75.3 The Agenda of the Human Security Network

Several concrete themes have emerged from the nine meetings of the HSN between 1999 and 2007, creating a broad agenda that reflects the myriad issues involved in human security. As table 75.2 illustrates, the HSN has focused on the following topics: the prohi-

bition and extraction of antipersonnel landmines, small arms, children in armed conflict, and education in human rights, and since 2007 also on climate change. Since 2004, the HSN has increasingly emphasized the importance of UN reform as well as the value of incorporating the concept of human security into the work of the UN. In 2005 the HSN member countries defined a work plan (2005–2008) that emphasized several concrete areas of cooperation:

8 Press Release, 1998: “Canada and Norway form New Partnership on Human Security.” Norwegian Initiative on Small Arms Transfers (NISAT), 11 May 1998: at: <http://www.nisat.org/export_laws-regs%20linked/norway/lysoern.htm>.

- Effective multilateral institutions,
- Human Rights,
- Protection of civilians,
- Small arms, light weapons and landmines,
- Women, Peace and Security,

Box 75.1: Excerpts from the paper for the Greek Presidency on: "Human security and the climate change impact on vulnerable groups" of 8 May 2007. Source: HSN, documents of the 9th Ministerial in Slovenia, 17-18 May 2007; at; <<http://www.humansecuritynetwork.org/docs/2007-ministerial-meeting-04-greek%20paper.doc>>.

The United Nations Security Council held on April 17th [2007] its first-ever debate on the impact of climate change on security where it was argued that Climate change was about 'our collective security in a fragile and increasingly interdependent world and that it could not only have serious environmental, social and economic implications, but implications for peace and security, as well.' This is especially true in vulnerable regions and groups which face multiple stresses at the same time – pre-existing conflict, poverty and unequal access to resources, weak institutions, food insecurity and spreading of diseases.

The Greek HSN Chairmanship

Responding to the challenge of a collective, preventive and cross regional approach to this real threat, [the] Greek HSN chairmanship aims at addressing the human security impact of climate change on vulnerable groups, such as women, children and persons fleeing their homes due to climate change.

Most policy-making analysts of climate change often focus on how to mitigate risk, particularly in the context of "national security." Human security issues related to climate change have largely been framed in terms of conflict or cooperation, rather than in terms of "whose security is at stake, and why?"

The Greek HSN chairmanship wishes to emphasize that climate change is an issue that transcends national boundaries and needs to be addressed accordingly, and that it primarily affects the human security particularly in volatile regions and vulnerable groups.

There is a considerable need for more research on the ways climate change might undermine human security, because the level of understanding people's vulnerability is still sufficiently uncertain for the purposes of designing effective response strategies. ... In this respect the human insecurity caused in part by climate change may in turn lead to more conventional security issues. Both security and climate change problems are determined by complex interaction across global, regional, national and local institutions. They also require an understanding of the affected groups' capacities to adapt to change and the limits of those capacities as well as the potential for violent outcomes, should these capacities fail.

In its capacity as a cross-regional forum/platform of communication, the HSN can aim at raising awareness on the human security impact of climate change on vulnerable groups as well as at promoting international synergies to find path-breaking solutions.

Vulnerable Groups

Women

Climate change can give rise to a number of socio-economic related problems which can have an adverse effect on human security. Namely, it is argued that climate change will severely impact the lives of poor women (who form the majority in the developing world), due to a number of different reasons. Among them first and foremost comes the issue of malnutrition. In many poor countries it is often the case that women are forced to eat less than men and it is therefore anticipated that in cases of scarcity of resources or

natural disasters caused by climate change, it will again be women to be malnourished, something extremely dangerous, especially during pregnancy. In addition, in the event of natural disasters it will be more often them who are vulnerable, since they have to save both their children and themselves.

Also women (and children) refugees created by natural disasters or conflicts caused by scarcity of resources, are exposed to increased risks compared to male refugees, be it in refugee camps, or in their resettlement areas, or even in countries where they seek asylum. Women and girls, in particular, are vulnerable to exploitation, trafficking and other forms of gender-based violence, while children can also be the prey of military recruitment and abduction.

Children

The consequences of climate change mean that the lives of up to tens of millions of children will be endangered by floods, drought and climate change related diseases, over the next decades. This is also the conclusion of a new report by Save the Children UK on how climate change will specifically affect children. Millions of children will be killed, forced to flee their homes and be put at risk from hunger, disease and physical or sexual abuse. Children in developing countries, where there are few adequate warning systems or strategies to lower risk, will also be most affected by 'slow-moving' disasters, including temperature extremes, desertification, and a rise in sea level brought by climate change. Small-scale disasters, which are typically overlooked by the international community, will also intensify, most affecting vulnerable communities living in rural areas, on flood plains or on steep slopes at risk of erosion.

Persons fleeing their homes due to climate change

It is worth quoting a study of 1995 which stated that, at the time, at least 25 million have fled their homes for environmental and climate reasons (due to changing environmental and climate conditions) and this number should double by 2010. The Red Cross estimates more people are now displaced by environmental disasters than by war. It is also important to stress that these people are mostly women and children.

The impacts will be more significant in sectors of the population with high resource-dependency, and in the environmentally and socially marginalized areas. Some of these climate driven outcomes are long term and chronic (such as declining productivity of agricultural land), while others are episodic. Stresses from climate change will differentially affect those made vulnerable by present political-economic processes. The impacts of climate change are likely to increase the costs of providing public infrastructure and services, and may affect State revenues. Therefore, climate change may have a negative impact on the State's ability to create opportunities and provide important freedoms for people, as well as its capacity to adapt and respond to climate change itself. Migration may be one response of people whose livelihoods are affected by climate change, although climate alone is unlikely to be the sole, or even the most important 'push' factor in migration decisions. Yet large-scale movements of people may increase the risk of conflict in host communities.

Table 75.3: List of Lead and Partner Countries for HSN Activities. **Source:** See at: <<http://www.humansecuritynetwork.org/docs/Table%20of%20Lead%20and%20Partner%20Countries-e.php>>.

	Issues	Lead Country/ Countries	Partner Countries
Cluster 1: People-centred Development and HIV/AIDS			
1	HIV/AIDS	Thailand	
2	People-centred development as a process of empowerment	Thailand, Greece	
Cluster 2: Human Rights and Humanitarian Affairs			
3	Human Rights Education	Austria	Thailand, Slovenia
4	Strengthening effectiveness of the UN human rights mechanisms	Canada, Switzerland	Slovenia
5	Children affected by armed conflict		Austria, Slovenia, Switzerland
6	Women, Peace and Security		Austria, Canada, Switzerland
7	Landmines	Austria	Canada, Chile, Thailand Slovenia, Switzerland
8	Small Arms and Light Weapons	Mali	Canada, Switzerland
Cluster 3: Emerging Issues			
9	Responsibility to Protect	Canada	Switzerland
10	Trafficking in persons, especially women and children	Thailand, Greece	Austria, Switzerland

- HIV/AIDS,
- Poverty and individual-directed development, and
- Other emerging issues.⁹

During its 10th ministerial meeting in Athens, in May 2008, the Greek presidency will address as a new theme: “Human Security and Climate Change Impact on Vulnerable Groups” (box 75.1). Since 2007, the members of the HSN have developed their next Medium Term Work Plan for 2009–2012 and during its 10th anniversary in Athens, “its members will review the work done so far and discuss working methods as well as future action.”

The Network has organized its work agenda around a series of intergovernmental meetings held in each of the member countries. In these conferences, Foreign Ministers meet with representatives of civil society involved in the issues under consideration. The participants consider issues according to a set agenda, evaluate proposals related to each element of the agenda, and discuss future areas in which the Network should become involved.

During the Thai presidency (2005–2006). The activities of the HSN focused on three clusters: 1) people-centred development and HIV/AIDS; 2) human rights and humanitarian affairs; and 3) emerging issues with lead and partner countries (table 75.3) taking the initiative.

The network has concentrated its efforts on building consensus to leverage the HSN’s influence among multilateral institutions. Since 2000, the HSN has realized thirty eight declarations, each of which calls upon international organizations such as the U.N. Security Council and the U.N. General Assembly to adopt specific proposals.¹⁰ Through such declarations, the HSN has played a key role in driving forward a number of important international conventions, including the Ottawa Convention, the Action Plan against Small Arms, the Additional Protocol to the Convention of the Rights of the Child, the Additional Protocol to the Convention Against Torture, and the Treaty of Rome establishing the International Criminal Court, and on 30 May 2008 the adaption of the Convention on Cluster Munitions in Dublin.

9 Second HSN Medium Term Workplan, 2005–2008; at: <<http://www.humansecuritynetwork.org/docs/Second%20Midterm%20Workplan-e.php>>.

10 See at: <http://www.humansecuritynetwork.org/statements-e.php>

In addition to seeking common interests and building consensus, each of the member countries has used the Ministerial meetings to bring a range of national and regional issues to the attention of the international body (Winter 2003). Some examples are the following:

- Education in issues of human rights (Canada, Switzerland and Austria);
- Protection of children (Austria, Slovenia and Jordan);
- Child soldiers and the protection of civilians in humanitarian crises in Africa (Mali);
- The spread of AIDS in Southeast Asia (Thailand);
- Human security and the climate change impact on vulnerable groups (Greece).

Through these initiatives, the HSN has incorporated diverse national concerns into its agenda. By adopting flexible mechanisms that allow for a variety of issues to be proposed, the Network has managed to address a series of critical international problems while simultaneously raising its profile in the international community. This is one area in which the flexibility of the concept of human security has been valuable, as it has allowed the HSN to strategically define its policy framework for action.

During the Canadian Presidency in 2004–2005, the HSN focused on the established human security issues (human rights, small and light arms, landmines, children affected by armed conflicts), and on emerging ones (responsibility to protect, HIV/AIDS, women, peace and security) by encouraging discussions surrounding the UN Security Council (Women Peace and Security Resolution).¹¹

During the Thai Presidency (2005–2006) at the 8th Ministerial meeting on 1–2 June 2006 in Bangkok the Thai foreign minister, Kantathi Suphamongkhon, suggested that the HSN should broaden its scope:

We should encourage a balanced approach towards both freedom from want and freedom from fear. The two freedoms are linked. ... We should broaden the scope of our focus into non-traditional threats to human security. This includes the need to address the problem of environmental degradation as well as life threatening diseases and natural disasters. Indeed, during the Human Security Network International Symposium on Building and Synergizing Partnership for Global Human Security and Development, held here in Bangkok yesterday and the day before, it was proposed that ‘freedom

from hazard impact’ be added to our list of concerned topics.¹²

In the ‘chairman’s summary’, the Thai foreign minister noted the traditional and non-traditional threats to human security and he stressed that the HSN “must continue to produce concrete results ... and remain a credible and effective force for providing political impetus to the cause of human security,” i.a. by “the creation of a network of Friends of the HSN,” and a broadening of its scope:

The network should also encourage a balanced approach towards both freedom from want and freedom from fear and broaden the scope of its focus into non-traditional threats to human security by addressing ‘freedom from hazard impact’ such as threatening diseases and natural disasters and promoting ‘freedom from exclusion’ through the involvement of the public in human security dialogue in order to engage all stakeholders.

The 8th ministerial recognized the “serious threats to human security posed by HIV/AIDS, Avian Influenza and a possible human influenza pandemic, SARS and other epidemics, including malaria” and it agreed to “promote and strengthen cooperation, for example, through advocating the mainstreaming of human security perspectives on health issues at all levels of the planning and implementation of policies and plans to address these problems.” The chairman’s summary noted also the proposals on the roles of the HSN made by the civil society:

(1) *Environment*: prevention of global environmental impact as a result of human activities, with emphasis on the cross-sectional connection between human security and environmental impact, the significance of humanitarian assistance, and engagement with the business sector such as the insurance industry in time of natural disasters; (2) *HIV/AIDS*: integration and measurement of human security in existing HIV/AIDS national programmes; (3) *Human rights education*: workshops should be convened to raise awareness on the linkage between human rights and human security through human rights education; and (4) *Small arms and light weapons*: support from governments for dialogues on these problems.¹³

During its presidency (2006–2007) Slovenia has addressed: a) the role of the HSN in the Human Rights

Box 75.2: Excerpts from the “Chair’s statement” on the results of the “9th HSN Ministerial Meeting, Ljubljana, Slovenia, 17-18 May 2007”. Source: <<http://www.humansecuritynetwork.org/docs/2007-ministerial-meeting-01-chair-statement.doc>>.

Protection of children from different forms of violence, including armed conflict

The 9th HSN Ministerial Meeting was devoted particularly to the protection of children from different forms of violence including armed conflict and urban armed violence. ... The HSN recognized that important UN events initiatives and processes on children, scheduled to take place in 2007 offer the opportunity for possible action to advance the agenda on children at international, regional and national levels and in particular to ensure that the protection of children continues to get high priority attention.

The Network encouraged a synergy of efforts and coordinated action of different stakeholders including governments, UN agencies and civil society organizations. In this regard, the Network recognized the importance of pursuing the implementation of the Convention on the Rights of the Child and its optional protocols.

It further recognized the importance of addressing the protection of children from all forms of violence, abuse and exploitation in a holistic manner in times of peace and war as well as in pre- and post-conflict situations as a means of preventing the impact of conflict on children including in its diplomatic, technical assistance and donor roles. In this respect the incoming Greek chairmanship is prepared to touch upon the issue of the impact of climate change on vulnerable groups as children.

The HSN reiterated its long-standing commitment to the protection of children affected by armed conflict and recognized the substantial progress made in this area including the implementation of the Optional Protocol to the Convention on the Rights of the Child on the involvement of children in armed conflict. The Network supported the adoption of the Paris Commitments and Principles on children associated with armed forces or armed groups in February this year. The Paris Principles are a set of Guidelines which relate to the protection of children from recruitment or use in armed conflict, their release and successful reintegration into civilian life. The Paris Commitments are

legal, administrative and operational measures to prevent the unlawful recruitment or use of children by armed forces or groups.

The Network expressed its commitment to continue providing prominent attention to the protection of children's rights from violence and armed conflict at the celebration of the fifth anniversary of the UN General Assembly Special Session on Children to be held in the fall of this year. In this regard, the HSN could collaborate with civil society organizations and encourage the participation of children on this occasion.

The Network highlighted the added value of the promotion of a further follow-up to the UN Study on Violence against Children at the national, regional and international levels, framed by the recommendations of the Study and including the time allowed for recommendations as well as recognizing the multifaceted nature of violence.

HSN members stressed the opportunity provided by the 10 year Strategic Review of the Machel Study conducted by SRSGCAAC in close collaboration with UNICEF to ensure a strategic focus to issues in the field of children and armed conflict, which require further attention.

The Network also recognized the importance of the integration of the protection of children and their rights in the peace and security agenda and in the work of the Peacebuilding Commission. In particular, the Network expressed support for the Security Council resolution 1612 and the work of the Security Council Working Group on Children and Armed Conflict.

The Network considered the possibility of organising a relevant event at the 62nd session of the UN General Assembly with the SRSGCAAC, UN Expert on Violence against Children, the Chair of the Committee on the Rights of the Child and UNICEF to address the child protection concerns in an integrated and strategic manner, as well as in the framework of the priorities of the incoming chair.

The HSN also expressed its intention to provide leadership to a holistic approach to child protection discussions in other international fora including the Human Rights Council as well as within relevant regional bodies and organizations, as appropriate.

Council; b) promotion of intercultural dialogue through human rights education; c) violence against children and children affected by armed conflicts (box 75.2).¹⁴ This was followed by presidencies of Greece (2007–2008) and Ireland (2008–2009).

Building on the success of the *International Campaign against Landmines* and the landmine convention adopted in Ottawa in 1999, the HSN – often in cooperation with citizen’s movements, NGOs and in-

dependent experts – has been a key actor in pushing selected policy issues on the agenda of multilateral organizations, and adding human security on the agenda of both the Security Council and the General Assembly. The agenda of the HSN’s activities addressed all four pillars of the human security concept: 1) ‘Freedom from want’ (UNDP 1994; CHS 2003; Japanese approach), 2) ‘freedom from fear’ (Canadian, Norwegian approach); 3) ‘freedom to live in dignity’ (focus of Austria, Switzerland et al.); 4) ‘freedom from hazard impacts’ (Bogardi/Brauch 2005).

In a case study on 'Human Security and the Security Council' Dedring (2008) analysed a Canadian initiative during 1999 and 2000 as a non-permanent member in the UNSC transforming 'human security'

into a practical policy guideline that led the UNSC to adopt the 'Protection of Civilians in Armed Conflict' as a new agenda item (Mc Rae/Hubert 2001).

According to Dedring (2008), three trends led to this successful initiative in the UNSC: a) the transformation of the human security concept into a concrete policy norm on the threat by armed conflict against civilians; b) the key role of the *Human Security Network* in garnering the increased responsibility of the UN system as a central pillar of global governance; c) support for the issue of civilian protection in armed conflict by the *High-level Panel on Threats, Challenges and Change* (UN 2004), which discusses 'protecting civilians' in detail and offers several policy recommendations to support specific UN actions. Several members of the *Human Security Network* were involved in the UNSC work where initiative and guidance often comes from non-permanent members who succeeded including the central obligation to ensure the security of the individual in the changing world on the UNSC agenda.

Launching the 'Friends of the Human Security Network' on 1 June 2006 in Bangkok, the Japanese Ambassador in charge of Human Security Yukio Takasu¹⁵ stated with reference to paragraph 143 in the 'Outcome Document' of the GA of September 2005 (von Einsiedel/Nitzschke/Chhabra 2008):

We should not rush to seek formal discussions in the UN on the definition of human security; such as holding formal consultations for negotiating over a legal definition. While human security is a value based approach, it is more to do with a policy-oriented concept. While the Outcome Document affirmed the importance of human security at above mentioned qualification on the use of force under the responsibility to protect, some member states still have reservation on human security, particularly over its relationship with humanitarian intervention. Therefore, it will be counter-productive to seek to define at this stage the concept of human security at a formal UN session. It would be sufficient to agree on a general operational definition as a base of collaborative efforts such as: e.g. to 'protect the vital core of all human lives in ways that enhance human freedoms and human fulfillment' [CHS 2003].

We should rather concentrate on achieving cooperation among interested countries, broaden areas of agreement and partnership rather than focusing on different emphasis; practicing the concept, taking concrete actions, implementing joint projects and combining efforts and resources together, to improve the situation of vulnerable people who are under severe threats. We should minimize formality and prefer an informal modality; such as informal discussions among concerned countries at senior official levels with no regular

meetings, and informal discussions and exchange of views on specific themes will be held on an ad hoc basis in and around NY at the margins of appropriate UN meetings.

Since October 2005 Japan has discussed its proposal of forming "Friends of Human Security" at several seminars, e.g. at the APEC Human Security Seminar (Tokyo, Oct. 2005); the Mexico-Japan Human Security Workshop (Mexico City), at a Swedish IPA Seminar (NY, February 2006), at an OSCE - Thailand Human Security Seminar (Bangkok, April 2006) and at a meeting with the UN Secretary General (Tokyo, May 2006).

During the Japan-EU Summit in April 2006, both sides also agreed to cooperate in spreading the concept of human security as well as promoting concrete actions in the UN and other fora. Currently, Japan is exploring with Mexico and the UN Secretariat the possibility of organizing an informal Friends of Human Security meeting in NY in the near future.¹⁶

Moreover, the diverse implications and applications of the concept of human security have allowed it to become a multidimensional conceptual foundation on which the diverse member countries can build consensus and act in coordination on the international stage (Werthes/Bosold 2006). Thus while academic actors call for a more concrete definition of human security (Owen 2004), the experience of the HSN demonstrates that it is precisely the flexibility of the term that is its most significant comparative advantage, since that flexibility has allowed member countries to generate consensus around an international agenda dedicated to promoting human security worldwide.

75.4 Conclusions

The Human Security Network represents a novel international mechanism for countries from a variety of regions to unite around common interests. The Network has created a structure that is explicitly informal and flexible, which has allowed it to overcome the bureaucratic inertia that has characterized traditional international organizations, thereby providing an effective approach for promoting international action on concrete problems. The HSN's effectiveness is the result of three key advantages:

First, it has developed a recognized capacity in *international agenda-setting*. The member countries,

15 See at: <http://www.mofa.go.jp/policy/human_secu/state0606.html>.

16 See at: <http://www.mofa.go.jp/policy/human_secu/state0606.html>.

through collective advocacy, have succeeded in placing a number of human security issues on the international agenda that would rarely have previously been considered to be matters of international security. Such issues include landmine destruction and aid to landmine victims, small arms trafficking, the rights of children in armed conflict, international humanitarian law, and climate change impact on vulnerable groups. In addition, the HSN has developed creative mechanisms for raising the profile of such issues and convincing the United Nations of the need to address them. Members of the HSN have succeeded putting human security issues on the agenda of the UNSC and including it into the 'Outcome Document' on UN reform adopted by the UN GA in September 2005.

Second, it has emphasized the *broad and multidimensional* nature of both the concept of human security as well as of the Network itself. By maintaining this approach and arguing that security must be addressed holistically, the Network has succeeded in pushing forward a diverse agenda in an inclusive and participatory way.

Third, it has become a platform on which countries can lobby collectively for issues of common concern, thereby contributing to the *international policy-making process*. Human security provides the framework through which like-minded countries can work together to address global problems that the international community has traditionally been unable to solve. Moreover, it allows countries that traditionally have little power on the international stage to leverage their collective influence, resources and experiences to become relevant players in international policymaking.

While these advantages have undoubtedly helped the HSN achieve a notable degree of international influence, much remains to be understood about the full scope of that influence. Thus future academic and public policy research should focus on the following areas.

First, researchers should examine the degree to which the member countries have adopted the policies advocated by the Network, as well as the ways in which they have used their foreign policies to push forward the Network's agenda. For example, the HSN has explicitly called upon the international community to combat illicit trafficking of small arms, but has not called for a general reduction in the trade or production of such weapons. This is explained largely by the fact that Austria, Canada and Switzerland remain the leading international producers of small arms, and often export them to countries with high

levels of crime and public insecurity (Bosold/Werthes 2006). As another example, Chile has still not ratified the Treaty of Rome, even though the HSN has repeatedly called upon countries to do so. Thus in the coming years, researchers should examine in depth the degree to which member countries act on their rhetorical commitments as part of the HSN and adopt the policies and practices necessary to effectively promote human security.

Finally, member states should consider ways to strengthen the role of civil society within the framework of the Network. The flexibility of the HSN should be seen as a way for civil society organizations to directly advocate for international action. By reaching out to civil society, the Network could take advantage of the wealth of mechanisms for policy diagnosis, implementation, monitoring and evaluation that have already been developed by such organizations. One concrete step could be to develop mechanisms to improve the representation of civil society organizations at the ministerial meetings of the HSN. In addition, civil society organizations could develop proposals for effectively implementing the recommendations of the Network, both at the national level in the member countries as well as in countries around the world.

76 Theoretical Perspective on Human Security: A South Asian View

A. K. M. Abdus Sabur

76.1 Introduction¹

Since its very inception, the term 'security' has remained an "ambiguous symbol" (Wolfers 1962: 147-65) and an "essentially contested concept" (Galie 1962: 121-46). "Security, in an objective sense, measures the absence of threats to acquired values, in subjective sense, the absence of fear that such values will be attacked" (Wolfers 1962: 150) has, for long, been considered to be the 'standard' definition of security. As defined from the perspective of the International Relations discipline, the definition leaves a number of questions open. Whose values might be attacked? Which are these values? Who might attack them, and why and by which means? How could this fear be measured? The list of questions that follow the definition mentioned above is quite long (Møller 2001, 2003). Only a few of them are cited above. Nonetheless, security thinking was until very recently an almost exclusive domain of the International Relations discipline and dominated by the realist or neo-realist school of thought (Morgenthau 1960; Smith 1986; Waltz 1979; Keohane 1986). The whole gamut of security thinking was focused on ensuring the security of an allegedly insecure state, though the preferred term was 'national security'. This was certainly a misnomer as what the realists have referred to has been the security of the territorial (rather than nation-) state, which was indeed the principal actor in the Westphalian universe. The salient futures of the realist and neo-realist thinking on security could be summarized as follows:

1. Nation states are the basic building blocks of the international system with unlimited sovereignty;
2. Primary function of a nation state is to survive and enhance its power in an anarchical and conflictual international system;
3. Competition between states to maximize one's interests often at the expense of others;
4. Development of individual state's capability (military and otherwise) to ensure security.

While the source of realist and neo-realist school of thought were Westphalian ideas of the nation-state², its overwhelming domination in Post-War security thinking was based on the bipolar East-West division of the world and the Cold War. For a long time, rethinking the meaning of security yielded only marginal results. Neither 'common security' promulgated in the Palme Commission's 1982 report (Independent Commission on Disarmament and Security Issues 1982) nor a radical extension of the idea under 'collective security' (Møller 2001, 2003) could go beyond the state-centric notion of security.

One of the worst outcomes was that 'national security' was achieved at the expense of the security of the individual or people in terms of their political, social, and economic rights and choices. Thus, instead of ensuring the security of its citizens, the state, quite often, has served as a threat to their security. It may be pertinent to mention that over the last century, 30 million people were killed in international wars, 7 million in civil wars, and 170 million people were killed by their own governments (Thakur 2000a: 3). While some concepts on security during the 1970's and 1980's, like, 'comprehensive security' and 'cooperative security' did, indeed, go beyond the state centric

1 This chapter considerably draws on Sabur (2003) and my ongoing research in the context of the BIIS-Ford Foundation Regional Collaborative Research Project on *Human Security in South Asia: Discourse, Practice and Policy Proposition* being administered by the Bangladesh Institute of International and Strategic Studies (BIIS).

2 The Westphalian state system, based on the separation of political and religious authority, evolved in Europe at the end of the Thirty Years War in the seventeenth century. Territorial sovereignty and the state as the only legitimate wielder of force are its identifying characteristics.

security, these were still far from making a decisive break with the realist school (Møller 2001).

The end of the Cold War and the accompanying structural changes of monumental proportion introduced a revolutionary change in security thinking. On the one hand, it has dramatically decreased the traditional security threats to the states that came out victorious in the Cold War. On the other hand, the world was confronted with a series of intra-state violent conflicts of various origins, large-scale atrocities, and even genocide. It suffices to mention that of the 103 wars since the end of the Cold War, 97 have been fought within rather than between states (Preston/Hubert 2000: 345). These could not be explained within the realist and neo-realist security paradigm, much less permit the devising of appropriate remedies.

In the circumstances, rethinking the meaning of security has become a growth industry during the 1990's. In the changed context, while the state-centric security concerns did not disappear, the new security agenda came to include issues as diverse as intra-state conflict, ethnic-religious violence, landmine, terrorism, democracy, human rights, gender, crime, consequences of underdevelopment, poverty, hunger, deprivation, inequality, diseases and health hazards, human development, economic security, market, water, energy, migration, environmental degradation, and so on. As a matter of fact, a process of 'securitization' of a wide range of issues is in the offing, while simultaneously, a degree of caution persists with regard to how far the process can proceed.

Perhaps, the most significant outcome of this process of new thinking on security is the idea that the security of an individual in terms of his physical safety, human dignity, development opportunity, and socio-economic and politico-cultural rights and choices is as important as the security of a state in the traditional sense. Non-military and non-violent threats to the security of an individual or a group of people are no less important than the violent ones. The new thinking also includes the assertion that ensuring security is no more the monopoly of the state. 'Non-state' actors - individuals, communities, civil society organization and others - also have a vital role to play in ensuring security. A whole gamut of new ideas re-defining the meaning of security in terms of safety, opportunity, and choice for the individual and people came to be known as human security; this would be described at greater length in this chapter (United Nations Development Programme 1994; Department of

Foreign Affairs and International Trade 1999; Ogata/Sen 2003).

Since the publication of the *Human Development Report 1994* by the United Nations Development Programme (UNDP), the concept of human security is attracting increasing attention on the part of scholars as well as practitioners. While it is regarded as a reflection of the new security environment of the post-Cold War era, a debate on the utility or relevance of human security is still continuing. Some scholars are sceptical of the validity of the concept. They argue that it is too vague to be examined academically, or that it should not blur the importance of the traditional security agenda (Paris 2001: 87-102). Others, however, brushing aside such scepticism, are moving ahead in articulating theoretical conceptions of and a practitioners' guide to human security. By now, a large number and wide diversity of literature already exists on human security. Nonetheless, the articulation of a succinct theoretical conception on the issue is far from complete. Meanwhile, attempts are also being made to conceptualize human security in general as well as in the context of different world regions (Ahsan 2001: 101-109; Møller 2001: 41-62; Moussa 2001: 87-92; Rojas-Arevena 2001: 69-76; Shaw 2001: 95-100).

In this regard, the relevance of human security to third world regions, particularly South Asia, could hardly be overstated. Notwithstanding the changes at the global level, South Asia remains bogged down in conflicts. Overarching emphasis on traditional security over a long historical period has led to a severe deterioration in the security situation of the regional states. The two regional archrivals, India and Pakistan, have emerged as the most impoverished nuclear powers of the world. Overarching emphasis on traditional security at the expense of progressive socio-economic and politico-cultural development has, ultimately, transformed South Asia, one of the most developed and promising regions of the Third World at decolonization, into the poorest and the most deprived region of the contemporary world. Nonetheless, not only the policy-making circles in the region, but also the academia and media still continue to remain oriented towards military security.

Keeping this in mind, while an attempt is made below to evolve a theoretical perspective on human security, particular attention is paid to South Asia. Thus, part X.2 is devoted to the issue of human security in a general framework, while part X.3 deals with human security in the context of South Asia.

76.2 Human Security: Evolving Theoretical Perspective

In the process of evolving a theoretical perspective on human security six questions have been the focus of scholarly attention: Security for whom? Security of what values? Security from whom? Security from what threats? Security by whom? Security by which means? (Møller 2001, 2003; Bajpai 2000; MacLean 2002) These questions will be discussed in our subsequent analysis, as the answer to these questions reveals the essence of human security and also separates it from traditional security.

While the term ‘human security’ is of recent origin, the ideas that underpin the concept are far from new (Møller 2001; Bajpai 2000; Department of Foreign Affairs and International Trade 1999). However, the articulation of the human security perspective is attributed to the United Nations Development Programme (UNDP) and Mahbub ul Haq. The first major contribution, in this regard, was the *Human Development Report* (UNDP 1994). The Report suggested that the concept of security must change urgently in two ways:

1. From an exclusive stress on territorial security to a much greater stress on people’s security; and
2. From security through armaments to security through sustainable human development (UNDP 1994: 24).

In the Report, the long list of threats to human security was synthesized under seven broad categories:

1. *Economic security* (assured basic income);
2. *Food security* (physical and economic access to food);
3. *Health security* (access to health care, safe environment, etc.);
4. *Environmental security* (safe physical environment);
5. *Personal security* (security from physical violence from the state, other states, groups of people with different identity, criminals, gender violence, drug and other sources);
6. *Community security* (within family, race, ethno-religious community, and so on); and
7. *Political security* (basic human and democratic rights) (UNDP 1994: 24–35).

While the Report mentioned human security as being ‘freedom from want’ and ‘freedom from fear’, its emphasis was certainly more on the first. This reflected the perspective of more developing countries on the

subject. On the other hand Canada, for which the promotion of human security is a significant foreign policy objective, regards the UNDP approach to be “extremely ambitious” (Preston/Hubert 2000: 349) and “unwieldy as a policy instrument” (Department of Foreign Affairs and International Trade 1999: 3). Considering that the UNDP “largely ignored the continuing human insecurity resulting from violent conflict” (Department of Foreign Affairs and International Trade 1999: 3), Canada came out with its own version of human security that puts significantly more emphasis on the ‘freedom from fear’ (Axworthy 1997: 183–96). The concrete issues that Canada emphasizes are:

1. The *protection of civilians in time of war* (legal and physical protection of people in war zones); and
2. The *resolution of violent conflict* (conflict prevention, resolution and post-conflict peacebuilding) (Axworthy 1997: 183–96).

Norway and some other European countries share the same viewpoint on human security (Bajpai 2000). As the ongoing discourse on human security suggests, the divergence of perspectives between the developed and developing countries on the subject is likely to be long lasting. This has led some analysts to argue that there persists a conflict of ideas and even interests between the East and the West concerning a whole gamut of issues pertaining to human security (Acharya 2001: 455–459).

However, the Canadian or European viewpoint on human security is not the sole viewpoint of the developed countries on the subject. The Japanese human security perspective is closer to the UNDP than the Canadian one. Japan also identified the promotion of human security as one of its foreign policy objectives. This was expressed in several speeches by Japanese Prime Minister Obuchi in December 1998 in Hanoi, and in a symposium on human security organized by the Japan Institute of International Affairs (JIIA) and United Nations University in December 1999. In March 1999, Japan also established a special fund called the “Human Security Fund” to promote human security in developing countries. The Japanese perspective on human security puts more emphasis on ‘freedom from want’ than ‘freedom from fear’. However, the Japanese position on the issue still remains somewhere in between the third world perspective as reflected in the UNDP Report and the other perspectives discussed above (Shinoda 2004: 1–18).

While the security of the individual and people is the prime concern of all the analysts dealing with hu-

Table 76.1: Dimensions of National and Human Security. **Source:** Compilation by the author.

	National Security	Human Security
Security for whom?	Primarily, the state	Primarily, the individual and people
Security of what values?	Territorial integrity and national sovereignty	Safety, freedom and opportunity for the individual and people
Security from whom?	Other states	State, non-state actors, globalization, nature, and so on
Security from what threats?	Direct threats from other states	Direct and indirect threats from state, non-state and global actors, indirect threats from nature
Security by whom?	Primarily by the state	State, non-state actors, civil society, NGOs (local, national and international), UN, International/multilateral organizations and, importantly, cooperation among all these actors
Security by which means?	Primarily by military means, but, to a lesser extent, also by diplomatic and economic means	Primarily by non-military means: conflict prevention, management, resolution and post-conflict peacebuilding, democratization of polity and society, human development and humane governance, building capacity for these purposes, sustainable resource management, prevention and effective management of natural disaster and others

man security, they disagree on whether preference should be given to 'freedom from want' or 'freedom from fear'. Depending on the answer, human security analysts are divided into two camps. A third approach, for instance, makes attempts to synthesize both views (Shinoda 2004: 1-18). On the basis of the critical analysis of these approaches and the available literature, an attempt is made in table 76.1 to define human security and delineate the idea from national security.

As evident from table 76.1, the security discourse in its focus has made a shift away from ensuring the security of the state to ensuring the security and well-being of its citizens, the individual, and people. As against the traditional security agenda of deterring direct threat from other states, the human security agenda is focused on the wider range of direct as well as indirect threats to the individual and people from within the family, community, nation, and the globe at large. While national security needs investment in military, human security needs investment in human development and humane governance.

All these have not only broadened the security agenda but also the actors that would ensure the security. While the state continues to remain an important player, the broadened security agenda recognize an expanded range of non-state and informal actors: civil society, NGOs, international/multilateral institutions, and so on. An important factor, not seldom, the state itself is viewed as a source of insecurity of the individual or people against which their security is to be organized. The new security concept has also paid considerable

attention to the process of globalization and consequential security threats.

On the basis of the above discussions and relying on the available literature, we may identify concrete human security issues, possible responses/methods, and the concerned actors. This is done in table 76.2. While identifying issues, a 'maximist' approach was undertaken. Almost all possible issues were included. This involves the risk of losing focus. However, a 'minimist' approach involves even a greater risk of ignoring either 'freedom from fear' or 'freedom from want', as it is the case with the UNDP and Canadian approaches. More importantly, the intensity of different threats to human security varies from society to society, from country to country, and region to region. Therefore, a broader agenda would allow us to encapsulate all possible threats to human security in a wide and diverse variety of countries and people in the contemporary world. The same will also keep provisions for studying human security situations in particular countries or regions with a focus on specific issues that are relevant to the context.

Two aspects of human security, 'freedom from want' and 'freedom from fear' are equally important for ensuring the security of the individual and people. It is also crucial for ensuring the national security that the Realist/Neo-realist school of security thinking is so much obsessed with. 'Freedom from fear' would be meaningless if 'freedom from want' is not ensured. More importantly, persistence of underdevelopment, poverty, inequality and large-scale human deprivation is certain to generate socio-political turmoil leading to violent intra-state conflict with cross-border repercussions.

Table 76.2: Human Security Issues and Possible Responses. **Source:** Compilation by the author.

Human Security Issues	Possible Responses/Methods	Concerned Actors
1. <i>Personal security of the individual from the consequences of violent conflict</i>	Legal and physical protection of the people in war zones; peacekeeping; conflict prevention; management and resolution; post-conflict peacebuilding; arms exports control; humanitarian response; normative and attitudinal change	State; UN; International/multilateral organizations; civil society; NGOs
2. <i>Economic security (assured basic income)</i>	Development policy and activities; creation of employment and conditions for self-employment	State; private enterprise (domestic and foreign); UN; international development agencies; developmental NGOs
3. <i>Food security (physical and economic access to food)</i>	Increasing food production; improving distribution mechanism; poverty alleviation; particularly, income generation for the vulnerable groups	State; peasantry (farmers); private enterprise; NGOs; UN; International/multilateral organizations
4. <i>Human development: health and education</i>	Viable health and education policy; protection against pandemic diseases; ensuring economic and physical access to health care and education	State; private enterprise; NGOs; UN; international/multilateral organizations
5. <i>Good governance: democracy and human rights</i>	Ensuring representative form of government and democratic governance; constitutional/legal and juridical protection of human rights; normative and attitudinal change	State; civil society; NGOs; UN; international/multilateral organizations
6. <i>Rights of ethno-racial and religious communities</i>	Constitutional/legal and juridical protection; minority right articulation; appropriate mechanism for ensuring the rights of deprived communities; normative and attitudinal change	State; local communities; civil society; NGOs; UN; international/multilateral organizations
7. <i>Discrimination against and abuse of women and children</i>	Constitutional/legal, and juridical protection of the rights of women and children; effective measures against trafficking in women and children; appropriate mechanism for ensuring the rights of women and children; normative and attitudinal change	State; family; local communities; civil society; NGOs; UN; international/multilateral organizations
8. <i>Globalization and disparities in developmental opportunities</i>	Development policy and activities; reform of the state sector; private sector development; foreign direct investment; cooperation at the sub-regional, regional and international levels; overseas development assistance; wider market access; improvement in terms of trade; foreign debt management	State; private enterprise (domestic and foreign); UN; international development agencies; international/multilateral organizations
9. <i>Unchecked population growth</i>	Population control; economic and physical access to health care; normative and attitudinal change	State; family; civil society; NGOs; UN; international/multilateral organizations
10. <i>Migration and refugees</i>	Legal and physical protection of migrants and refugees, humanitarian reaction; resolving the cause of forced migration; normative and attitudinal change	State; civil society; NGOs; UN; International/multilateral organizations
11. <i>Environmental degradation</i>	Dealing with the causes and consequences; sustainable environmental management: devising and implementing policy options through concerted efforts; capacity building	State; UN; international/multilateral organizations; civil society; NGOs
12. <i>Natural/man-made disaster</i>	Dealing with the causes and consequences; disaster prevention, management and mitigation; appropriate capacity building	State; UN; international/multilateral organizations; civil society; NGOs
13. <i>Misuse, overuse, and scarcity of crucial natural resources</i>	Dealing with the causes and consequences; sustainable resource management; capacity building	State; private enterprise; UN; international/multilateral organizations; civil society; NGOs
14. <i>Crime and Terrorism: national and international</i>	Law enforcement measures; dealing with the causes and consequences; capacity building	State; civil society; NGOs; UN; international/multilateral organizations
15. <i>Drug</i>	Law enforcement measures; curtailing the production, trafficking and use; dealing with the causes and consequences	State; civil society; NGOs; UN; international/multilateral organizations

On the other hand, 'freedom from want' is impossible to achieve or sustain without achieving 'freedom from fear'.

As it is evident from table 76.2, even in ensuring human security, the role of the state is of paramount importance. However, what is even more important is the cooperation among nation-state, non-state, and sub-state actors, and of multilateral and international organizations.

76.2.1 Human Security: The South Asian Context

State inherited by South Asian countries from the colonial past have been 'strong states' deeply involved in not only the political but also the economic management of the society down to the grass roots (Kohli 1991: 10). With an omnipotent state at their disposal, the ruling elites in South Asia embarked upon a development strategy with overwhelming preponderance of security considerations over human development. While this applies mostly to the two major actors in South Asia, India and Pakistan, others were also significantly influenced by similar perceptions. Exceptions were of insignificant consequences. Even Sri Lanka, which, among South Asian countries, gave the highest preference to human development even during the Cold War era, ultimately turned to be a 'security state'.

South Asia still remains unresponsive to the changes at the global level. Traditional security issues still dominate the security thinking and practical policy of regional states. The conflict between India and Pakistan over Kashmir, an intense arms race, particularly the nuclearization and the Kargil War of 1999 that is to have lasting impact on bilateral relations indicate this trend (Sabur 1999). The process of a thaw in Indo-Pakistan relations that surfaced in early 2003 is far from bringing any qualitative change in either the bilateral relations between the two countries or in the overall security environment in the region (Sabur 2005).

Concrete evidence also suggests that in the post-Cold War era, South Asia continued to be further militarized, and that against the prevailing trends in the contemporary world. Global military spending declined by about 37 per cent during the period 1987-94, while those in South Asia increased by 12 per cent. During the same period, global standing armies have been reduced by 17 per cent. But in South Asia, these increased by 7.5 per cent. Similarly military holdings have declined by 14.5 per cent in the world, but in South Asia these increased by 43 per cent (World

Bank 1997a: 80-81). India and Pakistan are almost solely responsible for the militarization of the region. The share of India and Pakistan in the total military expenditure of South Asia is 93 per cent and in total armed forces personnel is 87 per cent. Notwithstanding colossal human deprivation, India maintains the fourth largest army in the world and Pakistan the eighth largest one (World Bank 1997a: 81). With the nuclearization and Kargil War, military spending in India and Pakistan is witnessing a spiral of rather dramatic increase (Barai 1998: 44-49).

The overarching emphasis on national security as against human security over the last five plus decades has severely deteriorated the security situation in South Asia and significantly increased the security concerns of the regional states, those of India and Pakistan in particular. More importantly, it has transformed South Asia, one of the most developed and most promising regions in the developing world at decolonization, into the poorest and the most deprived region of the contemporary world. In 1949, average per capita income in Sri Lanka, India, Pakistan and present Bangladesh was almost the double of that in the Philippines, South Korea, and Indonesia. What may sound now almost unbelievable, per capita income in Japan at that time was less than double of the average per capita income in these four South Asian countries (Akash 1992: 122).

Where does South Asia stand now? In terms of per capita income, South Asia has already turned to be the poorest region of the world, barring Sub-Saharan Africa. With a population of 1.4 billion in 2002, South Asia is the home to 22.58 per cent of the world's total population of 6.2 billion (World Bank 2003a: 252-53). Nonetheless, South Asia's Gross National Income (GNI) in 2002 amounted to only US\$ 640 billion, what amounts only to two per cent of the world GNI (World Bank 2003a: 252-53). Nearly 40 per cent of the world's absolute poor numbering 500 million in 1993 live in the region (World Bank 1997a: 1-26). Its adult literacy rate of 48 per cent is lower than any world region. Nearly half the world's illiterate population is South Asian. There are more children out of school in South Asia than in the rest of the world and two-thirds of them are females (World Bank 1997a: 1-26). A striking contrast to the perceptions at the global level, it is not Sub-Saharan Africa with 30 per cent of underweight children, but South Asia with almost half of its children underweight remains the world's most malnourished region (World Bank 1997a: 1-26). The extent of human deprivation in South Asia is colossal. About 260 million people

lack access to health facilities; 337 million have no safe drinking water; 830 million have no access to basic sanitation facilities (World Bank, 1997a: 1–26). The list could be enlarged further, exposing a kind of monumental failure on the part of South Asian ruling elites to face the challenges of development that put the region at the bottom of world regions, adjudged by most development indicators.

Notwithstanding all these and the fact that the security discourse in the world has made a shift in its emphasis away from military security to human security, South Asia remains immune to contemporary trends in the world. Not only the states but also academia and media in the region have paid very little attention to human security issues. Scholarly works specifically devoted to the subject are rather few (Chari/Gupta 2003a; Basrur 2001; Khan 2001; Haq 1994). More importantly, emphasis on the theoretical perspectives on human security in these works has only been peripheral. On the positive side, under a major research project entitled *Human Security in South Asia: Discourse, Practice and Policy Proposition* administered by the Bangladesh Institute of International and Strategic Studies (BIISS) and funded by the Ford Foundation, ten book-length studies dealing with human security in the context of South Asia are being conducted by researchers from Bangladesh, India, Nepal, Pakistan, and Sri Lanka.

Under the circumstances, the task of evolving a theoretical perspective on human security in South Asia still remains both difficult and highly complicated. It is not only due to the complexities that one faces in dealing with human security issues, but also due to the fact that traditional security issues are more predominant in the region than anywhere else in the world. Thus, human security in the region will have to be projected and promoted against an obsession with national security, nationalist passion, and jingoism directed against the neighbouring states as well as ‘internal enemies’ of national integration.

While regional cooperation is indispensable for addressing the issues of socio-economic development, ruling elites in South Asian states have a vested interest in sustaining the conflicts with their neighbours, as these serve as convenient means of redirecting mass grievances caused by the enormous human deprivation that prevails in the region (Sabur 2003: 85–100). Under the circumstances, the most challenging task in the regional context is a shift of focus in the security discourse and practical policy away from a single-minded emphasis on national security to human security. This also remains a precondition for devising ef-

fective policies and sparing necessary resources for dealing with human security issues.

The human security situation in South Asia is one of the worst in the world, characterized by a high degree of both want and fear. Persistence of threats to the safety and security of the individual and people generated by violent intra-state conflicts, non-democratic rule, violation of democratic and human rights, bad governance, corruption, crime, terrorism, gender violence, trafficking in women and children, and the likes are enormous, and remain a constant source of fear. On the other hand, human deprivation caused by consequences of underdevelopment, poverty, hunger, deprivation, inequality, illiteracy, diseases and health hazards, overpopulation, environmental degradation, natural disaster, overuse and misuse of natural resources and so on in the region is more acute than in any world region, barring drought suffering Africa. Therefore, while dealing with human security, both in theory and practice, both the fundamental issues, ‘freedom from want’ and ‘freedom from fear’, are equally important as neither can go without the other. Attempts are made in table 76.3 to list the human security issues in South Asia under these two broad themes. This is done on the basis of the analysis of available literature on the subject as well as South Asian reality.

While both, ‘freedom from want’ and ‘freedom from fear’, are equally important, scope or even necessity for the compartmentalization of human security issues under both the broader themes is undeniable. First of all, it would be virtually impossible to focus equally on all these issues at a particular point of time due to a competitive need for attention and resources. There is also no pressing necessity for paying equal attention to all these issues at the same time. The issues are quite dynamic and the threats to human security generated by these also fluctuate. Therefore, while the most pressing issues could be brought to the forefront for dealing with, others could be temporarily put on the back burner.

While human security is the security of the individual and people, the non-state actors, primary responsibility of ensuring the security lies with the state. As can be seen from table 76.3, it is also particularly true for South Asia. States in the region are not only the agents of political order; they are also responsible for socio-economic development. However, in contrast to national security that is the domain of state, in ensuring human security, non-state actors, civil society, and the NGOs are assigned a crucial role. This is also designed to face the threats to human security emanat-

Table 76.3: Human Security Issues in South Asia and Possible Responses. **Source:** Compilation by the author.

Human Security Issues	Possible Responses/Methods	Concerned Actors
Freedom from Want		
1. <i>Economic security</i> (assured basic income)	Development policy and activities; creation of employment and conditions for self-employment through investment (domestic and foreign), foreign trade, and aid	State; private enterprise (domestic and foreign); regional cooperation; UN; international development agencies; developmental NGOs
2. <i>Food security</i> (physical and economic access to food)	Increasing food production; improving distribution mechanism; poverty alleviation; particularly, income generation for the vulnerable groups	State; peasantry; private enterprise; NGOs; regional cooperation; UN; International/multilateral organizations
3. <i>Human development: health and education</i>	Viable health and education policy; protection against pandemic diseases; ensuring economic and physical access to health care and education.	State; private enterprise; NGOs; regional countries; UN; International/multilateral organizations
4. <i>Population control</i>	Foresighted policy; access to maternity and reproductive health services; normative and attitudinal change	State; civil society; NGOs; regional cooperation; UN; International/multilateral organizations;
5. <i>Environmental degradation</i>	Dealing with the causes and consequences; sustainable environmental management: devising and implementing policy options through concerted efforts; capacity building	State; civil society; NGOs; regional cooperation; UN; International/multilateral organizations;
6. <i>Misuse and overuse of natural resources</i>	Sustainable resource management; capacity building	State; private enterprise; civil society; NGOs; regional countries; UN; International/multilateral organizations;
7. <i>Natural/man-made disaster</i>	Dealing with the causes and consequences; disaster prevention and management; capacity building	State; civil society; NGOs; regional countries; UN; International/multilateral organizations;
Freedom from Fear		
1. <i>Personal security of the individual from violence or harm</i> (violent conflicts within and along the borders)	Legal and physical protection of the people in conflict/insurgency/war zones; conflict prevention; management and resolution; post-conflict peacebuilding; arms exports control; humanitarian reaction; normative and attitudinal change	State; regional countries; civil society; NGOs; International/multilateral organizations;
2. <i>Good governance: democracy and human rights</i>	Ensuring representative form of government and democratic governance; constitutional/legal and juridical protection of human rights; normative and attitudinal change	State; regional countries; civil society; NGOs; UN; International/multilateral organizations
3. <i>Rights of ethnic and religious minorities</i>	Constitutional/legal and juridical protection; minority right articulation; normative and attitudinal change	State; civil society; NGOs; UN; International/multilateral organizations
4. <i>Discrimination against and abuse of women and children</i>	Constitutional/legal, and juridical protection of the rights of women and children; effective measures against trafficking in women and children; normative and attitudinal change	State; civil society; NGOs; regional countries; UN; International/multilateral organizations
5. <i>Crime, Corruption and Terrorism</i> (national and international)	Law enforcement measures; dealing with the causes and consequences; ensuring transparency and accountability in the process of governance; controlling the proliferation of small arms; capacity building; normative and attitudinal change	State; civil society; NGOs; regional countries; UN; International/multilateral organizations
6. <i>Migration and refugees</i>	Legal and physical protection of migrants and refugees, humanitarian reaction; resolving the cause of forced migration; normative and attitudinal change	State; civil society; NGOs; regional countries; UN; International/multilateral organizations
7. <i>Drugs</i>	Law enforcement measures; curtailing the production, trafficking and use; dealing with the causes and consequences	State; civil society; NGOs; regional countries; UN; International/multilateral organizations

ing from the action or inaction of the state. Similarly, cooperation at the regional and international level among the states and within regional multilateral and international organization is also considered crucial for promoting the cause of human security. Because, human security is designed to ensure the physical safety, human dignity, and developmental opportunity of the individual and people at the micro-level (starting with the family) as well as the macro-level (up to the world at large). The idea is international and its implementation significantly depends on the cooperation at the international level. In this regard, the universal international organization, the UN, is also assigned a crucial role (Thakur 1999).

76.3 Conclusion

While the ongoing discourse on human security among academic and policy-making circles is quite intense, it still remains far from being conclusive. A theoretical perspective on the subject is just evolving. The conceptualization of human security would take time and tremendous efforts. Therefore, this chapter was more designed to intensify the ongoing discourse on human security than offering suggestions on the subject.

Evolving a theoretical perspective on human security in South Asia is certainly a highly difficult undertaking, and it is likely to remain the same for some time to come. However, in view of the prevailing reality in the region, the issue is also of urgent necessity. On the one hand, human deprivation in South Asia characterized by large-scale poverty, malnutrition, illiteracy, and the lack of access to health facilities has no comparison in the contemporary world. On the other hand, while the world is making a shift away from military security to human security, the region remained bogged down in old-fashioned conflicts and a new spiral of arms race now extended to the nuclear arms. Therefore, reversing the trend in this regard remains the most cardinal task and the most difficult challenge. Under these circumstances, it is necessary to concentrate concerted efforts on the part of scholars and concerned professionals to face both the academic as well as practical challenges of human security.

77 Horizontal and Vertical Extension of International Security: A Human Security Approach

Sascha Werthes and Tobias Debiel

77.1 Introduction

When the *Human Development Report 1994* (UNDP 1994) was published, nobody expected that its ‘human security’ concept would attract so much attention. This is quite astonishing as the concept has provoked much criticism ever since due to its analytical ambiguity and its disputed political appropriateness. Extending the analytical and contextual focus of *security* was not totally unknown in the political and academic sphere (77.2). Different security concepts such as ‘common’, ‘extended’, and ‘comprehensive security’ had already broadened the scope. Therefore, the description of *security* as a ‘contested concept’ has been and is a very common one in student text books (e.g. Baylis/Smith 2005: 302).

What was new was shifting the reference object from the state to the individual, and to integrate elements of foreign and development policy (77.3). We suppose it is fair to say that this shift again encouraged and hardened the already existing ‘contestation’ of security as a concept. Although many authors agree that security implies freedom from threats to core values (for both individuals and groups), there is a mayor disagreement about the main focus of enquiry, illustrated by the “proliferation of descriptors added to the basic concept itself” (Liotta 2002: 475; see also Baylis/Smith 2005: 300). Despite having said that one can argue that while in the political field the human security approach is adaptable and has found different supporters (77.4). Nevertheless the practical adaptability in the academic field is still contested and doubted. It remains to be shown if a threshold-based definition of human security (77.5) or the work to develop human security indicators might be a first step to prove its practicability for academic purposes (77.6).¹

Human security and its new emphases were a response to the perceived interrelatedness of the complex foreign, developmental and security relevant

challenges in the late 20th and early 21st century. The perforation of state sovereignty – resulting from the multifaceted globalization processes and the incapability of states to respond to growing non-military security threats – produced a pressure for practical solutions and strategic responses. Moreover, in the post-Cold War and post-September 11th world ‘state failure’, ‘failing states’ and ‘defected democracies’ challenged the international community. Or as Carl Bildt points out when emphasizing an other aspect of the changing international order, while “the principle of state sovereignty was previously seen as sacrosanct, the combination of the NATO intervention in Kosovo in 1999 and the non-intervention by the international community in Rwanda in 1995 has led to an intense discussion about the right or duty to intervene in sovereign states in order to prevent massive violations of human rights” (Bildt 2004: 31).

Throughout the 1990’s various international actors were looking for integrative policy strategies. Foreign, development, and security policies lost their clear-cut differentiation. For many politicians and academics ‘complex emergencies’ and the root causes of many perceived threats and problems challenged classical policy approaches. Thus, practical politics had to find new concepts and strategies for new realities, or for the changed perception of reality. Academic and political experts alike had to find alternative ways to analyse and conceptualize these complex challenges in their field of study or region.² This is not to say that

1 The work on measuring human security in conjunction with vulnerability is steadily growing. See e.g. Mani 2005; Owen 2004, 2004a, 2004b; Matthew/Fraser 2002; King/Murray 2001-02; Bajpai 2000; Lonergan/Gustavson/Carter 2000; Bruderlein 2000. Especially the programmatic project work of GECHS: <> and GECHS Associates: <<http://www.gechs.org/associates/>>, UNCRD and UNU-EHS (Bogardi/Brauch 2005; Birkmann 2006; Brauch 2005, 2005a; Rechkemmer 2005) is here of importance and forward-looking.

old challenges and threats to security have disappeared altogether.

In line with these developments the first two parts try to sketch briefly the horizontal and vertical extension of the security agenda. This is by far no comprehensive look at all the relevant contributions in the security discourses and debates; therefore the description is to a certain degree limited and simplistic. The point of doing so is to illustrate why security is such a 'contested' concept and to demonstrate the dimensional extension which led to the human security approach.³

77.2 Horizontal Extension of the Security Agenda

Until the 1980's international security policy focused on military threats emanating from others states (Hough 2004: 6; Debiel/Werthes 2005: 8). A classical definition of security argues that a state is "secure to the extent to which it is not in danger of having to sacrifice core values if it wishes to avoid war and is able, if challenged, to maintain them by victory in such a war" (Lippmann 1943: 51). This 'state-centred' security concept refers to territorial integrity, political independence, survivability, and the capability to protect its own citizens. It is based on the assumption that most threats are of external origin and military in nature (Ayooob 1995: 5). Thus, the convincing ability to respond with (overwhelming) military means was regarded as sufficient. Stephan M. Walt (1991: 212; italics in the original) argued

security studies may be defined as *the study of the threat, use and control of military force* (Nye/Lynn-Jones 1988). It explores the conditions that make the use of force likely, the ways that the use of force affects individuals, states, and societies, and the specific policies that states adopt in order to prepare for, prevent, or engage in war.

2 This e.g. is very well reflected in the publications of UNESCO SecuriPax Forum an international network for promoting human security and peace (<http://www.unesco.org/securopax>), see: e.g. Lee (2004); Chourou (2005); Fuentes/Rojas Aravena (2005), also interesting with regard to this the contributions in Thomas/Wilkin (1999).

3 With regard to Human and Environmental Security see the excellent studies in: Brauch/Liotta/Marquina/Rogers/Selim (2003), and especially Brauch (2003, 2003b, 2005, 2005a, 2008, 2008a, 2008b, 2008c).

These security concepts primarily focus on the security of the state. In the early 21st century they have three major weaknesses. Firstly, the wilful neglect of states' sensitivity to situations in neighbouring states and strategically important regions in traditional security concepts is problematic. Analysing the oil crisis in the 1970's, Joseph S. Nye (1974) argued that in the age of interdependence the security of states can also be endangered by non-military developments. Therefore, Hough (2004: 7) is right when explicating

[a]lthough there is a case to be made that military threats in the twenty-first century are as apparent as ever, and maybe even greater than during the Cold War, the simple fact remains that they are not the only threats that face states, people and the world as a whole. Indeed, they never have been.

Traditional security concepts still adhere to a perspective that violent conflicts are primarily conflicts among states, or inter-state conflicts. Moreover, the assumption that the international system is constituted by sufficiently well consolidated states is too simplistic. It neglects the fact that most threats to security, especially in the crisis regions of the south, in the Caucasus, and in Central Asia, correlate with processes of state transformation and consolidation (Ayooob 1995; Hippler 2005; Paris 2004a). Thirdly, the capability of a country to protect its own citizens clearly overcharged these classic security concepts, as the new threats which endangered the citizens could apparently not be dealt with by military means.

These limits of traditional security concepts induced a horizontal broadening of the international security agenda. Since the 1980's the proponents of strategic studies, and in the 1990's the multilateralists called for new 'extended' or 'comprehensive' security concepts. These concepts not only incorporated an economic and environmental dimension, they also took into account a broad spectrum of additional threats to the security of states, such as for instance cross-border refugee migration, the spread of epidemics, but also gross violations of human rights. But they remained mainly 'state-centred' focusing on the security of the state and its integrity, and not on its capability to protect its citizens. Or as Hough (2004: 8) points out, although the viewpoint is unwelcome for traditionalists, "this widening of security did not undermine the Realist logic of conventional Security Studies." He accentuates that the focus was still on the state system and, even more importantly, that "widening was simply extending the range of factors that affect state power beyond the confines of military and trade affairs."

Although one might easily agree with Hough on the concept of ‘extended’ security, one might critically contest his conclusion on the ‘common’ and ‘comprehensive’ security concepts. One could cautiously claim that common and comprehensive security concepts imply a slight change in the perception of the world, as the perspective is no longer solely directed on the international system of states, but conceives the world as an international society of states. Basically, one can say that the comprehension of the world as an international system of states seduces the analyst to focus primarily on “power politics amongst states, and puts the structure and process of international anarchy at the centre of IR theory” (Buzan 2004a: 7), whereas the perspective of the international society of states “is about the institutionalization of shared interest and identity amongst states, and puts the creation and maintenance of shared norms, rules and institutions at the centre of IR theory” (Buzan 2004a: 7). This change of perspective implies that common and comprehensive security in comparison with traditional and extended security accentuate not only power, but also (international) law to enhance security (of states), or in other words to address security threats.

In a nutshell, the horizontal extension of the security agenda illustrates that besides military threats there are also non-military threats to states. Moreover, as is rudimentarily exemplified with regard to common and comprehensive security, the slight change of the perception of the world as an international society of states with regard to common and comprehensive security conceptions accentuates that states can deal with threats not only by means of (military) power but also with norms, rules, and institutions. Moreover, the change of perspective and the horizontal extension of the security agendas foster the awareness of the need to deal with security issues in different state departments. This is more easily said than done as this demands that the ends and means in a changing security environment have to be balanced. This aspect is nicely pointed out by Liotta (2002: 473, 2005) who emphasizes when speaking about the “Convergences of National and Human Security” that we should be careful not to be too excessively focused “on one aspect of security at the expense or detriment of the other” as this “may well cause us to be ‘boomeranged’ by a poor balancing of ends and means in a changing security environment.” The notion of ‘human security’ exemplifies another dimensional extension of the international security agenda which we will briefly discuss in the next part.

77.3 Vertical Extension of the International Security Agenda

In the 1990’s with the emergence of the ‘Copenhagen School’ (Wæver 2008, 2008a) another shift from the traditionalist, narrow conception of security occurred. This approach was not only broader (including non-military issues among the threats to states), but also emphasized that non-military issues can be considered matters of security even if they are not a direct threat to states (Buzan/Wæver/de Wilde 1998). They state that

[t]hreats and vulnerabilities can arise in many different areas, military and non-military, but to count as security issues they have to meet strictly defined criteria that distinguish them from the normal run of the merely political. They have to be staged as existential threats to a referent object by a securitizing actor who thereby generates endorsement of emergency measures beyond rules that would otherwise bind (Buzan/Wæver/de Wilde 1998: 5).

Their well-known framework of analysis is nevertheless criticized for being state centred, although more subtly (Hough 2004: 9). While accepting “the idea that non-military issues can be securitized and that the referent object of this can be something other than a state”, e.g. societies, the Copenhagen School approach sticks to the idea that it is mainly states who can be the securitizing actor (Hough 2004: 9) and the act of securing threatened people is still left to the state (Hough 2004: 17).

Beside the Copenhagen School (1990’s) other security concepts emerged in the late 1980’s, taking root in the middle of the 1990’s (e.g. the so-called Paris School or the Welsh School), which not only broadened and widened the international security agenda but also deepened⁴ it (Albrecht/Brauch 2008). ‘Comprehensive’ and ‘common’ security concepts opened the way for even more new security concepts, and among them is the *human security* concept. Basically, “the idea of human security is an attempt to conceptualize the changing nature of security” (Glasius/Kaldor 2005: 66, see also Kaldor 2007). The notion that human security “complements state security, enhances human rights and strengthens human development” (CHS 2003: 2), exemplifies that the human security concept is far more comprehensive than other secu-

4 Our perspective is more simplistic than that of ‘Critical Security Studies’. When speaking about *deepening* we simply refer to the level of analysis. On the different notions of deepening see Booth (2005: 14, 15).

rity concepts. Moreover, this description already illustrates the understanding that security threats should not only be dealt with by security policy and military means, but also by foreign and development policy and their respective policy tools. In similar vein Kofi Annan (2005) in his report *In larger Freedom* (A/59/2005) emphasizes the interrelatedness of development, security and human rights when saying:

Not only are development, security and human rights all imperative; they also reinforce each other. This relationship has only been strengthened in our era of rapid technological advances, increasing economic interdependence, globalization and dramatic geopolitical change. While poverty and denial of human rights may not be said to 'cause' civil war, terrorism or organized crime, they all greatly increase the risk of instability and violence (Paragraph 16).

The precursor of the human security concept was the UNDP Report (1994) which shifted the attention from the state as the referent object of security to the sub-national level (social groups and the individual). This move seemed justifiable and necessary as the debates on the legitimacy of humanitarian interventions in the early 1990's showed that the old security concepts offered no answer to the more and more pressing question of what to do when the state itself became the major security threat to its citizens, or when the state is not able to secure its citizens (Thomas/Tow 2002, 2002a; Bellamy/McDonald 2002; Annan 2000a).

'Failed' and 'failing states' as well as 'complex emergencies' challenged the concept of state sovereignty, but they also seriously demanded an answer to the question on the 'responsibility to protect' (ICISS 2001; Thakur 2002, 2005). Moreover, it became apparent and accepted that extreme economic and social distress, epidemics, the flow of refugees and trans-border migration, transnational terrorism, discrimination and violent repression by neo-patrimonial (authoritarian) elites, the illegal trade of drugs and weapons are all a result or a root cause of insecurity for people in the world and that therefore a security concept which mainly focuses on state security might not be sufficient anymore (Bach 2003; Clark 2003; Gasper 2008; Khagram/Clark 2003; Colletta 2003; Chen/Narasimhan 2003; Heymann 2003b; HSC 2005; Helsinki Process Secretariat 2005a, 2005b).

But even more important was the evolving awareness that these situations in distant locations demanded a policy response as they also produced significant effects on other states. Exaggerating this point, one can cautiously argue that proponents of

the human security approach sympathize with a 'world society' perspective. World society "takes individuals, non-state organizations and ultimately the global population as a whole as the focus of global societal identities and arrangements, and puts transcendence of the state-system at the centre of IR theory" (Buzan 2004a: 7). World society emphasizes "the idea of shared norms and values at the individual level, transcending the state" (Buzan 2004a: 10).

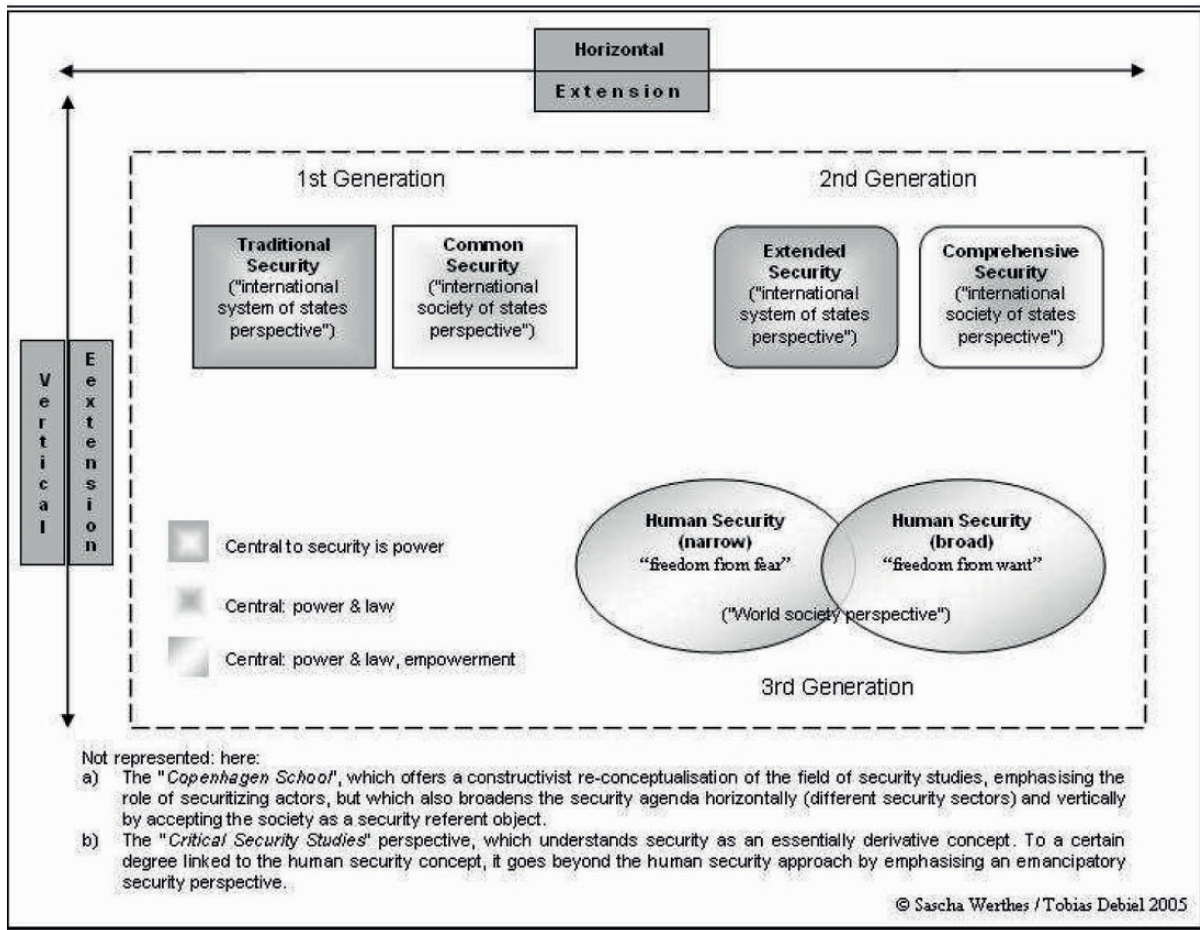

To put it simply, the capability of a country to protect its own citizens could be challenged and influenced by situations far away in other regions and states of the world. Therefore, a response to these events might sometimes seem to be necessary. Glasius and Kaldor call this line of argumentation the "enlightened self-interest case" (Glasius/Kaldor 2005: 70). Besides this, there is a "moral case", which "posits that human beings have a right to live with dignity and security, and a concomitant obligation to help each other when that security is threatened" and a "legal case", "[i]f human security is considered as a narrow category of protection of human rights, (...) then it is now generally accepted that other states, and international institutions such as the EU, have not only a right but also a legal obligation to concern themselves with human security world-wide." As this quotation exemplifies for many though certainly not all authors human security is fundamentally linked to human rights as both concepts concentrate on the core values of individuals: life and dignity (CHS 2003; Bastian 2004) or in the words of Amartya Sen (2003a: 9):

The basically normative nature of the concept of human rights leaves open the question of which particular freedoms are crucial enough to count as human rights that society should acknowledge, safeguard and promote. This is where human security can make a significant contribution by identifying the importance of freedom from basic insecurities - new and old.

Sen emphasizes that human security and human rights can be seen as complementary ideas, "since human security as an important descriptive concepts demands ethical force and political recognition" and therefore, "it is useful that this can be appropriately obtained through seeing freedoms related to human security as an important class of human rights."

But human security - it seems - is not only linked to human rights but also to human development. Precisely, to address the results and the root causes of insecurity, the UNDP proposed a comprehensive conception of human security, as they experienced firsthand the need to acknowledge human security, ei-

Figure 77.1: The Horizontal and Vertical Security Agenda Extension. **Source:** Debiel/Werthes (2005: 10).

ther as a prerequisite for or as a necessary ingredient to human development, as fundamentally pressing. When working in post-conflict situations the link between (human) security and (human) development becomes obvious. As many UNDP projects take place in environments where the link is provocatively obvious (e.g. in post-conflict situations), the UNDP must be at the forefront. This also might explain why its concept ranges from a narrow 'freedom from fear' perspective, which addresses threats to the physical and psychological integrity of people, to a broad 'freedom from want' perspective, which addressed threats to the socio-economic well-being of people (figure 77.1; see also Gasper/Truong 2005).

Although the 'Critical Security Studies' approach (Albrecht/Brauch 2008) stressed the need to focus on the individual, it differs from the other approaches and from the human security approach as it proposes, as Booth points out, thinking primarily on the establishment of "a settled political community (...) where members respect one another and have something to

say in shaping a valued form of life, including one in which we can look for the promotion of human security" as "security is inextricably linked with membership in a political community" and emancipation (Booth 2005: 110; Linklater 2005: 114). Figure 77.1 tries to illustrate the dimensional extension of security concepts (Brauch 2008, 2008a). One can argue that for 'traditional' security concepts and 'extended' security concepts power is central whereas for 'common' and 'comprehensive' security concepts not only power but also law is a central element and focus. Human security concepts add empowerment as a feature and focus, especially in the Japanese or CHS understanding. The term 'generation' is not used in a strictly historical understanding, but tries to put emphasis on peculiar modification processes when horizontally or vertically extending the security concept.

Nevertheless, despite the astonishing attention of the human security concept in the academic and political sphere, still no accepted definition is available (Ewan 2007). One of the most well-known definitions

is the one proposed by the ICISS (2001: 15): “Human security means the security of people – their physical safety, their economic and social well-being, respect for their dignity and worth as human beings, and the protection of their human rights and fundamental freedoms” (Alkire 2003a, see also Mack 2005). Due to this lack of an accepted definition two questions are appropriate: What are the practical adaptabilities and advantages of the concept and how can human security become more substantiated for academic purposes?

77.4 Practical Advantages of the Human Security Concept

One striking new element of the human security concept is that it refers to the security of individuals and to those living in different countries.⁵ No matter how human security is defined, on a normative political basis it emphasizes a universal moral claim of every individual to security. Without establishing a legal right to security, it addresses the question of whose responsibility it is to protect and empower individuals.

Some experts might have the subsidiarity principle in mind. That is, depending on the threat, different hierarchical levels are held responsible. An example is food security: first of all the individual is responsible. If the individual is not capable of securing his/her nutrition, the family, community or the state are held responsible for guaranteeing a possibility to survive. If the state cannot secure the survival of its citizens world society (or the international political community) is held responsible. While the need for humanitarian aid in cases of famine is more easily legitimized, a humanitarian intervention in complex emergencies is harder to legitimize (Thakur 2002; Weiss 2004). In general, the security of the citizens is still the obligation of the state, but in cases of need (e.g. Rwanda, Somalia, Sudan) one must find other coping mechanism (for critical reflections on these points, see e.g. Hampson 2002: 2–7).

Especially on the question of whose responsibility it is to provide security and more specifically when and in what cases, and by what means, the different human security concepts vary widely. The Canadian

(Dedring 2008; chap. 83 by Black/Swatuck) and Norwegian government focus on a narrow human security concept, mainly addressing ‘freedom from fear’, that is physical violence in violent conflicts. This means that under certain circumstances interventions in the internal affairs of a sovereign state can be legitimized. Put differently, they argue that in cases of imminent direct threats to the survival of people like in Rwanda in 1994 the international community has to accept its responsibility and act accordingly. Strategically this narrow approach focuses on banning of anti-personnel landmines (Ottawa Process), stopping the proliferation of small arms and light weapons in conflict zones, and on the establishment of the International Criminal Court. By concentrating mainly on aspects of physical violence this narrow approach allows an easier and clear-cut juxtaposition of ‘human security’ and ‘human development’ policies. The work of the *Human Security Network* (HSN) illustrates the practical and political applicability of this narrow approach (chap. 75 by Fuentes/Brauch). Although some critically argue that the actual network’s policy not always lives up their promises and pretensions (Werthes/Bosold 2006).

Going one step further the broad conception of human security emphasizes that the security *and* well-being of one individual has an effect on the security and well-being of other individuals. For example, extreme poverty might lead to crime or migration, or more drastically to trans-border criminal networks engaging in human, arms, and drug trafficking. The incapability of one state to deal with the spread of HIV/AIDS, SARS, or Dengue fever might lead in a globalized world to an increased spread of the epidemic in the whole world, threatening the survival and well-being of individuals everywhere. This broad approach, emphasized e.g. by UNDP (1994) and the Japanese government (chap. 84 by Shinoda), no longer allows for a clear-cut juxtaposition of (human) security and (human) development policies as it not only addresses threats to the survival but also to the well-being of the people. It therefore demands a policy of protection *and* empowerment (CHS 2003).

The human security concept helps with the conceptualization of a broad range of currently perceived threats. It also offers a normative reference point for evaluating and orientating policies and political instruments for the security and protection of the individual (Werthes/Bosold 2005). It demands creativity and flexibility on policy strategies and instruments.

Canada and Japan have proven that human security can serve as a political leitmotif (Debiel/Werthes

5 We owe this thought to Taylor Owen: “Human Security on Foreign Policy Agendas - Theoretical and Practical Implications” at the 3rd ECPR Conference in Budapest 2005; see at: <http://inef.uni-duisburg.de/page/documents/Panel_ECPR-short-info.pdf>.

2006; Werthes/Bosold 2006), and help to formulate policy agendas leading in the long run to substantial results (e.g. Ottawa Process and to a minor degree the establishment of the International Criminal Court). The ambiguity or the flexibility of the concept allows different (international) actors to focus on and prioritize different aspect of present insecurities. This might permit collaborative efforts of various international actors as long as political inventiveness is maintained (e.g. HSN; Bosold/Werthes 2005: 101; Glasius 2008). And not to forget the influential and interesting academic and practical work the concept itself stimulated (see e.g. projects of GECHS and UNU-EHS; Bogardi/Brauch 2005).

Last but not least, the traditionally harsh categorization, between development and security, leads to an insufficient emphasis of what are very serious and for millions of people all around the world life-threatening problems (Owen 2003b: 10; Chen/Fukuda-Parr 2003). Furthermore, the concentration of intellectual, financial and policy-influencing resources primarily on foreign affairs departments and security institutions, or the restricted focus solely on inter- or intrastate war, would potentially and eventually mean paying too little attention to a majority of threats (as well as their root causes). The human security approach might politically help to foster the necessary critical awareness as it addresses both conflict and development aspects (see Ulbert/Werthes 2008). While human security in the political field might be applicable and helpful, the question remains: how can it be substantiated for academic purposes?

77.5 Substantiating Human Security for Academic Purposes?

While for political purposes the definitional ambiguity positively turns out to be useful and practicable, for academic purposes its ambiguity or flexibility are obstacles for empirical research to help inform and advise public representatives (Paris 2001, 2004b; Buzan 2004b).

In the last decade substantial efforts have been made in trying to measure human insecurity in conjunction with vulnerability aspects (see e.g. HSR 2005; Mani 2005; Matthew/Fraser 2002; King/Murray 2001-02; Bajpai 2000; Lonergan/Gustavson/Carter 2000; Bruderlein 2000). To reiterate especially the programmatic project work of GECHS, UNCRD and UNU-EHS is here of importance and forward-looking. When juxtaposing, for example, the HSR and the

IHI approach (Lonergan/Gustavson/Carter 2000) one obstacle is strikingly obvious. For now all these works emphasize different aspects/dimensions of the broad human security agenda (see figure 77.1). Whereas the HSR concentrates mainly on conflict related insecurities, the *Index of Human Insecurity* is focused on developmental and to a certain degree environmental related insecurities. This is not to say, that one approach is 'better' than the other, but to illustrate a key characteristic of the current approaches, probably related to the complexity and manifoldness of the human security concept. A recent and interesting contribution to these measuring efforts is the work of Taylor Owen. We will briefly introduce his approach here in more detail to give just one simple but persuasive example on how human security can be substantiated for academic purposes.

Taylor Owen's (2003a, 2004, 2004a, 2004b) threshold-based definition of human security is most promising, showing how the human security approach can "legitimize itself in the world of foreign policy and development" to prove its utility (Owen 2003b). He focuses on regional or local insecurities. Based on the reports of UNDP (1994) and of the *Commission on Human Security* (CHS 2003), he incorporates different horizontal security dimensions focusing on imminent life-threatening dangers. On a regional scale, mortality data can be effective in crudely demonstrating threat patterns. He showed that the WHO 2000 mortality data for Cambodia, Laos, and Vietnam give evidence "that the threat from infectious diseases and disasters far outweighs that from violence and war" (Owen 2003b: 9).

His methodology is organized in four stages: In the *first* the most significant threats (e.g. by expert interviews) are determined and classified in six categories of 'human' security: economic, health, food, environment, personal and political. In a *second* step data are collected on these threats and on the imminent life-threatening danger of specific threats. These data help isolate the most serious threats from thousands of possible threats under the broad definitions of UNDP (1994) and of the Commission on Human Security (CHS 2003). In a *third* step the data (of any type with a spatial correlation) are mapped using *Geographic Information System* (GIS) techniques. With GIS, each threat can be shown as a layer on a map, either alone or with other threats. Examining various overlays between the threat layers in the *fourth* stage (data analysis), three trends emerge: *hotspots* (regions that experience the aggregate impact of multiple security threats), *correlations* (based on simple logic equa-

tions: if A and B, then C etc), and *consequences* (e.g. overlaying landmines with regions of high disease rates or poverty provides a picture of the war legacy).

Taylor Owen's methodology has shown that human security can be substantiated for academic purposes. It is designed to collect, organize, map, and analyse data that depicts human security threats, defined as life-threatening dangers with a significant mortality rate. Moreover, it effectively helps to present and illustrate complex, wide-ranging information to the policy making community, as maps are "infinitely more approachable than a complex database, especially when doing multivariate analysis" (Owen 2003b: 11). His methodology is very helpful for measuring and illustrating human (in)security on the sub-national level. Finally, his approach based on a threshold-based definition of human security can be seen as an attempt to overcome the aforementioned challenge. In fact oriented on the UNDP Report (1994) and the CHS Report (2003) the strength of Owen's approach is the first step where first of all exploring *the* specific regional and local insecurities (significant threats) is the main task.

77.6 Conclusion

We hopefully have on the one hand illustrated key elements and logics (horizontal and vertical extension) which furthered the emergence of the human security concept. On the other hand we tried to show that human security not only is of political attractiveness but also has practical advantages and can be substantiated for academic purposes. Especially the work on measuring human security in conjunction with vulnerability can be seen as a highly relevant policy oriented operational undertaking. The success or failure of this undertaking might soften or harden the debates on human security and its contestation.

Nevertheless, one critical question remains: What can peace and conflict studies gain with the human security approach? Similar to other security concepts ('extended', 'comprehensive'), which already broadened the international security agenda the human security approach responds to the manifold challenges of the Janus-faced globalization processes of the 1990's. These processes challenged classical thinking and international and multilateral action in a more and more globalized and interdependent world. Karns and Mingst (2004: 512) argued:

With respect to threats to peace and security, states have always assumed a prominent position and continue to

do so. Yet, even in security issues, the meaning of sovereignty is being challenged. (...), emerging norms of human security and humanitarian intervention, if confirmed, make responsibility to protect people a new aspect of sovereignty. Likewise, the concepts of sustainable development and human rights challenge sovereignty and the principle of non-interventions.

The thinking on human security clings to the idea that human rights, human development and human security are mutually reinforcing. From a peace and conflict research perspective, one might critically ask if the human security approach, when trying to respond to the three-dimensional erosion of state sovereignty, by proclaiming a (normative) responsibility to protect and to empower the individual, sufficiently addresses questions of *collective* violence, which still remains of primary concern for peace and conflict research.

Thinking on how to respond in cases of intra-state war and violent conflicts does not constrain the focus on state security and sovereignty. Although a consolidated (democratic) state in fact might be a guarantor of security and rule of law, in many cases the state itself is a major threat to security – inwards and outwards. Although human security has broadened the focus from the security of borders to the lives of people and communities inside and across those borders, (CHS 2003: 6) it only modestly and indirectly addresses the constituent element of many conflicts, namely the conflict parties. Conflict parties should be understood as more or less clearly definable collective units. One can argue that the human security approach is severely limited in dealing with violent conflict. Or one must criticize it for only addressing some root causes of violence and postulating humanitarian interventions as a matter of last resort. Therefore one must concede that the human security approach currently has no coping strategy for dealing with acute violent conflicts. This remains an important future task.

As a political and normative leitmotif 'human security' helps to clarify how to conduct, justify and sometimes legitimize policy decisions. It may also inspire decisions on policies and policy instruments. It helps to focus the (international) political agenda on the most vulnerable or most threatened individuals, too often forgotten in other security approaches. Finally it can also be substantiated for academic purposes.

78 Human Security in the Arab World: A Perspective from the Maghreb

Béchir Chourou

78.1 Introduction

The concept of ‘human security’ is not a common subject of research or discussion in the Middle East or in North Africa. Only recently has it appeared in newspapers and academic journals published in Arabic, particularly in Egypt and Jordan. But in the Maghreb the topic remains largely unknown, ignored or avoided. Two main factors account for this situation. First, the literature on human security is mostly in English, whereas the main language used by North African social scientists is French (although Arabic, the native tongue, is increasingly used). As a result, Maghrebi academics have little contact with the English-speaking academic community, and their research interests have not evolved in the same direction as the Anglophone research agenda.¹ Secondly and more importantly, human security includes components that are not open to free public discussion in most North African countries. Among those components one may mention protection against arbitrary arrest and torture, enjoying freedom of expression and association, and effective participation in political processes – topics that are too sensitive to be debated publicly.

This chapter seeks to bring human security into the research agenda of North African academia, and to present the current and future state of human security from a Maghrebi perspective. From a wide conceptualization of human security, this chapter refers to

the main threats to human security in the Maghreb and will identify those that can be considered as the most serious and that require, therefore, priority attention. Despite the fact that signs of acute material distress (hunger, disease, homelessness...) are not widespread or highly visible, insecurity in the Maghreb remains unacceptably high and is not likely to improve in the near future.

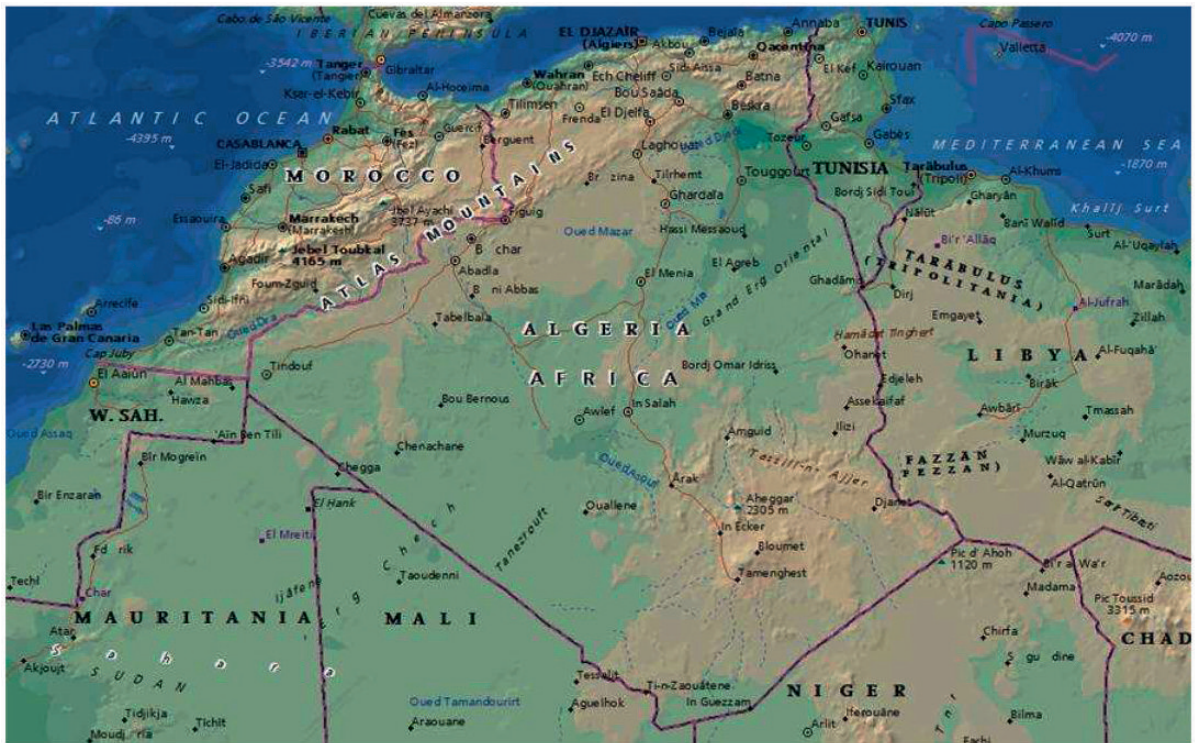

The northern part of Africa, in comparison with other regions of the continent, may appear to be in a fortunate position, but this is just an illusion: one may not see people dying of hunger or sleeping in the streets, but this does not mean that human suffering has been obliterated from the region. The chapter will attempt to show that two forms of direct violence (practices of autocratic regimes and inter-state conflicts) and a number of indirect violence (demographic growth, food insecurity, lack of education particularly among women, exposure to environmental hazards) represent major threats to human security in the Maghreb. This list of threats is not exhaustive but includes those that the author considers as requiring urgent attention and for which remedial action is readily available (at least in principle).

78.2 Identifying and Prioritizing Threats

Elsewhere this author opted for an approach which starts with a general definition of human security (HS) and then applies it to specific countries, regions and/or periods (Chourou 2008a). The main advantage of this approach is that it allows the researcher to identify threats, risks and vulnerabilities that are present in a given area at a specific period, to rank them according to their degree of severity and then on that basis, to recommend actions that need to be taken in the short, medium or long run to alleviate or eliminate such threats or risks. Human security was

1 It may be noted that the active involvement of the Canadian government in the field of human security has led to the publication and dissemination of a body of documents written in French. Also, a number of French social scientists are becoming interested in human security and have started publishing articles to make the topic better known in academic circles (see e.g. Peschadière 2006). One colleague, long-time student of human security Shahrbanou Tadjbakhsh has launched at Sciences Po (Paris) the *Human Security Journal* (although most articles in it are in English).

Figure 78.1: Map of the wider Maghreb consisting of Algeria, Libya, Mauritania, Morocco and Tunisia. **Source:** This map is in the public domain and not protected by copyright; at: <http://www.maghrebarab.com/maghreb_arab_map.html>.

defined as “the protection of the vital core of all human lives from critical and pervasive environmental, economic, food, health, personal and political threats” (Owen 2004a: 20). That chapter further adopted the four main factors that the Oxford Research Group identified as sources of global insecurity:

- adverse effects of climate change and global warming;
- competition for increasingly scarce resources, especially oil;
- increasing socio-economic divisions and the marginalization of the majority world;
- the future spread of military technologies (including weapons of mass destruction; Abbott/Rogers/Sloboda 2006: 28)

Finally, the list of direct and indirect threats to HS by Kanti Bajpai (2000: 40) was used as a basis for identifying those threats that may be considered (in a given situation) as most severe and that need consequently to be addressed in priority.

Combining these three elements, the previous chapter argued that in the Mashreq *direct* forms of violence – in Bajpai’s terminology (table 78.1) – are most

serious, whereas “in the Maghreb (North Africa), it is the forms of *indirect* violence which are more prominent, although some forms of direct violence are not totally absent” (Chourou 2008a: 776). Based on that premise, the present chapter will seek to identify those forms of violence which may be considered as the main threats to HS in the Maghreb.

Some of Bajpai’s categories will be recombined here to avoid repetitions and to gain greater differentiation between categories. Starting with forms of direct violence, ‘violent death/ disablement’ is most likely to be the result of terrorism or counter-terrorist activities undertaken by governments. Forms of violence listed in the category of ‘dehumanization’ and present in North Africa include unlawful detention of political opponents and rigged trials. As for the forms of violence listed under ‘discrimination and domination’ they are quite common in the Maghreb as well as in the rest of the Arab world. What may be noted, however, is that all these forms of violence have a common source and a common cause.

The Arab world is considered as the only region in the world where democracy does not represent a serious threat to existing regimes. For decades various movements have attempted to organize for the pur-

Table 78.1: Direct and Indirect Threats to Human Security. **Source:** Bajpai (2000: 40).

Direct Violence	Indirect Violence
<p>Violent Death/Disablement: victims of violent crime, killing of women and children, sexual assault, terrorism, inter-group riots/pogroms/genocide, killing and torture of dissidents, killing of government officials/agents, war casualties</p> <p>Dehumanization: slavery and trafficking in women and children; use of child soldiers; physical abuse of women and children (in households); kidnapping, abduction, unlawful detention of political opponents + rigged trials</p> <p>Drugs: drug addiction</p> <p>Discrimination and Domination: discriminatory laws/practices against minorities and women; banning/rigging elections; subversion of political institutions and the media</p> <p>International Disputes: Inter-state tensions/crises (bilateral/regional) + great power tensions/crises</p> <p>Most Destructive Weapons: the spread of weapons of mass destruction + advanced conventional, small arms, landmines</p>	<p>Deprivation: Levels of basic needs and entitlements (food, safe drinking water, primary health care, primary education)</p> <p>Disease: Incidence of life-threatening illness (infectious, cardio-vascular, cancer)</p> <p>Natural and Man-made Disasters</p> <p>Underdevelopment: low levels of GNP/capita, low GNP growth, inflation, unemployment, inequality, population growth/decline, poverty, at the national level; and regional/global economic instability and stagnation + demographic change</p> <p>Population Displacement (national, regional, global): refugees and migration</p> <p>Environmental Degradation (local, national, regional, global)</p>

pose of introducing democratic reforms, but in most cases they have been repressed, often violently. The only movements to have continued their opposition to autocratic rule are the Islamist movements. As grass root support for these movements increased, government oppression intensified and became more violent. This in turn led the Islamists to adopt violent action, including terrorist acts. Consequently, and as it will be argued below, terrorism may be considered – at least in its manifestations in North Africa – as a direct consequence of authoritarianism.

As for the other forms of direct violence (torture, unlawful detention of political opponents, subversion of political institutions, etc.) practiced by ruling regimes, they are designed to protect the status quo more than to fight terrorism. Therefore, violent death/disablement, dehumanization and discrimination/domination may be integrated into a single form of direct violence which may be called ‘authoritarianism’, and it will be argued that authoritarianism is one of the most (if not *the* most) important threat to human security in the Arab world in general and the Maghreb in particular.

Another form of direct violence identified by Bajpai is ‘international disputes.’ In the Maghreb the most prominent dispute is between Morocco and Algeria over the status of the Western Sahara. It will be argued that the dispute has had several direct and indirect effects on human security not only on the parties that are directly involved in it (Algerians, Moroc-

cans and Sahraouis) but also on neighbouring communities. In particular, it is responsible to one extent or another for the accumulation of weapons in the region and for stalling multilateral cooperation, including the process of economic integration. On that basis, the factor labelled ‘most destructive weapons’ may be renamed ‘armament’ and discussed in conjunction with ‘international disputes.’

As for the remaining factor in Bajpai’s list – ‘drugs’ – it will not be discussed here because drug addiction is not considered (yet) as a major problem in the Maghreb. This is not to say that there are no drug-related problems in the region. In fact, cross-border trafficking in drugs, particularly between Morocco and Europe, is well known but it will be assumed that its impact on human security is greater in Europe than in Morocco.

Turning now to Bajpai’s list of indirect forms of violence, all of them are present in the Maghreb. However, the allotted space does not allow a comprehensive discussion of each one of them. Consequently, they will be aggregated into two broad categories, each one containing threats that may be considered as most serious and needing urgent solutions. The first new category may be given the familiar label of ‘freedom from want’ and will include components of the *human development index* (HDI) for which improvements are particularly needed. The discussion will focus on access to food and water, education, and gender. The second proposed category may be labelled

‘environmental risks’ and will include sources of insecurity related to natural disasters (earthquakes, floods, droughts) and environmental degradation (pollution, desertification).

To sum up, threats to human security in the Maghreb are numerous but their degree of severity is not uniform throughout the region. The chapter will focus on those threats that are either present in many/all countries in the region or have an impact on many/all of those countries, and that need in all cases urgent attention. Specifically, the following threats will be discussed: Authoritarianism, international disputes and armament, aspects of human welfare (access to vital goods and services, discrimination against women) and exposure to environmental risks.

78.3 Forms of Direct Violence

For any human being the most fundamental right is protection against loss of life or limb *by human decision*. Of course, we are constantly faced with bodily harm as a result of illness or accidents, but we accept those risks as part of life and we normally do not spend sleepless nights worrying about such eventualities. On the other hand, we would feel a great deal of anxiety if there were a threat that another human being might *deliberately* inflict harm on us. Such a feeling of insecurity is widespread in the Arab world in general and North Africa in particular. Its primary cause is the existence of authoritarian regimes which have consistently rejected any form of political reform and which have used – and continue to use – any means to repress and suppress challenges and opposition to their rule. As a result, instead of being a provider of security, the state has become a major source of insecurity.

78.3.1 Authoritarianism

“Through much of human history the danger to an individual’s life, liberty and happiness came from the absolutism of monarchies, the dogma of churches, the terror of dictatorships, and the iron grip of totalitarianism” (Zakaria 1997). This observation applies eminently to the Arab world in general and to the Maghreb in particular. As the table 78.2 shows, the five countries under discussion have been ruled by totalitarian regimes since independence, whether outright absolutist monarchies or pseudo-republican systems. In most cases, rulers stay in power until they die, are killed or are forcibly removed. At the time of writing,

there has not been a single case of a peaceful and voluntary transfer of power.

When they were leading their respective nationalist anti-colonial movements, the later King Mohamed V in Morocco, Ben Bella in Algeria and Bourguiba in Tunisia denounced colonialism as contrary to human rights and democratic principles and called on the people to participate in political and military activities to oust the occupier. Ordinary people joined political parties, trade unions and other civil society organizations, created and ran underground resistance movements, participated in marches, demonstrations and strikes, and became skilled and courageous guerrilla fighters. When the colonial authorities arrested and jailed the top leaders, it was the grass roots rank and file who kept the nationalist movements alive and going. Yet, once independence had been achieved, those same people were declared unfit or at least unprepared for participation in political life.

The ensuing contest for power followed a familiar pattern. Those who became the heads of the newly independent states proceeded to do away, in one way or another, with individuals or groups who challenged them or sought otherwise to participate in the political process. The prevailing attitude among them was that they had a mission to lead their respective countries, and that any challenge to this principle was an act of treason.

This author argued elsewhere (Chourou 2002) that the first leaders who assumed power in North Africa after independence missed a unique opportunity, if not to create democratic forms of government from the outset, at least to set their countries on the road to democratic rule. It is true that in the early period of independence, opposition to the new political order came mostly from individuals or factions of the elite who were not necessarily or primarily motivated by the defence of democratic principles, but who were disappointed that they lost the battle for supreme power.

As for the public at large, they considered that the ‘fathers of the nations’ had the legitimate right to preside over the destinies of the new states. Furthermore, they had more pressing needs than political rights that had to be satisfied: employment, education, health-care, etc. Given the dire condition in which the countries were when colonial rule ended, whatever action taken by the new governments was bound to yield results that could only be considered as major achievements. Having a school, a dispensary, a road where none had existed; having a policeman who spoke one’s own language; having a national army, a na-

Table 78.2: History of Regimes in the Maghreb. **Source:** Compiled by the author.

Algeria	<p>1962: Independence. Ahmed Ben Bella formed the first government. He swiftly moved to neutralize potential opponents. In September 1963 he accumulated the functions of head of state, head of government and supreme commander of the armed forces.</p> <p>1965: Ben Bella was deposed by Defence Minister Houari Boumedienne who dissolved the Parliament and suspended the constitution. A new constitution was adopted in 1976 under which Boumedienne was elected President with 95 percent of the votes. He died in office in December 1978.</p> <p>1979: Colonel Chadli Bendjedid was appointed president.</p> <p>1989: Following popular uprisings in 1988, the government adopted a new constitution that introduced political reforms, including a multiparty system.</p> <p>1991: The Islamist party FIS won a majority of seats in the first round of legislative elections. The government cancelled the elections and Bendjedid resigned. His successor Mohamed Boudiaf was assassinated six months after taking office. Ali Kafi was appointed as the new president and the confrontations between the government and Islamists began.</p> <p>1994: General Liamine Zeroual was designated as acting president and was confirmed by elections in 1995.</p> <p>1999: Zeroual leaves office before the end of his term. The Army picked Abdelaziz Bouteflika as candidate who was elected president and re-elected in 2004.</p>
Libya	<p>1951: Independence. King Idriss Ist assumed power.</p> <p>1969: Col. Muammar Gaddafi overthrew the King, abolished the monarchy and became head of state.</p>
Mauritania	<p>1960: Independence. France chose Moktar Ould Daddah as Prime Minister. He instituted a single-party system and ruled until 1978 when he was overthrown by the military. Power was exercised by a junta. Col. Ould Taya staged a coup in 1984. He introduced a multiparty system in 1992, and was re-elected as president in 1992, 1997 and 2003. In 2005 he was overthrown by his colleagues who set up a transitory government to allow civil society to set up democratic institutions and to prepare for a transfer of power to civilians within two years. Elections were held in March 2007 and a civilian government takes office.</p>
Morocco	<p>1956: Independence. Monarchy was instituted in 1957 and Mohammed V became king. He was succeeded in 1961 by his son Hassan II who ruled until 1999 when he was succeeded by his son Mohammed VI. Since independence the political life has been dominated by the king.</p>
Tunisia	<p>1956: Independence. Habib Bourguiba abolished the monarchy, created a republic and became its first president. He and his party monopolized power.</p> <p>1987: He was overthrown by a military man, Zine el Abidine Ben Ali. Some political reforms were adopted but remained mostly formal. The president's current mandate (his fourth) was due to expire in 2009. The constitution was amended to eliminate limits on the number of allowed mandates and opened the way for the president to seek re-election in 2009.</p>

tional administration – these were concrete results of government policies. It was therefore quite natural that public opinion felt grateful for those achievements and supported the leaders who brought them about.

During the first years following independence, welfare improved quickly and substantially. Governments at that time benefited from a number of favourable conditions that made such gains possible. One of them was the transfer of economic and financial assets from colonial authorities to national governments. Another was the ready availability of funds provided by various donors ostensibly to combat underdevelopment, but in effect to influence the atti-

tudes of the new states towards the protagonists of the Cold War. Thus, the understanding that governments proclaimed, and that populations did not explicitly reject, was that governments would provide for people's needs, and in return people would stay away from politics.

However, by the late 1970's this 'contract' started to fall apart. At one time or another, North African governments had to deal with problems that were becoming more numerous and more difficult to resolve:

- Some policies adopted after independence failed to yield the expected benefits or proved to be outright harmful. This was the case, for example, of the various paths chosen to modernize national

economies and set them on the road to development. Algeria opted for heavy industry, Morocco and Tunisia for import substitution, agriculture being scorned in all three countries as synonymous with backwardness. Many of those decisions had been adopted without submitting them to a thorough public discussion, and when their nefarious effects became visible, it was too late or too costly to correct them.

- Governments controlled most aspects of social life, including economic activities. Agriculture, manufacturing, extractive industries, services were all mostly or totally publicly owned and managed. Thus, governments had the resources to build infrastructure and provide social services, including employment. However, by the early 1980's a number of factors combined to put governments in a difficult position. Prices of raw materials, particularly hydrocarbons, had fallen to historical lows, thereby reducing considerably government revenues. Subsidies to basic products and services (staple food, health, education...) kept increasing as populations and needs grew. Public enterprises, after years of low productivity and inefficient management, had become a major financial liability. In order to finance their growing deficits, governments turned to borrowing from international financial institutions and financial markets. However, this short-term solution was going to create a long-term problem, that of public indebtedness.
- After three or four decades of independence, major progress had been achieved on many fronts: life was certainly better in the 1980's and 1990's than in the 1950's. Nevertheless, public discontent with the political leadership was spreading and intensifying. This was a natural and predictable development, considering that expectations are forever rising, and that people's awareness and political sophistication are bound to improve with time. Unrest was particularly prevalent among the post-independence generation who came to bear the brunt of the ongoing economic and social problems. Unable to provide for their people's welfare, and at the same time unwilling to accept any challenge to their authority, these leaders chose to repress any calls for political change and greater citizen participation in public life.

Thus, the political process turned into a permanent confrontation between regimes that were unwilling to give up power and citizens who were adamant in their demands for political reforms. The forces mobilized by the contenders were highly uneven. Civil society

protesters were denied the use of peaceful means of expression and political action; it turned, therefore, to extra-legal behaviour, including violence and terrorist acts. Regimes, on the other hand, had at their disposal security, military and paramilitary forces, militias, judicial institutions, and other components of the state apparatus which they used, ostensibly, 'to maintain law and order' but in effect to maintain themselves in power.

Two aspects of this confrontation are of particular interest. First, when the confrontation started in earnest (in the 1970's in North Africa), it involved mostly traditional leftist parties (Communist, Trotskyite, liberal democratic...) and activist groups such as trade unions, students, professors, etc. In order to undermine such opposition, many regimes created directly or encouraged the creation of Islamist groups. By and large, the tactic succeeded: unable to resist attacks from the regimes and the religious parties, the lay opposition was sidelined. But for the regimes, this was going to prove to be a Pyrrhic victory. Having become the only movement with effective power and influence, the Islamists organized themselves into political parties which, eventually, sought to govern.

Unlike previous opposition groups, the Islamists parties were well organized, did not limit themselves to urban areas but operated in all parts of their respective countries, and had an ideology that people could understand because it was based on their religion. It was clear that if they were allowed to operate freely, they would be swept into power. Hence, regimes used every means at their disposal to eliminate that threat. But the Islamists were not about to go down without a fight. They proclaimed that since governments refused to fight at the polls and opted for violent confrontation, they had no choice but to fight back with the same tools.

The political agenda of the Islamists - in North Africa and elsewhere - was not restricted to local issues but included various aspects of international relations, including the Israeli-Palestinian conflict and American/Western influence in the Arab and Muslim world. Considering themselves as freedom fighters or oppressed opposition activists, Islamists used or condoned forms of violence which they considered as legitimate acts of war, but that others viewed as terrorist acts. The latter view being advocated by actors who considered themselves as the sole holders of the legitimate right to use violence and as victims of criminal fanatics, it became the accepted orthodoxy, and Muslims in general - not just Muslim activists - and Arabs in particular - and not just those who are members of

Islamist movements, came to be viewed as actual or potential terrorists. This view became even more widespread after 9/11.

Arab regimes exploited the situation to gain the political and material support of frightened Western governments. They resumed in earnest the hunt for political opponents. Any velleity to challenge rulers was branded as part of an Islamist plot to overthrow the existing national and international political order. Acting on the principle that danger had to be eliminated before it materialized governments in the Middle East and, to some extent, in the West launched what one might only call a witch hunt. North Africa was no exception. Practices such as arbitrary arrest and detention, torture, fake trials and other violations of human and civil rights had been common for years; after 9/11 they just became more widespread. People felt that they were under the constant surveillance of visible and invisible security watchdogs, that anything they said, read or wrote was scrutinized for suspicious content, that they may be called to explain not only their own behaviour but also that of family members, friends, neighbours and colleagues. Furthermore, should they be accused of any wrongdoing, they would have little opportunity to defend themselves. As a result, people opted for the prudent decision of not engaging in any activity that had the remotest chance of appearing critical, provocative, or politically motivated. Better yet, and inasmuch as neutrality may appear to be a form of opposition, one had better have a behaviour that shows ostensibly one's support for the existing political order.

In sum, people in North Africa have been victims of various forms of physical violence, including death, as a result of carrying out political activities or holding political opinions. Others perceive that their welfare is constantly threatened by rulers who see enemies everywhere. Reports by various national and international human rights organizations have shown that such fears are justified, and not just imagined. The obvious method of making people less concerned about their lives and limbs is allow them to freely choose their rulers and to periodically evaluate the performance of those rulers – i.e. to find a better method of governing than authoritarianism.

78.3.2 International Disputes and Armament

The conflict between the Polisario Front, Algeria and Morocco over the fate of the Western Sahara has been going on for over 30 years, but it has failed to attract wide international attention despite its human,

social, economic and political cost. Western Sahara was occupied by Spain in 1884; it became a Spanish province in 1936, and kept that status until Spain started in the mid-1970's to divest itself of its colonies. The national liberation front Polisario, created in 1973, asked for total independence, but the neighbouring countries of Mauritania and Morocco, invoking conflicting historical pretensions, asked for a restitution of what they considered as spoiled national territories. In the event, Spain agreed with Mauritania and Morocco to co-administer the province until a referendum on independence could be held. But in 1975, yielding to pressure from Morocco, Spain partitioned the territory into two parts which it turned over to the two North African countries. Polisario rejected that arrangement and proclaimed in early 1976 the creation of the *Sahrawi Arab Democratic Republic* (SADR), with Polisario as its government, operating out of the Algerian city of Tindouf.

Many countries recognized the new sovereign entity, including Algeria which had supported the Polisario since its creation, and continued to give it support in its fight to liberate Western Sahara from Moroccan and Mauritanian rule. In 1978 Mauritania signed a peace agreement with Polisario and abandoned the territory that it controlled, but Morocco moved swiftly to occupy it as well. Polisario's fight continued with Morocco until a ceasefire was negotiated in 1991 and a United Nations force was sent to monitor the ceasefire and prepare for the holding a referendum allowing Sahrawis to determine their future. However, all efforts to find a solution to the Western Sahara conflict have failed, and the problem is still unresolved. The conflict has had serious negative effects on the human security of the two main protagonists², the Sahrawis and the Moroccans. The *International Crisis Group* (ICG 2007) lists the following effects:

The first group of victims are the Sahrawis. Those living in refugees camps on the borders with Algeria suffer from malnutrition, sickness, precarious living conditions, and poverty – a condition shared by refugees all over the world. Their rulers, member of the Polisario, are said to be authoritarian and corrupt, using for their own purposes funds given by the international community to improve the lives of refugees. As

2 For an excellent summary of the Western Sahara crisis, a careful analysis of its human security cost, and useful recommendations to end the conflict, see two reports published by the International Crisis Group ICG 2007a, 2007b) in its series: *Middle East/North Africa Report*.

Figure 78.2: Western Sahara. **Source:** Map 3175, Rev. 2, January 2004. United Nations, Department of Peacekeeping Operations, Cartographic Section. Reprinted with permission; at: <http://www.un.org/Depts/Cartographic/map/profile/wsahara.pdf>.

for Sahrawis living in the Morocco-controlled territories, their material condition is somewhat better, but they have to endure harsh treatment, including arbitrary arrest and torture, from Moroccan authorities who want to discourage anyone from denouncing human rights violations or calling for independence.

They also fear losing their lands to Moroccan settlers who have been moving to Western Sahara in large numbers, with the encouragement of Moroccan authorities. The last categories of victims are the guerrillas who fought against the Moroccan army until 1991 (ICG 2007: 5-7).

Sahrawis also suffered in other ways. Western Sahara holds important reserves of phosphate which have been taken over by Morocco. The reserves are estimated at over one billion cu. m., and Morocco is said to extract 2.4 million tons annually. On the other hand, the ocean off the coast of Western Sahara is a major fishing ground, and Morocco is said to have caught there 700,000 tons of fish in 2005, valued at around US\$242 million (ICG 2007: 11). Such wealth could have improved the welfare of many Sahrawis: a trite but truthful statement.

Turning now to Moroccans, the group among them that suffered most and most directly from the conflict are the soldiers of the Moroccan army. Some 100,000 of them have been stationed in Western Sahara. Aside from those who died or suffered injuries in the course of fighting the Polisario guerrillas, or who have been victims of landmines planted by their own army (no figures or estimates are available for those casualties), Moroccan soldiers who have suffered most from the conflict are those who have been held prisoners by the Polisario. According to estimates made by international human rights organizations, hundreds of soldiers have been held prisoners by Polisario for up to 25 years. During their detention, they have been victims of various forms of ill-treatment. In 2005, Polisario decided to free the last Moroccan soldiers it held prisoners, hoping that Morocco would free some 50 Sahrawi prisoners and give information on 500 others who have 'disappeared' since the beginning of the conflict (ICG 2007: 9).

Economically, the Western Sahara has been a major burden for Morocco, despite the fact that the latter has exploited the territory's natural resources. The security measures alone have been a major burden on Morocco's budget. Building the 2,500 km-long wall (known as *Berm*), equipping it with sophisticated electronic surveillance instruments, and deploying some 130,000 soldiers to guard it – all of this constitutes a costly undertaking. Administering the territory and providing infrastructure and services to serve Moroccan expatriates and pacify local Sahrawis further contribute to the cost of Moroccan control over Western Sahara.

Of course, those expenditures may be viewed as investments that will go to improving the welfare of Moroccans and Sahrawis alike, but there is the risk that Morocco would lose all those investments should it be forced to abandon its control over the territory. Furthermore, those funds could have been spent to improve the welfare of citizens who live in parts of Morocco that continue to be impoverished. As a Mo-

roccan human rights activist, cited by Crisis Group, put it, "the cost of this issue is quite simply Morocco's non-development" (ICG 2007: 13).

In addition to the human and economic costs of the conflict, there is a political cost that needs to be assessed; it is borne not only by SADR and Morocco, but also by Algeria, le Maghreb, and the international community. Starting with the Sahrawis, they have been forced to live in refugee camps or under Moroccan administration for over thirty years. During this period they have had no political activities to speak of, or political institutions they could call their own. In their view, the situation of stalemate has been maintained for too long and there is no end in sight. As a result, a growing number of Sahrawis are getting restless and are calling for a return to warfare to settle the issue.

As for the SADR leadership, the initial success they had on the international scene has waned considerably. Of the 82 countries that have recognized the SADR at one point or another, 35 withdrew or froze their recognition. However, SADR achieved a major breakthrough when the Republic of South Africa granted it recognition in September 2004. But it is yet to be recognized by any member of the European Union, although some Scandinavian countries were reported to be considering such a move. At home, Sahrawi leaders are more and more blamed by the population for the lack of progress towards a settlement, as well as for improper behaviour. This may affect their credibility and legitimacy when dealing with actors involved in settling the Western Sahara conflict which, in turn, will have an impact on the final outcome and hence on the welfare of the Sahrawis.

The third actor involved in the Western Sahara conflict is Algeria. It has always supported Polisario and SADR on the basis that the Sahrawis are entitled to exercise their right to self determination. That support has been both symbolic and very concrete effects on the Algerian government and people. In the 1970's when the Non-Aligned movement still enjoyed some prestige – if not influence – on the international scene, Algeria's stand brought it respect and consideration. But when Polisario agreed to a ceasefire with Morocco, many countries, particularly in Africa, withdrew their recognition. Since then, Algeria has had to invest a lot of energy to ward off any further decline in the support for SADR and further gains by Morocco.

More importantly, Algeria has had to bear more material and costly sacrifices for its stand on the Western Sahara issue. Supporting Polisario has been

at the origin of tension with Morocco, leading both countries to maintain important military forces on their common borders. Antagonism has also resulted in maintaining those borders closed most of the time, preventing any movement of goods or persons between the two countries.

Hostility has also led both countries to devote important resources to defence and armament. According to the 2006 *Human Development Report* (UNDP 2006b), defence expenditures as a percentage of GDP increased for Algeria from 1.5 percent in 1990 to 3.4 percent in 2004, and from 4.1 percent in 1990 to 4.5 percent in 2004 for Morocco. In 1999 Algeria launched a 10-year programme to modernize its defence apparatus, spending about \$ 2.3 billion annually to purchase military equipment. The 2004 budget set aside DZD 202 billion (US\$ 2.8 billion) for the Ministry of Defence and DZD 186.6 billion for the Ministry of Education (Mouloud 2004). In March 2006 Algeria signed a contract with Russia for the purchase of US\$ 7.8 billion worth of military equipment, including 40 Mig-29 fighters.

Morocco, for its part, has been spending, between 1990 and 2004, 4.1 per cent to 4.5 per cent of its GDP on defence. Fighting the Polisario, then protecting and developing the Western Sahara have absorbed most of the defence expenditures. In addition, Morocco has traditionally considered Algeria as a security threat, given the differences in political regimes and ideologies that separate them. It also adopts the view that Algeria nurtures hostile feelings towards it, and could use the Western Sahara problem as a pretext to start a war in the region. Consequently, it feels that it needs to prevent Algeria from acquiring a position of military superiority.

It is therefore not surprising that Morocco should react to Algeria's deal with Russia by seeking to acquire from France 18 Rafale combat aircrafts at a cost of € 2.5 billion, two-thirds of which being financed by Saudi Arabia (Tilouine 2006). The Russo-Algerian deal elicited a similar reaction from Libya which has initiated discussions with France for the purchase of 24 Rafale jet fighters.

This atmosphere of mistrust, suspicion, open or latent hostility, and of rivalry is largely responsible for spending large resources on military activities and equipments instead of means to improve the welfare of the people. It has also led to the stalling of cooperation in the Maghreb. In 1989 the leaders of the five North African countries signed the Charter of the *Union du Maghreb Arabe* (UMA - Union of the Arab Maghreb), with the aim of achieving the economic in-

tegration of the region and increasing cooperation among the members in various domains. So far very little cooperation has been achieved. Even intra-regional trade remains insignificant, representing less than 2 per cent of any one country's foreign trade.

At the same time, most of the countries chose to extend and deepen their relations with Europe and the United States. Thus, Morocco and Tunisia signed in 1995 *Euro-Mediterranean Partnership* (EMP) agreements. Among the purported objectives of the agreements is to improve the human security and welfare of the partners, particularly those of the Southern Mediterranean. However, by the own admission of the Southern partners and even of the EU members, the EMP and the Barcelona Process of which it is a major component, have not reached their expected objectives. Some ten years after Morocco and Tunisia put the EMP agreements into effect, they achieved no welfare improvement that they could attribute directly to the EMP. On the contrary, and looking at Tunisia, the EMP had led to serious economic and social problems (Chourou 2004b).

In sum, the prevailing conflicts in North Africa and the arms race that they triggered and continue to nurture, have led to the death and injury of thousands of citizens, and there may be more victims should violence flare up. They are also the cause of lost opportunities for cooperation that would have gone a long way towards improving human security in the region.

78.4 Forms of Indirect Violence

This section focuses on two forms of indirect violence which have an important impact on human security: achieving greater freedom from want through better access to vital goods and services for all people but particularly for women, and providing greater protection against environmental risks.

Broadly speaking, the level of human welfare in North Africa is not catastrophic. Using the *Human Development Index* (HDI) as an indicator, only Mauritania is in the 'Low Development' category with an HDI of 0.486, ranking it 153rd out of 177 ranked countries. The other four countries are among the 'Median Development' group and are ranked from 64th for Libya to 123rd for Morocco. People on average do not suffer from acute deprivation. As table 78.3 shows, indicators of the standard of living for the three 'core' countries of North Africa are satisfactory; they compare favourably with those of other African and devel-

Table 78.3: Selected social and economic indicators for the 'Core' Maghreb. **Source:** UNDP's *Human Development Report 2006*.

oping countries. There are, however, a few areas which represent serious threats to human security and which call for urgent attention.

The first is demography. With the exception of Tunisia, demographic growth continues to be too high in relation to economic growth. Fertility rates remain high, even though they have decreased substantially from their levels in the 1980's and 1990's. One consequence of those early rates is that nearly one-third of the current population are under the age of 15. With a high proportion of youth, and the lack of participation of women in the modern economic sector (a point to which we shall return below), adult males are left with the task of earning a sufficient income to meet the needs of the remaining population. This task is further complicated by the fact that national economies are unable to supply sufficient jobs to meet the demand. Thus, unemployment rates hover around 15-25 per cent according to official figures, the actual figures being probably higher in many

cases, especially if disguised unemployment is taken into account.

These figures have important economic and social implications. As the population increases, national income has to keep up with it if standards of living are to remain stable, but increasing national income and, hence, avoiding poverty, will prove difficult in the future, especially for countries that do not have oil resources - and the core human-security objective of 'freedom from want' is likely to remain out of reach.

The second major challenge facing North Africa is food security. Although the area is predominately covered by desert where droughts are frequent and long-lasting, and water is scarce, the Mediterranean shores used to be quite fertile until human action spoiled them. After independence agriculture was deliberately abandoned in favour of industry, the latter being considered more appropriate for modernization and development. In fertile areas production was switched from food staples to cash crops for export, the rationale being that cash crops bring the hard currency

needed for industrialization. Over the years, such decisions led to the current problems of dependency on foreign markets for agricultural exports and food imports, inefficiency and low productivity of the agricultural sector, ecological and environmental problems arising from inappropriate use of irrigation, mechanization, and chemical products.

Regarding food production, it has been pointed out that "food security is less seen in terms of sufficient global and national agricultural food production, and more in terms of livelihoods that are sufficient to provide enough food for individuals and households" (Boko *et. al.*: 454). Consequently, food security may be defined in terms of: " i. the availability of food (through the market and through own production); ii. adequate purchasing and/or relational power to acquire or access food; iii. the acquisition of sufficient nutrients from the available food, which is influenced by the ability to digest and absorb nutrients necessary for human health, access to safe drinking water, environmental hygiene and the nutritional content of the food itself" (Boko *et. al.*: 454). When a society cannot produce the food it needs and must turn to external suppliers, food may acquire a strategic value, and dependency on outside sources may become a potential threat to human security.

In North Africa agricultural production is highly dependent upon weather conditions. The region is exposed to frequent droughts which may last for several consecutive years. As a result, there are wide variations in production volumes. This is particularly true for rain-fed crops such as wheat and barley, the two main staples for the region. Consumption, on the other hand, has been increasing steadily (see Fig. 79-1). As a consequence, all of the Maghreb countries have had to import larger and larger quantities of grain to fill their growing deficits (see Fig. 79-2). [Fig. 79-1 & Fig. 79-2 about here - all figures are in attached Appendix]

In this regard some remarks are in order. Concerning production, natural conditions in Algeria, Libya and Mauritania (lack of arable land, aridity) are not conducive to agricultural activities. As for Morocco and Tunisia, they opted in the 1970s to develop cash crops (fruits, vegetables) for export and to obtain required staple commodities from foreign markets where supply was plentiful and prices affordable.

However, those decisions were to prove to have been ill-advised. On the one hand, environmental degradation due to human and natural factors, and which was already underway, became more severe and more widespread. Erosion, overgrazing, drought, water scar-

city, increased salinity of aquifers and the extinction of native species of plants were making larger and larger areas unfit for agricultural activities. This has had serious social and economic effects such as loss of livelihood for many communities and migration, both internal and cross border.³

On the other hand, cash crops that Morocco and Tunisia started developing in earnest in the 1970s were to be exported to the European Union (EU) under preferential conditions. However, successive enlargements of the EU made access of North African agricultural products to European markets more and more difficult (Chourou 2004c). Furthermore, most of the exported products required large amounts of water to grow, and exporting them amounted to exporting what is called in environmental jargon 'virtual water', thereby exacerbating the water stress which was already severe in the region (Chourou 2009).

A further threat to food security in the Maghreb is the rising price of cereals on world markets. As Fig. 79-4 shows, prices paid by North African countries for imported wheat varied widely during the period 1990-2005, the average being between USD 140-180 per ton. But in 2007 prices increased sharply, reaching USD 250 per ton in September and USD 300 in October. This has had an effect on governments as well as consumers. Traditionally, all governments in the region had to subsidize basic commodities such as cereals, cooking oil, sugar, liquefied gas used for cooking, and gasoline. When prices increased, governments had to find cash to offset part of the increase and pass the remainder on to consumers. The problem was further compounded by simultaneous sharp increases in the prices of energy products. Inevitably, those who will be most affected by these developments are those who are already vulnerable and insecure.

Even though North Africa does not face at present a severe problem of hunger or malnutrition, the fact remains that food does have a strategic value that should not be allowed to be used as a threat to human security. Countries should adopt measures to achieve food security. This may be a costly process but appropriate results are likely to be obtained if those endowed with land and those with financial resources were to cooperate in achieving collective food security (Chourou 2003).

The third problem confronting the Maghreb is education. The second *Arab Human Development Re-*

3 For a more detailed discussion of environmental problems prevailing in the Maghreb see Chourou 2008b.

port published by UNDP in 2003 being entirely devoted to this question, there is no need to describe the situation in detail. Suffice it to say that illiteracy is still widespread, especially among women; that universal primary education remains a distant goal for many countries; and that higher education is still a luxury accessible only to a minority of the population. Furthermore, there is a dearth of scientific research and production, which is one of the main reasons why the Arab world will remain on the margin of the ongoing scientific and technological revolution. Not only are Arabs in general not participating in the production of knowledge, they are often unable to use knowledge produced by others. How can people use the internet if they cannot read or write, not to mention lacking the means to buy a computer? Human security is unattainable without minimal educational standards.

There is another issue of particular concern, that of gender. Whatever the degree of severity of social problems in the region, the victims of such problems are more likely to be female than male. Many women in the region still do not have access to adequate prenatal and postnatal health care, are not attended by skilled medical staff when they give birth, and die while giving birth.

With respect to education, illiteracy is far more prevalent among women than men. School attendance and enrolment are lower among girls than boys at all levels of education (with the notable exception of Tunisia where in 2006/2007 there have been more women enrolled in higher education than men), and there are more girls than boys who drop out of school or repeat grades.

These are only two aspects of the more general problem of discrimination against women that is besetting many – if not most – of the Arab States, and which is a major obstacle to the realization of human security for all citizens. No society can expect to make progress in any domain if it excludes half of its members from participating in the common efforts tending towards that objective.

The last threat to human security that will be mentioned here is exposure to natural risks and environmental hazards. The issue will not be discussed in detail since an entire chapter will be devoted to it in the forthcoming fifth volume in the Hexagon series (Chourou 2009). Suffice it to mention at this stage that in addition to environmental threats that face all mankind such as climate change and ozone depletion, there are some that are specific to the region. For example, Morocco and Algeria contain major seismic re-

gions. North Africa is also known as a region where rain may not fall for long periods of time, creating severe droughts, or fall in large quantities over short periods of times, thereby causing catastrophic inundations. Other natural phenomena include land degradation and desertification. The effects of these problems on human security are well known, and their future evolution has already been forecast by scientists. For example, there are numerous institutes in the Maghreb that study arid zones and at least one regional organization specializing in combating desertification. With respect to freshwater scarcity, the Food and Agricultural Organization of the United Nations (FAO) has been studying this problem for some time and has even designated 2003 as International Year of Freshwater (Chourou 2004a). The international community and the local authorities and scientists are well aware of these problems. What is needed is the urgent implementation of corrective measures to stop the degradation and waste of land and water resources, and preventive measures to ensure that future generations can have access to food as water required for living.

78.5 Conclusion: Future Prospects of Human Security in the Maghreb

Not all threats to human security confronting people in North Africa have been presented, and those that have been mentioned have not been discussed with the depth they deserve. But the message that this contribution attempted to convey is the following. From a purely material point of view, the majority of North Africans do not face *at present* many major problems. But human beings do not have needs that are exclusively material. Human security includes other aspects of a decent life, such as cultural identity, human dignity and self-fulfilment. It is those non-material dimensions of human security that are most wanting in North Africa and in the rest of the Arab world. It may well be true that average citizen feels lucky that his/her survival is not under immediate threat, yet there are increasingly visible signs that people are not totally happy with life. There are not many scientific studies that evaluate on a regular basis the state of mind or the outlook on life of Arab men and women, but informal observations and impressionistic reports indicate that a general feeling of *malaise* seems to pervade Maghrebi societies. An attentive observer may in fact detect a number of indicators that would confirm that feeling. In short, the crucial problem that con-

fronts most North Africans at present is the fact that the state has become the dominant threat to human security. A large number ordinary people fear their states and their governmental institutions, and feel that their states are not only unwilling or unable to protect them, but are themselves the main threat to their security. Only a few people are exposed to naked threats to their physical safety or to dire economic or social problems, but most see their dignity, their worth as human beings, their human rights and their fundamental freedoms trampled upon on a daily basis by institutions and individuals, including 'security' forces, who act on behalf of, and on orders from, national political authorities.

Numerous reports, books, articles and testimonies have given detailed descriptions of the suffering endured by North Africans for decades. In some countries, the existence of such practices has been acknowledged, and measures to put an end to them have been promised. It is therefore not necessary to enumerate or describe the practices themselves. It is more important to focus on what needs to be done to ensure that all citizens enjoy all aspects of human security – those pertaining to their physical well-being as well as those to their mental, psychological or emotional state.

In this regard prospects for human security in the Maghreb do not appear bright in the estimate of this writer. Reforms announced or introduced in various countries are mostly formalities with little practical impact on people's security. Thus, greater democracy in the form of more transparency in public affairs, greater accountability of political leaders, and formation of opposition parties is either nonexistent or remains purely theoretical. In most countries there are no political parties at all, or there is only one party, or there are several parties which in fact are created and tightly controlled by the ruling regimes. Regimes that are supposed to be republican have had leaders who have been in power for decades and are planning to rule for life, just like kings; some of them are even preparing their sons to succeed them.

In North Africa opposition movements, when they have not been co-opted, have been eliminated by the regimes. Their militants have been victims of various abuses, tried on a variety of fabricated charges, sentenced to long jail terms, and sometimes lost their lives. However, since the number of political activists is usually small, and given the fact that the majority of citizens do not appear to suffer from dire material problems, one might be tempted to dismiss human rights violations as a minor threat to human security

at large. However, such an attitude would be at odds not only with ethical principles (one human being at risk is one too many) but also with the harsh realities that ordinary people have to endure and that outsiders ignore or pretend to ignore.

Political leaders in the Maghreb take credit for advances made towards achieving freedom from want and at the same time, they profess concern that the process may be halted or even reversed should power fall into other, 'irresponsible' hands. However, they need to come to terms with the fact that public opinion no longer accepts such views. There may have been a time when people were willing to accept political leadership in exchange of the provision of public goods, but today they want to choose policies that will affect their lives and participate in the implementation of those policies and the evaluation of their outcomes. In other words, citizens want full and effective participation in the political process, including the right to choose individuals and parties that will manage public affairs: This is what is commonly called democracy.

However, democracy is not likely to take roots and thrive in the Maghreb in the near future, and that is why prospects for human security will remain bleak. Some may find this appraisal surprising or unfounded. Of course, if one takes the view that human security is limited to physical well-being, then one would have to recognize that North Africans are more fortunate than many people around the globe. But such a restrictive definition of human security is unnecessary and unacceptable. People face threats that are real even if they are not always visible to the naked eye. They fear their leaders and their institutions, injustice and arbitrariness, the present and the future. They make proclamations in which they do not believe, they comply with 'suggestions' to express 'spontaneously' their ardent support and eternal gratitude for their wise and beloved leaders, and they do so because they know that even silence and lack of involvement may be interpreted as opposition.

Achievements have been made in the Maghreb towards freedom from want; that much can be acknowledged but the task is far from being completed. It is time to recognize that authoritarianism is not required to sustain welfare – it may even undermine it but, more importantly, it is a major barrier to human security. At present, the main threats to human security in the Maghreb do not emanate from terrorists, unpatriotic power mongers, or selfish opportunistic manipulators but rather from power holders who are unwilling to let people take their lives into their own hands,

make their own mistakes and assume their responsibilities for doing so, and design their future as they see fit. There are no signs that North African leaders are going to change their way of thinking or that people are going to accept indefinitely their serfdom. The confrontation is therefore inevitable and its impact on human security is predictable; only the timing of the pre-announced catastrophe and the extent of the damage it will have on human security are debatable.

There is, however, one possibility for changing the course of events, albeit a remote one. If current leaders are not likely to willingly initiate a peaceful transition to democracy or to yield to public demands for political reforms, they *may* be more responsive to outside pressure. It should be kept in mind that all regimes in the region have been able to stay in power largely as a result of the political and material support they have received from the outside. After 9/11 and in the name of the 'war on terror', that support (as well as punishment in the form of isolation) became more intense and more concerted. Influential members of the international community - notably the United States and members of the European Union - decreed that Libya as a 'rogue state' has to be isolated and the remaining states of the Maghreb need international support as bulwarks against terrorism. But in 2007 even Libya, after making proper amends, was relieved from membership in the 'axis of evil' and its leader was welcomed in European capitals.

Of course, Western governments are fully aware of the poor record of North African states in the area of democracy and human rights. In fact, various initiatives have been taken in Washington and Brussels to put the region on the path towards democratization and greater respect of human rights. However, these efforts have not had any effect. This failure is due to many factors but the main one is the fact that neither the US nor the EU have the will or the desire to revise the foundation of their policy towards the Maghreb or the Middle East or the Muslim world in general. That policy continues to be based on the postulate that the international community, or at least its civilized members, are threatened by Islamic Fundamentalism personified by al-Qaeda, and that all states should and must put the elimination of that threat in the forefront of their priorities. The nefarious effects of that approach have been visible for quite some time, most recently in another part of Africa: Kenya. Following the outbreak of violence in that country following the presidential elections held in December 2007 an observer wrote in the *Financial Times*: "Seldom has an African tragedy been signaled so far in

advance. And seldom have western policymakers been so complicit in a crisis that is turning into Kenya's catastrophe. For the past three years the international donor community, led by the World Bank and supported by the International Monetary Fund, have ignored the warning signs and knowingly backed one of Africa's most corrupt regimes." (Holman 2008) To explain why Western donors and governments have failed to take appropriate action, the author writes: "The truth is, they never had the stomach for a fight. They did not believe it was ultimately in their interests to have a showdown with the barons of corruption. They did not want to upset what they saw as a regional "island of stability" [...] Weighing in the balance are the longstanding military agreements Kenya has signed with the US and the UK, which have assumed particular importance since President George W. Bush launched his war on terrorism." And the author concludes: "Not for the first time, an African country is paying a terrible price for the tolerance of its corrupt government by its [W]estern partners." (Holman 2008)

The West is following the same policy in North Africa as in Kenya and it is highly probable that it will have similar consequences. Yet current conditions at the global and regional levels are not likely to encourage a revision of that policy. With oil costing over \$100 per barrel, the war in Iraq continuing with no end in sight, persisting instability in Afghanistan and Pakistan, and continued tension in Iran, Palestine and Lebanon, the West would take no chance of allowing 'unfriendly' regimes to come to power in strategically vital countries, including those in North Africa.

Enlightenment cannot be expected from North African leaders, or perspicacity from Western democracies. Compassion, morality and humanism have become alien concepts. Fanatics have stepped in this vacuum to convince frustrated citizens that the good life that has been denied them at home and in foreign lands will be theirs in Paradise if they fight Satan personified in national tyrannical leaders and their supporters. Alas, policymakers in the North and the South seem to be doing everything they can to give credence to such a message. How long will this continue before all concerned come to their senses?

79 Human Security Concepts, Approaches and Debates in Southeast Asia

Zarina Othman

79.1 Introduction

The end of the bipolar world in 1989 triggered an in-depth re-evaluation of the concepts of peace and security (Brauch 2008, 2008a, 2008b, 2008c). The realist school defined peace as the absence of war and security as the absence of threats. Alternatively, the neo-liberal institutionalism, focuses on the important role played by international institutions and economic interdependence that can promote cooperation and security (Wæver 2008). Nevertheless, security for the developing states differs somewhat from the Western concept. Most owe their 'insecurity' first to their struggle for independence and later for economic independence (Thomas 1987: 10). As observed by Alagappa (1986: 2), a deteriorating economy can easily lead to domestic conflicts and this can threaten either the state as a whole or the regime in power, or both. Economy and regime security or the survival of the ruling regime are therefore crucial elements in promoting national security for the developing states (Collins 2003: 5; Ayooob 1995, Ayooob/Samudavanija 1986). Additionally their concern for security is focused primarily on the stability of their politics, a well developed economy and a harmonious society (Hernandez 1990, 100-101). The region is also concerned about China's growing economic power and Japan may pose a military threat again but closer economic ties and steps towards establishing the East Asian Community may support the neoliberal institutionalism with regard to the prospect of peace and security in the region (Lee/Tham/Yu 2006).¹

The 'human security' concept has attracted much debate among scholars since the *Human Development Report 1994* defined it as 'freedom from fear' and 'freedom from want', and included seven elements, namely: economic, food, health, environmental, personal, community and political (UNDP 1994). The UN's concept of human security suggests a concern with quality of life, including economic growth and access to resources, rather than a focus on weapons and defence against outside forces. Human security thus means putting the people first, before the state.

Canada has been a leading promoter of human security. The Canadian government defined human security as having an acceptable quality of life and a good guarantee of fundamental human rights (Axworthy 1997; Dedring 2008). Thus, humanitarian intervention due to violent conflicts can be legitimized to protect human rights and the quality of life, in addition to mere survival (ICISS 2001). Canada co-established the *Human Security Network* (HSN), an informal group of like-minded countries who pursue a 'people-centred' approach to security (see chap. 75 by Fuentes/Brauch).²

Japan, a friend of the HSN, defined human security within the context of globalization:

[I]n addition to providing national protection, focusing on each and every person, eliminating threats to people through cooperation by various countries, international organizations, non-governmental organizations and civil society, and striving to strengthen the capacity of people

1 This collection of papers was originally presented in an international conference held at Universiti Kebangsaan Malaysia, jointly organized by the *Institute of Malaysia and International Studies* (IKMAS, UKM) and the Centre for East Asian and Pacific Studies, University of Illinois, Urbana Champagne, on 19-20 May 2005.

2 The HSN wants to strengthen human security by creating a more humane world where people can live in security and dignity, free from want and fear, with equal opportunities to develop their full potential. As the only HSN-member in ASEAN Thailand organized the 8th HSN Ministerial in June 2006 in Bangkok (see at: <http://www.humansecurity.gc.ca/hsi_hsn-en.asp> and chap. 75 by Fuentes/Brauch.

and society so as to enable people to lead self-sufficient lives.³

The problems of people, especially those that are affected by globalization, displaced people and refugees have been the focus of Japan's human security approach (see chap. 84 by Shinoda). The awareness of the need for human security has been increasing,

partly due to the prosecution of war crimes, an increase in general violence among people around the world, and human suffering caused by landmines, small arms and the proliferation of child soldiers.

In Southeast Asia, a region that was severely hit by the tsunami of 26 December 2004, the human security concern has been perceived very slowly, at least to be included in the respective national policies. But closer examination reveals that the human security concept has been used since the late 1990's, especially

after the regional economic crisis of 1997–1998 (figure 80.1).

This chapter reviews the dynamics, patterns, approaches and debates on the various human security concepts and analyzes how members of the *Association of Southeast Asian Nations* (ASEAN)⁴ have responded to this approach. The central theme is that its members believe that human security is associated more with economic development as a precondition for political stability; while human rights issues have been considered as domestic problems that are best left to the individual states to deal with, and thus should not be discussed at the regional level.

This chapter discusses first the Southeast Asian concept of ‘comprehensive security’ (80.3), a tra-

ditional approach that has been adopted by ASEAN states for designing their respective national security policies; then it explores the human security approach (80.4), how it has evolved and some specific issues and policies; and finally it suggests what needs to be done to promote and strengthen this concept in Southeast Asia (80.5).

79.2 Competing Security Approaches in Southeast Asia

Southeast Asia lies in the middle of the major sea lanes between the Middle East and East Asia, and thus serves as a connecting channel for both transportation and communication. Southeast Asia is a diverse region (table 79.1) with different levels of development. ASEAN is grouped into four tiers according to their GDP per capita (table 79.2).

At the top tier are Singapore and Brunei; at the second tier are Malaysia and Thailand; at the third

4 ASEAN was established in 1967 by Indonesia, Malaysia, the Philippines, Singapore and Thailand. In 2007, all states except Timor Leste have become members of ASEAN (ASEAN 10). Below Southeast Asia and ASEAN are used interchangeably.

Table 79.2: Demographic and Socio-Economic Information of ASEAN States. **Source:** CIA (2007); at: <<https://www.cia.gov/library/publications/the-world-factbook/>> (15 May 2007); and at: <<http://www.aseansec.org>> (25 February 2008). **Source:** Compiled by the author.

State	Types of Government	Major Ethnic Groups/ Religion	GDP per Capita (US\$) Estimation	Land Area/ Population (Million/M)/ Estimation 2008
Brunei Darussalam	Absolute Monarchy	Malay/ Islam	\$25,600 (2005)	5,765 sq km/0.4 M
Kingdom of Cambodia	Monarchical/ Quasi-democracy	Khmer/ Buddhism	\$2,600 (2006)	181,000 sq km/14 M
Republic of Indonesia	Quasi-democracy	Malay/ Islam	\$3,800 (2006)	1,890,000 sq km/220 M
Lao People's Democratic Republic	Communist	Lao/ Buddhism	\$2,100 (2006)	236,800 sq km/ 6 M
Malaysia	Monarchical/ Quasi-democracy	Malay/ Islam	\$12,700 (2006)	330,257 sq km/ 26 M
Union of Myanmar	Military	Burman/ Buddhism	\$1,800 (2006)	676,577 sq km/ 56 M
Republic of the Philippines	Democratic	Filipino/ Christians	\$5,000 (2006)	76,964 sq km/ 86 M
Republic of Singapore	Quasi-democracy	Chinese/ Buddhism	\$30,900 (2006)	697.1 sq km/ 4 M
Kingdom of Thailand	Monarchical/ Quasi-democracy	Thai/ Buddhism	\$9,100 (2006)	513,254 sq km/ 65 M
Socialist Republic of Vietnam	Communist	Viet/ Buddhism	\$3,100 (2006)	330,360 sq km/ 84 M

tier are the Philippines and Indonesia; and at the fourth tier are Vietnam, Cambodia, Laos and Myanmar. Except Laos, all states are maritime nations, and are located in a volcano belt. Thus, it is vulnerable to earthquakes, volcano eruptions, and tsunamis, as well as other natural disasters.

79.3 Comprehensive Security Concept of ASEAN Members

ASEAN states have been especially concerned about their sovereignty and subscribed to the *Zone of Peace, Freedom and Neutrality* (ZOPFAN)⁵ since the early 1970's (Anthony 2005, Anwar 2001, Severino 1997). They have defined their security in a conventional

way, but most of their security threats have originated from within, from domestic issues - e.g. poverty, lack of economic opportunity for individuals - and from the related encounters with certain groups most affected by those issues, combined with outside forces that have insidiously infiltrated the general population (Al-Mashat 1985; Thomas 1987; Ayooob 1995).

Other security issues in the region have resulted from unresolved border disputes, (such as between Malaysia and the Philippines over Sabah (in Malaysia's North Borneo); Indonesia and Vietnam over the continental shelf near Natuna Island) and from long-standing political disputes, both with neighbouring countries and with certain groups within a state (including Muslim Moros in southern Philippines; Karen separatists in Myanmar, Muslims Patani in Southern Thailand), among others (Hashim/Dinisari 2006; Nik Mahmud 1994; Santos Jr. 2001; Snitwongse/Thompson 2005; Coronel 2005; Lim/Vani 1984).

These issues have attracted most of the attention of those leaders who are most attached to the conventional, or traditional, state-focused security approach

5 ZOPFAN is a doctrine that was adopted by ASEAN in 1971 declaring that the region should take care of their own survival without interference from external forces, particularly the major powers of the Cold War, the United States of America and the Soviet Unions (Anthony 2005, 63-64; Anwar 2001).

What makes Southeast Asia different from other developing regions is that it adopted a 'comprehensive concept' of security, a broader approach to national security, at least since the mid-1980's. This liberal approach to security has also been adopted by others in the more developed countries, such as 'common security' in Europe and 'cooperative security' in Canada (Dewitt 1994).⁶ The comprehensive security concept that ASEAN has adopted was originally brought forth by Japan in the 1970's. Japan's comprehensive security went further than the traditional Western realists' view of security, and yet it did not discount the importance of defence or territorial security (Radtke 2000: 2; 2008; chap. 84 by Shinoda).

Japan's comprehensive security is concerned with non-military issues, but mostly issues that are seen as not originating from within the country. As in Japan, the ASEAN idea of comprehensive security is broader than the more traditional concept, including 'high' as well as 'low' political issues. It goes beyond the traditional military threats, or the internal violence and disorder that arise from ethnic conflicts. It includes other issues such as maritime piracy, famine, environmental pollution, illegal immigration, illicit drug and weapons trafficking, and trafficking in human beings – all of which are threats to the stability of the region. Thus, the ASEAN concept of comprehensive security has included domestic non-military issues as well as external threats to their survival. At the same time, comprehensive security does not neglect the importance of military security (da Chuncha 2000; Ellings/Simon 1996; Ball 1996; Tillman 1987).⁷

Consistent with the notion of comprehensive security, Southeast Asian leaders have begun to understand that 'security begins at home', that 'we have to be strong on the inside in order to be stronger on the outside'. Based on the geographic size and their GDP per capita (table 79.2), Singapore, a tiny but rich state,

adopted the concept of 'total defence'. Indonesia, a huge yet poor state, has a concept it called 'national resilience', while Malaysia, a mid-sized state, has stressed the importance of domestic issues. All three have focused on internal and external as well as military and non military aspects of security in their comprehensive security approach. To ASEAN, domestic matters are considered important as related to national security goals, which generally include political stability, economic well-being and social harmony (Alagappa 1989).

Although comprehensive security has been understood within the context of regional security, it does not include a perception of common external threats. This is partly due to the fact that the focus under a comprehensive security approach continues to be mainly on traditional security. In other words, comprehensive security is just another version – albeit an expanded one – of the typical ASEAN style of state-centric security, where the referent object is the state. In reviewing the literature on comprehensive security, several distinct categories may be distinguished:

1. studies that focus on domestic factors where political stability, economic development and social harmony are considered as important ingredients of security (Alagappa 1989; Euraksul 1998);
2. studies that have viewed the phenomenon of growing interdependence in the region, which includes the possibility of cooperative efforts to resolve conflicts (Herrmann 1998; DuPont 1997; Baviera 1996; Feddema 2000), and
3. studies that have looked at the overall well-being of individuals within a state (including human rights) as being important for the state's comprehensive security (Hassan 1996; Yamamoto 1996).

Nevertheless, ASEAN's primary principles regarding regional security are embodied in its consensus, 'ASEAN Way', and its 'non-interference policy'. Human rights abuse in Myanmar – including the long-term detention of Burmese non-violent pro-democracy activist Aung San Suu Kyi – and the unresolved conflict with Southern Thailand, continue to be considered as under the exclusive jurisdiction of the state. Although these policies and principles have received a fair amount of criticism, nevertheless they have served successfully as a platform of principles from which to manage conflict (Othman 2006a; Sukma 2005; Askandar/Bercovitch/Oishi 2002).

ASEAN has also relied on norm-building, confidence and developing cooperative relationships, as ways to prevent conflict. This is exemplified in the

6 The 'cooperative security' concept developed in Canada is broader and more flexible than either Japan's 'comprehensive security' or Europe's 'common security'. It recognizes the value of existing bilateral and balance of power arrangements in contributing to regional security. The key focus of cooperative security is the habit of having dialogue and moving toward inclusive participation in addressing any given conflict.

7 The external threats in the region include the overlapping claims of the Spratly and Paracel archipelagoes in the South China Sea, nuclear issues in North Korea, the impact of economic growth issues (e.g., illegal immigration), and conflicting interests between India and China.

multilateral security meetings held by the *ASEAN Regional Forum* (ARF).⁸ Track II networks of non-officials, including academics, also play a major role in cultivating the regional security discourse.⁹ Two of these are based, respectively, with the ASEAN Institute of Strategic and International Studies (ISIS)¹⁰, and the Council for Security Cooperation in the Asia-Pacific (CSCAP).¹¹ The civil discourse in re-assessing the concept of security has been sponsored privately by various other groups. As observed by Mely C. Anthony (2004: 166), in 1994, a conference on “Peace, Disarmament and Symbiosis in the Asia Pacific”, explored the issues surrounding peace, security and human well-being, and acted as a catalyst for other similar conferences whose participants include academics and NGOs. In spite of such efforts, the concept of comprehensive security remains underdeveloped in many ways. The primacy of the state and its territory still dominates, even though states have seen security issues differently than those who have the Machiavellian perspective.

79.4 Human Security Debate in Southeast Asia and in ASEAN

The rationale behind the human security approach began with the change of the primary referent object of security from the state, to the human beings who live there. Fully discussing human security issues in Southeast Asia is currently quite difficult because resources for study and research are limited, and access to what is available is not allowed to everyone (Wun Gao 2004; Tan 2003; Pham 2001). In addition, states in this region have been generally slow to place human security on their general security agenda. Yet, the rise in recent years of many serious non-military issues – such as the Asian financial crisis, the Indonesian for-

est fires, the Bali terrorist bombing, the outbreaks of the *severe acute respiratory syndrome* (SARS) and the bird flu, tsunamis (chap. 88 by Wun Gao; Villagran 2009), earthquakes, floods, destruction of the rainforests, and global warming – have called attention in the region to the inadequacy of the combination of traditional and comprehensive security.

At least two major events have sparked interest in the human security approach in the region. The first was the Asian financial crisis of 1997–1998, and the second was the 2004 tsunami. The Asian financial crisis has served as a major turning point which brought human security to the attention of a wider group of Asian scholars.¹² More importantly, the globalization aspects of the phenomenon did not only demonstrate the nexus between the economy, low politics, and security, but also challenged state-centric security. The crisis began in one country, it quickly spread, and the impact was felt regionally. In every country the impact on individual people and families was strong and caused tension between and among different sectors in the society (Sucharithanarunge 2000: 59). The impact has included a rising unemployment rate, declining productivity and consumption, a widening gap between rich and poor, rising inflation, etc. – all of which in one way or another has worked against the well-being of the people and caused severe human insecurity. As people were desperately struggling for the means of survival, population movement across national boundaries increased. In some countries, ethnic tensions have also increased, as documented in the case of Indonesia's Ambon and Lombok, ‘*Reformasi*’, which means pressure for political change. Street demonstrations are seen increasingly in Malaysia and Indonesia, threatening the stability of the regimes in power and therefore the national security of the states themselves (Kim 1999; Sucharithanarunge 2000; Yasmeen 2003; Gochoco-Bautista 2003). In 1998 the fall of Indonesia's President the late Suharto was partly due to this economic crisis (Bhakti 2000, in Tow/Thakur/Taek-Hyun 2000).

Thailand, the first and only country in Southeast Asia that has officially adopted the approach of human security, has called for a common approach in the region to address the issues of human security in a balanced and comprehensive way (Capie/Evans 2002: 144). Thailand has defined human security in a

8 The current participants in the ARF are: Australia, Brunei Darussalam, Cambodia, Canada, China, European Union, India, Indonesia, Japan, Democratic Peoples' Republic of Korea, Republic of Korea, Laos, Malaysia, Myanmar, Mongolia, New Zealand, Pakistan, Papua New Guinea, the Philippines, the Russian Federation, Singapore, Thailand, Timor Leste, the United States, and Vietnam (Anthony 2004: 162).

9 Track I refers to government officials; Track II refers to non-officials and includes academics; while Track III refers to NGO activists.

10 For ISIS, see at: <http://www.isis.org.my/htm/affils/affils_asean-isis.htm>.

11 For CSCAP see at: <<http://www.cscap.org/about.htm>>.

12 The crisis, which began in Thailand, started as a monetary crisis and later was referred to as an economic crisis. Major affected countries in the region included Indonesia, Malaysia, the Philippines and Thailand.

way that is similar to the United Nations' original definition - promoting 'freedom from want' and 'freedom from fear'. According to this policy, prior to the military coup of September 2006, the government of Thailand was committed to eradicating poverty and to improving the quality of life for its people. This resulted in the establishment of a Ministry of Social Development and Human Security in 2002 (chap. 88 by Wun Gaeo).

In addition, the Thai's government has acknowledged that HIV/AIDS is a serious threat not only in Thailand but also in the Greater Mekong sub-region of Vietnam, Laos, Cambodia, Myanmar, Yunnan (Southern China) and Thailand, where prostitution continues to rise (chap. 43 by Affeltranger).¹³ Thailand's efforts extended to the regional level when it proposed the concept of human security to ASEAN, arguing that poverty, illiteracy, and economic dislocation can all lead to violence, rebellion, instability, and general insecurity, which threatens the region as a whole. It suggested that ASEAN should adopt a more people-centred approach to development. ASEAN responded positively in 1998 at the ASEAN *Post-Ministerial Conference* (PMC) in Manila, where it created an ASEAN-PMC Caucus on Human Security. Later another ASEAN-PMC Caucus was established, on Social Safety Nets, programmes targeting the vulnerable people to overcome short term poverty, due to sudden economic downfalls, such as the Asian economic crisis. The concept of human security was later established within the *Asia-Pacific Economic Cooperation* (APEC) meeting in 2003 in Bangkok.

During the Asian financial crisis, in Indonesia programmes included distributing inexpensive rice and scholarships for students from the poorest families. Malaysia has provided expanded training for the unemployed, and in the Philippines a computerized job assistance network was launched. Thailand has been very active in introducing social transfers for the elderly, and by giving cash transfers to needy families and to community-based programmes. Health and education programmes are being provided for the poor, along with a voluntary health insurance card, instalment plans for paying school fees, fee waivers, and free uniforms for students. There is an employee welfare fund for workers of bankrupt firms; extended training for the unemployed; and self-employment loans (Anthony cited in Dickens 2002: 25-26; Daud/Othman 2005: 197-199). Efforts such as these show

how a state demonstrates an ongoing concern with internal insecurity as well as care for the welfare of its people. This shows at least the acknowledgement of the human security concept by the governments in Southeast Asia.

Similarly, it seems that the 2004 tsunami has strengthened and expanded the important roles played by a transnational civil society and NGOs, and the armed forces have had shifting roles as they provided emergency assistance and relief work (Huxley 2005; Adiningsih 2005; Khalikov 2005; Ananta/Onn 2007).¹⁴ However, in between these two major events, the US 'global war on terror', sparked by the attacks of 11 September 2001, has slowed the adoption of a human security approach, because when Southeast Asia was identified as a major areas where terrorism flourishes there was a return to focusing more on traditional security measures.

Elsewhere the human security literature was categorized into three groups: 1) individuals as the object of security; 2) the world system theory, including globalization as a threat to human security; and 3) threats to human security that originate from within the state itself (Othman 2002: 62). Studies and reports in the first category deal with the protection of the most vulnerable groups, including women and children (Suhrke 1999; Kim/Hyun 2000). Analyses in the second category show how globalization - driven by an expansion of capitalism, as well as technological developments - affects human security through inequalities of power and distribution of resources, both within states, between states, and between private corporations. They point to the fact that human security cannot be gained by one group at the expense of another (Thomas 1999, 2000; Kim 1999). Finally, the third category deals with threats that come from within states, such as persons who are internally displaced due to discrimination (Axworthy 1997).

Asian scholars have argued that within the region human security debates are by definition a criticism of the Southeast Asian concept of comprehensive security. Comparing the two, comprehensive security and human security, Anthony (2002) pointed out that the former is more concerned with 'what' [the referent object of security is], while the latter has focused more on the 'who' of security. Issues that are being confronted by ASEAN members illustrate that there still is no single regional approach to human security.

13 See: Ministry of Foreign Affairs, Kingdom of Thailand, at: <<http://www.mfa.go.th>> (12 November 2004).

14 In the case of tsunamis, India, Pakistan, Malaysia and Singapore were among the countries that provided military forces to help with relief.

Table 79.3: Characteristics of Comprehensive Security and Human Security. **Source:** Compiled by the author.

Components	Comprehensive Security	Human Security
Unit of analysis	State	People
Source of threat examined	External and internal	External and internal
Type of threat examined	Military and non-military	Military and non-military
Element of threat examined	State and non-state	State and non-state
Theoretical and empirical emphasis	Human needs	Human rights

Rather, based on the *ASEAN Vision 2020*, its human security has focused mostly on the larger society rather than on the individual people within the society.¹⁵

It is being noted that ASEAN's idea of 'security begins at home' has led its members to begin looking at ways economic development can strengthen their countries' internal security. Although ASEAN countries have not focused on development for the people, the approach is to empower states to be able to provide more freedom for individuals to develop themselves and to take advantage of economic opportunities. Also, in assessing the debates, scholars like Amitav Acharya¹⁶ have argued that the two concepts of comprehensive security and human security can be easily differentiated. First, comprehensive security focuses on human needs, while human security focuses on human rights. Second, comprehensive security focuses on 'which threats to security?' while human security focuses on 'whose security?' Third, comprehensive security focuses on stability and order, while human security focuses on justice and emancipation. It is clear that human rights are the main missing element in comprehensive security. In human security, protecting the dignity and safety of the people is seen as an end in itself, while in comprehensive security protecting the people serves as a means for achieving national security and other goals.¹⁷

In general, ASEAN states were uncomfortable with, and slow to embrace, this concept of human security, perhaps mainly because of the emphasis on the human rights factor. This is because human rights have often been regarded as alien and as a challenge to the supremacy of the state, which usually has been considered as synonymous with the ruling regime (Anwar 2003). Anwar sees human rights and human security as the two sides of the same coin, implying that human security can only be assured if human rights are guaranteed. She has divided human rights into four categories: civil, political, social and economic rights. Although most states are trying to meet the basic needs of their citizens, and indeed pursuing economic development is one of the important components of human security, yet placing a priority on human rights is missing (table 79.2).

However, among the weaker ASEAN members such as Cambodia, Laos, Myanmar and Vietnam, conflicts over resources have also become human security issues (Malhotra 1999). For the Indochina states, democratization was seen as an alternative to the human security approach (Lizee 2002). Similarly, transnational issues such as trafficking in women and children are becoming a common concern in the region (chap. 91 by ThanhDam Truong). Yet, landmines issues, have been minimally studied from human security perspectives. Currently, most sovereign states of Southeast Asia have served at once as a source of trafficked people, as an area through which trafficked persons are transported, and as a destination for those who are trafficked. Trafficking (as opposed to smuggling) involves the ongoing exploitation of illegally transported persons, as they are manipulated or forced into becoming victims of organized crime syndicates and other criminal elements (Othman 2004, 2006b).¹⁸ There is a growing concern for children, defined legally as those under 18, who are trafficked and

15 The perspectives on security include all the fundamental needs and vital interests of human beings –society and the state; the political, social, economic, cultural, environmental, personal and physical climate of that state and society (national resilience and national security); the mutuality and interdependence of all dimensions of security; and threats from both the domestic and external environments. See at: <<http://www.aseansec.org/1814.htm>> (20 January 2006).

16 Amitav Acharya, "Human Security in the Asia-Pacific: Puzzle, Panacea, or Peril", at: <<http://www.cpsindia.org/globalhumanssecurity/puzlepanacea.htm>> (18 August 2004).

17 Amitav Acharya suggested that democracy and human rights should be essential components of human security.

forced into work in the sex industry and other exploitive work – prostitution, pornography, forced begging, some domestic work, and others related (see chap. 91 by ThanhDam Truong; chap. 92 by Perpiñan/Villareal/Oswald Spring). As with forcing children to bear arms as soldiers, by their very nature these activities are guaranteed to endanger the security of future generations.

Discussions and debates about human security have been mainly organized by universities (e.g. by Thammasat and Chulalongkorn universities in Bangkok, Thailand), and mostly attended by academicians.¹⁹ Yet, Track II channels such as annual discussions held by the ASEAN-ISIS *Asia Pacific Roundtable* (APR), have also begun to be a platform for discussing the human security approach in the region.²⁰ The 19th well established Asia Pacific Roundtable that was held in late May 2005, Kuala Lumpur, has partly focused

on ‘human security’.²¹ Another cooperation between an academe and INGO, has successfully established an international conference in Malaysia, that was held in June 2006, with the theme, “Advancing Human Security,” sponsored jointly by the International Committee of the Red Cross (ICRC, Malaysia branch) and the Northern University of Malaysia in June 2006.²² In May 2007, another regional conference jointly organized by Universiti Kebangsaan Malaysia and Universitas Padjadjaran, Indonesia on the theme “National and Regional Human Security: Reality and Aspiration” was organized.²³ The conference demonstrated the increasing awareness and interest in the concept, approach, and issues surrounding human security, and humanitarian and human rights issues were openly debated and discussed. At least this was a step forward, that involved a collaboration with the effort of both international NGOs and academic institutions (Goroscope Jamon 2000).

There were also other networks of NGOs that play an important role in the region. The *People’s Forum* for example, has openly discussed people’s disagreements regarding open regionalism and globalization. The *Alternative ASEAN Network* (AltSEAN), has focused on human rights protection (Anthony 2004: 167), and has openly questioned ASEAN’s non-interference policy.²⁴ Others include the *International Network for Political Leaders Promoting Democracy in Myanmar* (Burma) and the *Asian Network for Free Elections*. These networks are being recognized as respectable and acceptable contributors to the development of a civil society by state authorities (Sucharithanarungse 2000: 59). Meanwhile, a *Regional Working Group on Human Rights* (RWGHR) network seeks to establish a regional Human Rights Commission in ASEAN.

18 These findings rely on empirical research by Zarina Othman: “Trafficking in Women and Children: Challenges to the National Security of Malaysia” that was funded by the Faculty of Humanities and Social Sciences, Universiti Kebangsaan Malaysia. The research began in December 2003 and was completed in June 2006.

19 Since the 1990’s several conferences and workshops have been organized by Chulalongkorn University, Bangkok, Thailand. In 2005 two human security conferences were organized by Thammasat University, Thailand, which were partly sponsored by the Japanese Foundation. In October 2007, Chulalongkorn University, organized an international conference on “Mainstreaming Human Security: The Asian Contribution” in Bangkok. This conference was jointly organized by the University of Philippines Third World Studies Center, Waseda University (Japan), Mahidol University (Thailand), the Konrad Adenauer Stiftung (Germany), the Asian Institute of Technology (Thailand), Osaka University of Economics and Law (Japan), the Tata Institute of Social Sciences, (India), Global Collaboration Centre, Osaka University (Japan), M-Power and Ateneo de Manila University. The conference was a follow up to the previous international symposium on human security that was conducted in Thailand, in 2002, titled “Challenges to Human Security in a Borderless World,” organized by the Commission on Human Security and Chulalongkorn University. These two Thai universities, Thammasat and Chulalongkorn, were instrumental in spreading the conceptual human security debate to other universities in ASEAN countries. UNESCO is another active IO that has conducted several workshops focusing on Human Security in the region. In 2007 the workshop was held in March, in Bangkok. See at: <www.unesco.org>.

20 The Asia Pacific Roundtable (APR) has been hosted annually (usually in late May and early June, in Malaysia) as a forum for ASEAN ISIS since 1987.

21 Proceedings of the 19th Asia Pacific Roundtable, 2005: “Confidence Building and Conflict Reduction,” (Kuala Lumpur: ISIS). See at: <http://www.isis.org.my/html/affils/affils_asean-isis.htm>.

22 Proceedings of the “International Conference on Human Security, “Advancing Human Security, jointly organized by: Institute of Tun Dr. Mahathir Mohamad’s Thoughts (IPDM) and International Committee of the Red Cross (ICRC), 13–14 June 2006, Kuala Lumpur, Malaysia. See at: <http://www.ipdm.uum.edu.my/web/human%20security/hsecurity_preface.htm>.

23 See at: <<http://pkukmweb.ukm.my/~skimx/>>.

24 AltSeam acts as an advocacy group. It produces reports on political situations in Myanmar besides leading campaigns for human rights and democracy in the region.

Although the Malaysian government has argued that the UN concept of human security gives more autonomy to the people, and that such autonomy could cause the UN, or some other country, to justify coming into any nation and violating its territorial integrity and sovereignty for the sake of the 'sovereign individual'. This is observed as a common concern throughout Asia, and represents a fundamental difference between Asian and Western values concerning the individual's relation to society (Huntington 1993, 1996). Together with Indonesia and the Philippines, Malaysia had already established their national human rights institutions by the 1990's.²⁵ That at least shows that they recognized human rights as universal values.

Currently, the *ASEAN People's Assembly* (APA) is an example of a transnational civil society (Track III) that works toward a 'human-first' approach to security (Anthony 2004: 179). The APA Action Plan for example, is aimed at bringing attention to urgently needed security changes and providing alternative modalities for ASEAN governments to consider (Anthony 2004: 180). Among those modalities are the development of a human rights record; developing a *Southeast Asia Human Development Report* (HDR); developing democracy indicators that show the degree to which a country, and/or its government, is promoting or eroding democracy; and developing a framework to evaluate the progress of gender mainstreaming. Although most of these efforts seem to have had little impact on any individual country's policies and laws, at least there is a viable venue and growing infrastructure moving towards empowering civil society in the region, and signalling a healthy move toward a more liberal democracy and human security approach in the region.²⁶

Various small research have dealt with human security within a context that focused on transnational issues, such as drug trafficking (Othman 2002), human trafficking (Othman 2004), even though, as stated by Paul Evans (2004: 364), various research

projects on human security are more collaborative in nature. CSCAP has been actively conducted such research on human security, among which are human trafficking and terrorism. Another major research project that has involved the empirical study of human security approaches, focusing on protecting people, is called, "Whose Security Counts? Participatory Research on Armed Violence and Human Insecurity in Southeast Asia" (Suksai/Narag/Daraaceh 2003). The project focuses on the Philippines, Thailand, Indonesia, Myanmar (Burma) and Cambodia, and has looked at the impact of weapons on the security and well-being of civilians.

79.5 Suggestions and Conclusions

Undoubtedly the main challenge to human security in the region remains the perceived threat to national 'sovereignty' and to the regime in power. In Southeast Asia (ASEAN), security has generally meant to protect the state as the most important entity that needs protection. The general understanding has assumed that states' security, which is also understood as regime security, is a pre-requisite for the survival of the people. Yet security of the states does not necessarily guarantee the peoples' survival. Increasing interdependence, has resulted Southeast Asian states to adopt comprehensive concept of security which acknowledge that non-military issues can be a threat to national security. While acknowledging the existence of the non-military threats, the state continues to be the focus of their security concerns, demonstrating a realist view in their security approach.

It was not until the 1997–1998 Asian financial crises, that the region began to recognize that the people who live within a state are perhaps the more important entity needing protection. Empowering the people leads to freedom which in turn can strengthen the state. Thus the peoples' insecurity can be a threat to the regime and to state survival. Although there have been a slow shifting paradigm from state to human security, Southeast Asian's human security approach appears to focus more on development rather than on human rights, more on 'freedom from want' (Japanese concept) than on 'freedom from fear' (Canadian concept). Human rights continue to be seen as an internal matter only, with the state as the final arbiter and grantor of rights.

In addition, global war on terrorism has further slowed the pace of states accepting the human security approach, because it has caused ASEAN members

25 Members of the National Human Rights Commission in Southeast Asia are Indonesia (Komnas Ham), Malaysia (Suhakam), the Philippine Commission on Human Rights and the Thai Commission on Human Rights.

26 Report of the Fourth APA, 2005: *Towards a People-Centered Development in the ASEAN Community*. (Manila, the Philippines: ASEAN-ISIS & Institute for Strategic and Development Studies, 11–13 May), Report of the Third ASEAN APA. 2003: *Towards an ASEAN Community Caring Society* (25–27 September). The sixth APA took place in Manila in October 2007. See at: <<http://www.asean-isis-aseanpeoplesassembly.net/>>.

to fall back on the more traditional security measures to counter the threats. This trend must be resisted, as it is realized that both traditional and human security must be strong. Thus, the question is: what should be redesigned: ASEAN policies, human security, or perhaps both? Since the ASEAN members differ based on GDP per capita, focusing on development of the weaker ASEAN members as part of the human security approach should be encouraged. Development and modernization can help reduce migration of the people to neighbouring countries in search of jobs. For the more developed ASEAN states, human rights should be the focus, not only for the people, including the minorities, but also for the migrant workers who contribute much to both the host and sending countries (Tsai/Tsay 2004: 96).

Likewise, NGOs have played roles in promoting the concept in the region. Transnational civil society in the region, in the form of networks and other organized group efforts for the common good, has been challenging some of the most serious human security issues, and this should be encouraged to continue and expand human security. The scientific community in Southeast Asia made the following suggestions for developing the human security concept further and made the following policy relevant proposals to enhance its policy relevance within ASEAN member countries and as a regional security concept for ASEAN itself. Among the suggestions made, democratization, extreme poverty reduction and human development, inclusion of the quality of life are included, as well as promoting gender equality and good governance, respecting human rights, and enforcing the rule of law. These three tracks (government, networks and NGOs, scholars) have so far succeeded.

80 Human Security in Sub-Saharan Africa

Nana K. Poku and Bjorg Sandkjaer

80.1 Introduction

For almost half a century, Cold War ideology served to eclipse the distinction between the state and the multiplicity of community values, claims and identities of a state citizenry (Poku/Graham 2000). With regard to security, state and society were considered as one, what was in reality a complex relationship. In general, state policies appeared both well defined and comprehensive enough to include everything that mattered to the national interest. Thus, analysts legitimized state policies with regard to citizens by placing the domestic domain beyond the parameters of inquiry; what happens to the state mattered, what happened to the people within was of second order importance (Poku/Graham 1999). With the end of the Cold War, no similar framework of interpretation (or misinterpretation) is available. What emerges, in each case, as insecure is not a well-defined system of international relationships, but categories of people within a state or straddling state boundaries who have limited or no access to the protection of their state and the international community (Nolutshungu 1996).

The aim of this chapter is twofold: to explore security from a human perspective and to illustrate this perspective by drawing on case material from sub-Saharan Africa. This perspective is based on the premise that for many ordinary Africans the chief security concern is often their own government, either through its pervasive power and oppressive policies, or as a result of its incapacity to sustain the infrastructure of life. The resulting social decay presents a dramatic picture of insecurity of ordinary people in circumstances where states – and the international system of states – are either unable to provide protection or are themselves the principal sources of violence. The issue of how to adequately understand and address the security concerns of a people in these circumstances is the central preoccupation of this chapter.

The chapter is divided into six parts: the first and second explore, in some detail, what is meant by hu-

man security, charts its origins and outlines its significance for the study of contemporary African societies (80.2, 80.3). In the process, the two sections provide an analysis of the African state and the complexities it poses for the provision of security on the continent. Building on this, the third and fourth sections survey the extent of Africa's human security challenges by examining the continent's economic performance as well as development prospects (80.4, 80.5). The fifth examines Africa's progress towards the *Millennium Development Goals* (MDGs) and argues that on current evidence the goals might not be achieved by 2015 (80.6). The final section argues why the human security framework is so appropriate for the study of Africa and its societies (80.7).

80.2 Human Security and Africa

The human security framework is intended to connect the issue of security to a wide range of insecurities in the modern world (McGrew/Poku 2007). In the words of the *United Nations Development Programme* (UNDP) who coined the term 'human security', "the concept of security has for too long been interpreted narrowly: as security of territory from external aggression, or as protection of national interest in foreign policy or as global security from threat of nuclear holocaust ... forgotten were the legitimate concerns of ordinary people who sought security in their daily lives" (UNDP 1994: 22–23). The UNDP critique is clear and powerful; recognizing that in the modern world, threats posed to many people are of a wide variety, of lower intensity and less well-defined. Anthony Giddens offers the following insight: "[This is] a single world, having a unitary framework of experience ... yet at the same time one which creates new forms of fragmentation and dispersal" (Giddens 1990: 22). The binary oppositions, therefore, that shape our interpretation of violence, between private (criminal) and public (legitimate) or between external (interna-

tional) and internal (civil), can only be applied with difficulty to the contemporary world.

The UNDP formulation opens up the possibility of conceiving security as an ontological status; and as such can be threatened from a number of directions and by agents and actors who are not necessarily states. In so doing, it is possible to argue that for the majority of the people in the world apparent 'marginal' or 'esoteric' concerns - such as environmental, food, economic and health security - are far more real and immediate threats to their daily survival than interstate wars. Crucially, the human suffering which underlies it, as well as its impact on regional peace and security, must bring into sharper focus the ways in which different categories of people are marginal to the states in which they live and the various forms of insecurity confronting them.

As a result, security may be established through the specification of a number of variables of which the following two are particularly important (at least for our purposes): namely 'freedom from want' and 'freedom from fear'. The former describes a condition of existence in which basic material needs are met, and in which there is a reasonable expectation that protection will be afforded during any crisis or downturn - natural or manmade - so that survival is not threatened. While the latter refers to a condition of existence in which human dignity is realized, embracing not only physical safety but going beyond that to include meaningful participation in the life of the community, control over one's life and so forth.

Nowhere has the expanded notion of security been more applicable than in sub-Saharan Africa. Here, if we remove territorial boundaries from our cognitive map, we are left with the picture of people across the continent attempting to pursue security within the hostile environment of weak states. Across the continent, governments preside over fractured societies with multiplicity of ethnic identities and divergent interests making it particularly difficult to generate a legitimate basis for governance. Meanwhile, ordinary Africans lurch between an alien superstructure (the state) and decaying traditional African past. Their loyalties stretched between predatory elites and disintegration tribal systems as many heads to the melting pots of ever expanding cities. In lamenting this point, Claude Ake concludes that the African elites are responsible for "a pervasive alienation, the delinking of leaders from followers, a weak sense of national identity and the perception of the government as a hostile force" (Ake 1994: 14).

In the African context, therefore, the notion of security only makes sense if conceived in its broadest context. The 'Non-Aggression and Common Defence Pact' of the *African Union* (AU) of 2004 offers this definition:

[In Africa] human security means the security of individuals with respect to the satisfaction of the basic needs of life; it also encompasses the creation of the social, political, economic, military, environmental and cultural conditions necessary for the survival, including the protection of fundamental freedoms, access to education, healthcare, and ensuring that each individual has opportunities and choices to fulfil his/her own potential.¹

The AU definition thus embraces such issues as human rights; the right to participate fully in the process of governance; the right to equal development as well as the right to have access to resources and the basic necessities of life; the right to protection against poverty; the right to conducive education and health conditions; the right to protection against marginalization on the basis of gender; protection against natural disasters, as well as ecological and environmental degradation. The AU framework, thus, embraces the whole gamut of rights, civil and political, economic and social, and cultural. In this process, offering a radical account of politics as freedom from domination/exploitation as well as material sufficiency.

A word of caution must be entered here; notwithstanding the obvious synergy between the UNDP definition and the AU's reformulation, it would be a mistake to overstate their convergence. While both assert the importance of human security, they differ quite markedly on the role of the state in this process. The UNDP definition questions not only the ability of the state to provide security, but equally importantly, its role in propagating insecurity. For the AU, the breath of the UNDP definition proved problematic, not least because it risks mixing up the quite different agendas of international security on the one hand, and social security and civil liberties on the other. Thus while they readily accept the case for focusing on the interplay between the international and domestic security agendas, they cautioned against a reductionist approach which prioritizes the individual security above

1 Draft text as adopted by the first meeting of the African Ministers of Defence and Security on the establishment of the African Standby Force and the Common African Defence and Security Policy, 20-21 January 2004, Addis Ababa, Ethiopia, The text was adopted during the AU summit of that year.

the collective security of the state. For the AU, therefore, embracing the notion of human security involved devising a formulation which encompassed both the traditional, state-centric, notion of the survival of the state and its protection by military means from external aggression, as well as the non-military notion which is informed by the new international environment and the high incidence of intra-state conflict.

It is possible, therefore, to envisage the AU framework as representing a radical attempt to relocate the security discourse, to move it from the abstract terrain of the international relations discourse and to embed it in the socio-political and economic realities of the African continent. In the process, acknowledging that, in Africa state security is often not threatened by conventional threats of armed attacks by other countries, but by more insidious measures many of which arise from the weakness of the African state itself. Hence, without the provision of effective national security, neither citizen nor communities can be personally secure in the broader sense of the term. Without secure and stable countries and a body of practice or law – whereby countries regulate their interaction – individual, community, regional and international security remains allusive.

80.3 Weak States and Vulnerable Societies

Unlike Europe where nation-builders sought to replace the older empires with states comprising some combination of cultural, linguistic, and patriotic unity, African states emerged from the authoritarian structures of their colonial past. Any analysis of security and insecurity in contemporary Africa must, therefore, begin with the abnormality of the African state. With callous disregard for the histories of their subject, colonial leaders grouped a large number of diverse identities, ethnicities and cultures into new states; while at the same time separating nations with rich and unified histories into separate states. The division of the Somali people of the Horn of Africa is a typical example. Previously united by a common culture but lacking a centralized authority, this classically segmented political system was ultimately subjugated and divided among four imperial powers: Britain, France, Italy and an independent Ethiopia. Regardless of whether one is sympathetic to past or current Somali demands to redraw the inherited colonial boundaries of the horn of Africa, or ultimately accepts the

extreme methods of military force, there is no question that the roots of these conflicts are at least partially the result of illogically drawn European colonial boundaries (Poku 1996).

Total order in the Hobbesian sense, therefore, has thus been virtually impossible to achieve in Africa. Indeed, the biggest challenge to post-colonial leaders has been creating the nation state. Various approaches have been tried to meet this challenge. In some states, the dominant traditional nation became the core of the new nation, as other ethnic groups were assimilated into it or marginalized. Wolof in Senegal, American-Liberian in Liberia, Hutu in Rwanda, Shona in Zimbabwe, Baganda in Uganda, and Amhara in Ethiopia were the key elements in defining the new nations as the cultural basis of the new state. In other states, an artificial creation was decreed and all traditional nations were dissolved in it; those who could or would not fit were excluded. The Ivoirité of President Henri Konan Bedie defined a new nation of essentially southern ethnic groups ‘native’ to the land within Ivory Coast’s boundaries and the rest were decreed non-nationals and non-citizens. President Mobutu Sese Seko of Zaire (named Congo before and after his reign) instilled a Zairean identity among the many ethnic groups of the Congo that was so strong that it outlived both him and the change of name of his (and their) country back to Congo again (Weiss/Carayannis 2005).

John Garang, eventually Sudanese vice-president, struggled mightily all his life not only to give dignity and respect to a Southern Sudanese identity but also to create a single overarching identity to a Sudanese nation within a single state. In Tanzania, where none of the 340 ethnic groups is large enough to hold a dominant position, nationalist elites strove to forge a Tanzanian nation. The irony of these efforts is that their major effect was to arouse divisive reactions among the excluded or the dissolved ethnic groups. Despite, therefore, the claims to national unity which post colonial leaders extolled, the state and its leadership were always alien from the social base on which their power rested. It is, therefore, the case that the African state is less a ‘nation state’ than anywhere else, despite or because of efforts to make it so. In many cases, the state claims to rule over a defined territory but in fact rules only a large part of it and the people in that part, while in another part another group contests its right not just to rule the land but also to speak for the nation. Yet few of these rebellious groups are secessionist, and many of those few are protesting neglect rather than asserting separate-

ness; they do not contest the territorial unity of the state but its national unity.

Artificiality and the weakness of legitimacy, then raise the central question of how African states keep going. There are, it seems to us two linked elements which go some way towards providing an answer. The first is the commitment to the state of those who benefit from it, expressed through the institutions of government of which they form party. So long as the state's own hierarchy and the social groups who forms it continue to hold together, it is very difficult for anyone else to challenge it. The collapse of the state, or the mounting of any secessionist movement dedicated to its dismemberment, has invariably been prompted by deep divisions within the governing class or elite: the fragmentation of the Nigerian offer corps under the stress of coups and massacres in 1966; the destruction of the old Ethiopian government, and the bloody struggle for succession, after the 1974 revolution; the dissolution of the Somali Republic into clan rivalries; the shattering effects of despotic military rule in Liberia or Uganda; and the inability at any time to create a unified governing community in such states as Sudan, Chad and Sierra Leone, are all cases in point.

Much of the current analysis of the African state examines its functional capacities; states are said to collapse "because they can no longer perform the functions required of them to pass as states" (Zartman 2005: 5). One of these key functions is the legitimate monopoly of force. Many states in Africa are not able to claim the legitimate monopoly of force in the Weberian sense, both because the ostensible monopoly is contested and because its legitimacy is as well. Hence, there are large areas where security is challenged by both rebellion and internal lawlessness in Senegal, Guinea-Bissau, Liberia, Ivory Coast, Ghana, Nigeria, Chad, Sudan, Ethiopia, Somalia, Kenya, Uganda, Rwanda, Burundi, Congo, Angola, Zimbabwe, South Africa, and perhaps others, - a list that includes all of Africa's largest states. In all these states, though government is accepted, the political institutions through which its powers are exercised are treated with remarkable indifference by large sections of the community. While this passive acceptance might not be problematic in other contexts (one often hears about the disenfranchised or disenfranchised electorate in Western Europe and North Africa), in the African context it serves to deepen insecurities by alienating people from the apparatus of the state.

As a result, state managers have often had to form compromising alliances to augment their hold on the

livers of political power. This includes reaching to militias, such as the *Jeunes Patriotes* in Ivory Coast or the *Kamajors* and *Civil Defence Forces* in Sierra Leone, *Ninjas* in Congo-Brazzaville, *Janjaweed* in Sudan, civil defence forces in Zimbabwe and *AliR* in Congo who serve as 'official rebel armies' to enforce partisan security and impose their own law and disorder.

More officially, states opt to farm out security to private and public mercenaries at great cost to their own functional legitimacy (Reno 1998). Private mercenaries include such companies as *Executive Outcomes*, *Sandline International*, *Military Professional Resources Inc.*, and others. Public mercenaries include the proliferation of UN *Peace-Keeping Operations* (PKOs) operating in Africa - in Ivory Coast, Congo, Central African Republic, Ethiopia and Eritrea, and Sierra Leone, the African Union's PKO in Sudan, and regional PKOs such as the *Military Observer Groups* (ECOMOGs) of the *Economic Community of West African States* (ECOWAS) in Liberia, Sierra Leone, Ivory Coast and Guinea-Bissau.

For these reasons and more, the parallelism between statism and nationalism has had a limited role in contemporary African history. This has given rise to a position where individuals have greater attachments to their localities (or local communities) than to the overarching state. Hence, though the notion of the state is accepted, the political institutions through which its powers are exercised are treated with remarkable indifference. Indeed, the "vast majority of Africans now regard their governments as irrelevant or as purveyors of indifference and cruelty" (Cheru 1989: 2). When we take these circumstances in sum, it is little wonder that Africa has led the contemporary world in so-called "collapsed states" (Zartman 1997).

80.4 Economic Decline, Poverty and Insecurity

Whatever the causes of Africa's political crisis, the implications on the continent's economic development have been nothing short of catastrophic. Africa now stands as the most marginalized region in the global economy. The promised advantages of economic restructuring, as hailed by the dominant institutions of global economic governance - the IMF and the World Bank - have not been borne out (McGrew/Poku 2007). Take, for example, the nature of *Foreign Direct Investments* (FDI). For most of the past two decades FDI inflows to Africa have increased only mod-

estly, from an annual average of almost US \$1.9 billion in 1983–1987 to US \$3.1 billion in 1988–1992, and from US \$6.0 billion in 1993–1998 (UNCTAD 1999: 12).

While inflows to developing countries as a group almost quadrupled from less than US \$20 billion in 1981–1985 to an average of US \$75 billion in the years 1991–1996, inflows to Africa averaged around US \$4 billion a year. As a result, Africa's share in total inflows to development countries dropped from more than 11 per cent in 1976–1980 to 9 per cent in 1981–1985, 5 per cent in 1995 and to 3.5 per cent in 1998 (UNCTAD 2000). Its share of total output for the so called 'Triad' (European Union, United States and Japan) was even lower during the later parts of the 1990's as other regions became more attractive for investment locations.

The decline in FDI levels to Africa is mirrored by a similar decline in other indices of development. Since the 1980's, the human development index has declined for more than 30 countries (UNDP 1999a: 37). Countries from Africa constitute 95 per cent of this figure. According to UNDP, some 80 per cent of the Low Human Development Countries – countries with high population growth rates, low income, low literacy, and low life expectancy – are in Africa (UNDP 2000: 3). There are only eleven countries in the medium category, including South Africa and Botswana (Algeria, Botswana, Egypt, Gabon, Libya, Mauritius, Morocco, Seychelles, Swaziland and South Africa). Five of them (Mauritius, Seychelles, Botswana, Gabon and Swaziland) have a combined population of 4.6 million. When Libya and Tunisia are added, the figure rises to 17.9 million. All the remaining 42 countries on the continent are in the low human development category. This, however, does not tell the entire story. There are 55 countries in this category, which means African countries account for 79 per cent per cent of the category. Even more telling is that of the 30 countries with the lowest human development indices, 25 (or 83 per cent) are African (UNDP 2000).

The latest economic indicators from the African Development Report 2006 underline the extent of the continent's predicament. The Report's celebrated headline growth of 3.5 per cent in GDP in 2005 compared to 3.2 per cent in 2004 belies the systematic decline observable in real per capital GDP growth from 1.0 per cent to 0.8 per cent in the same period. In developmental terms, this means that the combined economies of Africa actually shrunk by 0.2 per cent in the 12 months up to the end of 2005. To put this in context, all other regions in the world are already out-

performing Africa, and efforts to redress this poor performance over the past two decades have not been successful. In 2005, for example, the average *Gross National Product* (GNP) per capita in the *Organisation for Economic Co-operation and Development* (OECD) countries was US \$29,000, compared with US \$576 in Africa (Bouda 2007). This means that the industrialized countries are roughly 51 times wealthier than African states. Assuming that the OECD countries could stop stretching this development gap further, and hoping that African economies could grow at an annual rate of 5.5 per cent over the coming years, it would still take the continent some 135 years to reach today's level of wealth enjoyed by OECD countries.

Raising the level of domestic savings remains fundamental to Africa's long-term prospects. In the short to medium term the *New Economic Partnership for Africa's* (NEPAD) external capital expectations are tied more to official inflows in the form of *Overseas Development Assistance* (ODA) and debt relief than to private capital inflows despite the continent offering the highest rates of return. This recognizes the historical fact that nowhere has foreign capital led economic transformation in a country and the prospects for private flows relative to the continent's massive needs. "From worldwide experience, private capital flows of more than 5 per cent of GDP are unlikely to be feasible or sustainable" (World Bank 2000a: 235). The removal of Africa's debt burden is critical to the continent's investment prospects – through releasing monies currently spent on debt servicing for urgent public investment and improving the image of the continent as an investment destination. Western creditor countries and institutions such as the World Bank have hitherto resisted calls for radical debt cancellation. The ruling debt relief mechanism HIPC is widely regarded as inadequate and criticized for tying debt relief to IMF World Bank supervised reforms. This policy is one dimension of the new directions in the tying of aid to policy choices of the donor countries.

The Africa Action Plan adopted at the 2002 G-8 meeting, with its highly conditional pledge to support NEPAD has been hailed as signalling a new willingness to raise ODA to Africa but it in fact confirms the trend.² The bright spots of private inflows illustrate both what is possible and their limits. In 2002 FDI inflows amounted to US \$11 billion, a drop of US \$6 billion compared to the previous year (UNCTAD 2001: 19).³ Outside the extractive sector the bulk of recent private flows have been for the purchase of privatized public assets rather than investment in new en-

terprises and the 2002 slow down is directly tied to trends in privatization.⁴ The few African countries, such as Lesotho, that have recently attracted FDI outside privatization and the extractive sector have mainly done so in labour intensive low value added manufacturing, mainly textiles. There is likely to be an expansion in this phenomenon as countries eligible under the USA's *Africa Growth and Opportunity Act* (AGOA) attract capital seeking to take advantage of the preferential US market access offered under the scheme. The opportunities under AGOA are, however, circumscribed by two factors. The first is the ending of the Agreement on Textile and Clothing with its quota limits on 1 January 2005, which will free all lower cost developing country manufacturers. Closely related to the preceding point is the evidence of the limits of such labour-intensive manufacturing in the form of declining terms of trade for such exports (UNCTAD 2001; Akyuz 2003). Even if exports of labour intensive manufactures from Africa should expand, thereby creating jobs and incomes, the stabilization of commodity markets and prices would be important for the ability of millions of Africans to participate effectively in the global economy.

80.5 Structural Adjustment and Human Insecurity

The physical indicators of economic weakness are just a mere foreshadow of the deep insecurity facing ordi-

-
- 2 At the 2002 Kananaskis summit G-8 leaders declared, "Each of us will decide, in accordance with our respective priorities and procedures, how we will allocate the additional money we have pledged. Assuming strong African policy commitments, and given recent assistance trends, we believe that in aggregate half or more of our new development assistance could be directed to African nations that govern justly, invest in their own people and promote economic freedom."
 - 3 Capital flows into Africa have declined greatly in real terms since the early 1980's. In 2000 the real per capita inflows were less than a third of what they had been two decades earlier. Over the same period SSA share of total capital inflows to developing countries declined from more than 20 per cent to 10 per cent (UNCTAD 2001: 19).
 - 4 Privatizations have played an important role in the integration of Africa's financial markets into the global system. The creation of stock exchanges to facilitate privatization and the fact that the shares of financial institutions have been a significant proportion of trading on most of these new exchanges have been important contributory factors.

nary people on the African continent. With a fifth of the world populations, Africa is home to one in three poor persons in the world and four of every ten of its inhabitants living in what the World Bank classifies as "a condition of absolute poverty" (World Bank 2000a: 346). More worrying still, Africa is the only region in the world where both the absolute number and the proportion of poor people are expected to increase during this millennium (UNDP 2006). Nearly half the population of Africa (300 million people) lives on less than 1 US\$ a day: if current trends continue, by 2015 Africa will account for 50 per cent of the poor of the developing world (up from 25 per cent in 1990).

Table 80.2 and table 80.3 provide a summary of both income and non-income poverty indicators for Africa and an indication of how this poverty picture has changed over the recent past. The data is sourced from the *Chronic Poverty Report* (CPRC 2005) and the World Bank's *World Development Indicators* (WDI). These poverty figures enable international and inter-regional poverty comparisons to be drawn. The most depressing aspects of the figures in both tables 80.2 and 80.3 is the increase of the numbers of people in poverty.

The culpability of some international institutions in Africa's current malaise should not be overlooked. Over the past two decades, the IMF and the World Bank have implemented a *series of adjustment programmes* (SAPs) which, in the official jargon, "aims to alter the domestic policy weakness of African states - by shifting the emphasis from state led development to market driven approaches" (World Bank 1996a, 1996b). Although there are many variations of SAPs, at heart, they all share the same logic: namely, the need to maintain fiscal discipline. In this sense, two broad policy components have come to characterize SAPs: short-medium term macroeconomic stabilization measures to restore internal and external balances, which falls within the province of the IMF; and SAPs proper, which are designed to "unleash market forces so that competition can help improve the allocation of resources...getting price signals right and creating a climate that allows business to respond to those signals in ways that increase the returns to investment" (World Bank 1996a: 33). In the process, SAPs have led to a radical rationalization of recipient governments' expenditure commitments in mainly - but not exclusively - areas concerned with the provisions of welfare (i.e. the health, education and basic sustenance such as food subsidies).

Table 80.1 represents selected figures for the impact of SAPs on agricultural growth in Africa over the last 20 years. It is clear from the table that SAPs have made very little impact on this sector. The more worrying observation is that this trend can be replicated across all the major indicators of economic growth. In almost all their evaluation reports, the World Bank (1990, 1996a, 1996b, 1997b; Jayarajah/Branson/Sen 1996) observed this trend, but attributed its causes not to the poor designs of SAPs, but their implementation. In their words, “no African country has achieved a sound macro-economic policy stance, and there is considerable concern that the reforms undertaken to date are fragile and that they are merely returning the continent to the slow growth path of the 1960’s and early 1970’s” (World Bank 1994: 1–2).

Table 80.1: GDP growth under adjustment - agriculture-growth rate (median) sub Saharan Africa, 1981-1983, 1987-1991 and 1992-1997. **Source:** Compiled by the authors based on ADB and IMF databases.

	1981-1986	1987-91	1992-97
Large improvements	4.2	2.4	2.0
Small improvements	3.1	2.8	2.1
Deterioration	2.3	3.3	2.8
All Countries	3.1	2.8	2.2

In truth, it is not clear whether the lack of effective implementation results from unwillingness to undertake reforms; from the objective conditions of the economies not permitting the kind of adjustment being recommended; or from the policies being inherently non-implementable. Despite two decades of adjustment policies, this debate remains largely unresolved. The only certainty, however, is that SAPs often have an immediate impact on the welfare of the poorest members of society, especially as they affect food prices, costs of education, and payment of medical services. Across the continent SAPs have done little to foster the social, political and economic conditions that could contribute towards improving the human security of ordinary Africans. Take the following examples:

The right to food: There is convincing evidence demonstrating that nutritional levels decrease among poor segments of the population as a result of the removal of food subsidies. Growing unemployment has a similar result. The switching effect of agricultural

policies, primarily from food crop production for local consumption to generation of foreign exchange through the production of coffee, tobacco or cotton, has resulted in a drastic decline in food production, reduced nutritional levels and increased malnutrition (Mukherjee 1994).

The right to education: Article 26 of the Universal Declaration of Human Rights declares that all people have the right to education. The Convention of the rights of the child has also established the right to early development and education. Thanks to extraordinary efforts during the 1960’s and 1970’s, the percentage of children completing at least four years of primary education reached 50 per cent or more in almost all developing countries. But since the 1980’s, increasing debt and consequent implementation of structural adjustment programmes has led many governments to freeze or cut educational spending (Tomasevski 1995). Primary schooling has often suffered disproportionately, and there was significant slippage in sub-Saharan Africa. The percentage of 6–11 year olds enrolled in school dropped from a high of 55 per cent in 1979 to 45 per cent in 1995 (UNESCO 1996).

The right to health: Health is one of the fundamental human rights embodied in Article 25 of the 1948 Universal Declaration of Human Rights. The goal of ‘Health for All by the year 2000’ agreed upon in the Alma Alta Declaration has been severely undermined by cutbacks in government health budgets as social and development objectives have been superseded by financial imperatives (WHO 2001b). The imposition of ‘user fees’ for primary healthcare drove large numbers away from public health services, contributing to increased rates of sexually transmitted diseases. Moreover, cutbacks in the public sector helped send health professionals to the private sector or abroad and reduced investments in healthcare delivery systems (Turshnet 1994).

The promotion of exports for debt repayment and the cutting of public expenditure on welfare in a region where 100 million people are undernourished; where there is 1 doctor for 36,000 people, compared with 1 for 400 people in the developed world; and where the HIV virus is killing people at a rate of 6,000 people per day is a scandal. One author has even referred to SAPs as a form of ‘economic genocide’. According to Chossudovsky (1997: 21).

Structural adjustment is conducive to a form of economic genocide which is carried out through the deliberate manipulation of market forces. When compared to genocide in various periods of colonial history (for example, forced labour and slavery), its im-

pact is devastating. Structural adjustment programmes directly affect the livelihood of more than four billion people.

80.6 The Challenge of the MDGs

The physical indicators of economic weakness are just a mere foreshadow of the deep insecurity facing ordinary people on the continent. With a fifth of the world populations, Africa is home to one in three poor persons in the world and four of every ten of its

inhabitants living in what the World Bank classifies as 'a condition of absolute poverty' (World Bank 2000a). More worrying still, Africa is the only region in the world where both the absolute number and the proportion of poor people are expected to increase during this millennium (United Nations 2005). Nearly half the population of Africa (300 million people) lives on less than 1 US\$ a day: if current trends continue, by 2015 Africa will account for 50 per cent of the poor of the developing world (up from 25 per cent in 1990).

Table 80.4: The Millennium Development Goals (MDGs) and targets. **Source:** Compiled by the authors based on UN Millennium Project (2005c).

Goals	Targets
Goal 1: Eradicate extreme poverty and hunger	Target 1: Halve, between 1990 and 2015, the proportion of people whose income is less than US\$1 a day Target 2: Halve, between 1990 and 2015, the proportion of people who suffer from hunger
Goal 2: Achieve universal primary education	Target 3: Ensure that by 2015 children everywhere, boys and girls alike, will be able to complete a full course of primary schooling
Goal 3: Promote gender equality and empower women	Target 4: Eliminate gender disparity in primary and secondary education, preferably by 2005 and in all levels of education not later than 2015
Goal 4: Reduce child mortality	Target 5: Reduce by two-thirds between 1990 and 2015, the under-five mortality rate
Goal 5: Improve maternal health	Target 6: Reduce by three-quarters between 1990 and 2015, the maternal mortality ratio
Goal 6: Combat HIV/AIDS, malaria, and other diseases	Target 7: Have halted by 2015 and begun to reverse the spread of HIV/AIDS

Table 80.2 and table 80.3 provide a summary of both income and non-income poverty indicators for Africa and an indication of how this poverty picture has changed over the recent past. The data is sourced from the Chronic Poverty Report (CPRC 2005) and the World Bank's *World Development Indicators* (WDI). These poverty figures enable international and inter-regional poverty comparisons to be drawn. The most depressing aspects of the figures in both Tables 81.2 and 81.3 is the increase of the numbers of people in poverty.

The world formally adopted the Millennium Development Goals (MDGs) as a programme of action in 2000, with a target date of achievement by 2015. The baseline for measuring progress was chosen as 1990. More than seven years have already passed and countries are left with less than eight years to reach MDG targets (table 80.2). Between 1990 and 2002 many countries made significant progress towards achieving the MDGs: average global incomes went up by 21 per cent; the number of people living in extreme poverty declined by 130 million; life expectancy rose from 63 years to 65 years; and primary school enrolments and access to safe drinking water and sanitation increased. Progress varied across regions, between countries and within countries. Africa fared worst among the regions. It saw the slowest progress overall and suffered reverses in some crucial areas. Based on the trends of the past 50 years, SSA will not achieve the MDGs.⁵ Take the following key areas:

80.6.1 Eradicating Extreme Poverty and Hunger

For sub-Saharan African countries to achieve the MDGs target of reducing by 50 per cent (table 80.1) the proportion of Africans whose incomes are less than 1 US\$ a day by 2015, will require growth in GDP close to 7 per cent in every country on the continent. This is currently not happening on key indicators, and the prevailing evidence indicates that the situation on the ground is getting worse. Economic growth rates in Africa have increased since the mid-1990's, reaching an average for the continent of 4.6 per cent in 2005. This reflected somewhat better terms of trade (especially for mineral exporters), a turn-round in aid levels (which fell until 2000, and then started rising), debt reduction and the impact of earlier macroeconomic and structural reforms. Among low-income countries, only Uganda and Mozambique have recorded consistent declines in poverty levels. These were also, significantly, the only countries that achieved growth close to 7 per cent for several years, although in Uganda growth has dipped and poverty has risen again slightly since 2003. However, most countries have not yet moved to the consistently higher growth needed to achieve the MDGs.

The remaining countries on the continent have made very little progress in eradicating hunger and malnutrition (see figure 80.1). Indeed, the numbers of

5 See: The MDG data base is available at: <<http://millenniumindicators.un.org/>> (27 February 2006).

Figure 80.1: The increase in proportion of hungry is the greatest in sub-Saharan Africa. **Source:** United Nations (2005: 8).

people suffering malnutrition has increased to well over 200 million in recent decades and the problem is especially severe in Central, East and Southern Africa where almost a half of the population of 360 million is estimated as being undernourished (see figure 80.2). Women and children are especially vulnerable to food insecurity and malnutrition, with the latter being especially important as a cause of under-five mortality (CHGA 2004). Trends were actually reversed during the 1990's in those countries most affected by adverse growth in GDP and by the effects of HIV/AIDS. UNDP concluded that, "during the 1990's, the spread of HIV/AIDS had a devastating effect on families and communities. The loss of productive capacity among families affected by HIV/AIDS had a major impact on food production and on nutritional well-being" (Dzenovska/Rasheed/Sandkjaer 2004: 20).

80.6.2 Achieving Universal Primary Education

Across Africa, the children not in school are the poorest and the most isolated. Although there has been overall progress in terms of total primary enrolment rates, which has increased by 38 per cent between 1990 and 2000 (UNESCO 2003b), these figures mask country and regional variations, and the problems surrounding the relevance of education, completion rates and progression. Only 46 per cent of girls in sub-Saharan Africa complete primary school, and in seven countries have a 20 per cent less chance of starting primary school than boys (Benin, Niger, Burkina Faso, Chad, Ethiopia, Guinea Bissau, and Mali)

Figure 80.2: Undernourished in Africa, estimated and projected, in millions. **Source:** United Nations (2005) and United Nations Millennium Development Goal Indicators Data Base; at: <<http://mdgs.un.org/unsd/mdg/Default.aspx>> (28 February 2006).

(UNESCO 2003b). The situation is likely to be extremely bad in those countries for which there are no reliable data available, such as DRC, Somalia and Liberia.

The target is that by 2015 children everywhere, boys and girls, will be able to complete a full course of primary schooling. However, achieving *universal primary education* (UPE) as promoted through *Education for All* (EFA) goals of universal access and completion is unlikely to be achieved by 2015 by most African countries, especially the poorest with large rural populations. This is especially true if the sole strategy for achieving EFA is based on the linear expansion of existing public school programmes. Clemens (2004)

Figure 80.3: Gender and education in sub-Saharan Africa. **Source:** UNICEF (2006: 117).

* Percentage of persons aged over 15 who can read and write.

** Percentage of persons of primary school age who attend school.

notes that data from 90 countries indicate that increasing enrolment from 50 per cent to 90 per cent takes an average of 58 years and, they assert, reaching 95 per cent enrolment by 2015 will require historically unprecedented growth rates and as we have noted earlier this is not happening. Sub-Saharan Africa has made only marginal progress on closing the gender gap in primary and secondary enrolment since 1990, and the pace of change required is the most dramatic of any region. At the current rate of progress, gender parity in primary education in SSA will not be reached until 2038 - and this does not mean that every African girl will have claimed her right to primary and secondary education by that date - it only means that there will be as many girls enrolled in school as boys by 2038 (World Bank 2004).

While African countries saw some progress in educating children during the 1990's this was not nearly enough to meet the goal set for 2015. In over a third of countries every other child is not in school; while some countries have increased their enrolment rates [such as Uganda and Malawi] other countries actually experienced declines [such as Central African Republic, Lesotho and South Africa] (see figure 80.4).

There continue to be significant urban-rural gaps in enrolment, and in some countries the enrolment ratio in urban areas is some 2 to 3 times higher than for rural populations. Unless the educational targets are substantially achieved in the coming decade then not only will millions of children be deprived of their right to basic education but many of the other targets

Figure 80.4: Children not enrolled in school, sub-Saharan Africa, per cent*. **Source:** UNESCO Data Base on Millennium Development Goal Attainment; at: <http://www.uis.unesco.org/ev.php?URL_ID=5261&URL_DO=DO_TOPIC&URL_SECTION=201> (28 February 2006).

* Note: estimates based on available data on primary school enrolment ratios.

will also be unachievable. A better-educated population is essential for the achievement of democratic states in Africa and for improvement in systems of governance. It is wholly improbable that economic growth and poverty reduction targets can be met without a better-educated and skilled population, and a more educated population is essential for improving labour productivity. Improved access to education for girls is also crucial for achieving progress on maternal and under-5 mortality, and for progress generally in the area of reproductive health.

Figure 80.6: Maternal mortality, SSA countries with rates higher than 1000 in 2000. **Source:** UN Statistics Division MDG indicators data base.

80.6.3 Improving Maternal Health and Reducing Child Mortality

This MDG encompasses two aims: to reduce by two-thirds the under-five mortality rate by 2015, and to reduce by three-quarters the maternal mortality ratio by the same date. At the present time 15 per cent of all children in Africa will not live to see their fifth birthday. Progress in decreasing the infant mortality rate seems to have been reversed during the past two decades, and some countries, such as Zambia, Malawi and Tanzania, have actually seen increases in infant mortality due to HIV/AIDS (see figure 80.5). There also remain significant gaps between urban and rural rates in many countries, and it is clear that the proba-

bility of a child dying is much greater in poorer families than in richer ones (the probability is twice as high for children in the bottom 20 per cent of the income distribution as it is in the top 20 per cent).

African countries currently account for about one third of all maternal deaths worldwide, with about 250,000 women dying during pregnancy and child birth every year. These trends seem if anything to have worsened during the past decade, in part associated with deteriorating health care systems (see figure 80.6). But the primary problem, apart from poor access to health care, continues to be the continued high levels of fertility, and thus persistently high risks of maternal mortality. The comparative rates of maternal mortality between developing country regions

Figure 80.7: Women in Parliament in 2004. **Source:** Population Reference Bureau (2005); United Nations (2005).

strikingly emphasizes the gap between Africa and other regions - in Africa a woman faces a 1 in 13 chance of dying in childbirth compared with 1 in 160 in Latin America and 1 in 280 in East Asia.

80.6.4 Promote Gender Equality and Empowerment of Women

Despite some improvements in addressing gender inequality since the 1995 World Conference on Women in Beijing, much remains to be done in Africa to make gender policy an effective instrument for poverty reduction. MDG3's first target is to eliminate gender disparity in all levels of education. However, the MDGs also link ending poverty to addressing women's unequal access to health services and to productive resources. North Africa has already achieved parity between girls and boys in secondary schools and is on track to achieve parity between the sexes at the primary level. Only six SSA countries are on track to achieve gender parity at the primary level, three of these are also on course to achieve parity at the secondary school level.

In most countries, African women remain vastly under-represented in politics, in the legislature, at the highest levels of the corporate sector and other economic institutions. Between 1990 and 2001, some countries made progress in equal access to paid employment in the non-agricultural sector but without renewed effort, neither sub-region is likely to reach equal employment between men and women by 2015. Despite an increase in the number of women in parliaments, women are still under-represented in political decision-making structures in both North Africa

and south of the Sahara (see figure 80.7). Statistics from all countries in Africa show that more males than females occupy senior government positions. More needs to be done for women to have their say in governance, democracy and decision-making. Research shows that this is a key way to fight poverty.

80.7 Conclusion

Where resources are scarce, as is the case across much of Africa, the object of political contestation is often to secure economic consumption - which in turn is best guaranteed by capturing the state itself. Elite control of the state systems ensures their access to both economic opportunities and the mechanism of the state power (military and police forces) ensuring that their economic and political privileges are protected. Thus, politics easily degenerates into a life and death struggle over private ownership of public resources. State effectiveness, therefore, has continually waned as a result of parochialization of the public realm. While in part, this reflects the way the state was created, its use by post colonial elites has created a skewed distribution of resources in favour of those groups that have power and wealth. The segmentation of society that has followed has impeded the many reforms of the political structures necessary to enhanced Africa's ability to develop sustainably.

States on the continent are, therefore, weak and much of their strength derives from the feebleness of political challengers than from the inherent capabilities of the state itself. For many people in these societies their chief security threat is often the very govern-

ment under whose sovereignty they live, either through its power and oppressive policies, or as a result of its incapacity to sustain the infrastructure of life for the vast majority. As predicate, the human security framework should be conceived as emancipatory; encompassing and empowering the hopes and aspirations of a group of people - individuals, Civil Society, development practitioners, NGOs, CBOs, donor organizations. - for a better continent. A continent on which children are not allowed to die from preventable diseases; where epidemics like HIV/AIDS is not allowed to decimate an entire generation; ethnic prejudice is not allowed to result in gratuitous violence or worse genocide; women are not illegally trafficked or sexually abused; corruption is not allowed to continue to reduce millions of people to a bleak and vulnerable future.

These are issues with an emotional charge of a kind that only a subjectifying narrative can fully convey and around which a coalition of forces are needed to bring radical political change. As such, the concept is intended to evoke discussions as explicit as possible, organized as emotively as possible, while making empirical observations as compelling and practical as possible.

81 Human Security in Central America

Philippe De Lombaerde and Matthew Norton

81.1 Introduction¹

The assessment of human security (HS) challenges and prospects in Central America (CA) presents a complex and contradictory picture. The region has been quite tumultuous during the past three decades, and the legacy of war, social violence, and democratization processes in various stages of progress and disrepair have all left important imprints.

Once considered as unlikely contenders for democratic institutionalization and consolidation (Barnes 1999), Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica, and Panama can now be considered as democracies. Civil wars which wrecked Guatemala, El Salvador, and Nicaragua through the 1980's and early 1990's have all been officially terminated through the signing of national peace accords, under the umbrella of the Esquipulas regional movement, spearheaded in the late 1980's by Costa Rica's then president Oscar Arias. Peace-building efforts with internal and external support – notably in Guatemala, but elsewhere as well (Pearce 1999) – have initiated the process of democratic consolidation, and though these efforts have been problematic in many ways, the spectre of a return of the organized and widespread political violence of the 1980's has somewhat receded. Since 1998, crises of political institutions have occurred in South America (Argentina: 2001, Bolivia: 2003, Ecuador: 2000, Paraguay: 1999–2000, Peru: 2000, Venezuela: 2002) and in the Caribbean (Haiti: 2001) (Rojas 2004: 10, 2008) but Central America has largely avoided direct involvement in these regional tensions (Malamud 2005).

But no observer or resident of the region would consider this the moment for a declaration of victory in terms of the human security agenda. Major and intractable human security challenges remain. The wars

and violence of the 1980's – in which an estimated 300,000 people died (Pearce 1999) – as well as the political structures in place previously, all exact a heavy toll as the region struggles towards more secure social formations for its residents. The past with its violence is gone but not forgotten. Central American societies are still characterized by high levels of social violence, and important economic security deficits exist. Although relative poverty indicators have shown improvements, absolute figures still rise (UNDP 2003b). The social and geographic income distribution does not show a tendency towards convergence and more equity (SICA-CEPAL 2004). Growth rates are insufficient; in the poorest countries recent GDP growth rates are only marginally higher than population growth rates. Access to basic services is deficient. This complex situation poses serious challenges for the region.

The objectives of this chapter are, first, to assess (real and perceived) HS threats and challenges in CA through the lens of a modern HS conceptual framework, and, second, to assess the relevance of adopting a regional perspective to HS in the Central American case.

We start with the presentation of the conceptual and theoretical framework (81.2). Then, after a general assessment of perceived human security (HS) threats in CA (81.3), we will assess clusters of HS challenges in three major HS pillars and connect them to the emerging regional human security discourse. The first cluster includes social and political issues, and particularly the challenges posed by high levels of social violence, and faltering democratic consolidation processes (81.4); the second is related to issues of economic development and the integration of CA in the regional and global economy (81.5); and the third deals with regional impacts of natural hazards and disasters (81.6). In section 81.7 these three human security threats and challenges are placed in the light of regional strategies to enhance and achieve the human security agenda. Section 81.8 concludes.

1 The authors thank Hans Günter Brauch and three anonymous referees for their useful comments. Only the authors are responsible for remaining errors.

81.2 Conceptual and Theoretical Framework

Due to the complex national and regional challenges facing the Central American countries the HS concept is a suitable tool for analysis. One common feature of all HS concepts is a focus on the linkage of threats to the security of individuals or humankind (Ogata/Cels 2003; CHS 2003). This integrative approach enables politicians, activists, policymakers, scholars, peace-builders and others to think about challenges in a way that does not attempt to isolate them. By conceptualizing the linkages between these complex threats and challenges, complex and integrated responses become possible. The HS approach also offers a normative focus on “the security of the people” (CHS 2003: 2).

The conceptual and theoretical framework on which this chapter is based departs from the traditional national security framework in two respects. On the one hand we will employ a multi-dimensional human security concept, thereby (at least to some extent) ‘moving down’ from the state level to the level of citizens. On the other hand, we will at the same time ‘move up’ from the national level to the regional level of analysis and link the HS perspective with a regional integration perspective.

It goes beyond the scope of this chapter to present in depth the conceptual development that the HS concept has undergone (Rojas/Fuentes 2002; Brauch 2003, 2005). This is done in extenso elsewhere in this volume. Suffice it here to say that we will follow the broader human security concept as it has been developed in the international policy community, particularly the UN context (UNDP 1994), as well as in academia roughly since the beginning of the 1990s (Buzan/Wæver/de Wilde 1998; Brauch 2005).

Concentrating only on the micro-level does not allow one to capture the reality of today’s security threats, risks and challenges and, in addition, as Brauch (2005: 22) also pointed out, it would not lead to many policy-relevant conclusions. ‘Moving down’ to the level of citizens, as we mentioned above, should therefore be taken as a key analytical thematization through all levels of analysis, rather than the only level of analysis considered. Maintaining a focus on the citizen-level provides a valuable analytical orientation for the consideration of national- and regional-level economic, political and social structures.

We thus propose to employ a human-centered and encompassing concept, combining the second and third approaches in Brauch’s overview of the concep-

tual developments of HS, associated with proposals originating in the UN system (UNDP 1994; Annan 2001). Bogardi and Brauch (2005) synthesized the current conceptual discussion and proposed to consider a HS concept based on three pillars:

- *freedom from fear*: political, military and societal security which is reached by reducing the probability that people confront violence and conflict;
- *freedom from want*: economic and societal security which is reached by reducing social vulnerability through poverty eradication;
- *freedom from hazard impacts*: environmental security which is reached by reducing vulnerabilities of societies confronted with natural and human-induced hazards.

We will use this conceptual framework in the rest of this chapter to structure our argumentation. One should be aware, however, that the borderlines between these three pillars are not always very clear and that there is quite some overlap. As we mentioned before, we opt for adding an explicit regional dimension to our conceptual framework, because of the characteristics of the human security issues in CA, as they will be discussed below.

In De Lombaerde (2005) we have argued that the rationales for a regional approach to security policy include the following:

- the regional scale of the threat or problem;
- the nature of border conflicts;
- the occurrence of negative spill-overs;
- destabilizing migration flows;
- prisoner dilemmas leading to e.g. uncoordinated military build-up;
- common external threats;
- external (extra-regional) policy objectives and creation of extra-regional bargaining power.

As we will see below, many of these rationales apply in the case of CA, although we should be aware of the existence of a grey zone between national and regional (human) security issues.

From a theoretical perspective, the linkages between regional integration and human security are complex and causality runs in both directions, if a systemic approach is not preferable. According to the liberal view on international relations, growing (regional) interaction and economic interdependence should lead to more shared prosperity and peace.² Also in the early developments of integration theory (functionalism) (Mitrany 1966, 1975), pragmatic coop-

eration in functional areas was expected to contribute to peace and stability in post-war Europe.

Other arguments are offered in the approaches inspired by the fiscal federalism literature (see e.g. De Lombaerde/Costea 2006), according to which the regional level is the adequate level for the provision of certain public goods (several of which directly contributing to the provision of HS), especially when the national jurisdictions are 'small' and the cross-border spill-over effects are important as in CA (see below).

The conceptual difference between regional cooperation (ad hoc, inter-governmental, sectoral) and integration (structural, supra-national, multi-sectoral) is relevant to the extent that deeper regional integration, whereby more policy areas are gradually involved (economic, political, military, infrastructure, ...), permits bargaining between countries, linking different issues on the policy agenda. This way, agreements can be reached more easily and conflicts avoided. Deeper integration is also capable of generating more effective regional policies since they are somewhat shielded from national political events and cycles, on the condition of having secured sufficient resources.

The Balassa type stages model of regional integration only indirectly informs us about the interlinkages between economic integration and (human) security issues. From the perspective of HS policies, of relevance here is, on the one hand, the possibility offered by customs unions (CUs) to autonomously generate financial resources at the regional level, and, on the other, the fact that deeper economic integration requires the building of regional institutions and administrative capacity, which can then more easily be mobilized in other policy areas.

81.3 Human Security Threats and Challenges in Central America

The perception of and the debate about HS threats in a region is a function of concrete historical circumstances and of the social context. The debate on HS is not (only) an academic debate. In CA, the HS debate is only slowly developing. CA was also absent from the Human Security Network, led by Canada and Norway (Rojas/Fuentes 2002). The debate first centred on the concept of 'democratic security' with

a regional dimension, as inspired by the political events of the late 1980's and early 1990's, and the Tegucigalpa Protocol of 1991. This concept refers to the repositioning of security within a framework of democratic rules, done in the context of the regional pacification process.

The most important aspects of the concept of 'democratic security' as understood in CA are:

- the recognition of the democratic State (*Estado democrático de Derecho*),
- the respect for human rights,
- the submission of the armed forces to civil authority,
- its integral and indivisible character,
- the peaceful solution of conflicts,
- the harmonization, coordination and cooperation in security and defense policies,
- mutual confidence building measures,
- the control of military forces and armaments, and
- collective defence (White Gómez 2004: 24-25).

Only gradually the concept acquired a broader significance when sectors of Central American societies became more conscious that security is not only about the absence of conflict (White Gómez 2004: 15). This conceptual development –and shift in the direction of a true HS conception– is still ongoing.

What are the dominant threats then to HS in CA in the early 21st century? Ranking the HS threats for a country or region and comparing them with other countries or regions is difficult. Rojas (2004, 2008) compiled perceived threat rankings for four sub-regions in Latin America and the Caribbean based on official documents and speeches (table 81.1). In all sub-regions, drugs trafficking and terrorism are ranked 1 and 2. Risks related to the environment and natural disasters, and threats linked to organized crime, are perceived as relatively more important in CA, whereas activities of guerrilla movements or subversive groups appear with the lowest rank. These rankings should be treated with care. Perceived threats may differ from objective threats, challenges, vulnerabilities and risks (Brauch 2005).

They are also very sensitive to 'events' occurring at the moment of assessment and to how they are used in political discourses. The terrorism threat, for example, appeared in many political discourses after the 9/11 event. However, the academic literature in the region seems to focus more on other threats. According to White Gómez (2004: 21), criminal violence is the perceived dominant threat in CA, whereas in the Caribbean the security threats are more related to global

2 Empirically, the causal linkages between trade and security are limited. Democracy appears to have an independent positive effect on both variables (Polachek 1992, 1997).

Table 81.1: Perceptions of threats to human security ranked by sub-region. **Source:** Compiled by the authors based on Rojas (2004: 10).

Rank	Central America	Caribbean	Andean Community	Mercosur
1	Drugs trafficking	Drugs trafficking	Drugs trafficking	Drugs trafficking
2	Terrorism	Terrorism	Terrorism	Terrorism
3	Environment and natural disasters	Poverty and social deprivation	Poverty and social deprivation	Arms trafficking
4	Organized crime	Environment and natural disasters	Guerrilla activity and subversive groups	Organized crime
5	Poverty and social deprivation	Arms trafficking	Arms trafficking	Environment and natural disasters
6	Arms trafficking	Organized crime	Organized crime	Poverty and social deprivation
7	Guerrilla activity and subversive groups	-	Environment and natural disasters	Guerrilla activity and subversive groups

Note: 1 = most important, 7 = least important.

warming, hurricanes, and large scale commercial crises. Thus perceived security threats in CA have shifted from the state level to the level of persons and citizens.

81.4 'Freedom from Fear': Social and Political Dimensions of Human Security in Central America

81.4.1 Interlocked Threats to Human Security

From a human security perspective, the people of CA experience a startling series of interlocked threats: from crime and social violence, to lingering psychosocial impacts of war, high levels of violence against women, migratory pressures and drug smuggling. But the progress that has been achieved in this former Cold War front cannot be ignored. Nicaragua signed its peace accord in 1990, El Salvador in 1992, and Guatemala in 1996. Since then, massive strides have been made in terms of nation-building, the institutionalization of democratic governance, the rule of law, and other social and institutional factors contributing to a future for the region characterized by greater security for all.

Even as the threat of organized political violence and outright civil war have decreased, throughout CA, social violence and crime are on the increase (Rojas/Fuentes 2002; Adorno 2003; Chinchilla 2003). Even in those countries that have not suffered the impacts of brutal wars - Costa Rica, Honduras, and Panama - new and pernicious forms of social violence have

emerged. While each country faces nationally particular challenges, regional threats are also emerging, particularly from emerging transnational crime syndicates. The fact that all Central American regimes are now democratic should not obscure the immense work that needs to be done in all countries to consolidate democratic institutions and civil society. The serious challenges for continuing democratization thus form a backdrop to all other challenges. Governments characterized by varying levels and sorts of fragility are thus stretched to their limits in trying to cope with these present and emerging threats.

The insecurity that characterizes much of CA supports the shift away from state-centric security concepts. If security is limited to threats to the state, then the view from CA looks quite promising. But when the security of individuals is considered as a focal point, an entirely different picture emerges. Rising levels of social violence mean that the threats posed to individuals throughout the region are an increasingly prominent part of the daily experience of Central Americans. Interpersonal violence, for example, has become the leading cause of death among 15-25 year olds (Harris 2002). This sense of insecurity is exacerbated by a generally perceived inability or unwillingness of law enforcement agencies to control this violence. In Honduras, despite numerous high-level efforts to bring the extraordinarily high level of child-murders under control, many remain uninvestigated, and *Casa Alianza*, a regional NGO, estimates that one third of these murders may have been committed by the police (Harris 2002). This combination of widespread violence and perceived impotence of gov-

ernments to cope with it, or even their involvement in it, creates an environment where the fear of violence becomes a generalized, routine, and pervasive dimension of social life throughout CA. Using the HS framework, this and other ways that individuals experience 'fear' and 'want' in their lives have become key security questions. We will review some of the most prominent social and political challenges to HS in the region by focusing on an interlocking set of issues with great impacts on individuals, and that help to conceptualize the nature and range of these challenges. They are in no way an exhaustive listing of HS challenges.

81.4.2 Gang Violence and Illegal Trafficking

Crime and criminal networks are some of the most glaring sources of fear experienced by ordinary Central Americans. Exacerbated by poverty, the region's geographical position between the cocaine-producing countries of South America and the USA, the relative weakness of the rule of law, and the ready availability of weapons, high-levels of crime, and the pervasiveness of various forms of criminal networks are among of CA's most significant contemporary human security challenges. Gang violence is one of the most virulent forms of such criminality, posing serious threats to human security and the consolidation of the rule of law throughout the region, but especially in Guatemala, Honduras, El Salvador, and Nicaragua. Though exact estimates of membership in gangs (*maras*) are difficult and are based on contentious definitions, it is assumed that there are roughly 70,000 to 100,000 members in the region (Arana 2005). Gang violence is not limited to attacks on or homicides of other gang members. Turf wars between gangs, and ongoing battles with police make the streets of many cities and towns in CA potential sites for this new sort of violence.

The mara phenomenon is of relatively recent vintage, beginning with the deportation of gang members from the U.S. and especially from Los Angeles. In 1996, the U.S. Congress extended and toughened immigration laws, making it possible to deport non-citizens who had been jailed for a year or more. This applied to thousands of imprisoned gang members from Los Angeles who were the children of refugees from the conflicts in CA. The deportees brought the knowledge, traditions, institutions, and styles of violence characteristic of U.S. street gangs to CA. Not only does the continuing flow of deported gang members transplant Angeleno gang culture – in 2003 nearly

80,000 immigrants were deported from the U.S. after many of them returned to CA – but it also provides a ready and willing pool of recruits and enables the emergence of robust international criminal networks, as members often maintain allegiance and links to their home gang.

Two outfits in particular have become 'super-gangs', extending from CA up to Los Angeles and other parts of the USA. These two organizations, *Mara Salvatrucha* and *Mara 18*, are only loosely organized, but they share loyalties and connections, and are so widespread that they have become a significant challenge to the state and source of violence. In El Salvador, at least 15 towns or cities are *de facto* run by gangs. This challenge is not limited to El Salvador. Honduras estimates that 40,000 youths are active gang members (Arana 2005). The potential for deadly violence is exacerbated in a regional context where firearms are widely available and only poorly regulated. In El Salvador, there are an estimated 450,000 guns in the hands of civilians, 1 for every 4 El Salvadorans, and 60 per cent are illegal or not properly registered (UNDP 2003a).

Controlling murder and crime that come with these violent groups is a key human security challenge in the region. The problem cannot be easily isolated. CA is a key zone in the drug trade in the western hemisphere. While drug mafias have existed, it is in their connection with the *maras* that the threat of drugs, drug money, and the intense violence associated with drug trafficking is at its most potent as a human security threat. With the easy access to weapons, the cash of the drug mafias and the loosely organized but numerous and territorially vast *maras*, a new potentially frightening threat begins to emerge. Given the desperation of many mara members and their loyalty to the gang, the widespread gang violence may become more severe if the drug mafia-mara links that seem to exist in an embryonic form should become full-fledged.³ There is even a report, perhaps apocryphal but at least suggestive of regional fears, that in the year 2000 members of *Mara Salvatrucha* may have met with an Al-Qaeda leader, Adnan el-Shukrijumah, in Honduras (Papachristos 2005). If such connections with trans-national drug or terror outfits have evolved, these emerging hybrid entities could pose both 'national' and a 'human' security threats.

3 "After the Massacre", in: *Economist*, 374, 8409, (15 January 2005).

81.4.3 Policing the Gangs and the Problems of Policing

Presidents, parliaments, and the public have not let this threat posed by the maras go unchallenged. In 2001, Ricardo Maduro was elected as president of Honduras with a zero tolerance pledge. His popular 'get tough' attitude has become known as '*mano dura*' (hard hand). *Mano dura* policies have since been adopted by Honduras, Nicaragua, and El Salvador to grapple with crime in the region and high penalties are adopted against all sorts of gang activities, and even for gang membership. The criminalization of gang membership has made arrests extremely easy, given the distinctive tattoos that adorn the bodies of most gang members. Due to these policies, jails have swelled with numerous arrests. Public officials and police claim that crime and gang violence have decreased, but so far there is little evidence to support this claim. The regionalization of this *mano dura* approach was solidified with an agreement signed in early 2004 that allows for the sharing of warrants between El Salvador, Honduras, Nicaragua, and Guatemala, the countries hit hardest by the maras (Garland 2004).

These policies have been criticized by human rights and other advocacy groups for two reasons. First, through the criminalization of gang membership, as well as through the policing tactics that have been authorized, these *mano dura* laws themselves pose a fundamental threat to human rights and human security. Second, because they are focused solely on punishment, it is argued that they will be ultimately ineffective in combating the spread of the maras and the violence they cause because both phenomena are closely linked to problems of poverty and social exclusion, and thus not amenable to approaches that focus only on punishment and law enforcement. Thus, the maras raise a dual HS issue for CA. The high level of social violence caused by the maras has created an intolerable atmosphere of threat and fear. But the preservation of human rights is itself a critical HS objective. The question is whether *mano dura* or similar approaches to the problem of the maras will be able to reduce violence and citizens' experience of threat without undermining fundamental human rights and constitutional guaranteed.

Another dimension of HS that is highly relevant for examining the mara problem: the insistence that approaches to HS challenges must address the root causes of violence (Ogata/Cels 2003; Paris 2002). This would require governments to deal with youth

unemployment and to implement unpopular rehabilitation schemes (Thale 2005). It seems that the *mano dura* approach will not be sufficient to combat these problems (Arana 2005). Rather, these laws may be quite counterproductive in the long-term, with thousands of jailed youths solidifying their gang links and commitments while in prison.

The issue becomes ever more tangled, as some groups have begun to take the law into their own hands combating these gangs, while gang members have stepped up their violence by targeting civilians as a response to the new aggressiveness of the police. The death toll of gang and non-gang members continues to grow. In San Pedro Sula in Honduras, two shocking incidents capture the dynamic and violent nature of this situation: In May 2004 over 100 gang members were killed in a fire in a local prison⁴; in December 2004 mara members armed with automatic weapons slaughtered all passengers on a bus travelling on a main highway⁵, as a reprisal for the prison fire and a violent reaction against the *mano dura* laws.

81.4.4 Democratic Transitions

The emergence of authoritarian responses to violence in the Central American context is not surprising. All countries in the region continue to undergo processes of democratic transition and consolidation. With traditions of both authoritarian rule (Sojo 2003) and patrimonialism (Holden 2004), the normative democratic resources of well-established democracies are lacking in most CA states. Thus, complex and urgent issues such as the maras and drugs are further complicated by the relative weakness and rigidity of existing governance structures. Especially in those states emerging from civil wars, these governance structures tend to be fragile and radicalized. Corruption (Brown/Cloke 2005) further complicates these matters. At the same time, processes of democratic consolidation which would allow more coherent and effective responses to HS threats are themselves often casualties of deteriorating HS conditions. Thus, the new democracies are often worse off than authoritarian states in dealing with fundamental and serious threats to individuals, and even to the state. Democratic consolidation is thus an important issue if the "incomplete democracies" (Barnes 1998: 63) in CA are

4 "Bringing it All Back Home", in: *Economist*, 371, 8376, (22 May 2004).

5 "After the Massacre", in: *Economist*, 374, 8409, (15 January 2005).

to be sufficiently empowered to provide security for all individuals.

The institutional level of democratic consolidation is particularly important in a region where the history of the military has remained problematic. Except in Costa Rica, where the military was abolished in 1949, the other countries have long had very powerful military apparatuses, or as Robert Holden (2004) has called them, “armies without nations”. During the 1980’s, the region emerged from this imbalance in the military and civilian relationship. Since the 1980’s the power of the military has been drastically diminished (Robinson 2003), but demilitarization remains a key priority and dimension of democratic consolidation and social change (Kincaid 2000).

Continued demilitarization coupled with a strengthening of the institutions of civil society are another key piece in the solidification of democratic norms and controls in CA states. Even in those countries that did not experience civil war, lingering patrimonialism and authoritarianism, alongside corruption pose tremendous challenges for the continuation of building strong and flexible systems of government capable of responding to the various threats to HS existing and persisting in the region for the foreseeable future.

81.4.5 Violence Against Women

The problem of gender-based violence, and specifically violence against women is endemic through all the countries of CA. This violence exists in a wide variety of different forms and settings which include the specific targeting of women in acts of criminal violence, high rates of domestic violence, and weak or non-existent legal options realistically available. The problem, in Central America as elsewhere in Latin America and the world, can be conceptualized as on the one hand women’s high exposure to violent and potentially violent situations, and on the other hand weak official recourse or response. Women in CA are particularly vulnerable to violence for many reasons not particular to the region: low levels of social, economic, and political power; patriarchal social structures that do little to constrain violent men, and much to constrain women from empowering themselves; and cultural and historical patterns of representation in which women come to be seen as more ‘acceptable’ targets for violence. Sexual violence of various kinds and intimate partner or domestic violence are two of the most epidemic forms of gender-based violence that Central American women experience.

These are compounded by extremely weak regulatory environments (particularly for domestic violence), and police and legal indifference or even obstruction. It is critical that this issue be considered as an integral part of the human rights agenda because of its discriminatory nature, and because of its pervasiveness. While estimates are difficult because of the nature of this sort of violence, UNIFEM estimates that a minimum of 1/3 of women will experience gender based violence at some point in their lives. It is likely that in CA, that percentage is even higher, reflecting trends in Latin America more generally, where *Human Rights Watch* estimates that 40 per cent of women will experience this sort of violence. While the proportion of the population directly affected alone makes this a stark human security issue facing the region, the nature of this kind of violence links it directly to a much more widely experienced environment of fear. Because intimate violence so often occurs over prolonged periods and in the home, it has impacts far beyond its physical repercussions. Children, communities, and society in general are ultimately implicated in this pattern of violence. Governmental policy throughout CA is particularly lacking, with treatment of victims of rape and domestic violence often amounting to a second victimization as women are forced to go from office to office, dealing with officials who are often neither trained to deal with these sorts of crimes, nor necessarily sympathetic (Velzeboer/Ellsberg/Clavel Arcas/García-Moreno 2003). Responses to the problem of violence against women, it should be noted, have varied widely. Costa Rica in many ways leads the region, with tools like its ‘Law Against Domestic Violence’ providing a positive legal framework to deal this sort of crime, as well as promoting training for police and social workers in recognizing and dealing with the particular demands that violence against women entails.

81.4.6 Border Disputes

As the focus of the security debate has been shifting to HS, one should not completely forget the ‘old’ security issues like the existence of continuing border disputes. Of the over 40 territorial claims and/or demarcation problems (on land or sea) in Latin America and in the Caribbean, several involve Central American countries: Belize-Guatemala, Honduras-Nicaragua, Costa Rica-Nicaragua, Colombia-Nicaragua. Looking at the recent history of militarized inter-state conflicts, one should not underestimate this heritage. CA showed a relatively high number of inter-state con-

flicts with a relatively high hostility level in the previous decade (table 81.2). It remains to be seen whether the positive evolution during recent years is solid and sustainable.

A definitive settlement of the pending border disputes is a pre-condition for further progress towards peaceful interaction, trust and cooperation (Rojas/Fuentes 2002: 23).

Table 81.2: Inter-state militarized conflicts in the Americas, 1990-2001. **Source:** Own calculations based on Mares (2003).

	US	Central America	Caribbean	Andean region	Southern Cone
US	-	# = 1 $\mu = 3,0$	# = 6 $\mu = 3,2$	# = 10 $\mu = 3,0$	-
Central America		# = 19 $\mu = 3,5$	-	# = 1 $\mu = 2,0$	-
Caribbean			-	# = 5 $\mu = 3,8$	-
Andean region				# = 13 $\mu = 3,5$	-
Southern Cone					-

Note:

#: number of conflicts;

μ : average hostility level (2 = threat, 3 = mobilization,

4 = use with < 1000 casualties in conflict zone, 5 = war)

Diagonal elements show intra-subregional conflicts.

81.5 Human Security as 'Freedom from Want'

Within the context of globalization and a possibly emerging regional world order, regional groupings of small countries are vulnerable, not only due to structural weaknesses related to their limited scale, often linked to a peripheral location, but also because their environment is highly exogenous. Due to their limited negotiation power in the political and economic arena, they have only few capacities to shape their own conditions for development and security. But flexible niche specialization strategies can show important results, as small countries like Singapore, Chile, various European countries and, to some extent, Costa Rica have shown.

Although the situation in Central America is probably not as extreme as in the Caribbean or South Pacific Islands, the successful integration of this sub-region in the world polity and economy is not without

risks. Initial conditions show problematic features: a limited scale of economic and governmental activity, a vulnerable socio-economic situation, combined with a vulnerable ecological situation (volcanic activity, resource intensive exports). Any realistic strategy should take these factors into account.

Looking at the human development indicators for the region, one observes that, except Costa Rica and Panamá, all countries are almost systematically underperforming, compared to the averages for Latin America and the Caribbean. This is the case for life expectancy, literacy rates, school enrolment, per capita income levels, electronic connectivity, etc. (table 81.3). Two countries, Honduras and Nicaragua, show per capita incomes of less than one third of the average figure for the wider region. Poverty, the quantity and quality of education, the quantity and quality of health services, and (intra and extra-regional) migration have been described as the most important social equity deficits in the region, and it has been argued that these should be the intervention points for a new HS strategy (Urquyo 2004: 112-122). The importance of the promotion of basic economic security as a pre-condition for further social development and development in general has also been emphasized by UNDP (2003b).

In addition to these low levels of socio-economic development, social and economic inequality should be addressed. This is one of the structural obstacles that represent risk for the further democratic development of the region and the generation of crisis situations (Rojas/Fuentes 2002: 23).

Pressures from intra-regional and extra-regional migration will continue. These migration flows have usually socio-economic determinants (e.g.: migration from Nicaragua to Costa Rica, migration flows to the US, transit migration to Mexico) but can be temporarily influenced by natural hazards like in the case of hurricane Mitch. In Costa Rica the decent treatment of legal and illegal immigrants from Nicaragua must remain a major priority in a country with a stable governmental system, founded on the rule of law and protection of human rights. Human trafficking (Clark 2003, 2003a), high levels of violence against women, child abuse and prostitution are important challenges for CA as its states seek to meet the demands to ensure HS for all residents.

81.6 Human Security as 'Freedom from Hazard Impacts'

The Central American states face other serious HS challenges and threats than the ones described thus far. Deforestation and ecological devastation are not only environmental issues (Khagram/Clark/Raad 2003, 2003a), but they are linked to human insecurity through the increased prevalence of natural disasters such as hurricanes, mud slides, through the destruction of valuable farm land, and the increasing pressure placed on fresh water.

Central America has been extremely vulnerable to natural hazards: hurricanes, flash floods, land slides, volcano eruptions, earthquakes etc. Data sources like the EM-DAT database make it now possible to analyse data on natural disasters in a systematic way over long periods of time. In table 81.4, we made a selection of data showing up-to-date cumulative figures since the beginning of the XXth century. These figures illustrate the tremendous environmental and social vulnerability reflected in the high figure of people who died in these events. One way of visualizing the degree of vulnerability of the region to natural disasters consists of relating these figures to population figures. If, for example, the total stock of affected people is related to current population stocks (see table 81.3), we find that the former represents the equivalent of between 35 and 79 per cent of current populations for Central American countries (except Panama); these are obviously very high figures. These and other indicators (e.g. number of events) also show that the vulnerability towards natural disasters of the region is relatively homogeneously distributed across countries. This has important implications for the need, design and feasibility of regional responses and policies in order to face these challenges, as will be further developed in the next section. One of the issues that emerges in this context is the fact that, apparently, the poorest countries bear the highest burden if we look at the damage figures.

Of the 11 categories of disasters that are considered, drought, earthquakes, epidemics, floods, and wind storms are the ones that affect practically the whole region. Earthquakes, floods and wind storms (in this order) are the most mortal disasters. Windstorms, earthquakes and floods (in this order) also have the highest economic cost.

81.7 Regional Cooperation and Integration as Responses to Human Security Challenges

81.7.1 The Regional Dimension of the HS Issues in CA

Many, if not most, of the challenges and threats in the social and political realm are regional in nature, requiring careful coordination and gradual harmonization of laws and practices. Others are far more pressing in some countries. Their officials and populations - with international support - must find a balance between ineffective responses to threats with failures to respond. Both responses will diminish future prospects for meeting the very serious social and political HS challenges that persist in the region.

Also in the economic realm, problematic policy issues and areas are increasingly international (regional and/or global) in scope. Migration issues and health policies, linked to the discussion on services and intellectual property rights on medicines at the WTO and in the CAFTA framework, illustrate very well that effective policy responses aimed at increasing HS levels increasingly require a coordinated regional approach, complementary to national policies. To cope with these challenges and to facilitate the integration of CA in the global economy, regional cooperation and integration will be crucial. Regional cooperation increases scales of operations, makes the handling of common and cross-border problems easier, enhances opportunities to provide regional public goods and strengthens the region's external negotiation position. One of the most important lessons of the signing of the Esquipulas agreements has precisely been to clarify the links between the HS and regional integration agendas in CA (Solís Rivera 2003).

In the area of environmental security (freedom from natural hazard), the situation in CA is a clear case in support of the call for a regional orientation in the 'fourth phase' of environmental security research and policy discussion (Brauch 2005: 38-39; 2008, 2008a, 2008b, 2008c). According to this author, this requires regional natural science models (climate, soil, water), and also new case studies from a comparative social science perspective on the policy processes at the regional level. In table 81.4 we showed the important overlap that exists between countries in terms of the type of natural disasters to which they are vulnerable. This offers many opportunities for joint learning, for joint designs of prevention policies and for the mobilization and pooling of resources for disaster

Table 81.4: Stock of Natural Disasters Affecting Central American Countries. **Source:** OFDA/CRED International Disaster Database (EM-DAT); at: <www.em-dat.net> (8 August 2006); own calculations.

Notes: 'Total affected' is the sum of killed, injured, homeless and other effected persons. 'Epidemics' include: arbovirus (dengue fever) in Costa Rica; arbovirus (equine encephalitis), diarrhoeal/enteric (cholera), arbovirus (dengue fever), arbovirus (dengue) and respiratory (pneumonia) in El Salvador; arbovirus (equine encephalitis), measles, diarrhoeal/enteric (cholera), arbovirus (dengue fever) and arbovirus (dengue) in Guatemala; meningitis (polio), arbovirus (equine encephalitis), arbovirus (dengue fever), diarrhoeal/enteric (cholera) and arbovirus (dengue) in Honduras; arbovirus (equine encephalitis), diarrhoeal:enteric (cholera), arbovirus (dengue fever), leptosporosis and arbovirus (dengue) in Nicaragua; measles, diarrhoeal/enteric (cholera), arbovirus (dengue fever), meningitis (viral meningitis).

management and reconstruction efforts. Especially in situations of major non-synchronous events, the region-wide (rapid) concentration of regional resources has a potential to save many lives.

81.7.2 Building Blocks for Regional Cooperation and Integration

Although the solidity of the historical process of regional integration in CA is an issue under debate, there are building blocks and relevant antecedents to further regional integration and cooperation.

Early stages of the institutionalization of the integration process were the creation of the *Organization of Central American States* in 1951 and, more importantly and after long negotiations (1952-1960), the creation of the *Central American Common Market* (CACM) in 1960 by the treaty of Managua. Original member states of CACM were Guatemala, Honduras, Nicaragua and El Salvador, with Costa Rica joining in 1962. Its objective was to encourage the industrialization and development through trade and regional integration. Although the CACM shared several weaknesses with other initiatives of the so-called first wave of regionalism in Latin America, like low levels of production factor mobility and unsuccessful industrial cooperation, it also showed quite remarkable results in terms of intra-regional trade expansion and coverage of the common external tariff (De Lombaerde 2005).⁶

As part of a 'second wave' of regionalization, taking place worldwide, the integration process was reactivated in 1991 with the signature of the *Tegucigalpa Protocol* (in force in 1993), establishing the *Central*

American Integration System (CAIS).⁷ The formal objectives of the CAIS are to initiate a process of political, economic, social, cultural and ecological integration in order to build a region of peace, liberty, democracy and development. The CAIS reformulated the security concept, with a new model of 'regional security' based on power balances, strengthening of civil power, fight against extreme poverty, promotion of sustainable development, environmental protection, eradication of violence, corruption, drugs and arms trafficking. In 1993, regional economic integration was re-launched with the Guatemala protocol and in 1994, a pragmatic content was given to the integration scheme with the adoption of the *Alliance for a Sustainable Development* (ALIDES) at the Summit of Masaya (White Gómez 2004: 40). In 1995 a *Social Integration Treaty* and a *Framework Agreement on Democratic Security* were signed, stressing the cooperative and collective dimension to security issues and reaffirming the emphasis on 'democratic security'. According to a recent comprehensive study of Central American regional integration, there are still significant potential gains to be expected from a further deepening of the process (SICA-CEPAL 2004).

Whether cooperation and integration deliver the quality of regional governance and the amount of regional goods that are needed, depends on the way in which political leadership further moulds the integration architecture and addresses a number of challenges and threats.

One of these challenges is related to the sustainability of the regional integration process and, by implication, the effectiveness of regional responses to HS

⁶ More than 98 per cent of extra-regional trade covered.

⁷ Members are: Belize, Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, Panamá.

challenges in CA. This is linked to the level of social participation of the citizens in these processes. In both CACM and OCAS, as in other initiatives in Latin America and the Caribbean, the state was the principal actor, influenced by national and regional bureaucracies (including ECLAC). According to some authors (Delgado Rojas 2001: 230, 240) the business communities were not closely involved in these negotiations and described as 'passive' players, whereas others saw them as key players influencing the process (Best 2006: 200). The attitude of the trade unions was one of distrust and ideological opposition. This has changed to some extent with the new regionalism wave of the 1990's (De Lombaerde/Garay 2006). Civil society became more involved in these revived or new schemes. With regard to institutionalized participation, CA has been innovative though (Delgado Rojas 2001: 238). Whereas the Andean Pact and, more recently, MERCOSUR established socio-economic advisory committees modelled on the European Social and Economic Committee, the Tegucigalpa protocol foresaw the creation of a Consultative Committee of CAIS in which regional workers' organizations, employers' federations, but also intellectuals and other groups in society took part. The particularity of this Committee is that eligibility is based on regional representation. Although this experiment was positive and promising in its conception, the results are deceiving (Best 2006: 200-201). Much activity of civil society at the regional level is reactive, rather than constructive, and reproduces national political dynamics, at the cost of more coordination of regional objectives (Rojas Delgado 2001: 243). For the integration process to be able to fulfil its promises in the political, economic and HS spheres, more effective civil society participation is still needed (Herrera 1999).

A second challenge is related to the linkages and tensions between the regional and other levels of governance. In our opinion, the emphasis on a stronger Central American region does not imply that the processes taking place at other levels are ignored. The governance architecture of the near future is probably one of multi-level governance with a high degree of flexibility and jurisdictional overlap. Bilateral and cross-border cooperation will remain important as well as developments at wider regional scales (continental and in the Caribbean Basin) and at a global multilateral level (WTO).

The *Association of Caribbean States* (ACS), is one such a forum that might offer opportunities for Central American states. The ACS was created in 1994 by the *Convention of Cartagena de Indias* signed as full

members by 25 independent states and by 12 associated member states, in order to foster regional integration and cooperation in various policy areas. Despite its internal heterogeneity, the ACS presents important possibilities for cooperation including the joint management of natural disasters, the development of solidarity mechanisms (spreading and reducing risks), and the joint promotion of tourism. The prudence with which CA has approached the ACS, is due to the fact that Cuba is a member, and that the CA states are highly dependent (both economically and politically) on the U.S.⁸ The work agenda of the ACS has been rather weak (González Arana 2001) but there is room for a more active and beneficial involvement of the Central American countries.

A third challenge to the regional integration process is precisely related to the multiple linkages with the U.S. An important recent development was the signing of the *Central American Free Trade Agreement* (CAFTA) in May 2004 by five Central American countries (Costa Rica, El Salvador, Guatemala, Honduras and Nicaragua).⁹ Ratification is still pending in Costa Rica, and in the U.S., the President has been hesitant for domestic reasons to present this agreement to Congress.

CAFTA covers: (i) principles of national treatment and non-discrimination of goods, services and FDI, (ii) market access and gradual reduction of trade barriers, (iii) trade facilitation, (iv) public procurement, (v) agriculture, (vi) services, and (vii) conflict resolution mechanisms. Analysts (and the public) have been divided on the expected effects of this agreement for economic activity and HS. This does not differ from the situation in other Latin American sub-regions and the discussion on the FTAA and the Andean-U.S. bilateral agreements. A balanced view necessarily may conclude that such agreements present both opportunities and threats to the countries involved. In addition, the contents of such agreements reflect necessarily the structural characteristics of the negotiation setting: the U.S., on the one hand, and the small Central American countries, on the other.

On the opportunities side, usually market access is highlighted. In the short and medium term, however, these effects may well be very limited. The reason is that access is only marginally increased if it is compared with access under the *Caribbean Basin Initia-*

8 Another obstacle is the border dispute between Colombia and Nicaragua.

9 The Dominican Republic joined the Agreement in November 2005 (DR-CAFTA).

tive (CBI), a unilateral concession by the U.S. in place since 1984. What is more relevant from an economic security point of view, is that unilateral preferences are now integrated in a bilateral agreement which should give more regulatory security to economic agents.¹⁰ Having negotiated the framework is particularly relevant if recent developments on the FTAA are taken into account. After the debacle at the Mar del Plata Summit on 4–5 November 2005, DR-CAFTA offers probably a more secure trade environment, which the Andean region, also quite dependent on the U.S. market, is still lacking.

As far as the threats are concerned, there are several issues at stake: (i) agriculture (especially the effects of trade liberalization on small farmers), (ii) intellectual property rights (traditional knowledge, pharmaceuticals), services (privatizations), (iv) worker rights protection. According to observers like *Human Rights Watch*, the latter are too weak in the agreement, because it does not include binding clauses which are able to bring labour legislation closer to critical standards.¹¹

This leads to a perhaps contradictory situation where, although the regional level is able to provide policy answers to HS threats of different kinds, they present at the same time also new threats.

81.8 Conclusions

A complex and, to some extent contradictory, picture follows from our assessment of the human security challenges and prospects in CA. This complexity makes the HS concept a particularly apt mode of analysis, although its use in Central American academia and politics is only slowly gaining importance.

Parting from a state-centered focus on national security, the last decade undoubtedly showed substantial progress after the difficult episodes in the 1980's and early 1990's.

However, if we part from a broader and person-centered definition of HS, the image is not as positive. Serious threats to HS, both from internal and external origins, exist and require policy responses. They are related to organized crime, poverty, low educational levels, distorting migratory flows, environmental risks, and the adjustment costs of economic liberaliza-

tion. Although reactive policies are often needed and urgent, a further shift towards proactive policies that address root causes of insecurity in the three HS pillars (like e.g. issues of social equity and mobility, corruption, housing, reforestation, etc.) is necessary along with the adoption of longer time horizons.

We have shown that traditional and non-traditional HS threats are highly interlocked in CA and that due to the structural characteristics of the region (small scales, high degrees of openness, dependence vis-à-vis US, etc.), effective policy responses require (deeper) regional cooperation and integration driven by institutional and political processes with (higher) degrees of democratic participation.

10 A similar development can be expected regarding the EU-GSP.

11 For a discussion of the process and results of CAFTA, see Weisleder (2004); see also at: <<http://www.hrw.org>>.

82 Human Security: A South American Perspective

Francisco Rojas Aravena

82.1 Introduction

For over a decade, human security has been in the global and hemispheric agenda. During this time it became a central concept within the United Nations system. This post Cold War security concept changed its approach towards people's security. 'Human security' stands within an ethical point of view in how priorities and politics are defined in this matter. Vulnerabilities link to the concept generate risks that will impact millions of people. Human security undertakes transnational challenges, and seeks to provide local responses. It also demands establishing international public goods to protect citizens. Although 'human security' is different from the classical security concept, a substantial progress on it will only be possible if there is not a confrontational defiance to the traditional concept of state security. There for it is a complementary concept.

'Freedom from fear' is the security objective laid down by the United Nations (2000) in its *Millennium Report*. Achieving this goal requires a recognition that the international system has fundamentally changed in recent years and that in the process a clear need has arisen to develop innovative approaches and perspectives so that we can grasp these changes and respond to new challenges.

During the Cold War, concepts of security mainly related to the state, and the military viewpoint prevailed. Since 1990 a transition can be observed towards a broader security concept whose objectives are peace, international stability and protection of individuals and communities. Since the mid-1990's the concept of human security emerged that emphasizes the protection of individuals. One major change that influenced the evolution of the human security concept is the new nature of conflicts, most of which take place within states.

Another factor that has contributed to this change in the security outlook deals with the complexity of global problems and their repercussions for millions

of people. There are now threats very different from that of a military attack against one's homeland, including environmental risks, international crime, drug trafficking and terrorism. All this entails far-reaching changes in the basic idea of sovereignty and shows that national capabilities are inadequate to deal with these problems.

The main changes and tendencies in the international system that have influenced the perception and analysis of new security challenges, and that have contributed to a reconceptualization are associated with the following structural and international factors:

1. End of bipolar conflict;
2. New power relationships;
3. Impact of globalization in different areas, and interdependence;
4. Changes in the dimensions of time and space;
5. Loss of state capabilities;
6. Increase in intra-national conflicts;
7. New international actors;
8. New threats to security; and
9. Development gaps.

Some tendencies that worked in the immediate post-Cold War years (1990-2000) were dropped after the terrorists attacks of 11 September 2001 in the U.S., which later spread to Europe (Madrid, 11 March 2004; London, 7 July 2005) and Asia. The U.S. response to this tragedy has challenged not only international law but also the multilateral agreements. This 'radical unilateral approach' has generated within the U.S. a serious polarization, and abroad it contributed to an increasing anti-Americanism.

In Latin America, especially in South America, the end of the Cold War coincided with a process of democratization and pacification in certain countries of South and Central America (Fuentes/Rojas 2005; chap. 81 by De Lombaerde/Norton). When consid-

Figure 82.1: Map of South America. **Source:** © 2005-2007 Map-Of-South-America.us. All rights reserved. Download at: <<http://www.map-of-south-america.us/south-america-map.gif>>.

ering the new security situation in the Americas, a number of tendencies must be taken into account:

1. Latin America and the Caribbean have had, and still have, a marginal position in global strategic affairs.
2. Latin America has not consolidated a disarmament policy in relation to weapons of mass destruction.
3. The military spending of Latin America and the Caribbean is low by comparison with the rest of the world.
4. International security institutions are weak in Latin America and the Caribbean.
5. Latin America has reached consensus on a common conceptual framework for security.
6. Internal conflicts.
7. The United States was the main actor in the region and hemisphere during the Cold War, and still is.

Latin American governments have gradually assimilated the new human security concept. In South America, for example, Chile made of this concept part of its foreign policy strategy through the Human Security Network. Ecuador included it in its defence policy definition. However, the debate over this issue among the governments has been relatively weak. More interesting debates take place within the aca-

demic community, but there is no consensus on the subject. Traditional concepts are still very powerful, and so is the notion of sovereignty in South America. Fear of foreign intervention, especially from the United States of America is also a factor. On the other hand, non-state actors have some visibility, including those organizations from the civil society, something seen as suspicious by many states. In sum, the concept of human security is still under construction.

This chapter also examines the relationship between human security and development, on the one hand, and human security and its links with state security and international security. A brief summary of the vulnerabilities of the region is done as well as the perceptions of threats and new threats. Finally, the chapter suggests some areas for future action.

82.2 Conceptual Approach on Human Security

Fear takes away freedom, and without freedom dignity and justice are lost. Without freedom, dignity and justice, people lose their basic rights. Human security presupposed the right to have rights; and the best way in which people can ensure themselves to those rights, is to reinforce democracy and governance.

Democracy is the political system that increases the rights of the people and facilitates the peaceful resolutions of conflict. Democracy could be an important measure of human security: i) Democracy have been better suited to hold governmental authorities accountable for human rights abuses. ii) There is a correlation between a lack of democracy and an inhibited economic development. iii) In democracy the ability to set the agenda via persuasion diffuses power from the central authority into the hands of citizens who chose to engage in the democratic process (Kay 2006: 267).

Human security complements state security; it does not oppose it. "Protecting and empowering people are thus about creating genuine possibilities for people to leave in safety and dignity. Seen from this angle human security reinforces state security but thus not replace it" (Ogata 2003: 5). The *Human Security Now* report defines human security as a way "to protect the vital core of all human live in ways that enhance human freedoms and human fulfilment" (CHS 2003). Human security is a universal concern and interdependent. The UN Secretary General defined human security as "freedom from fear and freedom from want" (Annan 2000a: 43).

In May 1999, a group of like-minded nations in international matters established the *Human Security Network* (HSN, see chap 76 by Fuentes). In the hemisphere Canada, Chile and Costa Rica have joined this initiative. But the HSN has established no common definition of human security, which led too two groups within the HSN. The first group emphasizes more on 'basic needs' or human development ('freedom from want'), while the other focused on a world without fear, giving priority to certain vulnerabilities resulting from more restricted threats ('freedom from fear').

South American nations stand in this second group. They separate the development from the defence and security agenda to avoid a 'militarizing' of the development agenda and the social demands and protests (Winter 2003; Garreta 2003; Villagra 2003). During the Third Summit of the Americas in Quebec (2001), the Presidents of the hemisphere addressed issues and challenges that included improved access to education, poverty, alleviation, strengthening human rights, democracy and economic integration. The resulting *Declaration of Quebec City* determined the region's priorities and goals for the upcoming years, which recognized the need to "continue addressing weakness in the development processes and increasing human security."¹

The 'Special Conference on Security' held in Mexico on October 2003, achieved a great and important consensus on security matters. The *Declaration on Security in the Americas*, adopted by the OAS, expresses principles and reaffirms shared values and a common approach, and also the coincidence of commitments and cooperation measures. The Declaration defines the basic purpose of security as the protection of human beings: "Security is strengthened when we deepen its human dimension"² (Rojas 2008).

82.3 Double Human Security Triad

Human security is linked on one hand with human centred concepts such as human rights and human development, and on the other with international and state security.

1 Third Summit of the Americas, *Declaration of Québec City*. Canada, 20–22 April 2001; at: <www.summit-americas.org/eng-2002/quebeccity-summit.htm>.

2 OAS, "Declaration on Security in the Americas", Mexico DF, 28 October 2003; at: <www.oas.org>.

82.3.1 Human Rights, Human Development and Human Security

Human security as an idea fruitfully supplements the expansionist perspective of human development by directly paying attention to what are sometimes called 'downside risks'. The insecurities that threaten human survival or the safety of daily life, or imperil the natural dignity of men and women, or expose human beings to uncertainty of disease and pestilence, or subject vulnerable people to abrupt penury related to economic downturns demand that special attention be paid to the dangers of sudden deprivation. Human security demands protection from these dangers and the empowerment of people so that they can cope with - and when possible overcome - these hazards (Sen 2003b: 8).

There is a complementarity between the concepts of human rights and human security. There is something deeply attractive in the idea that every person anywhere in the world, irrespective of citizenship or location, has some basic rights that others should respect. The moral appeal of human rights has been used for varying purposes, from resisting torture and arbitrary incarceration to demanding the end of hunger and unequal treatment of women (Sen 2003b: 9).

82.3.2 International, State and Human Security

One of the main intellectual and institutional challenges is to establish a conceptual link between human and international security that includes state security (Goucha/Rojas 2003). Once satisfactorily established, this relationship will simultaneously satisfy world security needs, as well as those of nations, individuals and people. It will also improve the implementation on human security measures.

The primordial characteristic of the new international conflicts, centred on intra-state problems, reveals the need to reach a better understanding of the interrelationship between these three levels, particularly in view of the impact of globalization. The new threats are transnational in nature and involve actors and agents that in most cases do not represent a nation or are not located in a clearly delimited state territory. There are a multidimensional causes for public and civil (in)security. New ways of linking states and non states actors are present in global scenarios. Private actors will increase their participation in the human security arena considering the emergence of new world threats, such as the green house effect and nat-

ural disasters, HIV/AIDS and other pandemic viruses, and transnational illegal crimes.

Globalization and interdependence brings new risks and vulnerabilities that affect nation's security. This also affects other states. As a result of this situation, problems arising because of these causes cannot be resolved within its own borders. Wars have also radically changed. The great majority of conflicts occur within states and have inter-state consequences. Their origins and motivations have more to do with ethnicity, religion or self-determination than with disagreements over borders or state interests. Non-state actors are playing a more prominent part. Demands are increasingly being directed at international, inter-state and non-governmental organizations, which mean that the capabilities of states, especially the less powerful ones, are being reduced.

Human security centres on the protection of individuals and communities. This concept has a unifying and multidimensional nature. It takes in more local dimensions, even if these relate to issues affecting great masses of people. It also takes in issues of a planetary scale that affect humanity as a whole (AIDS, SARS, the environment, organized crime, etc.). In both cases, these are non-traditional issues that have been taken at the other two levels (national security and international security). In other words, the focus is shifting from the state to individuals; the fundamental issue is the protection of individuals and people over and above their connection with a particular state.

The conditions required for human security can only be met in conjunction with the conditions required for state and international security. Indeed, an international crisis is at once a state crisis and a human security crisis. Likewise, a state crisis becomes a humanitarian crisis and an international crisis, and a human security crisis is simultaneously a state and international crisis, whence the need for a holistic approach.

To avoid the danger of over-reach it is necessary to agree on an approach or element that can provide a focal point for the concept of human security in the different dimensions and at the different levels where it is expressed. Similarly, a holistic or integrated perspective means that appropriate linkages can be made in the conceptual triad.

The specific structural element that enables this phenomenon to be best understood and targeted is violence, both the conditions under which this appears and its perpetrators. Joint action to forestall the use of force reaffirms international law and generates increased opportunities for concerted action. This

Table 82.1: Conceptualization of National, International and Human Security Dimensions. **Source:** Gurtov (1999: 25-26). Permission was obtained from Rienner Publishers.

	National security	International security (traditional)	Human security
Approach	National	Inter-state	Multidimensional
Focus	Nation state	Inter-state Regional Global	Individual Global (because of impact on individuals)
Conflicts	Intra-national Inter-state	Inter-state Transnational	Intra-national Inter-state Transnational Global
Implementation	National defence system Interministerial coordination	Bilateral coordination United Nations Coordination through regional organizations (OAS)	United Nations Interministerial coordination Intergovernmental coordination Coordination through regional/ international organizations Global networks
Function of the armed forces	Protecting national borders	Inter-state cooperation Cooperation through international organizations Peacekeeping operations (mainly chapter VI)	Protecting national borders, and peacekeeping operations (Chapters VI, VII of the UN Charter) Inter-state cooperation Cooperation through international organizations
Actors	State	State Intergovernmental organizations Non-governmental organizations	Individual Intergovernmental organizations Non-state actors Civil society Non-governmental organizations State

phenomenon can be analysed if three main aspects are considered: i) the conditions under which violence is likely to occur; ii) the perpetrators of violence; iii) and the preventive measures that can be taken so that violence and humanitarian crises do not break out.

Identifying violence as a pivotal element makes it possible to achieve a broad understanding of the phenomena that determine it and to obtain specific responses as to when and in what cases legitimate violence is the best means and when other instruments should be used. The militarization of responses results in a rising spiral of violence that is hard to stop. Conversely, the adoption of preventive measures limits the scope for the emergence of conditions that favours violence.

82.4 South America as a Part of the Main Vulnerabilities

In the case of Latin America, especially the South American nations, the main threats to human security are associated with a set of circumstances that include, weak democracy, rising poverty and inequity and, increasingly, urban violence and crime (Fuentes/Rojas Aravena 2005a: 103-179 or: 129-163). Although efforts have been made by multilateral institutions, governments and civil society to deal with these vulnerabilities, there is still a long way to go. There are six basic areas where threats could arise for human security:

1. *Socio-economic vulnerabilities.* Social and economic vulnerabilities reflect the growing inability of the production, trading and financial systems to

Table 82.2: The five variables of human security and mutual vulnerability. **Source:** Goucha/Rojas Aravena (2003: 22).

Variables	Ecology (Life)	Economy (Wealth)	Society (Support)	Politics (Power)	Culture (Knowledge)
	Environmental capital	Economic capital	Social capital	Political capital	Cultural capital
Effects	Sustainability Disaster	Prosperity Poverty	Equality Inequality	Peace Violence	Wisdom Ignorance
Globalization	A world of as- sociated effect 'greenhouse effect'	Dark side of globalization and compe-tition, more inequality	Refugees Migrations Hyper- urbaniza-tion	Governance Global regimes Co-operation/ conflict	Identities Values
Use of force	Bio-terrorism	Financial cri-sis E-terrorism Money laundering	Polarization Ungovernability Citizen security	Anti-mines Children at war Small arms Traditional disarmament	Intolerance and religious wars Local identities clashing with national and global security

solve people's most immediate problems, essentially poverty, the distribution of income and, increasingly, unemployment. From the human security point of view, it is essential to find the best tools for dealing with these insecurities. Accordingly, emphasis has been laid on the need to reiterate the principle of 'growth with equity' and establish that of 'crisis with security'. In other words, to generate and encourage the creation of mechanisms to protect people in adverse situations that includes inflation, unemployment and fiscal crises. A review of some indicators for Latin America reveals low rates of growth and great vulnerability to upheavals in the international economy, rising external debts and high unemployment rates. This last factor leads to an uncertain economic outlook for the countries of the region. From the social point of view, furthermore, we find that poverty levels are rising, social exclusion is not improving, the gap between rich and poor is widening, and social spending is low in some countries.

2. *Social integration and vulnerability.* The persistence of high levels of poverty in the region, combined with the weakness of democratic institutions, is seriously affecting the social integration of traditionally excluded sectors that are subject to severe discrimination. The sectors that are particularly vulnerable in Latin America are ethnic groups and immigrants. Empowerment of these is essential, because they are the sectors that suffer most from economic, social and indeed cultural insecurities. This section shows some examples of this exclusion. It examines more closely the subject of migration, a vital issue for human security

both internationally and regionally. It also considers the digital divide as a source of human insecurity.

3. *Politico-institutional vulnerabilities: weak democracies.* In Latin America, democracy has proved to be the best political system for attaining the goals of 'freedom from fear' and 'want'. The region has a disastrous history of violations of human rights and political rights during the periods of dictatorship, when the doc of national security was paramount. This is why it is important to consolidate democracy, as a system that has an inbuilt preference for dialogue and policy agreement, to solve disputes and promote human rights among the different actors and agents of society.

Latin American democracies tend to be weak. With a few exceptions, the region displays serious politico-institutional shortcomings that manifest themselves in recurring crises, unwarranted interference by the armed forces in domestic political matters in certain countries, lack of respect for political and civil rights and basic guarantees, high indices of corruption and institutionalized violence. It is not surprising that a feeling of profound mistrust prevails towards political parties and the crisis of representation affecting these.

4. *International security vulnerabilities (traditional).* In the Latin American region the traditional conflict and associated insecurity is linked to unresolved border conflicts. There are at least a dozen interstate border conflicts. The last small war was in 1995 between Ecuador and Peru. In countries like Colombia the guerrilla warfare has been spreading beyond national borders. In addition

important transnational security threats, such as drug trafficking and organized crime – including money laundering, kidnapping and others – threats to people security. The nature of these threats is multidimensional and required a cooperative approach to fight them.

5. *Internal security vulnerabilities.* The social violence and crime became an important problem in Latin American countries. The poverty, inequity and lack of social cohesion open opportunities to organized crime in the mayor cities. Unemployment, easy access to light weapons, and a weak police organization increase criminal rates and homicides. In addition, in many countries institutionalized violence is a constant threat; and normally the death squads are related to repression forces.
6. *Environmental vulnerabilities.* Since the 1990's the existence of a world environmental crises have been widely discussed. This has been portrayed as a problem of planetary scale whose origins are essentially human and not natural. For example, deforestation resulting from over-exploitation of woodland is reducing plant cover, diminishing genetic variety and triggering alluvial erosion and desertification.

Water shortages are also a serious problem for future development. During the twentieth century, water consumption grew more than twice as fast as population. Four in ten of the world's inhabitants live in areas where water is scarce. It is possible that by 2025, no less than two-thirds of the world's population, or some 5.5 billion people, will be living in countries where there is a serious shortage of water.

This context of deforestation and loss of plant species, water shortages and drought is generally intertwined with socio-political disasters such as armed conflict and forced migration that exacerbate the degradation, erosion and desertification of soils. The resultant loss of farming land is largely responsible for one of the main threats to people's security in the region and worldwide, i.e. food security.

82.5 New Threats in Latin America

Each one of these vulnerabilities can change into an effective threat with a great impact to human security in the region. The more traditional threats have a low probability of occurrence, but it is necessary to develop and complete the measures of mutual trust to

avoid making interpretation errors. The Special Security Conference of OAS in Mexico City in October 2003 referred to seven new threats.³ The security of states of the hemisphere is affected in different ways, by traditional threats and the following new threats, concerns, and other challenges of a diverse nature:

- terrorism, transnational organized crime, the global drug problem, corruption, asset laundering, illicit trafficking in weapons, and the connections among them;
- extreme poverty and social exclusion of broad sectors of the population, which also affect stability and democracy. Extreme poverty erodes social cohesion and undermines the security of states;
- natural and man-made disasters, HIV/AIDS and others diseases, other health risks, and environmental degradation;
- trafficking in persons;
- attacks to cyber security;
- the potential for damage to arise in the event of an accident of incident during the maritime transport of potentially hazardous materials, including petroleum and radioactive materials and toxic waste; and
- the possibility of access, possession, and use of weapons of mass destruction and their means of delivery by terrorists.

It is the responsibility of the specialized fora of the OAS, and inter-American and international fora to develop cooperation mechanisms to address these new threats, concerns, and other challenges, based on applicable instruments and mechanisms.

82.6 The South American Community of Nations

The South American Community of Nations has 12 States: Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Guyana, Paraguay, Peru, Suriname, Uruguay and Venezuela. It was created as a proposal from Brazil in 2000, where a first summit of Heads of State and Governments of the region took place. The main ideas in the first two summits were centered on the concept of integration. In the context of the III Summit progress was made towards the constitution of the South American Community of Nations, on 7 December 2004, in Cuzco, Peru.

Box 82.1: South American Presidential Summits. **Source:** Compiled by the author.

31 August 2000:	I Summit of Heads of State of the South American countries.
26 July 2002:	II Summit of the Heads of State of the South American countries.
1 July 2004:	Mercosur – Andean Community Trade Agreement.
8 December 2004:	III South American Presidential Summit.
8 December 2004:	Declaration of Cuzco.
30 September 2005:	I Summit of the South American Community of Nations
9 December 2006:	II Summit of the South American Community of Nations
28 March 2008:	III Summit of the South American Community of Nations

The foundational agreement of the South American Community of Nations expresses the need to “develop a South American framework that leads to an integration process in political, social, economic, environmental and infrastructure aspects in order to strengthen South America’s own identity.” It also states that it “has to contribute to the strengthening of Latin America and the Caribbean, providing a more visible representation in the international arena.” (Cuzco Declaration, 7–8 December 2004)

From the very beginning the South American Community of Nations signaled that peace, democracy and integration are fundamental components to guarantee development and security. The democratic commitment, in agreement with Democratic Charter of the OAS, had already been present in the context of the Declarations of Peace Zone of Usuhaiá, 1998 and Galapagos, 1989. During the Summit of 2002, in Guayaquil, the presidents signed the Declaration on the South American Zone of Peace. The leaders ratified the prohibition of the use or threat of use of force; of all massive destruction weapons; of the transit of arms through the region; and the elimination of the anti-personal mines. It also encouraged more transparency and the progressive limitation of arms purchases.

In the field of citizen security, during the Summit of Brasília, September 2005, the Heads of State released a declaration on this subject, stressing the growing relevance of the concept of human security and its ongoing evolution. They stated the importance of establishing common public policies and envision a more holistic vision of the subject.

In the official texts of the Community the concept of human security is not mentioned. However, many of the contents of citizen security are quite similar to those of human security. In South America violence and deaths due to the use of small arms and light weapons continue to be a primary challenge. Likewise, the expansion of organized crime has become a

real threat to the stability of the region. Global issues as the climate change continue to endanger the ecological balances and the biodiversity of South America. Instability and governance problems in the region are also major elements to consider. In sum, all these problems and limitations make it more difficult to reach consensus on policies and the joint confrontation of threats and vulnerabilities.

82.7 Policies for Action on Human Security

The end of the Cold War let the American continent in the path of searching and developing representative democracy. This was ensured in the Santiago Commitment to Democracy and the Renewal of the Inter-American System in 1991. This compromise was reconfirmed by the Summits of the Americas, and a decade later in Lima, Peru; on 11 September 2001 the *Inter-American Democratic Charter* was signed where essential elements of democracy are expressed such as the recognition and respect for human rights, public participation, free and fair elections, and transparency and accountability of government institutions. Article 1 established that: “The people of the Americas have a right to democracy and their governments have an obligation to promote and defend it. Democracy is essential for the social, political, and economic development of the Americas” (OAS 2001). As well Article 11 emphasizes that “Democracy and social and economic development are interdependent and are mutually reinforcing” (OAS 2001).

Even though democracy is now secure in the region, in the last decade there are signs of great difficulties expressed in high levels due to a lack of governance. The anticipated renunciation of 9 presidents, as well as the weakness and deficiencies shown by the political institutions are just part of this crisis (Rojas 2005a: 129–163). Regardless of this, since the last

Table 82.3: South American Data. **Source:** Prepared by the author.

	Territory	Population (million) (HDI 2005)	GNP – Per Capita (HDI 2005)	HDI Rank (2005)
Argentina	3,761,274 km ²	38,000,000	\$12,106	34
Brazil	8,500 km ²	181,400,000	\$7,790	63
Chile	756,096 km ²	16,000,000	\$10,274	37
Paraguay	406,752km ²	5,900,000	\$4,684	88
Uruguay	176,216 km ²	3,400,000	\$8,280	46
Bolivia	1,098,581 km ²	8,800,000	\$2,587	113
Colombia	1,141,748 km ²	44,200,000	\$6,702	69
Ecuador	270,667 km ²	12,900,000	\$3,641	82
Peru	1,285,220 km ²	27,200,000	\$5,260	79
Venezuela	916,445 km ²	25,800,000	\$4,919	75

months of 2005 to October 2006, free and fair elections took place in 12 countries in Latin America. This is a strong base for the citizens to express their will and their rights.

The results of these elections not only changed the political map of the region (Rojas 2006), they have also shown a dangerous tendency of less participation in the political processes. This signals the weak state of certain political parties, the disbelief of majority groups in the possibility of being included in the political agendas, as well as a strong feeling of disappointment with the democratic system, the rule of law, and the courts of justice to be able to resolve their needs of well-being.

Weakness in democracy and difficulties in governance will only help in limiting peoples rights. Also poverty and low levels of human development are factors that adversely affect social cohesion, the consolidation of democracy, and become issues that bend the balance against human security (Fernández 2006).

A new era of regional cooperation, the design to defend and protect the civil population, started with the decision of sending a regional military contingent – composed of troops from Brazil, Argentina and Chile – to first stabilize and then guarantee free elections in Haiti. This action can be seen as a mayor compromise with the operations for peace maintenance in the newly constituted UN Peace Commission⁴.

The human security concept has been incorporated in the definitions of the defence policy in Ecuador (República del Ecuador 2006). The President of

Chile, Ms. Michelle Bachelet (2006), reaffirmed in her UN speech on 20 September 2006 that this concept will be part of the international policy definitions in Chile.

Following the Ottawa Convention, a compromise on an anti-personal mine free zone has been adopted. Cooperative approaches and efforts of all states, as well as those of the OAS Mine Action Team will support humanitarian de-mining, mine risk education, landmine victim assistance and rehabilitation, and socio-economic recovery. As for terrorism, it is recognized as a serious threat to security, institutions, and democratic values. The entire region signed the Inter-American Convention against Terrorism where all states renew their commitment to fight terrorism and it's financing with full respect for the rule of law and international law, including international humanitarian law, international human rights law, and international refugee law.

All states in the Hemisphere signed the *Palermo Convention*, UN Convention against Transnational Organized Crime held by Italian government, in Palermo, 12–15 December, 2000. Regardless of these initiatives, actions against organized crime have been deficient. The region also signed the *Inter-American Drug Abuse Control Commission* (CICAD) and the Consultant Committee of the *Inter-American Convention against the Illicit Manufacturing of and Trafficking in Firearms, Ammunition, Explosives, and other Related Materials* (CIFTA).

The 'Maras' phenomenon in Central America is undermining weak states, bringing serious threats to democratic governance as well as national and regional stability (Rojas 2005: 56–73; Rojas 2008).

4 UN, General Assembly Resolution, UNGA document, A/RES/60/180, 20 December 2005; Ekinor (2006).

South American nations face the challenge of improving policies and actions in the double triad of human security. Achieving human development is crucial. Without resolving inequity and poverty issues, the main goal in human security will be impossible to obtain. Advancing an investigation and studies in defence and security are a part of the essential keys for conceptual development on human security. This will help improve public policies that will enhance stability and international and regional peace. In addition, for South American countries conceptual development is a key tool for the consolidation of democratic regimes and to overcome the unjust situation for its people.

83 Human Security in North America: A Canadian Perspective

David R. Black and Larry A. Swatuk

83.1 Introduction

This chapter maps the intellectual and practical terrain of human security in North America primarily from a Canadian perspective. Where it compares Canadian and U.S. perspectives and approaches to ‘human security’, it does so for illustrative purposes – the chapter does not present a systematic comparison. What the chapter shows in part is that ‘human security’ has lost much of its framing power since 9/11. The terrorist attacks on the U.S. have resulted in a restructuring of formal American approaches to foreign policy along more unilateralist and realist security lines (Harvey 2003/4). In Canada, 9/11 has helped displace the developmental aspects of human security (‘freedom from want’) by the responsibility to protect agenda (‘freedom from fear’).

This is most clearly illustrated by the former Paul Martin-led Liberal government’s ‘international policy statement’ (see below). With the rise of the minority-government of conservative Stephen Harper, Canada has continued to support the ‘freedom from fear’ agenda in its human security programme (see at: <<http://www.humansecurity.gc.ca/psh-en.asp>>). This is not to suggest that the developmental aspects of human security have been ignored by the new government. Rather, these issues have been shifted from the high-political ‘security’ agenda back to their traditional ‘homes’: the *Canadian International Development Agency* (CIDA; at: <www.acdi-cida.gc.ca>) and the *U.S. Agency for International Development* (USAID; at: <www.usaid.gov>). Fourteen years beyond the UNDP’s inaugural discussion of ‘human security’, it is clear that the core business of ‘security’ for North America’s states remains ‘security of the state’ (and by extension its citizens) first and foremost from external attacks by hostile forces (U.S. Government 2006).

American and Canadian approaches to ‘core threats’ differ markedly and in direct proportion to their roles and places in global politics. As the sole-remaining superpower, the U.S. official position is to

pursue American interests across the globe and to build coalitions if and where necessary (Swatuk 2004). The Canadian approach is more muted in line with the state’s global reach and capability. In this way, the Canadian turn toward ‘human security’ constitutes a logical extension of Canada’s post-World War II ‘middle power’ status and self-proclaimed ‘helpful fixer’ role in global politics (Holmes 1976; Wood 1988; Pratt 1989; Higgott/Cooper 1990). In contrast to American unilateralism, the ‘helpful fixer’ approach is based on multilateralism and consensus seeking and building – a process commonly known today as global governance (Black/Smith 1993; Hampson/Hillmer/Molot 2001).

The chapter proceeds as follows: after this introduction, it briefly examines current debates about human security in the North American and European settings in an indicative rather than exhaustive manner (83.2). It then describes official Canadian human security policy and practice (83.3), highlights debates among Canadian academics surrounding this approach (83.4) and offers concluding remarks (83.5).

A primary organizing concept is Cox’s (1986) distinction between ‘problem solving theory’ and ‘critical theory’. Problem solving theory accepts the basic parameters of the international system as it finds them – notably the privileged position of states – and seeks to ameliorate and ‘manage’ the action within it. Critical theory, on the other hand, takes a historicized view. It regards all orders as fundamentally transient, albeit over long historical periods, and analytically steps outside the confines of the existing order to identify both its origins, and the potential trajectories for change from the current to various alternative future orders. The distinction also entails a vital ethical dimension. Problem solving theory assumes the functional desirability of the existing order, and is therefore fundamentally conservative – both assuming and in effect working to replicate the core features of the dominant order. Critical theory on the other hand, in highlighting contradictions and conflicts within the current or-

der, highlights the potential to identify and work towards a normatively preferable future – a better, more just social and political order. As will be shown below, debates regarding the meaning and content of human security generally divide along problem solving versus critical theoretical lines.

83.2 Human Security Debates and Perspectives from Europe and North America

Since the 1994 UNDP Human Development Report, much has been said in the academic and policy worlds about ‘human security’, with an increasing circularity to on-going debates (see Paris 2001, 2004; Hampson 2002; and special section of *Security Dialogue* (2004), on ‘What is Human Security?’ for overviews). From the mid-1990’s, human security emerged as a hallmark of foreign policy in a relatively small group of more or less ‘like-minded’ states as members of the *Human Security Network* (HSN)¹, Canada central among them (chap. 75 by Fuentes/Brauch).

Clearly, there is a core network of groups and individuals committed to embedding human security in state, inter-state and non-state policy agendas (see: <www.humansecuritygateway.org> which is a Canadian research and information database managed by the Centre for Human Security at the Liu Institute, University of British Columbia). State-based support for ‘human security’ revolves around five interrelated concerns. *First*, the post-Cold War proliferation of collapsed, failed, fragile or otherwise dysfunctional states primarily found in Africa, Asia and Eastern Europe; *second*, the rise of ‘problems without passports’ (Renner 2005: 3) – e.g. small arms proliferation, climate change, drug and human trafficking, terrorism – resulting in ‘shared risks and vulnerabilities’ not amenable to single-state action; *third*, a strong desire to avoid unilateral strong/rogue-state action undertaken for power political motives, sometimes framed as ‘defence of national interests’ (and a corresponding decline in multilateral, international law-based behaviour); *fourth*, development fatigue and the end of ‘mega-conferences’: and *fifth*, real and potential

knock-on and/or spill-over effects of the preceding four factors – e.g. increasing poverty, disease pandemics, civil war, genocide, mass migration, environmental degradation (see, e.g., Government of Canada 2005; Worldwatch Institute 2005; CHS 2003).

Assumptions underlying a human security-based action agenda reflect primarily a liberal world view and a neo-liberal or liberal institutionalist theoretical position (Keohane 1984). Thus, the primary referent of security is the individual. In an interdependent, globalizing world, the capacity of individual states to ‘secure’ individuals qua citizens is limited. In several cases, states actually constitute a primary threat to the security of particular groups of people (women, children, the poor, marginalized ethnic groups). Nevertheless, states constitute the pre-eminent form of social organization and the only entity, separately or together, capable of amassing and deploying resources on a scale large enough to address complex socio-political and socio-economic problems (Mittelman 1988). Moreover, power is constituted in many forms – not just the threat and use of military force – and may reside with actors other than states. Thus, particular issues may be addressed successfully through creative networks of differently empowered actors (Axworthy 2001: 24). The global coalition of states, NGOs and social movements in support of banning – however partial – anti-personnel landmines is consistently cited as an example of the positive potential of a human security approach to shared threats and vulnerabilities (Renner 2005).

Such an analysis of world order also fits well with particular strands of constructivist social theory (Wendt 1999). Thus the international system is characterized by ‘mature anarchy’. While far from a settled social order, there is nevertheless an emergent global culture of behaviour based on norms, rules and procedures. Improved applied science across a variety of issue areas – e.g. on global climate change – is leading to the rise of ‘epistemic communities’ (Haas 1989, 1990, 1992, 1993). Social learning is leading toward global consensus on best economic and political practice. A wide variety of institutions and technologies facilitates dissemination, discussion and debate of these ideas across time and space.

Despite the neat categorization of human security into ‘freedom from fear’ and ‘freedom from want’, the actual agenda as suggested above is massive, indeed all-encompassing. The Commission on Human Security (2003) has attempted to capture these issues within six specific categories: a) violent conflict; b) migration; c) post-conflict reconstruction; d) economic insecurity; e) health threats; and f) poor educa-

1 The member states of the HSN are: Austria, Canada, Chile, Costa Rica, Greece, the Netherlands, Ireland, Jordan, Mali, Norway, Slovenia, Switzerland and Thailand, with South Africa as an observer, as well as Japan and Mexico as friends of the HSN (chap. 75 by Fuentes/Brauch).

tion. Yet, within each category are myriad issues and concerns. The post-Cold War linking of underdevelopment in the global South to insecurity in the global North ensured significant institutional overlap (Duffield 2001; Uvin 2008).²

In conflict situations, the Canadian government argues that defence must be able to fight a ‘three block war’ (combining combat, stabilization, and humanitarian relief and reconstruction; see: Government of Canada 2005: 8). Moreover, the government must employ a ‘3D’ approach (defence, diplomacy, development) to complex conflict and post-conflict situations (Government of Canada 2005: 24). This entails both an integrated ‘whole of government’ approach as well as firm commitment to multilateral cooperation.

The focus on conflict prevention through integrated, multilateral action is one part of the liberal prescriptive formula for achieving human security. Other key elements are: strong states must adhere to international rules, norms and procedures; mature democracies must lead by example; collective action based on shared consensus will lead to positive lasting outcomes; persistent political and/or economic instability of one state or region will result in the insecurity of all states and regions. The goal, baldly stated in the 2006 U.S. National Security Strategy document, is a world of liberal democratic states pursuing liberal capitalist economic policies (U.S. Government 2006; Government of Canada 2005).

While most Western liberal democracies agree on the objectives as well as the problems, there is less agreement on two key points: *One*, what has caused all this insecurity? For some it is bad governance (World Bank 1989, 1997b); for others it is ‘hyper-liberal’ globalization (Gill 1996; Panitch 1996; Panitch/Leys 2006). *Two*, how far should sovereign states commit to an agenda that may inhibit their ability to act unilaterally on the basis of national interest (in other words, how multilateral?). Most states are satisfied with drawn-out negotiation at the global level (e.g. the Doha Round) but firmer commitment at the regional level (e.g. NAFTA, EU, African Union) (Hette/Inotai/Sunkel 2001). Disagreement on these two

questions has inhibited the progress of a ‘human security’-agenda. This is particularly so in the post-9/11 context, where Washington policy makers seem unwilling to bend from a realist position of self-help across issue areas – from use of military force to global warming to farm subsidies to softwood lumber (Suhrke 2004: 365).

What we are left with is a circularity of the discussion about the meaning and utility of human security, on the one hand; and, a smorgasbord approach – where actors pick and choose what they will treat under the rubric of ‘human security’ – to implementation, on the other hand. Given that supporters and detractors of a human security approach to foreign policy constitute a global network, the North American debate is not dissimilar to the debate in Europe or elsewhere. However, America’s dominant global position and Canada’s position as the U.S.’s primary trading partner and physical neighbour, affects the ‘what is to be done?’ aspect of geopolitical analysis. Given the extent of the ‘war on terror’, it is perhaps understandable therefore that ‘freedom from fear’ has taken a central position in the state houses of Canada and the United States, with Canada’s human security programme looking very much like a ‘social triage’ – picking up the pieces and patching up the cracks in a world of states deeply affected both by post-Cold War state collapse (in West/Central Africa and the Balkans) and by the U.S.-led war on terror in the Middle East (Harvey 2004).

8.3.3 Human Security in Canadian Foreign Policy: Tracking the ‘Official’ Trajectory

Much has been written about the ‘human security’-agenda in Canadian foreign policy, particularly under Foreign Minister Lloyd Axworthy from January 1996 to October 2000.³ Canadian support through national policies and international groups, organizations and activities such as the *Human Security Network* (HSN), the Brahimi Report, and the Responsibility to Protect agenda led Grayson (2004a: 41–43) to argue that human security became a central theme in the ‘branding’ of Canada, both domestically and internationally. The Canadian government and its state-based human security fellow travellers were networked, in turn, with a diverse coalition of International and

2 The influence of Kaplan (1994) on Western government thinking is well chronicled (see Dalby 2002). The Canadian government statements begin with the premise that “security in Canada ultimately begins with stability abroad” (Government of Canada 2005: 2). The U.S. position on National Security (U.S. Government 2006) takes a similar position.

3 For a summary and critique, see Grayson (2004b), and the contributions to Hampson/Hillmer/Molot (2001).

Non-governmental Organizations in what former Foreign Minister Lloyd Axworthy characterized as the 'new diplomacy'.

Axworthy and other protagonists of human security in the 1990's drew much of their initial inspiration from the 1994 UNDP Human Development Report. Axworthy's early pronouncements on human security reflected the broad and holistic understanding articulated there:

[H]uman security is much more than the absence of military threat. It includes security against economic privation, an acceptable quality of life, and a guarantee of fundamental human rights. This concept ... recognizes the complexity of the human environment and accepts that the forces influencing human security are interrelated and mutually reinforcing (Axworthy 1997: 184).

In attempting to give operational shape to this approach, Axworthy explicitly prioritized peacebuilding (vs. peacekeeping), the campaign to ban anti-personnel landmines (in the context of broader efforts to promote disarmament), the need for greater coherence between foreign and development policies around the conceptual premises of human security (e.g., through the Canadian Peacebuilding Initiative; see at: <http://www.humansecurity.info/sites/cchs/files/pdfs/Consultation%20Papers/thibault_pdf.pdf>), the situation of children, and economic development through rules-based trade (Axworthy 1997). This last priority, in particular, illustrates how even in this early phase, there was a tendency to filter human security priorities through long-established, interest-based priorities of Canadian foreign (economic) policy. Even so, this articulation of human security clearly encompassed both 'freedom from fear' and 'freedom from want', broadly in the mold of the UNDP approach.

By 1999, however, the Department of Foreign Affairs had articulated a narrower 'freedom from fear' approach as Canada's distinctive conception of human security. While still emphasizing prevention as well as resolution of conflicts, it laid out five specific priorities focused on protecting individuals from physical threats. These priorities were: public safety, focusing on countering transnational terrorism, drug trafficking, and organized crime; protecting civilians in war-affected contexts, with emphasis on the threat of landmines, the plight of war-affected children and the internally displaced, and *in extremis* military deployments to halt atrocities and war crimes; conflict prevention, with particular attention to addressing the proliferation of *small arms and light weapons* (SALW) and the economic dimensions of civil wars; governance and accountability, from the global (In-

ternational Criminal Court) to the national and local (security sector reform) levels; and support for more sophisticated, multi-dimensional and effective Peace Support Operations (DFAIT 2002). While the recent 'International Policy Statement' (2005) has downplayed the *explicit* framing of these priorities as part of a coherent 'human security'-agenda, substantively they have been largely retained and indeed reinforced in this document.⁴

From a policy perspective, several points about this shift are worth emphasizing. First, the move to focus and narrow the 'human security'-agenda in this manner was and is entirely understandable in pragmatic policy-making terms. Indeed, despite these efforts to render this agenda more 'actionable', it remains a vast, ambitious, and in some respects highly intrusive (and therefore controversial) agenda from the perspective of practitioners of diplomatic statecraft. Moreover, it has been associated with some high profile diplomatic initiatives and achievements, however partial and fragile - notably the Landmines Convention; the creation of the International Criminal Court; the sponsorship of the *International Commission on Intervention and State Sovereignty* (ICISS 2001) and the championing of its conception of "the Responsibility to Protect" as a basis for more timely and effective responses to egregious human suffering; and the Kimberley Process to roll back the trade in 'blood diamonds', among others (at: <<http://www.humansecurity.gc.ca/psh-en.asp>>).

This raises a number of more or less immediate concerns. *First*, are Canadian resource commitments sufficient to meaningfully influence even the more focused 'freedom from fear' agenda sketched above? Certainly, prior to the IPS, the *explicit* resource commitments of CAN\$ 50 million over five years for the Foreign Affairs' Human Security Programme, beginning in June 2000, even when supplemented by the CAN \$10 million annual Canadian Peacebuilding Fund administered by CIDA, was strikingly limited in relation to the magnitude of the stated aspirations and priorities of the 'human security'-agenda. While these resource commitments have been enhanced through the creation of a 5-year, CAN\$ 500 million Global Peace and Security Fund in 2005, they remain quite minimal in relation to the expansive aspirations and demands of global human security. If, on the

4 See, for example, the discussions of "Building a More Secure World" and "Promoting a New Multilateralism" in the Diplomacy Document (Government of Canada 2005: 9-21).

other hand, one regards much of the spending on Development Assistance and at least some of the resources deployed to National Defence as crucial support for a 'human security'-agenda – a perhaps contentious but plausible claim – Canadian resource availability grows considerably (though still not sufficiently, according to the government's many critics). However another set of concerns arises about the ability of government agencies to effectively coordinate and concert their human security-oriented activities, through the 'whole-of-government' approaches that have become a policy watchword in Ottawa and other national capitals. There are also neglected questions to be posed about what *risks* may be associated with the urge to harmonize – what may be lost in the process – as well as how this governmentally-centred process of concertation affects the activities of, and relationships with, non-governmental actors?

A related concern is whether the widely-decried decline of 'problem-solving' resources – notably aid and defence capabilities (e.g., Welsh 2004: 224–234; Nossal 1998/9) – even if partially reversed through the plans set out in the IPS, effectively compromises Canadian ability to credibly promote the broader processes of normative change it has championed? What, for example, are the implications for promoting the principles associated with the 'Responsibility to Protect' of Canada's tardy and limited response to the crisis in Darfur, and the parallel neglect of equally urgent human security imperatives in, for example, the Democratic Republic of the Congo?

Third, do the priorities set out in Canada's 'freedom from fear' agenda constitute an effective basis for common action among the governments in the *Human Security Network* and others sympathetic to the concept, as well as between these governments and fellow travelling non-state actors? There is a tension here between the essentially statist desire to deploy a *distinctive* 'Canadian' approach to human security as a means of 'branding' this country with a positive image of enlightened cosmopolitanism,⁵ and the unavoidable conclusion that the urgent and wide-ranging imperatives highlighted by the notion of human security can only be effectively addressed through robust and determined collective (multilateral) action. Leadership in this domain must, therefore, be sensitive to the demands of building a broadly based normative and practical coalition across boundaries of region, culture, history, and wealth – an im-

perative that may be contradicted by urges of self-promotion and celebration.

For those *within* the Canadian government bureaucracy (and in other state-based bureaucracies) who have championed the 'human security'-agenda, there has been a strong sense of moral purpose and pride taken in what has been achieved. There is a palpable sense that they are engaged in an enterprise that is fundamentally worthwhile and, within the parameters of diplomatic practice, quite radical.⁶ Given this sense that they are pushing the boundaries of acceptable diplomatic conduct, as well as the deeply embedded assumption within diplomatic services that their proper role is to advance a relatively narrowly constructed 'national interest', human security advocates have felt a concomitant sense of intra-organizational vulnerability and a desire to minimize their differences with more traditional foreign policy priorities – for example, by stressing the essential complementarity between 'human' and 'state' security (DFAIT 2002: 1–3; Axworthy 2004). This ambiguous sense of both mission and vulnerability helps to explain some of the criticisms of the 'human security'-agenda from within the academic community, as well as the impatience and frustration expressed by human security policy makers towards their academic critics particularly on the left, who policy makers regard as potentially undermining a cause that they *should be* actively promoting and supporting.

83.4 Academic Debates

Scholarly reactions to the 'human security'-agenda in Canadian foreign policy can be loosely categorized into supporters, mostly of liberal/constructivist orientations; critics on the ideological right and critics on the ideological left. Collectively, these perspectives reflect diverse viewpoints concerning the nature of world politics and the potentialities for change in line with the 'problem solving' vs. 'critical theory' distinction, as well as varied commitments concerning the potential for the idea of human security to contribute to deep and normatively desirable change.

5 An image which does not necessarily withstand closer scrutiny; see: Grayson (2004b).

6 See essays in: McRae/Hubert (2001). These observations are also based, in part, on one of the co-author's 'participant observation' in the 'Annual Peacebuilding and Human Security Consultations' in Ottawa since 2002.

83.4.1 Supportive Perspectives

The Government of Canada (2005: 1) describes its approach to human security as “a people-centred approach to foreign policy which recognizes that lasting stability cannot be achieved until people are protected from violent threats to their rights, safety or lives”. The official viewpoint is that the human security programme “permits Canada to take leading edge positions on human security issues at a relatively low cost.” The Human Security Programme provides the Department of Foreign Affairs and International Trade with a tool for advocacy, leverage and support for multilateral initiatives (Government of Canada 2005).

Among the intellectual supporters of this approach are many analysts associated with development and disarmament NGOs, frequently affiliated with the *Canadian Peacebuilding Coordinating Committee* (CPCC; see: <<http://www.peacebuild.ca/>>; also NSI 2004; Regehr/Whelan 2004). Their approach is substantially based on informed ethical commitments and policy advocacy. They would certainly agree that the resources devoted to human security endeavours have been insufficient – often grossly so. Nevertheless, they see this agenda as a valuable innovation insofar as it compels a response to urgent humanitarian imperatives. They also see it as paving the way, potentially at least, towards deeper processes of change and innovation aimed at enhanced prevention of deadly conflicts and the building of ‘deep’ and sustainable peace. In this sense, their approach straddles the ‘problem solving’ vs. ‘critical theory’ divide. These researcher/activist/practitioners have a delicate strategic relationship with government officials supportive of human security within government – as more or less dependent allies, and at the same time as ‘civil society actors’ who must sustain a degree of critical distance to be legitimate and effective (see: <www.hsn.ubc.ca>).⁷

The multilaterally-funded *Human Security Centre* located within the University of British Columbia’s Liu Institute for Global Affairs constitutes a crucial node for coordinating activities and building networks both within Canada and around the world (<<http://www.humansecuritycentre.info/>>). The CIDA and

Foreign Affairs supported *Canadian Peacebuilding Coordinating Committee Annual Meeting* provides an important platform for state, NGO and academic actors to come together around crucial ‘freedom from fear issues’ (see, e.g. <<http://www.peacebuild.ca/consultations/?language=english>>). These consultations bring together Canadian, U.S. (e.g. *Harvard University’s Program on Humanitarian Policy and Conflict Research* (HPCR); *International Peace Academy*; the Fletcher School’s *Human Security Institute* at Tufts University; the *Centre for Unconventional Security Affairs* at the University of California-Irvine) and other (e.g., the Canadian government-supported *Human Security Institute* in Amman, Jordan) actors in an ever-growing network of support for the ‘freedom from fear’ agenda.

More theoretically, scholars from a liberal/constructivist perspective have emphasized the importance of the long-term global social change in creating the basis for a more just and secure global order. Through processes of normative change and institutional innovation, states *can be* increasingly compelled and constrained to embrace more ethically oriented policies, underpinning enhanced human security. Of course, this is a long-term process, and states will always have mixed motives. Scholars from this perspective argue, however, that rather than being simply dismissive of states’ professed commitments, critics should ‘hold them accountable to such standards ... demand consistency, and ... remain vigilant against the manipulation of moral norms for self-serving and short-sighted purposes’ (Franceschet/Knight 2001: 61). From this perspective, Canada’s (and Lloyd Axworthy’s) ‘human security’-agenda looks much more promising, even if this promise remains fragile and uncertain. Initiatives such as the Landmines Convention, effective support for the creation of the Rome Statute establishing the International Criminal Court, sponsorship of the ICISS and promotion of the “Responsibility to Protect”, and the campaign to create legal and institutional prohibitions on the trade in Small Arms and Light Weapons are all potential advances towards greater human security. Moreover, Canada’s role – through ‘soft power, moral suasion, and norm entrepreneurship’, or as a ‘tipping agent’ in constructing and popularizing new international norms through a process of ‘cascade’ (Franceschet/ Knight 2001; Howard/Neufeldt 2000) – has been highly significant.

Whether the diminution of ‘hard power resources’ (military and developmental) decried by the mainstream critics, as discussed below, significantly compromises these efforts to promote normative and in-

7 The ‘problem solving’ and ‘critical theory’ gap is often bridged in policy-oriented research that is funded by government, managed through university structures and involves several academics from different (liberal, feminist, post-modern/ structuralist) theoretical positions (see, e.g. Baines/Thomson/Wilson 2005).

stitutional innovation is an important though elusive question. Does Canada still have the standing and influence to play a leading role in such processes? How is this standing and influence created and sustained? At a deeper level, critical scholars question how much these high-level, reformist processes of normative and institutional politics change the underlying power structures of the global order, or simply create the *illusion* of change, thereby deflecting and demobilizing sources of potent and justified dissent (Panitch/Leys 2006). However, most supporters of human security as proselytized by Western governments would agree with the Harvard University HPCR claim that human security is ‘a complement to state-centric security models’, not a substitute for them (<<http://www.hpcr.org/>>). Where there are formal programmes in place – such as those at Tufts, University of California-Irvine, UBC – it is clear that they are designed to work within the interstices of state priorities. Given that, in U.S. President Bush’s words ‘America is at war’, this leads inevitably to a programme concentrating on ameliorating the worst effects of the exercise of traditional forms of state power (U.S. Government 2006).

83.4.2 Conservative Critics

One, more theoretical line of criticism takes seriously the radically transformative and cosmopolitan potential of human security, and argues that such a development is imprudent or even dangerous in a highly pluralistic world. This ‘Grotian’ or ‘international society’ perspective cautions that it is unwise, at best, to destabilize long-established norms of sovereign autonomy and self-determination, by potentially legitimizing intrusions of external actors in the name of the universalistic ideal of human security, and thus giving license to ‘crusading’. According to William Bain, “(t)he ethic of human security challenges and possibly undermines the moral foundation of international society as it has existed for nearly four-hundred years”, and “a foreign policy which is guided, at least in part, by a universal doctrine such as human security is difficult to reconcile with the practical realities and fundamentally pluralist nature of international society” (Bain 1999: 85 and 86). This critique finds resonance among many in the developing world, who pointedly question the target selection and motivations of the predominantly rich, Western ‘interveners’ in situations of profound human insecurity (Ayoob 2001). In the final analysis, this critique overstates the degree of universalistic coherence associated with the idea of human security. It also overestimates the continuing force of

the traditional norms of state-centric international society in a globalizing world context, and underestimates the adaptability of state-based authorities and prerogatives. It is important, however, in highlighting key tensions and dangers associated with the normative changes that human security promotes.

The critique of excessive and unseemly crusading is also a core feature of a second line of conservative criticism. From the perspective of some of the leading ‘mainstream’ scholars of Canadian foreign policy, there is nothing inherently wrong with devoting public resources to the amelioration of suffering in the name of human security where prudent and feasible (what Kim Nossal might characterize as voluntaristic acts of ‘good international citizenship’; see Nossal 1998/99: 98–105). They do, however, stress the continued centrality of states in world politics and the privileged status of inter-state security interests in the hierarchy of world issues, in line with ‘problem solving’ theory assumptions. They also stress that states are fundamentally and appropriately accountable to their own citizens; and they decry the excessive moralizing and hypocrisy which they see in a ‘human security’-agenda that promises much but can deliver very little, given the egregious neglect of traditional instruments of statecraft (Stairs 2001; Hampson/ Oliver 1998; Welsh 2004: 183–186). This, they imply, has the ultimate effect of diminishing the Canadian state, both intrinsically and in its ability to operate effectively in international affairs. Such a theoretical stance is at the heart of U.S. foreign policy both past and present, although one might disagree with the means chosen to secure the ‘national interest’ in the post-9/11 era (<<http://www.thenation.com/doc/20020715/falk>>). Similarly, the Canadian shift away from a broad ‘human security’-agenda, to a narrower ‘freedom from fear’ approach, to the close political and economic links Canada has with the U.S. (Government of Canada 2005).

A third, related type of worry, emanating from some scholars of international law, is that human security, by ‘securitizing’ a wide range of global dangers, opens the door to their being constructed as ‘threats’ and thereby gives license to a much more permissive approach to the application of force by those in a position to use it. For Vale (2002: 149), the UNDP-initiated focus on human security “helped to break the stranglehold that the military enjoyed over the security discourse ... But perversely it empowered the military, for the expansion of the security discourse enabled the military to redefine its role in multiple new ways.” Similarly, for Bruneel and Toope (2004: 258),

“The human security’-agenda is being perverted so that the stress is on ‘security’ and not on humanitarian concerns.” States and other advocates of human security have been too cavalier about the importance of traditional legal prohibitions on the use of force and the dangers of their erosion, with the result that many people may be rendered *less* rather than more secure. They have in mind, of course, the human costs associated with the war in Iraq and other excesses associated with the ‘war on terror’.

Interestingly in light of this concern, there has been at least one contribution to the debate from the security studies mainstream that has argued *for* the human security doctrine in Canadian foreign policy, on the grounds that it “has paved the way for nothing short of the rescuing of Canadian defence policy from military irrelevance and strategic sterility.” Sokolsky and Jockel (2000: 1) argue that the rise of the ‘human security’-agenda, with its much more frequent demands for robust interventions in situations of instability and conflict, has provided a far more compelling strategic rationale for upgrading the Canadian armed forces than the Cold War context did, and for enhancing their interoperability with allies – particularly the United States.⁸ They also argue that the ‘human security’-agenda has the *realpolitik* virtue of being fundamentally discretionary: policy makers can ‘pick and choose’ which human security causes they wish to pursue. Whether Canadian public opinion and transnational mobilization allow as much political discretion as the authors suggest is debatable, but critics on the left would share the overall view that these interventions have been treated as fundamentally discretionary and have therefore been far less timely and generous than the real needs of the people affected would warrant.

Notwithstanding Sokolsky and Jockel’s dissent, however, the dominant view of critics in this broad ‘problem solving’ category is that human security may be excessively destabilizing as an ideal, leads to false and inflated expectations, provides little or no basis on which to set priorities among competing claims on government attention and resources, and breeds unseemly and counter-productive crusading and sanctimony. The more muted tone of discussions of human security in the ‘International Policy Statement’ suggest that these criticisms have been telling among foreign policy-makers, even if much of the *substance* of the

‘freedom from fear’ agenda has been retained and re-inforced.

83.4.3 Critical and Transformative Perspectives

From this perspective, the Department of Foreign Affairs and International Trade (DFAIT) retreat from the more holistic and structural vision embodied in early human security pronouncements towards the more limited ‘freedom from fear’ agenda robs the concept of its transformative potential. Indeed from the outset, Lloyd Axworthy’s argument that the path to economic development (and hence human security) lies through ‘rules based trade’ – and hence the promotion of economic and trade liberalization along neo-liberal lines at national, regional, and global levels – is regarded by critics on the left as fundamentally compromising the promotion of human security. On this analysis, the ‘freedom from fear’ approach ends up addressing the worst manifestations of human insecurity, while neglecting a deeper analysis of both their links to structures of inequality, and Canada’s and other Western governments’ and societies’ complicity in those structures – notably through the neo-liberal trade and development policies we propagate (see, *The Socialist Register*, at: <<http://socialistregister.com/>>).

Canada’s ‘human security’-agenda also discursively constructs human insecurity as something emanating from the global South – thereby reinforcing the widely-held view of the South as a source of *threat* to Northern security, while deflecting attention from manifestations of human insecurity in Canada (Dalby 2002; Swatuk 2005a; Swatuk/Vale 1999). It also ignores the role of Western actors in creating persistent instability in the global South. For Renner (2005: 16), ‘The term ‘failed state’ hides an inconvenient truth: external factors are equally important’ (Callaghy/Kasimir/Latham 2001).

In its ‘freedom from fear’ variation, therefore, human security becomes a conservative, problem-solving approach – a palliative for and deflection from the deeper causes and manifestations of human *insecurity* (Swatuk 2001). Indeed, by masquerading as something radically new and transformative, this idea actually becomes retrogressive. In Kyle Grayson’s provocative and compelling analysis, ‘[n]ot only is there the illusion of change, but it is presented as a real and ultimate solution to the problem at hand. This, of course, greatly augments the hegemonic interests of particular actors, as existing asymmetrical power relations remain in place’ (Grayson 2004b: 49).

8 Hence, the particularly smooth fit among commerce, diplomacy, defence and development in Canada’s international policy (Government of Canada 2005).

This kind of deep critique is likely to be greeted with impatience and even hostility by many officials and practitioners who are doing the 'heavy lifting' on human security within government, and in various international and non-governmental organizations. Surely, by intellectualizing and criticizing the efforts of those attempting to ameliorate human suffering – both through immediate responses and through efforts to build the foundations for long-term normative change – such critical approaches are bound to be resented by those on the 'frontlines'. As post-conflict situations relapse into renewed violence with alarming frequency, however, and as diverse global threats – ecological, economic, and cultural – mount, such deep critiques need to be taken seriously if the more transformative and emancipatory potential of human security is to be approached.

While acknowledging, even absorbing, post-modern, feminist and other theoretical insights into the dangers of emancipatory projects, critical theorists generally focus on the need to construct a fairer world order through organized social protest, reformed international institutions, and sophisticated international law and regulation (Bond 2001; Cox 1997; Mittelman 1996). For many scholars of the left, this requires a clinical approach to politics (making positive inroads toward social justice wherever and whenever possible), as opposed to the cynical politics practiced by neo-realists (Pettifor 2003; Hayden/El-Ojeili 2005).⁹ Critical scholars in North America have generally engaged with 'problem-solving' theory and practice across two broad fronts: one, in the area of security studies (Krause/Williams 1997; Dalby 2002); the other, regarding the character and consequences of neoliberal globalization (Gill 1992; Cox 1997). The human security debate is not often engaged directly by critical theorists although all theoretical perspectives are ostensibly interested in world order values of peace, economic prosperity and environmental sustainability.

For many critical scholars, the human security debate exists at a superficial level. The real issues surrounding human *insecurity* are to be found at the level of a neo-liberal capitalist world order: address these inequalities and most other problems will fall away. This argument was at the heart of the post-9/11 debate regarding appropriate American responses to

terrorism. For scholars of the left, the new American imperialism was itself the cause of 9/11 (Panitch/Gindin 2005). It is primarily for this reason that critical scholars give the 'human security' debate short shrift.

Thus, leftist critics regard Canada's commitment to both globalization – albeit 'a fairer globalization' (Government of Canada 2005) – and deeper forms of integration with the United States (particularly economic and military) as ensuring that at best human security as practiced in Canada will be little more than 'poor relief and riot control' (Cox 1987).

83.5 Conclusion

In North America, human security as an academic pursuit remains a marginal addition to a mainstream overwhelmingly concerned with traditional issues of war and peace. It is telling that neither the Worldwatch Institute's 2005 annual 'State of the World' (focused on global security) nor the Krause and Williams (1997) seminal collection on critical security studies even mention the term 'human security'. While there are pockets of interest scattered across Canada and the United States, the number of actors and institutions specifically involved in human security research, teaching and advocacy is limited. Moreover, most of these actors are linked directly to U.S. and Canadian governments – for funding and through policy networks. These links limit the parameters for thinking beyond the narrow confines of state-determined interests. In our view, this explains why the study and practice of human security in North America is overwhelmingly centred on the 'freedom from fear' agenda, and why 'freedom from want' issues continue to be considered 'low security' and properly housed at CIDA and USAID.

To be sure, the debate regarding meaning and content of 'human security' is a global one. The networks being created – albeit with limited funds – are also global. At the same time, however, human security as theory and practice takes on particular forms in Canada and the United States, in part due to the specific geographies and geo-political economies of the two states. In our view, 'human security' has been folded into on-going practices of statecraft, and any emancipatory potential contained within the concept has been lost particularly since 9/11. While the U.S. government claims to 'champion aspirations for human dignity', the Bush doctrine makes it clear where American national security priorities currently lie (U.S. Government 2006). As a state politically and

9 This is a distinction first made to the authors some years ago by Craig Murphy as the then editor of *Global Governance* in a personal communication in August 1999.

economically subordinate to and dependent upon the United States, Canada finds real currency in 'human security'. It complements its historical self-definition as a 'helpful fixer' in global politics and its contemporary place as key American ally in North America.

One would like to see the North American debates regarding human security engage more directly with the critiques made by critical scholars on the left. This would mean, in part, reinvigorating discussions regarding the ways in which 'fear' and 'want' are inter-related, including exploring possible causal pathways. However, current trends suggest that this is unlikely to happen, so pressing are the needs of people caught in the crossfire of the war on terror.

84 Human Security Initiatives of Japan

Hideaki Shinoda

84.1 Introduction

This chapter examines the use of the concept ‘human security’ by the government of Japan and its implications. It argues that this concept has been favourably accepted by the Japanese government as a policy theme and it interprets how the government refers to it. While there are historical and political contexts in which Japan is naturally attracted by concepts like human security, it would be premature to assert that Japanese foreign policy as a whole is guided by this human security concept.

As its military power is constitutionally constrained, Japan naturally constructs security policies to cover not only military affairs but also economic and social affairs. The oil crisis in the 1970’s accelerated the pressure for Japan to develop a broad security perspective and invent the concept of ‘sogo-anzenhoshou’ or ‘comprehensive security’ (Nakanishi 1998: 150–154). The scope of ‘comprehensive security’ corresponded with that of human security insofar as both are intended to cover economic and social security concerns in addition to military ones (Miyawaki 1997: 54), although the concept of ‘comprehensive security’ did not yet address a ‘human-centred’ perspective.

When Kaoruko Kuruu introduced the debate about human security in the journal of the Japan Association of International Relations in 1998, the concept had not gained popularity among Japanese scholars (Kuruu 1998). But her article as well as some others’ appealed to the Japanese audience who were not satisfied with the “traditional” understanding of security. In general, those who were critical of the state-centred conception of security, or Japan’s security alliance with the United States, tended to take the idea of human security favourably. A research group chaired by Makoto Katsumata emphasized human security in order to examine negative impacts of economic globalization (Katsumata 2001). One of those involved in the group later published a lengthy

book on human security, in which the author looked over human-security-related discourses in major civilizations in the world (Mushanokoji 2003).

There are some others who take human security sceptically. It seems that most Japanese scholars on international relations initially found the concept of human security too ambiguous. Experts on ‘traditional security’ seldom speak of human security. On the other hand, Hiroyuki Tosa, post-positivist international relations researcher, harshly attacked the spread of the discourses on human security, insisting that it was in fact an inhumane standardization of human beings by the dominant power holders (Tosa 2003).

But neither scholastic scepticism nor philosophical examination prevented the Japanese audience from taking human security favourably. Sadako Ogata, one of the chairs of the *Commission on Human Security* (2003) became the president of the Japan International Cooperation Agency (JICA) and created a specialized section on human security issues within the structure of JICA. Many Japanese NGOs also talk about human security in favourable manners. An editorial writer of the Asahi Newspaper published his reports on international affairs under the title of ‘the strategy of human security’ (Yoshida 2004). Shinoda and Uesugi pointed out similarities between national security and human security as strategic perspectives, and also advocated more policy-oriented studies of human security (Shinoda/Uesugi 2005).

With this generally positive attitude toward human security in Japanese society, the government of Japan often emphasized the importance of human security and incorporated it into its foreign policy. According to the Ministry of Foreign Affairs (MoFA): Japan emphasizes ‘Human Security’ from the perspective of strengthening efforts to cope with threats to human lives, livelihoods and dignity as poverty, environmental degradation, illicit drugs, transnational organized crime, infectious diseases such as HIV/AIDS, the outflow of refugees and anti-personnel land mines, and has taken various initiatives in this context. To ensure ‘Human freedom and

potential', a range of issues needs to be addressed from the perspective of 'Human Security' focused on the individual, requiring cooperation among the various actors in the international community, including governments, international organizations and civil society (Ministry of Foreign Affairs of Japan, 2000, 2000a).

Taking this statement into account, this chapter analyses where human security concerns are reflected in Japanese foreign policy, and where Japan is advancing human security as a rationale for its development policy and humanitarian aid. But this does not imply that Japanese foreign policy as a whole is based on human security concerns.

84.2 Initial Reference to Human Security by the Japanese Government

After the Asian financial crisis, Japanese officials began to refer to human security. At an international conference in December 1998, Prime Minister Keizo Ouchi remarked:

The current economic crisis has aggravated those strains, threatening the daily lives of many people. Taking this fact fully into consideration, I believe that we must deal with these difficulties with due consideration for the socially vulnerable segments of population, in the light of 'Human Security', and that we must seek new strategies for economic development which attach importance to human security with a view to enhancing the long-term development of our region. ... While the phrase 'human security' is a relatively new one, I understand that it is the key which comprehensively covers all the menaces that threaten the survival, daily life, and dignity of human beings and strengthens the efforts to confront those threats. ... To support Asian countries in this economic crisis, we have pledged and steadily implemented contributions on the largest scale in the world. With Human Security in mind, we have given, as one of the most important pillars of our support, assistance to the poor, the aged, the disabled, women and children, and other socially vulnerable segments of population on whom economic difficulties have the heaviest impacts (Obuchi 1998).

Obuchi mentioned human security on his visit to Vietnam in the same month, and pledged to contribute 500 million yen (US\$ 4.2 million) to the establishment of the *Human Security Fund* under the United Nations (Obuchi 1998a). Obuchi (2000, 2000a) and his Foreign Minister Masahiko Komura (2000, 2000a) have repeatedly mentioned human security in Japan's national Diet and at the UN General Assembly. The topic of human security was discussed at sev-

eral international conferences hosted by the government of Japan and raised by Japan at summit meetings.¹ Foreign Minister Obuchi was a politician who was interested in advancing humanitarian affairs in international society, and he played an active role in signing the anti-land mines treaty.

Yukio Takasu (2000), then Director-General of Multilateral Cooperation Department of the MoFA, explained the Japanese interest in human security in 2000 by stating that:

The Japanese understanding of human security is very similar to the comprehensive and inclusive concept advocated by UNDP. I believe that Japan's experience since the end of the Second World War in promoting prosperity and the well-being of its people through economic and social development makes it particularly well-prepared to advocate such a broad concept of human security. We are confident, moreover, that this is the direction in which the world will be heading in the 21st century.

Takasu (2000) continues to link human security with Japanese foreign policy by emphasizing that "Human security is not a brand new concept. While the ultimate responsibility of a state is to protect its territory and safeguard the survival and well-being of its people, sound governments have long pursued human security as part of their national policy." While admitting that "the level of attention and high priority accorded to human security internationally these days are a reflection of several developments," he adds that:

I must hasten to add that the role of government will not diminish in a human-centered century. Human security efforts will not replace national security arrangements - the protection of territory and the life and property of the people remain the responsibility of government. While national security is prerequisite for ensuing security - that is, the survival and dignity of the individual - it is not the only requirement. Even if a state becomes rich and strong, there is no guarantee that the individuals who live in that state will be safe and rich. The role of government is to provide a foundation or environment that will enable individuals to take care of themselves and to develop their capabilities without undue restrictions (Takasu 2000).

It is evident that the Japanese government took advantage of the possibilities of human security by linking it with the international position of Japan. The central role of governments for human security pro-

1 See: Takemi (1999, 1999a); Takasu (2000, 2000a, 2000b); Ministry of Foreign Affairs of Japan (2000, 2000a, 2000b, 2000c); Komura (2000a).

vides Japan with a new mission. MoFA's *Diplomatic Blue Book 2000* referred to the concept of human security as a principle for Japan to tackle such broad international problems as global environmental issues, terrorism, transnational organized crime and drugs, protection of human rights and promotion of democratization, healthcare, international cooperation on the peaceful use of nuclear power and science and technology, and international emergency assistance for natural disasters.

The United Nations Trust Fund for Human Security, established by the Japanese contribution to the UN, has initiated projects ranging from the Human Dignity Initiative Project carried out by the UN Economic and Social Commission for Asia and the Pacific (ESCAP), the Medical Training Project in Tajikistan, designed by UNDP, the Tokyo International Conference on Semipalatinsk, to the Emergency School Rehabilitation in Decane, Kosovo, carried out by UNICEF with a Japanese NGO. Japan also earmarked 6.6 billion yen (US\$ 55.05 million) for the Fund from the Fiscal Year 1999 supplementary budget to assist the rehabilitation of Kosovo and the return of refugees, as well as the rehabilitation of East Timor (Ministry of Foreign Affairs of Japan 2000). As Prime Minister Yoshiro Mori announced in his speech at the UN Millennium Summit on the expansion of the UN Trust Fund for Human Security, Japan added to the Fund 2.5 billion yen (US\$ 23.81 million) in July 2000, an additional 1.5 billion yen (US\$ 14.48 million) in March 2001, 7.7 billion yen (US\$ 72.16 million) in August 2001, and 4 billion yen (US\$ 32.79 million) in February 2003.² In total, 25.9 billion yen (approximately US\$ 227 million) has been so far contributed by Japan to the Trust Fund (Japan remains the sole contributor of the Fund).³ This approximates the amount of Japan's annual contribution to the UN budget.⁴

The *Diplomatic Blue Book 2004* (Ministry of Foreign Affairs 2004: 185) enumerates major areas of support by the Trust Fund as follows:

-
- 2 For a "Chronology of activities related to Human Security by the Japanese Government," see details at: <http://www.mofa.go.jp/policy/human_secu/chronology.html>.
 - 3 See Ministry of Foreign Affairs (2004: 185).
 - 4 Around the time Japan was expanding the Trust Fund, Japan's assessment rate for the UN budget went down from 20.57% in 2000 (22.7 billion yen) to 19.63% in 2001 (21.7 billion yen). With the same assessment rate, however, the actual amount went up in the following years to 26.6 billion yen in 2002 and 32.1 billion yen in 2003.

Poverty: community reconstruction, vocational training, food production and the protection of children; medical and health care: reproductive health, control of infectious diseases such as HIV/AIDS and improvement of public health; refugees and internally displaced persons, assistance and conflict-related areas such as social reintegration for ex-combatants through vocational training (Ministry of Foreign Affairs 2004).

To further develop the human security concept, the Japanese government sponsored the Commission on Human Security⁵ that was co-chaired by the former UN High Commissioner for Refugees, Sadako Ogata, and Professor Amartya Sen, Master of Trinity College, Cambridge University, and composed of 10 prominent figures, including Ambassador Lakhdar Brahimi. The Commission held its first meeting in June 2001 and five more meetings up to February 2003. Ogata and Sen submitted the summary of the Final Report to the Japanese Prime Minister, Junichiro Koizumi, in February 2003, and the actual Final Report to the UN Secretary General, Kofi Annan, in May 2003.

The main proposals of the Commission in its Final Report were explained as follows: (1) Protecting people in violent conflict; (2) Protecting people from the proliferation of arms; (3) Supporting the security of people on the move; (4) Establishing human security transition funds for post-conflict situations; (5) Encouraging fair trade and markets to benefit the extreme poor; (6) Working to provide minimum living standards everywhere; (7) According higher priority to ensuring universal access to basic health care; (8) Developing an efficient and equitable global system for patent rights; (9) Empowering all people with universal basic education; (10) Clarifying the need for a global human identity while respecting the freedom of individuals to have diverse identities and affiliations.⁶

It is apparent that the first part in the Final Report (chapt. 1-5) were within Ogata's areas of concerns, and corresponded to 'freedom from fear', while the latter part of the report (the following five chapters) were within Sen's and corresponded to 'freedom from want'. As Ogata is close to the Japanese diplomatic circle, the influence of the Japanese government on the report has been widely specu-

5 See: Ministry of Foreign Affairs of Japan: "Commission on Human Security", at: <http://www.mofa.go.jp/policy/human_secu/commission/index.html>.

6 See: Commission on Human Security website, at: <<http://www.humansecurity-chs.org/finalreport/index.html>>.

lated. While there remained a demand to the international community for decisive actions in the realm of humanitarian causes (probably to the extent that Japan usually does not commit itself), it can be contended that the way the Commission set agendas was preferable to the Japanese government. The report covers the areas of concerns in which Japanese assistances have been conspicuous.

The Commission developed into the *Advisory Board on Human Security* in order to “carry forward the recommendations of the Commission.” The Advisory Board is composed of 8 members. Ogata remained as the chair, while Sen left. Three other members of the Commission remained, including Brahimi, and the Japanese Ambassador to the UN joined. It advises the UN Secretary General concerning the management of the UN Trust Fund to ensure that the general orientations of the Trust Fund fulfil its objectives as specified by the Commission’s Report.⁷

84.3 The Japanese Government’s Reference to Human Security in the Post-9-11 World

The world has changed after 11 September 2001. If not so in some or many nations, a certain change in the world-view has occurred in the United States, and with its major allies like Japan. It was evident that the Japanese government began to seek the way human security would be located in the new paradigm of the post September 11th world.

In December 2001, MoFA held an international symposium in Tokyo under the theme of ‘Human Security and Terrorism’. The members of the Commission on Human Security were mobilized to participate in the symposium – or accurately speaking, it had been originally prepared for them. In a similar tone, an international symposium was held in Tokyo again under the theme of “Human Security – Its Role in an Era of Various Threats to the International Community.”⁸

In the 2001 symposium’s opening speech, Prime Minister Koizumi began with the terrorist attacks of

11 September, recognizing such as a “threat to the entire humankind and challenge to democracy and freedom.” But he added, “prompt actions of the international community to prevent and eradicate terrorism, and its united initiatives concerning Afghanistan, have given us a ray of hope.” He continued:

Japan has made efforts to strengthen international solidarity, knowing that the fight against terrorism is a challenge of our own. Moreover, Japan proactively supported Afghan refugees through providing rescue materials and transportation as well as through extending economic assistance to neighbouring countries. Now, with Mrs. Sadako Ogata, my special representative, Japan will continue to contribute human resources and provide active support through United Nations organizations. Furthermore, in late January next year, Japan hosts a ministerial level Afghanistan reconstruction conference. Japan will also participate actively in the broad-based international initiatives against terrorism, through concluding and ratifying international conventions, cutting financial sources of terrorist organizations and taking other measures. Terrorism should never be tolerated, regardless of motives, since it threatens the survival, livelihood and dignity of citizens with heinous violence and killings. At the same time, we should take a closer look at the possibilities that armed conflicts, poverty and other socio-economic factors create ‘hotbeds’ for terrorism. To eradicate terrorism, it is necessary to tackle not only terrorism itself but also other diverse threats to individuals. This means that we have to build and sustain a society where individual human beings can fully realise their possibilities. This is what human security aims at, and this is what Japan’s foreign policy has attached importance.⁹

Apparently, while Japan kept its traditional emphasis upon “freedom from want,” it never doubted the military solution to terrorism conducted by its senior ally. What Japan sought to do was to present the field of its traditional activities as part of the fight against terrorism.

The 2003 symposium was an occasion for the members of the Commission on Human Security to present their views that were supposed to be reflected in the Final Report. There was no expert on terrorism among the Commission members. But the Minister for Foreign Affairs, Yoriko Kawaguchi, began her speech by saying that “in the first year of the new century, we witnessed the 11 September terrorist attacks, which victimized many people, including Japanese nationals.” She then remarked:

8 See: “Chronology of activities related to Human Security by the Japanese Government”, at: <http://www.mofa.go.jp/policy/human_secu/chronology.html>.

9 Remark by Mr. Junichiro Koizumi, Prime Minister of Japan, Tokyo, December 15, 2001, at: <http://www.mofa.go.jp/policy/human_secu/sympoo112_pm.html>.

I believe that the ideal of human security calls us to strengthen our efforts to enable each individual human being to achieve his or her abundant potential, and to ensure that the viewpoints of individual people are respected. The Japanese Government has actively promoted these goals as an important perspective in Japan's foreign policy, and since last year, I have personally continued to stress, in newspapers, magazines and other media, that human security should be one of the areas of emphasis of Japan's foreign policy and its Official Development Assistance (ODA) ... can assure you that the Japanese Government intends to take into account the Report's findings while developing new measures to further promote its foreign policy focused on human security. We will do so at a wide range of fora, such as the United Nations and other multilateral gatherings, and as we advance bilateral cooperation with individual countries as well. Japan's ODA has been playing an effective and important role in promoting human security. The Government has decided to greatly expand its conventional grant assistance for grassroots projects by offering 'grassroots human security grant aid', in keeping with the human security concept. Through its establishment of the Trust Fund for Human Security in the United Nations in March 1999, Japan has continued to offer concrete assistance, giving an orientation to the activities of international organizations that is based on the concept of human security. From now on, on the basis of this Report, Japan aims to utilize these two tools for realizing human security even more actively, achieving effective synergies between the two.¹⁰

Kawaguchi did not forget to mention the limit of state sovereignty and the necessity of human security. But by connecting Japan's aid to September 11th, she implied that Japan's efforts for human security would contribute to the "fight against terrorism," while the US was making efforts in the field of traditional security. Japan could duly support US activities, since it was presupposed that there was no contradiction between national security and human security.

The *Diplomatic Blue Book 2002* and *Diplomatic Blue Book 2003* mentioned human security only as a subsection of a chapter. *Diplomatic Blue Book 2004* somehow reversed the trend by including human se-

curity in the section title "Efforts to tackle Various Global Issues to promote Human Security" of a chapter on: "Japan's Foreign Policy in Major Diplomatic Fields." A general discussion on the Human Security Trust Fund and the Commission on Human Security in the section was followed by Controlling Infectious Diseases, Sustainable Development and Global Environmental Issues, Transnational Organized Crime and Illicit Drugs, and Human Rights.¹¹ So, human security is one of has now joined the major diplomatic fields and has now been mentioned to present a list of Japan's international assistances in social affairs.

Human security does not provide a dramatic change in Japan's ODA policy, while the so-called ODA Charter was revised to include human security in 2003. The revision indicates how human security is incorporated into Japan's foreign policy. Human security was recognized as the major principle of "Japan's Medium-Term Policy on ODA," which was understood to link the ODA Charter with specific Country Assistance Plans. This medium-term policy uses the terms "protection" and "empowerment" borrowed from the Final Report of the Commission on Human Security in order to explain how ODA leads to its ultimate goal of "people's life with dignity" or "strengthening local community." In short, Japan's reference to human security is intrinsically linked with its ODA and other forms of international aid. But it does not go beyond it. Thus, the position to promote human security is not contradictory to other major diplomatic fields, since it is very important in a compartmentalized way.

The Trust Fund for Human Security does not have a particularly coherent application of human security, as grants are provided according to the applications from existing UN agencies.¹² There is another channel of aid by the government of Japan called "grassroots human security grant aid." Eighteen projects for Iraq (exclusively for the Samawah region where the Self Defence Forces [SDFs] are stationed) have been implemented, in addition to two for Afghanistan and one for the Kyrgyz Republic.¹³ It is strategic with respect of the focused area, but not with regard to a coherent aid policy. It is more important to say that Japan's policy on human security does

not contradict its own pursuit of national security, as well as its allies' pursuit of national security. Human security will just reinforce them by broadening the sphere of security.

An interesting remark was made by Keitaro Sato, Special Adviser to the Minister for Foreign Affairs of Japan, when he attended a Ministerial Meeting of the Human Security Network as an observer in May 2004. He explained that “[t]he Japanese concept on human security is clearly in line with the conclusions of this report [of the Commission on Human Security],” while praising the efforts of the Commission, especially Ogata. He added that it was because the “Japanese notion of human security is to complement traditional state security by being people-centred and addressing insecurities that have not been considered as state security threats.” He then went on to point out the difference between the Network’s concept of human security and Japan’s.

As I stated previously, the concepts of human security promoted by the Network and by Japan are very similar...However, the fact remains that countries such as Cuba, Brazil, Mexico and Egypt raise objections to the phrase “human security,” because they believe that it means intervention in domestic affairs by foreign powers in the name of humanism. The Chair’s Summary delivered at the Fifth Ministerial Meeting of the Network last year stated that the Network will further discuss the recommendations of the report of the International Commission on Intervention and State Sovereignty entitled “The Responsibility to Protect,” and agreed that the Network will consider ways of supporting follow-up efforts described in the report. Japan is also convinced that sovereign states have a primary responsibility to protect their own citizens from avoidable catastrophe. However, having suffered from imperialistic pressure ourselves in the 19th century, we understand that the Network may wish to dissipate rising doubt based on the instinct of the above-mentioned countries. The notion of the ‘right of humanitarian intervention’, elaborated by the International Commission on Intervention and State Sovereignty, though interesting as a concept, is raising hopefully unfounded doubt on so-called ‘double-standard approach’. What may be important for both of us is to tell the world that human security has nothing to do with the double-standard approach. Indeed, the more we talk with the above-mentioned sceptical countries, the more worried they become about the double-standard approach. Needless to say, human security is at the opposite extreme of such an approach.¹⁴

It is interesting to see that Sato was able to attack the Human Security Network for the reason of suspected double standard, even after Japan’s unequivocal support for the US war against Iraq in 2003. It is true

that Japan has never officially committed itself to the “beheading of a dictator” or “democracy promotion” or the “spread of freedom in the region.” The Iraq War was not a war about human security for Japan. It was a consequence of traditional national security at least from the perspective of Japan. Japan found the cause of the war in the weapons of mass destruction and Iraq’s rejection of the UN inspection, whether such weapons had existed or not. Japan supported the U.S. also for its strong security alliance and its concerns over North Korea. A war may be waged for a reason of traditional national security, and not of human security. Thus the support for the Iraq War has nothing to do with Japan’s pursuit for human security, let alone the deployment of Self Defence Forces in Iraq. The government of Japan continues to say that its SDFs are engaged “only in humanitarian affairs.” It is true that SDFs have not been engaged in security operations and that they have only been supplying water and rebuilding schools. Should we say then that SDFs are doing something for human security? It is no use asking such a question. Human security is a diplomatic tool to conceptualize Japanese international aid policy like ODA. To link SDFs with human security does not sound attractive for those who are defending Japan’s alliance with the US, as well as those who are presenting Japanese aid policy. Human security is by definition not said to clash with national security, if it is well understood. Whether logical enough or not, Japan’s notion of human security fits well with its traditional foreign policy and security interests.

84.4 Reasons for Japan’s Interest in Human Security

Having looked at the way the government of Japan refers to human security, it is now necessary to examine its characteristics. First, the Japanese use of human security was derived from practical considerations. To rescue Asian countries from the financial

14 See: Statement by H.E. Ambassador Keitaro Sato, Special Adviser to the Minister for Foreign Affairs of Japan, on the Occasion of the Sixth Ministerial Meeting of the Human Security Network, held in Bamako 27–28 May 2004, at: <http://www.mofa.go.jp/policy/human_secu/state0405.html>. See also Statement by H.E. Ambassador Kenzo Oshima, Permanent Representative of Japan to the United Nations, at the Informal Meeting of the Plenary of the General Assembly, 27 January 2005, at: <<http://www.un.int/japan/statements/oshimao50127.html>>.

crisis was not only 'human-centred', but also in accordance with the national interests of Japan. It was crucial for Japan's economic recovery to keep strong markets in Asia. It was also important for Japan's political leadership to show concerns over the plight of Asian countries. Recently, an expansion of target areas to Africa occurred with respect to the management of the Trust Fund for Human Security. It is also rational for Japan to target African countries as well, since it has been regarding them as a base of supporters of Japan, for instance, in the United Nations especially when it comes to the issue of the permanent membership of the UN Security Council.

Second, following the first point, the Japanese interest in human security was developed in accordance with the way Japan presents the achievements of its ODA and other forms of international aids. It is certainly advantageous to present human security as a philosophy of its developmental and humanitarian aid. ODA and other forms of international assistances are the major tools to promote Japan's international status. To emphasize security, if not the traditional meaning of security, may advance the chance of Japan's candidacy for the permanent seat of the UN Security Council. The Trust Fund for Human Security and the Commission on Human Security, both the creatures of Japanese initiatives, may enhance the chance, when associated with the UN organization.

Third, it goes without saying that the government of Japan has no intention to imply a decline of nation states by referring to human security. What is crucial is to create effective governmental systems. The government of Japan expressed its willingness to take human security measures, and demanded due respect for Japan's efforts. Human security in this sense is not presented as an idea of universal cosmopolitanism: it is international at best and certainly embedded in international politics of states. The introduction of human security is not intended to revolutionize Japan's foreign policy, but polish and hopefully reinforce it.

Fourth, the soft image of human security coincides with the image of Japan which the Japanese government wants to advance. Due to the constitutional constraints and historical disadvantages, Japan has difficulty in earning a good reputation in international cooperation concerning 'traditional' security issues such as participation in peacekeeping operations. Human security is apparently expected to enable Japan to compensate for weakness in the traditional security field. The incumbent permanent members of the Security Council established their

status in the traditional security area, and Japan might be a leading force in a newly recognized field called human security. For this purpose, Japan declined to associate itself even with the countries of the Human Security Network.

Fifth, it is taken for granted that human security is a concept of foreign policy, and more specifically, an explanatory tool for international aid. It is advanced by the Ministry of Foreign Affairs, but does not go beyond the circle. For instance, there is no attempt in Japan to apply the concept to domestic issues. This also means that as human security presupposes the subject of providing security and the object to be secured, the government of Japan takes for granted an uneven relationship between Japan and people in other (developing) countries. Human security may be a comprehensive concept, but its use presupposes a particular environment of international politics.

Pointing to these characteristics does not necessarily lead to criticism of the Japanese use of the concept of human security. It simply indicates the fact that the Japanese interest in human security is never intended to sacrifice the national interests of Japan. By saying that the concept of human security does not add anything substantially new to Japanese foreign policy, however, this chapter argues that human security provides Japan with a useful conceptual tool to pursue its own foreign policy goals.

84.5 Japan and Human Security in the Post-9-11-World

Japan never dreamt of a world in which its major ally draws Japan into a fight against terrorism in a visible manner. During the Cold War, Japan made some efforts as an ally of the United States, but fortunately did not come across a situation in which Japan was asked to offer physical contributions. In the post-Cold War, Japan is recognized as an important player, if not most capable, and the Japanese government or more appropriately, MoFA, wishes to take the status of a major player in international society. In order to endear itself to the international community, Japan must do something that is appealing. Japan may have to send SDFs to Iraq, while repeatedly saying to the Iraqi people that they never engage in security operations, and that what they do is only humanitarian activities like supplying water and rebuilding schools. In other words, Japan is trying to adapt itself to a world under new security conditions, while keeping its traditional 'soft' image. Whether such an attitude

is wise or shrewd, it seems that for a foreseeable period of time Japanese policy-makers are willing to keep the image and hope to maintain associated reality.

In such a context, human security is most welcome for Japan. It does not harm the traditional orientations of Japanese foreign policy, in cases where it might the Japanese government carefully avoids such a scenario. Still, human security is expected to contribute to an advancement of the goals of Japanese foreign policy. This chapter emphasizes that this is no criticism of the Japanese use of human security. But the author can say so, as long as the Japanese interest in human security really contributes to what most of us believe is human security, or at least, that Japan's actions will not be harmful to efforts toward human security by others.

85 Human Security: International Discourses and Local Reality – Case of Mali

Max Schott

Studying security issues on the ground inevitably leads to the discovery of the inadequacy of our concept of human security (Burgess/Owen 2004: 345)

85.1 Introduction¹

Since the early 1990's, the concept of 'human security' has been the object of a multitude of discourses at the academic and policy-making level. Although the UNDP Human Development Report in 1994 (UNDP 1994) was not necessarily the starting point of human security as a "people-centered" idea², the discussion on human security that introduced this term began with the afore-mentioned UNDP publication. Since then, several international organizations, NGOs, governments, academics and research institutions have launched various human security initiatives such as the *Human Security Network*³ (HSN; see chap. 75 by Fuentes/Brauch) with Mali as a member, the Commission on Human Security⁴, UNESCO's Human Security Programme⁵, the Human Security Centre⁶, and many others⁷. These different actors incorporated the

concept into their discourses or research in pursuit of their individual or institutional values and interests.

One of the most important issues in the debate on human security concerns both its definition, how narrow or broad the concept should be; and its policy utility, the practice of human security (Owen 2004: 375–376). Despite the existence of these debates and many attempts to define human security, there is still no consensus on its definition⁸ or analytical utility⁹. This is also the case for the issue of policy utility: there is no common agreement as to how (and whether) the human security concept could be operationalized in terms of concrete policy. However, even without a common definition of human security, it is

1 The author is responsible for the choice and the presentation of the facts contained in this chapter and for the opinions expressed therein, which are not necessarily those of the United Nations and do not commit the Organization.

2 See among others: the Geneva Conventions, UN Charter, Universal Declaration on Human Rights and the international human rights framework.

3 The *Human Security Network* (HSN) is a group of countries that maintains dialogue on questions pertaining to human security. It includes Austria, Canada, Chile, Costa Rica, Greece, Ireland, Jordan, Mali, The Netherlands, Norway, Switzerland, Slovenia and Thailand, and South Africa as an observer. See at: <<http://www.humansecuritynetwork.org/>>.

4 The *Commission on Human Security* was established in January 2001. In 2003, Sadako Ogata and Amartya Sen, presented its Final Report. See *Human Security Now* (CHS 2003) at: <<http://www.humansecurity-chs.org/>>.

5 Since 2000, UNESCO's *Human Security Programme*, in cooperation with regional partners, has organized a series of regional experts meetings on the promotion of human security. See at: <<http://www.unesco.org/shs/humansecurity/>>.

6 The *Human Security Centre at the University of British Columbia* published a Human Security Report in 2005. See at: <<http://www.humansecurityreport.info/>>.

7 For example: *The Program for Peace and Human Security at the Centre d'études et de recherches internationales*; *The Institute for Human Security* at The Fletcher School of Law & Diplomacy; *The Jordan Regional Human Security Centre*; *The Program on Humanitarian Policy and Conflict Research* at the Harvard School of Public Health; and Canada's and Japan's foreign policies.

8 A recent initiative to define human security can be found in the outcome document of the UN World Summit: "We (Heads of State and Government) commit ourselves to discussing and defining the notion of human security in the General Assembly", September 2005 (A/60/L.1): 32 §143.

9 For a detailed discussion on this issue see: Special Edition on: "What is Human Security?", in: *Security Dialogue*, 35,3 (September 2004): 345–387.

possible to identify some common characteristics which appear in nearly all human security discourses. The individual is considered as the referent object of human security, the protection of human beings within a country being more important than the protection of borders, territory and sovereignty. Another common characteristic of the human security debate is the use of the 'freedom from want' and/or 'freedom from fear' slogan, mainly to describe or define human security. But the questions of what and whom exactly individuals 'fear' and what they 'want' are often left aside in what is a largely theoretical discourse.

In fact, a contradiction exists in the current discourse on human security and in the discussion on its conceptualization: on the one hand, the main characteristic of the concept is that the referent object for human security is the individual rather than the state. However, in contrast to this, it seems that human security has been largely conceptualized from the top down without consulting its referent object¹⁰. Thus, the related debates take place, more or less, only at a theoretical level without concretely taking into account the security concerns of the individual. However, this chapter argues that if one seeks to describe human security in a valid way, it is important to consult its referent object, the individual, not only with regards to concrete action but also in the conceptualization and policy formulation processes.

The objective of this case study is to contribute to greater conceptual precision and understanding of the human security concept in Mali through consultations with the local population and national policy-makers. Numerous interviews were carried out with the local population at the urban, pre-urban and rural levels in Mali to identify the security concerns on the ground. This research also focused on the implications of the human security agenda at the policy level in Mali. Interviews were carried out with members of the Human Security Cell in the *Ministry of Foreign Affairs and International Cooperation* (MOFAIC) of the Republic of Mali to analyse the following questions: How has the human security concept been translated into concrete policy plans? What were the priorities of the Malian government as Chair of the HSN from May 2003 to May 2004, and how independent was Mali in choosing these priorities? Finally, what is the level of correspondence or divergence between the human security priorities formulated at the

policy level and the human security preoccupations of the population at the local level?

In the first part, the discourses on human security will be analysed both by looking at some common rhetorical categories used to defend or criticize the human security concept, and by identifying common arguments concerning its necessity or the reasons for its existence (85.2). The second part will analyse the implications of the human security agenda at the policy level in Mali as Chair of the HSN and investigates its autonomy in formulating policy priorities (85.3). Finally, the third part will evaluate the perceptions of human security on the ground through consultations carried-out with the local populations at the rural, pre-urban and urban levels in Mali (85.4).

85.2 Discourses on Human Security: Rhetorical Categories and Arguments on its *raison d'être*

85.2.1 Three Rhetorical Categories in the Discourses on the Human Security Concept

In the discourses on human security three recurrent arguments for or against the human security concept and/or policy can be identified. These argumentation strategies correspond to three rhetorical categories identified by Albert Hirschman (1991) as the *perversity* thesis, the *futility* thesis and the *jeopardy* thesis. Although these theses have been developed to demonstrate reactionary rhetoric against social change, it is equally possible to use them in favour of change, in this case for the promotion of the human security concept; allowing one to place the different discourses for or against human security within this typology of argumentation strategies.

The *perversity* thesis implies that any action to improve something is fated to worsen the situation; in other words, it is the obverse of the intended result. One example of a 'classic' argument against the human security concept is that a certain security balance among world powers exists, and that any change in this balance - e.g. the introduction of a new security concept and/or policy - leads to disorder, insecurity and an increase in conflicts and victims instead of reducing them. But if the *perversity* thesis is used in a discourse in favour of human security, it could be said that, for example, responding to transnational threats such as terrorism with merely a 'classic' security logic

10 There are only a few studies consulting the individual in conceptualizing human security, e.g.: Bajpai (2004: 360).

and with military means, only ‘produces’ more terrorists and insecurity.

The *futility* thesis argues that attempts or resistance to change are in vain and will have no effect; they are powerless to alter the natural order of things. This argument is used against the promotion of the human security concept in the following way: a status quo exists in the security domain, and all attempts at change do not change anything. In other words, the various initiatives to promote human security are in vain because they cannot impose themselves upon major military powers. However, this thesis can also be found in a discourse in favour of the human security concept: e.g. despite resistance, it is impossible to ignore this concept at the policy level because worldwide interdependence and new transnational threats, such as infectious diseases, massive population movements, etc. would not permit such a position in the long term. This argument also applies to the academic level in terms of analytical utility (Thakur 2004: 347).

The *jeopardy* thesis states that the cost of the proposed reform or resistance to reform of the security agenda is too high, endangering other important projects or previously hard-won accomplishments. Using this argument against the human security concept states, for example, that it is indeed “an attractive idea” but that it threatens traditional issues of international cooperation such as the promotion of human rights (Buzan 2004b: 370) and ‘classic’ development aid projects or the cost is its analytical utility (Newman 2004: 358; Paris 2004: 371). In applying the jeopardy thesis in favour of the human security concept, one could say that it is possible to protect territory against transnational threats but the cost of increased military presence and investment in new surveillance technology would jeopardize other national interests such as public health systems (through budget cuts) or the implementation of human rights standards.

85.2.2 Human Security as a Response to New Transnational Threats or Power Struggles: Common Arguments for the Promotion of Human Security

Besides these three rhetorical categories, there are various arguments to explain the existence of the human security concept. One could identify two views with related arguments concerning the *raison d’être* of the concept and its promotion.

Through the *first view*, human security is considered as a response to the perception of new threats. This means that the world, the ‘environment’ of the

actors (states, civil society organizations, researchers, etc.) changes and the actors are thus ‘obliged’ to adapt their policies, priorities, and research issues to this new reality (Axworthy 2004: 348). Growing interdependence and new global threats are examples of perceptions of a changing environment (CHS 2003: 6). Thus, the necessity of the human security concept explains itself through exogenous change (both, perceived or real).

In the *second view*, the *raison d’être* of the human security concept is considered as a response to, or as a result of, changes in the configuration of actors – changes in power relations in the international sphere. The fall of the Berlin wall or the attacks of 11 September 2001, have mostly been considered as starting points of a new post-bipolar configuration; where ‘Middle power states’ are often identified as promoters of the human security concept (Liotta 2004: 363), aiming to find their niche in the world security agenda (Behringer 2005). The promotion of the human security concept could also be considered as an expression of ethical conviction of a powerful actor or as a result of pressure from new actors such as civil society organizations.

The formulation of policy priorities in the field of human security can either be seen as a response to perceived human security threats, or as an endogenous result of power relations. A combination of both is also possible because the perception of human security threats is also frequently a result of interactions between different human security actors.

85.3 Human Security on the Policy Level: Mali in the Human Security Network

How did the Malian government translate human security into concrete policy priorities during its Chairmanship of the Human Security Network (HSN), and how independent was Mali in identifying these priorities? Mali was invited to join the HSN in 1999, and during the HSN Ministerial Conference in Lucerne (Switzerland) in 11–12 April 2000, it became a full member of the Network, as the only African country. Mali has regularly participated in HSN meetings and activities. In Mali, human security issues are managed at the Ministry of Foreign Affairs by a *Conseiller Technique* acting as focal point for the HSN with limited assistance from the *Direction des Affaires Politiques*.

Before looking at Mali’s human security policy priorities, an overview of its precarious situation is indis-

pensable. As a *Least Developed Country* (LDC), ranked 174 of 177 in the Human Development Index (UNDP 2005b: 222), Mali is one of the world's poorest countries. Its 11 million inhabitants have a life expectancy at birth of 47.9 years and 72.3 per cent of its population lives with less than \$1 a day. 52 per cent live without sustainable access to an improved water source and 29 per cent are undernourished. More than 1 in 5 children dies before reaching the age of 5 and 33 per cent of children under 5 are underweight (UNDP 2005: 222–261).

85.3.1 Mali's Human Security Priorities as Chair of the Human Security Network

Mali organized several meetings to identify its priorities as Chair of the HSN, among them a *National Workshop on Human Security* (14–15 April 2003 in Bamako) arranged by the Government of Mali with financial and technical support from Canada and Switzerland¹¹. Approximately 50 participants from various ministries and public services, civil society organizations, and representatives from member states of the HSN in Mali attended the workshop and discussed possible priorities for Mali's Chair of the HSN¹². Based on the recommendations of several workshops, the Minister for Foreign Affairs and International Cooperation presented Mali's priorities¹³: a) human rights education; b) children in armed conflicts; c) small arms and light weapons; and d) gender in peace-keeping operations. In accordance with these priorities, several activities were selected during the national workshop to translate the human security

agenda into action at the national, sub-regional and international levels. The following activities were identified¹⁴:

- *At the national level*: Citizenship education, awareness-raising on trafficking of children, and road hazards, development of a manual on Mali's experience in fighting the illicit proliferation of small arms and light weapons, research on human rights education, promotion and development of a culture of peace, and the human rights 'Cités Consensuelles'.
- *At the sub-regional level*: Reinforcement of sub-regional cooperation in the fight against trafficking of children, and against illicit proliferation of small arms and light weapons, realization of a study on conflicts and armed non-state actors in the Economic Community of West African States (ECOWAS), consideration of food security as a dimension of human security, and awareness-raising on the human security concept in ECOWAS.
- *At the international level*: Support the development of an international convention concerning small arms and light weapons.

Although the consultative committee in charge of human security in Mali also identified and recommended 'freedom from want' dimensions of human security such as economic security or "health as an essential element of human security"¹⁵, which specifically correspond to the precarious situation of its population, it is interesting to see that the final priorities and envisaged actions of Mali correspond only to the 'freedom from fear' dimension of human security (except on food security). However, both 'freedom from want' and 'freedom from fear' are explicitly mentioned as part of the human security concept of the HSN¹⁶. This leads to the question of how independent was Mali in identifying its priorities as Chair of the HSN.

11 Ministry of Foreign Affairs and International Cooperation of the Republic of Mali (MOFAIC), Human Security Cell: "Termes de référence de l'atelier national sur la Sécurité Humaine" (Bamako, 2003): 3.

12 The Government of Mali in cooperation with the Advisory Board on Human Security also co-organized a colloquium in Bamako on 24 May 2004 on: "*Conflict and Development - The Human Security Approach*" to submit the general conclusions to the Ministerial Meeting of the Human Security Network in Bamako on 27–29 May 2004.

13 See the message by the Minister of Foreign Affairs of Mali, H.E. Mr. Lassana Traore delivered at the Fifth Ministerial Meeting of the Human Security Network, 10 May 2003 at: <http://www.humansecuritynetwork.org/docs/mali_priorities-e.pdf>. On the issue of Mali's autonomy in choosing its policy priorities, it is notable that its priorities were presented, *ex post*, slightly different in the Chair's Summary of the 6th Ministerial Meeting of the HSN, 27–29 May, Bamako, Mali 2004.

14 Ministry of Foreign Affairs and International Cooperation of the Republic of Mali (MOFAIC), Secrétariat général: "Rapport sur les travaux et le résultats de l'atelier national sur la Sécurité Humaine", Bamako, 14–15 April 2003: 11–12.

15 See at: <<http://ochaonline.un.org/webpage.asp?Page=1928>>.

16 See "The Vision of the Human Security Network"; at: <<http://www.humansecuritynetwork.org/menu-e.php>>.

85.3.2 Mali: An Autonomous Actor Within the Human Security Network?

If one compares the priorities of Mali's Chairmanship of the HSN with one aspect of the principles of the HSN, namely "Promoting sustainable human development, through the alleviation of absolute poverty, providing basic social services for all, and pursuing the goals of people-centred development, is necessary for building human security"¹⁷, it is interesting to note that Mali, one of the poorest countries in the world, where mortality is predominantly linked to poverty, did not mention poverty as a human security concern or priority while Chair of the HSN¹⁸. During a colloquium on "Conflict and Development - The Human Security Approach", the Malian Foreign Affairs Minister, strongly highlighted the inter-linkages between conflict and development, recognizing that "conflicts and poverty are the main causes of human insecurity in Africa"¹⁹. He also stressed the importance of finding practical solutions to attaining 'freedom from fear' and 'freedom from want'. However, the poverty issue is not reflected in the priorities or policy recommendations of Mali despite the fact that poverty is also explicitly mentioned in the 'Vision of the HSN':

A humane world where people can live in security and dignity, free from poverty and despair, is still a dream for many and should be enjoyed by all. In such a world, every individual would be guaranteed freedom from fear and freedom from want, with an equal opportunity to fully develop their human potential. Building human security is essential to achieving this goal²⁰.

This discrepancy between the policy priorities of Mali as Chair of the HSN and its national priorities²¹ raises the question of how independent Mali was in formulating the agenda of its Chairmanship. One key factor which may have undermined Mali's autonomy in the HSN is financial dependence. The expenses for the participation of the Malian delegation at the HSN meetings were generally covered by other HSN members (i.e. Canada, Austria and Switzerland). The national workshop on human security, whose objectives were to identify the priorities of Mali's Chair of the HSN, received financial and technical support from Canada and Switzerland²².

Obtaining information on the autonomy of Mali proved difficult, but the consultation process led to interesting questions, such as: if "the HSN is a group of like-minded countries from all regions of the world"²³ one could ask who or what determines this 'like-mindedness'?²⁴ The fact that the official description of the HSN stipulates the participation of countries from "all regions of the world" implies that the HSN seeks legitimacy and importance through this global dimension. Thus, had Mali only been chosen as a token member to represent Africa?

85.4 Human Security Facing Local Reality: A Bottom-up View from Mali

After a discussion of the theoretical framework of the human security concept and its policy implications for Mali's Chairmanship of the HSN, the pertinence of a theoretical approach to human security will be evaluated through a practical case study. This field research

17 See "Principles" of the Human Security Network at: <<http://www.humansecuritynetwork.org/principles-e.php>>. See also point 10 of the Chair's summary of the 6th Ministerial Meeting of the HSN, 27-29 May, Bamako, Mali 2004: "Recognizing that poverty reduction and people-centered development are essential elements to achieving human security, in particular freedom from want, the Network reaffirmed their commitments to the realization of Millennium Development Goals (MDGs), which call for global efforts to reduce poverty by half within 2015" at: <http://www.humansecuritynetwork.org/docs/bamako_chair-e.php>.

18 The only issue related to poverty is the "Declaration on Food Security" adopted during the 6th Ministerial Meeting of the HSN at the initiative of Mali.

24 The purpose is not to say that policy priorities are always imposed by the 'strong' members of the HSN, but rather that influence can be very subtle (or even unconscious for both sides). Providing a country that lacks financial and human resources with financial support for certain workshops, documentation or experts, has an impact on the results (policy priorities) because the 'donor' usually only finances what is deemed relevant in its view.

has served as a basis for comparing the human security policy priorities of Mali as Chair of the HSN with

the human security priorities of the Malian population.

85.4.1 Methodology for a Human Security Survey

The field research was carried out in 2003 through consultations with the local population in *Korofina sud* (urban area of Bamako), *Samaya* (pre-urban area) and *Tienfala* (rural area)²⁵ to consider the various human security preoccupations of people from different environments. Six local interviewers (3 women and 3 men) completed 120 interviews (40 in each area). In total, approximately 220 people were interviewed for the purpose of this research as both individual and ‘focus group’²⁶ interviews were used to collect infor-

mation. The human security concept as proposed by UNDP’s Human Development Report in 1994 served as a research basis, combining seven dimensions: *economic security*, *food security*, *health security*, *environmental security*, *personal security*, *community security* and *political security*.

In the questionnaire each of these security dimensions was subdivided into a series of qualitative and quantitative questions allowing the total set of answers to serve as an indicator representing an entire security dimension (e.g. food security). The sum of the seven security dimensions has been considered to be the indicator of human security. The largest part of the questionnaire covered qualitative questions because- based on an earlier feasibility study, the testing of the questionnaire, and on discussions with local actors- the evaluation of sentiments and perceptions of (in)security in a purely statistical manner was not considered appropriate. A quantitative dimension has been included by ranking different security dimensions (see table 85.2). After the data collection, methodological problems (translations from the local language, understandings and interpretations of security by the local populations, possibility that answers were given to obtain development projects or resources, etc.) and the validity of the results were extensively discussed with local interviewers and representatives

25 The survey and questioning were carried out during the period of June 6th to July 20th 2003 by APROFEM (*Association pour la Promotion de la Femme et de l’Enfant au Mali*), a local NGO, under the supervision of the Netherlands Development Organization (SNV - Bamako).

26 A ‘focus group’ interview refers to a group of individuals with common characteristics (e.g. divorced women), who are interviewed at the same time. This method can help reveal some preoccupations or sensitive issues such as domestic violence that might not necessarily emerge during one-on-one interviews. One problem with such a method, however, is the mutual influence within the focus group and the recording of polyvalent responses.

of the SNV-Bamako. This facilitated the analysis of the collected information and allowed for a clearer understanding of the responses given by the local populations.

85.4.2 Subjecting the Human Security Concept to Local Reality: Experience of Human Security in Mali

Table 85.1 gives an overview of the human security preoccupation of the local populations in Mali. It synthesizes the outcomes of the interviews based on the seven human security dimensions. Results stressed that these dimensions were perceived as interlinked; the perception of human (in)security mainly depends on comparison and human security was felt as a short term issue by local populations in Mali²⁷.

85.4.2.1 Three Main Aspects of Human Security in Mali

The following section summarizes the main human security concerns of the local Malian population.

Human security is close to the multidimensional concept of poverty. One important result is the verification of the hypothesis that human insecurity experienced by populations in peaceful areas (as the one covered) is close to the multidimensional concept of poverty.

The results of the interviews show that the security concerns of these populations are close or similar to what is called ‘multidimensional’ poverty by international development actors. Physical and economic access to healthcare services, food, fresh water, land, but also to the labour market and education were main examples deemed fundamental to the economic, food and health dimensions of human security (see table 85.2). On political and community security, the results are in line with ‘empowerment’ and ‘capacity building’ of the development discourse – to fight against the ‘voicelessness’ of the poor and to improve their involvement in debates and decision-making processes.

Table 85.2 shows that the most important locally identified security issues match with basic poverty issues: economic poverty, food shortages, and health is-

ues. However, the security dimensions that rely on good governance practices (political, community or environmental security) are considered less important by the local people. Thus, local governance is not understood as a key issue but rather as a topic in the sphere of development agencies discourse: positive developmental effects and impact of local participative democracy or active citizenship still have to be illustrated.

The risk of social exclusion as a major threat to human security in Mali. The interviews endorsed another hypothesis that the principal dimension of human insecurity in Mali is the risk of social exclusion. The main perceived source of human insecurity is to be alone and/or deprived of social relations/networks. The absence of the State or the malfunctioning of its (social) services and the insufficient redistribution of wealth are factors in the renewed importance of other forms of solidarity, such as family, friends, gangs, the village, etc. However, if solidarity among family or friends becomes weaker simultaneous with the urbanization processes, while at the same time, the State does not want to or cannot redress this lack of security; this contributes to a degradation of human security in Mali. This is particularly the case after the ‘downsizing’ of state services (Sen 2000c: 31–34) through structural adjustment programmes. The colloquium on ‘Conflict and Development - The Human Security Approach’ (Bamako, 24 May 2004) underlined the direct link between conflicts and the political and economic choice of states. Furthermore, negative impacts from adjustment programmes in the 1980’s were explicitly mentioned. The workshop also stressed the links between increasing unemployment through privatization, the transfer of resources out of the continent and increased conflict potential²⁸. Privatization and the downsizing of public social services due to structural adjustment programmes imposed from outside have had a negative impact on human security. This contributed to the delegitimization of the State and a relocation of power, human resources and expertise to the NGO community.

The most vulnerable groups to human insecurity in Mali are women and girls. In the context of social exclusion, another result was the verification of the hy-

27 Answers have shown that projections of the human security issue in the future are difficult for local people because the next day (‘tomorrow’) is seen as already insecure, and that poverty appeared in all seven dimensions as a cause of insecurity.

28 See the report of the colloquium “Conflict and Development - The Human Security Approach”, Bamako, Mali, 24 May 2004 at: <<http://ochaonline.un.org/DocView.asp?DocID=3268>>.

Table 85.1: Perception of causes/effects related to the seven human security dimensions by the local population of Mali in urban, pre-urban and rural areas. **Source:** Compiled by the author.

Economic insecurity	<ul style="list-style-type: none"> • Lack of sufficient and stable income (~\$20-\$170 per month) due to unemployment, unstable jobs, unequal access to work and insufficient access to capital (credit or grant); • Lack of legal or social protection at work in the informal sector; • Climatic conditions (drought periods) and insufficient access to water and fertile land ^{a)} (pre-urban and rural); loss of land due to expansion of the city (pre-urban); • Inability to save money because of social pressures to aid family and friends ^{b)}; • Lack of state assistance in crisis situations (particularly for women).
Food insecurity	<ul style="list-style-type: none"> • Lack of sustainable physical (rural) and economic access to sufficient and nutritious food; periods (July-August) of hunger, undernourishment; • Crop failure and insufficient food production owing to climatic conditions – drought periods and insufficient rainfall – and lack of fertile land and economic access to fertilizer (rural, pre-urban); • Living conditions: large families, lack of solidarity (urban, pre-urban); • Lack of political will and appropriate public policy, (pollution, bad crop management).
Health insecurity	<ul style="list-style-type: none"> • Exposure to diseases such as diarrhoea, malaria, meningitis, tuberculosis, hypertension, cholera, onchocerciasis; • Dirty and run-down environments: poor water quality, rubbish, pollution, (urban); proliferation of insects; • Lack of sustainable physical (rural) and economic access to good quality healthcare services (doctors) and drugs; and lack of choice between traditional or modern medicine owing to insufficient financial resources (use of witchcraft) (rural); • Misuse of drugs ('mobile pharmacies'), inadequate hygiene, strenuous work, bad (rotten food) or insufficient nourishment; • Lack of political will or capacity to provide equal and good quality healthcare services to poor people.
Environmental insecurity	<ul style="list-style-type: none"> • Insufficient development of public infrastructure or bad management of public services in the area (canalization, lack of rehabilitation measures, land speculation, (urban); lack of access to fresh water); • Deforestation (in drought periods as a result of poverty) (rural); pollution as a consequence of urbanization (pre-urban); use of rubbish as fertilizer; monocultures; • Lack of economic resources for fresh water, fertile land and the construction of flood protection measures (urban); • Climatic conditions – droughts, insufficient rain, insects (transmitting malaria and onchocerciasis).
Personal insecurity	<ul style="list-style-type: none"> • Criminality, domestic violence, rape, mistreatment; • Absence or failure of the state ^{c)} and its public institutions: lack of protection, non-application of the rule of law, (complicity or ignorance of the police); insufficient development of public infrastructure (lack of electricity, slums); (urban, pre-urban); • Collective self-justice: perception of dangerous individuals (outlaws, witches, etc.) resulting in lynch mobs and ostracism; • Road hazards (traffic accidents in urban areas).
Community insecurity	<ul style="list-style-type: none"> • Lack of trust among community members, social isolation and lack of social cohesion (pre-urban, urban) ('selfishness', 'disrespect of others', 'jealousy'); high-conflict potential due to permanent stress caused by financial insecurity; • Application of cruel traditions and 'traditional' laws: unequal rights of women; genital mutilation; • Failure of local public institutions: corruption, disrespect of community interests, abuse of power; unequal access to infrastructures and services within community; • Potential for conflict caused by disturbance of traditional power structures (village chiefs) as a result of the rapid introduction of democratic procedures.

Table 85.1: Perception of causes/effects related to the seven human security dimensions by the local population of Mali in urban, pre-urban and rural areas. **Source:** Compiled by the author.

Political insecurity	<ul style="list-style-type: none"> Absence or failure of public institutions (corruption, injustice, non-application of law); police corruption (<i>'they protect only the rich'</i>) (urban), lack of protection (rural), arbitrary arrests and mistreatment by the police in poor areas; Feelings of injustice: unequal access to justice and rights due to poverty (<i>'access to justice only for the rich...they can bribe'</i>); Inaccessibility of public institutions; feeling of being neglected by the government because of being poor; Non-access to decision-making levels because of poor status; feeling of non-representation and lack of voice among poor (voicelessness), particularly among poor women.
-----------------------------	--

- a. Access to land is generally codified by family traditions, with only men having inheritance rights. Women are excluded because they are considered most likely to leave the land following marriage or divorce.
- b. On the one hand, solidarity has been identified as securing but on the other, solidarity -as social pressure to help family and friends- has also been perceived as a threat to economic security.
- c. The fact that nobody made reference to the state in the rural area may demonstrate that the state is not recognized as a legitimate authority with duties and that these functions are still embedded within traditional authority structures (village chiefs).

Table 85.2: Ranking of the seven human security dimensions by local populations. **Source:** Compiled by the author..

	Urban area			Pre-urban area			Rural area			General		
	Women	Men	Total	Women	Men	Total	Women	Men	Total	Women	Men	Total
Economic security	2.5	2.5	2.5	1.7	1.6	1.7	2.8	4.3	3.6	2.3	2.8	2.6
Food security	2.3	2.2	2.3	2.0	2.0	2.0	1.8	2.0	1.9	2.0	2.1	2.1
Health security	1.9	1.7	1.8	3.0	3.2	3.1	2.3	1.7	2.0	2.4	2.2	2.3
Environmental security	5.1	4.6	4.9	5.3	5.0	5.2	5.1	5.0	5.1	5.2	4.9	5.1
Personal security	4.4	4.2	4.3	4.1	4.4	4.3	4.7	4.7	4.7	4.4	4.4	4.4
Community security	6.1	6.3	6.2	5.2	5.0	5.1	4.5	5.4	5.0	5.3	5.6	5.4
Political security	5.9	6.5	6.2	6.7	6.8	6.8	6.6	6.5	6.6	6.4	6.6	6.5

The interviewed persons were asked to rank the seven human security dimensions: the table shows the average values (1= the most important to 7= the least important).

pothesis that the most vulnerable populations to social exclusion and thus to human insecurity are women and young girls. Although the statement of the vulnerability of women is widely accepted by the 'development community', our field research enhanced the understanding of the precarious situation of women and young girls from a security-insecurity perspective (Chenoy 2005).

The results on the seven human security dimensions demonstrate that vulnerability to a state of insecurity increases very significantly when a person is not

integrated within a social network. It is mainly women, especially widows, divorcees or single women living alone, who find themselves in this situation of exclusion. From a human security perspective, these women have an 'interest' in getting married or, if separated, in returning to their families or village (if this is accepted by the community) so as to be protected within a social structure. The results have also demonstrated the heightened vulnerability of women to various forms of violence such as rape and domestic violence. Although women and men are theoretic

cally equally protected by the constitution, traditions still prevail and 'modern' institutions fail in applying the law: some traditions are often still considered legitimate and applied even if they do not fall within the realm of law.

85.4.3 Human Security Priorities at the Policy Level and Human Security Concerns of the Local Population: Discrepancy and Correspondence

A comparison of the thematic priorities during Mali's Chair of the HSN with the results of this 'bottom-up' research on human security, points to a discrepancy between the discourses on human security, the policy priorities of Mali, and concerns at the local level. In comparing the results of the consultations with the population of Mali with the 'official' discourse of the HSN, a certain correspondence can be observed between this discourse and the 'experience' of a local reality; poverty as a factor of human insecurity being present in both cases. However, analysis of the HSN discourse has shown us that the principal reason for this correspondence lies in the vast and fluid nature of the discourse, which encompasses everything (Paris 2001: 88) and immunizes itself against all forms of critique (except those related to its vast and fluid character).

85.4.4 Conclusion

This chapter argued that there is a need to nourish the discourses and discussions on human security with a 'bottom-up' view of a local reality, with concrete inputs from its referent object, the individual. This is especially important for the conceptualization process of human security and for the formulation of related policy priorities. In addition, human security issues should be identified by the concerned actors (policy makers together with the local population and civil society actors) on local or regional levels. This is important for appropriate and efficient action but also for analytical pertinence. As individuals are living in different cultural, social, political and economic contexts, their human security concerns also depend on local realities. Therefore, the definition of human security depends on the local or regional context. In other words, defining human security clearly and consensually seems to be impossible at a global level (Bajpai 2004: 360; Uvin 2004: 352) but definitions could be clarified (and probably more widely accepted) and

policies made more effective if they were applied to a specific context or region.

The issue of how narrowly or broadly to conceptualize human security can be linked to regional contexts. However, if one applies human security too narrowly to the local context of the interviewed population without taking into account the 'freedom from want' dimension of human security, it will 'reap' only incomprehension as it fails to correspond to the security preoccupations of the local population in Mali, which are closely linked to poverty and its consequences. Thus, while a narrow human security concept might be of interest at the policy or academic level, this concept will remain disconnected from the fundamental security preoccupations of its referent object: the individual. One could further generalize this statement with the hypothesis that this applies to the majority of populations living in 'peaceful' poor countries.

Improving human security in poor countries is closely linked to equal access (economic and geographic) to social services (Sen 2000a: 4). Thus, the state, at the global, national, and local levels, has an important role to play in promoting human security. The 'empowerment' of democratic states, which enables the provision of effective social services, is vital for improving the living conditions of the most vulnerable groups in terms of human insecurity, such as women, girls and elderly people. Therefore 'structural adjustments' of social services in poor countries through privatization and requests for 'cost efficiency', as well as promoting local governance without mobilizing and transferring the needed public resources, can threaten human security, especially in times of economic crises (Sen 2000b: 3). This could be of particular interest as the perception of exclusion and vulnerability is often linked to an increased potential for conflict and violence (UNDP 2005: 149-181). Consequently, eradication of poverty seems central to ensuring the security of the people as well as the security of the state (CHS 2003: 3, 5, 7).

While advocating a regional approach in defining a human security agenda, it might be possible, after further consultation with individuals in different parts of the world, to identify common characteristics and challenges to human security through comparative analysis of local/regional human security definitions. This would, in time, allow the development of a global human security concept, and eventually better and more efficient policy implementation.

86 Enhancing Human Rights – A Contribution to Human Security

Dieter Senghaas

86.1 Introduction

On 10 December 1948, the Universal Declaration of Human Rights was adopted in Resolution 217 (III) of the United Nations General Assembly. The prior history of this declaration had already been marked by considerable controversy. Essentially, there was a clash between the liberal and the real-socialist understanding of human rights; and the concern of several Islamic states, mainly with regard to reservations on Article 18 of the Declaration, which embodied the right of every person to freedom of conscience and religion, including the freedom “to change one’s religion or belief.”

These controversies continued during the next eighteen years, when the U.N. Commission on Human Rights elaborated internationally legally binding agreements. In 1966, these were adopted in the form of two human-rights conventions; the *Covenant on Civil and Political Rights* and the *Covenant on Economic, Social and Cultural Rights*. As the two decades following 1948 were marked, in terms of international politics, by the struggle for decolonization, and hence for the right to self-determination for peoples and to independent economic, social, and cultural development, corresponding demands found their way into the documents mentioned. Both covenants begin in identical fashion with the affirmation that: “All peoples have the right of self-determination.” Like many other statements in the covenants, this first sentence in itself highlights the fact that human rights have not only an individualistic but also a collective rights dimension. Looking at the two *Covenants* together and taking into consideration the concern for the ecological problématique as having been articulated since the early 1970’s there is a tremendous conceptual and political overlap of the human rights debate and movement as well as the concern for human security.

86.2 The Emergence of the Concept of Human Rights and Human Security

Taking into consideration the early controversies, which continued beyond 1966, the functional status of human rights in political and social processes, within societies and at the international level, can presently be resumed as follows: Reference to human rights, particularly, of course, civil and political rights, is aimed at averting arbitrary action by the state. Corresponding rights serve to safeguard individual autonomy and, ultimately, the inviolability of “human dignity.” This scheme of argumentation, of course, presupposes the existence of a legal community, because the possibility of arbitrary action by private persons against other private persons is deemed to be eliminated by virtue of the existence of a state monopoly on the use of force and of the “rule of law.”

However, a legitimate state monopoly on the use of force and the rule of law are only an embodiment and expression of a decent legal community if law has come into being by democratic means, and if there are constitutionally stipulated measures for furthermore developing existing law in the light of new political, social, economic, cultural, and (by implication) legal requirements. Hence, the realization of human rights—a process that must constantly start anew, though it necessarily remains controversial—is thus dependent on the existence of a democratic constitutional state based on the separation of powers and a broadly based political participation. It follows that the struggle for human rights is always also a struggle for the institutionalization of modern democracy, and, despite identical premises (separation of powers, principle of openness, freedom of assembly, etc.), that democracy takes very different institutional forms.

As well as offering protection against arbitrary action by the state and also promoting the constitutionally regulated elaboration of law, reference to human

rights currently primarily serves to identify and overcome all types of discrimination. In this respect, the discourse about human rights has become an anti-discrimination discourse – a trend which, incidentally, is fully in line with the 1948 declaration and the two 1966 *Covenants*. This does not just involve political discrimination *per se*, but also the social, economic, and cultural disadvantage that underlies such discrimination. The aim of such discourse is to overcome an institutionally entrenched order that systematically produces inequalities and thus goes against equality of opportunity at the most basic level. In concrete situations of chronic disadvantage, reference to human rights and by implication to human security thus becomes a lever to protest and, in some cases, to liberation. Article 27 of the *Covenant on Civil and Political Rights*, for example, states that: “In those States in which ethnic, religious or linguistic minorities exist, persons belonging to such minorities shall not be denied the right, in community with the other members of their group, to enjoy their own culture, to profess and practise their own religion, or to use their own language.”

Provisions such as these have often been criticized for their ‘collectivist’ stance. But such criticism is flimsy, for, as history shows, collective discrimination such as that which occurs in the case of minorities cannot generally be eliminated by individual measures alone. In fact, it is precisely in such cases that group-based legal provisions and collective measures are needed to ensure that the requirements of Article 2 of the *Declaration* focused on the individual are satisfied: “Everyone is entitled to all the rights and freedoms set forth in this Declaration, without distinction of any kind, such as race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status.”

Protection of the individual can be fixed by law, as can the prohibition of discrimination. Discrimination can, additionally, be overcome through appropriate constitutional regulations (such as the safeguarding of minority rights) and also through general measures of support. Over and above these important and fundamental reference points, human rights in general and the concern for human security imply a social order in which there are specific measures to ensure that human dignity is given some kind of look-in politically, legally, economically, socially, and culturally. The basic human rights documents, thus, leave no room for doubt as to the fact that they are underpinned by the notion of a “society in correspondence with the dignity of human beings.”

Much – some would say too much – is already contained in the 1948 *Declaration*: the freedom to marry, for example, and the protection of the family; social security and the right to work and to equal wages; even “the right to rest and leisure, including reasonable limitation of working hours and periodic holidays with pay” (Art. 24). Finally, there are provisions on cultural freedom, in that Art. 27 states that: “Everyone has the right freely to participate in the cultural life of the community, to enjoy the arts and to share in scientific advancement and its benefits.”

These kinds of general statements naturally need to be given concrete shape. The fact that there are a host of conflicting opinions as to what constitutes a “society in correspondence with the dignity of human beings”, ensuring human security, is not a drawback; it turns out to be almost an elixir of life for the idea of human rights. The widening and deepening of the idea of human rights – from the rights guaranteeing protection of the individual and non-discrimination, through to the positive notions for shaping a society, including an international order worthy of human rights – would never have come about if there had ever been one single self-consistent blueprint for human rights. The longer the discourse about human rights continues, and the more international it becomes, the more human rights will take concrete shape over the controversies it arouses. This trend is definitely to be welcomed, and it accounts for the conceptual bridge between the historically prior concept of human rights and the concept of human security as it is understood today.

86.3 Human Rights as the Result of a Cultural Revolution

In the West, and also beyond it – though in this case with anti-Western feeling – human rights have been interpreted as a typical outgrowth of European culture. This self-perception and external interpretation are essentially correct, given that human rights, as currently understood, are a product of European developments. But what do “European culture” and “European development” mean here? If one assumes European culture began with Greek antiquity, then it would now be about 2,500 years old. But it is only in the last 250 years that the idea of human rights has played a determining role in the development of European culture. The political struggle to get human rights enforced is confined to this period as well. And since it was a struggle in the true sense, the the-

sis that human rights had to be enforced *in opposition to Europe's own tradition*, as it had been shaped over the preceding centuries, is not a groundless one. What we nowadays associate with human rights in the narrow or broad sense was therefore clearly not something implanted into Europe's original 'cultural genes'. The overwhelming part of European history, including its cultural history, does not attest any particular sympathy for those things which human rights currently represent. And it is also quite wrong to imply that European history, by virtue of its internal logic, had inexorably to lead to the triumph of the idea of human rights.

The history of human rights in itself proves that this is not so. The human rights declarations of the late eighteenth century refer to humankind, but in reality this term only ever included a section of it: for a long time, it did not mean anyone who did not have education or property; it did not mean women, or children, let alone coloured people or slaves. All of them were excluded without scruple; and philosophy and political theory sometimes offered extravagant justifications for this kind of exclusion – justifications that one should also recall as a genuine expression of European cultural heritage! And what began in exclusionary fashion became inclusive, not because there is some internal logic leading from exclusion to inclusion, but because, with the passage of time and as a consequence of social mobilization from traditional to a modernizing society, those who were excluded were no longer willing to remain so, and instead called for equal rights – until finally the idea triumphed that where human rights are cited, this embraces *all* people, regardless of the concrete and cultural shape they take.

Hence, what we nowadays regard as self-evident, and what is claimed, with a reference to the Christian notion of man's being created in the image of God, to have always been regarded as self-evident in European history, had no determining influence whatever for 90 per cent of that history. The early European social and political system was autocratic and status-based, corporatist-and-collectivist; one seeks in vain across many centuries for the 'autonomous individual' as found in modern human rights documents. And until well into the nineteenth century, despite the revolutions at the end of the eighteenth, many European societies continued to be characterized by status-based social stratification and legal divisions, with individual rights and duties varyingly defined according to gender, status, and later on to class.

The *abstract individual* of Article 1 of the 1948 Declaration ("All human beings are born free and equal in dignity and rights") – in other words the individual irrespective of gender, age, colour, and so on – did not exist at all socially, legally, and thus culturally for most of European history. The idea of such an individual only emerged in the context of social conditions that were becoming intolerable because of class privilege and class exploitation, of conspicuous wealth side by side with poverty, and also because of the new, mostly bourgeois classes, who found the traditional order, the *ancien régime*, incompatible with their own aspirations. It was this constellation that generated the explosive cultural and political energy against Europe's own tradition which finally got the human-rights idea going – a process which was deepened by social movements of different orientation.

Of course, every far-reaching idea has isolated intellectual precursors. But it was only in a relatively late phase of European development that it was possible to emancipate the status-based individual, who possessed only an unequal status-determined freedom and dignity, and make of him or her a human being *per se*. It was only then – and, as already stated, in complete contrast to Europe's long history – that all people came to be regarded as free and equal *in principle*.

The idea of human rights thus represents a profound turningpoint in European history as well, indeed a cultural revolution. This was much more profound than is implied in those arguments that portray human rights – their embodiment in constitutional provisions and social policy – as an expression of "timeless European culture", or indeed as the end-product of European cultural traits present from time immemorial. By way of a counter to this, one should remember: Human rights were not given to Europe in the cradle, with the idea that one just had to sit and wait until Europe at some point reached maturity. On the contrary, they were the result of public agitation on a mass basis – the work of subversives in spirit and deed and of social revolutionary movements, led first by the bourgeoisie and then by the workers' movement. Women and marginal groups then followed.

This, then, is the true history of the idea of human rights and its translation into a social and political system that we nowadays view as "typically European/Western." This order only stabilized after 1945, and only after this did it – and the political culture underlying it – become a foregone conclusion. *Prior to*

this, every Western society had waged a battle, each in its own particular way, against its own tradition.

In Germany in particular, there should be no trouble recalling this fact, given that, until the middle of the last century, prominent intellectual currents and political movements existed here that expressly opposed the hard-won achievements of a political culture that we nowadays see as “Western”. Thus, Thomas Mann, far from acting as an eccentric, was actually being quite representative of what now seems an anachronistic intellectual current in Germany when, in 1918, writing of the contrast between Germany and the West, he stated that democracy was “alien and noxious” to the German nature: “I confess I am of the profound conviction that the German people will never bring itself to love political democracy, and that the much-decried ‘authoritarian state’ (Obrigkeitsstaat) is, and will remain, the form of government that best suits, best befits, and is essentially desired by, the German people.” And this then already world-renowned German writer (a Nobel prize winner) goes on to say: “Anyone who sought to make Germany simply into a bourgeois democracy in the Roman-cum-Western sense and spirit would rob it of what is best and most complex about it, of its problematical features, in which its nationality truly consists. He would be seeking to make it monotonous, unambiguous, un-subtle, and un-German and would thus be an anti-nationalist, insisting that Germany should become a nation in a sense and spirit alien to it.” (Mann 1918: 46) This was written nearly 90 years ago – by one of the most respected champions of “the German spirit”, and it reads like many present statements from some intellectuals of the non-Western world (Buruma/Margalit 2004).

86.4 History Repeats Itself Indeed

A realistic view of European development – one that is aware of Europe’s human rights struggle against its own tradition – is also important for understanding the human rights problematic outside Europe and the West, because tensions familiar from early European history are being played out afresh there. All extra-European societies currently find themselves in a state of profound upheaval. On top of this, they are undergoing internal pluralization. As a consequence, traditions are breaking away and reorientation is becoming overdue. Internal cultural conflicts are arising which are ultimately about the future of the social and political system. The human rights problematic

acquires, as ever, particular political explosiveness in this context.

The lines of conflict are relatively clearly drawn up: some want to imitate Europe, others want to revitalize the old traditions. Others again believe they can combine modern technologies with old values. Not surprisingly, the battlelines in argumentation observable in the late eighteenth century and the nineteenth century are also being replicated: Individual human rights are seen as a threat to traditional values, to the particular country’s own culture and tradition, and, most importantly, to current standards of decency. In contrast, the champions of human rights in the non-Western world are no longer prepared to bow to autocratic or despotic regimes, economic exploitation, or social and cultural discrimination.

It is serious abuse that once again gets human rights onto the agenda in each particular place all over the world, and this means that outside Europe too, traditional orders and cultures are coming into conflict with themselves. In East Asia, South-East Asia, and South Asia, and in the broad Islamic sphere of influence, cultures of corporatist-collectivist, patriarchal, or paternalistic bent are being called into question as a result of social mobilization leading to pluralization. This is an actual repetition of one of the crucial and recent experiences of Europe.

This process is not a smooth one, and it does not even follow a straight course. It gives rise to recalcitrant fundamentalist movements to which human rights for the most part are anathema. At the same time, however, there is a spread of political movements that have made it their aim to make human rights, the rule of law, and self-sustaining democracy a political reality. Of course, the prospects for human rights and democracy are greater in societies where development has been relatively successful than in societies that find themselves in a chronic development-crisis with no immediate prospect of a solution. This is the difference – to cite a concrete example – between Taiwan and Egypt.

86.5 Conclusion

Until well into the present century, anti-Western “German values” were still being championed in Germany. Until recently, “socialist values” were being played off against bourgeois ones in the real-socialist system. “Islamic values” are currently being propagated in Islamic societies. And the autocrats of Asia, along with the fundamentalist writers of the Arab-Is-

lamic region, are arguing in just the same way as Thomas Mann did 90 years ago with respect to Germany. In the case of these latter, the Islamist argumentation also displays an astonishing degree of congruence with the Catholic-inspired “theocratic counter-revolution”, so-called, which, during the first half of the nineteenth century, vehemently opposed both the humanistic view of history, culture, and mankind propounded by the French Revolution, and, of course, any form of liberalism and individualism.

The worldwide cultural conflict scenario, of which the human rights discourse is currently a core element, is thus very familiar. Its real setting is individual societies with their specific cultural cleavages. In these societies, a “clash *within* civilizations” is being fought out. In contrast, the “clash of civilizations” as predicted by Huntington, is a chimera (Senghaas 2002). This state of affairs has a remarkable side effect: the international dialogue is becoming easier, because the encounter is no longer between internally harmonious, rather monolithic or homogenous cultures, but between cultures that have come into conflict with themselves.

Whether the idea of human rights will ultimately triumph in many different places in the world, and whether this idea will be translated into political orders congenial to human rights – these are open questions. But just as was once the case in Europe, the answers outside Europe too will not depend on age-old preprogrammed cultural characteristics that supposedly help or hinder such transition. The decisive factor will be the political power-constellations within development processes, which will either succeed or fail – or, more frequently, will be caught in the cross-current between success and failure. It is here, and not in cultural legacies, that the uncertain future fate of human rights lies.

Since there has been an overlap between human rights issues and the concern for human security, there is a high probability that neither the concepts of human rights and human security nor the political movements, respectively, will counteract each other. It is rather to be assumed that with respect to both intellectual and political activities there will be a kind of mutually reinforcing feedback.

87 Natural Disasters, Vulnerability and Human Security

Fabien Nathan

87.1 Introduction

The 26th of December 2004 earthquake and tsunami in the Pacific region has attracted attention to the tremendous devastations triggered by natural hazards. The figures cannot express the amount of human suffering and loss of security experienced: more than 270,000 deaths, 5 million homeless, and dozens of billions of damage in dollars. In fact, every year thousands of people die, are injured, lose their homes, livelihoods or jobs in natural disasters, and the trend is on the rise. This clearly constitutes one of the most serious threats for a growing number of people and cannot be ignored by security studies. The aim of this chapter is first to stress the importance of this underestimated threat, and second to present risks as a situation of insecurity which calls for new security concepts, such as ‘human security’. When linked with vulnerability, as proposed in this chapter, this concept may be useful to encompass these threats. Security Studies could both benefit from such an enlargement and deepening of their security concepts and from assistance in reducing the vulnerability of people and societies.

87.2 What Insecurity: Natural Risks and Disasters

87.2.1 Types of Hazards, Disasters, and Impacts

87.2.1.1 Hazards

Disasters arise from the interaction between hazards and the ‘stakes’, i.e., the material and immaterial, living and inert, fixed and moving elements that these hazards threaten. The hazards therefore constitute the origin of the threat, the elements which might trigger disasters if they encounter vulnerable stakes.

A simple classification (UN/ISDR 2002¹) would encompass natural hazards into geological (earth

processes), hydro meteorological (atmospheric, hydrological and oceanographic processes), and biological hazards (epidemics, insect infestations). Geological hazards include earthquakes, tsunamis, volcanic activity, mass movements (landslides, rock fall, etc.), surface collapse, fault activity, etc.; hydro meteorological hazards include floods, mudflows, cyclones, storms, temperature extremes, drought, desertification, wild land fires, and avalanches; biological hazards include epidemics, insect infestations, and the like (UNISDR 2002: 44).

These hazards are not evenly scattered throughout the globe. They result from natural and ecosystemic processes and constraints, such as tectonics and subducted zones, climatic variation and logic, geological processes, fault lines, etc. No tsunami can happen in Bolivia, a country with no access to the sea; neither are there any snowstorms in the Sahara, nor cricket infestations in Austria.

Even if there is no absolute certainty about the total number of natural hazards in the world², it is increasingly recognized that some specific hazards have slightly risen³, and will continue to do so much more in the future because of human factors (climate change, deforestation, etc.).

1 Many authors adopt a similar classification, such as Ledoux 1995.

2 For Blaikie, Cannon, Davis, and Wisner (1994: 31): “there is a general consensus in research on disasters that the number of natural hazard events (earthquakes, eruptions, floods, or cyclones) has not increased in recent decades.” But that was in 1994 in their first edition, updated in 2004.

3 According to Feldbrügge and Von Braun (2002: 36) “the total sum of natural hazard events does not seem to have increased (...), but this is probably not true for all types of disasters. (...) The frequency and duration of some types of disasters (...) probably did increase.”

87.2.1.2 Types of Disasters

One usually makes a distinction between *natural* and *anthropogenic* disasters, such as *technological* (or *industrial*), and *socio-political*, (wars, ‘complex emergencies’). Sometimes, the category *environmental disaster* or *ecological disaster* is used to qualify both natural disasters affecting societies and disasters affecting the ecosystems (Boisson de Chazournes/Desgagné 1995). *Land degradation* is an intermediary between hazards and disasters. It describes “how one or more of the land resources (soil, water, vegetation, rocks, air, climate, relief) has changed to the worse” (Bohle 2002).

87.2.1.3 Types of Societal Impacts

Disasters induce several types of impacts. They produce three types of loss or damage, both at the individual and collective level, and also direct, indirect, and secondary.

Human losses or damages, characterized by deaths, injuries, physical and mental affections. In statistical databases, only the number of deaths, injured, and affected people are calculated as damage, while the mental/psychological consequences are swept away. Secondary effects include for instance premature deaths due to the increased vulnerability caused by the impact of a disaster, such as illnesses, and the impoverishment and degradation of the quality of life. A disaster, by increasing vulnerability to future disasters, can be a cause of human losses in another disaster.

Economic losses include the destruction of goods, livelihoods, networks, services, and economic fluxes. Disorganization is high when networks essential for social reproduction (communication networks and big technical macro-systems⁴ in industrialized countries) are interrupted. Indirect economic damages and secondary effects are much more difficult to quantify, but can be even greater.

Environmental losses consist of damage to one or several ecosystems. These losses are generally more induced by non-water-related hazards, as these are often integral parts of the ecosystems.

These impacts induce several *types of crises*:

Economic crisis: Economic recessions can result from the impact of natural disasters. In Ecuador, the El Niño phenomenon of 1998–1999 induced a

decrease of more than 7 per cent in the country’s Gross Domestic Product from one year to the other (UN/ISDR 2002: 34). A World Bank projection for Honduras (1999–2008) shows that “if access to foreign savings is limited post-event, catastrophes could stagnate GDP for Honduras over the next 8 years” (Freeman/Martin/Mechler/Warner/Hausmann 2002). Economic crisis, in turn, is a great factor of vulnerability for future disasters.

Socio-political: A disaster always threatens social order in some way or other. That is the reason why the states have always been very willing to control disaster response through civil protection schemes. The actual domination of those in power might be threatened by the impact of such a disaster, the challenge of the domination of any power being to guarantee stability and order. Disasters therefore are proof of the shortcoming of the current social order, and contestation might arise.

Cultural crisis: A disaster is also generally a cultural shock. It always induces a cultural trauma, as it deeply reminds the mortal character of societies and the fragility, even the arbitrariness, of the cultural arrangements (Duclos 1991). Generally, a disaster generates a mix of these damages and crises.

87.2.1.4 Disaster Impacts of Natural Hazards

The damages caused by natural hazard’s impacts are enormous. One reports between 600,000 and 800,000 deaths per decade⁵ and between 1 and 2 billion cumulated affected people. Economic losses amount to more than US\$ 685 billion in the 1990’s, rising exponentially.

87.2.1.5 Human Damages

Since the 1970’s, the global number of deaths has amounted to approximately 3.6 million persons (excluding droughts, famines and epidemics – OFDA/CRED 2002). The 1970 Bangladesh cyclone itself killed an estimated 300,000 people, and the Tangshan earthquake in China between 242,000 and 600,000 according to different estimates. The 1991 Bangladesh cyclone also caused more than 100,000 deaths.

Even if the total number of deaths seems to decline (without considering epidemics) because of the disappearance of the mega-disasters (more than

4 Such as the energy, transportation, commercial, and financial networks, as well as public services in capitalist societies (Gras 2003).

5 Since 1980, depending on what 10-year period one considers. During the 1970–1979 period, more than 2 million people died in natural disasters.

1 million deaths in a row) and the decrease of the very large ones (more than 100,000 deaths), it is probable that the number of deaths due to smaller disasters might be on the rise. The December 2004 tsunami caused the worst disaster since 1991, and quite often there are disasters of several thousands of victims, as the Bam earthquake in Iran (2003, 40,000 deaths), or the floods and mudslides in Venezuela (1999, more than 20,000).

The cumulative number of affected people is rising very fast, respectively 717,000 to 1,374 and 1,880 million people in the 1970's, 1980's, and 1990's (OFDA/CRED 2002). According to the Red Cross, when comparing "the decades 1983-1992 and 1993-2002, reported global deaths from natural and technological disasters have fallen by 38%. However, numbers of affected people reported have risen by 54% over the same period" (IFRC 2003: 179).

87.2.2 Cost of Disasters

The most spectacular trend in disasters is their rising costs, which overtakes the rise induced by economic growth. In the 1970's, natural disasters cost US\$ 54 billion, rising to US\$ 201 billion in the 1980's and US\$ 686 billion in the 1990's (IFRC). It is estimated, that the growth rate of economic damage due to natural disaster is increasing by 6 per cent a year (Dauphiné 2001). Since the 1950's, the value of damages in the 1990's has multiplied by a factor of 13.9 (MunichRe 2001: 43).

The most expensive disaster in history, the 1995 Kobe earthquake, cost more than US\$ 100 billion alone, devastating the city's portal economy. Second comes the Los Angeles earthquake in 1994 (US\$ 44 billion), then Hurricane Andrew in 1992 - also in the United States (US\$ 30 billion).

Generally, most losses are uninsured, especially in poor countries, and even more when indirect damages are included. The biggest 234 disasters of the second half of the 20th century (141 of which were insured) have amounted to destruction in monetary terms of US\$ 960 billion. Of these quasi tera-dollar damages, 35 per cent were due to earthquakes, 30 per cent to floods, and 28 per cent to storms (MunichRe 2001).

87.2.3 Water-related Disasters

Water-related disasters deserve a special mention. According to the World Water Assessment Programme, "more than 2,200 major and minor water-

related disasters occurred in the world during the period 1990-2001" (UNESCO/WWAP 2003a: 272). Of these disasters, 50 per cent were floods. Among the 234 biggest disasters of the second half of the century, 90 per cent of them are storms and floods, amounting to about 1.4 million deaths (MunichRe 2001: 43).

Floods account for a high proportion of damage and suffering throughout the world, accounting for 49 per cent of deaths through natural disasters from 1985 to 1999 (Abramovitz 2001: 11). In absolute numbers, "between 1973 and 1997 an average of 66 million people a year suffered flood damage, making flooding the most damaging of all natural disasters" (UNESCO/WWAP 2003a: 274). In terms of economic losses also: "global economic losses to floods alone average US\$ 3 billion per year, the equivalent of 20% of new investment in the water sector in developing countries" (UNESCO/WWAP 2003a: 22).

Moreover, 46 million people per year in coastal areas are at risk from storm surges and sea level rises (UN/ISDR 2002: 57). These figures highlight the tremendous importance of water-related disasters. About 70 per cent of the sum of all natural disasters is already induced by climatic processes (UN/ISDR 2001: 16), and climate change should increase this figure, contributing to more extreme precipitation patterns, accelerated sea level rises, and the like.

87.2.4 Urban Disasters

Urban disasters have occurred ever since cities have been in existence. But since half of the world population now lives in urban areas, this figure is rising and the problem is becoming more serious. Among the biggest urban disasters of the past 25 years are the Armero lahar (Colombia, 1985, with 21,800 deaths), the floods in Rio (1988, almost 20 per cent of the population affected, US\$ 1 billion damages), the Izmit earthquake (1999 in Turkey with 18,000 deaths), the Gujarat earthquake (2001 in India with 20,000 deaths), and the Bam earthquake (Iran in 2003 with 40,000 deaths).

Such great catastrophes are generally well covered in the media. But there are numerous neglected smaller events that affect people locally. For example, "In Sao Paulo, localized environmental degradation was associated with 220 floods and 180 landslides in 1996 alone" (Pelling 2003a: 27). These smaller disasters pose high risks for many cities of the South. In Bogota (Colombia) 60 per cent of the population live on slopes exposed to landslides; in Calcutta

(India) 66 per cent of the population live in slums exposed to floods and cyclones, and in La Paz (Bolivia) 83 per cent of the soil is theoretically not suitable for housing, but it is actually used for this very purpose.

87.2.5 Definition of a Disaster

Disasters are usually defined as: “a serious disruption of the functioning of a community or a society causing widespread human, material, economic or environmental losses which exceed the ability of the affected community/society to cope using its own resources” (UN/ISDR 2002a: 338). Thus, disasters are disruptions in the patterns of normal daily life, generating a crisis and a societal response to come back to order.

But the distinction between the normal and the crisis state is highly social. It depends on the perceptions of the people who qualify a state of disaster or crisis. For instance, when several million people die from malaria, or several thousand people die in car accidents in every country and city every year, or in work accidents, or prematurely in slums due to their terrible living conditions, this is not considered as a disaster. In contrast with a stock market crash (as in 1987, when the stock market is closed after a heavy windstorm, contributing to the greatest financial crash since 1929), which is considered a disaster and thus generates a crisis.

Disasters are also the result of perceptions. They are a question of measure and proportion. Human beings must evaluate the extent to which the situation is disastrous; damages must overtake a certain critical threshold to trigger such an evaluation. It is known that the Bangladeshi people have adapted to recurrent floods, considered as beneficial (*‘barsha’*), but they distinguish these from devastating floods (*‘bonna’*).

In capitalist cities, the threshold generally consists of the loss or damage of a certain number of human beings, goods, infrastructures, and services, all critical elements that contribute to social order. In ancient times, the destruction of a temple for instance may have been interpreted as a huge disaster generating a social crisis, and consequently disruption. In terms of security, it is thus easy to understand that multiplying disasters, especially urban and/or water-related, constitute a serious challenge. Now we must consider how to understand these disasters, i.e., who is at risk and why.

87.3 The Sources of Vulnerabilities and Affected Areas

87.3.1 The Geographic and Wealth Inequalities Among Impacts

Disasters do not affect societies evenly. Asia is disproportionately affected, being home to 94 per cent of the victims of natural disasters between 1964 and 1998 (Michellier 1999). Bangladesh, China, and India are home to 85 per cent of all affected people in the world. Ninety per cent of these disasters are due to floods and landslides. Broadly speaking, there is a clear differentiation in the severity of the impact between rich and poor countries, the latter being much more severely disturbed by the impact of natural disasters, both in human and economic terms (relative to the size of their economies).

Ninety-seven per cent of deaths occasioned by natural disasters occur in developing countries. Of the 50 deadliest natural disasters between 1960 and 2000, none occurred in an industrialized country⁶. The same applies to the 50 disasters with most affected people, and only three of them appear in the ‘top 50’ with regard to injuries. However, when the most costly disasters are considered, ‘industrialized countries’ appear 25 times among the ‘top 50’. Indeed, the economic prejudice in absolute values is much bigger in these countries. But in relative terms, closer to the reality of the impact, poorer countries suffer much more. Between 1985 and 1999, 57.3 per cent of the economic losses occurred in the richest countries, representing 2.5 per cent of their GDP. In the same period, the poorest countries experienced 24.4 per cent economic losses, amounting to 13.4 per cent of their GDP (Abramovitz 2001: 13–14).

This dichotomy between the rich and well protected, and the poor at high risk, is relevant for countries, sub-regions, and social groups or individuals within countries. Rich people are generally less affected, living in less dangerous areas, and being able to overcome losses. Miserable, marginalized, elderly people and all fragile groups that are relegated, dominated or stigmatized are among the prime victims of disasters and suffer more from their impacts. They are the most vulnerable groups. The same differentiation applies also to countries.

6 This data is drawn from the CRED/Em-Dat database, including also droughts, famines, and epidemics.

87.3.2 Explanation of These Inequalities: Risk, Vulnerability, and Insecurity

Disasters are less numerous and severe in well-off countries, even when the hazards are comparable. This can be explained by their different states of vulnerability.

Two types of definitions of risk may be distinguished:

- Objectivist definition: a *probability of damages* inflicted by one or several hazards to a vulnerable unit, or 'stake'. It accounts for latent threats, not yet manifested, but objectively and virtually existing (probable) and sometimes measurable.
- Subjectivist definition: "*perception of a possible danger*, more or less foreseeable by a social group or individual exposed to it"; a "representation of a real or supposed danger or hazard, affecting the stakes, indicators of a vulnerability" (Veyret 2003: 16,20). It accounts for socially constructed threats, and is closely related to their perception and representation.

Vulnerability can be described on the one side as a tendency to undergo damages, i.e. a state of fragility, or a set of conditions that raise the susceptibility of a community to the impact of a damaging phenomenon. On the other side, vulnerability is the incapacity to anticipate, cope with, resist to, adapt to, and recover from hazards. Vulnerable units are either non-resistant, i.e. incapable of withstanding the shock (without adapting); and/or non-resilient, i.e. incapable of absorbing the shock and adapting back to an acceptable state.

Security studies and risk or disaster studies use different vocabulary, but often qualify the same type of uncertain or realized states or situations. In order to procure a better integration of these disciplines, it could be useful to try and transcribe one 'language game' into another. This is proposed below.

If security is defined as the absence of threats, both objective and subjective, and safety is used for the absence of damages, then:

- *Risk* as a threat (real or perceived) accounts for a *state of insecurity*;
- *Disaster* as a realized threat describes a state of *non-safety*;
- *Vulnerability* as a contributor to a potential disaster is a *component of insecurity*.

Therefore *people* or societies *affected* by disasters are *not safe*; vulnerable people or societies at risk of haz-

ards are *insecure*. Wilches-Chaux (1993) remarks that if 'secure' means "free and exempt from any danger, damage or risk", vulnerability is synonymous with insecurity: "in the most profound sense of the term: insecurity for the existence; uncertainty in front of the daily history and in front of the surrounding world" (Wilches-Chaux 1992: 23). But according to our above-mentioned reasoning, vulnerability is not exactly *synonymous* with insecurity but a *component* of insecurity. If there were no hazard, the people, as vulnerable as they can be, wouldn't be threatened, and would not live in insecurity.

The concept of risk would be closer to describing a state of insecurity. Nevertheless, risk is a function of hazards and vulnerability. Consequently, no vulnerability (or no hazard) means no risk, which means no disaster, which means a situation of objective security and safety⁷. For this reason vulnerability is at the centre of the security problem. Thus, it is very important to understand the different components of vulnerability.

87.3.3 Features of Vulnerability

87.3.3.1 General Features

Vulnerability can be characterized as a *complex* process encompassing multiple intricate dimensions. As a process it is *dynamic*, i.e. constantly changing through time. Thouret and d'Ercole (1996: 408) interestingly talk of 'contingent vulnerability', i.e. conjunctural factors of vulnerability, "temporal and unpredictable, in a given locus and at the moment of the impact."

It is also often *cumulative*, causing disasters that in turn aggravate it, or adding to vulnerabilities in the case of other risks (such as socio-economical risks, etc.). Furthermore, vulnerability is both *hazard-related* (vulnerable to something) and *subject-related* (*one* is vulnerable, be it an individual, a group, a city, a society, the entire humankind, etc.). Therefore, one has to specify clearly which vulnerability one is talking about, and at which level of analysis (the individual level, the group level, or the societal level).

To make the analysis even more complex, vulnerability is also highly differentiated: different subjects, even at the same level, have different vulnerabilities. Some countries are disproportionately affected by

⁷ Note that there can be no vulnerability and no risk (objective security) but insecurity in a subjective sense can still exist.

disasters, as well as some cities, individuals, etc. Generally, the most miserable and isolated suffer most, as well as the less organized.

Finally, one can conclude that vulnerability is *context-dependent*, be it an individual exposed to natural hazards at the household level, or mankind at a global level. These 'transversal' features of global vulnerability apply to each component of vulnerability.

87.3.3.2 Components of Vulnerability

Vulnerability has two sides in interaction: exposure, and a series of insufficient capacities. Two types of *exposure* may be distinguished: a) physical exposure: presence and density of the people, habitat, networks, goods and services in risk zones, defining potential losses or damages, both human and non-human (stakes); and b) socio-ecological: human-induced ecosystemic perturbations aggravating the natural hazard—such as deforestation, land degradation, street pavement, some engineering practices, climate change, etc.

Insufficient capacities to prevent, prepare for, face and cope with hazards and disasters may be separated into:

- *physical weakness*: physical incapacity to resist or recover from a hazard's impact;
- *legal vulnerability*: weak state of the legislative and judiciary regulations to prevent, mitigate, prepare for, face, and recover from disasters;
- *organizational vulnerability*: weak state of the organizational disposals, at all levels, to prevent, mitigate, prepare for, face and recover from disasters;
- *technical vulnerability*: inadequate knowledge and/or use of risk management techniques;
- *political vulnerability*: weakness of the political powers, their legitimacy and control. Inadequacy of the control schemes, policies and planning, or broad political conditions;
- *socio-economical vulnerability*: socio-spatial segregation, large inequalities of wealth and access to the security disposals, misery, anomy and social disorganization, poor social position and social isolation of exposed people, existence of higher social risks undergone by people;
- *psychological and cultural vulnerability*: inadequate security paradigm or risk perceptions; cultural anomy or weakness; attachment to risk zones or risky behaviour, non-willingness or incapacity to protect oneself.

The overall vulnerability of an element (or stake) to one or several hazards is a mix of these particular vulnerabilities. This classification allows to guide the investigation on vulnerability as a reminder of the dimensions to consider. But as all these components are linked, such a list is not useful in forming a comprehensive picture of the state of vulnerability of an exposed unit, because one needs to establish relations.

87.3.4 Trends in Global Vulnerability

Vulnerability is also evolving. The rising number and severity of disasters worldwide shows a tremendous increase in vulnerability. At the global level, the main general trends explaining the rise are the following: a) *demographic pressures*: population growth, rapid and unplanned urbanization, increase of population density; b) *ecological degradation*: pollution, loss of biodiversity, land degradation, deforestation (global change issues); c) *socio-economic deterioration*: a reinforcement of the structures of domination throughout the world. Impoverishment, massive unemployment, rising inequalities, increasing violence, forced migrations, increasing concentrations of misery and extreme wealth, destruction of public collective structures, 'international financial pressures' (structural adjustments, Blaikie/Cannon/Davis/Wisner 1994: 32), etc; d) *disasters*: global epidemics, like AIDS and malaria; e) proliferation of 'low intensity' and high intensity wars. It could be added that the rise of natural disasters themselves constitutes a dynamics that increases vulnerability to future disasters.

At the local level, disasters are clearly linked with a mix of social risks, i.e. a situation of insecurity of the daily life including a state of misery, exclusion of services, goods, networks and rights. It is manifest in the existence of many people living in informal settlements like slums. People are forced to live in the most dangerous areas in poorly built houses. This situation of need and survival hinders capacity in preventing and coping with hazards. Now, how can security studies qualify and encompass this underestimated situation of insecurity? Is human security a possible concept?

87.4 Inclusion of Hazard Threats in Human Security

87.4.1 Requisites of an Integral Conception of Security

Security is never neutral. It is focused on a specific object (e.g. some people, the State), that one aims to protect and secure against specific threats induced by some agents of insecurity. It is evident that in the case of disasters, the threat is not a breach in security brought about by a foreign state or by terrorists. Disasters induce a crisis, or disruption in the functioning of a society in a manner that exceeds its ability to cope through the use of its own resources. It is therefore one of the highest forms of failure of security and stability at the collective level. We have seen the amazing impact disasters can generate, much bigger than that currently caused by terrorism. In terms of numbers of people affected, they are even much more important than wars. The nature of the threat is thus different.

At the individual level, the people to protect also differ from those in the previous vision. In the old State security conception, security meant protection for those people pertaining to the national community, by strengthening the State against one or several enemies. According to Brauch (2003c: 170), there are three main schools of thought in the international security debate: “a) the *Hobbesian* pessimist where *power* is the key category; b) the *Kantian* optimist where *international law* is crucial and c) the *Grotian* pragmatist where *cooperation* is vital.”

The traditional conception of security was Hobbesian, State-centred, and assumed security as a given. There is now a new consensus on the necessity to downplay the role of security and consider it more as a social construct. This means taking it as a normative and moral element dependant on social values (Wolfers’ 1962a definition in 87.4.3), and not as an objective reality. Simultaneously, this implies a reconceptualization of the concept of security by broadening and widening its dimensions according to the following research questions: which security for whom, by whom and with which means (Møller 2003; Brauch 2003)? The necessity for such an approach is obvious in our case, where there is no enemy to fight, but negative social, economic, and ecological forces that induce disasters. These are the agents of insecurity, conveyed by specific social individuals, groups and institutions, sometimes without even realizing it.

Humankind in its entirety is to be protected, but primarily the most vulnerable people. As argued above, they are the miserable or marginalized people, mainly found in the South. These vulnerable people need to be identified as the target of this type of security. Therefore, we need a new vision of security that would:

1. *recognize the threats*: e.g. natural disasters and their various impacts; other related threats;
2. *take into account all different levels*: global, regional, national/societal, intermediate (subregions, groups, communities) and individual;
3. *take into account all different temporal dimensions*: pre-disaster time, impact, post-disaster, short term/long term/future generations;
4. *prioritize what to protect?*: people, goods, livelihoods, infrastructures, networks, ecosystems, etc.;
5. *identify the agents of insecurity*: social, economical, ecological, political, cultural forces and actors involved, and all their interactions. Natural disasters and social risks are intertwined (see classification of vulnerability components below);
6. *propose a desirable state of security*: stability, absence or minimized disasters; and
7. *propose the necessary changes to reach it*: prevention, mitigation, preparedness, precaution, but also the struggle against misery, precariousness, inequalities of wealth and power, domination, ecological degradation, etc.

It is clear that international relations theories alone cannot provide these analyses. The analyses of vulnerability and socio-ecological dynamics required must be interdisciplinary and hybrid, holistic, and with a strong social and ecological focus.

87.4.2 Advantages of the Human Security Concept

Numerous events, factors and trends have challenged the old militaristic, realist conception of security focused on the State. In addition, these factors have contributed to a widening of the security concept: the end of the Cold War, liberal globalization, and economical deregulation, the ecological crisis, the increase of misery and inequalities, the changing nature of conflicts (more internal to States), the eruption of powerful non-State actors (NGOs, corporations, armed groups), the multiplication of disasters of all kind, etc. As we have seen, these trends have forced scholars and practitioners to extend the definition of security. Considerable literature can be

found on this broadening and deepening of the security concept (Wing 2000) to new referent objects (e.g. the individuals, communities, society, etc.; Wæver (1995) and the Copenhagen school), new domains (environment, economy, etc.; see Brauch 2003, 2003c, 2005), new means (conflict resolution, poverty alleviation, etc.), new levels (regional, community, societal), etc. Human security is part of this conceptual trend (Debiel 2004, also in this volume).

The United Nations Development Programme that introduced the concept in 1994 divides it into seven interrelated categories: economic security, food security, health security, environmental security, personal security, community security, and political security (UNDP 1994). The two major components thereof are summarized by “*freedom from fear*” and “*freedom from want*”. Some of the threats to human security include population growth, economical disparities, migration, ethnic disputes, social disintegration, environmental degradation, drug trafficking, poverty, etc. It is complementary to human development, which consists in *widening the range of choices*; human security is about *ensuring that people can exercise these choices* by offering them the necessary stability. It is close to Sen’s *Entitlements theory*. Thus, it is not surprising that Sen himself has become one of the promoters of this concept.

The definition of the *Human Security Commission* is useful and complementary to the one proposed by UNDP: Human Security is a goal to reach in order “to safeguard the vital core of all human lives from critical pervasive threats, in a way that is consistent with long term human fulfilment” (Alkire 2002a).

In our understanding of this emerging concept, human security would be interesting for points 1, 4, and 6, mentioned above, and partly for points 5 and 7. Indeed, the concept envisages security as a desirable state to reach (point 6.) in which disruptions would be avoided (point 1) and stability guaranteed. It also focuses on individuals and communities, i.e. on the human component (point 4), more than on immaterial entities like the State. It seeks to enlarge the narrow conceptions of security, in order to focus on those who really suffer. Thus, it introduces a part of social sciences analysis into international relations (IR), security studies and their networks, providing an interesting strategic advantage for points 5 and 7. It proposes a humanistic revolution in ‘security studies’ and in ‘international relations’.

87.4.3 Shortcomings of the Human Security Concept

Human security has stressed as the main threat the disruption of what is really important in people’s lives: a decent life at reasonable standards (*freedom from want*, i.e. from the most basic needs); and stability, i.e. a possibility to consider life and the future with serenity (*freedom from fear*), exempt from killings, injuries, huge losses, brutal changes, job insecurity, disasters, etc. Interestingly, the UNU/EHS suggests the addition of a third security pillar to the above-mentioned two: “freedom from hazard impact” (Brauch 2005). Both *objective* (“absence of threats to acquired values”) and meanings (“absence of fear that such values will be attacked” Wolfers 1962a: 23) are contained in these definitions of human security. ‘Want’ can be both an objective lack of basic elements for a decent life and a subjective desire, depending on socio-cultural determinations; ‘fear’ is obviously a subjective feeling, but can sometimes be linked to an objective reality (a high probability of being killed or injured for example); ‘hazard impact’ seems primarily to be purely objective, but the difficulties of measuring it, especially for the numerous small-scale and little impacts, show that there is also a strong social component in its determination.

What is implied if one takes this conception of human security seriously, is no less than a huge social change at all levels, including global, necessary to reach such an ambitious goal. But neither does it explain anything to make better diagnostics (points 2, 3 and 5), nor does it propose clear means for the changes and how to obtain their implementation (point 7). To make it useful, its promoters should explicitly recognize these deficiencies and more clearly separate the normative part, i.e. the objective proposed (whom to protect, from what and how; points 4, 1, 6 and 7), and the necessary analyses to be made for it (points 1 to 5).

Human security therefore needs an explicit agenda by which to understand and explain the root causes of human insecurity, by integrating studies of social sciences, ecological and natural sciences, international relations, critical analysis of power struggles and vulnerability, development studies, etc. Only then will it be possible to formulate more adequately the necessary changes to reach the goal of human security, and how to implement them. A tough political work would then remain to be done.

87.5 Conclusion

We have seen that natural disasters constitute a very important threat for millions of people, usually poorly taken into account in security studies, even though their acuteness is constantly growing. They generate social, economic, political, and cultural crises, with enormous human impact, mostly on the poorest and most fragile people of Southern countries. This can be characterized as a situation of chronic insecurity and may be understood only by recognizing the vulnerability of these people and societies, and all the components that are found deep within the social fabric (such as patterns of inequality of wealth and power, the ecological crisis, and political, economic, cultural, or legal frameworks, etc.).

Dealing with this insecurity, traditional security thinking is unable to comply with what we call the “requisites of an integral conception of security” that recognises the threats and analyses all their dimensions. The concept of human security that emerged in the 1990’s is useful in placing these new elements on the agenda, and in its insistence on human suffering. It is more accurate as a desirable objective for security than as an analytical framework, for which the concept of vulnerability is more adequate. Despite these deficiencies, it could be used as a strategic means to elaborate an integral conception of security. For that to happen, a clear agenda of interdisciplinary and hybrid research would need to be elaborated, with a strong focus on critical social science and ecological research. This could serve as a basis to formulate more accurate normative social changes and policies, and the means to achieve them, that is, a truly political task.

88 Environment as an Element of Human Security in Southeast Asia: Case Study on the Thai Tsunami

Surichai Wun'Gaeo

88.1 Introduction

This chapter addresses the research question: How do environmental resources become a key factor of human security for social groups? It poses two hypotheses: first, the state is both a determining and an intervening factor; and second, the affected communities are not passive actors, but are rather active partners in sustainable livelihood recovery.

The catastrophic Indian Ocean tsunami serves points to a need to refocus attention on environmental threats to human security. This calamity that struck the region on 26 December 2004 has prompted a wide range of national as well as international actors to respond to regional environmental threats. The experience of the tsunami in Thailand illustrates the larger picture of environmental threats to human security.

This chapter examines environmental resources as an element of human security by placing the ASEAN region and Thailand into a geographical context (88.2). It outlines a framework for human security from an environmental perspective focusing specifically on how natural disasters can threaten security and create situations of extreme vulnerability. Specifically, the environmental dimension of human security will be analysed for the impact the 2004 Indian Ocean tsunami had on humans and their economic possessions (88.3). The chapter then discusses the empirical findings of a field study conducted by the author and a team in the tsunami-affected areas of southern Thailand in 2006. This case study discusses the coping strategies in facing such extreme circumstances of vulnerability and human insecurity (88.4). Finally, the hazard impacts and social vulnerability are analysed interpreting the event by focusing on hazards posing threats to human security in Thailand (88.5).

88.2 Geographical Context: The ASEAN Region and Thailand

For Southeast Asians, human security has become a very concrete concept, understood unmistakably through the numerous forms of downside risks that have undermined the livelihoods of the millions of its vulnerable people. Southeast Asia encompasses Brunei, Indonesia, Malaysia, the Philippines, Singapore, Thailand, Cambodia, Laos, Myanmar and Vietnam (chap. 79 by Othman; figure 88.1). The region is often identified with the Association of Southeast Asian Nations (ASEAN) that was originally formed in 1967 by Indonesia, Malaysia, the Philippines, Singapore and Thailand. In 1984 Brunei became a member and after the end of the Cold War, Vietnam joined the organization in 1995, followed by Laos and Myanmar in 1997, and finally Cambodia in 1999.¹

Southeast Asia comprises different geographical landscapes, and it is an environmentally diverse region with an abundance of land, minerals, forests and aquatic resources (Focus 2006: 7). More than 500 million people inhabit the region. With the exception of Brunei and Singapore, the majority of the population in still lives in rural areas and earns its livelihood from agricultural activities. Most of the rural communities depend on local resources, such as forests and rivers, as crucial sources of food, medicine and housing.

Despite the immense dependency of these agricultural-based societies on the natural environment, the ASEAN approach to environmental resources tends to be piecemeal, and often contingent on the exigencies dictated by commercial needs (Focus 2006: 8). The region prioritizes economic growth, particularly in sectors such as finance, energy, and infrastructure,

1 ASEAN covers a total land area of 4.5 million square kilometres. Additional information about ASEAN is at: <<http://www.aseansec.org>>.

88 Environment as an Element of Human Security in Southeast Asia: Case Study on the Thai Tsunami

Surichai Wun'Gaeo

88.1 Introduction

This chapter addresses the research question: How do environmental resources become a key factor of human security for social groups? It poses two hypotheses: first, the state is both a determining and an intervening factor; and second, the affected communities are not passive actors, but are rather active partners in sustainable livelihood recovery.

The catastrophic Indian Ocean tsunami serves points to a need to refocus attention on environmental threats to human security. This calamity that struck the region on 26 December 2004 has prompted a wide range of national as well as international actors to respond to regional environmental threats. The experience of the tsunami in Thailand illustrates the larger picture of environmental threats to human security.

This chapter examines environmental resources as an element of human security by placing the ASEAN region and Thailand into a geographical context (88.2). It outlines a framework for human security from an environmental perspective focusing specifically on how natural disasters can threaten security and create situations of extreme vulnerability. Specifically, the environmental dimension of human security will be analysed for the impact the 2004 Indian Ocean tsunami had on humans and their economic possessions (88.3). The chapter then discusses the empirical findings of a field study conducted by the author and a team in the tsunami-affected areas of southern Thailand in 2006. This case study discusses the coping strategies in facing such extreme circumstances of vulnerability and human insecurity (88.4). Finally, the hazard impacts and social vulnerability are analysed interpreting the event by focusing on hazards posing threats to human security in Thailand (88.5).

88.2 Geographical Context: The ASEAN Region and Thailand

For Southeast Asians, human security has become a very concrete concept, understood unmistakably through the numerous forms of downside risks that have undermined the livelihoods of the millions of its vulnerable people. Southeast Asia encompasses Brunei, Indonesia, Malaysia, the Philippines, Singapore, Thailand, Cambodia, Laos, Myanmar and Vietnam (chap. 79 by Othman; figure 88.1). The region is often identified with the Association of Southeast Asian Nations (ASEAN) that was originally formed in 1967 by Indonesia, Malaysia, the Philippines, Singapore and Thailand. In 1984 Brunei became a member and after the end of the Cold War, Vietnam joined the organization in 1995, followed by Laos and Myanmar in 1997, and finally Cambodia in 1999.¹

Southeast Asia comprises different geographical landscapes, and it is an environmentally diverse region with an abundance of land, minerals, forests and aquatic resources (Focus 2006: 7). More than 500 million people inhabit the region. With the exception of Brunei and Singapore, the majority of the population in still lives in rural areas and earns its livelihood from agricultural activities. Most of the rural communities depend on local resources, such as forests and rivers, as crucial sources of food, medicine and housing.

Despite the immense dependency of these agricultural-based societies on the natural environment, the ASEAN approach to environmental resources tends to be piecemeal, and often contingent on the exigencies dictated by commercial needs (Focus 2006: 8). The region prioritizes economic growth, particularly in sectors such as finance, energy, and infrastructure,

1 ASEAN covers a total land area of 4.5 million square kilometres. Additional information about ASEAN is at: <<http://www.aseansec.org>>.

rather than focusing on long-term human development.

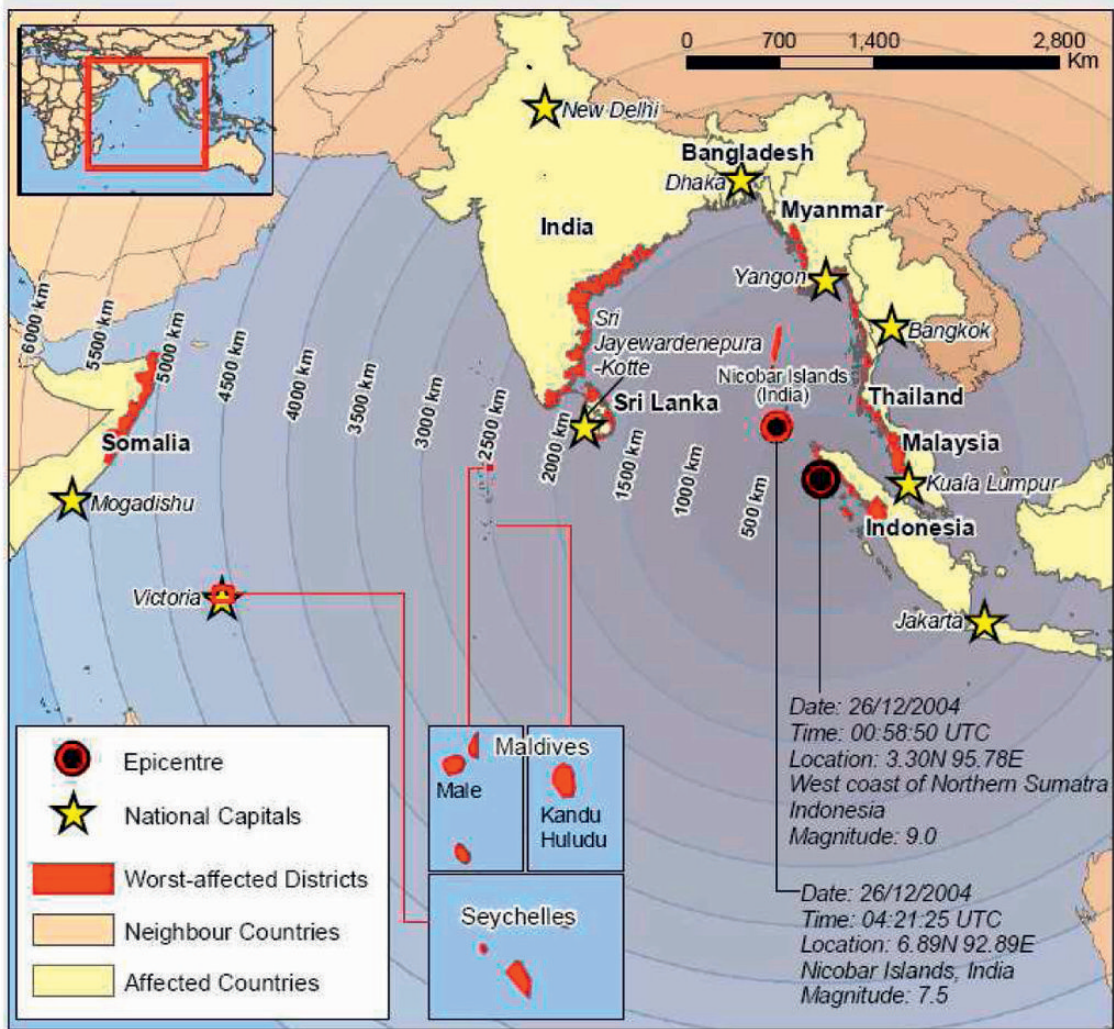

Within Thailand itself, major threats and challenges to human security during the past decade have included the 1997 Asian financial crisis that wiped out jobs, housing and lifetime savings, pushing many Thais into a state of income poverty; and the violent conflict in the southern border provinces, which has worsened in recent years, killing hundreds of innocent people, wreaking emotional devastation on families, and impeding the growth of the local economy. How-

ever, the threats arising from economic and social insecurities that have jeopardized human security are attributable not only to poor human-made policy choices, but also to sudden forces of nature.

88.2.1 The Indian Ocean Tsunami

Another major crisis facing Southeast Asia since 1997 was the tsunami that devastated South (chap. 93 by Ariyabandu/Fonseka) and Southeast Asian countries surrounding the Indian Ocean in December 2004.

Figure 88.2: Impact of the Tsunami in the Indian Ocean on 26 December 2004. **Source:** UNOCHA Situation Report No. 18 (14 January 2005), ReliefWeb Map Centre; at: <[http://www.reliefweb.int/rw/fullMaps_Sa.nsf/luFullMap/B02797119AFBF54C85256F8C005E4894/\\$File/rw_tsu_sitrep18_170105.pdf?OpenElement](http://www.reliefweb.int/rw/fullMaps_Sa.nsf/luFullMap/B02797119AFBF54C85256F8C005E4894/$File/rw_tsu_sitrep18_170105.pdf?OpenElement)>.

The names shown and the designations used on this map do not imply official endorsement or acceptance by the United Nations.

Countries affected by the tsunami include Indonesia, Malaysia, Myanmar and Thailand in Southeast Asia, as well as Sri Lanka, India, the Maldives, Somalia and South Africa (Acharya 2007; figure 88.2).

Responding to the destruction, international humanitarian assistance and relief efforts came from countries outside the region, especially from European countries, the United States, Australia, Japan and China. This tragedy focused international attention on natural disasters as a threat to human security. Moreover, it highlighted the need for Asian governments and Asian regional institutions to introduce a human dimension into their approach to security cooperation. In January 2005, a Special ASEAN Leaders’ Meeting in Jakarta discussed coordination of interna-

tional relief efforts and the creation of a regional early warning system. ASEAN proposed a resolution on “Strengthening Emergency Relief, Rehabilitation, Reconstruction and Prevention in the Aftermath of the Indian Ocean Tsunami Disaster,” which was later adopted by the UN General Assembly (Acharya 2007).

The Southeast Asian country most affected by the tsunami was Indonesia. About 165,708 people lost their lives and, over all, more than one million people were affected in Aceh.² However, while the tsunami itself resulted in tremendous negative impacts, it also helped move former conflict parties in Aceh toward reconciliation, not only among the people, but also by

strengthening relations between activists and the Indonesian government.

Thailand has historically had the good fortune of being a relatively disaster-free country, suffering only minor losses from natural catastrophes through the years. However, emerging as a newly industrialized country, it now faces an increased risk of damage to the economy and the public from man-made disasters associated with rapid development (Shook 1997). The 26 December 2004 tsunami was the greatest single natural disaster the country has suffered since 1950. Its impact was primarily associated with the tourism industry, which is the main source of income for the region. In Thailand, the calamity resulted in a confirmed 5,395 deaths, 2,817 missing persons unaccounted for, 3,302 houses totally destroyed, and more than 35,000 families whose livelihoods have been lost (Scheper/Patel 2006). The tsunami catastrophe greatly affected the tourism and hospitality industry.

According to an estimate by Thailand's *National Economic and Social Development Board* (NESDB), the country is assumed to have lost approximately 30 billion baht (equivalent to approximately USD 750 million or EUR 500 million) in revenue solely due to cancellations of holiday bookings. This factor alone would represent a decrease in the *gross national product* (GNP) by approximately 0.3 per cent (Weber 2005: 34). Beyond these economic losses, the destruction and damage to the environment also have far reaching effects on the coastal communities. Out of the affected people, up to 90 percent could be categorized as coastal poor, half of whom lived below the poverty line.

88.3 Environment and Human Security: A Theoretical Framework

The traditional approach to security has focused on the state. According to this traditional concept, the state monopolizes the right and means to protect its citizens. But in the 21st century, challenges to security have become much more complex. While the state theoretically remains the fundamental purveyor of security, it has in many instances failed to fulfil its security obligations. Moreover, sometimes the state has

even become a source of threat to its own people. Therefore, attention must now shift from 'state-centred' to 'people-centred' security (CHS 2003: 2). This shifting referent object of security led to the new paradigm of 'human security' that can no longer be understood purely in terms of violence, conflicts, or wars; instead, it must also embrace economic development, social justice and environmental protection. It first appeared in the 1994 *Human Development Report* of the *United Nations Development Programme* (UNDP 2004; Paris 2001: 89). This report identified seven elements of human security: 'economic', 'food', 'health', 'environmental', 'personal', 'community' and political security.

However, concerns over the linkages between global environmental change (GEC) and security have been discussed since the 1950's (Brauch 2005: 59). Environmental disasters challenge the survival of vulnerable people, and have therefore been perceived as a direct threat to human security. According to the Commission on Human Security, the relationship between human security and the environment is most pronounced in areas featuring human dependence on access to natural resources. Environmental resources are a critical component of the livelihood of many people (CHS 2003: 17). The attention now paid to the complex linkages and interdependencies between environmental risks and impacts on security perception is due to the development of environmental security (CHS 2003: 59).

Environmental security is described by Barnett as a process of minimizing environmental insecurity, in which humans are a major reference points. It addresses the impact of environmental degradation on the individual and people in terms of malnutrition, lack of energy and clean water (Brauch 2005: 24–25). As concerns on the impact of environmental changes on humans have mounted, the environmental agenda itself has become an object of securitization. The inclusion of the environmental security dimension in the framework of human security has resulted in understandings on the necessity of containing environmental threats that are a source of danger. Since human security according to the Commission on Human Security (2003) is 'freedom from fear and want', the attainment of environmental security probably means the achievement of this freedom.

88.3.1 Human Security and 'Social' Vulnerability to Hazards

Unlike conventional approaches to analyzing security, human security is centred on people and not on states or territorial boundaries. It focuses on empowering the individuals and communities within and across territorial boundaries, while simultaneously strengthening human rights and human development. According to the *Commission on Human Security*, human security calls for the protection of the vital core of all human lives by enhancing human freedoms and human fulfilment. Human security means protecting fundamental freedoms – freedoms that are the essence of life. It means protecting people from critical (severe) and pervasive (widespread) threats and situations. But it also refers to using processes that build on people's strengths and aspirations. It means creating political, social, environmental, economic, military and cultural systems that together give people the building blocks of survival, livelihood and dignity (CHS 2003: 4).

One key aspect of human security is not only the provision of physical protection of people, but also the creation of an enabling, multi-faceted environment that empowers people to fend for themselves and to have the freedom to determine their own goals and ways of life. Reducing 'hazard impacts' reduces economic damage (aiming at 'freedom from want') and also prevents the kind of social impact that can trigger violence (thus aiming at 'freedom from fear'). Thus, an effective environmental and hazard coping strategy can contribute to both human development and reduce the likelihood of violence occurring.

One of the complexities of human security lies in the scope and interconnectedness of the risks and vulnerabilities with which it is concerned. Environmental degradation and environmental change that render communities more vulnerable to disasters have increasingly been included in discussions on human security, particularly in many developing Asian countries, where agriculture is a way of life for many people in society. Natural disasters unquestionably threaten human security, causing human, economic and environmental losses (chap. 87 by Nathan). They impact on individuals, families and societies by exacerbating the risk of physical human loss and injury. They debilitate the education and health systems, which, in turn, limit the choices and opportunities of individuals to choose their livelihoods. Often resource-limited state institutions are further constrained, weakening their ability to provide physical protection and social safety nets for the citizenry. When a natural disaster takes

place in a country with a populace that already faces various deprivations such as extreme impoverishment and malnutrition, water insecurity, poor health, political powerlessness and environmental degradation, the effect on human security can be unfathomable.

88.3.2 Environment as an Element of Human Security

Two environmental causes of hazard impacts in Thailand dating from 2004 and 2006, respectively, have contributed to a high degree of physical vulnerability in affected areas, namely: a) deforestation of some regions in northern Thailand for agricultural land; and b) removal of the mangrove forests along the coastline for tourism.

In many developing Asian countries, where a disproportionate number of natural disasters have claimed victims during the past 40 years (chap. 87 by Nathan), the environment has an even more significant relationship with human security because of the high dependency of the predominantly agricultural-based societies on the natural environment. For the people living in these rural communities, many of whom represent the economically poorest in society, the environment serves as a comprehensive provider of the sources for life. Families rely on forests for fuel and on subsistence agriculture and fish from the sea and rivers for food (CHS 2003: 17). Furthermore, diversity of environmental resources

gives security and offers survival possibilities, and ... enables multiple livelihood strategies. For example, in a drought, certain foods may not be produced by a family nor be available on the local market, but a comparatively diverse set of wild plants in a local forest can be substituted and thus help people to survive (Neefjes 2000: 47)..

When threats to these environmental resources emerge, such as through land erosion caused by deforestation and agriculture, or pollution from industrial activity, the options for survival become minimized. The effect on the poor is both direct and immediate. Families are forced to "migrate to ever more marginal lands" in hopes of preventing food insecurity, hunger and famine.

The importance of the environment as an element of human security in these societies lies not only in the dependency on agricultural activities as a means of economic livelihood, but rather the environment itself constitutes an integral part of people's cultures and daily practices. For example, food habits, house designs, clothing, musical instruments, and work pat-

terns all reflect the community of plants and animals that surround them (Sachs 2002: 26). Because the environment is an integral part of life for people living in these agricultural-based societies, changes in environmental conditions greatly affect the way of life and therefore impact on human security.

The connection between environment and human security can be illustrated in the pattern of migration in agricultural-based societies. Most migrations in agricultural-based countries are seasonal and cyclical rather than permanent. Both the influx of labour migration from rural to urban areas after the harvest season and during times of famine, in search of income to prevent economic insecurity, clearly illustrate the environmental dimension of human security. Although the environment is not the sole determining factor for the movement of people, it nevertheless exerts an influence on people's decision making. Regardless of whether migration in these societies is driven by push or pull factors, the environment very likely induces the movement, since environmental change interacts with other factors and eventually affects the socio-economic system.

In addition to the phenomenon of environmental changes gradually eroding the socio-economic fabric

of rural communities, natural disasters also cause direct and immediate insecurity in human life. In many developing countries, natural disasters such as floods and earthquakes have socially and economically far reaching consequences on society. Natural disasters have caused food insecurity, shattered livelihoods and shaken economies through the destruction of infrastructure. Moreover, the loss of human lives has left many orphans or single parents, thereby exacerbating the social problems..

Against this backdrop, it is clear that environmental threats have far reaching effects on human life. As mentioned above, according to the *1994 Human Development Report* (UNDP 1994) environmental security is an element of human security. Environmental security aims to protect people from the short and long-term ravages of nature, man-made threats in nature, and deterioration of the natural environment. The report clearly highlights the nexus between environment and human security.

88.4 Environmental Threats to Human Security in Southeast Asia: Thailand and the Tsunami

88.4.1 Tsunami Impacts on Humans and Their Possessions

The Indian Ocean tsunami that struck Thailand on 26 December 2004 was the greatest natural disaster in

the country’s recorded history, causing unprecedented physical, emotional and economic damage and destruction (table 88.1). The tsunami affected six provinces along Thailand’s Andaman coast, namely Ranong, Phang-Nga, Phuket, Krabi, Trang and Satun. It left more than an estimated 8,000 people dead and impacted 407 villages, of which 47 were completely destroyed, including well-known tourist destinations

Figure 88.4: Satellite images of the Northern Kho Lak Bay (Thailand.) before and after the Tsunami. **Source:** UNOSAT, International Charter Space and Major Disasters Product ID: 325 - 14 Jan, 2005; at: <<http://unosat.web.cern.ch/unosat/>>.

such as Phuket and Phi Phi Island (UN 2005e: 9). With regard to specific affected groups, vulnerable fishing communities, ethnic minority groups, migrant workers and workers in the tourism industry were the most severely affected by the catastrophe. Nearly 1,500 children became orphans, suffering the loss of one or both parents (APWLD 2005). In addition to the shocking physical loss of loved ones, there was also a tremendous mental health impact on survivors, as they had to cope with the psychological and emotional trauma inflicted by the tsunami (Mental Recovery Centre in Phang Nga 2006; in: Wun'Gaeo et al. 2007).

The worst hit area – the central Thai Andaman coast, stretching from Phang Nga to Krabi, with Phuket at the centre – had seen a recent boom in development of interlinked economic activities based on coastal resources (figure 88.3). This development made use of natural resources and the fertile environment as the major driving force behind the rapid expansion of mass tourism (UNDP 2005c).

Prior to the disaster, there was a diversity of stakeholders involved in the local fishing communities. Groups that cooperated in the tourist sector included the entrepreneurs operating resorts and hotels, as well as other groups from the local communities, whose members were very diverse, being composed of Thais, both Buddhist and Muslim, illegal Burmese migrant workers, and three particular groups of ‘sea gypsies’ know locally as “Morken, Morklen and Urak Lawoi” (SAN 2006).

The booming of the tourism industry directly and indirectly created attractive new sources of income and jobs for local people, for example, as staff members and workers at resorts and hotels. It also provided a new market for local production, and subsequent revenues were invested in services and small businesses, mostly oriented toward the tourism industry (e.g., souvenir shops, restaurants, and guided tour businesses).

In terms of the economy alone, the impact of the tsunami was staggering, particularly on the tourism in-

Figure 88.5: Satellite images of Ko Phuket (Thailand.) after the Tsunami. **Source:** UNOSAT, International Charter Space and Major Disasters Product ID: 327 - 14 Jan, 2005; at: <<http://unosat.web.cern.ch/unosat/>>.

dustry. According to the Phuket Tourist Association (PTA), before the tsunami, 80–90% of business in the province was tourism-related. However, after the tsunami, as employers faced enormous reconstruction costs and a massive decrease in revenues, tens of thousands of workers in the hotel and tourism industries became unemployed, triggering a ripple effect on the informal economy as well (ILO 2005: 1). In total, the financial impact of the tsunami was estimated at more than USD 2 billion, representing a fall in overall GDP growth of 0.4% (UN 2005c: 9). In regard to the local ecological system, southern Thailand suffered substantial damage to its coral reefs, mangrove forests and other marine and coastal habitats. Because the tsunami caused inward flooding in coastal areas up to 3 kilometres, inland and surface water was contaminated by sea water, damaging inland potable water sources (figure 88.4, 88.5)

Apart from the tourism sector, coastal fishing communities also made significant contributions to the economy by supplying fish and seafood products

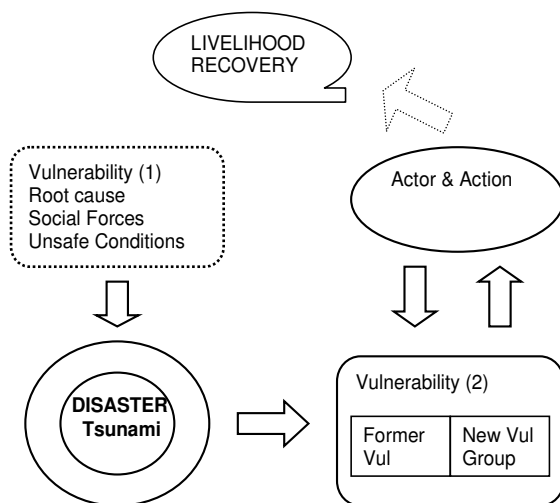

to the hotels and restaurants in the area. Migrant workers from Burma and ‘sea gypsies’ found employment in this complex sector too, but were ‘invisible’ insofar as they lacked official government documents. While casualties resulting from the tsunami among these populations also remain largely undocumented, it is nevertheless clear that prior to the tsunami, they were living in the area and derived benefit from tourism-related jobs, a situation the UNDP described as having “all eggs in one basket” (UNDP 2005c). There is no doubt that the tsunami caused a large loss of income from tourist revenue, fishing and related activities. People lost their productive assets such as boats, fishing equipment and business facilities. It is also expected that it will take time and require major efforts in order to recover from the tremendous drop in demand. Although the government immediately responded to the crisis, it remains unclear whether government officials fully took into account the complex features of the problem, which will require a long recovery and mitigation process.

88.4.2 Hazard Impacts and Social Vulnerability

Natural disasters do not recognize human social constructs such as class, gender, ethnicity and religion. But the social experiences of survivors in the process of recovery do tend to become differentiated along social lines. When disasters occur, it is necessary to locate the convergence of government efforts and external aid in providing immediate relief and assistance in returning to normal everyday life. The complex reality among the variety of relevant social groups (Thai Buddhists, Thai Muslims, Burmese migrants, and 'sea gypsies'), which is a result of the rapid development of fisheries and mass tourism along the Andaman coast, has created a situation in which there is a large mixed and growing population, with a tight interdependency of livelihoods, surviving on a limited range of opportunities. Government policy regarding recovery has paid much attention to the reconstruction of the tourism industry, but state distribution of resources has created many problems of lands rights and displacement, and is the cause of further vulnerability among those affected.

Figure 88.6 was developed based on the tsunami as it affected Thailand. It illustrates the correlation between vulnerable groups before the disaster and those emerging as newly vulnerable groups after the disaster, and the cause-effect relationship between relief actors and vulnerable groups. Relief action can lead people to the recovery phase or place them back again in a vulnerable condition.

Figure 88.6: The Vulnerability Cycle. **Source:** Designed by the author.

The first box (Vulnerability 1) contains the many groups who were socially vulnerable prior to the tsunami, such as illegal Burmese migrants, 'sea gypsies' and stateless persons. They existed but were 'invisible' to the Thai government. When the tsunami struck, the Thai government, NGOs and media discovered their existence. According to data presented by the Tsunami Evaluation Coalition, there are about 60,000 Burmese people who were affected by the tsunami (Scheper/Patel 2006). Burmese migrant workers who lacked legal documents were ignored by both their own government and the Thai government, and received no compensation. Most did not have an income generating capacity on their own. As migrants without official legal status, they had to rely on their employers to provide them with jobs. However, their employers also lost their businesses in the tsunami and therefore lacked the capacity to provide them adequate assistance. These conditions pushed them into a position of vulnerability.

The second box (Vulnerability 2) also contains new vulnerable groups that emerged in the aftermath of the tsunami. Their status relates to their economic position, gender, age and ethnicity. They include, for example, women, orphans and persons with disabilities. These groups of people became vulnerable due to inadequate support and the political opportunism involved in the Thai government's tsunami relief policy. Government actions had a major impact – easing or actually worsening – on peoples vulnerability during relief and recovery. Depending on the particular action, the government in fact brought about resilience and recovery for some, while perpetuating the vulnerability of others.

The tsunami itself frequently induced conditions of physical vulnerability, including, for example, fear of the tsunami aftermath, earthquakes and an unpredictable new tsunami coming. Empirical research reported in *Sociology of Tsunami* (Wun'Gaeo et al. 2007) and information from the Tsunami People's Network (2008) reveals that many problems stemmed from the role of the state and its perception during the period of relief and recovery. The top four problems attributable to the misguided role of state are: 1) land rights and disputes, 2) rights of ethnic minorities ('sea gypsies'), 3) problems of stateless persons, and 4) the negative impacts of mega projects.

The problem of renewed and continuing disputes over land rights between affected communities and business people with interests in tourism clearly reflects the bias in state policy, which was primarily interested in the reconstruction of the tourism industry

rather than being concerned about the livelihood recovery and security of the people affected by the tsunami. Many land disputes occurred immediately in the aftermath of the tsunami. While local people were still in shock from the tragedy of losing their physical assets and their loved ones, wealthy business people came and claimed rights over the land that previously belonged to the local communities. People in these communities consequently became landless. This kind of problem represents the 'double victimization' of some people affected by the tsunami, giving rise to even greater insecurity and vulnerability.

Stateless persons comprise the group perhaps most severely affected by the tsunami, since they were 'invisible' to the Thai government and the public before, during and after the disaster. The origins of the particular group of Thai people in question go back to the pre-colonial era, when their ancestors were living in communities spreaded around. When Britain colonized Burma, the delineation of its territory created the salience of arbitrarily fixed state borders. Prior to their migrating to work in Thailand, these stateless persons lived in Burma. However, both the Burmese and Thai governments, have so far, denied their existence and refused to grant them citizenship. This problem has existed since prior to the tsunami, and continues to this today. For the people in question, lacking an official identity card meant lacking entitlement, so they received no help from the Thai government and were left to suffer in silence.

Learning from the tsunami experience, these stateless and returnee diasporas people have made efforts to join together and form a network of stateless persons. Today, they are coordinating with local NGOs in order to struggle for recognition and citizenship rights.

Our assessment of the strategy in coping with the tsunami disaster focuses on three distinct periods, namely the emergency, recovery and rehabilitation periods. According to the field research conducted in Thailand, the major strength of the strategy in coping with the tsunami disaster was the speedy response of the government in effectively reacting to the crisis. Moreover, the social and community responses should also be regarded as part of the strength of the strategy. This is because cooperation among communities resulted in the creation of a self-organizing system that was more capable of directly reaching target groups. Self-organizing communities have also played an eminent role in planning long-term development measures.

However, the weakness of the plan and strategy lies first in the coping strategy and responsive measures adopted that overemphasized emergency management to the detriment of the recovery and rehabilitation processes. Second, in coping with the tsunami, Thailand put in place a mass tourism-led recovery strategy that aimed primarily to recover economic losses in affected areas by prioritizing assistance to foreign tourists in order to regain their confidence. Many local victims and foreign migrant workers were not registered or included in these efforts, resulting in the sad fact that aid and assistance simply never reached a large number of the victims. Third, there were shortcomings in the official assistance system, so that in practice, it only responded to the political leadership or government policy, and did not coordinate with community networks to assist local people and foreign migrant workers, who were the most vulnerable groups. Fourth, the holistic approach of livelihood recovery was not taken into account. Fifth, efforts in the area of communication tended to emphasize presenting the disaster to the public at large rather than facilitating communication at the community level. Sixth, there were problems in the macro-policy process, which could be observed in the mismatch between emergency and recovery management. Moreover, the policy implementation adopted favoured a mass tourism-led recovery strategy instead of a community-led strategy. Finally, there was no policy coordination, which subsequently caused confusion and conflict between different official agencies. As a consequence, legitimate questions were raised as to whether the post-tsunami relief strategy was designed to facilitate the revival of the tourism industry or to genuinely assist affected communities.

88.4.3 Interpretation of the Tsunami: Focusing on Hazards Posing Threats to Human Security in Thailand, and the State as an Intervening Factor

The tsunami experience in Thailand highlights policy gaps in coping with disasters. Some of these gaps are between sectoral policies, and result from a lack of policy coordination. However, there are also gaps between policies, on the one hand, and implementation measures, on the other. Moreover, gaps also exist between policy and operation, or between policy and the actual needs of affected victims in the stage of recovery and rehabilitation. Included in this latter case are gaps in the interface between policy and the recov-

ery measures initiated by the affected communities themselves.

All of these gaps indicated several problems. First, policy did not adjust to the changing demands of the communities. For example, after the emergency period, affected communities placed an importance on the recovery and rehabilitation processes, yet policy was still focused on emergency management. Second, the measures to cope with the disaster were designed to respond to pressure from high ranking authorities rather than to facilitate the needs of the affected communities. Finally, the above mentioned gaps demonstrate that the affected communities were not given priority in policy. Recently their leadership and creativity has however been more focused by some international agencies (UNDP 2008).

Almost as if underscoring their exclusion, at the memorial ceremony marking the one-year anniversary of the tsunami, the affected people were merely invited as guests of the government rather than being allowed to be the host themselves. Over all, in consideration of the overview of the system detailed above, the Thai political leadership then demonstrated in dealing with the tsunami disaster can rightfully be characterized as emergency management leadership rather than development leadership. At the same time, it must be emphasized that the dynamics of the post-disaster period were not only limited to the exigencies of the emergency period itself, but also extended to the need for recovery and rehabilitation, which are crucial for the sustainable development of the affected communities and areas (Wun'Gaeo et al., 2007: 311-371).

In spite of the actual shortcomings encountered on the ground in responding to the disaster, gigantic environmental catastrophes such as the 26 December 2004 tsunami have nevertheless sounded the alarm and awakened regional as well as national consciousness in regard to environmental threats to human security. Experiences and lessons learned from the Indian Ocean tsunami have vividly illustrated the dependency of the people on the environment, as well as the vulnerability of the country's economy and local communities to the devastating impact wrought by environmental disasters. The loss of income from the tourism industry has caused economic insecurity for the country, while for local communities, the tsunami not only wiped out vital infrastructure, but also created food insecurity and forced many people to alter their way of life.

88.5 Conclusion and Reflections

For the people of Southeast Asia, natural resources are not only a crucial repository of livelihood, but are also an intrinsic part of life and culture. However, the importance of environmental security has not yet been sufficiently acknowledged by policy makers. The resources in the region have been utilized primarily to enhance macro-economic prosperity, even while a majority of the population still lives in rural communities that depend on local resources as a means of livelihood. Failing to understand the importance of the environment and the unbalanced utilization of natural resources will likely lead to further environmental degradation and the destruction of the safety net of rural communities.

The increasing rate of environmental change and environmental degradation constitute environmental threats that bring about enhanced risks and vulnerabilities to people, thereby threatening their 'freedom from want and fear', which is a key element of human security. The experience of the 2004 tsunami disaster in Thailand has clearly shown the linkage between the environment and human security. The tsunami catastrophe has left a devastating impact on the economy, and has made society much more vulnerable. Furthermore, Thailand's experience in coping with the tsunami disaster has indicated a preference for a short-term active response while actually undermining human security over the long-term. This deficiency is unfortunately visible in the Thai state's general neglect of the recovery and rehabilitation processes in local communities.

Human security remains problematic in Southeast Asia today. Poverty and environmental threats continue to stand as obstacles to human development. The increasing frequency of environmental threats confronting the region only serves to underscore the notion that environmental security is a crucial element for the attainment of human security. However, the introduction of the environmental element into the comprehensive human security framework requires the utilization of resources in a sustainable way that will maximize the potential to preserve natural resources for the protection of human security. Finally, the role of the state, in particular, its policy process with clear community-based concerns, and, thereby policy networks in the respective region (Wun'Gaeo 2004), are major factors in coping with such environmental disasters when they occur.

89 The Impossibility of Securitizing *Gender vis à vis* ‘Engendering’ Security

Serena Eréndira Serrano Oswald

89.1 Introduction¹

This chapter scrutinizes the proposition and interest in the possibility of ‘securitizing gender’ that has been formerly present in security studies and discourses. Through a revision of the lineage of occidental science and by discussing the process of identity formation, a paradigmatic shift is suggested for approaching security.

When reflecting on the concept of security from a gender perspective, it is obvious that the problem is not to ‘securitize’ gender if we take the classical definitions of security: ‘state-centred’, narrowly defined and rendering an outdated concept that is marked by androcentric, hierarchical, Eurocentric, positivistic, dualistic and exclusionary undertones. Thus, it is essential to go to the roots of its limitations, revising it from its origin rather than trying to arbitrarily add an extra dimension to a concept that has no place for it at its nucleus. The alternative suggested, is to extrapolate the lessons learnt from the developments in the feminist agenda, both in theory and practice, in order to ‘engender’ the concept of security itself so as to make it viable for an equitable and more secure world. From this point of view, such issues as a) social identity, b) the formation of representations, and c) societal change should be considered as axial for our undertaking, in order to understand the processes through which social knowledge for security is gestated and implemented by social subjects or ‘selves’.

Consequently, the structure of the chapter shall first revise and evaluate the concept of ‘security’ (89.2) and link it to the systemic critique of the exclusionary – dualistic western tradition posed by *feminist political theory* (FPT) (89.3 and 89.4). Then, the impossibility of securitizing gender (89.5) shall be considered. After this, identity and representations shall be addressed in detail (89.6). The final part is comprised of general concluding remarks to integrate all reflections under the heading of women between and beyond (inter)national and human security (89.7), and a brief conclusion (89.8).

89.2 The Concept of Security

The term security derives from the Latin ‘*securitas*’. This word is composed of *si(ne) cura, curare*, etc. The etymological root ‘*cur*’ always implies concern for and a sense of responsibility. *Si(ne)* implies a negation, lack of. Hence, the concept of security should lead to a state of being in which human beings attain a way of life where they need not worry about social insecurity.

The meaning of the concept of security is “the state, feeling, or means of being secure; over-confidence, carelessness (archaic); protection from espionage, theft, attack, etc; staff providing such protection, etc; certainty; a pledge; a guarantee, a surety”.² Another definition identifies security with “freedom from fear, anxiety, danger, doubt, etc; protection or defence against attack and its procedures.”³ Some synonyms for the term are caution, warrant, promise, protection, payment, safety, transfer, safeness, invulnerability, immunity, welfare state, guarantee, sense of security, assurance, courage, rescue, deliverance, tranquillity, conservation, preservation, insurance, cau-

1 The author wishes to express deep gratitude to the editors, Ursula Oswald and Hans Gunter Brauch for their enduring patience and useful comments, as well as to three anonymous reviewers for their stimulating comments. My special tribute is to Jorge Ramón Serrano Moreno (UNAM-Mexico), whose insightful comments and meticulous diligence has been present throughout the development of this chapter.

2 See: *Chambers Dictionary* (Edinburgh: Chambers Har- rap Publishers Ltd, 2001); 1495.

tion, patronage, sponsorship, care, protectorate, guardianship, tutelage and custody.⁴ From this vast linguistic assortment, we can take some basic elements in order to make a rudimentary security compendium to guide our discussion. This is because in the present section we are addressing the very concept of security.

A fitting way to start doing that is first to call upon some of the best known structural thinkers. Levi-Strauss in 1962 coined the notion of '*bricolage*' or 'patchwork' to refer to the basic formation of mythical notions in pre-scientific societies, whereby something new is built using a mixture of existing materials (Bohanan/Glazer 1993; Leach 1970). Secondly, a process of representation and signification in language is thus constructed (Moscovici 2000; Duveen/Lloyd, 1990; Duveen/Moscovici, 2000; Deaux/Philogene 2000); thirdly, it is necessary to identify their implied backbone; fourth, we must consider them more comprehensively, especially if they are as elusive and contested as the 'security' concept.

Core elements in this 'mosaic' are that security:

1. is a state of being (as mythical contents in pre-scientific societies), which ranges from the *individual* (self, e.g. courage) to the *collective* (group or societal, e.g. protectorate) level;
2. is the antithesis of another condition - lack or absence of vulnerability, i.e. *invulnerability*- (something new is built);
3. has a linear timeframe that can range from *preventive* (protection) to *remedial* action (rescue), and can be seen as emphatically *processual* or *teleolog-*

ical, in synchronic and diachronic terms (Waever 2008: 102), (identifying their implied backbone);

4. cannot only be seen in *objective* or *institutionalized* terms (insurance, welfare state), as a 'sense of' it is also *subjective* - tranquillity - (signification is thus constructed);
5. is linked to a negative conception of liberty, 'freedom from', in terms defined by Isaiah Berlin (2002), (should be considered more comprehensively).

As a state of being, whether individually (intra- and intersubjectively), as group (intra- and inter-group/community/region), and at the institutionalized and societal level, security is an identity⁵ process (to be discussed below). As an antithetical proposition, it is framed in antagonistic terms 'that which it is not', an irreconcilable dualistic position that is deeply embedded in western thought since the early Greek philosophers (Arends 2008).⁶

The western notion of security is from its construction other-dependent (the dual model), in a binary exclusionary logic; thus it calls for a paradigmatic shift in terms of autonomy from its conception. This process or revision and critical evaluation of the security concept will also be fruitful for surpassing a functionalist-instrumental outlook, weighting security in-

3 See: Oxford University Press (2005); at: <http://www.oup.com/oald-bin/web_getald7index1a.pl> (September 2007): 1; WordReference.com 2007; at: <<http://www.wordreference.com/definition/security>> (September 2007): 1; AskOxford.com (2007); at: <http://www.askoxford.com/concise_oed/security?view=uk> (September 2007): 1; YourDictionary.com 1996-2007; at: <<http://www.yourdictionary.com/security>> (September 2007): 1. In Spanish it also means certitude, states' sanitary and economic obligations to its citizens, as well as mechanisms that ensure the smooth running of a business, procedure or thing; see: *Real Academia Española* (2007); at: <http://buscon.rae.es/draeI/SrvltConsulta?TIPO_BUS=3&LEMA=seguridad> (September 2007): 1.

4 See: *Roget's Thesaurus of English Words and Phrases* (London: Penguin Books Ltd., 150th Ed., 2002): 660, 767.

5 As an adjective the term *identity* is used technically, it is connected to identity (as a noun), and the way it is organized.

6 From the Minoic Period, 2800 BC the main great goddess, owner of the animals - *potnia theron* - had a male adolescent divinity subjected to her, a hierarchical dualism. In the Micenic Age, the hierarchy was reversed, with a male deity of Indo-European origin - Zeus - leading the celestial vault (Serrano Moreno 2008). With the ensuing turn from myth to logos, theogonic and cosmogonic explanations became less popular in the pre-Socratic Age, with Parmenides of Elea epitomizing the dualism, separating the existing all "*what is*" (*holos estin*) and the void "what is not" (*hos ouk estin*). Being (*to on*) is constant, eternal, whilst not being is nil (later *nihilum*) (Lobato Valderrey 2001: 17-29; Encyclopaedia Britannica 1991: *passim*). The perpetual opposition: either/or, taken up and further developed by Socrates, Plato and Aristotle, prevailing through expressions such as Gnosticism, Maniqueism, Marcionism, Neoplatonism, Scholasticism, Monarchic and Despotism, Colonialism, Christianity, Humanism, and prevalent in most social science discourse. Tracing the evolution of this perpetual dualism throughout the western tradition is a mammoth exercise way beyond the scope of this article (Arends 2008).

tegrally instead of linearly, as a process as well as an end per se.

Within the security debates, security has been seen mainly from two perspectives. A *traditional narrow* approach of state-based security, and recently a *wider security concept* (Brauch 2008, 2008a, 2008b, 2008c) incorporating *human security* and universal rights (UNESCO, UNO) but also *societal security* (Wæver 2008a), *social vulnerability* (the work by the UNU-EHS) and the human, gender and environmental security or HUGE approach (Oswald 2001, 2007d). It has grown together with – although not within – Peace Studies (Wæver 2008; Albrecht/Brauch 2008) and in a recent tradition of late modernity, including also changing societal structures, mass communication and risk society (Beck 1998; Beck 2001; Giddens 1991). The narrow realist security focus has itself been challenged during the post-Cold War period, with processes of *horizontal widening*, *vertical deepening* and *sectorialization* (Brauch 2005, 2005a, 2008, 2008a). On such lines, structural and directional syncretism has also occurred, with North and South facing a plethora of security challenges and debates, voices ranging from individuals, groups and transnational organizations emerging from the grassroots to the glass cusp⁷, enmeshed in an eclectic and fragile 'world order' bound by hopeful yet stilted and slow – in – delivering effective international agreements (Higgins 2006).

As seen from the shifting security concept, it is clear that either proponents of the narrow security concept, or even scholars seeking to widen or deepen the concept, have fallen prey to syncretism in their scientific endeavour. The point is not to add extra dimensions to an outdated concept forging at best a conceptual parallelism and at worse a surface dualism, if the security concept is obsolete from its roots. It needs a transcendental qualitative jump. This chapter does not provide a new security concept; rather it seeks to make visible some of the limitations of the current concept – even in its widest and most novel sense. Instead of focusing on the means to 'most efficiently' enforce peace–military or not, it favours a conception where the guiding outlook is based on a state of being, not on the best out of a number of mitigation and coping strategies. It implies a structural as well as a directional paradigmatic shift.

After having assessed security briefly, there is a need to understand what is meant by gender and from where it stems. Subsequently, taking elements from both strands of security and gender, and looking at the processes of identity and representation, it might be possible to highlight some of the axial elements of the conceptualization of the present author that ought to be addressed with a gender sensitive gaze, in order to achieve the frame for the proposed paradigmatic shift.

89.3 Gender

Given the development of the concept of 'gender equality' within *feminist political theory* (FPT) there is a recurrent bias in science and policy of equating gender to women, often assuming that addressing women's issues marginally, either statistically or rhetorically, means being gender sensitive. Nothing can be further from the truth. Gender has to be understood as an identity referent that builds upon sexual difference but seeks for equity in a world where hegemonic and dialectic 'man–woman' sexual assumptions degrade both diverse women and men. Due precisely to the identity referent, there is not a one universal female subject 'woman' and a universal male subject 'man'; there are women and men in plural, inserted in dramatically contrasting social settings. There can be found as much difference between women of different cultures, age and class groups throughout history, as there is difference between a man and a woman.⁸

Also, identity traits considered feminine are stereotypically equated to female and thus to women, likewise with masculinity – masculine – men (Lagarde 1990). The historical process of articulation of sexual difference is the scope of gender, and although sex is biologically determined and gender is culturally constructed mostly taking sex as a basis, extreme caution needs to be taken in order not to fall into a biological reductionism or a cultural determinism (Lamas 2001; Lamas 2002; Aguado 2004; Goetz 1972; López Austin [1980] 2004). Furthermore, sexuality is the symbolic or signified structure of sex – and it is not the same as

7 Cusp is no English word; it comes directly from Latin, see dictionary at: <http://www.oup.com/oald-bin/web_getald7index1a.pl>.

8 See: Cock (1989, 1992); Le Duc Castro Reguera LSE (2001); Craske (1999); Brydon/Chant (1989); Chant with Craske (2003); Chant/Gutmann (2000); Chant (1991); Chant (1997); Dore (1997); Gutmann/Matos Rodríguez/Stephen/Zavella (2003); González Montes/Tuñón Pablos (1997); Tuñón Pablos (1999, 2000); Rodríguez-Shadow (2000); Marcos (2006); Quezada ([1975] 1996); Quezada ([1996] 2002).

sexual preference or orientation, distinct from a gender identity which is the identitary process of each person bound to a specific context, of which sexuality is but a part.

Identity entails each person's concept of self (who am I?), and also the process of assigning and being assigned identity (and identity traits) to/by other(s) (who is s/he? / Who are they?). Besides, given their identity or identifications, each person is part of a broader *gender condition*, for example as 'woman' or 'heterosexual', etc. Lastly, each subject has a particular and *gendered situation* which is unique, for example as Juana de Asbaje y Ramírez or as Mohandas Karamchand Gandhi (Lagarde y de los Ríos 1988, 2001, 2001-2002; Braidotti 2004).

89.4 A Glance at Feminism

Overall FPT has striven to deconstruct the universalistic presumption on 'man'kind as neutral, universal, and masculine, in order to investigate human diversity. To this is added a false dichotomization in terms of a 'private' or 'domestic' and a 'public' or 'political' realm, historically segregating everyday life and labour according to sex.

Feminism is not the same as gender, just as equality does not mean equity. Feminism entails a political agenda (Phillips 1996), alongside academic discourses and theorizing, it has developed over decades of struggle in its divergent strands that are even conflicting or contradictory. Thus, it is impossible to speak of a single feminism, within FPT there are various types of feminism, the most notable strands are (based on Squires 1999):

- *Liberal feminists* (seek inclusion): focus on equality politics, inclusion of women in the sphere of government, on autonomy and impartiality, claim subjects' neutrality, want a balance between women and men. Identity and equality are seen as neutral and universal, and politics should be neutral too.
- *Radical, maternal or cultural feminists* (seek reversal): focus on reconfiguring the political realm, aiming to strategically affect the political given their specificity as 'women', favour 'difference - inclusive politics'. The political sphere is to open up to include women whose identity is seen as specifically female-gendered. An essentialist female identity is sustained, although oppression can come by re-shaping its contours.
- *Postmodern or post-structuralist feminists* (seek displacement): the latest trend within FPT, it seeks to destabilize the false dichotomy between inclusion and reversal. Subjects' positioning and 'gendering' is taken as verb not as noun, meaning an element of agency even within discursive regimes that ought to be deconstructed. Through this outlook, subjects and discourses being affected are 'engendered'. Diversity politics are embraced, seeking a plurality where no identity position has privilege or pre-eminence over other(s). Thus, gender identities stem from particular political discourses and realities; they are contextual though the social subject is an active agent and not a passive receptacle of essentialism or constructivism. Gender as category ought to be transcended⁹.

It is evident that FPT is a complex web of positions, in terms of academia and discourses as well as practical action even if it is analysed as 'theory'. The apparent opposition is not applicable because discourses have been informed from practical struggles and struggles have been nurtured by theory from the earliest waves of feminism (for example Olimpia de Gouges during the French Revolution or Mary Wollstonecraft in Britain). Also, the feminist agenda has shifted considerably and it remains regionally diverse still today.

First, throughout centuries the women's struggle sought to establish acceptance for women's equal capacity to reason vis à vis men, fighting for women's education, later demanding political emancipation, gaining increasing visibility as workforce after the first world war, demanding labour rights and equal pay, thereafter seeking political representation and executive positions at the same time as demanding public services from the grassroots, linked to racial and ethnic struggles, to liberation and decolonization waves, and to other minority groups and societal struggles such as human rights, environmental concerns, peace processes and even movements that go from pro- tra-

9 It might be pertinent at this stage to explicate that by "engendering" something is meant a usage that is linked to the feminist viewpoint of an active process of making something: "to engender" as 'verb'. Also, it implicates visibilizing that process through which 'something is being made' is marked with a *gender(ed)* identity. It makes a political statement that obviates the "neutrality" fallacy and seeks to deconstruct *gendered* meaning. It aims to elucidate how humans and culture are *gendered*, i.e. how they are constructed as "women" and "men" in specific spatial and temporal contexts.

ditional family lobbies to queer and new age movements. So, as an alternative paradigm, it has sought equality and restitution, but it never has advocated patriarchy or exclusionary gynocentrism.

This said, however, secondly it is primordial to state why the gender lens deriving from feminism is particular and indispensable. The gender element is an irreducible dimension of inequality; linked to other forms of exclusion, but it is the starting point of the gender perspective. *In a patriarchal world, women are primarily oppressed for being women and therein resides the axis of their insecurity, precisely given their gendered condition.* Thus, their particular condition as women must be addressed specifically; it should not be enmeshed with other theories of oppression and subordination (for example in the work by Oswald 2001, 2003, 2004, 2007c, 2008a, 2008d) as an uneasy theoretical concoction that makes theoretical and practical advances even harder.

After revising the core types of feminism and brushing over some of its historical developments and aims (Phillips 1996; Phillips 1999; Nicholson 1990; Amorós 2000; Jackson/Scott 2002; Tietjens Meyers 1997, Varela 2005), it is easier to understand why much of what is addressed under the general banner of 'gender' relates to women. The concept of gender developed within feminism, even if it seems that one of the aims of a gender sensitive gaze today is to avoid rigid sexual categories that establish polarities and can easily become hierarchically exclusionary.

Yet, the importance of diversity is inherent to the development of feminism and of a gender perspective. As said, this does not mean that all minority struggles or societal inequality axes are gender, even if they can be approached from a gender sensitive gaze. It is clear that FPT today, especially in its postmodern stream, aims at transcending binary oppositions that cage social subjects as defenceless victims of biological or cultural determinism (Butler 2004; Chant/McIlwaine 1998; del Valle 2000; Benhabib 2006; Gutmann 2000; Jiménez/Tena 2007; Jiménez 2003).

The false dichotomy that has historically privileged men over women is increasingly being questioned. That is the same reason why it is not recommendable to add an extra cosmetic dimension of 'gender' as a variable to the security agenda, which at best might translate into separating between 'women' and 'men' in research and policy-making. Affirmative action and positive discrimination are important, but they are only a remedial recourse given prevalent disparities. Instead, shifting paradigms (Kuhn [1962] 1996) implies looking at the roots of existing inequity

and its operational mechanisms; transforming mentalities and actions at the identity level, i.e., going to the root representations embedded in every person's world outlook, identifying the social and cultural representational mosaic as individuals and its relation to the cultural milieu where it emerges and is transformed (Serrano Oswald 2003). This means working as overall individual selves and also as members of local and global cultures. Not just embracing a part of our identity make-up being segregated as academics, as policy-makers, as citizens, as community facilitators, as professionals, as members of certain groups and associations, as family members, etc.¹⁰.

89.5 The Impossibility of Securitizing Gender

Reflecting on both the definitions of security and the development and implications of the 'gender' concept, as well as the notion within late-modern feminism of 'engendering' something/someone, the author suggests to 'engender' the security debates, instead of 'securitizing' the gender concept. The later is seen as an impossibility, because gender itself has been so dynamic and diverse that the rigidity inherent in security studies would not fit to it, rendering the enterprise futile, rhetoric at best. The former implies making the depths of the gender dimension visible, becoming sensitive to the way it has been present and shall be addressed in the security agenda as such. Thus, some of the steps that should be taken into account as a way to pave the road to 'engender' security will be outlined in the following pages of this chapter: a) a cautious look at the context and limitations from where we do 'science' (present section), b) the importance of identity, c) of change and social dynamism, hoping to d) transcend exclusionary dualisms (next sections).

First of all, security studies and FPT are scientific endeavours, as such it is important to recognize some of the ideological benchmarks of the development of modern science. Often, the critique has denounced the theory - praxis gap, the fact that historically and hegemonically it is Eurocentric, presently prioritizing

10 At this point, it must be explicitly said that the aim of this chapter is not to make a revision of feminist or gender sensitive works on security or peace studies, or on the scientific studies aiming at 'securitizing gender'. The core aim here is to seek a paradigmatic change in the conception of security itself.

Northern or developed countries' debates. Within FPT, the main argument is that it is a science developed by men for 'man'-kind, where most heads are still male. Important efforts are being undertaken in order to historically render women and 'female' knowledge visible (Bartra/Fernández/Lau 2002; Gutiérrez Castañeda 2002), especially of those not pertaining to hegemonic white and middle class groups in developed countries, and beyond academic groups and intellectual elites. Nevertheless, precisely in order to be aware of the bias inherent in our context as scientists, it is important to situate ourselves as scholars critical of, but stemming from, a western tradition.

One of the most influential philosophies of science emerging in the occident during the nineteenth century was Comte's *positivism*. Following from the earlier British tradition of Locke's *empiricism* (Aristotle; Aquinas; Locke) and closely tied to naturalism (Bacon, Voltaire) during European Enlightenment, science came to be seen as an exercise of universal truth, a neutral enterprise based on unbiased observation mediated by an appeal to reason (Harding 1986, 1987, 1991, 1993, 1996, 1998, 2003; Figueroa/Harding 2003). Although Comte's law of three stages has been demised, some traits of *modern positivism*, to be aware of, prevail as structural underpinnings of mainstream scientific understandings, both in the so-called 'natural' as well as the 'social' sciences: the positive methodology of science (experimental or empirical method) as true (Sophists, Stoics, Epicureans, Hume); research tools are refined rendering new discoveries, but research objects in themselves are and always remain the same without change (*ahistoricism*) (Bentham); complex systems can and must be simplified to simpler units (from the Greek tradition of monist or pluralist essences, atomists, Leibniz's 'monads') in order to be studied (*reductionism*); science and measurements have a logical structure and coherence, which ideally is numerically organized (*axiomization*; Pythagoreans, Spinoza).

Science is unitary, cumulative and transcultural (*universalism*; Hume). Defined in congruence with western scientific tradition, objectivity can be separated from subjectivity, the former having prominence over subjectivity which ought to be discarded or treated with extreme suspicion (following from the Platonian split between 'self' and Cartesian rationality, linked to materialism). The scientific undertaking or measurement is dissociated from the investigator and her/his subjectivity (objectivity, or from FPT 'impartiality').

Besides, it links to the emergence of *instrumentalism* (Epicurus; Bentham; Stuart Mill; Popper; Singer), *pragmatism/cism* (James, Sanders Price; Dewey), and *rational-choice theory* (Adam Smith). (The fact notwithstanding that since Marx the idea of false consciousness or reification - ideology - highlights the power dimension inherent in scientific undertakings, partially discarding 'neutrality').¹¹

Clearly it would be an aberration to generalize and state that science must necessarily contain these elements. Even within mainstream scientific debates over the twentieth century, many of the traits outlined have been critically scrutinized. However, the social subject, object of scientific enquiry and security, often remains a statistic or a gender-neutral universal 'citizen' (Phillips 1996), apparently living in no specific time, pertaining to no specific society or class, ethnically same, without a defined age and life cycle, void of experiences, passive albeit performer of perfectly scripted 'roles', living in an isolated, unalterable and power-free world, in a strangely 'measurable' vacuum. In order to situate subjects, and to explore how and where they *become* processually, and how they interrelate, it is indispensable to address identity.

89.6 Identity and Representations

The importance of addressing identity surfaces when homogenous and unitarian categories of social subjects are problematized, even meta-narratives which have sought to represent a homologous category of 'women' and 'men' (Butler 2006; Benhabib 2006). Precisely as feminism emerged questioning the maxim that 'biology is destiny' (Arizpe 1986: xv), epitomized by de Beauvoir's *Second Sex* firmly stating that "one is not born, but rather becomes, a woman" (de Beauvoir 1984: 276), meaning that it is not possible to reduce the process through which identities develop, nor the contexts wherein they gestate. "Feminine and masculine identities are not natural or given in biology, but must be constructed and should be understood as cultural achievements" (Moore 1994: 42).

The elements that braid in the socialization of social and cultural elements, roles, and practices (Rai 2002) are seen as the collective framework for punctuating and understanding similarity and difference

11 See: Robinson/Groves (1999); *Routledge Encyclopaedia of Philosophy* (2000); Lobato (2001); *Standard Encyclopaedia of Philosophy Online* (2007); Serrano Moreno (2008); Markova (1982); *Encyclopaedia Britannica* (1991); *Enciclopedia Hispánica* (1991).

between people throughout time (Seedat/Duncan/Lazarus 2001). Society becomes a space where knowledge is acquired since early infancy (Lloyd/Duveen 1992; Duveen/Lloyd, 1990; Duveen 1997; Duveen/Moscovici, 2000; Stigler/Shweder/Herdt 1990), where it is constantly negotiated in a power-loaded context (Foucault 1980, 1992, 1998, 2004; Bourdieu 1997; Swartz 1998). A context thus incessantly subject and subjected to change (Gluckman 1968, 1970), where individuals and groups actively interrelate forging identities vis à vis each other.¹² Thus, individuals and groups are seen as agents rather than reactive actors, creating and changing the social and cultural circumstances where they are bound, endlessly *becoming*, and not passively performing pre-assigned roles.

It is particularly important to emphasize that human beings are agents situated in contexts, and mark the distinction between mainstream psychological discourses that address identity as an instrumental and unproblematic process of 'role'-taking. "All the world's a stage, And all the men and women merely players. They have their exits and their entrances, And one man in his time plays many parts..." wrote Shakespeare in 1599 or 1600 in the comedy *As You Like It* (act II, scene vii, lines 139–42). From this Shakespearean quote we get a clear picture of what might be meant when we refer to people's lives unfolding as they enact divergent 'roles'. However, it is also a clear portrayal of the limitations inherent in this viewpoint, as it clearly lacks any *reference to humans being context-bound as well as to people's sense of agency and decision-making capacity*.

Identities are complex and contextualized processes. In social science, and even in FPT, it is too frequent to come across this notion of 'socially defined roles'.¹³ For example a woman pursues a mothering role with her children, another as professional and student perhaps being a nurse with on-going training, another as member of local political activities and fi-

nally one as wife and another as housekeeper. Some of these roles will be deemed 'traditional' (housekeeping, mothering, wife), and others shall be seen as 'non-traditional' (professional, political, educational). Some might be seen as mixed, for example her career as a nurse might be seen as progressive in the sense of economic empowerment and professional credentials, but also as traditional as an extension of her role as 'carer' (Everingham 1997; Langer 1964).

In the last half of the twentieth century, feminist debates denounced how in order to fulfil these different 'roles', women have to work double and triple timetables.¹⁴ The fact that women's working schedules have increased, especially facing recurrent economic crises in developing countries is both true and alarming. Notwithstanding, the notion of women switching different 'roles' is equivocal. People's identities must be understood as highly complex though integrated wholes, in constant flux and with many elements (traits) that come together often heterogeneously and even dissonantly in the representational nuclei (Wagner/Valencia/Elejarrrieta 1996; Wagner/Duveen/Themel/Verma 1999; Jodelet 1991). Furthermore, identities root in social contexts and thus they are not as individualistically fragmentary or as easily interchangeable. Thus, regardless of whether a woman is campaigning politically, attending training, kissing with her husband, breastfeeding her child, doing household chores or tending a patient at work in hospital, activities which are bound to specific time schedules both diachronically and synchronically, her identity is always present and changing as a whole. People are not machines or passive receptacles of identity that get programmed to be active and inactive in different situations, as fragmentary or cyclical task-fulfilling instruments. People have embedded and embodied identities and representational traits, and although they become salient at divergent times, they are constitutive of each *self*.

We are active human beings not passive players, and history is an unfolding project not a given script. Both as individuals and members of different groups our identities are composed of many traits – both conscious and unconscious – that gain saliency at different occasions, these are complex and often enmeshed, and cannot be reduced to the notion of roles or so-

cially defined roles. Identities are rooted and respond to changing social contexts, “it is not individuals who have experiences, but subjects who are constituted through experience” (Scott 1992: 26, in: Napolitano 2002: 6). Thus, a woman living in today’s society which still generally ascribes care to women might have internalized the ‘care ethic’ at the core of her identity, and her behaviour, her profession and activities, also her intimate life, all reflect this (Lagarde 1988, 2001, 2001–2002). It is not just a ‘role’ she interchangeably performs; it is an identity axis of her being. Besides, the processes of ‘gendered’ social identity formation do not necessarily entail a cognitive awareness¹⁵ as psychoanalysis has shown, for example violence has deep unconscious seeds.¹⁶

Identity gestates at divergent levels, which are interrelated but cannot be reduced one to the other. It operates at intra- personal (unconscious, subconscious and semiconscious), inter- personal, intra-group, inter-group, social or societal level (national and global), within specific, micro, medium and macro interactive webs (Serrano Oswald 2005). These identity dimensions have to be considered as multi-layered dimensions when addressing security, for identity is a fluid and complex phenomenon that cannot be merely seen in blocks within security dialogues, as has been the recurrent case with ‘ethnic’ or ‘national’ identity (Waever 2008a; Buzan 2008), or even ‘gender’ (Oswald 2008a; Hoogensen 2008). We find ethnic, national, and gendered *identities*, as plural, procession and multi-dimensional. Of course it is also imperative to elucidate the interrelation of identity to other social and discursive dimensions such as security, or gender, where it becomes manifest and is transformed. The above discussion intends to make it clear that a paradigmatic shift in security studies must seriously take into account that identity is:

- *A process*: We cannot speak of identity in absolute or ahistorical terms.

- *Relational*: Identity emerges and is transformed in social exchanges and interpersonal interactions; it defines and is defined in/by social relations.
- *Multi-dimensional*: It operates at intra-individual, inter-individual, intra-group, inter-group and ideological/societal levels (Doise 1986).
- *Contextual*: it does not exist in a vacuum, but is framed according to specific contexts; it is embodied and embedded.
- *Inescapable*: we cannot understand the diversity and complexity of social interaction unless we investigate identity processes, how they are sustained and evolve (Serrano Oswald 2003, 2004, 2005).

The human brain is constantly processing information from the myriad stimuli perceived in everyday life. When the brain ‘identifies’, ‘familiarizes’, ‘internalizes’ or ‘socializes’ information, it either makes analogies or differentiates with existing representations. Cognition does not take place in a ‘blank slate’, as Locke or the Stoics have argued (Farr 1991; Farr/Moscovici 1984; Fiske/Taylor, 1991). Cognition and representation occur in relation to existing representations in two basic processes: a) *generalization* and b) *particularization* (Farr /Anderson 1983).

Given the myriad stimuli that we cognize in everyday life and our need to simplify the universe of stimuli surrounding us, we take cognitive distance or proximity from the object of perception, as we link it to the stock of existing representations through analogies or differentiation (Hogg/Abrams 1988; Goffman 1959). Thus, for example, if one sees a woman begging in the streets, our perception may be *generalized* and linked to our existing prejudices as we categorize a ‘homeless, bohemian, lazy person, perhaps even a thief’. However, if we make an effort to *particularize*, we might find out that she is called Maria Sánchez, a war refugee from El Salvador, for whom it is impossible to work given her migrant status and thus unemployed, actively trying to make a living over 16 hour shifts singing and playing a native instrument in the streets. The source of prejudice is often related to our cognitive structure and its pre-disposition to process information through reductionism (Ichheiser 1949; Allport 1954). However, prejudice is not innate, although it is frequently stimulated by politicians and the mass media surrounding security issues. In the process of cognition, we have the ability to particularize and thus avoid stereotyping and prejudice. This can operate at individual as well as at group level. Social categorization and comparison usually hopes for asserting a positive identity for the self or the in-group in relation to

others and to outgroups. Merely by recognizing otherness, competitive or discriminatory reactions may be triggered (Tajfel/Turner 1979; Tajfel 1978, 1986, 1982; Turner/Hogg/Oakes/Reaicher/Wetherell 1987; Turner 1999).

However, the process of identifying and categorizing others does not necessarily mean ascribing negative representations to them, -the ritual of exclusion that follows occidental dialectical logic. The same would be the case in low self-esteem cases where the other is privileged over the self or group. Cognition is also an ideological process, but our representations are also the symbolic space of meaning that enables communication and change (Breakwell 1986). Without reference to the 'other(s)', identity could not possibly be particularized; however, diversity does not entail hierarchies (Billig 1982, 1991, 1996; 2002).

Positioning identities need not favour the self or in-group at the expense of marginalizing the other, or the other at the expense of oppressing the self. Otherization does not mean stigmatization, prejudice, discrimination or marginalization (Bergami/Bagozzi 2000). Forging identities is a collective, defined, negotiated and socially legitimated process that cannot be reduced to the biases inherent to cognitive information processing (Augoustinos 2001; Augoustinos/Walker 1995; Howarth 2002, 2002b; Wetherell/Potter 1992; Wetherell/Taylor 2001).

The "necessary condition for social life is the sharing of a single set of normative expectations by all participants, the norms being sustained in part because of being incorporated" (Goffman 1963: 127-128). Acquiescence to these social norms is the universal formula that accommodates plurality from the micro to the macro-level. "Human existence is conditioned existence" (Arendt 1998: 9) and communication involves "institutions to define basic categories" through which to attempt to establish and incorporate the perspective of the other (Douglas 1986: 55). However, the existence of social rules implies the inevitable duality of conformism and deviance, mediating states of order.

Drawing from Mead's social theory of mind or 'social behaviourism', we may address the most pervasive Cartesian self/other dichotomies. For Mead, the mind engages in self-reflection as it 'adopts the perspective of the other', analysing intention and reciprocating symbolic interaction through a symbolic exchange: communication. Meaning in "human society rests upon a basis of consensus" (Meltzer offprint: 7), culture is mediated through language. Through symbolic interaction, given the role of language and social

constructivism, the mind eventually comes to be seen as "social in both origin and function, arising in the social process of communication" (Meltzer offprint: 13). It is thus indispensable to understand the fluid nature of socio-cultural representations, how they change over time as they are institutionalized and as they themselves transform the social institutions wherein they are embedded.

Social representational compounds, for example those pertinent to gender status, are subject to the processes of anchoring and objectification (Duveen 1986, 2001). The process of institutionalization of gender differentiation can be taken as the historical period where social dynamics and practices for coping with 'the other' have been *objectified*, and the mechanisms through which new representational components have been and are *anchored*, both provide evidence of their cohesion and fluidity (Brewer 2001). The individual and particular exist with rapport to the plural and social; institutions exist to confer and mediate individual and social identity. Discourses are mediated as they integrate in societal belief systems (Hewstone/Augoustinos 1998), but access to the *power* to create and spread information contained in such discourses is unequal.

As has been discussed, institutional structures primarily function in order to enable communication by establishing meaning structures (Douglas 1986; Bourdieu 1991). However, meaning necessitates to be socially embedded, and furthermore, the "social conditions of the production and reproduction of the distribution between classes of knowledge and *its* recognition" differentially determine the symbolic power that meaning acquires (Bourdieu 1991: 113). Within the power differentials to access and inform discourses, a great split between mainstream and peripheral representations occur, leading to different claims as to what constitutes security. The social policies and structures that have accommodated the *de facto* presence of militarism remain central for understanding the construction and dissemination of social representations of security. Nationalism has been bound to racist and social Darwinist theories of naturalized supremacy and power exercises (Buzan 2008), it is a process of anchoring identity on the basis of common and generalizable traits to create a psychological bond as overall group - 'nation'. Traits are often language, a defined special territory, an ancestral shared heritage, historical developments, ethnic and racial background crystallized as social contract in institutions and culture (Rousseau; Weber; Durkheim).

The security debate has been strongly influenced by both processes of generalization and particularization, but caution must be exercised as to their usage. For example, generalizing and rejecting all narrow debates on security, instead of revising particular contributions that retain great relevance in today's discourses and policies. Perhaps taking the diachronic or/and synchronic axes, focusing on state-centred or/and human-centred approaches, or even when contextualizing the age of mass communications, realizing the importance of influence instead of resorting to imposition. Returning to the example of motherhood and care, we can go one step further and revise some discursive hegemonies within feminism and security studies. Depending on which traits we generalize and which we particularize in the 'engendered' ideological association: feminine - female - woman, we can fall prey to stereotyping. There is as much diversity within women as group as there is between genders. Thus, to state that all women by virtue of their 'roles' as humanity's carers, or given their life vis à vis violence, are innately more prone to be peaceful, responsible, or eco-friendly, is to undertake groundless *generalization* (Oswald 2001, 2004, 2007, 2007a, 2008d). Instead, it is important to root women in the specific social and cultural context where their identities and representations are gestated and exercised, and thus identify how divergent groups of women are socialized and often even marginalized, so as to map where they stand when societal conflict, violence or disasters emerge and develop, and how they are able and allowed, or constrained, to respond facing them.

If we revise the assertion that 'roles' are assumed to be socially assigned, how can they become quasi-natural then? How can they be legitimized in the process of deconstructing history? How to sustain ecofeminist affirmations of a mystical and natural connection of *all* women to a 'Mother Earth' or a 'sacred mother'? (Mies 1998; Mies/Bennholdt-Thomsen 1999; Mies/Shiva 1993; Warren 1997; Oswald 2004, 2008d). How to take this deep cosmovisional diversity as banner to claim that women are more oriented to peace? Why affirm feminist claims that generalize instead of particularizing intra-women's diversity, contributing to extend gender stereotypes? Outlooks rooted in a context of representational diversity, alluding to very different foundational myths and historical processes, to the many ways the feminine has gestated and is still represented in various cultures, including the ways in which patriarchal cultures have seeded and flourished. So, instead of particularizing the differences between a Mexican 'mother of the world' such as Coatlicue

(Solares 2007), the female half of the lady and lord of duality: Omecíhuatl/Ometecutli and the Greek 'mother earth' Gaia/Sophia (Zimmerman 1971), how can one establish a homogenous rapport based on today's readings of archeomythology between very different female deities, implying *all* women have a mystical connection to a *single* 'Mother Earth' and that patriarchy will be overcome by a *unitary* maternal thinking or mothering? It is like legitimizing the vicious cycle that women by virtue of their being 'discriminated-against' are more just, or given that they face and know violence closely, women promote peace. So in order to forge equitable and non-violent citizens, violence and discrimination against women should be reinforced? Organized collective action surrounding single issues is one thing, establishing a homogenous outlook among such diversity of women might resound as ideological hegemony. Trying to empower women as agents of peace thus can be a painfully ambiguous and oppressive mistake. Although it is important to recognize the contribution of ecofeminism and maternal feminism to highlight some of the processes by which some women have come to be discriminated against and patriarchy disseminated, to theorize about the human-environment interrelation, societal change must necessarily address specific cultures and their cosmovisions; perhaps rooted in millennial agricultural practices or deities that have nowadays become syncretized, and aim to work with diversity among women but *also* within men.

89.7 Women Between and Beyond (Inter)National and Human Security

It has become clear that the processes of identity formation, based on shifting representations, are the processes through which power is exercised and institutionalized. However, exclusion is not inevitable. Subjects are rooted in experience and paradigmatic change is thus possible at the societal level. Trying to revisit our goal, *engendering* security, we can make some important remarks to better visibilize the position of women between and beyond (inter)national and human security.

Women as a group are disproportionately disadvantaged. Nevertheless, binary logics exclude many other disadvantaged groups, men included. Envisaging a secure society entails considering some fundamental aspects.

Firstly, overcoming essentialist dualist postures such as man - woman. This outlook separates along many lines the strong vs. vulnerable, the active vs. passive, nature vs. culture, the male vs. the female, etc. In order to envisage an alternative social order we must first elucidate and deconstruct in our *minds* the dualistic world we inhabit, only then can transformation seed. This outlook does not negate affirmative action and positive discrimination efforts¹⁷, however, emphasis is placed on the process of transformation *in society*. Early radical feminist struggles in the 1960's embraced the slogan 'the personal is political', trying to seek the same public visibility and opportunities for women as men had in the *Women In Development* (WID) coalition. In the 1990's focus shifted to GAD (*Gender and Development*), to include also 'the political as personal', the societal roots of inequality, a process of gender mainstreaming no longer seeking equality but equity: equal opportunities *for all* to live in diversity.

Secondly, the term "socioandrarchy" (Serrano Oswald 2003) alludes to the complex web of hierarchical relations of power and subordination, including both patriarchy and capitalism, within a social system that is typical of (late) modernity. The phenomenon of 'andrarchy', meaning *rule by men*, is only possible given the social context wherein power is exercised. As a global phenomenon it segments into two sub-systems, 'patriarchy' - 'fraternity' for Pateman (1989) - keeps women under the authority of men at home and as political subordinates; and 'capitalism' which keeps women labourers subject to the commands of the owners of the means of production and capital, who are predominantly male (Burr 1998). Seen in terms of state formation and contract theory, subjugation of women and their need for male guardianship was at the core of the emergence of modern states in the seventeenth century, where the patriarchal pact systematically excluded women from the realm of politics and ownership. Subordination of women was ensured by means of sexual difference; being a woman following from a rigid sexual differentiation, was the key to subordination (Pateman 1991) and defencelessness.

17 The framework of international agreements aimed at affirmative action in favor of gender equity include: the "World Plan of Action" adopted at the World Conference of the International Women's Year (1975), the "Convention on the Elimination of All Forms of Discrimination against Women" (1979), the "Beijing Declaration and Platform of Action" (1995) and the United Nations' "Millennium Declaration" (2000).

Subjection can be enforced by subtle as well as overt means; regardless, it constitutes an act of violence¹⁸. In order to understand 'socioandrarchy' as a societal constant, it is important to realize the conditions that have led to its emergence and prevalence in a particular local context and sensitive to the scale of analysis. Within the scope of politics, societal paradigms are produced and reproduced as 'social facts' in the Durkheimian sense¹⁹ through changing social representations, inescapably exerting hegemonic power (Gramsci 2007) over individuals, kins and communities, groups, relations, institutions, government structures, regions, religions, cultural systems, etc. There is a structural and relational dimension to gender, exercised and constructed in complex social webs that pre- and out-date the individuals of a historical époque and mark it. Neither gender, nor violence are neutral.

Thirdly, the world is crippled by inequality. "Justice is the primary subject of political philosophy" (Young 1990: 3). Within early feminism, equality meant securing the same rights and opportunities for women as men had. Later, with a gender lens, equality advocated securing the same rights and opportunities for all women *and* all men. Presently, equity strives for *all* women to have the same capacity as *all* men to assert themselves as subjects, not in order for all to be the same, but rather to empower each subject to take direction and control in the process of *becoming*. That means securing the right for each person to affirming their difference in a context that can accommodate for diversity. However, caution must be exercised. In the discourses of multiculturalism and tolerance, the relation to the other(s) is incipiently segregational, defined in negative terms, instead of a dialogical paradigm of adopting the other's/others' perspective in communication. When difference is recognized merely discursively, the dangers of exclu-

18 Following the Beijing Plan for Action's 12 critical areas of concern for promoting the status of women, gender-based violence came to be seen as a political world issue. The different types of gender violence are sexual, conjugal, family, street-based, labor, patrimonial, psychological, intellectual, symbolic, linguistic, economic, juridical and political violence (Lagarde (1991); Amoros, (1990); Beijing World Conference 1995).

19 For Durkheim defines *social fact* as "any way of acting, whether fixed or not, capable of exerting over the individual an external constraint; or which is generated over the whole of a given society whilst having an existence of its own, independent of its individual manifestations" (Durkheim in Lukes 1993: 59).

sionary representations leading to stereotypes due to lack of knowledge of the other(s), make hierarchies and fear of the other(s) seed. Instead of rejecting the other(s) from the beginning and keeping a safe distance by means of general prejudice and stereotypes (indifferent tolerance), engaging with the other dialogically can give one a more realistic outlook as to who the other is and so if any threat is posed by this concrete other.

Fourthly, coexistence – existing side by side – might be desirable if neutrality would be realistic. However, as we have seen in processes of group identity formation, identities gestate with the other as referent object (subject). Change is not individualistic or instrumental. Objectivity as a state neutral to subjectivism is a rhetorical fallacy. Thus, sociogenetic transitions are collective and negotiated. Embracing diversity means engaging in a dialogue with the self and the other(s), processually overcoming the artificial subject-object dualistic split. Again, security has been constructed in relation to an-other that is a menace. That threat is anchored as an external referent object, as though the process of security and securitization was detached from the subjects of security. A false dichotomy is established, thus security operates at an abstract and often supposedly not alienated level. Power, threat and influence are deemed directly accessible, realistically and objectively assessed, and accurately recognized (Shepherd/Weldes 2008: 2). Absence of security does not necessarily entail an objective threat, or a threat as such; a sense of lost unity or even polyphasia in identity terms can be at the root of insecurity (Moscovici 1976; Wagner/Valencia/Elejabarrieta 1996; Wagner/Duveen/Themel/Verma 1999)²⁰. It is crucial to distinguish between, albeit not separating, ontological and sociological (so-

ciogenetic) security, as well as the fact that security as science pretends to be objective, however it is always understood from a subjective standpoint. Both processes are interrelated and interdependent, but they are distinct. Security is seen as power over ‘other(s)’ instead of a premise of self-sovereignty which is linked to other(s) but not other-dependent. This takes us back to the notion of security as absence of concern – a state of being in which human beings attain a way of life where they need not worry about social insecurity.

Fifth, clearly conflict is inherent to change (Gluckman 1965) and to diversity, nevertheless it does not necessarily lead to violence. Conflict is a constitutive feature of change. Peace does not mean the absence of conflict. Thus, facing a conflict or a deep or multi-layered conflict (a crisis) a new balance must be sought, and in this process violence is not necessary or desirable at all. When a new equilibrium cannot be established, violence is then likely to ensue, but it is not a mandatory outcome, nor is handling conflict or crises with further violence. That is a choice at individual, group, regional, national and supranational level. It seems unwise to polarize the debate either at state level (state-based security), or at the individual or minority level (people-based security). All levels ought to be addressed. The problem is that decision-makers who have been elected into power to address social conflicts are not in a power-free context, nor are they in a social vacuum. They must learn to reconcile divergent interests and stakeholders, accounting for power differences in societies, and for the many voices and choice – options in the public arena. Even when a particular voice is silenced (temporarily or permanently), that does not automatically cancel out the demand or decision – option of that voice or group of interests.

The problem of state-centric security (rationalist and narrow approach) is that it first takes the states and the processes inherent in state formation and group identities as unproblematic, as an overarching given, when clearly the dynamics of modern state formation in each nation are as problematic if not more than inter-state relations. Secondly, security is conceived in unilaterally militaristic-centred terms, with a realist vision of world politics and balance of powers sustained in the Hobbesian thesis of ‘war of all against all’, where a monopoly of military power lies in the hands of the state and men, and the end of enforcing peace justifies the means of securing it (Hobbes 1982). In a way it is the underlying tension of democracy conceived of in negative terms: the democratic social contract forces men to be free (Young/

20 According to Moscovici “‘cognitive polyphasia’ is a characteristic of social representations in which different forms of understanding are able to co-exist... indicating a persistent potential for instability within representational systems” (Moscovici 1976, quoted in: Wagner/Themel/Duveen/Verma 1999: 416) and also indicating the prevalent presence of change. The processes of internalization and externalization of social knowledge imply both a reproduction as well as a refabrication of representations, and this is because in the process of assimilation and transformation, some representational elements are more resistant to change than others (Serrano Oswald 2003). This makes possible the co-existence of contradictory discourses or a double moral, for example the case of terrorism where the discourse of democracy and liberty legitimates violence and prolonged insecurity.

Hall 1997; Young/Barber 2004), and it does so in particular and defined ways, with debates aligned in the strong - weak, centre - periphery, us - them dialectics. Furthermore, Herz' 'security dilemmas' emerged, where organized groups - states, compete one against each other for power and influence (Herz 1951).

Sixth, this takes the author to a further reflection. When security becomes "nothing but the absence of the evil of insecurity, a negative value so to speak" (Wolfers 1962: 488, cited in: Shepherd/Weldes 2008: 530) we can look at the special context of security and its relation to referent objects such as: 'security providers' 'by whom?', and 'security services' recipients' 'for whom?', always in terms of an antagonist threat 'dangers posed by' / 'against what?' (Brauch 2008a). Even if the broad definition of security is embraced, all the different conceptions of security that include military (Buzan 2008), political (da Costa 2008), societal (Waever 2008a), economic (Mesjasz 2008a), environmental (de Wilde 2008) and even gender (Oswald 2008d; Waever 2008a) and discursive dimensions (Shepherd/Weldes 2008) take this negative liberty conception of the interplay between objects of security, *to be secured 'from'*: a security provider and a receiver, and if at all the securitizing process seen emphasizing the security agent, the receiver or the threat. The frame is an on-going negative liberty dialectic. So long as something is framed as a restricted choice, as a residual agency exercise, it is seen in terms of a negative liberty concept - *freedom 'from'* coercion (originally in Berlin 2002 [1969]); later developed as 'positive' and 'negative peace' by Galtung²¹ 1969, 1969, 1996).

Nevertheless, in order to return to Berlin's conceptions, in order for freedom to be 'positive', liberty ought to be framed as *liberty 'to' something*. It implies *a choice* that is contextualized but not delimited - it means liberty to do and be, within a system which implies subjection to legitimized norms, but not subjugation and oppression. That is the thin line that distinguishes exclusionary dialectics of tolerant co-existence (either/or) vis à vis inclusive dialogics (both/and), life in diversity. It implies an original choice, a starting point that fixes a direction towards which work is aimed, instead of a residual option. A paradigmatic shift in the sense that security is seen as

a maxim, perhaps a realizable yet distant utopia from its conception, but thus security dynamics are not framed within the least possible life quality -survival dilemmas (Brauch 2003, 2008, 2008a), but as overarching goals of agentic well-being.

89.8 Conclusion

As indicated in the author's introductory remarks, it is appropriate to distinguish between exclusionary scientific patchwork and dialogical paradigmatic societal shifts à la Kuhn (1996), linked to the distinction between legitimizing everyday life within the status quo through science and a critical social science, actively involved in setting the agenda for the progression of societal change. Perhaps the purpose of revising the concept of security drawing from FPT is based on the fact that the concept of security is rooted in the occidental development of critical and instrumental reason, the process of state formation, the historical justification of war and exclusion, the evolutionary legitimation of power and survival of the fittest, and the development of the social sciences and security and peace studies (Albrecht/Brauch 2008). If the analysis of power relations concentrates in exclusionary oppositions (dualisms) framed in terms of dialectics which are irreconcilable, instead of opening the possibility for complementarity in a shared social space, our social science shall endlessly be confined to its traditional and structurally positivistic limitations. Feminism in its process of studying gender and patriarchal relations has addressed the ways identities and agency have been defined and change. It seems important to be critical of access to power, but it is important to transcend the limitations of universalizing interests and to see that although marginalization has forced groups into certain types of submission and even activism given mainstream discourses, many alternative definitions and goals inform agency gestating autonomy.

After centuries of struggle, feminism has earned a stigma as radicalism, leading to many activists in favour of equity not wanting to be associated with feminism. "Feminism, especially at its narrowest watershed, appears to be no more than a theory on, by and for women, when it should be a theory of society from the perspective of women" (Arizpe 1994: xix). Nevertheless, feminism has also transformed society and women's place and agency in society, with an undeniable impact lasting for generations. Despite prejudice and radicalization, one cannot deny the impor-

21 For Galtung, negative peace is seen as absence of violence, the end of overt conflict, a ceasefire. Positive peace is seen as social justice, an elimination of the causes at the root of war and violence, creating the social systems that enable conflict resolution.

tance that the revolution of women's position has had in modern society, how it has transformed our everyday lives, from the most intimate to the most inaccessible public spaces.

Today, as FPT has evolved from the radicalism and dialectical logic, inherent in its occidental scientific roots, to addressing and revising the specific forms of subordination and the ways these have been institutionalized for both women and men through a gender sensitive gaze, there are important lessons to be drawn from FPT for social science and praxis. The process of *engendering* democracy (Phillips 1996) and security, means developing gender sensitive representations in both men and women, all of which opens the possibility for social, cultural and political identities and relations in just and equitable terms. Returning to the initial reflection surrounding the possibility of 'securitizing gender', it may seem rather more urgent and desirable to commence '*engendering* security' now, vis á vis the hereto discussed real and futile impossibility of securitizing gender.

90 A HUGE Gender Security Approach: Towards Human, Gender, and Environmental Security

Úrsula Oswald Spring

90.1 Introduction¹

Gender violence is still an invisible aggression that occurs primarily within families, and is often socially accepted and sometimes even promoted. The origins of this subtle and sometimes brutal discrimination are complex, and closely related to the social representations (Moscovici 1976; Herzlich/Graham 1993) of gender construction.

On the background of manifold new risks and threats due to climate change, scarce and polluted resources, increasing poverty in Africa, Latin America (Boltvinik/Hernández Laos 1999) and in some Asian countries, as well as physical violence related to transnational crime, human trafficking and undemocratic governments and of failed states, this chapter develops a broader security concept of *Human, Gender and Environmental Security* (HUGE). HUGE represents a widened concept of security (Wæver 2000, 2008; Brauch 2005, 2005a, 2008, 2008a, 2008b, 2008c; Moeller 2003; Dalby 2008), which combines a broad gender concept that includes children, elders, indigenous and other minorities with a human-centred focus on *environmental security* (ES) challenges, peace-building and gender equity. *Gender security* (GS) reflects livelihood, food, health, and public security issues as well as education and cultural diversity.

The most frequent exclusion, discrimination and violence is related to gender, nevertheless there are almost no theoretical developments on gender security. This chapter asks why this happened. As gender security is related to human and environmental issues ag-

gravated by regressive globalization (Kaldor/Anheier/Glasius 2003) and climate change (IPCC 2007, 2007a), women and children are the most vulnerable. They are highly exposed and their security is threatened in multiple ways. This chapter explores further how gender security can be theoretically understood within the existing diverse evolution of feminist studies. Further, it searches how gender security is related to human and *environmental security* (ES), starting with the GECHS and UNU-EHS approach, who have addressed the environmental dimension of *human security* (HS), but without a gender dimension.

This chapter starts with a brief discussion of the links among human, environmental, and gender security for a peaceful and nonviolent livelihood (90.2). As GS has only recently been discussed in the social science literature and in *international relations* (IR), the analysis focuses on the development and limits of this concept that are imposed on gender epistemology by the prevailing patriarchal mindset in science. It then reviews the theoretical elements that are contributing to the evolution of GS (90.3). Four main feminist currents are reviewed: epistemological feminism (90.3.1), feminist empiricism (90.3.2), postmodernism (90.3.3), and standpoint feminism (90.3.4).

As a historically and socially constructed concept, the author explores four phases of GS studies (90.4). The first phase is linked to the analysis of identity and social representation (90.4.1), where the historical process of GS can be perceived as being in difficulty (chap. 89 by Serrano). The second phase discusses postmodern feminism (90.4.2), and links it to the gift economy of Geneviève Vaughan as a peaceful process to overcome the present discrimination and gender violence, transforming the *homo sapiens* into a *homo donans*. The third phase addresses the parallels established by ecofeminism (90.4.3) on gender violence, and nature, and environmental degradation. The fourth phase expands to new social movements (90.4.4) focusing on peace movements, antiwar ef-

1 This chapter builds on ideas by Oswald-Spring (2001, 2007e) for the online publication of EOLSS published by UNESCO. The author would like to thank Navnita Behera-Chadha (India), Patricia Kameri-Mbote (Kenya) and Hans Günter Brauch (Germany) for valuable and critical comments that are partly reflected in this chapter.

forts, environmentalists, feminists, and the 'March of the Women' with indigenous and other social movements against exclusive globalization (Oswald 2008).

In the conclusions (90.5), the HUGE concept takes up the research question and discusses gender links with HS and ES in order to stimulate a new economy of solidarity and a democratic, 'glocal' and participative model of governance that guarantees for the most vulnerable persons equity, and peace with quality of life and prospects for a future.

90.2 Human, Gender, and Environmental Security: HUGE

From a constructivist approach, the conceptualization of security has evolved focusing on the relationship among different security concepts. The 'Copenhagen school' systematized the links among several security approaches (Wæver 2000, 2008, 2008a; Buzan/Wæver/de Wilde 1998). The different security dimensions and levels of analysis are interrelated: often military security directly affects societal and economic security by causing for individuals and groups a fear for survival. Møller (2003) combined these different security concepts, thus widening the narrow concept of *national security* used in realist security studies (Albrecht/Brauch 2008), and in the intellectual tradition of Tzun Tzu, Thukydides, Machiavelli, Hobbes ([1658], 1952), Clausewitz, Morgenthau (1948), and Waltz (1979)².

These national security concerns still prevail in the Middle East (Selim 2003; Kaim 2003; Aydn 2003) and recently, in the 'war on terror', by defending in a globalized world specifically national borders, the transnational economy and their social achievements that have increasingly been challenged by migration and a process of cultural homogenization resulting from instant communication, fashion, and consumption.

Among the extended concepts are *societal security* (Wæver 2008a), labelled by Møller (2003) as 'incremental'; HS described as 'radical' and ES termed as "ultra-radical" (table 90.1). Going beyond the tra-

ditional realist approach of Wolfers (1962), the security definition of the Copenhagen school distinguished between different referent objects (state, nation, societal groups, individuals, humankind, and ecosystems), depending on the security concern where the values at risk are sovereignty, national unity, survival, and sustainability (Ullman 1983; Brauch 2008, 2008a). Asking for *security from whom* or *what*, *risks from whom* and *threats from whom* and *from what*, the sources of threat have changed since the late 20th century. This classification has offered a specific heuristic contribution that has inspired subsequent modifications (see table 90.1).

90.2.1 Human Security

Why do more than 24,000 persons, basically children, die each day of hunger, and why only in Sub-Saharan Africa has the number of undernourished children augmented from 29 to 37 million during the last decade? Why do three billion persons lack access to basic sanitation systems? Why did the globalization process and scientific progress create more than 2 billion extremely poor people? Why do 55 million Latin Americans not have enough to eat while living in the most biodiverse region on the planet that provided the world three of the five basic food crops (corn, beans, and potatoes)? How did this situation develop and get worse during the globalization process and in different countries of the south? What is happening with the UN *Millennium Development Goals* (MDGs) and the related process of development, modernization, efficiency, and justice? The present situation of severe gaps existing in a world of plenty together with absolute poverty requires a deeper and wider approach to GS (Bellamy/McDonald 2002), and an epistemological shift from a techno-centric, isolated or individualist perspective to a transdisciplinary, holistic approach (Oswald/Brauch 2008).

These social inequalities exist globally, but are accentuated in developing countries, where they create social vulnerability. The concept is related to unsatisfied human needs and limited access to resources (Melillo/Suárez/Rodríguez 2004), so therefore the lack of human security is understood as 'freedom from fear' (chap. 83 by Black/Swatuk) and 'freedom from want' as described by Ogata/Sen (2003; chap. 84 by Shinoda). The three or four pillars of human security (Annan 2005; Bogardi/Brauch 2005; Brauch 2005, 2005a, 2008, 2008a, chap. 74) should be organized in such a way that the minimal access to basic resources in the community is guaranteed for the poor-

2 Militarism and militarization describe the control of a state by force using weapons and armies to exercise power, internal repression, and external defence of the borders against potential invaders. The second meaning is related to the political culture or ideology, where military values such as patriotism are promoted together with national heroism, strength, capacity of armed response, WMD, superpower behaviour, military structure, and armed interventions.

Table 90.1: Human, Gender, and Environmental Security (HUGE): A Transradical Approach. **Source:** Møller (2003: 279); Oswald Spring (2001, 2004, 2007e). This table was compiled by the author.

Degree of expansion	Denomination (security of what?)	References object (security of whom?)	Value at risk (security of what?)	Sources of threat (security from whom and for what?)
No expansion	National Security (political, military)	The State	Sovereignty, territorial integrity	Other states, terrorism, sub-state actors, guerrilla
Incremental	Societal Security	Nations, societal groups	National unity and identity	Nations, migrants, alien cultures, mass media
Radical	Human Security	Individuals, humankind	Survival, quality of life, livelihood	State, globalization, elites, terrorism
Ultra-radical	Environmental Security	Ecosystem, Humankind,	Sustainability	Nature, global change, global warming, humankind
Trans-radical	Gender Security	Gender relations, indigenous, minorities, children, elders	Equity, equality, identity, solidarity, social representations	Patriarchy, totalitarian institutions (governments, religions, elites), dominant culture, intolerance, violence

est. This procedure would avoid both under- and over-consumption and could secure the basic needs for anybody (Altwater 2004; Altwater/Mahnkopf 2002), irrespective of geographical, social, age or gender relations, and with fewer impacts on natural resources. It would assure security for the weakest human beings, changing the threats from survival³ to the impending fears linked to the impacts of global change.

90.2.2 Environmental Security

Due to global and climate change, environmental security (Mathews 1989) is not only an issue of scientists (Dalby 2008; chap. 59 by Dalby/Brauch/Oswald) but increasingly also of politicians (Stern 2006). Resource depletion (water, land, air, minerals, and fossil hydrocarbons) and their pollution are limiting the offer for productive processes and life quality, worsened by higher demand due to population growth, urbaniza-

tion, more food demand, and the claim of an ongoing process of modernization in developing countries, particularly in China and India (The Economist 2007; IPCC 2007, 2007a). These factors are pressuring on the demand side, reducing at the same time the supply due to scarce and contaminated resources. Besides oil and gas, another geopolitical factor threatening ES⁴ (Dalby 2008; Brauch 2003, 2005, 2007, 2008, 2008a) is water and its surface reserves in the Amazon region (chap. 70 by Lopez), in Venezuela and Argentina, in the Baikal Lake (chap. 55 by Rakel, chap. 56 by Wunderer), and underground water such as the Guarani Aquifers in South America. Water transformed into food is traded worldwide as virtual water (Allan 2003, 2007 and chap. 41) and can increase the 'food power' of these countries, especially when global warming will gradually threaten the food security in the USA, Canada and Australia (UNESCO 1998), today's major food exporters, due to drought and extreme weather events (Alcamo/Endejan 2002; Brauch 2002, 2002a, 2003; chap. 33 by Oswald).

3 The World Bank (1998b) documented empirically that, for example, in Mexico for a decline of 1 per cent in GDP due to induced socio-economic crises, the rate of homicides increased by 1 per cent and robberies with violence by 2 per cent. Something similar occurs with global environmental change and the new threats of extreme hydro-meteorological events or the growing poverty in countries of the south, linked to soil erosion and urbanization due to the abandonment of fields by peasants.

4 In this chapter the security term is widened and deepened, overcoming the narrow approach of military security. The author is convinced that human, gender, and environmental security (HUGE, Oswald 2001, 2004, 2006c, 2007e) is a security concept that is able to deal with the new risks and threats (Beck 2001, 1998) from global and climate change (Crosswell 2005).

Disasters due to climate change will further reduce available resources. This requires special efforts for mitigation, adaptation, and sustainable development to improve environmental protection, environmental services (World Bank 2007), food sovereignty (Karremans/Radulovich/Lok 1993), the conservation of nature as well as higher efficiency in collecting, recycling, and re-use of waste. While environmental changes, and more precisely resource access, are stressors on social systems, they are not the sole or even the dominant cause of political violence and social vulnerability (Kahl 2006). Scarcity alone is not what kills people or causes political violence; numerous other factors are important in the destruction of the social networks that ensure survival (chap. 4 by Brauch). Likewise, the current dynamic changes in human affairs, encapsulated in the term globalization (Oswald 2008b), are uprooting traditional societies and displacing people that render them vulnerable, while also requiring them to rapidly learn and adapt to new circumstances (Myers 1989).

There is no reason to believe that states are necessarily acting in ways that ensure the security of their populations, despite official rhetoric. The critical development literature and discussions of political ecology emphasize that state actions in support of development may be a contributing factor to the vulnerability of social and ecosystems, which are then incapable of ensuring survival when disaster strikes. Neither are states the innocent arbiters of disputes, nor necessarily benign agencies primarily interested in the welfare of their populations; they may be involved in the violent suppression of resistance to central rule or to the dislocations of economic globalization and the concomitant commoditization of items essential for survival. The broader approach in terms of the human, environmental security, and peace (HESP) project (Brauch 2003, 2003f, 2005, 2008, 2008a), focuses on the complexity of political violence, and on the understanding of the underlying interrelations. This represents more than the traditional inter-state violence that pre-occupied security experts in the 20th century.

Therefore the shift from the 'holocene', the present stage of earth history, to an 'anthropocene' (Crutzen/Stoermer 2000) suggests that the link between human and ecological matters must be understood in a way that transcends the divisions between the 'natural' and the 'human' that have structured the thinking on security and especially identity since the emergence of modernity (chap. 59 by Dalby/Brauch/Oswald and 98 by Oswald/Brauch/Dalby).

Geological actions in one part of the planet may have consequences for supposedly remote peoples elsewhere making an '*Anthropocene ethic*', which focuses on these connections, and hence on social responsibilities, stressed by both HESP and HUGE. This emphasizes the importance of comparative research. This also implies a shift in our understanding of the context of our own lives so that we start from a concept of ourselves within an ecosystem which we are actively changing, rather than as urban 'civilized' dwellers manipulating an external environment which is in some ways 'threatening' to that mode of living (chap. 59 by Dalby/Brauch/Oswald).

Such an analysis also requires transdisciplinary comparisons for understanding in detail the human-nature interrelationship in different geographical contexts and historical settings.

90.2.3 Gender Security

90.2.3.1 Gender as Analytical Concept

Several organizations within the United Nations systems that collect data (UNSC Resolution 1325⁵; UNIFEM 2007; FAO 2002a, 2005d, 2006b) have confirmed that the violence against women and girls is the most frequent form of violence on earth (Riviere/Cominges 2001). Each third woman in the world is being beaten, and each fifth is being sexually harassed or violated (UN 2006). This violence against women includes 20 million abortions where 78,000 women die each year; 80 million women get pregnant against their will each year; 2 million women are affected by HIV/AIDS (Muthien/Combrinck 2003); 60 million girls are denied life due to gender abortion, infanticide or negligence; 2 million girls are forced into sex traffic; 130 million girls suffer from genital mutilation, and 4 million girls are sold each year as slaves for marriage or prostitution (UNFPA 2002a, 2002b). Sen (1990) speaks of about 100 millions girls that are missing.

Normally, this violent behaviour happens inside the house; however, in research surveys men who were responsible for committing these crimes have claimed innocence. They declared that men from other cultural backgrounds, different regions, and lower social classes are guilty of these crimes. These offences that are usually not reported by the affected women and their families are not punished by the tra-

5 See: United Nations Security Council Resolution 1325 on "Women, Peace and Security"; at: <http://www.un.org/events/res_1325e.pdf> and: <<http://www.peacewomen.org/un/sc/1325.html>>.

ditional system of justice, since intra-familial violence is often not yet recognized as an aggression, even less as a legal issue, because it is taken for granted from a male perspective (Meyers 1997). In addition, most countries in the South still lack laws against this type of violence, and even if they exist, they are not being enforced by male judges due to a patriarchal practice of law and power exercises.

Thus, gender security is normally taken for granted, socially identified, and represented within society. During millennia, society as a whole has forgotten that gender relations were socially constructed and reinforced through habits, ideology, and political systems. The world has been organized for at least five thousand years based on patriarchal patterns, where the male gender (the strong sex) dominates the female (the weak sex), creating inequity, exclusion, violence, and submission.

Female powers were considered marginal and merely delegated. They can only be exercised with permission of the dominant group (the father, husband, brother or boss). The main control on material goods remains in the hands of men who decide on family expenses, property, productive activities, inheritance, and gifts. The lack of the right to own property has reduced the negotiation capacity of women and increased their high insecurity. If they try to transgress the assigned social and family roles, they are exposed to interfamilial and social violence. Once married, the margin of manoeuvre has been further reduced by both their own family and the relatives of their husband, where she normally lives, and for whom she works.

Gender insecurity is often not perceived as such, due to the existing interdependence between patriarchy and female submission that are anchored by personal identity processes (care-giver) and social roles that have been induced and trained during millennia. As a result of this long-standing process, female identity gets obliged morally and socially to care for the others as her process of socialized self-identification.

Subjectivity of women is constituted in the pedagogy of gender to care about others, to maintain life from feeding on, from the intimate space through affective reproduction and the erotic one... In this function of caring about others with their affections we can find the sense of our existence: the mother when she is breast-feeding; the lover when she makes love. These facts permit the affirmation in the field of identity (Lagarde 1990).

Gender is also an analytical tool, socially constructed, and the axis of classification is linked to genital difference (sexual dimorphism: female-male),

facts that permits a biological explanation of social representations of gender, rooting still more the mechanisms of distinction, and with them the process of discrimination. Macela Lagarde (1990) correctly criticized this process of gender construction as bio-social-cultural) based on the sexual differences. Each culture recognizes sexual differences and specifies the characteristics that classify the sexual beings in diverse genders (Skjelsbaek 1997; Rosales 2002; Szasz/Lerner 1998; Foucault 1996). The number of sexual characteristics varies inter- and intra-culturally, although the generic classification is manifested in all known societies, and for this reason is considered a universal classification.

As the relationship between men and women implies complex interlinks (Jiménez/Tena 2007) and relates to human and societal security (Wæver 2008a), the threats are not always perceived as purely confrontational. Nobody is born as a man or woman; everybody is born with a body which acquires a generic significance in this world (De Beauvoir 1949; Lama 2002, 1996). From early childhood on gender is socialized (Lloyd/Duveen, 1992; Piaget 1950) and consolidated during the personal life history. Family structures, schools, work, and clubs are organized to subsume gender identity into daily life, avoiding that gender discrimination get perceived and combated.

Religions in East and West are strongly reinforcing the existing gender differences (Oswald 2008c); however, similar to the division of gender also religious roles and norms are socially constructed. Thus, the world has been organized for millennia along gender lines (Urrutia 2002), able to create a complex and partly unconscious process of gender identity. Worldwide, the results are social difference, exclusion, and discrimination between genders, similar to the gap between rich and poor. Both processes create long-standing insecurities.

The key role of women is in caring about the well-being of children, family, and animals, and is considered a *homo domesticus*. As the supposedly weak sex, women require protection from man and his physical force (military capacity in case of a state). Therefore, in moments of catastrophe, conflict and war, women became the highest vulnerable group, are an appreciated commodity for the aggressors, and an object of blackmail among the men in dispute. Recent reports on war show that the body of women is increasingly getting transformed into a battlefield due to forced pregnancy, HIV-AIDS forced infection, rape, genital destruction with arms, violent abortion, trafficking,

obliged prostitution, etc. (Rehn/Johnson; Hynes 2004).

90.2.3.2 Gender Security Studies

Nonetheless, this violence against women did not yet lead to a consolidated theory on gender security (GS). As a scientific issue it is still in evolution and requires discussion and clarification. GS is a complex concept developing slowly in social and gender sciences. Through a historical approach it is appropriate to integrate some past theoretical inputs. Betty Reardon (1985) was among the first who related gender perspectives to security concerns, peace-building, and peace education. She traced back the root causes of gender-related violence to occidental masculine behaviour, its institutions, and organization-building. The UN Security Council referred to it in Resolution UNSC 1325 separately to 'gender, security, and human rights'. Tasneem, Jayawardena. Shrestha, Siddiq, Qudusi, Bhatt and Anarkoly (2007) related it to social security issues, and they work to ensure the enhancement of the rights of groups to maintain sustainable living conditions. Several UN agencies have focused on livelihood, well-being, and food security (UNESCO 2002, 2003c; UNDP 1994, 2004; UNEP 2007a; UNFPA 2002, 2004; UN 2006, 2006b; USSD 2005; UNMP 2005a).

Key elements point to the economic security of women with respect to property rights, education and training, equal access to paid work regardless of ethnic, religious, and caste differences, and the encouragement of small-scale business within local areas (Beijing Conference 1995). IFAD (2005) found out that women face external and internal pressures⁶ and given variables (the entitlement base). In Latin America first and later in South Asia gender insecurity was linked to survival strategies and household marginalization, later to environmental concerns (Agarwal 1992).

Hoogensen (2005a: 1) argued that "global gender perspectives can in many respects transcend the constructed barriers and stereotypes between the Global North and South, thereby reducing if not eliminating

the hierarchical and unequal relationships that have often been a result of human security efforts."

In analytical terms and linking up human and ES to GS, this author proposes a transradical level of expansion (table 90.1). An initial definition of GS refers to the process of socialization to 'become' a gendered human being; a man or a woman, depending on the position of the social structure. Thus, GS is socially constructed and systemic within the present patriarchal society, and it is normally taken for granted. The relations are linked to gender status - ethnicity/race, class, age, and minority status - in relation to the model of reference. Equity and identity are values at risk, and the source of threat comes in first instance from the patriarchal hierarchical and violent order, characterized by exclusive, dominant, and authoritarian institutions such as non-democratic governments, churches, and elites; secondly, from the established and developed social relations of violence and prejudice. They are penetrating the most intimate space of a couple and family, affecting labour relations, political and social contacts, and primarily also the exercise of power where a system of exclusion, discrimination, and stigma dominates, threatening equity and personal or group identities.

90.3 Evolution of Gender Security

As any concept, GS has a long history and complex analytical processes behind it. The struggle for gender visibility and later participation as an integral part of GS was first oriented to raise conscience for equality, later to improve women's opportunities, and today to reduce social vulnerability and violence (Meentzen/Gomáriz 2003). The European Union refers to GS as the systematic examination of the differences in "conditions, needs, rates of participation, access to resources and development, management of the patrimony, of the power, of decision and images among women and men relating to their roles assigned in the function to their sex"⁷. Structural inequity (Werlhof 1983, 1983a; Mies/Werlhof 1983) is reduced in some progressive countries through quota systems⁸, which

6 The external vulnerabilities are caused by the macro policies with which individual units of poor and powerless women are unable to deal (i.e. with regard to food supply), and the internal are challenges from within extended households in the form of traditional power hierarchies, be they patriarchy, caste or religious norms, apart from practices such as alcoholism or indigenous rituals (the allocating process).

7 See at: <<http://wwelacitoyennete.com/magazine/mots/glossaireegaliteHF.php>>; a glossary from the European Union>.

8 It gives priority to woman in a process of selection of candidates or for labour positions, when both gender show similar profiles and competences. It is a concession of patriarchy that alleviates symptoms without changing the root causes.

can improve the participation of women, but it still remains discrimination, although a positive one with the goal to achieve greater equality. Clear political norms and roles supported by institutional actions that note existing differences could improve the gender balance, and therefore may reduce gender insecurity and violence.

The historical evolution of feminist thinking and the diverse practices had a strong influence on the deconstruction of the GS concept. Feminist studies have evolved through several phases: from theoretical feminism to the desire for female voting and greater equality during the 1960's and 1970's. It was a response to the evident gaps due to gender differences. Long before Kate Millet (1969) and Juliet Mitchell (1972) raised these issues, several social movements in the Third World, including those representing peasants, indigenous peoples, trade unionists and those struggling for national independence, have fought for greater equity. Elise Boulding (1992, 2000) and Betty Reardon (1996; Reardon/Nordland 1994) introduced gender issues into peace research, and since 1980 gender analysis reached a third wave, also called neo-feminism. Adrienne Rich (1986), Maria Mies (1982, 1998), Vandana Shiva (1988), Shiva and Mies (1997), Veronika Bennholdt-Thomsen, Faracloud and Werlhof (2001; Bennholdt-Thomsen 1994; Bennholdt-Thomsen/Mies 1999), and Oswald Spring (1990, 1991, 2000, 2006c, 2007e) linked social movements, environmental destruction, and peace requirements with subsistence perspectives and survival strategies, thus offering a process of diversification and an 'epistemology of opposition' (Ritzer 2002: 391).

The relation between GS and HS started with the debacle of five decades of failed and misguided development, directly linked to the omission of gender considerations. The exclusion of women and other minorities from science, technology⁹, history, and public life have implied and continue to cause enormous costs for the political process, the economy and the environment, for peace-building, and culture of the world (Reardon/Nordland 1994). The myths in traditional societies reflect the complementary roles of women and men in all sectors of life, and show the

equality that existed in productive and ritual processes. Patriarchy destroyed these complementary processes, and its origins are linked to social stratification in irrigation societies and to tribes of armed warriors organized around clan leaders that threatened agricultural settlement and incipient cities, conquering their food reserves, women, other commodities, and religious goods¹⁰.

These social changes caused adjustments in the social organization of gender cooperation, and the patriarchal system constituted the base of gender insecurity. It is characterized by male dominated extended households, patrilineal inheritance and patrilocal housing for married women (the Roman *paterfamiliae*). Community owned property became private property, and a system of norms was created that obliged society to legally consolidate the changes in the context of the *pax romana* (Oswald 2002, 2008c). Male kings or leaders strengthened their power due to conquests of new territories; they developed better weapons and armies, and made slaves out of the conquered people, and exploited nature. The leading elite established monarchies of absolute power ruling their land, commodities, resources, and subjects. With supernatural forces (in some cases they became divinities: Egypt, Inca) or as divine deputies of god on earth (pope, prophet) they consolidated empires (Spanish, French, Austrian, Ottoman). Military control stabilized their empires externally and internally. Social unrest obliged them to legitimize the hegemony of elites (Gramsci 1977), and democratic institutions and a division of power consolidated economic and political power. A system of rule justified the legal use of physical force in the hand of the state (Max Weber 1987).

9 During the evolution of the human species, women generated the first technological or agricultural revolution. Besides collecting plants and animals for food and shelter, women observed the process of plant growing and started the selection of seeds and their domestication, thus improving the nutrition and health of their families during the long absence of men who went hunting.

10 An ideological fight among gods and goddesses started in Olympus, where a former secondary half-god Zeus emerged as the victor, now subjugated with lightning and thunder both terrestrial and heavenly beings. As an authoritarian father he exercised his dictatorial will. These mythical origins of patriarchal power have permeated for thousands of years the relationship between genders, subjugating women into the symbolic space of the household, away from public affairs (Graves 1985; Eliade 1963, 1965). This religious-ideological base of patriarchy justifies violence, wars, conquest, intra-familial discrimination, social inequality, slavery, social immobility, and accumulation in the hands of small elites (Oswald 2003). Greek philosophy on the polis and democracy justified the organization of religion and policy through male intelligence. This established the pillars for exclusion, discrimination, and violence against women and their role as career.

This summarized process of the rise of patriarchy was further consolidated by the three monotheistic religions (Judaism, Christianity, and Islam). The belief in one father god and the only truth relied on male priests, representatives of god on Earth. Female exclusion, subordination and discrimination of the marginalized, and warfare expanded their religious beliefs. Also in Eastern religions with social stratification, goddesses and women were submitted to male control (Oswald 2008c). Without going deeper in analysing the origins of patriarchy (Robins 1993; Watkins/Rueda/Rodríguez 1999; Mies 1983; Mies 1998), this chapter tries to understand 'gender security' as a historical process that is able to comprehend the root causes of dominance, oppression, violence, and invisibility. Only one part of society (usually a few men) dominates and exploits the other part (primarily women and poor men, sometimes also children) for their own benefit. Hierarchical orders and repressive mechanisms maintain control, and mass media and religion the hegemony. They create social representations and identity processes to maintain the status quo. Therefore, only the overcoming of patriarchy related to other systemic factors of control and violence could overthrow the present unjust system of global society and liberate everybody, men and women.

Existing social representations also excluded women from science and technology; particularly in IR, where the dominant theories justified warfare. Nevertheless, an increasing number of men and women have been involved in deconstructing assigned social roles and patriarchal thinking. Epistemological feminism (91.3.1) criticized the so-called scientific objectivity, and feminist empiricism (91.3.2), postmodern feminisms (91.3.3), and standpoint feminisms (91.3.4) opened the field for gender security analyses.

90.3.1 Epistemological Feminism

Feminist epistemologies have analysed the ways in which metaphors of masculinity operate in the construction of ideals of rationality and objectivity (Bordo 1990; Lloyd/Duveen 1992). Sandra Harding (1986, 1988, 1991; Harding/Hintikka 1991) argued that dualism such as nature-culture, subject-object, and masculine-feminine supports modern epistemological analyses, and that feminist epistemology should deconstruct this dualism (Stuart 1990). Scientific theories contain also a gender bias, not only due to the under-representation of women, but also in the construction of objectivity and underlying values. Therefore, a GS approach proposes the incorporation

of explicit gender-related values, represented by the selection and delimitation of the object of study¹¹, the empirical work, the justification, the methodology, and a theory-building with ethics.

An explicit value-oriented approach could overcome these constraints, and make explicit the underlying values and simultaneously create higher validity. Therefore, the analysis on GS must critically understand the diversity and values in a so-called rigorous or objective scientific analysis. It scrutinizes especially the narrow concept of military security, the related military complex, and its economic interests (Valenzuela 1991).

90.3.2 Feminist Empiricism

Feminist empiricism criticizes the 'androgenic' (male-centred) mainstreaming in science, where the stereotypical masculine mental approach excludes emotions. Scientific knowledge in physics and biology (Harding 1986, 1988, 1991) are also permeated by these gender biases, and methodologies and scientific methods have themselves androgenic limits (Harding/Hintikka 1991). GS studies promote a shift and ask for cognitive 'equality' or 'sameness' with the patriarchal thinking. This approach insists that feminist methodology sticks also to qualitative techniques, where the investigated are included in the analysis as subjects (Mies 1983). It creates methodological diversity and pluralist theories and practices (Harding 1986; Shiva/Mies 1997; Haraway 1988, 1997). On the other hand, the position of gyno-centrism with opposition to male scientific analysis, stigmatized as 'bad science' (Longino 1990; Keller/Longino 2006; Daly 1982), avoids a deepening in GS. Therefore, the new approach of GS shifts from opposition to collaboration. It creates a common front of the multi-disciplinary that allows dealing with the present

11 In male sciences the same process occurs, but they do not make it explicit. Before starting with any research and particularly empirical studies, scientists must make numerous choices, not only on the delimitation of the object of analysis, but also on the questions they will pose and try to answer, on the terms they will use in their analyses, the instruments used, and the methodology they will employ. All these decisions orient the research to a certain direction and to specific goals. These choices constrain in advance the hypotheses and limit the results. They predispose the future research agenda. Values and mindsets enter at this stage of the investigation, and values influence also the choice of preferred theories.

threats and the coming challenges of climate change, which will affect both genders and the planet as a whole.

90.3.3 Postmodernism

Postmodern perspectives (Butler 1990; Alcoff 1996; Alcoff/Potter 1993; Giddens 1991, 1994; Nicholson 1990; Persram 1994) have established radical critiques by rejecting any gender category, due to the fact that every individual is unique. They also oppose possible coalitions between women and other suppressed groups, because most of them would repeat the patriarchal conduct within these groups. For the GS analysis, their critiques of theories justifying sexist practices, where women are treated in an essentialist sense or as objects, are useful. Postmodernism is not monolithic but diverse and extremely critical of other currents. Harding (1986, 1988, 1991) believes in objectivity and 'accuracy', and Haraway's (1988) view of science is analysed as fallibility, minimalism, anti-realism, and opportunism.

These currents avoid in GS studies a bias of androcentrism, super-generalization or super-specialization, insensitivity to gender analyses and issues, the normal elimination of sex and sexuality, double evaluation standards for men and women in scientific achievements, sexist dichotomies, and a formalism limiting the unity of analysis (Bartra 1998). However, a postmodern approach limits also the deepening of GS, due to its influence on occidental individualistic thinking. By postulating that each woman is unique, they conclude that there are no possibilities to generalize the existing differences and to establish wider categories. There exist also limits due to the Western individualism of postmodernism. Further, they create contradictions by promoting the schooling of girls in an increasing jobless world or with salaries lower than those of men. By undercutting communal enterprises, traditional food production, and collective child caring, they take away from the state the responsibility of these services and launch it into private hands. Would this tendency imply a shift from state patriarchy to private patriarchy, and therefore increase gender insecurity?

90.3.4 Standpoint Feminism

A third approach to GS is related to *standpoint* feminism. It was initially developed in the social sciences, particularly in political science by Hartsock (1983, 1983a, 1988, 1990, 1993), Harding (1988), Chodorow

(1978) and Collins/Pinch (1998), and in sociology by Dorothy Smith (1974). Women and other oppressed groups are better trained and sensitive to deconstruct the mechanisms of exclusion, domination, violence, and submission. With these epistemic privileges they can deepen their analysis and better understand gender differences. Their analysis does not glorify women in research nor does it introduce gender issues in a collateral way into international studies, but promotes a transversal and gender-clear approach, where both quantitative and qualitative methods should deconstruct the processes of identity formation and consolidation of stereotypes, thus generating, reproducing, and anchoring the present situation of inequity. A GS approach observes that there could be no single standpoint, since women and marginal groups are differently situated within diverse social positions, cultural backgrounds, socio-economic conditions, race, class, ethnic group (Warren 1998), sexual orientation and geographic location, and that it is precisely this diversity which can enrich their analyses (Hooks 1988).

Harding suggested that science has to be 'socially-situated' and in perspective, and that women and especially marginal ones dispose of an 'epistemological privilege' because they can better understand the process of marginality, having lived in underprivileged situations for a long time¹². Therefore, they know the complexity of the processes (Oswald 1991).

Starting from these local empirical situations, novelty, heterogeneity, complexity, and interaction opens GS a systematic perspective of analysis. Accuracy, perspective, normative consistency where political correctness is criticized, permits to include moral and political values (Habermas 1998, 2000) and to analyse sexuality (Szasz/Lerner 1998) and the power mechanisms related to human trafficking (chap. 92 by Perpiñan/Villareal/Oswald).

To guarantee these critical interactions an epistemic community is able to a) establish public fora for criticism; b) adapt theories and analytical approaches in response to these criticisms; c) take into account shared critical public standards of science; and d) recognize a 'tempered' acceptance of intellectual authorities among the inquirers, allowing to understand the existence of cognitive virtues or vices, but above all

12 This does not imply that other persons with critical empirical approaches could not understand and rigorously analyse these marginal situations when they acquire the ability to listen and patiently reflect on this empirical reality.

disallowing a social position of power as a ground for discussing seriously with somebody (Longino 1993: 128–135, 1990: 76–81).

The critical advance of the standpoint epistemology lies in its “logic of discovery” (Harding 1991: 56) where “marginalized lives provide the scientific problems and the research agendas – not the solutions – for standpoint theories” (Harding 1991: 62). Furthermore, there is a potential for understanding the marginalization from a bottom-up perspective, where new paradigms can rise and systemic disadvantages be overturned. Anyone, men and women with sensitivity, can engage in the process of systematizing problems.

Such an advance permits to situate knowledge socially by anchoring it in local interests and values. When oriented to a liberation perspective, the disadvantageous situation induces learning processes that are able to free them from their situation of oppression (Freire’s liberation methodology, 1998). In relation to GS studies, a clear distinction between the context of discovery and the context of justification would avoid confusions. Harding insists further that modern science is “deeply and completely constituted” by “local resources” (Harding 1986: 157) and bottom-up processes. This approach offers not only a theoretical and empirical link to HS, but includes also ES concerns when resource appropriation and distribution are incorporated.

In this phase of analysis, empiricism, postmodernism, and standpoint feminism are intensely influenced by history (Falco 1987). The concept building of traditional feminist currents started from a liberal approach, where patriarchy was analysed, including concerns of Marxists for class and reproduction (Carrasco 1999). From a radical perspective sexuality and its power relations are at the centre of scrutiny (Gutierrez 1991). The psychoanalytical currents are concerned with personal development and sexual liberation (Braidotti 2004). For the anarchists freedom is a key element (Letelier 1980), while for the phenomenologists it is the body and its sexuality (Dankelman 2002). The ethical philosophers insist on values and ethics, while the epistemologists study knowledge and processes of construction of science (Harding 1986, 1988; Haraway 1988; Hartsock 1983, 1988). Finally, there are the currents focusing on race (on Afro-Americans see: Hook 1988), sexual identities, age, deep feminism (Kheel 1985), which are concerned with religious and philosophical worries. Other currents stress the HS components through training the physical and psychological conditions of women,

which could strengthen the unequal and long-lasting struggle against patriarchy. In summary, an epistemology of GS is searching for integrating different social currents, represented by ecofeminism, environmentalists, and peace movements, where traditional processes of identity are being transformed.

90.4 Four Phases of Gender Security Studies

By linking logically and empirically (Bronfman 2000; Pedrero/Rendón/Barrón 1997; Bar Din 1991; Cano/Valenzuela 2001; B. García 1999; E. García 2004; INEGI 1999) *human* (Oliphant 1993; Montoya/Frazier/Hurtig 2002) and *environmental security* (Velázquez/Merino 1997; Steffen/Sanderson/Tyson/Jäger/Matson/Moore III/Oldfield/Richardson/Schellhuber/Turner/Wasson 2004) with *gender security*, the process of the construction and visibilization of the invisible, of the reproduction of injustices (Mortera 2000; CLOC 2002, 2004), and of the production and ideological circulation process (León de Leal 1980; Aranda 1988) can be understood.

Four phases are involved in the consolidation of ‘GS’: *first*, the process of identity building and social representation; *second*, the gift economy; *third*, the evolution of ecofeminism; and *fourth*, the emergence of social movements.

90.4.1 Analysis of Identity and Social Representations

Gender identity refers to the process of socialization to ‘become’ a gendered human being: man or woman, depending on the position of the social structure. Sociology defines gender identity as “a social construct regarding culture-bound conventions, roles and behaviours for, as well as relationships between and among, women and men and boys and girls” (Krieger 2001: 693–700). It is a constructed reality and explains how a person is socially identified, or how the society perceives him or her as a man or a woman. The concept refers also to the process of how other persons define a person based on roles and behaviour (hair, clothes, norms, social position). The formation of gender identity is a complex procedure that includes processes of gestation since birth, of learning during the first infancy, and later the socialization and acquiring of social roles. Multiple researchers determine the fixation of gender identity in the first infancy, even when subsequently differentiated and new roles were ob-

tained (Piaget 1950; Freud 1923, 1927; Doise 1986). It is distinct from the concept of sex, which describes only the biological differences. Since it is socially constructed it can be changed, although habits have been socially consolidated during millennia, using gender distinction for social discrimination and oppression as something given by physiology (bio-physiological determination). In the symbolic field it represents cultural ideals and stereotypes of masculinity and femininity (Oakes/Haslam/Turner 1994; Lacan 1985; Foucault 1996) reflected in the institutional environment, in the opportunities of job, the levels of salaries, and the workloads.

Identity¹³ generates roles within society where a systematic process of identification establishes the differences between status, needs, positions, and privileges of each gender (Falco 1987). These roles have two explanations. First they articulate the totality of ways through which oneself expresses gender identity, and secondly it defines the roles in relation to the type of activities that a society determines as adequate for a person with specific gender identity. As these processes are socially developed, these behaviours are not fixed, and greater equity inside a society through a systematic analysis of gender relations, understanding how a woman and a man deal in specific social contexts, can be achieved. The result of this long-standing gender discrimination has produced historical inequality and inequity.

Exclusion and discrimination normally menace more women and girls, creating higher social vulnerability. They are highly exposed in daily life to gender-related violence, and their labour inside the house and in childrearing is not considered productive, neither is quantified in the global GDP of a country. This creates economic dependency from men, socially identified as 'breadwinner', whenever half of the food in the poor countries is produced by women and also economic income depends increasingly on women's labour outside the house.

During disasters and conflict situations women are extremely vulnerable, and recent disaster studies have shown that the death rate of women has been

between 68 to 85 per cent. During armed conflicts and wars, bodies of women are increasingly transformed into a battlefield. Nevertheless, these facts have remained invisible in official statistics and in most public policies (Ginkel/Velásquez 2001). This creates a high degree of social vulnerability, and gender insecurity, understood as a historical and accumulative result of poverty and unequal access to material and cultural consumption (Oliver-Smith 2004). It increases susceptibility of communities or persons confronted with hazard impacts or wars.

But a crisis situation creates also conditions for resilience-building and empowerment, reinforcing gender security. The affected people prepare themselves through their experiences, preventing further disasters and adapting to difficult life situations. Women who are heads of single households are at greater risk, due to stereotypes developed in any specific society, and as a result of generally accepted social representations based on identity processes.

Thus, the security dynamics, related to climate change and socio-political processes, represents threats for individual identity and social representation, where not only the physical survival is at danger, but also the cultural one, often reinforced by religious concerns. Linking Gramsci's 'ideological apparatus of state' with identity and role theories, the past decades of impoverishment in the South and in Arab countries (El Kayat 2004), and recently also in the North, environmental destruction, migration, depopulation due to disasters, wars and desertification, have pushed survival strategies increasingly into the hands of women (Oswald 1991, 2008d).

Tajfel (1981: 31) argued that social identity¹⁴ means how "we live in a world in which processes of unification and diversification happen with gigantic steps and with a rapidity never ever before seen in history." Hogg and Abrams (1988: 78) argued that "persons have a basic need to simplify and to impose an order to their reality"; a reality that induces them to categorize their socio-natural environment through social comparisons. This process supports, affirms and, maintains self-esteem in a positive way, but it explains also how this individual self-esteem depends on belonging to a group, not necessarily within its own social system of reference.¹⁵

Moscovici described social representations as "systems of value, ideas and practices" that simultaneously "establish an order that permits an individual to get familiarized and to arrange its material and social world" (Moscovici 1976: xiii). Without discussing the identity analyses in more detail, (chap. 89 by Serrano),

13 There also exist processes of *inverse identification*, when social comparisons of the proper groups are rejected and the person relates itself for identification with external groups, due to a low self-esteem which cannot be improved inside its own group of reference. Diverse influences also intervene into the social practices characterized by collective or individual history, linking with cultural practices and creating a self-induced process of victimization or feeling of guilt.

the “deconstruction for deconstruction” (Behnke 2007: 105) increases the self-reflection in a critical manner. At the same time, social representations enforces the communication among members of the community, providing them with a socially shared code of interchange where names are classified without any ambiguities, including world-views, mindsets, and personal and social histories. Their cognitive poliphasia¹⁶ characterize social representations, where different forms of understanding may coexist, what indicates a persistent potential for instability within representational systems (Moscovici 1976a: xiii). According to the same author, social representations are systems of ideas, values, and practices fulfilling a dual function: a) establishing a framework of order where the subjects are oriented in their material and social world where they live; and b) permitting the communication with a common code among the members of a collective, where all objects are named and the processes precisely classified (Moscovici cited in: Herzlich/Graham 1993). The process of individualization implies a contradiction: on the one hand the men and women that seek to appropriate a life are *liber-*

ated from traditional gender adjudications. On the other hand, people are subtly *coerced* into seeking love and happiness through partnerships within increasingly impoverished networks of social relations (Serrano 2003a: 9).

Social representations originate in daily life, where the society is the thinking system (Flores 2001). They could be reinterpreted as an equivalent for contemporary myths (Eliade 1965; Graves 1985) of belief systems in primitive societies (Moscovici 1984: 181, 1990, 1998, 2000). For this reason, identity is *processual*, since its gestation it changes permanently; it is *relational*, given that it is transformed by exchanges and interactions; and *multidimensional*, because it operates in intra-individual, inter-individual, intra-group, inter-group, and ideological environments (Doise 1986). Identity is also *contextual*, given that it is forged into specific contexts, and *essentialist*, because the diversity and the complexity of the social interactions are sustained and transformed through identity processes (Serrano 2004).

Duveen explains how the two basic processes of historical production of social knowledge are linked to ‘anchoring’ and ‘objectification’. *Anchoring* is a process that permits integrating the unknown situation within the existing representation (internalization). *Objectification* permits that these new representations are projected into the world as concrete objects (Duveen 1997: 87). The acquisition of these control mechanisms (Maslow/Frager/Fadiman 1987) permit in independent situations to internalize in society two basic psychological processes, which works as control mechanisms and therefore generate gender insecurity: a) women *should be*: assigned identity (social facts); and b) women *should be available for others*: self-identity (socialized).

‘GS’ represents gender relations (men and women) as its object of reference, and the values at risks are precisely identity and social representations (table 90.1). Thousands of years of experiences have permitted to consolidate a system of social representations that has been able to control all elements in the specific socio-historic context of a society. Symbolic elements of identity were developed – such as class, ethnicity (Charles/Hinthens 1998), age, religion, race, nationality, professional ascription, political ideology, education, and others – which are in permanent change, reflecting a large diversity and capacity for adaptation, while conserving the outstanding historic attributes (gender, sex, and race) and the material conditions of late capitalism: poor and rich (Giménez 1999, Habermas 1995, 2000; Van Dijk s.d.).

14 Identity should not be confused with subjectivity; it includes all elements constituting a person, influenced by the socio-historical surrounding and the former process of establishing social representations where class, ethnicity, race, nationality, professional ascription, ideology, policy, education, experiences, and culture (Braidotti 2004). All these factors influence the constitution of behaviours, inducing also permanent changes. These processes can include a phenomenon of depersonalization of the ‘self’, because the categorization of the ‘other’ signifies simultaneously a socio-cultural exclusion of the proper personal or social story, tending to promote an apolitical theory building. “Our social history is full of familiar examples and horrors dehumanizing other groups, and more subtle forms of discrimination and depersonalization of them” (Tajfel 1981: 241). “The accentuation of stereotypes reflexes the perceptive selectivity from which it results more appropriated to perceive persons in contexts of level of social identity categorization instead of particularizing their personal identity” (Turner 1990: 26).

15 Thus, the vote of fear by a majority of Americans for President Bush and his war policy may only be understood in this sense, although in their personal life Americans oppose violence, war, terrorism or actions of uncontrolled masses. Another example is the fanaticism during sports events which may end with violence in the stadium. The peripheral information is used to define and to be congruent with the proper group, thus understanding the differences with other groups of reference (Archer/Lloyd 2002).

16 Multiple significance, sometimes contradictory.

The exercise of *power* is the basis for a privileged access to socially valued resources, such as commodities, money, status, leadership, group membership, education, and knowledge. Power implies the necessary control or change of mentalities of others to impose the proper ones. All dominant groups tend to create homogeneous identities and social representations within their subjects, where the oppressed decide to support and maintain the oppressive situation in the name of their supposed own interests. Gramsci described this process as *hegemony*, giving the ruling class a stable process of power¹⁷ exercise and domination, where *domination* is defined as the (ab-)use of social power by elites, institutions and dominant groups, producing social inequities such as political, cultural, class, ethnic, race, and gender discrimination.

90.4.2 Identity and Gift Economy

Any process of classification and choice implies relations of identification, inclusion or refusal and exclusion that constitute the basis for power exercise and gender insecurity. As any social organization relies on sexual differences, humans are soon getting an identity as man¹⁸ or woman. This implies specific identity conditions, as well as particular mechanisms of power exercise and processes of differential *gender empowerment* (GEM). Therefore identities show complex processes: they are developed (Moscovici 1990), confronted with realities, permanently resisted through existing representations within the group of reference, and projected as objects to the exterior (Du-

veen/Lloyd 1990; Duveen/Moscovici 2000a; Richards 2000; Richards/Schwanger 2004). The '*theory of social identity*' (TSI) sees the structure of the self in relation to three continua: *first*, the continuum of behaviour from interpersonal to inter-group; *second*, the continuum of identity from a personal to a social identity; and *third*, the continuum of beliefs from social mobility to social change (Tajfel/Turner 1979; Haslam/Oakes/Turner/McGarty 1995). These processes create GS processes that produce different behaviours in daily life, which are, however, able to consolidate a common behaviour worldwide, called 'gift economy'.

Genevieve Vaughan (1997) deconstructed post-modern feminism, including women's free labour for child rearing and work in the household as a 'gift economy'. This free gift is related to maternal thinking (Ruddick 1995) or mothering (Chodorow 1978), producing collective social changes which go beyond capitalism and communism, both systems with clearly patriarchal roots (Nikolic 2004). Capitalism is based on the 'exchange paradigm' in a free market society, where even justice has become a commodity. Communism exercised its power through a central state within a state economy. Both belong to the logic of exchange, opposed to the logic of gift. Both economic paradigms – logic of exchange and logic of gift – coexist today. "One is visible, the other invisible; one highly valued, the other under valued. One connected with men; the other with women. "Exchange puts the ego first and allows it to grow and develop in ways that emphasize me-first competitive and hierarchical behaviour patterns...What we need to do is validate the one connected with women, causing a

17 Multiple interactions of power exist: allied, confronted, aligned, subsumed or annulated, nevertheless the real power in the present neo-liberal world is in the hand of a few men, the managers or CEOs of multinational enterprises, supported by Presidents and Prime Ministers of industrialized governments (OECD countries), that have created a global hegemony based on military, financial, political, and cultural power (Beck 1998, 2001; Sen 1992, 1995a; Arizpe 2004; Strahm/Oswald 1990; Forrester 1999; Castells 2002; Nussbaum/Sen 1993). They discriminate not only against women, but also against poor men. There are structural impediments which stand in the way of transforming this reality, such as central and peripheral imperialism (Galtung 1971; Senghaas 1973) with associated anchorages, such as names (progress, modernity, development); images (white occidental young men); myths (free market); formal institutions (governments and the UN); formal organizations (foundations, NGO), and informal networks (professional associations, clubs).

18 Homosexuality represents in the present world an exception, and in most cultures these persons are discriminated and repressed socially, because they are questioning from inside the dominant system of patriarchy. If this group grows within the existing dichotomized occidental world, its practice could become a direct threat for patriarchy (Foucault 1996) and therefore homosexuals are socially punished and persecuted by majorities. When these groups ally with other protest movements, they have achieved in some countries an acceptance of marriage among the same sex and in exceptional cases, the right for adopting children, subverting the traditional family pattern. Although, there are some ethnic groups which have developed both female or male sexual characteristics, such as the 'mujes' in the Zapotecan culture (Bennholdt-Thomsen 1994), giving them special roles and using their abilities. In others they are conferring different social representations such as that of a healer, a witch or a shaman.

basic shift in the values by which we direct our lives and policies” (Vaughan 2004: 11). Thus, the invisible, considered as being without value has to be valued.

There is a second triggering process related to the exchange paradigm. Markets are creating artificial scarcity to reevaluate goods and services. Usually this scarcity is artificially created in order to maintain control and increase power, but induces simultaneously processes of depredation in social and environmental terms. This scarcity is increased by wasting resources, invested in armament. Only 17 billion US dollars would feed everybody in the world during one year. The same amount is spent in one week on the military, a typical example of waste that creates artificial scarcity. Further, gift giving by big ‘exchange-ego’ in the form of aid from industrialized countries to developing ones is not functioning, due to the strings imposed by the donors which often impoverish the poor countries.

Thus, the gift agenda implies to liberate “everyone – women, children and men – from patriarchy without destroying the human beings who are its carriers and the planet where they live” (Vaughan 1997: 23). These women-based practices started with a criticism of language, emphasizing the need-oriented satisfaction, rather qualitatively based, which creates emotional bonds between givers and receivers. Especially raising young children, mothering requires kindness and creativity, sometimes self-sacrifice, and for this reason it is an important gift for the child and society. The author emphasized especially the gift of goods through ‘communication’, what deeply challenges the patriarchal economy of exchanges, profits, and interests. “Giving and receiving word-gifts organized in sentences and discourses creates a human relationship among people with regard to things in the world” (Vaughan 1997: 38). By this intentionality of giving, the caretaking is more important than the objectivity of an account, satisfying the constant social communicative needs, where reality is represented and reinterpreted without competitiveness, transforming *homo sapiens* into a *homo donans*.

The gift-economy visualizes also the invisible passivity and receptivity of women not as a mechanical concatenation, but as a creative process, where always equal exchanges not only are self-reflecting, but also self-validated by reciprocity. These processes would change the dominant system of existing social representations by creating new identities, increasing GS, and reducing violence and exclusion.

The gifts of nature, such as air, water, sunlight, food, biodiversity, biomass, that are used by humans

unconsciously permitting them adaptation, evolution and well-being (Diamond/Orenstein 1990) coexist alongside human gifts. The present system of trade, deregulation, and private appropriation is concentrating temporary money in small elites, sacrificing humans and nature by pulling these natural gifts in trade, and invading the traditional areas of natural gift-giving. The extreme expression of this invasion is represented by the biogenetic industries, where *bio-projection*, or better named *bio-piracy* (Shiva 1993, 2002; Foyer 2005; Oswald 2002a) is turning thousands of years of human gifts in the form of food and seeds into genetic modified organisms. The ‘exchange paradigm’ privatizes these collective natural goods, protected by the Trade-Related Aspects of Intellectual Property Rights (TRIP’s) of the World Trade Organization (WTO). Similar processes are occurring with the privatization of water, health care, and education (Illich 1976a). All these processes have been reinforced by General Agreements on Trade and Services (GATS) agreements guarded by WTO (Arroyo/Villamar 2002).

Thus, the gift economy creates transitional structures to HS and ES, and criticizes the patriarchal capitalism and the position of power over other human beings and nature. This top-down vision (see later social movements) identity processes and social representations have to be challenged from the root causes, including the Euro-American construction of gender and of the environment. In this process subsistence economies from the South, often in the hands of women, are questioning the dominant way of understanding earth and life.

The symbolic understanding of male power (skyscrapers, monuments, jewels, arms, bank accounts, supermarkets, and malls) transforms social processes into private property. Nevertheless, gender identities of men and women are based on these processes, and mothering is threatened by narrow military security concerns. Thus, GS understands this mothering not as a self-sacrificing process leading to victimization and control, but as an integral human process and an especially intense moment of gift giving, which is able to increase human and gender security with care for the environment.

90.4.3 Ecofeminism

The gift economy and ‘ecofeminism’¹⁹ are deeply interrelated and complementary, and are interpreted here as the third pillar of GS studies. Ecofeminism is understood as a convergence of environmental, so-

cial, and feminist movements, where mothering spirituality is caring about nature and society, about the vulnerable above all. It represents a movement which is applying feminist modes of analysis and concepts to the environment (see 91.3.1). The key values are equality and equity, including care, inclusion, solidarity, and respect for other humans and for nature. The principle of sustainability and concern over the coming generation gives the philosophical approach and the activist a theoretical background to link up with human and environmental security. Ecofeminists see the oppression of women and the exploitation of nature as interconnected. The dominant patriarchal system in late capitalism is affecting human, environmental, and gender securities with the same root causes. Control and commoditization of life and goods in favour of a small bourgeoisie are destroying the livelihood of billions of people, pushing them into extreme poverty. Also, human health and environment are affected when toxic waste is dumped into seas, waters, the ground, and the atmosphere. As a result, anthropogenic reinforced GEC causes more and stronger disasters. Human and economic losses are affecting differently geographical regions with higher impacts in the Tropics, the Arctic, the Andes, and the Himalayas, and lower social classes (poor and marginal) and gender (highly women, children and elderly) are the most vulnerable.

When ecofeminists integrated several social theories, and cooperated with philosophers of ethics and morality (Zimmerman 1987) and social movements, they deepened in the analysis of the differences between gender and sexuality (Szasz/Lerner 1998). With regard to environmental destruction, food scarcity, and women's discrimination and violence (Pickup 2001), they found an analogue process of exploitation between gender and nature.

19 The term was originally coined by François d'Eaubonne (1974) as a philosophy and a social movement emerging from the union of feminists and environmentalists. It was related to eco-anarchism and bioregional democracy with a strong involvement of feminism and deep feminism. According to Warren (1997: 218): "Since 1974, ecofeminism has surfaced throughout the globe in the form of both women-initiated, grass-roots environmental actions and interdisciplinary perspectives on the inextricable interconnections among human systems of unjustified domination – both of humans and earth. The distinctiveness of ecofeminism, then, is that it is a feminist environmentalism and an environmental feminism." See also Eaton/Lorentzen (2003) on the debate in the US, Brazil, and Japan on aspects of the relationship between ecofeminism and globalization.

Ecofeminists were inspired by proposals of the Club of Rome, and later by the results of the Earth Summit in Rio de Janeiro (1992) on sustainable development, and the Food Summit in Rome (1995). The depletion of nature through a pillage of natural resources²⁰ and the exploitation and repression exercised against woman during thousands of years resulted in both environmental and gender insecurity. Both are victims of the same patriarchal system characterized by domination, appropriation, violence (Maier 2001), exclusion (Pickup 2001), and destruction (Warren 1997; Mies 1989).

A special focus was addressed to the results of the green revolution, genetically modified seeds and agribusiness that have been promoted by private and multilateral organizations (FAO, IFAD) and have created pollution of the air, land, and water. Biodiversity and local food cultures were damaged by free market practices and high subsidies in the industrialized countries. Southern countries were induced to adopt new legal systems. In both cases the critical points were the loss of communal land rights and the transfer of these property rights to male landlords and agribusiness. Further privatization of water and seeds threatened livelihood and biodiversity. Community owned land formerly used for food self-sufficiency went into private hands, and poor peasants started a massive rural-urban migration into shanty towns (Dore 1997; Dore/Molyneux 2000). Ecofeminists argued that colonization, plantation, and monocultures have also destroyed the mystical connection with 'Mother Earth'²¹ (Shiva 1988, 2002; Shiva/Jafri/Bhutani 1999; Plumwood 1991; Vaughan 1997; Howard 1999).

20 Since the 1970's, several ecofeminists claimed that new technologies such as genetically modified seeds, cloning, nanotechnology, modern communications, and genetic medicine created new relations of subordination for human beings (Throsby 2004; Schumacher 1973). A world network of female researchers organized as *Diverse Women for Diversity* (DIWO) has studied locally in different parts of the world the effects of these technologies for women, poor countries, minorities, and biodiversity. They concluded that these scientific advances are part of new mechanisms of exercising power that may subsume in a more subtle and probably also more efficient way all non-hegemonic groups, nature, and social relations. Health, education, water, biodiversity, and the assumed welfare of all human beings are now under attack by mercantilist interests, and human development is limited to specific social classes, reflected clearly in the *Human Development Index* (HDI), and directly linked to *Gender Empowerment Measures* (GEM).

The complexity of the interlinked processes brought ecofeminists to criticize neoliberalism and regressive globalization that was supported by politicians such as Margret Thatcher when she proposed in the 1980's her 'TINA' (There is No Alternative, Mies 1998) concept. In her mind the free market and transnational enterprises were the unique and inevitable productive and trade system for the whole world (Baldwin 1993). When ecofeminists recognized that the impacts of these neo-liberal initiatives were disastrous for the well-being, for social security, and jobs in many parts of the North and South (Tickner/Mason 2002), they offered deeper analyses. Due to the global and regional socio-economic crises (Renner 1989), internal violence (Mason/King 2001), environmental destruction (UNDP 2005; Cheney 1987), poverty (Campos 1995; Dos Santos 1978; Oswald 1989), and in some cases even worldwide terrorism (Thieux 2004), the ecofeminists related these global processes to the exploitation and discrimination of gender. They understood that it was inherent in the existing patriarchal system and their exchange paradigm.

Confronted with effects of globalization, comparative studies from North and South, undertaken by peasants (Via Campesina 2005; CLOC 2002, 2004) and intellectuals (Saxe Fernández 1999; Eaton/Lorentzen 2003; Brauch/Oswald/Mesjasz/Grin/Dunay/Behera/Chourou/Kameri-Mbote/Liotta 2008) pointed to alternative processes of transversal, multi-local, and decentralized efforts. Several of them were related to political activism and social mobilization (e.g. in the World Social Fora - WSF) as part of a dynamic process of scientific reflection and the search for other possible worlds that is reflected in the slogan of TAMA (there are multiples alternatives; Oswald 2008, 2008d).

From a transradical perspective, some proponents of ecofeminism (table 90.1) linked approaches and theories to ecoindigenism and cultural resistance, and then to GS (Oswald 2004, 2008a). This trans-local analysis facilitated a comparison of diverse geographical conditions; all of them have been subjugated to the same exclusive globalization process that was controlled by multinational enterprises and the G-8 governments.

With other movements of women, peasants, indigenous groups and environmentalists, ecofeminists par-

ticipated in a campaign against multinational oligopolies of genetic modified seeds, pointing to their potential negative impacts of contamination and genetic erosion of biodiversity on society, nature, health, and the economy. The central factor was the destruction of rural economies and the resulting migration of peasants to shanty towns within or outside of their country (Oswald 2002c, 2001; Shiva/Jafri/Bhutani 1999; Shiva 1993; CLOC 2004; Garcia 2004).

By promoting cultural and biological diversity, ecofeminists overcame the Cartesian relationship between subject and object. They deepened this interrelationship, including a critical revision of traditional cultural postulates that contain patriarchal roots. They opposed the dichotomy between liberty and emancipation, and showed the fallacy of a globalization process that excludes local sustainable development. They argued that only by a 'glocal' approach - internationally linked and locally anchored - supported by affected people, will it be able to counter the imposition and assignation of roles and identities promoted by multinationals, TV channels, and information agencies. The universality of Western thought was deeply scrutinized, especially by ecofeminists from the South. In their view, only a culturally diverse and environmentally sustainable self-reliance and food sovereignty can offer real alternatives (Via Campesina 2005; CLOC/Via Campesina/ANAMURI 2002). Diverse cosmo-visions, several of them which survived for hundreds of years within the communities, bloomed again and thus reinforced the cultural plurality and biodiversity, especially in towns and rural communities in poor countries.

Ecofeminists portrayed as a fallacy the paradigm that only modernization and progress will permit to reach a similar development as industrialized countries, and therefore HS. It is not only impossible to achieve (see data on the increase in poverty and marginalization), but also undesirable, since it would create new pressures and domination on gender and nature (conflicts in Bali for emission-cut of CO₂ in 2007). The industrialization, modernization, and agribusiness has increased natural hazards in number and intensity, and these often became societal disasters (see figure 90.1; chap. 15 by Wisner).

The growing urbanization process with chemical contamination, industrial toxic accidents, the exhaustion of aquifers, soil erosion, loss of biodiversity, chemical changes in the atmosphere (Crasswell 2005; Dankelman 2002; IPCC 2007), have also reduced the survival possibilities of peasants and contributed to growth of shanty towns (e.g. Accra, Cairo, Lagos, Ma-

21 Similar processes occurred several thousand years ago, when patriarchy evolved and expropriated the holy places in the hands of priestesses, such as the oracle in Delphi (Warren 1997).

nila, Mexico City, Mumbai or São Paulo, Loster 2007), where poverty and risks have increased. Further, urban slum dwellers are generating unprecedented environmental degradation, and survive in adverse life conditions which force women and children to develop their own 'survival strategies' (Oswald 1991, 2008d). Simultaneously HS and ES are triggering gender insecurity that could be aggravated by GEC and its unforeseeable global effects.

90.4.4 New Social Movements

The author proposes as a fourth pillar of GS studies the processes of confluence of diverse social movements. Historically, after the explosion of the atomic bomb, feminist movements allied with pacifists and supported the establishment of peace institutes and promoted nonviolent social behaviour (López 2004). Since the 1970's, these social groups have cooperated with ecofeminists, indigenous people and ecologists on issues of environmental and social deterioration. When the neo-liberal model spread everywhere, workers, trade unionists, the displaced middle class in many countries in the South, the unemployed, the young without a future, and many elders joint. All of them lacked a worthy alternative perspective for their life and future, and were forced to survive as self-employed in the informal economy.

During this fourth phase, questions related to GS acquired greater visibility, especially in Mexico when the Zapatistas, an indigenous movement in Chiapas, launched their 'conflict against neo-liberalism' on the same day (1 January 1994) when the *North American Free Trade Agreement* (NAFTA) entered into force (Oswald 2008e). The use of the internet by representatives of progressive church groups converted this armed movement into the first global cybernetic conflict.²² These movements create grass-root ethno-feminist and ethno-ecologist alternatives (Warren 1998; Stephen 1997), based on local self-reliance²³ (Benholdt-Thomsen/Mies 1999), economy of solidarity (Cadena 2005), and participative governments (MST 2003, 2005a). These concrete examples show how the poverty trap can be defeated, but explain also the underlying economic links of transnational culture of consumerism, promoted by multinational enterprises and their mass media. Further, they visibilize the gift-giving and solidarity, are able to care for social vulnerable and the environment, and therefore reinforce HS, GS, and ES or HUGE.

This phase of GS also coincided with the rise of international postmodern social movements (Melucci

1996). In Latin America they started with the opposition to free trade agreements, especially against the *Free Trade Agreement of the Americas* (FTAA). The global connection among social movements emerged during the protest against the WTO in Seattle. The alliances were strengthened during the World Social Fora in Porto Alegre, Brazil (2001–2003, 2005), in Mumbai, India (2004), and in Nairobi, Kenya (2007) as well as regionally in different parts of the world (Oswald 2008e).

They created extensive coalitions and networks of groups and persons against the dominant neo-liberal model. Their agenda included environmental destruction, cultural homogeneity, social exclusion, gender discrimination, social stigma, racism and others. They adopted a common agenda for a world struggle that should be able to alter programmes of multilateral organizations that have been consolidating this model of an unjust world order (World Bank, FMI, WTO, and G-8). Sara Larrain (2005) named these new social movements – consisting of indigenous, women, peace, and ecological groups – as *altermundism*²⁴.

As diverse social movements they are training inside their organizations processes of democratization and sustainability (Brundtland 1987, 1987a). Although differences exist among these social movements,²⁵ they agreed on specific themes such as the decentralization of power; even though they still have not yet determined how social and territorial decentralization should be implemented, and which could be the institutional options (Kaldor/Anheier/Glasius 2003). The social imaginary, once explored how to transform their legitimate demands – human rights, gender rights (Peters/Wolper 1995) welfare, food sovereignty, peace, environmental care and poverty relief. These movements questioned the hegemonic development agencies with their technological modernizing para-

22 Responding to international pressure, the Mexican government had to negotiate a nonviolent solution of the conflict and an armistice, although it has not yet fully implemented its commitments negotiated in San Andrés Larrainzer in Chiapas in 1994, and the indigenous laws adopted by the Senate and House of Deputies in 2002 do not reflect the negotiated agreements nor the self-determination claims of indigenous groups. This local rebellion had global repercussions, and worldwide solidarity groups for EZLN were created. Their ideas of dignity and cultural integrity spread and generate in different parts policies to improve the situation of their marginalized and poorest citizens, similar to the indigenous population of Chiapas, where a war of low intensity is still going on.

digms, using political power and economic pressure (IMF, WTO) to privatize public services at any costs of social conditions in developing countries and poor social sectors.

Social movements promote transparent public administrations with decentralized power exercises able to stimulate gender and regional equity within a framework of socio-environmental sustainability. Especially the improvement of GS has to overcome thousands of years of hegemony (March of Women), where women have lost the notion of being dominated and submitted (objectification, anchoring). This associative approach could prevent an alternative world superstructure (a kind of anti-UN). It conserved its cultural diversity both in thinking and in practice.

23 For more than 10,000 years, women and peasants have selected the best seeds, improving the performance in the field, developing diverse culinary cultures, and protecting harvests and animals from plagues and illnesses. After governments and the FAO abandoned these traditional practices with the spread of the green revolution and genetically modified seeds, hunger has remained an undeniable reality. One person dies each 4 seconds, 24,000 deaths per day due to lack of nutrition (FAO/IFAD/WFP, 2005a). In Mexico, as elsewhere, children are the major victims of this unjust system: 27.2 per cent of children less than 5 years and about 50 per cent between 10 and 22 years suffer from anaemia; 18 per cent of the children have not developed due to chronic undernourishment, and there are three times more rural children suffering from growth deficiency. More than half of those exhibit iron deficiency before they enter school. Industrialized sugar is the third food among children of 5–11 years, frequently provoking degenerative illnesses such as diabetes mellitus (Chávez/Martínez/Soberanes 1995). This food pattern provokes overweight in 5.4 per cent of the children, increasing to 18.8 per cent in kids over 5 years (23.5 per cent of urban children compared with 11.2 per cent in rural areas). Mexico is one of the countries with the greatest incidence of child diabetes (INNSZ 2001, 2003). These facts do not reflect the productive reality of the world. In spite of the population growth during the last two centuries, nowadays there is sufficient food to feed the whole human population 4.2 pounds per person (Lappé/Collins/Rosset 1998). Nevertheless, only 64 per cent of the agricultural products are used for human food. The rest is transformed industrially or is utilized as feed for animals and livestock (FAO 1996, 2005, 2005d, 2005e; FAO/IFAP/WFP 2000, 2002, 2005, 2005a), and increasingly for bio energy.

24 Atermundism is the self-defined term of the networks of different social movements working with the slogan: “Another world is possible”.

Respect for the diverse ideologies and practices of any social movement or group is a key to their success.

These social movements asked for social representation with greater harmony among human beings and nature, coherence between public and private policies, between political offers and public policies, and a relationship based on reciprocity and cooperation, as well as on solidarity. The convergence among paradigms and perspectives of gender, sustainability, equity, vulnerability, and positive peace has promoted a “conception centred on human beings, questioning the patriarchal paradigm and searching for coherence among the public and the private; the coherence among equity and democracy between gender, generations, cultures and territories” (Larrain 2005: 3). Their demands are based on social power without privileged access to resources socially valued such as goods, status, leadership, education, knowledge and power, but in a process of sharing tasks and ‘mandating obeying’ (EZLN), capable of generating an extensive base of diverse, but not antagonistic interests that can challenge the homogenizing neo-liberal rules of identity, social representations, and social cognition.

Habermas (1995) correctly mentioned that this phase aims at an ideological and discursive struggle. It is expressed clearly in the strategies of the Zapatistas. They struggle against the control of the mind by mass media, thus imposing socio-cultural representations (Castells 2002; Chomsky 1998). This process explains also why dignity and critical thought of ecofeminists, of social movements, and social actors are crucial for establishing new equilibria of power (Kothari 1990). It implies a social consensus, where existing processes

25 The ideological diversity of these movements spread from Marxism and anarchism to deep ecology and spirituality, and their methods from violence to contemplation. These movements with proper interests have built one common agenda and they democratically agree on a programme for a culture of social sustainability, granting synergies among feminists, ecologists, indigenous people, promoters of human rights (ethnic women, children and elderly; Tomasevski 1993; Muthien/Taylor 2002), activists against war, free trade agreements, the WTO, repression calling for debt relief for poor countries (Jubilee 2000) and the construction of an economy of solidarity (Cadena 2003, 2005). They were able to mitigate locally some impacts of exclusive globalization (Lopezllera 2003; Campos 1995), and to put the processes of liberalization and poverty alleviation (Richards, 2000) on the policy agenda in different parts of the world (Chile, Venezuela, Brazil, China, India, South Africa). These movements offered new energies and hope for alternative futures for the poor.

are deconstructed, re-interpreted, argued, criticized, and substituted with real alternatives.

This fourth pillar of GS offers an understanding of the interrelationship and mediation processes of different social levels: of micro and macro; of individuals or groups: of relationships among discourses and power domination, and deconstruction where the raising of local consciousness for a global struggle emerged. In strategic terms, the social representations, shared socially, permit the establishment of new identity patterns able to create wider alliances with greater achievements and increasing capacity for alternatives (CLOC 2004; Via Campesina 2005).

In summary, the transformation of identity patterns, the creation of alternative social representations, and the visibilization of the gift-giving economy reinforce cooperation and nurturing of humans and nature. Ecofeminists and social movements have criticized the Euro-American power exercises and ideological domination through propaganda that are able to threaten human, environmental, and gender security.

The multiple risks and threats inherent of their global neo-liberal economy and post-war progress brought concentration of wealth in a few hands, violence, armed conflicts, and *global environmental change* (GEC). To achieve mechanisms contrasting these growing insecurities, this author has proposed an integrative HUGE security concept consisting of *Human, Gender, and Environmental Security* (Oswald 1992, 2001, 2008a). This HUGE concept responds both to the scientific debates reviewed above, but also to the critical political questions of women and men who want to explore alternatives to the present exclusive globalization model.

90.5 Human, Gender, and Environmental Security: HUGE

The revision on bibliography on the three security concepts has shown that there is still a predominant disciplinary, male and Western approach in security research (Buzan/Wæver/Wilde 1998; Kaldor/Anheier/Glasius 2003; Steffen/Sanderson/Tyson/Jäger/Matson/Moore III/Oldfield/Richardson/Schellnhuber/Turner/Wasson 2004; Wæver 2000) deepening and widening in one or another aspect. The evolution of HS has broadened the discussion from protection of anti-personnel mines (CSH 2003) to poverty alleviation, human rights (UN 2006), governance, gender participation (IFAD, 2005, UNFPA 2004; Whitehead/Lockwood 1999) and dignified jobs and

social protection through income and governmental services (UNMP 2005a). Substantially more environmental concerns (UNDP 2007) appear in HS reports (UNDP 2004, 2006; World Bank 2007); food and livelihood issues (IBRD/WB 2007; World Bank 2007); peace and conflict resolution (UNESCO, 2002), and on the regional level new actors and triggering situations are analysed (BID 2007). The five lost decades of development and the increase of poor people worldwide reorientated the discussion also towards ethical concerns (Ogata/Sen 2004).

GECHS (Matthew/Fraser 2002) and UNU-EHS (Bogardi/Brauch 2005) have linked social vulnerability (Birkman 2006) with a loss of wealth as a result of the increasing and more severe disasters (MunichRe 2005). UNEP (2004) included the potential conflict situation due to scarce and polluted resources, and the chronic neglect of governments in poor countries (IFRC-RCS 2006, 2007). Economic concerns were widely debated when the Stern Report (2006) appeared, and critics in favour and against obliged the UNFCCC (2007) in Vienna to quantify future investments for mitigation and adaptation. After the appearance of the IPCC reports (2007, 2007a) and the G-8 Meeting in Heiligendamm (2007)²⁶, ES studies deepened in the transversal process of interrelated social problems with the environment²⁷ (UNEP-PCAU 2004), but few gender-related issues, mostly without any implicit reference to security (United Nations, 2006a; WECF 2006) were discussed.

Diverse publications appeared searching for protection of vulnerable social groups (youth, gender, minus valid, elderly; Villagrán 2006; UNDP 2007), animals, coral reefs, and specific ecosystems such as the dry tropical forests, whenever the GS aspect was missing. Before the Bali Climate Summit in December 2007 different networks organized and started lobbying with multilateral and governmental representatives for a more integral vision. Gender issues related to GS were implicitly managed (e.g. in the gender disaster network; the gender and climate change network, and among women for climate justice). Nevertheless, an integral concept, linking HS, GS, and ES is still missing, particularly when risks inherent in the model of development are growing (Beck 2007a).

26 G-8 Meeting in Heiligendamm, Germany on 8 June 2007"; at: <http://www.g-8.de/Webs/G8/EN/G8_Summit/SummitDocuments/summit-documents.htm>.

27 The concept of sustainable development has a base of ES that originated from the Brundtland Report on a clear social component.

Such an attempt is herewith introduced with the HUGE concept. The combined *Human, Gender, and Environmental Security* (HUGE) concept will contribute more both analytically (as a scientific tool for analysis) but also by putting new concerns on the policy agenda (as a policy tool for action by social movements, NGOs, as well as by governments and international organizations) than the three isolated HS, ES, and GS concepts introduced above (9I.2).

As discussed before, HUGE relies on a wider gender concept - and thus differs from the narrow approach focusing on the male-female relationship prevailing in many feminist discourses in the North (Bordo 1990; Butler 1990). This wider gender concept includes other vulnerable groups such as children, elders, indigenous and minorities (see above 9I.2.3), with a human-centred focus on ES challenges as well as peace-building and gender equity (Oswald 2001, 2004, 2006c). As 'GS' is still in incipient concept, it was necessary to explain the different components (9I.3) that permitted the creation of a GS reflection with some solid theoretical bases.

The historical evolution of the constituent elements (9I.4) also revealed the deepening and widening analysis of GS from socio-psychological identity concerns, to gift-giving, ecofeminism and social movements, where livelihood, food,²⁸ health and public security, as well as education and cultural diversity (Stephenson 1992) are interacting. Therefore, the HUGE proposal simultaneously aims an epistemological critique and a policy advice at several levels, and from institutional and grass-root perspectives.

Through the HUGE concept the patriarchal, violent, and exclusive structures within the family and society are scrutinized and focused to overcome the consolidated gender discrimination, where an alternative 'femininity' and 'masculinity' establish a field of experimentation, based on equality and mutual cooperation. Theoretical and empirical diversity permits on one side a deeper understanding of GS linked up with social deterioration and growing poverty, GEC,

and armed conflicts in many countries of the world (Muthien/Taylor 2002). Confronted with increasing risks and threats, multilateral organizations (FAO, UNDP, BID, WB) have launched a discussion on empirical standpoint studies and possible alternatives (Mason/King 2001).

Within these processes of change, a wider security paradigm was accepted and developed further within the United Nations (Rupasinghe 1998, Ogata/Sen 2003, Annan 2005), exploring first human security and later environmental (Rønnfeldt 1997, 1997a), health, food, and economic security (UNDP 1994; FAO 1996c, 2000a, 2000b, 2005, 2005d; Fuentes/Rojas 2005a). More recently GS was added to the policy agenda (Tasneem/Jayawardena/Shrestha/Siddiq/Quddusi/Bhatt/Anarkoly 2007; Hoogensen/Rottem 2004; Hoogensen 2008; Sullivan 2006; chap. 93 by Ariyabandu/Fonseka 2008) for overcoming the epistemological barrier of the patriarchal worldview (Lorber 1994; Lagarde 2000) and Eurocentric imposition (Preiswerk 1984; Slater 1997).

A general agreement crystallized in the *Millennium Development Goals* (MDGs) that was approved unanimously by the member countries of the United Nations. They established specific gender policies, first reversing the present situation of inequality through gender quota as a process of positive discrimination, specifically in rural and traditional societies, where the conventional roles are still very rigid and the process of gender differentiation is still taken for granted (UNMDG 2000). But this is not enough. Also in progressive and gender sensitive societies, differences and inequalities exist as socially constructed phenomena and must be eradicated. This means not only reducing the explicit factors of oppression (time, money, preferences, see: Green 1999; Damian 2002), but also to deepen in the social and individual unconsciousness, where psychoanalysis and Marxism both have tried to show the structural disadvantages of women in any existing society (Basu 1995; Muñón 1999; Muriel 1982; Oswald 1990; E. García 2004; B. García 1999). This process is challenging the present identity processes, consolidated in mass media and anchored by the existing social representations.

In this sense, HUGE reorientates 'human security' against structural discrimination processes, where specific governmental policies, institution building, and legal reinforcements should stimulate political and social participation of women, the young, and elders (Jelin 1998; Kaji' 2001). It deepens GS concerns by transforming existing processes of social representation-building and traditional role assignment, linking them

28 Women generate between 60 to 80 per cent of the food in poor homes, and half of the world's food requirements. In Mexico only 17 per cent of women own land property or have access to agrarian land rights. In Africa women in agriculture represent 33 per cent of the labour force. They account for 70 per cent of the rural daily wages, 60-80 per cent of the subsistence, 100 per cent of the transformation of food, 80 per cent of food storage, 90 per cent of weaving and 60 per cent of the activities of the market, but they only own 2 per cent of communal land rights (FAO 2002a).

up with HS and ES processes. During the past years empirical research on disasters in different parts of the world (tsunami in the Indian Ocean, earthquake in Pakistan, Turkey, Iran, floods in Mozambique, hurricanes in the Gulf of Mexico) has shown that a higher number of the dead and displaced people are women and girls (chap. 93 by Ariyabandu/Fonseka 2008; Oswald 2008a). Social vulnerability increases during and after disasters and conflicts by transcending the existing violent conditions in daily life and make women to victims of human trafficking, rape, and sexual exploitation (chap. 92 by Perpiñan/Villagran/Oswald).

HUGE focuses on 'ES' concerns where a healthy environment and resilience-building for highly vulnerable groups can reduce the impacts of risks associated with hazards (Brauch 2003, 2005, 2005a). In hazard prone areas, social movements, NGOs, and governments are enabling women and other exposed groups to reinforce their own resilience through a bottom-up organization. If combined with top-down policies, through institution building and specific tools (such as disaster funds), they are able to guarantee effective early warning, preventive evacuation, disaster help, and reconstruction. Thus, social vulnerability²⁹ in the recovery phase can be reduced. A complex and varied world implies political and cultural diversity that may contribute to nonviolent conflict resolution processes, thus possibly reinforcing peace-building in conflict-prone regions (Ameglio 2004). Aceh and Sri Lanka showed different outcomes after the tsunami impact in the Indian Ocean. In the first case international support after a serious disaster permitted a peace agreement, while in the second case struggle among foreign aid distribution aggravated the existing civil war situation.

Resilience-building is related to horizontal interchange of experiences that strengthens the empowerment of the vulnerable. When supported by disinterested world solidarity, the international aid after crises and disasters can take out countries and specific social groups from poverty and marginality (Galeano 1980; UNEP 2000–2006). It induces also sustainable development processes. In synthesis, HUGE integrates social, environmental, human, and cultural and identity concerns, offering solidarity, resilience, sustainable peace-building (Söderberg 2004),

and equity in an increasingly insecure and risky world (Beck 2007).

HUGE put on the agenda questions related to structural inequality (Galtung 1971, 1975; Senghaas 1973) and dependency (Marini 1973; Quijano 1970; Dos Santos 1978). The relationship between the centre of the centre and the centre of the periphery (elites in the North and South) may create a common social relationship of identity among the peripheries of the centre and the peripheries of the periphery (see *Via Campesina*), associated and anchored to images (Ramona, women commandant of EZLN), names (Zapata and Che Guevara as revolutionary symbols), histories (Durito, a reflexive animal used by EZLN to promote care about environment and social justice), myths (mother earth), generating formal and informal organizations capable to coordinate through a minimal format of institutionalization. Linking these movements simultaneously across the international levels (through the internet and web pages) and localities (through myths, symbolic acts, protests and daily struggle), the associative function of the anchorage is guaranteed and the processes of communication can be expanded. From this process of micro-genesis onward it is feasible to consolidate a wider social identity, motivating the participants to plan, participate, and develop creatively alternatives, taking as social norms the unconformity against the established model and their methods of domination, violence, discrimination, and exclusion. Once social facts have been transformed into normative and practical processes of alternatives, the structure of social representations is changing in daily life (Haslam/Oakes/Turner/McGarty 1995; Hartsock 1983, 1983a; Harding 1988). Simultaneously, in different parts of the world diverse processes of autonomy and political alternation (Bolivia, Venezuela, South Africa, and Liberia) are arising and are able to consolidate participative and more equal models of societies.

Thus, conflicts can be positive motors of change and development (Gandhi 1996; Galtung 1998); but when conflicts are tied to personal ambitions and geopolitical interests, mismanaged conflicts and change dynamics can affect the entire world (Gluckman 1965, World War I and II). The HUGE concept is therefore based on a sustainable culture of peace, but goes a step further by including widened security concerns (ES and HS), that were discussed in April 2007 for the first time in the Security Council, although more from the vantage point of international and national security than from a HUGE perspective (Wisner/Fordham/Kelman/Johnston/Simon/Lavell/Brauch/Os-

29 Immediate and efficient support for isolated regions affected by social and natural disasters could prevent long-term effects such as famine and violent conflicts (Denov 2005).

wald Spring/Wilches-Chaux/Moench/Weiner 2007; Brauch 2008c).

Thus, HUGE complements the top-down policy approach on official human security approaches (UNDP 1994) by extending the traditional scope of security (*widening*), the actors (also including grass-root perspectives), the referent objects and institutions (*deepening*), and the sectors (*sectorialization*) of security concepts. Since the Rio Earth Summit in 1992, the dangers posed by Global Environmental Change (GEC) – due to anthropogenically induced production and consumption patterns and waste (Dalby 2008) – were added to the international political and security agenda for the survival of humankind and for global and human security (Brauch 2008c).

Thus, a *horizontal widening* from national military security to political, economic; social, environmental security; a *vertical deepening* from “state” to “human” and “gender” security as well as from “national” upward to “regional”, “global” and downward to “societal”, “local” and “grass-root” security *sectorialization* from arms and military industry to energy, food, health, water, and livelihood security is included (Oswald/Brauch 2008: 941–942).

90.6 Conclusions

As population and environmental stresses increase conflicts and struggles about natural resources (land, water, oil, gas, genetic resources and food; Gleditsch 1997; Oswald 2006c, 2006d), complex strategies are required from governments and international organizations, but also from all organized groups at grass-root level to prevent, mitigate, and resolve them. Thus, the interrelationship of HS, GS, and ES is not simply a sum of three security concepts with their proper development; HUGE is more than the sum of these three concepts.

HUGE links together in theoretical terms the social, physical, and ideological components of the three concepts, establishes levels of analysis with system and sub-system relations, and revises the capacity of the system consistence by self-regulation (see figure 90.1). In policy terms it orientates the proposals in the direction of a desirable future for everybody, but especially for the highly socially vulnerable. The utopia is a decentralized, diverse, sustainable world with equity and dignity, where ecofeminist and ecoindigenist paradigms care for humanity and nature.

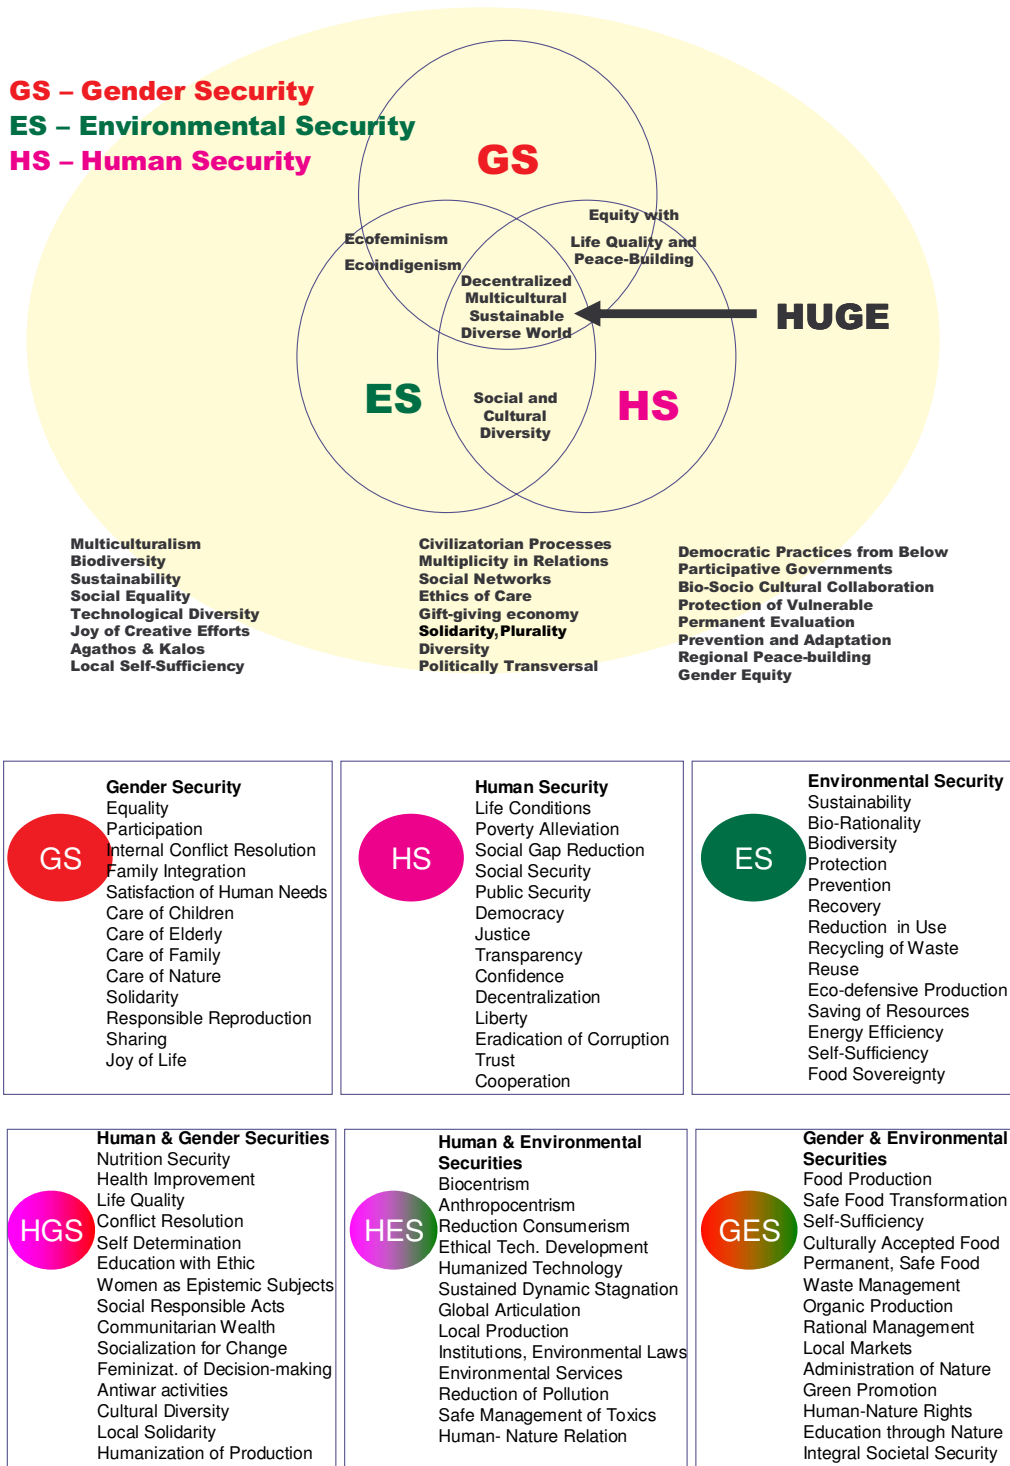

Growing complexities related to GEC are impeding the prediction of future scenarios and risks (Beck

2007) that are growing exponentially and in direct relation to the non-action and immobility of powerful nations (Stern 2006; UNFCCC 2007; Oswald 2007). The theoretical and ethical parameters are clear (Brown 2005). What is missing is an agreement of action (Post-2012) where all nations, social groups, and levels of society are co-ordinately involved and create a multicultural, diverse, and sustainable development for everybody. This means that nations with historical accumulation of greenhouse gases and high technological and economic development (USA, EU, Australia, and Canada) have a moral obligation to support poor nations in their efforts to mitigate and adapt to GEC. A diverse world implies also political and cultural diversity, able to establish fragile equilibria and to generate nonviolent conflict resolution processes that can be reinforced by peace-building and prevention in conflict-prone regions.

On the policy side, horizontal interchange among social movements, organizations, and experiences could strengthen the empowerment of the vulnerable. Solidarity with the poorest countries and social groups, financial aid, debt reductions, and genuine support for development (Sachs 2005) are pillars for sustainable peace (Oswald 2008), able to reduce threats and fears, and to strengthen the HUGE perspective. The concept could scrutinize at least five historical experiences of alternative movements and associations where there experiences are rooted:

- a) *the nonviolent resistance of indigenous societies* (Gaitán 2003, 2004; Gil 2004; Menchú 2004; Stavenhagen 2004; De la Rúa 2004; C. Rojas 2004; Armendariz 2004);
- b) *the nonviolent liberation struggle of Gandhi* (1993, 1996), later the feminist fights for equity and safe environment in India (Agarwal 1992), the struggle of Martin Luther King (1998) in the USA for human rights and race equality, the peaceful transition from the Apartheid regime by Nelson Mandela (1994), and all the peace movements over all the world searching harmoniously for conflict resolutions, such as nonviolent peace movements in India related to Jaina monks, the Buddhist anti-war campaigns in Myanmar, the Quaker’s peace-building process (Boulding 2000), the ‘gacaca’ in Burundi and Ruanda, and multiple others;
- c) *the tradition of independence fights and liberation of military regimes through guerrilla movements* (Che Guevara, EZLN, Shining Path, FLN, IRA, FAR, etc.), which negotiated peace agreements, truth commissions, and later power sharing processes through democratic elections;

Figure 90.1: Human, Gender, and Environmental Security: A HUGE scientific concept and an approach for action to face the security issues of the anthropocene era. **Source:** Designed by the author.

d) *grass-root mass organizations offering alternatives to exclusion* through an economy of solidarity, locally integrated enterprises, popular banks for

small local savers, movements of solidarity and alternative economy (the other stock market, Lopezllera 2003; Cadena 2003, 2005), and sustainable

mixed agriculture with self-reliant small businesses, represented by the *Movimento Sem Terra* (MST 2003; Dos Santos 2004) in Brazil which has organized more than two million landless peasants and regionally articulated chains of productive schemes (MST 2003; Santos de Morais 2002);

- e) *organized religious solidarity communities* such as the Christian Grass-roots Movement (*Movimiento Cristiano de Base*), inspired by the *Theology of Liberation* (Sergio Mendes Arceo, Camilo Torres, Samuel Ruíz, Fray Betto), as well as by Buddhist, Jaina and Hinduist monks.

The confluence and diversity of these different strategies, ideological and political struggles and activities, share common basic ethical principles such as plurality, diversity, equity, justice, sustainability, and social equality. They dream about globalization with a human face, social integration, gender equity, peace-building, nonviolent conflict resolution, environmental care, and risk reduction. They have maintained a flexible structure and alliance, avoiding the imposition of homogenizing ideas and hegemonic strategies of struggle, such as co-optation processes and male power hierarchies within global organization (Oswald 2008).

On the contrary, their respect for diversity, voices of the voiceless, and empowering of the socially vulnerable were explored in different ways. The varied strategies of survival and resistance-building processes have been collectively analysed through diverse past experiences (Moreton-Robinson 2000; Miall/Ramsbotham/Woodhouse 1999). Understanding of root causes, new threats and experiences are permitting new alliances and alternative grass-root strategies, linking peaceful conflict resolution, environmental care, and recovery to social development with self-reliance and food sovereignty, where interchanges and traditional technologies merge with modern ones (UNDP 2000-2006; UNEP 2003; Bennholdt/Farclas/Werlhof 2001; Bennholdt/Mies 1999; Oswald 2006). As a result of a dignified employment and conciliation of conflicts, migration as well as informal and illegal labour market was reduced when solidarity and a gift-giving economy (Vaughan 1997) is strengthening also international solidarity.

Less violence and more cooperation means that the hard security and related sectors of the military and police can be trained for civil protection and disaster management, enabling them to guard citizens from hazard impacts by reinforcing early warning, evacuation, and rebuilding processes. Arms complexes can be transformed into sustainable energy.

New investments in education and culture would help to consolidate a sustainable development process with environmental restoration in high-risk areas (islands, coastal areas, coral reef, mangroves, forests, savannas, mountain regions threatened by landslides and active volcanoes (Brown/Green/Hansen/Fredricksen 2004). This would reduce threats and consolidate security in hazard-prone regions. Confronted with new threats – generated by global and climate change, nanotechnology, and genetic modified organisms (GMOs; Beck 2007; Oswald Spring 2000b) – conscious communities and social groups are enabled to create resistance and resilience³⁰.

Bringing together human, environmental, and gender security with peace-building and risk reduction, the concept of the “Anthropocene suggests the interconnection of human and ecological matters (which) needs to be understood in a way that transcends the divisions between the natural and the human that have structured thinking about security and especially identity since the emergence of modernity. We are not on earth; we are part of an ecosystem we are changing.” (Dalby 2008; chap. 59 by Dalby/Brauch/Oswald).

The positive outcomes of these processes create larger ‘freedom from fear’, ‘from want’, and ‘from hazard impacts’, consolidating peaceful behaviour that is supported creatively by active and equal participation of women (Kameri-Mbote/Anyango Oduor 2007) and children (UNICEF 2000), bringing new energy to decentralized developing models that can consolidate nonviolent daily interaction. Emerging conflicts are resolved through negotiation and conciliation; where the vulnerable receive an opportunity to express their concerns and the solutions are proposed in equal terms, offering the conflicting parts a win-win opportunity.

Physical and structural violence is inherent in the present highly competitive free market system and its present mechanisms of regressive globalization. The Socialist utopia was destroyed by a repressive and bureaucratic communist regime in the USSR. Which utopia is left to develop ethic principles, communitarian responsibility, gender visibilization and environmentally sustainable development, in order to induce a

30 Latinos during Hurricane Katrina have shown that they have learnt to deal with hazards and new threats in a preventive manner by evacuating themselves. As illegal migrants from hurricane prone countries and later the illegal crossing of a dangerous and militarized border created experiences of how to deal with dangerous situations, and how to use marginal opportunities in order to achieve goals.

‘postmodern democracy based on consensus’, with equity, real citizen representation, and quality of life?

The history of wars, domination, and destruction brought poverty and death (Boltvinik/Hernández Laos 1999; Campos 1995; Strahm/Oswald 1990); will such an emerging civilization guarantee diverse, just, equitable, and sustainable coexistence, with tasking care for the vulnerable (Bonfil 1987)? This is the challenge for scientists, peace researchers, feminists, environmentalists, socialists, educators, politicians, and actors, and HUGE has to be developed locally to find concrete answers to these new challenges (Bennhold-Thomsen/Faraclas/Werlhof 2001; CLOC 2002), but also globally to change the root causes of violence and destruction.

91 Human Security and the Governmentality of Neo-liberal Mobility: A Feminist Perspective

Thanh-Dam Truong

91.1 Introduction

Transnational migration and its implications for human security as a policy field constitute one of the most complex issues of our time. Current experiences of displacement and security span between a cyber world – characterized by hyper mobility of finance, technology, information and the ‘cosmopolitan’ values of a ‘flexible citizenship’ (Ong 1999) – and the world of human trafficking and smuggling of migrants and refugees – a mode of mobility adopted by people who cross borders on foot, by boat, trucks and planes and who are often abandoned to die when arrangements break down (Carling 2007; El-Cherkeh/Stirbu/Lazaroiu/Radu 2004; Eschbach/Hagan/Rodriguez 2001). The extant legal vacuum reflects unresolved conflicts of interest at different levels and poses a great challenge to the right to mobility as an expression of the liberal ideal of individual liberty.

Current defining of international migration – for policy-making particularly – has tended to fragment the entirety of cross-border movement as a process. This fragmentation has led to much tension between different policies and their goals – of public order, economic competition and efficiency, human security and rights. Formally defined as the “movement of persons who leave their country of origin, or the country of habitual residence, to establish themselves either permanently or temporarily in another country” (IOM 2004: 33), international migration is legally and socially differentiated, tending to reflect the ‘anatomy’ of a stratified global society¹. The last three decades have witnessed the erosion of regimes of international migration based on welfare and humanitarian concerns, and the concomitant ascendancy of multilateral initiatives in migration management guided by the logic of trade and finance, foreign policy and national security – often shifting the seat of decision-making away from labour and welfare departments (Pellerin 2004). Gender and age appear significant in determin-

ing who participates in what regime of migration and for which types of work (Kempadoo/Doezema 1998; Agustin 2003; Dølvik/Eldring 2006). Regulatory regimes tend to be shaped by labour market demands, selective preferences of states and practices of intermediaries (Lucas 2006). The demise of the Refugee Convention² has opened the scope for market-based smuggling of refugees and migrants. The implementing of anti-trafficking policy has brought to light the degree to which a given social and cultural setting is conducive to human trafficking, smuggling and re-trafficking. Reviewing the evidence Truong (2005; 2003a) points to some broader social processes that either disrupt livelihood systems (such as militarized conflict) or gradually erode their sustainability (such as unsuccessful institutional reforms, or financial crisis and capital flight).

The legal view treats differing social worlds of transnational migration as mutually exclusive categories; this chapter offers a perspective on their recipro-

-
- 1 Four bodies of international legislations are directly relevant to the mobility of people across borders. They are: (1) The Convention Relating to the Status of Refugees (1951) and the 1967 Protocol Relating to the Status of Refugees which extended the geographical scope of refugee law (henceforth the Refugee Convention); (2) The United Nations Protocol to Prevent, Suppress, and Punish Trafficking in Persons, Especially Women and Children, supplementing the Convention against Transnational Organized Crime (henceforth the UN Trafficking in Persons Protocol); (3) International Convention on the Protection of the Rights of All Migrant Workers and Members of their Families, henceforth the UN Migrant Rights Convention; and (4) Mode 4 of the *General Agreement on Trade in Services* (GATS) of the *World Trade Organization* (WTO).
 - 2 The introduction of the categories of ‘asylum seekers’ and ‘voluntary return’ in the European Union for management purposes has undermined ‘*non-refoulement*’ as the core principle of the Refugee Convention (Samers 2004).

cal implications. It draws Foucault's insights on governmentality and emphasizes the significance of thoughts underlying political discourses, practices of discipline and control over mobility. We highlight the nature of intersectional domination of gender, class and race as being contingent on a one-dimensional vision of liberty in neo-liberalism as a political rationality. We argue that a concept of human security as a project that seeks to address the daily security of the most vulnerable – of which people on the move constitute a significant group – can no longer afford to remain locked in a positivist framework of interpretation. It needs a combination of methods and a genealogical approach to the '*dispositif*' of human security³. This means probing into a historically formed ensemble of institutions, procedures, supporting knowledge and their relationships with political economy, migration and security on different social scales. Exploring the notion of 'security' in respect to 'freedom' and questioning the context of, and capacity for, social transformation would bring new lights to the exercise of power in this domain. Sensitive to relations of inter-dependency and intersectional domination, feminist theory can contribute to an understanding that does not treat different categories of security as distinctive and self-contained, but as elements in a web of mutually implicating relationships and, also, as matters of social justice systemic to global capitalism as a whole.⁴

91.2 Neo-liberal Governmentality, Gender and Culture

Foucault has contributed to analytical practices regarding the historicity of specific discourses – the concrete questions concerning the institutional complexes of power. His concept of neo-liberal governmentality – first introduced in 1979 – is an important bridge connecting analyses of micro power and the reordering of reality at the macro level. Broadly defined as a complex network of relationships between thinking and ruling, governmentality has been identified by as a shift in the rationality of the mode of governing premised on the active con-

sent of the governed to subjugation through discreet techniques of control (Foucault 1991). Understanding governmentality requires excavating the hidden elements in the definition of what '*we*' are – something entirely political and historical, reflecting both the politics immanent in history and a history indispensable for politics (Foucault 2005).

This analytical disposition provides a bridge between the study of governmentality and gender and cultural studies – by which to trace the historical production and reproduction of gendered and cultural subjects as intersecting processes shaped by movements in structures of political economy and security systems. Beckwith (2005) proposes two meanings of gender appropriate in the study of governmentality. As a category gender has multidimensional the meanings, consisting of socially constructed identities, values, conventions and practices conceived as masculine and/or feminine – often overlapping with other categories such as race, class, age and religious affinity. Gender as process is manifest in differential effects of structures and policies (seemingly gender-neutral) upon women and men, and in the codification of the meanings of 'gender' in public institutions.

Processes of the (re-)codification of the meanings of gender under neo-liberal governmentality began with what Hindess (2004) regards as the mutation of liberalism as a political rationality and what Lemke (2001) refers to as an epistemological shift on three accounts: (a) the relationship between the state and the economy, (b) the basis of government, (c) the notion of the individual. Neo-liberalism in the reigning version of the Chicago school inverts the classical role of the state from a controller of the market to an object of control by the market, based on the claim of the market being a superior organization principle. The neo-liberal political project seeks to create a society characterized by the cultivation and optimization of socially grounded differences (Lemke 2001). The basis of its government is the concept of self-government articulated through notions of 'personal responsibility' and 'self care' in an 'entrepreneurial' culture – an artificially created form of behaviour tied to rational calculation, economic prosperity and well-being in a personal and institutional sense. The meaning of freedom becomes predominated by market freedom. The aim is to reform what was considered as "the devastating consequences of public sector growth" (Sal-skov-Iversen/Hansen/Bislev 2000), change the "dependency culture" among the dispossessed (Cannan 1995) and reshape social welfare policy (Hancock 2004).

3 The French word *dispositif* has no single direct English equivalent; it can mean any or all of 'socio-technical system', 'device', 'mechanism' (Lianos 2003).

4 See also chap. 90 by Oswald Spring, chap. 89 by Serrano Oswald, chap. 92 by Perpinan/Villareal/Oswald Spring and chap. 93 by Ariyabandu/Fonseka.

The subsuming of society (perceived as an entity made up of autonomous individuals and institutions) under the market (as a controller of the state) allows neo-liberalism to link the entrepreneurial action of individuals and institutions to the rationale of governing. The social domain – *per pro* this submission – becomes encoded as an economic domain⁵ and allows a systematic expansion of what market norms address – from criminality and penal administration to development of human capital. This eventually colonizes the entire social world with criteria of economic efficiency, including that of public administration. Empirical studies on governmentality in many fields have produced rich and fascinating findings on the current structural reforms worldwide (Dean 1999; Rose 1999; Cruickshank 1999; Rankin 2001; Larner 2000; Triantafyllou/Nielsen 2001; Larner/Walters 2004). Finely-grained differences apart, a convergence of views exists on how the application of values and practices of the private sector to the public sector gradually erases a century-old tradition of distinction between the two spheres, and creates ambivalent meanings of ‘empowered’ subjects.

From the standpoint of everyday life, by way of transferring the care for citizens’ well-being as a duty of the state to ‘self-care’ as an obligation of individual entities (person, firm, family) neo-liberalism undermines the intrinsic worth of societal care as an essential aspect of human relationships in several ways. The epistemological grounding of the human subject in the market gives emphasis to his/her entry and pays scant attention to what happens to him/her before or after. The neo-liberalist concept of care omits the relational dimension between people – something feminist ethics of care insist is significant. Feminist perspectives on the ethics of care have been built on the recognition of dependence as a universal feature at various stages in the human life (infancy, illness, old age, death). Caring for dependents is a feature commonly associated with women’s social role in the family, often ‘naturalized’ in theoretical and policy discourses (Himmelweit 1999; Engster 2007). Feminist attempts to extend the social value of care beyond the family and gender relations and to provide a broader perspective on care have offered a view of care as the enactment of other responsibilities of citizenship relevant to democracy and professional practices: being concerned for one another, and the civic virtues of em-

pathy, patience and solidarity (Sevenhuijsen 1998; Baker/Lynch/Cantillon/Walsh 2004).

On the empirical level Jenson and Sineau (2001) have illustrated how the redesign of the welfare state in Western Europe over the last decades has been characterized by the demise of family values due to a mixture of forces, including feminist demands for gender equality, shifting political configurations, and changing labour markets and employment needs. Contradictory tendencies – of reducing the role of the state in the care sector while simultaneously stimulating the participation of women in the labour market (as a means for empowerment) – has led to serious care gaps (Anderson 2001; Kurian 2006; Razavi 2007). State response has, in effect, resulted in the introduction of the principle of ‘work/family balance’ – enacted through care leave entitlements (applicable to both genders) – to be arranged through the work place, and the encouragement of horizontal forms of care provision in communities. The co-optation of the feminist language of has not equalized contribution to care arrangements (Risseuw 2006; Stratigaki 2004).

The gendered reality of care remains problematic, primarily because of its time-use and commoditization – an issue omitted in the neo-liberalist equation on self-government and efficiency (Williams 2002; Baker/Lynch/Cantillon/Walsh 2004). Care in all forms requires social time, something that the market cannot accommodate unless such time is mediated through the cash nexus. The diversion of social time to cash-related activities remains guided by gendered priorities and cooperative conflict because the biological time remains outside neo-liberal reasoning – except via the family as a mode of self-government. A consequence of the emphasis on self-care and de-emphasis on dependence is the devolution of the responsibility for social care from the state to an ill-defined realm occupied by voluntary associations with competing agendas and no constitutional obligations. The market does offer care – often circumventing state regulations – to those who can afford the price, when the family and community fail. Niches of market-based care provision as a commodity have emerged and been incorporated in global circuits of labour and production (Sassen 2000; Parreñas 2001; Hochschild/Ehrenreich 2002; Tyner 2004).

Turning to post-colonial societies, an establishment of the state along Western lines has taken different courses. In some social formations – such as the ‘developmentalist’ states in East and South East Asia – the family remains crucial, in the early stage of industrialization, in facilitating flexible accumulation, re-

5 In other words the notion of ‘society’ becomes equated with the notion of ‘market’.

gional and global competitiveness. High growth rates achieved through labour discipline have forged a four-tier system of industrial work. The first is the waged earner, normatively male under a formal wage system with social protection. The second is the casual worker, normatively female and confined to temporary or part-time contracts, piece rates and irregular work without protection. Such norms can be applied irrespective of the gender of the worker. The third is the dependent housewife – responsible for care work, nurturing and maintaining the workforce – who may or may not combine her unpaid care work with paid work⁶. The fourth is the paid ‘reproductive workers’ who take up sexualized services in prostitution and entertainment, or domestic service (Truong 1999). Semi-formalization of work in commercial sexual services and care provision arose in parallel with the growth of a consumer society (Lim 1998, Chin 1998; Li/Findlay/Jones, 1998; Chang/Ling 2000). These trends in consumption in high-income countries have led to the formation of intra-regional and international networks of labour transfer to meet demands. Increased use of private domestic services by double-income middle-class families has become the rule rather than the exception. The expansion of commercial sexual services – originally contingent on military bases of the United States – has transmuted such services into a sex business supporting tourism as an export-oriented industry.

In fragile states – as in parts of Sub-Saharan Africa and countries in transition from state-led communism to a market-led form of governance – the harshness of the neo-liberal discipline is manifest in the growing social polarization, poverty and the collapse of local care systems, affecting mostly the young and elderly (Holzner/Truong 1996; Truong 2005). The experiences of transition and structural reforms in the greater majority of countries in Central and East Europe and Sub-Saharan Africa indicate a different articulation of neo-liberal governmentality – premised on the disciplines imposed by international financial institutions, requisite for integration in the competitive environment of the global market. This has produced new regimes of insecurity in a continuum of unjust social structures leading to a crisis in the social reproduction process. The prolonged economic and social destabilization of these regions has induced massive

population movements and facilitated the formation of trafficking and smuggling networks, targeting those eager to search for a secure life space (Hughes 2000; Kligman/Limoncelli 2005; Keough 2006; Adepoju 2005a; Brachet 2005).

A shift of incentives in resource allocation based on price – and without due attention to the ways in which care relations and sexual relations are organized – has undermined the care systems based on traditional norms of kinship, friendship and neighbourhood. The consequence has been a strengthening of market norms in commercial sex. A serious structural distortion of values has occurred: work in the sex sector yields higher returns than in the care sector. An alteration is occurring in conventional patterns of livelihood: many women who migrate in search for respectable work must accept the provision of sexual services with stigmatization as the mean to provide for both themselves and their loved ones (Truong 2003a, 2003b).

Neo-liberalism has obliterated classical liberalism’s construct of the ‘free’ agent as inclusive of economic, social, political and cultural interests. It limits the concept to the basic ability to compete, accordingly narrowing the measures of individual choice and personal empowerment. While classical liberalism and state-led socialism did offer political projects inclusive of family security under the rubric of welfare – though often containing latent repressive structures – neo-liberalism offers post-colonial and post-communist societies a notion of an ‘entrepreneurial self’ based on risk-taking and irrespective of the social location in a stratified global society. The spread of neo-liberalism worldwide, plus its interactions with local forces, have contributed to the formation of locally specific versions of political rationality⁷ in which context the construct of the new ‘subjects’ of mobility (as having agency) and the interpretation of choice (autonomous or forced) must be analysed.

6 Under certain current conditions (job losses, pursuit of further education, international migration) the dependent ‘housewife’ has become de-gendered: a new category of househusband has emerged.

7 These may range from a rationality that sees the dependency on migrants’ remittances as an efficient means to solve national fiscal burdens or redress the decline of foreign investment, or the dependency on the trade in narcotics, small arms and organized crime to maintain the apparatus of state-security.

91.3 Countering Neo-liberalism: Human Security as a Political Rationality

The representation of human security as a field of intervention first emerged in conjunction with concerns for ethics in resource use in development activities. Within the disarmament and development nexus Ul Haq (1995) queried the ethics of those governments which gave budget allocation to armaments priority over provision of milk for children. 'We need today a new concept of human security - reflected in the lives of the people, not in the weapons of their countries' (Ul Haq 1995: 116). He posits that switching spending from military to development activities constitutes an ethical action which all governments should be encouraged to pursue. In an endorsement of the neo-liberal principle of individualism he argues that channeling resources in the direction of human development - enhancement of human capabilities - would contribute to a levelled playing field; one which is currently made uneven by factors of class, gender, ethnic and religious affinity. An improved degree of human development will *ipso facto* lead to better economic performance by developing nations and a more healthy competition in the global market.

Since this intervention the concept of 'human security' has been subject to new debates from various angles. Rather than treating peace and war as binary opposites Thomas (1999) views the proliferation of forms of human insecurity since the 1990's (such as intra-state violence, forced migration and environmental destruction) as the result of a newly polarized global social structure. She regards the worldwide neo-liberal reforms in the 1980's and 1990's as a phase of transition of capitalism - from national to global - which has generated new forms of human insecurity and for which collective responses are required. In her view an improvement in human security cannot succeed if based on neo-liberal individualism, which she defines as the problem rather than the solution. Her way of resolving the human insecurity question would involve a reining-in of the neo-liberal ideology at global level along with fostering collective efforts to protect vulnerable groups and improve their human development - *per pro* a rights-based approach to extant political systems.

Lodgaard (2001) sees the links between state security and human security as a matter of legitimacy. Failed states, he suggests, are states that no longer provide effective governance; nor, therefore, adequate human security. His view on human security is based

on the rule of law, public order and peaceful management of conflicts. To maintain its legitimacy the state has to comply with an expanding body of international law that seeks to provide - from a plethora of rights-platforms - protection of citizens from torture, arbitrary arrest and detention, gender-specific violence, child abuse, mishandling of refugees, organized crime and the results of armed conflict between factions within a state (Lodgaard 2001: 3-7). He places the concept of human security within the framework of governance, wherein it is defined as the daily security of groups of people vulnerable to violence during conflict situations. Ensuring human security is, to him, a matter of identifying and targeting problematic states; then protecting groups of people living under conditions generated by a failure of governance. Lodgaard considers policies for security (state as well as human) as being future-oriented, and therefore the basic objective should be prevention of human instigated violence. The concept of human security in his view should be narrowed down to direct and personal violence (Lodgaard 2001: 8). Global economic disorder as does not appear very prominent in his argument. He places economic security in the definitional boundaries of human development, which he believes cannot be mixed with human security. This position is backed by a nine-point agenda of the Human Security Network which is a group of like-minded countries: Austria, Canada, Chile, Costa Rica, Greece, Ireland, Jordan, Mali, the Netherlands, Norway, Switzerland, Slovenia and Thailand; South Africa is an observer. This agenda covers land mines, International Criminal Court, Human Rights, International Humanitarian Law, women and children in armed conflict, small arms proliferation, child soldiers and conflict prevention. Feminist scholars have argued that the human security discourse must consider everyday experience of security and cannot ignore the gendered nature of the state, civil society, market and the structural tendency for power differentiation (Blanchard 2003). Ensuring human security requires a process of transformation of values, conventions and practices sensitive to the intersection between different forms of social vulnerability derived from overlapping identities.

From the perspective of societies in Asia affected by the 1997 financial crisis and subsequent economic meltdown, the experience of human security depicts a vision of inter-connectedness rather than compartmentalization. Human security policies must strive beyond protecting human life in conflict situations and encompass such objectives as ensuring the survival and dignity of families and individuals (Acharya

2001).⁸ This view is also echoed by Amartya Sen (1999) in an approach to development policy, which he labels “development as freedom”. He brings out the indivisibility of the three ‘generations’ of human rights (political, socio-economic, and cultural) and provides empirical illustrations for the causal relationship between freedom and human flourishing, and that between the absence of freedom and misery.

East and Southeast Asia’s experience of the social and political impacts of the financial crisis does reveal a reality of human security that is systemic rather than compartmentalized. In the aftermath of this crisis these societies experienced the effects of a downward spiral of economic failure. At one level the crisis has set back the high performance in human development achieved through previous years of growth and investment, causing new forms of poverty and re-enforcing old forms (Lee 1998; Truong 2000). The rise in communal violence, illegal migration, human trafficking and organized crime in the region – as exacerbated by the economic downturn – has brought to the fore the inter-state character of human security.

Against this backdrop governments and civic groups have become increasingly aware of economic and societal security being more than just assured income and physical protection for particular individuals and groups. The experience of the Asian crisis shows that human insecurity in daily life can be the result of economic insecurity that intensifies both inter-community competition and personal insecurity. Violent responses for self-protection or self-enhancement have gone as far as annihilating the ‘Other’ and in consequence generated a process by which different identities – religious, gender, ethnical – one by one became an object of attack and a rallying point for oppositional politics and violence which can spread like bush fire, quickly spilling over to new issues and new states.⁹

8 Statement by Director-General Yukio Takasu at the International Conference on Human Security in a Globalized World, Ulan-Bator, 8 May 2000; at: <<http://www.mofa.go.jp>>.

9 Religious tension in Indonesia initially erupted between Muslim Indonesian and Christian Chinese, initially targeting Chinese women as objects of sexual violence. Gradually, all women including Muslim women became the epicentre of male violence. The attack on Bali in October 2002, and threats of similar attacks in tourist resorts in Thailand allegedly linked with Al Qaeda, reveal the weakness of a secular approach to human security which ignores how the constructs of religious identity can seed acts of violence.

Security policy (state and human) cannot but take serious notice of issues such as structural inequality, unstable economic systems and identity politics. To follow Lodgaard’s definition of the objective of security policy (state or human) as prevention, the experience of the Asian crisis tells us that prevention strategy does not concern only ‘problematic’ states nor just the violation of rights of groups of people living under ‘problematic’ conditions. Prevention must also be concerned with the ‘problematic’ environment of the global political economy, characterized by the ease of capital mobility that can abruptly destabilize the performance of economic systems and the livelihoods of populations. The issue is not just a matter of the failure or legitimacy of individual states; the failure of neo-liberalism as an economic doctrine is also an issue (Stiglitz 2002).

Placed in its original context of development ethics, the equation in the human security framework would extend beyond the choice between armament and human development to cover the choice between a widening of economic liberalism and improved social protectionism. To rephrase Ul-Haq’s equation, we need to fashion the concept of human security so that it is reflected not just in the fluctuation of our stock exchange, but as well in the consolidation of harmony and cooperation between different communities in society; appropriate locally-rooted social arrangements can assure income and protection for the most vulnerable, particularly in times of economic distress.

The cultural politics of resistance, which insist on the recognition of differences, have tended to overemphasize the bearings of history and to offer no alternative referent for what constitutes the human being when undressed of history and culture. Such politics have adopted a socially-embedded approach to ontology based on a definition of a self, having knowledge and action, encumbered by historical bearings (gender, race, colonial and post-colonial experience). By this approach an attempt is made to *integrate experience, insight and the contentions of particular social groups – deprived of recognition and respect by wider currents of social interaction – into alternative visions of egalitarian politics. There is resistance to assigning a standardized definition of the human person. This seems to stem from the collective awareness of how variants of biological reductionism have historically justified social domination on the basis of gender and race (Sayers 1982).* Regrettably, this resistance has also rather made a vacuum of the political arena. There is a shift towards cultural reductionism or a line of argument characterized by an over-emphasis of the role of

culture. An absence of consensus on what constitutes 'culture' led to a neo-liberalist form of pluralism by which the idea of multiculturalism has become nothing more than "a vague metaphor for a coalition of separatisms" (King 1996: 18).

Advocating the diversity of identity without a core referent runs the risk of discontinuity in the search for sameness as an intellectual and social project. A socially-embedded approach to ontology for the purpose of psychological emancipation and the political empowerment of disfranchised groups shows its limits when unable to recognize the human being (female or male, coloured or white) beyond the cultural subject. The stress on uniqueness of specific groups and difference from other groups has led to inward turns among cultural movements based on identities (Giri 2005). In a conflict situation the assertion of uniqueness and rights can become internally repressive – more concerned with the collective identity than individual members, irrespective of intra-group domination – or externally destructive – capable of fuelling cleansing campaigns once identities become intertwined with issues of material power (such as resources and territoriality).

Against this background 'ontological insecurity' may be considered a two-dimensional problem: simultaneously psychosocial and historical. At this juncture the issue is what art of government best assures ontological security, resolves cultural conflicts – as problems of overt as well as discreet processes of domination – and addresses intersectional discrimination. The ethical equation in human security may then be framed as a choice between 1) plurality of standpoints amongst the cultural subjects, and 2) a common referent which recognizes capability and vulnerability as two sides of human nature, and values practices of epistemic humility. A new conduct of knowing and valuing is much needed to allow reciprocity to rule together with autonomy under the overarching framework inter-connectedness.

91.4 Conclusion

Neo-liberalism has created a new style of governance. Economic values are more and more inscribed in the social domain without a corresponding inscription of social values. The emancipation potential of the new market-led society is fragmented; it is also effectively foiled by concepts of self-government and citizenship where there is no effective state as an equalizer. The key political question for codes of human security to

include the protection of people on the move is how to address the now obsolete but still affective demarcation between the 'domestic' (self) and the 'foreign' (distant others). Processes of global production, reproduction and consumption have intertwined 'self' and 'others'. There is need for new concepts capable of addressing the transnational nature of misery and wellbeing.

Foucault's insight on a historical conception of the art of government may help to fulfil the task ahead: to assess the philosophical underpinnings of human security and also the strength of the historical and ethical forces invoked. An art of government that seeks to promote human security as a means to global peace cannot avoid a dialogue on the cross-cultural concepts of compassion and autonomous spiritual capability to appreciate the inter-relatedness of being, having and loving – as well as the reciprocity involved¹⁰. These are significant human qualities (unfortunately overwritten by self-centred rational calculation) that can transform mutual negation into mutual recognition.

10 The term compassion in Buddhism is inclusive of meditation as a set of practices that promotes what is called *prajna* or penetrating insight. In this regard compassion cannot be taken as a given; it is a form of knowing that can be released through the will to discover inter-being.

92 Gender Security in South East Asia and Trafficking of Children for Sexual Exploitation in Central America: HUGE Security Challenges

Mary Soledad L. Perpiñan, María Eugenia Villarreal and Úrsula Oswald Spring

92.1 Introduction¹

Confronted with new risks and threats due to climate change; scarce and polluted resources; poverty in Africa, Asia and Latin America, increasingly survival lies in the hands of women (Oswald 1991). Military, political, economic, social, and cultural challenges are menacing the precarious life conditions and livelihood of the majority of human beings, and thus create insecurity for the people who aim at both 'freedom from fear' and 'freedom from want' (Brauch 2005, 2005a, 2008a, 2008c).

The central question of this chapter is how do women analyse and survive in very specific deprived situations in South East Asia and in Central America? How is the global unsecured environment triggering the subjective situation of threat for women and children, especially when transnational crime is promoting child trafficking for sexual exploitation? To answer these questions, the chapter uses a wider approach to 'gender security' (chap. 90 by Oswald; also Oswald 2001, 2007, 2007b, 2008a). It discusses how threats affecting women and children are resolved collectively by women and marginalized

groups, relying on their own capacities. This can enhance a holistic gender security approach, where often human and environmental security is also involved.

After a few theoretical reflections (92.2), two case studies on gender insecurity (Dore 1997; Dore/Molyneux 2000) will follow, one on South East Asia (92.3) and the other on Central America (92.4). While the first case study is based on participative research (Oswald 1992) the second reviews the trafficking in children for sexual exploitation in Central America. This is not only a challenge for human and gender security, but also for institutions and international organizations. While 'gender' in a narrow sense refers to roles given to men and women, the term 'gender security' focuses - from a narrow perspective - on how women view security, and what issues affect their sense of security and - from a wider view - how new human security challenges impact on the most vulnerable: women, children, elders, indigenous people and minorities (chap. 90 by Oswald).

The first case study on South East Asia conceptualizes security from the perspective of grassroots women based on Paolo Freire's (1974, 1974a, 1998, 1998a, 2000) '*Conscientizing Inquiry*', while the second case study on Central America reviews the social vulnerability of children, above all of girls and women to pornography and the sex trade, in contexts of post-war poverty and organized crime.

In the conclusions these human and gender security challenges are integrated, combining a bottom-up perspective with a top-down legal support through international conventions and national laws that should support gender education and the empowerment of women. This mutual support should enhance achieving human security as 'freedom from want', offering women conditions to live in dignity. Simultaneously it counters the root causes that impede their longing for 'freedom from fear' based on transparent international, national, and local police and judicial

1 This chapter is a collective work of three peace researchers on gender security, related to sexual abuse through child and women trafficking and women in war and in post-war as well as in unstable political situations. M.S. Perpiñan supplied the empirical data from Asia and M.E. Villarreal those from Central America. Ú. Oswald integrated the chapter with some theoretical and methodological reflections that are relying on a wider concept of gender. It includes also children, old people, indigenous and other minorities. This text has been carefully edited by Hans Günter Brauch who added boxes 93.1 and 93.3 and the three maps to enhance the understanding for readers from outside the regions analysed in this chapter. The authors are also very grateful to Ronald Lappin for his efforts to improve the English of three non-native speakers.

systems that efficiently combat organized crime and related money laundering and drug trafficking.

92.2 Some Theoretical Reflections

The term 'security' has too long been confined to 'national security' and only slowly entered *human security* (HS). When anthropogenic effects on *global environmental change* (GEC) were scientifically analysed and based on comparative empirical material, the *environmental security* (ES) concept evolved (chap. 59 by Dalby/Brauch/Oswald; Brauch 2003). GECHS and UNU-EHS have analysed the interrelation between HS and ES, but until 2007 they have not discussed the gender dimension (Oswald 2008a). Nevertheless, "violence against women and girls is a problem of pandemic proportions. At least one out of every three women around the world has been beaten, coerced into sex, or otherwise abused in her lifetime - with the abuser usually someone known to her" (UN GA 2006). This violence is not only a perverse human rights violation, but it devastates lives, creates future insecurity as a result of rape, it fractures families, communities, and takes lives and undercuts development. Nevertheless, it is interesting that gender security is still in an incipient process of theoretical consolidation (Hoogensen 2008; chap. 89 by Serrano and chap. 90 by Oswald).

Gender violence is part of the systemic discrimination, exclusion, and exploitation of women and girls. It is still a covert aggression, happening mostly within families. It is often socially accepted and sometimes promoted in the form of sex trade and pornography. The origins of this brutal and subtle discrimination are complex, and related to the identity process of gender construction. The term discrimination is understood as harmful as well as an unfair treatment of a person or a group, based on prejudice. Thus, discrimination is based on 'rejection processes' of the other, emphasizing critical attributes such as gender, sex or race among the most visible processes. Indirect discrimination occurs when apparently through neutral behaviour special groups get disadvantaged and are obliged to justify their legitimate aims and the means to achieve them (Argentine NGO 1995).

The complexity of daily life often induces people to identify themselves with the ideology of a group and to reject the other. This often creates stereotypes of how to think, to believe, and to act (free market ideology inducing development aggression). Thus, a system of values, ideas, beliefs, and practices underlies

discrimination and insecurity. It is acute and discerning, able to oversimplify complex life situations. In a discriminative behaviour mind and action can be distinguished. People who discriminate derive both emotional and material benefits, also understood as malice (IFRC-RCS 2007). It establishes and uses cultural stereotypes such as race or colour for justification. Gender discrimination is probably the most common, where the differences and behaviours based on gender discrimination were socially constructed during more than five thousand years (Oswald 2004), and are taken for granted by almost every society worldwide.

To answer the key question an integrated concept of *human, gender, and environmental security*: HUGE (Oswald 2001, 2004, 2007 and chap. 90 above) is proposed. It relies on a broader gender concept that includes, besides women, other vulnerable groups such as children, elders, indigenous and other minorities, with a human-centred focus on environmental security challenges as well as on peacebuilding and gender equity. It is a concept that analyses different levels, social relations, and identity processes, but proposes also policy tools from both top-down and from grass-root levels. The two empirical studies explore the policy part. South East Asia starts from a bottom-up empowerment process, while the case of Central America's child trafficking requires top-down international tools to deal with organized transnational crime and pornography.

Both empirical cases have as background situations of wars, internal conflicts, economic crises, disasters, and other social disruption. During this conflictive times social networks often get disrupted, and structural discrimination such as poverty, undemocratic power structures, and behaviour of neglect become manifest (IFRC-RCS 2005), increasing the existing social vulnerability of these groups. Often, it is triggered by long-term emergency situations such as famine, physical or sexual violence, water scarcity and pollution, economic crises, cast and class behaviour. It reduces efficiency of preventive actions, restricts aid during an emergency, and limits holistic development processes. It also facilitates criminal behaviour such as sex trafficking and pornography.

Rape in war has reached epidemic proportions.² Militaries, militias, men carrying arms, governments and non-state actors, neighbours, trusted leaders and men in position of power have all perpetrated violence against women and girls in times of conflict and displacements. Although rape, sexual assault, sexual slavery, forced prostitution, forced sterilization and forced pregnancy are crimes under national and international laws, the

guilty commit these crimes with complete impunity. The international community is doing too little to protect women and girls from these heinous acts (Egeland 2007: 8).

Reproductive health is a very sensitive issue for women. Each year 35,000 women and babies die in Nepal alone due to unsecured conditions of birth and neonatal management (IFRC/RCS 2006). In Afghanistan each 20 minutes a woman dies due to insufficient health services, the second highest rate of maternal deaths in the world³ that is only worse in the war-prone Sudan. These data show how governments are neglecting half of their population, as a result of patriarchal structures.

Sex trafficking is related to *gender-based violence* (GBV) as part of “extensive domestic violence, early/forced marriages, wife inheritance, property ownership, child custody, arbitrary incarceration, female genital mutilation and sexual harassment and assault” (Elia 2007: 39). Women remain invisible and often girls escape from domestic violence, take revenge, join partners and have been recruited by force in guerrilla movements. As women combatants “they have transgressed traditional gender norms and for most the prospect to return to their families is out of the question. ... [They now live] in Bogotá and Medellín, anonymous urban environments which offers them some small degree of security” (Schwitalla/Dietrich 2007: 58).

During emergencies and hazards, among the vulnerable people women are the most vulnerable. After the tsunami of 25 December 2004, in the Aceh Besar district, the surviving men outnumbered the female population with a 3:1 ratio (Oxfam 2005); in a case study from Sri Lanka women represented 65.3 per cent of the dead (Birkman/Fernando/Hettige 2006); “while there is no gender disaggregated information

available on the Kashmir quake casualties of autumn 2005, there are reports... [that] more women and children died [rather] than men” (chap. 93 by Ariyabandu/Fonseka). Both authors found that women in traditional societies did not get any first aid training, were never taught to swim due to cultural taboos, stayed inside their houses, and did not get any early warning. When they perceived the danger, their social identity of career obliged them to save lives at the cost of their own.

Gender discrimination also refers to different social treatment and life opportunities that are based on sex, including different connotations of values which change among cultural contexts. However, in most societies a married woman’s civil identity is now covered by her husband’s. In many parts of the world, irrespective of the property women bring into marriage, they are often segregated within the family, and due to lower wages women remain dependent on men. For professional and better trained women the barriers for upward mobility and better pay are often limited by the ‘glass ceiling’. Worldwide only 14 per cent of women are represented in parliaments and only 11 per cent have been in a ministerial or sub-ministerial post. Niger had only one per cent of women in parliament and in the Sudan there was no female minister. About 61 per cent of women between 15 and 64 are in the labour force but 86 per cent of men. However, in the manufacturing sector in Sri Lanka their salaries equal 85 per cent, in France 79 per cent, in Mexico 71 per cent, in Brazil 54 per cent, and in Bangladesh 50 per cent of the wages for men (UNSTAT 2006).

Thus, social representations are the root causes of any gender specific performance (Serrano 2004 and chap. 89 above). The traditional role assigned to women is to be a housewife who cares for children, family, old people, including domestic animals and orchards. This was one of the reasons during the tsunami disaster why women were inside their houses, busy with domestic work. The self-identity acquired by women, their social pressure, and life-learning processes have internalized a role of career for the others. They become morally self-obliged to be concerned with all family members and their livelihood. Small babies and children require this gift-giving from mothers. In a moment of risk or crisis, their first reaction is to save their children, elders, handicapped and domestic animals, often at the cost of their own life.

Similarly a man may reach the highest level of honour by offering his life as a hero for the ‘fatherland’; a woman gets her sublime self-realization by giving her life for others in a silent way. Thus, a widened under-

2 Obaid (2007: 5) reported some 40,000 cases of war-related rapes in Bosnia and Herzegovina: “In Rwanda, 39% of women surveyed reported being raped during genocide and in one study, two in three women who were raped were HIV-positive. In Burundi, 19% of a sample of women reported being raped.” The bodies of women are getting more and more transformed into battlefields (Rehn/Johnson 2002). Their reproductive organs are destroyed by machine guns. Forced pregnancy during ethnocide conflicts is frequent, such as violent abortion to reduce ethnic reproduction.

3 Due to gender discrimination, a buffalo is valued higher than the life of a woman, and money is often used to increase livestock instead of bringing a woman to a hospital during birth complications. Furthermore, hospitals are very rare and normally far away from rural villages.

standing of security is not only theoretically attractive, but also necessary to overcome the narrow focus of security related to military violence, and gender discrimination and aggression.

Finally, the methodology that was used in conducting the grassroots workshops was influenced by Paulo Freire's '*conscientizing inquiry*'. It refers to his methodology of having the people themselves researching their daily life and questioning the root causes of their situation of poverty and marginalization. This type of research enables them to seek the answers and thus to be enlightened during this process. The term is derived from 'conscientization', a type of learning that permits to understand the social and political contradictions in which people are living. Through the process of understanding, collective actions against oppressive elements can be taken. This learning process also places people in a direction of feasible alternatives that is able to change their longstanding situation of poverty through collective organization. In this sense, the transformation of real life conditions can be understood as a process of liberation. With their proper actions the involved people get 'freedom from fear' when they improve their life conditions with an economy of solidarity and cooperation. They also get 'freedom from threat' by collective organization and concrete actions against oppression (Freire 1974, 1974a). Later, the same author, when he was confronted with neoliberal globalization and mass media manipulation and consumerism, pointed to a global loss of hope and resulting depression. His last book in 1998 was '*Pedagogy of Hope*'.

In Brazil and Latin America his pedagogy was reproduced in diverse workshops, and is one of the key elements of the success of the *Movimento sem Terra* (MST), a mass movement of landless rural workers with an affiliation of more than 3 million persons. MST today produces three of five basic food crops for the biggest country in Latin America. The methodology of learning through the proper concrete experience is also being used in Africa and Asia.

It is a technique that transforms the male-oriented and supposedly neutral scientific enquiry (Bordo 1990; Lloyd/Duveen 1992; Harding 1986, 1988, 1991; Harding/Hintikka 1991) into a complex social analysis of daily life of exclusion and oppression. The concrete situation of daily life is no more an abstract object of research. Explored by grassroots participants, they become subjects of their own transformation, when they understand the origin of the problem and seek for collective solutions. Their active involvement strengthens the cooperation and reinforces the soli-

arity among the affected. The culture of silence and abuse of those in the lower ranks of society - especially women - is broken, when the marginalized are given respect and space to voice their opinions. This process improves their 'empowerment'.

This participative methodology is often reinforced with group dynamics and the consolidation of groups of economy solidarity. Today, more than one third of Latin American's GDP depends on this type of self-employed economy.⁴ It is able to articulate the productive activities at the local level and redistribute scarce resources at decent prices for marginalized communities. This permits vulnerable groups to ensure their food sovereignty and livelihood with dignity and perspective for the future (chap. 33 by Oswald). It enhances the cultural seed capital for freedom, empowerment, and liberation.

92.3 Field Work and Case Studies on South East Asia

Freire's '*conscientizing inquiry*' was employed in several peacebuilding workshops in South East Asia. They dealt with: a) displaced indigenous women of the Cordillera, in northern Philippines; b) Burmese refugees in a Thai camp along the Burmese border; c) the urban poor of Phnom Penh, Cambodia; d) the rural poor of Siem Reap, Cambodia; e) the Lumads (Manobos and Banwaon tribes) of Agusan del Sur, Mindanao; f) with Muslims, Christians, indigenous peoples from conflict-ridden areas in North and South Cotabato, S.K. Pendatun, Maguindanao, Sultan Kudarat, Sarangani, General Santos City, Mindanao; and g) with Muslims in Marawi City, the Islamic city of the Philippines (93.3.1).

The second part takes up some of the issues that have contributed to create fears and insecurities for marginalized women, such as aggressive development, armed conflict, and military juntas, in the aftermath of the killing fields, neo-colonialism, Muslim law, militarization, and US military presence, and the process of consciousness-building for women (93.3.2).

4 It integrates chains of micro-businesses, where saving practices, productive and trade activities are interrelated and directly in the hands of poor people. This process avoids intermediaries and thus the profit remains within the productive sector.

Box 92.1: Conflicts in South East Asia Affecting the National, Human, Gender, and Environmental Security of the countries and their people. This text was written by Hans Günter Brauch.

During the Second World War (1942–1945), South East Asia was the battlefield of the war between Japan and the Western allied powers, many of them were colonial countries (UK, France, USA, and the Netherlands). After the wars of liberation against their former colonial powers and obtaining independence, this region experienced with the Vietnam War one of the longest, most violent, and cruel proxy wars between the USA and the Socialist world (Soviet Union, China, North Vietnam).

In this region these conflicts and their impacts can neither be fully understood from a narrow military, political, and national security perspective of the major external country (the United States of America) nor of the states and regimes in the region. This narrow military security perspective using simplistic models and explanations (domino theory, geopolitics, and geostrategy) ignores the long-term impact of the Vietnam wars (of liberation against Japan and France and of North Vietnam against South Vietnam, the USA and its allies).

The HUGE approach (chap. 90 by Oswald) to security analysis widens the scope of analysis to the perspective of and impact on human beings and victims in the region ('human security') who did neither achieve 'freedom from want' nor 'freedom from fear' and who were not given the 'freedom to live in dignity (Annan 2005), nor did the most vulnerable and marginalized poor people in the region experience a 'freedom from hazard impact' (Bogardi/Brauch 2005; Brauch 2005, 2005a).

During World War II and the Vietnam War, as a result of the many wars and conflicts in this region over the past 70 years and the massive military presence of first Japanese and allied troops and later of French, British, US and allied soldiers, many poor women in the region were forced to become 'comfort women' for the Japanese soldiers, or later 'sex workers' for US and other soldiers, and often 'sexual slaves' to serve the sexual needs of millions of foreigners – coming first as soldiers and after the war as tourists, and thus creating a demand that was increasingly satisfied by organized crime networks. The 'gender insecurity' and the crimes against the dignity of these victims is a direct side effect of the geo-strategic power plays that were legitimized with the requirements of the 'national security' of external powers, be it by the regional 'colonial powers' (Britain, France, the Netherlands), the 'occupier' (Japan) or the 'liberator' (US and its allies supplying troops).

This massive use of military force and the employment of cruel weapons – in the name of peace and national security – did not only negatively affect the 'human' and 'gender security' of its people, it also became a testing ground of a crime against 'environmental security'. The massive use of herbicides (Agent Orange, Agent White et al.) by US troops and their allies had also long-lasting effects on the environment in Vietnam, Laos and Cambodia, and on the food chain affecting directly the human security of both the victims and their children in the region but also the soldiers and their offspring who were ordered to use these weapons (Westing 1972, 1976, 1980, 1984, 1989, 1997, 2000; Brauch 2000b, 2000c).

The HUGE approach that has been suggested and developed by Oswald (2001, 2007, chap. 90 above) widens the scope of security studies and puts the victims (human beings, women, children, old and indigenous people as well as minorities) but also the damaged environment on both the scientific agenda of 'security analysis' in international relations (Baylis 2008), in security studies and in peace research (Albrecht/Brauch 2008) but also in international law (Bothe 2008) and even in philosophy (Coicaud 2008), but hopefully in the future also of international relations and of international judicial bodies such as the International Court of Justice and the International Criminal Court in The Hague. This HUGE approach may enable both to sue the countries committing these crimes against humanity and bring the responsible politicians to justice. However, from the latter perspective, this HUGE approach may be perceived as a threat by those politicians responsible for committing these acts and for the elites in the respective countries supporting them and benefiting from their outcomes.

The *Uppsala Conflict Data Program* (UCDP) offers a comprehensive list of both minor internal and international conflicts and wars that were fought on the territory of the ten countries of South East Asia between 1946 and 2005, and that cost the lives of millions of people.⁵ However, the most devastating and costly conflict was the Vietnam War (1961–1975) that affected the territory of North and South Vietnam, Laos and Cambodia, and indirectly also the neighbouring countries, especially Thailand. According to estimates of the *US Civil War Center*⁶, as an American war, the Vietnam War involved some 8,744 million Americans who were fighting there, of whom 47,369 persons died in combat, 10,799 died otherwise, and 153,303 were wounded. This American war cost 111 billion current US dollars or 346.7 billion real US dollars (base of 1990). According to another source, this war "cost the United States 58,000 lives and 350,000 casualties. It also resulted in between one and two million Vietnamese deaths".⁷ The total cost and impact of this major war during the Cold War era on the human, gender, and environmental security in South East Asia may never be fully estimated. However, after the end of the Cold War all ten countries became members of the Association of South East Asian Countries (ASEAN), thus permitting closer cooperation within the region (chap. 79 by Othman).

5 This list of armed conflicts may be directly accessed at: <http://www.pcr.uu.se/publications/UCDP_pub/Conflict_List_1946-2005.pdf>. A survey of the other sources of the *Uppsala Conflict Data Program* (UCDP) is at: <<http://www.pcr.uu.se/research/UCDP/>>.

92.3.1 Peace Building Workshops

During several peace and security workshops, organized by the *Catholic Office for Emergency Relief and Refugees* (COERR), activities such as ‘dreams of peace’, followed by ‘transformative action’ and concrete plans to replicate the workshops in the respective communities of the participants reinforced ‘trauma healing’. It opened the way for self-reliant and situation adapted solutions that enhanced the conditions of daily life for women. In terms of human security they improved their livelihood, and in terms of gender security they found support and created a special collective group or community security.

92.3.1.1 Displaced Indigenous Women in the Cordillera of the Philippines

After the Fourth World Conference on Women in Beijing (1995), the *Third World Movement Against the Exploitation of Women* (TW-MAE-W), in partnership with the *National Commission on the Role of Filipino Women* (NCRFW), conducted a peacebuilding workshop in Baguio City, Philippines in 1995. This was attended by indigenous women from the mountain province of Benguet who had been displaced from their ancestral land because of development aggression.⁸ They were then living as squatters in the mountains of Pacdal where they experienced many threats to their human security, lacking jobs, housing, food, and money to send their children to school. Furthermore, their environmental security was threatened by open-pit mining with hazardous emissions, which has been dangerous for their health and biodiversity. One outcome of this workshop was the decision of the group to meet regularly and get organized to engage in transformative action to improve their livelihood.⁹

8 It refers to the bad effects of the so-called development such as mining, logging, and dam building that trample on the rights of indigenous peoples to their ancestral domain and cultural heritage. “Development is development aggression when the people become the victims, not the beneficiaries; when the people are set aside in development planning, not partners in development; and when people are considered mere resources for profit-oriented development, not the center of development. ... Development aggression violates the human rights of our people in all their dimensions – economic, social, cultural, civil and political” (The Philippine Alliance of Human Rights 1996).

92.3.1.2 Burmese Refugees in a Thai Camp

The *International Office of Migration* (IOM) in cooperation with COERR and TW-MAE-W held a workshop at the border of Thailand and Myanmar in the Mae Sot district where Mae La, the largest Burmese refugee camp with 30,000 people, was located. The Karen tribal women had escaped the military rule after experiencing life as fugitives in the jungles. They role-played the dangers they had experienced. By building their ‘dream world’, they discovered that they had found security in the refugee camps. Four out of the five groups built villages that had everything in place – houses with gardens, a school, church, meeting hall, and infirmary – practically a replica of the camp. One group showed the rugged terrain of a Burmese landscape with winding paths and a forest. For them, going back to the land of their birth was their dream, which was worth pursuing at the price of all insecurities.¹⁰

92.3.1.3 Urban Poor of Phnom Penh

One of the poorest countries in the world, Cambodia, was emerging in 2003 from the remnants of the ‘killing fields’. In spite of all foreign aid and the presence of many international NGOs who are there to help, most Cambodians still live in dire poverty. Community organizers and grassroots leaders living in the slums took part in a peacebuilding workshop. The participants began by choosing a theme song ‘O Cambodia’. They danced and sang to the melody with lyrics depicting rustic images of peace and security. This reflected their romantic longing to overcome the nightmare of genocide, systematic torture, and starvation under the Khmer Rouge. Among the very poor were the Vietnamese settlers who lived in shanties on stilts by the waterways.

Their answers to the question ‘when do you feel secure?’ were given in the negative sense: no war, no kidnapping, no poverty, no robbery, no drugs, no

9 More funding for another research project would be needed to assess the impact on the lives of the participants and subsequent actions taken. However, after the Baguio workshop, the displaced women of Benguet who squatted in the hillsides of Pacdal, Baguio, organized themselves and focused on economic security by opposing the open-pit mining.

10 More funding for another research project would be needed to assess the impact on the lives of the participants and subsequent actions taken. The Karen refugees in Mae Sot undertook efforts to reach the other women of Camp My Lai.

Figure 92.1: Map of South East Asia. **Source:** This map provided by Relief Web on 24 January 1997 is in the public domain; at: <http://www.reliefweb.int/mapc/asi_se/reg/seasia.html>.

gangsters, no terrorists, no corruption, no domination, and no conflict. The most common answer was an understanding of security as the absence of war. The participants acted out the situations when they felt insecure: motor robbery, kidnapping, house robbery, domestic violence. The Cambodian urban women dwelt much on violence in the household. Furthermore, good governance and the problems of corruption were at the forefront of their minds.¹¹

92.3.1.4 Rural Poor of Siem Reap

In a village in the vicinity of the historic temples of Angkor Wat, poor rural women gathered with Concern, a local NGO. During several sessions on peacebuilding, economic insecurities were aired, as well as political fears remaining from the days of siege. In the countryside the isolation of the villages made the par-

ticipants construct their 'dream world' with roads, thinking that they would be more secure if they could be closer connected with progress and development. Later, independent and full of initiative, the village women took upon themselves the task of running peace workshops, dividing themselves into groups, accepting responsibility for taking charge of particular localities, and working out a time frame.¹²

92.3.1.5 Lumads in Militarized Agusan

During 2005–2006, peacebuilding workshops were held in Mindanao, in the southern Philippines, in Tuburan, Agusan del Sur, where the Lumads, the indigenous peoples composed of Manobos and Banwaons were most apprehensive of the militarization of their areas. In the role-playing they repeated military operations, when soldiers in uniform attacked their husbands, accusing them of being rebels. Arrests were

¹¹ The community workers replicated the workshop in Phnom Penh and the villagers of Siem Reap by dividing the area among themselves. The funding was only for the running of the workshop. The local women pursued peacebuilding on their own initiative, relying on their own resources.

¹² They received funding from the *South East Asian Conflict Studies Network* (SEACSN) and from SIDA for the *Alliance for Conflict Transformation* and the *Third World Movement Against the Exploitation of Women* (TW-MAE-W).

made even without warrants of arrest. Two groups portrayed the economic connections: one with the palm oil plantation and another with the logging activities of local landlords and their business cohorts. The fourth group had a skit about a dysfunctional family and their attempt to work out reconciliation among its members.

The responses of persons interviewed by the participants were full of fears because of the martial law-like situation that made it dangerous for them to walk alone. The workshop ended suddenly because of news that a military contingent had ransacked the houses in one of the areas where some of them lived. This human insecurity was vividly felt by the Lumads.

92.3.1.6 Muslims, Christians, Indigenous Women Affected by Armed Encounters

A few years ago a 'total war' was declared by the Philippine government in Mindanao. Government forces used bombs and guns to quell the rebellion of the *Moro National Liberation Force* (MNLF), the *Moro Islamic Liberation Front* (MILF), and the *New People's Army* (NPA). Communities of Muslims, Christians, and indigenous peoples were caught in the crossfire. They were victims of the armed encounters, suffering death, violence, and displacement for months and even years.

Representatives from the *Women's Federation of Barangay Fatima* of General Santos City, of the *Multi-Purpose Cooperative, Women's Livelihood* of Pikit, North Cotabato, the *Blaan* of the *Imbaika Kutawato*, *Moro Next Generation* leaders of S.K. Pundatun, and Muslims from Sarangani, Maguindanao, Sultan Kudarat shared first-hand experiences.

Three groups played roles. On militarization, the group showed the abusive acts of the military in their place. They were afraid to fight and voice out their rights. Their farms were ruined by the military, and they were accused of being rebels and were detained without warrants of arrest. The second group on land feud portrayed the relationship of Muslims and Christians in the community. A Muslim family suffered from financial difficulty and sold their land to a Christian. The skit showed how the Muslims tried to get the land back when they had money to do so. The third theme was on family problems, where the group acted on domestic violence, where a husband who was a womanizer was left by his wife who fought for her rights. Through these activities the participants showed their insights on what gender security means. As a positive result, peacebuilding activities continue

to take place among the grassroots indigenous, Muslim and Christian communities of Mindanao.

92.3.1.7 Muslims of Marawi, Islamic City

A TW-MAE-W workshop in Marawi City, organized by Samira Ali Gutoc, the Secretary General of the *Philippine Muslim Council*, brought together heads of women, non-governmental and student organizations from Mindanao State University. The perspective of Muslim women on security was related to being discriminated against, of being deprived of the rights of the *Bangsamoro*¹³ in culture and religion, of being in a place where there are no Muslims. They felt secure when they were in the midst of their families and when their economic needs were met (money, electricity, stable livelihood). Their utopia was symbolized by a 'sarimanok', a rooster which stood for the Maranao culture, standing side by side with the Cross and the Virgin Mary. The symbolism of the veil differed. For all, the veil is some sort of security blanket. It gives identity and social belonging to the group. It creates security as a woman and it represents a protest and resistance to Muslim-bashing Westerners.

92.3.2 Results of a 'Conscientizing Inquiry' on Security

This 'conscientizing inquiry' on security in the Philippines, in a Burmese refugee camp in Thailand, and in Cambodia brought to the surface an understanding of security beyond the perspective of the state. In all meetings, the female participants came up with a holistic, comprehensive view. From the personal and family perspective, the meaning of security expanded in ever widening circles to include the role as women and wives, the community, nation, region, world, and cosmos.

Thus, the perception of security by women - or of 'women's security' as a specific form of 'gender security' - forms an integral part of human security. This goes beyond the individual and embraces people's security as well as global and planetary security. Using the Jungian approach¹⁴, the deep feelings of security expressed by these women in concrete terms signifies moving from the effects of failed personal relationships inside family to contextual factors like tensions

13 *Bangsamoro* or Moroland is the name for the 'homeland' of the Moro in the Philippines. The term comes from the Malay word *bangsa*, meaning *nation* or *people*, and the Spanish word *moro*, a term for Arabs or Muslims.

Figure 92.2: Map of the Philippines. **Source:** University of Texas at Austin, Perry-Castañeda Library Map Collection; at: http://www.lib.utexas.edu/maps/islands_oceans_poles/philippines.gif. This map is in the public domain.

caused by job, food, housing, health, and other domestic insecurities. At the social level, the security of social groups of an ethnic and religious nature was scrutinized especially in Mindanao by the groups so as

to understand the complexity of the interrelationship with regard to security.

A more comprehensive approach to security, including ‘gender security’, was expressed based on the

experience with the military, e.g. with the military junta in Burma, in the aftermath of the 'killing fields' in Cambodia, and militarization due to aggressive development policies in the Philippines. Although the sessions on security focused primarily on aspects of economic security, the political, gender, and socio-cultural elements were also expressed. Finally, concern with the security of the planet Earth led these women to take environmental factors seriously.

92.3.2.1 Impacts for 'Gender Security'

While all issues addressed by women in these workshops are issues affecting women directly, contextual challenges such as aggressive development practices, armed conflicts, and military rule, the militarization of Mindanao, the aftermath of the killing fields, the experience of neo-colonialism, the practice of Muslim law, and the US military presence are all highly relevant and contribute to 'gender insecurity'. The existing situation of gender insecurity in daily life got worse through the presence of the military, frequent rapes, and the experience of having lost loved human beings during the massacres. This confrontation with the loss of 'freedom from fear' was reinforced during the time in the refugee camp with the loss of 'freedom from threat'. Both insecurities influenced their identity process and created highly vulnerable women. Through the collective analysis, social representations were changed, and this gave women an opportunity to create higher resilience that enabled them to deal better with the newly emerging uncertainty.

92.3.2.2 Aggressive Development Practices and Neocolonialism

For the subjective insecurity of the women participating in these workshops, poverty prevailed. As a former colony of the USA that was conquered in 1898 mainly for economic reasons, the Philippine economy is still under foreign control. Transnational corporations have enriched themselves by exploiting the country's natural resources - minerals, coal reserves, timber, rubber, sugar, pineapple, banana, palm oil plantations - contributing little to the economic security of the country and to the human security of its people.

The last area is the Liguasan Marsh where a war in Pikit was launched to facilitate the exploitation of natural gas, a kind of biofuel coming out from the decomposition process. Even Marawi City, the capital of the province of Lanao del Sur in Mindanao that is considered as the 'Islamic capital' of the Philippines has suffered from development backwardness. Just a few kilometres away from the booming industrial city of Iligan, the capital of Lanao del Norte in northern Mindanao with heavy-powered industries, lies Marawi that often lacks electricity in the evenings and during weekends, in spite of the fact that it has the resources of Lake Lanao and the Agus River (figure 92.2). In contrast, new industries, corporate farming, and agribusiness corporations enjoy hydroelectric power at the expense of the inundation of hundreds of thousands of hectares of previous farmland which belonged to the Moros and Lumads.

The original owners of the land, the Moro people, now own less than 17 per cent of it and suffer immense poverty. Because of the feminization of poverty, the Moro women, as well as the Lumads, have become economically insecure. Indigenous women clearly pointed out how they have become victims of 'development aggression'. In the name of progress and development, the Philippine government has favoured large foreign corporations and given them access to the country's natural resources. Laws have been passed by the parliament of the Philippines to the detriment of the security and well-being of these people. The Mining Act of 1995 offers land to foreigners to engage in large-scale mining without respecting any health and environmental protection standards.

The right to life of people is inseparable from their right to sources of food and livelihood. Allowing the interests of big mining corporations to prevail over people's right to these sources amounts to violating their right to life. Furthermore, mining threatens people's health and environmental safety through the wanton dumping of waste and tailings in rivers and seas (The Catholic Bishops' Conference of the Philippines (CBCP) 29 January 2006).

As nurturers of life and caregivers, indigenous women suffer most from these consequences. Furthermore, logging concessions - whether legal or illegal - have caused havoc to the safety of the people. As direct consequences, flash floods and landslides have increased, claiming hundreds and even thousands of lives. Whenever natural disasters occur, women once again bear the heavier brunt of these tragedies. A strong statement was drafted by the *Regional Alliance Against Mining and Large-scale Commercial Logging*

14 Carl Jung developed the 'collective unconsciousness'. The study aimed to explore the collective unconscious of marginalized women, especially in conflict-ridden areas, with reference to their dreams and insights on peace and security.

and Corruption (RAMILCOR). This alliance firmly stressed that “it is the mandate of the Gospel that we oppose the scheme of the government to allow more foreign and local companies to devastate the land and its biodiversity and desecrate the integrity of God’s creation in our land.”¹⁵

92.3.2.3 Armed Conflict and the Military Junta

Ninety per cent of all casualties in contemporary armed conflicts are civilians, mostly women and children. They are most vulnerable to violence and have difficulty to get food, medical care, and education. The major participants in peacebuilding efforts are mainly survivors of wars and ethnic conflicts, as experienced in Burma and Cambodia in the workshops referred to above. The Free Burma Coalition presents an incisive analysis of Burma’s conflict. After freeing itself from 125 years of British colonial rule in 1948, Burma could not fully develop due to ideological and ethnic conflicts and foreign interference from Thailand, China, and the United States during the Cold War era. The pre-World War II period left the marks of a) political domination, b) psychological subjugation, c) economic exploitation, d) over-ethnicization¹⁶, and e) devastating years under Japanese occupation and militarism. Then followed 40 years of a Burmese Communist insurgency and of Kuomintang resistance supported by the US Central Intelligence Agency.

To complicate matters, in Thailand some circles benefited from the armed ethnic minority insurgencies and their trade in arms, teak, gem stones, agricultural and forest products. The government of India offered ideological and financial support to both pro-democratic revolts and to the nonviolent resistance of Aung San Suu Kyi and of the *National League for Democracy* (NLD). In 1990 the NLD won a landslide victory in the elections, gaining 82 per cent of parliamentary seats but Aung San Suu Kyi and the elected parliamentarians were never allowed to assume office.

The case of Burma shows the ideological divide in the understanding of security. The *State Peace and Development Council* (SPDC), the ruling military junta, and the armed forces refer to ‘national security’.

15 The Church statement sounds strong, but the implementation was weak, mainly because of a lack of political will and moral integrity of those who got elected to government positions.

16 ‘Over-ethnicitization’ means that ethnic uniqueness, superiority or differences have been disproportionately stressed.

The civilian democratic forces led by Aung San Suu Kyi as well as the ethnic minority groups stress “political reforms, economic liberalization and human rights”. The great challenge is to establish a common political language enabling dialogue.

After the savage army crackdown of the student-led revolt in August 1988, many militants fled to the jungles and went into exile. But anti-government demonstrations continued. On 9 September 1999 Burmese exiles staged protests in Thailand, Australia, Japan and Malaysia, while in Burma the military rounded up suspected opponents, mainly high school students, who were taken away and subsequently disappeared.

What impact has all this had on women and on their perception of security? The Burmese women are strong, brave, and resolute. In the international arena, many valiant Burmese women are working for the liberation of their country. The solidarity movement has grown due to their passion for peace, freedom, and justice. A strong example was a video presentation by the Nobel Peace Prize Laureate, Aung San Suu Kyi at the NGO Forum on Women in Beijing (China) in 1995 (box 92.2).

92.3.2.4 Aftermath of the Killing Fields

The women’s perspective of the Cambodian experience was highlighted during the Asia-Pacific Peace Research Association (APPRA) Conference in Siem Reap in 2003 by the Secretary of State of Cambodia, Madam You Ay, who also is the Minister for Women and Veteran Affairs. She addressed the impacts of the ‘Killing Fields’ and of the Khmer Rouge. The participants felt the pain and anguish of how women suffered and coped with their fears and insecurities. Secretary You Ay explained how the present Cambodian government has worked out reconciliation with its ‘win-win’ policy to enable all Cambodians to move on as a nation by understanding the deep wounds of complex situations, such as:

- 1863-1953: Cambodia was a protectorate of France;
- 1953-1970: Sihanouk rules first as King, then as Prime Minister, finally as Head of State until he gets deposed in a coup;
- 1965: North Vietnamese guerrillas set up bases in Cambodia against a US-backed government in South Vietnam;
- 1969: The US bombs North Vietnamese in Cambodia;

Box 92.2: Nobel Peace Laureate Aung San Suu Kyi on gender security. Presentation to the UN World Conference on Women, Beijing (1995). **Source:** NSW HSC online; at: <http://hsc.csu.edu.au/english/advanced/critical_study/2471/Speech_Aung.html#speech>. This text is in the public domain.

There is an outmoded Burmese proverb still recited by men who wish to deny that women too can play a part in bringing necessary change and progress to their society. 'The dawn rises only when the rooster crows.' But Burmese people today are well aware of the scientific reasons behind the rising of dawn and the falling of dusk. And the intelligent rooster surely realizes that it is because dawn comes that it crows and not the other way round. It crows to welcome the light that has come to relieve the darkness of night. It is not the prerogative of men alone to bring light to this world: women with their capacity for compassion and self-sacrifice, their courage and perseverance, have done much to dissipate the darkness of intolerance and hate, suffering and despair.

Often the other side of the coin of tolerance is insecurity. Insecure people tend to be intolerant, and their intolerance unleashes forces that threaten the security of others. And where there is no security there can be no lasting peace. In its *Human Development Report ... UNDP [1994]* noted that human security 'is not a concern with weapons - it is a concern with human life and dignity'. The struggles for democracy and human rights in Burma are a struggle for life and dignity. It is a struggle that encompasses our political, social and economic aspirations. The people of my country want the two freedoms that spell security: freedom from want and freedom from fear. It is want that

has driven so many of our young girls across our borders to a life of sexual slavery where they are subject to constant humiliation and ill-treatment. It is fear of persecution for their political beliefs that has made so many of our people feel that even in their own homes they cannot live in dignity and security.

Traditionally the home is the domain of the woman. But there has never been a guarantee that she can live out her life there safe and unmolested. There are countless women who are subjected to severe cruelty within the heart of the family which should be their haven. And in times of crisis when their men folk are unable to give them protection, women have to face the harsh challenges of the world outside while continuing to discharge their duties within their home.

Many of my male colleagues who have suffered imprisonment for their part in the democracy movement have spoken of the great debt of gratitude they owe their women folk, particularly to their wives who stood by them firmly, tender as mothers nursing their newly born, brave as lionesses defending the young. These magnificent human beings who have done so much to aid their men struggle for justice and peace - how much more could they not achieve if given the opportunity to work in their own right for the good of their country and of the world.

- 1975: The Year Zero with the Khmer Rouge under Pol Pot taking over and killing some 1.7 million people;
- 1977-1989: Rule of the Vietnamese;
- 1985-2006: Hun Sen usurps power and becomes Prime Minister;
- 2006: King Norodom Sihanouk is head of state.

Cambodia's bloody past is enshrined in the museums of skulls and remnants of land mines and the killing fields. Faced with sex trafficking and the spread of AIDS, the women and children have little security to speak of. The women suffer illiteracy with 43 per cent of those aged 25 and over who have had no schooling at all except for a few who did not even get to complete grade one (Cambodia Socio-Economic Survey, 2004). One bright light, however, is Cambodia's temples of hope. A tribute to women is the temple of Apsara in Banteaysrei, Siem Reap, the Temple of Women. It is about 40km from the main Angkor complex and predates it by about 400 years. It immortalizes the role of women seen in the beautiful apsara carvings, where apsara represents the female spirit of clouds and waters in the Hindu and Buddhist religion.

This sanctuary represents an inspiration and support to struggle for improving gender security.

92.3.2.5 The US Military Presence

The people of Mindanao, particularly the Islamic population called Moros, have resisted the US military presence since early 1900. In 1906 the Filipino Muslims, armed only with swords and spears, fled to the crater of the volcano Bud Dahu, where they were brutally annihilated by American troops (Sun Star Zamboanga, March 2006). Among the victims of this carnage were women and children who belonged to the community which refused to submit to American rule. Through the *Visiting Forces Agreement (VFA)* signed in 1998, the US Forces are allowed today to access any part of the Philippines for training exercises called 'Balikatan'. After 11 September 2001, President Bush extended his 'Operation Enduring Freedom' to the Philippines that has been considered by his administration as a frontline state in the 'war on terror'. However, the VFA has become a basis of new insecurity. The 'Long Term Security Assistance Plan' includes night flying, intelligence fusion, light infantry tactics,

command and control, combat, hostage retrieval, and sniping in training camps.

How does this affect 'gender security'? One example of many is a gang rape by five US marines of a 22-year-old woman from Zamboanga who was visiting Subic on 1 November 2005. This case has stirred up widespread opposition to America's military presence in the Philippines. Based on the dreadful experiences of sexual exploitation and abuse of women during the height of the US military presence in the 1980's, TW-MAE-W has rendered direct services to the sex trade survivors. In this case, the foreign military presence has created a higher degree of insecurity for the host country, and for many of its women.

All workshops had as a key theme the violence and discrimination against women, where material and emotional benefit was taken away by creating highly susceptible women. Their social vulnerability increased through the conflict and post-war situation, and was triggered by structural phenomena such as extreme poverty and GBV.

HUGE as an analytical tool may help to understand the interrelationship between environmental destruction and pollution due to war (Orange Agent in Vietnam, Napalm and chemical warfare, Westing 1972, 1976), destruction of livelihood and the GBV during fleeing and in refugee camps. Triggering structural effects with conjuncture of war and extreme poverty, women's bodies were often transformed into a battlefield (Rehn/Johnson 2002).

The resulting gender insecurity can be combated by external pressure, where genocide is today sued at the International Court of Justice in The Hague. Post-war corrupt governments can be sanctioned internationally, but also denied re-election by organized citizens. The South East Asian workshop took the bottom-up approach. Through Freire's 'conscientizing inquiry', all women exposed to GBV and extreme poverty analysed their situation, established networks, and started to transform their role from victim to actor. Conscience raising, identification of common situations and goals permitted their initial organization. They were able not only to understand the root causes of their situation, but to start searching for solutions. As the situations are complex and encountered at different levels - from the family to the international level - each level asks for a different strategy. The first step toward liberation was starting with 'freedom from threats' by reinforcing collectively the physical and emotional variables required for their own safety and that of their families. Closing polluting pit

mines and safe refugee camps were some of the alternatives.

Through interchange and alternatives they began also to work on 'freedom from fear'. New economic activities, orchards, and micro-businesses slowly changed their processes of identity, reinforced entrepreneurship, and thus empowered women. Thus changed social relations and women gained greater freedom to act and to provide part of the family's livelihood, without losing their care-giving capacity. The next step would be the interconnection of local levels with the national and international ones, an experience that will be explained with the trafficking of children for sexual exploitation in the case of Central America.

92.4 Case Study on Trafficking of Children for Sexual Exploitation in Central America

Several military coups, internal conflicts, guerrilla wars, revolts, foreign military presence of advisers, and intelligence agencies in the context of the Cold War and of several proxy wars, and more recently peace agreements have left deep wounds in Central America between the 1950's and the 1990's. The violence has destroyed basic infrastructure, familial links, created gangs (*Mara Salvatrucha*), often from child soldiers, organized crime, extreme poverty, deep social gaps, and social resentments. While the poor are left without job opportunities, schools, and basic health, elites have linked up to the military during the war situation and consolidated their business internationally. They consolidated their fortunes with military help and external investments. This is also the violent background for femicide, sexual exploitation, and sex trafficking that have evolved and got recently related also to gangs in charge of illegal migration, and arms and drug trafficking to Mexico and the USA (box 92.2).

Central America is composed of seven small countries. As they are economically very small, they established in 1960 the *Central American Common Market* (MCCA) that was replaced in 1993 by the Central American Integration System (*Sistema de Integración Centroamericana*: SICA) to pursue common economic and political activities. When in Cuba in January 1959, the guerrillas won the revolution against the Batista regime; this region, together with South East Asia, was converted into a strategic zone against the fight of communism. The US promoted major arms

Box 92.3: Overview of military rule, guerrilla wars, and foreign military presence in Central America.

During the Cold War and in its aftermath, several of the seven countries of Central America: Belize, Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, and Panama have experienced periods of intense violence due to

military rule, guerrilla wars, the presence of foreign military advisers, and repeated direct foreign intervention into their internal affairs.

Table 92.1: Violence in Central America (1946-2005) due to military and authoritarian rule, guerrilla activities and foreign intervention into their internal affairs. Some events before 1946 were included that had impacts on the post World War II conflicts. **Source:** This table was compiled by Úrsula Oswald Spring based on histories of Central American governments, on the historic literature (in Spanish) and on data taken from the Uppsala Conflict Data Programme (UCDP/PRIODATA data set); at: <http://www.pcr.uu.se/publications/UCDP_pub/Conflict_List_1946-2005.pdf>.

Country	Military/authoritarian rule, revolts, guerrilla conflicts			Intervention, consequences, facts and foreign presence

sales, military aid, and assistance. They repeatedly launched covert interventions justified with the domino theory that claimed if in one country a revolution would succeed, then the whole region would turn to communism. Therefore, progressive governments were ousted by coups (e.g. President Arbenz in 1954 in Guatemala), and military governments imposed a wild form of capitalism with high levels of repression. The guerrilla war broadened and the civilian population suffered much from this repeated oppression.

Guatemala experienced a long war with an ethnocide against the Mayan population. During three decades of civil war and military repression, extreme

cases of gender violence rose with the abduction of women and girls, not only supported by the military. As in any war situation, women and children were the most vulnerable group, and in Guatemala more than a million displaced persons fled from organized genocide by the military and a special elite group trained in atrocities, the so-called 'kaibiles'. Social networks were destroyed and family members killed. Others joined the guerrillas who were fighting in the mountains against these atrocities. As in any war, and especially in internal conflicts, the most affected people were the socially vulnerable, such as women, children, elders, and youth, who lost their livelihood, job, often

Box 92.4: Background data on Guatemala. This text is in the public domain.

Guatemala is a country of contrast and contradictions. Its inhabitants live in a multiethnic, pluricultural and multilingual nation. It has seen periods marked by beauty and dignity, however, Guatemala also experienced disgrace and terror, pain and grief due to 36 years of armed confrontation. With the start of the internal armed conflict in 1962, Guatemala experienced enormous human, material, and moral costs. In the documentation of human rights violations and acts of violence connected with this armed confrontation, the Commission for Historical Clarification (Truth Commission) stated that the number of persons killed or disappeared due to the fratricidal confrontation reached over 200,000. The conflict affected particularly the indigenous population of the north-western region, where over 150,000 were killed, 50,000 people were abducted or missing, 440 villages were destroyed, more than 100,000 people became refugees, 75,000 children died, 200,000 became orphans, 150,000 children suffered physical disability and 1 million people were internally displaced.

With the signing of the Peace Agreements on 29 December 1996, new possibilities for a reconciliation of the Guatemalan society emerged. The end of the armed conflict facilitated a slow and complex socio-political process, since democracy fostered the reconstruction of state institutions and the transformation of civil society institutions. Nevertheless, there is a misconception that when the fighting stops, war is over, that there will be no more bloodshed,

no more insanity, but the reality shows that when the war is over it does not mean that the psychological effects of the war also end.

This is especially true for the more than 100,000 traumatized, killed, and disappeared children. The report of the Truth Commission reported a much greater number of victims among children and adolescents. The violence against children was a strategic decision and tactic in the counter-insurgent conflict. These young victims were a consequence of the large number of massacres and murders committed against them, many children, babies, infants and even unborn babies were brutally massacred. It was during the displacement and flight that the greatest number of children lost their lives; about 60 percent of the people that died during flight were under eighteen.

These 36 years of the internal armed conflict in Guatemala caused high levels of violence: poverty, migration, systematic violations of human rights, and massacres, where child victims of war participated in these atrocities. Thousand of indigenous girls were raped by the Guatemalan military during this conflict, mostly young girls from Mayan communities who, under the arrogance of the armed uniformed perpetrators, were the spoils of war. The raping of the children was collective and perpetrated under order. Rape was used as a mechanism to trigger terror, by using women and children as instruments of victory and by using their bodies as battlefields.

also their health and family support. The lacking rule of law and its improper implementation permitted the emergence of criminal gangs, many of them now linked to transnational organized crime, where child trafficking, pornography, illegal migration, arms, and the drug trade are closely intertwined. In Guatemala, after the peace agreement many of the girls and boys who were orphans or victims of rape were seduced or captured by sexual exploiters and traffickers who have been involved in the sexual exploitation trade.

Guatemala is an extreme case where both *human security* (HS; Fuentes/Rojas 2005, 2005a) and *gender security* (GS) were threatened, and climate change, desertification, deforestation, and population growth after the war were contributing to a HUGE insecurity among the different indigenous groups and an extreme social stratification. The following analysis reviews one of the most dramatic forms of gender insecurity, the forced abduction of girls and boys for the sex trade. This is not a new phenomenon, as it started during the war with the support of the military. Similar to South East Asia's and Africa's war situation, the military introduces in any society forced sex and sex trafficking (Reardon 1996), not only for male foreign armed forces, but also to humiliate the dominated na-

tion. Therefore, sexual abuse is often part of military activities to destroy the enemy in its deepest concerns. But this has happened also during peace time and sexual trafficking is a major illegal activity generating profits of billions of dollars (UNODC 2003). It is permeating the whole social tissue of post-modern societies and the gangs related to this crime often get governmental and military protection not only in Central America, but also in neighbouring Mexico (Cacho 2005), and in several Asian and African countries.

According to a report by the *Special Representative of the Secretary-General for Children and Armed Conflict*, Olara A. Otunnu, the experience in many armed conflicts is that women and girls - even the very young ones - are raped, abducted by warring parties, and forced into sexual slavery. Rape may be followed by murder. Sexual violence is so widespread in contexts of conflict and displacement due to the vulnerability of women and girls. The abuses committed against children and women during armed conflicts were among the worst phenomena of the past and present century that are referred to in UN Security Council Resolution 1325 on "Women, Peace and Security" (UNSC 2000).

92.4.1 Commercial Sexual Exploitation of Children

Violence against women and girls continues unabated in every continent, country and culture. It takes a devastating toll on women's lives, on their families, and on society as a whole. Most societies prohibit such violence – yet the reality is that too often, it is covered up or tacitly condoned.

UN Secretary-General Ban Ki-moon, 8 March 2007

The *commercial sexual exploitation of children* (CSEC) is a global problem that has existed in some countries for centuries, and was embedded in historical and cultural practices.¹⁷ However, the growth in the trade of children began to attract public attention in the mid 1990's. Children were kidnapped and trafficked across borders for sexual exploitation, adults travel abroad to have sex with children, countless children are sold as sex slaves, and people are flooding the internet to contact sexual exploiters and to collect and distribute pornographic images involving children.

Since 1980 there has been a rise in sexual crimes against children, the sexual abuse and exploitation of children was further facilitated by the internet. There has been a development of organized crime and other networks of people exchanging and selling images of sexual abuses with children (UN 2001d). After the tsunami of 2004, just as after Hurricane Mitch in 1998, the CSEC increased in the aftermath of natural disasters due to the destruction of the social order and a disruption of safety nets for the most vulnerable. This created a fertile ground for predators.

The sexual exploitation of children is described by the United Nations as a “modern form of slavery” and as “the most severe form of violation of children's fundamental rights to survival, dignity and healthy human development” (Report of the Second ECPAT International Assembly, September 2002, Bangkok, Thailand; Muntarhorn 2002). The physiognomy of the CSEC is changing, mutating, and increasing. The CSEC is a global scourge affecting both rich and poor countries, and this has become a borderless phenomenon that is national and transnational; regional and inter-regional, although the extent of the problem varies by country and region (ECPAT 2001).

The commercial sexual exploitation and child pornography are carried out through sex trafficking and

Figure 92.3: Map of Central America. **Source:** University of Texas at Austin, Perry-Castañeda Library Map Collection; at: <http://www.lib.utexas.edu/maps/americas/camerica_caribbean_95.jpg>. This map is in the public domain.

sex tourism. Child sex trafficking exists when a young person has been kidnapped, recruited, transported, transferred, across borders for sexual purposes, coerced into the sex trade or sold as a sex slave (UNODC 2003, 2003a; UNHCR 2000, 2003). Trafficking is a process which selects vulnerable children, and then exacerbates their vulnerability (through violence, forced movement, slavery, servitude, coercion, threat and/or deceit) and then subjects them to severe exploitation.

The *International Organization for Migration* (IOM 2003) stated that 700,000 to two million women and children around the world become victims of trafficking every year. It is estimated that 1 million children are being recruited, coerced and trafficked each year as sexual commodities for sale and human trafficking. The use of the word ‘children’ often really refers to girls since there is less research on trafficking of boys.¹⁸ Sex trafficking is a very lucrative activity for criminal networks, amounting to an estimated global annual business of US\$7 billion. Actually child trafficking is a major issue of our time, as it is a fast, low cost, low risk and profitable revenue activity. It represents the third most profitable illegal enterprise after the sale of guns and drugs, and organized crime groups have used the same routes for

17 According to the ‘United Nations Convention on the Rights of the Child’ (1989), a child is a person under 18 years of age.

18 Boys do not seem to be obvious victims of trafficking for sexual purposes, but there are known cases of boys who have been trafficked for sex and used in pornography.

human trafficking, as for the trafficking of drugs and weapons (World Tourism Organization Report, 2004). The sexual exploitation of children is a recognized problem in South and South East Asia, Latin America, Africa and Eastern Europe.

GBV is also a major cause of death and disability. A World Bank study (1994) selected risk factors facing women aged 15 to 44 years. GBV ranks much higher than cancer, motor vehicle accidents, war, and malaria. There is also an increasing link with HIV infection. The economic costs of GBV are considerable and the US *Center for Disease Control and Prevention* (CDC 2003) estimates that the costs of intimate partner violence in the US alone exceed US\$ 5.8 billion per year (1.4 billion for direct medical and health care and 1.8 billion for productivity losses).

92.4.2 Sex Trafficking in Central America

In the case of Central America, the sex trafficking of children has increased recently. In 2002 it was estimated that more than 50,000 children may be involved in it or at risk of sexual exploitation in the region (ECPAT 2001a, 2002). According to a report of ILO (2004: 5), among the activities that children are involved in and receiving economical compensation for are as follows: agricultural work (70 per cent), manufacturing (8 per cent), street vending (8 per cent), domestic work (7 per cent), children being sexually exploited (3.5 per cent), and from other purposes (3.5 per cent). Most victims are trafficked from Honduras and El Salvador to Guatemala, from Nicaragua to Costa Rica, and from Guatemala to El Salvador (see figure 92.4).

Figure 92.4: Trafficking Routes in Central America.
Source: Casa Alianza, Guatemala (2003).

The root causes behind this phenomenon are manifold. At the structural level Central American countries are facing the consequences of armed conflicts of the past decades with high levels of violence, political instability, extreme poverty, exploitation, and family disintegration, compounded with social inequalities that help to generate social crises. This violence is often reproduced at home and in the community with women and children as the main target groups, particularly in the lower strata of society. Sexual violence inflicted upon girls, boys, and adolescents in their own home is part of everyday life for many families in the region.

92.4.3 Causes of Sex-Trafficking of Children

The combination of poverty and violence at home implies that children and young people become very vulnerable to other forms of violence and exploitation. These vulnerabilities are also rooted in the age, class, ethnicity, and gender discrimination of children, making them more susceptible to being trafficked for sexual purposes. At least 40 per cent of sexually exploited girls found in brothels are below 18 year of age,¹⁹ most of whom suffered rape and sexual abuse by a family member (Cicchetti/Cummings/Greenberg/Marvin 1990; Malinosky-Rummell/Hansen 1993). Thus, the road that leads to the commercial sexual exploitation of children is built on mistreatment, sexual abuse, and lack of affection, permanent exposure to physical and moral risk, unmet basic needs, family instability and breakdown. Other factors of risks for children are the lack of access to information, education, and health services. They are unable to defend themselves against unwanted sex and are powerless to insist on condoms.

At the social level the sexual exploitation of children is 'hidden' because there is a deeply seated social permissiveness of these phenomena. Some studies argue that there are many motives for hiding reality, perhaps from fear or from the conviction that it is impossible to have an alternative to this situation, society accepts it and assimilates it as part of its dark side. Trafficking is facilitated by the ability of traffickers or exploiters to trick or lure children into the sex trade, and for the relative impunity to exploit people's needs to escape their dire economic and social situation.

A brothel in Guatemala which detained under-age girls from Nicaragua was raided and closed down by the

19 See: ILO, 2001: Bulletin No. 1 (San José Costa Rica: ILO).

National Civil Police. One of these girls reported as being tricked in her own country – explained how she was lured into coming to Guatemala with the offer of a job as a waitress, but when she arrived in Guatemala, she was forced into prostitution.²⁰

Young children and adolescents are highly desirable sexual commodities; clients will pay higher prices to brothel owners or pimps to get access to them. There is a diversity of exploiters to be identified. The notion of an exploiter encompasses not only the pimp, the procurer, the industry, the owners of bars and brothels, the negligent authorities, but also the client of CSEC. The demand or driving factor (Klot/DeLargy 2007: 24) is the critical part of the equation in the sex trafficking of children and youth, the supplier justifies his or her actions because of the demand, and the fact that clients are willing to pay money for their service (Villarreal 2002).

This factor goes hand in hand with the supply factor. The demand is a predominant concern because it is interlinked with the pattern of patriarchal society and male behaviour, because the majority of cases of CSEC are related to men who perpetrate these crimes against children. This does not neglect the fact that women are also involved with sexually exploiting children, but the major concern is to address the issue from the demand side, and the role of males in relation to CSEC (UNICEF 2001: 57). Male behaviour is intrinsically linked to educational and socialization processes, where regrettably the knowledge base, attitudes, and behaviour are not adequately nurtured to respect the rights of children.

It is recognized that ‘there is no sex exploiter’ as such. Instead, there are people (adults, children, male, female) who sexually exploit children in many different ways, for many different reasons, and in many different social contexts (UNICEF 2001: 63). The demand for sex with children appears to be growing. This is caused by a combination of increasing tourism and fear of HIV-AIDS from adult sex workers. Child victims of trafficking suffer extensively. Regardless of the reason for leaving home, the worst damage starts as soon as they are forced into sexual exploitation.

As more information comes to light, it becomes tragically clear that the CSEC is devastating for child victims, because these children are exposed daily to physical, emotional, and mental abuse. They suffer *psychological traumata and post traumatic stress dis-*

order (PTSD), which is a psychological reaction to extreme physical and emotional trauma. They are at high risk to get sexually transmitted diseases and HIV-AIDS, and they have a higher rate of adolescent pregnancy than their peers who are not sexually exploited. Besides, they are exposed to consume drugs and alcohol in part, because they are obliged to do it and/or because they want to minimize the awareness of the consequences of the life they must endure.

92.4.4 Legal Instruments to Counter the Trafficking of Children

Several international legal instruments exist that protect child victims of trafficking, especially:

- ‘*Convention on the Rights of the Child*’ (20 November 1989, in force since 2 September 1990) is the main frame of reference for the promotion and protection of the rights of children;
- ‘*Optional Protocol to the UN Convention on the Rights of the Child on the Sale of Children, Child Prostitution and Child Pornography*’ (25 May 2000, in force since 28 January 2002);
- *International Labour Organization* (ILO) ‘*Convention 182 on the Worst Forms of Child Labour*, which includes trafficking of children’ (entered into force on 17 November 2000);
- ‘*UN Convention against Transnational Organized Crime*’ (15 November 2000; in force since 29 September 2003);
- ‘*Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children, supplementing the United Nations Convention against Transnational Organized Crime*’ (15 November 2000; in force since 25 December 2003).
- UN Security Council Resolution: UNSC Resolution 1325 that was unanimously accepted on 31 October 2000 promotes gender equity and abolition of sexual violence.

92.4.5 Problems of Legal Implementation in Central America

All Central American countries have ratified these international legal instruments, according to which they must take the necessary measures to prevent commercial sexual exploitation, provide care to its victims, and prosecute and sanction abusers. But despite these efforts, children are not yet adequately protected from trafficking, because the national legislations do

20 El Periódico, 2004: “La Explotación Sexual de Niñas y Adolescentes en Guatemala”, Editorial, in: *El Periódico*, Guatemala City, Guatemala, 9 October 2004.

not adequately criminalize and penalize sexual exploiters, and in very few cases laws are enforced and criminals arrested. The access to justice and to the judiciary is very limited generally, and even worse for children's crimes. Other factors are the inefficiency, corruption, and impunity of some customs officials, policemen, judges, and governmental authorities, the lack of mechanisms and institutional procedures in the national police for an effective persecution of exploiters and offenders, and the lack of extraterritorial legislation and agreements among countries to fight the trafficking of children.

While trafficking is a rampant problem in the region, the reporting and conviction rates are low, as is the delivery of justice. The governments must face this changing social phenomenon that presents new challenges such as:

- The age of sexually exploited children seems to be decreasing.
- The situation of sexually exploited children is becoming more violent in terms of physical and sexual violence, and forms where children are forced to engage in high risk sex.
- It is difficult to monitor the number of sexually exploited children because the exploiters change girls and boys from one country to another and from one place to another.
- There are insufficient services to provide sexually exploited girls with the opportunities and support that would allow them to leave and recover from sexual exploitation and other abuses.

Therefore, this problem requires innovative and integrated responses among each country of the region. Any interventions to prevent and to protect the victims must be based on governmental commitments of needed measures, and more cooperation between Central American states and other partners to:

- give higher priority to action against CSEC with adequate resources;
- promote stronger cooperation between states and all sectors of society, and strengthen families against CSEC;
- enforce laws, policies, and programmes against CSEC, and strengthen communication and cooperation between law enforcement and authorities;
- implement comprehensive laws addressing the issue of trafficking;
- apply extradition treaties and bilateral agreements to facilitate prosecution of traffickers;
- work for speedy delivery of justice;

- ensure that court procedures be made victim/child-friendly;
- coordinate responses from the various law enforcement agencies;
- provide victim protection;
- decriminalize the child victim;
- provide social welfare facilities to help the child victims rather than placing them in detention;
- practise restorative justice and compensation for child victims;
- protect witnesses;
- engage in training and capacity-building of law enforcers to help children;
- aim at cross-border and in-country cooperation between government officials, NGOs, the private sector, and members of civil society.

Trafficking is not only complex, it is also dynamic. Traffickers change their methods of operation and routes constantly in response to changes in the demand for commercial sex, and clients' demand for ever younger girls. Shifting economic conditions, conflict, and natural disasters gives rise to new trafficking patterns. Operations and trafficking routes also evolve in response to pressure from increased law enforcement of community awareness.

It is necessary to forge strategic alliances between government agencies, civil society, and international organizations to address trafficking issues. This will improve and expand services by enabling organizations to form regional, national, and local networks to reinforce each other's work. The networks must respond and prepare to tackle the trafficking immediately; they must enforce the protection of victims, reintegrate these victims, and prevent them from being re-trafficked. This also requires an increase in awareness of the perils of trafficking among vulnerable groups and the general population. Furthermore, governments must consider the sexual crimes against children as high priority areas, and allocate adequate resources and efforts to fight sexual exploitation of children, and a systematic follow-up must be maintained.

92.5 Conclusions

The central question of this chapter analyses how women survive in violent war, and in post-war situations in South East Asia and in Central America. Both regions represented strategic zones during the Cold War where both superpowers fought proxy wars. In both examples the fight against communism brought

about environmental disaster due to chemical warfare (loss of ES), guerrilla war, and a large number of displaced persons. Once a peace agreement was achieved, the destruction of the social networks and the militarization of wider regions maintained economic and physical insecurity (loss of HS) that was triggered by GEC and increasing natural hazards, which often led to social and political disasters.

The Guatemalan case also illustrated how a global insecure war context and later an unstable post-war situation with still high physical insecurity has triggered a negative subjective and physical situation for women and children, especially when transnational crime has promoted the trafficking of children for sexual exploitation. These new threats, often as a mortgage of previously induced military GBV, are triggered by international organized crime rings. This requires a global response by international organizations and a tightening of the rules of the nation state. Nevertheless, the involvement of the military, politicians, and sometimes even church members, has created a state of impunity where these illegal activities have grown rapidly (Cacho 2005). Due to the high profits, the traffickers used highly sophisticated technology and modern transportation systems to take the children far away from their home.

In South East Asia, the bottom-up empowerment of affected women has created consciousness and reinforced their own capacities to resolve highly complex situations. This resilience-building through understanding their life and the surrounding difficulties, permits them to act at the local level, improve their proper livelihood and that of their family members. In the long-run it has generated wider social networks among women, but it also fostered a preventive behaviour to avoid new violent conditions.

In both cases with the integration of wider concerns such as those of HS, GS and ES, the attractiveness of a HUGE paradigm has been exposed at different levels. This may also enhance a holistic gender security approach, where also human and environmental security considerations are simultaneously included (e.g. by closing open-pit mines, by cleaning of polluted regions from warfare, child trafficking, improvement of income and livelihood).

Thus, the above analysis of the loss of 'gender security' in South East Asia (92.3) and in Central America (92.4) is linked to the structural causes of social, physical, cultural and environmental security as a result of proxy wars, regressive globalization (Oswald 2008b), of militarization, cultural alienation, and intra-familial violence, all related to long-standing patri-

archal behaviour within authoritarian institutional frameworks.

The loss of 'gender security' has to be understood from a complex perspective and countered accordingly. The South East Asian case study discussed a tool (e.g. workshops with female victims of violent conflicts) for raising their consciousness that may contribute to a process of democratization, empowerment, and self-reliance. The design of these workshops was inspired by a bottom-up approach using Freire's (1974, 1974a, 1998, 1998a, 2000) liberation theories through a self-analysis of their situations by the affected people. Freire's 'pedagogy of hope' started with the achievement of internal peace (Boulding 1992, 2000), nonviolence within the family and community (Amgelio 2002, 2004), and continued with a process of creative reorganization (Sánchez 2001; Duque/Pastrana 1973) of the complex relations between the social economy,²¹ physical security (Zibechi 2006; Ouviaña 2005; Sader 2005), political stability (Brauch 2007c; Kaplan 2003; Annan 2005; Cordera 2003), cultural diversity (Lópezllera 2003; Arizpe 2004; De la Rúa 2004;), gender equity (Salazar 2003; Alcoff 1996; Alcoff/ Potter 1993), and environmental protection (Dalby 2007, 2008; Oswald 1999).

Such a collective identity-building permits to share hopes, experiences, doubts, and projects anchored in their proper social realities. They are free of prejudices and interests. Therefore, this "sociological imaginative" (Freire 1974) complements the individualistic approach of Freud's psychoanalytical catharsis. It creates social and cultural networks that are able to raise and consolidate an action-oriented conscience. These processes enable subaltern groups to overcome their internal contradictions and to start a transformation process with their own forces. For Freire it is clear that the enemy is external, being a part of the system of repression and exploitation, but is also internally expressed by personal obstacles which through threats, fears, hopelessness, apathy, and depression avoid the achievement of an integral security and freedom (Freire 1978).

This double strategy of liberation is also required in the second case on Central America, where the focus is on a top-down approach with international, national, and regional support through conventions and laws among governments. As the post-war situation in

21 See: Santos de Morais (2002); Collin (2004); Verano (1997); Martínez Alier (1995), Cadena (2003), 2005; Parrilla/Mario/Bianchi/Sudgen (2005); Bennholdt/Faraclos/Werlhof (2001).

Guatemala had destroyed the system of rule during three decades, from outside and from inside it is necessary to strengthen all security concerns, and therefore HUGE as an analytical tool and as policy means can be convenient. The creation of conventions, resolutions, and agreements may globally address complex problems related to transnational organized crime, money laundering, and sex trafficking. However, there has been hardly any improvement in the 'gender security' of the victims as long as the demand for young girls is rising internationally, and gangs of traffickers as part of global criminal networks can offer poor and badly educated women future fulfilments of their dreams.

Furthermore, so far there has been no comprehensive policy approach to deal with gender-based violence. A seminar organized with the support of UNFPA proposed a complex approach to GBV. The problem of war-related sexual violence has slowly been reaching decision-makers, most of them being men. However, the UNSC Resolution 1325 that was unanimously accepted by all member countries has created a promising international process that has been launched with the support of the countries of the Human Security Network.²² Therefore, Holzner and Mair (2007) proposed:

to abolish the notion that women are male property, by including them actively in peace talks; separate religious representations of women in civil laws; establish policies able to increase gender equity; bolster human security networks; apply in all its extension UNSC Res. 1325; stress the necessity of gender mainstreaming with concrete productive projects; changing roles and participation of women during and after conflicts improving their empowerment, serving for prevention of conflicts and strengthening their peacebuilding capacities in conflict areas; punishment for human rights violations; establishing clear boundaries among victim/perpetrator/protector and train mass media for denouncing GBV (Holzner/Mair 2007: 14-15).

Violence against women in conflict zones has been accepted as an inevitable 'side-effect' of conflicts, and this patriarchal behaviour was even reproduced in UN

peacekeeping operations. Thoraya Ahmed Obaid, the Executive Director of UNFPA, insists on the

necessity to address sexual violence as a crime and a major challenge to all development efforts... (GBV) is an indicator of the most severe breach of human security. ... Punishing perpetrators would contribute to restoring trust in the judicial system. Preventing it would spare disproportionate human and financial costs... reducing sexual violence in all war-affected countries will be a true sign of national recovery" (Obaid 2007: 6).

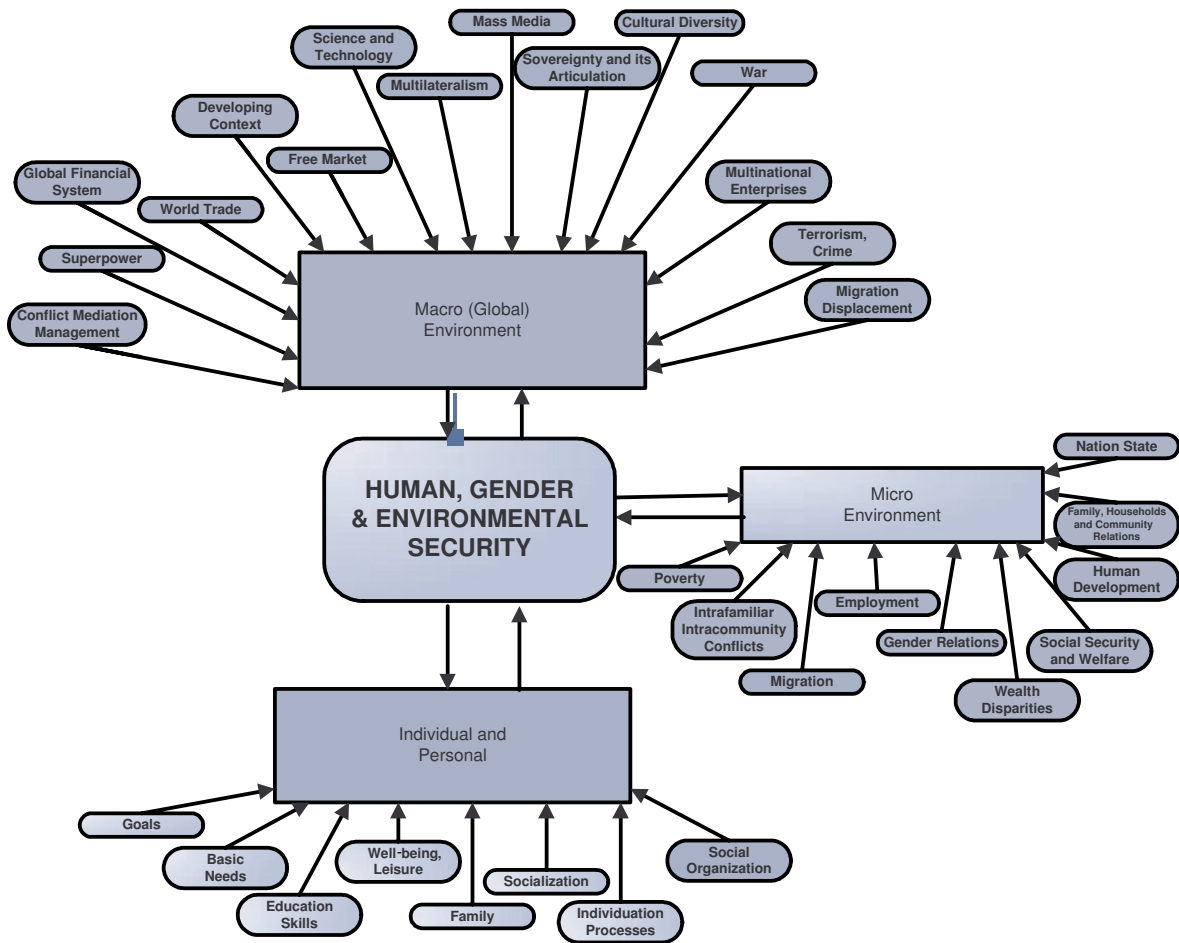

Further, in Guatemala, as in most post-war regions, there is a lack of the most critical and specialized health services. A *Comprehensive Reproductive Health in Crises* (CRHC) should include: emergency obstetric care; family planning; prevention of and attention to sexually transmitted infections and illnesses, including HIV-AIDS tests and drugs; surgery for reconstruction of sexual organs of abused women; advocacy; technical assistance and support; clinical training on-site; emergency funds and research (McGinn/Guy 2007: 70-71).

Finally, in Central America there exists the problem of reintegration of former women combatants into their community. This is a complex situation, while these women have broken gender stereotypes still valid in remote communities. The complexity of the related theme to GBV, war, and extreme poverty require a holistic gender-focused approach. Public acknowledgement is required with specific services for sexual and reproductive needs, psychological assistance, including the capacity to denounce former abuses and support for women and girls who have given birth. All these necessities require complex reintegration programmes and greater attention to sexually transmitted infections, with HIV-AIDS tests, medical care and drugs (Schwitalla/Dietrich 2007: 58-59).

In theoretical terms, HUGE is an analytical concept that helps to link human, gender, and environmental concerns in post-war situations. It distinguishes among different levels and it is a tool to integrate international and national actors, but also grass-root activities. As a policy tool it analyses the activities related to GBV, the role of social movements, of organized women groups, and NGOs for reducing the existing violence, and to create legal bases for a transparent system of rule. A HUGE approach to security is also suited to address global problems related to child and gender trafficking, where missing transparency in national governments, but also international demand of pornography and prostitution in industrialized countries, is triggering the possibility to

22 [7] UNSCR 1325 is an 18-point framework for the protection of women and girls. It promotes women's participation at all decision-making levels and peacebuilding processes; it promotes gender training, guarantees protection of the rights of girls and women, and strengthens gender mainstreaming. It highlights to end impunity for GSV, holding governments accountable for the actions of their armed forces and police.

Figure 92.5: Human, Gender and Environmental Security from Bottom-up and Top-down. **Source:** Úrsula Oswald Spring (2004a).

combat the root causes. This is especially valid when these rings of traffickers are further integrated into illegal migrant, drug, and arms trafficking and money laundering. Particularly the last point returned the ball to industrialized nations and transnational financial systems, including big banks and industry. However, the complexity of the issue and the established links with other illegal activities reduces the prospects for women at risk.

Therefore, a model of bottom-up empowerment and economic alternatives will be able to protect poor women from the temptation to search for a well-paid ‘job’, and thus becoming victims of a criminal ring from where there is often no return. The relationship between the two empirical cases has shown that only a combined methodology of a *top-down* institutional management with transparency and a *bottom-up* consciousness rising is in a position to be able to combat effectively the so frequent, but mostly silent, crimes

related to GVB, supported or at least accepted by patriarchal institutions and behaviour.

In theoretical terms, HUGE can be linked to three levels of analysis: the individual and family; the micro environmental, and the macro or global one. These three levels interact and reinforce each other (see figure 92.5). On each level specific identity-building processes have created social representations that often reinforce unconsciously the patriarchal mindset (chap. 89 by Serrano; chap. 90 by Oswald). Thus, a bottom-up approach using Freire’s methodology in the workshops in South East Asia might transform these social representations from within. Once the root causes have been understood, these women empower themselves.

In the case of Central America, a dual approach has been addressed: a *top-down* approach – referring to norms and legal and institutional changes – but also a bottom-up approach dealing with personal insecur-

rity in Guatemala after the war. But none of the mentioned strategies alone can resolve the complex problems of the trafficking of women and children. The solution to GBV and to related prostitution is so multifaceted and anchored in the existing system, that the top-down results alone will be necessary but insufficient.

International organizations are complex: first they have to combat within their own organization problems of patriarchal structures and mindsets, where often the vulnerable have been excluded from power. Later, they struggle to overcome the difficulties at the national level of their member states where they have to launch reinforcements of the rule of law and the system of rule in post-war situations.

Finally, there is the control at the local and intra-familial level that is beyond their reach. Therefore, the HUGE approach offers a methodology to work simultaneously at the three levels with different stakeholders. This underlines a need to create alternative processes of identity-building for highly vulnerable and exposed groups, but also different social perceptions within governmental institutions (second level). It is national governments that are responsible to implement the adopted conventions and treaties, and to pass national laws. Further, they also have to find ways to apply these laws in a hostile socio-economic environment, where weak institutions exist and brutal behaviour and GBV from former war situations are still remaining. Finally, they are also in an economic recovery phase that is characterized by high unemployment, social stratification, and poverty, where above all women are at high risk of accepting so called well-paid jobs. Confronted with these multiple obstacles, women and vulnerable groups and individuals have to find their own way for protection and empowerment. Through the HUGE methodology they may understand the complexity of their situation and the impact of the triggering of global and national negative reinforcements. Getting organized at the local level, they can start with small actions, and by doing so they slowly start to understand the greater complexity, and then they can undertake wider action.

Therefore, the methodology can also help social movements and NGO's first to situate and later to find ways out of the triggering situations. Once women groups are consolidated locally, the affected people can develop protection mechanisms. They also help to exercise greater control over the national governments by using international support and denouncements. Better national control reinforces the state of law at the local level, and gangs, criminal

rings, and politicians involved in illegal activities are getting denounced by media (Cacho 2005). Further, affected women and children are entitled to demand governmental protection. But thousands of years of exclusive and violent patriarchal structures cannot be abolished by law or local empowerment alone. This requires a longer-term integrated strategy that links both analytical tools and policy means, where the HUGE concept may be helpful to distinguish levels and activities.

93 Do Disasters Discriminate? A Human Security Analysis of the Impact of the Tsunami in India, Sri Lanka and of the Kashmir Earthquake in Pakistan

Madhavi Malalgoda Ariyabandu and Dilrukshi Fonseka

93.1 Threats to Human Security - Vulnerability and Disaster Risk

Although the traditional definitions of human security are confined to mean those threats posed to individuals by war, terrorism, genocide and human rights abuses, the compendium of literature on the subject has expanded to also include those threats posed by factors like hunger, disease and natural disasters. The *Human Development Report 1994* identifies seven interrelated dimensions of human security; economic security, food security, health security, environmental security, personal security, community security, and political security (UNDP 1994: 24)

Exposure and vulnerability to natural disasters pose a major threat to human security, by virtue of exposing individuals to the threats of physical, economic, social, health, personal, cultural and psychological insecurities. Disasters take lives away, displace people and make them socially and economically insecure. Frequently, post-disaster contexts further threaten human security, as political and institutional structures in disaster-hit countries are unable to deliver relief and recovery in a speedy, efficient, democratic and equitable manner. Further, the impact of a natural disaster is compounded in communities that are already hard-hit by past or continuing natural disasters or human conflicts.

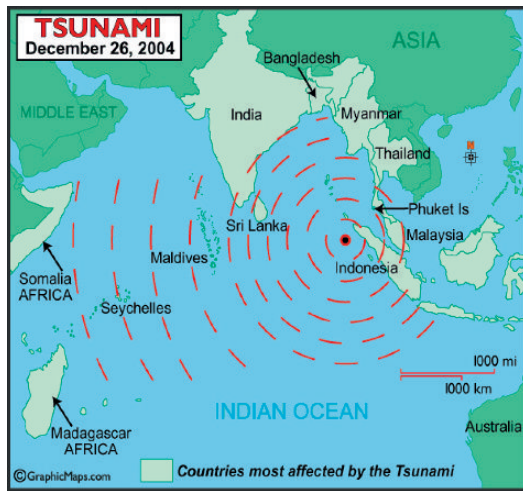

South Asia is one of the most disaster prone regions in the world, affected by a variety of natural hazards such as floods, drought, cyclones, windstorms, landslides, and earthquakes. According to the World Disaster Report (IFRC-RCS 2006) 210,610 persons were killed and more than 779 million persons were reported to be affected from natural disasters during the decade of 1996-2005 in the South Asian subcontinent. The subcontinent is also home to a very large number of resource poor people whose income levels

and assets are barely sufficient for survival. A large majority of poorer populations inhabit the most risk prone locations, such as flood plains, mountain slopes, arid and dry lands, and the coastal belt. Poor governance, institutional and policy frameworks, weak infrastructure, lack of social protection and security all lead to high levels of disaster related insecurity. Livelihoods with a poor asset base are fragile, insurance and other forms of protection are non-existent, literacy is low, access to information, health and other services are poor, markets are often exploitative, and the local governance structures, both formal and informal are dominated by the landed elite. Socially and economically imbalanced mega developments in the region which can lead to environmental degradation and higher intensity and frequency of hazards further increase levels of risk for impoverished people. Thus, the region effectively brings together the two main parameters of the disaster equation; hazards and vulnerability. Natural hazards frequently turn into disasters with large numbers of human casualties and displacement (Duryog Nivaran 2006).

This chapter proposes that the degree and extent of an individual's human security risk vis-à-vis natural disasters is contiguously related to the multiple and intersecting identities he/she subscribes to or is assigned to (i.e. gender, ethnicity, class, caste, religion etc) as well as to the physical, structural and attitudinal violence that is inflicted on these multiple and intersecting identities by his/her community.

The chapter looks at how different groups of people in India, Sri Lanka and Pakistan have been affected by the December 2004 Asian tsunami and the October 2005 Kashmir earthquake; unfolding vulnerabilities, the degrees of disaster risk and threat to human security from the immediate, natural hazard impact, and through disaster responses (93.2). Despite

Sri Lanka

Number of people killed 35,322
Number of people injured 21,441

India

Number of people killed 10,749
Number of people injured 6,913
Number of people missing 5,640

some progress made on disaster risk reduction approaches¹, these two most recent mega disasters demonstrate deep rooted problems; exposing the failure to understand and address causes and effects of vulnerability (93.3), and a recovery process devoid of risk and vulnerability reduction (93.4).

93.2 Vulnerable Identities Unfolded

Both the Asian tsunami (box 93.1) and the Kashmir earthquake have clearly demonstrated that while hazards themselves do not discriminate between the various cleavages in society (i.e. between rich and poor, men and women, high and low caste etc.), the severity of impacts has vastly differed. Natural disasters both expose and exacerbate vulnerabilities; existing socio-cultural, economic, institutional and political structures and systems make the impact of the disasters more severe on more vulnerable groups and individuals. Resource poor people, women and children, the disabled and old, men and women in ethnic, religious and caste minorities are more susceptible to the impacts of natural disasters by virtue of occupying vulnerable physical, socio-economic and cultural environments.

93.2.1 Denominators of Identity and Differential Impacts of the Disasters

The tsunami that struck the coasts of India and Sri Lanka offers many examples of identity-based vulnerabilities. Within affected populations, certain ethnicities, minorities and castes appear to have been more affected than others, and within caste and ethnic groups, the poorer classes, and women of all ethnic groups and social classes have borne the heavier burden of both the disaster and its recovery. This is true of the so-called lower castes and tribal groups in India, and the Tamil and Muslim minority communities in Sri Lanka and other religious minorities in both India and Sri Lanka. Those most affected by the tsunami were fishing communities and primarily the more impoverished belonging to majority and minority ethnic and religious groups living in close proximity to the sea.

In India, the populations of the affected coastal-belt belong to three main castes, the *Meenavars*, the Dalits ('Scheduled' Castes) and *Pazhankudi Makkal* ('Scheduled' Tribes²). These castes subscribe to economic, social and cultural hierarchies and live in almost complete geographic segregation. The *Meenavar* community comprises primarily fishermen, while a majority of Dalits and tribal groups work as

1 Such as efforts have been undertaken through the *International Decade for Natural Disaster Reduction* (IDNDR) and the *Hyogo Framework for Action 2005-2015 for Building the Resilience of Nations and Communities to Disasters*; see at: <www.unisdr.org>.

2 The Scheduled Castes and Scheduled Tribes are communities that were historically excluded from the social superstructure of Hindu society in India, who have been accorded special status under the Constitution of the Government of India.

Figure 93.1: Damage assessment map of the Tsunami on the coast line of Tamil Nadu, India (29 December 2004).

day labourers and coolies in the service of these fishermen. A good percentage of Dalits do not lay claim to land, capital or other assets and live in conditions of poverty. Despite India's legal and constitutional advances in safeguarding the rights of its 'lower' castes, in reality, caste-based discrimination is rampant and deeply-entrenched.

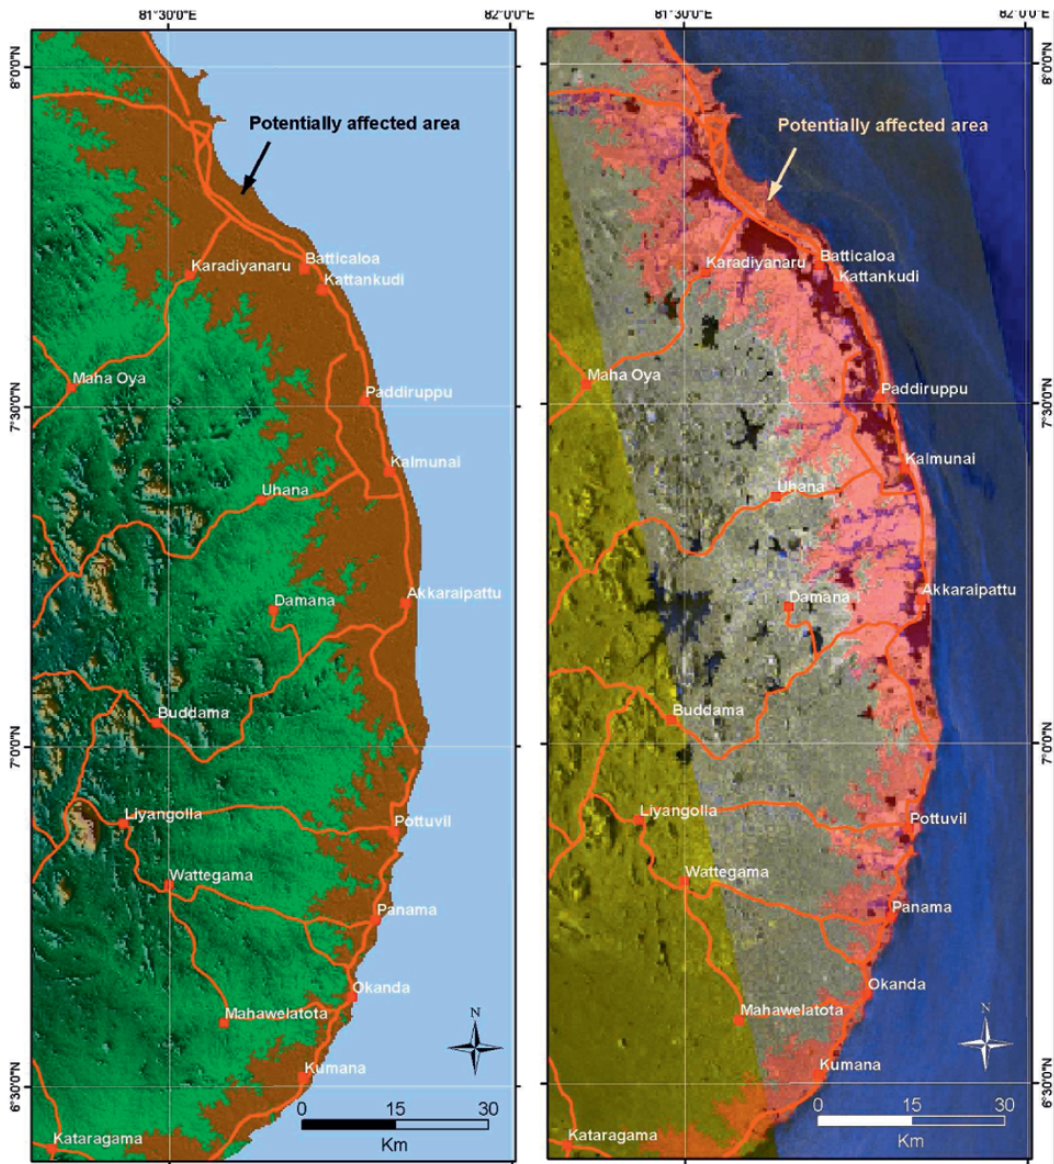

When the tsunami struck, the Dalit population was more vulnerable on a number of grounds, namely their existing impoverishment and the continued discrimination faced by Dalits at the hands of the state and other caste communities. As their livelihoods are inextricably linked to the coast, a high percentage of Dalits live in shanties along the seashore. When the tsunami struck, these shanties were simply washed away along with their occupants. The intersection of geographic proximity and impoverishment resulted in high death tolls among the Dalit communities (Duryog Nivaran 2005b: 45).

In Sri Lanka, the populations of the North and East Provinces are considered more vulnerable, both

through their conflict-affected and ethnic minority status and the prevalent conditions of poverty and underdevelopment in these war-affected provinces (figures 94.2, 94.3, 94.4, 94.5). This part of Sri Lanka is predominantly inhabited by Tamil and Muslim populations who live in relatively segregated communities. Those living in the North and East already bear the consequences of Sri Lanka's armed conflict, including massive displacement, economic disempowerment, socio-cultural upheaval and democratic deficits. The people of the North and East continue to live under the threat of violence (including child recruitment, civilian-military clashes, paramilitary flare-ups etc.) and suffer from underdevelopment (including unemployment, poor infrastructure, feeble local government institutions etc.).

Over half of total tsunami deaths and total tsunami displacement took place along the eastern and northern coasts where the tsunami waves hit with highest impact, and the highest incidences of death and displacement were recorded among impoverished

Figure 93.2: Sri Lanka East Coast. Potentially Affected Areas of the Tsunami (2 January 2005). Comparison Tsunami Pre & Post Crisis Image Comparison in Sri Lanka. **Source:** Produced by SERTIT: at:<http://sertit1.u-strasbg.fr/documents/asie/mid/p32_potentially_affected_area_eastcoast_midres.jpg>.

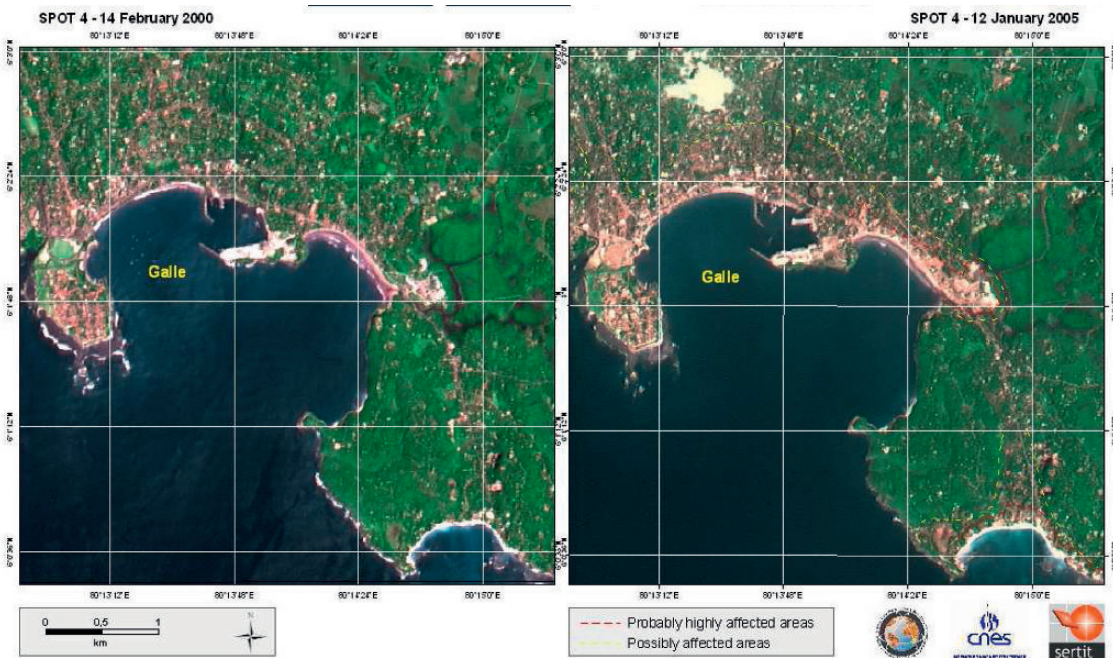

fishing communities living in shanties along the sea-shore. The perception of some was that the natural impact of disaster itself was more severe because “[security] forces had prevented the rebuilding of damaged coral reef in the affected seabed under the guise of security” and that this had robbed the coasts of their natural barriers and left them more vulnerable to the tsunami. Others believe that the North and East recorded higher incidences of injury “...due to lacerations and cuts as a result of people washing up against the barbed wire placed at coastal military posts” (Donor/Civil Society Steering Committee 2005: 63–76).

93.2.2 Vulnerable Within the Vulnerable

The death toll of women is estimated to be three times more than that of men in the Asian tsunami, and in the Kashmir quake it is estimated that more women perished in comparison to men. In both India and Sri Lanka more women than men died. Women and children constitute the majority who died in the tsunami in all locations in Sri Lanka (Oxfam 2005a: 9). The reported casualties in Sri Lanka among the fishing community clearly spell out the disparity; with 63 per cent of the deaths are those of females (3101

Figure 93.3: Satellite images on the Impact of the Tsunami on the South West Coast of Sri Lanka, Galle Area (before and after the disaster). **Source:** UNOSAT; at: <http://unosat.web.cern.ch/unosat/freeproducts/Tsunami/Sertit/Latest/P79_SriLanka_SW_Galle_lowres.jpg>.

deaths of women in comparison to 1769 men GOSL: 2005). In all the tsunami affected 14 administrative districts of the country, except in 3 districts the female death rate among fishing community is more than 60 per cent of the total (GOSL 2005).

In India, Tamil Nadu's worst affected district - Nagapattinam - reported 2406 female and 1883 male deaths (Oxfam 2005: 6). In an overall estimate in India the number of women killed by tsunami is 1.42 times the number of men, while the number of girls killed was 1.65 times the number of boys among children under 15 years of age (Krishnamoorthy 2005: 739).

While there is no gender disaggregated information available on the Kashmir quake casualties, there are reports which indicate that in *North Western Frontier Province* (NWFP) and in Azad Kashmir in Pakistan, more women and children died than men (APWLD 2005a).

The reasons are largely attributed to gender based socio-cultural differences which guide behaviour patterns. Women had less survival possibilities in the tsunami disaster due to their attire and long hair which became impediments to swiftly moving to safety, their inability to climb and swim, the timing of the disaster and their related location at the time. Men were reported to have been mostly outside, and could see the

wave and run to safety; some were out fishing or away from home, while women were inside tending to morning household chores. It is also widely reported that women were trying to save children, elderly and others in need of help during the first wave and were washed away with the second. It is also indicated that their weaker physical strength made it harder for them to hang on to things while carrying children in their arms.

In the Kashmir quake, APWLD Forum News (APWLD 2005a) indicates that in urban areas, social conditioning and patriarchal rules apply, and many women find it difficult to leave the shelter of their homes due to cultural norms of *purdah*.³ In certain areas of the *North Western Frontier Province* (NWFP) women would never leave their homes and run to the streets despite the violent shaking of buildings and concrete walls tumbling down. Such social conditioning and expectations, and the resulting behavioural patterns of both men and women lead to women having less survival or life saving skills and less chances of survival in disaster situations.

3 Purdah is the observance of the concept of veil, where men and women in the community are segregated, women are allowed to interact only with the male members of their immediate family and blood relations.

Figure 93.4: Satellite images on the Impact of the Tsunami on the South East Coast of Sri Lanka, Galle Area (before and after the disaster). **Source:** UNOSAT; at: <http://unosat.web.cern.ch/unosat/freeproducts/Tsunami/Sertit/Latest/P86_SriLanka_SE_mahirawa_lowres.jpg>.

93.3 Disaster Recovery Responses

Variations in the speed of recovery of various individuals and groups are easily traced back to existing vulnerabilities and capacities. Relief and recovery systems and institutional structures discriminate against the more vulnerable and already disaster affected people by design or by ignorance.

93.3.1 Inequalities in Relief Delivery - Disparities, New Divides and Deepening Conflicts

In India, there is evidence of continued institutionalized discrimination and social prejudice directed at Dalits and tribal communities in the delivery of emergency relief. Given their low social status and illiteracy, Dalits found it difficult to register their losses and receive compensation.⁴ According to Human Rights Watch, "...the greatest source of trouble seemed to be discrimination against Dalits by other victims of the tsunami, notably the communities of

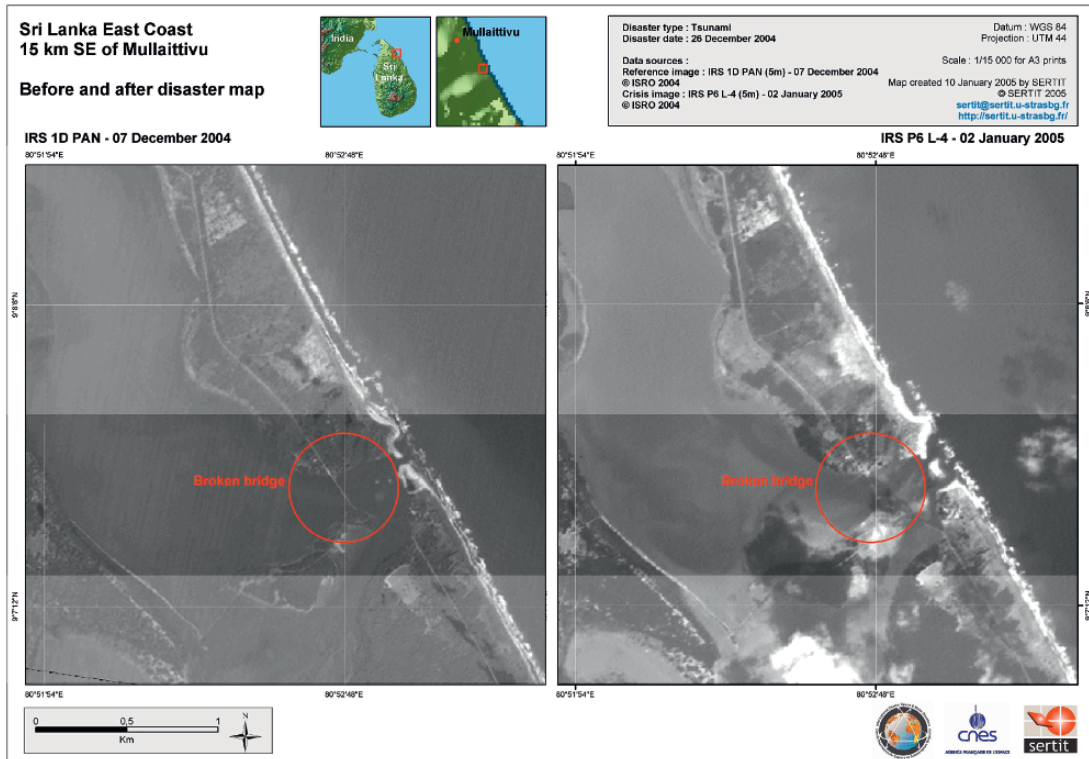

fishermen, who view themselves as belonging to a higher caste" (HRW 2005: summary page). Dalits and tribal groups such as the Irular community also came face-to-face with exclusion and discrimination when seeking shelter. Media reports highlighted that government officials were segregating relief camps by setting-up Meenavar-exclusive camps and dividing Muslims, Dalits and other lower castes into camps of their own. Authorities were divided about segregated shelters for different castes. Some believed that this was the only way to avoid caste conflicts; others thought it would reinforce divides and worsen caste relations.

In Sri Lanka, tsunami-affected communities in the North and East had greater difficulty accessing emergency relief than their country-folk in the South. Physical, social and organizational vulnerabilities played a role. Poor infrastructure and communication facilities, under-developed local government institutions and competing lines of authority between the *Government of Sri Lanka* (GoSL) and the *Liberation Tigers of Tamil Eelam* (LTTE) due to the protracted civil war meant that the emergency relief effort was far slower in reaching the North and East (Donor/Civil Society Steering Committee 2005: 63-76). Communities living in the North and East not only felt that poor infrastructure and strict security impeded delivery of relief to their areas, but also that their conflict-

4 "The After Effects of the Tsunami on Affected Dalit Communities", in: *National Campaign on Dalit Human Rights*, at: <<http://www.indianet.nl>>, January 2005.

Figure 93.5: Satellite images on the Impact of the Tsunami on the East Coast of Sri Lanka (before and after the disaster).

Source: UNOSAT; at: <http://unosat.web.cern.ch/unosat/freeproducts/Tsunami/Seritit/Latest/P63_se_mullaittivu%20irs_before_after_highres.jpeg>.

affected and minority status made them more vulnerable to discrimination and unequal treatment at the hands of government officials. They perceived a media bias to tsunami reporting which also contributed to an influx of emergency relief to the South at the neglect of the North and East (DRMU/HRCSL 2005a: 2-6). Inside the North and East, discrepancies between entitlements accorded to the new tsunami-affected compared with the existing entitlements for communities affected over many years by the conflict also created new divides, deepening schisms between existing divides and breeding fresh anger and resentment among already alienated communities.

93.3.2 Housing Insecurities – Delays and Discriminations

For already vulnerable groups, tsunami displacement turns out to be both protracted and difficult. Fishing families not only bore the brunt of the tsunami's natural impact, but given their existing vulnerability due to poverty, they also faced greater difficulties in recovering their homes and regaining their livelihoods. Those relatively better off were able to procure alter-

nate housing while the more impoverished had no choice but to languish in transitional shelters.

In Sri Lanka, the rebuilding of 100,000 houses for tsunami-displaced families has been long and arduous; one that has been complicated by the scarcity of land, bureaucratic procedures, political manoeuvring, donor inefficiency and apathy. While the rebuilding delays affected all displaced persons, its impact is most severe on communities living in the North and East. Half of total tsunami displacement occurred on the Eastern coast and the predominantly Muslim communities were most affected (DRMU/ HRCSL 2005: 2-6). The Government's buffer zone policy⁵ – prohibiting the construction of new houses and other buildings within 100 meters of the southern coast and 200 meters of the northern and eastern coasts – proved more detrimental to finding housing solutions for coastal communities in the East, given the very high numbers of displaced and the pre-existing land scarcity (Shanmugaratnam 2005). There was also a preva-

5 This policy was subsequently revised and the buffer zone was determined on a case by case basis according to the geographical contours of the coastal belt.

lent impression that the variations on the buffer zone policy were a further act of discrimination against communities in the North and East (Donor/Civil Society Steering Committee 2005: 63–76).

There was a clear ethno-regional variant to the pace of housing construction. The vast discrepancies cannot be entirely written-off against physical or organizational vulnerability alone, and have to do with the electoral and ethno-political realities of the country. As potential vote banks, the predominantly Sinhala tsunami-affected in the South commanded much greater leverage than their predominantly Tamil and Muslim counterparts in the North and East. As a result of becoming a tool for political mileage, tsunami resettlement in the South happened at a far more accelerated pace, and not to the same extent in the North and East.

Table 93.1: Post-tsunami Construction Status – Donor-built Housing Projects (December 2005).
Source: RADA (2005: 12).

District	Total houses damaged	Total units assigned to donors	Total under construction
East	50460	12208	2242
North	10953	3621	878
South	24,329	10298	6157

93.3.3 Poor Protection of Women’s Property Rights

Lines of inheritance and property rights are not in favour of women in many South Asian countries. In the aftermath of any disaster this issue comes to the fore when widows, female headed households and daughters of deceased parents are confronted with the problem of providing proof of ownership of land and other properties.

In Pakistan, there were incidents reported of male relatives of the dead seizing houses and property, and many women in Pakistan with no adult, male children face potential seizure of property, usually by male relatives. Similarly in Sri Lanka, a report by the *Women’s Division of the Human Rights Commission in Sri Lanka* (DRMU/HRCSL 2005b) highlights some particularly serious consequences for women in the North and East of Sri Lanka where the *dowry* system is practiced. Dowry (or property) under this system is passed through the matrilineal line as a type of collateral for marriage.

In the tsunami recovery activities it was observed that when issuing new deeds, some government servants were giving preference to male heads of households despite properties previously being in the name of the women. The report also indicates that in cases where land was not owned outright by tsunami victims but was state property, loss of documentation can lead to discrimination against women through the law. The existing law in Sri Lanka discriminates against the female relative by giving priority to the elder male (DRMU/HRCSL 2005b).

93.3.4 Regaining Lost Livelihoods at the Cost of Creating Opportunities and Strengthening Livelihoods

In livelihood recovery, those most-affected were those already lacking access to property and capital. These same persons were excluded from many economic livelihood programmes that focused on restoring lost economic opportunities without taking into consideration those who had none to begin with. As a result, the recovery process/recovery assistance is largely unable to provide livelihood security for the most vulnerable, which can not only increase their levels of risk and insecurity for future disasters, but also pull them further down in the levels of poverty.

In Sri Lanka, the brunt of the tsunami’s socio-economic impact has been borne by the fishing communities and large sections of this population are regarded as already underprivileged. According to government estimates, the country lost over 50 per cent of its fishing vessels and over 100,000 fishermen lost their livelihoods, with the largest concentration of estimated losses recorded from the North and East. Here, the lives and livelihoods of fishing communities were already hampered by fishing bans and restrictions in the *High Security Zones* (HSZs), incessant security checks and permit procedures (by the Government and the LTTE) and limited retail, all on account of heightened security conditions of the armed conflict. The socio-economic impact of the tsunami added another layer of vulnerability on these already vulnerable fishing communities. The issue of the buffer zone has serious implications for the livelihood security of fishing communities in all parts of the country, who have not been able to re-settle close to the coast and their source of livelihood. Here too the consequences are especially severe for communities in the North and East given that in the Jaffna district for example, 20–25 per cent of fishermen were

already conflict-displaced and lived in camps away from the coast (ADB, UN & WB 2005).

Similarly in India, the impoverished fishing communities of Tamil Nadu and Kerala bore the burden of the tsunami's socio-economic impact. Dalits suffered proportionately greater losses both directly and indirectly; it is estimated that Dalits lost over 1700 boats in Tamil Nadu; and over 600 catamarans in Kerala, plus fishing nets and other gear. Dalits also suffered significant losses to livestock and agriculture (National Campaign on Dalit Human Rights 2005). Given that a majority of Dalits worked as day labourers in the service of fishing communities their livelihoods were affected by the fishermen's losses.

Livelihood recovery interventions in India and Sri Lanka have adopted owner-centric policies, i.e. addressing the losses of registered owners of property, business, vessels and equipment. This approach neglects the poorer communities who did not own means of production, but depended on their physical labour for sustenance. In India, this largely excludes Dalits and tribals. Many of the livelihood interventions in both contexts seem to focus on 'regaining' lost socio-economic opportunities of those affected instead of seizing post-tsunami reconstruction as an opportunity to better the socio-economic opportunities of the marginalized and to close existing gaps between various groups in the affected regions.

93.3.5 Invisible Capacities and Denied Participation

Disaster management capacities of women and men differ due to their gendered social construction. Women perform multiple roles in day to day life; reproductive, productive, and social. These roles and functions are extended to risk management as well as to emergencies and recovery situations (Enarson/Hearn Morrow 1998; Ariyabandu/Wickramasinghe 2004).

In disaster aftermath, the impact and recovery of men and women is a reflection of the balance between capacities and vulnerabilities, both the actual and perceived. Within the prevailing gender relations in South Asian societies, disaster recovery dynamics work simultaneously to highlight and exacerbate women's vulnerabilities, and to ignore and downplay their skills, potential and capacities.

In disasters and emergencies women are often perceived, portrayed and treated as weak, incapacitated victims who wait for external assistance, despite the fact that in family and community spheres they successfully carry out multiple functions; as household

managers, giving leadership to community initiatives, and managing environmental resources. Capabilities, skills, and what women actually do in preparing for, in managing emergencies and in recovering from crisis is neither recognized nor given space in formal emergency and recovery operations, nor facilitated with resources and skill development opportunities. In most cases women's real and potential contributions are invisible.

Women's subordinated social status within the existing gender relations clearly became an impediment in accessing emergency and recovery relief. In Sri Lanka, government relief schemes effectively excluded women since the basis of all relief packages is the 'householder list' where it is the norm that the 'head of household' is male. This has proven to be a barrier in effectively reaching the affected, and to women directly accessing relief and recovery packages. This barrier is further exacerbated by women in general not having sufficient formal documentation required by government and many NGOs to access relief packages.

It was widely observed in Sri Lanka that women's participation in relief operations and in recovery planning was extremely low from the camp level to the various assessment and planning committees appointed by the government and other agencies. Similarly in Pakistan it was observed that women were not involved in camp management, especially in the camps run by the religious organizations.⁶ Low participation of women has multiple implications; it can lead to ignorance and neglect of women's needs, concerns and priorities, and teams comprised entirely of males may use their power and authority to harass, particularly sexually harass, women. Recovery plans made only by men may not sufficiently include women's perspectives, skills and experiences. By excluding women from recovery teams women are denied opportunities to contribute and to develop their skills and leadership qualities. The cycles of gender biased unequal power relations are further intensified and conditions are created for the perpetuation of the same. It is a tremendous loss to women as individuals, as well as to their families and communities.

Such lost opportunities have implications for women for attaining long-term economic security in terms of accessing better, more diversified and secure livelihood options, accessing credit, savings and insurance, denying them of skill development and empow-

6 Based on field observations by the Rural Development Policy Institute, Islamabad, Pakistan

erment opportunities. Vulnerability of women therefore will remain and intensify, with implications for risk and insecurity of children, elderly and other family members.

Similarly, gender-based social expectations isolate men in the aftermath of disasters, leaving them to deal with their own loss and grief. The formal aspects of psycho-social support bypass men. The gender based social conditioning does not give men and boys space to develop the skills of domestic chores and care giving, facts which are often overlooked in gender blind disaster recovery interventions. The gaps in coping capacities of men in such circumstances can victimize them within the recovery process. There are reports that alcohol consumption and depression among men has increased, leading to more violence in general and domestic violence in particular.

93.3.6 Swimming Through the Tides of Violence

A factor specific to women and girls in disaster situations is sexual violence. In the chaos resulting from the disaster and the disruption of the social and family protection, vulnerability of all women increases in terms of security of person. There is evidence across the globe that violence against women increases in the wake of disasters and that the increased risk is associated with gender inequality and the limited representation of women in disaster responses (Enarson 2000). A study of South Asian legal systems finds that ‘perpetration of gross forms of violence against women through state agencies, in the community and in the family is a manifestation of women’s unequal status and/or perceptions of their inferior status in the family and the community (Goonsekere 2005).

Owing to fear of stigma, cumbersome reporting procedures, and the perception of it as normal, formal reports of rape and other forms of gender-based violence including domestic violence are few. However, it is a fact that gender insensitive post disaster arrangements have created conditions that further exacerbate the pre-existing tendencies of gender-based violence against women. Tsunami affected women in a number of districts in Sri Lanka mentioned that they constantly lived in fear of their own safety and that of their children within and outside camps (UNCT 2005). There were reports of sexual abuse, including gang rape, molestation, and physical abuse of women and girls in the course of unsupervised rescue operations and during the early months in transitional shelter (CATAW 2005; APWLD 2005;

Fisher 2005; Rees/Pittaway/Bartolomei 2005). Although in Sri Lanka sexual harassment is a criminal offence, many women are not aware of this legal sanction and implied protection, and do not have the social and economic standing and status to pursue a legal case.⁷

In Pakistan, similar observations are reported from the camps where Kashmir earthquake victims were residing (APWLD 2005b). Muslim women found the situation specifically difficult given that their culture requires the separation of women from men. Camp conditions increased the levels of risk and vulnerabilities of displaced women who under the circumstances were living in unfamiliar locations and among strangers. Such gender insensitive arrangements encouraged harassment and violence against women (Tsuk 2005). Women living in the tent villages all over the earthquake affected areas stated that they did not feel secure while staying in the camps since there were no proper security arrangements.

93.3.7 Gender Blind Livelihood Recovery

In Sri Lanka, post tsunami livelihood recovery interventions show all the signs of gender blindness. Plans were made without adequate analysis and understanding of the complexities of the livelihood systems of coastal and other affected communities and without a sound base of gender disaggregated data. Mainstream recovery programmes take a sector-based approach, looking at fishery, tourism, agriculture sectors based on damage and needs assessments conducted from a macro point of view. Such assessments cannot capture the subtle dynamics within the sectors, particularly small scale production which the majority of poor and vulnerable communities were involved in prior to the disaster.

The majority of livelihood recovery programmes invest in large-scale infrastructure such as damaged harbours, road networks, larger multi-day boats, cooler trucks, freezers, and fishing gear for large scale fishing. Assistance to the poorer groups in the fishing sector is minimal. Women’s fisheries activities (which often include cleaning and sorting catches, small scale vending, processing fish, repairing nets, and in some places, lagoon fishing) remain invisible and, except for *ad hoc* interventions by NGOs and local *commu-*

7 See: “Women Living Under Muslim Law”, at: <<http://www.wluml.org/english/newsfulltxt.shtml?cmd%5B157%5D=x-157-18552>> (8 September 2005).

nity based organizations (CBOs), are neglected in sector recovery plans.

Women's home-based activities classified as 'informal sector' have received similar treatment, and women are largely absent or marginally represented in the livelihood recovery planning exercises. Thus women are unable to have any substantial influence on these programmes so that they more fully address women's livelihood options, related skill development and other needs. As a consequence, in the aftermath of a disaster, women are generally only able to find work in casual, daily-labour activities.

Most livelihood recovery interventions in Sri Lanka suffer from lack of imagination and drive for 'building back better'- the motto of the national recovery programme. Instead, most efforts are placed on getting back to normalcy. Income generation options and skill development programmes are stereotyped and lack gender sensitivity to encourage women to obtain new skills and facilitate innovation in home-based work. Due to socio-cultural constraints, particularly concerning their mobility, women usually do not get the opportunity for skill improvements unless efforts are specifically targeted at women in a socially appropriate manner. This requires imagination on the part of the recovery planners. Ill-informed and poorly planned livelihood recovery activities deepen poverty levels of women. Only a few exceptions can be seen in cases of individual women who defy tradition and challenge existing norms in order to survive within the circumstances into which they were pushed by such disasters (Koster 2006).

Although there is a renewed focus on gender issues since these two major disasters, willingness to address gender concerns is marred primarily by two factors; not having sufficient cadres of gender sensitive professionals (from the lowest to highest levels of planning and implementation and both at national and local levels), and lack of continued commitment at the policy and implementation levels.

93.4 Breaking the Vicious Cycle of Vulnerability – Securing Lives and Livelihoods

The interrelationship between development, poverty, vulnerability and disaster risk has been well established both conceptually and in practice (Duryog Nivaran 2005c; UNDP 2004; UN/ISDR 2005). Pre-existing vulnerabilities are compounded by insensitive relief and recovery efforts, reinforcing oppressive sys-

tems and structures, deepening levels of vulnerability and effectively strengthening the vicious cycle of vulnerability. The key to both poverty reduction and disaster risk reduction lies in reducing vulnerabilities. To secure people from poverty and disaster risk, the dynamic interlinkages which lead to vulnerability have to be tackled. Increasing levels of security in a sustainable manner needs to be approached through strengthening livelihood security and reducing income insecurity, to build more resilient livelihoods.

Recovering and replacing lost assets and factoring in disaster risk is an integral part of ensuring security of vulnerable groups. People with stable and secure livelihoods develop economic, food, health securities, and have better abilities to face disaster risk and recover from the losses, and therefore are less vulnerable to the impacts of hazards. Building disaster strong livelihoods is an outcome of appropriate development and disaster recovery interventions; which is a combination of responsive governance, responsive policy, socially responsible markets, disaster resistant community physical and social infrastructure, and collective community initiatives (Duryog Nivaran 2005b).⁸ These same principles can guide larger recovery and development programmes; making the investment longer lasting, leading to resilience rather than aid dependency – helping to ensure that vulnerable people are not pushed further down in the spiral of poverty and vulnerability.

Those mandated or inspired to respond to disasters should do so bearing in mind a few salient points.

- *There needs to be awareness of significant inequalities, imbalances and discriminatory practices in pre-disaster situations that render certain groups more vulnerable to disasters.* Also on a related note, there is sometimes a tendency to make recovery interventions armed with a set of assumed vulnerabilities and formulaic responses. However each disaster situation is unique; and alongside the more traditional and visible vulnerabilities there could also be new and subtler vulnerabilities that might be overlooked or ignored. Therefore it is important to carefully analyse the ground situation to assess the vulnerabilities that are specific to each situation instead of entering the post-disaster phase with a pre-determined and pre-programmed list.

⁸ See for a detailed discussion on the *Disaster Resistant Sustainable Livelihoods (DRSL) Framework* that was developed based on extensive research and field applications in South Asia in: ITDG/RDPI (2005).

- *There needs to be consultation with the affected communities.* In most cases, recovery planning takes place at the macro-level with little or no consultation, the consequences of which are most detrimental to already vulnerable groups, leading to heighten the levels of risk and insecurity. A systematic process of consultations – for example through town hall meetings, opinion surveys, focus group discussions etc. – will ensure a greater correspondence between recovery needs and recovery interventions, will reduce the likelihood of wastage and corruption and minimize feelings of isolation and victimization among the affected. It is imperative to ensure that the processes by which the affected are consulted do not themselves exclude the vulnerable and marginalized. For example, it is important to be sensitive to identity hierarchies and how they affect people’s participation in consultative processes.
- *Recovery interventions cannot be identity-blind.* Recovery interventions will serve better if they take into consideration the existing socio-economic hierarchies and cater to the needs of those at the very bottom of such hierarchies.
- *Recovery offers an opportunity to change existing vulnerabilities.* Recovery interventions that are focused on restoring the losses of those affected do little to help those that had little or nothing to begin with. Disaster recovery efforts should, at minimum, be geared towards not worsening the inequities of vulnerable groups and should optimally be geared to empower such groups and weaken the vicious cycle of vulnerability.
- Research and investment on context specific gender and vulnerability analysis, developing analytical frameworks and application tools for the benefit of the humanitarian community.

93.4.2 Challenge the Gaps

- Parallel to awareness building, develop accountability mechanisms, indicators for monitoring how the identity related concerns are addressed in humanitarian response and early recovery.
- Develop enforcement mechanisms for accountability on the sensitivity on identity issues tied with investment plans.
- Include the identity issues into the education curricular (primary, secondary, and tertiary), support the process with knowledge products, expertise, investment.
- Facilitate forums and networks to support changing the attitudes with identity based facts.

More specifically, in order to make significant changes in gendered and other identity related imbalances and discrimination in ensuring human security the following recommendations are proposed aimed at the policy, donor and academic community:

93.4.1 Develop Knowledge, Awareness and Capacities

- Action research and analysis for conceptual clarity on development – socio economic vulnerabilities – disasters.
- Application of the conceptual knowledge available when investing on disaster reduction and development programmes and encourage national stakeholders to do the same.
- Awareness programmes on identity-based vulnerabilities targeting donor agencies, national and local governments and civil society actors.

94 Failed Narco-state or a Human Security Failure? Ethical and Methodological Ruptures with a Traditional Read of the Afghan Quagmire

Shahrbanou Tadjbakhsh

94.1 Introduction

In international relations theories, the notion of 'security' is primarily codified as the prerogative of states (realism), and of states and institutions (liberalism) to be free from what Buzan, Wæver and de Wilde (1998: 5) call any danger that presents "an existential threat." Yet, the supremacy of states and institutions as the designated referent objects of security has been increasingly questioned by constructivists, feminists, and critical theorists who paved the way for the emergence of individuals as the main focus of the object and subject of 'security'.

The term 'human security', coined in the 1994 UNDP *Human Development Report*, reminds us that the individual is just as exposed to the risk of a nuclear power plant disaster, an epidemic or of starvation as to the threat of an interstate conflagration. Although the academic and political community is divided in its competing definitions of human security¹, the UNDP definition, described as "freedom from fear and freedom from want" (UNDP 1994), debunked the question of 'security' from its traditional conception of the safety of states from military threats to concentrate on the safety of people and communities. Since then, the central tenets of human security - the interdependence of security, development and human rights and the imperative of protecting and empowering individuals - have been echoed in various foreign policy documents (Japan and Canada), the UN (2004; Annan 2005), international commissions (ICISS 2001; CHS 2003), in regional organizations

such as the EU² and in exploding academic debates (Tadjbakhsh/Chenoy 2006).

Since the mid-1990's, similar interest grew in the concept of 'failed' or 'fragile states' among academic circles, an interest which then magnified among the international political community, especially those in the West, after the 11 September 2001 attacks made them imminently familiar with the global threats emerging from the failure or vacuum of some states³. In a rapprochement of experts of security and development studies, underdevelopment and gross human rights violations were explored in ways that these could lead to state failure and violent conflict, which would present dangers for international security and the institutions of weak, poor states.⁴

The concept of 'human security' is anything but neutral from a political or an intellectual point of view, as it implies a renewed look at existing paradigms of security and responsibilities. So is the concept of state failure and fragility. Similar to the human security concept, analysts do not agree on precisely what the terms of 'failed' or 'fragile' states mean. In both instances, the task of definition is further complicated by the opprobrium by government officials, political leaders and development agencies. A com-

1 For a detailed analysis of the various definitions, critiques and counter-critiques, see Brauch (2008, 2008a) and for an extensive bibliography, see Tadjbakhsh and Chenoy (2006).

3 For extensive discussions on the concepts and features of fragile, failing or failed states in the academic literature see: See Brown (1996), Rotberg (2002), Rice (2003); Crocker (2003), Fukuyama (2004); Rotberg (2004), Krasner/Pascual (2005)

4 In the previous volume of this book series the development and security linkages were addressed by Brauch (2008a), Uvin (2008), Sending (2008), Katseli (2008) and by Klingebiel/Roehder (2008).

mon analytical approach to both debates is to forego definitions in favour of characterization, of what constitutes the nature of failed states and what human security entails. This author proposes a constructivist view of the political and normative usage of these terms to see whether these two ultimately political concepts are compatible. Does the application of the concept of human security, used in this chapter in its broad definition of 'freedom from fear, freedom from want and a life of dignity', both as an analytical framework and as an end goal, help to recognize, understand and respond to the structural fragility within states?

94.1.1 Purpose of the Chapter

Using the case of Afghanistan, this chapter seeks to demonstrate the differences, both in the conceptualization and the operationalization of fragile states as 'dangerous' from the state-based, institutional based and human based point of views. The human security approach is proposed as a critical, analytical and operational framework which refutes the instrumentalization of societies and states, and people within them for a good called 'international security', on the one hand, and the focus on the viability of institutions as ends by themselves as the other.

By 2007, five years since they had been driven out of power by the US and its allies, the rearmed and revived Taliban and their Al-Qaeda partners had begun a major offensive against NATO and US coalition troops, using suicide bombers and roadside bombs. Afghanistan had come to be considered a failed 'narco-state', with an impoverished and dissatisfied population, renewed violent insurgencies, and once again the largest production of opium poppies in the world. A window of opportunity on peacebuilding and stabilization seemed to have closed and, like the Russians and British invaders before them, the American and their NATO allies were in danger of suffering defeat in the rugged land of Afghanistan. This chapter makes the case that the post-conflict reconstruction and peace-building process in Afghanistan was doomed to fail because of the fixation of the international community on the traditional 'national security' paradigm within the state-building process and the lack of proper attention to the people, their needs and their perceptions.

94.1.2 Structure of the Chapter

The chapter is divided in two parts: it first proposes an ethical rupture by reviewing the differences between a traditional (security based or institutional based) approach and a human security approach to 'conceptualizing' fragile states (95.2). It will scrutinize differences in terms of evaluations of failure, strength and weaknesses, as well as motivations for engagement from the three different points of views. It will argue that the human security framework poses an ethical challenge to realism and institutional liberalism by introducing the element of human dignity. It then suggests a methodological rupture with traditional approaches to responses and responsibilities of the international community (95.3). Questions of interventions, stabilization, aid, and a liberal approach to state-building are scrutinized from the realist, liberal and human security viewpoints and as applied in Afghanistan, before proposing an alternate framework of engagement. It will argue that the human security framework proposes different solutions to the problems of efficiency and legitimacy of states and their institutions, specifically in the cases of 'failed states' (95.4).

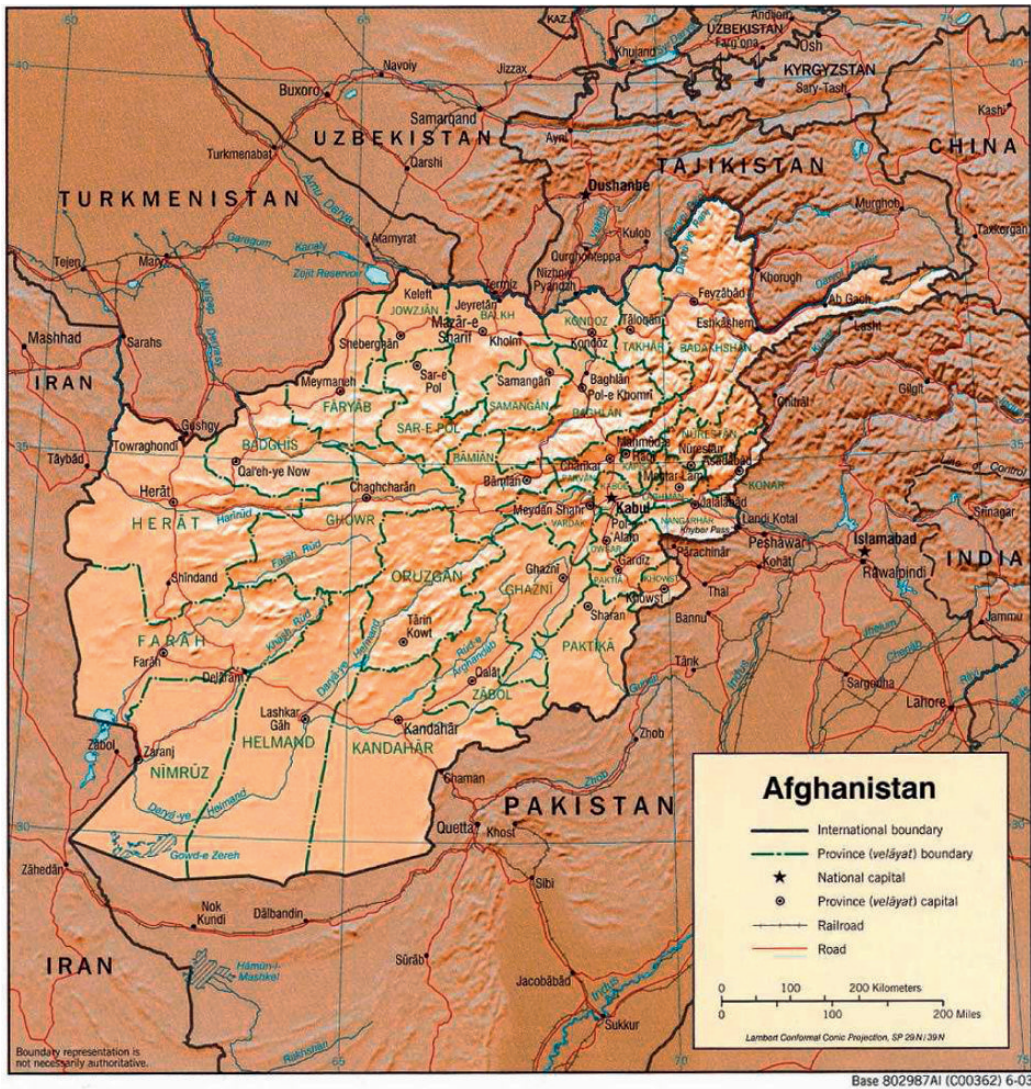

94.2 Conceptualizing the State and Its Failures, Motivations and Evaluations

94.2.1 The Realist View of 'Danger to International Security'

Security is considered by realists as being almost synonymous with military power (Møller 2001: 41). Since the peace treaties of Westphalia in 1648, the Hobbesian model of the state has said to provide security for people living within its borders in exchange of the monopoly of the legitimate means of use of physical force within this territory, that is to say in exchange for state sovereignty. However, a large number of states today are partly or completely failing to fulfill their social contract to protect people (Mack 2004a). In lacking the ability to provide for security, the failed or failing state has endangered its sovereignty, and as a consequence, is considered "utterly incapable of sustaining itself as a member of the international community" (Helman/Ratner 1992: 3).

For realist experts, threats to international security stem from *weapons of mass destruction* (WMD), terrorism, non-state actors who misuse their access to

Figure 94.1: Relief Map of Afghanistan (2003). **Source:** University of Texas at Austin, Perry-Castañeda Library Map Collection; at: <http://www.lib.utexas.edu/maps/middle_east_and_asia/afghanistan_rel_2003.jpg>. This map is in the public domain.

means of violence and some non-traditional but nonetheless potentially destabilizing threats as narcotics and arms trafficking. From this constant has come a consensus that weak or failing states, which are a breeding ground of those phenomena, have implications for international security in that their very weakness can ‘spill over’ and threaten neighbours, in the classic security dilemma, in the form of refugees, arms, diseases and conflicts coming over the borders. This view can be labeled as ‘functional’ as it sees the problem of fragility from the point of view of potential spill-overs and triggers for conflict: terrorism, weapons proliferation, organized crime, regional instability, global pandemics, and energy insecurity, etc.

This thinking has led to the conceptualization of ‘failed states as dangerous’. Fukuyama writes for example that “weak or failed states are the source of many of the world’s most serious problems” (Fukuyama 2004).

For realist security experts and nations portraying themselves as custodians of collective security, i.e. the 5 members of the Security Council, threats are to international and regional security, as well as to the national security of faraway nations which can become victims, as the US was on 11 September 2001.

The danger of failed states for international security was propagated for example in the UN Report of the High Level Panel on Threats and Responsibilities,

which maintained that the neglect of non-traditional threats could be detrimental not only to the people's existential survival but also to that of the state as the basic unit of the international system (UN High Level Panel 2004). Threats to regional security prompted Javier Solana to solicit a *Human Security Doctrine for Europe*, which claimed that "In an era of global interdependence, Europeans can no longer feel secure when large parts of the world are insecure" (Study Group on Europe's Security Capabilities, 2004)⁵.

This thinking was also reflected in the position of the US which came to equate its own national security with stability and order in the world's poorest regions. The Report of the *Commission on Weak States and US National Security* raised the alarm on states that "mattered to US national security, American values and the prospects for global economic growth" (Center for Global Development 2004: 1).

The mostly northern government-led designation of some countries as 'fragile, failing, or failed' however raises concerns over the conflation of the military security agenda of Western nations engaged in a 'War against Terror' with the security needs of civilians suffering violence and injustice. It has also hinted at the fallacy of a conceptualization of danger linked with geopolitical factors. The 11 September 2001 attacks shifted security preoccupations away from threats emanating from powerful states, a danger that had dissipated with the collapse of the Cold War alliances, toward those emanating from weak states (Simpson 2007).

94.2.2 The Liberal Institutional View: Underdevelopment as Dangerous

In the liberal literature on fragile and failed states, strength is measured by the state's ability and willingness to provide fundamental political goods associated with statehood; notably physical security, legitimate political institutions, economic management, and social welfare (Patrick 2006: 29). From the liberal/institutional point of view, failed states can no longer perform the basic functions of providing for these basic goods usually due to the weakness or inexistence of institutions as a result of violence or extreme poverty. Strong states are distinguished from weak ones, and weak states from failed or collapsed

states, Rotberg asserts, "according to the levels of their effective delivery of the most crucial political goods" (Rotberg 2003: 4). Failed states are defined by the patterns of governmental collapse within a nation, and also by the degree to which they have lost their monopoly on violence to non-state actors.

From a liberal standpoint, threats emanating from failed states have primarily negative impacts on institutions. Terrorism, trans-national crime, trafficking of people, arms and drugs, as well as communicable diseases, are said to emanate from the breakdown of law and order institutions, porous borders, breakdown in public health care, and the general contagion effects of chaos. These threats are said to cause direct impacts, such as the loss of lives, public health epidemics, and indirect ones through the imposition of high economic costs. The liberal view is especially concerned with the threats to financial institutions, be they to the flow of the capital markets, to the potential for investments, and, increasingly, to the global energy market by increasing the volatility, costs and risks of interruption of supplies of oil and gas. From a liberal point of view, fragile and failed states are also a threat to institutions such as democracy. As the *Commission on Failed States* in the US notes, even "the human costs of state failure - when governments cannot or will not meet the real needs of their citizens - challenge American values and moral leadership around the globe" (Center for Global Development 2004: 2). Within this conception, even the human costs are not a 'bad' by themselves but specifically because they render major powers powerless.

If the realist political community conceptualized 'fragile states as dangerous for international security' per se, development specialists, bilateral aid agencies and international financial institutions influenced by the liberal school, concentrated on 'underdevelopment as dangerous'. When conflict was seen as a de-developing process (Collier/Elliott/Hegre/Hoeffler/Reynal-Querol/Sambanis 2003), then underdevelopment was also potentially dangerous, because it not only potentially led to intra-state conflicts, but also to the export of new non-traditional threats to a wider geography than the territory of a state to other more affluent societies.

If underdevelopment was seen as potentially 'dangerous', then development was therefore reconceptualized as a security strategy (Duffield 2001). From this stemmed interest among international development and financial institutions in the question of aid effectiveness in 'difficult environments'.

5 In the Barcelona Report *Human Security Doctrine for Europe*, human security refers to freedom for individuals from basic insecurities caused by gross human rights violations.

If previous contention was to avoid such countries where aid could be wasted, new thinking revolved around using aid precisely to strengthen weak states' institutions and policies, in order to ensure the achievement of the *Millennium Development Goals* (MDGs).

This approach prompted the OECD to seek aid coordination and harmonization in 'difficult partnerships' and define fragile states as "countries where there is a lack of political commitment and insufficient capacity to develop and implement pro-poor policies" (OECD/DAC 2005: 2). It also permeated through the work of the British Department for International Cooperation (DfID) which recognized weakness where "the government cannot or will not deliver core functions to the majority of its people, including the poor," (DfID 2005: 7) and the World Bank, which set up a Conflict Prevention and Reconstruction Unit to assess the causes, consequences and characteristics of conflicts.

In terms of measuring fragility, two measures are often used in liberal institutional literature: (1) poor economic performance, measured by the GDP and (2) bad 'governance', measured of by the World Bank's *Country Policy and Institutional Assessment* (CPIA) ranking, an aggregate quantitative indicator of the quality of macro-economic management, of the government and public sector, and of structural and poverty-reduction policies. The focus is on the strength of institutions and on the 'soundness' of policies, judged against liberal norms.

The *Failed State Index* for example, uses 12 criteria such as mounting demographic pressures, economic inequality and decline, human flight and displacement, criminalization of the state, progressive deterioration of public services, fragmented political power, and widespread violations of human rights and intervention of other states among others to rank 146 nations according to their viability as states. These indicators are based mainly on the threats to the states and their institutions but not on the more subjective measures of empowerment, such as participation in political process, or subjective feelings of security from the point of view of populations, admittedly difficult to obtain and calculate at aggregate levels.⁶

94.2.3 The Human Security Alternative: Legitimacy from the Point of View of Populations

From a human security point of view, the primary threat in weak or failed states is to the survival, livelihood and dignity of the population, whether these threats induce destabilizing conflicts or not (Tadjbakhsh/Chenoy 2006: 167). Thus, for example, poverty is conceptualized as a 'threat' to human dignity, even though it may not lead to conflict, or may not necessarily be directly linked to aid or institutional effectiveness. The emphasis is therefore on the people within a state rather than the existence, power or nature of the state itself. Institutions become means and the individual become both objects and 'agents' of change. By human security definition, a weak state is one which cannot exercise its primary function of social protection and therefore fails in its duty to protect, care for and empower its citizens (Hampson/Daudelin/Hay/Reid/Martin 2002). It thus loses its most important asset: legitimacy, echoing Rotberg's claim that when nation-states fail to deliver positive political goods to their people, "[t]heir governments lose legitimacy and, in the eyes and hearts of a growing plurality of its citizens, the nation-state itself becomes illegitimate" (Rotberg 2002: 85).

Within human security discourses, fragile or failed states, and the underdevelopment that stems from and within them, are not only 'dangerous' to the international security, or a challenge to the institutions of good governance. Threats to the security of the states (their power, territory and sovereignty), to markets (their solubility and vulnerability), and to democracy (its sustainability and process) are recognized as vulnerabilities because they ultimately affect the dignity, well-being, capabilities, opportunities, and freedoms of people.

It is not a matter of judging weakness or strength normatively but against the outcomes they are able to achieve from the point of view of the population. Furthermore, while the human security approach also recognizes that various threats can spread within a given country, bleed into other regions, and negatively impact global security, the inter-connections of threats is viewed from the way that these are mutually linked in a domino effect within the human geography: health insecurity could lead to poverty, which could lead to education deficits, etc. Responses to insecurities stemming from environmental degradation could contribute to population displacement, deterio-

6 The Failed State Index for 2006 calculated by the Fund for Peace (2006), gave a value of 99.8 for Afghanistan, considerably better than the 112.3 value of Sudan, ranked first in the index. See at: <http://www.fundforpeace.org/publications/profiles/cp_afghanistan.pdf>.

ration of health, hunger, loss of livelihoods, and so on.

To recognize fragility, therefore, instead of measuring the effectiveness of institutions (such as bad governance) or their performance through monetary indicators (such as GDP), it is necessary to take the query to the level of individuals, to look at indicators of poverty, inequality, access to health services, literacy, participation etc. in short, human outcome indicators. It is also necessary to measure human security through qualitative studies that assess people's own evaluation of how secure, provided for and empowered they really feel. Weakness is ultimately judged through public opinion.

Engagement in failed and fragile states, from a human security point of view, is therefore based on the principle of ethics, and not the purely functional of achieving a good for international security or institutional stability. Additionally, from a human security point of view, the reason why a state is failing would also be scrutinized. The realist or institutional focus on 'failed states' locates failure in the state itself. Yet, global arms trade, unfair trade regimes, and conditioning loans and grants on structural adjustment policies that minimize state functions and social service spending would also be seen as 'dangerous' to the local populations as would be the nature of their states' viability. When the international system is locked in a pattern of 'mutual vulnerability' through the core-periphery model, no region in the international system is immune to the risks that affect the human security of others (Nef 1999). Responsibilities for inducing failure, including through externally-led regime change, would therefore need to be shared.

94.2.4 Alternative Reads of the Afghan Quagmire

From a realist and liberal point of view, Afghanistan under the Taliban regime was an optimal example of how non-state actors like al Qaeda used the government of a failed state to carry out a campaign against a state adversary, the US, with global consequences.

A realist read of the motivations of the international intervention would therefore argue that the initial preoccupation with creating stability in Afghanistan was for selfish reasons and that the intervention was based on self-interest and power politics. Only when instability in Afghanistan began to bleed into insecurities for the Western world did the world community, led by the U.S, respond through military force.

A document called *Securing Afghanistan's Future* prepared for a donor Conference in Berlin in 2003 for example argued that unless the international community provided adequate assistance, Afghanistan would become a narco-mafia state. The traditional security discourse, as well as the traditional economic and institutional views which perpetuated in the documents prepared for donor conferences in Tokyo (2002), Berlin (2004) and London (2006), identified regional stability, territorial security for the nation-state, and even security of political and economic systems (the presidential elections, the potential for investments, democracy) as units of consideration.

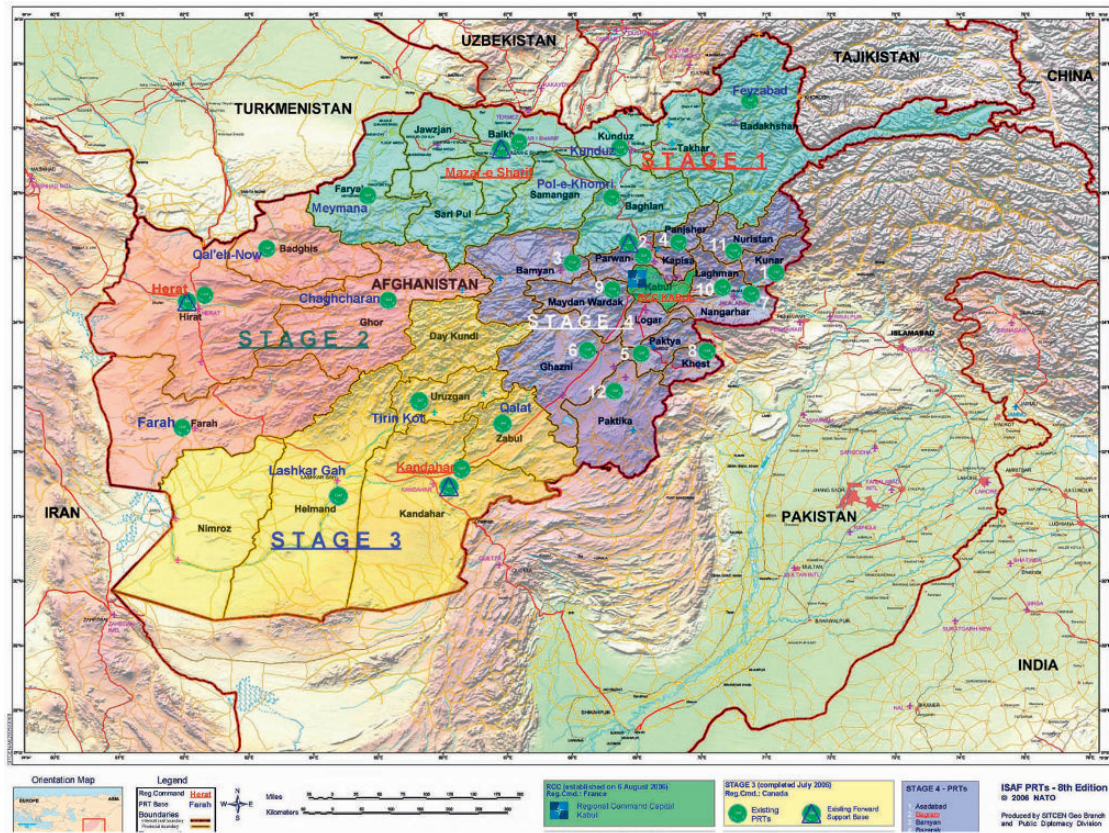

The human security point of view breaks in five respects with this traditional read of the 'security problem' of Afghanistan.

First, a human security approach would require an ethical motivation for international engagement on meeting the needs of the Afghan population, and not a functional view of the potential cost that a narco-mafia state would have on the international and regional regimes. Given that insecurities, conflicts and state failures were the result of decades of conflicts compounded by foreign interference, the ethical responsibility would be to restore the long denied human security of the people of Afghanistan based on the welfare needs, as well as the rights, of the Afghan population, not as an indication of concerns for global and regional insecurity. This view would be critical to the self-interest of the West, both during the Cold War which saw the politicization of aid to overthrow the Soviet-backed regime, and the post-Taliban period, where winning the 'War against Terrorism' often led to the blurring of certain humanitarian principles and codes of practice (Barakat 2002).

Second, the Taliban regime, which had the monopoly of violence and security before the US intervention in October 2001, could be considered in fact a strong realist state. From a human security point of view, however, the Taliban regime would be considered a willing weak state which could not provide the necessary development and human rights needs of its population. The post-intervention Afghan 'state', could further be considered a weak incapable state which was challenged in its functions to provide, protect and empower its citizens, beyond being a threat to citizens of other countries through exporting instability and hosting terrorists.

Third, indications of 'insecurity' would not only focus on the presence of terrorists or Taliban groups and narco-trafficking, but instead on the lack of jobs, food, housing, education services, healthcare, civic

Figure 94.2: NATO in Afghanistan: International Security Assistance Force (ISAF) and Provincial Reconstruction Teams (PRTs). Data valid as of 15 November 2006 **Source:** NATO; at: <<http://www.nato.int/issues/afghanistan/graphics/e040628a.jpg>>.

amenities etc. The failure of security would not be then blamed on the national army, the police or NATO troops, but on the fact that the reconstruction process had not generated the means to provide services and jobs and protect human rights in the country, especially in rural areas. In 2004, for example, when international discussions concentrated on the expansion of NATO troops throughout the country, Afghanistan had the worst education system in the world, with nearly three-quarters of all adult Afghans illiterate and fewer than one in five girls in school (figure 94.2). Half of all Afghans were poor, only thirteen percent had access to safe water, and average life expectancy loomed at 44.5 years (Tadjbakhsh/Saba/Zakhilwal 2004).

Fourth, inequalities in access to goods and services would be deemed more ‘dangerous’ to the local population than the presence of insurgents. From a human security point of view, the potential for further cycles of instability and conflict in Afghanistan were because of the continued existence of ‘horizontal inequalities’ between groups within society (Stewart

1999) whether ethnic, religious or social. Inequalities persisted not only in income distribution but also in political participation (in parliaments, cabinets, armies and local governments), in economic assets (in land, human capital and communal resources) and in social conditions (in education, housing and employment). Because these grievances had been manipulated to lead to and sustain conflicts in the past, their continued existence in the Afghan society was, in fact, dangerous.

Finally, using the human security approach would require looking not at the forms of good governance and democratic institutions existing in Afghanistan (i.e. elections, constitutions, parliaments etc.), but more about the legitimacy of their contents and the legitimacy of their provenance. Could these institutions, and the new state that had been created out of the intervention, provide for public goods? Did they have the capacity to regulate, distribute and empower? Were they deemed as legitimate by the majority of Afghans? When states are heavily dependent on foreign funding, legitimacy is often endangered as they be-

come accountable to the demands of external actors as opposed to their own constituencies. When models are imposed from outside and regimes are changed through military interventions, as historically they had been in Afghanistan throughout the occupations by the British, Soviets and Americans, legitimacy is not guaranteed from a human security point of view. As Luckham argues, “In the case of collapsed states, it makes a lot of difference whether the state fell apart from within or was brought down by external intervention. The latter almost inevitably makes foreign powers and even international agencies de facto parties in the conflict, making it much harder for them to act as legitimate honest brokers with a credible claim to be able to resolve it” (Luckham 2005: 34).

94.3 How to Deal with Failed States? Responses and Responsibilities

94.3.1 To Intervene or Not?

The realist conceptualization of failed states as dangerous for international, regional and national security requires a security-based response and immediate engagement by international powers, echoing their prerogative authorized by Chapter VII of the UN Charter. The shift of the debate away from the right of some states to intervene to the responsibility to protect by all states was first raised in the context of the right or duty to intervene for humanitarian reasons (Bettati/Kouchner 1987), and later crystallized through the Canadian sponsored *International Commission on Intervention and State Sovereignty* (ICISS) in 2001. The commission’s final report, *The Responsibility to Protect* contented that where a population “is suffering harm, as a result of internal war, insurgency, repression or state failure, and the state in question is unwilling or unable to halt or avert it, the principle of non-intervention yields to the international responsibility to protect” (ICISS 2001). The *Responsibility to Protect* (RTP) norm was endorsed at the 2005 World Summit of the UN, paragraph 139 in the Final Summit Outcome of the UN in 2005.

While the RTP faced criticism for its carte blanche to international military action and the erosion of sovereignty, from southern countries vocal through the G77 and the Non-Aligned Movement, the protest lost its moral force in situations where the states had already failed and sovereignty had been dissipated by a government’s failure to fulfill its core responsibilities, including provision of basic physical security and pro-

tection of citizens’ rights (Luckham 2005: 18). The supremacy of sovereignty had already been dented in 1993 when Francis M. Deng et al. (1996) articulated the idea of ‘sovereignty as responsibility’, and consequently adopted by Kofi Annan in his dual qualification of sovereignty, which not only protected a state from unwarranted outside interference but also obligated it to respect the basic rights and interests of its own citizens (Annan 1999). In the case where the state was unable or unwilling to exercise its sovereignty as responsibility, the ICISS proposed that this surrogate sovereignty would have to be replaced by “a more robust and genuinely equitable multilateralism, based on common norms and principles accepted by all the major international actors” (Luckham 2005: 18).

However, a number of factors came to debunk the moral supremacy of the RTP discourse and practice, even in failed states, where sovereignty had eroded with the collapse of the state:

First, the RTP Report was introduced in the coincidental aftermath (for the commission had been set up by Canada in September 2000) of the September 11 attacks which shifted the debate and actions away from military intervention on behalf of others to interventions in self-defense in a global campaign against a ‘War on Terrorism’. The US administration’s pre-emptive war, and use of force to confront perceived threats to its national security concerns in echo of the right, under the controversial Article 51 of the UN charter, prompted Chomsky to criticize it as an “imperial grand strategy” and “the right to commit aggression, plain and simple” in the name of humanitarian ideals (Chomsky 2006). This enshrining of national interest in the guise of morality reminded critics of the era of colonialism, where European governments insisted on their “white man’s burden,” “la mission civilisatrice,” and moral duty to bring peace, justice, and civilization while in fact pursuing territory, geo-strategic advantage, and natural resources.

Second, the focus of RTP was only on partial human security threats: Interventions by international and regional organizations were discussed in the context of promoting ‘freedom from fear’ and human rights. The ‘just cause’ criteria within the discourse set the bar for international intervention at ‘large-scale loss of life’ or ‘large-scale ethnic cleansing’. This limited international responsibility to reacting to violent punctual threats, and mostly as a punitive response to the actions of states that were willingly infringing harm on their population. Thus, the international community saw itself less responsible for interventions in cases of gross underdevelopment, poverty,

famine or environmental disasters, either man-made or natural.

Third, critics argued that interventions by themselves often led to more killings, both directly and indirectly, and increased human rights violations, which exacerbated, rather than reduced, the humanitarian crisis. While civilians suffer in all wars, the suffering of those in countries where the international community had intervened in the name of humanitarian ideals presented a moral dilemma. Furthermore, as the development community reiterated, wars did not only have direct human costs, but also indirect ones on the loss of livelihoods caused by the dislocation of economy and society resulting from conflict (Stewart/Fitzgerald 2000).

Criticism of humanitarian intervention came from proponents of the 'empire' school, who argued that success or green light in one case would lead "the hegemon to resort to interventions again and again, driven by the imperative of increasing its power and accumulated advantages within the international system." (Bello 2006). Since interventions could never be attempted against powerful states, international action in the name of humanitarian protection risked turning into a prerogative of the strong against the weak. They also came from the realist camp which argued that although military interventions were "easily feasible", "the benefits of humanitarian military interventions are smaller and the costs far greater than their advocates usually recognize over the long term" (Pham 2004). An ill-timed humanitarian military intervention could intensify the level of violence which would increase the domestic security threat and spread regional instability (Pham 2004). In addition, they could lead to what Johnson called 'blowbacks': anti-Western protests, including the emergence of armed networks such as Al-Qaeda, able to strike at targets in the West itself (Johnson 2004). Finally, criticism of RTP also came from the humanitarian organizations camp that were in principle for neutrality and against the blurring of lines between humanitarian and military action. MSF, which criticized the US military's airdropping of humanitarian food rations as a propaganda operation and pulled out its international staff from most of Afghanistan because of the danger caused by rising anti-Western feelings, categorically claimed that "independent and impartial humanitarian organizations cannot associate themselves with any of the parties, even if the intervention is carried out for human protection purposes... [otherwise] populations at risk will be the first to suffer" (Dumait-Harper 2002)

From a human security point of view, ultimately, the criteria set out by the RTP, failed to separate the humanitarian from the political rationale, and consequently to alleviate the fears of the motives, i.e., the 'ends' of interventions as well their means (Tadjbakhsh/Chenoy, 2006: 195). The human security framework would instead seek the end point against which the 'good' of an intervention had to be measured. In other words, actions are not considered right in themselves but are judged against their outcomes. The position is close to the 'simple truths' that Chomsky outlined: "The first is that actions are evaluated in terms of the range of likely consequences. A second is the principle of universality; we apply to ourselves the same standards we apply to others, if not more stringent ones" (Chomsky 2006). Additionally, the focus of a broader human security engagement would be on prevention rather than dealing with crises that are already underway. Thus, a key way in which human security engagement seeks to go beyond humanitarian intervention is to address a broader range of threats to individuals' security, and not just their freedom from fear but also their freedom from want, not only acts of direct violence but also acts of structural violence (Galtung 1969: 170), and indeed threats to security that lie beyond the control of human beings.

94.3.1.1 The Failure of the 'Intervention' in Afghanistan

The realist line of thought would argue that it was precisely the failure of the international community to stay the course and build a lasting peace in Afghanistan following the withdrawal of the Soviet forces in 1980 that had laid the groundwork for the rise of the Taliban, the establishment of terrorist training camps, and the tragedy of 9/11.

Walzer described the invasion of Afghanistan as "a triumph of just war theory" (Walzer 2004 cited in Chomsky 2006). But 'Operation Enduring Freedom' in October 2001, Bello argues, "took advantage of sympathy for the US generated by the events of 11 September 2001 and the image of the Taliban government sheltering Al Qaeda to eliminate negotiations with the Taliban as an option and throw international law out of the window by invading Afghanistan, with little protest from European countries" (Bello 2006). To critics of the empire school, the consequent diversion of the hunt for Bin Laden objective and the establishment of a strong US military presence in a region strategic to the control of oil-rich Middle East and energy-rich Central Asia provided evidence for

the logic of great power national interest embedded in humanitarian envelopes.

Second, critics argued that the campaign ended up creating a new political order that was worse than under the Taliban, for it failed to protect the basic physical security concerns of the population. If the Taliban had given Afghanistan its first secure political regime in over 30 years, in contrast, the externally imposed replacement regime was unable to provide for basic security. The government of Hamid Karzai did not exercise much authority outside Kabul, endangering its own authority, legitimacy and indeed sovereignty in the failure to secure the basic physical security needs of the population.

Third the campaign soon ended up doing what its promoters said they would eliminate: terrorizing the civilian population. The estimation of the number of civilian casualties of the war in Afghanistan since 2001 varies. According to Herold, between 3,000 – 3,400 civilian were killed alone between October 7, 2001 through March 2002 as a result of US bombing⁷, although the estimates were disputed by Muravchik of the American Enterprise Institute⁸ and Conetta of the Project on Defense Alternatives.⁹ In 2002, Steele argued in *The Guardian* that “as many as 20,000 Afghans may have lost their lives as an indirect consequence of the US intervention. They too belong in any tally of the dead.”¹⁰ According to the BBC, about 4,000 people were killed in Afghanistan in 2006, a quarter believed to have been civilians (at: http://news.bbc.co.uk/2/hi/south_asia/6614251.stm).

94.3.1.2 ‘War is Hell’ as Opposed to ‘War as Hell’: The Human Toll

The death of civilians as a result of collateral damage has led to three responses to justify this moral dilemma:

One is embedded within the ‘Just War’ theory, which holds the principle that civilians are not legitimate targets of war, and only those capable of harming others can be denied protection of their right to life (Walzer 1997: 22). Harming of civilians can be justified in ‘Just War’ theory in terms of the military advantage obtained from such attacks: the good must outweigh the unintended evil consequences of the act – the proportionality principle (Wheeler 2002). Yet, Wheeler argues, “if we apply the Just War principle, ... it is hard to justify U.S. attacks against facilities that sustain civilian life, and where such strikes resulted in hundreds of Afghans being killed” (Wheeler 2002). To critics like Herold, killing civilians even if unintentional is criminal as it is unacceptable to place civilians at risk in war (Herold 2004).

A *second* response is to blame the enemy for instigating the war in the first place. The US Secretary of Defense Rumsfeld for example said in 2001: “We did not start this war. So understand responsibility for every single casualty in this war, whether they are innocent Afghans or innocent Americans, rests at the feet of the al Qaeda and the Taliban.”¹¹ Walzer (1977) had dubbed blaming your enemy for the cruelty of war as the ‘War is hell’ doctrine (Walzer 1977: 146). That war can and must be fought with moral restraint distinguishes the doctrine of ‘war is hell’ from the ‘Just War’ tradition of moral theorizing (Wheeler 2002). The attraction of this moral conception of war is that it absolves political leaders of the death and suffering inflicted on innocent Afghans as a consequence of the U.S. bombing campaign.

The *third* response is what Wheeler calls accepting the necessity of fighting ‘Just Wars’ but insisting that ‘due care’ be taken in the protection of civilians (Wheeler 2002). Wheeler argues that there is sufficient evidence to suggest that the US had not shown ‘due care’ in its treatment of Afghan civilians, despite its repeated claims¹², by targeting elements of the infrastructure of the country and strikes where civilian deaths were foreseeable.

10 Jonathan Steele, in: *The Guardian*, 20 May 2002; at: <http://www.guardian.co.uk/afghani-stan/comment/story/0,11447,718647,00.html>

11 Press conference of Donald H. Rumsfeld, 5 December 2001; at: http://www.wavsource.com/SNDS_2007-04-27-99994518282138/news/20010911/rumsfeld_did_not_start_wav.

Human security advocates, like cosmopolitans, would argue that all lives are morally equal and should be treated accordingly, in contrast with 'Just War' theorists. Therefore, in times of war, there is a moral and legal duty to seek alternate strategies than military strikes to secure victory at a significantly reduced cost in terms of civilian casualties.

94.3.2 Stabilization and Securitization

If the realist driven policy response propagates quick and often short-term, pre-emptive or punitive action to deal with threats deemed too dangerous to leave to deterrence, sanctions or containment, it calls for immediate stability in post-conflict countries through strengthening domestic military and police forces, limiting opportunities for international terrorist activities, and suppressing trans-national crime. This approach tended to focus on 'stabilization' through security-led responses at different levels in Afghanistan:

At a first level, the traditional security response to Afghanistan concentrated on expanding international troops outside of Kabul and by expanding the mandate of the military to heart and mind operations, i.e., delivery of small scale relief and development projects through *Provincial Reconstruction Teams* (PRTs). NATO, in its first ground operation outside Europe, took over the command of the 20,000 strong US-led coalition troops and the 20,000 strong *International Security Assistance Forces* (ISAF) in July 2006, and by October, had decided to expand its presence into all of Afghanistan. From the traditional viewpoint, the answer was to seek increased armed forces from the international community and support the capacity of the newly established Afghan National Army for the Government.

At an auxiliary level, as the Afghan state was unable to hold the monopoly of military power over competing factions and non-state actors, and as NATO troops, with their expanded mandate of war-fighting, training and relief/development delivery, were not sufficient, international *private security forces* (PSFs) had begun operating in Afghanistan, as they had in most post-conflict situations. The 1990's had witnessed a rise in international private military and security industry, made up of former soldiers with clear

corporate structures. The delocalization of the result of this globalization of *Disarmament, Demobilization, and Reintegration* (DDR) of ex-international-combatants into the Afghan operation theatre meant that private security companies provided operational support in combat, military advice and training, arms procurement and maintenance to logistical support, including guaranteeing security country-wide for the Presidential elections in 2004.

From a human security perspective, the traditional response had a number of problems:

First, the expansion of NATO troops were deemed a short-term solution to violence that threatened the coalition troops, but not the answer to the security problems of Afghans who aspired for the ability to have a job, to participate in political processes, to have choices for the education of their children and to live a healthy life. Hence, insecurity was not to have been dealt only through short-term, 'residual' and sporadic military solutions, but a long-term comprehensive strategy that combined stabilization with development, conflict resolution, and promotion of human rights.

Second, the security-based response failed to eliminate the system of incentives for armed regional militia loyal to individuals instead of institutions, as well as criminal opportunists, especially narco-criminals. A human security response would have promoted public policy and state-building efforts that reduced local incentives that triggered insecurities in the first place. As the chapter will argue further down, competitive market forces were not the best way to tackle distorted incentives.

Third, the humanitarian and development projects of the military through *Provincial Reconstruction Teams* (PRTs) were deemed inadequate and dangerous from a human security viewpoint, similar to the position of humanitarian organizations operating in Afghanistan, as PRTs could blur the lines between soldiers and civilians, and transform aid workers into militant targets.

Fourth, in collapsed states and post-conflict societies, where the state does not have the capacity to provide security, as was the case in Afghanistan, the presence of *private security forces* (PSFs), becomes a symptom of state weakness and reinforces such deficit in four ways: first, the motivation of profit could lead PSFs to be more accountable to shareholders and not to the state or citizens; second, their services could be skewed towards the elite and powerful while the poor remained insecure; third, they could crowd out the establishment of legitimate and functioning state institu-

12 For example, Department of Defense spokesperson, Victoria Clarke, stated on 23 October that "U.S. forces are intentionally striking only military and terrorist targets. We take *great care* in our targeting process to avoid civilian casualties", cited in Wheeler (2002).

tions, which do not receive enough support from donors and finally, *private militaries corporations* (PMC) are not bound to respect or adhere to human rights and humanitarian law. The rules of engagement thus remain unclear and they are not integrated into the regulatory and accountability structures of the state security sector in which they are operating (Bourne 2004). Ultimately, the Afghan State should have had the prerogative of taking back the provision of security in its own hands.

It could therefore be argued that continuing to tackle insecurity through offensive operations was insufficient at best and counter-productive at worse, trapped in a desire for a “a quick, cheap war followed by a quick, cheap peace” (ICG 2006). Ultimately, the U.S.-led military engagement in Afghanistan helped produce a climate of fear, intimidation, terror and lawlessness (Tadjbakhsh/Saba/Zakhilwal 2004) and neglected the longer-term threat to security posed by inequality and injustice.

94.3.3 The Institutional Solution: Engagement through Aid

Much of the literature emanating from IFIs argues that donor assistance *may* have a stabilizing effect on failed and failing states, but this depends on whether the country has the absorptive capacity to direct aid towards poverty reduction and good governance. Collier and Dollar argued therefore for selectivity, factoring in the strength of potential recipients’ policy frameworks into donor’s decision-making (Collier/Dollar 2002). Critics argued however that selectivity applied to fragile states would lead to aid ‘darlings’ and ‘orphans’ (Dollar/Levin 2005). From a human security point of view, the rationale for aid would be to ensure that foreign assistance is given to the citizens that need it the most. The argument would then not only be against aid selectivity, but also against conditionalities based on specific economic and political models or increasingly so, on military imperatives. This new type of conditionality meant that development assistance was increasingly confused with the politics of bilateral support and foreign policy priorities based on a narrow security agenda, instead of being based on social justice and enlightened self-interest in shared prosperity and collective security.

In post-intervention situations, focus on immediate stabilization at the detriment of more long term needs of the population is especially problematic given the pronounced discrepancy between military and reconstruction spending. Between 2002 and

2006, the international community had spent US \$ 7.3 billion on development, as opposed to US \$ 82.5 billion on military spending (Senlis Council 2006: chapter 5). According to the data of the Congressional Research Service prepared for the U.S. Congress, the military budget authority for *Operation Enduring Freedom* in Afghanistan between 2001 and 2007 was at a rate of 90.3 billion dollars. This amount massively overshadowed the 8.6 billion US\$ authorized for humanitarian aid, reconstruction, counter narcotics, diplomatic operations and initial training of the Afghan Army (Belasco 2007: 8).

The ‘Marshall Plan’ for Afghanistan, which President Bush alluded to on numerous occasions in the aftermath of the fall of the Taliban, never materialized. Shortfalls in the delivery of funding pledged, combined with the slow, non-transparent processes of aid disbursements, the short-term duration of donor aid pledges, and the lack of labour-intensive investment in infrastructure, curbed the capacity of the government to deliver on its promises to the Afghan people (Sedra 2003; Tadjbakhsh/Saba/Zakhilwal 2004). At the same time, potential inflows of large aid pledged during highly politicized and political donor meetings meant, in the long term, that Afghanistan would become a rentier state funded through foreign countries, while in the short term, it made it difficult to resist the temptation of quick fix projects that raised expectations of rapid growth and recovery to an unrealistic level (Tadjbakhsh/Saba/Zakhilwal 2004). Additionally, competition for resources, responsibilities, and territory in Afghanistan led to a “projectization” of the reconstruction process and a fragmentation of the process along institutional and project lines (Sedra 2003: 4). The entire aid process had lacked continuity and coherence and was been plagued by problems of transparency and coordination. Ghani, Lockhart and Carnahan, with intimate knowledge and experience of Afghanistan where Ghani was Minister of Finance (2002–2004), have argued that the current aid system undermines states effectiveness in four specific areas: creation of parallel structures; the lack of harmonization; the non-state provision of traditional state services and its impact on state legitimacy; and the lack of predictability in aid flows (Ghani/Lockhart/Carnahan 2005: 10).

Additionally, the presence of foreign contractors in the reconstruction efforts of Afghanistan not only created distortions of the local economy and enhanced corruption, but additionally delivered poor quality goods. A 2006 CorpWatch report detailed the inadequacies of the US funded reconstruction effort,

where the US Agency for International Development (USAID) and other organizations granted contracts to corporations with minimal oversight and virtually no quality assurance, leaving the Afghan people with poorly constructed schools and medical facilities while corporations got millions of dollars in profits (Nawa 2006).

Ultimately, a government that is legitimate and accountable to its people needs to follow a national process, one that the international community can only support but not lead. The provision of aid can help this process only if it is transparent and consultative. From the human security point of view, it is questionable whether increased money for reconstruction by itself can bring peace. How the aid is spent may be a more important question, as is the institutional context of local capacity. Beyond aid, other responsibilities of the international community include stemming the flow of proliferation of weapons, promoting fair and equitable trade, and encouraging regional cooperation for a flow of investments and know-how. The debate on aid in fragile states should not be based on the interests of donor institutions on the selectivity or absorption capacities, but on methods of allowing for sustainable home-grown policies and individual agency to take over and make aid, in the long term, a need of the past.

94.3.4 State-building: The End State Vision and Its Responsibilities

94.3.4.1 Liberal Approach to State Responsibility and its Applicability in Post-Conflict Contexts

Duffield argues that the result of reconceptualizing development as conflict prevention led increasingly to the uncritical imposition of Western liberal values, political institutions, and capitalist markets on a subordinated but diverse and multi-cultural developing world (Duffield 2001). The Liberal Peace School came to argue for the supremacy of liberal economic instruments and democratic practices of ‘open societies’ and ‘open markets’ as a means of enforcing peace and reform in a post-conflict situation (Paris 2004). The problem however was that these reforms were often imposed from outside, often through conditionalities for aid, if not through advice provided by international institutions. Additionally, the legitimacy and effectiveness of the models themselves, based on a formula of a political model of liberal democracy, good governance, and an economic model of a liberal mar-

ket economy, for post-conflict situations are questionable.

In principle, argues Luckham, democracy poses an alternative to violence by encouraging the resolution of disputes through the political process. But in practice, democratic institutions have often failed to resolve conflicts and in some cases have even aggravated them (Luckham 2005: 36). Mansfield and Snyder have even argued that that the process of creating a democracy – democratization – is particularly prone to violence and war (Mansfield/Snyder 1995). To be legitimate, the timing and management of democratic processes, such as elections and constitutions, should be locally driven and locally owned rather than externally imposed (Bastian/Luckham 2003). Close attention is needed to make both the democratization process and democratic institutions as inclusive as possible at all levels. This would mean not paying lip service to institutions such as civil society and decentralization and focusing on a check list of Western recognized institutions, but fostering a true democratic political culture.

Luckham also argues that a developmental state needs to be created in a post-conflict situation, and “whether this is best done by expanding free markets and limiting the role of the state should be treated “as an empirical issue, to be decided on the basis of national circumstances, rather than as an overriding priority” (Luckham 2005: 35). Yet the standard neo-liberal economic model often imposed in post-conflict situations cannot be considered the most adequate mode of reaching the goals of a developmental state. First, the economies of post-conflict countries are generally extremely weak, if not collapsed altogether. Therefore, rapidly opening the economy and instituting a liberal market economy is not necessarily the best solution for stable economic development. Second, establishing a liberal market economy should be the choice of the national government and the local population and not that of the international community. Third, introducing a system based upon competitiveness may exacerbate sources of conflict and/or reinforce inequalities.

94.3.4.2 Failure to Establish Liberal Peace in Afghanistan

While the initial focus was on the removal of the remnants of the Taliban, it became soon apparent that Afghanistan needed a stable state that was at peace with itself and no danger to the world community. Given that the international community still adhered to a traditional state-centered understanding of security, and

with the desire to steer clear of the East Timor experience of the UN administration, a decision was made to recreate the Afghan state with a new regime. That a state was needed in Afghanistan was not contested. What type of state, and with what responsibilities, however, was open to different interpretations? Sedra for example argued that “while in the long run federal models of governance may be more suitable for [Iraq and Afghanistan]; a strong and representative central state apparatus is required to achieve stability and security in the short-term” (Sedra 2003: 4). Yet, a fundamental priority should not have been simply to reconstruct the state and its monopoly of legitimate violence, but to establish a legitimate public authority, “sufficiently independent of the occupiers to enjoy public respect, and sufficiently inclusive to draw wide support from the diverse ethnic and religious communities of [the] country” (Luckham 2005: 33).

The ‘state-building’ process in Afghanistan started with the December 2001 Bonn Agreement that put in place first an interim and subsequently a transitional government followed by a traditional consultative processes (known as *Loya Jirgas*) leading to a new Constitution in January 2004, national presidential election in October 2004 and parliamentary elections in September 2005. The checklist of what institutions a sovereign democratic state needed was designed at Bonn, with a precise timetable and sequencing guidelines. However, the design of this grand project seemed forced at best. The Bonn agreement was not an indigenous peace accord in the first place, as it left one of the warring parties, the Taliban, completely out of the possibility of negotiations. In the long term, their marginalization impeded the possibility of reconciliation on the one hand, and led to a false premise that war had been won or settled on the other. Furthermore, although participation in the presidential elections in 2004 far surpassed the expectations of the international community, and consultative traditional methods such as a *Loya Jirga* (assembly of elders) seemed to bring consensus around new political frameworks, it is a fact that the choices had already been made in the imposition of a Western-backed president to which these methods seemed to provide *ex post* legitimacy.¹³ Tired of two decades of

war, ordinary Afghans were unanimous in their desire for stability and progress. It was in this hope, and at the outset of a highly mediatized international intervention built on promises of this stability and funds for reconstruction, that Afghans were eager to embrace what was in fact presented as their only, and attractive choice: Western backed leaders (such as Karzai), western backed processes (such as a Constitution which was drafted with foreign experts’ support), and Western-backed institutions (such as a Parliament that was resuscitated after 30 years). That the parliamentary elections in September 2005 suffered from a very low turnout was an indication of the growing scepticism and disappointment that the Afghans felt in ‘their’ participatory democracy.¹⁴ The sustainability of this Western-backed liberal peace, however, could easily falter once the promises dissipated in the face of concrete realities.

Despite the imposition of democratic institutional models and the recreation of all the tenets of what a modern state should have, the post-Taliban state was unable to operate as an effective and legitimate state, neither from a traditional security, nor from a human security viewpoint. By 2007, the authority of President Hamid Karzai barely extended beyond Kabul, and achievements such as the establishment of a new currency, the Afghani, and the return of two million refugees, macro-economic recovery and the return of 2 million children to school had not created the sufficient legitimacy and satisfaction for the population to be able to divert attention from the precariousness of the new regime. Efforts to rebuild a national army and police force were slow and ineffective with heavy reliance on the good will of warlords, who, in turn, were driven more by personal ambition rather than goodwill (Sedra 2003: 1). By 2007, national reconciliation had still not taken place and the authority of warlords, some in the national parliament, couldn’t be curbed.

The economic blue-print for a post-conflict recovery in Afghanistan was also mired with inconsistencies

13 During the first *Loya Jirga*, for example, Karzai was gently ‘imposed’ by the then American Ambassador Zalmay Khalilzad and UNAMA, over the choice of a majority of delegates who thought they would be welcoming back the King from exile to head the new Transitional Government (personal interviews, Kabul 2004).

14 According to a United States Institute of Peace Report, “The disappointing turnout on election day reflects mounting disillusionment among the electorate about the benefits of democracy. Many Afghans who had voted in the 2004 presidential elections said they did not feel motivated to vote this time because nothing had improved as a result of the first election.” DeGrasse, Beth and Emily Hsu, 2005: “Afghanistan: Old Problems, New Parliament, New Expectations”, in: *USIPeace Briefing* (October); at: <http://www.usip.org/pubs/usipeace_briefings/2005/1025_afghanwomen.html>.

as it adhered to a standard model neo-liberal model based on the opening of markets and trade regimes in a post-conflict situation. In the 2006 *Interim Afghanistan National Development Strategy* (I-ANDS), for example, the government's economic vision was said to build a "liberal market economy" based on "an enabling environment for the private sector to generate legitimate profits and pay reasonable taxes, thereby enhancing public revenues that can then be invested in public services" (Government of Afghanistan 2006: 17). Laudable as this goal was, the challenge of reality was damning. The trend in GDP growth after 2002 was mainly based on foreign support and an illegal but important drug trade. The economy, while booming, was mainly informal and highly illicit. It was also highly concentrated on Kabul, where a combination of foreign assistance and narcotics profit had created the semblance of normality where business thrived, consumers flocked, and construction boomed. Participation in markets was not open to all and benefits were not spread equitably: gaps between the poor and the new rich had increased in the capital, and outside of Kabul, life had not changed much. Experience has shown that a fast track market economy would in fact be more conflictual in the short term as it does not address distributions, inequalities and urban-rural disparities, many of which may have contributed to conflict in the first place. For Afghanistan, where economic greeds and social grievances in the absence of a strong centralized state had for decades contributed to conflict (Tadjbakhsh/Saba/Zakhilwal 2004), a private sector with its potential pitfalls in terms of exclusive access and inequalities, was not the remedy. The ends and means of economic growth should have been based instead on principles of investing in human potential, regulated directly through public policy intervention, and not exclusively on creating an environment for the private sector as the engine of growth. The ultimate end of an economic vision should have been on the need to cater to people's long term needs: job creation, an adequate redistribution of wealth and assets, and poverty eradication. This would involve not only investing in economic development, and unleashing the forces of the market, but also on ensuring adequate measures of distribution and containment of rising inequalities of income and opportunities among different groups in different regions.

94.3.4.3 Coordinated/Integrated or Piecemeal Sector-specific Approach and Prioritization of Security over Development

If in previous decades of peacebuilding experiences, the military was traditionally involved in stabilization, humanitarian aid workers in providing for relief immediately after the conflict, development actors taking over for longer-term strategies, and the diplomatic community was engaged in political resolution of conflicts, new interventions such as in Iraq and Afghanistan set a trend where all these actors were operating in the same zone at the same time. The involvement of the military in delivering humanitarian aid and reconstructing local infrastructures, as seen by the PRTs in Afghanistan, for example, brought the military into relief and development mandates of others. Economic actors, such as *International Financial Institutions* (IFIs,) engaged in reconstruction and long-term rehabilitation, including the preparation of a medium term development strategy (*Poverty Reduction Strategy Papers* or PRSPs) even while the conflict was ongoing. The blurring of boundaries created multi-sectoral challenges requiring better coordination between economic, political, civilian and military actors in Afghanistan.

The piecemeal approach to sectors and the turf wars between institutions with different mandates was also mirrored at the state model in its planning and budgeting priorities.

The 2005 *Interim Afghanistan National Development Strategy* (I-ANDS) which was prepared for example in anticipation of a *Poverty Reduction Strategy Paper* (PRSP), and the *Afghanistan Compact*, the framework for co-operation for international community engagement beyond the completion of the Bonn Agreement, both identified what they called "three critical and interdependent areas or pillars of activity": 1) security, 2) governance, rule of law and human rights, and 3) economic and social development (Government of Afghanistan 2006).

Despite the claim on interdependence, however, the security pillar was seen as a foremost priority and as separate goal from that of governance and economic and social development. For its security vision, the government concentrated on the use of force to protect the rights of all Afghans, and sought additional assistance in combat assistance from the international community, including support for the capacity of national security forces to help create security forces that were professional, cost-effective and democratically accountable. (Government of Afghanistan

2006: 70). The separation, and subsequent prioritization of security over development approaches, reflected a realist solution to the state-building process, concentrating on law and order. This approach was also encouraged by analysts and policy makers who, taking the Weberian state as the model, concluded that building a functioning state required a basic level of security for human development to be able to take place, hence prioritization had to be on *security sector reforms* (SSR) (Ponzio 2005: 64).

From a human security point of view, however, the method of delivering 'security' through force, and the narrow definition of 'security' were exactly the problems that compounded the exacerbation of 'insecurity' in the first place, even from a traditional definition. Instead of hierarchizing and prioritizing among threats, it would have been more effective to explore on the linkages and interactions. Even where sectoral approaches may be easier to implement, they may lead to fragmentation and contradictions if they fail to take into account the inter-connection between various insecurities.

The human security school of thought would argue that the design of a strategy that isolated traditional security-related activities in Afghanistan was flawed to begin with. Security, in the broader sense, had to be achieved *through* social, economic and human rights interventions in order to achieve more sustainable results. And yet, in the *I-ANDS* and in the *Afghanistan Compact*, security and socio-economic development were seen as sectoral concerns with separate goals. Neither was the linkage between these sectors explored, nor was their human impact assessed. They were, in the traditional sense, institutional and sectoral strategies, to strengthen, at the end of the day, the 'security' of institutions of democracy and of the market.

Motivations and methods of eradicating opium plantations in Afghanistan present an accurate example where a traditional security focus were inadequate. If a ban imposed by the Taliban in July 2000 had led to a substantive drop in cultivations, five years later Afghanistan had become once again responsible for 90 per cent of the world's illicit opium production, and the US\$ 2.7 billion drugs trade accounted for about a third of Afghanistan's economy. Yet, the answer to the drug problem saw different solutions by different actors: The U.S. government had contemplated the eradication of drugs through aerial sprays, a position criticized as not only harmful to the indebted farmers, but also potentially backfiring as it would further hike up prices and enrich criminal car-

tels, including insurgents thought to be strongly linked with the lucrative activities of traffickers. The *UN Office on Drugs and Crime* (UNODC) had called for NATO to take military action to destroy heroin laboratories, disband public opium markets, attack opium convoys and bring major traders to justice¹⁵. President Karzai wanted to see additional international support for providing alternative livelihood to farmers, but existing programmes had faltered in their promises of cash for work providing jobs, irrigation canals and new roads. Each strategy was seen as inadequate by itself to be able to compensate people for losing their opium incomes, especially for the poorest farmers who were often deeply indebted to local drugs barons. The problem of narcotics in Afghanistan could not be dealt with in vacuum of the larger socio-economic implications and strategies of state-building and livelihoods.

94.4 Conclusions: An Ethical and Methodological Rupture

Human security is proposed in this chapter as an ethical and methodological rupture with the existing conceptualization of state-based and institutional based view of the problem of 'failed states' and their solutions.

First, human security poses a moral challenge to realism and liberal institutional views. The failure of states should not only be viewed through the lens of potential instability for international security or institutional stability, but from the point of view of their inability to provide for their populations. Human security offers the definition of an end point towards which all politics has to strive, i.e., the ethics of ultimate ends. In a world of nation states, national interests cannot of course be ignored, as neither can be the bureaucratic interests of international organizations. Yet, it is crucial to acknowledge the biases and the interests of states and institutions and open them up to an ethical scrutiny. The most important added value of applying a human security approach is to 'evaluate' donor objectives and interventions against the needs and sensitivities of the local population. This requires an understanding of the expectations of the populations concerned by the aid provided, and thus taking into account their needs, their aspirations

15 Judy Dempsey: "UN Urges NATO to Hit at Afghan Drugs", in: *International Herald Tribune*, 12 September 2006.

as well as the coping skills they developed during conflict. A human security approach propagates instead that civilians be at the centre-stage of a 'demand-driven' reconstruction and recovery processes that address the needs of the individuals and communities as defined by them. However, adequate consultation is often neglected when funding proposals have to be submitted in short time and where insecurity and lack of infrastructure prevents consultation with various regions. This creates a gap between the expectations of the recipients of the intervention and the perceptions of the external actors. When the international community takes the lead in determining the priorities of state-building based on their understandings of models and needs, the danger is not only that a state's weak structures will be overwhelmed and marginalized in the decision-making processes but it may also undermine the role of people as agents of change. Legitimacy of institutions in the long term comes not from the time-table of donors with their blue prints, but from the meaning that the populations give to them.

Second, human security claims a methodological rupture with realism and liberalism by proposing that the best way to achieve a broad definition security (both for the state and the international system) is to increase that of people. This rupture has implications for how security and development strategies should be designed, implemented and evaluated against outcomes of satisfaction of basic needs and empowerment. This methodological rupture also has implications for how ends and means are reversed. The survival, well-being and dignity of the individual become the ultimate goal, and constructs such as the state, the institutions of political democracy, and the marketplace are relegated to secondary status as means to achieve that goal. This too is a break from realism and liberalism.

Hence, the human security point of view dispels the belief that the surest way to provide security and build lasting peace in Afghanistan was through military action and reaction. Rather, the framework argues that there was a moral and ethical imperative to promote public policy reforms and state building efforts that enlarged people's choices and reduced local incentives that trigger conflict in the first place. State-building strategies needed to expand the notion of 'security' to cover not only territorial security, or the monopoly of the state to the use of force, but also its commitment to provide for basic human needs (education, health, food, shelter, incomes and livelihoods,

etc) as well as strategic needs (such as participation, dignity, empowerment, human rights etc).

The 'human security' agenda of the 1990's had shifted the focus away from state-centered security toward the security of people. The 'failed states' agenda, however, represents a return to more traditional, state-centric views of security threats and their solutions. The current policy directions in 'fragile states' such as in Afghanistan focus too narrowly on state function, primarily for taking back the prerogative of security provision, and secondary to ensure the stability of mainly economic institutions. The role of people as agents of change is often neglected. Yet, a strategy toward sustainable peace requires a transformed relationship between citizens and their state, and a changed relationship between the state and the international community. Together, these changes improve the chance for a state to meet its obligations to the human rights of its people (Simpson 2007). The failed state discourse by contrast puts the focus on diverted agendas, that of a military mentality around conflict or a preoccupation of whether or not 'we', as the international community, should act and be engaged in a failed state. Instead, the international community should focus on prevention of conflicts, reforming trade regimes, and responsible arms practices for a more practical, effective, and ethical way to approaching global (human) security.

95 Relevance of Human and Environmental Security Concepts for the Military Services: A Perspective of a Former Chief of Staff

Joseph C. Singh

95.1 Introduction

Environmental protection and nature conservation are fundamental to human security. The challenge facing nations today is no longer deciding whether conservation of biological diversity is a good idea, but rather how it can be implemented in the national interest and within the means available to each. (Brundtland Commission 1987: 66).

There is overwhelming evidence for a direct and integral relationship between the human condition and the environment. Historically, early civilizations derived their needs from being hunters and collectors, from their association with great rivers and watersheds and biodiversity, in terms of flora and fauna that supported their needs for food, fuel, and shelter. Such examples are the almost mystical and religious relationships that exist between the Nile, the Euphrates, the Ganges, the Amazon and their human populations.

It has been argued that the collapse of the great Aztec, Mayan, and Inca civilizations occurred when their exploitation of natural resources reached the point of unsustainability. The desertification of parts of Africa through deforestation and harvesting of firewood has manifested itself in the cycle of famine, disease, and civil wars.¹

At the national levels, the irresponsible exploitation of natural resources and the environment has led to degradation of watersheds, landslides from denuded mountain and hill slopes, polluted water and streams, spread of diseases such as malaria and typhoid, and the excessive urbanization resulting from the migration from rural and hinterland areas to the cities and towns in pursuit of the material culture. The relationships between the environment and the hu-

man condition are the subject of much debate at international fora. The Convention on Biodiversity (1992) and the Kyoto Protocol (1997) are two examples of the outcomes of policy debates that have been converted into political strategies.

The vulnerabilities of the planet to catastrophic events such as tsunamis, earthquakes, volcanoes, hurricanes, floods, and fires are very topical due to the massive loss of life, property damage, investments, and the scale of physical, emotional, and mental suffering. The newest manifestation of conflict after the damage to humankind and the environment from major wars, wars of attrition, chemical warfare, and civil wars, are terrorist attacks on the infrastructure to cause maximum trauma to humankind for political ends.

Undoubtedly a combination of demographic growth due to population growth and environmental stress from increasing demand for resources will be a catalyst for social unrest and make for increasing vulnerability to intra- and inter-state tensions and conflicts. Human security as now defined puts the individual at the centre of debate, analysis, and policy. "It is the individual who is paramount; government is an instrument of the people to protect human life and enhance human welfare"². Environmental security is the relative public safety from environmental dangers caused by natural or human processes due to ignorance, accident, mismanagement or design and originating within or across national borders. This relationship between human security and environmental security forms the basis of international and national strategies to cope with the negative manifestations of the lack or absence of such security. Such strategies should stress the importance of international interde-

2 Hans van Ginkel, in: *News Release*, 13 June 2004, Issue 39: September - October 2005, United Nations University, UN Development Programme, at: <<http://update.unu.edu/>>.

pendence and, at the national level, the development of synergies among the decision-making and implementation agencies and institutions.

This chapter discusses the relevance of human and environmental security concepts for the military services. It will rely on a review of global debates on the reconceptualizing of security for the 21st century and on evolving concepts on human and environmental security. These concepts will be assessed for the Caribbean region to determine their relevance for the military services. The decisions these countries make will have implications for the military services if they are to be capable of responding to such threats, challenges, vulnerabilities, and risks in the future.

95.2 Evolving Concepts of Human Security

Scarcities brought about by environmental factors can interact with political, economic, social, and cultural factors and lead to instability, and in the poorer developing countries, where economic options are limited, there is greater pressure being placed on ecologically endangered areas, including urban slums. Such environmentally linked instability may increasingly result in large-scale population movements and, in the event of trans-boundary unregulated human flow, can easily precipitate crisis situations for state authorities and institutions such as the military services, as e.g. the tensions among the USA, Mexico, and Haiti have indicated.

95.2.1 Manifestations of Instability Linked to the Environment

Manifestations of environmental instability are linked to:

- land scarcity through allocations of large forestry, agricultural and mining concessions;
- deforestation resulting from large scale agriculture, chain saw logging, and ranching;
- siltification of rivers through alluvial and hydraulic mining, and the run-off from agriculture;
- water scarcity from conversion of land use through building of water conservancies, creation of reservoirs for hydropower projects, and reduction of wetlands;
- scarcity of fish stocks through heavy sedimentation, and suspended solids from mining activities and agricultural run-off.

95.2.2 The Poverty Challenge

The *Caribbean Regional Emergency Disaster Prevention Plan* (1997) stated that economic and social development are major determinants of vulnerability. The increasing poverty in urban areas with bad infrastructure has contributed substantially to risk. The *IUCN Wellbeing of Nations Report* (2001) confirmed that human and ecosystem well-being are intimately intertwined, and validates the need to plan and manage for ecosystem protection and human development simultaneously. According to this report, the key conditions for combining high human well-being and low ecosystem stress are freedom, good governance, and education. The IUCN report stressed that poverty is multi-dimensional, and insufficient income is only one indicator of human deprivation. Poverty is experienced as a lack of adequate food and water; vulnerability to environmental disasters and the ravages of disease; it is about the hardships of rural and urban existence, being exposed to hard working conditions, violence, crime, and violations of human rights. Men and women also experience poverty differently. Poverty is frequently rooted in lack of access to, and control of, assets upon which human livelihoods depend.

Speaking on Earth Day, US Secretary of State, Colin Powell (2004) said that the Bush administration had adopted an environmental policy linked to poverty reduction, good government, and sound economic and trade policies: “The new approach that we are taking is about creating conditions for growth that will help people lift themselves out of poverty and do it in a way that will sustain development, using the Earth’s resources, but not abusing the Earth’s resources.” However, Said W. Musa, the Prime Minister of Belize, speaking to the Opening Ceremony of the 23rd Regular Meeting of the CARICOM Conference of Heads of Government (2002) argued that:

The great integrationist endeavour we are engaged in has but one supreme objective: to enhance the quality of life of our peoples. Not simply to lift them out of poverty – although that must remain our first goal – but to empower them to take control of their lives and to attain the highest levels of excellence in their cultural, political, and economic existence. All this occurs within a global context that tends to make the poor more wretched and the rich more powerful.

95.2.3 The Democratic Challenge: Good Governance

The global debate has also shown that environmental problems are exacerbated in areas where there is con-

flict, chaos, and humanitarian challenge. Environmental degradation is demonstrably worse in countries where there is rampant corruption, lack of accountability to Parliament and citizens, and where there is lack of functional literacy, disease, and a sense of hopelessness. Said W. Musa (2002) pointed out that in the Caribbean,

...our political systems are by and large inherited from another era and were designed to divide the many for rule by the few. If we are serious about building national consensus about the critical issues affecting our societies, we have to change that and put in place new policies, structures, and institutions that will make possible people-centred development.

95.2.4 The Sustainable Development Challenge

In an environment where access to material resources has resulted in conditions of poverty, the human security condition is further aggravated by the lack of access to knowledge-technical, scientific and cultural, socio-political and economic knowledge. Only through increasing the consciousness and knowledge of people will they be better equipped to face the challenges of the globalized economy and marketplace and be able to seize the opportunities to break the vicious cycle of persistent poverty. Providing access to knowledge and education is a major challenge to be overcome if an environment conducive to sustainable development with a people-centred approach is to be constructed.

The Secretary-General of the United Nations, Kofi Annan (2005), in identifying a strategy for the pursuit of the *Millennium Development Goals* (MDG) highlighted three aspects of human security to be addressed by states in the attainment of these goals. He identified these as:

- *Freedom from want*: provision of adequate food, shelter, health, education, and sustainable livelihoods;
- *Freedom from fear*: ensuring that conditions of peace, stability, and the rule of law are enforced; that there is freedom to pursue legitimate interests; and, that contingency plans to safeguard human lives in times of natural disasters exist;
- *Freedom to live their lives in dignity*: adherence to the Constitution, a system of governance that allows for inclusive, participatory democracy; and, that within the state ethnic, religious, and cultural freedoms are guaranteed.

95.2.5 Strategic Responses to Threats to Human Security

Fox and Carr (1985) argued that realists must see: “the extent to which the daily lives of people are threatened by refugees, drugs, etc. and therefore security is no longer just military security. As time passes, it must be conceived more broadly.” In setting performance indicators to monitor the implementation of the strategy, the availability of resources to carry out the implementation process will be a vital component for achieving success. Many states have faced a severe decline in their human resources through emigration to the more developed countries, and the balance sheet of resources available for implementing strategies to address issues of human security will have shortfalls. It is important that states have a coordinated national effort that combines the work of all national agencies and institutions, including the armed forces, to produce a synergetic approach to strategy implementation.

95.3 Evolving Concepts on Environmental Security

95.3.1 Environmental Security and Scarcities

Environmental security is the relative public safety from environmental dangers caused by natural or human processes due to ignorance, accident, mismanagement or design, and originating within or across national borders. Former US Secretary of State Warren Christopher (1996) in a major policy speech at Stanford University said:

The environment has a profound impact on our national interests in two ways: first, environmental forces transcend borders and oceans to threaten directly the health, prosperity, and jobs of American citizens. Second, addressing natural resource issues is frequently critical to achieving political and economic stability, and to pursuing our strategic goals around the world.

Particularly in poorer developing countries, environmental scarcity can limit economic options and therefore force those already impoverished to seek their livelihood in ecologically endangered areas, including human slums. The US Government considers that:

...environmental scarcities are of significant importance in a typology of threats to international security. Environmentally linked instability is increasingly likely to spill over to other states in a key strategic region, or to result in a complex humanitarian emergency stemming from large-scale population movements³.

IUCN (2004a) has stated that the natural resources of our planet are being depleted, some irreversibly. For example, the IUCN's "Red List of Threatened Species"⁴ estimates that

some 11,046 species are now threatened with extinction. This includes 24% of all mammal species and 12% of all bird species. The scale of threat is similar, or possibly even worse for other vertebrates. Calculations indicate that some 25% of reptiles, 20% of amphibians and 30% of fishes (mainly freshwater) are threatened. Forests continue to be lost and degraded, a trend that threatens forest ecosystems as well as the 1.7 billion people who rely on forests for numerous goods and services. Water scarcity has grown in seriousness, with grim ecological and human implications - particularly in parts of Africa and West Asia. Some 27% of the world's coral reefs have also been effectively lost, up from 10% in 1992, taking a huge toll on marine biodiversity.

Concerns over climate change have also gained prominence, as our understanding has grown of the links between greenhouse gas emissions, rising temperatures and sea levels, and the growing frequency and intensity of extreme weather events.

IUCN also points out that

all the evidence suggests that current patterns of resource exploitation and consumption are unsustainable and are approaching natural limits in some areas. These problems underpin concerns that competition over dwindling natural resources may trigger future conflicts.

95.3.2 Environmental Threats Impacting on Human Security

The threat of living on a planet, whose resources could no longer be sufficient for humanity's needs, compels us to adopt a process that reflects a new ethic of conservation and stewardship for the environment. Thus, governments, industry, development agencies, local and indigenous communities, and the general public, have become increasingly concerned about the depletion of biological resources with the growing awareness that development depends on their maintenance. This accounts for the global, regional, and national commitments to, for example, the objectives of the Convention on Biodiversity (CBD), the Programmes of Work deriving from deliberations at the Conference of Parties (COP-7) of the

CBD and the Millennium Goals. Based on research and many international and national debates there are global concerns with the following threats to environmental security, nature conservation, and their impacts on human security:

- Habitat alteration as a consequence of natural resources exploitation, infrastructural works in or near to areas of high biodiversity significance;
- Chemical pollution and sediment loading from mining and agricultural run-off;
- Climate change and the melting of the polar ice caps;
- Natural disasters such as floods, hurricanes, volcanoes, and fires;
- Unregulated tourism especially where the volume of tourists and their impacts far exceed the carrying capacity of the destination sites;
- Wars, internal conflicts, terrorism, and the narcotics trade;
- Unregulated planning and land use policy;
- Introduced and invasive species;
- Persistent poverty;
- Poor governance, corruption, and money laundering;
- Lack of legislative, regulatory, monitoring and enforcement capacity and capability;
- Lack of harmonization of regulatory and enforcement mechanisms at transboundary and regional scales;
- Poor communication, public awareness, and education;
- Marginalization of local and indigenous communities, and land tenure issues.

95.3.3 Strategic Responses to Threats

In determining the nature of strategic responses to such threats, three factors will be of paramount importance:

- Opportunities to develop strategic collaborative responses through regional mechanisms and interdependence;
- Pro-active national integrated sectoral and societal responses through networking and synergies; and,
- Identification of resources, and building of capacities and capabilities to respond.

In assessing the feasibility of success through the strategic responses, states will have to conduct a reality check and many will find that there are a number of constraints that will influence the degree of success

3 Christopher (1996) on US Environmental Diplomacy, 10 April 1996, Stanford University, Palo Alto, CA.

4 IUCN: 2004 IUCN Red List of Threatened Species. *The Red List Consortium, International Union for Conservation of Nature and Natural Resources*, at: <www.iucnredlist.org>.

achieved in the implementation of their responses. These limiting factors will include:

- the lack of resources;
- the lack of political will and consensus;
- competing national priorities;
- breakdown in the rule of law;
- environmental insecurity and degradation; and,
- increasing dependence by civil authorities on the involvement and intervention of the armed forces.

95.4 The Military Services and Relevance of Concepts

95.4.1 The Military and Impact on Human Security

The traditional role and core competencies of the armed forces are generally the following: a) protection of national sovereignty; b) maritime regulatory and enforcement; c) aid to the civil authorities: internal security, counter narcotics operations, and homeland security; d) disaster relief operations and civil defence missions; e) humanitarian missions such as medical outreach in remote areas, poverty alleviation through engineering works related to housing, water, sanitation, drainage, and irrigation; f) search and rescue; and g) peace building and peace enforcement.

95.4.2 The Military and Impact on Environmental Security

From a traditional military perspective, in addition to conflict prevention due to environmental factors, environmental security has focused on: a) protecting the health of the soldier to carry out the mission; b) the use of force to protect the nation's interests that are challenged by environmental changes; c) protection of the environment from the damage that the military itself may cause; and, d) the role of the military in safeguarding natural resources.

95.4.2.1 Evolving Concepts in the USA

Sherri Goodman (1995), the former US Deputy Undersecretary of Defense for Environmental Security, stated at an Installation Commanders Conference, "environmental security is critical to the defense mission and should be fully supported".⁵ She gave the following four reasons:

- It is critical to protecting the quality of life of the armed forces.
- It is critical to military readiness. If steps are not taken to clean up and protect the environment now, it is going to cost more down the road. Through the armed forces' work with environmental regulators, the latter's concerns are integrated into defence operations so military training may proceed without any impediment. The conservation programme keeps the training exercises realistic and representative by rotating training areas, reseeded and replanting, thus assuring that future training will be as effective as current training.
- It is money well spent and ensures improved efficiency and performance of the environmental security in all areas from cleanup to compliance, conservation, pollution prevention, and technology development.
- It is the law.

She also indicated that the Armed Forces need to go beyond compliance to find new ways to direct more resources to pollution prevention, since the key to protecting and saving the environment is prevention. For example, there must be a responsive and reinvigorated technology programme and the armed forces must seek cooperative efforts with industry, state and local governments, and other federal agencies. The efforts must be global and negotiations must be entered into with foreign governments to establish protocols for the exchange of technologies.

These initiatives are evidence of the holistic and global dimensions of the concepts relating to human and environmental security, and of the role that the armed forces are called upon to play as a component of national synergy and of international interdependence.

95.4.2.2 Evolving Concepts in India

Eustace D'Souza (1995), a retired Major General of the Indian Army and a former Secretary General of the World Wide Fund For Nature, said:

In almost all parts of the world today, the military are a recognizable force politically, socially and to some extent, economically. It is not generally realized, however, that the military have a positive role to play in protecting and restoring our degraded environment. On the contrary, there are many who feel that they are only capable of wanton destruction of wildlife and nature. This

5 Sherri Goodman: "Beyond Compliance to Pollution Prevention-at the Installation Commanders Conference", Washington, 24 January 2005, in: *Defense Issues*, 10, 19.

is not so. Indeed, the military have a unique non-violent and productive role to play in protecting the environment, creating security and social patterns founded on cooperation and not on confrontation.

D'Souza argued that the military are well suited for the important and productive task of protecting the endangered environment and ensuring its regeneration where necessary. He said that the military have the leadership, motivation, training, and discipline to perform this role effectively; that the military have the infrastructure-mobility, intercommunications, medical and engineering skills necessary for such work; and, when armed forces personnel retire, this large number of trained and disciplined personnel forms a valuable pool of human resources for environmental duties.

95.4.2.3 Evolving Concepts in Brazil

The Brazilian Army is providing logistic support and guarantees the security of operations to monitor, control, and combat deforestation in the Amazon. The agreement between IBAMA (Brazilian Institute of the Environment and Renewable Natural Resources) and the Army Command of Land Operations, signed on 6 August 2004, is part of the Action Plan for the Prevention and Control of Deforestation in the Amazon that requires the participation of 13 ministries. The preservation of the Amazon is considered a matter of national security and the Minister of the Environment, Marina Silva, said that the partnership with the army represents a joint effort by a society that wants to see the Amazon protected and developed with sustainable growth and the preservation of its communities and its biodiversity.

The Brazilian military are also involved in military missions relating to human security. Crime in Brazil's urban centres is a grave problem, especially in Rio de Janeiro. Gambling, racketeering, gang violence, the trafficking of arms and drugs, and general disorder create a tremendous sense of public insecurity. Former President Cardoso (1995) while maintaining that it was not appropriate for the military to be involved in police duties due to their lack of proper training, yet, given the gravity of disorder in the slums of Rio, which he compared to an 'undeclared civil war', nevertheless ordered their deployment.

The Brazilian armed forces also have a tradition of civic action roles rooted in the notions of the military as an agent of development and a state- and nation-builder. Many Brazilian officers continue to think of their institution as "a force for national integration and the sole representative of the state in remote re-

gions of a vast and underdeveloped country" (State and Soldier in Latin America 2005).

Concrete examples of enlisting military troops in civic action include the construction of roads, bridges, dams, and other infrastructure projects, and the provision of education, food, and field health services in impoverished and remote areas. This social mission of the Brazilian Armed Forces is a model that has heavily influenced the multidimensional role of the military in developing states such as in Guyana and the Caribbean islands.

95.4.2.4 Discussion on General Implications for the Military Services

Since the removal of authoritarian regimes in Latin America and the Caribbean, and the blossoming of democracy through 'free and fair' elections, respect for human rights and building of institutions such as the judiciary, and the legislature, greater impetus is being given to seeking out of opportunities for military and police reform and in reorienting the latter towards a greater display of professionalism in its external role.

However, the resolution or diminution of disputes through diplomatic interventions or recourse to the international institutions such as the World Court and the Law of the Sea Convention and the rise of the narcotics industry and other 'grey area' or asymmetric threats to human and environmental security, combined with the pressure to reduce financial allocations to the military, obviate against the likelihood of the military focusing on purely professional military missions.

The dilemma faced by civilian governments in re-defining the role of the military is 'over inclusion' while another is 'excessive exclusion'. The promotion of dialogue between the military and civilian institutions can find creative solutions to the implications of reform as follows:

- promotion of downsizing and restructuring so that savings can be redirected from personnel and other basic operating costs to strengthen and re-tool conventional capabilities with existing resources;
- promoting legitimate ways of harnessing and redirecting the resources of the military into peace-keeping, peace-building and peace-enforcement missions under the umbrella of the United Nations or regional peacekeeping authorities;
- establishing and equipping police and non-security forces, such as community policing groups, in

order to rely on them to deal with police-type responsibilities, such as stopping criminal activities and maintaining social order;

- establishing the jurisdiction of the police and the military;
- ensuring that police reforms (overcoming corruption and enforcing compliance with human rights standards) lead to a restoration of confidence in the police, and that the military does not continue to be the 'default option' when the civilian administration needs to impose order.

95.5 Human and Environmental Security in the Caribbean

95.5.1 Current Threat Assessment

The scenarios that are familiar to the English-speaking Caribbean include: a) criminal activities spawned by unemployment, poverty, and the narco-industry; b) the annual hurricane season; c) flooding of low-lying coastal states; d) fires of domestic origin which then expand because of closely constructed built-up areas; e) forest fires (dry leaf litter) and in the savannahs (grass fires which go out of control); f) volcanic activity near to human settlements; g) wide-spread diseases such as malaria, typhoid in humans, and 'foot and mouth' in animals; h) polluted waterways from oil and chemical spills or from heavy metals contamination through leaching from shipping disasters, breaches of holding dams, and run-offs from agricultural and mining activities.

Given the limited resources, and the fact that many of these challenges give little advance warning, there will be a need for urgent response because of the likelihood of loss of life, trauma, damage to property, and negative impact on the environment. These scenarios justify the involvement of the military as a component of the national response mechanism, and logically there should be adequate contingency planning which not only allows for synergies through an integrated civil and military response mechanism, but which also acknowledges the limits of jurisdiction of both the civilian authority and the military command. Based on the scale and scope of the threat to the human condition and the environment, contingency plans will involve regional or trans-border collaboration or an integrated national response.

95.6 Implications for the Military in the Caribbean

95.6.1 Regional Threats and Importance of Networking

In the case of regional and trans-boundary contingencies, the implications for the armed forces will be the need to network among regional armed forces. Such networking would be emphasized through the following:

- *Diplomatic linkage.* Personal and cordial relationships are desirable among heads of services, their staffs and key senior operational commanders, particularly those responsible for border regions, air, naval or Coast Guard units and for intelligence collation and analysis.
- *Intelligence linkage.* An intelligence linkage should be established for swift passage of information and where possible, person to person contact should take place overtly and covertly.
- *Contingency planning.* Contingency plans must be developed with the full involvement of the headquarters of each of the armed forces that are parties to the agreed strategy. These contingencies should deal with the scenarios identified above.
- *Information and communication linkage.* Routine communication and information systems should be established which are, as far as possible, compatible, and which should facilitate the exchange of information in an efficient manner.
- *Joint training doctrine and exercises.* Where possible, such training should be realistic and involve the civilian population, especially if the latter are convinced that it is in their interest to be concerned about illegal migration, narco-trafficking, environmental degradation, and natural disasters.
- *Public information.* The use of the media can generate a climate of confidence and mutual respect, and thus motivate the civilian agencies and communities to be supportive of the overall strategy.
- *Rules of engagement* should be documented and disseminated on a need-to-know basis.
- *Documentation of incidents* through taping and filming as audio visual aids for training purposes, and to emphasize to more developed states, the need for assistance in order to cope with the challenges.
- *Language training* will be a significant factor in speed of transmission and accuracy of information.

- *Accountability* must be ensured so that, in the spirit of interdependence and collaboration, national interests are served.

95.6.2 Regional Threats and Importance of Synergy

In the case of national efforts to respond to endogenous threats, for example pervasive poverty, increase in crime and its associated violence, and natural disasters – the military, with its organization structure, resources, and access that it has to national institutions, should hold itself in readiness to initiate contingency plans perhaps through its Armed Forces Staff Colleges, since they incorporate national planning, organizational planning, threat analyses, doctrine, educational and training requirements, and systems development.

Much conceptual work needs to be done, including testing of ideas with civilian agencies and specialized institutions, refining them and then evaluating the effectiveness of these through operations and feedback. When workable results have been achieved, the documentation of the contingencies would have laid a foundation for a coordinated response to any of the scenarios relating to human and environmental security.

95.7 Conclusion

The environment is an important part of what former Secretary of Defence William Perry (1996) called 'preventive defence', i.e. "a strategic vision of preventing the causes of conflict and creating the conditions for peace."⁶ States, in analysing the role of their armed forces, must determine the ways in which military resources may be used to achieve political objectives. Ken Booth et al. (1987: 11) argued that: "Any satisfactory definition of strategy must take into account the peacetime applications of strategic thinking and must locate the use of military force in a more general context of foreign policy making." Henry Kissinger (1957: 15) stated that "at every stage of formulation of strategy, doctrine would be considered as a combination of political, economic and military factors." Political leaders also have concerns about the military's 'mission creep' and the extent of their involvement and

creeping jurisdiction in the internal functions of the state.

While this may be true of the more sophisticated military, the reality of developing countries is that of necessity their military roles must reflect national defence and development and have a more diversified role rather than being highly specialized and inflexible. There must be sufficient checks and balances built into the authority relationships and command and control to ensure that the civilian jurisdiction over the military in democratically run states is not compromised.

State governments and civilian organizations have supported military involvement in civic action and enlisted the energies of the military and their logistical capability in poverty reduction efforts. The armed forces themselves cannot turn a blind eye to poverty and underdevelopment which, when translated into the extent of human suffering and misery that they engender, can be catalysts for social disorder. On the other hand, some military leaders have serious misgivings about the extent of the military's involvement in civic action and the likelihood of compromising their abilities to carry out their primary missions for national defence.

Given that a framework should exist which allows for clearly defined roles in the internal and external security sector, the military services ought to be able to conceptualize and implement a multi-mission approach to capacity building and capabilities which, with civilian approval, permits its intervention in those threats which will have negative consequences on human security and on environmental security, and the responses to which cannot be based solely on the civilian agencies and institutions.

96 Towards a Human Security-Based Early Warning and Response System

Albrecht Schnabel and Heinz Kruppenbacher

96.1 Introduction: Early Warning for Human Security Purposes

The recent attention given to the concept of human security – both in academic and political debates – is an encouraging development for those committed to improving the security and livelihood conditions of suffering populations. Not national security and defence, but the security and safety of the population are at the core of human security-focused domestic and international policy. While there are diverse interpretations of what is considered to be a human security threat, this chapter uses a definition that has been developed in a project on the operationalization of human security currently pursued by one of the authors: A human security threat constitutes an already or potentially life-threatening danger to a population in a specific geographic context. The specific source and nature of this threat depends on each situation and context – it could range from flooding to land slides to diseases or violent conflict.¹ Consequently, efforts to monitor, analyse and respond to such diverse threats vary greatly. In this chapter the authors argue that the contextualized, sometimes multi-layered nature of human security must therefore be

matched with an equally multifaceted monitoring, warning and response system.

Depending on the nature and source of the identified threats, their symptoms and causes, monitoring and early warning exercises must focus on very specific information and threat indicators. As the salience of data and events monitored will inevitably vary from threat to threat, the monitoring and warning approach used needs to differ accordingly. Contemporary political early warning systems lack the necessary flexibility to meet this requirement. They generally suffer from two major shortcomings: *First*, their focus lies exclusively on trends leading towards or away from violent conflict. Environmental, economic, and other threats do not feature on the radar screen unless they trigger social unrest or political upheaval. *Second*, in the past, early warning was targeted at ‘Third World countries’ only and the information gained was primarily used by Western states in order to enhance their country policies and development programmes. We believe that in a globalized world where developments in one corner of the globe sooner or later affect all societies, such ‘open source intelligence’ provided more or less exclusively for the donor community is not appropriate anymore – indeed has never been. Early warning information needs to be shared with all stakeholders and the response to human security threats has to be found in a participatory process with the response itself mainly being the responsibility of the local/national governments and non-state actors. Hence, no single-focus early warning system alone will satisfy the monitoring and warning capacity required for human security provision. Moreover, the up to now ‘extractive’ approach to early warning practiced by Western governments has to give way to one that is based on true partnership. The latter is a prerequisite for long-term, sustainable response strategies and mechanisms to alleviate potential and emerging threats to populations’ survival and state and regional stability.

1 The methodological approach towards human security analysis, monitoring, warning and response described in this chapter relies in large part on *swisspeace*’s ongoing work in human security research, particularly the four-year project “Operationalizing Human Security for Livelihood Protection: Analysis, Monitoring and Mitigation of Existential Threats by and for Local Communities,” jointly sponsored by *swisspeace* (HUSEC) and the National Center of Competence in Research (NCCR) North-South: Research Partnerships for Mitigating Syndromes of Global Change. The project is directed by Albrecht Schnabel, who acknowledges NCCR North-South for its support of his work. For further background see: Schnabel (2004: 109–131, 2004a, 2005a); Schnabel/MacFarlane (2005).

The chapter begins with an examination of existing first- and second-generation approaches to early warning and an illumination of the factors that explain their relatively limited utility for human security early warning (96.2). This part is followed by a discussion of the emerging concept of human security (96.3). We conclude by outlining how a third-generation early warning system would have to look like in order to successfully address the genuine human security needs of societies (96.4).

96.2 From Conflict- to Human Security - Early Warning Systems

Most if not all current political early warning systems are geared towards one specific threat, i.e. violent conflict, while they neglect other existential risks to human security linked to economic, political, social or environmental developments. The main reason for this negligence lies in the fact that political early warning generally builds on a traditional definition of security. According to this definition, which was coined during or even before World War Two, the security concept encompasses all forms of military threats and indirect warfare against a nation-state, while non-military threats to society are factored out. There are several reasons why decision-makers favour such a military-centered definition of security.²

The main argument was raised by Richard H. Ullman with regard to his home country: "Politicians have found it easier to focus the attention of an inattentive public on military dangers, real or imagined, than on non-military ones; political leaders have found it easier to build a consensus on military solutions to foreign policy problems than to get agreement on the use (and, therefore, the adequate funding) of other means of influence that the United States can bring to bear beyond its frontiers" (Ullman 1983: 129).

The resurgence of ethnic conflict after the end of the Cold War era has seemed to reconfirm the prevalence of military conflict as the main source of national, regional and global instability and human suffering, further confirming the tendency to return to traditional definitions of security and security provision in the creation of early warning analysis.

96.2.1 Genesis of Early Warning

Originally, early warning was a military concept. Over time it was adjusted for civilian purposes and various types of early warning systems emerged to assist national and international actors in the early anticipation of, and timely preparation for, natural disasters, the outbreak of famine, political destabilization, and forced migration.³ The rationale behind these political early warning frameworks, however, was still reactive rather than pro-active. Early warning and response measures were taken only after a humanitarian emergency had occurred and not beforehand. Crisis de-escalation was the key issue, not solid early preparedness.

Contrary to this first generation of political early warning schemes, present day early warning systems address - at least in theory - not only the symptoms but also the underlying causes of violent conflict. As the term 'early warning' indicates, monitoring and analysis of a potentially conflictive (or otherwise disastrous) situation should be initiated at the earliest possible stage in order to prevent rather than alleviate human suffering. The *Forum on Early Warning and Early Response* (FEWER), for example, defined (political) early warning as the "collection and analysis of information about potential and actual conflict situations, and the provision of policy options to influential actors at the national, regional and international levels that may promote sustainable peace." It further argued that "[e]arly warning is not only about assessing the possibility of conflict but also identifying the possible resurgence of conflict and the opportunities for peace" (Forum on Early Warning and Early Response 1999: 3).

On the one hand such definitions are helpful as they (a) link theoretical analysis of violent conflict to concrete action, (b) acknowledge the necessity to involve a broad range of state and non-state as well as local, regional, national, and international actors in addressing threats to sustainable peace, and (c) they point out the necessity to look not only for signs of escalating tensions but also of peace-building opportunities. The fact remains, however, that this and similar definitions used within the early warning community are still focusing on one single facet of the threat spectrum, which is violent conflict. Neither do they take other existential threats to society into account, nor

2 Krummenacher (1989) has discussed these motives with regard to the Swiss security policy.

3 An overview is given by: Krummenacher/Baechler/Schmeidl (1999: 77-99) and Schmeidl/Jenkins (1998: 56-69).

do they clearly delineate what type of information needs to be collected and analysed. Thus, such definitions invite decision-makers with a traditional military-centred understanding of security to continue looking at factors intimately linked to power structures and the adverse behaviour of opposition groups. The root causes of human insecurity, however, are easily neglected, since the focus is on inter- and intra-state violent conflict triggered by power struggles between opposing parties.

Most if not all political early warning activities fall into this trap.⁴ For instance, the FAST approach⁵ to early warning circumvents this definitional cliff by stressing the need to use a so-called 'analytical framework' in order to identify and categorize causes and issues of conflict for each of the observed countries.⁶ Nevertheless, in the FAST scheme, too, the dependent variable is violent conflict, and environmental or economic collapse, societal disintegration or state failure is beyond its explanatory power. In other words, while FAST is probably one of the more elaborate early warning systems that deals with violent conflict, it still does not capture the complex reality that contemporary societies face with regard to human security. If we are to create early warning systems that live up to this complex reality, we need to build a third generation type of early warning system. To this end, however, a number of challenges have to be overcome. Some of them pertain to models and approaches of early warning systems in general, while others are related to the fact that human security as a dependent variable is not as easily defined and operationalized than such narrowly defined threats as 'famine', 'forced migration', or 'violent conflict'.

4 These include early warning efforts by, among others, the *Uppsala Conflict Data Program* (UCDP), *Virtual Research Associates* (VRA), *Kansas Event Data System* (KEDS), UNDP's *Early Warning Systems in Southeastern Europe*, *ReliefWeb*, *Country Indicators for Foreign Policy* (cifp), *Global Information and Early Warning System* (GIEWS), or *International Crisis Group*, as well as *FAST International*, with whom the two authors are associated.

5 The FAST methodology distinguishes four vital components in early warning exercises: 1) systematic information collection on root, proximate, and intervening factors explaining the likelihood of armed conflict, 2) analysis of these factors and their interlinkages, 3) timely communication of early warning signals to all relevant stakeholders, and 4) linking early warning signals to concrete preventive activities (see: <<http://www.swisspeace.org/fast/>>).

6 See: <<http://www.swisspeace.org/fast/html>>.

96.2.2 Why a Human Security Focus?

96.2.2.1 Human Security as a Guide for Preventive Activity

Why should we focus on human security when considering preventive action? It is not easy to summon the necessary resources and goodwill to commit states, interstate and non-state organizations to preventive activities, when so much of their attention is already required to address the consequences of already ongoing crises. However, most of the very same actors who find it difficult to invest in preventive activities also realize and admit that prevention is the best insurance against the suffering and instability associated with structural and direct violence, and the costs of repairing the subsequent damage. Still, they remain stuck in a mainly reactive mode.⁷

How, then, can we assure that this obvious preference to react can be utilized in encouraging preventive action? The concept of human security offers a solution. If we assume that certain basic human security needs must be met to maintain a minimum standard of stability and order, then we can respond to cases where such needs are neglected. Once such neglect is addressed and needs are met, chances for suffering, disintegration and conflict are significantly reduced. Thus, reaction to observable slippage in the provision of basic security needs amounts to the prevention of eventual conflict, violence and, possibly, war. At the same time a foundation for long-term, positive peace is laid.

96.2.2.2 Human Security as a Pragmatic Notion

The provision of human security is not simply an idealist sentiment. It is a very pragmatic notion. Individuals want their needs fulfilled. In representative and participatory political systems politicians are interested in serving – at least nominally – the interests of their constituencies. If they want to secure their political office, they have little choice but to accommodate

7 For a series of case studies on efforts to mainstream conflict prevention within the UN and regional organizations around the globe, see Carment/Schnabel (2003, 2004) and Schnabel/Carment (2004). Case studies analysed in these books include the *European Union* (EU), the *Organization for Security and Cooperation in Europe* (OSCE), the *United Nations* (UN), the *International Monetary Fund* (IMF), the *Organization of American States* (OAS), the *North Atlantic Treaty Organization* (NATO), and the *Association of South-east Asian Nations* (ASEAN).

their voters' (reasonable) demands. Human security provision is thus the norm in well-functioning political systems where citizens have means and ways to keep those in power under control and where they ensure that the latter spend a substantial portion of their resources on securing the population's interests. If citizens enjoy good, accountable, and responsible governance, a culture of peace is more likely to develop than in an environment of oppression, insecurity and instability. This has positive effects on cross-border relations as well. Human security provision is thus a key ingredient in the creation and consolidation of 'security communities' (Adler/Barnett 1998).

Unfortunately, the majority of the world's population is ruled by governments that do not offer responsible, accountable, and good governance. Governments that are not interested in the welfare of their people will refuse to embrace a human security agenda. There have been suggestions to initiate human security audits or periodically publish a human security index or report. However, these efforts will not be successful as long as the provision of human security runs counter to the interests of many governments. What is needed are self-enlightened governments and leaders; the presence of domestic opposition groups who are capable of challenging irresponsible governments by non-violent means; and/or external pressure by states, sub-regional and regional organizations or the UN to encourage more responsible behaviour by governments.

96.2.2.3 Human Security Concepts in and for the UN System

While human security may be the key to good governance and peace, a fundamental shift of domestic, regional, and international norms towards the recognition of the general welfare of individuals and communities (i.e. the population as a whole) as the primary goal of governance is difficult to achieve. The work of the *International Commission on Intervention and State Sovereignty* (ICISS 2001) is a prominent example of an attempt to integrate human security in emerging global debates (and evolving norms) on the international community's responsibility to intervene in the affairs of sovereign states for 'human protection purposes'.⁸ In its final report, entitled *The Responsibility to Protect*, the ICISS defines "human security" as "the security of people - their physical safety, their economic and social well-being, respect for their dignity and worth as human beings, and the protection of their human rights and fundamental freedoms" (ICISS 2001: 15, para 2.21). It links the in-

ternational community's responsibility to prevent, to react and to rebuild directly to violations of human security. Other reports, studies, proclamations, or resolutions, many of which were the results of studies commissioned or undertaken by the United Nations, have produced a tremendously rich reservoir of recommendations for actions by nation states and their intergovernmental organizations to improve development, human rights and security provision, and thus to strengthen the chances for peace, stability and regional or global security for all.⁹

96.2.3 Human Security – From Debate to Policy?

Threats to the basic human needs of individuals and communities lead to human suffering, social and communal deterioration, and thus to violence in its various direct and structural manifestations. On the other hand, if individuals and communities feel secure and protected from actual and feared existential threats that emanate from social, political, and economic injustice, military violence, environmental disruptions or natural disasters – that is, if their basic human security is assured – human suffering on an individual level and conflict and violence on communal, regional and international levels can be significantly reduced.¹⁰ Therefore, investing in human security – particularly if approached in a pragmatic, systematic and focused way – will produce improved livelihood conditions for individuals and communities that currently live in vulnerable and life-threatening situations. Investing in human security improvements is thus a win-win situation. Moreover, if done in a contextualized (i.e. adjusted to specific needs and specific contexts) and focused manner (i.e. addressing the root causes of

8 The *International Commission on Intervention and State Sovereignty* (ICISS 2001) was established by the Canadian government, co-chaired by Gareth Evans and Mohamed Sahnoun, and modeled along the Brundtland Commission (1987). See at: <<http://www.dfait-maeci.gc.ca/iciss-ciise/menu-en.asp>>.

9 Among these are: UNDP's: *Human Development Report* (<<http://hdr.undp.org/>>), the *UN Millennium Development Goals* (<<http://www.un.org/millennium-goals/goals.html>>), several reports by the UN (2000e, 2001e, 2004, 2005f); the Human Security Commission's (2003) report, at: <<http://www.humansecurity-chs.org/finalreport/index.html>>; the *Human Security Report* (2005), at: <<http://www.humansecurityreport.info>>.

10 See also Lake/Rothchild (1996: 41–75).

threats), such investment is bound to produce positive results.

Many governments and international organizations have recognized the concept of human security as an important item on their national and international security and development agendas.¹¹ It is championed by those governments and non-governmental groups and organizations that oppose power politics – the tendency by powerful states and multilateral organizations to wield their might to advance their own interests and views of the world, which, incidentally, often do not coincide with the views of many of the less powerful. When it was initially introduced to broader policy and academic debates by the *Human Development Report* (UNDP 1994), where the concept was used as a comprehensive approach to encompass all human rights, security and development threats experienced by individuals and communities, the human security concept was meant to represent a key instrument in fighting poverty and improving human livelihoods. Human security has been promoted primarily by countries such as Sweden, Norway, Japan, Switzerland and Canada.¹² Some politicians and policy-makers have actively introduced the concept to the highest-level international debates – most prominently exemplified by former Canadian foreign minister Lloyd Axworthy's initiative to introduce the concept into UN Security Council debates (Oberleitner 2005: 185–203; Dedring 2008). Japan's initiative of a Human Security Commission added prominence and worldwide deliberations to the concept of human security (CHS 2003).

There has been an ongoing debate between those favouring a broad and those favouring a narrow definition of the human security concept. Some of the most forward-looking protagonists of human security, such as Canada, champion a narrow definition of the concept, one focused on *freedom from fear*. For reasons of political expediency as well as intellectual clarity, the focus is on personal security, immediate threats from violent conflict, and the provision of a *negative peace* (Galtung 1969). Such threats are miti-

gated primarily by operational preventive action once violent conflict is imminent or – in post-war situations – its resurgence must be prevented (Human Security Centre 2005). Others think quite differently: Much like the 1994 *Human Development Report*, the Human Security Commission's Report *Human Security Now* argues that a broader bandwidth of threats should be addressed, and existential threats of individuals should be addressed regardless of their source. The Commission equates human security with the protection of “the vital core of all human lives in ways that enhance human freedoms and human fulfilment” (CHS 2003: 4). The Commission further argues that, “[h]uman security means protecting fundamental freedoms – freedoms that are the essence of life. It means protecting people from critical (severe) and pervasive (widespread) threats and situations. It means using processes that build on people's strengths and aspirations. It means creating political, social, environmental, economic, military and cultural systems that together give people the building blocks of survival, livelihood and dignity” (CHS 2003: 4).

Thus, our understanding of human security analysis and provision – and our point of departure for a human security-based early warning system – focuses on the following five pillars (Schnabel 2004a):

First, human security focuses not only on armed conflict and its consequences for civilians, but also on many non-traditional security threats, including threats arising from diseases, or economic or environmental disasters. The costs of non-traditional security threats can be as – or more – devastating for human beings as those of traditional security threats. Moreover, they often have the potential to escalate into violence and war.

Second, the nature and level of human security and human insecurity depend highly on the context of one's analysis. For example, populations along border regions experience dramatically different threats than those living elsewhere in the country, or those living in a large capital. Thus, analysis of human security threats as well as the identification of mitigation measures is highly context-specific.

Third, a thorough threat (not ‘conflict’) analysis is key to identifying the most pertinent human security challenges.

Fourth, using a vulnerability scale as threshold criteria, one is able to differentiate between life-threatening and non-life-threatening dangers for the population. The former – actual or potential life-threatening danger – qualifies as a human security threat. Thus, a sanitation issue with deadly consequences for the

11 For an analysis of human security as a foreign policy tool, see: Debiel/Werthes (2006).

12 See the ‘human security’ website of the Canadian Government's Department of Foreign Affairs and International Trade (DFAIT); at: <<http://www.dfaitmaeci.gc.ca/foreignp/humansecurity/menu-e.asp>>. See also Lloyd Axworthy (1997: 183–196) and Behringer (2005: 305–342). For more information on the work of the Human Security Network, see: <<http://www.humansecuritynetwork.org/>> and chap. 75 by Fuentes/Brauch.

population of a refugee camp could be a major human security threat, while ethnic tensions within that same camp, yet with little potential of escalating into physical violence, are not human security threats. In order to assure the feasibility of response measures, 'human security clusters' are formed by a small number of such existential threats within a given context.

While this seems to be a very selective approach, focusing on issues with the most severe impact on the survival of the population, the *fifth* component of this approach focuses on root cause analysis and alleviation. The root causes of such visible, actual, life-threatening dangers inevitably overlap with those root causes of non-life-threatening vulnerability. Tackling the root causes of the former will inevitably also reduce suffering at the level of the latter. Root cause alleviation in the context of the most severe human security threats is thus seen as a comprehensive tool for the prevention of both life-threatening and non-life threatening dangers for suffering and endangered populations. Below we will discuss the possibilities for building an early warning system on such an approach to human insecurity identification and human security provision.

96.2.4 Challenges and Opportunities of Human Security-based Early Warning

Many challenges of a human security-focused early warning system reflect those of any early warning system. Some challenges are, however, unique to attempts at gearing an early warning system towards a cluster of threats that have emerged as key obstacles to the survival and safety of the population. They focus on a different approach to threat analysis, the necessity to undertake ongoing analysis, assessment and possibly reconsideration of key threats, and the necessity to move away from 'one-size-fits-all' approaches to the design and application of focus, method and implementation of early warning systems.

96.2.4.1 Focus of Early Warning

One of the key questions of any early warning effort is: What do we warn of? What are the core threats to human security that need to be addressed and that we wish to cover with our early warning system? In the context of human security monitoring it is obvious that a wide array of environmental, economic, social, cultural and political dimensions needs to be considered. However, the focus of monitoring and warning as well as the indicators used depend on the perceived

real threats (existing dangers) and potential threats (fears and concerns) identified in each covered geographic context. Once these threats are identified, the early warning system must develop indicators, methodologies and approaches to data collection and analysis that are suitable to the type of information required to measure such threats. For instance, event data may be particularly useful to track latent conflict developments but not the onset of environmental disasters. Thus, the nature of the threats monitored will also influence the methodology and type of data collection and assessment. One has to envision to run parallel systems based on a diversity of threats - or to generate one system with several thematic analysis units utilizing the same information collection, monitoring and analysis system. In the latter case the data collection and indicators used must be broad and versatile enough to accommodate the diversity of information required for tracking developments of several threat scenarios.

96.2.4.2 Method

Once the threats to, and vital requirements for, human security in a given country or region are identified, appropriate methodological approaches to monitoring and analysis have to be chosen. There are basically three methodological types of early warning systems: qualitative and quantitative approaches, and a combination of both. Examples for qualitative early warning systems are the publications of 'Human Rights Watch', 'Amnesty International', or the 'Crisis Group'.¹³ Analysts of such institutions are normally based in the countries monitored and produce risk assessments and recommendations based on context-specific background expertise. Quantitative early warning models boomed in the 1990's; partly because of a greater availability of data due to the fall of the Iron Curtain, and partly because of significant improvements of computer technology. The basic principle behind such models is the collection of structural or event data, which is then analysed in order to provide statistical trends of a country's stability or the

13 We consider them to be early warning systems even though they often lack typical early warning characteristics such as theoretical rigidity and periodicity. The country reports of the Crisis Group, for example, do not focus on the same conflict relevant factors but highlight varying specific dimensions or thematic issues of a conflict. In addition, reports are issued in irregular intervals and end-users of CG-reports never know when to expect the next issue.

level of conflictive and cooperative actions. Examples for quantitative oriented early warning systems are the Kansas Event Data System developed by Deborah Gerner and Philip Schrodt¹⁴, Barbara Harff's work in the field of genocide and politicide¹⁵, and the *Country Indicators for Foreign Policy* (CIFP) programme run by David Carment.¹⁶ Early warning systems that combine both approaches, such as FAST International¹⁷ and CEWARN (which draws on FAST methodology)¹⁸, benefit from the combination of extensive, standardized data collections, quantitative analysis, and qualitative expertise of country experts. We strongly believe in the necessity of combining quantitative and qualitative approaches to data collection and analysis.

96.2.4.3 Recipient of Analysis

It is not enough simply to generate information and hand it to those who might be in the situation to take necessary responses. If the recipients of early warning information are not placed, capable or willing to take action, early warning analysis would be nothing but an academic exercise without any effect on the improvement of volatile situations. Those who are engaged in early warning work, particularly if operating on a system that focuses on context-specific threats and their amelioration, must assure that the recipients of their analyses – the expected response actors – are closely involved in the early warning process and that they support the work done by the early warning system. Thus, those of us involved in early warning must ask a number of important questions: Whom do we want to warn? Who is the appropriate recipient of our analysis and warning? Are we aware of the political context within which recipients will receive our analysis and warning? Will they use the results of analysis and warning to serve the population's or their own particular interests? Is transparency of early warning analysis and recommendations assured? In short: How do we treat information, who should receive it and who not? Have the recipients of warning signals been adequately involved in developing the system so that it re-

sponds as closely as possible to their needs, capacities and requirements? Are the outputs/products of the early warning system presented and packaged in a way that is most appropriate for quick and thorough consumption by the recipients, and that responds to the recipients' needs and capabilities? Without satisfactory answers to these questions early warning activities stand on very weak ground.

96.2.4.4 Quality of Analysis

As a result of the 'cottage industry' that emerged from the prevention hype of the early to mid-1990's, many institutions claim to produce early warning analysis and policy description. However, only few have been able to produce useful products on a consistent, systematic basis, and others have overstepped their mandate of providing solid analysis to embark on the slippery path of advocacy. Despite the obvious need to pool resources and know-how, institutions show little willingness to cooperate, share information or develop and use common tools and methods. Funding continues to be rare and competition for funding is high. Donors are not without fault – they tend to show interest in supporting a diversity of small programmes with limited funds rather than a limited number of collaborating programmes with more significant funds. Donor coordination and cooperation would be able to improve much in this direction. Furthermore, as regards the methods used to collect and analyse data, too many institutions cover too many countries in unsystematic ways, with very little attention to detail and long-term analysis. The more countries would be covered by early warning efforts, the less 'selective', judgmental and thus politically sensitive it would appear if a country finds itself included on a certain organization's early warning roster. Unfortunately, governments' and regional or international organizations' willingness to fund early warning and preventive activities seems to have declined sharply in the past years, despite repeated calls in major international reports and policy statements for strengthening, not weakening, preventive capacities of state and intergovernmental actors. The former UN Secretary-General Kofi Annan's quest to make prevention part and parcel of international, global policy making, has not materialized and has lost further momentum with the end of his term.

96.2.4.5 Warning-Response Gap

The main challenge of early warning is the ability to bridge the gap between early warning and early ac-

tion. Strong commitment by all stakeholders to act timely, appropriately and in a coordinated manner is imperative in ensuring effective early warning and crisis mitigation. With the help of thorough conflict and threat analyses, stakeholders (and key security providers, including foremost government authorities) can work with early warning systems on the root causes of potential violence and on the identification of early indications for evolving instability and crisis. Focusing on human security – on the survival needs of the populations – states would be able to show their commitment to serving society, not merely themselves. With their support, security providers would be able to adapt their work to the aim of long-term, sustainable and preventive action. Early action requires proper preparedness and the selection of the most appropriate and effective entry points for mitigation strategies. Both should be pursued in close cooperation with early warning systems. However, the issue of timing is not only crucial in the initial involvement in evolving crises situations, but also in choosing the most appropriate exit strategy: At that point, one's assistance should have created the basis for sustainable improvement, and relevant stakeholders should have been strengthened and equipped to the point where they can carry forward the work initiated by external actors, while progress should ideally be visible enough to allow external actors to sense that their input has been successful. Continuous monitoring of the impact of mitigation measures is thus a key issue in measuring what would otherwise be extremely difficult to assess: The impact of preventive activities. Such monitoring would quickly reveal if the gap between warning and response is not being closed. It would also inform those responsible for monitoring and analysis as to which recommendations and measures work, which do not, and which impact this may have on the approach, methodology and nature of monitoring, analysis and the generation and transfer of recommendations. If we talk about an 'early warning system' – in contrast to an early warning 'activity' – we are referring to a process that spans monitoring, analysis, recommendation for (policy) response, design and implementation of response actions, and subsequent monitoring and assessment of such mitigation measures. For early warning to be successful – in any context and in regard to any threat – we have to take such a system approach. Thus, partners in early warning and response need to work closely together.

96.2.4.6 Political Sensitivity

Resistance of those who fear intrusions in their own political backyards has been successful in spoiling efforts of strengthening early warning and preventive capacities by the UN and other well-intentioned international actors. Political sensitivities still surround 'early warning' as a political activity: They concern on the one hand the presence of foreign representatives who conduct 'intelligence' work for supposed benign reasons to improve and strengthen development assistance programmes, and on the other hand the debates at highest international levels about a much talked about 'responsibility to protect' populations whose human security needs are being violated at least partly at the hands of their own governments. For many governments these are worrisome issues. These developments go hand in hand with a certain degree of loss of faith in the UN as the neutral 'conscience of humankind' – because the organization is too heavily influenced by the North while proving extraordinarily resistant to efforts of further democratization, political opening and reform. Nevertheless, in order to be effective and be heard, early warning systems need to find ways of remaining objective and maintaining the ability to offer constructive criticism – even directed at governments, if needed – while at the same time they must retain the possibility to cooperate with government actors. Here again the advantage of a human security focus comes to the fore: Focusing on issues below the level of armed violence creates space for tackling root causes of human misery through engaging less sensitive issues, yet with a chance for real impact.

96.2.4.7 Measuring Success

The role and success of early warning depends on the degree to which it can be translated into early action. Thus, early warning can only be as useful as relevant organizations and individuals are committed to incorporating early warning analysis into their short-, mid-, and long-term activities and planning, particularly if this refers to efforts at root cause mitigation. In general it is difficult to prove the effectiveness of early warning systems in preventing crises, disasters and destabilization: Success of early warning depends on the counterfactual that due to specific actions negative events and developments did not occur. In addition, it is difficult to measure the extent to which early warning signals are incorporated into the work of relevant stakeholders, and to what degree and extent they do trigger early action. Should a deteriorating sit-

uation improve for the better, it is moreover difficult to link such developments to the implementation of recommendations generated by the early warning system. Often, credit for constructive mitigation efforts has to be situated with the implementing actor (for instance, government agencies), even if they were triggered by analysis and recommendations from the early warning system. Nevertheless, this challenge may be less problematic for a human security-based early warning system, where specific – and very concrete – threats are monitored, and specific response measures are designed and assessed for their implementation and effectiveness. Assessment of response measures requires a clear understanding of the targets, goals and indicators for success associated with each of them. We are thus not dealing with counterfactuals: We do not search for what has not happened (i.e. a crisis), but what has happened (i.e. the effect that counter-measures had on specific root causes). Human security-based early warning focuses on key problems that can be alleviated in order to prevent key threats. If such key problems persist, counter-measures were either misplaced, ineffective, or they were never implemented. Information on these issues will inform revised measures and undoubtedly will have an impact on the results of threat monitoring.

96.3 Contours of a Human Security-Based Early Warning System

Despite their often-lamented lack of measurable success, early warning systems are likely to proliferate. Catastrophes of various kinds will continue to happen, but authorities at state and international levels as well as private business and civil society actors are increasingly wary of the high costs of post-disaster rebuilding. While even functioning early warning systems will not always lead to early and effective responses, there is no alternative to the creation and strengthening of early warning systems. The often-mentioned claim that despite the ample and timely availability of information and warning, response measures fail due to inadequate political will is also an overstated and unhelpful argument. Any early warning effort outside a well-lubricated early warning system in which each part of the system feeds off and informs the other will have great difficulties in generating the desired results. Moreover, if – as is the case with most early warning systems – threats are pre-selected with little or no effort in consulting stakeholders or in adapting to changing security situations, such

early warning efforts simply miss the point of their very existence: To generate knowledge about effective response options to prevent major disasters from threatening populations' safety and survival. What we propose here can be summarized very simply in three points: a) early warning must be part of a monitoring-warning-response system, without which it cannot be effective; b) early warning systems must respond to the actual threat(s) to the security and survival of the population in a given context; and c) the key threats monitored and responded to by early warning systems must be identified as a result of collaborative, participatory multi-stakeholder processes. Particularly the latter point will also increase the likelihood that different components of early warning systems will not only speak to each other but also act with each other in successfully addressing those root causes that are responsible for the most severe threats to all stakeholders' survival and future well-being.

96.3.1 Human Security Threat Analysis

Human security-based early warning systems, if properly conceived, would help resolve a great number of problems that have so far plagued such systems. Due to the multi-stakeholder process in identifying (and over time verifying) key threats and respective response strategies to life-threatening dangers, chances are high that an early warning system would target the most relevant threat(s), including traditional (and non-traditional) security threats. Focusing on threats that, in the first instance, affect populations, will add legitimacy to early warning efforts at the level of society, state and international community. All three communities will have to contribute to response efforts and thus must be able to identify themselves with the legitimacy, approach and focus of any given early warning system.

Human security early warning systems will prioritize a small number of severe threats and outline feasible response measures to effectively alleviate root causes, thus increasing the likelihood that response actors (or human security providers) find it necessary to implement response options. Root cause alleviation will in all cases reduce the suffering among the population and therefore generate positive – and observable – results that speak to the necessity and success of implementing contextual human security warning and response systems. Focusing not only on armed conflict, genocide or failed statehood (issues that are at the centre of existing early warning programmes) will increase the likelihood that govern-

ment actors will listen and act in political contexts that tend to be hostile towards traditional early warning and prevention initiatives.

96.3.2 Structure and Procedure

In addition to these basic requirements, we can identify a few technical issues of structure and procedure, which would help overcome some of the challenges of successful early warning outlined above. These apply to attempts at generating new human security-based early warning systems, or at upgrading existing early warning systems so that they are able to meet the basic criteria of human security early warning.

When developing early warning systems or when integrating an early warning component into one's work, one should ideally develop comprehensive approaches that combine monitoring, analysis, early warning and early response: Thus, applied prevention should take the form of integrated, systematic and long-term commitments, in close cooperation between all those involved in the early warning cycle ranging from threat monitoring to response implementation. Existing efforts should be evaluated, revised and adjusted to reflect such comprehensive approaches.

The early warning system should offer systematic early warning services for in-house access, for partners within the early warning system, and for use by external audiences and users. While early warning systems can collect, monitor and analyse data (at local, country, regional or global levels) either locally or externally, linking both local and external monitoring, data collection and processing provides a solid balance between local and external expertise and biases.

Early warning systems can process their collected event and structural data either through qualitative or quantitative methods. While there are often clear preferences towards one or the other method (often related to misplaced mistrust toward the other 'school of thought'), both approaches to early warning analysis are highly complementary and should go hand in hand. Whenever possible, long-term, systematic and thorough analysis of positive and negative trends should be combined with short-term expert analysis of particular events, how those events affect certain more or less problematic situations, and how these may impact the level and nature of the threat under observation by the early warning system.

96.3.3 Taking an Early Warning 'System' Approach

Ideally, a number of very general steps should be standard practice for early warning systems: 1) Those who collect and code pertinent data should possess local expertise; 2) only state-of-the-art data processing and analysis tools should be utilized; 3) local and international experts should interpret the results of such analysis in a holistic manner, by taking into account political, economic, social and cultural factors in crisis and disaster situation assessments; 4) those experts relate the findings to entry points for local and external actors who have the capacity to slow down or alleviate negative - and strengthen positive - developments; 5) early warning analysts are informed about policy and programme design and implementation; and 6) performance of implementation measures is included in monitoring activities.

Early warning is a team effort: Few organizations have the capacity, competence and mandate to be responsible for all aspects of early warning and early response: from monitoring to analysis to decision support and policy design, to implementation and evaluation. Realistically, several actors, both at state and non-state levels, need to cooperate closely if an early warning system is to run smoothly and for the benefit of all stakeholders involved. Some organizations are better placed to conduct monitoring and analysis, others to develop policy options and assure implementation. Nevertheless, without close cooperation - starting with a common decision as to what to warn of (threat) and what to look for (root cause indicators) - no early warning system can function effectively. The ownership of early warning systems should as much as possible rest with local or national actors. This may help to counter and alleviate any possible misgivings about the practice of certain countries, mostly from the North, and certain intergovernmental organizations to interfere in the internal affairs of states.

If willingness to engage in such cooperation can be secured, then the first step will have been accomplished towards an effective warning and response tool. If the various actors involved in an early warning system are not willing to cooperate, the effectiveness and success of such a system is doomed. Therefore it pays to accept delays in launching early warning systems until the key stakeholders have reached the point where they will in fact be ready to create a truly cooperative early warning and response system. That point, we believe, will be reached quicker if an early warning

system is based on human security criteria, speaks directly to the stakeholders' needs and the context concerned, and builds on cooperative efforts between a range of governmental and non-governmental human security providers.

96.4 Conclusion

Physical survival is the very basic need of a human being. Other needs beyond the simple physical survival determine the quality or comfort of life. For the majority of the world's population, life is a constant struggle to secure a minimum of comfort and self-fulfilment. Human security, as defined earlier in the chapter and based on the human security research conducted by one of the authors, stands for the ability of people to secure this minimal right – the right of physical survival. If people cannot be sure if they will survive the next day or week or month, if they have to fight to secure the survival of themselves, their families and communities, society will neither be stable nor peaceful. It is therefore these existential threats that endanger the lives of people, which are at the heart of our understanding of human insecurity. Those threats vary from region to region, from country to country, from place to place.

Most of today's early warning efforts focus on violent conflict as the key threat in need of prevention. However, consider these figures: The number of battle-related deaths has declined sharply over the past 50 years – according to one estimate from around 700,000 during the time of the Korean War to roughly 20,000 in 2002;¹⁹ and according to another estimate from approximately 600,000 in 1998 to 170,000 in 2002.²⁰ The differences in estimates relate to the inclusion or exclusion of civilian war-related deaths. These figures are still tremendously high, particularly considering that non-violent solutions to communal, intra-state and interstate conflict should be embraced by any political authority with some sense of responsibility towards its and other nations' populations. More needs to be done to prevent these violent conflicts. Still, violent conflict is by far not the greatest threat to people's survival: Even if we continue to focus on violent deaths: In the year 2000, out of a global estimate of 1,659,000 violence-related

deaths, only 310,000 were war-related, while 520,000 were homicides and 815,000 suicides.²¹

Moreover, while around 40,000 to 230,000 people died in violent conflicts in 2001 according to estimates by the UN Fund for Population Activities, in the same year 22 million people worldwide died of preventable diseases. HIV/AIDS are killing approximately 3 million people annually; tuberculosis 1.7 million; and hepatitis B between one-half and 3 million people. Between 600,000 and 1.2 million people are estimated to die of measles every year; 2.5 million children under the age of 5 die of diarrhea; and 4 million of respiratory infections. In addition, cancer, for instance, kills 7 million people per year.²² Every year an estimated 529,000 women die during childbirth (a number much higher than battle-related deaths and equal the annual figure of homicides).²³

Similar comparisons could be made in relation to casualties of environmental catastrophes. These statistics show that threats to people's survival are manifold – and that the focus of today's early warning systems on violent conflict is greatly inadequate if we want to prevent the most significant threats to people's survival. Moreover, reducing the danger of such threats will create the conditions for social and political stability and avoid wars, which, in turn, will prevent further suffering caused by armed conflict.

Beyond the main claim of our research that early warning systems should also focus on threats beyond armed violence, we found that too many early warning efforts operate in virtual vacuums: They monitor, analyse, and generate more or less suitable recommendations for security providers that are more or less informed and convinced about the utility of such information. Most of today's early warning systems are not 'systems' as such – they are individual components of what should be full-fledged early warning (and response!) systems.

A number of questions remain unanswered – such as who should take the lead and coordinate early warning and response systems, how tasks can be distributed based on each partner's comparative advantage, and how different early warning systems, each of them focusing on very specific priority threats, can collaborate in order to avoid overlap and duplication

19 See at: <<http://www.humansecurityreport.info/figures/Figure1.6.pdf>>.

in the collection of data and events, and in the generation of response measures that would be relevant to a variety of early warning systems (and their priority threat focus). These and other questions need to be answered in the abstract and by trial-and-error - yet the fundamental mind-shift towards human security-focused early warning must first happen before further technical challenges can be resolved.

97 Methods and Techniques of Remote Sensing to Contribute to Security in Tropical Rain Forests

Dirk H. Hoekman

97.1 Introduction to Information Needs and Techniques¹

Primary and secondary tropical rain forests cover large parts of the Earth's land surface. The significance of these forests, and the need for information, can be seen from several perspectives. First, tropical rain forests play an important role in global hydrological, biochemical and energy cycles and, thus, in the Earth's climate. Second, tropical rain forests are among the Earth's most complex ecosystems and have large biodiversity. The functioning of this ecosystem and the significance of its genetic resources are still not well understood. Third, tropical rain forests are of large economic value as a major source of timber and other products, and as a source of land. Large areas are converted into forest plantations, arable land and pastures. The rate of deforestation in natural tropical forests has been fairly stable at a level of 14.2 million ha per year on average during the past decennium according to FAO (2001b).

Increased awareness and concern on the unprecedented high rate of deforestation resulted into an ongoing discussion among scientists and politicians, which may be characterized by strong conflicting interests and lack of data. Following the 1992 UNCED conference in Rio de Janeiro some progress has been made in the areas of sustainable forest management and climate, however, progress in the area of protection of biological diversity has been relatively poor. For sustainable forest management certain 'Criteria and Indicators' have been developed, among others, by the *International Tropical Timber Organization* (ITTO) and the *Forest Stewardship Council* (FSC), resulting in a system for timber certification. The Kyoto Protocol of the *United Nations Framework Conven-*

tion on Climate Change (UNFCCC) describes measures to mitigate the increase of greenhouse gases in the atmosphere. Article 3.3, in particular, concerns the role of deforestation and afforestation. A crediting system enables trading of CO₂ emission and sequestration volumes. In contrast to the development of 'timber certificates' and 'carbon credits' the *Convention on Biological Diversity* (CBD) which was ratified in 1994 did not yield mechanisms (yet) for protection of biodiversity. New initiatives, such as proposed at the 2002 COP-6 conference in The Hague, focus on an ecosystem approach in connection with issues related to sustainable management, climate and fire prevention.

Partly, the slow and cumbersome progress in these important fields is a consequence of the lack of insight in the functioning of ecosystems, lack of accurate data, and lack of good definitions. Remote sensing systems may play an important role in the development and implementation of such international treaties. The ongoing discussion on the carbon cycle is a clear example. Though there is a strong interest in data on the amount and distribution of biomass over the earth surface, most of the currently existing biomass maps may be of very poor quality. This is clearly illustrated by the paper of (Houghton/Lawrence/Hackler/Brown 2001). Seven biomass maps of the Brazilian Amazon produced by different authors and approaches are cross-compared. The results show clear disagreement, both for the spatial distribution of biomass (correlation between results obtained with the different methods vary from 0.05 to 0.35) and the absolute levels of biomass.

At present, the largest single source of uncertainty in the global carbon budget, amounting to 1.3 Giga-ton carbon per year, is due to terrestrial ecosystems (IPCC 2001). The study of the carbon cycle and its influence on processes related to climate change requires different sorts of earth surface observation (monitoring) in order to supply the necessary infor-

1 JAXA is acknowledged for providing JERS-1 SAR data in the framework of the K&C Initiative programme.

mation on carbon flow dynamics (Quegan/Le Toan 2001). Forest structure and biomass are important ecological descriptors needed as input for quantification of ecosystem productivity at different levels.

During the past decade research activities on the development of the application of *synthetic aperture radar* (SAR) for monitoring ecosystem processes has grown significantly. Its potential use can be categorized broadly as follows: (a) classification and detection of change in land cover; (b) estimation of woody biomass; (c) monitoring the extent and duration of inundation; and (d) monitoring other temporally-dynamic processes (Kasischke/Melack/Dobson 1997). To fulfil information needs, accurate mapping and monitoring is required at different scales. Severe cloud cover often prevents the acquisition of optical remote sensing data, thus making the (additional) use of satellite radar remote sensing for monitoring applications necessary. At the other hand, radar data may provide different or additional information, thus making (the additional use of) radar data (both spaceborne and airborne) an interesting choice, also for less timeliness-demanding applications such as inventory (Hoekman 2001). In recent years many research activities focused on the use of SAR to study tropical rain forest. At continental scale mosaics of all tropical rain forests have been created using JERS-1 SAR images (Siqueira/Hensley/Shaffer/Hess/McGarragh/Chapman/Freeman 2000; Rosenqvist/Shimada/Chapman/Freeman/De Grandi/Saatchi/Rauste 2000) and, for Africa, using ERS-1 SAR (De Grandi/Malingreau/Leysen 1999). At a larger scale researchers have focused their studies on the development of inversion algorithms, segmentation and classification techniques for polarimetric and interferometric SAR images and created a variety of types of tropical rain forest classifications, for example using texture (Oliver 2000), mapping tropical rain forest types and its biophysical characteristics (Hoekman/Quiñones 2002) or individual trees (Varekamp/Hoekman 2001).

In this chapter the suitability of radar techniques for acquiring relevant information on rain forests is illustrated with examples of studies conducted by the author in Indonesia.

97.2 Space Agencies and Ecosystem Monitoring

97.2.1 Ecosystems

Many of the world's ecosystems are critically endangered or lost. The Millennium Ecosystem Assessment (see at: <www.maweb.org>) clearly shows that the functions and capacities provided by the remaining ecosystems would not suffice to sustain mankind. Consequently, it is of utmost importance to protect remaining intact ecosystems, restore degraded ecosystems, and to develop approaches for continental scale ecological structures. However, until now, efforts seem to be too small and insufficiently uncoordinated.

97.2.2 Observations from Space

The Space Agencies are aware of their specific role in providing relevant information. Dedicated space missions and sensors have been designed to observe our environment systematically. However, until now, data have not been exploited sufficiently, notably for the terrestrial ecosystems. For example, only 3 per cent of the millions of space radar images collected in the previous decade have ever been used. Because of limited processing capabilities the focus has been on spatially fragmented observation of short duration, mainly for scientific purposes.

97.2.3 Recent Developments

Several recent developments may lead to a considerable better information supply. (i) The *Japanese Space Agency* (JAXA) adopted the policy to exploit data from new missions systematically to support international conventions such as the climate convention (UNFCCC), the biodiversity convention (CBD) and the wetlands convention (Ramsar). Since Japan lacks capability to do this on its own, tasks are delegated to internationally renowned organizations. These organizations receive large quantities of data free of charge, for a specific geographical region and purpose, and during the whole mission period, under the condition that all these data will be processed and that publicly accessible products are generated. (ii) BOS (an Indonesian nature conservation organization) and SarVision successfully introduced a rapid illegal logging response system in Indonesia based on radar data provided by the *European Space Agency* (ESA) (see at: <www.sarvision.nl>). As a result Space Agencies are

motivated to provide large quantities of radar data to develop large scale application in tropical rain forest areas. (iii) Recent developments in computing capabilities and Internet technologies allow automated processing of enormous quantities of data and fast distribution of resulting maps to remote users. For example, it has been demonstrated by SarVision and BOS that illegal logging operation could be ended within 5 days after a new observation of the ESA radar satellite.

97.2.4 New Opportunities

Capitalizing on these new developments, a number of problems, which currently limit progress in environmental security issues, can be addressed. (i) Information required by local managers can be generated systematically and spatially complete, and can be made available in a fast, frequent and continuous way, even at remote locations. (ii) Transparency is achieved. Financers of environmental services, politicians, or even the general public, can monitor ecosystem developments. (iii) Currently every organization is buying its own (very limited amount of) data; there is reluctance to share data, or to develop common methodologies. Better use of limited financial resources is made, and a major step towards integrated policies, when the proposed large scale applications emerge.

97.2.5 New Approaches

The approach should be highly proactive. Dedicated remote sensing organizations should serve as a bridge between user communities and the space agencies by participating in space mission planning, claiming capacity and data from the space agencies, processing data systematically in a fast and automated way in consultation with the users, and making products widely available. Data, in principle, should be collected within a targeted vast region for *all* areas environmentally important or sensitive, even though such data may not seem to serve a direct purpose. The reason is that as soon as adverse conditions develop (in many areas this inevitably will happen), data are already available and the developments which led to these adverse conditions can be assessed. To this aim the concept of a public library is proposed, where users can find up-to-date products as well as complete histories of land cover change. For Indonesia, for example, such a library is currently being filled by SarVision with data products of the Insular South-East Asian region. It encompasses medium resolution data

(with 150–1000 m detail) covering the entire region for the past decade, the most recent products showing the status less than 6 months ago. In addition, for areas of particular importance, and for applications like fast illegal logging response, it contains data at even higher resolution (25 m detail), the most recent products showing the status less than 35 days ago. Product types range from continental scale land cover, forest cover change and fire occurrence maps to detailed products showing hydrological and ecological characteristics (see at: <www.sarvision.nl>)

97.3 Peat Swamp Forests and the K&C Initiative

97.3.1 Present Condition of Peat Swamps

Thick deposits of peat underneath tropical peat swamp forests are among the world's largest reservoirs of carbon. Although occupying only about 0.3 per cent of the global land surface, they could contain as much as 20 per cent of the global soil carbon stock, representing 63–148 Giga ton of carbon (Rieley/Setiadi 1997; MacDicken 2002). The tropical peat swamp forests of Southeast Asia account for approximately 26.5 million ha of the total tropical resource of 38 million ha, with Indonesia alone contributing an estimated 17–27 million ha (Waldes/Page 2002).

The role of peat swamp forests in the conservation of biological diversity is noteworthy as they harbour a high percentage of globally threatened species. For example, of the 57 mammal and 237 bird species recorded in peat swamp forests to date, 51 per cent and 27 per cent, respectively, are listed as globally threatened species (Sebastian 2002). Furthermore, a number of formerly widespread species that are now rare can still be found in peat swamp forests, such as the Sumatran rhinoceros, the Sumatran tiger and the Orangutan in Borneo.

The areas are threatened by large scale deforestation, canal drainage and forest fire, causing enormous carbon emissions (Goldammer 1999; IUCN/WWF 2000). Emissions from the fires in Indonesia during the strong 1997–1998 *El Niño Southern Oscillation* (ENSO) event, for example, have been estimated at 0.8–2.5 Giga ton of carbon. This is equivalent to 13–40 per cent of the global annual emission from anthropogenic fossil fuel combustion (Page/Siegert/Rieley/Boehm/Jaya/Limin 2002).

Despite the relevance of this ecosystem, relatively little is known about its functioning and existing maps

are often of poor quality. L-band radar monitoring provides a means to observe seasonal dynamics of flooding, the impact of drainage by canals and the condition of the forest cover. A new methodology for mapping biophysical parameters, hydrological modelling and monitoring based on historical JERS-1 radar data has recently been introduced (Hoekman 2007). This methodology will be applied within the K&C Initiative.

97.3.2 K&C Initiative

In 2000, the *Earth Observation Research and Applications Centre* (EORC) of the *Japan Aerospace Exploration Agency* (JAXA) initiated the *Advanced Land Observing Satellite (ALOS) Kyoto & Carbon (K&C) Initiative* to support explicit and implicit data and information needs raised by international environmental *Conventions, Carbon Cycle Science and Conservation* of the environment (commonly referred to as CCC). The Initiative, which is led and coordinated by EORC JAXA, is also supported by an international Science Team from 13 countries and focuses primarily on defining and optimising provision of data products and validated thematic information derived from in-situ and satellite sensor data, focusing particularly on that acquired by the *ALOS Phased Array L-band Synthetic Aperture Radar (PALSAR)*.

The objective of the ALOS K&C Initiative is to define, develop and validate thematic products derived primarily from ALOS PALSAR data that can be used to meet the specific information requirements relating to the CCC. A key component has been the development of a systematic data acquisition strategy that fits within the constraints imposed by the orbital and technical capabilities of the spacecraft and also ensures that adequate data will be collected to allow the required thematic output products to be developed on a timely basis.

The K&C Initiative is based on the three coordinated themes relating to global biomes; forests, wetlands, deserts and semi-arid regions, and a fourth theme dealing with the generation of regional ALOS PALSAR mosaics. Each theme has identified key products that can be generated from the mosaics including land cover (forest mapping), forest change mapping and forest biomass and structure (forests), global wetlands inventory and change (wetlands), freshwater resources and desertification (deserts). Each of these products is generated using a combination of the PALSAR ScanSAR or fine resolution mosaics of backscatter or coherence datasets.

*The K&C Initiative builds on the experience from the Global Rain Forest Mapping (GFRM) and Global Boreal Forest Mapping (GBFM) projects, using data acquired by the JERS-1, the predecessor of the ALOS PALSAR. These projects confirm the utility of L-band SAR data for mapping and monitoring forest and wetland areas and the benefits of providing spatially and temporally consistent mosaics for regional-scale monitoring and surveillance.*²

97.3.3 Radar Observation Methods

The usefulness of spaceborne radar data is mainly related to the ability of making observations frequently, thus enabling timely action to be taken, for example, in case areas of suspected illegal logging are detected, or in case of fire events. Statistics derived from the study of spatial and temporal distribution of cloud cover using geostationary meteorological satellites reveal that the probability of acquiring SPOT or Landsat-TM images with less than 30 per cent cloud cover are very low (Gastellu-Etchegorry 1988). For Kalimantan, the mean probability to acquire images with less than 70 per cent cloud cover is only 4 per cent per month.

The use of spaceborne radar to map and monitor peat swamp forests has certain unique advantages. In the first place, observation by radar systems is unimpeded by cloud cover, which is an advantage over optical data in the humid tropics. In the second place, radar can penetrate vegetation cover to a certain extent, depending on wavelength. The JERS-1 and ALOS imaging radar (or SAR) systems use a relatively long wavelength (23.5 cm, or 1.275 GHz), also referred to as L-band. It allows observation of flooding under a closed forest canopy. Hence, in principle, seasonal flooding dynamics can be revealed well.

A certain level of understanding of the physical interaction between the radar wave and the terrain is necessary to allow for an accurate interpretation of these L-band SAR images. Biomass and flooding are the two main terrain parameters and polarization is an important radar wave parameter. The effect of biomass is an increase of the radar echo (or backscatter)

2 See: Rosenqvist/Chapman/Cihlar/Costa/DeGrandi/Dobson/dos Santos/Finlayson/Hallikainen/Hess/Hoekman/Igarashi/Krug/LeToan/Lowry/Lucas/McDonald/Milne/Moreira/Olsen/Quegan/Running/Salas/Sawada/Schmullius/Shimada/Siqueira/Tadono/Tateishi/Taylor/Telmer/Townshend/Tschirley/Yamagata/Yasuoka/Zimmerman (2005).

Figure 97.1: Satellite radar observations of JERS-1 at 24 September 1996 (top) and 21 January 1998 (bottom) of an area in Central Kalimantan near Palangkaraya (size: 70 km x 30 km). Large areas of swamp forest (with large orang-utan populations) vanished rapidly. Construction of canals locally resulted in drainage and collapse of forest on peat domes. The increased accessibility also resulted in an increase of illegal logging. Time series of radar observation clearly show vegetation changes related to these processes. **Source:** Courtesy: GRFM project. Permission to publish this radar image was granted by JAXA/GRFM project.

intensity with increasing biomass up to a level of around 100 ton/ha. Above this biomass level the radar image intensity saturates and the radar wave does not penetrate the vegetation well. Below this biomass level, or in open canopies, the effect of flooding is noticeable. In this case the interaction mechanism is somewhat different. The radar instrument is side-looking and the water surface acts as a mirror. Hence, smooth open water surfaces yield no radar return, i.e. these areas appear black in the image. However, when vegetation is present it causes a second reflection (mainly by tree trunks) in the direction of the radar. This effect is particularly strong for the so-called HH-polarization, which, in fact, is the only polarization

used by the JERS-1 SAR. In practice, for forested peat domes, the combined effect of flooding and biomass is a variation in the image intensity for which the *range of variation* is mainly determined by the biomass level (i.e. low biomass areas show large variations in time; high biomass areas small variations) and for which the *relative brightness* is mainly determined by the intensity of flooding (i.e. dry terrain shows a relatively low intensity; flooded terrain a relatively high intensity).

Figure 97.2: JERS-1 SAR time series of the collapse of the peat dome in Kahiyu: (a) 12 Jul 1995; (b) 19 Mar 1997; (c) 11 Sep 1997; (d) 25 Oct 1997; (e) 21 Jan 1998. Permission to publish this radar image was granted by JAXA/GRFM project.

97.3.4 Mega Rice Project (Central Kalimantan)

Time series of ERS and JERS-1 SAR observation have proven to be useful to monitor changes in land cover, (illegal) logging activities, fire damage or fire susceptibility in Kalimantan (Siegert/Rücker/Hinrichs/Hoffmann 2001; Hoekman/Vissers/Sugardiman/Vargas 2001).

Figure 97.1 gives an example of the rapid and large-scale changes that currently take place in the Indonesian rain forest areas. In this particular area, also known as the mega rice project area, 1 million ha of forest, mainly peat swamp forest, has been cleared with the purpose to convert the land into rice growing areas. At present the area is largely abandoned because the soil is unsuitable.

97.3.5 Mawas – Kahiyu Peat Swamp Forest (Central Kalimantan)

Time series of L-band radar data can provide useful information on hydrology in peat swamps. For many peat swamp areas in Borneo and Sumatra large series of JERS-1 images (i.e. 15–30) collected in the period 1992–1998 exist. Such data reveal biophysical characteristics, temporal dynamics in flooding, and ombrog-

enous domes. Since tropical rainfall can be very localized and surface run-off is fast, the availability of large time series strongly supports proper interpretation (Hoekman 2007). In one of the peat domes in this area all trees died of drought and sub-surface fires and fell down. The dome's collapse is shown in more detail in the time sequence of events in figure 97.2.

Until 1996 the dome was still hydrological intact. In 1997 the construction of a very wide canal (for the mega rice project) is visible. In figure 97.2(c) (September) the canal is filled with water (the canal becomes black) and a small somewhat brighter area appears. This area grows very fast and becomes even more bright as shown in figure 97.2(e) until the collapse is completed (January 1998). The physical interpretation of the radar brightness changes in the dome area can be associated with an initial period of excess drought under a dense canopy, i.e. the area becomes somewhat darker, like in Figure 97.2(b), followed by a period in which trees collapse and the brightness increases due to direct radar reflections from exposed trunks, like in figures 97.2(d-e). It is interesting to note that the spatial extent of the collapse halted at the relatively flat and wet fringe well visible in radar images of previous date. The obvious cause of the collapse is the huge drainage caused by the wide canal. The coin-

cluding strong ENSO period may have accelerated the process.

97.3.6 Sebangau Peat Swamp Forest (Central Kalimantan)

Many instances of forest collapse at peat dome tops occurred in parts of Borneo and Sumatra during the strong 1997–1998 ENSO event. As yet it is not entirely clear how much selective logging, and the associated construction of small canals for log transportation, have contributed to these collapses. The Sebangau National Park, located directly south-west of Palangkaraya comprises large peat dome complexes. Figure 97.3 clearly shows a large number of collapse events during the ENSO period.

Figure 97.3: In the Sebangau National park several areas of peat dome forest collapse, caused by the 1997 ENSO event, show up as bright areas indicated by the arrows (date: 17 July 1998). Permission to publish this radar image was granted by JAXA/GRFM project.

0 5 10 15 km

However, a recent collapse in Sebangau (detected by ENVISAT SAR in 2004), at the end of a canal extending to the top of a large dome, clearly shows collapses also occur in non-ENSO years. There is still little evidence that under conditions of extreme drought such massive collapses may occur naturally and thus form part of the dome formation process.

97.3.7 Berbak Peat Swamp Forest (Jambi, Sumatra)

After a collapse the remaining area is characterized by open vegetation and a large number of dead tree trunks and is very susceptible to fire. Lowered water tables cause peat oxidation. Peat fire and oxidation cause huge carbon emissions and soil subsidence. Soil subsidence causes stagnating water. Therefore, in time, the conditions for forest regeneration may diminish. At a certain point the damage is beyond recovery ultimately leading to complete combustion and oxidation of remaining peat dome layers. In order to prevent this irreversible process, restoration activities, such as canal blocking and replanting, are necessary. Van Eijk and Leenman (2004) conducted research in the Berbak National Park in Sumatra to study possibilities for regeneration. Time series of JERS-1 images proved to be very useful to determine and map certain degrees of damage. Depending on the nature of the damage certain restoration approaches are suggested. Radar images clearly show different patterns of damage, expressed by the number of fire events and flooding duration in subsided areas (Hoekman 2007).

97.4 Tree Mapping

97.4.1 Information Needs

To enforce national legislation for sustainable forest management or to verify implementation of guidelines for sustainable forest management as proposed by the *International Tropical Timber Organization* (ITTO), information on terrain, forest and tree characteristics is needed. Among others, systems should be available to monitor logging activities and to detect illegal logging, allowing timely action to be taken.

97.4.2 Tree Mapping Algorithm

Parameters such as tree position, tree crown dimensions, canopy cover and terrain slope angle, and the

Figure 97.4: Analysis of high-resolution interferometric airborne radar data. A strip of approximately 180 m in length and 30 m wide is processed into a 3-dimensional reconstruction of the tree crowns present in the upper canopy layer. At the left a side-view is shown where the radar is looking from top-left. At the right a top-view is shown. The side-view shows that the transect is crossing a hilltop. Combining the side- and top-views it can be noticed that the two leftmost tree crowns are positioned on top of each other and that the large tree, number 7 from the left, has a sub-crown pointing to the right and upwards.

location of skid trails and logging roads, are of particular interest. In principle such information can be retrieved on a routine basis over large areas from aerial photographs. Repetitive observation would allow assessment of logging intensity, erosion and fire susceptibility, verification of reforestation obligations, etc. However, cloud cover too often prevents timely observation. Radar does not have this limitation. Moreover, images of short-wave high-resolution radar, in principle, may give sufficient information. Since other physical mechanisms underlie radar imaging, radar images can not be treated in the same way as aerial photographs. Notably effects of ‘radar shadow’ and ‘lay-over’ should be handled with care. To study the potential of radar the ESA *Indonesian Radar Experiment* (INDREX) campaign and the NASA *Pacific Rim 2* (PACRIM 2) were executed in the years 1996 and 2000, respectively, in East-Kalimantan.

Tree mapping technique basics are described in (Hoekman/Varekamp 2001) and (Varekamp /Hoekman 2001). The results of radar canopy reconstruction have been compared with stereo aerial photography, which was acquired near simultaneously, for tuning of the algorithms and validation. A result for a small area is shown in figure 97.4.

The agreement between fully automated radar canopy reconstruction and stereo aerial photography viewing appears to be very high. New studies focus on aggregation of radar tree data into maps, which are corrected for the relief, showing, among others, statistics such as the total crown volume per ha, the number of trees per ha, the mean crown height and the mean crown projected area. Such statistics may be correlated with forest degradation and regeneration stages and, as such, provides important information for the current forest rehabilitation programs in Indo-

nesia (Hoekman/Vissers/Völker/Nugroho/Siegert 2002).

97.4.3 TerraSAR-X and TanDEM-X Missions

With the advent of new generation high-resolution spaceborne radar missions tree mapping from space may soon become a reality. The TerraSAR-X satellite with X-band radar (wavelength 3 cm) is scheduled for launch in April 2007. An identical satellite named TanDEM-X will be launched two years later to form a pair. This pair of X-band radar systems forms an interferometric system capable of retrieving very high resolution 3-dimensional data.

High resolution interferometry allows assessment of 3D canopy architectural descriptors. These descriptors, such as crown size statistics, vertical distribution of the crown layer, gap occurrence intensity, etc., allow forest degradation/regeneration stage mapping or natural regeneration mosaic mapping. Also terrain slope information is very important in this respect. Another application would be the detection of selective logging in tropical forest. Usually mature (large canopy) trees are felled, which cause local damage in the form of gaps (neighbouring trees collapse) and skid trails (made to extract the trunks).

Information on the forest state is needed for land use planning, forest rehabilitation planning, forest protection, fire prevention and nature conservation. Forests in degraded state are more vulnerable to fire, which is causing major problems in countries like Indonesia and Brazil.

97.5 Summary and Evaluation

97.5.1 Information Needs

Scientists, policy makers and land managers have a large variety of information needs for which imaging radar may be well applicable. Partly this is related to the large quantity, high frequency and timeliness of data needed for development and proper implementation of mechanisms such as those related to carbon offset trading or timber certification. Obviously weather independent monitoring techniques will play a key role. On the other hand radar data may give new insights to scientists because of several of its unique characteristics and capabilities. Long wavelength (such as L- and P-band) polarimetric radar is capable of providing detailed information on forests' biophysical characteristics related to flooding, soil, vegetation structure and biomass.

97.5.2 Future Missions

In the near future some capabilities which are currently exclusive to airborne SAR may be available from spaceborne SAR. The ALOS PALSAR (launched January 2006) would give a boost to accurate monitoring of forest biophysical properties, including forest structure, flooding and biomass. The combination with advanced C-band systems such as RADARSAT-2 and ENVISAT ASAR would even increase this capability. For forest and timber certification mechanisms it would be ideal if individual large canopy trees could be mapped (in 3-dimensions) from space, as was experimentally achieved by aircraft. In principle this is possible with the new X-band satellite radar systems such as for the TerraSAR-X and TanDEM-X missions, which have a 2 m resolution. Finally, to complete the 'wish list', it would be worthwhile to have a P-band SAR system in space to further improve forest structure mapping and biomass monitoring, such as the proposed BIOMASS system (Le Toan/Quegan 2005).

97.5.3 Individual Tree Monitoring

High-resolution airborne InSAR is even capable of 3-dimensional mapping of individual canopy trees. This capability may be utilized to implement highly transparent new timber certification techniques in tropical forests. Aggregation of such detailed information reveals different forest structures in statistical sense, related to logging damage intensity or forest regeneration after logging, and may be useful for forest reha-

bilitation programmes as currently being executed in Indonesia.

Better knowledge of the forest state, and the possibility to monitor this state, or to monitor the natural succession stages, are of importance for climate studies related to global carbon cycle science and ecology (biodiversity).

Illegal selective logging is very hard to detect with current remote sensing methods. TanDEM-X is likely to provide useful data, and could be used operationally for law enforcement. The environmental and economic importance of this application is large. Slope information is important to detect illegal logging on steep slopes, causing erosion damage.

97.5.4 Peat Swamp Monitoring

Many of the tropical peat swamp forests in Borneo and Sumatra are seriously threatened by (illegal and legal) logging and conversion to plantations for the oil palm and pulp and paper industries. In all cases the hydrology is affected by excess drainage, leading to collapse of remaining forests, notably in dry years. Beyond a certain point the hydrological integrity of ombrogenous areas is lost, leading to an irreversible process of total collapse and the combustion and oxidation of the remaining thick peat layers. Unless rigorous measures are taken very soon, this most likely will lead to major negative effects on biodiversity and global climate.

More information is needed to support protection and restoration efforts. The availability of better vegetation and peat depth maps may be very useful. However, the most crucial factors may appear to be the knowledge on the hydrological functioning and the relationships between hydrological and ecological characteristics. These latter points are still poorly understood. Radar, unimpeded by cloud cover, can provide continuous observations which can be related to hydrological characteristics, may become a key instrument in future protection and restoration efforts.

Exploitation of PALSAR time series to be collected by the ALOS satellite may provide significant support for peat land management, protection and restoration, such as described in the Ramsar "*Guidelines for Global Action on Peatlands*" (GGAP)". Moreover, it may significantly support other international treaties, such as CBD and Kyoto Protocol, and carbon cycle science.

97.5.5 New Approaches to Implement Environmental Security Services

With the new developments in remote sensing technology, a number of problems, which currently limit progress in environmental security issues, can be addressed. Information required by local managers can be generated systematically and spatially complete, and can be made available in a fast, frequent and continuous way, even at remote locations. Financers of environmental services, politicians, or even the general public, can monitor ecosystem developments. Since transparency can be achieved donors will be more easily tempted to invest in environmental services because they can better assess the status of the terrain before starting a project, they can follow changes in the land cover, and can evaluate achievements in a fast and reliable way. In this way remote sensing systems can boost carbon offset trading and timber certification, or similar services, in remote areas, from which otherwise information is poorly available.

The approach should be highly proactive. Data, in principle, should ideally be collected within a targeted vast region for *all* areas environmentally important or sensitive, even though such data may not seem to serve a direct purpose. The reason is that as soon as adverse conditions develop (in many areas this inevitably will happen), data are already available and the developments which led to these adverse conditions can be assessed.

98 Linking Anthropocene, HUGE and HESP: Fourth Phase of Environmental Security Research

Úrsula Oswald Spring, Hans Günter Brauch and Simon Dalby

98.1 Introduction¹

After two decades of research “environmental security discussions can now move to a fourth stages of syn-

1 The authors are grateful to Patricia Kameri-Mbote (Kenya) and Czeslaw Mesjasz (Poland) for their very useful comments and stimulating suggestions that are reflected in this final text. With the Copenhagen school (Buzan/Wæver/de Wilde 1998) the authors understand ‘securitization’ as the use of extraordinary actions and means to cope with major security issues. Mesjasz (2008, 2008a, 2008b) has discussed applications of a ‘broadened’ security concept to the economic realm but he has repeatedly cautioned about the dangers if one were “to use extraordinary means to too numerous aspects of our life, which in some cases will be treated as ‘public goods’, [because] then the sense of security would be diluted.” With the ‘widening’ suggested in this chapter, new security dangers and concerns, such as environmental issues (climate change, water shortages, desertification) and their impacts (natural hazards) are addressed that require ‘extraordinary means’ from the state, society, the business and scientific community to develop the knowledge to ‘understand’ and ‘explain’ these new security dangers, as well as policies and measures to ‘cope’ with them to reduce the costs of ‘business as usual strategies’ (Stern 2007). These new security dangers do not only, or not primarily, affect the ‘state’ but affect both human individuals and ‘humankind’ in an unequal way thus posing new global equity problems. Narrow ‘national security’ responses, as have been addressed in many publications in the US since 2007 (Brauch 2008c) for coping with these new security issues, fail to recognize that the institutions, missions, policies and means of the traditional security approaches are bound to fail to cope with their ‘human security’ implications, and specifically with the impact of human-induced natural hazards on historically and culturally determined ‘gender’ relations (Oswald 2008b). Thus, the ‘extraordinary measures’ required to cope with these new security issues require a fundamental rethinking, re-contextualization and reconceptualization of security as suggested in this chapter (see also Dalby 2007), including the traditions and institution of ‘patriarchy’.

thesis and reconceptualization” (Dalby 2002a: 96). In this chapter the authors outline the topics, scope, areas and methods for a fourth research phase on human, environmental and gender security and peace research (Dalby 2002, 2007, 2007a, 2007b, 2008, 2008a; Brauch 2003, 2003b, 2005, 2007a; Oswald 2001, 2006; Boulding 2006). This phase, we argue, needs to build on the first three phases of environmental security research (see chap. 59 by Dalby/Brauch/Oswald) while explicitly incorporating advances in earth system science and disaster research into the analysis. It requires distancing security analysis from some of traditional assumptions in international relations thinking and focusing more explicitly on the specific contexts where people, especially socially vulnerable groups and their social networks, are insecure.

While the first three phases of environmental security research primarily focused on the ‘nation state’ as the key referent of environmental security concepts and policy (‘national security’), this chapter suggests that during the fourth phase the referent object of securitization should be both *widened* and *deepened* (Buzan/Wæver/de Wilde 1998; Brauch 2003, 2005, 2008, 2008a, 2008b; Oswald 2006). This implies that the environmental dimension of security should include both societal (Wæver 2008a), human (part IX) and gender (Oswald 2001) issues but also sectoral approaches such as water (part VII), food (part V), health (part VI), and livelihood security (chap. 36 by Bohle) and ecofeminist perspectives (chap. 90 by Oswald). Furthermore, the widening of the referents of securitization should include – besides the narrow focus on ‘national security’ – the global, regional, societal, community, family and human level. Thus, the state-focused approach to environmental security should be broadened to a ‘people-centred’ approach (Annan 2001, 2005; CHS 2003; Bogardi/Brauch 2005).

This chapter first introduces three conceptual components for the fourth phase: earth system research and the *Anthropocene* (98.2), *Human, Gender and Environmental Security* (HUGE, 98.3), *Human and Environmental Security and Peace* (HESP, 98.4). Second, it discusses the study of substantive issues that need attention in the fourth phase (98.5), such as extreme weather events, social systems and gender relations, environmental, social and urban vulnerability, migration, complex emergencies, crises and conflicts, political coping strategies with human insecurities. The final parts of the chapter are looking forward to implementing the fourth phase (98.6) and present conclusions (98.7).

98.2 Earth System Research and the 'Anthropocene'

One of the weaknesses in the environmental conflict literature in the 1990's was the failure to incorporate environmental science and ecological understandings directly into discussions of ecological change and environmental degradation.² Simple environmentalist assumptions of worsening conditions were frequently used as independent variables without enough careful analysis of the specifics of particular environments (Sullivan 2000). Taking the relevant science on environmental change seriously is unavoidable if the fourth phase analyses of insecurity are to link physical and human sciences in a useful way. The contemporary work in earth system science is trying to comprehend the interlinkages and connections in the biosphere (IGBP 2001). Crucially it involves understanding the environment as the shared context for human life that is now being substantially changed by both anthropogenic and natural processes. This links human actions at the largest planetary scale with practical ecological processes in specific places and shows that assumptions of nature separate from humanity are not accurate modes of considering either environment or security (Schellnhuber/Crutzen/Clark/Hunt 2005).

Understanding humanity as part of a dynamic biosphere that is being actively changed by human actions allows for an overarching conception of the human predicament, and one that directly connects the consequences of consumption in one part of the

planet with the hazards being faced by people in other parts. Making these connections explicit suggests a new global ethic where responsibilities to people in other parts of the world are related to the ecological interconnections of people in distant places (Pirages/DeGeest 2004). If global climate change is partly caused by excessive consumption in one part of the world, but increases the vulnerabilities elsewhere, then there is an obligation on the part of the consumers to take responsibility for the consequence of their actions at a distance.

In particular 'earth system research' (Schellnhuber/Wenzel 1998; Steffen/Sanderson/Tyson/Jäger/Matson/Moore III/Oldfield/Richardson/Schellnhuber/Turner II/Wasson 2004; Schellnhuber/Crutzen/Clark/Hunt 2005) offers a conceptual framework combining the various syndromes of environmental change. It insists on the importance of understanding the global economy as an ecological factor, one that has introduced novel 'forcing' agents into the biosphere, most notably such things as ozone depleting chemicals and greenhouse gases. The sheer scale of human activity becomes clear when looking at how the various facets of our collective activities act as ecological mechanisms (McNeill 2000; chap. 2). We can no longer operate with a set of categories that assume environment as an external factor to human affairs; the separation no longer makes sense when scientific knowledge is taken seriously and the scale of contemporary global changes is recognized (Dalby 2006).

Following a suggestion by Paul Crutzen and Eugene Stoermer (2000; Crutzen 2002), the *International Geosphere Biosphere Programme* (IGBP 2001) and other earth scientists suggest that we now live in a new era of natural history, the *Anthropocene*; one marked by the emergence of a new series of geological, biological and climatological forcing mechanisms in the biosphere. We have left the period of the *Holocene*, the relatively stable period of earth history between the end of the last ice age and the appearance of industrial society. Human activities have introduced new biophysical factors into the biosphere and begun to change the physical parameters that determine the functioning of the major earth system processes. The most high profile of these is climate change but other systems are being fundamentally altered too. The need for a new term comes not from a single historical innovation or ecological change but from the recognition that the total amount of human activity in all its diversity is now on such a scale that we are living in a qualitatively new era. In terms of the sciences of climate, geochemistry, geomorphology and

2 For surveys of this literature see i.a.: Gleditsch (1997, 1998, 2001, 2001a, 2001b, 2003); Kahl (2003, 2006); Brauch (2003, 2007, 2007a, 2007b, 2007c).

ecology it is no longer appropriate to think only in terms of 'natural' mechanisms to understand the processes that shape our habitat.

Climate change and carbon dioxide levels are only one facet of the changes that matter. The artificial 'fixing' of nitrogen, the rapid increase in human appropriations of 'natural' productivity, the extinction of avian and mammalian species not to mention the depletion of the oceanic fish stocks, all interact in fashions that we don't yet understand (UNDP 2007). What is clear is that many of these relationships work in non-linear often chaotic ways which will produce surprises in the future. Where the critical thresholds are we simply don't know, although we discovered one relating to ozone depletion in the 1980's quite by accident. There may well be negative feedback systems that counteract some of the perturbations, but there is no reason to believe that the cascading interconnected non-linearities will be benign to the current arrangements of human civilization (Schellnhuber/Crutzen/Clark/Hunt 2005).

During last half century many environmental concerns emerged that require a 'global' response. But in the *Anthropocene* no single environmental concern matters. It's the cumulative totalities that are beginning to interact in all sorts of unpredictable synergies that matters. In that sense the environment as a simple category of concern has also been transcended; the preservationist and romantic premises of its arguments have been undercut by both the scale of human activity and the growing sophistication of scientific understandings of ecology. Technical fixes can solve many pollution problems, but grasping the totality of material transformations is what is now the pressing priority; not least because the changes in climate and ecological processes render poor populations, in places apparently remote for industrial societies, especially vulnerable (Dalby 2003).

Ecology thus has a geopolitical dimension, and this is especially clear at the global scale where human actions are now accelerating ecological change mechanisms. One now has to recognize environments as actively constructed on various scales by their human inhabitants; simplistic assumptions about degradation as a cause of many things confuse science and environmentalism. This new geological era requires a different understanding of the environment and hence, crucially, of the changing social context of humanity. Naming our era the *Anthropocene* signals this epochal shift in human circumstances; it necessitates a rethinking of many other facets of human existence connected directly to the emerging understandings of

that changing global ecological context (Flannery 2006). Above all else it emphasizes the simple but crucial point that human activities are interconnected in numerous ways that cannot be ignored if human security is to be taken seriously. Environment is no longer the separate backdrop for human activities. It is increasingly the artificial context in which we all live and as such it is the shared context of our insecurities.

98.3 Human, Gender and Environmental Security (HUGE)

The deplorable conditions of physical, environmental, human, societal and gender security of a large part of humanity have inspired researchers (Oswald 2001, 2006, chap. 90 above; Møller 2001, 2003: 278–279) to ask security *for whom* (the nation state, society, human beings or humankind or the environment); *for what* (eternal or earthly peace, social justice, humane livelihood, sustainable development, gender equity); *from whom* (state and sub-state actors, terrorists, migrants, alien cultures, multilateral organizations, globalization, elites, nature, humankind, patriarchy, totalitarian institutions, religions, cultures and intolerance) and *for what* (sovereignty, territorial integrity, national unity and identity, survival and quality of life, sustainability, equity, identity, social representations and solidarity).

Oswald (2001, 2004, 2006) suggested a widened concept of *Human, Gender and Environmental Security* (HUGE)³ that combines an extended gender concept including children, elders, indigenous and other minorities with a human-centred focus on environmental security challenges, peace-building and gender equity. 'Gender security' is considering livelihood, food security, health care, public security, education and cultural diversity. This broad concept analyses the patriarchal, violent and exclusive structures within the family and society, questioning the existing process of social representation-building and traditional role assignment between genders. HUGE reorients 'human security' to include equity and develop-

3 The HUGE concept draws a, broadly defined, feminist analysis of society, power and identity. This shows that for several thousand of years the world has been organized through patriarchal relations where the male gender (strong sex) dominates over the female one (weak sex), including a symbolic distribution of public space for men and private for women and where power relations are also gendered: men public affairs; women delegated powers through household).

ment issues through social organization, specific governmental policies, private ethical investments and legal reinforcements. It aims at a socio-political participation of women, the young and elders. It focuses on gender discrimination and violence (Johnson 2002), by widening the narrow male-female relationship of some feminist approaches.

HUGE includes 'environmental security' concerns where a healthy environment and resilience-building of highly vulnerable groups (especially women) can reduce risk impacts (Oswald 2008a). For hazard prone areas, HUGE analyses the potential of technical, financial and human support for reducing this vulnerability, enabling women and other exposed groups to reinforce their own resilience through bottom-up organization combined (Oswald 2008b) with top-down policies and tools able to guarantee effective early warning, evacuation, disaster help and reconstruction. Immediate and efficient support for isolated regions affected by social and natural disasters could prevent long-term effects such as famine and violent conflicts. As non-violent conflict resolution is a central part of personal and social identity in a world where processes of unification and diversification are occurring faster than ever in the past, human beings have a basic necessity to simplify and to put order into complex realities through social comparison. The upcoming system of values, ideas and practices enhance conditions for living together, offering persons and groups the possibility to get familiarized with the social and material world. In synthesis, HUGE integrates social, environmental, human, cultural, political and identity concerns, aiming at solidarity, resilience, participatory democracy, peace-building and equity in a world that is facing many new security dangers and concerns due to the gradual transition from the Holocene to the Anthropocene.

98.4 Human and Environmental Security and Peace (HESP)

Thus, HUGE offers both an analytic framework for analysis and participatory action. A fourth phase of research on '*human and environmental security and peace* (HESP)' should combine the structural factors from the natural and human dimensions of *global environmental change* (GEC) based on the expertise from the natural and social sciences with outcomes and conflict constellations (Brauch 2003, 2003b, 2005, 2007a). Both HUGE and HESP are complementary, although there are differences in the goals

and focus. HESP aims at these ten conceptual and policy goals:

Scientific Orientation and Approach

1. *Orientation*: An equity-oriented Grotian perspective may support multilateral environmental efforts in international organizations and regimes to avoid conflictual outcomes of global environmental change, environmental scarcity, degradation and stress.
2. *Spatial Approach*. The analysis of environmental security issues on a regional level requires a spatial approach which may be called a *political geo-ecology*.⁴
3. *Human Security Focus*: The reference for research and policy should be human beings, individual victims and communities of distress migration, disasters, crises and conflicts.
4. *Sustainable Development and Sustainable Peace*: A human security perspective to the analysis of environmental security issues may aim at an enduring "sustainable peace"⁵.

Scientific Focus on Causes, Impacts and Extreme Outcomes of Global Environmental Change

5. *Causes*: The research should broaden the scope to include both environmental degradation and environmental scarcity and their impact on environmental stress and on nature and human-induced hazards. This requires close interaction between social and natural sciences and an interdisciplinary approach.
6. *Outcomes*: The research should include hazards, distress migration and environmental refugees as well as the complex interactions among these out-

4 Geoecology was introduced by Huggett (1995) as an interdisciplinary natural science. A *political geoecology* focuses from the perspective of international relations on the interactions between the geosystem and human activities, and especially on national and international political processes (Brauch 2003: 134, 2003b: 921–922). These three authors intend to develop this new approach of a *political geoecology* further in a third co-authored chapter to be published in vol. V of this book series from their respective scientific background in social anthropology, geography and political science.

5 See Kofi Annan's speech to the German Bundestag of 28 February 2002 on "Building Sustainable Peace", at: http://www.bundestag.de/aktuell/presse/2002/pz_0202283.html; in which he stressed: "that the aim must always be to create a sustainable peace, just as we aim to achieve sustainable development - and indeed sustainable development itself is one of the conditions for lasting peace" and Oswald (2008).

comes which may often lead to disasters, crises and conflicts.

7. *Policy Process*: Case studies should include the policy processes, e.g. how the state and the society have responded to the challenges and outcomes, they should emphasize the role the knowledge factor (learning, capacity building) has played in developing adaptive and mitigation strategies to reduce vulnerability and to strengthen resilience.
8. *Regional Orientation*: A regional perspective on the causes, the policy process and its outcomes is needed. This requires regional natural science models (climate, soil, water), and comparative social science case studies on the policy processes at the regional scale.

Policy Goals

9. *Policy Goals on the Societal and Individual Level*: Environmental security studies should contribute to strategies for reducing the *impact* of environmental stress, decreasing the *vulnerability* and strengthening the coping capacities and *resilience*.
10. *Policy Goals on the Communal, Sub-national, National and International Level*: Strategies for coping with outcomes of environmental stress should be developed by improving disaster preparedness and response and by integrating disaster reduction into development planning and resilience-building. The resolution, prevention and avoidance of resulting violence should become a major policy goal (Brauch 2005: 37-39).

HESP combines a *normative orientation* (the dual policy goals of *sustainable development* and *sustainable peace*) with a 'people-centred' *human security perspective* from the individual to the global level to develop strategies for adaptation and mitigation and to reduce the likelihood and impact of vulnerability to these outcomes by strengthening resilience. However; neither in the scientific community nor in politics, does an agreement exist- and will hardly ever exist in the future - on how to operationalize these dual goals as guidelines for analysis and action (Brauch 2008a). Both concepts and policy goals of *sustainable development* and *sustainable peace* are as highly contested as the security concept. Nevertheless, these dual goals require the scientific development of complex knowledge, a societal and political problem awareness, anticipatory learning and 'ingenuity' in the framework of a 'culture of prevention'.

From a scientific perspective that adheres to a rather narrow, strictly defined focus and rigorous primarily quantitative research methods, this wide and

embracing scientific concept and research goals are likely to be heavily criticized. This wide ranging understanding will most likely be rejected as impractical within a traditional quantitative scientific understanding. However, that traditional scientific approach has failed, and will continue to fail, to address the interconnectedness of highly complex human or societal and natural factors precisely because its mode of understanding deals with analysis of discrete entities rather than complex social systems.⁶

Undoubtedly the ten programmatic points for a fourth research phase on 'environmental security' that were submitted first by Brauch (2003, 2003b, 2005, 2008) are intended to provoke scientific objections, suggestions and critiques and in response more conceptual work and policy oriented scientific reflection will be needed. Most certainly, its emancipatory approach is bound to clash with purely scientific, primarily apolitical and frequently quantitative approaches that often are limited to explain the complex reality with highly sophisticated methods and narrow results that regularly resist any translation as guidelines for policy action and change that aims at an improvement of the prospects for the majority of humankind in their struggle for daily survival for their well-being and for a life in dignity.

The policy relevance of HESP as a research programme for a fourth phase of research is to *recognize* early-warning indicators, to *examine* both the environmental consequences of wars and the existing conflicts over scarce resources that may lead to environmental stress to *prevent* them escalating into violence and, last but not least, to develop longer-term priori-

6 Mesjasz in his comment on this draft chapter argued in September 2006 that "such a general programme, while very good at the universal level, may be criticized for the absence of something more specific. What makes the difference between HESP and, say, very broadly defined Galtungian peace research understood as a study of very broadly defined structural violence. In my opinion, only one factor - more attention paid to the environment and the gender violence. As far as I know gender sensitivity was also a part of discourse in structural violence (to eliminate) HESP should include some more specific features. In epistemological terms it would mean that some aspects of HESP should be defined in negative terms, as an opposition, for example, to economic short-sightedness of contemporary, market- and profit-oriented understood methods of running the economy at all levels. Here HESP is presented at a too high level of generality and postulativeness - a kind of theory of 'everything good', without exposing what is different between HESP and approaches already applied."

ties for developed and developing countries, and for international organizations to prevent and avoid violent and fatal societal consequences of extreme weather events and hazards from occurring, and to contribute to regional environmental good governance.

98.5 Substantive Issues for the Fourth Research Phase

The above discussion raises numerous questions about what we know and how best to formulate a research agenda that focuses on how to increase resilience and coping capacities, improve conflict resolution, reduce human and economic losses, and where possible identify those who are particularly vulnerable in advance of a disaster occurring. Given the lack of focus in traditional security studies on vulnerabilities and environmental matters (Buzan/Wæver/de Wilde 1998; Wæver 2008, 2008a), and the inappropriate focus on the state in many international relations texts, it is especially important that disciplines such as anthropology, sociology, social psychology, cultural studies, human geography and political science play a part in these investigations. Working these methodological matters into the research agenda is necessary and needs to be done with a focus on the most vulnerable people (Birkmann 2006) first rather than on states or economies or development. None of this is easy but at least three important considerations point the way forward to a substantial new research agenda.

One key point is that appropriate tools are needed in this research and security studies frequently do not supply the appropriate tool box. A broader approach is necessary linking the empirical and theoretical knowledge of peace research with development and environmental studies. The United Nations University combines under the goal of *human security* these five research areas: a) *peace* (international relations, †UN system, †human security and armed conflicts); b) *governance* (human rights/ethics, democracy/civil society, leadership, governance); c) *development* (globalization and development, growth and employment, poverty and basic needs, urbanization); d) *science, technology and society* (innovation, information and biotechnologies, software technology, food and nutrition); and e) *environment* (resource management, sustainable industry and cities, water, land, global climate and governance).

One notable shortcoming of the empirical case studies during the second phase of environmental se-

curity research (Homer-Dixon 1994, 1999; Homer-Dixon/Blitt 1998; Bächler/Böge/Klötzli/Libiszewski/Spillmann 1996; Bächler/Stillmann 1996a, 1996b) was that these analyses pursued different goals and used various methods thus preventing generalized conclusions relevant for theory formulation and policy-making. While there has been considerable discussion in the literature about the appropriate research methods on the links between environmental factors and violence (Levy 1995; Gleditsch 2001a, 2001b) the diverse contexts and the complexities of the relationships between natural factors and many dimensions of human existence illustrate there is no single methodology for the broad range of policy and academic questions. Kahl's (2006) work of comparison and synthesis has gone some way towards resolving the methodological difficulties but does not link the empirical discussion of violence and state failure to a wider consideration of human security. We suggest that the fourth phase of environmental security research should take three methodological matters seriously.

First, and in part building on Kahl's (2006) work, the methodological approach of 'structured focused comparison' that has been developed by Alex George (1979, 1988) in security studies offers substantial solutions to the shortcomings of research on different goals. If lessons from one place are to be applied elsewhere then the parameters of each case study need to allow 'structured focused comparisons' (Eckstein 1975; George 1979, 1993; Krepon/Caldwell 1991; Mitchell/Bernauer 1998; George/Bennet 2005), enabling careful comparisons from one case for other situations.

Second, there is a need for multi-, inter- and transdisciplinary research to clarify the parameters of the questions and to allow synergies among researchers. While social science methods and research designs are widely divergent the possibilities for complementarities are considerable if a common objective and careful teamwork is present from the start (Oswald 1988, 1992a, 1992b, 2005). In particular it is important to couple regional with topical specialists to integrate local expertise and the idiosyncracies of specific environments with generalizations across case studies. Likewise research into violence, social change and conflict resolution is also important besides the traditional focus on warfare.

Third, numerous substantive issues require further attention but this chapter concentrates on six salient themes that are of primary importance for the fourth phase of environmental security research: extreme (weather) events (99.5.1), social systems and gender

Figure 98.1: Scenarios for GHG emissions from 2000 to 2100 (in the absence of additional climate policies) and projections of surface temperatures. **Source:** Fourth IPCC Assessment Report, Synthesis Report, Summary for Policymakers, figure SPM 5, p. 7 of 22 for a full explanation; at: <http://www.ipcc.ch/pdf/assessment-report/ar4/syr/ar4_syr_spm.pdf>. Reprinted with permission according to IPCC rules.

relations (99.5.2), environmental, social and urban vulnerability (99.5.3), migration (99.5.4), complex emergencies, crises and conflicts (99.5.5), as well as resilience-building and political coping strategies (99.5.6).

98.5.1 Extreme Weather Events

According to the IPCC (2001, 2001b, 2001f), the IFRC (2002a, 2005) and the reinsurance industry (MunichRe 2002, 2006; Swiss Re 2006) during the 20th century climate change has contributed to an increase in the number, intensity, scope and damage of hydro-meteorological events, such as storms, cyclones, floods, land-slides and drought. With the projected rise in temperature between 1.4°C and 5.8°C (IPCC 2001) or 1.2°C and 6.4°C (IPCC 2007) and a most likely corridor between 1.8°C and 4°C during the 21st century, an increase in these extreme weather events has been projected by the IPCC (2001: 3) as ‘likely’ or ‘very likely’. In addition, the projected sea-level rise between 9 and 88 cm will inundate densely populated coastal regions and small flat islands (see Kinnas in this volume), thus forcing the affected people to leave their homes, lose their livelihoods and their agricultural land.

Climate change will also have very severe negative affects on health (WHO/WMO/UNEP 1996) and ‘health security’ (part VI) caused by vector- (malaria, dengue, avian ‘flu pandemic), food- (streptococci) and

water-borne (diarrhoea, dysentery, cholera) infectious, diseases and extreme temperatures (heat waves; cold spills). Drought, soil properties, pests, pathogens and crop yields, are also widely affected by climate change, thus creating severe challenges for ‘food security’ (FAO 1996d, 2005f; Brauch 2002, Oswald 2007g, chapter xy in this volume). Climate change has contributed to a retreat of glaciers and is projected to lead to a progressive melting of the ice shields in the Arctic and Antarctic regions (chap. 73 by Hooigensen). This will have repercussions on the hydrological cycle, drought and floods, surface water, aquifers increasing in already water-stressed countries their ‘water insecurity’ (part VII).

During the first three phases of environmental security studies, threats, challenges, vulnerabilities and risks posed by global environmental change have not been systematically analysed⁷ and extreme weather events and their socio-political, economic and environmental outcomes have more or less been ignored. Traditional international relations research has also not focused on global change and on its winners and losers except on governmental mechanisms and international regime formation involved in the curbing of greenhouse gas emissions. While considerable attention has been paid to the cross boundary impacts of specific pollutants, and the international regimes established to deal with these matters, the larger questions of the consequences of any particular state as a

Figure 98.2: Development of major natural hazards between 1950 and 2007 (Number of events). **Source:** © 2008 Münchener Rückversicherungs-Gesellschaft GmbH, GEO Risk Research. NatCatSERVICE. Reprinted with permission.

result of the actions of others in changing the composition of the earth's atmosphere needs attention that focuses on how this affects the vulnerability of people in many places. While the discussion of winners and losers in climate change addresses some of these matters, if states remain the exclusive focus the vulnerabilities of people and their social systems then they are not adequately included.

Extreme weather events have remained outside the normal considerations of *International Relations* (IR) with its focus on wars, treaties, and high politics ignoring the vulnerabilities of people. But as the glo-

bal change research is now making very clear, human activities are causing changes in major bio-geo-chemical processes which will alter extreme events in addition to changing rainfall patterns and droughts.

Research in IR needs to incorporate this discussion in the analysis of the global politics of vulnerability. Human activity and climate change must be understood as a cause of hazards, and more generally as an active part of the biosphere (Dalby 2006). This then also leads to an understanding of the ecological consequences of production and consumption on environmental damage and social conflict in parts of the world where materials and fuels originate (Le Billion 2005; Dalby 2007). Climate change in particular leads to new questions of causal responsibility and equity across boundaries.⁸

98.5.2 Social Systems and Gender Relations

Sociological and anthropological research on hazards and disasters has shown that economic, social and value systems have been severely affected by these 'environmental', 'natural' and 'human-induced' catastrophes but that the intensity of the impact depends on

7 In part this is probably because of the sheer difficulties of working with scenarios given the absence of definitive predictions as to how future climate will behave. An additional reason may well be that Thomas Homer-Dixon (1994) concluded that war was unlikely as a result of climate change, and hence the research agenda focused on resource scarcities which were identified as a possible cause of conflict and which were also a matter ostensibly amenable to rigorous empirical research. See the controversy between Homer-Dixon and his critics (Diehl/Gleditsch 2001; Peluso/Watts 2001); but see also Alcamo/Endejan (2002).

Figure 98.3: Development of major hydro-meteorological hazards from 1950 to 2007 (Trend of economic and insured damages). **Source:** © 2008 Münchener Rückversicherungs-Gesellschaft GmbH, GEO Risk Research. NatCatSERVICE. Reprinted with permission.

the complex interaction among environmental, social, urban, rural and other vulnerabilities of the affected human beings.

The impact of extreme weather events differs according to the specific social, economic and political system that influences the vulnerability of the affected people. This depends on the composition of the society, the relations between social classes, ethnic and religious groups, the level of development and education, available financial resources and knowledge, existing economic cleavages between the wealthy and the poor and the nature of the systems of rule as well as the effectiveness of government and societal institutions. All these factors reduce the 'protection' and 'empowerment' of people (CHS 2003).

The largest number of hydro-meteorological hazards as well as the highest number of killed and affected people has been documented in Asia, Africa and in Latin America while the highest economic damages have been recorded in OECD countries (CRED; IFRC-RCS; MunichRe). This reflects the fact that in wealthy industrial countries a significant part of the damage is insured and the affected will be financially compensated for parts of their losses and thus can recover relatively soon. But in developing countries only wealthy people are insured while poor people cannot afford such insurance and thus each time they are directly affected by such events they lose all of their belongings and are often forced to leave their homes. This situation often gets worse with weak and fragile governments and corrupt elites that not only fail in early warning, in disaster preparedness and response, but also in being unable to reduce the impact of these hazards. In some cases they have failed to assist the victims and have even captured part of the international relief for their own benefit (chap. 15 by Wisner).

Selected empirical case studies (Castro Garcia 2005; UNU-EHS 2006; chap. 93 by Ariyabandu/Fonseka) have documented the case that substantially more women have died in hydro-meteorological and geophysical hazards and are the primary victims of the resulting societal disasters. Women often are seen and perceive themselves as weak, incapable and depend-

8 It is possible to push this line of inquiry much further, but few security researchers are willing to entertain notions that, for instance, the car culture which is directly responsible for death on a large scale, and indirectly for the greenhouse gases that in turn generates numerous insecurities for many who don't drive, can be considered a threat to human security. Among populations in Northern states cars are the greatest hazard to young adults in particular, but such casualty rates are not considered a matter of human insecurity despite the carnage on the roads (Dauvergne 2005). If they were, the whole political economy of auto mobility would no doubt be challenged in innovative ways (Paterson 2007).

ing on men. Their role in daily life is *reproductive* (child-bearing, nurturing and maintenance of households), *productive* (livelihood support, food production), *social* (integrating family and community as a whole) and *psychological* as well as *cultural* (transmission of emotional stability and historic memory of the family, clan and village).

The world has been organized for thousands of years based on patriarchal relations where males dominate females. This social reality has created identity patterns, and in case of imminent danger, women usually try to save their children and family members risking their lives (see chapter Xy by Serrano and chapter xy by Oswald). Often they are inside their homes and unaware of the pending threat. They have not been trained in effective disaster response, and sometimes their clothes, long hair, and those carrying children have reduced their chance to survive. In spite of the existing evidence on the higher vulnerability of women in disasters, no systematic data collection (CRED; IFRC-RCS; MunichRe, Swiss Re) has distinguished the number of victims (dead and affected people) by sex and age, which reflects the prevailing gender insensitivity in hazard and disaster analyses.

Policy debates and scientific discourses on human security often focus on individuals rather than on collectivities and their social networks. In contrast gendered formulations bring with them the habit of the social compact and collective traditional indigenous responses as crucial to the survival of poor and marginal populations instead of the liberal market economic version of 'human'. It does so by understanding human ecology, the interconnectedness of human systems with their local environments rather than disconnected global consumer habits, rights and securities. A holistic consideration of causes of insecurity links to the impacts on those who are most vulnerable. It focuses attention on how to deal with the cycle of poverty or specifically the 'spiral of social vulnerability'. Poor people often live in hazard-prone habitats, lack a regular income and in many cases sufficient food what negatively affects their health security and survival. Both global climate change and extreme events make their situation worse by destroying their few belongings and their livelihoods.

98.5.3 Environmental, Social and Urban Vulnerability

The object of 'vulnerability' is both human beings and the environment (Bohle 2002). However, the 'environmental vulnerability' concept is used with various

different meanings in the global change literature (Steffen/Sanderson/Tyson/Jäger/Matson/Moore III/Oldfield/Richardson/Schellnhuber/Turner II/Watson 2004), climate change impacts analyses (IPCC 2001b) and in the hazard and disaster community (UN/ISDR 2004). For the hazard community, vulnerability is the combination of additional contributing factors causing a hazard due to natural variability or human inducement to become a disaster. The contributing factors are configured by the worldview, mindset, perception, the theories and models of the analyst. Thus, vulnerability is always socially constructed.

Of the 11 types of vulnerability identified by Wilches-Chaux (1989: 20–41), three features are discussed here: environmental, social and urban vulnerability. For Castro Garcia (2005) and Oliver-Smith (2004) vulnerability combines the interaction of nature and culture. Vulnerability results from "poverty, exclusion, marginalization and inequities in material consumption", and it is generated by "social, economic and political processes" (Barnett 2001: 132–133). For Cardona (2004: 49) "vulnerability signifies a lack or a deficiency of development" that often contributes to "disaster vulnerability". In his view population growth, rapid urbanization, environmental degradation, global warming, international financial pressures and war have all increased vulnerability originating in: physical fragility or exposure; socio-economic fragility; and lack of resilience. Heijmans (2004: 115–127) distinguished three causes: nature, financial resources, and social structure.

Frerks and Bender (2004: 194–205) argued that the societal focus on vulnerability has shifted from disasters as a natural event to focus instead on exposure and a complex socially constructed process. Wisner (2004: 183–193) criticized many studies on 'social vulnerability' arguing that they devalued local knowledge and coping capacities and he supported efforts to empower people. Cannon, Twigg and Rowell (2003: 4) argue that vulnerability analysis can "become an integral part of humanitarian work ..., by using vulnerability analysis in both the operation of emergency preparedness and reducing poverty."

As the HUGE framework discussed above suggests, livelihoods are influenced by *social and political networks* that may have varying levels of cohesion and resilience in the face of hazards. When disasters occur, relief and recovery is tied with the restoration of livelihoods, and the strengthening of self-protection. Vulnerability can be seen as a term that encompasses all levels of exposure to risk. There are two separate approaches to vulnerability and capacity. The

first conceives people who have a high degree of vulnerability and are low in capacity. The second perceives them as two distinct sets of factors. A capacity might include institutional membership, group cohesion or literacy. Some capacities are not the opposite of vulnerabilities, and some low-level vulnerability characteristics are not amenable to being considered capacities.

Pelling (2003a: 5) analysed 'urban vulnerability' to natural disasters and the role of social resilience. He defined vulnerability as "exposure to risks and an inability to avoid or absorb potential harm", *physical* vulnerability as that "in the built environment", *social* vulnerability as that "experienced by people and their social, economic and political systems", and *human* vulnerability as the combination of "physical and social vulnerability".

Disasters often strike mega-cities such as the earthquake in Mexico City of 1985, in Kobe in 1996, and near Istanbul (in Izmit in 1999). Questions of how to survive in cities, how migration and informal survival strategies may facilitate people caught in such circumstances are an additional part of the human security agenda, one that is now beginning to address urban agendas explicitly. Disasters are usually not singular events; they are closely linked to both environmental and social vulnerabilities. When multiple challenges come together (e.g. in Mexico in 1985, the experience of centuries of poverty, decades of authoritarian government, corruption and economic crises were compounded by a hazard event), survival and adaptation are especially pressing. Large families often have complex survival strategies facing environmental, social and urban vulnerability (Oswald 1991), spreading risks with some people migrating and others maintaining their traditional livelihoods. The diversity of survival and coping skills is especially important for women and their direct childcare and eldercare responsibilities as well as their traditional medical knowledge.

In Bangladesh, one of the most vulnerable multi-hazard countries that lost more than 1 million people due to hazards between 1950 and 2000, the combination of storm shelters, simple early warning systems, citizens' empowerment, disaster preparedness and training has significantly reduced the number of victims in more recent extreme weather events. However, Bangladesh has also experienced many cases of internal rural-urban environmental and hazard-induced displacement, and international migration to India and elsewhere (Suhrke 1993, 1996, 1997; Brauch 2002; chap. 19 by Ahmed).

98.5.4 Migration

Socio-economic pressures, high environmental, social, rural and urban vulnerability and lack of future expectations for the young have become major drivers for urbanization and migration. For many poor people, migration means abandonment of their livelihood, cultural heritage and of their existing social networks for immediate survival and a better long-term future. Besides these manifold *push* factors, extended external family and social networks (*pull* factors) have emerged as facilitators for the massive movement of affected or potentially threatened people. It is also worth noting that sometimes cities come to rural areas due to the rapid urbanization currently happening in many parts of the world; the results of the imposition of new buildings, highways and economies on traditional rural societies also seriously disrupt traditional social networks and modes of subsistence (Davis 2006). These are essential questions for the fourth phase of environmental security research.

Hazards obviously are closely linked to migration, not only as a result of repeated experience with many small and some major disasters but also of effective early warning and forced evacuation. The insecure economic situation, persistent poverty, lack of public security due to spreading organized crime, youth gangs (see chap. 81 by de Lombaerde/Norton; Rojas 2008) and criminality within the forces responsible for public order, and violent conflicts have all contributed to social vulnerability have thus become additional drivers of migration.

In his acceptance speech for the Peace Nobel Prize on 10 December 2007 in Oslo Rajendra Pachauri, Chairman of the IPCC, argued that:

Migration and movement of people is a particularly critical source of potential conflict. Migration, usually temporary and often from rural to urban areas, is a common response to calamities such as floods and famines. But as in the case of vulnerability to the impacts of climate change, where multiple stresses could be at work on account of a diversity of causes and conditions, so also in the case of migration, individuals may have multiple motivations and they could be displaced by multiple factors.

In a similar vein the new *Security Risk Climate Change* (WBGU 2007, 2008) that was addressed in its annual report by the German Advisory Committee on Global Change, warned that

without resolute counteraction, climate change will overstretch many societies' adaptive capacities within the coming decades. This could result in destabilization and violence, jeopardizing national and international

security to a new degree. However, climate change could also unite the international community, provided that it recognizes climate change as a threat to humankind and soon sets the course for the avoidance of dangerous anthropogenic climate change by adopting a dynamic and globally coordinated climate policy. If it fails to do so, climate change will draw ever-deeper lines of division and conflict in international relations, triggering numerous conflicts between and within countries over the distribution of resources, especially water and land, over the management of migration, or over compensation payments between the countries mainly responsible for climate change and those countries most affected by its destructive effects.⁹

These quotes directly address the new security issues posed by global climate change, one of several interconnected global challenges confronting humankind during the 21st century, and point to the importance of migration as part of the agenda. But quite who moves and in what ways in the face of long-term climate change and short-term disasters needs much further analysis. It is also important to note how politicians respond to a crisis; if the migrants are constructed as a threat to national security, rather than as disaster victims in need of assistance, then violence and further dangers may result for migrants (Smith 2007).

Research is needed on why people move in the face of disaster. Some move to get to safety once warnings are issued, but others may wish to stay and look after their livelihood and valuable cultural goods. The danger of losing their belongings in a disaster is considerable and failed reconstruction efforts, political corruption and wholesale looting during complex emergencies suggest that staying at home remains an important option for many even while risking their lives. Getting out of harm's way is the first and immediate response to impending disaster. Storm shelters and short-term emergency housing are inevitably a matter of moving, although sometimes only over a short distance and for a relatively short time until the immediate danger has passed. But in situations where housing and infrastructure are destroyed it is frequently necessary to move for longer distances and duration to re-establish family support systems or simply find a roof over one's head. But the difficulty of displacement is that the collective wisdom of villages

and their environments are destroyed when communities are broken up in the migration process. This makes survival more precarious for those who lose their support systems and rebuilding more difficult for those who are left behind or who only return much later.

98.5.5 Complex Emergencies, Crises and Conflicts

While the first three phases of environmental security research focused on the worst and often least likely outcomes of environmental stress – in most cases totally ignoring environmentally triggered hydro-meteorological hazards – violent domestic and international conflict and wars, the low-level violence with a few deaths, as well as societal crises were often not covered¹⁰ because IR and peace research have traditionally been focused on warfare rather than smaller scale violence and public insecurity.

Complex emergencies dealing with violent conflicts, post-conflict situations and hazards have increasingly confronted humanitarian agencies and NGOs with new challenges. Two research communities working on early warning of conflicts and hazards have ignored each other, as well as national governments and international organizations. For these reasons the fourth phase assumes that vulnerabilities cut across traditional academic and administrative divisions. This can contribute to a political and scientific agenda-setting by addressing the potential gain from synergies in research and action. e.g. mainstreaming both early warning activities and the focus on communities. But the key point for social scientists is to foster a constructive dialogue between different disciplines and paradigms. Given different definitions, foci of research and agendas the necessary cross disciplinary learning process will not be easy.

However, one key point provides a starting place for linking environmental security research with complex humanitarian disasters. Homer-Dixon (1999) argued that the frequency with which 'resource capture' by elites in crises aggravates the insecurity of vulnerable people and sometimes causes violence. Crises are used by elites, often under the pretext of maintaining order ('national security') to reassert control over resources and economic power during periods of rapid

9 See source at: <http://www.wbgu.de/wbgu_jg2007_engl.html> and an English summary for policy makers at: <http://www.wbgu.de/wbgu_jg2007_kurz_engl.html>. This report was discussed at a meeting organized by the German Foreign Ministry on 13–14 June 2007 in Berlin (Auswärtiges Amt 2008).

10 Strahm/Oswald (1990); Chomsky (1998); Stavenhagen (2003); Kaldor/Anheier/Glasius (2003); Shiva (2003); Calva (2003); Kaplan (2003); Stiglitz (2002); World Bank (1998b); Oswald (2004, 2005).

change. Here is a direct link with violence in humanitarian emergencies and to a larger political discussion of the global economic conditions that precipitate both violence and insecurity (Peluso/Watts 2001; Oswald/Brauch 2006).

All these considerations focus on measures and policy implications that flow from attempts to both prevent and respond to disasters. This suggests that states and corporations need to think about future investments in alternative renewable energy sources and technologies that reduce economic and environmental vulnerabilities caused by fossil fuels. These interconnection and technological innovations that reduce vulnerabilities might be understood in many ways.

98.5.6 Resilience-Building and Political Coping Strategies

Resilience, empowerment and coping capacity are crucial for survival and reconstruction in the aftermath of hydro-meteorological and geophysical hazards.¹¹ Resilience building and coping strategies should be complemented with preventive environmental management in terms of land planning, reforestation and ecosystem protection. Careful coastal planning (e.g. mangroves, coral reefs) is also important as the waterfront resorts worldwide (e.g. in Cozumel and Cancun in Mexico¹²), widespread deforestation in Haiti and the urban use of the everglades in New Orleans and Florida have shown. This suggests a need to widen the focus of environmental security by reducing social vulnerability with ecosystem protection and land use and urban planning; vulnerability

mapping for relocations from hazard-prone to safe areas, building shelters and evacuation facilities; early warning, institution building, disaster funds, and citizens' training and empowerment, especially of women and children.

In transboundary river basins suffering water stress (scarcity, pollution), cooperation through *international water resource management* (IWRM) aiming at basin-wide regimes and institutions may contribute to peaceful resolution of water disputes thus avoiding an escalation into violent conflict (Bogardi/Castelein 2002; UNESCO 2003d, 2006; chap. in part VII). Environmental and water scarcity has been both a cause of conflict and cooperation in hydro-diplomacy (Enrique 2004; Oswald 2005, 2007g) and environmental peace-building (Conca/ Dabelko 2002). On the contrary, abundance of natural resources has also led to conflicts (Collier 2000a; Collier/Elliott/Hegre/Hoeffler/Reynal-Querol/Sambanis 2003; LeBillon 2005).

A key question is how hazards become disasters. Hazards do not always kill people because similar events often have different outcomes. Why people sometimes die or don't is key to understanding human insecurities as part of a policy agenda for governments and non-government agencies. This emphasizes the importance of comparing experience with early warning and preparations to deal with consequences (IFRC 2005). Beyond appropriate precautionary policies further investigations of crisis responses are required. More particularly the intersection of traditional security studies and disaster responses highlights difficulties during crises.¹³

11 Comparisons between Cuba and Haiti are especially informative given their similar locations as islands in the Caribbean and rather different levels of casualties. With regard to the hurricanes during 2005 in the Gulf of Mexico, the resilience and coping strategies seem to have been better in Cuba and Mexico than in the U.S. and Haiti, which suggests that learning to deal with hurricanes is feasible, and can be achieved in poorer countries. The key to the success in Cuba is due to local experience, training and organization where citizens are playing a crucial active role (Sims and Vogelmann 2002).

12 Here developers destroyed the coral reef and mangroves to build a cruise ship port, which was destroyed during hurricane Wilma in 2005. In Cancun, 27,000 hotel rooms and facilities were built on a sand barrier dividing an interior lagoon from the sea. Wilma and previous hurricanes have repeatedly opened this natural connection between both and thus destroyed this tourist infrastructure that was rebuilt despite its high environmental vulnerability.

13 See the U.S. response to hurricane Katrina in New Orleans in August 2005 where the National Guard first tracked looters rather than rescuing people from floods. Imposing order was seen as their prime responsibility, actually helping people was secondary. This raises questions on the lack of appropriate preparation to deal with hurricanes, and particularly the flooding that resulted from the failure of the dikes around New Orleans. But it also highlights who has priority in a crisis. When imposing order gets priority over aiding victims, the state response may endanger numerous people precisely by declaring an emergency situation. It also raises the issue of social resilience and the possible contribution of civil society organizations to flood relief and the provision of shelter, food and water when state agencies are preoccupied with maintaining control. In contrast, the illegal Latino immigrants (230,000 estimated people) used their own networks and survived with few casualties.

Coping strategies such as the neighbourhood disaster response system in Havana suggest that planning and preparation for people's needs in advance, can prevent putting troops on the streets. A comparison of Havana and New Orleans during the hurricane season of 2005 is a starting point. Likewise an investigation of the role of the Zapatistas¹⁴ in the response to hurricane Stan in Mexico would point to the difficulties of states dealing with insurgencies while coping with disasters. The situation in Sri Lanka compared to that in Aceh (Indonesia) after the Tsunami in late 2004 suggests clearly that political change is possible in the aftermath of disasters but the complex politics of such events requires detailed fieldwork to examine the dynamics in individual cases (Le Billon/Waizenegger 2007). Clearly resilience is crucial to survival and in many cases in opposition to the imposition of an urban based commodity system. An investigation of these matters of rural and urban survival is part of the fourth phase research agenda.

In some cases business organizations are in a position to help organize and administer aid in the face of government incapacity or corruption. Many businesses are intrinsically adaptive mechanisms, shipping product to where there are demands at very short notice in a flexible mode of operation that is frequently anathema to centrally organized command systems. But a major danger is that privatization of relief functions and the reliance on corporations to provide assistance will only aggravate the vulnerability of the poor who will be unable to purchase aid in a crisis. Privatizing aid simultaneously reduces the capabilities of states to aid their poorest citizens when help is most needed (Klein 2007). Insurance also provides some non-government protection in disasters but only for those affluent enough to have property and cash to buy insurance. This shortcoming could be overcome by micro insurance schemes.

Unfortunately elite control of the supplies can also lead to its appropriation and their sale at inflated prices adding further to the burdens of the poor and the most vulnerable. Elite actions to capture and control relief supplies usually lead to further distrust and political violence. This feeds into policy issues in dis-

aster relief assistance where governments refuse access to aid workers where they might aid insurgencies: 'national security' is more important than 'human security'. Does the 2004 tsunami response teach us new lessons, and if so how can interventions be mounted that do not run into local bureaucratic and political opposition?

So a big question for human security research is how to work with civil organizations to build resilience in the face of disasters. Such responses are more complex after earthquakes, but nonetheless carefully crafted and effectively enforced building codes and evacuation training in schools and public buildings could reduce fatalities. For example the Pakistan earthquake (2005) suggests that local knowledge is important for survival because external aid to deal with disasters is frequently too late, except in the case of famines, which can be dealt with if there is reasonable response to early calls for food aid.

In all disasters gender also plays a crucial role. Normally food supply and provisional shelter are given to the heads of family (usually men). Widows and women living alone with children are not only confronted with gender-specific risks after a disaster (rape, theft of their belongings, discrimination), but are also excluded from emergency help. The few anthropological data available on gender-specific victims during different catastrophes (on the 2004 tsunami in Sri Lanka and on the 2005 earthquake in Kashmir, see chap. 93 by Ariyabandu/Fonseka; on Stan in Guatemala and Mexico see García/Marín/Méndez/Bitrán 2006) showed that at least 60 per cent of victims were women.

98.6 Looking Forward: Implementing the Fourth Phase

Reconceptualizing security in terms of ecology means thinking about causal chains from different perspectives by multidisciplinary teams. It requires enhanced adaptive strategies, and may involve security in terms of building codes understood as planning to minimize the damage by future disasters. Governance is a key but IR and its focus on state security is not an appropriate conceptual toolkit given the shift in referent object in 'human security' discussions from states to societies. There is a considerable irony that this is an IR issue because of transboundary causations but IR as a discipline has had relatively little to say about how to deal with the results.

14 Attempts to prevent development of indigenous survival strategies by central governments anxious to avoid a consolidation of insurgent organizations was the case in Mexico where 60,000 troops were present when the hurricane struck and the low intensity war against indigenous movements suggested the extension of neo-liberalism as opposed to facilitating indigenous self-organization.

This brings the discussion back to the anthropogenic causes of environmental vulnerability which means that the North has to assume responsibility for historical and present climate change. Thus, human security links to energy policy. It focuses on the context and implies that the North must not destroy Southern ecologies due to the export of biomass and 'virtual water' in crops to Northern markets. Hence 'human security' has a duty to consider the consequences of consumption and must incorporate a forward looking energy strategy to decrease fossil energy sources.¹⁵ If rain fed rice fields in the South are gone due to climate change indirectly contributing to starvation in the South then the North must respond.

Multi- and interdisciplinarity are needed to investigate the complex interconnections of many causes of social vulnerability. In particular outcomes of environmental stress triggered by extreme events may lead to conflicts. The interactions between stress, hazards and societal outcomes are also related to problems of the distribution of aid when conflict and violence complicate coping with disasters due to inadequate governance (see Sri Lanka after tsunami). Anthropology and social movement research is probably most important for analysing matters of strategies to cope with vulnerabilities of the poor and the most likely victims from disasters, because early warnings are useless without understanding and empowerment from below.

It is also worth noting that, globally, little disasters kill more people than big disasters and climate change seems to be increasing the numbers of those killed by hydro-meteorological events (United Nations International Strategy for Disaster Reduction, 2004, 2007). Understanding how this happens requires looking at the anthropological literature as well as media sources, anecdotal material, and increasingly, internet sources. Likewise there is a crucial need to disaggregate data on the basis of gender, age, handicapped, but also in terms of other demographic attributes so that the social dimensions of vulnerabilities can be unpacked from summary statistics. There remain all sorts of possibilities for online media monitoring of environmental difficulties and violent conflict similar to contemporary health monitoring early warning systems. But monitoring alone is not enough without an ability to respond to imminent destruction. The

fourth phase clearly has to look for practical innovations to increase resilience while reducing vulnerability in a rapidly changing biosphere.

Further work needs to be done on integrated early warning systems linking together conflict analyses with hazard mapping and conflict. How for instance do low level disputes work into hazards and vulnerabilities? What about herder and pastoralists conflict in Africa, related to early warning systems? How are land and water conflicts linked to environmental destructions and governance issues? Much of this research needs an explicit link to the ongoing work on complex emergencies, and work of such agencies as the *International Crisis Group* (ICG). Combining the academic literature on early warning of hazards and conflicts may be easier than pushing ministerial cooperation, but this too is an important part of the fourth phase of environmental security research.

The need to press ahead on all these themes in the fourth phase has recently been emphasized by the publication of the fourth assessment of the IPCC in 2007 (IPCC 2007). This work was highlighted by the Nobel peace prize the IPCC won in 2007 and this in turn has generated further reports and commentary (Campbell et al. 2007; Smith and Vivekananda 2007; UNDP 2007). While the IPCC's research on the impacts of climate change has looked extensively at hydro-meteorological hazards and the dangers of extreme events, much less work has been done on the socio-economic and political dimensions (Brauch 2002). In the earlier IPCC reports clarifications were lacking on the differences between hazard-induced migration in comparison with environmental stress-induced migration, a topic that was a matter of concern during the second phase of environmental security research.

These issues have now been addressed in part by Rajendra Pachauri, Chairman of the IPCC, in his acceptance speech upon receiving the Nobel Peace Prize:

One of the most significant aspects of the impacts of climate change ... relates to the equity implications of changes that are occurring and are likely to occur in the future. In general, the impacts of climate change on some of the poorest and the most vulnerable communities in the world could prove extremely unsettling. And, given the inadequacy of capacity, economic strength, and institutional capabilities characterizing some of these communities, they would remain extremely vulnerable to the impacts of climate change and may, therefore, actually see a decline in their economic condition, with a loss of livelihoods and opportunities to maintain even subsistence levels of existence.

15 A similar logic applies to replacing petroleum products in an energy strategy; there is no need to fight over supplies of oil in the Persian Gulf if one's economy is no longer dependent on those supplies.

The IPCC chairman noted that IPCC does not “provide assessments, which are policy prescriptive”, and thus restrained from any comments “on how conflicts inherent in the social implications of the impacts of climate change could be avoided or contained.” But he also stated that the IPCC reports have much information of high relevance “for individual researchers and think tanks dealing with security issues as well as governments that necessarily are concerned with some of these matters.” And he suggested that “it would be particularly relevant to conduct in-depth analysis of risks to security among the most vulnerable sectors and communities impacted by climate change across the globe.”

Pachauri identified peace with “the secure access to resources that are essential for living” and he added that “a disruption in such access could prove disruptive of peace.” He pointed out that climate change will directly affect the access of some populations to a) clean water, b) sufficient food, c) health conditions, d) ecosystem resources, e) the security of settlements. Thus climate change, he argued would directly affect water, food and health security. The effects he projected will probably be specifically severe for Africa, where by “2020, between 75 and 250 million people are projected to be exposed to increased water stress due to climate change.” With regard to food security he stated that “by 2020, in some African countries, yields from rain-fed agriculture could be reduced by up to 50%. Agricultural production, including access to food, in many African countries is projected to be severely compromised.” But also the health security

of millions of people is projected to be affected through, for example, increases in malnutrition; increased deaths, diseases, and injury due to extreme weather events; increased burden of diarrhoeal diseases; increased frequency of cardio-respiratory diseases due to higher concentrations of ground level ozone in urban areas related to climate change; and the altered spatial distribution of some infectious diseases.

Summarizing the projected effects based on the Fourth Assessment Report, Rajendra Pachauri pointed to the implications of specific likely regional climate changes:

- The Arctic, because of the impacts of high rates of projected warming on natural systems and human communities,
- Africa, because of low adaptive capacity and projected climate change impacts,

- Small islands, where there is high exposure of population and infrastructure to projected climate change impacts,
- Asian and African mega-deltas, due to large populations and high exposure to sea level rise, storm surges, and river flooding.

The IPCC Chairman (see foreword) also pointed to highly probable physical and social effects of climate change: an increase in the number and intensity of natural hazards, as well as in climate- and hazard induced distress migration. In a later speech to the World Economic Forum in Davos on 23 January 2008, Pachauri pointed to the economic costs of these trends and their likely impact for the Third World:

Some of the impacts of climate change are already translating into monetary flows and expenditure ... For instance, economic losses attributed to natural disasters have increased from US\$75.5 billion in the 1960s to US\$659.9 billion in the 1990s. Losses to insurers from natural disasters nearly doubled in 2007 to just below \$30 billion globally according to risk records. From 1980 through 2004, the global economic costs of weather-related events totalled \$1.4 trillion (inflation corrected), of which \$340 billion was insured.¹⁶

But these impacts are not likely to be felt equally; some people are more vulnerable than others and the consequences of climate change will vary regionally. In Davos Pachauri continued:

Far more important than the aggregate impacts of climate change on global economic activity are the consequences for some of the most vulnerable communities across the globe. In Africa, between 75 and 250 million people are projected to be exposed to increased water stress due to climate change by 2020. In the same year, in some countries yields from rainfed agriculture could be reduced by up to 50%. Agricultural production, including access to food, in many African countries would be severely compromised. This would further adversely affect food security and exacerbate malnutrition. Worldwide the health status of millions of people is projected to be affected through, for example, increases in malnutrition; increased deaths, diseases and injury due to extreme weather events; increased burden of diarrhoeal diseases; increased frequency of cardio-respiratory diseases; and other impacts.

Facing these new security threats, challenges vulnerabilities and risks requires a long-term, sophisticated policy strategy with many extraordinary policy, societal economic and scientific initiatives and measures to be able to *cope* with these new security dangers

16 See source at: <<http://www.ipcc.ch/graphics/speeches/pachauri-davos-january-2008.pdf>>.

and concerns. Rajendra Pachauri, in his Nobel Acceptance speech, stressed that:

climate change poses novel risks ..., such as impacts related to drought, heat waves, accelerated glacier retreat, and hurricane intensity. ... Adaptation measures essential to reduce such vulnerability, are seldom undertaken in response to climate change alone but can be integrated within, for example, water resource management, coastal defence, and risk-reduction strategies. The global community needs to coordinate a far more proactive effort towards implementing adaptation measures in the most vulnerable communities and systems in the world. Adaptation is essential. ... But, adaptation alone is not expected to cope with all the projected effects of climate change, and especially not in the long run as most impacts increase in magnitude.

Therefore, echoing the logic of the Stern Report (2007) on the economic dimensions of climate change, the IPCC chairman suggested that

... A rational approach to management of risk would require that human society evaluates the impacts of climate change inherent in a business-as-usual scenario and the quantifiable costs as well as unquantifiable damages associated with it, against the cost of action. With such an approach the overwhelming result would be in favour of major efforts at mitigation. The impacts of climate change even with current levels of concentration of greenhouse gases would be serious enough to justify stringent mitigation efforts.

With reference to the narrow mandate of the IPCC, Pachauri asserts that the question as to how “climate change will affect peace is for others to determine”, but the IPCC in its four Assessment Reports so far has “provided scientific assessment of what could become a basis for conflict.” Finally and with reference to Willy Brandt’s earlier speech as Nobel Laureate of 1971, he emphasized that “learning is in our world the true credible alternative to force.”

The learning that is now needed urgently on past, present and probable future security impacts of global environmental and climate change is just starting. Both the HESP research programme and the HUGE security concept - outlined above - are intended to contribute to the framing of the social science research on the manifold societal implications of environmental change at the global scale in the new circumstances of the Anthropocene.

98.7 Anthropocene Ethics and the Fourth Phase

From the past two decades of environmental security research, and in particular from its empirical investiga-

tions (chap, 60 by Dalby/Brauch/Oswald), emerged some consensus that the initial assumptions of scarcity or degradation causing violence were neither empirically accurate nor a useful set of precepts for policy-making. While environmental change, and more precisely resource access, are stressors on social systems, they are not the sole or even the dominant cause of political violence and social vulnerability (Kahl 2006). Scarcity alone is not what kills people or causes political violence; numerous other factors are important in the destruction of the social networks that ensure survival. Likewise the current dynamic changes in human affairs, encapsulated in the term globalization, are uprooting traditional societies and forcing people to move and change in numerous ways that render them vulnerable, while also requiring them to rapidly learn and adapt to new circumstances.

Despite official rhetoric there is no reason to believe that states are necessarily acting in ways that ensure the security of their populations. The critical development literature and discussions of political ecology emphasize that state actions in support of development may be a contributing factor to the vulnerability of social systems which are then incapable of ensuring survival when disaster strikes. Neither are states the innocent arbiters of disputes, nor necessarily benign agencies primarily interested in the welfare of their populations; they may be involved in the violent suppression of resistance to central rule or to the dislocations of economic globalization and the concomitant commoditization of items essential for survival. The broader approach, summarized in this chapter in terms of *HESP*, focuses on the complexity of political violence and the necessity of understanding this as much more than the traditional inter-state violence that pre-occupied security analysts through the twentieth century.

More recent research in the third phase has also suggested that linkages between North and South are important, both in terms of economic and ecological phenomena. While the assumption in the 1980’s, that environmental degradation was likely to cause social conflict, always implicitly assumed human agency in causing the damage to natural systems, until the 1990’s (Renner 1996) it was not focused upon directly nor was it linked to the larger patterns of development supported by numerous states. Frequently it was assumed that poor and marginal populations were the problem, now it is understood that the global economy and affluent consumption has the largest impact on natural systems and on social vulnerability.

It is now also clear that the rapid pace of globalization makes numerous people vulnerable in various places as a result of the disruption of social networks and support systems that are especially important to women who also frequently have the most important role in ensuring collective survival. As both HESP and HUGE have stressed, geological actions in one part of the planet have consequences for supposedly remote peoples elsewhere. An 'Anthropocene ethic' which focuses on these connections is now essential.

To accomplish this agenda requires research in many places and disciplines. This clearly needs comparative cases in carefully structured ways to sort out key factors of vulnerability by examining what endangers and what protects in complex circumstances. This also requires investigating connections between different places, looking at the distant consequences of trade and industrial activity as well as the international patterns of migration and innovation that facilitate resilience-building. This moves beyond the state centric approaches that have so frequently stymied innovation in the social sciences and explicitly links physical and human science research; there are many signs of such thinking emerging in the ongoing debate about human security and the United Nations; the fourth phase is thus timely (Dodds/Pippard 2005).

Ecological investigations have made it clear that these are all part of a larger set of syndromes of change belonging to a single biospheric system. Understanding humanity as a contributing factor to ecological processes at the global scale suggests that we can no longer operate on the assumption of the environment as a separate surrounding entity. Rather we are actively, albeit unintentionally, creating a habitat for humanity, one in which the risks due to environmental change are increasing for many and are unevenly distributed. These new circumstances for humanity, living in an increasingly 'artificial' biosphere, has given rise to a discussion of a new geological era, the *Anthropocene*.

The Anthropocene suggests that the interconnection of human and ecological matters needs to be understood in a way that transcends the divisions between the 'natural' and the 'human' that have structured thinking on security and especially identity since the emergence of modernity. We are not on earth, we are part of an ecosystem we are changing. Thus discussions of climate change are also about discussing the vulnerabilities created by urban consumption systems for those vulnerable both in the rural areas and the urban slums of the South. The fourth phase of environmental security research has to focus

on these interconnections recognizing that both economic and ecological linkages are involved in the global economy which now operates to varying degrees as part of all supposedly 'glocal' social systems (Sachs/Santarius 2007). Geological actions in one part of the planet may have consequences for supposedly remote peoples elsewhere making an '*Anthropocene ethic*' which focuses on these connections, and hence on social responsibilities, stressed by both HESP and HUGE. This emphasizes the importance of comparative research. This also implies a shift in our understanding of the context of our own lives so that we start from a concept of ourselves within an ecosystem which we are actively changing, rather than as urban 'civilized' dwellers manipulating an external environment which is in some ways 'threatening' to that mode of living (Dalby 2007a, 2007b).

In summary, the fourth phase of environmental security research needs to be more comprehensive than the earlier phases, and it needs to integrate physical and human sciences in ways that do neither focus simply on states on the one hand or environmental causes as a simple variable on the other. Dynamic change is crucial for understanding both human and ecological systems and how they are coupled in contemporary security thinking which is simultaneously sensitive to the specific contexts in which human insecurity occurs. Ecological thinking with its focus on adaptability, resilience and interconnection now understands security in contrast to earlier formulations assuming central control and violence as the essence of security.

The purposes of research thus focuses on analyzing risks and anticipating likely changes that may lead to violence and disruption so that preventative capacity building and policies of adaptation can be formulated in time to simultaneously mitigate the dangers and so reduce future vulnerabilities. This follows from discussions on human security as a 'culture of prevention', where anticipation rather than response to disaster is priority. The objects of analysis are not necessarily states or specific ecological parameters but starting from the social life of vulnerable people, a focus on the determinants of their economic, political and ecological vulnerabilities. Rather than the traditional security focus on conflict as the clash of separate entities, the focus is now on the interconnections between ecological and social change and the parameters that prevent or facilitate the adaptation of human systems to ensure survival.

99 Towards Sustainable Peace for the 21st Century

Hans Günter Brauch and Úrsula Oswald Spring

99.1 Introduction¹

Since the start of the Industrial Revolution humankind has been gradually moving towards a new era in earth history, the ‘Anthropocene’ (Crutzen/Stoermer 2000; Crutzen 2002) that is increasingly being influenced by the human-induced perturbations of *global environmental change* (GEC) and their societal outcomes.²

In a schematic framework (figure 99.1) the IPCC (2007c: 26) visualized the complex interaction between anthropogenic drivers, impacts, and policy responses to climate change and their linkages. Thus, humankind, international society, and business as well as the community of states and international organizations, will be faced with a new challenge to its well-being and survival that may be more severe than any security threat, challenge, vulnerability, and risk the world of states experienced during the past five centuries and especially since the two world wars and the pandemics during the 20th century.

Nicholas Stern (2006, 2007: iv) warned that “climate change will affect the basic elements of life for people around the world – access to water, food production, health, and the environment. Hundreds of millions of people could suffer hunger, water shortage, and coastal flooding as the world warms.” The Stern Review estimated based on formal economic models “the overall costs and risks of climate change will be equivalent to losing at least 5% of global GDP each year, now and forever. If a wider range of risks and impacts is taken into account, the estimates of damage could rise to 20% of GDP or more.” The Stern Review further argued that “all countries will be affected. The most vulnerable – the poorest countries

and populations – will suffer earliest and most, even though they have contributed least to the causes of climate change. The costs of extreme weather, including floods, droughts and storms, are already rising, including for rich countries.” The *Millennium Ecosystem Assessment* (MA 2005) argued that the proactive regionalized and globalized scenarios with regard to combating desertification are the most promising.

Peer reviewed research assessed by the IPCC (2007, 2007a, 2007b) leaves no doubt that during the 21st century humankind will face many new environmental security challenges that may pose fundamental new problems for the survival of individuals, states, and global policy actors. While in the 20th century and especially since 1945 the ‘security dilemma’ of states prevailed in the analysis of international relations, since the end of the Cold War this state-centred security perspective has changed due to a *widening* (from military and political to economic, societal, and environmental security), *deepening* (from national and international to human, gender, and global security) and *sectorialization* (energy, water, food, health, climate and livelihood security) of the security.

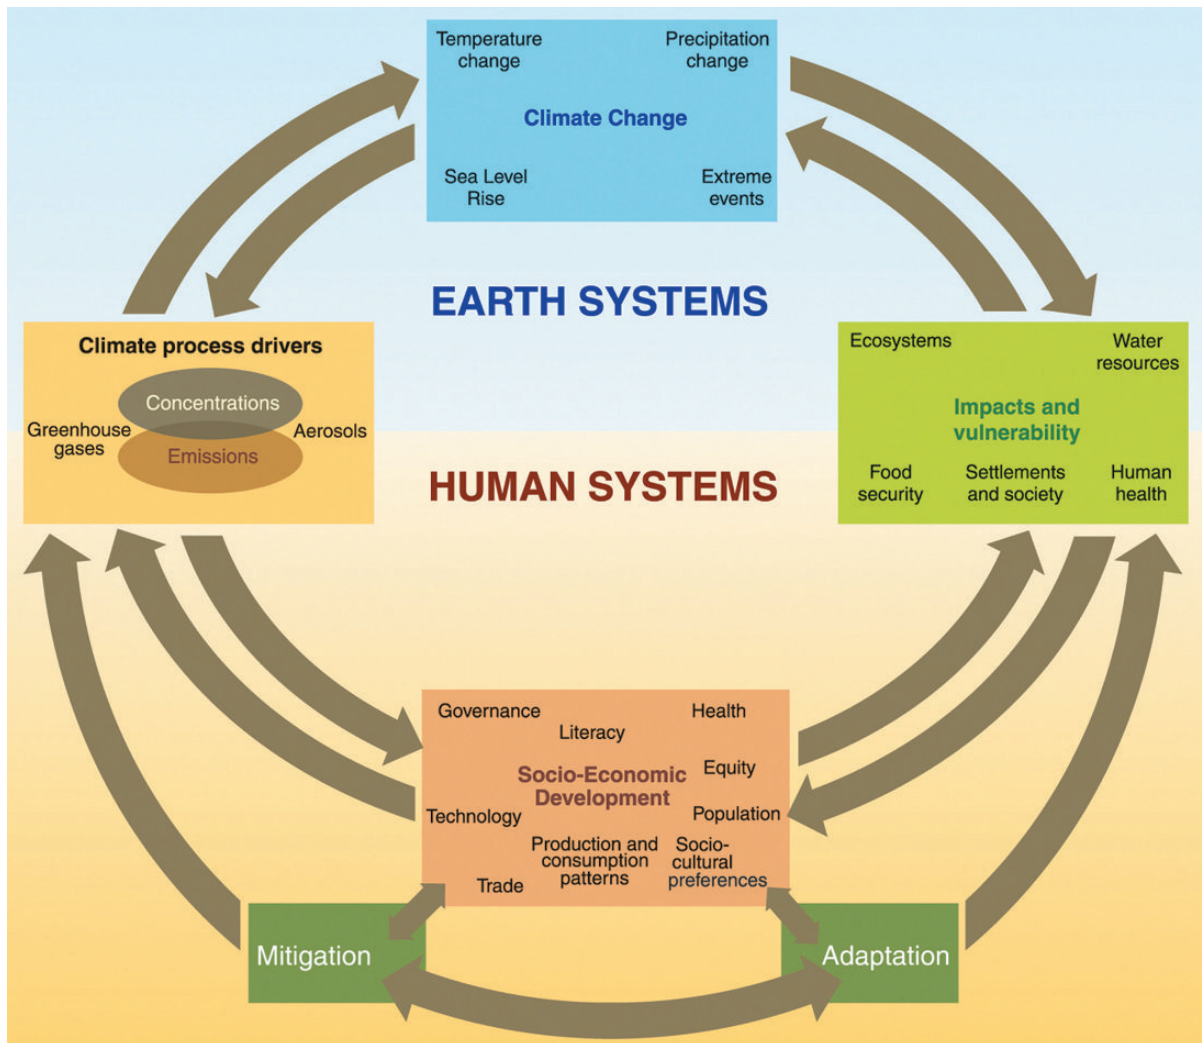

The state-centred ‘security dilemma’ (Herz 1950; Booth/Wheeler 2008) has been escaped by the evolving ‘security community’ (Deutsch 1957; Adler/Barnett 1998) in Europe with the expansion of the EU from 15 to 27 member states. But it has not globally been overcome with the end of the Cold War, rather the arms competitions have intensified in other parts of the world, e.g. between the new nuclear countries India and Pakistan, between China and Taiwan, between Iran and its Arab neighbours in the Gulf, as well as between Israel and its Arab neighbours. In addition, the dissolution of state authority in failing states as well as new networks of non-state actors (criminal gangs, drug and human trafficking, and terrorists) have posed intensive threats to national, regional, and international security.

A new human-centred ‘survival dilemma’ has emerged that has serious impacts on that part of

1 The authors are grateful to two reviewers for their useful comments that helped to significantly revise and condense this chapter.

2 This has been discussed in more detail in: chap. 1 and 4 by Brauch and in chap. 98 by Oswald/Brauch/Dalby.

Figure 99.1: Schematic framework of anthropogenic climate change drivers, impacts, and responses. **Source:** IPCC (2007c: 26). Reproduction permitted under IPCC rules.

humankind living in poverty in the South (Brauch 2000d, 2004, 2008c). Climate change will affect the countries and people in the South more seriously – as documented by the national communications to the UNFCCC – due to more severe and intensive hazards, a high degree of social vulnerability resulting from poverty and lacking resources for adaptation, and mitigation measures as well as an insufficient state capacity for implementation.

The monopoly of the state, its top leadership, and the power-based military establishment as the key ‘securitizing actor’ (Wæver 1995, 2008, 2009a) who defines the threats, challenges, vulnerabilities, and risks for national security has been challenged by a knowledge-based global epistemic community, the *Intergovernmental Panel on Climate Change* (IPCC 1990c, 1995, 1996, 1996a, 1996b, 2001, 2001a, 2001b, 2001c,

2001f, 2007, 2007a, 2007b, 2007c) that has addressed new global challenges facing humankind due to anthropogenic climate change.

The IPCC by its mandate has been limited to “assess on a comprehensive, objective, open and transparent basis the latest scientific, technical and socio-economic literature produced worldwide relevant to the understanding of the risk of human-induced climate change, its observed and projected impacts and options for adaptation and mitigation.” It relies on peer-reviewed scientific knowledge and governmental reports. So far the IPCC did not address the societal consequences and related security issues, but its scientific messages have been perceived and communicated as most urgent environmental challenges by many media and put on the agenda of the UN, OAS, AU, of G-8, EU countries, and of many other regional

organizations. The heads of states and governments and their representatives have agreed in many policy declarations and statements that most urgent policy responses are needed. Thus, the year 2007 has been the turning point from a process of *politicization* (since 1992) towards a *securitizing* of global environmental and climate change (chap. 4 by Brauch).

These new environmental security challenges humankind faces in the 21st century cannot be solved by traditional and power-based security strategies, policies, and measures. They require a shift from a unilateral and national security concept – as pursued by the US administration (2001–2008) – to a cooperative and multilateral Grotian (Bull 1977; Wight 1991; Brauch 2008a) or Confucian (Lee 2008, Oswald 2008c) approach to security. The response to these new manifold challenges requires an extended security approach that involves besides the foreign and defence departments also ministries and agencies responsible for environment, development, science and technology, as well as economic policies and measures (chap. 77 by Werthes/Debiel) to adapt to these new challenges and to mitigate against their impacts.

The new global non-military security dangers and concerns in the Anthropocene, and the reconceptualized security concepts have already resulted in a new global, regional, international, and national ‘soft’ security agenda. The threefold contextual changes with a) the end of the *Cold War* (bipolarity, military, systemic, and ideological conflict), b) with *globalization* (emergence of new non-state actors, societal and economic processes, global communication and internet technologies), and c) with the emerging new security challenges in the Anthropocene requires a new international peace and security policy that differs fundamentally from the cooperative security and peace policies during the Cold War that aimed to overcome the global bipolar systemic and power conflict by a common security policy relying on arms control and disarmament policies, i.e. that was focusing at the military and its weapons. Such a new international peace and security policy for the Anthropocene should combine the two goals of a sustainable development pattern with the vision of a sustainable peace.

This concluding chapter tries to transform the conceptual and empirical results into a policy perspective that translates the scientific knowledge into political action. The chapter is structured into eight parts: the first two parts discuss the processes of knowledge creation (99.2), and of translating knowledge into policies and measures (99.3), while the following three parts refer to the role of society (99.4), of the business

community (99.5) in facing the new global challenges, as well as the role of the state and international organizations (99.6) in responding to these new global challenges. The final two parts address these new challenges for international peace and security (99.7) and suggest conceptual ideas for moving towards a sustainable peace policy for the 21st century (99.8).

99.2 Knowledge Creation: Scientific Research and Epistemic Communities

A key thesis is that the narrow conceptualization of political and military security policy during most of human history has been ‘power-based’ relying on diplomacy and the military in achieving the national interest. In the 21st century due to the increasing importance of issues of *global environmental change* (GEC) the new and widened concepts of *environmental security* and the deepened concepts of *human security* will increasingly be ‘knowledge-based’.

Since its establishment in 1988, the IPCC, as a science-based ‘epistemic community’ (Haas 1989, 1990, 1992, 1993) consisting of a few thousand authors and evaluators from different scientific disciplines from all parts of the world, has assessed the peer-reviewed knowledge primarily in the natural sciences on global climate change (GCC). With its first four assessment reports the IPCC has succeeded to create global awareness within the scientific community, in the media, and in the political realm, and has thus politicized climate change. With its *Fourth Assessment Report* (AR4), the IPCC (2007, 2007a, 2007b, 2007c) has succeeded to make climate change a global issue of utmost importance that requires extraordinary political, societal, and economic responses. The IPCC has thus become a new *securitizing* actor that indirectly securitized GCC issues without addressing security itself.

The other scientific and technological committees created in the framework of the *UN Convention on Biodiversity* (1992) and of the *UN Convention to Combat Desertification* (1994) as well as the *World Water Forum* (1997, 2000, 2003, 2006) have also become new policy focused epistemic communities. In the scientific realm the *Earth System Science Partnership* (ESSP) and its key scientific programmes were instrumental for scientific agenda setting:

- a.) *International Geosphere-Biosphere Programme* (IGBP), a research programme that studies global change by analysing interactive physical, chemical, and biological processes that define Earth System

dynamics changes occurring in these dynamics and the role of human activities on changes (Nobre/Noone 2009).

- b.) *DIVERSITAS* integrates biodiversity science for human well-being by linking biology, ecology, and the social sciences, producing socially relevant new knowledge to support sustainable use of biodiversity (Larigauderie/Loreau/Walther 2009).
- c.) *International Human Dimensions Programme* (IHDP), an international, interdisciplinary science organization that promotes and coordinates research, capacity building, and networking by developing a social science perspective on global change at the interface between science and practice (Young/Rechkemmer 2009); and the
- d.) *World Climate Research Programme* (WCRP) that draws on climate-related systems, facilities and intellectual capabilities of 185 countries to advance the understanding of processes that determine our climate, focusing on its predictability and on the effect of human activities (Church/Henderson-Sellers 2009).

These four scientific programmes and the many associated projects, such as *the Global Environmental Change and Human Security* (GECHS), have created global networks that encouraged the creation of 'new knowledge'. The advisory bodies of the global environmental conventions (such as the IPCC) have assessed and communicated this knowledge to the global community, to governments, and many international organizations. This new science-based knowledge that has been created during the past two decades has succeeded to create a wide global public awareness, and has been added to the policy agendas of most nation states and international organizations, e.g. of the United Nations and its organs: the General Assembly, the Security Council, and the Secretary-General as well as its specialized agencies (UNESCO, WMO, FAO, WHO), and its programmes (UNEP, UNDP).

The new knowledge on environmental challenges has been a result of both disciplinary research in the atmospheric sciences (meteorology, chemistry, physics) and of multidisciplinary studies, as well as of inter- and transdisciplinary research teams, where the linkages between different disciplines were instrumental for new scientific insights. Universities and major research institutes have become the creators of scientific knowledge that has been transmitted through teaching to students, thus creating within two decades a scientifically trained global environmental change community and sensitizing decision-makers in society, the

business community, and in the state, as well as in the international organizations for these new political and security issues. In transmitting this knowledge to the people, the IPCC has become a highly respected communicator and 'catalyst', whose assessments were widely reported and discussed in the mass media, by social movements, parliaments, cabinets, and international fora.

While most knowledge in the social and political sciences has been based on historical evidence and systematic analyses, the IPCC's scientific information is based on past climate analyses, observations, and measurements (meteorology, climate history) as well as on climate scenarios and modelling up to 2050 and 2100. As one key assumption has been the 'anthropogenic' or human-induced climate change, projections on future greenhouse gases require the integration of population projections, on the processes of urbanization and of agricultural and industrial production and services, as well as on transportation and on the projected energy consumption of fossil fuels (coal, oil, natural gas).

While these trends can be mathematically modelled, political constellations, decisions, and resulting events cannot be predicted, as the failure of the intelligence services and of many social science analyses to foresee the end of the Cold War (Gaddis 1992/1993) has shown. Thus, unpredictable events, such as future wars, diseases and pandemics, as well as turning points in global history due to learning and proactive policies cannot be foreseen. While policy-making as a result of manifold human choices, decisions, and responses to decisions is unpredictable, the trends posed by the many new global, regional, and local environmental challenges constrain the political leverage of decision-makers, and no action or late reactions may increase the costs for future decisions to adapt and to mitigate these challenges. Thus, anticipatory learning based on scientific knowledge and its communication via the media to society and policy-makers may lead to innovative policies that may revise the projected trends.

99.3 Translating Knowledge into Policies and Measures

Translating knowledge into action has become a major task of the 21st century. Anticipatory knowledge by creating public awareness has already become instrumental for launching manifold countermeasures in the framework of national climate change policies.

The concern with climate change, as well as rapid rises in the costs of fossil fuels, has triggered many innovations and initiatives for energy efficiency in production, households, and in transportation.

The Kyoto Protocol with its quantified emission reduction obligations for the industrialized countries (Annex-1 countries of UNFCCC; Annex-A countries of the Kyoto Protocol) and its three flexible mechanisms: emissions trading, joint implementation, and clean development mechanisms have brought about many economic incentives for the emergence of a rapidly growing new renewable energy sector.

The grim messages transmitted by the IPCC as well as the international climate change policies have contributed to societal learning based on the precautionary principle with the goal to shift from reactive to proactive policy-making. After Australia has ratified the Kyoto Protocol in 2007, only the remaining superpower is missing.

Recognizing and addressing the new security challenges has become an issue of utmost political importance that requires extraordinary policy measures. During the G-8 summits in 2007 and 2008, the presidents and heads of government of the eight leading industrialized countries have committed themselves to reduce their greenhouse gas emissions by 50 per cent by 2050, and medium-term reduction goals up to 2020 are presently being negotiated in the framework of the post (Kyoto) 2012 climate change regime that will set the policy framework for the policies and measures to be adopted at the COP 15 of the UNFCCC in Copenhagen in December 2009.

With regard to water scarcity and degradation, the *Millennium Development Goals* (MDGs) have adopted a set of short-term policy and measures to be achieved by 2015. They linked them to poverty alleviation and sustainable development policies in poor countries. On desertification, the COP 8 of UNCCD (1994) adopted “The 10-year strategic plan and framework to enhance the implementation of the Convention (2008–2018)” in September 2007 in Madrid.³

The *Millennium Development Goals* (MDG) aim at eradicating extreme poverty and hunger by 2015 by reducing “by half the proportion of people who suffer from hunger” (target 2). However, by 2005 the implementation has lagged behind in many developing countries with high poverty rates (World Bank 2005). According to the Director General of FAO, Jacques Diouf (2007: 17), “the proportion of people suffering

from hunger and malnutrition in developing countries, where hunger is concentrated [according to a World Bank study for the years 1990 to 2003], only a 3 per cent drop, from 20 to 17 per cent, was registered.” Therefore, “growth in the agricultural sector is thus a critical factor in hunger and poverty prevention, as was recently recognized by the World Bank in its 2008 *World Development Report: Agriculture for Development*.”

According to IFPRI’s *Global Hunger Index* (Welt-hungerhilfe/IFPRI/Concern 2007) “if current trends continue, there will still be around 580 million people going hungry in 2015.” During 2008, world food reserves (in cereals) have reached a minimum, while according to World Bank (2008) estimated prices of maize rose by more than 60 per cent from 2005 to 2007, and according to the *US Department of Agriculture* (USDA) this trend has “increased the food import bill of developing countries [in 2006] by 10 per cent over 2005 levels. For 2007, the food import bill for these countries increased at a much higher rate, an estimated 25 per cent.”⁴

This global food crisis is due to a growing middle class in poor countries, changes in the diet in China and India, drought and other natural hazards, bad harvests, speculative behaviour by transnational agribusiness, and a rapidly growing demand for biofuel that has been highly subsidized (US, EU).⁵ These developments have resulted in spring 2008 in food riots in Haiti and in several other developing countries. This tense food situation has threatened the well-being and survival of millions of extremely poor people primarily in developing countries in South Asia and in Sub-Saharan Africa.

The unequal trends in population change that have been projected until 2050 by the UN Populations Division (2007) for some industrialized countries (ageing and population decline, chap. 12 by Lutz) and developing countries (especially in Africa continued rapid population growth) and the direct and indirect

5 According to the World Bank’s WDR 2008 both the ethanol (USA: 46 per cent; Brazil: 42 per cent; EU: 4 per cent; others: 8 per cent) and biodiesel (EU: 75 per cent; USA: 13 per cent; others: 12 per cent) production was highly concentrated in mid 2007. Source at: <<http://econ.worldbank.org/WBSITE/EXTERNAL/EXTDEC/EX-TRESEARCH/EXTWDRS/EXTWDR2008/0,contentMDK:21501336~pagePK:64167689~piPK:64167673~theSitePK:2795143,00.html>>.

impacts of climate change will most likely increase the environmentally-induced migration pressure from the most affected regions towards urban centres and abroad (WBGU 2008; IOM 2008). This poses new potential human security problems for the migrants as well as national security concerns for the countries of immigration. Whether the projected global environmental changes and the population changes and processes of uncontrolled distress migration and chaotic urbanization will result in extreme societal outcomes, such as crises and conflicts, depends on the policy constellations and on the decisions future policy decision-makers will take. But there is also the reaction of civil society and of the business world that are creating adaptation and mitigation strategies to better cope with the coming threats and risks.

Two combined strategies can offer guidelines and a conceptual framework for translating anticipatory knowledge and learning into proactive policies and measures: a *strategy of sustainable development* combined with the *vision of a sustainable peace*.

- *Sustainable development* is a broad scientific concept with many and often conflicting meanings. It tries to combine the economic growth of post-modern capitalism with sustainability and social equality. The outcomes are different in the North and the South, between men and women, and poor and rich. As a policy goal it tries to avoid further resource depletion and environmental destruction, without affecting the existing economic dynamics. As a policy strategy, through the Agenda 21, it creates instruments of policy measurements, able to mitigate the negative outcomes of the present consumerist society. Aware of these new threats, the Brundtland Commission (WCED 1987) defined sustainable development as a crucial element of the future of humankind and its livelihood, where the definition contains a prospective element: “development that meets the needs of the present generation without compromising the ability of future generations to meet their own needs.” This simple definition still refers to continuous growth and life improvement for the highly privileged in consumerist nations, where the notion prevails that there are no inherent ‘limits to growth’ on a planet of finite natural resources and limited ecological resilience (Dalby 2006; Oswald 2008d).
- *Sustainable peace* has been used as a semantic construct in the UN context and by action-oriented researchers who combined peace with sustainable development. As a new concept it has

been used by several United Nations organizations and governments (Oswald 2008). Peck (1998: 45) has defined sustainable peace as “sustainable development (which) involves the institutionalization of participatory processes in order to provide civil and political rights to all peoples. The building blocks of sustainable peace and security are well-functioning local, state, regional and international systems of governance, which are responsive to basic human needs.” Sustainable peace has also been linked to ‘preventive diplomacy’ that tries to prevent the escalation of conflicts before they become violent. Despite this conceptual progress in linking development with environmental peace and culture, most official declarations are oriented towards short-term goals. Thus, a different paradigm and social behaviour is required to overcome the present security dangers in a coherent way.

The three actors for translating this knowledge into forward looking action are:

- *Society* from the family, to the local community, the town to the region, the national and international level. Many organized societal actors, social movements, clubs, non-governmental organizations (NGOs), etc. play a key role in promoting new policy goals for both sustainable development and peace, and to put them on the agenda of electoral processes and policy agendas.
- The three *economic sectors* of agriculture, industry and the services and the *business community* can play both an impeding as well as an innovative role towards achieving sustainable development. Whether the business sector is only guided by greed and the profit motive or whether it becomes a socially and ethically responsible innovative agent depends both on the society and the political framework established by the state.
- The *state* and *inter-state actors*, such as international organizations, regimes, and networks, will remain key actors for creating the policy guidelines, frameworks for innovative policies and measures aiming at and implementing the dual goal of sustainable development and sustainable peace.

99.4 Facing New Global Challenges: Role of Society

In the 21st century, pertaining to global environmental challenges the source of threat is ‘us’ and our eco-

conomic market-oriented and profit driven capitalist model, and the modern mode of production and consumption developed initially in the Western world that has been globalized. It is our collective and individual consumptive behaviour and our use of fossil energy that is contributing to global warming and to the accumulation of greenhouse gases in the atmosphere. Besides the natural climate variability, the anthropogenic climate change has been the result of the collective industrial and private consumption of cheap fossil fuels (coal, oil, and gas) since the technological revolution in the 18th century. Cheap fossil energy facilitated many technological innovations and breakthroughs, but it also made possible the developments of modern weaponry (tanks, aircraft, battleships, missiles, nuclear weapons) and their use in the two world wars and the nuclear arms race during the Cold War.

While during most of human history the source of threat to tribal, communal, city or national security was the 'other', the other tribe that competed for scarce water and food, for power and influence and the other state that challenged or impeded the realization of the national political, economic and military interests, in the emerging Anthropocene age of earth and human history, the source of the manifold new environmental threats, challenges, vulnerabilities, and risks has been humankind as a species, but especially the people in the industrialized countries that have during the past 250 years contributed most to the increase of greenhouse gases in the atmosphere. However, with the rapid industrialization of countries such as China, South Korea, and India, but also in Brazil, Mexico and South Africa, to mention only a few threshold states, the growth pattern in fossil energy consumption is gradually shifting from the industrialized to the newly and rapidly industrializing countries.

Thus, the debate between the developing and the industrialized countries that has dominated the climate negotiations since 1990 that it is 'they', the industrialized countries who should only take legally binding quantitative greenhouse gas reduction obligations (UNFCCC, KP), is insufficient. According to the principles of the UNFCCC, its parties "should protect the climate system for the benefit of present and future generations of humankind, on the basis of equity and in accordance with their common but differentiated responsibilities and respective capabilities."

It is also 'us' as individuals and not only 'they' (North, transnational corporations, consumerism) that pose the new threats due to the waste and inefficient use of fossil energy in the household and in transportation. However, in 2006, on average an

American still consumed 20 times or a European 10 times as much energy as a person living in India, and this relationship is even worse in relation to many African countries. As the private energy consumption between North and South but also between the wealthy elites in the South and their poor population has been unequal, also the impact of the climate-related hydro-meteorological hazards has been highly unequal. The major number of people killed, affected, and economically damaged have been living in the South, and it has been the highly socially vulnerable poor people in many of the poorest countries that have often repeatedly lost most of their belongings.

According to the IPCC (2007c: 53) there is a high probability that the hydro-meteorological hazards (tropical and other storms, floods, landslides as well as heat waves, drought and forest fires) will increase both in number and intensity. Furthermore, due to the projected sea level rise, the very existence of many small island states, of coastal regions, and of river deltas are seriously threatened. Thus, climate change will not only affect the survival of the highly socially vulnerable segments of society, but it will also challenge the territorial integrity of the affected nation states. In addition (figure 99.1) climate change will impact on precipitation levels that will affect the food security of many countries due to drought or floods. For these new threats, the military with its traditional defence strategies and weaponry offers no solution, but the military may be used for humanitarian missions to counter the hazard impacts.

In facing and coping with the security dangers posed by global environmental change, the societal actors play a key role in reducing social vulnerability and enhancing resilience building. Thus, public awareness for these new dangers and training for the people has become essential to enable them to save their lives and to better protect their few essential belongings. Thus, the increased resilience of the local societal actors in the physically most vulnerable regions can significantly reduce the impact of these disasters. But these bottom-up activities must be supplemented by disaster preparedness and funding from the state and international humanitarian actors.

The transmitters of traditional knowledge (e.g. elders, local leaders, women), as well as the representatives and communicators of modern technological knowledge (represented by the disaster preparedness agencies, schoolteachers), play a key role among the societal actors. Social movements, non-governmental organizations, religious groups, and the media can make a difference in creating public preparedness.

The key task of societal actors for coping with climate change impacts from the local, to the communal, city or regional and national level are: awareness creation, policy action with adaptation and mitigation, and resilience-building.

99.5 Facing New Global Challenges: Role of the Business Sectors and Community

The three economic sectors (agriculture, industry, and services) and the business community will play an essential role in the adaptation of production and consumption patterns to the new conditions required in the Anthropocene era of earth history. A key challenge for a reduction of global emissions from the energy sector by 50 per cent by 2050 is the gradual decarbonization of the energy sector by a dual strategy of increased energy efficiency and by a gradual replacement of fossil energy sources by renewables, such as hydropower, wind power, geothermal and solar energy, through both concentrated solar thermal and photovoltaic plants. Biomass can also make a contribution to the heating and transportation sector, as long as it does not conflict with food production and does not negatively affect biodiversity.

Thus, the success of the gradual decarbonization of the energy and other economic sectors requires the active involvement of the business community. The results of scientific and technological research, especially in the energy sector and in production, transportation, housing, but also in agriculture and in the services, must be implemented in new energy efficient processes of production and consumption.

With regard to the development, production, and commercialization of renewable energies, at least in many European countries, small and medium-sized companies have played a leading role as technology innovators and in the implementation of adaptation and mitigation policies. Later, often multinational corporations have bought the most promising companies to build up green production units within their conglomerates and to implement energy efficiency enhancement strategies in an effort to reduce their energy costs. While many of these initiatives have been driven by the profit motive and by efforts to enhance their 'green' image, some business leaders and companies have also stressed their social and ecological responsibility for the future generations.

The companies that have joined for example the *World Business Council for Sustainable Development*

(WBCSD) and its regional and sectoral affiliates have stressed a responsibility for their activities and for their impacts on the environment. Ethical business goals are often linked with efforts to enhance resource and energy efficiency and to reduce the carbon component in their energy consumption. Many ecologically concerned business leaders understand the 'logic of change' in the free-market model, but also the responsibility of business to collaborate on the 'logic of value' to grant the poorest their basic human needs and to reduce the growing inequality (chap. 11 by Oswald/Brauch). They accept a responsibility of the free-market system for environmental damages, inequality, and discrimination, and link their investments to innovations that reinforce the well-being of humankind as a whole without ignoring long-term undesirable effects on the environment and for human beings.

UNEP's fourth *Global Environmental Outlook* (UNEP 2007: 400–401) distinguished in its perspectives towards 2015 and beyond four scenarios with different priorities:

- *Markets First*: the private sector, with active government support, pursues maximum economic growth as the best path to improve the environment and human well-being. ... Technological fixes to environmental challenges are emphasized at the expense of other policy interventions and some tried-and-tested solutions.
- *Policy First*: the government, with active private and civil sector support, initiates and implements strong policies to improve the environment and human well-being, while still emphasizing economic development. ... The emphasis is on more top-down approaches, due in part to desires to make rapid progress on key targets.
- *Security First*: the government and private sector compete for control in efforts to improve, or at least maintain, human well-being for mainly the rich and powerful in society. *Security First*, ... has as its focus a minority: rich, national, and regional. It emphasizes sustainable development only in the context of maximizing access to and use of the environment by the powerful. ... Responses under *Security First* reinforce the silos of management, and the UN role is viewed with suspicion, particularly by some rich and powerful segments of society.
- *Sustainability First*: the government, civil society, and the private sector work collaboratively to improve the environment and human well-being, with a strong emphasis on equity. Equal weight is

Figure 99.2: Global GINI index of income across states and households. (Lesser is more equal). **Source:** UNEP (2007: 413).

given to environmental and socio-economic policies, and accountability, transparency and legitimacy are stressed across all actors. ... Emphasis is placed on developing effective public-private sector partnerships not only in the context of projects but also that of governance, ensuring that stakeholders across the spectrum of the environment development discourse provide strategic input to policy-making and implementation. There is an acknowledgement that these processes take time, and that their impacts are likely to be more long-term than short-term.

These four scenarios projected the impacts on the income across states and households until 2050. “*Security First* exhibits growing inequality measured by both the GINI Index and the ratio of income between the wealthiest and the poorest 10 per cent of the global population. ... *Sustainability First* showed the most significant improvement in both cases” (UNEP 2007: 413–414).

While the *Security First* scenario further increases the income inequality, thus increasing poverty, social vulnerability and reducing the coping capacity, what may also result in higher human and environmental insecurity especially in the South, the *Sustainability First* scenario offers the best prospects for reducing global income gaps.

The UNEP (2007: 403–404) study assumed that the *Security First* (SecF) scenario focuses on the national level of decision-making, while *Sustainability First* (SustF) scenario combines all levels. While for the SecF scenario the level of international cooperation is low, for the SustF scenario it is high. For the SecF scenario the public participation in governance is the lowest while it is high for the SustF scenario. In the SecF scenario the governmental investment focuses on the military but in the SustF scenario it is the

highest especially for health and education. For the SecF scenario official development assistance and environmental mainstreaming is the lowest and for the SustF scenario it is the highest. The SecF scenario prefers closed borders, while the SustF scenario opts for open ones.

In the UNEP (2007) GEO-4 study, the *Security First* scenario comes closest to a power-focused, pessimist or neorealist worldview on security (in the tradition of Sun Tzu, Thucydides, Hobbes, Morgenthau, etc.) that focuses on a narrow national military security concept and to a neo-Malthusian pessimist standpoint on environmental issues (table 1.1). In contrast, the *Sustainability First* scenario reflects a liberal, pragmatist worldview on security issues that is based on a widened and deepened security concept including the environmental dimension of human security where cooperation matters and an equity-oriented environmental standpoint where cooperation will contribute to solve problems peacefully.

99.6 Responding to New Global Challenges: Role of the State and International Organizations

In democratic systems, the political process, the political parties, and the parliaments can be both a force of obstruction and innovation. The electoral behaviour of the people depends on the public awareness on the impact of climate change and on their political willingness to change their consumptive behaviour and pay the prize for a gradual transformation of their economy. Thus, in a democratic society the city, state, and national governments representing the state are to reflect the policy concerns of its people and not (only) the narrow economic interests of a small and often powerful elite that tries to influence the policy

agenda through its campaign contributions and lobbyists. The policies of the nation state are supposed to reflect the interests of the majority of its people as translated through the electoral process. The nation state by adopting climate change policies with specific and legally binding measures for adaptation and mitigation sets the legal and regulatory framework for the society and the economic sector. The state can support and temporarily subsidize technological innovations, energy efficiency measures, as well as the development and commercialization of renewable energy technologies and products.

Since the global turn in 1990, and especially since the *UN Conference on Environment and Development* (UNCED) in Rio de Janeiro (1992) and the *UN Summit on Sustainable Development* (UNSSD) in Johannesburg (2002), key problems of global environmental change: climate change, biodiversity, and desertification have been added on the international and national policy agendas. Since 1992 and 1994 three new international regimes, systems of rules and norms, have evolved globally, i.e. the climate change (UNFCCC, 1992), the biodiversity (CBD, 1992), and the desertification (UNCCD, 1994) conventions, of which only the climate change regime, its conference of parties (COPs), and the IPCC, its scientific epistemic community, have succeeded to both politicize and at least since 2007 to progressively securitize climate change by making it an issue of utmost importance that requires extraordinary measures in implementing the policy goals to be negotiated in the framework of the post 2012 climate change regime. But the referent object of these *securitization moves* differed for international, national, and human security (chap. 4 by Brauch).

While no similar global convention was adopted to deal with the challenges of water scarcity and degradation as well as with the hydro-meteorological impacts of climate change, nevertheless global scientific epistemic communities and policy-oriented networks have evolved on water and disaster issues. Several international river basin management regimes and treaties have evolved, such as the *Nile Basin Initiative* (chap. 48 by Adly/Ahmed; chap. 49 by Kameri-Mbote/Kindiki), the *Mekong River Commission* (chap. 43 by Affeltranger), and the Rio Grande/Bravo treaty regime (Oswald 2007), to address the multi- or bilateral problems of sharing and controlling the flow of water taking the different interests in environmental conservation, electricity generation, irrigation, etc. and early warning of floods and droughts into account to reduce negative economic impacts and to

solve water conflicts peacefully by negotiation instead of using political threats and military intervention.

With regard to international hazards, after the *International Decade for Natural Disaster Reduction* (IDNDR), the *International Strategy on Disaster Reduction* (UN/ISDR) was set up in 2001, and in 2005, ten years after the Kobe Earthquake the *Hyogo Plan for Action* was adopted (2005–2015). A key policy goal has been to improve the technical early warning systems and to initiate processes of disaster preparedness.

The four environmental and this hazard regime have initiated a global political process to increase public awareness through the media and to enhance the coping capacities of governments in implementing the globally adopted policy goals. The policy task of international organizations has become the development of an effective and legally binding policy framework. The task of the states has been both to advance the development of the action goals and to implement them locally.

The ‘securitization’ of *Global Environmental Challenges* (GEC) adds climate change, water, and desertification as issues of utmost importance on the top of the national and international policy agenda that require extraordinary measures. Thus, climate change has become a major policy issue that directly affects the livelihood and the survival of human beings as well as key interests of the nation state. Many business as usual strategies that have ignored the anthropogenic nature of climate change and policies that have opposed to accept any legally binding reduction obligations are increasing the costs of natural hazards and of the needed policy response. The *Millennium Ecosystem Assessment* (MA) has argued that both global and regional reactive scenarios will have negative impacts. To the contrary, in the framework of combating desertification, the MA has argued that proactive regional (*Adaptation Mosaic*), and global (*TechnologyGarden*) scenarios may be most effective in achieving the policy goals at least costs.

Thus, proactive environment policies that face and cope with these new global environmental dangers require strategies of “environmental peacemaking” (Conca/Dabelko 2002). This necessitates both a change in the worldviews of security specialists, and of the mindset of policy-makers on the national and international level. Climate change impacts cannot be solved with a *Security First* scenario where the military and the level of armaments are crucial. Rather, cooperative and multilateral strategies and diplomatic agreements (Oswald 2007) are needed that require

primarily other political tools, technological innovations, a sustainable development strategy, but also policies that aim at a sustainable peace.

99.7 New Challenges for International Peace and Security

The peaceful end of the Cold War in Europe (1989/1990) and between the two rival political, economic, social, and ideological systems (1990/1991) did neither lead to a new era of enduring global peace. The social and political sciences failed to project both the end of the Cold War (Gaddis 1992/1993) and the post-Cold War developments (Gleditsch 2008). In all these policy projections global environmental change, climate change, water, and desertification were not addressed as security dangers and concerns, and the widening and deepening of the security concept had not yet occurred. Most projections were framed in narrow political and military state-centred concepts of national, international, common or cooperative security among nation states.

Two decades after the global turn, the assessment is mixed: while there was some nuclear and conventional disarmament in the US, Russia and in Europe, and a closure of many military bases, there was no major conversion of military industry. Rather, military spending shifted from procurement to research and development, and since 1997/1998 world military spending has been rising again. In 2006, the sole superpower accounted for 46 per cent of world military expenditure (SIPRI 2007: 268–269).

The multilateral detente policy in the framework of the CSCE process (1975) relied on arms control policy and confidence building measures; economic and environmental cooperation; and human exchanges and human rights. The arms control policy aimed at enhancing strategic stability and preventing a breakdown of the deterrence system by building cooperation across the systems' boundaries. The contextual change since 1989 was instrumental for several major arms control and real disarmament agreements, but it also put new issues on the international agenda: to contain horizontal and vertical proliferation and new sources of political instability (Brauch/van der Graaf/Grin/Smit 1992; Brauch 2002b). The weapons innovation process continues unabated. Since 1990, the public focus has shifted to the 'horizontal proliferation' of ABC weapons and missiles, while arms exports remained uncontrolled and conventional weapons were illegally exported to developing countries, to

secessionist movements or to warlords in Africa and Asia. Simultaneous Latin America experienced a transition from military regimes to democratically elected governments.

With the end of the Cold War, the bipolar global international power, ideological and systemic conflict and the global deterrence system had become obsolete. Many proxy wars could be resolved, while new violent conflicts have emerged with the disintegration of multi-national, ethnic, and religious states, and with the collapse of regimes previously supported by both superpowers. New global terrorist networks have emerged where Islamic fundamentalism filled the ideological void with the end of communism and the dissolution of the USSR.

While intra-state wars have temporarily increased since the end of the Cold War (Gleditsch 2008) in failing or failed states, involving secessionist movements and warlords, interstate wars have declined in number and intensity. The *Human Security Report* claimed that "armed conflicts involving a government as one of the warring parties had declined by more than 40 per cent around the world from the end of the Cold War to 2003" (Human Security Centre 2005). The *Human Security Brief 2007* (Human Security Centre 2008: 6) stated that also for non-state conflicts there has been a decline in number, and in reported battle deaths between 2002 and 2006.

While since 1990 the number of wars and casualties has declined (Human Security Centre 2005, 2008; Gleditsch 2008), many small-scale violent disputes that were triggered also by environmental factors were not recorded in the war databases as they failed to meet the criteria of a 'war'. The empirical case studies in the environmental security debate did not systematically analyse these small-scale conflicts between herders and resident farmers or the food and hunger riots. Thus, there is a lack of empirical research on linkages between environmental factors, hazards, migration, crises and conflicts. As policy decisions cannot be predicted, it is impossible to foresee whether policy-makers will be able to resolve environmentally-triggered disputes or whether they will escalate into violence. Thus, the projection of new trends with extreme or fatal outcomes can neither be confirmed nor falsified.

Contrary to armed conflicts there has been a steady increase in the number and intensity of the people who died and were affected, as well as the economic damages caused by natural hazards, most of them being climate related (chap. 4 by Brauch).

As the perception of the enemy has been changing in some countries, and as the securitization of issues related to GEC and GCC is just evolving, the policy debate and the scientific research on a new security policy for the Anthropocene (Dalby 2009) and for a new global peace policy in the early 21st century is just emerging. Our conceptual ideas to be sketched below combine a strategy of sustainable development and a vision of a sustainable peace where scenarios of *security first* have the worst prospects for coping with these new security issues compared with the *sustainability first* scenario.

These opposite trends support a fundamental re-thinking of security and peace issues, and its reconceptualization where increasingly the impacts of GEC and GCC are being perceived and addressed as international, national, and human security dangers and concerns.

99.8 Sustainable Peace Policy in the Anthropocene

Neither the peace policy of the Cold War nor the new conflicts in the immediate post-Cold War era offer any orientation for the goals, requirements, policies, measures, and means for a new peace policy in the 21st century. Among most experts there is agreement

- that global population may stabilize in the second half of the 21st century around 9 billion people (chap. 12 by Lutz);
- that the anthropogenic climate change is for real, that the average global average temperature has increased globally by 0.6° C during the 20th century (figure 4.2), the sea level has risen by 10–20 cm, and that the number and intensity of hydro-meteorological hazards has increased since 1950 (figures 98.5, 98.6);
- that with a tripling of the global population and improved sanitation during the 20th century, water has become scarce and degraded due to pollution and salinization in many arid and semi-arid regions;
- that areas with soil degradation and desertification have grown globally, and that this process has forced many people to leave their homes;
- that the process of urbanization has been very rapid and often chaotic, and has resulted in many megacities with a low quality of life for slum dwellers;
- that despite the promises of the green revolution, the number of undernourished people has remained a reality in many parts of the world.

These many new challenges for international peace and security require a new conceptual and policy-oriented research programme to move from knowledge to action, from reactive to proactive policies, and to explore the opportunities of environmental cooperation for a new peace policy. Such a sustainable peace policy for the Anthropocene requires new strategies, policies, tools, and measures that fundamentally differ from the peace policy during the Cold War. Reflecting these changes, the Nobel Peace Committee by awarding the Nobel Peace Prize to the IPCC and Al Gore in 2007, justified its decision arguing that

indications of changes in the earth's future climate must be treated with the utmost seriousness, and with the precautionary principle uppermost in our minds. Extensive climate changes may alter and threaten the living conditions of much of mankind. They may induce large-scale migration and lead to greater competition for the earth's resources. Such changes will place particularly heavy burdens on the world's most vulnerable countries. There may be increased danger of violent conflicts and wars within and between states.

On 17 April 2007, the UN Security Council by discussing for the first time climate change as an international security issue acknowledged that *global climate change* (GCC) may trigger societal outcomes that could pose threats to international peace and security. This dual reference to global environmental and specifically climate change as a danger or threat for international peace and security requires an innovative conceptual thinking to develop the framework of a new peace policy for the Anthropocene age.

Besides climate change, water scarcity but also water pollution in international river basins can lead to political disputes as well as military conflicts. The processes of desertification due to an overuse of fragile soils by a rapidly growing population, and also due to a decline in precipitation resulting from climate change (figure 99.1), has already forced millions of people to leave their homes by moving to the urban centres and to neighbouring countries in the region or by emigrating overseas (Myers 1993, 1995; Biermann/Boas 2007; WBGU 2008; IOM 2008). One result has been an often chaotic urbanization process that has resulted in an ungovernability of megacities that has posed many new risks and problems of internal security. The complex linkages between these global environmental challenges and the possible societal outcomes have so far not systematically been analysed,

and have often too easily been disputed, downgraded or dramatized (Bulhaug/Gleditsch/Theisen 2008, 2008a).

The policy responses to these trends depend on the environmental and security perspective of the analysts, of which only three combined types (table 1.1) will be briefly discussed:

- the position of the Hobbesian and Neo-Malthusian pessimist;
- the position of the Kantian and Cornucopian optimist;
- the Grotian and equity-oriented pragmatist;

For the Neo-Malthusian environmental expert, the present trends will inevitably lead to a major crisis of humankind that in the perspective of the (neo)realists may only be solved by force. Thus the message of the adherence of this view is to maintain military strength and to adjust the missions of the armed forces to deal with these challenges. This is reflected in UNEP's *Security First* scenario, in the MEA's reactive regional scenario of *Order from Strength*, and in some securitization moves on climate change in terms of US national security.

From a Cornucopian perspective, human ingenuity, technological innovations, and responses to the new global challenges will be able to cope with these problems. From a legal perspective human rights, democratic rule, and new forms of global governance will be able to solve these challenges. From the vantage point of this combined perspective spreading democracy, the market economy, and introduced new technologies will solve all problems. This position is reflected in UNEP's two scenarios of *Politics First* and *Markets First*.

From a pragmatic perspective on security, multilateral cooperation is essential in addressing these new global environmental challenges. For the equity-oriented ecological distributionist a new global process is needed that leads to a more just distribution of resources and to an improved perspective for human well-being both on the national and international level.

The position of a Grotian equity-oriented pragmatist comes closest to the *Sustainability First* scenario of UNEP. It also takes the two proactive scenarios of the MA into account of a global *TechnoGarden* that focuses on green technologies and ecological economics, and of a regional *Adapting Mosaic* that includes integrated management, local adaptation, and learning. Within this third perspective a few conceptual ideas for a sustainable peace policy for the An-

thropocene in the early 21st century will be offered. Such a new peace policy will conceptually combine a 'sustainable development' strategy with the vision of a 'sustainable peace', as introduced above. Such a new peace policy should meet these requirements:

- Its major orientation must be *multilateral* instead of *national*. None of the above new challenges can either be solved nationally or with national military power. Rather, military power or military superiority is irrelevant for addressing, facing, and coping with the societal impacts of climate change. Unilateral military policies are bound to fail in solving these new global dangers.
- The major orientation must be *proactive* rather than *reactive*. This requires an early recognition of these challenges, an anticipatory multidisciplinary research process on the linkages between the natural and the social sciences, and an anticipatory learning by the society, the business community, and the representatives of the state. Both the Millennium Ecosystem Assessment and the Stern Report have pointed to the negative effects and high costs of acting late.

These dual goals and requirements must be translated into horizontally integrated new policies on the state level among different ministries, and on the international level between different international organizations, programmes, and agencies.

99.8.1 Strategy of Sustainable Development

Sustainable development has been the key policy guideline for the *Millennium Development Goals* (2000), for the *Millennium Ecosystem Assessment* (MA 2005; chap. 3 by Leemans), and for the *Sustainability First Scenario* of UNEP's *GEO-4* (2007). This guideline requires an inclusion of environmental sustainability goals into all sectoral policies. Within the European Union this has been adopted with the Cardiff process (European Council, Cardiff 1998) and with the European Union's Green diplomacy (European Council, Thessaloniki 2003). Such a policy requires many specific measures and tools.

With regard to climate change this implies a gradual decarbonization of production and consumption. Instead of focusing exclusively on the defence of the national access to hydrocarbons (oil and gas) with military means, the step-by-step introduction of energy efficient technologies and the commercialization of renewables must become obligatory, and its implementation must be enforced by the nation state. As

Table 99.1: Phases, levels, and instruments of peace-building.

Phases ▶ Levels ▼	Preventive	Peace-building	Consolidation of a Culture of Peace
Inter-national	Conventions, sanctions, UNSC resolution, treaties, emergency aid and development assistance, INGOs	UN Blue Helmets, financial support, international pressure for peace-building, boycotts of arms exports, control of transnational crime rings	Financing reconstruction, elimination of landmines, recovering and cleaning of environment after war damages, regime change support, UNHCR, ICC, WB
Regional	Agreements, regional surveillance, legal advice and treaties among neighbours, mutual support, control of arms trade	Regional peace forces, financing of peace-building, mediators, security mechanisms for peace processes, third country negotiation	Training of police, civil servants and cooperation for reconstruction, repatriation of refugees, food and emergency support, market structure
National	Democratization processes, reduction of social gaps and poverty, social improvements with equity and sustainability, social movements, NGOs	Negotiation of peace processes among all factions, public information, disarmament of combatants, peace processes training, job opportunities, constitution, rule of law and implementation, truth commissions	Building of institutions and infrastructure, public security, training of police and civil servants, democratic elections, constitution, school and health services, housing, rule of law and justice, support for independent mass media

many developing countries in the South cannot afford to pay for the learning curve towards new economies of scale, the access to these technologies must be shared and new forms of economic cooperation must be created that are in the medium- and longer-term beneficial both for the countries that share these technologies and for the recipient countries. A goal should be to produce these systems locally to the extent the local infrastructures and scientific sophistication permits. Important tools are technological innovations, economic inducements, and global distribution of these technologies in order to reduce in the medium term the resource competition for oil and gas. Sharing of scientific information and North-South scientific partnerships are important steps towards that end.

99.8.2 Sustainable Peace as Peace-building

Three phases of sustainable peace could be distinguished: a) a *preventive element*; b) a *peace-building process*, and c) the *consolidation of a culture of sustainable peace*. For the *first phase* national and international organizations and regimes have spread through diverse types of pressure a Western model of social, political, and economic organization to war-stricken and conflict-prone countries in the South. This process may increase local resistance and produce rejection and greater violence. But if it is combined with development aid, debt relief, and support for an internal reorganization and a fight against corruption, and if these efforts lead to a real improve-

ment of the quality of life for the majority of the population, this approach can induce a process of peace negotiation. There is also a possibility of an internal adjustment, where social equity and job opportunities strengthen a participatory democracy which may prevent and mitigate violent outcomes. Local social movements aiming at food sovereignty and an economy of solidarity, which is often in the hands of women, can also establish stable bases for policies of sustainable development.

To get to the *second phase*, to the cessation of violence and to the *peace-building process*, internally all groups involved in the conflict and in the building of a post-war society must be involved. This process is often supported by creative mass media and strong external mediators (Lederach 1997). The negotiation process itself requires a concealed agenda setting (De la Rúa 2007), secure places for the negotiators (guaranteed by UN peacekeeping forces, an African Peace Corps, or a safe place in a third country), independent financial support and step by step agreements. The negotiated agreements must be implemented and there is a need for a close monitoring and evaluation of the results and the progress achieved to avoid setbacks and a resumption of violence. Bridging processes such as a special attention for refugee camps, reconstruction of destroyed basic infrastructure (roads, bridges, markets, and governmental buildings), demilitarization of armed groups and their involvement and training in civil activities, truth commissions, a return of internally displaced persons with economic opportunities, etc. must be offered. Simultaneously, the ille-

gal arms trade, kidnapping, rape, and robbery must be stopped by the peacekeepers, and gang-related illegal activities must be dismantled. Legality at any cost, called 'zero tolerance', is important in this stage to strengthen the path to peace and to avoid violent outcomes (UNDP 2001a).

The *third phase* results from the former negotiation process where all parties to the conflict were involved and where during the negotiation process a win-win situation was found that satisfied the most important groups and gave them some benefits through a peace agreement. But some illegal groups remain that have lost in this peace process (such as arms and drug dealers, or human traffickers). They will try to destroy the peace process at any cost. These groups must be controlled internally (by the police, military or civil society) and externally (e.g. by Interpol). During this last phase, the consolidation of civil institutions, the return to normality, the elimination of war threats from landmines, small arms, and other war tools must be implemented. Simultaneously, a civil government, police forces, the involvement of the military and guerrillas in civil activities and under civil control, the establishment of legal private businesses with job creation, food, water and public health services and later the reestablishment of transport and communication infrastructure, ports, airports and train stations are crucial to stabilize the fragile process. The more parties in a conflict that have been involved in this process, the more stable and less corrupt the results may be during the reconstruction phase where political parties emerge and democratic elections must be held.

During these three phases different inputs occur from diverse geographical levels: the international, the regional, and the national levels, and from the local peace-building measures within these countries. The international and regional, but often also the national processes, are guided by international multilateral (UN) or regional organizations (AU, OAS, EU) which establish a framework for action in societies that are moving away from violence and conflict. The mechanisms used to achieve a sustainable peace are besides treaties among the conflict parties, disarmament measures, collection of small arms, control of the arms trade, and clearing of landmines and other war remnants. Table 99.1 synthesizes these three phases and the levels of action, taking the activities of international and public actors and civil society into account.

99.8.3 Beyond Environmental Peacemaking

Ken Conca (2002: 3) has pointed to a conundrum of the research and policy debate on ecological or environmental security:

Ecological security is emerging within OECD member nations as a powerful frame for international environmental protection, yet its terms of reference constitute an obstacle to international cooperation in the very places where the ecological insecurities of people and communities are most starkly displayed.

Conca (2002: 3–5, 9) argued that this literature did not “provide a clear strategy for peace” and he suggested that “environmental cooperation can create synergies for peace” by stressing “cooperative potential rather than violent inevitabilities.” He asked “whether environmental degradation can trigger broader forms of peace,” and “be an effective general catalyst for reducing tensions, broadening cooperation, fostering demilitarization, and promoting peace.” Such a strategy must work on two levels: “First, it must create minimum levels of trust, transparency, and cooperative gain among governments. ... Second, it must lay the foundation for transforming the national-security state itself.” Conca (2002: 13) suggests focusing “in particular on regional peace and cooperation, for both ecological and political reasons.” This thesis was discussed in six case studies on the Baltic (VanDeveer 2002), South Asia (Swain 2002), the Aral Sea Basin (Weinthal 2002b), the Caspian Sea (Blum 2002), Southern Africa (Swatuk 2002), and for water cooperation in the US-Mexico border region (Doughman 2002).

In conclusion, Conca and Dabelko (2002: 220–221, 230–232) discussed “problems and possibilities of environmental peacemaking,” cautioning that these six cases do not offer “formal tests of environmental peacemaking propositions.” They interpreted the case studies both with regard to interstate and trans-societal dynamics, and suggested that “certain forms of environmental cooperation could be extremely useful tools in the hands of peacemakers” that can combine “environmental, developmental, and peace-related concerns.” In a similar vein, Tänzler, Dabelko, and Carius (2002) reviewed “Environmental cooperation and conflict prevention” initiatives at the WSSD (2002) with a special focus on protecting transboundary resources in Africa on water cooperation, peace parks, and for integrating environmental protection into regional cooperation arrangements (NEPAD, AU). Six years later Dabelko (2008: 41–44) stated that a growing number of conflict-prevention and post-

conflict scholars and practitioners argue that natural resource management can be a key tool for helping prevent or end conflict and for building peace in a post conflict setting. The cooperation imperative spurred by environmental interdependence and the long-term need for iterated interaction can be used as the basis for confidence building rather than merely engendering conflict.

He illustrated the peace-building potential of environmental cooperation with examples of “rehabilitating the Jordan River Valley through cross-border community cooperation” (Williams/Parker 2008: 42) by the “good water makes good neighbours” project of the *Friends of the Earth Middle East* (FoEME) and with the Siachem Peace Park proposal in South Asia (Ali 2008), and with activities of UNEP’s *Post Conflict and Disaster Management Branch* (PCDMB) that have strengthened environment management institutions in conflict regions.

Within the EU, conflict prevention activities and the mainstreaming of environmental issues into all sectoral policies has been pursued in parallel, and so far no long-term strategy has evolved that addresses issues of what has been introduced as “environmental conflict avoidance” (Brauch 2000d, 2003: 86–89, 123–124).

99.8.4 Vision of a Sustainable Peace with Nature

However, the symbiosis of strategies for ‘sustainable development’ with a policy vision of a ‘sustainable peace’ as two goals of a new peace policy for the Anthropocene in the early 21st century requires a more fundamental rethinking of a comprehensive policy approach that includes many of the policy goals that have already been adopted in several international policy declarations (Agenda 21 of 1992; Millennium Development Goals of 2000; Policy Declaration and the Implementation Plan of the WSSD in 2002) and the normative scientific propositions on the precautionary principle, international peace with equity, on peace with nature or peace with the creation.

However, what has been lacking is a sufficient translation of this new knowledge into action and a transformation of these policy goals into policies and their effective implementation. The experiences with the guidelines adopted in the UNFCCC (1992), and with the quantitative emission reduction goals approved in the Kyoto Protocol (1997), have been disappointing.

It will be seen whether the recent *securitization moves* of issues of climate change, water, desertification, as well as the debate on environmentally induced forced migration will not only enhance the urgency of the security dangers and concerns posed by GEC and GCC, but also lead to long-term and proactive policies as suggested in the framework of the *Sustainability First* scenario of UNEP and the *TechnoGarden* and *Adaptation Mosaic* scenarios of the MA.

99.8.5 From ‘Facing’ to ‘Coping’ with Global Environmental and Climate Change

This requires moving a step further from understanding and *facing* these new security issues for the well-being, security, and survival of future generations to concrete political, economic, and societal strategies, specific policies and measures for *coping* with these new security dangers. This necessitates a fundamental change in our thinking on security and peace, where the past experience gained and the thinking of the past may offer little advice. Clark, Crutzen, and Schellnhuber (2004) proposed a new paradigm of a “science for global sustainability” as well as a “new contract for planetary stewardship”. They argued:

We are currently witnessing the emergence of a new scientific paradigm that is driven by unprecedented planetary-scale challenges, operationalized by transdisciplinary millennium-scale agendas, and delivered by multiple-scale co-production based on a new contract between science and society (Clark/Crutzen/Schellnhuber 2004: 24).

For coping with GEC and GCC “management systems for a sustainability transition need to be systems for adaptive management and social learning” that “require appropriate information, incentives, and institutions” (Clark/Crutzen/Schellnhuber 2004: 20).

This suggested scientific revolution must be translated into new international policies for the 21st century. International peace and security as the highest human and international policy goals of the UN charter require a policy strategy that combines sustainable development with sustainable peace.

100 Summary and Results: Facing Global Environmental Change and Sectorialization of Security

Hans Günter Brauch¹

The previous 99 chapters contain diverse theoretical and conceptual approaches and empirical results that are briefly summarized below following the ten parts of the book. Given the diversity of the theoretical and empirical approaches from many different disciplines, regions, and countries addressing global environmental change as one of three crucial factors contributing to a reconceptualization of security in the early 21st century, no effort will be made to reduce this complexity and to synthesize these chapters into a few key messages. Rather, this concluding chapter will provide an overview of major arguments made and topics addressed in these chapters. The three general messages of this book are:

- *Global environmental change* and especially global anthropogenic climate change, water scarcity, degradation and stress, as well as soil erosion and desertification have gradually been *securitized* since the year 2000 and become major security dangers and concerns for the environmental dimension of international, national, and human and gender security in the Anthropocene era of earth history (parts I–III).
- Besides the *widening* (environmental dimension, part VIII) and *deepening* (human and gender referent objects, part IX) of security concepts a *sectorialization* of security were conceptually mapped for energy, food, livelihood and health, as well as for water security (parts IV–VII).
- *Facing Global Environmental Change* requires multi-, inter-, and transdisciplinary research programmes (chap. 98) that address the linkages between earth and human systems (figure 99.1) but also new policies for coping with GEC that are based on the four goals of the conceptual quartet (peace, security, development, environ-

ment) and that should aim at strategies of sustainable peace with sustainable development (chap. 99).

The book started with a contextualization of *Global Environmental Change* (GEC) (100.1) that was followed by a securitization of GEC (100.2), and a securitization of extreme natural and societal outcomes (100.3). The next four parts introduced four sectoral security concepts focusing on energy security (100.4), food security (100.5), livelihood and health security (100.6), and water security (100.7). The last three parts reviewed the debates on environmental security (100.8), and human security (100.9), and the concluding section offered conceptual considerations for moving from knowledge to action (100.10).

100.1 Contextualization of Global Environmental Change

Part I provides a conceptual and political, a historical and systematic context for the analysis of GEC. In the introduction, *Hans Günter Brauch* distinguished three stages in the evolution of the GEC agenda: from *scientific agenda setting* (since 1970's), to a *politicization* (since 1992) and *securitization* (since 2000). He reviewed the global policy debate on environmental (UN, OSCE, NATO, ENVSEC, OECD, EU) and human security (UNDP, UNESCO, UNU) concepts and issues, before he mapped the global reconceptualization of security and environmental linkages and addressed several sectoral security concepts.

In looking backward to the 20th *John McNeill* argued that “our politics and institutions are ill-adapted to the complex demands of ecological prudence” and that “the international security anxiety of the 20th century selected for states and societies that emphasized military power and industrial strength over all else: survival of the dirtiest.” In many wars environmental

1 The author is grateful to three reviewers for their very useful and critical comments.

concerns were dropped and active ecological change was encouraged by the military (chap. 2).

From a systemic perspective, *Rik Leemans* in his review of the UN's *Millennium Ecosystem Assessment* (2001–2005) argued that the anthropogenic changes to ecosystems “have contributed to substantial net gains in human well-being (including many aspects of security) and economic development,” but they have also resulted in “growing costs in the form of degradation of ecosystem services, increased risks of nonlinear changes, and the exacerbation of poverty and security for some groups of people.” In his view, “the MA shows that these problems could grow much more serious in the coming decades. At the same time, the assessment shows that the future really is in our hands. People can reverse the degradation of many ecosystem services and improve human well-being further over the next 50 years, but the changes in policy and practice required are substantial and not currently under way” (chap. 3).

100.2 Securitization of Global Environmental Change

The eleven chapters in part II offer an overview on the environment – human interactions, reviewed climate history, climate change impacts for small island states, security aspects of desertification, discussed water as a security issue, assessed demographic trends as a security concern, and discussed linkages between urbanization and security.

Influenced by the Copenhagen school, *Hans Günter Brauch* reviewed the *securitization* of GEC (water, desertification, global climate change (GCC)). He outlined a new security policy for the Anthropocene, introduced the *securitization* approach and offered an overview of several models on nature and human interactions (OECD, UNCSD, EEA), discussed the approaches of the Toronto and Swiss schools on environmental security, outlined his own PEISOR model before he noted several vulnerability frameworks on natural hazards and disasters and a model for analysing causal linkages between climate change and conflicts. The empirical part provided an overview of the many *securitization moves* on international, national, and human security where the IPCC was perceived as an undeclared *securitizing actor* that put climate change on the top of several policy agendas (UNSC, UNGA, G-8, EU, World Bank, OECD et al.): He offered a brief assessment of the impact of GCC on the audience as reflected in public opinion polls. The

chapter concluded that three EU countries took the lead during their presidencies of the UNSC (UK), of G-8 and EU (Germany), and of the Human Security Network (Greece) while in the US the debate in the strategic community focused exclusively on the impacts on US national security.

Wolf Dieter Blümel (chap. 5) argued that “natural climatic fluctuations and variations were quite common during the past millennia. Humankind has definitely been influenced in its cultural development, regardless of the type of political regime.” This natural warming was further enhanced by human activities, especially during the past 150 years through the burning of fossil energy and changes in the earth's surface. He argued that climate history can help “understanding the natural system, for prognostic, modelling purposes, and even for the comprehension of social behaviour or reactions.” *Arie S. Issar* and *Mattanyah Zohar* (chap. 6) showed that these changes “were concurrent with major transformations in the history of the people” in the Near East during the past ten millennia. *Yannis Kinnas* (chap. 7) argued that climate change affects human security with a particular impact on the SIDS.

Rajeb Boulharouf and *Douglas Pattie* (chap. 8) claimed that “the relationship between environmental degradation and migration is important, complex, and yet little understood.” *Andreas Rechkemmer* (chap. 9) described the various aspects of the interaction between desertification and the people, and reviewed recent efforts at the multilateral level to identify effective mitigation measures. *Ali Ghazi* (chap. 10) argued that the Algerian government with its many technocratic programmes that often excluded the people has failed to reverse the trend towards soil degradation. He concluded that “a situation of continued degradation of the country's natural resources will only cause famine, which in turn will generate social conflicts, and consequently insecurity.”

Úrsula Oswald Spring and *Hans Günter Brauch* (chap. 11) reviewed the securitization of water since 2000 and the linkage between the sectoral water security concept and other new concepts. They reviewed the evolution of water security as a political concept and its use in scientific analyses, they discussed five dimensions of water security as an issue of environmental, social and societal as well as economic, political and military security, and four referent objects reflected in concepts of human, gender, national, and international security. Water security is also closely related to food and health security. In conclu-

sion they discussed both scientific and political tasks for achieving water security.

Wolfgang Lutz (chap. 12) assessed the “Changing Population Size and Distribution as a Security Concern” in terms of different security concepts, from the narrow national military security, to societal and environmental security. The key message is that “world population is likely to level off at around 9 billion during the second half of this century and then possibly start a declining tendency.” With population ageing and shrinking, the focus of the security attention is moving from total size to the distribution of the population, what is “largely a human security concern challenging the viability of established social security systems and creating fears about who will care for the rapidly increasing number of elderly in the societies concerned. There are also concerns that population ageing will result in lower economic growth.”

Ben Wisner and *Juha I. Uitto* (chap. 13) argued for Tokyo, Los Angeles, Manila and Mexico City that “urban social vulnerability remains a serious problem as yet insufficiently faced by municipal, metropolitan, or other higher levels of government.” They concluded that “the social basis for disaster-resilient cities is continued generalized capacity building across the whole of these heterogeneous populations. Revitalized democratic participation in the governance of cities, better education systems, employment generation, broader inclusion of women, minorities, and youth all contribute.”

Isabelle Milbert (chap. 14) concentrated her discussion of the policy dimensions of human security and vulnerability challenges “on Indian cities, which appear relatively ‘at peace’, and on the issues of urban dwellers’ security and vulnerability.” She concluded that “Indian cities and urban dwellers, even in a context of rapid economic growth, remain vulnerable to industrial, infrastructural, natural and social risks.” Due to the lack of local government activities the vulnerabilities for informal sector workers have accumulated. For several Indian cities “security in all its senses has become a key element in the fierce international competition for foreign investment and industries location.”

100.3 Securitization of Extreme Natural and Societal Outcomes

The eight chapters in part III discuss selected natural hazards and extreme societal outcomes. They focused on HIV/AIDS (chap. 16, 17), dealt with natural haz-

ards (chap. 18) and environment-induced migration (chap. 19), summarized the results of the Toronto and the Swiss schools on environmental security (chap. 20, 21), and dealt with environmental conflict resolution (chap. 22).

Ben Wisner (chap. 15) suggested a cooperation between the peace and conflict research and the hazard communities in addressing the “interactions between conflict and natural hazards.” He concluded that “war and violent conflict complicate the challenges of integrated disaster management.” Furthermore, “integrated disaster management can help to reduce the social and economic disparities ... that divides people in fragile societies and can lead to violent conflict.” He further argued that “disaster reduction work in the 21st century should not lose its ability to be inspired by such large visions, nor should practitioners lose the courage to speak truth to power in pursuit of the vision of a peaceful, just, and sustainable world.”

Nana K. Poku and *Bjorg Sandkjaer* (chap. 16) argued that “the full implications of the HIV/AIDS epidemic in Africa” are now being understood. This endemic often became “an add-on to other ‘more urgent’ demands.” They claimed that “until poverty is reduced there will be little progress with either reducing transmission of the virus or creating an enhanced capacity to cope with its socio-economic consequences.” This requires “the development of policies and programmes that address the interrelationships between poverty and development.” They stated that “the political energies required for overcoming the epidemic can be drawn from these other, longer-established social agendas. A symbiosis between longstanding demands such as education, food security or local democracy and HIV/AIDS will enable both aims to be met.”

Sophia Benz (chap. 17) illustrated “how HIV/AIDS as a health issue interacts with conflict or war experience. Recognizing the HIV/AIDS epidemic as a non-traditional threat to security highlights the importance of a widened and deepened definition of security.” She argued that “the results of the quantitative analysis indicate that countries’ prior conflict involvement significantly correlates with higher HIV-prevalence,” but also “that peace initiatives have a vital role in promoting health and indirectly contribute to stop the HIV virus from spreading.”

Janos J. Bogardi, *Jörn Birkmann*, *Niklas Gebert* and *Neysa Jacqueline Setiadi* (chap. 18) examined extreme hazard events as a major challenge and outlined new approaches how natural hazards and global environmental change can be analysed with concepts of

human security. A case study of Padang in Sumatra assessing community preparedness to tsunami showed that even communities which have not experienced any major tsunami event for decades are now getting prepared. This included knowledge and attitude (awareness), policy and guidelines, emergency planning, warning system and capacity mobilizing resources. The assessment approach also provided “insights for measuring preparedness even in regions which have not experienced a major hazard event for decades.”

Imtiaz Ahmed (chap. 19) showed for India and Bangladesh how environmental refugees “contribute to distress migration,” discussing the fate of environmental refugees as ‘stateless persons’ in Bangladesh and India, as well as India’s policy of fencing the borders to stop the flow of ‘illegal’ migrants from Bangladesh. He concluded that “for distress migration ‘security’ can no longer be defined in military terms, not even within the familiar ‘realist’ notion of national security.” He argued that ‘environmental’, ‘human’, ‘social’, and ‘gender security’ have influenced the “understanding of security not only within the national domain but also regionally and internationally.” He suggested a comprehensive security approach and “an innovation in policy-making in the age of environmental insecurity and post-nationality. Indeed, nothing short of creative and bold interventions would stop the reproduction of environmental refugees and the state of insecurity arising out of it.”

Thomas Homer-Dixon and *Tom Deligiannis* (chap. 20) provided a summary of the results of the Toronto group on environmental scarcities and civil violence. They argued how demand, supply, and distributional dimensions of human interaction with renewable resources can lead to scarcity and social effects from environmental scarcity, such as resource capture, and ecological marginalization, and highly contextual and interactive environmental scarcity-conflict linkages. Societies often overcome them through technological or social change, but many societies lack the capacity to alleviate its impacts, what can undermine a society’s ability to apply needed ingenuity. Many policy choices made today will have future consequences for the young generation. They are affected by ingenuity leading to ideas for new technologies and reformed institutions to overcome the impacts and effects of environmental scarcities. They concluded that there is no single solution, earlier interventions are better than late ones, policy responses do not have to be capital-intensive, and effective

policy interventions will not necessarily be unique or special.

Simon A. Mason, Tobias Hagmann, Christine Bichsel, Eva Ludi, and Yacob Arsano (chap. 21) analysed the linkages between sub-national and international water conflicts for The Eastern Nile Basin by both continuing and refocusing the research of the Swiss group on environment and conflicts since 1992. They introduced a “conceptual model with its *physical* water linkages between the sub-national, national, and inter-national systems of an international river basin, and its *political* conflict/cooperation linkages between the same levels.” They concluded with this hypothesis: “If water is taken out of a system (physical linkage) without compensation and without the participation of the people directly affected (economic and political linkage), conflict escalates or is transferred across the systems. Inversely, water conflicts are transformed or cooperation is transferred across systems, when water is brought into a system or is withdrawn and compensated, and this compensation happens with the participation of the people affected.”

Finally, *Saleem Ali* (chap. 22) identified the fault lines among communities that are grappling with extractive industry projects, and he discussed how an environmental analysis of the issues can inform discussions of local, national, and regional security. After a definition of ‘security’ in environmental narratives he discussed the relevance of international security for the analysis of extractive industries.

100.4 Energy Security for the 21st Century

Eleven chapters in part IV discuss conceptual aspects and concrete policy problems of energy security. *Klaus-Dietmar Jacoby* (chap. 23) reviewed the history and development of the IEA’s energy security programme since 1974 and subsequent modifications in the response mechanism enabling more flexible *coordinated emergency response measures*, the IEA’s coordinated actions during the oil supply disruptions of the 1991 Gulf War and in response to Hurricane Katrina (2005). Changes in energy markets have led to broadening the scope of the IEA’s energy security programme to the security of gas supplies and electricity.

Leo Schrattenholzer (chap. 24) combined two discussions on environmentally compatible energy supply in the framework of sustainable development in the scenario community with the security discourse in

the social sciences and the policy debate on energy security. He reviewed sustainable energy scenarios, explained specific indicators, discussed their significance and typical scenario results from the perspective of energy security, and assessed the implications of energy scenarios on international, regional, national security.

Jörg Schindler and Werner Zittel (chap. 25) argued that “world oil production is nearing its peak”, what “will have great implications on the availability of energy sources in the coming decades.” After a review of the imminent peak oil production, of future natural gas supply, and the future supply potential of coal, nuclear, and renewable energy technologies, *fuel supply scenarios* were offered for the most probable energy supply to sketch the major trends and challenges during the next decades. They concluded that the imminent peak of oil will cause an energy supply gap which cannot be filled by any other energy source. The oil peak will lead “to structural changes which will enforce changes in the lifestyle of industrialized countries.” Enhancing energy efficiency and promoting the rapid transition towards renewables is essential. Securing future energy supplies by military force will cause more problems than it solves.

Different answers to this challenge were offered in three chapters on renewable energy sources. André Faaj (chap. 26) explored “bio-energy market developments, resource potentials, and links between developing bioenergy markets, trade and socio-economic development, and how sustainable bio-energy production could be realized.” He discussed drivers, barriers, and future potentials for international bio-energy markets and identified socio-economic implications for possible exporting countries, and raised several key opportunities and issues for the developing international bio-energy markets and their possible impacts of relevance for policy-makers, market parties, international stakeholders, and other key stakeholders. He concluded that “biomass may be able to play a crucial role in enhancing diversity of energy supplies and energy security, as well as reducing greenhouse gas emissions and supporting rural development.” He also showed “that a gradual and sustainable development is necessary to develop the biomass resource base and infrastructure over time. Securing sustainability, e.g. by means of well established and credible certification schemes, is essential to avoid conflicts with food production and sustainable development.”

David Faiman (chap. 27) argued that “low-cost electricity from renewable energy could essentially decouple the security issue from that of energy.” He dis-

cussed the potential for *concentrator photovoltaic* (CPV) technology for the large-scale generation of solar electricity at low cost. He illustrated his thesis for seven of the world’s larger electricity producers (Mexico, Chile, Spain, South Africa, Saudi Arabia, India, Australia), and showed that it would be both technically and economically feasible to freeze their fossil fuel consumption at the 2012 level by a massive construction programme of CPV solar power plants. He argued that using solar to freeze the fossil requirements for electricity production and using low-cost solar electricity to generate transportation fuel would promote security. Low-loss transmission and efficient storage would enable other renewables, such as wind and wave power, to make their respective contributions to a world electricity grid, and hence to greater security by reducing the dependence on fossil fuels.

Franz Trieb, Wolfram Krewitt, and Nadine May (chap. 28) argued that “a strategy for energy and water security in the Southern European Union, the *Middle East, and North Africa* (MENA) can be based on a combination of rational use of energy, renewable energy sources, and international cooperation.” They concluded that “renewable energies can relieve Europe and the quickly growing economies of the ... MENA from increasing subsidies for their energy and water sector, and from overloading their environment and natural resources.” In the authors’ view “a strategy for energy sustainability must include three components: a) the rational use of energy, b) renewable energies, and c) a Trans-Mediterranean Partnership for Energy and Development.” They suggested that “the challenges of the 21st century must be tackled in a joint EU-MENA effort rather than lost through separatism and wishful thinking of national energy autonomy.” This requires a cooperative policy framework to implement this vision that will be beneficial for both regions.

A different perspective related to oil in the Middle East was offered by Mohammad El-Sayed Selim and Abdullah Sahar Mohammad (chap. 29) who reviewed the integration of energy security into the Arab conceptualization of security, the main substantive issues being debated, “the main energy-related threats to Arab security, the main strategies pursued by the Arab countries to achieve energy security, and the interlinkages between energy and conflicts in the Arab world.” They concluded that “the Arabs need to develop an ‘Arab energy security’ concept which should be integrated into the overall conceptualization of security. Such a concept would include elements of the use of the available energy and diversifying energy sources,

and partners, and building new strategic relations with oil customers.”

Gareth Winrow (chap. 30) analysed energy supply security within the economic and geopolitical dimension of security for the transportation of crude oil and natural gas from Central Asia through Russia and Turkey to outside markets. Due to its energy dependence on Russia, Turkey has diversified its oil and gas imports to Azerbaijan and Central Asian suppliers with new pipelines that avoid a sole reliance on the Russian system. From the Turkish perspective “major economic, political, and strategic issues are closely interlinked. Turkey has been a key player in the Great Game since the 1990’s and will remain so, given its sensitivities to developments in the neighbouring volatile Caucasus and the wider Caspian region.”

Nogoye Thiam (chap. 31) argued that *Sub-Saharan African* (SSA) countries experience an extreme lack of energy, a low level of energy consumption per inhabitant, and a dual structure which highly depends on oil imports and on biomass (60 per cent) which makes the energy system highly vulnerable. Most SSA countries lack a sustainable, affordable and environmentally sound modern energy supply, what is a key requirement for most *Millennium Development Goals* and *Poverty Reduction Strategies*. Thus, a transition towards sustainable energy sources is needed that relies on natural gas and renewables that has been constrained “by the high costs for importing equipment and the lack of information on the latest technologies used to generate electricity.” This requires a reduction of energy losses, higher energy efficiency, and new consumptive behaviour.

Rolf Linkohr (chap. 32) discussed two key questions whether a North-South energy partnership will contribute to energy security and whether we can avoid conflicts by exploiting exclusively renewable energy sources. His response to the first question is positive, “if we extend the partnership to all categories of life – environment, human rights, democracy, and good governance”, but he doubts that this can be achieved. In his view “the best approximation is probably a market-driven approach including all technologies and greenhouse gas abatement costs. The *European Neighbourhood Policy* (ENP) [may] ... develop into such a new relationship between North and South and deserves sympathy and political backing.”

100.5 Food Security for the 21st Century

This part provides three analyses on food security from Latin American, African, and Asian perspectives. *Úrsula Oswald Spring* (chap. 33) started with a critical analysis on: “Food as a new human and livelihood security challenge.” In her perspective, “food represents not only a security issue of intake of nutrients, but it forms part of a holistic understanding of life and a constituting element of any civilization.” She linked the concept of food security with food sovereignty. After an introduction of basic concepts such as food security, food sovereignty, survival strategies, self-sufficiency and livelihood, she scrutinized the contradiction that in a world with increasing production and a diverse offer of food, hunger is still a major cause of illness and death. She analysed three global models of food production: the productive paradigm of the ‘green revolution’; the new paradigm of the ‘life sciences’; and the paradigm of ‘organic agriculture’. In the concluding part she compared these three models and discussed their impacts for environmental, gender, and human security.

Mohamed Salih (chap. 34) argued that the conceptualization of security in the domain of globalized food production and food products, implies certain risks emanating from the intensification of food production through the use of new biotechnologies. By contrasting the governance of food security as food safety in developed countries with food scarcity and famine in developing countries, he argued that the former are “by necessity informed by the democratic dispensations which characterized the late 20th and early 21st century, whereby governance involves state and non-state actors as well as multilateral, corporate, private and global social movements, social justice networks, and NGOs.” In his assessment, “food governance regimes are more proactive in old democracies than new democracies and authoritarian regimes.” This implies that “reconceptualizing food security governance means giving ‘voice’ to those forces which could contribute effectively to an efficient and effective integrated governance regime duly conscious of the global-local nexus in the important sphere of human existence.”

Finally, *Selim Kapur*, *Burçak Kapur*, *Erhan Akça*, *Mustafa Aydın*, and *Hari Eswaran* (chap. 35) argued that “the security complex of energy, water, and food could be achieved, or at least enhanced, by improvement of integrated programmes for the sustainable management of land, water, and energy resources.” As an energy-scarce country with less than self-sufficiency

in food production, and an unequal distribution of water, Turkey launched the GAP project (South-eastern Anatolian Irrigation Development Project) with the aim: “to develop a strategy for a sustainable and secure production of energy and food.” They suggested a combined research programme via a *sustainable land and water management* (SLWM) strategy that called for a holistic and systems-based approach in a basin context without which the “long-term survival and short-to-mid-term development would be at risk. This eventuality would inevitably create security problems for regional as well as international levels. To deal with these, the starting point should be the development of a successful SLWM research strategy.”

100.6 Livelihood and Health Security for the 21st Century

Hans-Georg Bohle (chap. 36) reviewed the concept of sustainable livelihood security in geography and development studies against the background of the human security discourse by analysing “the academic and political context in which the livelihoods approach has emerged and became popular and asks how the concept was utilized by both researchers and practitioners and to what effect.” He focused “on the normative base and the discursive context of the concept,” and argued “that the new approach on sustainable livelihood security has emerged as an influential way of thinking on how the rural and urban poor can be identified and targeted, how pro-poor interventions can be planned, and how policy-relevant analysis on local levels can guide research on vulnerability, poverty and development.” This approach is “closely connected with the concept of human security, putting people at the centre and taking equity, human rights, capabilities and sustainability as its normative basis.”

Then, *Guénaël Rodier* and *Mary Kay Kindhauser* (chap. 37) reviewed: “Global Health Security: The WHO Response to Outbreaks Past and Future.” After a brief introduction of the evolution of the health security concept within the WHO, they discussed three health security issues for the outbreaks of anthrax, SARS, and H5N1 avian influenza, and how they have altered perceptions of the infectious disease threat. These changes were then placed in the context of concerns that had been mounting during the last decades of the previous century. Changes in concepts of national and international security were then discussed in terms of their increased ability to accommodate infectious disease threats and the operational

framework was explained that was put in place by WHO to defend global health security.

Jennifer Leaning (chap. 38) argued that future dramatic global threats will impact on human and health security that is advanced by more specific health system elements of what the medical and public health community consider as ‘health security’. She claimed that the term ‘health security’ in response to international threats of bioterrorism and pandemic disease is an enhancement of the ‘national security’ concept where the resources of the state are used to protect its citizens against external threats. But the near-term risks to human societies in the 21st century may be far more disruptive and widespread to our individual and collective well-being. In conclusion she assessed the relevance of the human security framework for these global threats, suggesting that this framework requires a most robust and creative application on a scale that could only be described as a truly comprehensive international security strategy to withstand what lies ahead and not to lose past collective achievements.

After this conceptual analysis a team of junior researchers offered four case studies on Africa and Asia. *Fred Eboko* and *Teresa Nemeckova* (chap. 39) argued that HIV/AIDS has increasingly been interpreted by international organizations as a challenge to world order, and as a threat to the national security for the most affected states in Africa, and also for Western states which perceive it as a threat to their security. They analysed its implication for the security of African states and the dynamics of the expansion of AIDS in Sub-Saharan Africa, and they showed how ‘the security’ theme was applied to this challenge. The case study on Botswana, a country with the highest HIV/AIDS prevalence, documented that AIDS is not only a threat for the poorest countries and that a sound national multi-sectoral approach to the national security threat is needed to combat the pandemic. The conclusions place the AIDS challenge into a broader global context of the security debate.

Isabel Fischer and *Mohammad Musfequs Salehin* (chap. 40) applied the concepts of human, livelihood, and health security to current debates in South and Southeast Asia, discussed the linkages of poverty, health, and human security, and presented empirical evidence based on two case studies on Vietnam and Bangladesh before they summarized the lessons learned and offered conclusions. Empirical results from Vietnam showed that the government’s efforts to reach the MDGs have improved the ‘human security’ of its people but that vulnerable groups still face poverty and health constraints. In Bangladesh the lack

of education reduces health and increases human insecurity. Spread of knowledge on basic health care and reproductive health among vulnerable groups is as important as the political will to change the cultural bias which avoids efficient prevention programmes.

100.7 Water Security for the 21st Century

This part with 18 chapters starts with a theoretical analysis, eight empirical chapters deal with water security issues in the international river basins of the Mekong, Euphrates and Tigris, Jordan and Nile, Senegal, Volta and Zambezi, four chapters examine water resource management and conflicts in Central Asia, while two review water security issues in India and Jordan, and one offers a theoretical analysis for the Middle East, one on Sub-Sahara Africa, and the last chapter offers a legal analysis of water security in armed conflicts.

J. A. [Tony] Allan (chap. 41) evaluated “the extent to which the well established international ‘virtual water’ trade will continue to mobilize the ‘soil water’ and freshwater in the global system to meet future local water needs.” He examined the contexts and driving forces (demography, water reuse, water efficiency in industry and services, poverty reduction) that have and will determine whether peoples and nations enjoy water security. He stressed “the need to conceptualize water security by accounting for all the types of water that meet the gross water requirements of societies, economies and environments.” He addressed two types of water security: “the water security of communities, economies and regions” that can be achieved by importing ‘virtual water’, and the water security at the global level. He pointed to “the importance of economic processes beyond the water sector in the achievement of a form of water security by the water scarce. This form of water security is heavily dependent of orderly international relations.”

Vandana Shiva (chap. 42) argued from an ecofeminist perspective that “water has already become blue oil - commodified, dwindling, yet overused and abused. ... The transformation of water into a commodity to be traded for profit is also leading to its overexploitation and its long distance transport. ... And as water is diverted, rerouted, mined and privatized, water conflicts and water wars are an inevitable result.” She developed her argument for river valley projects and large dams and a river linking project in India, discussed water disputes due to privatization

that “transfers water from where it flows to where there is money - cities and industrial areas.” She discussed two examples for the diversion of the Ganga waters to Delhi, and of the Banas River in Rajasthan to Ajmer and Jaipur that resulted in violent conflicts.

Bastien Affeltranger (chap. 43) analysed flood and drought hazards in the Mekong River Basin and details related to data needs for forecasting activities. He presented research results on the status of the Mekong Commission, reviewed the concept of the “value(s) of hydrological data” and discussed the recruitment of the *Chief Executive Officer* at the MRC, an environmental regime to establish a basin organization for the Lower Mekong that was created in 1995 by the Lao PDR, the kingdoms of Thailand, Cambodia, and the SR Vietnam under the auspices of the United Nations. He reviewed “the circulation and exchange patterns of environmental information as an analytical tool to understand and assess the day-to-day operation and effectiveness of an environmental regime such as the MRC.”

Mustafa Aydn and *Fulya Ereker* (chap. 44) analysed “the tension between the three riparian states: Turkey, Syria and Iraq.” They reviewed the “technical data about the available water resources, water use and demands of the riparian countries and the underlying reasons of the tension between them, as well as their conflicting arguments and initiatives for cooperation.” They argued that the dispute among the riparians “over water has a clear connection with the level of overall relationship between them.” They also showed “that ... for positive-sum results the actions of the downstream states serve a critical function, where uncompromising and unreasoned rhetoric against the upstream states leaves no room for further steps towards an agreement.” In their view “water is first of all a vital resource for human security, as well as for the socio-economic development of states. Thus, water scarcity makes it instantly a ‘national security’ issue, as in the case of Euphrates-Tigris Basin.” They concluded that “the improvement of the overall relationship and an effective cooperation between Turkey, Iraq and Syria to a level to conclude a comprehensive agreement would be the most appropriate expectation to solve the water-related disputes among the three countries.”

The section on water security issues in the Near East starts with a country study on Jordan by *Bassam Ossama Hayek* (chap. 45) that analysed its water and food situation, linked its water status to demographic change, presented water uses and future needs, summarized official plans for meeting the future water de-

mand based on comprehensive studies. He discussed the question “how Jordan will be able to adjust its economic practices to cope with this challenge, what the role of policy-makers will be, and which contributions will be needed from the international community.” Based on available data and scenarios he compared “present water uses with future water needs and the projected supply, taking current and future national plans, the role of institutions and the international community into consideration.”

Jan Selby (chap. 46), analysing the impacts of new security thinking on Israeli-Palestinian water politics, pointed to two sub-issues: “firstly, the impacts of post-Cold War reconceptualizations on the two main parties’ approaches to water issues during the course of their peace process; and secondly, the impacts of these reconceptualizations on external actors’ approaches to and involvement in these water issues.” He discussed “the impacts of new security thinking within Israeli-Palestinian relations at large,” as a necessary context “for analysing the specificities of their water relations.” He argued that “the practical influence of new security thinking on Israeli-Palestinian relations and their water politics has been at best negligible, at worst politically regressive.” He concluded that in the contested geopolitical contexts traditional security logics have predominated in Israel, Palestine, and in the USA.

Anders Jägerskog (chap. 47) argued that “in spite of fears of water-related violence and conflict, Israelis, Jordanians, and Palestinians have maintained a basic level of cooperation over their shared waters.” He analysed “prospects and potential avenues for increased coherence between different issues, in this case predominantly between conflict prevention and security issues and the sustainable use of natural resources.” He discussed “whether the actual water cooperation and coordination that takes place within the water sector ... could be further utilized as a conflict prevention and cooperation enhancement mechanism in other sectors.” He concluded “while the cooperation on water is rather strong and robust it has not been shown to promote cooperation in other political sectors.”

Two chapters deal with the Nile River Basin from the perspective of a downstream and upstream country. *Emad Adly* and *Tarek Abdallah Ahmed* (chap. 48) argued that “Egypt faces the pressing challenge of closing the gap between its limited water resources and the increasing water demand.” They reviewed Egypt’s views “on water and food security challenges from both governmental and non-governmental per-

spectives.” They analysed Egypt’s policies to reconcile traditionally opposed and diverging approaches. They argued that “collaboration and complementarity should shift from the traditional unilateral supply-driven centralized approach to a more effective participatory, demand-driven and consultative policies and action in the framework of a continued regional dialogue.” They suggested that “this complex and challenging relationship should be extended from the national to the regional level, allowing countries of the Nile Basin to share their concerns, responsibilities and visions.”

Patricia Kameri-Mbote and *Kithure Kindiki* (chap. 49) offered a legal view on “the perspectives of governments and NGOs of upstream countries regarding the consumptive utilization of the Nile River resources in the pursuit for water and food security within the basin states.” They reviewed the relationship between water scarcity and interstate armed conflict; and the status of bilateral treaties on the consumptive uses of the Nile between Egypt, Britain, and other powers before and during the colonial period. Water and food scarcity nurtured political tensions among basin states. They contended “that the current state of affairs whereby riparian states’ interests in the Nile Basin are diametrically opposed, coupled with the strong foundation in international law for the claims of upstream states, suggests that the traditional political methods of settling disputes like negotiation or conciliation are unlikely to yield results in the foreseeable future.” They concluded that “downstream states, notably Egypt, will continue to delay or complicate political dispute settlement mechanisms.” They recommended “a change in diplomacy by upstream states to one of convincing downstream states to submit the Nile question to some international judicial process.”

Two senior water specialists from South Africa, *Peter Ashton* and *Antony Turton* (chap. 50), offered a theory-guided analysis on: “Water Security in Sub-Saharan Africa: Emerging Concepts and their Implications for Effective Water Resource Management in the Southern African Region.” They argued that “in the post Cold War Sub-Saharan Africa, more and more countries are engaging with their neighbours to share their common water resources,” and that “this process is taking place through sets of negotiated water-sharing regimes that are most easily understood within the framework of a *Hydropolitical Complex*.” In their views it became “a prominent feature of the international relations of the *Southern African Development Community* (SADC) region.” They argued

that the answer to this dilemma “requires an understanding of two critical elements relating to the strategic access to water. ... The first element concerns security of supply (of water) ... the second element relates to the need for each state to choose an appropriate strategy ... that will achieve and sustain a high level of security of supply.” They explored “the relevance of the Southern African Hydropolitical Complex, both as an analytical concept and as a possible mechanism for building and sustaining inter-state cooperation, and thereby avoiding possible conflicts over water.” They concluded “that, in terms of water security in sub-Saharan Africa, the future trajectory of the various states in the Southern African Hydropolitical Complex will most likely be based on mutual cooperation, where the management of transboundary water resources will become a driver of regional integration in its own right.”

Martin Kipping (chap. 51) distinguished among three schools on ‘water security’, the Neo-Malthusian, the Cornucopian, and the political approach. He refined “the debate on water conflicts and water cooperation by investigating a case that constitutes a puzzle for the Neo-Malthusian discourse: the Senegal River in West Africa,” by identifying “causal mechanisms that will help generating better hypotheses for future comparative analyses and large-N studies.” He concluded that “growing water scarcity was a necessary condition for the intensification of international cooperation on the Senegal River,” but also “that the dam-induced increase in water availability was at least a reinforcing factor, if not surely a necessary condition” for conflict.

In a case study on the water regime formation in West Africa since 1990, *Maëlis Borghese* (chap. 52) addressed the question: “What realities, actors and mechanisms do encourage states to cooperate on international basins?” Based on regime theory she explored “the drivers for international cooperation... [and] the ongoing negotiation process in the Volta River Basin.” She argued that the “formation of local water institutions ... have convinced governments of the advantages of cooperation”, what supported “the *cognitivist* with *neo-liberal* views of cooperation theories.” While “the role of ideas and knowledge is essential to comprehend the realities of the formation of environmental cooperation in developing countries, ... their impact depends on their linkage with funding enabling them to effectively spread and shape states’ preferences.”

Stefan Lindemann (chap. 53) distinguished two approaches for resolving water-related conflicts in in-

ternational river basins through: general principles of international water law, and ‘horizontal’ initiatives for international river management between two or more riparian states. He developed the theoretical and methodological framework for a systematic and theoretically guided comparison and methodological considerations he applied to four case studies on the effectiveness of water regimes in South Eastern Africa where he identified the political determinants of water regime formation and effectiveness.

Four chapters deal with water problems in Central Asia. *Martin Kipping* (chap. 54) discussed the question: “Can ‘Integrated Water Resources Management’ Silence Malthusian Concerns? – The Case of Central Asia.” He explored how separate spheres of *International Relations* (IR) and problem-solving contributions in the natural sciences “can link up productively to ease solving international water problems.” He showed how most problems “could effectively be handled by adopting IWRM principles for water management, ... could largely reduce overall pressure on water resources; and decentralized management structures would mitigate local water conflicts.” He stated that “The Malthus-inspired, social science discourse on resource conflicts is able to adequately describe Central Asia’s main water conflicts: the international upstream-downstream conflict over relative water distribution, the international upstream-downstream conflicts over absolute water distribution as well as the diverse local scarcity conflicts.” He argued that “the prescriptive concept of IWRM is complementary to the social science analyses” suggesting “promising ways for managing the conflicts in question: Basin-wide integrated management and resulting intersectoral reallocation of water resources would create win-win solutions to the relative distribution conflict.”

Eva Patricia Rakel (chap. 55) identified the main environmental risks in Central Asia for potential or existing conflicts. She addressed social, political, and economic developments in *Central Eurasia* (CE) and national, regional, and transnational policy measures to counter these risks. She reviewed the prospects for joint environmental management in the CE countries, with a special focus on the Aral Sea and Caspian Sea as two main ecological systems at risk. She concluded that: “the CE region is confronted with many environmental problems with decisive implications for the region’s future. It is unlikely that environmental problems could lead directly to violent confrontations within and between the CE states. Environmentally-related conflicts in CE are related to other factors such as ethnicity, political instability, and declining and/or

diverging economic and living standards.” She claimed that “environmental issues in CE could act as major catalysts in intensifying already existing divisions, as well as having serious ecological, developmental, and health implications.”

Julia Wunderer (chap. 56) noted that while “the Central Asian states have signed numerous agreements concerning water issues at both the bilateral and regional levels” and established several water management institutions, their effectiveness remained limited. She discussed the question about “the conflict regulating effects of the regional water regime in Central Asia to resolve the environmental, economic and socio-political water-related problems,” and on the obstacles to regime implementation. She identified the “dimensions of conflicts over water in a politically instable environment and their correlations to the assumptions of the conflict-centred regime theory”, developed “a framework of conflict dimensions ... to analyse the multidimensional factors” relying on regime theory with which she analysed “the Central Asian water regime ... with a focus on transboundary river systems” and evaluated “the status of its implementation and success.” In the conclusions she confirmed “the assumption of the conflict proneness of the Central Asian societies ..., explaining the interdependencies between the environmental, economic, and political conflict dimensions.” In her assessment, “regime success is already limited by their failure to reach fundamental changes of behaviour, so that water-related security risks in Central Asia continue to exist.”

In an empirical study, *Christopher Martius, Jochen Froebrich* and *Ernst-August Nuppenau* (chap. 57) argued that “the Amu Darya River Basin in Central Asia is one of these crisis regions where management of water resources is unsustainable and uneconomic, bearing great potential for social conflicts.” Four factors drive the environmental and economic development in the irrigated lands of Central Asia: demography, climate change, increased water demand, and land degradation. They described the region and its specific problems, and then outlined a scenario of how to achieve IWRM in the specific situation of the ADL. They concluded that while “the declared Uzbek development policy of gradual change does not make this country a member of the so-called ‘fast-track countries’ among the CA states ..., security should centre on people – not on states, and ... for security and humanitarian reasons, the international community should not write off countries like Uzbekistan.” They suggested a pragmatic and stepwise “implemen-

tation of key activities and technologies ... to produce visible results that help to provide the ground for reaching acceptance for more advanced, institutional changes which must be considered as a prerequisite for implementing IWRM.”

Last but not least, *Mara Tignino* (chap. 58) pointed to water as a source of conflict and as a catalyst for cooperation. She focused “on the consequences of armed conflicts on water and water installations,” by dealing “with the legal framework provided by *ius in bello* or International Humanitarian Law (IHL) regarding water.” She argued that “the regime on water security built up by the IHL does not address water security as an autonomous issue. The IHL deals with water through its objectives, namely the protection of the victims of war and the regulation of the conduct of hostilities. Thus, water is dealt with as a basic need of people, as a weapon or as an objective of military activities.” She outlined some of the main rules provided by the IHL dealing with water and suggested the need for a comprehensive protection of water security in times of armed conflict.

100.8 Environmental Security Concepts and Debates

Fifteen chapters offer an overview of the environmental security discourse and on environmental security debates in North America, Russia, Belarus and Ukraine, in India and in the Far East, in the Arab World, on Israel and Palestine, on Uganda, Rwanda, Ethiopia and Burundi and in Sub-Sahara Africa, on Amazonia, the Caucasus region, on the Asia Pacific, as well as on the Arctic and Antarctic region.

Simon Dalby, Hans Günter Brauch, and Úrsula Oswald Spring (chap. 59) assessed the first three phases of research on environmental security, discussing their main achievements and the lessons learned and yet to be learned on the contexts of insecurity and the pillars of human security. They reviewed the major critiques of the environmental security debate and of the policy activities since 1990, translating research into action. In conclusion, they argued that “while the first phase of environmental security research focused on concepts and on their legitimization and critique, the second phase has been theory-oriented and empirically-based with a strong emphasis on case studies. In the third phase a plurality of methods have been applied: from qualitative case studies, to syndromes of global change and scientific approaches to mitigate them, to quantitative analyses

of state failures, and quantitative analyses of the causes of violent conflicts, to assessments of cooperative efforts in trans-boundary fresh water dispute resolution, to simulations of the interdependence between water availability and food crises.” In these three phases they noted “a lack of research on hazards and disasters, gender sensitivity, social vulnerability, bottom-up resilience as well as peace-building.”

Richard Matthew and *Bryan McDonald* (chap. 60) argued that the “sceptical, obstructionist mindset of the Reagan and Bush presidencies was swept away by the science-based environmentalism of Clinton and Gore.” The Clinton administration argued that “the environment ... could be saved without sacrificing human development, and the United States would lead this effort through the example of its own behaviour and through the authority attached to being the world’s only remaining superpower.” Within the “North American security community ... the process of rethinking security soon became intertwined with the process of environmental rescue.” While some believed “that in our degraded global environment, natural resource scarcity was rapidly becoming a significant contributor to violent conflict. Others looked at the sheer size of the world’s militaries, and their ugly Cold War footprints, and concluded it was time for these powerful entities to be greened and harnessed to an environmental agenda. Still others sought to integrate environmental issues into the larger project of complementing the concept of national security with the concept of human security.”

Alexander Sergunin (chap. 61) noted that “ecological security was nearly a taboo in the Soviet era.” He argued that “environmental issues reached the national agenda when Gorbachev (1987, 1988) introduced the idea of ecological security in his book on *perestroika*.” But on the practical level the debate mostly focused on “the implications of the Chernobyl catastrophe (1986).” He stated that “the broader debate on numerous environmental problems was at an embryonic phase, public attention was preoccupied with the political cataclysms of the early 1990’s. Only in the 1990’s the environmental security debate emerged.” He explored “how environmental problems have affected the CIS security discourse, including threat perceptions and national security doctrines and it examines how different national schools (Russian, Belorussian and Ukrainian) identify their approaches to the solution of the ecological problems.”

P.S. Ramakrishnan (chap. 62) started “with a discussion on our present state of understanding of ‘knowledge systems’, ... two case studies are used as il-

lustrative examples of the role of knowledge systems for linking ecological conservation with sustainable livelihood/development of traditional mountain societies – one from the north-eastern hill region of India ..., and another from the Garhwal and Kumaon region of the Central Himalayan mountain region.” In this review he concluded “with a brief discussion on such an approach to empower these marginalized sections of mountain societies by providing them with a better quality of life, as part of a short-term developmental strategy. This approach is critical for ‘environmental security’ linked with ‘human security’.”

Miranda Schreurs (chap. 63) focused on China, Japan, the Korean Peninsula, Mongolia, and the Russian Far East. She argued that due to the low status of environmental protection in this region until 1990, “‘environmental security’ as a concept is relatively new to both the scholarly and political debate. ... Rapid industrialization, however, has resulted in such serious pollution and natural resource degradation that governments are being forced to pay more attention.” She noted a “growing awareness among policy-makers that the region’s environmental degradation is causing human health problems, worsening the quality of life, threatening long-term economic growth potential, contributing to political instability, and in some cases contributing to regional frictions and even deadly conflict.” This shift has led “to changes in environmental laws and programmes” and to a “greater discussion of environmental degradation as a threat to national well-being.” She considered the specific “environmental challenges confronting Northeast Asia and the ways these have been linked to environmental security debates.” She briefly reviewed “the growing environmental awareness and its implications for the environmental security debates”, and discussed “the role of NGOs and environmental scientific communities and the implications for environmental security debates.” She addressed “the international dimensions of Northeast Asia’s environmental security problems as well as the regional cooperation for environmental security, linking environmental and human security concerns to official development assistance, assessing the regionalization of environmental protection and drawing general conclusions.”

Mohamad El-Sayed Selim (chap. 64) distinguished between two traditions of environmental security where the first referred to “that area where environmental concerns and security strategies interact,” and the second viewed “environmental security as ‘securing the environment’, which means taking a series of steps to ensure that the ecosystem will be preserved.”

In the Arab world environmental awareness began in the early 1980's, and since the early 1990's environmental issues have been linked with security. He reviewed Arab "approaches of environmental security by assessing the extent to which this concept has been integrated into Arab discourses on environment and security." He argued that environmental questions related to water "are highly politicized and closely linked to security issues," and that during the Middle Eastern multilateral negotiations a special working group dealt with the environment.

David Newman (chap. 65) focused on the "relationship between the military and environmental dimensions of the security discourse in Israel and Palestine" that lagged behind the environmental discourse in the industrialized world. He argued that "the reconceptualization of the security debate" has not impacted on Israel and Palestine. "For Israelis, security means safety from suicide bombers (for the individual) and from an existential threat to the State as a whole (for the collective), while for Palestinians, security is safety from Israeli soldiers and roadblocks (for the individual) and from the ongoing process of Occupation (for the collective). The fact that the environment in this region is undergoing a constant process of degradation is, at the most, of concern to aware citizens but is not defined in terms of security. For both Israelis and Palestinians, 'security' still belongs to another realm of discourse." He addressed "the notion of environmental security in Israel/Palestine from two, interlinked, perspectives," by dealing *firstly* with the "environmental and ecological threat faced by societies who do not undertake actions aimed at preserving and replenishing scarce resources within the context of a growing population and a semi-arid and arid environment," and *secondly* by examining "the way in which the existence of the political and military conflict impacts, both directly and indirectly, on environmental management." He concluded "with a brief discussion of the implications of conflict resolution and a peace agreement on the environment. While peace is obviously a positive development, the hasty implementation of development projects 'in the name of peace' without due recourse to the necessary environmental checks and balances, could result in substantial and irreversible damage to the environment."

Robin Twite (chap. 66) argued that "the long conflict between Israelis and Palestinians is fuelled by ... the memory of past violence, disputes over land, opposing historical narratives, religious dogmatism, demographic fears about the increasing number of the

'other' ... At the heart of the conflict is the struggle over land, which in its turn relates to security since each community wishes to ensure its safety by ensuring that it controls a viable geographic area and has access to natural assets such as water. On each side are those who believe that only by controlling as much land as possible can their future be secure." He stated that "extremists on both sides have made use of the environmental argument to persuade the wider public that they must avoid compromise and that their security ... is threatened by making concessions. Mutual suspicion is at the heart of these arguments and conflicting claims are purposely fuelled by statements in the media which serve to promote fear and hostility." He concluded that "environmental security is a necessity for Israel, Palestine, and the neighbouring countries," and that "obtaining environmental security implies trust. ... What is needed now is an equally clear concept as to what needs to be done in order to secure security and trust for the peoples of the region."

From a Palestinian perspective, *Mohammed S. Dajani Daoudi* (chap. 67) argued that environment and security issues were not yet seriously addressed. While the Palestine National Authority claimed that "environmental problems are primarily 'due to violent Israeli occupation practices on the ground, including the confiscation of land, illegal settlement activities, the uprooting of trees, the destruction of Palestinian agricultural land," in his view, "the PNA also bears a heavy responsibility for the poor environmental conditions in the Palestinian Territories." He concluded that "occupation, policies of closure and curfews, lack of awareness on the Palestinian side, and many other factors all have had significant negative environmental impacts. In the current phase of the conflict, the absence of even minimal cooperation is worsening the situation on a daily basis, with impacts not only on the environment but also on human health. Hence, both parties should pursue parallel attempts to address environmental protection along with reaching a peaceful resolution to the conflict."

Then, two authors from Africa reviewed international and national environmental security issues in Eastern Africa. *Mersie Ejigu* (chap. 68) analysing problems of environmental scarcity, insecurity, and conflict for Uganda, Rwanda, Ethiopia, and Burundi, pointed to the increase in intra-state conflicts in Africa since the end of the colonial period that are driven by "ideology, access to resources, deprivation, ethnicity, religion, greed, political power, etc" where "many of these conflicts are related to the use and

management of natural resources, in particular land.” He argued that “environmental insecurity arises not from the loss of extreme scarcity of environmental resources but more from the perceived and actual threat ... arising from that scarcity.” Among the many factors contributing to environmental insecurity and armed conflict: governance, socio-economic situation, culture, level of technology, and property rights, he considered governance as “the most vital factor because government policies and institutions heavily influence the behaviour of resource users and determines how, when, and why a natural resource is used.” He concluded based on several case studies that “environmental insecurity plays a significant role in causing, triggering, and aggravating armed conflicts”, and that “the probability of conflict increases, where environmental insecurity induces population mobility particularly towards heterogeneous communities (e.g. ethnic, culture, etc.); and where these migrants tend to dominate economic and political spheres, the recipient communities become aggravated and propensity to conflict mounts. Conflicts are almost certain where a weak state fails to deliver law and order, provide transparent and accountable administration, implement unbiased and fair policy, and institute effective mechanisms to address and resolve grievances and disputes.”

Sam Moyo (chap. 69) defined environmental security as related to “two central concepts: repairing damage to the environment for human life support and for the moral value of the environment itself; and preventing damage to the environment from attacks and other forms of human abuse.” He argued that “environmental insecurity generally occurs as a cumulative result of high population growth, decline in quantity and quality of renewable resources and the lack or unequal access to these resources.” He referred “to the capacity of individuals and groups to meet their basic needs from a sustainable environment,” involving “serious consequences for social, economic, political and physical security.” He suggested a widened security concept including “non-military threats, such as human rights abuses, outbreaks of diseases, resource scarcity and environmental degradation.” He also conceived “Environmental security [as] an integral part of human security.” He concluded that “without greater measures to insure environmental security, continued population and economic growth will diminish natural life support systems leading to migration and conflict. With half the world clustering into urban environments, natural disasters and global environmental change affect greater num-

bers of people who are dependent on civil systems for water, power, transportation, food, and other manufactured systems.” In his view, “the environment is now considered in terms of human security and viewed much more urgent and important a future challenge than conventional and nuclear war.”

Turning from Africa to Latin America, *Alexander Lopez* (chap. 70) analysed “the dynamic link between environmental factors and security and social conflicts as a result of continuous interactions between systemic (Amazon) and supra-systemic factor”, that “explain why environmental matters have been politicized and to a certain extent militarized.” He tried to explain “why social conflicts are mainly a product of two systemic constraints of a misallocation of resources and of skewed land distribution.” He stressed that in “most cases environmental change is no direct source of social conflicts, but an important aggravating factor through its side-effect,” arguing that “in the Brazilian Amazon in most situations environmental scarcity is no key factor for social conflicts, rather in the northern state of Roraima abundance is crucial.” He concluded that “the contribution of environmental change to social conflicts in the Brazilian Amazon may be understood as indirect and/or interactive This means that social conflicts are understood partially as the outcome of the social and environmental side effects of environmental change.” This implies “that deforestation, pollution from mining activities, and flooding in connection with other sources will produce social conflicts and/or contribute to social conflicts by introducing more entropy to a system that is already in turbulence. ... As a trigger environmental change basically releases accumulated non-environmental social pressures, and as an aggravating factor environmental change adds to other factors producing conflicts.”

Vicken Cheterian (chap. 71) argued that “the past two decades of environmental politics was part of a nationalizing project in the Caucasus.” He reviewed “the conditions for the emergence of environmentalist movements in the Soviet Union, and why they lost the leadership of independent politics to nationalist forces.” He argued “that environmental politics continues to remain expressions of national projects, and as such unsuitable neither for addressing regional environmental concerns, nor for solving complex security problems.” He looked “at newly emerging environmental movements that carry the potential of separating environmental politics from nationalizing projects, and create the necessary conditions for environmental cooperation on the regional level.” He

concluded that “the rise and fall of environmentalist movements in the Caucasus and other post-Soviet republics should make international organizations highly cautious about rapid transplantation of value-charged projects.”

Jon Barnett (chap. 72) offered a brief background to the Asia-Pacific region he reviewed several major regional environmental security issues and discussed two key case studies of environmental insecurity for Kiribati, the Marshall Islands, Tokelau and Tuvalu, and China. He argued that these cases “provide a useful contrast and reveal much about the diverse nature of environmental insecurity in the region,” and he claimed “that environmental insecurity in the region is caused by economic rather than demographic changes.” He stated that due to the different socio-ecological contexts, the environmental security issues differ widely throughout the region. He claimed that “environmental insecurity in the region is caused by economic rather than demographic changes; ... that lead to ... greenhouse gas emissions, overuse and pollution of water, deforestation, and air pollution.” This calls for “constraining the externalities of economic development, through ... improved land use planning at national and local levels, reducing the rate of greenhouse gas emissions through the use of sustainable energy technologies, adoption of cleaner production technologies, adoption of sustainable harvest targets, and reducing consumption in developed countries. Failure to address environmental problems through these and other methods may, and in some cases is already causing widespread and significant impacts on people’s livelihoods.”

Gunhild Hoegensen (chap. 73) discussed “the nature of environmental security, and its relevance in two regions that are relatively peaceful and pristine – the Arctic and Antarctic.” She argued “that the concept is relevant but context dependent”, and that “the security of the Arctic and Antarctic are deeply connected to the environment, both with regard to the impacts of humans on the environment, but also the subsequent impacts of the environment upon humans.” She stressed that “the environmental linkages between the polar climates and the rest of the planet are extremely complex and non-linear, and the Arctic and Antarctic influence climate over a large part of the globe.” In both regions the ‘categories’ to identify security are “very fluid, and closely linked to each other. Economic security cannot be completely isolated, for example, from environmental security or political security.” She focussed on “the impacts of climate change and how this phenomenon has and

continues to impact the many security dynamics of the Arctic and Antarctic.”

100.9 Human and Gender Security Concepts and Debate

With 23 chapters this part offers an overview of the debates on human security in the social sciences and in international organizations (chap. 74–77), it reviews human security discourses in the Arab world, in Southeast Asia, in Sub-Saharan Africa, in Central and South America (chap. 78–82) and analyses human security as ‘freedom from fear’, ‘freedom from want’ and as ‘freedom to live in dignity’ and as ‘freedom from hazard impacts’ (chap. 83–88). This is followed by a controversial discussion on human and gender security approaches (chap. 89–93) and it concludes with three case studies on Afghanistan, Guyana, and on a human security based early warning and response system (chap. 94–96).

Introducing into the scientific and political debate on human security, in chapter 74, *Hans Günter Brauch* surveyed the evolution of the human security concept in the social sciences and in international organizations. This is followed by a brief analysis by *Claudia Fuentes Julio* and *Hans Günter Brauch* (chap. 75) on the *Human Security Network* (HSN) where they analysed the objectives of the HSN and explored the reasons why its member countries have advocated these objectives at the international level. They examined the specific agenda items of the HSN and its mechanisms for coordination. They concluded that its “effectiveness is the result of three key advantages: *First*, it has developed a recognized capacity in *international agenda-setting*. ... *Second*, it has emphasized the *broad and multidimensional* nature of both the concept of human security as well as of the Network itself. ... *Third*, it has become a platform on which countries can lobby collectively for issues of common concern, thereby contributing to the *international policy-making process*.”

The next two chapters offered conceptual discussions from a South Asian and European perspective. *A.K.M. Abdus Sabur* (chap. 76) claimed that in the realist tradition national security “was achieved at the expense of the security of the individual or people in terms of their political, social, and economic rights and choices. Thus ... the state ... has served as a threat to their security.” He argued that “the end of the Cold War and the accompanying structural changes of monumental proportion introduced a revolutionary

change in security thinking,” what “has dramatically decreased the traditional security threats to the states that came out victorious in the Cold War. On the other hand, the world was confronted with a series of intra-state violent conflicts of various origins, large-scale atrocities, and even genocide.” He developed a general framework for a theoretical perspective on human security he applied to South Asia.

Sascha Werthes and *Tobias Debiel* (chap. 77) shifted the reference object from the state to the individual, and integrated elements of foreign and development policy. They argued that “the perforation of state sovereignty – resulting from the multifaceted globalization processes and the incapability of states to respond to growing non-military security threats – produced a pressure for practical solutions and strategic responses.” They briefly sketched “the horizontal and vertical extension of the security agenda”, which furthered the emergence of the human security concept. They showed “that human security not only is of political attractiveness but also has practical advantages and can be substantiated for academic purposes.” They concluded that “as a political and normative leitmotif ‘human security’ helps to clarify how to conduct, justify and sometimes legitimize policy decisions. It may also inspire decisions on policies and policy instruments. It helps to focus the (international) political agenda on the most vulnerable or most threatened individuals, too often forgotten in other security approaches. Finally it can also be substantiated for academic purposes.”

This is followed by five chapters that review the human security debate in the South. *Béchir Chourou* (chap. 78) argued that “the concept of ‘human security’ is not a common subject of research or discussion in the Middle East or in North Africa. ... In the Maghreb the topic remains largely unknown, ignored or avoided,” because the literature on human security includes components that are not open to free public discussion. By referring to the main threats to human security in the Maghreb and identifying the most serious challenges, he attempted “to show that two forms of direct violence (practices of autocratic regimes and inter-state conflicts) and a number of indirect violence (demographic growth, food insecurity, lack of education particularly among women, exposure to environmental hazards) represent major threats to human security in the Maghreb.”

Zarina Othman (chap. 79) reviewed “the dynamics, patterns, approaches and debates on the various human security concepts” and analysed “how members of the *Association of Southeast Asian Nations*

(ASEAN) have responded to this approach.” She argued that “its members believe that human security is associated more with economic development as a precondition for political stability; while human rights issues have been considered as domestic problems that are best left to the individual states to deal with, and thus should not be discussed at the regional level.” She discussed first “the Southeast Asian concept of ‘comprehensive security’, a traditional approach that has been adopted by ASEAN states for designing their respective national security policies”; then she explored “the human security approach, how it has evolved and some specific issues and policies”; and finally she suggested “what needs to be done to promote and strengthen this concept in Southeast Asia.” She concluded that “the main challenge to human security in the region remains the perceived threat to national ‘sovereignty’ and to the regime in power.” But this state security “does not necessarily guarantee the peoples’ survival.” Due to increasing interdependence Southeast Asian states adopted a comprehensive concept of security which acknowledges non-military issues as threats to national security.

Nana Poku and *Bjorg Sandkjaer* (chap. 80) pursued a twofold aim: “to explore security from a human perspective and to illustrate this perspective [with] material from sub-Saharan Africa,” based “on the premise that for many ordinary Africans the chief security concern is often their own government, either through its pervasive power and oppressive policies, or as a result of its incapacity to sustain the infrastructure of life.” They argued that “the resulting social decay presents a dramatic picture of insecurity of ordinary people in circumstances where states ... are either unable to provide protection or are themselves the principal sources of violence.” Their key focus was “how to adequately understand and address the security concerns of a people in these circumstances.” In the first two parts they explored “what is meant by human security,” by charting its origins and outlining its significance for the study of contemporary African societies and analysing “the African state and the complexities it poses for the provision of security on the continent.” In the third and fourth part they surveyed “the extent of Africa’s human security challenges by examining the continent’s economic performance as well as development prospects.” They then examined “Africa’s progress towards the *Millennium Development Goals* (MDGs)” arguing that “the goals might not be achieved by 2015.” They suggested that “the human security framework should be conceived as emancipatory; encompassing and empower-

ing the hopes and aspirations of a group of people – individuals, civil society, development practitioners, NGOs, CBOs, donor organizations – for a better continent.” In their view “the concept is intended to evoke discussions as explicit as possible, organized as emotively as possible, while making empirical observations as compelling and practical as possible.”

Philippe De Lombaerde and *Matthew Norton* (chap. 81) assessed *human security* (HS) threats and challenges in *Central America* (CA). They evaluated “clusters of HS challenges in three major HS pillars and connect[ed] them to the emerging regional human security discourse.” The first included “social and political issues, and particularly the challenges posed by high levels of social violence, and faltering democratic consolidation processes.” The second was “related to issues of economic development and the integration of CA in the regional and global economy”, and the third dealt “with regional impacts of natural hazards and disasters.” They placed these three human security threats and challenges “in the light of regional strategies to enhance and achieve the human security agenda.” They concluded that the HS concept is well suited for the analysis of these security challenges “although its use in Central American academia and politics is only slowly gaining importance.” They argued that “from a broader and person-centred definition of HS, ... serious threats to HS, both from internal and external origins, exist and require policy responses. They are related to organized crime, poverty, low educational levels, distorting migratory flows, environmental risks, and the adjustment costs of economic liberalization.” They showed “that traditional and non-traditional HS threats are highly interlocked in CA and that due to the structural characteristics of the region (small scales, high degrees of openness, dependence vis-à-vis US, etc.), effective policy responses require (deeper) regional cooperation and integration driven by institutional and political processes with (higher) degrees of democratic participation.”

Francisco Rojas Aravena (chap. 82) argued that several structural and international factors have contributed to a reconceptualization of security: “1. end of bipolar conflict; 2. new power relationships; 3. impact of globalization ... and interdependence; 4. changes in the dimensions of time and space; 5. loss of state capabilities; 6. increase in intra-national conflicts; 7. new international actors; 8. new threats to security; and 9. development gaps.” He argued that “Latin American governments have gradually assimilated the new human security concept.” In South

America, “Chile made this concept part of its foreign policy strategy” and “Ecuador included it in its defence policy definition.” He examined “the relationship between human security and development ... and human security and its links with state security and international security.” He concluded that “South American nations face the challenge of improving policies and actions in the double triad of human security. Achieving human development is crucial. Without resolving inequity and poverty issues, the main goal in human security will be impossible to obtain. ... In addition, for South American countries conceptual development is a key tool for the consolidation of democratic regimes and to overcome the unjust situation for its people.”

David Black and *Larry Swatuk* (chap. 83) mapped “the intellectual and practical terrain of human security in North America” by comparing Canadian and US perspectives. They argued that “the Canadian turn toward ‘human security’ constitutes a logical extension of Canada’s post-World War II ‘middle power’ status and self-proclaimed ‘helpful fixer’ role in global politics. In contrast to American unilateralism, the ‘helpful fixer’ approach is based on multilateralism and consensus seeking.” They briefly examined “current debates about human security in the North American and European settings in an indicative rather than exhaustive manner,” they described “official Canadian human security policy and practice”, and they highlighted “debates among Canadian academics surrounding this approach.” They “would like to see the North American debates regarding human security engage more directly with the critiques made by critical scholars on the left. This would mean, in part, reinvigorating discussions regarding the ways in which ‘fear’ and ‘want’ are interrelated, including exploring possible causal pathways.”

Human security as ‘freedom from want’ on the human development agenda was covered by *Hideaki Shinoda* (chap. 84) who examined “the use of the concept ‘human security’ by the government of Japan and its implications”, arguing “that this concept has been favourably accepted by the Japanese government as a policy theme and it interprets how the government refers to it. While there are historical and political contexts in which Japan is naturally attracted by concepts like human security, it would be premature to assert that Japanese foreign policy as a whole is guided by this human security concept.” He claimed that “most Japanese scholars on international relations initially found the concept of human security too ambiguous. Experts on ‘traditional security’ sel-

dom speak of human security.” He analysed “where human security concerns are reflected in Japanese foreign policy, and where Japan is advancing human security as a rationale for its development policy and humanitarian aid.” He concluded that “Japan is trying to adapt itself to a world under new security conditions, while keeping its traditional ‘soft’ image”, arguing that the human security approach “does not harm the traditional orientations of Japanese foreign policy. ... Human security is expected to contribute to an advancement of the goals of Japanese foreign policy.”

Max Schott (chap. 85) presented a case study on what the people and members of the Human Security Cell in the *Ministry of Foreign Affairs and International Cooperation* in Mali consider as their key human security concerns. In the first part, he analysed “both discourses on human security ... by looking at some common rhetorical categories used to defend or criticize the human security concept.” He then discussed “the implications of the human security agenda at the policy level in Mali as Chair of the HSN and investigated its autonomy in formulating policy priorities.” Finally, he evaluated “the perceptions of human security on the ground through consultations carried out with the local populations at the rural, pre-urban and urban levels in Mali.” He proposed to link the “discourses and discussions on human security with a ‘bottom-up’ view of a local reality, with concrete inputs from its referent object, the individual.” He stressed that it might be possible ... to identify common characteristics and challenges to human security through comparative analysis of local/regional human security definitions. This would, in time, allow the development of a global human security concept, and eventually better and more efficient policy implementation.”

The third pillar of human security as ‘freedom to live in dignity’ through different human rights treaties was introduced by Dieter Senghaas (chap. 86) who discussed the “emergence of the concept of human rights and human security,” and the role of “human rights as the result of a cultural revolution.” He concluded that in the “worldwide cultural conflict scenario, of which the human rights discourse is currently a core element, ... its real setting is individual societies with their specific cultural cleavages.” He argued that due to the ‘clash within civilizations’ “the international dialogue is becoming easier, because the encounter is no longer between internally harmonious, rather monolithic or homogenous cultures, but between cultures that have come into conflict with themselves.” But it is uncertain “whether the idea of

human rights ... will be translated into political orders congenial to human rights.” In his view “the decisive factor will be the political power-constellations within development processes, which will either succeed or fail.” As human rights issues and the concern for human security overlap and will not counteract each other, he assumed “that with respect to both intellectual and political activities there will be a kind of mutually reinforcing feedback.”

The fourth pillar of human security as ‘freedom from hazard impacts’ is conceptually introduced by Fabien Nathan (chap. 87). He analysed the linkage between vulnerability and human security and offered a typology of the concepts of natural risks and disasters, of the sources of vulnerabilities and affected areas, and discussed the inclusion of hazard threats into human security. He concluded that “natural disasters constitute a very important threat for millions of people, usually poorly taken into account in security studies, even though their acuteness is constantly growing”, and that “traditional security thinking is unable to comply with the ‘requisites of an integral conception of security’ that recognizes the threats and analyses all their dimensions.” He suggested that the human security concept “could be used as a strategic means to elaborate an integral conception of security.”

Surichai Wun’Gaeo (chap. 88) addressed the question: “How do environmental resources become a key factor of human security for social groups?” He developed two hypotheses: “first, the state is both a determining and an intervening factor; and second, the affected communities are not passive actors, but are rather active partners in sustainable livelihood recovery.” For the Indian Ocean tsunami he examined “environmental resources as an element of human security by placing the ASEAN region and Thailand into a geographical context.” He outlined “a framework for human security from an environmental perspective focusing specifically on how natural disasters can threaten security and create situations of extreme vulnerability.” Based on a field study he discussed “the coping strategies in facing such extreme circumstances of vulnerability and human insecurity.” He discussed “hazard impacts and social vulnerability interpreting the event by focusing on hazards posing threats to human security in Thailand.” He concluded that “human security remains problematic in South-east Asia today. Poverty and environmental threats continue to stand as obstacles to human development. The increasing frequency of environmental threats confronting the region only serves to under-

score the notion that environmental security is a crucial element for the attainment of human security.” But this would require “the utilization of resources in a sustainable way that will maximize the potential to preserve natural resources for the protection of human security.”

The next five chapters by women from Mexico, Vietnam/Netherlands, the Philippines and Sri Lanka offer different approaches to human and gender security. *Serena Eréndira Serrano Oswald* (chap. 89) scrutinized the possibility of ‘securitizing gender’ in security studies. She suggested a paradigmatic shift for approaching security by discussing the process of identity formation. She argued “that the problem is not to ‘securitize’ gender” and she proposed “to extrapolate the lessons learnt from the developments in the feminist agenda ... in order to ‘engender’ the concept of security itself so as to make it viable for an equitable and more secure world.” This approach is framed in a discussion on social identity, the formation of representations, and societal change. She linked the concept of ‘security’ to the systemic critique of the exclusionary – dualistic western tradition. In her view “the process of engendering democracy and security, means developing gender sensitive representations in both men and women. Regarding the possibility of ‘securitizing gender’, it may be more urgent and desirable to commence ‘engendering security’ vis-à-vis the impossibility of securitizing gender.”

Úrsula Oswald Spring (chap. 90) focused “on the development and limits of the gender security concept that are imposed on gender epistemology by the prevailing patriarchal mindset in science.” She reviewed four main schools of thought: “epistemological feminism, feminist empiricism, postmodernism, and standpoint feminism.” She explored the process of identity and social representations, discussed post-modern feminism and linked it to the gift economy, ecofeminism and social movements. She combined human, environmental, and gender security for a peaceful and nonviolent livelihood with threats posed by environmental degradation and social marginalization. She argued that more cooperation reduces violence and that this could overcome hard security approaches, and that the military and police could be reassigned to civil protection and disaster management. Furthermore, she discussed gender links with human and environmental security to foster an economy of solidarity and a democratic, ‘glocal’ and participative model of governance that guarantees equity, peace with quality of life, and prospects for a future for the most vulnerable people.

ThanhDam Truong (chap. 91) argued that the regimes of international migration based on welfare and humanitarian concerns were replaced by “multilateral initiatives in migration management guided by the logic of trade and finance, foreign policy and national security,” that “opened the scope for market-based smuggling of refugees and migrants.” While “the legal view treats differing social worlds of transnational migration as mutually exclusive categories”, she addressed their reciprocal implications based on Foucault’s theory of governmentality and emphasized “the significance of thoughts underlying political discourses, practices of discipline and control over mobility.” She highlighted “the nature of intersectional domination of gender, class and race as being contingent on a one-dimensional vision of liberty in neo-liberalism as a political rationality.” She argued that a human security concept that addresses the daily security of the most vulnerable can no longer be locked in a positivist interpretation. She claimed that “exploring the notion of ‘security’ in respect to ‘freedom’ and questioning the context of, and capacity for, social transformation would bring new lights to the exercise of power in this domain.” In her view “feminist theory can contribute to an understanding that does not treat different categories of security as distinctive and self-contained, but as elements in a web of mutually implicating relationships and, also, as matters of social justice systemic to global capitalism as a whole.” She discussed the neo-liberal governmentality with regard to gender and culture and suggested human security as a political rationality for countering neo-liberalism. She concluded that “neo-liberalism has created a new style of governance”, and she suggested “as the key political question for codes of human security to include the protection of people on the move is how to address the now obsolete but still affective demarcation between the ‘domestic’ (self) and the ‘foreign’ (distant others).”

Then, *Mary Soledad L. Perpiñan, María Eugenia Villarreal* and *Úrsula Oswald Spring* (chap. 92) addressed the question how women analyse and survive in very violent situations in South East Asia and in Central America. They discussed “how threats affecting women and children are resolved collectively by women and marginalized groups, relying on their own capacities.” They reviewed two case studies on gender insecurity in South East Asia based on participative research and the trafficking in children for sexual exploitation in Central America. In their view, “both regions represented strategic zones during the Cold War where both superpowers fought proxy wars. In both

examples the fight against communism brought about environmental disaster due to chemical warfare, guerilla war, and a large number of displaced persons.” They argued that “once a peace agreement was achieved, the destruction of the social networks ... was triggered by global environmental change and increasing natural hazards, which often led to social and political disasters.”

Madhavi Malalgoda Ariyabandu and *Dilrukshi Fonseka* (chap. 93) discussed the gender dimension of natural hazards for the tsunami in India and Sri Lanka (2004), and the Kashmir earthquake in Pakistan (2005). They argued that “exposure and vulnerability to natural disasters pose a major threat to human security, by ... exposing individuals to the threats of physical, economical, social, health, personal, cultural and psychological insecurities.” While disasters kill and displace people and make them socially and economically insecure, “post-disaster contexts further threaten human security, as political and institutional structures ... are unable to deliver relief and recovery.” South Asia is one of the most hazard prone regions and “home to a very large number of resource poor people.” In addition, “poor governance, institutional and policy frameworks, weak infrastructure, lack of social protection and security all lead to high levels of disaster related insecurity.” They argued “that the degree and extent of an individual’s human security risk vis-à-vis natural disasters is ... related to the multiple ... identities ... as well as to the physical, structural and attitudinal violence that is inflicted on these identities by his/her community.” They analysed “how different groups of people in India, Sri Lanka, and Pakistan have been affected by the December 2004 Asian tsunami and the October 2005 Kashmir earthquake; unfolding vulnerabilities, the degrees of disaster risk and threat to human security from the immediate, natural hazard impact, and through disaster responses.” Both mega disasters demonstrated deep rooted problems; exposing the failure to understand and address causes and effects of vulnerability, and a recovery process devoid of risk and vulnerability reduction.

The last three chapters offer case studies on specific issues. *Shahrbanou Tadjbaksh* (chap. 94) combined the debate on human security with that of failed states and suggested “a constructivist view of the political and normative usage of these terms to see whether these two ultimately political concepts are compatible.” She reviewed “the differences between a traditional (security or institutional based) approach and a human security approach to ‘conceptualizing’ fragile states.” She scrutinized “differences

in terms of evaluations of failure, strength and weaknesses, as well as motivations for engagement from the three different points of views,” arguing “that the human security framework poses an ethical challenge to realism and institutional liberalism by introducing the element of human dignity.” Distancing herself from “traditional approaches to responses and responsibilities of the international community,” she scrutinized “questions of interventions, stabilization, aid, and a liberal approach to state-building ... from the realist, liberal and human security viewpoints ... as applied in Afghanistan,” and proposed “an alternate framework of engagement,” arguing that “the human security framework proposes different solutions to the problems of efficiency and legitimacy of states and their institutions, specifically in the cases of ‘failed states’.”

Joseph Singh (chap. 95) discussed “the relevance of human and environmental security concepts for the military services,” focusing on concepts of human and environmental security. These concepts were assessed “for the Caribbean region to determine their relevance for the military services,” arguing that “the decisions these countries make will have implications for the military services if they are to be capable of responding to such threats, challenges, vulnerabilities, and risks in the future.”

Albrecht Schnabel and *Heinz Krummenacher* (chap. 96) argued that “a human security threat constitutes an already or potentially life-threatening danger to a population in a specific geographic context. The specific source and nature of this threat depends on each situation and context – it could range from flooding to landslides to diseases or violent conflict.” They argued “that the contextualized ... nature of human security must ... be matched with an equally multifaceted monitoring, warning and response system,” and that “the monitoring and warning approach needs to differ accordingly.” In their view, “contemporary political early warning systems lack the necessary flexibility to meet this requirement. They ... suffer from two major shortcomings: *First*, their focus lies exclusively on trends leading towards or away from violent conflict. ... *Second*, early warning was targeted at ‘Third World countries’ only and the information gained was primarily used by Western states in order to enhance their country policies and development programmes.” They proposed to share early warning information with all stakeholders and that “the response to human security threats has to be found in a participatory process ... of the local/national governments and non-state actors,” based on true partner-

ship “as a prerequisite for long-term, sustainable response strategies and mechanisms to alleviate potential and emerging threats to populations’ survival and state and regional stability.” They examined “existing first- and second-generation approaches to early warning and an illumination of the factors that explain their relatively limited utility for human security early warning.” Then they discussed “the emerging concept of human security,” and concluded “by outlining how a third-generation early warning system would have to look in order to successfully address the genuine human security needs of societies.”

100.10 From Knowledge to Action and Policy Outlooks

The last part refers to the increasing role of remote sensing for environmental security analysis. *Dirk H. Hoekman* (chap. 97) argued that “remote sensing systems may play an important role in the development and implementation of such international treaties.” Therefore, “accurate mapping and monitoring is required at different scales. Severe cloud cover often prevents the acquisition of optical remote sensing data, thus making the use of satellite radar remote sensing for monitoring applications necessary.” He illustrated the “suitability of radar techniques for acquiring relevant information on rain forests ... with examples of studies conducted by the author in Indonesia.”

This is followed by a research manifesto by *Úrsula Oswald Spring*, *Hans Günter Brauch*, and *Simon Dalby* (chap. 98) in which they outlined the topics, scope, areas and methods for a fourth research phase on human, environmental and gender security, and peace research that should build on the first three phases of environmental security research while explicitly incorporating advances in earth system science and disaster research into the analysis. They distanced security analysis from traditional assumptions in international relations thinking and focusing more explicitly on the specific contexts where people, especially socially vulnerable groups and their social networks, are insecure. While the first three phases of environmental security research primarily focused on the ‘nation state’ as the key referent of environmental security concepts and policy, they suggested that during the fourth phase the referent object of securitization should be both *widened* and *deepened*. This implies that the environmental dimension of security should include both societal, human, and gender issues but

also sectoral approaches such as water, food, health, and livelihood security and ecofeminist perspectives. Furthermore, the widening of the referents of securitization should include the global, regional, societal, community, family, and human level. Thus, the state-focused approach to environmental security should be broadened to a ‘people-centred’ approach.

They introduced three conceptual components for the fourth phase: earth system research and the Anthropocene, the combined *Human, Gender and Environmental Security* (HUGE) concept, and the *Human and Environmental Security and Peace* (HESP) programme. They also addressed the study of substantive issues that need attention in the fourth phase, such as extreme weather events, social systems and gender relations, environmental, social and urban vulnerability, migration, complex emergencies, crises and conflicts, political coping strategies with human insecurities.

Finally, in chapter 99, *Hans Günter Brauch* and *Úrsula Oswald Spring* developed their conceptual perspective for a sustainable peace for the 21st century translating the conceptual and empirical results into a policy perspective that moves from scientific knowledge to political action for society, the business community in facing the new global challenges, as well as the role of the state and international organizations in responding to these new global challenges. They addressed these new challenges for international peace and security, and suggested conceptual ideas for moving towards a sustainable peace policy for the 21st century.

Biographies of Contributors

Editors

Hans Günter Brauch (Germany): Dr. phil. habil, Adj. Prof. (Privatdozent) at the Faculty of Political Science and Social Sciences, Free University of Berlin; since 2005 fellow at the *Institute for Environment and Human Security* of the *United Nations University* (UNU-EHS) in Bonn; since 1987 chairman of *Peace Research and European Security Studies* (AFES-PRESS). He is the editor of the *Hexagon Book Series on Human and Environmental Security and Peace* (HESP) with Springer-Verlag. He was guest professor of international relations at the universities of Frankfurt on Main, Leipzig and Greifswald and at the teachers training college in Erfurt. From 1976-1989 he was research associate at Heidelberg and Stuttgart universities, a research fellow at Harvard and Stanford University and he was also teaching at the universities of Darmstadt, Tübingen, Stuttgart and Heidelberg.

Publications: He has published 65 books, studies and research reports in English and German; 144 book chapters, more than 78 articles in journals on security, armament, climate, energy and migration policies and on Mediterranean issues, and more than 80 internet publications of keynote speeches and conference presentations. His monographs include: (co-author with H. v.d. Graaf, J. Grin, W. Smit): *Militärtechnikfolgenabschätzung und präventive Rüstungskontrolle*, 1997; *Klimapolitik der Schwellenstaaten Südkorea, Mexiko und Brasilien*; *Osterweiterung der Europäischen Union. Umwelt- und Energiepolitik der Tschechischen Republik*, 2000. Books in English: (co-ed. with D.L. Clark): *Decisionmaking for Arms Limitation - Assessments and Prospects*, 1983; (ed.): *Star Wars and European Defence - Implications for Europe: Perceptions and Assessments*, 1987; (co-author with R. Bulkeley): *The Anti-Ballistic Missile Treaty and World Security*, 1988; (ed.): *Military Technology, Armaments Dynamics and Disarmament*, 1989; (co-ed. with R. Kennedy): *Alternative Conventional Defense Postures in the European Theater*, Vol. 1: *The Military Balance and Domestic Constraints*, 1990; Vol. 2: *Political Change in Europe: Military Strategy and Technology*, 1992; Vol. 3: *Military Alternatives for Europe after the Cold War*, 1993; (co-ed. with H.J. v.d. Graaf, J. Grin; W. Smit): *Controlling the Development and Spread of Military Technology*, 1992; (co-ed. with A. Marquina): *Confidence Building and Partnership in the Western Mediterranean. Tasks for Preventive Diplomacy and Conflict Avoidance*, 1994; *Energy Policy in North Africa (1950-2050). From Hydrocarbon to Renewables*, 1997; (co-ed. with A. Marquina, A. Bi-

ad): *Euro-Mediterranean Partnership for the 21st Century*, 2000; (co-ed. with A. Marquina): *Political Stability and Energy Cooperation in the Mediterranean* (2000); *Liberalisation of the Energy Market for Electricity and Gas in the European Union: a Survey and implications for the Czech Republic*, 2002; (co-ed. with P. Liotta, A. Marquina, P. Rogers, M. Selim): *Security and Environment in the Mediterranean. Conceptualising Security and Environmental Conflicts*, 2003; *Environmental Dimension of Human Security: Freedom from Hazard Impact*, 2005; *Threats, Challenges, Vulnerabilities and Risks in Environmental and Human Security*, 2005; (co-ed. with U. Oswald Spring, C. Mesjasz, J. Grin, P. Dunay, N. Chadha Behera, B. Chourou, P. Kameri-Mbote, P.H. Liotta): *Globalization and Environmental Challenges: Reconceptualizing Security in the 21st Century*, 2008; (co-ed. with U. Oswald Spring, C. Mesjasz, J. Grin, P. Kameri-Mbote, B. Chourou, P. Dunay, J. Birkmann): *Coping with Global Environmental Change, Disasters and Security - Threats, Challenges, Vulnerabilities and Risks*, 2009 (forthcoming).

Úrsula Oswald Spring (Mexico), full time professor/researcher at the *National University of Mexico* (UNAM) in the *Regional Multidisciplinary Research Center* (CRIM) and first MunichRe Foundation Chair on Social Vulnerability at the *United National University Institute for Environment and Human Security* (UNU-EHS) for 2005-2009. She was the founding Secretary General of El Colegio de Tlaxcala; General Attorney of Ecology in the State of Morelos (1992-1994) and National Delegate of the Federal General Attorney of Environment from 1994-1995. As Minister of Ecological Development in the State of Morelos (1994-1998) she planted over 30 million trees, promoted environmental education from childhood on and produced drinking water for the whole population with a reduction of 65% in infant mortality due to water-born illnesses. Between 1998 and 2000, she was President of the *International Peace Research Association* (IPRA) and later General Secretary of the Latin-American Council for Peace Research (CLAIP, 2002-2006). She studied medicine, clinical psychology, anthropology, ecology, classical and modern languages and obtained her Ph.D from the University of Zürich

(1978). For her scientific work she received the *Price Sor Juana Inés de la Cruz* (2005), the *Environmental Merit in Tlaxcala*, Mexico (2005, 2006); the *Price of Development of the UN* in Geneva. She was recognized as *Women Academic in UNAM* (1990 and 2000); and *Women of the Year* (2000). She works on nonviolence and sustainable agriculture with groups of peasants and women and is the representative for Latin American of *Diverse Women for Diversity*. She has written 45 books and more than 328 scientific articles and book chapters on sustainability, water, gender, development, poverty, drug consumption, brain damage due to under-nourishment, peasantry, social vulnerability, genetic modified organisms, bioethics and human, gender and environmental security, peace and conflict resolution, democracy and conflict negotiation. Among her major publications are: (co-author with Rudolf Strahm): *Why we are so poor?* (translated into 17 languages, 1.5 million copies); *Unterentwicklung als Folge von Abhängigkeit* (Berne: Lang, 1978); *Mercado y Dependencia* (México, D.F.: Ed. Nueva Imagen, 1979); *Piedras en el Surco* (México, D.F.: UAM-X, 1983); *Campesinos Protagonistas de su Historia: la Coalición de los Ejidos Colectivos de los Valles del Yaqui y Mayo, una Salida a la Cultura de la Pobreza* (México, D.F.: UAM-X, 1986); *Estrategias de Supervivencia en la Ciudad de México* (Cuernavaca: CRIM/UNAM, 1991); *Fuenteovejuna o Caos Ecológico* (Cuernavaca: CRIM/UNAM, 1999); (ed.): *Peace Studies from a Global Perspective: Human Needs in a Cooperative World* (New Delhi: Mbooks, 2000); (co-author with Mario Salinas): *Gestión de Paz, Democracia y Seguridad en América Latina* (México, D.F.: UNAM-CRIM/Coltlix, Böll, 2002); (ed.): *El recurso agua en el Alto Balsas* (México, D.F.: IGF, CRIM/UNAM, 2003); (Ed.): *Soberanía y Desarrollo Regional. El México que queremos* (México, D.F.: UNAM, 2003); (ed.): *Resolución no violenta de conflictos en sociedades indígenas y minorías* (México, D.F.: CLAIPI, IPRA & Böll Foundation, COLTLAX, 2004); *El valor del agua: una visión socioeconómica de un Conflicto Ambiental* (COLTLAX, CONACYT, 2005); (ed.): *International Security, Peace, Development, and Environment*, Book 39: *Encyclopaedia on Life Support Systems* (Paris: UNESCO - EOLSS, UK, online); *Gender and Disasters* (Bonn: UNU-EHS, 2008); (co-ed. with H.G. Brauch, C. Mesjasz, J. Grin, P. Dunay, N. Chadha Behera, B. Chourou, P. Kameri-Mbote, P.H. Liotta): *Globalization and Environmental Challenges: Reconceptualizing Security in the 21st Century*, 2008; (co-ed. with H.G. Brauch, C. Mesjasz, J. Grin, P. Kameri-Mbote, B. Chourou, P. Dunay, J. Birkmann): *Coping with Global Environmental Change, Disasters and Security - Threats, Challenges, Vulnerabilities and Risks*, 2009 (forthcoming).

Address: Prof. Dr. Úrsula Oswald Spring, Priv. Río Bravo Núm.1, Col. Vistahermosa, Cuernavaca, Morelos, 62290 México.

John Grin (Netherlands) is professor at the Department of Political Science of the University of Amsterdam and scientific director of the Amsterdam School for Social Science Research (ASSR; at: <www.assr.nl>). A physicist by training, his main interest throughout his career has been political judgment of and governance over socio-technological development, empirically focusing on military technology and security policy; agriculture, water management and biomedical technology. He co-established and is co-director of the transdisciplinary *Dutch Knowledge Network for System Innovations and Transitions* (KSI; <www.ksinetwork.nl>), in which some hundred researchers of ten different universities co-operate on major changes towards a sustainable society. His books include: *Military-technological choices and political implications. Command and control in established NATO posture and a non-provocative defence* (Amsterdam: VU University Press; New York: St. Martin's Press, 1990); (co-ed. with Wim A. Smit, Lev Voronkov): *Military-technological innovation and stability in a changing world. Politically assessing and influencing weapon innovation and military research and development* (Amsterdam: VU University Press, 1992); (co-ed. with Hans Günter Brauch, Henny van der Graaf, Wim Smit): *Controlling the Development and Spread of Military Technology* (Amsterdam: VU University Press, 1992); (co-author with Hans Günter Brauch, Henk van de Graaf, Wim Smit): *Militärtechnikfolgenabschätzung und Präventive Rüstungskontrolle. Institutionen, Verfahren und Instrumente* (Münster: LIT, 1997); (co-author with Henk van de Graaf, Rob Hoppe): *Technology assessment through interaction: A guide* (Den Haag: SDU, 1997); (co-ed. with Armin Grunwald): *Vision Assessment: Shaping Technology in 21st century society. Towards a repertoire for Technology Assessment* (Heidelberg: Springer, 2000); (co-ed. with Wytse Versteeg and Maarten Hajer): *Meervoudige democratie - ervaringen met vernieuwend bestuur* (Amsterdam: Aksant, 2006) and (co-author with Arienne van Staveren) *Werken aan systeeminnovaties* (Assen: van Groenou, 2007); (co-ed. with H.G. Heinz Krummenacher (Switzerland) is the managing director of "swisspeace - the Swiss Peace Foundation" and head of its early warning unit. He is also the CEO of the *Global Crisis Prevention Mechanism* (GCPM), a joint project of the Washington based Alliance for Peacebuilding and swisspeace. Krummenacher started his professional career with the Swiss Defence Department, where he was a secretary of the interdepartmental risk analysis conference and head of the study group tasked with re-defining Swiss security policy (1985-1989). Between 1990 and 1992 he served as foreign editor with the Swiss daily newspaper *Der Bund*. Before joining swisspeace in 1998 he was vice director and head of the social research department at IHA-GfK, a leading Swiss market research institute (1992-1998). Krummenacher studied contemporary history, political science, and journalism at the University of Zürich. He received his PhD in political science in 1985. He has published primarily on the impact of international norms on state behaviour, security concepts, conflict prevention and management, and conflict early warning. Among his most recent publications are: "Computer Assisted Early Warning - the FAST Example" (2006), "Global Terrorism - Symptom of Local Conflicts" (2004), and "Prevention and Power Politics: Central Asia as a Show Case" (2001).

Address: Dr. Heinz Krummenacher, swisspeace, Sonnenbergstrasse 17, P.O. Box, 3000 Bern 7, Switzerland.

Authors of Forewords and Preface Essays

Rajendra K. Pachauri (India) has been the chief executive of TERI since 1981, designated initially as Director and since April 2001 as Director-General. In April 2002 he was elected as Chairman of the *Intergovernmental Panel on Climate Change* (IPCC), which was established by the *World Meteorological Organization* (WMO) and the *United Nations Environment Programme* (UNEP) in 1988. IPCC along with former Vice President Al Gore has been awarded the *Nobel Peace Prize* for the year 2007. Dr. Pachauri has a PhD in industrial engineering and a PhD in economics. He has been on several international and national committees including membership of the Economic Advisory Council to the Prime Minister of India, the *Advisory Board on Energy* (ABE) which reported directly to the Prime Minister of India, a senior advisor to the Administrator of the *United Nations Development Programme* (UNDP) and several others. He has been President (1988) and Chairman (1989-90) of the *International Association for Energy Economics* (IAEE). He has been President of the Asian Energy Institute since 1992. In April 1999, he was appointed member of the Board of Directors of the *Institute for Global Environmental Strategies* (IGES), Japan and continues to hold this appointment. He was awarded the 'Padma Bhushan' in 2001 by the President of India and he was also bestowed the 'Officier De La Légion D'Honneur' by the Government of France in 2006. He has been active in several international forums dealing with the subject of climate change and its policy dimensions. He was conferred with the 'Padma Vibhushan', second highest civilian award, for his services in the field of science and engineering in January 2008 by the President of India.

Address: Prof. Dr. Rajendra K. Pachauri, Director-General, TERI, Habitat Place, Lodhi Road, New Delhi 110 003, India.

Achim Steiner (Germany), Executive Director of the United Nations Environment Programme (UNEP) and Under-Secretary General of the United Nations. Following the nomination by the Secretary-General, the General Assembly, on 16 March 2006, elected Mr. Steiner unanimously as UNEP's fifth Executive Director for a four-year term. Prior he was the Director-General of IUCN - the World Conservation Union - the world's largest environmental network with over 1,000 members including states, government agencies, and non-governmental organizations in 140 countries. He has worked both at the grass-roots level and at the highest levels of international policymaking to address the interface between environmental sustainability, social equity, and economic development. His professional career has included assignments with governmental and non-governmental, as well as international organizations in different parts of the world. In Washington, where he was Senior Policy Adviser of the IUCN Global Policy Unit, he led the development of new partnerships between the environment

community and the World Bank and United Nations system. In South-East Asia, he worked as Chief Technical Adviser on a programme for sustainable management of Mekong River watersheds and community-based natural resources management. In 1998, he was appointed Secretary-General of the World Commission on Dams, based in South Africa, where he managed a global programme of work to bring together the public sector, civil society, and the private sector in a global policy process on dams and development. In 2001, he was appointed Director-General of the World Conservation Union, one of the most influential and highly respected organizations in the field of conservation, environment and natural resources management. As Chief Executive, he has held responsibility for the management and oversight of 1,000 staff located in 42 countries, implementing the Union's global work programme. His professional track record in the fields of sustainable development policy and environmental management, his first-hand knowledge of civil society, governmental and international organizations, as well as his global experience spanning five continents make him an excellent choice to lead the United Nations Environment Programme. Mr. Steiner was born in Brazil in 1961 where he lived for 10 years. His educational background includes a Bachelor of Arts from the University of Oxford, as well as a Master of Arts from the University of London with specialization in development economics, regional planning, and international development and environment policy. He also studied at the German Development Institute in Berlin, as well as the Harvard Business School. He serves on a number of international advisory boards, including the *China Council for International Cooperation on Environment and Development* (CCICED).

Address: Mr. Achim Steiner, Executive Director of UNEP, United Nations Environment Programme, Headquarters, United Nations Avenue, Gigiri, PO Box 30552, 00100. Nairobi, Kenya.

Email: Nick Nuttall, Spokesperson, Office of the Executive Director <Nick.Nuttall@unep.org>.

U. Joy Ogwu (Nigeria), Ambassador, is the Permanent Representative of the Federal Republic of Nigeria to the United Nations. She was Minister of Foreign Affairs of Nigeria (2006-2007) and previously she served as Director General of the *Nigerian Institute of International Affairs* (NIIA), Nigeria, as chair of the Centre for Advanced Social Science in Port-Harcourt and as chairperson of the United Nations Secretary-General's Advisory Board on Disarmament Matters for 2006. She is a professor of political science and international relations. She obtained her BA and MA in political science from Rutgers University (USA) and a Ph.D. from the University of Lagos in Nigeria in 1977, when she joined the Institute of International Affairs at the University of Lagos. She lectured at the *Nigerian National War College* and the *Nigerian Institute for Policy and Strategic Studies* (NIPSS), later she joined the NIIA as a lecturer,

headed the research department on international politics before she became Director General of the NIIA. In her studies she focused on Latin America and on possibilities of a South-South relationship between Sub-Saharan Africa and Latin America. In her activities in the government as a member of the *Presidential Advisory Council on International Relations* she influenced the relationship of Nigeria with South America and she initiated the *United Nations Educational Social and Cultural Organization* (UNESCO) funded programme for teaching human rights in Nigerian schools. Her publications include: (Ed.): *Nigerian Foreign Policy: Alternative Futures* (Macmillan 1986); (Ed.): *Nigeria's International Economic Relation; Dimensions of Dependence and Change* (1988, rev. 2005); *The Economic Diplomacy of the Nigerian State* (1992, 2001); *The Nigerian Navy and the South Atlantic* (1995); (Ed.): *New Horizons for Nigeria in World Affairs* (2005). She has published extensively in scholarly journals and books and lectured on South-South and Latin America's foreign relations. Several publications appeared in Portuguese, Spanish, French and Croatian.

Address: Her Excellency Amb. Prof. Dr. Joy Ogwu, Permanent Mission of the Federal Republic of Nigeria to the United Nations, 828 Second Avenue, New York, NY 10017, USA.

Luc Gnacadja (Benin) is the Executive Secretary of the United Nations Convention to Combat Desertification (UNCCD). He is an architect by profession, having graduated from the African School of Architecture and Urbanism in Lome. He is also the successful CEO of a consultancy firm and an accomplished manager, honing his skills at the Harvard University Kennedy School of Government and the World Bank Training Institute. He was Minister of Environment, Housing and Urban Development of Benin (1999-2005). He gained first hand knowledge of the UNCCD process over several years as head of delegation to the Conference of the Parties to the UNCCD. He was also head of delegation to the Conference of the Parties to the *United Nations Convention on Climate Change* (UNFCCC) and the *Convention on Biological Diversity* (CBD). His pronounced leadership qualities enabled him at the national level to initiate and build synergies between the Rio conventions, in conjunction with the National Commission on Sustainable Development. He has served as chairman of several international ministerial conferences, meetings and workshops related to the environment, urban and regional development, and sustainable development, including the African Ministers Conference on Environment and the Commission on Sustainable Development. In March 2003 Mr. Gnacadja was honoured with the "2002 Green Award" in Washington by the World Bank.

Address: Mr. Luc Gnacadja, Executive Secretary of the United Nations Convention to Combat Desertification (UNCCD), UNCCD Secretariat, P.O. Box 260129, D-53153 Bonn, Germany.

Sálvano Briceño (Venezuela): Ph.D. (University of Paris II (Panthéon-Sorbonne), Paris, France). Sálvano Briceño was appointed the director of the secretariat of the *International Strategy for Disaster Reduction* (UN/ISDR) in June 2001. His career spans over several decades and has focused on the management of environmental and sustainable development programmes at the United Nations, the *World Conservation Union* (IUCN) and the government of Venezuela. Prior to joining UN/ISDR, Mr. Briceño was the coordinator of the BIOTRADE and GHG Emissions Trading Initiatives of the *UN Conference on Trade and Development* (UNCTAD), Geneva (1999-2001). Before that, he was deputy executive secretary of the *UN Convention to Combat Desertification* (UNCCD) secretariat (1996-1999), following several years as the coordinator of Intergovernmental and Institutional Support of the *UN Framework Convention on Climate Change* (UNFCCC) where he was responsible for assisting the Executive Secretary with management, legal, information support, external relations and interagency relations of the organization (1991-1996). Further UN experience includes five years with UNEP's Caribbean Environment Programme at Kingston, Jamaica, where he collaborated closely with the Pan-Caribbean Disaster Preparedness and Prevention Programme (1987-1991). Earlier in his career, Mr. Briceño joined the *World Conservation Union* (IUCN) as the executive officer of IUCN's Commission on Education, where he focused on environ-

mental education programmes and coordinated a worldwide network of experts (1985-1987). During the 1980's he worked as research associate at Harvard University's Energy and Environment Policy Center, following an active career with the Ministry of Environment and Renewable Natural Resources in Venezuela where he was Director General responsible for environmental education, professional development and international relations.

Address: Dr. Sálvano Briceño, Director, Secretariat of the International Strategy for Disaster Reduction (UN/ISDR) Palais des Nations, CH-1211 Geneva 10, Switzerland.

Email: <isdr@un.org>.

Website: <<http://www.unisdr.org/>>.

Michael Zammit Cutajar (Malta) was executive secretary of the UN Framework Convention on Climate Change (1996-2002), after having set up and directed the secretariat supporting the UN's climate change negotiations. He began his UN career in UNCTAD and returned in several senior capacities (1967-71, 1974-78, and 1986-91) and also worked for the UN Conference on the Human Environment and UNEP (1971-74)). Over the 1980's, he joined the International Foundation for Development Alternatives and was a consultant to the UN Office for Emergency Operations in Africa and the Office for Special Political Affairs. He was born in Malta and educated there at St. Edward's College and also at the University of London.

Vandana Shiva (India) is a physicist, ecofeminist, environmental activist and author of over 300 papers in leading scientific and technical journals. She was trained as a physicist and received her Ph.D. in physics at the University of Western Ontario in 1978. She continued with interdisciplinary research in science, technology and environmental policy at the Indian Institute of Science and the Indian Institute of Management in Bangalore. In 1982, she founded the Research Foundation for Science, Technology and Ecology. She has fought for changes in the practice and paradigms of agriculture and food, intellectual property rights, biodiversity, biotechnology, bioethics and genetic engineering. She has assisted grassroots organizations of the green movement in Africa, Asia, Latin America, Ireland, Switzerland and Austria with campaigns against genetic engineering. She has served as an adviser to governments in India and abroad as well as to NGOs, including the *International Forum on Globalisation*, the *Women's Environment & Development Organization* and the *Third World Network*. She participated in the nonviolent *Chipko movement* during the 1970's, and she established *Navdanya*, a movement for biodiversity conservation and farmers' rights. She is a leader of the *International Forum on Globalization*, and of the *alter-globalization movement*. She has argued for traditional practices in her book *Vedic Ecology*. She received the *Right Livelihood Award* (Alternative Nobel Prize); the Global 500 Award of the *United Nations Environment Programme* (UNEP) both in 1993, and the Earth Day International Award of the *United Nations* (UN). Additional awards include: Order of the Golden Ark, by his Royal Highness Prince Bernhard of the Netherlands

(1993); VIDA SANA International Award, Spain; "Pride of the Doon" Award from Doon Citizen Council, Dehra Dun, India (1995); The Golden Plant Award, Denmark (1997); Alfonso Comin Award, Barcelona, Spain (1998), Commemorative Medal by Her Royal Highness Princess Maha Chakri Sirindhorn of Thailand; Medal of the Presidency of the Italian Republic from the International Scientific Committee of the Pio Manzu Centre at Rimini; Pellegrino Artusi Award, Italy (2000); HORIZON 3000 Award of Austria (2001). Among her major publications are: (co-authored with H.C. Sharatchandra, J. Banyopadhyay): *Social Economic and Ecological Impact of Social Forestry in Kolar* (Bangalore: Bangalore Indian Institute of Management, 1981); *Staying Alive: Women, Ecology and Survival in India* (New Delhi: Zed Press, 1988); *Ecology and the Politics of Survival: Conflicts Over Natural Resources in India* (Thousand Oaks, CA: Sage, 1991); *The Violence of the Green Revolution: Ecological degradation and political conflict in Punjab* (New Delhi: Zed, 1992); (Ed.): *Biodiversity: Social and Ecological Perspectives* (London: Zed, 1992); (Ed.): *Women, Ecology and Health: Rebuilding Connections* (New Delhi: Dag Hammarskjöld Foundation and Kali for Women, 1993); *Monocultures of the Mind: Biodiversity, Biotechnology and Agriculture* (New Delhi: Zed, 1993); (co-author with Maria Mies): *Ecofeminism*, (Halifax: Fernwood Publications, 1993); *Close to Home: Women Reconnect Ecology, Health and Development Worldwide* (London: Earthscan, 1994); (co-author with: Ingunn Moser): *Biopolitics* (London: Zed, 1995); *Biopiracy: the Plunder of Nature and Knowledge* (Cambridge, MA: South End Press, 1997); *Stolen Harvest: The Hijacking of the Global Food Supply* (Cambridge, MA: South End Press, 1999); *Tomorrow's Biodiversity* (London: Thames and Hudson, 2000); *Patents, Myths and Reality* (New Delhi: Penguin India, 2001); *Water Wars* (Boston: South End Press, 2001); *Vedic Ecology: Practical Wisdom for Surviving the 21st Century* (Novato, CA: Mandala Publishing Group, 2002); *Water Wars; Privatization, Pollution, and Profit* (Cambridge, MA: South End Press, 2002); *Globalization's New Wars: Seed, Water and Life Forms* (New Delhi: Women Unlimited, 2005); *Earth Democracy; Justice, Sustainability, and Peace* (Cambridge, MA: South End Press, 2005).

Emad Adly (Egypt), national coordinator of the *Global Environment Facility* (GEF) Small Grants Programme of the *United Nations Development Programme* (UNDP) in Egypt since 1992. He obtained a bachelor degree from the Faculty of Medicine, Cairo University (1980) and a master degree from Paul Cezanne University, France (2006). He is chair and founder (in 1978) of the *Arab Office for Youth and Environment* (AOYE) in Cairo; general coordinator and founder (in 1990) of the *Arab Network for Environment and Development* (RAED) in Cairo; co-chair and founder (in 1996) of the *Mediterranean Information Office for Environment, Culture and Sustainable Development* (MIO-ECSDE) in Athens; chairperson of the Steering Committee and founder (in 2001) of the *Nile Basin Discourse* (NBD) in Entebbe; board member of the Egyptian Water Partnership; member of the Governors' Board of the Arab Water Council and member of other national, regional and international organizations, including as national coordinator of the *Local Initiative Facility for Urban Environment* by UNDP (1993-2005). He is co-editor of: *The Gulf of Aqaba* (Washington, DC: Environment Law Institute, 1991); he has supervised the *Montada Al Baa* (Environment Forum) newsletter since 1989 and has been a co-editor of the *Sustainable Mediterranean* newsletter since 1997. He supervised many publications on environment and sustainable development in Egypt and in the Arab region.

Address: Mr. Emad Adly, P.O.B 2 Magles Elshaab, Cairo, Egypt.

Email: <eadly@hotmail.com>.

Bastien Affeltranger (France) is a geographer in disaster mitigation with a focus on water-related hazards. As freelance consultant (1998-2005), he worked for municipalities, ministries (France; Quebec, Canada), river basin organizations (Mekong; Okavango) and U.N. agencies (UNESCO; WMO; WHO; UNU-EHS; UN/ISDR). Regions of activity include: Europe, Southern Africa and Southeast Asia. He has written papers on community-based risk reduction, with a focus on social evaluation of flood warning systems. He wrote a book on hydropolitics in the Mekong river basin. In 2005 he joined the national *Institute for Industrial Environment and Risks* (INERIS, France) where he works on industrial and dam safety.

Address: Dr. Bastien Affeltranger, INERIS, B.P. 2, Parc ALATA, 60550 Verneuil-en-Halatte, France.

Email: <bastien.affeltranger@ineris.fr>.

Website: <www.ineris.fr>.

Imtiaz Ahmed (Bangladesh) is a professor of international relations, University of Dhaka and also the executive director of the Centre for Alternatives. He is the editor of: *Theoretical Perspectives: A Journal of Social Sciences and Arts* and co-editor of *Identity, Culture & Politics: An Afro-Asian Dialogue* (Colombo - Dakar) and *South Asian Refugee Watch* (Colombo - Dhaka). Aside from numerous articles in national and international journals and several edited vol-

umes, his publications include: *State and Foreign Policy: India's Role in South Asia* (New Delhi: Vikas, 1993); *The Efficiency of the Nation State in South Asia: A Post-nationalist Critique* (Colombo: ICES, 1998); *The Construction of Diaspora: South Asians Living in Japan* (Dhaka: UPL, 2000); (Ed.): *Women, Bangladesh and International Security: Methods, Discourses and Policies* (Dhaka: UPL, 2004); *Futures Beyond Nationalism*; (guest editor), Special issue of *Futures: The journal of policy, planning and futures studies*, 37,9 (November 2005); (Ed.): *Understanding Terrorism in South Asia: Beyond Statist Discourses* (New Delhi: Manohar Publishers - Colombo: Regional Centre for Strategic Studies, 2006).

Address: Prof. Dr. Imtiaz Ahmed, House 13B, Helal Kutir, Road 117, Apt. 4B, Gulshan, Dhaka-1212, Bangladesh.

Email: <imtiaz@bangla.net>.

Website: <www.imtiazalter.netfirms.com>.

Tarek A. Ahmed (Egypt) is a lead specialist of the project planning and management component, under the "Water Resources Planning and Management Project" of the *Nile Basin Initiative* (NBI) team in Addis Ababa, Ethiopia. He was associate professor at the National Water Research Center, Egypt, specializing in water distribution and management where he was responsible for managing the Nile Basin portfolio, under the supervision of the Minister of Water Resources and Irrigation of Egypt. Prior to the 3rd World Water Forum in Kyoto, Japan, he worked for the World Water Council in Marseilles, France, preparing and editing the main forum report 'World Water Actions'. During a one-year post-doctoral programme at WEDC, Loughborough University, UK, he probed the responsibility of governments having to make decisions contradicting environmental and/or social criteria. In Egypt, he participated in a water policy reform programme studying the potential for transferring water management to stakeholders. He worked for consultancies where he developed work plans for water supply of the Republic of Sao Tomé e Príncipe, and coordinated multi-sectoral development efforts for the Ké-Macina area, Republic of Mali. He authored and co-authored more than ten research papers on various disciplines of water management. He studied state administration at: *l'Ecole Nationale d'Administration* (ENA) at Strasbourg, France. He graduated as a civil engineer from Cairo University, and obtained MSc and PhD degrees from Southampton University, UK in civil, environmental and irrigation engineering.

Address: Dr Tarek A. Ahmed, Water Resources Planning & Management Project, Nile Basin Initiative, P.O.Box 60173, Addis Ababa, Ethiopia.

Email: <tahmed@nilebasin.org>.

Website: <http://wrrmp.nilebasin.org/>.

Erhan Akça (Turkey): assistant professor, Department of Technical Programs, Adiyaman University. He obtained a MSc and PhD from Çukurova University on: "Assessment of Land Reclamation Studies Effect on Soil's Quality". He

has also been working on ancient land use and ceramic technology, i.e. on indigenous technologies. He is also soil consultant of TEMA (*The Turkish Foundation for Combating Soil Erosion, for Reforestation and the Protection of Natural Habitats*). His publications include: "Classification Systems, Indigenous", in: *Encyclopedia of Soil Science* (New York: Marcel Dekker 2004): 254-257; "The Indigenous Technical Knowledge of Anatolia and GIS", in: *Journal of the Chamber of Turkish Architecture* (April 2003): 28-33; "Differentiating the natural and man-made terraces of Lake Van, Eastern Anatolia, utilizing earth science methods", in: *Journal Lakes & Reservoirs: Research & Management* (February 2008): 83-93. His present research focuses on indigenous traditional knowledge for sustainable natural resource management.

Address: Assistant Prof. Erhan Akça, Adiyaman University, Department of Technical Programs, 02400, Adiyaman, Turkey.

Email: <erakca@gmail.com>.

Website: <www.adiyaman.edu.tr>.

Ali Ghazi (Algeria): engineer in agronomy from the *National Institute Agronomique El Harrach in Algiers* (1977). Since 1996 he has been Central Inspector of Environment in the Ministry of Town and Country Planning, Environment and Tourism; the local correspondent of FAO in the evaluation of worldwide forests; and since 2005 he is the focal point of the UNEP (FEM/PNU) project on the self-assessment of national capacities for implementing the international conventions on biological diversity, combating desertification and climate change. He is a member of the council of the Algerian Society of Water. He previously held these positions: as director of fauna, flora and protected areas in the *National Agency for Nature* (ANN, 1991-1996); as sub-manager for reforestation and nursery gardens in the Ministry of Water, Environment and Forests (1985-1991); as national coordinator of a regional project by UNEP (PNUD/RAB) on the introduction of the Jojoba (1987-1990); as sub-manager for reforestation within the State Secretariat on Forests (1983-1985) and chief officer for reforestation (1980-1983). Among his publications (in French and Arabic) are: *The choice of sorts of trees for the reforestation of the arid and semiarid area*, thesis in engineering (Algiers: INA 1977); "The emphasis on saline soil in Algeria", in: *Technical Bulletin I.N.R.F.* (Algiers: National Institute of Forest Research, 1985); *Results of tests on the introduction of the Jojoba in Algeria* (Algiers: Ministry of Water and Mines, 1988); *Conception and use of the frame of reference on a large scale of the village of Murviel les - Montpellier by remote sensing* (Montpellier: INRA, 1991); *The pistachios of the Atlas in a project on Algeria's North-green belt* [in Arabic] (Tunis, 1991); *Soil and biological means in Algeria by 2010* (Algiers: National Institute of Global and Strategy Studies (INESG) 1997); *Genetic means: legislative and regulatory aspects* (U.I.C.N, 1996); *Biodiversity in Algeria: strategic importance* (1999); *For an integrated policy of development of the coastal region* (Algiers: IN-ESG, February 2006); "Problématique de la Désertification en Algérie: Etat et Mesure de Lutte pour la Protection des

Ressources Naturelles", in: Kepner, William; Rubio, José L.; Mouat, David; Pedrazzini, Fausto (Eds.): *Desertification in the Mediterranean Region. A Security Issue* (Dordrecht: Springer, 2006): 169-186.

Address: M. Ali Ghazi, Ministère de l'Aménagement du Territoire et de l'Environnement et du Tourisme, Rue des Quatre canons, Alger, 16000, Algeria.

Email: <alighazio2@yahoo.fr>.

Saleem H. Ali (Pakistan, United States) is associate dean for graduate education and associate professor of environmental planning at the University of Vermont's Rubenstein School of Natural Resources, and on the adjunct faculty of Brown University's Watson Institute for International Studies. His research has focused on the causes and consequences of environmental conflicts and on how ecological factors can promote peace. He is also a senior fellow at the United Nations mandated University for Peace (Costa Rica). Much of his empirical research has focused on environmental conflicts in the mineral sector. In September 2007, he was chosen as one of eight 'revolutionary minds' by *Seed* magazine. His publications include: (Ed.): *Peace Parks: Conservation and Conflict Resolution* (Cambridge, MA: MIT Press, 2007); *Mining, the Environment and Indigenous Development Conflicts* (Tucson: Univ. of Arizona Press, 2004). He is a regular columnist for Pakistan's *Daily Times* and has contributed op-ed pieces for *The International Herald Tribune* and *The Boston Globe*. He received his doctorate in environmental planning from MIT, a master in environmental studies from Yale University and a bachelor degree in chemistry from Tufts University.

Address: Prof. Dr. Saleem H. Ali, University of Vermont, 153 S. Prospect St., Burlington, VT 05401, USA.

Email: <saleem@alum.mit.edu>.

Website: <http://www.uvm.edu/~shali>.

Professor J. A. [Tony] Allan is a professor of geography in King's College in the University of London. He gained a first degree at Durham University (1958) and his PhD at the School of Oriental and African Studies (SOAS) in London (1971). His research focuses on water resources in water scarce regions. He coined the concept of 'virtual water' to explain the absence of armed conflict over water resources in the extremely water scarce Middle East and North Africa. He also promotes the importance of other political economy explanations and emphasizes the economic and political processes beyond the watershed that explain why economies can achieve water security. He also addresses the social and political contexts which influence and usually determine water use and policy, and has deployed a wide range of environmental, economic, social and political theory that takes into account the underlying fundamentals of water in the hydrological cycle and the impact of engineering interventions. The difficulties of scientists and professionals in gaining a place for their 'knowledge' in water policy discourses is his major current research theme. A major research focus is global water resource and the extent to which global resources will be sufficient to meet the needs of future populations. The rich diversity of the theorization

is a feature of the international contribution of the Water Issues Research Group he founded at SOAS. His books include: (with Paul Howell): *The Nile: Sharing a scarce resource* (Cambridge: CUP, 1995); *Water and peace in the Middle East: Negotiating resources in the Jordan Basin* (London: I.B. Tauris, 1996); *The water question in the Middle East: the second best works* (London: I.B. Tauris, 2000). In 2008 he was awarded the Stockholm Water Prize for contributions to water science and particularly to the political economy of water.

Address: Professor J A Allan, Room M70, Geography Department, King's College London, The Strand, London WC2, UK, and: SOAS, Thornhaugh Street, London WC1H 0XG, UK.

Email: <ta1@soas.ac.uk>.

Madhavi Malalgoda Ariyabandu (Sri Lanka) holds a MSc. in agricultural economics from the School of Development Studies, University of East Anglia, UK, and a MSc. in agronomy from the Peoples Friendship University, Moscow, USSR. She has authored: *Defeating Disasters; Ideas for Action* (1999), co-authored (with M. Wickramasinghe): *Gender Dimensions in Disaster Management – a Guide for South Asia* (2004), which was translated into four South Asian languages: Hindi, Urdu, Tamil and Sinhala; *Disaster Communication – a Resource Kit for Media* (1992); and (with A. Bhatti): *Livelihood Centred Approach to Disaster Management – a Policy Framework for South Asia* (2005); and co-edited (with P. Sahni): *Disaster Risk Reduction in South Asia* (2003), and authored numerous articles on the theme of political economy of development and disasters, including: “Sex, Gender and Gender Relations in Disasters”, in: Enarson, E.; Chakrabarti, D. (Eds.): *Women, Gender and Disaster: Global Issues and Initiatives* (forthcoming). She served as the national gender advisor and project manager for micro enterprise recovery in the Tsunami Recovery Unit, *United Nations Development Programme* (UNDP) Sri Lanka (2005-2006). Before she was the programme manager, disaster mitigation, with ITDG South Asia (1997- 2005), and research and training officer at the Agrarian Research and Training Institute, Colombo, Sri Lanka (1982-1992). She is the chairperson of *Duryog Nivaran*, a South Asia network for disaster mitigation. She was awarded the Mary Fran Myers Award in 2004, for “advancing women’s careers in emergency management and the academy and for promoting gendered disaster research”, by the *Gender and Disaster Network* (GDN) and the Natural Hazards Center, University of Colorado, USA. She is currently programme officer for South Asia at the *United Nations International Strategy for Disaster Reduction* (UN/ISDR).

Address: Ms. Madhavi Malalgoda Ariyabandu, UN/ISDR, International Environment House II, 7-9 Chemin de Balexert, CH 1219, Chatelaine, Geneva, Switzerland.

Yacob Arsano (Ethiopia), assistant professor of political science and international relations at Addis Ababa University.

He received a PhD from University of Zürich in political science, specializing in hydropolitics; two MA degrees from Ohio University, in political science and in international affairs, and a BA in government affairs from Addis Ababa University. He has published articles and co-authored books on hydropolitics, conflict handling and comparative politics. His recent book (2007) is: *Ethiopia and the Nile: Dilemmas of National and Regional Hydropolitics*. He was a research fellow with the University of Bergen, Norway (1999-2000, 2007), with the Swiss Federal Institute of Technology Zürich (2000-2004), and with the National Center for Competence in Research - North-South, University of Bern (2004-to date). He was a research associate of the Pastoral and Environmental Network in the Horn of Africa (1995-96). He served as regional vice secretary general of the World Herders Council (1997-2000). He is a founding member of Ethiopian Water Resources Association, founding member of Ethiopian Political Science Association and a member of several professional associations, including: Organization for Social Science Research in Eastern and Southern Africa, Ethiopian Educational Researchers Association, International Water History Association and International Studies Association. He is chairman of Regional Scientific Advisory Board for North-South Research in the Horn of Africa and vice chairman for National Water Research and Development of Ethiopia. He received the 2005 Peter-Becker Junior Prize for peace and conflict research from the Philipps University of Marburg, Germany, with Simon Mason of the Swiss Federal Institute of Technology Zürich (ETH). He has taught courses on hydropolitics in Northeastern Africa and the Middle East, politics in the Horn of Africa, comparative politics and African political systems. Currently he is dean of the College of Social Sciences, Addis Ababa University.

Address: Prof. Dr. Yacob Arsano, 1176, College of Social Sciences, Addis Ababa University, Addis Ababa, Ethiopia.

Email: <yarsano@ethionet.et> or <yacob@psir.aau.edu.et>.

Peter Ashton (South Africa): PhD (aquatic ecology, Rhodes University, South Africa), is a principal scientist and divisional fellow specializing in integrated water resources management issues at the *Council for Scientific and Industrial Research* (CSIR). He is also an honorary professor of water resources management at Pretoria University and is one of the ten founding members of the *Universities Partnership for Transboundary Waters*. He has worked on a variety of ecological and water resources research and consultancy projects in several African countries. His current research interests focus on the inclusion of ecological knowledge and good governance processes in decision-making, with special reference to the management of transboundary rivers in Africa. Major publications include: “Avoiding Conflicts Over Africa’s Water Resources”, in: *Ambio*, 31,3 (2002): 236-242; (co-author with V. Ramasar): “Water and HIV/AIDS: Some Strategic Considerations for Southern Africa”, in: Turton, Anthony; Henwood, Roland (Eds.): *Hydropolitics in the Developing World: A Southern African Perspective* (Pretoria: African Water Issues Research Unit, 2002): 217-235; “Water and Development: A Southern African Perspective”, in: *Managing Water Resources Past and*

Present - The 2002 Linacre Lectures (Oxford University Press, 2004): 149-172; (co-author with M.J. Neal): "An Overview of Key Strategic Issues in the Okavango River Basin" in: Turton, Anthony; Ashton, Peter; Cloete, Eugene (Eds): *Transboundary Rivers, Sovereignty and Development: Hydro-political Drivers in the Okavango River Basin* (Geneva: Green Cross International and Pretoria: African Water Issues Research Unit, 2003): 31-63. He has also contributed many chapters to books.

Address: Dr Peter Ashton, Room S-255, Building 33, Environmentek, Council for Scientific and Industrial Research (CSIR), P.O. Box 395, Pretoria, 0001, Republic of South Africa.

Email: pashton@csir.co.za

Mustafa Aydin (Turkey): professor of international relations at the TOBB - University of Economics and Technology; as well as at the National Security Academy, Ankara. He was a research fellow at the Center for Political Studies, University of Michigan (1998); a UNESCO fellow at the Richardson Institute for Peace Studies, Lancaster University, UK (1999); a Fulbright Scholar at the John F. Kennedy School of Government, Harvard University (2002); an Alexander S. Onassis Fellow at the University of Athens (2003); and a research fellow at the EU Institute for Security Studies, Paris (2003). Among others, he is the author of: *Ten Years After: Turkey's Gulf Policy Revisited* (2002); *Turkish Foreign Policy; Framework and Analysis* (2004); (co-editor with K. Ifantis): *Greek-Turkish Relations in the 21st Century: Escaping from the Security Dilemma in the Aegean* (2002); (co-editor with C. Erhan): *Turkish-American Relations; 200 Years of Divergence and Convergence* (2002); (co-editor with T. Y. Ismael): *Turkey's Foreign Policy in the 21st Century: A Changing Role in World Politics*; (co-editor with K. Ifantis): *International Security Today: Understanding Change and Debating Strategy* (2006); (Ed.): *Central Asia in Global Politics* (in Turkish, 2004); *Turkey's Eurasian Adventure* (in Turkish, 2008).

Address: Prof. Dr. Mustafa Aydin, TOBB-Economics and Technology University, Sogutozu Caddesi, No 43, Sogutozu, 06560, Ankara, Turkey.

E-Mail: <maydin@etu.edu.tr>

Jon Barnett (Australia) is an Australian Research Council Fellow, Department of Resource Management and Geography, University of Melbourne. He has a PhD in resource management and environmental science from the Australian National University. Prior to joining Melbourne University he was a New Zealand Science and Technology Post-doctoral Fellow, Macmillan Brown Centre for Pacific Studies, University of Canterbury. He is a geographer whose research concerns theoretical and applied problems in development and environment, development and security, and environment and security. He has conducted research on the human dimensions of climate change in the Pacific Islands, including likely impacts, policy responses, and regional and global climate politics. In 2003 he led the first research project investigating the possible impacts of climate change in Timor Leste. He is currently conducting re-

search on environmental security and climate change in the Pacific Islands, and on water resource problems in China. He has written one book and fifty peer-reviewed academic papers published in international books and journals. A selection of these include: "Peace and Development: Towards a New Synthesis", in: *Journal of Peace Research*, 45; (co-author with Grant Walton): "The Ambiguities of Environmental Degradation and Violence: The Case of the Tolukuma Gold Mine", in: *Society and Natural Resources* 21; "The Geopolitics of Climate Change", in: *Geography Compass*, 1; (co-author with Neil Adger): "Climate Change, Human Security and Violent Conflict", in: *Political Geography* 26; "Adapting to Climate Change in Pacific Island Countries: The Problem of Uncertainty", in: *World Development*, 29; "Security and Climate Change", in: *Global Environmental Change* 13; (co-author with Neil Adger): "Climate Dangers and Atoll Countries", in: *Climatic Change*, 61; *The Meaning of Environmental Security* (London: Zed).

Address: Dr. Jon Barnett, Resource Management and Geography, The University of Melbourne 3010, Victoria, Australia.

Navnita Chadha Behera (India), professor at the Nelson Mandela Centre for Peace and Conflict Resolution, Jamia Millia Islamia. See: *Biographies of editors*.

Sophia Benz (Germany): doctoral student at the Institute of Political Science, Department of International Relations, Peace and Conflict Research, University of Tübingen, Germany and visiting research scholar at the University of California at Berkeley, Department of International and Area Studies, Peace and Conflict Studies (2007-2009). Her current work focuses on the duration of civil wars and the 'new wars' hypothesis. In 2005 she obtained a masters degree in politics and management from the Faculty of Public Policy and Management, Konstanz University, Germany. In 2001 and 2002/2003 she worked with the United Nations Fund for International Partnerships in New York on child health, women and population issues and with the United Nations Office on Drugs and Crime in Vienna on private sector fundraising. An earlier and extended version of this chapter was submitted to the University of Konstanz, Department of Public Policy and Management in partial fulfilment for the requirements of the MA degree in politics and management (see at: <<http://w3.ub.uni-konstanz.de/v13/volltexte/2005/1473/pdf/Benz.pdf>>). Papers on the linkage between HIV/AIDS and conflict have been presented at the Fifth Pan-European International Relations Conference, The Hague, Netherlands, 9-11 September 2004, at the 11th EADI General Conference, Bonn, Germany, 21-24 September 2005 and at the DVPW Conference, Mannheim, Germany, 6-7 October 2005. Her first book analyses: *The Killing of the Fittest: A Quantitative Analysis of HIV/AIDS and Conflict* (Saarbrücken: VDM Verlag, 2008).

Address: Ms. Sophia Benz, Institut für Politikwissenschaft, Abteilung Internationale Beziehungen - Friedens- und Konfliktforschung, Zimmer 26, Melanchthonstrasse 36, 72072 Tübingen, Germany.

Email: <Sophia.Benz@uni-tuebingen.de>.

Website: <<http://www.uni-tuebingen.de/ifp/>>.

Christine Bichsel (Switzerland) is a research fellow at the Department of Geography, University of Berne, Switzerland. She holds a PhD degree in geography from the University of Berne (2006). For her master's thesis she spent four months conducting field research in Solukhumbu, Nepal. After completion of her degree in geography, she continued her Chinese language training at the Beijing Normal University, Beijing, China (2000–2001). In 2002, she began her PhD studies with the Swiss *National Centre for Competence in Research* (NCCR) North-South programme and joined swisspeace / Swiss Peace Foundation, Berne, Switzerland as a doctoral student. For her PhD thesis, she conducted field research totalling 14 months in Kyrgyzstan, Uzbekistan and Tajikistan (2002, 2003, 2004, 2005). In 2007, she worked in Kyrgyzstan as a consultant for the *German Technical Assistance* (GTZ). As of March 2008, she is a visiting researcher at the Department of Geography, National University of Singapore. Her publications include: "In Search of Harmony: Repairing Infrastructure and Social Relations in the Ferghana Valley", in: *Central Asian Survey*, 24,1; *Conflict Transformation in Central Asia: Irrigation Disputes in the Ferghana Valley* (London: Routledge, 2008).

Address: Dr. Christine Bichsel, Department of Geography, Hallerstrasse 12, 3012 Bern, Switzerland.

Jörn Birkmann (Germany) is academic officer and head of the Vulnerability Assessment Section at the United Nations University - Institute for Human Security and Environment (UNU-EHS). He holds a PhD in spatial planning from Dortmund University as well as a licence as an urban planner. He has broad working experience in the field of vulnerability, sustainable development and environmental assessment, being specialized in the area of the development of assessment methodologies and indicators to estimate and evaluate different socio-economic trends at the sub-national, local and household scale. His work experience also encompasses research activities and lectures around the globe, for example in London and Mexico. Besides research and training activities at UNU-EHS he also teaches at the Institute for Geography, University of Bonn. His current field of research is on the development of quantitative and qualitative methodologies to assess vulnerability. His latest edited book is: *Measuring vulnerability to hazards of natural origin. Towards disaster resilient societies* (Tokyo - New York: United Nations University Press, 2006).

Address: Dr. Jörn Birkmann, UN Campus, Hermann-Ehlers Str. 10, 53113 Bonn, Germany.

Email: <birkmann@ehs.unu.edu>.

Website: <<http://www.ehs.unu.edu>>.

David Black (Canada) is director of the Centre for Foreign Policy Studies and professor of political science and international development studies at Dalhousie University. His

current research interests focus primarily on Canada and Sub-Saharan Africa, with emphases on human security, development assistance, multilateral diplomacy and extractive industry investment. His published work has also addressed human rights in Canadian and South African foreign policies, the role of post-apartheid South Africa in Africa, and on sport and world politics. Among his recent publications are an edited section of the: *Canadian Journal of Development Studies* (XXVIII, 2007) on: "Canadian Aid Policy in the new Millennium: Paradoxes and Tensions"; (co-ed. with Sandra MacLean and Timothy Shaw): *A Decade of Human Security: Global Governance and New Multilateralisms* (Ashgate 2006); (co-ed. with Janis van der Westhuizen): Special Issue of: *Third World Quarterly* (25, 2004) on "Global Games". He is currently the president of the International Studies Association - Canada Section, a member of the Executive Council of the *Canadian Consortium on Human Security* (CCHS), and a member of the Editorial Board of the *Canadian Foreign Policy* journal.

Address: Prof. Dr. David Black, Department of Political Science, Dalhousie University, Halifax, NS, B3H 4H6, Canada.

Email: <blackd@dal.ca>.

Wolf Dieter Blümel (Germany): Dr. rer. nat. (Stuttgart University), professor of physical geography, Faculty of Geo- and Bio-Sciences, University of Stuttgart. He mainly works on geomorphology, geoecology and paleoclimatology of drylands/deserts and polar regions. He was coordinator and leader of the interdisciplinary *Geoscientific Spitsbergen Expedition* (SPE 1989-1992) and was member in two longer-lasting Antarctic research projects. His research activities in drylands focussed dominantly on Southwest Africa, the Arabian Peninsula, Israel, SE-Spain, Mexico and the southwest of the USA. Additional focuses are environmental problems, geoarchaeology and landscape history of Central Europe. Most of his articles have been published in different national and international journals like: *Geomorphology*, *Zeitschrift für Geomorphologie*, *Palaeo*, *Catena*, *Die Erde*, *Geographische Rundschau*, *Nova Acta Leopoldina*, *Erdkunde*, *Lecture Notes in Earth Sciences* a.o. He is author of: *Physische Geographie der Polargebiete* (Stuttgart: Teubner, 1999); (co-author of): *Der Süden Deutschlands - Eine Zeitreise vom Erdmittelalter zur Gegenwart* (Heidelberg: Elsevier, 2007) and of other books. He edited several specific volumes of scientific journals. He is on the editorial board of the journal: *Die Erde* and *Stuttgarter Geographische Studien*. He was appointed as member of the *Deutsche Akademie der Naturforscher Leopoldina* (since July 2008: National Academy of Science) and belongs to the *Commission for Geomorphology* of the *Bavarian Academy of Science*. He works as a referee for the *German Science Foundation* (DFG), the Alexander von Humboldt Foundation and as an evaluator of academic institutions and research projects. For decades he has been a member of several scientific associations like: *Deutsche Gesellschaft für Polarforschung*, *Deuqua* or *Deutsche Bodenkundliche Gesellschaft*.

Address: Prof. Dr. Wolf Dieter Blümel, Institut für Geographie, Universität Stuttgart, Azenbergstrasse 12, D-70174 Stuttgart, Germany.

Website: <<http://www.geographie.uni-stuttgart.de>>.

Janos J. Bogardi (Hungary, Germany) graduated in civil engineering with special emphasis on water resources and agricultural water resources development at the Technical University of Budapest, Hungary. After obtaining a post graduate diploma on hydrology from the University of Padua, Italy, he earned his PhD in civil engineering at the University of Karlsruhe, Germany. He was honoured to receive the title of *'Doctor Honoris Causa'* from the Agricultural University of Warsaw, Poland, the Technical University of Budapest, Hungary and the State University for Architecture and Civil Engineering, Nizhny Novgorod, Russian Federation. After his activities as assistant professor at the Institute for Water Resources Management of the Technical University of Budapest, his professional activities took him as scientific staff member to the Federal Institute for Hydraulic Engineering in Karlsruhe, and the University of Karlsruhe, respectively. He alternated these posts with expert assignments for German consulting engineers in Darmstadt and Essen. In the following three years he was then seconded by the *German Agency for Technical Co-operation* (GTZ) to the *Asian Institute of Technology* (AIT) in Bangkok, Thailand. Subsequently he became professor for hydraulics and general hydrology at the Agricultural University of Wageningen, The Netherlands, for almost eight years. His trajectory at the United Nations started at the *United Nations Educational Scientific and Cultural Organization* (UNESCO) in Paris, France, as senior programme specialist and then chief of the Section on Sustainable Water Resources and Management. In 2003 he was appointed director of the United Nations University Institute for Environment and Human Security (UNU-EHS) in Bonn. In 2007 he was assigned Vice-Rector a.i. of United Nations University (UNU) in Europe. He has authored, co-authored, and edited more than 170 publications including books, journal papers, research reports, lecture notes, as well as numerous articles for the media.

Address: Prof. Dr. Janos J. Bogardi, UN Campus, Hermann-Ehlers Str. 10, 53111 Bonn, Germany.

Email: <bogardi@ehs.unu.edu>.

Website: <<http://www.ehs.unu.edu>>.

Hans-Georg Bohle (Germany): Ph.D. (Göttingen University), professor of geography, Geography Department, University of Bonn. He is chair of development geography at the Geography Department of Bonn University. At UNU-EHS he is a Munich Re Foundation Chair on Social Vulnerability. His academic work is directed on issues of vulnerability, risk and human security, with special emphasis on food, water and health. His regional focus is on South Asia (India, Pakistan, Nepal Bangladesh, Sri Lanka). He serves in the Steering Committee of GECHS (*Global Environmental Change and Human Security*) and in the International Scientific Advisory Board of GCAFS (*Global Environmental Change and Food Systems*). He is a member of

the European Academy of Science and of the German Academy of Sciences Leopoldina.

Address: Prof. Dr. Hans-Georg Bohle, Geography Department, University of Bonn, Meckenheimer Allee 166, D-53115 Bonn, Germany.

Email: <bohle@geographie.uni-bonn.de>.

Maëlis Borghese (France), a political scientist who works as a regional coordinator for Southern Africa with *Agence Française de Développement* (AFD), Paris, France. She has graduated from the *Institut d'Etudes Politiques de Paris* and from the Free University of Berlin (Dipl.-Pol.) before joining AFD. She has specialized in international relations, development economics and policy with a particular focus on natural resources management and transboundary water cooperation. From June 2005 to June 2007 she was responsible for the management of water supply projects as well as for the follow-up of general budget support programmes at the AFD office in Ghana. Since August 2007, she works for the Africa Department of AFD's Headquarters in Paris, where she is responsible for the activities in Southern Africa. Her publications include: (with Jonathan Lautze and Mark Giordano): "Driving forces behind African transboundary water law: internal, external, and implications", Paper for the International Workshop on African Water Laws of the International Water Management Institute, Johannesburg, 26-28 January 2005; (with Hélène Nieul, Marion Weinspach, Blandine Pons and Mathilde Renard): "Témoignage, Une génération en quête d'un nouvel engagement", in: Henri Rouillé d'Orfeuil (Ed.): *Les ONG dans la tempête mondiale* (Paris: Editions Charles Léopold Mayer, 2004): 85-95.

Address: Ms. Maëlis Borghese, 27 rue de la Cour des Noues, 75020 Paris, France.

Email: <maelis_borghese@hotmail.com>.

Rajeb Boulharouf (Algeria), a graduate of the *Ecole Nationale D'Administration* (ENA) with a specialization in diplomacy, was at the time of this article submission external relations and public information coordinator of the Secretariat of the *United Nations Convention to Combat Desertification* (UNCCD). He was the spokesperson of the Secretariat in Bonn, Germany. He worked on multilateral issues covering scientific and environmental matters at the Algerian Ministry of Foreign Affairs and with the Permanent Mission of Algeria in New York. He joined the UNCCD secretariat in the 1990's where he was responsible for the development of chapter 12 of 'Agenda 21'. In his past position at the UNCCD secretariat, he overlooked emerging issues and had over the last years concentrated on the social, economic and security 'risks' of desertification. He was directly responsible for the organization of the two UNCCD sponsored events on desertification and migrations in Almeria, Spain in 1994 and 2006. He is now in charge of the newly established Conference Services Unit of UNCCD. Other publications: *Teachers' Kit on Desertification* (Paris: UNESCO, 2001); *Desert Nights. Tales From*

the Desert. International Film Festival on Desertification (Rome: Tipographia Ostiense, 2006).

Address: Mr. Rajeb Boulharouf, UN Campus, Herman-Ehlers-Strasse 10, D-53113 Bonn, Germany.

Email: <rboulharouf@unccd.int>.

Hans Günter Brauch (Germany), Privatdozent (adj. prof.) at the Faculty of Political Science and Social Sciences, Free University of Berlin, since 1987 chairman of *Peace Research and European Security Studies* (AFES-PRESS). See: *Biographies of editors*.

Sálvano Briceño (Venezuela), director of the Secretariat of the *International Strategy for Disaster Reduction* (UN/ISDR) since June 2001. See: *Biographies of authors of forewords and preface essays*.

Vicken Cheterian (Switzerland), head of research programmes at CIMERA, a Geneva based consultancy. He leads policy related studies on media and development, causes of conflicts, conflict resolution, and democratization processes. He studied the causes of conflicts, state collapse and the rise of nationalism in the Caucasus, and holds a Ph.D. in history and politics of international relations from the Graduate Institute of International Studies, University of Geneva. Before he worked as a journalist for major European papers such as *Le Monde Diplomatique*, and *Neue Zürcher Zeitung* reporting on conflicts and political developments from the Middle East, Caucasus, Russia, Central Asia, Ukraine, and Eastern Europe. Mandated by the Swiss Federal Department of Foreign Affairs, he led a three year long project for confidence building between journalists and political analysts in the Caucasus (1997-2000), and later mandated by the Swiss Agency for Development and Cooperation he set-up the Caucasus Media Institute, a media training and research centre in Yerevan (2002-2004). He worked as a consultant for the *Environment and Security Initiative* (ENVSEC) launched by UNEP, UNDP, OSCE and NATO co-authoring two EnvSec reports on the South Caucasus and Eastern Europe. Among his publications are: *Dialectics of Ethnic Conflicts and Oil Politics in the Caucasus* (Geneva, 1997); *Little Wars and a Great Game, Local Conflicts and International Competition in the Caucasus* (Bern, 2001); (co-author with Nina Iskandaryan): *Post-Soviet Media: From Propaganda to Journalism* [in Russian] (Yerevan, 2006); *War and Peace in the Caucasus, Trouble on Russia's Frontier* (London: Hurst, 2008).

Address: Dr. Vicken Cheterian, CIMERA, rue de Vuache 1, Box 1242, 1211 Geneva 1, Switzerland.

Email: <vicken.cheterian@cimera.org>

Website: <http://www.cimera.org/en/about/cheterian.htm>.

Béchir Chourou (Tunisia), professor of international relations at the University of Tunis-Carthage in Tunisia. See: *Biographies of editors*.

Mohammed Dajani Daoudi (Palestine), Ph.D. (1981), Ph.D. (1984), is a professor of political science and founding director, American Studies Institute, Al-Quds University. He is a Jerusalem-born scholar and peace activist with two doc-

torate degrees in government (University of South Carolina, Columbia, SC, 1981; University of Texas, Austin, Texas, 1984). He is founding director of the Wasatia moderate Islamic Initiative - Palestine; chairman, Board of Directors, House of Water and Environment; chairman, Board of Directors/IPCRI; member, Board of Directors, YMCA-West Jerusalem; consultant, Seeds of Peace; founding director, Jerusalem Studies and Research Institute and ISBN Palestine Agency, Al-Bireh, Palestine. He worked as founding director of the Palestinian Public Administration National Institute; senior consultant on public administration of the Palestinian Ministry of Planning and International Cooperation. Between mid-1998 and 2004 he was director of the Technical Assistance and Training Department, *Palestinian Council for Development and Reconstruction* (PECDAR), in charge of implementing a 23-million US\$ World Bank Technical Assistance Trust Fund. Between 1995 and 1997 he was chief technical advisor, *United Nations Development Programme* (UNDP), Programme of Assistance to the Palestinian People, providing training and consultancy services to the Palestinian Authority on public administration development and institution building. Between 1990 and 1995, he founded and acted as chairman of the Department of Political Science and Diplomacy, Applied Science University, Amman, Jordan. He frequently participates in local, regional and international conferences, and is author and co-author of numerous academic books and articles in English and Arabic.

Address: Prof. Dr. Mohammed Dajani Daoudi, P. O. Box 14085, Jaffa Gate, Jerusalem, Israel.

Tom Deligiannis (Canada) is completing his Ph.D. in the Department of Political Science, University of Toronto, under the supervision of Thomas Homer-Dixon. His dissertation is building on the tradition of environmental conflict research at the University of Toronto through detailed field work in Peru, exploring the impacts of human-induced environmental and demographic change in Chuschi and Quispillacta, two communities in south-central Ayacucho, in Peru's southern highlands. From 2005-2007, he was resident assistant professor in the Department of Environment, Peace and Security, at the UN mandated University for Peace, in Costa Rica. He was an adjunct professor at the UPEACE in the MA program on Environmental Security and Peace. He also teaches a module on environmental security as part of the University of Geneva/UNEP's short course on environmental diplomacy. In 2006-2007, he was project director of UPEACE's Climate Change and Adaptation project.

Address: Mr. Tom Deligiannis, 23 Harrison Ave., Guelph, ON, N1H 5J9, Canada.

Email: <deligiannis@hotmail.com>.

Stavros Dimas (Greece) has been European Commissioner for the Environment since November 2004. See: *Biographies of authors of forewords and preface essays*.

Fred Eboko (France) is a political scientist and sociologist. He obtained a Ph.D. from Université Montesquieu in Bordeaux (France) in 2002. He is senior research fellow at the *Institut de Recherche pour le Développement* (IRD, formerly ORSTOM, France), and has been working on public policy and youth in the fight against AIDS in Africa for more than a decade. He was on a IRD posting (2005-2008) to the Paul Ango Ela Foundation for geopolitics in Central Africa (FPAE) in Yaoundé, Cameroon. He is associate researcher at the *Centre d'Etude d'Afrique Noire* (CEAN) of the *Institut d'Etudes Politiques de Bordeaux*. He has published over 30 articles on questions related to AIDS in Africa, among them: "Pouvoirs et maladie en Afrique: des maladies qui tuent aux maladies qui 'sauvent'?", in: *Enjeux. Bulletin d'Analyses Géopolitiques pour l'Afrique Centrale* (Yaoundé) No. 31 (April-June 2007): 7-8; "Patterns of Mobilization. Political Culture in the Fight Against AIDS. A Comparative Approach", in: Amy Patterson (Ed.): *The African States and the AIDS Crisis* (Aldershot: Ashgate, 2005): 37-58; "Law against morality? Access to anti-AIDS drugs in Africa", in: *International Social Science Journal*, No. 186 (Paris: Unesco, 2005): 713-722; "Politique publique et sida en Afrique. De l'anthropologie à la science politique", in: *Cahiers d'études africaines*, XLV, 178 (2004): 351-387; "De l'intime au politique. Le sida en Afrique, un objet en mouvement", in: Vidal, L. (Ed.): "Les objets de la santé", in: *Autrepart*, 29 (2004): 117-33.

Address: Dr. Fred Eboko, UMR 912, IRD-INSERM-Université de la Méditerranée, SE4S, Observatoire Régional de la Santé, 23 rue Stanislas Torrents, 13006 Marseille, France.
E-mail: <fred.eboko@wanadoo.fr> and <Fred.Eboko@bondy.ird.fr>.

Mersie Ejigu (Ethiopia), currently president and chief executive officer of the *Partnership for African Environmental Sustainability* (PAES) and senior fellow at the *Foundation for Environmental Security & Sustainability* (FESS). He is also visiting professor at the University for Peace, Department of Environmental Security and Peace, a former Assistant Director General for Programmes and Policy of IUCN - The World Conservation Union, He has served as Minister of Planning and Development of Ethiopia (1982-1991) and Minister of Agriculture and Natural Resources (1991). He has been a consultant for UNDP, UNDESA, IMF, The World Bank and UNICEF in areas of strategic planning, finance and development policy, environmental policy, and programme formulation and evaluation. He pursued his undergraduate studies in agricultural economics at the Alemaya College of Agriculture, and graduate studies in economics at the University of British Columbia, Vancouver, Canada. He initiated, designed and guided the project to study the link between environmental security and armed conflict in Burundi, Ethiopia, Rwanda and Uganda funded by the European Union. Among his most recent most relevant publications are: "Land, Forest, Insecurity and Conflict", in: *The International Forestry Review, Special Issue on Africa*, 8,1 (2006): 72-77; "Grasping the Nettle", in: *Our Planet, The magazine of the United Nations Environment Programme* (UNEP), 16,3 (November 2005): 20-21, special issue on: "Energy, Finance and Climate Change"; "L'Afrique a besoin d'énergies renouvelables", Point de vue, in: *Le Monde*, 22 June 2005; "Poverty, Deforestation, Environmental Insecurity, and Conflict in the Horn of Africa and Great Lakes Countries", in: *Forests and Conflicts*, European Tropical Forest Research Network, No. 43-44 (Winter 2004-2005); *Post Conflict Liberia: Environmental Security as a Strategy for Sustainable Peace and Development*, FESS Working Paper, 2006.

Address: Mr. Mersie Ejigu, 9015 Edgepark Rd, Vienna, VA 22182, USA.
Email: <mejigu@paes.org>.

Fulya Ereker (Turkey), research assistant and PhD candidate at the Department of International Relations at Ankara University. She holds a BA in international relations from the Black Sea Technical University and a MA in international relations with a dissertation on "An Analysis of Turkish Foreign Policy Making and Decision-Makers". She is working on a PhD dissertation on "Foreign Policy and Identity: The Case of Turkish Foreign Policy". Among others, she published: "Just War Concept: From Antiquity Up to Present" (2004, *Uluslararası İlişkiler*); "The Effect of the Political System on Turkish Foreign Policy" (2004, *Istanbul Ticaret Universitesi Sosyal Bilimler Dergisi*), both in Turkish.

Address: Ms. Fulya Ereker, Ankara University, Faculty of Political Science, Cebeci, 06590, Ankara, Turkey.
E-mail: <fereker@politics.ankara.edu.tr>.
Website: <http://www.politics.ankara.edu.tr>.

Hari Eswaran (USA) has worked on sustainable agriculture and global climate change since 2000. He organized a workshops on 'Sustainable Land Management' and on 'Stressed Agro-ecosystems'. Based on twenty years of experience on global soil resources, he completed a 1:30M map of: 'Soil Regions of the World', published as a *Soil Management Collaborative Research Support Program* (SM-CRSP) document. As a former chairman of a Commission of the International Society of Soil Science, he coordinated international scientific efforts on soil genesis, classification, and resource assessment and monitoring. He chairs an International Task Force on Land Degradation of the International Society of Soil Science. He is co-author of: "Issues and challenges of dryland agriculture in Southern Asia", in: Juo, A.S.R.; Freed, R.D. (Eds.): *Agriculture and the Environment: Bridging Food Production and Environmental Protection in Developing Countries*. ASA Special Publication No. 60 (Madison WI.: American Society of Agronomy, 1995): 161-180; "Global soil carbon resources", in: Lal, R.; Kimble, J.; Levine, E.; Stewart, B.A. (Eds.): *Soils and Global Change. Advances in Soil Science* (Boca Raton: Lewis, 1995): 27-44.

Address: Dr. Hari Eswaran, USDA-Natural Resources Conservation Service, Room 4250, South Building, 14th & Independence Ave, SW, Washington, DC 20250, USA.
Email: <hari.eswaran@wdc.usda.gov>.

André P.C. Faaij (The Netherlands), associate professor at the Copernicus Institute for Sustainable Development of Utrecht University; study of chemistry and environmental sciences, Ph.D. on energy production from biomass and wastes, visiting researcher at the Center for Energy and Environmental Studies, Princeton University and at King's College, London University. Main research experience: energy system scenario analysis and modelling, bio-energy and other renewables, land-use issues, international bio-energy trade, sustainability assessments of energy systems, alternative transport fuels, decarbonization of fossil fuels, capture and storage of CO₂ (CCS), waste treatment, material and energy efficiency, technological learning, greenhouse gas balances and energy and research policies. He coordinates a research cluster on energy supply and system studies and is experienced in research and management in a multidisciplinary and international setting. He is a member of expert groups in bio-energy and energy policy, research and strategic planning. He advises governments, the EC, IEA, the UN, GEF, OECD, WEF, the energy sector and industry, NGOs, etc. He leads Task 40 of the IEA on Sustainable International Bio-energy Trade and acted as national representative in several other tasks. He advises the UN Biofuels Initiative and FAO's bioenergy activities, supported by the G8 Global Bio-energy Partnership. He recently joined the IPCC team to draft the Special Report on Renewable Energy, the new *Global Energy Assessment* (GEA) and he be-

came member of the *World Economic Forum's* (WEF) Global Agenda Council on Alternative Energies. He was lead author for the World Energy Assessment of the UN, the Worldwatch Institute's book on Biofuels for the 21st Century, the IPCC 4th assessment report and of the IEA's World Energy Outlook. He is board member and guest editor of the journal *Biomass & Bioenergy* and is reviewer for journals, scientific and government bodies. He published over 450 titles in scientific journals, reports, books and proceedings, (co-) organized a range of international workshops and conferences and is frequently lecturing across the globe.

Address: Prof Dr. André P.C. Faaij, Copernicus Institute, Utrecht University, Heidelberglaan 2, 3584 CS, Utrecht, The Netherlands.

Email: <A.P.C.Faaij@uu.nl>.

Website: <<http://www.geo.uu.nl/20419main.html>>.

David Faiman (Israel) is professor of physics and chairman of the Department of Solar Energy and Environmental Physics at Ben-Gurion University's Jacob Blaustein Institutes for Desert Research, in Sede Boqer where he is also director of Israel's National Solar Energy Center. A physicist by training, he obtained his first degree from the University of London, and his second and third degrees from the University of Illinois. Between 1969 and 1976 he performed research in theoretical physics at Oxford University, CERN and the Weizmann Institute. In 1976 he joined the Ben-Gurion University where he participated in the establishment of the Blaustein Institutes, refocusing his research activities into the field of applied solar energy. He is widely published and has chaired or been a member of numerous international committees. At present he is Israel's representative to the Task 8 Photovoltaic Specialist Committee of the *International Energy Agency* (IEA), and has co-authored their latest book: *Energy from the Desert: Practical Proposals for Very Large Scale Photovoltaic Systems* (London: James & James, 2007).

Address: Prof. Dr. David Faiman, Department of Solar Energy & Environmental Physics, Blaustein Institutes for Desert Research, Ben-Gurion University of the Negev, Sede Boqer Campus, 84990 Israel.

Email: <faiman@bgu.ac.il>.

Isabel Fischer (Germany): Dipl.-Ing. sc.agr., since 2003, doctoral student at the Institute of Agricultural Economics and Social Sciences in the Tropics and Subtropics, Department of Agricultural Development Theory and Policy and research associate in subproject F2.2 "Risk Management of Farm Households in Northern Vietnam" of the so-called The Uplands Program (SFB 564): "Research for Sustainable Land Use and Rural Development in Mountainous Regions of Southeast Asia" at the University of Hohenheim, Germany. Her current research focuses on vulnerability of rural households, risk management and microinsurance. From 1995 until 2002, she studied agricultural science at the University of Hohenheim, specializing in economics and social sciences in the tropics and subtropics. Her publications include: *Media Supported Communication in Agricultural*

Extension and Participatory Rural Development in Northern Thailand. Research in Development Economics and Policy Discussion Paper No 4/2004 (Stuttgart: Grauer Verlag); Dufhues, T.; Lemke, U.; Fischer, I.: *New ways for rural finance - Livestock insurance schemes in Vietnam*. Research in Development Economics and Policy Discussion Paper No 5/2004 (Stuttgart: Grauer Verlag); Beuchelt, T.; Fischer, I.: "What do Vietnamese Farmers do when a Crisis Occurs? Covering Lack of Resources through Social Networks", in: Buchenrieder, G.; Dufhues, T. (Eds.): *Making rural households' livelihoods more resilient. The importance of social capital and the underlying social networks*. Studies on the Agricultural and Food Sector in Central and Eastern Europe, vol. 34 (Halle: Institute of Agricultural Development in Central and Eastern Europe, 2006): 45-57; Dufhues, T.; Buchenrieder, G.; Fischer, I.: *Social capital and rural development: Literature review and current state of the art*. Discussion Paper 96/2006 (Halle: Institute of Agricultural Development in Central and Eastern Europe (IAMO)); (co-author with G. Buchenrieder): *Laptop, Livestock Drawings and Ricewine: A Demand Analysis for Livestock Insurance in Northern Vietnam*. Research in Development Economics and Policy Discussion Paper No 3/2008 (Stuttgart: Grauer Verlag).

Address: Ms. Isabel Fischer, University of Hohenheim, Dept. 490A, 70593 Stuttgart, Germany.

Jochen Froebrich (Germany), Dr.-Ing., team leader for *Integrated Water Resources Management* (IWRM) at Wageningen University, The Netherlands, was a senior scientist at the Institute of Water Quality and Waste Management, University of Hannover. He specialized in water stress management in arid and semi arid regions. He has worked on a variety of multidisciplinary projects in North Africa, Southern Europe and Central Asia. His current research interests focus on the inclusion of water quality aspects in water management under water scarcity. He is leading a number of international research teams in this field. Relevant examples are the EC-project tempQsim (EVK1-CT2002-00112) for im-

proving water quality models and their applicability in dryland basins or the INCO-project Jayhun (INCO 516761) for developing risk management strategies in the Amu Darya basin in the view of future changes in water availability. Another important activity is research on best option combinations to mitigate water stress (within the integrated project (IP) AquaStress). Major publications include: Froebrich, J.; Olsson, O.; Bauer, M.; Normatov, I.; Petrov, G.: "Improved dam operation in the Amu Darya river basin including transboundary aspects", in: Berga, L.; Buil, J.M.; Bofill, E.; De Cea, J.C.; Garcia Perez, J.A.; Mañueco, G.; Polimon, J.; Soriano, A.; Yagüe, J. (Eds.): *International symposium on dams in the societies of the 21st century*, ICOLD congress, Barcelona, 18 June 2006 (London: Taylor & Francis, 2006): 97-103; Froebrich, J.; Bauer, M.; Ikramova, M.; Olsson, O.: *Water quantity and quality dynamics of the THC - Tuyamuyun Hydroengineering Complex and implications for reservoir operation*. Environmental Science and Pollution Research (ESPR), in: ESPR, 14,6 (2005): 435-442; Froebrich, J.: "New Challenges in Lake and River Monitoring", in: *Freshwater Forum*, 23 (2005), Freshwater Biological Association, Ambleside, UK; Froebrich, J.: "Enhanced reservoir operation - concept for improving water quality and water management in water stressed areas", in: *International Agricultural Engineering Journal*, 14,4 (2005): 147-160.

Address: Dr.-Ing. Jochen Froebrich, Division of Integrated Water Resources Management, Center for Water and Climate, Wageningen University, Alterra, P.O. Box 47, 6700 AA Wageningen; Building no. 104, Droevendaalsesteeg 4, 6708 PB Wageningen, The Netherlands.

Niklas Gebert (Germany) is research associate at the United Nations University - Institute for Human Security and Environment (UNU-EHS) and is currently conducting research on socio-economic vulnerability assessment in Indonesia within the *German Indonesian Tsunami Early Warning System* (GITEWS) project. He holds a M.Sc. in human geography from the University of Bonn (Germany). He specialized in geographical development research with emphasis on vulnerability assessment in Malawi. Prior to his en-

agement at UNU-EHS, he worked as a junior professional for the *German Technical Cooperation* (GTZ) in the field of food security, HIV/AIDS in Africa and on capacity development for chemical management.

Address: Mr. Niklas Gebert, UN Campus, Hermann-Ehlers Str. 10, 53111 Bonn, Germany.

Email: <gebert@ehs.unu.edu>

Luc Gnacadja (Benin) is the executive secretary of the *United Nations Convention to Combat Desertification* (UNCCD). See: *Biographies of authors of forewords and preface essays*.

John Grin (Netherlands) is professor at the Department of Political Science of the University of Amsterdam and scientific director of the *Amsterdam School for Social Science Research* (ASSR). See: *Biographies of editors*.

Tobias Hagmann (Switzerland), PhD in public administration (Swiss Graduate School of Public Administration ID-HEAP). He has been a lecturer in political geography at the Department of Geography, University of Zürich since 2007. His main research focuses on conflict studies, the political sociology of the state, and on politics in the Horn of Africa. Between 1998 and 2006 he was a researcher at swisspeace, Bern, a research officer for ACORD Somalia, Nairobi in 2001 and a visiting researcher at the Institute of Ethiopian Studies at Addis Ababa University (2003-2005). He has published articles on environmental conflicts and politics in Ethiopia and Somalia in: *African Affairs, Journal of Modern African Studies, Peace, Conflict and Development*, and *Politique Africaine*.

Address: Dr. Tobias Hagmann, Department of Geography, University of Zürich, Winterthurerstrasse 190, CH-8057 Zürich, Switzerland.

E-Mail: <tobias.hagmann@geo.uzh.ch>

Website: <www.geo.uzh.ch>

Bassam Ossama Hayek (Jordan), director of the Environmental Research Centre, *Royal Scientific Society* (RSS). He is a chemical engineer and obtained a Ph.D. in chemical engineering from the University of Swansea (UK) in 1994. He started his career in 1994 as a researcher in the environment field at the RSS. He has experience in the treatment of domestic and industrial wastewater; environment assessment; hazardous waste management and control. He has executed and supervised research projects and studies on the treatment of wastewater, industrial audits (pollution prevention and waste minimization and cleaner production), environmental assessment, and hazardous materials management. He participated as a member in national committees such as the Domestic Wastewater Management Committee and the Reclaimed Water Reuse Coordination Committee (Ministry of Water and Irrigation), the National Hazardous Material Management Committee and the AGENDA 21 task force (Ministry of Environment). He has written and supervised or co-authored some 20 publications of scientific papers and technical reports, including: *Environment Sector in Jordan; Key Issues for Environmental Risk Assessment*, International Risk Management Meet-

ing, Italy 2001; *Environmental and Economic Improvement through Implementation of Cleaner Production in Hospitality Sector in Jordan: Case Studies in Four Hotels, 2008*. He supervised the following studies: *Environmental Impact Assessment for Gas Transmission Project, 2004*; *Environmental Impact Assessment for Silica Sand Project, 2002*; *Environmental Impact Assessment for Kemira Arab Potash Co., 2000*; *Water Pollution Crises Management; A Case Study on Cryptosporidium Outbreak in Munshiyat Bani Hassan - Jordan*, report submitted to the Ministry of Health, Jordan, November 2007.

Address: Dr. Bassam Hayek, Director, Environment Research Centre, Royal Scientific Society, P.O. Box 1438, Al Jubeiha 11941, Amman, Jordan.

Dirk H. Hoekman (The Netherlands), Ph.D., associate professor in remote sensing at Wageningen University, with main interests in the physical aspects of remote sensing, microwave remote sensing and applications of remote sensing in forestry, agriculture, (agro-)hydrology, climate studies and environmental change. Co-founder of SarVision, an organization devoted to the development of operational monitoring systems. Co-ordinator for training and research programmes, including the NASA PACRIM-2 and ESA INDREX-1 and -2 campaigns, to support the realization of operational monitoring systems for sustainable forest management and nature conservation. Lead scientist for the JAXA Kyoto & Carbon Initiative for exploitation of the ALOS PALSAR satellite in the region Insular SE Asia (Malaysia, Indonesia, Philippines and Papua New Guinea). His major publications include: "Satellite radar observation of tropical peat swamp forest as a tool for hydrological modelling and environmental protection", in: *Aquatic Conservation: Marine and Freshwater Ecosystems*. Special edition on: *Satellite-based radar - developing tools for wetlands management*, 17 (2007): 265-275; (co-author with Tran, N.Thanh; Wehrens, Ron; Buydens, Lutgarde M.C.: "Initialization of Markov Random Field Clustering of Large Remote Sensing Images", in: *IEEE Transactions on Geoscience and Remote Sensing*, 43,8 (2005): 1912-1919; (co-author with Quiñones, Marcela J.): "Exploration of factors limiting biomass estimation by polarimetric radar in tropical forests", in: *IEEE Transactions on Geoscience and Remote Sensing*, 42,1 (2004): 86-104; (co-author with Vissers, Martin A.M.): "A new polarimetric classification approach evaluated for agricultural crops", in: *IEEE Transactions on Geoscience and Remote Sensing*, 41,12 (2003): 2881-2889; (co-author with Quiñones, Marcela J.): "Biophysical Forest Type Characterisation in the Colombian Amazon by Airborne Polarimetric SAR", in: *IEEE Transactions on Geoscience and Remote Sensing*, 40,6 (2002): 1288-1300; (co-author with Varekamp, Chris): "Observation of tropical rain forest trees by airborne high resolution interferometric radar", in: *IEEE Transactions on Geoscience and Remote Sensing*, 39,3 (2001): 584-594; (co-author with Quiñones, Marcela J.): "Land cover type and biomass classification using AirSAR data for evaluation of monitoring scenarios in the Colombi-

an Amazon", in: *IEEE Transactions on Geoscience and Remote Sensing*, 38 (2000): 685-696.

Address: Prof. Dr. Dirk Hoekman, Wageningen University, Dept. of Environmental Sciences, Droevendaalsesteeg 4, 6708 PB, Wageningen, The Netherlands.

Thomas Homer-Dixon (Canada) holds the CIGI Chair of Global Systems at the Balsillie School of International Affairs in Waterloo, Canada, and is a professor in the Centre for Environment and Business at the University of Waterloo. He was born in Victoria, British Columbia and received his B.A. in political science from Carleton University in 1980 and his Ph.D. from MIT in international relations and defence and arms control policy in 1989. He then moved to the University of Toronto to lead several research projects studying the links between environmental stress and violence in developing countries. Recently, his research has focused on threats to global security in the 21st century and on how societies adapt to complex economic, ecological, and technological change. His books include: *The Upside of Down: Catastrophe, Creativity, and the Renewal of Civilization* (New York: Knopf - Washington, DC: Island Press, 2006), *The Ingenuity Gap* (New York: Knopf, 2000), which won the 2001 Governor General's Non-fiction Award, and *Environment, Scarcity, and Violence* (Princeton; Princeton University Press, 1999), which won the Caldwell Prize of the American Political Science Association.

Address: Prof. Dr. Thomas Homer-Dixon, The Centre for International Governance Innovation, 57 Erb St. West, Waterloo, ON, N2L 6C2, Canada.

Gunhild Hoogensen (Norway) is associate professor in the Department of Political Science at the University of Tromsø. Her main research interest is security studies, broadly speaking, and more specifically the relevance and application of the human security concept to the Arctic context and to military education (particularly in the field of civil-military cooperation or relations). She leads the Human Security Programme at the University of Tromsø, which includes such projects as the International Polar Year project GAPS (security and oil and gas activity in the Arctic) as well as MENSEA (military education and the new security agenda). She is also academic coordinator for the Model UN programme and co-academic coordinator (political science) for various masters programmes offered to the Norwegian military. Her publications include the following books: *Environmental Change and Human Security in the Arctic* (London: Earthscan, 2008); *International Relations, Security, and Jeremy Bentham* (London: Routledge, 2005) and *Women in Power: World Leaders Since 1960* (New York: Praeger, 2006), and articles in: *Security Dialogue*, *Canadian Foreign Policy*, and *International Studies Review*.

Address: Prof. Dr. Gunhild Hoogensen, Department of Political Science, University of Tromsø, N-9037 Tromsø, Norway.

Arie S. Issar (Israel), professor emeritus at the J. Blaustein Institutes for Desert Research, and the Geological Department of Ben Gurion University of the Negev. He founded and headed the Water Resources Center of the Institute for Desert Research since 1975 until his retirement in 1998. He received his Ph. D. at the Hebrew University of Jerusalem in 1961. From 1980-1998 he was the holder of the Alain Pöcher Chair in Hydrogeology of Arid Zones. He received the following prizes: Ernest D. Bergmann Prize for Special Scientific Contributions to the Development of the Negev Desert (1985); Prize of the President of the International Association of Hydrogeologists for Outstanding International Contributions toward the Advancement of Hydrogeology (2003); Honorary Member of the Israeli Association for Water Resources (2005). His current research focuses on the impact of climate change on the hydrological cycle and socio-economic systems; and developing conceptual models in order to mitigate the negative impact of global change on the water resources of the Middle East, including long term policies of sustainable development of the fossil aquifers of the region. He has published about hundred papers and co-edited five books and wrote five books in the fields of geology and hydrogeology. On the impact of climate changes on the hydrological cycle and on the environment he published these books: *Water Shall flow from the Rock. Hydrogeology and Climate in the Lands of the Bible* (Heidelberg - New York: Springer-Verlag, 1990); *Climate Changes during the Holocene and their Impact on Hydrological Systems* (Cambridge: Cambridge University Press, 2003); (Co-ed. with Angelakis, Andreas N.): *Diachronic Climatic Impacts on Water Resources (with Emphasis on the Mediterranean Region)* (NATO ASI Series. Springer-Verlag, 1996); (Co-ed. with Brown, Neville): *Water, Environment and Society in Times of Climate Change* (Dordrecht, The Netherlands, Kluwer Academic Publishers, 1998); (Co-ed. with Zohar, Mattanyah): *Climate Change - Environment and Civilization in the Middle East* (Berlin - Heidelberg - New York : Springer 2004, 2007).

Address: Prof. Dr. Arie S. Issar, ZIWR, BGU, Sede Boker Campus, 84990, Israel; Home: Hameshoreret Rachel St.13, Jerusalem, 96348, Israel.

Email: Issar@bgu.ac.il.

Klaus-Dietmar Jacoby (Germany) is a Ministerialrat in the German government. He was head of the Emergency Planning and Preparations Division in the Office of Oil Markets and Emergency Preparedness of the *International Energy Agency* (IEA) from 2001 to 2006. Since then he is working as a Seconded National Expert in the EU Commission to revise the existing oil emergency stockholding legislation. He has spent most of his working life in various sectors of the German government, principally in the Ministry of Economy and Technology and in the Ministry of Foreign Affairs. In his previous activities he was responsible for en-

ergy, scientific and technology policy and information, computer and communication policy. He holds an advanced degree in economics from Cologne University and studied at the *Ecole Nationale d'Administration* (ENA) in Paris. He is married and has one son.

Address: Mr. Klaus-Dietmar Jacoby, European Commission, DG Energy, 301 Avenue de Tervuren, 1150 Brussels, Belgium.

Email: <klaus-dietmar.jacoby@ec.europa.eu>.

Website: <http://ec.europa.eu/energy/index_en.html>.

Anders Jägerskog (Sweden): Ph.D. is project director at the *Stockholm International Water Institute* (SIWI) where his work focuses on international water issues and in particular transboundary waters. Previously he has worked at the secretariat for the *Expert Group on Development Issues* (EGDI) at the Swedish Ministry for Foreign Affairs, at the *Swedish International Development Co-operation Agency* (Sida) with water resources in southern Africa and at the *Stockholm International Peace Research Institute* (SIPRI) with Middle Eastern security issues. In 2003 he finished his PhD on the water negotiations in the Jordan River Basin at the Department of Water and Environmental Studies, Linköping University, Sweden. He was a member of the Scientific Programme Committee at the *Stockholm International Water Institute* (SIWI) from 2002-2006 and is currently a member of the Scientific Committee of the *International Lakes Commission* (ILEC). He has published over 60 scientific articles, book chapters, debate articles and reports. His publications include: *Managing Transboundary Waters* and: *Water Scarcity Challenges in the Middle East and North Africa* (MENA). Background Papers prepared for the Human Development Report 2006 (2006); "Water Sharing between Israel, Jordan and the Palestinians", text box: in: *State of the World 2005*, Worldwatch Institute (2005); "Human Security - problems, opportunities and policy implications", in: *Conflict, Security and Development* (2004); *Why states cooperate over shared water? The water negotiations in the Jordan River Basin*, Linköping University, PhD Dissertation, Linköping Studies in Arts and Science, Sweden (2003); at: <http://www.ep.liu.se/diss/arts_science/2003/281/digest.pdf>; "Risk and uncertainty from a political perspective: cases from water negotiations", in: *Towards Catchment Hydrosolidarity in a world of Uncertainties*, SIWI Proceedings 2003, Report 18, SIWI Seminar (Stockholm: Stockholm International Water Institute, 2003); "The power of the sanctioned discourse - a crucial factor in determining water policy", in: *Water, Science and Technology*, 47,6 (2003); "Hydrosolidarity as seen from a political perspective - overcoming sanctioned discourse obstacles", in: *Balancing human security and ecological security interests in a catchment: Towards upstream/downstream hydrosolidarity*, SIWI Proceedings 2002 SIWI Seminar (Stockholm: Stockholm International Water Institute, 2002); "Contributions of Regime Theory in Understanding Interstate Water Cooperation: Lessons Learned in the Jordan River Basin", in: Turton, A.R.; Henwood, R. (Eds.): *Hydropolitics in the Developing World: A Southern African Perspective* (Pretoria: African Water Issues Research Unit (AWIRU), 2002).

Address: Dr. Anders Jägerskog, Stockholm International Water Institute, Drottninggatan 33, SE-111 51 Stockholm, Sweden.

Email: <anders.jagerskog@siwi.org> and <anders.jagerskog@webaid.se>.

Patricia Kameri-Mbote (Kenya), is professor of law, University of Nairobi. See *biographies of editors*.

Burcak Kapur (Turkey), research and teaching assistant at the Department of Agricultural Structures and Irrigation, Faculty of Agriculture, University of Çukurova, Adana, Turkey. Mr. Kapur obtained a MSc degree from the International Centre for Advanced Mediterranean Agronomic Studies with a thesis on: "Climate Change, Climatic Water Balance and Crop Water Requirements: Investigation on the Next 100 Years for the Apulia Region." He is currently working as a project assistant on the "Impact of Climate Change on Agricultural Production System in Arid Areas" in cooperation with the Research Institute for Humanity and Nature, Kyoto, Japan for his Ph.D. study. He contributed papers to: *Global Climate Change and Effects on Soil, Crop Productivity and Water Resources. Proceedings of the International workshop for ICCAP; Land degradation and desertification in Turkey* (Nato-CCMS and Science Committee Workshop).

Address: Mr. Burcak Kapur, University of Çukurova, Department of Agricultural Structures and Irrigation, 01330-Balcalı, Adana, Turkey.

Email: <bkapur@cu.edu.tr>.

Website: <www.cu.edu.tr>.

Selim Kapur (Turkey), professor of soil science at the Faculty of Agriculture and chairman of the Department of Archaeometry, Çukurova University, Adana, Turkey. He was a European Council Higher Education Scholar in Aberdeen, Scotland (1973-1976), a research fellow at Wageningen Agricultural University, The Netherlands (1978); and General Secretary of the Working Group on Land Degradation and Desertification of the International Union of Soil Sciences. He is a scientific committee member of the European Soil Bureau Network of the EU-Joint Research Centre, Institute of Environment and Sustainability, Ispra, Italy. He has led and participated in link projects with the British Council, NATO and leading EU initiatives on land use and mitigation of land degradation caused by inappropriate use of land. He is coordinating a TEMA (Turkish acronym for the leading/renowned NGO in the country and abroad dealing with the mitigation of land degradation and desertification) - Mitsui (Japan) bilateral project in the Karapınar (Konya) erosion control station of the Ministry of Agriculture and Rural Affairs seeking to develop a sustainable land management programme for the semi-arid regions allocated on terrestrial dunes and past lacustrine surfaces threatened by climate change and inappropriate use of soil and water. He authored numerous articles, published by the *EU-JRC Institute of Environment and Sustainability* (IES), in special issues and conference proceedings, of chapters in the proceedings of the International Working Group of Land Degradation and of papers on sustainable Land Manage-

ment and Soil Development with special reference to Soil Micromorphology and indigenous land use published in international journals. His recent studies on the development of the 'Anthroscape' context within the IES frameworks are in progress. He is the key editor of the proceedings of the 13th International Meeting on Soil Micromorphology (to be published by Springer), co-editor of the International Board of the *Encyclopedia of Soil Science* (New York: Marcel Dekker), of the *EU-MEDCOASTLAND Project* proceedings, the 3rd and 7th volume of the International Meetings on Soils with a Mediterranean type of climate (*Options Mediterraneennes, Catena*, Elsevier) and principle editor of the proceedings of the 1st International Meeting on Land Degradation.

Address: Prof. Dr. Selim Kapur, University of Çukurova, Departments of Soil Science and Archaeometry, 01330-Balcalı, Adana, Turkey.

Email: <kapurs@cu.edu.tr>.

Kithure Kindiki (Kenya) is currently associate dean and senior lecturer of international law, School of Law, University of Nairobi. He is an advocate of the High Court of Kenya. He holds a Ph.D degree in international law from the University of Pretoria, and has ten years of University teaching at both undergraduate and post-graduate levels. He has published many articles in peer-reviewed journals and has acted as a consultant for many governmental, inter-governmental and non-governmental organizations. Among his major publications are: (co-ed. with Ambani, Osogo): *The Anatomy of Bomas: Selected Analyses of the 2004 Draft Constitution of Kenya* (Nairobi: Claripress, 2005); *Humanitarian intervention and State Sovereignty in Africa: The Changing Paradigms in International Law* (Eldoret: Moi University Press, 2003): 1727-1746; "Broadening the Horizons: the Draft Constitution of Kenya and the Protection of Socio-economic Rights", in: (co-ed. with Ambani, Osogo): *The Anatomy of Bomas: Selected Analyses of the 2004 Draft Constitution of Kenya* (Nairobi: Claripress, 2005); "International Trade and Human Rights: Conceptual and Practical Linkages", in: *Pacific Rim Journal of International Law* (2006); "The African Peace and Security Council and the Charter of the United Nations", in: *The Law Society of Kenya Journal*, 1,1 (2005); "Europe and the Reconstruction of Somalia", in: *Forced Migration Review*,

23 (2005); "The Proposed Integration of the African Court of Justice and the African Court of Human and Peoples' Rights: Legal Difficulties and Merits", in: *African Journal of International and Comparative Law*, 15,1 (2007): 138-146; "A People Betrayed - The Darfur Crisis and International Law: Rethinking Westphalian Sovereignty in the 21st Century", in: *Bond Law Review*, 19,2 (2007): 102-123; "International Law on Trial: The Darfur Crisis and the Responsibility to Protect Civilians", in: *International Community Law Review*, 9,4 (2007): 445-473; "Synchronizing Kenya's Energy Law with the Framework Environmental Law", in: Okidi, Charles; Kameri-Mbote, Patricia; Akech, Migai (Eds.) *Environmental Law After the Framework Law* (Nairobi: East African Educational Publishers, 2008).

Address: Department of Public Law, School of Law, University of Nairobi, Parklands Law Campus, Junction Forest/Limuru/Parklands Roads, PO BOX 30197-00100 Nairobi, Kenya.

Email: <kkindiki@yahoo.co.uk> and <kithure@mail.uonbi.ac.ke>.

Yannis Kinnas (Greece) holds a doctorate in political science from Athens Panteion University, and a Ph.D. in International Relations from London University. He was associate professor in Athens and has taught and lectured in the United States and Europe. In 1990 he was Radford Distinguished Visiting Professor at Baylor University (USA). From 1976 to 1997 he worked with the Greek Ministry of Foreign Affairs in charge of environmental and economic affairs. From 1987 to 1996 he served with the Permanent Mission of Greece to the United Nations and other international organizations in Geneva. There he also coordinated the Greek presidency in the European Union in 1988 and 1994. In 1994 he became Ambassador for Environment and Economic Affairs. Between 1964-1976 he worked with transnational banks as head of their foreign departments. Since his retirement in 1997 he has worked as a consultant with international NGOs on environmental policy and its application in the *Millennium Environment Assessment* (MEA). He has written on environmental issues and European integration, including nine books. His articles have appeared in learned journals and edited books in Belgium, India, Italy, Japan, Poland, Switzerland, United Kingdom, United States. His latest co-edited book is in Greek on nuclear energy and proliferation (Athens 1996). He was member of the Advisory Board of the: *Journal for Environment and Development*, San Diego (USA) and he is a member of the AFES-PRESS Scientific Advisory Board in Germany.

Address: Dr. Yannis Kinnas, 2 Akronos Street, Athens 116-33, Greece.

Email: <jkinnas@hotmail.com>.

Website: <http://www.afes-press.de/html/scientific_board.html>.

Martin Kipping (Germany), political scientist; is 1st secretary for development cooperation, economic affairs and humanitarian aid at the German Embassy in Kabul, Afghanistan; former water sector desk officer at the German Federal Ministry for Economic Cooperation and Development (BMZ), Bonn. He graduated from the *Institut*

d'Etudes Politiques de Paris and from Free University of Berlin (Dipl.-Pol.) before participating in a training programme for young professionals at the *German Development Institute* (DIE), Bonn. He has specialized in questions of international relations and development with a particular focus on conflict management, resource conflicts, transboundary water cooperation and water sector policy. He is currently preparing a PhD thesis on external state-building interventions at the Free University Berlin. His publications include: "Wasserkonflikte und Wasserkooperation am Senegalfluss", in: Kipping, Martin; Lindemann, Stefan, 2005: *Senegalpolitik und internationale Flussmanagement im Südlichen Afrika* (Münster: Lit-Verlag); (co-author with Elke Herrfahrdt, Tanja Pickardt, Mathias Polak, Caroline Rohrer and Carl Felix Wolff): *Water Governance in the Kyrgyz Agricultural Sector - On its Way to Integrated Water Resources Management?* (Bonn: DIE, 2006); "Conflits et coopération liés à l'eau du fleuve Sénégal", in: *Géocarrefour: La pénurie d'eau : donnée naturelle ou question sociale?*, 80,4 (September 2005); "Challenges for German Development Cooperation in the Water Sector", in: Neubert, Susanne; Scheumann, Waltina; Kipping, Martin (Eds.), 2008: *Water Politics, Policies and Development Cooperation: Local Power Plays and Global Governance* (Berlin - Heidelberg: Springer-Verlag).

Address: Martin Kipping, Ravelsberger Str. 55, D-52146 Würselen, Germany.

Email: <martin.kipping@gmx.net>.

Wolfram Krewitt (Germany) is head of the Department Systems Analysis and Technology Assessment, German Aerospace Center (DLR), he holds a diploma of mechanical engineering from the Technical University of Aachen, and a PhD in energy engineering from the University of Stuttgart. He is an energy engineer with professional experience in the application of renewable energy technologies in Latin America, and more than 15 years experience in the field energy system analysis. He worked with the University of Stuttgart, Institute of Energy Economics and the Rational Use of Energy, where he was heading the Department of Material Flows and Sustainable Development. He joined DLR 2001 as a project manager, and since 2006 is leading the Department of Systems Analysis and Technology Assessment. He co-ordinated various national and international research projects, and has experience as a consultant in Eastern European countries and in South America. He worked as a consultant for the IAEA/IEA on the development of a system of sustainability indicators in the energy sector. Among his major publications and project reports are: (co-author with: Simon/Graus/Teske/Zervos/Schäfer): "The 2 °C scenario - A sustainable world energy perspective", in: *Energy Policy*, 35 (2007): 4969-4980; (co-author with Teske/Schäfer/Simon/Graus): "Energy [R]evolution - A Sustainable World Energy Outlook. Greenpeace International", GPI REF JN 035 (Amsterdam, 2007); at: <<http://www.energyblueprint.info/>>; (co-author with: Nitsch/Fischedick/Pehnt/Temming): "Market perspectives of stationary fuel cells in a sustainable energy supply system - long term scenarios for Germany", in: *Energy Policy*, 34 (2006): 793-803; (co-author

with: Nitsch/Reinhardt): “Renewable energies – between climate protection and nature conservation?”, in: *International Journal for Global Energy Issues*, 23,1 (2005): 29-42; (co-author with: J. Nitsch): “The German Renewable Energy Sources Act – an investment into the future pays off already today”, in: *Renewable Energy*, 28 (2003): 533-542; “External Costs of Energy – do the answers match the questions? Looking back at ten years of ExternE”, in: *Energy Policy*, 30 (2002): 839-848.

Address: Dr. Wolfram Krewitt, Deutsches Zentrum für Luft- und Raumfahrt, Institute of Technical Thermodynamics, Pfaffenwaldring 38-40, D-70569 Stuttgart, Germany.

Heinz Krummenacher (Switzerland) is the managing director of swisspeace – the Swiss Peace Foundation and head of its early warning unit. See *biographies of editors*.

Jennifer Leaning (USA) is professor of the practice of international health at the Harvard School of Public Health and associate professor of Medicine at Harvard Medical School, and cordirector of the Harvard Humanitarian Initiative. Her research and policy interests include issues of public health, medical ethics, and early warning in response to war and disaster, human rights and international humanitarian law in crisis settings, and problems of human security in the context of forced migration and conflict. She has field experience in problems of public health assessment and human rights in a range of crisis situations (including Afghanistan, Albania, Angola, Kosovo, the Middle East, former Soviet Union, Somalia, the Chad-Darfur border, and the African Great Lakes area) and has written widely on these issues. She also has extensive experience in clinical medicine and medical management, most recently (1992-1997) as the medical director of one of the largest group practices in Massachusetts, and currently chairs the Harvard University Student Health Coordinating Board. She currently serves on a number of non-profit boards, including the Board of Directors of the American Red Cross, Massachusetts Bay Chapter; Physicians for Human Rights; and The Humane Society of the United States. She received her A.B. degree from Radcliffe College, magna cum laude, a master's degree in demography and public health from the Harvard School of Public Health, and her M.D. with honors from the University of Chicago Pritzker School of Medicine. She trained in internal medicine and emergency medicine at Massachusetts General Hospital and is board certified in both specialties. She is a member of the American College of Emergency Physicians. Among her recent publications on these issues are: (co-author with: VanRooyen, M.: “After the Tsunami - Facing the Public Health Challenges”, in: *New England Journal of Medicine*, 352 (2005): 435-438; (co-author with: Walker, P.; Wisner, B.; Minear, L.): “Smoke and mirrors: deficiencies in disaster funding”, in: *BMJ*, 330 (2005): 247-250; (co-author with: Lautze, S.; Raven-Roberts, A.; Kent, R.; Mazurana, D.: *Assistance, protection, and governance networks in complex emergencies*, in: *Lancet*, 364 (2004): 2134-2141; “Diagnosing Genocide – The Case of Darfur”, in: *NEJM*, 351 (19 August 2004): 735-

738; (co-author with: Gingerich T.): *The Use of Rape as a Weapon of War in the Conflict in Darfur, Sudan*, United States Agency for International Development (October 2004); at: <http://www.hsph.harvard.edu/fxbcenter/HSPH-PHR_Report_on_Rape_in_Darfur.pdf>; (co-author with: Arie S.; Stites, E.): “Human Security in Crisis and Transition”, in: *Praxis: The Fletcher Journal of International Development*, 19 (2004): 5-30; (co-author with: Stabinski, L.; Pelley, K.; Jacob, S.; Long, J.): “Reframing HIV and AIDS”, in: *BMJ*, 327 (2003): 1101-1103; “Public Health, War and Terrorism”, in: *Harvard Health Policy Review*, 4,1 (Spring 2003): 51-55; (co-ed. with: Briggs, S.M.; Chen L.C.): *Humanitarian Crises: The Medical and Public Health Response* (Cambridge, MA: Harvard University Press, 1999).

Address: Prof. Dr. Jennifer Leaning, Harvard Humanitarian Initiative, 14 Story Street, 2nd Floor, Cambridge, MA 02138, USA.

Email: <jleaning@hsph.harvard.edu>.

Rik Leemans (The Netherlands), Dr. (University of Uppsala), professor of environmental systems analysis, Environmental Sciences Department, Wageningen University and director of the WIMEK graduate school. He also chairs the international *Earth System Science Partnership* (ESSP), the Response Option Working Group of the *Millennium Ecosystem Assessment* (MEA) and the Dutch National Global Change Committee. He works on various aspects of global environmental change. He currently directs several multidisciplinary projects on land-use change, biogeochemical cycles, global biodiversity. All these projects accentuate resilience vulnerability and sustainability. His early studies at Uppsala University (Sweden) emphasized the successional dynamics and structure of boreal forests. His subsequent research position at the Biosphere Project of the *International Institute of Applied System Analyses* (IIASA, Austria) focussed on boreal forest models. Over the last decade he was a senior scientist of the *National Institute of Public Health and the Environment* (RIVM) in Bilthoven. Here, he directed the development of integrated modelling approaches for the biosphere within the IMAGE 2 model. Since then his research has excelled into modelling global environmental change. He has published many papers in books, reports and academic journals like *Science*, *Climatic Change*, *Ecological Modelling*, *Global Environmental Change* and *Ecology and Society*. He was involved as a lead-author in all assessments of the *Intergovernmental Panel on Climate Change* (IPCC) that was rewarded the Nobel Peace price in 2007. He is on the editorial board of *Ecosystems*, *Climatic Change*, *Global Environmental Change*, *Carbon Balance and Management* and a member of *Faculty of 1000 Biology*. He works as a referee for the *Dutch Science Foundations* (NWO and WOTRO), the *European Research Council* (ERC) and is evaluator of academic institutions and research projects. He has been a member of several scientific associations, such as the *International Association of Vegetation Science*, *The Integrated Assessment Society* and the *American Ecological Society*.

Address: Prof. Dr. Rik Leemans, Environmental Systems Analysis, Wageningen University & Research, PO Box 47, 6700 AA Wageningen, Tel: +31 317 484919.

Email: <rik.leemans@wur.nl>.

Stefan Lindemann (Germany): political scientist; specialized in environmental and development policy, with a particular emphasis on water-related issues. He is currently a PhD student in development studies at the *London School of Economics and Political Science* (LSE) where he is preparing a thesis on the role of “inclusive elite bargains” in understanding the causes of civil war in Sub-Saharan Africa. Previously, he has worked for the *German Advisory Council on the Environment* (SRU), as a short-term consultant for *Gesellschaft für technische Zusammenarbeit* (GTZ) and the *UK Department of International Development* (DFID). He has also been involved in several research projects at the *Environmental Policy Research Centre* (FFU) of the Freie Universität Berlin.

Address: Mr. Stefan Lindemann, Stubbenkammerstrasse 11, 10437 Berlin, Germany.

Email: <S.Lindemann@lse.ac.uk>.

Rolf Linkohr (Germany), Ph.D. (University of Munich), is president of the *Centre for European Energy Strategy* (CERES), a Brussels-based company he founded in 2005. From 2005 to 2007 he was Special Advisor to the EU-Commissioner for Energy Andris Piebalgs. He studied physics and physical chemistry and worked with the automobile industry to develop electric cars, before being elected Member of the European Parliament in 1979 and subsequently was re-elected four times until 2004 when he did not run again. At the European Parliament for many years he was the spokesman for science, technology and energy in the Socialist Group. He created the *Scientific and Technological Options Assessment* (STOA), the Parliament's Technology Assessment Unit, he founded the *European Energy Foundation*, he was President of the *European-Latin American Institute* (IRELA). At present he works on strategic issues like clean coal, the next generation of nuclear reactors, renewables and energy efficiency. His particular interests are climate policy and energy as well as the relationship between combatting poverty, energy and CO₂ - emissions trading.

Address: Dr. Rolf Linkohr, Asangstraße 219a, 70329 Stuttgart, Germany.

E-Mail: <linkohr-stuttgart@t-online.de>

Alexander López (Costa Rica), Ph.D. from the University of Oslo, Norway. He is currently the director of the Institute for International Affairs of the Universidad Nacional de Costa Rica. He has worked and conducted extensive field work in the Brazilian Amazon focusing on environmental conflicts related to mining. In México and Central America he has been working on issues related to socio-environmental conflict resolution and the management of transboundary river basins. He is a member of the Universi-

ty Partnership for Transboundary Waters, and member of the Scientific Steering Committee of the *Global Environmental Change and Human Security* Project (GECHS). His latest publications in English on the Amazon are: “Population Movements, Environmental Change and Social Conflicts in the Brazilian Amazon”, in: Unruch, Jon D.; Krol, Maarten; Kliot, Nurit (Eds.): *Environmental Change and its Implication for Population Migration* (Dordrecht - Boston - London: Kluwer Academic Publisher, 2004); *Hydropolitical Vulnerability and Resilience along International Waters. Latin America and the Caribbean* (Nairobi: UNEP, 2007).

Address: Prof. Dr. Alexander López, Director, Escuela de Relaciones Internacionales, Universidad Nacional de Costa Rica, 4 piso, Facultad de Ciencias Sociales, Heredia, Costa Rica

Eva Ludi (Switzerland/UK), PhD (Geography, University of Bern, Switzerland), is a research fellow in the Rural Policy and Governance Group at the *Overseas Development Institute* (ODI) in London, UK. She is involved in a number of policy-oriented research projects, among them “RiPPLE - Research-inspired Policy and Practice Learning in Ethiopia and the Nile Region”, a five-year *Research Programme Consortium* (RPC); at: <<http://www.research4development.info/projectsAndProgrammes.asp?ProjectID=60092>> funded by the UK *Department for International Development* (DFID) that aims to meet the challenge by providing evidence-based learning to support *water supply and sanitation* (WSS) implementation programmes in rural Ethiopia. From 2001 to 2005 she was project coordinator of the Individual Project 7 at *swisspeace*: “Environmental Change and Conflict Transformation” of the NCCR North-South “Research Partnerships for Mitigating Syndromes of Global Change”; at: <<http://www.north-south.unibe.ch>>, funded by the *Swiss National Science Foundation* (SNF) and the Swiss Agency for Development and Cooperation. She also held a research fellow position at the *Centre for Development and Environment* (CDE), Institute of Geography, University of Bern, Switzerland. Her main areas of work are: leader and team member in international and interdisciplinary teams assessing options for sustainable land management and sustainable rural development in Ethiopia, Eritrea, Tajikistan, Kyrgyzstan, Tanzania, Kenya and Nicaragua, sustainable water management and impacts of WSS on poverty reduction and growth in Ethiopia, impacts of agro-commodity dependence on poverty and environmental degradation in Ethiopia, Tanzania and Kenya. Her publications include: (with R. Slater; L. Peskett; D. Brown): *Climate change, agricultural policy and poverty reduction - how much do we know?* Natural Resource Perspectives 109 (London: ODI, 2007); (with L. Cabral and J. Farrington): *The Millennium Villages Project - a new approach to ending rural poverty in Africa?* Natural Resource Perspectives 101 (London: ODI, 2006); (with Yacob Arsano; Berhanu Debele; Seyoum Gebre Selassie): “Horn of Africa. Manag-

ing Resources and Disputes in Uncertain Environments“ (Bern: NCCR North-South, 2004); “Sustainable Pasture Management in Kyrgyzstan and Tajikistan: Development Needs and Recommendations”, in: *Mountain Research and Development*, 21,2 (2003: 119-123); *Economic Analysis of Soil Conservation: Case Studies from the Highlands of Amhara Region, Ethiopia* (Bern: University of Bern, Institute of Geography, 2002).

Address: Dr. Eva Ludi, Overseas Development Institute, 111 Westminster Bridge Road, London SE1 7JD, United Kingdom.

E-Mail: <e.ludi@odi.org.uk>.

Website: <http://www.odi.org.uk/>.

Wolfgang Lutz (Austria): leader, world population program of the *International Institute for Applied Systems Analysis* (IIASA) in Austria; director of the *Vienna Institute of Demography* (VID) of the Austrian Academy of Sciences; affiliated professor at the College of Population Studies, Chulalongkorn University (Bangkok); principal investigator of the Asian MetaCentre for Population and Sustainable Development (Singapore and Bangkok); chair of the scientific programme committee of the African Population and Health Research Centre (Nairobi). From 1998-2001, Secretary-General, *International Union for the Scientific Study of Population* (IUSSP). He holds a Ph.D. in demography from the University of Pennsylvania (1983) and a second doctorate (habilitation) in social statistics from the University of Vienna. He has authored and edited 25 scientific books and monographs and published more than 160 refereed articles, including several contributions in: *Science and Nature*. His most recent books include: *Frontiers of Population Forecasting* (1999); *Population and Climate Change* (2001); *Population and Environment: Methods of Analysis* (2002); *The End of World Population Growth in the 21st Century: New Challenges for Human Capital Formation and Sustainable Development* (2004); and *The New Generations of Europeans: Demography and Families in the Enlarged European Union* (2006).

Address: Prof. Dr. Wolfgang Lutz, IIASA, Schlossplatz 1, A-2361 Laxenburg, Austria.

E-mail: <lutz@iiasa.ac.at>.

Website: <http://www.iiasa.ac.at/~lutz/>.

Christopher Martius (Germany): PhD (Biology, University of Göttingen), lecturer (agroecology), and senior scientist at the *Center for Development Research* (ZEF) of the University of Bonn, Germany. Since January 2008 he works as head of the Programme Facilitation Unit for Central Asia and the Caucasus of the *Consultative Group on International Agricultural Research* (CGIAR) and coordinator of the regional programme of the *International Center for Agricultural Research in the Dry Areas* (ICARDA), in Tashkent, Uzbekistan. He joined ZEF in 1998. For six years he was a fellow of the Max-Planck-Institute for Limnology in Plön, Germany. He has over 12 years of work experience in tropical ecology, especially in rain forests of Brazilian Amazonia, where he worked at the *Brazilian Research Center for the Amazon region* (INPA), and over 5 years of work in Central Asia, where he coordinates an internation-

al, interdisciplinary project on land and water resource management in Khorezm, Uzbekistan. Other research projects in which he is involved include the role of soil organisms in conservation agriculture in Eastern and Southern Africa, and the role of termites in the formation of stable organic matter in tropical ecosystems. His current research interests focus on integrated concepts for improving sustainability of land use and specifically the management of biological soil resources in this context. He is a member and since 2004 co-speaker of the Board of the DesertNet, a competence network of German institutions dealing with the science needed for combating desertification. He has published more than 60 articles on tropical ecology, nutrient cycling, soil ecology and biodiversity in scientific journals, co-authored more than 15 papers on Central Asia, and (co-editor with H. Tiessen and P.L.G. Vlek): *Management of Organic Matter in Tropical Soils: Scope and Limitations* (Dordrecht: Kluwer, 2001).

Address: Dr. Christopher Martius, Center for Development Research (ZEF), University of Bonn, Walter-Flex-Strasse 3, 53113 Bonn, Germany.

Simon J.A. Mason (Switzerland), mediator SDM, environmental scientist, Swiss Federal Institute of Technology (ETH Zürich), Dr sc. (PhD) on water conflicts and cooperation in the Nile Basin. He was project coordinator of the sub-project water and conflict transformation of the NCCR North South, focusing on dialogue workshops for transforming water conflicts (2003-2006). Since 2005 he has been senior programme officer at the *Center for Security Studies* (CSS), ETH Zurich, in the “Mediation Support Project” (joint project with swisspeace), focusing on the determinants of third party intervention in effective mediation in peace processes. He has been a co-trainer of one week courses on water conflict analysis, negotiation and mediation at the Mediterranean Academy for Diplomatic Studies, University of Malta, and the Egyptian Ministry of Water Resources. Co-winner of the Junior Peter Becker prize in conflict and peace research (together with Y. Arsano). His publications include: *From Conflict to Cooperation in the Nile Basin* (ETH Zurich, 2004); “Are we scorpions?”, in: *Mountain Research and Development*, 25,2 (May 2005): 115-120; (co-author with K. Spillmann): “Transforming Environmental and Natural Resource Use Conflicts”, in: Cogoy, M.; Steining, K. (Eds): *The Economics of Global Environmental Change* (Cheltenham, UK - Northampton, MA: Edward Elgar 2007): 225-272.

Address: Dr. J.A. Simon Mason, Center for Security Studies, ETH Zurich/WEC, ETH Zentrum, Weinbergstr. 11, CH 8092 Zurich, Switzerland.

E-mail: <mason@sipo.gess.ethz.ch>.

Richard A. Matthew is associate professor of international and environmental politics in the Schools of Social Ecology and Social Science, University of California at Irvine (UCI), and director, Center for Unconventional Security Affairs

(<www.cusa.uci.edu>) and of the Global Environmental Change and Human Security Research Office (<www.gechs.uci.edu>), both at UCI. His research focuses on international relations in the developing world, especially on South Asia, and he has published widely on transnational security threats including environmental change, terrorism and landmines. Recent books and co-edited volumes include: *Contested Grounds: Security and Conflict in the New Environmental Politics* (1999); *Dichotomy of Power: Nation versus State in World Politics* (2002); *Conserving the Peace: Resources, Livelihoods, and Security* (2002); *Reframing the Agenda: The Impact of NGO and Middle Power Cooperation in International Security Policy* (Praeger 2003); and *Landmines and Human Security: International Relations and War's Hidden Legacy* (2004).

Address: Prof. Dr. Richard A. Matthew, Social Ecology I, University of California, Irvine, Irvine, California, 92697-7075, USA.

Email: <rmatthew@uci.edu>.

Website: <www.cusa.uci.edu>.

Nadine May (Germany) is a consultant with VDI/VDE-IT GmbH. From 2001 to 2005 she attended the Technical University of Braunschweig and obtained a degree in geo-ecology. She wrote her diploma thesis on "Ecobalance of a Solar Electricity Transmission from North Africa to Europe" at the Institute of Technical Thermodynamics of the German Aerospace Centre (DLR) in Stuttgart in 2005. From 2006 to 2007, she was project manager at GAB Consulting GmbH in Lamstedt, investigating the fate and behaviour of pesticides. Since 2007, she has been working for VDI/VDE-IT GmbH as a consultant in the field of Renewable Energies co-ordinating and managing national and European R&D projects. Furthermore, she was involved in the evaluation of the "Export Initiative Renewable Energies" and has published: "Solarthermische Kraftwerke - Hoffnungsträger für eine zukunftsfähige Energieversorgung", in: *FORUM der Geökologie*, 18,2 (2007): 26-31.

Address: Ms. Nadine May, VDI/VDE Innovation + Technik GmbH, Steinplatz 1, D-10623 Berlin, Germany.

Email: <may@vdivde-it.de>.

Bryan McDonald is the assistant director of the Center for Unconventional Security Affairs at the University of California, Irvine (UCI). He received a Ph.D. in social ecology from the University of California, Irvine in 2008 and a M.A. in political science from Virginia Tech in 1999. His research examines the changing shape of world politics since the end of the cold war with a focus on international, human, and environmental security. He is co-editor of *Landmines and Human Security: International Politics and War's Hidden Legacy* (2004) and *Global Environmental Change and Human Security* (forthcoming 2009). His work has been published in: *Democracy & Society*, *The Canadian Journal of Political Science*, *Global Environmental Politics*, *Organization & Environment*, *the Natural Resources Journal*, *Environment, Politics and the Life Sciences*, *International Environmental Agreements*, and the *Environmental Change and Security Project Report*. He has

presented papers at meetings of the: *The American Political Science Association*, *The International Studies Association*, and *The American Collegiate Schools of Planning*.

Address: Dr. Bryan McDonald, Social Ecology I, University of California, Irvine, Irvine, California, 92697-7075, USA.

J.R. McNeill (USA) was born in Chicago on 6 October 1954. He studied at Swarthmore College and Duke University, where he completed a Ph.D. in 1981. Since 1985 he has taught some 2,500 students at Georgetown University, in the History Department and School of Foreign Service, where he held the Cinco Hermanos Chair in Environmental and International Affairs before becoming university professor in 2006. His research interests lie in the environmental history of the Mediterranean world, the tropical Atlantic world, and Pacific islands. He has held two Fulbright awards, a Guggenheim fellowship, a MacArthur grant, and a fellowship at the Woodrow Wilson Center. He has published more than 40 scholarly articles in professional and scientific journals. His books are: *The Atlantic Empires of France and Spain, 1700-1765* (Chapel Hill: University of North Carolina Press, 1985); (co-ed. with Alan L. Karras): *Atlantic American Societies from Columbus through Abolition* (London: Routledge, 1992); *The Mountains of the Mediterranean World* (New York: Cambridge University Press); (Ed.): *The Environmental History of the Pacific World* (London: Variorum, 2001); *Something New Under the Sun: An Environmental History of the Twentieth-century World* (New York: Norton, 2000), co-winner of the World History Association book prize, the Forest History Society book prize, and runner-up for the BP Natural World book prize, and translated into 6 languages; and most recently *The Human Web: A Bird's-eye View of World History* (New York: Norton, 2003), co-authored with his father William H. McNeill. He also edited or co-edited five more books, including the *Encyclopedia of World Environmental History* (New York: Routledge, 2003). He is currently working on a history of yellow fever in the Americas from the 17th through the 20th centuries.

Address: Prof. Dr. John R. McNeill, Department of History, Georgetown University, Washington DC 20057, USA.

Email: <mcneillj@georgetown.edu >.

Czeslaw Mesjasz (Poland): Dr hab., associate professor, Faculty of Management, Cracow University of Economics, Cracow, Poland. See *biographies of editors*.

Isabelle Milbert (France, Switzerland) is a professor at the Graduate Institute of International and Development Studies, Geneva, where her teaching and research specialization includes urban management, governance, international cooperation strategies and modern Indian studies. From 2001 to 2008, she has headed two research projects on governance, law and public policies, in Latin America and in India. She is presently member of the Executive Committee of EADI (*European Association of Development Institutes*)

and Associate Researcher at the South Asia Research Centre (Paris, CNRS). Her publications include: *What Future for Urban Cooperation? An Assessment of Post-Habitat Strategies* (Bern: SDC, 2000); "Alliances in International Co-operation: A Change of Paradigm in Urban Governance?", in: Westendorff, D. (Ed.), 2004: *From Unsustainable to Inclusive Cities* (Geneva: UNRISD): 185-205; "Slums, slum dwellers and multilevel governance", in: *EJDR*, 18,2 (2006): 299-318; "Gouvernance et mondialisation", in: Cadène, Ph. (Ed.), 2007: *Mondialisation. L'intégration des pays en développement* (Paris: SEDES); "L'économie et la société en Inde", in: Godement, F.; Delamotte G. (Ed.), 2007: *Géopolitique de l'Asie* (Paris: Editions Colin): 39-67; "La lente urbanisation de l'Inde", in: *Urbanisme*, No. 355 (July-August 2007): 41-46. Her PhD is on Indian urban law and public policies and received the prize of the best PhD thesis (University of Paris II, 1986).

Address: Prof. Dr. Isabelle Milbert, GIIDS, 20, rue Rothschild, cp.136, 1211 Geneva 21, Switzerland.

E-mail: <isabelle.milbert@graduateinstitute.ch>.

David Newman (Israel), Ph.D (University of Durham, UK, 1981) is professor of political geography and geopolitics, Department of Politics and Government, Ben Gurion University, Israel. He is co-editor of *Geopolitics*, a quarterly peer reviewed journal published by Taylor & Francis (Routledge). He has been at Ben Gurion University since 1987, in the Department of Geography until 1997, when he founded and chaired the Department of Politics and Government. From 1996-1998 he was Director of the Hubert Humphrey Institute for Social Research at Ben Gurion University. In 2003 he facilitated the founding of the *Centre for the Study of European Politics and Society* (CESPS) at the University. He was the Leverhulme Professor of Geopolitics at the University of Bristol, UK, in 2006-07. His recent publications include: "The geopolitics of peacemaking in Israel-Palestine", in: *Political Geography*, 21,5 (1999): 629-646; "On borders and power: A Theoretical Framework", in:

Journal of Borderland Studies, 18,1 (2002): 13-25; "Conflict at the interface: The impact of boundaries and borders on contemporary ethno-national conflict," in: Flint, Colin (Ed.): *Geographies of War and Peace* (Oxford: Oxford University Press, 2003); "The resilience of territorial conflict in an era of globalization", in: Kahler, Miles; Walters, Barbara (Eds.): *Territory, Conflict and Globalization* (Cambridge: Cambridge University Press, 2004); "The lines that continue to separate us: Borders in our borderless world", in: *Progress in Human Geography*, 30,2 (2006) 1-19; "Geographic Discourses: The Changing Spatial and Territorial Dimensions of Israeli Politics and Society", in: *Israel Studies*, 13, 1 (2008) 1-15; "Borders and bordering: towards an interdisciplinary dialogue", in: *European Journal of Social Theory*, 9,2 (2006), 171-186; "The academic boycott of Israel", in: *Israel Journal of Foreign Affairs*; 2,2 (2008), 45-56; "Geographic Discourses: The Changing Spatial and Territorial Dimensions of Israeli Politics and Society", in: *Israel Studies*, 13,1 (2008), 1-15; "The formation of national identities in Israel / Palestine: The construction of spatial knowledge and the contested territorial narratives", in: Slocum, Nikki (Ed.): *Promoting Conflict or Peace through Identity* (Aldershot: Ashgate, 2008); "The Renaissance of a Border which Never Died: The Green Line between Israel and the West Bank", in: Diener, Alexander; Hagen, Joshua (Eds.): *Border Lines: History and Politics of Odd International Borders* (Lanham, MD: Rowman & Littlefield, 2009); "Theorizing Borders: New Directions in Border Studies", in: Wastl-Water, Doris (Ed.): *Research Companion to Border Studies* (Aldershot: Ashgate, 2009).

Address: Prof. Dr. David Newman, Department of Politics and Government, Ben Gurion University, Beer Sheva, Israel 84105.

Matthew Norton (UK) is currently a Ph.D. researcher at the Sociology Department of Yale University. Previously he was the coordinator of the Department of International Peace Studies and a lecturer at the University for Peace in San José (Costa Rica). He obtained an MA in Conflict Resolution from Bradford University (UK) and a BA in Philosophy from Villanova University (US). He has focused on a linked series of questions relating to conflict, culture, sentiment, epistemology, and politics in a variety of professional and research settings. He is currently looking at the study of war from the vantage of meaning, the construction and destruction of moral communities, the role of art in enabling solidarity, and the interface of culture and disaster. He has published in the: *Journal of Political and Military Sociology*.

Address: Dr. Matthew Norton, Department of Sociology, Yale University, P.O. Box 208265, New Haven CT 06520-8265, USA.

Ernst-August Nuppenau (Germany): PhD (agricultural economics, University of Kiel), is a professor of environmental

and agricultural policy analysis, University of Giessen, Germany. He has worked in several projects of resource conservation and spent two years in Zimbabwe for development studies. His current research interest and focus is on the efficiency of water use and spatial optimization of irrigation systems as well as on the economics of salinity. Major publications include: "How multi-functionality can translate into non-trade concerns in the WTO: on price transmission and competition between constituencies", in: *International Journal of Agricultural Resources, Governance and Ecology*, 4,3/4: 306-326; "Biodiversity Management through Compensation Payments for Landscape Elements: On Spatial Aspects in Bio-Economic Modeling to get Cost Effectiveness", in; Kontoleon, A.; Pascual, U.; Swanson, T. (Eds): *Frontiers in Bio-economic Modelling* (Cambridge: Cambridge University Press): 446-477; (with Fang Lan): "Adoption of Efficient Irrigation Technologies in a Spatial Model for Water Use", in: *Journal of Quantitative and Technical Economics*, 23,3 (2006): 85-94. He has also contributed chapters to various books.

Address: Prof. Dr Ernst-August Nuppenau, Institut für Agrarpolitik und Marktforschung, Justus-Liebig-Universität, Senckenbergstrasse 3, D-35394 Giessen, Germany.

Email: <ernst-august.nuppenau@agr.uni-giessen.de>.

P.S. Ramakrishnan (Palayanoor Sivaswamy Ramakrishnan) (India) is emeritus professor and Indian National Science Academy honorary senior scientist at the School of Environmental Sciences, Jawaharlal Nehru University. With a wide range of experiences working in universities and research institutions in India and abroad, in the interface of natural and social sciences, he has used knowledge systems (traditional and formal) as powerful tools for ensuring rural community participation in conservation linked sustainable development initiatives, based on a value system that they understand. He has been successful in converting his research results into policy and developmental initiatives, working in the broad area of ecology linked with sustaina-

ble development. With over 450 research articles and 23 research-based synthesis volumes, he has taken research results to society at large through policy documents, outreach volumes, and audio-visual documentaries.

Address: Prof. Dr. P.S. Ramakrishnan, School of Environmental Sciences, Jawaharlal Nehru University, New Delhi 110067, India.

Guénaél Rodier (France, Switzerland) is director, International Health Regulations Coordination Programme, World Health Organization (WHO), Geneva. His main degrees include an MD from René Descartes University, Paris, a MSc in clinical tropical medicine from the London School of Hygiene and Tropical Medicine (recipient of the Frederick Murgatroyd Award) and a qualification in public health from Ordre des Médecins, Paris. From 2000 to 2005, he was director, Communicable Disease Surveillance and Response, WHO, Geneva and has an extensive experience in emerging infections and epidemic control. He has been actively involved in the development of new WHO strategies, tools and guidelines for communicable disease surveillance and response, and initiated and supervised the revision of the International Health Regulations. He has coordinated international teams for outbreak investigations, research projects, and assessments of national surveillance systems in more than 30 countries. His work relates to the international control of avian influenza, SARS, viral haemorrhagic fevers (Ebola, Marburg), arboviruses (Rift valley fever, dengue, yellow fever), plague, cholera, Hantavirus, drug-resistant tuberculosis, and HIV infection. Dr Rodier started his career as a general practitioner in the Republic of Djibouti,

East Africa, from 1983 to 1989 then he joined the International Health Programme of the University of Maryland at Baltimore and was seconded to the U.S. Naval Medical Research Unit No. 3, Cairo, Egypt, from 1990 to 1994. He joined WHO, Geneva, in 1994. He has contributed to more than 70 scientific peer reviewed publications. Selected publications are: "WHO response to epidemics", in *World Health* (1997); (co-author with D. Heymann): "SARS: Lessons from a new disease - Preparing for the next disease outbreak. Learning from SARS", in: *US National Academies Press* (2004); (co-author with D. Heymann): "SARS: A Global Response to an International Threat", in *The Brown Journal of World Affairs* (2004); "Menace microbienne, santé publique et sécurité de l'Etat: l'urgence d'un investissement intersectoriel et d'une coopération internationale", in: *Géopolitique* (2006); "Implementing the International Health Regulations (2005) in Europe", in: *Eurosurveillance* (2006); "Global Public Health Security", in: *Emerging Infectious Diseases* (2007).

Address: Dr Guénaél Rodier, IHR Coordination Programme, World Health Organization, 20, Avenue Appia, 1211 Geneva 27, Switzerland.

Albrecht Schnabel (Germany) is a senior fellow at the Research Division of the *Geneva Centre for the Democratic Control of Armed Forces* (DCAF) in Geneva, Switzerland. Before joining DCAF, he was a senior research fellow at the Swiss Peace Foundation “swisspeace” in Bern. At swisspeace he directed the research programme on human security (HUSEC) and was responsible for the Bern-based team of the early warning programme FAST International. Previously he served as an academic officer in the Peace and Governance Programme of the United Nations University, Tokyo, Japan (1998-2003). He has taught at Queen’s University (1994), the American University in Bulgaria (1995-1996), the Central European University (1996-1998), Aoyama Gakuin University (2002-2003) and since 2004 at the University of Bern. In 1997 he was a visiting research fellow at the *Institute for Peace Research and Security Policy* (IFSH) at the University of Hamburg and participated in OSCE election monitoring missions in Bosnia-Herzegovina. Since 1999 he has served as a trainer for the UN System Staff College course on Early Warning and Early Response and, in 2001-02, as president of the International Association of Peacekeeping Training Centres. He was educated at the University of Munich, the University of Nevada, and Queen’s University, Canada, where he received his PhD in Political Studies in 1995. He has published widely on ethnic conflict, refugees, human security, conflict prevention and management, peacekeeping, post-conflict peace-building, including most recently: “The Human Security Approach to Direct and Structural Violence”, in: *SIPRI Yearbook 2008: Armaments, Disarmament and International Security* (Oxford: Oxford University Press, 2008): 87-96.

Address: Dr. Albrecht Schnabel, Geneva Centre for the Democratic Control of Armed Forces (DCAF), Rue de Chantepoulet 11, PO Box 1360, 1211 Geneva 1, Switzerland.

Max Schott (Germany/USA) is programme officer in the Human Security Unit, *Office for the Coordination of Humanitarian Affairs* (OCHA) of the United Nations Secretariat in New York. From 2001 to 2008 he worked at UNESCO Headquarters at the Office of the Assistant Director-General for Social and Human Sciences and within the Division for Human Rights, Human Security and Philosophy; as well as at the World Health Organization in Geneva. He has participated in the coordination of numerous regional and international research policy conferences on human security; in collaboration with diverse regional organizations such as the League of Arab States and ASEAN, among others. He has extensively travelled to West, East,

and Central Africa within the framework of several projects aiming, *inter alia*, at the establishment of regional think tanks, namely in Djibouti and Cape Verde; carried out in close cooperation with regional institutions such as ECOWAS and IGAD. He has also supervised projects tackling poverty and human security issues in Benin, Burkina Faso, Mali, Niger and Senegal. After studying political science and sociology at the Albert-Ludwigs-University of Freiburg and at the Sorbonne in Paris, he obtained the *Diplôme de Sciences Po* with a major in security and development issues from the *Institut d'Etudes Politiques de Paris*. He holds a *Diplôme d'Etudes Approfondies* in international relations from the *Ecole Doctorale de Sciences Po*, Paris. He has also lectured on 'human rights and development at the UN' for the Master's degree at the *Institut d'Etudes Politiques de Paris*.

Address: Mr. Max Schott, Human Security Unit, Office for the Coordination of Humanitarian Affairs (OCHA), United Nations Secretariat, New York, NY 10017, (USA).

Serena Eréndira Serrano Oswald (México), PhD candidate in social anthropology at the National Autonomous University of Mexico (UNAM). She holds a BA Hons in political studies and history from the *School of Oriental and African Studies* (SOAS) and an MSc in social psychology from the *London School of Economics and Political Science* (LSE), both at the University of London. Her particular areas of interest are: gender studies, identity, social representations, migration and the social and cultural construction of motherhood. She is currently working for a research project on HIV-AIDS and migration for the National Council of Science and Technology (CONACyT). In early 2008 she translated into Spanish selected chapters of the book: Brauch/Oswald Spring/Mesjasz/Grin/Dunay/Chourou/Kameri-Mbote/Liotta (Eds.): *Globalization and Environmental Challenges: Reconceptualizing Security in the 21st Century* (Berlin - Heidelberg - New York: Springer, 2008). She worked on women-related research projects for the pharmaceutical industry in Mexico. During 2003-2005, she was assistant editor for volume 39 of the *Encyclopedia on Life Support Systems* (EOLSS). Selected publications: "Migración, identidad y cultura: el caso de San Martín Tilcajete, Oaxaca. Incursiones desde una perspectiva multidimensional y de género", in: *Regiones y Desarrollo Sustentable*, 5,9 (July-December 2005): 33-49; "Género, Migración y Paz: Incursiones a una Problemática desde una Perspectiva Multidimensional e Incluyente", in: Oswald Spring, Úrsula (Ed.): *Resolución Noviolenta de Conflictos en Sociedades Indígenas y Minorías* (Mexico City: Colegio de Tlaxcala - UAEM - CLAIP - Fundación Heinrich Böll, 2004). She writes periodic articles for the Oaxacan journal *Mujeres*.

Address: Ms. Serena Eréndira Serrano Oswald, Priv. Rio Bravo #1, Col. Vistahermosa, Cuernavaca, Morelos, México C.P. 62290.

Mary Soledad L. Perpiñan (Philippines), founding chair and chief executive officer of the *Third World Movement Against the Exploitation of Women (TW-MAE-W)*, honorary chair and foundress of the IBON Foundation, Inc., a socio-economic databank and research centre, member of the International Advisory Board of the Global Health Council, Washington, D.C., has been Secretary General of the *Asia-Pacific Peace Research Association (APPRA)*, council member of the *International Peace Research Association (IPRA)*, and convenor of the Women and Peace Commission. She obtained an A.B. Humanities and B.S.E. *summa cum laude*; was a Fulbright scholar at Fordham University, New York, where she finished a master's degree in education; studied spirituality at the Gregorian University, Rome, and social analysis at INODEP under Sorbonne University, Paris. Among her publications are: *From Darkness to Light, Flint and Fire* (2008); has had many papers and articles published in books, journals and periodicals. She worked on commissioned research projects for the United Nations; among them: "Inroads of NGOs in the UN". She presented papers at international conferences on peace, women and religious studies, served as an UN expert on women issues and human rights, and participated in almost all major UN world conferences during the past 22 years. Popularly known as Sister Sol, she is a Good Shepherd Sister by vocation; an educator and writer by profession; an ecofeminist, peace practitioner and social activist by conviction. She was cited among the women activists worldwide of the 20th century in the "Roll of Honour" of the UN General Assembly Special Session five years after Beijing to be remembered and honoured, both in their lifetime, and beyond. She was among the '1000 Women for the Nobel Peace Prize 2005' nominees.

Address: Mary Soledad L. Perpiñan, 1043 Aurora Boulevard, Quezon City, Philippines 1108.

Franz Trieb (Germany) is project manager at the German Aerospace Centre (DLR), he has a diploma in mechanical engineering from University of Clausthal and doctorate in physics from the University of Oldenburg. He has worked in the field of renewable energies since 1983. After the implementation of hydrogen storage for an autonomous renewable energy system at the University of Oldenburg, Germany, he conducted a two-year postgraduate course 'Renewable Energy' at the National University of Tacna, Peru. Since 1994, he is project manager at the Institute of Technical Thermodynamics of the German Aerospace Centre (DLR) in Stuttgart, Germany, working on solar energy resource assessment by satellite remote sensing, market strategies for concentrating solar power and renewable energy scenarios. Two recent studies look at the future demand and the sustainable supply of electricity using the potential of renewable energy sources in the countries of the Mediterranean Region and Europe. Among his major publications and project reports are: "Assessment of the Potential for Diversification of Energy Sources in the Countries of the GCC", invited paper, *13th Annual Energy Conference Proceedings* (Abu Dhabi: Emirates Center for Strategic Studies and Research (ECSSR), 2008), i.p.; (co-author with: Müller-Steinhagen, Hans): "Concentrating Solar Power for Seawater Desalination in the Middle East and North Africa", in: *Desalination*, 220 (2008): 165-183; (co-author with: Müller-Steinhagen, Hans): "Europe-Middle East-North Africa Cooperation for Sustainable Electricity and Water", in: *Sustainability Science*, 2,2 (2007): 205-219; (co-author with: Müller-Steinhagen, Hans): "The DESERTEC Concept - Sustainable Electricity and Water for Europe, Middle East and North Africa", in: Knies, Gerhard; Möller, Uwe; Straub, Michael (Eds.): *Clean Power from Deserts - White Book, Club of Rome, Trans-Mediterranean Renewable Energy Cooperation*, (Hamburg: club of Rome, 2007): 23-44; "Concentrating Solar Power for Sea Water Desalination - AQUA-CSP", in: *Symposium Proceedings, Towards Innovative Desalination and Power Generation in Kuwait*, Kuwait Foundation for the Advancement of Sciences (KFAS), 9-11 December 2007: 242-256; "Sustainable Electricity and Water for Europe, Middle East and North Africa", invited keynote, European Parliament, Brussels, Belgium, 28 November 2007: (co-author Müller-Steinhagen, Hans): *Concentrating Solar Power for Seawater Desalination (AQUA-CSP)*, Internet Publication of Final Report of the AQUA-CSP Study, 12 November 2007, at: <www.dlr.de/tt/aqua-csp>; (co-authors Schillings, Christoph; Kronshage, Stefan; Viebahn, Peter; May, Nadine; Paul, Christian; Klann, Uwe; Kabariti, Malek; Bennouna, Abdelaziz; Nokraschy, Hani; Hassan, Samir; Yusef, Laila; Hasni, Tewfik; Bassam, Nasir; Satoguina, Honorat): *Trans-Mediterranean Interconnection for Concentrating Solar Power (TRANS-CSP)*, Internet Publication of Final Report of the TRANS-CSP Study, 23 June 2006, at: <www.dlr.de/tt/trans-csp>; (co-author Schillings, Christoph; Kronshage, Stefan; Viebahn, Peter; May, Nadine; Paul, Christian; Klann, Uwe;

Kabariti, Malek; Bennouna, Abdelaziz; Nokraschy, Hani; Hassan, Samir; Yusef, Laila; Hasni, Tewfik; Bassam, Nasir; Satoguina, Honorat): *Concentrating Solar Power for the Mediterranean Region (MED-CSP)*, Internet Publication of the MED-CSP Study Report, April 2005, at: <www.dlr.de/tt/med-csp>.

Address: Dr. Franz Trieb, Deutsches Zentrum für Luft- und Raumfahrt, Institute of Technical Thermodynamics, Pfaffenwaldring 38-40, D-70569 Stuttgart, Germany.

Thanh-Dam Truong (Netherlands/Vietnam), associate professor in women, gender and development studies at the *Institute of Social Studies* (ISS) where she has been on the staff since 1982. She received a Ph.D. in political and cultural studies from The University of Amsterdam in 1988. Prior to her present appointment she worked from 1973-1976 with the United Nations Development Programme in New York and in West Africa - on women in the informal sector; on desertification and changing livelihoods. In 1971 and 1972 she was a free lance journalist. She is one of the first scholars who wrote an academic analysis on sex tourism: *Sex, money and morality: Prostitution and Tourism in Southeast Asia* (London: Zed - New York: St. Martin Press, 1990). Her work has been translated into several languages (Dutch, Japanese, Indonesian, Thai and Spanish). Her continued interests in gender, culture and social justice have brought her to new areas of research on the gendered dimensions of global/local interactions and the challenges these pose to the field of human development and human security. Currently she coordinates the European Focal Point of the Open Research Centre on "Human Security in Global Cities Networks" funded by Chubu University (Nagoya, Japan) and the Japanese Government. She co-edited the volume: *Engendering Human Security: Feminist Perspectives* (London: Zed - New York: Palgrave Macmillan, 2006). She is also chief co-editor of the journal: *Gender, Technology and Development*.

Address: Prof. Dr. Thanh-Dam Truong, Institute of Social Studies, Kortenaerkade 12, 2518 AX The Hague, The Netherlands.

Email: <Truong@iss.nl>.

Website: <<http://www.iss.nl>>.

Anthony Turton (South Africa): is a unit fellow at the *Council for Scientific and Industrial Research* (CSIR) and an extraordinary professor in the Water Institute at University of Pretoria. He is a product of the Water Issues Research Group at SOAS and has a D.Phil. degree in international relations from the University of Pretoria. He is a founding member and past president of the Universities Partnership for Transboundary Waters, a consortium of ten universities on five continents with a special interest in transboundary river basin management. His professional background is strategic planning and political risk assessment. His current research interests revolve around the management of rivers that cross international borders. An active writer, he has edited a number of books including: *Water Wars: An Enduring Myth or Impending Reality? African Dialogue Monograph Series No. 2*. (Durban: Accord

Publishers, 2000); (co-ed. with Hussein Solomon): *Hydro-politics in the Developing World: A Southern African Perspective* (Pretoria: African Water Issues Research Unit, 2002); (co-ed. with Roland Henwood); (co-ed. with Peter Ashton and Eugene Cloete): *Transboundary Rivers, Sovereignty and Development: Hydropolitical Drivers in the Okavango River Basin* (Pretoria - Geneva: AWIRU & Green Cross International, 2003); (co-ed. with Hanlie Hattingh, Gillian Maree, Dirk Roux, Marius Claassen and Wilma Strydom): *Governance as a Trialogue: Government-Society-Science in Transition* (Berlin: Springer Verlag, 2007). He has also contributed a number of chapters to various books.

Address: Dr. Anthony Turton, Room AB18, Building 2I, Natural Resources and Environment (NRE), Council for Scientific and Industrial Research (CSIR), P.O. Box 395, Pretoria, 0001, Republic of South Africa.

Robin Twite (Israel) has been the director of the Water and Environment Programme at the *Israel Palestine Center for Research and Information* (IPCRI) since 1993. This non-governmental organization is based in Jerusalem and is managed jointly by Israelis and Palestinians. The Water and Environment Programme (funded by international donors) is designed to create closer relationships between Israelis and Palestinians by giving them opportunities to work together on environmental issues. Previously he was for thirty years a career officer in the British Council during which time he served in the Middle East for a decade and as director of the Council's worldwide network of libraries and information services.

Address: Robin Twite, 10 Noah Emmanuel St, Jerusalem 95103, Israel and: PO Box 9321, Jerusalem 91092, Israel.

Email: Robin@ipcricri.org.

Website: <www.ipcricri.org>.

Juha I. Uitto (Finland): Ph.D. (Lund University), M.Sc. (University of Helsinki), senior evaluation adviser, *United Nations Development Programme* (UNDP). He is a geographer with expertise in environmental policy and governance, natural resources management, and environmental hazards and vulnerability. An international development professional with more than twenty years of experience, he is an expert in programme and project management, monitoring and evaluation. He currently leads the UNDP Evaluation Office work on country and regional programme evaluations in Asia and Pacific, Europe and CIS, and Arab States. During his tenure with the United Nations University in Tokyo, Japan (1990-99), he was senior academic programme officer on environment and sustainable development. In this capacity, he initiated the project on urban social vulnerability with Ben Wisner. He has published peer reviewed articles in journals such as: *Applied Geography*, *Asia Pacific Viewpoint*, *The Geographical Journal*, *Geographical Review of Japan*, *Energy Policy*, *Environmental Hazards* and *Global Environmental Change*. His edited books include: (with A.K. Biswas): *Water for Urban Areas: Challenges and Perspectives* (UNU Press 2000); (with Labor

Janský): *Enhancing Participation and Governance in Water Resources Management: Conventional Approaches and Information Technology* (UNU Press 2006). He serves as council member of the American Geographical Society and is past board director of the World Seismic Safety Initiative.

Address: Dr. Juha I. Uitto. UNDP Evaluation Office, One UN Plaza, New York, NY 10017, USA.

Gareth M. Winrow (United Kingdom): formerly professor in the Department of International Relations at Istanbul Bilgi University. He lived and worked in Turkey for 20 years having studied at the universities of Oxford (BA Hons. in modern history), Lancaster (MA in international relations and strategic studies) and Manchester (Ph.D. in the Department of Government). A recipient of two NATO Research Fellowships and of a US Institute of Peace Fellowship, he is on the editorial board of the journal, *Turkish Studies*, and is a member of Chatham House (London). He has worked as a consultant on Turkish politics and energy and security issues. His publications include articles in journals such as: *Middle East Journal*, *Journal of Southeast European and Black Sea Studies*, *Central Asian Survey*, *European Security*, *Il Politico*, *Jane's Intelligence Review*, and *Mediterranean Security*. His books and monographs include: *Turkey in Post-Soviet Central Asia* (1995); (co-author with Kemal Kirisci): *The Kurdish Question and Turkey: An Example of a Trans-State Ethnic Conflict* (1997); *Turkey and Caspian Energy* (1999); *Dialogue with the Mediterranean: The Role of NATO's Mediterranean Initiative* (2000); *Turkey and the Caucasus: Domestic Interests and Security Concerns* (2000).

Ben Wisner (USA) began work in Tanzania in 1966 (living for 2 years in a Tanzanian *ujamaa* village). During 1966-1995 he worked mostly in Africa on questions concerning wood fuel and rural energy, water and sanitation, drought, flood, community health and food security, summarizing much of this work in: *Power and Need in Africa* (London: Earthscan, 1988). He has taught in the medical school of Dar es Salaam University; in geography at Eduardo Mondlane University, Maputo, Mozambique; at the Swiss Technical Institute in Zürich; New School for Social Research; Rutgers University; Hampshire College; California State University at Long Beach. His work took an additional urban turn in the mid 1990's, and he lead a 4 year program on “The Geography of Urban Social Vulnerability” for the

United Nations University, was on the board of the Earthquakes and Megacities Initiative (1997-2002), and worked with ISDR on school safety. He was lead author of: *At Risk* (London: Routledge, 2004); lead editor of: *Towards a New Map of Africa* (London: Earthscan, 2006). He is research fellow at DESTIN, London School of Economics and Benfield Hazard Research Centre, University College London, and visiting professor of environmental studies, Oberlin College. He advises the Asian Disaster Prevention Center, Bangkok, Reuters AlertNet in London, and the UN University, Institute for Environment and Human Security (UNU-EHS), among other advisory roles.

Address: Dr. Ben Wisner, 373 Edgemoor Place, Oberlin, OH 44074, USA.

Julia Wunderer (Germany), received a diploma in political science from the Free University of Berlin in 2005 with a diploma thesis on “Conflicts on Water Resources in Central Asia” on which the chapter in this volume is based. She worked as trainee from 2005 to 2006 in the Hertie Foundation in Frankfurt/Main and since then at the Faculty of Law and the International Office of Humboldt-University of Berlin. Her research interest focuses on conflict analysis, environmental conflicts, and on East European countries in transitions.

Address: Ms. Julia Wunderer, Warschauer Straße 45, 10243 Berlin, Germany.

Surichai Wun'Gaeo teaches sociology at Chulalongkorn University. He has formerly served as deputy director of research at the University's Institute of Asian Studies. He has been a visiting professor at several universities including Hitotsubashi and Ritsumeikan Universities in Japan and University of Illinois at Urbana-Champaign. His main research interests are in sociology especially public participation in research and policy-making process. He has written and published extensively on topics including rural society, culture, alternative development paradigms, globalization and cultural identity. He received his B.A. (Hons.) in sociology from Chulalongkorn University and had his post-graduate studies in sociology from the University of Tokyo. He currently serves as the president of the *Asian Rural Sociological Association* (ARSA) and is also a director of *Chulalongkorn University Social Research Institute* (CUSRI). In addition, he is also a member of the M-Power Mekong Program on Water, Environment and Resilience. His publications include: *Human Security in a Borderless World* and *Rural Livelihoods and Human Insecurities in Globalizing Asian Economies*.

Address: Prof. Dr. Surichai Wun-Gaeo, Department of Political Science, Chulalongkorn University, Phayathai Rd, Bangkok 10330, Thailand.

Email: <surichai1984@yahoo.com >.

Michael Zammit Cutajar (Malta) was executive secretary of the UN Framework Convention on Climate Change (1996-2002). See: *Biographies of authors of forewords and preface essays*.

Werner Zittel (Germany), Dr. rer. nat., has been working with *Ludwig-Bölkow-Systemtechnik* (LBST) GmbH, Ottobrunn since 1989. He obtained a PhD in physics while working at the Max-Planck-Institute for Quantum Optics in Garching, and at the Technical University of Darmstadt (1982-1987). Then he worked at the Institute for Technical Physics, of the DFVLR (now DLR) in Stuttgart (1987) and from 1987-1989 he was a scientific researcher at the Fraunhofer Institute for Solid State Technology in Munich. His research projects have focused on: climate change effects of the trace gas methane (especially in Russia); external and social costs of energy use in the public transport sector; studies on the energetic amortization of renewable energy generation technologies; use of hydrogen in existing natural gas grids; hydrogen production from biomass; analysis of the existing hydrogen markets; introduction scenarios for hydrogen into the energy and transport economy; fundamental questions of the power industry; analysis of fossil resource availability and advanced hydrogen storage systems for automotive use: He is a member of the Association for the Study of Peak Oil; Germanwatch e.V.; Global Challenges Network e.V.; and Vice-President of ASPO [*The Association for The Study of Peak Oil and Gas*] Germany e.V. Among his major publications are: Campbell, Colin J.; Liesenborghs, Frauke; Schindler, Jörg; Zittel, Werner: *Ölwechsel* (München: Deutscher Taschenbuch Verlag, 2002, 2007); Strobl, Wolfgang; Zittel, Werner: "Effiziente Energieanwendung - Energie und Verkehr", in: Rebhan, E. (Ed.): *Energiehandbuch - Gewinnung, Wandlung und Nutzung von Energie* (Berlin - Heidelberg: Springer Verlag): 713-783.

Address: Dr Werner Zittel, Ludwig-Bölkow-Systemtechnik GmbH, Daimlerstrasse 15, 85521 München-Ottobrunn, Germany.

Email: <zittel@lbst.de>.

Mattanyah Zohar (Israel), Ph.D, was born in Germany in 1938. As his family perished or scattered during the Nazi persecutions, he was saved when he was sent to his family in Turkey. In Turkey and India he had his basic education. During the 1950's and 1960's he worked as a sailor and technician in several European countries. In 1970 he immigrated with his wife to Israel. After completing his military service, he began studying archaeology and assyriology at The Hebrew University in Jerusalem. He worked with the *Mission archeologique Tell Yarmouth* sponsored by the French C.N.R.S. Paris and with the Israel Department of Antiquities on various excavations which were published in: *Israel Exploration Journal* and *Atiqot, The New Encyclopedia of Archaeological Excavations in the Holy Land, The Oxford Companion to Archaeology* and in several monographs on the burial customs of semi-nomadic populations of the Near East, linguistics, etc. His Ph.D. dissertation:

Early Transition Periods in the Archaeology of Syria-Palestine at the Institute of Archaeology of the Hebrew University (1993) attributed the rise and decline of ancient Near Eastern cultures to factors beyond the scope of human capability, in particular to climate change what was then flatly rejected by academic circles. He continued working for the Department of Antiquities and as lecturer for prehistory on specialized study tours in the Balkan countries, Anatolia, and Caucasia. By 2000 he joined Prof. Arie Issar, hydrogeologist at Ben Gurion University, Beer Sheva, with whom he co-authored: *Climate Change - Environment and Civilization in the Middle East* (Berlin - Heidelberg - New York: Springer 2004, 2007).

Address: Dr. Mattanyah Zohar, Rehov Mishlat 12 b, Po.B. 82548, 90805 Mevasseret Zion, Israel.

Hexagon Series on Human and Environmental Security and Peace (HESP)

This book series includes monographs and edited volumes that cross scientific disciplines and develop common ground among scientists from the natural and social sciences, as well as from North and South, addressing common challenges and risks for humankind in the 21st century.

The 'hexagon' represents six key factors contributing to global environmental change – three *nature-induced* or supply factors: *soil*, *water* and *air* (atmosphere and climate), and three *human-induced* or demand factors: *population* (growth), *urban systems* (habitat, pollution) and *rural systems* (agriculture, food). Throughout the history of the earth and of *homo sapiens* these six factors have interacted. The supply factors have created the preconditions for life while human behaviour and economic consumption patterns have also contributed to its challenges (increase in extreme weather events) and fatal outcomes for human beings and society. The series covers the complex interactions among these six factors and their often extreme and in a few cases fatal outcomes (hazards/disasters, internal displacement and migrations, crises and conflicts), as well as crucial social science concepts relevant for their analysis.

Further issues related to three basic areas of research: approaches and schools of environment, security, and peace, especially in the environmental security realm and from a human security perspective, will be addressed. The goal of this book series is to contribute to a fourth phase of research on environmental security from a normative peace research and/or human security perspective. In this series, the editor welcomes books by natural and social scientists, as well as by multidisciplinary teams of authors. The material should address issues of global change (including climate change, desertification, deforestation), and its impacts on humankind (natural hazards and disasters), on environmentally-induced migration, on crises and conflicts, as well as for cooperative strategies to cope with these challenges either locally or in the framework of international organizations and regimes.

From a human-centred perspective, this book series offers a platform for scientific communities dealing with global environmental and climate change, disaster reduction, human, environmental and gender security, peace and conflict research, as well as for the humanitarian aid and the policy community in national governments and international organizations.

The series editor welcomes brief concept outlines and original manuscripts as proposals. If they are considered of relevance, these proposals will be peer-reviewed by specialists in the field from the natural and the social sciences. Inclusion in this series will also require a positive decision by the publisher's international editorial conference. Prior to publication, the manuscripts will be assessed by the series editor and external peer reviewers.

Mosbach, Germany, October 2008

Hans Günter Brauch,
Free University of Berlin, UNU-EHS and AFES-PRESS

Hexagon Series on
Human and Environmental Security and Peace (HESP)

Edited by
Hans Günter Brauch,
Free University of Berlin, UNU-EHS and AFES-PRESS

- Vol. 1: Hans Günter Brauch, P. H. Liotta, Antonio Marquina, Paul Rogers, Mohammad El-Sayed Selim (Eds.): *Security and Environment in the Mediterranean - Conceptualising Security and Environmental Conflicts. With Forewords by the Hon. Lord Robertson, Secretary General of NATO, and the Hon. Amre Moussa, Secretary General of the League of Arab States* (Berlin - Heidelberg - New York: Springer, 2003).
- Vol. 2: Hillel Shuval, Hassan Dweik (Eds.): *Water Resources in the Middle East: Israel-Palestinian Water Issues - from Conflict to Cooperation* (Berlin - Heidelberg - New York: Springer-Verlag, 2007).
- Vol. 3: Hans Günter Brauch, Úrsula Oswald Spring, Czeslaw Mesjasz, John Grin, Pál Dunay, Navnita Chadha Behera, Béchir Chourou, Patricia Kameri-Mbote, P.H. Liotta (Eds.): *Globalization and Environmental Challenges: Reconceptualizing Security in the 21st Century* (Berlin - Heidelberg - New York: Springer-Verlag, 2008).
- Vol. 4: Hans Günter Brauch, Úrsula Oswald Spring, John Grin, Czeslaw Mesjasz, Patricia Kameri-Mbote, Navnita Chadha Behera, Béchir Chourou, Heinz Krummenacher (Eds.): *Facing Global Environmental Change: Environmental, Human, Energy, Food, Health and Water Security Concepts* (Berlin - Heidelberg - New York: Springer-Verlag, 2009).
- Vol. 5: Hans Günter Brauch, Úrsula Oswald Spring, Czeslaw Mesjasz, John Grin, Patricia Kameri-Mbote, Béchir Chourou, Pál Dunay, Jörn Birkmann (Eds.): *Coping with Global Environmental Change, Disasters and Security - Threats, Challenges, Vulnerabilities and Risks* (Berlin - Heidelberg - New York: Springer-Verlag, 2009/2010), in press.
- Vol. 6: Czeslaw Mesjasz: *Stability, Turbulence or Chaos? Systems Thinking and Security* (Berlin - Heidelberg - New York: Springer-Verlag, 2010), in preparation.

Authors or editors who would like to have their publication projects considered for inclusion in this series should contact both the series editor:
