Hazard Evaluations and Field Studies (Cincinnati, OH) (82)
- Agency for Toxic Substances and Disease Registry, Division of Health Assessment and Consultation (82).

These 1999–2007 reports were predominantly addressing a range of toxicology and environmental and occupational health issues as indicated by the 20 most frequently used control vocabulary terms and classification codes provided by technical support personnel indexing entries into the database. The topical nature of the reports retrieved in this time cohort are revealed by the specific controlled vocabulary terms and classification codes more frequently used to index these reports (and the number of citations indexed by them are parenthetic notations). The ten most frequently used controlled vocabulary terms and classification codes indexing toxicology-related technical reports in the *NTIS* database are (Controlled Vocabulary Terms):

- Toxicity (1712)
- Occupational Health and Safety (1721)
- Public Health (1533)
- Ground Water (1205)
- Air Pollution (1187)
- Water Pollution (1146)
- Recommendations (1133)
- Risk Assessment (994)
- Hazardous Materials (921)
- Water Quality (918).

During the period between the third and fourth editions of this book, there has been a continuation of the production of a number of series of toxicology-related technical reports issued by specific agencies and departments:

- EPA's series, *Aquatic Life Ambient Water Quality Criteria*, and supporting ambient water quality criteria standards and preparation guidelines
- Agency for Healthcare Research and Quality's *Evidence Report/Technology Assessment* Series, including environmental and public health topics
- National Institute for Occupation Safety and Health's *NIOSH Health Hazard Evaluation Report* Series
- New, revised, and updated to public health assessment reports and toxicological profiles prepared by the Agency for Toxic Substances and Disease Registry.

The completion of the Human Genome in 2000 paved the way for a tremendous surge in the production of genomics data and the creation of a new generation of genomic, proteomic, metabolomic, and other biological-sequence databases forming the nexus of data archives, and data retrieval and management tools of the emerging field of bioinformatics. As applied to the fields related to toxicology, the term 'Toxicogenomics' is one of recent addition to the toxicology lexicon, and one continuing to evolve as toxicology is pursued at molecular levels. These databases are described in more detail in this book's chapter of databases, while the emergence of the technical report literature in this field is mentioned here.

Toxicogenomics and the various toxicologic overlaps with 'The New Biology' of bioinformatics, genomics, proteomics, and other spin-off disciplines from molecular and structural biology and genetics is the newest topic of interest to toxicology and environmental and occupational health and medicine. Numerous documents in -omic-related disciplines may be identified by consulting the NTIS database. The following is a list of the most relevant technical reports extracted from the NTIS database and the Federal entities responsible for their production) on this new and emerging topic.

NTIS at a Crossroads

Since publication of the third edition of this current work, the General Accountability Office (formerly the Government Accounting Office) published two reports on NTIS. The first report (U.S. Government Accounting Office 2000) 'cast doubt on the long-term viability of NTIS, due to the increasing availability of

reports on the Internet and insufficient funds to cover operating costs.' In response, NTIS cut staff and costs. A second GAO report (U.S. Government Accounting Office, 2001) acknowledged NTIS changes, and concluded 'that the role of NTIS should be explored in the context of broader issues associated with the dissemination of government information in the Internet age.' Additional comments about the current operation of NTIS and future directions are suggested (Drake 2006).

The U.S. Congress directed the National Commission on Libraries and Information Science (NCLIS) to conduct a study on the proposal to close NTIS. Their study produced two reports: a *Preliminary Assessment of the Proposed Closure of the NTIS* (March 2000) and a *Comprehensive Assessment of Public Information Dissemination* (January 2001). These NCLIS reports reiterated NTIS's value-added features as contributing to the 'public good' (the collection, organization, dissemination, and permanent public availability of federally funded scientific and technical information). They further emphasized the impact NTIS has on the national economy and suggested appropriations of $5 million per year (a very small fraction of the total annual budget for federal research). Completion of these NCLIS reports and study 'coincided with the change in both the Presidential administration and Congress,' and noted that 'the George W. Bush administration and the 108th Congress have not taken action on this report. At the end of 2003, the National Technical Information Service remains in the Department of Commerce, but the agency has received no regular appropriated funds since the completion of the study.' (Nickum 2006).

The apparent demise of NTIS is also reflected in the manner by which the Environmental Protection Agency is making access to its technical reports 'more accessible,' but not in any sort of a systematic, unified manner (Nickum 2006). There are many ways within the EPA environmental information management system to locate appropriate technical reports. However, there is no single or central database or federated search function to assure the ability to search across all of the EPA technical reports. Should this practice (the management of publication within subunits of Federal agencies) continue, the loss of a central authority control will represent a significant loss in the identification of technical report literature.

Regardless of the current status of NTIS, it is the future that holds great unknowns not only for NTIS but for the generation and dissemination of corpus of technical report literature generated on the accounts of the Federal government. The U.S. Congress will be presented the challenge of overseeing the future of NTIS. According to the U.S. General Accounting Office:

> In light of developments in report dissemination through the Internet, the Congress may wish to reexamine how scientific, technical, and engineering information is disseminated to the public. In this reexamination, the Congress could specifically look at how this information is defined; whether there is a need for a central repository of this information, such as at NTIS; and, if a central repository is maintained, whether all information should be retained permanently, and what business model should be used to manage it.
>
> (U.S. General Accounting Office 2001)

While individual departments and agencies within the Federal government may boast about easier and improved access to their reports and documents to meet demands of their user groups and constituencies, the significant loss of bibliographic controls over the full body of technical report literature represents a tremendous negative impact on the ability to identify, locate, obtain, use, evaluate, synthesize, and share this body of primary research information. This in turn demands new approaches for users who are seeking comprehensive access to technical report literature that largely has been the historical role of NTIS for nearly a half century. Development of appropriate bibliographic finding tools lags significantly, and represents a disturbing trend in the world of digital access.

NATIONAL ACADEMIES

The National Academy of Sciences is an honorific society of distinguished scholars engaged in scientific and engineering research, dedicated to the furtherance of science and technology and to their use for the general welfare. It has been expanded over the years to include the National Research Council, the National Academy of Engineering, and the Institute of Medicine. The National Academies Press (NAP) was created by the National Academies to publish the reports issued by each of the Academies.

The Board on Environmental Studies and Toxicology (BEST) is the body that oversees a vast amount of the toxicology-related work of the National Academies. BEST's mission is to 'provide independent expert assistance to the federal government and advice to the nation on matters of science and technology affecting public policy on important environmental and ecological problems.'

COUNCIL ON ENVIRONMENTAL QUALITY

The Council on Environmental Quality (CEQ) is responsible for developing national policies related to ensuring the quality of the environment and for determining the environmental impact of federal government programs and initiatives. CEQ is also responsible for overseeing implementation and enforcement of NEPA.

Environmental Quality, last prepared by CEQ in 1997, was one of the most important government documents bridging the scientific and technical underpinnings with the policy and decision-making aspects related to assuring the quality of our national and global commitments to environmental quality.

NATIONAL TOXICOLOGY PROGRAM (NTP)

The NTP is an interagency program that evaluates toxic agents of public health by research for developing and applying tools of modern toxicology and molecular biology. NTP publishes a variety of reports and government documents (see: http://ntp.niehs.nih.gov/), including the following reports.

- NTP 2006: Current Directions and Evolving Strategies (pdf) provides an overview of plans as well as a description of the NTP Centers, Report on Carcinogens (11th Edition is complete and 12th edition under review in 2008), and outreach. Previous NTP Current Directions – 2005, 2004, 2002, 2001, 2000, 1999, and 1998.
- The 11th *Report on Carcinogens* (RoC) was released on January 31, 2005. The 11th RoC contains 246 entries, 58 of which are listed as known to be human carcinogens and with the remaining 188 being listed as reasonably anticipated to be human carcinogens.

NTP also provides access to NTP Study Reports:

- Long-Term Toxicology and Carcinogenesis Studies
- Short-Term Toxicity Studies
- Genetically Modified Model Studies
- Immunology Toxicity
- Developmental
- Special Drinking Water
- Reproductive Assessment by Continuous Breeding
- NIEHS AIDS Therapeutics Toxicity Reports.

NTP provides access to various 'Reports and Monographs' and 'Journal Publications' from its Center for the Evaluation of Risks to Human Reproduction (CERHR), including reports for a variety of chemicals.

GOVERNMENT PRINTING OFFICE

Accessing the literature of the U.S Government Printing Office is achieved by several platforms. The *Catalog of U.S. Government Publications* (CGP) is one of the most widely used finding-tool for U.S. Federal government publications in electronic and digital formats. The online version, which is available free to the public (http://catalog.gpo.gov/F) provides direct access to both print and online government documents from several sources:

- National Bibliography of U.S. Government Publications
- Congressional Serial Set Catalog
- Congressional Publication
- GPO Access Publications
- Internet Publication
- Periodicals
- Serials.

There are some 1400 depository libraries and 53 regional libraries in the Federal Depository Libraries Program (FDLP). They are required to retain documents permanently to ensure the availability of archival collections.

When examining the content of the *CGP* it was apparent that an all-too-familiar trend was observed. Between the years from the mid-1990s to the present (2007) there has been a steady decline in the number of government documents retrieved. It warranted further examination. Figure 65.3 is a representation of toxicology-related information (of the same broad toxicology, pollution, and occupational and environmental health parameters) used in generating the NTIS output shown in Figure 65.1. It is noted here that there is rather incomplete inventorying of retrospective in the *CGP*, as noted above, so the numbers prior to 1976 are skewed to significantly lower entries (if any at all).

As stated in the description of this observation and trend with the *NTIS* database, much more in-depth analysis is need to determine all of the factors contributing to this decline, including: internal policies and actions with the U.S. GPO, Federal funding priorities over time with regard to toxicology-related issues and topics, shifting research and development priorities within departments and agencies, issues related to the new sense of national security and terrorist threats, and migration of bibliographic data away from the traditional bibliographic utilities and to the data and information management activities of individual departments and agencies within the U.S. government.

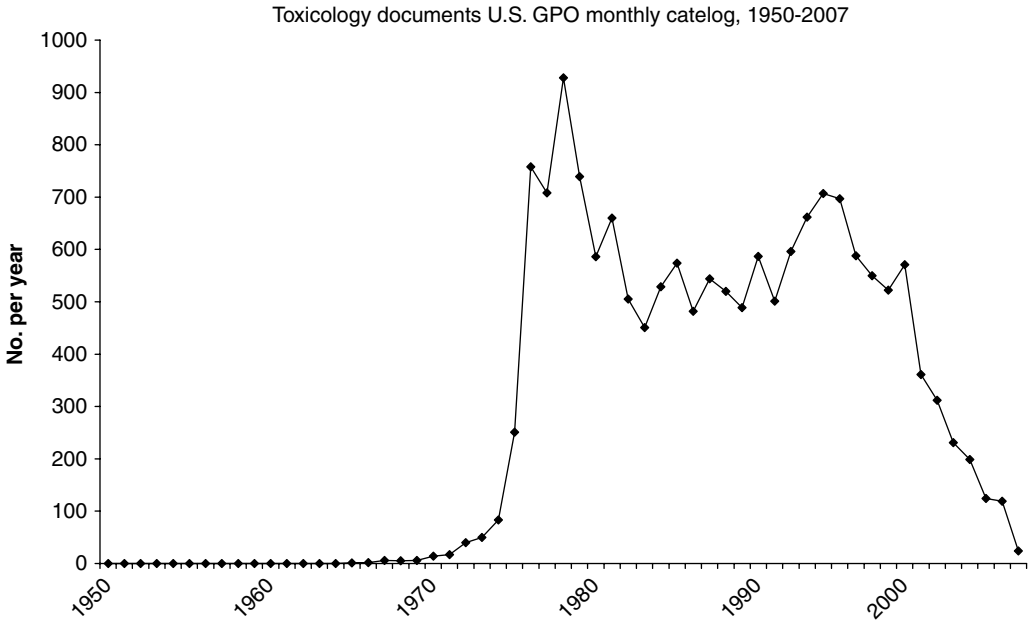

FIGURE 65.3 Production of U.S. Federal Government Documents retrieved from the *Catalog of U.S. Government Publications* from 1950 (more accurate representation from 1976) to 2007

LIBRARY OF CONGRESS

The Library of Congress maintains a website on technical reports and standards (see: www.loc.gov/rr/scitech/trs/trsover.html). This site provides an overview of technical reports, access to its collections of technical reports and standards, guidelines for locating and obtaining technical reports, and a large inventory of 62 publicly available (free) and nine commercially available (subscription) databases and electronic resources, including: *AGRICOLA* (U.S. Department of Agriculture), *Arctic Science and Technology Information System*, *ACSE Civil Engineering Database*, *DTIC's Technical Reports Collection*, *IncyWincy*, the Naval Research Laboratory's *NRL Database*, Virtual Technical Reports Center database, and the Windows Live Academic database.

The Library of Congress still maintains relevant Science Traces Bullets (brief guides to the literature for *Asbestos & Asbestosis*, *Chemical and Biological Warfare*, *Pesticides and Food*, and *Poisonous Plants*), Selected Internet Resources in Science and Technology (*Animal Welfare, Companion Animals, and Veterinarian Science*; *Avian Influenza (bird flu)*, *Bovine Spongiform Encephalopathy (BSE) or Mad Cow Disease*; *Chemical and Biological Warfare*; and *Health and Medical Information*); Science Reference Guides (*Human Genome Project*, *Rachel Carson: Selected Reading List*, and *Ricin [Toxic Substance]*).

LOCATING THE HARD-TO-FIND

The *GrayLIT Network* provided access to the gray literature of U.S. Federal Agencies easily accessible over the Internet by tapping into the search engines of distributed gray literature collections. The *GrayLIT Network* was the world's most comprehensive portal to Federal gray literature. Sadly, this database of government information no longer exists. *The GrayLIT Network* 'retired' on October 31, 2007. *Science.gov* (http://www.science.gov/) or the *Science Accelerator* (http://www.scienceaccelerator.gov/) databases replace the *GreyLIT Network* and search across collections of the U.S. Department of Energy's (DOE's) scientific and technical information. As a free public service, searches will include research and development results, project descriptions, accomplishments, technical reports, and more, via resources made available by the Office of Scientific and Technical Information (OSTI), U.S. DOE.

JUDICIAL AND LEGAL INFORMATION

Legal research is a precise and specialty area in librarianship. Like matters dealing with medical situations involving real bona fide situations of a legal matter, individuals should seek the qualified counsel of a professional lawyer or paraprofessional for preliminary inquires regarding legal environmental compliance,

health status, or other issues related to toxic and chemical products or situations. Many law schools, such as at the University at Buffalo, have law libraries that provide subject guides and guides to library research pertaining to the environment.

Nancy Kubasek and Gary Silverman have recently published the sixth edition of their textbook, *Environmental Law* (Upper Saddle River, NJ: Pearson Prentice Hall, 2008). This work provides an overview of the American legal system and the historical sources of environmental law in the U.S. It describes the litigation process and other tools for resolving environmental disputes, including a review of administrative law and its impact on the environment. Specific application of environmental law and policy is made for air-quality control, water-quality control, controlling toxic substances, waste management, and hazardous releases. Legal aspects of energy, natural resources, and international environmental law are also covered.

Regina S. Axelrod, David Leonard Downie, and Norman J. Vig contributed to the creation of a second edition of their book, *The Global Environment: Institutions, Law, and Policy* (Washington, DC: CQ Press, 2005). It provides a nice overview of the issues of environmental issues, many of which deal with environmental health and hazardous materials. Jean Macchiaroli Eggen also provides an updated version of her book, *Toxic Torts in a Nutshell, 3rd Ed.* (St. Paul MN: Thomson/West Publishers, 2005).

A synopsis of the basic information tools for environmental law is provided by the librarians in the Charles B. Sears Law Library at the University at Buffalo (see: http://law.lib.buffalo.edu/departments/info-services/research/bibliographies/federal/Envt.pdf):

The University at Buffalo Law Library also maintains a special Environmental Law Research Guide (see: http://law.lib.buffalo.edu/departments/infoservices/research/webguides/environment.asp) that provides links to representative bibliographic and research databases (see: Law – United States at http://law.lib.buffalo.edu/departments/info-services/research/webguides/environment.asp and Law – Foreign and International at http://libweb1.lib.buffalo.edu/infotree/resourcesbysubject.asp?subject=Law+-+Foreign+and+International), and also links to various web-based resources.

The primary database for legal research including judicial issues at all levels of government (in the U.S.) from local to Federal levels in the subscription-based *LexisNexis Academic* (for universities and colleges). *LexisNexis Academic* provides articles (full-text) and reports from more than 6000 magazines, newspapers, wire services, legal resources, reference books, and government publications from around the world. For details see: http://academic.lexisnexis.com/online-services/academic-content.aspx. This database consists of five major segments: News Library: news stories and articles from magazines, newspapers, wire services, legal resources, and specialized newsletters, with strong international coverage, broadcast transcripts from popular radio and television news/interview programs; Legal Library: a large collection of federal and state laws, regulations, and court cases, together with law review articles; Business Library: business news, company profiles, financial statements, bankruptcy reports, accounting pronouncements, investment analysis, business directories, etc.; Reference Library: biographies, country profiles, quotation dictionaries, public opinion polls, and the World Almanac; and Medical Library with specialized medical and pharmaceutical newsletters, including the F.D.C. Pink Sheet.

The Transactional Records Access Clearinghouse (TRAC) recorded in December 2007, 20 federal prosecutions of environmental law (according to enforcement data from the Justice Department). This is down from 39 in the previous month, and represents the fourth consecutive month for which a decline in prosecutions can be seen. Among the statutes included in such prosecutions are 16 USC 703 (taking, killing, or possessing migratory birds) and 33 USC 1319 (Water Pollution Enforcement), both of which show significant declines in this time period. For reports on the latest enforcement trends, see: http://trac.syr.edu/tracreports/bulletins/.

GENERAL ACCOUNTABILITY OFFICE

The U.S. Government Accountability Office (GAO, formerly the Government Accounting Office) is known as 'the investigative arm of Congress' and 'the congressional watchdog.' GAO supports the Congress in meeting its constitutional responsibilities and helps improve the performance and ensure the accountability of the federal government for the benefit of the American people. GAO is an independent, nonpartisan agency that works for Congress. Often called the 'congressional watchdog,' GAO investigates how the federal government spends taxpayer dollars. The head of GAO, the Comptroller General of the United States, is appointed to a 15-year term by the President from a slate of candidates Congress proposes. GAO's work includes oversight of federal programs; insight into ways to make government more efficient, effective, ethical, and equitable; and foresight of long-term trends and challenges. GAO's work is mandated by

requests of congressional committees or subcommittees or is mandated by public laws or committee reports, and they undertake research under the authority of the Comptroller General. GAO supports congressional oversight by:

- auditing agency operations to determine whether federal funds are being spent efficiently and effectively;
- investigating allegations of illegal and improper activities; reporting on how well government programs and policies are meeting their objectives;
- performing policy analyses and outlining options for congressional consideration; and
- issuing legal decisions and opinions, such as bid protest rulings and reports on agency rules.

For details about GAO and access to its full-text reports and testimonies go to: http://www.gao.gov/.

A brief sample of recent GAO reports follows:

TOXIC CHEMICALS: EPA's New Assessment Process Will Increase Challenges EPA Faces in Evaluating and Regulating Chemicals, GAO-08-743T

Chemical Regulation: Approaches in the United States, Canada, and the European Union, GAO-06-217R

CHEMICAL REGULATION: Actions Are Needed to Improve the Effectiveness of EPA's Chemical Review Program, GAO-06-1032T

PROTECTION OF CHEMICAL AND WATER INFRASTRUCTURE: Federal Requirements, Actions of Selected Facilities, and Remaining Challenges, GAO-05-327

TOXIC CHEMICAL RELEASES: EPA Actions Could Reduce Environmental Information Available to Many Communities, GAO-08-128

ENVIRONMENTAL RIGHT-TO-KNOW: EPA's Recent Rule Could Reduce Availability of Toxic Chemical Information Used to Assess Environmental Justice, GAO-08-115T

IDENTIFYING STATE, COUNTY, AND LOCAL SOURCES OF TECHNICAL REPORTS

The rapid assimilation of data and information on the Internet and the World Wide Web (WWW) is reflected in the development of these electronic services by state and tribal, county and parish, local municipalities (towns, villages, cities), and other subnational agencies, departments, offices, bureaus, and intergovernmental bodies. The content of state and territorial, tribal, county, and local government web pages varies considerably. Information about health and the environment are among the most frequently posted resources by subnational government bodies (Stoss 2001).

It is well beyond the scope of this current work to inventory all of the relevant technical report literature produced by state, tribal, county, and local government agencies. It is also most unfortunate that there is not nearly as much attention given the bibliographic content of reports from subnational sources. They are rarely covered by the traditional, mainstream bibliographic databases. There are scores of state documents that are not identified by traditional bibliographic utilities, and are identified only after painstaking bibliographic data-mining among many individual state websites or department and agency catalogs. Some suggestions for easing this process have been updated from previously published work (Stoss 2001).

An inventory of online, World Wide Web Sites for identifying state, tribal, county, and local government sources of information, including that related to toxicology, and environmental and occupational health is provided below.

Readers are encouraged to check university websites of law schools, schools or departments of public health, environmental sciences and engineering. University library inventories of Internet resources by subject are fertile sources of such subnational information and should be consulted in addition to academic department pages.

The organizations and associations listed below also produce directories for their constituencies. These professional and trade associations for subnational levels of government also have publications, especially newsletters, serving as bibliographic surrogates for reports published at subnational levels of government. Availability of these resources, typically published as technical reports, is achieved by entering the title(s) in a desired library's online public access catalog (OPAC) or electronic catalog.

List of World Wide Web Sites for Locating State, County, Tribal, and Local (City) Government Sources of Information

Environmental Health and Safety Online
Dunwoody, GA, EHSO, Inc.

Web: www.usmayors.org

Western Governors Association
Web: www.westgov.org

NON-GOVERNMENTAL ORGANIZATION REPORTS

Non-governmental organizations (NGOs) are a growing source of technical reports on a wide range of subjects including the health effects of chemicals. NGO reports are often done by experienced scientists or area experts. NGOs can often produce fast state of the knowledge reports without having to be subject to extensive interagency review or political challenge. Most NGOs have a report section on their websites and these reports are usually available for free. These reports may also examine an issue with a reference to a government position, for example the National Resources Defense Council report entitled *Arsenic and Old Laws A Scientific and Public Health Analysis of Arsenic Occurrence in Drinking Water, Its Health Effects, and EPA's Outdated Arsenic Tap Water Standard* (2000) (http://www.nrdc.org/water/drinking/arsenic/aolinx.asp). These reports provide an important perspective on health-related issues. Similar NGO reposts may also address areas outside government or industry mandates such as the June 2004 Environmental Defense released a report, *Orphan Chemicals in the HPV Challenge: A Status Report*, which examined the lack of health-related information on high-production-volume (HPV) chemicals (http://www.environmentaldefense.org/documents/3810_HPVorphansReport_062004.pdf).

Organizations that represent health effects groups also produce excellent reports that highlight current issues. For example, the Breast Cancer Fund produces a report State of the Evidence 2006: *What Is the Connection between the Environment and Breast Cancer?*, which addresses current evidence on the causes of breast cancer (http://www.breastcancerfund.org/). Other interesting reports address local issues such as the *Seattle Precaution Principle White Paper* produced by the Seattle Precautionary Principle Working Group (http://washington.chenw.org/PPgroup.html) or the San Francisco white paper *The Precautionary Principle and the City and County of San Francisco* March 2003

(http://www.sfenvironment.org/downloads/library/13precprinwhitepaper.pdf). NGOs have also reanalyzed government-generated information to make a different such as *Chemical Trespass – Pesticides in Our Bodies and Corporate Accountability* a 2004 report by Pesticide Action Network North America (PANNA) uses CDC data to analyze pesticide body burdens in the U.S. population (http://panna.org/campaigns/docsTrespass/chemicalTrespass2004.dv.html). In summary, NGOs produce a wide range of reports that offer interesting perspective on current toxicological issues, many of which are available on the World Wide Web.

There is no single effective database serving as a dedicated resource for collecting, sharing, and disseminating bibliographic data for technical reports produced by non-profit organizations and institutions. If the research providing the basis for the technical report is funded or conducted on behalf of the United States government, that report should be included among the resources of the National Technical Information Service. Some tools partially fill this STM literature gap. *GuideStar* is an organization linking the non-profit sector on many fronts and is a resource worth noting since its founding in the late 1990s. In particular is *GuideStar's* partnership with hundreds of thousands of individuals and organizations working with and within the non-profit sector. There is a simple search interface for searching basic information about non-profit organizations, including their report literature; however, this is not a robust searching system for this literature. Free registration is required for using the resource. Value-added components are available for purchase. See: http://www.guidestar.org/.

Other examples of NGO reports include *Exhausted by Diesel: How America's Dependence on Diesel Engines Threatens Our Health* (1998; National Resources Defense Council; http://www.nrdc.org/air/transportation/ebd/ebdinx.asp) and *Out of Control and close to Home: Mercury Pollution from Power Plants* (2003; Environmental Defense; http://www.environmentaldefense.org/documents/3370_MercuryPowerPlants.pdf).

CHAPTER

66

Audiovisual and Non-Print Resources

FRED STOSS, STEVEN G GILBERT, AND PHILIP WEXLER

INTRODUCTION

Al Gore's Academy Award Winning documentary film, *An Inconvenient Truth*, serves as a dramatic example of the overwhelming power of visual images in communicating complex and controversial environmental issues to a broadly defined audience. The production of this documentary was sparked by another form of audiovisual resource, the traditional slide show, which itself evolved from 35-mm photographic slides to today's PowerPoint and KeyNote presentation software. Some popular environmental-themed DVDs of 2007 include: *Global Warming: The Rising Storm*, *Global Warming in the Arctic*, *The Great Warming*, *In the Company of Butterflies*, *A Life among Whales*, *Miracle Planet*, *Plagues and Pleasures on the Sultan Sea*, *Solar Energy: Saved by the Sun*, *State of the Ocean's Animals*, and *Swim for the River*.

An Inconvenient Truth reinforces the importance of audiovisual materials as time-honored and popular formats for delivery of information. Non-print resources come in a wide variety of formats from printed posters and placards to digital downloadable files. Their purpose ranges from simple entertainment to serious study and legal certification. However, the availability of such resources in videotape, audiotape, CD-ROM, and DVD formats is a recent phenomenon. The combination of sight, sound, and motion can be a very effective medley for understanding information and for stimulating and sustaining interest in a topic. Another advantage of these new electronic and digital formats, particularly with the availability of highly portable hardware, is that they provide a convenience to the viewer in both time and place.

RESOURCES

A few reference resources for locating audiovisual resources, primarily DVDs, include the following.

Amazon.com
Web: http://www.amazon.com

IMDb (Internet Movie Database)
Web: http://www.imdb.com/

LOCATOR plus (from the National Library of Medicine)
Web: http://www.nlm.nih.gov/locatorplus

Contains bibliographic records of audiovisual and non-print materials cataloged by the National Library of Medicine.

National Information Center for Educational Media (NICEM)
Web: http://www.nicem.com

Bibliographic data on videos, audios, software, filmstrip, slides and assorted educational media through a variety of means including online, CD-ROM and print.

Online Computer Library Center (OCLC)
Web: http://www.oclc.org

Provides access to the holdings of more than 15 000 libraries participating in the OCLC Network.

WorldCat /WorldCat.org
Web: http://www.worldcat.org/

The WorldCat or WorldCat.org database allows searching for books, DVD, and CD on a wide range of topics including toxicology.

DVDs and Videos: Making available Movies and TV Programs

Major Motion Picture Releases

Movie studios remain enthralled by true and fictional accounts of toxic chemicals or threats. *Erin Brockovich*, based on a true story, was released by Universal Pictures and Columbia Pictures in late 1999. Starring Julia Roberts, as Erin Brockovich and Albert Finney as Ed Masry, the plotline involves contamination of drinking water with hexavalent chromium.

Erin Brockovich (and many other feature films and educational films in video or increasingly in DVD formats) is readily available for purchase from sites such as amazon.com (http://www.amazon.com), any video chain store such as Blockbuster or Hollywood Films, Netflix, or other online video/DVD rental or distribution sites.

A few more recently produced feature films include: *Chain Reaction* (2002, Gemstone Entertainment), *A Civil Action* (2001, 1999, Paramount Pictures), *Dandelion Dead* (2002, HBO Home Video), *Eight Legged Freaks* (2002, Warner Brothers Pictures), *Gas-s-s-s* (2007, Twentieth Century Fox), *The Invitation* (2001, 2003), *Right at Your Door* (2008, Lions Gate), *The Simpson's Movie* (2007, 20th Century Fox), *Toxic Crusaders: The Movie* (2002, Troma Entertainment, Inc), and *Venomous* (2001, 20th Century Fox).

Audio Files

The MEDIAFLY™ Network (http://www.mediafly.com/Welcome.aspx) is a source for personalized podcasts, news, science, medicine, technology, and more, delivered to your PC or mobile device. MEDIAFLY Network gets its audio feeds from a variety of sources, such as print and broadcast media stories and news alerts or releases from non-profit groups and from syndicated broadcast media.

National Public Radio (NPR; http://www.npr.org) and Public Radio International (PRI; http://www) provide audio feeds from NPR News programs, such as Morning Edition or All Things Considered, and featured programs such as the National Press Club, feature themes related to toxicology and toxic or hazardous chemicals in our environment. PRI also provides audio feed and podcasts from its programs, including Living on Earth, This American Life, Living Green, and The World.

Informa Healthcare ToxiCast™ (http://toxicast.com/) provides podcasts on different issues of toxicology, highlighting published books.

The EnvironMinute (http://www.environminute.com/), which focuses on the steps individuals and corporations can take to better the environment.

PodcastDirectory.com is another Internet-based finding tool. From this directory, you can search for blogs and commentary sites, podcasts, Internet radio sites, or vidcasts (video podcasts) in a wide variety of fields including science and health.

The Centers for Disease Control and Prevention (CDC) provides podcasts for easy downloading on more medically based features (http://www2.cdc.gov/podcasts/).

USA.gov provides a comprehensive inventory of podcasts created by or on the account of U.S. Federal government departments and agencies (http://www.usa.gov/Topics/Reference_Shelf/Libraries/Podcasts.shtml).

The U.S. Environmental Protection Agency (www.epa.gov) is the source of a growing number of podcasts both nationally and at regional websites.

National Library of Medicine podcasts are accessible at http://www.nlm.nih.gov/medlineplus/directorscomments.html.

Public Educational Media Producers and Distributors

A major factoring influencing the popularity of electronic and digital formats is the demand by students, teachers, parents, and youth leaders for quality information in formats that not only communicate ideas and teach concepts, but resources that do so in an entertaining manner. Using the WorldCat database, with a librarian's assistance, on the free version of WorldCat.org (http://www.worldcat.org) one can easily identify libraries holding TV series, for example, and in some cases, shed some light on episodes where toxic chemicals or toxicology issues are a central theme.

Companies that produce and distribute DVDs (some available as videos) that are related to the environment, natural resources, and wilderness themes are listed below. Each provides free catalogs of their offering (many of which are found in public and school library collections).

Access to Visual Resources in the Social Networks

The YouTube-Phenomena takes the availability of visual information in the form of digital video images to new and sometimes chaotic dimensions. As with many other aspects of diving for information in the uncharted seas of the Internet, searching for visual information can be frustrating and fruitful at the same time. YouTube (http://www.youtube.com) is likely to make further inroads into the scientific arena but the viewer needs to scrutinize retrieved information carefully for accuracy and relevance.

A step beyond the two-dimensional visual landscape is offered by SecondLife (http://secondlife.com/), a 3-D virtual world created by its residents. This digital world is filled with people, entertainment, experiences, and opportunity, where you can even build your own house. Residents retain intellectual property rights in their digital creations, and can buy, sell and trade with other residents. In this virtual world, you create your own persona, known as an *avatar*. It is a fascinating concept, but the extent to which it will have applications to science, and be utilized by the scientific and toxicological community remains to be seen.

Digital Data and Images

Accessing data resources has become easier through the use of information technologies and a need within the STM community to have ready access to such data. The national digital science library (NDSL) is an information portal for science and technology (see: http://nsdl.org/) and gathers digital data for use in classrooms from K-12 to colleges and universities. Records retrieved through the NDSL include Cornell University's Environmental Inquiry Toxicology guide for high-school students. Other national digital library initiatives in the U.S. Federal government are proposed, but funding support has become more scant in recent years. The National Agricultural Library effort to create the National Digital Library for Agriculture will contain a wide variety of data of interest to a broadly defined agriculture community (see: http://www.nal.usda.gov/ndla/about.shtml).

Innovations and advances in the secure delivery and archival capacity by networked environments allow for the transfer of high-resolution technical images (photographs, illustrations, etc.) via the Internet. Logical Images (http://www.logicalimages.com/) is a new company based in Rochester, New York providing such services for the medical community. They provide diagnostic training tools via their proprietary *VisualDx* software for clinicians, first responders (including bioterrorism responders), and other healthcare professionals. These services assist in clinical diagnoses, treatments, and patient education. For bioterrorism, high-resolution photographs are provided for such biological agents such as: cutaneous anthrax and inhalational anthrax; botulism; bubonic plague, pneumonic plague, septicemic plague; smallpox; tularemia, and viral hemorrhagic fevers. Additional areas covered include public health and emergency medicine.

Fotosearch (http://www.fotosearch.com/) is a private company providing a reliable search engine to identify stock images from a database of more than 2.5 million images from 100 stock-photography, stock-illustration, and stock-video publishers. Acclaim Images (http://www.acclaimimages.com/search_terms/toxicology.html) is another stock photography supplier providing images related to toxicology.

U.S. Government Agencies

Federal, state and local (county, parish, municipal) agencies, such as the U.S. EPA (http://www.epa.gov) and the U.S. Chemical Safety Hazard and Investigation Board (http://www.csb.gov/index.cfm) may have relevant audiovisual resources covering issues related to toxicology. Toxicology audiovisuals (as well as books and journals) with a medical bent may also be identified via the U.S. National Library of Medicine's (NLM) LocatorPlus (http://locatorplusv2.nlm.nih.gov/). Although not the first group to foray into this arena, NLM is also working on an extensive, high quality, database of pill images.

Non-Government Professional Training Resources

Both for-profit and NGO environmental health and safety (EH&S) and occupation health and safety (OHS) sectors create and/or distribute a variety of audiovisual products. These stress on-the-job safety measures, hazardous materials handling, regulatory compliance, and dedicated and ongoing training in areas related HAZWOPER (hazardous wastes operations), transportation and storage of toxic and hazardous materials or compliance with specific federal regulations and guidelines (especially those related to the Occupational Safety and Health Administration, Environmental Protection

Agency, Department of Transportation). In some instances, these materials may be available for specific states. Such non-print materials come in formats such as posters and wall placards, VHS videos (decreasing dramatically in recent years), DVDs, and more recently in a variety of video streaming formats, most notably, variations of Shockwave. Listed here are some suppliers of environmental compliance courses and training workshops and safety posters and placards.

PART

IV

Internet and Digital Tools

CHAPTER

67

The Internet: Recent Trends

STEVEN G. GILBERT, ASISH MOHAPATRA, PERTTI J. HAKKINEN, AND PHILIP WEXLER

INTRODUCTION

The Internet has radically changed the organization and access to toxicology and other information. The Internet will continue to evolve and the current chapter offers a snapshot of some of the tools now available. Many terms used to describe features of the Internet, such as blog, portal, and discussion forum can be used quite loosely, with standardized definitions hard to come by and sometimes changing over time. The web's future transformation continues to be variously predicted. One model considers the process moving from Web 1.0 (connecting information) to Web 2.0 (connecting people) to Web 3.0 (connecting knowledge) and ultimately to Web 4.0 (connecting intelligence) (http://colab.cim3.net/file/work/SICoP/2007-04-25/InternetTo2020.pdf). The challenge for toxicology and the environmental health sciences will be to integrate the ever-expanding data on hazard with exposure, to facilitate better decision making to protect the environment and human health. Key characteristics of Internet-based sources of information relevant to toxicology will be presented here.

SEARCH ENGINES

The first crude search engines started in 1993, shortly after the World Wide Web (or 'web') began its tremendous growth in the number and size of its sites. For a history of search engines see http://www.searchenginehistory.com/. There are now many different types of search engines that attempt to find either general sources of information or specialize in finding specific types of information. Google (http://www.google.com) has become such a common worldwide entry point to web-based information that having 'Googled' is understood as having searched the web using one or more specified search words, perhaps without even using Google! That is, Google has become to searching as 'Kleenex' is to tissues. Google's global ambitions are attested to by the ever-expanding list of languages with which it can be searched. It should be noted, however, that some countries do restrict searches and web access to certain sites.

Further, Google's various tools include Google Scholar (http://scholar.google.com/intl/en/scholar/about.html), offering searching across many disciplines and sources: peer-reviewed papers, theses, books, abstracts and articles, from academic publishers, professional societies, preprint repositories, universities and other scholarly organizations, and as such is a useful tool for toxicology. Similarly, Scirus (http://www.scirus.com/), by Elsevier Science is another product of value to the resourceful toxicologist. Elsevier calls it 'the most comprehensive scientific research tool on the web. With over 450 million scientific items indexed (as of mid-2008), it allows researchers to search for not only journal content but also scientists' homepages, courseware, pre-print server material, patents and institutional repository and website information.'

Vivisimo (http://www.vivisimo.com) offers Clusty (http://clusty.com/about), which Vivisimo states 'queries several top search engines, combines the results, and generates an ordered list based on comparative ranking. This 'metasearch' approach helps raise the best results to the top and push search engine spam to

the bottom.' Clusty is noted by Vivisimo as grouping 'similar results together into clusters, which help you see your search results by topic so you can zero in on exactly what you're looking for or discover unexpected relationships between items.'

Toxseek (http://toxseek.nlm.nih.gov) is an example of a government-sponsored toxicology-focused metasearch and clustering engine. Available from the (U.S.) National Library of Medicine (NLM), it enables simultaneous searching of many different information resources on the web. The ToxSeek user interface allows selection of resources from a wide range of authoritative sources from all over the world. It uses natural language processing and artificial intelligence to retrieve, integrate, rank, and present search results as coherent and dynamic sets. It searches across diverse biomedical and environmental health resources and so provides a way to efficiently locate information resources on topics related to toxicology and environmental health.

Newer search engines exist that strive to answer questions and draw inferences from various layers of information and databases by using semantic web informatics capabilities to a search engine. More information about this is provided in the semantic web section of this chapter.

TOOLS FOR OBTAINING NEWS

Online newspapers and newsletters (the latter which is discussed in the Journals and Newsletters chapter of this book) are now widely used by toxicologists and others. A relatively new feature of the Internet is tools that aggregate articles or other information. The results are usually provided in condensed form, including a short description and link to a longer article (often as all or part of a web page). Really Simple Syndication (RSS) uses web-based programs to constantly scan the contents of websites for new content. This information is then delivered to subscribers' desktops or mobile devices through an RSS feed, often called a news feed.

For example, *Environmental Health News* (www.EnvironmentalHealthNews.org) is an aggregator that offers continuously updated lists and summaries of news articles from around the world. They offer a daily e-letter, *Above the Fold*, which allows customization of news feeds. All content on EnvironmentalHealthNews.org is available for syndication. This means that EnvironmentalHealthNews.org provides the means for webmasters to post news directly on their own websites. Once implemented, content is delivered to the recipient's website. New content usually appears daily, depending upon news coverage.

RSS feeds are available from numerous news sources and scientific journals. For example, the tables of contents from Toxicological Sciences (http://toxsci.oxfordjournals.org/rss/), Toxicology and Industrial Health (http://tih.sagepub.com/rss/), and American Chemical Society publications (http://pubs.acs.org/alerts/rss/index.html) are available as RSS feeds.

Topix has emerged as a key consolidator of news, and their toxicology site is http://www.topix.com/med/toxicology.

BLOGS

A blog (short for web log) is a means for an individual or group to post information of any kind, e.g., news or personal opinions. Blogs can be part of discussion forums and message boards, as these older technologies have evolved.

There are sites devoted to blogs covering a wide range of subjects, while some organizations include blogs as one of a range of information sources. For example, the National Institute for Occupational Safety and Health (NIOSH) has its own blog at http://www.cdc.gov/niosh/blog, with the goal 'to further communicate the scientific issues related to NIOSH's research and recommendations, and to stimulate discussion on those issues.' The American Chemical Society offers a blog described as an 'open forum.' Named the Chemical Research in Toxicology blog (http://acspublications.blogs.com/crtopenforum/), it allows for toxicology-focused communication among participants.

Examples of toxicology-focused blogs developed by individuals include 'Environmental Health and Safety (It's my day job).' Others, as of mid-2008, are the 'Angry Toxicologist' and 'ToxicoDiary,' which bills itself as an 'Environmental Toxicology Blog, and Courses: Exposure, Toxicity, Metabolism.' Readers will be able to easily locate these types of blogs via a search engine such as Google (http://blogsearch.google.com/) or Bloglines (http://www.bloglines.com/), a free online service for searching, subscribing, creating and sharing blogs, news feeds, and other web content. Many blogs, particularly personal ones, are of a transient nature.' Intentions are usually good, but users need to be wary. As with the web in general, there is untold good information, but it takes a critical eye to discern.

OPEN ACCESS PUBLISHING

Greater access to toxicology and other types of information is benefiting from policy changes encouraging or mandating open access to peer-reviewed articles

over the Internet. This change is having a dramatic affect, with global implications, on the availability of recent research in the toxicological sciences. For example, the journal *Environmental Health Perspectives* (EHP) (http://www.ehponline.org/) has made all previously published articles available, and current articles are immediately available from the EHP website. Further, the (U.S.) National Institutes of Health (NIH) has instituted a policy on Enhancing Public Access to Archived Publications Resulting from NIH-Funded Research (Public Access Policy). The Public Access Policy ensures that the public has access to the published results of NIH-funded research, no later than one year after publication in a journal. It requires scientists to submit final peer-reviewed journal manuscripts that arise from NIH funds to the digital archive PubMed Central (http://www.pubmedcentral.nih.gov/). The Policy requires that these final peer-reviewed manuscripts be accessible to the public on PubMed Central to help advance science and improve human health.

Some universities, e.g., Harvard University's Law School, are also moving toward open access to all publications by faculty and students. The Harvard Law School faculty voted unanimously in 2008 to commit to a mandatory open access policy to faculty publications (http://cyber.law.harvard.edu/).

Examples of other websites relevant to open access include:

Public Library of Science (PLoS)
Web: http://www.plos.org/journals/journals.php

PLos is a non-profit organization where scientists and researchers publish open access articles in a series of journals. The commitment of this organization is to make scientific and medical literature a freely available public resource.

Science Commons
Web: http://sciencecommons.org/

Science Commons is another authoritative open access data-sharing and networking platform. By making scientific research 're-useful,' it helps people and organizations open and mark their research and data sets for reuse. By integrating fragmented information resources on the web, Science Commons helps researchers find, analyze, and use data from disparate sources by marking and integrating the information with a common, computer-readable language.

Open Directory Project
Web: http://www.dmoz.org.

This project is a comprehensive human-edited directory of the web. It is constructed and maintained by a vast global community of volunteer editors. As of mid-2008, a simple search with the keyword 'toxicology' (http://search.dmoz.org/cgi-bin/search?search=toxicology) provides several toxicology-related websites.

Supercourse
Web: http://www.pitt.edu/~super1/

Supercourse is a global repository of lectures on public health and prevention. As of mid-2008, it has a network of over 55 000 scientists in 174 countries sharing for free a library of 3455 lectures in 26 languages. As noted in the Supercourse website, the concept of the Supercourse and its lecture style has been described as both the 'Global Health Network University' and the 'Hypertext Comic Books.'

PODCASTING

Podcasts are digital voice recording (or video as Vodcasts) that can be downloaded or streamed off the Internet for listening to (and possibly watching) a speaker at a more convenient time. University lectures are being taped and then posted to the web for students to review, and radio station interviews are also commonly podcast. The (U.S.) National Institutes of Health has begun to use both podcasts and vodcasts (http://nihrecord.od.nih.gov/newsletters/2007/08_10_2007/story4.htm). This material is also becoming increasing searchable, e.g., see the (U.S.) National Public Radio (http://www.npr.org) and Apple's iTunes (http://www.apple.com/itunes/). Books sellers are also starting to use podcasts for education and marketing, e.g., Informa Healthcare (http://www.toxicast.com/). Short podcasts on specific toxicology issues or chemicals are also being developed,e.g., see one on caffeine at http://www.toxipedia.org/display/toxipedia/Caffeine#Caffeine-TeachingResources. SciVee (http://www.scivee.tv/) 'invites scientists to make their research known by combining their published scientific article with a corresponding video into an online presentation called a "SciVee pubcast."' These new approaches take advantage of the incredible flexibility of the Internet to communicate and share knowledge.

WIKIS

Toxicology, as well as many branches of science, labors under the burden of increased specialization. Most researchers spend their time learning more and

more about a focused area of science, which creates the challenge of sharing this knowledge with the public, decision makers, and the media in meaningful ways. Wiki-based sites offer one possible solution to sharing scientific and toxicological information (http://www.toxipedia.org). Wiki sites allow the user to easily create, edit, format text, incorporate pictures, and link web pages. The precursor to modern wiki sites was developed in 1994 by Ward Cunningham and called WikiWikiWeb ('wiki' is the Hawaiian word for 'quick'). Wikis are used to create collaborative websites for use by the public and increasingly for internal corporate or institutional sites for knowledge management. The most toxicologically oriented wiki site is Toxipedia (www.toxipedia.org), started in 2007 by a non-profit institute to be the 'free toxicology encyclopedia and resource center that welcomes everyone to help contribute to a healthier world.' It serves as a source of information about the health effects of chemicals, risk assessment, ethics, history, and society, and also includes a teaching resources section. The ability of wiki technologies to encourage the sharing of information by specialists is just beginning to be explored. Other wikis of possible interest to toxicologists include:

Encyclopedia of Earth
Web: http://www.eoearth.org/

Encyclopedia of Earth is an electronic reference about the Earth, its natural environments, and their interaction with society.

DBpedia
Web: http://www.dbpedia.org

DBpedia's website calls DBpedia 'a community effort to extract structured information from Wikipedia and to make this information available on the Web.' DBpedia allows users to ask sophisticated queries about Wikipedia's contents, and to link other datasets on the web to Wikipedia data. The dataset is a large multi-domain ontology which has been derived from Wikipedia. As of mid-2008, the DBpedia dataset currently describes 2.18 million 'things' with 218 million 'pieces of information.' DBpedia's search capabilities could be applied to toxicology, risk assessment, environmental, and public health information.

Wikipedia
Web: http://en.wikipedia.org/

Wikipedia is a free encyclopedia with, as of mid-2008, almost 2.5 million articles in English, and has some level of Wikipedia information available in 123 other languages.

SOCIAL NETWORKING

Social networks are Internet-based software systems that allow people who share interests and activities to easily communicate. These sites provide various ways for users to interact, such as chat, messaging, email, video, voice chat, file sharing, blogging, and discussion groups. Social networking is already being used by millions of people around the world and is revolutionizing the way we share information and communicate. Two of the most popular general social networking sites are MySpace and Facebook. More organizations are establishing a presence on social networking sites. For example, Toxipedia has a Facebook page (http://www.facebook.com/group.php?gid = 2422634471) that is used to share information and communicate about changes in Toxipedia. While there is no specific toxicology-focused networking, this has been considered and will no doubt be in place by the next edition of this book. A more business-oriented social networking site is LinkedIn. A list of social networking sites can be found at http://en.wikipedia.org/wiki/List_of_social_networking_websites.

Social networking meets 3-D virtual reality in *Second Life* (http://secondlife.com/), where 'residents' create graphical representations of themselves known as 'avatars,' who conduct their lives according to self-contained rules and economies, in an online environment of individuals and communities. Virtual worlds such as this (*Second Life* is the first, largest, and best known, but not the only one) may have arisen from the gaming community, but are being widely utilized for professional enterprises. *Second Life* is populated by libraries, schools, government, health organizations, and businesses of all kinds.

SEMANTIC WEB

The Semantic web is an evolving extension of the web in which the semantics of information and services on the web is defined, making it possible for the web to understand and satisfy the requests of people and machines to use the web content (Berners-Lee, Tim; James Hendler and Ora Lassila, May 17, 2001. 'The Semantic Web.' Scientific American Magazine.; W3C Semantic Web Frequently Asked Questions. http://www.w3.org/2001/sw/SW-FAQ). It can be defined as a set of formats and languages that find and analyze data on the web, allowing consumers and businesses to understand all kinds of useful online information (Feigenbaum et al 2007, in a Scientific American article, 'The Semantic Web in Action').

The Semantic web is not going to replace the traditional web, but it complements the current web structure and web technology as machines and machine learning become much effective in processing and 'understanding' the data that they merely display at present. Scientific researchers are developing advanced semantic web applications, including a system that identifies genetic causes of heart disease, and another system that explores the early stages of a disease outbreak (e.g., influenza). Other examples of the application of the semantic web include:

Environmental Health, Public Health, Emergency Preparedness and Response

Web: http://www.w3.org/2001/sw/sweo/public/UseCases/UniTexas/

The healthcare industry deals with massive quantities of information. To effectively make a decision to protect human health and public health, effective data integration and knowledge dissemination and translation are required. The Semantic web holds promise in this direction. In 2004, the University of Texas Health Science Center at Houston used the Semantic web to develop better detect, analyze, and respond to emerging public health problems at the onset of Hurricane Katrina. The system, called *SAPPHIRE (Situational Awareness and Preparedness for Public Health Incidences using Reasoning Engines*), integrated a wide range of data from local healthcare agencies, hospitals, environmental protection agencies, and scientific literature. It allowed public health officials to assess the public health, environmental health, and environmental toxicological information through different layers, degrees of focus, and perspectives (http://www.w3.org/2001/sw/sweo/public/UseCases/UniTexas/).

DSSTOX

Web: http://www.epa.gov/ncct/dsstox/index.html

The Distributed Structure-Searchable Toxicity (DSSTox) Database Network is a project of U.S. EPA's National Center for Computational Toxicology, helping to build a public data foundation for improved structure–activity and predictive toxicology capabilities. The DSSTox website provides a public forum for publishing downloadable, structure-searchable, standardized chemical structure files associated with toxicity data.

Unified Medical Language System (UMLS), National Library of Medicine (NLM), National Institutes of Health (NIH)

Web: http://www.nlm.nih.gov/research/umls/

The purpose of NLM's Unified Medical Language System® (UMLS) is to facilitate the development of computer systems that behave as if they 'understand' the meaning of the language of biomedicine and health.

Pubmed-Hakia

Web: http://pubmed.hakia.com

Hakia, a semantic search engine, announced in June 2008 that it had expanded its health and medical search capabilities by adding more than ten million abstracts from Pubmed, the medical database maintained by the U.S. National Library of Medicine.

CHAPTER

68

Web-Based Databases

ASISH MOHAPATRA AND PHILIP WEXLER

INTRODUCTION

The transformation of information processing since the latter portion of the 20th century, catalyzed by the dramatic impact of the Internet, has significantly changed the practice and application of science and technology. It would have been difficult to imagine how far reaching those changes would be, when the first edition of *Information Resources in Toxicology* was published in 1982. The transformation of online databases, bibliographic, numeric, biosequence, and others, has played a pivotal role in identifying, creating, gathering, organizing, disseminating, and archiving data. Online databases have both driven and been a beneficiary of information technology breakthroughs.

Long gone are the days when a researcher in need of a literature search would make an appointment with a librarian subject specialist, trained in mastering the various nuances of bibliographic databases. Many of today's databases are, de rigeur, 'user-friendly,' at the same time often allowing, but not requiring, the use of complex search instructions or Boolean logic. The near total embrace of the online environment does away with the need, in many instances, to offer print counterparts to databases.

This chapter will highlight some of the more prominent databases in toxicology and related fields, both free and fee-based. 'Databases' is here used in its broadest, or loosest, context. Some of these resources would be readily recognized as typical digital databases. Others are more in the nature of reports, but are highlighted because of their significance and because they are structured online in a manner to allow efficient searching within the body of the document(s). Still others are more in the way of portals or gateways to sources of information, or programs. More database references are scattered throughout this book, most prominently in the chapter on Organizations and the specialized subject chapters.

DATABASES WITH A FOCUS ON TOXICOLOGY AND RELATED SUBJECTS

3E Company
Web: http://www.3ecompany.com/

3E Company's suite of fee-based data products and information services enable improved compliance with global Environmental Health & Safety (EH&S) requirements related to the safe manufacturing, distribution, transportation, usage and disposal of chemicals and hazardous products. Includes Ariel products and services and its massive aggregation of global regulatory content.

Agency for Toxic Substances and Disease Registry (ATSDR)
Web: http://www.atsdr.cdc.gov/

ATSDR provides health information to prevent harmful exposures and disease related to toxic substances. Its databases include:

- ATSDR Toxicological Profiles – For hazardous substances found at National Priorities List (NPL) sites. These hazardous substances are ranked based on frequency of occurrence at NPL sites, toxicity, and potential for human exposure. ATSDR also prepares toxicological profiles for the Department of Defense

(DOD) and the Department of Energy (DOE) on substances related to federal sites. Drawn from the Toxicological Profiles are: (1) Public Health Statements taken from the Profile's Chapter 1 and providing the information in a more succinct question and answer format and (2) ToxFAQs – even briefer and easier to understand guides taken from the same source material. Both Public Health Statements and ToxFAQs are available in English and Spanish.
- HazDat Database – Contains information about waste sites where ATSDR has been active, including a list of contaminants and links to site documents.
- National Exposure Registry (NER) – The NER is a long-term effort to collect information on the potential impact of hazardous substances on human health. It is a listing of persons exposed to hazardous substances, and contains subregistries for specific substances. Four subregistries were active as of mid-2008 – trichloroethylene (TCE), trichloroethane (TCA), benzene, and dioxin.

Other ATSDR databases include:

- Case Studies in Environmental Medicine
- Interaction Profiles
- Minimal Risk Levels
- Priority List of Hazardous Substances

Canadian Centre for Occupational Health and Safety (CCOHS)
Web: http://ccinfoweb.ccohs.ca/

CCOHS offers online access to data collections such as Material Safety Data Sheets (MSDSs), CHEMINFO, CHEMpendium™, RTECS® (Registry of Toxic Effects of Chemical Substances), OSH References, Canadian *enviro*OSH Legislation *plus* Standards.

Some of the databases (e.g., MSDS, CHEMINFO, CHEMPendium, RTECS, OHS references and Canadian enviroOSH Legislation and Standards) on CCOHS website are for subscribers only, while others are free.

Among the latter are OHS answers, INCHEM, ILO encyclopedia, Fatality reports, Chemindex, WHMIS classifications and Workplace Health Promotion Resources. INCHEM is produced in cooperation with the International Programme on Chemical Safety (see below under IPCS).

Centers for Disease Control and Prevention, U.S. (CDC) National Report on Human Exposure to Environmental Chemicals
Web: http://www.cdc.gov/exposurereport/report.htm

Provides an ongoing assessment of the U.S. population's exposure to environmental chemicals using biomonitoring, by measuring the chemicals or their metabolites in human specimens such as blood or urine.

Clinical Toxinology Resources
Web: http://www.toxinology.com

The Clinical Toxinology Resources website offers information on venomous animals and poisonous animals, plants, and mushrooms. It covers the whole world, with both general information and information about particular organisms, located through a searchable database that allows users to look for an animal, plant, or mushroom, based on a common name, a scientific name or family, a country or region.

Cornell University Poisonous Plants Informational Database
Web: http://www.ansci.cornell.edu/plants/

This is a reference that includes plant images, pictures of affected animals and presentations concerning the botany, chemistry, toxicology, diagnosis, and prevention of poisoning of animals by plants and other natural flora (fungi, etc.). The information presented here is not a complete database of all plants that are poisonous, but attempts to cover many of the plants that grow in the U.S. that may be poisonous to livestock.

Environmental Protection Agency, U.S. (EPA)
Web: http://www.epa.gov/epahome/Data.html

The U.S. EPA offers an embarrassment of riches, when it comes to databases relevant to toxicology, environmental health, and ecotoxicology, and the environment in general. To list a few:

- ECOTOX – A source for locating single chemical toxicity data for aquatic life, terrestrial plants, and wildlife. It integrates three previously independent databases – AQUIRE, PHYTOTOX, and TERRETOX – into a system which includes toxicity data derived predominately from the peer-reviewed literature, for aquatic life, terrestrial plants, and terrestrial wildlife, respectively.
- Global Endocrine Disorder Research Inventory – This compilation of ongoing research projects related to endocrine disruptions was assembled following the recommendation of the Intergovernmental Forum on Chemical Safety (IFCS) and the 1997 Declaration of the Environment Leaders of the Eight on Children's Environmental Health.
- HPV Voluntary Challenge Chemical List – The U.S. high-production-volume (HPV) chemicals are those which are manufactured in or imported into the United States in amounts equal to or greater than one million pounds per year. The U.S. HPV chemicals were identified through information collected

under the Toxic Substances Control Act (TSCA) Inventory Update Rule (IUR). Organic chemicals that are manufactured in, or imported into, the United States in amounts equal to or exceeding 10 000 pounds per year are subject to reporting under the TSCA IUR. Reporting is required every four years.
- Integrated Risk Information System (IRIS) – Accessible via the EPA site as well as the National Library of Medicine. See latter, below, for description.
- National Emissions Inventory – EPA's Emission Inventory and Analysis Group prepares a national database of air emissions information with input from numerous state and local air agencies, from tribes, and from industry. This database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs). The database includes estimates of annual emissions, by source, of air pollutants in each area of the country, on an annual basis.
- Pesticide Product Information System (PPIS) – Contains information concerning all pesticide products registered in the United States.
- Safe Drinking Water Information System (SDWIS) – The Safe Drinking Water Information System (SDWIS) contains information about public water systems and their violations of EPA's drinking water regulations. These statutes and accompanying regulations establish maximum contaminant levels, treatment techniques, and monitoring and reporting requirements to ensure that water provided to customers is safe for human consumption.
- STORET – The STORET Legacy Data System (LDC) contains historical water-quality data dating back to the early part of the 20th century and collected up to the end of 1998. The current STORET contains data collected beginning in 1999, along with older data that have been properly documented and migrated from the LDC. Both systems contain raw biological, chemical, and physical data on surface and ground water collected by federal, state, and local agencies, Indian Tribes, volunteer groups, academics, and others.
- Toxics Release Inventory – Accessible via the EPA site as well as the National Library of Medicine. See latter, below, for description.

European Commission

The European Chemical Substances Information System (ESIS) (http://ecb.jrc.europa.eu/esis/) searches the following databases:

- EINECS (European Inventory of Existing Commercial chemical Substances) O.J. C 146A, 15.6.1990
- ELINCS (European List of Notified Chemical Substances) in support of Directive 92/32/EEC, the 7th amendment to Directive 67/548/EEC
- NLP (No-Longer Polymers)
- BPD (Biocidal Products Directive) active substances listed in Annex I or IA of Directive 98/8/EC or listed in the so-called list of non-inclusions
- PBT (Persistent, Bioaccumulative, and Toxic) or vPvB (very Persistent and very Bioaccumulative)
- C&L (Classification and Labeling), substances or preparations in accordance with Directive 67/548/EEC (substances) and 1999/45/EC (preparations)
- Export and Import of Dangerous Chemicals listed in Annex I of Regulation (EEC) No 304/2003
- HPVCs (High Production Volume Chemicals) and LPVCs (Low Production Volume Chemicals), including EU Producers/Importers lists
- IUCLID Chemical Data Sheets, IUCLID Export Files, OECD-IUCLID Export Files, EUSES Export Files
- Priority Lists, Risk Assessment process and tracking system in relation to Council Regulation (EEC) 793/93 also known as Existing Substances Regulation (ESR).

The new European Chemicals Agency (ECHA) (http://echa.europa.eu) will likely be a source for additional databases in the future. One of their first online ventures is the REACH-IT portal, the main channel for companies to submit data to ECHA.

ExPub

Web: http://www.expub.com

A fee-based service focusing on global chemical information. Offers content from the U.S Environmental Protection Agency (EPA), the National Toxicology Program (NTP), the National Library of Medicine (NLM), the National Technical Information Service (NTIS), the Agency for Toxic Substances and Disease Registry (ATSDR), the National Cancer Institute (NCI), the European Chemicals Bureau (ECB), the U.S Department of Defense (DOD), the World Health Organization (WHO), and others.

EXTOXNET

Web: http://extoxnet.orst.edu/

The EXTension TOXicology NETwork (EXTOXNET) is an effort of University of California, Davis, Oregon State University, Michigan State University, Cornell University, and the University of Idaho. Information includes discussions of toxicological issues of concern (TICs); toxicology newsletters; other resources for toxicology information; toxicology fact sheets; Pesticide Information Profiles (PIPs); and Toxicology Information Briefs (TIBs).

ICON EHS Database
Web: http://cohesion.rice.edu/centersandinst/icon/research.cfm

A product of the International Council on Nanotechnology (ICON), the ICON Environmental, Health and Safety (EHS) database contains summaries (abstracts) and citations for research papers related to the EHS implications of nanoscale materials.

International Agency for Research on Cancer (IARC)
Web: http://www.iarc.fr/en/Index-of-IARC-sites/Databases

IARC offers a number of useful tools of relevance to cancer and carcinogenesis, not all, strictly speaking databases, but worth consulting. They include the IARC Monographs Database on Carcinogenic Risk to Humans, the IARC Cancer Epidemiology Database, the IARC TP53 Database, and CAREX (International Information on Occupational Exposure to Carcinogens).

International Program on Chemical Safety (IPCS)
Web: http://www.who.int/ipcs/en/

IPCS is a joint program of three agencies – World Health Organization (WHO), International Labour Organization (ILO), and United Nations Environment Program (UNEP). Below are two of its major web-based chemical safety tools.

INCHEM
Web: http://www.inchem.org/

Consolidates information from a number of intergovernmental organizations whose goal it is to assist in the sound management of chemicals. A Web site and search engine provided in cooperation with the Canadian Centre for Occupational Health and Safety (CCOHS) (see above) provides individual or combined access to:

- Concise International Chemical Assessment Documents (CICADs)
- Environmental Health Criteria (EHC) Monographs
- Harmonization Project Publications
- Health and Safety Guides (HSGs)
- International Agency for Research on Cancer (IARC) – Summaries and Evaluations
- International Chemical Safety Cards (ICSCs)
- IPCS/CEC Evaluation of Antidotes Series
- Joint Expert Committee on Food Additives (JECFA) – Monographs and Evaluations
- Joint Meeting on Pesticide Residues (JMPR)
- Pesticide Documents (PDs)
- Poisons Information Monographs (PIMs)
- Screening Information Data Set (SIDS) for High Production Volume Chemicals.

INTOX
Web: http://www.intox.org/

A tool for poison centers and related units concerned with preventing, recording, evaluation, diagnosing, treating, and reporting on chemical emergencies. It is a databank of consolidated, authoritative information on toxic agents and the management of toxic exposures; an information management tool for poison centers and others dealing with toxic exposures; the gateway to a global electronic network of poison centers and other users of the package; and, it provides a forum for collaboration between experts and those responding to emergencies concerning toxic exposures.

MSDS Online
Web: http://www.ilpi.com/msds/

MSDS' (Material Data Safety Sheets) contain a wealth of toxicity and related data, and are plentiful online. MSDS Online is a good source for consolidating this information and leading the MSDS database collections.

National Institute for Occupational Safety and Health Databases and Information Resources
Web: http://www.cdc.gov/niosh/database.html

Includes Immediately Dangerous to Life and Health, Health Hazard Evaluations, etc.

National Library of Medicine, U.S. (NLM), TEHIP
Web: http://sis.nlm.nih.gov/enviro.html

NLM, the largest medical library in the world, is a part of the U.S. National Institutes of Health. Its Toxicology and Environmental Health Information Program (TEHIP) is one of the world's major purveyors of toxicological information. Many of these are accessible through the TOXNET system (http://toxnet.nlm.nih.gov). Among NLM's offerings are:

- Dietary Supplements Labels Database – Offers information about ingredients in more than two thousand selected brands of dietary supplements. It enables users to determine what ingredients are in specific brands and to compare ingredients in different brands. Information is also provided on the health benefits claimed by manufacturers. The Database can be searched by brand names, uses noted on product labels, specific active ingredients, and manufacturers. Warnings and Recalls from the U.S. Food and Drug Administration (FDA), related to specific ingredients and supplement brands have also been provided.
- Carcinogenic Potency Database (CPDB) – Reports analyses of animal cancer tests on 1547 chemicals. CPDB includes 6540 chronic, long-term animal

tests, both positive and negative for carcinogenicity, from the general published literature as well as the National Cancer Institute and the National Toxicology Program. NLM offers a link to CPDB, which has been developed by the Carcinogenic Potency Project at the University of California, Berkeley and the Lawrence Berkeley National Laboratory.

- Chemical Carcinogenesis Research Information System (CCRIS) – From the National Cancer Institute with information on carcinogenicity, mutagenicity, tumor promotion, and tumor inhibition test results, for some 10 000 chemicals.
- Drug Information Portal – A gateway to selected drug information from the National Library of Medicine and other key government agencies. Includes links to individual resources with potential drug information, including summaries tailored to various audiences. Resources include the NLM search systems useful in searching for a drug, NLM research resources, resources organized by audience and class, and other NIH and government resources such as FDA and CDC.
- GENE-TOX – An EPA database, no longer updated, on genetic toxicology.
- Hazardous Substances Data Bank (HSDB) – With over 5000 chemical-specific records, and the recent inclusion of radionuclide information, this peer-reviewed databank extensively covers many aspects of toxicology and related fields, including human, animal (including ecotox) toxicity, chemical and physical properties, emergency medical treatment, chemical safety and handling, environmental fate, and considerably more.
- Haz-Map – An occupational health database designed for health and safety professionals and for consumers seeking information about the health effects of exposure to chemicals and biologicals at work. It links jobs and hazardous tasks with occupational diseases and their symptoms.
- Household Products Database – Links thousands of consumer brands to health effects from Material Safety Data Sheets (MSDS) provided by manufacturers and allows scientists and consumers to research products based on chemical ingredients. Users can determine which products contain specific ingredients, manufacturers of products and their contact information, acute and chronic health effects of such ingredients, and how to link to other NLM databases with information on the chemicals.
- Integrated Risk Information System (IRIS) (from the U.S. EPA) – IRIS data, focusing on hazard identification and dose–response assessment, is reviewed by work groups of EPA scientists and represents EPA consensus. Among the key data provided in IRIS are EPA carcinogen classifications, unit risks, slope factors, oral reference doses, and inhalation reference concentrations.
- International Toxicity Estimates for Risk (ITER) – Compiled by Toxicology Excellence for Risk Assessment (TERA), ITER, contains over 650 chemical records with key data from the Agency for Toxic Substances & Disease Registry (ATSDR), Health Canada, National Institute of Public Health & the Environment (RIVM) – The Netherlands, U.S. Environmental Protection Agency (EPA), the International Agency for Research on Cancer (IARC), NSF International, and independent parties whose risk values have undergone peer review. ITER provides a comparison of international risk assessment information in a side-by-side format and explains differences in risk values derived by different organizations.
- LactMed – A database of drugs and other chemicals to which breastfeeding mothers may be exposed. It includes information on the levels of such substances in breast milk and infant blood, and the possible adverse effects in the nursing infant.
- Radiation Event Medical Management (REMM) – REMM offers guidance to healthcare providers, primarily physicians, without formal radiation medicine expertise, about clinical diagnosis and treatment during mass casualty radiological/nuclear events. It also provides web-based information that is downloadable in advance, to be used during an event if the Internet is not available.
- Toxics Release Inventory – An EPA database, established under the Emergency Planning and Community Right to Know Act of 1986 (EPCRA). TRI's data, beginning with the 1987 reporting year, cover air, water, land, and underground injection releases, as well as transfers to waste sites and, since 1991, source reduction and recycling data.
- TOXLINE – Containing over 3 million bibliographic citations, TOXLINE encompasses the biochemical, pharmacological, physiological, and toxicological effects of drugs and other chemicals. TOXLINE is created by merging a variety of subfiles – records from NLM's own MEDLINE, International Labour Office, Toxic Substances Control Act Test Submissions, Toxicology Research Projects from NIH's CRISP database, the Swedish National Chemicals Inspectorate's RISKLINE database, Pesticides Abstracts, International Pharmaceutical Abstracts, etc. Some of these subfiles are ongoing and others are archival, in the sense that they have ceased publication or NLM has ceased, after a certain date, carrying their data in TOXLINE.
- TOXMAP – A Geographic Information System (GIS) that uses U.S. maps to help users visually explore

data from the U.S. Environmental Protection Agency (EPA)'s Toxics Release Inventory (TRI) and Superfund Program.
- ToxMystery – For the elementary school age and younger set, an animated program teaching about chemical hazards. Spanish version available.
- ToxTown – A program using color, graphics, sounds, and animation to add interest to learning about connections between chemicals, the environment, and the public's health. ToxTown's target audience is students above elementary-school level, educators, and the general public. Spanish version available.
- ToxLearn – A modular tutorial teaching the basics of toxicology. Prepared in partnership with the U.S. Society of Toxicology, it replaces ToxLearn. Modules, beginning with fundamentals, and progressing to more specialized topics, will be released gradually.
- Wireless Information System for Emergency Responders (WISER) – A system designed to assist first responders in hazardous material incidents. WISER provides a wide range of information on hazardous substances, including substance identification support, physical characteristics, human health information, and containment and suppression advice.
- World Library of Toxicology, Chemical Safety, and Environmental Health (WLT) – A global, multilingual portal to sources of information, compiled by Country Correspondents from around the world. Will enable users to identify government and non-government organizations, universities, professional societies, poison control centers, etc. on a country-by-country basis, as well as link to globally oriented information on legislation, news, etc. "The WLT, sponsored and supported by NLM, is hosted by Toxipedia, in partnership with the International Union of Toxicology. It is accessible at http://www.wlfox.org."

More resources under development:

- TOX-REF, (Toxicity Reference File) contains data on the NORMAL/THERAPEUTIC, TOXIC, and LETHAL levels of chemicals, heavy metals and drugs. The values are from journals and other credible sources containing reference values.
- Databases on liver toxicity, and pill identification, are also in the works.

National Toxicology Program
Web: http://ntp.niehs.nih.gov/

NTP Study Reports – Covering studies in carcinogenesis and long-term toxicology, short-term toxicity, genetically modified models, immunology, developmental effects, drinking water, reproductive assessment by continuous breeding, and AIDS Therapeutics Toxicity Reports.

Report on Carcinogens (RoC) – The RoC is an informational scientific and public health document first ordered by Congress in 1978 that identifies and discusses agents, substances, mixtures, or exposure circumstances that may pose a hazard to human health by virtue of their carcinogenicity.

Organization for Economic Co-Operation and Development (OECD)

e-Chem Portal
Web: http://webnet3.oecd.org/echemportal/

A project still under development, but accessible in stages online, e-Chem Portal provides free public access to information on chemical properties and direct links to collections of information prepared for government chemical review programs at national, regional, and international levels. Access is currently provided to portions of the Japanese Chemical Risk Information Platform (CHRIP), the European Chemical Substances Information System (ESIS), EPA's High Production Volume Information System (HPVIS), the International Program on Chemical Safety's (IPCS) INCHEM system, the Australian National Industrial Chemicals Notification and Assessment Scheme (NICNAS) Priority Existing Chemical Assessment Reports, the Organisation for Economic Cooperation and Development (OECD) High Production Volume (HPV) Database, the Screening Information Data Sets (SIDS) export files in for High Production Volume (HPV) Chemicals in International Uniform Chemical Identification Database (IUCLID) format as maintained by the OECD, and the OECD Initial Assessment Reports for HPV Chemicals including Screening Information Data Sets (SIDS) as maintained by United Nations Environment Programme (UNEP) Chemicals.

PAN Database
Web: http://pesticideinfo.org/

The PAN database brings together a diverse array of information on pesticides from many different sources, providing human toxicity (chronic and acute), ecotoxicity and regulatory information for pesticide active ingredients and their transformation products, as well as adjuvants and solvents used in pesticide products. Produced by the Pesticide Action Network of North America, one of five PAN Regional Centers worldwide, which works to replace pesticide use with ecologically sound and socially just alternatives.

ProQuest/CSA Illumina
Environmental Sciences and Pollution Management Collection
Web: http://www.csa.com/factsheets/envclust-set-c.php

A multidisciplinary database, provides wide coverage of the environmental sciences. Abstracts and citations are drawn from over 6000 serials including scientific journals, conference proceedings, reports, monographs, books, and government publications. Specific databases include ASFA 3: Aquatic Pollution and Environmental Quality, Bacteriology Abstracts, Ecology Abstracts, Environmental Engineering Abstracts, Health and Safety Science Abstracts, Human Population and Natural Resource Management, Industrial and Applied Microbiology Abstracts, Pollution Abstracts, Risk Abstract, Sustainability Science Abstracts, Toxicology Abstracts, and Water Resources Abstracts.

Pubmed-Hakia
Web: http://pubmed.hakia.com

Hakia, a semantic search engine, announced in June 2008 that it had expanded its health and medical search capabilities by adding more than 10 million abstracts from Pubmed, the medical database maintained by the US National Library of Medicine and the National Institute of Health. By using semantic web informatics capabilities, Hakia has provided an efficient search engine where literature can be effectively connected and inferences can be drawn.

Reprotox
Web: http://www.reprotox.org

An information system developed by the Reproductive Toxicology Center for its members. REPROTOX contains summaries on the effects of medications, chemicals, infections, and physical agents on pregnancy, reproduction, and development. The REPROTOX® system was developed as an adjunct information source for clinicians, scientists, and government agencies.

Risk Assessment Information System (RAIS)
Web: http://rais.ornl.gov/

The RAIS provides a world wide web-based integrated system of toxicology and risk-related information as well as online tools for performing real-time calculations for chemical and radiological environmental risk assessments under EPA CERCLA and RCRA guidance. Toxicity data in the RAIS include current non-radionuclide and radionuclide toxicity values that are fully searchable in a parsed database structure, in addition to toxicological profiles developed specifically for RAIS.

Scorecard
Web: http://www.scorecard.org

Provides extensive information on pollution problems and chemical releases. Developed by the Environmental Defense Fund, Scorecard, is now managed by the Green Media Toolshed.

Skin Deep: Cosmetic Safety Database
Web: http://www.cosmeticdatabase.com/

Skin Deep pairs ingredients in thousands of products against toxicity and regulatory databases. Produced by The Environmental Working Group (EWG) (http://www.ewg.org/), a non-profit organization that advocates for environmentally related health protective policies.

Syracuse Research Corporation's (SRC) Environmental Fate Databases (EFDB)
Web: http://www.srcinc.com/what-we-do/product.aspx?id=132

SRC offers a suite of files with information on the environmental fate of chemicals:

- DATALOG is a bibliographic file containing 18 types of environmental fate data.
- BIOLOG, or the Microbial Degradation/Toxicity File, provides sources of microbial toxicity and biodegradation data.
- CHEMFATE is a data value file containing 25 categories of environmental fate and physical/chemical property information on commercially important chemical compounds.
- BIODEG contains experimental values relating to biodegradation subjects.
- BIODEG SUMMARY provides summary evaluation and reliability codes for different test methods, as well as summaries for biodegradability under aerobic and anaerobic conditions.

Thomson/Micromedex Poisindex System
Web:http://www.micromedex.com/products/poisindex/

Poisindex, a mainstay of the poison control/information community, is a fee-based service which identifies ingredients for hundreds of thousands of commercial, pharmaceutical, and biological substances. Each substance is linked to one or more management document(s) providing information on clinical effects, range of toxicity, and treatment protocols for exposures involving the substances. POISINDEX information includes Product/Substance Identification for

- common household products (cleaners, personal care, insect protection)
- industrial chemicals (manufacturing agents)
- industrial products (cleaners, protective agents)
- pharmaceutical products (prescriptions, generic, trade, OTC, veterinary)
- biological entities (botanic, zoologic, food poisoning)

- and more than 1000 detailed toxicologic management protocols.

Toxicant and Disease Database
Web: http://database.healthandenvironment.org/

From the Collaborative on Health and the Environment (CHE), the Toxicant and Disease Database is a searchable database that summarizes links between chemical contaminants and approximately 180 human diseases or conditions.

Wildlife and Contaminants Online
Patuxeat Wildlife Research Center
Web:http://www.pwrc.usgs.gov/contaminants-online/

Consisting of Biological and Ecotoxicological Characteristics of Estuarine and Coastal Terrestrial Vertebrates, Contaminants Exposure and Effects – Terrestrial Vertebrates Database, and Utility and Vulnerability Ranking Program for Terrestrial Vertebrates.

Toxicology Excellence for Risk Assessment
Web: http://www.tera.org

TERA offers, via its website, as well as on the NLM TOXNET system, International Toxicity Estimates for Risk, a free database of human health risk values and cancer classifications for over 600 chemicals of environmental concern from multiple organizations worldwide. ITER presents risk data in a tabular format for easy comparison, along with a synopsis explaining differences in data and a link to each organization for more information. Also available on the TERA site, and slated for implementation on NLM's TOXNET system, is the prototype of RiskIE, The Risk Information Exchange (RiskIE), which contains notifications about a variety of human health risk assessment projects that are in progress or recently completed. This web-based system enables users to publicly share and track the progress of projects and can be used to identify opportunities for collaboration in the health protection efforts among organizations.

STATE INFORMATION

A number of states offer valuable toxicity fact sheets and other chemical information on their websites. These may serve as databases, in effect. Consider particularly New Jersey's Right to Know Hazardous Substance Fact Sheets (http://web.doh.state.nj.us/rtkhsfs/indexfs.aspx) and California's Hazard Evaluation System and Information Service (HESIS) Publications (http://www.cdph.ca.gov/programs/hesis/Pages/Publications.aspx#factsheetschem).

The Environmental Information Exchange Network (http://www.exchangenetwork.net/) is a partnership among states, tribes, and the U.S. Environmental Protection Agency that is creating a new way to exchange environmental information. Partners on the Exchange Network share data efficiently and securely over the Internet. This new approach is providing real-time access to higher-quality data while saving time, resources, and money for partner states, tribes, and territories.

FOCUS ON TOXICOGENOMICS

The completion of the decoding of the human genome has provided scientists and researchers great challenges and potential opportunities in identifying the genetic basis of diseases, cures for cancer, and progress in personalized genetic medicine in the 21st century. Research in bioinformatics, genomics, proteomics, systems biology and a host of other '-omics' and related informatics disciplines, including toxicogenomics and toxicoinformatics, is a natural progression from traditional disciplines of molecular biology, structural biology, genetics, computational toxicology, and information technology. Following is a select list of websites and databases in these areas. See the genomics chapter for additional information and tools.

Web Portals and Information Resources

Center for Toxicoinformatics, U.S. Food and Drug Administration (FDA)

A gateway for toxicogenomic research in the U.S. FDA's National Center for Toxicological Research (http://www.fda.gov/nctr/science/centers/toxicoinformatics/).

Array Track
Web:http://www.fda.gov/nctr/science/centers/toxicoinformatics/ArrayTrack/index.htm

This is a free bioinformatics resource for DNA microarray and systems biology, which allows for the management, analysis, and interpretation of -omics data within a single package. It is used by FDA for the review of genomic data submissions.

Department of Energy and the National Institutes of Health, U.S.
Web: http://www.genome.gov/10001772

About the Human Genome Project.

Oak Ridge National Laboratory
Web: http://www.ornl.gov/sci/techresources/Human_Genome/home.shtml

About the Human Genome Project.

National Academy of Sciences
Web: http://www.nas.edu

The U.S. National Research Council's Committee on Emerging Issues and Data on Environmental Contaminants (established in 2001) has focused on toxicogenomics as a major scientific and technical issue (see http://dels.nas.edu/emergingissues/). It has conducted a number of workshops and research studies and published several reports available from the U.S. National Academies Press (see inclusion of toxicogenomics in this book's Chapter on Technical Reports and Government Documents).

Some examples are:

- Applications of Toxicogenomic Technologies to Predictive Toxicology and Risk Assessment (2007)
- Validation of Toxicogenomic Technologies: A Workshop Summary (2007).

A recommendation of the first report notes that, 'Current public databases are inadequate both to manage the types and volumes of data expected to be generated by large-scale applications of toxicogenomic technologies and to facilitate mining and interpretation of the data,' and calls for the creation of extensive effort to develop and maintain a 'national, publicly available toxicogenomics database.'

National Cancer Institute–The Cancer Genome Anatomy Project (CGAP)
Web: http://cgap.nci.nih.gov/

The goal of the NCI's Cancer Genome Anatomy Project is to determine the gene expression profiles of normal, precancer, and cancer cells, leading eventually to improved detection, diagnosis and treatment for the patient. By collaborating with scientists worldwide, CGAP seeks to increase its scientific expertise and expand its databases for the benefit of all cancer researchers. (Excerpted from the CGAP website.)

National Center for Toxicogenomics, National Institute of Environmental Health Sciences
Web: http://www.niehs.nih.gov/research/atniehs/nct.cfm

Environmental Genome Project

Humans differ in their susceptibility to environmental contaminants exposure and these susceptibilities may change over time. To deal with these issues from a genomics perspective, the NIEHS developed the Environmental Genome Project (EGP) in 1997. The long-term goal of the EGP is to characterize how specific human genetic variations, or polymorphisms, contribute to environmentally induced disease susceptibility.

Toxicogenomics Research Consortium

NIESH supports the research efforts undertaken by the Toxicogenomics Research Consortium (http://www.niehs.nih.gov/research/supported/centers/trc/). The NIESH Microarray Group and five academic centers (Duke University, Massachusetts Institute of Technology, Oregon Health and Science University, University of North Carolina at Chapel Hill, and the University of Washington) comprise this consortium.

National Genome Research Institute, NIH

Genome.Gov-ENCODE Project
Web: http://www.genome.gov/10005107

The National Human Genome Research Institute (NHGRI) launched a public research consortium named ENCODE, the **Enc**yclopedia **O**f **D**NA **E**lements, in September 2003, to carry out a project to identify all functional elements in the human genome sequence.

International HAPMAP PROJECT
Web: http://www.genome.gov/10001688

The haplotype map, or 'HapMap,' will be a tool that will allow researchers to find genes and genetic variations that affect health and disease. The HapMap should be a powerful resource for studying the genetic factors contributing to variation in response to environmental factors, in susceptibility to infection, and in the effectiveness of and adverse responses to drugs and vaccines.

National Library of Medicine's (U.S.) Special Information Services (SIS)

Enviro-Health Links – Toxicogenomics
Web: http://sis.nlm.nih.gov/enviro/toxicogenomics.html

An extensive collection of toxicogenomic information including sources of overview information and bibliographic searches from NLM's PubMed and TOXLINE databases.

The Genomics and Bioinformatics Group

Laboratory of Molecular Pharmacology
Center for Cancer Research
NIH, DHHS

Web: http://discover.nci.nih.gov/index.jsp

The Genomics and Bioinformatics Group (GBG) website offers useful bioinformatic program packages, microarray data analysis information, and molecular databases for genomic and proteomic research. (Excerpted from the website.)

Toxicogenomic Databases

In addition to the standard or more traditional types of genetic toxicology databases, a new generation of gene expression database has evolved in response to the rapid development of microarray technologies and the subsequent generation of gene expression data. For a brief overview of such gene expression databases see: Walker JR, Wiltshire T (2006) Databases of free expression Mamm. Genome 17(12): 1141–1146.

The NLM-National Center for Biotechnology Information (NCBI) maintains the Gene Expression Omnibus (GEO), a gene expression repository supporting MIAME (minimum information about microarray experiments, a metadata accounting protocol) compliant data submissions, and a curated, online resource for gene expression data browsing, query and retrieval (http://www.ncbi.nlm.nih.gov/geo/).

Below is a short list of genomic or specific toxicogenomic databases relevant to toxicology and human health risk assessment.

Chemical Effects in Biological Systems (CEBS) (from NIEHS)

This is an integrated public repository for toxicogenomics data. The CEBS Knowledgebase can be accessed at http://cebs.niehs.nih.gov/cebs-browser/cebsHome.do For a description of the efforts in building the database configuration of CEBS see Nucleic Acids Res. 2008 Jan; 36(Database issue): D892–900. Epub 2007 Oct 25.

Comparative Toxicogenomics Database (CTD)
Web: http://ctd.mdibl.org/

A publicly available database from Mount Desert Island Biological Laboratory developed in collaboration with NIH-NLM. The CTD website provides details of a dedicated database devoted to genes and proteins of toxicological significance.

DbZach
Web: http://dbzach.fst.msu.edu/

A toxicogenomic information management system, built on a relational database storing various data generated or otherwise relevant to the Zacharewski lab at Michigan State University.

Endocrine Disrupter Knowledgebase Database (EDKD) (from the FDA)
Web: http://edkb.fda.gov/

This consists of a biological activity database, relevant literature citations, computational models, and ultimately, models for risk assessment. It is designed to help research and regulatory scientists, and other interested parties set priorities for testing of endocrine-disrupting compounds, make use of the existing body of knowledge, and reduce dependency upon slow and expensive animal experiments.

Gene Ontology (GO) Database
Web: http://www.geneontology.org/index.shtml

A relational database housing both the Gene Ontology and the annotations of genes and gene products to terms in the GO. The advantage of housing both ontologies and annotations in a single database is that powerful queries can be performed over annotations using the ontology.

Genomes online database (GOLD) version 2.0
Web: http://www.genomesonline.org
A web resource for comprehensive access to information regarding complete and ongoing genome projects, as well as metagenomes and metadata, around the world.

GeneSNPs Database {from NIEHS}
Web: http://www.niehs.nih.gov/research/supported/programs/egp/genesnps/index.cfm

Developed as a web-based, publicly available graphical display of the newly identified SNPs discovered through resequencing environmentally responsive genes (ERGs) by the University of Washington. High-quality, well-validated SNP data relevant to the NIEHS-listed ERGs are imported from other publicly available web resources. The imported data are then converted to a graphical display developed by the University of Utah and made available to the public through the web-accessible GeneSNPs database (http://www.genome.utah.edu/genesnps/).

HuGE Navigator
Web: http://www.hugenavigator.net/

A continuously updated knowledge base in human genome epidemiology, including information on population prevalence of genetic variants, gene–disease associations, gene–gene and gene–environment interactions, and evaluation of genetic tests.

Online Mendelian Inheritance in Man (OMIM)
Web: http://www.ncbi.nlm.nih.gov/omim

'OMIM is a comprehensive, authoritative, and timely compendium of human genes and genetic phenotypes.

The full-text referenced overviews in OMIM contain information on all known Mendelian disorders and over 12,000 genes. OMIM focuses on the relationship between phenotype and genotype. It is updated daily, and the entries contain copious links to other genetic resources.' (Excepted from the NCBI website.)

The Pharmacogenetics and Pharmacogenomics Knowledge-Base (PharmGKB)
Web: http://www.pharmgkb.org/

'… links genomic, phenotypic, and clinical information collected from ongoing pharmacogenetic studies, high-density tissue microarray data associated with pathology and clinical outcomes, and separate published efforts to combine the results generated from gene expression analysis with data collected from toxicology or molecular pharmacology experiments.'

Pharmacogenetic Effect Database (PharmGED)
Web: http://bidd.cz3.nus.edu.sg/phg/

Described by Zheng CJ, et al (2007) PharmGED: Pharmacogenetic Effect Database. Nucleic Acids Res. 35 (Database issue): D794–799. Epub 2006 Dec 6.

ToxCast
Web: http://www.epa.gov/ncct/toxcast

The U.S. EPA launched the agency's *ToxCast* program in the early autumn of 2007; the first summit has been planned for May 2009. ToxCast is the EPA's efforts in building a database to predict chemical toxicities based on a variety of factors, including genomic data. The initial release of ToxCast included 340 chemicals that have undergone extensive toxicology tests. These candidate chemicals will undergo additional bioassay testing with the hopes of generating an analytical tool to predict (Dix et al 2007).

SCIENTIFIC DATABASES CONTAINING TOXICOLOGY INFORMATION

AGRICOLA
Web: http://agricola.nal.usda.gov/

Produced by the National Agricultural Library, AGRICOLA contains bibliographic records of materials acquired by the National Agricultural Library and cooperating institutions in agricultural and related sciences. Records come from the NAL Online Public Access Catalog and NAL's Article Citation Database.

Elsevier
Web: http://www.elsevier.com

A major publisher, and purveyor of scientific databases, such as:

- EMBASE (http://www.embase.com/) – A broad-based scientific gateway to biomedical and pharmacological literature, with over 18 million records, from about 1800 priority journals, including both EMBASE and MEDLINE records. Portal to SCIRUS search engine. Links from molecular sequence numbers to NCBI information.
- Science Direct (from Elsevier) (http://www.sciencedirect.com/) – Covers a substantial portion of the world's full-text scientific, technical and medical (STM) literature.
- Scirus (http://www.scirus.com) – An extensive web-based scientific research tool. Allows researchers to search for not only journal content but also scientist's homepages, courseware, pre-print server material, patents and institutional repository and website information.
- Scopus (http://www.scopus.com) – A major abstract and citation database of scientific research literature and quality web sources. Developed in close collaboration with librarians and researchers from over 30 institutions around the world and continued with guidance from the Scopus Content Selection and Advisory Board, a global body representing every major scientific discipline. Scirus Topic Pages form a topic-centered communication and collaboration platform for scientists.

National Library of Medicine
Web: http:www.nlm.nih.gov

In addition to the more specialized toxicology database under NLM's listing above, NLM is the purveyor of vast amounts of other specialized and more general biomedical information, much of it of high relevance to the toxicologist. A few of these other products are:

- ClinicalTrials.gov – A registry of federally and privately supported clinical trials conducted around the world. Provides information on the trial's purpose, who may participate, locations, and phone numbers for more details.
- DailyMed – DailyMed provides high-quality information about marketed drugs. This information includes FDA-approved labels (package inserts). This website provides health information providers and the public with a standard, comprehensive, up-to-date, look-up and download resource of medication content and labeling as found in medication package inserts.
- Human Genome Resources (http://www.ncbi.nlm.nih.gov/genome/guide/human/resources.shtml) – An integrated, one-stop, genomic information

resource for data that promise to provide new insights into human biology and new approaches for combating disease. Databases fall into the following subject areas: Genes and Human Health (including RefSeq, a database of reference sequences of chromosomes, genomic contigs, mRNAs, and proteins for human and major model organisms), reagent, the genomic sequence, maps and markers, transcribed sequences, cytogenetics, and comparative genomics.

- MedlinePlus – Brings together authoritative information from NLM, the National Institutes of Health (NIH), and other government agencies and health-related organizations. Preformulated MEDLINE searches are included in MedlinePlus and give easy access to medical journal articles. MedlinePlus also has extensive information about drugs, an illustrated medical encyclopedia, interactive patient tutorials, and latest health news.
- PubChem – Provides information on the biological activities of small molecules. It is a component of NIH's Molecular Libraries Roadmap Initiative.
- PubMed – MEDLINE is an NLM bibliographic database of citations and abstracts (over 5000 biomedical journals covered), published globally. With over 17 million citations from MEDLINE and other life science journals for biomedical articles dating back to the 1950s, PubMed includes links to full-text articles and other related resources, such as in-process (pre-indexing) citations, citations preceding the date that the journal was selected for MEDLINE indexing, out-of-scope citations from MEDLINE journals, etc.
- RxNorm – Provides standard names for clinical drugs (active ingredient + strength + dose form) and for dose forms as administered to a patient. It provides links from clinical drugs, both branded and generic, to their active ingredients, drug components (active ingredient + strength), and related brand names. NDCs (National Drug Codes) for specific drug products (where there are often many NDC codes for a single product) are linked to that product in RxNorm. RxNorm links its names to many of the drug vocabularies commonly used in pharmacy management and drug interaction software, including those of First Databank, Micromedex, MediSpan, Gold Standard Alchemy, and Multum. By providing links between these vocabularies, RxNorm can mediate messages between systems not using the same software and vocabulary.

SciFinder

(from Chemical Abstracts Service) (http://www.cas.org/products/scifindr/) – A research discovery tool that allows exploration of CAS databases that contain literature from many scientific disciplines, including biomedical sciences, chemistry, engineering, materials science, and agricultural science.

Thomson/Reuters

- BIOSIS Previews and Biological Abstracts (http://www.biosis.org/) – Interdisciplinary life sciences information.
- ISI Web of Knowledge (http://www.isiwebofknowledge.com/) – A multidisciplinary platform including information from high-quality and relevant journals, patents, proceedings and evaluated web content in the sciences, social sciences, arts, and humanities.
- http://www.thomsonreuters.com/product_services/scientific/Web_of_Science

Unigene Database

Web: http://www.ncbi.nlm.nih.gov/unigene

Unigene is an organized view of the transcriptome. Each Unigene entry is a set of transcript sequences that appear to come from the same transcription locus (gene or expressed pseudogene), together with information on protein similarities, gene expression, cDNA clone reagents, and genomic location. (Excerpted from the Unigene website.)

CHAPTER

69

Software Tools for Toxicology and Risk Assessment

CHARLES PITTINGER AND ASISH MOHAPATRA

INTRODUCTION

This chapter covers software tools of interest to toxicologists. The first section focuses on Quantitative Structure Activity Relationships (QSAR)-related software tools. In addition, the QSAR-related approaches used by various regulatory agencies are highlighted. The second section of this chapter covers non-QSAR software tools and resources useful for work in toxicology and risk assessment.

QSAR TOOLS

Structure–activity relationships (SARs) and quantitative structure–activity relationships (QSARs) are theoretical models that can be used to predict the physicochemical, biological, and environmental properties of substances. A SAR is an (qualitative) association between a chemical substructure and the potential of a chemical containing the substructure to exhibit a certain biological property or effect. A QSAR is a mathematical model that quantitatively relates a quantitative numerical measure of chemical structure (e.g., a physico-chemical property) to a physical property or to a biological effect (e.g., a toxicological endpoint).

QSARs are tools commonly used in the absence of available data for prioritization, classification, and screening level risk assessment. A broad range of QSAR models can readily fill data gaps for assessing chemicals, particularly for fundamental physical–chemical properties, in an expedient and cost-effective manner. QSAR-based evaluations can provide a systematic and consistent approach to chemical evaluations involving large numbers of chemicals. Certain (Q)SARs and other types of theoretical models have gained broad acceptance by regulatory institutions and the private sector. Predictive models can reduce costs, time, and concerns related to conducting toxicity bioassays. Input data requirements are generally modest and increasingly available through public and computerized databases.

THE BROAD UNIVERSE OF QSARS

An SAR model qualitatively compares structurally similar chemicals for which a measured toxicological or environmental property or endpoint ('the activity') is available to estimate the same property/endpoint for an analogous, untested chemical. In QSAR models, the endpoint is quantitatively related to a series of structurally similar chemicals (which are often related). The relationship may be continuous or categorical, and is typically developed by regression methods, classification methods (e.g., discriminant analyses and decision trees), or neural networks.

The broadest array of QSAR models is available for endpoints related to physical and chemical properties of chemicals, such as solubility, hydrophobicity, adsorptivity, and volatilization. Fewer are available for biological processes such as biodegradability and toxicity to non-mammalian organisms. Still fewer are QSARs for predicting mammalian and/or human health effects. This is due to several factors. Prediction of physical–chemical parameters often relies upon relatively well-characterized physical and chemical principles and processes. These may require less complex mechanistic understanding than biological processes

involving enzyme kinetics and physiological interactions among multiple organs and organ systems (e.g., adsorption, distribution, metabolism and elimination (ADME) pathways). In addition, physical–chemical endpoints typically have a longer history of study, such that more homogeneous data sets are available for a broader range of chemicals.

QSAR APPLICATIONS FOR CHEMICAL SCREENING, PRIORITIZATION, AND REGULATORY AND CORPORATE DECISION-MAKING

QSAR predictions are used by regulatory authorities, private corporations, and institutions in three major contexts: priority-setting, hazard classification and labeling, and screening for health and ecological risks of chemicals. Regulatory uses of QSARS include: (1) supporting priority setting of chemicals; (2) guiding experimental design of regulatory tests or testing strategies; (3) providing mechanistic information; (4) grouping of chemicals into categories based on similarity; (5) filling a data gap needed for classification and labeling; and (6) filling a data gap needed for risk assessment. Each application carries unique considerations for QSAR, with the most stringent considerations placed upon QSARs used for 'high regulatory impact,' for example, risk assessments under mandated regulatory programs.

QSAR RELIABILITY AND VALIDITY

The reliability of the results of QSAR estimates varies both with application and endpoint. Environmental fate endpoints based on predictions of physical/chemical parameters are the most common and best validated uses of QSAR, and results are relatively well accepted. Systemic toxicity endpoints are more complex, as toxicity is the net expression of multiple biological processes including ADME. Reliability of QSAR predictions for human health endpoints is generally regarded as less than those for non-mammalian (e.g., fish and invertebrates) toxicity endpoints, partly due to the limited availability of high quality data availability. (Non-mammalian species such as fish and aquatic invertebrates (e.g., *Daphnia, Ceriodaphnia*) and algae are typically less expensive to test, and the bioassays carry fewer legal and ethical concerns.)

In order to be considered for regulatory use, it is widely agreed that QSARs need to be assessed for scientific validity. Importantly, QSARs are generally not used as the sole information source upon which to base regulatory decisions. Empirical data, if available, are considered first and have greater reliability than QSAR predictions, unless there are explicit reasons to consider the data erroneous. QSAR predictions are considered in the context of the weight of evidence from multiple sources (e.g., empirical bioassay data, monitoring, epidemiology, etc.). The collective evidence is often weighed on a case-by-case basis by trained experts, applying the best professional judgment.

Risk assessments with 'high regulatory impact' (e.g., enforceable standards such as new chemical registrations or litigation over contaminated sites) must be legally defensible, transparent, and unbiased. Many commercial QSAR packages (e.g., TOPKAT, DEREK, MCASE) maintain proprietary and confidential training sets, algorithms, and software. As such, they can be challenged as legally indefensible in a court of law, due to lack of transparency.

QSAR packages developed by public organizations, such as the US Environmental Protection Agency's (EPA's) EFAST and EPISUITE models, are typically more transparent. In many cases, they apply the same or similar peer-reviewed databases and algorithms used in commercial QSAR packages. There is currently a need for well-validated, public domain QSAR models for broad regulatory applications and decision support systems.

QSAR APPLICATIONS

Predicting Physical–Chemical Properties of Chemicals

Physical–chemical QSAR models are available to predict a range of chemical properties including: melting point, boiling point, water solubility, biodegradability, vapor pressure, Henry's law constant, sediment adsorptivity, octanol–water partition coefficient, and half-life in the environment. These and other parameters can be readily predicted by EPISUITE (see Relevant Websites section), and enables batch data entry based on Chemical Abstract Service (CAS) numbers or SMILES notations.

Predicting Environmental Fate and Transport

The physical–chemical parameters listed above are often used to estimate fate and transport of chemicals in the environment, a critical aspect of exposure analysis in chemical risk assessments. QSAR model predictions of physical and chemical properties of chemicals, together with empirical data, can be used

as inputs to more sophisticated environmental fate models to predict chemical concentrations in source waters and drinking waters. Models such as EFAST (e.g., the Exposure and Fate Assessment Screening Tool, at the EPA website) are capable of incorporating multiple parameters in predicting fate and transport processes including wastewater treatment from point-source emissions, fate in the environment, concentration at drinking water intakes, atmospheric deposition, land runoff, soil leaching, groundwater migration, etc.

QSAR models for biodegradation are more limited in scope and accuracy than packages that predict physical–chemical parameters. The 'PBT Profiler' (Persistent, Bioaccumulative and Toxic) is a public domain QSAR package developed through the U.S. EPA. EPISUITE and the PBT Profiler include estimates of biodegradability based on chemical similarity. More sophisticated but narrower models such as CATABOL (see Relevant Websites section) require mechanistic understanding of enzyme-mediated processes, similar to those available for predicting toxicity.

Predicting Ecological Effects

QSARs for the prediction of toxicity to aquatic organisms, including fish, invertebrates, and algae, are relatively well developed for a broad range of chemical classes. More than 100 SARs for 55 chemical classes are available in a free, downloadable model called ECOSAR from the EPA website, based on test data and assumptions from test data. Aquatic toxicity endpoints include; reproduction, growth and mortality, such as acute toxicity to fish, invertebrates, and algae. The PBT Profiler also estimates chronic toxicity to fish by means of the ECOSAR model; it compares the fish chronic value to maximum water solubility, in order to estimate potential for aquatic risk.

Predicting Human Health Effects

A variety of QSAR models have been developed for human health endpoints and 'packaged' into user-friendly commercial or public-use programs. Human health hazard endpoints commonly predicted by QSAR models include: mutagenicity, carcinogenicity, teratogenicity, neurotoxicity, reproductive and developmental toxicity, skin/eye sensitization and irritation, and systemic toxicity. The more popular commercial QSAR packages for human health include The Open Practical Knowledge Acquisition Toolkit (TOPKAT), Multicase (MCASE), and the Deductive Estimation of Risk from Existing Knowledge (DEREK). Two general types of models can be distinguished: statistically based models such as TOPKAT, and rule-based models such as MCASE. Concise characterizations of these and other QSAR packages appear on the OECD website.

INTERNATIONAL USES OF QSARS BY REGULATORY AUTHORITIES

The OECD has recently published several pivotal documents summarizing QSAR applications worldwide. Their 'Guidance Document on the Validation of (Quantitative) Structure–Activity Relationships ((Q)SAR) Models (ENV/JM/MONO(2007)2)', available at www.oecd.org/ehs/, discusses OECD Principles for the Validation, for Regulatory Purposes, of (Q)SAR Models. It provides guidance on how individual regulatory agencies can evaluate specific (Q)SAR models with respect to those principles.

OECD's 'Report on the Regulatory Uses and Applications in OECD Member Countries of (Q)SAR Models in the Assessment of New and Existing Chemicals' (ENV/JM/MONO(2006)25) compiles case studies on current regulatory applications and prospective uses of (Q)SARs received from Australia, Canada, Czech Republic, Denmark, Germany, Italy, Japan, the Netherlands, the United States, the United Kingdom, and the European Commission. This report is 'part of the OECD effort to develop guidance for regulatory applications of (Q)SAR models, and emphasizes the use of programme-specific case studies to highlight the importance of legal and practical constraints and information requirements of individual regulatory programmes within member countries in applying (Q)SAR approaches.'

An excellent website that overviews QSARs by country and by property or effect is maintained by the OECD, at: http://webdomino1.oecd.org/comnet/env/models.nsf. The following sections summarize QSAR applications by selected regulatory jurisdictions worldwide.

European Union

The European Union (EU), like the U.S. EPA, supports the use of QSARs for screening new chemicals. The EU's Technical Guidance Document provides extensive guidance for the use of QSARs (see Further Reading section). The European Commission's Joint Research Centre has a QSAR Group within the Institute for Health and Consumer Protection's European Chemicals Bureau (ECB). The mission of the QSAR Group is to promote the regulatory use of valid (Q)SARs and related estimation methods. In addition to coordinating the activities of the EU QSAR Working Group, the ECB has initiated a wide range of in-house

and collaborative activities in the area of non-testing approaches. Further information on ECB (Q)SAR activities can be found at the following website: http://ecb.jrc.it/QSAR/. The European Union's recently enacted REACH (**R**egistration, **E**valuation, **A**uthorisation, and Restriction of **CH**emicals) legislation manages new and existing chemicals in a single regulatory framework. REACH, which will be led by the European Chemicals Agency (ECHA), includes the fostering of research on the development and validation of alternative (non-animal) methods, including (Q)SAR models and in vitro test methods. Under REACH, non-testing methods, including (Q)SARs, read-across and chemical category approaches will be used more extensively and more systematically than under previous EU legislation on chemicals.

United States

A number of U.S. regulatory agencies currently employ QSARs broadly in chemical screening, prioritization, and decision-making. The New Chemicals Program in the U.S. EPA's Office of Pollution Prevention and Toxic Substances (OPPTS) uses a variety of methods to make predictions that include QSAR, nearest analog analysis, chemical class analogy, mechanisms of toxicity, chemical industry survey data, and professional judgment. The models are used to identify possible chemicals of concern, for which additional experimental data may be requested from the notifying company through the OPPTS Sustainable Futures Program, new chemical submitters may 'fast track' the review process by use of the Pollution Prevention Framework, incorporating The PBT Profiler. EPA's Office of Pesticides Programs (OPP) is exploring the use of QSARs for non-active (i.e., 'inert') components of pesticide formulations. The EPA has used QSAR on a discretionary basis under the Hazardous Waste Identification Rule to screen and prioritize some 4000 chemicals for PBT characteristics.

The TSCA Interagency Testing Committee (ITC) uses QSAR predictions, in combination with empirical data and professional judgment, to maintain a 'Priority Testing List.' Finally, ongoing investigative programs in EPA's Office of Research and Development (ORD) are in place to develop, validate, and apply QSARs for various health, ecological, and exposure-related endpoints. ORD's National Center for Environmental Assessment is using TOPKAT to predict health effects associated with drinking water disinfection by products, among others. ORD's National Health and Environmental Effects Research Laboratory is developing receptor-binding QSAR models to predict endocrine disruption. ORD's National Center for Environmental Research Star Grant Program supports academic research in QSAR development.

FDA's National Center for Toxicological Research (NCTR), Center for Toxicoinformatics has an established program for the investigation of (Q)SAR models to identify chemicals with endocrine-disrupter properties, at: http://www.fda.gov/nctr/science/centers/toxicoinformatics/edkb/.

Canada

Existing Substances

The Canadian Environmental Protection Act, 1999 (CEPA 1999) requires the Ministers of the Environment and Health to 'categorize' the substances on the Canadian Domestic Substances List (DSL). Each of the more than 23 000 substances on the Domestic Substances List (DSL), an inventory of chemicals and biological agents that were in commerce in Canada between January 1984 and December 1986, was categorized in 2006. The purpose of categorization was to determine which substances on the DSL may have the greatest potential for exposure to the general population or are persistent (P) or bioaccumulative (B) and inherently toxic (iT) to human beings or to non-human organisms. Environment Canada considers persistence, bioaccumulation, and inherent toxicity to environmental organisms while Health Canada considers greatest potential for exposure and inherent toxicity to humans.

New Substances

The New Substances Branch of Environment Canada is responsible for conducting the environmental risk assessment on all new industrial chemicals and polymers, while Health Canada conducts an evaluation of the risk to human health. The notification scheme is tiered, with increasing information requirements as the volume of import or manufacture increases. The risk assessments are conducted through an examination of effects and an assessment of environmental fate and exposure. The program requires the submission of physical/chemical and effects data, however, when adequately validated by the notifier and acceptable to the government evaluators, data generated using (Q)SARs are accepted as an alternative to test data and can be used as a basis for regulatory decision making.

More information on the assessment approaches used by Environment Canada and Health Canada can be found at the following websites:

- Health Canada Categorisation and Screening Health Risk Assessment (http://www.hc-sc.gc.ca/ewh-semt/contaminants/existsub/index_e.html)

- Environment Canada Categorisation and Screening Risk Assessment (http://www.ec.gc.ca/substances/ese)
- Health Canada Human Health Risk Assessment Protocols for Contaminated Sites (http://www.hc-sc.gc.ca/ewh-semt/contamsite/risk-risque-eng.php)
- Health Canada New Substances (http://www.hc-sc.gc.ca/ewh-semt/contaminants/chem-chim/index_e.html)
- Environment Canada New Substances (http://www.ec.gc.ca/substances/nsb/eng/index_e.htm).

Denmark

To support the self-classification process, the Danish EPA published an advisory list for self classification of dangerous substances. The list of suggested hazard classifications was derived by using predictions from (Q)SAR models obtained or developed by the Danish EPA for the following endpoints: acute oral toxicity, skin sensitization, mutagenicity, carcinogenicity, and danger to the aquatic environment. The models were used to make predictions for the approximately 47 000 discrete organic substances on the EINECS list. The Danish Advisory List contains 20 624 chemical substances with suggested classifications for one or more of the dangerous properties, and is searchable via the ECB website (http://ecb.jrc.it/QSAR).

NON-QSAR-RELATED SOFTWARE TOOLS

The above section of this chapter focused on QSAR-related software tools. In addition, the QSAR-related approaches are used by various agencies in assessing toxicological effects of chemicals were highlighted. In the section below, other software tools for use in toxicology and risk assessment are noted.

Web Sites

Predictive Toxicology Resources Online

Web: http://www.predictive-toxicology.org/programs.html

This website is an extension of the resources available in the book entitled, '*Predictive Toxicology*' (2005). The book includes techniques and systems currently utilized in predictive toxicology. It highlights a survey of strategies to characterize chemical structures and biological systems, and prediction methods and algorithms, sources of toxicity data, commercial and non-commercial predictive toxicology programs, and technologies in computational chemistry and biology, statistics, and data mining.

Some examples are provided below. For detailed information on the software, the readers are encouraged to refer to the Predictive Toxicology Web site.

Expert Systems

- DEREK Expert system for the prediction of toxicity (genotoxicity, carcinogenicity, skin sensitization, …)
- METAPC Windows based Metabolism and Biodegradation Expert System
- METEOR Expert system for the prediction of metabolic transformations
- OncoLogic Rule based expert system for the prediction of carcinogenicity

Data Driven Systems

- lazar Open source inductive database for the prediction of chemical toxicity
- MC4PC Windows based Structure-Activity Relationship (SAR) automated expert system
- PASS predicts 900 pharmacological effects, mechanisms of action, mutagenicity, carcinogenicity, teratogenicity and embryotoxicity.

- TOPKAT Quantitative Structure Toxicity Relationship (QSTR) models for assessing various measures of toxicity

Computational Chemistry Programs

- DRAGON is an application for the calculation of molecular descriptor.
- JOELib A Java based cheminformatics (computational chemistry) library (open source)
- OpenBabel A cross-platform program and library designed to interconvert between many file formats used in molecular modeling and computational chemistry (open source)

'Risk World' Software List

Web: http://www.riskworld.com/softsw001.htm
Risk world website has an extensive list of risk assessment related software. Readers are encouraged to review this list of software; however, as of mid-2008, several of the Web links to the software do not work and some of these software might have been discontinued.

Environmental Health and Safety Free Software Portal

Web: http://www.ehsfreeware.com/
A portal of on-line databases of information, downloadable software, and lots of other resources related to the environment, health and safety. Additional information resources are available at http://www.ehsfreeware.com/links.htm.

STATISTICAL AND RISK FORECASTING TOOLS

R Statistical Package

This is a free software environment for statistical computing and graphics. It is an integrated suite of software facilities for data manipulation, calculation and graphical display. Included is an effective data handling and storage facility; a suite of operators for calculations on arrays, in particular matrices; a large, coherent, integrated collection of intermediate tools for data analysis, graphical facilities for data analysis and display either on-screen or on hardcopy, and a well-developed, simple and effective programming language which includes conditionals, loops, user-defined recursive functions and input and output facilities (excerpted from http://www.r-project.org/).

Crystal Ball

Crystal Ball is a Microsoft® Excel®-based suite of analytical tools that includes Monte Carlo simulation, optimization, and forecasting and predictive modeling. These advanced analytical techniques can be used in standard spreadsheets modeling software to create predictions for effective outcomes in financial, environmental and other forecasting related projects. For additional information, refer to http://www.oracle.com/crystalball/index.html/.

Analytica

Analytica is a visual software package developed by Lumina Decision System, Inc. for creating, analyzing and communicating quantitative decision models. Analytica includes hierarchical influence diagrams for visual creation and view of models, intelligent arrays for management of multidimensional data, Monte Carlo simulation for analyzing risk and uncertainty, and a general modeling language. It is designed to enable the creation of models that are transparent, interpretable, extensible, and flexible. The design of Analytica is based on key ideas from the field of decision analysis. For additional information, refer to http://www.lumina.com/.

Risk Calc

"Risk Calc supports probability bounds analysis, standard fuzzy arithmetic, and classical interval analysis. Its applications are like those of Monte Carlo packages such as @Risk or Crystal Ball, but Risk Calc does not require you to specify precise details of statistical distributions and their dependency relationships when empirical data are lacking." (excerpted from http://www.ramas.com/riskcalc.htm)

United States Environmental Protection Agency (U.S. EPA)

National Centre for Environmental Assessment (NCEA)
Risk Tools – Human Health Risk Assessment
Web: http://cfpub.epa.gov/ncea/cfm/nceatools_human.cfm
Several risk assessment models and databases are provided to facilitate human health risk assessments. Some Emerging tools are Bench Mark Dose (BMD) Modeling and Physiological Based Pharmaco Kinetic (PBPK) modeling tools and frameworks.

Risk Tools – Ecological Risk Assessment
http://cfpub.epa.gov/ncea/cfm/nceatools_ecological.cfm
Several risk assessment models and databases are provided to facilitate ecological risk assessments. Models,

databases, methods and other tools and resources are provided on the Web page.

Bench Mark Dose (BMD) Modelling
Web: http://www.epa.gov/ncea/bmds/index.html
BMD methods involve the fitting of mathematical models to dose-response data and using the different results to select a BMD that is associated with a predetermined benchmark response (BMR), such as a 10% increase in the incidence of a particular lesion or a 10% decrease in body weight gain. The BMD software facilitates toxicological modeling operations by providing simple data-management tools and an easy-to-use interface to run multiple models on the same dose-response data set. The models are appropriate for the analysis of dichotomous (quantal) data (Gamma, Logistic, Log-Logistic, Multistage, Probit, Log-Probit, Quantal-Linear, Quantal-Quadratic, Weibull and Multistage-Cancer), continuous data (Linear, Polynomial, Power, and Hill) and nested developmental toxicology data (NLogistic, NCTR, and Rai & Van Ryzin). A beta version 2.0 as of June 28, 2008 is still at the experimental stage and has important changes and enhancements and a different graphical interface.

The following website has an extensive list of various environmental models available by United States Environmental Protection Agency (USEPA) http://www.epa.gov/epahome/models.htm

The following website has lists of USEPA databases and software Web: http://www.epa.gov/epahome/Data.html/.

The National Computational Toxicology Centre: Web: http://www.epa.gov/comptox/.

Detailed information on Databases and models such as ACToR (Aggregated Computational Toxicology Resource); Distributed Structure-Searchable Toxicity (DSSTox) Database Network; and ToxRefDB (Toxicity Reference Database) and ToxCast™ can be accessed at Web: http://www.epa.gov/comptox/databases.html.

Vapour Intrusion Risk Assessment Modelling Tools
Web: http://www.epa.gov/oswer/riskassessment/airmodel/johnson_ettinger.htm

Online modeling learning module – Petroleum Hydrocarbon Transport

Journals

Environmental Modelling & Software
Publisher: Elsevier Publications
Environmental Modelling and Software publishes contributions, in the form of research articles, reviews, short communications as well as software and data news, on recent advances in environmental modeling and/or software. The aim is to improve our capacity to represent, understand, predict or manage the behaviour of environmental systems at all practical scales, and to communicate those improvements to a wide scientific and professional audience. (Excerpted from Web: http://www.elsevier.com/wps/find/journaldescription.cws_home/422921/description-description)

Organization

International Environmental Modelling and Software Society (IEMMS)
Web: http://www.iemss.org/
IEMMS is a not-for-profit organization that unites interested stakeholders dealing with environmental modeling, software and related topics. It strives to develop and use environmental modeling and software tools to advance the science and improve decision making with respect to resource and environmental issues. Further, it emphasizes on the interdisciplinarity and the development of generic frameworks and methodologies which integrate models and software tools. In addition, it promotes contacts between physical, social and natural scientists, economists and software developers from different countries and coordinate their activities. It improves the cooperation between the scientists and decision makers/advisors on environmental matters. It also improves the exchanges of information in the field of environmental modeling and software among scientific and educational organizations and private enterprises, as well as non-governmental organizations and governmental bodies.

Conclusion

This chapter has summarized some of the software and modeling frameworks for toxicology and ecological and human health risk assessments. There are other modeling tools and toxicology software available in the emerging areas of toxicology (e.g., toxicogenomics). The readers are encouraged to review those tools available from various research institutes and universities that are engaged in genomics research and analysis. Other emerging areas such as modeling complex diseases to understand gene-gene and gene-environmental interactions are currently carried out by agencies such as IARC (International Agency for Research on Cancer), various European and North American universities and agencies. Dose response (toxicology) and expose assessment modeling are important for health risk assessments, and the modeling tools and software are constantly being refined in these areas. The information provided in this chapter is by no means an exhaustive list of software tools; rather it is a condensed list of relevant software, models and other related tools available from various governmental and commercial organizations.

CHAPTER

70

The Legal and Regulatory Framework

NEIL S. SHIFRIN AND E. MICHAEL THOMAS

INTRODUCTION

This chapter provides a general understanding of what/how chemicals are regulated in the U.S. and of compliance considerations for the regulated community. It represents conditions exclusive of the European Union's December 2006 passage of the Registration, Evaluation, Authorisation, and Restriction of Chemicals (REACH) legislation, which may change future U.S. chemical practices. Although many chemicals are regulated in the U.S. through environmental laws, this chapter will mainly focus on chemicals in commerce, not in wastes or as environmental contaminants.[1] Where possible or important, distinctions will be made between *products* and *constituents*, both of which may pose chemical exposures to people.

CHEMICALS VS PRODUCTS AND REGULATORY AUTHORITIES

Chemicals or products are generally not directly regulated in the U.S. Exceptions at the Federal level include pesticides, drugs, alcohol, some foods, materials regulated by the U.S. Environmental Protection Agency's (EPA's) Toxic Substances Control Act of 1976 (TSCA) and some special chemicals like High Production Volume (HPV) chemicals, fuel additives (e.g., tetraethyl lead and methyl tertiary-butyl ether (MTBE)) and ozone-depleting chemicals (e.g. fluorocarbons). At the State level, California's Proposition 65 (Safe Drinking Water and Toxic Enforcement Act of 1986), which has nationwide and worldwide impact, regulates (for label listing) all products containing carcinogens, mutagens, or reproductive toxicants.

Regulatory authority over chemicals in the U.S. stems from the intended use of the chemical, the intended purpose of the product in which the ingredient is used, and the claims that are made about chemical and product function. For example, a simple chemical like citric acid may be governed by several agencies depending on whether the end use is in a food, cosmetic, or drug product.

In contrast, for a non-pesticide consumer household product, an ingredient might be regulated by EPA under the Toxic Substances Control Act (TSCA), whereas the product might be governed by the Consumer Product Safety Commission (CPSC). If the ingredient was alcohol, then the Bureau of Alcohol, Tobacco, and Firearms (BATF) would govern it. EPA (under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA)) would regulate citric acid or ethanol if used as an active ingredient of a pesticide or disinfectant.

The regulatory complexity of products, use, and chemicals is further exemplified by a synthetic surfactant derived from a petroleum product versus a soap (fatty acid salt) derived from natural sources (e.g., coconut oil). 'Soaps' for simple skin cleaning purposes are

[1]US environmental laws which specifically address chemicals include the Clean Water Act (Priority Pollutants and Water Quality Criteria), Safe Drinking Water Act (MCLs), Clean Air Act (NAAQS and NESHAPS), Resource Conservation and Recovery Act (Appendix IX Hazardous Constituents), the Comprehensive Environmental Response, Compensation, and Liability Act aka "Superfund" (Toxic Inventory List, among others), the National Environmental Policy Act, the Occupational Safety and Health Act, the Atomic Energy Act (radionuclides), and the Lead-Based Paint Poison Prevention Act.

exempted from U.S. Food and Drug Administration (FDA) regulations, but synthetic detergents for the same use are regulated by the FDA. If there are no claims for the product beyond 'cleaning' skin or other surfaces, the synthetic ingredient may be regulated by TSCA and the soap product is regulated by CPSC. However, if cosmetic claims are made (makes skin softer or more beautiful) or antibacterial claims (kills germs on skin), both the ingredient and the product are regulated by FDA as a cosmetic or over-the-counter (OTC) drug. In this circumstance, the FDA-regulated surfactant ingredient, and the product in which it is contained, would be exempt from many TSCA regulations.

Conversely, the same synthetic surfactant used in a household cleaning product without pesticidal claims is regulated by TSCA while the product would fall under CPSC jurisdiction. If pesticidal claims were made for this household product, then the active ingredient and the product must be registered with EPA under FIFRA. The complexity of the regulatory categorization and subsequent registration, notification, labeling, and compliance requirements stem from the basic intent of use, product type, and claims made about the material.

Similarly, if nutritional claims are made for a food component, then it is regarded as a food or food additive, depending on historical status. However, if drug claims are made for the same item (e.g., treats or improves a disease condition in humans or animals), it is regulated by FDA as a drug. In addition to FDA's drug *approval* powers, the 1994 Dietary Supplement Health and Education Act makes FDA regulate *substantiation* of claims made by manufacturers of 29 000 dietary supplements marketed in the U.S.

Being clear about product/chemical roles and how the regulatory boundaries are drawn is essential to knowing what regulatory arena applies. While many regulatory arenas are designed not to overlap (e.g., many parts of FDA, FIFRA, and TSCA), there are other regulatory arenas (e.g., Prop. 65, TSCA import certification regulations, Drug Enforcement Agency (DEA), Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA, commonly known as Superfund), Superfund Amendments and Reauthorization Act (SARA), Centralized Waste Treatment (CWT), and Clean Air Act (CAA)) in which there are no such barriers and chemicals are subject to the regulation, no matter what their function or form. Nanotechnology, as used in products, is beginning to be regulated (e.g., by EPA in 2006 for environmental risks).

Regulatory or legal expertise is needed to ensure compliance and to meet product or ingredient regulatory requirements. Beyond this general guide, consultation with appropriate legal or regulatory experts is advised to ensure noting new requirements and changes in laws and regulations.

LAWS, AGENCIES, AND REGULATIONS

Manufacturers, distributors, exporters, and importers must determine if the chemicals in their commerce must be registered, labeled, or reported. U.S. EPA's TSCA, California's Proposition 65, and FDA's authorities are the most far-reaching laws governing chemicals in commerce. Table 70.1 lists laws, associated agencies, and their scope of chemical and product regulation.

Table 70.2 shows the historical development of some of these key laws.

The Toxic Substances Control Act (TSCA), enacted into law in 1976, is the broadest federal legislation applicable to chemical manufacturing, use, import, export, distribution, and disposal. Existing chemicals (on the TSCA Inventory List) have limited reporting and testing requirements while new chemicals coming onto market have more stringent requirements for testing, safety assessment, and risk management. A new chemical substance is defined to be 'any chemical substance which is not included in the chemical substance list compiled and published' under TSCA, a list known as the TSCA Inventory.[2]

As a general matter, under TSCA Title I, Section 5, no person may manufacture any new chemical substance or manufacture or process any chemical substance for a significant new use without first submitting to EPA a notice of intent (the Pre-Manufacture Notice or PMN) to manufacture or process such chemical substances. The PMN must be accompanied by sufficient information, as determined by EPA, to allow a reasoned evaluation of the health and environmental effects of the chemical substance.[3] TSCA Section 5 also contains an extensive list of exemptions and exclusions under which a new chemical substance or significant new use of an existing chemical substance may be excused from the PMN requirement.[4] EPA may require that

[2]42 U.S.C. § 2602(9). The TSCA Inventory contains more than 70,000 chemicals that, by virtue of their presence on the Inventory, are considered to be "existing chemical substances." Information about accessing the TSCA Inventory is available at www.epa.gov/opptintr/newchems/pubs/invntory.htm.

[3]42 U.S.C. § 2604.

[4]Exclusions from the definition of chemical substance are found at 42 U.S.C. § 2602(1)(B)(i) – (1)(B)(v), and include such items as pesticides, tobacco, tobacco products, special nuclear material, food, drugs and cosmetics. Exemptions from the requirement to file a PMN are defined at 42 U.S.C. § 2604(h)(1) – (h)(5), including material manufactured in small quantities solely for purposes of scientific experimentation or analysis for chemical research for the development of a product.

TABLE 70.1 Laws and oversight agencies governing product chemicals

Law	Agency	Requirements/scope
Federal		
Consumer Product Safety Act, 1972	CPSC	Safety of consumer products not regulated under FDA, FIFRA, etc. Power to recall. Research
Hazardous Substances Act,	CPSC	Labeling and definitions of consumer products containing chemicals (e.g., antifreeze). Response to consumer concerns. Required reporting of hazards
Poison Prevention Packaging Act,	CPSC	Packaging/testing requirements to prevent childhood tampering of specific pharmaceuticals or household products
Flammable Fabrics Act	CPSC	Testing standards and banning authority from flammable hazards of clothing
Toxic Substances Control Act, 1976	EPA	Testing/information requirements for substances on TSCA inventory. Premanufacturing Notice requirements and EPA control prior to commercialization of new chemicals. Bans of identified hazardous chemicals (e.g., PCB, asbestos)
Federal Insecticide, Fungicide, & Rodenticide Act	EPA	Registration, safety and efficacy testing, packaging, labeling, use, restriction, and banning authority over all pesticides (active ingredients and formulations) marketed in US or exported
Safe Drinking Water Act, 1974	EPA	Drinking water standards for specific chemicals and requirements for reporting by water supply companies/agencies
Food Quality Protection Act, 1996	FDA	Safety standards for residues in raw and processed foods; allows for pesticide residues
Food, Drug & Cosmetic Act	FDA	Approval of new drugs and their safety, labeling, efficacy, stability, packaging, and advertising, including during investigation (Kefauver-Harris Amendments) and generics. Regulation of food, food additives, cosmetics, and medical devices including grandfathering commonly used additives generally regarded as safe (GRAS) and Delaney Clause (no safe carcinogen level) exclusions
Fair Packaging and Labeling Act	FTC	Truth in labeling, advertising, and packaging all consumer products
Occupational Safety & Health Act	OSHA	Protection of worker safety during manufacturing, including classification of carcinogens, hazard assessment standards, research, and chemical product information via material safety data sheets (MSDS)
Controlled Substances Act	DEA	Identifies and controls/prevents distribution/use of illicit drugs
Domestic Chemical Diversion Act	DEA	Controls import/export of illicit drug precursors or solvents
State		
California Proposition 65 (Safe Drinking Water and Toxics Enforcement Act)	Office of Environmental Health Hazard Assessment	Requires labeling/warning and allows citizen suits to identify/protect from 1/100,000 cancer risk or 1,000 × safety factors for mutagens or teratagens covering currently about 700 listed chemicals in products made or sold in California or in drinking water. New chemicals added by Science Advisory Board
New Jersey Right to Know	NJ DEP	Labeling and worker notification of the top 5 ingredients of all mixtures in bulk containers in certain industrial facilities

additional testing and data collection be conducted in connection with the PMN. Moreover, under separate sections of Title I, if EPA determines that the manufacture, processing, distribution in commerce, use or disposal of a chemical substance or mixture presents or will present an unreasonable risk of injury to health or the environment, EPA may require additional testing of the chemical substance to generate sufficient data to determine the risk,[5] and may impose one or more of a suite of restrictions on the manufacture, processing or distribution in commerce, including prohibitions, limitations in quantities, markings or warnings, recordkeeping, use restrictions, or other limitations. These restrictions must be applied to the extent necessary to protect adequately against the risk posed by the chemical substance, but must also use the least burdensome requirements.[6]

Title I also imposed a ban on the manufacture and distribution of polychlorinated biphenyls (PCBs) and authorized the EPA to regulate the use of existing PCBs and to exempt certain PCB manufacturing and distribution if EPA determines it will not present an unreasonable risk.[7] The other three TSCA titles impose specifically tailored requirements on asbestos-containing material,

[5]42 U.S.C. § 2603.

[6]42 U.S.C. § 2605.

[7]42 U.S.C. § 2605(e).

TABLE 70.2 Historical evolution of US laws and agencies governing product chemicals

Current law	Prior, related laws/versions
Consumer Product Safety Act, 1972 (CPSC)	Poison Prevention Packaging Act, 1970 Child Protection Act, 1966 Federal Hazardous Substances Act, 1960 Flammable Fabrics Act, 1953 Caustic Poison Act, 1927
Food Quality Protection Act, 1996 (FDA)	Tamper-Resistant Packaging Regulations, 1982 Infant Formula Act, 1980 Saccharin Study and Labeling Act, 1977 Medical Device Amendments, 1976 Regulation of Biologics (vaccines, etc.), 1972 OTC Drug Review, 1972 Radiation Control For Health & Safety Act, 1968 Animal Drug Amendments, 1968 Fair Packaging and Labeling Act, 1966 Kefauver-Harris Drug Amendments, 1962 Color Additive Amendment, 1960 Food Additive Amendment (Delaney Clause), 1958 Pesticides Amendment, 1954 Durham-Humphrey Amendment (prescriptions), 1951 Federal Food Drug & Cosmetic Act, 1938 Certified Color Regulations, 1907 Food and Drug Act, 1906 Biologics Control Act, 1902
Toxic Substances Control Act, 1976 (EPA)	Safe Drinking Water Act, 1974 Federal Insecticide, Fungicide, and Rodenticide Act, 1947 Other environmental laws, e.g., CERCLA, RCRA, CWA

indoor radon emissions, and exposure to lead in soils and lead-based paint.[8]

The scope of chemicals governed and excluded by TSCA is best described from EPA's documentation (from http://www.epa.gov/opptintr/chemtest/pubs/mtlintro.htm):

> The TSCA Inventory currently contains over **70,000 existing chemicals,** many of which are produced or imported at low or negligible volumes, while others are polymers which, because of their physical size (e.g., high molecular weight) and other characteristics, are unlikely to present significant risk concerns. By excluding low volume chemicals (~25,000 chemicals produced or imported in amounts less than 10,000 pounds per year) and polymers (which tend to be poorly absorbed by organisms and therefore typically exhibit low toxicity), the remaining TSCA Inventory is comprised of about 15,000 non-polymeric chemicals produced/imported at levels above 10,000 pounds per year.
>
> Of these 15,000 non-polymeric chemicals, there are 3,000–4,000 chemicals that are produced/imported in amounts over 1 million pounds per year; these chemicals are considered by EPA to be U.S. High Production Volume (HPV) chemicals. **EPA has identified this 15,000 chemical subset as being the broad focus "universe" of the TSCA Existing Chemicals and Chemical Testing Programs with the primary focus placed on the 3,000–4,000 HPV chemicals**.

This arrangement of chemicals according to TSCA is shown graphically in Figure 70.1 (taken from http://www.epa.gov/opptintr/chemtest/pubs/mtlchem1.htm). Actually, as of 2003, there were 81 000 chemicals on the TSCA Inventory, as noted by Batelle (2003), which is a good overview of TSCA. Chemicals on the Inventory are handled by EPA differently than new chemicals coming onto market in that more rigorous testing and safety information is required for the latter. Thus EPA's original 'TSCA Inventory,' (http://www.chemicalspolicy.org/usfederal.shtml) was a list of all chemical substances in commerce prior to December, 1979 (about 60 000 substances, more than 99% by volume of what is on the market today), and was in a way grandfathered from the requirements of new chemicals coming onto market. Many safety initiatives also are run by EPA through TSCA, such as the High Production Chemicals Initiative and the Voluntary Children's Chemical Evaluation Program (VCCEP).

Pesticides are regulated in the United States at the federal level primarily under FIFRA[9], the Federal Food, Drug and Cosmetic Act (FFDCA)[10] and the

[8]TSCA Titles, II, III and IV, respectively, 42 U.S.C. § 2641 et seq, 42 U.S.C. § 2661 et seq, 42 U.S.C. § 2681 et seq.

[9]7 U.S.C. §§ 136–136y.

[10]21 U.S.C. §§ 321–346a.

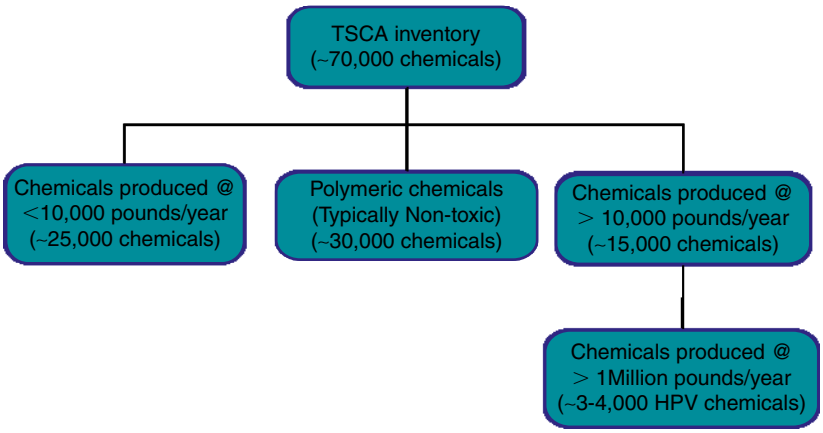

FIGURE 70.1 Regulation under TSCA

Food Quality Protection Act (FQPA).[11] A pesticide is defined in FIFRA as 'any substance or mixture of substances intended for preventing, destroying, repelling, or mitigating any pest, … intended for use as a plant regulator, defoliant or desiccant, and … any nitrogen stabilizer.'[12] FIFRA prohibits the distribution or sale of any pesticide that is not registered with EPA.[13] The FIFRA registration process requires the submission of data on the toxicity and environmental impacts of the pesticide sufficient for EPA to determine that it will perform its intended function without unreasonable adverse effects to the environment when used in accordance with common practice.[14] FIFRA also requires that pesticide products bear labels approved by the EPA which include the approved use for the pesticide, directions for use necessary to effect its approved use, its active ingredients and such warnings as EPA deems necessary to protect health and the environment.[15] It is a violation punishable by civil or criminal penalties to 'misbrand' a pesticide with an inadequate label or to use a pesticide in a manner inconsistent with its label.[16]

The pesticide provisions of the FFDCA authorize EPA to set maximum pesticide residue levels in food and feed crops. Any pesticide residue in or on a food is deemed under FFDCA to be unsafe unless a pesticide residue tolerance level has been established by EPA for the pesticide and the residue is within an applicable tolerance level established by EPA or unless the residue is otherwise exempt from the tolerance requirements.[17] A pesticide residue at a given tolerance level may be deemed by EPA to be 'safe' if EPA has 'determined that there is a reasonable certainty that no harm will result from aggregate exposure to the pesticide chemical residue, including all anticipated dietary exposures and all other exposures for which there is reliable information.'[18] Foods that have pesticide residue levels that exceed EPA-specified tolerances are deemed to be 'adulterated' and may not be sold in interstate commerce or imported into the United States.[19]

In 1996, the FQPA amended FIFRA and FFDCA to impose more stringent pesticide residue tolerance levels especially to limit the exposure of infants and small children to pesticide residues on food. The FQPA necessitated commencement of an ongoing reevaluation of the tolerance levels previously established under the FFDCA and a reregistration under FIFRA. The FQPA repealed the previous standard for setting pesticide residue tolerances which had included consideration of the impact of tolerances on the 'production of an adequate, wholesome, and economical food supply' and replaced it with the current standard which is solely based on health impacts.

A regulatory program with a unique impact on regulation of chemicals in the United States is the Proposition 65 program in California. Proposition 65 was a citizen initiative petition placed on the ballot in California and enacted into law in 1986. Proposition 65 prohibits the discharge or release into water or onto or into land of any chemical known to the state to cause

[11]The FQPA amended both FIFRA and FFDCA in 1996 to correct certain inconsistencies between the two regulatory programs and to impose more stringent standards for pesticide residues in food. Pub. L. 104–170, 110 Stat. 1489 (1996).

[19]21 U.S.C. § 334.

cancer or reproductive toxicity and precludes intentionally exposing any individual to such chemicals without first giving clear and reasonable warning to the individual.[20] By its terms it applies only to activities in California but, because California is such a large portion of the market for goods in the United States, its impact is quite extensive as any enterprise seeking to do business in California must comply with its terms for its activities within the California border, which often has a spill-over effect on the non-California markets targeted by such enterprises.

Proposition 65 requires the Governor to publish and annually maintain a list of chemicals known to the state to cause cancer or reproductive toxicity.[21] The warning requirements of Proposition 65 apply to all businesses with 10 or more employees unless the business can prove that the exposure falls below certain risk-derived limits.[22] Proposition 65 authorizes private individuals to bring suit to enforce its provisions and to collect a portion of any penalties (of up to $2500 per day per violation) recovered in such an enforcement action, which has prompted a significant amount of entrepreneurial litigation by plaintiff's lawyers and environmental groups.[23]

'SAFE' LISTS

Some chemicals can be used without regulatory intervention if they are 'generally recognized as safe' (GRAS) for specified uses or any for use or grandfathered as such via the TSCA Inventory (i.e., documented as used prior to TSCA, 1977). FDA maintains a GRAS list for food ingredients and specific uses, has published Monographs for ingredients' safe uses (e.g., sunscreens, antimicrobials, over-the-counter (OTC) products), and maintains a process for adding food materials to its GRAS list via either regulatory notification or an external review process. The monographs specify product and chemical testing and use requirements, packaging, labeling, safe levels, and stability, efficacy, and safety testing for materials with a long history of safe use.

COMPLIANCE

If not allowed or exempted as noted above, many chemicals must be registered, petitioned, notified, or tracked and reported. Some of this compliance involves testing and some does not. FDA must be petitioned for new drug applications or new food additives. Pesticides must be registered with U.S. EPA under FIFRA. Environmental and safety assessments are required along with approval of usage, packaging, and labeling and companies must wait for affirmative responses from the agencies before putting the materials in commerce.

TSCA requires notification for any new chemical manufacture or import (PMN) in a product or mixture but an agency-affirmative response is not required. If the agency takes no action within 90 days of notification, the chemical can be commercialized without restriction. All available safety and property information must be submitted but many PMNs do not submit specific safety studies and EPA performs its own fate/effect modeling, often from structure–activity modeling. However, EPA does often require safety studies for high-volume, widely exposed chemicals. Sometimes EPA will stop the 90-day clock, asking for more safety data, or will approve limited uses with consideration of expanded uses via a Consent Order or 'significant new use rule' (SNUR) process. EPA maintains a list of chemical 'categories of concern' with recommended safety testing, which facilitates the notification review for new chemicals within those categories.

TSCA notification is somewhat relaxed for other chemical categories, including polymers, limited use or risk chemicals, and R&D chemicals.

REGULATION DEVELOPMENT

Earlier sections of this chapter have described the provisions of several of the most significant federal laws governing chemicals in the United States, e.g., TSCA, FFDCA, FIFRA. Each of these statutes either identifies an executive branch agency responsible for implementation of the statutory provisions or authorizes the President to designate such an agency.[24]

[20]Cal. Code § 25249.6.

[21]Cal. Code § 25249.8. The list of designated chemicals can be found at Cal. Code Regs. Tit. 22, § 12000.

[22]For carcinogens, the limit is the level of exposure expected to result in one excess lifetime case of cancer per 100 000. For reproductive toxins, the limit is the level of exposure that will have no observable effect assuming exposure at one thousand times the level in question, i.e., the exposure level limit is 1/1000th of the no observable effect level.

[23]Cal. Code § 25249.7 (authorizing 'actions brought by any person in the public interest' upon 60 days prior notice to the attorney general and the relevant district attorney or city attorney). See Cal. Code § 25192 (specifying apportionment of penalties collected under Proposition 65).

[24]For examples, see www.fda.gov/oc/mous/domestic/225-79-2001.html and www.fda.gov/oc/mous/domestic/225-85-8400.html.

In turn, each of the statutes either authorizes or requires the responsible agency to develop regulations that further articulate and make specific the general legal requirements set forth by Congress in the statute.[25]

Although the language of the laws passed by Congress is binding upon entities whose activities fall within the scope of the statutory language, that language may not be sufficiently detailed or specific to be apparent to such entities that their activities are subject to limitations under penalty of law. Thus, the executive agencies are charged with 'putting flesh onto the bones' of the general mandates articulated in statutes, translating them into very specific requirements which direct the regulated community to conduct its activities consistently with the regulations or face legal sanctions for violation of the statutes and their associated suite of regulations. The primary mechanism at the federal level for adopting and enforcing these regulations is the process of administrative agency rulemaking.

The most commonly employed rulemaking process, 'informal rulemaking,'[26] has three fundamental components: adequate notice of proposed regulations to those potentially affected by the rulemaking, receipt of comments from interested parties on the proposed rule and publication of the final rule with a statement of the basis and purpose of the rule.[27] First, an agency engaged in rulemaking is required to publish a 'notice of proposed rulemaking' in the Federal Register or otherwise provide actual advance notice to persons who would be subject to the contemplated rulemaking.[28] The notice must include the time, place, and nature of the rulemaking proceedings; it must identify the legal authority under which the rule is proposed; and it must describe the terms or substance of the proposed rule or the subjects or issues involved.[29] 'The rule of thumb is that the notice must "fairly appraise interested persons of the subjects and issues the agency was considering."' (Amon & Mayton, p. 49). The notice of proposed rulemaking must describe the substance of what is being proposed and the underlying factual, legal, and technical bases for the proposal.

The second element of informal rulemaking is the requirement that, '[a]fter [provision of the required] notice, the agency shall give interested persons an opportunity to participate in the rule making through submission of written data, views, or arguments with or without opportunity for oral presentation.'[30] This requires the agency to allow interested persons to comment on the proposed rule, usually during a specified period after the notice of proposed rulemaking during which the agency will accept written comments and submissions concerning the proposal. Solicitation of comments is intended to improve the rulemaking by providing the agency with the benefit of awareness of 'the actual values and interests of the people subject to the action [to] "assure[e] that the agency will have before it the facts and information relevant to a particular administrative problem, as well as suggestions for alternative solutions."' (Amon & Mayton, p. 54).

The third element of informal rulemaking is the requirement that '[a]fter consideration of the relevant matter presented, the agency shall incorporate in the rules adopted a concise general statement of their basis and purpose.'[31] Although this requirement is stated in rather spare terms, it has come to be viewed by agencies and courts reviewing rulemakings as requiring that the rulemaking agency provide a comprehensive description of the enacted rule, a detailed summary of the major comments and criticisms of the proposed rule submitted by interested persons, a detailed description of how the agency took into account or rejected the comments, a description of the factual and evidentiary basis for the rule, an explication of the agency's rationale and methodology for evaluating the impacts of the rule, a legal analysis of the statutory authority for the provisions of the rule and of how the rule effectuates the purposes of the statute and the rulemaking, and an explanation of how and why the final rule differs from the initial proposal, based on identified material made available for review during the rulemaking process. Thus, the 'concise general statement of … basis and purpose' has become an 'extremely demanding judicial definition' of comprehensive documentation required of the agency to justify being upheld by a court reviewing the agency's rulemaking process (Pierce, p. 440).

In summary, the process of informal rulemaking, through which the detailed regulations governing chemicals at the federal level in the United States are developed by executive branch agencies, requires fair

[25]For examples, see www.fda.gov/oc/mous/domestic/225-79-2001.html and www.fda.gov/oc/mous/domestic/225-85-8400.html.

[26]Informal rulemaking is the predominant form of rulemaking used by federal agencies. 'Formal rulemaking' is distinguished from informal rulemaking by addition of a formal hearing conducted by the agency to gather evidence and data which may include issuance of subpoenas, witness testimony taken under oath and other formal procedures akin to judicial hearings. Formal rulemaking, in the rare instances when it occurs, is usually specifically required by statute.

[27]These elements are set out in the Administrative Procedure Act, 5 U.S.C. §§ 551 et seq, §§ 553(b)(1), (2) and (3).

[28]5 U.S.C. § 553(b).

[29]5 U.S.C. §§ 553(b)(1), (2) and (3).

[30]5 U.S.C. § 553(c).

[31]5 U.S.C. § 553(C).

notice, a comprehensive announcement of the agency's intentions and bases for its intentions in the notice of proposed rulemaking. The process next requires acquiescence to a broad outreach requesting input to the agency's decision-making process from the public by soliciting, accepting, considering, and evaluating comments from all interested parties. Finally, the agency is required to make a demonstrably rational decision, by fully utilizing the information placed at its disposal through the comment process, carefully documenting and explaining the derivation or deviation of its rulemaking decision from the concerns expressed in all of the sources of information, data, analysis, and legal authority cited to it during the comment period.

INFORMATION RESOURCES

Table 70.3 is a list of agencies of the 50 States that oversee independently or by Federal authorization chemical or product issues, in addition to running environmental programs. In some cases, such as California under its Proposition 65 initiative, information related directly to chemical product safety is provided. In other cases, the State's environmental and public health agency information is provided.

Table 70.4 provides a list of national and federal agency information pertinent to chemical product safety issues.

CHAPTER

71

Hazard Communication

Michele R. Sullivan

INTRODUCTION

Chemical information is the foundation of workplace chemical safety programs – without it, sound management of chemicals cannot occur. Hazard communication works to reduce chemical illnesses and injuries by ensuring that workers and those who provide protections for workers – physicians, nurses, industrial hygienists, safety engineers, and other professionals – have the information they need about chemicals to devise protections. Selection of appropriate engineering controls, personal protective equipment, and controls such as substitution, is predicated on knowing what chemicals are present, what form they are present in, and what their hazardous effects are, including physical and chemical characteristics.

Hazard communication is based on identification and transmittal of available information on chemical products. Over the last decades, the availability of chemical information in workplaces has increased dramatically, and the provision of labels and material safety data sheets (MSDS) with products has become a standard business practice. There is a whole generation of employers and employees now who have never worked in a situation where information about the chemicals in their workplace is not available. Initially, hazard communication focused on health and physical hazards and related information on safe handling. Gradually, the scope of hazard communication has broadened to include environmental hazards and regulatory information.

BACKGROUND

OSHA published its Hazard Communication Standard (HCS) on November 25, 1983. The OSHA HCS requires chemical manufacturers and importers to evaluate the hazards of the chemicals they produce and distribute. The information about the hazards and associated protective measures is required to be disseminated on container labels and MSDSs. All employers with exposed employees are required to provide access to the labels and MSDSs, and to train workers. While the HCS has been amended since 1983 to include all workers exposed to chemicals, as well as to reflect new technology in information dissemination and other developments, the basic approach is still the same.

Many other countries (Canada, Europe, Korea, etc.) have also developed hazard communication laws that require information about chemicals to be prepared and communicated via MSDSs/labels to those exposed to hazardous chemicals. The regulated chemicals, the hazard definitions, the MSDS/label requirements and the use of symbols and pictograms vary in these laws. The inconsistencies between the various hazard communication laws are substantial enough that different labels and MSDSs must often be developed for the same product when it is marketed in different countries. The diverse and sometimes conflicting hazard communication requirements can create confusion among those who seek to use hazard information effectively.

In 1992 the United Nations Conference on Environment and Development, also known as the 'Earth Summit,' called for development of a globally harmonized chemical classification and labeling system. This international mandate initiated an extensive effort to develop the Globally Harmonized System of Classification and Labeling of Chemicals (GHS). It involved numerous international organizations, many countries, and extensive stakeholder representation. The GHS includes harmonized provisions for classification of chemicals for their health, physical, and environmental effects, as well as for labels and MSDSs. While the GHS has been formally accepted by the United Nations, it is considered to be a living document that will be updated as necessary to reflect new technology and scientific developments, or provide additional explanatory text.

The GHS is currently in the process of being implemented by many countries. When adopted around the world, it is anticipated that the GHS, by harmonizing and standardizing hazard communication requirements, will improve the quality and consistency of chemical hazard information, including MSDSs/labels. Employers, employees and others should benefit from adoption of the GHS through better, more standardized, and consistent information about chemicals.

WHAT IS THE CORE OF HAZARD COMMUNICATION?

Hazard assessment (also called hazard determination or classification) is the starting point for all hazard communication, especially for MSDSs which present the known hazards of a material. The assessment involves the identification of the hazards of a material by assigning a type of hazard using defined criteria. The properties, characteristics, and composition of the material affect the hazards. Hazards are communicated by MSDSs, labels, and other documents. Regulatory information is often provided on MSDSs.

Generally hazard communication incorporates a three-pronged approach: labels on containers, development of material safety data sheets, and employee training. Each of these elements is interdependent – they do not stand alone as a mechanism to communicate information. A label is the immediate source of information. It is intended to be a visual reminder for workers that the materials are hazardous, and that more detailed information is also available on the MSDSs and in training. These three aspects work together to provide a complete approach to hazard communication, ensuring that the information is provided in different ways to reinforce and explain it to those exposed.

WHAT IS THE FIRST STEP IN COMMUNICATING HAZARDS?

The first step is to collect information about the material and its components including physical, chemical, and environmental characteristics, and toxicity information. The collected information is then evaluated to determine the potential physical, health, and environmental hazards associated with the material. Until the GHS is implemented worldwide, the hazard communication regulations for each country or region must be consulted for specific requirements pertaining to hazard classification and MSDSs.

The references and sources of information used in the hazard identification should be documented. This information will provide needed internal documentation. It will also help update the hazards and MSDS, answer inquiries, and provide a historical reference.

Once the physical, health, and environmental hazards have been identified, their impact on all sections of the MSDS must be evaluated. Each of the sections in the MSDS builds on or supports the hazards identified in the hazard assessment.

WHAT IS AN MSDS?

MSDSs are reference documents. They are basically a one-stop shopping source for everything you might need or want to know about a chemical product. They are used worldwide to transmit detailed information about a chemical product, how it should be used, its effects, how to protect against those effects, what regulations apply to the chemical, and other information.

The MSDS provides information about the hazards of a product and how the material can be safely handled, used, and stored. It includes information on physical and chemical properties, physical and health hazards, routes of exposure, precautions for safe handling and use, emergency and first-aid procedures, and control measures.

The MSDS acts as a reference for the management of hazardous chemicals in the workplace. Information on an MSDS aids in the selection of safe products, helps employers and employees to handle products safely, and serves as a regulatory framework.

Generally, an MSDS has 16 sections, each with a fixed heading name. According to the GHS, information in the MSDS should be presented using the following 16 headings:

1. Product and Company Identification
2. Hazard(s) identification
3. Composition/information on ingredients

4. First-aid measures
5. Fire-fighting measures
6. Accidental release measures
7. Handling and storage
8. Exposure controls/personal protection
9. Physical and chemical properties
10. Stability and reactivity
11. Toxicological information
12. Ecological information
13. Disposal considerations
14. Transport information
15. Regulatory information
16. Other information.

WHAT RESOURCES ARE NEEDED?

In order to have complete and accurate hazard identification and communication of hazard and regulatory information on MSDSs, reliable data sources are needed. This chapter provides information sources relevant to the hazard determination and preparation of MSDSs.

Table 71.1 lists references for each of the 16 MSDS sections. These references are useful for obtaining the information necessary to compose the various sections of an MSDS, including hazard determination and regulatory information. Citations for the references are also given in Table 71.1.

ARE THERE OTHER RESOURCES FOR HAZARD COMMUNICATION?

The Society for Chemical Hazard Communication (SCHC) is a unique organization in that it focuses solely on hazard communication. SCHC's purpose is to promote effective communication of chemical hazards. The Society is committed to sharing knowledge and resources to ensure a consistent and uniform approach to assessing and communicating chemical hazards on product labels, MSDS, and other product literature and documentation.

SCHC holds meetings to provide up-to-date information on current developments and offers professional development courses to educate and provide information on hazard communication.

SCHC maintains a website at www.SCHC.org. The site contains SCHC presentations, links to hazard communication and related websites, a list of hazard communication and translation resources, and updates on legislative and standards activity concerning hazard communication.

CHAPTER

72

Professional Education

STEVEN G. GILBERT AND KATIE FREVERT

INTRODUCTION

The illiterate of the 21st century will not be those who cannot read and write, but those who cannot learn, unlearn, and relearn. Alvin Toffler

In times of change, learners inherit the Earth, while the learned find themselves beautifully equipped to deal with a world that no longer exists. Eric Hoffer

Toxicologists are confronted with two educational challenges: first, acquiring the fundamental and specialty knowledge and second, to keep pace with the rapid advances across the vast landscape of the toxicological sciences.

A career in toxicology offers a wide range of opportunities that crosses many disciplines and will provide a lifetime of challenges. Toxicology may be defined as the study of the adverse effects of chemical and physical agents on biological organisms. A challenge and attraction of toxicology is the need to integrate knowledge from basic biology, chemical and physical sciences, molecular and genomic sciences, biochemistry, neurosciences as well many other fields, depending on your specialty. Another important aspect of toxicology is evaluating the probability of harm which involves risk assessment, risk management, and risk communication. Employment opportunities in toxicology include basic research, regulatory, and safety evaluation positions. Toxicologists work in many areas such as public health, law, academic, industrial, pharmaceutical, government, or non-profit institutes. The work of a toxicologist affects almost every aspect of our lives by ensuring that what we eat, breathe, and drink is not harmful. Careful planning and attention to one's undergraduate courses, and awareness of graduate educational opportunities will enhance career opportunities. A number of national and international professional organizations have excellent detailed information on developing a career in toxicology.

We are continuously in a state of learning more about what affects environmental and human health. Professional toxicologists must constantly strive to remain current with state-of-the-art science in their education and work experience. Several of the professional societies offer continuing education programs at their national meetings. In addition there are professional certification programs.

Following is a list of career and continuing education opportunities, followed by a list of on-site and distance-learning university-affiliated programs in toxicology. The reader is encouraged to check an institution's website for updated information on its programs. Several of the professional societies also maintain extensive list of academic programs in toxicology. Information on K-12 and general public education resources in toxicology is detailed in Chapter 73, *K-12 and Public Education*. An excellent national resource that contains a broad range of information on Education, Careers, and Outreach is at the National Library of Medicine, National Institutes of Health (http://sis.nlm.nih.gov/enviro/edcotox.html#a5). Detailed information on career opportunities in toxicology was provided with permission by the Society of Toxicology.

CAREERS AND EDUCATION IN TOXICOLOGY

Society of Toxicology* – Careers in Toxicology

Overview

The Society of Toxicology (SOT) is a professional and scholarly organization that represents the great variety of scientists from academic institutions, government and industry who are practicing toxicology in the U.S. and around the world. The organization is dedicated to supporting the creation and communication of sound scientific information that reduces uncertainties in assessing risks and improves decisions regarding the health of humans, other animals, and the environment. Further information is provided on the Society's website (http://www.toxicology.org).

The SOT communicates research to diverse audiences throughout the world. SOT members publish their findings in the leading research journals, present their research at meetings and conferences, testify before government panels, serve in advisory capacities on an international basis, and conduct lectures and training programs for professionals, students, and the general public. The SOT Annual Meeting, held each year in March, is the largest of its kind in the world, with about 5000 participants, and features ground-breaking toxicology research and the exhibition of the latest in instrumentation and services.

The SOT has a strong commitment to public and professional education, offering a variety of programs including a Congressional fellowship, continuing education courses, workshops, symposia, student travel awards and student summer internships. Significant efforts are also aimed at recruiting students from under represented populations to careers in toxicology and to helping the public achieve a better understanding of toxicology. The SOT coordinates several community outreach programs, including a public forum on local issues, special training programs for K-12 teachers, and media training for toxicologists.

The SOT was founded in 1961 as a not-for-profit scientific society. It is governed by an 11-person, elected Council and managed by an administrative office in the Washington, D.C. area. There are approximately 5000 individual members from 42 countries and nearly 60 SOT Associates. The SOT's activities are highly diverse and conducted through the efforts of over 20 elected and appointed committees and task forces. The Society has established 18 specialty sections and 18 regional chapters that foster scientific exchange throughout the year.

Facts about Toxicology

'The dose makes the poison.'
'Toxicology is part of the solution.'
Toxicology … is the science that studies the harmful effects of drugs, environmental contaminants, and naturally occurring substances found in food, water, air and soil.
Toxicology … research is important for improving the health of humans, animals and their environments.
Toxicology … studies are required to ensure the safety of medicines, household and gardening chemicals, and industrial and natural chemicals to which humans and animals are frequently exposed.
Toxicology … research is intended to identify harmful effects of potential new products and to determine safe levels for approved products.
Toxicology … research also provides understanding of the mechanisms by which chemical substances cause injury, and this information can be used in the treatment of poisonings.

Career Opportunities in Toxicology

What is Toxicology?

Hardly a week goes by without hearing that a chemical may potentially threaten our health – pesticides in the food we eat, pollutants in the air we breathe, chemicals in the water we drink, toxic dump sites near our homes. Chemicals make up everything around us. Which chemicals are really dangerous? How much does it take to cause harm? What are the effects of a particular chemical? Cancer? Nervous system damage? Birth defects?

Finding scientifically sound answers to these very important questions is what toxicologists do, using the most modern molecular, genetic, and analytical techniques available. Toxicology combines the elements of many scientific disciplines to help us understand the harmful effects of chemicals on living organisms.

An additional, important aspect of toxicology is determining the likelihood that harmful effects will occur under certain exposure circumstances, sometimes called 'risk assessment.' If the risks are real, then we must be able to deal with them effectively. If the risks are trivial, then we must ensure that valuable public resources are not spent ineffectively. Such important decisions must be made with the best scientific evidence possible.

*Reproduced with permission from The Society of Toxicology; originally published by: Society of Toxicology, 1821 Michael Faraday Drive, Suite 300, Reston, Virginia 20190-5332; Tel: (703) 438-3115; Fax: (703) 438-3113; E-mail: sothq@toxicology.org; http://www.toxicology.org; SOT careers web site: http://www.toxicology.org/AI/APT/careerguide.asp.

The responsibility of the toxicologist is to:

1. Develop new and better ways to determine the potential harmful effects of chemical and physical agents and the amount (dosage) that will cause these effects. An essential part of this is to learn more about the basic molecular, biochemical and cellular processes responsible for diseases caused by exposure to chemical or physical substances;
2. Design and carry out carefully controlled studies of specific chemicals of social and economic importance to determine the conditions under which they can be used safely (that is, conditions that have little or no negative impact on human health, other organisms, or the environment);
3. Assess the probability, or likelihood, that particular chemicals, processes or situations present a significant risk to human health and/or the environment, and assist in the establishment of rules and regulations aimed at protecting and preserving human health and the environment.

Why Consider a Career in Toxicology?

Challenges

Wise use of chemicals is an essential component of the high standard of living we enjoy. The challenge to toxicologists is to ensure that we are not endangering our health or the environment with the products and by-products of modern and comfortable living. As a career, toxicology provides the excitement of science and research while also contributing to the well-being of current and future generations. Few other careers offer such exciting and socially important challenges as protecting public health and the environment.

Opportunities

With the increase in our health consciousness, as well as concern for our environment, a wide and growing variety of career opportunities exist in toxicology.

Toxicologists

participate in basic research using the most advanced techniques in molecular biology, analytical chemistry and biomedical sciences;

work with chemical, pharmaceutical and many other industries to test and ensure that their products and workplaces are safe, and to evaluate the implications of new research data; work for local and federal governments to develop and enforce laws to ensure that chemicals are produced, used and disposed of safely; work in academic institutions to teach others about the safe use of chemicals and to train future toxicologists.

Attractive Salaries and Professional Advancement

The demand for well-trained toxicologists continues to increase. Highly competitive salaries are available in a variety of employment sectors. Increasing specialization in the science of toxicology now provides the toxicologist with a competitive advantage over chemists, engineers, biologists or other scientists without specialized training in toxicology. Opportunities are available for career advancement to executive levels for those with organizational and administrative skills and a superb record of scientific achievement.

What Do Toxicologists Do?

Research

Many toxicologists, especially in academic and nonprofit institutions, are principally involved in the discovery of new knowledge concerning how toxic substances produce their effects. There are many subspecialty areas in toxicology research: chemical carcinogenesis, reproductive and developmental toxicology, neurotoxicology, immunotoxicology, inhalation toxicology, risk assessment and many others. Researchers use laboratory animals, human and animal cells in culture, and other test systems to examine the cellular, biochemical and molecular processes underlying toxic responses. Research opportunities are available for individuals employed in industry, academia and government. There are many commercial and nonprofit laboratories that also provide interesting and challenging research opportunities.

Research is considered to be 'basic' where no immediate commercial or public health application is expected, but the knowledge will add to our understanding of basic life processes. Such research is of great value in solving important and long-term problems. Examples of this would be studies of how a particular enzyme involved in the detoxification of a chemical is regulated at the gene level or how a chemical affects the rate of cell division.

Other research is considered 'applied' when the results are expected to yield direct social or commercial benefit. Examples would be studies to identify new chemicals that selectively kill certain pests or studies to determine if a particular industrial process is responsible for a specific disease identified in a population of workers. Development of antidotes for radiation injury or chemical poisoning are examples of applied research of public health importance.

Product Safety Evaluation

Many industries employ toxicologists to assist in the evaluation of the safety of their products. For therapeutic drugs, food additives, cosmetics, agricultural chemicals

and other classes of chemicals, federal laws often require that the manufacturer provide adequate testing of the product before it is released into commerce. Tests to determine if a chemical has the potential to cause cancer, birth defects, reproductive effects, neurological toxicity or other adverse effects are commonly conducted by the manufacturer.

Toxicologists involved in product safety evaluation have the responsibility to ensure that such tests are designed, conducted and interpreted in a scientifically sound manner. Information from such studies is, in turn, reviewed by toxicologists in various regulatory agencies, such as the Food and Drug Administration (FDA) and the Environmental Protection Agency (EPA), or by international organizations to ensure that the products will not present an unreasonable risk to human health or the environment.

When the information is available, toxicologists also utilize studies of human populations (the science of epidemiology) to assist in the evaluation of the safety and potential risks of the chemical products and by-products of modern society.

Teaching

Toxicologists employed in colleges and universities are involved in teaching toxicology to students and others. Because of increasing interest in the impacts of chemicals on our society, many colleges and universities offer toxicology courses at both the undergraduate and graduate level. Academic institutions that do not have graduate programs in toxicology employ toxicologists to participate in curriculum development and teach basic programs such as chemistry and biology. Thus, opportunities exist to teach toxicology in small colleges as well as major universities. One of the most important efforts of toxicologists in academic institutions is the training of future generations of toxicologists in basic and applied research, data interpretation and evaluation, and risk assessment and regulatory affairs.

Public Service, Regulatory Affairs and Consulting

An important part of any science is communicating results and discussing implications. The tremendous growth in public awareness of chemical hazards over the last two decades has resulted in the passage of many laws governing the production, use and disposal of chemicals. Many local, state and federal regulatory agencies employ toxicologists to assist in the development and enforcement of these laws. An increasingly important area of toxicology is in public communication of chemical risks. Toxicologists employed by regulatory agencies may often be called upon to explain the scientific basis for regulatory actions, or to assist in communicating to the public why regulatory actions are or are not taken in particular situations. There are many private consulting firms with expertise in toxicology that can now provide such services to local and state health departments, public utilities, private industries, etc. Thus, many employment opportunities in the private sector are available to the toxicologist interested in assisting public agencies and private industries in resolving many important public health and environmental problems. Some scientists like this aspect so much that they pursue consulting full-time.

Where Do Toxicologists Work?

The 'Job Market Survey' estimates that 9000 toxicologists are employed in North America. Of recent Ph.D.'s, 53% entered industry, 34% found positions in academia and 12% in government. These numbers are similar to overall employment statistics in the discipline as projected in the 'Job Market Survey.'

Comparison with other careers is possible by investigating the Occupational Outlook Handbook (http://www.bls.gov) produced by the U.S. Bureau of Labor Statistics.

Chemical, Consumer Products, Pharmaceutical and Other Industries

Industries are the number one employer of toxicologists (47%). Product development, product safety evaluation, and regulatory compliance generate a large job market for toxicologists. Pharmaceutical industries employ 17% of toxicologists, and chemical industries employ 7%. These industries often employ toxicologists trained at all levels of education. The 'Toxicologist Supply and Expertise Survey' found that, of recent graduates, 53% of those with Ph.D.s, 73% of those with master's degrees and 58% of those with bachelor's degrees entered industry. Many industries have their own research and product safety evaluation programs, while others may contract their work to specific research organizations that are managed independently from the industry.

Academic Institutions

Academic institutions are the number two employer of toxicologists (21%). The rapid growth in toxicology programs has generated a large and growing market for toxicologists with doctoral level training. Although most of these opportunities are in schools of medicine and/or public health in major universities, smaller colleges are beginning to employ

toxicologists to teach toxicology in basic biology, chemistry and engineering programs.

Government

Government is the third largest employer of toxicologists (14%). Although most government jobs are with federal regulatory agencies, many states are now beginning to employ toxicologists with masters or doctoral degrees.

Consulting

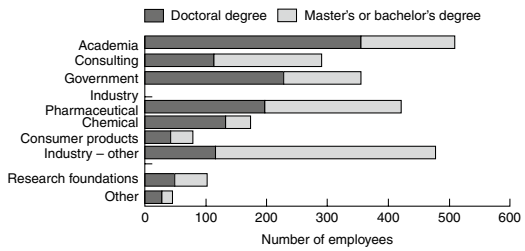
An increasing number of toxicologists are employed in the professional services industry (12%). Providing professional guidance and advice to local public agencies, industries and attorneys involved in problems with toxic chemicals is a rapidly growing activity for the experienced toxicologist. Many graduates of baccalaureate and master's programs in toxicology are finding employment with consulting firms. Individuals with doctoral training and several years of experience in applied toxicology may also find opportunities directing projects and serving as team leaders or administrators in the consulting field.

Research Foundations

A small proportion of toxicologists pursue research within nonprofit organizations (4%). Numerous public and private research foundations employ toxicologists to conduct research on specific problems of industrial or public concern. Toxicologists at all levels of education may work for these research foundations.

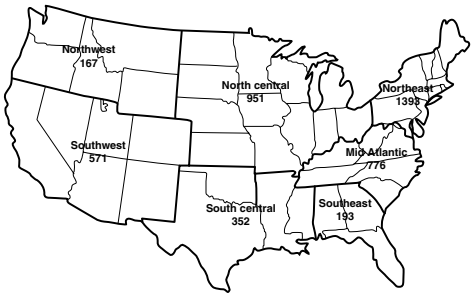
Regional Distribution of Toxicology Jobs

Although the majority of government and industry jobs are located in the eastern portion of the United States, employment opportunities at all levels are available throughout the country. The geographic distribution of SOT members in the continental United States reflects job distribution.



How Much Do Toxicologists Earn?

As with any profession, the level of education and length of experience are key determinants of salary. Entry level positions for those with doctoral degrees are often in the range of $35 000 to $60 000, with rapid advancement possible. In general, positions in industry pay slightly better than government or academia. Mid-range professionals with a Ph.D. degree and 10 years of experience can expect to earn $70 000 to $100 000 annually. Most executive positions in toxicology exceed $100 000 per year, and some corporate executive toxicologists earn $200 000 or more. Of course, salaries for those with master's and/or bachelor's degrees in toxicology will generally be less than those for individuals with doctoral degrees, but are still highly competitive with other science-based professions.



How Do I Prepare for a Career in Toxicology?

Jobs are available for recipients of associate through doctoral degrees. Candidates with two- or four-year degrees can work in toxicology as laboratory assistants, research technicians or animal care specialists.

Depending upon your career aspirations, a bachelor's degree may not be enough for you to achieve your goals. The higher the degree, the more likely your position will provide more opportunities, more responsibility and higher salaries. Of recent graduates from toxicology programs, 55% received Ph.D.s, 22% master's degrees, and 23% bachelor's degrees. According to the 'Job Market Survey,' about half of employed toxicologists have a Ph.D. Post-doctoral experience was considered an 'absolute' requirement by 29% of the employers who planned to hire toxicologists in the next few years; an additional 38% listed such experience as 'desired.' Post-doctoral training is a route to employment in toxicology for those with advanced degrees in other areas, such as the Ph.D. in other biomedical sciences, the M.D., or D.V.M.

In the 'Job Market Survey,' employers requested strong written and oral communication skills and knowledge of computers. Good laboratory practice, project management skills and statistics experience were also viewed as important. The fast pace of change

and future job market will favor workers who can demonstrate flexibility and adaptability.

High School

A strong foundation for any future scientist is based on skills in reading, writing, mathematics, computer science and communication, along with courses in biology, chemistry, and physics. Knowledge of a foreign language is important for exchanging information in our global society. Extra curricular activities such as science fairs and clubs build leadership experience. Part-time or summer work in a research laboratory is also valuable.

Undergraduate Education

If your institution does not have a baccalaureate program in toxicology, a major in biology or chemistry provides a basis for a career in this discipline. Take as many biology and chemistry courses as you can, as well as physics, computer science, statistics and mathematics (including calculus). Improve your writing and speaking skills, and develop a multidisciplinary foundation to increase your options and qualifications. While breadth in your undergraduate training is important, depth and experience provided by working in a laboratory or completing a student research project can be very important in increasing your skills and helping you determine the kind of science career that suits your interest and skills. Engage in activities that improve team-building aptitude, as well as those that improve hand–eye coordination. Join local and national scientific professional societies and participate in student-oriented events, regional and national meetings. All of these efforts will be repaid whether you enter the job market immediately after receiving your degree or pursue graduate study.

Financial Support

Information about financial aid is available on the world wide web at sites such as Financial Aid (http://www.finaid.org) and FastWeb (http://www.fastweb.com). Of special interest to members of groups underrepresented in the sciences is the Minority On-Line Information Service (MOLIS) (http://web.sciencewise.com/molis). MOLIS is a database including information on faculty and programs at about 300 minority institutions, as well as hyperlinks to other information that is of benefit to the minority education and research communities.

Preparation for Graduate Study

Careful planning and attention to your undergraduate courses will enhance your graduate education opportunities.

Most graduate toxicology programs have specific prerequisites for admission. In addition to a baccalaureate degree in a relevant field of study such as biology or chemistry, these requirements often include advanced coursework in chemistry, especially organic chemistry, at least one year of general biology, a year of college math including calculus, and general physics. Additional upper division courses in biochemistry, molecular biology and physiology will often increase your competitive advantage for admission. Effective communication is an important skill for toxicologists; therefore, coursework in scientific writing and public speaking is also useful. Involvement in extracurricular activities is a valuable way to develop and demonstrate your leadership and communication skills.

Consult the programs that are of interest to you to determine their specific admission requirements. In addition to a strong academic record, demonstration of basic laboratory and research skills and leadership abilities will increase your chances of admission to the more competitive programs. Undergraduate research experience or working during the summer in a research laboratory is a plus. From January to April each year, the SOT provides a listing of summer internships available in academic, industrial and government research laboratories across the country. Contact the SOT Headquarters office for more information about the Summer Internship Program.

Performance on the Graduate Record Examination is also important. You should take the exam at least nine months prior to the time you plan to begin your graduate study and you should prepare in advance for the exam.

If possible, plan to visit the programs you wish to consider in advance of your application process. Notify the director of the program of your interests and arrange to speak with the director and other faculty in the program.

An excellent source of information is Careers in Science and Engineering: A Student Planning Guide to Graduate School and Beyond (National Academy Press, 1996) (http://www.nap.edu/readingroom/books/careers). One example in this book traces the career path of a physicist into toxicology.

Graduate Training in Toxicology

Select a Program That's Right for You.

Identifying a graduate training program that is best for you requires some advanced planning. First, you should establish a potential career plan. Consider the various subspecialties in toxicology, such as neurotoxicology, chemical carcinogenesis, teratology, etc., to determine if there is a specific field of research that is of particular interest to you. Attending regional and

national scientific meetings will help you explore areas of interest. Although choosing a specialty early in your graduate education certainly does not commit you to this direction, it will help you in deciding which programs are most likely to meet your needs. It is also useful to talk with toxicologists in local universities, industries and governmental agencies to help you in your selection of a training program and future career direction. Make sure that you are able to satisfy all of the admission requirements prior to the time you intend to begin the program, as these requirements may vary between programs and from the general requirements described above. Geographical considerations are also important to some individuals. Some students balance employment and graduate study. The list of academic programs in toxicology contained in this Guide should help you find the right program for you.

Tips for success in graduate school can be found in Peterson's Graduate School Survival Guide (http://www.petersons.com/graduate/transition1.htm).

Financial Support

Most students in toxicology graduate programs have financial support, which can come from a variety of sources.

Academic Institutions

Many universities have funds to support graduate students during their training. These awards are generally offered as either Teaching Assistantships (TAs) or as Research Assistantships (RAs). As TAs, students generally assist in the preparation and teaching of undergraduate or graduate courses, and obtain valuable experience in teaching that will help them in their future careers as toxicologists. RAs generally assist faculty in research on specific topics or provide general assistance to multiple faculty in the program. Check with the specific academic program directors for more information on the availability of student support for graduate training at your school of choice.

The Government

Research Manpower Development Programs

The National Institute of Environmental Health Sciences (NIEHS) supports research training in four areas related to toxicology: (a) environmental toxicology, emphasizing training in the principles that determine the effects of exposure to environmental agents; (b) environmental pathology, emphasizing training in chemical (as opposed to infectious disease) pathology; (c) environmental mutagenesis, emphasizing training in the application of the principles of genetics and biochemistry to assess the potential genetic hazards to man from environmental chemicals; and (d) environmental epidemiology and biostatistics, emphasizing training in the use of statistical and mathematical tools to assist in the identification of environmental diseases in human populations and in experimental design and interpretation of data.

NIH Individual Investigator Research Awards

Many toxicologists in academic institutions who receive grant support from the National Institutes of Health (NIH) have RAs. These RA positions are often used to support graduate students in their final years of dissertation research. The level of support for a RA may vary from institution to institution, but are generally similar or slightly higher than training grant stipends.

Other Federal Programs

In addition to the specific programs noted above, federal support for graduate training may be available through other training programs or research grants and contracts available from other federal agencies such as the National Science Foundation, the Armed Forces, the EPA, the Department of Defense or the Department of Energy.

The Private Sector

The SOT selects several pre-doctoral students each year for Graduate Fellowship awards. These awards are currently sponsored by the Covance Company, Novartis, and The Procter & Gamble Company. Any student member of the SOT who has (at time of award) completed one year, but not more than three years, of graduate study towards the Ph.D. degree in an area of toxicology, and whose major professor is a member of the SOT is eligible. The Education Committee evaluates candidates on scholastic achievement, letters of recommendation and the dissertation research. Applications and further information are available from the SOT Web site.

Individual academic programs may receive graduate student training support from sponsoring industries or foundations.

Post-doctoral Training in Toxicology

If you've already completed a doctoral degree in a biomedical science, you can enter the field of toxicology by spending two to three years as a post-doctoral fellow in a toxicology laboratory. Post-doctoral education of a toxicologist takes many forms depending on the goal of the scientist. Post-doctoral experience is necessary for most academic and research positions, but is not a requirement for many other positions in government or industry.

Post-doctoral experience can further enhance the marketability of a toxicologist. Recent toxicology graduates may lack experience in project management, people management and grant-writing, and experience in these areas can be gained during post-doctoral training. Although higher numbers of toxicologists are undertaking post-doctoral training in recent years, a smaller proportion of the total number of graduates are engaged in post-doctoral fellowships – 30% in 1990–1995 vs. 43% in 1984–1989.

The SOT Career Resource and Development Services maintains an active list of post-doctoral opportunities available in toxicology. You may obtain more information about the Career Resource and Development Services by visiting the SOT website, or by contacting the SOT.

Government-sponsored Programs

Numerous government agencies provide post-doctoral training programs in toxicology at agency facilities such as the EPA (in its regional laboratories), the FDA at its Beltsville and National Center for Toxicology Research facilities, Occupational Safety and Health Administration, Center for Disease Control's National Institute for Occupational Safety and Health, and the many National Institutes of Health laboratories, especially NIEHS.

A time-honored post-doctoral training route has been through investigator-initiated research grants, which focus the post-doctoral fellow in the area of the mentor. Most researchers at academic institutions who receive federal research grants have funds to support post-doctoral fellows. One means of exploring post-doctoral opportunities is to directly contact individual faculty from graduate programs in toxicology.

In addition to individual research grants, many academic programs receive federal training grants with funds specifically dedicated to post-doctoral training. For example, the NIEHS provides post-doctoral fellowships to academic institutions for post-doctoral training in environmental toxicology and/or environmental pathology. Consult the 'Employment and Training Opportunities' on the NIEHS website (http://www.niehs.nih.gov). You can also write to the Program Administrator (Scientific Programs Branch, MD 3/03, NIEHS, Division of Extramural Research and Training, P.O. Box 12233, Research Triangle Park, NC 27709) to obtain a list of academic programs that receive NIEHS-sponsored post-doctoral training grants in toxicology.

Industry-sponsored Programs

Many companies that employ toxicologists (such as pharmaceutical, chemical, food and automotive companies) provide post-doctoral training opportunities for individuals with doctoral degrees in toxicology or related disciplines.

Another often-overlooked source of post-doctoral training is the contract laboratory. The contract laboratory exposes the early career scientist to the broadest issues in general toxicology, especially testing and preparing documents for submission to regulatory agencies. In many respects, this type of experience represents the practice or art of toxicology, while the university experience represents the science of toxicology.

The Colgate-Palmolive Company offers the Colgate-Palmolive Post-Doctoral Fellowship, which is directed specifically toward innovations in toxicology methodology involving alternatives to whole animal use in testing. This award is administered through the SOT, and further information can be found on the SOT website.

Toxicology Survey References

Information on career outlook and salary is based on the following five reports available on the SOT website.

Gad SC (2005) Sixth Triennial Toxicology Salary Survey. Intern. J. Toxicol.

Gad SC (2002) Fifth Triennial Toxicology Salary Survey. Intern. J. Toxicol. 21.

Gad SC (1999) Fourth Triennial Toxicology Salary Survey and Trends in the Toxicology Job Market. Intern. J. Toxicol. 18: 219–225.

Job Market Survey: Past, Present, and the Future. (1997) SOT Placement Committee Report.

Toxicologist Supply and Expertise Survey: Past, Present, and Future. (1998) SOT Placement Committee Report.

Organizations Supporting Careers in Toxicology

American College of Medical Toxicology (ACMT)

ACMT is a professional, non-profit association of physicians with recognized expertise in medical toxicology, focusing on the diagnosis, management and prevention of poisoning/toxicity and other adverse health effects due to medications, chemicals, occupational and environmental toxins, and biological hazards.

British Society of Toxicology (BTS)

Web: http://www.thebts.org/index.php?content=yt

BTS provides students wanting to learn more about toxicology or seeing careers in toxicology (Young Toxicologists (YTP)) in the UK.

International Union of Toxicology (IUTOX)
Web: http://www.iutox.org/whatisiutox.asp

IUTOX fosters international scientific cooperation among toxicologists and promotes global acquisition, dissemination, and utilization of knowledge in the science of toxicology and ensures continued training and development of toxicologists worldwide.

Society of Toxicology (SOT)
Web: http://www.toxicology.org/ai/apt/career-programs.asp
Web: http://www.toxicology.org/ai/apt/careerguide.asp#How%20Do%20I%20Prepare

SOT, a U.S.-based organization, has an extensive web-based Resource Guide to Careers in Toxicology as well as information on training programs.

Toxicology Teaching Project (Indiana University of Pennsylvania)
Web: http://nsm1.nsm.iup.edu/tsimmons/Tox_Teach_Project_Home.shtm

This project is a joint venture between the Allegheny-Erie Regional Chapter of the Society of Toxicology and the Environmental Health Science Program of Indiana University of Pennsylvania.

Academic Programs

University Listings of Undergraduate, Graduate, Post Graduate Distance Leaning Opportunities

In larger part, the below list was adapted from the Society of Toxicology's 'Academic and Post-Doctoral Toxicology Programs and Web Sites' available on web at:

http://www.toxicology.org/ai/apt/careerprograms.asp. The SOT website contains additional references and material on toxicology careers that students will find useful.

Brown University
Providence, RI
Pathobiology: Environmental Pathology Program
Degrees offered: Ph.D., M.D./Ph.D.
Contact information
Department/College: Department of Pathology and Laboratory Medicine

CIIT Centers for Health Research
Research Triangle Park, NC
Post-Doctoral Toxicology Training
Contact information
CIIT Centers for Health Research
Web: http://www.thehamner.org/program/index.html

Clemson University
Pendleton, SC
Institute of Environmental Toxicology Program
Degrees offered: M.S., Ph.D.

Medical Toxicologist

Medical toxicologists are physicians with recognized expertise in the diagnosis, management, and prevention of poisoning/toxicity and other adverse health effects due to medications, chemicals, occupational and environmental toxins, and biological hazards. Medical toxicology is officially recognized as a medical subspecialty by the American Board of Medical Specialties (ABMS). The American College of Medical Toxicology (ACMT) is a professional, non-profit association that supports physicians with recognized expertise in medical toxicology and is dedicated to advancing the science and practice of medical toxicology. A list of

training programs in medical toxicology is available from ACMT (http://www.actox.org/) and a list of programs accredited by the American Council of Graduate Medical Education (click on 'List of Programs by Specialty' and then select 'Medical Toxicology').

CONTINUING EDUCATION FOR PROFESSIONALS

American Board of Toxicology, Inc. (ABT)
Web: http://www.abtox.org/.

A professional certification program for toxicologists is offered by this group.

American Industrial Hygiene Association (AIHA)
Web: http://www.aiha.org/Content

Has a number of programs of interest to toxicologists and industrial hygiene professionals.

British Society of Toxicology (BTS)
Web: http://www.thebts.org/

Provides information on continuing professional development and educational courses available in the United Kingdom.

Canadian Network of Toxicology Centres (CNTC)
Web: http://www.uoguelph.ca/cntc/

Focused on advanced principles in toxicology.

CIIT Centers for Health Research (CIIT)
Web: http://www.thehamner.org/

Offers training in toxicology to scientists at every career level and offers stipends and benefits.

National Environmental Health Association (NEHA)
Web: http://www.neha.org/

Incorporated in 1937, offers extensive training in toxicological sciences.

National Institute for Environmental Health Sciences (NIEHS)
Web: http://www.niehs.nih.gov/health/scied/prodevelop/index.cfm

A variety of training programs for scientists.

Society of Toxicology (SOT)
Web: http://www.toxicology.org/ai/ce/ce.asp.

Produces yearly continuing education courses at their annual meeting and has information about current and past courses.

US Army Center for Health Promotion and Preventive Medicine
Web: http://chppm-www.apgea.army.mil/tox/home.aspx

The Directorate of Toxicology of the US Army specializes in the toxicology of military supplies and unique chemicals.

CHAPTER

73

Public Education

STEVEN G. GILBERT AND KATIE FREVERT

INTRODUCTION

> It is not the truth that makes you free. It is your possession of the power to discover the truth. Our dilemma is that we do not know how to provide that power.
>
> Richard Lewontin (New York Review of Books, January 7, 1997)

Education lays the foundation for a civil society by empowering people with tools for life-long learning, a common set of information, and sets the course of the future leaders of our society. One of the challenges of education and education-related resources is the need for a range of material depending on age and background. This chapter addresses resources for teachers and students in K-12 classrooms, and continuing education for the interested public. It includes separate sections on environmental justice and relevant Spanish language resources.

Knowledge about the health effects of chemicals influences decisions that affect not only our individual lives but also our community. The principles of toxicology – dose/response and hazard/exposure – influence the environments in which we live and potentially hazardous effects of the products we buy. We are continuously learning more about what affects environmental and human health; this learning and the knowledge derived from it needs to start in K-12 classrooms.

Opportunities are being sought by educators to integrate environmental health topics and toxicology into a variety of subject areas – mathematics, science, language, arts, and social studies. Environmental health issues are compelling, current, and relevant to young people. They provide the context in which to teach critical thinking and problem-solving skills in multiple disciplines. Rather than compete for class time, environmental and toxicology education fits well within the range of subjects students are traditionally expected to master. Curricula available in this chapter are written to meet the learning objectives and benchmarks that are part of education today.

For K-12 teachers there are a number of general resources that provide an excellent overview of toxicology. Several of these have been developed by government agencies or professional organizations. Video resources for teachers were given a separate heading. The videos referenced are at a middle school/high school level. A broad range of curricula are included that address toxicological issues at different grade levels. In addition, listed under a separate heading, are resources and interactive activities targeted directly for a student's use. Most of these resources are web-based and most are downloadable.

The toxicology texts are directed at K-12 teachers or more senior students. The journal cited is specifically for secondary students. The journal articles listed are drawn from science journals and address educational challenges and successes related to working with K-12 students in toxicology and environmental health sciences.

Equally relevant to non-professional education is material directed toward the general public, media, and government representatives. One's work environment or family life may promote different concerns about chemical exposures. Resources directed to the lay person or non-professional is listed in a separate category but many of the K-12 materials may also be useful. Issues related to environmental justice were listed separately to emphasize the importance of this growing

area. The organizations included offer excellent educational material and guidance in addressing issues at a local level. A growing list of resources in Spanish is available to the public. Communication of health risks to all people remains a societal imperative. This requires that information be provided to meet individual and collective needs in schools, at home, and in the workplace.

The resources presented in this chapter focus primarily on K-12 educational resources and resources useful for the general public. Information for those seeking careers in toxicology is in Chapter 72. An excellent national resource that contains a broad range of information on Education, Careers, and Outreach is at the National Library of Medicine, National Institutes of Health (http://sis.nlm.nih.gov/enviro/edcotox.html).

K-12 EDUCATIONAL RESOURCES

Books

Friis RH (2007)
Essentials of Environmental Health
Jones & Bartlett Publishers
Jones and Bartlett Publishers, Sudbury, Massachusetts, Boston, Toronto, London

A comprehensive study of the major topics in environmental health: toxicology, environmental epidemiology and environmental policy and regulation.

Gilbert SG (2004)
A Small Dose of Toxicology – The Health Effects of Common Chemicals
CRC Press, Boca Raton, FL
Web: http://www.asmalldoseof.org

An introductory text on toxicology that introduces the principles of toxicology and covers a number of common agents, targets of toxic agents, and applied toxicology. The website contains references and PowerPoint presentations for each chapter.

Journals

EHP Student Edition (2005–)
The EHP Science Education Program
Web: http://www.ehponline.org/science-ed-new/resources.html

A library of over 90 science and interdisciplinary lessons based on selected articles and scientific research published in Environmental Health Perspectives. Lessons advance critical basic skills through the context of engaging, current environmental health topics. Grades 9–12 in biology, chemistry, environmental science, geology, and physical science. Many lessons are also appropriate for undergraduates. Lessons and corresponding news articles are downloadable and free.

General Educational Resources

A to Z Index
The National Centers for Disease Control
Web: http://www.cdc.gov/az/a.html

This site acts as a current resource for information on any health topic.

Center for Toxicology Educational Activities and Curricula
University of Arizona College of Pharmacy, NIEHS Center, Toxicology and Environmental Health Program
Web: http://coep.pharmacy.arizona.edu/curriculum/

K-12 educational activities, includes online lesson plans with labs, curricula, Power Point presentations.

Education, Careers, and Outreach
National Library of Medicine
National Institutes of Health
Web: http://sis.nlm.nih.gov/enviro/edcotox.html

This provides information and links to a broad range of toxicology educational materials from K-12 to advanced degrees.

Education Materials
Northwest Association for Biomedical Research
Web: http://www.nwabr.org/education/index.html

Secondary-level curriculum on ethics, HIV, stem cells, animal testing and consumer awareness.

The EHP Science Education Program
Web: http://www.ehponline.org/science-ed-new/

A library of over 90 science and interdisciplinary lessons based on selected articles and scientific research published in *Environmental Health Perspectives*. Lessons advance critical basic skills through the context of engaging, current environmental health topics. Grades 9–12 in biology, chemistry, environmental science, geology, and physical science. Many lessons are also appropriate for undergraduates. Lessons and corresponding news articles are downloadable and free.

Environmental Health Science Education
The National Institute for Environmental Health Sciences (NIEHS)
Web: http://www.niehs.nih.gov/health/scied/teachers/

Resources for K-12 teachers. Curricular materials, lesson resources, fact sheets, booklets. The home page address directs users to downloadable lessons and activities online and web-based for teachers related to toxicology or environmental health sciences. Site includes many links to activities, tools and resources, with an associated student page.

EPA Teaching Center
United States Environmental Protection Agency
Web: http://www.epa.gov/teachers/

Curriculum resources page with links for environmental health topics, including but not limited to: air, human health, waste and recycling, and water.

The North American Association for Environmental Education (NAAEE)
Web: http://www.naaee.org/

The North American Association for Environmental Education (NAAEE) is a network of professionals, students, and volunteers working in the field of environmental education throughout North America and in over 55 countries around the world.

Toxicology for K-12 Educators
Society of Toxicology
Web: http://www.toxicology.org/ai/k12o/k-12educators.asp

This site offers: toxicology curriculum resources, professional development opportunities for K-12 educators, direct web links to other teacher resources.

Curriculum Materials

AMBIENT – Atmospheric and Marine-based Interdisciplinary Environmental Health Training Modules
University of Miami, Rosenstiel School of Marine and Atmospheric Science

Web: http://www.rsmas.miami.edu/groups/niehs/ambient/modules.html

Four curriculum modules in booklets and on web, for Grades 5–8. Contaminants affecting human health: in water, soil, air, and food.

Assessing Toxic Risk
Cornell University, National Science Foundation
Web: http://ei.cornell.edu/pubs/atr.asp

High-school-level curriculum about toxicology concepts. Focus on bioassays; e.g. testing the effects of chemicals on duckweed, daphnia, or seed germination. Includes laboratory activities, and a section to help students plan bioassay experiments to test the effects of suspected toxics. Student and teacher editions are available (for purchase).

Chemicals, the Environment and You: Explorations in Science and Human Health.
Curriculum and CD-ROM
National Institutes of Health, Office of Science Education and National Institute of Environmental Health Sciences
Web: http://science.education.nih.gov/Customers.nsf/MSEnvironment.htm

Students in Grade 6–7 explore the relationship between chemicals in the environment and human health, utilizing basic concepts in the science of toxicology. This curriculum includes six hands-on activities that will encourage students to think about chemical exposures, dose–response, and individual susceptibility.

Crabby Kathy
University of Medicine and Dentistry of New Jersey-School of Public Health with the Public Education and Risk Communication Division, Environmental and Occupational Health Sciences
Web: http://kids.niehs.nih.gov/kathy/home.htm

Grade K-6. Storybook chronicles the experience of a third-grade class as they investigate an environmental health issue of their teacher Kathy.

Enviro-Health Links – Education, Careers, and Outreach
Web: http://sis.nlm.nih.gov/enviro/edcotox.html

Resource links provided by the U.S. National Library of Medicine, Environmental Health & Toxicology.

Enviro-Health Connections
Maryland Public Television and Johns Hopkins University Bloomberg School of Public Health
Web: http://www.thinkport.org/classroom/connections/default.tp

Web-based format for teachers and their students to explore the relationships between the environment and human health. Grades 5–12. The complex questions raised by environmental health issues can be addressed in the context of classes in language arts, social studies, mathematics, as well as science and health.

Environmental Health Fact Files: LEAD and ASTHMA
University of Washington, NIEHS Center for Ecogenetics and Environmental Health Sciences
Web: http://www.iehmsp.com/online/teachers/EH_fact_files.php

Interdisciplinary curricular materials designed to integrate environmental health across the middle school curriculum. Each Environmental Health Fact File focuses on an environmental health topic (lead and asthma) of importance to middle school students and their teachers. Lessons in mathematics, science, language arts and social studies (free and downloadable).

Exploring Environmental Issues: Focus on Risk
American Forest Foundation, Project Learning Tree
Web: http://www.plt.org/curriculum/risk.cfm

High-school-level module helps students explore the different aspects of environmental and human health risks that affect their everyday lives. It incorporates science, social studies, math, geography, and language arts. Through eight hands-on activities, students analyze, explore, discover, and learn about risk assessment, risk communication, risk perception, and risk management (free to teachers who participate in training).

Hydroville Curriculum Project
Oregon State University, Environmental Health Sciences Center and Marine Freshwater Biomedical Sciences Center
Web: http://www.hydroville.org

Grades 9–12. Environmental health scenarios that are real-world scenarios based on actual occurrences and real data.

My Health My World
Baylor College of Medicine
Web: http://kids.niehs.nih.gov/baylor/home.htm

Grades K-4. Storybooks, teacher guides, magazines for students. Inquiry-based, educational materials on environmental health issues. Students learn fundamental physical and life science concepts and acquire problem-solving and decision-making skills.

PEER – Partnership for Environmental Education and Rural Health

Texas A&M University, Department of Veterinary Anatomy and Public Heath
Web: http://peer.tamu.edu/index.html

Environmental health science curriculum modules for middle school science and non-science classes. Web-links to related resources for teachers

Peril
Canadian Network of Toxicology Centres, University of Guelph
Web: http://www.uoguelph.ca/cntc/educat/peril/index.html

Middle school grade level. A game of risk perception (available for purchase).

The Trouble in Fruitvale and Thresholds & Toxicology, SEPUP Modules
Lawrence Hall of Science, UC Berkeley
Web: http://www.lawrencehallofscience.org/sepup/

Grades 6–12. One of a series of SEPUP (Science Education for Public Understanding) modules. Activities use inquiry-based problem-solving approaches to learning. Science kits cover topics such as risk, threshold limits, water quality, toxic waste, food additives, household chemicals, product safety and government approvals for new products. Each module includes a kit containing materials needed to complete the activities, student pages, and background and instructional materials for the teacher (available for purchase).

The Living Environment – Toxicology Lessons
Science NetLinks, American Association for the Advancement of Science
Toxicology 1: Toxicology and Living Systems
Web: http://www.sciencenetlinks.com/lessons.cfm?DocID=429
Toxicology 2: Finding the Toxic Dose
Web: http://www.sciencenetlinks.com/lessons.cfm?DocID=430
Toxicology 3: Toxicology and Human Health
Web: http://www.sciencenetlinks.com/lessons.cfm?DocID=431
Toxicology activities for secondary teachers (free).

The Quicksilver Question
University of Washington, NIEHS Center for Ecogenetics and Environmental Health Sciences
Web: http://www.iehmsp.com/online/webModules/qsIntro.php

This middle-school-level web module is an innovative, interactive computer-based curriculum that introduces basics of environmental health and toxicology. Students solve the mercury mystery by using community resources to find a solution. Extension lessons for mathematics, science, language arts and social studies (free and downloadable).

The Toxicology Study Guide
The Canadian Network of Toxicology Centres (CNTC)
Web: http://www.uoguelph.ca/cntc/educat/guide/study.shtml

The Toxicology Study Guide – An Environmental Education Unit for Secondary Schools and Communities (English, French).

The Unsolved Mysteries of Human Health: How Scientists Study Toxic Chemicals (Hydroville Supplement)
Oregon State University, Environmental Health Sciences Center and Marine Freshwater Biomedical Sciences Center
Web: http://www.unsolvedmysteries.oregonstate.edu/

This secondary-level teaching tool addresses complex concepts with scientific accuracy and through non-technical language.

Toxic Leak!
Event-Based Science
Web: http://www.ebsinstitute.com/ebs.ToxicLeak.html

Grades 7–12. Book and accompanying video. An interdisciplinary curriculum centered around a real gasoline leak, that contains activities to study groundwater, pollution, permeability and porosity of soils, and geology. The unit is inquiry-oriented and emphasizes cooperative learning, teamwork, independent research, and hands-on investigations.

ToxRAP (Toxicology, Risk Assessment and Pollution)
Rutgers, University of Medicine and Dentistry of New Jersey-School of Public Health
Web: http://eohsi.rutgers.edu/rc/

Grades K-9. Lesson plans, oversized children's storybook and a game for students. Activities and lessons use a risk assessment framework that draws upon processes and tools from toxicology, environmental health risk assessment and risk management. The Case of the Green Feathers (K-3), What is Wrong with the Johnson Family (3–6), Mystery Illness Strikes the Sanchez household (6–9) (available for purchase).

Video Resources for Educators

EnviroMysteries: 'Water+?=Trouble'
Maryland Public Television and Johns Hopkins University Bloomberg School of Public Health

Web: http://enviromysteries.thinkport.org/watertrouble.html

Grades 5–9, video and hardcopy teacher's guide. The first episode of *EnviroMysteries*, students are introduced to environmental health concepts through the eyes of a young group of television journalists, who are chronicling the local health department's investigation of a waterborne illness.

EnviroMysteries: 'Breaking the Mold'
Maryland Public Television and Johns Hopkins University Bloomberg School of Public Health
Web: http://enviromysteries.thinkport.org/breakingthemold/

Grades 5–9, video and hardcopy teacher's guide. This video and accompanying extensive online educational resources look at health and airborne illness and empower students to take an active role in environmental issues that can affect their health today and in the future.

Is It Safe – Video
Toxicology Education Foundation
Web: http://www.toxedfoundation.org/video_pg.html

A 17-minute video on the basic concepts of toxicity, exposure, and risk with a goal of empowering the public to make good decisions about risk associated with everyday products (downloadable or available free on DVD).

Kids and Chemicals – Facts and Laws
Public Broadcasting System
Web: http://www.pbs.org/now/classroom/classroom_kids1.html

Online lessons for grades 9–12. Includes identification of synthetic chemicals and how they affect people. Used with PBS NOW program video (available for purchase).

TRADE SECRETS: A MOYERS REPORT
Public Broadcasting System – PBS Bill Moyers and Sherry Jones
Web: http://www.pbs.org/tradesecrets/program/program.html

Bill Moyers investigation of the history of the chemical revolution and the companies that drove it. Today, every man, woman, and child has synthetic chemicals in their bodies. No child is born free of them. Crucial questions raised by the documentary and addressed in a panel discussion moderated by Bill Moyers in the program's final half hour (available for purchase).

Students' Resources

NIEHS Resource Page for Students
The National Institute for Environmental Health Sciences (NIEHS)

Materials and activities help students understand links between human health and the environment. Lists research and job opportunities in the field for students.

Environmental Diseases from A to Z
The National Institute for Environmental Health Sciences (NIEHS)
Web: http://www.niehs.nih.gov/health/topics/atoz/

Environmental Health and Science Hot Topics
The National Institute for Environmental Health Sciences (NIEHS)
Web: http://www.niehs.nih.gov/kids/hottopics.htm

Peril
Canadian Network of Toxicology Centres, University of Guelph
Web: http://www.uoguelph.ca/cntc/educat/peril/peril_orders.htm

A game of risk perception for secondary age students, must be ordered (available for purchase).

The Quicksilver Question Interactive Web Module
University of Washington, NIEHS Center for Ecogenetics and Environmental Health Sciences
Web: http://www.iehms.com/online/webModules/qsStudents.php

An innovative, interactive computer-based learning activity based on a community environmental health topic (click on 'For Non- Student's' at bottom of the page) (free).

ToxMystery
US National Library of Medicine
Web : http://toxmystery.nlm.nih.gov

An interactive learning site, designed to help kids age 7 to 10 find clues about toxic substances that can lurk in the home. With lively animations, surprising sound effects and lots of positive reinforcement, ToxMystery provides a fun, game-like experience, while teaching important lessons about potential environmental health hazards (free).

Tox Town
US National Library of Medicine
Web: http://toxtown.nlm.nih.gov/

Interactive activity for elementary and secondary students exploring commonly encountered toxic chemicals, environmental health risks, and the public's health (free).

Toxicology for K-12 Students
Society of Toxicology
Web: http://www.toxicology.org/ai/k12o/k-12students.asp

Web pages to investigate science and explore careers.

PUBLIC EDUCATION RESOURCES

Agency for Toxic Substances and Disease Registry/U.S. (ATSDR)
US Department of Health and Human Services
Web: http://www.atsdr.cdc.gov/

ATSDR serves the public by using the best science, taking responsive public health actions, and providing trusted health information to prevent harmful exposures and diseases related to toxic substances.

The Canadian Network of Toxicology Centres (CNTC)
2nd Floor, Bovey Bldg
Gordon Street
University of Guelph
Guelph, Ontario. N1G 2W1
Phone: 519-824-4120 ext. 52950
Fax: 519-837-3861
Email: dwarner@uoguelph.ca
Web: http://www.uoguelph.ca/cntc/

CNTC, formed in 1988, has as one of its missions to 'transfer information and achieve toxicological literacy among all Canadians.'

Toxicology Education Foundation
P.O. Box 31021
Raleigh, North Carolina 27622-1021
Phone: 919-676-4666
Fax: 919-841-5042
Email: tefhq@toxedfoundation.org
Web: http://www.toxedfoundation.org/

The Toxicology Education Foundation's purpose is to encourage, support, and promote charitable and educational activities that increase the public understanding of toxicology.

Toxicology Problem Set
The Southwest Environmental Health Sciences Center
The Biology Project
The University of Arizona
Tucson AZ 85721
Phone: 520-621-2211
Web: http://www.biology.arizona.edu/chh/problem_sets/toxicology/toxicology.html

Eleven problem sets designed to elucidate the basic principles of toxicology.

Toxicology Tutorials
U.S. National Library of Medicine, Environmental Health & Toxicology
2 Democracy Plaza, Suite 510
6707 Democracy Blvd., MSC 5467
Bethesda, MD 20892-5467
Phone: 301-496-1131 (local and international)
Fax: 301-480-3537
Toll free: 1.888.FINDNLM
Email: tehip@teh.nlm.nih.gov
Web: http://www.sis.nlm.nih.gov/enviro/toxtutor.html

Three toxicological tutorials that cover basic principles, toxicokinetics, and, cellular toxicology. Currently undergoing revision in a joint project with the U.S. Society of Toxicology. To be renamed ToxLearn.

World Wildlife Fund
Toxic Chemicals
1250 Twenty-Fourth Street, N.W.
P.O. Box 97180
Washington, DC 20090-7180
Phone: 202-293-4800
Email: membership@wwfus.org
Web: http://www.worldwildlife.org/toxics/

ENVIRONMENTAL JUSTICE RESOURCES

Center for Community Action and Environmental Justice (CCAEJ)
PO Box 3 3124
Riverside, CA 92519
Phone: 951-360-8451
Fax: 951-360-5950
Email: admin@ccaej.org
Web: http://www.ccaej.org

The Center's goal is to bring groups of people together to find opportunities for cooperation, agreement and problem solving, with resource for community groups in English and Spanish.

Center for Health, Environment and Justice (CHEJ)
P.O. Box 6806
Falls Church, VA 22040-6806
Phone: (703) 237-2249
Email: chej@chej.org
Web: http://www.chej.org/

Through training, coalition-building and one-on-one technical and organizing assistance, CHEJ works to build healthy communities, with social justice, economic well-being, and democratic governance.

Community Coalition For Environmental Justice
1620 18th Ave
Suite 10
Seattle, WA 98122
Phone: 206-720-0285
Fax: 206-720-5241
Email: justice@ccej.org
Web: http://www.ccej.org/

A Seattle Washington organization provides community education, speakers, activism opportunities, and an EJ library.

Environmental Coalition of South Seattle
8201 10th Avenue South, #3
Seattle, WA 98108
Phone: 206-767-0432
Fax: 206-767-0203
Email: ecoss@ecoss.org
Web: http://www.ecoss.org

A Seattle, Washington-based group that provides education and other resources on environmental health issues in south Seattle.

Environmental Justice & Health Union
528 61st Street, Suite A
Oakland, CA 94609
Phone: not available
Email: ejhu@ejhu.org
Web: http://www.ejhu.org/

The mission of the Environmental Justice and Health Union is to identify tools to help environmental justice activists and environmental health professionals work together to stop environmental disease in low-income communities of color in the United States.

Environmental Justice Resource Center (EJRC) of Clark Atlanta University
223 James P. Brawley Drive
Atlanta, GA 30314
Phone: 404-880-6911
Fax: 404-880-6909
Email: ejrc@cau.edu
Web: http://www.ejrc.cau.edu/

EJRC is an excellent resource for reports, news, books, and other materials on EJ. EJRC was formed in 1994 to serve as a research, policy, and information clearinghouse on issues related to environmental justice, race and the environment, civil rights, facility siting, land use planning, brownfields, transportation equity, suburban sprawl, and Smart Growth.

Greenaction for Health and Environmental Justice
One Hallidie Plaza
Suite 760
San Francisco, CA 94102
Phone: 415-248-5010
Fax: 415-248-5011
Email: greenaction@greenaction.org
Web: http://www.greenaction.org/

Focused primarily in Southwest U.S., Greenaction mobilizes community power to win victories that change government and corporate policies and practices to protect health and to promote environmental justice.

U.S. Environmental Protection Agency Environmental Justice
Mail Code: 2201A
1200 Pennsylvania Ave., NW
Washington, D.C. 20460-0001
Phone: 800-962-6215
Email: visit web site to contact
Web: http://www.epa.gov/compliance/environmentaljustice/

U.S. EPA has a wide range of resources and good source for laws, regulations, programs, and grant information.

Environmental Community Action (ECO-Action)
The Grant Building
44 Broad St. NW, Suite 711
Atlanta, GA 30303
Phone: 404-584-6499
Fax: 404-584-6497
Email: contactus@eco-act.org
Web: http://www.eco-act.org/

An Atlanta, Georgia-based organization with a resources and examples of local EJ actions. The site includes training programs on the precautionary principle.

West Harlem Environmental ACTion (WEACT)
WE ACT, Inc.
271 West 125th Street, Suite 308
New York, New York 10027-4424
Email: Peggy@weact.org
Web: http://www.weact.org/

WEACT is a non-profit organization working to improve environmental policy, public health, and quality of life in communities of color. WEACT advances its mission through research, public education, advocacy, organizing, government accountability, litigation, legislative affairs and sustainable economic development.

SPANISH RESOURCES

Dictionary of Environmental Science and Engineering: English–Spanish/Spanish–English
Howard Headworth, Sarah Steines
ISBN: 0-471-96273-2
Wiley
Paperback, 324 pages
February 1998
Web: http://www.wiley.com/WileyCDA/WileyTitle/productCd-0471962732.html

Is It Safe – Video – Spanish language version
Toxicology Education Foundation

A 17-minute video on the basic concepts of toxicity, exposure, and risk with a goal of empowering the public to make good decisions about risk associated with every day products (downloadable or available free on DVD).

Toxicologia Ambiental: Evaluation de Riesgos y Restauracion Ambiental – (Spanish Language Program from the University of Arizona)

CHAPTER

74

Grants and Funding

FREDERICK W. STOSS

INTRODUCTION

'Competition for research funds has always been a problem for researchers investigating various aspects of toxicology and environmental health.' This is the first sentence of this chapter in the previous installment of *Information Resources in Toxicology*. This chapter was introduced in the 3rd edition, and its introduction rings more loudly a decade later. The same needs to support and fund basic and applied research, educational opportunities, and activism at the grassroots and community level is, perhaps, more acute now than then. Our understanding of the complexities of living organisms to toxic exposures expands rapidly and is now being studied at molecular levels only speculated a decade ago. As during other eras of great exploration there remains a constant – the need for funding and support for the research spawned from the initial ideas and stimulations of that exploration.

In 1997, the National Academy of Sciences (NAS), the National Academy of Engineering (NAE), the Institute of Medicine (IOM) and the National Research Council (NRC) joined together to launch Shaping the Future, the first Academies-wide fundraising initiative in our history. More than $300 million were raised. The National Academies address critical national issues and provide cogent, unbiased advice to the United States government and its citizens in matters of science, engineering, and medicine. They still need sources outside the funding from the Federal government to support their missions. The Foundation Gateway is a resource for foundations and other private funders and organizations that are interested in supporting the work of the National Academies (see: http://www.nas.edu/gateway/foundations/engineering.html).

There is a bitter irony that this chapter on financial support for research and education in the areas related to toxicology are written as forecasters place the U.S. and the world's economies in a global recession. These general negative tones for the overall economy give rise to the pessimism for the funding of basic research and development activites and educational support. Newsletters, blogs and trade journals will provide needed current-awareness services.

John Billings (2007), professor of health policy and public service (New York University) and former foundation executive, stated, 'At last estimate, private foundations had assets of more than $550 billion and gave out almost $41 billion annually, and these numbers will continue to grow as high-tech and financial investment entrepreneurs begin to cash out.' While these numbers are impressive by themselves, they do not necessarily reflect the current state of affairs for government funding in the areas related to environmental and public health.

The period of time from 2007 to early 2008 was marked by various editorial commentaries, news articles, and features noting the inadequacy of funding science and health-related research in the first years of the new millennium. Joycelyn Kaiser (2007) comments on the continuing trend in the success rate of proposed biomedical science funding from the U.S. National Institutes of Health (NIH) in 2008. 'According to data from the presidential budget request, the success rate for researchers seeking for NIH grants is expected to drop from 21% in 2007 to

19% in 2008. The falling numbers have been due to the decreasing budget from the government to finance NIH grants.' An article by Jeffrey Levi, Chrissie Juliano, and Maxwell Richardson in the trade magazine, *Nation's Health* ('Federal Funding for Preparedness at Health Departments Suffers Cuts,' November 2007, Vol. 37 Issue 9, p. 12) comments on a National Association of County and City Health Officials about the loss of local departments of health throughout the United States.

While most departments are noted to have increased their capacities to respond to medical emergencies since 9/11, continued loss of funds from the Centers for Disease Control and Prevention 'have led local health departments to delay or cancel acquisition of equipment and supplies, reduce staff time on preparedness, delaying completion of preparedness plans and cancel work force training.'

Changing paradigms in funding are noted in recent years. Ian Wilhelm (2007) reports that a growing number of U.S. foundations are making loans or investments to achieve their charitable goals. The report, which examined 92 philanthropies, says the number of funds involved in so-called mission-related investing doubled in the last 10 years, with 42 active in such investments in 1995 and 90 in 2005. The foundations have primarily used mission investments to focus on economic development, creating affordable housing, improving education, and helping the environment. How much of such funding is applied to environmental health and toxicology-related activities was not reported. The FSG Social Impact Advisors, a non-profit research and consulting group in Boston, formerly known as the Foundation Strategy Group prepared this report, paid for by the David and Lucile Packard Foundation, in Los Altos, CA. The 54-page report, 'Compounding Impact: Mission Investing by U.S. Foundations,' is available free on the FSG website: http://www.fsg-impact.org/app/content/ideas/item/485. Specific regional changes in grant funding are noted for California by Delfin Jr. and Tang (2007).

There are also recent lamentations about the ugliness with which politics has hindered basic research and development in decreasing budget allocations in the sciences, including those broadly related to the environment and aspects of medical research or the potential of conflicts of interest entering Federal funding allocations (Anonymous 2008a, 2008b, Golston 2008, Kaiser 2007, 2008, Mervis 2008a, 2008b, Pope 2008, Renner 2007). Additional articles include: 'Business And Academia Try To End Science Funding Stalemate' (Anonymous, CongressDaily, 11/13/2007, p. 8); 'Spending Stalemate' (David Goldston, Nature; 10/25/2007, Vol. 449 Issue 7165, p. 962).

GRANTSMANSHIP: THE ART OF GETTING FUNDED

Since the writing of the third edition of this work, there has been an increase in the number of books published on the topic of how to write effective grant proposals and how to build an expertise in what many regard as the *art* of the grant-writing process, often called, 'Grantsmansip.'

A search of the OCLC database, *First Search*, reveals more than 3400 items retrieved on the general topic of grants, grantsmanship, and grant or proposal writing, with nearly 900 of those works written since 2000 and nearly all of them describing the process of how to write grant proposals and other requests for funding. The specific resources for identifying the sources of funding are described below. This section of the chapter provides an introductory perspective on the art of grantsmanship and the resources that are blossoming with regard to writing cogent and, hopefully, successful grant proposals.

Many libraries and information centers maintain in their collection a cadre of resources to assist individuals and organizations seeking grants and funding and the process of preparing proposals and other solicitations for grants and other opportunities for funding. Library of Congress Subject Headings for locating books about grants and grant writing are:

- Fund raising
- Grants-in-aid
- Medical care – research grants
- Proposal writing for grants
- Proposal writing in education
- Proposal writing in human services
- Proposal writing in medicine
- Public health – research grants.

In addition to these terms being used as primary indexing terms, they are more effectively used as secondary indexing terms, such as Toxicology-Research Grants or Toxicology-Scholarships, Fellowships.

There remains, however, a paucity of monographs specifically addressing the writing of grants specifically for toxicology, environmental health, or general environmental science. The lack of such resources is partially offset by a number of good monographs addressing grantsmanship from a more generic perspective such as, *The Only Grant-writing Book You'll Ever Need*, by Ellen Karsh and Arlen Sue Fox (New York: Carroll and Graf Publishers, distributed by Publishers Group West [Berkeley, CA], 2006); *Finding Funding: Grantwriting from Start to Finish, Including Project Management and Internet Use, 5th Edition* (Thousand Oaks, CA: Corwin Press, 2008); *Grant*

Writing for Dummies, by Beverly A Browning (Hoboken, NJ: Wiley Publishing, 2005); *The Everything Grantwriting Book*, by Judy Tremore and Nancy Burke Smith (Avon, MA: Adams Media Corp., 2003); *The Complete Idiot's Guide to Grant Writing*, by Waddy Thompson (Indianapolis, MN: Alpha Book, 2007); *Webster's New World, Grant Writing Handbook*, by Sara D. Wason (Hoboken, NJ: Wiley Publishing, 2004); and *Proposal Writing: Effective Grantsmanship*, by Soraya M. Coley and Cynthia A. Scheinberg (Los Angeles, CA: SAGE Publications, 2008). The Foundation Center's *Guide to Proposal Writing* (the Foundation Center, New York, NY) provides an overview of grantwriting, including the six steps for successfully writing grants. Appendices include practical aids, including a bibliography, a sample proposal, and other useful resources.

Laura N. Gitlin and Kevin J. Lyons have updated their classic book (nearly 900 academic, public, hospital and other special libraries claim one or more of the work's three editions), *Successful Grant Writing: Strategies for Health and Human Service Professionals, 3rd Edition* (New York: Springer Publishing Company, 2008). John J. Garland contributes another monograph for the health sciences, with *Better Physician Writing and Speaking Skills: Improving Communication, Grant Writing, and Chances for Publication* (Oxford, Seattle, WA: Radcliffe Publishing, 2007). Otto O. Yang published a 2007 update to the *Guide to Effective Grant Writing: How to Write an Effective NIH Grant Application* (New York: Springer Publishers, 2007), which is frequently used as a textbook or supplemental reading for writing or communication classes in medical schools and science writing classes.

Non-profit organizations, institutes, agencies, especially at state, regional, or local levels, may not have the same caliber of resources for grantwriting as found in colleges, universities, and for-profit entities. The American Association of Museums (AAM) represents museums and professionals and non-paid staff who work for and with museums, a vast major of which are in the non-profit sector. AAM represents more than 15 000 individual museum professionals and volunteers, 3000 institutions, and 300 corporate members, including museum directors, curators, registrars, educators, exhibit designers, public relations officers, development officers, security managers, trustees, and volunteers. AAM also represents such personnel from science and technology, military and maritime, and youth museums, as well as aquariums, zoos, botanical gardens, arboretums, historic sites, and science and technology centers – all of which have the potential for addressing the issues related to toxicology and environmental or occupational health. AAM distributes through its bookstore (http://iweb.aam-us.org/Purchase/SearchCatalog.aspx), in the 'Development' section, 24 books on various aspects of grantwriting and grantsmanship, including: *Thank You for Submitting Your Proposal: A Foundation Director Reveals What Happens Next* (Martin Teitel, Emerson and Church Publishers, 2006), *Proposal Planning, and Writing, 3rd. Ed.* (Lynn E. Miner and Jeremy Miner, Oryx Press/Greenwood Publishing Group, 2003), and *The "How To" Grants Manual: Successful Grantseeking Techniques for Obtaining Public and Private Grants, 6th Ed.* (David G. Bauer, Praeger Publishers, 2007).

The *Grassroots Fundraising Journal* provides information for small to medium-sized non-profits on how to raise money from individuals. Articles include case studies, profiles of major donors, tax laws affecting nonprofits, and the historical background of grassroots fundraising (see: http://www.grassrootsfundraising.org/magazine/index.html).

Fundraising Success Magazine (http://www.fundraisingsuccessmag.com) and *FundRaising Success Advisor* are among the free subscription serials available from the North American Publishing Company (Philadelphia, PA), and produced primarily to assist non-profits in their quest for grant funding. Their *Fundraising Resource Guide* includes hundreds of agencies, consultants and service/product/software providers (see: http://www.fundraisingsuccessmag.com/resourceguide/index.php).

The Fund$Raiser Cyberzine is a digital magazine for small to medium-size non-profit groups looking to raise money. They provide information, news, reviews, feature articles, and more on a monthly schedule (current issue is always free). See: http://www.fundsraiser.com/.

FINDING FUNDS AND GRANTS

Finding appropriate grants and sources of funding can be an arduous task. As in years past, the competition for available funds is intense and the need to have an arsenal of resources at the ready is essential for those applying for grants to support research, learning, and advocacy.

Traditional grant and funding reference resources include the following list of titles and annotations. If you are using an academic, public, or special library to access these resources in their print formats, be sure to check the year(s) for which the directory-style resource(s) is compiled. If there is only an older (>5 years) print copy available, check to see if that library or institution subscribes to an online equivalent (see below).

There have been very few changes in the inventory of general grant and funding reference works. It is,

however, sad to announce the one resource that was most specific to this topic, as it pertains to non-government-supported funding, is the canceling of the print and CD-ROM version of the *Environmental Grant-Making Foundations* directory. A quick search of the OCLC database reveals that it was poorly subscribed to in any of its eight or nine editions. The announcement of their demise was made in a brief statement on their website.

GuideStar, a powerful directory database produced and maintained by Philanthropic Research, Inc., is a 501(c)(3) public charity founded in 1994. *GuideStar* identifies charitable causes and enables supporters and non-profit managers to research and benchmark organizations' missions, programs, and performance. Information for the database is collected from a number of resources. Financial information comes from the IRS Business Master File of exempt organizations and IRS Forms 990, 990-EZ, and 990-PF. Other information, such as an organization's programs, accomplishments, and goals, are obtained directly from the organization or from the organization's Form 990 or 990-EZ. You can search the database and view basic information about organizations entered, including Form 990 images and other public documents when available. There is a simple, no-cost registration providing access to this information. There is no fee to register, but they do ask you to agree to a site license agreement. *GuideStar's* database includes information on all tax-exempt non-profits registered with the IRS. Currently, there are more than 1.7 million organizations in the database including information on more than 900 000 public charities, approximately 118 000 private foundations, and nearly half a million other exempt organizations. *GuideStar's* search engine allows you to search by keyword or using our advanced search. The number of fields available in the advanced search is determined by whether you are a *GuideStar Basic*, *GuideStar Select*, or *GuideStar Premium* user (the latter two products are subscription based).

A simple search for 'toxic* and foundation*' identifies 382 sources, while 'toxic* and grant*' retrieves 72 entries. Sadly, there is not a means to search the free database to differentiate whether an entry is receiving or providing funding. For the broad search for any entry giving or receiving foundation funding the following entries retrieved are provided as examples.

- Toxicology Education Foundation (Raleigh, NC 27622)
- Reproductive Toxicology Center: A Non-Profit Foundation (Bethesda, MD 20814)
- Promind Foundation Charitable Trust (Sebastopol, CA 95472)
- ILSI Research Foundation (Washington, DC 20005)
- Te Giovanni Lorenzini Medical Foundation (Houston, TX 77030)
- Silent Spring Institute, Inc. (Newton , MA 02458)
- International Life Sciences Institute (Washington, DC 20005)
- Texas Southern University Foundation (Houston, TX 77004)
- Coalition for Justice in the Maquiladoras (San Antonio, TX 78228).

An additional search for "'environmental medicine' and foundation*" reveals 12 entries; for "'environmental health' and foundation" retrieves 72 database entries, and for lead poisoning 11 entries are found.

STANDARD GRANT AND FUNDING REFERENCE RESOURCES

Annual Register of Grant Support, 2008
National Register Publishing Co., Wilmette, IL

Provides grant programs of government agencies, public and private foundations, corporations, community trusts, unions, professional societies and associations, and educational and special interest groups.

Catalog of Federal Domestic Assistance, 2007
U.S. Government Printing Office, Washington, DC

A comprehensive compendium of federal government assistance programs administered by more than 50 agencies, including those providing support for toxicology research.

Corporate 500: The Directory of Corporate Philanthropy
Ceased publication

Corporate Foundation Profiles
The Foundation Center, New York, NY

Most current: 2002. More than 3000 programs on human health and bio-medicine are profiled.

Directory of Grants in the Physical Sciences
Ceased publication.

Directory of Research Grants
Oryx Press, Phoenix, AZ

Most current: 2006. Lists research funding in all areas of study, including the life, physical, and medical sciences.

Foundation 1000, 2007
The Foundation Center, New York, NY

Profiles of the 1000 largest U.S. foundations.

Foundation Grants Index
The Foundation Center, New York, NY

Provides a listing of grants of $5000 and greater. A useful tool to examine the types of funding support available for specific grant funding areas.

Grants Register
Ceased publication.

Grants for Information Technology
The Foundation Center, New York, NY

Most recent: 2000. With increased attention to data and information management, data archives, communication, and new technologies such as the Internet, World Wide Web, and CD-ROMs.

A Guide to NIH Grant Programs
Oxford University Press, New York, NY, 1992

No longer provided and no evidence of it being updated. However, NIH provides a website for its grants: http://grants.nih.gov/grants/grant_basics.htm. This is, sadly, not a substitute for the Guide.

National Directory of Corporate Giving, 2007
The Foundations Center, New York, NY

Provides profiles of more than 1500 corporations and companies contributing to non-profit, non-governmental organizations.

The Community of Science (COS, http://www.cos.com) is an online inventory of research funding in the United States and Canada. The Community of Science World Wide Web server contains information about scientific expertise, funded scientific research, and funding opportunities for research, and is a primary source of comprehensive grant, fellowship, and other funding opportunities in the public and private sector. For many research-oriented universities and colleges, COS, is an essential one-stop shopping mall of information. The COS philosophy is to provide working researchers with valuable information tools through its inventories of institutional support and funding opportunities. It maintains an extensive, multidisciplinary Topic Index, an interactive inventory of funded research projects, which includes many topics related to environmental and drug toxicology, environmental and occupational medicine, environmental health, and related topics.

The two most important resources for the official listings of U.S. Federal government announcements of grants and research funding are the *Commerce Business Daily* (http://cbd.cos.com/), which provides a daily listing of notices of actions and activities of the U.S. federal government and requests for proposals and contract awards and the *Federal Register* (http://gpo.lib.purdue.edu/), the official record of the U.S. government, in a searchable format, updated daily, and free of charge from GPO Access.

Channing Bete Company, long noted for its series of information booklets for general audiences has begun a special funding alerts Website of 'Current Funding Opportunities' (http://www.channing-bete.com/funding/funding-topics/health.php\?\), to provide users of their information resources access to grants applying to those issues. Topic included cover grants for various environmental health (e.g., U.S. Environmental Protection Agency (EPA) – National Community-Based Lead Outreach and Training Grant Program, U.S. Environmental Protection Agency (EPA) – Tribal Educational Outreach on Lead Poisoning and Baseline Assessment of Tribal Children's Existing and Potential Exposure and Risks Associated with Lead), drug and alcohol treatment (e.g., Open Society Institute – Closing the Addiction Treatment Gap, U.S. Department of Education, Office of Safe and Drug-Free Schools – Safe and Drug-Free Schools and Communities (SDFSC) Programs for Native Hawaiians; Mothers Against Drunk Driving (MADD) – UMADD Mini-Grants). If you are looking for a simple introductory resource, or are planning a grant-writing workshop and are looking for tips and strategies for writing a successful grant proposal, you can obtain Channing Bete's free booklet, *Finding And Getting Funding* (EM489833CBC), a brief primer on the grants process. They also produce a free online publication, Funding Opportunities-e-Newsletter (http://img.channing-bete.com/H303L/cbc_H303L.html\). Contact information for Channing Bete: One Community Place, South Deerfield, MA 01373-0200; 800-391-2118, 800-477-4776; www.channing-bete.com.

INTERNSHIPS AND SCHOLARSHIPS

New to this chapter in its fourth edition is a brief commentary and compilation on funding of higher education and post-graduate research. This is by no means to be a comprehensive discourse on how to obtain scholarships, internships, and other opportunities of support for higher education. It is meant to provide an overview of the resources and strategies for locating additional information.

Several of the more popular reference books frequently found in academic and larger public libraries:

The Scholarship Book [2007]: The Complete Guide to Private-sector Scholarships, fellowships, Grants and Loans for the Undergraduate
Cassidy DJ (2007)

New York: Prentice Hall Press

Vault Guide to Top Internships
Rosen R (2007)
New York: Vault

Scholarships, Fellowships and Loans. Vol. 5. The College Blue Book, 35th Edition.
Detroit, MI: Thompson-Gale

The U.S. Environmental Protection Agency's Science to Achieve Results (STAR) Program has four formal solicitation periods during the year: January, April, August, and October. STAR Requests for Applications invite research proposals from academic and non-profit institutions located in the U.S., and state and local governments. Details are found at http://es.epa.gov/ncer/rfa/.

Social Science Research Council (SSRC) fellowship and grant programs provide support innovators within fields, and especially to younger researchers whose work and ideas will have longer-term impact on society and scholarship. These programs often target the spaces between disciplines, where new perspectives emerge and struggle for acceptance, thus ensuring the production of knowledge and expertise on key topics, regions, and social challenges. They are great resources for bridging the scientific, medical and technical gaps favoring a strong sense of social responsibilities, such as environmental conditions in urban, rural, and migrant communities. The book, The Art of Writing Proposals, by Adam Przeworski and Frank Salomon, is among the many resources and services and opportunities provided. See: http://fellowships.ssrc.org/.

GuideStar (see above) also provides an interesting retrieval of non-profit organizations accepting interns or foundations that support internship programs in the areas of toxicology and environmental health and medicine.

Several selected and more prestigious sources of support for scholarly pursuits are provided here.

Alexander Hollaender Distinguished Postdoctoral Fellowship Program
Web: http://www.orau.gov/orise/edu/postgrad/alexh.htm

This site describes the U.S. Department of Energy's prestigious postdoctoral award for research opportunities in energy-related life, biomedical and environmental sciences.

National Academy of Science Fellowships
Web: http://www4.nas.edu/osep/fo.nsf

Information related to NAS predoctoral, dissertation, and postdoctoral fellowship programs.

Oak Ridge Associated Universities/Oak Ridge Institute for Science and Education
Web: http://www.orau.org/ and www.orau.gov/orise/Educ.html

ORAU programs include Junior Faculty Enhancement Awards to help faculty members enhance their research during the early stages of their careers. The Oak Ridge Institute for Science and Education (ORISE) was established by the U.S. Department of Energy to undertake national and international programs in education, training, health, and the environment. The ORISE Resource Guide is available in Adobe PDF format (728K) and provides a comprehensive listing of ORISE's educational opportunities for pre-college and college faculty as well as postdoctoral, doctoral, graduate, undergraduate, and pre-college students.

Scholarship and Fellowship Databases
Web: http://www.finaid.org/finaid/awards.html

This page provides links to a variety of general scholarship and fellowship databases. The term scholarship refers to awards intended primarily for undergraduate students. The term fellowship refers to awards intended primarily for graduate and postgraduate students.

Smithsonian Opportunities for Research
Web: http://www.si.edu/youandsi/studies/ofg/fellapp.htm

Grants site for the Smithsonian Institution, providing guidelines and assistance for grants and fellowships.

Society of Toxicology—Awards
Web: http://www.toxicology.org

Lists SOT awards and fellowships and links to the Sponsored Awards & Student Awards page at www.toxicology.org/spon.html, including the Burroughs Welcome Fund Award in toxicology (www.bwfund.org).

Grant and funding resource opportunities are covered in Technology Grant News, a newsletter published four times a year. This publication presents a variety of approaches to supporting technology use and development in the world of philanthropic support available for technology. Technology Grant News provides accurate, one-stop information on technology grants, free technology resources, technology partnerships, strategic alliances and technology advancement for your organization. It is a unique service for colleges and universities, K-12 schools, non profits, libraries and museums, and towns and cities. Subscriptions (for as low as $35.00 per year) to Technology Grant News provides access to a searchable Grant Index. For details go to: http://www.technologygrantnews.com/

technology-funding.html or 561 Hudson Street, Suite 23, New York, N.Y. 10014; (212) 929-4347.

Many colleges and most research universities have administrative offices or departments devoted to sponsored programs services [e.g., State University of New York (SUNY) at Buffalo Sponsored Programs Administration at http://wings.buffalo.edu/spa]. These offices serve as liaisons between grant-making groups (and other funding sources) and those faculty and staff seeking and preparing grants. These program offices typically provide comprehensive resources for applying for grants, including institution-specific requirements and guidelines and other grants-related resources. They may provide resources and documentation required to complete grant and contract applications, including links to Internet resources.

ADDITIONAL SELECT WEB-BASED GRANT-FINDING RESOURCES

American Fund for Alternatives to Animal Research – Grants
Web: http://www.ortge.ufl.edu/fyi/v23n05/fyi017.html
Information on grants in the biological sciences to replace or reduce the use of animals in biomedical research.

Biomedical Grant Information
Web: http://scilib.ucsd.edu/bml/grants.htm

This site is compiled by the Biomedical Library at the University of California at San Diego for the biomedical research community.

Catalog of Federal Domestic Assistance
Web: http://www.gsa.gov/fdac

The Catalog of Federal Domestic Assistance, produced by the General Services Administration, is a government-wide compendium of federal programs, projects, services, and activities which provide assistance or benefits to the American public. It contains financial and non-financial assistance programs administered by departments and establishments of the federal government. Entries from the Catalog of Federal Domestic Assistance include Agriculture, Environmental Quality, and Science and Technology (which includes the following subcategories: Biotechnology, Biological Sciences, Science and Education, Environmental Research, and Pesticides Control).

Centers for Disease Control and Prevention (CDC)
Web: http://www.cdc.gov/funding.htm

Site providing information on funding opportunities at the CDC.

Computer Retrieval of Information on Scientific Projects (CRISP)
Web: www-commons.cit.nih.gov/crisp

A weekly update of this service provides information on research supported by the U.S. Public Health Service.

(U.S.) Department of Energy Office of Science
Web: http://www.er.doe.gov/production/grants/grants.html

This is the DOE Office of Science's 'Grants and Contracts Web Site,' providing information on applying for an Energy Research Grant.

(U.S.) DHHS Grantsmanship
Web: http://www.hhs.gov/progorg/grantsnet

The U.S. Department of Health and Human Services has assembled a vast repository of resources for its grants programs (e.g., NIH, NIEHS, and CDC). These documents comprise a core collection of useful resources for locating grants information, applying for funding, and preparation of proposals.

EPA Grants
Web: http://www.epa.gov/epahome/grants.htm

The U.S. Environmental Protection Agency's official grants page, providing access to all relevant information concerning the agency's grants and procurements, including the EPA Grant Programs as listed in the Federal Domestic Assistance Catalog, STAR Grants and Cooperative Agreements from the EPA's National Center for Environmental Research and Quality Assurance (NCERQA), and McCrea's Resident Research Associate Program for postdoctoral and senior research awards. EPA Grants and Fellowship Information (http://www.epa.gov/epahome/scifund.htm) provides additional access to research funding opportunities in specific EPA program areas.

Federal Information Exchange (FEDIX)
Web: http://web.fie.com

Provides detailed and comprehensive coverage of federal agency programs and opportunities for funding research. Includes Opportunity Alert, an e-mail service announcing new funding opportunities in specified areas of interest.

FinAid
Web: http://www.finaid.org

To date, the most comprehensive source for all types of information about grants, fellowships, and scholarships.

Fundraising Online-IGC
Web: http://www.igc.org/fundraising

IGC has been providing Internet access to non-profit groups for a long time, and on this site they pull together some good advice about online fund-raising and online resources for fund-raising. Updated periodically.

Grants Net
Web: http://www.os.dhhs.gov/progorg/grantsnet

A resource for finding information about the Department of Health and Humans Service and other federal grants, includes key contacts for federal grant-making agencies.

International Foundation for Ethical Research – Preproposals
Web: http://www.ortge.ufl.edu/fyi/v22n20/fyi022.html

Grants for valid alternatives to the use of live animals in research, testing, and teaching.

MedWeb
Web: http://www.emory.edu/medweb/

An inventory of resources broadly related to biomedical research, including electronic publications, general grants and funding sources, guidelines and guides, institutes and agencies issuing grants, lists of Internet resources, National Library of Medicine Extramural Grants and Contracts Program, and public health.

National Institutes of Health – Office of External Research
Web: http://www.nih.gov/grants/oer.htm

An inventory of grant and contract opportunities, guidelines, and other relevant information. Includes links to the comprehensive listing of funding programs from the NIH.

National Oceanic and Atmospheric Administration Grants
Web: http://www.rdc.noaa.gov/~grants

The NOAA Grants home page provides links to appropriate sites, including the Grants Management Administration with links to specific NOAA research program areas.

National Science Foundation Biological Sciences Directorate
Web: http://www.nsf.gov/home/grants.htm

This page provides access to all NSF programs and projects related to the biological sciences and includes relevant information and resources for grants and funding. Specifies requirements, program areas, and deadlines for NSF-sponsored research grants and other funding opportunities. NSF also maintains a Grant Proposal Guide as an online resource. Alphabetical listing of NSF programs is also available.

NIEHS Grants and Contracts
Web: http://www.niehs.nih.gov/external/grant.htm

NLM Extramural Programs (Grants and Other Assistance Mechanisms)
Web: http://www.nlm.nih.gov/ep

The Extramural Programs (EP) of the National Library of Medicine (NLM) funds projects in areas defined by NLM as important to its mission. Grants are available to investigate the management and utilization of biomedical information, such as representation of medical knowledge in computers; organization and retrieval issues for image databases; enhancement of human intellectual capacities through virtual reality, dynamic modeling, artificial intelligence, and machine learning; medical decision making; linguistic analyses of medical languages and nomenclatures; investigations of topics relevant to health information or library science; and biotechnology informatics issues. These areas are applicable to data, information, and library management related to toxicology and environmental or occupational health issues and concerns.

NonProfit Gateway
Web: http://www.nonprofit.gov

NonProfit Gateway was created for non-profit groups to access federal information, including grants and other financial information. Grants-related information is available on topics such as loans and grants, federal register notices (and other toxicology issues such as community right-to-know, pollution prevention, and partnerships). The website is the result of a year-long partnership between federal agencies and departments and hundreds of non-profit groups. The Nonprofit Resources section provides links to department and agency-specific management and policy resources, such as grants, non-financial, laws, regulations, volunteer opportunities partnering, and budgets. The NonProfit Gateway provides a convenient hypertext link from a tabular matrix to specific grant-providing offices of Cabinet Departments, Federal Agencies, and Search Notices of Funding Availability.

RAMS
Web: http://www.rams-fie.com/

Provides access to assorted grants and funding opportunities.

The Grants and Other Funding chapter of the third edition of this book contained an extensive inventory of grant-providing resources from the 1998 edition of

Environmental Grantmaking Foundations. Since this reference resource no longer exists, it is not possible to provide an accurate inventory of such resources. However, the National Council for Science and the Environment (NCSE) provides an information resources portal where one can link to more than 240 'Foundations Providing Grants for Environmental Purposes.' By accessing this site one is directed to an annotated inventory of environmental grant-making organizations and a direct link to its website. To access this site go to: http://ncseonline.org/nle/. There no search capability to this inventory, and no indexing associated with it. It is, though, the most comprehensive resource for environmental grant funding.

CHAPTER

75

Poison Control Centers

AXEL HAHN

INTRODUCTION

Poisoning is a significant global public health problem. According to World Health Organization (WHO) data, in 2002 an estimated 350 000 people died worldwide from unintentional poisoning. More than 94% of fatal poisonings occurred in low- and middle-income countries. Sufficient global figures for poisonings and their spectrum are lacking, and common statistics about poisonings are unavailable even in Western countries with a high level of chemical production. The official statistics of deaths are related to poisonings in some countries, but often only to a small sample of the variety of substances and compounds, and are not related to any products or product categories. Often, the country-specific spectrum of poisonings can be assessed only roughly via inquiries made to their centers. Since many countries have several poison centers, the data for regular national poisoning statistics need to be combined and harmonized for analysis and use in prevention and public health matters.

HISTORY

After World War II there was a proliferation of new drugs, chemicals, and household products, so that suicides and childhood poisonings from these agents drastically increased. For prevention and risk management the medical communities developed instruments to both unintentional and intentional poisonings. Special toxicology centers were founded in Europe in the late 1940s. Focal points were initiated in Denmark, Hungary, and the Netherlands, and these countries started very early with poison information services.

The first U.S. poison information center was founded in Chicago in 1953. By 1957 there were 17 poison control centers in the US. The centers collected their special information and gave it to a panel of medical professionals who added their treatment recommendations. The summarized data were typed onto index cards. Whenever medical professionals called, the aggregated data could be read easily from the printed cards. Later the originated poison centers started taking calls from the general public and improved their services and offerings. Based on their business the centers can be divided into poison information centers and poison treatment centers. The majority of poison centers in the world are not part of a patient treatment facility and function strictly as information centers.

A similar movement evolved in Europe but compared to the USA the majority of the EU centers were centralized toxicology treatment centers with integrated poison information centers. The French developed an inpatient unit for the treatment of poisoned patients in the late 1950s. In England the National Poison Information Service was developed at Guy's Hospital in London. In 1963 the first German center was formed in Berlin at the Childrens' Hospital of the Free University, followed in 1965 by a Poisoning Treatment Center at the Munich Technical University and further 15 centers. Australasian centers were also established in the 1960s.

POISON CENTERS

Modern poison centers are specialized units, often called poison control centers (PCCs) which advise on, or assist with, the prevention, diagnosis, and

management of poisoning. The structure and function of poison centers varies around the world. At a minimum a poisons center is an information service, but poison centers may also include other services such as toxicology laboratories and/or clinical treatment units. Poison centers provide emergency poison information, but can also provide clinical service and analytical toxicology support and can be involved in research, education, and training. The centers may also play an important role in monitoring adverse effects of drugs and consumer products, in handling problems of substance abuse, and in the management of chemical disasters. Often this valuable work of the poison centers is called 'toxicovigilance' or 'toxicosurveillance' in analogy to the well-known 'pharmacovigilance' or 'pharmacosurveillance.'

A poison center as part of a medical facility is able to provide immediate, free, and expert treatment advice and assistance over the telephone in case of exposure to poisonous or hazardous substances. They answer questions about personal care products, household products, medicines, pesticides, plants, bites and stings, food poisoning, alcohol, gases, fumes, etc. More than 75% of poison inquiries are managed simply by phone, greatly reducing the need for costly emergency room and doctor visits. In most countries around the world poison control centers can be reached toll free, 24 hours a day, seven days a week, and 365 days a year.

POISON INFORMATION SERVICE

The poison information service deals with the risk assessment, diagnosis, management, and prevention of exposure to any substance, by any route, in patients of any age, and arising from any circumstance, be it accidental, intentional, occupational use, etc. In addition the poison center can provide general information about substances, their properties, and toxicity to the public. The users are physicians, patients, and their relatives, bur also other emergency services, government ministries, regulatory agencies, education services, researchers, etc. The staff of the poison centers are usually physicians, nurses, scientists, or pharmacists, or a combination of these occupations. This depends very much on local circumstances, the budget, and can differ considerably around the world.

CLINICAL TREATMENT/INTENSIVE CARE UNITS

Poison centers in Western countries are often part of (university) hospital departments, often in close connection to their intensive care units. The poison center physicians or nurses would be in tight contact to the clinical treatment of poisoned patients and have special practical experience, especially in high-risk case treatment (suicide attempts, industrial intoxications, plant protection agents, drug abuse, etc.). These centers with their special knowledge could give assistance in special treatment of patients, in particular if precise and skilful treatment of highly intoxicated patients is needed, e.g., an urgent need for antidotal or secondary poison elimination therapy like dialysis, hemoperfusion, etc. Some poison centers include a high-tech laboratory for a wide range of analytical toxicology problems.

THE ASSESSMENT OF POISONINGS

The assessment of poisonings in the sense of a substance or compound related disease follows the approved principles of Clinical Toxicology.

- The evidence of a disease: Is there a disease or a definite health impairment with medical findings and signs?
- The proof of an substance or compound related exposure: Is there a (laboratory)-confirmed exposure to the involved substance or compound?
- The causal connection: Is there a causal connection between the health impairment and the related exposure?

Beside the causal connection between the health impairment and the related exposure, the severity of the poisoning has to be assessed for different analysis. Due to the fact that a great deal of the poisonings come from inquiries by phone, the assessment process has to be focused on the given phone information. The first investigations in assessing telephone inquiries on poisonings were based on developing a PhoneToxScore, which was improved through the now well-established Poison Severity Score.

POISONING SEVERITY SCORE

A standardized and generally applicable scheme for grading the severity of poisoning allows a qualitative evaluation of morbidity. Working from a simple grading scale proposed by the European Association of Poisons Centers and Clinical Toxicologists (EAPCCT), a Poisoning Severity Score (PSS) for the assessment of cases of telephone enquiries has been developed jointly with the International Programme on Chemical Safety (IPCS) and the European Commission.

0 None:	No symptoms or signs
1 Minor:	Mild, transient and spontaneously resolving symptoms or signs
2 Moderate:	Pronounced or prolonged symptoms or signs
3 Severe:	Severe or life-threatening symptoms or signs
4 Fatal:	Death

FIGURE 75.1 Poison severity score (PSS)

The Poisoning Severity Score has been elaborated, tested, and gradually revised during a project running from 1991 to 1994. Fourteen poisons centers from various countries have participated. Each center independently graded 371 cases of acute poisoning by ten different toxic agents. The data were then analyzed and compared. The concordance in grading the severity increased during the study period, and in the last phase there was an acceptable concordance among centers in 80% or more of the cases. Given the condition and quality of the original case records, this result was considered satisfactory and agreement was reached on the scoring scheme presented here. The Poisoning Severity Score grades severity as (0) none, (1) minor, (2) moderate, (3) severe, and (4) fatal poisoning (see Figure 75.1). It is intended to be an overall evaluation of the case, taking into account the most severe clinical features. Use of the Poisoning Severity Score normally requires a follow-up of all cases, but may be used on admission or other times during the course of poisoning if this is clearly stated when data are presented.

The Poisoning Severity Score has been found to be applicable for grading the severity of poisoning. It is foreseen that the Poisoning Severity Score will meet the expectations and be used in practice, but its future use and evaluation may result in some further revision and refinement. One relevant publication is Casey et al (1998).

NOTIFICATIONS OF POISONINGS IN GERMANY

In contrary to other countries Germany has a legal basis for the documentation of poisonings since 1990. With the German Chemicals Act (ChemG), the legislation of Germany has provided a basis 'to protect humans and the environment from harmful effects of dangerous substances and preparations, particularly to make them recognizable, to avert and to prevent the development of such effects.' For a realistic assessment of risks for human health, importance has been increasingly given to the knowledge of data on human toxicology that can be obtained from the evaluation of cases of poisoning in humans.

A physician who is consulted for treatment or evaluation of sequelae of diseases caused by chemical substances or products in Germany is obliged to submit essential data on poisonings to the National Center for Documentation and Assessment of Poisonings at the Federal Institute for Risk Assessment (BfR-DocCenter). The reporting refers to health impairments or even in suspected poisonings that are associated with the following substances:

- Chemical substances and products used in the household, e.g., detergents and cleansing agents, hobby, and do it yourself (DIY) articles;
- Cosmetics;
- Pest control products;
- Plant protection products;
- Wood preservatives;
- Chemicals used at the workplace;
- Harmful chemical substances found in the environment, also after industrial accidents and transportation accidents and
- Plants/animals.

In addition, the German poison information and treatment centers were subjected to compulsory reporting of their findings of general importance gained in the context of their activities.

At the same time there is a notification process for manufacturers or distributors for dangerous preparations, biocides, cosmetics, and detergents for use in emergencies by poison centers, in which the BfR-DocCenter with its 'Poison Information Database' has a key function for the German poisons centers.

The estimation of toxic risks in humans is based on analyses and evaluation of the data from poisoning cases. For these purposes, the data on cases in humans are continuously documented in the form of case data sets and case reports. Information on identified risks is provided to the responsible ministries, manufacturers, and industrial associations in the form of rapid communications or annual summarizing reports by means of the product information system called PRINS. The DocCenter publishes annual reports on the knowledge gained from the cases of poisoning reported by physician as electronic documents on the internet (www.bfr.bund.de) and administers the German Commission 'Assessment of Poisonings'.

REPORTED CASES

Experience has shown that the concept of 'poisoning' can cause considerable misjudgments of the

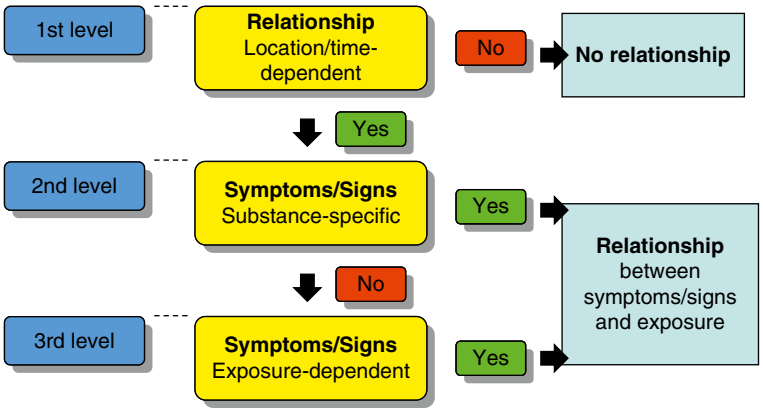

FIGURE 75.2 BfR three level model: Relationship between symptoms/signs and exposure

degree of severity and the sequelae in a 'case of poisoning.' However, the term 'poisoning' as it is commonly understood does not comply with a large number of severe cases reported to the BfR-DoCCenter, as most of the reported cases have no acute severe damage to health or subsequent damage to health in their course. This applies particularly to unintentional ingestion by children and adults. Owing to the small amounts ingested, a major part of the cases on which advise is given by poison control centers or which are treated in hospitals do not result in serious acute nor in permanent damage to health. Fortunately, cases of poisonings resulting in severe or even irreversible damage to health are very rare. In order to avoid unnecessary dramatization, the term 'poisoning' should be used in a differentiated way. This applies especially to cases involving chemical substances from the environment. It would be more appropriate here to refer to them as to health impairments caused by chemical substances.

ASSESSMENT OF POISONINGS

Evaluation of the single cases according to proved and scientifically acknowledged principles is required to derive from the reports substantiated statements about the course of poisonings by chemicals. The fundamentals for documentation and computerized evaluation of data were developed under a research project of the Federal Ministry for the Environment, Nature Conservation and Nuclear Safety. This is the only way to develop a systematic and realistic description of the health risk associated with individual substances. Evaluation of the individual cases should be based on the causal relationship between exposure and manifestation of the health impairment. The most important criterion is to answer the question whether there is a chronological relationship between health impairment and exposure. If the answer is 'yes,' a causal relationship cannot be denied. As a rule, this question can be answered easily in cases of acute poisoning. In many cases, particularly those involving suspected chronic exposure, data are often contradictory and vague. In such cases it is of great importance whether symptoms or signs disappear if exposure is avoided ('dechallenge') and appear again after fresh exposure ('rechallenge'). In many cases, original conditions are not reproducible in a plausible way and such cases cannot be evaluated. The evaluation of causality is supported by assignment of the cases to different categories.

Base Criteria for Evaluation

The first step of evaluation (see Figure 75.2) involves assigning a case to one of three clear-cut categories, depending on the relationship between the location of the poisoning event and time-dependency of symptoms/signs (1st level), the substance-specific symptoms/signs (2nd level), and additional exposure-dependent symptoms/signs (dechallenge/rechallenge 3rd level). This led to the 'relationship between health impairment and exposure' of: 1. No relationship, 2. Relationship exists, and 3. Relationship cannot be evaluated.

A more detailed pre-analysis especially in the clarification of the exposure is shown in Figure 75.3.

In cases, especially in those with chronic low-dose levels, a matrix of exposure vs. probability is recommended.

The evidence of related symptoms/signs, specific clinical analysis and other diagnoses is very important to assess, especially in difficult cases, to have a clear evaluation of the relationship between exposure and health impairment (Figure 75.4).

One question that is posed is whether the symptoms and signs observed are already known, i.e., have they been described in literature or in plausible reports about other cases? If there is a 'typical' pattern

Exposure		Noxious agent	Ambient monitoring		Human biomonitoring	
		Source? distance?	Single measurement	Measurements representative	Single measurement	Above reference levels
NO	None	–	–	–	–	–
YES	Possible	+	+	–	–	–
	Probable	+	+	+	+	–
	Certain	+	+	+	+	+
?	Not assessible	Lack of data				

FIGURE 75.3 BfR assessment tool: Decision matrix "exposure vs. probability"

Causality		Exposure	Health impairment			
		Plausible	Partly specific symptoms/signs	Specific symptoms/signs	Specific clinical analysis	Other diagnoses
NO	None	–	–	–	–	+
YES	Possible	+	+	–	–	+
	Probable	+	+	+	–	–
	Certain	+	+	+	+	–
?	Not assessible	Lack of data				

FIGURE 75.4 BfR assessment tool: Causality matrix "exposure vs. health impairment"

of symptoms and signs, the degree of probability of a relationship between exposure and disease is high. If it is not, the relationship is uncertain but cannot be excluded without a sufficient degree of certainty. Evaluation of the substance-related pattern of symptoms and signs, which is often very unspecific and difficult to assess, requires a high degree of sound practical experience in toxicology. This applies particularly to chronic poisonings. A detailed inquiry concerning case history, findings, differential diagnoses, etc. conducted by telephone and in writing is useful. Results of clinical and environmental measurements also help.

Specific Problems Involved in the Evaluation of Chronic Exposure to Chemicals

In cases of chronic exposure to substances and subsequent impairment of health (e.g., cases of 'environmental poisoning'), such an evaluation is particularly difficult since many cases involve a vague exposure and the level of possible exposure to substances can be assumed to be small. As a rule, the pattern of manifestations of health disturbances is often different and unspecific for most of the chemicals. An essential problem is the differentiation of the symptoms and signs observed in relation to spontaneously occurring

disorders, e.g., headache, lack of concentration, dizziness, etc. The relationship between chronic exposure to substances and subsequent health impairment can only be established on the basis of the toxicological history and extensive examinations using assessment tools like Figs 75.2–75.4. The several kinds of differential diagnosis have to be proved. Experience has shown the importance of having all findings and assessments of a case discussed among a group of specialists.

International Associations

American Association of Poison Control Centers (AAPCC) and American Academy of Clinical Toxicologists (AACT)

The American Association of Poison Control Centers (AAPCC) was founded in 1958 to promote cooperation between poison centers in various cities, and to standardize the operation of these centers. In addition, AAPCC activities included poison prevention and education programs for both physicians and the general public. In 1968 the American Academy of Clinical Toxicologists (AACT) was established by a group of medical doctors. The AACT's main objective was to apply principles of toxicology to patient treatment and improve the standard of care on a national basis. The 1960s and 1970s had a rapid proliferation of poison centers, and by 1978 there were 661 centers in the United States. This trend reversed during the 1980s and 1990s with a number of centers closing or merging. There was 51 certified centers in the US in 2000, and in 2004, a total of 63 poison control centers (PCCs) provided emergency phone consultations to the US public.

The AAPCC provides a forum to promote the reduction of morbidity and mortality from poisonings through public and professional education and scientific research, and ways to set voluntary standards for poison center operations together with criteria for certification of poison centers and their systems. Current criteria and actual lists of US poison centers can be downloaded from the AAPCC website (www.aapcc.org). The AAPCC periodically surveys all US poison centers to characterize operations, services, staffing, and public education activities. The AACT regularly organizes congresses and joint meetings.

The Toxic Exposure Surveillance System (TESS)

The Toxic Exposure Surveillance System (TESS) is a US monitoring system for toxic exposures. The TESS data are compiled regularly by the AAPCC on behalf of the US poison centers. These data can be used to identify hazards early and their trends, give information for prevention measures and strategies, provide data for educational and research matters and can be a base for post marketing surveillance.

National Poison Data System

The AAPCC is creating a New Core System Database (NCSBeta), the only comprehensive poisoning surveillance database in the United States. NCSBeta is a valuable resource for product safety managers, medical directors, regulatory affairs directors, and other important decision-makers within industry. The AAPCC previously developed the National Poisoning and Exposure Database, which contains detailed toxicological information on more than 24 million poison exposures reported to U.S. poison centers. This includes more than 2 million reports to poison centers in the year 2000 alone, and covers an estimated 96% of all poison exposures reported to poison centers in the U.S.

The European Association of Poisons Centers and Clinical Toxicologists (EAPCCT)

The European Association of Poisons Centers and Clinical Toxicologists (EAPCCT, www.eapcct.org/) was founded in 1964 with the specific goal of advancing knowledge and understanding of the diagnosis and treatment of all forms of poisoning. This includes a better understanding of the principles and practice of clinical toxicology in order to prevent poisoning, and to promote better care for the poisoned patient particularly through poisons information centers and poisons treatment centers. The EAPCCT hosts annual international congresses.

Together with the American Academy of Clinical Toxicology, the EAPCCT sponsors the scientific journal *Clinical Toxicology* (until 2004 named *Journal of Toxicology – Clinical Toxicology*). As the official journal of the EAPCCT, *Clinical Toxicology* publishes peer-reviewed scientific research and clinical advances in clinical toxicology. The EAPCCT regularly organizes joint meetings, particularly through the auspices of the International Programme on Chemical Safety (IPCS), which is a joint undertaking of WHO, International Labour Organisation (ILO), and United Nations Environment Programme (UNEP).

WHO and the International Programme on Chemical Safety (IPCS)

The International Programme on Chemical Safety (IPCS), established in 1980, is a joint program of three Cooperating Organizations (WHO, ILO, and UNEP), implementing activities related to chemical safety. WHO is the Executing Agency of the IPCS, whose

main roles are to establish the scientific basis for safe use of chemicals, and to strengthen national capabilities and capacities for chemical safety. The IPCS Programme on Poisoning Prevention and Management seeks to build capacity in countries to deal with these problems. An important area of activity is promoting the establishment and strengthening of poison centers, an effort carried out under the IPCS INTOX Programme. Other WHO activities include the provision of information on chemicals, the provision of information management tools, and the development of internationally peer-reviewed guidelines concerning the prevention and clinical management of poisoning and to provide the world directory of poison centers (WHO Yellow Tox, www.who.int/ipcs/poisons/centre/directory/en/).

The IPCS INTOX Programme

The IPCS INTOX Programme (www.who.int/ipcs/poisons/intox/en/index.html) is a global endeavor to promote chemical safety through the establishment and strengthening of poisons centers. The program's objectives are achieved through international cooperative and collaborative efforts coordinated by IPCS. These efforts have been particularly directed at the following activities: (1) Development and provision of information on chemicals and chemical exposures (INTOX Databank), (2) Development and provision of information management tools (INTOX Data Management System), and training in their use, (3) Development of training materials (INTOX Poisons Centre Training Manual), (4) Maintenance of a network for sharing information and for mutual assistance on poisons center and toxicological issues (INTOX Network), and (5) Workshops on the establishment of poisons centers.

Who Participates in the IPCS INTOX Programme?

More than 100 experts from over 75 countries and those responding to emergencies concerning toxic exposures bring their collective knowledge, expertise, and experience to the development of IPCS Poisons Information Monographs (PIMs) and IPCS Treatment Guides. They contribute to the program in a number of different ways, e.g., by writing and peer-reviewing documents for the INTOX Databank on the prevention, diagnosis, and management of poisoning, by assisting with training, by providing support to newly established poisons centers, by participating in INTOX working groups, and by making available their expertise and knowledge to help with toxicological problems.

The INTOX Databank and Data Management System (the INTOX Package) was developed and is under maintenance of the Canadian Center for Occupational Health and Safety (CCOHS). The INTOX monographs are a unique collection, providing advice on the prevention and treatment of poisoning. The following are the collections of documents contained in the IPCS INTOX Databank.

IPCS Poisons Information Monographs (PIMs)

PIMs provide evaluated information on substances (chemicals, pharmaceuticals, poisonous plants, and poisonous and venomous animals) commonly involved in cases of poisoning. A PIM is a practical document designed to facilitate the work of poisons information specialists, clinicians, and analytical toxicologists. PIMs summarize the physico-chemical and toxicological properties of the substance, clinical features of toxicity resulting from different routes of exposure to the substance, the patient management, and the supporting laboratory investigations.

IPCS Treatment Guides

These guides are concise documents which harmonize indications for the clinical management of poisoning cases. They deal with the management of symptoms, clinical conditions or syndromes commonly observed in toxic exposures. Treatment Guides are prepared by experienced clinical toxicologists and pharmacists, reviewed by working groups and then incorporated into the IPCS INTOX Databank when consensus on clinical recommendations has been reached.

IPCS/EC Evaluation of Antidote Series

Antidote Monographs provide definitive and authoritative guidance on the use of antidotes to treat poisoning. This series summarizes and assesses, on an antidote-by-antidote basis, their clinical use, mode of action, and efficacy. This series is an undertaking of IPCS and the European Commission.

IPCS International Chemical Safety Cards (ICSCs)

Summarized health and safety information on nearly 1300 chemicals for individuals at the workplace.

IPCS Environmental Health Criteria monographs (EHCs)

Comprehensive data from scientific sources for the establishment of safety standards and regulations.

CCOHS CHEMINFO Database

Chemical profiles of a wide variety of potential workplace hazards, including a detailed evaluation of health, fire and reactivity hazards, along with first aid recommendations.

FIGURE 75.5 WHO regions of the world

WHO/FAO Pesticide Data Sheets

Basic information for safe use of pesticides.

UK Poison Information Documents (UK PIDs)

Detailed chemical and pharmaceutical monographs produced for poison centers by the UK National Poisons Information Service Centers.

International Agency for Research on Cancer (IARC)

In 1969, the International Agency for Research on Cancer (IARC) initiated a program on the evaluation of the carcinogenic risk of chemicals to humans involving the production of critically evaluated monographs on individual chemicals. In 1980 and 1986, the program was expanded to include evaluations of carcinogenic risks associated with exposures to complex mixtures and other agents. The objective of the program is to elaborate and publish in the form of monographs critical reviews of data on carcinogenicity for agents to which humans are known to be exposed and on specific exposure situations; to evaluate these data in terms of human risk with the help of international working groups of experts in chemical carcinogenesis and related fields; and to indicate where additional research efforts are needed.

Candidate Substances Database

The Candidate Substances Database is a convenient tool for identifying over 120 000 chemical substances. This database allows users to conveniently and quickly locate information on chemical names and specific Chemical Abstracts Service (CAS) Registry Numbers. Each record contains identification information on a unique chemical substance, including chemical names and synonyms, the CAS registry number, and any other unique identifying numbers. Data are derived from authoritative CCOHS databases such as CHEMINFO, the RTECS® database from the U.S. National Institute for Occupational Safety and Health (NIOSH), and the Domestic Substances List/Non-Domestic Substances List (DSL/NDSL) database from Environment Canada.

WHO World Directory of Poisons Centers

As noted above, a world directory of poisons centers (Yellow Tox) is maintained by WHO. The Yellow Tox directory is a list of all Poison Centers in the world and is regularly updated. The directory is separated into the different WHO regions (see Figure 75.5), including the Americas region (the whole continent from the north to the south), Africa (different parts), European region inclusive of Greenland, Eastern Mediterranean Region (with different part of Africa and Middle East), South-East Asia and Western Pacific Region.

Based on the status of 2007 the world has in total 219 Poison Centers, 10 in the Africa Region, 79 Centers in the Americas' Region, 10 in the South-East Asia Region, 90 in the European Region, 14 in the Eastern

TABLE 75.1 WHO regions of the world and number of centers

WHO region	Number of centers
African Region	10
Region of Americas	79
South-East Asia Region	10
European Region	90
Eastern Mediterranean	14
Western Pacific Region	16
Total	219

TABLE 75.2 Countries and number of centers

Countries	Number of centers
USA	66
Italy	18
France	13
Germany	10
Poland	9
Canada	8
United Kingdom	6
India	4
Australia	4
Spain	4
South Africa	3
Indonesia	3
Japan	3
Tobago	2
Algeria	2
China	2
Vietnam	2
Greece	2
Kazachstan	2
Romania	2
Egypt	2
Iran	2
Pakistan	2
48 Countries	1
Total Centers	219

Mediterranean Region and 16 in the Western Pacific Region (see Table 75.1).

The largest concentration of poison centers exists in the Western industrial world (see Table 75.1), with the North American continent having 79 poison centers and the European Region with 90 poison centers. This means that there are only 55 in the rest of the world's countries.

The excellent medical care with Poison Centers in the Western industrial world is to be seen clearly if the number of the poison centers is listed by the countries (see Table 75.2). The U.S. has 66 centers, Italy 19, France 13, Germany 10, Poland 9, and the United Kingdom 6.

TABLE 75.3 Table of countries and the population served by a poison center

Countries	Population served by a poison center (millions of people per center)
USA	4.5
Italy	3.2
France	4.8
Germany	8.2
Poland	4.3
Canada	4.1
United Kingdom	10.1
India	273.8
China	657.0

The calculation of the number of poison centers by the countries' population shows the wide range of medical care in giving advice and treatment in poisoning matters (Table 75.3). Investigations in Germany showed that, under ideal conditions, a poison center could support 10–15 million people.

REPORTS ON POISONINGS

Regular reports on poisonings are published in many poison centers, some of them with a long tradition. Most of the reports of the countries are only in the national language, and not all are harmonized and standardized according to international recommendations. Information about reports is available via the world directory of poison centers (Yellow Tox) (http://www.who.int/ipcs/poisons/center/directory/en/index.html).

Substantial progress was made through the recommendations of the EAPCCT and the joint progress through the WHO INTOX Programme. Significant and nationwide reports on poisonings are available in English:

- USA: Annual Reports of the National Poisoning and Exposure Database since 1983 (http://www.aapcc.org/annual.htm)
- Sweden: Actual annual reports (http://www.giftinformationscentralen.se)
- Germany: BfR Reports of the Centre for Documentation and Assessment of Poisonings (http://www.bfr.bund.de/cd/1717).

CHAPTER

76

Patents

TODD STEDEFORD

INTRODUCTION

A patent is a property right granted to an inventor for an invention (Black's Law Dictionary 2004). The right conveyed by a patent is the power to exclude others from making, using, or selling an invention for a set period of time. In the United States (U.S.), a patent issued by the U.S. Patent and Trademark Office (USPTO) is only effective in the U.S. and U.S. territories, generally for a term of 20 years (USPTO 2007a). For inventors seeking protection outside of the U.S., a patent application must be filed within each country the inventor seeks patent rights or with a regional patent office. The World Intellectual Property Organization (WIPO) administers services, based on international agreements, which enable inventors from its 184 member states to file international patent applications (WIPO 2007). Once filed, the inventor's patent rights are preserved from the date of filing against subsequent patent applications from an inventor belonging to a member state (see http://www.wipo.int/pct/en/texts/articles/atoc.htm; http://www.wipo.int/treaties/en/ip/paris/trtdocs_wo020.html).

A wide variety of information is available in patent applications and patents that are relevant to toxicologists. For example, if the keywords 'hepatotoxicity' and 'prevention' are used to search the USPTO's Patent Application database (http://appft1.uspto.gov/netahtml/PTO/search-bool.html), 2935 applications are flagged (search conducted on 01/27/2008). These results can be scanned or further refined by adding or changing the search terms. For example, patent application number 20070275885 titled '*Microcystins as agents for treatment of cancer*' is one of the 2935 flagged applications. This invention relates to the use of microcystins for treating cancers, including liver cancer, and provides a method for screening microcystins to identify those with enhanced cytotoxicity. As another example, a search of the USPTO's Patent Database (http://www.uspto.gov/patft/) for abstracts that contain 'liver' and 'damage' as keywords (ABST/(liver and damage)) produces 58 issued patents (search conducted on 01/27/2008). Patent Number 7,235,523 titled '*Methods for the treatment of hepatic disorders*' describes an invention for inhibiting specific receptors involved in liver injury and damage.

Patents are a unique medium for conveying toxicological, and other, information because restrictions are placed on the granting of a patent for prior published work. In the U.S., if a description of the invention is published more than one year before a patent application is filed, a patent may not be granted (USPTO 2007b). For example, if a research group publishes their invention in the form of a meeting abstract or a journal article, they may lose the right to patent the invention if a patent application is not filed within one year of the date of publication. However, in many foreign countries, an inventor must file a patent application on the date of public use or disclosure in order to preserve patent rights.

Because of the time restrictions for filing patent applications based on prior published works, several advantages are gained by using patent applications and patents as an information resource. First, novel inventions may appear in the form of a patent application or patent prior to surfacing in the scientific literature. Second, patent data may assist researchers with making informed decisions when choosing strategies for

researching or developing new products. Third, patent data may aid with identifying competitors or possibly future collaborators. Fourth, patent applications and patents may contain solutions to technical problems experienced by researchers. Finally, patent data can assist with revealing research trends and emerging technologies, which may be used as guides for strengthening the competitiveness of research programs or grant applications.

This chapter provides resources for obtaining patents, information on patents, and patenting scientific information. A selection of books and journal articles is provided, along with an introduction to international patent organizations. In addition, an assortment of open access and fee-for-service databases which provide full-text patents has been compiled. The information resources are presented in the following order: 'Books', 'Journals', 'Journal articles', 'Organizations', 'Databases', and 'Other resources'.

RESOURCES

Books

Durham AL (2004)
Patent Law Essentials: A Concise Guide, 2nd Edition
Praeger Publishers, Westport, CT

Contains 12 chapters dealing with general aspects of patent law, including an overview of the field, distinguishing patent rights from other rights, reading a patent, patent subject matter, and litigation. Special topics, such as design patents, plant patents, foreign patents, and patent computer programs, are also discussed.

Gilbert J (2004)
The Entrepreneur's Guide to Patents, Copyrights, Trademarks, Trade Secrets & Licensing
Berkley Publishing Group, New York

Deals with various aspects of intellectual property. Three of the 18 chapters are exclusively devoted to patent topics, including: what may be patented, filing a successful patent application, and avoiding, detecting and defending against patent infringement.

Gordon TT, Cookfair AS (2000)
Patent Fundamentals for Scientists and Engineers, 2nd Edition
CRC Press, Boca Raton, FL

Addresses a variety of themes in its 13 chapters including: a background on patents, the U.S. and Canadian patent systems, patentability, searching patents, record keeping, and patents around the world.

Grubb PW (2005)
Patents for Chemicals, Pharmaceuticals and Biotechnology: Fundamentals of Global Law, Practice and Strategy, 4th Edition
Oxford University Press, New York

In 25 chapters five major aspects of patents are addressed, including: an introduction and background to the modern patent system, patent law and procedure, patentability of inventions in specific technical fields, patenting in practice, and commercial exploitation of patents.

Knight HJ (2001)
Patent Strategy: For Researchers and Research Managers, 2nd Edition
John Wiley & Sons, New York

Contains nine chapters that address the following areas: basic intellectual property concepts, the value of patents, developing a patent strategy, researching, infringement, working with patent attorneys and agents, disclosure and filing, and future perspectives.

Mueller JM (2006)
An Introduction to Patent Law, 2nd Edition
Aspen Publishers, New York

An introductory text that covers the basic tenets of patent law. The 11 chapters discuss foundations of the U.S. patent system, patent claims, disclosure requirements, novelty and loss of right, the non-obviousness requirement, the utility requirement, potentially patentable subject matter, correcting issued patents, infringement, including defenses and remedies, and international patenting issues.

Stim R (2006)
Patent, Copyright & Trademark: An Intellectual Property Desk Reference, 8th Edition
Nolo, Berkeley, CA

Comprehensive resource divided into four parts with in-depth coverage of patent law, copyright law, trademark law, and trade secret law.

Thomas JR (2005)
Pharmaceutical Patent Law
BNA Books, Washington, DC

Eighteen chapters dedicated to a specific area of patent law. This text covers a variety of topics, including: patent acquisition, marketing approval procedures, infringement, and international and comparative aspects of pharmaceutical patent law.

Journals

Journal of Patent Associated Literature (JOPAL) (1988–)
World Intellectual Property Organization, Geneva
Web: http://www.wipo.int/scit/en/jopal/issue.htm

A monthly publication compiled by the World Intellectual Property Organization, which contains bibliographic details of articles published in leading scientific and technical periodicals arranged according to symbols of the International Patent Classification (IPC).

Journal of the Patent and Trademark Office Society (1918–)
Patent and Trademark Office Society, Arlington
Web: http://www.jptos.org/

A monthly publication produced by the Patent and Trademark Office Society that provides a forum for addressing legal and technical subjects relating to the useful arts and knowledge of the functional attributes of intellectual property law.

Patent, Trademark & Copyright Journal (1970–)
The Bureau of National Affairs, Inc., Washington, D.C.
Web: http://www.bna.com/products/ip/ptcj.htm

A weekly publication produced by the Bureau of National Affairs, Inc., which provides unique and comprehensive coverage of intellectual property cases, statutes, trends, and other key developments in all areas of intellectual property law.

World Patent Information (1979–)
Elsevier Inc., New York
Web: http://www.elsevier.com/wps/find/journaldescription.cws_home/654/description#description

A quarterly, peer-reviewed journal that provides a worldwide forum for the exchange of information between experts in industrial property documentation, information, classification, and statistics. Regular features include the following: papers addressing industrial property information and documentation, new regulations, short reports on relevant meetings and conferences, bibliographies, and book and literature reviews.

Organizations

European Patent Office (EPO)
80298 Munich, Germany
Phone: +49-89/23 99-0
Fax: +49-89/2399-4465 (Patent)
Web: http://www.european-patent-office.org/index.en.php

Established in 1973 by the Convention on the Grant of European Patents, the EPO administers a centralized patent grant system on behalf of the following current, contracting states: Austria, Belgium, Bulgaria, Switzerland, Cyprus, Czech Republic, Germany, Denmark, Estonia, Spain, Finland, France, Hellenic Republic, Hungary, Ireland, Iceland, Italy, Liechtenstein, Lithuania, Luxembourg, Latvia, Monaco, Netherlands, Poland, Portugal, Romania, Sweden, Slovenia, Slovakia, Turkey and the United Kingdom.

Japan Patent Office (JPO)
3-4-3, Kasumigaseki, Chiyoda-ku
Tokyo 100-8915 Japan
Phone: +03-3581-1101
Web: http://www.jpo.go.jp/index.htm

The 1885 Patent Monopoly Act created a foundation for a system of patent rights in Japan. The New Utility Model Law, enacted in 1905, served as a complement to the patent system. The JPO offices were completed nearly 30 years later followed by a complete revision of the patent law in 1959. In 1995, the JPO issued its two millionth patent.

The Trilateral Co-operation
Web: http://www.trilateral.net/

The Trilateral Co-operation was set up in 1983 and consists of the European Patent Office (EPO), Japan Patent Office (JPO), and the U.S. Patent and Trademark Office (USPTO). The Trilateral Offices process more than 85% of all patent applications filed worldwide, including Patent Cooperation Treaty applications.

United States Patent and Trademark Office (USPTO)
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450
Phone: +1-571-273-8300
Fax: +1-800-786-9199
Web: http://www.uspto.gov/

The USPTO was established based on the powers of the U.S. Congress as derived from Article 1, Section 8 of the U.S. Constitution – that is, to promote the progress of science and useful arts, by securing for limited times to inventors the exclusive right to their discoveries. The USPTO administers a patent grant system on behalf of the U.S. and foreign applicants for U.S. patents.

World Intellectual Property Organization (WIPO)
P.O. Box 18, CH-1211
Geneva 20 Switzerland
Phone: +41-22 338 9111
Fax: +41-22 733 54 28
Web: http://www.wipo.int/portal/index.html.en

The WIPO is a specialized agency of the United Nations. The WIPO Convention established the WIPO in 1967 with a mandate from its member states to promote the protection of intellectual property throughout the world through cooperation among states and in collaboration with other international organizations. WIPO currently consists of 184 members, including the United States.

Databases

Delphion (fee-for-service)
The Thomson Corporation
Web: http://www.delphion.com/

Delphion provides full-text access to over 35 million records from 70 patent offices worldwide. Value-add analysis, powerful search technology, and productivity tools are but a few of the many features provided.

Derwent World Patents Index (DWPI) (fee-for-service)
The Thomson Corporation
Web: http://scientific.thomson.com/products/dwpi/

A comprehensive database that is updated annually with 1.5 million patent documents from 41 patent-issuing authorities. As of October 2006, the database contains 14.85 million records covering 31.66 million patent documents. The subject experts for DWPI translate non-English language sources, such as Japanese, to English to aid searchers with identifying inventions filed in languages other than English. The database can be accessed in a number of different ways, including Dialog, Questel.Obit, STN, Delphion, Westlaw, and Data Feed.

esp@cenet – Europe's Network of Patent Databases
European Patent Office
Web: http://www.espacenet.com/

esp@cenet is a worldwide, open access patent database managed by the European Patent Office. The database provides information on more than 50 million patent documents from all over the world. Four search options are available to users, including a quick search, advanced search, number search, and classification search. Tutorials for using the database are freely available for download or provided online as e-learning modules. Search results contain bibliographic information and in many cases complete, full-text descriptions of the invention.

FreePatentsOnline – Patent Analytics and Patent Searching
Web: http://www.freepatentsonline.com/

FreePatentsOnline.com provides free searching of world patent data, PDF downloads, and account functions including alerts, and the ability to save, comment on, and share documents. Commercial services are also available including XML data feeds and patent analytics.

Google Patent
Web: http://www.google.com/patents

Google Patent Search provides open access to U.S. patents made available by the U.S. Patent and Trademark Office. Patents can be searched by patent number, inventor, and filing date and downloaded in PDF format.

Mayall's IP Links
Web: http://www.mayallj.freeserve.co.uk/

Mayall's IP Links provides links to a broad range of topics, including: patent databases, IP related software, patent laws, government patent offices, and miscellaneous resources.

PatentStorm: U.S. Patents
Web: http://www.patentstorm.us/

PatentStorm provides easy access to patents and full-text patents from the U.S. Patent and Trademark Office.

PATOLIS (PATent OnLine Information System) (fee-for-service)
PATOLIS Corporation
Web: http://www.patolis.co.jp/en/index.html

The PATOLIS database is the most comprehensive industrial property retrieval system in Japan. PATOLIS is used by more than 5000 Japanese companies, and provides non-Japanese speakers with an ultimate source to access Japanese intellectual property information.

The PATLIB Network
European Patent Office
Web: http://patlib.european-patent-office.org/directory/overview.pl

A network of patent information centers consisting of the national patent offices of each member state of the European Patent Organization. Over 323 offices are listed with complete contact information, including: mailing address, telephone, facsimile, e-mail, web, and key personnel.

Thomson Patent Store (fee-for-service)
The Thomson Corporation
Web: http://scientific.thomson.com/products/tps/

A fast and convenient web-based document delivery service for obtaining original patent documents from just €3 or $3 from major patenting authorities, including but not limited to the following: U.S. patents, World (PCT) patents, European patents, Japanese patents (English-language patent abstracts), and German patents.

United States Patent and Trademark Office
Web: http://www.uspto.gov/patft/

An open access database of patents issued in the U.S. since 1790. Patents issued from 1790 through 1975 are searchable by issue date, patent number, and current U.S. classification and available as full-page images. Patents issued from 1976 to present are available in full text with images of the original files. Published patent applications are available from 15 March 2001. Three search options are available for patents or patent applications: (1) quick search, (2) advanced search, and (3) patent number or publication number search.

Other Resources

Canadian Patent Office Record (CPOR)
Web: http://napoleon.ic.gc.ca/cipo/patgazarc.nsf/f_maincpor_e?OpenForm

A weekly publication that contains new patents, Canadian applications open to public inspection, and important notices. As of 2008, the Canadian patent database (http://patents.ic.gc.ca/cipo/cpd/en/introduction.html) has been updated daily. If the keywords 'toxicology' and 'risk assessment' are used to search the Canadian Patent Database, at least 50+ and 100+ applications are flagged, respectively (search conducted on January, 10, 2009). These results can be scanned or further refined by adding or changing the search terms.

Electronic Official Gazette – Patents (eOG:P) (U.S. Patent and Trademark Office)
Web: http://www.uspto.gov/web/patents/patog/

An online publication of patents issued for the week that is traditionally contained in the Official Gazette of the United States Patent and Trademark Office for Patents. Users can browse patents by number, classification, a range of classes, type of patent (e.g., utility, design, and plant), and patentee name.

The Estonian Patent Gazette
Web: http://www.epa.ee/default.asp?id=512

A bimonthly publication that contains information on the following: Estonian patents, European patents, supplemental protection of medicinal products and plant protection products, licenses and pawns, bibliographic information, and legal acts and information.

European Patent Bulletin
Web: http://www.european-patent-office.org/e_pub/bulletin/index.htm

A weekly publication that contains bibliographic data as well as data concerning the legal situation of European patent applications and patents.

The Official Gazette (Bulgaria)
Web: http://www.bpo.bg/en/index.html; Click 'Data bases' tab; then select 'BULETINS'

A monthly publication that includes bibliographic data and abstracts with drawings/chemical formulas of published applications and granted patents for inventions and utility models.

Official Journal of the EPO (European Patent Office)
Web: http://www.european-patent-office.org/epo/pubs/oj_index_e.htm

A monthly publication that provides coverage on general information from the EPO, the EPO Board of Appeal Case Law, regulations, schedule of fees and costs, information from contracting/extension states, international treaties, and upcoming events.

Patents Office Journal (Ireland)
Web: http://www.patentsoffice.ie/en/publications_download.aspx

A biweekly publication that provides information on a variety of topics, including the following: applications for patents, published applications, granted patents (including European patents), and expired patents.

PART

VI

The Global Arena

CHAPTER

77

Overview of International Activities

J. KUELLMER AND U. SCHLOTTMANN

The risks connected with chemical substances have been assessed in a number of conventions that have aimed to apply restrictions on the use of dangerous chemicals and control of their worldwide trade. The developments in chemicals policy at the European and world level are discussed, with an insight into the interlaced structure of international cooperation that exists at both the political and the technical level.

INTRODUCTION

The industrialization that the world has achieved in the past two hundred years is inextricably connected with the production and use of chemicals. According to OECD estimates, sales are twice as high as in the telecommunications sector (BMZ 2002). Chemical products have undoubtedly contributed to a substantial improvement in the quality of life. Plastics, surfactants, and a large number of basic chemicals are improving the medical and hygienic situation worldwide. However, numerous toxic substances present risks and hazards that occur during the entire life cycle of a substance: during production, during transport and trade, and during storage, use, and disposal. Awareness of environmental and health risks has grown over the last 20 years. Today this is making itself felt in an increasingly complex set of international regulations on chemical safety. The focus is increasingly shifting towards the developing countries and their populations, as people there are less aware of the risks and hazards than those in the industrialized countries. Today the worldwide spread of persistent, bio-accumulating, and toxic chemicals by air or water, their occurrence in places where they are not used, and the destruction of the ozone layer are making it clear to everyone that chemical safety is an international challenge and not just an empty phrase. But it should not be necessary for risks arising from chemicals to assume international dimensions before action is taken. That is why national or European regulations provide an appropriate framework for a large number of chemicals. Moreover, national laws and European Community (EC) legislation are enforceable law. Compliance with this law is monitored, while noncompliance is prosecuted and punished.

INTERNATIONAL ACTIVITIES

Protocols and Conventions

The Montreal Protocol

The gaps in the ozone layer over the polar region present a threat to humans, animals, and plants, because of the increase in UV-B radiation reaching the surface of the earth. This natural protective shield has been damaged by the worldwide use of ozone-depleting substances (ODS), such as chlorofluorocarbons (CFCs) and halons, which are used for fire protection materials. The Montreal Protocol (MP) is the international contractual basis for the United Nations worldwide program for discontinuing the use of ODS. The year 2007 marks two important milestones for the Montreal Protocol: it is the date by which developing countries must have reduced their CFC consumption and production by 85%, and it is also the 20th anniversary of the treaty's signature. It is thus an opportune time to reflect on why the Montreal Protocol is well on its way to achieving its goals.

Twenty years ago, 46 countries undertook to stop producing and using substances that were damaging to the ozone layer. In the meantime 191 countries have signed this protocol. The signatory states are responsible for a total of over 90% of the consumption of these substances. The original target (from 1987) of halving the consumption of CFCs by the year 2000 has since been raised considerably on a number of occasions in light of the alarming reports on the status of the ozone layer. For example, the production of CFCs in the industrialized countries was discontinued at the beginning of 1996. The amendment to the MP, which was passed in Beijing in 1999, states that from 2002 onwards the production and use of the substance bromochloromethane, which can be used as a solvent and fire extinguisher, is to be totally banned in the signatory states. This amendment and the treaty modifications adopted at the same meeting were transposed into European law by decree of the EC Council (European Council 2002). It follows from the reasons given for this decision that additional steps must be taken to monitor trade in ODS, especially partially halogenated CFCs and new substances. Methyl bromide remained unnoticed by the public for a very long time; this is despite the fact that one atom of bromine destroys 80 times more ozone than a chlorine atom (Zellner 2001). Thus the bromine content of a compound such as methyl bromide is more reactive and has a greater impact on stratospheric ozone than the chlorine content of CFCs. This pesticide has nevertheless been in use for decades as a preferred means of treating arable land. In Germany its use in the agricultural sector was banned in 1982 owing to its harmful effects on the groundwater. Since then, most industrialized countries have banned the use of methyl bromide. Under the MP, the USA agreed a ban on methyl bromide in 2005 and developing countries by 2015.

The Montreal Protocol is closely linked to the Convention on Climate Change (Kyoto Protocol, into force since February 2005). The climate protection already achieved by Montreal Protocol is far larger than the reduction target of the first commitment period of the Kyoto Protocol (Velders et al 2007). Additional climate benefits that are significant compared with the Kyoto Protocol reduction target could be achieved by actions under the Montreal Protocol, by managing the emissions of substitute fluorocarbon gases and/or implementing alternative gases with lower global warming potentials (http://www.uneptie.org/ozonaction).

The Stockholm Convention (POPs)

The POPs Convention implements international prohibition and restriction measures with regard to certain persistent organic pollutants (POPs). The core of the Convention is that 12 particularly dangerous POPs for the environment are to be prohibited or reduced until they are totally eliminated. The dynamic design of the rules of the Convention allows the original POPs substances to be joined by further substances that meet the four criteria of persistency, bioaccumulation, long-range transport potential, and harmful properties. The POPs Convention prohibits the following chemicals: aldrin, dieldrin, endrin, chlordane, mirex, toxaphene, heptachlor, hexachlorobenzene, di(para-chlorophenyl), trichloroethane (DDT), polychlorinated biphenyls (PCBs), polychlorinated dibenzodioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs). With the exception of DDT, which may still be produced and used on a country-specific basis for combating malaria, and of unwanted by-products, all other substances are listed in the Appendix (Appendix A) to the Convention, which regulates the phasing out of the production and use of these substances. The production and use of DDT for vector control will remain necessary until inexpensive alternatives become available. The relevant countries must inform the United Nations Environment Program (UNEP) on Chemicals and the World Health Organization (WHO) about the use of DDT. The Secretariat, in cooperation with WHO, reviews periodically to gather information about the amounts of DDT used by Parties, the conditions of such use and its relevance to that Party disease management strategy. The POPs Secretariat reported back to the third conference of the Parties 2007 in Dakar, Senegal. The use of DDT as a pesticide in the agricultural sector is, however, prohibited.

In May 2001 the signatory conference for the POPs Convention took place in Stockholm. The Convention entered into force once it had been ratified by 50 countries. This was the case on 17 May 2004. Up to date (February 2009) there are 162 ratifications. April 2004 saw the introduction of Regulation (EC) No. 850/2004 of the European Parliament and the Council on persistent organic pollutants (http://www.pops.int).

The Rotterdam Convention (PIC)

According to estimates by the World Health Organization (WHO), about one million accidents each year are caused worldwide through poisoning from pesticides. The worldwide trade in dangerous chemicals is merely the beginning of the life cycle of a chemical; it is followed by storage, use, and the disposal of residual stocks. That is why steps should be taken as early as the trade stage to ensure that dangerous chemicals do not adversely affect man and the environment. This applies particularly to developing countries, most of which are

today suffering from the effects of incorrect usage. For this reason, a meeting of the International Community of States in Rotterdam 1998 decided to adopt a convention defining binding rules for the trade in dangerous chemicals (PIC Convention). In accordance with the precautionary principle, this convention allows states to impose a ban on imports before a chemical is imported. This does not prohibit trade in chemicals, but makes it subject to very stringent rules, namely the 'PIC procedure', where PIC stands for 'prior informed consent'. In the context of imports, this means that the potential importing country must be informed about the chemical and take a decision before the chemical is actually imported.

The Convention covers pesticides and industrial chemicals that have been banned or severely restricted for health or environmental reasons by Parties and which have been notified by Parties for inclusion in the PIC procedure. One notification from each of two specified regions triggers consideration of addition of a chemical to Annex III of the Convention. Severely hazardous pesticide formulations that present a hazard under conditions of use in developing countries or countries with economies in transition may also be nominated for inclusion in Annex III. There are 39 chemicals listed in Annex III of the Convention and subject to the PIC procedure, including 24 pesticides, four severely hazardous pesticide formulations and 11 industrial chemicals. Many more chemicals are expected to be added in the future. The Conference of the Parties decides on the inclusion of new chemicals. Once a chemical is included in Annex III, a 'decision guidance document' (DGD) containing information concerning the chemical and the regulatory decisions to ban or severely restrict the chemical for health or environmental reasons, is circulated to all Parties. Parties have nine months to prepare a response concerning the future import of the chemical. The response can consist of either a final decision (to allow import of the chemical, not to allow import, or to allow import subject to specified conditions) or an interim response. Decisions by an importing country must be trade neutral (i.e., apply equally to domestic production for domestic use as well as to imports from any source). The import decisions are circulated and exporting country Parties are obligated under the Convention to take appropriate measure to ensure that exporters within its jurisdiction comply with the decisions.

The Convention promotes the exchange of information on a very broad range of chemicals, through:

- requirement for a Party to inform other Parties of each national ban or severe restriction of a chemical;
- possibility for a Party which is a developing country or a country in transition to inform other Parties that it is experiencing problems caused by a severely hazardous pesticide formulation under conditions of use in its territory;
- requirement for a Party that plans to export a chemical that is banned or severely restricted for use within its territory, to inform the importing Party that such export will take place, before the first shipment and annually thereafter;
- requirement for an exporting Party, when exporting chemicals that are to be used for occupational purposes, to ensure that an up-to-date safety data sheet is sent to the importer; and
- labeling requirements for exports of chemicals included in the PIC procedure, as well as for other chemicals that are banned or severely restricted in the exporting country.

The text of the Convention was adopted on 10 September 1998 by a Conference of Plenipotentiaries in Rotterdam, the Netherlands. The Convention entered into force on 24 February 2004 once it had been ratified by 50 countries. Up to date (Feb. 2009) there are 127 ratifications.

Spring 2003 saw the introduction of Regulation (EC) No. 304/2003 of the European Parliament and the Council on the Export and Import of Dangerous Chemicals. This superseded the existing Council Regulation (EEC) No. 2455/92 (July 1992) concerning the Export and Import of Certain Dangerous Chemicals. No reductions were to be made in the level of environmental and health protection in the importing countries. In order to achieve this goal, some of the provisions go beyond those of the PIC Convention. This conforms with Article 15, Paragraph 4 of the PIC Convention, which states that the contracting parties may take measures that provide more stringent protection for human health and the environment than laid down in the Convention, provided these measures are compatible with the Convention and with international law. The EC also considered it advantageous in terms of practicability that there should be a single agency responsible for contact between the EC, the PIC Secretariat, other contracting parties, and other countries. The Commission has assumed the function of the point of contact for this purpose. Exports of dangerous chemicals that are prohibited in the Community or subject to strict restrictions continue to be subject to a joint export notification procedure. In the case of imports, the EC must take decisions before the importation of chemicals that are subject to the international PIC procedure is allowed. The fact that exporters and importers are obliged to furnish information on the quantities of chemicals in international trade that are covered by this Regulation

makes for better monitoring and assessment of the impacts and effectiveness of this Regulation (http://www.pic.int).

The Basel Convention

The cross-border transport of hazardous wastes seized the public's attention in the 1980s after misadventures of 'toxic ships' sailing from port to port trying to offload the poisonous cargoes.

The Basel Convention regulates the transboundary movements of hazardous and other wastes applying the 'Prior Informed Consent' procedure. Shipments to and from non-Parties are illegal unless there is a special agreement. Each Party is required to introduce appropriate national or domestic legislation to prevent and punish illegal traffic in hazardous and other wastes. The Convention obliges its Parties to ensure that hazardous and other wastes are managed and disposed of in an environmentally sound manner. Therefore Parties are expected to minimize the quantities that are moved across borders, to treat and dispose of wastes as close as possible to their place of generation and to prevent or minimize the generation of wastes at source. Strong controls have to be applied from the movement of generation of hazardous waste to its storage, transport, treatment, reuse, recycling, recovery and final disposal. Recently the Basel Conventions handled issues like electronic and electrical wastes (e-waste), mercury and asbestos wastes and illegal dumping of hazardous wastes. The Convention entered into force 5 May 1992. Up to date (February 2009) there are 170 ratifications (www.basel.int).

In March 2007 a first meeting of an Ad Hoc Joint Working Group was convened in Helsinki, Finland, to prepare, in consultation with other relevant secretariats and the United Nations Environment Program, a study on how cooperation and synergies between the secretariats of the Basel Convention, the Rotterdam Convention, and Stockholm Convention could be improved (http://ahjwg.chem.unep.ch).

The Aarhus Convention

The United Nations Economic Commission for Europe (UNECE) Convention on Access to Information, Public Participation in Decision-Making and Access to Justice in Environmental Matters was adopted on 25 June 1998 in the Danish city of Aarhus at the Fourth Ministerial Conference as part of the 'Environment for Europe' process. It entered into force on 30 October 2001. The Convention establishes a number of rights of the public (individuals and their associations) with regard to the environment. It provides for the right of everyone to receive environmental information that is held by public authorities, to participate in environmental decision-making and the right to review procedures to challenge public decisions that have been made.

Autumn 2006 saw the introduction of Regulation (EC) No. 1367/2006 of the European Parliament and the Council on the application of the provisions of the Aarhus Convention in Environmental Matters to Community institutions and bodies. Bodies, offices, or agencies established by, or on the basis of the EC Treaty, had to adapt their internal procedures and practices to the provisions of the Regulation until 28 June 2007 (http://www.unece.org/env/pp/).

Intergovernmental Forums and Activities

The Stockholm Conference

The Stockholm Conference, held from 5 June to 16 June 1972 in Stockholm, was an environmental watershed (Engfeldt 2002). The Conference adopted recommendations for action at the international level. As a result of the Conference, environment ministries and agencies were established in more than 100 countries, a key requirement for carrying forth the results of the Conference. It also marked the beginning of the explosive increase in non-governmental and intergovernmental organizations dedicated to environmental preservation. The United Nations Environment Program was established. The Declaration and the Action Plan of Stockholm have been particular instruments in the rapid development of international environmental law.

The United Nations Conference on Environment and Development (UNCED)

The first Conference on Environment and Development (UNCED) was held in Rio de Janeiro in 1992, in which the positive experiences of the Montreal Protocol were maintained. Numerous heads of state and heads of government approved Chapter 19 of Agenda 21, which sets out details of the principles for internationally effective chemical safety. This chapter contains objectives for environmentally sound handling and use of chemicals, including measures to prevent illegal international trade in toxic and dangerous products. An important point is the intensification of international cooperation and the coordination of ongoing international and regional activities (www.un.org/geninfo/bp/enviro.html).

The World Summit on Sustainable Development (WSSD)

Ten years after the conference in Rio de Janeiro (UNCED), the World Summit for Sustainable

Development (WSSD) in Johannesburg ended with the approval of the declaration tabled by South Africa of the action plan that had been negotiated over a period of several months ('Johannesburg Plan of Implementation'). In the period leading up to the conference, the EU had urged that decisions be passed in Johannesburg on concrete targets, timetables, and implementation programs for chemical safety. Item 23 of the plan of implementation contains a renewal of the commitments in Agenda 21. Throughout their entire life cycle, chemicals are to be properly handled in the interests of sustainable development and the protection of human health and the environment, with the aim of ensuring by the year 2020 that chemicals are used and produced in such a way that significant negative impacts on human health and the environment are minimized. Transparent procedures for risk assessment and risk management that are based on scientific findings are to be used, and the precautionary principle in Principle 15 of the Rio Declaration for Environment and Development is to be taken into account. Developing countries are to be given technical and financial assistance with building up their capacities for the proper handling of chemicals and hazardous wastes (www.un.org/events/wssd).

The Strategic Approach to International Chemicals Management (SAICM)

The decision to develop a Strategic Approach to International Chemicals Management (SAICM) is based on the resolutions passed by the UNEP Global Ministerial Environment Forum (GMEF) in Cartagena in February 2002 and by the WSSD.

Adopted by the International Conference on Chemicals Management (ICCM) on 6 February 2006 in Dubai, United Arab Emirates, the Strategic Approach to International Chemicals Management (SAICM) is from now on the policy framework for international action on chemical hazards. The main goal of this Strategic Approach is thus to implement the sustainable use of chemicals as speedily and efficiently as possible. SAICM allows for a clear and meaningful statement of priorities that groups a number of different activities and brings together the existing chemicals management organizations. Therefore SAICM aims to encourage governments and other stakeholders from sectors such as agriculture, environment, health, industry, and labor to collaborate more effectively on minimizing potential risks. The Strategic Approach supports the achievement of the goal agreed at the 2002 Johannesburg World Summit on Sustainable Development of ensuring that, by the year 2020, chemicals are produced and used in ways that minimize significant adverse impacts on the environment and human health. To this end, SAICM promotes capacity building for developing countries and countries with economies in transition and better coordination of international efforts to improve chemicals management. Another reason to believe that SAICM will have a substantial regulatory role is that many proponents see it as the perfect vehicle for the European Union to globalize its REACH Regulation (Kuellmer 2006, Logomasini 2006, EurActiv 2007).

In order to put the strategic approach into practice, a chemicals secretariat has been established at UNEP Chemicals in Geneva. UN follow-up conferences will be held to guide and monitor the SAICM process. These International Conferences on Chemicals Management (ICCM 2–5) are scheduled for 2009, 2012, 2015, and 2020. The decisions adopted in Dubai by more than 140 States will hopefully allow the ambitious minimization goal of the 2002 Johannesburg Summit to be translated into practical actions by the year 2020 (http://www.chem.unep.ch/chemicals/default.htm).

The Classification and Labelling of Chemicals (Globally Harmonized System, GHS)

The GHS is the United Nations Globally Harmonized System of Classification and Labelling of Chemicals. The international mandate that provided the impetus for this work was adopted in the 1992 United Nations Conference on Environment and Development (UNCED), as reflected in Agenda 21. In its Plan of Implementation (para. 22 (c)) adopted in Johannesburg on 4 September 2002, the World Summit on Sustainable Development (WSSD) encouraged countries to implement the new GHS as soon as possible with a view to having the system fully operational by 2008. Being developed at UN level, the GHS provides a harmonized basis for globally uniform environmental, health, and safety information on hazardous chemical substances and mixtures.

The Globally Harmonized System for the Labelling and Classification of Chemicals was adopted in late 2002 by the UN Committee of Experts on the Transport of Dangerous Goods and the Globally Harmonized System of Classification and Labelling of Chemicals (CETDG/GHS), an Economic and Social Council (ECOSOC) subsidiary body serviced by the UNECE secretariat, in Geneva after a decade of efforts and cooperation amongst a broad number of countries and organizations, notably the Committee, ILO and OECD under the umbrella of the Inter-Organization Programme for the Management of Chemicals (IOMC). In July 2003 this draft was approved and published as

a United Nations recommendation. At its session December 2006, the Committee of Experts adopted a set of amendments to the first edition of the GHS, which will be included in a revised edition of the GHS to be published in 2007. Implementation has started with pilot countries introducing the system in their national practices in different regions of the world. The European Union is negotiating a draft proposal (European Commission 2006 a) for a Regulation which would introduce the GHS criteria in Community law. In accordance with the Commission's commitment to better regulation, the Commission Services have undertaken a public consultation on this draft proposal late autumn 2006. Adopted by the legislator on November 28, 2008 the GHS Regulation will repeal the currently existing EU Directives on classification and labeling, i.e. Directive 67/548/EEC and 1999/45/EC, after a transitional period. As soon as the GHS is implemented, trade barriers will be abolished and costs will be reduced. Animal experiments, many of which are unnecessary because of widespread repetition and duplication of tests, will be eliminated. Moreover, greater transparency will be achieved in the use of chemicals. The GHS is to address the fields of transport, workplace, consumers, and environment. The harmonization approach encompasses the classification criteria and labeling provisions on physicochemical, health-endangering, and environmentally harmful properties. On the one hand the new system is to be based on successful existing precursor models. At the same time, however, it is to introduce standardized safety data sheets worldwide and easily understood hazard symbols which make clear the risks to humans and the environment that arise when using chemicals. The labeling and information sheets would be used for the carriage of dangerous goods and the use of chemicals in industry and agriculture. This will unify the existing classification and labeling systems and supersede the separate systems for dangerous goods and hazardous substances (http://www.unece.org/trans/danger/danger.html).

The Intergovernmental Forum for Chemical Safety (IFCS)

As part of the implementation of UNCED 1992, the International Conference on Chemical Safety was held in Stockholm in April 1994, which was organized by the United Nations Environment Program (UNEP), the International Labor Organization (ILO) and the World Health Organization (WHO). The conference established the Intergovernmental Forum on Chemical Safety (IFCS), the central task of which is to promote, monitor, and harmonize the implementation of Chapter 19. The Forum is to draw up recommendations for governments and for international and intergovernmental organizations. Moreover, Forum I in 1994 laid down a concrete plan of action on the six key areas of Chapter 19 with a time scale extending until 2000. In 1995, to coordinate the work of the international organizations, the Inter-Organization Program for the Sound Management of Chemicals (IOMC) was set up, comprising UNEP, WHO, ILO, FAO, UNIDO, UNITAR (1998), and OECD. In 2000 the participants in the IFCS Forum III approved the Bahia Declaration and a concrete plan of action. This declaration makes recommendations on measures in the field of chemical safety after the year 2000. Forum IV 2003 in Bangkok was held under the motto 'Chemical Safety in a Vulnerable World' (Gaertner et al 2003). Djerassi (2004) argues that the 'absence of adequate knowledge in many less-developed countries of the extent and nature of their exposure to dangerous chemicals is their greatest vulnerability.' In order to overcome this deleterious situation, he calls for the formation of a steering committee to encourage and facilitate North/South interaction on new approaches to chemical safety. Forum V was held in September 2006 in Budapest, Hungary. Eighty-one governments participated in the meeting, together with representatives from 12 intergovernmental organizations (IGO) and 64 nongovernmental organizations (NGO). At Forum V the IFCS took stock of the progress achieved on the commitments and recommendations made at previous sessions and charted the course for work in a number of new areas. In light of the adoption of the SAICM by the ICCM in February 2006, Forum V the future role of IFCS as a contribution to the implementation of SAICM was considered (http://www.who.int/ifcs).

The International Programme on Chemical Safety (IPCS)

The IPCS was founded in 1980 as a joint venture by the UNEP, WHO, and ILO. The aim of the IPCS is to produce a fundamental scientific base for reducing the risks to human health and the environment that are caused by chemicals. It seeks to strengthen national and international efforts in the field of chemical safety. This benefits not only the participating states, but also, in particular, those states where the structures for chemical safety and the knowledge needed for building up such structures are not yet very well developed. One key area of the work of the IPCS is to compile and disseminate findings regarding risks to man and the environment arising from chemicals which may be of both industrial and natural origin. To this end numerous monographs on substances and assessment methods have been produced.

An invaluable tool for those concerned with chemical safety and the sound management of chemicals is IPCS INCHEM. Produced through cooperation between the International Programme on Chemical Safety (IPCS) and the Canadian Centre for Occupational Health and Safety (CCOHS) INCHEM directly responds to one of the Intergovernmental Forum on Chemical Safety (IFCS) priority actions to consolidate current, internationally peer-reviewed chemical safety-related publications and database records from international bodies, for public access. INCHEM offers quick and easy electronic access to thousands of searchable full-text documents on chemical risks and the sound management of chemicals.

The following items have been published (to date June 2007):

- Substance reports (Environmental Health Criteria, EHC). These reports prepared for scientific experts contain up-to-date information on health hazards and risks for a specific substance or group of substances. Recent EHCs also contain information on environmental impacts. There are currently 237 EHC reports, with more than 1000 CAS entries. There are over 800 000 INCHEM sessions in 2006 (WHO-web).
- Safety data sheets (International Chemical Safety Cards, ICSC). These summarize the principal data on a product and information on health protection and safe handling tailored to the use of the product; for example, in factories or the agricultural sector. There are currently more than 1400 ICSCs at the UN level. There were over 700 000 INCHEM sessions in 2006.
- Poisons Information Monographs (PIMs). These contain a brief description of the main chemical, physical, and toxicological properties of individual substances and provides information on diagnosis and the treatment of poisoning. PIMs are intended for poison emergency centers and other advisory units. There are currently 230 PIMs covering 462 substances.
- New substance reports (Concise International Chemical Assessment Documents, CICAD). These contain information on the hazard potential of a substance, dose–response relationships and, on the basis of sample exposure data, risk characterizations. As a rule, CICADs are based on existing substance reports. The intention is that national substance reports prepared in accordance with the CICAD procedure should be capable of easy transformation into internationally usable and recognized substance reports with a minimum of financial input. There are 71 CICADs, covering 200 chemicals. They are published by the Wissenschaftliche Verlagsgesellschaft in Stuttgart. There were over 400 000 INCHEM sessions in 2006 (http://www.who.int/ipcs/en/).

The World Library of Toxicology

The U.S. National Library of Medicine (NLM), through its Toxicology and Environmental Health Information Program (TEHIP), is a major electronic repository of worldwide toxicological data and literature citations. It has lately taken a more overt role in global activities through its forthcoming online World Library of Toxicology, Chemical Safety and Environmental Health (WLT). The WLT is being designed as an online web-based portal to information resources in toxicology, chemical safety, and environmental health, coordinated and managed by NLM and largely built by a network of Country Correspondents. Links to information resources available in specific countries will be provided in both English and the country's native language. Additionally, links to major multilateral organizations will be offered. Ancillary information such as a 'Global ert' news feature, international environmental laws, and a core list of toxicology resources, will also be available. The WLT will be accessible from http://sis.nlm.nih.gov/enviro.html.

The Governing Council of the United Nations Environment Program (GC UNEP)

The United Nations Environmental Program (UNEP) was founded as a UN institution in Stockholm in 1972 to address global problems of environment policy that can only be dealt with meaningfully by adopting a multilateral approach. The Governing Council of UNEP (GC UNEP) meets every two years to decide the UNEP work program, in line with the political objectives. For this reason delegates from 141 countries met in Nairobi for the 24th session of the GC UNEP in February 2007 to take the further steps towards the implementation of an action plan whose objective is to minimize the health and environmental impacts of chemicals by 2020. The final omnibus decision on chemicals management (UNEP/GC/CW/L.2 and UNEP/GC/CW/CRP.11) has sections on the prevention of illegal international traffic, SAICM, cooperation between UNEP and relevant Multilateral Environmental Agreements (MEAs). In the case of illegal traffic, the UNEP was particularly requested to assist the developing countries in their efforts to identify areas dangerous to humans through capacity building. On heavy metals, the GC urges filling information gaps regarding lead and cadmium, requests the UNEP Executive Director to compile an inventory of existing risk management measures, and encourages governments to reduce risks posed to human health and the environment. Following the UNEP's submission of a worldwide mercury evaluation in 2003/05, concrete steps to reduce the use of mercury worldwide are to follow. On mercury, the decision 2007: acknowledges progress made within UNEP's mercury program;

outlines priorities in reducing risks from releases of mercury; urges governments to gather information on means to reduce risk caused by supply of mercury; requests the UNEP Executive Director to prepare a report on mercury emissions, and strengthen the UNEP mercury partnerships; establishes an ad hoc open-ended working group of government and stakeholder representatives to review and assess options for enhanced voluntary measures and new or existing international legal instruments, and decides that the group will provide a progress report to GCSS-10/GMEF, and a final report to GC-25/GMEF, which will take a decision on the matter (http://www.unep.org/gc/gc24).

Sustainable Chemistry

The term 'sustainable chemistry' describes a fundamental strategy that aims not only to reduce the environmental impact of chemicals, but also to minimize all burdens on the environment and to conserve resources; it includes legal regulations (Eissen et al 2002). Its broadly based objective is a networked and closely coordinated design of chemical and product policy, environmental and health policy which takes account of social, economic, and ecological aspects (Tundo 2000). A sustainable chemicals policy can only be implemented jointly with industry and should not restrict its competitiveness (Lankey 2002). In the long term, ecological benefits go hand-in-hand with economic benefits. The chemical industry has been demonstrating this for years in cases where process innovations that make ecological sense have been systematically implemented, thus giving rise to profitable energy-saving effects. A global sustainability policy in the chemicals sector lends special significance to the responsibility of industry and the industrialized countries for the developing countries. For this reason the systematic implementation of modern knowledge management (e.g., through a GHS) and an approach based on substance flows should be an essential component of the future sustainability strategy in chemicals policy, since more transparency leads to greater safety. The OECD has initiated work to identify effective techniques and approaches in the field of sustainable chemistry and to identify activities in further development and use of sustainable chemistry programs. This includes such things as recognizing and rewarding sustainable chemistry accomplishments; disseminating technical information; promoting the incorporation of sustainable chemistry principles into various levels of chemical education; and promoting the research, discovery, and development of innovative sustainable chemistry technologies (http://www.chemistry-conferences.com).

INTERGOVERNMENTAL ORGANIZATIONS

The Organization for Economic Co-operation and Development (OECD)

The Organization for Economic Co-operation and Development (OECD) must continue to be regarded as a very important body for the development of international chemical safety; some 85% of worldwide production of chemicals takes place in the member countries of the OECD. The growing number of members (currently 30) combined with the shrinking budget has given rise to a substantive debate about the original work of the OECD. In the Environment Health and Safety Program (EHS), which has been in existence since 1971, the OECD has maintained its proven long-term key activities for the year 2008/9. Notable examples include good laboratory practice (GLP) in the testing of chemicals (Schlottmann 1997), the chemical test methods – physically, toxicologically and eco toxicologically – (Schlottmann 2002), the harmonization of classification and labeling (GHS), and risk assessment. The OECD can be expected to emerge strengthened from the initiated reform process if it plays an active part in shaping this process itself.

The OECD Mutual Acceptance of Data (MAD) system is a multilateral agreement that data generated in the testing of chemicals in accordance with the OECD Test Guidelines and OECD GLP Principles shall be accepted by other Member countries for the purposes of assessment and other uses relating to the protection of man and the environment. Test facilities which want to submit safety studies to regulatory authorities have to comply with the GLP principles. Member countries shall adopt the measures necessary for verification of compliance of test facilities located in their territory. These measures shall include GLP inspections and study audits in accordance with the recommendations of the OECD. The OECD GLP regulations are laid down in the OECD Series on GLP, which contains at present 15 documents such as the GLP Principles, Guidance for GLP monitoring procedures and specific interpretations of the GLP Principles. The OECD MAD system is open to adherence by non-member countries which express their willingness and demonstrate their ability to participate therein. Prerequisite for fully adhering MAD Decision is a full implementation of OECD GLP regulations and a successful on-site evaluation, so-called 'Mutual Joint Visits' (MJV). In a first round of MJV, most of the GLP monitoring programs of the European Union and the OECD Member countries have been successfully verified. Additionally South Africa, Slovenia, and Israel passed the verification process and are now full MAD Members with the

same rights and obligations as OECD Member countries. Provisional adherents to the MAD system are currently India and Singapore. Singapore is the fifth non-member economy to join the Council Decisions on Mutual Acceptance of Data in the Assessment of Chemicals. The period of provisional adherence, during which time Singapore will accept data from OECD member countries and other adhering economies while it establishes its GLP compliance monitoring program, began in March of 2007. The next round of the periodic evaluation program (MJV) started in 2008 and all monitoring programs in the MAD framework will be again evaluated until 2017. The GLP monitoring programs of the MAD Member countries give regulatory authorities confidence in the quality and integrity of submitted safety studies and enable the Mutual Acceptance of Data. The OECD MAD system saves governments and chemical producers over EUR 60 million every year by allowing the results of a variety of safety tests done on chemicals and chemical products such as industrial chemicals and pesticides to be shared across OECD (www.oecd.org/ehs/).

Other Intergovernmental Organizations, Agencies, and Associations

There are many additional multilateral organizations, agencies, and associations whose mission, in whole or in part, relates to various aspects of potentially hazardous chemicals. Some of these operate under forms of legal frameworks. Others are professional, scientific, or trade groups. While it is beyond the scope of this chapter to discuss them in depth, or even itemize them all, a small sampling would include: World Health Organization (WHO), International Labor Organization (ILO), Food and Agricultural Organization (FAO), United Nations Institute for Training and Development (UNITAR), United Nations Industrial Development Organization (UNIDO), International Agency of Research on Cancer (IARC), International Union of Toxicology (IUTOX) and International Council of Chemical Associations (ICCA).

MAIN FEATURES OF EC CHEMICALS LEGISLATION

The New EC Chemicals Policy

The EU legislative framework for chemical substances was a patchwork of many different Directives and Regulations which has developed historically. There have been different rules for 'existing' and 'new' chemicals. However, this system has not produced sufficient information about the effects of the majority of existing chemicals on human health and the environment. The identification and assessment of risks – covering the possible hazards of a substance as well as exposure of humans and the environment to it – have proved to be slow, as have been the subsequent introduction of risk management measures. The current system has hampered research and innovation. All chemicals that were reported as being on the European Community market between 1 January 1971 and 18 September 1981 (listed in the European Inventory of Existing Commercial Chemical Substances (EINECS)) were called 'existing' chemicals. In 1981, they numbered more than 100 000 different substances. Chemicals introduced to the market after 1981 (more than 3800) were termed 'new' chemicals. While new chemicals have been tested before they have been placed on the market, there have been no such provisions for 'existing' chemicals. Thus, although some information exists on the properties and uses of existing substances, there has been generally a lack of sufficient information publicly available in order to assess and control these substances effectively.

The allocation of responsibilities was also not appropriate: Public authorities have been responsible for undertaking risk assessments of substances rather than the enterprises that manufacture, import, or use the substances; and these risk assessments required to be comprehensive, rather than targeted and use-specific. Since 1993, only 141 high-volume chemicals have been identified as priority substances for risk assessment.

In the Strategy for a Future Chemicals Policy, published in COM (2001) 88, the European Commission (2001) outlined the results of a review of the current system and its new strategy for ensuring a high level of chemicals safety and a competitive chemicals industry through a system for the **R**egistration, **E**valuation and **A**uthorisation of **Ch**emicals – the REACH system. The REACH Regulation (EC) No 1907/2006 creates a level playing field for 'existing' and 'new' substances and entered into force on 1 June 2007. It simplifies EU level regulation in replacing 40 existing pieces of legislation and in creating a single system for all chemicals. By closing the knowledge gap for more than 30 000 existing substances it will provide information on both their acute and long-term effects. For industry, there will be an incentive for safer substances which will direct and stimulate innovation while REACH gives more flexibility for chemicals used for the purposes of research and development. As a result of globalization and ultrafast information exchange via networked media and the Internet, the different legal systems worldwide in place increasingly influence one another. REACH will fundamentally reshape the European legal system and give new priority to environmental

and health-protection concerns with an impact on non-EU countries (European Commission 2006 b). A European Chemicals Agency (in the following Agency) will manage the scientific, technical, and administrative work.

Aims of REACH

The important aims are to improve protection of human health and the environment from the risks of chemicals while enhancing the competitiveness of the EU chemicals industry. The seven objectives that needed to be balanced within the overall framework of sustainable development were (European Commission 2007):

- Protection of human health and the environment;
- Maintenance and enhancement of the competitiveness of the EU chemical industry;
- Prevention of fragmentation of the internal market;
- Increased transparency;
- Integration with international efforts;
- Promotion of non-animal testing.

REACH is based on the idea that industry itself is best placed to ensure that the chemicals it manufactures and puts on the market in the EU do not adversely affect human health or the environment. This requires that industry has certain knowledge of the properties of its substances and manages potential risks. Authorities should focus their resources on ensuring industries are meeting their obligations and taking action on substances of very high concern or where there is a need for EC action. REACH creates a single system for both what was described as 'existing' and 'new' substances; substances were described as non-phase-in substances (i.e. those not produced or marketed prior to the entry into force of REACH) and phase-in substances (those substances listed in the EINECS, or those that have been manufactured in the EC, but not placed on the EC market, in the last 15 years or the so-called 'no longer polymers' of Directive 67/548).

Scope

REACH is very wide in its scope covering all substances whether manufactured, imported, used as intermediates, or placed on the market, either on their own, in preparations, or in articles, unless they are radioactive, subject to customs supervision, or are non-isolated intermediates. Waste is specifically exempted. Food is not subject to REACH as it is not a substance, preparation, or article. Member States may exempt substances used in the interests of defense. Other substances are exempted from parts of REACH, where other equivalent legislation applies.

Registration

Registration means that a manufacturer or importer has provided a registration dossier to the Agency and not received any indication that it is incomplete. This does not by itself mean that the dossier is in compliance with the legislation nor does it mean all the properties of the registered substance have been identified.

Substances on their Own or in Preparations

There is a general obligation for manufacturers and importers of substances to submit a registration to the Agency for each substance manufactured or imported in quantities of 1 tonne or above per year. Failure to register means that the substance is not allowed to be manufactured or imported. However, the Regulation exempts certain substances that are adequately regulated under other legislation, like medicinal products, or that generally present such low risks as not to require registration, like water, oxygen, certain noble gases, and cellulose pulp. In other cases substances occurring in nature such as minerals, ores and ore concentrates, cement clinker, etc., are not required to be registered as long as they are not chemically modified. Polymers are also exempted from the requirement to register, since they usually are not very hazardous, but in certain circumstances monomers in polymers have to be registered. However, the registration of polymers may be reviewed later.

The Commission has to review some of these exemptions, those contained in Annexes IV and V, within 12 months after entry into force of REACH. The Commission will also review the scope of the regulation five years after entry into force. Manufacturers and importers of substances need to obtain information on the substances they manufacture or import and use this information to assess the risks arising from the uses and to ensure that the risks which the substances may present are properly managed. Registration documents the performance of this duty and requires manufacturers and importers to submit a technical dossier, for substances in quantities of 1 tonne or more, and a chemical safety report, for substances in quantities of 10 tonnes or more. The technical dossier contains information on the properties, uses, and on the classification of a substance as well as guidance on safe use.

To find out the properties of the substances, information requirements are set out in the testing annexes that vary according to the tonnage in which the substance is manufactured or imported, and to the needs of the

chemical safety assessment. The tonnage 'trigger' has been chosen as it gives an indication of the potential for exposure. Tonnage for phase-in-substances is calculated as a three year average as long as they have been manufactured or imported for three consecutive years. General rules are also set out for the use of existing information, techniques such as (Q)SARs ((Quantitative) Structure Activity Relationships) and read across, and for waiving of tests (omitting them if they are not required because of their use or it is not technically possible to carry them out). New tests are only required when it is not possible to provide the information in any other permitted way. Where new tests are carried out there are general provisions on the generation of information to ensure the quality of the information. Application of Good Laboratory Practice (GLP) is required only for toxicological and eco-toxicological tests and analyses. For substances in quantities of 1–10 tonnes, non-phase-in substances and phase-in substances meeting at least one of the two criteria set out in Annex III: either substances that are potentially CMR category 1 or 2, persistent, bio-accumulative and toxic (PBT) or very persistent and very bio-accumulative (vPvB) substances or substances that are potentially dangerous to health or the environment and are used in dispersive uses are prioritized and must submit a defined set of information (set out in Annex VII) along with any other available information. Other substances at this tonnage level have to submit a set of physico-chemical information and any available and relevant (eco-) toxicological information.

For substances in quantities of 10–100 tonnes, information derived from the application of the relevant testing annexes (VII and VIII) needs to be submitted with the registration as well as all available and relevant information the registrant has. For substances in quantities of 100 tonnes or more, information derived from the application of Annexes VII and VIII, as well as all other available information the registrant has, needs to be submitted with the registration. In addition, if the manufacturer or importer does not already possess the required information required by Annexes IX, and for substances at or above 1000 tonnes, Annex X, proposals for testing for the purpose of registration need to be submitted. As those tests might be costly or involve testing on vertebrate animals, the necessity for and the quality of the testing proposal will be checked by the Agency in the evaluation process to save animals' lives and unnecessary costs. The chemical safety report (CSR) for substances manufactured or imported in quantities starting at 10 tonnes, documents the hazards and classification of a substance and the assessment as to whether the substance is PBT or vPvB. The CSR also describes exposure scenarios for specific uses of substances that are classified as dangerous or that are PBT or vPvB substances. Exposure scenarios are sets of conditions that describe how substances are manufactured or used during their life-cycle and how the manufacturer or importer controls, or recommends to control, exposures of humans and the environment. The exposure scenarios must include the appropriate risk management measures and operational conditions that, when properly implemented, ensure that the risks from the uses of the substance are adequately controlled. Exposure scenarios need to be developed to cover all 'identified uses' which are the manufacturers' or importers' own uses, and uses which are made known to the manufacturer or importer by his downstream users and which the manufacturer or importer includes in his assessment. Relevant exposure scenarios will need to be annexed to the safety data sheets that will be supplied to downstream users and distributors. To reduce costs for industry, the Agency and Competent Authorities, registrants are required to jointly submit information on the hazardous properties of the substance and its classification, and can, if they agree, also jointly submit the chemical safety report. The intention is that registrants will save money by co-operating on the preparation of the dossier. The information is submitted by one lead registrant on behalf of the others; the other joint registrants have to submit other information individually, such as their company details and their production volume. However, manufacturers and importers are allowed to opt out of the joint submission of registration dossiers if this would result in excessive cost, if they disagree with the lead registrant on the interpretation of information, or if disclosure of confidential information would cause substantial commercial damage. A 'light' registration is required for certain isolated intermediates as long as they are being manufactured under strictly controlled conditions. Intermediates are substances that are used in the manufacturing process but are consumed or transformed into another substance and therefore are not present in the final manufactured substance. For those intermediates that do not leave the site on which they are used, and those that are transported between sites under controlled conditions, only the hazard classification, any information on the properties of the substance that is already available to the registrants and information on the risk management measures applied, or recommended, need to be submitted to the Agency. If more than 1000 tonnes of an intermediate are transported under controlled conditions, as the risk of exposure is potentially higher, information which is required in Annex VII needs to be included in the registration dossier and submitted to the Agency. To facilitate the transition to the

REACH system, the registration provisions will be applied in a step-wise fashion to phase-in substances manufactured/imported over one tonne per year. For these substances, a series of registration deadlines are established for the different tonnage ranges.

Notifications under Directive 67/548/EEC of 'new substances' are considered as registrations (European Commission 2006b). They will need to be updated when a higher tonnage range is reached. The Agency is responsible for managing all registrations. About 30 000 phase-in substances (excluding intermediates) are expected to be registered over the first 11 years after the entry into force of REACH, plus a number of 'non-phase-in' substances. Given the number of registrations expected, only a simple electronic completeness check will be performed by the Agency at this stage (the quality of the submitted dossiers may be checked in the evaluation process). If the registration is not rejected within a set deadline, then the registrant may begin (for non-phase-in substances) or continue (for phase-in substances) to manufacture or import the substance. However, this does not imply any form of approval by the Agency of the assessment or use of the substance.

Substances in Articles

For the registration of substances in articles (e.g. manufactured goods such as cars, textiles, electronic chips), a special regime applies. The rules for substances in articles have been developed bearing in mind the need to adopt a proportionate approach to the millions of articles placed on the market in the EU, and the potential some of them may have to cause harm to human health and the environment due to the chemical substances contained in them. REACH requires all substances that are intended to be released from articles during normal and reasonably foreseeable conditions of use to be registered according to the normal rules, including tonnage deadlines and information requirements, if those substances are present in the articles above 1 tonne per year. In addition, all substances of very high concern present in articles above a concentration limit of 0.1% weight by weight and present above 1 tonne per year must be notified to the Agency except where exposure to humans and environment can be excluded during normal conditions of use including disposal. In such cases safety instructions should be provided. Information will also be made available to consumers on request. As a safety net, the Agency can require a registration of a substance in an article at any time when it considers that its release poses a risk to human health or the environment.

Data Sharing

Persons intending to register phase-in substances are required to pre-register them between 12 and 18 months after the entry into force of REACH. This is to facilitate data sharing and so reduce testing on vertebrate animals and to reduce costs to industry. For both phase-in and non-phase-in substances, data gained by vertebrate animal testing are to be shared, in exchange for payment. Communication mechanisms are set up to enable manufacturers and importers to reach agreements on the sharing of studies on vertebrate animals. Information not involving tests on vertebrate animals (e.g. in vitro studies and QSARs) must be shared on the request of a potential registrant. For phase-in substances, a system is established to help registrants to find other registrants with whom they can share data and to get an overview about which studies are available (pre-registration). Pre-registrants of the same phase-in substance are then required to share existing vertebrate animal test data as well as other information and agree on the generation of new test data in a Substance Information Exchange Forum. Downstream users of a substance that has not been pre-registered may ask the Agency to extend the pre-registration period by 6 months to give them more time to find a supplier or pre-register the substance themselves.

Information in the Supply Chain

The communication requirements of REACH ensure that not only manufacturers and importers but also their customers, i.e. downstream users and distributors, have the information they need to use chemicals safely. Information relating to health, safety and environmental properties, risks and risk management measures is required to be passed both down and up the supply chain. Commercially sensitive information is not required to be exchanged. The primary tool for information transfer is the well-established and familiar safety data sheet (SDS) for all dangerous substances. The provisions of the Safety Data Sheets Directive (European Commission 1991) have been carried over into the REACH Regulation and in addition added the requirement for SDS to be provided for PBT or vPvB substances and preparations containing them. As more information will be available as a result of registrations the quality of SDS will improve. Where chemical safety assessments are performed according to the registration requirements, relevant exposure scenarios shall be annexed to the safety data sheet and shall thus be passed down the supply chain. New information on hazardous properties and information that challenges the quality of risk management measures in the SDS shall be passed up the supply chain.

Downstream Users

Downstream users (DU) may be any industrial user of chemicals, whether formulators of preparations (e.g. paint producers) or users of chemicals such as oils and lubricants in other industrial processes or producers of manufactured articles such as electronic components. They are required to consider the safety of their uses of substances, based primarily on information from their suppliers, and to apply appropriate risk management measures. DU will need to communicate effectively with their suppliers, to get the information they need in the SDS supplied to them. In particular they will have to check that their use(s) is 'covered' by the SDS, i.e. that they use a substance within the conditions described in the exposure scenarios in the Annex to the SDS, and apply these conditions. To get the relevant information, DU have the right to make their uses known to their suppliers so that the suppliers can include these uses in their chemical safety assessments as 'identified' uses or pass the request on up the supply chain. A DU can also choose to keep his use confidential or decide to use a substance outside the conditions described in the exposure scenario(s) communicated to him. In these cases he will have to perform a chemical safety assessment (CSA) developing the exposure scenarios for his intended uses and, if necessary, a refinement of the supplier's hazard assessment. This obligation does not apply if the DU uses less than 1 tonne of the substance per year. However, a DU relying on the 1 tonne exemption still needs to consider the use(s) of the substance and identify, apply, and recommend appropriate risk management measures. In rare cases, the DU may propose additional testing if he considers this necessary to complete their CSA.

Evaluation

There are two types of evaluation with different aims, the dossier evaluation and the substance evaluation. The Agency will do a quality check of the registration dossiers. It may check the compliance of registration dossiers with the requirements laid down for registration in the Regulation. At least 5% of dossiers should be checked. Secondly the Agency is checking the testing proposals. The aim here is to prevent unnecessary animal testing, i.e. the repetition of existing tests, and poor-quality tests. Therefore, the Agency will check the testing proposals submitted as part of the registrations before such tests are performed. The Agency will also invite third parties to submit information that would avoid the need for vertebrate testing. For the substance evaluation the Agency, in co-ordination with the Competent Authorities of Member States, may clarify suspicions of risks to human health or the environment by requesting further information from industry. To promote a consistent approach, the Agency will, in co-operation with the Member States, develop guidance on the prioritization of substances for further evaluation. The Agency will publish a Community rolling action plan on its website identifying the Member State who shall carry out the evaluation of those priority substances. Any draft decision prepared by a Competent Authority of a Member State requesting further information on a substance must either be accepted by all other Member States' Competent Authorities, in which case the Agency takes the decision, or if an agreement cannot be reached the Commission takes the decision. The Agency is also given responsibility for assuring the consistency of such decisions at the draft stage. Evaluation may lead authorities to the conclusion that action needs to be taken under the restrictions or authorization procedures in REACH, or that information needs to be passed on to other authorities responsible for relevant legislation. The evaluation process will ensure that reliable and useful data are provided and made available to the relevant bodies by the Agency.

Authorization

For substances of very high concern, an authorization is required for their use and their placing on the market. The substances required to be authorized are substances which are (European Commission 2006b):

- CMR category 1 and 2;
- PBT/vPvBs; and
- identified from scientific evidence a, such as endocrine disrupters.

The European Commission will develop guidance to clarify the criteria for such a case-by-case detection in close co-operation with industry, Member States, and other relevant stakeholders. These substances have hazardous properties of such high concern that it is essential to regulate them centrally through a mechanism that ensures that the risks related to their actual uses are assessed, considered, and then decided upon by the Community. This is justified because the effects on humans and the environment of these substances are very serious and normally irreversible. Substances that fall into these categories will be fed into the authorization system as resources allow. Their uses will not be banned by default. The Agency will publish a list of substances meeting the criteria above and reflecting its multi-annual work plan, taking into consideration comments from interested parties.

The authorization procedure consists of two steps: in the first step, a decision is taken via comitology as to which substances on the candidate list will be included in the system, which uses of the included substances will be exempted from the authorization requirement (e.g. because sufficient controls established by other legislation are already in place), and which deadlines will have to be met. This step is necessary to prioritize substances and to focus resources. Once a substance is included in the system, in the second step of the procedure, those using or making available such a substance will need to apply for an authorization for each use of the substance within the deadlines set, including an analysis of possible substitutes. If this analysis shows that suitable alternatives are available then the application must also include a substitution plan. If not, information on relevant research and development activities must be provided, if appropriate. An authorization will be granted if the applicant can demonstrate that the risk from the use of the substance is adequately controlled. If not then it may also be granted if the socioeconomic benefits outweigh the risks and there are no suitable alternative substances or processes. PBTs, vPvBs, and those CMR substances for which a safe level cannot be defined, cannot be authorized based on adequate control of risk. Six years after the entry into force of the regulation, the Commission will review whether endocrine disrupters should also be excluded from the adequate control route. The Agency will provide expert opinions on the application and the applicant has an opportunity to comment on draft opinions. The Commission will grant an authorization for each use, meeting the above conditions. All authorizations will be reviewed after a certain time which will be set on a case-by-case basis. In setting the length of this review period the Commission will take into account relevant information, including the risks of the substance and of alternatives, socio-economic benefits, analysis of alternatives, and any substitution plan. If suitable substitutes have become available by the time of the review, the Commission may amend or withdraw the authorization, even one given for adequate control. Downstream users may apply for their own authorizations or may use a substance for an authorized use provided they obtain the substance from a company to whom an authorization has been granted and that they keep within the conditions of that authorization. Such downstream users will need to notify the Agency that they are using an authorized substance (Figure 77.1).

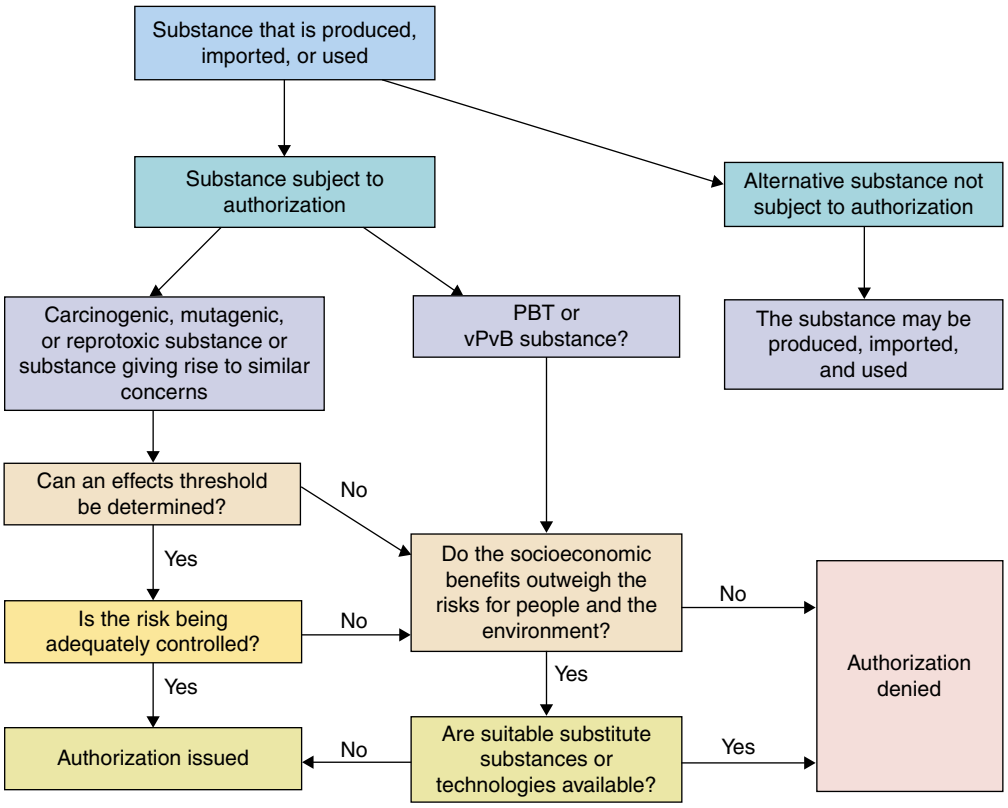

FIGURE 77.1 REACH authorization procedure step-by-step (Lahl et al 2006)

Restrictions

The restrictions procedure enables to regulate Community wide, yet in a focused way, conditions for the manufacture, placing on the market or use of certain substances where there is an unacceptable risk to health or the environment or the prohibition of any of these activities, if necessary. All activities with a substance which are not restricted are allowed under REACH unless the substance is included in the authorization system. Any substance on its own, in a preparation, or in an article may be subject to EC-wide restrictions if it is demonstrated that risks need to be addressed on an EC-wide basis. Thus, the restrictions provisions act as a safety net. Proposals for restrictions will be prepared by Member States or by the Agency on behalf of the Commission in the form of a structured Dossier. This Dossier is required to demonstrate that there is a risk to human health or the environment that needs to be addressed at EC level and to identify the most appropriate set of risk reduction measures. Deadlines for the procedure to prepare a Commission decision are set out in the Regulation. Interested parties will have an opportunity to comment and the Agency will provide opinions on any proposed restriction. The existing restrictions set out in Directive 76/769/EEC (such as the ban on asbestos and restrictions on the uses of certain azo-dyes) have been carried over in a consolidated version into the REACH Regulation.

The European Chemicals Agency (ECHA)

As already mentioned above, the ECHA was created to decide, to manage, and in some cases carry out the technical, scientific, and administrative aspects of REACH and to ensure consistency at Community level concerning these aspects. The ECHA manages the registration process, it carries out dossier evaluations and co-ordinates the substance evaluation process and generally takes decisions resulting from evaluations, except in cases of disagreement among Member States representatives when the Commission would decide. It provides expert opinions to the Commission in the authorization and restriction procedures and has duties with regard to confidentiality and access to information. It also handles requests for exemptions from the registration requirement for product and process-oriented research and development, and facilitates the sharing of animal test data at the pre-registration stage by enabling the formation of the Substance Information Exchange Forums (SIEFs). The ECHA will comprise the following elements (European Commission 2006b):

- Management Board;
- Executive Director, reporting to the Management Board;
- Committee on risk assessment and a Committee on socio-economic analysis
- Member State Committee;
- Forum for exchange of information on enforcement activities. This Forum integrates the current informal network of Member States authorities into the Agency;
- Secretariat that will provide technical, scientific, and administrative support for the Committees. It will also undertake a number of other tasks including under pre-registration, registration, evaluation, and information provision;
- Board of Appeal that will consider any appeals against the decisions of the Agency.

The ECHA is located in Helsinki and was operational as of 1 June 2008.

Access to Information

Non-confidential information on chemicals, for example to allow those exposed to chemicals to make decisions on the acceptability of the related risks, will be made available. This is done in such a way that the interests of the public's 'right to know' is balanced with the need to keep certain information confidential. Some information will be published on the Agency's website, some information will generally be always kept confidential, and some may be made available on request in accordance with the Commission's normal rules on access to information.

Benefits and Costs

With regard to the benefits, positive occupational impact and public health impact of REACH is expected as chemicals are linked to respiratory and bladder cancers, mesothelioma, skin disorders, respiratory diseases, eye disorders, asthma, etc. Increased information on hazards and controls will help better implementation of existing legislation. Authorization of substances of very high concern and speedier restrictions will also assist positive occupational and public health and positive environmental impact of REACH.

Combining the estimates of the direct and indirect costs, the Extended Impact Assessment of the Commission's proposal of October 2003 has estimated the overall costs to fall in the range of € 2.8–5.2 billion. These costs will be incurred over a period of 11–15 years. Therefore, from a macroeconomic perspective, the overall impact in terms of the reduction in the EU's Gross Domestic Product (GDP) is expected to be very limited.

The Extended Impact Assessment and several background documents can be found at:

http://europa.eu.int/comm/environment/chemicals/background/impact_assessment_intro.htm.

The EC Biocide Directive

A fundamentally different approach was taken for a group of special products known collectively as 'biocide products' (Gaertner 2000). Designed to control these products, the Directive 98/8/EC on the Marketing of Biocide Products (European Commission 1998) is still relatively young. The area of application of the EC Biocide Directive covers a large number of products ranging from disinfectants to mothballs, from large-volume industrially used material preservatives to niche products, from enclosed use in cooling circuits to open use as rat poisons. The only thing these products have in common is that they are used against living organisms that are regarded by humans as harmful. Thus biocides have by definition the effect of impairing or killing living organisms. In view of this property, which they share with plant protection agents, the model used for the EC Biocide Directive was not general chemical legislation, but the EC Plant Protective Directive.

In particular, the abovementioned heterogeneity of the products concerned is probably a major challenge for the competent authorities, which renders it difficult to arrive at correct assessments. For this reason, critics of the directive are already prophesying its failure. Compared with the aforementioned sets of rules, however, the EC Biocide Directive has a major advantage, which gives the authorities more enforcement power and probably exerts more pressure on the relevant industries to contribute to timely completion of the individual testing and decision procedures. What the EC Biocide Directive prescribes is an authorization, rather than a registration procedure. In other words, the marketing of a biocide product remains prohibited until the approval authority grants approval on the basis of comprehensive documents to be submitted by the applicant and the evaluation thereof; the onus of proof regarding the acceptability of the product rests with the applicant. This also has an impact on the testing program for old biocide-active substances, that is, for those active substances that were already on the European market when the implementation deadline expired in May 2000. Admittedly existing biocide-active substances and biocide products containing such active substances are subject to transitional rules. These, however, include an arrangement in which the existing active substances are fed into a multiphase review program. Existing active substances that have not cleared the first hurdle of this review program, in accordance with the First Review Regulation (EC) No. 1896/2000, will shortly cease to be marketable, as will the biocide products containing such active substances. The Biocide Directive is not affected by the amendments to EC chemicals legislation described above.

The EC Pesticide Directive

Plant protection products are (as in Directive 91/414/EC) substances which are intended to protect plants or plant products against animals, plants, micro-organisms, or diseases (European Council 1991). Substances which destroy plants, regulate growth, or inhibit germination are also regarded as plant protection products.

All EU Member States apply the same plant protection evaluation procedures and authorization criteria. A joint positive list of active substances permitted in plant protection products is also part of a harmonization process. Active substances are evaluated in a joint procedure and a decision on their inclusion in the positive list is made. Important aims for the authorization decisions are a sufficient protection of crops, avoiding harmful effects on human health, and avoiding unacceptable effects on the environment. Reports prepared by the three evaluation authorities involved and recommendations made by an independent scientific advisory committee form the basis for management decisions. Besides plant protection products, the e.g. German National Plant Protection Act also provides for adjuvants and plant resistance improvers. Adjuvants are added to plant protection products, for instance, in order to improve wetting of leaf surfaces. Plant resistance improvers are substances which improve the resistance of plants. Products for use on cut flowers also belong to this category. Adjuvants and plant resistance improvers may only be placed on the market if they have been included in a list with the national competent authority. This listing procedure is less complex than the authorization procedure for plant protection products.

Introduction to Country Chapters

The U.S. National Library of Medicine (NLM), through its Toxicology and Environmental Health Information Program (TEHIP), is a major electronic repository of worldwide toxicological data and literature citations. It has lately taken a more overt role in global activities through its support and sponsorship of the recently released online World Library of Toxicology, Chemical Safety and Environmental Health (WLT), available through Toxipedia, and with the partnership of the International Union of Toxicology. The WLT is designed as an online Web-based portal to information resources in toxicology, chemical safety, and environmental health, largely built by a network of Country Correspondents. Links to information resources available in specific countries is provided in both English and the country's native language. Additionally, links to major multilateral organizations are offered. Ancillary information such as a "Globalert" news feature, international environmental laws, and a core list of toxicology resources, is also available. The WLT can be accessed at www.wltox.org.

Following is a brief selection of chapters representing countries outside the United States, to give readers a flavor of the diversity and extent of toxicological activities worldwide. A country's absence from this group of chapters does not imply that its toxicological activities are insignificant. More often than not, size limitations, difficulties in identifying appropriate contributors, and other logistical issues, have limited this selection.

The Word Library of Toxicology, Chemical Safety, and Environmental Health (WLT) is a new multilingual, multi-lateral web-based resource presenting an online, expanded, and up-to-date look at toxicological activities around the globe. It is a good source for keeping up on the toxicology information infrastructure of the countries in this chapter, and others. The WLT, a project of Toxipedia and the International Union of Toxicology, is sponsored and supported by the U.S. National Library of Medicine. It can be accessed at www.wltox.org.

CHAPTER

79

European Union*

PERTTI J. HAKKINEN

INTRODUCTION

The European Union (EU) includes 27 Member States. The EU countries are Austria, Belgium, Bulgaria, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, and the United Kingdom.

The EU is a unique international organization in that its member countries have delegated some of their sovereignty so that decisions on specific matters of joint interest can be made on an EU-wide basis. One example of an EU-wide agency involved with toxicology-related matters is the European Environment Agency (EEA). The EEA gathers information on the state of the EU environment. Another EU-wide agency is the European Chemicals Agency (ECHA), created in Helsinki, Finland to work on and implement the Registration, Evaluation, Authorisation, and Restriction of CHemicals (REACH) legislation.

The safe uses of chemicals in consumer products and articles (e.g., in toys, clothing, and furniture) within the EU are covered in part by the General Product Safety Directive (GPSD). The GPSD includes a rapid exchange notification system named RAPEX to quickly share suspected or known safety issues about non-food consumer products.

The EU's European Commission non-food scientific committees include experts in toxicology and other areas of science from academia and elsewhere. The Scientific Committee on Consumer Products (SCCP), Scientific Committee on Health and Environmental Risks (SCHER), and Scientific Committee on Emerging and Newly Identified Health Risks (SCENIHR) provide the EU with a proactive and flexible approach to risk assessment. They work together as needed with other Community bodies responsible for scientific advice such as the European Food Safety Authority (EFSA), the European Agency for the Evaluation of Medicinal Products (also known as the European Medicines Agency, EMEA), and the European Centre for Disease Prevention and Control (ECDC).

The SCCP provides advice on the safety of non-food consumer products. Examples of the types of issues within the scope of the SCCP include the safety of cosmetic products, toys, textiles, clothing, etc. The SCHER deals with toxicity and ecotoxicity issues relevant to chemical, biochemical, and biological compounds. The SCENIHR provides advice on emerging or newly identified risks and issues requiring a comprehensive assessment of risks to consumer safety or public health. Further, the SCENIHR provides opinions on human health issues not covered by other EU risk assessment bodies such as new technologies (nanotechnology has been a topic of interest), physical hazards such as noise and electromagnetic fields (e.g., from mobile phones), and methodologies for assessing new risks.

The European Commission's Joint Research Centre (JRC) is a source of independent scientific and technical reference for European policy makers, serving the

*Adapted from P.J. Hakkinen, European Union and Its European Commission, Encyclopedia of Toxicology, 2nd edition. P. Wexler (Ed.) (2005). Appendix 1.16, pp. 507–510.

European Commission, the Member States, and others. The JRC's seven scientific institutes carry out research of direct concern to EU citizens, working with industry, universities, other research institutes, and Member States. The JRC is among the European Commission's 36 Directorates-General (DGs). The DGs are specialized services within the European Commission. Examples of other DGs include the Brussels, Belgium-based Directorate General (the JRC's central coordination and administrative body), the Institutional and Scientific Relations Directorate, and the Programme and Resource Management Directorate. In addition, the DG Health and Consumer Protection has the overall goal of promoting a better quality of life by ensuring a high level of protection of consumers' health, safety, and economic interests as well as of public health. The seven JRC institutes are the Institute for Health and Consumer Protection (IHCP), the Institute for Environment and Sustainability (IES), and the Institute for Protection and Security of the Citizen (IPSC) in Ispra, Italy, the Institute for Reference Materials and Measurements (IRMM) in Geel, Belgium, the Institute for Transuranium Elements (ITU) in Karlsruhe, Germany, the Institute for Energy (IE) in Petten, the Netherlands, and the Institute for Prospective Technological Studies (IPTS) in Seville, Spain.

In addition, among the IHCP's units are the European Chemicals Bureau (ECB) and the European Centre for the Validation of Alternative Methods (ECVAM) to animal experimentation. The working areas of the ECB, until the new European Chemicals Agency (ECHA) begins full operations, are collecting information on new and existing chemicals, and providing scientific and technical support to the conception, development, implementation, and monitoring of EU policies on dangerous chemicals. Further, the ECB has supported the development and harmonization of testing methods such as quantitative structure activity relationships, the legal classification and labeling of substances, the management of risk assessment of substances, the notification of new substances, the authorization of biocides, and the information exchange on import and export of dangerous substances.

The European Chemical Substances Information System (ESIS) serves as a portal to the existing chemicals data sets maintained by ECB. ESIS includes information related to the European Inventory of Existing Chemicals (EINECS), the European List of Notified Chemical Substances (ELINCS), High Production Volume Chemicals (HPVCs) and Low Production Volume Chemicals (LPVCs), Classification, and Labeling, IUCLID (International Uniform Chemical Information Data Base) Chemical Data Sets, and the EU's chemical risk assessment process. IUCLID, currently IUCLID version 5 (IUCLID5), is the basic tool for data collection and evaluation within the EU Risk Assessment Programme, as well as under the OECD Existing Chemicals Programme, and it will be used by the ECHA for REACH purposes. The Risk Assessment Reports (RARs) are extensive documents written in first draft by EU member states, and the ECB also mediates meetings that attempt to reach consensus on the conclusions of the risk assessments.

Another example of an EU-wide database established by the European Commission is the European Pollutant Emission Register (EPER), developed as a register of industrial emissions into air and water. Member States have to produce reports on the emissions of industrial facilities into the air and waters, and the reports covers 50 pollutants. EPER gives access to information on the annual emissions of thousands of industrial facilities in the Member States as well as Norway. It lets users group information easily, by pollutant, activity (sector), air and water (direct or via a sewerage system), or by country. In addition, it is possible to see detailed data on individual facilities by searching by name or by clicking on a map. Users can also look for the sources of a particular pollutant. The European Commission has made these data publicly accessible on a website hosted by the European Environment Agency (EEA).

The EU has been very active in helping European research achieve scientific excellence, and European industry to be innovative and competitive globally. In a variety of sectors covering the whole spectrum of modern technology, the EU finances projects undertaken by research centers, universities, and industry. The emphasis is on putting research and innovation to work for socioeconomic objectives, including job creation and improved quality of life. Current research priorities include, among others, life sciences, nanotechnology, space, food quality, sustainable development, and the knowledge-based society. The support of research includes the European Commission-led multi-year Framework Programmes for Research. The EU is currently in the 7th Framework Programme (2007–2013), supporting research in toxicology, risk assessment, and numerous other areas such as those noted above as research priorities.

CHAPTER

80

Australia

PAUL WRIGHT

INTRODUCTION

Australia is a continent of great biodiversity and natural resources, with a predominantly dry climate that makes environmental sustainability a constant issue. Its population of 20 million is mainly concentrated in coastal urban and industrial centers. Mining, agricultural, and livestock industries are major export contributors and important chemical users.

Medicinal Toxicity

During the early part of the 20th century, there was a general acceptance in Australia that therapeutic compounds provided great benefits and their potential risks were not emphasized. Nonetheless, there were some notable local episodes of medicinal toxicities, including the chronic overuse between the 1950s and 1970s of very popular analgesic 'APC' powders (a mixture of aspirin, phenacetin, and caffeine) that produced gastric ulcers and an epidemic of chronic renal failure ('analgesic nephropathy') in Australia (Michielsen 2007). However, it was the thalidomide episode in Australia (marketed between 1957–61), which led to the establishment in 1963 of the Australian Drug Evaluation Committee (ADEC) as an independent committee to advise on drug safety. The Therapeutic Goods Administration (TGA, Australian equivalent to FDA) and ADEC have since played a pivotal role in the genesis of Australia's drug regulatory system.

The recent rapid increase in public use and access to complementary medicines, resulting in both adverse reactions and interactions with pharmaceuticals, has raised concerns throughout Australia about the appropriate regulation of these therapies. This led to the establishment of a specific evaluation committee within the TGA in 1997, and additional government reforms and regulations followed. During 2003, in what may be the world's largest medicines recall, the TGA withdrew over 1300 complementary medicine products marketed by Pan Pharmaceuticals, Australia's largest contract manufacturer of complementary medicines at that time. The recall was the result of initial reports of serious adverse events associated with Pan's travel sickness tablets, which led to an extensive TGA audit of Pan that found widespread serious deficiencies in the company's manufacturing and quality control procedures, including substitution of ingredients, manipulation of test results, and substandard manufacturing processes (TGS 2003).

Occupational Toxicity

Australia has always relied heavily on the mining industry for export income, including specific industries with recognized potential health problems through occupational exposure, e.g. lead mining and smelting, and uranium mining with associated processing and usage, e.g. the Anglo-Australian atomic test sites in 1953, near Woomera in South Australia.

Of particular note are the extensive ongoing health issues surrounding asbestos mining, processing/manufacture, usage, and waste removal. Poor workplace conditions at the major asbestos mine that operated between 1938–66 in Wittenoom, Western Australia, led to the diagnosis of Australia's first mesothelioma case in 1962. Following the diagnosis of numerous cases in subsequent years, the Australian Mesothelioma Surveillance

Program (later the Australian Mesothelioma Register) was established in 1980.

Environmental Toxicity

Intensive agricultural practices during the 200 years of European settlement have seen the extensive use of pesticides and herbicides to control insect pests and introduced noxious weeds. Important examples include: the ongoing legacy of contaminated sites from arsenic trioxide cattle dip baths used between 1895 and 1950 to control cattle tick infestations originating from Java; and more recently, the excessive use of organochlorine insecticides to control the heliothis moth, a devastating and increasingly resistant cotton pest.

Australia's unique flora and fauna provide an astounding range of natural toxins. Toxic Australian fauna include 17 of the world's 20 most venomous snakes, as well as venomous spiders and marine animals, such as the blue-ringed octopus and various species of fish, jellyfish, and cone snails. Of the thousand species of plants in Australia that are toxic to livestock and humans, around 60% are native plants and these commonly result in poisoning of the livestock grazing on native pastures. Algae toxins are also found in freshwater and marine environments, with contaminated drinking water being the most common problem presented by cyanotoxins. Consequently, aspects of clinical toxicology and toxinology have been of particular interest in Australia, including antivenom development and the treatment of acute poisonings.

Toxicology Research

Australian toxicologists are making significant contributions from academia, government, and the commercial sector towards assessing the level of risk associated with chemicals and protecting the community from environmental hazards. Most Australian academic and research toxicologists were initially based in small groups within university departments of pharmacology. The growing importance of toxicology in Australia was recognized by the establishment in the mid-1980s of the Key Centre for Applied and Nutritional Toxicology at the Royal Melbourne Institute of Technology (RMIT) in Melbourne, Victoria, Australia. Funded by the Australian Research Council's (ARC) Key Centre for Teaching and Research program, it delivered the first general toxicology masters degree program in Australasia, in addition to extensive research activities into detoxication biochemistry, biochemical mechanisms of toxicity, immunotoxicology, toxicokinetics, ecotoxicology, and food toxicology. Now located within the RMIT School of Medical Sciences, the toxicology faculty delivers the world's first and only fully online toxicology postgraduate degrees (i.e. Graduate Diploma in Toxicology and Master of Toxicology), which commenced in 2001.

A second national toxicology research center was established in 1991 at Queensland University, in partnership with Queensland Health, by the National Health and Medical Research Council (NHMRC). This National Research Centre for Environmental Toxicology (NRCET, now known as EnTox) was specifically established to conduct extensive research activities into human environmental toxicology. Recently, the Australian Centre for Human Health Risk Assessment (ACHHRA) was established at Monash University in 2001, by a consortium of four universities with federal health department support. This center has expertise in epidemiology, toxicology, and environmental sciences and is concerned with risk assessment of human exposure to hazardous chemicals and micro-organisms (Priestley et al 2007).

Most recently, NanoSafe Australia was established in 2006 as a nationwide nanosafety/nanotoxicology research network. It is co-ordinated from RMIT and is providing occupational and environmental health and safety information, research and services to the ARC Nanotechnology Network (ARCNN) and the NHMRC Advisory Committee on Health and Nanotechnology, as well as government, industry, and non-government organizations.

Toxicology-related Societies

Toxicology is, by its nature, a multidisciplinary science and Australian toxicologists come from many scientific fields. Many academic and research toxicologists received a pharmacology or biomedical-related education, but the majority of the >1000 persons actively engaged in toxicology-related employment in Australia are employed in government regulatory areas. Consequently there are several cognate professional societies of which Australian toxicologists are active members, including pharmacology, pharmaceutical, pathology, chemistry, environmental, regulatory, and forensic societies.

Of particular note is the Australasian Society of Clinical and Experimental Pharmacologists (ASCEP), which established the Toxicology Section as its first subgroup in 1982, then became the Australasian affiliate in the International Union of Toxicology in May 1988, and finally changed its name to include Toxicologists in 1991. Since then, ASCEPT established a lecturer-exchange program with the British Toxicology

Society in 1996, and the Clinical Toxicology Section in 2001. Australian toxicologists have also served as directors on the executive committee of IUTOX for 12 continuous years (Priestly BG, Di Marco P, Wright PFA, from 1992–2004) and ASCEPT hosted the first International Congress of Toxicology to be held in the southern hemisphere (ICT-IX, Brisbane July, 2001).

In the ecotoxicology arena, the Australasian Society for Ecotoxicology (ASE) was established in 1994 and simultaneously launched its main publication the *Australasian Journal of Ecotoxicology* (AJE). The most recent significant event in Australian toxicology was the establishment of the Australasian College of Toxicology and Risk Assessment (ACTRA) in July 2006, in order to provide a program of continuing education and establish a registration scheme for practitioners in toxicology and health risk assessment in Australia and New Zealand.

Technical Reports and Other Documents

Australian Mesothelioma Register

Reports provided by the Australian Safety and Compensation Council (ASCC) of the incidence of mesothelioma in the Australian population (11th–5th reports for 1994–2000 are available online).

Web: http://www.ascc.gov.au/ascc/aboutus/publications/statreports/australianmesotheliomaregister.htm

Australian Native Poisoning Plants

Online article by Dr Ross McKenzie, Queensland Animal Research Institute (ARI) and curator of the ARI Poisonous Plants Files, provided by the Association of Societies for Growing Australian Plants (ASGAP) – this has been reprinted from the March 1994 issue of Bulletin for the SGAP Queensland Region.

Web: http://asgap.org.au/APOL7/sep97-4.html

Australian Occupational Health and Safety (OHS) Statistics

Statistical reports provided by the ASCC of work-related injuries and fatalities.

Web: http://www.ascc.gov.au/ascc/AboutUs/Publications/StatReports/

Health based risk assessment of contaminated land involving carcinogens

Published as: Wright PFA (Ed.) (1996) Health based risk assessment of contaminated land: Focus on carcinogens: proceedings of an ASCEPT toxicology workshop (Chief editor, Wright, PFA) Australasian Society of Clinical & Experimental Pharmacologists & Toxicologists (ASCEPT), Sydney, ISBN 0-646-30641-7. 124 pages.

NanoSafe Australia's position paper on OHS best practices for the Australian nanotechnology industry

Published as: Harford A, Edwards J, Priestly B, Wright P. Current OHS best practices for the Australian Nanotechnology industry. Journal of Occupational Health and Safety – Australia and New Zealand 23(4): 315–331. ISSN 0815-6409.

Databases

Australian Inventory of Chemical Substances (AICS)

Maintained by NICNAS, this chemical inventory currently lists >38 000 chemical entities available for use in Australia. Chemicals listed in AICS can be imported or manufactured in Australia without having to notify NICNAS as a new chemical, unless exempt.

Web: http://www.nicnas.gov.au/industry/AICS/Search.asp

Australian OHS Sites

This website is provided by the National Research Centre for Occupational Health and Safety Regulation, and lists important Australian OHS weblinks, including OHS legislation (by jurisdiction), authorities, centers, institutes, and general OHS sites.

Web: http://www.ohs.anu.edu.au/links/index.php

Australian Safety and Compensation Council (ASCC) – Health and safety topics

This government website includes much of the information that was available via the Australian OHS Index and OHS Research Database of the former NOHSC websites (http://natindex.nohsc.gov.au/ and http://www.nohsc.gov.au/applications/researchDB/mb.aspx, respectively).

Web: http://www.ascc.gov.au/ascc/HealthSafety/

Clinical Toxinology Resources

This website is provided by the Toxinology Dept, Women's & Children's Hospital, Adelaide, and the Dept of Paediatrics, University of Adelaide. It provides a range of toxinology references and first aid information with specific sections for snakes, spiders, and marine life.

Web: http://www.toxinology.com/

Environmental Resources Information Network (ERIN)

This unit of the federal Department of the Environment, Water, Heritage and the Arts (formerly Department of the Environment and Water Resources), develops and manages a comprehensive, accurate and accessible information base for environmental decisions. Information services provided or hosted by ERIN

include: Australian Government Environment Portal, Australian Natural Resources Atlas, Australian Wetlands Database, Environment Image Database, National Chemical Information Gateway, and the National Pollutant Inventory (see separate listing below).

Web: http://www.environment.gov.au/erin/index.html

Hazardous Substances and Dangerous Goods

This website contains information on the ASCC National Standards and Codes of Practice, along with guidance material, for hazardous substances and dangerous goods. Other information is provided on the Exposure Standards, Regulatory Framework for Hazardous Substances, and the Globally Harmonised System (GHS) of classification and labeling of chemicals. Information is also provided on specific chemicals, i.e. arsenic, asbestos, cyanide, ethylene oxide, hydrogen fluoride, industrial organic solvents, isocyanates, lead, synthetic fibers, timber, tobacco, and vinyl chloride.

Web: http://www.ascc.gov.au/ascc/HealthSafety/HazardsSafetyIssues/HazardousSubstances/

Hazardous Substances Information System (HSIS)

The HSIS is a web resource providing information on substances classified as hazardous and/or having National Exposure Standards.

Web: http://hsis.ascc.gov.au/Default.aspx

HyperTox

A poison information program written by Australian clinical toxicologists originally based in Newcastle University, with modules available for download as trial shareware.

Web: http://www.hypertox.com/

National Coroners Information System (NCIS)

This is a national database of Australian coronial cases, including information about every death reported to an Australian coroner since July 2000. The NCIS is a valuable hazard identification and death prevention tool for coroners and research agencies and is based at the Victorian Institute of Forensic Medicine (VIFM).

Web: http://www.ncis.org.au/

National Pollutant Inventory (NPI)

This program is run by the federal Department of the Environment and Water Resources, in cooperation with state/territory government departments. The National Pollutant Inventory (NPI) provides Australians with free access to information on the types and amounts of pollutants being emitted in their community.

Web: http://www.npi.gov.au/index.html

Veterinary Education and Information Network (VEIN)

Provided by the Faculty of Veterinary Science, University of Sydney, this veterinary database includes information on production animal clinical toxicology, pesticides and veterinary chemicals, and toxic plants in Australasia.

Web: http://vein.library.usyd.edu.au/links/toxicology.html

Virtual Anaesthesia Textbook: Poisonings, Bites and Envenomations

An online database with useful Australian links for toxicology and toxinology, provided by Chris Thompson at the Royal Prince Alfred Hospital, Sydney, Australia.

Web: http://www.virtual-anaesthesia-textbook.com/vat/poisoning_bites.html

Organizations – Government

National Government (Federal Commonwealth Agencies)

Author's note:
Following the November 24th 2007 federal election, a new Australian Government was sworn in on December 3rd 2007, including Ministerial appointments with greatly revised portfolios. All federal Australian government websites listed in this chapter are current for January 2008, however website URLs may subsequently change due to the renaming and reorganization of various departments.

Australian Institute of Health and Welfare (AIHW)

Australia's national agency for health and welfare statistics and information.

Web: http://www.aihw.gov.au/
Postal address: AIHW, G.P.O. Box 570, Canberra, ACT 2601, Australia
Phone: +61-2-6244 1000
Fax: +61-2-6244 1299
Email: info@aihw.gov.au

Australian Pesticides and Veterinary Medicines Authority (APVMA)

Australian government authority (formerly the National Registration Authority, NRA) that is responsible for the evaluation and registration of pesticides and veterinary medicines. It also administers the National Registration Scheme for Agricultural and Veterinary Chemicals (NRS) in partnership with the States and Territories.

Web: http://www.apvma.gov.au/
Postal address: APVMA, P.O. Box E240, Kingston, ACT 2604, Australia
Phone: +61-2-6210 4700
Email (Public Affairs): Communications@apvma.gov.au

Australian Radiation Protection and Nuclear Safety Agency (ARPANSA)

Federal Government agency with the responsibility for protecting the health and safety of people and the environment from the harmful effects of ionizing and non-ionizing radiation. It includes the Radiation Health Committee, Nuclear Safety Committee, and Radiation Health & Safety Advisory Council.

Web: http://www.arpansa.gov.au/index.htm
Postal address: ARPANSA, 619 Lower Plenty Road, Yallambie, VIC 3085, Australia
Phone: +61-3-9433 2211
Fax: +61-3-9432 1835
Email: info@arpansa.gov.au

Australian Safety and Compensation Council (ASCC)

Commonwealth authority for matters relating to occupational health and safety (OHS). ASCC was formerly the National Occupational Health and Safety Commission (NOHSC) and there is a progressive migration of webpages and information from http://www.nohsc.gov.au/ to the ASCC webpages.

Web: http://www.ascc.gov.au/
Postal address: Office of the Australian Safety and Compensation Council, Department of Employment and Workplace Relations, Loc 64N1, G.P.O. Box 9879 Canberra, ACT 2601, Australia
Phone: +61-2-6121 5317
Fax: +61-2-6121 9138
Email: info@ascc.gov.au

Department of Agriculture, Fisheries and Forestry (DAFF)

This federal government department includes the APVMA, Australian Quarantine and Inspection Service (AQIS), and Biosecurity Australia.

Web: http://www.affa.gov.au/
Postal address: Australian Government Department of Agriculture, Fisheries and Forestry, G.P.O. Box 858, Canberra, ACT 2601, Australia
Phone: +61-2-6272 3933

Department of Health and Ageing

This federal government department contains several regulatory authorities, including those related to therapeutics (TGA), industrial chemicals (NICNAS), food standards (FSANZ), radiation safety (ARPANSA), and health statistics (AIHW) – these authorities are listed separately.

Web: http://www.health.gov.au/
Postal address: Department of Health and Ageing, G.P.O. Box 9848, Canberra, ACT 2601, Australia
Phone: +61-2-6289 1555
Fax: +61-2-6281 6946

Department of the Environment, Water, Heritage and the Arts

This federal government department (formerly Environment Australia, then Department of the Environment and Heritage, and then Department of the Environment and Water Resources) contains the Australian Antarctic Division, Australian Greenhouse Office and the Supervising Scientist Division.

Web: http://www.environment.gov.au/
Postal address: Department of the Environment, Water, Heritage and the Arts, G.P.O. Box 787, Canberra, ACT 2601, Australia
Phone: +61-2-6274 1111
Fax: +61-2-6274 1666

Australian Greenhouse Office (AGO)

This office delivers the majority of programs under the Australian government's climate change strategy.

Web: http://www.greenhouse.gov.au/
Postal address: Australian Greenhouse Office, G.P.O. Box 787, Canberra, ACT 2601, Australia
Phone: +61-2-6274 1888

Supervising Scientist Division

Conducts environmental research and monitoring, environmental supervision, audit and inspection of uranium mining in the Alligator Rivers Region and wetlands.

Web: http://www.environment.gov.au/ssd
Postal address: Supervising Scientist, G.P.O. Box 461, Darwin, NT 0801, Australia
Phone: +61-8-8920 1101
Fax: +61-8-8920 1190

Environment Protection and Heritage Council (EPHC) of Australia and New Zealand

The EPHC was formed in 2001 from the merging of the National Environment Protection Council (NEPC), the environment protection components of the Australian and New Zealand Environment and Conservation Council (ANZECC), and Heritage Ministers' Meetings. EPHC incorporates the National Environment Protection Measures (NEPM) of the NEPC.

Web: http://www.ephc.gov.au/
Postal address: EPHC Secretariat, Level 5, 81 Flinders Street, Adelaide, SA 5000, Australia
Phone: +61-8-8419 1200
Fax: +61-8-8224 0912
Email: exec@ephc.gov.au

Food Standards Australia New Zealand (FSANZ)

This statutory agency sets food standards governing the use of food additives, and maximum contamination limits in food, for Australia and New Zealand.

Web: http://www.foodstandards.gov.au/
Postal address: FSANZ, P.O. Box 7186, Canberra BC, ACT 2610, Australia
Phone: +61-2-6271 2222
Fax: +61-2-6271 2278
Email: reception@foodstandards.gov.au

National Public Health Partnership (NPHP)

The NPHP was responsible for identifying and developing a strategic and integrated response to public and environmental health priorities in Australia. In June 2006 it was replaced by the Australian Health Protection Committee (AHPC) and the Australian Population Health Development Principal Committee (APHDPC).

Web: http://www.nphp.gov.au/
Postal Address: NPHP Secretariat, G.P.O. Box 4057, Melbourne, VIC 3001, Australia
Phone: +61-3-9603 8338
Fax: +61-3-9603 8310
Email: nphp@dhs.vic.gov.au
Email to AHPC: ahpc@health.gov.au
Email to APHDPC: aphdpc@health.gov.au

National Environmental Health Strategy (enHealth)

Located within the NPHP, the enHealth Council is specifically concerned the environmental health aspects of public health.

Web: http://enhealth.nphp.gov.au/

Therapeutic Goods Administration (TGA)

Located in the Department of Health & Ageing, the TGA evaluates and registers therapeutic products (medicines and medical devices). It administers the Australian Register of Therapeutic Goods (ARTG). Certain committees and sections are listed below with special relevance to toxicology, chemical risk assessment and public and environmental health.

Web: http://www.tga.gov.au/
Postal address: TGA, PO Box 100, Woden, ACT 2606, Australia
Phone: +61-2-6232 8444
Fax: +61-2-6232 8605
Email: info@health.gov.au

TGA Committees

Adverse Drug Reactions Advisory Committee (ADRAC)

A subcommittee of ADEC that advises the TGA on the safety of medicines.

Web: http://www.tga.gov.au/adr/adrac.htm

Australian Drug Evaluation Committee (ADEC)

An expert committee providing independent, scientific advice on new drugs.

Web: http://www.tga.gov.au/docs/html/adec/adec.htm

Complementary Medicines Evaluation Committee (CMEC)

An expert committee providing scientific and policy advice relating to controls on the supply and use of complementary medicines.

Web: http://www.tga.gov.au/docs/html/cmec/cmec.htm

National Drugs and Poisons Schedule Committee (NDPSC)

Sets the Standard for the Uniform Scheduling of Drugs and Poisons (SUSDP) to promoting uniform scheduling of substances and uniform labeling and packaging requirements throughout Australia.

Web: http://www.tga.gov.au/ndpsc/index.htm

TGA Sections

Complementary Medicines

This section regulates complementary medicines, i.e. 'traditional' or 'alternative' medicines, including vitamins, minerals, nutritional supplements and herbal, aromatherapy, and homoeopathic products.

Web: http://www.tga.gov.au/cm/cm.htm

Office of Chemical Safety (OCS)

The Canberra office provides health risk assessments of new and existing pesticides and veterinary medicines to the APVMA and NDPSC. The Sydney office is the National Industrial Chemicals Notification and Assessment Scheme (NICNAS).

Web: http://www.tga.gov.au/chemicals/index.htm (safety information about chemicals)
http://www.health.gov.au/internet/wcms/publishing.nsf/Content/ohp-ocs.htm (OCS archive website)

National Industrial Chemicals Notification and Assessment Scheme (NICNAS)

This agency assesses applications to introduce new chemical entities into Australia, and selectively reviews existing priority industrial chemicals listed on the Australian Inventory of Chemical Substances (AICS) which currently lists >38 000 chemical entities available for use in Australia. NICNAS also runs the Advisory Group on Chemical Safety (AGCS).

Web: http://www.nicnas.gov.au/
AICS link: http://www.nicnas.gov.au/industry/AICS/Search.asp
http://www.tga.gov.au/chemicals/agcs.htm

Over-the-counter (OTC) Medicines

This section is involved in the regulation of over-the-counter medicines for self-treatment from pharmacies, supermarkets, health food stores, and other retailers.

Web: http://www.tga.gov.au/npmeds/npmeds.htm

Prescription Medicines

This section is involved in the regulation of medicines that require a doctor's prescription for purchase from a pharmacist, or use in a hospital.

Web: http://www.tga.gov.au/pmeds/pmeds.htm

State and Territory Governments (Locations Shown in Map)

Australian Capital Territory, ACT	South Australia, SA
Queensland, QLD	Tasmania, TAS
New South Wales, NSW	Victoria, VIC
Northern Territory, NT	Western Australia, WA

The following are lists of links to the government departments in the various states and territories that are relevant to toxicology, chemical risk assessment, and public and environmental health. An example of one corresponding state government department is shown in each case. Due to the separation of powers between the federal commonwealth and the states/territories, roles are divided, with the assessment, evaluation, and registration of chemicals occurring federally (by the four main regulatory agencies of the TGA, NICNAS, FSANZ, and APVMA) and the legislation administered by the states. These federal regulatory agencies are summarized in 'Chemicals Schemes at a Glance' (http://www.nicnas.gov.au/Chemicals_In_Australia/Chemical_Schemes.asp).

Australian Environment Departments

A regional listing of the state environment departments in Australia, provided by the EPHC.

Web: http://www.ephc.gov.au/nepc/links_nepc.html

NSW Department of Environment and Climate Change

Formerly the NSW Department of Environment and Conservation, and incorporating the NSW Environment Protection Authority.

Web: http://www.environment.nsw.gov.au/home.htm
Postal address: NSW Department of Environment and Climate Change, P.O. Box A290, Sydney South, NSW 1232, Australia
Phone: +61-2-9995 5000
Fax: +61-2-9995 5999

Australian Health Departments

A regional listing of the state health departments from the federal Dept Health & Aging. Each health department has units for Public/Population Health and Environmental Health, with Toxicology and Epidemiology sections.

Web: http://www.health.gov.au/internet/main/publishing.nsf/Content/health-related.htm

Public Health SA

Located in the Dept Health SA, this section provides information and services on environmental health, drugs and poisons.

Web: http://www.dh.sa.gov.au/pehs/
Postal address: Public Health SA, Dept of Health, P.O. Box 6 Rundle Mall, Adelaide, SA 5000, Australia
Phone: +61-8-8226 7100
Fax: +61-8-8226-7102
Email: public.health@health.sa.gov.au

Australian OHS Departments

A regional listing of the state OHS-related departments in Australia, from the ASCC.

Web: http://www.ascc.gov.au/ascc/AboutUs/StateContacts/

Worksafe Online (WA)

A division within the Western Australian Dept of Consumer and Employment Protection (DOCEP), providing extensive work safety information, including hazardous substances.

Web: http://www.worksafe.wa.gov.au/newsite/worksafe/default.html
Postal address: Worksafe, P.O. Box 294, West Perth, WA 6872, Australia
Phone: +61-8-9327 8777
Email: safety@docep.wa.gov.au

Government Research Organizations

Antarctic Climate & Ecosystems (ACE) CRC

This research partnership focuses on the sustainable management of Antarctic marine ecosystem resources and the study of atmospheric and oceanic processes of the Southern Ocean.

Web: http://www.acecrc.org.au/
Postal address: ACE CRC, Private Bag 80, Hobart, TAS 7001, Australia
Phone: +61-3-6226 7888
Fax: +61-3-6226 2440
Email: enquiries@acecrc.org.au

Australian Institute of Marine Science (AIMS)

Conducts research into marine environments and their resources, including bioproducts and sustainable management.

Web: http://www.aims.gov.au/
Postal address: AIMS, PMB 3, Townsville MC, Townsville QLD 4810, Australia
Phone: +61-7-4753 4444
Fax: +61-7-4772 5852
Email: reception@aims.gov.au

ARC Nanotechnology Network (ARCNN)

The ARCNN is a research network of the various groups within Australia working in the field of nanotechnology and related areas (nanosafety/nanotoxicology).

Web: http://www.ausnano.net/
Postal address: ARCNN Convenor, Prof. Chennupati Jagadish, Dept of Electronic Materials Engineering, ANU, Canberra, ACT 0200, Australia
Phone: +61-2-6125 0363
Fax: +61-2-6125 3915
Email: arcnn@ausnano.net

Australian Research Council (ARC)

A statutory authority within the federal Dept of Education, Science and Training (DEST) portfolio, which advises on research matters and manages the National Competitive Grants Program.

Web: http://www.arc.gov.au/
Postal address: ARC, G.P.O. Box 2702, Canberra, ACT 2601, Australia
Phone: +61-2-6287 6600
Fax: +61-2-6287 6601
Email: info@arc.gov.au

Australian Research Network for Algal Toxins (ARNAT)

A network co-ordinated by AIMS to facilitate communication between researchers of toxic algae found in Australian waters.

Web: http://www.aims.gov.au/arnat/arnat-00001.htm

Centre for Environmental Contaminants Research (CECR)

Conducts research into contaminants in water, sediments, soils, groundwater, and the atmosphere, including water and sediment quality assessment, and aquatic ecotoxicology.

Web: http://www.clw.csiro.au/cecr/
Postal address: Dr Graeme Batley, Director of CECR, CSIRO Energy Technology, Private Mailbag 7, Bangor, NSW 2234, Australia
Phone: +61-2-9710 6830
Email: Graeme.batley@csiro.au

Commonwealth Scientific and Industrial Research Organisation (CSIRO)

This is Australia's national science agency and includes Divisions that are concerned with environmental sustainability, i.e. Energy Technology (CET), Land and Water (CLW), Marine and Atmospheric Research (CMAR) and Sustainable Ecosystems (CSE).

Web: http://www.csiro.gov.au/
Postal address: CSIRO Enquiries, Bag 10, Clayton South, VIC 3169, Australia
Phone: +61-3-9545 2176
Fax: +61-3-9545 2175
Email: Enquiries@csiro.au

Cooperative Research Centres (CRC)

The CRC Program of DEST includes several collaborative research centers concerned with environmental sustainability and chemical contamination.

Web: https://www.crc.gov.au/
Postal address: CRC Program, DEST, G.P.O. Box 9880, Canberra City, ACT 2601, Australia
Phone: +61-2-6240 5011
Fax: +61-2-6240 9096
Email: crc.program@dest.gov.au

CSIRO Human Nutrition

Conducts research into food and nutrition and its effects, including diagnostic genotoxicity assays developed by its Genome Health Nutrigenomics group.

Web: http://www.csiro.au/people/Michael.Fenech.html
Postal address: Dr Michael Fenech, CSIRO Human Nutrition, Kintore Ave, Adelaide, SA 5000, Australia
Phone: +61-8-8303 8880
Fax: +61-8-8303 8899
Email: Michael.Fenech@csiro.au

Cooperative Research Centre for Water Quality and Treatment

This research partnership focuses on issues relating to water quality management and health risk reduction.

Web: http://www.waterquality.crc.org.au/
Postal address: Dr Dennis Steffensen, CEO CRC for Water Quality & Treatment, Australia Water Quality Centre, Private Mail Bag 3, Salisbury, SA 5108, Australia
Phone: +61-8-8259 0326
Fax: +61-8-8259 0228
Email: dennis.steffensen@sawater.com.au

Cooperative Research Centre for Contamination Assessment and Remediation of the Environment (CRC-CARE)

This research partnership develops advanced new technologies for dealing with land, groundwater, and air contamination.

Web: http://www.crccare.com/
Postal address: CRC CARE, P.O. Box 486, Salisbury South, SA 5106, Australia
Phone: +61-8-8302 5041
Fax: +61-8-8302 3057
Email: ravi.naidu@unisa.edu.au

CRC Reef Research Centre

This research partnership focuses on the sustainable use of the Great Barrier Reef World Heritage Area.

Web: http://www.reef.crc.org.au/
Postal address: CRC Reef Research Centre, PO Box 772, Townsville, QLD 4810, Australia
Phone: +61-7-4729 8400
Fax: +61-7-4729 8499
Email: info@crcreef.com

Environmental Biotechnology CRC (EBCRC)

This research partnership develops advanced technologies based on biological systems to improve efficiency and reduce (or utilize) industrial waste to the environment.

Web: http://www.ebcrc.com.au/
Postal address: EBCRC, Suite G01 Bay 3, Locomotive Workshop Building, Australian Technology Park, Eveleigh, 1430 NSW, Australia
Phone: +61-2-9209 4963
Fax: +61-2-9209 4980
Email: crcwmpc@unsw.edu.au

National Health and Medical Research Council (NHMRC)

Main government granting body for medical research, which is also responsible for human and animal research ethics.

Web: http://www.nhmrc.gov.au/
Postal address: NHMRC, G.P.O. Box 1421, Canberra, ACT 2601, Australia
Phone: +61-2-62179000
Fax: +61-2-6217 9100
Email: nhmrc@nhmrc.gov.au

Australian Health Ethics Committee (AHEC) & Human Research Ethics Committees (HREC)

These committees are concerned with human research ethics and have provided guidelines for these activities in the 'National Statement on Ethical Conduct in Human Research (2007)'.

Web: http://www.nhmrc.gov.au/ethics/human/).

Animal Ethics Committees (AEC) & Animal Welfare Committee (AWC)

These committees are concerned with animal research ethics and have defined the appropriate ethical procedures for animal experimentation in Australia in the 'Australian code of practice for the care and use of animals for scientific purposes (7th Edition, 2004)'.

Web: http://www.nhmrc.gov.au/ethics/animal/index.htm

National Institute of Forensic Science (NIFS)

This institute supports research in forensic science, conducts training programs for registering practitioners, and conducts quality assurance programs.

Web: http://www.nifs.com.au/
Postal address: NIFS, P.O. Box 13075, Law Courts Post Office, VIC 8010, Australia
Phone: +61-3-9640 0707
Fax: +61-3-9640 0709
Email: info@nifs.com.au

Rural Industries Research and Development Corporation (RIRDC)

The RIRDC manages and funds priority research, including the sustainable use of the environment, and translates the results into practical outcomes for industry development.

Web: http://www.rirdc.gov.au/
Postal address: RIRDC, P.O. Box 4776, Kingston, ACT 2604, Australia
Phone: +61-2-6272 4819
Fax: +61-2-6272 5877
Email: rirdc@rirdc.gov.au

Victorian Institute of Forensic Medicine (VIFM)

The VIFM provides forensic pathology and related services, training and research in Victoria. It has academic status as the Monash University Dept of Forensic Medicine and administers the National Coroners Information System (NCIS) database.

Web: http://www.vifm.org/
Postal address: VIFM, 57–83 Kavanagh St, Southbank, VIC 3006, Australia
Phone: +61-3-9684 4444
Fax: +61-3-9682 7353

Organizations – Non-Government

Alcohol and other Drugs Council of Australia (ADCA)

NGO working to reduce the harm caused by alcohol and other drugs.

Web: http://www.adca.org.au/
Postal address: ADCA, P.O. Box 269, Woden, ACT 2606, Australia
Phone: +61-2-6281 0686
Fax: +61-2-6281 0995
Email: adca@adca.org.au

Australian Cancer Research Foundation (ACRF)

A charity that funds cancer research, including epidemiology.

Web: http://www.acrf.com.au/
Postal address: ACRF, Suite 409, The Strand Arcade, 412 George Street, Sydney, NSW 2000, Australia
Phone: +61-2-9223 7833
Fax: +61-2-9223 1800
Email: info@acrf.com.au

Australian Drug Foundation

A foundation working to prevent and reduce alcohol and other drug-related problems.

Web: http://www.adf.org.au/
Postal address: Australian Drug Foundation, P.O. Box 818, North Melbourne, VIC 3051, Australia
Phone: +61-3-9278 8100
Fax: +61-3-9328 3008
Email: adf@adf.org.au

Australian Medical Council

Independent national standards body for medical education and training.

Web: http://www.amc.org.au/
Postal address: Australian Medical Council, P.O. Box 4810, Kingston, ACT 2604, Australia
Phone: +61-2-62709777
Fax: +61-2-62709799
Email: amc@amc.org.au

Australian Patient Safety Foundation (APSF)

Non-profit independent organization for the advancement of patient safety; has developed classification systems and database software for coding and reporting of incidents and adverse events.

Web: http://www.apsf.net.au/
Postal address: APSF, G.P.O. Box 400, Adelaide, SA 5001, Australia
Phone: +61-8-8222 5115
Fax: +61-8-8232 6938
Email: research@apsf.net.au

Royal Society for the Prevention of Cruelty to Animals (RSPCA Australia)

Australian branch of Society for the Prevention of Cruelty to Animals, including animal experimentation.

Web: http://www.rspca.org.au/
Postal address: RSPCA Australia Inc., P.O. Box 265, Deakin West, ACT 2600, Australia
Phone: +61-2-6282 8300
Fax: +61-2-6282 8311

Rural Health Education Foundation (RHEF)

Provides accredited education services (including clinical toxicology) to general practitioners and other

health professionals working in rural and remote Australia.

Web: http://www.rhef.com.au/
Postal address: RHEF, P.O. Box 324, Curtin, ACT 2605, Australia
Phone: +61-2-6232 5480
Fax: +61-2-6232 5484
Email: rhef@rhef.com.au

Walter and Eliza Hall Institute (WEHI) of Medical Research

The Molecular Genetics of Cancer Division conducts significant research into apoptosis.

Web: http://www.wehi.edu.au/
Postal address: WEHI, 1G Royal Parade, Parkville, VIC 3050, Australia
Phone: +61-3-9345 2555
Fax: +61-3-9347 0852
Email: information@wehi.edu.au

Commercial Organizations with Toxicology and Regulatory Activities

Association of Therapeutic Goods Consultants

Professional association of technical consultants to the therapeutic goods industry.

Web: http://www.atgc.com.au/
Postal address: ATGC, P.O. Box 273, Annandale, NSW 2038, Australia
Email: info@atgc.com.au

Austox Program

AUSTOX Urine Toxicology Proficiency Program administered by a reference facility for drug screening (Toxicology Unit, Pacific Laboratory Medicine Services).

Web: http://www.austox.com/
Postal address: Toxicology Unit, PaLMS, Macquarie Hospital Campus, P.O. Box 53, North Ryde, NSW 1670, Australia
Phone: +61-2-9887 5666
Fax: +61-2-9805 1259
Email: info@toxicologyunit.com

Australian Centre for Occupational Health and Safety

A company that provides MSDS services to industry via its Infosafe database.

Web: http://www.acohs.com.au/
Postal address: ACOHS Pty Ltd, 2–4 Burleigh Court, Nunawading, VIC 3131, Australia
Phone: +61-3-9875 6900
Fax: +61-3-9875 6956
International Email: international@acohs.com.au

Australian Water Association (AWA)

Australia's largest water industry association that promotes the sustainable management of water, including public health issues.

Web: http://www.awa.asn.au/
Postal address: AWA, P.O. Box 388, Artarmon, NSW 1570, Australia
Phone: +61-2-9413 1288
Fax: +61-2-9413 1047
Email: info@awa.asn.au

National Association of Testing Authorities, Australia (NATA)

Government-endorsed provider of accreditation for laboratories and testing facilities, Australia's GLP compliance monitoring authority for the OECD Principles of GLP and Australia's representative on the OECD GLP Working Group.

Web: http://www.nata.asn.au/
Postal address: NATA, P.O. Box 7507, Silverwater, NSW 2128, Australia
Phone: +61-2-9736 8222
Fax: +61-2-9743 5311
Email: nswmanager@nata.asn.au

National Safety Council of Australia (NSCA)

Provides commercial OHS training and consulting services.

Web: http://www.nsca.org.au/
Postal address: NSCA, Building 4, Brandon Office Park, 540 Springvale Road Glen Waverley, VIC 3150, Australia
Phone: +61-3-8562 1555
Fax: +61-3-8562 1590
Email: melbourne@nsca.org.au

Plastics and Chemicals Industries Association (PACIA)

Main national body representing Australia's fourth largest manufacturing sector.

Web: http://www.pacia.org.au/
Postal address: PACIA, Level 1, Unit 7, Skipping Girl Place, 651 Victoria Street, Abbotsford, VIC 3067, Australia
Phone: +61-3-9429 0670
Fax: +61-3-9429 0690
Email: info@pacia.org.au

Risk Management Institution of Australasia Limited (RMIA)

Professional association for risk management practitioners, providing accreditation and involved in the development and promotion of the Risk Management Standard, AS/NZS 4360.

Web: http://www.rmia.org.au/
Postal address: RMIA, P.O. Box 97, Carlton South, VIC 3053, Australia
Phone: +61-3-8341 1000
Fax: +61-3-9347 5575
Email: admin@rmia.org.au

Waste Management Association of Australia (WMAA)

Peak national forum for the Australian waste management industry.

Web: http://www.wmaa.asn.au/
Postal address: WMAA, Suite 4D, Level 4, 5 Belmore Street, Burwood NSW 2134, Australia
Phone: +61-2-8746 5000
Fax: +61-2-9701 0199
Email: enquiries@wmaa.asn.au

Interest Groups with a Toxicology, Environmental and Occupational Safety and Health Focus

The information on these websites should be compared with websites and refereed sources of the relevant government authorities and scientific literature.

Asbestos Diseases Society of Australia (ADSA)

A charitable organization that provides the Asbestos Diseases Advisory Services (ADAS), and counseling/support services to those who develop asbestos-related diseases and their families. It also provides information on asbestos toxicity and conducts fund-raising for medical research.

Web: http://www.asbestosdiseases.org.au/
Postal address: ADSA, P.O. Box 1394, Osborne Park, WA 6916, Australia
Phone: +61-8-9344 4077
Fax: +61-8-9345 0422

Australasian Society of Oral Medicine And Toxicology (ASOMAT)

Association of dentists and doctors to promote concepts of bio-compatible dentistry (as opposed to mercury amalgam).

Web: http://www.asomat.org/
Postal address: ASOMAT, P.O. Box A860, Sydney South, NSW 2000, Australia

Clean Air Society of Australia and New Zealand (CASANZ)

Organization for people interested in environmental management affairs with particular reference to air quality and related issues.

Web: http://www.casanz.org.au/
Postal address: CASANZ – Admin. Officer, 70 Olinda-Monbulk Road, Olinda, VIC 3788, Australia
Phone/fax: +61-3-9751 0393
Email: admin.officer@casanz.org.au

Friends of the Earth Australia

A federation of independent local groups working for an environmentally sustainable future.

Web: http://www.foe.org.au/
Postal address: Friends of the Earth, P.O. Box 222, Fitzroy, VIC 3065, Australia
Phone: +61-3-9419 8700
Fax: +61-3-9416 2081
Email: cam.walker@foe.org.au

Global Lead Advice and Support Service (GLASS)

This is run by the Lead Education and Abatement Design Group 'LEAD Group', a community organization providing information on lead poisoning and contamination prevention and management.

Web: http://www.lead.org.au/fs/fst1.html
Postal address: LEAD Group, P.O. Box 161, Summer Hill, NSW 2130, Australia
Phone: +61-2-9716 0014
Fax: +61-2-9716 9005

Greenpeace Australia Pacific

Independent campaigning organization concerned with global environmental problems.

Web: http://www.greenpeace.org.au/
Postal address: Greenpeace, Level 4, 35–39 Liverpool St, Sydney, NSW 2000, Australia
Phone: +61-2-9261 4666
Fax: +61-2-9261 4588
Email: greenpeace@au.greenpeace.org

National Toxics Network (NTN)

A community-based network concerned with pollution reduction and protection of environmental health.

Web: http://www.oztoxics.org/ntn/
Postal address: National Toxics Network Inc., P.O. Box 173, Bangalow, NSW 2479, Australia
Email: evolve@joimmig.com

Total Environment Centre (TEC)

Australian environmental movement concerned with the public health effects of toxic chemicals.

Web: http://www.tec.org.au/
Postal address: TEC, P.O. Box A176, Sydney South, NSW 1235, Australia
Phone: +61-2-9261 3437
Fax: +61-2-9261 3990

World Wildlife Fund Australia (WWF-Australia)

Environmental conservation group concerned with industrial effects on the environment and biodiversity.

Web: http://www.wwf.org.au/
Postal address: WWF-Australia, P.O. Box 528, Sydney, NSW 2001, Australia
Phone: +61-2-9281 5515
Fax: +61-2-9281 1060

Universities

Universities Researching and Teaching Toxicology and OHS

List of Australian Universities

The Australian Education Network website provides direct links to Australian universities. There are four main groupings of Australian universities, which help them to promote mutual objectives, i.e.

- Group of Eight (Go8): oldest 'sandstone' universities and/or strong overall research capability.
- Australian Technology Network (ATN): originally technical institutions, these have strengths in the practical application of research.
- Innovative Research Universities Australia (IRU Australia): founded in the 1960s–1970s and containing areas of specialization.
- New Generation Universities (NGU): received university accreditation since 1970 (http://www.australian-universities.com/list/).

Australian National University (ANU)

A Go8 research-intensive university established in the nation's capital in 1946.

Web: http://www.anu.edu.au/
Postal address: The Australian National University, Canberra, ACT 0200, Australia
Phone: +61-2-6125 5111
Email: enquiries@anu.edu.au

ANU College of Medicine and Health Sciences

Research activities include clinical toxicology.

Web: http://cmhs.anu.edu.au/

Centre for the Study of Bioactive Molecules (CSBM)

Multidisciplinary research centre, including research into natural toxins.

Web: http://csbm.anu.edu.au/home.html

National Centre for Epidemiology and Population Health (NCEPH)

Includes environmental health and epidemiology research groups.

Web: http://nceph.anu.edu.au/

National Research Centre for Occupational Health and Safety Regulation

Research centre funded by the ASCC to conduct research into OHS regulation, which also publishes seminar papers and working papers in OHS, including 'Regulation at Work'.

Web: http://www.ohs.anu.edu.au/

Curtin University of Technology (Curtin)

Western Australian technical university and ATN member.

Web: http://www.curtin.edu.au/
Postal address: Curtin University of Technology, G.P.O. Box U1987, Perth, WA 6845, Australia
Phone: +61-8-9266 9266
Fax: +61-8-9266 2255

School of Public Health

Conducts research and teaching in environmental health, epidemiology and OHS.

Web: http://www.publichealth.curtin.edu.au/index.cfm

Muresk Institute

Research areas include ecotoxicology.

Web: http://muresk.curtin.edu.au/

Flinders University of South Australia (Flinders)

Second university established in South Australia in 1966 and IRUA member.

Web: http://www.flinders.edu.au/
Postal address: Flinders University, G.P.O. Box 2100, Adelaide, SA 5001, Australia
Phone: +61-8-8201 3911
Fax: +61-8-8201 3000
Email: central.records@flinders.edu.au

Department of Clinical Pharmacology

Research and teaching areas include drug and xenobiotic metabolism, and human and molecular toxicology.

Web: http://som.flinders.edu.au/FUSA/ClinPharm/index.htm

Department of Environmental Health

Research and teaching areas include environmental toxicology, risk assessment, bioremediation, and epidemiology.

Web: http://som.flinders.edu.au/FUSA/EnvHealth/Default.htm

Griffith University (Griffith)

Queensland University with a School of Public Health and School of Environmental Studies and IRUA member.

Web: http://www.griffith.edu.au/
Postal address: Griffith University Gold Coast Campus, PMB 50 Gold Coast Mail Centre, QLD 9726, Australia
Phone: +61-7-5552 8800

Centre for Aquatic Processes and Pollution

Conducts ecotoxicology research in coastal aquatic ecosystems and is now part of the Australian Rivers Institute.

Web: http://www.griffith.edu.au/environment-planning/australian-rivers-institute

James Cook University (JCU)

Leading tropical research university in north Queensland.

Web: http://www.jcu.edu.au/
Postal address: James Cook University, Townsville, QLD 4811, Australia
Phone: +61-7-4781 4111
Fax: +61-7-4779 6371

Tropical Australian Stinger Research Unit

Conducts medical and biological research on cubozoans (box jellyfish).

Web: http://www.jcu.edu.au/interest/stingers/index.htm

La Trobe University (La Trobe)

An IRUA member with a School of Pharmacy and Applied Science at the Bendigo campus in regional Victoria.

Web: http://www.latrobe.edu.au/
Postal address: La Trobe University, VIC 3086, Australia
Phone: +61-3-9479 1111
Fax: +61-3-9478 5814

Vaux Laboratory, Dept Biochemistry, School of Molecular Sciences

Research laboratory of David Vaux, a world leader in apoptosis research.

Web: http://www.latrobe.edu.au/biochemistry/lab/vaux/index.htm

Monash University (Monash)

Second university established in Victoria in 1958 and G08 member.

Web: http://www.monash.edu.au/
Postal address: Monash University, VIC 3800, Australia
Phone: +61-3-9902 6000
Fax: +61-3-9905 4007

Accident Research Centre (MUARC)

Conducts research into the causes and prevention of road accidents.

Web: http://www.monash.edu.au/muarc/

Australian Centre for Human Health Risk Assessment (ACHHRA)

A multi-institutional and disciplinary center located in the Department of Epidemiology and Preventive Medicine, concerned with risk assessment of human exposure to hazardous chemicals and microorganisms.

Web: http://www.med.monash.edu.au/epidemiology/achhra/

Monash Venoms and Toxins Group

Located in the Department of Pharmacology, it conducts research into snake, spider and jellyfish venoms.

Web: http://www.med.monash.edu.au/pharmacology/research/index.html

Victorian College of Pharmacy

Includes the Centre for Drug Candidate Optimisation conducting preclinical development and evaluation.

Web: http://www.vcp.monash.edu/

Queensland University of Technology (QUT)

This ATN member was formerly the Queensland Institute of Technology (QIT) that became a university

in 1989. The School of Life Sciences has a pharmacy program and the School of Physical and Chemical Sciences has a forensic science program.

Web: http://www.qut.edu.au/
Postal address: QUT, G.P.O. Box 2434, Brisbane QLD 4001, Australia
Phone: +61-7 3138 2111
Email: qutinformation@qut.edu.au

International Laboratory for Air Quality and Health (ILAQH)

Conducts interdisciplinary research into air quality and its impact on human health, with a specific focus on fine and ultrafine particles.

Web: http://www.ilaqh.qut.edu.au/

School of Public Health

Contains the Centre for Health Research including activities in health and safety, environmental health and epidemiology.

Web: http://www.hlth.qut.edu.au/ph/

RMIT University (RMIT)

Royal Melbourne Institute of Technology, is one of Australia's oldest technical institutions that became a university in 1992. It has a long-standing strength in toxicology expertise and education, and is an ATN member.

Web: http://www.rmit.edu.au/
Postal address: RMIT University, G.P.O. Box 2476V, Melbourne, VIC 3001, Australia
Phone: +61-3-9925 2000
Fax: +61-3-9663 2764

Key Centre for Applied and Nutritional Toxicology

Established the first general toxicology degree program in Australasia in the mid-1980s. Initially supported by Australian Research Council Key Centre funding, it conducts research into detoxication biochemistry, biochemical mechanisms of toxicity, immunotoxicology, toxicokinetics, ecotoxicology, and food toxicology.

Web: http://www.rmit.edu.au/browse;ID=tp3btm6v20gc1
Postal address: School of Medical Sciences, RMIT University, P.O. Box 71, Bundoora, VIC 3083

NanoSafe Australia

Australia's nanotoxicology research network co-ordinated from RMIT and providing occupational and environmental health and safety services to the Australian Research Council Nanotechnology Network (ARCNN), as well as government, industry and NGOs.

Web: http://www.rmit.edu.au/nanosafe/

RMIT Drug Discovery Technologies (RDDT)

Contract research organization providing preclinical drug development services.

Web: http://www.rddt.com.au/

School of Applied Sciences

Includes the occupational health and safety group and programs, and the ecotoxicology and environmental biology research group.

Web: http://www.rmit.edu.au/applied-sciences

School of Medical Sciences

Location of the RMIT toxicology expertise, which commenced the world's first and only fully online toxicology postgraduate degrees (Graduate Diploma in Toxicology and Masters of Toxicology) in 2001.

Web: http://www.rmit.edu.au/medical-sciences/toxicology-pg

University of Adelaide (Adelaide)

Oldest university in South Australia and Go8 member.

Web: http://www.adelaide.edu.au/
Postal address: The University of Adelaide, SA 5005, Australia
Phone: +61-8-8303 4455

Department of Public Health

Conducts research into occupational and environmental health and safety, and runs the National Short Course in Environmental Health.

Web: http://www.public-health.adelaide.edu.au/

Molecular Toxicology

A research area within the Pharmacology Discipline, including cyanobacterial toxins and drug metabolism leading to toxicity.

Web: http://www.adelaide.edu.au/health/pharm/research/toxicology.html

University of Queensland (UQ)

Oldest university in Queensland and Go8 member.

Web: http://www.uq.edu.au/

Postal address: The University of Queensland, Brisbane, QLD 4072, Australia
Phone: +61-7-3365 1111

National Research Centre for Environmental Toxicology (EnTox)

Originally the NHMRC-funded centre 'NRCET', it conducts research into human environmental toxicology.

Web: http://www.entox.uq.edu.au/
Postal address: 39 Kessels Road, Coopers Plains, QLD 4108, Australia
Phone: +61-7-3274 9009
Fax: +61-7-3274 9003

TetraQ

Contract research organization providing preclinical drug development services.

Web: http://www.tetraq.uq.edu.au/index.html

University of Melbourne (UniMelb)

Oldest university in Victoria and Go8 member.

Web: http://www.unimelb.edu.au/
Postal address: The University of Melbourne, VIC 3010, Australia
Phone: +61-3-8344 4000
Fax: +61-3-8344 5104

Australian Venom Research Unit

Toxinology expertise located in the pharmacology department.

Web: http://www.avru.org/

Centre for Environmental Stress and Adaptation Research (CESAR)

A joint Melbourne and Monash university centre with research in environmental biomonitoring and chemical stress.

Web: http://www.cesar.org.au/

Faculty of Medicine, Dentistry and Health Sciences

Offers the Graduate Diploma in Drug Evaluation and Pharmaceutical Sciences, co-ordinated by Austin Health.

Web: http://www.mdhs.unimelb.edu.au/

University of New South Wales (UNSW)

Second university established in NSW and Go8 member.

Web: http://www.unsw.edu.au/
Postal address: The University of New South Wales, Sydney, NSW 2052, Australia
Phone: +61-2-9385 1000

Institute of Environmental Studies (IES)

Runs postgraduate programs in Environmental Management and Environmental Network (EN) project.

Web: http://www.ies.unsw.edu.au/

School of Safety Science

Research and teaching programs in safety, the environment, and general risk management, including applied toxicology research.

Web: http://www.safesci.unsw.edu.au/

University of Newcastle (Newcastle)

An IRUA university located in Newcastle, NSW.

Web: http://www.newcastle.edu.au/
Postal address: University of Newcastle, Callaghan Campus, University Drive, Callaghan, NSW 2308, Australia
Phone: +61-2-4921 5000
Fax: +61-2-4921 5656
Email: EnquiryCentre@newcastle.edu.au

School of Medicine and Public Health

Contains the Discipline of Clinical Pharmacology and Clinical Toxicology in association with the Hunter Area Health Service.

Web: http://www.newcastle.edu.au/school/medprac-pop/

University of South Australia (UniSA)

An ATN member founded in 1991 through the amalgamation of South Australian Institute of Technology and South Australian College of Advanced Education.

Web: http://www.unisa.edu.au/
Postal address: University of South Australia, G.P.O. Box 2471, Adelaide, SA 5001, Australia
Phone: +61-8-8302 6611
Fax: +61-8-8302 2466
Email: campuscentral.cityeast@unisa.edu.au

Centre for Environmental Risk Assessment and Remediation (CERAR)

Multidisciplinary research center focusing specifically on both environmental risk assessment and remediation.

Web: http://www.unisa.edu.au/cerar/default.asp

Centre for Pharmaceutical Research

Provides pre-clinical services.

Web: http://www.unisa.edu.au/cpr/default.html

School of Pharmacy and Medical Sciences

Research participant in the CRC Water Quality and Treatment.

Web: http://www.unisa.edu.au/pmbs/

University of Sydney (USyd)

Oldest university in Australia and Go8 member.

Web: http://www.usyd.edu.au/
Postal address: The University of Sydney, NSW 2006, Australia
Phone: +61-2-9351 2222

Faculty of Veterinary Science

Provides the Veterinary Education and Information Network (VEIN).

Web: http://www.vetsci.usyd.edu.au/

Reproductive Toxicology and Chemical Hazard Assessment Laboratory (CHALUS)

Located in the Discipline of Anatomy and Histology, this lab specialises in teratology research.

Web: http://www.anatomy.usyd.edu.au/research/groups/webster/index.html

University of Tasmania (UTas)

The main university in Tasmania.

Web: http://www.utas.edu.au/
Postal address: University of Tasmania, G.P.O. Box 252, Hobart, TAS 7001, Australia
Phone: +61-3-6226 2999
Fax: +61-3-6226 2018

School of Aquaculture

Research activities include aquatic toxicology.

Web: http://www.utas.edu.au/aqua
Postal address: Locked Bag 1370, Launceston, TAS 7250, Australia
Phone: +61-3-6324 3801
Fax: +61-3-6324 3804
Email: Enquiries@aqua.utas.edu.au

School of Pharmacy

Research activities include chemical ecology and toxicology.

Web: http://www.utas.edu.au/pharmacy
Postal address: Private Bag 26, Hobart, TAS 7001, Australia
Phone: +61-3-6226 2190
Fax: +61-3-6226 2870

University of Technology Sydney (UTS)

An ATN university with ecotoxicology and forensic science degrees.

Web: http://www.uts.edu.au/
Postal address: University of Technology, Sydney, P.O. Box 123, Broadway, NSW 2007, Australia
Phone: +61-2-9514 2000

Centre for Ecotoxicology (CET)

This research centre is a joint venture of the UTS and the Environment Protection Authority of New South Wales; activities include sediment toxicity testing, and laboratory and field studies in aquatic toxicology.

Web: http://www.science.uts.edu.au/centres/ecotox/index.html

Neurotoxin Research Group

Located in the Department of Medical and Molecular Biosciences, its activities include the isolation and bioactivity characterization of animal neurotoxins.

Web: http://www.science.uts.edu.au/health/nrgresearch.html

University of Western Australia (UWA)

Oldest university in Western Australia and Go8 member.

Web: http://www.uwa.edu.au/
Postal address: The University of Western Australia, 35 Stirling Highway, Crawley, WA 6009, Australia
Phone: +61-8-6488 6000
Fax: +61-8-6488 1380
Email: general.enquiries@uwa.edu.au

Centre for Forensic Science

Runs postgraduate research and coursework programs in forensic science.

Web: http://www.forensicscience.uwa.edu.au/

School of Medicine and Pharmacology

Laboratories include molecular toxicology and oxidative stress and clinical toxicology (in association with PathWest pathology services).

Web: http://www.pharm.uwa.edu.au/

School of Population Health

Research programs include cancer epidemiology.

Web: http://www.sph.uwa.edu.au/

Victoria University (VU)

This vocationally orientated NGU member was formerly the Victoria University of Technology (VUT).

Web: http://www.vu.edu.au/
Postal address: Victoria University, P.O. Box 14428, Melbourne VIC 8001, Australia
Phone: +61-3-9919 4000
Fax: +61-3-9689 4069

Centre for Environmental Safety and Risk Engineering (CESARE)

Conducts research primarily in the area of fire safety and risk engineering.

Web: http://www.vu.edu.au/Faculties_and_TAFE/Health_Engineering_and_Science/Centre_for_Environmental_Safety_and_Risk_Engineering_CESARE/indexdl_89402.aspx

Other Universities also Teaching Toxicology and Environmental and Occupational Health and Safety

Central Queensland University (CQU)

This NGU member has a Centre for Environmental Management.

Web: http://www.cqu.edu.au/
Postal address: Centre for Environmental Management, CQU, Bryan Jordan Drive, Gladstone QLD 4680, Australia
Phone: +61-7-4970 7310
Fax: +61-7-4970 7207
Email: cem-enquiries@cqu.edu.au

Charles Darwin University (CDU)

The School of Science and Primary Industries includes research into toxicology of aquatic snakes.

Web: http://www.cdu.edu.au/
Postal address: Charles Darwin University, Darwin, NT 0909, Australia
Phone: +61-8-8946 6666
Fax: +61-8-8927 0612

Charles Sturt University (CSU)

Provides a course in Forensic Toxicology.

Web: http://www.csu.edu.au/
Postal address: Charles Sturt University, P.O. Box 789, Albury, NSW 2640, Australia
Phone: +61-2-6051 6000
Fax: +61-2-6051 6629

Deakin University (Deakin)

The School of Life & Environmental Science includes environmental management, and the School of Biological & Chemical Sciences, offers a bachelor degree in forensic science.

Web: http://www.deakin.edu.au/
Postal address: Deakin University, Geelong VIC 3227
Phone: +61-3-5227 2333
Email: enquire@deakin.edu.au

Edith Cowan University (ECU)

This NGU member has a School of Natural Sciences, which offers a degree in Environmental Health.

Web: http://www.ecu.edu.au/
Postal address: Edith Cowan University, 100 Joondalup Drive, Joondalup, WA 6027, Australia
Phone: +61-8-6304 0000
Email: enquiries@ecu.edu.au

Murdoch University (Murdoch)

This IRUA member has a School of Biological Sciences and Biotechnology and a School of Veterinary & Biomedical Sciences.

Web: http://www.murdoch.edu.au/
Postal address: Murdoch University, South Street, Murdoch, WA 6150, Australia
Phone: +61-8-9360 6000

Southern Cross University (SCU)

This NGU member has a School of Environmental Science and Management.

Web: http://www.scu.edu.au/
Postal address: Southern Cross University, P.O. Box 157, Lismore, NSW 2480, Australia
Phone: +61-2-6620 3000
Fax: +61-2-6620 3700

Swinburne University of Technology (Swinburne)

This university has an Environment and Biotechnology Centre and programs in Public and Environmental Health.

Web: http://www.swin.edu.au/
Postal address: Swinburne University, P.O. Box 218, Hawthorn, VIC 3122, Australia
Phone: +61-3-8676 7002

University of Canberra (UC)

This NGU member has a School of Health Sciences offering degrees in forensic science.

Web: http://www.canberra.edu.au/
Postal address: University of Canberra, ACT 2601 Australia
Phone: +61-2-6201 5111

University of Wollongong (UOW)

The Faculty of Health and Behavioural Sciences offers degrees in OHS.

Web: http://www.uow.edu.au/
Postal address: University of Wollongong, Wollongong, NSW 2522, Australia
Phone: +61-2-4221 3555

Professional Societies

Association of Regulatory and Clinical Scientists (ARCS Australia)

Professional association that supports scientists involved in the development of therapeutic products, including regulatory affairs.

Web: http://www.arcs.com.au/
Postal address: ARCS, Suite 904, 28 Clarke Street, Crows Nest, NSW 2065, Australia
Phone: +61-2-8905 0829
Fax: +61-2-8905 0830
Email: arcs@arcs.com.au

Australasian College of Toxicology and Risk Assessment (ACTRA)

Recently established in July 2006 to provide a registry, continuing education and accreditation for toxicologists and health risk assessment professionals.

Web: http://www.actra.org.au/
Postal address: ACTRA Secretariat, Meetings First P/L, 4/184 Main Street, Lilydale, VIC 3140, Australia
Phone: +61-3-9739 7697
Fax: +61-3-9737 7076
Email: actra@meetingsfirst.com.au

Australasian Faculty of Occupational Medicine (AFOM)

This Faculty undertakes the professional training of occupational physicians and other roles of the former Australian College of Occupational Medicine.

Web: http://afom.racp.edu.au/
Postal address: AFOM, 145 Macquarie St, Sydney, NSW 2000, Australia
Phone: +61-2-8247 6219
Fax: +61-2-9247 8082 http://images/Copy_of_Vivien Haslam.jpg
Email: afom@racp.edu.au

Australasian Faculty of Public Health Medicine (AFPHM)

This Faculty undertakes the professional training of doctors in public health and community medicine in Australia and New Zealand.

Web: http://afphm.racp.edu.au/
Postal address: AFPHM, 145 Macquarie St, Sydney, NSW 2000, Australia
Phone: +61-2-8247 6224
Fax: +61-2-9252 3526
Email: afphm@racp.edu.au

Australasian Pharmaceutical Science Association (APSA)

Professional society that represents all branches of the pharmaceutical sciences, including regulatory areas.

Web: http://www.apsa-online.org/
Postal address: APSA, School of Pharmacy & Medical Sciences, University of South Australia, SA 5000, Australia
Phone: +61-8-8302 2391
Fax: +61-8-8302 2389
Email: info@apsa-online.org

Australasian Radiation Protection Society Inc. (ARPS)

Professional society of members engaged in one or more aspects of radiation protection.

Web: http://www.arps.org.au/
Postal address: ARPS, P.O. Box 7108, Upper Fern Tree Gulley, VIC 3156, Australia
Phone: +61-3-9756 0128
Fax: +61-3-9753 6372
Email: arps@21century.com.au

Australasian Society for Ecotoxicology (ASE)

Professional society representing all branches of ecotoxicology and publishes the *Australasian Journal of Ecotoxicology* (AJE).

Web: http://www.ecotox.org.au/
Postal address: Ross Hyne (ASE), Centre for Ecotoxicology, DEC NSW, Lidcombe, NSW 2141, Australia
Phone: +61-2-9995 5081
Fax: +61-2-9995 5183
Email: Ross.Hyne@environment.nsw.gov.au

Australasian Society of Clinical and Experimental Pharmacologists and Toxicologists (ASCEPT)

This society has separate sections representing toxicology and clinical toxicology. It is the IUTOX affiliate for

Australasia and hosted the 9th International Congress of Toxicology ('ICT-IX', Brisbane, 2001).

Web: http://www.ascept.org/
Postal address: ASCEPT Secretariat, Meetings First P/L, 4/184 Main Street, Lilydale, VIC 3140, Australia
Phone: +61-3-9739 7697
Fax: +61-3-9737 7076
Email: ascept@meetingsfirst.com.au

Australian and New Zealand Forensic Science Society (ANZFSS)

Professional society representing all branches of forensic science.

Web: http://anzfss-vic.blogspot.com/
Postal address: Tahnee Dewhurst, http://photos1.blogger.com/blogger2/5532/906561639777752/1600/contact.jpghttp://photos1.blogger.com/blogger2/5532/906561639777752/1600/contact.0.jpgANZFSS-Victorian Branch, P.O. Box 130, Rosanna, VIC 3084, Australia
Phone: +61-3-9450 3540
Fax: +61-3-9450 3660

Australian and New Zealand Society of Occupational Medicine (ANZSOM)

Professional organization for registered medical practitioners involved or interested in occupational medicine.

Web: http://www.anzsom.org.au/
Postal address: ANZSOM Federal Secretariat, P.O. Box 717, East Bentleigh, VIC 3165, Australia
Phone: +61-3-9570 1859
Fax: +61-3-9579 4808
Email: anzsom@westnet.com.au

Australian Institute of Occupational Hygienists (AIOH)

Professional organization providing certification for occupational hygienists.

Web: http://www.aioh.org.au/
Postal address: AIOH , P.O. Box 1205, Tullamarine, VIC 3043, Australia
Phone: +613 9335 2577
Fax: +613 9335 3454
Email: admin@aioh.org.au

Australian Marine Sciences Association (AMSA)

Professional association for marine scientists from all related disciplines, including ecotoxicology and aquatic toxicology.

Web: http://www.amsa.asn.au/
Postal address: AMSA, P.O. Box 8, Kilkivan QLD 4600, Australia
Phone: +61-7 4772 4858
Fax: +61-7 4772 4858
Email: secretary@amsa.asn.au

Australian Society for Medical Research (ASMR)

Peak professional society representing Australian health and medical researchers, including 49 affiliated professional societies and medical colleges (e.g. ASCEPT).

Web: http://www.asmr.org.au/
Postal address: ASMR, 145 Macquarie Street, Sydney NSW 2000, Australia
Phone: +61-2-9256 5450
Fax: +61-2-9252 0294
Email: asmr@world.net

Australian Society for Veterinary Pathology (ASVP)

Professional body to promote the practice of veterinary pathology in improving animal and human health.

Web: http://www.asvp.asn.au/
Postal address: ASVP President, Paul Canfield, Dept. Vet. Anatomy & Pathology
University of Sydney, NSW 2006, Australia

Federation of Australian Scientific and Technological Societies (FASTS)

Federation of 69 professional organizations, representing the interests of >60 000 Australian scientists and technologists and promoting their views on a wide range of policy issues to government, industry, and the community.

Web: http://www.fasts.org/
Postal address: FASTS Office, L.P.O. Box 8283, ANU, Acton, ACT 2601, Australia
Fax: +61-2-6257 2897

Mutagenesis and Experimental Pathology Society of Australasia (MEPSA)

This society was formed in 1999 from the amalgamation of the Australia and New Zealand Environmental Mutagen Society (ANZEMS) and the Australasian Society for Experimental Pathology (ASEP).

Web: http://www.mepsa.org/
Postal address: A/Prof. Terry Piva, Hon. Secretary of MEPSA, School of Medical Sciences, RMIT University, Bundoora, VIC 3083, Australia
Phone: +61-3-9925 6503
Fax: +61-3-9925 7063
Email: terry.piva@rmit.edu.au

Pharmaceutical Society of Australia (PSA)

Professional organization for pharmacists in Australia.

Web: http://www.psa.org.au/
Postal address: PSA, P.O. Box 21, Curtin, ACT 2605, Australia
Phone: +61-2-6281 1366 or +61-2-6283 4777
Fax: +61-2-6285 2869
Email: psa.nat@psa.org.au

Royal Australian Chemical Institute (RACI)

The qualifying body for professional chemists and society promoting the science and practice of chemistry in Australia. It is the IUPAC affiliate for Australia, with toxicology-related activities in the Biomolecular Chemistry Division.

Web: http://www.raci.org.au/
Postal address: RACI, 21 Vale Street, North Melbourne, VIC 3051, Australia
Phone: +61-3-9328 2033
Fax: +61-3-9328 2670
Email: member@raci.org.au

Royal College of Pathologists of Australasia (RCPA)

This medical diagnostic organization promotes the science and practice of pathology.

Web: http://www.rcpa.edu.au/
Postal address: RCPA, Durham Hall, 207 Albion Street, Surry Hills, NSW 2010, Australia
Phone: +61-2-8356 5858
Fax: +61-2-8356 5828
Email: contact@rcpa.edu.au

Safety Institute of Australia (SIA)

A professional body of safety and health practitioners that also provides peer review/accreditation, and is a member of International Network of Safety & Health Practitioner Organizations.

Web: http://www.sia.org.au/
Postal address: SIA, P.O. Box 2078, Gladstone Park, VIC 3043, Australia
Phone: +61-3-8336 1993
Fax: +61-3-8336 1179

Society for Free Radical Research (Australasia) (SFRR Australasia)

This professional society includes scientists investigating free radical-mediated disease, oxidative stress, and apoptosis.

Web: http://www.sfrra.org/
Postal address: Clare Hawkins (SFRR Aust.), Heart Research Institute, 114 Pyrmont Bridge Road, Camperdown, NSW 2050, Australia
Phone: +61-2 8208 8900
Fax: +61-2 9565 5584
Email: hawkinsc@hri.org.au

Society of Environmental Toxicology and Chemistry (SETAC) Asia/Pacific

The local unit undertaking SETAC's activities, which involve multidisciplinary approaches to examine the impacts of chemicals and technology on the environment.

Web: http://www.setac.org/htdocs/who_guap.html
Postal address: Prof Mike McLaughlin, President of SETAC Asia Pacific,
CSIRO Land and Water/University of Adelaide, PMB 2, Glen Osmond SA 5064, Australia
Phone: +61-8-8303 8433
Fax: +61-8-8303 8572
Email: Mike.McLaughlin@csiro.au

Poison Control Centers

Poison Information Centres in Australia

List of Poison Information Centres in Australia, provided by Therapeutics Information Resources Australia P/L.

Web: http://ausdi.hcn.net.au/poisons.html

SAFETYvictoria

Authorized Victorian State Government site for safety and emergency information, providing links to poisons information, food poisoning and first aid.

Web: http://www.safety.vic.gov.au/
Postal address: SAFETYvictoria, Office of the Emergency Services Commissioner, 23/121 Exhibition St, GPO Box 4356QQ, Melbourne, VIC 3000, Australia
Phone: +61-3-8684 7933
Fax: +61-3-8684 7956

Victorian Poisons Information Centre

The Centre is located at the Royal Children's Hospital, Melbourne, and its role is to provide the Victorian public with a timely, safe information service in poisonings and suspected poisonings.

Web: http://www.rch.unimelb.edu.au/poisons/
Postal address: Victorian Poisons Information Centre, Royal Children's Hospital, Flemington Road, Parkville, VIC 3052, Australia
Fax: +61-3-9349 1261
Email: poison.centre@rch.org.au

Federal Government Legislation (State Government Legislation not Shown)

Agricultural and Veterinary Chemicals & Medicines

Relevant legislation for AgVet chemicals governing the APVMA (NRA).

Web: http://www.apvma.gov.au/about_us/legislat.shtml

Australian code of practice for the care and use of animals for scientific purposes

This code is provided by the NHMRC and defines the appropriate ethical procedures for animal experimentation in Australia (currently in 7th Edition, 2004).

Web: http://www.nhmrc.gov.au/publications/synopses/ea16syn.htm

Australian Commonwealth Law (ComLaw)

A web portal to all legislation, provided by the Attorney-General's Department, and incorporating the Federal Register of Legislative Instruments (FRLI). All items are progressively being migrated to ComLaw from the older database 'SCALEplus' (http://scaletext.law.gov.au/), which has not been updated since 2005.

Web: http://www.comlaw.gov.au/

Australian Therapeutic Goods Legislation

All TGA-related legislation setting out the requirements for inclusion of therapeutic goods in the Australian Register of Therapeutic Goods.

Web: http://www.tga.gov.au/legis/

Environment-related Legislation

Information and links to the legislation administered by the Australian Government Environment and Water Resources Portfolio.

Web: http://www.environment.gov.au/about/legislation.html

Food Safety Standards

The Food Standards Code for Australia.

Web: http://www.foodstandards.gov.au/thecode/foodsafetystandardsaustraliaonly/index.cfm

Health Legislation

A listing of legislation administered by the Minister for Health and Ageing.

Web: http://www.health.gov.au/internet/main/publishing.nsf/Content/health-eta2.htm

National statement on ethical conduct in human research

These guidelines are provided by the NHMRC and defines the appropriate ethical procedures for research in humans in Australia (March 2007 Edition).

Web: http://www.nhmrc.gov.au/publications/synopses/e72syn.htm

OHS National Standards and Codes of Practice

This main webpage links to the 'Index of National Standards Codes of Practice and related Guidance Notes', e.g. the 'National Standard for the Storage and Handling of Workplace Dangerous Goods' [NOHSC: 1015(2001)]. These National OHS standards and codes of practice are not legally enforceable unless State and Territory governments adopt them as regulation or codes of practice under their principal OHS Acts.

Web: http://www.ascc.gov.au/ascc/HealthSafety/OHSstandards/OHSstandardsandcodesofpractice.htm

Miscellaneous Resources

Chemical Detective

An educational program by the Deakin University's School of Biological & Chemical Sciences to encourage the study of molecular and physical science in regional secondary school students. Web: http://caligula.bcs.deakin.edu.au/bcs_courses/forensic/Chemical%20Detective/index.htm

CHAPTER

81

Brazil

CRISTIANA L. CORREA, MARIANA P. SOARES, AND FLAVIO A.D. ZAMBRONE

INTRODUCTION

In Brazil, concerns over poisoning date back to the end of the 19th century, when, between 1880 and 1903, a number of doctoral theses were written on occupational lead intoxication. In the late 1950s and early 1960s, the first papers in clinical toxicology appeared in the Brazilian literature. Two outstanding centers were established in the city of São Paulo, one at the Instituto Biológico (Biological Institute), represented by Dr. Waldemar Ferreira de Almeida, and another in the Hospital das Clínicas of the University of São Paulo, headed by Dr. Samuel Schvartsman; the first dedicated to pesticide intoxication and the second to toxicological emergencies.

Poison Control Centers were introduced in Brazil by Samuel Schvartsman and Eduardo Marcondes in 1963. About 1980, the Health Ministry established the Sistema Nacional de Informações Fármaco-Toxicológicas (SNIFT) (National Pharmaco-Toxicological Information System) co-ordinated and administered by Fundação Oswaldo Cruz (Oswaldo Cruz Foundation), with the objective of developing new regional poison control centers and supporting the existing ones by collecting and disseminating toxicological information.

One of the most important roots of Toxicology in Brazil, principally due to its Analytical Toxicology approach, was planted in the Faculdade de Ciências Farmacêuticas (FCF) (College of Pharmaceutical Sciences) at University of São Paulo by the renowned Professor Ester Camargo Fonseca Moraes, among others. In 1966, the effective establishment of a toxicology curriculum within a course of pharmaceutical sciences proved to be of paramount importance for the development of toxicology in Brazil.

Toxicology consolidated its leadership when in 1973 the first postgraduate course in the country dedicated to toxicology and toxicological analysis was established in a Master's degree program at the Universidade de São Paulo. A PhD doctoral program was established at the same institution in 1978.

One of the important milestones of toxicology in Brazil was the foundation of the Sociedade Brasileira de Toxicologia (Brazilian Society of Toxicology) in 1973. Today it has approximately 382 members and is instrumental in the profession's integration, creating a channel for discussion and setting forth topics related to this science, be it by organizing meetings, workshops, and congresses or by publishing and issuing magazines and newsletters dedicated to toxicology. An example of the activities of the society is the Congresso Brasileiro de Toxicologia (Brazilian Congress of Toxicology) that is held every 2 years and aims at promoting research in general toxicology and its sub-disciplines, emphasizing scientific knowledge and technological progress within an ethical framework. The most recent congress (XIV Congresso Brasileiro de Toxicologia) took place in 2005, with a registration of 725 participants, among them researchers, students, professors, professionals, and registration agents.

Today, professional toxicologists are able to pursue specialization through a number of graduate courses (specialized certificate, master and doctoral degree courses) offered at universities throughout the country. Interdisciplinary programs with representation

from areas related to healthcare are becoming increasingly common.

Despite the lack of estimates in the number of professionals who work with toxicology in Brazil, it is known that they perform functions in research institutes, forensic medical institutes, public and private institutes, governmental agencies, universities, companies rendering consulting services, laboratories, and others.

RESOURCES

Books

Azevedo FA (2003)
Toxicologia do Mercúrio (Mercury Toxicology)
S.I.: Rima Editora

This publication approaches several aspects of mercury toxicology and its biogeochemical cycle. The author presents the subject skillfully and purposefully, which makes this a reference work for discussion of queries regarding environment management. Besides these attributes, the historical approach concerning mercury is particularly enlightening.

Azevedo FA, Chasin AAM (2003)
Metais: Gerenciamento da Toxicidade (Metals: Toxicity Management)
S.I.: Editora Atheneu

Includes chapters on the main metals: 1. Aluminum, 2. Chrome, 3. Manganese, 4. Iron, 5. Nickel, 6. Copper, 7. Zinc, 8. Arsenic, 9. Selenium, 10. Cadmium, 11. Mercury, 12. Lead, 13. Metal Immunotoxicology, 14. Diagnosis and Treatment of Intoxications, 15. Risks to the Environment and Reported Accidents, 16. Management of Residues, 17. Analytical Aspects.

Azevedo FA, Chasin AAM (2004)
As Bases Toxicológicas da Ecotoxicologia (Toxicological Basis of Ecotoxicology)
S.I.: Rima Editora.

By discussing the basis of toxicology that sustains ecotoxicology, the topics presented in this work reflect, didactically and objectively, the support of toxicological knowledge, not only for the specific field of ecotoxicology, but also for environmental toxicology. The text focuses on the relationship between ecology and toxicology. In order to do so, a classical focus, attained through the presentation of fundamental topics of toxicology, enables the establishment of standard terminology and concepts in toxicology, and at the same time covers the rationale for its inclusion in ecological sciences. In this way, it encompasses the scope of ecotoxicology, the knowledge of which has become indispensable for the good practice of environment management.

Carlini EA, Mansur J (2004)
Drogas e Subsídios para uma Discussão (Drugs and Data for Discussion)
São Paulo: Brasiliense

This work opens a discussion on the issue of drugs of abuse, covering areas such as legalization, discriminalization, and consumption prohibition. Initially a series of arguments are listed with current pros and cons on liberation, but without discussing the merit of each statement. Having presented such arguments, the authors go on to discuss the possible effect of the main illicit drugs (cocaine, hemp, heroin, etc.) and compare them to the licit ones (alcohol, tobacco, etc.), suggesting the relative nature of legalization and prohibition in terms of the 'noxiousness' of the substances.

Graff S, Lopes AC (2006)
Fundamentos de Toxicologia Clínica (Principles of Clinical Toxicology)
São Paulo: Editora Atheneu

Principles of Clinical Toxicology, within the scope of the series 'Clínica Médica Ciência e Arte' (Internal Medicine Science and Art), presents the basic principles of toxicology, in a clear and simple form, focusing on important concepts whose knowledge will allow the treatment of a patient who is accidentally or otherwise poisoned.

Guimaraes MA, Mazaro R. (col.) (2004)
Princípios éticos e práticos do uso de animais de experimentação (Ethical and practical principles for the use of experimentation animals)
São Paulo: UNIFESP – Universidade Federal de São Paulo

This work presents information, in summarized and objective form, regarding the appropriate use of experimental animals in research. The principles discussed in this book provide those working with laboratory animals, a knowledge of the techniques used in their management by considering the well-being of the animals and the ethics involved in their care. The work also aims at strengthening the consciousness of the importance of the animal as a study subject, as well as offering guidance and assistance in the conduct of research, teaching or laboratory assays.

Larini L (1993)
Toxicologia, 2nd Edition (Toxicology)
São Paulo: Manole

The work offers an introduction to toxicology that allows the student or the professional to comprehend basic aspects of this science and, at the same time, presents guidance for solving problems that might appear during the activities involving human intoxications.

Larini L (1999)
Toxicologia dos Praguicidas (Toxicology of Pesticides)
São Paulo: Manole Ltda.

The work covers toxicological aspects involving the use of pesticides. It was written for students of pharmacy and biochemistry, medicine, veterinary medicine, and other related professionals.

Mendes R (Org.) (2003)
Patologia do Trabalho (Occupational Pathology)
Atualizada e Ampliada. São Paulo: Editora Atheneu

In its 2nd updated and extended edition, the treatise on occupational pathology consolidates its position achieved in the last decade as the most complete encyclopedia on occupational health produced in Brazil. The virtue and strength of this work lie in the consolidation of the thought and expertise of the most prominent Brazilian academic leaders in occupational health, along with the experience acquired by the professional work of occupational physicians, general physicians, epidemiologists, engineers, toxicologists, hygienists, ergonomists, and many others, who are renowned and respected throughout Brazil and abroad.

Michel OD (2000)
Toxicologia Ocupacional (Occupational Toxicology)
Rio de Janeiro: Revinter.

Concerns to avoid the development of diseases due to exposure of individuals to chemical agents in the workplace lead to the undertaking of preventive measures. The latter are the basis of biological monitoring which consists in determining if the concentration of these agents or their metabolites in workers is within levels established by governmental agencies or the scientific community.

Midio AF (1992)
Glossário de Toxicologia: com versão em Inglês e Espanhol (Glossary of Toxicology)
São Paulo: Roca

Aiming at facilitating dynamic, more comprehensible, homogeneous, and credible communication, terms and concepts that are used in toxicology were compiled and adapted from dozens of foreign publications to compose this Glossary. Nevertheless, this should be considered a core rather than a comprehensive compilation of terms in toxicology.

Midio FA, Martins DI (2000)
Toxicologia de Alimentos (Food Toxicology)
São Paulo: Livraria Varela

This book has the objective of introducing basic concepts associated with food toxicology and safety conditions for food ingestion, expecting that other sources of information will extend knowledge in this area.

Midio AF, Silva ES (1995)
Inseticidas-Acaricidas: Organofosforados e Carbamatos (Insecticides-Acaricides: Organophophate and Carbamate)
São Paulo: Roca

This publication aims at presenting in a comprehensible manner, options of analytical methodology that are applicable to the control of occupational exposure to insecticides–acaricides of the organophosphate and carbamate groups.

Moreira AHP, Caldas LQA (2001)
Intoxicações Agudas: Bases do Diagnóstico Clínico-Laboratorial de Urgência (Acute Intoxication)
Rio de Janeiro:Editora Revinter Ltda.

This work presents the most important aspects of diagnosis and the main steps of toxicological therapy. Moreover, there is an extensive description of toxicological analysis methods, many of which can be considered classical. The methods are rapid and simple. Most of them can be carried out in the emergency room without the need of expensive equipment or extensive academic knowledge.

Mezadri TJ, Tomaz VA, Amaral VLL (2004)
Animais de Laboratório: Cuidados na iniciação experimental (Laboratory Animals: Concerns in Experimental Initiation)
Florianópolis: Editora UFSC

This manual was written for professors, researchers, students, and laboratory technicians who work in the Biological and Health Sciences area regarding the basis of fundamental procedures in the management, biosafety, clarification of legal rules, and ethical guidance, aiming at the well-being of the animal and protection of laboratory personnel.

Oga S (2008)
Fundamentos de Toxicologia, 3rd Edition (Principles of Toxicology)
São Paulo: Atheneu

The present book was realized by a group of professors of Faculdade de Ciências Farmacêuticas (College of Pharmaceutical Sciences) of the University of São Paulo and has as its basic objective to contribute to the

teaching of toxicology. Thus, pertinent and state-of-the-art themes are approached in a succinct fashion, and presented in the same sequence as is taught in most of the pharmacy colleges in Brazil.

Pires RC (2005)
Toxicologia Veterinária: Guia Prático para Clínico de pequenos animais (Veterinary Toxicology: Practical Guide for Small Animal Veterinarians)
S.I.: Editora Paidéia

This work is a practical guide for veterinarians specializing in small animals. It presents general treatment for intoxications, toxic plants, poisonous animals, pesticides, metals, food, and drugs. It further discusses mechanisms of action, signs, diagnosis, and treatment with dose prescriptions.

Ribeiro LR, Salvadori DMF, Marques EK (2003)
Mutagênese Ambiental (Environmental Mutagenesis)
Canoas: ULBRA

This book focuses on the importance of mutagenesis in the carcinogenesis process. The criteria used to select the tests described in the book were: mutagenicity tests that can be used as indicators of potential carcinogenicity to mammals, assays that are part of the minimum required battery of tests suggested for the registration of chemical products and, finally, some tests, that in spite of not fulfilling the aforementioned criteria, can be easily performed in Brazilian laboratories.

Schvartsman S (1991)
Intoxicações agudas, 4th Edition (Acute Intoxications)
São Paulo: Sarvie

Despite the title – Acute Intoxications – this book also presents several aspects concerning chronic exposure, due to the frequency and importance of this type of exposure. For the same reason, although the book focuses basically on childhood intoxication, there are also some commentaries about adult problems. There are references to some medications and processes that are rarely available in our area. Considering that this is not a pharmacology or clinical therapy publication, discussions about side effects were avoided.

Schvartsman S, Almeida WF (1989)
Tratamento das Intoxicações Agudas, 4th Edition (Treatment of Acute Intoxications)
São Paulo: Associação Nacional de Defensivos Agrícolas

This book aims at attaining the objective of giving simple and quick information on the handling of toxic accidents. The potentially toxic agents are listed in alphabetical order to facilitate navigation through the text. It often refers the reader to another intoxication type for which the treatment is similar, but not necessarily identical. The objective is to stabilize the patient while detailed information is sought elsewhere.

Seibel SD, Toscano Junior A (2001)
Dependência de Drogas (Drug Addiction)
São Paulo: Editora Atheneu

This work presents a broad overview of the drug addiction problem. It discusses the most recent information on the subject and demonstrates that Brazil has an expert body of researchers/scholars in this subject. Two editors have compiled the work of 56 authors.

Spinosa HS, Gorniak SL, Palermo Neto J (2008)
Toxicologia aplicada à Medicina Veterinária (Applied Toxicology to Veterinary Toxicology)
São Paulo: Editora Manole

This book focuses on the importance of toxicology applied to veterinary medicine, since it offers essential information about relevant toxic agents that can affect animals in general. It was made for students and professionals of the veterinary area, helping them to be updated and well prepared for their daily work.

CHAPTER

82

Canada

BARIL MARC, BLAIN JACQUES, AND LAJOIE ALAIN

INTRODUCTION

Canada has a very long history of scientific activity related to toxicology. In the 1960s, Health and Welfare Canada had several laboratories dedicated to this new field of science. In the early 1970s, the Medical Council of Canada (http://www.mcc.ca/english/news/index.html) offered some specific grants to support universities starting initiatives in toxicology. Nearly 40 years later, as it is clearly evident in this chapter, toxicology has literally exploded in Canada. From its origins in pharmacology, toxicology has since influenced many spheres of knowledge. From forensic science to emergency response, environmental science to occupational health and safety, modern techniques such as PBPK (physiological-based pharmacokinetic) modeling, and sophisticated online Internet databases, the science of toxicology is now a firmly established component in the Canadian science arena. For its part, the Society of Toxicology of Canada has been very proactive over the years. Annual congress, grants for graduate student, and newsletters help to keep a network of Canadian toxicologists very active in their specialized fields of interest. The following information resources lists some major books, journals, research articles and other relevant toxicology resources from Canada.

RESOURCES

Original Research Articles in Toxicology

Many Canadian authors routinely submit their original research articles in toxicology to international publications, particularly the official journals of the U.S. Society of Toxicology. In addition, review articles and book chapters frequently appear in books that are edited and published in the United States. Consequently, readers are referred to the detailed descriptions of books and journals that appear in the appropriate section of this text dealing with the United States, because these frequently contain articles of Canadian origin.

In addition, there are some Canadian journals that describe original research in toxicology even if it is not their main topic. For example, there is a pharmacology and toxicology section in the *Canadian Journal of Physiology and Pharmacology*, and articles concerned with environmental toxicology are routinely published in the *Canadian Fisheries Journal*. Other relevant public health articles are published in the *Canadian Journal of Public Health*.

Journals

Canadian Journal of Fisheries and Aquatic Sciences
ISSN: 0706-652X 1205-7533
Web: http://pubs.nrc-cnrc.gc.ca/cgi-bin/rp/rp2_desc_e?cjfas

Published continuously since 1901 (under various titles), this monthly journal is the primary publishing vehicle for the multidisciplinary field of aquatic sciences.

Canadian Journal of Forest Research
ISSN: 0045-5067 1208-6037
Web: http://pubs.nrc-cnrc.gc.ca/cgi-bin/rp/rp2_desc_e?cjfr

Published since 1971, this monthly journal features articles, reviews, notes, and commentaries on all aspects of forest science, contributed by internationally respected scientists. It also publishes special issues dedicated to a topic of current interest.

Canadian Journal of Physiology and Pharmacology
ISSN: 0008-4212 1205-7541
Web: http://pubs.nrc-cnrc.gc.ca/cgi-bin/rp/rp2_desc_e?cjpp

Published since 1929, this monthly journal is affiliated with the Canadian Physiological Society, the Pharmacological Society of Canada, the Canadian Society for Nutritional Sciences, and the Society of Toxicology of Canada. It reports current research in all aspects of physiology, nutrition, pharmacology, and toxicology. It publishes symposium reviews and award lectures, and on occasion dedicates entire issues (or portions thereof) to subjects of special interest to its international.

Canadian Journal of Public Health
ISSN: 0008-4263
Web: http://www.cpha.ca/english/cjph/cjph.htm

The *Canadian Journal of Public Health* is a professional journal which carries a wide variety of in-depth articles on all aspects of public health. The editorial is peer-reviewed, and the editorial board is made up of public health experts from across Canada.

Canadian Journal of Soil Science
ISSN: 0008-4271
Web: http://pubs.nrc-cnrc.gc.ca/aic-journals/cjss.html

Research is published in a number of topic sections: Agrometeorology, Ecology, Biological processes and plant interactions, Composition and chemical processes, Physical processes and interfaces, Genesis, landscape processes and relationships, Contamination and environmental stewardship, Management for agricultural, forestry and urban uses.

Canadian Water Resources Journal
ISSN: 0701-1784

The Canadian Water Resources Association recognizes the need to provide a Canadian-oriented publication in which authors can present their views on a broad range of water resource-related topics. The *Canadian Water Resources Journal* accepts manuscripts in English or French and publishes abstracts in both official languages. In general, preference is given to manuscripts focusing on information and policy aspects of Canadian water management.

Environmental Health

The following publications (Southam Information and Technology Group) deal primarily with environmental health and the impact of toxic substances on the environment. Some also discuss the regulatory aspects of toxic substances. *Ecolog Canadian Pollution Legislation* contains environmental pollution legislation of both the federal and provincial governments. A weekly report on waste management and industrial pollution control is also available.

Environmental Compliance Report is a supplement to *Ecolog Canadian Pollution Legislation.* This monthly publication discusses legislative changes, regulatory amendments, and recent cases.

Environmental Reviews
ISSN: 1208-6053
Web: http://pubs.nrc-cnrc.gc.ca/cgi-bin/rp/rp2_desc_e?er

Published since 1993, this annual journal presents authoritative reviews on a wide range of environmental science and associated environmental studies topics, with emphasis on the effects on and response of both natural and manmade ecosystems to anthropogenic stress.

Occupational Health and Safety

Information which pertains to occupational health and safety with emphasis on hazardous exposures is primarily published by the Southham Magazine and Information Group (1450 Don Mills Rd., ON M3B 2 × 7): *Occupational Health and Safety Canada* (published six times per year) and *Canadian Occupational Health and Safety News* (a weekly report) – evaluates employee exposure and indoor air quality. In addition, *Workplace: Environmental Health and Safety*, published by Templegate Information Services (Toronto), reports on regulations, standards, and guidelines pertaining to occupational health.

STC – Newsletter

S.T.C. News is an official newsletter of the Society of Toxicology of Canada (P.O. Box 517, Beaconsfield, QC H9W 5V1).

Comments: *CNTC News* is produced by the Canadian Network of Toxicology Centres (Bovey Bldg., Gordon St., Guelph, ON N1G 2W1).

Web: http://www.stcweb.ca/newsletter_e.htm

Computerized Information Resources

With the Internet readily available in Canada, the number of publicly accessible databases containing some type of toxicological information has mushroomed in the last decade. The following table gives a broad picture of such digital resources. Information presented below was extracted from the Health Canada inventory database at http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/.

Some of the databases, especially those maintained by governmental organizations, are also accessible by searching for the organization on the web.

Air Data and Management System (ADaMS)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/airdataBC_e.html

Comments: Organization maintaining the database:

Water, Air Monitoring and Reporting Branch BC Ministry of Water, Land and Air Protection

Purpose of database: To store data on hourly average concentrations of major air pollutants in British Columbia, as well as meteorological data.

Air Quality and Meteorological Database (Northwest Territories)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/airqualityNT_e.html

Comments: Organization maintaining the database:

Environmental Protection Service, Dept of Resources, Wildlife and Economic Development, Government of NWT

Purpose of database: To store ambient air quality data and meteorological data for the Northwest Territories.

Air Quality Information System (AQUIS)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/airqualityON_e.html

Comments: Organization maintaining the database:

Water, Air Monitoring and Reporting Branch BC Ministry of Water, Land and Air Protection

Purpose of database: To store data on hourly average concentrations of major air pollutants in British Columbia, as well as meteorological data.

Arctic Contaminants Database (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/arcticdb_e.html

Comments: Organization maintaining the database:

Organizational Unit Toxic Substances Division, Environmental Contaminants Bureau, Safe Environments Programme, HECS Branch, Health Canada

Purpose of database: To monitor tissue (blood, breast milk) levels of environmental contaminants in Arctic populations.

Asbestos Workers Registry (Ontario)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/asbestON_e.html

Comments: Organization maintaining the database:

Occupational Health and Safety Branch Ontario Ministry of Labor

Purpose of database: To collect and store data on hours of Ontario worker exposure to asbestos. Number of data records: 24 000.

Banque de Données Commune (BDC) (Québec)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/communitydb_f.html

Comments: Organization maintaining the database:

Vice-presidence Finances, Direction de la statistique et de l'information de gestion, Service de l'évolution et du fonctionnement des systèmes d'information, CSST

Purpose of database: To house strategic and tactical information for statistical, actuarial, and accounting purposes; as well as client profiles and managerial information related to Quebec workers compensation. There are approximately 515 618 185 records in the database.

Canadian Breast Cancer Screening Database (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/breastcancer_e.html

Comments: Organization maintaining the database:

Health Canada

Purpose of database: Data are collected and analyzed to monitor and evaluate the performance of breast cancer screening in organized programs.

Canadian Childhood Cancer Surveillance and Control Program – Economic Impact Study (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/childhoodcancer_e.html

Comments: Organization maintaining the database:

Health Canada

Purpose of database: Information is gathered to assess the economic impact of childhood cancer.

Canadian Childhood Cancer Surveillance and Control Program – Etiology Surveillance System (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/etiology_e.html

Comments: Organization maintaining the database:

Health Canada

Purpose of database: Data are collected and analyzed to investigate factors, which may increase the risk of children developing cancer, using a case-control design.

Canadian Community Health Survey (CCHS) (Statistics Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/cchs_e.html

Comments: Organization maintaining the database:

Statistics Canada

Purpose of database: To track and monitor legal and illicit drug use among the general Canadian population aged 12 years and older.

Canadian Hospitals Injury Reporting and Prevention Program (CHIRPP)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/chirpp_e.html

Comments: Organization maintaining the database:

There is a network of 15 CHIRPP centers across Canada which contribute data to this national database. The IWK Grace Health Centre is one of these 15 centers.

Purpose of database: For surveillance of childhood injuries across Canada, and specifically within Nova Scotia.

Canadian Pollution Prevention Information Clearinghouse (CPPIC)
Web: http://www.ec.gc.ca/nopp/docs/fact/en/cppic.cfm

Comments: The Canadian Pollution Prevention Information Clearinghouse (CPPIC), an online database and comprehensive resource provides Canadians with the information they need to put pollution prevention (P2) into practice.

Cancer Case Surveillance System (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/cancercase_e.html

Comments: Organization maintaining the database: Health Canada

Purpose of database: The goal of this surveillance program, which collects information from a variety of databases, is to provide timely, reliable cancer statistics for use in publications and to respond to information requests; to monitor national cancer incidence, prevalence and mortality, using temporal geographic and high-risk population information, survival analysis, and projections; and to establish a nationwide and world class population-based cancer surveillance network.

CCOHS. Web Information Services
Web: http://ccinfoweb.ccohs.ca/about.html

Comments: The center Web Information Services provide simple, one-step searching across all OHS database collections.

Central Information System (CIS) (Occupational Health, Newfoundland)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/cis_e.html

Comments: Organization maintaining the database:

Occupational Health and Safety Division, Newfoundland Department of Labor.

Purpose of database: To track all inspections activity of occupational and health safety officers in Newfoundland and Labrador.

Chemical Health Hazard Assessment Tracking System (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/chemicalhazard_e.html

Comments: Organization maintaining the database:

Chemical Health Hazard Assessment Division Bureau of Chemical Safety Food Directorate Health Products and Foods Branch Health Canada

Purpose of database: CHHAD uses internal submission/risk assessment tracking systems to retrieve past assessments and files on specific compounds; Content National and provincial data on food contaminants.

Chronic Respiratory Surveillance System (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/respiratory_e.html

Comments: Organization maintaining the database: Health Canada

Purpose of database: Information gathered, on a one-time basis, facilitates the monitoring, analysis and interpretation of chronic respiratory mortality and hospitalization trends in Canada,

Compensation Assessment and Accident Prevention System (CAAPS) (Northwest Territories)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/caaps_e.html

Comments: Organization maintaining the database:

CGI, Edmonton Office (current outsourcer) David Hiscock, Service Manager, Technical Support 10303 Jasper Ave, Suite 800 Edmonton, Alberta T5J 3N6 Tel: (780)-409-2200 E-mail: david.hiscock@cgi.com

Purpose of database: The database is used to collect and store workers compensation claims data and employer assessment information.

Comprehensive Record and Information System for Pesticides (CRISP) (British Columbia)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/crisp_e.html

Comments: Organization maintaining the database:

British Columbia Ministry of Water, Land & Air Protection

Purpose of database: To track the use of pesticides in British Columbia.

Connaissance et Surveillance de la Qualité de l'Air (CESPA)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/cespa_e.html

Comments: Organization maintaining the database:

Service de l'information sur le milieu atmosphérique (SIMAT), Direction du suivi de l'état de l'environnement (DSÉE), Ministère de l'environnement du Québec (MENV)

Purpose of database: To increase the knowledge on ambient air quality and

to facilitate surveillance in this area, at the national, provincial, and local/municipal levels.

Drinking Water Information Management System (DWIMS) (Ontario)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/dwims_e.html

Comments: Organization maintaining the database:

Drinking Water Surveillance Program, and the Systems Group of the Environmental Monitoring and Reporting Branch, Ontario Ministry of the Environment

Purpose of database: To collect and store drinking water quality data to support standards development in the Drinking Water Surveillance Program (DWSP) and for audit water samples collected when MOE inspects municipal waterworks in Ontario; to define contaminant levels and trends; to assess emerging contaminants; and to monitor the efficiency of water treatment processes.

Drinking Water Quality Database (Nunavut)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/waterqualityNU_e.html

Comments: Organization maintaining the database:

Departmental Systems Coordinator Dept of Health and Social Services Government of Nunavut

Purpose of database: To record and store data on parameters of bacteriological quality of drinking water in Nunavut.

Drinking Water Web System (DWWS) (Ontario)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/dwws_e.html

Comments: Organization maintaining the database:

IMTB/CMD, Ontario Ministry of the Environment. The DWWS is a standalone system which has been managed from a business perspective in the Laboratory Services Branch. Effective June 1, 2003, the DWWS will be part of a much larger database handled by the Ministry's Information Management and Technology Branch (IMTB; contact: Wilson Soon – see above).

Purpose of database: To store data on drinking water sample test results in order to monitor Ontario drinking water quality.

Eco-Log Occupational Health and Safety Legislative Database
Web: http://www.businessinformationgroup.ca/oh&s/oh&sdatabase.asp

Enteric Disease Surveillance System (EDSS) (Health Canada)

Comments: Sponsoring organization: Health Canada

Purpose of database: To collect and disseminates laboratory-based weekly acute surveillance data on enteric foodborne organisms causing human disease, in an effort to identify and reduce risk factors and to enable early intervention.

Environment Integrated System (EnvI) (New Brunswick)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/envi_e.html

Comments: Organization maintaining the database:

Information Management Services (IMS) Branch New Brunswick Dept of Environment & Local Government

Purpose of database: This operational data warehouse stores New Brunswick water quality data for monitoring purposes, as well as industrial certificate-of-approval documents.

Environmental Cancer Risk Surveillance System (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/cancerrisk_e.html

Comments: Organization maintaining the database: Health Canada

Purpose of database: Stores data used to assess the risk of cancer from environment-related factors, and monitors known environmental risk factors.

Environmental Data Management System (EDMS) (Manitoba)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/edms_e.html

Comments: Organization maintaining the database:

Manitoba Conservation (Air Quality Section)

Purpose of database: To compile ambient air quality data from air monitoring stations in Manitoba and to generate summary statistics based on these data.

Environmental Data Store (EDS) (Ontario)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/eds_e.html

Comments: Organization maintaining the database:

Environmental Sciences and Standards Science Division, Environmental Monitoring and Reporting Branch, Ontario Ministry of the Environment

Purpose of database: Serves as a repository for all data on surface water sample analyses done by the Ontario Ministry of the Environment, including surface water monitoring data.

Environmental Monitoring Company (EMC) System Manager Central Data Management System (Manitoba)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/emc_e.html

Comments: Purpose of database: To compile ambient air quality data from air monitoring stations in Manitoba and to generate summary statistics based on these data.

Environmental Monitoring Inventory Database (EMI) (Environment Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/emi_e.html

Comments: Organization maintaining the database: Environment Canada

Purpose of database: The goal is to create an inventory of all the environmental monitoring activities conducted by Environment Canada in order to generally improve the management of toxic substances by the federal government.

Environmental Monitoring System (EMS) (British Columbia)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/ems_e.html

Comments: Purpose of database: To capture data covering physical/chemical and biological analyses performed on water, air, solid waste discharges and ambient monitoring sites throughout the province.

Equipment Registration Database (Newfoundland)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/equipment_e.html

Comments: Organization maintaining the database:

Workplace Health and Safety, Occupational Health and Safety, Newfoundland Department of Labor

Purpose of Database: Serves as an in-house registration and tracking system for radiation equipment.

Fichier des Tumeurs du Québec (J65)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/fichier_e.html

Comments: Organization maintaining the database:

Direction générale de la santé publique, Ministère de la Santé et des Services Sociaux (MSSS)

Purpose of database: The database is a centralized system used to collect data on all new cancer cases reported annually in the province of Québec. The data are used for cancer surveillance, program evaluation, and epidemiologic research.

Global Public Health Intelligence Network (GPHIN) (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/gphin_e.html

Comments: Organization maintaining the database: Health Canada

Purpose of database: Intended to provide 24-hour-per-day, 7-days-a-week monitoring of global infectious disease outbreaks and natural disasters in terms of the details of outbreak events. The goal is to identify potential international health risks and to provide an early warning to programs and public health clients (e.g., the World Health Organization) who assess and manage risk.

Great Lakes Wildlife Toxicology Database
Web: http://www.on.ec.ca/search/metadata.cfm?ID=116&Lang=e

Contains toxicology data for 3000 samples from 11 tissues from 16 species of wildlife collected from 157 sites in the Great Lakes Basin during 1970–1994. Contaminant levels for 5 metals, 26 organochlorine compounds, 7 dioxin congeners, 13 furan congeners, and 42 PCB congeners.

Hedgehog Environmental Systems
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/hedgehog_e.html

Comments: Organization maintaining the database: Health Canada

Purpose of database: The Hedgehog Environmental System provides a single centralized source of integrated data for the critical functions required by public health inspectors and environmental health officers.

International Circumpolar Surveillance (ICS) Database (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/ics_e.html

Comments: Organization maintaining the database: Health Canada

Purpose of database: The aim is to gather data which will lead to a better understanding of the epidemiology of infectious diseases in northern Aboriginal populations in order to improve prevention and control programs. Enables the assessment of the burden of illness and identification of risk factors related to invasive pneumococcal diseases among aboriginal peoples.

Intoxications (Poisonings Database, Québec)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/intoxications_e.html

Comments: Organization maintaining the database:

Direction de la Toxicologie Humaine, Institut National de Santé Publique du Québec

Purpose of database: The database records and stores data on all poisoning-related calls to the Centre Anti-Poison du Québec (CAPQ).

Inventaire des Émissions Atmosphériques (INVSRC) (Inventory of Atmospheric Emissions, Québec)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/invsrc_e.html

Comments: Organization maintaining the database:

Atmospheric Quality Service (Service de la qualité de l'atmosphère), Québec Ministry of the Environment

Purpose of database: To store inventory data on atmospheric emissions of a variety of airborne contaminants.

Leak Test Sampling Database (British Columbia)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/leak_e.html

Comments: Organization maintaining the database:

Radiation Protection Services, British Columbia Centre for Disease Control

Purpose of database: To record certain environmental radiation and Leak Test results for the province of British Columbia. Content Data on soil contaminants, ionizing radiation, and nuclear submarine environmental samples.

Links Database of OHS Division Activities (Saskatchewan)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/links_e.html

Comments: Organization maintaining the database:

Research Officer, Occupational Health and Safety Division, Saskatchewan Labor

Purpose of database: To identify and analyze trends in occupational injuries and illnesses in Saskatchewan to better target activities in the Occupational Health and Safety Division.

Lotus Notes R5 Database (British Columbia)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/lotus_e.html

Comments: Organization maintaining the database:

Health Space Solutions – Hope, British Columbia, Vancouver Island Health Authority, Health Protection and Environmental Services Software Application, Vancouver Island Health Authority (John Harper is the software coordinator and analyst)

Purpose of database: To collect and store data on environmental inspections and permit approvals.

Medico-Environmental Surveillance of Workers' Health, Québec)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/smest_e.html

Comments: Organization maintaining the database:

Direction des technologies de l'information, Direction de la protection de la santé publique, Ministère de la Santé et des Services Sociaux (Québec)

Purpose of database: The database is an occupational health information system which captures data gathered by the occupational health teams of CLSC and the Régies Régionales from the establishments (e.g., industrial) within their respective regions as part of provincial programs or health programs specific to these establishments.

Merged Information System (MIS) (Ontario)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/mis_e.html

Comments: Organization maintaining the database:

Information and Administrative Services Occupational Health and Safety Branch Ontario Ministry of Labor

Purpose of database: The database serves as a repository for occupational health and safety data on projects, organizations, events, field visits conducted, and orders issued. Used for sector planning and evaluation.

Mine Medical X-Ray Database (Yukon)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/mine_e.html

Comments: Organization maintaining the database:

Inspections and Compliance Unit, Yukon Workers' Compensation Health and Safety Board

Purpose of database: The database organizes and houses annual X-ray and medical files of miners exposed to silica in Yukon mines.

Municipal Information Management System (MIMS) (Newfoundland)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/mims_e.html

Comments: Organization maintaining the database:

Information Technology Division, Department of Municipal and Provincial Affairs

Purpose of database: To store drinking water quality data relating to Newfoundland's local/municipal public water supplies.

Municipal Wastewater Database (New Brunswick)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/wastewater_e.html

Comments: Organization maintaining the database:

Environmental Management Division, Stewardship Branch, New Brunswick Dept of the Environment and Local Government

Purpose of database: To collect and store wastewater data for internal records/analysis.

National Contaminants Information System (NCIS)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/ncis_e.html

Comments: Organization maintaining the database: Fisheries and Oceans Canada

Purpose of database: Secures data on waterborne contaminants for Fisheries and Oceans Canada, in support of the Fisheries Act, the Oceans Act and the Canadian Environmental Assessment Agency.

National Dose Registry (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/nds_e.html

Comments: Organization maintaining the database:

There is a network of 15 CHIRPP centers across Canada, which contributes data to this national database. The IWK Grace Health Centre is one of these 15 centers.

Purpose of database: For surveillance of childhood injuries across Canada, and specifically within Nova Scotia. Content Provincial and national data on childhood injuries.

National Enteric Surveillance Program (NESP) (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/nesp_e.html

Comments: Organization maintaining the database: Health Canada

Purpose of database: The collection, collation, and dissemination of laboratory-based surveillance data on enteric pathogens causing human disease provide a timely national view of enteric pathogens in Canada.

National Environmental Monitoring of Radionuclides (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/radionuclides_e.html

Comments: Organization maintaining the database:

National Monitoring Section Environmental Radiation Hazards Division Safe Environments Programme HECS Branch, Health Canada

Purpose of database: To record and maintain data on radionuclide in environmental and food samples from across the country.

National Pollutant Release Inventory (NPRI) (Environment Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/npri_e.html

Comments: Purpose of database: The NPRI database is the only legislated, nationwide, publicly accessible inventory of its kind in Canada. Its main objective is to provide Canadians with access to pollutant release information from facilities located in their communities.

National Population Health Survey (NPHS) Asthma Supplement 1996–97 (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/nphs_e.html

Comments: Organization maintaining the database:

The data are the property of Statistics Canada, but the Centre for Chronic Disease Prevention and Control, Health Canada, maintains a copy.

Purpose of database: Survey data are used to monitor the prevalence of asthma nationwide (all provinces), and to provide information on severity of asthma, associated risk factors, and management and treatment practices.

National Surveillance for Enteric Pathogens from Food and Animals – Guelph Laboratory (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/pathogens_e.html

Comments: Purpose of database: To monitor trends in the sources and characteristics of enteric pathogens (including antimicrobial resistance) isolated from food and animal sources, as an aid in determining risk factors for human illness.

Occupational Exposure Database Management (OEDM) (Ontario)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/oedm_e.html

Comments: Organization maintaining the database:

Information and Administrative Services Occupational Health and Safety Branch Ontario Ministry of Labor

Purpose of database: The sampling results associated with work environment exposure to various airborne hazards in the OEDM database are used in the analysis of work exposure to specific hazards as well as in providing information for regulatory changes.

Occupational Health and Safety Client-Generated Activities Database (Newfoundland)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/client_e.html

Comments: Organization maintaining the database:

Occupational Health and Safety Division, Newfoundland Department of Labor

Purpose of database: To keep records of all client-driven assignments from and initial contact by occupational health and safety officers in Newfoundland and Labrador.

OnAIR Database (Ontario)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/onair_e.html

Comments: Organization maintaining the database:

Environmental Sciences and Standards Science Division, the Database Environmental Monitoring and Reporting Branch, Ontario Ministry of the Environment

Purpose of database: OnAIR is Ontario's industrial, commercial, institutional, and municipal air emissions registry. OnAIR gives the public immediate access to information about what emissions are being released into the air and by whom.

Oracle Research Database of WCB Claims (Oracle WCB) (Saskatchewan)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/oracle_e.html

Comments: Organization maintaining the database:

Performance Management Coordinator of the Occupational Health and Safety Division (OHSD), Saskatchewan Labor

Purpose of database: To identify and analyze trends in occupational injuries and illnesses in Saskatchewan to better target Occupational Health and Safety Division activities.

Pesticide Product Information System (PEPSIS) (Ontario)
Web: http://app.ene.gov.on.ca/pepsis/

Organization maintaining the database:

Ontario Pesticides Advisory Committee (OPAC)

Purpose of database: To provide a listing of pesticides classified for use in Ontario.

Physician Asthma Management Survey (PAMS) (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/pams_e.html

Comments: Organization maintaining the database:

Centre for Chronic Disease Prevention and Control, Health Canada

Purpose of database: To understand physician asthma management practices in Canada.

Prairie Livestock and Environment Database
Web: http://web2.gov.mb.ca/agriculture/pled/

Prevention Services Information System (PSIS) (WCB of the Northwest Territories and Nunavut)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/psis_e.html

Comments: Purpose of the database: To collect and store NWT and Nunavut information on occupational health and safety inspections, investigations and certifications (for inspection purposes).

Product Safety Information System (PSIS)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/productpsis_e.html

Comments: Organization maintaining the database:

National Compliance and Information Systems Division Consumer Product Safety Bureau Product Safety Programme Healthy Environments and Consumer Safety Branch Health Canada

Purpose of database: This national database is a health surveillance system.

Radiation Exposure Report Database (Newfoundland)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/radiation_e.html

Comments: Organization maintaining the database:

Workplace Health and Safety, Occupational Health and Safety, Newfoundland Department of Labor

Purpose of database: The database is a tracking system to monitor individual occupational radiation exposure; and to evaluate trends in radiation exposure, dose history, and dose management.

RATL: A Database of Reptile and Amphibian Toxicology Literature
Pauli BD, Perrault JA, Money SL
National Wildlife Research Centre 2000
Canadian Wildlife Service
Environmental Conservation Branch
Technical Report Series Number 357
Web: http://dsp-psd.communication.gc.ca/Collection/CW69-5-357E.pdf

Rapid Risk Factor Surveillance System (RRFSS) (Ontario)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/rrfss_e.html

Comments: Organization maintaining the database:

A consortium of 20 health units in Ontario forms the RRFSS Working Group.

Purpose of database: The information in the database is used to assist with

program planning and evaluation (i.e., to prioritize health issues, direct operational plans, measure effectiveness of strategies, and monitor progress towards program goals and objectives); and for advocacy or to influence local interests; and to monitor trends over time.

Saskatchewan Environment's Environmental Management System (SEEMS)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/seems_e.html

Comments: Organization maintaining the database:

Environmental Information Section, Environmental Protection Branch, Saskatchewan Environment

Purpose of database: To manage provincial drinking water quality data and information.

Spatial Data Warehouse (SDW) (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/sdw_e.html

Comments: Purpose of database: The Geographic Information System (GIS) infrastructure developed by Health Canada's Centre for Surveillance Coordination (CSC) supports the spatial information needs of CSC projects, epidemiologists, regional surveillance and public health programs, etc.

Special Waste Information System (SWIS) (British Columbia)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/swis_e.html

Comments: Organization maintaining the database:

BC Ministry of Water, Land and Air Protection

Purpose of database: To track the generation & transport of special waste.

Spills Database (Nunavut)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/spills_e.html

Comments: Organization maintaining the database:

Environmental Protection Service, Department of Sustainable Development, Government of Nunavut

Purpose of database: To monitor all spills of hazardous materials in Nunavut and the Northwest Territories.

Sport Fish Contaminant Monitoring Program Database (FISHBASE) (Ontario)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/fishbase_e.html

Comments: Organization maintaining the database:

Biomonitoring Section Sport Fish Contaminant Monitoring Program Environmental Monitoring and Reporting Branch Ontario Ministry of the Environment

Purpose of database: To store data used to develop sport fish consumption advisories, which are published in the Guide to Eating Ontario Sport Fish.

Système de Surveillance Épidémiologique sur les Maladies à Déclarations Obligatoires (MADO) (Epidemiological Surveillance System)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/mado_e.html

Comments: Organization maintaining the database:

Ministère de la Santé et des Services Sociaux (MSSS), Québec

Purpose of database: To store Québec public health network data on diseases subject to mandatory reporting (i.e., notifiable diseases) for the purpose of tracking and documenting the progress of these diseases.

Système Informatisé Eau-Potable (LCH) (Drinking Water Information System, Québec)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/lch_e.html

Comments: Organization maintaining the database:

Direction des ressources informationnelles (Information Resources Directorate), Ministère de l'Environnement du Québec

Purpose of database: To monitor drinking water quality, specifically in distribution networks (Aqueduc) in Québec regions, localities, and municipalities.

Toxin (Toxin Database, Québec)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/toxin_e.html

Comments: Organization maintaining the database:

Québec Anti-Poison Centre (Le centre Anti-poison du Québec (CAPQ),

Institut national de santé publique du Québec (INSPQ)

Purpose of database: To capture data on incidents of poisoning reported to the CAPQ; and to store and provide information on interventions and on health resources (e.g., treatment guides) available in Québec.

Water Quality Database (Newfoundland)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/water_e.html

Comments: Organization maintaining the database:

Water Resources Management Division Newfoundland Department of the Environment

Purpose of database: Collects and stores data that archives provincial (Newfoundland) laboratory testing results.

Watertrax (British Columbia)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/watertrax_e.html

Comments: Organization maintaining the database:

Internet-based service provider is Watertrax Inc. Phone: (604) 691-1744; Email: rong@watertrax.com

Purpose of database: To monitor drinking water quality in British Columbia.

West Nile Virus Database (Health Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/westnile_e.html

Comments: Organization maintaining the database: Health Canada

Purpose of database: To monitor trends in the prevalence and incidence of West Nile virus infections.

Work Injuries and Diseases Database (NWISP) (Association of Workers' Compensation Boards of Canada)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/nwisp_e.html

Comments: Organization maintaining the database:

NWISP Coordinator, Association of Workers' Compensation Boards of Canada

Purpose of database: The database uses information derived from accepted claims from injured workers made to the various Canadian workers compensation boards and commissions. Includes national, provincial, and territorial group-level or aggregate data.

Year 2000 Emission Inventory Update (British Columbia)
Web: http://www.hc-sc.gc.ca/ewh-semt/pubs/eval/inventory-repertoire/year2000_e.html

Comments: Organization maintaining the database:

Air Protection Section Water, Air and Climate Change Branch British Columbia Ministry of Water, Land and Air Protection

Purpose of database: To track releases of air pollutants to the British Columbia environment.

Legislation and Regulatory Isues

Canadian federal laws, including those which govern the control of toxic substances, are compiled in the *Consolidated Statutes of Canada.* These statutes are updated annually and revised volumes are periodically published in their entirety or as statements of current law called the *Revised Statutes of Canada.* They are also available online through the *Justice Department of Canada.* Proposals for new laws and amendments to existing ones are published in the *Canada Gazette* (Part I), which appears weekly and is available to the public. Once proposals are announced, interested parties have 45 or 60 days to voice their opinions and/or objections before any changes are implemented. Part II of the *Canada Gazette* reports on new statutory regulations and is published biweekly, whereas Part III, published on an ad hoc basis, announces Public Acts of parliament as they are enacted.

The Canadian statutes, which deal specifically with toxic substances, are listed along with their location in the *Statutes of Canada*, the federal department(s) responsible for their enforcement, and a brief description of the law as it pertains to toxicology.

Full text is available on line at www.laws.justice.gc.ca.

Arctic Waters Pollution Prevention Act
Chapter A-12
Northern Affairs

This act provides the legislation to prevent pollution of the Arctic waters, which are adjacent to the mainland and islands of the Canadian Arctic. The act also prohibits the release of substances, which would cause the water to be unsuitable for man, animals, plants, or fish.

Canadian Environmental Protection Act
Chapter C-16
Environment Canada, Health Canada

This act regulates the manufacture and importation of industrial chemicals and other potentially toxic substances not covered by other legislation in order to protect the environment and human life and health. This law sets the minimum standard for assessing substances to which other federal acts regulating toxic substances must adhere. Under this act, the ministers of both departments are jointly responsible for compiling a 'Priority Substances List' which will specify substances to which priority should be given in assessing their toxicity.

Fisheries Act
Chapter F-14
Fisheries and Oceans, Environment Canada

One of the mandates of this law is the protection of fish and their habitats against harm by toxic substances by prohibiting the discharge of any deleterious substance into water frequented by fish.

Food and Drugs Act
Chapter F-27
Health Canada

This act regulates the manufacture, preservation, packaging, and storage of food, drugs, cosmetics, and medical devices. Under this legislation, all these items must be reviewed and found to meet all defined criteria to ensure the safety to human health and life prior to their use in Canada.

Hazardous Products Act
Chapter H-3
Health Canada

This act prohibits the advertising, sale, and importation of hazardous materials. Products designed for human use (household, garden, or personal use) must be shown to pose no danger to the health or safety of the public due to design or contents. Under this legislation the WHMIS was developed to ensure the protection of workers from the adverse effects of hazardous materials.

Migratory Birds Convention Act
Chapter M-7
Environment Canada

This legislation was put in place for the protection of migratory birds and their environment in Canada and the United States. It prohibits the deposition of substances harmful to migratory birds or their habitats.

Pest Control Products Act
Chapter P-9
Pest Management Regulatory Agency (PMRA), Health Canada

This act regulates the manufacture, importation, sale, and use of products to control pests and organic functions of plants and animals with the intent to ensure the safety, merit, and value of the products used in Canada. Manufacturers, importers, exporters, or distributors of a pest control product must comply with restrictions on the formulation, composition, packaging, labeling, product use, and contaminants defined in this act.

Transportation of Dangerous Goods Act
Chapter T-19
Transport Canada

This act regulates the transportation of dangerous goods within Canada. Safety procedures defined in

the law must be adhered to before any shipping of hazardous substances can occur.

THE REGULATION OF CHEMICALS IN CANADA

To ensure the health, safety, and life of humans and the environment, all chemical products must undergo a review process and meet all criteria outlined by the relevant regulatory laws prior to their use in Canada. In some cases, more than one law, requiring the input of several regulatory departments, may cover regulation of a substance. The full text of regulations is available on line at http://laws.justice.gc.ca/en/BrowseRegTitle.

For example, regulation of pesticides occurs primarily under the Pest Control Act, which is enforced by the Pest Management Regulatory Agency of Health Canada. However, establishment of permissible maximum residue limits of pesticides in food is legislated under the Food and Drug Act, whereas the Canadian Environmental Protection Act, the Fisheries Act, and the Migratory Birds Convention Act cover environmental protection against these substances. Therefore, during the course of product registration, experts from Health Canada, Agriculture and Agri-Food Canada, Environment Canada, and Natural Resources Canada may be consulted prior to granting approval. In addition, individual provinces and municipalities may also regulate use of pesticides within their own jurisdiction and may even prohibit the use of a substance, which has been approved by federal authority. They may not, however, use a substance, which has not been approved by federal authority.

The Regulatory Process of Chemical Products

While the process for product approval is similar in many ways among the different regulatory bodies, major differences exist dependent on a product's uses, effects, and human or environmental exposures (be they intentional or not). The following is a brief outline of the regulatory process beginning with the requirements for submission, the review process, and post-marketing surveillance. Where they exist, differences have been delineated.

Product Submission

When submitting a product for review, the petitioner must supply the regulatory body with information which includes product specifications (product recipe with chemical and trade names, the amount of each ingredient contained, and details on packaging), product labeling information, justification of functionality, levels of use, effectiveness, and practicality, and the scientific data required for the evaluation of the product with respect to possible adverse effects on human and environmental health.

Product Review

Experts subject the data submitted by the petitioner to review from the responsible regulatory agency. In some cases, where required, a single submission may undergo review by more than one government bureau. It is imperative that the petitioner supplies any deficiencies in information requested by the reviewer. Once all the data for a submission have been reviewed, it is recommended for either advancement or rejection. In the case of pharmaceutical products, once approval has been granted, the petitioner is notified in a Notice of Compliance. In the case of pesticides, the intent of approval is published in Part I of the Canada Gazette for public scrutiny to which interested parties have 60 days to voice their opinions and/or objections to the proposal. In addition, the PMRA publishes their own 'Proposed Regulatory Decision Documents', which are mailed to the appropriate individuals or interest groups and to which a 60-day reply period applies. Comments received from the public are reviewed and may result in alterations to the submission and subsequent reassessment. Announcement of final approval is published in the Canada Gazette (Part II) and thereafter becomes effective for a period of 5 years, after which time the petitioner must reapply for approval.

Post-Marketing Surveillance

In Canada, physicians are required to report adverse drug effects to Health Canada. Based on this feedback, a product may be monitored and, should potential human health hazards of a product be identified, Health Canada in conjunction with the manufacturer would then take the appropriate action to rectify any problems, which may, if warranted, include the removal of the product from the market. Similarly, for food additives or residues, violation of the Food and Drugs Act for these substances can result in the removal of those affected food products from outlets, the seizure of stocks, and the rejection of imports or prosecution. With pesticides, even once registration has been granted, the PMRA continues to monitor these substances and if precipitated by health and safety concerns, the compound will undergo special review and re-evaluation of all available studies/data on the active ingredient and microcontaminants.

If warranted, registration of a pesticide may be canceled or suspended.

Protection Against Toxic Substances

General Environment

Management of Toxic Substances by the Federal Government

The Federal Toxic Substances Management Policy provides the government with a strategy for handling toxic substances both domestically and internationally. The principal objectives of this policy are (i) to eliminate toxic substances resulting from human activity, which are persistent, and bioaccumulate within the environment and (ii) to manage other toxic substances of concern throughout their entire life cycles in order to prevent or minimize their release into the environment.

Access to Health and Safety Information

Although active ingredients of substances must be disclosed in the labeling information, under the Access to Information Law (Chapter A-1 of the *Canadian Statutes*), any formulary information need not be disclosed because it is considered confidential business information. Therefore, any information supplied to the government for regulatory purposes by a petitioner must be kept confidential if it would result in financial, commercial, or scientific interference to that party. Information resulting from government research regarding environmental or product testing may be released if the testing was carried out by, or on behalf of, the government institution, unless the testing was done as a service to a person, group, or organization for a fee. However, proprietary information may be disclosed in the interest of the health and safety of humans and the environment and if such disclosure outweighs the financial loss, gain, or prejudice of the third party.

Work Environment

Under the auspices of the Hazardous Products Act, WHMIS was developed in 1988 to provide information about hazardous materials in the workplace. This system is overseen by both federal and provincial governments and requires suppliers of hazardous materials to supply adequate labeling information to ensure the safe handling of products and a Material Safety Data Sheet (MSDS) containing information as required by the Controlled Products Regulations and the Ingredient Disclosure List (both issued under the Hazardous Products Act) as a condition of the sale and importation of that product. WHMIS also requires that all workers who work with or near a hazardous substance be informed of its potential hazards and trained to work safely with chemicals.

Provincial legislation also plays a role in regulating worker exposure to toxic substances. For example, in Ontario the Occupational Health and Safety Act allow a toxic substance to be 'designated' and its use in the workplace to be either prohibited or strictly controlled. Designation is reserved for substances known to be particularly hazardous, and currently there are 11 such designated substances. This act also allows exposure to biological and chemical agents in the workplace air to be controlled via the adoption of threshold limit values.

Governmental Organizations

Federal Government

Health Canada

Health Canada has five branches and is represented in five Canadian regions: Atlantic, Quebec, Ontario, Manitoba/Saskatchewan, and Pacific West.

Health Protection Branch

Several activities of the Health Protection Branch are closely linked to toxicology. This branch is responsible for programs that ensure the safety of the food supply, pharmaceuticals and cosmetics, medical or radiation-emitting devices, and the environment. It is also expected to protect Canadians from hazardous consumer products and materials in the workplace and technology. It carries out regulatory and field inspections, has surveillance responsibilities, and investigates disease outbreaks and product hazards. To carry out this large mandate the Health Protection Branch is organized into several directorates.

The role of the Environmental Health Directorate is to assess and manage health risks at work and at home, in the natural and technological environments. This directorate is divided into five bureaus: Chemical Hazard, Product Safety, Medical Device, Radiation Protection, and Tobacco Control.

The Bureau of Chemical Hazard is primarily concerned with the effects of chemicals and biological agents in the environment on human health (e.g., hazard identification and risk quantification relating to chemicals and micro-organisms in air, soil, drinking water, and water for recreational uses). This bureau manages health risks through the introduction of regulations, standards, and guidelines. It is organized into four divisions: Environmental and Occupational

Toxicology, Environmental Substances, Monitoring and Criteria, and Bioregional Health Effects. Its programs currently include five major project areas: air quality, water quality, new chemical substances and biotechnology products, environmental contaminants, and bioregional health effects (e.g., Great Lakes Basins, St. Lawrence River region, and the Arctic). The Canadian Environmental Protection Act, the Canadian Environmental Assessment Act, the Department of Health Act, and agreements such as the Great Lakes Water Quality Agreement, the Canada-Ontario agreement, and the Canada/US Clean Air Act Accord mandate these activities.

Product Safety is concerned with the prevention of injury and death caused by failure of consumer products. It is also responsible for the safety of all consumer and workplace chemical products that do not fall under other legislation. The WHMIS is one of the major programs that product safety administers.

Radiation Protection is concerned with radiation risks to humans, including those from medical and industrial X-ray equipment, lasers, ultraviolet radiation from the sun, microwave ovens, airport noise, and power lines and radon in homes. It also manages the Occupational Dosimetry Service and National Dose Registry.

There are three other directorates within the Health Protection Branch (Food, Drug, and Laboratory and Centre for Disease Control). Some of their activities are also concerned with toxicological research and toxicity testing.

Environment Canada

Environment Canada's objective is to foster a national capacity for sustainable development in co-operation with other governments, departments of government, and private sectors that will result in a safe and healthy environment. The Environmental Protection Service Program is responsible for development of strategies for pollution prevention, controlling pollution from existing sources, and assisting in the remediation of polluted sites.

The National Water Research Institute maintains research facilities at the Canada Centre for Inland Waters (867 Lakeshore Rd., Burlington, ON L7R 4A6), which also houses research laboratories of other organizations and departments that are concerned with environmental research and development of the Great Lakes.

Environment Canada also maintains research laboratories at the Bedford Institute of Oceanography (Department of Fisheries and Oceans, Dartmouth, NS), which conduct chemical, toxicological, and microbiological analyses to support the department's environmental protection programs.

Department of Fisheries and Oceans

This department has research facilities throughout Canada and is organized along disciplinary lines into biological sciences, physical and chemical sciences, and hydrography. The physical and chemical sciences also cover toxicology and contaminants science relating to both marine and freshwater environments.

Pacific Region

Institute of Ocean Sciences
J. C. Davis
9860 West Saanich Rd.
Sidney, BC V8L 4B2

Its chemical oceanographic research is directed toward determining the source, distribution, and trends of concentrations of organochlorine, hydrocarbons, and organometallics in marine and freshwater environments to better understand how these pollutants are cycled within marine and freshwater systems.

Central and Arctic Region

Freshwater Institute (regional headquarters for Ontario, the prairie provinces, and the Northwest Territories)
J. Cooley
501 University Crescent
Winnipeg, MN R3T 2N6

It is the major Canadian center for freshwater and Arctic fisheries research, including marine mammals and fish habitat. Its toxicological research includes acidification, radionuleotides, and heavy metal pollution and toxic chemicals.

The Great Lakes Laboratory for Fisheries and Aquatic Sciences (GLLFAS) at the Bayfield Institute
867 Lakeshore Rd.
Box 5050
Burlington, ON L7A 1A6

It is designated as a center of disciplinary expertise for the study of freshwater fisheries contaminants and toxicology. It is involved in ecotoxicology and 'acid rain' studies as well as studies concerning the impacts of dioxins discharged into the aquatic environment from Canadian pulp mills.

Quebec Region

Maurice Lamontagne Institute
850 Route de la Mer

Box 1000
Mont-Joli, QC G5H 3Z4

It is active in investigating pollution of the St. Lawrence river system.

Scotia-Fundy Region
St. Andrews Biological Station
W. Watson-Wright
Brandy Cove Rd.
St. Andrew, NB, E0G 1X1

One of its three primary functions is to study the impacts of human activities on aquatic ecosystems, including the identification of hazards and the effects of pollutants (including acid rain) on fish species and their environments.

Newfoundland Region

Northwest Atlantic Fisheries Centre
L. W. Coady
P.O. Box 5667
St. John's, NF A1C 5X1

Research is focused on major ground fish, marine mammals, and freshwater and anadromorphous species in the Newfoundland-Labrador area. One aspect of the study is concerned with toxicology/contaminants (hydrocarbons and pesticides).

Federal Government Databases

Agriculture and Agri-Food Canada. Environment

Comments: Environmental stewardship is the foundation for the sector's long term health and vitality. Canada's success in agriculture is based on a foundation of industry innovation, scientific research and public policy that encourages farming to be more productive while keeping the land healthy.

Web: http://www.agr.gc.ca/index_e.php?s1=info&s2=t&page=env

Agriculture and Agrifood Canada – Advancing Canadian Agriculture and Agri-Food (ACAAF) program

Comments: The Advancing Canadian Agriculture and Agri-Food (ACAAF) program is a 5-year, $240 million program aimed at positioning Canada's agriculture and agri-food sector at the leading edge to seize new opportunities.

Web: http://www.agr.gc.ca/acaaf/index_e.html

Canadian Food Inspection Agency

Comments: Dedicated to safeguarding food, animals and plants, which enhances the health and well-being of Canada's people, environment and economy.

Web: http://www.inspection.gc.ca/english/toce.shtml

Clean Energy Portal

Comments: This portal offers unique and extensive access to Canada's burgeoning environmental energy sector and up-to-date details on international climate change initiatives.

Web: http://www.cleanenergy.gc.ca/index_e.asp

Environment Canada – National Pollutant Release Inventory

Comments: The National Pollutant Release Inventory (NPRI) is the only legislated, nationwide, publicly accessible inventory of its type in Canada. It is a database of information on annual releases to air, water, land and disposal or recycling from all sectors – industrial, government, commercial, and others.

Web: http://www.ec.gc.ca/pdb/npri/npri_home_e.cfm

Environment Canada – Canadian Environmental Sciences Network

Comments: The Canadian Environmental Sciences Network is developing as a means for rejuvenating the Canadian environmental sciences community and increasing its cohesion. CESN aims to build on current areas of environmental networking in Canada, using a 'network of networks' approach, to increase communication and develop a sense of collective direction.

Web: http://www.cesn-rcse.ec.gc.ca/

Environment Canada – Canadian Wildlife Service

Comments: The dangers of pesticides and acid rain have become all too familiar to Canadians. Not surprisingly, the threat is no less serious to wildlife. Chemical contamination of wildlife populations provides a useful indication of the overall health of the environment.

Therefore, wildlife biologists monitor the effects of toxic chemicals entering ecosystems through such human activities as agriculture, industry, forestry, and urbanization.

Web: http://www.cws-scf.ec.gc.ca/focus_e.cfm#targ7

Environment Canada – CEPA Environmental Registry

Comments: The CEPA Environmental Registry is a comprehensive source of public information relating to activities under the Canadian Environmental Protection Act, 1999 (CEPA 1999).

Web: http://www.ec.gc.ca/CEPARegistry/

Environment Canada – Clean Air Online

Web: http://www.ec.gc.ca/cleanair-airpur/Home-WS8C3F7D55-1_En.htm

Environment Canada – EcoAction

Comments: Since 1995, Environment Canada's EcoAction Community Funding Program has provided financial support to community groups for projects that have measurable, positive impacts on the environment. Funding support can be requested for projects that have an action focus, a community capacity building focus, or a combination of both objectives.

Web: http://www.ec.gc.ca/ecoaction/index_e.html

Environment Canada – Freshwater website

Web: http://www.ec.gc.ca/water/e_main.html

Environment Canada – Management of Toxic Substances website

Web: http://www.ec.gc.ca/toxics/en/index.cfm

Environment Canada – National Air Pollution Surveillance Network (NAPS)

Comments: The National Air Pollution Surveillance (NAPS) Network was established in 1969 as a joint program of the federal and provincial governments to monitor and assess the quality of the ambient air in Canadian urban centers.

Web: http://www.etc-cte.ec.gc.ca/NAPS/index_e.html

Environment Canada – National Office of Pollution Prevention (NOPP)

Comments: Environment Canada's focal point for the management of toxic substances, implementation of federal pollution prevention policy and legislation, and the development of new concepts and policy instruments that facilitate the transition to pollution prevention in Canada.

Web: http://www.ec.gc.ca/NOPP/EN/index.cfm

Environment Canada – National Pollutant Release Inventory

Comments: The NPRI Communities portal is part of the NPRI website. The community's portal is being created to help the public understand, access, and interpret the information contained in the NPRI and use it to make important decisions related to their health, environment, economy, government, and quality of life.

Web: http://www.ec.gc.ca/npri-inrp-comm/default.asp?lang=en&n=57708B50-1

Environment Canada – State of the Environment (SOE) InfoBase

Comments: The State of the Environment (SOE) InfoBase, administered by the Knowledge Integration Strategies Division, presents Environment Canada's work on state of the environment reporting and environmental indicators-designed to translate science and data into information and knowledge that can be used.

Web: http://www.ec.gc.ca/soer-ree/English/default.cfm

Environment Canada – Toxic Substances Division

Comments: The Toxic Substances Division (TSD) provides scientific and technical expertise in a variety of program areas relating to toxic substances. Areas of expertise include: risk assessment, chemical toxicity evaluations, environmental effects, chemistry, biology, compliance promotion, and laboratory analysis.

Web: http://www.mb.ec.gc.ca/pollution/e00s26.en.html

Environment Canada – The Green Lane

Comments: Environment Canada's Internet resource for weather and environmental information.

Web: http://www.ec.gc.ca/envhome.html

Fisheries and Oceans Canada – Center for Aquaculture and Environmental Research

Comments: The Center for Aquaculture and Environmental Research is a specialized center for aquaculture and coastal research.

Web: http://www-sci.pac.dfo-mpo.gc.ca/sci/facilities/westvan_e.htm

Government of Canada – Chemical Substances – Chemical Management Plan

(An ecoACTION Initiative)

Web: http://www.chemicalsubstanceschimiques.gc.ca/en/index.html

Government of Canada's Chemicals Management Plan will improve the degree of protection against hazardous chemicals exposure among Canadians. A number of new, proactive measures were included under this plan to ensure that chemical substances are managed properly. By taking action now will significantly reduce future costs associated with water treatment, clean-up of contaminated sites, and treating illnesses related to chemical exposure. It will improve Canadians' quality of life, and better protect Canadian environment. This plan will improve the conditions for business in Canada by ensuring a level playing field and a predictable, science-based regulatory regime. This new plan will build on Canada's position as a global leader in the safe management of chemical substances and products. It will marshal new and better science to improve the assessment and mitigation of risks. Further, it will provide Canadian families with better information about the safe use and disposal of a range of everyday products excerpted from (http://www.chemicalsubstanceschimiques.gc.ca/plan/index_e.html).

Health Canada – Consumer Product Safety

Comments: Health Canada helps protect the Canadian public by researching, assessing and collaborating in the management of the health risks and safety hazards associated with the many consumer products, including pest management products, that Canadians use everyday.

Web: http://www.hc-sc.gc.ca/cps-spc/index_e.html

Health Canada – Environmental and Workplace Health

Comments: The environment, including the workplace, has an important impact on a person's health. Health Canada works to protect the health of Canadians from environmental risks.

Web: http://www.hc-sc.gc.ca/ewh-semt/index_e.html

Health Canada – Environmental Contaminants Bureau

Comments: The Environmental Contaminants Bureau collects, generates and analyzes scientific information for assessing the human health risks posed by air pollutants, commercial chemicals and other substances that contaminate the environment.

Web: http://www.hc-sc.gc.ca/ahc-asc/branch-dirgen/hecs-dgsesc/sep-psm/ecb-bce/index_e.html

Health Canada – Environmental Health Assessment Services

Web: http://www.hc-sc.gc.ca/home-accueil/contact/hecs-dgsesc/ehas-sese_e.html

Health Canada – Pest Management Regulatory Agency

Comments: Health Canada's Pest Management Regulatory Agency (PMRA), is the federal agency responsible for the regulation of pest control products in Canada.

Web: http://www.pmra-arla.gc.ca/english/index-e.html

Health Canada – Product Safety Programme

Comments: The Product Safety Programme (PSP) assists in the protection of Canadians by researching, assessing and collaborating in the management of the health risks and safety hazards associated with issues such as: children's products, household products (including household chemical products), cosmetics (including personal care products), new chemical substances, products of biotechnology, workplace chemicals, radiation-emitting devices, noise, ultraviolet (UV) radiation, Globally Harmonized System of Classification (GHS).

Web: http://www.hc-sc.gc.ca/ahc-asc/branch-dirgen/hecs-dgsesc/psp-psp/index_e.html

Health Canada – Toxicology Research Division

Comments: The Divisions uses toxicology research methods to identify and characterize food-based human health hazards.

Web: http://www.hc-sc.gc.ca/ahc-asc/branch-dirgen/hpfb-dgpsa/fd-da/ bcs-bsc/tr-rt/index_e.html

Health Canada – Workplace Hazardous Materials Information System

Web: http://www.hc-sc.gc.ca/ewh-semt/occup-travail/whmis-simdut/index_e.html/msds.htm

Industry Canada – Environment

Comments: The Environment section contains various websites dealing with all aspects of the environment including eco-efficiency, sustainable development, and climate change.

Web: http://www.ic.gc.ca/cmb/welcomeic.nsf/ICPages/SubjectEnvironment

National Research Council Canada – Institute for Chemical Process and Environmental Technology (ICPET)

Comments: With its partners, NRC-ICPET contributes to increasing the competitiveness of Canada's chemistry intensive industries through research into innovative processes and technologies that enable sustainable development.

Web: http://icpet-itpce.nrc-cnrc.gc.ca/research.html

Office of the Auditor General of Canada – Commissioner of the Environment and Sustainable Development

Comments: The Commissioner provides parliamentarians with objective, independent analysis and recommendations on the federal government's efforts to protect the environment and foster sustainable development. Encouraging the government to be more accountable for greening its policies, operations, and programs is a key to the Commissioner's mandate.

Web: http://www.oag-bvg.gc.ca/domino/cesd_cedd.nsf/html/cesd_index_e.html

The Hazardous Materials Information Review Commission (HMIRC)

Comments: The Workplace Hazardous Materials Information System (WHMIS) is Canada's national hazard communication standard. The key elements of the system are cautionary labeling of containers of WHMIS 'controlled products', the provision of material safety data sheets (MSDSs) and worker education and training programs.

Web: http://www.hmirc-ccrmd.gc.ca/english/index.shtml

Provincial Governments

Alberta

Agriculture Alberta – Agri-Food Laboratories Branch

Comments: The primary purpose of the laboratory is to enable the growth of Alberta's agriculture and food industry. The focus is on food safety and the support of Food Safety Division Programs, through applied research, technology development and technology transfer.

Web: http://www1.agric.gov.ab.ca/$department/deptdocs.nsf/all/afla4271

Scientific Societies

Canadian Association of Poison Control Centers
Secretary Treasurer: P. Gaudreault
Hospital Sainte-Justine
3175 Cote Sainte-Catherine
Montreal, QC H3T 1C5

Canadian Society of Forensic Science
Suite 215
2660 Southvale Crescent
Ottawa, ON K1B 4W5

Society of Toxicology of Canada
Executive Director, G. Krip
P.O. Box 517
Beaconfield, QC H9W 5V1

This is a society of approximately 500 members from academia, government, and industry. It holds its annual meeting and scientific symposium in December, normally in Montreal.

Toxicology Education and Schools

Several Canadian universities offer programs in toxicology at the graduate (MSc and PhD) and/or undergraduate levels. In addition, many schools offer postgraduate diploma programs in toxicology composed of coursework only, whereas others offer programs, which although are not toxicology per se emphasize toxicology in their multidisciplinary programs. These schools, per province, are listed below with the different programs, some explanations regarding especially the aim of the program if available and/or either a contact person or a website to refer to.

Programs in Toxicology

Alberta
University of Calgary
Department of Pharmacology & Therapeutics
Division of toxicology
M.Sc. and Ph.D. in Medical Sciences
University of Calgary, Faculty of Medicine, Department of Pharmacology & Therapeutics,
3330 Hospital Drive NW, Calgary AB T2N 4N1
D. L. Severson
Professor and Head

British Columbia
University of British Columbia
Faculty of Pharmaceutical Sciences
Drug metabolism, Pharmacokinetics and Toxicology
MSc and PhD
2146 East Mall
Vancouver, BC V6T 1Z3
Graduate program Phone: 604-822-2390
Fax: 604-822-3035
Web: www.pharmacy.ubc.ca./research/research_areas_pages_/drug_metabolism.html

The goals of the Drug Metabolism, Pharmacokinetics, and Toxicology group are to pursue research and training in the areas of drug disposition (absorption, distribution, metabolism and excretion) and in clarifying the relationship between pharmacokinetics and drug toxicity.

Simon Fraser University
Environmental Toxicology Program
Department of Biological Sciences
8888 University Drive, Burnaby, B.C. Canada V5A 1S6
Dr. Chris Kennedy, Associate Professor
Aquatic Toxicology

Email: ckennedy@sfu.ca

Master's of Environmental Toxicology Program

Simon Fraser University developed the Master of Environmental Toxicology (MET) program due to the increasing amount of damage that is inflicted on our environment (such as air pollution, mercury levels in fish, etc.). At the inception of the ET program at SFU, there were very few formalized toxicology training programs in Canada. At the present, the Universities of Toronto, Guelph, Saskatchewan, and Montreal offer a Master of Science and/or Doctorate in Toxicology.

A Coop option is available to MET students in which students complete two semesters of Coop during their studies.

Collaborative Program in Biomedical Toxicology

The Biomedical Toxicology Program is a collaborative degree. Students interested in enrolling in Biomedical Toxicology must meet all of the admission criteria for a collaborative degree. The following participate in the Collaborative Program in Biomedical Toxicology:

University of Western Ontario
MSc and PhD in Pharmacology and Toxicology
BSc (Hons)

Home department	Address	Graduate co-ordinator	Graduate administrator
Laboratory Medicine & Pathobiology	Banting Institute, 100 College St.	Prof. H. Elsholtz 978-8782	Ms M. Michael 978-2550
Medical Science	Room 7213, Medical Sciences Bldg.	Prof. M. Liu 978-5012	Ms J. Chapman 978-8886
Nutritional Sciences*	Room 316 Fitzgerald Bldg.	Prof. V. Tarasuk 978-6071	Ms G. Lim 978-6071
Pharmacology*	Room 4207 Medical Sciences Bldg.	Prof. D. Riddick 978-0813	Ms D. Clark 978-5244
Pharmaceutical Sciences*	Room 413 19 Russell Street	Prof. D. Hampson 978-4494	Ms E. Boddie 978-2179
Zoology	Room 426 Ramsay Wright Bldg.	Prof. Don Jackson 978-3496	Ms J. Valotta 978-3477

*Part-time degree programs are available.

Sub disciplines: Pharmacology, molecular, nutritional, and environmental toxicology
Dr. J. R. Bend
Department of Pharmacology and Toxicology
Medical Sciences Building
Rm 275
London, ON N6A 5C1
Phone: 519-661-3312
Fax: 519-661-4051
Email: jbend@julian.uwo.ca

Trent University
MSc and PhD in Watershed Ecosystems
Sub discipline: Environnemental toxicology
Dr. Chris D. Metcalfe
Environmental and Resource Studies
Peterborough, ON K9J 7B8
Phone: 705-748-1272
Fax: 705-748-1569
Email: cmetcalfe@trentu.ca

Environmental & Resource Science/Studies
Chair of the Program
R. C. Paehlke, Ph.D
Telephone: (705) 748-1011 ext. 1261
Email: ers@trentu.ca
Fax: (705) 748-1569
Web: www.trentu.ca/ers

University of Waterloo
MSc and PhD in Biology
Sub discipline: Environnemental toxicology
Dr. W. D. Taylor
Department of Biology
Waterloo, ON N2L 3G1
Phone: 519-888-4567, ext. 2556
Fax: 519-746-0614
Email: wdtaylor@sciborg.uwaterloo.ca
Jennifer Lehman, Graduate Coordinator

Québec
Université de Montréal

MSc, PhD and Diploma in Toxicology
Sub disciplines: Human health and environmental quality
Chair
Dr. Michel Gérin
2910 Edouard-Montpetit, app. 1
P.O. Box 6128, Succ. Centre-ville
Montréal, QC H3C 3J7
Phone: 514-343-6134
Fax: 514-343-2200

MSc, PhD as per participating departments
Sub disciplines: Industrial, environmental, and ecotoxicology
P.O. Box 6128
Succursale Centre-ville
Montréal, QC H3C 3J7

Participating departments:
Occupational and Environmental Health
Dr. Michel Gérin
Phone: 514-343-6134

Community Health: Environmental Toxicology
Dr. Michel Gérin
Phone: 514-343-6134

Pharmacology
Dr. Mahmoud Sharkawi
Phone: 514-343-6338

Nutrition
Dr. Emile Lévy
Phone: 514-345-4626

Biological Sciences
Dr. Raymond McNeil
Phone: 514-343-6878
Certificate in Eco-Industrial Toxicology

Sub disciplines: Industrial and environmental toxicology
Mrs. Elisabeth Lalague

Faculté de l'éducation permanente
P.O. Box 6128, Succ. Centre-ville
Montréal, QC H3C 3J7
Phone: 514-343-6982

Université Laval
Experimental Medicine program
MSc and PhD in Experimental Medicine
Sub disciplines: Pharmacology and toxicology
Dr. Bao-Linh Dinh
Faculty of Medicine
Sainte-Foy, QC G1K 7P4
Phone: 418-656-5533
Fax: 418-656-2189

Poison Control Centers

The following list represents current contact information for poison control centers across Canada as provided by the Canadian Association of Poison Control Centres web site (December 2006).

Alberta

Poison and Drug Information Service (PADIS)
Foothills Medical Centre North Tower
1403 29th Street, N.W., Room 805
Calgary, Alberta T2N 2T9
Canada
Emergency Phone: (Calgary) (403) 944-1414
Emergency Phone: (Alberta wide toll free) (800) 332-1414
Administrative Phone: (403) 944-6900
Fax: (403) 944-1472
Web: http://www.padis.ca/

British Columbia

B.C. Drug and Poison Information Centre
St. Paul's Hospital
1081 Burrard St.
Vancouver, BC V6Z 1Y6
1-800-567-8911 (toll free B.C.)
(604) 682-5050 (Lower Mainland)
(604) 682-2344 ext. 62126 general inquiries
Fax: (604) 806-8262
Email: daws@dpk.bc.ca

Manitoba

Provincial Poison Information Centre
Children's Hospital Health Sciences Centre
840 Sherbrook St.
Winnipeg, MB R3A 1S1
(204) 787-2591 emergency inquiries
(204) 787-2444 general inquiries
Fax: (204) 787-4807
Email: mtenenbein@hsc.mb.ca

New Brunswick

Poison Control Centre
The Moncton Hospital
135 McBeath Ave.
Moncton, NB E1C 6Z8
(506) 857-5555 emergencies
(506) 857-5353 general inquiries
Fax: (506) 857-5360

Emergency Department, Saint John Regional Hospital
P.O. Box 2100
Saint John, NB E2L 4L2
Phone: (506) 648-6222 (local)
Fax: (506) 648-6901

Newfoundland and Labrador

Provincial Poison Control Centre
The Dr. Charles A. Janeway Child Health Centre
710 Janeway Place
St. John's, NF A1A 1R8
Phone: (709) 722-1110
Fax: (709) 726-0830

Northwest Territories

Emergency Department
Stanton Yellowknife Hospital
550 Byrne Road
Yellowknife, NT X1A 2N1
Phone: (867) 669-4100
Fax: (867) 669-4128
Web: http://www.srhb.org/

Nova Scotia

Poison Control Centre
The Izaak Walton Killam Children's Hospital
5850 University Ave.
Halifax, NS B3J 3G9
Phone: (902) 428-8161(local)
Fax: (902) 428-3213
1-800-565-8161 toll free from P.E.I.

Nunavut

Baffin Regional Hospital
P.O. Bag 200
Iqaluit, NU X0A 0H0
(867) 979-7350 emergencies
(867) 979-4422 ambulance
(867) 979-7300 general inquiries

Cambridge Bay (Ikaluktutiak) Health Centre
X0E 0C0
Phone: (867) 983-2531

Rankin Inlet (Kangiqliniq) Health Centre
X0C 0G0
Phone: (867) 645-2816

Ontario

Ontario Regional Poison Information Centre
Children's Hospital of Eastern Ontario
401 Smyth Road
Ottawa, ON K1H 8L1
1-800-267-1373 English-French, toll-free Ontario
(613) 737-1100 emergency inquiries
(613) 737-2320 general inquiries
Fax: (613) 738-4862

Ontario Regional Poison Information Centre
The Hospital for Sick Children
555 University Ave.
Toronto, ON M5G 1X8
1-800-268-9017 (toll-free Ontario)
(416) 813-5900 local
Fax: (416) 813-7489
Email: margaret.thompson@sickkids.ca
Web: http://www.sickkids.on.ca/poison/

Prince Edward Island

Poison Control Centre
The Izaak Walton Killam Children's Hospital
5850 University Ave.
Halifax, NS B3J 3G9
Phone: 1-800-565-8161 (toll free from P.E.I.)

Québec

Centre antipoison du Québec
Le Centre Hospitalier de l'Université Laval
2705 boul. Laurier
Sainte-Foy, QC G1V 4G2
1-800-463-5060 (Québec only)
(418) 656-8090
Fax: (418) 654-2747
Email: capq@chul.ulaval.ca

Saskatchewan

Emergency Department
Regina General Hospital
1440 14th Ave.
Regina, SK S4P 0W5

NGOs

Biocap Canada

Comments: BIOCAP is Capturing Canada's Green Advantage by building research partnerships to encourage productive, competitive and sustainable methods for using our country's biological capital to create clean, sustainable forms of energy, fight climate change and encourage rural economic development.

Web: http://www.biocap.ca/

Board of Canadian Registered Safety Professionals

Web: http://www.acrsp.ca/

Canada's National Certification Body for Environmental Practitioners (CECAB)

Comments: The Canadian Environmental Certification Approvals Board (CECAB) is responsible for the certification of environmental practitioners in Canada.

Web: http://www.cecab.org/

Canada's National Occupational Health and Safety Web Site (CANOSH)

Comments: Enabling Canadians to easily and independently locate occupational health and safety information provided by the federal, provincial and territorial governments of Canada and by the Canadian Centre for Occupational Health and Safety (CCOHS).

Web: http://www.canoshweb.org/

Canadian Association for Research on Work and Health (CARWH)

Web: http://www.workhealth.ca/

Canadian Centre for Occupational Health and Safety (CCOHS)

Comments: CCOHS promotes a safe and healthy working environment by providing information and advice about occupational health and safety.

Web: http://www.ccohs.ca/

Canadian Centre for Pollution Prevention (C2P2)

Comments: To share knowledge, tools and innovative thinking with business, governments, academia, individuals and organizations in order to catalyze behavioral change leading to more sustainable practices, increased competitiveness, and a healthier environment.

Web: http://www.c2p2online.com/index.php3?session =

Canadian Federation of Biological Societies

Comments: The Canadian Federation of Biological Societies is a research consortium representing Canadian Biological and Biomedical professional associations founded in 1957 to promote the acquisition, facilitate the dissemination and encourage the utilization of knowledge in the Biomedical/Life Sciences.

Web: http://www.cfbs.org/

Canadian Institute for Health Information (CIHI)

Comments: The Canadian Institute for Health Information (CIHI) provides timely, accurate and comparable information.

Web: http://secure.cihi.ca/cihiweb/splash.html

Canadian Institutes of Health Research (CIHR)

Comments: Canadian Institutes of Health Research (CIHR) is the major federal agency responsible for funding health research in Canada. It aims to excel in the creation of new health knowledge, and to translate that knowledge from the research setting into real world applications.

Web: http://www.cihr-irsc.gc.ca/e/193.html

Canadian Network of Toxicology Centres

Comments: The Canadian Network of Toxicology Centres (CNTC) was formed in 1988 by the signing of a Memorandum of Understanding by three existing centers: the Centre for Toxicology at the University of Guelph, the Toxicology Research Centre at the University of Saskatchewan, and the Centre interuniversitaire de recherche en toxicologie de l'Université de Montréalet de l'Université du Québec à Montréal. These centres became the 'nodes' of the CNTC.

Web: http://www.uoguelph.ca/cntc/

Canadian Neurotoxicity Information Network

Comments: The Canadian Neurotoxicity Information Network is a non-profit organization dedicated to providing important health information to those suffering from symptoms of the disease.

Web: http://www3.sympatico.ca/cnin/

Canadian Pharmacists Association

Comments: The Canadian Pharmacists Association is the national organization of pharmacists, committed to providing leadership for the profession of pharmacy. CPhA's website is your link to a comprehensive source of drug information, pharmacy practice support material, patient information and news about the world of pharmacists.

Web: http://www.pharmacists.ca/flash.cfm

Canadian Radiation Protection Association

Comments: The Canadian Radiation Protection Association is a professional organization that supports the development and implementation of radiation safety programs in industry, medicine, research and the environment through scientific inquiry, public involvement and interaction with local, provincial, federal, and international authorities.

Web: http://www.crpa-acrp.ca/en/news.php

Canadian Registration Board of Occupational Hygienists

Comments: The CRBOH is a national, not-for-profit organization, which sets standards of

professional competence for occupational hygienists and occupational hygiene technologists in Canada.

Web: http://www.crboh.ca/page.cfm?onumber=1

Canadian Water Network

Comments: The Canadian Water Network/Réseau canadien de l'eau (CWN/RCE) is a federally funded Network of Centres of Excellence.

Web: http://www.cwn-rce.ca/

Clean Air Strategic Alliance

Comments: The Clean Air Strategic Alliance (CASA) was established in March 1994 as a new way to manage air quality issues in Alberta.

Web: http://www.casahome.org/

David Suzuki Foundation

Comments: Since 1990, the David Suzuki Foundation has worked to find ways for society to live in balance with the natural world that sustains us. Focusing on four program areas – oceans and sustainable fishing, climate change and clean energy, sustainability, and the Nature Challenge.

Web: http://www.davidsuzuki.org/

EcoLog

Comments: EcoLog Environmental Resources Group is Canada's leading publisher of print and electronic environmental and OH&S news, legislation and compliance solutions.

Web: http://www.ecolog.com/default.asp

Environmental Health Research Network (RRSE)

Comments: The RRSE, funded by the Fonds de la recherche en santé du Québec (FRSQ), brings together virtually all Québec university researchers working in the environmental health field. The aim of environmental health research, which is preventive in nature, is to characterize the impact of chemical and physical contaminants of the environment as health determinants.

Web: http://www.rrse.ca/

Radiation Safety Institute of Canada

Comments: Founded in 1980, the Radiation Safety Institute of Canada is an independent, national organization dedicated to the promotion of radiation safety in the workplace, in the environment and in homes and schools.

Web: http://www.radiationsafety.ca/

Society of Toxicology of Canada

Comments: The Society of Toxicology of Canada is a non-profit association whose objectives are to: promote the acquisition, facilitate the dissemination, and encourage the utilization of knowledge in the science of toxicology.

Web: http://www.stcweb.ca/

TOXEN

Web: http://www.er.uqam.ca/nobel/toxen/

Toxicology Testing Laboratories

Dozen of laboratories offer their services in the field of toxicology testing in Canada. Before doing any business with a laboratory, it is recommended to verify if the laboratory is certified by a recognized association and has participated in different quality programs.

Environmental Consulting Services

Via the Internet it is now possible to find dozens of specialists in different fields of toxicology. Considering the number of specialists involved and the dynamic of the field, an exhaustive list of either companies or individuals who offer their services can not be presented here.

For a summary list of environmental consultants offering toxicology and risk-assessment-related services in Canada, readers are encouraged to access the following provincial (state level) environmental services association websites.

Alberta
Web: http://www.esaa.org/

British Columbia
Web: http://www.bceia.com/

Manitoba
Web: http://www.meia.mb.ca/

New Brunswick
Web: http://www.nbeia.nb.ca/

Newfoundland and Labrador

Chile

JUAN CARLOS RIOS, JUAN JOSE MIERES, AND ENRIQUE PARIS

INTRODUCTION

In Chile, the teaching of toxicology started shortly after 1900 in the Pharmacy School of the University of Chile when that school was part of the Medicine Faculty, under the direction of Dr. Carlos Ghighliotto. The subjects taught there were compiled under the title 'Toxicology, Legal Pharmacy'. In 1950 Professor Hermann Schmidt Hebbel, pharmacist and professor of bromatology published articles in the journal *The Pharmacist*. These were later compiled in the text *Toxicology Manual: Its Projections Toward Industrial Hygiene and Forensic Chemistry*, which was a required study text for several generations.

RESOURCES

Books

Araya A (1977)
Manual de Seguridad e Higiene Industrial (Manual of Industrial Hygienics and Safety)
Santiago, Chile

Brantes MJ (1990)
Guía consulta: intoxicaciones por plaguicidas (Guide for Poisoning with Pesticides)
Servicio de Salud Metropolitano Occidente

Borgel L et al (2001)
Protocolos para el manejo del paciente intoxicado (Protocols for the Management of the Poisoned Patient)
OPS

Bruning SW, Bruning VW (2002)
Plantas Tóxicas en Pediatria (Toxic Plants in Pediatrics)
Editorial IKU.

A detailed review of Chilean botanical species toxic effects oriented to pediatrics.

Díaz O, García M (2003)
Avances en toxicología de contaminantes químicos en alimentos (Advances in Toxicology of Chemical Contaminants in Food)
Universidad de la Frontera.

Lazo W (2001)
Hongos de Chile (Chilean Fungus)
Salesianos SA
A textbook that lists mushroom species found in Chile.

Ministerio de Salud (1985)
Manual de Toxicologia Ocupacional (Manual of Occupational Toxicology)
Santiago

Paris E, Rios JC (2005)
Intoxicaciones: Epidemiologia, Clínica y Tratamiento (Poisonings: Clinical Features and Management)
Santiago: Ediciones Universidad Católica

Textbook oriented to the clinician. Covers the basic management of the most common poisonings in Chile.

Schmidt-Hebbel H (1986)
Tóxicos químicos en alimentos: avances en su identificación, previsión y desintoxicación (Toxic Chemicals in Food: Advances in their Identification, Prevention and Decontamination)
Fundación Chile

Tapia R (1989)
Toxicologia (Toxicology)
Universidad de Chile

Tapia R, Fernández C (1985)
Toxicología general y aplicada : asignatura de toxicología (General and Applied Toxicology: Toxicology Subject)
Universidad de Chile

Technical Report and Other Documents

Guia clinica para el manejo de mordedura de araña de rincón-Loxosceles laeta (Clinical Guide for the Management of the Loxosceles Laeta Bite)
Web: http://www.cituc.cl/LoxoscelesLaeta.pdf

Prevencion y manejo de intoxicaciones por sustancias químicas en incidentes mayores (Prevention and management of poisonings caused by chemical substances in major incidents) Web: http://epi.minsal.cl/epi/html/public/bioter/aquim/aqpreven.doc

Situacion epidemiologica de las intoxicaciones agudas por plaguicidas chile, 1998 (Epidemiological situation of acute poisonings by pesticidas in Chile)
Web: http://epi.minsal.cl/epi/html/vigilan/revep/intox1998.pdf

Software

Respel 1.0. Reglamento sanitario sobre manejo de residuos peligrosos (Sanitary Regulations for the Management of Hazardous Wastes) (2005)

Allows industrial companies to determine if their wastes are classified as hazardous or not hazardous according to the Chilean legislation.

Journals (General Scientific Journals)

Boletín de la Sociedad Chilena de Química (Journal of the Chilean Chemical Society) (1949–)

Red Nacional de Vigilancia Epidemiológica de Intoxicaciones Agudas por Plaguicidas REVEP (National Network of Epidemiological Vigilance of Acute Poisonings Caused by Pesticides REVEP) (1998–2002)

Revista de Biologia Marina y Oceanografia (Journal of Marine Biology and Oceanography) (1997–)

Revista Chilena De Salud Pública (Chilean Journal of Public Health) (1997–)
Revista Médica de Chile (Chilean Journal of Medicine) (1872–)

Organizations

Governmental Organizations

Comisión Nacional del Medio Ambiente-CONAMA (National Committee of Environment)
Teatinos 254/258, Santiago, Chile

The National Committee of Environment (CONAMA) is the institution of the State that watches over the people's interest specifically the right to live in an environment free of pollution, the protection of the environment, the preservation of nature and the conservation of the national patrimony.

Instituto de Salud Pública (Public Health Institute)
Av. Marathon 1000- Ñuñoa – Santiago

Public institution of a technical and scientific nature that guarantees the quality of goods and services offered to the community in areas related to health. This includes evaluation of the quality of laboratories, vigilance of diseases, control and supervision of drugs, cosmetics and devices for medical use, environmental health, and production and control of vaccines.

Servicio Agrícola y Ganadero: Sub-Departamento de Plaguicidas y Fertilizantes
(Agricultural and Livestock Service, Sub-Department of Pesticides and Fertilizers)
Paseo Bulnes 140, Santiago

Develops and applies institutional politics oriented to improve the efficiency in the evaluation and approbation of agrochemical substances in order to have efficient products with minimal risk to the health of people, animals and the environment, avoiding negative impact on the domestic and foreign trade.

Servicio Médico Legal (Legal Medicine Service)
Avenida La Paz 1012, Independencia, Santiago

Institution commissioned to assist the Justice System and the Public Ministry in matters related to legal medicine through carrying out thanatological, psychiatric, clinical and toxicological investigations.

Non-governmental Organizations

Sociedad Chilena de Medicina Legal, Forense y Criminalistica (Chilean Society of Legal, Forensic and Criminalistic Medicine)
Av. Providencia 365 oficina 22, Providencia, Santiago
Sociedad Chilena de Nutrición, Bromatología y Toxicología (Chilean Society of Nutrition, Bromatology and Toxicology)
Guayaquil 34 , Depto. 3-C, Santiago

Poison Control Centers

CITUC – Centro de Información Toxicologica y de Medicamentos de la Pontificia Universidad Católica de Chile (Poison Information and Drug Information Center)
Marcoleta 367, Santiago
Phone: 562-6353800
Fax: 562-2472112
Email: cituc@med.puc.cl

Centro de Información para Emergencias Químicas de la Pontificia Universidad Católica de Chile (Chemical Emergency Information Center)
Marcoleta 367, Santiago
Phone: 562-2473600
Fax: 562-2472112

Legislation and Regulations

D.F.L. N° 725/67. Código Sanitario Publicado en el Diario Oficial de 31.01.68-Ministerio de Salud (Sanitary Code)

Reglamento del sistema nacional de control de productos farmacéuticos dto. N° 1876, DE 1995 Publicado en el Diario Oficial de 09.09.96 (Regulations for the national system of control of pharmaceuticals)

D.S. N° 404/83 – Reglamento de Estupefacientes (Regulation of Stupefacient Drugs)

D.S. N° 405/83 – Reglamento de Productos Psicotrópicos (Regulation of Psychotropic Products)

El 9 de marzo de 1994 se publicó en el Diario Oficial la Ley N° 19.300, sobre Bases Generales del Medio Ambiente (LBGMA) (General Basis of the Environment)

D.S. N°148 de 2003 Ministerio de Salud Reglamento Sanitario sobre Manejo de Residuos Peligrosos (Sanitary Regulation for the Management of Hazardous Wastes)

D.S. N° 95 de 2001 Ministerio Secretaría General de la Presidencia Reglamento del Sistema de Evaluación de Impacto Ambiental (Regulation of the System of Evaluation of Environmental Impact)

D.S. N° 93 de 1995 Ministerio Secretaría General de la Presidencia Reglamento para la Dictacion de Normas de Calidad Ambiental y de Emisión (Regulation for the Development of Norms about the Environmental Quality and Emissions)

Decreto 88: 2004. Reglamento de notificación obligatoria de las intoxicaciones por plaguicidas (Regulation of Mandatory Notification of Poisonings Caused by Pesticides)

Education/Schools

Few Chilean universities teach toxicology. It is, however, a required subject in the pharmacy programs of several universities of the country. It is optional in the curriculum of some veterinary and nursery schools. Beginning in 2007 the Faculty of Medicine of the Pontificy Catholic University of Chile will offer toxicology for their graduate students in different medical specialities.

Food toxicology is covered in undergraduate courses of Food Engineering and is currently taught at several university departments within the new Food Science and Technology degree programs. Different university faculties and professional societies provide courses of toxicology but there are no graduate programs for specialization in that area.

CHAPTER

84

China

ZHIXIONG ZHUANG

INTRODUCTION

Ancient China's knowledge of toxicants dates back over 5000 years. The famous folk legend of *Shennong Tastes all Kinds of Herbs* offers guidance on how to differentiate foods from drugs and poisons in China. *Shennong Bencao Jing* (*Shennong Native Herbs Anthology*) is considered the first Chinese monograph on pharmacology. It itemized 365 medicinal products (including plant, animal, and mineral) and categorized them by broad toxic effect – large, medium, and small. *Zhu Bing Yuan Hou Lun*, written in 610 by Chao Yuan Fang during the Sui Dynasty, identifies snake, bee, and scorpion venom as toxic agents, and offers numerous detailed observations and descriptions of toxic gases, concentration distributions, testing methods, and preventative countermeasures. In *Wai Tai Mi Yao*, written in 752 by Wang Tao during the Tang Dynasty, there are reports of testing animals for effects by exposing them to toxic gases. During the Southern Song Dynasty, Song Ci (in 1247) in *Xi Yuan Ji Lu* records the use of poison for suicide or homicide, and suggests methods of detoxification and poison identification. *Ben Cao Gang Mu*, written in 1590 by Li Shi Zhen during the Ming Dynasty, and which describes numerous poisons and discusses the toxicity of drugs, is often regarded as the first truly comprehensive and seminal pharmacology and toxicology work. Also in the Ming Dynasty, *Tian Gong Kai Wu*, written in 1637 by Song Ying Xing, discusses occupational mercury poisoning and its prevention.

Since the 1920s, parallel with the introduction of Western medicine and science, forensic scientists in China had begun to identify poisons by pathology and chemical analysis. Of special note is Chen Ke Hui, a famous Chinese pharmacologist who, in 1934, discovered an antidote for cyanide poisoning by a ferrihemoglobin forming agent and sodium hyposulfite. Modern toxicology in China could be said to originate with the establishment of the People's Republic of China. At that time, poisoning and treatment was largely the task of occupational health. Chemical toxicity testing and toxicity classification, though, began to emerge. Industrial toxicology developed in the 1950s, and the training of professionals in this area as well as the establishment of acute toxicity testing methods were emphasized. In 1957, the first training class in toxicology was held in China by former Soviet Union experts, who introduced standard toxicity theory and research methods. In 1960, a number of Chinese institutions participated in a training class in military toxicology. Senior pharmacologists and toxicologists also initiated safety evaluation for foods, environmental agents, and drugs. Mutagenesis and teratogenesis research methods were introduced in the 1970s.

Since reforms in China at the end of the 1970s, the national education authority considered the global importance of toxicology and established educational requirements. Toxicology Basic Courses in Schools of Public Health and the Departments of Preventive Medicine, as well as postgraduate education for master's and doctorate degrees were also established. In the 1980s, Health Toxicology branches of the Chinese Society of Preventive Medicine (CSPM), and the Chinese Society of Environmental Mutagens (CSEM) were set up and published the *Journal of Toxicology* (original name: *Journal of Health Toxicology*) and *Carcinogenesis, Teratogenesis, and Mutagenesis*, respectively. In 1993, the

Chinese Society of Toxicology (CST) made its appearance, a milestone for toxicology in China. CST consists of 18 special committees, and jointly with the Chinese Society of Pharmacology (CSP), issues the *Chinese Journal of Pharmacology and Toxicology*.

In the 1980s and 1990s, China sent many toxicologists to the United States, Europe, Japan and other more developed countries for training. They returned with knowledge of state-of-the-art theories and methods which they then communicated to other scientists. At the same time, via scholarly articles and computer communication, developments in Chinese toxicology were relayed throughout the world. This not only promoted Chinese toxicology to a new level, but advanced the foundation of interdisciplinary toxicological research. Technologies in cellular and molecular biology, for example, were introduced into toxicology. This would include detection of TNT hemoglobin adducts, benzene–DNA adducts, DNA–protein adducts, and oncogenes and relevant proteins, the foundation of transgene cell strain and transgene animal models, separation and identification of gene mutations, etc. Significant achievements were also made in reproductive toxicology, immunotoxicology, liver and kidney toxicology, neurotoxicology, and behavioral toxicology, all critical in the public health arena.

Bringing the story up to date, in the 21st century, as the human genome project has evolved, toxicological research in China has utilized genomics, metabonomics, proteomics, gene chip (DNA chip) and other cutting-edge techniques, to carry out research on toxic mechanisms of xenobiotics and polymorphism on environmental response genes (e.g. xenobiotic metabolizing enzyme genes and DNA repair genes).

In the field of regulatory toxicology, there were no hygienic standards for exogenous chemicals in China before the founding of the People's Republic of China. In the 1950s, by referring to the hygienic standard for tolerance limits of the former Soviet Union, China issued corresponding Chinese standards for some chemicals. Afterwards, as the state situation in China evolved, tolerance limits were prepared, until at this point in time, China has standards in place for a great number of chemical compounds.

Beginning in the 1980s, China issued some relevant laws and regulations to protect the environment and public health. These include:

- Law of the People's Republic of China on Prevention and Control of Water Pollution (adopted firstly in 1984, revised in 1996)
- Law of the People's Republic of China on the Prevention and Control of Atmospheric Pollution (adopted firstly in 1987, revised in 1995 and 2000)
- Environmental Protection Law of the People's Republic of China (1989)
- Food Hygiene Law of the People's Republic of China (1995)
- Law of the People's Republic of China on the Administration of Drug (1989)
- Law of the People's Republic of China on the Prevention and Treatment of Occupational Diseases (2002)
- Law of the People's Republic of China on the Quantity and Safety of Agricultural products (2006), etc.

In the meantime, some procedures and standards for safety evaluation of exogenous chemicals were also issued and adopted, for example:

- Procedures and Methods of Safety Evaluation for Cosmetics (GB 7919-1987),
- Procedures for Toxicological Assessment of Food Safety (GB 15193.1-2003),
- Procedures for Toxicological Assessment of Pesticide (1991),
- Toxicological Test methods of Pesticides for Registration (GB/T 15670-1995)
- Guideline for New Drug (Western medicine) Toxicology Research (1993),
- Standard for Drug Non-clinic Research Quality Management (1999),
- Standard for Chemicals Toxicity Identification Management (2000),
- Technical Standard for Testing and Assessment of Health Food (2003),
- Standard for Pesticide Toxicology Security Evaluation Laboratory (2003),
- Technical Standard for Toxicity Testing of Chemicals (2004),
- Standard for Good Laboratory Practices of Pesticide Toxicology Assessment (NY/T718-2003)
- Guidelines for the Testing of Chemicals (HJ/T 153-2004)
- Guidelines for the Hazard Evaluation of New Chemical Substances (HJ/T 154-2004)
- Guidelines for Chemical Testing Good Laboratory Practices (HJ/T 155-2004), etc.

HISTORICAL EVOLUTION ON CHINESE SOCIETY OF TOXICOLOGY (CST)

In the early 1990s, Wu De Chang, Liu Shi Jie and other 24 senior toxicologists proposed establishing the Chinese Society of Toxicology. In April 1993, the preparatory committee of Chinese Society of Toxicology (CST) was established; Prof. Wu De Chang was the director. In May 1993, the China Association for Science

and Technology and The National Science Committee of China formally approved founding of CST.

The Chinese Society of Toxicology (CST) holds a national congress every 4 years, voting Council Member, Standing Council Member and Principal. Past and present officers follow:

The First Council (1993–1997):
President: Professor Dechang WU (Academician)
Vice Presidents: Professor ShuYuan Song, Boqin Lv, Quanguan Jiang, Peizhe Liu, Weige Li, Jiongliang Zhou and Jinxiu Ruan
Secretary General: Professor Changqing Ye;

The Second Council (1997–2001):
President: Professor Dechang WU (Academician)
Vice Presidents: Professor Peizhe Liu, Weige Li, Jiongliang Zhou, Jinxiu Ruan, Zhiji Cai, Junshi Chen, and Youxin Liang
Secretary General: Professor Changqing Ye;

The Third Council (2001–2005):
President: Professor Changqing Ye
Vice Presidents: Professor Junshi Chen (Standing), Kangtai Rong, Jiwang Zheng, Jianren Yao, Wei Meng, Xinru Wang, and Zhixiong Zhuang
Secretary General: Professor Pingkun Zhou;

The Fourth Council (2005–2009):
President: Professor Zhixiong Zhuang
Vice Presidents: Professor Jie Wang, Xinru Wang, Zhicheng Shi, Pingkun Zhou (Standing), Wei Meng, and Mingyang Liao
Secretary General: Professor Pingkun Zhou.

Organization of Chinese Society of Toxicology (CST)

Over 1600 toxicologists from universities and scientific health research institutes, are registered in the CST. CST consists of 19 branch committees: Section of Analytical Toxicology (SAN), Section of Biotoxin Toxicology (SBI),Section of Biochemical and Molecular Toxicology (SBM), Section of Clinical Toxicology (SCL), Section of Drug Dependence Toxicology (SDD), Section of Ecological Toxicology (SEC), Section of Feed Toxicology (SFE), Section of Food Toxicology (SFO), Section of Genetic Toxicology (SGE), Section of Industrial Toxicology (SID), Section of Immunotoxicology (SIM), Section of Military Toxicology (SMI), Section of Radiation Toxicology (SRA), Section of Regulatory Toxicology (SRG), Section of Reproductive Toxicology (SRP), Section of Toxicology History (STH), Section of Veterinary Toxicology (SVE), Section of Drug Toxicology and Security Evaluation, and Section of Poisoning and Treatment (SPT).

CST is affiliated with the Academy of Military Medical Sciences of the Chinese People's Liberation Army, and its official headquarters, led by a secretary general is located at:

CST Office: 27 Taiping Road, Haidian District, Beijing 100850, China
Phone: 86-10-66932387
Fax: 86-10-68183899
Email: chntox@nic.bmi.ac.cn chntox@yahoo.com.cn

In order to strengthen the main business of the Society, CST established four working committees: Academic Committee, Foreign Affairs Committee, Organization Committee, and Youth Committee.

The Relationship between CST and International Academic Organizations

In July 1997, CST successively joined International Union of Toxicology (IUTOX) and the Asian Society of Toxicology (ASIATOX). Professor Junshi Chen, Honorary President and Standing Council Member of CST, Researcher of Chinese Center for Disease Control and Prevention, and Academician of China National Academy of Engineering, was elected as Director of ASIATOX and Council Member of IUTOX; Professor Pingkun Zhou, the Secretary General of CST, was elected as the Secretary General of ASIATOX; and Professor Zhixiong Zhuang, the President of CST, and Professor Xinru Wang and Jie Wang, the Vice President of CST was also elected as the Council Member of ASIATOX.

Academic Communications

Domestic Academic Communications

The Chinese Society of Toxicology pays great attention to academic communications. As of 2007, four National Congresses, two Youthful Scholar Science and Technology Fora and more than 100 symposia have been held by the CST and its branch committees. These have covered a variety of topics. The national congresses, for example, have been held in Beijing, Xi'an, Nanjing, and, most recently, in Shenyang (2005).

Cross-Taiwan Strait Toxicology Seminar

These seminars are held every 2 years and are a collaborative effort between the Chinese Society of Toxicology and the Chinese Taiwan Society of Toxicology, to discuss problems of mutual concern. They have been held in .Nanjing (Oct. 15–16, 2001), Taibei (Dec. 14–20, 2003) and Shenyang (Sep. 18–19, 2005), respectively.

Hosting the International Meetings on Toxicology

Since 2002, Chinese Society of Toxicology has hosted three international meetings on Toxicology. At the thirtieth anniversary of Normalization of Relationship Between China and Japan, Chinese Society of Toxicology and Japanese Society of Toxicology jointly sponsored the China–Japan Joint Congress on Toxicology and Pharmacology , (CJJCTP) on Dec. 1–4, 2002 in Shenzhen, China.

On Nov. 10–13, 2003, Chinese Society of Toxicology (CST) and International Union of Toxicology (IUTOX) jointly sponsored the 5th Congress of Toxicology in Developing Countries (5CTDC) in Guilin, China.

On June 18–21, 2006, Chinese Society of Toxicology (CST) successfully sponsored the 4th International Congress of Asian Society of Toxicology (ASIATOX-IV) in Zhuhai, China.

Academic Periodical

'*Chinese Toxicology Communication*', the interior academic periodical of CST, which is delivered to every council member and branch committees, plays the role of academic communication, information window and link. There are also other academic periodicals, e.g. '*Journal of Drug Dependence*' and '*Chinese Journal of Pharmacology and Toxicology*', sponsored by CST and Chinese Society of Pharmacology (CSP); '*Poisoning Rescue Communication*' and '*Animal Toxicology*' sponsored by some Branch Committees.

Network Construction

In Feb. 2005, the website (www.chntox.org) of CST was established and started operating. CST issues all kinds of relevant information on the web page in this network station, which includes many columns, for example, Brief Introduction of CST, CST Rule, Organization, Academic Activity, Science Forum, Popular Science Education, Special Committee, Chinese Toxicology Communication, Toxicologists Database and News bulletin. It enables the flow of information to be more smooth and the relation between members to be more close.

The website of Medical Professor Net (www.med-professor.com), sponsored by Branch of Industrial Toxicology of CST, has been providing the consultant service for public health and medicine.

The website of Poison & Human Net (www.nwu.edu.cn), jointly sponsored by Section of Toxicology History of CST and College of Life Sciences, Northwest University, has been providing the relevant consultant service for government, society, and the general public.

The website of Toxicology (http://www.toxsmmu.com/index.asp) was jointly sponsored by Section of Genetic Toxicology and Department of Toxicology, The Second Military Medical University.

Journals

Biomedical and Environmental Sciences
ISSN 0893-3985
C. M. Chen (Ed.)
Published under the auspices of Chinese Center for Disease Control and Prevention (China CDC), 27 Nan Wei Road, Beijing, 100050.

Biomedical and Environmental Sciences, an international journal with special emphasis on scientific findings in China, publishes articles dealing with the biologic and toxic effects of environmental pollutants on man and other forms of life. The effects may be measured with pharmacological, biochemical, pathological, and immunological techniques. The journal also publishes reports dealing with the entry, transport, and fate of natural and anthropogenic chemicals in the biosphere and their impact on human health and well-being.

Chinese Journal of Industrial Hygiene and Occupational Diseases (1983–)
ISSN 1001-9391
Domestic Periodical Register CN-12-1094/R
S. Wang (Ed.)
Sponsored by the Chinese Preventive Medical Association. Edited and published by Tianjin Center for Disease Control and Prevention.

This journal is intended for personnel responsible for labor hygiene and occupational health. It frequently publishes articles and reviews concerned with toxicological issues of chemical substances.

Chinese Journal of Industrial Medicine (1988–, bimonthly)
ISSN 1002-2214
CN-21-1267/R
F. S. He and Z. D. Zhao (Eds.)
Sponsored by Labour Hygiene & Occupational Diseases Society, Chinese Preventive Medical Association. Published by Shen Yang Institute of Labour Hygiene & Occupational Diseases, Editorial Board of the Chinese Journal of Industrial Medicine, 18 South 11 W.Road, Tie Xi District, Shen Yang, 110024.

This journal is for professionals in occupational medicine and labor safety and for managers in charge of labor hygiene and occupational diseases.

Chinese Journal of Pharmacology and Toxicology (1986–, quarterly)
ISSN 1000-3002
CN-11-1155/R
Y. X. Zhang (Ed.)
Sponsored by the Chinese Pharmacological Society. Undertaken by Academy of Military Medical Sciences, 27 Taiping Road, Beijing, 100850. Edited and published by Editorial Office of Chinese Pharmacology and Toxicology, 27 Taiping Road, Beijing, 100850.

This journal is intended mainly for pharmacologists, toxicologists, hygienists, and occupational doctors. Series of this journal contain reviews, articles, and press and new briefs concerning toxicology and pharmacology.

Chinese Journal of Preventive Medicine (1953–, bimonthly)
ISSN 0253-9624
CN-11-2816
Y. D. Chen (Ed.)
Chinese Medical Association, 42 Dongsi Xidajie, Beijing, 100710.

This periodical is one of the important Chinese medical series published by the Chinese Medical Association. This journal is intended for preventive medical professionals. It contains the most extensive presentations on preventive medicine, and toxicology is one of the topics of this journal. Every major article has an English abstract.

Industrial Health and Occupational Diseases (1973–, bimonthly)
ISSN 1000-7164
CN-21-1147/R
M. R. Xu (Ed.)
An Shan Institute of Industrial Health, 29 129-Park, An Shan, Liaoning, 114001. Sponsored by An Shan Institute of Industrial Health, An Shan Iron & Steel Corp. at An Shan, Liaoning. Edited by Editorial Board of Industrial Health and Occupational Diseases.

This is a professional periodical for persons interested in occupational health and labor safety; it also is intended for managers in business and industry. Toxicological issues are one of the topics covered in this journal.

Journal of Environment and Health (1984–, bimonthly)
ISSN 1001-5914
CN-12-1095
S. X. Dong (Ed.)
Published by the Editorial Board of the Journal of Environmental & Health, 76 Tian Shan She Street, Hedong District, Tianjin, 300011.

This is a professional periodical for persons responsible for and interested in environmental health and environmental protection as well as teachers at medical universities. The topics include review, survey, and research; technology and methods; special information; short reports; training courses; and press reviews.

Journal of Health Toxicology (1987–, quarterly)
ISSN 1002-3127
CN-2413/G2
X. Gao (Ed.)
Sponsored by the Chinese Preventive Medical Association, edited by the editorial board, and published by the editorial department (Beijing Center for Disease Control and Prevention). Chaowai, Dong de Qiao Bei, Beijing, 100020.

This journal is an important periodical of toxicology in China. It belongs to the series published by the Chinese Preventive Medicine Association. The topics of this journal include industrial toxicology, environmental toxicology, health criteria of chemical substances risk assessment for chemicals, and toxicological test methods. This journal is intended mainly for toxicologists, hygienists, and occupational doctors. It is also a useful reference for teaching and training. The language of the journal is Chinese with abstracts in English.

Journal of Hygiene Research (bimonthly)
ISSN 1000-8020
CN 11-2816
J. S. Chen (Ed.)
Published under the auspices of the Institute for Nutrition and Food Safety, Chinese Center for Disease Control and Prevention, 29 Nan Wei Road, Beijing, 100050.

The major topics of this journal include reviews and articles on labor hygiene, environmental health and monitoring, occupational medicine, nutrition and food hygiene, and health statistics. Toxicology is one aspect of this journal. This journal is intended for medical professionals of sanitary anti-epidemic stations, teachers and students of medical universities, and researchers of hygienic institutes. Some articles have English abstracts.

Journal of Preventive Medicine of Chinese People's Liberation Army (1983–, bimonthly)
ISSN 1001-5248
CN-12-1198/R
Z. F. Gu (Ed.)
Sponsored and published by the Preventive Medicine Center, People's Liberation Army. Edited by the editorial board of Journal of Preventive Medicine PLA, The Preventive Medicine Center, PLA, 1 Da Li Road, Tian Jin, 300050.

This is a special journal for military preventive medicine. Topics cover health criteria research and review, experimental technology, and survey and experiment in field preventive medicine for military purposes. It includes some toxicological issues.

State Food and Drug Administration

The State Food and Drug Administration is directly under the State Council, which is in charge of comprehensive supervision on the safety management of food, health food and cosmetics and is the competent authority of drug regulation. The main responsibilities are:

- To organize relevant authorities to draft laws and regulations on the safety management of food, health foods and cosmetics; organize relevant authorities to formulate comprehensive supervision policy, work plan, and supervise its implementation.
- To exercise comprehensive supervision on the safety management of food, health foods and cosmetics in accordance with laws; organize and coordinate supervision work on safety of food, health food and cosmetics carried out by relevant authorities.
- To organize and carry out investigation and impose punishment on serious safety accidents of food, health foods and cosmetics; delegated by the State Council, organize, coordinate and conduct specific law-enforcement campaigns over safety of food, health foods and cosmetics nationwide; organize, coordinate and collaborate with relevant authorities in carrying out emergency rescue work on serious safety accidents of food, health food and cosmetics.
- To comprehensively coordinate the testing and evaluation for the safety of food, health food and cosmetics; formulate provisions on releasing of supervision information for safety of food, health food and cosmetics in conjunction with relevant authorities and monitor their implementation; sum up safety information of food, health food and cosmetics from relevant authorities and release it to the public regularly.
- To draft law and administrative regulations on drug administration and supervise their enforcement; carry out protection system for certain traditional Chinese medicinal preparations and administrative protection system for pharmaceuticals in accordance with law or regulations.
- To draft law and regulations on administration of medical devices and supervise their enforcement; take charge of registration and regulation of medical devices; draft relevant national standards, draw up and revise professional standards of medical devices, manufacturing practice and supervise their implementation.
- To be in charge of drug registration, draw up, revise and promulgate national standard of drugs; draw up criteria for marketing authorization of health foods; review and approve health foods; set up classification system for prescription drugs and OTC drugs; establish and improve ADR monitoring system; be responsible for drug reevaluation, review drugs to be withdrawn and formulate national essential medicines list.
- To draft and revise good practices for drug research, manufacturing, distribution and use, and supervise their implementation.
- To control the quality of drugs and medical devices in manufacturers, distributors and medical institutions; release national quality bulletin on drugs and medical devices on a regular basis; investigate and punish illegal activities of producing and selling counterfeit and inferior drugs and medical devices in accordance with law.

Web: http://www.craes.cn/index.jsp

China National Environmental Monitoring Center

As the center of network, technology, information, and training for national environmental monitoring, the China National Environmental Center is responsible for managing and guiding the work of the national environmental monitoring system, and providing technical support to SEPA in carrying out environmental supervision and management.

Address: No. 1, Yuhuinanlu, Chaoyang District, Beijing 100029, P. R. China
Phone: 010-84637722-2526
Web: http://www.cnemc.cn

Nuclear Safety Center of SEPA

The Nuclear Safety Center is mainly engaged in the technical assessment, verification, monitoring, science researches, and science and technology information of nuclear safety concerning nuclear power plants, reactors, recycling facilities of nuclear fuels, application of nuclear technologies, uranium mines and safety associated with radiation, and to provide technical support and safeguard for the safety of civil nuclear facilities and supervision management of radiation safety in the country.

Address: No. 54 Honglian Nancun, Haidian District, Beijing 100088, P. R. China
Phone: 010-62257804
Fax: 010-62257804

National Center of Environmental Analysis and Testing

National Center of Environmental Analysis and Testing is a center for the methodologies of analysis and testing and technology researches of environmental sciences. The work includes: analysis and testing of the key national research programs of sciences and technologies, and major engineering projects; and to undertake the analysis and arbitration of environmental disputes; to provide services of analysis and testing; and to organize academic and technical exchanges of environmental analysis and testing.

Address: No. 1 Yuhuinanlu, Chaoyang District, Beijing 100029, P. R. China
Phone: 010-84637722
Fax: 010-84634275
Web: http://www.cneac.com

Chinese Academy of Sciences (CAS)

CAS was founded in Beijing on 1st November 1949 on the basis of the former Academia Sinica (Central Academy of Sciences) and Peiping Academy of Sciences. CAS is a leading academic institution and comprehensive research and development center in natural science, technological science, and high-tech innovation in China. The mission of CAS is: to conduct research in basic and technological sciences; to undertake nationwide integrated surveys on natural resources and ecological environment; to provide the country with scientific data and advice for governmental decision-making, and to undertake government-assigned projects with regard to key S&T problems in the process of social and economic development; to initiate personnel training; and to promote China's high-tech enterprises by its active involvement in these areas.

Address: 52 Sanlihe Rd., Beijing 100864, P. R. China
Phone: 86-10-68597289
Fax: 86-10-68512458
Email: bulletin@mail.casipm.ac.cn
Web: http://www.cas.cn/

Chinese Academy of Engineering (CAE)

The Chinese Academy of Engineering was established in 1994. As the most prestigious and informative advisory institution in China's engineering science and technology, the academy boasts a group of academics with outstanding contributions to engineering and technological sciences. The Academy is a national and independent organization composed of elected members with the highest honor in the community of engineering and technological sciences of the nation. Its missions are to initiate and conduct strategic studies, provide consultancy services for decision-making of nation's key issues in engineering and technological sciences and promote the development of the undertaking of engineering and technological sciences in China and devote itself to the benefit and welfare of the society.

Address: 2 BingJiaoKou HuTong, Beijing 100088, P. R. China
Beijing Post Box 8068
Phone: 8610-59300264
Fax: 8610-59300140
Email: CAEChn@cae.cn
Web: http://www.cae.cn/index.html

Institute of Materia Medica, Chinese Academy of Medical Sciences and Peking Union Medical College

The main task of the institute is searching for new drugs for treatment of commonly occurring diseases that seriously threaten people's health. These include cancer, cardio- and cerebral vascular diseases, inflammatory and immunological disease, hepatitis and other viral diseases, disorders of nervous system and retrogression of old age, etc. At the same time, emphasis is put on the application and development of modern medical theory and high technology.

Address: 1 Xian Nong Tan, Beijing 100050, P. R. China
Phone: 86-10-63037394
Fax: 86-10-63017757
Email: webmaster@imm.ac.cn
Web: http://www.imm.ac.cn/

Non-government Organizations (NGOs)/Societies

The China Association for Science and Technology (CAST)
Address: 3 Fuxing Road, Beijing 100863, P. R. China
Phone: 8610-68571898
Fax: 8610-68571897
Email: castint@cast.org.cn
Web: http://www.cast.org.cn/

Chinese Environmental Mutagen Society (CEMS)
Address: 38, College Road, Haidian District, Beijing 100083, P. R. China
Phone: 10-62335754
Fax: 10-62335754
Email: iaems_cn@163.com; a38@cast.org.cn
Web: http://www.cems.org.cn/html/us.htm

Chinese Medical Association (CMA)
Address: 42, Western Dongsi Avenue, Beijing 100710, P. R. China
Phone: 010-85158515
Web: http://www.cma.org.cn/

Chinese Pharmaceutical Association (CPA)
Address: 18/F Tower 9, Jianwai SOHO, No. 4 Jianwai Street, Chaoyang District, Beijing 100022, P. R. China
Phone: 0086-10-58699271
Fax: 0086-10-58699272
Email: Beijing2007@cpa.org.cn
Web: http://www.cpa.org.cn/en/english.htm

Chinese Pharmacological Society
Address: 1 Xian Nong Tan, Beijing 100050, P. R. China
Phone: 010-63165211
E-mail: cnphars@cnphars.org;

CHAPTER

85

Czech Republic

M. HORNYCHOVA AND J. VESEAL

HISTORY OF TOXICOLOGY IN THE CZECH REPUBLIC

It was not until 1987 that toxicology was recognized by the Czechoslovak Academy of Sciences (ČSAV) as being a scientific discipline, and was classified as an independent combined medical discipline.

At the same time the Chair of Toxicology at the Institute of Postgraduate Medical and Pharmaceutical Studies (ILF, presently Institute for Postgraduate Medical Education – IPVZ) in Prague was established.

Although not initially recognized as a scientific discipline, toxicology began to make its presence felt in all areas – health care, education, the chemical and food industries, and later in relation to the environment – after the establishment of Czechoslovakia in 1918.

Health Care

The Minister of Health, Vavro Šrobár, had originally been engaged in the planning of a national public health institute which, with a donation from the Rockefeller Foundation was opened on November 5, 1925 as the NIPH.

During the time of the First Republic, the NIPH became an eminent scientific institution. Its activities included the manufacture of sera and vaccines, wide-ranging scientific activities, and participation in bacteriological and pharmaceutical research. Another important part of the institute was a public health department concerned with nutritional hygiene, occupational health, living conditions, etc. In 1942, a veterinary department was set up containing laboratories for the analysis of meat and milk.

In 1952, an edict by the Ministry of Health included the establishment of the Institute of Epidemiology and Microbiology, the Institute of Hygiene, and the National Institute for Research and Control of Drugs. A fourth institute was added in 1962, the Institute of Industrial Hygiene and Occupational Diseases.

On January 1, 1953, the Department of Veterinary Hygiene was established within the Ministry of Agriculture (National Institute of Public Health 2007).

One of the most prominent people in Czech toxicology was MUDr. Jaroslav Teisinger, DrSc. (1902–1985), founder of the Czech occupational medicine school, who also founded the first advisory bureau for occupational diseases in 1932. In 1942, with his participation, the First Congress of Occupational Medicine was convened and made the motion to consider, in the program of the Second Congress (1947), the problem of solvents in the working environment.

In 1947, at the Charles University Faculty of Medicine there was established the Clinic of Occupational Diseases. Prof. Teisinger became its first Head Physician. The Clinic served as an undergraduate and postgraduate training facility. The scope of the Teisinger school was on the one hand problems of occupational pulmonary diseases (silicosis, asbestosis, allergic pulmonary diseases), and on the other, problems of toxicology. In 1952, Prof. Teisinger founded the Institute of Occupational Hygiene and Occupational Diseases, which is now incorporated in the National Institute of Public Health as the Center of Occupational Medicine. There, in the early 1950s, workplace limits for toxic substances were recommended and established, with Prof. Teisinger presiding over that activity. In 1962, a Toxicology

Information Center was established at the Clinic. It was one of the first not only in Europe but in the whole world, its head being MUDr. Jarmila Filipová. It was a unique facility that provided information on the diagnosis and treatment of acute intoxications, for the needs of professionals and the lay public in the Czech Republic and abroad. On the initiative of Prof. Teisinger, in 1968, the file of the Toxicology Information Center was officially recognized by the University Hospital directorate as a department of the Clinic, and retained the name, Toxicology Information Center (Apatykar.info 2007).

The Specialised Group for Toxicological Chemistry of the Czechoslovak Chemical Society commenced its activities in 1964. Its members were recruited from the ranks of chemists, physicians, pharmacists, veterinarians, the military, and other professions. Its founder and first committee chairman was Prof. MUDr. Ing, Dr. Karel Kácl, DrSc. (1900–1986), chairman of the Chair of Medical Chemistry I at the Charles University Faculty of Medicine in Prague in the years 1945–1970. In the pre-World War II period he had founded the Department for Chemical Poisons. In 1953, he established a laboratory, the name of which was changed to the Institute for Toxicology and Forensic Chemistry – up to 1990 together with the 1st Institute for Medical and Forensic Chemistry forming a common Chair. In 1990 that Chair was divided into the First Institute of Medical Chemistry and Biochemistry and the Institute for Toxicology and Forensic Chemistry, the latter existing independently from 1990–1998, and now integrated into the Institute of Forensic Medicine and Toxicology of the First Faculty of Medicine and the Faculty General Hospital.

Military Toxicology

The Chair of Military Toxicology was formed in September 1, 1951, and dedicated to problems of chemical weapons and the prevention of their effects. In the early 1950s, the activities were purely educational. Later, research focused mostly on yperite (mustard gas), cyanide and nerve-paralyzing substances, was initiated. However, results were classified and there were only very few publications. A practical output was research, development, and introduction of the re-activator pralidoxime (2-PAM). In 1965, a lay syringe (LIS) containing atropine was introduced in Czechoslovakia. At the close of the 1960s, as a result of research, maximum admissible doses for nerve-paralyzing agents and yperite were recommended. In the early 1970s, research was focused on protection against nerve-paralyzing agents. In the early 1980s, very potent antidotes against nerve-paralyzing substances were developed, some of which the army is equipped with to date. The 1990s have witnessed intensive research, namely in the area of non-cholinergic effects of nerve-paralyzing agents, improved treatment of poisonings with soman and tabun, and the study of the effects of inhalation exposure to low concentrations of sarine (Institute of Analytical and Food Chemistry 2007).

The Field of Chemistry

The development of toxicology in the Czech Republic was influenced greatly by the appearance of the chemical industry and the production of novel chemicals, especially after World War II. As an example, we present the development of the discipline of toxicology at one faculty. Following the formation of an independent Czechoslovakia in 1918, the Czech Technical University arose from the Imperial and Royal Czech Polytechnic Institute in Prague, becoming the Czech Technical University (ČVUT) in 1920. This included the Chemical and Technological Engineering University (VŠCHTI). Established therein was the Institute of Analytical and Food Chemistry, concerned with general analytical chemistry and the analysis and testing of foodstuffs, and host lectures on Toxicology and Forensic Chemistry and Microscopy. In the academic year 1938/39, Professor Hanuš held lectures in Analysis of Foodstuffs and practicals in Chemical Analysis of Foodstuffs and Spices and the subject The Testing of Foodstuffs. Professor Hanuš (1872–1955) can be considered to be the true founder of the chemistry and analysis of foodstuffs in our country; he was one of the eminent analytical chemists of that period. In 1939, part of the curriculum in the field of food chemistry was transferred to and became a component of the curriculum of the Institute of Chemical Technology of Foodstuffs and Food Science, founded in 1925, at the VŠCHTI. The development of food chemistry and analysis in the period between the two World Wars has been underscored by the introduction of modern instruction by experts in food quality control through postgraduate studies. Much of the training was designed for state food testing institutions and the ministries. In 1952, an independent University of Chemical Technology (VŠCHT) was formed and within its framework the Faculty of Food Technology (FPT). In 1959, the Analysis of Foodstuffs was first included in the curricula of all FPT disciplines. In the academic year 1969/70 the Faculty was renamed Faculty of Food and Biochemical Technology (FPBT). In 1990, the Faculty returned to its former name (Faculty of Military Health Sciences of the University of Defence 2007).

RESOURCES

Books

Balíková M (2004)
Forensic and Clinical Toxicology
Prague: Galén
ISBN 80-7262-284-6

This book is designed foremost for students of medicine, natural sciences and pharmacology, as well as for specialists within the framework of continuing professional education in health care, criminalistics and judiciary. It provides orientation in complex toxicological problems, in areas such as pharmacokinetics; biotransformation, general approaches to the treatment of acute intoxications, laboratory diagnostics of intoxications and the developmental trends in analytical toxicology, and presents individual noxae causing acute poisonings. It presents legislation concerning addictive substances. There is also practical information regarding acute poisonings.

Bencko V, Cikrt M, Lener J (1995)
Toxic Heavy Metals in the General and Occupational Environment
Prague: Grada
ISBN 80-7169-150-X

This publication is intended for professionals who are involved in the problems of protecting the environment. Its aim is to contribute to the practical application of knowledge in the field of toxicology with regard to metals, their genotoxic and carcinogenic effects and immunotoxicity in the effort to improve the environment by way of industrial operations, and to contribute to the gradual reduction of toxic metals in the food chain.

Hrdina V (2004)
Natural Toxins & Poisons
Prague: Galén
ISBN 80-7262-256-0

This publication acquaints the professional and public with problems concerning natural toxins of bacterial, plant, and animal origin. It reviews toxicokinetics, and presents the characteristics and organotropic properties of poisons and toxins, as well as the principles of treating acute intoxications caused by natural toxins.

Marhold J (1980)
Survey of Industrial Toxicology: Inorganic Substances
Prague: Avicenum

This book represents a fundamental work in industrial toxicology. It presents a list of inorganic substances and a detailed description of them including their toxicological parameters.

Marhold J (1986)
Survey of Industrial Toxicology: Organic Substances
Prague: Avicenum

The book is a companion to the one above. It presents a list of organic substances and a detailed description of them, including their toxicological parameters.

National Institute of Public Health in Fortuna (1997)
Manual of Prevention in Medical Practice. Part 5. Prevention of Unfavourable Occupational Factors and Processes
Prague: National Institute of Public Health in Fortuna
ISBN 80-7071-060-8

Belonging to a series of methodological publications this handbook is intended not only for general practitioners but for students of the disciplines of preventive medicine. It describes in detail the individual factors in the working environment from the point of view of their characteristics and effects on humans. It further looks into workplace accidents, occupational diseases, and occupational health care at the enterprise.

National Institute of Public Health in Fortuna (2000)
Manual of Prevention in Medical Practice. Part 8. The Foundations of Health Risk Evaluation
Prague: National Institute of Public Health in Fortuna
ISBN 80-7071-161-2

This manual contains important information for all professionals dealing with the general and working environments. It focuses namely on the management of health risks due to exposure to chemical substances.

Occupational Safety Research Institute (2005)
Identification and Evaluation of Risk
Prague: Occupational Safety Research Institute
ISBN 80-903604-2-4

A revised edition of this book deals with approaches to and methods of risk assessment in two thematic units: Risk and Its Assessment; Methods and Identification in Risk Assessment. The objective of this publication is to assure that the limiting of risks becomes an essential component in the responsible management of every enterprise.

Pelclová D (2000)
The Most Frequent Types of Poisoning and Associated Therapy
Prague: Galén
ISBN 80-7262-074-6

This publication intends to orientate physicians in the treatment of acute poisonings. It presents various types of intoxications selected according to their frequency and seriousness. Each therapeutic approach has been updated on the basis of collaboration with the European Association of Poisons Centres and Clinical Toxicologists (EAPCCT).

Prokeš J, et al (2005)
The Foundations of Toxicology: General Toxicology and Ecotoxicology
Prague: Galén
ISBN 80-7262-301-X

A textbook for students of medicine summarizing basic pieces of knowledge in toxicology. It reflects present-day topics of interest such as drug addiction, conditions for testing various substances in laboratory animals, environmental protection and the negative effects of chemical noxae not only in industry and agriculture, but also in households, and the abuse of chemical weapons by extremist and terrorist groupings, etc.

Ševela K, Ševčík P, Kraus R (2002)
Acute Intoxication in Medicine
Prague: Grada
ISBN 80-7169-843-1

This publication, besides summing up the major clinical symptoms, laboratory findings, as well as listing antidotes for each toxic substance, presents reviews of differential diagnostic procedures. Further options are presented for the treatment of acute addictive drug intoxications in pre-hospital and post-hospitalization care.

Vondráček V, Riedl O (1980)
Clinical Toxicology: Pharmaceuticals, Foods, Poisonous Flora & Fauna
Prague: Avicenum

This publication presents a list of toxic substances and their effects on human health. It briefly characterizes each toxin and describes and analyzes the symptoms of poisonings. It also takes up the course and treatment of intoxications.

Reports

Environmental Health Monitoring System in the Czech Republic. Summary Reports 1998–2005
Prague: National Institute of Public Health
Web: http://www.szu.cz/chzpa/sumrep.htm (English)
Web: http://www.szu.cz/chzp/reporty.htm (Czech)

These reports present results of the monitoring and assessment of trends in pollution, exposure, impacts on health and health risks, that are the output of the Environmental Health Monitoring System (an integrated system of data collection, processing, and evaluation of information on the state of components of the environment and their influence on the health of the Czech population, with the aim of following up and evaluating temporal series of selected quality indicators of components of the environment and population health, assessing the magnitude of exposure of the population to noxae, and the consequent health impacts and risks).

Journals

In the Czech Republic there are no special journals focused on toxicology. However, relevant articles may be found in the following:

Air Protection
Prague: Civic Association for Protecting Ambient Air Quality
ISSN 1211-0337
Web: http://ochrana-ovzdusi.cz (Czech only)

The journal *Air Protection* publishes information on the pollution and quality of the ambient air in Prague and other regions of the Czech Republic. It popularizes results in science and research in the field of environmental protection, namely ambient air protection. On a long-term basis it is directed at workers in industry, the national administration and self-government bodies, inspection and public health services, as well as the general public.

Central European Journal of Public Health
Prague: National Institute of Public Health
ISSN 1210-7778

Web: http://www.szu.cz/svi/cejph/cejpheng.htm (English)
Web: http://www.szu.cz/svi/cejph/cejph.htm (Czech)

This journal is published in English and takes up the tradition of the international *Journal of Hygiene, Epidemiology, Microbiology and Immunology*. It is a platform for the publication of research in all spheres of public health.

Chemical Papers
Prague: Association of Czech Chemical Societies
ISSN 1213-7103
Web: http://chemicke-listy.vscht.cz/en/index.html (English)
Web: http://chemicke-listy.vscht.cz/cz/index.html (Czech)

This journal publishes papers in chemistry and related fields (biochemistry, environmental science, material science, pharmaceutics, food science, information science), and original papers on laboratory technique and methods.

Cosmos
Prague: Cosmos Ltd.
ISSN 1214-4029
Web: http://www.vesmir.cz (Czech only)

Cosmos is a popular science journal that publishes articles covering the whole vast field of natural sciences. It thereby records the present state as well as trends in each discipline. It is mainly addressed to naturalists and teachers.

Czech and Slovak Pharmacy
Prague: Czech Medical Association/J.E. Purkyně
ISSN 1210-7816
Web: http://www.clsjep.cz/en/nts/casop/farmacie/farmacie.asp (English)
Web: http://www.clsjep.cz/nts/casop/farmacie/farmacie.asp (Czech)

This journal publishes papers in the field of pharmacy and allied disciplines. It also provides information on research dealing with synthetic and natural drugs, pharmacokinetics, technology of new drug forms, cultivation of medicinal plants, pharmaceutical care, dispensing, etc. The journal is an important source of information for all pharmaceutists, healthcare personnel and specialists from areas connected with pharmacy and various aspects of therapeutic drugs.

Czech Occupational Medicine
Prague: Tigis
ISSN 1212-6721
Web: http://www.tigis.cz/prac/Index.htm (Czech only)

This journal publishes original papers and information from practice in occupational health care, studies in occupational diseases, industrial hygiene, ergonomics, technology, and environment.

Homeostasis
Prague: Collegium Internationale Activitatis Nervosae Superioris
ISSN 0960-7560
Web: http://www.szu.cz/chpnp/index.php?page=journals (English only)

This journal is devoted to studies of integrative brain functions in homeostasis, their adaptation to environmental and psychosocial conditions, and underlying mechanisms ranging from molecular to systemic processes and behavior. Particularly encouraged are the following topics: central nervous and endocrine control of autonomic functions, ingestive behavior, neurocirculatory regulation, effects of stress and pertinent coping and intervention procedures, including drug effects, modification of lifestyle- and work-related risk factors which disturb homeostasis and may cause disease.

Occupational Medicine
Prague: Czech Medical Association/J.E. Purkyně
ISSN 0032-6291
Web: http://www.clsjep.cz/en/nts/casop/prac_lekar/prac_lekar.asp (English)
Web: http://www.clsjep.cz/nts/casop/prac_lekar/prac_lekar.asp (Czech)

This journal is focused on occupational hygiene, physiology and psychology, preventive care at worksites, and occupational diseases. The journal publishes papers from the clinical, epidemiological, experimental, and laboratory sphere, case-histories, diagnostic and differential diagnostic criteria, therapeutic procedures, rating criteria, and preventive provisions in occupational diseases and ancillary disciplines (orthopaedics, neurology, ENT, dermatology).

Databases

An ABC list of hazardous substances
Eurochem

A vast list of 300 000 substances with references to toxicological properties, R-, S-, labels, safety certificates, safety symbols, producers of chemical compounds.

Web: http://www.eurochem.cz/cindex

AISLP information system on pharmaceuticals
Zentiva

AISLP is an information system covering human, homeopathic, and veterinary therapeutic products registered in the Czech Republic and in Slovakia.

Web: https://www.zdravcentra.cz/cps/rde/xchg/zc/xsl/aislp.html?init=y

Biotox CZ

Poisons, narcotics, drugs; a complex of a number of interlinked projects dealing with natural substances and their effects on the human organism.

Web: http://www.biotox.cz/projekty.php

Database Eurochem
Eurochem

EuroChem is the B2B portal for chemical searching and chemical databases, offering chemicals exchange and trading. Chemical database EuroChem contains over 127 000 chemical compounds and over 250 000 properties including references to their sources.

Web: http://www.eurochem.cz/?LA=EN

Database of Medicinal Products
State Institute for Drug Control

The items in the database include homeotherapeuticals, over-the-counter remedies, and exclusive therapeuticals with insert information and synoptic data on each product.

Web: http://www.sukl.cz/cs02leciva/index.php

Food Safety Strategy
National Institute of Public Health

Information on harmful substances in foodstuffs – biological hazards, chemical hazards, radiation treatment of foodstuffs.

Web: http://www.chpr.szu.cz

Hazardous Substances Database Dance 2005
The Ministry of Industry and Trade of the Czech Republic

A database covering hazardous chemical substances that are listed in the Register of Chemical Substances Classified Obligatorily as Hazardous in decree No. 369/2005 Coll. (following the act on chemical substances and chemical products; classification, packaging and labeling hazardous chemical substances and chemical products).

Web: http://www.mpo.cz/cz/prumysl-a-stavebnictvi/dance/vyhledani-latek.html

Integrated Pollution Registry
The Ministry of Environment of the Czech Republic

At present, the Integrated Pollution Registry covers information on emissions (including accidental) into the ambient air, water, soil and on the transfer of 72 substances under mandatory notification. It is operated by CENIA, the Czech Environmental Information Agency. The Registry is a component of the Unified Environmental Information System.

Web: http://www.irz.cz

Lists of chemical substances: EINECS, ELINCS, and NPL
The Ministry of Environment of the Czech Republic

The lists of chemical substances EINECS, ELINCS, and NPL are published by the Ministry of Environment following Act No. 356/2003 Coll., on chemical substances and chemical agents, and amendments of certain laws. They describe and classify each substance and are thus a source of information for the safeguarding of health and the environment against their undesirable effects.

Web: http://chem-latky.env.cz

Official Czech Catalog of Pesticides

The list of registered products is a database of plant protection agents in which it has been demonstrated that the risk following their application is acceptable from the point of view of present-day knowledge as regards the health of humans, animals, and environmental protection. By decision of the State Phytosanitary Administration they have been approved for introduction on the market and exploitation in agriculture in the Czech Republic. The list describes the agents, their properties, use and mode of application.

Web: http://www.srs.cz/portaldoc/pripravky_na_ochranu_rostlin/registrace/registrace_pripravku/registr_pripravku06.zip

Transportation information system DOK
Ministry of Transport of the Czech Republic

The information system collects data about hazardous substances that may be the object of transport; it is available to administrative organs, rescue and emergency services, and those included in crisis management readiness at the traffic department. It serves as a source of information for the establishing of suitable conditions for the transport of such substances, and for the liquidation of the consequences in cases of an accident.

Web: http://cep.mdcr.cz/dok2/DokPub/dok.asp

Organizations

Government

Academy of Sciences of the Czech Republic

The Academy is a public non-university scientific institution of the Czech Republic encompassing a complex of research institutes engaged primarily in basic research. AS CR formulates and pursues a conceptual policy of science and research, participates in national and international research programs, promotes cooperation with the application sphere, and fosters the development of education, scholarship and culture.

Address: Národní 3, 117 20 Prague 1, Czech Republic
Phone: +420 221 403 111
Fax: +420 224 240 512
Email: info@cas.cz
Web: http://www.cas.cz/en (English)
Web: http://www.cas.cz (Czech)

Institute of Biophysics, Academy of Sciences of the Czech Republic

The Institute is involved in (a) research dealing with the physical and chemical characteristics of the structure and interactions of bio-macromolecules, (b) research in the biophysical properties of live organisms, including the action of environmental factors, and (c) theoretical investigations in those fields.

Address: Královopolská 135, 612 65 Brno, Czech Republic
Phone: +420 541 517 111
Fax: +420 541 211 293
Email: ibp@ibp.cz
Web: http://www.ibp.cz/index.php (English)
Web: http://www.ibp.cz (Czech)

Institute of Chemical Process Fundamentals, Academy of Sciences of the Czech Republic

The Institute of Chemical Process Fundamentals (ICPF) is one of the six institutes constituting the Section of Chemical Sciences of the Academy of Sciences of the Czech Republic. The Institute functions as a center for advanced research in chemical, biochemical, catalytic, and environmental engineering and it acts as a graduate school for PhD studies in the fields of chemical engineering, physical chemistry, industrial chemistry, and biotechnology.

Address: Rozvojova 2, 165 02 Prague 6, Czech Republic
Phone: +420 220 390 111
Fax: +420 220 920 661

Professional Societies

Association of Chemical Industry of the Czech Republic

The Association is the most important organization for supporting the chemical industry in the Czech Republic. It was founded in 1992 as a voluntary association of manufacturing, commercial, designing, research and advisory organizations with relations to chemical, pharmaceutical, petrochemical, and rubber and plastics industries.

Address: Dělnická 12, 170 00 Prague 7, Czech Republic
Phone: +420 266 793 580
Fax: +420 266 793 578
Email: mail@schp.cz
Web: http://www.schp.cz/html/index.php?&lng=2 (English)
Web: http://www.schp.cz (Czech)

Czech Chemical Society

CCS is a member of the Association of the Czech Chemical Societies, Czech Union of Science and Technology Societies and the Federation of European Chemical Societies and EUCemSoc consortium.

Address: Novotného lávka 5, 116 68 Prague 1, Czech Republic
Phone: +420 221 082 383
Fax: +420 222 220 184
Email: csch@csch.cz
Web: http://www.csch.cz (Czech/English)

Czech Committee of Food Science and Technology

CCFoST represents the interests of the Czech Republic in the International Union of Food Science and Technology (IUFoST) as an Adhering Body.

Address: Technicka 5, 166 28 Prague 6, Czech Republic
Phone: +420 224 353 109

Czech Pharmaceutical Society of the Czech Medical Association of J. E. Purkyně

This is a professional and scientific association with its seat in Hradec Králové and active on the territory of the Czech Republic. The Society is an independent, voluntary, non-governmental organization open to pharmacists and other specialists in health care and all related fields of activity.

Address: Faculty of Pharmacy Charles University, Heyrovského 1203, 500 05 Hradec Králové, Czech Republic
Phone: +420 495 067 403
Fax: +420 495 512 482
Email: jahodar@faf.cuni.cz
Web: http://en.cfs-cls.cz (English)
Web: http://www.cfs-cls.cz (Czech)

Czech Society for Experimental and Clinical Pharmacology and Toxicology of the Czech Medical Association of J. E. Purkyně

The society associates workers in experimental and clinical pharmacology and toxicology, and supports the universal development of those disciplines in the Czech Republic. It is a member of the International Union of Pharmacology (IUPHAR) and the European Union of Pharmacology (EPHAR), and expands relations with analogous organizations abroad.

Address: Department of Pharmacology, Faculty of Medicine, Simkova 870, 500 38 Hradec Králové, Czech Republic
Email: gersl@lfhk.cuni.cz
Web: http://farmspol.cls.cz/pharmacology.htm (English)
Web: http://farmspol.cls.cz/cile.htm (Czech)

Czech Society of Forensic Medicine and Forensic Toxicology of the Czech Medical Association of J. E. Purkyně

The fundamental function of the society is to guarantee the expertise and quality of forensic medical practice.

Address: Institute of Postgraduate Medical Studies, Chair of Forensic Medicine, FN Na Bulovce, Budínova 2, 180 81 Prague 8, Czech Republic
Phone: +420 266 083 437
Email: premysl.klir@email.cz
Web: http://www.cls.cz/spolecnosti/cls44.htm (Czech only)

Society of Occupational Medicine of the Czech Medical Association of J. E. Purkyně

The Society of Occupational Medicine gathers specialists in the field of occupational medicine. This discipline studies the impact of work and working conditions on the health of workers. It deals with the prevention, diagnostics, treatment, and medicolegal aspects of diseases caused or exacerbated by working conditions.

Address: Na Bojišti 1, 120 00 Prague 2, Czech Republic

Miscellaneous Resources

ChemInfo

ChemInfo is the product of the SciChem company that provides consultation services in the field of chemistry. Besides the database of companies, it contains information about chemical workplaces, schools and information sources. It also offers mediation in transactions in chemical equipment and articles.

Web: http://www.cheminfo.cz/

EcoMonitor environmental news database

EcoMonitor is a database accessible cost-free, that includes full texts of articles on the environment from selected journals, the press disclosures of the Ministry of Environment and non-governmental organizations from the electronic conference apc.ecn.press. It is updated according to need regularly. Its operation is guaranteed by the 'Brontosaurus' ecological center 'Zelený klub' (The Green Club).

CHAPTER

86

Denmark

HILDE BALLING

INTRODUCTION

In the following pages a short introduction to the history of toxicology in Denmark is given in the form of thematic sections followed by a brief description of regulation and legislation in the area of chemicals today. Ongoing research and education are described in the section on organizations, including research institutions and regulatory bodies, but not including the pharmaceutical industry.

Pharmacology and Forensic Medicine

Pharmacology has been taught at the University of Copenhagen (founded in 1479) since 1660. During the first couple of hundred years the teaching focused on pharmacotherapy. The physicians to a great extent had to be personally knowledgeable about the drugs, which were administered largely on an empirical basis.

The Royal Danish School of Pharmacy, later the Danish University of Pharmaceutical Sciences and, as of January 2007, the Faculty of Pharmaceutical Sciences at the University of Copenhagen, was founded in 1892. Until then there was no education in pharmaceutics. If one wanted to become a pharmacist one had to practice at a pharmacy, follow lectures at the University of Copenhagen and at the College of Advanced Technology (founded in 1829), and pass an examination before a commission consisting of five professors from the University of Copenhagen, and a pharmacist.

Experimental research in pharmacology was initiated by Professor Hans Chr. Gram (1891–1900) and further developed by his successor Professor Johannes Boeck (1900–1938). In 1898 the first Danish institute of pharmacology was established in Copenhagen.

Lectures in forensic medicine were given as early as 1740. In 1819 forensic medicine was accepted as a specific discipline under the professorship in pharmacology and in 1905 a professorship in forensic medicine was established at the University of Copenhagen. For many years forensic toxicology was a part of forensic medicine. In connection with the construction of a new institute in the 1960s forensic toxicology became a separate department unde r the Institute of Forensic Medicine.

According to the Act of 30 April 1909 the Institute of Pharmacology or other laboratories were obligated to perform forensic toxicology investigations upon request from the Medico Legal Council. The development of forensic toxicology became one of the main interests of the Institute of Pharmacology and a Department of Forensic Toxicology was established in 1943. In 1973 this department was transferred to the Institute of Forensic Medicine and a smaller unit of toxicology was established at the Institute of Pharmacology under the leadership of Professor Jens S. Schou.

At the University of Aarhus, founded in 1928, the Institute of Forensic Medicine was established in 1959. The first toxicological investigations were performed at the beginning of the 1960s and in 1968 the Department of Forensic Toxicology was established.

At the University of Odense, founded in 1966, now University of Southern Denmark, the Institute of Forensic Medicine was established in 1971. A unit of forensic toxicology was established in 1980 and became the Department of Toxicology in 2004.

From Hygiene to Environmental Medicine

Hygiene as an independent science was established at the medical faculty at the University of Copenhagen as early as 1840 but it was not until 1913 that the first professorship in hygiene was established. Bacteriology and technical and veterinary hygiene were separate disciplines so when a professorship in hygiene was established it came to include nutritional and occupational hygiene, and public health. The Institute of Hygiene, established in 1931 at the University of Copenhagen (later the Institute of Hygiene and Social Medicine), carried out investigations in relation to nutritional and occupational hygiene. Later, when the analyses became more extensive, the laboratories became part of the new National Food Institute and the new Institute of Occupational Health (see below). In 1969, an independent institute of social medicine was established at the University of Copenhagen and in 1990 the Institute of Hygiene was abolished. The toxicological resources were transferred to the Institute of Pharmacology (later the Department of Pharmacology).

From the start in 1840 and up to the middle of the twentieth century hygiene focused on sanitary conditions and acute and chronic infections but soon the picture began to change, with a focus on the broad spectrum of environmental factors that humans can be exposed to. As in other countries, the expression 'environmental medicine' was chosen to characterize the tasks. Environmental medicine is multidisciplinary and involves occupational medicine, epidemiology, and toxicology. The word 'hygiene,' on the other hand, in everyday language had come to mean personal hygiene and cleaning.

In the beginning of the 1990s a research program in toxicology/environmental medicine was initiated at the Department of Pharmacology at the University of Copenhagen. A professorship in medical toxicology was filled from 1993 to 1996 (Henrik E. Poulsen). A professorship in environmental medicine was established in 1998 (Steffen Loft) and transferred to the Institute of Public Health, which had been established at the University of Copenhagen in 1997, including the Department of Occupational and Environmental Health. Up until the present, research and teaching in toxicology at the University of Copenhagen have been integral parts of the Department of Pharmacology (now Department of Neuroscience and Pharmacology) and the Department of Occupational and Environmental Health, but recently a professorship in toxicology of 5 years duration (Elisabeth E. Knudsen) has been established at the Department of Occupational and Environmental Health.

At the University of Aarhus a professorship in hygiene was established in 1938, and the Institute of Hygiene, including the science of toxicology, was established in 1943. Later, in 1987, the name of the institute was changed to the Institute of Environmental and Occupational Medicine with Herman Autrup as professor in environmental medicine. The Institute of Public Health was established in 2005, including the Institute of Environmental and Occupational Medicine, now the Department of Environmental and Occupational Medicine.

At the University of Odense, now the University of Southern Denmark, a professorship in hygiene was established in 1972 at the Institute of Hygiene, later the Institute of Hygiene and Social Medicine. In 1980 the name was changed to the Institute of Public Health, Department of Hygiene, and in 1982 further changed to the Institute of Public Health, Department of Environmental Medicine, with Philippe Grandjean as professor in environmental medicine.

The Working Environment

Denmark has had worker protection regulations since 1873 when the Danish Working Environment Authority (WEA) was set up to supervise compliance with the Act. From the start chemists were employed, and in 1978, occupational physicians and occupational toxicologists as well.

A working environment laboratory was established in 1946. In 1955 this laboratory became the Institute of Occupational Hygiene, the tasks of which from 1977 included research and education. In 1988, the Institute was established as a governmental research institute, The National Institute of Occupational Health (now The National Research Centre for the Working Environment) which was separated from the Danish Working Environment Authority in 1997.

Beginning in 1958 medical students were taught occupational medicine and in 1995 the first Danish professorship (Finn Gyntelberg) was established at the University of Copenhagen. Two more professorships were established at the University of Aarhus in 2002 (Jens Peter Bonde) and in 2004 (Torben Sigsgaard).

Poison Treatment

The Poison Treatment Centre at Bispebjerg Hospital in Copenhagen opened in 1949 and gained international respect for improvements in the treatment of poisoned patients, especially barbiturate poisonings, during the 1950s and 1960s. Along with providing actual treatment, the Centre advised physicians on treatment of drug poisonings.

The Danish Poison Information Centre started advisory activities on poisoning with chemical products and other non-drug substances in 1972 at the Clinic of Occupational Medicine, Rigshospitalet, later Bispebjerg Hospital.

In 2002 the information activities in the two centres were joined in a collaboration between three departments at Bispebjerg Hospital, the Danish Poison Control Centre, and in 2006 this centre was opened for inquiries from the public.

Veterinary Toxicology

A veterinary school was founded in Copenhagen in 1773 by the first Danish veterinary Peter Abildgaard and in 1958 the Royal Veterinary and Agricultural University was founded in Copenhagen.

A professorship in pharmacology was established in 1901 (Carl H. Hansen) and in 1950 toxicology as a discipline was included when the Institute of Pharmacology and Toxicology and a professorship in pharmacology and toxicology (Svend Dalgaard-Mikkelsen) were established. In 1994 the Institute was divided into two areas and a professorship in toxicology was established (Christian Friis). As of January 2007 the Royal Veterinary and Agricultural University merged with the University of Copenhagen and became the Faculty of Life Sciences.

Food Toxicology and the Institute of Toxicology

The National Food Institute, later the National Food Agency, was established in 1968 and consisted of the Institute of Toxicology and the Central Laboratory (later the Institute for Food Research and Nutrition). In 1969 the National Vitamin Laboratory and the National Pesticide Laboratory were incorporated in the National Food Institute.

In 1968 the main activities of the Institute of Toxicology were toxicological investigations and risk assessments of food additives, pesticide residues, and contaminants of foods. Beginning in 1978 the activities included toxicological studies and risk assessments of pesticides, household chemicals, and cosmetics and in 1986 human safety aspects of genetically engineered plants, animals, and micro-organisms and their products were included. In 1994 risk assessments of foodborne micro-organisms and micro-organisms used in the production of foods were included, and in 1996 the name of the institute was changed to the Institute of Food Safety and Toxicology.

In 1997 the National Food Agency and the Veterinary Directorate merged and became the Danish Veterinary and Food Administration. In 2002 the Institute for Food Research and Nutrition and the Institute for Food Safety and Toxicology merged and became the Institute for Food Safety and Nutrition which in 2004 became a part of the Danish Institute for Food and Veterinary Research. As of January 2007 the Institute for Food and Veterinary Research merged with the Technical University of Denmark and has been divided into two institutes: the National Food Institute and the National Veterinary Institute. The Danish Veterinary and Food Administration, now under the Ministry of Food, Agriculture and Fisheries, by contract is secured continued direct toxicological assistance by the Department of Toxicology and Risk Assessment at the National Food Institute.

Ecotoxicology

Ecotoxicology as defined by the French professor Réné Truhaut is concerned with the toxic effects of chemical and physical agents on living organisms, especially on populations and communities within defined ecosystems, and includes the transfer pathways of those agents and their integration with the environment.

In Denmark, scientific and experimental ecotoxicology was initiated in the late 1970s at the independent, international consulting and research organization the Water Quality Institute (later DHI Water Environment Health) in Hørsholm where testing in the aquatic environment became highly developed. In 1977 a new Laboratory for Environmental Sciences and Ecology was established at the Technical University of Denmark (founded in 1829) under the leadership of Professor Finn Bro Rasmussen. During the 1980s the Institute organized several international conferences (e.g. the 1st European Conference on Ecotoxicology of SECOTOX (1989)). In 1991 the Institute merged with the Institute of Environment & Resources (later becoming the Department of Environmental Engineering) at the Technical University of Denmark.

A professorship in environmental toxicology was established in 1977 at the Department of Biology at the University of Odense, now the University of Southern Denmark, with Professor Ole Karlog (1977–1985) as head. Aquatic ecotoxicology was established with the employment of Professor Michael H. Depledge (1987–1994), and later, under the leadership of Professor Poul Bjerregaard, research on endocrine disruption was developed.

In 1990 the Danish National Environmental Research Institute established the Department of Terrestrial Ecology in Silkeborg, focusing on terrestrial

ecotoxicology with Dr Hans Løkke as head. In 2004 a professorship of 5 years duration in terrestrial ecology/ecotoxicology (Martin Holmstrup) was established as a collaboration between the Department of Terrestrial Ecology and Department of Biological Sciences at the University of Aarhus. The Danish National Environmental Research Institute was a part of the Ministry of the Environment until January 2007 when it merged with the University of Aarhus.

The departmental structure at Roskilde University, founded in 1972, has been undergoing major changes. As of September 2006 six new departments have been established. Two of the departments, the Department of Science, Systems and Models and the Department of Environmental, Social and Spatial Change carry out some research in ecotoxicology and environmental toxicology and started courses in ecotoxicology in 2003.

The Danish Environmental Research Programme 1992–2004 (http://info.au.dk/smp/smp_uk/Hjem/hjem.htm) has had a great impact on the development of Danish ecotoxicology. The research carried out in the Danish Centre for Ecotoxicological Research (1992–1997) resulted in a range of new tools that increased understanding of and enabled assessment of the risks posed by environmentally hazardous substances. New tools were developed, particularly in connection with the aquatic environment and for cleaning up contaminated soil. In the Danish Centre for Environmental Oestrogen Research (1996–2000) methods of testing that can reveal estrogen-like effects of chemicals were developed and effects of selected chemicals were studied on levels of biological organization ranging from the molecular level through cellular and organ level to studies of individuals and populations.

Regulatory Toxicology

As far back as in 1701, a Danish decree directed the police director not to allow the selling of tainted or unhealthy foods and drinks. In 1818, a regulation instructed medical officers to observe especially the putrefaction of corn and unhealthy drinking water and in 1829 medical practitioners were ordered to report diseases, the symptoms of which indicated food poisoning, and further provide material for chemical analyses by the health police. In 1836 the Police Commissioner in Copenhagen published a list made by the medical officer indicating the colorings which could be used by producers of confectionery and toys and in 1843 the list, consisting of 39 compounds, applied to all of Denmark.

The first real food act was passed in 1903 and supplemented by statutory orders on analyses of foods (1911), on addition of colorings and preservatives (1913), and on investigations of materials coming into contact with foods (1913).

Until 1945 the Danish legislation on food primarily focused on the bacteriological control of foods and to a much lesser degree on food additives. After World War II a new food act taking into account new aspects and thoughts was prepared. The Food Act of 1950 was an emergency powers act which authorized the authorities to issue orders regulating food additives which were increasingly used in the food industry.

Developments in the food industry and the growth of food export resulted in an increasing awareness of toxicological aspects in Denmark and in the other Scandinavian countries and in 1955 an initiative was taken to suggest to WHO the idea of setting up an expert committee on food additives. In 1956 the first meeting of experts was convened by the WHO and since then annual meetings have taken place in what came to be known as the FAO/WHO Joint Expert Committee on Food Additives.

In 1968 the National Food Institute, including the Institute of Toxicology, was established under the Ministry of the Interior. From the start, the Institute of Toxicology provided toxicological assistance to the Ministry of the Interior and also advised the National Board on Health on toxicological matters.

The Ministry of the Environment was founded in 1971 and in 1972 the Danish Environmental Protection Agency was established. Agencies for nature protection etc. were established and in 1973 the National Food Institute, including the Institute of Toxicology, was transferred to the Ministry of the Environment. In 1987, when the National Food Institute was transferred to the new Ministry of Health, the Ministry of the Environment by contract was secured continued direct toxicological assistance provided by the Institute of Toxicology.

The National Institute of Occupational Health (now the National Research Centre for the Working Environment) was separated from the Danish Working Environment Authority in 1997 but stayed as a part of the Ministry of Employment. The Institute provides toxicological assistance to the Danish Working Environment Authority in connection with the regulation of chemical substances in the working environment.

Regulation and Legislation of Chemicals Today

The area of environmental chemicals is regulated by three authorities in Denmark – the Ministry of the Environment, the Ministry of Food, Agriculture and Fisheries, and the Ministry of Employment, and their agencies the Danish Environmental Protection Agency,

the Danish Veterinary and Food Administration, and the Danish Working Environment Authority.

The activities in the Danish Environmental Protection Agency concentrate on preventing and combating water, soil, and air pollution. Furthermore, the overall responsibility for the regulation of chemical substances and products lies within the agency.

Knowledge on chemical substances is used to lay down quality criteria as a basis for the setting of limit values for the maximum permissible concentration of chemical substances in the environment and in emissions (quality criterion: the highest non-harmful dose for humans or for the environment). Likewise, the evaluation of chemical substances is the basis for the classification of chemical products.

The activities in the Danish Working Environment Authority concentrate on health and safety in the working environment, including substances and materials. The Danish Working Environment Authority also sets administrative standards for air pollution at the workplace in the form of limit values for a number of substances and materials that have been documented to be injurious to health.

The Product Register (http://www.at.dk/sw12537.asp) was established at the Danish Working Environment Authority in 1979 as a joint register for the Working Environment Authority and the Danish Environmental Protection Agency. The register holds information on approximately 38 000 notified products and provides a useful means of obtaining an overall picture of the distribution of chemical products. All of the information is stored in a database and is used to assess the risks presented to the environment and to the working environment by chemical substances and products.

The activities in the Danish Veterinary and Food Administration concentrate on securing 'safety, health and quality in foods from farm to table.' The agency is responsible for the setting of national limit values for the use of food additives and for the maximum permissible concentrations of residues of pesticides and certain chemical pollutants in foods.

The monitoring program for foods was established in 1983 and results are reported for periods of 5 or 6 years. The fourth period report 1998–2003 consists of four sub-reports: Chemical contaminants, Pesticides, Food additives, and Microbial contaminants. The objectives of the monitoring program is 'to monitor, by means of analyses, the contents of desirable and undesirable substances/micro-organisms in foods, to investigate the dietary habits of the Danish population, and to carry out intake estimates by combining contents in foods and data on diet.' Subsequently, a nutritional and/or toxicological assessment can be made.

The program has been temporarily terminated due to lack of resources. Meanwhile, plans for a modernized program are being discussed.

The Danish Medicines Agency under the Ministry of Health and Prevention concentrates on securing that medicinal products are of satisfactory quality, are safe to use, and have the desired effect.

Legislation

Most of the Danish legislation concerning chemicals is based on regulation set by the European Union and then adopted in the Danish legislation. For some areas the Danish legislation is more extensive than the regulation in the European Union prescribes. Furthermore, Danish legislation also exists for areas not covered by the regulation in the European Union.

In Denmark regulation of environmental chemicals is based on the Environmental Protection Act and the Chemical Substances and Products Act and supplemented by the Working Environment Act and by the Food Act.

The Environmental Protection Act covers releases into the air, water, soil, and subsoil of chemical substances that can be dangerous to the health or to the environment. The Act is based on two main principles: polluting chemicals should not be released in the landscape and 'the polluter pays the bill.'

The Chemical Substances and Products Act regulates all chemical substances and products manufactured, imported, or sold in Denmark, including regulations on the distribution, consumption, and disposal of chemical substances. The purpose of the Act is to prevent damage to the health and to the environment and to promote the use of cleaner technologies. It is based on the principle that assessments of chemical substances should be life cycle assessments.

The Chemical Substances and Products Act is currently supplemented by orders, e.g. Statutory Order No 1065 of 30 November 2000 on classification, packaging, labeling, sale, and marketing of chemical substances and products.

The Danish Environmental Protection Agency publishes a series of factsheets presenting the orders applying to chemical substances and products in Denmark, addressing consumers, retail traders, wholesalers, importers, and manufacturers.

The Danish Working Environment Act lays down the general objectives and requirements in relation to the working environment, including substances and materials, and is currently supplemented by executive orders. WEA Guidelines are based on acts and executive orders and explain how these are to be interpreted. An example is WEA Guideline C.0.13, May

2004, dealing with the notification of substances and materials for industrial use, that is 'produced or imported substances or materials to be used in work or work processes of an industrial character, or is for re-sale in Denmark, export, or use in the producer's or importer's own business.'

The Food Act lays down the general objectives and requirements in relation to foods, including regulation of food additives and of chemical contaminants in foods, and currently is supplemented by statutory orders, e.g. Statutory Order No 22 of 11 January 2005 on Food Additives (in Danish). Positivlisten (the Positive List) describes the additives which are accepted for use in different foods and in which amounts they can be used.

The Danish Medicines Act lays down general objectives and requirements in relation to medicinal products, including authorization and control of medicinal products, reporting of adverse drug reactions, and medicinal product trials on humans. The law is currently supplemented by executive orders, e.g. Executive Order No 1211 of 7 December 2005 on the quality of medicinal products (in Danish). The Danish Medicines Agency publishes guidelines as well, e.g. on authorization of medicinal products.

The background narrative is based on relevant Danish texts and websites.

Chief physician Peter Jacobsen, Clinic of Occupational and Environmental Medicine, Bispebjerg Hospital, Copenhagen, kindly provided data for the section on the Danish Poison Control Centre.

Director of Research Department Hans Løkke, National Environmental Research Institute, kindly provided data for the section on ecotoxicogy.

RESOURCES

Books

The list of books is based on searches at http://bibliotek.dk/ and on lists provided by some of the institutions described in the section 'Organizations.' The list covers the period 1990–2006. Only a few books in Danish are included, mostly textbooks.

Journals

In Denmark there are no special journals in the field of toxicology. One of the reasons for not having journals strictly in Danish is the fact that the Scandinavian countries collaborate in publishing journals, for example *Basic & Clinical Pharmacology & Toxicology*; *Scandinavian Journal of Work, Environment & Health*; *Scandinavian Journal of Forensic Sciences*; and *Scandinavian Journal of Laboratory Animal Science*.

Technical Reports and Other Documents

DATABASES

(Q) SAR (Quantitative Structure Analysis Relationship) prediction database
Danish Environmental Protection Agency and National Food Institute, Technical University of Denmark
Web: http://www.dfvf.dk/Default.aspx?ID=20861

Relevant databases in Danish are mentioned in the section below. The section on organizations is based on information at the relevant websites and on contributions from the organizations. The number of toxicological academic man-years adds up to 240.

Organizations (Government)

Chemical Division
Ministry of Defence
Emergency Management Agency
Web: http://www.brs.dk/uk/chemical_laboratory.htm

The Chemical Division offers expert consulting and assistance to the authorities, including rescue preparedness, police, military, and health authorities in accidents involving hazardous materials or unknown substances. The assistance includes analytical chemical investigations of unknown substances, chemical warfare agents (CWA), and explosives. The expert consulting includes an information system for On-scene Commanders about hazardous materials. The information system (http://www.kemikalieberedskab.dk/english.shtml) comprises three levels:

- A guidebook for first response to hazardous materials incidents, covering about 2300 chemical substances and products.
- A manual providing more thorough information on individual hazardous chemicals.
- The National Response Centre where trained chemists offer 24-hour service on the telephone. The experts have access to the Product Register run by the Danish Working Environment Authority and to key functions within the chemical industry in Denmark. This level also covers any responses within Europe in the frame of the ICE organization (International Chemical Environment).
- http://www.kemikalieberedskab.dk/kemikalieberedskabsvagten.shtml (in Danish).

The contents of the latest editions of the two handbooks have been transferred into a database version:

- Førsteindsats ved kemikalieuheld (First response to hazardous materials incidents) – in Danish (http://www.kemikalieberedskab.dk/soeg_fi.shtml)
- Indsatskort for kemikalieuheld (Manual for response to hazardous materials incidents) – in Danish (http://www.kemikalieberedskab.dk/soeg_ik.shtml)

Danish Working Environment Authority
Ministry of Employment
Web: http://www.arbejdstilsynet.dk/sw7737.asp

From 1978 up till today the focus in occupational toxicology at the Danish Working Environment Authority has been and still is on chemicals. Carcinogens, neurotoxic substances and products, reprotoxic chemicals, and skin and airway irritants as well as allergens are the chemicals of primary concern. Rules, guidances, and sector information are the primary tasks in relation to occupational toxicology and are carried out in collaboration with toxicologists at the National Research Centre for the Working Environment, the Danish Environmental Protection Agency, and sister organizations in the Nordic countries and in the European Union.

The Danish Working Environment Authority runs the Product Register (described above) (http://www.arbejdstilsynet.dk/sw12537.asp).

The National Research Centre for the Working Environment
Ministry of Employment
Web: http://www.arbejdsmiljoforskning.dk/?lang=en

The Centre is a national centre for working environment research, including research into primarily environmental toxicology (gases and particles in outdoor and indoor air). Moreover, the Centre is involved in teaching at several Danish universities as well as at the Nordic Institute for Advanced Training in Occupational Health (http://www.niva.org), including teaching in toxicology.

Toxicology Group, an intramural network group, provides the framework for toxicological support to the authorities and for dissemination of relevant information to occupational safety professionals and to the public. The members of the group, who are scientists working part time in an advisory function, participate in The Scientific Committee on Occupational Exposure Limits (SCOEL) (http://ec.europa.eu/employment_social/health_safety/scoel_en.htm) and in the Nordic Expert Group (NEG), a Nordic collaboration for the production of criteria documents on chemicals for occupational exposure limits (http://www.av.se/arkiv/neg/). Once a year a postgraduate course in toxicology is arranged.

Danish Environmental Protection Agency
Ministry of the Environment
Web: http://glwww.mst.dk/homepage/

Danish EPA Chemicals Division is responsible for tasks relating to hazard and risk assessment of new and existing chemical substances, national and international regulation of risk chemicals, quality criteria for chemicals in soil, water and air, chemicals in consumer products, including cosmetics and toys, negotiations on the EU Chemicals Strategy, and strategies and action plans in the field of chemicals.

Danish EPA Pesticides & Gene Technology Division is responsible for the approval of pesticides and biocides, the Pesticide Research Programme, international chemicals conventions, and enforcement and supervision of the chemicals legislation. Furthermore, the division deals with applications for approval for use of genetically modified organisms (GMOs).

Danish Veterinary and Food Administration
Ministry of Food, Agriculture and Fisheries
Web: http://www.uk.foedevarestyrelsen.dk/Forside.htm

The Division for Chemical Food Safety, Animal Welfare and Veterinary Medicinal Products among other tasks is responsible for the regulation of chemical contaminants in foods, including dioxin, heavy metals, pesticides, and veterinary medicines. Furthermore, the Division is responsible for the regulation of materials and objects coming into contact with foods.

The Division for Food Quality, Technology and Marketing Practices among other tasks is responsible for the regulation of food additives, including aromatics and enzymes.

The Danish Medicines Agency
Ministry of Health and Prevention
Web: http://www.dkma.dk/1024/visUKLSArtikelBred.asp?artikelID=744

The Consumer Safety Division monitors the safety of medicinal products and is in charge of adverse reaction reports. Moreover, it is responsible for authorizing clinical trials with medicinal products.

The National Institute of Radiation Protection

Ministry of Health and Prevention
National Board of Health
Web:http://www.sst.dk/Forebyggelse/Straalehygiejne/Om_SIS.aspx?lang=da (in Danish)

The National Institute of Radiation Protection (SIS) is the radiation protection authority on ionizing radiation. Its tasks include protecting the Danish population, animals and the environment against unnecessary

radiation, formulating regulations, licensing and inspection of X-ray generators, inspecting the use of radioactive materials, providing information and advice, standardization, and carrying out supervision of the radiation area.

Organizations (Non-Government)

Department of Occupational and Environmental Medicine
Odense University Hospital
Web: http://www.ouh.dk/wm141566 (in Danish)

At present a research program 'Reprotoxicological effects of work in greenhouses' studies the exposure to pesticides, especially compounds with possible estrogenic effects, before and during pregnancy in greenhouse workers. The Department takes part in a course in pregnancy and child development for medical students.

Department of Occupational Medicine
Aarhus University Hospital
Web: http://www.sundhed.dk/wps/portal/_s.155/1921?_ARTIKELGRUPPE_ID_=1044040727120518 (in Danish)

The research of the Department of Occupational Medicine among other areas includes reproductive toxicology. For instance the Department participates in the cost-shard EU-project INUENDO studies on the impact of exposure to environmental xenobiotics with hormone-like action on human fertility.

Department of Occupational Medicine
Viborg Hospital
Web: http://www.sygehusviborg.dk/sw435.asp (in Danish)

The Department of Occupational Medicine performs toxicological risk assessments in projects carried out at the department as well as in projects carried out in collaboration with other institutions. An example is a project on emission of chemical substances from products made of exotic wood carried out for the Danish Environmental Protection Agency in collaboration with several other institutions.

Centre for Environment and Toxicology
DHI Water Environment Health
Web: http://www.dhigroup.com/Contact/DHIOffices/DenmarkDHIHeadOffice.aspx
Web: http://tox.dhigroup.com/Default.asp?ID=22

The Centre for Environment and Toxicology possesses broad international expertise in the fields of toxicology and ecotoxicology and offers a strong interdisciplinary knowledge base for chemical substances and their effects on humans, animals, and the environment. Furthermore, the Centre has in-depth knowledge of the European Union's new chemicals legislation REACH and offers courses and education in toxicology and chemicals management.

FORCE Technology
Web: http://www.force.dk

Force Technology is an independent technological institute working with measurements and testing, development, documentation, and assessments in many areas, including toxicological and ecotoxicological risk assessments of chemicals, materials, and products, often in connection with air pollution, indoor air quality, consumer products evaluation, and life cycle assessment studies. Furthermore, the Institute has special expertise in persistent organic pollutants (POPs), metals, and volatile organic compounds (VOCs).

SCANTOX
Web: http://www.scantox.dk

SCANTOX is a preclinical contract research organization performing routine and specialized tests, including dermal and inhalation studies, genotoxicity, reproductive toxicity, and pharmacological tests. Moreover, SCANTOX is very experienced in conducting research with minipigs.

Universities

Roskilde University
Department of Environmental, Social and Spatial Change
Web: http://www.ruc.dk/enspac_en/

The research activities of the Department of Environmental, Social and Spatial Change are organized around a variety of thematic areas including population and ecosystem ecology. The Department runs studies courses in ecotoxicology and PhD courses with some ecotoxicological relevance in the national Ph.D. school, GESS (Graduate School of Environmental Stress Studies (www.ruc.dk/gess) hosted by the department.

University of Aarhus
National Environmental Research Institute
Department of Environmental Chemistry and Microbiology
Web: http://www.dmu.dk/International/About+NERI/Departments/Environmental+Chemistry+and+Microbiology/

The research activities of the Department of Environmental Chemistry and Microbiology concentrate on

abating chemical and microbiological problems that arise from human impacts on the environment. The Department specializes in the characterization of the natural chemical, biochemical, and ecological processes that affect and moderate these chemicals and micro-organisms and in the implementation of monitoring programs. Current high-resolution analytical methods are combined in order to understand ecological processes that affect the distribution and fate of chemicals and their potential exposure to natural biota, and new analytical methods for assessing the distribution and fate of organic pollutants in the environment are developed.

University of Aarhus
Department of Public Health
Department of Environmental and Occupational Medicine
Web: http://www.folkesundhed.au.dk/en/en/mil/unit/presentation

The research most relevant for toxicology is molecular epidemiological studies using biomarkers of effect and susceptibility, respiratory toxicology, and endocrine disruption. As a part of the M.Sc. program in human biology the Department runs a course in human toxicology. The Department hosts Centre for Arctic Environmental Medicine (http://www.cam.gl/engelsk/index.htm).

University of Copenhagen
Institute of Forensic Medicine
Department of Forensic Toxicology
Address:
Frederik V's Vej 11
P. O. Box 2713

Email: forensic@forensic.dk

The Department of Forensic Toxicology performs post-mortem toxicology investigations in order to clarify deaths related to intoxication. Additionally, toxicological investigations are performed on blood samples from subjects involved in criminal cases and traffic cases. The analytical methods are mainly based on mass spectrometry (GC-MS or LC-MS/MS). The Department takes part in the course in forensic medicine for medical students.

University of Aarhus
Institute of Forensic Medicine
Department of Forensic Toxicology and Drug Analysis
Web: http://www.retsmedicin.au.dk/index.jsp (in Danish)

The Department of Forensic Toxicology and Drug Analysis carries out research into the field of forensic toxicology. Main themes are epidemiologic studies and method development, i.e. development of highly sensitive analytical procedures for detection of primarily drugs and narcotics in saliva, hair, urine, and blood. Research is also carried out in order to evaluate and understand (lethal) intoxications. Furthermore, the national focal points for the European Monitoring Centre for Drugs and Drug Addiction (http://www.emcdda.europa.eu/) are provided with information on the prevalence of new psychotropic substances on the Danish illicit drug market and on the monitoring of the purity of the 'well-known' narcotics. The Department takes part in courses for medical students and for chemistry students.

Aalborg University
Danish Building Research Institute
Department of Health and Comfort
Web: http://www.en.sbi.dk/research/health_and_comfort/department-of-health-and-comfort

The Department of Health and Comfort works with measurements of indoor exposures, including concentrations of particles in different size fractions and odor assessments. Full risk assessments are normally done in collaboration with external experts. The internal expertise includes hazard identification, exposure assessment, and contributions to risk management.

University of Aarhus
Institute of Anatomy
Department of Neurobiology
Web: http://www.anatomi.au.dk/neurobiology/presentation

The research of the Department of Neurobiology focuses primarily on degenerative and toxic processes in the nervous system. Expertise is available in a wide range of areas, including heavy metal toxicology. The Department hosts a research group involved in male reproductive toxicology.

University of Copenhagen
Institute of Public Health
Department of Occupational and Environmental Health
Web: http://pubhealth.ku.dk/mam_en/

The research of the Department of Occupational and Environmental Health involves an interplay between in vitro assays, experimental animal studies, and epidemiology/mechanistic studies applying biomarkers in humans, in particular the development and application biomarkers, including gene expression patterns, within the area of oxidative damage to DNA

and repair, cardiovascular function as well as foreign compound metabolism. Recently a professorship in toxicology of 5 years duration with focus on development of test methods has been established at the department. Placental perfusion is used as a human system for fetal exposure as a core in this work. The Department runs studies courses for medical students and, as a part of the M.Sc. program in human biology, a course in toxicology. Moreover, a postgraduate course in toxicology is run by the Department of Experimental Medicine at the University of Copenhagen (http://emed.ku.dk/kurser/toksikologi/).

University of Copenhagen
The Faculty of Pharmaceutical Sciences
Department of Pharmaceutics and Analytical Chemistry
Toxicology and Environmental Health
Web: http://www.farma.ku.dk/index.php/Toxicology-and-Environmental-C/3779/0/

The research activities focus on the emission to the internal or external environment of elements and compounds with biological activity, and on their processing and effects on these environments. In recent years, antibacterial agents, high-volume drugs, steroid hormones, hormone mimicking substances and degradation products hereof have been of particular interest as model compounds. Current research projects deal with the development of analytical methods, HPLC-MS in particular, modeling of effects of emissions on aquatic ecosystems, risk and effect analysis of the substances and the relationship between environment and health.

University of Aarhus
Department of Pharmacology
Web: http://www.pharmacology.au.dk/

The Department of Pharmacology comprises of divisions for basic pharmacology and toxicology and for clinical pharmacology. The emphasis of the basic research is on cardiovascular and endocrine pharmacology with special emphasis on diabetes research.

University of Southern Denmark, Odense
Institute of Forensic Medicine
Department of Toxicology
Web: http://www.sdu.dk/health/research/units/forensic.php

The Department of Toxicology performs post-mortem toxicology investigations, including identification of drugs, poisons, and narcotics and carries out research into forensic toxicology. Furthermore, the Department takes part in courses in forensic medicine for medical students.

Technical University of Denmark
DTU Food
National Food Institute
Department of Toxicology and Risk Assessment
http://www.food.dtu.dk/Default.aspx?ID=21033

The research of the Department of Toxicology and Risk Assessment contributes to a better understanding of mechanisms of actions of chemicals in food and food constituents and evaluation of possible health effects in humans. The main research areas include biomarkers and bioactive compounds, bionomics, diet and cancer, endocrine disrupters, food allergy, nanomaterials, and novel food. Furthermore, it contributes to a better understanding of mechanism of actions of chemicals in the environment, including products for industrial use and for house keeping and personal use, and evaluation of possible health effects in humans after exposure to such chemicals. The main research areas include alternatives to animal studies, genotoxicology, reproductive toxicology, QSAR (Quantitative Structure Analysis Relationship), and gene expression in plants.

Technical University of Denmark
DTU Environment
Department of Environmental Engineering
Web: http://www.er.dtu.dk/English.aspx

The Ecotoxicology and Environmental Chemistry group is concerned with the impact and fate of chemicals in the environment and the development of the tools required for environmental risk assessment of chemicals. A studies course in environmental chemistry and ecotoxicology is run by the group.

University of Southern Denmark, Odense
Institute of Public Health
Department of Environmental Medicine
Web: http://www.sdu.dk/health/research/units/environmed.php

The research activities include the following areas: adverse health effects of key environmental pollutants, especially in regard to developmental and reproductive outcomes, development and validation of biomarkers, environmental and reproductive epidemiology, methodology studies in environmental health risk assessment, and risk perception. The Department takes part in courses in toxicology for medical students.

University of Southern Denmark, Odense
Institute of Biology
The Ecotoxicology Group
Web: http://www.biologi.sdu.dk/gb/research_groups/ecotox/gruppe.htm

The Ecotoxicology Group carries out both basic and strategic research into aquatic toxicology and ecotoxicology. Principal areas of research are: trace metals in the aquatic environment; metallothionein synthesis; effects of pesticides in stream invertebrates; and estrogen mimicking compounds. A basic course in ecotoxicology and toxicology and graduate courses in toxicology, risk assessment of chemicals, ecotoxicology, and chemical analyses in environmental biology are run by the group.

Roskilde University
Department of Science, Systems and Models
Eucaryotic Cell Biology Group
Web: http://roskilde-university.com/nsm/forskning/forskningsgrupper/cellbiol/

The research activities of the Eucaryotic Cell Biology Group among other areas include DNA repair and genomic stability, intracellular messengers in cell signaling and toxicity, and toxicology and biokinetics of essential and toxic metals.

University of Copenhagen
Faculty of Life Sciences
Department of Veterinary Pathobiology
Laboratory of Toxicology
Web:http://www.ivp.kvl.dk/Om-instituttet/Faggrupper/Biomedicin/Toks.aspx (Danish/English)

The research activities of Laboratory of Toxicology focus mainly on the metabolism of toxicants in animals and their mode of actions. A studies course in basic pharmacology and toxicology is run by the laboratory.

Technical University of Denmark
Risø DTU
National Laboratory for Sustainable Energy
Radiation Research Department
Web: http://www.risoe.dk/About_risoe/research_departments/NUK.aspx/

The Radiation Research Department works in the fields of radiation safety, radiation physics, dosimetry, radioecology, tracer studies, radiochemistry, isotopes, nuclear instruments, and industrial and medical applications of nuclear methods. The risk to man from environmental radioactivity is assessed by taking into account exposure pathways from terrestrial and marine ecosystems involving external and internal exposure.

University of Aarhus
Institute of Anatomy
Reproductive Laboratory
Address:
Reproductive Laboratory
Institute of Anatomy
Building 1234
University of Aarhus
DK-8000 Aarhus C
Denmark
Phone +45 89496402 or 89423074
Email: erik.ernst@dadlnet.dk

The Reproductive Laboratory carries out clinical and experimental research into the area of reproductive toxicology. Moreover, the laboratory, in collaboration with Department of Occupational Medicine, Aarhus University Hospital, carries out reproductive toxicological and epidemiological research.

University of Copenhagen
Faculty of Life Sciences
Research School of Environmental Chemistry and Ecotoxicology
Web: http://www.receto.dk/

A postgraduate school of environmental chemistry and toxicology – molecular studies of fate and effects of pollutants in aquatic and terrestrial ecosystems.

University of Aarhus
National Environmental Research Institute
Department of Terrestrial Ecology
Section of Soil Fauna and Ecotoxicology
Web: http://www.dmu.dk/International/About+NERI/Departments/Terrestrial+Ecology/Section+of+Soil+Fauna+and+Ecotoxicology/

The Section of Soil Fauna and Ecotoxicology carries out basic, applied, and commercial contract research into soil fauna ecology, ecophysiology, and ecotoxicology and provides consultancy for national and international authorities within its areas of expertise. The main objective of the research activities is to describe and understand how different kinds of pollutants, climatic conditions, and various methods of farming affect soil living animals and the ecosystems that they are a part of.

University of Aarhus
Department of Biological Sciences
Zoophysiology Group, Ecotoxicology
Web: http://www.biology.au.dk/zoofys.velkom-en

The research in ecotoxicology focuses on effects of environmental contaminants on animal behavior with emphasis on mechanistic links to other levels of biological organization, e.g. effects of endocrine disrupters on the sexual behavior and reproduction in fish and mechanistic relationships between metabolism, respiration, and behavior in arthropods. Studies courses in basic ecotoxicology and experimental ecotoxicology are run by the group.

Poison Control Centers

The Danish Poison Control Centre
The Capital Region: Bispebjerg Hospital
Poison Hot Line
Web: http://www.giftlinjen.dk/english.6

The Danish Poison Control Centre is a collaboration between three departments at Bispebjerg Hospital: Clinic of Occupational and Environmental Medicine, Department of Clinical Pharmacology, and Department of Anesthesiology. The special knowledge about poisoning is used to detect and identify hazardous products and situations, which may pose a particular risk of poisoning. The Centre has an active surveillance program and contacts distributors or regulatory authorities when situations call for it. Furthermore, the center undertakes research in clinical toxicology, provides education, assists in cases of poisoning emergencies, and provides guidance and advice to the authorities.

The Poison Control Hotline is a telephone service offering immediate guidance for poisoning emergencies to all Danes 24 hours a day, seven days a week. Furthermore, The Poison Control Hotline offers guidance for treatment of poisonings to doctors, nurses, and other health personnel.

Two databases in Danish can be found at the website of the Poison Hot Line:

- Kemikalielisten (Database on chemicals: risks, symptoms and precautionary measures in poisoning with chemical products including household chemicals and other common chemical products).
- Plantelisten (Database on plants: risks, symptoms and precautionary measures in poisoning with specific plants).

Legislation

Retsinformation ('Legal Information'), established in 1985, is the official online legal information system of the Danish State and contains all Danish rules and regulations. All documents are in Danish but translations of some of the central acts can in some cases be found on the website of the relevant ministry.

CHAPTER

87

Ecuador

HOMERO C. HARARI, RAUL E. HARARI, AND RAMIRO I. LOPEZ

INTRODUCTION

Toxicology has been a subject of little research in Ecuador, in some cases because of economic constraints and limited trained personnel but also because of limited interest and application. In spite of that, during the last 15 years, toxicology in Ecuador has developed due to the critical need to understand increasing occupational and environmental problems.

In 1941, the first step was taken by the Ecuadorian government with the creation of the National Institute of Hygiene and Tropical Medicine 'Leopoldo Izquieta Perez,' as a scientific center ascribed to the Ministry of Public Health, whose aim is the promotion of scientific research to: (a) prevent, diagnose and control infectious, endemic and epidemic diseases; (b) develop technologies for the production of safer preventive products used in human and animal health; (c) for the registry and sanitary control of drugs, biological products, food, hygienic products, cosmetics, pesticides and other products of general consumption and (d) for training personnel.

During these early years, only isolated scientists, like Dr. Rodrigo Fierro and Dr. Plutarco Naranjo, worked in this field and they were pioneers, looking for information and articulating questions of national interest concerning health issues such as goiters and allergies.

As industrial development matured, in the 1970s, toxicants became a concern, but it took two decades to develop initial activities in this field. At the beginning of the 1980s various official institutions tried to organize and oversee some basic labs. For example, the National Petroleum Industry (PETROECUADOR), built an important lab to deal with hydrocarbons and substances related to the oil industry and its impacts. Unfortunately, a fire destroyed this first lab and it took many years to construct a new one. Now, all three oil refineries in Ecuador have their own labs. They are trying to improve their techniques and to train their personnel in the environmental aspects of the industry.

The need for trained personnel led the government to give support to many professionals to travel to developed countries to advance their education, but also within Ecuador, some universities organized seminars and courses to improve the situation. In parallel, some universities created basic labs set up for new research. The technology was not optimal, but scientifically credible results were obtainable.

In Ecuador, poisoning incidents, according to statistics, increase 20% in incidence a year (INHLIP-CIATOX 2005) and are responsible for some 1000 deaths a year (INHLIP-CIATOX 2005). Among the causes of poisoning are violence, familiar disintegration, and depression, but all of them linked to voluntary poisoning. Other causes are unsafe conditions in the handling and use of chemicals at home, at work, and in the general environment. Acute intoxications due to pesticides increased from 3.54/100 000 inhabitants in 1990 to 14.52/100 000 inhabitants in 2003 (Ministry of Public Health, National Department of Epidemiology 2003), and in 2004, 156 intoxications were reported in classifications X40-X49 of the CIE (International Classification of Diseases 10-WHO). This signifies a rate of 0.1/10 000 inhabitants (Ministry of Public Health, Basic Health Indicators, Ecuador 2005). This information should be weighed carefully, though, because although the

tracking system is improving the capacity to collect information, misclassification and lack of information from remote areas where the incidence may be greater are a distinct possibility.

Information from the Social Insurance Ecuadorian Institute, Ministry of Labor, and Ministry of Environment is scarce. The private sector had minimal interest in toxicological questions and issues and only within the past few years have private labs started providing services to identify pesticides or heavy metals in urine.

The Ministry of Agriculture has its own lab for identifying pesticides in soil and water, and there is a lab of the CEEA (Ecuadorian Commission of Nuclear Energy) that could also help in the identification of some toxic substances from agriculture or industry. But this information is not published.

There is clearly a need to include Toxicology as a subject in more Graduate Programs as well as to cover the increased demand of poisoned patients who are unable to get treatment unless they have access to hospitals in major cities. Today we have as many as 200 professionals and technicians that can deal with toxicological emergencies at a basic level. Technology, in spite of several modern labs, is not quite state-of-the-art. One of the main problems is the lack of integration of information, training, and application of the knowledge and of encompassing multidisciplinary approach in the studies.

This has an even greater effect in tracking poisoned patients, since many go to private hospitals, and intoxications are not officially reported.

Recently, the creation of Toxicological Information Centers, such as the Toxicological Advisement and Information Center – CIATOX, formerly a unit of the National Institute of Hygiene and Tropical Medicine 'Leopoldo Izquieta Perez,' has become one of the options to support and improve the treatment of poisoned patients, as well as to reduce risks associated with chemical substances and for data collection. Such centers, though, must be complemented with other activities and resources, as part of a systematic development of toxicology. This chapter presents the primary resources and tools now available to help develop toxicology for the benefit of communities and the environment in Ecuador.

The critical objective continues to be seeking the development of methods, techniques, studies, and research seeking biological indicators to correlate with environmental measurements within a scientific design. The concept of exposure and its association with effects is lacking in the studies that some researchers are conducting in Ecuador.

Thus, we can say that the evolution of toxicology in Ecuador shows that there are many problems to be studied and solved. There is clearly an interest and many actors who could potentially participate. At the same time we need to organize a national system including stakeholders from governmental, private, and non-governmental organizations, together with universities and scientific institutions, to assess the situation in Ecuador as a whole and to develop a new framework, for the future.

Organizations (Non-Government)

Accion Ecologica

NGO dedicated to the defense of natural resources in Ecuador. Experience in oil, mining, pesticides, and water management policy.

Web: http://www.accionecologica.org (Spanish only)

CEAS

Health research and advisory center.

Web: http://www.ceas.med.ec/ (Spanish only)

CEDENMA – Ecuadorian Committee for the Defense of Nature and Environment

Group of non-governmental organizations for the defense of nature, environment and health.

Web: http://www.cedenma.org/ (Spanish only)

CEOSL – The Ecuadorian Confederacy of Trade Union Free Organizations

Confederacy at national level, in which it groups organized workers in commerce, services, crafts, and culture; and, in general workers with a degree of dependency.

Web: http://www.uocra.org/itcilo/vero.htm (Spanish only)

Cimas del Ecuador

Work in the design of alternative models of local development, which considers environmental, social, and cultural differences.

Web: http://www.cimas.edu.ec/ (Spanish and English)

Comunidec

Research systems on local development.

Email: comunide@ecuanex.net.ec

ECOLEX

Promotes and executes policy alternatives and legislation for sustainable development.

Web: http://www.ecolex-ec.org/ (Spanish and English)

FENACLE – National Federation of Peasants and Agricultural Workers of the Ecuador

Organization with great experience in the defense of labor rights of workers in banana and flower Plantations.

Guayaquil, Ecuador
Phone: +593 4 2414077
Email: fenacle@easynet.net.ec

FFLA – Fundacion Futuro Latinoamericano

ONG with experience in socio-environmental conflicts and environmental policy

Web: http://www.ffla.net/ (Spanish only)

Fundacion Ambiente y Sociedad

Research and advice in environment and society.

Phone: (593-2)-2904-815
Alemania 550 y Vancouver, piso 4
Quito, Ecuador

Fundación Ciencia Para el Estudio del Hombre y la Naturaleza

Address: Paúl Rivet 257 y Wimper
Phone: 593 2 2524455/593 9 94830562

CHAPTER

88

Finland

HANNU KOMULAINEN

INTRODUCTION

Toxicology first came into its own in Finland in the late 1970s. The first full-time professorship in toxicology (precisely in toxicology and pharmacokinetics, changed later to toxicology) was founded at the University of Kuopio, Department of Pharmacology and Toxicology in 1976; the Finnish textbook, *Pharmacology and Toxicology* edited by Tuomisto and Vartiainen, was published in 1978, and contained a separate section on toxicology; the Finnish Society of Toxicology was founded in 1979 and the first postgraduate program in toxicology was launched to start at the beginning of 1980s at the University of Kuopio. Research on toxicological topics had been conducted at universities and institutes long before, but the above breakthroughs are formal signs of the evolution of the discipline. The term 'toxicology' appeared more often in university positions and the names of departments in the 1980s. Currently toxicology is an established science in Finland and, as described in the sections on 'Organizations' below, it has a clearly defined role in Finnish society. In several institutes, it is part of their activity or is integrated with other disciplines. Relatively few divisions are devoted solely to toxicology. This is true also for ecotoxicology, which has developed simultaneously. The Finnish Society of Toxicology has had about 300 members (out of the total population of 5.1 millions) through the years and the society has been active both nationally and internationally in multilateral organizations such as EUROTOX and IUTOX, and organizing, for example, the 10th IUTOX meeting (ICT-X) in Tampere in 2004.

As to information sources in toxicology in Finland, most essential information can be gained through the Internet. Compared to the previous edition of this book, fewer books are currently being published on toxicological topics. Although the key textbooks and handbooks are maintained by new editions and a whole series of books have appeared in subjects such as radiation, while the regulatory side of chemicals has received little attention. One reason may be that chemical legislation in the EU is in flux due to REACH. Perhaps, once it is established, more definitive regulatory documentation will become available. However, it is likely that the information will be increasingly digital even then because it can be more readily been updated. As to the use of the information, the main responsibility in several public functions in Finland resides at the local and municipal levels, with the guidance from ministries being informative rather than binding. For that reason, relevant information in easily and quickly accessible form is highly valued and will be a challenge in the future.

This chapter focuses on current information considered most useful – the newest relevant sources. The older literature dropped out from this edition is still long available through libraries. As to descriptions of the organizations, the perspective has been wide because it is often more important to know where to find the information than precisely what can be found there. Internet search engines are powerful tools for finding documents if one has a reliable reference. Most of the listed digital sources exist in both Finnish and English versions, and others include English summaries. Contact information is provided where feasible but it mostly can also be located from digital sources.

RESOURCES

Books

The listed handbooks and textbooks are largely in Finnish. A short description of their contents is provided. More information may be available at the website for the publication or the publisher.

Anttonen H, Lapinlampi T, Virtanen S (2006)
Elektoniikka-alan kemikaaliopas (Guide to the Safe Use of Chemicals in the Electronics Industry)
Työterveyslaitos: Helsinki
ISBN (pdf) 951-802-710-2

The guide helps to identify chemical risks in the electronics industry and provides tools for their systematic evaluation and assessment. Relevant chemicals, the associated health risks and risk prevention strategies are also are described by job.

Hoppu K, Pohjalainen T, Taalikka P (Eds.) (2002)
Lasten myrkytykset (Poisonings in Children)
Duodecim: Helsinki
ISBN 951-656-129-2

This book is aimed as guidance for household situations involving poisoning in children. Contains instructions for emergency help, information on typical agents causing poisonings in children and prevention of poisonings.

Ikäheimonen T (Ed.) (2002)
Säteily- ja sen havaitseminen (Radiation and its Detection) Säteilyturvakeskus: Helsinki
ISBN 951-712-496-1 (print)
ISBN 951-712-503-8 (pdf)

A book on the basics of nuclear physics, units of radiation, detectors of radiation and measurement of radiation. Available also as a pdf-file on the web pages of the Radiation and Nuclear Safety Authority (STUK). (Finnish only: http://www.stuk.fi/julkaisut_maaraykset/kirjasarja/fi_FI/kirjasarja). This is the first part of the series of seven books on radiation and nuclear safety.

Jantunen M, Komulainen H, Nevalainen A, Tuomisto J, Venäläinen R, Viluksela M (2005)
Selvitys elinympäristön kemikaaliriskeistä – Kansallisen kemikaaliohjelman taustaselvitys (Evaluation on Health Risks of Chemicals in our Environment – Report for National Chemical Programme)
Publications of the National Public Health Institute B 11/2005: Helsinki
ISBN 951-740-495-6 (print)
ISBN 951-740-533-2 (pdf)

A thorough evaluation and summary on the exposure and the associated health risks of environmentally relevant chemical substances in Finland in 2005. This is the most comprehensive summary published so far including food, water, indoor and outdoor air, contaminated soils, waste and waste water, consumer products, and even cosmetics. Some general recommendations are also given for risk assessment and the needs for future work in environmental chemical safety are prioritized. Contains an executive summary in English. Also available on the Internet (http://www.ktl.fi/attachments/suomi/julkaisut/julkaisusarja_b/2005b11.pdf).

Koulu M, Tuomisto J (Eds.) (2007)
Farmakologia ja toksikologia (Pharmacology and Toxicology), 7th Edition
Kustannusosakeyhtiö Medicina: Kuopio
ISBN 978-951-97316-2-9

This textbook is the first comprehensive presentation of pharmacology in the Finnish language aimed especially at students of medicine and pharmacy. The book also contains the basics of toxicology, including principles of general toxicology, organ toxicity, mutagenicity, carcinogenicity, teratogenicity, and the evaluation of toxicity. The toxicity of drugs, alcohols, solvents, carbon monoxide, metals, pesticides, and air pollutants have been dealt with in more detail in separate chapters, as has occupational toxicology.

Lähteenmäki P, Nuutinen T, Parkkinen P (2000)
Ravintomme lisäaineet (Food Additives), 2nd Edition
Suomen Ravitsemusinstituutti: Helsinki
ISBN 9789525046014

A handbook on food additives for consumers; also contains useful information for professionals in nutrition and food safety control.

Neuvonen PJ, Himberg J-J, Huupponen R, Kivistö K, Ylitalo P (Eds.) (2002)
Kliininen farmakologia ja lääkehoito (Clinical Pharmacology and Therapeutics)
Kandidaattikustannus Oy: Helsinki
ISBN 951-8951-17-9

A Finnish textbook on clinical pharmacology and therapeutics, also containing information on clinical toxicology.

Nikunen E, Leinonen R (2002)
Ympäristölle vaaralliset kemikaalit – riskinarviointi ja luokitus (Hazardous Chemicals in the Environment – Risk Assessment and Classification)
Kemianteollisuus ry.: Helsinki

A handbook on assessment of environmental effects of chemicals and classification and labeling.

Nordman H, Oksa P, Karjalainen A, Koskinen H (2006)
Asbestisairauksien diagnostiikka ja seuranta (Diagnostics and Surveillance of Asbestos-induced Diseases)
Työterveyslaitos: Helsinki
ISBN 951-802-628-9

A book on occupational asbestos-induced diseases; the diagnostics and surveillance of the exposed persons in Finland.

Nyberg J, Jokela K (Eds.) (2006)
Ionisoimaton säteily – Sähkömagneettiset kentät (Non-ionizing Radiation – Electromagnetic Fields)
Säteilyturvakeskus, Helsinki
ISBN 951-712-501-1 (print)
ISBN 951-712-508-9 (pdf)

A book on electromagnetic fields covering properties of radiation, exposure, dosimetry, biological effects, and health risks. The sixth part of a series of seven books on radiation and nuclear safety.

Pääkkönen R, Rantanen S (2003)
Työympäristön kemiallisten ja fysikaalisten riskien arviointi ja hallinta (Risk Assessment and Management of Chemical and Physical Risks in the Work Environment), 3rd Edition
Työterveyslaitos, Helsinki
ISBN 951-802-544-4

A guide book on occupational health risk assessment.

Paile W (Ed.) (2002)
Kirja säteilyn terveysvaikutuksista (Effects and Health Risks of Ionizing Radiation)
Säteilyturvakeskus: Helsinki
ISBN 951-712-499-6 (print)
ISBN 951-712-506-2 (pdf)

A book on effects of ionizing radiation, from the cellular level to health risks. The book focuses especially on cancer but also addresses developmental effects. There is also a section on the Chernobyl nuclear accident. The book is available also as a pdf file on the web pages of the Radiation and Nuclear Safety Authority (STUK) (Finnish only: http://www.stuk.fi/julkaisut_maaraykset/kirjasarja/fi_FI/kirjasarja). It is the fourth part of a series of seven books on radiation and nuclear safety.

Pelkonen O, Ruskoaho H (Eds.) (2003)
Lääketieteellinen farmakologia ja toksikologia (Medical Pharmacology and Toxicology), 3rd Edition
Kustannus Oy Duodecim: Helsinki
ISBN 951-656-090-3

A textbook in pharmacology and toxicology for medical, dental, and pharmacy students. The book contains sections of general pharmacology, systematic pharmacology, and toxicology. The emphasis is on mechanisms of action of drugs. The section of toxicology (140 pages) covers general principles of toxicology, organ-specific toxicity, clinical toxicology, occupational toxicology, environmental toxicology, and evaluation of toxicity and risk assessment.

Pöllänen R (Ed.) (2003)
Säteily ympäristössä (Radiation in Environment)
Säteilyturvakeskus: Helsinki
ISBN 951-712-497-X (print)
ISBN 951-712-995-5 (pdf)

A book on radioisotopes in nature and the associated radiation and doses in Finland. Possible health risks are also briefly addressed. The book covers radiation in indoor and outdoor air, in drinking water, in food, internal and external radiation, cosmic radiation, and basics of radiation protection. Available also as a pdf file on the web pages of the Radiation and Nuclear Safety Authority (STUK). (Finnish only: http://www.stuk.fi/julkaisut_maaraykset/kirjasarja/fi_FI/kirjasarja). The second part of the series of seven books on radiation and nuclear safety.

Pukkila O (Ed.) (2004)
Säteilyn käyttö (Radiation in Use)
Säteilyturvakeskus: Helsinki
ISBN 951-712-498-8 (print)
ISBN 951-712-505-4 (pdf)

A book on the use of radioisotopes and radiation in medicine (diagnostics and treatment), industry, and research. There is also a description of the relevant legislation, a section about radiation in consumer products and cases of accidents and unexpected situations in the use of radiation. It is available also as a pdf file on the web pages of the Radiation and Nuclear Safety Authority (STUK) (Finnish only: http://www.stuk.fi/julkaisut_maaraykset/kirjasarja/fi_FI/kirjasarja). The third part of the series of seven books on radiation and nuclear safety.

Riihimäki V, Isotalo L, Jauhiainen M, Kemiläinen B, Laamanen I, Luotamo M, Riala R, Zitting A (2005)
Kemikaaliturvallisuuden tiedonlähteet (Information Resources on Chemical Safety), 2nd Edition
Työterveyslaitos: Helsinki
ISBN: 951-802-556-8

This is the most comprehensive single compilation of information resources on chemicals in Finnish, containing both national and international sources. The book contains the sources, description of the contents of the information, some basics of toxicology, instructions on interpretation of the data, and classification

and labeling phrases of chemicals. In addition to a hardcopy, the book is available as an electronic form on the web pages of the publisher, the Finnish Institute of Occupational Health (Finnish only: http://www.ttl.fi/internet/kemikaalitieto/kemturva.pdf).

Sandberg J (Ed.) (2004)
Ydinturvallisuus (Nuclear Safety)
Säteilyturvakeskus: Helsinki
ISBN 951-712-500-3 (print)
ISBN 951-712-507-0 (pdf)

A book on nuclear power, from a Finnish perspective. Environmental and health risks associated with nuclear power plants and nuclear waste, regulation of nuclear safety, and the role of STUK as a responsible authority. Available also as a pdf file on the web pages of the Radiation and Nuclear Safety Authority (STUK) (Finnish only: http://www.stuk.fi/julkaisut_maaraykset/kirjasarja/fi_FI/kirjasarja). The fifth part of the series of seven books on radiation and nuclear safety.

Vainio H, Liesivuori J, Lehtola M, et al (2005)
Kemikaalit ja työ – Selvitys työympäristön kemikaaliriskeistä (Chemicals at work – Report of the Finnish Occupational Health Institute for the National Programme of Chemical Safety)
Työterveyslaitos: Helsinki
ISBN 951-802-636-X (hard copy)
ISBN 951-802-645-9 (pdf)

A thorough summary on occupational exposure to chemicals, their health effects, health risks, and risk management in Finland in 2005. In addition to descriptions of single chemicals and exposures, the book contains short chapters on management of chemical waste and risk management in general. The book contains an executive summary in English. The entire edition is also available on the Internet (http://www.ttl.fi/Internet/Suomi/Aihesivut/Kemikaaliturvallisuus/Kemikaalit+ja+tyo/sisallysluettelo.htm).

Journals

Most institutes have a bulletin or a newsletter to provide information on their work and some of them are mentioned later in the description of the organizations. The journals below may have a wider coverage of readers, are more technical or science-based, or otherwise relevant.

African Newsletter on Occupational Safety and Health
Finnish Institute of Occupational Health, Helsinki (financially supported by the World Health Organization and the International Labour Organization)
ISSN 0788 – 4877 (printed)
ISSN 1239 – 4386 (on-line)

An electronic journal on occupational safety and health issues of Africa. The journal is published in English and is available at the home page of the Finnish Institute of Occupational Health. Three issues per year.

Web: http://www.ttl.fi/Internet/English/Information/Electronic + journals/African + Newsletter (English only)

ALARA (Radiation Safety)
STUK – Radiation and Nuclear Safety Authority, Helsinki
ISSN 1235-1970

An information magazine from the Radiation and Nuclear Safety Authority for professionals in radiation and nuclear power issues. Contains articles on health and environmental safety with a summary in English, facts on radioisotopes, and information on the national regulations on radioactive agents and nuclear power. Offers information on study reports and publications of the institute. Four issues per year. The contents of each issue are available in the Internet.

Web: http://www.stuk.fi/julkaisut_maaraykset/alara/fi_FI/alara (Finnish only)

Asian-Pacific Newsletter on Occupational Safety and Health
Finnish Institute of Occupational Health, Helsinki
ISSN 1237-0843 (printed)
ISSN 1458-5944 (online)

An electronic journal on occupational safety and health issues in the Asian-Pacific region. The journal is available at the home page of Finnish Institute of Occupational Health, published in English. Three issues per year.

Web: http://www.ttl.fi/Internet/English/Information/Electronic + journals/Asian-Pacific + Newsletter/ (English only)

Barents Newsletter on Occupational Safety and Health
Finnish Institute of Occupational Health, Helsinki
ISSN 1455-8459 (printed)
ISSN 1458-5952 (online)

An electronic journal on occupational safety and health issues in the Barents region of Russia. The journal is available at the home page of Finnish Institute of Occupational Health. The articles are in English and in Russia. Three issues per year.

Web: http://www.ttl.fi/Internet/English/Information/Electronic + journals/Barents + Newsletter (English only)

Duodecim (Finnish Medical Journal Duodecim)
Finnish Medical Society Duodecim, Helsinki
ISSN 0012-7183

This is the oldest Finnish medical serial publication, founded in 1885. It is intended for medical professionals,

especially physicians. The primary purpose is to provide postgraduate scientific and vocational training for physicians. The journal publishes peer-reviewed original articles, reviews, and case reports in all specialties of clinical medicine as well as articles of general interest on biomedicine and public health. Six special issues are normally published each year; 24 issues are published annually. Toxicology is among the topics covered in this journal's articles. The contents and abstracts of the articles considered exceptionally important are also in English.

Web: http://www.terveysportti.fi/terveysportti/dlehti2.koti (English)
Web: http://www.terveysportti.fi/terveysportti/dlehti2.koti (Finnish)

Kansanterveys (Journal of National Public Health Institute)
National Public Health Institute, Helsinki
ISSN 1236-973X

An information journal of the National Public Health Institute for professionals working in the public and environmental health care system, from municipalities to ministries and other governmental institutes. Ten yearly issues, each focusing to some specific theme. Short notes on the ongoing research in the institute. The articles can also be accessed via the Internet.

Web: http://www.ktl.fi (Finnish)

Kemia-Kemi (Finnish Chemistry)
Kempulssi Oy, Helsinki
ISSN 0355-1628

A professional magazine dedicated to chemistry, *Kemia-Kemi* is a membership magazine of the Association of Finnish Chemical Societies. Published under the auspices of the Chemical Industry Federation. The magazine reviews news and developments in international and Finnish chemical trades and chemistry. Toxicology is among the topics covered. Maintains a comprehensive directory on enterprises and companies offering services related to chemistry.

Web: http://www.kemia-lehti.fi/english.htm (English)
Web: http://www.kemia-lehti.fi/index.htm (Finnish)

Scandinavian Journal of Work, Environment and Health
Finnish Institute of Occupational Health; National Institute of Occupational Health, Denmark; National Institute of Occupational Health, Norway; and National Institute for Working Life, Sweden
ISSN 0355-3140

A scientific journal publishing original papers and review articles concerning occupational health and the work environment. The fields covered are medicine, toxicology, epidemiology, industrial hygiene, safety, ergonomics, sociology, psychology, and physiology. Six issues per year. The papers are indexed in leading index services.

Web: http://www.sjweh.fi (English only)

Suomen Lääkärilehti (Finnish Medical Journal)
Finnish Medical Association, Helsinki
ISSN 0039-5560

Suomen Lääkärilehti, published by the Finnish Medical Association as a membership magazine, is the leading journal aimed at physicians in Finland. The journal serves as an information medium for the association and its members in vocational questions and supports the postgraduate training of physicians. The journal publishes articles mostly on diagnostics, treatment, and rehabilitation, and articles concerning the practical work of physicians. Toxicology, especially related to drugs, is frequently dealt with. The journal is published in 36 issues per year. The articles have an English summary, available also in the Internet.

Web: http://www.laakarilehti.fi/e/ (English)
Web: http://www.laakarilehti.fi (Finnish)

TABU (Drug information from the National Agency for Medicines)
National Agency for Medicines, Helsinki
ISSN 1236-7427

A safety information magazine of the National Agency for Medicines for healthcare professionals and pharmacists. Contains summaries on new active ingredients and reviews on the use and side effects of pharmaceuticals. Six issues per year. Contains summaries in English and Swedish. Available in the Internet.

Web: http://www.nam.fi/english/publications/tabu/index.html (English)
Web: http://www.nam.fi/julkaisut/tabu/2004/index.html (Finnish)

Työ, terveys, turvallisuus (Work, Health, Safety)
Finnish Institute of Occupational Health, Helsinki
ISSN 0041-4816

A magazine for all individuals interested in occupational health and safety. The topics cover all fields of occupational safety and health. Eight issues per year, in Finnish only. Short abstracts of key articles available on the web pages.

Web: http://www.ttl.fi/Internet/Suomi/Tiedonvalitys/Tyo + Terveys + Turvallisuus + –lehti (Finnish only)

Ympäristö (Environment)
Stellatum Oy, Espoo
ISSN 1237-0711

The magazine of the Ministry of the Environment and the Finnish Environment Institute on environmental

issues for all who are interested in environmental safety, waste management, contaminated soils, etc., the subjects dealt with by those institutes. Short articles and notes about ongoing activities elsewhere are included. Six issues per year, only in Finnish.

Web: http://www.ymparisto.fi/default.asp?contentid=222885&lan=fi (Finnish only)

Ympäristö ja Terveys (Environment and Health)
Suomen Ympäristö- ja Terveysalan Kustannus Oy, Helsinki
ISSN 0358-3333

A professional periodical for persons responsible for and interested in environmental and occupational health, as well as the hygiene of food in Finland. Contains useful information especially for authorities and persons responsible for environmental safety and occupational protection in industry. The journal frequently publishes special issues. One such issue (10/2006) is a summary on exposure of Finns to chemicals and radiation. Eight issues per year.

Web: http://www.ymparistojaterveys.fi/ytlehti/ytindex.php (Finnish only)

Databases

International study programmes database
Web: http://finland.cimo.fi (English)

The International Study Programmes Database, maintained by CIMO (Centre for International Mobility), gives information about study programs taught in English in Finnish universities and polytechnics. This database provides information about close to 400 international study programs. In almost all of the programs, the language of instruction is English.

KAMAT – Tietokortit kemiallisesta altistumisesta metalli- ja autoalojen työtehtävissä (Information cards on exposure to chemicals in metal and car industry)
Web: http://www.ttl.fi/Internet/partner/kamat (Finnish only)

A database, maintained by the Finnish Institute of Occupational Health, on exposure to chemicals in the metal and automobile industries in Finland. The database contains information arranged by job, on exposure to chemicals, health risks, occupational diseases and mitigation of the exposure and the risks.

Kansainväliset kemikaalitietokortit (International Data Cards on Chemicals)
Web: http://kappa.ttl.fi/kemikaalikortit (Finnish only)

The Finnish translation of the database produced by the International Programme on Chemical Safety (IPCS) and the European Union (EU), maintained by the Finnish Institute of Occupational Health. Data on over 1500 industrial chemicals including physical-chemical properties of the chemical, classification and labeling, exposure, health risks, instructions for emergency situations and safe storage. Data may be searched by different keywords. The original international cards have been translated to several other languages and there is access to them through the website.

Kemikaalien ympäristötietorekisteri (Data bank of Environmental Properties of Chemicals – EnviChem)
Web: http://www.ymparisto.fi/default.asp?contentid5141944&lan=fi&clan=en (Finnish only)

This database, maintained by Finnish Environment Institute, Chemicals Division covers about 2700 chemicals. The database consists of information on the toxicity of substances in relation to different species, especially aquatic organisms, together with information on the persistence and accumulation of these substances in the environment. The list of species and abbreviations helps in the interpretation of the data. The information is mainly compiled from scientific literature, handbooks, and databases in the field of ecotoxicology and contains some 3500 references. The scientific value of the compiled information has not been assessed. The database is useful to environmental authorities, researchers, consultants, and companies dealing with chemicals. The database is also available on CD-ROM.

Kemikaalirekisterin tuoterekisteri, KETU (The Product Register of the Chemicals Register)
Web: http://www.sttv.fi/kemo/TURE/In_English.htm (English)

A database of chemical products marketing commerce in Finland, maintained by the National Product Control Agency for Welfare and Health (STTV). The database is based on the Decree of the Ministry of Social Affairs and Health on submitting information on chemicals (374/2002). The collection and registration of data started in 1979. KETU contains data on approximately 100 000 industrial chemical products and compounds registered in Finland. Of them, about 30 000 are in commerce. The data are based on information submitted by the manufacturers and importers, according to the Chemical Act, and within the context of the registration of the product. The register contains information such as classification of the chemical, safety instructions, components hazardous

to health, physical–chemical properties, health risks, precautions in handling and instructions for storage and disposal. The safety data sheets (see below) are based on the same information. Since some data may be confidential, access is restricted to authorities responsible for chemical control.

Käyttöturvallisuustiedotteet (Safety Data Sheets)
Web: http://www.onemed.com:8080/ipublisher/medlabwww.nsf/sivut/finnishtemplate?OpenDocument&cid=Kayttoturvallisuustiedotteet (Finnish only)

A compilation of safety data sheets provided by the manufacturers of chemicals. The database is maintained by OneMed Company. Each entry contains information on classification of the chemical, safety instructions, components hazardous to health, physical–chemical properties, health risks, precautions in handling, and instructions for storage and disposal. An electronic database.

LEO
Web: http://pretty.ttl.fi/LEO/search.htm (Finnish only)

LEO is a reference database of publications concerning occupational safety and health published since 1978 in Finland. The database is maintained by the Finnish Institute of Occupational Health. It contains more than 40 000 computerized references and the number increases by about 2000 per year.

Onnettomuuden vaaraa aiheuttavat aineet-turvallisuusohjeet (OVA-ohjeet) (Safety sheets on substances causing potentially accidents)
Web: http://www.ttl.fi/ova (Finnish only)

The database, maintained by the Finish Institute of Occupational Health, on 88 industrial chemicals which have the most potential to cause accidents in Finland. OVA-cards offer rescue instructions for rescue workers and persons responsible for occupational health. There is also access to R- and S-sentences (classification and labeling).

TOKEVA-ohjeet (Instructions for rescue workers in chemical accidents)
Web: http://www.pelastusopisto.fi/pelastus/home.nsf/Pages/6CB9D53FDFE9D71FC22571CE003DD9E2 (Finnish only)

Provides instructions for handling of chemical accidents and other incidents for rescue workers. The information is meant for rescue professionals but the data and the source are very useful for anyone who handles (dangerous) chemicals. In addition to general instructions, substance-based instructions are given on hazards, personal protection and equipment needed in rescue work, as well as detailed advice on what to do and how. The database can be uploaded from the Pelastusopisto home page.

Torjunta-ainerekisteri (A register on pesticides)
Web: http://www.evira.fi/portal/fi/kasvintuotanto_ja_rehut/torjunta-aineet/torjunta-ainerekisteri

A register and database on pesticides (pesticide products) in use in Finland, maintained by Finnish Food Safety Authority (EVIRA). The file contains basic information on each product, assessment of health and environmental risks, safety instructions and the text in containers of the products. The register is a useful source of information on pesticide products on market.

TYKI
Web: http://pretty.ttl.fi/TYKI/search.htm (Finnish only)

A databank of the Information Center of the Finnish Institute of Occupational Health containing bibliographic data on books, journals, series of monographs, reports, and standards available in the library since 1983. Altogether, there are over 35 000 references, many of them in English, Swedish, or German.

Organizations (Government)

The web pages of the organizations and research institutes are the major sources of relevant information in their fields. The documents are available as files, behind links or there are instructions on how to retrieve them physically, e.g. from a library. Therefore, it is advisable to start the information search from the web page of the relevant institute, if the exact title of the document is not known. The web pages have variable information in English and many of them in Swedish. The web pages typically contain the relevant legislation, access to series of publications of their own, descriptions of the research projects, lists of publications, newsletters and information on the services they provide. For this reason, the emphasis in the annotations below is on the institute's general expertise and activities.

Finnish Environment Institute (SYKE)

Conducts research on environmental issues from global problems such as climate change and declining biodiversity, to regional and local questions. Provides expert assistance for the administration, local authorities, industries, companies, and other organizations, both in Finland and abroad. SYKE's wide-ranging information services are designed to benefit everyone

interested in environmental issues. Publishes a series of monographs. A responsible authority on environmental effects of chemicals.

Finnish Food Safety Authority (EVIRA)

This agency, under the ministries of Agriculture and Forestry, Trade and Industry and Social Affairs and Health, is responsible for food control (including contaminants), control of plant production and animal feeds and animal diseases. The agency is responsible for the evaluation of pesticides and chemical contaminants in food and feed. It performs risk assessments and chemical analyses on inorganic compounds, a wide range of organic compounds and mycotoxins. The web pages contain related legislation, daily intakes of contaminants in food, results from monitoring of pesticide use, lists of accepted veterinary medicines, dietary advice of fish consumption, etc. The agency publishes Kaari magazine ('from the field to the table') and has its own series of publications (in Finnish with English summaries).

Finnish Forest Research Institute (Metla)

The Finnish Forest Research Institute (Metla) is a governmental, sectoral research institute, subordinate to the Ministry of Agriculture and Forestry. Its duty is to promote through research, the economic, ecologic, and socially sustainable management and use of forests. Some research topics address terrestrial ecotoxicology, especially effects of contaminants in forests. The institute also has laboratories for different chemical analyses.

Fax: +358 10 211 2101
Email: kirjaamo@metla.fi

Finnish Game and Fisheries Research Institute (RKTL)

The Institute generates data on fisheries, game, and reindeer for sustainable use of natural resources, and helps to maintain biodiversity through research and aquaculture. The web pages contain, e.g., statistics on fish consumption in Finland.

Web: http://www.rktl.fi/english (English)

Finnish Institute of Occupational Health (TTL, FIOH)

The Finnish Institute of Occupational Health is the main research and specialized organization in occupational health and safety in Finland. The Institute produces, compiles, and disseminates research-based information on the interaction between work and health, and promotes the practical application of this information. The institute and its web pages are the main source of information on industrial chemicals, exposure to chemicals, biomonitoring, occupational diseases, and industrial hygiene. The Institute maintains registers in areas such as occupational diseases and exposure to carcinogenic substances (ASA-registry) at work, and offers different services related to occupational health. The Internet information services include comprehensive compilation of publications (LEO), reports and books (TYKI) of the institute by subject, some English electronic publications and electronic journals, free of charge (see Journals) and the database on instructions for the handling of dangerous chemicals most likely to cause accidents (OVA-cards). Several international Newsletters of Occupational Health (Asian, Barents and Asian-Pacific) are also available in an electronic form. The pages contain the information related to the national expert network on emergency preparedness in chemical accidents in Finland (COSK). There is also a method (ELMERI) to assess and score workplace safety and health. The institute publishes Työ Terveys Turvallisuus (TTT) magazine, in Finnish.

Finnish Meteorological Institute

The Finnish Meteorological Institute generates and collects information about the atmosphere, and is the information source on weather, climate, and air pollution. The web pages contain statistics on air pollutants, information on health effects of air pollutants, health-based guideline values, weather forecasts, a comprehensive questions/answers section, and a glossary of terms. The concentrations of nitrogen oxides, ozone and PM_{10} are shown countrywide in real-time. The Institute has published Meteorological Yearbooks of Finland covering the time since the beginning of the 1900s.

Geological Survey of Finland (GTK)

The Geological Survey of Finland, operating under the Ministry of Trade and Industry, is Finland's national geosciences agency and a national geological research centre. GTK's core activities include geological mapping, exploration, evaluation, and processing of natural resources. The GTK has made for example comprehensive analyses of elements in ground water, surface water, and soil, and produced maps of these data. The website of the institute contains information on maps, services offered (including analytical services), research projects, and publications and reports.

Ministry of Agriculture and Forestry (MMM)

The administrative sector of the Ministry of Agriculture and Forestry comprises agriculture and horticulture, rural development, forestry, veterinary services, control of foodstuffs of animal origin, fisheries, game and reindeer husbandry, use of water resources and land surveying. The Ministry has two official publication series.

Web: http://www.mmm.fi/en/index/frontpage.html (English)

Ministry of the Environment (YM)

The Ministry responsible for environmental issues in Finland including legislation on air and water quality, housing, land use and building, effects of chemicals on the environment, contaminated soils, waste disposal, and ecotoxicological risk assessment. The Ministry has three series of publications: *The Finnish Environment*, *Environment Guides*, and *Reports*. *The Finnish Environment* contains publications on research, reports and work group memoranda. *Environment Guides* contains various manuals and guides. Most of these publications are in Finnish, with brief documentation pages in Swedish and English. In addition, the Ministry of the Environment publishes the periodical *Asu ja rakenna* (Live and Build) which deals with housing policies, building and planning and together with the Finnish Environment Institute, *Ympäristö* (The Environment), which covers a wide range of environmental issues.

Ministry of Social Affairs and Health (STM)

The Ministry directs and guides the development and policies of social protection, social welfare, and health care. It prepares legislation and key reforms and steers their implementation. The Ministry is, in general, responsible for the assessment of health effects of different factors, including occupational and environmental health issues, chemicals, and pesticides. The website of the Ministry contains different reports on health, most in Finnish with English summaries.

MTT Agrifood Research Finland (MTT)

The largest research institute in Finland. Operates under the Finnish Ministry of Agriculture and Forestry, at 14 locations. Produces and disseminates scientific research information and develops and promotes the transfer of new technology for the agriculture and food sector. Research topics include bioactive peptides, product development of new healthy foods and food technology, reduction of greenhouse gas emissions and water pollution caused by agriculture and the food processing industry. MTT has a chemistry laboratory to make analyses on trace elements, organic contaminants, microbial toxins, food components and bioactive molecules in food and feedstuffs.

National Agency for Medicines

The agency is responsible for regulatory control of medicinal products, medicinal devices, and blood products. The web pages contain drug consumption statistics, links to national and EU legislation, and administrative regulations including reporting on pharmacovigilance. The agency publishes TABU magazine, with drug information in Finland.

National Public Health Institute (KTL)

The National Public Health Institute is a governmental research institute operating under the Ministry of Social Affairs of Health. KTL carries out research on different aspects of public health including infectious, cardiovascular, and other diseases. KTL is responsible for vaccines and the development of vaccination programs. The Department of Environmental Health is devoted to environmental health issues and carries out research on chemical, biological, and physiological factors and exposures. The web pages of the Department of Environmental Health contain information on health effects of pollutants in urban air, drinking water (both chemical impurities and microbiological risks), mold, household microbes, and some chemicals (e.g. dioxins), in Finnish. KTL publishes three series of monographs, available on the Internet, reports of the national health surveys, dissertations and instructions, and recommendations of the Institute.

Email: firstname.lastname@ktl.fi

National Product Control Agency for Welfare and Health (STTV)

The Product Control Agency is a central office which operates under the Ministry of Social Affairs and Health. STTV is responsible for overseeing and steering the implementation of the Alcohol Act, the Chemicals Act, the Tobacco Act, and the Health Protection Act at national level, and for supervisory activities according to the Gene Technology Act. Accordingly, the agency is responsible for the regulatory assessment of health effects of chemicals, pesticides, and biocides and is a national authority on GLP. STTV maintains the chemicals product register (KETU) and supervises compliance with regulations concerning material safety data sheets. The web pages contain information on the related legislation and links to legislation, statistics on for example alcohol consumption, concentrations of tar, nicotine and carbon monoxide in

cigarettes sold, pages for REACH, a help desk for REACH implementation (reach@sttv.fi), and annual summaries of the results of monitoring of drinking water and swimming water quality in Finland. The GLP instructions of the OECD are available as well as the list of the laboratories complying with them.

National Research and Development Centre for Welfare and Health (STAKES)

STAKES is an expert agency in the field of social welfare and health care, under the Ministry of Social Affairs and Health. It produces information and expertise for policymakers and other stakeholders, acts as a statistical authority and maintains registries. Most of the information produced by the statistical groups at STAKES is freely available through the web pages. The statistics include data on alcohol consumption, drug use, and the frequency of congenital malformations in Finland.

Radiation and Nuclear Safety Authority (STUK)

STUK is the authority, operating under the Ministry of Social Affairs of Health. It is responsible for radiation and nuclear safety in Finland. The STUK monitors radiation constantly throughout the country and provides the data from automated stations on the internet daily. The Institute offers companies and private citizens various radiation-associated measuring and expert services. The web pages contain much essential and useful information; legislation, regulatory guides on radiation (ST Guides) and nuclear safety, also in English. The Finnish web pages contain information on sources, doses, and health effects of different types of radiation, such as radon, plus answers to frequently asked questions.

Web: http://www.stuk.fi/en_GB (English)
Web: http://www.stuk.fi (Finnish)

Safety Technology Authority (TUKES)

The Safety Technology Authority (TUKES) is a state agency under the Ministry of Trade and Industry and is responsible for the technical safety and reliability of different products. Its goal is to protect people, property, and the environment from risks of accidents in the manufacture, process, transport, and storage of dangerous goods, such as explosives, flammable liquids, natural gas, and chemicals hazardous to health and to the environment. On its website, the authority publishes *TUKES Review* (in English) which contains accident statistics including fatalities in accidents related to industries and products under the authority of the agency.

Technical Research Center of Finland (VTT)

VTT Technical Research Centre of Finland is a large contract research organization on technology. Some of its projects (listed on the web pages) also address toxicology, food, food safety, and monitoring of environmental

pollutants. For example, there is available a calculation system (LIPASTO) on the website for traffic exhaust emissions and energy consumption in Finland. The Centre's work is published in its magazines *Impulssi* (in Finnish) and *VTT Innozone* (in English) and are also available on its website.

Organizations (Non-Government)

Several non-profit organizations deliver health-related information aimed primarily for laymen but some specific information is also useful for professionals and may not be available elsewhere. A few such sources are introduced below.

Allergia- ja Astmaliitto

Allergia- ja Astmaliitto is a public organization whose mission is to provide information on asthma and allergy to citizens, in Finnish. The web pages contain significant information on cosmetics. The Society has collected data on the adverse health effects of cosmetics in Finland and its website includes ingredient information on over 5000 cosmetics products. An allergic person may select non-allergic products on the basis of this ingredient data. There are also booklets on the health effects of different air pollutants.

Web: http://www.allergia.com (Finnish only)
Address: Allergia- ja Astmaliitto ry
Paciuksenkatu 19
FI- 00270 HELSINKI, Finland
Phone: +358 9 473 351
Fax: +358 9 4733 5330

Finnish Cancer Registry

The Finnish Cancer Registry, funded basically by The Cancer Society of Finland (www.cancer.fi), maintains a nationwide database on all cancer cases in Finland and conducts epidemiological and statistical research on cancer. The collection of this data is mandated by legislation. The data on cancer statistics and mass screening of cancer are comprehensively available on the web pages of the Registry.

Web: http://www.cancerregistry.fi/eng (English)
Web: http://www.cancerregistry.fi (Finnish)
Address: Finnish Cancer Registry
Liisankatu 21 B
FI-00170 Helsinki, Finland
Phone: +358 9135 331
Fax: +358 9 135 5378

Hengitysliitto Heli (Pulmonary Association Heli)

Pulmonary Association Heli is Finland's largest social and health, non-profit organization for people with respiratory diseases and their families. The web pages contain information (booklets), prepared by professionals, on the health effects of air pollutants and smoking, in Finnish. There are also slide presentations for education and preventive work, including smoking cessation.

Web: http://www.hengitysliitto.fi/english (English)
Web: http://www.hengitysliitto.fi (Finnish)

Universities

There is only one university, the University of Kuopio, which offers a full degree in toxicology (M.Sc. in toxicology) in Finland. The universities with medical faculty teach some basics of toxicology and several universities have courses in ecotoxicology in their curriculum. Those same universities also have the strongest research programs. The Internet pages of each university are the best source of information on degrees, courses, graduate schools, research profiles, and lists of publications. There is also comprehensive coverage in English. Direct contact addresses of faculties and departments can also be found there. In the listing below, key universities are briefly highlighted from the perspective of toxicology and ecotoxicology, and the main contact information is provided. All universities in Finland are governmental and there is no tuition for students, including foreigners. There is a separate database for international study programs (see DATABASES).

Åbo Akademi

In Åbo Akademi the basic language in teaching is Swedish. The university has 8000 students. The Faculty of Natural Sciences and Mathematics offer studies in, for example, chemistry, physics, biochemistry, pharmacy, and geology.

Helsinki University of Technology (TKK)

Helsinki University of Technology (TKK) is the largest (about 15 000 students), oldest, and most diversified university of technology. Teaching and research of some units (e.g. Water and Waste Water Engineering) cover environmental and health issues from the technological perspective. The topics include water and wastewater treatment processes, water supply and sewer networks as well as municipal solid waste management.

Tampere University of Technology

The Department of Environmental Engineering and Biotechnology teaches and conducts research on issues of drinking water, wastewater and solid waste management, and remediation of contaminated environments. The university has 10 000 students.

University of Helsinki

The University of Helsinki is the largest university in Finland, having the widest range of disciplines and 38 000 degree students. There are faculties in medicine, pharmacy, biosciences, natural sciences, microbiology, and veterinary medicine. The faculties of Medicine and Pharmacy each have their own departments of Pharmacology and Toxicology, to teach the basics of toxicology.

University of Joensuu

The University of Joensuu has several faculties related to biology and environment and is a center of ecotoxicology in Finland. The Faculty of Biosciences offers instruction in biology, biochemistry, ecotoxicology and hydrobiology, and applied biology. There are also a Botanical Garden and Ecological Research Institute and faculties of Forestry and Science. The university is coordinating or is part of several graduate schools on ecological/environmental sciences. The university has over 8200 students.

University of Jyväskylä

The University of Jyväskylä has strong natural sciences and ecotoxicology in its curriculum. The Institute for Environmental Research (http://www.jyu.fi/erillis/ymtk/en) provides scientific research, and services and training in the environmental field for authorities, private and public organizations and enterprises. The Institute also provides accredited laboratory services on analytical chemistry from environmental samples (inorganic and organic compounds) and offers noise measurements as a service work.

University of Kuopio

The University of Kuopio is a health-oriented university including departments of medicine, biotechnology, pharmacy, and environmental sciences. The Department of Pharmacology and Toxicology is the one instance in Finland with a comprehensive curriculum in toxicology and can confer a full degree in toxicology (master of science, M.Sc.). The University is in the process of beginning an international training program in toxicology (all courses and training in English). There is also a graduate school in environmental health, with courses in English. The total number of students in the university is around 5400.

University of Oulu

The University of Oulu is one of the centers of medicine and pharmacology and toxicology in Finland. It has faculties/departments in medicine, biochemistry, biology, chemistry, geochemistry, and also technology. There are about 17000 students. The Department of Pharmacology and Toxicology is devoted especially to xenobiotic metabolism. The department offers a battery of services on metabolism on contract basis, partly through a spin-off company (http://www.oulu.fi/farmakologia). The University also coordinates a national graduate school in toxicology.

University of Tampere

The University of Tampere is a multidiscipline university, with 15600 degree students and has a medical faculty. The Cell Research Center (http://www.uta.fi/laitokset/laaket/bio/linkit/cellresearchcenter.html) develops novel cell and tissue culture techniques based on normal human cells, and also cell culture models which reflect an organ structure. The methods are aimed at evaluation of newly developed drugs and for in vitro toxicology tests. The center also specializes in automation technology for cell culture, manipulation, and analysis. Some services are offered as a contract basis.

University of Turku

The University of Turku has a medical faculty, and a Department of Pharmacology and Clinical Pharmacology. There is also a faculty on mathematics and natural sciences including departments of chemistry, biology, biochemistry and food chemistry, and geology. The university offers a two-year Master's Degree Programme in Environmental Sciences by the

above-mentioned departments, principally for foreigners. Teaching is in English. The program includes ecotoxicology, geoinformatics, and tropical environments and development. The university has about 17 000 students.

Professional Societies

Finnish Society for Environmental Science

The Society's aim is to promote environmental science research, to be a link between members, and to spread information about the protection of environment. The society was founded in 1987 and has about 200 members. Its main activity has been the Finnish Conference of Environmental Sciences, the 8th held in 2007.

Web: http://www.uku.fi/laec/yts/english (English)
Web: http://www.uku.fi/laec/yts/suomi (Finnish)

Finnish Society of Toxicology

The Finnish Society of Toxicology was founded in 1979 by toxicologists and ecotoxicologists. The society has a membership of approximately 300. The society is a member of EUROTOX and IUTOX. The members of the national society have served as a Secretary or in other posts of EUROTOX and IUTOX. The main activity of the society is to transmit information to members about congresses and other events, via email and in the newsletter *Toksikologi*. The Society organizes an annual scientific meeting. It has published *Ethical Guidelines* for toxicologists and maintains the *Register of Finnish Toxicologists*. Most registered toxicologists are also EUROTOX Registered Toxicologist. The society organized the 10th International Congress of Toxicology (ICT X) in 2004, in Tampere. The statutes of the society, the rules of the register, and the guidelines are printed in the membership directory in Finnish and English.

Poison Control Centers

Poison Information Centre

The Poison Information Centre provides services especially for the treatment of ambulatory and acute poisonings, on a 24-hour basis for hospitals and the general public. The center also distributes general information on poisonings and their treatment. The internet pages contain information by agent/compound for users who need to contact the Poison Information Centre. There is also a special information service on teratogenic compounds for healthcare professionals and parents.

Legislation

Acts, decrees and official decisions and regulations (secondary legislation) are best found from FINLEX databases in the internet (a governmental website). The internet pages of the ministries and the agencies may contain some information on the legislation they are responsible for and have links to exact texts. The most convenient way to find a specific regulation in FINLEX is to use the number or the year of the act. The regulations are organized by the year of adoption. For several regulations translations are available, most in English. The web pages of FINLEX contain also the drafts of acts and decrees under consideration by the parliament for adoption, in the preparatory phase.

Access to the web pages of FINLEX (http://www.finlex.fi/en (English); http://www.finlex.fi (Finnish)).

CHAPTER

89

France

NATHALIE FOUILHÉ SAM-LAÏ, PHILIPPE SAVIUC, AND VINCENT DANEL

INTRODUCTION

The history of toxicology in France is closely linked to crimes and to forensic medicine. Most of the first toxicologists were forensic medicine specialists. Some famous criminal stories where toxicology played a key role are part of this history: 'l'affaire des poisons' under the reign of Louis XIV, where the Marquise de Montespan, a former mistress of the king, was suspected of being at the head of a group of poisoners (many of them were condemned to death, even the then Marquise de Brinvilliers); the famous Marie Lafarge who was convicted of murdering her husband with arsenic in 1840 (he probably died of typhoid); Hélène Jegado, a famous Briton poisoner, who was condemned to death in 1852; Marie Besnard, suspected in 1947 of having poisoned 12 people with arsenic (she was eventually acquitted after some famous experts battles). More recently, French toxicologists reported from some hair analysis that Napoleon might have died from a criminal arsenic poisoning! Toxicology was also linked to occupational health rather early. Lead poisoning was the first ever poisoning recognized as an occupational pathology in 1919; amazingly enough, years later, child lead poisoning is (since 1998) the only accidental poisoning which must be declared to health authorities on a mandatory basis.

Toxicology is, perhaps, not as well recognized or organized as it might be in France, largely due to the lack of cohesive university programs devoted to the subject. It tends to fall largely within the scope of academic programs in pharmacy. Apart from some postgraduate courses, there are no programs in medical or veterinary schools. Most physicians practicing clinical toxicology have a background in intensive care and emergency medicine, forensic medicine, or occupational medicine. Analytical toxicology is mainly the field of pharmacists, pharmacologists, and biologists, either in hospitals or in some Forensic Medicine Institutes.

A poisoned patient is normally admitted to a general emergency department or an intensive care unit. The only dedicated poisoning unit that remains in France is in Hospital Lariboisière in Paris. Before being transferred to Hospital Lariboisière, this unit was the famous Fernand-Widal Clinical Toxicology unit, set up in the 1960s, together with the Paris Poison Control Center. A real French 'school' of Clinical Toxicology originated in Fernand-Widal and is still very lively in Lariboisière hospital. Two other dedicated clinical units that existed in Marseille and in Grenoble have now disappeared. Some people have particularly contributed to the recent history of Clinical Toxicology: Chantal Bismuth in Paris, Jacqueline Jouglard in Marseille and Louis Roche in Lyon. Louis Roche founded with some others the European Association of Poisons Control Centres and Clinical Toxicologists (EAPCCT) in 1964. There are currently ten Poisons Control Centers (PCC) that answer the general public round the clock, and three Toxicovigilance Centers opened only during working hours; on the whole those centers receive about 200 000 calls per year. The people who answer on the phone are mainly physicians, sometimes pharmacists. All cases are registered in a national database maintained by the Paris Center; a chemical products and compounds composition database is run by the Nancy Center. Each Poisons Center is mainly funded by the university hospital to which it belongs; all centers depend upon the Direction Générale de la Santé at the Ministry of Health.

Some funding is provided by the National Institute for Public Health Surveillance, especially for toxicovigilance purposes. A good number of calls are also answered by the SAMU health system (dial 15). Mostly for economical reasons, there is now a clear trend towards the diminution of the number of PCC and towards setting up closer links between the SAMU system and the PCC. The Société de Toxicologie Clinique is obviously mainly interested in Clinical Toxicology.

The Toxicovigilance system, coordinated by the National Institute for Public Health Surveillance, relies on the Poisons Control and Toxicovigilance Centers network; some poisonings such as carbon monoxide and lead poisoning are registered and followed-up at a national level.

Animal and experimental research is mainly done by pharmacists, biochemists, and biologists; there are very few laboratories working exclusively in the field of Toxicology; they are located either in universities or in some private pharmaceutical firms. The Société Française de Toxicologie, the biggest French Toxicology Society, is mainly interested in research.

Risk assessment studies and epidemiological studies, as carried out in most health agencies, are mainly conducted by pharmacists or epidemiologists.

There are 13 different Toxicology scientific societies, encompassing all fields of Toxicology and having from tens to hundreds of members. Efforts are underway, however, to set up the French Federation of Toxicology. The main objectives at the moment are to organize a joint meeting as soon as possible, to list all possible Toxicology resources and to list all possible Toxicology courses that may exist at the university at a post-graduate level.

There are no specialized toxicology journals published in France, and most toxicologists submit their works to international journals; an electronic journal has just been launched in Lyon.

RESOURCES

Books

Baud F (1995)
Réanimation des Intoxications Aiguës (Management of the Critically Poisoned Patient).
Paris: Masson
State-of-the-art of the management of severe acute poisonings in man.

Baud F, Barriot P, Riou B (1992)
Les Antidotes (Antidotes)
Paris: Masson
Pharmacological properties and therapeutic uses of antidotes.

Bédry R, Llanas B, Danel V, Fayon M (2007)
Guide Pratique de Toxicologie Pédiatrique (Practical Guide of Pediatric Toxicology)
Paris: Arnette
Clinical features, diagnosis, and management of the main acute poisonings in children.

Bismuth C, Baud F, Conso F, Dally S, Fréjaville JP, Garnier R, Jaeger A (2000)
Toxicologie Clinique (Clinical Toxicology)
Paris: Flammarion Médecine-Sciences
Clinical features, diagnosis, and management of poisonings.

Bruneton J (2005)
Plantes Toxiques: Végétaux Dangereux pour l'Homme et les Animaux (Toxic Plants: Dangerous Plants to Human and Animals)
Paris: Lavoisier
Clinical features, diagnosis, and management of poisonings by plants.

Danel V, Barriot P (1999)
Intoxications Aiguës en Réanimation (Acute Poisonings)
Paris: Arnette
Clinical features, diagnosis, and management of the main acute poisonings.

Danel V, Mégarbane B (2009)
Urgences Toxicologiques de l'adulte (Toxicologic Emergencies)
Paris: Arnette
Clinical features, diagnosis, and management of the main toxicological emergencies in the prehospital and in the hospital settings.

Descotes J (1998)
An Introduction to Immunotoxicology
London: Taylor & Francis
Basic principles of immunotoxicology.

Descotes J, Testud F, Frantz P (1992)
Les Urgences en Toxicologie (Toxicologic Emergencies)
Paris: Maloine
Clinical features, diagnosis, and management of poisonings.

Jaeger A, Vale JA (1999)
Intoxications Aiguës (Acute Poisonings)
Paris: Elsevier
Clinical features, diagnosis, and management of main acute poisonings.

Kintz P (1998)
Toxicologie et Pharmacologie Médicolégales (Forensic Toxicology and Pharmacology)
Paris: Elsevier
Toxicology and pharmacology of the main drugs from a forensic point of view.

Lauwerys RR, Haufroid V, Hoet P, Lison D (2007)
Toxicologie Industrielle et Intoxications Professionnelles (Industrial Toxicology and Occupational Poisonings)
Paris: Masson
Industrial poisonings and occupational health hazards.

Mebs D (Trans Goyffon M) (2006)
Animaux venimeux et vénéneux (Venomous and Poisonous Animals)
Paris: Lavoisier.

Mion G, Goyffon M (2000)
Les Envenimations Graves (Severe Envenomations) Paris: Arnette
Clinical features, diagnosis, and management of severe envenomations by snakes, hymenoptera, scorpions, and spiders.

Reichl FX (Trans/adapted from German by Prudhomme C) (2002)
Atlas de Poche de Médecine de l'Environnement (Pocket Atlas of Environmental Medicine)
Paris: Maloine

Reichl FX (Trans/adapted from German by Perraud R, Krahe EC) (2004)
Guide pratique de toxicologie (Practical guide of toxicology)

Testud F (2005)
Pathologie Toxique Professionnelle et Environnementale (Occupational and Environmental Toxic Pathology)
Paris: Eska
Toxic effects of occupational and environmental chemicals.

Testud F, Garnier R, Delemotte B (2001)
Toxicologie Humaine des Produits Phytosanitaires: Tome I (Human Toxicology of Pesticides: Part I)
Paris : Eska
Toxicology of pesticides.

Testud F, Grillet JP (2007)
Produits Phytosanitaires: Intoxications aiguës et Risques professionnels (Pesticides: Acute Poisonings and Occupational Risk)
Paris: Eska
Toxicology of pesticides in occupational environment.

Viala A, Botta A (2005)
Toxicologie (Toxicology)
Paris: Lavoisier
General textbook of toxicology.

Weber M, Rothmann C (2006)
Mémo Intoxications Aiguës (Pocket Handbook Acute Poisonings)
Paris: Arnette
Pocket handbook of clinical toxicology.

Zetlaoui P, Lenoble M (2004)
Intoxications aux Urgences (Acute Poisonings in the Emergency Department)
Paris: Elsevier
Clinical features, diagnosis, and management of main acute poisonings.

CHAPTER

90

Germany

HERBERT DESEL AND REGINE KAHL

INTRODUCTION

The formation of toxicology as a scientific discipline in Germany originated with basic research in chemistry and medicine at universities on the one hand and in occupational toxicology programs associated with 19th century industrialization. In academia, lectures on toxicology were presented by Georg Augustin Bertele (1767–1818) at the medical faculty in Landshut. Experimental research on toxic gases was performed by Hermann Eulenberg between 1865 and 1876 in Cologne. The state of the art in toxicology at the end of the 19th century was presented by Rudolf Kobert (1854–1918) in his famous textbook on intoxications first published in 1893 and in an extended form from 1902–1906 when he was a professor in Rostock. Equally reknowned is the textbook on toxicology published in 1928 by Louis Lewin (1850–1918) a reprint of which appeared in 1992.

Physicians employed by chemical companies were instrumental in formulating the discipline of occupational toxicology in Germany. The first medical officer at BASF was Carl Knaps in 1868, followed by Wilhelm Grandhomme at Farbwerke Hoechst in 1874. In the 1870s, Ludwig Hirt (1844–1907) published a textbook on occupational medicine with a focus on toxic substances at the workplace. In his institute in Würzburg, Karl Bernhard Lehmann (1858–1940) first established threshold values for industrial gases at the workplace in 1884. In 1898, he described chloracne in people working in electrolytic factories. A medical department was founded at the Badische Anilin- und Soda-Fabrik (BASF) in 1903 when it became clear that aromatic amines induce bladder cancer in exposed workers. State authorities also began to show concern for toxicological problems, e.g. in the Kaiserliches Gesundheitsamt (later Reichsgesundheitsamt, i.e. Imperial Health Office) founded in 1876. Soon, legislation on chemical safety was implemented, e.g. the law on the use of colors harmful to human health in 1887. In 1905, a conference on the instruction of workers about the hazards of toxic substances was held at the central office for labor welfare in Hagen.

The flourishing of toxicological research around 1900 did not, however, result in the establishment of toxicological institutes at German universities. Rather, toxicology was looked upon as a part of pharmacology, and toxicological research was performed in some of the university institutes of pharmacology which were founded in increasing numbers in the early 20th century. Even today, the state-controlled curricula for students of medicine and pharmacy contain pharmacology and toxicology as one common subject.

The first full professorship for toxicology in an independent institute was awarded to Paul Pulewka in Tübingen in 1951, later followed by Herbert Remmer. The German Science Council (Wissenschaftsrat) in 1960 and the Deutsche Forschungsgemeinschaft (DFG) in 1975 called for the foundation of toxicological institutes at all universities, and in the following decades a number of universities complied with this demand. In the 1960s the Institutes of Toxicology in Würzburg (1965, Dietrich Henschler) and Marburg (1966, Wolfgang Koransky) and the Departments of Toxicology in Mainz (1966, Karl-Joachim Netter), Homburg (1967, Karl Pfleger), Kiel (1969, Friedrich Karl Ohnesorge) and at the Institute for Occupational Physiology in Dortmund (1978 Hubert Antweiler, 1982 Hermann Bolt) were established. In the German

Democratic Republic, the Institute for Industrial Toxicology in Halle led by Werner Ponsold was founded in 1968. In the 1970s, the Institute for Toxicology and Embryonic Pharmacology in Berlin (1972, Dieter Neubert), the Institute for Toxicology in Düsseldorf (1974, Friedrich Karl Ohnesorge), the Institute for Toxicology in Hannover (1977, Hans Wellhöner), and the Department of Toxicology in Hamburg (1978, Hans Marquardt) came up. Later, university institutes of toxicology were also established in Kaiserslautern, Mainz, Jena, München, and Potsdam. In parallel with the foundation of university institutes, a number of toxicological research institutes outside academia or associated to academia emerged, such as the Institute of Toxicology at the GSF in Neuherberg (1975, Helmut Greim). In industry, a number of pharmaceutical companies including Bayer, BASF, Hoechst, Merck, and Schering founded toxicological departments in the 1950s and 1960s.

As in other countries, this positive development was reversed in the 1990s, with a diminishment of toxicological research. In 1999, the Deutsche Forschungsgemeinschaft published a memorandum critical of the situation. With the advent of REACH (Registration, Evaluation and Authorisation of CHemicals), the new European Union's chemicals legislation, the need for toxicologists will steeply increase in the next few years. This will hopefully cause universities to stop the close-down of toxicological institutes.

RESOURCES

Books

General Monographs

Marquardt H, Schäfer S (eds) (2004)
Lehrbuch der Toxikologie (Textbook of Toxicology), 2nd Edition
Stuttgart: WVG
ISBN: 3-8047-1777-2

This comprehensive multi-author textbook covers most aspects of toxicology in 1348 pages. Contains sections on general toxicology, organ toxicology, the most important groups of toxic substances, specific fields of toxicology, toxicological methodology, and risk assessment.

Student textbooks

Wolf HU (Ed.) (1992)
Hagers Handbuch der Pharmazeutischen Praxis, Band 3: Gifte (Hager's Textbook of Pharmaceutical Practice, Vol.3: Poisons), 5th Edition
Berlin Heidelberg, New York: Springer
ISBN: 3-540-52633-1

Data, in condensed form, on the properties, signs, and therapy of intoxication, and regulation of toxic substances, listed in alphabetical order and comprising both generic names and product trade names.

Textbooks on Toxicology

Dekant W, Vamvakas S (2005)
Toxikologie – Eine Einführung für Chemiker, Biologen und Pharmazeuten (Toxicology – An Introduction for Chemists, Biologists and Pharmacists), 2nd Edition
Heidelberg: Spektrum Akademischer Verlag
ISBN: 3-8274-1452-0

Eisenbrand G, Metzler M, Hennecke FJ (2005)
Toxikologie. Für Naturwissenschaftler und Mediziner (Toxicology for Natural Scientists and Physicians), 3rd Edition
Weinheim: Wiley VCH
ISBN: 3-527-30989-6

Two textbooks mainly designed for students of chemistry and biology and in part also for students of medicine. The focus is on general toxicology, toxicological mechanisms, German law regulating treatment of hazardous substances and less amply on the actions of specific compounds. In addition, basic anatomical and pathophysiological information is provided.

Most Important Textbooks on Pharmacology and Toxicology

Aktories K, Förstermann U, Hofmann F, Starke K (Eds) (2005)
Allgemeine und spezielle Pharmakologie und Toxikologie. Begründet von W. Forth, D. Hentschler, W. Rummel (Forth, Hentschler & Rummel's General and Special Pharmacology and Toxicology), 9th Edition
München, Jena: Urban & Fischer
ISBN: 3-437-42521-8

A comprehensive general textbook covering the theoretical basis as well as the clinical aspects of pharmacology, with an extensive chapter on toxicology. Each chapter was written by an expert and starts with the pathophysiological basis.

Mutschler E, Geisslinger G, Kroemer HK, Ruth P, Schäfer-Korting M (2005)
Mutschler Arzneimittelwirkungen kompakt. Basiswissen Pharmakologie und Toxikologie (Effects of Drugs – Compact. Basic Knowledge of Pharmacology and Toxicology)
Stuttgart: Wissenschaftliche Verlagsgesellschaft
ISBN: 3-8047-2214-8

General textbook for students of medicine, pharmacy, and the life sciences contains three major sections

(general pharmacology, special pharmacology, toxicology). For the non-medical reader, a brief introduction to anatomy, physiology, and pathophysiology precedes each chapter.

Schmidt H (Ed.) (2007)
Pharmakologie und Toxikologie. Begründet von C. J. Estler (Estler's Pharmacology and Toxicology), 6th Edition
Stuttgart: Schattauer Verlag
ISBN: 3-7945-2295-8

A multi-author book with 22 chapters, one of which covers toxicology in a brief but systematic manner.

Further Important Textbooks on Pharmacology and Toxicology

Lüllmann H, Mohr K, Hein L (2006)
Pharmakologie und Toxikologie (Pharmacology and Toxicology), 16th Edition
Stuttgart: Thieme
ISBN: 3-13-368516-3

Oberdisse E, Hackenthal E, Kuschinsky K (Ed.) (2001)
Pharmakologie und Toxikologie (Pharmacology and Toxicology), 3rd Edition
Berlin: Springer
ISBN: 3-540-41993-4

Two popular textbooks addressed to medical students with main focus on pharmacology

Most Important Textbooks on Analytical and Medical Toxicology

Pfleger K, Maurer H, Weber A (2000)
Mass Spectral and GC Data of Drugs, Poisons, Pesticides, Pollutants and Their Metabolites I/ II/ III/IV
Weinheim: VCH Verlagsgesellschaft
ISBN: 3-527-26989-4

Reference to mass spectra of more than 4000 substances, most of them important for toxicological analyses in cases of intoxications; written in English, intensively used throughout the world.

Schaefer C, Spielmann H, Vetter K (2006)
Arzneiverordnung in Schwangerschaft und Stillzeit (Drugs in Pregancy and Lactation), 7th Edition
Stuttgart: Urban und Fischer
ISBN: 978-3-437-21332-8

By far most important monograph on teratogenic effects in German language. Frequently updated, based on authors' long consulting experience and research in the field.

von Mühlendahl KE, Oberdisse U, Bunjes R (2003)
Vergiftungen im Kindesalter (Intoxications in Childhood), 4th Edition
Stuttgart: Thieme
ISBN: 3-13-129814-6

The experience of more than 20 years of poisons information is presented in this standard book for diagnosis and treatment of intoxications. The main focus is on intoxications in childhood, but useful hints for intoxications in adults are also included for many toxic agents.

Further Important Textbooks on Analytical and Medical Toxicology

Ludewig R, Regenthal R
Akute Vergiftungen und Arzneimittelüberdosierungen (Acute Intoxications and Drug Overdoses), 10th Edition
Stuttgart: WVG
ISBN: 978-3-8047-2280-4

A valuable guide for the clinical management of intoxications, and a comprehensive index to many uncommon substances and products. Substances are grouped by chemical or use. Each entry comprises toxicokinetic and toxicodynamic data and the symptoms and therapy of intoxication.

Wirth W, Gloxhuber C (1994)
Toxikologie (Toxicology), 5th Edition
Stuttgart: Thieme
ISBN: 3-13-421105-X

Although over 10 years old, this is still an important textbook on medical toxicology. Following a shorter section on general toxicology, the main section is divided into the toxicology (chemistry, exposure, symptoms and mechanisms of acute and chronic intoxication, and therapy) of inorganic compounds, organic compounds, plant poisons, and animal poisons.

Environmental Toxicology and Biotoxins

Biogene Gifte (Poisons from Biological Sources), 2nd Edition
Stuttgart: Fischer
ISBN: 3-437-30747-9

This book presents the biology, chemistry, and toxicology of toxins from all types of biological organisms. Many color pictures and chemical structures are included.

Bresinsky A, Besl H (1985)
Giftpilze (Poisonous Fungi)
Stuttgart: WVG
ISBN: 3-8047-0680-0

This monograph contains short information on intoxication syndromes and more detailed information on the identification of poisonous fungi.

Frohne D, Pfänder HJ (2005)
Giftpflanzen (Poisonous Plants), 5th Edition
Stuttgart: WVG
ISBN: 3-8047-2060-9

In this handbook many plants with toxic ingredients are presented with photographs and comprehensive descriptions of their basic and clinical toxicology.

Junghanss T, Bodio M (1996)
Notfall-Handbuch Gifttiere (Emergency Handbook Venonous and Poisonous Animals)
Stuttgart: Thieme
ISBN: 3-13-100441-X

This valuable handbook is a collection of very detailed and comprehensive data on poisonings caused by exotic animals from the whole world. Designed for the use in specialized treatment centers and poisons centers.

Lindner E (1990)
Toxikologie der Nahrungsmittel (Toxicology of Food), 4th Edition
Stuttgart: Thieme
ISBN: 3 13-490804-2

A book about the toxic substances in food which are either natural or formed during storage or preparation, as well as about food additives.

Mebs D (2002)
Venomous and Poisonous Animals. A Handbook for Biologists, Toxicologists and Toxinologists, Physicians and Pharmacists
Stuttgart: Medpharm/WVG
ISBN: 3-88763-093-9

German version: Mebs D (2000) Gifttiere. Ein Handbuch für Biologen, Toxikologen, Ärzte und Apotheker, 2nd edition

Merian E, Anke M, Ihnat M, Stoeppler M (Ed.) (2004)
Elements and their Compounds in the Environment, 2nd Edition
Weinheim: VCH
ISBN: 3-527-30459-2

Formerly titled 'Metals and their Compounds in the Environment' (German and English versions). This is the standard reference monograph on many aspects of environmental and toxicological chemistry. Each chapter deals with a specific element and written by an international expert.

Stuttgart: WVG
ISBN: 3-8047-1639-3

In this comprehensive handbook many poisonous animals are presented with photographs, and their toxins, as well as the symptoms of and therapy for the intoxication are described.

Teuscher E, Lindequist U (1994)
Wichmann HE, Schlipköter H-W, Fülgraff G (2006)
Handbuch der Umweltmedizin. Toxikologie – Epidemiologie – Hygiene – Belastungen – Wirkungen – Diagnostik – Prophylaxe (Handbook of Environmental Medicine)
Landsberg: Ecomed (loose leaflet book)
ISBN: 978-3-609-71180-5

Environmental toxicology is an important field in environmental medicine. Among many other data this book contains toxicological reviews on substances present in the environment. The looseleaf book is continuously updated and has chapters on ozone, sulfur dioxide, passive smoking, polycyclic aromatic hydrocarbons, a number of metals, benzene, formaldehyde, pentachlorphenol, polychlorinated biphenyls, tetrachloroethene, herbicides, and nitrite/nitrate.

Occupational Toxicology – Monographs on Workplace Concentration Values

Deutsche Forschungsgemeinschaft (DFG) (Ed.) (2006)
List of MAK and BAT Values 2006. Maximum Concentrations and Biological Tolerance Values at the Workplace. Report 42
Weinheim: Wiley-VCH
ISBN: 3-527-31599-3

German version: Deutsche Forschungsgemeinschaft (DFG) (Ed.) MAK- und BAT-Werte-Liste 2006. Maximale Arbeitsplatzkonzentrationen und Biologische Arbeitsstofftoleranzwerte. Mitteilung 42

Weinheim: Wiley-VCH
ISBN: 3-527-31598-5

The MAK value (Maximale Arbeitsplatzkonzentration=maximum concentration in the workplace) is defined as the maximum permissible concentration of a chemical compound present in the air within a working area which, according to current knowledge, generally does not impair the health of the employee nor cause undue annoyance. These values are established annually by the Commission for the Investigation of Health Hazards in the Workplace of the German Science Foundation.

The BAT value (Biologische Arbeitsstofftoleranzwert= biological exposure value) is defined as the maximum permissible quantity of a chemical compound, its metabolites, or any deviation from the norm of biological parameters induced by these substances in exposed humans. The BAT values are also established by a commission of the Senate of the German Science Foundation and are published annually.

This periodical provides cumulative tables listing established Maximum Concentrations at the Workplace and the Biological Exposure Values for Occupational Toxicants, and also contains classification proposals for carcinogens. These values and classification proposals provide the basis for the legislative process on hazardous substances, which is prepared by the Bundesministerium für Arbeit und Sozialordnung (see below).

Drexler H, Greim H (Eds.) (2006)
Biologische Arbeitsstofftoleranz Werte (BAT-Werte), Expositionsäquivalente für krebserzeugende Arbeitsstoffe (EKA) und Biologische Leitwerte (BLW). Arbeitsmedizinisch toxikologische Begründungen (Biological Exposure Values for Occupational Toxicants and Carcinogens. Critial Data Evaluation for BAT, EKA and BLW Values)
Weinheim. Wiley-VCH (loose leaflet series, volumes 1 to 13)
ISBN: 3-527-19032-5

Critical data evaluations of the newly established or revised BAT values are published as supplementary material to this loose-leaf book.

Greim H (Ed.) (2006)
Gesundheitsschädliche Arbeitsstoffe. Toxikologisch arbeitsmedizinische Begründungen von MAK-Werten (Occupational Toxicants. Critical Data Evaluation for MAK Values and Classification of Carcinogens).
Weinheim: Wiley-VCH (loose leaflet series, volumes 1 to 41)
ISSN 0930-1984

MAK values are established by a commission of the Senate of the German Science Foundation and are published annually (see above). The critical data evaluations of newly established or revised MAK values are published as supplementary monographs to this loose-leaf book (in total about 3000 pages).

Occupational Toxicology – Further Important Monographs

Berufsgenossenschaft Chemie (BG Chemie) (Ed.) (2004)
Toxikologische Bewertungen (Toxicological Evaluations)
Heidelberg
ISSN 0937-4248
Web: http://www.bgchemie.de/webcom/show_article.php/_c-85/_nr-232/i.html (English)
Web: http://www.bgchemie.de/webcom/show_page.php/_c-86/_nr-1/_lkm-438/i.html (German)

In this series, more than 240 chemical substances are carefully evaluated with respect to their toxicological effects. English translations have been published as 'Toxicological Evaluations' for most of these chemicals.

Roth L, Rupp G (2000)
Krebserzeugende Stoffe (Carcinogenic Substances), 3rd Edition
Stuttgart: Wissenschaftliche Verlagsgesellschaft
ISBN: 3-8047-1724-1

This book aims at improving safety in handling of carcinogenic compounds at the workplace. A list of established and suspected carcinogens is provided together with a detailed profile of the individual carcinogens (physicochemical properties, toxicological data, safety regulations, and recommendations for safe handling). The book also lists the pertinent regulations for manufacturing and handling carcinogens.

Journals

Traditional professional journals of toxicology in Germany are no longer published in German but have switched to English language in order to gain a wider readership. These journals are listed elsewhere.

However, recently two German language journals focusing on environment-related topics have been founded that contain in part information related to toxicology:

Umweltmedizin in Forschung und Praxis (Environmental Medicine – Research and Practice)
Landsberg: ecomed
ISSN 1430-8681
Umweltwissenschaften und Schadstoff-Forschung (Environmental Sciences and Hazardous Substance Research)
Landsberg: ecomed
ISSN 0934-3504

Databases (Free Access)

Chemicals and Contact Dermatitis (Chemikalien und Kontaktallergie)

Managed by the Federal Institute for Risk Assessment. The database contains data of 244 chemical substances that have been evaluated for their potential for causing contact dermatitis.

Web: http://www.bfr.bund.de/cd/1934 (German only)

GESTIS International

Limit values for chemical agents provided by the BG-Institute for Occupational Safety and Health. This database contains a collection of occupational limit values for hazardous substances, gathered from various EU member states and the United States.

Web: http://www.hvbg.de/e/bia/gestis/limit_values (English)
Web: http://www.hvbg.de/d/bia/gestis/limit_values (German)

GESTIS Substance Database (GESTIS-Stoffdatenbank)

The Information system on hazardous substances of the Berufsgenossenschaften (i. e. German institutions for statutory accident insurance and prevention). To date, this is the most important database on hazardous substances with free and public access via internet in German language.

Web: http://www.hvbg.de/e/bia/gestis/stoffdb (English)
Web: http://www.hvbg.de/d/bia/fac/stoffdb (German)

Index of Authorized Plant Protection Products

Only in German (Verzeichnis zugelassener Pflanzenschutzmittel) by the Federal Office of Consumer Protection and Food Safety.

Web: http://www.bvl.bund.de/infoppp (German only)

International Chemical Safety Cards (ICSC)

German version (Internationale chemische Sicherheitsdatenblätter) provided by the BG-Institute for Occupational Safety and Health.
Web: http://www.hvbg.de/d/bia/gestis/icsc (German only)

Phytomedicine (Plant protection – Phytopathology – Stored Products Protection) Online searchable bibliographical database including more than 452 000 literature citations. Managed by the Federal Biological Research Centre for Agriculture and Forestry.

Web: http://www.bba.de/english/database/phytomed/phytomed.htm (English only)

Plastics Recommendations (Kunststoffempfehlungen)

Managed by the Federal Institute for Risk Assessment. The Plastics Recommendations represent the current level of science and technology for the conditions under which consumer goods made of high polymer substances meet the requirements of Article 3, paragaph 1 a of the EC Regulation 1935/2004 in respect of their health safety.

Web: http://www.bfr.bund.de/cd/1711 (English)
Web: http://www.bfr.bund.de/cd/447 (German)

Technical Rules for Hazardous Substances (Technische Regeln Gefahrstoffe, TRGS)

Developed by the Committee on Hazardous Substances. TRGS are collections of rules for the handling of hazardous substances at the workplace outlined within the Ordinance on Hazardous Substances (Gefahrstoffverordnung).

Web: http://www.baua.de/nn_7554/en/Topics-from-A-to-Z/Hazardous-Substances/TRGS/TRGS__content.html__nnn=true (mainly German, at the bottom of the list, several TRGS are presented in English translation)

WINGIS online Information System for Hazardous Substances (WINGIS Gefahrstoff-Informationssystem) of the Institution for Statutory Accident Insurance and Prevention for the Construction Industry (BG Bau)

Information on technical products used in the construction industry, utilizing the GISCODE nomenclature.
Web: http://www.wingis-online.de (German only)

Organizations (Government)

Germany is a member state of the European Union (EU). It is formed of 16 federal states (Bundesländer). Legislation is divided between the European Parliament, the Federal parliament (Bundestag), and parliaments of the Länder. Federal administration duties are mainly directed to national and international harmonization and development of guidelines. Federal Ministries in Germany have changed their name and duties in the last decade. Responsibilities for toxicological topics are widely distributed between the ministries and the institutes listed below.

Committee on Hazardous Substances (Ausschuss für Gefahrstoffe, AGS)
Web: http://www.baua.de/prax/ags (German only)

The main duty of the AGS is the development of technical rules for handling of hazardous substances in the workplace (Technischen Regeln Gefahrstoffe, TRGS, see below).

Committee for Occupational Safety and Safety Technology of the Federal States (Länderausschuss für Arbeitsschutz und Sicherheitstechnik)
c/o Landesamt für Arbeitsschutz, Postfach 90 02 36, D-14438 Potsdam
Web: http://lasi.osha.de (German only)

Federal Agency for Nature Conservation (Bundesamt für Naturschutz, BfN)
Konstantinstr. 110, D-53179 Bonn
Web: http://www.bfn.de (German only)

The BfN is the central federal administration for the international and national aspects of nature conservation.

Federal Biological Research Centre for Agriculture and Forestry (Biologische Bundesanstalt für Land- und Forstwirtschaft, BBA)
Messeweg 11-12, D-38104 Braunschweig
Web: http://www.bba.bund.de/cln_044/nn_813794/EN/Home/homepage__node.html__nnn=true (English)

Web: The BBA's tasks are defined by the Plant Protection Act and the Gene Technology Act, and include conducting research in the field of plant protection, development of environmentally sound plant protection practices and involvement in the evaluation and authorisation of plant protection products (among many others).

Federal Environmental Agency (Umweltbundesamt)
Wörlitzer Platz 1, D-06844 Dessau
Web: http://www.umweltbundesamt.de/index-e.htm (English)
Web: http://www.umweltbundesamt.de (German)

The Federal Environmental Agency provides support to the BMU, in particular at a scientific and technical level in the fields of air pollution control, noise abatement, waste and water management, soil protection and environmental chemicals, in particular in the drawing up of statutory and administrative provisions.

Federal Institute for Drugs and Medical Devices (Bundesinstitut für Arzneimittel und Medizinprodukte)
Kurt-Georg-Kiesinger-Allee 3, D-53175 Bonn
Web: http://www.bfarm.de/cln_043/nn_424302/EN/Home/homepage__node.html__nnn=true (English)
Web: http://www.bfarm.de (German)

Authorization and registration of drugs, collection and evaluation of side effects of drugs and medical devices.

Federal Institute for Occupational Safety and Health (Bundesanstalt für Arbeitsschutz und Arbeitsmedizin, BAUA)
Friedrich-Henkel-Weg 1-25, D-44149 Dortmund
Web: http://www.baua.de/eindex.htm (English)
Web: http://www.baua.de (German)

BAUA is the knowledge service provider and service institution for industry, government, social partners on occupational safety and is the authority mainly responsible for the notification of biocides.

Federal Institute for Risk Assessment (Bundesinstitut für Risikobewertung)
Thielallee 88-92, D-14195 Berlin
Web: http://www.bfr.bund.de/cd/template/index_en (English)
Web: http://www.bfr.bund.de (German)

The Federal Institute for Risk Assessment (BfR) was founded in 2002. It prepares expert reports and opinions on questions of food safety and consumer health protection on the basis of internationally recognized scientific risk assessment criteria.

Federal Ministry of Food, Agriculture and Consumer Protection (Bundesministerium für Ernährung, Landwirtschaft und Verbraucherschutz, BMELV)
D-11055 Berlin. Phone: +49-30-2006-0
Web: http://www.bmelv.de/cln_044/nn_754188/EN/00Home/homepage__node.html (English)
Web: http://www.bmelv.de (German)

The BMELV was renamed in 2005 (formerly BMVEL) and has many responsibilities in the control of food, agriculture, and rural development.

Federal Ministry of the Environment, Nature Conservation and Nuclear Safety (Bundesministerium für Umwelt, Naturschutz und Reaktorsicherheit, BMU)
Alexanderstraße 3, D-10178 Berlin
Web: http://www.bmu.de/english/aktuell/4152.php (English)
Web: http://www.bmu.de (German)

Responsible for the protection of human health against hazardous substances, for prevention of hazardous incidents in industrial plants and for dealing with other environmental issues.

Federal Ministry of Health (Bundesministerium für Gesundheit)
D-11055 Berlin
Web: http://www.bmg.bund.de/cln_041/nn_600110/EN/Home/homepage__node,param=.html__nnn=true (English)
Web: http://www.bmg.bund.de (German)

The Bundesministerium für Gesundheit located in Bonn and in Berlin is active in all fields of health and medicine, e.g. medicinal drugs, prevention, health insurance, as well as the protection of consumer and veterinary medicine.

Federal Ministry of Labor and Social Affairs (Bundesministerium für Arbeit und Soziales)
D-10117 Berlin
Web: http://www.bmas.bund.de/Englisch/Navigation/root.html (English)
Web: http://www.bmas.de (German)

Among many responsibilities on economic topics this ministry is responsible for occupational safety in Germany.

Federal Office for Radiation Protection (Bundesamt für Strahlenschutz)
Web: http://www.bfs.de (English/German)

BfS is responsible for the safety and protection of man and the environment against damage due to ionizing and non-ionizing radiation. Of special importance are

defense against immediate hazards, and precautions for the protection of the general public, workers, and patients.

Federal Office of Consumer Protection and Food Safety (Bundesamt für Verbraucherschutz und Lebensmittelsicherheit)
Rochusstraße 65, D-53123 Bonn
Web: http://www.bvl.bund.de/cln_027/nn_493778/EN/Home/homepage__node.html__nnn=true (English)
Web: http://www.bvl.bund.de (German)

The Federal Office of Consumer Protection and Food Safety (BVL) exercises several duties through which it contributes to safer food, feed, and commodities in Germany (risk management). It is responsible for the authorization of plant protection products, veterinary drugs, feed additives, and genetically modified organisms.

German Institute for Medical Documentation and Information (Deutsches Institut für Medizinische Dokumentation und Information)
Waisenhausgasse 36-38a, D-50676 Köln
Web: http://www.dimdi.de/dynamic/en (English)
Web: http://www.dimdi.de (German)

The DIMDI is hosting about 90 databases for access via the internet, part of which is freely accessible to the public after entering into a contract. The DIMDI cooperates with the central medical library in Cologne and thus provides full text archival medical literature for a fee.

Organizations (Non-Government)

Bau-Berufsgenossenschaft (Bau-BG) – Institution for Statutory Accident Insurance and Prevention for the Construction Industry
Hildegardstraße 29/30, D-10715 Berlin
Web: http://www.bgbau.de (German only)

Berufsgenossenschaft Chemie (BG Chemie) – Institution for Statutory Accident Insurance and Prevention for Chemical Industry
Kurfürsten-Anlage 62, D-69115 Heidelberg
Web: http://www.bgchemie.de (German only)

BG – Institute for Occupational Safety and Health – (BGIA, Berufsgenossenschaftliches Institut für Arbeitssicherheit)
Alte Heerstraße 111, D-53757 Sankt Augustin
Web: http://www.hvbg.de/e/biahttp://www.hvbg.de/e/bia (English)
Web: http://www.hvbg.de/d/bia (German)

The BGIA is a research and testing institute affiliated with the German Berufsgenossenschaften (BG), the institutions for statutory accident insurance and prevention in Germany.

Centre for Environmental Research Leipzig-Halle (Umweltforschungszentrum Leipzig-Halle)
Permoserstraße 15, D-04318 Leipzig
Web: http://www.ufz.de/index.php?en=616 (English)
Web: http://www.ufz.de (German)

Chemical Industry Federation (Verband der Chemischen Industrie)
Karlstr. 21, D-60329 Frankfurt am Main
Web: http://www.vci.de (Germany only)

Fraunhofer Institute of Toxicology and Experimental Medicine (Fraunhofer Institut für Toxikologie und Experimentelle Medizin)
Nikolai-Fuchs-Str. 1, D-30625 Hannover
Web: http://www.item.fraunhofer.de/english (English)
Web: http://www.item.fraunhofer.de (German)

Important fields of research at the Fraunhofer ITEM are drug research, and bio- and genetic engineering. From the beginning, research activities have focused on changes in the lungs, as they result from exposures at workplace and environment.

German Cancer Research Center (Deutsches Krebsforschungszentrum)
Im Neuenheimer Feld 280, D- 69120 Heidelberg
Web: http://www.dkfz.de/index_e.htm (English)
Web: http://www.dkfz.de (German)

The DKFZ was founded in 1964 as a non-profit organization and supraregional research center by the Land (state) Baden-Württemberg. It is mainly funded by the Bundesforschungsministerium (Federal Ministry for Research and Technology) (90%). After the dissolution of the former institutes, a new program-oriented organizational structure of the DKFZ was adopted in 1991. Today, multidisciplinary cancer research is performed by more than 50 divisions and working groups.

German Federal Foundation for the Environment (Deutsche Bundesstiftung Umwelt)
An der Bornau 2, D-49090 Osnabrück
Web: http://www.dbu.de/english (English)

National Research Center for Environment and Health (GSF – Forschungszentrum für Umwelt und Gesundheit)
Ingolstädter Landstraße 1, D-85764 Neuherberg
Web: http://www.gsf.de/index_en.php (English)
Web: http://www.gsf.de (German)

The GSF research focus is on chronic degenerative diseases such as lung diseases, allergies, cancer, and cardiovascular diseases that are influenced to a large extent by environmental conditions.

Oeko-Institut – Institute for Applied Ecology (Öko-Institut)
Postfach 50 02 40, D-79028 Freiburg
Web: http://www.oeko.de/index_engl.htm (English)
Web: http://www.oeko.de (German)

Oeko-Institut is a leading European research and consultancy institution working for a sustainable future.

Research and Advisory Institute for Hazardous Substances (FoBiG – Forschungs- und Beratungsinstitut Gefahrstoffe)
Werderring 16, D-79098 Freiburg
Web: http://www.fobig.com (English)
Web: http://www.fobig.de (German)

FoBiG is a private company specializing in toxicological risk assessment.

Universities

Postgraduate scientific work in toxicology can be carried out at all universities with a medical faculty in the departments of toxicology or pharmacology. A few universities have such departments in the faculty of pharmacy or veterinary medicine. Postgraduate work leads to a doctorate in the discipline of the student's basic degree, e.g., medicine, chemistry, pharmacy, biology, food chemistry, etc. There is no degree of 'doctor of toxicology' nor is there a degree in toxicology at the graduate level.

Professional Societies

Gesellschaft für Toxikologie in der DGPT (Society of Toxicology associated with the German Society of Experimental and Clinical Pharmacology and Toxicology) GT is engaged in development of toxicological science and education in Germany. Since the 1980s GT has been running a postgraduate training program with qualified courses in more than ten toxicological subdisciplines. GT and its members also teach toxicological topics in training programs with the main focus outside toxicology (e.g. environmental medicine). Expert committees regularly develop and publish position statements on toxicological topics of political and public concern. Today, GT has 950 personal members.

Legislation

Although handling of chemical compounds is regulated by national legislation, this must be harmonized with legislation in the European Union. Binding guidelines of the European Union must be adopted nationally. The most important laws dealing with chemical compounds are described below.

Chemicals Act-Protection Against Hazardous Substances Act (Gesetz zum Schutz vor gefährlichen Stoffen-Chemikaliengesetz) and Ordinance on Hazardous Substances (Gefahrstoffverordnung)

Responsibility: Federal Ministry of Labor and Social Affairs (Bundesministerium für Arbeit und Soziales)

Federal agency in charge: Federal Institute for Occupational Safety and Health (Bundesanstalt für Arbeitsschutz und Arbeitsmedizin)

The law prescribes a registration procedure for all chemical compounds to be introduced into the market except those regulated by another law. The extent of toxicological data required for registration depends on the amount of the chemical to be marketed. The law

regulates the classification and labeling of chemicals and the handling of chemicals in the workplace, including the establishment of threshold values.

Drug Law (Arzneimittelgesetz)

Responsibility: Federal Ministry for Health (Bundesministerium für Gesundheit) Federal agency in charge: Federal Institute for Drugs and Medical Devices (Bundesinstitut für Arzneimittel und Medizinprodukte)

The Drug Law prescribes a procedure for the marketing authorization for drugs in which the quality, clinical efficiency, and safety of new drugs is assessed. Extensive toxicological data are required for this procedure. The Drug Law requires benefit assessment in addition to risk assessment.

Federal Immissions Control Act (Bundesimmissionsschutzgesetz)

Responsibility: Federal Ministry of the Environment, Nature Conservation and Nuclear Safety (Bundesministerium für Umwelt, Naturschutz und Reaktorsicherheit)

Federal agency in charge: Federal Environmental Agency (Umweltbundesamt)

The law is devoted to the protection of humans, animals, plants, and objects from harmful effects arising from the environment, in particular from the air. It prescribes a procedure for the approval of installations in order to minimize the emission of dangerous substances into the environment.

Foods and Feed Code (Lebensmittel- und Futtermittelgesetzbuch)

Responsibility: Federal Ministry for Health (Bundesministerium für Gesundheit) Federal agency in charge: Federal Office of Consumer Protection and Food Safety (Bundesamt für Verbraucherschutz und Lebensmittelsicherheit)

The law regulates the handling of foods, cosmetics, and commodities. It is devoted to the protection of the consumer by prohibiting products that may affect human health. It prescribes that only approved food additives may be used.

Plant Protection Act (Pflanzenschutzgesetz)

Responsibility: Federal Ministry of Food, Agriculture and Consumer Protection (Bundesministerium für Ernährung, Landwirtschaft und Verbraucherschutz)

Federal agency in charge: Federal Office of Consumer Protection and Food Safety (Bundesamt für Verbraucherschutz und Lebensmittelsicherheit)

In implementing Directive 91/414/EEC, the Plant Protection Act prescribes a procedure for the marketing authorization for pesticides in which extensive toxicological data are required in order to ensure that the compounds do not exhibit harmful effects on humans, animals, or the environment.

These laws contain authorizations for the government to enact ordinances (Verordnungen) that regulate issues of the law in detail below the legislation level. For instance, details concerning the issues of the Chemicals Act are regulated by the Ordinance on Dangerous Substances (Gefahrstoffverordnung) published by the Federal Ministry for Labour and Social Affairs. Since Germany is a confederation, the approval of the Bundesrat (Federal Council, representing the federal states) is required for many of these ordinances. As a rule, federal agencies are responsible for registration and marketing authorization, for establishment of threshold values, and for recommendation of precautions for health protection, whereas agencies of the states are responsible for supervision and prosecution.

CHAPTER

91

India

SHRUTI PATEL AND ARUNA DEWAN

INTRODUCTION

The Indian economy is surging ahead and the current decade has witnessed extensive industrial growth in India, although agriculture still remains the main occupation for a large segment of the Indian population. According to the 2001 census, the employment of women in agriculture and household industries has increased remarkably as compared to the 1991 census. Though per hectare use of pesticides has been reported to be much less when compared to developed countries, pesticide exposures, both acute and chronic, continue to cause serious health problems to farm workers. Employment of women translates into higher exposures for vulnerable groups, including children. There are vast populations in India who are being exposed to arsenic-contaminated ground water. Also of concern is chemical waste dumped in the country in the guise of recycling. This has added to the already existing burden of infectious diseases, compounded by widespread malnutrition. Environmental groups backed by media are playing a significant role in creating public awareness and building up pressure on policy makers. Some recent examples include the controversy related to pesticide residues in soft drinks and asbestos-related hazards in ship-breaking yards. Regulatory bodies are implementing stringent laws, and analytical facilities in private and Government institutions are being upgraded to meet international standards.

Most of the regulations concerning pharmaceuticals, food additives, preservatives, air and water pollutants, industrial chemicals, and pesticides rely on toxicological data, and toxicity testing is becoming more and more elaborate. Experimental toxicological research in India has been following in the footsteps of its Western counterparts, and research is being carried out in universities throughout the country. The country is also upgrading its capabilities to keep up with global standards for measuring and monitoring chemicals at ppb levels.

India has lagged behind in an important aspect of toxicology. Practice and teaching of clinical toxicology has yet to find its due place in the medical curriculum and healthcare system. Pesticide poisoning continues to take a heavy toll on human lives. There is limited clinical toxicological research on acute and chronic poisoning due to pesticides and industrial chemicals. Poison Information Centers which act as focal points of consultation and information dissemination for emergency treatment of poisoning are few and have yet to make their presence felt in this country of more than a billion people. Training in medical management of chemical emergencies is rudimentary and only very recently have programs on advanced HAZMAT life support been started for emergency physicians. Toxicology training for paramedics and pre-hospital management of chemical exposures is almost non-existent. Research on occupational and environmental human exposure and bio-monitoring needs to be strengthened.

Toxicology has made considerable strides in India, although further progress is necessary.

RESOURCES

Books

Abbasi SA (1998)
Heavy Metals in the Environment
New Delhi: Mittal Publications

The natural occurrence of heavy metals in the environment, the elevation of these natural levels due to pollution, and the toxic effect this has on the environment in general and in human beings in particular, is a topic of interest for a very large cross-section of people – ranging from metallurgists to environmentalists, geologists to biologists, engineers to doctors, social scientists to journalists, city planners to health workers. In this volume the three authors have pooled their combined expertise of over 50 years in this field to provide us with a goldmine of information and deep insight. A must for everyone interested in environment.

Aggrawal A (2006)
Self-Assessment and Review of Forensic Medicine and Toxicology
New Delhi: Peepee Publishers
ISBN: 81-88867-85-3

Agrawal KC (2001)
Environmental Pollution: Causes, Effects & Controls
Bikaner: Nidhi Publishers
ISBN: 8190118145

This book presents up-to-date and all basic information about the major types of environmental pollution – air, water, indoor, noise, solid and hazardous waste, radiation, thermal, and oil pollution and their adverse effects on man and the environment. Technological and legal pollution control measures have been discussed in the Indian context. The text has been updated in light of current status of Government policies and programs. Notable international treaties and protocols viz., Stockholm Conference, World Charter for Nature, Rio Earth Summit, Montreal Protocol and Kyto Protocol, have also been described. Glossary of relevant terms is given at the end. The book will serve as a major text for students of botany, zoology, geography, geology, environmental biology, environmental science, environmental chemistry, environmental engineering, home science, law, and medical and veterinary sciences.

Ahluwalia SK (2005)
Environment Problems in India
Jaipur: ABD Publishers
ISBN: 8183760031

Environmental problems have impacted on and attracted the attention of every community and nation of the world. Global warming, ozone layer depletion and numerous other phenomena have made globalization of environmental problems. Therefore, efforts are made worldwide to find solutions that are global in nature, require international cooperation and a scientific and political consensus. This has resulted in evolution of various approaches and techniques toward solution of these problem and sustainable development. 'Environmental Problems in India' makes a thorough investigation into various concepts, approaches, methods, techniques, rules, regulations, and laws dealing with environmental problems. Delving deep into social dimensions of these problems and the relationship between society and nature, the book arrives at certain conclusions for the alleviation and/or mitigation of these problems. The book includes all latest energy-saving conservation and sustainable development strategies. This all-encompassing book on management of environmental problems will suit the needs of teachers, students, environmental NGOs, and general readers.

Arora M (2001)
Environmental Management of Toxic and Hazardous Chemicals
New Delhi: Ivy Publishing House
ISBN: 8178900009

Bajaj YPS, Peles JD, Barrett GW (1999)
Transgenic Medicinal Plants
Springerlink Publisher
ISBN: 3540651209

Banerjee BN (1987)
Environmental Pollution and Bhopal Killings
New Delhi: Gyan Publishing House
ISBN: 8121201195

This book alleges that Union Carbide Corporation (UCC; the US chemical multinational)'s criminal irresponsibility simply ruined hundreds of innocent lives in Bhopal by the sudden releases of over 40 tonnes of methyl isocyanate (MIC) and the associated lethal chemicals. The tragedy was totally man-made and created by those unscrupulous death-dealers who would for making easy profit, not hesitate in any kind of reckless behavior. The same death-dealing US Company – Union Carbide contributed to spreading disinformation to evade the responsibility and in the process contributed to untold suffering to thousands of people. However, the Bhopal tragedy with its suffering and agony continues and thousands of people are afflicted by lung, eye and skin diseases besides psychological problems. The official agencies categories the gas victims as severely affected (65 000), mildly affected (20 000) and those under controlled effects (14 000). The abortion, mortality, and infant mortality rates in the severely affected category have been found to be three to four times higher than in the controlled category during April, 1965 to March, 1986. While official agencies' reports, kept confidential, point to a very serious situation, the Madhya Pradesh Government wants people to believe that all is well in Bhopal. In fact, statistics bleed

with reality of significant number of gynecological disorders, record abortions and corneal opacity (blurred vision). The Madhya Pradesh Government's approach to the Bhopal disaster by way of suppression of information, inadequate medical relief, and economic rehabilitation as well as persecution of voluntary relief workers have come in for severe criticism both in the press and the public. Thus the human agony continues.

Bhushan B, Kumar V (2006)
Environmental Impact Assessment
New Delhi: Shree Publishers & Distributors
ISBN: 8183290817

Environment Impact Assessment (EIA) is an activity designed to identify and predict the impact on the biogeophysical environment and on man's health and well-being of legislative proposals, policies, programs, projects, and operational procedures, and to interpret and communicate information about the impacts. EIA should be an integral part of all planning for major actions, and should be carried out at the same time as engineering, economic, and socio-political assessments. This book responds to both the evolution in EIA thinking and to the maintenance of the basic approach. The emphasis in this book is on developing understanding of the EIA processes. It is intended to place the reader in the position of being able to apply these processes to any situation, while being aware of the strengths and limitations of the approaches being used and the assumptions being made. The intended readers of this book include decision-makers, policy and management advisors, the assessors, technical staffs, students and teachers of environmental science and laymen with an interest in environmental quality.

Bhushan B, Kumar V (2006)
Environmental Management
New Delhi: Shree Publishers & Distributors
ISBN: 8183290884

The environment is integral to the overall process of development. It includes the relationship and interdependencies that exist between people and natural resources. Environmental change is thus the product not only of natural events, but also of the application of development models, practices, and life-styles. The last two decades have seen a renewed interest in the use of environmental management as part of an integrated approach toward disease vector control. This interest has originated in part from a growing concern about the possible adverse health impacts of the continued development of water resources. This book discusses various techniques for environmental assessment and management. It will enable the users to incorporate the principles of environmental management and sustainable development into their daily activities, particularly in their efforts to promote a sustainable, equitable, and participatory development process. It will also enable them to identify environmental opportunities as well as constraints when pursuing economic and social development objectives.

Toxicological Study of Pesticides in Animals
CRC Press
ISBN: 084936907X

This book discusses studies that have been conducted on various animal species. The book reviews the effects of pesticides through changes in behavior, the nature of morphological and biochemical lesions, as well as the tracking of the metabolic disposition of pesticides in target sites of an organism. In vitro studies provide information regarding cellular responses and biochemical lesions with pesticides. Toxicological profiles of pesticides are cited using different species of animals for in vivo and in vitro studies. This information should help scientists and decision-makers reach conclusions regarding the toxicological effects of pesticides on humans and the environment.

Dwivedi P (2004)
Environmental Pollution and Environmental Management
Jodhpur: Scientific Publisher
ISBN: 81-7233-358-7

This book highlights critical environmental issues, and touches upon various environmental pollution with focus on the causes, sources, and remediation. The emphasis has been laid on key environmental management strategies to combat the menace caused by various pollutants, and also to be prepared in advance to tackle the effects of such pollutants as well as natural hazards.

Environmental Pollution: Hazards and Control
New Delhi: Concept
ISBN 81-8069-260-4

This book attempts to address the multidimensional problems of environmental pollution. Explaining the concept of environment, change of ecological balance and pollution, it traces the causes accountable for producing air, water, noise, vehicular, metal dust, soil, pesticidal, radioactive, and food pollution. It further analyses the impact of different pollutants on human and animal life. Suggestions for their better management and control have been given as well. The book will be of special interest to the policy makers, researchers, environmentalists and development agencies.

Environment and Health
New Delhi: Sumit Enterprises
ISBN: 8184200110

Environmental education has close links with the other four cross-curricular themes sharing many of the same features of investigative skills and body of knowledge. Pupils may research original and secondary sources, set up simulations, reach conclusions, and discuss the validity of their ideas. The five themes share the possibilities for promoting the discussion of value and beliefs, extending knowledge and understanding, encouraging practical activities and decision-making and providing opportunities for pupils to make positive contributions to their community's way of life.

Environment and Metal Pollution
Jaipur: ABD Publishers
ISBN: 8185771197

This book comprehensively deals with the subject of metals and their environmental and health consequences. It contains 12 major chapters besides references and index, covering the topics on almost all aspects of metals. Not only the environment-related topics, but also the topics covering the general aspects of metals such as nature and classification, uses and production, metals as micronutrients and metal interaction with microbes have been included in the book. Topics dealing with the surveys on metal pollution, recycling and recovery, and treatment and disposal have been dealt with in detail. The environmental test procedures and bioassays with metals have also found a place in the book.

Khitoliya RK (2005)
Environment Protection and The Law
New Delhi: A.P.H. Publishing Corporation
ISBN: 8176487961

It is widely felt that proper legislative measure enacted and implemented in time, can save the earth from environmental disaster. The need for environmental protection is an area that has been at the forefront of social concern during the last three decades globally. What is needed is balance between development and environment. An integration of the environment and development is required at the policy planning and management level. The problems of environmental degradation are addressed and emphasis on the need for legal instrument to protect the same has been attempted. The important judicial pronouncements have also been added besides role of people's participation. Important constitutional provisions relating to protection and improvement of the environment have been discussed in detail and the various aspects of environment have been narrated at length. The book integrates the various aspects of environmental pollution control to tackle environmental problems for achieving sustainable development. The relevant conference, summit, rules, and acts are also included in appendices.

Kishore J (2006)
National Health Programs of India: National Policies & Legislations Related to Health
New Delhi: Century Publications
ISBN: 8188132152

This book is first of its kind intended to fulfill the long felt need of providing information about national programs, policies, and legislation related to health at one

place. It is a tribute not only to the vibrancy of the type of health program management but also to the volume and quality of recent academic research on public health interventions that this book has to be so thoroughly revised and updated within a short period of time. There are many significant changes in government approach in relation to public health since the beginning of this new century. As public health is a dynamic process so is its information. One can observe a progressive change in the field of Public Health in India. Many new public health institutions are coming up. New goals and targets are set in various policies, programs, and legislations by the government. India is making a presence globally and targets are set in various policies, programs, and legislation by the government. India is making a presence in the global market and taking part in globalization. Each chapter of this popular book provides current and concise coverage of a wide range of programs, policies, and legislations related to health. Its presentation offers a great opportunity to learn about public health delivery by the government and to practice preventive and social medicine in the community. The book has all the facts one needs to know about health programs in India. It is a unique book providing valuable updated information useful for undergraduate, postgraduate medical, nursing and social science students, public health experts, policy makers, project officers, and social workers.

Environmental Chemical Hazards
New Delhi: Sarup & Sons
ISBN: 8176251267

The study of environmental chemical hazards in the recent past has gained tremendous importance because of their dangerous dimensions and occurs largely by the activities of man. This book is a serious attempt to cover most aspects of environmental chemical hazards. Every chapter included in this book is self sufficient and well explained with a number of diagrams and case studies, selected from different countries. An effort has been made to describe each chapter in light of newer developments in a simple language and elegant style. This book may serve as a ready reference for all environmentalists including students of environmental science, regulatory pollution control authorities, city planners, health technicians, agriculture scientists, government departments, and industries.

Environmental Contamination and Bioreclamation
New Delhi: APH
ISBN 81-7648-587-X

The growing population and relentless marches towards development have forced man towards urbanization and industrialization. With the mushrooming of industrial concerns over many years, the concentrations of different pollutants in various ecosystems have increased, causing eco-degradation. Most of the water bodies have been thoughtlessly used for the disposal of wastes as a dustbin far beyond assimilative capacities and they have been grossly polluted. The waste, which is posing a serious ecological problem, could be gainfully used for agriculture as well as aquaculture. Bioreclamation strategy must be used for sustainable development and to conserve the non-renewable resources for future generations.

Kumar A (Ed.) (2005)
Environment and Toxicology
New Delhi: A.P.H. Publishing Corporation
ISBN: 8176489174

Untoward effects of any substance in the environment, including drug toxicities or poisoning whether as a

consequence of internal or external exposure and relating to both immediate and long-term implications in the realm of human ecology, or to transformation which leads to an understanding of the mechanisms through which toxic manifestations arise and to the means for alleviation and control of toxic effects. Toxicology is one of the several multidisciplinary fields of Environmental Science. Many of these fields are overlapping, as many of the things that they derive from other disciplines are common to them. The present book, entitled 'Environment and toxicology', is the unique compilation of the most innovative research articles of eminent environmental scientists of India which will be helpful for post-graduate students, research scholars, academicians, and also for other people who are engaged in the field of Environmental Toxicology.

Kumar A (Ed.) (2006)
Heavy Metal Pollution Research: Recent Advances
New Delhi: Daya Publishing House
ISBN: 8170353855

Some 65 of the known 92 elements are metallic in nature. The term 'metal' designates an element that is a good conductor of electricity whose electrical resistance is directly proportion to absolute 0 T. In addition, metals share some distinctive characteristics such as high thermal conductivity and high density. Metallic elements are intrinsic components of the environment. Some 19 heavy metals of the known 65 metals are toxic in nature and are a great threat to the living as well as non-living world, and so man is no exception. Actually toxic heavy metals are present at $<0.1\%$ levels in the earth's crust but anthropogenic activities such as smelting and mining of ores, releasing industrial wastes, use of metallic compounds in industries and in the production of vehicles and airplanes have released a large number of toxic metals and their salts into the environment. So, dispersion of heavy metals into the environment has become a most challenging problem. If proper management and mass awakening right from grass-root level to top policy makers have not been considered inevitable within time, no force on this earth can check the propagation of carcinogenic characters of the heavy metals. This book will be helpful in solving the crux of heavy metal pollution; as it is a compilation of the most advanced research articles of the scientists of repute in the concerned field. Besides, the book will be very helpful for the students, research scholars, professors, scientists as well as for those who have an interest in toxicology.

Kumar A (Ed.) (2006)
Industrial Pollution: Problems and Solutions
New Delhi: Daya Publishing House
ISBN: 8170353750

The storm of modernization and industrialization has not only uprooted man but has also destroyed his habitat and environment. The increase in discharge of carbon dioxide and other pollutants from various industries is as sharp as the decrease in release of oxygen by plants as a result of which the bioequilibrium maintained since time immemorial has been affected. So, industrial pollution has become a great threat for the generations to come. So, it is the prime duty of we scientists to explore the quantum of pollution load as well as to devise certain strategies and technologies so that our sustainable development would not be jeopardized otherwise our long-cherished dream of establishing eco-socialism on this watery planet could not come true. The present book entitled 'Industrial Pollution: Problems and Solutions' is a unique collection of advanced research papers of eminent environmental scientists which will be very helpful for students, research scholars, professors, scientists, and policy makers for assessment of industrial pollution load and to devise the know-how by which it can be solved.

Malhotra S (2004)
Air Pollution and Its Control
Jaipur: Pointer Publishers
ISBN: 8171323871

Air pollution has been growing since the Industrial Revolution. Rapid industrialization, burgeoning cities, and greater dependence on fossil fuels have brought in their wake increased production of harmful pollutants, making life more and more unpleasant and unhealthy. Among the most common and virulent of air pollutants are sulfur dioxide, suspended particulate matter, nitrogen oxides, carbon monoxide and lead. In addition, there is evidence of a growing threat to human health from even indoor pollutants such as radons, formaldehyde, mercury and organic substances. To this end, this book is timely and appropriate as it focuses attention on most of the factors that are causing havoc in the present day to the sustainability of Earth. Various methods and techniques of air pollution and its control are also discussed. This book will be useful for students of Environmental Sciences, Life Sciences, Environmental Engineering and also researchers and teachers.

Ecology of Polluted Waters and Toxicology
Jaipur: ABD Publication
ISBN 81-85771-60-X

This book contains 25 research articles and reviews on different aspects of ecology of polluted waters, both lentic and lotic water bodies, and toxicity of pollutants to fish and other aquatic organisms. Keeping in view the multidisciplinary nature of the subject, diverse areas of research have been covered including environmental impact assessment, river pollution, plankton diversity, impact of pollution on aquatic macrophytes and bank vegetation, heavy metal pollution, toxicity of insecticides, herbicides, fungicides, metals, etc. to fish, tadpoles, prawn, and other aquatic organisms.

'The book shall be of great help to the teachers, researchers, and post graduate students in the field of limnology, ichthyology, environmental science, botany, zoology, environmental chemistry and toxicology as a reference book.' (jacket).

Pande GC, Pande DC (Eds.) (1999)
Environmental Development and Management: Strategies and Policies
New Delhi: Anmol Publications Pvt. Ltd
ISBN: 812610211X

'Environmental Development and Management: Strategies and Policies' is indeed a novel addition to the existing literature on the wider dimensions of the burning problem. It is an outcome of extensive research work by many collaborating experts in this field; and gathering, examining and analyzing the data of observations on varying dimensions from different parts of the globe. It is a timely, up-to-date and rigorously selective collection of precisely relevant original and field-based observations, analytical conceptual discussions, and well-documented scientific papers of experts, veterans in academics and scientists of wider recognition. A really vast profile of the extensive subject matter is spread over the broad five parts. The first part, 'Environmental Concepts: Options and Strategies' consists of a few chosen and nicely edited papers on nature, dimensions, depth of crisis, consciousness, awareness, space informatics and condensed backdrop of the environmental debate during 20th century and its status at the beginning of 21st century. Part Two and Part Three constitute the heart of the volume wherein scientists have investigated the levels of pollution and scaled the threat to human survival. Each major aspect of ecological deterioration and source of pollution has been carefully examined and every dimension has received a very lucid treatment. Similarly different strategies and methods of agro-forest resource management in different parts of the globe have been discussed at length, dressed with facts and palpitating with life. Parts Four and Five comprise very interesting discussions on diagnosis of the impact of ecological degradation on habitat, society and the economy. These parts present the prognostic and prescriptive options of environmental management.

India's Environmental Policy
New Delhi: Omsons Publications
ISBN: 8171172261

The book tries to analyze India's reference to marine environment. India with its long coastline and 25% of its population living in the coastal areas has been a party to many international conventions to protect the marine and coastal environment over the past two decades. India has attempted to provide some constructive leadership on international environment policy. Among South Asian nations, India, particularly has taken the cognizance of the dangers inherent in growing ecological deterioration and has taken steps to initiate measures at national as well as international levels to arrest, reduce, and rectify marine pollution.

Ramamoorthy S, Ramamoorthy R (1995)
Handbook of Chemical Toxicity Profiles of Biological Species
CRC Press
ISBN: 1566700140

The two volumes comprising this new handbook provide a unique resource for studies involving toxicity profiles in aquatic, avian, and mammalian species. The arrangement of material in alphabetical order by species allows the reader straightforward access to information on the effects of chemicals on various life forms. For each group of species, the acute and chronic (short- and long-term) toxicity data are arranged in descending order, enabling the reader to evaluate the relative toxicity of chemicals for any given species.

This arrangement of data also indicates the relative importance of exposure routes. Toxicity profiles include LC_{50} values, cancer indices, and Virtually Safe Doses (VSDs) and are provided for each organ. In addition, the Handbook provides important comparisons of identical toxicity testing methods and duration of exposure (e.g., LC5096h) to arrive at a ratio. The ambient concentration and its ratio to the toxic level will assist in selecting the cut-off chemical. This approach helps the reader to maximize the use of resources and to generate data that are specifically relevant to the species and ecosystem under study. The species-specific approach in the 'Handbook of Chemical Toxicity Profiles of Biological Species' makes it a powerful tool for a wide range of studies. It may be used, for example, in evaluating the status of endangered or other species, making impact assessments, developing regulatory controls, and determining important areas for future research.

Satake M (1997)
Environmental Toxicology
New Delhi: Discovery Publishing House

Shafi SM (2005)
Environmental Pollution
New Delhi: Atlantic Publishers & Distributors
ISBN: 812690366X

This book is the outcome of intensive efforts made by the author for more than 7 years in collection of materials, their recasting to suit own scheme of requirement and also incorporating new research findings from reputed researchers on environmental pollution in the book. The book has been styled to cover the requirements of University syllabus for the graduate (Honours) and postgraduate students of various universities. The book covers major aspects of the environment: air pollution, water pollution by physical agents (causing radioactive pollution, thermal pollution, sound pollution). Under the umbrella of these four major aspects a great deal of valuable information has been given on many topics including particulate pollutants, problems of aerosol accumulation, role of aerosol in photochemical pollution, phenomenon of acid rain and its effects, problem of ozone depletion, uses and destructive role of chlorofluorocarbons, causes of global warming, and role of some air-borne organisms as biopollutants. These items represent the main segments of atmospheric pollution. Likewise, matters on industrial pollutions, particularly sewage and some other biodegradable wastes, role of infectious agents in water to spread diseases, production of excess of plant nutrients in water, organic chemicals of exotic sources, inorganic chemicals in water, agricultural solid wastes, sediments, coastal pollution/oil pollutions, etc., represent main instances of water pollution. The information on the effects of pollutants on human health, animal health, plants, materials and properties are of general public interest and introduction of legal steps for controlling pollution carry additional significance.

Metal Toxicity and Tolerance in Plants and Animals
New Delhi: Sarup & Sons
ISBN: 8176255874

Many heavy metals are essential for plants and animals when present in growing medium in low concentrations; they become toxic only when a concentration limit is exceeded. The toxic metal phytotoxicity has been known for more than a century. However, the interest in this field has been developed only recently. The capacity of the plants to survive on soils that contain high concentrations of certain toxic metals has fascinated ecologists and plant physiologists for decades. This book is very useful to those who are interested in toxic metals and their interaction with plants, particularly students and teachers of plant physiology, ecophysiology, molecular biology, and environmental science.

Singh VP (2005)
Toxic Metals and Environmental Issues
New Delhi: Sarup & Sons
ISBN: 8176255491

The book is the outcome of the work that has been done during the last three decades on toxic metals in soil–plant systems. Toxic metal problems are universal and the situation in developing countries is worse and unimaginable. In this book the author has taken some important toxic metals of the environment, which are of more concern to humans. Their occurrence, contaminations, effects on health hazards, and environmental issues are very well described. The book gives a very concise, integrated, and updated account of phytotoxicity, tolerance, detoxification, and phytoremediation of toxic metals in soil–plant–animal system. The book provides the most comprehensive information to readers, students, and researchers who are working in environment.

Hazardous Wastes, Organic Pollutants and Prior Informed Consent: Global Environmental Law, Policy and Action Plan Series
New Delhi: SBS Publishing
ISBN 81-89741-35-7

This book deals with the international guidelines related to hazardous wasted, organic pollutants and their movements to various areas by different ways and means, provides readers with an integrated understanding of the global environmental regimes for hazardous wastes and organic pollutants. The basal convention on the control of transboundary moments of hazardous wastes and their disposal, which aims to prevent the unauthorized dumping of toxic waste in developing countries, has been covered in detail with sufficient case studies. The Rotterdam convention on prior informed consent hazardous chemicals in international trade is discussed to elaborate upon the mechanism for the import of such chemicals. In addition, the Stockholm convention on persistent organic pollutants is presented to elaborate upon the guidelines to eliminate the global use of such nominated chemicals. The agenda 21 action plan in this regard is also elaborately covered.

Sood A (1999)
Toxicology
ISBN 81-7625-078-3

In the recent past the field of 'Toxicology' has undergone a veritable revolution. The present title is being compiled to include the numerous new concepts on this field. Each concept included in this book is self-sufficient. Further, a sincere effort has been made to represent each concept in this book in a clear and explanatory straightforward style. This approach combined with an extensive cross-referencing system helps the reader to place each concept into a broader modern scientific context. Many structural formulae have been included whenever the meaning of a concept can be best conveyed by means of a structural formula. It is presumed that the reader is readily familiar with the basic concepts in chemistry, biology, science, etc.

Talwar P (Ed.) (2006)
Environmental Management
New Delhi: Isha Books
ISBN: 8182053412

The objective of environmental management is improved human life quality. It involves the mobilization of resources and the use of government to administer the use of both natural and economic goods and services. It is based on the principles of ecology. In the complex and interdependent world that we have been given, environmental management is required because the activities of development in one sector affect in both positive and negative ways the quality of life in others. Designed as a guide to hands-on, day-to-day environmental management, this book covers the nuts and bolts of effective environmental management. It provides a through introduction to those new to the field or to the environmental specialists who need a thought-provoking refresher. It will enable the students to gain a practical understanding of environmental hazards, controlling air and water pollution, managing hazardous wastes, implementing pollution prevention programs, dealing with compliance audits and regulatory inspections, and much more.

Thukral AK, Virk GS (2000)
Environmental Protection
Jodhpur: Scientific Publishers
ISBN 81-7233-258-0

'Environmental Protection' presents articles on the state of environment, pollution control, and biodiversity conservation by eminent teachers and scientists. The book will be useful for postgraduate students in life sciences, botany, zoology, microbiology, genetics, and environmental sciences. The researchers will find information on recent trends in environmental research.

Indian Drugs
ISSN (printed): 0019-462X
Published by Indian Drug Manufacturers' Association

Indian Drugs is a well-known Scientific and Research journal published by IDMA on the 28th day of every month for the past 39 years. IDMA seeks to promote original research in India in pharmaceutical sciences and in all major fields that fall within its ambit, through this reputed publication. Original Research Papers, Review Articles, Short Notes in five broad disciplines: Pharmaceutics, Pharmacology, Pharmaceutical Analysis, Pharmaceutical Chemistry, and Pharmacognosy & Phytochemistry are published from all over India and from many countries abroad after scrutiny by the Editorial Advisory Board.

Indian Journal of Chemical Technology
ISSN: 0971-457X

Indian Journal of Chemical Technology has established itself as the leading journal in the exciting field of chemical engineering and technology. It is intended for rapid communication of knowledge and experience to engineers and scientists working in the area of research development or practical application of chemical technology. This bimonthly journal includes novel and original research findings as well as reviews in the areas related to – Chemical Engineering, Catalysis, Leather Processing, Polymerization, Membrane Separation, Pharmaceuticals and Drugs, Agrochemicals, Reaction Engineering, Biochemical Engineering, Petroleum Technology, Corrosion & Metallurgy and Applied Chemistry. Educator & Chem-Tech Scan are two recent additions to the journal. Chem-Tech scan highlights new researches and technology developments, patents granted and technology offers in the field of chemical technology.

Indian Journal of Chemistry
ISSN: 0376-4699

Indian Journal of Chemistry (Section B) is a leading monthly journal in Organic and Medicinal Chemistry started publishing from 1976. It publishes papers on organic reaction mechanisms, theoretical organic chemistry, structure–activity relationships, medicinal chemistry, synthesis of chiral compounds, bio-organic chemistry, enzymes in organic synthesis, reagents in organic synthesis, heterocyclic compounds, phytochemistry (natural products), amino acids, peptides and proteins, spectroscopy in characterization of organic compounds, chemoenzymatic and enantioselective synthesis of organic compounds, synthesis of fullerenes, metal-catalyzed asymmetric reactions, bioactive plant products and combinatorial chemistry. Apart from full-length papers, notes and communications, the journal publishes short reviews on frontline areas under the column 'Advances in Contemporary Research'.

Indian Journal of Clinical Biochemistry (IJCB)
ISSN (printed): 0970-1915
Published by Association of Clinical Biochemistry of India

Indian Journal of Clinical Biochemistry (IJCB) is a biannual (January and July) publication of the Association of Clinical Biochemistry of India (ACBI). It covers the research areas in the fields of Clinical Biochemistry, Pathological, Microbiological, Molecular, Cellular, Genetic and Bioinformatic concepts and other advanced techniques. The journal primary mission is to serve the public interest in health care by providing leadership in clinical laboratory science to national professional societies, the diagnostics industry, government and non-government organizations. This journal also acts as a bridge in various interdisciplinary areas of medicine. It covers laboratory accrediation programs pertaining to health and disease.

Indian Journal of Experimental Biology
ISSN (printed): 0019-5189
Published by National Institute of Science Communication and Information Resources

This journal, started in 1963, publishes full papers, notes and reviews in cell biology, molecular biology, genetic engineering, endocrinology, reproductive biology, immunology, developmental biology, comparative physiology, radiation biology, chronobiology, microbiology, pharmacology, toxicology and other biological fields including instrumentation and methodology. The papers having experimental design involving alteration and/or manipulation in biological system(s) providing insight into their functioning are considered for publication. Studies involving higher animals, human beings and of clinical nature are not encouraged for publication in the journal. Review articles in frontier areas of contemporary relevance are also published.

Web: http://indmeddb.nic.in/jnstatus.html
Medical Journal Armed Forces India
ISSN (printed): 0377-1237
Published by Armed Forces Medical Services, India

This journal was conceived in 1945 as the *Journal of Indian Army Medical Corps*. Col Dr. Thapar was the first Editor who published it on behalf of Lt. Gen Gordon Wilson, the then Director of Medical Services in India. Over the years the journal has achieved various milestones. Presently it is published in Vancouver style, printed on offset, and has a distribution exceeding 5000 per issue. It is published in January, April, July, and October each year. MJAFI is now indexed/abstracted by ExtraMED, Index Medicus for South East Asia, International Abstracts of Biological Sciences, Abstracts of World Medicine, IndMED, Hygiene and Tropical Disease Abstracts and EMBASE and is exchanged with Armed Forces Medical Publications of nine countries. The journal accepts original articles, contemporary issues, review articles, drug update, quizzes, case reports, letters, journal scans, and book reviews for publication. Approximately 20 articles are published in each issue, besides permanent features like guest column, editorial, 25 MCQs, an article on medical emergency and medical philately. Both civilian and military personnel can contribute articles for publication.

Andhra Pradesh
Phone: 91 8647 253971
Fax: 91 8647 254815
Email: assistjr@sancharnet.in

ASSIST started its involvement with the issue of child labor. Gradually the involvement broadened to address more fundamental problems in society which have been the root causes of the problem of child labor. Hence even though starting with a child labor rehabilitation program, the process entailed the generation of people's movements on some issues like social housing, sanitation, drinking water, community health, savings, credit, income generation, self-reliance, and ecology encompassing the whole community, region, and district. Disadvantaged social groups such as scheduled tribes, scheduled castes, fishermen, and weavers have emerged as the main target population. In all these target groups the poorest of the poor such as artisans, agricultural laborers, small and marginal farmers, and migratory workers have been a natural option for ASSIST's program intervention.

The major activities include research, development, consultancy and training programs related with Remote Sensing Applications and GIS, Environmental Resource Planning, Water Supply Engineering, Sanitary Engineering, Wetland Ecosystem Management, Biodiversity Conservation and Eco-restoration Programs, Community Action Support Programs, Environmental Policy and Legal Studies, Environmental Impact Assessment Studies, Harbor Modeling Studies, etc.

Centre for Environment Education (CEE)
Web: education.vsnl.com/cee/index.html
Web: envfor.nic.in/cee/cee.html

Centre for Environmental Education (CEE) was set up in 1984 to spread awareness of environmental issues and to try to find solutions for them. It is based at Ahmedabad and they have offices all over the country. They mainly aim to create environmental awareness in the communities. They conduct widespread environmental education and training programs through a very vast network. They have also taken up projects related to conservation of biodiversity and eco-development. Publications and database: They have a vast range of publications – books, posters, educational packages, bibliographies, and directories. There is also a large computerized database – the Environment Education bank, which has a collection of more than 800 environment concepts, about 2500 environment-related activities and 100s of case studies.

The Occupational Health and Safety Centre (OHSC), Bombay is a voluntary organization formed in 1988 by a group of trade unionists, lawyers, safety engineers, social activists interested in the health of the workers and the employees and safety at their work-place. The OHSC aims to assist workers and employees in their efforts to bring in a safer and healthier work place. Nearly 2000 workers have been compensated for occupational diseases and injuries, many for the first time in Mumbai and some for the first time in India.

Orissa Environmental Society (OES)
Web: http://www.orissaenvironment.com/

The Orissa Environmental Society was established in 1982 at Bhubaneshwar. It was set up to encourage and organize study, research, understanding, and appreciation of nature; to formulate co-curricular courses in environmental sciences at all levels of education and advise the government. They conduct research, seminars, and workshops on forest and wildlife protection and organize eco-development camps. They are campaigning for a biosphere reserve forest area in the state. They are the resource agency for pollution control in Talcher industrial area. Publications: *The Journal of Environmental Science*, reports, proceedings, etc.

Srishti
1001, Antariksh Bhavan
22, Kasturba Gandhi Marg
New Delhi 110 001

Srishti was set up in Delhi in 1988 to promote conservation and enrichment of the environment; to carry out research on all aspects of sustainable living; to foster concern for the environment among the people, making its preservation a shared responsibility. It has been working for the conservation of the Delhi Ridge by involving community participation; they have kept a bird count in the wetlands of Delhi. They have co-ordinated the Asian midwinter waterfowl census for northern India and have carried out tree plantation, conservation of biodiversity and waste management. They played a very active role in the drafting and finalization of the Biodegradable Waste (Management and Handling) Rules, 1998. They worked closely with the CPCB and the MOEF in the finalization of the rules. Now that the rules have been issued, they are propagating the cause of better bio-medical waste practices.

The Indian National Science Academy plays a crucial role in promoting, recognizing, and rewarding excellence. Another important task is to publish journals, organize scientific discussions, and bring out proceedings and monographs. The Academy promotes public awareness and understanding of science. Acting as links between the scientific community and the planners, they advise the governments on critical issues. Importantly they serve as forums for interaction among scientists within and outside the country.

Iran

MOHAMMAD ABDOLLAHI

TOXICOLOGY IN IRAN

History of Toxicology in Iran

The history of toxicology in Iran dates backs to the establishment of its Pharmacy and Medicine schools. Toxicology itself was one of the main courses in the Pharmacy curriculum while students of Medicine were familiar with toxicology during the course of Legal Medicine. The Faculties of Pharmacy and Medicine in University of Tehran were established nearly 90 years ago in 1920. When the Iran Legal Medicine was established in Tehran, new laboratories for the diagnosis of poisons in biological fluids were developed. Clinical toxicology in Iran was started by the efforts of several specialist physicians in the fields of toxicology, anesthesiology, and pediatrics in the Loghman-Hakim Hospital of Tehran, Imam-Reza Hospital of Mashhad, and later in Isfahan and other cities.

Poisoning in Iran

The exact number of patients suffering from poisonings per year in Iran is unknown but the rate of poisoning is likely similar to that in other countries. There are both acute and chronic cases of poisonings and the vast majority of them relate to drugs and pesticides. Human exposures to chemicals either as acute or chronic are common in Iran. Acute chemical poisonings particularly from pesticides and drugs, especially self-administered are a common cause of admission to Emergency Departments or Poisons Treatment Units. Acute household chemical poisonings, particularly in children, are also common. Chronic exposure to chemicals in the industries (occupational poisonings) and environmental pollutions that induce diseases are also health problems, especially in heavily air polluted cities such as Tehran. Almost all emergency units and the majority of intensive care units (ICU) treat intoxications but there are few ICUs in Iran with a primary focus on toxicological cases. Chronic poisonings are mostly missed because of the lack of awareness of the problem by most clinicians. Lack of adequate clinical toxicology teaching, particularly of chronic poisoning to all medical students is a problem for the medical management of chemicals.

Teaching of Toxicology

Basic and clinical toxicology are taught to undergraduate Pharmacy students and more recently to Medical students, postgraduate students in Clinical Medicine, and to MSc and PhD students of Toxicology. Clinical toxicology courses as part of Continuing Medical Education are also given to some general practitioners and specialists in clinical medicine. There are very strong departments of Toxicology in the Faculties of Pharmacy in the Medical Universities of Iran. These departments usually graduate Pharmacists and Physicians with a PhD in Toxicology. In 1987, Tehran University of Medical Sciences (TUMS) started the postgraduate training of Pharmacists and Physicians in Toxicology at the PhD level and five years later Shaheed Beheshti, followed by Mashhad University of Medical Science, and, more recently, Tabriz University of Medical Sciences joined in Toxicology education at the PhD level. In addition, the Department of Pharmacology from the School of Medicine in TUMS, and the Pharmacy Schools of Mashhad, Ahwaz, Kerman, and

Shiraz Universities of Medical Sciences, joined in toxicology education at the MSc levels. Medical Universities also train Physicians in residency programs of Legal Medicine. Recently, a residency program of Emergency Medicine has been established in Iran in which Physicians are trained to manage poisoning cases. In addition, a fellowship of Clinical Toxicology is being approved by authorities to train Toxicologists at higher fellowship levels. Added to these, there are pediatricians, anesthesiologists, internalists, and legal medicine specialists who are active in the management of poisonings in Iran in private and non-private hospitals. There is a National Board of Toxicology located within the Undersecretary of Education in the Ministry of Health and Medical Education that governs all toxicology matters in terms of teaching, study, and jobs.

RESOURCES

Drug and Poison Information Services

Address: Valiasre Ave., Daneshkian St., No.
Phone: +98 21 66419306, 98 21 88923195
Fax: 98 21 88890857
Email: irfda@yahoo.com

There are strong Drug and Poison Information Centers (DPICs) that are under the supervision of the Medical Universities and the Food and Drug Department of the Ministry of Health (MOH). The first official DPIC was established on 1995 at Tehran. The role of DPICs that are mainly supervised by Pharmacists trained in toxicology is to help both health professionals and the general public in reducing the risks of poisonings. These centers collect and distribute data on hazardous products and poisoning risks. DPICs in Iran are very active in Continuing Medical Education programs, especially in toxicology. Most DPICs are involved in scientific projects and document important intoxications in the medical literature. Almost all provinces of Iran have officially notified a DPIC. Some states have more than one center. In total, 29 active DPICs exist in Iran. Only Medical and Pharmacy doctors who are primarily educated and experienced in toxicology and drug information provide advice by telephone, email, and fax. Iran has very good cooperation with the World Health Organization's International Programme on Chemical Safety (WHO/IPCS) program and is one of the official collaborative centers of the INTOX project.

Toxicology Laboratories

There are few laboratories in Iran providing toxicology services and therapeutic drug monitoring. Some hospital laboratories provide analytical services for poisonings. Although there is no critical problem in this field, Iran needs to establish more special toxicology and therapeutic drug monitoring (TDM) laboratories to improve the present status.

National Committee on Chemical Safety

Web: http://www.mohme.gov.ir/health/index.htm

Since the Ministry of Health, Medical Care and Education is responsible for the health of the populace, the National Committee of Chemical Safety is located in the Department of Occupational and Environmental Health of the Ministry of Health. The national profile of chemical safety, prepared by this committee in the Persian language, includes information from various organizations and legislation dealing with toxic substances.

Address: 5th Floor, Building of MOH, Square of Hafez and Jomhouri, Tehran
Phone: 98 9123842076
Fax: 98 21 66707417
Email: webmaster@hbi.ir

The Iranian Society of Toxicology

Web: http://www.irantox.org/
Address: Medical Council, Tabriz St., North Sarparast St., West Taleghani Av., Tehran
Phone: 98 21 88972240
Fax: 98 21 88972239
Email: admin@irantox.org

The Iranian Society of Toxicology (IST) was established in 1989. Its main objectives include advancement of toxicology, scientific contacts between toxicologists and other scientific societies, study of the health effects of poisons and chemicals, and advice to the regulatory authorities. IST is a member of the International Union of Toxicology (IUTOX). IST supports the scientific and professional development of its members by organizing education courses that are well attended by Toxicologists, Physicians and Pharmacists. IST with the help of Iranian Universities of Medical Science has organized seven National and International Congresses with the proceedings of these congresses being sent to the Iranian authorities for their consideration. IST welcomes new members, even international members. Most Iranian toxicologists, who are primarily Pharmacists or Physicians with a specialty in toxicology, pharmacology, anesthesiology, pediatrics, internal medicine, or legal medicine, are members of IST.

Government Agencies

In total, there are four centers in Iran that control and manage issues related to poisons in terms of import, export, distribution, safety, efficacy, and environment. Each center has its own rules, acts, and policies.

Ministry of Industry
Web: http://www.mim.gov.ir/
Address: No. 250, Somaieh Av., Tehran
Phone: 98 21 88897590-9
Fax: 98 21 88808275
Email: mimwebmaster@mim.gov.ir

This ministry is responsible for importing any chemical into the country. Only chemicals that are not produced domestically are allowed to be imported.

Ministry of Health and Medical Education
Web: http://www.mohme.gov.ir/
Address: Nasr 5 Building, South Falamak, Shahrak Gharb, Tehran
Phone: 98 21 88463530
Fax: 98 21 88463530
Email: webmaster@mohme.gov.ir

Three undersecretaries of MOHME govern toxicological issues in Iran.

They include the following:
Undersecretary of Food & Drugs
Web: http://www.fdo.ir/
Address: Fakhr-Razi St., Enghelab Av.
Phone: 98 21 66405598
Fax: 98 21 66705868
Email: info@fdo.ir

Undersecretary of Health
Web: http://www.mohme.gov.ir/health/index.htm
Address: 5th Floor, Building of MOH, Square of Hafez and Jomhouri, Tehran
Phone: 98 9123842076
Fax: 98 21 66707417
Email: webmaster@hbi.ir

Undersecretary of Education
Web: http://www.mohme.gov.ir/education/index.htm
Address: Nasr 5 Building, South Falamak, Shahrak Gharb, Tehran
Phone: 98 21 88363560
Fax: 98 21 88363560
Email: webmaster@hbi.ir

The Department of Environmental and Occupational Health situated within the Undersecretary of Health is responsible for controlling health issues related to poisons and chemicals. The National Committee on Chemical Safety, mentioned above, has been established in this department. The Undersecretary of Food and Drug situated within the MOHME is responsible for registering pesticides that may be used in houses. Issues related to poisoning by drugs are also managed in this department. Within the Undersecretary of Education, there is a National Board of Toxicology that is composed of distinguished scientists of toxicology who establish rules, makes policies, and control all toxicology curricula in the universities.

Ministry of Jahad-E-Agriculture
Web: http://www.agri-jahad.org/English/Main/Default.asp
Address: Keshavarz Bulvd., Tehran
Phone: 98 21 81361
Fax: 98 21 81361

The Plant Protection Organization which is an affiliate of this ministry controls all issues related to pesticides that are used in agriculture within the country. Registration of new pesticides, permission to import or export pesticides, control of pesticide formulating factories and companies are duties of this ministry.

Iran Department of Environment
Web: http://www.irandoe.org/en/
Address: Pardisan Nature Park, Hakim Express way, Tehran
Phone: 98 21 88241720-9
Fax: 98 21 88241720-9
Email: info@irandoe.org

This department is responsible for protecting environment from all possible pollutants by issuing necessary acts and policies, and also by direct intervention.

Iran Legal Medicine Organization
Web: http://www.lmoportal.ir/en/
Address: Behesht Avenue, Tehran-11144
Phone: +98 215 5619096
Fax: +98 215 5613937

This organization is responsible for forensic matters of toxicology in the country. Interpretations of this organization are the basis of judgments in the courts.

Non-Government Organizations

Iran Green Mountain Group
Web: http://greenmountain.ir/en/
Address: No. 160, Azadi Av.
Phone: 98 21 66436089

Those interested in mountaineering and the beautiful nature of the country gathered in 1996 to establish a mountaineering group named OJE-SABZ (Green Soar).

The group was certified first by I.R.I Mountaineering Federation and then by Iran Department of Environment, as an NGO. OJE SABZ club consists of some sub groups as follows: Mountaineering group for men, Mountaineering group for women, Mountaineering group for youth. All are acting as semi-independent sub groups. This group has been active in maintaining a clean environment.

ACKNOWLEDGMENT

The author wishes to thank Dr. Shekoufeh Nikfar and Dr. Yasna Behmanesh for their kind assistances in providing information of Toxicology from Ministry of Health and Medical Education, and Ms Shabnam Kharabaf for her help in providing information of books from the National Library.

CHAPTER

93

Israel

YEDIDIA BENTUR AND BIANCA RAIKHLIN-EISENKRAFT

INTRODUCTION

After the establishment of the State of Israel in 1948, the discipline of Toxicology received a tremendous uplift throughout the country.

The importance of the discipline has been increasingly recognized and Toxicology has been pursued and developed in university departments and governmental agencies. Attention is being drawn to the adverse effects of pollution. The marketing and utilization of pesticides are regulated by the Ministries of Agriculture and Environmental Protection. Air quality is closely monitored by the Ministry of Environmental Protection. Disposal of hazardous wastes is regulated and specific sites have been allocated. The Israel Institute of Standards has established standards which are being regularly updated for the protection of human health and the environment. The Ministry of Health regulates and controls the marketing and utilization of medications as well as of water and food quality.

The Israel Poison Information Center was established in 1964 and its main goal is to provide 24 hour/7 days/week telephone consultations in clinical and occupational toxicology, first aid and triage including laboratory services. Heathcare providers and the public receive online consultation on the management and follow-up of patients with acute poisonings. In addition to daily rounds, journal clubs and seminars, as well as participation in bi-annual national toxicology meetings, the staff of MDs and PhDs is engaged in updating the intentional commercial products database, as well as teaching, research, and regulatory activities.

The Center's databases are a reliable information source on the active ingredients of commercial products and on the epidemiology of poisonings in Israel.

The goals of the Ministry for Environmental Protection are to formulate a comprehensive national environmental policy and to develop the tools necessary for implementing this policy. The Ministry seeks to incorporate environmental considerations into decision-making and planning processes; to promote sustainable development; to implement programs for pollution control, monitoring and research; to develop and update legislation and standards; to ensure effective enforcement and supervision; to improve environmental education and awareness; and to advance regional and global cooperation on the environment.

Air Quality Web: http://www.sviva.gov.il/bin/en.jsp?enPage=e_BlankPage&enDisplay=view&enDispWhat=Zone&enDispWho=Air_Qual&enZone=Air_Qual& (English)
Web: http://www.sviva.gov.il/bin/en.jsp?enPage=BlankPage&x=1&enDisplay=view&enDispWhat=Zone&enDispWho=echut_haavir&enZone=echut_haavir& (Hebrew)
Phone: +972-2-6553918 (department secretary)
Fax: +927-2-6553763
Email: gilam@sviva.gov.il

Air quality in Israel is impacted by rapid industrial development, growing vehicle use, rising standards of living and an ever-growing population. In recent years, measures have been initiated to reduce air pollution from all sources – transportation, electricity production, industry and quarrying operations. At the same time, efforts have been invested in implementing the provisions of international conventions on ozone depletion and climate change.

Hazardous substances
Web: http://www.sviva.gov.il/bin/en.jsp?enPage=e_BlankPage&enDisplay=view&enDispWhat=Zone&enDispWho=HAZARDOUS&enZone=HAZARDOUS (English)
Web: http://www.sviva.gov.il/bin/en.jsp?enPage=BlankPage&x=1&enDisplay=view&enDispWhat=Zone&enDispWho=chomarim_mesucanim&enZone=chomarim_mesucanim& (Hebrew)

Fax: +972-3-7634548
Email: zohary@sviva.gov.il

Hazardous substances, which are found in almost every sector, pose a grave risk to human health and the environment. Therefore, appropriate safety and control procedures for handling and treating hazardous substances and their wastes are integral elements in Israel's environmental management program. Several government ministries are responsible for the implementation of dozens of laws and regulations dealing with all aspects of hazardous substances. The Ministry of the Environment has instituted a host of administrative and legislative measures to control hazardous substances at every stage of production, transfer, maintenance, use, and disposal. At the same time, the Ministry is promoting a policy based on minimization, reuse, recycling, neutralization, and safe disposal of hazardous wastes.

Emergency Environmental Center

Phone: 1222-6911, *6911

The Environmental Center operates within the framework of the Information and Response Center. The Center serves as the focal point for information and response on environmental accidents at the time of their occurrence, including: discharge of a hazardous material to the environment, leak from a container or moving truck, dispersal of sharp odors in the environment, leak of household gas from a central gas system, marine or coastal pollution, exceptional air pollution river or water source pollution, dumping of hazardous waste in the public domain animal abuse, miscellaneous environmental accidents.

Preservation of Israel's water resources is one of the major challenges confronting the country today. Israel entered the 21st century with one of its greatest water overdrafts ever. Today this cumulative deficit stands at some 1.5 billion cubic meters, an amount equal to the annual consumption of the country, in comparison to the average annual replenishment rate of major aquifers. Moreover, water scarcity is exacerbated by the deteriorating quality of water resources due to demographic, industrial, and agricultural pressures. Preservation of Israel's water resources is one of the major challenges confronting the country today. Israel entered the 21st century with one of its greatest water overdrafts ever.

Rivers
Web: http://www.sviva.gov.il/bin/en.jsp?enPage=e_BlankPage&enDisplay=view&enDispWhat=Zone&enDispWho=Rivers&enZone=Rivers& (English)
Web: http://www.sviva.gov.il/bin/en.jsp?enPage=BlankPage&x=1&enDisplay=view&enDispWhat=Zone&enDispWho=maim_venehalim&enZone=maim_venehalim& (Hebrew)

In Israel, there are 16 main rivers which flow into the Mediterranean Sea and 25 main rivers that flow to the Jordan River and Lake Kinneret (Sea of Galilee). All of them once supported rich aquatic and wetland ecosystems where fauna and flora thrived. With time, a rapidly expanding population, accelerated urbanization and industrialization, and growing agricultural needs led to the depletion and deterioration of the country's rivers. Water was diverted for drinking and agricultural irrigation, sewage was introduced and the natural habitats of plants and animals were destroyed. The Ministry of the Environment has long recognized the urgent need for action and placed river restoration high on its agenda. Over the past decade, it has invested major efforts in making sure that Israel's ailing rivers are restored and revitalized. Growing awareness has led to major governmental, public and private investments in pollution prevention and ecological restoration. Over the past decade, billions of dollars were invested in sewage facilities and wastewater treatment plants, in upgrading pretreatment facilities in the country's factories and in rehabilitating riverbanks, establishing riverside parks and restoring natural habitats.

Radiation

Email: chanaig@sviva.gov.il

Radiation is energy that travels in the form of waves or high-speed particles. There are many different types of radiation that have a range of energy forming an electromagnetic spectrum. The spectrum has two major divisions: non-ionizing and ionizing radiation. The Radiation Abatement Division of the Ministry of the Environment is responsible for both ionizing and non-ionizing radiation, including the risks associated with the entire spectrum of electromagnetic radiation.

Israel Institute for Occupational Safety and Hygiene
Web: http://www.osh.org.il/site/english_main.html (English)
Web: http://osh.org.il/homepage.asp (Hebrew)
Phone: +972-3-5266444

Email: mail@osh.org.il
22 Mazah Street, P.O. Box 1122, Tel Aviv, 61010, Israel

Israel Institute for Occupational Safety and Hygiene (IIOSH) is Israel's national public institution concerned with workplace safety and health. It was established in the 1950s on the basis of organizations and laws that came into existence during the period of the British Mandate, prior to the establishment of the State of Israel in 1948. These regulations reinforced the activity of organizations founded earlier (at the beginning of the 1930s) that dealt with occupational safety, such as: the General Trade Union, the Manufacturers' Association, and the Jewish Agency. However, the field of occupational safety obtained its formal and mandatory status, acknowledged by the Mandate authorities and the Jewish leaders, only in 1946.

The Pharmaceutical Administration is the responsible body in the Ministry of Health for regulation of pharmaceutical and medical products, cosmetics, medical devices and drug treatment; for the development of rational use of medications and other health products and development of a national drug policy. Its main objective is to ascertain that all medications, medical devices, and other health products on the Israeli health market meet appropriate standards of safety, efficacy, and quality and are consumed on an optimal cost–benefit basis. The departments of the Pharmaceutical Administration include the Department of Drug Registry, the Institute of Standards and Control of Medicinal Products, Pharmacoepidemiology and Pharmacoeconomics and the Department of Clinical Trials.

Pesticides represent an important component of Integrated Pest Management in Israeli agricultural production. However, reckless application of pesticides may cause serious damage to users, to treated crops, and to consumers of these crops. In order to assure efficient and safe usage of pesticides, the following regulations are implemented and enforced:

Plant Protection Act: regulating import and marketing of pesticides and approval of new formulations.

Labeling regulations: enforcing labeling with detailed instructions for use, potential hazards and ways to prevent them – written in Hebrew on all packages containing pesticides sold to customers. The manufacturers are held legally responsible for the contents of these instructions.

The Israel Institute for Occupational Safety and Hygiene (IIOSH) is Israel's national public institution concerned with workplace safety and health. It was established in the 1950s on the basis of organizations and laws that came into existence during the period of the British Mandate, prior to the establishment of the State of Israel in 1947. These regulations reinforced the activity of organizations founded earlier (at the beginning of the 1930s) that dealt with occupational safety, such as: the General Trade Union, the Manufacturers' Association, and the Jewish Agency. However, the field of occupational safety obtained its formal and mandatory status, acknowledged by the Mandate authorities and the Jewish leaders, only in 1946. Following the establishment of the State of Israel, this field of activity received its semi-governmental status in 1950, with a special secretary appointed to coordinate the activity in the field of the occupational safety under supervision by one of the departments of the Ministry of Labour. IIOSH was founded as a statutory tripartite non-profit institution in accordance with the 'Labour Inspection (Organization) Law – 1954'.

The Standards Institution of Israel

The Israel Institution of Standards is a national corporation operating by the 1953 law of standards. The objectives of this institute are to prepare standards and to ensure quality of consumer products. Over the years its activities have expanded to various aspects of life and it kept its leading role in promoting quality while ensuring citizens' safety, welfare, and quality of life. Industry, business, consumer, governmental, academic, and research sectors are represented in the various committees of the institute. Its three main areas of activities include standards, testing, and quality assurance.

MARINA MARINOVICH, MAURELLA DELLA SETA, PAOLO PREZIOSI, IDA MARCELLO, AND ROBERTO BINETTI

INTRODUCTION

The first information on toxic substances can be found in the works of Pietro d'Abano (1256–1315): *Liber de Veneni,* published posthumously 1402; Pietro Andrea Gregorio Mattioli (1500–1577), the father of modern botany: a textbook on herbs and a translation, with comments, of *De Pedacio Dioscoride Anarzabeo Libri Quinque* (1544); Francesco Redi (1626–1698); and Felice Fontana whose treatise on viper poison was published in 1781.

A more modern approach was done by Prof. Bernardo Ramazzini (1633–1714) of the University of Bologna, who, describing several cases of occupational intoxication and outlining the health hazards of irritating chemicals, dust metals and other abrasive agents, can be considered the father of industrial toxicology and occupational medicine in Italy.

In the latter half of the 19th century, eminent professors of pharmacology in Italian universities also turned their attention to mechanistic problems in toxicology: Pietro Albertoni (1849–1933), Luigi Sabbatani (1863–1928), and Pietro Giacosa (1853–1928). The latter was the author of a textbook on medicine, pharmacology, and toxicology.

The two branches of toxicology in Italy, forensic and industrial, developed in parallel, and in 1910 the first Department of Occupational Medicine was opened at the University of Milan by Prof. Luigi Devoto (1864–1936), one of the most highly respected figures in this field.

This was followed in 1917 by the creation, at the Pharmacology Institute of the University of Florence, of a Division of Toxicology, which was later directed by the famous pharmaco-toxicologist Mario Aiazzi Mancini (1887–1980).

In the present the history of toxicology in Italy is well represented by the activity of the Italian Society of Toxicology. The Italian Society of Toxicology (SITOX, formerly SIT) was founded in Pavia on October 20, 1967. The founding members were Prof. Pietro Mascherpa, Director of the Institute of Pharmacology of the University of Pavia School of Medicine, and Professors Gianmartino Benzi and Francantonio Bertè. The President of the Republic officially recognized the Society on May 16, 1972. It is actively engaged in promoting the value of scientific, professional and regulatory aspects of modern toxicology.

RESOURCES

Books

Annuario DEA delle Università e Istituti di Studio e di Ricerca in Italia 2001–2002
Roma: DEA Editrice

This publication contains updated information on Italian universities, centers for study and research, and academic and cultural institutes, with a 'Who's who?' section at the end. Useful for consultation by toxicologists and other scientists.

Bertol E (2000)
Trattato di tossicologia forense, 2nd Edition
Padova: CEDAM

A large volume covering all the most important aspects of forensic toxicology, including historical, diagnostic, pathological, and analytical aspects of toxicology in general as well as the dynamics, pathological effects, and analysis of individual toxicants and toxicant groups. There are also chapters on environmental toxicology and doping and detailed discussions of the various forms of drug abuse. Useful for in-depth study and consultation.

Gagliano Candela R (2001)
Tossicologia forense: in schemi, tabelle e testo. In allegato: doping, principali avvelenamenti, gas tossici, stupefacenti, alcaloidi delle piante, veleni animali, tecniche di tossicologia analitica
Milano: Giuffrè

Capuano A, Dugo G, Restani P (1999)
Tossicologia degli alimenti
Torino: UTET

Cerutti G (2006)
Residui, additivi e contaminanti degli alimenti
Milano: Tecniche Nuove

This new edition, updated with the new laws in force by the European Community, classifies and examines the harmful substances in the safety of food and describes the proper industrial transformation process to follow. Schemes and tables accompany the text and summarize the information and the technical indications to observe.

Dolara P (1997)
Tossicologia: generale e ambientale
Padova: Piccin

Dolara P (2006)
TOX. Lezioni di tossicologia
Firenze: Firenze University Press
Web: http://www.fupress.com/scheda.asp?IDV=725

TOX is a handbook addressed to the students of Toxicology of the Faculty of Pharmacy and Sciences, but it can usefully be used by students of other Faculties and Course of Bachelor (Medicine, Agrarian, Engineering) and by all those interested in a short, general organization of the toxicological subjects. TOX covers the main fields of general toxicology (acute and chronic toxicity, mutagenesis, teratogenesis, carcinogenesis, reproductive toxicity, oxidative damage, epidemiological methods), and of special toxicology (food toxicity, heterocyclic amines, aromatic amines, tobacco smoke, pesticides, nitro compounds, amines, aromatic amines) and of environmental toxicology (environmental estrogens, PAH, heavy metals, dioxins and polychlorinated benzofurans, water and air pollution).

Cantelli Forti G, Hrelia P, Marinovich M, Galli CL (2000)
Tossicologia molecolare e cellulare
Torino: UTET

Froldi R (2004)
Lezioni di tossicologia forense, 3rd Edition
Torino G Giappichelli (Ed.)

This volume, which contains information on the most important problems of modern-day forensic toxicology, is intended for medical students, but it is also useful for law students.

Galli CL, Corsini E, Marinovich M (2007)
Tossicologia, 2nd Edition
Padova: Piccin

This book was conceived primarily as a toxicology text for students enrolled in various faculties (medicine, sciences, pharmacy, agriculture, and veterinary medicine). Following discussion of the general principles of toxicodynamics and kinetics, there is in-depth coverage of specific toxic effects (such as mutagenesis, carcinogenesis, and teratogenesis) and the methods used to study them. Other topics discussed include toxic effects on specific target organs, problems related to nutritional and food toxicology, environmental toxicology, occupational exposure to toxicants, and risk assessment.

Ignesti G (1999)
Piante medicinali: botanica, chimica, farmacologia, tossicologia
Bologna: Pitagora

Italian Energy & Environment Directory (Annuario Nazionale dell'Energia e dell'Ambiente) (2001)
Roma: Inter-ed

This important two-volume publication (total 1210 pages) provides a wealth of useful information on energy and the environment in Italy, including much that pertains to the field of toxicology. The volumes contain a 'Who's who?' section with 400 biographies and accurate information on 13 000 figures, 3600 companies, 400 products and services, 200 ministerial bodies, 460 research centres, 370 associations, and 470 municipal agencies.

Manara L, Mannaioni P (1995)
Farmacologia e Doping
Milano: Masson

This volume examines the main pharmacodynamic and toxicological aspects of compounds related to the phenomenon of doping in the world of athletics. There

are useful discussions of nutritional factors and those affecting muscle work, anabolic steroids, stimulants, sedatives, tranquilizers, cardiovascular drugs and diuretics, analgesics, and anti-inflammatory agents.

Meneguzzi Marchi R (1999)
Patologie da solventi per gli addetti al restauro
Padova: Il Prato

Mannaioni P, Chiesara E, Marozzi E (2004)
Tossicologia medica
Torino: UTET

Toxicology medicine can be defined as a specialized medicine branch characterized by the acquaintance of the major adverse effects, caused to humans by chemical substances (primarily drugs) and from the capacity of treating the intoxication caused by such chemical substances. The work can be placed mainly on the diagnostic and therapeutic front of the acute and chronic intoxication, but without neglecting the traces of pathogenesis useful and necessary for diagnosis and treatment. It includes, in addition, the elements of etiology, pathogenesis, and symptomatology of acute and chronic intoxication and drug addiction, needed to perform an accurate diagnosis and a prompt treatment.

Mari F (2001)
Veleni: intrighi e delitti nei secoli
Firenze: Le lettere

Montuschi L (Ed.) (1997)
Ambiente, salute e sicurezza: per una gestione integrata dei rischi da lavoro
Torino: G Giappichelli

Silvestrini B (1995)
Malati di Droga. Le Sostanze d'Abuso: Danni Fisici e Psichici, Reazione Individuale, Difese
Milano: Sperling e Kupfer

A non-conventional and clearly written discussion of drug abuse with a great deal of useful information, specifications, and personal evaluations.

Vighi M, Bacci E (1998)
Ecotossicologia
Torino:UTET

A volume considering the most important aspects of environmental toxicology.

Journals

Advances in Occupational Medicine & Rehabilitation (Aggiornamenti in Medicina Occupazionale e Riabilitazione)
Pavia: Fondazione Salvatore Maugeri
Web: http://www.fsm.it/bs/advances_occ.html

Current toxicology and therapy
Parma: Casa editrice Maccari

Epidemiology and Prevention (Epidemiologia e Prevenzione)
Milano: Zadig
Web: http://www.zadig.it/eprev/

Bimonthly journal of the Italian Epidemiological Association (Associazione Italiana di Epidemiologia, AIE). The AIE website (www.epidemiologia.it) contains the English indexes of the issues. Original contributions on occupational and non-occupational epidemiology. Articles in Italian; occasional summaries in English and Italian.

Giornale Italiano di Medicina del lavoro e Ergonomia
Pavia: Fondazione Salvatore Maugeri
Web: http://gimle.fsm.it/

Industrial medicine quarterly journal (occupational medicine, workplace and environmental hygiene, occupational toxicology) and ergonomics (evaluation of the relationship between man/workplace, occupational rehabilitation, psychology in the workplace, bioengineering).

Chiesara E (Ed.) (1990)
Guidelines for the Evaluation of Toxic Effects of Chemicals. Second part. Other toxic effects [in Italian]
Roma: Istituto Superiore di Sanità, Serie Relazioni

Guidelines established by the Italian National Toxicological Advisory Committee for the evaluation of the general toxic effects of chemicals (i.e., excluding mutagenesis, carcinogenesis, and teratogenesis).

Journal of Applied Cosmetology
Rome: International Ediemme

Official journal (quarterly review) of the International Society of Cosmetic Dermatology. It contains original papers, review articles, and research on the skin and cosmetics (including toxicological aspects of the latter).

Journal of Experimental & Clinical Cancer Research

Official Journal of Regina Elena Institute for Cancer Research, published quarterly (http://www.ifo.it/). Original contributions dealing with basic and applied research in the field of experimental and clinical oncology.

La Medicina del Lavoro
Fidenza: Mattioli
Web: http://www.lamedicinadellavoro.it/

Bimonthly journal that contains original contributions, report, review and letters related to the field of occupational health and industrial hygiene in Italian or English.

Pharmacological Research
London: Academic Press

A monthly peer-reviewed journal containing articles dealing with experimental or clinical pharmacology and toxicology. The journal is published by Elsevier for the Italian Society of Pharmacology.

Prevenzione Oggi (Prevention Today)
Rome: ISPESL
Web: http://prevenzioneoggi.ispesl.it/nindex.asp

Prevention Today is the most widely distributed Italian bilingual journal in the field of occupational safety and health. Published quarterly by ISPESL, with an intended readership of researchers and people involved in company safety, it publishes original scientific papers in the following areas: safety technologies; occupational hygiene; occupational medicine; psychosocial factors; training; workplace health promotion; communications and safety culture; epidemiology; certification; corporate social responsibility; environmental impact of production plants.

Rivista di Tossicologia Sperimentale e Clinica (Experimental and Clinical Toxicology Journal)
Rome: Società Editrice Universo

A quarterly journal that publishes papers dealing with experimental and clinical toxicology in Italian (and sometimes in English).

Technical Reports and Other Documents

Carere A (Ed.) (2006)
Environmental carcinogens and primary prevention [in English]
Rome: Annali Istituto Superiore di Sanità
Vol. 42, No. 2
Web: http://www.iss.it/publ/annl/cont.php?id=1969&lang=1&tipo=3&anno=2006

Selected topics and articles referred to the research area 'Environmental carcinogens and primary prevention'.
Mucci N, Camoni I (1995)

Guidelines of the Italian CCTN for the Classification of Some Effects of Chemical Substances
Rome: Istituto Superiore di Sanità
Serie Relazioni 96/2 EN

Definitions of the categories and the criteria for the classification of chemical substances on the basis of their potential carcinogenic, mutagenic, and toxic-reproductive effects, elaborated by the Italian National Advisory Toxicological Committee (CCTN) in 1994. All the allocations effected by the CCTN in the period 1977–1995 are reported and updated according to these criteria.

Binetti R, Marcello I (Eds.) (2006)
Miglioramento della prevenzione e della gestione delle intossicazioni acute [in Italian]
Rome: Annali Istituto Superiore di Sanità
Vol. 42, No. 3
Web: http://www.iss.it/publ/annl/cont.php?id=1970&lang=1&tipo=3

Galli CL, Rossi L, Vines P, Zapponi GA (Eds.) (1991)
Risk Assessment of Chemical Carcinogens [the majority of contributions in English]
Rome: Annali Istituto Superiore di Sanità Vol. 27, No. 4

A monograph dedicated to the examination of the many aspects of carcinogenic risk assessment.

Carreri V, Maroni M (2001)
Salute e Ambiente in Lombardia. Quarto rapporto. Unità Organizzativa Prevenzione-Direzione Generale Sanità/Regione Lombardia e International Centre for Pesticide Safety
Milano: ICPS

Maroni M (1998)
Salute e qualità dell'aria negli uffici
Milano: Masson

Ceriani D, Visentin S, Basla R, Maroni M (1999)
Studio cooperativo interlaboratoriale. Residui di antiparassitari in acque potabili. Biennio 1997–1998
Milano: Regione Lombardia/Direzione generale sanità e International centre for pesticides and health risk prevention 1–229

Databases

Carcinogens Data Bank (Banca dati cancerogeni-BDC). Istituto Superiore di Sanità
Web: http://www.iss.it/site/bancadaticancerogeni/ (Italian only)

BDC is a factual, non-bibliographic database developed by the Environment and Primary Prevention Department in collaboration with the Data Management, Documentation, Library and Publishing Activities service of the ISS. BDC provides classifications and evaluations of carcinogenicity formulated by the European Union in the context of 67/548/EEC Directive and contained in *IARC Monographs on the Evaluation of Carcinogenic Risks to Humans* published by the International Agency for Research on Cancer (IARC) of the World Health Organization (WHO),

Report on Carcinogens published by the United States National Toxicology Program (NTP), Integrated Risk Information System (IRIS) databank of the United States Environmental Protection Agency (EPA). BDC does not classify carcinogenic agents but gives synthetically integrated classifications and carcinogenicity evaluations produced by Competent Authorities at national and international level (IARC, EU, US EPA, NTP, CCTN). Data are derived from primary sources. It is possible to search by CAS number, synonyms, or chemical name.

Chemical carcinogens: structures and experimental data. Istituto Superiore di Sanità. (Cancerogeni chimici: strutture e dati sperimentali (ISSCAN)

Web: http://www.iss.it/ampp/dati/cont.php?id=233&lang=1&tipo=7 (Italian and English)

This database is freely downloadable from the website of ISS, and contains experimental data on chemical compounds tested with the long-term carcinogenicity bioassay on rodents (rat, mouse). A portion of the chemicals has been the subject of carcinogenicity classification by various regulatory agencies and scientific bodies. The data have been checked for their quality, and are coded as to be directly usable for structure–activity relationships analyses. Out of the three downloadable files, the 'structure-data file' (.sdf) can be accessed with Chemical Relational Database software programs that permit the effective linkage of chemical toxicity with chemical structure, and facilitate and greatly enhance data gathering and hypothesis generation, by permitting: (a) exploration across both chemical and biological domains; and (b) structure-searchability through the data.

Dangerous preparation archive. (Archivio Preparati Pericolosi). Istituto Superiore di Sanità

Web: http://www.preparatipericolosi.iss.it/iss/index.phtml (Italian only)

In the year 2000 an archive of dangerous preparations was created at the ISS, following a principle included in the Directive 88/379/EEC on dangerous preparations, subsequently modified by the Directive 1999/45/EC, concerning the creation of a data bank on dangerous preparations in each European country. The information stored in the archive is useful for purposes of health consumers' and workers' protection and prevention, and particularly in case of acute poisonings. The archive is fully informatized, therefore the companies can send the information using the web and the authorized poison centers can find the information on the archive using the web as well. In each Member State different procedures are in place to comply with the 1999/45/EC Directive; therefore an international co-ordination could be useful in order to create a European network of national databanks on dangerous preparations.

EDCs (endocrine disrupting chemicals)-diet interaction database (EDID). Istituto Superiore di Sanità

Web: https://excmail.iss.it/exchweb/bin/redir.asp?URL=http://dspace.iss.it/dspace/handle/2198/35http://dspace.iss.it/dspace/handle/2198/35] is available within the ISS website, in the EDC dedicated area (http://www.iss.it/inte/)

Diet is a significant source of exposure to EDCs, however, food safety assessment must also consider the concurrent intake of natural food components (e.g., vitamins, trace elements, phytoestrogens) modulating the endocrine system, including possible protective effects towards contaminants. EDID is a database on international literature's studies, either on experimental systems and on animal populations and humans; relevant reports of international and national agencies are also included. Due to copyright issues, the majority of documents are presented as abstracts. EDID is periodically updated, easy to consult and it aims to stimulate further research in the food toxicology field. The database has been created as part of the ISS special project on EDCs as well as of the 6th FP Network of Excellence CASCADE (www.cascadenet.org).

List of identified and classified substances. [Base Dati Etichettatura Sostanze Pericolose]. Istituto Superiore di Sanità

Web: http://www.dbsp.iss.it/4DACTION/WebEntra

This database, developed by the Environment and Primary Prevention Department, contains more than 100 000 chemical substances with CAS numbers and chemical names. The database gives the identification for all substances listed in the European Inventory of Existing Commercial Chemical Substances (EINECS) and hazard classification for more than 3000 substances included in Annex I of Council Directive 67/548/EEC. Substances are searchable by CAS numbers and chemical names.

National Inventory of Chemical Substances. (Inventario Nazionale delle Sostanze Chimiche). Istituto Superiore di Sanità

Web: http://www.iss.it/spps/index.php?lang=1 (Italian only)

In 1978, the ISS established a computerized National Inventory of Chemical Substances, *Inventario Nazionale delle Sostanze Chimiche* (INSC: National Inventory of Chemical Substances), a factual data bank on chemicals

(in Italian) that can be consulted for routine and emergency needs. The INSC provides extensive information on chemical identification, toxicological and ecotoxicological data, occupational health and safety, environmental fate, standards, evaluation, and classification for over 3000 entries. In addition, for approximately 2000 other substances, raw data (consisting of bibliographic information and specific articles collected in the open and gray literature) are available. The INSC can be accessed via the telecommunication network by public administrators, regional agencies, and international organizations (email: inscweb@iss.it).

National Inventory for Emissions and their Sources (Inventario Nazionale delle Emissioni e loro Sorgenti -INES). APAT – Agency for Environmental Protection and Technical Services

Web: http://www.eper.sinanet.apat.it/site/it-IT/ (Italian only)

In 1999, Italy established a national register on pollutant releases and transfers, the INES register, through Legislative Decree 372/99. The INES register is an inventory containing qualitative and quantitative information on pollutants released into water and into air by specific facilities defined at the EU level. Those facilities listed in EC Directive 96/61/EC of 24 September 1996 concerning integrated pollution prevention and control (IPPC) and fulfilling the criteria set out in Ministerial Decree of 23 November 2001 must report under INES. The competent authorities validate the data and send the results to the National APAT, which analyses the data, draws up summary statistics and fills in the INES register, then sends these on to the Ministry of the Environment that submits these data to the relevant EU bodies. The National APAT is in charge of providing and disseminating environmental information related to the INES register. For this purpose a website was set up on 11th November 2004 and is available to the public. According to relevant by-laws adopted for the implementation of the INES register, three reporting cycles have already been completed.

National Environmental Informative System (Sistema informativo nazionale Ambientale) SINAnet APAT Agenzia per la Protezione dell'Ambiente e per i Servizi Tecnici

Web: http://www.sinanet.apat.it/it/sinanet (Italian only)

In 1998 the Minister of the Environment entrusted APAT (formerly ANPA) with the responsibility for the overall management of the SINA Program, a national initiative started in 1988 with the objective of designing, operating, and developing the national environmental information system. Since then, APAT and the Italian Environment Agencies System have dedicated significant resources to the development of an effective and integrated Environmental Information and Monitoring System (EIMS), with the following objectives: to improve the quality, relevance and timeliness of environmental data; to disseminate relevant data and information for supporting decision making processes; and to bridge the gap between scientific data and policy level.

Sensitizing Agents Data Bank (Banca Dati Sensibilizzanti – BDS). Istituto Superiore di Sanità

Web: http://www.iss.it/bdse/ (Italian only)

BDS is a factual and bibliographic database produced by the Infectious, Parasitic and Immuno-Mediated Diseases Department, Environment and Primary Prevention Department and Data Management, Documentation, Library in collaboration with Publishing Activities of the ISS. BDS gives controlled and updated information concerning agents that may cause sensitization. It is worthwhile that the main objective of the BDS is not the classification of sensitizing or potentially sensitizing agents within specific risk classes, but it is essentially to provide concise and non-confidential information related to this endpoint. For each entry are available: chemical identification; danger classification according to the Council Directive 67/548/EEC; sensitizing properties; occupational exposure limits based on international agencies (ACGIH, DFG and European Union) and peer-reviewed scientific literature data in this field. The substances are categorized in different groups regarding sensitizing properties. Data are derived from monographs, government documents, technical reports, and primary journal literature. References are identified for all data sources. At present, the BDS includes: all the substances officially classified by European Union, (Annex I to Directive 67/548/EEC); some substances listed in Annex I (directive 67/548/EEC) for endpoints different than 'sensitization' but indicated as sensitizers by other relevant institutions, all the substances indicated as sensitizers by relevant Agencies or Institutions (ACGIH, DFG); some substances indicated as sensitizers by Industry and other non-governmental organizations (ETAD and HERA); all the substances regarded as 'potentially sensitizing dyes' by the Commission of the European Community for the award of the Community eco-label to textile products; some substances for which, even in the absence of any categorization by European Union, ACGIH or DFG, it is not possible to

exclude a sensitizing potential on the basis of reliable documents.

Organizations (Government)

National Health Service

Central Structure

The Italian National Health Service (INHS) was established in 1978 (Law 833, 23.12.1978), it was largely revised in 1992–1993 (Legislative Decrees 502/92 and 517/93); this revision gave to each Italian Region more power, autonomy, and responsibility for the management of the Health Service at local level in comparison with the coordination and supervising role of the Central Government. The main task of the Italian Health Service is to provide health care uniformly throughout the Nation, trying to give equal access to the services regardless of the social and economic differences of the population. This task reflects a constitutional principle that is the safeguarding of each individual's health both physical and psychological (art. 32 of the Italian Constitution Law). In 1999 a new 'Reform' of the Service (Legge Delega 419/1998 and Legislative Decree 229/1999) strengthened the 'Regionalization' of the Italian Health Service and reorganized the structures of the INHS along business lines.

The Structural Organization of the Italian National Health Service

1. The Ministry of Health (MOH), supported by the Consiglio Superiore di Sanità (National Health Council), provides high-quality advisory services on technological and scientific issues. The MOH involves local health structures through the central bodies which ensure co-operation among the central and the regional administration, that is: the Permanent Conference State/Regions, which takes care of the relationships between the Central Government and the Governments of the 21 Regions and Self-governing Provinces; and the Agency for Regional Health Care Services (ASSR);
2. National Bodies: several scientific technical institutions that operate at the central level:
   - National Institute of Health (ISS);
   - National Institute of Occupational Safety and Prevention (ISPESL);
   - National Institutes for Care and Scientific Research (IRCCS);
   - Experimental Zooprophylactic Institutes (IIZZSS);
   - Italian Medicine Agency (AIFA)
3. Administrative/scientific/technical institutions operating at the regional, provincial, and municipal level:
   - Healthcare Offices of Regions and Self-governing Provinces
   - Local Healthcare Agencies, ASL;
   - Public Hospitals.

The institutions mainly involved in toxicology are the following.

Experimental Animal Prophylaxis Institutes (Istituti Zooprofilattici Sperimentali – II.ZZ.SS.)

Web: http://www.ministerosalute.it/alimenti/attivita/sezAttivita.jsp?lang=italiano&label=coo&id=112&area=ministero&colore=2&lang=it (Italian only)

The Experimental Animal Prophylaxis Institutes (Istituti Zooprofilattici Sperimentali – IIZZSS) are Health Institutes ruled according to public law, enjoying self-government as to the management and administration and providing a number of services. They act as the technical and operative support of the National Sanitary Service with regard to animal health, control of the wholesomeness of food of animal origin for human consumption, hygiene of breeding and zoo-technical productions. They are concerned as well about the correct relationship between the environment, animals, and human settlements. IIZZSS have addressed special attention to: Public Veterinary Health, zoonoses and consequently urban veterinary hygiene, to prevent some communicable pathologies between men and animals (bovine spongiform encephalopathy, brucellosis, tuberculosis, etc.). IIZZSS perform their tasks for the Ministry of Health, Istituto Superiore di Sanità, Regions, Local Health Units, breeders and producers of animal-origin food for human consumption and producers of zoo-technical services and goods, and for end-consumers. IIZZSS represent a network throughout the whole national territory consisting of 10 central sites and 90 diagnostic centers located in almost every Italian Province.

National Medicines Agency (Agenzia italiana del farmaco – AIFA)

Web: www.agenziafarmaco.it/ (Italian only)
AIFA – Agenzia italiana del farmaco
Via della Sierra Nevada, 60-00144 – ROMA (Italia)
Phone: +39 06 5978401

AIFA is the Italian Drug Agency. It authorizes the commercialization of medicines, according to National and European procedures; it monitors drug adverse effects, through a drug surveillance network; it takes care of the application of European and National directives for clinical trials; it promotes the Italian Ethical Committees Network and the National Monitoring Center for Clinical Trials (https://oss-sper-clin.agenziafarmaco.it/

index_ingl.htm (English); https://oss-sper-clin.agenziafarmaco.it/ (Italian)]; it controls the production of pharmaceutical firms; provides drug information and controls Italian pharmaceutical expenditure.

National Institutes for Care and Scientific Research (Istituti di Ricovero e Cura a Carattere Scientifico – IRCCS)

Web: http://www.ministerosalute.it/ricsan/organizzazione/sezorganizzazione.jsp?id=73&label=ir1 (Italian only)

The National Institutes for Care and Scientific Research, ruled by the art. 42 of the Law n. 33 of 2/12/1978, by the DPR 617/1980 and by the Legislative Decree 269/1993 are emerging hospitals that, besides providing health care in the context of the National Health System, carry out both scientific research and training in the healthcare sector. Moreover, they provide the National Health System with technical and operational support for delivering health assistance and pursuing the National Health Plan targets in the field of health research. They play, therefore, a crucial role within the National Health System in identifying particular needs and responding to them, by sharing their scientific knowledge and operational resources. This function not only obliges these Institutes to respect the provisions laid down by national and regional health planning, but also to be consistent in terms of their own specialization and disease prevention, diagnosis, therapy, and rehabilitation methods. At present there are 40 Institutes, operating in the following medical specialties: Oncology, Neurosciences, Paediatrics, Dermatology, Communicable diseases, Orthopedics, Biotechnologies, Organ transplantation, Cardiology, Human Growth and Development, Geriatrics, Psychiatry, Gastroenterology, Genetics, Rehabilitation, and Occupational Medicine.

National Institute of Health (Istituto Superiore di Sanità)

Web: http://www.iss.it/chis/?lang=2 (English)
Web: http://www.iss.it (Italian)
Istituto Superiore di Sanità
Viale Regina Elena, 299, Rome
Phone: +39/6/49901
Fax: +39/6/49387118
Email: presidenza@iss.it

The Istituto Superiore di Sanità (ISS) is the leading technical and scientific public body of the Italian National Health Service. Its health protection activities include biological, physical, and chemical research, control, training and consultation, hazard identification, and risk assessment. ISS is organized into Departments and National Centres. At present there are seven Departments (Department of Environment and Primary Prevention; Department of Food Safety and Veterinary Public Health; Department of Technology and Health; Department of Therapeutic Research and Medicines Evaluation; Department of Cell Biology and Neurosciences; Department of Haematology, Oncology and Molecular Biology; Department of Infectious, Parasitic and Immuno-Mediated Diseases;) and four National Centres (National Centre for Epidemiology, Surveillance and Health Promotion; National Centre for Food Quality; National AIDS Centre and Risk Assessment and National Italian Transplant Centre). The first above mentioned four Departments and two Centres are involved in toxicological studies, evaluations and controls. Its activities include research, clinical trials, control, training and consultation in the interest of public health protection. Since 1978, it has served as the technical and scientific body of the Italian National Health Service. It is under the authority of the Ministry of Health. The Institute conducts scientific research in a wide variety of fields, from cutting-edge molecular and genetic research to population-based studies of risk factors for disease and disability. Research priorities are based on those set forth in the National Health Plan. An important activity of the Institute, which is mandated by the Minister of Health or the Regions, is certification of the chemical and biological purity of drugs and vaccines, as well as inspection and quality control of medical and diagnostic devices and equipment, food products and packaging. It monitors trends in disease, mortality and other health factors and provides technical support for health-related environmental surveys and for investigations of epidemics and other public health problems at national, regional, and local level. It also supervises the laboratories engaged in the testing of prohibited substances in sport and the national veterinary institutes. It also serves as the national reference center for MEDLARS (MEDical Literature Analysis and Retrieval System), a comprehensive international set of databanks co-ordinated by the US National Library of Medicine (NLM). The Institute produces a number of publications, including a quarterly peer-reviewed journal, technical reports, a monthly newsletter describing the Institute's major research activities, and a national epidemiological bulletin. The Institute plans, implements, and evaluates training activities in a wide variety of areas, with courses designed to address the needs of the National Health Service. It develops and tests innovative training methods, including web-based distance learning. Training is provided for various categories of professionals; methods range from short courses and hands-on workshops to more structured and formal courses at national and international level. It actively promotes co-operation at three different levels of involvement: scientific partnerships with industrialised

countries (USA, European partners, Japan); scientific and development projects in partnership with economies in transition (including China, South Africa, the Central Asian Republics and countries in Latin America, the Balkans and the Middle East); development partnerships in Africa and countries in turmoil, where humanitarian and technical assistance are provided in close collaboration with the Italian Ministry of Foreign Affairs, various UN Agencies and the World Bank, as well as the Global Fund for AIDS, Tuberculosis and Malaria. Several members of the Institute serve on panels of experts for the Fund as well as on other international committees and commissions. There is growing interest and co-operation in the application of telematics to health issues, in keeping with the priorities recently established by the G8 and the Italian government. ISS contributes to IARC, UNEP, IPCS, and NATO-CCMS activities and programs.

A National Toxicological Advisory Committee (CCTN) (in Italian the Commissione Consultiva Tossicologica Nazionale) was established in 1977 and was active up to 2001, within the ISS and appointed by the Ministry of Health, with the mandate to classify and evaluate the potential risk of carcinogenic effects, mutagenic effects and reproductive toxicity and other toxic effects related to human exposure to chemicals and to identify specific areas for toxicological research.

Several data-banks concerning toxicological hazards and risks are present on the ISS website; most of them are in Italian (see databases section).

National Institute of Occupational Safety and Prevention (Istituto Superiore Prevenzione e Sicurezza sul Lavoro – ISPESL)

Web: http://www.ispesl.it/index.asp?language=0 (English)
Web: http://www.ispesl.it (Italian)
ISPESL
Via Urbana 167-00184 Roma (Italia)
Phone: +39-06-4827917
Fax +39-06-48906750
Email urp@ispesl.it

The National Institute of Occupational Safety and Prevention is a technical scientific body of the National Health Service under the supervision of Ministry of Health, but independent with regard to organization, management, and funding. It has six central technical–scientific departments (Occupational Medicine, Occupational Hygiene, Safety Technologies, Productive Plants and their Interaction with the Environment, Documentation, Information and Training, Certification) and 37 field departments at the local level spread over the country. It acts as a national center for information, documentation, research, and experimentation for safeguarding health and safety at work. ISPESL's scientific research programs are mainly focused on prevention of occupational accidents and diseases, with emphasis on technological safety, and on definition, measurement and assessment of risks (toxic substances, industrial plants, electromagnetic fields). The Institute also provides consultancy and technical assistance to public bodies and private companies. Moreover, it carries out training activities addressed to the National Health Service staff in the fields of prevention, health and safety at workplaces. The Institute's databases of Solutions (http://www.ispesl.it/soluzioni/index.htm) and Risk Profiles (http://www.ispesl.it/risk_profiles/index.htm), are aimed at small and medium-sized enterprises (SMEs), providing a basic information technology resource for the Italian accident-prevention system.

Other National Institutions

APAT (Agency for the Protection of the Environment and the Technical Services)

Web: http://www.apat.gov.it/site/en-GB/default.html (English)
Web: http://www.apat.gov.it/site/it-IT/ (Italian)
APAT
Via Vitaliano Brancati, 48
00144 ROMA (Italy)
Phone +39-06-50071
Fax +39-06-50072916

Further to the sweeping reorganization of the environmental controls in 1993, the agency that had been initially set up as the National Agency for Environmental Protection (ANPA) has been subjected to a thorough reform that has caused it to merge with the Department of the National Technical Services of the Prime Minister's Office, with which it had already co-operated, and to change its name into APAT (Agency for the Protection of the Environment and the Technical Services).

The APAT carries out technical-scientific tasks and activities of national interest for the protection of the environment, the conservation of the water resources and the soil. The agency has technical-scientific and financial autonomy and is subject to the policy-making and supervisory authority of the *Ministry for the Environment, Land and Sea* and to the control of the State Audit Court.

The APAT works based on a 3-year program – brought up to date on a yearly basis – that lays down objectives, priorities, and resources, with a view to enforcing the directives of the Ministry for the Environment, Land and Sea. In the sectors falling within its province, the APAT carries out co-operation,

consulting, service and support activities under special agreements with other public administrations. In particular, the website of the APAT National contains a vast bulk of documentation, divided into different environmental themes (such as water, air, environmental certification, emergencies, industries, technologies, and infrastructures). The APAT publishes a number of national reports (e.g. on waste management and the quality of the environment in urban areas) including the Environmental Data Yearbook, which is widely distributed in both Italian and English (http://www.apat.gov.it/site/en-GB/APAT/Publications/Environmental_Data_Yearbook/).

The National Agency for Environmental Protection also manages environmental databases and makes these available to the general public through its website. These include GELSO (Good practices for local sustainability); National air emissions inventory – CORINAIR-IPCC (http://www.apat.gov.it/site/enGB/Environmental_Services/National_air_emissions_inventory_(CORINAIR-IPCC)/default.html); INES (National register on pollutant releases and transfers; see databases section); BRACE (National Database on Air Quality (http://www.brace.sinanet.apat.it/web/struttura.html); Meteorological Marine Data (http://www.apat.gov.it/site/en-GB/Environmental_Services/Meteorological_Marine_Data/default.html).

ICPS – The International Centre for Pesticides and Health Risk Prevention

Web: http://www.icps.it/English/home-I.htm (English)
Web: http://www.icps.it/ITALIANO/home-I.htm (Italian)
Ospedale L. Sacco – Azienda Ospedaliera Polo Universitario

Phone: +39 02 3568661
Fax: +39 02 38203163
Email: mail@icps.it

The International Centre for Pesticides and Health Risk Prevention (ICPS) was created by the Government of the Region of Lombardy on the proposal of the World Health Organization (WHO) – Regional Office for Europe, in co-operation with the University of Milan. ICPS was inaugurated on March 25, 1990.

The mandate of ICPS is to work as a Collaborating Centre on Occupational Health, specialized in the pesticide area, for the preventive and safety programmes of the WHO.

The activities of the Centre are organized into three major areas as follows.

- Information and documentation on pesticide toxicity to man and environment epidemiological, toxicological and clinical research on the effects of pesticides in man;
- Training and education of personnel involved in public health, occupational and community health, and agriculture laboratory research for development and standardisation of methods for biological monitoring and residue measurement in environmental and biological media;
- Support to the Region of Lombardy by providing information and documentation on pesticide toxicity and the adverse health risks that may derive.

Italian Ministry for the Environment, Land and Sea (Ministero dell'ambiente, e della tutela del territorio e del mare)

Web: www.minambiente.it (Italian only)
Ministero dell'Ambiente e della Tutela del Territorio e del Mare Via Cristoforo Colombo, n. 44 00147 Roma
Phone: +39 06 57221

The Italian Ministry for the Environment Land and Sea was established in 1986. Within its scope of competency lie responsibilities related to: sustainable development, protection of territory, pollution and industrial risks, international protection of the environment, appraisal of environmental impact, nature conservation, waste and cleanup, and protection of seas and inland waters. The Italian Ministry for the Environment Land and Sea is strongly committed to promoting and supporting international partnership and co-operation towards global sustainable development.

Italian National Agency for New Technologies Energy and the Environment (Ente per le Nuove Tecnologie, l'Energia e l'Ambiente – ENEA)

Web: http://www.enea.it/com/ingl/default.htm (English)
Web: http://www.enea.it (Italian)
ENEA – Rome Headquarters
Lungotevere Thaon di Revel, 76-00196 Roma
Phone:+39-06-36271
Fax:+39-06-36272591/2777

ENEA, the Italian National Agency for New Technologies, Energy and the Environment is a public undertaking operating in the fields of energy, the environment, and new technologies to support competitiveness and sustainable development.

ENEA is mainly called upon: to promote and carry out basic and applied research and innovation technology activities, also through prototypes and product industrialization; to disseminate and transfer technologies, encouraging their use in productive and social

sectors; to provide high-tech services, studies, tests and evaluations to both public and private bodies and enterprises.

To these aims and in the sectors falling within its areas of competence, ENEA: carries out complex research, development and demonstration projects, mainly technology- and engineering-based, sets up and operates major scientific apparatuses; assesses the level of advanced technologies development, as well as their economic and social impacts, also on demand by public administrations; promotes collaboration with foreign bodies and institutions, also for defining technical regulations and participation to major research programmes and international organizations, providing its (specific) expertise; promotes, fosters and supports innovation technology processes in the national production system, especially in small and medium-sized enterprises; collaborates with regions and local administrations to promote productive development of local resources, through joint actions; promotes technical and professional training and competency of researchers, also through ad-hoc agreements with national and international universities.

Italian National Research Council (Consiglio Nazionale delle Ricerche – CNR)

Web: http://www.cnr.it/sitocnr/Englishversion/CNR/AboutCNR/AboutCNR.html (English)
Web: http://www.cnr.it/sitocnr/home.html (Italian)
Consiglio Nazionale delle Ricerche
Piazzale Aldo Moro, 7-00185, Roma
Phone: +39-06-49931
Fax: +39-06-4461954

The National Research Council (CNR) is a public organization; its duty is to carry out, promote, spread, transfer, and improve research activities in the main sectors of knowledge growth and of its applications for the scientific, technological, economic, and social development of the country. To this end, the activities of the organization are divided into macro areas of interdisciplinary scientific and technological research, concerning several sectors: biotechnology, medicine, materials, environment and land, information and communications, advanced systems of production, judicial and socio-economic sciences, classical studies and arts. CNR is distributed all over Italy through a network of institutes aiming at promoting a wide diffusion of its competences throughout the national territory and at facilitating contacts and co-operation with local firms and organizations. From the financial point of view, the main resources come from the State, but also from the market: even 30% of its balance sheet, an extraordinary result, is the result of revenues coming from external job orders for studies and activities of technical advice as well as from agreements with firms, contracts with the European Union and with other international organizations. The CNR does not have laboratories specifically devoted to toxicological research, although it supports many toxicologically oriented research projects and many of its laboratories are involved in basic research projects with relevance to toxicology.

Co-operation with universities and industrial companies is a systematic choice with the general aim of 'creating value for the country by competences through scientific research'.

Milan University Research Center on Risk Characterization – MURCOR

Web: http://www.biodip.unimi.it/it/dipartimento/mucor.htm (Italian only)
University of Milan
Dept. of Biology, Via Celoria, 26, 20133, Milan
Phone:+39 02 50314753
Fax:+39 02 50314802
Email: marialuisa.broccia@unimi.it

The Center bases its activity on the broad experience of several scientists of the University of Milan who have worked or still are working as members of national and international toxicological committees. The important and different experience acquired will help to properly succeed in the prefixed aims of the Center:

- Qualitative/quantitative evaluation of environmental pollutants and the consequent assessment of the toxic potential effects, including genotoxicity, carcinogenicity, developmental, reproductive, and environmental toxicity;
- Risk characterization on human population, wildlife, and environment;
- Development of innovative researches for the potential effects and toxic risks knowledge integration.

The Center offers the competence of the member scientists. This expertise is meant to help public or private institutions for the management of problems connected to environmental disasters, industrial accidents, environmental or food chain pollution, proposing solutions based on recent knowledge as final goal.

Regional (ARPA) and Provincial (APPA) Environmental Protection Agencies

Web: http://www.reteambientale.it/arpa.asp (English)
Web: http://www.reteambientale.it/eng/arpa.asp (Italian)

The Regional Environmental Protection Agencies (ARPA) and Provincial Environmental Protection Agencies (APPA, merely for the autonomous provinces of Trento and Bolzano), set up in pursuance of

Law no. 61/1994, carry out for the most part control activities (accurate controls and monitoring of the environmental variables, supervising the actual compliance with the laws), providing also technical/scientific, technical/juridical and technical/analytical support to public administrations (basically Regions, Provinces and Muni-cipalities) that are entrusted with administrative control, environmental planning and authorization functions. ARPA and APPA are included in the National Network of Environmental Authorities and Programming Authorities.

Each agency has its own website, where a variety of activities on different environmental matrices and risks to the population are described in detail, such as plans for handling emergencies, industrial plants at risk for serious incidents, alerts regarding spills or leakages of toxic substances. Some sites also provide access to online journal searches, studies and research activities on topical environmental issues.

World Health Organization
Web: http://www.who.int
Regional Office for Europe
European Center for Environment and Health, Rome Division
Via Vincenzo Bona 67
00156 Rome
Phone: +39-06-487751
Fax: +39-06-4877599

The Rome Division of the Environment and Health Department of the WHO Regional Office for Europe was set up in 1991. Its attentions are focused on water pollution and wastewater disposal at an international level, food safety, radiation protection, and analytical epidemiology. Its advice and assistance are available to Member States of the WHO Regional Office for Europe.

Organizations (Non-Government)

Mario Negri Institute for Pharmacological Research (Istituto di Ricerche Farmacologiche Mario Negri)
Web: http://www.marionegri.it/mn/it/info/engWarn.html (English)
Web: http://www.marionegri.it/mn/it/index.html (Italian)
Via La Masa, 19, 20156 Milan
Phone: +39-02-390141
Fax: +39-02-3546277/39001918
Email: mnegri@irfmn.mnegri.it

The Mario Negri Institute for Pharmacological research is a scientific non-profit foundation for biomedical research and higher education that started its activity in 1963. The following lines of toxicological research are currently being pursued:

- Relations among toxic effects, metabolism, and disposition of xenobiotics in animals;
- Development of short-term toxicity tests using isolated perfused organs and cells as models of target organ toxicity;
- Evaluation of chemical composition and toxicity of urban waste incinerator emissions;
- Toxicokinetics.

In its 44 years of activity, the Institute has published approximately 9300 articles in international journals, 3700 transfer articles, and 200 books (monographs and Conference Proceedings).

Universities

In Italy there more than 40 university departments of pharmacology and toxicology. Since 1917, the Department of Pharmacology of the University of Florence has included a chair of toxicology with an associated clinical service. Toxicology services are also associated with the chairs of clinical pharmacology at the Universities of Modena (the service is mainly involved in problems of drug addiction), Padua, and Pavia (see Poison control centers). These centers, which are supervised by the Ministry of Health, are involved in cancer research, including toxicological studies of carcinogenic substances and anticancer drugs.

This section pertains exclusively to institutions offering officially approved courses related to the disciplines of toxicology, those offering postgraduate specialization courses in toxicology and those with PhD programs or Masters in pharmacotoxicology.

Currently (2007) there are ten universities offering a dedicated degree on toxicology: Milan (Lodi), Bologna, Florence, Pisa, Sassari, Novara, Catania, Arcavacata di Rende, Camerino, Cagliari.

Courses Pertaining to Toxicology held at Universities

In 1988, new rules were established for university studies that have significantly influenced the teaching of toxicology in Faculties of Medicine and Surgery, Pharmacy, Veterinary Medicine, and Biological Sciences. Courses in toxicology are generally taught by full or associate professors. However, they may also be assigned to university researchers who have obtained teaching certification (based on evaluation obtained after 3 years of employment as researchers). In some cases, the courses are assigned to faculty members from other universities or non-university scientists with particular

experience in the given field. In the latter cases, the assignments are based on yearly contracts that can be renewed if necessary.

In the Faculty of Medicine, toxicology is considered an obligatory part of the pharmacology course. Toxicology is also taught in the dentistry degree, in which it accounts for 10–20 of the teaching hours dedicated to pharmacology. The course concentrates on areas with specific relevance for dentistry, such as mercury toxicity.

In the Faculty of Pharmacy, the course of pharmacology is taught over a period of five semesters, one or two of which are dedicated to toxicology. The course covers the following subjects: principles and aims of toxicology; biotransformation of chemicals, mechanism of action, and toxicity testing; some topics in toxicology; toxicity of drugs of clinical interest, heavy metals, household products, and food toxicology; carcinogens, teratogens, and drugs of abuse; and topics in environmental toxicology and ecotoxicology. In the Faculty of Pharmacy there are also other courses dealing with topics in the fields of toxicology and toxicological analysis, e.g., complementary concepts in toxicological chemistry and analysis of drugs.

In the Faculty of Veterinary Medicine toxicology is taught for a total of 100 teaching hours/year. The degree of Biological Sciences has only optional courses in toxicology.

Research Doctorate (PhD) in Toxicology

In accordance with Law 380/80, research doctorate programs have been established in various subjects. The programs are proposed by individual professors of a given university and administered by the same university, although other universities may be involved in the student's learning experience.

Each year the Ministry of Universities and Scientific and Technological Research activates a cycle of doctorate programs and establishes the number of positions that will be offered. An entrance examination is held at the university that is administering the program. The Commission of Examiners is composed of two full professors and one associate professor; the names of the examiners are selected at random by the Ministry of Universities and Scientific and Technological Research.

The doctorate programs generally last 3 or 4 years, during which time the student will be involved in studies and research activities approved by the program coordinator. Research activities are carried out in a university institute approved by the coordinator. At the end of the course, the student is expected to present a complete dissertation regarding his or her research to a Commission of Examiners, which is composed of two full professors and one associate professor selected at random by the Ministry of Universities and Scientific and Technological Research. The student receives a monthly salary from the state during the entire period of study. This salary is increased by 50% for study periods abroad, which can last 1 or 2 years.

The following doctorate programs were offered in the area of toxicology for the academic year 2006–2007.

Professional Societies

CellTox (The Italian Association of in Vitro Toxicology)
Web: http://www.celltox.it/ (Italian only)
President: Dr. Isabella De Angelis
Dipartimento Ambiente e Connessa Prevenzione Primaria
Istituto Superiore di Sanità
Viale Regina Elena 299
00161 Roma
Email: info@celltox.it

CellTox was founded in 1991 and currently has approximately 100 members. Its scope is to promote the use of in vitro systems in pharmacological and toxicological research and to develop methods and techniques for the study of toxic effects at cellular and molecular levels. Its activities include biennial congresses, continuing education courses, and scientific meetings.

Italian Society of Toxicology, SITOX

Fax: +39-02-29520179
Email: sitox@comm2000.it

The Italian Society of Toxicology (formerly SIT) was founded in Pavia on October 20, 1967. The founding members were Prof. Pietro Mascherpa, Director of the Institute of Pharmacology of the University of Pavia School of Medicine, and Professors Gianmartino Benzi and Francantonio Bertè. The President of the Republic officially recognized the Society on May 16, 1972. Article 1 of the Society's charter extended eligibility for membership to 'all those who are interested in scientific problems and applicative issues related to toxicology.' Indeed, IST members are scholars working in a variety of fields including pharmacology, occupational medicine, poison control, forensic toxicology, veterinary toxicology, and agriculture.

Presidents of the Society include Professors Pietro Mascherpa (1968–1974), Leonardo Donatelli (1974–1979), Paolo Preziosi (1980–1986), Luigi Ambrosi (1986–1992), Pierfrancesco Mannaioni (1992–1996), Rodolfo Paoletti (1996–2002), and Giorgio Cantelli Forti (2003–present). The Society sponsors an annual postgraduate course in toxicology and a national congress every 3 years. The Italian Society of Toxicology is a member of the Federation of the European Societies of Toxicology (EUROTOX) and the International Union of Toxicology (IUTOX). The latter was chaired over from 1989 through 1992 by Prof. Paolo Preziosi, Past President of the SITOX, and various SITOX members are on the Executive Board of the IUTOX (Professors R. Paoletti, C. L. Galli) or EUROTOX (Professors P. Preziosi, V. Cuomo, M. Marinovich).

The SITOX has also organized international conferences and congresses with the IUTOX (1st Joint IUTOX/IST Symposium on Behavioral Toxicology, 1986; VI International Congress of Toxicology 1992) and with the EST (XXIV Congress of European Society of Toxicology, 1983), and the 41st Congress of EUROTOX, held in Florence in September 2003. It has sponsored international conferences, congresses, and round-table discussions with other scientific societies. Its members have attended the Summer Schools organized by the IUTOX. At the European level, the IST took part in a Workshop (WHO/EURO/IPCS/CE/EUR 9618) on Health Aspects of Chemical Safety-Workshop on manpower development and training (WHO/EURO interim documents 18) with a presentation by Professors P. Preziosi, V. Silano, and A. Sampaolo entitled Changing need for Toxicologists in Italy resulting from European Community Legislation (28 Nov. through 2 Dec. 1983).

Numerous meetings have been held with other societies on various topics such as 'Methodological trends for a reduction in the use of laboratory animals in toxicological studies', held with the Italian Society of Applied Pharmacological Sciences.

The SITOX has contributed to reforms of the Italian university system with the establishment of a 4-year School for Specialization in Toxicology and one currently defined as the School for Specialization in Pharmacology. These have evolved from an earlier program established on 15 Sept. 1984, which involved a School for Specialization with three directions: Pharmacology, Chemotherapy, and Medical Toxicology.

Finally, based on Article 67 of Decree 382 of the President of the Republic, the IST established a national research project that involved 28 operative units from various Italian university departments, and this project has evolved into another project entitled 'New Evaluation Approaches in Toxicology.'

The Society has also established a program that awards €150 000 to a scholar who has conducted particularly important research in the field of toxicology over the past 3 years.

Currently the society includes over 450 members. Fifty-five percent are pharmacologists; the rest are professionals working in the fields of anesthesiology, toxicological and pharmaceutical chemistry, and occupational medicine.

RENTIC – National Register of Italian Certified Toxicologists

Web: http://www.pharmtox.org/sitox/rentic.php (Italian only)

In March 1999 the Italian Society of Toxicology created the Italian Register of Certified Toxicologists (RENTIC), due to the increasing need to emphasize the importance of toxicologists, and to institute a register with complete information about toxicology experts to be available for public and private organizations. The basis for registration in these societies is peer-review evaluation of the applicants. A key criterion for acceptance is theoretical training covering the main areas of toxicology. Furthermore, job experience is required. After reviewing the merits of the applicant, the register then accepts the applicant to the register usually for 5 years. The members of RENTIC are also members of ERT, the European Register of Toxicologists, officially inaugurated in 1997.

Poison Control Centers

The poison centers in bold are those which have been acknowledged by the Ministry of Health as suitable for having granted the online access 24 h/day to the National Data Bank on Dangerous Preparations, located in the ISS.

[a] ***Centro Antiveleni***
Policlinico A. Gemelli
Largo Agostino Gemelli, 8
00168 Roma (Italia)
Phone: +39-06-3054343
This center, opened in 1971, has developed a computerized system based on the utilization of three databanks: the first databank stores all the information on toxic products (9000 documents), the second contains clinical information on all cases treated in the center (49 000 to date), and the third, interfaced with analytical laboratory instruments, allows immediate chemical-analytical identification of poisons. The service is operative 24 hours a day.

[b] ***Ospedale Niguarda Ca' Grande***
Piazza Ospedale Maggiore
20162 Milan
Phone: +39/2/66101029
This center, which works in close collaborations with the Ministry of Civil Defence, has developed a program for early warning in cases of large-scale toxic disasters. A registry is kept of the main industrial structures in the Lombardy Region that are at risk for such disasters, with information on the substances and materials used and stored on site.

[c] ***Ospedale Cardarelli***
Via Cardarelli, 9
80131 Napoli
Phone: +39/81/7472870
This center serves the regions of southern Italy (Campania, Calabria, Puglia, Lucania, and Sicily – total population, approximately 18 million). Chemical and toxicological studies are performed in the laboratories of the Azienda Ospedaliera 'A. Cardarelli' and the Laboratory of the Institute of Forensic Medicine, II Faculty of Medicine, University of Naples.

[d] ***Centro Nazionale di Informazione Tossicologica***
Fondazione Salvatore Maugeri
Clinica del Lavoro e della Riabilitazione I.R.C.C.S.
Via S. Boezio, 26
27100 Pavia
Phone: +39-0382-24444
This center was established in 1992 at the Pavia Medical Institute as part of a convention reached between the University of Pavia and the 'Salvatore Maugeri' Foundation, a national non-profit organization dedicated to clinical care and research in rehabilitation and environmental medicine. It forms a part of the university's Toxicology Division. The NTCI function as a poison control center and also carries out academic and research activities related to the management of illnesses related to chemical exposure. It serves as the co-ordinating center for a nationwide network of hospitals that provide training in clinical toxicology. Its staff includes physicians and research scientists working in the fields of emergency medicine, toxicology, pharmacology, and occupational and environmental health. Teaching activities are carried out within the University of Pavia postgraduate schools of medical toxicology, occupational medicine, and anesthesiology and intensive care. The NTCI laboratory is involved in many research activities based on animal models and/or in vitro methods that are being conducted in conjunction with research institutes in Europe and the United States. Studies include new therapeutic methods in clinical toxicology and neurotoxicity biomarkers.

Centro di Documentazione Tossicologica
Centro Interdipartimentale sulle Intossicazione Acute
Dipartimento di Farmacologia
'E. Meneghetti'
Università degli Studi di Padova
Largo E. Meneghetti, 2
35131 Padova
Phone: +39-049-8275078

Previously known as the 'Centro di studio dei tossici – Servizio antiveleni,' this poison control service now operates within the Inter-Departmental Centre for Research on Acute Intoxication (CIRIA), which includes the Department of Pharmacology (Chair of Toxicology, Toxicology Laboratory, and Chair of Neuropsychopharmacology) and the Institute of Anaesthesiology and Resuscitation of the University of Padua. It serves the regions of northwest Italy (Friuli-Venezia, Veneto, and Trentino Alto-Adige; total population, 7 million).

Legislation

Italy joined the European Economic Community (EEC) in 1957 following the treaty of Rome and, since

then, Italian legislation on control of chemical substances is guided largely, like in the other Member States, by European Community legislation.

Specific and extensive legislation has been developed, by European community and in consequence on a national level, for different categories of substances dealing with industrial chemicals, pesticides, biocides, food and feed additives, and cosmetics.

At legislative level in Italy there are, first of all, Acts that are adoption of European Union Directives as mentioned above, and also national Acts independent from the European legislation. In addition to EU Directives and national Acts, Italy is driven by a number of international treaties, like the Convention on Long-Range Transboundary Air Pollution (LRTAP), adopted in 1979 under the auspices of the United Nations Economic Commission for Europe (UNECE) and the voluntary Prior Informed Consent (PIC) procedure developed by UNEP and the Food and Agriculture Organization (FAO) of the United Nations.

Moreover, Italy is a Member country of the OECD and participates in its activities in the field of chemicals even if volunteers. The web page of OECD (Organisation for Economic Co-operation and Development) in the section of activities related to Chemical Safety of Environment Department (http://www.oecd.org/department/) makes available information, documents, and publications concerning work of Member countries on specific categories of chemicals (e.g. new and existing chemicals; endocrine disrupters; pesticides; biocides) and production and use of chemicals (e.g. chemical accidents; pollutant release and transfer registers).

The Italian Legislation may be summarized as falling in the framework of hazard identification, risk assessment and risk management of specific substances according to well-known European Union criteria.

Hazard Identification (The Dangerous Properties of Chemicals)

The key directive in this field is Council Directive 67/548/EEC (O.J. L. 196, 16/8/1967) and its subsequent amendments on the approximation of laws, regulations, and administrative provisions relating to the classification, packaging, and labeling of dangerous substances that established a common system for this purpose. Directive does not apply to medicinal products, biocides, pesticides, foodstuffs, cosmetics, wastes and radioactive substances covered by specific rules. The basic Dangerous Substances Directive, implemented in Italy by Law no. 256 of 29 May 1974, is continually updated to take account of scientific and technical progress. To date (March 2007) it has been amended nine times and adapted to technical progress 29 times. The 7th amendment (Council Directive 92/32/EEC), the most innovative, was adopted by Legislative Decree No. 52 of 3 Feb. 1997. The 29th Adaptation to Technical progress (Directive 2004/73/EC) was implemented in Italy by Ministerial Decree of 28 February 2006 and an Italian version of Annex I of Council Directive 67/548/EEC can be accessed at the ISS website: (see List of Identified and Classified Substances in the section Databases).

National Competent Authority responsible for dangerous substances and preparations is the Ministry of Health, with technical/scientific support of Istituto Superiore di Sanità. Coordination of the notification procedures for new chemicals is under the responsibility of the Ministry of Health. A Notification Unit, which is in charge of the technical and scientific aspects of the procedure, has been operating in the Istituto Superiore di Sanità since 1981.

Another key directive is the 1999/45/EC one, regarding the classification, packaging and labeling of dangerous preparations that replaced directive 88/379 as from 30 July 2002 for most preparations and as from 30 July 2004 for plant protection products and biocides. Directive 1999/45/EC in fact extends the scope of basic Dangerous Preparation Directive (88/379/EEC) to include plant protection products and biocides. Directive 1999/45 has been adapted to technical progress by Directive 2001/60/EC and both the Directives were incorporated into Italian legislation by Legislative Decree No. 65 of 15 March 2003. National authority responsible for dangerous preparations is the Ministry of Health, with the technical cooperation of the Istituto Superiore di Sanità (see Dangerous Preparation Archive in the section Databases).

The two previously mentioned key directives (67/548/EEC and 1999/45/EEC) give the basis for a cascade of legislative actions (downstream legislation) which, at the Italian level, provide risk management instruments in order to define the intrinsic dangerous properties of substances and/or preparations. In particular there are links between these Directives and other areas of European legislation concerning:

- export and import of certain dangerous chemicals;
- worker protection (e.g. lead, asbestos, carcinogens, or chemical agents as such);
- biocidal products;
- pesticides;
- pharmaceutical products;
- cosmetic products;
- the restriction of marketing and use of certain dangerous substances and preparations;
- animal testing; or

- the risk assessment of existing substances.

In 1994 an OECD Task Force established a Globally Harmonised System (GHS) aimed to harmonize Classification and Risk Communication of dangerous substances and mixtures. The GHS criteria, subsequently adopted at UN level and published in March 2003, will be implemented in the near future in the European legislation through a regulation, and after a transitional period will replace the current legislation on classification and labeling (Council Directive 67/548/EEC for substances and Directive 1999/45/EC for preparations).

Risk Assessment (Health Risks Represented by Exposure to Chemicals)

At the present time, there is still a separation between 'new' and 'existing' chemicals. Existing chemicals (100 106 substances included in the EINECS Inventory) are chemicals introduced on the European Union market before 1981. Risk assessments available of existing chemical are very limited and public authorities hold the burden of proof. New chemicals are chemicals introduced into the market after 1981, they have to be notified and for them the control is instead very stringent.

The evaluation and control of the risks related to exposure to existing chemicals are defined by EEC Council Regulation N. 793/93 of March 23, 1993, O.J. L. 84, 5/4/1993. It requires industry to provide a data package to Commission for European Communities for all existing substances placed on the market of the European Union in quantities greater than 1000 tonnes per annum/producer or importer. A limited set of data was also requested for substances put on the market in quantities between 10 and 1000 tons. These data were included in an EU database. A non-confidential version is available called IUCLID (International Uniform Chemical Information Database). Four priority lists have been published as Commission Regulations [1179/94 (O. J. N. 131, 26.5.1994), 2268/95 (O.J. N. 231, 28.9.1995) 143/97 (O.J. N. 25, 28.1.1997) and 2364/2000 (O. J. N. 273, 26.10.2000)]. This program of activity is fully coordinated with the OECD HPV program on existing chemicals. Non-confidential data stored in the IUCLID and Risk Assessment Reports can be accessed through the website of the European Chemical Bureau (ECB) of the Commission's Joint Research Center (located at Ispra, Varese, Italy) (http://ecb.jrc.it/existing-chemicals/). Risk assessment required by the Council Regulation 93/793 is carried out according to the principles laid down in Commission Regulation 1488/94 of June 28, 1994 (O.J. L. 161). In Italy, the Ministry of Health, with the technical/scientific co-operation of the Istituto Superiore di Sanità, was appointed as national competent authority responsible for the application of Regulation 93/793 for existing chemicals by the Decree of November 29, 1994. Italy was rapporteur Member State for four substances present in the first three lists. Risk assessment required for new chemicals by Directive 92/32/EC is carried out in accordance with the principles set out by the Commission Directive 93/67/EEC (O.J. N. L. 227 8.9.1993). Directive 93/67/EEC was incorporated into Italian legislation by the Legislative Decree n. 52 of 3.2.1997. A detailed Technical Guidance Document was issued by the European Commission in support of Directive 93/67/EEC. In Italy, the Ministry of Health and Istituto Superiore di Sanità are the designated national authorities responsible also for the risk assessment of new chemicals.

Risk Management

There are specific requirements for some dangerous substances. Italy follows Council Directive 76/769/EEC (O.J. L. 262, 27/9/1976) and subsequent amendment relating to restriction on the marketing and use of certain dangerous substances and preparations. Products covered by this directive include the chemicals PCB and PCT, certain lead compounds, mercury, arsenic, benzene, substances classified as carcinogenic, mutagenic or toxic for reproduction (category 1 or 2) and other very dangerous chemicals like all forms of asbestos, nickel (which is restricted in jewelry and metal objects such as buttons on clothing), certain types of creosote.

In Italy substances and preparations are regulated by the above-mentioned Legislative Decree 52/1997, the Legislative Decree 65/2003, and EEC Regulation no. 793/93. Marketing and use of substances and preparations must be controlled by competent institutions at the national, regional, and local levels. Sites of production, storage, and sales may be inspected at any time, and specimens and information may be collected. Violations ascertained during such inspections are subject to sanctions (including imprisonment). Like other Member States, Italy is required to present an annual report on these controls to the EC Commission.

Laws, rules, regulations, and all official acts concerning toxic substances are published in the *Gazzetta Ufficiale della Repubblica Italiana*, issued daily and accessible in full text format and freely for the last 60 days (http://www.gazzettaufficiale.it/). Information concerning European Community Directives enacted into Italian legislation can be found on the website of Parlamento Italiano (Italian Parliament) (http://www.parlamento.it/parlam/leggi/deleghe/dlattcee.htm (Italian only)).

REACH

The current above-mentioned legislation has been greatly modified by the new REACH regulation (regulation n. 1907/2006 published in the European OJ n. L396 of 30.12.2006) which entered into force on 1st June 2007. REACH is an acronym standing for Registration, Evaluation and Authorisation of CHemicals, and represents a new system aimed at ensuring a higher level of protection for human health and environment, first of all transferring the burden of the proof to industry. REACH prescribes the obligation for industry to collect relevant information for all chemicals put on the market in quantities $\geq$ 1 ton/year; such information has to be forwarded, in form of a registration, to a central European Agency on Chemicals (ECHA, recently settled in Helsinki). The principle 'no registration – no marketing' will be immediately applicable for new substances (i.e. those put for the first time on the European market after 1 June 2007), and within 11 years for substances already on the market prior to the entering into force of REACH. The regulation foresees also specific provisions for the evaluation of chemicals, and for the authorization of substances of very high concern (SVHC).

The European Chemical Agency (ECHA) will manage all the technical aspects related to the REACH regulation.

In Italy the Ministry of Health has been appointed as national Competent Authority, in co-operation other Ministries (Environment and Economic Development) for the more political issues, and with the technical co-operation of the National Agency for Environmental Protection (APAT), particularly for the environmental exposure assessment, and of the Istituto Superiore di Sanità (ISS) for all the other technical issues; within the ISS a National Centre for Chemical Substances is about to be created.

As soon as the new GHS system will be implemented in Europe through a new regulation, presently under co-decision procedure in the Council and the European Parlament, the REACH regulation will make reference to it for classification purposes. Also for GHS the national competent authority will probably be the Ministry of Health in cooperation with the ISS.

Plant Protection Products are those preparations containing one or more active substances, presented in the form in which they are supplied to the user and aimed to: (1) protect plants and plant products from all harmful organisms or to prevent the effects; (2) encourage or regulate the vital processes of plants, with the exclusion of fertilizers; (3) preserve plant products with the exclusion of preservatives governed by special provisions; (4) eliminate unwanted plants; (5) eliminate parts of plants, slow down or prevent undesired growth. In Italy the legislation regulating plant protection products is the Legislative Decree No. 194, of 17 March 1995, implementing Directive 91/414/EEC concerning the marketing of Plant Protection Products.

The directive sets up the criteria for a harmonized system of authorization for marketing the active substances used in plant protection products at the EU level. Member States may then approve products containing such substances for use on their own territory. Annex VI of Directive 91/414 provides uniform principles for the authorization of plant protection products. In Italy the Ministry of Health is responsible for the authorization of preparations containing pesticides and specifically:

- authorizes release on the market and the use of a phytosanitary product throughout Italy or in any parts of Italian territory;
- renews or modifies the authorizations already granted;
- re-examines, withdraws, or uses its powers to refuse renewal, or withdraws authorizations granted;
- establishes, by means of a decree of Ministry of Health, the maximum residue levels of active substances to be contained in products intended for human consumption. At present, the maximum residue levels were established by D.M. on 27 August 2004, containing a number of recent Community regulations, and which re-groups and unifies all national standards previously in force in this field.

Phytosanitary products may be put on the market and used only if they have been authorized by the Ministry of Health, in conformity with Legislative Decree No. 194, 17 March 1995, and Legislative Decree No. 290, 23 April 2001.

The home page of the website of Ministry of Health (Department for Veterinary Public Health, Nutrition and Food Safety) contains information on legislation concerning pesticides and instructions and forms for application of the licenses (most of section available also in English language) (http://www.ministerosalute.it/alimenti/sicurezza/sicApprofondimento.jsp?lang=english&label=pro&id=403&dad=s). Moreover, the website offers access to a database that includes all authorized phytosanitary products in Italy with a variety of information but not the review reports (http://www.ministerosalute.it/alimenti/sicurezza/fitosanitari/ricerca.jsp). The database is in Italian and can be searched by the pesticide name or product type (activity of the active substance).

Biocidal products are defined in Directive 98/8/EC as: 'Active substances and preparations containing one or more active substances, put up in the form in which they are supplied to the user, intended to destroy, deter, render harmless, prevent the actions of,

or otherwise exert a controlling influence on any harmful organism, by chemical or biological means'. The Biocide Directive covers a wide range of products across four main product categories: general biocidal products and disinfectants, preservatives, pest control and other biocidal products. More in detail, there are 23 specific Product Types described by the directive. It harmonizes the rules for placing on the market biocidal products by introducing common data requirements both for active substances and the biocidal products. This directive was implemented in Italy by Legislative Decree No. 174, of 25 February 2000. In Italy, some of the product types described in the biocide directive (insecticides, disinfectants and repellents) were already covered by a national registration procedure (Decree n. 392 of 6 October 1998), according to which the above-mentioned products can be marketed or utilized only with ministerial authorization. Such national registration procedure will be gradually repealed as far as the biocide directive will be progressively implemented. The final goal of the biocide directive is the authorization of the products: conditions that must be met for such authorization may vary according to the risk associated with the biocide and other factors. There is a system of reciprocal recognition between Member States, but it is not automatic. For example, a substance whose use will be authorized in Scandinavian countries might not be safe in another area with different climatic characteristics. The decree 174/2000 also provides guidelines on advertising of biocidal substances. The Ministry of Health and the Ministry of Environment, with the technical cooperation of the ISS, are the Institutions responsible for the implementation of the set of rules for biocidal products in Italy. From the web pages of the Ministry of Health it is possible to access all key legislation pertaining to biocides, and the basic principles are described in the site.

In particular, Ministry of Health, Directorate-General for Medicinal Products and Medical Devices co-ordinates the activities of the Competent Authority and is responsible for all activities foreseen by the Directive excluding the refusals of mutual recognition of authorizations for product types 15, 17, and 23. Ministry of Environment is competent authority for Evaluation of the effects on the environment including refusals of mutual recognition of authorizations for product types 15, 17, and 23. All the technical activities are performed in cooperation with the ISS.

Food Additives

The Ministry of Health is responsible for food safety in Italy. Direct food additives are regulated by a decree of the Ministry of Health No. 209 of February 27, 1996 concerning food additives permitted in the preparation and preservation of food. This decree is in accordance with EC council directives concerning food additives (94/34/EC), sweeteners (94/35/EC), coloring agents (94/36/EC), and other types of food additives (95/2/EC). The Italian decree includes a list of approved chemicals that may be used as food additives. New additives must be subjected to extensive toxicological testing in animals to demonstrate that they are safe for use in food, and their use must be shown to be absolutely necessary from a technological point of view.

Indirect food additives (chemicals used in food packaging materials) are regulated by the amended version of Council Directive 76/893/EEC. The Italian decree includes a positive list, of chemicals that may be used in food as indirect additives, compiled by the EU. The safety of new additives must be demonstrated by premarketing toxicological tests conducted according to suggested guidelines. Final decisions on approval are made by the European Food Safety Authority (EFSA). In Italy, the Ministry of Health, with the technical/scientific cooperation of the Istituto Superiore di Sanità, is the national competent authority responsible in this field. On the website of the Ministry of Health there is a large availability of documents, legislation for matters relating to food including drinking water (http://www.ministerosalute.it/alimenti/sicurezza/sicApprofondimento.jsp?lang=italiano&label=alip&id=251&dad=s) most of them in Italian.

Food Supplements

The products marketed as foods containing concentrated sources of nutrients or ingredients with physiological effect and presented for supplementing the intake of those substances from the normal diet are defined as 'food supplements'.

'Food supplements' means foodstuffs whose purpose is to supplement the normal diet and which are concentrated sources of nutrients or other substances with a nutritional or physiological effect, alone or in combination, marketed in dose form (such as capsules, pastilles, tablets, pills and other similar forms, sachets of powder, ampoules of liquids, drop-dispensing bottles, and other similar forms specifically designed to be taken in measured small unit quantities).

In order to ensure a high level of protection for consumers and facilitate their choice, the products that will be put on to the market must be demonstrated to be safe and must bear adequate and appropriate labeling.

There is a wide range of nutrients and other ingredients that might be present in food supplements

including, but not limited to, vitamins, minerals, amino acids, essential fatty acids, fiber, and various plants and herbal extracts.

As a first stage, the Directive should lay down specific rules for vitamins and minerals used as ingredients of food supplements. Food supplements containing vitamins or minerals as well as other ingredients should also be in conformity with the specific rules on vitamins and minerals laid down in the Directive or at national level in the case of lack of European measures.

At a later stage specific rules should be laid down concerning nutrients, other than vitamins and minerals, or other substances with a nutritional or physiological effect used as ingredients of food supplements, provided that adequate and appropriate scientific data about them become available. Until such specific Community rules are adopted and without prejudice to the provisions of the Treaty, national rules may be applicable concerning nutrients or other substances with nutritional or physiological effect used as ingredients of food supplements, for which no Community-specific rules have been adopted.

The chemical substances used as sources of vitamins and minerals in the manufacture of food supplements should be safe and also be available to be used by the body. For this reason, positive lists of those substances have been established. Such substances have been approved by the European Food Safety Authority (EFSA) (http://www.efsa.europa.eu/en.html), on the basis of the said criteria, for use in the manufacture of foods intended for infants and young children, and other foods for particular nutritional uses can also be used in the manufacture of food supplements. The Legislative decree 169/2004 implemented the Food supplements Directive in Italy with specific rules regarding the daily intake of the nutritional ingredients and the admitted plant extracts.

The Ministry of Health, with the technical cooperation of the Istituto Superiore di Sanità, is the national competent authority responsible in this field and on the website of the Ministry of Health is possible to consult the guidelines for producing and putting on the Italian market these products, the list of the nourishing ones and of the substances having physiological effects like plant extracts (http://www.ministerosalute.it/alimenti/dietetica/dieApprofondimento.jsp?lang=italiano&label=int&id=58&dad=s; Italian only).

Feed Additives

Since 18 October 2004, applications for authorizing the placing and use of feed additives in the market, are regulated in the European Union under Regulation (EC) No 1831/2003. The European Food Safety Authority (EFSA) is responsible for the scientific assessment of the feed additives. This legislation is under the jurisdiction of the Ministry of Agriculture (http://erclib.vet.unibo.it/jb/ud/22780/file/lgs-06.pdf; Italian only).

Cosmetics

Production and marketing of cosmetic products are regulated in Italy by the amended version of Council Directive 76/768/EEC within the Law no. 713 of 11 October 1986 and next updating decrees (Legislative Decrees No. 300 of 10 Sept.1991; n. 126 of 24 April 1997 and n. 50 of 15 Feb. 2005). Directive 76/768/EEC on the approximation of the laws of the Member States relating to cosmetic products ('Cosmetics Directive'), adopted in 1976, aims to guarantee the safety of cosmetic products for human use while encouraging commercial exchange and eliminating barriers to trade.

Official restrictions and prohibitions on specific ingredients that can be used in cosmetics are mainly regulated through the Annexes of Cosmetics Directive that include various lists (list of substances whose use is prohibited in the composition of cosmetic products (negative list); lists of ingredients subject to restrictions (restricted list); positive lists of cosmetic colorants, preservatives and ultraviolet (UV) filters that are permitted in cosmetic products). Where substances are subject to a positive list, the inclusion of a new substance on a positive list is preceded by a scientific risk evaluation of the substance by the Scientific Committee of Cosmetics and Non-Food Products Intended for Consumers (SCCNFP) an independent group of qualified scientists with significant experience in risk assessment, appointed by the European Commission. The SCCNFP also reviews the positive and prohibited/restricted lists in response to technical progress and/or concerns about the impacts of particular ingredients on safety. However, the final decision on addition (or removal) of substances from the lists is taken by the Commission and the Member States.

The EU Cosmetics Directive has to date undergone seven amendments and 31 adaptations (by the European Parliament and the Council) in order to reflect technical and scientific progresses concerning cosmetic products. For example, the 6th Amendment led to the adoption of the inventory of ingredients employed in cosmetic products and banned the marketing of cosmetic ingredients or their combinations tested on animals after 1 January 1998. The 7th Amendment introduced the 'period-after-opening labeling' concerning the durability and provided for more detailed provisions on the 'phasing out of animal testing' (for both the bans on animal testing of cosmetic products and of ingredients and on marketing the deadline for implementation is 2009. An exception is

made for the marketing of products tested for repeated-dose toxicity, reproductive toxicity and toxicokinetics that is extended until 2013).

The responsibility to ensure that cosmetic products are safe for consumer use is placed upon the manufacturer or their authorized agent or by any other person responsible for placing the product on the EU market. Guidelines to perform the risk assessment of the cosmetic ingredients were provided in 1997 and updated several times by the Communities Scientific Committee on Cosmetology. The Ministry of Health is the competent authority that enforces the cosmetics legislation in Italy. The website of Ministry of Health provides information concerning Italian implementations of community legislation and relevant documents (http://www.ministerosalute.it/cosmetici/cosmetici.jsp; Italian only).

Limitations Concerning Specific Chemicals

Italy follows Council Directive 76/769/EEC (O.J. L. 262, 27/9/1976) and subsequent amendment relating to restriction on the marketing and use of certain dangerous substances and preparations. Products covered by this directive include the chemicals PCBs and PCTs, certain lead compounds, mercury, arsenic, benzene, and other very dangerous chemicals. The basic Directive 76/769/EEC was put in force in Italy by the Decree of the President of the Republic No. 904 of 10/9/1982.

Miscellanous Reources

International Medlars Center

Italian National Medlars Centre
Web: http://www.iss.it/sdoc/cent/index.php?anno=2006&lang=1&tipo=7 (Italian only)

The National Medlars Centre was established at the Istituto Superiore di Sanità (ISS) in 1978. Before 1998, Italian users who wished to make an online search on files produced or distributed by the NLM could access the ELHILL or TOXNET computers using a password assigned by the ISS. After the institution by NLM of free websites TOXNET (http://Toxnet.nlm.nih.gov), and PubMed (pubmed.gov), the tasks of the ISS are now more oriented toward disseminating knowledge of NLM files in training courses, and distributing information and teaching material conceived for in-depth exploitation of toxicological resources on the Internet. Italian users are very interested in direct searching of toxicological information. An interlibrary loan documentation center has been established at the Documentation Service of the ISS for articles not available in Italy, within the activities of NLM DOCLINE (DOC on LINE) (email: documentazione@iss.it).

MATline, job-exposure matrix for carcinogenic chemicals. DoRS-Documentation Service for Health Promotion of Piedmont Region

Web: http://www.dors.it/matline/matline.php (Italian only)

MATline is a matrix developed by DoRS in collaboration with the Industrial Hygiene group from the Environmental Protection Agency. The matrix is a tool that can be used to predict which industrial processes can be expected to involve the use of a substance that is considered carcinogenic selected according to the method of classification adopted by the European Union (67/548/EEC Directive) and by the International Agency for Research on Cancer (IARC). Each agent is associated with a list of industrial processes coded according to the tariff headings used by the National Institute of Insurance against Occupational Injuries and Diseases (INAIL). Main toxicological data, target organs, uses and types of industry are reported for each agent. The matrix currently includes more then 600 carcinogenic agents, 23 classes of agents and some 7000 links between agents and industrial processes. The main sources of information are the IARC Monographs and databases available through the National Library of Medicine's TOXNET portal.

CHAPTER

95

Japan

TETSUO SATOH AND TAKESHI MORITA

INTRODUCTION

Toxicology is a relatively new science compared with pharmacology and pathology. However, it is a multidisciplinary field encompassing these subjects as well as other related life and social sciences. In Japan, the study of modern toxicology originated in academic settings in the 1970s subsequent to severe health tragedies induced by chemicals in the 1960s. These included the congenital malformations induced by thalidomide, Minamata disease induced by methyl mercury, Itai-itai disease induced by cadmium, chinoform-induced SMON (subacute myelo-optico-neuropathy) disease, and Kanemi Oil Poisoning Case induced by Co-PCB (coplanar polychlorinated biphenyl) or PCDF (polychlorinated dibenzo furan). These events were driving forces in the formation of modern toxicology. The pharmaceutical and chemical industries joined in the pursuit of toxicological research in the 1980s. As GLP (Good Laboratory Practice) system was also introduced in the 1980s, industrial companies needed a platform for the exchange of information and for discussion. In the 1990s, further development of the GLP system and experiences in industry ensured high-quality testing and results. In addition, regulators became involved with the scientific sector. Their participation induced the development of regulatory sciences including toxicity test guidelines, e.g., OECD or ICH guidelines, for hazard identification, and subsequently industry recognized the significance of education/training. Subjects such as risk evaluation, mechanistic toxicology and cutting-edge research toxicology including the -omics disciplines are advancing among the academic, regulatory, and industrial sectors in the 2000s. High-throughput screening of chemicals is also an important issue, and food safety is of particularly high interest to the public. On the other hand, clinical toxicology including occupational safety and epidemiology, is not a major focus of toxicology in Japan. Toxicology should clearly play an important role in risk communication. Many future challenges to toxicology remain.

TOXICOLOGY IN JAPAN

History of the Japanese Society of Toxicology – Past, Present and Future

Origin of the Japanese Society of Toxicology

In Japan, the Toxicology Research Group and the Toxic Action Research Group were formed in 1975 and 1976, respectively. In 1981, the two groups merged to form the Japanese Society of Toxicological Sciences (JSTS) as a non-profit scientific society to promote the acquisition and utilization of knowledge in toxicology and to facilitate the exchange of information among its members as well as among investigators worldwide. The first membership list contained 943 names on June 1, 1981, and grew to nearly 2400 members in 25 years. Prior to the founding of the JSTS, the Toxicological Research Group joined the membership of the International Union of Toxicology in 1980. The JSTS was renamed the Japanese Society of Toxicology (JST) in 1997.

Mission

The mission of the JST is to advance health through understanding of toxicology, and to stimulate research in toxicology.

JST shall promote the following activities:

1. Convening the annual meeting.
2. Publication of the official Journal.
3. Education and certification of toxicologists.
4. Scientific and publicity activities for members and the public.
5. Other programs/projects necessary to accomplish the purpose of JST.

Members

JST has recognized five member categories: General members, Student members, honorary members, meritorious members, and Supporting members. Among its current members are 42 from across the world; Korea (15), USA (11), United Kingdom (9), Canada (3), China (1), and Denmark (1). JST currently has the second largest toxicology society membership in the world. Member affiliations are Contract Research Organization (CRO, 70%), Academia (22%), Government (6%) and others (2%).

Board of Directors, Council and General Meeting

JST's managing structure includes 20 Directors and 292 Councillors as of September 1, 2006. The Board of Directors meets twice a year to draft the action plans of JST. The Council Meeting and the General Meeting are held once a year to discuss the action plans proposed by the Board of Directors.

Committees

JST has five strategic Committees to accomplish the society activities – General Affairs, Editorial, Educational, Finance and Science and Publicity.

General Affairs Committee

The committee has two major responsibilities. One is to strategically draw up the general action plans of JST for the year by reviewing the plans proposed by the individual committees and preparing the subjects for discussion at the Board of Directors. Another is to manage JST membership, including nomination and approval of new councillors and members.

Editorial Committee

As an official journal, JST has published the 'Journal of Toxicological Sciences (JTS)' bimonthly (online ISSN: 1880-3989; print ISSN: 0388-1350). The journal contains invited review articles, peer-reviewed original papers, and Letter to the Editor. JTS has invited distinguished toxicologists from throughout the world to become Associate Editors and Editorial Board members. One of the society's top strategic priorities is the ongoing development of its journal. JST is in the process of developing a new look and feel for the journal. In addition, based on the judgment of the Educational Committee, JST provides Best Paper Awards (Tanabe Award) for the best scientific papers appearing in JTS. The recipients of the award are honored at a special awards ceremony at the JST annual meeting, and their names are listed in the JST publications. The Editorial Committee takes responsibilities for the publication of JTS and the determination of the candidates for the Best Paper Awards.

Educational Committee

To foster and improve the quality of toxicologists in Japan, the Education Committee has provided certification and recertification examinations, continuing education courses, and fundamental education courses every year.

Since 1995, the Board of Directors of JST has seriously discussed the accreditation and certification of toxicologists in Japan. After extensive deliberations, the certification program of toxicologists was newly launched in 1997 under the control of the Education Committee. The aspect of our certification examination is similar to that of the American Board of Toxicology. At the first certification examination in 1997, 99 toxicologists were certified by the JST as diplomates of the Japanese Society of Toxicology (D.J.S.T.). The written examination has been offered every year, and 289 toxicologists have been formally approved as diplomate. As of June, 2006, 78% of the diplomates are from industry, and 14% from academia, and 8% from national institutes, research institutes, and foundations. Diplomates can be recertified every 5 years based upon their active practice of toxicology and maintaining an expert knowledge in general toxicology.

An applicant must have had a principal involvement in the practice of toxicology, in addition to the appropriate background education. The examination covers all aspects of toxicology and toxicity testing. The certified toxicologist should have knowledge which encompasses all aspects of toxicology and should be able to conduct proper toxicological planning, testing, evaluation and risk assessment.

Financial Committee

The Financial Committee deals with all of the financial issues of JST. JST has continued to make progress in strengthening the financial foundation of the Society. Major steps are taken to set up and implement a system for monitoring ongoing financial actions and

develop future plans. In addition, the society has considered modernizing and upgrading the budget and expenditures management process. The society has 48 supporting members that are mainly private industries, and they have supported the achievement of the strategic plans of the society financially.

Science and Publicity Committee

JST has provided public education lectures on toxicology since 1995 at its annual meetings, and the JST website has been redesigned with links to other websites in 2006. The website also presents updated information in both Japanese and English for its worldwide membership. These activities fall under the auspices of the Science and Publicity Committee. Furthermore, in addition to the above-mentioned Best Paper Awards, JST presents prestigious awards such as the Toxicological Science Award and the Young Investigator Awards each year in recognition of distinguished toxicologists, based on the judgment of the Awards Subcommittee, organized under the control of the Science and Publicity Committee. The recipients of the awards are honored at a special awards ceremony at the JST annual meeting, and their names are listed in the JST publications.

National and International Activities

National Level

Annual Meeting

The scientific meeting of JST is held annually. The scientific program of the annual meeting contains the invited lectures of prestigious speakers from throughout the world, symposia, workshops, oral/poster presentations, luncheon seminars, and panel discussions. At the annual meeting in 2006, there were 1600 participants from five countries. This is the largest number of meeting registrants to date.

Public Education Lecture

To promote public education in toxicology, JST has organized a lecture for the public during each year's annual meeting. Scientific experts are invited to give a lecture on a popular and important topic related to clinical medicine and drug therapy.

International Level

International Congress of Toxicology

As one of its global activities, the IUTOX organizes the International Congress of Toxicology (ICT) every 3 years, and the ICTs have been hosted by an IUTOX member society, as elected by the IUTOX member societies in the world. The JST hosted the ICT-IV in 1986 in Yokohama, Japan. Professor Fuminori Sakai, Past Vice President of IUTOX, chaired the ICT-IV, and 1104 registrants from 39 different countries participated.

Asian Society of Toxicology

The JST and the Korean Society of Toxicology organized joint meetings of toxicology in 1987 (Seoul, Korea), 1990 (Nagoya, Japan) and 1993 (Seoul, Korea). In 1994, representatives of the toxicology societies in Japan, China, Korea, Taiwan, and Thailand met in Sapporo, Japan to promote the toxicological sciences in Asia. As a consequence of serious discussions, the establishment of the Asian Society of Toxicology (ASIATOX) (formerly The Asian Federation of the Toxicological Sciences) was officially approved at the meeting. ASIATOX joined the IUTOX membership in 1996. The first ASIATOX congress (ASIATOX-I) was hosted by JST in Yokohama, Japan in 1997. There were 474 participants from 13 countries. ASIATOX-II, III, and IV have been held in Korea, Thailand, and China respectively, spaced 3 years apart. The 4th Congress will be held in Taiwan in 2009.

Risk Assessment Summer School

IUTOX has sponsored the Risk Assessment Summer School (RASS) every other year. The purpose of RASS is to train young toxicologists by offering stimulating lectures by experts and discussing the topics under consideration. One or two young toxicologists representing JST have participated in every RASS meeting in the past.

Future Perspectives

The development of toxicology as a recognized scientific discipline has proceeded at a rapid pace for the last 10 years. Its genomic basis, in particular, has been of consequence, and its growth is likely to accelerate in the future. Over the years, JST has achieved exceptional success with its meetings, publications, and its member services and outreach activities. Two important tasks in JST activities include maintaining the high-quality certification program of toxicologists and considering ways to improve the society journal.

Concerning certification, the number of JST-certified toxicologists has increased every year and the certification program is now well recognized throughout Japan. The diplomates receive several benefits such as health promotion at the workplace. Another goal of the program is to expand it to toxicologists in other countries. Concerning its journal, the JTS editorial team envisions a publication with increased visibility and which enhances the scientific edge in the

field of toxicology. As JTS modernizes, it will provide a highly efficient web-based manuscript submission and review system in the near future. The system will facilitate all aspects of manuscript submission, including tracking and communication between authors, reviewers, and editor.

Finally, the ultimate aim of all the Committees of JST is to advise Council in developing an implementation plan that ensures a systematic and efficient expenditure of energies and resources, and that is most closely aligned with a carefully considered strategy for accomplishing its long-range plan.

RESOURCES

Books

Education Committee of the Japanese Society of Toxicology (Ed.) (2002)
Toxicology
Tokyo: Asakura-shoten (Japanese)

Fujita S (Ed.) (1999)
Toxicology
Tokyo: Asakura-shoten (Japanese)

This is a textbook mainly for toxicology education in veterinary school.

Japan Poisoning Information Centre (Ed.) (1999)
First aid manual for acute poisoning, 3rd Edition
Tokyo: Jiho (Japanese)

Japanese Society of Toxicology (Ed.) (2003)
Dictionary of Toxicological Terms
Tokyo: Jiho (Japanese–English)

This is a Japanese–English and English–Japanese dictionary of terms which are frequently used in toxicology.

Kariya K, Satoh T, Takahashi M, Noguchi H (Eds.) (2004)
Japanese Edition of Casarett & Doull's Toxicology, 6th Edition
Tokyo: Scientist Publishers (Japanese)

One of the best-selling books in toxicology, 'Casarett & Doull's Toxicology' (6th ed.) (edited by C. Klaassen) was translated into Japanese. The book is extremely useful for the education and training of toxicologists in Japan.

Naitoh H, Yokote N (Japanese Translating Eds.) (2002/2003)
Clinical Toxicology
Ford et al (Eds.) Vols. 1/2
Tokyo: Maruzen (Japanese)

Nishi K (Ed.) (2003)
Emergency manual for drugs and poisoning, 7th Edition
Tokyo: Iyaku-Journal (Japanese)

National Profile on Chemicals Management JAPAN (2003)
Jiho Co. Ltd. (Japanese)
Web: http://www.mhlw.go.jp/houdou/2003/10/dl/h1029-1b.pdf (Japanese only)

Sakamoto T (Japanese Translating Ed.) (1999)
Poisoning and Drug Overdose, 2nd Edition
Kent R Olson (Ed.)
Tokyo: Medical Science International (Japanese)

Satoh T, Kariya K, Kitada K (Eds.) (2006)
Introduction to Clinical Toxicology (formerly Toxicology in Medicine), 3rd Edition
Tokyo: Nankodo (Japanese)

A textbook for advanced undergraduate and graduate students to use in the classroom setting. It provides a thorough, systematic introduction to toxicology. It describes the most current knowledge on toxicology from the viewpoint of clinical pharmacy rather than fundamental pharmaceutical sciences.

Satoh T, Ueno Y (Eds.) (1995)
Essential Toxicology, 3rd Edition
Tokyo: Nankodo (Japanese)

A basic textbook in toxicology for undergraduate and graduate students. Topics such as toxicokinetics, metabolism, excretion, mutagenesis, carcinogenesis, hepatotoxicity, and the natural toxins are covered.

Journals

Almost all journals are published as official journals of the professional societies. See Professional Society Section.

Foods & Food Ingredients Journal of Japan
Web: http://www.ffcr.or.jp/zaidan/FFCRHOME.nsf/pages/ffij-eindex (English Abstract)
Web: http://www.ffcr.or.jp/zaidan/FFCRHOME.nsf/pages/ffij-jindex (Japanese Abstract)

Health and Nutrition News
Web: http://www.nih.go.jp/eiken/english/info/info_news_e.html (English)
Web: http://www.nih.go.jp/eiken/info/info_news.html (Japanese)

Industrial Health
Web: http://www.niih.go.jp/en/indu_hel/index.html (English)
Web: http://www.niih.go.jp/jp/indu_hel/index.html (Japanese)

Industrial Health is an international academic journal published by the National Institute of Industrial Health (NIIH). Contributed papers are closely examined by professors in Japan and overseas. The journal covers fields in medicine, ergonomics, industrial hygiene engineering, and policy sciences.

The Tohoku Journal of Experimental Medicine
Web: http://journal.med.tohoku.ac.jp/ (English)

Tohoku University publishes *The Tohoku Journal of Experimental Medicine* (TJEM). The TJEM is one of the oldest and the most prestigious periodicals in Japan and the world. It is open to original articles in all branches of medical sciences from authors throughout the world.

Technical Reports and other Documents

Chemicals in the Environment; Report on Environmental Survey and Monitoring of Chemicals in FY2001–2005
Web: http://www.env.go.jp/chemi/kurohon/en/index.html (English)
Web: http://www.env.go.jp/chemi/kurohon/index.html (Japanese)

'Chemicals in the Environment' by the Ministry of the Environment (MOE) includes three types of surveys i.e., Initial Environmental Survey, Environmental Survey for Exposure Study, and Monitoring Investigation.

Chemical Hazard Evaluation Sheets
Web: http://www.safe.nite.go.jp/data/sougou/pk_list.html?table_name=hyoka&rank=sheet&sort=cas (Japanese only)

Chemical Substance Fact Sheets for Risk Communication
Web: http://www.env.go.jp/chemi/communication/factsheet.html (Japanese only)

The fact sheets provide general public with simplified and easy-to-understand information on chemical substances subjected to the Law Concerning Reporting, etc., of Release of Specific Chemical Substances to the Environment and Promotion of the Improvement of their Management (PRTR Law).

Information on PRTR chemicals
Web: http://www.env.go.jp/chemi/prtr/archive/target_chemi.html (Japanese only)

Information System on Safety and Effectiveness for 'Health Foods'
Web: http://hfnet.nih.go.jp/ (Japanese only)

Links to Chemical Safety Database for Chemical Management
Web: http://www.meti.go.jp/policy/chemical_management/06DB/index.htm (Japanese only)

Results of Eco-toxicity tests of chemicals conducted by Ministry of the Environment in Japan (2003 version)
Web: http://www.env.go.jp/chemi/sesaku/02e.pdf (English)
Web: http://www.env.go.jp/chemi/sesaku/02.pdf (Japanese)
Web: http://www.env.go.jp/chemi/sesaku/01.html (Japanese only)

Test results conducted based on the OECD-GLP standard and the OECD test guidelines are shown. However, because these data have not been evaluated by experts, confirmation of test result is needed if these data are to be used for assessment.

Databases

Chemical Database (WebKis-Plus)
Web: http://w-chemdb.nies.go.jp/index.html (English)
Web: http://w-chemdb.nies.go.jp/ (Japanese)

Chemical Hazard Evaluation Reports
Web: http://www.safe.nite.go.jp/data/sougou/pk_list.html?table_name=hyoka (Japanese only)

More than 100 hazard evaluation reports are presented.

Chemical Risk Information Platform (CHRIP)
Web: http://www.safe.nite.go.jp/english/db.html (English)

Web: http://www.safe.nite.go.jp/japan/db.html (Japanese)

The Platform includes Total Search System for Chemical Substances, PRTR Chemicals Database, and Biodegradation and Bioconcentration of the Existing Chemical Substances under the Chemical Substances Control Law.

Comprehensive Information Search Systems on Food Safety
Web: http://www.ifsis.fsc.go.jp/fsilv1/do/FSILogon (Japanese only)

Database for GHS Classification Results
Web: http://www.safe.nite.go.jp/ghs/ghsi.html (Japanese only)
Web: http://www.safe.nite.go.jp/ghs/index.html (Japanese only)

The results of GHS classification on about 1500 chemicals and the documents for classification are presented.

Environmental Risk Evaluation on Chemicals, Vols. 1–4
Web: http://www.env.go.jp/chemi/risk/index.html (Japanese only)

Evaluation Reports by the Food Safety Commission
Web: http://www.fsc.go.jp/english/index.html (English)
Web: http://www.fsc.go.jp/index.html (Japanese)

The Food Safety Commission is an organization that undertakes risk assessment. The Commission's primary goals can be summarized into three main tasks: (1) conducting risk assessment on food in a scientific, independent, and fair manner, and making recommendations to relevant ministries based upon the results from the risk assessment, (2) implementing risk communication among stakeholders such as consumers and food-related business operators, and (3) responding to food-borne accidents and emergencies.

Food additives:

Global Information Network on Chemicals (GINC) Chemical substances toxicity database
Web: http://wwwdb.mhlw.go.jp/ginc/html/db1.html (English)
Web: http://wwwdb.mhlw.go.jp/ginc/html/db1-j.html (Japanese)

This database is for existing chemicals with high production volume (HPV). Several types of toxicity testing reports are included, e.g., in most cases, a single dose toxicity test, a 28-day repeat dose toxicity test, a reproductive/development toxicity test and mutagenicity tests. Each report consists of the nomenclature of the chemical, abstracts and summarized data from the studies in English, and toxicity test results in order.

Health and Nutrition Information Infrastructure Database System
Web: http://nihn-jst.nih.go.jp:8888/nns/owa/nns_main_e.hm01 (English)
Web: http://nihn-jst.nih.go.jp:8888/nns/owa/nns_main.hm01 (Japanese)

The Database covers the National Nutrition Survey (NNS). Data search functions include NNS information search, Nutrient contribution information search, Dish information search, and Nutrient requirement of each country search.

Information on Chemicals
Web: http://www.nihs.go.jp/hse/chemical/index-e.html (English)
Web: http://www.nihs.go.jp/hse/chemical/index.html (Japanese)

The database includes Legislation in Japan (English and Japanese), Summary of Environmental Health Criteria (Japanese), Concise International Chemical Assessment Documents (CICAD) (Japanese), and International Chemical Safety Cards (ICSC) (Japanese).

Primarily Evaluation Reports by the New Energy and Industrial Technology Development Organization (NEDO) Chemical Material Management R&D Program
Web: http://www.safe.nite.go.jp/risk/riskdoc2.html (Japanese only)

Primary evaluation reports for more than 50 chemicals are presented.

Risk Assessment Documents
Web: http://unit.aist.go.jp/crm/mainmenu/e_1.html (English for explanation)

Web: http://unit.aist.go.jp/crm/mainmenu/1.html (Japanese only)

Risk assessment documents developed based on the evaluation of the available scientific data for the chemicals with known or anticipated risks for human health and/or the environment. They provide the scientific basis for regulatory bodies, industries, and the public in the decision-making process of chemical risk management.

Summary of Pesticide Documents and Evaluation Reports
Web: http://www.acis.go.jp/syouroku/index.htm (Japanese only)
Web: http://www.acis.go.jp/eng/indexeng.htm (English for explanation)

Pesticide Documents prepared by applicants and Evaluation Reports prepared by the Food Safety Commission, Cabinet Office are presented.

National Institute of Advanced Industrial Science and Technology (AIST)
Web: http://www.aist.go.jp/index_en.html (English)
Web: http://www.aist.go.jp/index_ja.html (Japanese)

The missions of National Institute of Advanced Industrial Science and Technology (AIST) are (1) contribution to a sustainable society, (2) contribution to industrial competitiveness, (3) contribution to local industrial development, and (4) contribution to industrial technology policies. Research fields are Life Science & Technology, Information Technology, Nanotechnology, Materials & Manufacturing, Environment & Energy, Geological Survey and Applied Geoscience, and Metrology and Measurement Technology.

National Institute of Genetics (NIG)
Web: http://www.nig.ac.jp/index-e.html (English)
Web: http://www.nig.ac.jp/ (Japanese)

This institute carries out comprehensive genetic research to advance the knowledge of basic and applied genetics as one of the inter-university institutes. NIG also serves as a center for various genetic resources such as mutant strains, clones and vectors, the DNA Data Bank of Japan, and a DNA sequencing center. Recent generation of massive information on biological systems and their environment calls for new directions in life sciences, such as bioinformatics, system-level analysis, and theoretical approaches to extract knowledge from databases.

National Institute of Health Sciences (NIHS)
Web: http://www.nihs.go.jp/index.html (English)
Web: http://www.nihs.go.jp/index-j.html (Japanese)

The National Institute of Health Sciences (NIHS) is responsible for conducting basic research to ensure the quality, efficacy, and safety of a wide range of products that directly and indirectly affect the populace. The major activities of NIHS cover extensive testing and research to ensure the quality and safety of drugs, foods and other goods closely related to people's lives. Such activities include biological studies, information services, and co-operation with international organizations.

National Institute of Radiological Sciences (NIRS)
Web: http://www.nirs.go.jp/ENG/nirs.htm (English)
Web: http://www.nirs.go.jp/index.html (Japanese)

National Institute of Radiological Sciences (NIRS) is the only institution in Japan dedicated to comprehensive scientific research for radiation and health. Experts from many fields collaborate in research and development to enhance the levels of radiological sciences. NIRS has conducted various activities as an institution with advanced equipment and personnel with expertise in a wide range of professional fields including medical science, physics, engineering, chemistry and pharmaceutical science.

Web: http://www.cerij.or.jp/ceri_en/index_e4.shtml (English)
Web: http://www.cerij.or.jp/ceri_jp/index_j4.shtml (Japanese)

The Chemicals Evaluation and Research Institute, Japan (CERI) engages in a wide scope of activities related to chemicals, including experiments, testing, analysis, evaluations, and research and development. Its ultimate objective is to further the sound development of industry and enhance people's lifestyles by upgrading the quality of chemicals and assuring their safety while at the same time emphasizing environmental preservation and the protection of health. CERI carries out basic research, the development of testing methods, the development of techniques to assess risk, data collection and analysis, and other functions.

Japan International Center for Occupational Safety and Health (JICOSH)
Web: http://www.jicosh.gr.jp/english/ (English)
Web: http://www.jicosh.gr.jp/Japanese/index.html (Japanese)

Japanese firms are often placed in a difficult position in proceeding with effective and efficient safety and health management or taking appropriate countermeasures. In addition, although ensuring safety and maintaining and improving the health of workers are essential requirements that are commonly recognized throughout the world, there still are such problems as information or technologies relating to safety and health that are owned by specific countries are not commonly shared by all parties concerned. JICOSH works to help resolve these issues.

Web: http://www.jstage.jst.go.jp/browse/_journallist (English)
Web: http://www.jstage.jst.go.jp/browse/-char/ja (Japanese)

In order to maintain and develop Japan's science and technology research at an international level, it is important to disseminate outstanding research and development results to the world instantaneously. To that end, it is important to digitize bulletins of academic societies and research papers that currently appear on paper and to disseminate them on the Internet.

CHAPTER

96

Malaysia

SALMAAN H. INAYAT-HUSSAIN, JAMALUDIN ABU BAKAR, EFFENDI IBRAHIM, MAZLIN MOKHTAR, AND MICHELLE ALIA NUNIS

INTRODUCTION

Malaysia's industries in the areas of medical devices, pharmaceuticals, herbal medicine, nutraceuticals, and cosmeceuticals are rapidly growing. Therefore, there is an increasing urgency for the toxicological safety assessment of these products. Some regulations are already in place in the country and certain regulations concerning toxicity testing are currently being discussed for mandatory adoption by the industries. As an example, in Malaysia the standard that has been accepted by the Industry Standard Committee on Medical Devices (ISC-R) was *MS ISO 10993-3:2005, Biological evaluation of medical devices – Part 3: Tests for genotoxicity, carcinogenicity and reproductive toxicity*. Other parts of the ISO 10993-3 biological evaluation of medical devices are currently being discussed for adoption to meet the goals of the Malaysia Medical Devices Act 2007.

The herbal industry is an important sector in the country where products developed include cosmetics, health foods and herbal pharmaceuticals. Universities and research institutions have been performing various types of toxicity testing and currently a committee at the Institute for Medical Research of the Ministry of Health is co-ordinating a global information hub on integrated medicine. In this committee, issues including the regulation of safety of herbal products are being discussed.

The release of hazardous waste into the environment has posed risks to the environment and to human health worldwide. Previous studies have indicated that waste water genotoxicity has significant effects to human health and therefore genotoxicity testing on waste water for safe human reuse is crucial. Recently, New Work Item Proposal DIN 38415 – Part 3 and ISO13829:2000 – Water quality – Determination of the genotoxicity of water and waste water using the *umu* test has been proposed to the standards committee for discussion and possible adoption in Malaysia.

Establishment of the National Institute of Occupational Safety and Health (NIOSH) has led to a better workplace and reduction in accidents relating to chemicals. Other governmental agencies including the Ministry of Health, Ministry of Natural Resources and Environment and Ministry of Science, Technology and Innovation are working together to ensure that Malaysia's toxicology advancements are progressing well. Human capital development is also an important issue and many universities in the country are now introducing toxicology subjects at both undergraduate and postgraduate levels.

RESOURCES

Books

Environmental Health Focus (2003)

A joint publication of the Environmental Health Research Centre, Institute for Medical Research, Malaysia and supported by Centre of Environmental Health Development, WHO Collaborating Centre for Environmental Health, University of Western Sydney, Australia

ISSN: 1675-3941
All editorial communications to:
Chief Editor at EHRC
Environmental Health Focus

Institute for Medical Research
Jalan Pahang
50588 Kuala Lumpur

Mohd SI (2006)
Environmental Law in Malaysia
ISBN: 9679427757

This book provides basic guidelines to the current legal mechanisms in Malaysia. Chapters overview the legal aspects of pollution as they relate to the atmosphere, inland water, coastal waters, land, flora and fauna, litigation, international factors and international cooperation, and NGOs.

Vincent JR, Mohamed Ali R (2005)
Managing Natural Wealth: Environment and Development in Malaysia
ISBN: 9812302379

With access to unpublished data and key decision makers, the authors of this book analyze major environmental policy issues in Malaysia during the 1970s and 1980s, a period which saw profound socioeconomic change, the emergence of serious problems with pollution as well as rapid depletion of natural resources. This volume is an update to the book, *Environment and Development in a Resource-Rich Economy: Malaysia under the New Economic Policy*, which was published in 1997. This update includes a review of key developments since the 1990s.

Journals

Journal of Occupational Safety & Health

The OSH journal features articles, papers and reports of local experiences and research in OSH in Malaysia and the region.

Further information can be obtained from:
The Secretariat
Journal of Occupational Safety and Health
NIOSH, Lot 1, Jalan 15/1
Section 15, 43650 Bandar Baru Bangi
Selangor, Malaysia
Fax: 603-89265900

Malaysian Applied Biology (1977–)

Malaysian Applied Biology publishes scientific articles on original research in all fields of biology and applied biology or in any related scientific field provided it has not been considered for publication in other journals. Acceptance for publication is based on contribution to scientific knowledge, originality of data, ideas or interpretations and on their conciseness, scientific accuracy and clarity, as judged by two referees appointed by the Editorial Board.

Manuscripts should be submitted in triplicate to:
Prof Zubaid Akbar
Editor, Malaysian Applied Biology
c/o School of Environment & Natural Resource Sciences
Faculty of Science and Technology
Universiti Kebangsaan Malaysia
43600 UKM, Bangi, Selangor D.E.
Malaysia

Malaysian Journal of Pathology (1978–)
ISSN: 0126-8635

Malaysian Journal of Pathology is the official journal of the Malaysian Society of Pathologists. The journal is published semi annually.

The Business Manager
The Malaysian Journal of Pathology
Department of Pathology
Faculty of Medicine
University of Malaya
50603 Kuala Lumpur, Malaysia
Web: http://www.geocities.com/cpathamm/

Medical Journal of Malaysia (1979–)
ISSN: 0300-5283

The *Medical Journal of Malaysia* invites articles of interest from various areas of medicine in the form of original papers, research notes, communications, and correspondence. This journal also allows brief abstracts, of not more than 50 words, of original papers published elsewhere, concerning medicine in Malaysia.

All correspondence pertaining to articles and related matters should be addressed to:
Hon Editor
Medical Journal of Malaysia
Malaysian Medical Association
4th Floor, MMA House
124 Jalan Pahang
53000 Kuala Lumpur
Web: http://www.mma.org.my/mjm/mmj.htm

Sains Malaysiana (1972–)
ISSN 0126-6039

A journal on mathematics, earth science, physical sciences and biology. The journal is issued semi-annually primarily as a channel for publication of research reports of the academics of the university. Articles are published in both Malay and English.

All correspondence pertaining to articles and related matters should be addressed to:
Editor-in-Chief
Sains Malaysiana
Fakulti of Science and Technology
Universiti Kebangsaan Malaysia

Technical Reports and Other Documents

Round table dialogue No. 12: Malaysian network for integrated management of chemicals and hazardous substances for environment and development (MYNICHE) (2005)
Mazlin Bin Mokhtar, Ahmad Fariz Mohamed, Nurul Wah (Eds.)
ISBN: 983-9444-64-6

Environmental Impact Assessment (EIA)
The EIA provides guidelines for:
Coastal Resort Development Projects
Petrochemical Industries
Industrial Estate Development
Groundwater and/or Surface Water Supply Projects
Thermal Power Generation and/or Transmission Projects
Drainage and/or Irrigation Projects
Fishing Harbours and/or Land Based Aquaculture Projects
Dam and/or Reservoir Projects
Mines and Quarries
Development of Resort and Hotel Facilities In Hill Stations
Development of Tourist and Recreational Facilities In National Parks
Development of Tourist and Recreational Facilities On Islands in Marine Parks
Industrial Projects
Municipal Solid Waste and Sewage Treatment and Disposal Projects
Toxic and Hazardous Waste Treatment and Disposal Projects
Management and Disposal of Waste In DownStream Petroleum Industries
Management and Disposal of Waste In UpStream Petroleum Industries
Siting and Zoning
Coastal and Land Reclamation
Forestry
Petroleum Industries

All the assessment is conducted by Department of Environment (DOE), Ministry of Natural Resources and Environment of Malaysia

Web: http://www.doe.gov.my
In Malaysia, EIA is required under section 34A, Environmental Quality Act, 1974.

Water Quality Report
Malaysia's water quality is controlled by the Department of Environment, Ministry of Natural Resources and Environment of Malaysia.
Web: http://www.doe.gov.my

It consists of three parts of monitoring programmes which are Marine Monitoring, Ground Water Monitoring and Surface Water Monitoring.

To date, a total of 927 manual stations are located within 120 river basins throughout Malaysia.

Air Quality Report

The Department of Environment (DOE) has formulated a set of air quality guidelines in 1989, termed Recommended Malaysian Air Quality Guidelines (RMG) for air pollutants, defining the concentration limits of selected air pollutants which might adversely affect the health and welfare of the general public. In 1993, the DOE developed its own air quality index system known as Malaysian Air Quality Index (MAQI). DOE revised the MAQI system by adapting

the Air Pollutant Index (API) which closely follows the Pollutants Standard Index (PSI) system of the United States

Web: http://www.doe.gov.my

The pollutants included in Malaysia's API are ozone (O_3), carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2) and suspended particulate matter less than 10 microns in size (PM_{10}).

Malaysian Standards

1. MS ISO 15225:2005, Nomenclature – Specification for a nomenclature system for medical devices for the purpose of regulatory data exchange
2. MS ISO 10993-1:2005, Biological evaluation of medical devices – Part 1: Evaluation and testing
3. MS ISO 10993-3:2005, Biological evaluation of medical devices – Part 3: Tests for genotoxicity, carcinogenicity and reproductive toxicity
4. MS ISO 10993-13:2005, Biological evaluation of medical devices – Part 13: Identification and quantification of degradation products from polymeric medical devices
5. MS ISO 10993-14:2005, Biological evaluation of medical devices – Part 14: Identification and quantification of degradation products from ceramics
6. MS ISO 10993-15:2005, Biological evaluation of medical devices – Part 15: Identification and quantification of degradation of products from metals and alloys
7. MS ISO 10993-16:2005, Biological evaluation of medical devices – Part 16: Toxicokinetic study design for degradation products and leachables
8. MS ISO 10993-17:2005, Biological evaluation of medical devices – Part 17: Establishment of allowable limits for leachable substances

Organizations (Government)

Atomic Energy Licensing Board
Web: http://www.aelb.gov.my

This agency acts as an enforcement body to implement the Atomic Energy Licensing Act (Act 304).

Address: Atomic Energy Licensing Board
Ministry of Science, Technology and Innovation
Batu 24, Jalan Dengkil
43800 Dengkil
Selangor, Malaysia
Phone: +603-8926-7699
Fax: +603-8922-3685
Email: kp@aelb.gov.my

Environmental Institute of Malaysia
Web: www.doe.gov.my

This institute was established under the Department of Environment to enhance manpower development programs and to raise public awareness on the importance of environmental conservation.

Address: Department of Environment
Ministry of Natural Resources and Environment
Level 1–4, Podium 2 & 3
Lot 4G3, Precint 4
Federal Government Administrative Centre
62574 Putrajaya, Malaysia
Phone: +603-8871-2000/8871-2200
Fax: +603-03-8889-1973/75

Forest Research Institute of Malaysia
Web: http://www.frim.gov.my

This is a statutory body governed under Ministry of Natural Resources and Environment which is involved in research and development and testing services for the forestry and forest products industry.

Address: Forest Research Institute Malaysia (FRIM)
52109 Kepong, Selangor
Malaysia
Phone: +603-6279-7000
Fax: +603-6273-1314
Email: webgroup@frim.gov.my

Malaysian Institute for Nuclear Technology Research
Web: www.mint.gov.my

This institute is involved in the research and development related to nuclear technology.

Address: Malaysian Institute for Nuclear Technology Research (MINT)
Bangi 43000 Kajang
Selangor, Malaysia
Phone: +603-8925-0510
Fax: +603-8925-8262
Email: CorporateComm@mint.gov.my

Melaka Institute of Biotechnology
Web: www.mib.gov.my

This is a state government institute involved in toxicity testing including mutagenicity and cytotoxicity.

Address: Melaka Biotechnology Corporation
Lot 7, MITC City
75450 Ayer Keroh
Melaka, Malaysia
Phone: +606-231-3622
Fax: +606-231-3276

Ministry of Human Resources
Web: www.mohr.gov.my

This ministry oversees the Department of Occupational Safety and Health (DOSH). DOSH is a government agency responsible for the administration and enforcement of legislations related to occupational safety and health for Malaysia.

Address: Ministry of Human Resources
Aras 6-9, Blok D3, Kompleks D
Pusat Pentadbiran Kerajaan Persekutuan
62530, Putrajaya, Malaysia
Phone: +603-8886-5000
Fax: +603-8889-2381
Email: ksm1@mohr.gov.my

Ministry of Natural Resources and Environment
Web: www.nre.gov.my

The Department of Environment (www.doe.gov.my) is under this ministry. The DOE has a division on hazardous/toxic substances and implements the Environmental Quality Act 1974 and its associated rules and regulations which include toxic substances.

Address: Ministry of Natural Resources and Environment
Aras 14, No.25, Persiaran Perdana
Wisma Sumber Asli, Presint 4
62574 Putrajaya, Malaysia
Phone: +603-8886-1111
Fax: +603-8889-2672
Email: webmaster@nre.gov.my

Ministry of Science, Technology and Innovation
Web: www.mosti.gov.my
Address: Ministry of Science, Technology and Innovation,
Aras 1-7, Blok C5, Pusat Pentadbiran Kerajaan Persekutuan,
62662 Putrajaya, Wilayah Persekutuan, Malaysia
Phone: +603-8885-8000
Fax: +603-8888-6070
Email: webmaster@mosti.gov.my

The Department of Chemistry (www.kimia.gov.my) is under the purview of this ministry and is a national organization of ten laboratories which provides comprehensive, modern, high-quality and cost-effective scientific services (analytical, investigatory, and consultancy).

These services are critical in supporting the implementation of 49 Acts/Regulations and various programmes by government agencies in:

Combating crime and maintaining public security and order
Protecting environmental quality
Maintaining food and water safety (Public Health)
Tariff classification for customs duties
Consumer protection
Evaluation of supplies for government contracts
Laboratory accreditation
Administration of Justice
Forensic (Toxicology, Narcotic, Serology, Criminalistic and Document Examination)
Environmental Health (Food, Water and the Environment)

National Hydraulic Research Institute of Malaysia
Web: www.nahrim.gov.my

This institute is involved in research and consultancy in aspects of water hydraulics and water environment. This institute also offers services based on advanced technologies within the fields of ecology and environmental chemistry.

Address: National Hydraulic Research Institute of Malaysia (NAHRIM)
Ministry of Natural Resources and Environment
Lot 5377, Jalan Putra Permai
43300 Seri Kembangan
Selangor, Malaysia

CHAPTER

97

Mexico

MARIA E. GONSEBATT

INTRODUCTION

The history of toxicology in Mexico should include, at the outset, reference to the indigenous cultures which had acquired an intimate knowledge of the medicinal properties of the land's flora. These early civilizations even cultivated botanical gardens of medicinal plants. The use of medicinal plants by the Aztecs was described by Sahagun in his *General history of the things of the New Spain* and in 1552, the *Libellus de Medicinalibus Indorum Herbis,* containing a description of medicinal plants and their uses, was published.

Modern toxicology began to take root in Mexico in the early 1970s in several laboratories at different institutes and universities, such as the Instituto Politécnico Nacional and the Universidad Nacional Autónoma de México. Today, research in toxicology, genotoxicology, environmental toxicology, and food toxicology is performed mostly in public universities in Mexico City such as those mentioned above but also in various state universities such as the Universidad Autónoma de Aguascalientes, Universidad de Durango, Universidad Autónoma de Nuevo León, Universidad de San Luis Potosí, Universidad Autónoma de Querétaro and Instituto Tecnológico de Sonora. Toxicology is taught in an assortment of Mexican university faculties, such as chemistry, medicine, veterinary science, and sometimes biology, as a part of the academic curricula. Food toxicology is currently taught within several university departments within the new Food Science and Technology degree programs. There are postgraduate programs in toxicology, environmental toxicology, and environmental management in public and private superior education institutions. The CONACYT or Consejo Nacional de Ciencia y Tecnología (National Science and Technology Council) funds most of the research and the postgraduate programs. The Secretary of Environmental Resources (SEMARNAT) also funds research in specific areas. The Sociedad Mexicana de Toxicología, SOMTOX (Mexican Society of Toxicology) was founded in 1994 by members of the Mexican chapter of the Latin American Society of Toxicology (ALATOX). SOMTOX holds biennial meetings. Dr. Lilia Albert Palacios was its first president. Genetic toxicologists participate in academic societies such as the Sociedad Mexicana de Genética (Mexican Society of Genetics) and the Sociedad Mexicana de Genética Humana (Mexican Society of Human Genetics). The publication of books in the area has been sponsored mostly by the Pan American Health Organization (PAHO) and by government agencies such as the Instituto de Ecología (Ecology Institute) and the Secretary of Environmental Resources (SEMARNAT), and universities. There are no specialized toxicology journals in Mexico, although chemistry, biology, ecology and clinical sciences journals publish toxicological research findings. The journal *Revista de Contaminación Ambiental,* edited by several universities, specializes in environmental pollution research.

RESOURCES

Books

Adame Romero A (1993)
Contaminación Ambiental (Environmental Pollution)
Trilla: México

A text describing environmental aspects of pollution and toxicology.

Albert LA (1988)
Curso básico de toxicologia ambiental (Basic course on environmental toxicology)
Limusa: Noriega, México

An introduction to environmental toxicology, a basic course.

Albert LA, Saldívar Osorio L (Eds.) (1996)
La Toxicologia en Mexico: estado actual y perspectivas (Toxicology in Mexico: actual state and perspectivas)
Sociedad Mexicana de Toxicología: México

Meeting proceedings.

Alvarez Moya C (2000)
Genetica, ambiente y salud (Genetic, Environment and Health)
Universidad de Guadalajara: México

A text on human genetics, genetics toxicolgy, carcinogenesis, environmetal pollution.

Asociación Mexicana de Pediatría (2004)
Intoxicaciones (Intoxications)
McGraw-Hill Interamericana: México

Aspects of pediatric toxicology.

Botello AV, et al (Eds.) (1996, 2005)
Golfo de México, contaminación e impacto ambiental: diagnóstico y tendencias (Gulf of Mexico, pollution and environmental impact: diagnosis and tendencies)
Universidad Autonoma de Campeche and UNAM: México

Analyzes the impact of marine pollution by pesticidas, etc. in the Gulf of Mexico.

Calixto Flores R, et al. (2003)
Ecologia y Medio Ambiente (Ecology and Environment)
Thomson Learning Ibero: México

Describes ecology as a science, the dynamic of ecosystems, ecodevelopment and health with emphasis in pollution, erosion and restoration.

Cervantes C, Moreno-Sanchez R (1999)
Contaminacion ambiental por metales pesados: impacto en los seres vivos (Heavy Metals Environmental Pollution: impact in living organisms)
A. G. T: México

Describes the pollution due to heavy metals and its effects in plants.

Curso Toxicologia Ambiental, Economica y Forense (1986)
Memorias del curso toxicologia ambiental, economica y forense (Proceedings of the Environmental, economic and forensic toxicology Course)
UNAM, Facultad de Medicina Veterinaria y Zootecnia, Division de Estudios de Posgrado, Coordinacion de cursos de actualizacion: México

Veterinary toxicology texts.

Félix-Burgos G, Romero Sevilla L (1998)
Ecología y Salud (Ecology and Health)
McGraw-Hill Interamericana: México

A basic course to learn about environmental health.

Gordillo Hernández D (1995)
Ecologia y contaminacion ambiental (Ecology and environmental pollution)
Interamericana: McGraw-Hill: México

A basic text describing those aspects of environmental pollution that affect ecology. Environmental protection.

Jaramillo F, et al (2006)
Toxicología básica (Basic Toxicology)
Universidad Autónoma de Aguascalientes, Universidad de Guadalajara, UJED: México

Basic toxicology describing the principles of toxicokinetics and toxicodynamics, and analyzing the effects and mechanisms of toxic xenobiotics in organs and systems. The book presents up-to-date information, and examples with tables and figures. In the appendix the problem of the half life and toxicity of pharmaceutical drugs is analyzed.

Perez Lucio C (coordinator) (1999)
Toxicologia laboral (Occupational Toxicology)
Conferencia Interamericana de Seguridad Social: México

Proceedings of the Interamerican Conference on Social Security.

Perez Zapata A, De Leon Rodríguez I (1993)
La contaminacion por plomo en Coatzacoalcos: un ejemplo de deterioro ambiental (Lead pollution in Coatzacoalcos: an example of environmental deterioration)
IPN: México

A text describing lead pollution in a specific oil area in Mexico.

Posadas del Río FA, et al (2006)
Biotransformation of Xenobiotics
Universidad Autónoma de Aguascalientes: México

Analyzes the biotransformation, metabolism or detoxification of xenobiotics as part of the interaction of xenobiotics with living organisms. Chemical changes and biological effects. The book was printed in English

Rodríguez-Arnaiz R (2003)
Las toxinas ambientales y sus efectos genéticos, 4a ed (Environmental toxics and its genetics effects, 4th Ed.)
Fondo de Cultura Economica: México

An introduction on topics of genetic damage by environmental mutagens.

Rosiles Martinez R, Ocampo Cambero L (coordinadores) (1978)
Memorias del primer curso de actualizacion en toxicologia veterinaria (Memoirs of the first course of actualization in toxicology)
UNAM. Facultad de Medicina Veterinaria y Zootecnia. Division de Estudios Superiores: México

A veterinary toxicology course.

Sánchez Gómez J (2003)
Manejo de residuos industriales (Industrial waste management)
Universidad Autónoma de Aguascalientes: México

Keywords: hazardous waste, pollution, natural resources, sites, permeability, different types of geology, dumping sites.

Sumano López H, Lizarraga Madrigal I (2001)
Farmacología y toxicología aplicada en equinos (Equine applied pharmacology and toxicology)
UNAM, Facultad de Medicina Veterinaria y Zootecnia, Departamento de Medicina y Zootecnia para Equinos: México

Descriptions of horse diseases and treatments, pharmacological and toxicological information for veterinary students.

Publications sponsored by the Panamerican Center of Human Ecology and Health (Centro Panamericano de Ecología Humana y Salud) PAHO, WHO, México

Albert LA (1997)
Ejercicios complementarios [para el] curso basico de toxicologia ambiental (Complementary exercises for the basic course on Environmental Toxicology)
Centro Panamericano de Ecologia Humana y Salud-WHO: México

Exercises for students of basic toxicology courses. Publication sponsored by PAHO.

Aitio A, et al (1986)
Control de calidad en laboratorios de toxicologia ocupacional (Quality control in occupational toxicology laboratories)
Centro panamericano de ecologia humana y salud: México

Spanish translation of the book: Euro-WHO Quality control in the occupational toxicology laboratory European cooperation on environmental health aspects of the control of chemicals-interim document 4. Copenhagen Euro-WHO.

Carreón Valencia T (1995)
Manual de procedimiento en la toma de muestras biológicas y ambientales para determinar niveles de contaminantes (Procedure manual for biological and environmental sampling to determine levels of pollutants)
Centro Panamericano de Ecología Humana y Salud División de Salud y Ambiente: México

A description of the requirements to perform and to obtain biological and environmental simples to determine levels of pollutants.

Centro Panamericano de Ecología Humana (1986)
Toxicología Alimentaria (Food Toxicology)

Food poisoning.

de Fernicola NGG (1985)
Cursos de toxicologia a nivel de grado y de posgrado en america latina (Pregraduate and Postgraduate Toxicology Courses in Latin America. A compilation)
Centro Panamericano de Ecologia Humana y Salud: México

A description of the toxicology courses, graduate and postgraduate studies in Latin America. A publication sponsored by PAHO.

Listado de Plaguicidas Restringidos y Prohibidos en Paises de la Region de Las Americas (1989) (List of restricted and prohibited plaguicides in the Americas region)

Centro de Ecologia Humano, Centro Panamericano de Ecología Humana y Salud Programa de Salud Ambiental, Organización Panamericana de la Salud: México

Secretaría de Salubridad y Asistencia (1973)
Apuntes sobre intoxicaciones (Notes on intoxications)

Consejo nacional de prevencion de accidents: México

Valle Vega P (1986, 1991)
Toxicología de alimentos (Food Toxicology)
Centro Panamericano de Ecología Humana y Salud, Programa de Salud Ambiental
Coedición con: Organización Panamericana de la Salud y la Organización Mundial de la Salud: México

Vega GS (1985)
Aspectos específicos de la toxicología de algunos contaminantes (Specific aspects of some pollutants toxicology)

Centro Panamericano de Ecología Humana y Salud, PAHO, WHO: México

A publication sponsored by the Pan American Health Organization on the epidemiologic evaluation of the risks by environmental chemical agents.

Vega GS (1985)
Toxicología (Toxicology)

A basic toxicology text describing the toxicology of pollutants, genotoxicity, carcinogenesis.

Publications sponsored by PUMA (University Program of the Environment at the Universidad Nacional Autónoma de México) www.puma.unam.mx/publica.htm (Programa universitario del Medio Ambiente (PUMA)

Cortinas de Nava C, Mosler García C (2002)
Gestión de resíduos peligros (Hazardous waste management)

Contains information for researchers and other professionals interested in learning about the management of hazardous waste, their disposal, toxic evaluation, recycling, etc.

Mendieta JG (1997)
Medio Ambiente en México Parte I: Autores y Artículos (The Environment in Mexico, Part I: Authors and Publications)

An analytic presentation of the main publications on the environment in Mexico.

Mosler García C, Rodríguez Hernández MC, Garfias y Ayala FC (1999)
Compendio de Información Ambiental 1998 (Compendium of Environmental Information 1998)

Information on environmental pollution, quality of fuels, impact on the environment, toxic and hazardous waste, effects of toxic substances, etc.

Rivero Serrano O, Garfias Vázquez M, González Martínez S (1996)
Residuos Peligrosos (Hazardous waste)

National and foreign experts analyze the generation, management, transport and final disposal of hazardous waste in Mexico and in other countries

Rivero Serrano O, Ponciano Rodríguez G (1996)
Riesgos ambientales para la salud en la Ciudad de México (Environmental Health Risk in Mexico City)

Analysis by national and foreign experts of the factors involved in the health risk for the inhabitants of Mexico City and Valley.

Riveros H, Cabrera E (1999)
Emisiones vehiculares (Vehicular emissions)

Describes the emissions of hydrocarbons and carbon monoxide of the different motor vehicles used in Mexico City.

Manuals

Lazaro-Chavez Mancilla E (1985)
Sustancias desinfectantes y drogas de utilidad en las piscifactorias: Manual de usos (Disinfectant substances and useful drugs in fisheries)

Secretaría del Trabajo y Previsión Social (1990)
Instructivo relativo a las condiciones de seguridad e higiene para el almacenamiento, transporte y manejo de sustancias corrosivas, irritantes y toxicas en los centros de trabajo (Instructions for the security and hygienic conditions for the storage, transport and handling of hazardous substances)
Secretaría del Trabajo y Previsión Social: México

Secretaria de Salud Direccion General de Salud Ambiental (1993)
Manual de Toxicología (Toxicology Manual)
Secretaria de Salud, Direccion General de Salud Ambiental: Secretaria de Salud, Dirección de Control de Riesgos Ambientales: México

A manual describing emergencies, poisonings, and treatments.

Publications of the National Ecology Institute, México

Botello AV, et al (2006)
Golfo de México. Contaminación e impacto ambiental. Diagnóstico y tendencias (Gulf of Mexico. Environmental pollution and impact. Diagnosis and tendencies)
Several editorials.

Cárdenas B, et al (2003)
Tratamiento biológico de compuestos orgánicos volátiles de fuentes fijas (Biological treatment of volatile organic compounds from fixed sources)

General description of air pollution in Mexico and of the Mexican legislation. Describes the general methods for the treatment of the air polluted with VOC. Biofiltration as a methodology for the effective reduction of VOC emission.

Fernandez A, et al (2004)
Sustancias tóxicas persistentes (Persistent toxic substances)
INE, Semarnat: IMP

A detailed analysis of organic persistent compounds. This text represents the first intent to communicate the

problem of OPC to the different groups of interest. Although there is not an objective evaluation of the risk due to organic persistent compounds, the text presents a useful analysis for the discussion of a national diagnosis on these compounds.

Fernández L, et al. (2006)
Manual de técnicas de análisis de suelos contaminados (Technical manual for the analysis of polluted soils)

Compilation of the methodologies for the analysis soils for the follow up of remediation and characterization of polluted soils.

Gutiérrez Avedoy V (coordinator) (2006)
Diagnóstico basico para la gestión integral de residuos (Basic diagnostic for an integral waste management)

Important information for the necessary policy and instrument design in the search of adequate solutions for integral waste management.

Instituto Nacional de Ecología (2004)
Introducción al análisis de riesgos ambientales (Introduction to environmetal risk analysis)
A manual providing basic concepts and tools for the analysis and decision making.

Instituto Nacional de Ecología (2006)
Inventario nacional de emisiones de gases efecto invernadero (Nacional inventory of greenhouse gases emisión)
Statistic complement to Mexico's third communication to UN on climate change.

Rosas I, et al. (2003)
Microbiología ambiental (Environmental Microbiology)

Description of the bacterial and other unicellular microorganisms present in the environment.

Toledo A (2003)
Agua, hombre y paisaje (Water, man and landscape)

The challenge to understand and analyze the landscape we inhabit and to think about our reality using a new science that understand the creativity of the natural systems and of human imagination.

Bases para una política nacional de residuos peligrosos (2001) (Bases for a national policy for hazardous waste)

Updated information for the discusión of the country's problem on hazardous waste disposal policy.

Velasco E, Bernabé M (2004)
Emisiones biogénicas (Biogenic Emissions)

A revision on the basic concepts and relevant aspects of these subjects. A material for beginners as well as for those already familiarized with biogenic emissions.

Volke Sepúlveda T, Velasco Trejo JA (2003)
Tecnologías de remediación para suelos contaminados (Remediation Technologies for Soil Pollution)

A revision of the main technologies for soil remediation.

Volke Sepúlveda T, et al (2005)
Suelos contaminados por metales y metaloides: muestreo y alternativas para su remediación (Metal and metalloid contaminated soils: methods and bioremediation alternatives)

A general information of inorganic pollutants more frequently found in the contaminated sites in Mexico. The human activities that lead to these contaminations. Sampling methodologies to characterize the sites and technical information to plan, develop, and select bioremediation strategies.

Zuk MM, et al (2006)
Introducción a la evaluación de los impactos de las termoeléctricas de México (Introduction to the impact evaluation of thermoelectrics in México)

Careful description of the relationship between the generation of electricity, pollution emission and their impact on air quality and population health.

Legislation on Natural Protected Areas (National Ecology Institute, México)

Áreas naturales protegidas de México con decretos estatales (2003) (Mexico's natural protected areas with state decrees)
Volúmenes 1 y 2

Compilation of 173 decrees, agreements, and declarations of the protected areas in 22 states.

Áreas naturales protegidas de México con decretos federales (2003) (Mexico's natural protected areas with federal legislation)
Primera reimpresión

Compilation of the 218 secretarial decrees and agreements.

Journals

Toxicology and Environmental Pollution

Revista internacional de contaminación ambiental (International Journal of Environmental Pollution)

Edited by the Universidad Nacional Autónoma de México, Autónoma de Tlaxcala y Veracruzana publishes original peer-review genetic toxicology, environmental pollution and toxicological research and reviews.

Speciality Journals: Health and Medical Sciences

Archives of Medical Research

Edited by Elsevier Science, publishes original peer-reviewed medical research grouped in three main categories: biomedical, clinical, and epidemiological.

Archivos de Cardiología de Mexico (Archives of Cardiology of Mexico)

Edited by the Nacional Institute of Cardiology. Publishes clinical and experimental cardiovascular research.

Gaceta Médica de México (Medical Gazette of Mexico)

Official organ of the National Academy of Medicine. Publishes, clinical, epidemiological, historical, and review articles.

Revista Ciencia (Science Journal)

Edited by the Mexican National Academy of Science. Publish members works with general scientific and humanistic interest.

Revista de Investigación Clínica (Journal of Clinical Research)

Edited by the National Institute of Medical Sciences and Nutrition and publishes clinical, biomedical and epidemiological research.

Revista del Instituto Nacional de Cancerología (Journal of the Nacional Institute of Cancer)

Edited by the Nacional Institute of Cancer and publishes clinical, epidemiological, and basic research on cancer.

Revista de la Facultad de Salud Pública y Nutrición (Journal ofthe Faculty of Public Health and Nutrition)

Edited by the Universidad Autonoma de Nuevo León, publishes epidemiological, clinical, and nutricional research.

Salud Mental (Mental Health)

Edited by the National Institute of Psychiatry, publishes clinical, basic, and epidemiological research related with the neuropsychiatric area.

Biological and Chemical Sciences

Acta botánica mexicana
Edited by the Instituto de Ecología

The objective of this journal is to disseminate the results of research carried out in different disciplines of botany, with an emphasis on the plants of Mexico.

Acta zoológica mexicana (nueva serie)
Edited by the Instituto de Ecología

Publishes original scientific research about terrestrial fauna in the fields of Behavior, Ecology, Physiology, Genetics, Morphology, Systematics and Zoogeography.

Bioquimia
Edited by the Mexican Association of Clinial Biochemistry

Publish original clinical laboratory research.

Ciencias marinas
Edited by the Instituto de Ciencias del Mar, UNAM

Publishes original research on all the areas of Marine Sciences.

Ciencia y Tecnología Alimentaria
Edited by the Mexican Society of Nutrition and Food technology

Publishes original research on subjects related with the food science and technology.

Hidrobiológica
Edited by the Universidad Autonoma Metropolitana

Publishes original research on hydrobiology, biology, and ecology of aquatic systems.

Journal of the Mexican Chemical Society
Edited by the Mexican Chemical Society

Publishes original contributions of research in all areas of the theory and practice of chemistry in its broadest context, as well as critical reviews.

Laborat Acta
Edited by Laborat Acta

Publishes experimental data and laboratory methodologies.

Revista mexicana de ciencias farmacéuticas
Edited by the Asociación Farmacéutica Mexicana (AFMAC)

Publishes scientific research, original technical information, and bibliographic research with interest for the pharmaceutical community.

Revista mexicana de biodiversidad
Edited by the Instituto de Biología, Universidad Nacional Autónoma de México

Publishes original work on systematics, biogeography, ecology, and evolution of American taxons.

General

Science and Development Magazine (Revista Ciencia y Desarrollo)

Edited by CONACYT mainly intended for science and technology communication.

Gaceta Ecológica (Ecological Gazette)

Edited by the National Ecology Institute with analysis of environmental subjects and environmental legislation.

Organizations (Non-Governmental)

Center for Judicial and Environmental Studies (Centro de Estudios Jurídicos y Ambientales)

Promotes the study, development, and application of the environmental legislation.
Av. Universidad 700-401
Colonia del Valle
México, D. F. 03650
Web: http://www.ceja.org.mx

Ecological Culture (Cultura Ecológica A.C.)

Develops toxicological and environmental legislation databases (local and national).
Magdalena 22-404
Colonia Del Valle
México D.F. 03100

Measoamerican Network of Biotic Resources (Red Mesoamericana de Recursos Bióticos)

International network of universities from Central-South México, Guatemala, Belice, Nicaragua, Honduras, El Salvador, Costa Rica y Panamá for teaching and research on regional biotic resources.
Web: http://www.redmeso.net

Mexican Association of Occupational Hygiene (Asociación Mexicana de Higiene Industrial)

Non-profit organization that trains and certifies industries. Holds annual meetings and paticipates in international events
Aquiles Elorduy No. 271
Col. Electricistas
México, D.F., C.P. 02060
Web: http://www.amhi.org.mx

Nacional Federation of Occupational Health (Federación Nacional de Salud en el Trabajo (FeNasTAC)

Non-profit organization that promotes research and training on Occupational Health. Organizes annual meetings to communicate and update information on Occupational Health.
Aquiles Elorduy 271
Col. Electricistas, CP 02060
México D.F., México
Web: http://www.fenastac.org

National Association of the Chemical Industry (Asociación Nacional de la Industria Química)

An association that represents 90% of the private production of chemicals. Has different committees: Environmental, Emergency System in the Transport for the Chemical Industry and Security and Hygiene.
Angel Urraza 505
Colonia del Valle
Mexico, D.F. 03650
Web: http://www.aniq.org.mx

Regional Laboratories of the Mesoamerican Network of Biotic Resources, Toxicology and Pollution (Red Mesoamericana de Recursos Bióticos, Toxicología y Contaminación)

To provide solutions for the toxicological and pollution problems of Mesoamérica region,
Jose Fernando Mendez Sanchez (Coordinator)
Email: fms@uaemex.mx
Web: http://www.redmeso.net/RMjun02/lab_reg/toxicologia.htm

Mexican Health Foundation (Fundación Mexicana para la salud)

Its mission is to contribute towards scientific and technological knowledge and to the study of health policies by promoting research, the development of highly qualified human resources and technological development.
Periférico Sur No. 4809
Col. El Arenal Tepepan, Deleg. Tlalpan
C.P. 14610, México, D. F.

Legislation and Regulations

These General Laws are effective after their publication at the *Diario Oficial* where people can have access to the texts. That is why the date of publication is given. They can also be accessed at: www.cem.itesm.mx/derecho/nlegislacion/federal/index.html/.

General Law of Health (Ley General de Salud), Diario Oficial de la Federación 7 de febrero de 1984).

General law for the ecologic equilibrium and environmental protection (Ley general para el equilibrio ecológico y la protección ambiental), Diario Oficial de la Federación 28 de enero de 1988)

Law of national waters (Ley de aguas nacionales), Diario Oficial de la Federación 1 de Diciembre de 1992).

The below regulations as well as many others can be consulted at: www.semarnat.gob.mx/leyesynormas/pages/inicio.aspx.

General law for the prevention and integral management of waste (Ley General para la prevención y gestion integral de residuos, Diario Oficial de la Federación 8 de octubre de 2003)

NOM-001-Semarnat-1996 Establece los límites máximos permisibles de contaminantes en las descargas de aguas residuales en aguas y bienes nacionales (Regulation for the concentration limits of pollutants in residual waters discharges)

Education/Schools

In various Mexican university faculties, such as chemistry, medicine, and veterinary colleges, and some biology, the discipline of toxicology is studied within the normal curriculum and also as monographic courses. Lately several private and public institutions offer college degrees in Environmental Sciences such as the Centro de Investigación en Ecosistemas at the Universicad Nacional Autónoma de México (www.oikos.unam.mx/licenciatura/index.html), the Technological Institute of Sonora which offers a degree in Environmental Engineering (www.itson.mx/OfertaAcademica/ica.html), the University of Mexico State offers a college degree in Environmental Sciences at the Faculty of Urban and Regional Planning (www.uaemex.mx/pestud/licenciaturas/CAmbientales.html). Food toxicology is currently taught at several university departments within the new Food Science and Technology degree programs. Different university faculties and professional societies provide monographic courses and specialization programs for postgraduates. Some specific postgraduate programs are:

Postgraduate program on Toxicology at the Toxicology Section, CINVESTAV (www.cinvestav.mx/toxicologia)
Postgraduate program in Biomedical Sciences (www.pdcb.unam.mx/index.php), Biological, Chemical and Biochemical Sciences at the Universidad Nacional Autónoma de Mexico, UNAM (www.posgrado.unam.mx/programas/alfabetico.html)
Multidisciplinary Program of Postgraduate Program in Environmental Sciences at the Autonomous University of San Luis Potosí. (www.uaslp.mx)

Postgraduate studies in Environmental Sciences:
Universidad Autonoma del Estado de México (www.uaemex.mx/pestud/mae_doc/ciencias%20ambientales/index.html)´
Benemérita Universidad Autonoma de Puebla (www.csambientales.buap.mx/posgrados/index.html

Environmental toxicology and restoration is an area of interest in several postgraduate programs in science and engineering. The Universidad Nacional Autónoma de México has an Environmental Program called PUMA (www.puma.unam.mx) that promotes research, education, and publications in hazardous waste management, air, and soil pollution, etc.
Most of the programs in toxicology, environmental sciences and related areas offered by the different

educational institutions can be accessed at: http://agenda.universia.net.mx/

The Netherlands

YURI BRUINEN DE BRUIN AND JACQUELINE VAN ENGELEN

SHORT HISTORY OF TOXICOLOGY IN THE NETHERLANDS

The First Developments (1800–1950)

Before World War II, toxicological research in The Netherlands was dispersed over several institutions. The first lecturer in toxicology was the physician A.W.M. van Hasselt (1814–1902), who taught toxicology at the State Military Training Hospital. In 1848 he published a book entitled *De noodzakelijkheid van algemeen toezigt op het gebruik van vergiften* (The Need to Regulate the Use of Venoms). Although Van Hasselt contributed significantly to the training and practical skills of physicians, he did not succeed in establishing continuity in the practice of toxicology.

The first professor of toxicology at Leiden University was the pharmacist E.A. van der Burg, who was appointed in 1877. His major accomplishment was the application of the emerging discipline of analytical chemistry in the confirmation of criminal poisoning. He established his name in the famous mass murder case of Goeie Mie ('good Mary') of Leiden in 1881–82. She poisoned at least 100 people, 27 of whom died, with the arsenic compound orpiment. This was confirmed by Van der Burg's analysis in exhumed bodies by means of the arsenic mirror method developed by Marsh some years before. Van der Burg and his successors continued to play a central role in forensic toxicology until the 1950 when the Central Laboratory of Forensic Sciences, now the Netherlands Forensic Institute, was founded.

Post 1950

Toxicology as a biomedical discipline emerged in The Netherlands after World War II. This process was invigorated on the one hand by the need to develop antidotes against chemical warfare agents, and on the other by the emergence of the chemical industry in The Netherlands and the need to protect the workforce and general population. The result was a prosperous growth of all aspects of toxicology in the Dutch universities, and industrial and governmental institutions. Among others, four people can be identified who have been instrumental in this development: Ernst M. Cohen (biological toxicology, TNO and Leiden University), Herman van Genderen (biological toxicology, RIVM and University of Utrecht), Ad N.P. van Heijst (clinical toxicology, RIVM and Utrecht University Hospital) and Reinier L. Zielhuis (occupational and environmental toxicology, University of Amsterdam) were pioneers each in his own field. The result was a flourishing toxicology community in The Netherlands, in which all aspects of the discipline were covered, ranging from molecular to public health aspects.

1979: Establishment of the Foundation of the Netherlands Society of Toxicology, Training and Accreditation

Toxicologists soon outnumbered the other professions in the Netherlands Society of Physiology and Pharmacology, necessitating the foundation of the Netherlands Society of Toxicology (NVT: *Nederlandse Vereniging voor Toxicologie)* in 1979. Within 10 years, the NVT, with a membership of 750, became the 4th largest toxicology society in the world, after the United States, Japanese, and British. In the 1980s, the NVT was the first European society to develop a system of postdoctoral training and accreditation, which

formed the model for the European registration as Eurotox Registered Toxicologist.

2007: Current Situation of Toxicology in the Netherlands

At present, toxicology is practiced in a broad sense with the aim to protect man and its environment. Major subfields of toxicology consist of Nutrition Toxicology, Medicinal Toxicology, Occupational Toxicology, Genetic Toxicology, Environmental Toxicology, Teratology and Reproductive Toxicology, Toxicological Pathology, Toxicology and Risk Assessment and In-Vitro Toxicology.

The education and registration of toxicologists remain an important area of the Netherlands Society of Toxicology, which actively encourages the education in toxicology at all universities. After completion of education there are two ways to register as a toxicologist in the Netherlands. The first route – primarily the route followed by PhD – students with additional training with post-doctoral education in toxicology proceeds via the Dutch 'Association for Education to Biomedical Scientific Research' (Dutch abbreviation: SMBWO) and leads to registration as Medical Biological Researcher-Toxicologist. The second route to registration as a toxicologist is operated by the Society itself. A detailed 'Concilicum Toxicologicum (CT)' specifies all requirements to qualify for registration. Every 5 years the registration has to be renewed. A registration committee and an independent committee of appeal have been established.

Recently, a number of toxicology departments at several universities and university medical centres had to stop their activities. This development conflicts with the current increasing (international) need for well-trained toxicologists working for the Dutch Universities and research and policy support and implementation institutions like the RIVM, TNO, Notox and other private and governmental organizations. The Netherlands Society of Toxicology is undertaking major efforts to fulfill these needs and to return toxicology to the flourishing position it held in previous years.

Journals

Although no journals concentrate exclusively on toxicology, relevant articles may be found in the following:

Chemie magazine
Magazine on topics related to chemistry.
Web: http://www.vnci.nl/actueel/chemiemagazine/default.asp (Dutch only)

Chemisch2Weekblad
Magazine for professionals in chemistry, life sciences, laboratory, and process technology.
Web: http://www.c2w.nl/Default.lynkx?id=5 (Dutch only)

Natuur, wetenschap & techniek
Magazine about nature sciences and technology.
Web: http://www.natutech.nl/ (Dutch only)

Nederlands tijdschrift voor geneeskunde (Netherlands Journal of Medicine)
Web: http://www.ntvg.nl/ (Dutch only)

Pharmaceutische weekblad
Weekly magazine for pharmacists.
Web: http://www.pw.nl/ (Dutch only)

Tijdschrift Kanker
Journal about cancer research and therapy.
KBU Uitgevers B.V.: Oisterwijk

Tijdschrift voor Bedrijfs – en verzekeringsgeneeskunde
Magazine to promote the science of professional insurance medicine covering scientific and monitoring research
Bohn, Stafleu & Van Loghum: Houten
ISSN 0929-600X

Tijdschrift voor diergeneeskunde
Veterinary journal
Web: http://www.knmvd.nl/tvd (Dutch only)

Tijdschrift voor sociale gezondheidszorg
Bi-weekly journal of social health care
Web: http://www.onderzoek.hva.nl/artefact-1018.892.html (Dutch only)

Technical Reports and Other Documents

Chemical maps
Safety information on chemical substances.
Web: http://chemiekaarten.sdu.nl/do/home (Dutch only)

Health Council
Reports related to issues relating to public health
Web: http://www.gr.nl/adviezen.php (English and Dutch)

Databases

National Database of Dangerous substances used in Healthcare
Web: https://www.databankzorg.nl/action/home;jsessionid=5C6D41919D08A3199A159194DE81C796) (Dutch only)

Organizations (Government)

Biosafety Clearing-House
Information exchange mechanism on Biosafety.
Web: http://www.vrom.nl/ggo-vergunningverlening/ (English and Dutch)
Postal address: P.O. Box 1, 3720 BA Bilthoven, The Netherlands
Phone: +31-(0)30-2742793
Fax: +31-(0)30-2744401
Email: bggo@rivm.nl

Chemical Substances Bureau
Performs national legal tasks with respect to New and Existing Chemicals.
Web: http://www.rivm.nl/bms/english/ (English)
Web: http://www.rivm.nl/bms/over_bms/ (Dutch)
Postal address: P.O. Box 1, 3720 BA Bilthoven, The Netherlands
Phone: +31-(0)30-2744077
Fax: +31-(0)30-2744401
Email: bms.ns@rivm.nl (new substances), bms.bs@rivm.nl (existing substances)

Food and Consumer Product Safety Authority
Monitors food and consumer products to safeguard public health and animal health and welfare.
Web: http://www2.vwa.nl/portal/page?_pageid=35,1554211&_dad=portal&_schema=PORTAL (English)
Web: http://www2.vwa.nl/portal/page?_pageid=35,1554060&_dad=portal&_schema=PORTAL (Dutch)
Postal address: P.O. Box 19506, 2500 CM Den Haag, The Netherlands
Phone: +31-(0)70-4484848
Fax: +31-(0)70-4484747
Email: info@vwa.nl.

InfoMil
Information centre for the environment to intermediate between authorities and target groups.
Web: http://www.infomil.nl/aspx/get.aspx?xdl=/views/infomil/xdl/page&ItmIdt=28225&SitIdt=111&VarIdt=46 (English)
Web: http://www.infomil.nl/aspx/get.aspx?xdl=/views/infomil/xdl/page&ItmIdt=28063&SitIdt=111&VarIdt=46 (Dutch)

Postal address: P.O. Box 93144, 2509 AC Den Haag, The Netherlands
Phone: +31-(0)70-3735575
Fax: +31-(0)70-3735600

Ministry of Agriculture
Nature and food quality policy making on food production.
Web: http://www9.minlnv.nl/servlet/page?_pageid=163&_dad=portal30&_schema=PORTAL30 (English)
Web: http://www9.minlnv.nl/servlet/page?_pageid=78&_dad=portal30&_schema=PORTAL30 (Dutch)
Postal address: PO Box 20401, 2500 EK Den Haag, The Netherlands
Phone: +31 (0)70 3786868

Ministry of Health, Welfare and Sport (VWS)
Promotion of health, social infrastructure and sport.
Web: http://www.minvws.nl/en/ (English)
Web: http://www.minvws.nl/ (Dutch)
Postal address: P.O. Box 20350, 2500 EJ Den Haag, The Netherlands
Phone: +31-(0)70-3407911
Fax: +31-(0)70-3407834

Ministry of Housing, Spatial Planning and the Environment (VROM)
Policy making on Housing, Spatial Planning and the Environment.
Web: http://international.vrom.nl/pagina.html?id=7318 (English)
Web: http://www.vrom.nl/pagina.html?id=1 (Dutch)
Postal address: P.O. Box 20951, 2500 EZ Den Haag, The Netherlands
Phone: +31-(0)70-3395050 (Monday to Friday 9.00–21.00 h)

Ministry of Social Affairs and Employment
Encouragement of employment, modern industrial relations and social security.
Web: http://www.employment.gov.nl/ (English)
Web: http://home.szw.nl/index/dsp_index.cfm (Dutch)
Postal address: P.O. Box 90801, 2509 LV Den Haag, The Netherlands
Phone: +31-(0)70-3334444
Fax: +31-(0)70-3334033

Ministry of Transport, Public Works and Water Management
Responsible for mobility policy in the Netherlands and for protection against floods or falling water tables.
Web: http://www.verkeerenwaterstaat.nl/?lc=uk (English)
Web: http://www.verkeerenwaterstaat.nl/?lc=nl (Dutch)
Postal address: P.O. Box 20901, 2500 EX Den Haag, The Netherlands
Phone: +31-(0)88-4890000 (Monday–Friday 09.00–17.00 h)
Email: venwinfo@PO Box51.nl

RIZA, Institute for Inland Water Management and Waste Water Treatment
Research advisory body for inland water and international integrated water management.
Web: http://www.rijkswaterstaat.nl/rws/riza/home/english/index.html (English)
Web: http://www.rijkswaterstaat.nl/rws/riza/home/home.html (Dutch)
Postal address: P.O. Box 17, 8200 AA Lelystad, The Netherlands
Phone: +31-(0)320-298411
Fax: +31-(0)320-249218
Email: rizarws@riza.rws.minvenw.nl

Municipality Healthservice
Promotion of public health care.
Web: http://www.ggd.nl/kennisnet/statpagina/show_pagina.asp?dmod=statpagina&paginanr=101&style=1&headerparam=1017 (Dutch only)
Postal address: P.O. Box 85300, 3508 AH Utrecht, The Netherlands
Phone: +31-(0)30-2523004
Fax: +31-(0)30-2511869
Email: helpdesk@ggdkennisnet.nl

National Institute for Public Health and the Environment
Research to public and environmental health via a 'centre for infectious diseases', and divisions on 'public health', 'nutrition, medicines, and consumer safety', and 'environmental safety'.
Web: http://www.rivm.nl/en/ (English)
Web: http://www.rivm.nl/ (Dutch)
Postal address: P.O. Box 1, 3720 BA Bilthoven, The Netherlands
Phone: +31-(0)30-2749111
Fax: +31-(0)30-2742971
Email: info@rivm.nl

Netherlands Environmental Assessment Agency
Advises the Dutch government on a wide variety of environmental issues from a scientific base built on knowledge and expertise.
Web: http://www.mnp.nl/en/index.html (English)
Web: http://www.mnp.nl/nl/index.html (Dutch)
Postal address: Antonie van Leeuwenhoeklaan 9, 3721 MA Bilthoven, The Netherlands
Phone: +31-(0)30-2742745
Fax: +31-(0)30-2744479
Email: info@mnp.nl.

Netherlands Forensic Institute
Technical and scientific research for the purpose of crime solving.
Web: http://www.forensischinstituut.nl/NFI/en (English)
Web: http://www.forensischinstituut.nl/NFI/nl (Dutch)
Postal address: P.O. Box 24044, 2490 AA Den Haag, The Netherlands
Phone: +31-(0)70-8886666
Fax: +31-(0)70-8886555
Email: info@nfi.minjus.nl

Royal Netherlands Institute for Sea Research (NIOZ)
Promotion of multidisciplinary marine research in coastal and shelf seas as well as in the open ocean covering biology, toxicology, biochemistry.
Web: http://www.nioz.nl/nioz_nl/fe091c5f4f44361f88aa41f8a230a729.php (English)
Web: http://www.nioz.nl/ (Dutch)
Phone: +31-(0)222-369300

The Health Council of the Netherlands
Advisory body for Ministers and Parliament in the field of public health.
Web: http://www.gr.nl/index.php?phpLang=en (English)
Web: http://www.gr.nl/missie.php?phpLang=nl (Dutch)
Postal address: P.O. Box 16052, 2500 BB Den Haag, The Netherlands
Phone: +31-(0)70-3407520
Fax: +31-(0)70-3407523
Email: info@gr.nl

The State Inspectorate of Health
Protects and promotes health and healthcare.
Web: http://www.igz.nl/uk/ (English)
Web: http://www.igz.nl/ (Dutch)
Postal address: P.O. Box 2680, 3500 GR Utrecht, The Netherlands
Phone: +31-(0)88-1205000 (Monday–Friday 9:00–17:00 h)
Fax: +31-(0)88-1205001
Email: loket@igz.nl

VROM Inspection
Inspection of construction and demolition, waste treatment and dangerous substances
Web: http://www.vrom.nl/pagina.html?id=16535 (Dutch only)
Postal address: P.O. Box 20951, 2500 EZ Den Haag, The Netherlands
Phone: +31-(0)70-3395050 (Monday–Friday 9.00–21.00 h)

Organizations (Non-Government)

IVAM
Research agency in chemical risks, sustainable building, energy, chain management, quality of living and cleaner production.
Web: http://www.ivam.uva.nl/uk/index.htm (English)
Web: http://www.ivam.uva.nl/nl/index.htm (Dutch)
Postal address: P.O. Box 18180, 1001 ZB Amsterdam, The Netherlands
Phone: +31-(0)20-5255080
Fax: +31-(0)20-5255850
Email: office@ivam.uva.nl

KNAW, Royal Netherlands Academy of Arts and Sciences
Advising the government on research related to research quality assurance and promotion.
Web: http://www.knaw.nl/organisation/organisation.html (English)
Web: http://www.knaw.nl/index.html (Dutch)
Postal address: P.O. Box 19121, 1000 GC Amsterdam, The Netherlands
Phone: +31-(0)20-5510700
Fax: +31-(0)20-6204941
Email: knaw@bureau.knaw.nl

KNAW – Fungal Biodiversity Centre
Development of taxonomy and evolution of fungi and functional aspects of fungal biology and ecology applying molecular and genomics approaches.
Web: http://www.cbs.knaw.nl/index.htm (English)
Web: http://www.cbs.nl/nl-NL/default.htm (Dutch)
Postal address: P.O. Box 85167, 3508 AD Utrecht, The Netherlands
Phone: +31-(0)30-2122600
Fax: +31-(0)30-2512097
Email: info@cbs.knaw.nl.

KNAW – Hubrecht Laboratory
Research into developmental biology, strategic biomedical and genomics.
Web: http://www.niob.knaw.nl/ (English)
Web: http://www.niob.knaw.nl/index_nl.html (Dutch)
Postal address: Uppsalalaan 8, 3584 CT Utrecht, The Netherlands
Phone: +31-(0)30-2121800
Fax: +31-(0)30-2516464

Netherlands Genomics Initiative
Excellence research performed at 11 genomics centers on human and environmental health.
Web: http://www.genomics.nl/ (English only)
Postal address: P.O. Box 93035, 2509 AA Den Haag, The Netherlands
Phone: +31-(0)70-3440672/3440640
Fax: +31-(0)70-3440632
Email: info@genomics.nl

NIZO Food Research B.V.
Research into flavor, texture, health, food safety, and processing.
Web: http://www.nizo.nl/ (English only)
Postal address: P.O. Box 20, 6710 BA Ede, The Netherlands
Phone: +31-(0)318-659511
Fax: +31-(0)318-650400
Email: info@nizo.nl

NOW, Netherlands Organization for Scientific Research
National research council for the development of science, technology and culture in the Netherlands.
Web: http://www.nwo.nl/nwohome.nsf/pages/NWOP_5SME25_Eng (English)
Web: http://www.nwo.nl/nwohome.nsf/pages/NWOP_5SME25 (Dutch)
Postal address: P.O. Box 93138, 2509 AC Den Haag, The Netherlands
Phone: +31-(0)70-3440640
Fax: +31-(0)70-3850971
Email: nwo@nwo.nl

Sanquin Blood Supply Foundation
Supplies blood products, promotes transfusion medicine, and carries out research and training in immunology, immunohematology, and infectious diseases.
Web: http://www.sanquin.nl/sanquin-eng/sqn_home_eng.nsf/ (English)
Web: http://www.sanquin.nl/sanquin-nl/sqn_home_nl.nsf (Dutch)
Postal address: P.O. Box 9892, 1006 AN Amsterdam, The Netherlands
Phone: +31-(0)20-5123000
Fax: +31-(0)20-5123303
Email: website@sanquin.nl

TNO
Application of science to strengthen businesses and the government.
Web: http://www.tno.nl/tno/index.xml (English)
Web: http://www.tno.nl/tno/index.xml (Dutch)
Phone: +31-(0)15-2696900
Fax: +31-(0)15-2612403
Email: wegwijzer@tno.nl

TNO Built Environment and Geosciences
Spatial organization in the Netherlands including use of subsurface, mobility, the infrastructure, renewable energy, and intercity networks.
Web: http://www.tno.nl/bouw_en_ondergrond/index.xml (English and Dutch)

TNO Defence, Security and Safety
Building up the defense knowledge-base, such as military operations, military equipment, command and control and operational decision making, threat and protection, instruction and training and crime, calamity and terrorism combat.
Web: http://www.tno.nl/defensie_en_veiligheid/index.xml (English and Dutch)

TNO Quality of Life
Research into work and employment, chemistry, innovation, prevention and healthcare, pharma and food and nutrition.
Web: http://www.tno.nl/kwaliteit_van_leven/index.xml (English and Dutch)

TNO Science and Industry
Designing, engineering, planning, processing techniques and the management of the manufacturing process.
Web: http://www.tno.nl/industrie_en_techniek/index.xml (English and Dutch)

ZonMw
The Netherlands organization for health research and healthcare innovation.
Web: http://www.zonmw.nl/en/home.html (English)
Web: http://www.zonmw.nl/nl.html (Dutch)
Postal address: P.O. Box 93 245, 2509 AE Den Haag, The Netherlands
Phone: +31-(0)70-3495111
Fax: +31-(0)70-3495100
Email: info@zonmw.nl

Universities and Hospitals

Academic Medical Center (AMC)
Integrated academic hospital and medical center performing medical health research.
Web: http://www.amc.nl/index.cfm?sid=8 (English)
Web: http://www.amc.nl (Dutch)
Postal address: P.O. Box 22660, 1100 DD Amsterdam, The Netherlands
Phone: +31-(0)20-5669111

Amsterdam University
Research in areas among which are science and medicine.
Web: http://www.english.uva.nl/ (English)
Web: http://www.uva.nl/object.cfm (Dutch)
Postal address: P.O. Box 19268, 1000 GG Amsterdam, The Netherlands
Phone: +31-(0)20-5259111
Email: info@uva.nl

Delft University of Technology
Multidisciplinary research via research centers
Web: http://www.tudelft.nl/live/pagina.jsp?id=b226846d-f19f-4c34-97ed-165fecc5ad8f&lang=en (English)

Web: http://www.tudelft.nl/live/pagina.jsp?id=b226846d-f19f-4c34-97ed-165fecc5ad8f&lang=nl (Dutch)
Postal address: P.O. Box 5, 2600 AA Delft, The Netherlands
Phone: +31-(0)15-2785404
Fax: +31-(0)15-2781855
Email: voorlichting@tudelft.nl

Delft Centre for Life Science and Technology
Research into micro-organisms for food, medicines, and material production.
Web: http://www.tudelft.nl/live/pagina.jsp?id=8e492e6a-5d2b-4456-9647-fb21b7e088cf&lang=en (English only)
Postal address: Julianalaan 67, 2628 BC Delft, The Netherlands
Phone: +31-(0)15-2787156
Fax: +31-(0)15-2782355
Email: drclst@tudelft.nl

Safety Science Group
Development of tools to predict risk and risk perception
Web: http://www.tbm.tudelft.nl/live/pagina.jsp?id=6e6f2439-b657-4f31-a6dc-1787e92a86f6&lang=en (English)
Web: http://www.vk.tbm.tudelft.nl/live/pagina.jsp?id=6e6f2439-b657-4f31-a6dc-1787e92a86f6&lang=nl) (Dutch)
Postal address: P.O. Box 5015, 2600 GA Delft, The Netherlands
Phone: +31-(0)15-2785143
Fax: +31-(0)15-2784811
Email: info@tbm.tudelft.nl

TNW Department of Biotechnology
Design of new organisms, novel proteins, biocatalysts and new products for application in health care, chemical manufacture and environmental protection.
Web: http://www.bt.tudelft.nl/live/pagina.jsp?id=e327376f-7742-4725-baa7-fd7f2fa47a3d&lang=en (English only)
Postal address: Julianalaan 67, 2628 BC Delft, The Netherlands
Phone: +31-(0)15-2782342
Fax: +31-(0)15-2782355
E-mail: bpt@tnw.tudelft.nl

Eindhoven University of Technology
Fundamental/strategic technological research in areas such as Biomedical Engineering and Polymer Sciences and Technology.
Web: http://w3.tue.nl/en/ (English)
Web: http://w3.tue.nl/nl/ (Dutch)
Postal address: P.O. Box 513, 5600 MB Eindhoven, The Netherlands
Phone: +31-(0)-40 2479111

Eramus MC
University medical center specialized in individual to community health(care).
Web: http://www.erasmusmc.nl/content/englishindex.htm (English)
Web: http://www.erasmusmc.nl (Dutch)
Postal address: P.O. Box 2040, 3000 CA Rotterdam, The Netherlands
Phone: +31-(0)10-4639222 (hospital)
Email: info@erasmusmc.nl

NIHES – The Netherlands Institute for Health Sciences
Research training in medicine and the health sciences.
Web: http://www.nihes.nl/site/index.php (English only)
Postal address: P.O. Box 2040, 3000 CA Rotterdam, The Netherlands
Phone: +31-(0)10-4638450
Fax: +31-(0)10-4638451
Email: info@nihes.nl

FUGON, The Netherlands Federation for Innovative Drug Research (FIGON)
Promoting innovative drug research in the Netherlands.
Web: http://www.figon.nl/english/index.html (English)
Web: http://www.figon.nl/index.html (Dutch)
Postal address: P.O. Box 93245, 2509 AE Den Haag, The Netherlands
Phone: +31-(0)70-3495170
Fax: +31-(0)70-3495387
Email: selhorst@zonmw.nl

Leiden/Amsterdam Center for Drug Research (LACDR)
Advanced innovative drug research.
Web: http://www.lacdr.nl/index.php3?c=44&m=&session=(English only)
Postal address: P.O. Box 9502, 2300 RA Leiden, The Netherlands
Phone: +31-(0)71-5274341
Email: m.ham@chem.leidenuniv.nl

Leiden University Medical Center
Healthcare-oriented research and education for the faculties of Medicine and Biomedical Sciences
Web: http://www.lumc.nl/english/start_english.html (English)
Web: http://www.lumc.nl/ (Dutch)
Postal address: 9600, 2300 RC Leiden, The Netherlands
Phone: +31-(0)71-5269111
Email: informatie@lumc.nl

Maastricht University
Multidisciplinary themes and focal points via independent research institutes and participation in research schools.
Web: http://www.unimaas.nl/default.asp?taal=en (English)
Web: http://www.unimaas.nl/default.asp?taal=nl (Dutch)
Postal address: P.O. Box 616, 6200 MD Maastricht, The Netherlands
Phone: +31-(0)43-3882222
Email: communicatie@bu.unimaas.nl

Health Risk Analysis and Toxicology
Studying endogenous and exogenous (chemical) factors in relation to human health in particular to genetic and genomic effects.
Web: http://www.grat.unimaas.nl/ (English only)
Postal address: P.O. Box 616, 6200 MD Maastricht, The Netherlands
Phone: +31-(0)43-3881097
Fax +31-(0)43-3884146
Email: mc.vandevoort@grat.unimaas.nl

NUTRIM Nutrition and Toxicology Research Institute Maastricht
Research in the fields of nutrition and toxicology.
Web: http://www.nutrim.unimaas.nl/uk/01.html (English)
Web: http://www.nutrim.unimaas.nl/nl/01.html (Dutch)
Postal address: P.O. Box 616, 6200 MD Maastricht, The Netherlands
Phone: +31-(0)43-3881476
Fax: +31-(0)43-3670286
Email: Mh.Grispen@nutrim.unimaas.nl

Radboud University Nijmegen
Innovative and fundamental multidisciplinary research via independent research institutes.
Web: http://www.ru.nl/english/ (English)
Web: http://www.ru.nl/ (Dutch)
Postal address: P.O. Box 9102, 6500 HC Nijmegen, The Netherlands
Phone: +31-(0)24-3616161
Fax: +31-(0)24-3564606

Centre for Molecular Life Sciences (NCMLS)
Research into molecular medicine and cell biology.
Web: http://www.ncmls.nl/ (English only)
Postal address: P.O. Box 9101, 6500 HB, Nijmegen, The Netherlands
Phone: +31-(0)24-3610707
Fax: +31-(0)24-3610909
Email: info@ncmls.ru.nl

SENSE Research School
Joint venture of eight Dutch Universities for social economic and natural sciences of the environment.
Web: http://www.sense.nl/index.php?module=ContentExpress&func=display&ceid=4&menuID=M100000000 (English only)
Postal address: De Boelelaan 1087, 1081 HV Amsterdam, The Netherlands
Phone: +31-(0)20-5989532
Fax: +31-(0)20-5989553
Email: avando@sense.nl

Utrecht University
Research via faculties and institutes, thematic research programs, national research schools and top technological institutes, companies.
Web: http://www.uu.nl/uupublish/homeuu/homeenglish/1757main.html (English)
Web: http://www.uu.nl/uupublish/homeuu/1main.html (Dutch)
Postal address: P.O. Box 80125, 3508 TC Utrecht, The Netherlands
Phone: +31 (0)30 2533550

Academic Biomedical Centre Utrecht
Biomedical research, education, facilities, and bio-business.
Web: http://www.abc.uu.nl (English only)
Postal address: P.O. Box 80163, 3508 TD Utrecht, The Netherlands
Phone:+31-(0)30-2535804/+ 31-(0)6-54782612
Email: info@abc.uu.nl

Department of Pharmaceutics
Research into the development and use of medicines
Web: http://www.pharm.uu.nl/ffwuk.htm?/english/ (English)
Web: http://www.pharm.uu.nl/ffwnl.htm?/pharmaceutics/ (Dutch)
Postal address: P.O. Box 80082, 3508 TB Utrecht, The Netherlands
Phone: +31-(0)30-2537306
Fax: +31-(0)30-2517839

Institute for Risk Assessment Sciences
Research into Environment and Occupational Health, Toxicology and Public Health and Food Safety.
Web: http://www.iras.uu.nl/ (English only)
Postal address: P.O. Box 80.176, 3508 TD Utrecht, The Netherlands
Phone: +31-(0)30-2535400
Fax: +31-(0)30-2535077

University of Groningen
Research into multidisciplinary areas via research schools and institutes.

Web: http://www.rug.nl/corporate/index?lang=en (English)
Web: http://www.rug.nl/corporate/index (Dutch)
Postal address: P.O. Box 72, 9700 AB Groningen, The Netherlands
Phone: +31-(0)50-3639111
Email: communicatie@rug.nl

Groningen Research Institute of Pharmacy
Linking medical sciences with chemistry, biology and physics.
Web: http://www.rug.nl/farmacie/onderzoek/organisatieeninbedding/index?lang=en (English)
Web: http://www.rug.nl/farmacie/onderzoek/organisatieeninbedding/index (Dutch)

Department of Toxicology
Toxicology research into food products, genetic polymorphism and lifestyle, biomarkers and risk assessment.
Web: http://www.tox.wur.nl/UK/ (English)
Web: http://www.tox.wur.nl/NL/ (Dutch)

Product Design and Quality Management
Research into food-related areas.
Web: http://www.pdq.wur.nl/UK/ (English)
Web: http://www.pdq.wur.nl/NL/ (Dutch)

RIKILT, Institute of Food Safety
Research into food quality, health, and the safety of food and animal feed.
Web: http://www.rikilt.wur.nl/UK/ (English)
Web: http://www.rikilt.wur.nl/NL/ (Dutch)
Postal address: P.O. Box 230, 6700 AE Wageningen, The Netherlands
Phone: +31-(0)317-475422
Fax: +31-(0)317-417717
Email: info.rikilt@wur.nl

Van Hall Instituut
University for Agriculture, Food Technology, and Environmental and Animal Sciences.
Web: http://www.vhall.nl/International/English/General/Index_Introduc.htm (English)
Web: http://www.vhall.nl/Hoofd.htm (Dutch)
Postal address: P.O. Box 1528, 8901 BV Leeuwarden, The Netherlands
Phone: +31-(0)58-2846100
Fax: +31-(0)58-2846423

VLAG
Research into food technology, nutrition, and health.
Web: http://www.vlaggraduateschool.nl/about.htm (English only)
Postal address: P.O. Box 8129, 6700 EV Wageningen, The Netherlands
Phone: +31-(0)317-485108/485751
Fax: +31-(0)317-483342
Email: vlag@wur.nl

The Centre for Human NutriGenomics
Research into genomics, nutrition, and human health.
Web: http://www.nutrigenomics.nl (English only)
Email: ingeborg.vanleeuwen-bol@wur.nl

Vrije Universiteit van Amsterdam
Research into multidisciplinary areas via research schools and institutes.
Web: http://www.english.vu.nl/home/index.cfm (Research only)
Postal address: De Boelelaan 1105, 1081 HV Amsterdam, The Netherlands
Phone: +31-(0)20-5987777
Fax: +31-(0)20-5985611
Email: international@dienst.vu.nl

Faculty of Earth and Life Sciences
Research into Biology, Biomedical Sciences, Public Health, and the Environment.
Web: http://www.falw.vu.nl/english/index.cfm (English)
Web: http://www.falw.vu.nl (Dutch)

Postal address: De Boelelaan 1085, 1081 HV Amsterdam, The Netherlands
Phone: +31-(0)20-5987000
Fax: +31-(0)20-6462457
Email: falw@falw.vu.nl

Faculty of Sciences, Group of Chemistry and Pharmaceutical Sciences
Research into chemistry and pharmaceutical sciences.
Web: http://www.chem.vu.nl/en/index.php (English)
Web: http://www.chem.vu.nl (Dutch)
Postal address: De Boelelaan 1083, 1081 HV Amsterdam, The Netherlands

Enterprise/Industry

Akzo Nobel
Research, development and manufacture of pharmaceuticals, coatings, and chemical products.
Web: http://www2.akzonobel.nl/company/ (English)
Web: http://www2.akzonobel.nl/nl/home/ (Dutch)
Postal address: P.O. Box 9300, 6800 SB Arnhem, The Netherlands

Professional Societies

Association of the Dutch Chemical Industry
Web: http://www.vnci.nl/ (Dutch only)
Postal address: P.O. Box 443, 2260 AK Leidschendam, The Netherlands
Phone: +31-(0)70-3378787
Fax: +31-(0)70-3203903
Email: info@vnci.nl

Dutch Cosmetics Association (NCV)
Association of manufacturers and importers of cosmetics, or products for personal care.
Web: http://www.ncv-cosmetica.nl/index_en.asp (English)
Web: http://www.ncv-cosmetica.nl/index.asp (Dutch)
Postal address: P.O. Box 914, 3700 AX Zeist, The Netherlands
Phone:+31-(0)30-6049480
Fax: +31-(0)30-6049999
Email: info@ncv-cosmetica.nl

Dutch Society of Soap and Detergent Producers
Association of manufacturers and importers of washing and detergent products.
Web: http://www.nvz.nl/internet/pages/index.php (Dutch only)
Postal address: P.O. Box 914, 3700 AX Zeist, The Netherlands
Phone: +31-(0)30-6921880
Fax: +31-(0)30-6919394
Email: nvz@nvz.nl

Dutch Society of Pathology
Organization for clinical, animal, and experimental pathology.
Web: http://www.pathology.nl (Dutch only)
Postal address: P.O. Box 9101, 6500 HB Nijmegen, The Netherlands
Phone: +31-(0)24-3614323
Fax: +31-(0)24-3668750
Email: info@pathology.nl

Royal Netherlands Chemical Society (KNCV)
Professional organization for chemists and chemical engineers in The Netherlands.
Web: http://www.kncv.nl/ (Dutch only)
Postal address: P.O. Box 249, 2260 AE Leidschendam, The Netherlands
Phone: +31-(0)70-3378790
Fax: +31-(0)70-3378799
Email: kncv@kncv.nl

The Netherlands Society of Toxicology (NVT)
Promotion of science and applications in the field of toxicology, such as occupational toxicology, genetics, environment, teratology and reproduction, pathology, and risk assessment.
Web: http://www.toxicologie.nl/uk/index1.html (English)
Web: http://www.toxicologie.nl/ (Dutch)
Postal address: P.O. Box 249, 2260 AE Leidschendam, The Netherlands
Phone: +31-(0)70-3378797
Fax: +31-(0)70-3378799

Poison Control Centers

National Poisons Information Centre (NVIC)
Rapid health risk assessments of exposure to xenobiotic compounds.
Web: http://www.rivm.nl/en/aboutrivm/organization/mev/vic/index.jsp (English)
Web: http://www.rivm.nl/vergiftigingeninformatie/ (Dutch)
Postal address: P.O. Box 1, 3720 BA Bilthoven, The Netherlands
Phone: +31-(0)30-2508561

Certifying and Advisory Boards

Committee for the Registration of Pesticides
P.O. Box 217, 6700 AE, Wageningen, The Netherlands

Dutch Expert Committee on Occupational Standards
P.O. Box 20350, 2500 EJ, Den Haag, The Netherlands

Food Allergy
P.O. Box 51, 2100 AB, Heemstede, The Netherlands

Health Council
P.O. Box 20350, 2500 EJ, Den Haag, The Netherlands

National Service for Occupational Health and Safety
P.O. Box 879, 2700 AW, Zoetermeer, The Netherlands

Office of Dangerous Environmental Substances, RIVM
P.O. Box 1, 3720 BA, Bilthoven, The Netherlands

Registration Committee for Human Drugs
P.O. Box 20350, 2500 EJ, Den Haag, The Netherlands

Registration Committee for Veterinary Drugs
P.O. Box 289, 6700 AG, Wageningen, The Netherlands

ACKNOWLEDGMENTS

The authors would like to thank Prof. Dr. F.A. de Wolff (Freek) of Leiden University for providing a short history of toxicology in The Netherlands.

CHAPTER

99

Norway

BIRGITTE LINDEMAN

INTRODUCTION

Norway is a Scandinavian country and has approximately 4.6 million inhabitants and an extensive coast line along the North Atlantic Ocean. Norway's outlying possessions are Svalbard and Jan Mayen in the Arctic Ocean and Bouvet and Peter I Islands in the South Atlantic. Norway also has claims in Antarctica. For geographic and historic reasons Norway gives high priority to the management of natural resources and the environment in the polar areas. Furthermore, due to a high dependence both on petroleum and gas production as well as fishing and aquaculture, extensive programs for environmental monitoring of pollution along the Norwegian coast and on the Norwegian continental shelf have been established.

The increasing awareness of environmental pollution issues during the last part of the 20th century led to the establishment of the Ministry of the Environment in 1972 and shortly thereafter of the Pollution Control Authority. The Ministry of the Environment is generally responsible for most aspects of environmental protection covering water, air, noise, and waste, as well as nature reserves. It is responsible also for the coordination of local planning under the Building and Planning Act of 1965. Planning is regarded as a local responsibility under this act, with guidance from the Ministry. Five subordinate institutions currently (2007) report to the Ministry of the Environment (Directorate for Cultural Heritage, Directorate for Nature Management, Norwegian Pollution Control Authority, Norwegian Mapping Authority, Norwegian Polar Institute).

The Norwegian Pollution Control Authority (SFT) is responsible for providing the relevant documentation for the Ministry of the Environment in connection with pollution issues. It also sets emission standards and controls industrial activities. Chemical safety is an important activity covered by SFT. Due to the EFTA/EU Agreement on the European Economic Area (EEA Agreement), Norway regulates the use of chemicals largely in the same way as the EU countries; decisions in the EU system are of direct relevance as to how Norway develops its legislation concerning chemicals.

Along with the increasing interest for toxicology in the 1970s, toxicology as a distinct field of science entered a period of expansion and consolidation. In response to the need for competence in toxicological sciences, the Norwegian Research Council initiated a 3-year research and educational program in toxicology in 1979, involving 18 students with backgrounds in medicine, dental medicine, veterinary medicine, biology, biochemistry, biophysics, and agricultural sciences. At the same time, there was a great increase in education and research activities at universities and at institutions working within environmental health and occupational health. Currently, teaching in toxicology at MSc level takes place at several universities and university colleges. The University in Oslo has recently established a lecture course in Regulatory Toxicology to meet the national need for toxicological risk assessment competence. As there are only a few pharmaceutical companies with research departments in Norway, most toxicological scientists are employed in research institutions and universities. The Norwegian Society of Pharmacology and Toxicology (NSFT) is the national professional society for both toxicologists as well as pharmacologists. By 2007 NSFT had approximately 300 members in the Section of Toxicology.

Presently (2007) there are approximately 60 Norwegian toxicologists registered in The European Register of Toxicologists.

RESOURCES

Books

Most of the toxicological textbooks used at Universities and University Colleges are not published in Norway.

Stenersen J (2002)
Gifter: virkninger og mekanismer: utvalgte emner fra toksikologien (Poisons – effects and mechanisms)
ISBN 82-584-0480-6

A basic textbook in Norwegian covering selected topic in toxicology and ecotoxicology.

Journals

In Norway there are no special journals in the field of toxicology. One of the reasons for not having journals in Norwegian is the fact that the Nordic (Scandinavian) countries co-operate in publishing journals together. For example, The Nordic Pharmacological Society, of which the Norwegian Society of Pharmacology and Toxicology is a member, publishes *Pharmacology and Toxicology*.

There are several special reports concerning different aspects of toxicology such as criteria documents regarding individual chemicals, classification, and labeling of chemical substances for toxic effects, biomarkers, etc.

Journal of the Norwegian Medical Association
Web: http://www.tidsskriftet.no (Norwegian only)

The journal publishes papers on toxicological issues written in Norwegian, but the journal's editorial policy is medical science in general. Scientific articles have summaries written in English.

Technical Reports and other Documents

Gold E (2006)
Gard handbook on protection of the marine environment
ISBN 82-90344-19-8

Småstuen Haug L, Becker G (2006)
Interlaboratory Comparison on Dioxins in Food 2006
Norwegian Institute of Public Health, Report 2006: 7
Web: www.fhi.no

Stoltenberg C, Dybing E (Eds.) (2006)
Kunnskapsoppsummering om barns helse og miljø
Norwegian Institute of Public Health, Report 2006: 3
Web: www.fhi.no

This report is a follow up of the Fourth Ministerial Conference on Environment and Health in 2004 in Budapest where the countries in the WHO European Region committed themselves to building a healthy future for their children by adopting the Children's Environment and Health Action Plan for Europe. The report describes children's health and environment in Norway.

Organizations (Government)

Links to all governmental ministries are found at http://government.no/.

The Ministry of Agriculture and Food
Address: P.O. Box 8007 Dep, N-0030, Oslo
Visiting address: Akersgt. 59 (R5)
Phone: (+47)-22-24-90-90
Email: postmottak@lmd.dep.no

Ministry of Fisheries and Coastal Affairs
Address: P.O. Box 8118 Dep, NO-0032, Oslo
Visiting address: Grubbegt. 1
Phone: (+47)-22-24-90-90
Email: postmottak@fkd.dep.no

Ministry of Foreign Affairs
Address: P.O. Box 8114 Dep, N-0032, Oslo
Visiting address: 7. juni-plassen/Victoria Terrasse
Phone: (+47)-22-24-90-90
Email: post@mfa.no

Norwegian Agency for Development Cooperation (Norad)
Web: http://www.norad.no (Norwegian; Click on 'English' to see English version)

The Norwegian Agency for Development Cooperation (Norad) is a directorate under the Norwegian Ministry of Foreign Affairs (MFA). Norad's most important task is to contribute in the international co-operation to fight poverty.
Address: P.O. Box 8034 Dep, NO-0030, Oslo
Visiting address: Ruseløkkveien 26
Phone: (+47)-22-24-20-30
Email: postmottak@norad.no

Ministry of the Environment
Address: P.O. Box 8013 Dep, NO-0030, Oslo
Visiting address: Myntgt. 2
Phone: (+47)-22-24-90-90
Email: postmottak@md.dep.no

Ministry of Health and Care Services
Address: P.O. Box 8011 Dep, NO-0030, Oslo

Visiting address: Einar Gerhardsens plass 3
Phone: (+47)-22-24-90-90
Email: postmottak@hod.dep.no

The Ministry of Government Administration and Reform
Address: P.O. Box 8004 Dep, NO-0030, Oslo
Visiting address: Akersgt. 59
Phone: (+47)-22-24-90-90
Email: postmottak@fad.dep.no

Ministry of Labour and Social Inclusion
Address: P.O. Box 8019 Dep, NO-0030, Oslo
Visiting address: Einar Gerhardsens plass 3
Phone: (+47)-22-24-90-90
Email: postmottak@aid.dep.no

Ministry of Transport and Communications
Address: P.O. Box 8010 Dep, NO-0030, Oslo
Visiting address: Akersgt. 59
Phone: (+47)-22-24-90-90
Email: postmottak@sd.dep.no

Directorate of Fisheries
Web: http://www.fiskeridir.no (Norwegian; Click on 'English' to see English version)

The Directorate of Fisheries serves as the Ministry of Fisheries and Coastal Affairs advisory and executive body in matters pertaining to fishing and the management of aquaculture.
Address: P.O. Box 2009, NO-5817, Bergen
Visiting address: Strandgt. 229
Phone: (+47)-55-23-80-00
Email: postmottak@fiskeridir.no

Directorate for Health and Social Affairs (SHdir)
Web: http://www.shdir.no (Norwegian; Click on 'English' to see English version)

The Directorate for Health and Social Affairs is an integral part of the central administration of health and social affairs in Norway, and is organized under the joint auspices of the Ministry of Health and Care Services and the Ministry of Labour and Social Affairs.
Address: P.O. Box 7000 St. Olavs plass, NO-0130, Oslo
Visiting address: Universitetsgata 2
Phone: (+47)-810-200-50
Email: postmottak@shdir.no

Directorate for Nature Management
Web: http://english.dirnat.no (English)
Web: http://www.naturforvaltning.no (Norwegian)

The Directorate for Nature Management is a national body that has the scientific responsibility for managing the Norwegian countryside. It is responsible to the Ministry of Environment.
Address: NO-7485, Trondheim
Visiting address: Tungasletta 2
Phone: (+47)-73-58-05-00
Email: postmottak@dirnat.no

Health, Environment, and Safety
Web: http://www.hmsetatene.no/english (English)
Web: http://www.hmsetatene.no (Norwegian)

This is the website of the four authorities who are responsible for the co-ordinated supervisory activities pursuant to regulations relating to Systematic Health, Environmental and Safety Activities (HES) in Enterprises. Directorate for Civil Protection and Emergency Planning[1], Norwegian Labour Inspection Authority[2], Norwegian Industrial Safety and Security Organisation[3], Norwegian Pollution Control Authority[4]
[1]Address: P.O. Box 2014, NO-3103 Tønsberg
Visiting address: Rambergveien 9
Phone: (+47)-33-41-25-00
Email: postmottak@dsb.no

[2]Address: Statens hus, NO-7013 Trondheim
Visiting address: Prinsens gate 1
Phone: (+47)-73-19-97-00
Email: direktoratet@atil.no

[3]Address: P.O. Box 5468 Majorstuen, NO-0305, Oslo
Visiting address: Essendropsgate 6
Phone: (+47)-23-08-85-30
Email: nso@nso.no

[4]Address: P.O. Box 8100 Dep
NO-0032, Oslo
Visiting address: Strømsveien 96
Phone: (+47)-22-57-34-00

National Institute of Occupational Health
Web: http://www.stami.no/In_English (English)
Web: http://www.stami.no (Norwegian)

The National Institute of Occupational Health is a research institute contributing to the increased knowledge and practical applications of occupational health. The Institute is organized under the Ministry of Labour and Social Inclusion as an integrated part of the national system for protection of workers.

NOA (national surveillance system for work environment and occupational health)
Web: http://www.stami.no/NOA/In_English (English)
Web: http://www.stami.no/NOA (Norwegian)

NOA is the national surveillance system for work environment and occupational health in Norway, and is a department at the National Institute of Occupational

Health. NOA shall co-ordinate, systematize and disseminate information on the status and time trends in work-related hazards, exposure factors, and health outcomes.
Address: P.O. Box 8149 Dep, NO-0033, Oslo
Visiting address: Gydas vei 8
Phone: (+47)-23-19-51-00
Email: stami@stami.no

Norwegian Board of Health Supervision
Web: http://www.helsetilsynet.no (Norwegian; Click on 'In English' to see English version)

The Norwegian Board of Health Supervision is an independent supervision authority, with responsibility for general supervision of health and social services in the country.
Address: P.O.Box 8128 Dep, NO-0032, Oslo
Visiting address: Calmeyers gate 1
Phone: (+47)-21-52-99-00
Email: postmottak@helsetilsynet.no

Norwegian Defence Research Establishment (FFI)
Web: http://www.mil.no/felles/ffi/English (English)
Web: http://www.ffi.no (Norwegian)

The Norwegian Defence Research Establishment is responsible for defense-related research in Norway.
Address: P.O. Box 25, NO-2027, Kjeller
Visiting address: Instituttveien 20
Phone: (+47)-63-80-70-00
Email: ffi@ffi.no

Norwegian Food Safety Authority
Web: http://www.mattilsynet.no (Norwegian; Click on British flag to see English version)

The Norwegian Food Safety Authority is a governmental body with responsibility for food and drinking safety. The Norwegian Food Safety Authority also performs duties relating to cosmetics and medicines, and inspects animal health personnel.
Address: Felles postmottak, P.O.Box 383, NO-2381, Brumunddal
Visiting address: Ullevålsveien 76, Oslo
Phone: (+47)-23-21-68-00
Email: postmottak@mattilsynet.no

The Norwegian Scientific Committee for Food Safety (VKM)
Web: http://www.vkm.no (Norwegian; Click on 'English web' to see English version)

VKM is appointed by and financed by the Ministry of Health. VKM is an independent body that performs risk assessment for the Norwegian food safety authority.
Email: vkm@fhi.no

The Food Portal
Web: http://matportalen.no/Emner/english (English)
Web: http://matportalen.no (Norwegian)

The Food Portal is a consumer-oriented portal focusing on food safety. The information is usually published in Norwegian, but may occasionally publish articles in English.
Email: redaksjon@matportalen.no

Norwegian Industrial Safety and Security Organisation
Web: http://www.nso.no/index.htm (Norwegian; Click on British flag to see English version)

The main purpose of the Norwegian Industrial Safety and Security Organisation (NSO) is to organize and control own protection (emergency preparedness) in operations governed by the regulations relating to emergency preparedness requirements.
Address: P.O. Box 5468 Majorstuen, NO-0305, Oslo
Visiting address: Essendropsgate 6
Phone: (+47)-23-08-85-30
Email: nso@nso.no

Norwegian Institute for Agricultural and Environmental Research (Bioforsk)
Web: http://www.bioforsk.no (Norwegian; Click on 'English' to see English version)

Bioforsk is a national R&D institute under the Norwegian Ministry of Agriculture and Food. The main areas of competence are linked to food quality and safety, agriculture and rural development, environmental protection and natural resources management.
Address: Fr. A. Dahlsvei 20, NO-1432 ÅS
Visiting address: Fr. A. Dahlsvei 20
Phone: (+47)-64-94-70-00
Email: post@bioforsk.no

Norwegian Institute of Public Health
Web: http://www.fhi.no (Norwegian; Click on 'English' to see English version)

The Norwegian Institute of Public Health is a national center for expert knowledge of epidemiology, infectious disease control, environmental medicine, forensic toxicology, and research on drug abuse.
Address: P.O. Box 4404 Nydalen, NO-0403, Oslo
Visiting address: Geitmyrsveien 75
Phone: (+47)-22-04-22-00
Email: folkehelseinstituttet@fhi.no

Norwegian Labour Inspection Authority
Web: http://www.arbeidstilsynet.no (Norwegian; Click on 'In English' to see English version)

The Norwegian Labour Inspection Authority is a governmental agency under the Ministry of Labour and Social Inclusion, focused on occupational safety and health.
Address: Statens hus, NO-7013, Trondheim
Visiting address: Prinsens gate 1
Phone: (+47)-73-19-97-00
Email: direktoratet@atil.no

Norwegian Mapping Authority
Web: http://www.statkart.no/IPS (Norwegian only)

The Norwegian Mapping Authority is responsible for providing nationwide geographic information and services to private and public users. It also serves as the central government's professional body in the area of maps and geodata and handles the administrative tasks associated with this.
Address: NO-3507, Hønefoss
Visiting address: Kartverksveien 21
Phone: (+47)-32-11-81-00
Email: firmapost@statkart.no

Norwegian Maritime Directorate
Web: http://www.sjofartsdir.no/no (Norwegian only)
Address: P.O. Box 2222, NO-5509, Haugesund
Visiting address: Smedasundet 50A
Phone: (+47)-52-74-50-00
Email: postmottak@sjofartsdir.no

Norwegian Pollution Control Authority (SFT)
Web: http://www.sft.no (Norwegian; click 'Norwegian Pollution Control Authority' for English version)

The Norwegian Pollution Control Authority (SFT) is a directorate under the Ministry of the Environment. SFT's main fields of responsibility include marine and fresh water pollution, hazardous substances, regulation of onshore and offshore industry, waste management, noise, air pollution and climate change. SFT exercise regulatory authority under the Pollution Control Act, the Product Control Act and the Greenhouse Gas emission Trading Act.

State of the Environment Norway
Web: http://www.environment.no (English)
Web: http://www.miljostatus.no (Norwegian)

State of the Environment Norway aims to provide you with the latest information about the state and development of the environment. The Norwegian Pollution Control Authority has the overall editorial responsibility.
Address: P.O. Box 8100 Dep, NO-0032, Oslo
Visiting address: Strømsveien 96
Phone: (+47)-22-57-34-00
Email: postmottak@sft.no

Norwegian Radiation Protection Authority
Web: http://www.stralevernet.no (Norwegian; click English flag for English version)

The Norwegian Radiation Protection Authority is the competent national authority in the area of radiation protection and nuclear safety.
Address: P.O. Box 55, NO-1332, Østerås
Visiting address: Grini Næringspark 12
Phone: (+47)-67-16-25-00
Email: nrpa@nrpa.no

Norwegian Water Resources and Energy Directorate
Web: http://www.nve.no (Norwegian; Click on 'In English' to see English version)

The Norwegian Water Resources and Energy Directorate (NVE) is subordinated to the Ministry of Petroleum and Energy, and is responsible for the administration of Norway's water and energy resources.
Address: P.O. Box 5091 Majorstuen, NO-0301, Oslo
Visiting address: Middelthunsgate 29
Phone: (+47)-22-95-95-95
Email: nve@nve.no

Petroleum Safety Authority Norway (PSA)
Web: http://www.ptil.no/English (English)
Web: http://www.ptil.no (Norwegian)

The Petroleum Safety Authority Norway is an independent regulatory body under the Ministry of Labour and Government Administration. The PSA has the regulatory responsibility for safety, emergency preparedness, and the working environment in the petroleum activities.
Address: P.O. Box 599, NO-4003, Stavanger
Visiting address: Professor Olav Hanssens vei 10
Phone: (+47)-51-87-60-50
Email: postboks@ptil.no

Norwegian Polar Institute
Web: http://npiweb.npolar.no (English)
Web: http://npweb.npolar.no (Norwegian)

The Norwegian Polar Institute is Norway's central institution for research, environmental monitoring and mapping of the Polar Regions. The Institute's activities are concentrated on environmental management needs at both poles.
Address: Polar Environmental Centre, NO-9296, Tromsø
Visiting address: Hjalmar Johansens gate 14
Phone: (+47)-77-75-05-00
Email: postmottak@npolar.no

The Product Register
Click on 'Norwegian Pollution Control Authority' to see English version.
Web: http://www.SFT.no (Norwegian)

The Product Register is the Norwegian authorities' central register of substances and chemical products that are on the market in Norway. The information is used as a tool for preventing damage to health and the environment caused by chemicals. The Product Register (PR) was established in 1981 by the Norwegian parliament.
Address: P.O. Box 8180 Dep, NO-0034, Oslo
Visiting address: Schweigaards gate 34E
Phone: (+47)-22-05-48-80
Email: produktregisteret@produktregisteret.no

Institute of Marine Research
Web: http://www.imr.no/english (English)
Web: http://www.imr.no (Norwegian)

The Institute of Marine Research is a national consultative research institute which is owned by the Ministry of Fisheries and Coastal Affairs. The Institute performs research and provides advisory services in the fields of marine ecosystems and aquaculture.
Address: P.O. Box 1870 Nordnes, NO-5817, Bergen
Visiting address: Nordnesgt. 50
Phone: (+47)-55-23-85-00
Email: post@imr.no

Organizations (Non-government)

The Bellona Foundation
Web: http://www.bellona.org (English)
Web: http://www.bellona.no (Norwegian)

The Bellona Foundation is a multi-disciplinary international environmental NGO based in Oslo. Bellona works with questions related to the clean-up of the Cold War legacy in Russia, the safety of the oil and gas industry in Russia and Europe, and fighting global warming.
Address: P.O. Box 2141 Grünerløkka, NO-0505, Oslo
Visiting address: Nordregate 2
Phone: (+47)-23-23-46-00
Email: info@bellona.no

Greenliving
Web: http://www.gronnhverdag.no (Norwegian only)

Greenliving is the major green consumer's network in Norway.
Address: Grensen 9B, NO-0159, Oslo
Visiting address: Grensen 9B
Phone: (+47)-23-10-95-50
Email: post@gronnhverdag.no

The Standardization Organizations in Norway
Web: http://www.standard.no (Norwegian; Click on 'English' to see English version)

Standards Norway (SN), The Norwegian Electrotechnical Committee (NEK), and The Norwegian Post and Telecommunication Authority (PT) are the three standards writing bodies in Norway.

Universities

The Norwegian University of Life Sciences (UMB)
Web: http://www.umb.no/?avd=30 (English)
Web: http://www.umb.no (Norwegian)

The Norwegian University of Life Sciences (UMB) is focused on higher education and research within environmental and biosciences. UMB focuses specifically on biology, food, environment, land use, and natural resource management.
Address: P.O. Box 5003, NO-1432, ÅS
Visiting address: ÅS
Phone: (+47)-64-96-50-00
Email: postmottak@umb.no

National Veterinary Institute
Web: http://www.vetinst.no (Norwegian; Click on 'In English' to see English version)

The National Veterinary Institute is a national research institute in the fields of animal health, fish health, and food safety, whose primary function is supply of independent research-based advisory support to the governing authorities.
Address: P.O. Box 8156 Dep, NO-0033, Oslo
Visiting address: Ullevålsveien 68
Phone: (+47)-23-21-60-00
Email: adm@vetinst.no

Norwegian School of Veterinary Science
Web: http://www.veths.no/default.aspx?id=566 (English)
Web: http://www.veths.no (Norwegian)

The Norwegian School of Veterinary Science (NVH) is the sole institution educating veterinary surgeons and veterinary nurses in Norway. The school is also responsible for the major part of all veterinary research conducted in the country.
Address: P.O. Box 8146 Dep, NO-0033, Oslo
Visiting address: Ullevålsvn 72
Phone: (+47)-22-96-45-00
Email: post@veths.no

Foodsafety.no
Web: http://www.foodsafety.no (English)

This website is a joint venture between the Norwegian School of Veterinary Science and the National Veterinary Institute of Norway. Foodsafety aims to ensure that the

food we eat is safe and does not contain infective agents or contaminants that can make it injurious to our health. The website provides a presentation of the activity of the two major veterinary institutions in Norway dealing with food safety.

Norwegian University of Science and Technology
Web: http://www.ntnu.no/indexe.php (English)

University of Oslo
Web: http://www.uio.no/english (English)
Web: http://www.uio.no (Norwegian)

The University of Oslo is Norway's largest and oldest institution of higher education.
Address: P.O. Box 1072 Blindern, NO-0316, Oslo
Visiting address: Problemv. 7
Phone: (+47)-22-85-50-50
Email: informasjon@uio.no

Centre for Development and the Environment
Web: http://www.sum.uio.no (English)

The Centre for Development and the Environment (Senter for utvikling og miljø, SUM), is primarily a research institution. It was established by the University of Oslo in 1990 in response to the report of the Brundtland Commission: Our Common Future.
Address: P.O.Box 1116 Blindern, NO-0317, Oslo
Visiting address: Sognsveien 68
Phone: (+47)-22-85-89-00
Email: info@sum.uio.no

University of Tromsø
Web: http://uit.no/informasjon/english (English)
Web: http://uit.no (Norwegian)

Arctic research is one of the University's highest priorities. The Roald Amundsen Centre for Arctic Research is an umbrella organization for all those involved in Arctic research at the University, irrespective of faculty affiliation. The main objective of the Centre is to enhance Arctic research at the University of Tromsø.

Centre for Environment and Development Studies (SEMUT)

SEMUT shall contribute to strengthen research, education, and dissemination of research results with a focus on environment and development at the University of Tromsø and with research and development institutions in other parts of North Norway. The work of SEMUT is mainly directed towards developing countries.
Address: 9037 Tromsø
Visiting address: Breivika
Phone: (+47)-77-64-40-00
Email: postmottak@uit.no

Phone: (+47)-22-97-98-00
Email: post@grip.no

Norwegian Institute for Air Research (NILU)
Web: http://www.nilu.no/index.cfm?lan_id=3 (English)
Web: http://www.nilu.no (Norwegian)

The Norwegian Institute for Air Research (NILU) is an independent research institute that conducts environmental research with emphasis on the sources of airborne pollution, atmospheric transport, transformation and deposition and is also involved in the assessment of the effects of pollution on ecosystems, human health, and materials. A main priority for NILU is to provide scientific facts on the quantitative relationships between these factors, and at the same time make the results available in user-friendly manners for decision-makers.
Address: P.O. Box 100, NO-2027, Kjeller
Visiting address: Instituttveien 18
Phone: (+47)-63-89-80-00
Email: nilu@nilu.no

Norwegian Institute for Nature Research (NINA)
Web: http://www.nina.no (Norwegian; Click on 'English' to see English version)

The Norwegian Institute for Nature Research (NINA) is Norway's leading institution for applied ecological research. NINA is responsible for long-term strategic research and commissions applied research to facilitate the implementation of international conventions, decision-support systems, and management tools, as well as to enhance public awareness and promote conflict resolution.
Address: N-7485, Trondheim
Visiting address: Tungasletta 2
Phone: (+47)-73-80-14-00
Email: mail@nina

Norwegian Institute for Water Research
Web: http://www.niva.no/symfoni/infoportal/portenglish.nsf (English)
Web: http://www.niva.no (Norwegian)

The Norwegian Institute for Water Research (NIVA) is Norway's leading multidisciplinary research institute in the field of use and protection of water bodies and water quality, in fresh and marine waters.
Address: Gaustadalléen 21, NO-0349, Oslo
Visiting address: Gaustadalléen 21
Phone: (+47)-22-18-51-00
Email: niva@niva.no

Norwegian Water Network
Web: http://www.water-norway.org (English only)

The Norwegian Water Network connects institutions and programs involved in integrated water management.

Offshore.no
Web: http://www.offshore.no (Norwegian only)

Norwegian site dedicated to the offshore industry.
Address: P.O. Box 1335 Vika, NO-0112, Oslo
Visiting address: Strandgaten 193, Bergen
Phone: (+47)-22-83-83-68
Email: redaksjonen@offshore.no

The Polar Environmental Centre
Web: http://www.polarenvironment.no/index.cfm?lid=2 (English)
Web: http://www.polarenvironment.no (Norwegian)

The Centre for the Environment and co-operation in the Polar Areas and the Barents region (The Polar Environmental Centre) is Norway's center of research, environmental monitoring, and advisory services in the Northern Region and the Arctic/Antarctic. The bodies of the Polar Environmental Centre are: The Norwegian Polar Institute, Akvaplan-niva, the Norwegian Institute for Air Research, the Norwegian Institute for Nature Research, the Norwegian Institute for Cultural Heritage Research, the Geological Survey of Norway, the Norwegian Radiation Protection Authority, the Norwegian Mapping Authority's Tromsø office, and the National Coastal Administration.
Address: Polarmiljøsenteret, NO-9296, Tromsø
Visiting address: Hjalmar Johansensgt. 14
Phone: (+47)-77-75-00-00
Email: pmas@npolar.no

Research Council of Norway
Web: http://www.forskningsradet.no (Norwegian; Click on 'English' to see English version)

The mandate of the Council is to promote and support basic and applied research in all areas of science, technology, medicine, and the humanities. Important goals include raising the general level of the understanding of research in society as a whole and supporting innovation in all sectors and branches of industry. The

Research Council of Norway is a strategic body which identifies areas of special effort, allocates research funds and evaluates the resulting research. The Council is the principal research policy adviser to the government, and it acts as a meeting-place and network-builder for Norwegian research.

Address: P.O.Box 2700 St. Hanshaugen, NO-0131 OSLO
Visiting address: Stensberggata 26
Phone: (+47)-22-03-70-00
Email: post@forskningsradet.no

UNEP/GRID-Arendal
Web: http://www.grida.no (English)

GRID-Arendal is an official United Nations Environment Programme (UNEP) center. The mission of GRID-Arendal is to provide environmental information, communications, and capacity-building services for information management and assessment. GRID-Arendal provides analysis and supports communication on issues such as climate change, environment and poverty, environment and security, the urban environment and sustainable development through education.

CHAPTER

100

Poland

MAREK BANASIK AND TODD STEDEFORD

INTRODUCTION

The foundations of toxicology in Poland date back to the first academic lectures in this field beginning in 1783–86. The lectures were given at the Main Crown School (established in 1364 as the Studium Generale and presently called the Jagiellonian University) in Cracow (Kraków) by a physician and pharmacist named Jan Szaster (1746–1793). Another important figure was Józef Sawiczewski (1762–1825), who lectured on toxicology to students of pharmacy at the former Kraków University (Jagiellonian University). Further developments in the field of toxicology in Poland were slowed down due to political reasons. Poland's independence as a State was compromised by its partitioning among Russia, Prussia, and Austria in 1772, 1793, and 1795, which ultimately dissolved the State. In addition, the minimal amount of industrialization and lack of scientific laboratories didn't favor the development of toxicology.

After Poland regained its independence in 1918, the teaching of toxicology together with forensic medicine took place as part of medical and pharmaceutical education. Outside Warsaw (Warszawa), the teaching of toxicology was restricted to methods of detection and identification of chemicals causing poisonings in people. Toxicological analysis was the most often practiced toxicology activity in Poland. This speciality was represented mostly by toxicological chemistry and forensic departments of pharmaceutical university faculties that worked on the needs of forensic medicine. Laboratory analyses outside academic centers were mostly performed by pharmacists. The development of experimental methods and testing equipment for toxicological analyses were more often conducted by specialist institutions, such as the National Institute of Hygiene (http://www.pzh.gov.pl), the Institute of Forensic Research (at present, The Prof. Dr. Jan Sehn Institute of Forensic Research; http://www.ies.krakow.pl), as well as university departments of forensic medicine.

After World War II, Poland underwent intensive industrialization that resulted in new problems, especially in the field of industrial toxicology. Unfortunately, after the war, there was a lack of laboratory space, laboratory equipment, and most importantly independent scientists, as the majority of researchers were killed by German and Soviet invaders or had fled the country. As a result, the redevelopment of Poland progressed, unguided by scientific influence, and the importance of basic research became an absent priority. However, with the progressive use of chemicals in agriculture, especially plant protection chemicals, fertilizers, and veterinary medicines, a revival in the need for toxicological research began with the Ministry of Health (present name; http://www.mz.gov.pl), Ministry of Agriculture and Rural Development (present name; http://www.minrol.gov.pl), Ministry of Economy (present name; http://www.mgip.gov.pl), Ministry of Justice (http://www.ms.gov.pl), and Ministry of National Defence (http://www.wp.mil.pl) founding their own research units. Institutes for occupational medicine and safety were established in Lublin (http://www.imw.lublin.pl), Łódź (http://www.imp.lodz.pl), Sosnowiec (http://www.imp.sosnowiec.pl), and Warszawa (http://www.ciop.pl). An additional developmental stimulus came from strong co-operation between toxicology research institutions and industry in the 1970s.

Toxicology research is undertaken largely at medical colleges and governmental medical institutions, such as e.g. the Nofer Institute of Occupational Medicine (NIOM; http://www.imp.lodz.pl) in Łódź established in 1954. Its scientific division deals mostly with industrial toxicology and occupational pathology. In 1975, NIOM became a World Health Organization Collaborating Centre in Occupational Health (http://www.whoocchealthccs.org). Nowadays, it provides background research and expertise to the Ministry of Health and serves as an advisory body to the Ministry of the Environment (http://www.mos.gov.pl) and various governmental agencies, as well as to local administration, trade unions, and industry. In addition, NIOM organizes numerous courses for toxicologists.

The first organization of Polish toxicologists was the Toxicological Section of the Polish Pharmacological Society (PPS; http://pharmacology.slam.katowice.pl – click the Polish flag) formed in 1966. The main toxicological interests of PPS were acute and chronic poisonings, pharmacodynamic and pharmacokinetic interactions of medicines, drug addiction, clinical research of medicine poisonings, and toxicological evaluation of new medicines. In the course of time, the scope of research and toxicological problems began to exceed the interests of the Toxicological Section of PPS. Therefore, on March 8, 1978 the Polish Society of Toxicology (PST; http://www.imp.lodz.pl/nowy_pttox) was established. PST is an interdisciplinary scientific society working under the aegis of the Polish Academy of Sciences (http://www.pan.pl). It comprises 11 (http://www.imp.lodz.pl/nowy_pttox/oddzialy.htm) regional sections gathering over 300 members – persons working in experimental and practical toxicology. PST is a member of the Federation of European Toxicologists & European Societies of Toxicology (EUROTOX; http://www.eurotox.com) and the International Union of Toxicology (IUTOX; http://www.iutox.org). In Poland, toxicologists are recruited mostly from pharmacists, physicians, chemists, veterinarians, and graduates of medical analytics.

After the collapse of Communism and the recovery of Poland's full independence in 1989, research in toxicology began to flourish. The information that follows in the resources section is reflective of Poland's commitment to toxicological research and continued growth.

Journals

Acta Biochimica Polonica (1954–)
Polish Academy of Sciences Committee of Biochemistry and Biophysics (Komitet Biochemii i Biofizyki Polskiej Akademii Nauk): Warszawa
ISSN: 0001-527X
Email: abp@nencki.gov.pl
Web: http://www.actabp.pl

A quarterly journal of the Polish Biochemical Society (http://www.ptbioch.edu.pl) and the Committee of Biochemistry and Biophysics of the Polish Academy of Sciences (http://www.pan.pl/index.php?option=com_content&task=view&id=1016&Itemid=162) covering enzymology and metabolism, membranes

and bioenergetics, gene structure and expression, protein, nucleic acid, and carbohydrate structure and metabolism. It publishes research articles, short communications, review articles, and book reviews. This journal is supported by the Polish Ministry of Science and Higher Education.

Acta Poloniae Pharmaceutica – Drug Research (1990–)
Polish Pharmaceutical Society: Warszawa
ISSN: 0001-6837
Web: http://www.ptfarm.pl/?pid=33

A bimonthly journal that publishes peer-reviewed articles on all pharmaceutical topics. It is a continuation of 'Acta Poloniae Pharmaceutica' (ISSN: 0001-6837; 1937–1939 and 1947–1989).

Acta Toxicologica (2003–)
Nofer Institute of Occupational Medicine, Publishing House: Łódź
ISSN: 1731-6383
Email: oficyna@imp.lodz.pl
Web: http://www.imp.lodz.pl/nowy_pttox/dzialalnosc_publikacje_acta_toxi.htm

A biyearly journal of the Polish Society of Toxicology (http://www.imp.lodz.pl/nowy_pttox). It is a continuation of 'Acta Poloniae Toxicologica' (ISSN: 1230-6967; 1993–2002). This is the only journal published in Poland and the whole of Central Europe devoted entirely to the field of toxicology. The major research topics of the journal are: experimental and clinical toxicology, ecotoxicology, metabolism of xenobiotics, and toxicological analytics. This journal is financially supported by the Polish Ministry of Science and Higher Education.

Annals of Agricultural and Environmental Medicine (AAEM) (1994–)
Institute of Agricultural Medicine: Lublin
ISSN: 1232-1966
Email: aaem@galen.imw.lublin.pl
Web: http://www.aaem.pl

AAEM is published semi-annually. It publishes peer-reviewed articles on the following research topics: diseases associated with agriculture, forestry, and the food-industry; health effects of chemical pollutants; work-related accidents; problems of occupational hygiene; occupational disease prevention; methods of monitoring biohazards; and occupational and non-occupational environmental factors of importance for human health and disease.

Bromatology and Toxicological Chemistry (Bromatologia i Chemia Toksykologiczna) (1968–)
Polish Pharmaceutical Society (Polskie Towarzystwo Farmaceutyczne): Warszawa
ISSN: 0365-9445
Web: http://www.ptfarm.pl/?pid=34

A quarterly journal, in Polish with English versions of the abstracts, devoted to problems of health and environmental protection.

Environmental Medicine (Medycyna Środowiskowa (MŚ)) (1998–)
Institute of Occupational Medicine and Environmental Health (Instytut Medycyny Pracy i Zdrowia Środowiskowego): Sosnowiec
ISSN: 1505-7054
Email: pms@imp.sosnowiec.pl
Web: http://www.imp.sosnowiec.pl/modules.php?name=Content&pa=showpage&pid=26

A biyearly journal of the Polish Society of Environmental Medicine (http://www.imp.sosnowiec.pl/modules.php?name=Content&pa=showpage&pid=27) published in Polish with English versions of the abstracts. Articles address a broad range of issues relating to environmental medicine.

International Journal of Occupational Medicine and Environmental Health (1994–)
Nofer Institiute of Occupational Medicine and Polish Association of Occupational Medicine: Łódź
ISSN: 1232-1087
Email: redakcja@imp.lodz.pl
Web: http://www.imp.lodz.pl/oficyna/ofic_pages/journal/journ_ang/journal_ang_n.htm

First published under the title 'Polish Journal of Occupational Medicine' (ISSN: 0860-6536; 1988–1990), and then as 'Polish Journal of Occupational Medicine and Environmental Health' (ISSN: 0867-8383; 1991–1993). This quarterly journal publishes peer-reviewed articles addressing a variety of issues including, but not limited to the following: occupational and environmental health policy, toxicology and mutagenesis, epidemiology, carcinogenesis, etc.

International Journal of Occupational Safety and Ergonomics (JOSE) (1995–)
Central Institute for Labour Protection – National Research Institute: Warszawa
ISSN: 1080-3548
Email: jose@ciop.pl
Web: http://www.ciop.pl/757.html

A peer-reviewed quarterly journal that publishes articles on a broad range of issues relating to occupational safety and ergonomics, including: hazardous chemical, physical, and biological agents; new technologies for collective and individual protection; criteria and requirements of occupational safety and ergonomics

and quality; studies of human psychophysical abilities; etc. Volumes 1 and 2 were published under the same title and ISSN by Ablex Publishing Corporation (Norwood, NJ, USA).

Journal of Environmental Protection Science (2007–)
Wrocław University of Technology: Wrocław
Email: jeps.editor@gmail.com
Web: http://www.jeps.us

An open access, peer-reviewed journal with multidisciplinary coverage on the following topics: environmental science/protection/engineering, industrial hygiene, risk assessment/management, toxicology, and epidemiology.

Occupational Medicine (Medycyna Pracy) (1950–)
Nofer Institute of Occupational Medicine and Polish Association of Occupational Medicine (Instytut Medycyny Pracy im. prof. J. Nofera i Polskie Towarzystwo Medycyny Pracy): Łódź
ISSN: 0465-5893
Email: edytor@imp.lodz.pl
Web: http://www.imp.lodz.pl/english/niom.htm (click 'structure', then 'publishing house')

This bimonthly journal, published in Polish with English versions of the abstracts, is primarily addressed to occupational physicians and industrial hygienists. It covers the following topics: occupational pathology, physical, chemical and biological hazards, toxicology and mutagenesis, health policy, management and organization of healthcare, and epidemiology.

Polish Journal of Ecology (1998–)
Institute of Ecology Publishing Office (Oficyna Wydawnicza Instytutu Ekologii): Dziekanów Leśny
ISSN: 1505-2249
Email: pol.j.ecol@cbe-pan.pl
Web: http://www.pol.j.ecol.cbe-pan.pl

A quarterly journal that until 1997 appeared under the title 'Ekologia Polska' (ISSN: 0420-9036; 1953–1997). It is an open access, peer-reviewed journal that publishes original scientific papers dealing with all aspects of ecology: both fundamental and applied, physiological ecology, ecology of population, community, landscape as well as global ecology.

Polish Journal of Environmental Studies (1992–)
HARD: Olsztyn
ISSN: 1230-1485
Email: office@pjoes.com
Web: http://www.pjoes.com

A bimonthly peer-reviewed journal that publishes original papers and critical reviews on a wide range of topics, including the following: environmental pollution research, environmental engineering, determination of harmful substances, analytical methods, circulation of pollutants, hazards to human health and safety, land reclamation, etc.

Organizations (non-government)

Institute for Sustainable Development
ul. L. Nabielaka 15/1
00-743 Warszawa
Phone: +48-22-851-0402 ~ 04
Fax: +48-22 851-0400
Email: ine@ine-isd.org.pl
Web: http://www.ine-isd.org.pl

An independent, non-governmental and non-profit organization, whose main target of activity is implementation and dissemination of the sustainable development concept in Poland. It focuses on economic, legal, social, and political issues in connection with environmental protection; it collaborates with the Polish parliament, with state administrations as well as local governments and non-governmental ecological movements.

Institute of Public Health and Environmental Protection
ul. Batystowa 1B/2
02-835 Warszawa
Phone: +48-22-648-3712
Fax: +48-22-648-3712
Email: iphep.office@gmail.com, iphep.office@yahoo.com

A not-for-profit organization devoted to the development of cutting-edge methods in risk assessment. It also produces health assessments that address the first two components of a risk assessment – that is, hazard identification and dose–response assessment. Its health assessments contain qualitative descriptors and quantitative values for non-cancer and cancer endpoints.

Klon/Jawor Association (Stowarzyszenie Klon/Jawor)
ul. Szpitalna 5/5
00-031 Warszawa
Phone: 022-828-9128
Email: klon@klon.org.pl
Web: http://www.klon.org.pl

A non-governmental organization that supports the Polish voluntary sector by collecting and disseminating information. The Association administrates the portal 'ngo.pl – Portal of Non-Government Organizations' (ngo.pl – Portal Organizacji Pozarządowych; http://www.ngo.pl).

League of Nature Conservation (Liga Ochrony Przyrody)
Zarząd Główny (Head Office)
ul. Tamka 37/2
00-355 Warszawa
Phone: +48-22-828-8171
Fax: +48-22-828-6580
Email: zg@lop.org.pl
Web: http://www.lop.org.pl

An independent organization established in 1928, that promotes the protection of nature.

Polish Association of Cosmetics and Home Care Products Producers
ul. Wilcza 46/404
00-679 Warszawa
Phone: +48-22-625-5782
Fax: +48-22-629-3469
Email: biuro@czystepiekno.pl
Web: http://czystepiekno.pl

A public interest organization that promotes, develops, and protects the business of the cosmetics and home care industry in Poland.

Polish Chamber of Chemical Industry
ul. Śniadeckich 17
00-654 Warszawa
Phone: +48-22-828-7506, 48-22-828-7507
Fax: +48-22-627-2154
Email: pipc@pipc.org.pl
Web: http://www.pipc.org.pl

Represents chemical companies towards domestic and foreign government and non-government organizations. The Chamber is authorized to represent the chemical industry on an international forum.

Polish Chamber of Parmaceutical Industry and Medical Devices POLFARMED
ul. Łucka 2/4/6
00-845 Warszawa
Phone: +48-22-654-5351, 48-22-654-5352
Fax: +48-22-654-5420
Email: office@polfarmed.com.pl
Web: http://www.polfarmed.pl

Voluntary and self-governing organization of enterprises operating in the fields of production of medicinal products, medical devices as well as introducing medicaments and medical devices on the territory of Poland and operating in the fields of manufacturing raw materials, appliances to their production and servicing of medical devices.

Polish Ecology Chamber
ul. Warszawska 3
40-009 Katowice
Phone: +48-32-253-5155, 48-32-253-7281
Fax: +48-32-253-5155
Email: pie@pie.pl
Web: http://www.pie.pl

A voluntary, self-governing organization of enterprises operating in the field of environmental protection in Poland.

Polish Environmental Partnership Foundation
Mailing Address:
ul. Św. Krzyża 5/6
31-028 Kraków
Phone: +48-12-430-2443, 48-12-430-2465
Fax: +48-12-429-4725
Email: biuro@epce.org.pl
Web: http://www.epce.org.pl

Partnership that helps the public sector and civil society groups implement sustainable development in specific regions, promote the development of sustainable tourism, support local authorities with establishing initiatives aimed at reducing green house gases, etc.

Polish Foundation for Energy Efficiency
ul. Wierzbowa 11
40-169 Katowice
Phone: +48-32-203-5114, 48-32-203-5120
Fax: +48-32-203-5114, 48-32-203-5120
Email: office@fewe.pl
Web: http://www.fewe.pl

An independent, non-governmental and not-for-profit organization. Undertakes the mission of promoting the efficient use of energy and environmentally friendly energy production. Initiates and participates in drafting policy goals in the field of efficient energy use.

Polish Green Network
ul. Sławkowska 26A
31-014 Kraków
Phone: +48-12-431-2808
Fax: +48-12-431-2808
Email: info@zielonasiec.pl
Web: http://www.zielonasiec.pl

Promotes sustainable development through a variety of activities, including: co-ordinating the work of regional information centres; participating in creating laws, politics, strategies, and programs; carrying out public monitoring of management of public funds and access to information; and organizing seminars, workshops, conferences.

Waste Prevention Association 3R
P.O. Box 54
30-961 Kraków
Phone: +48-12-654-9986
Fax: +48-12-654-9986
Email: office@otzo.most.org.pl
Web: http://www.otzo.most.org.pl

A registered, non-governmental and non-profit environmental organization. Promotes clean production methodology, waste reduction at source, and environmentally friendly waste management, including segregation and recycling, as well as rational utilization of 'historical' waste.

Universities

AGH University of Science and Technology
al. A. Mickiewicza 30
30-059 Kraków

Professional Societies

Polish Association of Industrial Hygienists
Mailing Address:
ul. św.Teresy od Dzieciątka Jezus 8
91-348 Łódź
Phone: +48-42-631-4701
Fax: +48-42-631-4702
Email: malgo@imp.lodz.pl
Web: http://www.imp.lodz.pl/pthp/pthp.htm

A professional and scientific organization registered in 1992. Its objectives include promoting progress in the area of occupational hygiene, upgrading the professional and scientific qualifications of its members, supporting research work, and developing appropriate forms of training and post-graduate education. The Association has over 300 members.

Polish Association of Occupational Medicine (Polskie Towarzystwo Medycyny Pracy)
Zarząd Główny PTMP (Head Office)
ul. Św. Teresy od Dzieciątka Jezus 8
91-348 Łódź
Fax: +48-42-631-4719
Web: http://www.imp.lodz.pl/ptmp/ptmp.htm

Established in 1969, the Association promotes development of occupational medicine in Poland. It co-publishes with the Nofer Institute of Occupational Medicine (http://www.imp.lodz.pl) 'International Journal of Occupational Medicine and Environmental Health' (ISSN: 1232-1087) and 'Medycyna Pracy' (ISSN: 0465-5893). The Association has over 1800 members.

Polish Association of Public Health (Polskie Towarzystwo Zdrowia Publicznego)
Zarząd Główny PTZP (Head Office)
ul. św. Teresy od Dzieciątka Jezus 8
91-348 Łódź
Phone: +48-42-631-4846
Fax: +48-42-631-4849
Web: http://www.imp.lodz.pl/ptzp

Established in 1993, the Association promotes progress in the area of public health in Poland. The Association comprises seven regional sections.

Polish Biochemical Society
Zarząd Główny PTBioch (Head Office)
Instytut Biologii Doświadczalnej im. M. Nenckiego
ul. L. Pasteura 3
02-093 Warszawa
Phone: +48-22-589-2499
Email: ptbioch@nencki.gov.pl
Web: http://www.ptbioch.edu.pl

Founded in 1958, the Society promotes and supports all aspects of biochemistry in Poland by: holding national and international scientific conferences, symposia, meetings, etc.; publishing scientific journals, books and monographs; and maintaining close links with related societies in Poland and abroad. It co-publishes with the Committee of Biochemistry and Biophysics, Polish Academy of Sciences 'Acta Biochimica Polonica' (ISSN: 0001-527X) and publishes 'Postępy Biochemii' (ISSN: 0032-5422). The Society has about 1200 members.

Polish Chemical Society
ul. Freta 16
00-227 Warszawa
Phone: +48-22-831-1304
Email: ZGPTChem@chemix.ch.pw.edu.pl
Web: http://www.ptchem.lodz.pl

Established in 1919, the Society aims to promote chemical sciences and spread chemical knowledge in society through a host of activities, including the following: organizing meetings, sessions, and conferences of chemists; organizing public lectures and scientific courses; and publishing journals connected with the Society's activities (e.g., 'Polish Journal of Chemistry', ISSN: 0137-5083).

Polish Medical Association (Polskie Towarzystwo Lekarskie)
Al. Ujazdowskie 22
00-478 Warszawa
Phone: +48-22-628-2988/48-22-628-8699
Fax: +48-22-628-8699
Email: ptl@interia.pl
Web: http://ptl.org.pl

Established in 1951, the Society organizes continuing education for physicians and promotes the maintenance of the highest professional standards in the field.

The Association comprises 43 regional sections and has about 22 000 members. It publishes 'Polski Merkuriusz Lekarski' (ISSN: 1426-9686), 'Przegląd Lekarski' (ISSN: 0033-2240), and 'Wiadomości Lekarskie' (ISSN: 0043-5147).

Polish Medical Society of Radiology
President
Katedra Radiologii Medycyny Nuklearnej
Śląska Akademia Medyczna
ul. Medyków 14
40-752 Katowice
Phone: +48-32-252-5566
Fax: +48-32-252-5566
Email: gwawrzonek@csk.katowice.pl
Web: http://www.polradiologia.org (click 'Radiology in Poland')

With its origin dating back to 1925, the Society has a history of providing an atmosphere for professional exchange among radiologists through meetings, scientific publications, and continuing education. The Society publishes 'Polish Journal of Radiology' (ISSN: 1733-134X).

Polish Pharmaceutical Society (Polskie Towarzystwo Farmaceutyczne)
Zarząd Główny PTFarm (Head Office)
ul. Długa 16
00-238 Warszawa

Fax: +48-22-831-1542
Email: zarzad@ptfarm.pl
Web: http://www.ptfarm.pl

Established in 1947, the Society promotes the development of pharmaceutical sciences in Poland. It publishes 'Acta Poloniae Pharmaceutica – Drug Research' (ISSN: 0001-6837), 'Bromatologia i Chemia Toksykologiczna' (ISSN: 0365-9445), and 'Farmacja Polska' (ISSN: 0014-8261). The Society has about 7000 members.

Polish Pharmacological Society
Zarząd Główny PTF (Head Office)
Katedra i Zakład Farmakologii Doświadczalnej i Klinicznej
ul. Krakowskie Przedmieście 26/28
00-927 Warszawa
Phone: +48-22-826-2116
Fax: +48-22-826-2116
Email: phawar@hotmail.com
Web: http://pharmacology.slam.katowice.pl (click the Polish flag)

The Society was established in 1965 and promotes the development of pharmacology and toxicology in Poland.

Polish Society of Environmental Medicine (Polskie Towarzystwo Medycyny Środowiskowej)
Zarząd Główny PTMŚ (Head Office)
Institute of Occupational Medicine and Environmental Health
ul. Kościelna 13
41-200 Sosnowiec
Web: http://www.imp.sosnowiec.pl/modules.php?name=Content&pa=showpage&pid=27

The Society promotes progress in environmental medicine and environmental health in Poland. It co-publishes with the Institute of Occupational Medicine and Environmental Health (http://www.imp.sosnowiec.pl) 'Medycyna Środowiskowa' (ISSN: 0465-5893).

Polish Society of Toxicology
Mailing address:
Zarząd Główny PTTox (Head Office)
ul. św.Teresy od Dzieciątka Jezus 8
91-348 Łódź
Phone: +48-42-631-4502/48-42-655-2505
Fax: +48-42-656-8331
Email: impx@imp.lodz.pl
Web: http://www.imp.lodz.pl/nowy_pttox/, http://www.pttox.farm.amwaw.edu.pl

Created in 1978, the Society's aims and objectives are as follows: organizing and supporting all activities in furtherance of toxicological research; associating all toxicologists; disseminating cutting-edge scientific achievements in toxicological research; informing the public about current toxicological problems; and representing Polish toxicology nationally and abroad. The Society comprises 10 regional sections gathering over 300 members. It publishes 'Acta Toxicologica' (ISSN: 1731-6383). The Society is a member of EUROTOX (http://www.eurotox.com) and IUTOX (http://www.iutox.org).

Polish Society of Veterinary Sciences
Zarząd Główny PTNW (Head Office)
ul. Nowoursynowska 159c
02-776 Warszawa
Phone: +48-22-593-1606
Fax: +48-22-593-1606
Email: ptnw@sggw.pl
Web: http://www.ptnw.pl

The Society was founded in 1952 and directs activities towards: developing and propagating veterinary sciences in Poland; motivating scientific research; encouraging and supporting educational and specialization programs; and representing Polish veterinary sciences internationally. The Society co-publishes 'Medycyna Weterynaryjna' (ISSN: 0025-8628).

Miscellaneous Resources

AIRCLIM-NET
Web: http://www.ietu.katowice.pl/airclim-net/index.htm

Polish thematic network for problems of air pollution and climate change. It has been established to cluster scientific and research potential active in the field of air pollution and climate change in order to strengthen the position of research work in the development of the European Research Area (http://ec.europa.eu/research/era/index_en.html).

Baltic Sea Network on Occupational Health and Safety: Poland
Web: http://www.balticseaosh.net/poland/index.shtml

The Baltic Sea Network is an expert information network. Its purpose is to strengthen peer-to-peer networking and collaboration of expert institutions and respective bodies in occupational health and safety, between and within countries in the Baltic Sea region.

Clinical Toxicology Internet Service (Internetowy Serwis Toksykologii Klinicznej)
Web: http://www.etox.2p.pl

An interactive, region-specific, directory of toxicologists in Poland.

EcoFund Foundation
Web: http://www.ekofundusz.org.pl

EcoFund is a foundation called into being in 1992 by the Ministry of Finance of the Republic of Poland to efficiently administer the money derived from the conversion of a part of the foreign debt of Poland into a fund intended to support environmental protection projects.

ekoinfo.pl – Environmental Protection Information Service (ekoinfo.pl – Serwis Informacyjny Ochrony środowiska)
Web: http://www.ekoinfo.pl

eko-net.pl – Service for Specialists of Environmental Protection (eko-net.pl – Serwis dla Specjalistów Ochrony Środowiska)
Web: http://www.eko-net.pl

A site designed to provide professional advice to environmental managers in Polish companies and public administration aimed at: facilitating the access to information needed by those running a business with respect to law and good practices, and preventing negative impacts on the environment.

Ekopartner
Web: http://www.ekopartner.com.pl

A monthly magazine (ISSN: 1230-2961) on the environment and sustainable development, published since 1991 by Green Park Foundation (http://www.fundacjagreen.net). Presents views, opinions, and practical knowledge on how to manage the environment.

Environment Protection in Poland
Web: http://www.geo.uw.edu.pl/LINKI/ECO/eco.html

An alphabetically arranged database of Polish environmental resources available on the Internet.

ENVITECH-Net
Web: http://www.envitech-net.org

Its mission is to integrate applied research with the needs of industry and facilitate development of innovative environmental technologies for building sustainable future.

European Association of Poisons Centres and Clinical Toxicologists (EAPCCT)
Web: http://www.eapcct.org

A website of the European Association of Poisons Centres and Clinical Toxicologists.

European Chemicals Agency (ECHA)
Web: http://ec.europa.eu/echa

An Agency established with aiding countries with the implementation of the regulation concerning the

Registration, Evaluation and Authorisation of Chemicals (REACH; http://ec.europa.eu/environment/chemicals/reach/reach_intro.htm).

European Chemicals Bureau (ECB)
Web: http://ecb.jrc.it

A Bureau that provides scientific and technical support for the conception, development, implementation, and monitoring of European Union policies related to dangerous chemicals.

European Ecological Natura 2000 Network
Web: http://natura2000.mos.gov.pl/natura2000

A website prepared with financial support of the European Union in the framework of the Poland and Hungary: Assistance for Restructuring their Economies (PHARE) Twinning Project 'Implementation of the European Ecological Natura 2000 Network in Poland'.

European Environment Information and Observation Network (EIONET)
Web: http://www.eionet.europa.eu

A partnership network of the European Environment Agency (EEA; http://www.eea.europa.eu) and its members and participating countries. The network supports the collection and organization of data and the development and dissemination of information concerning Europe's environmental information.

EIONET: Poland
Web: http://www.eionet.europa.eu/Countries/Poland

National Focal Point – Poland
Web: http://nfp-pl.eionet.eu.int

The Chief Inspectorate for Environmental Protection is the Polish National Focal Point of the EEA and the EIONET in Poland.

State of the Environment Reporting Information System (SERIS): Poland
Web: http://www.eionet.europa.eu/seris/view_on_coverage? country=pl

An open-access database with recent publications (1995 onwards) on the state of the environment in Poland.

Foundation for Polish Science
Web: http://www.fnp.org.pl

An independent, self-financing non-profit organization established in 1991 as a result of the system transformation in Poland. The Foundation's mission is to provide assistance and support to the scientific community in Poland.

Health Market (Rynek Medyczny)
Web: http://www.rynekmedyczny.pl

A multilingual, open access, interactive directory of Polish healthcare providers.

INFOBAZA – National Information Service of Databases and Software for Science (INFOBAZA – Krajowy Informator o Bazach Danych i Oprogramowaniu dla Nauki)
Web: http://infobaza.task.gda.pl

A search engine for locating Polish scientific databases and computer programs.

Journals Showcase
Web: http://witryna.czasopism.pl

Matters of Science – Bulletin of the Minister of Science and Higher Education (Sprawy Nauki – Biuletyn Ministra Nauki i Szkolnictwa Wyższego)
Web: http://www.sprawynauki.waw.pl

Medical Sites and Portals
Web: http://www2.bg.am.poznan.pl/inne/serwisy

ngo.pl – Portal of Non-Government Organizations (ngo.pl – Portal Organizacji Pozarządowych)
Web: http://www.ngo.pl

A compilation of resources available to non-governmental organizations (NGOs), including: a database of NGOs, the Polish voluntary sector, statistics and reports, and European Union funds in Poland. It is administered by Klon/Jawor Association (http://www.klon.org.pl).

Office of the Committee for European Integration
Web: http://www.ukie.gov.pl

It co-ordinates the works of all ministries and institutions directly engaged in the process of Poland's integration with the European Union.

Polish Clinical Toxicology
Web: http://www.poltox.net

An online resource with information on Polish toxicology centers.

Polish Portal of Environmental Protection (Ogólnopolski Portal Ochrony Środowiska)
Web: http://www.ppozbhp.pl/?3

Polish Portal of Occupational Safety and Health (Ogólnopolski Portal Bezpieczeństwa i Higieny Pracy)
Web: http://www.ppozbhp.pl/?2

Science in Poland
Web: http://www.staff.amu.edu.pl/~zbzw/ph/sci/naupol.htm

An overview of science in Poland, with topics covering: Nobel Prize laureates; famous discoverers, travelers, and scientists; a directory of scientific institutions; and searchable databases.

Science & Scholarship in Poland
Web: http://www.naukawpolsce.pl

An open-access service providing information on the achievements of over 60000 Polish scientists and scholars, their discoveries and inventions, and their inquiries into man, nature, and space. It reports on the life of Polish universities and research institutes as well as the most interesting events in the field both in Poland and worldwide.

The Central Medical Library (Główna Biblioteka Lekarska im. Stanisława Konopki)
Web: http://www.gbl.waw.pl

An online gateway providing access to resourses of the Central Medical Library. The Library, established in 1945, collects Polish medical and related literature as well as important titles of World medical literature.

The Internet Public Library: Poland
Web: http://www.ipl.org/div/news/browse/PL

A collection of links to Polish resources indexed by the University of Michigan's School of Information, USA.

The National Library
Web: http://www.bn.org.pl

The Researcher's Mobility Portal – Poland
Web: http://www.eracareers-poland.gov.pl

A collection of online resources intended to aid researchers planning on conducting research in Poland.

UNEP/GRID-Warsaw
Web: http://www.gridw.pl

Established in 1991 pursuant to the official agreement signed between the Director of the United Nations Environment Programme (UNEP; http://www.unep.org) and the Ministry of the Environment, Forestry, and Natural Resources of the Republic of Poland, UNEP/GRID (Global Resource Information Database) is a specialized center in charge of collecting and processing environmental information concerning Poland and Central and Eastern Europe.

University Accreditation Commission
Web: http://uka.amu.edu.pl

Provides standards and guidelines for quality assurance in the Polish higher education area.

Word Heath Organization (WHO)
Web: http://www.who.int

IPCS Directory of Poison Centres: European Region
Web: http://www.who.int/ipcs/poisons/centre/directory/euro/en (click 'Poland')

Country-specific listings of Poison Control Centres compiled by the International Programme on Chemical Safety.

WHO: Countries: Poland
Web: http://www.who.int/countries/pol/en

WHO Regional Office for Europe: Poland
Web: http://www.euro.who.int/countryinformation/CtryInfoRes?COUNTRY=POL

Online Databases

Biodiversity Clearing House Mechanism in Poland
Web: http://www.biodiversity-chm.org.pl

The main goal of this service is to ensure the mechanism of efficient exchange of information on biological diversity in Poland between involved persons and institutions.

Genetically Modified Organisms
Web: http://gmo.mos.gov.pl

Geological Cartography of Poland – Map Series
Web: http://www.pgi.gov.pl/mapy

Integrated Pollution Prevention and Control Poland (IPPC Poland)
Web: http://ippc.mos.gov.pl/preview/pl/ippc-ps_index.html

Internet Database of Treaties (Internetowa Baza Traktatowa)
Web: http://www.msz.gov.pl/apps/apps/?portlet=bpt/ linki

A site managed by the Ministry of Foreign Affairs of the Republic of Poland that contains lists and texts of all international treaties for which Poland is or was a party since January 1, 1950.

Internet System of Legal Acts (Internetowy System Aktów Prawnych)
Web: http://isip.sejm.gov.pl

An information resource managed by the Polish parliament, which contains bibliographic descriptions of all legislation since 1919.

Occupational Safety and Health Online (BHP Online)
Web: http://www.ciop.pl/7501.html

An access site for several databases managed by the Central Institute for Labour Protection – National Research Institute.

On-line Database on National Air Emission Inventories
Web: http://emissions.ios.edu.pl

Polish Environmental Impact Assessment Information and Communication System – INFOOS (Polski System Informacyjny Ocen Oddziaływania na Środowisko)
Web: http://www.mos.gov.pl:1090/fsystem

A publicly accessible list of data on documents containing information on the environment and its protection. User ID: gosc; password: gosc.

Polish Science (Nauka Polska)
Web: http://nauka-polska.pl

A searchable database of Polish science.

Polish Scientific Journal Contents
Web: http://psjc.icm.edu.pl

A searchable database of life science journals indexed by Index Copernicus.

Public Information Bulletin (Biuletyn Informacji Publicznej)
Web: http://www.bip.gov.pl

An easy access portal to important public information.

The National Library Computer Catalog
Web: http://alpha.bn.org.pl/screens/mainmenu.html

WebOPAC catalog of the National Library in Warsaw, Poland.

CHAPTER

101

Russia

B.A. KURLYANDSKIY, KH.KH. KHAMIDULINA, AND K.K. SIDOROV

HISTORY AND CURRENT STATE OF TOXICOLOGY IN RUSSIA

The history of toxicology in Russia is believed to date back to the late 18th and early 19th centuries. Toxicological studies were pursued more intensively at the Medical Surgical (Military Medical) Academy in St. Petersburg during the 19th century. As in other countries, the science of toxicology in Russia had its origin in forensic medicine and pharmacology.

During the early 20th century the growth of the chemical and military industries greatly contributed to the development of toxicology. Military toxicology advanced in parallel with military chemistry in the wake of World War I and for decades thereafter. It played an important role in the development of all the branches of classical toxicology: theoretical (fundamental principles), prophylactic, and chemical.

The most authoritative school in military toxicology emerged in today's St. Petersburg (formerly Petrograd and Leningrad). Later two other prominent schools in military toxicology were founded in Moscow and in Kiev.

The expansion of industrial toxicology dates from 1920s. In 1923 in Moscow the Research Institute of Occupational Diseases (now Research Institute of Occupational Health) was founded. Years later similar institutes were established in Kharkov (1923), Leningrad (1924), Baku (1924), Donetsk (1925), Sverdlovsk (now Ekaterinburg) in 1925 and others. Thanks to a wide range of research activities, for the first time basic principles for regulation of industrial poisons were formulated. The founders of Russian industrial toxicology were N.V. Lazarev (1895–1974) and N.S. Pravdin (1882–1954).

By the end of the 1960s basic principles of studying exposures to chemicals became clearly defined. During that period monographs summarizing the outcome of various studies were published by outstanding Soviet toxicologists.

A new stage in the history of toxicology was the rapid development of clinical and pharmacological toxicology. A specialized center for treatment of acute poisonings was opened under the auspices of the N.V. Sklifosovskiy Research Emergency Aid Institute in Moscow in 1963. E.A. Luzhnikov was a leader in the formation of the center. Around the same period, in Leningrad a similar center was established at the Military Medical Academy and on the basis of a military field hospital and a municipal emergency care center. Currently Russia has more than 46 poison centers.

The modern history of Russian toxicology is characterized by a number of important theoretical generalizations. Among them is the idea of common mechanisms of toxic actions of chemicals based on common biological concepts concerning the universal responses of living organisms to toxic exposures.

Another important achievement of Russian toxicology was the principle of natural detoxification which emerged from biochemical toxicology. Natural detoxification was considered the basis of adaptation and compensation mechanisms exhibited by organisms exposed to chemicals.

The emergence of extensive pesticide use in the 1960s and 1970s dictated increased investigations into the toxicology of these chemicals. Since the mid-1960s

and up to now chronic effects, such as carcinogenicity, mutagenicity, and teratogenicity have been intensively studied.

During the last two decades environmental toxicology and risk assessment have emerged as new and rapidly developing areas of toxicology. In recent years priority has been given to the toxicology of acute poisonings, drug toxicology, food toxicology, prophylactic toxicology, behavioral toxicology, toxicology of reproductive and endocrine systems, and genetic, reproductive, and developmental toxicology.

STATE REGISTRATION OF CHEMICAL AND BIOLOGICAL SUBSTANCES IN THE RUSSIAN FEDERATION

One of the major forms of activities in the field of protection of human health and the environment consists in collecting information sufficient for securing safety in production and use of chemical substances. For this purpose obligatory state registration of potentially hazardous chemical and biological substances was implemented in Russia by the Government's Act N869 of November 12th 1992. The necessity of this procedure was highlighted subsequently in Federal Law N52 of 1999 and in the Government's Act N554 of 2000.

In accordance with these Government's Acts all industrial chemicals, including ingredients in mixtures, which are manufactured in Russian or imported for use in production and daily life, must be registered. If the substance is well-known and has necessary hygienic and ecological standards, this chemical is registered on a permanent basis. The designation of a state registration number and issuing a state certificate to a substance confirm the adequacy and quality of information necessary to judge about its hazardous properties and recommended safety measures. If at the time of registration a minimum information is available but it allows to consider the hazard of the compound insignificant, the state registration is valid for a 3-year term with a special note in the registration certificate. In this case the applicant is officially notified of the reasons for temporary registration.

In Russia the denial of registration means that toxicological and hygienic data on a given substance are insufficient for its safe production and use and therefore the substance should be further studied, otherwise its production and use shall be prohibited.

Since 2004 state registration certificates have been issued by the Federal Service for surveillance on Consumer Rights Protection and Human Well-being, basing on toxicological and hygienic expertise carried out by the Russian Register of Potentially Hazardous Chemical and Biological Substances (RRPHCBS). The Russian Register of Potentially Hazardous Chemical and Biological Substances is a scientific and practical health establishment.

In the course of the expertise RRPHCBS develops and issues to the applicant the Information card of potentially hazardous chemical and biological substances which contains sufficient data about substances needed for their safe handling.

The 'Information card' is the most comprehensive and systematized inventory of data on all known physical and chemical, toxicological, environmental and other properties of hazardous substances.

The development of a clear set of characteristics, necessary for the state registration, made it possible to set up and put into operation a computerized information system 'Hazardous substances'. This database has 270 fields and is widely used by the sanitary and epidemiological surveillance bodies, enterprises and companies, manufacturers and consumers of chemical products.

Organizations (Non-Governmental)

All-Russian Society of Nature Protection

Founded in 1924 in the former USSR. In 1991 it was reorganized into a public organization of the Russian Federation. Its major goal is to ensure environmental safety of the population and sound use of nature. Its main activities are aimed at encouraging the solution of scientific and practical nature-protection measures, public monitoring of observance of nature-protection legislation and participation in the law-making process; organization of public club-like environmental movements in different environmental fields and in different regions of Russia; awareness raising of ecological issues among population at large. In particular, it contributed to the development of the Federal Law 'Protection of Lake Baikal'. It is one of the co-founders of the newspaper 'Green World' published since 1991.

ECO-Accord, Center for the Environment and Sustainable Development

'ECO-Accord' was established in 1992 as a non-governmental and non-commercial organization of the RF citizens. Its main goal is to promote the process of transition to the sustainable development by searching new approaches and solutions of environmental, economic, and social problems at global, national, and local levels, public awareness raising on issues of the environment and sustainable development. 'Eco-Accord' collaborates with a wide range of stakeholders from Russia and New Independent States on the territory of the former USSR as well as from all over the world. 'Eco-Accord' takes an active part in international processes, 'Environment for Europe', 'Environment and Health', co-operation for the environment and sustainable development in the Asia-Pacific Region. It promotes the implementation of international conventions and agreements on chemical management and safety in Russia. A special attention is drawn to the implementation of WSSD decisions and recommendations.

ECO-Defense

ECO-Defense is an ecological public organization, created in 1990, it is a member of the Social and Ecological Union; at present it has its sub-divisions in Moscow, Kaliningrad, Voronezh, and Ekaterinburg. Its goal is to contribute to the solution of ecological problems, to provide the population with ecological information and to promote right to know, to encourage the involvement of citizens in ecological campaigns aimed

at the protection of the environment; to enhance education of children and adults in ecology. ECO-Defense is particularly active in preventing the pollution of the Baltic Sea. ECO-Defense is editing a number of periodicals.

Green Cross. Russian National Organization

Russian Green Cross is a public organization, created in 1994, and has its representations in 23 RF subjects. It is one of the most influential ecology-protection movements in this country. Its goal is improving health of the environment and setting up safe conditions for humans. It promotes ecological education of the population, encourages conservation of forest and animal reservations, organizes events for cleaning up soil and water bodies in different Russian regions; it initiates convocation of ecological forums and round tables.

Greenpeace (Russian Branch of the international organization)

A Greenpeace office in Russia was established in 1989 and in 1992 it was given the name of Greenpeace Russia. In 2001 a Greenpeace subdivision was opened in Saint Petersburg. Greenpeace Russia seeks to protect biodiversity; prevent the pollution of oceans, land, air and fresh water; end all nuclear threats, promotes peace and non-violence; conducts campaigns for the use of renewable energy sources, elimination of toxic chemicals, against the release of genetically modified organisms to the environment.

Guild of Ecologists, Ecology in Russian Regions: Moscow and Moscow Region

Guild of Ecologists is a non-commercial association unifying reliable ecological companies and organizations giving priority to conservation of the environment, health, and human well-being. The main target of the Guild is to defend the interests of righteous undertakers-ecologists, to encourage high-quality ecological services, to promote best ecological technologies and initiatives. It closely co-operates with the Government of the Moscow City. It actively participates in home events dedicated to chemicals and waste management, clean air in workplaces and residential settings. It publishes a journal 'Ecological Review of the Moscow Region'.

International Social and Ecological Union

This organization was set up about 50 years ago. Officially established in Russia in 1988, it unifies activists of the ecological movement in Russia and ensures links between them and experts in different branches of science, jurists, with bodies responsible for the protection of the environment, mass-media and public organizations in foreign countries as well. Its main goal is conservation of the environment and ensuring its safety. Its scope covers a great number of fields including climate changes, urban ecology, conservation of unique natural ecosystems and recovery of affected territories; biological safety, chemical disarmament, contribution to the law -making process and monitoring of law-abidance in ecology; human health. The Union is a founder of a number of experts centers, initiates different programs, and supports initiatives of its members. Among its programs there is a program 'Chemical Pollution and Chemical Safety' (email: lefed@online.ru)

P.O. 211, 119019 Moscow
Phone: 7(494)-963-5420
Web: http://www.seu.ru/about/

Russian National Division of the World Wide Fund

The Russian representation of WWF was opened in 1994 and in 2004 it received the status of the WWF Russian National Organization. Its priority objectives are the development and conservation of especially protected natural zones in Russia (national parks, animal, and plant reservations, etc.); conservation of rare species of animals and plants; creation of economic tools to conserve biological diversity; promotion of nature-protection legislation; support of education in nature protection.

UNEP National Committee for Russia (UNEPCOM)

UNEP National Committee for Russia (UNEPCOM) was created in 1994. Its founders were the Russian Academy of Sciences, RF Foreign Office, Russian Academy of Natural Sciences, Union of Journalists of Russia and other stakeholders. UNEPCOM ensures interaction between UNEP and the civil society of Russia, contributes to the implementation of UN international agreements and programs in Russia, promotes WSSD recommendations for the environment protection and sustainable development in Russia.

Universities

In Russia, the teaching of basic principles of toxicology and its specialties has been traditionally conducted within a medical school curriculum. Thus, particular fields within toxicology may fall under various departments or 'chairs,' for example: chairs of pharmacology (general principles of toxicology); chairs of general hygiene (methodological principles of toxicometry and hygienic regulation); chairs of nutrition (food toxicology); chairs of communal hygiene (toxicology of chemicals contaminating water, atmospheric air and soil); chairs of military and emergency medicine. Recently, chairs on toxicology and related disciplines also have been established in a number of medical universities. Among these are the following.

Bashkir State Medical University, Ufa
3, Lenin str., 450 000, Yfa, Republic of Bashkorostan

CHAPTER

102

South Africa

MARY GULUMIAN

INTRODUCTION

Toxicology, as a distinct discipline, is not recognized in South Africa. It is taught at different universities as a subject in the overall syllabus within a number of scientific disciplines including Forensic Medicine, Pharmacology, Marine and Veterinary sciences, Environmental Health, and Occupational Hygiene. The level of toxicology taught in these syllabi may be basic and biased towards that particular sub-discipline. There is a need for these tertiary institutions to recognize Toxicology as a discipline in its own right and create opportunities to study and obtain higher degrees in one or more of the many sub-disciplines of toxicology.

The presence of toxicants in the environment, workplace and food products is increasingly being recognized in South Africa. The widespread use of biomass fuel and coal in South Africa as well as significant industrial activity has led to increased indoor and outdoor air pollution (Brent and Rogers 2002, Coetzee et al 1986) with increased levels of harmful particulate matter (Engelbrecht et al 2001, Naidoo and Chirkoot 2004). There is well-documented toxic metal contamination of soil and groundwater in the vicinity of industrial and mining sites (Grobler 1999, Oosthuizen and Ehrlich 2001). South Africa is also the largest user of pesticides in sub-Saharan Africa and rivers, wetlands and wildlife have been shown to be contaminated (Dalvie et al 2003, Fatoki and Awofolu 2004, van Wyk et al 2001). Traditional medicine is widely practiced in South Africa but the toxicity to humans and livestock of only a limited number of these herbal remedies has been investigated (Stewart et al 2002). Unfortunately, there is a severe shortage of adequately trained professionals to carry out the much-needed basic and applied research: toxicology testing and risk assessment of the toxic substances associated with industrial, mining, and other activities.

Against this background and with the support of the International Union of Toxicology (IUTOX), the Toxicology Society of South Africa (TOXSA) was established in 2001 in Stellenbosch by some one hundred interested scientists to promote and advance the study and application of toxicology in South Africa. TOXSA was admitted as a full national member society of IUTOX in 2004, having complied with all criteria of membership. TOXSA will be the host of the 7th Congress of the Toxicology in Developing Countries (7CTDC) to be held in South Africa in 2009.

RESOURCES

While most scientific work on toxicology and its allied disciplines is routinely published in international peer-reviewed journals, a substantial part of work emanating from these disciplines is published in local South African journals. Material published locally and internationally can be accessed via the appropriate websites on the Internet. Scientific work that may be of relevance to toxicology is also published in books by international publishing houses as well as by local publishers.

It seems that toxicological subjects investigated in the country concentrate mainly on issues pertaining to the environment where strong core institutes and research units that have been established over the years have mostly investigated the effects of metals, pesticides, and other pollutants on the ecosystem but

also have occasionally studied the effects of these pollutants on humans.

Books

Books on nutrition, medicinal and poisonous plants, pesticides, water research, mycotoxins and animal poisons have been published by local and international publishers.

Animal Poisons

Wiley Publishers
ISBN: 0-471-44164-3

Journals

The Department of Education (DE) in South Africa encourages research productivity by rewarding quality research output at public higher education institutions. Research output is defined as textual output that is original and peer-reviewed and is published either in the Department of Education accredited journals or in those listed in the ISI journal lists.

African Journal of Aquatic Science
ISSN: 1608-5914; EISSN: 1727-9364

Published semiannually in association with Southern African Society of Aquatic Scientists, the journal serves as a reference source for those interested in understanding the valuable aquatic resources of Africa. Amongst the topics covered in this journal are ecology, conservation, biomonitoring, management,

water quality, ecotoxicology, biological interactions, physical properties, and human impacts on aquatic systems. This journal is on the approved accredited list of the DE.

Web: http://www.nisc.co.za/journals?id=2; http://www.dwaf.gov.za/iwqs/sasaqs/Journal.htm
Phone: +27(0)33-344-2789
Email: mdcoke@futurenet.co.za

African Zoology
ISSN: 1562-7020

African Zoology is the official journal of the Zoological Society of Southern Africa. It is published online and can be accessed on the Internet at http://www.journals.co.za/ej/ejour_afzoo.html.

Postal address: School of Botany and Zoology, University of KwaZulu-Natal, Private Bag X01, Scottsville, 3209 South Africa
Phone: +27-(0)12-420-3232

Bothalia
ISSN: 0006-8241

Bothalia is listed on the ISI journal list and published semiannually by the South African National Biodiversity Institute (SANBI). It is devoted to botanical science, and covers taxonomy, ecology, anatomy, and cytology.

Web: http://www.sanbi.org/products/publications/bothalia.htm
Postal address: National Botanical Institute, Private Bag X101, Pretoria, South Africa
Phone: +27(0)12-843-5000
Fax: +27(0)12-804-3211

Journal of the South African Veterinary Association
ISSN: 0038-2809

The *Journal of the South African Veterinary Association* publishes reviews on various topics, clinical and non-clinical articles, research articles, and short communications as well as case reports and letters. It is included on the ISI Journal list and can be accessed at http://www.journals.co.za/ej/ejour_savet.html/.

Postal address: P.O. Box 25033, Monument Park 0105, South Africa

Koedoe
ISSN: 0075-6458

It is published semiannually by the South African National Parks of S.A. Currently it does not have a website. The journal is on the list of DE-accredited journals.

Postal address: P.O. Box 787, Pretoria 0001, South Africa

Occupational Health South Africa
ISSN: 1024-6274

Occupational Health South Africa is the official journal of the Mining Medical and Other Health Care Professionals Association (MMOA), South African Society of Occupational Health Nursing Practitioners (SASOHN), South African Society of Occupational Medicine (SASOM), and Southern African Institute for Occupational Hygiene (SAIOH). It is published bimonthly and can be accessed at http://ohsa.sheafrica.info/. The journal is on the approved accredited journal list of DE.

Postal address: Safety First, P.O. Box 14402, Club View 0014, South Africa
Phone: +27(0)12-654-8349

Onderstepoort Journal of Veterinary Research
ISSN: 0030-2465

The *Onderstepoort Journal of Veterinary Research* is published quarterly by the Agricultural Research Council and the University of Pretoria. The journal is ISI listed and publishes papers reporting on original research covering all aspects of veterinary science. It can be accessed at http://www.journals.co.za/ej/ejour_opvet.html.

Postal address: Bag X5, Onderstepoort 0110, South Africa

Ostrich
ISSN: 0030-6525, EISSN: 1727-947X

This journal is published semiannually by the National Inquiry Services Centre (NISC) in association with BirdLife South Africa. *Ostrich* is listed on the ISI journal list and publishes papers in the general field of ornithology in sub-Saharan Africa and its islands on subjects related to the behavior, biology, breeding, ecology, migrations, and movements and systematics of birds. It can be accessed at http://www.nisc.co.za/journals?id=6.

Postal address: BirdLife South Africa, P.O. Box 515, Randburg 2125, South Africa
Phone: +27(0)23-541-1828
Email: lycium@mweb.co.za

South African Journal of Animal Science

This journal is ISI listed and is published electronically by NISC SA triennially at approximately 3–4-month intervals and can be accessed on the Internet at http://www.nisc.co.za/ or through http://www.sasas.co.za/.

Postal address: P.O. Box 13884, Hatfield 0028, Pretoria, South Africa
Phone: +27(0)12-420-5017
Email: secretary@sasas.co.za

South African Journal of Botany
ISSN: 0254-6299

The *South African Journal of Botany* is the official journal of the South African Association of Botanists and publishes papers in any field of Botany. It is ISI listed and can be accessed on the Internet at http://www.ajol.info/journal_index.php?jid=118 or

http://www.ajol.info/journal_index.php?jid=118&tran=0&ab=0.

Postal address: Research Centre for Plant Growth and Development, University of Natal Pietermaritzburg, Private Bag X01 Scottsville 3209, South Africa
Phone: +27(0)46-622-9698

South African Journal of Clinical Nutrition
ISSN 0038-2469

The *South African Journal of Clinical Nutrition* is published quarterly and is the official joint publication of the Association for Dietetics in South Africa, the Nutrition Society of South Africa, and the South African Society of Parenteral and Enteral Nutrition. It is a peer-reviewed scientific journal and is published quarterly. It can be accessed at the http://www.sajcn.com/. It is one of the accredited journals by DE.

Postal address: c/o Dept of Human Nutrition, Stellenbosch University and Tygerberg Academic Hospital Fransie Van Zijl Avenue, Clinical Building, Tygerberg 7505, South Africa

South African Journal of Science
ISSN 0038-2353

This journal is published monthly and is the official publication of the Academy of Science of South Africa (ASSAf). It is an ISI listed journal and can be accessed on the Internet at http://www.sajs.co.za/.

Postal address: PO Box 72135, Lynwood Ridge 0040, South Africa
Phone: +27(0)12-420-4956/4965

South African Journal of Wildlife Research
ISSN: 0379-4369

Published biannually by the Southern African Wildlife Management Association (SAWMA) online and can be accessed on the Internet at http://www.sawma.co.za/. It is listed on the ISI journal list.

Postal address: P O Box 217, Bloubergstrand 7437, South Africa
Phone: +27(0)21-554-1297

South African Medical Journal
ISSN 0038-2469

The *South African Medical Journal* is published by the South African Medical Association, which represents most medical professionals in South Africa. It can be accessed at the https://www.ajol.info/journal_index.php?jid=76&ab=samj website. It is on the DE accredited journal list.

Postal address: Private Bag X1, Pinelands, 7430, South Africa
Phone: +27(0)21-530-6520.

Water South Africa
ISSN: 1816-7950

Water SA is published quarterly by the Water Research Commission (WRC). It contains original research articles and review articles on all aspects of water science, technology, and engineering. It can be accessed on the Internet at http://www.wrc.org.za/publications_watersa.htm.

Postal address: Private Bag X03, Gezina 0031, South Africa
Phone: +27(0)12-330-0340

Technical Reports and other Documents

A number of governmental and non-governmental organizations as well as tertiary education institutions publish technical reports on subjects that are of relevance to toxicology. These emanating from post-graduate work conducted at the latter institutions have also been included in this section as they may be considered as important contributions to subjects of relevance to toxicology.

Technical Reports

The following reports are available from the Water Research Commission (WRC).
Web: http://www.wrc.org.za/
Postal address: Private Bag X03, Gezina 0031, South Africa
Phone: +27(0)12-330-0340
Fax: +27(0)12-331-2565
Email: info@wrc.org.za

Databases

Agricultural Geo-Referenced Information System
Provides orientation atlas, natural resource atlas, demographic atlas and geo-references information systems
Web: http://www.agis.agric.za

Biodiversity GIS (BGIS): Highlighting the Hotspots
This is a unit within the South African National Biodiversity Institute (SANBI). It manages spatial biodiversity planning information and promotes the use of this information by making it freely available at this website: http://bgis.sanbi.org/.

Medical Research Council Health Knowledge Network is the African Trials Registry
Web: http://www.sahealthinfo.org.za

National Air Quality Information System (NAQIS)
For South Africa, this gives a multi-phased approach on the development of the national air quality information system in South Africa which will be developed by the Department of Environmental Affairs and Tourism (DEAT).
Web: http://www.environment.gov.za/HotIssues/2006/NAQIS/NAQIS%20Framework%20Document%20-%20Final%20Draft.pdf

National Chemical Monitoring Programme (NCMP)
This aim to provide regular reporting on the chemical quality of South Africa's surface waters.
Web: http://www.dwaf.gov.za/iwqs/water_quality/NCMP/default.htm

National Inquiry Services Centre (NISC SA)
Web: http://www.nisc.co.za/

This center was established in 1995 in Grahamstown in May 1995. NISC SA provides local and global information for Africa, about Africa and by Africans. By so doing, it launches African publishing and research into the world arena. It provides the following databases of relevance:

NISC Bibliographic databases
Web: http://www.nisc.co.za/databases
African HealthLine
Web: http://www.nisc.com/factsheets/qaha.asp
African Journals OnLine (AJOL)
Web: https://www.ajol.info/index.php

National Microbiological Monitoring Programme for Surface Water

This organization provides information on the status and trends of the extent of fecal pollution, in terms of the microbial quality of surface water resources in priority areas.

Web: http://www.dwaf.gov.za/iwqs/microbio/nmmp.htm

National Toxicity Monitoring Programme

This program measures, assesses, and regularly reports on the status and trends on the nature and extent of potentially toxic substances and toxic organisms in South African water resources in a manner that supports strategic management decisions in the context of fitness for use of those water resources.

Web: http://www.dwaf.gov.za/iwqs/water_quality/ntmp/index.htm

Pesticide Registration Information for South Africa
Web: http://www.pesticideinfo.org/Detail_Country.jsp?Country=South%20Africa

Plants of Southern Africa

This is an online checklist covering all southern African plants.

Web: http://posa.sanbi.org/searchspp.php

PlantZAfrica
Web: http://www.plantzafrica.com/

Has information about popular southern African plants such as plants of southern Africa:

Web: http://www.plantzafrica.com/frames/plants-fram.htm
and vegetation of southern Africa:
Web: http://www.plantzafrica.com/frames/vegfram.htm

Resource Quality Services

This is provided by the Department of Water Affairs and Forestry and lists a number of programs that give important toxicological information on water quality.

Web: http://www.dwaf.gov.za/iwqs/

South African National Biodiversity Institute (SANBI)

This provides information sources on southern Africa's biodiversity and can be accessed at http://www.sanbi.org/frames/infofram.htm. Databases on their website that are of interest to toxicology include:

South African National Bioinformatics Institute (SANBI) carries out analyses of genomes relevant to South African health research and biotechnology.
Web: http://www.sanbi.ac.za/

South African Traditional Medicines Database is developed and maintained by the South African Traditional Medicines Research Unit at the University of Cape Town, South Africa. The database contains information on the reported medicinal treatments, chemical information, pharmacological and toxicological content of a wide variety of South African Traditional medicines.
Web: http://www.mrc.ac.za/Tramed3/

Strategic Framework for Monitoring and Assessment of Water Quality and Aquatic Ecosystem Health
Web: http://www.dwaf.gov.za/iwqs/wrmais/default.htm

This programme can be accessed at:

Organizations (government)

Department of Agriculture

The Department of Agriculture ensures access to sufficient safe and nutritious food and the enhanced sustainable management of natural agricultural resources and ecological systems.

Web: http://www.nda.agric.za/.
Postal address: Private Bag X250, Pretoria, 0001, South Africa
Address: 20 Beatrix Street, Arcadia, Pretoria 0002, South Africa
Phone: +27(0)12-319-6000.

Department of Education

The Department of Education, among its many other functions, gives accreditations to locally published scientific journals to reward researchers who publish in these and other journals that are listed on the ISI journal lists.

Web: http://www.education.gov.za/
Postal address: Private Bag X895, Pretoria, 0001, South Africa
Address: Sol Plaatje House, 123 Schoeman Street, Pretoria
Phone: +27(0)12-312-5911
Fax: +27(0)12-325-6260

Department of Environmental Affairs and Tourism (DEAT)
Web: http://www.environment.gov.za/
Postal address: Private Bag X447, Pretoria 0001, South Africa
Address: 315 Pretorius Street, cnr. Pretorius & van der Walt Streets, Fedsure Forum Building, North Tower, 2nd Floor (Departmental reception) OR, 1st Floor (Departmental information center), Pretoria, 0001
Phone: +27(0)12-310-3911, or Call Center number 086-111-2468

Lead projects of this Department include:
National Biodiversity Strategy and Action Plan
Web: http://www.environment.gov.za/ProjProg/ProjProg/2004Jun10/natStrategy_26052004.html
National State of the Environment Report
Web: http://www.ngo.grida.no/soesa/
National Waste Management Strategy Implementation Project
Web: http://www.environment.gov.za/nwmsi/index.html
South African Air Quality Information System (SAAQIS)
Web: http://www.environment.gov.za/HotIssues/2006/NAQIS/NAQIS.html
State of the Environment Initiative
Web: http://www.environment.gov.za/soer/overview.html

Department of Health

The Department of Health aims to improve access to health care for all and also to improve the quality of care at all levels of the health system.

Web: http://www.doh.gov.za/
Postal address: Private Bag X828, Pretoria, 0001
Phone: +27(0)12-312-0000
Fax: +27(0)12-326-4395

Department of Science and Technology

The mission of this Department includes the facilitation of the National System of Innovation for communities, researchers, industry, and government.

Web: http://www.dst.gov.za/
Postal address: Postal Address: Private Bag X894, Pretoria 0001
Address: DST Building (Building no. 53), (CSIR South Gate Entrance), Meiring Naude Road, Brummeria 0001
Phone: +27(0)12-843-6300.

Department of Water Affairs and Forestry

The Department of Water Affairs and Forestry is responsible for conserving, managing, and developing water resources and forests in a scientific and environmentally sustainable manner. Web: http://www.dwaf.gov.za/

Postal address: Private Bag X313, Pretoria 0001, South Africa
Address: Sedibeng Building, 10th Floor, R1029, 185 Schoeman Street, Pretoria, South Africa
Phone: +27(0)12-336-7500
Fax: +27(0)12-328-4254

Organizations (non-government)

AVCASA

The Association of Veterinary and Crop Association of South Africa (AVCASA) was established in 1958 to represent companies involved in the crop protection and animal health products industry in South Africa. Web: http://www.avcasa.co.za/contacts.html. Over the years it has changed identity several times. From early 2003, the AVCASA represents three affiliate associations, namely, South African Animal Health Association (SAAHA; http://www.saaha.co.za), CropLife SA (www.croplife.co.za) and the Agricultural Chemical Distribution Association of South Africa (ACDASA; http://www.acdasa.co.za).

AVCASA promotes the interest of its members by providing guidelines for the classification, labeling, responsible handling and storage of products, occupational hazards and personal protection, as well as the disposal of waste and empty containers. It also serves the farmer by providing guidelines for the safe storage and responsible use of crop protection and animal health products on the farm, stressing the personal protection of farm workers and by offering training programs in responsible product handling and usage.
Postal address: PO Box 1995, Halfway House, 1685, South Africa
Address: Lanzerac, Constantia Park 526, 16th Road, Midrand, South Africa
Phone: +27(0)11-805-2000
Fax: +27(0)11-805-2222
Email: info@saaha.co.za

Biotechnology Innovation Centres (BRICs)

The National Biotechnology Strategy was released by the Department of Science and Technology in 2001 in order to develop the South African biotechnology industry to the extent that it can begin to address national needs and become established within the global biotech industry. Four centers were established around the country to develop an active and sustainable biotechnology sector in South Africa. New projects have a strong focus on different areas of health biotechnology: diagnostics, drug discovery and development, vaccines and bioprocess technologies and nutraceuticals from Biotech processes.

BioPAD is based in Pretoria.
Web: http://www.biopad.org.za/
Postal address: P.O. Box 75887 Lynnwood Ridge 0040, South Africa
Address: The Innovation Hub, Unit 3&4, Enterprise Building, Mark Shuttleworth Street, Persequor, Pretoria
Phone: +27(0)12-844-0145
Fax: +27(0)12-844-0153

Cape Biotech is based in Cape Town.
Web: http://www.capebiotech.co.za/cat1.php?catID=2
Postal address: P O Box 13372, Mowbray 7705, South Africa
Address: 1st Floor, Minolta House, Black River Park, Fir Rd, Observatory 7925, South Africa
Phone: +27(0)21-442-3780
Fax: +27(0)21-442-3781
E-mail: info@capebiotech.co.za

LIFElab is based in Cato Manor on the East Coast.
Web: http://www.lifelab.co.za/questions.asp
Postal address: P O Box 30603, Mayville 4058
Address: 750 Francios Road, Intuthuko Junction, Pod 8, Level 2, Cato Manor
Phone: +27(0)31-261-6427
Fax: +27(0)31-261-4581

PlantBio is based in Hayfields.
Web: http://www.plantbio.org.za/about.asp
Postal address: Postnet Suite 201, P/Bag X6, Cascades 3202
Address: Suite 38, Hayfields Mall, 28 Blackburrow Road, Hayfields 3201
Phone: +27(0)33-846-1980
Fax: +27(0)33-846-1983/1990

The Medicines Control Council

The MCC operates through external experts who are members of Council. Committee structures comprise of the African Traditional Medicines Committee, Veterinary Clinical Committee, Biological Committee, Clinical Trials Committee, Pharmacovigilance Committee, Complimentary Medicines Committee, Analytical Committee, Clinical Committee, Pharmaceutical/Bioavailability Committee and the Scheduling Committee. The experts evaluate data sets submitted by the pharmaceutical industry for purposes of registration. The Council, in considering whether a medicine is suitable for use for its intended purpose, assesses its relative risk against the benefits. The Medicines and Related Substances Control Act 101 of 1965 defines a medicine.

Web: http://www.mccza.com/
Phone: Clinical Evaluation & Trials +27(0)12-312-3264; Inspectorate and Law Enforcement +27(0)12-312-0861; Medicines Evaluation & Research +27(0)12-312-0057

The National Health Laboratory Service (NHLS)

Web: http://www.nhls.ac.za/
Postal address: P.O. Box 1038, Johannesburg, South Africa, 2000
Address: 1 Modderfontein Road, Sandringham, Johannesburg, South Africa
Phone: +27(0)11-386-6000
Fax: +27(0)11-386-6002
Email: louise.blake@nhls.ac.za

The NHLS has two specialized divisions that conduct research of relevance to toxicology:

National Institute for Occupational Health (NIOH) supports the development and provision of occupational health services in South Africa. It houses the Department of Toxicology and Biochemistry which conducts research on the health effects of the exposures of biological systems and human populations to occupational and environmental contaminants within a risk assessment framework.

Web: http://www.nioh.ac.za/.
Postal address: P.O. Box 4788, Johannesburg 2000, South Africa
Address: 25 Hospital Street, Constitution Hill 2001, Johannesburg, South Africa
Phone: +27(0)11-712-6400
Fax: +27(0)11-712-6545/+27(01)11-712-6532
E-mail: Info@nioh.nhls.ac.za

The National Institute for Communicable Diseases (NICD) is one of the major global role players in infectious disease intelligence.
Web: http://www.nhls.ac.za/div_nicd.html
Postal address: P.O. Box 1038, Johannesburg, South Africa, 2000
Address: 1 Modderfontein Road, Sandringham, Johannesburg, South Africa
Phone: +27(0)11-386-6000
Fax: +27(0)11-386-6002

The Nuclear Energy Corporation of South Africa

NECSA is a public company in terms of the Nuclear Energy Act, 1999 and is wholly owned by the State. Among its other functions, it undertakes and promotes research and development in the field of nuclear energy and radiation sciences and technology. Apart from its main operations at Pelindaba, NECSA also operates the Vaalputs radioactive waste-disposal facility. It also provides a 24-hour emergency service for nuclear-related accidents throughout Africa. It is used (among other things) to produce radioisotopes that are used to fight diseases and to accurately measure critical process parameters such as levels of radioactivity, mass, density and quality and thus helps to keep the wheels of industry turning. NECSA is accredited by the International Atomic Energy Agency as a regional designated center, servicing the rest of Africa in radioactive waste management. The Corporation has been given the responsibility of developing a low-cost radioactive waste-disposal facility – known as the Borehole Nuclear Waste Disposal System – to be used for the disposal of radioactive waste from hospitals on the continent.

Web: http://www.necsa.co.za/
Postal address: P.O. Box 582, Pretoria 0001, South Africa
Address: Church Street West Extension, Pelindaba, Brits District, South Africa
Phone: +27-12-305-4911
Fax: +27-12-305-3111
Email: info@necsa.co.za

The Safety in Mines Research Advisory Committee

SIMRAC was established in terms of Section 29 (9) (a) of the Minerals Act (Act 50 of 1991) with the principal objective of advising the Mine Health and Safety Council on the determination of the safety risk on mines and the need for research into safety on mines based on the safety risk.

Web: http://www.simrac.co.za/homepage.htm
Postal address: Private Bag X63, Braamfontein 2017, Johannesburg, South Africa
Address: 2nd Floor Braamfontein Centre, 23 Jorissen Street, Braamfontein, Johannesburg, South Africa
Phone: +27-11-358-9180/9187
Fax: +27-11-403-1821
Email: bmosiuoa@mhsc.org.za

Science Councils

There are currently eight science councils in South Africa six of which are of relevance to toxicology.

Web: http://www.ird.fr/fr/science/dss/sciences_afrique/pdf/south_af/south_af6_rd_performers.pdf

The Agricultural Research Council (ARC) (http://www.arc.agric.za) is based in Pretoria and is a statutory parastatal body formed in terms of the Agricultural Research Act, 1990 (Act 89 of 1990). Its mission states that it is committed to the promotion of agriculture and related sectors through research, technology development and technology transfer, in order to optimize the role of agriculture in respect of national growth and development in the Republic of South Africa. The ARC has 15 research institutes under its control which in turn are divided into three categories: specialist institutes, plant science institutes, and animal science institutes. Of these the Onderstepoort Veterinary Institute is of importance as it houses the Department of Toxicology.

Web: http://www.arc.agric.za/home.asp?pid=614
Physical address: 1134 Park Street, Hatfield, Pretoria
Address: P O Box 8783, Pretoria, 0001, South Africa
Phone: +27(0)12-427-9700
Fax: +27(0)12-342-3948

Toxicological Diagnostics screens samples for toxic substances, verifies analytical results, advises clients, investigates unknown causes of livestock poisoning and interprets laboratory results in a meaningful manner to clients.

Animal Bio-laboratory houses cattle, sheep and small animals (mice, rats, guinea pigs) for animal experiments and toxicity testing.

Research laboratories investigate mechanisms for controlling poisoning of livestock by poisonous plants.

The Council for Mineral Technology (MINTEK) conducts research on mineralogical examination of ores, refining technologies and the manufacture of end-products.

Web: http://www.mintek.co.za/
Postal address: Private Bag X3015, Randburg 2125, South Africa
Address: 200 Hans Strijdom Drive, Randburg, Johannesburg, South Africa
Phone: +27(0)11-709-4111
Fax: +27(0)11-793-2413
Email: info@mintek.co.za

The Council for Scientific and Industrial Research (CSIR) was established in 1945 and presently is the largest community and industry-directed scientific and technological research, development and implementation organization in Africa. It conducts contract research, and provides, among other services, specialist consulting, education and training, and global science and technology links. Numerous divisions provide these services, a number of which specialize in toxicology.

Web: http://www.csir.co.za/plsql/pTl0002/PTL0002_PGE001_HOME
Postal address: P O Box 395, Pretoria 0001, South Africa
Address: Meiring Naudé Road, Brummeria, Pretoria, South Africa
Phone: +27(0)12-841-2000/2911
Fax: +27(0)12-349 1153
Within CSIR, there are four sections that conduct work relevant to toxicology.

Bio/Chemtek provides contract research to customers in the broad area of biotechnology and chemical manufacturing technology. The range of technology solutions and information also covers the chemical process industries and the manufacture of bio-chemicals.

Web: http://www.csir.co.za/plsql/pTl0002/PTL0002_PGE106_SITE_SRCH_RSLT

Environtek (Water, Environment and Forestry Technology)

Environtek provides technologies for environmental assessment and management, terrestrial resources and environmental management, forestry and forest products, water resource management and coastal development and marine resources.

Biotoxicology, a subsection of Environtek, concentrates on aquatic biotoxicology. Research conducted by this group is focused on the development, modification, evaluation and application of biological assays.

Web: http://www.csir.co.za/environmentek/biotox/biotoxweb/index.html
Links to some of the projects are given below:
Endocrine Disruption Studies
Web: http://www.csir.co.za/environmentek/biotox/biotoxweb/research_endocrine/endocrine_frame.html
Biomarker Studies

Toxicity Tests
Web: http://www.csir.co.za/environmentek/biotox/biotoxweb/research/continuous.html

Centre for Integrated Waste Management provides practical, cost-effective and innovative approaches to dealing with waste.
Web: http://www.csir.co.za/ciwm/

Natural Resources and the Environment with a main focus on pollutions and waste, to reduce human activity-induced pressures on the environment. Research areas include Air Quality and Climate Change, Integrated Waste Management and Industrial Ecology, Coastal and Marine Pollution, and Water Treatment and Remediation.

Web: http://www.csir.co.za/plsql/pTl0002/PTL0002_PGE005_DIVISIONS?DIVISION_ NO=7318422

The National Research Foundation (NRF) acts as the main national funding agency and also as the administrative address for four national research facilities namely, Hartebeesthoek Radio Astronomy Observatory near Krugersdorp in Gauteng, the J.L.B. Smith Institute for Ichthyology Research (Grahamstown), the National Accelerator Centre in Faure, Western Cape and the South African Astronomical Observatory in Cape Town and Sutherland. These report to the NRF and are subsidized by the state.

Web: http://www.nrf.ac.za/
Postal Address: P O Box 2600, Pretoria 0001, South Africa
Address: Meiring Naudé Road, Brummeria, Pretoria, South Africa
Phone: +27-12-481-4000/4001
Fax: +27-12-349-1179
Email: info@nrf.ac.za

The South African Bureau of Standards (SABS) provides numerous services including compliance with National Standards, certification of products and services to assure quality and safety. The SABS is a member of the International Organisation for Standardisation and the International Electrotechnical Commission and is closely involved in the activities of the SADC and the Pacific Area Standards Congress.

Web: https://www.sabs.co.za/
Postal address: Private Bag X191, Pretoria 0001, South Africa
Address: 1 Dr Lategan Road, Groenkloof, Pretoria
Phone: +27(0)12-428-7911
Fax: +27(0)12-344-1568

The South African Medical Research Council (MRC) was established in 1969. Its mandate, among others, is to strengthen and develop institutional research capacity and also provide scientifically based information on health status in South Africa. It therefore funds university-based centers, units and groups – a number of which conduct research on topics of importance in toxicology.

Web: http://www.mrc.ac.za/
Postal address: P O Box 19070, 7505 Tygerberg, South Africa
Address: Francie van Zijl Drive, Parowvallei, Cape, South Africa.
Phone: +27(0)21-938-0911
Fax: +27(0)21-938-0200
Email: info@mrc.ac.za

The PROMEC Unit is based in Cape Town and whose main thrust is to address health issues related to food safety, nutrition and cancer.

Web: http://www.mrc.ac.za/promec/contents.htm

Its current projects can be found at http://www.mrc.ac.za/promec/projects.htm and include: The Identification and Human Exposure to Food- and Water-Borne Toxins; Cancer Registry; Epidemiology and Early Detection; Experimental Carcinogenesis; Occurrence, Incidence, Taxonomy and Toxicity of Toxigenic Fungi and the Antimutagenic and Cancer-modulating Properties of Two Unique South African Herbal Teas: Rooibos (*Aspalathus linearis*) and Honeybush (*Cyclopia genistoides*).

Web: http://www.mrc.ac.za/promec/antimutagenic.htm

The Environment and Health Research Unit is based in Johannesburg and conducts research on environmental health and nutrition.

Web: http://www.mrc.ac.za/healthdevelop/projects.htm

The South African Traditional Medicines Research Unit is based in Cape Town. Its main activities include a comprehensive traditional database for East and Southern Africa; a traditional medicines formulary; laboratory screening of traditional medicines for activity in malaria and tuberculosis and the development of systems for the scientific understanding of the action and uses of 'essential' traditional medicines in the treatment and prevention of disease.

Web: http://www.mrc.ac.za/traditionalmedicines/traditionalmedicines.htm

The South African Institute for Environmental Health

SAIEH aims to promote science and the practice of environmental health.

Web: http://www.saieh.co.za/
Postal address: Private Bag X37, Greyville 4023, South Africa
Address: 34 Wallace Rd, Morningside, Durban, 4000
Phone: +27-(0)31-303-2480
Fax: 031-312-9441
Email: sue@saieh.co.za

The South African National Accreditation System

SANAS is recognized by the South African Government as the single National Accreditation Body that gives formal recognition that Laboratories, Certification Bodies, Inspection Bodies, Proficiency Testing Scheme Providers and Good Laboratory Practice (GLP) test facilities are competent to carry out specific tasks.

Web: http://www.sanas.co.za.
Postal address: Private Bag X23, Sunnyside 0132, Pretoria, South Africa
Address: The DTI Campus, 77 Meintjies Street, Sunnyside, Pretoria 0002, South Africa
Phone: +27(0)12-394-3760
Fax: +27(0)12-394-0526

The South African National Biodiversity Institute

SANBI was established in 2004 with the intention that it will be the leading institution in biodiversity science in Africa, facilitating conservation, sustainable use of living resources and human wellbeing. It provides number of services amongst which MEDBASE, the National Medicinal Plants Database for South Africa is a system of databases holding holistic data on the 300 most important traditional medicinal plants of southern Africa.

Web: http://www.sanbi.org/homepage.htm
Postal address: Private Bag X101, Pretoria 0001, South Africa
Address: 2 Cussonia Ave, Brummeria, Pretoria
Phone: +27-12-843-5000
Fax: +27-12-804-3211
Email: info@sanbi.org

The Unilever Centre for Environmental Water Quality

UCEWQ was established in 2002 and is based at the Rhodes University, Institute for Water Research. Its main mandates include protecting water resources, research and monitoring, training and consultancy.

Web: http://www.ru.ac.za/institutes/iwr/ucewq/index.html
Postal address: P O Box 94, Grahamstown 6140, South Africa
Address: Old Geology Building, Artillery Road, Grahamstown, Eastern Cape South Africa
Phone: +27-46-622-4014/2428/4014
Fax: +27-46-622-9427
Email: ucewq@iwr.ru.ac.za

The Water Research Commission

WRC operates in terms of the Water Research Act (Act 34 of 1971). Its mandate is to support water research and development as well as the building of a sustainable water research capacity in South Africa. It funds a number of projects of which the Water and Health relevant to Toxicology.

Web: http://www.wrc.org.za/
Address: Marumati Building, c/o Frederika Street and 18th Avenue, Rietfontein, Pretoria
Postal address: Private Bag X03, GEZINA 0031, South Africa
Phone: +27-12-330-0340
Fax: +27-12-331-2565
Email: info@wrc.org.za

Universities

South African universities do not offer programs in toxicology at graduate (MSc, PhD or National Diploma) levels but many of them offer it as a subject in Environmental health. Others offer postgraduate programs that include toxicology in their curricula.

Cape Peninsula University of Technology

It is situated in Cape Town and is a result of a merger between the Cape and Peninsula Technikons.

Web: http://www.cput.ac.za/.
It is spread over five different campus sites.
For general information: +27(0)021-959-6121, info@cput.ac.za
In the Faculty of Applied Sciences situated in the Bellvile Campus, it offers courses and post graduate programs in Environmental Health (http://info.cput.ac.za/prospectus/qual.php?q=94&d=8) which include the National Diploma (http://info.cput.ac.za/prospectus/qual.php?q=94&f=3), Baccalaureus Technologiae (http://info.cput.ac.za/prospectus/qual.php?q=95&f=3), Magister Technologiae (Research-based Degree or Course-driven Degree) (http://info.cput.ac.za/prospectus/qual.php?q=102&f=3) and Doctor Technologiae Environmental

Health (Course Aim) (http://info.cput.ac.za/prospectus/qual.php?q=103&f=3).
Postal address: P.O. Box 1906, Bellville 7535, Cape Town, South Africa
Address: Symphony Way, (off Moderdam Road), Bellville
Phone: +27(0)21-460-6911
Fax: +27(0)21-460-3698
or Tel. Faculty Office: +27(0)21-959-6569
Fax: +27(0)21-959-6118
Email: jepthai@cput.ac.za

Central University of Technology

This was previously the Technikon Free State. It was opened on 1 January 1981. The first schools or academic sections were Engineering, Management, and Art and Design.

Web: http://www.cut.ac.za/web/academics

Later the Faculty of Health and Environmental Sciences was added. It consists of two Schools, namely the School of Health Technology as well as the School for Agriculture and Environmental Sciences offering National Diploma programs and B. Tech, Master's and doctorate degrees.

Web: http://www.cut.ac.za/web/academics/faculties/hea/homepage.
Postal address: Private Bag X20539, Bloemfontein 9300, Free State, South Africa
Phone: +27-(0)51-507-3911
Fax: +27-(0)51-507-3199

Durban University of Technology

This university is the result of a merger between the ML Sultan Technikon and Technikon Natal.

Web: http://www.dut.ac.za/
Phone: +27(0)31-204-2696
Fax: +27(0)31-204-2038

It is spread over seven different campus sites. It offers postgraduates a program on Environmental Health in the Department of Environmental Health located in Mansfield Road.

Web: http://www.dut.ac.za/department.aspx?id=64&fid=4#
Phone: +27(0)31-204 2111
Fax: +27(0)31-202-3405

Mangosuthu Technikon (MANTEC)

This establishment is situated on the outskirts of Durban.

Web: http://www.mantec.ac.za/
Postal address: P.O. Box 12363, Jacobs 4026, South Africa
Address: Mangosuthu Highway, Umlazi, KwaZulu-Natal, South Africa
Phone: 27(0)31-907-7111
Fax: +27(0)31-907-2892

It houses the Department of Environmental Health in the Faculty of Natural Sciences and it offers a National Diploma course in Environmental Health.

Web: http://www.mantec.ac.za/envirohealth.html
Phone: +27(0)31-907-7242
Fax: +27(0)31-907-7242

Nelson Mandela Metropolitan University (NMMU)

This university was opened on 1 January 2005, the result of a merger of the Port Elizabeth Technikon, the University of Port Elizabeth, and the Port Elizabeth campus of Vista University. In its Faculty of Health Sciences it offers National Diploma programs, undergraduate (Baccalaureus Technologiae, B Tech) and post graduate degrees (Magister Technologiae (M Tech) and Doctor Technologiae (D Tech)) in Environmental Health.

Web: http://www.nmmu.ac.za/default.asp?bhcp=1
Web: http://www.nmmu.ac.za/default.asp?id=181&bhcp=1
Postal address: P.O. Box 77000, Nelson Mandela Metropolitan University, Port Elizabeth 6031, South Africa
Phone: +27(0)41-504-2121/2111
Fax: +27(0)41-504-2854

Rhodes University

It is situated in Grahamstown. Within its Faculty of Science in the Department of Environmental Sciences, which offers post graduate degrees BSc, BEcon, BJourn and BA, it also offers an undergraduate program (BSc) in Environmental Sciences.

Web: http://www.ru.ac.za/
Web: http://www.scifac.ru.ac.za/scisub.htm
Web: http://campus.ru.ac.za/?action=category&category=45/
Web: http://campus.ru.ac.za/index.php?action=category&category=1419
Department of Environmental Science, Rhodes University, P.O. Box 94, Grahamstown 6140, South Africa
Phone: +27(0)46-603-7002
Fax: +27(0)46-622-9319

In addition, the Faculty of Science houses the Institute for Water Research and the Unilever Centre for Environmental Water Quality.

Web: http://www.ru.ac.za/institutes/iwr/
Web: http://www.ru.ac.za/institutes/iwr/ucewq/index.html
Postal address: Institute for Water Research, Rhodes University, P O Box 94, Grahamstown 6140, South Africa
Phone: +27(0)46-622-4014
Fax: +27(0)46-622-9427

Finally, in the Faculty of Pharmacy is the Biopharmaceutics Research Institute which conducts contractual research in drug testing and development.

Web: http://www.ru.ac.za/academic/departments/pharmacy/
Postal address: Biopharmaceutics Research Institute, Rhodes University, Grahamstown 6139, South Africa
Phone: +27(0)46-603-8189
Fax: +27-(0)46-636-1205

North-West University

This university was created in 2004 from the merger of the University of North-West with the Potchefstroom University for Christian Higher Education.

Web: http://www.nwu.ac.za/nwu/terms-and-conditions.html

In its Faculty of Natural Sciences there is the Centre for Environmental Management public where training courses are provided on environmental management.

Web: http://www.puk.ac.za/fakulteite/natuur/index_e.html
Web: http://www.puk.ac.za/fakulteite/natuur/soo/cem/index.html

In its School of Pharmacy it houses the Drug Research and Development unit which provides services in this field.

Tshwane University of Technology

This university is situated in Pretoria but has other campuses in other parts of the country.

Web: http://www.tut.ac.za/tut_web/

In its Faculty of Science it houses the Department of Environmental Health which offers postgraduate programs (Bachelor's Degree in Technology, Master's Degree in Technology and Doctorate in Technology) in Environmental Health.

Web: http://www.tut.ac.za/tut_web/index.php?struc=951
Postal address: Private Bag X680, Pretoria 0001, Republic of South Africa
Phone: +27 (0)12-382-5911
Fax: +27 (0)12-382-5114

University of Cape Town

The University of Cape Town is situated in Cape Town and is South Africa's oldest university.

Web: http://www.uct.ac.za/

In the Faculty of Science the Department of Environmental and Geographical Science focuses on issues relating to environmental change and human–environment interactions. It offers undergraduate and graduate (MSc and PhD) programs in Environmental and Geographical Science.

Web: http://www.egs.uct.ac.za/
Postal address: Department of Environmental and Geographical Science, University of Cape Town, Private Bag X3, Rondebosch 7701, South Africa
Address: Shell Environmental and Geographical Science Building, South Lane, Upper Campus, University of Cape Town
Phone: +27(0)21-650-2873/4
Fax: +27(0)21-650-3456
Email: admin@enviro.uct.ac.za

The Environmental Evaluation Unit (EEU) is an independent, self-funded consulting, research, and training unit. It undertakes work throughout South Africa and the SADC countries, and provides expertise to leading private and public corporations, research institutions, planning and development organizations, state departments, local authorities, and communities.

Web: http://www.egs.uct.ac.za/eeu/index.html

Email: info@acdasa.co.za

Chemical and Allied Industries' Association (CAIA)

This was established in 1993 and since 1994 the CAIA launched Responsible Care in South Africa to respond to public concerns about the manufacture, storage, transport, use, and disposal of chemicals.

Web: http://www.caia.co.za/index.htm
Postal address: P.O. Box 91415, Auckland Park 2006, South Africa
Phone: +27-(0)11-482-1671

Paraffin Safety Association of Southern Africa

This was borne out of concern of high paraffin poisoning in the country. It provides educational material to paraffin users through a network of partnerships. These include NGOs, community groups, emergency and healthcare workers, herbalists and any other group or individual who can effectively disseminate safety information. It has trained a corps of master trainers who train and provide educational material in the 11 official languages to these community partners. Following the government gazetting legislation on stove standards, the Paraffin Safety Association is focusing on packaging standards to ensure paraffin is sold in clearly marked, childproof containers.

Poison Working Group
Web: http://www.ewt.org.za/workgroups_overview.aspx?group=poison&page=overview

The aim of the Poison Working Group of the Endangered Wildlife Trust is to protect all elements of wildlife in southern Africa against deliberate or unintentional harm by stopping irresponsible and insensitive practices involving poisons.

Postal Address: The Endangered Wildlife Trust, Private Bag X11, Parkview, 2122, South Africa
Address: The Gold Fields Environment Centre, Johannesburg Zoological Gardens, Parview, South Africa

Fax: +27(0)11-486-1506
Email: ewt@ewt.org.za

Legislation

Various Acts are promulgated by different governmental departments pertaining to toxicology. In addition, a great number of Bills, Regulations and Guidelines are also published within these Acts that can be accessed on their respective websites.

Environment Conservation Amendment Act, 2003
Substitution of section 20 of Act 73 of 1989, as substituted by section 9 of Act 79 of 1992
Web: http://www.environment.gov.za/PolLeg/Legislation/2004Mar17_2/ECA_Act50-03.pdf

Fertilizers, Farm Feeds, Agricultural Remedies and Stock Remedies Act No. 36, 1947
Web: http://www.nda.agric.za/act36/main.htm

Foodstuffs, Cosmetics and Disinfectants Act 54, 1972

Controls the sale, manufacture and importation of foodstuffs, cosmetics and disinfectants; and provides for incidental matters.

Web: http://www.doh.gov.za/docs/index.html

Genetically Modified Organisms Act, 1997

It applies to (a) the genetic modification of organisms; (b) the development, production, release, use and application of genetically modified organisms (including viruses and bacteriophages); and (c) the use of gene therapy.

Web: http://www.doh.gov.za/docs/index.html

Hazardous Substances Act, 1973

It provides for the control of substances which may cause injury, ill-health or death of human beings by reason of their toxic, corrosive, irritant, strongly sensitizing or flammable nature or the generation of pressure thereby in certain circumstances, and for the control of certain electronic products.

Web: http://www.doh.gov.za/docs/index.html

Higher Education Act 101, 1997

This Act regulates higher education. Its purpose is to provide for the establishment, composition, and functions of a Council on Higher Education; to provide for the establishment, governance, and funding of public higher education institutions; to provide for the appointment and functions of an independent assessor; to provide for the registration of private higher education institutions; to provide for quality assurance and quality promotion in higher education; to provide for transitional arrangements and the repeal of certain laws and to provide for matters connected therewith.

Web: http://www.education.gov.za/dynamic/dynamic.aspx?pageid=329&catid=12&category=Acts&legtype=1

Marine Pollution Act, 1981

It provides for the protection of the marine environment from pollution by oil and other harmful substances, and for that purpose to provide for the prevention and combating of pollution of the sea by oil and other harmful substances; to determine liability in certain respects for loss or damage caused by the discharge of oil from ships, tankers and offshore installations and to provide for matters connected therewith.

Web: http://web.uct.ac.za/depts/shiplaw/fulltext/marpollu.htm

Medicines and Related Substances Control Amendment Act, 1997

Amendment of section 1 of Act 101 of 1965, as amended by section 1 of Act 65 of 1974, section 1 of Act 17 of 1979, section 1 of Act 20 of 1981 and section 1 of Act 94 of 1991 and includes generic substitution of drugs.

Web: http://www.doh.gov.za/docs/index.html

Mine Health and Safety Act, 1996

It provides for the protection of the health and safety of employees and other persons at mines and, for that purpose, to promote a culture of health and safety; to provide for the enforcement of health and safety measures and to provide for appropriate systems of employee, employer, and state participation in health and safety matters.

Web: http://www.polity.org.za/html/govdocs/legislation/1996/act96-029.html?rebookmark=1

National Environmental Management: Air Quality Act, 2004

It is to reform the law regulating air quality in order to protect the environment by providing reasonable measures for the prevention of pollution and ecological degradation and for securing ecologically sustainable development while promoting justifiable economic and social development; to provide for national norms and standards regulating air quality monitoring, management and control by all spheres of government.

Web: http://www.environment.gov.za/PolLeg/Legislation/2005Mar15/air_quality_act_2004.htm

National Environmental Management: Biodiversity Act, 2004

The objectives of this Act are within the framework of the National Environmental Management Act, to provide for the management and conservation of biological diversity within the Republic and the use of indigenous biological resources in a sustainable manner.

Web: http://www.environment.gov.za/PolLeg/Legislation/2006Nov2/NEMBA.pdf

National Environmental Management: Protected Areas Act 57, 2003

The objectives of the Act are to provide, within the framework of national legislation, including the National Environmental Management Act, for the declaration and management of protected areas.

Web: http://www.environment.gov.za/

National Water Act, 1998

It ensures that the nation's water resources are protected, used, developed, conserved, managed, and controlled.

Web: http://www.dwaf.gov.za/Documents/Legislature/nw_act/NWA.pdf

Occupational Health and Safety Amended Act, 1993

It provides for the health and safety of persons at work and for the health and safety of persons in connection with the use of plant and machinery and for the protection of persons other than persons at work against hazards to health and safety arising out of or in connection with the activities of persons at work.

Web: http://www.labour.gov.za/download/7880/Amended%20Act%20%20Occupational%20Health%20and%20Safety.pdf

Traditional Health Practitioners Act, 2004

The purpose is to (a) establish the Interim Traditional Health Practitioners Council of South Africa; (b) provide for the registration, training and practices of traditional health practitioners in the Republic and (c) serve and protect the interests of members of the public who use the services of traditional health practitioners.

Web: http://www.doh.gov.za/docs/legislation/acts/2004/act35.pdf

Miscellaneous resources

Africa Stockpiles Programme

Highlights the need for the urgent cleanup of stockpiles of obsolete pesticides and the prevention of further accumulation in African countries; requires a co-ordinated, multistakeholder approach.

Web: http://www.africastockpiles.org/aboutasp.html

CHAPTER

103

Spain

GUILLERMO REPETTO AND MANUEL REPETTO

INTRODUCTION

The most frequently consulted toxicological textbook in the world during the Middle Ages was written by Maimonides in 1198. He was born in Córdoba (Spain) and was the most influential figure in medieval Jewish philosophy. Maimonides wrote a number of medical texts, including 'The poisons and their antidotes', explaining poisoning symptoms, antidotes, and prevention.

In 1677, Antonio de Trilla, a physician from Toledo published the book 'Treaty of the three types of poisons: mineral, plants and animals'; and Antonio Ximenez de Lorite, from Sevilla, published in 1790 the first study in Spanish that refers to health problems caused by air pollution from factories.

Mateo Orfila, the founder of modern toxicological science, was born at Mahon (Minorca), studied Medicine and immediately became a private lecturer on Chemistry in Paris. In 1819 he was appointed professor of Medical Jurisprudence, and four years later he succeeded Vauquelin as professor of chemistry in the Faculty of Medicine in the French capital. In 1830 he was nominated Dean of that Faculty, a high medical honor in France. He published several books including 'The Treaty of Poisons or General Toxicology' (1814), with experimental observations on the symptoms of poisoning, explaining the kinetics and organ tropism of poisons, their physiological action, and the means of detecting them. Few branches of science can be said to have reached such a pinnacle due to the labor of a single individual.

Other interesting historical publications in Spain were the 'Compendium of General and Special Toxicology' by Pedro Mata (1875), a book dedicated to Orfila, but criticizing his work, or the 'General Toxicology' by Perez-Argiles (1943).

Judicial toxicological analyses were first ordered by the judges to members of the National Forensic Medicine Body, or to Professors of Legal Medicine or Pharmacy. The organization, now known as the National Institute of Toxicology and Forensic Sciences, was established in 1887, to perform the requested studies. About 250 scientists are now working in the Institute's four centers.

The National Institute for Health and Safety at Work (INSHT) was created in 1970. It is composed of four territorial departments and 40 provincial offices, and is involved, with the Autonomic Communities, in the protection of worker health and the prevention and control of occupational exposures.

The first meeting of Spanish toxicologists was organized in 1971 and mainly focused on forensic toxicology. Since then, a biannual meeting was convened, leading to the foundation in 1980 of The Spanish Association of Toxicology (AETOX), just in time to organize in 1987, an International Meeting on the Bicentenary of Orfila near his birthplace (Minorca). The AETOX is now a society of approximately 400 members from academia, government, and industry. It holds, apart from the general biannual meeting, other workshops organized by a number of sections of the society (Alternative Methods, Clinical Toxicology, Environmental Toxicology, Food Safety, Forensic Toxicology, Veterinary and Toxicology).

AETOX has very good relationships with other societies interested in human and environmental health, such as the Spanish Society of Environmental

Health (SESA), founded in 1964, with more than 350 members, a part of the larger Spanish Society of Public Health and Administration (SESPAS), with 3500 members.

A very important milestone in the Spanish academic system occurred in 1996; 'Toxicology' was identified as an independent area of knowledge within the universities, representing its recognition as a scientific and professional discipline. Since then, the number of professors of toxicology teaching in various faculties has increased considerably, with more than 50 positions occupied throughout the country. However, in Spain, there are not degrees in Toxicology, nor recognition of a medical speciality in clinical toxicology.

The relevance and complexity of regulatory activities forced the administration to create the Spanish Agency of Pharmaceuticals and Medical Products (AGEMED) in 1997 for the authorization of medicines, and the Spanish Agency on Food Safety and Nutrition in 2001.

Following the example given by other European associations and the recommendation of EUROTOX, a Register of Spanish Toxicologists was established in 2000. About 50 professionals in basic and applied toxicology have been registered, demonstrating at least five years of experience and high level of professional competence and ethical conduct.

Finally, in 2004, the Spanish Committee of the International Union of Toxicology (IUTOX) was formed, under the umbrella of the International Council of Scientific Unions (ICSU). This committee is a collaboration between Spain's public administration and scientific societies and has a global impact due to the influence of IUTOX.

RESOURCES

Books

Many Spanish authors routinely submit their original research articles in toxicology to international journals and books that are referenced in the appropriate sections of the other countries in this book. In addition, there are some Spanish journals and books that describe original research in toxicology and environmental and occupational safety and health. There is a broad audience in many Spanish-spoken countries for these publications.

Agudo J (2004)
El control de contaminación. Técnicas jurídicas de protección medioambiental (Pollution control. Legal techniques of environmental protection)
Madrid: Editorial Montecorvo SA

This book describes the current legislation to control pollution.

Alastuey MC (2004)
El delito de contaminación ambiental: Artículo 325.1 del código penal (The crime of environmental contamination)
Albolote: Editorial Comares S.L.

This book deals with the legal prosecution of those responsible for pollution.

Alonso MJ, Melgar J, García MA (1997)
Hongos silvestres comestibles en la Provincia de Lugo: contaminación por plomo y cadmio y sus repercusiones toxicológicas (Lead and cadmium contamination of fungi and their toxicological consequences)
Lugo: Servicio de Publicaciones Diputación Provincial de Lugo

A research document on cadmium and lead human exposure through fungi.

Aragón P (2005)
Contaminación atmosférica: manual de laboratorio (Atmospheric pollution: laboratory handbook)
Valencia: Universidad Politécnica de Valencia

A laboratory handbook on atmospheric pollution.

Azpeitia P, Rosado A (2004)
Revisión de métodos de análisis de contaminantes prioritarios en suelos (Review of analytical methods of contaminants in soil)
Madrid: Instituto Geológico y Minero de España.

A review of analytical techniques in contaminated soil.

Ballesteros E, Jurado R, San Andres MI (2000)
Toxicología Animal Originada por Plantas, Flora Silvestre Española (Animal Toxicology from the Spanish flora)
Madrid: Editorial Complutense

Animal poisoning due to plants.

Bataller Sifre R (2004)
Toxicología Clínica (Clinical Toxicology)
Valencia: Universitat de València.

A book on different aspects of clinical toxicology.

Baucells J, Vernet J (2004)
La prevención y el control integrados de la contaminación (The integrated pollution prevention and control)
Madrid: Marcial Pons

Contains information on prevention and integrated control of contamination.

Bello J, López de Cerain A (2001)
Fundamentos de Ciencia Toxicológica (The Foundation of Toxicological Science)
Madrid: Díaz de Santos

A textbook for undergraduate students.

Cabrera R, Mencias E, Cabrera J (1993)
Toxicología de los Psicofármacos (Psychotropic Toxicology)
L. Beecham: Madrid

An epidemiological study of poisoning by psychotropics, considering pharmacokinetics and pharmacodynamics in general, and that pertains to the different groups of this type of medicine.

Cabrera R (2001)
Manual Toxicológico de Productos Fitosanitarios para uso Sanitario (Toxicological Workbook of non-agriculture pesticides)
Madrid: Consejería de Salud

A book about the toxicology of biocides.

Camí J (1995)
Farmacología y toxicidad de la MDMA (Pharmacology and Toxicity of MDMA)
Neurociencias: Barcelona

Review of the pharmacology, effects, and clinical characteristics of ecstasy use.

Capó M (2002)
Principios de Ecotoxicología (Principles of Ecotoxicology)
Madrid: McGraw-Hill Interamericana

A review on the basis of ecotoxicology.

Carreño F, Rodríguez I (2006)
Elaboración y estructuración de una base de datos cartográfica de la contaminación marina provocada por el Prestige y su integración en un sistema de información geográfico (Preparation and structure of a cartographic database of the marine contamination produced by the Prestige and integration in a geographic information system)
Madrid: Editorial Dykinson

Database constructed with data from the disaster of the contamination caused by the leakage of petrol from a ship.

Casas M, Gutiérrez M, San L (1995)
Avances en Drogodependencias (Advances in Drug Addiction)
Neurociencias: Barcelona

The current situation of the criteria regarding therapeutic methods based on the substitution of opiates by methadone, buprenorphine, etc., and the use of antagonists.

Compaño R, Rios A (2002)
Garantía de Calidad en los laboratorios analíticos (Quality assurance in analytical laboratories)
Madrid: Síntesis

A practical review on the implementation of quality control and assurance systems in analytical process.

Coordinadora de ONGs (1995)
Directorio. Organizacions no-gubernamentales que intervienen en drogodependencias (Directory. Non-Governmental Organizations Intervening in Drug Addictions)
OMGs: Madrid

File on human resources and associations of all types with activities in the fight against drug addiction.

de la Fuente L, Frutos J (1995)
Toxicología y Seguridad Química Evaluación y Gestión del Riesgo Químico (Toxicology, Chemical Safety and Chemical Risk Management)
Madrid: Colegio Oficial de Biólogos. Consejería de Salud

A review on risk assessment and management.

de la Peña E, Gómez Campoy E (2005)
Toxicología Ambiental: Seguridad Química (Environmental Toxicology: Chemical Safety)
Murcia: AETOX, SESA, Consejeria de Sanidad. Comunidad Autónoma de la Región de Murcia. CSIC (CD-ROM)

An update on the basis and procedures used in chemical safety.

de la Peña E, Guadaño A, Barrueco C, Repetto G, Gonzalez Menció F, Garcia Partida P (1995)
ICLAS/CSIC Working Group on Complementary Methods
Madrid: Comité Español del ICLAS/CICYT/CSIC, Dirección General de Investigación Científica y Técnica

Report produced in a meeting of experts in alternative and complementary methods to the use of animals in testing.

de la Peña E, Burguete I, Guadaño A (1999)
Evaluación Mutagénica y Genotóxica (Mutagenic and Genotoxic Evaluation)
Murcia: DGES,CMEyC – SEMA

This is a compendium of available techniques applicable to the study of the genotoxic and mutagenic capacity of compounds.

de la Peña E, Gomez Campoy E (2000)
Evaluación Toxicológica de los Plaguicidas y la Sanidad Ambiental (Toxicological Evaluation of Pesticides and Environmental Safety)
Murcia: Monografía SESA/AET SESA, AET, RAMCM, CSyC, CFRM.

This is a compilation of strategies used for testing the toxicity of pesticides.

de Moreno MD (2003)
Toxicologia Ambiental: Evaluacion de Riesgo para la Salud Humana (Environmental Toxicology: Human Risk Assessment)
Madrid: McGraw-Hill/Interamericana de España, S.A.

This book describes the strategies for the assessment of human risks from environmental exposure.

Dirección General de Calidad y Evaluación Ambiental (2006)
Prevención y control integrados de la contaminación (IPPC): documento de referencia de mejores técnicas disponibles en la industria de procesos de metales férreos (Prevention and integrated control of contamination: the iron industry)
Madrid: S.G.T. Ministerio de Medio Ambiente

A review on the control procedures applicable to the iron industry to reduce pollution.

Domènech X (2000)
Química atmosférica: origen y efectos de la contaminación (Atmospheric chemistry: origin and effects of contamination)
Madrid: Miraguano Ediciones

A book reviewing the sources and adverse effects of atmospheric pollutants.

Domènech X (2000)
Quimica del Suelo, el Impacto de los Contaminantes (Chemistry of Soil and Impact of contaminants)
Madrid: Miraguano Ediciones

A book reviewing the adverse effects caused by soil pollutants.

Dueñas A (1999)
Intoxicaciones agudas en medicina de urgencia y cuidados Intensivos (Acute Poisonings in Urgency Medicine and Intensive Care)
Madrid: Masson, S.A.

Clinical features, diagnosis, and management of main acute poisonings are presented from the perspective of clinical toxicology.

Felices F, Nogué S, Civeira E (1993)
Medicina Intensiva Práctica. Intoxicaciones Agudas (Practical Intensive Medicine. Acute Poisonings)
IDEPSA: Madrid

Describes the general basis for the treatment of acute poisoning, with chapters covering medicines, drugs of abuse, alcohol, and other frequent agents of poisoning.

Gelpi E (2001)
Advances in Mass Spectrometry 15
Barcelona: Wiley

This volume comprises the proceedings of the 15th International Mass Spectrometry Conference held in Barcelona.

Gestal JJ, Smyth E, Figueiras A, Montes A (2004)
Recollida e limpeza do fuel do Prestige. Avaliación da exposición e danos á saúde en voluntarios e traballadores (Cleaning of Fuel from the Prestige. Exposure Evaluation and Health Effects in Volunteers and Workers)
Saúde Pública: Santiago de Compostela, Universidade de Santiago de Compostela

A study of the human health effects due to the cleaning procedures applied in the petrol leakage from the Prestige ship.

Gisbert-Calabuig JA (2004)
Medicina Legal y Toxicologia, 6th Edition (Legal Medicine and Toxicology)
Barcelona: Masson

An extensive text and reference book for forensic science students.

Hernández I, Gil A, Delgado M, Bolúmar F (2005)
Manual de Epidemiología y Salud Pública
Madrid: Panamericana

A textbook for students of public health.

Laborda R (2001)
Evaluación de la exposición a agentes químicos en el trabajo: manual práctico (Exposure Assessment to Chemical Agents at Work: Practical Manual)
Valencia: Bèrnia

A laboratory handbook for the evaluation of the ocupational exposure to chemicals.

Ladrón de Guevara J, Moya V (1995)
Toxicología Médica: Clínica y Laboral (Medical Toxicology: Clinical and Occupational)
Madrid: McGraw-Hill

Contains a general section, several chapters on basic, clinical, and workplace toxicology, followed by a descriptive dictionary of poisonous compounds.

López de Cerain A, Bello J (2000)
Toxicología: guía de prácticas (Toxicology: A Guide of Practical Teaching)
Pamplona: Universidad de Navarra

A textbook describing practical procedures for training in toxicology.

Manzanera R, Torralba I, Solanes P (1995)
Plan municipal de acción sobre drogodependencias (Municipal Plan of Action on Drug Addiction)
Corporation: Barcelona

Municipal plans for the prevention, treatment, and rehabilitation of drug addicts.

Marruecos L, Nogué S, Nolla J (1993)
Toxicología Clínica (Clinical Toxicology)
Springer Verlag Ibérica: Barcelona

A study of epidemiology, physiopathology, laboratory and clinical diagnosis; also addressing the therapeutics of the principal types of acute poisoning, with special discussion of the most frequent groups of poisons.

Mateu J (1994)
Toxicología Médica: productos de uso doméstico, mordeduras y picaduras, Toxicología Vegetal. Tratamiento general de las Intoxicaciones (Medical Toxicology)
Doyma: Barcelona

Compilation of the symptoms and therapeutics of poisoning by household products, cosmetics, and products for personal hygiene, detergents and soaps, disinfectants, pesticides, fuels, etc. and by poisonous animals.

Mateu J (1995)
El niño intoxicado (The Poisoned Child)
McEdiciones: Barcelona

A very attractively presented book; addressed to the public rather than to health professionals, with the intention of preventing poisonings and to give first aid to the poisoned.

Mateu J (1999)
Guia Practica de Primeros Auxilios (II) (Toxicologia Vegetal y Accidentes) (Vegetal Toxicology and accidents)
Murcia: Diego Marin Librero Editor, S.L.

A guide for first aid treatment of poisonings.

Mencias E, Mayero LM (2000)
Manual de Toxicologia Basica (Manual of Basic Toxicology)
Madrid: Ediciones Diaz de Santos, S.A.

A multiauthor book with a variety of information about the toxicity and treatment of different compounds.

Nogue S, Sanz P (2001)
Atlas de Toxicologia Clínica y Laboral (Atlas of Clinical and Occupational Toxicology)
Barcelona: Universidad Politecnica de Cataluña

A book about clinical and occupational effects of toxicants.

Nogué S, Munné P, Nicolás JM (2003)
Intoxicaciones agudas. Protocolos de Tratamiento (Acute Poisonings. Protocol Treatments)
Barcelona: Morales i Torres editores S.L.

A very detailed book containing established protocols used for the treatment of acute poisonings in the Clinic Hospital of Barcelona.

Obiols J (1998)
Quinto Control biológico de los trabajadores expuestos a contaminantes químicos (5th Biological Control of Workers Exposed to Chemical Pollutants)
Madrid: Instituto Nacional de Seguridad e Higiene en el Trabajo

This is a compilation from a biological control carried out in workers of different activities.

Pérez M, Soler F (2005)
Toxicología Clínica de Pequeños Animales (Clinical Toxicology of Small Animals)
Madrid: Consulta de Difusión Veterinaria 98

Piqueras J (1996)
Intoxicaciones por plantas y hongos (Poisonings by Plants and Toadstools)
Masson: Barcelona

Summarizes the author's experience in the treatment of patients poisoned by plants and especially by toadstools, with a detailed classification and description of the botanical and toxicological aspects.

REMA (Red Española de Métodos Alternativos) (2005)
Curso-Taller de Reducción, Refinamiento y Reemplazo de animales en Investigación, Desarrollo y Docencia (Course on Reduction, Refinement and Replacement of Animals in Research, Development and Education)
Madrid: Red Española de Métodos Alternativos (REMA) (CD-ROM)

This publication is targeted for scientists using animals in research, education, and testing. There are many possibilities to reduce, refine, or replace their use.

Repetto M (1978)
Toxicologia de los Aerosoles (Toxicology of Aerosols)
Universidad: Sevilla

This book studies the physiochemical properties of colloidal dispersions and the uses and applications of

aerosols, as much to military, agricultural, or medical ends as to meteorological. It revises knowledge of absorption by inhalation, of lung clearance, and of local or systemic pathologies that aerosols can cause. This book also presents the appropriate methodology for toxicity testing.

Repetto M, et al (1985)
Toxicología de la Drogadicción (Toxicology of Drug Addiction)
Díaz de Santos: Madrid

This is a collective book, whose authors – physicians, chemists, biologists, pharmacists, a judge, and a psychologist – approach the different aspects of the problem of drug addiction from their personal points of view.

Repetto M, Sanz P (1995)
Glosario de términos usados en Toxicología (Glossary of Terms Used in Toxicology)
Doble Cero: Sevilla

This is the Spanish version of the IUPAC glossary, including most of the words used in toxicology (Duffus et al 1993), including over 1000 terms.

Web: http://buscatox.info

Repetto M, et al (1995)
Toxicología Avanzada (Advanced Toxicology)
Díaz de Santos: Madrid

This collective work is an examination of several toxicological subjects, from ancient to the modern, based on extensive research of the literature.

Repetto G, del Peso A, Salguero M, Repetto M (1999)
Inventory of the Spanish Institutions and Scientists Involved in Alternatives to the use of Laboratory Animals (Refinement, Reduction or Replacement)
Revista de Toxicología 16: 50–127

Database on groups working on the development of alternative methods in Spain.

Repetto M (2001)
Evolución, estado actual, retos y tendencias de la Toxicología comenzar el milenio (Evolution, Present Situation and Trends of the Toxicology at the Start of the Millennium)
Sevilla: Área de Toxicología, Universidad de Sevilla (CD-ROM)

Published as a textbook in a short course for postgraduate students of toxicology.

Repetto M (2002)
Toxicología de Postgrado (Postgrade Toxicology)
Sevilla: Área de Toxicología, Universidad de Sevilla (CD-ROM)

Published as a textbook in a course to obtain the title of Universitary Expert in Toxicology.

Repetto M (2003)
Toxicología de Postgrado 03, 2nd Edition (Postgraduate Toxicology)
Sevilla: Área de Toxicología, Universidad de Sevilla (CD-ROM)

Repetto M (2004)
Toxicología de Postgrado 04, 3rd Edition (Postgraduate Toxicology)
Sevilla: Área de Toxicología, Universidad de Sevilla (CD-ROM)

Repetto M (2005)
Toxicología de Postgrado 05 (Enlargement of Postgraduate Toxicology 05)
Sevilla: Área de Toxicología, Universidad de Sevilla (CD-ROM)

Published as a textbook in a course to obtain the title of Universitary Master in Toxicology.

Repetto M, Cameán AM (2006)
Toxicología Alimentaria (Food Toxicology)
Madrid: Díaz de Santos

This multiauthor book is an extensive review of the different areas related to food toxicology, including analytical procedures, distribution and kinetics, effects of chemicals, risk assessment, treatment of poisonings, etc.

Repetto M (2006)
Toxicología de Postgrado 06, 4th Edition (Postgraduate Toxicology 06)
Sevilla: Área de Toxicología, Universidad de Sevilla (CD-ROM)

Repetto M (2007)
Ampliación de Toxicología de Postgrado 07, 2nd Edition (Enlargement of Postgrade Toxicology 07)
Sevilla: Área de Toxicología, Universidad de Sevilla (CD-ROM)

Repetto M, Repetto G (2009)
Toxicología Fundamental, 4th Edition (Fundamental Toxicology)
Díaz de Santos: Madrid

This is a multidisciplinary text in which, from biological, chemical, anatomical, and physiological knowledge, physiopathological processes of toxic origin are explained. Several chapters are also dedicated to the basis of toxicological analysis and the treatment of the poisoned.

San Andrés MI (2000)
Toxicología Animal originada por Plantas (Toxicology of Animals due to Plants)
Madrid: Editorial Complutense

The effects of plant toxins on animals are reviewed.

Sogorb MA, Vilanova E (2004)
Técnicas analíticas de contaminantes químicos: aplicaciones toxicológicas, medioambientales y alimentarias (Analytical Techniques of Chemical Pollutants: Toxicological, Environmental and Food Applications)
Madrid: Díaz de Santos

This book covers many different applications for the analytical quantification of chemicals.

Soler F (2003)
Plantas Tóxicas para el Ovino I (Toxic Plants for the Ovine)
Revista OVIOS: Monografía Nov

Soler F (2004)
Plantas Tóxicas para el Ovino II (Toxic Plants for the Ovine)
Revista OVIOS: Monografía Marzo

Valledor A (1994)
Envenenamiento por animales (Poisoning Due to Animals)
Diaz de Santos: Madrid

A review of the habits and characteristics of animals (vertebrates and invertebrates) of the entire world, whose behavior produces poisoning and also of the preventive and therapeutic actions applicable in each case.

Valverde JL, Perez De-Gregorio JJ (2002)
Manual de Toxicología Medioambiental Forense (Manual of Environmental Forensic Toxicology)
Madrid: Editorial Universitaria Ramon Areces

A review of the legislation and the procedures used for the investigation of cases of environmental pollution.

Vera DJ (2005)
Actividades molestas, insalubres, nocivas y peligrosas: normativa de evaluación del impacto ambiental y prevención y control de la contaminación (Regulations for the Environmental Impact Evaluation and Prevention and Control of Contamination)
Madrid: Ed. Tecnos

Procedures for environmental impact studies and the integrated prevention of pollution.

Journals

Adicciones (Addictions)
Madrid: Socidrogaalcohol Society
Presents papers on aspects of research, symptoms, or epidemiology regarding abuse of drugs or alcohol.
Web: http://socidrogalcohol.psiquiatria.com/adicciones/

Alimentaria. Revista de tecnología e higiene de los alimentos (Foodstuffs. Journal of technology and safety of foods) (1963–)
Madrid: Servicio de Informática y Documentatión Alimenticia
Web: http://sumaris.cbuc.es/03005755.htm

Ambienta: La revista del Ministerio de Medio Ambiente (The Journal of the Ministry of Environment)
Madrid: Ministerio del Medio Ambiente
Web: http://www.mma.es/secciones/biblioteca_publicacion/publicaciones/revista_ambienta/index.htm

Archivos de prevención de riesgos laborales (Archives of Occupational Risks Prevention)
Barcelona: Societat Catalana de Seguretat i Medicina del Treball (SCSMT)
Web: http://dialnet.unirioja.es/servlet/revista?tipo_busqueda=CODIGO&clave_revista_6054

Boletín del Grupo de Trabajo Especializado en Métodos Alternativos-GTEMA (Bulletin of the Group on Alternative Methods)
Bulletin of the Spanish Group on Alternative Methods.
Web: http://www.uv.es/aetoxweb/grupos/gtema/gtema.html

Ciencia Forense: Revista Aragonesa de Medicina Legal (Forensic Science. Journal from Aragón)
Zaragoza: Fernando el Católico
Web: http://www.dpz.es

Conductas Adictivas (Addictives Behaviors)
Journal about addictive behaviors.
Web: http://www.conductasadictivas.org/

Cuadernos de Medicina Forense (Journal of Forensic Medicine)
Sevilla: Asociación Andaluza de Médicos Forenses
Web: http://scielo.isciii.es/scielo.php?pid=1135-7606&script=sci_serial

Ecosistemas: Revista científica y técnica de ecología y medio ambiente (Ecosystem: Scientific and Technical Journal of Ecology and Environment)
Madrid: Asociación Española de Ecología Terrestre
Web: http://www.revistaecosistemas.net/

El Farmaceutico (The Pharmacist) (1966–)
Madrid: Real e Ilustre Colegio Oficial de Farmaceuticos
Web: http://www.edicionesmayo.es

Food Science and Technology International (Published since 1960 as Revista de Agroquimica y Tecnologia de Alimentos)
Valencia: SAGE Publications
Web: http://fst.sagepub.com/

Grasas y aceites (Fats and Oils)
Sevilla: Instituto de la Grasa
A journal about edible fats from any origin.
Web: http://grasasyaceites.revistas.csic.es/index.php/grasasyaceites/

Ingeniería Química (Chemical Engineering)
Madrid: Alción
Chemical engineering and environment.
Web: http://www.alcion.es

Technical Reports and Other Documents

A few representative technical reports have been selected and the links to several collections are included.

Calitox
Quality indicators for the urgent patient assistance in acute poisonings.
Web: http://wzar.unizar.es/stc/actividades/CALITOX-AETOX-30-04-2006.zip

Chemical Products
Basic guide on labeling and safety data sheets.
Sevilla: Junta de Andalucía
A very complete compilation of the criteria used for labeling of chemicals and for the preparation of safety cards.
Web: http://www.juntadeandalucia.es/salud/principal/documentos.asp?pagina={pdf}institucional/sanidad%20ambiental/guias/inglesprot.pdf (English)
Web: http://www.juntadeandalucia.es/salud/principal/documentos.asp?pagina={pdf}/institucional/sanidad%20ambiental/nuevaweb_sa/guiaquimicos3ed.pdf (Spanish)

Chemical Products
Hazard and control of health risk.
Sevilla: Junta de Andalucía
A very interesting update of the criteria for hazard and risk assessment.
Web: http://www.juntadeandalucia.es/salud/principal/documentos.asp?pagina=productos_quimiscos_op1 (Spanish)

Diccionario de acrónimos para las Ciencias de la Salud (Dictionary of Acronyms for Health Sciences)
Illera M (1994)
Madrid: Fundación Welcome

Publications of the Ministry of Health and Consumer Issues
The information about many publications by the Ministry of Health and Consumer Issues can be found in the following link.
Web: http://www.msc.es/

Publications of the Ministry of the Environment
Many publications of the Spanish Ministry of the Environment are included in the following link.
Web: https://www.fomento.es/cpmf/

Publications of the National Institute of Health and Safety at Work
Web: http://www.es/portal/site/Insht/

About 400 publications are available, most of them online.

Technical Guides for the Evaluation and Prevention of Risks
National Institute of Health and Safety at Work
More than 25 illustrative Technical Guides (not binding) designed to interpret the rules which arise from the Prevention of Risks at Work Act.
Web: http://www.insht.es/portal/site/Insht (English)
Web: http://www.insht.es/portal/site/insht/ (Spanish)

Occupational Exposure Limits for Chemical Agents, which have been adopted by the National Institute for Health and Safety at Work (Instituto Nacional de Seguridad e Higiene en el Trabajo, INSHT)
Web: http://www.insht.es (Spanish only)

Databases

Acute poisoning. Protocols of treatment of the Clínic Hospital, Barcelona
Nogué S, Munné P, Nicolás JM (2003)
Web: http://wzar.unizar.es/stc/actividades/protocolos.html

A very up-dated and complete collection of detailed protocols of poisoning treatment.

CINDOC – Center of Information and Documentation
Web: http://www.cindoc.csic.es/eng/principal.html (English)
Web: http://www.cindoc.csic.es/ (Spanish)

Collects the Spanish scientific output and make it widely available by developing and distributing to the corresponding databases.

Data base of Medicines – CGCOF
Web: http://pfarmals.portalfarma.com:8080/farma/

Information about the human pharmaceutical products authorized in Spain.

DIAGNOS^{MD}
Web: http://www.diagnos98.com/

Diagnos is a very useful computerized system developed in 1998 as a tool to assist in the differential clinical diagnostics of the different types of disease. Includes a special part dedicated to poisonings from general chemicals (200), pharmaceuticals (500) and plants (3000), and adverse interactions. The recommended treatment is also included.

Dialnet
Web: http://dialnet.unirioja.es/

Supplies information and alerts about the content of journals published in Spanish, doctoral theses, etc.

Directory of Chemical Companies and Products. Spanish Chemical Industry Federation
Web: http://www.adinte.net/basefeique/indice.htm (Spanish and English)

A database with information of the products produced by Spanish chemical companies.

Directory of Spanish resources on Pharmacology
Web: http://www.imim.es/DREF/default.htm

Information about societies related to Pharmacology, journals, institutions, ethical committees and pharmaceutical laboratories.

Documentation and information centre on drugs. Ministry of Health and Consumer Issues
Web: http://www.pnsd.msc.es/en/Categoria2/centro/home.htm (English)
Web: http://www.pnsd.msc.es/Categoria2/centro/home.htm (Spanish)

EPER – España. Spanish Pollutant Emissions and Sources Register
Web: http://www.eper-es.es/

Includes the emission maps from the different areas of Spain.

Hispagua. Spanish Water Information System
Web: http://hispagua.cedex.es/en/index.php (English)
Web: http://hispagua.cedex.es/index.php (Spanish)

A database about water quality.

Informtoxic. A multimedia toxicological database
Argemi J, Mateu J (1993)
Barcelona: Infofarma España S. L.
Web: http://www.infanciasegura.com

A database containing detailed information on clinical and toxicological aspects regarding domestic products, and bites and stings of poisonous animals, together with the general treatment of poisonings.

Inventory of the Spanish Institutions and Scientists Involved in Alternatives to the use of Laboratory Animals (Refinement, Reduction or Replacement)
Web: http://www.uv.es/aetoxweb/grupos/gtema/gtema.inv.html

Database on groups working on the development of alternative methods in Spain.

Limit values: Biological limit values – VLBs
Web: http://www.insht.es/Inshtweb/Contenidos/Documentacion/TextosOnline/Valoies_Limite/GT-LEPN024-07%20VLA%202008%20negro_2.pdf

Official list of biological limit values approved in Spain for monitoring occupational exposure to chemical compounds.

Limit values: Carcinogenic and mutagenic susbtances with limit value adopted
Web: http://www.insht.es/Inshtweb/Contenidos/Documentacion/TextosOnline/Valoies_Limite/GT-LEPN024-07%20VLA%202008%20negro_2.pdf

Official list of environmental limit values approved in Spain for monitoring occupational exposure to carcinogenic and mutagenic compounds.

Limit values: Occupational exposure limits – TLVs
Web: http://www.insht.es/Inshtweb/Contenidos/Documentacion/TextosOnline/Valoies_Limite/GT-LEPN024-07%20VLA%202008%20negro_2.pdf

Official list of environmental limit values approved in Spain for monitoring occupational exposure to chemical compounds, including the Daily Exposure Values (TLV-TWA) and their Short Exposure values (TLV-Stel).

Register of non-agricultural pesticides or biocides
Ministry of Health and Consumer Issues
Web: http://www.msc.es/en/ciudadanos/saludAmbLaboral/prodQuimicos/sustPreparatorias/biocidas/frmRegistroPlaguicidas.jsp

The official database of the biocides authorized in Spain, with information about the risks, uses and producers.

Register of Plant Protection Products – Pesticides
Ministry of Agriculture, Fisheries and Food
Web: http://www.mapya.es/es/agricultura/pags/fitos/registro/menu.asp

The official database of the pesticides and other Plant Protection Products authorized in Spain, with information about the risks, uses and producers.

Registry of Toxicologists – Spain
Web: http://www.uv.es/aetoxweb/info/regtoxicol.html

The Spanish Registry of Toxicologists includes more than 50 professionals specialized in basic and applied toxicology. The list is included in the Register of EUROTOX. The registered toxicologists should possess a high level of professional competence and ethical conduct.

RISCTOX. Syndicate Institute of Work
Web: http://www.istas.net/ecoinformas/web/index.asp?idpagina=575

Toxicological data provided to workers of about 1000 products of industrial use, including exposure levels and human and environmental adverse effects.

SciELO – Spain – Scientific Electronic Library Online
Web: http://scielo.isciii.es/scielo.php (Spanish only)

The objective of the site is to implement an electronic virtual library, providing full access to a collection of serial titles, a collection of issues from individual serial titles, as well as to the full text of articles.

SINAC – Information System on Water of Human Consumption
Ministry of Health and Consumer Issues
Web: http://sinac.msc.es/sinac/homeEstatica.html

Network with information about the quality of tap water.

SIRIPQ – Information and Rapid Interchange System on Chemical Products
Ministry of Health and Consumer Issues
Web: http://www.msc.es/en/ciudadanos/saludAmbLaboral/prodQuimicos/sustPreparatorias/rednacVigi/siripq.htm (English)
Web: http://www.msc.es/ciudadanos/saludAmbLaboral/prodQuimicos/sustPreparatorias/rednacVigi/siripq.htm (Spanish)

Network for the surveillance and control of the use of chemicals and to the prevention of the risks derived from the exposure to substances.

SISAL – Information System on Occupational Health
Ministry of Health and Consumer Issues
Web: http://www.msc.es/ciudadanos/saludAmbLaboral/saludLaboral/sisal.htm

Network for the surveillance, control and prevention of the risks derived from the occupational exposure to chemicals.

Spanish legislation. Journal of the Official Gazette
Web: http://www.boe.es/g/eng/index.php (English)
Web: http://www.boe.es/g/es/bases_datos/iberlex.php (Spanish)

The complete Spanish legislation to be searched.

Spanish legislation on Hazardous Substances, Chemical and Occupational Safety and Health
Web: http://www.insht.es/portal/site/Insht/menuitem.75eb39a3ca8b485dce5f66a150c08a0c/?vgnextoid=75164a7f8a651110VgnVCM1000000dc0ca8cDRCRD (Spanish only)

The Spanish legislation classified according to the different areas.

Spanish Resources on Safety and Health – CEW
Web: http://www.civileng.com/segur.htm

A summary of resources for workers in a web of civil engineering.

Swimming pool water treatment products
Ministry of Health and Consumer Issues
Web: http://www.msc.es/ciudadanos/saludAmbLaboral/calidadAguas/piscinas/home.htm

The official database of products used in swimming pools authorized in Spain, with information about the risks, uses, and producers.

Table of concentrations of xenobiotics in human biological fluids as reference for the toxicological diagnostic
Web: http://busca-tox.com

Reference values useful for the interpretation of the concentrations present in blood or urine.

Toxicologia.net
Web: http://wzar.unizar.es/stc/toxicologianet/index.htm

An interesting database and self-learning system mainly focused in clinical toxicology.

Virtual Library on Health in Spain
Web: http://bvs.isciii.es/i/index.php (English)
Web: http://bvs.isciii.es/E/index.php (Spanish)

Represents an instrument to spread scientific knowledge that arises from national and international public organizations' concern to offer quality-assured scientific information through the Internet.

Water quality
Ministry of Health and Consumer Issues
Web: http://www.msc.es/en/ciudadanos/saludAmbLaboral/calidadAguas/home.htm (English)
Web: http://www.msc.es/ciudadanos/saludAmbLaboral/calidadAguas/home.htm (Spanish)

A database about water quality.

Organizations (government)

Spain is a constitutional and hereditary monarchy, with legislative power being held by the Parliament. Executive power is nominally exercised by the cabinet led by the President of the Government. The country is divided into 17 counties, administered by locally elected governments and parliaments, with considerable autonomy in environmental matters. The following presents a summary of legislation concerning pollution, hazardous toxic waste, pesticides, additives and product control in Spain. In this chapter are listed the various authorities with addresses. The most

relevant centers related to toxicology and environmental and occupational safety and health are included.

Administration of the State
Web: http://www.060.es/ (Spanish only)

Institute of Safety and Occupational Health of Murcia – CARM
Web: http://www.carm.es/issl/ (Spanish only)

Ministry of the Environment and Rural and Marine Affairs
Paseo de Infanta Isabel 1, 28071, Madrid
Web: http://www.marm.es/index_en.htm (English)
Web: http://www.marm.es/ (Spanish)

Ministry of Defence
P. de la Castellana 109, 28071, Madrid
Web: http://www.mde.es/ (Spanish only)

Ministry of Education, Social Affairs and Sport
C/ Alcalá 36, 28071 Madrid
Web: http://www.mepsyd.es/ (Spanish only)

Ministry of Science and Innovation
C/ Albacete 5, 28027, Madrid
Web: http://web.micinn.es

From the centers depending on this Ministry, the following are cited:

Agency against doping (AEA)
Web: http://www.csd.mecd.es/

Center of Biologic Researches CIB
Web: http://www.cib.csic.es/en/index.php? (English)
Web: http://www.cib.csic.es/ (Spanish)

Center of Environmental Sciences CCMA
Web: http://www.ccma.csic.es/ (English)
Web: http://www.ccma.csic.es/ (Spanish)

Center Mediterranean of Environmental and Marine Research CMIMA
Web: http://www.cmima.csic.es/index.php?displayLang=EN (English)
Web: http://www.cmima.csic.es/index.php?displayLang=ES (Spanish)

Center for Research on Energy, Environment and Technology CIEMAT
Web: http://www.ciemat (English)
Web: http://www.ciemat.es/ (Spanish)

Center of Soil Science and Applied Biology – CEBAS
Web: http://www.cebas.csic.es/ (Spanish only)

Center of Scientific Research Isla de la Cartuja (CIC)
Web: http://www.cartuja.csic.es/ (Spanish only)

Center for Research and Development (CID)
Web: http://www.cid.csic.es/indexC.html (Spanish only)

Doñana Biological Station
Web: http://www.ebd.csic.es (English)
Web: http://www.ebd.csic.es/ (Spanish)

Experimental Station of Zaidin EEZ
Web: http://www.eez.csic.es/ (Spanish only)

Institute of Agro chemistry and Food Technology – IATA
Web: http://www.iata.csic.es/index.htf.en (English)
Web: http://www.iata.csic.es (Spanish)

Institute of Aquaculture Torre de la Sal IATS
Web: http://www.iats.csic.es/

Institute of Chemical Research IIQ
Web: http://www.iiq.cartuja.csic.es/

Institute of Chemical and Environmental Research of Barcelona IIQAB
Web: http://www.iiqab.csic.es/

Institute of Edible Oils (Instituto de la Grasa)
Web: http://www.ig.csic.es/

Institute of Marine Sciences – ICM
Web: http://www.icm.csic.es/index.php?displayLang=EN (English)
Web: http://www.icm.csic.es/index.php?displayLang=ES (Spanish)

Institute of Marine Sciences in Andalusia
Web: http://www.icman.csic.es/ (Spanish only)

Institute of Molecular Biology of Barcelona
Web: http://www.ibmb.csic.es/index.php?pIdioma=ENG (English)
Web: http://www.ibmb.csic.es/index.php?pIdioma=CAST (Spanish)

Institute of Molecular and Cellular Biology of Cancer – IBMCC
Web: http://www.cicancer.org/

Institute of Natural Resources and Agrobiology of Salamanca – IRNASA
Web: http://www.irnasa.csic.es/

Institute of Natural Resources and Agrobiology of Seville – IRNAS
Web: http://www.irnase.csic.es/ (Spanish only)

Institute of Neurobiology Cajal – INRC
Web: http://www.cajal.csic.es/ (English)
Web: http://www.cajal.csic.es/ (Spanish)

Institute of Neurosciences
Web: http://in.umh.es/

http://www.vnci.nl/Institute of Parasitology and Biomedicine 'López Neyra'
Web: http://www.ipb.csic.es/index_ingles.html (English)

Web: http://www.ipb.csic.es/ (Spanish)

Institute of Pharmacology and Toxicology – IFT
Web: http://www.ift.csic.es/

Institute of Sustainable Agriculture – IAS
Web: http://www.ias.csic.es/

Institute of Vegetal Biochemistry and Photosynthesis – IBVF
Web: http://www.ibvf.cartuja.csic.es/

National Institute of Research and Agrarian and Food Technology – INIA
Web: http://www.inia.es/

Centre of Research on Animal Health CISA
Web: http://www.inia.es/

Centre of Forestry Research – CIFOR
Web: http://www.inia.es/gcont/redestem/centrosydep.jsp?idcentro=16

Centre of Phytogenetic Resources – CRF
Web: http://www.inia.es

Department of the Environment INIA
Web: http://www.inia.es

Institute Geological and Mining
Web: http://www.igme.es/

Ministry of Health and Consumer Issues
P° del Prado 18–20, 28071, Madrid
Web: http://www.msc.es

Agency for the Evaluation of Medical Technology – AETS
Web: http://www.isciii.es/

General Sub direction of Environmental and Occupational Health
Web: http://www.msc.es

Institute of Health Carlos III http://www.isciii.es/
C/ Sinesio Delgado 4–6, 28029 Madrid
A large institution formed by several centers.
Web: http://www.isciii.es/

Institute of Research on Rare Diseases http://www.isciii.es/htdocs/centros/enfermedadesraras/enfermedaderaras_presentacion.jsp

National Center of Environmental Health

National Institute of Consumption
C/ Príncipe de Vergara 54, 28071 Madrid
Web: http://www.consumo-inc.es

Center for Research and Quality Control – CICC
Web: http://www.consumo-inc.es

Center for Information and Documentation on Consumption
Web: http://www.consumo-inc.es

Chemical products information
Web: http://www.msc.es/ciudadanos/saludAmbLaboral/prodQuimicos/home.htm

Health and the environment
Web: http://www.msc.es/ciudadanos/saludAmbLaboral/medioAmbiente/home.htm

National Plan on Drugs
C/ Recoletos, 22, 28001 Madrid
Web: http://www.pnsd.msc.es/en/home.htm (English)
Web: http://www.pnsd.msc.es/ (Spanish)

Spanish Agency of Pharmaceuticals and Medical Products
Parque Empresarial Las Mercedes – Edificio 8, C./ Campezo 1, 28022 Madrid
Web: http://www.agemed.es/

Created in 1997 for the authorization and control of medicines.

Spanish Agency on Food Safety and Nutrition– AESAN
C/ Alcalá 56, 28071 Madrid
Web: http://www.aesa.msc.es

Created in 2001 to promote the health by ensuring food safety.

Water Program (Programa agua)
Web: http://www.mma.es/agua/entrada.htm

Ministry of Home Affairs
C/ Rafael Calvo, n° 33, Madrid
Web: http://www.mir.es/

General Direction on Civil Protection and Emergencies
Web: http://www.proteccioncivil.org/index.html

Ministry of Industry, Tourism and Commerce
P° de la Castellana 160, 28071 Madrid
Web: http://www.mityc.es/

Ministry of Justice
San Bernardo 45, 28015 Madrid
Web: http://www.justicia.es/

National Institute of Toxicology and Forensic Sciences – INTCF
With four centers:
Department of Madrid. c/ Luis Cabrera 9, 28002 Madrid
Department of Barcelona. c/ Mercé 1, 08002 Barcelona
Department of Sevilla. Avda. Doctor Fedriani, s/n 41009 Sevilla
Delegation of La Laguna. Campus de Ciencias de la Salud. La Cuesta 38320, La Laguna
Web: http://www.mju.es/toxicologia/

Mainly focused in forensic toxicology, but also collaborates in clinical toxicology and carries out toxicity studies. It has a toxicological information service.

Ministry of Labour and Social Affairs
Agustín de Bethencourt 4, 28071 Madrid
Web: http://www.mtas.es/

National Institute for Health and Safety at Work INSHT
Torrelaguna 73, 28027 Madrid
Web: http://www.insht.es/portal/site/Insht

Created in 1982 is composed of four territorial departments and 40 provincial offices; it is involved, with the Autonomic Communities, in the protection of the health of the workers and the prevention and control of occupational exposure.

Portal on Chemical Risk

Universities

In various Spanish university faculties, such as pharmacy, medicine, and veterinary colleges, and some of chemistry and biology, the discipline of toxicology is studied within the normal curriculum and also as monographic courses. In Spain there are not degrees in toxicology, nor recognition of a medical speciality in clinical toxicology.

Food toxicology is currently taught at several university departments within the new Food Science and Technology degree programs. Different university faculties and professional societies provide monographic courses and specialization programs for postgraduates. Environmental Sciences is also very much in demand.

Postgraduate studies lead to a doctorate in the discipline of the student's basic degree, e.g., medicine, chemistry, pharmacy, biology, and food chemistry. There is no 'doctor in toxicology' degree. However, there are titles of 'Expert in Toxicology' and 'Master in Toxicology'.

For additional information the reader is referred to the publication by Cameán and Sanchez Burson in 2002, 'Toxicology implementation in the Spanish University: results of a survey'.

This section pertains exclusively to institutions offering officially approved courses related to the disciplines of toxicology and those offering postgraduate specialization courses in toxicology.

Professional Societies

These bodies provide a focal point for toxicology, environmental and occupational safety and health

professionals in Spain. They arrange meetings and publish journals and books to keep scientists up to date with changes in methods, techniques, and advances in the subject allowing for continuing professional development.

AEFI – Spanish Association of Industrial Pharmacists
Web: http://www.aefi.org/

AETOX – Spanish Association of Toxicology
Web: http://www.aetox.com

With professionals of different disciplines working in the diverse areas of toxicology. A national meeting is held every two years and a quarterly journal is edited. The working sections are Alternative Methods – GTEMA, Clinical Toxicology Section, Environmental Toxicology Section, Food Safety Section, Forensic Toxicology Section and Veterinary Toxicology Section.

ASEICA – Spanish Association of Research in Cancer
Web: http://www.onco.net/aseica/

Group of Clinical Toxicology (GITAB). SOCMIC – Societat Catalana De Medicina Intensiva I Crítica
Web: http://www.academia.cat/societats/intensiva/index.html

Formed by the doctors who work in the different hospitals in northeastern Spain and who have intensive care units for poisoned patients.

REMA – Spanish Network for the Development of Alternative Methods
Web: http://www.remanet.net

SEBBM – Spanish Society of Biochemistry and Molecular Biology
Web: http://sebbm.bq.ub.es/

Sociedad Española de Medicina Legal y Forense (Spanish Society of Legal and Forensic Medicine)

Legislation

In Spain, a number of laws dealing with chemical compounds provide the legal authority for control and intervention by public institutions. It is necessary to carry out a risk assessment on the notified substances to identify possible toxicological and ecotoxicological effects and the potential for human and environmental exposure. Although handling of chemical compounds is regulated by national legislation, Spanish legislation must be harmonized with legislation in the European Union, and guidelines of the European Union have bindingly to be adopted by national regulation. Specific legislation has been developed for different categories of substances. The major categories are industrial chemicals, pesticides, food additives, feed additives, and biocides. The most relevant laws and regulations dealing with chemical compounds are described here or can be accessed in the link: http://www.msc.es/ciudadanos/saludAmbLaboral/prodQuimicos/legislacion.htm.

Dangerous substances
The Council Directive 67/548/EEC, on the approximation of the laws, regulations and administrative provisions relating to the classification, packaging, and labeling of dangerous substances, was amended several times and was adapted many times to the technical and scientific progress. It was mainly included in the Spanish Royal Decree 363/1995. However, the Spanish legislation on chemicals is adapting to the absolute new EU regulatory framework for the Registration, Evaluation and Authorization of Chemicals (REACH). The aim is to improve the protection of human health and the environment through the better and earlier identification of the properties of chemical substances. At the same time, innovative capability and competitiveness of the EU chemicals industry should be enhanced. REACH gives greater responsibility to industry to manage the risks from chemicals and to provide safety information on the substances. Manufacturers and importers are required to gather information on the properties of their substances, which will help them manage them safely, and to register the information in a central database in which consumers and professionals can find hazard information.

Restriction of substances
The Council Directive 76/769/EEC on the approximation of the laws, regulations, and administrative provisions of the Member States relating to restrictions on the marketing and use of certain dangerous substance and preparations was mainly translated into the Spanish Royal Decree 1406/1989.

Dangerous preparations
The Directive 1999/45/EC of the European Parliament and of the Council concerning the approximation of the laws, regulations and administrative provisions of the Member States relating to the classification, packaging and labeling of dangerous preparations was included in the Spanish Royal Decree 255/2003.

Accident hazards
The Council Directive 96/82/EC on the control of major-accident hazards involving dangerous substances

(Seveso) is mainly included in the Spanish Royal Decree 1254/1999 and Royal Decree 119/2005.

Product safety
The Directive 2001/95/EC of the European Parliament and of the Council on general product safety is included in the Spanish Decree 1801/2003.

Human pharmaceuticals
The Directive 65/65/EEC on the approximation of provisions laid down by law, regulation, or administrative action relating to proprietary medicinal products is presently included in the Spanish Law 25/1990.

Veterinary pharmaceuticals
The Council Directive 81/851/EEC on the approximation of the laws of the Member States relating to veterinary medicinal product is included in the Spanish Law 13/2007.

Cosmetics
The Council Directive 76/768/EEC on the approximation of the laws of the Member States relating to cosmetic products is reflected in the Spanish Royal Decree 1599/1997.

Biocides (non-agricultural pesticides)
The Directive 98/8/EC of the European Parliament and of the Council of concerning the placing of biocidal products on the market is included in the Royal Decree 1054/2002.

Pesticides
Council Directive 91/414/EEC concerning the placing of plant protection products on the market is included in Royal Decree 2163/1994.

Food additives
The Commission Directive 96/77/EC laying down specific purity criteria on food additives other than colors and sweeteners is included in the Royal Decree 142/2002.

Feed additives
The Regulation (EC) No 1831/2003 of the European Parliament and of the Council on additives for use in animal nutrition was translated to the Spanish Royal Decree 893/2005.

Toys safety
The Council Directive 88/378/EEC on the approximation of the laws of the Member States concerning the safety of toys is included in Royal Decree 880/1990.

Animal protection
The Council Directive 86/609/EEC on the approximation of laws, regulations, and administrative provisions of the Member States regarding the protection of animals used for experimental and other scientific purposes is at the present included in the Royal Decree 2001/2005.

Good laboratory practices
The Directive 2004/10/EC of the European Parliament and of the Council on the harmonization of laws, regulations, and administrative provisions relating to the application of the principles of good laboratory practice and the verification of their applications for tests on chemical substances is included in Royal Decrees 822/1993, 1369/2000 and 2043/1994.

Worker protection
The Council Directive 80/1107/EEC on the protection of workers from the risks related to exposure to chemical, physical, and biological agents at work was translated into the Royal Decree 374/2001. They include the admissible exposure levels in the working atmosphere.

Carcinogens
The Council Directive 90/394/EEC on the protection of workers from the risks related to exposure to carcinogens at work was translated into Royal Decree 665/1997.

Water
The Council Directive 98/83/EC on the quality of water intended for human consumption, was included into the Royal Decree 140/2003, and the Directive 2000/60/EC of the European Parliament and of the Council establishing a framework for Community action in the field of water policy, into the Royal Decree 1/2001.

Pollution control
The Council Directive 2008/1/EC of concerning integrated pollution prevention and control was initiated in the Spanish Law 16/2002.

Waste
The Council Directive 75/442/EEC on waste was included in the Spanish Law 10/1998.

Emissions
For example, the Directive 97/68/EC of the European Parliament and of the Council on the approximation of the laws of the Member States relating to measures against the emission of gaseous and particulate pollutants from internal combustion engines to be installed in non-road mobile machinery is related to the Spanish Law 34/2007.

Ionizing radiation
Council Directive 97/43/Euratom on health protection of individuals against the dangers of ionizing radiation in relation to medical exposure, and repealing Directive 84/466/Euratom are related to Royal Decree 815/2001.

Electromagnetic fields
The Directive 2004/40/EC of the European Parliament and of the Council on the minimum health and safety requirements regarding the exposure of workers to the risks arising from physical agents (electromagnetic fields) is related to the Spanish Royal Decree 1066/2001.

Noise
The Directive 2002/49/EC of the European Parliament and of the Council relating to the assessment and management of environmental noise – Declaration by the Commission in the Conciliation Committee on the Directive relating to the assessment and management of environmental noise is included in the Spanish Law 37/2003.

Doping
The Resolution of the Council and of the representatives of the Governments of the Member States, meeting within the Council on a code of conduct against doping in sport in 1992 and other regulations recommended by the Mundial Agency against Doping and UNESCO are followed in Spain within the Law 10/1990 of the sport, and the Organic Law 7/2006 of the protection of health and against doping in sport.

Illicit drugs
The Regulation (EC) No 273/2004 of the European Parliament and of the Council on drug precursors is regulated through the Spanish Law 3/1996 and modifications.

Miscellaneous Resources

3Erres. List of alternatives to animals
Web: http://www.rediris.es/list/info/3erres.es.html
http://www.rediris.es/list/info/3erres.html

Forum in Spanish about the development, validation and acceptance of alternative methods to animal use.

RegSafe-Regulatory Safety Sciences, SE-182 73 Stocksund, Sweden.
lars.wiklund@regsafe.se

INTRODUCTION

In Sweden, toxicology, ecotoxicology, health and environmental risk assessment are disciplines at various universities and colleges and also at research institutions connected to central authorities and in clinics for environmental and occupational medicine. Toxicology in Sweden is concentrated in the Stockholm-Uppsala area. The main center for education and training in toxicology and health risk assessment is the Institute of Environmental Medicine (IMM), Karolinska Institutet, Stockholm, while Uppsala University offers Sweden's most extensive education within ecotoxicology.

HISTORICAL NOTES IN SWEDISH TOXICOLOGY*

1663: The earliest regulations regarding the handling of poisons were announced via the medical legislation. In 1663 the 'Kungl. Maj:t' (Swedish Government) issued a charter for *Collegium medicorum*, resulting in the public recognition of certain physicians in Stockholm.

1707: Johan Linder, MD (1678–1724), later raised to the nobility Lindestolpe, published the first Swedish monograph in toxicology: *De Venesis* ('About poisons').

Carl Wilhelm Scheele (1742–1786), a chemist and a pharmacist was the discoverer of many chemical substances, most notably said to have discovered oxygen and chlorine. Like many other chemists of his time, Scheele often worked under difficult and even dangerous conditions. Also, he had a habit of tasting chemicals that he found. It appears that this, together with frequent exposure to poisonous chemicals, was the cause of his premature death at the age of 43. At the end of his life he showed symptoms resembling mercury poisoning.

1773: Carl Peter Thunberg, a student and successor of Carl von Linné (1707–1778), sends a letter from his journey to Japan to the Swedish Academy of Sciences, describing poisoning with white lead, accidentally contaminating food.

1810: Karolinska Institutet (KI) was founded. A letter from King Karl XIII to the *Collegium Medicum* authorized the immediate establishment of a 'college for the corps of field surgeons'. The name *Medico Chirurgiska Institutet* was established in 1811 and *Carolinska* was added in 1822. In 1811 Jöns Jacob Berzelius (1779–1848) became one of KI's first professors and laid the foundation for the Institute's natural-scientific orientation. In 1895, Alfred Nobel (1833–1896) appointed Karolinska Institutet to award the annual Nobel Prize in Physiology or Medicine.

1845: NJ Berlin (1812–1891), the last student of Jöns Jacob Berzelius, published a book with the title: 'Anvisning till de allmännaste gifters upptäckande på kemisk väg – För Läkare och Apotekare' (Instructions for the chemical detection of the most general poisons – For physicians and pharmacists).

1850: On behalf of 'Kungl. Maj:t' (Swedish Government), the 'Sundhetskollegium' (something like: 'the Health teaching-staff') give a proposal for a poison regulation ('giftlagstiftning').

*Parts of the historical notes cited from: Holmstedt B, Malmfors T, Svensk Förening för Toxikologi, 1969–1994, Historiska återblickar, Stockholm, Maj 1994 and Lemne M, Bergendorff A, Toxikologi – Utbildning, forskning, testning, UHÄ-rapport 1982: 26.

1872: 'Kungl. Maj:t' (Swedish Government) decides that a position for forensic chemistry should be established, followed by changes in regulations for investigations of poisons at post-mortem examination of corpse. The first holder of this position was Nils Peter Hamberg (1815–1902). The position was later gradually developed to 'Statens rättskemiska laboratorium' (Swedish National Laboratory of Forensic Chemistry).

1876: Ordinance regarding care and the selling of arsenic and other poisonous substances and products is published in 'Svensk författningssamling' (Swedish Code of Statutes).

1889: The Riksdag (Swedish Parliament) approve a law on occupational risks. The first labor inspectors are appointed.

1900–1919: Possible arsenic poisoning from paints and wallpaper in houses. Development of new analytical methods indicating arsenic in blood, urine and spinal fluid, and the presence of organic arsenic.

1906: In the 'Giftstadga' (regulation on poisons) the poisons are divided in two classes: poisons of first degree and poisons of second degree.

1930: Erik MP Widmark (1889–1945) publishes a method for the quantification of alcohol in blood. His research on the absorption, distribution, and elimination of ethanol in the body was very influential on forensic alcohol analysis and toxicology, and paved the way for innovative traffic safety legislation that stipulated punishable limits of alcohol in the blood of a person driving a car.

1930–1939: Carl Gustav Santesson (1862–1939), professor in pharmacology at Karolinska Institutet, is studying the mechanisms of action of arrow poisons and hallucinogenic natural products.

1939–1941: 'Statens institute för folkhälsa' (Swedish Institute for Public Health) was established. Important findings regarding metal toxicity was published. The institute was closed in 1971.

1943: A new 'Giftstadga' (Poison Control Act) was launched.

1958: Karl Borg, at the National Veterinary Institute (Statens Veterinärmedicinska Anstalt, SVA) demonstrates high levels of methyl mercury from pesticide-treated seeds in seed-eating birds.

TOXICOLOGY BECOMES ORGANIZED

Toxicology in Sweden received an organized form in the 1960s. In 1963 the Poison Board (Giftnämnden) was established, and was later replaced with the Products Control Board (Produktkontrollnämnden), that became the Swedish Chemicals Agency (KemI) in 1986. In 1964 the medical research council established a research group in toxicology, which was later reorganized to the department of toxicology at Karolinska Institutet. The European Society of Toxicology (EST) had its annual conference in Stockholm in 1965: 'Experimental studies and clinical experience. The assessment of risk'.

The scientific community in Sweden has for long time provided important contributions for improved awareness of chemical risks and environmental protection. Swedish scientists, for instance, focused attention on the health hazards from organic mercury compounds used in agriculture several years before the Minimata poisonings in Japan brought those problems to the attention of the rest of the world. In 1966, PCBs were identified for the first time in wild animals in the Baltic, and later also in humans, by the scientist Sören Jensen, Stockholm University. In 1971 the first legal step to restrict PCB use in Sweden was taken (the Act on PCB), and legislation and bans were soon followed in many other countries. The Swedish Ordinance on PCB was revised in 1989 and a final time limit for the use of existing PCBs was set to January 1st 1995.

Other Swedish milestones include the establishment of the Swedish Society of Toxicology (SFT) in 1969, although not formally formed until year 1977/78. Prof. Bo Holmstedt was the first president of SFT (1978–1979) and later elected as its first honorary member. The Swedish Society of Toxicology attracts individuals from many areas of toxicology, and the number of members in SFT is currently approximately 400.

Karolinska Institutet began special education in toxicology in 1973. In 1976 this education was expanded to a Masters training program in toxicology, at that time the first cohesive toxicology educational program in Europe. Among the initiators of this unique toxicology program ('Toxikologutbildningen') were Prof Bo Holmstedt, Prof Sten Orrenius, Ass. Prof Torbjörn Malmfors and Dr Anders Bergendorff, all later elected as honorary members of SFT.

Bo Holmstedt (1918–2001) was a prominent toxicologist both nationally and internationally, well-known in the toxicology community for his outstanding research, engagement in education, contributions to toxicological organizations and with a role as a leading authority in toxicological evaluation. He became Sweden's first professor in toxicology in 1964, and in 1974 he was elected to the Swedish Royal Academy of Sciences. He held several international leading positions, most prestigious President of the International Union of Toxicology, IUTOX (1983–1986).

Sten Orrenius has been on the staff of Karolinska Institutet in various positions since 1967 (Professor of Forensic Medicine, Professor of Toxicology and

Director of the Institute of Environmental Medicine (IMM)). He was also Dean of the medical school 1980–1987, and member of the Karolinska Institutet Nobel Assembly 1971–2002. He holds honorary memberships in several international societies, and is also a member of the Royal Swedish Academy of Sciences. Sten Orrenius was president of SFT 1979–1981.

Torbjörn Malmfors, Malmfors Consulting AB, received his PhD at Karolinska Institutet in 1965. Torbjörn Malmfors has been instrumental in many international and national toxicological educational activities with a particularly focus on risk assessment. A major educational initiative he started in 1985 is the Risk Assessment Summer School (RASS), a program of the IUTOX, with Torbjörn Malmfors as the course director. Other successful educational initiatives include BTox, a toxicology education program in Estonia, Latvia, and Lithuania, and STox in Slovenia. Torbjörn Malmfors has been active in various toxicological societies, e.g. President of SFT (1983–1986), Secretary General of the Federation of European Societies of Toxicology (FEST), and Treasurer of IUTOX.

Anders Bergendorff has from the start of the masters training program in toxicology at Karolinska Institutet in 1976 up to his retirement in 2003, served as the Director of Studies, and he has been the prominent person for this united and broad education in toxicology. During all the years Anders Bergendorff has successfully managed the program, and also introduced renewals and developments in order to maintain and improve the high quality. Anders Bergendorff was the secretary of SFT 1983–1988.

The contributions and commitment to the educational activities from all these initiators of the first toxicology program at KI have been exceedingly important for promoting the competence, knowledge, and development of toxicology in Sweden.

In 1986 the Swedish Chemicals Agency was formed and in 1993 the Eurotox conference: 'Use of mechanistic information in risk assessment' was held in Uppsala.

Today the science of toxicology and ecotoxicology as well as health and environmental risk/safety assessments are natural parts of the Swedish society, e.g. at universities, governmental and non-governmental organizations, industries, etc. In 1999 and 2005 the Swedish Parliament adopted 16 national environmental quality objectives. The environmental quality objectives create a transparent and stable framework for environmental programs and initiatives, and serve to guide such efforts at various levels in society. 'A non-toxic environment', one of these objectives, aims to reduce health and environmental risks associated with the manufacture and use of chemical substances. The Swedish Chemicals Agency is the responsible agency for this objective.

Journals

Arbete och Hälsa
ISSN: 0346-7821
Web: http://www.medicine.gu.se/avdelningar/samhallsmedicin_folkhalsa/amm/aoh (Swedish)

Arbete och Hälsa is a scientific report series previously published by the National Institute for Working Life. As this Institute was closed down in 2007, *Arbete och Hälsa* was transferred to the Section of Occupational and Environmental Medicine at Göteborg University. The series publishes scientific original works, dissertations, criteria documents and literature surveys. Part of this scientific series contains the criteria documents of the Nordic Expert Group and the Criteria Group of the Swedish National Institute for Working Life.

In Sweden there are no special journals in the field of toxicology. One of the reasons for not having journals strictly in Swedish is the fact that the Nordic (Scandinavian) countries cooperate in publishing journals, e.g. *Pharmacology and Toxicology* (ISSN: 0901-9928) and *Scandinavian Journal of Work, Environment & Health* (ISSN: 0355-3140) (http://www.sjweh.fi/index.php).

Databases

Several databases are provided, produced, or administrated by different Swedish regulatory agencies. The Swedish Chemicals Agency (KemI) provides databases with information on chemical substances, toxicology and risk assessment, as well as regulatory information about chemicals (Riskline, N-Class, SPIN etc.). The library of Karolinska Institutet provides many databases related to medicine and toxicology, some with Swedish origin, e.g. SweMed+. Information of the databases is found under each of the organizations providing databases.

Organizations (government)

Ministries

Each ministry is responsible for a number of central government agencies. It is these agencies that are responsible for the day-to-day operations of public administration. The Government establishes objectives, guidelines, and the allocation of resources for the agencies' activities, but it does not decide how the agencies are to apply a law or interfere with decisions made in different matters. Only agencies with relevance on

toxicology and environmental issues are included in this overview.

Ministry of Agriculture (Jordbruksdepartementet)
Postal address: SE-103 33 Stockholm, Sweden
Address: Fredsgatan 8, Stockholm
Phone: +46-8-405-10-00
Web: http://www.sweden.gov.se/sb/d/2064; jsessionid=a5ZxPZiopFVc (English)
Web: http://www.regeringen.se/sb/d/1473 (Swedish)

Agencies for which the Ministry of Agriculture, is principal:
The Swedish Board of Agriculture (Jordbruksverket)
Swedish National Food Administration (Livsmedelsverket)
Swedish University of Agricultural Sciences (Sveriges lantbruksuniversitet, SLU)
National Veterinary Institute (Statens veterinärmedicinska anstalt, SVA)

Ministry of Culture (Kulturdepartementet)
Postal address: SE-103 33 Stockholm, Sweden
Address: Drottninggatan 16, Stockholm
Phone (switchboard): +46-8-405-10-00
Web: http://www.sweden.gov.se/sb/d/8371 (English)
Web: http://www.regeringen.se/sb/d/8339 (Swedish)

Agency for which the Ministry of Culture is principal:
The Swedish Museum of Natural History

Ministry of Defense (Försvarsdepartementet)
Postal address: SE-103 33 Stockholm, Sweden
Address: Jakobsgatan 9, Stockholm
Phone (switchboard): +46-8-405-10-00
Web: http://www.sweden.gov.se/sb/d/2060 (English)
Web: http://www.regeringen.se/sb/d/495 (Swedish)

Agencies for which the Ministry of Defense is principal:
Swedish Defense Research Agency, FOI, (Totalförsvarets forskningsinstitut)
Swedish Rescue Services Agency (Räddningsverket)

Ministry of Education and Research (Utbildningsdepartementet)
Postal address: SE-103 33 Stockholm, Sweden
Address: Drottninggatan 16, Stockholm
Phone (switchboard): +46-8-405-10-00
Web: http://www.sweden.gov.se/sb/d/2063 (English)
Web: http://www.regeringen.se/sb/d/1454 (Swedish)

Agency for which the Ministry of Education and Research is principal:
The Swedish Research Council (Vetenskapsrådet)

Ministry of Employment (Arbetsmarknadsdepartementet)
Postal address: SE-103 33 Stockholm, Sweden
Address: Jakobsgatan 26, Stockholm
Phone: +46-8-405-10-00
Web: http://www.sweden.gov.se/sb/d/8281; jsessionid=aF8NValR9UW5 (English)
Web: http://www.regeringen.se/sb/d/8270 (Swedish)

Agencies for which the Ministry of Employment is principal:
National Institute for Working Life (Arbetslivsinstitutet) (The National Institute for Working Life was closed in 2007)
Swedish Work Environment Authority (Arbetsmiljöverket)

Ministry of Enterprise, Energy and Communications (Näringsdepartementet)
Postal address: SE-103 33 Stockholm, Sweden
Address: Jakobsgatan 26, Stockholm
Phone: +46-8-405-10-00
Web: http://www.sweden.gov.se/sb/d/2067 (English)
Web: http://www.regeringen.se/sb/d/1470 (Swedish)

Agency for which the Ministry of Enterprise, Energy and Communications is principal:
VINNOVA, The Swedish Agency for Innovation Systems (Verket för innovationssystem)

Ministry of the Environment (Miljödepartementet)
Postal address: SE-103 33 Stockholm, Sweden
Address: Tegelbacken 2, Stockholm
Phone (switchboard): +46-8-405-10-00
Web: http://www.sweden.gov.se/sb/d/2066; jsessionid=a24XKpf2tE65 (English)
Web: http://www.regeringen.se/sb/d/1471 (Swedish)

Agency for which the Ministry of Environment is principal:
FORMAS, The Swedish Research Council for Environment, Agricultural Sciences and Spatial Planning
Swedish Chemicals Agency (Kemikalieinspektionen)
The Swedish Environmental Protection Agency (Naturvårdsverket)
The Swedish Radiation Safety Authority (Strålsäkerhetsmyndigheten, SSM)

Ministry for Foreign Affairs (Utrikesdepartementet)
Postal address: SE-103 39 Stockholm, Sweden
Address: Gustav Adolfs torg 1, Stockholm
Phone (switchboard): +46-8-405-10-00
Web: http://www.sweden.gov.se/sb/d/2059; jsessionid=alkgbgNxoyo_ (English)
Web: http://www.regeringen.se/sb/d/1475 (Swedish)

Agency for which the Ministry of Foreign Affairs is principal:
SWEDAC, The Swedish Board for Accreditation and Conformity Assessment

Ministry of Health and Social Affairs (Socialdepartementet)
Postal address: SE-103 33 Stockholm, Sweden
Address: Fredsgatan 8, Stockholm
Phone (switchboard): +46-8-405-10-00
Web: http://www.sweden.gov.se/sb/d/2061 (English)
Web: http://www.regeringen.se/sb/d/1474 (Swedish)

Agencies for which the Ministry of Health and Social Affairs is principal:
Medical Products Agency (MPA) (Läkemedelsverket)
National Board of Health and Welfare (NBHW) (Socialstyrelsen)
Swedish National Institute of Public Health (SNIPH) (Statens Folkälsoinstitut)
Swedish Council for Working Life and Social Research (Forskningsrådet för arbetsliv och socialvetenskap, FAS)

Ministry of Integration and Gender Equality (Integrations – och jämställdhetsdepartementet)
Postal address: SE-103 33 Stockholm, Sweden
Address: Fredsgatan 8, Stockholm
Phone (switchboard): +46-8-405-10-00
Web: http://www.sweden.gov.se/sb/d/8366 (English)
Web: http://www.regeringen.se/sb/d/8324 (Swedish)

Agency for which the Ministry of Integration and Gender Equality is principal:
The Swedish Consumer Agency (Konsumentverket)

Ministry of Justice (Justitiedepartementet)
Postal address: SE-103 33 Stockholm, Sweden
Address: Rosenbad 4, Stockholm
Phone (switchboard): +46-8-405-10-00
Web: http://www.sweden.gov.se/sb/d/584 (English)
Web: http://www.regeringen.se/sb/d/1476 (Swedish)

Agency for which the Ministry of Justice is principal:
The Swedish Gene Technology Advisory Board (Gentekniknämnden)

Governmental agencies

FORMAS, Swedish Research Council for Environment, Agricultural Sciences and Spatial planning (Forskningsrådet för miljö, areella näringar och samhällsbyggande)
Postal address: P.O. Box 1206, SE-111 82 Stockholm, Sweden
Address: Kungsbron 21, Stockholm
Phone: +46-8-775-40-00
Email: info@formas.se
Web: http://www.formas.se/default____529.asp (English)
Web: http://www.formas.se/default____182.aspx (Swedish)

FORMAS is a governmental research-funding agency related to several ministries which supports and disseminates information on research within its areas of responsibility. The Council promotes growth within the framework of an ecologically sustainable development.

Medical Products Agency, MPA (Läkemedelsverket)
Postal address: Medical Products Agency, P.O. Box 26, SE-751 03 Uppsala, Sweden
Address: Uppsala Science Park, Dag Hammarskjölds väg 42, Uppsala
Phone: +46-18-17-46-00
Web: http://www.lakemedelsverket.se/Tpl/StartPage____395.aspx (English)
Web: http://www.lakemedelsverket.se/Tpl/StartPage____3.aspx (Swedish)

The Medical Products Agency is responsible for regulation and surveillance of the development, manufacturing, and sale of drugs and other medicinal products. The control and supervision of the Agency concerns three main product areas: Medicinal Products, Cosmetic and Hygiene Products, and Medical Technical Products. Its operations are largely financed through fees.

National Board of Health and Welfare (NBHW) (Socialstyrelsen)
Postal address: Socialstyrelsen, SE-106 30 Stockholm, Sweden
Address: Rålambsvägen 3, Stockholm
Phone: +46-8-555-530-00
Email: socialstyrelsen@socialstyrelsen.se
Web: http://www.socialstyrelsen.se/en/ (English)
Web: http://www.socialstyrelsen.se/ (Swedish)

The National Board of Health and Welfare is a government agency under the Ministry of Health and Social Affairs, with a very wide range of activities and many different duties within the fields of social services, health and medical services, environmental health, communicable disease prevention and control and epidemiology.

National Food Administration (Livsmedelsverket)
Postal address: The National Food Administration, P.O. Box 622, SE-751 26 Uppsala, Sweden
Address: Hamnesplanaden 5, Uppsala
Phone: +46-18-17-55-00
Email: livsmedelsverket@slv.se
Web: http://www.slv.se/default.aspx?id=231&epslanguage=EN-GB (English)

Web: http://www.slv.se/ (Swedish)

The National Food Administration (NFA) is the central administrative authority for matters concerning food, including drinking water. The NFA has the task of protecting the interests of the consumer by working for safe food of good quality, fair practices in the food trade, and healthy eating habits. The NFA's work is to a large extent based on international co-operation, especially within the EU.

National Institute for Working Life (Arbetslivsinstitutet)

As of July 1, 2007, the National Institute for Working Life was closed down permanently.
Web: http://www.arbetslivsinstitutet.se/en/ (English)
Web: http://www.arbetslivsinstitutet.se/ (Swedish)

Library of the National Institute For Working Life:
The book collections were moved to the Stockholm University Library (www.sub.su.se).
Publication services:

Many of the Institutes publications are available by new owners, see (http://www.arbetslivsinstitutet.se/en/publications.asp).
Database developed by the National Institute for Working Life:

Arbline

Arbline is a bibliographic database in the field of occupational environment, and is available online at Karolinska Institutet University Library, and at the Stockholm University.

National Veterinary Institute (Statens Veterinärmedicinska Anstalt, SVA)

Postal address: National Veterinary Institute, SVA, SE-751 89 Uppsala, Sweden
Address: Ulls väg 2B, Uppsala
Phone: +46-18-67-40-00
Email: sva@sva.se
Web: http://www.sva.se/en/Startpage/ (English)
Web: http://www.sva.se/ (Swedish)

The National Veterinary Institute (SVA) is a Swedish national authority that strives for good animal and human health, a good environment, and sustainable food production. The most important role of SVA is to align the activities towards contagious and other serious infectious diseases of animals that imply a threat to supplies of animal foodstuffs, that lead to losses for the production of animals, that concern pets, or involve diseases that can be transferred to humans, i.e., zoonoses.

SWEDAC, The Swedish Board for Accreditation and Conformity Assessment (Styrelsen för ackreditering och teknisk kontroll)

Postal addresses: Head office: P.O. Box 878, 501 15 Borås, Sweden
Stockholm office: P.O. Box 2231, 103 15 Stockholm, Sweden
Addresses: Head office: Österlånggatan 5, Borås
Stockholm office: Slussplan 9, Stockholm
Phone: Borås: +46-33-17-77-00
Stockholm: +46-8-406-83-00
Email: registrator@swedac.se
Web: http://www.swedac.se/sdd/System.nsf/(GUIview)/index_eng.html (English)
Web: http://www.swedac.se/sdd/System.nsf/(GUIview)/index.html (Swedish)

SWEDAC is a public authority under the Ministry for Foreign Affairs. SWEDAC is the national accreditation body, assessing the competence of laboratories, certification and inspection bodies. SWEDAC is also the public authority responsible for regulations and surveillance in the field of legal metrology.

The Swedish Board of Agriculture (Jordbruksverket)

Address: Jordbruksverket, SE-551 82 Jönköping, Sweden
Phone: +46-36-15-50-00
Email: jordbruksverket@sjv.se
Web: http://www.sjv.se/home.4.7502f61001ea08a0c7fff125607.html (English)
Web: http://www.sjv.se/2.7502f61001ea08a0c7fff3.html (Swedish)

The Swedish Board of Agriculture is the Government's expert authority in the field of agricultural and food policy, and the authority responsible for the sector's agriculture, horticulture and reindeer husbandry. Its responsibility includes monitoring, analyzing, and reporting to the Government on developments in these areas, and implementing policy decisions within its designated field of activities. The Board is also responsible for the assessment of animal research, in terms of ethics, and the allocation of research assistance to alternative research methods (transferred from the former Swedish Animal Welfare Agency (Djurskyddsmyndigheten) that was in operation 2004–2007).

Swedish Chemicals Agency (Kemikalieinspektionen, KemI)

Postal address: Swedish Chemicals Agency, P.O. Box 2, SE-172 13 Sundbyberg, Sweden
Address: Esplanaden 3A, Sundbyberg

Phone (switchboard): +46-8-519-41-100
Email: kemi@kemi.se
Web: http://www.kemi.se/default____550.aspx (English)
Web: http://www.kemi.se/ (Swedish)

The Swedish Chemicals Agency (KemI) is a supervisory authority under the Ministry of the Environment. KemI works to prevent damage to people and the environment caused by chemical and biotechnological products. The vision is for future generations to be able to live healthily in a good environment in a sustainable society. KemI works in Sweden and in the EU to promote legislation and rules that contribute to achieving the environmental quality objective of 'A non-toxic environment'.

The Swedish Chemicals Agency (KemI): keeps a product register; maintains a number of databases; approves pesticides; assesses the risk of chemicals; checks companies' compliance with applicable regulations; provides support to local authorities; provides support to other countries; issues reports, publications and a journal; arranges seminars; and provides statistical information on chemicals.

Selected databases provided by KemI:
N-Class – Database on Environmental Hazard Classification Web: http://apps.kemi.se/nclass/default.asp

The N-Class Database contains information on the classifications of more than 7000 substances. The data primarily concern environmental effects constituting the basis for classifications and classification proposals. Classifications of fire and health hazards are also included.

PRIO – A web-based tool for risk reduction of chemicals
Web: http://www.kemi.se/templates/PRIOEngframes____4144.aspx

A web-based tool intended to be used to preventively reduce risks to human health and the environment from chemicals.

Riskline – A bibliographic toxicology database
Web: http://apps.kemi.se/riskline/index.htm

Riskline contains over 7000 bibliographical references to peer-reviewed information on approximately 3000 chemical substances. It is the only existing bibliographic database containing solely peer-reviewed/expert group international information in complete series. Riskline contains information on both environmental effects/ecotoxicology and health effects/toxicology.

Riskline is available online at http://www.kemi.se/default____550.aspx, and as a subfile of the US TOXLINE at the National Library of Medicine (NLM), Washington, DC, USA (http://toxnet.nlm.nih.gov/index.html).

SPIN (Substances in Preparations in Nordic Countries) database
Web: http://195.215.251.229/DotNetNuke/default.aspx

The SPIN database contains information on products on the market reported to each of the Nordic products registers. SPIN also contains data on amounts of substances and in what products and sectors the substances are used.

The Swedish Consumer Agency (Konsumentverket)
Postal address: P.O. Box 48, SE-651 02 Karlstad, Sweden
Address: Lagergrens gata 8, Karlstad
Phone: +46-54-19-41-50
Email: konsumentverket@konsumentverket.se
Web: http://www.konsumentverket.se/mallar/en/startsidan.asp?lngCategoryId = 646 (English)
Web: http://www.konsumentverket.se/ (Swedish)

The Swedish Consumer Agency is assigned by the government to protect the health and safety of consumers. Means to this end are the analysis of injury data, participation in European and international standardization, market control and information to consumers.

The Agency provides advice on consumer products and carries out tests on the functionality and safety of products, including chemical products such as shampoo, detergents and toys.

Swedish Council for Working Life and Social Research (Forskningsrådet för arbetsliv och socialvetenskap, FAS)
Postal address: P.O. Box 2220, SE-103 15 Stockholm, Sweden
Visiting address: Wallingatan 2, Stockholm
Phone: +46-8-775-40-70
Email: fas@fas.se
Web: http://www.fas.forskning.se/default____206.aspx (English)
Web: http://www.fas.forskning.se/default____3.aspx (Swedish)

The Swedish Council for Working Life and Social Research supports and initiates basic and needs-based research within the fields of the labor market, work organization, working environment, public health, health services, and social welfare. The Council was established in 2001 through a merger of the Swedish Council for Social Research and the Swedish Council for Work Life Research.

Swedish Defense Research Agency, FOI (Totalförsvarets forskningsinstitut)
Postal address: FOI, SE-164 90 Stockholm, Sweden
Address: Gullfossgatan 6, Kista
Phone: +46-8-555-030-00
Email: registrator@foi.se
Web: http://www.foi.se/FOI/templates/startpage____96.aspx (English)
Web: http://www.foi.se/FOI/templates/startpage____4.aspx (Swedish)

The Swedish Defense Research Agency works with research, methods and technological development and other studies for the national defense system. FOI was established in 2001 by the merger of the past authorities FOA (Försvarets Forskningsanstalt) and FFA (Flygtekniska Försöksanstalten). FOI provides expertise in many areas, e.g. assessment of different types of threats, and protection against and management of hazardous substances.

FOI conducts research operations in the Stockholm area, Linköping and Umeå. The FOI head office is situated in Kista, Stockholm.

Swedish Environmental Protection Agency (Naturvårdsverket)
Postal address: SE-106 48 Stockholm, Sweden
Address: Valhallavägen 195, Stockholm
Phone: +46-8-698-10-00
Email: natur@naturvardsverket.se
Web: http://www.naturvardsverket.se/en/In-English/Menu (English)
Web: http://www.naturvardsverket.se/sv/ (Swedish)

The Swedish Environmental Protection Agency (Swedish EPA), created in 1967, is the national agency for environmental protection and nature conservation as well as outdoor recreation and hunting issues. Its key tasks are to present proposals for environmental policy and legislation to the Swedish Government and ensure that environmental policy decisions are implemented. The Agency complies with the ISO 14001 environmental management standard and EMAS for both direct and indirect environmental impact.

The library catalogue ELIN is the Web Catalogue of the Swedish Environmental Protection Agency. The database contains more than 45 000 references to both Swedish and international literature on environmental protection and conservation.

The Swedish Gene Technology Advisory Board (Genteknikнämnden)
Address: Genteknikнämnden, Retzius väg 13 A, SE-171 77 Stockholm, Sweden
Phone: +46-8-508-846-30
Email: genteknik@genteknik.se
Web: http://www.genteknik.se/Bazment/30.aspx (English)
Web: http://www.genteknik.se/Bazment/1.aspx (Swedish)

The Gene Technology Advisory Board, established in 1994, has an overall responsibility in the field of gene technology. The Board is to monitor developments in the field of gene technology, oversee ethical issues, and give advice on use of gene technology. According to its instructions the Board is to promote an ethically defensible and safe use of gene technology by the provision of advice, so that the health of people and animals is safeguarded.

GMO Regulations in Sweden (Genvägen)
Website of the authorities responsible for the regulations of activities involving GMOs.
Address: The Swedish Board of Agriculture, SE-551 82 Jönköping, Sweden
Phone: +46-36-15-50-00
Email: genteknik@sjv.se
Web: http://www.gmo.nu/gmoenglish.4.778a5d1001f29869a7fff935.html (English)
Web: http://www.gmo.nu/2.778a5d1001f29869a7fff2.html (Swedish)

Swedish Museum of Natural History (Naturhistoriska Riksmuseet)
Postal address: The Swedish Museum of Natural History, P.O. Box 50007, SE-104 05 Stockholm, Sweden
Address: Frescativägen 40, Stockholm
Phone: +46-8-519-540-00
Web: http://www.nrm.se/2.5fdc727f10d795b1c6e80005635.html (English)
Web: http://www.nrm.se/2.1286b10fdbe80efba80001.html (Swedish)

The Swedish Museum of Natural History is an authority under the Ministry of Culture.

The Museum is a major research institute that combines a venerable tradition with modern working methods.

Department of Contaminant Research and The Environmental Specimen Bank
(Enheten för Miljögiftsforskning och Miljöprovbanken)
Postal address: Swedish Museum of Natural History, Department of Contaminant Research,
P.O. Box 50007, SE-104 05 Stockholm, Sweden
Address: Frescativägen 40 (the museum's main entrance), contact the Reception
Web: http://www.nrm.se/researchandcollections/contaminantresearch.4.5fdc727f10d795b1c6e80005704.html (English)

Web: http://www.nrm.se/forskningochsamlingar/miljogiftsforskning.4.1b7895310364fc40ba80001077.html (Swedish)

The Department of Contaminant Research is the division at the museum appointed by the Swedish Environmental Protection Agency to monitor contaminants in the Swedish natural environment and their deleterious effects on the fauna.

Swedish National Institute of Public Health, SNIPH (Statens Folkhälsoinstitut)
Postal address: SE-831 40 Östersund, Sweden
Address: Forskarens väg 3, Östersund
Phone: +46-63-19-96-00
Email: info@fhi.se
Web: http://www.fhi.se/default____1417.aspx (English)
Web: http://www.fhi.se/ (Swedish)

The Swedish National Institute of Public Health follows up, evaluates, and disseminates knowledge about methods in the field of public health and exercises supervision in the areas of alcohol, illicit drugs, and tobacco.

The Swedish Radiation Safety Authority (Strålsäkerhetsmyndigheten, SSM)
Postal address: SSI, SE-171 16 Stockholm, Sweden
Address: Solna strandväg 96, Solna
Phone: +46-8-799-40-00
Email: registrator@ssm.se
Web: http://www.stralsakerhetsmyndigheten.se/In-English/About-the-Swedish-Radiation-Safety-Authority1/ (English)
Web: http://www.stralsakerhetsmyndigheten.se/Allmanhet/ (Swedish)

The Swedish Radiation Safety Authority is a managing authority under the Ministry of the Environment since 1 July 2008, with national collective responsibility within the areas of radiation protection and nuclear safety.

The authority, took over the responsibility and tasks from the Swedish Radiation Protection Institute and the Swedish Nuclear Power Inspectorate when these ceased to exist on 30 June 2008, works towards protecting people and the environment from the harmful effects of radiation, now and in the future. The task of protecting covers both you as a private person and as a professional.

Swedish Rescue Services Agency – SRSA (Räddningsverket)
Postal address: Swedish Rescue Services Agency, SE-65180 Karlstad, Sweden
Address: Norra Klaragatan 18, Karlstad
Phone: +46-54-13-50-00
Email: srv@srv.se
Web: http://www.srv.se/templates/SRV_AreaPage____350.aspx (English)
Web: http://www.srv.se/ (Swedish)

The Swedish Rescue Services Agency (SRSA) is the central administrative authority for questions relating to rescue services and measures to prevent accidents and damage, both in Sweden and internationally.

SRSA will be closed on December 31, 2008 and on 1st January 2009 a new authority, the Swedish Civil Contingencies Agency (Myndigheten för samhällsskydd och beredskap, MSB) will come into force to strengthen Sweden's civil protection and emergency preparedness. The new authority will be responsible for unifying, coordinating, and supportive tasks prior to, during and after emergencies. Web: http://www.sou.gov.se/msb/ (Swedish)

The Swedish Research Council (Vetenskapsrådet)
Address: Swedish Research Council, Regeringsgatan 56, SE-103 78 Stockholm, Sweden
Phone: +46-8-546-44-000
Web: http://www.vr.se/2.69f66a93108e85f68d480000.html (English)
Web: http://www.vr.se/ (Swedish)

The Swedish Research Council is a government agency funding basic research of the highest scientific quality in all disciplines. The Council has a national responsibility to support and develop basic research and promote research innovation and research communication. The goal is for Sweden to be a leading nation in scientific research.

Swedish Work Environment Authority, SWEA (Arbetsmiljöverket)
Address: Ekelundsvägen 16, SE-171 84 Solna, Sweden
Phone: +46-8-730-90-00
Web: http://www.av.se/inenglish/index.aspx (English)
Web: http://www.av.se/ (Swedish)

The Swedish Work Environment Authority is the administrative authority for questions relating to the working environment. It was formed in 2001, through the merger of the ten districts of the Labor Inspectorate and the National Board of Occupational Safety and Health. The Authority's principal objective is to reduce the risks of ill health and accidents in the workplace and to improve the work environment from the physical, mental, social, and organizational viewpoints.

VINNOVA, Swedish Governmental Agency for Innovation Systems
Postal address: VINNOVA, SE-101 58 Stockholm, Sweden
Address: Mäster Samuelsgatan 56, Stockholm
Phone: +46-8-473-30-00

Email: vinnova@vinnova.se
Web: http://www.vinnova.se/In-English/ (English)
Web: http://www.vinnova.se/ (Swedish)

VINNOVA is a State authority that aims to promote growth and prosperity throughout Sweden. The particular area of responsibility comprises innovations linked to research and development. The tasks are to fund the needs-driven research required by a competitive business and industrial sector, and to strengthen the networks that are such a necessary part of this work.

Organizations (non-government)

Forskning.se
Address: forskning.se, Vetenskapsrådet (Swedish Research Council), 103 78 Stockholm, Sweden
Phone: +46-546-44-000
Email: red@forskning.se
Web: http://www.forskning.se/webbspecifikasidor/inenglish.4.303f5325112d733769280001889.html (English)
Web: http://www.forskning.se/ (Swedish)

Forskning.se is a nationwide website that provides information on research and research findings by: collecting and sorting data on research results; supplementing texts with comprehensible summaries; prioritizing clear, straightforward presentations; being committed to the scrutiny of current Swedish research; and giving precedence to cooperative activities.

The International Chemical Secretariat (ChemSec)
Postal address: P.O. Box 7005, SE-402 31 Göteborg, Sweden
Address: Norra Allégatan 5, Göteborg
Phone: +46-31-711-04-95
Web: http://www.chemsec.org/index.php (English)

ChemSec is a non-profit organization dedicated to work towards a toxic-free environment. In order to achieve this, the Secretariat promotes the implementation of precautionary perspectives into international chemicals policies and practices.

IVL Swedish Environmental Research Institute (IVL Svenska Miljöinstitutet AB)
Postal address: PO Box 210 60, SE-100 31 Stockholm, Sweden
Address: Valhallavägen 81, Stockholm
Phone: +46-8-598-563-00
Postal address: P.O. Box 5302, SE-400 14 Göteborg, Sweden
Address: Aschebergsgatan 44, Göteborg
Phone: +46-31-725-62-00
Web: http://www.ivl.se/en/ (English)
Web: http://www.ivl.se/ (Swedish)

IVL's services to its customers and funding agencies include applied research, technological development, environmental monitoring, and assessments. An important role is to compile, evaluate, and communicate knowledge, which may be of benefit to Sweden and Swedish industry.

IVL's activities are divided in four main areas: Sustainable production, Achievement of environmental goals, Environmental communication, and International activities.

MISTRA, The Foundation for Strategic Environmental Research (Stiftelsen för miljöstrategisk forskning)
Address: Gamla Brogatan 36-38, SE- 111 20 Stockholm, Sweden
Phone: +46-8-791-10-20
Email: mail@mistra.org
Web: http://www.mistra.org/english (English)
Web: http://www.mistra.org/ (Swedish)

MISTRA supports strategic environmental research with a long-term perspective aiming to solve major environmental problems. The main part of MISTRA's funding is focused on broad-based interdisciplinary programs.

NewS, A new strategy for the risk assessment and management of chemicals
Address (Program director): Sven Ove Hansson, Philosophy Unit, Royal Institute of Technology (KTH), Teknikringen 78, SE-100 44 Stockholm, Sweden
Phone: +46-8-790-95-64
Email: soh@infra.kth.se
Web: http://www.infra.kth.se/fil/news/index.htm (English)

NewS proposes a new strategy for coping with potential unwanted adverse effects to human health and to the environment from exposure to chemical substances. Science-based precaution is a key term in the new strategy, and so is simplified risk assessment.

NewS consists of 11 research projects that aim at making the new strategy as operative as possible.

Nordic Council and the Nordic Council of Ministers, Official co-operation in the Nordic region
The Secretariats of the Nordic Council and the Nordic Council of Ministers are both based in Copenhagen.

The Nordic Council
Address: Store Strandstræde 18, DK-1255 Copenhagen K, Denmark
Phone: +45-33-96-04-00
Email: nordisk-rad@norden.org

The Nordic Council of Ministers
Address: Store Strandstræde 18, DK-1255 Copenhagen K, Denmark

Phone: +45-33-96-02-00
Email: nmr@norden.org
Web: http://www.norden.org/start/start.asp?lang=6 (English)
Web: http://www.norden.org/start/start.asp?lang=1 (Swedish)

Official Nordic co-operation is channeled through two organizations: the Nordic Council and the Nordic Council of Ministers. The Nordic Council was formed in 1952 and is the forum for Nordic parliamentary co-operation. The Nordic Council of Ministers, formed in 1971, is the forum for Nordic governmental co-operation.

ReproSafe, Reproduction and Chemical Safety
Address (Ulf Magnusson, Program Manager, Chair): The Centre for Reproductive Biology in Uppsala (CRU), P.O. Box 7054, SE-750 07 Uppsala, Sweden
Phone: +46-18-67-23-24
Email: ulf.magnusson@og.slu.se
Web: http://www-cru.slu.se/ReproSafe.htm (English)
Web: http://www-cru.slu.se/RSsvhem.htm (Swedish)

The ReproSafe (Reproduction and Chemical Safety) program is a research program supported by the Swedish Environmental Protection Agency. The ReproSafe program addresses the issue of a growing scientific and public concern that chemicals in the environment may impair human and wildlife reproduction. The program is built on a comparative approach aiming to increase the knowledge about mechanisms of action for chemically induced reproductive impairment and to develop new and sensitive methods for recording such impairment. A postgraduate school on reproductive toxicology is attached to the program and regularly seminars and stakeholder meetings are arranged.

Stockholm Environment Institute (SEI)
Address: Stockholm Environment Institute, Kräftriket 2B, SE-106 91 Stockholm, Sweden
Phone: +46-8-674-70-70
Web: http://www.sei.se/index.php (English)

The Stockholm Environment Institute (SEI) is a non-profit, independent research institute and think-tank specializing in sustainable development and environmental issues. It works at multiple levels, global, national, regional and local, and accords particular attention to cross-scale problems and interactions.

The Swedish Plastics and Chemicals Federation (Plast- & Kemiföretagen)
Postal address: P.O. Box 55915, SE-102 16 Stockholm, Sweden
Address: Storgatan 19, Stockholm
Phone: +46-8-783-86-00
Email: info@plastkemiforetagen.se
Web: http://www.plastkemiforetagen.se/PoK_eng/index.htm (English)
Web: http://www.plastkemiforetagen.se/index.htm (Swedish)

The Swedish Plastics and Chemicals Federation is the trade organization of the manufacturers and suppliers of chemicals and plastic products in Sweden. The goal of the Federation is to create good conditions for competitiveness, growth, and productivity. One of the most essential goals is that processes and products should fulfill high demands in respect of health, safety, and environment. The Swedish Plastics and Chemicals Federation is a member of The Confederation of Swedish Enterprise.

Universities

Different education and/or training programs in toxicology, ecotoxicology and health and environmental risk/safety assessment on various levels, i.e. undergraduate, MSc and PhD are provided at several universities in Sweden. The Institute of Environmental Medicine (IMM) at Karolinska Institutet (KI), Stockholm is the main center for education and training in toxicology and health risk assessment in Sweden, while Uppsala University offers Sweden's most extensive education within ecotoxicology. Details of present courses and programs are found at each university.

Göteborg University (Göteborgs Universitet)
Postal address: P.O. Box 100, SE-405 30 Göteborg, Sweden
Address: Vasaparken, Göteborg
Phone: +46-31-773-10-00
Web: http://www.gu.se/english/?languageId=0 (English)
Web: http://www.gu.se/ (Swedish)

The Faculty of Science (Naturvetenskapliga fakulteten)
Web: http://www.science.gu.se/english/ (English)
Web: http://www.science.gu.se/ (Swedish)

The Faculty of Science includes all the major subject areas in the fields of mathematics and natural sciences. The Faculty of Science offers national degree programs and courses, as well as International Master's Programs.

Masters program in Ecotoxicology
Web: http://www.science.gu.se/english/education/master/ecotoxikology/ (English)
Web: http://www.science.gu.se/utbildning/masterprogram/program/ (Swedish)

Web: http://www.amm.se/
http://www.miljosamverkan.se/vgrtemplates/Page____14291.aspx (Swedish)

The Department of Occupational and Environmental Medicine is a part of Sahlgrenska University Hospital (SU). The hospital provides an infrastructure necessary for teaching and research in co-operation with the Sahlgrenska Academy at Göteborg University.

Karolinska Institutet
Postal address: Karolinska Institutet, Registry Office, SE-171 77 Stockholm, Sweden
Address: Nobels väg 5, Solna
Phone: +46-8-524-865-95
Email: registrator@ki.se
Web: http://ki.se/?l=en (English)
Web: http://ki.se/?l=sv (Swedish)

Karolinska Institutet is one of Europe's largest medical universities. It is also Sweden's largest center for medical training and research.

The Institute of Environmental Medicine (Institutet för Miljömedicin, IMM)
Postal address: P.O. Box 210, 171 77 Stockholm, Sweden
Address: Nobels väg 13, Karolinska Institutet, Solna
Web: http://ki.se/ki/jsp/polopoly.jsp?d=1666&l=en (English)
Web: http://ki.se/ki/jsp/polopoly.jsp?d=1666&l=sv (Swedish)

The Institute of Environmental Medicine (IMM) is an interdisciplinary research organization that carries out research, education, and investigations in the fields of environmental medicine, toxicology, epidemiology, and health protection. The Institute also provides assistance to public authorities and others through consulting and training personnel in the field of toxicology and environmental medicine. An important part of the work at IMM is to provide the governmental agencies with environmental health risk assessments as a basis for regulations and standard settings.

Education and training in toxicology and risk assessment at IMM
IMM offers graduate training programs for higher degrees in Toxicology, Environmental Medicine, Epidemiology, Molecular Toxicology, Cell and Molecular Biology, and Molecular Genetics.
Study program in Toxicology (Toxikologutbildningen Master program 120 hp)
Web: http://ki.se/ki/jsp/polopoly.jsp?d=9340&a=7374&l=sv (Swedish)

The 2-year toxicology program at IMM, Karolinska Institutet started in 1976, at that time the first toxicology educational program in Europe. This study program in toxicology is the only cohesive education program in Sweden with the emphasis on toxicology and health risk assessment. The program is directed to either research or a professional career, and aims to educate in basic and applied toxicological research, toxicological investigations and testing, and regulatory toxicology and health risk assessment. The program is designed to provide a scientific knowledge base in toxicology and health risk assessment to meet the needs from universities, industry, and governmental agencies for qualified toxicological expertise. On successful completion of the program students have been awarded a Master of Medical Science in Toxicology ("Magister"). The curriculum for the study program in toxicology was changed in 2008 to a 2-year Master Program in Toxicology (120 ECTS credits) with

the exam entitled Degree of Master of Medical Science with a major in Toxicology.

Department of Biosciences and Nutrition (Institutionen för biovetenskaper och näringslära)
Web: http://ki.se/ki/jsp/polopoly.jsp?d=229&l=en (English)
Web: http://ki.se/ki/jsp/polopoly.jsp?d=229&l=sv (Swedish)

The department performs research and education in areas of medical science. These include signal transduction and gene regulation, structural biology and bio-organic chemistry, human genetics and functional genomics, cellular virology and environmental toxicology.

Department of Public Health Science
Division of Occupational and Environmental Medicine (Arbets- och miljömedicin)

Division of Toxicology
Web: http://www.farmbio.uu.se/research.php?avd=3 (English)
Web: http://www.farmbio.uu.se/avdelningar.php?avd=3 (Swedish)

The division of toxicology provides several courses in toxicology.

Evolutionary Biology Centre – EBC (Evolutionsbiologiskt centrum)
Web: http://www.ebc.uu.se/index_eng.php (English)
Web: http://www.ebc.uu.se/ (Swedish)

EBC answers for most of Uppsala University's research and education in biology.

Department of Physiology and Developmental Biology (Institutionen för fysiologi och utvecklingsbiologi)
Web: http://www.fu.uu.se/ (English)

The Department performs research and education in comparative immunology, developmental biology, environmental toxicology, epigenetics, evolutionary organism biology, and neurophysiology.

Department of Environmental Toxicology
Web: http://www.fu.uu.se/etox/ (English)

The research at Department of Environmental Toxicology is largely focused on developmental effects of contaminants in various animal classes and enzyme-catalyzed activation of compounds in target cells and tissues. A particular interest is in toxic events that target the hormone system, the reproductive system, and the early brain development in vertebrates.

Educational programs in ecotoxicology, biology (Utbildning)

Web: http://www.ibg.uu.se/en/master/biology/index.html (English)
Web: http://www.ibg.uu.se/se/program/biologi/index.html (Swedish)

Uppsala University offers Sweden's most extensive education within ecotoxicology. The course package in ecotoxicology was first given in 1980 and is the only comprehensive education program in ecotoxicology in Sweden. Ecotoxicology is included as specialization in the Master of Science Program in Biology.

Professional Societies

Swedish Society of Toxicology (Svensk Förening för Toxikologi, SFT)
Address: SFT, c/o Plast- & Kemiföretagen, P.O. Box 55915, SE-102 16 Stockholm, Sweden
Phone (SFT secretary): +46-8-783-81-47
Email (SFT secretary): lisa.ekstig@plastkemiforetagen.se
Web: http://www.imm.ki.se/sft (Swedish mainly)

The Swedish Society of Toxicology is an association for: individuals with a profession in toxicology, risk assessment or related areas; students in the field of toxicology; others with a keen interest in toxicology. The overall purpose for the Swedish Society of Toxicology is to: promote the development of new knowledge within the field of toxicology; work for the spreading of toxicology knowledge and information; work for an increased and scientifically based practical application of toxicological knowledge in society. The aim of SFT is to promote the development of toxicology in Sweden and work for toxicological education and research through the arrangement of public meetings and scientific seminars and discussions. The society works for the exchange of information between members and between members and representatives of other scientific disciplines and other parts of the society as well as aim at cooperation between other closely related organizations nationally and internationally.

The Swedish Academy of Pharmaceutical Sciences (SAPS) (Läkemedelsakademin, Apotekarsocieteten)
Postal address: P.O. Box 1136, SE-111 81 Stockholm, Sweden

Web: http://www.swepharm.se/templates/SPstandard.aspx?id=759 (English)
Web: http://www.swepharm.se/ (Swedish)

The Swedish Academy of Pharmaceutical Sciences (SAPS) is a non-profit organization for people engaged in the field of medicinal drugs. The aim of the organization is to further developments in pharmaceutical research and to promote high, professional standards. The organization is a national provider of continuing education and post-graduate courses. Regional activities, in collaboration with the various divisions, are run in more than 40 locations throughout the country. The activities encompass a broad spectrum of subjects from generally oriented topics to more specific scientific-oriented ones. The Academy co-operates on a number of courses with universities and other providers of education inside and outside of Sweden. Also, a number of international symposia and workshops are held under the sponsorship of SAPS.

Toxicological Council (Toxikologiska Rådet)
Address: The Toxicological Council, Swedish Chemicals Agency, P.O. Box 2, SE-172 13 Sundbyberg, Sweden
Phone: +46-8-519-41-100
Email: toxrad@kemi.se
Web: http://www.kemi.se/templates/Page____2988.aspx (English)
Web: http://www.kemi.se/templates/Page____2832.aspx (Swedish)

The Toxicological Council is an expert body, managed by the Swedish Chemicals Agency (KemI), providing scientific advice and consultation on toxicological issues to government agencies within the environmental sector. The Toxicological Council promotes a high scientific level in risk analyses carried out by the agencies and provides guidance on criteria and principles for scientific interpretation. The Council strives for a co-coordinated and uniform design of risk analyses between agencies. Working methods vary from in-house meetings to seminars on topical toxicological issues and discussions on assessments and interpretations of toxicological data.

Poison Control Centers

Swedish Poison Information Centre (Giftinformationscentralen)
The Swedish Poisons Information Centre is located to the Karolinska University Hospital, Solna
Phone: +46-8-33-12-31
Web: http://www.giftinformation.se/intro.asp?CategoryID=6414 (English)
Web: http://www.giftinformation.se/ (Swedish)

The Swedish Poisons Information Centre is an autonomic unit of the National Corporation of Swedish Pharmacies. The main responsibility for the Swedish Poisons Information Centre is to answer questions and give advice to the general public, physicians, and other healthcare personnel in cases of acute poisonings. The service is available on a 24-hour basis, every day of the year. If needed, enquiries can be conducted in English. The staff includes physicians, pharmacists, and administrative personnel. An internal education and training period of 3–6 months is required before the pharmacists are allowed to answer telephone calls on their own. The physicians, who are specialized in anesthesiology, intensive care, and clinical toxicology, have the ultimate medical responsibility for the information provided. They also work within the ICU on a regular basis.

Miscellaneous Resources

Stockholm Centre for Public Health (Centrum för folkhälsa), Stockholm County Council
Postal address: Stockholm Centre for Public Health (Centrum för folkhälsa), PO Box 17533, SE-118 91 Stockholm, Sweden
Address: Västgötagatan 2, Stockholm
Phone: +46-8-737-35-00

Web: http://www.folkhalsoguiden.se/AvdEnhet.aspx?id=1228 (English)
Web: http://www.folkhalsoguiden.se/StartAvd.aspx?id=611 (Swedish)

Stockholm Centre for Public Health, within Stockholm County Council, has regional responsibility for work in the arena of Public Health. The principal tasks are to monitor and report on the health of the population in Stockholm, and to develop and support health-promoting and preventive work. Stockholm Centre for Public Health is closely linked to Karolinska Institutet, and also works in close co-operation with other actors on Public Health issues.

Hospitals

Karolinska University Hospital (Karolinska Universitetssjukhuset)
Karolinska University Hospital, Solna
Postal address: SE-171 76 Stockholm, Sweden
Address: Karolinskavägen, Solna
Phone: +46-8-517-700-00

Karolinska University Hospital, Huddinge
Postal address: SE-141 86 Stockholm, Sweden
Address: Hälsovägen, Flemingsberg
Phone: +46-8-585-800-00
Web: http://www.karolinska.se/templates/DivisionStart____53585.aspx?epslanguage=EN (English)
Web: http://www.karolinska.se/default.aspx?epslanguage=SV (Swedish)

Karolinska University Hospital is besides being a hospital also part of a medical school. Karolinska University Hospital works closely with several colleges and universities, mainly Karolinska Institutet, but also with Södertörns University College, Stockholm University, and the Royal Institute of Technology in Stockholm. Karolinska Institutet certifies researcher education and grants academic degrees (MD, PhD) in medicine. The Karolinska University Laboratory is one of the world's largest and most complete clinical laboratories.

Lund University Hospital (Universitetssjukhuset i Lund)
Department of Occupational and Environmental Medicine (Arbets-och Miljömedicin)
Postal address: University Hospital, Occupational and Environmental Medicine, SE-221 85 Lund, Sweden
Phone: +46-46-17-31-85
Email: AMM.usil@skane.se
Web: http://www.skane.se/templates/Page.aspx?id=109565 (Swedish)

Occupational and Environmental Medicine includes one clinical unit (Department of Occupational and Environmental Medicine) at the University Hospital in Lund and a unit (Division of Occupational and Environmental Medicine within the Department of Laboratory Medicine/Lund) in the Medical Faculty at Lund University.

Malmö University Hospital (Universitetssjukhuset MAS)
Postal address: SE-205 02 Malmö, Sweden
Phone: +46-40-33-10-00
Email: UMAS@skane.se
Web: http://www.skane.se/upload/Webbplatser/UMAS/sprak_filer/engelska.pdf (English)
Web: Web: http://www.skane.se/default.aspx?id=21002 (Swedish)

Norrlands University Hospital (Norrlands universitetssjukhus (Nus))
Postal address: Norrlands universitetssjukhus, SE-901 85 Umeå, Sweden
Phone: +46-(0)90-785-00-00
Web: http://www.vll.se/default.aspx?id=25719&refid=1926 (English/Swedish)

Occupational Medicine North
A collaboration between the occupational and environmental clinics in Sundsvall and Umeå.

Department of Occupational and Environmental Medicine in Umeå
The University Hospital of Northern Sweden, SE-901 85 Umeå, Sweden.
Phone: +46-(0)90-785-24-50

Department of Occupational and Environmental Medicine in Sundsvall
The Hospital in Sundsvall, SE-851 86 Sundsvall, Sweden
Phone: +46-60-18-19-26

Sahlgrenska University Hospital (SU) (Sahlgrenska Universitetssjukhuset)
Department of Occupational and Environmental Medicine (Arbets- och miljömedicin)
Postal address: Occupational and Environmental Medicine, Sahlgrenska University Hospital,
P.O. Box 414, SE-405 30 Göteborg, Sweden
Address: Medicinaregatan 16A, Göteborg
Phone: +46-31-786-63-00
Email: amm@amm.gu.se
Web: http://www.amm.se/eng/

CHAPTER

105

Taiwan

JUNG-DER WANG

INTRODUCTION

Dr. Tsungming Tu, the first medical doctor and pharmacologist in Taiwan, began his studies on opiates, morphine, Chinese herbs, and snake venoms after he graduated from Kyoto Imperial University in 1922. His team has cultivated a lot of outstanding pharmacologists and toxicologists in the Graduate Institute of Pharmacology at the National Taiwan University College of Medicine (NTUCM). Among them, Drs. Chen-Yuan Lee, Chuan-Chiung Chang, Che-Ming Teng and his colleagues have conducted series of studies on snake venoms and natural products, including the discovery of bungarotoxins, which won Dr. Lee the Redi Award in 1976. There was another team of researchers who conducted studies on toxicology at the Graduate Institute of Biochemistry of the NTUCM after World War II. Among them, Drs. Ta-Cheng Tung and Jung-Yaw Lin, Guo-Huang Lin and Jen-Kun Lin were famous for studies of various phytotoxins and fungotoxins, including mimosine, abrin and ricin, territrem and azo dyes. Most of these early studies focused more on laboratory works and help the establishment of two graduate institutes of toxicology in Taiwan: one in the National Taiwan University College of Medicine (1990), with another in Chung-Shan Medical University (1996). Later on, the Division of Environmental Health and Occupational Medicine was set up in the National Health Research Institutes in 1999, which also contribute to the education and training of young toxicologists. So far, there are ***about more than 300 professionals who have joined the Taiwan Society of Toxicology and conducted laboratory researches.***

In 1982, Dr. Jung-Der Wang began to establish an occupational and environmental clinic at the National Taiwan University Hospital, which began the recognition and documentation of diseases resulting from occupational and environmental hazards in factories. Later on, Dr. Jou-Fang Deng established the Taiwan National Poison Control Center (PCC-Taiwan) in 1985 under the auspices of Department of Health, Taiwan and the Veterans General Hospital-Taiwan, which provides 24-hour free consultation assistance for identification, diagnosis, and treatment of poisonings, interpretation of laboratory tests for 23 million inhabitants. His team has co-ordinated to establish a National Antidote Stocking System in 2001, which managed the distribution and stocking of seven antidotes of first priority: physostigmine, cyanide antidote (hydroxocobalamin), BAL (DMSA, DMPS), Ca-EDTA, methylene blue, botulism antitoxin, and the antivenom against Viper russeli formosensis. Because of the co-operation among doctors from these two and other medical centers, they established the Board of Occupational Medicine approved by the Department of Health of Taiwan in 2002 and so far there have been about more than 234 board-certified occupational and environmental physicians responsible for seeing patients suffering from poisoning of occupational and environmental hazards and about 934 board-certified emergency physicians seeing patients with acute poisoning.

RESOURCES

Books

Bureau of Food and Drug Analysis (1996)
Drug Abuse Compilation: Toxicity, Metabolism and Analysis
Taipei: Bureau of Food and Drug Analysis

This book published by the Bureau of Food and Drug Analysis serves as a formal reference for healthcare workers to understand the toxicity and analytic method of different drugs that are commonly abused by people. It is an easy-to-read and ready reference.

Chang IC (1994)
Chemical Process Safety Management
Taipei: Yang-Chih Book Co., Ltd

This book provides fundamental information for chemical process safety, such as chemical toxicity and health hazard, fire and explosives, hazard identification, risk assessment, and safety management.

Chen JM (2007)
Environmental Toxicology
Taipei: Wun-Ching Publishing Group

Chen JS (1994)
Hazardous Substances Management
Taipei: Shin-Wen-Jing Book Co., Ltd

Chen JS, Cheng (1997)
Poisonous Plants in Mainland China
Taipei: Di Jin

This book contains mainly the pictures of different poisonous plants grown in mainland China. It is a good resource for people to use and identify such plants.

Chen TC, Sheng TJ (1992)
Food Additives
Taipei: Wen-Yuan Book Co., Ltd

This book is a comprehensive treatise on food additives. It is divided into three main parts: introduction to food additives, chemical and physical properties of individual food additives, and special information on food additives, such as the food additives act, dosage, usage, manufacture, storage, transport, stability, and toxicity.

Chen ZY, Hsu PM (1993)
Toxicological Chemistry
Taipei: Da-Shing

This book illustrates several toxicological aspects of generally used chemicals, including description of chemicals, intoxication symptoms, antidotes and treatments, chemical analysis of toxicants, and overview of toxic compounds.

Cheng PK (1989)
Nuclear Radiation and Detection
Taipei: Asian-Eastern Book Co.

This book discusses several important aspects of radiation hazards, including radiation protection, interaction of ionizing radiation with the biosphere, radio-detector, scintillation detection, semi-conductance detection, and nucleonics.

Cheng YC (1991)
Poisonous Plants
Taipei: Du Chia Publishing

This book contains mainly pictures of poisonous plants in Taiwan, including Taipei. It is a good resource for people to check and identify such plants.

Chueng JY (1995)
Essentials in the Protection of Public Health
Taipei: Shu-Shing Publishing Co., Ltd

This book is a concise treatise on the protection of public health. The book covers various areas of environmental sciences: environmental protection, public hazards, environmental assessment, air pollution protection, odor control, water protection, noise control, waste management, and global environmental protection.

Foundation for Poison Control (1999)
The Principle of Treatment of Acute Poisoning (I)
The Principle of Treatment of Acute Poisoning (II)
Taipei: Foundation for Poison Control

These two books are major handbooks for healthcare workers and people to have a quick access on the management information of most common poisons.

Horng KC, Yang MT, Tseng CM (1994)
Industrial Safety and Health/Management and Practice
Taipei: Yang-Chih Book Co.

This book is a comprehensive treatise on industrial safety and health. Several areas of this discipline are covered, including the role of labor safety inspection, management system, self-safety examination, education and training, physical examination, occupational hazards, and occupational safety.

Lee YJ (1995)
Environmental Attitudes and Environmental Protection Behavior – Theory & Practice
Taipei: Architectural Information Magazine Ltd

This book gives a detailed analysis on the environmental problems arising from the general population. The emphasis of this treatise is focused on environmental behavior, environmental policy, resident attitudes, and expert opinion.

Lin JK (1994)
Food and Cancer
Taipei: Lien-Jing Publishing Co.

This book is written in Chinese and aimed at laypeople. A systematic discussion on the role of dietary factors in the etiology of human cancer is given. The importance

of some anticancer factors in the daily diet is also described. The concept that reactive oxygen species may play important roles in the development of cancer, cardiovascular diseases, and aging is illustrated. This book has received the Golden Tripod Award from the Bureau of Cultural Communication, Executive Yuan, Republic of China.

Lin JK (1995)
Biochemical Mechanisms of Carcinogenesis and Anticarcinogenesis
Taipei: Laboratory for Cancer Research, Institute of Biochemistry, College of Medicine, National Taiwan University, Taipei

This book is a collection of original papers dealing with the biochemical and molecular mechanisms of carcinogenesis and anticarcinogenesis. The collection comprises four parts; analytical methods for cancer research, naturally occurring amines and N-nitroso compounds in environmental carcinogenesis, molecular mechanisms of chemical carcinogenesis, and biochemical and molecular mechanisms of anticarcinogenesis and cancer chemoprevention.

Lin JK (1995)
Genetic Engineering and Cancer Medicine
Taipei: Lien-Jing Publishing Co.

This book is a collection of 34 comprehensive papers dealing with the new developments in genetic engineering and cancer medicine. It is written in Chinese and aimed especially at high school and college students. The research works and contributions made by several Nobel prize winners are described. The recombinant DNA technology is systematically introduced.

Lin JL (2003) (2004) (2006)
Toxin in Life (1)
Toxins in Life (2)
Toxins in Life (3): Plain talking about detoxification
Taipei: Hung-Shin Book Co.

The above three books contain typical examples of poisonings and their management, which are written for lay people to obtain useful daily knowledge for toxins.

Lin JY (2003)
Drug Crimination and Prevention
Tao-Yuan: Central Police University Press

The book is mainly used for police and safety professionals to have a more in-depth understanding on drug abuse and its prevention. It collects many cases that previously happened in Taiwan and the pictures are useful for people to read and quickly get an idea of the issue.

Lin-Shiau SY (1995)
Modern Concepts in Biochemical Pharmacology
Taipei: Lien-Jing Publishing Co.

This book is a collection of papers dealing with the toxicity and mechanisms of several drugs. All are written in Chinese and suitable for laypeople.

Lin SN (1997)
Drug Abuse and Prevention
Taipei: Medtoday

This book is written by a professor in psychiatry who has ample experience of dealing with drug abuse. It is suitable for healthcare workers and public.

Miao SL, Liu YC, Liu CY (1995)
Environmental Science Dictionary
Taipei: Fishery Product Publishing Co.

This dictionary is a comprehensive treatise written in Chinese. It provides general information on environmental sciences and includes environmental pollution and hazard, assessment and monitoring, and management.

Shiau SY (1993)
Biochemical Pharmacology
Taipei: Lien-Jing Publishing Co.

This book is written in Chinese and describes the biochemical and molecular mechanisms of drug actions. Recent developments in drug receptor biology and biochemistry are described.

Teng WC (1996)
Biotechnology
Taipei: Chiow-Chow Book Co.

This book describes recent developments in biotechnology with special emphasis on medical products, food supplements, agricultural products, energy products, gasoline derivatives, and new products used in pollution control.

Tsai FG (1993)
Poisonous Plants Found Commonly in the Garden of Taipei City
Taipei: Department of Information, Taipei City Government

This book is published by the City Government of Taipei to help all residents to identify poisonous plants. It contains many pictures of such plants.

Tsai YM (1993)
Modern Safety Management
Taipei: Yang-Chih Book Co.

This book covers the following areas: safety management, industrial hygiene, safety control, and psychology and behavior.

Yang CC (2003)
Epidemiologic Data of Acute Pesticide Poisoning in Taiwan, 1985–2001
Taipei: Quarterly Publication of the Taiwan PCC

The book summarizes different cases of pesticide poisoning that were collected by PCC (Poison Control Center), and provides real examples for control of pesticide poisoning.

Yang YN (1996)
The Story of Snake Venom Research in Taiwan
Taipei: Tian-Shia Book Co., Ltd

The book is for the public to understand the history of snake venom research.

Wang JD (1987)
Environmental Pollution and Disease (I)
Taipei: Health World Publishing Co.

Wang JD (1990)
Environmental Pollution and Disease (II)
Taipei: Health World Publishing Co.

These two books are written for public education and provide actual cases and the settings of occurrence of many occupational and environmental diseases. They are written in Chinese and also contain prevention strategy.

Wang JD (2002)
Basic Principles and Practical Applications in Epidemiological Research
Singapore: World Scientific

This book details the method of epidemiology and provides several cases of occupational and environmental diseases with different types of causal inference for the recognition of occupational and/or environmental causes.

Journals

Journal of the Chinese Medical Association
Taipei: Chinese Medical Association

Journal of Chinese Oncology Society (1984–)
Taipei: Chinese Oncology Society

This journal generally publishes papers dealing with cancer research, but sometimes it also publishes papers concerning toxicology.

Journal of Food and Drug Analysis (1992–)
Taipei: National Laboratories of Foods and Drugs, Department of Health, Executive Yuan

This journal publishes papers dealing with drug and food analysis. Papers describing the toxicities of drugs are also included.

Journal of Formosan Medical Association (1901–)
Taipei: Formosan Medical Association

This journal publishes papers dealing with clinical medical sciences, but occasionally it also publishes papers relating to toxicology.

Journal of the Chinese Chemical Society
Taipei: The Chemical Society

It is published bimonthly by The Chemical Society located in Taipei. The scope of the Journal includes both experimental and theoretical reports of original research.

Journal of Occupational Safety and Health (1992–)
Taipei: Institute of Occupational Safety and Health, Council of Labor Affairs, Executive Yuan

This journal publishes papers covering the research on occupational safety and health, sponsored by the Council of Labor Affairs.

Newsletter on Drug and Food (1970–)
Taipei: Food and Drug Bureau, Department of Health, Executive Yuan

This newsletter covers various aspects of drug and food inspection, namely, updated information on the development of drug and food analysis, side effects of drugs, toxic contaminants of foods, toxicological implication in drug metabolism, and new systems of drug and food control.

Newsletter on Occupational Safety and Health (1993–)
Taipei: Institute of Occupational Safety and Health, Council of Labor Affairs, Executive Yuan

This newsletter is a short communication for occupational health and safety. It usually covers the most updated information on toxic substances.

Newsletter on Science & Technology of Environmental Protection (1983–)
Taipei: Committee for Environmental Sciences, National Science Council, Executive Yuan

This newsletter reports the research and developments of the environmental sciences. Research papers dealing with environmental pollution and toxicant analysis are included.

Taiwan Journal of Public Health (1983–)
Taipei: Taiwan Public Health Association

This journal publishes peer-reviewed articles related to all aspects of public health, including: environment

health, epidemiology, community medicine, health policy and management, behavior sciences, industrial hygiene.

The Journal of Health Sciences
Taipei: Department of Technological and Vocational Education, Ministry of Education

It publishes peer-reviewed articles on healthcare-related sciences, including nursing, recreation and healthcare, medical technology, rehabilitation, public health and management, etc.

The NTUH Drug Bulletin (1979–)
Taipei: Department of Pharmacy, National Taiwan University Hospital

This bulletin publishes abstracts selected from all kinds of medical journals and emphasizes the pharmacological and toxicological aspects of drugs.

Reports

Annual Report on the Prevention of Industrial Pollution
Technological Instruction Group, Prevention of Industrial Pollution, Department of Economics, Executive Yuan, Taipei

The annual report publishes papers dealing with environmental protection, pollution prevention technology, control of toxic compound contaminants, new technology, and legislative information.

Annual Research and Inspection Report
Food and Drug Bureau, Department of Health, Executive Yuan, Taipei

There are two kinds of papers published in this annual report: original research papers dealing with the methods of food and drug analysis and survey reports on the sanitary condition of foods and the active ingredients in the marketing of drug preparations.

Yearbook on Environmental Protection (1983–)
Taipei: Bureau of Environmental Protection, Executive Yuan

A general report on the progress, accomplishments, and ongoing projects of the Bureau of Environmental Protection during the previous fiscal year.

Organizations (government)

Academia Sinica
The most prominent research institutions in Taiwan.
Web: http://www.sinica.edu.tw/main_e.shtml (English)
Web: http://www.sinica.edu.tw/main.shtml (Chinese)
Address:
Academia Sinica
No. 128, Sec. 2, Academia Rd, Nankang, Taipei 115 Taiwan, R.O.C.
Phone: +886(2)27899481
Email: *aspublic@gate.sinica.edu.tw*

Institute of Biomedical Sciences (IBMS)

This is a branch of Academia Sinica. Established in 1981, IBMS has worked closely with major medical centers in Taiwan (National Taiwan University Hospital, Tri-Service General Hospital, and Veterans General Hospital) to promote translational research and provide a favorable environment for training and nurturing biomedical scientists.
Web: http://www.ibms.sinica.edu.tw/index_e.shtml (English)
Web: http://www.ibms.sinica.edu.tw/index_c.shtml (Chinese)

Institute of Molecular Biology

This is a branch of Academia Sinica. Established in 1982, the Institute has majored its study on molecular biology, including toxicology. It also collaborates with other Institutes in Taiwan, Europe, and the United States.

Web: http://www.imb.sinica.edu.tw/en/ (English)
Web: http://www.imb.sinica.edu.tw/ch/ (Chinese)

Atomic Energy Council (AEC)

The Atomic Energy Council was founded in 1955 at the ministerial level under the Executive Yuan. Its original mission was to foster peaceful application of atomic energy. With six reactors in operation and two under construction, it has shifted to reactor safety regulation, radiation protection, radioactive waste management, and environmental monitoring.
Web: http://www.aec.gov.tw/english/ (English)
Web: http://www.aec.gov.tw/www/index.php (Chinese)
Address:
Atomic Energy Council, Executive Yuan
Floor 2-8, No. 80, Section 1, Chenggong Rd, Yonghe City
Phone: +886(2)8231-7919
Fax: +886(2)8231-7804
Email: public@aec.gov.tw

Institute of Nuclear Energy Research

The Institute was established in 1968 specializing in nuclear technology research and development programs, under the administration of AEC, Executive Yuan.
Web: http://www.iner.gov.tw/e-inerweb/iner_index.htm (English)
Web: http://www.iner.aec.gov.tw (Chinese)

Department of Health, Executive Yuan, Taiwan, ROC

The department is the highest public health administration unit in the Executive Yuan. It missions are to handle medical, health care, and disease prevention, as well as food, drugs, and cosmetic management and health insurance affairs.
Web: http://www.doh.gov.tw/EN/Webpage/index.aspx (English)
Web: http://www.doh.gov.tw/CHT2006/index_populace.aspx (Chinese)
Address:
Department of health, Executive Yuan
No.100, Aiguo E. Rd., Jhongjheng District
Taipei City 10092, Taiwan
Phone: +886(2)2321-0151

Bureau of Food and Drug Analysis, Department of Health, Executive Yuan, Taipei

This is a governmental organization for food and drug inspection and analysis. The main role of this laboratory is to provide instrumental analysis and laboratory detection of chemical toxicants and biological toxins. National surveys on the concentrations of food additives in marketed foods are performed frequently.
Web: http://www.nlfd.gov.tw/english/index.aspx (English)
Web: http://www.nlfd.gov.tw/index.aspx (Chinese)

National Bureau of Controlled Drugs, Department of Health, Taiwan

Established in 1999, the Bureau is responsible for licensing and reporting system; enforcing inspection to control drug flow and use; studying the toxicity evaluation indicators and the testing methods of controlled drugs; implementing official policy for the non-government testing laboratory certification system.
Web: http://www.nbcd.gov.tw/home/english_version/index.aspx (English)
Web: http://www.nbcd.gov.tw/home/home/index.aspx (Chinese)

Center for Disease Control (CDC)

Established in 1999, CDC was responsible for national policy of infectious diseases control and the implementation.
Web: http://www.cdc.gov.tw/en/index.asp (English)
Web: http://www.cdc.gov.tw/index.asp (Chinese)

Committee on Chinese Medicine and Pharmacy

The Committee was set up in 1971, and is responsible for the regulation policy of Chinese medicine and pharmacy for Taiwan.
Web: http://www.ccmp.gov.tw/en/index.asp (English)
Web: http://www.ccmp.gov.tw/ (Chinese)

Environmental Protection Administration, Executive Yuan

This is a national poison control network for air pollution, environmental control, and industrial sanitation. Similar organizations are also set up in the city and provincial governments.
Web: http://www.epa.gov.tw/english/ (English)
Web: http://www.epa.gov.tw/main/index.asp (Chinese)
Address:
Environmental Protection Administration
No. 41, Sec. 1, Chung-Hwa road
10042, Taipei, Taiwan
Phone: 886(2)2311-7722
Fax: 886(2)2311-6071

Environmental Analysis Laboratory (EAL)

The EAL's mission are to upgrade the quality of environmental analysis data and to enhance the capability of public and private environmental analytical laboratories.
Web: http://www.niea.gov.tw/english/a001.htm (English)
Web: http://www.niea.gov.tw/ (Chinese)

Industrial Technology Research Institute (ITRI)

The ITRI is a non-profit R&D organization engaging in applied research and technical services, including nanotechnology and biomedical engineering. It was founded in 1973. By 2001 it had grown to a 6000-people operation, and serves as the technical center for industry and an unofficial arm of the government's industrial policies in Taiwan.

Taiwan Agricultural Chemicals and Toxic Substances Research Institute, Council of Agriculture

This organization was established in 1985 and is responsible for matters regarding actual toxicity testing, review, field tests of pesticides and toxic substances related to plants. The objectives of this institute are to provide technical assistance to government in reinforcing pesticide regulations, and to develop safe, economic, and effective ways of applying pesticides.
Web: http://www.tactri.gov.tw/e-intro.asp (English)

CHAPTER

106

United Kingdom

L. ASHDOWN, P.T.C. HARRISON, P. HOLMES, AND M. TAKAMIYA

INTRODUCTION

Humanity's growing understanding that external agents may cause harm has an extremely long history, dating no doubt to the recognition by early humans that some plants and animals were poisonous and extending to the understanding that non-living materials could also cause harm. Indeed, the first known deity connected with poisons, Gula, dates back to 4500 BC, and treatises on herbal medical experiments with poisons date back to 2000 BC. A number of philosophers – including Homer, Aristotle, Theophrastus, and Socrates – from early Greek civilization were clearly well aware of the effects of some poisons, while there are stories dating from the pre-AD period of experiments, usually on criminals, of the effects of poisons and the use of antidotes.

While Europe has its own long history of famous poisoners, such as Cesare Borgia and Catherine de Medici, and knowledge of the effects of poison even found its way into the plays of Shakespeare (Romeo and Juliet Act 5 'Thy drugs are quick. Thus with a kiss I die'), the formal study of poisons as a 'science', in a way recognizable to modern toxicology is generally held to have started with Paracelsus – born Phillip von Hohenheim in Einsiedeln, Switzerland in 1493 – who famously wrote 'Alle Ding sind Gift und nichts ohn Gift; allein die Dosis macht, dass ein Ding kein Gift ist' [All things are poison and nothing is without poison, only the dose permits something not to be poisonous]. However, it was not until the 1700s that toxicological treatises can really be identified within the UK by the publication of such work as 'The Mysteries of Opium Revealed' by Dr John Jones in 1701, that discussed not only the medical uses of opium but also potential adverse effects, and a hypothesis by Dr George Baker in the 1760s that lead in apple juice was to blame for a condition, Devon Colic, that had been known since 1655. The work of Sir Percival Pott is also of note in this century, with the recognition of an association between exposure to soot and the high incidence of scrotal cancer in young chimneysweeps in 1775, thus establishing the first demonstration that a malignancy could be caused by an environmental carcinogen. In turn, the 1800s saw early applications of forensic toxicology, for example, the use of a test developed by James Marsh as evidence of arsenic poisoning in a murder case in 1840, and also the introduction of the first measures to control the sale of a poisonous substance, such as the Arsenic Act of 1851. Indeed, a bill had been proposed as early as 1819 to regulate the distribution and sale of arsenic, but was heavily opposed by the Committee of Associated Apothecaries on the grounds that it would 'embarrass the dispensing of medicines, and [was] not calculated to effect the object intended'.

With the coming of the twentieth century, there were major developments across the globe in our ability to manufacture novel toxic agents and to detect them through chemical analysis, as well as a growing understanding of the mechanisms by which the toxic agents work and the types of effect that can occur; World War I contributed in no small measure to this through the use of various poison gases in 1914 and the subsequent efforts by both sides to develop more powerful weapons and counter measures. Since that time, with its well-established university system, the establishment of dedicated research units (e.g. the

MRC's Toxicology Unit, originally established at Porton Down in 1947, to study the mechanism of action of chemicals at all levels from the animal to the individual molecules) and our large chemical, agrochemical, and pharmaceutical industrial sectors, the UK has been heavily involved in applied toxicological research, as well as contributing to basic chemical and biological (e.g. the identification of the structure of DNA by Crick and Watson at the Cavendish Laboratory, Cambridge University in 1953) understanding.

Thus, today the UK remains active in basic academic research and the application of such knowledge to practical issues across the wide field of toxicology, from the discovery and development of new drugs, regulation of the use of chemicals in relation to novel foods and food-related materials, biocides and industrial and consumer products, through to environmental- and eco-toxicology and forensic toxicology. The UK government has also played a leading role in improving the welfare of experimental animals (e.g. through the Animals (Scientific Procedures) Act 1986) and in promoting adoption of alternative test approaches wherever possible (e.g. through promotion of replacement, reduction and refinement for the use of animals, the so called '3Rs' principle) and its establishment of a National Centre for the Replacement, Refinement and Reduction of Animals in Research (NC3Rs). The current time is, however, a particularly challenging one in the history of toxicology in the United Kingdom (UK). As well as the need to address the challenges and opportunities posed to toxicological risk assessment by the rapid developments in new technologies (such as '-omics') and the increasing understanding of the mechanistic basis of genotoxic and non-genotoxic carcinogenesis and mixture toxicology, there are the forthcoming challenges presented by a major step change in the approach to chemical regulation across the European Union (EU) with the impending implementation of the Registration, Evaluation (Restriction) and Authorisation of Chemicals (REACH) regulations in 2007. Supporting this wide range of activities is a growing base of academically and/or professionally trained toxicological specialists. For example, there are at present approximately 1000 members of the British Toxicological Society (BTS) and 297 UK Registered Toxicologists (the designation of which also confers membership of the EUROTOX Register of Toxicologists). The BTS, along with sister organizations such as the Royal College of Pathologists and the Institute of Biology and the Society of Apothecaries of London, oversees the professional standing of toxicologists in this country. The Society of Environmental Chemistry and Toxicology (SETAC) has a role in representing the particular interests of environmental toxicologists and ecotoxicologists.

RESOURCES

The following books and journals were identified through the use of structured searches of online databases. The term 'toxicology' was applied as the main keyword to identify relevant documents with, for books, only those with authors identified as British or who are based in the UK being selected. Where there was any degree of uncertainty, a book was included if it was also published in the UK. Relevant journals were defined as those with one or more editors based in the UK.

Books

Aldridge WN (1996)
Mechanisms and Concepts in Toxicology
CRC Press, 254 pp

This book focuses on research procedures in toxicology, aiming to illustrate toxicological concepts and types of toxicity from a mechanistic point of view.

Ashford N, Miller C (1998)
Chemical Exposures: Low Levels and High Stakes
Chapman and Hall: London, 464 pp

This work clarifies the nature of chemical sensitivity, shows how it differs from traditional allergies and toxicity, and suggests how federal and state governments can help those who are affected.

Bal R, Halffman W (Eds.) (1998)
The Politics of Chemical Risk – Scenarios for a Regulatory Future
Kluwer Academic Publishers: London, 392 pp

This book forms a discussion of the politics of chemical risk.

Barrett S, Gots RE (1998)
Chemical Sensitivity: The Truth about Environmental
Prometheus Books: Loughton, 212 pp

The authors explore the speculations about environmental exposure in the light of scientific knowledge of human physiology, allergy and immunology, pathology, toxicology, and clinical medicine.

Donaldson K, Borm P (2006)
Particle Toxicology
CRC Press, 456 pp

The book brings together the state of the science in particle physico-chemistry, cell biology, and toxicology in a single volume. It also covers mathematical modeling and human studies as avenues for future research.

Gibson G (1993)
Peroxisomes: Biology and Importance in Toxicology and Medicine
CRC Press, 734 pp

This book describes the basic structure and functions of peroxisomes which are responsible for many cellular functions including an active auxiliary fatty acid B-oxidation system.

Harvey PW (1996)
Adrenal in Toxicology: Target Organ and Modulator of Toxicity
CRC Press, 330 pp

This book focuses on adrenal toxicity, examining how drugs and chemicals can directly and indirectly affect the adrenal gland.

Hendry JH, Lord BI (1995)
Radiation Toxicology
CRC Press, 360 pp

This book covers every injury to the bone marrow which can occur from low and high doses of ionizing radiation – for example, X-rays, gamma-rays and especially damaging types of radiation such as alpha-rays.

Hester RE, Harrison RM (Eds) (1998)
Risk Assessment and Risk Management
The Royal Society of Chemistry: Cambridge, 180 pp

This work addresses risk assessment and management within the context of environmental science and technology. Chapters cover areas including: the assessment of risks to health from the land-filling of household wastes; and aquatic risk assessment and management for pesticides.

Jones A, Dargan P (Eds.) (2001)
Churchill's Pocket Book of Toxicology
Elsevier, 176 pp

This practical manual covers the basic principle of care for poisoned patients including elimination methods, supportive care, talking to relatives, and use of the toxicology laboratory.

Kimber I, Dearman RJ (1997)
Osweiler G (1996)
Toxicology
Blackwell Publishing

This book is a concise review of clinically relevant toxicants in veterinary medicine. It covers basic toxicology, including the action of poisons, therapy, and antidotes; clinical toxicology of body systems; and classes of toxicants.

Kimber I, Maurer T (1996)
Toxicology of Contact Hypersensitivity
CRC Press, 208 pp

This book considers the condition from the perspective of the toxicologist rather than the dermatologist.

Morgan BJT (Ed.) (1996)
Statistics in Toxicology: A Volume in Memory of David A. Williams
Oxford University Press, 248 pp

Rhodes CJ (2000)
Toxicology of the Human Environment
CRC Press, 512 pp

This book covers all aspects of toxic agents in the environment from their detection to their effects.

Roberts RJ (1999)
Apoptosis in Toxicology
CRC Press, 248 pp

This book focuses on the molecular regulation of apoptosis with particular emphasis on toxicant action.

Robinson L, Thorn I (Eds.) (2001)
Handbook of Toxicology and Ecotoxicology for the Pulp and Paper Industry
Blackwell Publishing, Oxford

This book provides a guide to the use and meaning of toxicological and ecological information in the paper industry.

Robinson L, Thorn I (2005)
Toxicology and Ecotoxicology in Chemical Safety Assessment
CRC Press, 256 pp

The information contained in this book will help those personnel understand, interpret, and apply the range of information supplied on a material safety data sheet when planning the safe handling and use of chemicals.

Rose J (1998)
Environmental Toxicology: Current Developments
CRC Press, 414 pp

A collection of essays which highlights current developments in the field of environmental toxicology. It also examines the effects of toxins on other organisms, as well as the techniques, policies, and management strategies employed in studying and controlling environmental pollutants.

Shaw I, Chadwick J (1998)
Principles of Environmental Toxicology
CRC Press, 216 pp

This textbook provides a general introduction to all the major areas of environmental toxicology, including the fate of chemicals in the environment, environmental toxicity testing, risk assessment, radioactivity in the environment, legislation, environmental monitoring, and the future impact of industrial development on the environment.

Swanson TM, Vighi M (Eds.) (1998)
Regulating Chemical Accumulation in the Environment: The Integration of Toxicology and Economics in Environmental Policy-making
Cambridge University Press, 240 pp

This book forms a general study of the value of interdisciplinary approaches in environmental policy making.

Timbrell J (1997)
Study Toxicology Through Questions
CRC Press, 160 pp

This is a compilation of questions with answers for students of toxicology. The book should also be useful for qualified toxicologists and scientists working in related areas who are preparing for internal examinations.

Timbrell JA (1999)
Principles of Biochemical Toxicology
Taylor & Francis, 404 pp

This textbook provides an explanation of dose–response relationships, disposition and metabolism, toxic responses to foreign compounds and detailed examples to illustrate mechanisms of toxicity.

Timbrell J (2001)
Introduction to Toxicology
CRC Press, 232 pp

This third edition features relevant toxicological examples that reinforce principles.

Wooley A (2003)
A Guide to Practical Toxicology: Evaluation, Prediction and Risk
CRC Press, 336 pp

This book looks at the importance of toxicological normality, reviews toxicity testing methods, and explores new and 'alternative' methods of safety evaluation.

Wright DA, Welbourn P (2002)
Environmental Toxicology
Cambridge University Press, 656 pp

This is an introductory textbook dealing with most aspects of the subject, from the molecular to the ecosystem level.

Zakrzewski SF (Ed.) (2002)
Environmental Toxicology
Oxford University Press, 352 pp

This book consists of two parts. In the first part basic metabolic, physiological, and pharmacological concepts are used to explain the fate of toxic chemicals in the body, with emphasis on carcinogenesis and mutagenesis. The second part deals with specific environmental problems.

Toxicology of Chemical Respiratory Hypersensitivity
CRC Press, 172 pp

This book examines aspects of chemical respiratory allergy and occupational asthma caused by exposure to chemicals. It covers occupational safety measures, and methods for identifying and characterizing chemical allergens.

Journals

Bioorganic & Medicinal Chemistry Letters
Elsevier Science Ltd

Presents preliminary experimental or theoretical research results of outstanding significance and timeliness on all aspects of science at the interface of chemistry and biology, and on major advances in drug design and development.

Chemosphere
Elsevier Science Ltd

Offers maximum dissemination of investigations related to all aspects of environmental science.

Comparative Biochemistry and Physiology. C, Comparative Pharmacology and Toxicology
Pergamon

Concerned with chemical and drug action at different levels of organization, biotransformation of xenobiotics, mechanisms of toxicity, including: reactive oxygen species and carcinogenesis, endocrine disruptors, natural products chemistry, and signal transduction with a molecular approach to these fields.

Crop Protection
Butterworth

Emphasizes the practical aspects of control in the field, and includes work which may lead in the near future to more effective control.

Environmental Pollution
Elsevier Science Ltd

Addresses issues relevant to the nature, distribution and ecological effects of all types, and forms of chemical pollutants in air, soil, and water.

Environmental Science & Policy
Elsevier Science Ltd

Promotes communication among government, business and industry, academia, and non-governmental

organizations that are instrumental in the solution of environmental problems.

Environmental Technology
Publications Division, Selper Ltd.

Publication of technological manuscripts in the field of applied environmental studies, including environmental biotechnology, environmental and sanitary engineering, industrial waste management and hazardous waste disposal, air and water pollution control, solid waste management, industrial hygiene, and associated technologies.

Expert Opinion on Drug Metabolism & Toxicology
Ashley Publications Ltd

Provides a forum for the commentary and analysis of current and emerging research approaches in the ADME-Tox arena, as well as metabolic, pharmacokinetic, and toxicological issues relating to specific drugs or drug classes.

Food and Chemical Toxicology
Pergamon Press

Publishes original research reports and occasional interpretative reviews on toxic effects, in animals or humans, of natural or synthetic chemicals occurring in the human environment.

Food Chemistry
Elsevier Science Ltd

Publishes original peer-reviewed research papers dealing with a wide range of subjects which are essential to the food scientist and technologist.

Health Technology Assessment
National Co-ordinating Centre for Health Technology Assessment

Publication from program which ensures that high-quality research information on the costs, effectiveness, and broader impact of health technologies is produced in the most effective way for those who use, manage, and provide care in the NHS.

Health, Risk & Society
Carfax

Devotes to a theoretical and empirical understanding of the social processes which influence the ways in which health risks are taken, communicated, assessed, and managed.

Human & Experimental Toxicology
SAGE Publications

Covers all aspects of experimental and clinical studies of functional, biochemical, and structural disorder.

Journal of Applied Toxicology
John Wiley and Sons

Devoted to publishing original research, theoretical and literature reviews relating to the toxicity of drugs and chemicals to living systems at the molecular, cellular, tissue, and target organ level.

Journal of Cardiovascular Risk
Lippincott Williams & Wilkins

Embraces all the scientific, clinical, and public health disciplines that address the causes and prevention of cardiovascular disease, as well as cardiovascular rehabilitation and exercise physiology.

Journal of Occupational Medicine and Toxicology
BioMed Central

Open access, peer-reviewed, online journal that considers original research related to the field of occupational medicine and toxicology.

Journal of Toxicology and Environmental Health. Part A
Taylor & Francis

Features strictly refereed original research in the field of environmental toxicology in general as well as in special interest fields such as target organ toxicities, immunotoxicology, risk assessment, carcinogenesis, mutagenesis, ecotoxicology, environmental factors affecting health, and aquatic toxicology.

Marine Environmental Research
Elsevier Science Ltd

Serves as a forum for new information on biology, chemistry, and toxicology and syntheses that advance understanding of marine environmental processes.

Marine Pollution Bulletin
Pergamon

Concerned with the rational use of maritime and marine resources in estuaries, the seas, and oceans, as well as with documenting marine pollution and introducing new forms of measurement and analysis.

Particle and Fibre Toxicology
BioMed Central

Open-access, peer-reviewed, online journal for new scientific data, hypotheses, and reviews on the toxicological effects of particles and fibers.

Pest Management Science
John Wiley & Sons

Covers all aspects of research and development, application, use, and impact on the environment of products designed for pest control and crop protection.

The Annals of Occupational Hygiene
Oxford University Press

Interests in recognition, quantification, management, and control of risk.

Toxicology and Industrial Health
SAGE Publications

Contains original research papers presenting scientific data dealing with basic and applied research in the field of toxicology and industrial health.

Toxicology in vitro
Pergamon Press

Publishes original research papers and reviews on the application and use of in vitro systems for assessing or predicting the toxic effects of chemicals and elucidating their mechanisms of action.

Toxicology Mechanisms and Methods
Taylor & Francis

Contains original research on subjects dealing with the mechanisms by which foreign chemicals cause toxic tissue injury. Addresses aspects of the development, validation, and application of new and existing laboratory methods, techniques, and equipment.

Toxicon
Pergamon Press

Provides a medium for the publication of papers on the chemical, pharmacological, zoo-toxicological, and immunological properties of natural poisons.

Trends in Food Science & Technology
Elsevier Science Ltd

The international peer-reviewed mini-review journal in its field.

Waste Management & Research
IWM Business Services Ltd

Satisfies the growing demand for essential information that can be practically applied by those who are responsible for the management of both municipal and industrial waste.

Water Research
Pergamon Press

Publishes refereed, original research papers on all aspects of the science and technology of water quality and its management worldwide.

Water Science and Technology
Pergamon Press

Covers all aspects of the science and practice of water pollution control and water quality management worldwide.

Xenobiotica; the fate of foreign compounds in biological systems
Taylor & Francis

Covers general xenobiochemistry, molecular toxicology, and clinical pharmacokinetics and metabolism.

Organizations (Government)

Government Departments

Department for Environment, Food, and Rural Affairs (DEFRA)

Responsibilities include EU risk assessment, emission controls, risk assessment on non-native species, etc.
Nobel House, 17 Smith Square, London SW1P 3JR, UK
Phone:+44-(0)20-7238-6000
Web: http://www.defra.gov.uk/

Specific areas of activity include:
Chemicals

Responsibilities include protecting the environment and human health from the risks posed by exposure to hazardous chemicals. Aims to maximize the important socio-economic benefits that we rely on chemicals for.
Email: chemicals.strategy@defra.gsi.gov.uk
Web: http://www.defra.gov.uk/environment/chemicals/

Drinking Water Inspectorate (DWI)

Responsible for assessing the quality of drinking water in England and Wales, taking enforcement action if standards are not being met, and appropriate action when water is unfit for human consumption.
Room M03, 55 Whitehall, London SW1A 2EY, UK
Phone:+44-(0)20-7082-8024
Fax:+44 (0)20 7082 8028
Email: dwi.enquiries@defra.gsi.gov.uk
Web: http://www.dwi.gov.uk/

Water

Responsible for all aspects of water policy in England, including water supply and resources, and the regulatory systems for the water environment and the water industry.
Email: wq.enquiries@defra.gsi.gov.uk (general enquiries)
Web: http://www.defra.gov.uk/environment/water/

Department of Health (DH)

Areas of activity relevant to toxicology include risk assessment of carcinogenicity, mutagenicity of chemicals in food, consumer products, and the environment.

Richmond House, 79 Whitehall, London SW1A 2NS, UK
Phone:+44-(0)20-7210-4850
Fax:+44-(0)20-7210-5025
Web: http://www.dh.gov.uk/Home/fs/en

Specific activities include:
Animals in Medical Research

Areas of activity relevant to toxicology include animal experimentation.
Web: http://www.dh.gov.uk/en/Policyandguidance/Researchanddevelopment/A-Z/DH_4001729

International Health

Areas of activity relevant to toxicology include guidance on the move to treat certain NHS patients overseas.
Web: http://www.dh.gov.uk/en/Policyandguidance/International/index.htm

Department of Trade and Industry (DTI)

The Department responsible for trade, business, employees, consumers, science and energy.
Specific divisions include:
DTI Chemicals Unit

The DTI Chemicals Unit works with industry to help promote improvements in productivity and competitiveness, and to represent interests of the UK chemicals industry (excluding pharmaceuticals but including plastics and rubber processing), including issues relating to chemical regulation.
Contact: Unit Director
Phone:+44-(0)207-215-2911/+44-(0)207-215-2968
Web: http://www.dti.gov.uk/sectors/chemicals/index.html

Office of Science and Innovation

The Office of Science and Innovation, located within the DTI, is responsible for UK Science Policy and for funding basic research allocated via the Research Councils. It aims to maximize the contribution made by our science, engineering, and technology skills and resources to the UK's economic development, and to the quality of our lives.
Web: http://www.dti.gov.uk/science/index.html

Home Office

Activities relevant to toxicology include the establishment of toxicological information to allow the safe use of chemicals; safety assessments of chemicals to meet regulatory requirements, toxicological assessment of potential drug compounds.

Direct Communications Unit
2 Marsham Street, London SW1P 4DF, UK
Phone: +44-(0)20-7035-4848
Fax:+44-(0)20-7035-4745
Email: public.enquiries@homeoffice.gsi.gov.uk
Web: http://www.homeoffice.gov.uk/

Animals in Scientific Procedures Inspectorate

This is the part of the Home Office responsible for provision of scientific advice to the Home Secretary and to officials who operate the system that approves licences for laboratories that use animals in research.
Web: http://www.homeoffice.gov.uk/science-research/animal-testing/

National Assembly for Wales

This is the devolved administration for Wales, and is responsible for developing a sustainable environment for the Welsh population. Areas of activity include sustainable development, environmental strategy, planning and the sustainable management of landscapes.
Cathays Park, Cardiff CF10 3NQ, UK
Phone: +44-(0)845-010-3300
Web: http://new.wales.gov.uk/?lang=en

Scottish Parliament
This is the devolved administration for Scotland.
Edinburgh EH99 1SP, Scotland, UK
Phone: +44-(0)131-348-5000/+44-(0)845-278-1999
Fax: +44-(0)131-348-5601
Email: sp.info@scottish.parliament.uk
Web: http://www.scottish.parliament.uk/home.htm

Of particular relevance to toxicology is the work of the Environment and Rural Development division.
Environment and Rural Development

Considers and reports on matters relating to rural development, environment and natural heritage, agriculture and fisheries and such other matters as fall within the responsibility of the Minister for Environment and Rural Development.
Contact Jenny Goldsmith
Phone: +44-(0)131-348-5242
Email: ERDC@scottish.parliament.uk
Web: http://www.scottish.parliament.uk/business/committees/environment/index.htm

Government agencies and services

Central Science Laboratory (CSL)

An executive agency of the UK Government Department for Environment Food and Rural Affairs (Defra), undertaking research and analytical, diagnostic and consultancy services designed to support land-based and food industries.

Sand Hutton, York YO41 1LZ, UK
Phone: +44-(0)1904-462000

Fax: +44-(0)1904-462111
Email: info@csl.gov.uk
Web: http://www.csl.gov.uk/

Centre for Environment, Fisheries & Aquaculture Science (CEFAS)
Web: http://www.cefas.co.uk/default.aspx

Government-supported aquatic scientific research and consultancy service operating out of a number of laboratories:
Cefas Lowestoft Laboratory
Pakefield Road, Lowestoft, Suffolk NR33 0HT
Phone: +44-(0)1502-562244
Fax: +44-(0)1502-513865

Cefas Burnham Laboratory
Remembrance Avenue, Burnham-on-Crouch, Essex CM0 8HA
Tel: +44-(0)1621-787200
Fax: +44-(0)1621-784

Cefas Weymouth Laboratory
The Nothe, Barrack Road, Weymouth, Dorset DT4 8UB
Tel: +44-(0)1305-206600
Fax: +44-(0)1305-206601

English Nature

A Government Agency funded by Defra, promoting conservation of England's wildlife and natural features.
Natural England, Northminster House, Peterborough PE1 1UA, UK
Tel: +44-(0)845-600-3078
Fax: +44-(0)1733-455103
Email: enquiries@naturalengland.org.uk
Web: http://www.english-nature.org.uk/

Environment Agency (EA)

The lead public body for protecting and improving the environment in England and Wales. Operates at both a national and regional level.
Environment Agency, Head Office, Rio House, Waterside Drive, Aztec West, Almondsbury, Bristol BS32 4UD, UK
Phone: +44-(0)8708-506506
Web: http://www.environment-agency.gov.uk/

Area of particular relevance to toxicology:
Science and Research

Responsible for conduct of government science program for risk assessment of banned chemicals and environmental monitoring
Web: http://www.environment-agency.gov.uk/science/

Food Standards Agency (FSA)

The Food Standards Agency is an independent Government department set up by an Act of Parliament in 2000 to protect the public's health and consumer interests in relation to food.
UK Headquarters
Food Standards Agency, Aviation House, 125 Kingsway, London WC2B 6NH
Switchboard: 020-7276-8000
Emergencies only: 020-7270-8960
Web: http://www.food.gov.uk/

Northern Ireland
Food Standards Agency Northern Ireland, 10c Clarendon Road, Belfast BT1 3BG
Phone: 02890-417700

Scotland
Food Standards Agency Scotland, St Magnus House, 6th Floor, 25 Guild Street, Aberdeen AB11 6NJ
Phone: 01224-285100

Wales
Food Standards Agency Wales, 11th Floor, Southgate House, Wood Street, Cardiff CF10 1EW
Phone: 02920-678999

Area of particular relevance to toxicology:
Science and Research

Conducts and commissions extensive scientific research and survey work to ensure that advice to the public is based on the best and most up-to-date food science.
Web: http://www.food.gov.uk/science/

Health and Safety Executive (HSE)

Responsible for the regulation of almost all risks to health and safety arising from work activities in Britain, including nuclear installations, mines, factories, farms, hospitals and schools, offshore gas and oil installations, the safety of the gas grid, and movement of dangerous goods and substances and railway safety.
Phone: +44-(0)845-345-0055
Web: http://www.hse.gov.uk/

Groups of particular relevance to toxicology:
Chemical

Group responsible for chemical production, oil refining and associated onshore oil-related industry, coatings production, pharmaceuticals production, fertilizers production, production of compressed gases, production of hygiene/cleaning materials, large-scale storage of chemicals and their transport by road.
HSE Bootle Headquarters, Redgrave Court, Merton Road, Bootle, Merseyside, L20 7HS
Web: http://www.hse.gov.uk/chemicals/index.htm

Health and Safety Laboratory (HSL)

Agency of the HSE undertaking research and development; advice and consultancy; forensic investigation into causes of accidents; environmental and biological monitoring; risk assessment and control; establishing standards; and validation, certification and training.
Web: http://www.hsl.gov.uk/

Health Protection Agency (HPA)

The Health Protection Agency is the independent public body responsible for protecting UK public health through the provision of support and advice to the NHS, local authorities, emergency services, other Arms Length Bodies, the Department of Health, and the Devolved Administrations. The Agency was established as a special health authority (SpHA) in 2003. On 1 April 2005, the Agency was established as a non-departmental public body, replacing the HPA SpHA and the National Radiological Protection Board (NRPB) and with radiation protection as part of health protection incorporated in its remit. The HPA has a large network of approximately 3000 staff based at three major centers (Colindale, Porton, and Chilton) and regionally and locally throughout England. There is a small central office based in London. The Agency works closely with locally based colleagues employed within the Devolved Administrations. The Centre for Infections at Colindale is the base for communicable disease surveillance and specialist microbiology. The Centre for Radiation, Chemical and Environmental Hazards is based at Chilton and the Centre for Emergency Preparedness and Response, focusing on applied microbiological research and emergency response, is based at Porton.
HPA Central Office, 7th Floor, Holborn Gate, 330 High Holborn, London WC1V 7PP, UK
Phone: +44(0)20-7759-2700/2701
Fax: +44(0)20-7759-2733
Email: webteam@hpa.org.uk
Web: http://www.hpa.org.uk/

Divisions of particular relevance to toxicology include:
Centre for Radiation, Chemical and Environmental Hazards
Chemical Hazards and Poisons Division

The HPA Centre for Radiation, Chemical and Environmental Hazards comprises the Radiation Protection Division (formerly the National Radiological Protection Board) and the Chemical Hazards and Poisons Division.
HPA Centre for Radiation, Chemical and Environmental Hazards, Chilton, Didcot, Oxon, OX11 0RQ
Phone: 01235-822895
Email: chemicals@hpa.org.uk

Chemical Hazards and Poisons Division

The part of the Centre for Radiation, Chemical and Environmental Hazards, providing comprehensive expert advice and support for chemical incidents across England and Wales. The Division provides advice to UK Government Departments and Agencies on human health effects from chemicals in water, soil, and waste as well as information and support to the NHS and health professionals on toxicology.
Chemical Hazards and Poisons Division, Chilton, Didcot, Oxon, OX11 0RQ
Phone: 01235-822895
Email: chemicals@hpa.org.uk

Radiation Protection Division

Part of the Centre for Radiation, Chemical and Environmental Hazards, the Division carries out the Health Protection Agency's work on ionizing and non-ionizing radiations. It undertakes research to advance knowledge about protection from the risks of these radiations; provides laboratory and technical services; runs training courses; provides expert information and has a significant advisory role in the UK.
Centre for Radiation, Chemical and Environmental Hazards Radiation Protection Division, Chilton, Didcot, Oxon, OX11 0RQ
Phone: 01235-831600
Fax: 01235-833891
Email: rpd@hpa-rp.org.uk

Centre for Emergency Preparedness and Response

Centre for Emergency Preparedness and Response plays an important role in preparing for and co-ordinating responses to potential healthcare emergencies, including possible acts of deliberate release.
Phone: 01980-612100
Fax: 01980-612839
Email: erd@hpa.org.uk

National Poisons Information Service (NPIS)

A clinical toxicology service for NHS healthcare professionals, consisting of a network of units across the UK, providing information and advice on the diagnosis, treatment, and management of patients who may have been accidentally or deliberately poisoned (information available on TOXBASE).
Web: http://www.hpa.org.uk/Chemicals/npis.htm

Medicines and Healthcare Products Regulatory Agency (MHRA)
The Agency responsible for the regulation and safety assessment of medicines and medical devices in the UK.

Medicines and Healthcare Products Regulatory Agency (Information center), 10-2 Market Towers, 1 Nine Elms Lane, London, SW8 5NQ, UK
Phone: +44-(0)20-7084-2000/+44-(0)20-7210-3000
Fax: +44-(0)20-7084-2353
Email: info@mhra.gsi.gov.uk
Web: http://www.mhra.gov.uk/home/idcplg?IdcService=SS_GET_PAGE&nodeId=5

National Health Service (NHS)

The NHS for England was established in 1948 and is now the largest organization in Europe. There are separate organizations for Northern Ireland, Scotland and Wales, and the Isle of Man and the Channel Islands have separate independent health service structures.
National Health Service – England, Customer Service Centre, The Department of Health, Richmond House, 79 Whitehall, London SW1A 2NL UK
Phone: +44(0)207-210-4850
Minicom: +44(0)207-210-5025
Email: dhmail@dh.gsi.gov.uk
Web: http://www.nhs.uk/

Pesticides Safety Directorate (PSD)

The Pesticides Safety Directorate (PSD) is the Executive Agency of the Department for Environment, Food and Rural Affairs (Defra), responsible for: providing controls on pesticides used in agriculture, horticulture and in the garden; monitoring the use of pesticides and taking enforcement action against illegal use; providing policy advice to Ministers and taking the lead on pesticide issues for Defra; supporting the UK and EU reviews of the safety of pesticides on the market, working to standardize pesticide regulation within Europe; and co-ordinating a program of research and development to complement the approvals system and support our policy objectives.
PSD, Mallard House, Kings Pool, 3 Peasholme Green, York, YO1 7PX, UK
Phone: +44(0)-1904-455775
Fax: +44(0)-1904-455733
Email: information@psd.defra.gsi.gov.uk
Web: http://www.pesticides.gov.uk/corporate.asp?id=211

Scottish Agricultural Science Agency (SASA)

SASA is a government executive agency providing scientific information and advice on agricultural crops.
SASA, 1 Roddinglaw Road, Edinburgh, EH12 9FJ Scotland, UK
Phone: +44(0)-131-244-8890
Fax: +44(0)-131-244-8940
Email: info@sasa.gsi.gov.uk
Web: http://www.sasa.gov.uk/

Scottish Environmental Protection Agency (SEPA)

SEAPA is responsible for regulating and advising the Scottish Parliament through Ministers, on environmental protection. In broad terms, SEPA regulates: activities that may pollute water or air; the storage, transport and disposal of waste; the keeping and disposal of radioactive materials. Some of SEPA's other principal responsibilities include: maintaining a flood warning system; implementing the National Waste Strategy; controlling, with the Health and Safety Executive, the risk of major accidents at industrial sites; and operating the Scottish part of the Radioactive Incident Monitoring Network.
SEPA Corporate Office, Erskine Court, Castle Business Park, Stirling FK9 4TR, Scotland, UK
Phone: +44(0)-1786-457700
Fax: +44(0)-1786-446885
Web: http://www.sepa.org.uk/about/index.htm

Scottish National Heritage (SNH)

The SNH is controlled by a Board appointed by Scottish Ministers, and determines the objectives, strategies, and policies of SNH, in the light of SNH's statutory obligations and guidance from the Scottish Executive. It is supported in this work by three advisory Area Boards covering North, East and West Scotland, a Scientific Advisory Committee and an Audit and Risk Management Committee.
SNH (Headquarters), Great Glen House, Leachkin Road, Inverness IV3 8NW, Scotland, UK
Phone: +44-(0)1463-725000
Web: http://www.snh.org.uk/

Veterinary Medicines Directorate (VMD)

The VMD is an Executive Agency responsible for issues concerning the use and manufacture of veterinary medicines in the UK, with the objective of protecting public and animal health, the environment and promoting animal welfare by assuring the safety, quality, and efficacy of veterinary medicines.
VMD, Woodham Lane, New Haw, Addlestone, Surrey KT15 3LS, UK
Phone:+44-(0)1932-336911
Fax:+44-(0)1932-336618
Web: http://www.vmd.gov.uk/

Government Advisory Committees

Advisory Committee on Hazardous Substances (ACHS)

Provides expert advice on the science behind hazardous chemicals. The principal role is advising the UK Chemicals Stakeholder Forum. In particular, the

Committee has advised the Forum on its criteria for concern, in light of physical and chemical properties of substances.
Zone 4/E1, Ashdown House, 123 Victoria Street, London SW1E 6DE, UK
Phone: +44-(0)20-7082-8109
Email: ACHS@defra.gsi.gov.uk
Web: http://www.defra.gov.uk/environment/chemicals/achs/

Advisory Committee on Pesticides (ACP)

Under Section 16(7) of the Food and Environment Protection Act 1985, Ministers established the Advisory Committee on Pesticides to provide advice on any matters relating to the control of pests in furthering the general purposes of Part III of the Act.
Department for Environment, ACP, Food & Rural Affairs, Mallard House, Kings Pool, 3 Peasholme Green, York YO1 7PX, UK
Phone: +44-(0)-1904-455702/+44-(0)-1904-640500 (switchboard)
Fax:+44-(0)1904-455722
Email: acp@psd.defra.gsi.gov.uk
Web: http://www.pesticides.gov.uk/acp_home.asp

Advisory Committee on Toxic Substances (ACTS)

Advises the Health and Safety Commission on matters relating to the prevention, control, and management of hazards and risks to the health and safety of persons arising from the supply or use of toxic substances at work, with due regard to any related risks to consumers, the public, and the environment.
Health & Safety Executive, ACTS, Floor 9SW, Rose Court, 2 Southwark Bridge, London SE1 9HS, UK
Email: acts@hse.gsi.gov.uk
Web: http://www.hse.gov.uk/aboutus/hsc/iacs/ acts/

Air Quality Expert Group (AQEG)

This is an independent group that provides scientific advice on air quality, in particular the air pollutants contained in the Air Quality Strategy (AQS) for England, Scotland, Wales and Northern Ireland and those covered by the EU Directive on ambient air quality assessment and management.
AQEG Secretariat, Defra 7/F15, Ashdown House, 123 Victoria Street, London SW1E 6DE, UK
Phone: +44-(0)20-7082-8421
Fax: +44-(0)20-7082-8385
Email: air.quality@defra.gsi.gov.uk
Web: http://www.defra.gov.uk/environment/air-quality/panels/aqeg/index.htm

Animal Procedures Committee (APC)

Advises the Home Secretary on matters concerned with the Act and their functions under it, relating to any experimental or other scientific procedures applied to a protected animal which may have the effect of causing that animal pain, suffering, distress, or lasting harm. In addition, examines other related subjects considered worthy of further study.
ACP, 3rd floor, Seacole SW Quarter, 2 Marsham Street, London SW1P 2AW, UK
Phone: +44-(0)20-7035-4578/+44-(0)20-7035-4776/+44-(0)20-7035-5513
Fax: +44-(0)20-7035-1135
Web: http://www.apc.gov.uk/

Chemicals Stakeholder Forum (CSF)

The UK Chemicals Stakeholder Forum (CSF) was set up in September 2000 following the development of the UK Chemicals Strategy in December 1999. The principal function of the Forum is to advise the Government on how industry should reduce the risks from hazardous chemicals to the environment and to human health through the environment. The Forum has 23 members drawn from industry, environmental, and animal protection and conservation organizations, trade unions, consumer groups, and the scientific community.
Defra UK CSF Secretariat, Zone 4/E1 Ashdown House, 123 Victoria Street, London SW1E 6DE, UK
Phone: +44-(0)20-7082-8109
Email: chemicals.strategy@defra.gsi.gov.uk
Web: http://www.defra.gov.uk/environment/chemicals/csf/

Committee on Carcinogenicity of Chemicals in Food, Consumer Products and the Environment (COC)

COC is an independent advisory committee that provides advice to Government Departments and Agencies on matters concerning the potential carcinogenicity of chemicals ranging from natural products to new synthetic chemicals used in pesticides or pharmaceuticals. It consists of a panel of independent doctors and scientists recruited for their individual expertise from universities, research institutes and, in some cases, industry. The independent members of COC are supported in their work by a joint secretariat provided by the Health Protection Agency and the Food Standards Agency.
Mrs Janice Cleverly (Administrative Secretary), Health Protection Agency, Centre for Radiation and Chemical Hazards, Chemical Hazards and Poisons Division (Head Office), Chilton, Didcot, Oxon OX11 0RQ, UK
Phone: +44-(0)1235-841475
Email: janice.cleverly@hpa.org.uk
Web: http://www.advisorybodies.doh.gov.uk/coc/index.htm

Committee on Medical Effects of Air Pollutants (COMEAP)

COMEAP is an Advisory Committee of independent experts that provides advice to Government Departments and Agencies on all matters concerning the potential toxicity and effects upon health of air pollutants.

Miss Julia Cumberlidge (COMEAP Secretariat), Area No. 518 Wellington House, 133–155 Waterloo Road, London SE1 8UG, UK
Phone: +44-(0)20-7972-4108
Email: jcumberl@doh.gsi.gov.uk
Web: http://www.advisorybodies.doh.gov.uk/comeap/

Committee on Mutagenicity of Chemicals in Food, Consumer Products and the Environment (COM)

COM is an Independent Advisory Committee that provides advice to Government Departments and Agencies on matters concerning the potential mutagenicity of chemicals ranging from natural products to new synthetic chemicals used in pesticides or pharmaceuticals. It consists of a panel of independent doctors and scientists recruited for their individual expertise from universities and research institutes and, in some cases, industry.

Mrs Janice Cleverly (Administrative Secretary), Health Protection Agency, Centre for Radiation and Chemical Hazards, Chemical Hazards and Poisons Division (Head Office), Chilton, Didcot, Oxon OX11 0RQ, UK
Phone: +44-(0)1235-841475
Email: janice.cleverly@hpa.org.uk
Web: http://www.advisorybodies.doh.gov.uk/com/index.htm

Committee on Products and Processes (CPP)

Provides expert advice to government authorities in England and Wales on approval issues.

CPP Secretariat, Room G01, 55 Whitehall, London SW1A 2EY, UK
Phone: +44-(0)20-7082-8013/8015
Fax: +44-(0)20-7082-8012
Email: CPP@defra.gsi.gov.uk
Web: http://www.dwi.gov.uk/cpp/

Committee on Toxicity of Chemicals in Food, Consumer Products and the Environment (COT)

A DH expert committee that provides expert advice to government authorities in England and Wales on a wide range of issues relating to the toxicity of chemicals. The Committee's terms of reference are to assess and advise on the toxic risk to man of substances which are: (a) used or proposed to be used as food additives, or used in such a way that they might contaminate food through their use or natural occurrence in agriculture, including horticulture and veterinary practice or in the distribution, storage, preparation, processing or packaging of food; (b) used or proposed to be used or manufactured or produced in industry, agriculture, food storage or any other workplace; (c) used or proposed to be used as household goods or toilet goods and preparations; (d) used or proposed to be used as drugs, when advice is requested by the Medicines and Healthcare Products Regulatory Agency; (e) used or proposed to be used or disposed of in such a way as to result in pollution of the environment.

Mr Khandu Mistry, Room 523, Department of Health, Wellington House, 133–155 Waterloo Road, London SE1 8UG, UK
Phone: +44-(0)20-7972-4946
Fax: +44-(0)20-7972-1001
Email: Khandu.Mistry@dh.gsi.gov.uk
Web: http://www.advisorybodies.doh.gov.uk/cotnonfood/index.htm

Expert Panel on Air Quality Standards (EPAQS)

The Expert Panel on Air Quality Standards (EPAQS) was set up in 1991 to provide independent advice on air quality issues, in particular the levels of pollution at which no or minimal health effects are likely to occur. Members of the Panel are primarily drawn from those eminent in the fields of health research, practice, and teaching. The Panel's recommendations were adopted as the benchmark standards in the National Air Quality Strategy. EPAQS gives advice on non-occupational ambient air quality standards, with particular reference to the levels of airborne pollutants at which no or minimal effects on human health are likely to occur, taking account of the best available evidence.

EPAQS Secretariat, Defra 7/F15, Ashdown House, 123 Victoria Street, London SW1E 6DE, UK
Phone: +44-(0)20-7082-8421
Fax: +44-(0)20-7082-8385
Email: air.quality@defra.gsi.gov.uk
Web: http://www.defra.gov.uk/environment/airquality/panels/aqs/index.htm

Parliamentary Select Committee on Science and Technology

One of the departmental select committees of the House of Commons (Parliament). This committee focuses on the expenditure, administration, and policy of the Office of Science and Innovation and its associated public bodies.

Phone: +44-(0)20-7219-2793/+44-(0)20-7219-2794
Fax: +44-(0)20-7219-0896

Email: scitechcom@parliament.uk
Web: http://www.parliament.uk/parliamentary_committees/science_and_technology_committee.cfm

Royal Commission on Environmental Pollution (RCEP)

A standing body independent of government. Reviews and anticipates trends and developments in environmental policies, identifies fields where insufficient attention is being given to problems, and recommends action that should be taken.
Third Floor, The Sanctuary, Westminster, London SW1P 3JS, UK
Phone: +44-(0)20-7799-8970
Fax: +44-(0)20-7799-8971
Email: enquiries@rcep.org.uk
Web: http://www.rcep.org.uk/

Sustainable Development Committee

The government's independent watchdog on sustainable development, reporting to the Prime Minister and the First Ministers of Scotland and Wales. Its policies are composed of ten areas; climate change, consumption, economics, education, energy, engagement, health, housing, regional and local government, and transport.
Sustainable Development Committee (Main Office), Ground Floor, Ergon House, Horseferry Road, London SW1P 2AL, UK
Phone: +44-(0)20-7238-4995
Fax: +44-(0)20-7238-4981
Email: enquiries@sd-commission.org.uk
Web: http://www.sd-commission.org.uk/pages/aboutus.html

Veterinary Products Committee (VPC)

The Veterinary Products Committee (VPC) was established in 1970 under section 4 of the Medicines Act 1968 (the Act). The VPC took over from the Advisory Committee on Pesticides and other Toxic Chemicals which had, up until then, been responsible for advising the Health and Agriculture Ministers on the administration of the voluntary Veterinary Products Safety Precautions Scheme (VPSPS), which had been established in 1964 for the scrutiny of veterinary medicines. In October 2005, the Medicines Act 1968 was disapplied to veterinary medicines by the Veterinary Medicines Regulations S.I. 2005 No 2745 (the Regulations) which made provision for the continuance of the VPC.
Veterinary Medicines Directorate, Woodham Lane, New Haw, Addlestone, Surrey KT15 3LS, UK
Phone: +44-(0)1932-338490
Fax: +44-(0)1932-336618
Email: vpc@vmd.defra.gsi.gov.uk
Web: http://www.vpc.gov.uk/

Working Group on Action to Control Chemicals (WATCH)

WATCH is the scientific and technical subcommittee of HSC's Advisory Committee on Toxic Substances. It advises on matters relating to the prevention, control, and management of hazards and risks to the health and safety of persons arising from the supply or use of toxic substances at work, with due regard to any related risks to consumers, the public, and the environment.
Health & Safety Executive, Floor 9SW, Rose Court, 2 Southwark Bridge, London SE1 9HS, UK
Email: acts@hse.gsi.gov.uk
Web: http://www.hse.gov.uk/aboutus/hsc/iacs/acts/watch/index.htm

Government-funded Independent Research Councils

Biotechnology and Biological Sciences Research Council (BBSRC)

The funding agency for academic research and training in the non-clinical life sciences. Supports research and research training in universities and research centers throughout the UK, and promotes knowledge transfer from research to applications in business, industry and policy, and public engagement in the biosciences.
BBSRC, Polaris House, North Star Avenue, Swindon SN2 1UH, UK
Phone: +44-(0)1793-413200 (switchboard)
Fax: +44-(0)1793-413201
Web: http://www.bbsrc.ac.uk/

BBSRC is responsible for:
Institute of Grassland and Environmental Research (IGER)

Institute of Grassland and Environmental Research (IGER) is one of eight research institutes funded by the Biotechnology and Biological Sciences Research Council. Its mission is to determine viable options for grassland-dominated landscapes and land use systems that lead to a sustainable rural economy, a multifunctional healthy environment, and a safe and high-quality food chain. This will be achieved by undertaking integrated research aimed at better understanding the interactions between plants, soil, microbes, livestock, food, the environment, and humans.
Plas Gogerddan, Aberystwyth, Ceredigion SY23 3EB, UK
Phone: +44-(0)1970-823000
Fax: +44-(0)1970-828357
Web: http://www.iger.bbsrc.ac.uk/default.asp

Medical Research Council (MRC)

The MRC is a publicly funded research council focused on improving human health through medical and other scientific research activities. It supports research across

the biomedical spectrum, from fundamental lab-based science to clinical trials, and in all major disease areas. It is governed by the MRC Council, which directs the scientific strategy and corporate policy. Five MRC Research Boards decide which scientific proposals the MRC funds, and a Training and Development Board distributes funding scientific training. A MRC Executive Board, based at our head office in London, is responsible for the day-to-day management of the organization. It also supports a number of MRC research units, institutes, and an affiliated company, MRC Technology, which works with industry to translate scientific discoveries into new treatments and technologies.

MRC Head Office, 20 Park Crescent, London W1B 1AL, UK
Phone: +44-(0)20-7636-5422
Fax: +44-(0)20-7436-6179
Email: corporate@headoffice.mrc.ac.uk (general enquiries)
Web: http://www.mrc.ac.uk/index.htm

Research groups of particular relevance to toxicology include:

MRC Environmental Epidemiology Unit

The MRC Epidemiology Resource Centre, located at the University of Southampton, has a remit to investigate occupational and environmental causes of disease within the UK.

MRC Epidemiology Resource Centre, Southampton General Hospital, Southampton SO16 6YD, UK
Phone: +44-(0)23-8077-7524
Fax: +44-(0)23-8070-4021
Web: http://www.mrc.soton.ac.uk/index.asp

MRC Toxicology Unit

The Toxicology Unit studies fundamental mechanisms of cellular and tissue response to injury caused by drugs, chemicals, and endogenous molecules.

MRC Toxicology Unit, Hodgkin Building, PO Box 138 University of Leicester, Lancaster Road, Leicester LE1 9HN, UK
Phone: +44-(0)116-252-5544
Fax: +44-(0)116-252-5616
Web: http://www.le.ac.uk/mrctox/

MRC Dunn Human Nutrition Unit

The unit studies the fundamental processes of human nutrition, especially in energy metabolism, the involvement of these processes in human disease and ageing, and the impact of diet on human health and longevity.

The Wellcome Trust/MRC Building, Addenbrooke's Site, Cambridge, CB2 0XY, UK
Phone: 01223-252700
Fax: 01223-252715
Web: http://www.mrc-dunn.cam.ac.uk

MRC Centre for Nutritional Epidemiology in Cancer Prevention and Survival (CNC)

The MRC Centre for Nutritional Epidemiology in Cancer Prevention and Survival (CNC) was launched in July 2006 with a £2.3 m MRC award to the University of Cambridge to fund research into the impact of diet on cancer. The center is hosted by the Clinical School's Department of Public Health and Primary Care and is directed by Dr Shelia Bingham to provide international leadership in research in the epidemiology and molecular origins of the dietary causes of cancer.

MRC Centre for Nutritional Epidemiology in Cancer Prevention and Survival (CNC), Department of Public Health and Primary Care, University of Cambridge, Cambridge CB1 8RN, UK
Phone: 01223-740151
Web: http://www.srl.cam.ac.uk

MRC Human Reproductive Sciences Unit

The Unit undertakes studies at a molecular, cellular, and endocrine level on the regulation of the human reproductive system, with particular attention to mechanisms that might be exploited for purposes of contraception or account for infertility, menstrual cycle abnormalities, and disorders of pregnancy and fetal development. Immunological, hormonal, and pharmacological approaches for the reversible regulation of human fertility are under investigation, and clinical development through links with industry and international agencies.

Centre for Reproductive Biology, Queen's Medical Research Institute, 47 Little France Crescent, Edinburgh, EH16 4TJ, UK
Phone: 0131-242-9100
Fax: 0131-242-6231
Web: http://www.hrsu.mrc.ac.uk

MRC Centre for Neurodegenerative Research

The MRC Centre for Neurodegeneration Research (CNR) works mainly on two neurodegenerative diseases, Alzheimer's disease and motor neurone disease. The research is urgently needed because there are no effective therapies for these progressive diseases.

MRC Centre for Neurodegenerative Research, King's College London; Institute of Psychiatry, Box PO37, De Crespigny Park, London SE5 8AF, UK
Phone: 020-7848-0259
Web: http://cnr.iop.kcl.ac.uk/

Natural Environment Research Council (NERC)

NERC is a publicly funded research council focused on delivery of independent research, survey, training,

and knowledge transfer in the environmental sciences. NERC funds scientific research projects and also supports a number of research centers.
NERC, Head Office, Polaris House, North Star Avenue, Swindon SN2 1EU, UK
Phone: +44-(0)179-3411500
Fax: +44-(0)179-3411501
Web: http://www.nerc.ac.uk/

NERC-supported research groups of particular relevance to toxicology include:
British Geological Survey

Studies the potential risk to human health posed by the geologically diverse and naturally mineralized rural and urban environments of the UK, including the impact of a long industrial heritage.
Central Enquiries Desk, British Geological Survey, Kingsley Dunham Centre, Keyworth, Nottingham NG12 5GG, UK
Phone: +44-(0)115-936-3143
Fax: +44-(0)115-936-3276
Email: Enquiries@bgs.ac.uk
Web: http://www.bgs.ac.uk/

Centre for Ecology and Hydrology (CEH)

Undertakes research in the land and freshwater environmental sciences.
Polaris House, North Star Avenue, Swindon, Wiltshire, SN2 1EU, UK
Phone: +44-(0)1793-442516
Fax: +44-(0)1793-442528
Email: director@ceh.ac.uk
Web: http://www.ceh.ac.uk/index.html

Natural History Museum

The Natural History Museum is an international leader in the scientific study of the natural world. More than 300 scientists work at the Museum to tackle a diverse range of global problems, such as threats to the Earth's biodiversity, the maintenance of delicate ecosystems, environmental pollution and disease.
Natural History Museum, Cromwell Road, London, SW7 5BD, UK
Phone: + 44-(0)20-7942-5000
Web: http://www.nhm.ac.uk/research-curation/

Organizations (Non-Government)

Non-government Organizations/Trade Associations

Biosciences Federations

The federation address a wide range of scientific areas, from physiology and neuroscience, biochemistry and microbiology, to ecology, taxonomy and environmental science. Currently, the society has 42 member societies and organizations.
Biosciences Federations, P.O. Box 502, Cambridge CB1 0AL, UK
Email: info@bsf.ac.uk (general enquiries)
Web: http://www.bsf.ac.uk/default.htm

British Plastics Federation (BPF)

This is a trade association of the UK plastics industry.
BPF, 6 Bath Place, Rivington Street, London EC2A 3JE, UK
Phone: +44-(0)20-7457-5000
Fax: +44-(0)20-7457-5045
Email: bpf@bpf.co.uk
Web: http://www.bpf.co.uk/

British Union for the Abolition of Vivisection (BUAV)

Anti-vivisection campaigning organization. Raises awareness and exposes the reality of animal experimentation and creates meaningful changes in policy while defending the rights of animals and the well-being of people through public campaigning, hard-hitting undercover investigations, media activities, political lobbying, promotion of cruelty-free products, legal and scientific expertise, and quality educational and information materials.
BUAV, 16a Crane Grove, London N7 8NN, UK
Phone: +44-(0)20-7700-4888
Fax: +44-(0)20-7700-0252
Email: info@buav.org
Web: http://www.buav.org/

Chemical & Industrial Consultants Association

This is a trade body established by independent consultants specialising in applications of chemistry in industry.
CICA Honorary Secretary, 8 Chestnut Close, Baltonsborough, Somerset BA6 8PH, UK
Phone/Fax: +44-(0)1458-851568
Email: secretary@chemical-consultants.co.uk
Web: http://www.chemical-consultants.co.uk/

Chemical Hazards Communication Society (CHCS)

Chemical Hazards Communication Society was launched at an inaugural meeting at the Health and Safety Executive, London in April 1994, as an unincorporated, non-profit-making society. It provides information and training guidance for associations or for government, involved with the ever-increasing complexity of chemical hazards regulations and international codes.
Chemical Hazards Communication Society, P.O. Box 222, Lymington SO42 7GY, UK
Phone: +44-(0)7000-790337
Fax: +44-(0)7000-790338

Mobile and messaging: +44-(0)7880-723330
Email chcs@chcs.org.uk
Web: http://www.chcs.org.uk/

Chemical Industries Association (CIA)

This is the largest trade association of chemical manufactures in the UK.
CIA, Kings Buildings, Smith Square, London SW1P 3JJ, UK
Phone: +44-(0)20-7834-3399
Fax: +44-(0)20-7834-4469
Email: enquiries@cia.org.uk
Web: http://www.cia.org.uk/newsite/

Friends of the Earth

This is an environmental pressure and campaign group that seeks to influence policy and practice by; working local to global, solutions based research, and enabling campaigning. It is organized as two distinct organizations, a charity (Friends of the Earth Trust) and a limited company (Friends of the Earth Limited). Both focus on conservation and the protection and improvement of the environment.
Friends of the Earth, 26–28 Underwood Street, London N1 7JQ, UK
Phone: +44-(0)20-7490-1555
Fax: +44-(0)20-7490-0881
Web: http://www.foe.co.uk/

Fund for the Replacement of Animals in Medical Experiments (FRAME)

FRAME is a registered charity promoting the total elimination of laboratory animal use. It supports efforts to reduce the numbers of animals used through better science and better experimental design, and refines procedures so that the suffering of any animals necessarily used is minimized in line with the 3R's principle.
FRAME, Russell & Burch House, 96–98 North Sherwood St, Nottingham NG1 4EE, UK
Phone: +44-(0)115-9584740
Fax: +44-(0)115-9503570
Email: frame@frame.org.uk
Web: http://www.frame.org.uk/

Green Alliance

This is an independent charity working to promote sustainable development by ensuring that the environment is at the heart of decision-making.
Green Alliance, 36 Buckingham Palace Road, London SW1W 0RE, UK
Phone: +44-(0)20-7233-7433
Fax: +44-(0)20-7233-9033
Email: ga@green-alliance.org.uk
Web: http://www.green-alliance.org.uk/

Greenpeace

Greenpeace is an independent non-profit campaigning organization active in the UK. It focuses on government's and industry's role in environmental issues around the world.
Greenpeace, Canonbury Villas, London N1 2PN, UK
Phone: +44-(0)20-7865-8100
Fax: +44-(0)20-7865-8200
Email: info@uk.greenpeace.org
Web: http://www.greenpeace.org.uk/

Institute of Occupational Medicine (IOM)

The IOM is an independent center of scientific research in the fields of occupational and environmental health, hygiene, and safety. It was founded as a charity in 1969 by the UK coal industry in conjunction with the University of Edinburgh and became fully independent in 1990.
IOM, Riccarton, Edinburgh EH14 4AP, UK
Phone: +44-(0)870-850-5131
Fax: +44-(0)870-850-5132
Email: Info@iom-world.org
Web: http://www.iom-world.org/

Institute of Occupational Safety and Health (IOSH)

IOSH is an independent, non-profit organization that sets professional standards, supports and develops members, and provides authoritative advice and guidance on health and safety issues.
IOSH, The Grange, Highfield Drive, Wigston, Leicestershire, LE18 1NN, UK
Phone: +44-(0)116-257-3100
Fax: +44-(0)116-257-3101
Email: enquiries@iosh.co.uk
Web: http://www.iosh.co.uk/

Institution of Chemical Engineers

This is the UK's professional institution for chemical engineers.
Institution of Chemical Engineers (Headquarters), Davis Building, 165–189 Railway Terrace, Rugby CV21 3HQ, UK
Phone: +44-(0)1788-578214
Fax: +44-(0)1788-560833
Web: http://cms.icheme.org/MainWebSite/Homepage3bf36337.aspx?Map=1B65ED76D4B00E9E78817E89DC003264

Pesticide Action Network (PAN) UK

PAN is an independent, non-profit organization working to promote healthy food, agriculture, and environment, and focuses on the use of chemicals in food production and agriculture. In particular, the focus is

on the elimination of the hazards of pesticides, reduction of dependence on pesticides, and prevention of unnecessary expansion of use; and increasing the sustainable and ecological alternatives to chemical pest control.
PAN, Development House, 56–64 Leonard Street, London EC2A 4JX, UK
Phone: +44-(0)20-7065-0905
Fax: +44-(0)20-7064-0907
Email: admin@pan-uk.org
Web: http://www.pan-uk.org/About/index.htm

Royal Society for the Prevention of Cruelty to Animals (RSPCA)

This is a UK charity working to prevent cruelty, promote kindness to, and alleviate suffering of animals. It is active in relation to the use of animals in scientific experiments.
RSPCA, Wilberforce Way, Southwater, Horsham, West Sussex, RH13 9RS, UK
Phone: +44-(0)870-3335-999
Fax: +44-(0)870-7530-284
Web: http://www.rspca.org.uk/servlet/Satellite?pagename= RSPCA/News/NewsFeature

Sense about Science

This is an independent charitable trust promoting good science and evidence in public debates.
Sense about Science, 60 Cambridge Street, London SW1V 4QQ, UK
Tel: +44-(0)20-7478-4380
Email: enquiries@senseaboutscience.org
Web: http://www.senseaboutscience.org.uk/index.php

Wellcome Trust

The Wellcome Trust is an independent charity funding research to improve human and animal health.
Wellcome Trust, Gibbs Building, 215 Euston Road, London NW1 2BE, UK
Phone: +44-(0)20-7611-8888
Fax: +44-(0)20-7611-8545
Email: contact@wellcome.ac.uk
Web: http://www.wellcome.ac.uk/

Women's Environmental Network (WEN)

WEN is an independent campaigning organization, which represents women and campaigns on issues that link women, environment, and health. Formed in 1988, it is a registered charity.
WEN, P.O. Box 30626, London E1 1TZ, UK
Phone: +44-(0)20-7481-9004
Fax: +44-(0)20-7481-9144
Email: nappies@wen.org.uk
Web: http://www.wen.org.uk/rnw/

Women's Institute (WI)

The (NFWI) is the largest organization for women in the UK with 215 000 members in England, Wales, and the Islands. It works to educate women, to expand their horizons, and to develop and pass on important skills. It is active in the field of the potential effects of chemicals present in the environment.
National Federation of Women's Institutes, 104 New Kings Road, London SW6 4LY, UK
Phone: +44-(0)20-7371-9300
Web: http://www.womens-institute.co.uk/index.shtml

WWF-UK

WWF-UK is part of an international organization, the WWF. It is an independent conservation charity that carries out conservation work in Africa, Latin America, the Asia-Pacific region, and Europe. It also undertakes environmentally focused campaigns in the UK.
WWF-UK, Panda House, Weyside Park, Godalming, Surrey, GU7 1XR, UK
Phone: +44-(0)1483-426444
Fax: +44-(0)1483-426409
Web: http://www.wwf-uk.org/core/about/about-wwf.asp

Consultancies and Laboratories

AEA Technology plc

Formerly part of the United Kingdom Atomic Energy Authority, now provides independent consultancy, technical services and products to the rail, environment, and portable power market.
329 Harwell International Business Centre, Didcot, Oxon OX11 0QJ, UK
Phone: +44-(0)870-190-1900
Fax: +44-(0)870-190-8261
Email: enquiry@aeat.co.uk
Web: http://www.aeat.com/

ALCAT

Conducts food and chemical sensitivity test.
Wellington House, 96–98 Wellington Street, Newmarket, Suffolk CB8 8SX, UK
Phone: +44-(0)1638-665-350
Fax: +44-(0)1638-664-913
Email: info@nptech.co.uk
Web: http://www.alcat.info/Default.htm

Biolab Medical Unit (UK)

A medical referral laboratory specializing in nutritional and environmental medicine.
Biolab Medical Unit, The Stone House, 9 Weymouth Street, London W1W 6DB, UK

Phone: +44-(0)20-7636-5959/5905
Fax: +44-(0)20-7580-3910
Email: info@biolab.co.uk
Web: http://www.biolab.co.uk/

Bodycote Testing Ltd

Offers a wide range of chemical analysis techniques reflecting its interests in metallic, pharmaceutical, and environmental analysis.
Phone: +44-(0)161-868-6675
Email: mtweb@bodycote.com
Web: http://mt.bodycote.com/?OB=84

Building Research Establishment Ltd (BRE)

A former government research laboratory with expertise in buildings, construction, energy, environment, fire, and risk; undertakes research-based consultancy, testing and certification services.
BRE, Bucknalls Lane, Watford WD25 9XX, UK
Phone: +44-(0)1923-664000
Email: enquiries@bre.co.uk
Web: http://www.bre.co.uk/

Covance Laboratories Ltd

Global drug development services company, providing a portfolio of preclinical and clinical development and commercial services.
Covance Laboratories Ltd, Otley Road, Harrogate HG3 1PY, North Yorkshire, UK
Phone: 01423-500011
Fax: 01423-501999
Web: http://www.covance.com/

Crowther Clayton Associates

Environmental, water, wastewater, health and safety executive, and chemical engineering consultants.
31 Tennyson Road, London NW7 4AB, UK
Phone: +44-(0)20-8959-7376/ +44-(0)20-8959-7000 CLAYTON
Fax: +44-(0)20-8959-6880
Freephone: 0800-074-7166
Email: rccweb@crowther-clayton.com
Web: http://www.crowther-clayton.com/

David Horrocks Environmental Health Services
An environmental protection consultancy.
17 Starlight Ways, St Albans, Hertfordshire
Phone: 01727-863112

EEF Sheffield
An environmental protection consultancy.
Broomgrove, 59 Clarkehouse Road, Sheffield S10 2LE, UK
Phone: +44-(0)114-268-0671
Fax: +44-(0)114-266-4227
Email: info@eefshe.co.uk
Web: http://www.eefshe.co.uk/

Food Chemical Risk Analysis (FCRA)

Company providing scientific and regulatory support to food and chemical industries operating in European markets.
Food Chemical Risk Analysis, 14 St Mary's Square, Brighton BN2 1FZ, UK
Phone: +44-(0)1273-241-753
Web: http://www.fcra.co.uk/

Huntingdon Life Sciences (HLS)

An international development company providing a range of services to the pharmaceutical, biopharmaceutical, chemical, crop protection, veterinary, and food industries.
Huntingdon Research Centre, Woolley Road, Alconbury, Huntingdon, Cambridgeshire, PE28 4HS, UK
Phone: +44-(0)1480-892-000
Fax: +44-(0)1480-890-693
Email: sales@ukorg.huntingdon.com
Web: http://www.huntingdon.com/

Instant Analysis

Offers chemical analysis and consultancy in relation to chemical product development.
Quality House, 73 Windsor Road, Prestwich, Manchester M25 0DB, UK
Phone: +44-(0)161-721-4418
Fax: +44-(0)161-740-4186
Email: info@instantanalysis.co.uk
Web: http://www.instantanalysis.co.uk/

IPPC Consultants Limited

An environmental protection consultancy.
Mobile: +44-(0)7712-583517
Email: martin.glossop@ippc-consultants.co.uk
Web: http://www.ippc-consultants.co.uk/

Len Hall Chemical Consultant

Online health and safety advice to chemical and distribution industries.
14 Knowsley Meadows, Darwen, Lancashire, BB33 2UP, UK
Phone: +44-(0)1254-701972
Mobile: +44 (0)7747 692193
Email: lhdgsa@aol.com
Web: http://www.lenhallsafetyadvisor.co.uk/

LGC

Formerly the Laboratory of the Government Chemist, LGC is now an independent, science-based service

company providing chemical, biochemical, and DNA-based analysis. LGC's services include analytical testing, research, consultancy, validation, training, and knowledge transfer for the public and private sectors. It is active in: food and agriculture, oil and chemicals, pharmaceuticals, environment, health care, life sciences, and law enforcement. It also provides chemical, biochemical, and DNA-based analytical services. It operates through several sites.
LGC Limited, Queens Road, Teddington, Middlesex, TW11 0lY, UK
Web: http://www.lgc.co.uk/

M R Associates

An environmental protection consultancy.
1st Floor, Westgate House, 100 Wellington Street, Leeds, West Yorkshire, LS1 4LT, UK
Phone: +44-(0)800-019-9725
Fax: +44-(0)845-130-3178
Email: enquiries@mraukltd.com
Web: http://www.mrassociates.co.uk/

MESH Consultants

Consults on health and safety of employees.
East Malling Enterprise Centre, New Road, East Malling, Kent, ME19 6BJ, UK
Phone: +44-(0)1732-897455
Email: martin.moy@consultmesh.co.uk
Web: http://www.consultmesh.co.uk/

Osborne Richardson

An environmental protection consultancy.
4th floor, Circus House, 26 Little Portland Street, London, W1W 8BX, UK
Phone: +44-(0)207-5801500
Email: mail@or-environmentalhealth.com
Web: http://www.or-environmentalhealth.com/

Peter Fisk Associates

Provides specialist services in environmental science, human health, and chemistry in relation to data collation and analysis (including the OECD HPV Programme, REACH submissions, hazard and risk assessment, voluntary initiatives and general regulatory compliance)
39 Bennell's Avenue, Tankerton, Whitstable, Kent CT5 2HP, UK
Phone/Fax/voice mail: +44-(0)1227-752442
Mobile: +44-(0)7795-517615
Email: peter.fisk@ecotoxchem.co.uk
Web: http://www.ecotoxchem.co.uk/index.html

Quintiles UK Ltd

Quintiles is a full-service contract research organization for the pharmaceutical and biotechnology industry. Facilities in Scotland provide preclinical development, pharmaceutical sciences, clinical trial manufacturing, packaging and distribution, clinical trial management, central laboratory services, regulatory affairs, data management, and clinical trial services.
Quintiles UK, Research Avenue South, Heriot Watt University Research Park, Riccarton, Edinburgh EH14 4AP, UK
Email: qedi.busdev@quintiles.com
Web: http://www.quintiles.com/

RPS

An international consultancy providing advice upon the development of natural resources, land and property, the management of the environment, and the health and safety of people.
Business Information Unit, RPS Group Plc, Centurion Court, 85 Milton Park, Abington, OX14 4RY, UK
Phone: +44-(0)1235-863252
Fax: +44-(0)1235-438151
Web: http://www.rpsplc.co.uk/

SafePharm Laboratories

Contract research company involved in the safety evaluation of speciality and performance chemicals, pharmaceuticals, agrochemicals, intermediates, and medical devices.
SafePharm Laboratories, Shardlow Business Park, London Road, Shardlow, Derbyshire, DE72 2GD, UK
Phone: +44-(0)1332-792896
Fax: +44-(0)1332-799018
Email: marketing@SafePharm.co.uk
Web: http://www.safepharmlabs.com/

SATRA

A not-for-profit organization offering a wide range of testing, research, training, and consultancy services relating to the physical, chemical, environmental, and flammability properties of materials and consumer products.
SATRA House, Rockingham Road, Kettering, Northamptonshire, NN16 9JH, UK
Phone: +44-(0)1536-410000
Fax: +44-(0)1536-410626
Email: info@satra.co.uk
Web: http://www.satra.co.uk/

Sequani

Sequani is a contract research organization conducting both preclinical and clinical research on pharmaceutical, biotechnology, and medical device products.
Sequani, Bromyard Road, Ledbury HR8 1LH, UK
Phone: +44-(0)1531-634121
Fax: +44-(0)1531-634753
Web: http://www.sequani.com/

STL

STL is an environmental testing organization, working in the fields of water cycle, contaminated land, emissions, effluent and microbiological analysis, and endocrine-disrupting chemicals.
STL Business Centre, Torrington Avenue, Coventry CV4 9GU, UK
Phone: +44-(0)24-7642-1213
Fax: +44-(0)24-7685-6575
Email: info@stl-ltd.com
Web: http://www.stl-ltd.com/

Surgical Materials Testing Laboratory (SMTL)

SMTL undertakes contract laboratory testing of medical devices and dressings to British, European, and International standards, clinical trials, and research and development into disposable medical devices and dressings.
SMTL, Princess of Wales Hospital, Coity Road, Bridgend CF31 1RQ, UK
Phone: +44-(0)1656-752820
Fax: +44-(0)1656-752830
Web: http://www.smtl.co.uk/

The Risk Assessment Company
Undertakes occupational health and safety consultancy.
Phone: +44-(0)870-870-9102
Fax: +44-(0)870-870-9103
Mobile: +44-(0)7973-560173
Email: info@riskassessmentcompany.co.uk
Web: http://www.riskassessmentcompany.co.uk/

Watts & Crane Associates

Independent company providing scientific advice on environmental sources and pathways of chemicals, and their effects on human and ecological receptors, for the water, chemicals, retail, and regulatory sectors.
Watts & Crane Associates, 23 London Street, Faringdon, Oxfordshire, SN7 7AG, UK
Phone: +44-(0)1367-244311
Mobile: +44-(0)7845-929978
Web: http://www.wfcenvironment.co.uk/index.html

WRc plc

WRc plc (formerly Water Research Centre) is an independent company, founded in 1989, that provides consultancy to industries in the water, waste, and environment sectors, and to government and regulatory bodies.
WRc, Frankland Road, Blagrove, Swindon, Wiltshire, SN5 8YF, UK
Phone: +44-(0)1793-865000
Fax: +44-(0)1793-865001
Email: solutions@wrcplc.co.uk
Web: http://www.wrcplc.co.uk/

Universities

Brunel University
Uxbridge, Middlesex, UB8 3PH, UK
Phone: 01895-274000
Fax: 01895-232806
Web: http://www.brunel.ac.uk/

Centre for Environmental Research in Centre for the Analysis of Risk and Optimisation Modelling Application

The mission of CARISMA is to be a center of excellence recognized for its research and scholarship in: analysis of risk, optimization modeling and the combined paradigm of risk and return quantification. As such the center is involved in research, postgraduate and masters degree training and consultancy.
Uxbridge UB8 3PH, UK
Phone: +44-(0)1895-265187
Fax: +44-(0)1895-269732
Email: carisma@brunel.ac.uk
Web: http://www.carisma.brunel.ac.uk/http://carisma.brunel.ac.uk/

Centre for Epidemiology and Health Service Research

This is composed of an interdisciplinary team of academics, undertaking research and providing consultation support in the fields of epidemiology and health-service-related research, with a particular emphasis on maintaining and promoting the highest methodological standards.
Web: http://www.brunel.ac.uk/about/acad/health/healthres/researchareas/ehsrg

Cardiff University
Wales CF10 3XQ, UK
Phone: +44-(0)29-2087-4000 (main switchboard)
Web: http://www.cardiff.ac.uk/index.html

Department of Epidemiology, Statistics and Public

Identifying factors in the social and physical environment which cause ill health and consequently reduce the quality of life.
Department of Epidemiology, Statistics & Public Health, Centre for Health Sciences Research, Cardiff University, 4th Floor, Neuadd Meirionnydd, Heath Park, Cardiff CF14 4YS, UK
Phone: +44-(0)29-2068-7228
Email: coomberr@cf.ac.uk
Web: http://www.cardiff.ac.uk/medicine/epidemiology_statistics/

Department of Pharmacology, Therapeutics and Toxicology, Wales College of Medicine, Cardiff University, Heath Hospital Campus, Cardiff, CF14 4XN, UK

Cranfield University
Cranfield University (Main campus), Cranfield, Bedfordshire MK43 0AL, UK
Phone: +44-(0)1234-750111
Fax: +44-(0)1234-750875

Cranfield Health

Focuses on health research, education and consultancy and combines science technology, human factors and management to provide new solutions for the health sector.
Cranfield University, Cranfield Health, Silsoe, Bedfordshire MK45 4DT, UK
Phone: +44-(0)1234-750111
Email: health@cranfield.ac.uk
Web: http://www.cranfield.ac.uk/health/

Institute of Environment and Health

A part of Cranfield Health that promotes a healthier environment through activities such as: facilitating information exchange, identifying and evaluating environment and health issues, and managing research programs on the adverse effects of chemicals.
Institute of Environment and Health, Cranfield University, Silsoe, Bedfordshire MK45 4DT, UK
Phone: +44-(0)1525-863002
Web: http://www.silsoe.cranfield.ac.uk/ieh/

Lancaster University
Bailrigg, Lancaster LA1 4YW, UK
Phone: +44-(0)1524-65201
Web: http://www.lancs.ac.uk/

Department of Environmental Science

Conducts research into the aquatic, atmospheric, and terrestrial environments.
Department of Environmental Science, Lancaster University, Lancaster LA1 4YQ, UK
Phone: +44-(0)1524-65201 (ext. 94308)
Fax: +44-(0)1524-593985
Email: EnvSci@lancaster.ac.uk
Web: http://www.es.lancs.ac.uk/

The Lancaster Environment Centre

Conducts biostatistical analysis. Has particular strengths in environmental epidemiology.
Lancaster Environment Centre, Lancaster University, Lancaster, LA1 4YQ, UK
Phone: +44-(0)1524-510223
Email: lec@lancs.ac.uk
Web: http://www.lec.lancs.ac.uk/lu_theme4.htm

Professional Societies

British Pharmacological Society (BPS)

Concerns with research into drugs and the way they work; covering the whole spectrum of pharmacology, including the laboratory, clinical, and toxicological aspects.
16 Angel Gate, City Road, London EC1V 2PT, UK
Phone: +44-(0)20-7239-0171
Fax: +44-(0)20-7417-0114
Email: yn@bps.ac.uk
Web: http://www.bps.ac.uk/

British Society of Toxicological Pathologists (BSTP)

Non-profit organization involved in the education of pathologists working in the field of human safety assessment.
Email: bstpoffice@aol.com
Web: http://www.bstp.org.uk/

British Toxicology Society (BTS)

Currently the BTS is the largest professional toxicology society in the UK, with approximately 1000 members and 297 registered toxicologists. BTS is active to promote the advancement, communication, and understanding of those scientific disciplines necessary to foster public health and environmental safety. It is affiliated to regional (EUROTOX) and international (IUTOX) toxicology societies, and BTS members automatically have access to national society member benefits within these umbrella organizations. The UK Register of Toxicologists is jointly sponsored by the Institute of Biology and the British Toxicology Society, and was established in 1993. Members of the UK Register of Toxicologists gain automatic membership of the EUROTOX Register of Toxicologists.
BTS Administration Office, P.O. Box 249, Macclesfield SK11 6FT, UK
Phone: +44-(0)1625-267881
Fax: +44-(0)1625-267879
Email: secretariat@thebts.org
Web: http://www.thebts.org/

Chartered Institute for Environmental Health (CIEH)

CIEH is a professional and campaigning body that sets standards and is responsible for the accreditation of courses. It also provides information, evidence and policy advice, and qualifications, events, and trainer and candidate support materials on topics relevant to health, wellbeing, and safety. CIEH works to push environmental health further up the public agenda and to promote improvements in environmental and public health policy for environmental and public health.
CIEH, Chadwick Court, 15 Hatfields, London SE1 8DJ, UK
Phone: +44-(0)20-7928-6006
Fax: +44-(0)20-7827-5862
Email: info@cieh.org
Web: http://www.cieh.org/

Forensic Science Society

The Forensic Science Society is an international professional body with members in over 60 countries. It publishes a peer-reviewed journal, a newsletter, awards qualifications and prizes, arranges scientific conferences in the UK and abroad, and is engaged in setting standards and accreditation in forensic sciences. Most of its members are UK scientists but there is a significant minority of other forensic professionals involved such as police officers and crime scene investigators. The Society was founded in 1959 by Professor Stuart Kind

and with over 2500 members it is one of the oldest and largest forensic associations in the world.

18A, Mount Parade, Harrogate, North Yorkshire, HG1 1BX, UK
Phone: +44-(0)1423-506-068
Web: http://www.forensic-science-society.org.uk/stoppress.html

In Vitro Toxicology Society (IVTS)

IVTS is a toxicological society that provides a forum for discussion for scientists actively involved in the study, practice, or development of in vitro toxicology. It organizes scientific meetings on the subject of in vitro toxicology and its practical applications, and promotes an exacting scientific approach to the practice of in vitro toxicology.
Contact via Dr Val Baker (IVTS Committee Chairman), Sanofi-Aventis, Alnwick Research Centre, Willowburn Ave, Alnwick, Northumberland NE66 2JH, UK

Fax: +44-(0)1665-608503
Email: val.baker@sanofi-aventis.com
Web: http://www.ivts.org.uk/

Institute of Biology (IOB)

This is a professional body for UK biologists that operates under a Royal Charter.
IOB, 9 Red Lion Court, London EC4A 3EF, UK
Phone: +44-(0)20-7936-5900
Fax: +44-(0)20-7936-5901
Email: info@iob.org
Web: http://www.iob.org/

Occupational and Environmental Toxicology Group (OETG)

This group represents and informs members in the RSC of matters pertaining to the risks from chemicals in the work place and in the environment.
Dr Sean McWhinnie Manager Science Policy, Royal Society of Chemistry, Burlington House, Piccadilly, London W1J 0BA, UK
Phone: +44-(0)20-7440-3309
Fax: +44-(0)20-7437-8883
Web: http://www.rsc.org/Membership/Networking/InterestGroups/Toxicology/index.asp

Pathological Society of Great Britain and Ireland

The objective of the Society is to advance pathology and facilitate communication between pathologists.
2 Carlton House Terrace, London SW1Y 5AF, UK
Phone: +44-(0)20-7976-1260
Fax: +44-(0)20-7976-1267
Web: http://www.pathsoc.org.uk/index.php?option=com_frontpage&Itemid=1

Research Defence Society (RDS)

RDS was founded in 1908 by Dr Stephen Paget FRCS. It represents medical researchers in the public debate about the use of animals in medical research and testing.
RDS, 25 Shaftesbury Avenue, London W1D 7EG, UK
Phone: 020-7287-2818
Fax: 020-7287-2627
Email: info@rds-net.org.uk
Web: http://www.rds-net.org.uk/pages/home.asp?i_ToolbarID=8&i_PageID=94

Royal College of Pathologists (RCPath)

Promotes excellence in the practice of pathology and to be responsible for maintaining standards through training, examinations, and professional development.
2 Carlton House Terrace, London SW1Y 5AF, UK
Phone: +44-(0)20-7451-6700
Fax: +44-(0)20-7451-6701
Email: info@rcpath.org
Web: http://www.rcpath.org/

Royal College of Physicians (RCP)

The Royal College of Physicians was established in 1962 to co-ordinate the development and maintain the internationally renowned standards and reputation of British pathology, and has charitable status. It sets standards in clinical practice and education and training, conducts assessments and examinations, quality assures external audit programmes, supports doctors in their practice of medicine, and advises the government, public and the profession on health care issues.
11 St Andrews Place, Regent's Park, London NW1 4LE, UK
Phone: +44-(0)20-7935-1174 (main switchboard)
Fax: +44 (0)20 7487 5218
Web: http://www.rcplondon.ac.uk/index.asp

Royal Society

An independent charity operating under Royal Charter since 1662, the Society acts to influence science policy, debates, and scientific issues with the public.
6–9 Carlton House Terrace, London SW1Y 5AG, UK
Phone: +44-(0)20-7451-2500
Fax: +44-(0)20-7930-2170
Web: http://www.royalsoc.ac.uk/

Royal Society of Chemistry (RSC)

The RSC's original Charter was granted in 1848. The current Charter, granted in 1980, defines its objectives as: the general advancement of chemical science and its application, to establish, uphold and advance the standards of qualification, competence and conduct of

those who practise chemistry as a profession; and to serve the public interest by acting in an advisory, consultative or representative capacity in matters relating to the science and practice of chemistry.
Royal Society of Chemistry, Burlington House, Piccadilly, London W1J 0BA, UK
Phone: +44-(0)20-7437-8656
Fax: +44-(0)20-7437-8883
Web: http://www.rsc.org/

Society of Environmental Toxicology and Chemistry United Kingdom Branch (SETAC-UK)

Promotes a scientific forum for environmental toxicologists and chemists in the UK, multidisciplinary research into environmental problems, and application and development of fundamental research to applied problem.
Contact: Dr Richard Handy, School of Biological Sciences, the University of Plymouth, Drake Circus, Plymouth PL4 8AA, UK
Phone. +44-(0)1752-232900
Fax: +44-(0)1752-232970
Email: r.handy@plymouth.ac.uk
Web: http://www.setac-uk.org.uk/

The Society for Experimental Biology (SEB)

A non-profit organization that supports and promotes experimental biology to both the scientific community and the general public.
SEB, 3 The Carronades, New Road, Southampton, Hants SO14 0AA, UK
Phone: +44-(0)23-8022-4824
Fax: +44-(0)23-8022-6312
Web: http://www.sebiology.org/index.asp

United Kingdom Environmental Mutagen Society (UKEMS)

The UK branch of the European Environmental Mutagen Society (EEMS), representing scientists involved in research on genetic damage caused by environmental agents (chemicals and radiation).
UKEMS, School of Biological Sciences, University of Wales Swansea, Singleton Park, Swansea SA2 8PP, UK
Web: http://www.ukems.org/

Poison Control Centers

A clinical toxicology service for healthcare professionals working in the NHS and is a service commissioned by the HPA. Provides information and advice on the diagnosis, treatment and management of patients who may have been accidentally or deliberately poisoned. Operates through a number of centers. Provides comprehensive expert advice and support for chemical incidents across England and Wales in order to anticipates and prevent the adverse effects of acute and chronic exposure to hazardous chemicals and other poisons.

Legislation

The UK does not have a single unified body of legislation but is divided into three states, each with its own laws and legal systems. These comprise England and Wales (English law), Scotland (Scottish Law), and Northern Ireland and Wales for which some specific legislation applies.

Laws enacted by Parliament are termed 'Acts' and represent the primary legislation of the nation. However, most secondary legislation in the UK is in the form of Statutory Instruments. These, produced for example as orders or regulations, are made by a Minister or by the Queen-in-Council, and are assigned a unique number, with a new series of numbers being started each year. In Northern Ireland, however, secondary legislation is produced as Statutory Rules.

In addition, the legislative framework in the UK is influenced by the laws of the European Union. Of these, European Union Regulations are legislative acts which apply directly across all Member States and make up one of the most powerful forms of EU law which must be given immediate force in all Member States. In particular individual countries do not need to pass local laws to bring EU regulations into effect. In contract, the European Union also produces Directives, which are collective legislative acts which can be adopted by each Member State through a variety of legislative procedures depending on subject matter, and are only binding on those Member States to which they are addressed. How each country puts a Directive into effect depends on its particular legal structure. In the UK, most Directives are enacted via Statutory Instruments although some Directives create such major changes to law that Parliament passes a separate Act to incorporate the change.

There are many UK laws that relate to hazardous chemicals and that impinge on toxicology and experimental research in the UK, and although they are not published in a particular order or under particular headings, for convenience the most recent of these are presented below under a number of topic areas: General legislation on chemicals; Legislation on specific substances/chemicals; Restriction of use in certain products; Food related; Transport of chemicals; and Planning, environment, waste and accident related. The following text presents only a selection of the most recent modification to the legislative base. Full details of current UK legislation may be found at: http://www.opsi.gov.uk/legislation/uk.htm.

England and Wales

General Legislation on Chemicals

Statutory Instrument 2005 No. 2571: The Chemicals (Hazard Information and Packaging for Supply) (Amendment) Regulations 2005: http://www.opsi.gov.uk/si/si2005/20052571.htm

Statutory Instrument 1993 No. 3050: The Notification of New Substances Regulations 1993: http://www.opsi.gov.uk/si/si1993/Uksi_19933050_en_1.htm

Statutory Instrument 2004 No. 3386: The Control of Substances Hazardous to Health (Amendment) Regulations 2004: http://www.opsi.gov.uk/si/si2004/20043386.htm

Statutory Instrument 1990 No. 1255: The Classification, Packaging and Labelling of Dangerous Substances (Amendment) Regulations 1990: http://www.opsi.gov.uk/si/si1990/Uksi_19901255_en_1.htm

Legislation on Specific Substances/Chemicals

Asbestos

Statutory Instrument 2006 No. 2739: The Control of Asbestos Regulations 2006: http://www.opsi.gov.uk/si/si2006/20062739.htm

Pesticides

Statutory Instrument 2006 No. 1742: The Pesticides (Maximum Residue Levels in Crops, Food and Feeding Stuffs) (England and Wales) (Amendment) (No. 2) Regulations 2006: http://www.opsi.gov.uk/si/si2006/20061742.htm

Pesticides Act 1998 (c. 26): http://www.opsi.gov.uk/acts/acts1998/19980026.htm

Creosote

Statutory Instrument 2003 No. 1511: The Creosote (Prohibition on Use and Marketing) (No. 2) Regulations 2003: http://www.opsi.gov.uk/si/si2003/20031511.htm

Nickel

Statutory Instrument 2005 No. 2001: The Dangerous Substances and Preparations (Nickel) (Safety) Regulations 2005: http://www.opsi.gov.uk/si/si2005/20052001.htm

Medicines

Health Act 2006 (c. 28): http://www.opsi.gov.uk/acts/acts2006/20060028.htm

Health (Wales) Act 2003 c. 4: http://www.opsi.gov.uk/acts/acts2003/20030004.htm

Statutory Instrument 2006 No. 1952: The Medicines for Human Use (National Rules for Homoeopathic Products Regulations 2006: http://www.opsi.gov.uk/si/si2006/20061952.htm

Statutory Instrument 2005 No. 3324: The Medicines for Human Use (Prescribing) (Miscellaneous Amendments) (No. 2) Order 2005: http://www.opsi.gov.uk/si/si2005/20053324.htm

Statutory Instrument 2003 No. 2915: The Prescription Only Medicines (Human Use) Amendment (No. 2) Order 2003: http://www.opsi.gov.uk/si/si2003/20032915.htm

Statutory Instrument 2006 No. 395: The Medicines (Traditional Herbal Medicinal Products for Human Use) (Consequential Amendment) Regulations 2006: http://www.opsi.gov.uk/si/si2006/20060395.htm

Statutory Instrument 2006 No. 2407: The Veterinary Medicines Regulations 2006: http://www.opsi.gov.uk/si/si2006/20062407.htm

Statutory Instrument 2005 No. 2745: The Veterinary Medicines Regulations 2005: http://www.opsi.gov.uk/si/si2005/20052745.htm

Restriction of Use in Certain Products

Statutory Instrument 2006 No. 1463: The Restriction of the Use of Certain Hazardous
Substances in Electrical and Electronic Equipment Regulations 2006: http://www.opsi.gov.uk/si/si2006/20061463.htm

Statutory Instrument 2001 No. 2551: The Batteries and Accumulators (Containing Dangerous Substances) (Amendment) Regulations 2001: http://www.opsi.gov.uk/si/si2001/20012551.htm

Statutory Instrument 2000 No. 1460: The Sulphur Content of Liquid Fuels (England and Wales) Regulations 2000: http://www.opsi.gov.uk/si/si2000/20001460.htm

Statutory Instrument 2006 No. 1198: The Cosmetic Products (Safety) (Amendment) Regulations 2006: http://www.opsi.gov.uk/si/si2006/20061198.htm

Statutory Instrument 2005 No. 2469: The Detergents Regulations 2005: http://www.opsi.gov.uk/si/si2005/20052469.htm

Food Related

Food Standards Act 1999 (c. 28): http://www.opsi.gov.uk/acts/acts1999/19990028.htm

Statutory Instrument 2006 No. 3116: The Food for Particular Nutritional Uses (Addition of Substances for Specific Nutritional Purposes) (England) (Amendment) Regulations 2006: http://www.opsi.gov.uk/si/si2006/20063116.htm

Statutory Instrument 2006 No. 1464: The Contaminants in Food (England) Regulations 2006: http://www.opsi.gov.uk/si/si2006/20061464.htm

Statutory Instrument 2005 No. 775: The Contaminants in Food (England) (Amendment) Regulations 2005: http://www.opsi.gov.uk/si/si2005/20050775.htm

Statutory Instrument 2006 No. 15: The Official Feed and Food Controls (England) Regulations 2006: http://www.opsi.gov.uk/si/si2006/20060015.htm

Statutory Instrument 2006 No. 2808: The Feeding Stuffs (England) (Amendment) Regulations 2006: http://www.opsi.gov.uk/si/si2006/20062808.htm

Statutory Instrument 2006 No. 113: The Feeding Stuffs and the Feeding Stuffs (Sampling and Analysis) (Amendment) (England) Regulations 2006: http://www.opsi.gov.uk/si/si2006/20060113.htm

Statutory Instrument 2006 No. 3120: The Feed (Specified Undesirable Substances) (England) Regulations 2006: http://www.opsi.gov.uk/si/si2006/20063120.htm

Transport of Chemicals

Railways and Transport Safety Act 2003: http://www.opsi.gov.uk/acts/acts2003/20030020.htm

Miscellaneous Resources

Reports

Spurgeon DJ, Svendsen C, Hankard PK, et al (2004)
Application of Sublethal Ecotoxicological Tests for Measuring Harm in Terrestrial Ecosystems
Environment Agency, 108 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/SCHO0504BIFL &2DE&2DE

This research by the Environment Agency and the Centre of Ecology & Hydrology Monks Wood has recommended a number of biological methods for measuring harm to terrestrial ecosystems. Assessing risks to ecological receptors from contaminants in soil is a requirement under Part IIA of the Environmental Protection Act 1990 and other regulations, such as the Habitats Directive.

Royal Commission on Environmental Pollution (2003)
Chemicals in Products: Safeguarding the Environment and Human Health. Twenty-fourth Report. Cm 5827

The Stationery Office, 307 pp
Web: http://www.rcep.org.uk/chemicals/ch00-rep.pdf.

The report focuses on chemicals used in products which can gradually find their way into the environment and people's bodies.

EA & Defra (2002)
Contaminants in Soils: Collation of Toxicological Data and Intake Values for Humans for Arsenic
Environment Aency
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/473303ca004946dc273fc0a802960602/ Product/View/STOX1&2DE&2DE

This document summarizes international approaches to deriving human health criteria values for arsenic. Human health criteria values and background intake data on arsenic are presented for use in deriving Soil Guideline Values.

EA & Defra (2003)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Benzene
Environment Agency, 29 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX11&2DE&2DE

This report provides details of the derivation of index doses for benzene and is for use by those concerned with the assessment of contaminated land. The report describes the compound and discusses toxicity, carcinogenicity, and genotoxicity. The derivation of the index doses and the intake of benzene from food, water, and air are reported.

EA & Defra (2002)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Benzo(a)pyrene
Environment Agency, 24 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX2&2DE&2DE

The aim of this report is to set out authoritative health criteria values for benzo(a)pyrene, which have been established through a review of the scientific literature and a subsequent peer-review process. The health criteria values presented herein will be used to derive Soil Guideline Values (SGVs) for benzo(a)pyrene.

EA & Defra (2002)
Contaminants in Soils: Collation of Toxicological Data and Intake Values for Humans for Cadmium
Environment Agency, 20 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX3&2DE&2DE

The aim is to derive an oral tolerable daily intake (TDI) and derive Soil Guideline Values (SGVs) for cadmium in soil that will pose no significant threat to health.

Toxicology Advice and Consulting (2005)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Carbon tetrachloride
Environment Agency, 23 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/&20SCHO0904BIEY&2DE&2DE

This document summarizes international approaches to deriving human health criteria values for carbon tetrachloride. Human health criteria values and background intake data are presented for use in deriving Soil Guideline Values.

EA & Defra (2002)
Contaminants in Soils: Collation of Toxicological Data and Intake Values for Humans for Chromium
Environment Agency, 20 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX4&2DE&2DE

The aim is to derive an oral tolerable daily intake (TDI) and an inhalation Index Dose, which in turn are needed to derive Soil Guideline Values (SGVs) for chromium, that is concentrations of chromium in soil that will pose no significant threat to health.

Toxicology Advice and Consulting (2004)
Contaminants in Soil: Collation of Toxicological data and Intake Values for Humans. 1,2-Dichloroethane
Environment Agency, 27 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002 cc6ba273fc0a802960686/Product/View/SCHO0804BICI&2DE&2DE

This document summarizes international approaches to deriving human health criteria values for 1,2-dichloroethane. Human health criteria values and background intake data on 1,2-dichloroethane are presented for use in deriving Soil Guideline Values.

EA & Defra (2003)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Dioxins, Furans and Dioxin-like PCBs
Environment Agency, 39 pp

Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX12&2DE&2DE

The toxicity, carcinogenicity, and genotoxicity of chlorinated dibenzo-p-dioxins and dibenzofurans and related PCBs are reviewed with the aim of deriving tolerable daily intakes (TDI) needed to derive Soil Guideline Values (SGV).

EA & Defra (1999)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Ethylbenzene
Environment Agency, 24 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX17&2DE&2DE

This publication details the derivation of health criteria values for ethylbenzene. The report has been written for technical professionals who are familiar with the risks posed by land contamination to human health but who are not necessarily experts in risk assessment. It is expected to be of use to all parties involved with or interested in contamination, but in particular to those concerned with the assessment of land contamination.

EA & Defra (2004)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Ethylbenzene
Environment Agency, 23 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX17-E-E#

The aim of this report is to set out authoritative health criteria values for ethylbenzene, which have been established through a review of the scientific literature and a subsequent peer-review process. The health criteria values presented herein will be used to derive Soil Guideline Values (SGVs) for ethylbenzene; these are concentrations of ethylbenzene in soil below which there will be no significant harm to human health.

EA & Defra (2002)
Contaminants in Soils: Collation of Toxicological Data and Intake Values for Humans for Inorganic Cyanide
Environment Agency, 20 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX5&2DE&2DE

The aim is to derive tolerable daily intakes (TDIs), which in turn are needed to derive Soil Guideline Values (SGVs) for inorganic cyanide, that is, concentrations of inorganic cyanide in soil that will pose no significant threat to health.

EA & Defra (2002)
Contaminants in Soils: Collation of Toxicological Data and Intake Values for Humans for Lead
Environment Agency, 20 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX6&2DE&2DE

The aim is to derive a blood lead concentration, which in turn is needed to derive Soil Guideline Values (SGVs) for lead, that is, concentrations of lead in soil that will pose no significant threat to health.

EA & Defra (2002)
Contaminants in Soils: Collation of Toxicological Data and Intake Values for Humans for Mercury
Environment Agency, 29 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX7&2DE&2DE

The aim is to derive oral tolerable daily intakes (TDIs), which in turn are needed to derive Soil Guideline Values (SGVs) for mercury, that is concentrations of mercury in soil that will pose no significant threat to health.

EA & Defra (2003)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Naphthalene
Environment Agency, 23 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX20&2DE&2DE

This document summarizes international approaches to deriving human health criteria values for naphthalene. Human health criteria values and background intake data on naphthalene are presented for use in deriving Soil Guideline Values.

EA & Defra (2002)
Contaminants in Soils; Collation of Toxicological Data and Intake Values for Humans for Nickel
Environment Agency
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX8&2DE&2DE

The aim is to derive an oral tolerable daily intake (TDI) and an inhalation Index Dose, which in turn are needed to derive Soil Guideline Values (SGVs) for nickel, that is, concentrations of nickel in soil that will pose no significant threat to health.

EA & Defra (2002)
Contaminants in Soils; Collation of Toxicological Data and Intake Values for Humans for Phenol
Environment Agency
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX9&2DE&2DE

The aim of this report is to set out authoritative health criteria values for phenol, which have been established through a review of the scientific literature and a subsequent peer-review process. The health criteria values presented herein will be used to derive Soil Guideline Values (SGVs) for phenol; these are concentrations of phenol in soil below which there will be no significant risk to human health.

EA & Defra (2002)
Contamination in Soils; Collation of Toxicological Data and Intake Values for Humans for Selenium
Environment Agency
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX10&2DE&2DE

This document summarizes international approaches to deriving human health criteria values for selenium. Human health criteria values and background intake data on selenium are presented for use in deriving Soil Guideline Values.

Toxicology Advice and Consulting (2004)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Trichloroethene
Environment Agency, 28 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/SCHO0904BIEZ&2DE&2DE

This document summarizes international approaches to deriving human health criteria values for trichloroethene. Human health criteria values and background intake data on trichloroethene are presented for use in deriving Soil Guideline Values.

EA & Defra (2004)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. 1,1,1-Trichloroethane
Environment Agency, 31 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX25-E-E

The aim of this report is to set out authoritative health criteria values for 1,1,1-trichloroethane, which have been established through a review of the scientific literature and a subsequent peer-review process. The health criteria values presented herein will be used to derive Soil Guideline Values (SGVs) for 1,1,1-trichloroethane.

EA & Defra (2004)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. 1,1,2,2- and 1,1,1,2-tetrachloroethane
Environment Agency, 25 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX16-E-E

The aim of this report is to set out authoritative health criteria values for tetrachloroethanes, which have been established through a review of the scientific literature and a subsequent peer-review process. The health criteria values presented herein will be used to derive Soil Guideline Values (SGVs) for tetrachloroethanes.

EA & Defra (2004)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Tetrachloroethene
Environment Agency, 34 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX23-E-E

The aim of this report is to set out authoritative health criteria values for tetrachloroethene, which have been established through a review of the scientific literature and a subsequent peer-review process. The health criteria values that are presented herein will be used to derive Soil Guideline Values (SGVs) for tetrachloroethene.

EA & Defra (2004)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Toluene
Environment Agency, 26 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX14&2DE&2DE

The document summarizes international approaches to deriving human health criteria values for toluene. Human health criteria values and background intake data on toluene are presented for use in deriving Soil Guideline Values.

EA & Defra (2004)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Vinyl Chloride
Environment Agency, 25 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/STOX18&2DE&2DE

The aim of this report is to set out authoritative health criteria values for vinyl chloride, which have been established through a review of the scientific literature and a subsequent peer-review process. The health criteria values presented herein will be used to derive Soil Guideline Values (SGVs) for vinyl chloride.

Toxicology Advice and Consulting (2004)
Contaminants in Soil: Collation of Toxicological Data and Intake Values for Humans. Xylene
Environment Agency, 28 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/SCHO0904BIFI&2DE&2DE

This document summarizes international approaches to deriving human health criteria values for xylene. Human health criteria values and background intake data on xylene are presented for use in deriving Soil Guideline Values.

Royal Commission on Environmental Pollution (2005)
Crop Spraying and the Health of Residents and Bystanders: Summary of the Royal Commission on Environmental Pollution's Report
The Stationery Office, 20 pp
Web: http://www.rcep.org.uk/chemicals/ch25-sum.pdf.

This report addresses a complex and controversial issue: the human health risks associated with the use of agricultural pesticides.

Boucard T (2006)
Environment Agency Workshop on Chronic Aquatic Ecotoxicity Testing of Human Pharmaceuticals
Environment Agency
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732e37e0215562c273fc0a802960644/Product/View/SCHO0506BKTJ&2DE&2DE#

The workshop aimed to establish a consensus on how and when to assess chronic impact through low-level exposure of pharmaceuticals in the aquatic environment. This report summarizes the main discussion points, the conclusions and the overall research needs and recommendations identified.

Leverett D (2006)
Guidance on the use of Direct Toxicity Assessment in PPC Impact Assessments
Environment Agency, 41 pp
Web: http://publications.environment-agency.gov.uk/epages/eapublications.storefront/4732ff27002cc6ba273fc0a802960686/Product/View/SCHO0106BKDP&2DE&2DE

This guidance gives advice on conducting DTA testing specifically for the purposes of meeting the requirements under the PPC Regulations.

Environment Agency (2006)

CHAPTER

107

Uruguay

A. NEGRIN, P. SCARABINO, V. COLLAZO, A. LABORDE, AND M. BURGER

INTRODUCTION

In our country, Toxicology finds its roots in 1975 when the Information and Assessment Toxicology Center (CIAT) was founded by the Faculty of Medicine of the Republic University.

It was created due to an increasing concern about potentially toxic chemicals and their impact on human health. Since Uruguay has an agriculture-based economy, pesticides were of particular concern.

Many Professors from the Emergency, Legal Medicine, and Internal Medicine Departments supported the development of the CIAT. Professor Eva Fogel was one of the pioneers and its first Professor Director. Eventually the poison center became the Toxicology Department and developed the post graduation program for Clinical Toxicology specialists in 1981.

The Uruguayan population is three million, so there is only one poison control center which offers its services to the community and health professionals all over the country. It is placed at the University Hospital, 'Hospital de Clinicas', and it works the whole year, 24 hours a day, giving information and assessment by the phone number 1722 . Selected antidotes in accordance with the local epidemiology are kept at the poison center, although many of them are available at the emergency rooms.

The CIAT also provides hospital-based assistance when required by the medical doctors from the hospital.

Consultation to the poison center continuously increased since 1976, from 1000 to 11 000 in 2006. As an example, Figure 107.1 shows the general distribution of consultation in 2005.

Other activities of the Toxicology Department and the poison center itself are the assistance of the hospitalized and ambulatory patients, medical school teaching and professional advice on areas such as occupational and environmental health, drug abuse, chemical risk assessment, and regulations.

Several activities of the CIAT are aimed at contributing with risk management on chemicals and participating in government commissions. In this frame the CIAT assists the Agriculture Ministry at national registration of agricultural pesticides.

The Toxicology Department has a library that offer on-site reading and copies to students and professionals.

The CIAT has participated in the INTOX Program development (INTOX Data Base and INTOX Poison Information System). This Program belongs to the

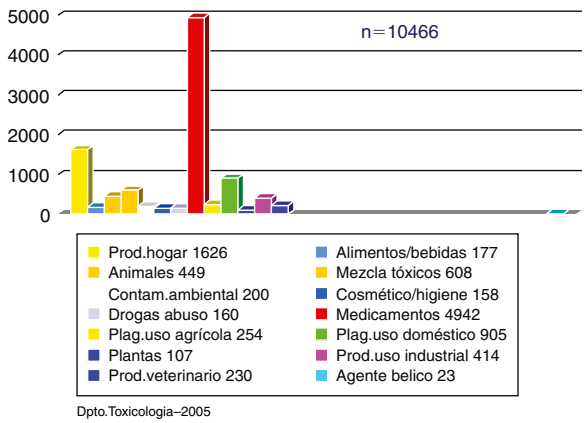

FIGURE 107.1

International Program on Chemical Safety (IPCS) of the World Health Organization (WHO) and was performed with the contribution of the Canadian Center on Occupational and Health Security (CCOHS).

The Specialization in Clinical Toxicology is a 3-year postgraduate course given by the Postgraduate School of the Faculty of Medicine. A 9-month course is given for Spanish-speaking foreign doctors; many Latin American toxicologists have been trained in Uruguay.

Venezuela

ARISLEIDA J. RODRÍGUEZ AND MAYLIN E. VELÁSQUEZ

TOXICOLOGY IN VENEZUELA

Forensic Toxicology in Venezuela could be said to have originated on May 7th, 1878 with the Medical-Forensic Code of Instructions Promulgation, which described in the Third Section of Title III, named Chemical Expertise, the standards for taking samples, conservation, and procedures to follow in cases of poisoning with homicidal intent.

Teaching at the Graduate Level

The first decree on teaching Clinical Toxicology relating to Venezuela Superior and Scientific Instruction, appeared in September 1883. This called for the study of Toxicology in Medical Schools where, for the first time, it was linked to Legal Medicine, and was offered as a single course in the sixth year of the program. Later, it was eliminated from the program of studies in compliance with decree 347 of October 6, 1945, promulgated by President Isaías Medina Angarita, when medical schools fell under a new regulation.

This situation continued until 1954, when Toxicology was incorporated, linked again to Legal Medicine, in the program of studies of Venezuela Central University School of Medicine (UCV), Zulia University (LUZ), Center-Westerly 'Lisandro Alvarado' University (UCLA), Easterly University (UDO), Andes University (ULA), and Carabobo University (UC).

In 1894 the first law of Pharmacy was promulgated, establishing in its article 6 that the faculties of Pharmacy should be responsible for teaching Toxicology. By 1912 the programs were oriented mainly to the properties and mechanisms of action of drugs. Years later, on July 24, 1940, under the government of General Eleazar López Contreras, the Education Law was promulgated by the Sovereign Republic Congress and countersigned by the Education Ministry; this brought meaningful changes in Pharmacy studies, among them the widening of Toxicology studies with an experimental basis and the establishment for the subject of the name Toxicology and Toxicological Expertise.

About 1960, the University Counsels were authorized to approve the Faculty Regulations according to the Universities Law of 1958, promulgated by the Government Executive Board. This law allowed the University Counsels to approve the creation of Mentions or Pre-specializations, so they approved and created, among others, the figures of Toxicology and Industrial Hygiene for the UCV Pharmacy Faculty and Toxicology for the ULA Pharmacy Faculty. These studies have evolved until now following the development of Toxicology as an integrated science.

Also, in the Schools of Bioanalysis, the studies of Toxicology were initiated in the UCV and ULA in October of 1966, followed by the Aragua Nucleus of the UC in 1970 and the Main Campus of the UC in 1976.

A Chair in Veterinary Toxicology was created for the first time in LUZ in 1975. This was followed by the UCLA in Barquisimeto, Lara State. At present, Toxicology is also taught in the UCV Veterinary Faculty.

At the School of Medicine 'Dr. Witremundo Torrealba' and since the founding of the Legal Medicine Chair in Aragua on November 3, 1978, a Toxicology Module, which includes four theoretical subjects and a practical module named Laboratory of

Toxicological Expertise, has been conducted. Included in the new program are studies of Clinical Toxicology in the Program of the Pharmacology Chair; this is also included in the Medical study program of the Carabobo nucleus but as an optional feature.

At present, other University careers such as Industrial Engineering and Agronomical Engineering have developed study subjects in conformance with Toxicology as an Integrated Science.

Teachings at the Postgraduate Level

The teachings of Clinical Toxicology in Venezuela have been the responsibility of a multidisciplinary team, including Dr. Manuel Arellano Parra as a pioneer with several teachers, pharmaceuticals, toxicologists and physicians as collaborators; among them we can mention Cristina Zombi from Valera, Rafael Angeli, Gladis Arias Delgado, Norath Arrieta Sánchez, Elva Luz Bermúdez, Héctor R. Campos, Luís LaCruz Ochoa, Diego Piña, Nelson Vicuña Fernández among others.

One-year specialization courses were initiated in 1973, being sponsored by national and international organizations related to Toxicology until the 1980s. By 1983 in Maracay Aragua State, by the initiative of Dr. Yelitza C. Reyes F., Pharmaceutical Toxicologist, Director of the Regional Toxicology Unit (UTR) in the Civil Hospital of Maracay, with the collaboration of CIATOX under the Direction of Dr. Vanesa de París and support from the Faculty of Pharmacy, a module of Clinical Pediatric Toxicology was proposed at the level of Pediatric Postgraduate Residence at Central Hospital of Maracay to be completed in the two first years of residence, and constituting the first toxicological studies at Hospital Postgraduate level with University support. It was offered only until 1988 due to lack of support from the Hospital Center administration.

In 1990, in Caracas, the 3-year Postgraduate Residence of Clinical Toxicology at the Hospital 'Leopoldo Manrique Terrero' was established, under the direction of Dr. Alfredo González Carrero, Physician Toxicologist. Unfortunately, this course, in spite of its superior program of studies at the Postgraduate level, does not receive University support.

In 1995, in the Toxicology Unit of Aragua State, a basic course of Clinical Toxicology was created, sponsored by the UC Medicine Faculty under the co-ordination of Dr. Yelitza C. Reyes and the support of Teaching Collaborators, Toxicologist Physicians, Toxicologist Pharmaceutics, Epidemiological Physicians and Pathologists; among them Betty Omaña, Carmen Rodríguez, Maria J. Yeguez S., Juanita Rojas de Carrasco, José Trujillo, Solanuela Mendoza, Ivonne Romero, Mireya Abreu and Carmela Martínez.

The main goal of this course was to offer basic tools to new graduate physicians from different schools, so they could attend toxicological accidents. It was designed with 180 theoretical and 100 experimental hours, the classes being imparted at the Maracay Central Hospital Emergency Services and the 'Leopoldo Manrique Terrero' Hospital with support from the Toxicology Service, by then with a duration of 6 months. The course was suspended in November 2003 due to budgetary constraints.

At the Barquisimeto hospital 'Dr. Antonio María Pineda' from Lara State, The Clinical Toxicological Postgraduate Program has the support of the UCLA and the Center Occidental Toxicological Center, which was initiated in 1978 with duration of 3 years of residence under the direction of Dr. Elva Luz Bermúdez, Toxicologist Pharmaceutical.

In 1980, the ULA Medicine Faculty initiated the 3-year Clinical Toxicology Postgraduate Program under the direction of Dr. Luis LaCruz, Toxicologist Physician.

In 1986, the UCV Pharmacy Faculty University Counsel approved as a postgraduate study the 3-year specialization in Analytic Toxicology, initiating its activities that year under the coordination of Dr. Gladis de Galiz, Toxicologist Pharmaceutical, and geared to pharmacy professionals.

By 1980, the UCV developed a Multidisciplinary Master Program directed by Dr. Gladis Carmona, Physician Toxicologist. This program was restructured in 1990, being split into two programs, one with the name of Clinical Toxicology under the direction of Dr. Carmona and the other as Analytical Toxicology, under the direction of Dr. Yoolitza Aular, Pharmaceutical Toxicologist, both of 2 years' duration. At present, the Clinical Toxicological Master Program is suspended.

Centers, Services and Toxicological Units

In chronologic order, we have:

- 1943, Toxicology Service of the Paraíso National Hippodrome, renamed in 1976 as Toxicology Direction of the Hippodrome National Institute a laboratory model and pioneer in equine anti-doping control. Founded by Dr. José Luis Andrade, this laboratory processes samples from animals of all the hippodromes of the country and cooperates with hippodromes from the Caribbean islands, Curacao and Aruba.
- 1946, Forensic Medicine Service of the Laboratory of Toxicological Expertise, it operated from January 10,

1946 until 1951. The services were performed in the UCV Pharmacy Faculty from 1951 until 1958 in a private laboratory under the direction of Dr. Alfredo Sandoval. In 1958, The Judicial Police Technical Body (CTP) was created, today called the Penal and Criminality Research Body, where the first laboratory of Toxicology was formed; its first Director was Dr. Fernando Azuaje, Pharmaceutical Toxicologist. At present, the Forensic Toxicologist Laboratory is annexed to the Legal Medicine Institute, with laboratories in almost all the country states. It is important to highlight the one created in 1965 by covenant with the UC in the 'Enrique Tejeras' Hospital of Valencia, Carabobo State, annexed to the Legal Medicine Cathedra and directed at the beginning by the Pharmaceutical Dr. Judith Chafardet.

- 1954, Industrial Toxicology Laboratory of the Venezuela Institute of Social Security (IVSS), its founder and first director was Pharmaceutical Dr. Pedro Rodriguez Muriño, and was located in the Hospital 'Pérez Carreño' known as the big neck of Caracas; also, two more laboratories existed in Valencia, Carabobo State and Maracaibo, Zulia State.
- 1960, Malaria Toxicological Clinical Studies Section, created for biological monitoring of workers.
- 1970, Medical Service of Malaria Sanitary Hygiene located in Maracay City, Aragua State. It oversaw health and agricultural aspects from the point of view of Toxicology in two main areas: Plaguecides Toxicology and Industrial Toxicology. This service was dissolved when the Malaria unit was restructured in 1997.
- 1971, Center of Information and Toxicological Advice CIATOX 'Dr. Julio C. Velasco' (actually SIMET) founded by Drs. Asdrúbal Lárez A. and Manuel Arellano Parra, located in the Pharmacy Faculty of Venezuela Central University, actually under the co-ordination of Dr. Daniela Pascualato, offers information services, advice and teaching. In 1986, this center was separated from the analysis section then named the Toxicological Analysis Service (SATOX). Currently, it is directed by Dr. Yvonne León in Caracas, Metropolitan District.
- 1972, Center of Toxicological Advice (CATOX) 'Dr. Jorge Lizarraga', actually named Toxicology Department CATOX, founded by Dr. Gladis Carmona, under the leadership of Dr. Isaura Moleiro de Ovalle. It is located at the city hospital 'Enrique Tejera' in Valencia Central Hospital. It offers information, advice, clinical appointments, toxicological analysis, and teaching.
- 1974, Center of General Intoxications, today Coche Toxicological Service, it functions in 'Dr. Leopoldo Manrique Terrero, Hospital, it was founded by Drs. Asdrúbal Lárez A. and Manuel Arellano Parra; in charge of the direction is Dr. Betty Omaña. This center supplies information, advice, ambulatory services, hospitalization, teaching and toxicological analysis services.
- 1974, The Advice Center 'Dr. Pablo Paredes' from the ULA Faculty of Pharmacy is reinstalled, it counts with a Toxicology Laboratory in the Andes University Hospital, being its founder Dr. Angel Garrido. Since 2000 it has had a Center of Drugs Information (CIMRA) directed by Dr. Alexis Morales.
- 1975, Regional Toxicology Unit Dr. Yelitza Coromoto Reyes Figuera, depending from the Health Corporation of Aragua State, founded and directed to the present day by Dr. Yelitza C. Reyes F. It is an Analysis Unit, but it has in its program an Advice and Information Modulus, Social Work for the Community, teaching and Investigation. The unit is part of a Health Program named 'Toxicology Programmatic Unit', tightly related to the Toxicological consultations from different Hospital Centers of the Corporation Net. Dr. Reyes F is the Regional Program Coordinator.
- 1977, Toxicological Center of the Center-Occidental Region 'Dr. Elba Luz Bermúdez' (CTRCO), founded by Dr. Omaira Bastida de Espinosa and directed by Dr. Elba Luz Bermúdez, it provides information, advice, ambulatory clinical consultations and, under hospitalization, teaching and toxicological analysis.
- 1978, Barinas Toxicological Center (FUNCETOXBA), founded by the current director Dr. Olga F. de Mazzei, it supplies information, advice, laboratory analysis and teaching.
- 1990, Carabobo University Toxicological Investigations Center (CITUC), founded by Dr. Maritza Rojas. Its present co-ordinator is Dr. Guido Esquillante. Initially, it was a Center of Advice, but it also has a Toxicological Analysis Section, also producing Scientific Investigation Studies.
- 1995, Chiquinquirá Toxicological Center (CETOXCHI), located in the 'Lady of Chiquinquirá' Hospital in Maracaibo, Zulia State, co-ordinated by Drs. Angélica Quiroz Durán and Víctor Núñez Pinto, the latter dedicated to offering advice and training to professionals, and health care and treatment of the hospitalized patient.

In Venezuela, the study of toxicology within Toxicological Centers has developed erratically, due in some measure to lack of governmental support and/or sponsorship from national universities.

Similarly, there is a dissociation between Clinical and Analytical Toxicology, thus impeding excellence

in training professionals and in the development of programs that permit a mutual strengthening of both subjects.

There is no Toxicologist's registry at the national level despite several independent efforts from interested people, this probably has occasioned a dispersion of these professionals' resources, which are definitely lost when they are forced to acquire other specialties to fulfill their economical sustenance.

It is expected, with great enthusiasm, that further technological and communication breakthroughs will give to Toxicology the relevance it deserves, allowing to it extend its field of action to other scenarios.

ORGANIZATIONS (GOVERNMENT)

Ministry of Popular Power for Sciences and Technologies

Oversees communications and information policy of the National Government Administration.
Address: Av. Universidad. Esquina El Chorro. Torre MCT
City: Caracas
State: Gran Caracas
Phone: (58-212)-2103401–10
Fax: (58212)-2103536
Web: http://www.mct.gob.ve/publico/home/home.php

National Fund of Science, Technology and Innovation (FONACIT)

To finance the execution of plans, programs, and projects defined by the MTC to stimulate scientific, technological, and innovative knowledge, in order to contribute to the social development of the country.
Email: conicit@conicit.gov.ve
Web: http://www.fonacit.gov.ve/

Regional Foundation for Science and Technology (FUNDACITES)

Contributing to the development of science, technology, and innovation by means of support to institutions and individuals.
Web: http://www.mct.gob.ve/publico/enlaces/adsc_enlaces.php?tipo=1

Venezuelan Institute of Scientific Investigations (IVIC)

Its mission is to generate new knowledge through scientific investigation, technological development, and the formation of high-level resources.
Web: http://www.ivic.ve

Ministry of Popular Power for the Environment

This Ministry guarantees the rational use of the natural resources by means of a systemic administration and improvement in environment and quality of life.
Address: Centro de Documentación y Divulgación Ambiental, local 23, torre sur, Centro Simón Bolívar, nivel Plaza Caracas, El Silencio
City: Caracas
State: Gran Caracas
Phone: (58-212)408-20-96/20-86
Email: cedodia@marn.gov.ve
Web: http://www.marn.gov.ve

Ministry of Popular Power for the Health

Focused on strengthening the country's sovereignty and spurring research investigations and technological innovations for health and public health management.
Address: Av. Baralt, Centro Simón Bolívar, Edif. Sur, El Silencio
City: Caracas
State: Gran Caracas
Phone: (58-212)-4080000
Email: msds@msds.gov.ve
Web: http://www.mpps.gob.ve

Annexed Organisms
Autonomic Institute of Caracas University Hospital (HUC)

Its goal is to create, develop, and apply integrated health processes of the highest qualities, by means of prevention, assistance, research, and teaching activities; with the objective of attending patients, relatives, and institutions that request health services from the Medical Faculty and students of the Venezuela central University.
Address: Urbanización Parque Central. Ciudad Universitaria
City: Caracas
State: Gran Caracas
Phone: (58-212)-6617111/6617211
Email: huc@reacciun.ve
Web: www.huc.gov.ve

Autonomic Service Institute of Superior Studies 'Dr. Arnoldo Gabaldon' (IAESP)

The main goal of the Institute is contributing to the consolidation of a multidisciplinary team, of high technical and scientific capability, capable of responding to priorities in the social and health environment, according to the new directions in education, science, and technology, both at the national and the international levels.
Address: Av. Bermúdez Sur, Apartado
City: Maracay
State: Aragua
Phone: (58-243)-2325633/2320833
Ffax: (58-243)-2326933
Web: http://www.iaesp.edu.ve/

Biomedicine Institute

Directed to research and control of diverse endemic diseases from the perspective of integrated attention

to health, operational and socio-epidemiologic research, together with the development of human resources both in the University academic area as well as in programs and services.

Address: San Nicolás a Providencia, Parroquia San José
City: Caracas
State: Gran Caracas
Phone: (58-212)-8604630
Fax: (58-212)-8604636

José Félix Ribas Foundation

Its mission focuses on prevention, treatment, rehabilitation, and scientific investigation on the use and abuse of psychotropic and stupefacient substances; the administration and maintenance of Therapeutics Communities, Centers of Ambulatory Attention and the Centers of Preventive Integrated Education (CEPI).
Address: Esq. Jesuita, Torre Bandagros, Piso 5
City: Caracas
State: Gran Caracas
Phone: (58-212)-8619304/8616862
Email: funfr@reacciun.ve

National Institute of Hygiene 'Dr. RAFAEL RANGEL'

National Sanitary Reference Center for prevention and surveillance; supports the Ministry of Health and Social Development to fulfill the health politics of the Venezuelan state.
Address: Urbanización Parque Central. Ciudad Universitaria
City: Caracas
State: Gran Caracas
Phone: (58-212)-6624797/6932421
Web: http://www.msds.gov.ve/msd/modules.php?name=Content&pa=showpage&pid=58

Annexed Service
Autonomic Service of Pharmaceutical Products (SERFA-SUMED)

A servide of the Venezuelan State Institution, concerned with the production and supply of Medicines for the National Public Health System. It is in the control of and supported by the Ministry of Health and Social Development and its activities correspond to the alignment with the National Health Politics.
Address: Km. 0. Carretera Vieja Los Teques. Sector Las Adjuntas, Parroquia Macarao
City: Caracas
State: Distrito Capital
Phone: (58-212)-4339941/4339742
Email: contacto@sefar.gob.ve
Web: http://www.sefar.gob.ve/

Ministry of Popular Power for the Land and the Agriculture

Concerned with food safety, boosting agricultural development, and the just distribution of land.
Address: Av. Urdaneta entre esquina Platanal a Candilito a media cuadra de la Plaza La Candelaria, Parroquia La Candelaria
City: Caracas
State: Gran Caracas
Phone: (58-212)-5432050 (office attention for the worker farm)
Web: http://www.mat.gob.ve

Agricultural Sanitation Autonomic Service (SASA)

SASA guarantees the quality of agricultural products by means of the integrated development of sanitary programs to cover the needs of the production and agricultural sectors by way of modern technologies.

Address: Avenida Lecuna, Torre Este, Piso 12, Parque Central, El Conde
City: Caracas
State: Gran Caracas
Phone: (58-212)-5090379/5090240/5090247/5090378/5090499/5090595/5090597
SASA on line: (58-212)-5090211
Fax: (58-212)-5090376/5731756
Web: www.sasa.gob.ve

Ministry of Popular Power for the Work and Social Security

Its main function is to promote employment, dignified work and protection of human rights for both men and women, the development of a solid social system, and enhancing labor relations for all workers.
Address: Centro Simón Bolívar, Edificio Sur, Piso 5, Plaza Caracas, El Silencio
City: Caracas
State: Gran Caracas
Phone: (58-243)-4084200 (Master)
On line: 0800-8722256
Web: http://www.mintra.gov.ve

National Institute of Health and Labor Security

An Institute concerned with health promotion, disease prevention, and attention to health and labor security, and guaranteeing optimal working conditions and worker rights.
On line: 0800-46772735
Web: http://www.inpsasel.gov.ve/

Workers Center of Health Studies (CEST)

A center of Investigation from the University of Carabobo, focused in the study of workers' health

problems. It is part of the Investigative Direction of the School of Medicine 'Dr. J. Witremundo Torrealba' of the Aragua Nucleus of the above-mentioned University. Its main goal is to provide answers to occupational health and safety questions. The symbol CEST corresponds to the Spanish: Centro de Estudios en Salud de los Trabajadores.
Address: El Centro de Estudios en Salud de los Trabajadores (CEST) esta ubicado en el Instituto de Altos Estudios de Salud Pública 'Dr. Arnoldo Gabaldon', Av. Bermúdez Sur.
City: Maracay
State: Aragua
Phone: (58-243)-2321001
Fax: (58-243)-2324566
Email: cest@telcel.net.ve
Web: http://cest.fundacite.arg.gov.ve/

ORGANIZATIONS (NON-GOVERNMENTAL)

Association for the Environment and Natural Defense

Contributing to improve the quality of life of communities by promoting the integrated handling of solid waste, through education and discussion.
Address: Av. Francisco de Miranda, Torre La Primera, Piso 15, Espacios de entrenamiento de la USB, Campo Alegre
City: Caracas
State: Gran Caracas
Fax: (58-212)-9527450
Email: adan@adan.org.ve
Web: www.adan.org.ve

ECOCICLA Foundation

Its mission is to create an environmental conscience in communities, to implement municipal systems of integrated management of residues and solid wastes, according to the policies of ambient quality improvement.
Address: Av. Universidad. Talleres del CCEAS
City: Naguanagua – Valencia
State: Carabobo
Phone: (58-241)-8600110
Fax: (58-241)-8671201
Email: ecocicla@cantv.net
Web: www.fundacite.arg.gov.ve

Guayana Ecological Research Center

javascript:changeWindow('http://www.uneg.edu.ve')Its main concern is to renew and optimize the lines of investigation through postgraduate programs in Guayana.
Address: Experimental National University of Guayana – Headquarters Chilemex. General Coordination of Investigation and Postgraduate. Guayana Ecological Research Center. Chilemex Urbanization, Chile Street. Universidad Nacional Experimental de Guayana – Sede Chilemex. Coordinación General de Investigación y Postgrado. Centro de Investigaciones Ecológicas de Guayana (CIEG). Urbanización Chilemex, Calle Chile.
City: Puerto Ordaz – Ciudad Guayana
State: Bolívar
Phone: (58-286)-9240192
Fax: (58-286)-9234786
Email: cieg@uneg.edu.ve
Co-ordinator: Dr. Glenda Rodríguez
Email: grodriguez@uneg.edu.ve
Assistant: Hernán Castellano
Email: hcastell@uneg.edu.ve
Web: www.uneg.edu.ve (Link Organización – Link Estructura Organizativa – Link Vice-Rectorado Académico: Centros de Investigación) Centro de Investigaciones Ecológicas de Guayana (CIEG))

Marine Life Venezuelan Ecological Society 'Sea Vida'

Association dedicated to the investigation and conservation of sea wildlife and its habitat, and ecotourism oriented to sea mammals (dolphins and whales).
Address: Urbanización Blandín, Edif. Santa Teresa, apto 1-C
City: Maracay
State: Aragua
Phone: (58-244)-3958477
Email: seavida@yahoo.es

Specialists Association in Emergency Controls with Dangerous Materials (AsoHazMat)

Address: Av. 3Y entre calles 82 y 83 C.C. Los Pirineos Local 20
City: Maracaibo
State: Zulia
Email: Asohazmat@cantv.net, Asohazmat1@cantv.net, Asohazmat2@cantv.net
Phone: (58-261)-7920160
Fax: (58-261)-7920029
Web: www.asohazmat.com

Venezuela Ambient Foundation

Address: Centro Comercial Omnicentrol, Av. Universidad, Talleres del CCEAS
City: Naguanagua – Valencia
State: Carabobo
Phone: (58-241)-8600110
Fax: (58-241)-8671201
Email: ecocicla@cantv.net
Web: www.fundacite.arg.gov.ve

Venezuela System of Integrated Toxicology (SIVEINTOX)

Its principal objective is the invigoration and the normalization of the toxicological activity of the country in all its areas, national and international scientific exchange, and harmonization of protocols in handling of case reports and laboratory techniques.
Address: Unidad de Toxicología Regional 'Dr. Yelitza Coromoto Reyes Figuera'
City: Maracay
State: Aragua
Director: Dra. Yelitza C. Reyes F
Phone: (58-416)-6437342
Email: ycrfut@cantv.net

Information Service of Medicines and Toxics

Scientific and technical support to optimize the Drugs Therapy Act and handle the poisoned patient. Provides information to citizens on the use and drugs and the prevention of poisoning. The SIMET fulfill their activities through the Information Center of Medications (CEDIMED) and the Information Center and Assortment Toxicological (CIATO).

Coordinator: Fcta: Daniela Pasqualatto
Phone: (58-212)-6052686/6052732
Email: Simet@camelot.rect.ucv.ve

Toxicological Analysis Service

A unit oriented towards the toxicological analysis of biological and non biological samples, identification and quantification of agents, metabolites, alteration of biochemical parameters and others, with the objective of giving the analytical support required for the diagnosis, treatment and control of intoxication cases.

APPENDIX

I

Toxicology Data and Information Management

STEPHANIE HOLMGREN

ACKNOWLEDGMENT

A portion of this material is based on the previous 3rd edition written by Frederick W. Stoss and Philip Wexler.

Information is a source of learning. But unless it is organized, processed, and available to the right people in a format for decision making, it is a burden, not a benefit.

(C. William Pollard, *The Soul of the Firm*)

Knowledge is of two kinds: we know a subject ourselves, or we know where we can find information upon it

(Samuel Johnson, in James Boswell's *Life of Johnson*)

As the number of toxicology-related print (books, technical reports, etc.) and electronic resources (databases, computational tools, etc.) has grown, so too has the amount of literature describing these resources. This literature allows research scientists, policy makers, journalists, librarians, and other practitioners to keep pace with the latest developments and trends in the rapidly evolving field of toxicology.

What factors are behind the phenomenal growth in toxicology and environmental health resources? One of the primary driving forces has been and continues to be federal, state, and local legislative and regulatory initiatives. Environmental health and safety rules, worker and community right-to-know laws, and emergency planning and response programs mandate industry, research institutions, and the government to fully disclose and freely disseminate toxicology data and information. For example, the Toxic Substances List, the forerunner of the Registry of Toxic Effects of Chemical Substances (RTECS), was an outcome of the 1970 Occupational Safety and Health Act's call for 'a list of all known toxic substances by generic family or other useful grouping, and the concentrations at which such toxicity is known to occur.' (Section 20(a) (6)). Numerous other government initiatives and resulting regulations; such as The Toxic Substances Control Act (1976), Consumer Product Safety Act (1972), and the Safe Drinking Water Act (1977), are responsible for many of the private and public information systems available today.

The general public has also contributed to the demand for and supply of toxicology and environmental health information. As more information has become available in recent years, citizens have adopted a more pro-active 'local stakeholder' role. Increased citizen understanding of the issues has allowed them to collaborate with government, industry, and other interested parties to influence policy, make decisions, and implement community solutions. Furthermore, non-profit and grassroots groups, such as the Right to Know Network and the Children's Environmental Health Coalition, are not only users of information, but have missions to provide information as well.

Advances in computing technology have laid the foundation to meet the above demands for toxicology information. Faster computing speeds, larger storage capacity, data information systems, and telecommunication networks have provided the wherewithal for government, industry, and academia to make leaps not only in discovering new knowledge, but gains in effectively, efficiently,

and equitably making this information available to the public. Ironically, it is the unprecedented pace and breadth of information dissemination that makes staying current even more of a challenge in the Internet age.

The application of microarrays, high-throughput, and 'in silico' testing methods, is generating an extraordinary mass of data. As a result, data management systems have been challenged to cope with storing, organizing, and retrieving this extensive quantity of data. Taxonomies, standards, and data quality measures are playing a critical role in creating more effective data management systems. This is especially important because, increasingly, data sets from different disciplines are being integrated to discover new patterns or insights. For example, TOXMAP overlays geospatial maps, demographic and health data, with information from the Toxic Release Inventory and Superfund sites (National Library of Medicine). In addition, as more original research data are being made available online for other investigators to use, it becomes important that they can incorporate diverse data files into their existing systems.

Converting the data to knowledge has required substantial progress in computational tools, data and text mining applications, biostatistics, and informatics to extract meaning from the data. The resulting discoveries improve our understanding of the body's biological mechanisms and enhance our ability to better assess toxic exposure and risk.

PERIODICALS

Practical information about the development of new, or enhancements to existing, databases and information resources can be found in many periodicals. Some publications now provide dedicated coverage (similar to the book review sections) to electronic and online data and information resources. The following is a select list of trade magazines, scholarly journals, and newsletters that frequently monitor information and data management tools for toxicology and environmental health information.

Information Science Journals

CD-ROM (Online, Inc., Weston, CT)

Database (Online, Inc., Weston, CT)

ERMD News (Special Libraries Association, Environment & Resource Management Division, Washington, DC)

Online (Online, Inc., Weston, CT)

Online Information Review (Emerald Group Publishing, West Yorkshire, England)

Sci-Tech News (Special Libraries Association, Science and Technology Division, Washington, DC)

Searcher (Information Today, Medford, NJ)

Scholarly Journals/Trade Publications

Chemical & Engineering News (American Chemical Society, Washington, DC)

Chemical Health and Safety (American Chemical Society, Washington, DC)

Clinical Toxicology (Taylor and Francis, Oxfordshire, England)

Environmental Health Perspectives (National Institute of Environmental Health Sciences, Research Triangle Park, NC)

Environmental Manager (Air and Waste Management Association, Pittsburgh, PA)

Environmental Progress (American Institute of Chemical Engineers, New York)

Environmental Science and Technology (American Chemical Society, Washington, DC)

Journal of Analytical Toxicology (Preston Publications, Niles, IL)

Journal of Chemical Information and Modeling (American Chemical Society, Washington, DC)

Journal of Environmental Health (National Environmental Health Association, Denver, CO)

Occupational Hazards (Penton Media, Cleveland, OH)

Occupational Health and Safety (1105 Media, Chatsworth, CA)

Pollution Engineering (BNP Media, Troy, MI)

Public Health Reports (Association of Schools of Public Health, Washington, DC)

Toxicological Sciences (Oxford University Press, Oxford, England)

Toxicology (Elsevier, Shannon, Ireland)

DATABASES

Several online bibliographic databases are also quite useful for retrieving relevant resources on information and data management for toxicology and environmental health.

BIBLIOGRAPHY

The computing advances noted earlier have led to an abundance of web-based information resources and tools. Given the dynamic nature of these online resources, this bibliography only includes references from 2000 to the present. The reader will notice that many of the same subjects related to occupational health, clinical toxicology, and hazardous substances are still well covered in the literature. In addition, new themes have emerged such as biological agents, 'omics,' and informatics applications in toxicology. Related to these new themes is the emphasis in the literature on describing the development and design of specific databases or integrated applications. Finally, another trend reflected in the bibliography is that the development of these resources is a global phenomenon.

The remainder of the chapter is divided into four sections. Section one lists those print articles or books that highlight useful toxicology-related information resources. The selected resources range from print (books, periodicals, government documents, technical reports, etc.) and electronic materials (databases, websites, CD-ROMs, etc.) to government (agencies, laws and regulations, etc.) and professional resources (associations, conferences, listservs, etc.).

Within the past 10 years, more and more of the above types of resources have become available online. As a result, the print guides themselves have moved to a web-based format to take advantage of the interactive nature of the Internet. Section two will feature a representative sample of these online guides.

The third section covers articles that describe the development and application of specific databases or information systems. The abundance of these articles truly reflects how essential computing technology, computational biology, and informatics are to expanding the toxicology knowledge base.

Finally, the last section includes articles that explore issues surrounding the development, use, and management of toxicology information systems. Taxonomy development, data quality, interoperability, standards, and open access are among the issues that need to be addressed to ensure effective, efficient, and equitable access to the information.

PRINT GUIDES TO TOXICOLOGY-RELATED RESOURCES

These print publications describe an array of toxicology, chemical, environmental health, and occupational health resources, predominantly online. The multidisciplinary nature of toxicology has resulted in each subject area identifying those resources and tools that uniquely serve its own community's needs.

ONLINE GUIDES TO TOXICOLOGY-RELATED RESOURCES

As previously discussed, most information resources and tools are now available online. Several university academic libraries and professional societies have adopted the role of compilers of 'subject guides' or 'links' pages to these web-based toxicology-related resources. Since these online guides may be as ephemeral as the resources they list, only a handful has been included in this second section. The websites below were selected for comprehensiveness of coverage, authority, currency, and predominance of web-based resources. In addition, only those sites that focused specifically on toxicology were included. Given the multidisciplinary nature of toxicology, a comprehensive list would also need to include occupational health, biochemistry, genetics, and other related fields.

TOXICOLOGY-RELATED DATABASES AND INFORMATION SYSTEMS

The combination of computing technology, informatics, and biostatistics has forged powerful analytical tools for toxicology researchers. These tools have led to unparalleled advances in knowledge as well as opened new areas of inquiry heretofore unable to be explored. They have become essential for capturing, managing, organizing, integrating, mining, and analyzing the flow of data and textual information generated in toxicology and environmental health research.

Numerous articles delve into the opportunities and challenges of developing, managing, and utilizing these information systems. The purpose of these computer-based applications can range from managing experimental data and tracking chemical exposures to integrating multiple databanks and assessing drug safety. A recent trend is on harnessing computational power to conduct predictive toxicology. As this in silico or 'within a computer-simulated environment' method proves its validity and reliability, more of these tools will continue to be added to the researchers' array of resources. While many of these databases and information systems are intended for toxicologists, several are geared towards the general public, policy makers, and health professionals.

ISSUES SURROUNDING TOXICOLOGY INFORMATION SYSTEMS

While previous sections have focused on specific resources, online tools, and information systems, these articles explore cross-cutting topics associated with these resources. Among some of the issues covered include:

- information seeking behavior and guidelines for effective searching
- new applications or uses for an existing information system
- integration and interoperability of systems
- data collection and quality
- standards for data and database design
- extraction of meaningful information from the data through informatics and text/data mining.

Glossary of terms used in Toxicology, 2nd edition

(IUPAC Recommendations 2007)

Abstract: This glossary, a revision of the IUPAC "Glossary for Chemists of Terms Used in Toxicology" [*Pure Appl. Chem.* **65**, 2003 (1993)] incorporating new and redefined terms from the "Glossary of Terms Used in Toxicokinetics" [*Pure Appl. Chem.* **76**, 1033 (2004)], contains definitions and explanatory notes, if needed, for terms frequently used in the multidisciplinary field of toxicology. The glossary is compiled primarily for those scientists and others who now find themselves working in toxicology or requiring a knowledge of the subject, especially for hazard and risk assessment. Many medical terms are included because of their frequent occurrence in the toxicological literature. There are three annexes, one containing a list of abbreviations and acronyms used in toxicology, one containing a list of abbreviations and acronyms used by international bodies and by legislation relevant to toxicology and chemical safety, and one describing the classification of carcinogenicity according to the weight of evidence available.

Keywords: toxicology; toxicokinetics; risk assessment; hazard assessment; carcinogenicity; IUPAC Chemistry and Human Health Division.

Note: Terms for which no primary source is given have been taken verbatim from the original IUPAC "Glossary for Chemists of Terms Used in Toxicology" [1] or have been newly defined by the compilers of this paper. New or redefined terms in the "Glossary of Terms Used in Toxicokinetics" are currently referenced as in that glossary [2]. Other terms that are quoted verbatim from their sources are referenced individually. For other chemical terminology, the reader is referred to the on-line version of *Compendium of Chemical Terminology* (the "Gold Book") [3].

CONTENTS

PREFACE

IUPAC aims to promote world-wide "regulation, standardization, or codification" in relevant areas of chemistry. In 1993, the importance of toxicology to chemists was recognized by the publication in *Pure and Applied Chemistry* (*PAC*) of the "Glossary for Chemists of Terms Used in Toxicology" [1]. This glossary has been widely accepted and used, but, inevitably, with the continuing development of both chemistry and toxicology, terms have changed their meanings as a result of altered usage and new terms have been coined. Further, some important terms were overlooked, notably those relating to toxicokinetics, and a supplementary glossary has already been published in *PAC* [2]. The revised and extended glossary presented here includes all new terms identified as relevant by the Working Party, together with those in toxicokinetics previously omitted. As before, the glossary is compiled primarily for chemists who now find themselves working in toxicology or requiring a knowledge of the subject. However, there are also many other scientists as well as regulators and managers who have to interpret toxicological information and need ready access to internationally accepted definitions of relevant terms in common use. In order to make this a convenient one-stop glossary, the terms included in this glossary have come from a wide range of disciplines which contribute to toxicology. For some of the entries, alternative definitions are given in order to display the significant differences in the use that occur in practice. We are grateful to all those whose names are listed below who have contributed to this glossary with constructive criticism and who have suggested modifications for its improvement. Their contributions have been invaluable. The Working Group is responsible for any remaining flaws, but we hope that the final version will be sufficiently close to achieving the original objectives to justify the very widespread support that we have received.

ACKNOWLEDGMENTS

For their valuable comments and suggestions for improvements, the authors are very grateful to the following contributors to this glossary: Ole Andersen, Rick Becker, Joseph Borzelleca, Rita Cornelis, John Fowler, Philippe Grandjean, Birger Heinzow, Jane Huggins, Paul Illing, Marek Jakubowski, József Nyitrai, Stephanie Publicker, Mike Schwenck, Ron Shank, Wayne Temple, Philip Wexler, Howard Worth, and Paul Wright.

ALPHABETICAL ENTRIES

abiological See *abiotic*.

abiotic abiological Not associated with living organisms.

abiotic degradation Process in which a substance is converted to simpler products by physical or chemical mechanisms: examples include *hydrolysis* and *photolysis*.

abiotic transformation Process in which a substance in the environment is modified by nonbiological mechanisms.

abortifacient Substance that causes pregnancy to end prematurely and causes an abortion.

absolute lethal concentration (LC_{100}) Lowest *concentration* of a substance in an environmental medium which kills 100% of test organisms or species under defined conditions.

Note: This value is dependent on the number of organisms used in its assessment.

absolute lethal dose (LD_{100}) Lowest amount of a substance that kills 100% of test animals under defined conditions.

Note: This value is dependent on the number of organisms used in its assessment.

absorbance, *A* Logarithm of the ratio of incident to transmitted *radiant power* through a sample (excluding the effects of sample cell walls). Depending on the base of the logarithm, decadic and Napierian absorbances are used. Symbols: A, A_{10}, A_e. This quantity is sometimes called extinction, although the term "extinction", better called *attenuance*, is reserved for the quantity which takes into account the effects of luminescence and scattering as well.
Corrected from [3]

Note: When natural logarithms are used, the Napierian absorbance is the logarithm to the base e of the incident *spectral radiant power*, essentially monochromatic, divided by the transmitted spectral radiant power, P_λ.

absorbed dose (of a substance) internal dose. Amount (of a substance) taken up by an organism or into organs or tissues of interest.
See *absorption, systemic*.

absorbed dose (of ionizing radiation), *D* Energy imparted by ionizing radiation to a specified volume of matter divided by the mass of that volume.

absorptance (in chemistry), α. Ratio of the absorbed to the incident radiant power. Also called *absorption factor*. When $\alpha \leq 1$, $\alpha \approx A_e$, where A_e is the Napierian absorbance.
[3]
See also *absorbance*.

absorption (general)
1. Process of one material (absorbate) being retained by another (absorbent).

Note: The process may be the physical solution of a gas, liquid, or solid in a liquid; attachment of molecules of a gas, vapor, liquid; or dissolved substance to a solid surface by physical forces, etc.

2. Transfer of some or all of the energy of radiation to matter which it traverses.

Note: Absorption of light at bands of characteristic wavelengths is used as an analytical method in spectrophotometry to identify the chemical nature of molecules, atoms, or ions and to measure the concentrations of these species.

Corrected from [3]

absorption (in biology) uptake Penetration of a substance into an organism and its cells by various processes, some specialized, some involving expenditure of energy (active transport), some involving a *carrier* system, and others involving passive movement down an electrochemical gradient.

Note: In mammals, *absorption* is usually through the respiratory tract, gastrointestinal tract, or skin into the circulatory system and from the circulation into organs, tissues, and cells.

[2]

absorption (of radiation) Phenomenon in which radiation transfers some or all of its energy to matter which it traverses.
[3]

absorption, systemic *Uptake* to the blood and transport via the blood of a substance to an organ or *compartment* in the body distant from the site of *absorption*.
[2]

absorption coefficient (in biology) absorption factor Ratio of the absorbed quantity (*uptake*) of a substance to the administered quantity (intake).

Note: For *exposure* by way of the respiratory tract, the absorption coefficient is the ratio of the absorbed amount to the amount of the substance (usually particles) deposited (adsorbed) in the lungs.

absorption factor See *absorptance* (in chemistry), *absorption coefficient* (in biology).

abuse (of drugs, substances, solvents, etc.) Improper use of drugs or other substances.

acaricide Substance intended to kill mites, ticks, or other Acaridae.

acceptable daily intake (ADI) Estimate by JECFA of the amount of a food additive, expressed on a body weight basis that can be ingested daily over a lifetime without appreciable health *risk*.

Note 1: For calculation of ADI, a standard body mass of 60 kg is used

Note 2: *Tolerable daily intake* (TDI) is the analogous term used for contaminants.

[2]

acceptable daily intake (ADI) **not allocated** See *no acceptable daily intake allocated*.

acceptable residue level of an antibiotic Acceptable *concentration* of a residue that has been established for an antibiotic found in human or animal foods.

acceptable risk Probability of suffering disease or injury that is considered to be sufficiently small to be 'negligible'.

Note: Calculated risk of an increase of one case in a million people per year for cancer is usually considered to be negligible.

accepted risk Probability of suffering disease or injury that is accepted by an individual.

accidental exposure Unintended contact with a substance or change in the physical environment (including, e.g., radiation) resulting from an accident.

acclimatization, biological

1. Processes, including selection and adaptation, by which a population of microorganisms develops the ability to degrade a substance, or develops a tolerance to it.
2. In animal tests, allowing an animal to adjust to its environment prior to undertaking a study.

accumulation (in biology) See *bioaccumulation*.

accuracy Quantity referring to the differences between the mean of a set of results or an individual result and the value which is accepted as the true or correct value for the quantity measured.

acid dissociation constant, K_a Equilibrium constant for the following reaction of an acid HB:

$$HB(aq) \rightleftharpoons H^+(aq) + B^-(aq)$$

$$K_a = [H^+][B^-] / [HB]c^o$$

where $c^o = 1\,\text{mol dm}^{-3}$ is the standard amount concentration and activity coefficients have been neglected.

Note 1: This constant, because activity coefficients are neglected, is valid at a specified ionic strength. The thermodynamic dissociation constant is found by suitable extrapolation of the conditional constant to zero ionic strength. Note that it is defined as a dimensionless quantity, but sometimes it is given dimensions by omitting the standard amount concentration.

Note 2: Because this constant differs for each acid and varies over many degrees of magnitude, the acidity constant is often represented by the additive inverse of its common logarithm, represented by the symbol pK_a (using the same mathematical relationship as $[H^+]$ is to pH), viz.:

$$pK_a = -\log_{10} K_a$$

In general, a larger value of K_a (or a smaller value of pK_a) indicates a stronger acid, since the extent of dissociation is larger at the same concentration.

[4]

acidosis Antonym: *alkalosis* Pathological condition in which the hydrogen(1+) (hydron) amount concentration of body fluids is above normal and hence the pH of blood falls below the reference interval.

action level

1. *Concentration* of a substance in air, soil, water, or other defined medium at which specified emergency counter-measures, such as the seizure and destruction of contaminated materials, evacuation of the local population or closing down the sources of pollution, are to be taken.
2. Concentration of a pollutant in air, soil, water, or other defined medium at which some kind of preventive action (not necessarily of an emergency nature) is to be taken.

activation (abiotic) *Conversion* of a *xenobiotic* to a more *toxic* derivative by modification not involving biological catalysis.

activation (in biology) See *bioactivation*.

active ingredient Component of a mixture responsible for the biological effects of the mixture. Compare *inert ingredient*.

active metabolite *Metabolite* causing biological and (or) toxicological effects.

After [2]

See *metabolite*.

active transport Movement of a substance across a cell membrane against an electrochemical gradient, in the direction opposite to normal diffusion and requiring the expenditure of energy.

acute Antonym: *chronic*

1. Of short duration, in relation to *exposure* or effect; the effect usually shows a rapid onset.

   Note: In regulatory *toxicology*, 'acute' refers to studies where dosing is either single or limited to one day although the total study duration may extend to two weeks to permit appearance of toxicity in susceptible organ systems.

2. In clinical medicine, sudden and severe, having a rapid onset.

After [2]

acute effect Effect of finite duration occurring rapidly (usually in the first 24 h or up to 14 d) following a single *dose* or short *exposure* to a substance or radiation.

Note: Acute effects may occur continuously following continuous dosing or repeatedly following repeated dosing.

After [2]

acute exposure Antonym: *chronic exposure*
Exposure of short duration.
[2]
See *acute*, *exposure*.

acute toxicity Antonym: *chronic toxicity*

1. *Adverse effects* of finite duration occurring within a short time (up to 14 d) after administration of a single *dose* (or *exposure* to a given *concentration*) of a test substance or after multiple doses (exposures), usually within 24 h of a starting point (which may be exposure to the *toxicant*, or loss of reserve capacity, or developmental change, etc.).
2. Ability of a substance to cause *adverse effects* within a short time of dosing or *exposure*.

[2]

acute toxicity test short-term toxicity test Antonym: *chronic toxicity test* Study in which organisms are observed during only a short part of the life span and in which there is often only a single *exposure* to the test agent at the beginning of the study.

adaptation

1. Change in an organism, in response to changing conditions of the environment (specifically chemical), which takes place without any irreversible disruptions of the given biological system and without exceeding normal (homeostatic) capacities of its response.
2. Process by which an organism stabilizes its physiological condition after an environmental change.

   Note: If this process exceeds the homeostatic range, it becomes pathological and results in symptoms of disease (*adverse effects*).

added risk Difference between the *incidence* of an *adverse effect* in a treated group (of organisms or a group of *exposed* humans) and a control group (of the same organisms or the spontaneous incidence in humans).

addiction Surrender and devotion to the regular use of a medicinal or pleasurable substance for the sake of relief, comfort, stimulation, or exhilaration which it affords; often with craving when the drug is absent.

additive effect Consequence that follows *exposure* to two or more physicochemical agents which act jointly but do not interact: The total effect is the simple sum of the effects of separate exposures to the agents under the same conditions.
[2]

adduct New chemical species AB, each molecular entity of which is formed by direct combination of two separate molecular entities A and B in such a way that there is change in connectivity, but no loss, of atoms within the moieties A and B.

Note 1: Stoichiometries other than 1:1 are also possible, for example, a bis-adduct (2:1). An 'intramolecular adduct' can be formed when A and B are groups contained within the same molecular entity.

Note 2: This is a general term that, whenever appropriate, should be used in preference to the less explicit term *complex*. It is also used specifically for products of an addition reaction.

[3]

adenocarcinoma *Malignant tumor* originating in glandular *epithelium* or forming recognizable glandular structures.

adenoma *Benign tumor* occurring in glandular *epithelium* or forming recognizable glandular structures.

adjuvant

1. In pharmacology, a substance added to a *drug* to speed or increase the action of the main component.
2. In immunology, a substance (such as aluminum hydroxide) or an organism (such as killed mycobacterium) that increases the response to an *antigen*.

administration (of a substance) Application of a known amount of a substance to an organism in a reproducible manner and by a defined route.

adrenergic Secreting adrenaline (epinephrine) and/or related substances; in particular referring to sympathetic nerve fibers.
See *sympathomimetic*.

adsorption Increase in the *concentration* of a substance at the interface of a condensed and a liquid or gaseous layer owing to the operation of surface forces.
[2]
See also *interfacial layer*.

adsorption factor Ratio of the amount of substance adsorbed at the interface of a condensed and a liquid or gaseous phase to the total amount of the substance available for *adsorption*.
[2]

adstringent See *astringent*.

advection (in environmental chemistry) Process of transport of a substance in air or water solely by mass motion.
[2]

adverse effect Change in biochemistry, physiology, growth, development morphology, behavior, or lifespan of an organism, which results in impairment of functional capacity or impairment of capacity to compensate for additional stress or increase in susceptibility to other environmental influences.
After [2]

adverse event Occurrence that causes an *adverse effect*.

Note: An adverse event in clinical studies is any untoward reaction in a human subject participating in a research project; such an adverse event, which may be a psychological reaction, must be reported to an institutional review board.

aerobe Organism that requires dioxygen for respiration and hence for growth and life.

aerobic Requiring dioxygen.

aerodynamic diameter (of a particle) Diameter of a spherical particle with relative density equal to unity that has the same settling velocity in air as the particle in question.

aerosol Mixture of small particles (solid, liquid, or a mixed variety) and a *carrier* gas (usually air).

Note 1: Owing to their size, these particles (usually less than 100 μm and greater than 0.01 μm in diameter) have a comparatively small sedimentation velocity and hence exhibit some degree of stability in the earth's gravitational field.

Note 2: An aerosol may be characterized by its chemical composition, its radioactivity, the particle size distribution, the electrical charge, and the optical properties.

[2]

aetiology See *etiology*.

after-effect of a poison Ability of a *poison* to produce a change in an organism after cessation of contact.

age sensitivity Quantitative and qualitative age dependence of an effect.

agonist Antonym: *antagonist* Substance that binds to cell *receptor*s normally responding to a naturally occurring substance and produces an effect similar to that of the natural substance.

Note 1: A partial agonist activates a receptor but does not cause as much of a physiological change as does a full agonist.

Note 2: A co-agonist works together with other co-agonists to produce a desired effect.

air pollution Presence of substances in the atmosphere resulting either from human activity or natural processes, in sufficient concentration, for a sufficient time and under circumstances such as to interfere with comfort, *health*, or welfare of persons or to harm the environment.

air pollution control system
1 Network of organizations that monitor air pollution.
2. Group of measures or processes used to minimize or prevent air pollution.

albuminuria Presence of albumin, derived from *plasma*, in the urine.

algicide algaecide Substance intended to kill algae.

aliquot (in analytical chemistry) Known amount of a homogeneous material, assumed to be taken with negligible *sampling error*.

Note 1: The term is usually applied to fluids.

Note 2: The term "aliquot" is usually used when the fractional part is an exact divisor of the whole; the term "aliquant" has been used when the fractional part is not an exact divisor of the whole (e.g., a 15-mL portion is an aliquant of 100 mL).

Note 3: When an aliquot is taken of a laboratory sample or test sample or the sample is otherwise subdivided, the samples have been called split samples.

[2]

alkalosis Antonym: *acidosis* Pathological condition in which the hydrogen(1+) (hydron) substance concentration of body fluids is below normal and hence the pH of blood rises above the reference interval.

alkylating agent Substance that introduces an alkyl substituent into a compound.

allele One of several alternate forms of a *gene* that occur at the same relative position (locus) on homologous *chromosomes* and which become separated during *meiosis* and can be recombined following fusion of *gametes*.

allergen Immunostimulant antigenic substance that may or may not cause a clinically significant effect but which is capable of producing immediate *hypersensitivity*.

allergy Symptoms or signs occurring in sensitized individuals following *exposure* to a previously encountered substance (*allergen*) which would otherwise not cause such *symptom*s or *sign*s in non-sensitized individuals. The most common forms of allergy are *rhinitis*, *urticaria*, *asthma*, and *contact dermatitis*.

allometric

1. Pertaining to a systematic relationship between growth rates of different parts of an organism and its overall growth rate.

[2]

2. Pertaining to a systematic relationship between size, shape, and metabolism in different species.

allometric growth Regular and systematic pattern of growth such that the mass or size of any organ or part of a body can be expressed in relation to the total mass or size of the entire organism according to the *allometric* equation:

$$Y = bx^{\alpha}$$

where Y = mass of the organ, x = mass of the organism, α = growth coefficient of the organ, and b is a constant.

[2]

allometric scaling

1. Adjustment of data to allow for change in proportion between an organ or organs and other body parts during the growth of an organism.
2. Adjustment of data to allow for differences and make comparisons between species having dissimilar characteristics (e.g., in size, shape, and metabolism).

After [2]

allometry (in biology) Measurement of the rate of growth of a part or parts of an organism relative to the growth of the whole organism.

[2]

allomone *Semiochemical* that is produced by an organism inducing a response in an organism of another species that is favorable to the emitter.

See *kairomone*, *synomone*.

all-or-none effect See *quantal effect*.

alopecia Baldness; absence or thinning of hair from areas of skin where it is usually present.

alveol/us (pulmonary), -i pl., -ar adj. Terminal air sac of the lung where gas exchange occurs.

ambient Surrounding (applied to environmental media such as air, water, sediment, or soil).

ambient monitoring Continuous or repeated measurement of agents in the environment to evaluate ambient *exposure* and *health risk* by comparison with appropriate reference values based on knowledge of the probable relationship between exposure and resultant *adverse* health *effects*.

ambient standard See *environmental quality standard*.

Ames test In vitro test for *mutagenicity* using mutant strains of the bacterium *Salmonella typhimurium* which cannot grow in a given histidine-deficient medium: *mutagen*s can cause reverse *mutation*s which enable the bacterium to grow on the medium. The test can be carried out in the presence of a given microsomal fraction (S-9) from rat liver (see *microsome*) to allow metabolic transformation of mutagen precursors to active derivatives.

amnesic shellfish poisoning (ASP) Serious illness that is a consequence of consumption of bivalve shellfish (mollusks) such as mussels, oysters, and clams that have ingested, by filter feeding, large quantities of microalgae containing domoic acid; acute symptoms include vomiting, diarrhea, and in some cases, confusion, loss of memory, disorientation, and even coma.

amplification (of genes) See *gene amplification*.

anabolism Antonym: *catabolism* Biochemical processes by which smaller molecules are joined to make larger molecules.

anaemia See *anemia*.

anaerobe Antonym: *aerobe*

Organism that does not require dioxygen for life.

Note: Obligate (strict) anaerobes grow only in the absence of dioxygen. Facultative anaerobes can grow either in the presence or in the absence of dioxygen.

anaerobic Antonym: *aerobic* Not requiring dioxygen.

anaesthetic See *anesthetic*.

analgesic Substance that relieves pain, without causing loss of consciousness.

analogue metabolism Process by which a normally non-biodegradable compound is biodegraded in the presence of a structurally similar compound which can induce the necessary enzymes.

analytic study (in epidemiology) Study designed to examine associations, commonly putative or hypothesized causal relationships.

anaphylactoid Of or resembling *anaphylaxis*.

anaphylaxis Life-threatening type 1 hypersensitivity allergic reaction (see *allergy*) occurring in a person or animal *exposed* to an *antigen* or *hapten* to which they have previously been sensitized.

Note: Consequences of the reaction may include angio-edema, vascular collapse, shock, and respiratory distress.

anaplasia Loss of normal cell differentiation, a feature characteristic of most *malignancies*.

anemia Condition in which there is a reduction in the number of red blood cells or amount of *hemoglobin* per unit volume of blood below the reference interval for a similar individual of the species under consideration, often causing pallor and fatigue.

anesthetic Substance that produces loss of feeling or sensation: general anesthetic produces loss of consciousness; local or regional anesthetic renders a specific area insensible to pain.

aneuploid Cell or organism with missing or extra *chromosome*s or parts of chromosomes and thus an abnormal number of chromosomes which is not an exact multiple of the haploid number.

anoxia Strictly total absence of oxygen but sometimes incorrectly used instead of *hypoxia* to mean a decreased oxygen supply in tissues.

antagonism (in toxicology) Combined effect of two or more factors that is smaller than the solitary effect of any one of those factors.

Note: In *bioassays*, the term may be used when a specified effect is produced by *exposure* to either of two factors but not by exposure to both together.

antagonist (in toxicology) Antonym: *agonist* Substance that binds to a cell *receptor* normally responding to a naturally occurring substance and prevents a response to the natural substance.

anthelmint(h)ic antihelminth helminthagogue helminthic vermifuge

1. n., Substance intended to kill or cause the expulsion of parasitic intestinal worms, such as helminths.
2. adj., Acting to expel or kill parasitic intestinal worms.

anthracosis (coal miners' pneumoconiosis) Form of *pneumoconiosis* caused by accumulation of anthracite carbon deposits in the lungs due to inhalation of smoke or coal dust.

anthropogenic

1. Caused by or influenced by human activities.
2. Describing a conversion factor used to calculate a *dose* or *concentration* affecting a human that has been derived from data obtained with another species (e.g., the rat).

[2]

anti-adrenergic See *sympatholytic*.

antibiotic Substance produced by, and obtained from, certain living cells (especially bacteria, yeasts, and molds), or an equivalent synthetic substance, which is *biostatic* or *biocidal* at low concentrations to some other form of life, especially pathogenic or noxious organisms.

antibody Protein (*immunoglobulin*) produced by the immune system in response to *exposure* to an antigenic molecule and characterized by its specific binding to a site on that molecule (antigenic determinant or *epitope*).

[3]

anticholinergic

1. adj., Preventing transmission of *parasympathetic* (acetylcholine releasing) nerve impulses.
2. n., Substance that prevents transmission of parasympathetic nerve impulses.

anticholinesterase See *cholinesterase inhibitor*.

anticoagulant Substance that prevents blood clotting (e.g., warfarin).

antidote Substance capable of specifically counteracting or reducing the effect of a potentially *toxic* substance in an organism by a relatively specific chemical or pharmacological action.

antigen Substance or a structural part (*epitope*) of a substance that causes the immune system to produce specific *antibody* or specific cells and combines

with specific binding sites (*epitopes*) on the antibody or cells.

antihistamine Substance that blocks or counteracts the action of *histamine*.

antihelminth See *anthelmint(h)ic*.

antimetabolite Substance, structurally similar to a *metabolite*, which competes with it or replaces it, and so prevents or reduces its normal utilization.

antimuscarinic

1. n., Substance inhibiting or preventing the actions of muscarine and muscarine-like agents (e.g., atropine) on the muscarinic acetylcholine *receptors*.
2. adj., Inhibiting or preventing the actions of muscarine and muscarine-like agents on the muscarinic acetylcholine receptors.

antimycotic fungicide Substance used to kill a fungus or to inhibit its growth.

antinicotinic

1. n., Substance inhibiting or preventing the actions of nicotine and nicotine-like agents (e.g., suxamethonium chloride) on the nicotinic acetylcholine *receptors*.
2. adj., Inhibiting or preventing the actions of nicotine and nicotine-like agents on the nicotinic acetylcholine receptors.

antipyretic Substance that relieves or reduces fever.

antiresistant Substance used as an additive to a *pesticide* formulation in order to reduce the resistance of insects to the pesticide (e.g., an antimetabolite that inhibits metabolic inactivation of the pesticide).

antiserum Serum containing *antibodies* to a particular *antigen* either because of immunization or after an infectious disease.

Note: Usually, the antibodies are polyclonal.

antiviral **See** *virucide*.

aphasia Loss or impairment of the power of speech or writing, or of the ability to understand written or spoken language or signs, due to a brain injury or disease.

aphicide Substance intended to kill *aphids*.

aphid Common name for a harmful plant parasite in the family Aphididae, some species of which are vectors of plant virus diseases.

aplasia Lack of development of an organ or tissue, or of the cellular products from an organ or tissue.

apopto/sis n., tic adj. Active process of programmed cell death, requiring metabolic energy, often characterized by fragmentation of *DNA*, and cell deletion without associated *inflammation*.
[2]
See *necrosis*.

arboricide Substance intended to kill trees and shrubs.

area source Widespread origin of *emissions*. Area under the concentration–time curve
See *area under the curve*.

area under the curve (AUC) Area between a curve and the abscissa (horizontal axis), i.e., the area underneath the graph of a function: often, the area under the tissue (*plasma*) *concentration* curve of a substance expressed as a function of time.
[2]

area under the moment curve (AUMC) Area between a curve and the abscissa (horizontal axis) in a plot of (*concentration* $\times$ time) vs. time.
[2]

argyria argyrosis Pathological condition characterized by gray-bluish or black pigmentation of tissues (such as skin, retina, mucous membranes, internal organs) caused by the accumulation of metallic silver, due to reduction of a silver compound which has entered the organism during (prolonged) administration or *exposure*.

arrhythmia Any variation from the normal rhythm of the heartbeat.

arseniasis Chronic arsenical poisoning.

artefact Observation, effect, or result which is inaccurate because it is produced by the methodology used in scientific investigation or by experimental error.

arteriosclerosis Hardening and thickening of the walls of the arteries.
See also *atherosclerosis*.

arthralgia Pain in a joint.

arthritis *Chronic inflammation* of a joint, usually accompanied by pain and often by changes in structure.

arthropathy arthrosis Disease of a joint.

arthrosis Joint or articulation.

asbestosis Form of *pneumoconiosis* caused by inhalation of asbestos fibers.

ascaricide Substance intended to kill roundworms (Ascaridae).

asphyxia Condition resulting from insufficient intake of oxygen: Symptoms include breathing

difficulty, impairment of senses, and, in extreme, convulsions, unconsciousness and death.

asphyxiant Substance that blocks the transport or use of oxygen by living organisms.

Note: Examples include both physical (nitrogen gas) and chemical (carbon monoxide) asphyxiants.

assay
1. n., Process of quantitative or qualitative analysis of a component of a *sample*.
2. n., Results of a quantitative or qualitative analysis of a component of a sample.
3. v., To carry out quantitative or qualitative analysis of a component of a sample.

assimilation Uptake and incorporation of substances by a living organism.

asthenia Weakness; lack or loss of strength.

asthma Chronic respiratory disease characterized by bronchoconstriction, excessive mucus secretion, and *edema* of the pulmonary alveoli, resulting in difficulty in breathing out, wheezing, and cough.

astringent
1. adj., Causing contraction, usually locally after topical application.
2. n., Substance causing cells to shrink, thus causing tissue contraction or stoppage of secretions and discharges; such substances may be applied to skin to harden and protect it.

ataxia Unsteady or irregular manner of walking or movement caused by loss or failure of muscular coordination.

Atherosclerosis Pathological condition in which there is thickening, hardening, and loss of elasticity of the walls of blood vessels, characterized by a variable combination of changes of the innermost layer consisting of local accumulation of lipids, complex carbohydrates, blood and blood components, fibrous tissue, and calcium deposits. In addition, the outer layer becomes thickened and there is fatty degeneration of the middle layer.
See also *arteriosclerosis*.

atrophy Wasting away of the body or of an organ or tissue, involving a decrease in size and (or) numbers of cells.

attenuation (in genetics) Regulation of *gene* expression in bacteria by premature termination of *transcription* of a biosynthetic *operon*.

attractant Substance that attracts animals. Some attractants fulfill natural biological functions such as mating or predation: Others may be used to attract animals for monitoring or for control.
See also *pheromone*.

attributable risk Part of a *risk* that is identified as due to *exposure* to a defined substance.
[2]

autoimmune disease Pathological condition resulting when an organism produces *antibodies* or specific cells which bind to constituents of its own tissues (auto*antigens*) and cause tissue injury: Examples of such disease may include rheumatoid *arthritis*, *myasthenia* gravis, systemic lupus erythematosus, and scleroderma.

autooxidation See *autoxidation*.

autophagosome Membrane-bound body (secondary *lysosome*) in which parts of the cell are digested.

autopsy necropsy Postmortem examination of the organs and body tissue to determine cause of death or pathological condition.

autosome Any *chromosome* other than a sex chromosome.

autoxidation Reaction with dioxygen at moderate temperatures.

autoxidation (in food chemistry) Apparently spontaneous, usually slow reaction of foodstuff components with dioxygen in an *aerobic* environment at moderate temperatures.

auxotroph Organism unable to synthesize an organic molecule which is required for its growth: When the compound is given to the organism with the other nutrients it requires, growth of the organism may occur.

auxotrophy Inability of a microorganism to synthesize a particular organic compound required for its growth.

avicide Substance intended to kill birds.

axenic animal See *germ-free animal*.

azoospermia
1. Absence of live motile spermatozoa in semen.
2. Failure to form live spermatozoa.

back-mutation Process that reverses the effect of a *mutation* which had inactivated a *gene*; thus, it restores the wild phenotype.

bacterial artificial chromosome (BAC) *DNA* vector into which large DNA fragments can be inserted and cloned in a bacterial host.

bactericide Substance intended to kill bacteria.

bagassosis Lung disease caused by the inhalation of dust from sugar-cane residues.

basal lamina, pl. -ae Triple-layered structure on which epithelium sits: It consists of an electron-dense layer (lamina densa) between two electron-transparent layers (lamina lucida). The lamina densa is composed of type IV collagen, and the lamina lucida contains the glycoprotein laminin.

base pairing Linking of the complementary pair of polynucleotide chains of nucleic acids by means of hydrogen bonds between complementary purine and pyrimidine bases, adenine with thymine or uracil, cytosine with guanine.

basement membrane Specialized layers (*basal laminae*) of extra-cellular matrix that separate epithelial tissue from underlying connective tissue: Cancer cells must break through the basement membrane in order to migrate to other parts of the body and form metastases.

Bateman function Equation expressing the build up and decay in *concentration* of a substance (usually in *plasma*) based on first-order *uptake* and *elimination* in a *one-compartment model*, having the form

$$C = [fDk_a/V(k_a - k_e)][\exp(-k_e t) - \exp(-k_a t)]$$

where C is the concentration and D the *dose* of the substance, f the fraction absorbed, and V the *volume of distribution*. k_a and k_e are the first-order *rate constants* of uptake and elimination, respectively, and t is time.
[2]

B-cell See *B lymphocyte*.

benchmark concentration (BMC) Statistically calculated lower 95% confidence limit on the *concentration* that produces a defined *response* (called the *benchmark response* or BMR, usually 5 or 10%) for an *adverse effect* compared to background, often defined as 0 or 5%.
[2]

benchmark dose (BMD) Statistically calculated lower 95% confidence limit on the *dose* that produces a defined *response* (called the *benchmark response* or BMR, usually 5 or 10%) of an *adverse effect* compared to background, often defined as 0 or 5%.
[2]

benchmark guidance value *Biological monitoring* guidance value set at the 90th percentile of available *biological monitoring* results collected from a representative *sample* of workplaces with good occupational hygiene practices.
[2]

benchmark response *Response*, expressed as an excess of background, at which a *benchmark dose* or *benchmark concentration* is set.
[2]

benefit Advantage to or improvement in condition of an individual or a population.

benign Antonym: *malignant*
1. Of a disease, producing no persisting harmful effects.
2. *Tumor* that does not invade other tissues (see *metastasis*), having lost growth control but not positional control.

Note: Such a tumor is not *carcinogenic* but may cause mechanical damage to adjacent tissues.

berylliosis See *beryllium disease*.

beryllium disease berylliosis Serious and usually permanent lung damage resulting from chronic inhalation of beryllium.

bias
1. Deviation of results or inferences from the truth, or processes leading to such deviation.
2. Any trend in the collection, analysis, interpretation, publication, or review of data which can lead to conclusions which are systematically different from the truth.

biased sample Antonym: *random sample* Any *sample* that is not a random sample.

bilirubin Orange–yellow pigment, a breakdown product of heme-containing proteins (hemoglobin, myoglobin, *cytochrome*s), which circulates in the blood *plasma* bound to albumin or as water-soluble glucuronide conjugates, and is excreted in the bile by the liver.

bioaccessibility Potential for a substance to come in contact with a living organism and then interact with it. This may lead to *absorption*.

Note: A substance trapped inside an insoluble particle is not bioaccessible, although substances on the surface of the same particle are accessible and may also be bioavailable. Bioaccessibility, like bioavailability, is a function of both chemical speciation and biological properties. Even surface-bound substances may not be accessible to organisms which require the substances to be in solution.

bioaccessible Able to come in contact with a living organism and interact with it.
See *bioaccessibility*.

bioaccumulation Progressive increase in the amount of a substance in an organism or part of an organism that occurs because the rate of intake exceeds the organism's ability to remove the substance from the body.

Note: Bioaccumulation often correlates with *lipophilicity*.

See also *bioconcentration*, *biomagnification*.

bioaccumulation potential Ability of living organisms to concentrate a substance obtained either directly from the environment or indirectly through its food.

bioactivation Metabolic *conversion* of a *xenobiotic* to a more *toxic* derivative or one which has more of an effect on living organisms.

bioassay Procedure for estimating the *concentration* or biological activity of a substance by measuring its effect on a living system compared to a standard system.

bioavailability (general) biological availability physiological availability Extent of *absorption* of a substance by a living organism compared to a standard system.

[2]

bioavailability (in toxico- or pharmacokinetics) Ratio of the *systemic exposure* from extravascular (ev) exposure to that following intravenous (iv) *exposure* as described by the equation:

$$F = A_{ev}\ D_{iv}/B_{iv}\ D_{ev}$$

where F (fraction of *dose* absorbed) is a measure of the bioavailability, A and B are the *areas under the* (plasma) *concentration–time curve* following extravascular and intravenous administration, respectively, and D_{ev} and D_{iv} are the administered extravascular and intravenous *doses*.

[2]

bioavailable Able to be absorbed by living organisms.

See *bioavailability*.

biochemical mechanism Reaction or series of reactions, usually enzyme-catalyzed, associated with a specific physiological event in a living organism.

biochemical (biological) oxygen demand (BOD) Amount *concentration* of oxygen taken up through the respiratory activity of microorganisms growing on organic compounds present when incubated at a specified temperature (usually 20 °C) for a fixed period (usually 5 days). It is regarded as a measure of that organic *pollution* of water which can be degraded biologically but includes the oxidation of inorganic material such as sulfide and iron(II). The empirical test used in the laboratory to determine BOD also measures the oxygen used to oxidize reduced forms of nitrogen unless their oxidation is prevented by an inhibitor such as allyl thiourea.

biocid/e n., -al adj. Substance intended to kill living organisms.

bioconcentration Process leading to a higher *concentration* of a substance in an organism than in environmental media to which it is *exposed*.

See *bioaccumulation*.

bioconcentration factor (BCF) Measure of the tendency for a substance in water to accumulate in organisms, especially fish.

Note 1: The equilibrium *concentration* of a substance in fish can be estimated by multiplying its concentration in the surrounding water by its *bioconcentration factor* in fish.

Note 2: This parameter is an important determinant for human intake of aquatic food by the ingestion route.

bioconjugate See *conjugate*.

bioconversion See *biotransformation*.

biodegradation Breakdown of a substance catalyzed by enzymes in vitro or in vivo. This may be characterized for purposes of *hazard* assessment as:

1. Primary. Alteration of the chemical structure of a substance resulting in loss of a specific property of that substance.
2. Environmentally acceptable. Biodegradation to such an extent as to remove undesirable properties of the compound. This often corresponds to primary biodegradation, but it depends on the circumstances under which the products are discharged into the environment.
3. Ultimate. Complete breakdown of a compound to either fully oxidized or reduced simple molecules (such as carbon dioxide/methane, nitrate/ammonium, and water). It should be noted that the products of biodegradation can be more harmful than the substance degraded.

bioelimination Removal, usually from the aqueous phase, of a test substance in the presence of living organisms by biological processes supplemented by physicochemical reactions.

bioequivalen/ce n., -t adj. Relationship between two preparations of the same *drug* in the same dosage form that have a similar bioavailability.

bioinactivation Metabolic *conversion* of a *xenobiotic* to a less *toxic* derivative.

[2]

bioinformatics Discipline encompassing the development and utilization of computational facilities to store, analyze, and interpret biological data.

biokinetics (in toxicology) Science of the movements involved in the *distribution* of substances.
[2]

biological absorption See *absorption, biological*.

biological accessibility See *bioaccessibility*.

biological acclimatization See *acclimatization, biological*.

biological assessment of exposure See *biological monitoring*.

biological availability See *bioavailability*.

biological cycle Complete circulatory process through which a substance passes in the *biosphere*. It may involve transport through the various media (air, water, soil), followed by *environmental transformation*, and carriage through various *ecosystems*.

biological effect monitoring (BEM) Continuous or repeated measurement of early biological effects of *exposure* to a substance to evaluate ambient *exposure* and *health risk* by comparison with appropriate reference values based on knowledge of the probable relationship between ambient exposure and biological effects.

biological exposure indices (BEI) Guidance values recommended by ACGIH for assessing *biological monitoring* results.
[5]

biological half life For a substance, the time required for the amount of that substance in a biological system to be reduced to one-half of its value by biological processes, when the rate of removal is approximately exponential.
[2]

biological half time, $t_{1/2}$ See *biological half life*.

biological indicator Species or group of species that is representative and typical for a specific status of an *ecosystem*, which appears frequently enough to serve for monitoring and whose population shows a sensitive response to changes (e.g., the appearance of a toxicant in an ecosystem).
[6]

biological marker See *biomarker*.

biological monitoring biological assessment of exposure

biomonitoring Continuous or repeated measurement of any naturally occurring or synthetic chemical, including potentially *toxic substances* or their *metabolites* or biochemical effects in tissues, secreta, excreta, expired air, or any combination of these in order to evaluate occupational or environmental *exposure* and *health risk* by comparison with appropriate reference values based on knowledge of the probable relationship between ambient exposure and resultant *adverse* health *effects*.

biological oxygen demand See *biochemical oxygen demand*.

biological preparation biological biopreparation
Compound derived from living organisms and their products for use in medicine or as a *pesticide*, etc.

biological specimen
1. Organ, tissue (including blood), secretion, or excretion product taken from an organism as a *sample* reflecting the state of the whole organism.
2. Organism taken as a sample reflecting the state of a population or their environment.

biological warfare Military operations using any organism (bacteria, virus, or other disease-causing organism) or *toxin* found in nature, to kill, injure, or incapacitate human beings, animals, or plants.

biomagnification ecological magnification Sequence of processes in an ecosystem by which higher *concentration*s are attained in organisms at higher trophic levels (at higher levels in the food web); at its simplest, a process leading to a higher concentration of a substance in an organism than in its food.

biomarker Indicator signaling an event or condition in a biological system or *sample* and giving a measure of *exposure*, effect, or susceptibility.

Note: Such an indicator may be a measurable chemical, biochemical, physiological, behavioral, or other alteration within an organism.

[2]

biomarker of effect effect biomarker
Biomarker that, depending upon the magnitude, can be recognized as associated with an established or possible *health* impairment or disease.
[2]

biomarker of exposure exposure biomarker
Biomarker that relates *exposure* to a *xenobiotic* to the levels of the substance or its *metabolite*, or of the product of an interaction between the substance and some *target* molecule or cell that can be measured in a *compartment* within an organism.
[2]

biomarker of susceptibility susceptibility biomarker
Biomarker of an inherent or acquired ability of an organism to respond to *exposure* to a specific substance.
[2]

biomass
1. Total amount of biotic material, usually expressed per unit surface area or volume, in a medium such as water.
2. Material produced by the growth of microorganisms, plants, or animals.

biomineralization Complete conversion of organic substances to inorganic derivatives by living organisms, especially microorganisms.

biomolecule Substance that is synthesized by and occurs naturally in living organisms.

biomonitoring See *biological monitoring*.

biopesticide Biological agent with pesticidal activity, for example, the bacterium *Bacillus thuringiensis* when used to kill insects.
After [6]

biopsy Excision of a small piece of living tissue for microscopic or biochemical examination; usually performed to establish a diagnosis.

biosphere Portion of the planet earth that supports and includes life.

biostatic Adjective applied to a substance that arrests the growth or multiplication of living organisms.

biota All living organisms as a totality.

biotransformation bioconversion *Chemical conversion* of a substance that is mediated by living organisms or *enzyme* preparations derived therefrom.

2,3-bis(sulfanyl)propan-1-ol British anti-Lewisite dimercaprol 2,3-dimercaptopropan-1-ol Metal chelator that has been used in the treatment of arsenic, antimony, gold, mercury, and lead poisoning.

blastocyst Mammalian *embryo* at the stage at which it is implanted into the wall of the uterus.
[9]

blood–brain barrier Physiological interface between brain tissues and circulating blood created by a mechanism that alters the permeability of brain capillaries, so that some substances are prevented from entering brain tissue, while other substances are allowed to enter freely.
After [2]

blood–placenta barrier Physiological interface between maternal and fetal blood circulations that filters out some substances which could harm the fetus while favoring the passage of others such as nutrients: Many fat-soluble substances such as alcohol are not filtered out, and several types of virus can also cross this barrier.

Note: The effectiveness of the interface as a barrier varies with species and different forms of placentation.

blood plasma See *plasma (in biology)*.

blood substitution See *exchange transfusion*.

blood–testis barrier Physiological interface between the blood supply and the spermatozoa of the seminiferous tubules.

Note: This interface consists of specific junctional complexes between Sertoli cells.
After [2]

B lymphocyte B cell Type of *lymphocyte* that synthesizes and secretes *antibodies* in response to the presence of a foreign substance or one identified by it as foreign. The protective effect can be mediated to a certain extent by the antibody alone (contrast *T lymphocyte*).

body burden Total amount of a substance present in an organism at a given time.

bolus
1. Single *dose* of a substance, originally a large pill.
2. Dose of a substance administered by a single rapid intravenous injection.
3. Concentrated mass of food ready to be swallowed.

botanical pesticide Substance with activity against pests, that is produced naturally within a plant and may act as a defense against predators.

botulism Acute food poisoning caused by botulinum toxin produced in food by the bacterium *Clostridium botulinum* and characterized by muscle weakness and paralysis; disturbances of vision, swallowing, and speech; and a high mortality rate.

brady- Antonym: *tachy-* Prefix meaning slow as in bradycardia or bradypnoea

bradycardia Antonym: *tachycardia* Abnormal slowness of the heartbeat.

bradypnoea Antonym: *tachypnoea* Abnormally slow breathing.

breathing zone Space within a radius of 0.5 m from a person's face.

British anti-Lewisite (BAL) See *2,3-bis(sulfanyl) propan-1-ol*.

bronchoconstriction Antonym: *bronchodilation* Narrowing of the air passages through the bronchi of the lungs.

bronchodilation Antonym: *bronchoconstriction* Expansion of the air passages through the bronchi of the lungs.

bronchospasm Intermittent violent contraction of the air passages of the lungs.

builder (in chemistry) Material that enhances or maintains the cleaning efficiency of a surfactant, in a detergent, principally by inactivating water hardness; complex phosphates (especially sodium tripolyphosphate, i.e., pentasodium triphosphate), sodium carbonate, and sodium silicate are the builders most commonly used.

byssinosis *Pneumoconiosis* caused by inhalation of dust and associated microbial contaminants and observed in cotton, flax, and hemp workers.

bystander exposure Liability of members of the general public to come in contact with substances arising from operations or processes carried out by other individuals in their vicinity.

cacosmia Imagined perception of vile odors, including coprosmia (smelling feces) and necrosmia (the smell of death).

calcification Form of mineralization in which organic tissue becomes hardened by deposition of calcium salts within its substance.

calibration Operation that, under specified conditions, in a first step establishes a relation between the quantity values with measurement *uncertainties* provided by measurement *standards* and corresponding *indications* with associated measurement uncertainties and, in a second step, uses this information to establish a relation for obtaining a measurement result from an indication.

[7]

calibration material See *reference material*.

cancer *Disease* resulting from the development of a *malignant tumor*.

carbonylhemoglobin carboxyhemoglobin Compound that is formed between carbon monoxide and *hemoglobin* in the blood of animals and humans and is incapable of transporting oxygen.

carboxyhemoglobin See *carbonylhemoglobin*. **carcinogen** n., **-ic** adj. Agent (chemical, physical, or biological) that is capable of increasing the *incidence* of malignant *neoplasms*, thus causing *cancer*.

Note: Annex 3 describes the classification systems for carcinogens.

carcinogen/esis n., -etic adj. Induction, by chemical, physical, or biological agents, of *malignant neoplasm*s and thus *cancer*.

carcinogenicity Process of induction of *malignant neoplasm*s, and thus *cancer*, by chemical, physical, or biological agents.

carcinogenicity test Long-term (*chronic*) test designed to detect any possible carcinogenic effect of a test substance.

carcinoma epithelioma *Malignant tumor* of an epithelial cell.

cardiotoxic Chemically harmful to the cells of the heart.

carrier

1. Substance in appreciable amount which, when associated with a trace of a specified substance, will carry the trace with it through a chemical or physical process.
2. Person who is heterozygous (e.g., carries only one *allele*) for a recessive genetic character leading to *disease*, and hence does not, under most circumstances, display the disease *phenotype* but can pass it on to the next generation.

[2]

3. Gas, liquid, or solid substance (often in particulate form) used to absorb, adsorb, dilute, or suspend a substance to facilitate its transfer from one medium to another.

carrier-linked prodrug carrier prodrug Compound that contains a temporary linkage between a given active substance and a transient *carrier* group, the latter producing improved physicochemical or *pharmacokinetic* properties and easily removable in vivo.

[2]

carrier protein

1. Protein to which a specific *ligand* or *hapten* is *conjugated*.
2. Unlabeled protein introduced into an assay at relatively high *concentration*s that distributes in a *fractionation* process in the same manner as labeled protein analyte, present in very low concentrations.
3. Protein added to prevent nonspecific interaction of reagents with surfaces, *sample* components, and each other.
4. Protein found in cell membranes that facilitates transport of a *ligand* across the membrane.

[2]

carrier substance Substance that binds to another substance and transfers it from one site to another.

[2]

carry-over

1. Transfer in farming and agricultural processing of a component from one system such as soil or feed to another system such as a plant, animal, or human being: Carry-over is expressed as the *concentration* of the component in the second system divided by its concentration in the first.

2. Process in analytical studies by which materials are carried into a reaction mixture in which they do not belong.
3. Persistence of a substance in soil (e.g., a *pesticide*), such that injury may occur subsequently to a new crop.
4. Persistence of a test substance in participants undergoing a cross-over clinical trial study, in which each participant randomly receives the placebo and test substance with an intervening washout period.

case cohort study Variant of the *case control study* in which the controls are drawn from the same cohort as the cases but are identified before the cases develop; some of the controls may later become cases.

case control study Study that starts with the identification of persons with the disease (or other outcome variable) of interest, and a suitable control (comparison, reference) group of persons without the *disease*. The relationship of an attribute to the disease is examined by comparing the diseased and nondiseased with regard to how frequently the attribute is present or, if quantitative, the levels of the attribute, in the two groups.

catabolism Antonym: *anabolism*

1. Reactions involving the oxidation of organic substrates to provide chemically available energy (e. g., ATP) and to generate metabolic intermediates.
2. Generally, process of breakdown of complex molecules into simpler ones, often providing biologically available energy.

catatonia Behavior marked by excessive and sometimes violent motor acivity and excitement, or by generalized inhibition or stupor, that may occur in schizophrenia, mood disorders, or organic brain syndromes.

cathartic See *laxative*.

ceiling value (CV) Airborne *concentration* of a potentially *toxic substance* that should never be exceeded in a worker's breathing zone.

cell cycle Regulated biochemical steps that cells go through involving *DNA* replication and cell division, usually depicted as a sequential cyclical series of events.

cell line Defined unique population of cells obtained by culture from a primary source through numerous generations.
See also *transformed cell line*.

cell-mediated hypersensitivity State in which an individual reacts with allergic effects caused by the reaction of *antigen*-specific *T-lymphocytes* following *exposure* to a certain substance (*allergen*) after having been *exposed* previously to the same substance or chemical group.

cell-mediated immunity Immune response mediated by *antigen*-specific *T-lymphocytes*.

cell proliferation Rapid increase in cell number.

cell strain Cells having specific properties or markers derived from a primary culture or *cell line*.

censored data *Sample* observations for which the complete distribution is not known: for example, a cohort study in which some persons cannot be followed to the predetermined end of the study ('right-censored data') or environmental assay data in which some results are less than the sample detection limit ('left-censored data').

certified reference material (CRM) *Reference material*, accompanied by documentation issued by an authoritative body and referring to valid procedures used to obtain a specified property value with *uncertainty* and *traceability*.

Example: Human serum with assigned quantity value for the concentration of cholesterol and associated measurement *uncertainty* stated in an accompanying certificate, used as *calibrator* or measurement *trueness* control material.

[7]

chain of custody Sequence of responsibility for a substance from the manufacturer to the distributor, to the user, or to the person(s) ultimately responsible for *waste* disposal. This term is also used in controlled transmission of *sample*s from collection to analysis, especially of samples of materials used for medico-legal or forensic purposes.

chelation therapy Treatment with a chelating agent to enhance the *elimination* or reduce the *toxicity* of a metal ion.

chemesthesis Sensations that arise when chemical compounds activate *receptor* mechanisms for other effectors, such as light, pain, pressure, and heat, in the eye, skin, nose, mouth, and throat; for example, the burning feeling from chili pepper, the cooling from the menthol in mouthwash, and the stinging feeling of carbonation.

chemical etiologic agent See *toxic substance*.

chemical conversion Change from one chemical species to another.

[2]

chemical etiologic agent See *toxic substance*.

chemical oxygen demand (COD) Measure of the amount of oxygen, divided by the volume of the system, required to oxidize the organic (and inorganic) matter in wastewater using a chemically oxidizing agent. In practice, it is usually expressed in milligrams O_2 per liter.

chemical safety Practical certainty that there will be no *exposure* of organisms to toxic amounts of any substance or group of substances: This implies attaining an acceptably low *risk* of exposure to potentially toxic substances.

chemical species (of an element) Specific form of an element defined as to isotopic composition, electronic or oxidation state, and (or) complex or molecular structure.
[2]

chemical warfare Military operations using the toxic properties of chemical agents to kill, injure, or incapacitate human beings, animals, or plants.

chemophobia Irrational fear of chemicals.

chemosis Chemically induced swelling around the eye caused by *edema* of the conjunctiva.

chemosterilizer Substance used to sterilize mites, insects, rodents, or other animals.

chloracne Acne-like eruption caused by *exposure* to certain chlorinated organic substances such as polychlorinated biphenyls or 2,3,7,8-tetrachlorodibenzo-*p*-dioxin [2,3,7,8-tetrachlorooxanthrene] and other polychlorinated dibenzo dioxins and furans.

cholinomimetic See *parasympathomimetic*.

cholinesterase inhibitor Substance that inhibits the action of acetylcholinesterase (EC 3.1.1.7) and related enzymes which catalyze the hydrolysis of choline esters: Such a substance causes hyperactivity in *parasympathetic* nerves.

Note: Examples include organophosphate and carbamate *pesticides*.

chromatid Either of two filaments joined at the centromere into which a *chromosome* divides as it duplicates itself during cell division.

chromatin Stainable complex of *DNA* and proteins present in the nucleus of a *eukaryotic* cell.

chromosomal aberration Abnormality of *chromosome* number or structure.

chromosome Self-replicating structure consisting of *DNA* complexed with various proteins and involved in the storage and transmission of genetic information; the physical structure that contains the *gene*s.

chronic Antonym: *acute* Long-term (in relation to *exposure* or effect).
1. In experimental toxicology, chronic refers to mammalian studies lasting considerably more than 90 days or to studies occupying a large part of the lifetime of an organism.
2. In clinical medicine, long-established or long-lasting.

[2]

chronic effect long-term effect Antonym: *acute effect* Consequence that develops slowly and (or) has a long-lasting course; may be applied to an effect which develops rapidly and is long-lasting.
[2]

chronic exposure long-term exposure Antonym: *acute exposure* Continued *exposure* or exposures occurring over an extended period of time, or a significant fraction of the test species, or of the group of individuals, or of the population's life-time.

chronic toxicity long-term toxicity Antonym: *acute toxicity*
1. Adverse effects following chronic exposure.
2. Effects that persist over a long period of time whether or not they occur immediately upon *exposure* or are delayed.

chronic toxicity test long-term toxicity test Antonym: *acute toxicity test* Study in which organisms are observed during the greater part of the life span and in which *exposure* to the test agent takes place over the whole observation time or a substantial part thereof.

chronotoxicology Study of the influence of biological rhythms on the *toxicity* of substances or of the influence of a toxicant on biological rhythms.

ciguateratoxin poisoning Serious illness caused by eating carnivorous fish such as snappers and barracuda that have become contaminated by *toxins* produced by the microalga, *Gambierdiscus toxicus*; gastrointestinal symptoms may accompany a wide variety of neurological symptoms, including *ataxia*, *vertigo*, flaccid paralysis, respiratory arrest, and reversed perception of hot and cold; the neurological symptoms may persist for many years.

circadian nychthemeral Relating to or exhibiting an approximately 24-h periodicity.

circulation of substances in the environment Movement of *xenobiotic* substances in the environment with air flow, river current, sediment flow, etc.

cirrhosis
1. Liver disease defined by histological examination and characterized by increased fibrous tissue,

abnormal morphological and physiological changes such as loss of functional liver cells, and increased resistance to blood flow through the liver (portal *hypertension*).
2. Chronic interstitial *inflammation* and *fibrosis* of an organ.

cirrhotic Describing an organ showing *cirrhosis*.

clastogen Agent causing *chromosome* breakage and (or) consequent gain, loss, or rearrangement of pieces of chromosomes.

clastogenesis Formation (or generation) of chromosomal breaks and (or) consequent gain, loss, or rearrangement of pieces of *chromosome*s.

clearance (general) $(c_o/c_i)(\Delta V/\Delta t)$ Product of the *concentration* c_o of a component in an output system and the volume flow rate of the output system divided by the concentration c_i of this component in the input system.

Note: The term 'mean volume rate' is recommended for this quantity.

[2]

clearance (in physiology and toxicology)
1. Volume of blood or *plasma* or mass of an organ effectively cleared of a substance by *elimination* (*metabolism* and *excretion*) divided by time of elimination.

   Note: Total clearance is the sum of the clearances of each eliminating organ or tissue for that component.
2. (in *pulmonary toxicology*) Volume or mass of lung cleared divided by time of *elimination*; used qualitatively to describe removal of any inhaled substance which deposits on the lining surface of the lung.
3. (in *renal* toxicology) Quantification of the removal of a substance by the kidneys by the processes of filtration and secretion; clearance is calculated by relating the rate of renal excretion to the *plasma concentration*.

[2]

cleavage (of a molecule) Splitting of a molecule into smaller molecular entities.

clinical toxicology Scientific study involving research, education, prevention, and treatment of diseases caused by substances such as drugs and toxins.

Note: Often refers specifically to the application of toxicological principles to the treatment of human poisoning.

clon/e n., **-al** adj.
1. Population of genetically identical cells or organisms having a common ancestor.
2. To produce such a population.
3. *Recombinant DNA* molecules all carrying the same inserted sequence.

clonic Pertaining to alternate muscular contraction and relaxation in rapid succession.

cloning vector Small circle of *DNA* (e.g., a plasmid) or modified bacteriophage (bacterial virus) that can carry a segment of foreign DNA into an appropriate host organism (e.g., a bacterial, yeast, or mammalian cell).

After [9]

cluster sampling
1. A method of sampling in which the population is divided into aggregates (or clusters) of items bound together in a certain manner. A *sample* of these clusters is taken at random, and all the items which constitute them are included in the sample.
2. A sampling method in which each unit selected is a group of persons (all persons in a city block, a family, etc.) rather than an individual.

coagonist See *agonist*.

cocarcinogen Chemical, physical, or biological factor that intensifies the effect of a *carcinogen*.

Codex Alimentarius Collection of internationally adopted food standards drawn up by the Codex Alimentarius Commission, the principal body implementing the joint FAO/WHO Food Standards Program.

cohort Component of the population born during a particular period and identified by period of birth so that its characteristics (such as causes of death and numbers still living) can be ascertained as it enters successive time and age periods. The term "cohort" has broadened to describe any designated group of persons followed or traced over a period of time, as in the term *cohort study* (*prospective study*).

cohort analysis Tabulation and analysis of *morbidity* or *mortality* rates in relationship to the ages of a specific group of people (cohort), identified by their birth period, and followed as they pass through different ages during part or all of their life span. In certain circumstances such as studies of migrant populations, cohort analysis may be performed according to duration of residence in a country rather than year of birth, in order to relate *health* or mortality experience to duration of *exposure*.

cohort study concurrent study follow-up study incidence study longitudinal study prospective study *Analytic study* in *epidemiology* in which subsets of a

defined population can be identified who are, have been, or in the future may be *exposed* or not exposed, or exposed in different degrees, to a factor or factors hypothesized to influence the probability of occurrence of a given disease or other outcome. The main feature of the method is observation of a large population for a prolonged period (years), with comparison of *incidence rates* of the given disease in groups that differ in *exposure* levels.

combined effect of poisons Simultaneous or successive effect of two or more *poison*s on the organism by the same route of *exposure*.

cometabolism Process by which a normally nonbiodegradable substance is biodegraded only in the presence of an additional carbon source.
See also *metabolism*.

comet assay Means of measuring *DNA* damage, particularly DNA strand breaks. A cell is embedded in agar and exposed to a DNA-damaging agent. The cell is then permeabilized with a detergent, and an electric field is applied. If the cell's genomic DNA has been broken into small fragments, these fragments move out of the cell by electrophoresis and form a streak or "tail" leading away from the cell which looks like a comet.

comparison group See *control group*.

comparative genomics Study of the relationship of *genome* structure and function across different biological species.
After [9]

comparative risk See *relative excess risk*.

compartment Conceptualized part of the body (organs, tissues, cells, or fluids) considered as an independent system for purposes of modeling and assessment of *distribution* and *clearance* of a substance.
[2]

compartmental analysis Mathematical process leading to a model of transport of a substance in terms of *compartments* and rate constants, usually taking the form $C = Ae^{-at} + Be^{-bt} \ldots$ where each exponential term represents one compartment. C is the substance *concentration*; A, B, … are proportionality constants; α, β, … are rate constants; and t is time.
[2]

compartmentalize Separate into *compartments*.

compensation pseudo-adaptation Adaptation of an organism to changing conditions of the environment (especially chemical) is accompanied by the emergence of stresses in biochemical systems which exceed the limits of normal (*homeostatic*) mechanisms. Compensation is a temporary concealed pathology which later on can be manifested in the form of explicit pathological changes (decompensation).

competent authority In the context of European Community Council Directive 79/831/EEC, the Sixth Amendment to the European Community Council Directive 67/548/EEC relating to the Classification, Packaging and Labeling of Dangerous Substances, official government organization or group receiving and evaluating notifications of new substances.

competent bacteria Culture of bacteria (or yeast) treated in such a way that their ability to take up *DNA* molecules without transduction or conjugation has been enhanced.

complementary DNA (cDNA) *DNA* generated from an expressed m*RNA* through a process known as reverse transcription.
[9]

complete mineralization Complete breakdown of a complex organic compound to carbon dioxide, water, oxides, and oxidative inorganic products such as nitrate or sulfate.

comprehensive effect of poisons Simultaneous or successive effect made on an organism by *poisons* entering from different media, air, water, or food or through the skin.

computational toxicology Application of mathematical and computer models to predict *adverse effects* and to better understand the mechanism(s) through which a given chemical causes harm.

concentration
1. Any one of a group of three quantities characterizing the composition of a mixture and defined as one of mass, amount of substance (chemical amossunt), or number divided by volume, giving, respectively, mass, amount (of substance), or number concentration.
2. Short form for amount (of substance) concentration (substance concentration in clinical chemistry).

[2]

concentration–effect curve exposure–effect curve
Graph of the relation between *exposure concentration* and the magnitude of the resultant biological change.

concentration–effect relationship exposure–effect relationship Association between *exposure concentration* and the resultant magnitude of the continuously graded change produced, either in an individual or in a population.

concentration–response curve exposure–response curve Graph of the relation between *exposure concentration* and the proportion of individuals in a population responding with a defined effect.
[2]

concentration–response relationship exposure–response relationship Association between *exposure concentration* and the *incidence* of a defined effect in an exposed population.

concord/ance n., **-ant** adj. Pairs or groups of individuals of identical *phenotype*.

Note: In twin studies, this is a condition in which both twins exhibit or fail to exhibit a trait under investigation.

concurrent study See *cohort study*.

concurrent validity Measurement and its criterion refer to the same point in time: An example would be a visual inspection of a wound for evidence of infection validated against bacteriological examination of a specimen taken at the same time.

confounding (in data analysis)
1. Situation in which the effects of two processes are not distinguishable from one another: The distortion of the apparent effect of an *exposure* on *risk* brought about by the association of other factors which can influence the outcome.
2. Relationship between the effects of two or more causal factors as observed in a set of data, such that it is not logically possible to separate the contribution which any single causal factor has made to an effect.
3. Situation in which a measure of the effect of an exposure on risk is distorted because of the association of exposure with other factor(s) which influence the outcome under study.

confounding variable confounder Changing factor that can cause or prevent the outcome of interest, is not an intermediate variable, and is associated with the factor under investigation.

congener One of two or more substances related to each other by origin, structure, or function.
[2]

congenital Trait, condition, or disorder that exists in an organism from birth.
After [9]

conjugate (in biochemistry)
1. Chemical species produced in living organisms by covalently linking two chemical moieties from different sources.

Example: A conjugate of a *xenobiotic* with some group such as glutathione, sulfate, or glucuronic acid, to make it soluble in water or *compartmentalized* within the cell.

See also *phase II reaction*.

2. Material produced by attaching two or more substances together, for example, a *conjugate* of an antibody with a fluorochrome, or an enzyme.

[2]

conjunctiva Mucous membrane that covers the eyeball and lines the under-surface of the eyelid.

conjunctivitis *Inflammation* of the *conjunctiva*.

conservative assessment of risk Assessment of *risk* that assumes the worst possible case scenario and therefore gives the highest possible value for risk: Risk management decisions based on this value will maximize safety.

construct validity Extent to which a measurement corresponds to theoretical concepts (constructs) concerning the phenomenon under study; for example, if on theoretical grounds, the phenomenon should change with age, a measurement with construct validity would reflect such a change.

contact dermatitis Inflammatory condition of the skin resulting from dermal *exposure* to an *allergen* (sensitizer) or an irritating (corrosive, defatting) substance.

contact poison
1. Chemical that injures the target organism through physical contact and skin absorption rather than through ingestion or inhalation.

[10]

2. *Pesticide (herbicide)* that causes injury to only the plant tissue to which it is applied or which is not appreciably translocated within plants.

[11]

containment Process by which possible release, discharge, or spill of a *toxic* substance during normal use or after an accident is prevented by appropriate action.

contaminant
1. Minor impurity present in a substance.
2. Extraneous material inadvertently added to a *sample* prior to or during chemical or biological analysis.
3. In some contexts, as in relation to gas cleaning equipment, used as a synonym for '*pollutant*', especially on a small scale.
4. Unintended component in food that may pose a *hazard* to the consumer.

content validity Extent to which the measurement incorporates the domain of the phenomenon under study; for example, a measurement of functional *health* status should embrace activities of daily living, occupational, family, and social functioning, etc.

contraindication Antonym: *indication* Any condition that renders some particular line of treatment improper or undesirable.

control group comparison group Selected subjects of study, identified as a rule before a study is done, which comprises humans, animals, or other species who do not have the disease, intervention, procedure, or whatever is being studied, but in all other respects are as nearly identical to the test group as possible.

control, matched Control (individual or group or case) selected to be similar to a study individual or group, or case, in specific characteristics: some commonly used matching variables are age, sex, race, and socioeconomic status.

convection (as applied to air and water motion) Predominantly vertical motion of air or of water, induced by the expansion of the air or of water heated by the earth's surface, or by human activity, and its resulting buoyancy.
[2]

conversion See *chemical conversion*, *biotransformation*.

core grade Quality rating, based on standard evaluation criteria established by the U.S. Office of Pesticide Programs regulatory agencies, given to toxicological studies after submission by registrants.

corrosive
1. adj., Causing a surface-destructive effect on contact; in *toxicology*, this normally means causing visible destruction of the skin, eyes, or the lining of the respiratory tract or the gastrointestinal tract.
2. n., Substance that causes a surface-destructive effect on contact.

count mean diameter Mean of the diameters of all particles in a population.
See also *mass mean diameter*.

count median diameter Calculated diameter in a population of particles in a gas or liquid phase above which there are as many particles with larger diameters as there are particles below it with smaller diameters.
[2]
See also *mass median diameter*.

crackles See *crepitations*.

crepitations crackles râles Abnormal respiratory sounds heard on auscultation of the chest, produced by passage of air through passages which contain secretion or exudate or which are constricted by spasm or a thickening of their walls.
See also *rhonchi*.

Note: Auscultation is the process of listening for sounds within the body by ear unassisted or using a stethoscope.

criteri/on (pl. -a) Validated set of data used as a basis for judgment.

criterion validity Extent to which the measurement correlates with an external criterion of the phenomenon under study.

critical concentration (for a cell or an organ) *Concentration* of a substance at and above which adverse functional changes, reversible or irreversible, occur in a cell or an organ.
[2]

critical dose *Dose* of a substance at and above which adverse functional changes, reversible or irreversible, occur in a cell or an organ.
[2]

critical effect For *deterministic effects*, the first *adverse effect* that appears when the *threshold* (*critical*) *concentration* or dose is reached in the *critical organ*: Adverse effects with no defined threshold concentration are regarded as critical.
[2]

critical end-point *Toxic* effect used by the USEPA as the basis for a *reference dose*.

critical group Part of a *target* population most in need of protection because it is most *susceptible* to a given *toxicant*.

critical organ (in toxicology) Organ that first attains the *critical concentration* of a substance and exhibits the *critical effect* under specified circumstances of *exposure* and for a given population.
After [2]

critical organ concentration (of a substance) Mean *concentration* of a substance in the *critical organ* at the time the substance reaches its *critical concentration* in the most sensitive type of cell in the organ.
[2]

critical period (of development) Stage of development of an organism (e.g., organogenesis in the fetus) that is of particular importance in the life cycle if the normal full development of some anatomical, physiological, metabolic, or psychological structure or function is to be attained.

critical study pivotal study Investigation yielding the *no-observed-adverse-effect-level* that is used by the USEPA as the basis of the *reference dose*.

cross-product ratio See *odds ratio*.

cross-sectional study (of disease *prevalence* and associations) disease frequency survey prevalence study Study that examines the relationship between diseases (or other *health*-related characteristics) and other variables of interest as they exist in a defined population at one particular time.

Note: Disease *prevalence* rather than *incidence* is normally recorded in a cross-sectional study and the temporal sequence of cause and effect cannot necessarily be determined.

cumulative death rate Proportion of a defined group that dies within the specified time period (e.g., month, year).

Note: It may refer to all deaths or to deaths from a specific cause or *specific* causes.

cumulative effect Overall change that occurs after repeated *doses* of a substance or radiation.
[2]

cumulative incidence incidence proportion Number or proportion of individuals in a group who experience the onset of a *health*-related event during a specified time interval.

Note: This interval is generally the same for all members of the group, but, as in lifetime *incidence*, it may vary from person to person without reference to age.

cumulative incidence rate Proportion of the *cumulative incidence* to the total population.
[2]

cumulative incidence ratio Value obtained by dividing the *cumulative incidence rate* in the *exposed* population by the cumulative incidence rate in the unexposed population.

cumulative median lethal dose Estimate of the total administered amount of a substance that is associated with the death of half a population of animals when the substance is administered repeatedly in doses which are generally fractions of the *median lethal dose*.

cumulative risk

1. Probability of a common harmful effect associated with concurrent *exposure* by all relevant pathways and routes of exposure to a group of substances that share a common chemical mechanism of toxicity.
2. Total probability of a harmful effect over time.

cutaneous dermal Pertaining to the skin.

cyanogenic Describing any compound able to produce cyanide.

Note: An example is amygdalin, found in peach and apricot stones.

cyanosis Bluish coloration, especially of the skin and mucous membranes and fingernail beds, caused by abnormally large amounts of reduced *hemoglobin* in the blood vessels as a result of deficient oxygenation.

cyanotoxin *Toxin* produced by Cyanobacteria, sometimes called blue–green algae.

Note: Examples are microcystin and cylindrospermin.

cyclooxygenase specific inhibitors Substances, such as aspirin and ibuprofen, that block the activity of cyclooxygenase (COX), an *enzyme* that is responsible for the formation of prostanoids (including prostaglandins, prostacyclin, and thromboxane); inhibition of COX can provide relief from *inflammation* and pain.

cytochromes *Conjugated* proteins containing heme as the *prosthetic group* and associated with electron transport and with redox processes.
[2]

cytochrome P420 Inactive derivative of cytochrome P450 found in microsomal (see *microsome*) preparations.

cytochrome P448 Obsolete term for *cytochrome P450* I, A1, and A2, one of the major families of the cytochromes P450 hemoproteins.

Note: During the monooxygenation of certain substances, often a *detoxification* process, these iso-enzymes may produce intermediates which can initiate *mutations*, *cancer*, *immunotoxic* reactions, and *adverse effects*.

cytochrome P450 (CYP) Member of a superfamily of heme-containing monooxygenases involved in *xenobiotic metabolism*, cholesterol biosynthesis, and steroidogenesis, in eukaryotic organisms found mainly in the *endoplasmic reticulum* and inner mitochondrial membrane of cells. "P450" refers to the observation that a solution of this enzyme exposed to carbon monoxide strongly absorbs light at a wavelength of 450 nm compared with the unexposed solution (a difference spectrum caused by a thiolate in the axial position of the heme opposite to the carbon monoxide ligand).
After [2]

cytogenetics Branch of genetics that correlates the structure and number of *chromosome*s as seen in isolated cells with variation in *genotype* and *phenotype*.

cytokine Any of a group of soluble proteins that are released by a cell causing a change in function or development of the same cell (autocrine), an adjacent cell (paracrine), or a distant cell (endocrine). Cytokines are involved in reproduction, growth, and development; normal homeostatic regulation; response to injury and repair; blood clotting; and host resistance (immunity and tolerance).

cytoplasm Fundamental substance or matrix of the cell (within the *plasma* membrane) which surrounds the nucleus, *endoplasmic reticulum*, *mitochondria*, and other *organelles*.

cytotoxic Causing damage to cell structure or function.

death rate Estimate of the proportion of a population that dies during a specified period. The numerator is the number of persons dying during the period; the denominator is the size of the population, usually estimated as the mid-year population. The death rate in a population is generally calculated by the formula: 10^n (number of deaths during a specified period)/(number of persons at *risk* of dying during the period) where n is usually either 3 or 5 giving rates per 1000 or per 100 000 people in the population studied.

Note 1: This rate is an estimate of the person-time death rate, the death rate per 10^n person-years: usually $n = 3$. If the rate is low, it is also a good estimate of the *cumulative death rate*.

Note 2: This term is sometimes described as the crude death rate.

decipol Unit of perceived air quality: air on mountains or the sea has a decipol = 0.01; city air with moderate air pollution has a decipol = 0.05–0.03; acceptable indoor air quality has decipol = 1.4 (for 80 % satisfaction).

decompensation Explicit pathophysiological changes following compensation for *adverse effects*.

decontamination Process of rendering harmless (by neutralization, *elimination*, removal, etc.) a potentially *toxic* substance in the natural environment, laboratory areas, the workplace, other indoor areas, clothes, food, water, sewage, etc.

defoliant Substance used for removal of leaves by its *toxic* action on living plants.

dehydrogenase *Enzyme* that catalyzes oxidation of compounds by removing hydrogen.

delayed effect latent effect Consequence occurring after a *latent period* following the end of *exposure* to a *toxic* substance or other harmful environmental factor.

***de minimis* risk** See *risk de minimis*.

denaturation

1. Addition of methanol, acetone, or other suitable chemical(s) to alcohol to make it unfit for drinking.
2. Change in molecular structure of proteins so that they cannot function normally, often caused by splitting of hydrogen bonds following *exposure* to reactive substances or heat.

denitrification Reduction of nitrates to nitrites, nitrogen oxides, or dinitrogen (N_2) catalyzed by facultative *aerobic* soil bacteria under *anaerobic* conditions.

dental fluorosis Tooth enamel malformations due to excessive fluoride *exposure* during dental development.

deoxyribonucleic acid (DNA) Constituent of *chromosome*s that stores the hereditary information of an organism in the form of a sequence of purine and pyrimidine bases: this information relates to the synthesis of proteins, and hence it is a determinant of all physical and functional activities of the cell, and consequently of the whole organism.

deoxyribonucleic acid (DNA) **cloning** Replication of *DNA* sequences ligated into a suitable *vector* in an appropriate host organism.
See *deoxyribonucleic acid*.
[9]

deoxyribonucleic acid (DNA) **repair** Restoration of the molecular structure of *DNA* after it has been damaged by a chemical or physical agent: This may involve direct DNA damage reversal, base excision repair, nucleotide excision repair, mismatch repair, or double-strand break repair.

deoxyribonucleic acid (DNA) **sequencing**
Determining the order of base pairs in a *DNA* molecule.
See *deoxyribonucleic acid*.
After [9]

dependence

1. A psychic craving for a *drug* or other substance that may or may not be accompanied by a physical dependency.
2. Reliance on a drug or other substance to maintain *health*.

depilatory Substance causing loss of hair.

deposition
1. Process by which a substance arrives at a particular organ or tissue site, for example, the deposition of particles on the ciliated epithelium of the bronchial airways.
2. Process by which a substance sediments out of the atmosphere or water and settles in a certain place.

dermal cutaneous Pertaining to the skin.

dermal irritation Skin reaction resulting from a single or multiple *exposure* to a physical or chemical entity at the same site, characterized by the presence of *inflammation*; it may result in cell death.

dermatitis *Inflammation* of the skin: contact dermatitis is due to local *exposure* and may be caused by irritation, allergy, or infection.

descriptive epidemiology Study of the occurrence of disease or other *health*-related characteristics in populations, including general observations concerning the relationship of disease to basic characteristics such as age, sex, race, occupation, and social class; it may also be concerned with geographic location. The major characteristics in descriptive epidemiology can be classified under the headings: individuals, time, and place.

desensitization Suppression of sensitivity of an organism to an allergen to which the organism has been *exposed* previously.

desiccant
1. Drying agent.
2. In agriculture, a substance used for drying up plants and facilitating their mechanical harvesting.

desorption Decrease in the amount of adsorbed substance; opposite of *adsorption*.

desquamation Shedding of an outer layer of skin in scales or shreds.

deterministic Term applied to *health* effects, the severity of which varies with the dose and for which a *threshold* is believed to exist.

deterministic effect deterministic process Phenomenon committed to a particular outcome determined by fundamental physical principles.
See also *stochastic effect*.
[2]

detoxification detoxication
1. Process, or processes, of chemical modification that make a *toxic* molecule less toxic.
2. Treatment of patients suffering from poisoning in such a way as to promote physiological processes which reduce the probability or severity of *adverse effects*.

detriment Estimated measure of the expected harm or loss associated with an *adverse event*, usually in a manner chosen to facilitate meaningful addition over different events. It is generally the integrated product of arbitrary values of *risk* and *hazard* and is often expressed in terms such as costs in U.S. dollars, loss in expected years of life or loss in productivity, and is needed for numerical exercises such as cost–benefit analysis.

developmental toxicity *Adverse effect*s on the developing organism (including structural abnormality, altered growth, or functional deficiency or death) resulting from *exposure* through conception, gestation (including organogenesis), and postnatally up to the time of sexual maturation.

diaphoresis Profuse perspiration.

diaphoretic sudorific Substance that causes sweating.

diarrheal shellfish poisoning (DSP)**, diarrhetic shellfish poisoning** (DSP) Serious illness that is a consequence of consumption of bivalve shellfish (mollusks) such as mussels, oysters, and clams that have ingested, by filter feeding, large quantities of microalgae containing a group of high-molecular-weight polyethers such as okadaic acid, dinophysis toxins, pectenotoxins, and yessotoxin; *gastroenteritis* develops shortly after ingestion and generally lasts 1–2 days.

diffusion Spontaneous differential movement of components in a system.

Note: In molecular terms, the driving force for diffusion is random thermal motion. In thermodynamic terms, the driving force is a gradient of chemical potential.

[2]

diffusion coefficient, D Proportionality constant D, relating the *flux* (flux density) of amount of entities B, $J_{n,\mathrm{B}}$, to their *concentration* gradient

$$J_n = -D \operatorname{grad} c_{\mathrm{B}}$$

After [2]

dimercaprol 2,3-dimercaptopropan-1-ol See *2,3-bis (sulfanyl)propan-1-ol*.

diploid *Chromosome* state in which the chromosomes are present in homologous pairs.

Note: Normal human somatic (nonreproductive) cells are diploid (they have 46 chromosomes), whereas reproductive cells, with 23 chromosomes, are haploid.

discharge See *emission*.

discharge standard discharge release limit effluent standard emission standard Maximum amount of a *pollutant* released from a given source to a specified medium which is acceptable under specified circumstances.

discontinuous effect See *intermittent effect*.

discordance (genetic) Antonym: *concordance*
Any difference in a character between individuals due to genetic differences such as may occur in dizygotic twins, or between matched pairs in a *case cohort study*.

disease Literally, dis-ease, lack of ease; pathological condition that presents a group of symptoms peculiar to it and which establishes the condition as an abnormal entity different from other normal or pathological body states.

discontinuous effect See *intermittent effect*.

dispersion (in environmental chemistry) Dilution of a *pollutant* by spreading in the atmosphere or water due to diffusion or turbulent action.

disposition
1. Natural tendency shown by an individual or group of individuals, including any tendency to acquisition of specific diseases, often due to hereditary factors.
2. Total of the processes of *absorption* of a chemical into the circulatory systems, *distribution* throughout the body, *biotransformation*, and *excretion*.

[2]

dissipation Reduction in the amount of a *pesticide* or other compound that has been applied to plants, soil, etc. (used when it is not clear whether this is by mineralization degradation, binding, or leaching).

distributed source See *area source*.

distribution
1. Apportionment of a solute between two phases. The terms "partition" or "extraction" may also be used in this sense where appropriate.

[2]
2. Dispersal of a substance and its derivatives throughout the natural environment or throughout an organism.

[2]
3. Final location(s) of a substance within an organism after dispersal.

distribution constant See *partition ratio.*

distribution volume Theoretical volume of a body *compartment* throughout which a substance is calculated to be distributed.

[2]

2,3-disulfanyl-1-propanol See *2,3-bis(sulfanyl)propan-1-ol.*

diuresis Excretion of urine, especially in excess.

diuretic micturitic Agent that increases urine production.

DNA See *deoxyribonucleic acid*.

DNA adduct See *adduct.*

DNA amplification See *gene amplification, deoxyribonucleic acid.*

DNA cloning See *deoxyribonucleic acid cloning.*

DNA repair See *deoxyribonucleic acid repair.*

DNA sequencing See *deoxyribonucleic acid sequencing.*

dominant *Allele* that expresses its phenotypic effect when present in either the homozygous or the heterozygous state.
After [9]

dominant half life *Half life* of a fraction of a substance in a specific organ or *compartment* if it defines approximately the overall *clearance* rate for that substance at a specific time point.

[2]

dominant lethal mutation Genetic change occurring in a germ cell that does not cause dysfunction of the gamete but which is lethal to the fertilized egg or developing embryo which develops from it.

Note: Induction of a dominant lethal event after *exposure* to a chemical substance (dominant lethal test) indicates that the substance has affected germinal tissue of the test species.

dosage *Dose* divided by product of mass of organism and time of dose.

Note: Often expressed as mg (kg body weight)$^{-1}$ day^{-1} and may be used as a synonym for dose.

[2]

dose (of a substance) Total amount of a substance administered to, taken up, or absorbed by an organism, organ, or tissue.

[2]

dose (of radiation) Energy or amount of photons absorbed by an irradiated object during a specified *exposure* time divided by area or volume.

[2]

dose–effect Relation between *dose* and the magnitude of a measured biological change.
[2]

dose–effect curve Graph of the relation between *dose* and the magnitude of the biological change produced measured in appropriate units.

dose–effect relationship Association between *dose* and the resulting magnitude of a continuously graded change, either in an individual or in a population.
[2]

dose–response curve Graph of the relation between *dose* and the proportion of individuals in a population responding with a defined biological effect.
[2]

dose–response relationship Association between *dose* and the *incidence* of a defined biological effect in an *exposed* population usually expressed as percentage.
[2]

Draize test Evaluation of materials for their potential to cause dermal or ocular irritation and corrosion following local *exposure*; generally using the rabbit model (almost exclusively the New Zealand White) although other animal species have been used.

drug medicine pharmaceutical Any substance that when absorbed into a living organism may modify one or more of its functions.

Note: The term is generally accepted for a substance taken for a therapeutic purpose, but is also commonly used for abused substances.

duplicate portion sampling method (diet/food) duplicate diet study Study in which test persons consume their ordinary diet but, for each meal, they prepare for subsequent analysis a duplicate portion of all food as prepared, served, and consumed.

duplicate samples Two *sample*s taken under the same or comparable conditions.
See *replicate* sampling.

dysarthria Imperfect articulation of speech due to neuromuscular damage.

dysfunction Abnormal, impaired, or incomplete functioning of an organism, organ, tissue, or cell.

dysplasia Abnormal development of an organ or tissue identified by morphological examination.

dyspnea Difficult or labored breathing: shortness of breath.

ecogenetics Study of the influence of hereditary factors on the effects of *xenobiotics* on individual organisms.

ecology Branch of biology that studies the interactions between living organisms and all factors (including other organisms) in their environment: such interactions encompass environmental factors that determine the distributions of living organisms.

ecosystem Grouping of organisms (microorganisms, plants, animals) interacting together, with, and through their physical and chemical environments, to form a functional entity within a defined environment.

ecotoxicologically relevant concentration (ERC) environmentally relevant concentration (ERC) *Concentration* of a *pesticide* (active ingredient, formulations, and relevant metabolites) that is likely to affect a determinable ecological characteristic of an exposed system.
After [9]

ecotoxicology Study of the *toxic* effects of chemical and physical agents on all living organisms, especially on populations and communities within defined *ecosystems*; it includes transfer pathways of these agents and their interactions with the environment.

ectohormone See *pheromone*.

ectoparasiticide Substance intended to kill parasites living on the exterior of the host.

eczema Acute or chronic skin *inflammation* with *erythema*, papules, vesicles, pustules, scales, crusts, or scabs, alone or in combination, of varied *etiology*.

edema oedema Presence of abnormally large amounts of fluid in intercellular spaces of body tissues.

effect biomarker See *biomarker of effect*.

effective concentration (EC) *Concentration* of a substance that causes a defined magnitude of *response* in a given system.

Note: EC_{50} is the median concentration that causes 50 % of maximal response.

effective dose (ED) *Dose* of a substance that causes a defined magnitude of *response* in a given system.

Note: ED_{50} is the median dose that causes 50% of maximal response.

effluent Fluid, solid, or gas discharged from a given source into the external environment.

element (in molecular biology) Sequence in the promoter region of a *gene* that regulates expression of that *gene* through interaction with a trans-acting factor.

elimination (in toxicology) Disappearance of a substance from an organism or a part thereof, by processes of *metabolism*, *secretion*, or *excretion*.
[2]
See also *clearance*.

elimination half life or half time Period taken for the *plasma concentration* of a substance to decrease by half.

Note: May also be applied to other body compartments such as blood, specific organs, or tissues.

elimination rate Differential with respect to time of the *concentration* or amount of a substance in the body, or a part thereof, resulting from *elimination*.
[2]

eliminator (of a poison) Substance that contributes to the *elimination* of a poison from an organism.

embryo
1. Stage in the developing mammal at which the characteristic organs and organ systems are being formed: for humans, this involves the stages of development from the second to the eighth week postconception (inclusive).
2. In birds, the stage of development from the fertilization of the ovum up to hatching.
3. In plants, the stage of development within the seed.

embryonic period Period from fertilization to the end of major organogenesis.
[8]

embryotoxicity
1. Production by a substance of *toxic* effects in progeny in the first period of pregnancy between conception and the fetal stage.
2. Any *toxic* effect on the conceptus as a result of prenatal *exposure* during the embryonic stages of development: These effects may include malformations and variations, malfunctions, altered growth, prenatal death, and altered postnatal function.

embryotropic effect Change in the *embryo* and the regulation of its development.

emesis Vomiting.

emission discharge effluent release Release of a substance from a source, including discharges to the wider environment.

emission and exposure control Technical and administrative procedures and specifications applied for the monitoring, reduction, or *elimination* of *emissions* from a source or *exposure* to a target.

emission standard Quantitative limit on the *emission* or discharge of a substance from a source, usually expressed in terms of a time-weighted average *concentration* or a *ceiling value*.

endemic Present in a community or among a group of people; said of a disease prevailing continually in a region.

endocon Portion of a conjugated metabolite that is derived from a natural product (such as a sugar, amino acid, or other organic acid) of the metabolizing organism.
See also *exocon*, *phase II reaction*.
After [6]

endocrine Pertaining to *hormones* or to the glands that secrete hormones directly into the bloodstream.

endocrine disrupter endocrine modifier Exogenous chemical that alters function(s) of the endocrine system and consequently causes *adverse* health *effects* in an intact organism, its progeny, or (sub)populations.
[8]

endocrine modifier See *endocrine disrupter*.

endocytosis *Uptake* of material into a cell by invagination of the *plasma* membrane and its internalization in a membrane-bounded vesicle.
[2]
See also *phagocytosis, pinocytosis*.

endogenous Antonym: *exogenous* Produced within or caused by factors within an organism.
[2]

endoplasmic reticulum Intracellular complex of membranes in which proteins and lipids, as well as molecules for export, are synthesized and in which the *biotransformation* reactions of the monooxygenase enzyme systems occur.

Note: May be isolated as *microsomes* following cell fractionation procedures.

endothelial Pertaining to the layer of flat cells lining the inner surface of blood and lymphatic vessels, and the surface lining of serous and synovial membranes.

endothelium Layer of flattened epithelial cells lining the heart, blood vessels, and lymphatic vessels.
[2]

endotoxin *Toxin* that forms an integral part of the cell wall of certain bacteria and is released only upon breakdown of the bacterial cell; endotoxins do not form toxoids.

enteritis Intestinal *inflammation*.

enterohepatic circulation Cyclical process involving intestinal re*absorption* of a substance that has been excreted through the bile, followed by transfer back to the liver, making it available for biliary *excretion* again.

environment Aggregate, at a given moment, of all external conditions and influences to which a system under study is subjected.

environmental damage *Adverse effect*s to the natural environment.

environmental exposure level (EEL) Level (*concentration* or amount or a time integral of either) of a substance to which an organism or other component of the environment is *exposed* in its natural surroundings.

environmental fate Destiny of a chemical or biological *pollutant* after release into the natural environment.

environmental health Human welfare and its influence by the environment, including technical and administrative measures for improving the human environment from a *health* point of view.

environmental health impact assessment Estimate of the *adverse effects* to *health* or *risk*s likely to follow from a proposed or expected environmental change or development.

environmental health criteria documents Critical publications of IPCS containing reviews of methodologies and existing knowledge—expressed, if possible, in quantitative terms—of selected substances (or groups of substances) on identifiable, immediate, and long-term effects on human *health* and welfare.

environmental hygiene environmental sanitation Practical control measures used to improve the basic environmental conditions affecting human *health*, for example, clean water supply, human and animal *waste* disposal, protection of food from biological contamination, and housing conditions, all of which are concerned with the quality of the human environment.

environmental impact assessment (EIA) Appraisal of the possible environmental consequences of a past, ongoing, or planned action, resulting in the production of an environmental impact statement or 'finding of no significant impact (FONSI)'.

environmental impact statement (EIS) Report resulting from an *environmental impact assessment*.

environmental medicine Specialty devoted to the prevention and management of environmentally induced injury, illness, and disability, and the promotion of the health of individuals, families, and communities by ensuring a healthy environment.

environmental monitoring Continuous or repeated measurement of agents in the environment to evaluate environmental *exposure* and possible damage by comparison with appropriate reference values based on knowledge of the probable relationship between ambient exposure and resultant *adverse effect*s.

environmental protection

1. Actions taken to prevent or minimize *adverse effect*s to the natural environment.
2. Complex of measures including monitoring of environmental *pollution*, development and practice of environmental protection principles (legal, technical, and hygienic), including *risk assessment*, *risk management*, and *risk communication*.

environmental quality objective (EQO) Overall state to be aimed for in a particular aspect of the natural environment, for example, 'water in an estuary such that shellfish populations survive in good *health*'.

Note: Unlike an environmental quality standard, the EQO is usually expressed in qualitative and not quantitative terms.

environmental quality standard (EQS) ambient standard Amount *concentration* or mass concentration of a substance that should not be exceeded in an environmental system, often expressed as a *time-weighted average* measurement over a defined period.

environmental risk assessment Estimate of the probability that harm will result from a defined *exposure* to a substance in an environmental medium. The estimate is valid only for a given species and set of conditions.

environmental sanitation See *environmental hygiene.*

environmental tobacco smoke (ETS) See *sidestream smoke*.

environmental transformation Chemical transformation of substances resulting from interactions in the environment.

environmentally relevant concentration See *ecotoxicologically relevant concentration*.

enzootic Present in a community or among a group of animals; said of a disease prevailing continually in a region.

enzyme Biological catalyst: a protein, nucleic acid, or a conjugate of a protein with another compound (co-enzyme).

enzyme induction Process whereby an enzyme is synthesized in response to a specific substance or to other agents such as heat or a metal species.
[2]

epidemiology Study of the distribution and determinants of *health*-related states or events in specified populations and the application of this study to control of health problems.

epigastric Pertaining to the upper-middle region of the abdomen.

epigene/sis n., -tic adj. Phenotypic change in an organism brought about by alteration in the expression of genetic information without any change in the genomic sequence itself.

Note: Common examples include changes in nucleotide base methylation and changes in histone acetylation. Changes of this type may become heritable.

epigenetic See *epigene/sis, -tic*.

epileptiform Occurring in severe or sudden spasms, as in convulsion or epilepsy.

epithelioma Any tumor derived from *epithelium*.

epithelium Sheet of one or more layers of cells covering the internal and external surfaces of the body and hollow organs.
[2]

epitope Any part of a molecule that acts as an antigenic determinant: A macromolecule can contain many different epitopes, each capable of stimulating production of a different specific *antibody*.

equilibrium State of a system in which the defining variables (temperature, pressure, chemical potential) have constant values in time.
[2]

equivalent diameter (of a particle) Diameter of a spherical particle of the same density as a particle under investigation that, relative to a given phenomenon or property, would behave in the same way as the particle under investigation.

erythema Redness of the skin produced by congestion of the capillaries.

eschar Slough or dry scab on an area of skin that has been burnt.

estimated daily intake (EDI) Prediction of the daily *intake* of a residue of a potentially harmful agent based on the most realistic estimation of the residue levels in food and the best available food consumption data for a specific population: Residue levels are estimated taking into account known uses of the agent, the range of contaminated commodities, the proportion of a commodity treated, and the quantity of home-grown or imported commodities.

Note: The EDI is expressed in mg residue per person.

estimated environmental concentration (EEC) Predicted *concentration* of a substance, typically a *pesticide*, within an environmental *compartment* based on estimates of quantities released, discharge patterns, and inherent disposition of the substance (fate and distribution) as well as the nature of the specific receiving *ecosystems*.
See also *expected environmental concentration*.
After [9]

estimated exposure concentration (EEC) Measured or calculated amount or mass *concentration* of a substance to which an organism is likely to be *exposed*, considering *exposure* by all sources and routes.

estimated exposure dose (EED) Measured or calculated *dose* of a substance to which an organism is likely to be *exposed*, considering *exposure* by all sources and routes.

estimated maximum daily intake (EMDI) Prediction of the maximum daily intake of a residue of a potentially harmful agent based on assumptions of average food consumption per person and maximum residues in the edible portion of a commodity, corrected for the reduction or increase in residues resulting from preparation, cooking, or commercial processing.

Note: The EMDI is expressed in mg residue per person.

etiology aetiology
1. Science dealing with the cause or origin of *disease*.
2. In individuals, the cause or origin of disease.

eukaryote Antonym: *prokaryote* Cell or organism with the genetic material packed in a membrane-surrounded structurally discrete nucleus and with well-developed cell organelles.

Note: The term includes all organisms except archaebacteria, eubacteria, and cyanobacteria (until recently classified as cyanophyta or blue–green algae).

European Inventory of Existing Chemical Substances (EINECS) List of all substances supplied either singly or as components in preparations to persons in a Member State of the European Community on any occasion between 1 January 1971 and 18 September 1981.

eutrophic Describes a body of water with a high *concentration* of nutrient salts and a high or excessive rate of biological production.

eutrophication Adverse change in the chemical and biological status of a body of water following depletion of the oxygen content caused by decay of organic matter resulting from high primary production as a result of enhanced input of nutrients.

excess lifetime risk Additional or excess *risk* incurred over the lifetime of an individual by *exposure* to a *toxic* substance.

excess rate See *rate difference*.

exchange transfusion Method of active artificial *elimination* of *toxicity* consisting in complete replacement of blood of the patient by donor blood.

excipient Any largely inert substance added to a *drug* to give suitable consistency or form to the drug.

excitotoxicity Pathological process by which neurons are damaged and killed by the overactivation of *receptors* for the excitatory neurotransmitter glutamate, such as the *N*-methyl-d-aspartic acid (NMDA) receptor and α-amino-3-hydroxy-5-methyl-4-isoxazole propionic acid (AMPA) receptor.

Note: Excitotoxins like NMDA and kainic acid bind to glutamate t receptors, and can cause excitotoxicity by allowing high levels of calcium ions to enter cells, activating enzymes such as phospholipases, endonucleases, and proteases such as calpain which damage cell structures including the cytoskeleton, membranes, and *DNA*.

excretion Discharge or *elimination* of an absorbed or *endogenous* substance, or of a *waste* product, and (or) its *metabolites*, through some tissue of the body and its appearance in urine, feces, or other products normally leaving the body.

Note: Excretion does not include the passing of a substance through the intestines without *absorption*.

[2]
See also *clearance, elimination*.

excretion rate Amount of substance and (or) its *metabolite*s that is excreted divided by time of excretion.

[2]

exocon Portion of a conjugated metabolite that is derived from the parent molecule.

[6]

exogenous Antonym: *endogenous* Resulting from causes or derived from materials external to an organism.

exogenous substance See *xenobiotic*.

exon Coding section of a *gene* that is separated from other coding sequences of the same gene by intervening noncoding sequences.
See *intron*.

exothelium Layer of flattened epithelial cells external to an organ or tissue.

expected environmental concentration (EEC) expected exposure concentration (EEC) Calculated *concentrations* of a substance, typically a *pesticide*, in various environmental compartments based on calculations using maximum-*exposure* scenarios.

Note: EEC models assume a maximum number of applications per growing season at the maximum rate of application according to the application methods stated on the product label.

After [10]

expected exposure concentration (EEC) See *expected environmental concentration*.

experimental model ecosystem See *microcosm*.

explant Living tissue removed from its normal environment and transferred to an artificial medium for growth.

exponential decay Variation of a quantity according to the law

$$A = A_0 e^{-\lambda t}$$

where A and A_0 are the values of the quantity being considered at time t and zero, respectively, and λ is an appropriate constant.

[2]

exposed Antonyms: non-exposed, unexposed
Subject to a factor that is under study in the environment, for instance, an environmental *hazard*.

exposed group (sometimes abbreviated to **exposed**) (in epidemiology) People (or other organisms) who have been *exposed* to a supposed cause of a disease or *health* state of interest, or possess a

characteristic that is a determinant of the health outcome of interest.

exposure

1. *Concentration*, amount, or intensity of a particular physical or chemical agent or environmental agent that reaches the *target population*, organism, organ, tissue, or cell, usually expressed in numerical terms of concentration, duration, and frequency (for chemical agents and microorganisms) or intensity (for physical agents).
2. Process by which a substance becomes available for *absorption* by the target population, organism, organ, tissue, or cell, by any route.
3. For X- or gamma radiation in air, the sum of the electrical charges of all the ions of one sign produced when all electrons liberated by photons in a suitably small element of volume of air completely stopped, divided by the mass of the air in the volume element.

[2]

exposure assessment Process of measuring or estimating *concentration* (or intensity), duration, and frequency of *exposure*s to an agent present in the environment or, if estimating hypothetical exposures, that might arise from the release of a substance, or radionuclide, into the environment.

exposure biomarker See *biomarker of exposure*.

exposure control See *emission and exposure control*.

exposure–effect curve See *concentration–effect curve*.

exposure limit General term defining an administrative substance *concentration* or intensity of *exposure* that should not be exceeded.

exposure ratio In a *case control study*, value obtained by dividing the rate at which persons in the case group are *exposed* to a *risk* factor (or to a protective factor) by the *rate* at which persons in the control group are exposed to the risk factor (or to the protective factor) of interest.

exposure–response relationship See *concentration–response relationship*, *dose–response relationship*.

exposure surface Surface on a *target* where a substance (e.g., a *pesticide*) is present. With mammals, examples of outer *exposure* surfaces include the exterior of an eyeball, the skin surface, and a conceptual surface over the nose and open mouth. Examples of inner exposure surfaces include the gastrointestinal tract, the respiratory tract, and the urinary tract lining.

[12]

exposure test Determination of the level, *concentration*, or *uptake* of a potentially *toxic* compound and (or) its *metabolite*(s) in biological *sample*s from an organism (blood, urine, hair, etc.) and the interpretation of the results to estimate the absorbed *dose* or degree of environmental *pollution*; or the measuring of biochemical effects, usually not direct *adverse effect*s of the substance, and relating them to the quantity of substance absorbed, or to its concentration in the environment.

expressed sequence tag (EST) Partial or full complementary *DNA* sequence that can serve as a marker for a region of the *genome* which encodes an expressed product.

[9]

expression (in genetics) Conversion of the genetic information encoded in *DNA* into a final gene product (either a protein or any of the different types of RNA).

Note: Because changes in *RNA* synthesis are often estimated by measuring mRNA levels, the term 'gene expression' is often misleadingly used as synonymous with transcription. The term 'gene expression' includes transcription, processing, and splicing of mRNA, as well as translation, and post-translational modification of the protein product.

external validity Generalizability of the results of a particular study, beyond the limits of the population actually studied.

extracellular space Volume within a tissue, outside cells, and excluding vascular and lymphatic space.

[2]

extracellular volume Volume of fluid outside the cells but within the outer surface of an organism.

[2]

extraction ratio Amount of substance extracted from a source divided by the total contained within the source.

[2]

extra risk Probability that an agent produces an observed *response*, as distinguished from the probability that the response is caused by a spontaneous event unrelated to the agent.

extraneous residue limit (ERL) Refers to a *pesticide* residue or contaminant arising from environmental sources (including former agricultural uses) other than the use of a pesticide or contaminant substance directly or indirectly on the commodity. It is the maximum *concentration* of a pesticide residue or contaminant that is recommended by the *Codex Alimentarius Commission* to be legally permitted or recognized as acceptable in or on food, agricultural commodity, or animal feed.

Note: The mass content is expressed in milligrams of pesticide residue or contaminant per kilogram of commodity.

extrapolation Calculation, based on quantitative observations in *exposed* test species or in vitro test systems, of predicted *dose–effect* and *dose–response relationships* for a substance in humans and other biota including interspecies extrapolations and extrapolation to susceptible groups of individuals.

Note: The term may also be used for qualitative information applied to species or conditions that are different from the ones in which the original investigations were carried out.

extrapyramidal movement disorders Involuntary movement disorders mediated by signaling through neurons outside the pyramidal (corticospinal) tract, often describing side effects of psychiatric medications.

fecundity

1. Ability to produce offspring frequently and in large numbers.
2. In demography, the physiological ability to reproduce.
3. Ability to produce offspring within a given period of time.

[8]

feromone ectohormone pheromone Substance used in olfactory communication between organisms of the same species eliciting a change in sexual or social behavior.

fertility Ability to conceive and to produce offspring: For litter-bearing species, the number of offspring per litter is used as a measure of fertility.

Note: Reduced fertility is sometimes referred to as subfertility.

fertility toxicant Produces abnormalities of male or female reproductive functions or impairs reproductive capacity.

fertilizer Substance applied to soil or hydroponic systems for improving the root nutrition of plants with the aim of increasing crop yields and (or) controlling production.

fetal period See *fetus*.

fetotoxicity *Toxicity* to the *fetus*.

fetus (often incorrectly foetus) Young mammal within the uterus of the mother from the visible completion of characteristic organogenesis until birth.

Note: In humans, this period is usually defined as from the third month after fertilization until birth (prior to this, the young mammal is referred to as an embryo).

fibrosis Abnormal formation of fibrous tissue.

fiducial limit Form of confidence limit given as a stated probability, for example, $P = 0.95$.

Note: In toxicology, the terms 'fiducial limits' and 'confidence limits' are generally considered to be synonymous.

finding of no significant impact (FONSI) Statement prepared and issued to the public when the results of an environmental impact assessment identify no harmful effects of concern.

See *environmental impact assessment*.

first-order chemical reaction first-order reaction

1. Chemical reaction where the initial rate is directly proportional to the *concentration* of one of the reactants.

[2]

2. Any process in which a variable decreases with time at a constant fractional amount.

[2]

first-pass effect *Biotransformation* and, in some cases, *elimination* of a substance in the liver after *absorption* from the intestine and before it reaches the *systemic* circulation.

[2]

first-pass metabolism See *first-pass effect*.

fixed dose procedure Acute *toxicity* test in which a substance is tested initially at a small number (3 or 4) predefined *dose*s to identify which produces evident toxicity without lethality: The test may be repeated at one or more higher or lower defined discriminating doses to satisfy the criteria.

fluoridosis See *fluorosis*.

fluorosis fluoridosis

*Adverse effect*s of fluoride, as in dental or skeletal fluorosis.

flux (of a quantity) Flow rate of an entity through a cross-section perpendicular to the flow divided by the cross-sectional area.

foci (singular focus) in neoplasia Small groups of cells distinguishable, in appearance or histochemically, from the surrounding tissue: indicative of an early stage of a lesion that may lead to the formation of a neoplastic nodule.

foetus See *fetus*.

follow-up study See *cohort study*.

food additive Any substance, not normally consumed as a food by itself and not normally used as a typical ingredient of a given food, whether or not it has nutritive value, that is added intentionally to food for a technological (including organoleptic) purpose in the manufacture, processing, preparation, treatment, packing, packaging, transport, or holding of the food. Addition results, or may be reasonably expected to result (directly or indirectly), in the substance or its byproducts becoming a component of, or otherwise affecting, the characteristics of the food to which it is added.

Note: The term does not include 'contaminants' or substances added to food for maintaining or improving nutritional qualities.

food allergy *Hypersensitivity* reaction to substances in the diet to which an individual has previously been sensitized.

food chain Sequence of transfer of matter and energy in the form of food from organism to organism in ascending or descending *trophic levels*.

food intolerance Physiologically based reproducible, unpleasant (adverse) reaction to a specific food or food ingredient that is not immunologically based.

food web Network of *food chains*.

forced diuresis Method of stimulating diuresis based on performing hydrational therapy, sometimes with parallel introduction of diuretics, with the aim of achieving increased clearance of a *toxic* substance in urine.

foreign substance See *xenobiotic*.

founder effect Changes in allelic frequencies that occur when a small group is separated from a large population and establishes a colony in a new location.
[9]

fractionation Process of classification of an analyte or a group of analytes from a *sample* according to physical (e.g., size, solubility) or chemical (e.g., bonding, reactivity) properties.
[2]

frame-shift mutation Point *mutation* involving either the deletion or insertion of one or two nucleotides in a *gene*: By the frame shift mutation, the normal reading frame used when decoding nucleotide triplets in the gene is altered.

fumigant Substance that is vaporized in order to kill or repel pests.

functional genomics Development and implementation of technologies to characterize the mechanisms through which *gene*s and their products function and interact with each other and with the environment.
[9]

fungicide Substance intended to kill fungi.

fungus preparation Substance obtained from fungi that has an insecticidal effect reflecting the pathogenicity of the fungi for insects.

gamete Reproductive cell (either sperm or egg) containing a haploid set of *chromosome*s.

gametocide Substance intended to kill *gametes*.

gastroenteritis *Inflammation* of the stomach and intestine.

gastrointestinal Pertaining to or communicating with the stomach and intestine.

gavage Administration of materials directly into the stomach by esophageal intubation.

gene Length of *DNA* or *RNA* (in viruses) that encodes a functional product, which may be a polypeptide or a ribonucleic acid.

Note: A gene is the fundamental unit of heredity.
After [9]

gene amplification Occurrence of extra copies of a *gene*; with respect to a plasmid, an increase in the number of plasmid copies per cell, which may be induced by a specific treatment.

Note: Spontaneous gene amplification frequently occurs in tumor cells.

gene expression Transcriptional activation of a *gene* so that its functional product is produced.

gene therapy Introduction of genetic material into an individual, or the modification of the individual's genetic material, in order to achieve a therapeutic or prophylactic objective.
After [9]

genetic epidemiology Study of the correlations between phenotypic trends and genetic variation across population groups and the application of the results of such a study to control of health problems.

gene map Map showing the positions in the *genome* of *gene*s or other genetic markers, either relative to each other or as a physical map of absolute distances.

generally regarded as safe (GRAS) Phrase used to describe the USFDA philosophy that justifies approval of food additives that may not meet the usual test criteria for *safety* but have been used

extensively and have not demonstrated that they cause any harm to consumers.

genetically modified organism (GMO) Bacterium, plant, or animal whose *DNA* has been deliberately altered.

genetic polymorphism Existence of inter-individual differences in *DNA* sequences coding for one specific *gene*, giving rise to different functional and (or) morphological traits.
After [2]

genetic susceptibility Predisposition to a particular *disease* or sensitivity to a substance due to the presence of a specific allele or combination of *alleles* in an individual's *genome*.
After [9]

genetic toxicology Study of chemically or physically induced changes to the structure of *DNA*, including *epigenetic* phenomena or *mutations* that may or may not be heritable.

genome Complete set of chromosomal and extrachromosomal *genes* of an organism, a cell, an organelle, or a virus, i.e., the complete *DNA* component of an organism (or the complete *RNA* component of an RNA virus).

Note: This includes both the DNA present in the chromosomes and that in subcellular organelles (e.g., mitochondria or chloroplasts).

[2]

genomics

1. Science of using *DNA*- and *RNA*-based technologies to demonstrate alterations in *gene* expression.
2. (in toxicology) Method providing information on the consequences for gene expression of interactions of the organism with environmental stress, *xenobiotics*, etc.

[2]

genotoxic Capable of causing a change to the structure of the *genome*.

genotype Genetic constitution of an organism as revealed by genetic or molecular analysis; the complete set of *gene*s possessed by a particular organism, cell, organelle, or virus.

germ-free animal axenic animal Animal grown under sterile conditions in the period of postnatal development: Such animals are usually obtained by cesarean operation and kept in special sterile boxes in which there are no viable microorganisms (sterile air, food, and water are supplied).

germ-line cell Cell with a haploid *chromosome* content.

Note: In animals, the germ-line cells are the sperm or egg (synonym *gamete*); in plants, the pollen cell or the ovum.

After [9]

germinal aplasia Complete failure of gonad development.

germ warfare See *biological warfare*.

glomerular Pertaining to a tuft or cluster, as of a plexus of capillary blood vessels or nerve fibers, especially referring to the capillaries of the glomerular of the kidney.

glomerulus Tuft or a cluster, as of a plexus of capillary blood vessels or nerve fibers (e.g., capillaries of the filtration apparatus of the kidney).

glomerular filtration Formation of an ultrafiltrate of the blood occurring in the *glomerulus* of the kidney.
[2]

glomerular filtration rate Volume of ultrafiltrate formed in the kidney tubules from the blood passing through the glomerular capillaries divided by time of filtration.
[2]

glue-sniffing Inhalation of solvent vapor from plastic cements or other adhesives in order to become intoxicated.
See also *solvent abuse*.

glycobiology See *glycomics*.

glycome Description of the complete set of carbohydrates and their functions in a living organism.

glycomics glycobiology Global study of the structure and function of carbohydrates, especially oligosaccharides (short chains of sugars) in a living organism.

gnotobiont See *gnotobiote*.

gnotobiota Specifically and entirely known microfauna and microflora of a specially reared laboratory animal.

gnotobiot/e n., **-ic** adj. gnotobiont Specially reared laboratory animal whose microflora and microfauna are specifically known in their entirety.

goiter Noncancerous enlargement of the thyroid gland, visible as a swelling at the front of the neck, that is often associated with iodine deficiency.

goitrogen Any substance (such as thiouracil) that induces the formation of a goiter.

gonadotropic Pertaining to effects on sex glands and on the systems that regulate them.

good agricultural practice (GAP) in the use of pesticides Nationally authorized safe uses of *pesticides* under actual conditions necessary for effective and reliable pest control.

Note: It encompasses a range of levels of pesticide applications up to the highest authorized use, applied in a manner that leaves a residue which is the smallest amount practicable. Authorized safe uses include nationally registered or recommended uses, that take into account public and occupational *health* and environmental safety considerations. Actual conditions include any stage in the production, storage, transport, distribution, and processing of food commodities and animal feed.

good laboratory practice (GLP) principles Fundamental rules incorporated in OECD guidelines and national regulations concerned with the process of effective organization and the conditions under which laboratory studies are properly planned, performed, monitored, recorded, and reported.

good manufacturing practice (GMP) principles Fundamental rules incorporated in national regulations concerned with the process of effective organization of production and ensuring standards of defined quality at all stages of production, distribution, and marketing.

Note: Minimization of *waste* and its proper disposal are part of this process.

graded effect Antonyms: *all-or-none effect*, *quantal effect*, *stochastic effect* Consequence that can be measured on a graded scale of intensity or severity and its magnitude related directly to the *dose* or *concentration* of the substance producing it.

graminicide *Pesticide (herbicide)* used for the control of weedy grasses (*Gramineae*).
[6]

granuloma Granular growth or *tumor*, usually of lymphoid and epithelial cells.

ground treatment of plants Dusting or spraying of plants with *pesticides* by hand, by special machines, or by apparatus fixed to tractors or driven by them.

guideline for exposure limits Scientifically judged quantitative value (a *concentration* or number) of an environmental constituent that ensures aesthetically pleasing air, water, or food and from which no *adverse effect* is expected concerning noncarcinogenic endpoints, or that gives an acceptably low estimate of lifetime *cancer risk* from those substances which are proven human *carcinogens* or carcinogens with at least limited evidence of human *carcinogenicity*.

guideline value Quantitative measure (a *concentration* or a number) of a constituent of an environmental medium that ensures aesthetically pleasing air, water, or food and does not result in a significant *risk* to the user.

guides to air quality Sets of atmospheric *concentration*s and *exposure* times that are associated with specific effects of varying degrees of *pollution* on humans, animals, vegetation, and the environment in general.

guides to environmental quality Sets of *concentration*s, numbers and *exposure* times that are associated with the specific effects of factors in environmental media on humans, animals, vegetation, and the environment in general.

guinea-pig maximization test Magnusson and Kligman test Widely used skin test for screening possible contact *allergens*: considered to be a useful method to identify likely moderate and strong *sensitizers* in humans.

haem See *heme*.

half life, $t_{1/2}$ half time Time required for the *concentration* of a reactant in a given reaction to reach a value that is the arithmetic mean of its initial and final (equilibrium) values. For a reactant that is entirely consumed, it is the time taken for the reactant concentration to fall to one-half of its initial value.

Note: The half life of a reaction has meaning only in special cases:

1. For a first-order reaction, the half life of the reactant may be called the half life of the reaction.
2 For a reaction involving more than one reactant, with the *concentration*s of the reactants in their stoichiometric ratios, the half life of each reactant is the same, and may be called the half life of the reaction. If the concentrations of reactants are not in their stoichiometric ratios, there are different half lives for different reactants, and one cannot speak of the half life of the reaction.

See also *biological half life*, *elimination half life*.
[2]

half time, $t_{1/2}$ See *half life*.

haploid monoploid State in which a cell contains only one set of *chromosome*s.

haplotype
1. Contraction of the phrase "haploid genotype", the genetic constitution of an individual with respect to one member of a pair of allelic *genes*: Haplotype can refer to only one locus or to an entire genome (a *genome*-wide haplotype would comprise half of a diploid genome, including one allele from each allelic gene pair).
2. Set of *single nucleotide polymorphisms* found to be statistically associated on a single chromatid.

hapten Low-molecular-mass *species* which is not itself antigenic unless complexed with a carrier, such as a protein. Once bound, it presents an *epitope* that can cause the *sensitization* of *lymphocytes*.
After [1]

harm adverse effect Damage or *adverse effect* to a population, species, individual organism, organ, tissue, or cell.

harmful occupational factor Component of the work environment, the effect of which on a worker under certain conditions leads to ill *health* or reduction of working ability.

harmful substance noxious substance Substance that, following contact with an organism, can cause ill *health* or *adverse effect*s either at the time of *exposure* or later in the life of the present and future generations.

hazard Set of inherent properties of a substance, mixture of substances, or a process involving substances that, under production, usage, or disposal conditions, make it capable of causing *adverse effect*s to organisms or the environment, depending on the degree of *exposure*; in other words, it is a source of danger.
See also *risk.*

hazard assessment Determination of factors controlling the likely effects of a *hazard* such as the *dose–effect* and *dose–response relationships*, variations in *target* susceptibility, and mechanism of *toxicity*.

hazard communication standard U.S. OSHA standard requiring all employers to inform employees of the *hazard* of substances in the workplace and the steps necessary to avoid harm.

hazard evaluation Establishment of a qualitative or quantitative relationship between *hazard* and benefit, involving the complex process of determining the significance of the identified hazard and balancing this against identifiable benefit.

Note: This may subsequently be developed into a *risk* evaluation.

hazard identification Determination of substances of concern, their *adverse effect*s, *target* populations, and conditions of *exposure*, taking into account *toxicity* data and knowledge of effects on human *health*, other organisms, and their environment.

hazard index (HI) Sum of the *hazard* quotients for substances that affect the same target organ or organ system.

Note: Ideally, hazard quotients should be combined for pollutants that cause *adverse effects* by the same mechanism. Aggregate exposures below a hazard index of 1.0 were unlikely to result in adverse health effects over a lifetime of *exposure*. A hazard index greater than 1.0 does not necessarily suggest a likelihood of adverse effects. The hazard index cannot be translated to a probability that adverse effects will occur, and is not likely to be proportional to risk.

hazard quotient (HQ) Ratio of *toxicant exposure* (estimated or measured) to a reference value regarded as corresponding to a threshold of *toxicity*.

Note: If the *hazard* quotient exceeds unity, the toxicant may produce an *adverse effect*, but normally this will require a hazard quotient of several times unity; a hazard quotient of less than 1.0 indicates that no adverse effects are likely over a lifetime of exposure.

hazardous production factor hazard at work hazardous occupational factor Production factor the effect of which on a worker under certain conditions results in injury or some impairment of *health*.

health
1. State of complete physical, mental, and social well-being, and not merely the absence of *disease* or infirmity.
2. State of dynamic balance in which an individual's or a group's capacity to cope with the circumstances of living is at an optimal level.
3. State characterized by anatomical, physiological, and psychological integrity; ability to perform personally valued family, work, and community roles; ability to deal with physical, biological, psychological, and social stress; a feeling of well-being; and freedom from the *risk* of disease and untimely death.
4. In ecology, a sustainable steady state in which humans and other living organisms can coexist indefinitely.

health advisory level (HAL) In the United States, nonregulatory health-based reference level of chemical traces (usually in ppm, i.e., mg L^{-1}) in drinking water at which there are no adverse health *risks* when ingested over various periods of time.

Note: Such levels are established for 1 day, 10 days, long-term and life-time *exposure* periods. They allow for a wide margin of safety.

health-based exposure limit Maximum *concentration* or intensity of *exposure* that can be tolerated without significant effect (based on only scientific and not economic evidence concerning exposure levels and associated *health* effects).

health hazard Any factor or *exposure* that may adversely affect *health*.

health surveillance Periodic medico-physiological examinations of *exposed* workers with the objective of protecting *health* and preventing occupationally related disease.

healthy worker effect Epidemiological phenomenon observed initially in studies of occupational *diseases*: Workers usually exhibit lower overall disease and death rates than the general population, due to the fact that the old, severely ill, and disabled are ordinarily excluded from employment. Death rates in the general population may be inappropriate for comparison, if this effect is not taken into account.

heat shock proteins stress proteins Group of proteins whose synthesis is increased by increased transcription when cells are exposed to elevated temperatures.

Note: Production of high levels of heat shock proteins can also be triggered by *exposure* to different kinds of environmental stress conditions, for example, infection, *inflammation*, exposure of the cell to chemicals (such as ethanol, arsenicals, or certain metal species), ultraviolet light, starvation, hypoxia (oxygen deprivation), nitrogen deficiency (in plants), or water deprivation. Hence, the alternative name, stress proteins. Their upregulation is sometimes described more generally as part of the stress response.

heavy metal toxic metal Erroneous terms used commonly in the toxicological literature but having no generally agreed meaning, sometimes even applied to nonmetals, and therefore a source of confusion and to be avoided. The term 'metal' is adequate without the qualifying adjective but may be misleading since it implies a solid material when toxicological concern is mostly for the ionic form or another chemical species.

helminthagogue See *anthelmint(h)ic*.

helminthic See *anthelmint(h)ic*.

hematemesis Vomiting of blood.

hematoma Localized accumulation of blood, usually clotted, in an organ, space, or tissue, due to a failure of the wall of a blood vessel.

hematotoxicity Adverse changes in blood caused by *exposure* to chemicals.

hematuria Presence of blood in the urine.

heme haem Complex consisting of an iron ion coordinated to a *porphyrin* acting as a tetradentate ligand, and to one or two axial ligands.
After [3]

hemochromatosis Hereditary disorder affecting iron metabolism in which excessive amounts of iron accumulate in the body tissues.

Note: The disorder is characterized by diabetes mellitus, liver dysfunction, and a bronze pigmentation of the skin.

hemodialysis Use of an artificial kidney to remove *toxic* compounds from the blood by passing it through a tube of semipermeable membrane.

Note: The tube is bathed in a dialyzing solution to restore the normal chemical composition of the blood while permitting diffusion of toxic substances from the blood.

hemoglobin *Heme*-containing protein in red blood cells with an important function in transporting oxygen from the lungs to body tissues.

hemoglobinuria Presence of free *hemoglobin* in the urine.

hemolysin Substance that damages the membrane of erythrocytes causing the release of *hemoglobin*.

hemolysis Release of *hemoglobin* from erythrocytes, and its appearance in the *plasma*.

hemoperfusion Passing blood through a column of charcoal or adsorbent resin for the removal of *drug*s or *toxins*.

hemosiderin Insoluble iron(III) hydroxide-based pigment deposited in cells in conditions of iron overload.

Henderson–Hasselbalch equation Equation of the form:

$$pH = pKa - \lg([HA]/[A^-])$$

for the calculation of the pH of solutions where the ratio $[HA]/[A^-]$ is known and HA and A^- are the

hydronated and dehydronated forms of an acid, respectively.
Corrected from [3]

hepatic Pertaining to the liver.

hepatotoxic Poisonous to liver cells.

Henry's law constant At constant temperature and pressure, the ratio of the partial pressure of a gas above a liquid to its solubility in the liquid and therefore a measure of its partition between the gas phase and the solute phase.

Note 1: The solubility may be expressed in any convenient units, such as amount fraction, molality, or amount (substance) concentration. The exact definition used should always be given.

Note 2: Rigorously, the Henry's law constant is the limiting value at zero partial pressure.

[13]

herbicide Substance intended to kill plants.

heterozygote Organism that has different allelic forms of a specified *gene* on each of a pair of homologous *chromosomes* or describing the *genome* of that organism.
After [9]

Hill plot Graphical method for analyzing binding of a molecule A to a macromolecule P with n binding sites. A Hill plot of $\lg[\theta/(1-\theta)]$ vs. $\lg[A]$ has a slope of 1 if binding is noncooperative and >1 for cooperative binding, where $\theta = [A]_{bound}/n[P]_{total}$ is the fraction of sites occupied.
[2]

histamine 2-(1H-imidazol-4-yl)ethan-1-amine, an amine derived from histidine by decarboxylation and released from cells in the *immune system* as part of an allergic reaction: It is a powerful stimulant of gastric secretion, constrictor of bronchial smooth muscle, and vasodilator.

histogenic origin Germ cell layer of the *embryo* from which a given adult tissue develops.

histology Study (usually microscopic) of the anatomy of tissues and their cellular and subcellular structure.

histopathology Microscopic pathological study of the anatomy and cell structure of tissues in disease to reveal abnormal or adverse structural changes.

hit-and-run effect Toxicity that follows a single *exposure* to a substance.

homeostasis Normal, internal stability in an organism maintained by coordinated responses of the organ systems that automatically compensate for environmental changes.

homology (in biology)
1. Similarity of anatomical structures in different species because of shared ancestry
2. Similarity of *DNA* or *RNA* nucleotide sequences, or of protein amino-acid sequences, supporting the hypothesis that they share a common ancestor.

Note: Homology among DNA or RNA nucleotide sequences, or among protein amino-acid sequences, is often concluded on the basis of sequence similarity. In general, if there are almost identical sequences, it is likely that they are homologous. However, it is possible that highly similar sequences were not derived from a common ancestor, i.e., they are similar but not homologous.

homozygote Organism that has the same allelic form of a specified *gene* on each of a pair of homologous chromosomes or describing the genome of that organism.
After [9]

horme/sis n., **-tic** adj. Benefit at low dose of a substance that is harmful at a higher dose.

hormone Substance formed in one organ or part of the body and carried in the blood to another organ or part where it selectively alters functional activity.

human ecology Interrelationship between humans and the entire environment – physical, biological, socioeconomic, and cultural, including the interrelationships between individual humans or groups of humans and other human groups or groups of other species.

human equivalent dose Human *dose* of an agent that is believed to induce the same magnitude of a *toxic* effect that the known animal dose has induced.

human exposure threshold (of toxicological concern) Generic value of *exposure* to a substance, or a group of substances falling within a defined structural class, below which there is expected to be no appreciable risk to human health.

hydrolysis Chemical reaction of a substance with water, usually resulting in the formation of one or more derivatives.

hydrophilic/ adj., **-ity** n. lipophobic Antonym: *hydrophobic* Describing the character of a substance, material, molecular entity, or group of atoms which has an affinity for water.

hydrophobic/ adj., **-ity** n. lipophilic Antonym: *hydrophilic* Describing the character of a substance, material, molecular entity, or group of atoms which is insoluble or confers insolubility in water, or resistance to wetting or hydration.

hygiene Science of *health* and its preservation.

hyper- Antonym: *hypo-* Prefix meaning above or excessive: when used with the suffix '-emia' refers to blood and with the suffix '-uria' refers to urine, for example, 'hyperbilirubinemia'.

hyperemia Excessive amount of blood in any part of the body.

hyperalimentation Ingestion or administration of nutrients in excess of optimal amounts.

hyperbilirubinemia Excessive *concentration* of bilirubin in the blood.

hypercalcemia Excessive *concentration* of calcium in the blood.

hyperglycemia Excessive *concentration* of glucose in the blood.

hyperkalemia Excessive *concentration* of potassium in the blood.

hypernatremia Excessive *concentration* of sodium in the blood.

hyperparathyroidism Abnormally increased parathyroid gland activity that affects, and is affected by, *plasma* calcium *concentration*.

hyperplasia Abnormal multiplication or increase in the number of normal cells in a tissue or organ.

hyper-reactivity Term used to describe the responses of (effects on) an individual to (of) an agent when they are qualitatively those expected, but quantitatively increased.

hyper-reflexia Exaggeration of reflexes.

hypersensitivity State in which an individual reacts with *allergic* effects following *exposure* to a certain substance (*allergen*) after having been *exposed* previously to the same substance.

Note: Most common chemical-induced allergies are type I (IgE-mediated) and type IV (cell-mediated) hypersensitivity.

hypersusceptibility Excessive reaction following *exposure* to a given amount or *concentration* of a substance as compared with the large majority of other *exposed* subjects.

hypertension Persistently high blood pressure in the arteries or in a circuit, for example, pulmonary hypertension or hepatic portal hypertension.

hypertrophy Excessive growth in bulk of a tissue or organ through increase in size but not in number of the constituent cells.

hypervitaminosis Condition resulting from the ingestion of an excess of one or more vitamins.

hypo- Prefix meaning under, deficient: when used with the suffix '-emia' refers to blood and with the suffix '-uria' refers to urine, for example, 'hypocalcemia'.

hypocalcemia Abnormally low calcium *concentration* in the blood.

hypokalemia Abnormally low potassium *concentration* in the blood.

hypomagnesemia Abnormally low magnesium *concentration* in the blood.

hyponatremia Abnormally low sodium *concentration* in the blood.

hypovolemic Pertaining to an abnormally decreased volume of circulating fluid (*plasma*) in the body.

hypoxemia Deficient oxygenation of the blood.

hypoxia

1. Abnormally low dioxygen content or tension.
2. Deficiency of dioxygen in the inspired air, in blood, or in tissues, short of anoxia.

hypoxic Dioxygen-deficient.

iatrogenic Any adverse condition resulting from medical treatment.

icterus Excess of bile pigment in the blood and consequent deposition and retention of bile pigment in the skin and the sclera.

idiopathic environmental intolerance See *multiple chemical sensitivity*.

idiosyncrasy Genetically based unusually high sensitivity of an organism to the effect of certain substances.

immediately-dangerous-to-life-or-health-concentration (IDLHC) According to the U.S. NIOSH, the maximum *exposure concentration* from which one could escape within 30 min without any escape-impairing symptoms or any irreversible *health* effects.

immission Environmental *concentration* of a *pollutant* resulting from a combination of *emission*s and dispersals (often synonymous with *exposure*).

immune complex Product of an *antigen–antibody* reaction that may also contain components of the complement system.

immune response Selective reaction of the body to substances that are foreign to it, or that the *immune*

system identifies as foreign, shown by the production of antibodies and *antibody*-bearing cells or by a cell-mediated *hypersensitivity* reaction.

immune system Integrated network of organs, glands, and tissues that has evolved to protect the body from foreign substances, including bacteria, viruses, and other infection-causing parasites and pathogens.

Note: The immune system may produce hypersensitivity reactions which, in the extreme, can be fatal. If the immune system misidentifies normal body components as foreign, this leads to autoimmune disorders, such as lupus, in which the body destroys its own constituents.

immunoassay Ligand-binding assay that uses a specific antigen or antibody, capable of binding to the analyte, to identify and quantify substances. The antibody can be linked to a radioisotope (radioimmunoassay, RIA) or to an enzyme which catalyzes an easily monitored reaction (enzyme-linked immunosorbent assay, ELISA), or to a highly fluorescent compound by which the location of an antigen can be visualized (immunofluorescence).
[3]

immunochemistry Study of biochemical and molecular aspects of immunology, especially the nature of *antibodies*, *antigens*, and their interactions.

immunogen See *antigen*.

immunoglobulin Family of closely related glycoproteins capable of acting as antibodies and present in *plasma* and tissue fluids; immunoglobulin E (IgE) is the source of *antibody* in type I *hypersensitivity* (*allergic*) reactions.

immunoglobulin E-mediated hypersensitivity State in which an individual reacts with allergic effects caused fundamentally by the reaction of *antigen*-specific *immunoglobulin* E following *exposure* to a certain substance (*allergen*) after having been *exposed* previously to the same substance.

immunomodulation Modification of the functioning of the *immune system* by the action of a substance that increases or reduces the ability to produce *antibodies*.

immunopotentiation Enhancement of the capacity of the *immune system* to produce an effective response.

immunosuppression Reduction in the functional capacity of the *immune response*; may be due to:
1. Inhibition of the normal response of the *immune system* to an *antigen*.
2. Prevention, by chemical or biological means, of the production of an *antibody* to an antigen by inhibition of the processes of transcription, translation, or formation of tertiary structure.

immunosurveillance Mechanisms by which the *immune system* is able to recognize and destroy *malignant* cells before the formation of an overt *tumor*.

immunotoxic Harmful to the *immune system*.

impermeable Of a membrane, not allowing a given substance to pass through. When applied to non-biological membranes with no qualification, the term normally refers to water.

implantation Attachment of the fertilized ovum (blastocyst) to the endometrium and its subsequent embedding in the compact layer, occurring 6 or 7 days after fertilization of the ovum.
[8]

in silico Phrase applied to data generated and analyzed using computer modeling and information technology.

in vitro Antonym: *in vivo* In glass, referring to a study in the laboratory usually involving isolated organ, tissue, cell, or biochemical systems.

in vivo Antonym: *in vitro* In the living body, referring to a study performed on a living organism.

incidence Number of occurrences of illness commencing, or of persons falling ill, during a given period in a specific population: usually expressed as a rate.

Note: When expressed as a rate, it is the number of ill persons divided by the average number of persons in the specified population during a defined period, or alternatively divided by the estimated number of persons at the mid-point of that period.
[2]

incidence rate (epidemiology) Measure of the frequency at which new events occur in a population.

Note: This is the value obtained by dividing the number of new events that occur in a defined period by the population at *risk* of experiencing the event during this period, sometimes expressed as person-time.

incremental unit risk estimate For an air pollutant, this is the additional lifetime *cancer risk* occurring in a hypothetical population in which all individuals are *exposed* continuously from birth throughout their lifetimes to a *concentration* of 1 microgram per cubic meter ($\mu g\ m^{-3}$) of the pollutant in the air they breathe.

indication Quantity value provided by a measuring instrument or a measuring system.
[7]

indirect exposure
1. *Exposure* to a substance in a medium or vehicle other than the one originally receiving the substance.
2. Exposure of people to a substance by contact with a person directly *exposed*.

individual monitor See *personal sampler*.

individual protective device (IPD) personal protective device (PPD) personal protective equipment (PPE) Device for individual use for protection of the whole body, eyes, respiratory pathways, or skin of workers against hazardous and harmful production factors.

individual risk Probability that an individual person will experience an *adverse effect*.

inducer Substance that causes *induction*.

induction Increase in the rate of synthesis of an *enzyme* in response to the action of an *inducer* or environmental conditions.

Note: Often the inducer is the substrate of the induced enzyme or a structurally similar substance (gratuitous inducer) that is not metabolized.

induction period latent period Time from the onset of *exposure* to the appearance of signs of *disease*.

industrial hygiene See *occupational hygiene*.

inert chemical Substance that is not generally reactive.

inert ingredient Any intentionally added ingredient of a mixture that does not contribute to the desired biological effect: This definition does not include impurities and does not imply that the inert ingredient has no biological effects. Related term: *active ingredient*

infertility (in human medicine) Inability to become pregnant within 1 year of unprotected intercourse.
[8]

inflammation Reaction of the body to injury or to infectious, allergic, or chemical irritation; characterized by redness, swelling, heat, and pain resulting from dilation of the blood vessels accompanied by loss of *plasma* and leucocytes (white blood cells) into the tissues.

infusion (in physiology) Therapeutic introduction of a fluid other than blood, as a (usually saline) solution, into a vein.
[2]

ingestion
1. Process of taking food and drink into the body by mouth.
2. Process of taking in particles by a phagocytic cell.

inhalation Act of drawing in of air, vapor, or gas and any suspended *particulates* into the lung.

inherently biodegradable Class of compounds for which there is unequivocal evidence of *biodegradation* (primary or ultimate) in any test of biodegradability.

inhibitory concentration (IC) *Concentration* of a substance that causes a defined inhibition of a given system.

Note: IC_{50} is the median concentration that causes 50 % inhibition.

inhibitory dose (ID) Dose of a substance that causes a defined inhibition of a given system.

Note: ID_{50} is the median dose that causes 50 % inhibition.

initiator
1. Agent that induces a change in a *chromosome* or *gene* that leads to the induction of *tumors* after a second agent, called a *promoter*, is administered to the tissue.
2. Substance that starts a chain reaction

Note: An initiator is consumed in a chain reaction, in contrast to a catalyst.

insecticide Substance intended to kill insects.

intake Amount of a substance that is taken into the body, regardless of whether or not it is absorbed: The total daily intake is the sum of the daily intake by an individual from food, drinking-water, and inhaled air.

integral indicator of toxic effect Parameter (such as body weight or temperature) characterizing the overall changes in the general state of the organism *exposed* to a *toxic* substance.

interactome Large-scale protein–protein interaction map.

interfacial layer Inhomogeneous space region intermediate between two bulk phases in contact, and where properties are significantly different from, but related to, the properties of the bulk phases.
[2]

intermittent effect discontinuous effect Biological change that comes and goes at intervals.

internal dose See *absorbed dose*.

internal validity Selection and comparison of index and comparison groups in such a manner that, apart from *sampling error*, the observed differences between these groups with respect to dependent variables under study may be attributed only to the hypothesized effect under investigation.

interpolation Estimation of a value between two known data points.

interpretation (of data or findings) Evaluation of the observations from an investigation or study in order to determine their significance for human *health*, for the environment or for both.

interspecies dose conversion Process of extrapolating from the doses of one animal species to another, for example, from rodent dose to human equivalent.

interstitial fluid Aqueous solution filling the narrow spaces between cells.
[2]

interstitial pneumonia Chronic form of pneumonia involving increase of the interstitial tissue and decrease of the functional lung tissue.

intervention study Epidemiological investigation designed to test a hypothesized cause–effect relationship by intentional change of a supposed causal factor in a population.

intestinal reabsorption Absorption further down the intestinal tract of a substance or substances that have been absorbed before and subsequently excreted into the intestinal tract, usually through the bile.

intoxication
1. Poisoning: pathological process with clinical signs and symptoms caused by a substance of *exogenous* or *endogenous* origin.
2. Drunkenness following consumption of beverages containing ethanol or other compounds affecting the central nervous system.

intrinsic activity Maximal stimulatory effect induced by a compound in relation to that of a given reference compound.
[2]

intrinsic clearance Volume of *plasma* or blood from which a substance is completely removed in a period of time under unstressed conditions.
[2]

intrinsic factor (in biochemistry) Specific protein required for the absorption of vitamin B_{12} and secreted by cells in the gastric glands of the stomach.
[2]

intron Noncoding sequence within *gene*s that separates the exons (coding regions).

Note: Introns are spliced out of the m*RNA* molecule created from a *gene* after transcription and prior to translation.

After [9]

ionizing radiation Any radiation consisting of directly or indirectly ionizing particles or a mixture of both or photons with energy higher than the energy of photons of ultraviolet light or a mixture of both such particles and photons.

irreversible alteration Change from normal structure or function that persists or progresses after cessation of *exposure* of the organism.

irritant
1. n., Substance that causes *inflammation* following immediate, prolonged, or repeated contact with skin, mucous membrane, or other biological material.

   Note: A substance capable of causing inflammation on first contact is called a primary irritant.
2. adj., Causing inflammation following immediate, prolonged, or repeated contact with skin, mucous membrane, or other tissues.

ischemia Local deficiency of blood supply and hence oxygen to an organ or tissue owing to constriction of the blood vessels or to obstruction.

isotonic Denoting a liquid exerting the same osmotic pressure or chemical potential of water (*water potential*) as another liquid with which it is being compared.

itai-itai disease Illness (renal osteomalacia) observed in the Toyama prefecture of Japan, resulting from the ingestion of cadmium-contaminated rice.

Note: Damage occurred to the *renal* and skeletoarticular systems, the latter being very painful ('itai' means 'ouch' in Japanese and refers to the intense pain caused by the condition).

jaundice Pathological condition characterized by deposition of bile pigment in the skin and mucous membranes, including the conjunctivae, resulting in yellow appearance of the patient or animal.

joint effect Simultaneous or successive effect of factors of diverse types (chemical, physical, biological) on an organism.

kairomone *Semiochemical* that is produced by one organism inducing a response in an organism of another species that is unfavorable to the emitter. Related terms: *allomone, synomone*

kinetics (in chemistry) Branch of chemistry concerned with measuring and studying rates of chemical reactions.
[2]

ketone bodies Acetoacetate, beta-hydroxybutyrate, and acetone, produced from acetyl-CoA, mainly in the mitochondria of liver cells when carbohydrates are so scarce that energy must be obtained from breaking down fatty acids; beta-hydroxybutyrate is not itself a ketone, but is called a ketone body because, like the other compounds, it is produced from ketones.

ketosis Pathological increase in the production of *ketone bodies*, for example, following blockage or failure of carbohydrate metabolism.

kinetics (in toxicology) See *toxicokinetics*.

knock-down Technique used to decrease the expression of a particular *gene* in a cell or living organism in order to define its function.

knock-in Technique used to express an *exogenous gene* or to overexpress an *endogenous* gene in a living organism in order to define its function.

Note: In mammalian toxicology, this technique is most readily applied to the mouse.

knock-out (in biology) Technique used to inactivate a particular *gene* in a living organism in order to define its function.

Note: In mammalian toxicology, this technique is most readily applied to the mouse.
After [9]

lachrymation See *lacrimation*.

lacrimation Secretion and discharge of tears.

lachrymator See *lacrimator*.

lacrimator Substance that irritates the eyes and causes the production of tears or increases the flow of tears.

larvicide Substance intended to kill larvae.

laryngospasm Reflex spasmodic closure of the sphincter of the *larynx*, particularly the glottic sphincter.

larynx Main organ of voice production, the part of the respiratory tract between the *pharynx* and the trachea.

lassitude Weakness; exhaustion.

latency See *latent period*.

latent effect See *delayed effect*.

latent period
1. Delay between *exposure* to a harmful substance and the manifestations of a *disease* or other *adverse effect*s.
2. Period from disease initiation to disease detection.

[2]

lavage Irrigation or washing out of a hollow organ or cavity such as the stomach, intestines, or lungs.

laxative cathartic purgative Substance that causes evacuation of the intestinal contents.

lead colic (painters' colic) Chronic intestinal pains and constipation caused by lead poisoning.

lesion
1. Area of pathologically altered tissue.
2. Injury or wound.
3. Infected patch of skin.

lethal Deadly; fatal; causing death.

lethal concentration (LC) *Concentration* of a substance in an environmental medium that causes death following a certain period of *exposure*.

lethal dose (LD) Amount of a substance or physical agent (e.g., radiation) that causes death when taken into the body.

lethal synthesis Metabolic formation of a highly *toxic* compound often leading to death of affected cells.

leukemia Progressive, *malignant* disease of the blood-forming organs, characterized by distorted proliferation and development of leucocytes and their precursors in the bone marrow and blood.

leukopenia Reduced *concentration* of leukocytes in the blood.

lgP_{ow} lgK_{ow} Logarithm to the base 10 of the partition coefficient of a substance between octan-1-ol and water.

Note: This is used as an empirical measure for lipophilicity in calculating *bioaccumulation*, fish *toxicity*, membrane *adsorption*, and penetration, etc.

library (in DNA bioinformatics) Collection of *DNA* sequences in a searchable electronic form.

library (in molecular biology) Collection of genomic or complementary *DNA* sequences that have been cloned in a *vector* and grown in an appropriate host organism (e.g., bacteria, yeast).
After [9]

life-long exposure Subjection to a potentially *toxic* substance during the whole lifetime.

ligand Ion, molecule, or molecular group that binds to another chemical entity to form a larger complex.

limacide Substance intended to kill mollusks including the gastropod mollusk, *Limax*.

limit recommended See *recommended exposure limit*.

limit test Acute *toxicity* test in which, if no ill-effects occur at a preselected maximum dose, no further testing at greater *exposure* levels is required.

limit value (LV) Limit *concentration* at or below which Member States of the European Community must set their *environmental quality standard* and *emission standard* for a particular substance according to Community Directives.

limited evidence According to the USEPA's Guidelines for Carcinogen *Risk* Assessment [17], 'limited evidence' is a collection of facts and accepted scientific inferences that suggests that an agent may be causing an effect, but this suggestion is not strong enough to be considered established fact.

linearized multistage model Sequence of steps in which (a) a *multistage model* is fitted to *tumor incidence* data; (b) the maximum linear term consistent with the data is calculated; (c) the low-*dose* slope of the *dose–response* function is equated to the coefficient of the maximum linear term; and (d) the resulting slope is then equated to the upper bound of *potency*.

lipophilic/ adj., **-ity** n. hydrophobic/ adj., -ty n. Antonyms: *hydrophilic/ -ity, lipophobic/ -ity* Having an affinity for fat and high lipid solubility.

Note: This is a physicochemical property which describes a partitioning equilibrium of solute molecules between water and an immiscible organic solvent, favoring the latter, and which correlates with *bioaccumulation*.

lipophobic/ adj., **-ity** n. hydrophilic/ adj., -ity n. Antonyms: *hydrophobic/* adj. *ity n., lipophilic/* adj. *ity n*. Having a low affinity for fat and a high affinity for water.

liposome

1. Artificially formed lipid droplet, small enough to form a relatively stable suspension in aqueous media, useful in membrane transport studies and in *drug* delivery.
2. Lipid droplet in the *endoplasmic reticulum* of a fatty liver.

After [1]

local effect Change occurring at the site of contact between an organism and a *toxicant*.

logit In competitive binding assays, the *logit*-log *dose* relationship, in which the *response* is defined by:

$$R = \text{logit}\,(y) = \lg\,[y/(1-y)]$$

where $y = b/b_0$ with b = fraction of tracer bound and b_0 = value of b with no unlabeled ligand in the system.

Note: Logit-transformed assay data frequently yield straight-line dose–response data, amenable to statistical analysis. More generally in toxicology, the transformation is applied to dose–response data where b_0 denotes the maximum response in the absence of a toxic substance.

[2]

log-normal distribution *Distribution* function $F(y)$, in which the logarithm of a quantity is normally distributed, i.e.,

$$F(y) = f\text{gauss}(\ln y)$$

where $f\text{gauss}(x)$ is a Gaussian (or normal) *distribution*.

[3]

log-normal transformation Transformation of data with a logarithmic function that results in a normal *distribution*.

[2]

long-term effect See *chronic effect*.

long-term exposure See *chronic exposure*.

long-term toxicity See *chronic toxicity*.

lowest-effective dose (LED) Lowest *dose* of a chemical inducing a specified effect in a specified fraction of *exposed* individuals.

[2]

lowest lethal concentration found See *minimum lethal concentration*.

lowest-observed-adverse-effect level (LOAEL) Lowest *concentration* or amount of a substance (*dose*), found by experiment or observation, that causes an *adverse effect* on morphology, functional capacity, growth, development, or life span of a *target* organism distinguishable from normal (control) organisms of the same species and strain under defined conditions of *exposure*.

lowest-observed-effect level (LOEL) Lowest *concentration* or amount of a substance (*dose*), found by experiment or observation, that causes any alteration in morphology, functional capacity, growth, development, or life span of *target* organisms distinguishable from normal (control) organisms of the same species and strain under the same defined conditions of *exposure*.

lymphocyte Animal cell that interacts with a foreign substance or organism, or one which it identifies as foreign, and initiates an immune response against the substance or organism.

Note: There are two main groups of lymphocytes, B lymphocytes and T lymphocytes.

lymphoma General term comprising *tumors* and conditions allied to tumors arising from some or all of the cells of lymphoid tissue.

lysimeter Laboratory column of selected representative soil or a protected monolith of undisturbed field soil with which it is possible to *sample* and monitor the movement of water and other substances.

lysosome Membrane-bound cytoplasmic organelle containing hydrolytic enzymes.

Note: Release of these enzymes from lysosomes damaged by xenobiotics can cause autolysis of the cell.

macrophage Large (10–20 μm diameter) amoeboid and phagocytic cell found in many tissues, especially in areas of *inflammation*, derived from blood monocytes and playing an important role in host defense mechanisms.

macroscopic (gross) pathology Study of changes associated with disease that are visible to the naked eye without the need for a microscope.

Mad Hatter syndrome See *mercurialism*.

Magnusson and Kligman test See *guinea-pig maximization test*.

mainstream smoke (tobacco smoking) Smoke that is inhaled by the smoker.

malaise Vague feeling of bodily discomfort.

malignancy Population of cells showing both uncontrolled growth and a tendency to invade and destroy other tissues.

Note: A malignancy is life-threatening.

malignant Antonym: *benign*

1. Tending to become progressively worse and to result in death if not treated.
2. In *cancer*, cells showing both uncontrolled growth and a tendency to invade and destroy other tissues.

mania Emotional disorder (mental illness) characterized by an expansive and elated state (euphoria), rapid speech, flight of ideas, decreased need for sleep, distractibility, grandiosity, poor judgment, and increased motor activity.

margin of exposure (MOE) Ratio of the *no-observed-adverse-effect level* (NOAEL) to the theoretical or *estimated exposure dose* (EED) or *concentration* (EEC).

margin of safety (MOS) See *margin of exposure*.

mass mean diameter Diameter of a spherical particle with a mass equal to the mean mass of all the particles in a population.

mass median diameter Diameter of a spherical particle with the median mass of all the particles in a population.

material safety data sheet (MSDS) Compilation of information required under the U.S. OSHA *Hazard* Communication Standard on the identity of hazardous substances, *health* and physical *hazard*s, *exposure* limits, and precautions.

maximum allowable (admissible, acceptable) concentration (MAC) Regulatory value defining the *concentration* that if inhaled daily (in the case of work people for 8 h with a working week of 40 h; in the case of the general population, 24 h) does not, in the present state of knowledge, appear capable of causing appreciable harm, however long delayed during the working life or during subsequent life or in subsequent generations.

maximum average daily concentration of an atmospheric pollutant peak daily average concentration of an air pollutant Highest of the average daily *concentration*s recorded at a definite point of measurement during a certain period of observation.

maximum contaminant level (MCL) Under the Safe Drinking Water Act (USA), primary MCL is a regulatory *concentration* for drinking water which takes into account both *adverse effect*s (including sensitive populations) and technological feasibility (including natural background levels): Secondary MCL is a regulatory concentration based on 'welfare', such as taste and staining, rather than *health*, but also takes into account technical feasibility.

Note: MCL Goals (MCLG) under the Safe Drinking Water Act do not consider feasibility and are zero for all human and animal *carcinogens*.

maximum exposure limit (MEL) Occupational *exposure* limit legally defined in the United Kingdom under COSHH as the maximum *concentration* of an airborne substance, averaged over a reference period, to which employees may be *exposed* by inhalation under any circumstances, and set on the advice of the HSC Advisory Committee on *Toxic* Substances.

maximum permissible concentration (MPC) See *maximum allowable concentration*.

maximum permissible daily dose Maximum daily dose of substance whose penetration into a human body during a lifetime will not cause diseases or *health hazard*s that can be detected by current investigation methods and will not adversely affect future generations.

maximum permissible level (MPL) Level, usually a combination of time and *concentration*, beyond which any *exposure* of humans to a chemical or physical agent in their immediate environment is unsafe.

maximum residue limit (MRL) for pesticide residues Maximum contents of a *pesticide* residue (expressed as mg kg^{-1} fresh weight) recommended by the *Codex Alimentarius Commission* to be legally permitted in or on food commodities and animal feeds.

Note: MRLs are based on data obtained following *good agricultural practice* and foods derived from commodities that comply with the respective MRLs are intended to be toxicologically acceptable.

maximum residue limit (MRL) for veterinary drugs Maximum contents of a *drug* residue (expressed as mg kg^{-1} or μg kg^{-1} fresh weight) recommended by the *Codex Alimentarius Commission* to be legally permitted or recognized as acceptable in or on food commodities and animal feeds.

Note: The MRL is based on the type and amount of residue considered to be without any toxicological *hazard* for human *health* as expressed by the acceptable daily intake (ADI) or on the basis of a temporary ADI that uses an additional uncertainty factor. It also takes into account other relevant public health *risks* as well as food technological aspects.

maximum tolerable concentration (MTC) Highest *concentration* of a substance in an environmental medium that does not cause death of test organisms or species (denoted by LC_0).

maximum tolerable dose (MTD) Highest amount of a substance that, when introduced into the body, does not kill test animals (denoted by LD_0).

maximum tolerable exposure level (MTEL) Maximum amount (*dose*) or *concentration* of a substance to which an organism can be *exposed* without leading to an *adverse effect* after prolonged *exposure* time.

maximum tolerated dose (MTD) High *dose* used in *chronic toxicity* testing that is expected on the basis of an adequate *subchronic* study to produce limited *toxicity* when administered for the duration of the test period.

Note 1: It should not induce
(a) overt toxicity, for example appreciable death of cells or organ dysfunction, or
(b) toxic manifestations that are predicted materially to reduce the life span of the animals except as the result of neoplastic development, or
(c) 10% or greater retardation of body weight gain as compared with control animals.

Note 2: In some studies, toxicity that could interfere with a carcinogenic effect is specifically excluded from consideration.

maximum velocity, V_{max} maximum rate In *Michaelis–Menten kinetics*, the maximum rate of *conversion* of a substrate when its *concentration* is not rate-limiting. [2]

mean life mean time Average lifetime of a molecular, atomic, or nuclear system in a specified state.

Note: For an exponentially decaying system, it is the average time for the number of molecules, atoms, or nuclei in a specified state to decrease by a factor of e, the base of natural logarithms.

mean residence time (in pharmacokinetics) (MRT) Average time a *drug* molecule remains in the body or an organ after rapid intravenous injection.

Note 1: Like clearance, its value is independent of dose.

Note 2: After an intravenous bolus:

$$t_r = A_m/A$$

where *t*r is the MRT, A is the area under the plasma concentration–time curve, and A_m is the area under the moment curve.

Note 3: For a drug with one-compartment distribution characteristics, MRT equals the reciprocal of the elimination rate constant.

After [2]

measurement uncertainty See *uncertainty*.

median effective concentration (EC_{50}) Statistically derived median *concentration* of a substance in an environmental medium expected to produce a certain effect in 50% of test organisms in a given population under a defined set of conditions.

Note: EC_n refers to the median concentration that is effective in *n*% of the test population.

median effective dose (ED_{50}) Statistically derived median *dose* of a chemical or physical agent (radiation)

expected to produce a certain effect in 50% of test organisms in a given population or to produce a half-maximal effect in a biological system under a defined set of conditions.

Note: ED_n refers to the median dose that is effective in $_n$ % of the test population.

median lethal concentration (LC_{50}) Statistically derived median *concentration* of a substance in an environmental medium expected to kill 50% of organisms in a given population under a defined set of conditions.

median lethal dose (LD_{50}) Statistically derived median *dose* of a chemical or physical agent (radiation) expected to kill 50% of organisms in a given population under a defined set of conditions.

median lethal time (TL_{50}) Statistically derived median time interval during which 50% of a given population may be expected to die following *acute* administration of a chemical or physical agent (radiation) at a given *concentration* under a defined set of conditions.

median narcotic concentration (NC_{50}) Statistically derived median *concentration* of a substance in an environmental medium expected to cause *narcotic* conditions in 50% of a given population under a defined set of conditions.

median narcotic dose (ND_{50}) Statistically derived dose of a substance expected to cause *narcotic* conditions in 50% of test animals under a defined set of conditions.

medicine

1. Science and practice of diagnosing, treating, or preventing disease and other damage to the body or mind.
2. Any drug or therapy used to treat disease or injury.

Note: Any substance may be used as a drug or a remedy; the end effect will depend on the dose.

meiosis Process of 'reductive' cell division, occurring in the production of *gametes*, by means of which each daughter nucleus receives half the number of *chromosome*s characteristic of the somatic cells of the species.

See also *miosis*.

mercurialism Mad Hatter syndrome

Chronic poisoning caused by *exposure* to mercury, often by breathing its vapor but also by skin absorption and, less commonly, by ingestion.

Note: Central nervous system damage usually predominates.

mesocosm See *microcosm*.

mesothelioma Malignant *tumor* of the mesothelium of the pleura, pericardium, or peritoneum, that may be caused by *exposure* to asbestos fibers and some other fibers.

metabolic activation bioactivation *Biotransformation* of a substance to a more biologically active derivative.

[2]

metabolic enzymes Proteins that catalyze chemical transformations of body constituents and, in more common usage, of *xenobiotics*.

[2]

metabolic half life metabolic half time

Time required for one-half of the quantity of a substance in the body to be metabolized.

Note: This definition assumes that the final quantity in the body is zero. See *half life*.

metabolic model Analysis and theoretical reconstruction of the way in which the body deals with a specific substance, showing the proportion of the intake that is absorbed, the proportion that is stored and in what tissues, the rate of breakdown in the body and the subsequent fate of the metabolic products, and the rate at which it is eliminated (see *elimination*) by different organs as unchanged substance or *metabolites*.

metabolic transformation *Biotransformation* of a substance that takes place within a living organism.

metabolism

1. Sum total of all physical and chemical processes that take place within an organism from uptake to elimination.
2. In a narrower sense, the physical and chemical changes that take place in a substance within an organism, including *biotransformation* to *metabolites*.

metabolite Intermediate or product resulting from *metabolism*.

metabolomics See *metabonomics*.

metabonomics metabolomics Evaluation of cells, tissues, or biological fluids for changes in *metabolite* levels that follow *exposure* to a given substance, in order to determine the metabolic processes involved, to evaluate the disruption in intermediary metabolic processes that results from *exposure* to that substance, or to determine the part of the genome that is responsible for the changes.

Note: Although 'metabolomics' and 'metabonomics' are frequently used as synonyms, there is a growing consensus that there is a difference

in that 'metabolomics' places a greater emphasis on comprehensive metabolic profiling, while 'metabonomics' is used to describe multiple (but not necessarily comprehensive) metabolic changes caused by a biological perturbation.

After [2]

metaplasia Abnormal transformation of an adult, fully differentiated tissue of one kind into a differentiated tissue of another kind.

metastasis

1. Movement of bacteria or body cells, especially *cancer* cells, from one part of the body to another, resulting in change in location of a disease or of its symptoms from one part of the body to another.
2. Growth of pathogenic microorganisms or of abnormal cells distant from the site of their origin in the body.

methaemoglobin See *methemoglobin*.

methemoglobin methaemoglobin Derivative of *hemoglobin* that is formed when the iron(II) in the *heme* porphyrin is oxidized to iron(III); this derivative cannot transport dioxygen.

methemoglobinaemia methaemoglobinaemia Presence of methaemoglobin in the blood in greater than normal proportion.

methemoglobin-forming substance methaemoglobinforming substance Substance capable of oxidizing directly or indirectly the iron(II) in *hemoglobin* to iron(III) to form methemoglobin.

Michaelis constant, K_M Substance *concentration* of *substrate* at which the rate of reaction is equal to one-half of the limiting rate (maximum rate).

Note: Also called the *Michaelis concentration*. The Michaelis constant (Michaelis concentration) may be used only when *Michaelis–Menten kinetics* is obeyed.

[2]

Michaelis–Menten kinetics Description of the dependence of an initial rate of reaction upon the *concentration* of a substrate S that is present in large excess over the concentration of an *enzyme* or other catalyst (or reagent) E with the appearance of saturation behavior following the Michaelis–Menten equation:

$$\nu = V[\mathrm{S}]_o/(K_M + [\mathrm{S}])$$

where $\underline{\upsilon}$ is the observed initial rate, V is its limiting value at substrate saturation (i.e., $[\mathrm{S}] >> K_M$), and K_M the substrate concentration when $\underline{\upsilon} = V/2$. The definition is experimental, i.e., it applies to any reaction that follows an equation of this general form. The symbols V_{max} or $\underline{\upsilon}_{max}$ are sometimes used for V.

Note 1: The parameters V and K_M (the '*Michaelis constant*') of the equation can be evaluated from the slope and intercept of a linear plot of $1/\upsilon$ vs. $1/[\mathrm{S}]$ ('Lineweaver–Burk plot') or from slope and intercept of a linear plot of υ vs. $v/[\mathrm{S}]$ ('Eadie–Hofstee plot').

Note 2: A Michaelis–Menten equation is also applicable to the condition where E is present in large excess, in which case the total *concentration* $[\mathrm{E}]_o$ appears in the equation instead of $[\mathrm{S}]_o$.

Note 3: The term has sometimes been used to describe reactions that proceed according to the scheme:

$$E + S \underset{k_{-1}}{\overset{k_1}{\rightleftarrows}} ES \xrightarrow{k_{cat}} \text{Products}$$

in which case $K_M = (k_{-1} + k_{cat})/k_1$ (Briggs–Haldane conditions). It has more usually been applied only to the special case in which $k_{-1} >> k_{cat}$ and $K_M = k_{-1}/k_1 = K_S$, the dissociation constant of the complex. In this case, K_M is a true dissociation constant (Michaelis–Menten conditions).
See also *rate-controlling step*.

[3]

Michaelis–Menten mechanism Simplest mechanism that explains *Michaelis–Menten kinetics*.

Note 1: According to the mechanism, a substrate S first combines with a molecule of enzyme E, and this process is followed by a step in which the *enzyme*-substrate complex ES breaks down (sometimes with the participation of the solvent) into enzyme and reaction products:

$$E + S \underset{k_{-1}}{\overset{k_1}{\rightleftarrows}} ES$$

$$ES \xrightarrow{k_2} E + \text{Products}$$

If, as is usual, the substrate S is present in great excess of the enzyme it can be shown that steady-state conditions apply, and that the rate equation is:

$$\nu = \frac{k_2 [E]_o [S]_o}{(k_{-1} + k_1)/k_1 + [S]_o}$$

where $[\mathrm{E}]_o$, $[\mathrm{S}]_o$ are the total *concentrations* of enzyme and substrate. This equation is of the required general form of the Michaelis–Menten equation.

Note 2: Other, more complicated, mechanisms lead to the *Michaelis–Menten equation*, adherence to which therefore does not require that the Michaelis–Menten mechanism applies.

[2]

microalbuminuria Chronic presence of albumin in slight excess in urine.

microarray Grid of nucleic acid molecules of known sequence linked to a solid substrate, which can be probed with a sample containing either m*RNA* or *complementary DNA* from a cell or tissue to reveal changes in *gene* expression relative to a control sample.

Note: Microarray technology, which is also known as 'DNA gene chip' technology, allows the expression of many thousands of *genes* to be assessed in a single experiment.

After [8]

microcosm experimental model ecosystem Artificial test system that simulates major characteristics of the natural environment for the purposes of ecotoxicological assessment.

Note: Such a system would commonly have a terrestrial phase, with substrate, plants, and herbivores, and an aquatic phase, with vertebrates, invertebrates, and plankton. The term '*mesocosm*' implies a more complex and larger system than the term '*microcosm*', but the distinction is not clearly defined.

micromercurialism Early or subclinical effects of *exposure* to elemental mercury detected at the low *exposure* levels.

micronucleus test Test for *mutagenicity* in which animals are treated with a test agent after which time the frequency of micronucleated cells is determined; if a test group shows significantly increased levels of micronucleated cells compared to a control group, the chemical is considered capable of inducing chromosomal damage.

microproteinemia Chronic presence of microprotein (alpha-1 and beta-2 microglobulin) in blood, indicating proximal renal tubule damage.

microsome Artefactual spherical particle, not present in the living cell, derived from pieces of the *endoplasmic reticulum* present in homogenates of tissues or cells.

Note: Microsomes sediment from such homogenates (usually the *S*9 fraction) when centrifuged at 100 000 g for 60 min: The microsomal fraction obtained in this way is often used as a source of *monooxygenase enzymes*.

micturitic See *diuretic*.

midstream sampling Taking an *aliquot* of a flowing liquid, such as urine, avoiding initial and terminal flow periods which are likely to be unrepresentative.

[2]

Minamata disease Neurological *disease* caused by methylmercury, first seen in subjects ingesting contaminated fish from Minamata Bay in Japan.

mineralization Complete conversion of organic substances to inorganic derivatives, often visible as microscopic deposits which may be associated with damage to soft tissue (e.g., in the kidney).

minimal risk level (MRL) Estimate of the daily human *exposure* to a hazardous substance that is likely to be without appreciable risk of adverse noncancer *health* effects over a specified duration of exposure: This substance-specific estimate is used by ATSDR health assessors to identify contaminants and potential health effects that may be of concern at hazardous waste sites.

minimum lethal concentration (LC_{min}) Lowest *concentration* of a *toxic* substance in an environmental medium that kills individual organisms or test species under a defined set of conditions.

minimum lethal dose (LD_{min}) Lowest amount of a substance that, when introduced into the body, may cause death to individual species of test animals under a defined set of conditions.

miosis meiosis (obsolete) myosis Abnormal contraction of the pupil of the eye to less than 2 mm.

miscible Liquid substances capable of mixing without separation into two phases; refers to liquid mixtures.

miticide Substance intended to kill mites.

mitochondri/on sing., **/a** pl. Eukaryote cytoplasmic organelle that is bounded by an outer membrane and an inner membrane; the inner membrane has folds called cristae that are the center of ATP synthesis in oxidative phosphorylation in the animal cell and supplement ATP synthesis by the chloroplasts in photosynthetic cells.

Note: The mitochondrial matrix within the inner membrane contains ribosomes, many oxidative *enzymes*, and a circular *DNA* molecule that carries the genetic information for a number of these enzymes.

mitogen Substance that induces *lymphocyte* transformation or, more generally, *mitosis* and cell proliferation.

mitosis Process by which a cell *nucleus* divides into two daughter nuclei, each having the same genetic complement as the parent cell: Nuclear division is usually followed by cell division.

mixed-function oxidase (MFO) See *monooxygenase*.

modifying factor (MF) See *safety factor, uncertainty factor*.

molluskicide limacide molluscicide Substance intended to kill mollusks.

monitoring Continuous or repeated observation, measurement, and evaluation of *health* and (or) environmental or technical data for defined purposes, according to prearranged schedules in space and time, using comparable methods for sensing and data collection.

Note: Evaluation requires comparison with appropriate reference values based on knowledge of the probable relationship between ambient *exposure* and *adverse effects*.

monoclonal Pertaining to a specific protein from a single clone of cells, all molecules of this protein being the same.

monoclonal antibody *Antibody* produced by cloned cells derived from a single *lymphocyte*.

monooxygenase mixed-function oxidase *Enzyme* that catalyzes reactions between an organic compound and molecular oxygen in which one atom of the oxygen molecule is incorporated into the organic compound and one atom is reduced to water; involved in the *metabolism* of many natural and foreign compounds giving both unreactive products and products of different or increased *toxicity* from that of the parent compound.

Note: Such enzymes are the main catalysts of phase 1 reactions in the metabolism of *xenobiotics* by the *endoplasmic reticulum* or by preparations of *microsomes*.

Monte Carlo simulation Analysis of a sequence of events using random numbers to generate possible outcomes in an iterative process.

After [2]

morbidity Any departure, subjective or objective, from a state of physiological or psychological well-being: In this sense, 'sickness', 'illness', and 'morbid condition' are similarly defined and synonymous.

morbidity rate Term (to be avoided) used loosely to refer to *incidence* or *prevalence* rates of *disease*.

morbidity survey Method for the estimation of the *prevalence* and (or) *incidence* of a *disease* or diseases in a population.

mordant Substance that fixes a dyestuff in or on a material by combining with the dye to form an insoluble compound, used to fix or intensify stains in a tissue or cell preparation.

mortality Death as studied in a given population or subpopulation.

Note: The term 'mortality' is often used incorrectly instead of 'mortality rate'.

mortality rate See *death rate*.

mortality study Investigation dealing with death rates or proportion of deaths attributed to specific causes as a measure of response.

mucociliary transport Process of removal of particles from the bronchi of the lungs in a mucus stream moved by cilia, thus contributing to *uptake* from the gastrointestinal tract.

[2]

Mulliken population analysis Partitioning scheme based on the use of density and overlap matrices, at one time used for allocating the electrons of a molecular entity in some fractional manner among its various parts (atoms, bonds, orbitals).

[2]

multicompartment model Product of a *compartmental analysis* requiring more than two *compartments*.

[2]

multifactorial disease Illness with pathogenesis dependent on complex interplay of genetic and (or) environmental factors.

After [9]

multigeneration study

1. *Toxicity* test in which two to three generations of the test organism are *exposed* to the substance being assessed.
2. Toxicity test in which only one generation is exposed and effects on subsequent generations are assessed.

multiple chemical sensitivity (MCS) idiopathic environmental intolerance Intolerance condition attributed to extreme sensitivity to various environmental chemicals, found in air, food, water, building materials, or fabrics.

Note: This syndrome is characterized by the patient's belief that his or her symptoms are caused by very low-level *exposure* to environmental chemicals. The term 'chemical' is used to refer broadly to many natural and

man-made chemical agents, some of which have several chemical constituents. Several theories have been advanced to explain the cause of multiple chemical sensitivity, including allergy, toxic effects, and neurobiologic sensitization. There is insufficient scientific evidence to confirm a relationship between any of these possible causes and symptoms.

multiple (or multiphasic) screening Procedure that has evolved by combining single screening tests, and is the logical corollary of mass screening.

Note 1: Where much time and effort have been spent by a population in attending for a single test such as mass radiography, it is natural to consider the economy of offering other tests at the same time.

Note 2: Multiple (or multiphasic) screening implies the administration of a number of tests, in combination, to large groups of people.

multipotent Of a cell, capable of giving rise to several different kinds of structure or types of cell. [2]

multistage cluster sampling Cluster sampling with more than two stages, each sampling being made on aggregates (or clusters) in which the clusters already obtained by the preceding sampling have been divided.

multistage model *Dose–response* model for *cancer* death estimation of the form

$$P = 1 - \exp[-(q_o + q_1 d_1 + q_2 d_2 + \ldots + q_k d_k)]$$

where P is the probability of cancer death from a continuous *dose* rate, d_i, of group (or stage) $i = 0, 1, 2\ldots$, the q's are constants, and k is the number of dose groups (or, if less than the number of dose groups, k is the number of biological stages believed to be required in the *carcinogen*esis process). With the *multistage model*, it is assumed that cancer is initiated by cell *mutations* in a finite series of steps. [2]

multistage sampling Type of sampling in which the *sample* is selected by stages, the sampling units at each stage being subsampled from the larger units chosen at the previous stage.

multivariate statistics Set of statistical tools to analyze data matrices using regression and (or) pattern recognition techniques. [2]

murine Of or belonging to the family of rats and mice (Muridae).

mutagen Agent that can induce heritable changes (*mutation*s) of the *genotype* in a cell as a consequence of alterations in or loss of genetic material.

mutagenesis Induction (or generation) of heritable changes (*mutation*s) of the *genotype* in a cell as a consequence of alterations or loss of *genes* or *chromosome*s (or parts thereof).

mutagenicity Ability of a physical, chemical, or biological agent to induce (or generate) heritable changes (*mutation*s) in the *genotype* in a cell as a consequence of alterations or loss of *genes* or *chromosome*s (or parts thereof).

mutation Any relatively stable heritable change in genetic material that may be a chemical transformation of an individual *gene* (*gene* or point *mutation*), altering its function, or a rearrangement, gain, or loss of part of a *chromosome*, that may be microscopically visible (chromosomal mutation).

Note: Mutation can be either germinal, and inherited by subsequent generations, or somatic and passed through cell lineage by cell division.

myalgia Pain or tenderness in a muscle or group of muscles.

myasthenia Muscular weakness.

mycotoxin *Toxin* produced by a fungus.

Note: Examples are aflatoxins, tricothecenes, ochratoxin, and patulin.

mydriasis Extreme dilation of the pupil of the eye, either as a result of normal physiological response or in response to a chemical *exposure*.

myelosuppression Reduction of bone marrow activity leading to a lower *concentration* of platelets, red cells, and white cells in the blood.

nanoparticle Microscopic particle whose size is measured in nanometers, often restricted to so-called nanosized particles (NSPs; <100 nm in aerodynamic diameter), also called *ultrafine particles*.

nanotoxicology Scientific discipline involving the study of the actual or potential danger presented by the harmful effects of nanoparticles on living organisms and *ecosystems*, of the relationship of such harmful effects to *exposure*, and of the mechanisms of action, diagnosis, prevention, and treatment of intoxications.

narcotic

1. Nonspecific usage – an agent that produces insensibility or stupor.

2. Specific usage – an opioid, any natural or synthetic *drug* that has morphine-like actions.

natriuretic Substance increasing the rate of excretion of sodium ion in the urine.

natural occurrence Presence of a substance in nature, as distinct from presence resulting from inputs from human activities.

Note: The contamination of the natural environment by some man-made compounds may be so widespread that it is practically impossible to get access to biota with a truly natural level; only 'normal' levels can be measured, those which are usually prevalent in places where there is no obvious local contamination.

necropsy See *autopsy*.

necro/sis n., /**tic** adj. Sum of morphological changes resulting from cell death by lysis and (or) enzymatic degradation, usually accompanied by *inflammation* and affecting groups of cells in a tissue.

Note: Not to be confused with *apoptosis*.
[2]

negligible risk
1. Probability of *adverse effects* occurring that can reasonably be described as trivial.
2. Probability of adverse effects occurring that is so low that it cannot be reduced appreciably by increased regulation or investment of resources.

nematicide nematocide Substance intended to kill nematodes.

neonat/e n., /**al** adj. Infant during the first 4 weeks of postnatal life.

Note: For statistical purposes, some scientists have defined the period as the first 7 days of postnatal life. The precise definition varies from species to species.

neoplas/ia, -m New and abnormal formation of tissue as a *tumor* or growth by cell proliferation that is faster than normal and continues after the initial stimulus that initiated the proliferation has ceased.

nephritis *Inflammation* of the kidney, leading to kidney failure, usually accompanied by *proteinuria*, *hematuria*, *edema*, and *hypertension*.

nephropathy renopathy Any *disease* or abnormality of the kidney.

nephrosis *Disease* of the kidneys marked by degeneration of renal tubular epithelium.

nephrotoxic Chemically harmful to the cells of the kidney.

neural Pertaining to a nerve or to the nerves.

neurologic shellfish poisoning (NSP) Serious illness that is a consequence of consumption of toxic bivalve shellfish (mollusks) such as mussels, oysters, and clams that have ingested, by filter feeding, large quantities of microalgae containing brevetoxin: Symptoms include *gastroenteritis*; rectal burning; *paresthesias* of the face, trunk, and limbs; *myalgias*; *ataxia*; *vertigo*; and reversal of hot/cold sensation. See also *amnesic shellfish poisoning*, *diarrheal shellfish poisoning*.

neuron(e) Nerve cell, the morphological and functional unit of the central and peripheral nervous systems.

neuropathy Any *disease* of the central or peripheral nervous system.

neurotoxic/ adj., /**ity** n. Able to produce chemically an *adverse effect* on the nervous system: such effects may be subdivided into two types.
1. Central nervous system effects (including transient effects on mood or performance and presenile dementia such as Alzheimer's disease).
2. Peripheral nervous system effects (such as the inhibitory effects of organophosphorus compounds on synaptic transmission).

nitrification Sequential oxidation of ammonium salts to nitrite and nitrate by microorganisms.

nitrosative stress *Adverse effects* occurring when the generation of reactive nitrogen species in a system exceeds the system's ability to neutralize and eliminate them; nitrosative stress may lead to nitrosylation reactions that can alter protein structure, thus inhibiting normal function.

no-acceptable-daily-intake-allocated This expression is applicable to a substance for which the available information is not sufficient to establish its safety, or when the specifications for identity and purity are not adequate, or when the available data show that the substance is hazardous and should not be used.

Note: The basis for the use of the expression should be determined before action is taken; in the first two cases above, not being able to allocate an ADI does not mean that the substance is unsafe.

***n*-octanol-water partition coefficient** Obsolete for *octan-1-ol-water partition coefficient*. See *octan-1-ol-water partition coefficient*.

nodule Small node or boss that is solid and can be detected by touch.

no-effect dose (NED) subthreshold dose Amount of a substance that has no effect on the organism.

Note: It is lower than the *threshold* of harmful effect and is estimated while establishing the threshold of harmful effect.

no-effect level (NEL) Maximum dose (of a substance) that produces no detectable changes under defined conditions of *exposure*.

Note: This term tends to be substituted by *no-observed-adverse-effect level* (NOAEL) or *no observed-effect level* (NOEL).

non-bioenvironmental transformation Change in the chemical or physical nature of a substance occurring as a result of physicochemical conditions and independent of any biological system.

nonionizing radiation Electromagnetic radiation of low energy that is not capable of causing ionization.

nonoccupational exposure Environmental *exposure* outside the workplace to substances that are otherwise associated with particular work environments and (or) activities and processes that occur there.

nonstochastic See *deterministic*.

non-target organism Organism affected by a *pesticide* although not the intended object of its use.

no-observed-adverse-effect level (NOAEL) Greatest *concentration* or amount of a substance, found by experiment or observation, which causes no detectable adverse alteration of morphology, functional capacity, growth, development, or life span of the *target* organism under defined conditions of *exposure*.

no-observed-effect level (NOEL) Greatest *concentration* or amount of a substance, found by experiment or observation, that causes no alterations of morphology, functional capacity, growth, development, or life span of *target* organisms distinguishable from those observed in normal (control) organisms of the same species and strain under the same defined conditions of *exposure*.

no-response level (NRL) Maximum *dose* of a substance at which no specified response is observed in a defined population and under defined conditions of *exposure*.

nosocomial Associated with a hospital or infirmary, especially used of *diseases* that may result from treatment in such an institution.

noxious substance See *harmful substance*.

nucle/us (in cell biology) sing., **/i** pl. Compartment in the interphase eukaryotic cell bounded by a double membrane and containing the genomic *DNA*, with the associated functions of transcription and processing.

nuisance threshold Lowest *concentration* of an air pollutant that can be considered objectionable.

nutritional table method Procedure for evaluating the dietary intake of a large number of people.

Note 1: The accuracy of the method depends on the accuracy with which records of the food consumption can be established and the accuracy of the nutritional tables specifying the *concentration* of various nutrients, vitamins, essential, and non-essential substances including pesticide residues.

Note 2: For each record of quantity of food consumed during a certain time period, the daily intake of the substance in question is calculated by multiplying the substance concentration in the food item (as obtained from the nutritional table) by the quantity of food consumed and dividing by the time of observation.

nychthemeral circadian Relating to or exhibiting a nychthemeron or 24-h period.

nystagmus Involuntary, rapid, rhythmic movement (horizontal, vertical, rotary, mixed) of the eyeball, usually caused by a disorder of the labyrinth of the inner ear or a malfunction of the central nervous system.

objective environment Actual physical, chemical, and social environment as described by objective measurements, such as noise levels in decibels and *concentration*s of air *pollutants*.

occupational environment Surrounding conditions at a workplace.

occupational exposure Experience of substances, intensities of radiation, etc., or other conditions while at work.

occupational exposure limit (OEL) Regulatory level of *exposure* to substances, intensities of radiation, etc., or other conditions, specified appropriately in relevant government legislation or related codes of practice.

occupational exposure standard (OES)

1. Level of *exposure* to substances, intensities of radiation, etc., or other conditions considered to represent specified good practice and a realistic criterion for the control of exposure by appropriate plant design, engineering controls, and, if necessary, the addition and use of personal protective clothing.

2. In UK, *health*-based exposure limit defined under COSHH Regulations as the *concentration* of any airborne substance, averaged over a reference period, at which, according to current knowledge, there is no evidence that it is likely to be injurious to employees, if they are *exposed* by inhalation, day after day, to that concentration, and set on the advice of the HSE Advisory Committee on *Toxic* Substances.

occupational hygiene Identification, assessment, and control of physicochemical and biological factors in the workplace that may affect the *health* or well-being of those at work and in the surrounding community.

occupational medicine Specialty devoted to the prevention and management of occupational injury, illness, and disability, and the promotion of the *health* of workers, their families, and their communities.

occupational safety and health See *occupational hygiene*.

octan-1-ol–water partition coefficient, P_{ow}, K_{ow} Ratio of the solubility of a chemical in octan-1-ol divided by its solubility in water.

Note: Measure of *lipophilicity*, used in the assessment of both the uptake and physiological distribution of organic chemicals and prediction of their environmental fate.

ocular Pertaining to the eye.

odds Ratio of the probability of occurrence of an event to that of non-occurrence, or the ratio of the probability that something is so, to the probability that it is not so.

odds ratio (OR) θ cross-product ratio relative odds Quotient obtained by dividing one set of odds by another. The terms 'odds' or 'odds ratio' are defined differently according to the situation under discussion. Consider the following notation for the distribution of a binary *exposure* and a disease in a population or a *sample*.

	Exposed	Nonexposed
Disease	*a*	*b*
No disease	*c*	*d*

The odds ratio (cross-product ratio) is *ad/bc*.

Note 1: The *exposure*-odds ratio for a set of case control data is the ratio of the odds in favor of exposure among the cases (*a/b*) to the odds in favor of exposure among noncases (*c/d*), which is equal to *ad*/(*bc*). With incident cases, unbiased subject selection, and a 'rare' disease (say, under 2% cumulative *incidence* rate over the study period), *ad/bc* is an approximate estimate of the *risk* ratio. With incident cases, unbiased subject selection, and density sampling of controls, *ad/bc* is an estimate of the ratio of the person-time incidence rates (force of morbidity) in the *exposed* and unexposed. No rarity assumption is required for this.

Note 2: The disease-odds (rate-odds) ratio for a cohort or cross-section is the ratio of the odds in favor of disease among the exposed population (*a/c*) to the odds in favor of disease among the unexposed (*b/d*), which is equal to *ad/bc* and hence is equal to the exposure odds ratio for the cohort or cross-section.

Note 3: The *prevalence*-odds ratio refers to an odds ratio derived cross-sectionally, as, for example, an odds ratio derived from studies of prevalent (rather than incident) cases.

Note 4: The *risk*-odds ratio is the ratio of the odds in favor of getting disease, if exposed, to the odds in favor of getting disease if not *exposed*. The odds ratio derived from a cohort study is an estimate of this.

odor threshold odour threshold odor detection threshold In principle, the lowest *concentration* of an odorant in the air that can be detected by a human being.

Note: In practice, a panel of 'sniffers' is often used, and the *threshold* taken as the concentration at which 50% of the panel can detect the odorant (although some workers have also used 100% thresholds). The odor concentration at the detection threshold may be defined as one odor unit.

oedema See *edema*.

olf Unit used to measure scent emission of people and objects; one olf is defined as the scent emission of an 'average person', a sitting adult who takes an average of 0.7 baths per day and whose skin has a total area of $1.8\,m^2$; the scent emission of an object or person is measured by specially trained personnel comparing it to normed scents.

Note: The olf should not be confused with the of unit of scent immission (as opposed to emission), the *decipol*, which also takes into account the ventilation system's air volume flow.

olfactometer Apparatus for testing the power of the sense of smell.

oligozoospermia Sperm *concentration* less than a reference value.
[8]

oliguria Excretion of a diminished amount of urine in relation to fluid intake.

-omics, -omes Neologism referring to the fields of study in biology ending in the suffix -omics, such as *genomics* or *proteomics*: The related neologism -omes are the objects of study of the field such as the *genome* or *proteome*, respectively.

oncogene *Gene* that can cause neoplastic (see *neoplasia*) transformation of a cell; oncogenes are slightly changed equivalents of normal genes known as proto-oncogenes.

oncogenesis Production or causation of *tumors*.

oncogenic Capable of producing *tumors* in animals, either *benign* (noncancerous) or *malignant* (cancerous).
[9]

one-compartment model Kinetic model, where the whole body is thought of as a single *compartment* in which the substance distributes rapidly, achieving an *equilibrium* between blood and tissue immediately.
[2]

one-hit model *Dose–response* model of the form

$$P = 1 - e^{-bd}$$

where P is the probability of *cancer* death from a continuous *dose* rate, d, and b is a constant.

onycholysis Loosening or detachment of the nail from the nail bed following some destructive process.

oogenesis Process of formation of the ovum (plural ova), the female *gamete*.

operon Complete unit of *gene* expression and regulation, including structural genes, regulator gene(s), and control elements in *DNA* recognized by regulator gene product(s).

ophthalmic Pertaining to the eye.

organ dose Amount of a substance or physical agent (radiation) absorbed by an organ.

organelle Microstructure or separated compartment within a cell that has a specialized function, for example, ribosome, peroxisome, lysosome, Golgi apparatus, mitochondrion, nucleolus, nucleus.

organic carbon partition coefficient, K_{oc} Measure of the tendency for organic substances to be adsorbed by soil or sediment, expressed as:

$$K_{oc} = \frac{(\text{mass adsorbed substance})/(\text{mass organic carbon})}{(\text{mass concentration of absorbed substance})}$$

The K_{oc} is substance-specific and is largely independent of soil properties.

organoleptic
1. Relating to perception by a sensory organ.
2. Involving the use of sensory organs, e.g., organoleptic tests.

osteo- Prefix meaning pertaining to bone.

osteodystrophy Abnormal development of bone.

osteogenesis Formation or development of bone.

osteomalacia Condition marked by softening of the bones (due to impaired mineralization, with excess accumulation of osteoid), with pain, tenderness, muscular weakness, anorexia, and loss of weight, resulting from deficiency of vitamin D and calcium.

osteoporosis Significant decrease in bone mass with increased porosity and increased tendency to fracture.

ovicide Substance intended to kill eggs.

oxidative stress *Adverse effects* occurring when the generation of *reactive oxygen species* (ROS) in a system exceeds the system's ability to neutralize and eliminate them; excess ROS can damage a cell's lipids, protein, or *DNA*.

palpitation
1. Unduly rapid or throbbing heartbeat that is noted by a patient; it may be regular or irregular.
2. Undue awareness by a patient of a heartbeat that is otherwise normal.

paralysis Loss or impairment of motor function.

paralytic shellfish poisoning (PSP) Serious illness that is a consequence of consumption of toxic bivalve shellfish (mollusks) such as mussels, oysters, and clams that have ingested, by filter feeding, large quantities of microalgae containing saxitoxin or its derivatives.

Note: Initially there is tingling, numbness, and burning of the tongue and lips, which spreads to the face, neck, arms, fingertips, legs, and toes; this is followed by weakness of the upper and lower limbs, loss of motor coordination, and, in severe cases, paralysis.

para-occupational exposure
1. *Exposure* of a worker's family to substances carried from the workplace to the home.
2. Exposure of visitors to substances in the workplace.

parasympathetic Of, relating to, or affecting the parasympathetic nervous system which stimulates digestive secretions, slows the heart, constricts the pupils of the eyes, and dilates blood vessels. See *sympathetic nervous system*.

parasympatholytic Producing effects resembling those caused by interruption of the parasympathetic nerve; also called anticholinergic.

parasympathomimetic cholinomimetic Producing effects resembling those caused by stimulation of the parasympathetic nervous system.

parenteral dosage Method of introducing substances into an organism avoiding the gastrointestinal tract (subcutaneously, intravenously, intramuscularly, etc.).

paresis Slight or incomplete paralysis.

paresthesia paraesthesia Abnormal or unexplained tingling, pricking, or burning sensation on the skin.

particulate matter (in atmospheric chemistry)
1. General term used to describe airborne solid or liquid particles of all sizes.

   Note: The term *aerosol* is recommended to describe airborne particulate matter.
2. Particles in air, usually of a defined size and specified as PM_n where n is the maximum *aerodynamic diameter* (usually expressed in μm) of at least 50 % of the particles.

[2]

partition coefficient *Concentration* of a substance in one phase divided by the concentration of the substance in the other phase when the heterogeneous system of two phases is in *equilibrium*.

Note 1: The ratio of concentrations (or, strictly speaking, activities) of the same molecular species in the two phases is constant at constant temperature.

Note 2: The *octan-1-ol–water partition coefficient* is often used as a measure of the *bioconcentration* factor for modeling purposes.

[2]

Note 3: This term is in common usage in toxicology but is not recommended by IUPAC for use in chemistry and should not be used as a synonym for partition constant, partition ratio, or distribution ratio.

partition ratio, K_D Ratio of the *concentration* of a substance in a single definite form, A, in the extract to its *concentration* in the same form in the other phase at equilibrium, for example, for an aqueous/organic system:

$$K_D(A) = [A]^{org}/[A]^{aq}$$

[2]

passive sampler Device for taking samples of environmental media following diffusional contact with a suitable collecting material.
See *personal sampler*.

passive smoking Inhalation of sidestream smoke by people who do not smoke themselves.
See also *sidestream smoke*.

patch test Test for allergic sensitivity in which a suspected *allergen* is applied to the skin on a small surgical pad.

Note: Patch tests may be used to detect *exposure* to *pesticides*.

peak daily average concentration of an air pollutant See *maximum average daily concentration of an atmospheric pollutant*.

penetration (in cell biology)
1. Action of entering or passing through a cell membrane.
2. Ability or power to enter or pass through a cell membrane.

perceived environment perceived risk
See *subjective environment*.

percutaneous Through the skin following application on the skin.

perfusion (in physiology)
1. Act of pouring over or through, especially the passage of a fluid through the vessels of a specific organ.
2. Liquid poured over or through an organ or tissue.

[2]

perinatal Relating to the period shortly before and after birth, usually from the 20th to the 29th week of gestation to 1 to 4 weeks after birth.

peritoneal dialysis Method of artificial *detoxication* in which a *toxic* substance from the body is transferred into liquid that is instilled into the peritoneum.

Note: Effectively, this represents the employment of the peritoneum surrounding the abdominal cavity as a dialyzing membrane for the

purpose of removing *waste* products or toxins accumulated as a result of *renal* failure.

permeability Ability or power to enter or pass through a cell membrane.

permeability coefficient, *P* Quantity defining the permeability of molecules across a cell membrane and expressed as

$$P = \frac{KD}{\Delta x}$$

where K is the partition coefficient, D is the diffusion coefficient, and Δx is the thickness of the cell membrane.

Note: SI units m s^{-1}; frequently used units cm s^{-1}, with units cm^2 s^{-1} for D, cm for Δx.

permeable Of a membrane, allowing a given substance to pass through.

Note: When applied to nonbiological membranes with no qualification, the term normally refers to water.

permeation Action of entering or passing through a cell membrane.

permissible exposure limit (PEL) Recommendation by U.S. OSHA for a *time-weighted average concentration* that must not be exceeded during any 8-h work shift of a 40-h working week.

peroxisome *Organelle*, similar to a *lysosome*, characterized by its content of catalase (EC 1.11.1.6), peroxidase (EC 1.11.1.7), and other oxidative *enzymes*.

persistence Attribute of a substance that describes the length of time that the substance remains in a particular environment before it is physically removed or chemically or biologically transformed.

persistent inorganic pollutant (PIP) Inorganic substance that is stable in the environment, is liable to long-range transport, may bioaccumulate in human and animal tissue, and may have significant impacts on human health and the environment.

Note 1: Examples are arsenides, fluorides, cadmium salts, and lead salts.

Note 2: Some inorganic chemicals, like crocidolite asbestos, are persistent in almost all circumstances, but others, like metal sulfides, are persistent only in unreactive environments; sulfides can generate hydrogen sulfide in a reducing environment or sulfates and sulphuric acid in oxidizing environments. As with organic substances, persistence is often a function of environmental properties.

persistent organic pollutant (POP) Organic chemical that is stable in the environment, is liable to long-range transport, may bioaccumulate in human and animal tissue, and may have significant impacts on human health and the environment.

Examples: dioxin, PCBs, DDT, tributyltin oxide (TBTO).

Note: The Stockholm Convention on Persistent Organic Pollutants was adopted at a Conference of Plenipotentiaries held from 22 to 23 May 2001 in Stockholm, Sweden; by signing this convention, governments have agreed to take measures to eliminate or reduce the release of POPs into the environment.

personal monitoring Type of environmental monitoring in which an individual's *exposure* to a substance is measured and evaluated.

Note: This is normally carried out using a personal *sampler*.

personal protective device (PPD) individual protective device (IPD) personal protective equipment (PPE) Equipment (clothing, gloves, hard hat, respirator, etc.) worn by an individual to prevent *exposure* to a potentially *toxic* substance.

personal sampler individual sampler Compact, portable instrument for individual air sampling, measuring, or both, the content of a harmful substance in the respiration zone of a working person.
See also *passive sampler*.

pest Organism that may harm public *health*, attacks food and other materials essential to mankind, or otherwise affects human beings adversely.

pesticide A substance intended to kill pests.

Note: In common usage, any substance used for controlling, preventing, or destroying animal, microbiological, or plant pests.

pesticide residue Any substance or mixture of substances found in humans or animals or in food and water following use of a pesticide: the term includes any specified derivatives, such as degradation and conversion products, metabolites, reaction products, and impurities considered to be of toxicological significance.

phagocytosis Process by which particulate material is endocytosed by a cell.
[2]
See also *endocytosis, pinocytosis*.

pharmaceutical Medicinal *drug*.

pharmacodynamics Process of interaction of pharmacologically active substances with *target* sites in living systems, and the biochemical and physiological consequences leading to therapeutic or *adverse effect*s.
[2]

pharmacogenetics Study of the influence of genetic factors on the effects of *drug*s on individual organisms.
[2]

pharmacogenomics Methods and science permitting identification of the *gene*s which influence individual variation in the efficacy or toxicity of therapeutic agents, and the application of this information in clinical practice.
[2]

pharmacokinetics
1. Process of the *uptake* of *drug*s by the body, the *biotransformation* they undergo, the *distribution* of the *drug*s and their metabolites in the tissues, and the *elimination* of the drugs and their metabolites from the body.
2. Study of such processes.

[2]

pharmacology Science of the use and effects of *drug*s: may be subdivided into *pharmacokinetics* and *pharmacodynamics* defined above.
[2]

pharynx Throat, the part of the digestive tract between the esophagus below and the mouth and nasal cavities above and in front.

phase I reaction of *biotransformation* Enzymic modification of a substance by oxidation, reduction, hydrolysis, hydration, dehydrochlorination, or other reactions catalyzed by *enzymes* of the cytosol, of the *endoplasmic reticulum* (microsomal enzymes), or of other cell *organelles*.
See also *cytochrome P450*.

phase II reaction of *biotransformation* Binding of a substance, or its *metabolites* from a phase I reaction, with *endogenous* molecules (*conjugation*), making more water-soluble derivatives that may be excreted in the urine or bile.

Note: Phase II reactions include glucuronidation, sulfation, acetylation, amino acid (e.g., glycine), and glutathione conjugation.

phase III reaction of *biotransformation* Further *metabolism of conjugated metabolites* produced by *phase II reactions*.
[2]

phenome Complete phenotypic description of an organism (by analogy with *genome*).

phenotype Observable structural and functional characteristics of an organism determined by its *genotype* and modulated by its environment.

pheromone See *feromone*.

photo-irritation *Inflammation* of the skin caused by *exposure* to light, especially that due to *metabolites* formed in the skin by *photolysis*.

photolysis Cleavage of one or more covalent bonds in a molecular entity resulting from absorption of light, or a photochemical process in which such cleavage is an essential part.

Note: Term often used incorrectly to describe irradiation of a sample, although in the combination *flash photolysis* this usage is accepted.

[3]

photooxidation Oxidation reactions induced by light. Common processes are:
1. Loss of one or more electrons from a chemical species as a result of photoexcitation of that species.
2. Reaction of a substance with oxygen under the influence of ultraviolet, visible, or infrared light. When oxygen remains in the product, this latter process is also called photooxygenation. Reactions in which neither the substrate nor the oxygen are electronically excited (i.e., photosensitized oxidations) are sometimes called photoinitiated oxidations.

[3]

photophobia Abnormal visual intolerance of light.

photosensitization of skin Allergic reaction (see *allergy*) due to a metabolite formed by the influence of light.

phototoxicity *Adverse effect*s produced by *exposure* to light energy, especially those produced in the skin.

physical map (in genetics) Map showing how much *DNA*, measured in base pairs, separates two genes.

Note: Not to be confused with a genetic map which shows the position of genes in relation to each other, based on the frequency of crossing overs.

physiological availability See *bioavailability*.

physiological pharmacokinetic model See *physiologically based pharmacokinetic modeling*.

physiologically based pharmacokinetic modeling (PBPK) toxicologically based pharmacokinetic modeling Mathematical modeling of kinetic behavior

of a substance, based on measured physiological parameters.
[2]

pinocytosis Type of *endocytosis* in which soluble materials are taken up by the cell and incorporated into vesicles for digestion.
[2]

piscicide Substance intended to kill fish.

pivotal study See *critical study*.

placentation
1. Formation of a placenta in the uterus.
2. Type or structure of a placenta.
3. In botany, arrangement of placentas within the plant ovary.

plasma (in biology)
1. Fluid component of blood in which the blood cells and platelets are suspended.
2. Fluid component of semen produced by the accessory glands, the seminal vesicles, the prostate, and the bulbo-urethral glands.
3. Cell substance outside the nucleus (i.e., the cytoplasm).

plasma half life See *elimination half life*.

plasmapheresis Removal of blood from the body and centrifuging it to obtain *plasma* and packed red blood cells: The blood cells are resuspended in a physiologically compatible solution (usually type-specific fresh frozen plasma or albumin) and returned to the donor or injected into a patient who requires blood cells rather than whole blood.

plasmid Autonomous self-replicating extra-chromosomal circular *DNA* molecule present in bacteria and yeast.

Note 1: Plasmids replicate autonomously each time a bacterium divides and are transmitted to the daughter cells.

Note 2: DNA segments are commonly cloned using plasmid *vectors*.

After [9]

pleura Lining of the lung.

ploidy Term indicating the number of sets of *chromosome*s present in an organism.

plumbism saturnism Chronic poisoning caused by absorption of lead or lead salts.

pneumoconiosis Usually fibrosis of the lungs that develops owing to (prolonged) inhalation of inorganic or organic dusts.

Note: Cause-specific types of pneumoconiosis are:
1. anthracosis: from coal dust
2. asbestosis: from asbestos dust
3. byssinosis: from cotton dust
4. siderosis: from iron dust
5. silicosis: from silica dust
6. stannosis: from tin dust

pneumonitis *Inflammation* of the lung.

point mutation Change in a single base pair in *DNA*.

point source Single *emission* source in a defined location.

poison (in toxicology) Substance that, taken into or formed within the organism, impairs the *health* of the organism and may kill it.

poison-bearing Containing a *poison*.

poisoning intoxication Morbid condition produced by a *poison*.

pollutant Any undesirable solid, liquid, or gaseous matter in a solid, liquid, or gaseous environmental medium.

Note 1: 'Undesirability' is often *concentration*-dependent, low concentrations of most substances being tolerable or even essential in many cases.

Note 2: A primary pollutant is one emitted into the atmosphere, water, sediments, or soil from an identifiable source.

Note 3: A secondary pollutant is a pollutant formed by chemical reaction in the atmosphere, water, sediments, or soil.

pollution Introduction of *pollutants* into a solid, liquid, or gaseous environmental medium, the presence of pollutants in a solid, liquid, or gaseous environmental medium, or any undesirable modification of the composition of a solid, liquid, or gaseous environmental medium.

polyclonal antibody *Antibody* produced by a number of different cell types.

polydipsia Chronic excessive thirst.

polymerase chain reaction (PCR) Technique by which specific *DNA* segments are amplified selectively using cycles of annealing, chain extension, and thermal dissociation.
After [9]

polymorphism in metabolism polymorphia (in metabolism) Interindividual variations in *metabolism* of endogenous and *exogenous* compounds due to genetic influences, leading to enhanced side effects or *toxicity* of *drug*s (e.g., poor vs. fast metabolizers) or to different clinical effects (metabolism of steroid hormones).

polyuria Excessive production and discharge of urine.

population (in statistics) Totality of related items under consideration.

Note 1: A clearly defined part of a population is called a subpopulation. The term 'population segment' is sometimes used as a synonym for subpopulation.

Note 2: In the case of a random variable, the probability distribution is considered as defining the population of that variable.

population (in epidemiology) Assemblage of individuals with defined characteristics.

population at risk Persons who can and may develop an adverse *health* effect and who are potentially *exposed* to a substance under study. People already having chronic disease are excluded from the population at *risk* in studies of the *incidence* of the *adverse effect*.

[2]

population critical concentration (PCC) *Concentration* of a substance in the critical organ at which a specified percentage of the *exposed* population has reached the individual critical organ concentration.

Note: The percentage is indicated by PCC-10 for 10%, PCC-50 for 50%, etc. (similar to the use of the term LD_{50}).

population effect Absolute number or *incidence* rate of cases occurring in a group of people.

population risk See *societal risk*.

porphin(e) See *porphyrin*.

porphyria Disturbance of porphyrin *metabolism* characterized by increased formation, accumulation, and excretion of porphyrins and their precursors.

porphyrin porphin(e) Natural pigment containing a fundamental skeleton of four pyrrole nuclei united through the α-positions by four methine groups to form a macrocyclic structure.

posology Pharmacological study of the choice of appropriate *dose* of a drug in relation to the physiological factors, such as age, that may influence its effect.

post-translational modification Processes by which proteins are biochemically modified within a cell following their synthesis on the ribosomes.

potency (in toxicology) Expression of relative *toxicity* of an agent as compared to a given or implied standard or reference.

potentiation Dependent action in which a substance or physical agent at a *concentration* or *dose* that does not itself have an *adverse effect* enhances the harm done by another substance or physical agent.

See also *synergism*.

practical certainty (of safety) Numerically specified low *risk* of *exposure* to a potentially *toxic* substance (e.g., 1 in 1000) or socially acceptable low risk of *adverse effect*s from such an exposure applied to decision making in regard to chemical safety.

precautionary principle Approach to risk management that can be applied in circumstances of scientific uncertainty, reflecting a perceived need to take action in the face of a potentially serious risk without waiting for definitive results of scientific research.

Note: The 1992 Rio Declaration on Environment and Development says: 'In order to protect the environment, the precautionary approach shall be widely applied by states according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.'

precision (in metrology) Closeness of agreement between *indications* obtained by replicate measurements on the same or similar objects under specified conditions.

Note: Measurement precision is usually expressed numerically by measures of imprecision, such as standard deviation, variance, or coefficient of variation under the specified conditions of measurement.

[7]

precordial Pertaining to the region over the heart and lower thorax.

precursor Substance from which another, usually more biologically active, substance is formed.

predicted environmental concentration (PEC) predicted exposure concentration (PEC)

See *estimated environmental concentration*.

predicted exposure concentration (PEC) See *estimated environmental concentration*.

predicted no-effect concentration (PNEC) Concentration that is expected to cause no adverse effect to any naturally occurring population in an environment at risk from *exposure* to a given substance.

predictive validity Reliability of a measurement expressed in terms of its ability to predict the criterion: An example would be an academic aptitude

test that was validated against subsequent academic performance.

predictive value Percentage of positive results that are true positives or of negative results that are true negatives.

premature ovarian failure Follicular depletion by the age of 35 years.
[8]

preneoplastic Before the formation of a *tumor*.

prevalence Number of instances of existing cases of a given disease or other condition in a given population at a designated time; sometimes used to mean *prevalence rate*.

Note: When used without qualification, refers usually to the situation at a specified time (point prevalence).

prevalence rate (ratio) Total number of individuals who have an attribute or disease at a particular time (or during a particular period) divided by the population at *risk* of having the attribute or disease at this point in time or midway through the period.

primary pollutant See *pollutant*.

prior informed consent (PIC) Concept in law and medicine that states that before one is subjected to a risk, especially a risk of bodily harm, one is entitled to be fully informed well in advance of the nature of that *risk* in order to make an informed decision about whether to accept it or not.

primary protection standard Accepted maximum level of a *pollutant* (or its indicator) in the *target* organism, or some part thereof, or an accepted maximum intake of a pollutant or nuisance into the target under specified circumstances.

probability sample See *random sample*.

probit Probability unit obtained by adding 5 to the normal deviates of a standardized normal distribution of results from a dose–response study.

Note 1: Addition of 5 removes the complication of handling negative values.

Note 2: A plot of probit against the logarithm of *dose* or *concentration* gives a linear plot if the response follows a logarithmic normal distribution. Estimates of the LD_{50} and ED_{50} (or LC_{50} and EC_{50}) can be obtained from this plot.

procarcinogen Substance that has to be metabolized before it becomes a *carcinogen*.
[2]

prodrug Precursor converted to an active form of a *drug* within the body.
[2]

progression (in oncology) Increase in the size of a *tumor* or spread of *cancer* in the body.

prokaryote Unicellular organism, characterized by the absence of a membrane-enclosed nucleus.

Note: Prokaryotes include bacteria, blue–green algae, and mycoplasmas.

promoter (in molecular genetics) Sequence of nucleotides in a *DNA* molecule to which *RNA* polymerase binds so as to start transcription.

promoter (in oncology) Agent that induces *cancer* when administered to an animal or human being who has been *exposed* to a cancer *initiator*.

promotor Erroneous spelling of *promoter* (in molecular genetics), found in some literature.

pro-pesticide Substance applied in a form that is not active as a *pesticide* and which becomes active once it enters an organism and undergoes chemical modification.

prophage Latent state of a phage *genome* in a lysogenic bacterium.

proportional mortality rate (ratio) Proportion of observed deaths from a specified condition in a defined population divided by the proportion of deaths expected from this condition in a standard population, expressed either on an age-specific basis or after age adjustment.

prospective cohort study See *cohort study*.

prosthetic group Nonprotein entity essential for an *enzyme's* activity and tightly bound to the enzyme molecule in its active form.
[2]

proteinuria Excretion of excessive amounts of protein (derived from blood *plasma* or kidney tubules) in the urine.

proteome Description of the complete set of proteins encoded by the *genome*.
[2]

proteomics Global analysis of *gene* expression using a variety of techniques to identify and characterize proteins.

Note: It can be used to study changes caused by *exposure* to chemicals and to determine if changes in m*RNA* expression correlate with changes in protein expression: the analysis may also show changes in post-translational

modification, which cannot be distinguished by mRNA analysis alone.
[2]

provisional tolerable weekly intake (PTWI) See *tolerable weekly intake*.

pseudo-acceptable daily intake (PADI) Intake for a substance derived by applying a thousandfold uncertainty factor to the lowest low-effect level for noncarcinogenic endpoints.

pseudoadaptation Apparent adaptation of an organism to changing conditions of the environment (especially chemical) associated with stresses in biochemical systems that exceed the limits of normal (homeostatic) mechanisms.

Note: Essentially, there is a temporary concealed pathology that later on can be manifested in the form of explicit pathological changes sometimes referred to as 'decompensation'.

psychosis Any major mental disorder characterized by derangement of the personality and loss of contact with reality.

psychotropic Exerting an effect upon the mind and capable of modifying mental activity.

public health impact assessment Applying *risk* assessment to a specific target population of known size, giving as the end product a quantitative statement about the number of people likely to be affected in a particular population.

pulmonary Pertaining to the lung(s).
[2]

purgative See *laxative*.

pyrexia Condition in which the temperature of a human being or mammal is above normal.

pyrogen Any substance that produces fever.

quality assurance All those planned and systematic actions necessary to provide adequate confidence that a product or service will satisfy given requirements for quality.

quality control

1. Operational techniques and activities that are used to fulfill requirements for quality.
2. In toxicology, procedures incorporated in experimental protocols to reduce the possibility of error, especially human error.

Note: This is a requirement of *good laboratory practice*.

quantal Describing a condition that can be expressed only as 'occurring' or 'not occurring', such as death.
[2]

quantal effect all-or-none effect Antonym: *graded effect* Condition that can be expressed only as 'occurring' or 'not occurring', such as death or occurrence of a *tumor*.

quantitative structure–activity relationship (QSAR) Quantitative structure–biological activity model derived using *regression analysis* and containing as parameters physicochemical constants, indicator variables, or theoretically calculated values.

Note: The term is extended by some authors to include chemical reactivity, i.e., activity and reactivity are regarded as synonyms. This extension is discouraged.
[2]

quantitative structure–metabolism relationship (QSMR) Quantitative association between the physicochemical and (or) the structural properties of a substance and its metabolic behavior.
[2]

radiant power Power emitted, transferred, or received as radiation.

radiation toxicology Scientific study involving research, education, prevention, and treatment of diseases caused by ionizing or nonionizing radiation.

râles See *crepitations*.

random sample probability sample Antonym: *biased sample* Subset of units of a population that is arrived at by selecting units such that each possible unit has a fixed and known probability of selection.

rate (in epidemiology) Measure of the frequency with which an event occurs in a defined population in a specified period of time.

Note 1: Most such rates are ratios, calculated by dividing a numerator (e.g., the number of deaths) or newly occurring cases of a disease in a given period, by a denominator, (e.g., the average population during that period).

Note 2: Some rates are proportions, i.e., the numerator is contained within the denominator (as when a number of patients with a given disease is divided by the total population from which they come).
[2]

rate constant, k rate coefficient Numerical constant in a rate-of-reaction (v) equation; for example, $v = k$ [A]α[B]β…….where [A], [B] etc. are reactant concentrations, k is the rate constant, and α, β, etc. are corresponding empirical constants.

Note: For further consideration of the relevant mathematics, see [3].

rate-controlling step rate-determining step rate-limiting step In a reaction occurring by a composite reaction sequence, an elementary reaction, the rate constant for which exerts a strong effect – stronger than that of any other rate constant – on the overall rate.

Note 1: It is recommended that the expressions *rate-controlling*, *rate-determining*, and *rate-limiting* be regarded as synonymous, but some special meanings sometimes given to the last two expressions are considered under a separate heading.

Note 2: For further consideration of this term, see [3].
After [3]

rate-determining step See *rate-controlling step*.

rate difference (RD) Absolute difference between two *rates*.

Note 1: For example, the difference in *incidence* rate between a population group *exposed* to a causal factor and a population group not exposed to the factor.

Note 2: In comparisons of exposed and unexposed groups, the term *excess rate* may be used as a synonym for rate difference.

rate-limiting step See *rate-controlling step*.

rate ratio (in epidemiology) (RR) Value obtained by dividing the *rate* in an *exposed* population by the rate in an unexposed population.

ratticide Substance intended to kill rats.

reabsorption (in biology) *Absorption* by a living organism of a substance which it has previously absorbed and then released (e.g., the uptake of a substance from the proximal renal tubule following glomerular filtration).

reactive nitrogen species (RNS) Radical nitrogen-based molecules that can act to facilitate nitrosylation reactions; reactive nitrogen species include dioxidonitrogen(•) (nitrogen dioxide, nitryl radical) NO_2•, oxidonitrogen(•) (nitrogen monoxide, nitrosyl radical) $NO^{\bullet}$ oxidonitrogen(1+) (nitrosyl cation) NO^+, hydroxyoxidonitrogen (nitrous acid) HNO_2, and oxidonitrate(1−) NO^-.

reactive oxygen species (ROS) Intermediates in the reduction of molecular dioxygen O_2 to water.

Note: Examples are superoxide $O_2{}^-$•, hydrogen peroxide H_2O_2, and hydroxyl HO•.
[2]

readily biodegradable Arbitrary classification of substances that have passed certain specified screening tests for ultimate biodegradability; these tests are so stringent that such compounds will be rapidly and completely biodegraded in a wide variety of *aerobic* environments.
See also *biodegradation*.

reasonable maximum exposure (RME) Highest *exposure* that is reasonably expected to occur.

Note: Typically, the 95% upper confidence limit of the *toxicant* distribution is used: If only a few data points (6–10) are available, the maximum detected *concentration* is used.

recalcitrance Ability of a substance to remain in a particular environment in an unchanged form.

receptor Molecular structure in or on a cell which specifically recognizes and binds to a compound and acts as a physiological signal transducer or mediator of an effect.
[2]

receptor-mediated endocytosis *Endocytosis* of a substance and its *receptor* following receptor binding.
[2]

recessive gene *Allele* which in the heterozygous state is expected to have no effect on the *phenotype* of the organism which carries it.
After [9]

recombinant DNA *DNA* made by transplanting or splicing DNA into the DNA of host cells in such a way that the modified DNA can be replicated in the host cells in a normal fashion.

recombinant DNA technology Methods involving the use of *restriction enzymes* to cleave *DNA* at specific sites, allowing sections of DNA molecules to be inserted into *plasmid* or other vectors and cloned in an appropriate host organism (e.g., a bacterial or yeast cell).
After [9]

recommended exposure level (REL) (in toxicology) Highest allowable regulatory airborne concentration.

Note: This exposure concentration is not expected to injure workers. It may be expressed as a ceiling limit or as a time-weighted average (TWA).

reconstitution Restoration to original form of a substance previously altered for preservation and storage.
[2]

recovery

1. Process leading to partial or complete restoration of a cell, tissue, organ, or organism following its damage from *exposure* to a harmful substance or agent.

2. Term used in analytical and preparative chemistry to denote the fraction of the total quantity of a substance recoverable following a chemical procedure.

recovery factor Fraction or percentage of the total quantity of a substance extracted under specified conditions.

recycling (of waste) Process or method allowing for the recovery of some value from a *waste*, either as reusable material or as energy.

reference concentration (RfC) An estimate (with uncertainty spanning perhaps an order of magnitude) of a continuous inhalation *exposure* to the human population (including sensitive subgroups which include children, asthmatics, and the elderly) that is likely to be without an appreciable risk of deleterious effects during a lifetime.

Note: It can be derived from various types of human or animal data such as NOAEL, LOAEL, or benchmark concentration, with uncertainty factors generally applied to reflect limitations of the data used. It is generally used in USEPA's noncancer health assessments.

reference distribution Statistical distribution of reference values.

reference dose (RfD) An estimate (with uncertainty spanning perhaps an order of magnitude) of a daily oral *exposure* to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime.

Note: It can be derived from a NOAEL, LOAEL, or benchmark dose, with uncertainty factors generally applied to reflect limitations of the data used. It is generally used in USEPA's noncancer health assessments.

reference group See *reference sample group*.

reference individual Person selected with the use of defined criteria for comparative purposes in a clinical study.

reference interval Area between and including two reference limits, for example, the percentiles 2.5 and 97.5.

reference limit Boundary value defined so that a stated fraction of the reference values is less than or exceeds that boundary value with a stated probability.

reference material (RM) sufficiently homogeneous and stable regarding one or more properties, used in *calibration*, in assignment of a value to another material, or in quality assurance.
[7]

reference population Group of all reference individuals used to establish criteria against which a population that is being studied can be compared.

reference sample group Selected reference individuals, statistically adequate numerically to represent the reference population.

reference value Quantity value, generally accepted as having a suitably small measurement uncertainty, to be used as a basis for comparison with values of quantities of the same kind.
[14]

regioselectiv/ity n., -e adj. Terms referring to a reaction in which one direction of bond making or breaking occurs preferentially over all other possible directions.

Note: Reactions are termed completely (100%) regioselective if the discrimination is complete, or partially (x%), if the product of reaction at one site predominates over the product of reaction at other sites.
[2]

regression analysis Statistical methods for modeling a set of dependent variables, Y, in terms of combinations of predictors, X.
[2]

regulatory dose Term used by the USEPA to describe the expected dose resulting from human *exposure* to a substance at the level at which it is regulated in the environment.

regulatory sequence *DNA* sequence to which specific proteins bind to activate or repress the expression of a *gene*.

relative excess risk (RER) Measure that can be used in comparison of adverse reactions to *drugs*, or other *exposures*, based solely on the component of *risk* due to the exposure or drug under investigation, removing the risk due to background exposure experienced by all in the population. The *relative excess risk*, R, is given by

$$R = (R_1 - R_0)/(R_2 - R_0)$$

where R_1 is the *rate* in the population, R_2 is the rate in the comparison population, and R_0 is the rate in the general population.

Note: Rate is used here as in epidemiology.
[2]

relative odds See *odds ratio*.

relative risk (RR) risk ratio rate ratio

1. Ratio of the *risk* of disease or death among the *exposed* to the risk among the unexposed.

2. Ratio of the *cumulative incidence rate* in the exposed to the cumulative incidence rate in the unexposed.

relative systemic availability Quantity of metabolizable substance divided by product of quantity of absorbed substance and *exposure*.
[2]

remediation
1. Giving a remedy.
2. Removal of pollution or contaminants from environmental media such as soil, groundwater, sediment, or surface water for the general protection of human health and the environment.

remedy Anything, such as a medicine or therapy, that relieves pain, cures disease, or corrects a disorder.

renal Pertaining to the kidneys.
[2]

renal plasma flow Volume of *plasma* passing through the kidneys in unit time.
[2]

renopathy See *nephropathy*.

repeatability measurement repeatability Measurement precision under *repeatability* conditions of measurement.
[14]

repeatability condition repeatability condition of measurement Condition of measurement in a set of conditions including the same measurement procedure, operator, measuring system, operating conditions, and location, and replicated measurements over a short period of time.
[14]

repellent Substance used mainly to repel blood-sucking insects in order to protect humans and animals.

Note: This term may also be used for substances used to repel mammals, birds, rodents, mites, plant pests, etc.

replicate sampling Act of taking multiple *sample*s concurrently under comparable conditions.

Note: Replicate sampling may be accomplished by taking samples adjacent in time or space.

replication
1. Duplicated or repeated performance of an experiment under similar (controlled) conditions to reduce to a minimum the error, and to estimate the variations and thus obtain a more precise result: Each determination, including the first, is called a replicate.
2. Process whereby the genetic material is duplicated.

reproducibility measurement reproducibility Measurement precision under reproducibility conditions of measurement.
[14]

reproducibility condition reproducibility condition of measurement Condition of measurement in a set of conditions including different locations, operators, and measuring systems.

Note 1: The different measuring systems may use different measurement procedures.

Note 2: A specification should give the conditions changed and unchanged, to the extent practical.

[14]

reproductive toxicant Substance or preparation that produces nonheritable *adverse effects* on male and female reproductive function or capacity and on resultant progeny.

reproductive toxicology Study of the nonheritable *adverse effect*s of substances on male and female reproductive function or capacity and on resultant progeny.

reserve capacity Physiological or biochemical capacity that may be available to maintain homeostasis when the body or an organism is *exposed* to an environmental change.

reservoir (in biology) Storage *compartment* from which a substance may be released with subsequent biological effects.
[2]

residence time See *mean residence time*.

residual risk *Health risk* remaining after risk reduction actions are implemented.
[2]

residual time See *mean residence time*.

residue *Contaminant* remaining in an organism or in other material such as food or packaging, following *exposure*.

resistance (in toxicology) Ability to withstand the effect of various factors, including potentially *toxic* substances.

resorption (in biology) Process in which the components of some differentiated structure that has been produced by the body undergo lysis and assimilation.

Note: Specifically in developmental toxicology, term applied to the lysis and assimilation of the fetus caused by chemical or biological stress of the pregnant mother.

resorptive effect Action of a substance after its reabsorption from the gut into the blood.

respirable dust respirable particles Mass fraction of dust (particles) that penetrates to the unciliated airways of the lung (the alveolar region).

Note: This fraction is represented by a cumulative log-normal curve having a median aerodynamic diameter of 4μm, standard deviation 2μm (values for humans).

[2]

response Proportion of an *exposed* population with a defined effect or the proportion of a group of individuals that demonstrates a defined effect in a given time at a given *dose rate*.

restriction enzymes Endonucleases that recognize specific base sequences within a *DNA* helix, creating a double-strand break of DNA.

Note: Type I restriction *enzymes* bind to these recognition sites but subsequently cut the DNA at different sites. Type II restriction enzymes both bind and cut within their recognition or *target* sites.

[3]

retention

1. Amount of a substance that is left from the total absorbed after a certain time following *exposure*.
2. Holding back within the body or within an organ, tissue, or cell of matter that is normally eliminated.

retrospective study Research design used to test etiological hypotheses in which inferences about *exposure* to the putative causal factor(s) are derived from data relating to characteristics of the persons or organisms under study or to events or experiences in their past.

Note: The essential feature is that some of the persons under study have the *disease* or other outcome condition of interest, and their characteristics and past experiences are compared with those of other, unaffected persons. Persons who differ in the severity of the disease may also be compared.

returned effect of poisons Enhancement of the *dose–effect* relationship for a poison following repeated *exposure* to decreasing doses.

reverse mutation (back mutation) *Mutation* in a mutant *allele* which makes it capable of producing the nonmutant *phenotype*; this may result from restoration of the original *DNA* sequence of the *gene* or from production of a new DNA sequence which has the same effect.

reverse transcription Process by which an *RNA* molecule is used as a template to make a single-stranded *DNA* copy.

reversible alteration Change from normal structure or function, induced by a substance or other agent(s), that returns to normal status or within normal limits after cessation of *exposure*.

rhabdomyolysis Acute, fulminating, potentially lethal disease of skeletal muscle that causes disintegration of striated muscle fibers as evidenced by myoglobin in the blood and urine.

rhinitis *Inflammation* of the nasal mucosa.

rhonch/us sing., /i pl. Harsh *crepitation* in the throat, often resembling snoring.

ribonucleic acid (RNA) Linear, usually single-stranded, polymer of ribonucleotides, each containing the sugar ribose in association with a phosphate group and one of four nitrogenous bases: adenine, guanine, cytosine, or uracil.

Note: RNA encodes the information for the sequence of amino acids in proteins synthesized using it as a template.

risk

1. Probability of *adverse effects* caused under specified circumstances by an agent in an organism, a population, or an ecological system.
2. Probability of a hazard causing an adverse effect.
3. Expected frequency of occurrence of a harmful event arising from such an *exposure.*

After [2]

risk assessment Identification and quantification of the *risk* resulting from a specific use or occurrence of a chemical or physical agent, taking into account possible harmful effects on individuals or populations *exposed* to the agent in the amount and manner proposed and all the possible routes of *exposure*.

Note: Quantification ideally requires the establishment of *dose–effect* and *dose–response* relationships in likely *target* individuals and populations.

risk assessment management process Global term for the whole process from *hazard* identification to *risk* management.

risk associated with a lifetime exposure Probability of the occurrence of a specified undesirable event following *exposure* of an individual person from a given population to a specified substance at a defined level for the expected lifetime of the average member of that population.

risk aversion Tendency of an individual person to avoid *risk*.

risk characterization Outcome of *hazard* identification and *risk* estimation applied to a specific use of a substance or occurrence of an environmental *health* hazard.

Note: Risk characterization requires quantitative data on the *exposure* of organisms or people at risk in the specific situation. The end product is a quantitative statement about the proportion of organisms or people affected in a target population.

risk communication Interpretation and communication of *risk* assessments in terms that are comprehensible to the general public or to others without specialist knowledge.

risk *de minimis* negligible risk *Risk* that is negligible and too small to be of societal concern (usually assumed to be a probability below 10^{-5} or 10^{-6}).

Note 1: This term can also mean 'virtually safe'.

Note 2: In the United States, this is a legal term used to mean 'negligible risk to the individual'.

risk estimation Assessment, with or without mathematical modeling, of the probability and nature of effects of *exposure* to a substance based on quantification of *dose–effect* and *dose–response* relationships for that substance and the population(s) and environmental components likely to be *exposed* and on assessment of the levels of potential exposure of people, organisms, and environment at *risk*.

risk evaluation Establishment of a qualitative or quantitative relationship between *risk*s and benefits, involving the complex process of determining the significance of the identified *hazard*s and estimated risks to those organisms or people concerned with or affected by them.

risk identification Recognition of a potential *hazard* and definition of the factors required to assess the probability of *exposure* of organisms or people to that hazard and of harm resulting from such exposure.

risk indicator See *risk marker*.

risk management Decision-making process involving considerations of political, social, economic, and engineering factors with relevant *risk* assessments relating to a potential *hazard* so as to develop, analyze, and compare regulatory options and to select the optimal regulatory response for safety from that hazard.

Note: Essentially risk management is the combination of three steps: *risk evaluation*; *emission* and *exposure* control; *risk monitoring*.

risk marker risk indicator Attribute that is associated with an increased probability of occurrence of a disease or other specified outcome and that can be used as an indicator of this increased *risk*.

Note: A risk marker is not necessarily a causal factor.

risk monitoring Process of following up the decisions and actions within *risk management* in order to check whether the aims of reduced *exposure* and risk are achieved.

risk perception Subjective perception of the gravity or importance of the *risk* based on a person's knowledge of different risks and the moral, economic, and political judgment of their implications.

risk phrases Word groups identifying potential *health* or environmental *hazard*s required under CPL Directives (European Community); may be incorporated into *Safety* Data Sheets.

risk quotient Ratio of *predicted environmental concentration* to *predicted no-effect concentration*.

Note: The higher this value above 1, the greater the risk. If the value is below 1, there should be no risk as a result of the predicted *exposure*.

risk ratio Value obtained by dividing the probability of occurrence of a specific effect in one group by the probability of occurrence of the same effect in another group, or the value obtained by dividing the probability of occurrence of one potentially hazardous event by the probability of occurrence of another.

Note: Calculation of such ratios is used in choosing between options in *risk management*.

risk-specific dose Amount of *exposure* corresponding to a specified level of *risk*.

RNA See *ribonucleic acid*.

rodenticide Substance intended to kill rodents.

route of *exposure* Means by which a *toxic* agent gains access to an organism by administration through the gastrointestinal tract (ingestion), lungs (inhalation), skin (topical), or by other routes such as intravenous, subcutaneous, intramuscular, or intraperitoneal routes.

S9 fraction Supernatant fraction obtained from an organ (usually liver) homogenate by centrifuging at $9000\,g$ for 20 min in a suitable medium; this fraction contains cytosol and microsomes.

safety Reciprocal of *risk*: practical certainty that injury will not result from a *hazard* under defined conditions.

Note 1: Safety of a *drug* or other substance in the context of human *health*: the extent to

which a substance may be used in the amount necessary for the intended therapeutic purpose with a minimum risk of *adverse* health *effects*.

Note 2: Safety (toxicological): The high probability that injury will not result from *exposure* to a substance under defined conditions of quantity and manner of use, ideally controlled to minimize exposure.

safety data sheet Single page giving toxicological and other *safety* advice, usually associated with a particular preparation, substance, or process.

safety factor (SF) See *uncertainty factor*.

safety pharmacology Science directed to the discovery, development, and safe therapeutic use of biologically active substances as a result of the identification, monitoring, and characterization of potentially undesirable pharmacodynamic activities of these substances in nonclinical studies.

saluretic See *natriuretic*. sample (in statistics)

1. Group of individuals often taken at random from a population for research purposes.
2. One or more items taken from a population or a process and intended to provide information on the population or process.
3. Portion of material selected from a larger quantity so as to be representative of the whole.

sampling error That part of the total error (the estimate from a *sample* minus the population value) associated with using only a fraction of the population and extrapolating to the whole, as distinct from analytical or test error.

Note: Sampling error arises from a lack of homogeneity in the parent population.

[2]

sarcoma *Malignant tumor* arising in a connective tissue and composed primarily of *anaplastic* cells resembling supportive tissue (see *anaplasia*).

saturable elimination *Elimination* that becomes *concentration*-independent at a concentration at which the elimination process is functioning maximally.

[2]

saturnia Pain in a joint resulting from lead poisoning.

saturnism plumbism Intoxication caused by lead. *Scatchard plot* Method for analyzing data for freely reversible ligand/*receptor* binding interactions.

Note: The graphical plot is [bound ligand]/[free ligand] against [bound ligand], with slope the negative reciprocal of the binding affinity and intercept on the *x*-axis the number of receptors.

[2]

scotoma Area of diminished or lost vision within the visual field, surrounded by an area of less affected or normal vision.

sclerosis Hardening of an organ or tissue, especially that due to excessive growth of fibrous tissue.

screening

1. Carrying out of a test(s), examination(s), or procedure(s) in order to expose undetected abnormalities, unrecognized (incipient) diseases, or defects: Examples are mass X-rays and cervical smears.
2. Pharmacological or toxicological screening consists of a specified set of procedures to which a series of compounds is subjected to characterize pharmacological and toxicological properties and to establish *dose–effect* and *dose–response* relationships.

screening level Decision limit or cut-off point at which a *screening* test is regarded as positive.

secondary metabolite Product of biochemical processes other than the normal metabolic pathways, mostly produced in microorganisms or plants after the phase of active growth and under conditions of nutrient deficiency.

secondhand smoke See *sidestream smoke*.

second messenger Intracellular effector substance increasing or decreasing as a result of the stimulation of a *receptor* by an *agonist*, considered as the 'first messenger'.

[2]

secretion

1. Process by which a substance such as a hormone or *enzyme* produced in a cell is passed through a *plasma membrane* to the outside, for example, the intestinal lumen or the blood (internal secretion).
2. Solid, liquid, or gaseous material passed from the inside of a cell through a plasma membrane to the outside as a result of cell activity.

sedative Substance that exerts a soothing or tranquillizing effect.

self-cleaning of water (in a reservoir) Water purification by natural biological and physicochemical processes.

self-purification of the atmosphere Purification of the atmosphere from contaminants by natural biological and physicochemical processes.

semichronic See *subchronic*.

semiochemical Substance produced by plants or animals, or a synthetic analogue thereof, that evokes a behavioral response in individuals of the producing species or other species (e.g., *allomones*, *kairomones*, *pheromones*, and *synomones*).

semipermeable (selectively or differentially permeable) membrane Membrane that will preferentially allow certain molecules or ions to pass through it while preventing the passage of others.

sensibilization See *sensitization*.

sensitivity (in metrology and analytical chemistry),

1. Quotient of the change in the *indication* and the corresponding change in the value of the quantity being measured.

[7]

2. Slope of the calibration curve. If the curve is in fact a 'curve', rather than a straight line, then of course sensitivity will be a function of analyte concentration or amount. If sensitivity is to be a unique performance characteristic, it must depend only on the chemical measurement process, not upon scale factors.

[3]

sensitivity (of a screening test) Extent (usually expressed as a percentage) to which a method gives results that are free from false negatives.

Note 1: The fewer the false negatives, the greater the sensitivity.

Note 2: Quantitatively, sensitivity is the proportion of truly diseased persons in the screened population who are identified as diseased by the screening test.

sensitization *Immune response* whereby individuals become *hypersensitive* to substances, pollen, dandruff, or other agents that make them develop a potentially harmful *allergy* when they are subsequently *exposed* to the sensitizing material (*allergen*).

sensitizer Substance causing *sensitization*.

sensory effect level

1. Intensity, where the detection *threshold* level is defined as the lower limit of the perceived intensity range (by convention, the lowest *concentration* that can be detected in 50% of the cases in which it is present).
2. Quality, where the recognition threshold level is defined as the lowest concentration at which the sensory effect can be recognized correctly in 50% of the cases.
3. Acceptability and annoyance, where the nuisance threshold level is defined as the concentration at which not more than a small proportion of the population, less than 5%, experiences annoyance for a small part of the time, less than 2%.

Note: Since annoyance will be influenced by a number of factors, a nuisance threshold level cannot be set on the basis of concentration alone.

serum Clear watery fluid especially that moistens the surface of serous membranes or that exudes through *inflammation* of any of these membranes.

[2]

serum blood serum Watery proteinaceous portion of the blood that remains after clotting.

[2]

shellfish poisoning Serious illness which is a consequence of consumption of bivalve shellfish (mollusks) such as mussels, oysters, and clams that have ingested, by filter feeding, large quantities of microalgae. See *amnesic shellfish poisoning, diarrheal shellfish poisoning, neurologic shellfish poisoning, paralytic shellfish poisoning*.

short-term effect See *acute effect*.

short-term exposure limit (STEL) Fifteen-minute *time-weighted average* (TWA) *exposure* recommended by ACGIH which should not be exceeded at any time during a workday, even if the 8-h TWA is within the *threshold limit value: time-weighted average*, TLV-TWA.

Note: Workers can be exposed to a maximum of four STEL periods per 8-h shift, with at least 60 min between exposure periods.

[2]

short-term toxicity See *acute toxicity*.

side-effect Action of a *drug* other than that desired for beneficial pharmacological effect.

siderosis

1. *Pneumoconiosis* resulting from the inhalation of iron dust.
2. Excess of iron in the urine, blood, or tissues, characterized by hemosiderin granules in urine and iron deposits in tissues.

sidestream smoke environmental tobacco smoke (ETS) secondhand smoke Cloud of small particles and gases that is given off from the end of a burning tobacco product (cigarette, pipe, cigar) between puffs and is not directly inhaled by the smoker.

Note: This is the smoke that gives rise to passive inhalation on the part of bystanders.

sign Objective evidence of a disease, deformity, or an effect induced by an agent, perceptible to an examining physician.

signal transduction Molecular pathways through which a cell senses changes in its external or internal environment and changes its pattern of *gene* expression or *enzyme* activity in response.
After [9]

silicosis *Pneumoconiosis* resulting from inhalation of silica dust.

simulation test Procedure designed to predict the rate of *biodegradation* of a compound under relevant environmental conditions.

single nucleotide polymorphism (SNP) Single base variation at a chromosomal locus which exists stably within populations (typically defined as each variant form being present in at least 1–2% of individuals).
After [8]

sink In environmental chemistry, an area or part of the environment in which, or a process by which, one or more *pollutants* is removed from the medium in which it is dispersed.

Note: For example, moist ground acts as a sink for sulfur dioxide in the air.

sister chromatid exchange (SCE) Reciprocal exchange of *chromatin* between two replicated *chromosome*s that remain attached to each other until anaphase of *mitosis*; used as a measure of *mutagenicity* of substances that produce this effect.

skeletal fluorosis Osteosclerosis due to fluoride.

slimicide Substance intended to kill slime-producing organisms.

Note: Used on paper stock, water cooling systems, paving stones, etc.

slope factor Value, in inverse *concentration* or *dose* units, derived from the slope of a *dose–response* curve; in practice, limited to *carcinogenic* effects with the curve assumed to be linear at low concentrations or doses.

Note: The product of the slope factor and the *exposure* is taken to reflect the probability of producing the related effect.

societal risk Total probability of harm to a human population including the probability of *adverse effects* to *health* of descendants and the probability of disruption resulting from loss of services such as industrial plant or loss of material goods and electricity.

soil partition coefficient (soil K_d) Experimental ratio of a substance's concentration in the soil to that in the aqueous (dissolved) soil phase at equilibrium: It is valid only for the specific concentration and solid/solution ratio of the test.

See also *organic carbon partition coefficient*.
[6]

solvent abuse solvent sniffing Deliberate inhalation (or drinking) of volatile solvents, in order to become intoxicated.

solvent-sniffing See *solvent abuse*.

somatic
1. Pertaining to the body as opposed to the mind.
2. Pertaining to nonreproductive cells or tissues.
3. Pertaining to the framework of the body as opposed to the viscera.

soporific Substance producing sleep.

sorption Noncommittal term used instead of *adsorption* or *absorption* when it is difficult to discriminate experimentally between these two processes.

speciation (in chemistry) *Distribution* of an element among defined *chemical species* in a system.
[3]

speciation analysis (in chemistry) Analytical activities of identifying and (or) measuring the quantities of one or more individual *chemical species* in a *sample*.
[3]

species
1. In biological systematics, group of organisms of common ancestry that are able to reproduce only among themselves and that are usually geographically distinct.
2. See *chemical species*.

species differences in sensitivity Quantitative or qualitative differences of response to the action(s) of a potentially *toxic* substance on various species of living organisms.

species-specific sensitivity Quantitative and qualitative features of response to the action(s) of a potentially *toxic* substance that are characteristic for a particular species of living organism.

specific death rate Death rate computed for a subpopulation of individual organisms or people having a specified characteristic or attribute, and named accordingly.

Example: Age-specific death rate, the number of deaths of persons of a specified age during a given period of time, divided by the total number of persons of that age in the population during that time.

specificity (of a screening test) Proportion of truly nondiseased persons who are identified by the screening test.

specific pathogen free (SPF) Describing an animal removed from its mother under sterile conditions

just prior to term and subsequently reared and kept under sterile conditions.

specimen Specifically selected portion of any substance, material, organism (specifically tissue, blood, urine, or feces) or environmental medium assumed to be representative of the parent substance, etc. at the time it is taken for the purpose of diagnosis, identification, study, or demonstration.

spectral radiant power The radiant power at wavelength lambda (λ) per unit wavelength interval.

splicing Processes through which *introns* are removed from a m*RNA* prior to translation and the *exons* joined.
[9]

spreader Agent used in some *pesticide* formulations to extend the even disposition of the active ingredient.

stability half life (half time) Time required for the amount of a substance in a formulation to decrease, for any reason, by one-half (50%).
See also *half life, half time*.

standard That which is established as a measure or model to which others of a similar nature should conform.

standard (in law or regulation) technical directive Technical specification, usually in the form of a document available to the public, drawn up with the consensus or general approval of all interests affected by it, based on the consolidated results of science, technology, and experience, aimed at the promotion of optimum community benefits and approved by a body recognized on the national, regional, or international level.

standard (in analytical chemistry) See *reference material*, *standard material.*

standardization
1. Making any substance, *drug*, or other preparation conform to type or precisely defined characteristics.
2. Establishment of precisely defined characteristics, or precisely defined methods, for future reference.
3. Definition of precise procedures for administering, scoring, and evaluating the results of a new method that is under development.

standard material (in analytical chemistry) standard
See *reference material*.

standard(ized) morbidity ratio (SMR) Ratio of the number of patients with a particular *disease* observed in a study group or population to the total number of people in the group or population multiplied by 100.

Note: This ratio is usually expressed as a percentage.

standard(ized) mortality ratio (SMR) Ratio of the number of deaths observed in the study group or population to the number of deaths that would be expected if the study population had the same specific rates as the standard population, multiplied by 100.

Note: This ratio is usually expressed as a percentage.

stannosis *Pneumoconiosis* resulting from inhalation of tin dust.

steady state (in chemistry and toxicology) State of a system in which the conditions do not change in time.

Note: For further information, see [3].
[2]

stem cell *Multipotent* cell with mitotic potential that may serve as a precursor for many kinds of differentiated cells.
[2]

stereoselective synthesis Chemical reaction (or reaction sequence) in which one or more new elements of chirality are formed in a substrate molecule and which produces the stereoisomeric (enantiomeric or diastereoisomeric) products in unequal amounts.

Note: Traditionally called asymmetric synthesis.
[2]

stereoselectivity Specificity of chemical reactivity of stereoisomers based on their three-dimensional molecular structure.
[2]

stochastic Pertaining to or arising from chance and hence obeying the laws of probability.

stochastic effect stochastic process Phenomenon pertaining to or arising from chance, and hence obeying the laws of probability.

stochastic process See *stochastic effect*.

stratification (in epidemiology) Process of or result of separating a *sample* into several subsamples according to specified criteria such as age groups, socioeconomic status, etc.

stratified sample Subset of a population selected according to some important characteristic.

stress proteins See *heat shock proteins*.

structural alert Chemical grouping which is known to be associated with a particular type of toxic effect (e.g., mutagenicity).

structure–activity relationship (SAR) Association between specific aspects of molecular structure and defined biological action.
See also *quantitative structure–activity relationship*.

structure–metabolism relationship (SMR) Association between the physicochemical and (or) the structural properties of a substance and its metabolic behavior.
[2]

subacute See *subchronic*.

subchronic Repeated over a short period, usually about 10% of the life span; an imprecise term used to describe *exposure*s of intermediate duration.

subchronic effect Biological change resulting from an environmental alteration lasting about 10% of the lifetime of the test organism.

Note: In practice with experimental animals, such an effect is usually identified as resulting from multiple or continuous *exposures* occurring over 3 months (90 days). Sometimes a subchronic effect is distinguished from a *subacute* effect on the basis of its lasting for a much longer time.

subchronic toxicity test Animal experiment serving to study the effects produced by the test substance when administered in repeated *doses* (or continually in food, drinking water, air) over a period of up to about 90 days.

subclinical effect Biological change with detectable symptoms following *exposure* to an agent known to cause *disease* either before symptoms of the disease occur or when they are absent.

subfertility Fertility below the normal range for a given species.
[8]

subjective environment perceived environment
Surrounding conditions as perceived by persons living in these conditions.

substrate (in biology)
1. Substance material on which an *enzyme* acts.
2. Surface on which an organism grows or to which is attached.

subthreshold dose See *no-effect dose*.

sudorific See *diaphoretic*.

sufficient evidence According to the USEPA's Guidelines for *Carcinogen Risk Assessment*, sufficient evidence is a collection of facts and scientific references that is definite enough to establish that an *adverse effect* is caused by the agent in question.

suggested no-adverse-response level (SNARL) Maximum *dose* or *concentration* that on current understanding is likely to be tolerated by an *exposed* organism without producing any harm.

suicide reaction Formation of irreversible cleavage complexes (also referred to as "suicide complexes") leading to cell death.

summary sheet Two-to-four page summary of a *risk assessment*.

summation (in neurophysiology) Process of addition of separate postsynaptic responses caused by stimuli that are adjacent in time and space.

Note: Excitation of a synapse evokes a graded potential change in the postsynaptic membrane that may be below the threshold required to trigger an impulse. If two or more such potentials are caused either nearly simultaneously, at different synapses on the same neuron (spatial summation), or in rapid succession at the same synapse (temporal summation), the summed response may be sufficient to trigger a postsynaptic impulse. Summation may occur between excitatory potentials, inhibitory potentials, or between an excitatory and an inhibitory potential.

Superfund Federal authority, established by the U.S. Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) in 1980, to respond directly to releases or threatened releases (such as from landfills or waste disposal areas) of hazardous substances that may endanger *health* or welfare.

superoxide dismutase Enzymatic antioxidant that removes the potentially toxic superoxide ion (O^{2-}) by disproportionating it to O_2 and hydrogen peroxide (H_2O_2).

superthreshold dose See *toxic dose*.

surface layer Region of space comprising and adjoining the phase boundary between a solid and liquid phase, between a solid and gas phase, or between a liquid and gas phase within which properties of matter are significantly different from the values in the adjoining bulk phases.

surrogate Relatively well studied *toxicant* whose properties are assumed to apply to an entire chemically and toxicologically related class; for example, benzo(a)pyrene data may be used as toxicologically equivalent to that for all *carcinogenic* polynuclear aromatic hydrocarbons.

surveillance Systematic ongoing collection, collation, and analysis of data and the timely dissemination of information to those who need to know in order that action can be taken to initiate investigative or control measures.

susceptible vulnerable Describing a group of organisms more vulnerable to a given *exposure* than the majority of the population to which they belong.

Note: Susceptibility may reflect gender, age, physiological status, or genetic constitution of the organisms at risk.

[2]

susceptibility biomarker See *biomarker of susceptibility*.

susceptibility Condition of lacking the power to resist a particular *disease* or infection; thus, in susceptible people, 'normal expected' results occur, but with a lower *exposure* (or *dose*) than in the rest of the population.

sympathetic nervous system Part of the autonomic nervous system originating in the thoracic and lumbar regions of the spinal cord that tends to inhibit or oppose the physiological effects of the *parasympathetic* nervous system, as in tending to reduce digestive secretions, speed up the heart, and contract blood vessels.

See *parasympathetic*.

sympatholytic anti-adrenergic

1. adj., Blocking transmission of impulses from the adrenergic (sympathetic) postganglionic fibers to effector organs or tissues.
2. n., Agent that blocks transmission of impulses from the adrenergic (sympathetic) postganglionic fibers to effector organs or tissues.

sympathomimetic adrenergic

1. adj., Producing effects resembling those of impulses transmitted by the postganglionic fibers of the *sympathetic nervous system*.
2. n., Agent that produces effects resembling those of impulses transmitted by the postganglionic fibers of the sympathetic nervous system.

symptom Any subjective evidence of a disease or an effect induced by a substance as perceived by the affected subject.

symptomatology General description of all of the signs and symptoms of *exposure* to a *toxicant*.

Note: Signs are the overt (observable) responses associated with exposure (such as convulsions, death, etc.), whereas symptoms are covert (subjective) responses (such as nausea, headache, etc.).

synapse Functional junction between two neurons, where a nerve impulse is transmitted from one neuron to another.

synaptic transmission See *synapse*.

syndrome Set of *signs* and *symptoms* occurring together and often characterizing a particular *disease*-like state.

synergism (in toxicology) synergistic effect

synergy (in toxicology) Pharmacological or toxicological interaction in which the combined biological effect of *exposure* to two or more substances is greater than expected on the basis of the simple summation of the effects of each of the individual substances.

synergist (in toxicology) Substance that contributes more than additively to a mutual effect with another substance.

synergistic effect See *synergism*.

synergy See *synergism*.

synomone *Semiochemical* that is produced by one organism inducing a response in an organism of another species that is favorable to both the emitter and the responding organism.

See *allomone, kairomone*.

synteny Property of *gene*s which reside on the same *chromosome*.

systematic sample Subset selected according to some simple rule such as specified date or alphabetic classification.

systemic

1. Relating to the body as a whole.
2. Occurring at a site in the body remote from the point of contact with a substance.

After [1]

systemic effect Consequence that is either of a generalized nature or that occurs at a site distant from the point of entry of a substance.

Note: A systemic effect requires *absorption* and distribution of the substance in the body.

systems biology Study of the mechanisms underlying complex biological processes as integrated systems of many diverse, interacting components.

Note: It involves (1) collection of large sets of experimental data (by high-throughput technologies and/or by mining the literature of reductionist molecular biology and biochemistry), (2) proposal of mathematical models that might account for at least some significant aspects of this data set, (3) accurate

computer solution of the mathematical equations to obtain numerical predictions, and (4) assessment of the quality of the model by comparing numerical simulations with the experimental data.

tachy- Prefix meaning rapid as in *tachycardia* and *tachypnoea*.

tachycardia Antonym: *bradycardia* Abnormally fast heartbeat.

tachypnoea Antonym: *bradypnoea* Abnormally fast breathing.

taeniacide Substance intended to kill tapeworms.

target (in biology) Any organism, organ, tissue, cell, or cell constituent that is subject to the action of an agent.

target population (in epidemiology)
1. Collection of individuals, items, measurements, etc. about which inferences are required: The term is sometimes used to indicate the population from which a *sample* is drawn and sometimes to denote any reference population about which inferences are needed.
2. Group of persons for whom an intervention is planned.

T cell See *T lymphocyte*.

technical directive See *standard*.

telomere Structure which terminates the arm of a *chromosome*.

Note: A similar term 'telomere', with a different meaning is found in the IUPAC "Gold Book".

[3]

temporary acceptable daily intake Value for the *acceptable daily intake* (ADI) proposed for guidance when data are sufficient to conclude that use of the substance is safe over the relatively short period of time required to generate and evaluate further safety data, but are insufficient to conclude that use of the substance is safe over a lifetime.

Note: A higher-than-normal *safety* factor is used when establishing a temporary ADI, and an expiration date is established by which time appropriate data to resolve the safety issue should be available.

temporary maximum residue limit Regulatory value established for a specified, limited time when only a temporary *acceptable daily intake* has been established for the *pesticide* concerned or, with the existence of an agreed acceptable daily intake, the available residue data are inadequate for firm maximum residue recommendations.

teratogen Substance that, when administered prenatally (to the mother), induces permanent structural malformations or defects in the offspring.

teratogenicity
1. Potential to cause the production of nonheritable structural malformations or defects in offspring.
2. Production of nonheritable structural malformations or defects in offspring.

teratology Study of malformations, monstrosities, or serious deviations from normal development in organisms.

testing of chemicals
1. In *toxicology*, evaluation of the therapeutic and potentially *toxic* effects of substances by their application through relevant routes of *exposure* with appropriate organisms or biological systems so as to relate effects to *dose* following application.
2. In chemistry, qualitative or quantitative analysis by the application of one or more fixed methods and comparison of the results with established standards.

tetanic Pertaining to tetanus, characterized by tonic muscle spasm.

theoretical maximum daily intake (TMDI) Predicted maximum daily intake of a residue, assuming that it is present at the *maximum residue level* and that average daily consumption of foods per person is represented by assessed regional diets: It is expressed in milligrams of residue per person per day.

After [14]

therapeutic cloning Generation and manipulation of stem cells with the objective of deriving cells of a particular organ or tissue to treat a disease.

therapeutic index Ratio between *toxic* and therapeutic doses (the higher the ratio, the greater the safety of the therapeutic dose).

three-dimensional quantitative structure–activity relationship (3D-QSAR) Quantitative association between the three-dimensional structural properties of a substance and its biological properties.

[2]

See *quantitative structure–activity relationship*.

threshold Dose or *exposure concentration* below which a defined effect will not occur.

See also *critical effect*.

threshold concentration See *threshold*.

threshold dose See *threshold*.

threshold limit value–ceiling (TLV–C) As defined by ACGIH, *concentration* of a potentially *toxic* substance

that should not be exceeded during any part of the working *exposure*.

[2]

threshold limit value–short-term exposure limit (TLV–STEL) As defined by ACGIH, *concentration* to which it is believed that workers can be *exposed* continuously for a short period of time without suffering from (1) irritation, (2) *chronic* or irreversible tissue damage, or (3) *narcosis* of sufficient degree to increase the likelihood of accidental injury, impair self-rescue or materially reduce work efficiency, and provided that the daily TLV-TWA is not exceeded.

Note: It is not a separate independent *exposure* guideline; rather, it supplements the TLV-TWA limit where there are recognized *acute* effects from a substance whose *toxic* effects are primarily of a chronic nature. TLV-STELs are recommended only where *toxic* effects have been reported from high short-term exposures in either humans or animals.

[2]

threshold limit value–time-weighted average (TLV–TWA) As defined by ACGIH, *time-weighted average concentration* for a conventional 8-h workday and a 40-h workweek, to which it is believed nearly all workers may be repeatedly *exposed*, day after day, without *adverse effect*.

[2]

threshold of toxicological concern (TTC) Human *exposure* threshold value for a group of chemicals below which there should be no appreciable risk to human health.

thrombocytopenia Decrease in the number of blood platelets (thrombocytes).

thyrotoxicosis Condition resulting from excessive concentrations of thyroid hormones, as in hyperthyroidism, characterized by bulging eyes and rapid heart rate.

tidal volume Quantity of air or test gas that is inhaled and exhaled during one respiratory cycle.

time-weighted-average-exposure (TWAE) time-weighted-average concentration (TWAC) *Concentration* in the *exposure* medium at each measured time interval multiplied by that time interval and divided by the total time of observation.

Note: For occupational exposure, a working shift of 8 h is commonly used as the averaging time.

tinnitus Continual noise in the ears, such as ringing, buzzing, roaring, or clicking.

tissue dose Amount of a substance or physical agent (radiation) absorbed by a tissue.

tissue/plasma partition coefficient See *partition ratio*.

T lymphocyte Animal cell that possesses specific cell surface *receptor*s through which it binds to foreign substances or organisms, or those which it identifies as foreign, and which initiates *immune responses*.

tolerable daily intake (TDI) Estimate of the amount of a potentially harmful substance (e.g., contaminant) in food or drinking water that can be ingested daily over a lifetime without appreciable *health risk*.

Note 1: For regulation of substances that cannot be easily avoided, a provisionally *tolerable weekly intake* (PTWI) may be applied as a temporary limit.

Note 2: *Acceptable daily intake* is normally used for substances not known to be harmful, such as food additives.

[2]

tolerable risk Probability of suffering disease or injury that can, for the time being, be tolerated, taking into account the associated benefits, and assuming that the *risk* is minimized by appropriate control procedures.

tolerable weekly intake (TWI) Estimate of the amount of a potentially harmful substance (e.g., a contaminant) in food or drinking water that can be ingested weekly over a lifetime without appreciable *health risk*.

[2]

tolerance

1. Adaptive state characterized by diminished effects of a particular *dose* of a substance: The process leading to tolerance is called 'adaptation'.
2. In food *toxicology*, dose that an individual can tolerate without showing an effect.
3. Ability to experience *exposure* to potentially harmful amounts of a substance without showing an *adverse effect*.
4. Ability of an organism to survive in the presence of a *toxic* substance: Increased tolerance may be acquired by adaptation to constant *exposure*.
5. In immunology, state of specific immunological unresponsiveness.

tonic

1. Characterized by tension, especially muscular tension.
2. Medical preparation that increases or restores normal muscular tension.

topical (in medicine) Applied directly to the surface of the body.
[2]

topical effect Consequence of application of a substance to the surface of the body which occurs at the point of application.
[2]

torsade de pointes Potentially lethal form of ventricular *tachycardia* following chronic abuse of alcohol and mainly due to hypomagnesemia.

total diet study
1. Study designed to establish the pattern of *pesticide* residue intake by a person consuming a defined diet.
2. Study undertaken to show the range and amount of various foodstuffs in a typical diet or to estimate the total amount of a specific substance in a typical diet.

total terminal residue (of a pesticide) Summation of levels of all the residues of a defined *pesticide* in a food.
See also *residue*.
After [6]

toxemia (blood poisoning)
1. Condition in which the blood contains *toxins* produced by body cells at a local source of infection or derived from the growth of microorganisms.
2. Pregnancy-related condition characterized by high blood pressure, swelling, and fluid retention, and proteins in the urine.

toxic Able to cause injury to living organisms as a result of physicochemical interaction.

toxicant See *toxic substance*.

toxic chemical See *toxic substance*.

toxic dose superthreshold dose Amount of a substance that produces intoxication without lethal outcome.

toxicity
1. Capacity to cause injury to a living organism defined with reference to the quantity of substance administered or absorbed, the way in which the substance is administered and distributed in time (single or repeated *doses*), the type and severity of injury, the time needed to produce the injury, the nature of the organism(s) affected, and other relevant conditions.
2. *Adverse effect*s of a substance on a living organism defined as in 1.
3. Measure of incompatibility of a substance with life: This quantity may be expressed as the reciprocal of the absolute value of *median lethal dose* ($1/LD_{50}$) or *concentration* ($1/LC_{50}$).

toxicity equivalency factor (TEF), *f* Ratio of the toxicity of a chemical to that of another structurally related chemical (or index compound) chosen as a reference.
[6]

toxicity equivalency factor (in *risk assessment*) (TEF), *f* Ratio of the toxicity of a chemical to that of another structurally related chemical (or index compound) chosen as a reference. Factor used to estimate the *toxicity* of a complex mixture, commonly a mixture of chlorinated dibenzo-*p*-dioxins [oxanthrenes], furans, and biphenyls: In this case, TEF is based on relative toxicity to 2,3,7,8-tetrachlorodibenzo-*p*-dioxin [2,3,7,8-tetrachlorooxanthrene] for which the $f = 1$.

toxicity equivalent (TEQ), T_{xe} Contribution of a specified component (or components) to the *toxicity* of a mixture of related substances.

Note 1: The amount-of-substance (or substance) *concentration* of total toxicity equivalent is the sum of that for the components B, C … N.

Note 2: Toxicity equivalent is most commonly used in relation to the reference *toxicant* 2,3,7,8-tetrachlorodibenzo-p-dioxin [2,3,7,8-tetrachlorooxanthrene] by means of the *toxicity equivalency factor* (TEF, *f*) which is 1 for the reference substance. Hence, where c is the amount-of-substance concentration:

$$T_{xe} = \sum_{i=B}^{N} f_1 c_i$$

toxic substance Substance causing injury to living organisms as a result of physicochemical interactions.
[2]

$t_{1/2}$
See *half life*, *half time.*

toxicity exposure ratio (TER) Ratio of the measure of the effects (e.g., LD_{50}, LC_{50}, NOEC) to the estimated *exposure*.

Note: It is the reciprocal of a *risk quotient* or *hazard quotient*.

[6]

toxicity test Experimental study of the *adverse effect*s of *exposure* of a living organism to a substance for a defined duration under defined conditions.

toxic material See *toxic substance*.

toxicodynamics Process of interaction of potentially *toxic substance*s with *target* sites, and the biochemical and physiological consequences leading to *adverse effect*s.

toxicogenomics Scientific subdiscipline that combines *toxicology* with *genomics* to determine how an organism's genetic make-up influences its response to a toxic substance.

toxicogenetics Study of the influence of hereditary factors on the effects of potentially *toxic* substances on individual organisms.

toxicokinetics

1. Generally, the overall process of the *absorption* in biology (*uptake*) of potentially *toxic* substances by the body, the distribution of the substances and their metabolites in tissues and organs, their *metabolism* (*biotransformation*), and the *elimination* of the substances and their metabolites from the body.
2. In validating a toxicological study, the collection of toxicokinetic data, either as an integral component in the conduct of nonclinical toxicity studies or in specially designed supportive studies, in order to assess systemic *exposure*.

toxicological data sheet Document that gives in a uniform manner data relating to the *toxicology* of a substance, its production and application, properties and methods of identification.

Note: The data sheet may also include recommendations on protective measures.

toxicologically based pharmacokinetic modeling (TBPK) See *physiologically based pharmacokinetic modeling*.

toxicology Scientific discipline involving the study of the actual or potential danger presented by the harmful effects of substances on living organisms and ecosystems, of the relationship of such harmful effects to *exposure*, and of the mechanisms of action, diagnosis, prevention, and treatment of intoxications.

toxicometry Term sometimes used to indicate a combination of investigative methods and techniques for making a quantitative assessment of *toxicity* and the *hazard*s of potentially *toxic* substances.

toxicophobia Morbid dread of *poisons*.

toxicophoric group toxogenic group toxophoric group Structural moiety that upon metabolic activation exerts *toxic* effects: The presence of a toxicophoric group indicates only potential and not necessarily actual *toxicity* of a *drug* or other substances.

toxicovigilance Active process of identification, investigation, and evaluation of various *toxic* effects in the community with a view to taking measures to reduce or control *exposure*(s) involving the substance(s) which produces these effects.

toxic substance chemical etiologic agent poison toxicant toxic chemical toxic material Material causing injury to living organisms as a result of physicochemical interactions.

toxification Metabolic conversion of a potentially *toxic* substance to a product that is more toxic.

toxin Poisonous substance produced by a biological organism such as a microbe, animal, plant, or fungus.

Note: Examples are botulinum toxin, tetrodotoxin, pyrrolizidine alkaloids, and amanitin.

toxinology Scientific discipline involving the study of the chemistry, biochemistry, pharmacology, and *toxicology* of *toxins*.

toxogenic group See *toxicophoric group*.

toxophoric group See *toxicophoric group*.

traceability (in metrology) Property of a measurement result whereby the result can be related to a stated reference through a documented unbroken chain of calibrations, each contributing to the measurement uncertainty.

[7]

tracer

1. Means by which something may be followed; for example, a radioactive isotope may replace a stable chemical element in a *toxic* compound enabling the toxicokinetics to be followed.
2. Labeled member of a population used to measure certain properties of that population.

tracer substance Substance that can be tracked through one or more reactions or systems, often by detecting an incorporated isotope.

[2]

transcription Process by which the genetic information encoded in a linear sequence of nucleotides in one strand of *DNA* is copied into an exactly complementary sequence of *RNA*.

transcriptome Total m*RNA* expressed in a cell or tissue at a given point in time.

transcriptomics Global analysis of *gene* expression to identify and evaluate changes in synthesis of m*RNA* after chemical *exposure*.

[2]

transformation

1. Alteration of a cell by incorporation of foreign genetic material and its subsequent expression in a new *phenotype*.
2. Conversion of cells growing normally to a state of rapid division in culture resembling that of a *tumor*.
3. Chemical modification of substances in the environment.

transformed cell Cell that has become genetically altered spontaneously or by incorporation of foreign *DNA* to produce a cell with an extended lifetime in culture.
[2]

transformed cell line See *cell line*, *transformed cell.*

transgene *Gene* from one source that has been incorporated into the genome of another organism.

transgenic Adjective used to describe animals carrying a *gene* introduced by micro-injecting *DNA* into the nucleus of the fertilized egg.

translation Process through which a polypeptide chain of amino acid molecules is generated as directed by the sequence of a particular m*RNA* sequence.

transposon Mobile nucleic acid element.

treatability In relation to *waste* water, the amenability of substances to removal without adversely affecting the normal operation of biological treatment processes (such as a sewage treatment plant).

triage
1. Process for sorting people into groups based on their need for or likely benefit from immediate medical treatment.

   Note: Triage is used in hospital emergency rooms, on battlefields, and at disaster sites when limited medical resources must be allocated.
2. System used to allocate a scarce commodity, such as food, to those most likely to benefit from it.
3. Process in which things are ranked in terms of importance or priority.

trophic level Amount of energy in terms of food that an organism needs.

Note: Organisms not needing organic food, such as plants, are said to be on a low trophic level, whereas predator species needing food of high energy content are said to be on a high trophic level. The trophic level indicates the level of the organism in the food chain.

trueness Closeness of agreement between the average of a theoretically infinite number of replicate measured quantity values and a reference quantity value.

tubular reabsorption Transfer of solutes from the *renal* tubule lumen to the tubular epithelial cell and normally from there to the peritubular fluid.
[2]

tumorigenic Able to cause *tumors*.

tumor tumour neoplasm
1. Any abnormal swelling or growth of tissue, whether *benign* or *malignant*.
2. An abnormal growth, in rate and structure, that arises from normal tissue, but serves no physiological function.

tumor necrosis factor (TNF) cachectin cachexin Protein produced by several of the body's cell types, such as white blood cells, red blood cells, and other cells that line the blood vessels; it promotes the destruction of some types of *cancer* cells and is a *cytokine* involved in systemic *inflammation*.

tumor progression Sequence of changes by which a *benign tumor* develops from the initial lesion to a *malignant* stage.

tumor suppressor gene *Gene* that serves to protect cells from entering a cancerous state.

Note: According to Knudson's "two-hit" hypothesis, both alleles of a particular *tumor* suppressor *gene* must acquire a mutation before the cell will enter a transformed state.

turnover time See *mean life*.

two-compartment model Product of *compartmental analysis* requiring two *compartments*.
[2]
See *compartmental modeling, multicompartment model*.

ulcer Defect, often associated with *inflammation*, occurring locally or at the surface of an organ or tissue owing to sloughing of necrotic (see *necrosis*) tissue.

ultrafine particle Particle in air of *aerodynamic diameters* 100 nm.

Note: As a group, ultrafine particles are referred to as PM0.1 (100 nm is 0.1 μm).
[2]

uncertainty (in metrology) Parameter characterizing the dispersion of the quantity values being attributed to a measurand, based on the information used.

Note: The parameter may be, for example, a standard deviation or the half width of an interval, having a stated coverage probability.
[7]

uncertainty factor (UF)
1. In assay methodology, confidence interval or fiducial limit used to assess the probable precision of an estimate.
2. In *toxicology*, value used in extrapolation from experimental animals to man (assuming that man may be more sensitive) or from selected individuals to the general population. For example, a value applied to the *no-observed-effect-level* (NOEL) or *no-observed-adverse-effect-level* (NOAEL) to

derive an *acceptable daily intake* (ADI) or *tolerable daily intake* (TDI).

Note: The NOEL or NOAEL is divided by the value to calculate the ADI or TDI.

See also *modifying factor, safety factor*.

unit risk Upper-bound excess lifetime *cancer risk* estimated to result from continuous *exposure* to an agent at a *concentration* of $1\,\mu g\ L^{-1}$ in water, or $1\,\mu g\ m^{-3}$ in air.

Note: The interpretation of unit risk is as follows: if unit risk $= 1.5 \times 10^{-6}\,\mu g\ L^{-1}$, 1.5 excess tumors are expected to develop per 1 000 000 or 10^6 people if exposed daily for a lifetime to $1\,\mu g$ of the chemical in 1 liter of drinking water.

upper boundary Estimate of the plausible upper limit to the true value of a quantity.

Note: This is usually not a statistical confidence limit.

uptake Entry of a substance into the body, an organ, a tissue, a cell, or the body fluids by passage through a membrane or by other means.

urticaria Vascular reaction of the skin marked by the transient appearance of smooth, slightly elevated patches (wheals, hives) that are redder or paler than the surrounding skin and often attended by severe itching.

vacuole Membrane-bound cavity within a cell.

validity of a measurement Expression of the degree to which a measurement measures what it purports to measure.

validity of a study Degree to which the inferences drawn, especially generalizations extending beyond the study *sample*, are warranted when account is taken of the study methods, the representativeness of the study sample, and the nature of the population from which it is drawn.

vasoconstriction Antonym: *vasodilation* Decrease of the caliber of the blood vessels leading to a decreased blood flow.

vasodilation Antonym: *vasoconstriction* Increase in the caliber of the blood vessels, leading to an increased blood flow.

vector See *cloning vector*.

vehicle Substance(s) used to formulate active ingredients for administration or use.

Note: In this context, it is a general term for solvents, suspending agents, etc.

venom Animal *toxin* generally used for self-defense or predation and usually delivered by a bite or sting.

ventilation

1. Process of supplying a building or room with fresh air.
2. Process of exchange of air between the ambient atmosphere and the lungs.
3. In physiology, the amount of air inhaled per day.
4. Oxygenation of blood.

ventricular fibrillation Irregular heartbeat characterized by uncoordinated contractions of the ventricle.

vermicide Substance intended to kill intestinal worms.

vermifuge See *anthelmint(h)ic*.

vertigo Dizziness; an illusion of movement as if the external world were revolving around one's self or as if one's self were revolving in space.

vesicant

1. adj., Producing blisters on the skin.
2. n., Substance that causes blisters on the skin.

vesicle

1. In cell biology, small bladder-like, membrane-bound sac containing aqueous solution or fat.
2. In pathology, blisterlike elevation on the skin containing serous fluid.

virtually safe dose (VSD) Human *exposure* over a lifetime to a carcinogen which has been estimated, using mathematical modeling, to result in a very low incidence of *cancer*, somewhere between zero and a specified incidence (e.g., 1 cancer in 1 000 000 exposed people).

virucide antiviral Substance used to control viruses. [6]

volume of distribution Apparent (hypothetical) volume of fluid required to contain the total amount of a substance in the body at the same *concentration* as that present in the *plasma* assuming equilibrium has been attained.

volatile organic chemical (VOC) Any organic compound having, at 293.15 K, a vapor pressure of 0.01 kPa or more, or having a corresponding volatility under the particular condition of use. [15]

waste Anything that is discarded deliberately or otherwise disposed of on the assumption that it is of no further use to the primary user.

wasting syndrome Disease marked by weight loss and atrophy of muscular and other connective tissues that is not directly related to a decrease in food and water consumption.

water potential (in physiology) Difference in free energy or chemical potential (per unit molal volume) between pure water and water in cells and solutions.

Weibull model *Dose–response* model of the form

$$P(d) = \gamma + (1 - \gamma)(1 - e^{-\beta d\alpha})$$

where $P(d)$ is the probability of a tumor (or other response) from lifetime, continuous *exposure* at dose d until age t (when tumor is fatal), α is a fitted dose parameter (sometimes called the Weibull parameter), β is a fitted dose parameter, and γ is the background response rate.

weight-of-evidence for toxicity Extent to which the available biomedical data support the hypothesis that a substance causes a defined *toxic* effect such as cancer in humans.

withdrawal effect Adverse event following withdrawal from a person or animal of a *drug* to which they have been chronically *exposed* or on which they have become dependent.

working zone Space measuring up to 2 m over the level of the floor or platform that contains a worker's permanent or temporary station.

x-disease Hyperkeratotic disease in cattle following *exposure* to chlorinated dibenzo-*p*-dioxins, naphthalenes, and related compounds.

xenobiotic Compound with a chemical structure foreign to a given organism.

Note: Frequently restricted to man-made compounds.

yeast two-hybrid system Genetic method for analyzing the interactions of proteins.

zero-order kinetics *Kinetics* of a reaction in which the *rate* is independent of the *concentration*(s) of the reactants.

[2]

zoocide Substance intended to kill animals.

zygote

1. Cell such as a fertilized egg resulting from the fusion of two *gametes*.
2. Cell obtained as a result of complete or partial fusion of cells produced by *meiosis*.

ANNEX 1: ABBREVIATIONS AND ACRONYMS USED IN TOXICOLOGY LITERATURE

ADI	acceptable daily intake
ADME	absorption, distribution, metabolism, excretion
ADMET	absorption, distribution, metabolism, excretion, toxicokinetics
AF	assessment factor
AIC	Akaike Information Criterion, *C*: a measure of the goodness of fit of an estimated statistical model calculated in the general case from the equation $C = 2k - 2 \ln L$
ALARA(P)	as low as reasonably achievable (practicable) In UK, regulations relating to worker exposure In USA, goal of risk management (USNRC regulations)
ASP	amnesic shellfish poisoning
ATP	adenosine triphosphate
AUC	area under the concentration–time curve
AUMC	area under the moment curve
BAC	bacterial artificial chromosome
BAL	British anti-Lewisite
BCF	bioconcentration factor
BEI	biological exposure indices (ACGIH)
BEM	biological effect monitoring
BMC	benchmark concentration
BMCL	confidence limit for BMC
BMD	benchmark dose
BMDL	confidence limit for BMD
BMDS	benchmark dose at a given standard deviation
BMR	benchmark rate
BOD	biochemical oxygen demand; biological oxygen demand b.w., b.wt. body weight
cDNA	complementary DNA
CMR	carcinogenic, mutagenic, and reproductive (toxicant)
COD	chemical oxygen demand
CoMFA	comparative molecular field analysis
COPC	compound of probable concern
CRM	certified reference material
CSAF	chemical specific adjustment factor
CTD	common technical document (drug registration)
CYP	cytochrome P450
Cyt	cytochrome
CV	ceiling value
D	absorbed dose of radiation
DDT	dichloro diphenyl trichloroethane
DNA	deoxyribonucleic acid
DNEL	derived no-effect level
DSP	diarrheal shellfish poisoning; diarrheic shellfish poisoning
EC	effective concentration, Enzyme Commission, European Community
EC_{50}	median effective concentration to 50% of a population
EC_n	median effective concentration to *n* % of a population
eCTD	electronic common technical document (drug registration)
ED	effective dose
EDC	endocrine-disrupting compound
EDI	estimated daily intake
ED_{50}	median effective dose to 50% of a population
ED_n	median effective dose to *n*% of a population
EEC	estimated environmental exposure concentration; estimated exposure concentration; expected environmental exposure concentration
EED	estimated exposure dose
EEL	environmental exposure level
EIA	environmental impact assessment
EIS	environmental impact statement
ELISA	enzyme-linked immunosorbent assay
EMDI	estimated maximum daily intake
EQO	environmental quality objective
EQS	environmental quality standard
ERL	extraneous residue limit
EST	expressed sequence tag
ETS	environmental tobacco smoke
f	toxicity equivalency factor
F	fraction of dose absorbed; bioavailability
FONSI	finding of no significant impact
GAP	good agricultural practice
GCP	good clinical practice
GHS	global harmonization system for classification of hazardous substances
GLP	good laboratory practice
GFR	glomerular filtration rate
GMO	genetically modified organism
GMP	good manufacturing practice
GRAS	generally regarded as safe
HAL	health advisory level
HAZOP	hazard and operability study
HEQ	human equivalent dose
HSG	Health and Safety Guide (IPCS)

HQ	hazard quotient
i.c.	intracutaneous
IC	inhibitory concentration
IC_n	inhibitory concentration to n% of a population
i.d.	intradermal
ID	inhibitory dose
ID_n	inhibitory dose to n% of a population
IDLHC	immediately dangerous to life and health concentration
i.m.	intramuscular
inhl	by inhalation
i.p.	intraperitoneal
IPD	individual protective device
I-TEF	international toxicity equivalency factor
i.v.	intravenous
K_d	soil partition coefficient
K_M	Michaelis constant
K_{oc}	organic carbon partition coefficient
K_{ow}	octan-1-ol–water partition coefficient
K_D	partition ratio
LADD	lifetime average daily dose
LC_{min}	minimum lethal concentration
LC_n	median concentration lethal to n% of a test population
LC_{50}	see LC_n
LD	lethal dose
LD_{min}	minimum lethal dose
LD_n	median dose lethal to n% of a test population
LD_{50}	see LD_n
LED	lowest effective dose
LED_x	lowest effective dose for a biological effect in x% of the individuals in the test population
LEL	lowest-effect level, same as LOEL
LOEL	lowest-observed-effect level
LOAEL	lowest-observed-adverse-effect level
LT_n	median time for death of n% of a test population
LV	limit value
MAC	maximum allowable concentration
MAK	maximal arbeitsplatz konzentration (German)
MCL	maximum contaminant level
MCLG	maximum contaminant level goal
MCS	multiple chemical sensitivity
MEL	maximum exposure limit
MF	modifying factor
MFO	mixed-function oxidase
MN	micronucleus
MOE	margin of exposure
MOS	margin of safety
MPC	maximum permissible concentration
MPL	maximum permissible level
MRL	maximum residue limit; minimal risk level (ATSDR)
MRT	mean residence time
mRNA	messenger ribonucleic acid
MSDS	material safety data sheet
MTC	maximum tolerable concentration
MTD	maximum tolerable dose; maximum tolerated dose
MTEL	maximum tolerable exposure level
NADP(H)	nicotinamide adenine dinucleotide phosphate (reduced)
NAG	*N*-acetyl-d-glycosaminidase
NC_n	median concentration narcotic to n% of a population
ND_n	median dose narcotic to n% of a population
NED	no-effect dose
NEL	no-effect level, same as NOEL
NOAEL	no-observed-adverse-effect level
NOEL	no-observed-effect level
NRL	no-response level
NSAID	nonsteroidal anti-inflammatory drug
NSC	normalized sensitivity coefficient
NSP	nanosized particle; nanoparticle (ultrafine)
OEL	occupational exposure level
OES	occupational exposure standard
OR	odds ratio
PADI	pseudo-acceptable daily intake
PAH	polycyclic aromatic hydrocarbon
PBPK	physiologically based pharmacokinetic modeling
PBPD	physiologically based pharmacodynamic modeling
PBTK	physiologically based toxicokinetic modeling
PBB	polybrominated biphenyl
PCB	polychlorinated biphenyl
PCC	population critical concentration
PCDF	polychlorinated dibenzofuran
PCR	polymerase chain reaction
PEC	predicted environmental concentration; predicted exposure concentration
PEL	permissible exposure limit
PBT	persistent, bioaccumulative, and toxic
p.c.	per cutim (Latin) = through the skin
PEL	permissible exposure limit
PIC	prior informed consent
PIP	persistent inorganic pollutant
$PM_{0.1}$	ultrafine particles in air with a maximum aerodynamic diameter $<0.1\,\mu m$
$PM_{2.5}$	particles in air with a maximum aerodynamic diameter of $2.5\,\mu m$

PM_{10}	particles in air with a maximum aerodynamic diameter of 10 μm
PMR	proportionate mortality rate, ratio
PNEC	predicted no-effect concentration
p.o.	per os (Latin) = by mouth
POP	persistent organic pollutant
P_{OW}	octan-1-ol–water partition coefficient
Q	quality factor (radiation)
PPAR	peroxisome proliferator-activated receptor
PPD	personal protective device
PPE	personal protective equipment
PSP	paralytic shellfish poisoning
PTWI	provisional tolerable weekly intake
QSAR	quantitative structure–activity relationship
3D-QSAR	three-dimensional quantitative structure–activity relationship
QSMR	quantitative structure–metabolism relationship
RD	rate difference
REL	recommended exposure limit (NIOSH)
RER	relative excess risk
RfC	reference concentration
RfD	reference dose
RIA	radio-immunoassay
RME	reasonable maximum exposure
RNA	ribonucleic acid
RNS	reactive nitrogen species
RR	rate ratio; relative risk
ROS	reactive oxygen species
S-9	rat liver microsome preparation
SAR	structure–activity relationship; standard absorption rate
s.c.	subcutaneous
SCE	sister chromatid exchange
SD	standard deviation
SE	standard error
SF	safety factor
SMR	standard morbidity ratio; standard mortality ratio; structure–metabolism relationship
SNARL	suggested no-adverse-response level
SNP	single nucleotide polymorphism
SPF	specific pathogen free
STEL	short-term exposure limit
$t_{1/2}$	half life; half time
T_{eq}	toxicity equivalent
TBPK	toxicologically based pharmacokinetic modeling
TCDD	2,3,7,8-tetrachlorodibenzo-*p*-dioxin [2,3,7,8-tetrachlorooxanthrene]
TDI	tolerable daily intake
TEF	toxicity equivalency factor
TEQ	toxicity equivalent
TER	toxicity exposure ratio
TL_n	see LT_n
TLV	threshold limit value (ACGIH)
TLV-C	threshold limit value (ACGIH)–ceiling
TLV–STEL	threshold limit value (ACGIH)–short-term exposure limit
TLV–TWA	threshold limit value (ACGIH)–time-weighted average
TMDI	theoretical maximum daily intake
TTC	threshold of toxicological concern
TWA	time-weighted average
TWAC	time-weighted average concentration
TWAE	time-weighted average exposure
TWI	tolerable weekly intake
UDP	uridine diphosphate
UF	uncertainty factor
V_{max}	maximum velocity
VOC	volatile organic compound
vPvB	very persistent and very bioaccumulative
VSD	virtually safe dose

ANNEX 2: ABBREVIATIONS AND ACRONYMS OF NAMES OF INTERNATIONAL BODIES AND LEGISLATION

ABT	American Board of Toxicology
ACGIH	American Conference of Governmental Industrial Hygienists
ATS	Academy of Toxicological Science
ATSDR	Agency for Toxic Substances and Diseases Registry
BCR	Bureau Communautaire de Référence (Bruxelles)
BIBRA	British Industrial Biological Research Association
CCFA	Codex Committee on Food Additives
CCPR	Codex Committee on Pesticide Residues
CDC	Centers for Disease Control and Prevention
CEC	Commission of the European Communities
CEN	Committee Européen de Normalisation
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act (USA)
CHIP	Classification, Hazard Information, and Packaging (UK)
COSHH	Control of Substances Hazardous to Health Regulations (UK)
CPL	Classification, Packaging, and Labeling
CTD	Common Technical Document for the Registration of Pharmaceuticals for Human Use for submission to the FDA and ICH
DFG	Deutsche Forschungsgemeinschaft (German Research Council)
EC	European Community; European Commission
ECB	European Chemicals Bureau
ECHA	European CHemicals Agency
EEA	European Environmental Agency
EEC	European Economic Community
EINECS	European Inventory of Existing Chemical Substances
ELINCS	European List of New Chemical Substances
EMEA	European Medicines Agency
EPA	Environmental Protection Agency (USA), same as USEPA
EU	European Union
EUROTOX	European Society of Toxicology

UNEP	United Nations Environment Program
USEPA	United States Environmental Protection Agency, same as EPA
USFDA	United States Food and Drug Administration, same as FDA
WHO	World Health Organization, same as OMS

ANNEX 3: CLASSIFICATION OF CARCINOGENICITY

1 Classification according to IARC [16]

Classification based on the weight of the evidence and not on *potency* as follows.

1. Sufficient evidence. Causal relationship has been established between *exposure* to the agent and human cancer: a positive relationship has been observed between exposure to the agent and cancer in studies in which chance, bias, and confounding could be ruled out with reasonable confidence.
2. Limited evidence. Positive association has been observed between exposure to the agent and cancer for which a causal interpretation is considered to be credible, but chance, bias, or confounding could not be ruled out with reasonable confidence.
3. Inadequate evidence. Available studies are of insufficient quality, consistency, or statistical power to permit a conclusion regarding the presence or absence of a causal association.
4. Evidence suggesting lack of carcinogenicity. There are several adequate studies covering the full range of doses to which human beings are known to be *exposed*, which are mutually consistent in not showing a positive association between exposure to the agent and any studied cancer at any observed level of exposure. A conclusion of "evidence suggesting lack of *carcinogenicity*" is inevitably limited to the cancer sites, circumstances, and doses of exposure and length of observation covered by the available studies. In addition, the possibility of a very small *risk* at the levels of exposure studied can never be excluded.
5. Overall evaluation. Total body of evidence is taken into account; the agent is described according to the wording of one of the following categories, and the designated group is given. The categorization of an agent is a matter of scientific judgement, reflecting the strength of the evidence derived from studies in humans and in experimental animals and from other relevant data.

Group 1 The agent (mixture) is carcinogenic to humans. The exposure circumstance entails exposures that are carcinogenic to humans. This category is used only when there is sufficient evidence of carcinogenicity in humans. Exceptionally, an agent (mixture) may be placed in this category when evidence of carcinogenicity in humans is less than sufficient, but there is sufficient evidence of carcinogenicity in experimental animals and strong evidence in exposed humans that the agent (mixture) acts through a relevant mechanism of carcinogenicity.

Group 2 This category includes agents, mixtures, and exposure circumstances for which, at one extreme, the degree of evidence of carcinogenicity in humans is almost sufficient, as well as those for which, at the other extreme, there are no human data but for which there is evidence of carcinogenicity in experimental animals. Agents, mixtures, and exposure circumstances are assigned to either 2A (probably carcinogenic to humans) or 2B (possibly carcinogenic to humans) on the basis of epidemiological and experimental evidence of carcinogenicity and other relevant data.

Group 2A The agent (mixture) is probably carcinogenic to humans. The exposure circumstance entails exposures that are probably carcinogenic to humans. This category is used when there is limited evidence of carcinogenicity in humans and sufficient evidence of carcinogenicity in experimental animals. In some cases, an agent (mixture) may be classified in this category when there is inadequate evidence of carcinogenicity in humans and sufficient evidence of carcinogenicity in experimental animals and strong evidence that the carcinogenesis is mediated by a mechanism that operates in humans. Exceptionally, an agent, mixture, or exposure circumstance may be classified in this category solely on the basis of limited evidence of carcinogenicity in humans.

Group 2B The agent (mixture) is possibly carcinogenic to humans. The exposure circumstance entails exposures that are probably carcinogenic to humans. This category is generally used for agents, mixtures, and exposure circumstances for which there is limited evidence of carcinogenicity in humans and less than sufficient evidence of carcinogenicity in experimental animals. It

may also be used when there is inadequate evidence of carcinogenicity in humans but there is sufficient evidence of carcinogenicity in experimental animals. In some instances, an agent, mixture, or exposure circumstance for which there is inadequate evidence of carcinogenicity in humans but limited evidence of carcinogenicity in experimental animals together with supporting evidence from other relevant data may be placed in this group.

Group 3 The agent (mixture or exposure circumstance) is not classifiable as to its carcinogenicity to humans. This category is used most commonly for agents, mixtures, and exposure circumstances for which the *evidence of carcinogenicity is inadequate* in humans and *inadequate or limited* in experimental animals. Exceptionally, agents (mixtures) for which the *evidence of carcinogenicity is inadequate* in humans but *sufficient* in experimental animals may be placed in this category when there is strong evidence that the mechanism of carcinogenicity in experimental animals does not operate in humans. Agents, mixtures, and exposure circumstances that do not fall into any other group are also placed in this category.

Group 4 The agent (mixture) is probably not carcinogenic to humans. This category is used for agents or mixtures for which there is evidence suggesting lack of carcinogenicity in humans and in experimental animals. In some circumstances, agents or mixtures for which there is inadequate evidence of carcinogenicity in humans but evidence suggesting lack of carcinogenicity in experimental animals, consistently and strongly supported by a broad range of other relevant data, may be classified in this group.

2 Classification according to the USEPA [17,18]

Group A: "Human Carcinogen"
"This group is used only when there is sufficient evidence from epidemiologic studies to support a causal association between exposure to the agents and cancer."

Group B (1 and 2): "Probable Human Carcinogen"
"This group includes agents for which the weight of evidence of human carcinogenicity based on epidemiologic studies is 'limited' and also includes agents for which the weight of evidence of carcinogenicity based on animal studies is 'sufficient'. The group is divided into two subgroups. Usually, Group B1 is reserved for agents for which there is limited evidence of carcinogenicity from epidemiological studies. It is reasonable, for practical purposes, to regard an agent for which there is 'sufficient evidence of carcinogenicity' in animals as if it presented a carcinogenic risk to humans. Therefore, agents for which there is 'sufficient' evidence from animal studies and for which there is 'inadequate evidence' or 'no data' from epidemiologic studies would usually be categorized under Group B2."

Group C: "Possible Human Carcinogen"
"This group is used for agents with limited evidence of carcinogenicity in animals in the absence of human data. It includes a wide variety of evidence, e.g., (a) a malignant tumor response in a single well-conducted experiment that does not meet conditions for sufficient evidence, (b) tumor responses of marginal statistical significance in studies having inadequate design or reporting, (c) benign but not malignant tumors with an agent showing no response in a variety of short-term tests for mutagenicity, and (d) responses of marginal statistical significance in a tissue known to have a high or variable background rate."

Group D: "Not Classifiable as to Human Carcinogenicity"
"This group is generally used for agents with inadequate human and animal evidence of carcinogenicity or for which no data are available."

Group E: "Evidence of Non-Carcinogenicity for Humans"
"This group is used for agents that show no evidence for carcinogenicity in at least two adequate animal tests in different species or in both adequate epidemiologic and animal studies. The designation of an agent as being in Group E is based on the available evidence and should not be interpreted as a definitive conclusion that the agent will not be a carcinogen under any circumstances."

3 Classification according to the European Union [19]

For the purpose of classification and labeling and having regard to the current state of knowledge, such substances are divided into three categories:

Category 1
Substances known to be carcinogenic to man. There is sufficient evidence to establish a casual association

between human exposure to a substance and the development of cancer.

Category 2
Substances which should be regarded as if they are carcinogenic to man. There is sufficient evidence to provide a strong presumption that human exposure to a substance may result in the development of cancer, generally on the basis of

- appropriate long-term animal studies and
- other relevant information.

Category 3
Substances which cause concern for humans owing to possible carcinogenic effects but in respect of which the available information is not adequate for making a satisfactory assessment. There is some evidence from appropriate animal studies, but this is insufficient to place the substance in category 2.

4 Classification according to the American Conference of Governmental Industrial Hygienists, Inc. (ACGIH) [5]

A1: Chemical substances that are confirmed to be carcinogenic for humans
A2: Chemical substances that are suspected to be carcinogenic for humans
A3: Chemical substances that are carcinogenic for animals
A4: Substances that are not classified as carcinogenic
A5: Substances that are not suspected to be carcinogenic for humans

APPENDIX

III

TOXICOLOGICAL QUOTATIONS: FAMOUS, INFAMOUS, OBSCURE

The widely subscribed to, generally accurate, but not infallible, rule of toxicology:

Alle Dinge sind Gift und nichts ist ohne Gift; allein die Dosis macht, dass ein Ding kein Gift ist. (Theophrastus Phillipus Auroleus Bombastus von Hohenheim, aka Paracelsus, 1493–1541)

Literal Translation: All things are poison, and nothing is without poison. The dosage alone determines that a thing isn't poison.

Loose Translation: All substances are poisons; there is none which is not a poison. The right dose differentiates a poison and a remedy.

Looser Translation: The dose makes the poison.

First Witch:

Round about the cauldron go,
In the poisoned entrails throw.
Toad that under cold stone
Days and nights has thirty-one.
Sweltered venom sleeping got,
Boil thou first I'th' charmed pot.

All:

Double, double, toil and trouble,
Fire burn, and cauldron bubble.
Second Witch:
Fillet of a fenny snake,
In the cauldron boil and bake.
Eye of newt and toe of frog,
Wool of bat and tongue of dog,
Adder's fork and blind-worm's sting,
Lizard's leg and owlet's wing,
For a charm of powerful trouble,
Like a hell-broth boil and bubble.

All:

Double, double, toil and trouble,
Fire burn, and cauldron bubble.

(William Shakespeare, *Macbeth*)

My heart aches, and a drowsy numbness pains
My sense, as though of hemlock I had drunk,
Or emptied some dull opiate to the drains
One minute past, and Lethe-wards had sunk.

(John Keats, *Ode to a Nightingale*)

He who has recourse to poison in order to think will soon be unable to think without poison.

(Charles Baudelaire, *Artificial Paradise*)

It is his theory that all medicinal virtues are comprised within those substances which we term vegetable poisons. These he cultivates with his own hands, and is said even to have produced new varieties of poison, more horribly deleterious than Nature, without the assistance of this learned person, would ever have plagued the world withal.

(Nathaniel Hawthorne, *Rappaccini's Daughter*)

Continual dreams of junk: I am looking for a poppy field… Moonshiners in black Stetsons direct me to a Near East café…One of the waiters is a connection for Yugoslav opium…

Buy a packet of heroin from a Malay Lesbian in white belted trenchcoat…I cop the paper in Tebetan section of a museum. She keeps trying to seal it back…I am looking for a place to fix…

(William S. Burroughs, *Naked Lunch*)

"When you come to a patient's house you should ask him what sort of pains he has, what caused them, how many days he has been ill, whether the bowels are working and what sort of food he eats." So says Hippocrates in his work *Affections*. I may venture to add one more question: What occupation does he follow?

(Bernardino Ramazzini, *Diseases of Workers*)

No one should drink beer with henbane seeds except those who have forfeited their lives, because doing so results in frenzy of the brain, loss of reason and sometimes sudden death.

(Joacobus Theodorus Tabernaemontanus, *Kraeuterbuch*, 1664)

But once, when my father was soaring high in self-confident absentmindedness, and made tea by pouring hot coffee over tea leaves, she called him "The Great Poisoner." He laughed, I remember, but looked abashed and sorrowful.

(Donald Hall, *Willow Temple*)

The Goddess brought them inside, bade them sit down, and mixed for them a potion of ground barley, cheese, pale honey, and Pramneian wine, but added to the mixture the medicines of gloom, that make one utterly forget his true home.

(Homer, *Odyssey*)

Now that we may understand it, I will tell you why different creatures have different foods, and why what is bitter and acrid to one can nevertheless seem very sweet to another. In this matter there are such great differences and variations that what is food for one can be bitter poison for others. For example, there is a serpent that dies if touched by the saliva of a man, biting itself to death. Moreover, hellebore is a dire poison to us, but it fattens goats and quails.

(Lucretius, *De Rerum Natura (On Nature)*, Book IV)

She had never forgotten that, if you drink much from a bottle marked "poison," it is almost certain to disagree with you, sooner or later.

(Lewis Carroll, *Alice in Wonderland*)

Expect poison from the standing water.

(William Blake, *The Marriage of Heaven and Hell*)

After the first glass you see things as you wish they were. After the second, you see things as they are not. Finally, you see things as they really are, and this is the most horrible thing in the world.

(attributed to Oscar Wilde, in Conrad, Barnaby, III, *Absinthe: History in a Bottle*)

There would be meat stored in great piles in rooms; and the water from leaky roofs would drip over it, and thousands of rats would race about on it. It was too dark in these storage places to see well, but a man could run his hand over these piles of meat and sweep off handfuls of the dried dung of rats. These rats were nuisances, and the packers would put poisoned bread out for them, they would die, and then rats, bread, and meat would go into the hoppers together. This is no fairy story and no joke; the meat would be shoveled into carts, and the man who did the shoveling would not trouble to lift out a rat even when he saw one – there were things that went into the sausage in comparison with which a poisoned rat was a tidbit.

(Upton Sinclair, *The Jungle*)

The very idea of being in a canoe in the waters off the New Jersey Turnpike was viscerally thrilling but this thrill was counterbalanced by a gnawing consideration of the toxicity of the environment.

(Robert Sullivan, *The Meadowlands: Wilderness Adventures at the Edge of a City*)

Toxic waste, poison air, beach goo, eroded roads draw nations together, whereas magnanimous platitude and sweet semblance ease each nation back into its comfort or despair.

(A.R. Ammons, *Garbage*)

Our Adonais has drunk poison – oh!
What deaf and viperous murderer could crown
Life's early cup with such a draught of woe?

(Percy Bysshe Shelley, *Adonais*)

London … loses at least two out of three sunrises, owing to the environing smoke.

(John Ruskin, *Modern Painters*)

A friend told him that the particular drink he was drinking was slow poison, and he replied, "So who's in a hurry?"

(Nathaniel Benchley in *Robert Benchley*, spoken by Robert Benchley)

After a heated argument on some trivial matter Nancy … shouted, "If I were your wife I would put poison in your coffee!" Whereupon Winston [Churchill] with equal heat and sincerity answered, "And if I were your husband I would drink it."

(Consuelo Vanderbilt Balsam, *Glitter and Gold*, spoken by Nancy Astor)

I got them before they could get me.

(Vachel Lindsay, last words after drinking Lysol)

Television is the thalidomide of the 1990s. In 1995, American children spend about one-third of their awake time watching television.

(Robert Bly, *The Sibling Society*)

…rotten little verses transformed by the innocent, the decent, the good and the young into hymns of detonated twilights along toxic shores…

(Jane Miller, *Far Away*)

I want to love you but I better not touch (Don't touch)
I want to hold you but my senses tell me to stop
I want to kiss you but I want it too much (Too much)
I want to taste you but your lips are venomous poison
You're poison running through my veins
You're poison, I don't want to break these chains

(Alice Cooper, *Poison*)

Cocaine habit forming? Of course not. I ought to know, I've been using it for years.

(Tallulah Bankhead)

There is poison in the fang of the serpent, in the mouth of the fly and in the sting of a scorpion; but the wicked man is saturated with it.

(Chanakya)

There is thy gold, worse poison to men's souls, Doing more murders in this loathsome world, Than these poor compounds that thou mayst not sell.
I sell thee poison; thou hast sold me none.
Farewell: buy food, and get thyself in flesh.
Come, cordial and not poison, go with me To Juliet's grave; for there must I use thee.

(Shakespeare, *Romeo and Juliet*)

Malice sucks up the greater part of her own venom, and poisons herself.

(Michel de Montaigne (1533–1592))

Every form of addiction is bad, no matter whether the narcotic be alcohol, morphine or idealism.

(Carl Jung (1875–1961))

The United States is like the guy at the party who gives cocaine to everybody and still nobody likes him.

(Jim Samuels)

I kissed my first girl and smoked my first cigarette on the same day. I haven't had time for tobacco since.

(Arturo Toscanini)

Never take the antidote before the poison

(Latin Proverb)

I think it's ironic that for once dad's butt prevented the release of toxic gas.

(Bart Simpson)

A little learning is a dangerous thing; Drink deep, or taste not the Pierian spring: There shallow draughts intoxicate the brain, And drinking largely sobers us again (An Essay on Criticism)

(Alexander Pope)

Is the chemical aftertaste the reason why people eat hot dogs, or is it some kind of bonus?

(Neil Gaiman)

Actually, it only takes one drink to get me loaded. Trouble is, I can't remember if it's the thirteenth or fourteenth.

(George Burns)

Yes, madam, I am drunk. But in the morning I will be sober and you will still be ugly.

(Winston Churchill) *(replying to Lady Astor's comment 'Sir, you're drunk!')*

I feel sorry for people who don't drink. When they wake up in the morning, that's as good as they're going to feel all day.

(Frank Sinatra)

I hate to advocate drugs, alcohol, violence, or insanity to anyone, but they've always worked for me.

(Hunter S. Thompson)

Take me, I am the drug; take me, I am hallucinogenic.

(Salvador Dali)

Junk is the ideal product… the ultimate merchandise. No sales talk necessary. The client will crawl through a sewer and beg to buy.

(William S. Burroughs)

"Exactly," said Challenger, rubbing his hands, "we are all poisoned. Our planet has swum into the poison belt of ether, and is now flying deeper into it at the rate of some millions of miles a minute. Our young friend has expressed the cause of all our troubles and perplexities in a single word, `poison.'"

(Arthur Conan Doyle, *The Poison Belt*)

Everything one does in life, even love, occurs in an express train racing toward death. To smoke opium is to get out of the train while it is still moving. It is to concern oneself with something other than life or death.

(Jean Cocteau)

I cannot see her tonight.
I have to give her up
So I will eat fugu.

(Yosa Buson, 1716–1783. Note: Fugu, in this famous haiku, refers to the pufferfish, a Japanese delicacy when prepared properly, but a deadly poison if eaten otherwise.)

You will conceive and bear a son…now then be careful to take no wine or strong drink and to eat nothing unclean

(Bible, Judges 13:3–4)

'T is not the drinking that is to be blamed, but the excess.

(John Selden (1584–1654) In "Table Talk" 1689)

The choice, after all, is ours to make….If we have concluded that we are being asked to take senseless and frightening risks, then we should no longer accept the counsel of those who tell us that we must fill our world with poisonous chemicals: we should look about and see what other course is open to us.

(Rachel Carson, Silent Spring, 1962)

I can't believe that Godzilla was the only surviving member of its species… But if we continue conducting nuclear tests… it's possible that another Godzilla might appear somewhere in the world again.

(Kyohei Yamane-hakase, character in *Gojira* (the original Godzilla movie, 1954, last lines of the film)

Black as hell, strong as death, sweet as love.

(Turkish proverb, about coffee)

If we were to judge of the interest excited by any medical subject by the number of writings to which it has given birth, we could not but regard the poisoning by lead as the most important to be known of all those that have been treated of, up to the present time.

(M.P. Orfila, A General system of Toxicology, 1817)

Wipe off this glass three times.
There is arsenic in it.
I hear messages from God
through the fillings in my teeth.

Anne Sexton (1928–1974)

Sweet are the uses of adversity,
Which like the toad, ugly and venomous,
Wears yet a precious jewel in his head:
And this our life, exempt from public haunt,
Finds tongues in trees, books in the running brooks,
Sermons in stones, and good in every thing.

William Shakepeare (1564–1616) (As You Like It, Act ii, Sc I)

Everybody's youth is a dream, a form of chemical madness.

F. Scott Fitzgerald (1896–1940) (The Diamond as Big as the Ritz)

It is time to get drunk! So as not to be the martyred slaves of Time, get drunk; get drunk without stopping! On wine, on poetry, or on virtue, as you wish.

Charles Baudelaire (1821–1867)

Drugs bring us to the gates of paradise, then keep us from entering.

Mason Cooley (b. 1927)

No monster vibration, no snake universe hallucinations. Many tiny jeweled violet flowers along the path of a living brook that looked like Blake's illustration for a canal in grassy Eden: huge Pacific watery shore, Orlovsky dancing naked like Shiva long-haired before giant green waves, titanic cliffs that Wordsworth mentioned in his own Sublime, great yellow sun veiled with mist hanging over the planet's oceanic horizon. No harm.

Allen Ginsberg (letter, describing an LSD experience)

There are days when solitude, for someone my age, is a heady wine that intoxicates you with freedom, others when, it is a bitter tonic, and still others when it is a poison that makes you beat your head against the wall.

Colette, 'Freedom,'1908

If the headache would only precede the intoxication, alcoholism would be a virtue.

Samuel Butler

Malice sucks up the greater part of her own venom, and poisons herself.

Michel de Montaigne
