THE AMERICAN INSTITUTE OF ARCHITECTS

RAMSEY AND SLEEPER

ARCHITECTURAL GRAPHIC STANDARDS

SIXTH EDITION

THE AMERICAN INSTITUTE OF ARCHITECTS

PRESENTING THE

SIXTH EDITION

OF THE LATE AUTHORS

CHARLES G. RAMSEY

AND

HAROLD R. SLEEPER

The American Institute of Architects proudly presents this new edition of Architectural Graphic Standards. Many individuals and members have contributed generously to the preparation of its plates. To them the Institute extends its thanks.

It can be stated without qualification that this standard refernce work should be in every architect's office. The very fact that it has been published in five previous editions is testimony to its usefulness. In this time of technological transformation, The American Institute of Architects is inincreasingly obligated to provide authoritative practice aids. Six years in preparation, this book with painstaking research helps to meet that responsibility. We sincerely hope that you find it useful.

Rex Whitaker Allen, FAIA

FOREWORD

Architectural Graphic Standards was initially authored in 1932 by Charles George Ramsey, AIA, and Harold Reeve Sleeper, FAIA. Since then, this encyclopedia has served as a major reference guide serving architects, engineers, designers, builders, decorators, homeowners, draftsmen, and students. Keeping with the high standards and traditions of the late authors, the Sixth Edition represents the optimum judgment on current standards and practice and is the joint effort of The American Institute of Architects and John Wiley & Sons, Inc. Because of its breadth of scope the book reflects a contribution from the entire profession of architects.

The Sixth Edition is entirely new in organization and format but carries on the philosophy of earlier editions. It remains a source book and standards guide, and not a book of experimental, exotic or sophisticated techniques. It illustrates proven and current practice. The book will be exceptionally valuable to its users for establishing the general parameters of design in the early stages of a project. Although it includes overall design guidelines, it does not attempt to influence the technique of building construction since this process is the province of the practitioner. Throughout, an effort has been made to present materials free of bias in design either in a traditional or contemporary sense.

The reader will note that in organizing the Sixth Edition the authors supported a 16-part organizational sequence upon which the Uniform System for Construction Specifications, Data Filing and Cost Accounting* was to be based. It was anticipated, however, that Architectural Graphic Standards' fundamental emphasis upon the graphic presentation of construction details would require a degree of departure from the evolving Uniform System. Deviations did develop and are indicated by differences between chapter titles in Architectural Graphic Standards and corresponding division titles in the Uniform System (see statement on Table of Contents page). Essentially, the 16-part idea is utilized to make the Sixth Edition easier to use for those familiar with the System. For others, it can serve as an introduction to the logic and convenience of a standardized sequence for information within the building industry.

The user of Architectural Graphic Standards can be assured that every page has been subject to careful review and analysis and represents the best effort possible within the constraint of space and time. Some readers will also regret the omission of certain plates—for example, the beautiful sketch of a Georgian Town Clock, and its replacement by an equally elegant Clock and Carillon Tower to meet present day needs and usage. However, in some cases, we have retained material from earlier editions since it would be nearly impossible to find such material outside of the Library of Congress if it were needed in a work of archeological restoration or alteration. Such examples can be found in the fireplace section.

In summary, the Editorial Advisory Committee, editor, coordinating editors, and project directors have attempted to provide the user of Architectural Graphic Standards with the basic information needed for day to day actual practice; by indicating guidelines for construction applicable to the entire architectural spectrum, ranging from the humble shed to the complex curtain wall high rise building. We have not thrown away the past, nor have we endeavored to fill the book with the complicated and specialized world of technology which is coming in the next decade.

WALKER G. STONE
Vice President
John Wiley & Sons, Inc.

New York, N.Y.
June 30, 1970

PREFACE

For generations of architects, engineers, draftsmen and builders, Architectural Graphic Standards will need no introduction. It has been their drafting room companion since 1932 when the 233-page First Edition, authored by Charles George Ramsey, AIA, and Harold Reeve Sleeper, FAIA, was published by Wiley. In the subsequent four editions, including the Fifth published in 1956, these authors revised, modernized, added new pages and dropped obsolete ones until the Fifth Edition contained 758 pages, and the work was established as the architects' and building industry's reference bible. With every edition, the task of updating required more and more time for research, analysis, and plate development and this activity became in essence Harold R. Sleeper's career and his major contribution to the architectural profession. During Sleeper's last years, and after work on the Sixth Edition had begun, he invited his publisher to carry on this work. He also expressed the hope that The American Institute of Architects would assume authorship and carry on his, Ramsey's, and his publisher's graphic standards philosophy for the benefit of future generations of practitioners.

In 1962, Walker G. Stone, an Architectural Engineering graduate of the University of Illinois, with a position at that time as Editor-in-Chief, Professional Publications, and later Vice President of Wiley, began discussion with William H. Scheick, Executive Director of the AIA, with the objective of carrying out Sleeper's expressed wish. The AIA responded favorably since a new edition of Architectural Graphic Standards, reflecting the rapidly changing techniques of contemporary building, was in keeping with the Institute's goal of serving its membership and the building industry with authoritative practice aids. In 1963, Wiley and the AIA jointly established an Advisory Board on Architectural Graphic Standards to advise both parties on the feasibility, contents and format of the project. The members of the ten man board were Walker G. Stone, Wiley, New York, New York; John C. Anderson, AIA, Minneapolis, Minnesota; Joseph N. Boaz, AIA, Atlanta, Georgia; Harold D. Hauf, FAIA, Los Angeles, California; Dean F. Hilfinger, FAIA, Bloomington, Illinois; Gershon Meckler, PE, Toledo, Ohio; Edwin T. Pairo, AIA, Washington, D.C.; F. Spencer Roach, AIA, Philadelphia, Pennsylvania; Harry E. Rodman, FAIA, Troy, New York, and Jack Train, FAIA, Chicago, Illinois.

Thus in July, 1964, on the basis of the Advisory Board's report, Wiley and the AIA agreed as publisher and author to produce this Sixth Edition. Joseph N. Boaz, AIA, former Professor of Architecture, School of Design, North Carolina State University and now with the architectural firm of Toombs, Amisano and Wells, Atlanta, Georgia, accepted the invitation to become its editor. His leave of absence was arranged through the willing support of the Dean of the School of Design, Henry Kamphoefner, FAIA. He immediately took up residence in New York City where the project became headquartered in space provided by Wiley.

The Advisory Board's recommendations had made it clear that the new edition would be a completely new book, not simply a revision. To assist the Editor in determining content, organization and format, a smaller Editorial Advisory Committee succeeded the earlier ten man board. The committee was composed of the following: Harold D. Hauf, FAIA, then with the architectural firm of Charles Luckman Associates of Los Angeles and later Professor of Architecture at the University of Southern California; Louis DeMoll, FAIA, partner of the Ballinger Company, Architects and Engineers of Philadelphia, Pennsylvania; Dean D. Kenneth Sargent, FAIA, School of Architecture, Syracuse University; and ex officio committee members Walker G. Stone, Project Director for Wiley, and myself, bearing project management responsibility for the AIA.

In the initial 14 months, Editor Boaz devoted full time to the project at Wiley's office in New York City and for the year and a half following his September, 1965, return to his teaching duties in North Carolina, he was able to continue direction of the work on a part-time basis. During the period February, 1965, to February, 1966, he was ably assisted by William Tashlick, AIA, Assistant to the Editor, now with the Rouse Co., Columbia, Maryland, and Wiley's architectural drafting staff, headed up by Chief Draftsman David Edward Miller, an architectural student of Rensselaer Polytechnic Institute. During this 20-month period, Editor Boaz undertook the staggering task of determining the detailed contents of the book, its organization, the graphic design of typical pages, including typography, and the meticulous research and assembly of definitive data sources and technical files for each subject. He worked closely with many authors of technical references, with trade associations, and with scholars with specialized knowledge. At the same time, he and his assistant supervised the Wiley drafting staff in the production of approximately 200 pages of the finished book.

The Editorial Advisory Committee, after several review sessions, concluded that the revision as initially planned would not meet the standards of the AIA in a period of rapidly changing technology unless the participation of many specially qualified members of the Institute were obtained.

In the new approach adopted by the Editorial Advisory

Committee, 94 architectural and engineering firms were selected for their special interest and experience in the subjects assigned. The coordination of this selection process and the work of these firms was part of my own AIA management responsibilities. Beginning in 1968, I was assisted in this task by a new Coordinating Editor for Manuscript, Douglas S. Stenhouse, AIA, Washington, D.C. These firms, with the careful guidance of Editor Boaz and the Editorial Advisory Committee chaired by Harold Hauf, FAIA, contributed over 475 plates of this book. Their contributions are acknowledged on each of the pages they prepared.

In order for these firms, scattered all over the nation, to produce pages of technical excellence, a highly complex coordinating procedure was devised. Editor Boaz transmitted a data file for each subject ranging in size from one to thirteen pages. His transmittal included his own Editor's remarks, instructions for graphic make up of pages, sample completed pages and tracing paper forms. To assist him in this highly complex task, the AIA and Wiley employed Charles Fouhy, AIA, as Coordinating Editor for Production and Operations at Wiley's offices in New York. Charles Fouhy managed the complicated flow of pages and communications among all concerned and then supervised the preparation and accuracy of the final inked drawings prepared by Wiley's architectural drafting staff and the J. and R. Technical Services, Inc., New York, New York. They are to be commended for their adherence to the highest publishing standards.

Each of the contributing firms submitted a preliminary drawing for review by the Editorial Advisory Committee, followed by a final submission for editorial approval. Although the technical judgment of the individuals in firms who prepared the plates was given heaviest weighting, every page received review and critique at both stages by one member of the Committee, by Editor Boaz, and by Chairman Hauf, who resolved any ambiguities in the critiques and indicated final approval. The review was meticulous and often resulted in returns to the contributors for revision. It was a long and difficult task but it is believed that the results herein attest to a conscientious, scholarly, and thorough effort by all participants.

A parallel development in 1967 was the enlargement of the Editorial Advisory Committee which was then made a part of the regular national AIA Committee Structure. The new members were Bernard B. Rothschild, FAIA, of Finch, Alexander, Barnes, Rothschild and Paschal, Atlanta, Georgia, and Robert E. Walters, AIA, of Caudill, Rowlett and Scott, Houston, Texas. In 1968 the Committee was further augmented by the addition of Andrew Bustard, AIA, Havertown, Pennsylvania; Gordon Comb, AIA, St. Paul, Minnesota; and Jay S. Pettit, Jr., AIA, Detroit, Michigan.

Throughout this long history, the ultimate responsibility has been patiently borne by the successive Presidents of the AIA, the Board of Directors and, particularly, the Chairmen of the Commission on Professional Practice. They are listed as follows:

	President	*Chairman, Commission on Professional Practice*
1964	Arthur G. Odell, Jr., FAIA Charlotte, North Carolina	Daniel Schwartzman, FAIA New York, New York
1965	Morris Ketchum, Jr., FAIA New York, New York	Dean F. Hilfinger, FAIA Bloomington, Illinois
1966	Charles M Nes, Jr., FAIA Baltimore, Maryland	Victor C. Gilbertson, FAIA Minneapolis, Minnesota
1967	Robert L. Durham, FAIA Seattle, Washington	Bernard B. Rothschild, FAIA Atlanta, Georgia
1968	George E. Kassabaum, FAIA St. Louis, Missouri	Jack D. Train, FAIA Chicago, Illinois
1969-1970	Rex W. Allen, FAIA San Francisco, California	Joseph H. Flad, FAIA Madison, Wisconsin

When Victor Gilbertson completed his term on the AIA Board in 1966, he was asked to continue his policy direction on behalf of the Board, in recognition of the complexity of the project and the confusion caused by annual changes in assignment of responsibility. He deserves a note of thanks.

Those of us who have been associated with this project from its beginning feel strongly that two men of the AIA deserve particular thanks and recognition for their interest, patience and enthusiastic support. They are William H. Scheick, FAIA, Executive Director of the AIA from 1960-1969, and Morris Ketchum, Jr., FAIA, whose strong position of leadership reinforced the AIA and the project staff when problems of finance, staff, and the complexity of the project were discouraging.

Additionally, William L. Slayton, Executive Vice President of the AIA since December 1969, has enthusiastically supported the project.

So the efforts of hundreds of people, mostly volunteers, were combined to finally produce a document of technical excellence. Here, also, we wish to acknowledge the vitally important assistance of hundreds of organizations and individuals whose contributions have provided the data sources utilized by plate contributors. Their names are listed following the text. Without their technical output, this work would not have been possible.

Most important to any author is the encouragement and professional guidance of his publisher. Walker G. Stone, Vice President of Wiley, who has been deeply involved with Architectural Graphic Standards, played a continuous and decisive role in this entire project. For this, The American Institute of Architects extends its thanks.

It has been my privilege to work with all of these devoted and generous contributors from the inception of the AIA's authorship of Architectural Graphic Standards. The patience and fortitude of all participants has been an inspiration to me. They deserve the appreciation of the entire building industry.

ELLIOTT CARROLL, FAIA
Deputy Executive Vice President
The American Institute of Architects

July 16, 1970

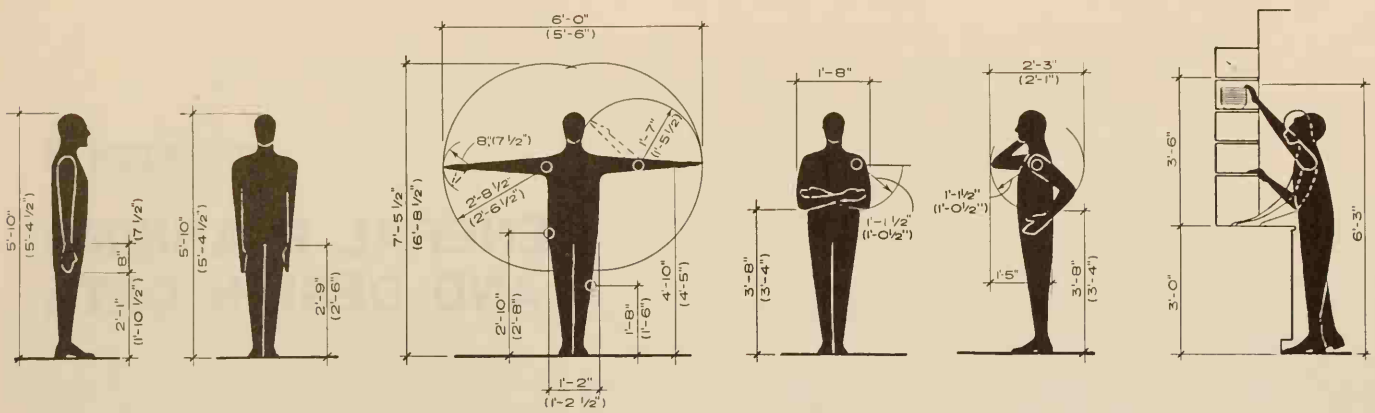
TABLE OF CONTENTS

ARCHITECTURAL GRAPHIC STANDARDS AND THE UNIFORM SYSTEM

Within the limits of Architectural Graphic Standards' fundamental emphasis on graphic presentation of design and construction information, the contents of this edition are arranged in Chapters substantially paralleling the sixteen Divisions of the Uniform System for Construction Specifications, Data Filing and Cost Accounting.

CHAPTER 1

GENERAL PLANNING AND DESIGN DATA

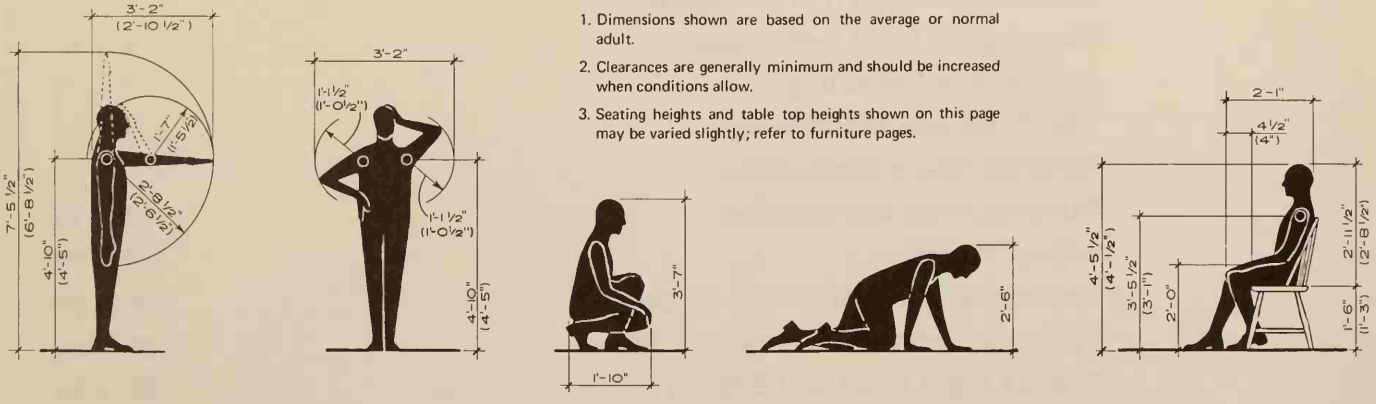


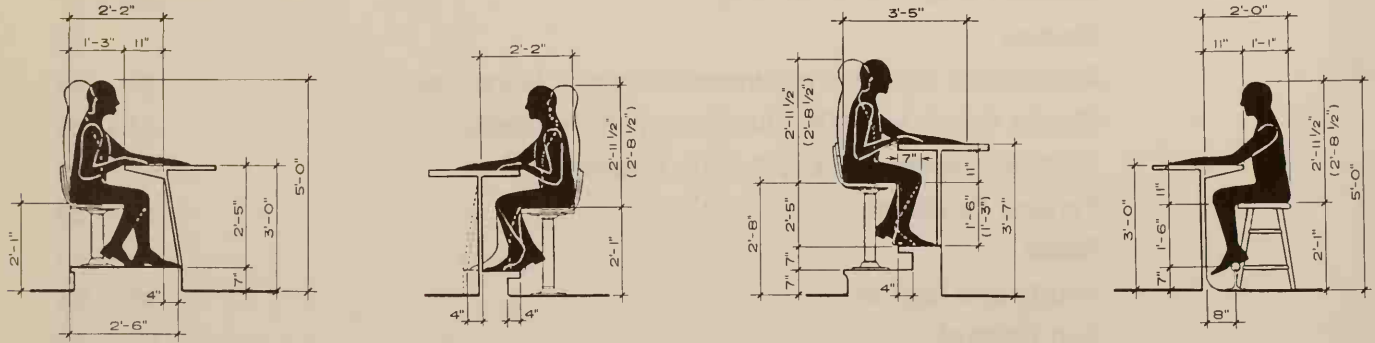
KEY TO DIMENSIONS

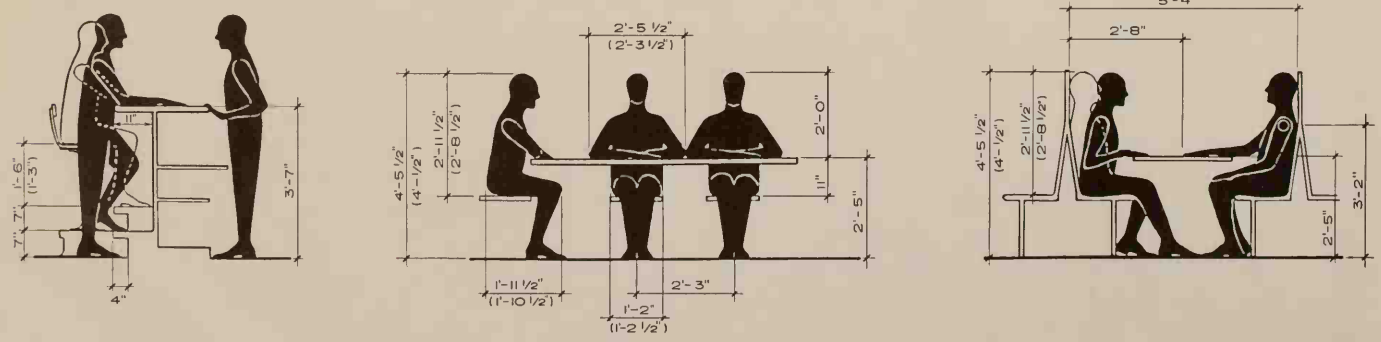
2'-3" (2'-1") MEN / WOMEN

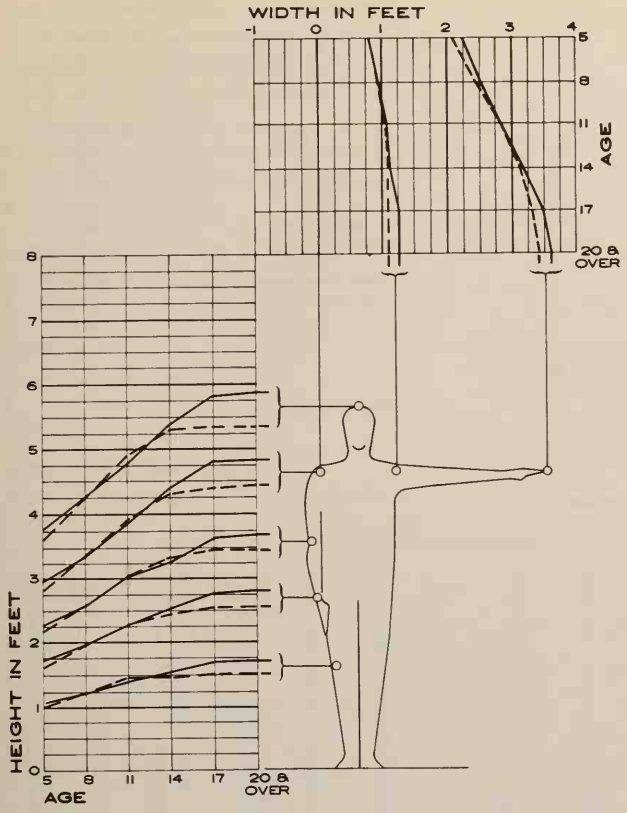
GENERAL NOTES

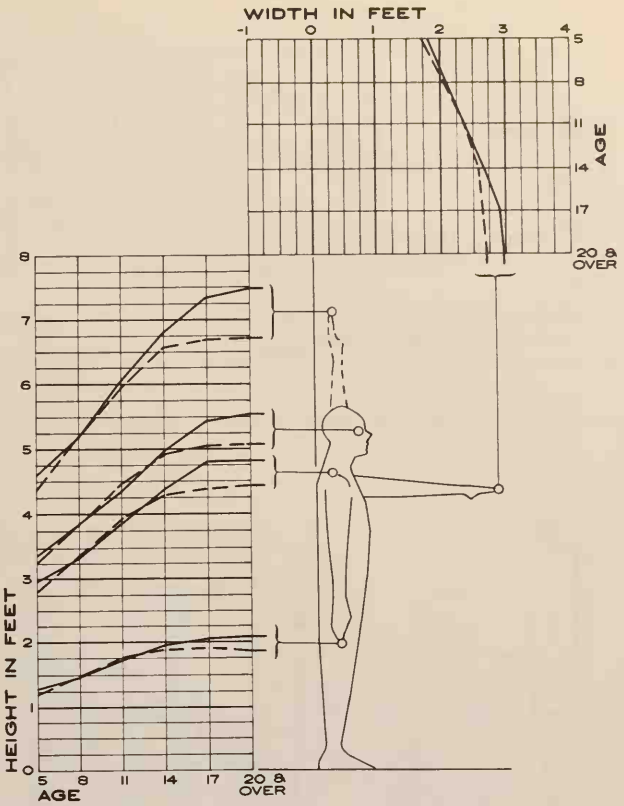
1. Dimensions shown are based on the average or normal adult.
2. Clearances are generally minimum and should be increased when conditions allow.
3. Seating heights and table top heights shown on this page may be varied slightly; refer to furniture pages.



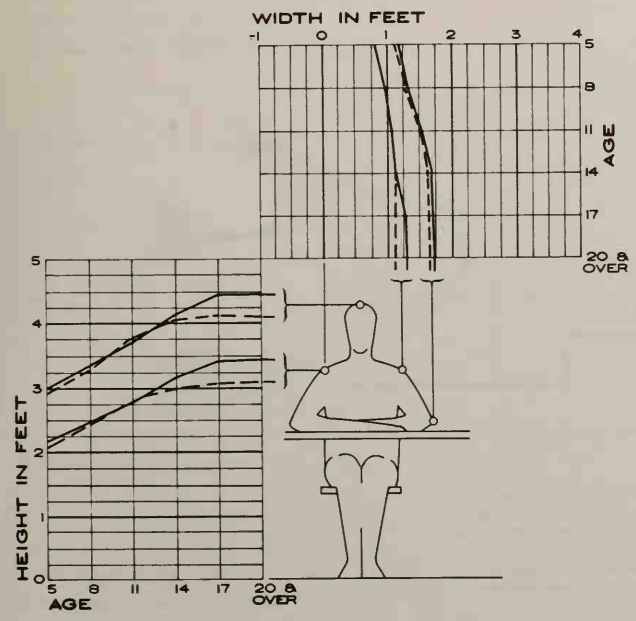


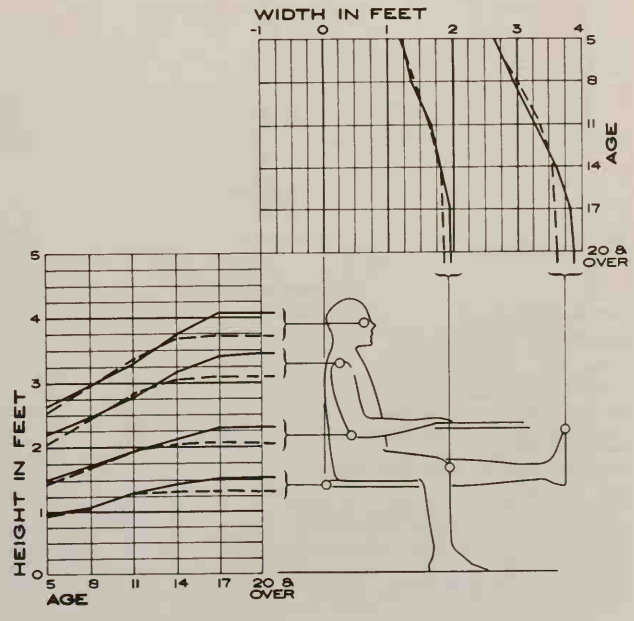


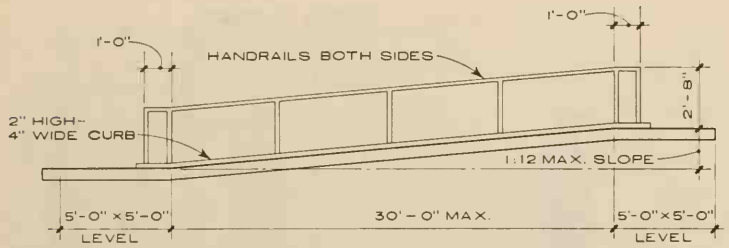




LEGEND
MALE ——————
FEMALE — — — — —







RAMPS

NOTE:

Avoid ramps if possible.
Ramp surface should be non-slip.
Ramp should be minimum 36" wide clear.

ACCESS

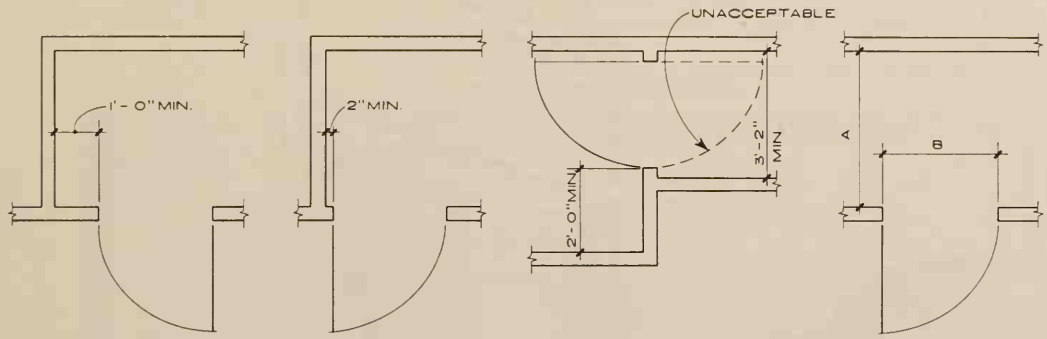
Access from main entrance sidewalk through the entrance to the elevator, and from the elevator to all of building planned for occupancy should be free of steps.

Exterior and interior thresholds should be flush, if not possible – maximum height 1".

Revolving doors not usable.

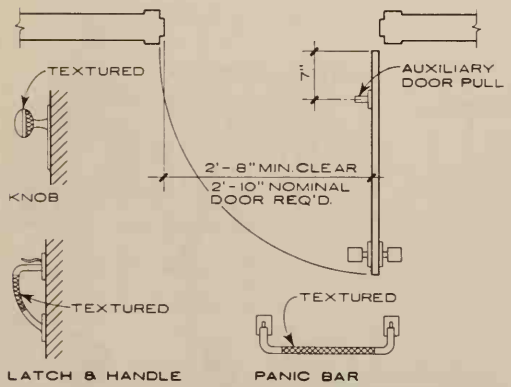
If double doors used – one leaf must have 2'-6" clear opening.

Door closers must be adjustable for both speed and effort.



A	B
3'-8"	2'-10" CLEAR
OVER 3'-8"	2'-8" CLEAR

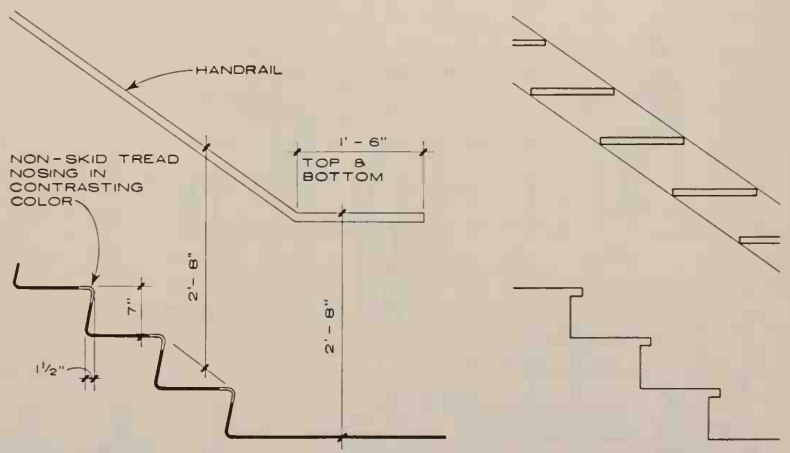
RESTRICTED SPACE PLANNING



DOORS & HARDWARE

NOTE:

Provide 32" clear width when door is at 90°.
Plan door swings to open into larger spaces.
Auxilary door handle 7" from hinge edge as shown is recommended.
Door knob height and auxilary door handle height maximum 36".
Floor should be level on each side of door for distance of 5'-0" from door in direction it swings and 3'-0" from door in opposite direction it swings.
Hardware identification for blind – integral or applied textured surfaces as shown above.



STAIRS

NOTE:

Individuals with restrictions in the knee, ankle, or hip, with artificial legs or leg braces cannot use steps noted as unacceptable, without great difficulty and hazard.
Steps noted as acceptable can be used with minimum difficulty by the above mentioned individuals.

Wm. Baltzer Fox, AIA; Noakes Associates, Architects; Washington, D. C.

THE HANDICAPPED

Where capable of movement may be classified as:

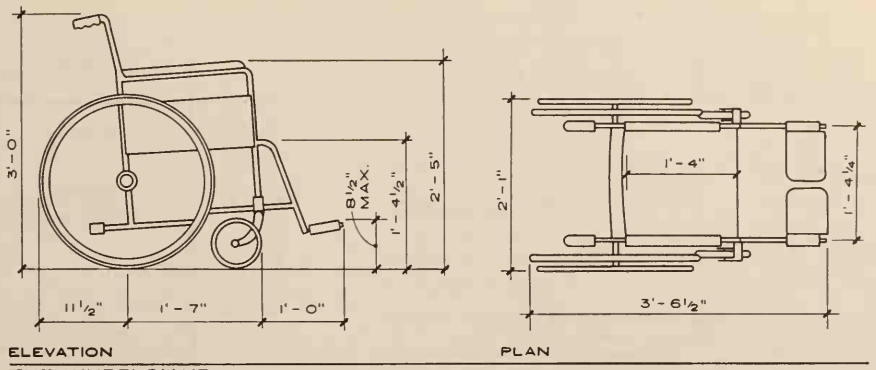
1. Confined to wheelchairs.
2. Walk with difficulty (braces or crutches).
3. Blind or see with difficulty.
4. Deaf or hear poorly.
5. Badly coordinated or subject to palsy.
6. Infirm from age.

IDENTIFICATION FOR BLIND

1. Room identification—raised letters or numbers 4'– 6" to 5'– 6" to side of door.
2. Hazardous openings—integral or applied textured surfaces on hardware.
3. Audible signals—to provide warning.
4. Flooring materials—direct and locate blind occupants of building.

IDENTIFICATION FOR DEAF

1. Visible signals as warning.

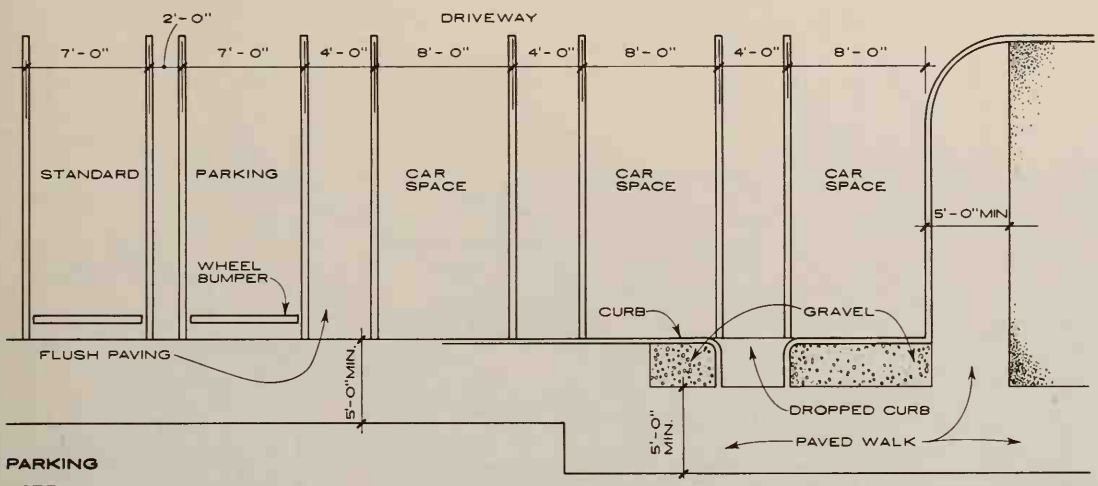


ELEVATION PLAN

THE WHEELCHAIR

NOTE:

All information shown here is predicated on requirements of a wheelchair and therefore will be adequate for any other means of ambulation.



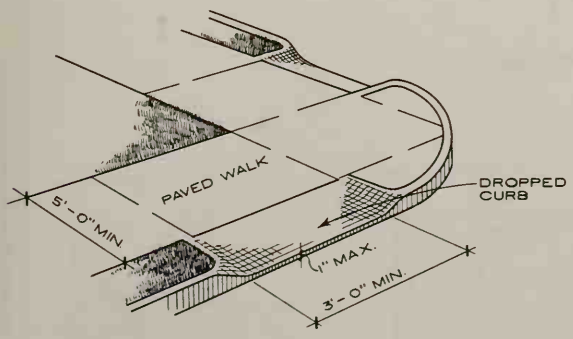
PARKING

NOTE :

Spaces should be clearly marked: "for use by the handicapped."

Locate close to building entrance.

Avoid travel behind parked cars.



SIDEWALKS & CURBS

NOTE :

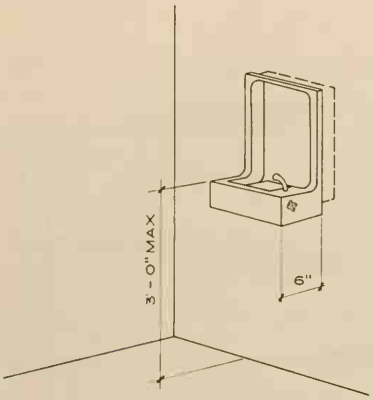
Minimum 5'– 0" wide sidewalk.

Sidewalk gradient not to exceed 1:20.

Provide dropped curbs at intersections.

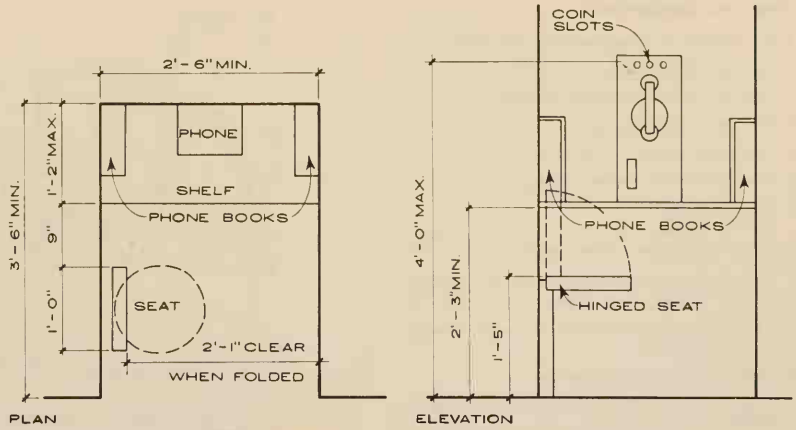
Do not locate dropped curbs on curves.

Wm. Baltzer Fox, AIA; Noakes Associates, Architects; Washington, D. C.



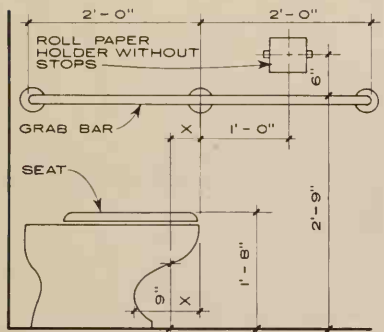
DRINKING FOUNTAINS

NOTE:
If recessed unit in alcove, control and spout should project minimum of 2" beyond adjacent walls. Controls and spout at front of unit, and water should spout parallel to front face.
Provide hand only or hand-foot control.

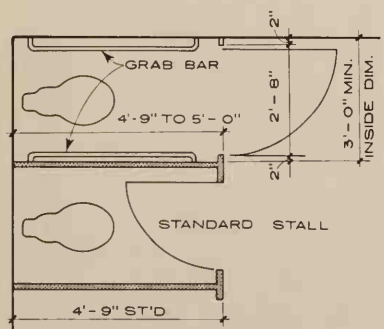


PUBLIC TELEPHONES

NOTE:
Folding seat must be easily operable. Add to depth of booth, as required, for doors if they are necessary. Doors must not project into 3' – 6" clearance.



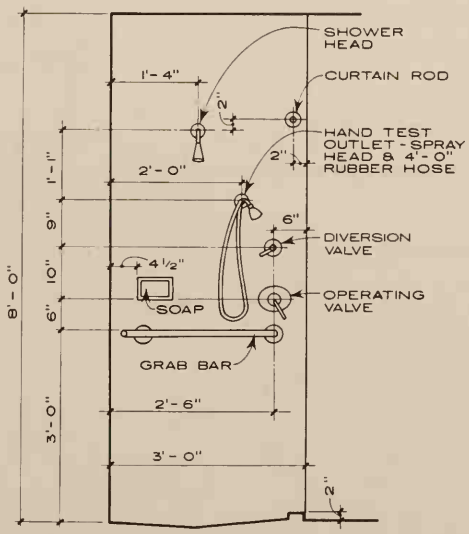
ELEVATION ("X" AS GREAT AS POSSIBLE)



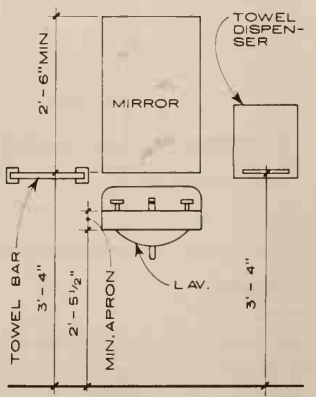
PLAN

PUBLIC TOILETS

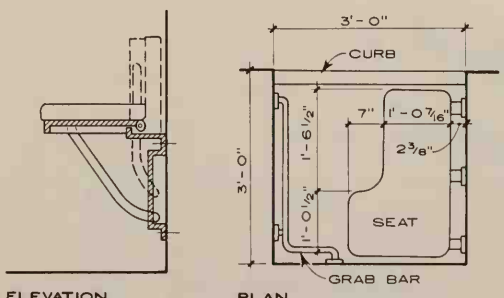
NOTE:
Provide one toilet stall for handicapped in all public toilet rooms. Stall to be one farthest from toilet room entrance.
Urinals may be floor or wall mounted with projection of 1' – 6" from wall and lip at 1' – 5" above floor. Urinal flush valve at max. of 4' – 0" above floor.



ELEVATION
SHOWER STALL

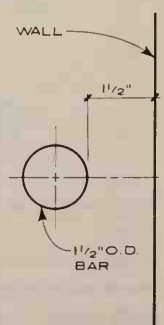


ELEVATION
LAVATORIES



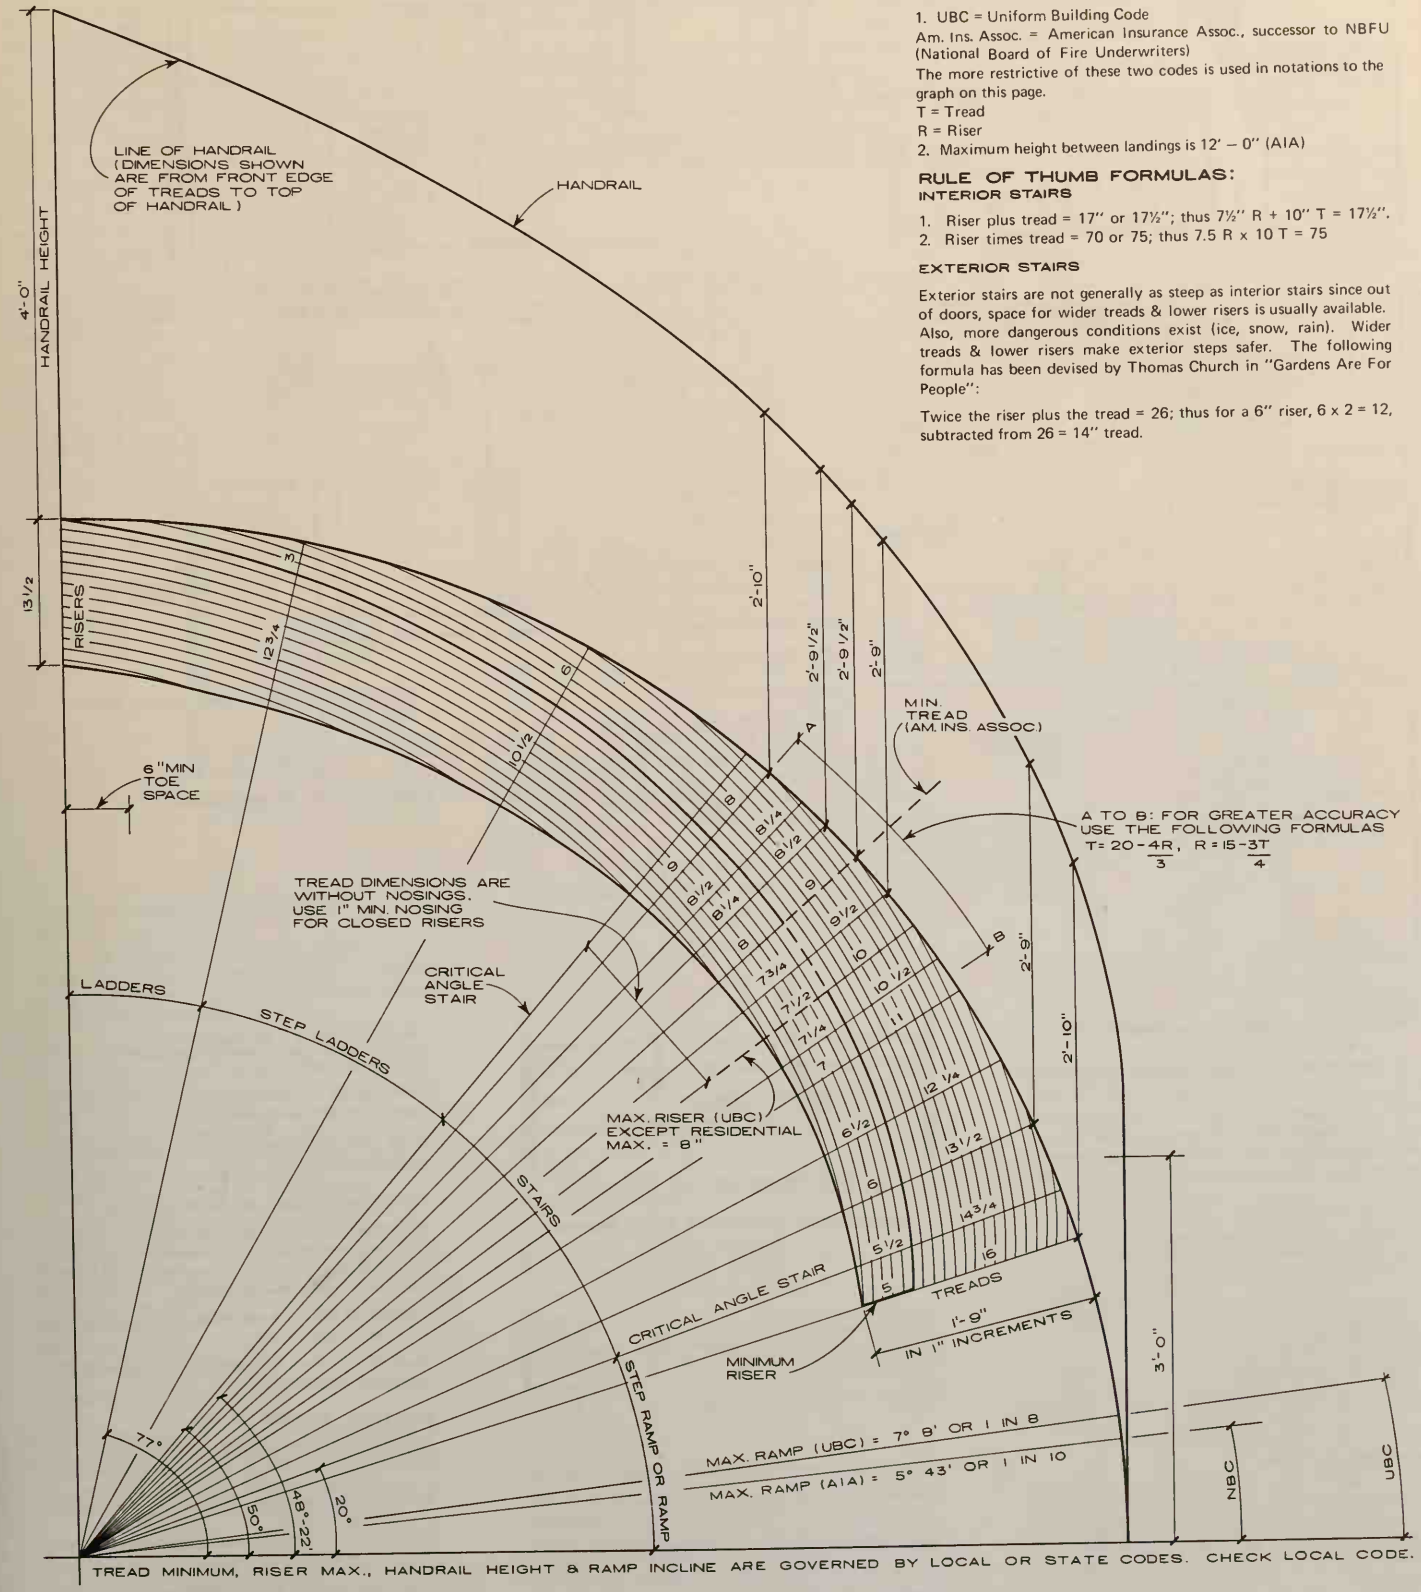
ELEVATION PLAN
FOLDING SHOWER SEAT MODEL NO UI-1

SHOWER



GRAB BAR

Wm. Baltzer Fox, AIA; Noakes Associates, Architects; Washington, D. C.



GENERAL NOTES:

1. UBC = Uniform Building Code
Am. Ins. Assoc. = American Insurance Assoc., successor to NBFU (National Board of Fire Underwriters)
The more restrictive of these two codes is used in notations to the graph on this page.
T = Tread
R = Riser
2. Maximum height between landings is 12' – 0" (AIA)

RULE OF THUMB FORMULAS:

INTERIOR STAIRS

1. Riser plus tread = 17" or 17½"; thus 7½" R + 10" T = 17½".
2. Riser times tread = 70 or 75; thus 7.5 R x 10 T = 75

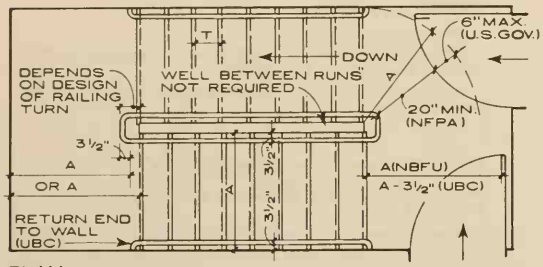
EXTERIOR STAIRS

Exterior stairs are not generally as steep as interior stairs since out of doors, space for wider treads & lower risers is usually available. Also, more dangerous conditions exist (ice, snow, rain). Wider treads & lower risers make exterior steps safer. The following formula has been devised by Thomas Church in "Gardens Are For People":

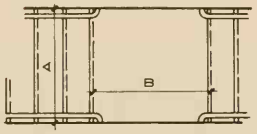
Twice the riser plus the tread = 26; thus for a 6" riser, 6 x 2 = 12, subtracted from 26 = 14" tread.

TREADS AND RISERS
SCALE: 3/4"= 1'-0"

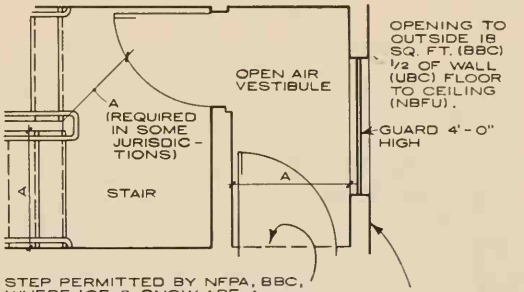
Paul Vaughan, AIA; Charleston, West Virginia



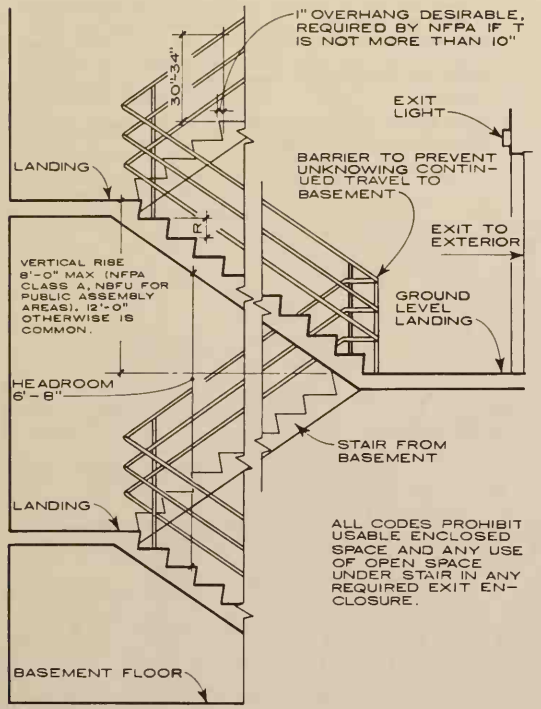
PLAN



STRAIGHT RUN LANDING
B = A UP TO 4'-0" (UBC, NBFU)
B = 44" MIN. (NFPA)



STEP PERMITTED BY NFPA, BBC, WHERE ICE & SNOW ARE A PROBLEM; NOT PERMITTED BY NBFU, UBC.



SECTION

ENCLOSED STAIR DIMENSIONS

TO DETERMINE REQUIRED WIDTH "A"

Determine occupancy load from tables of allowed area per person for various occupancies for floor under consideration. (UBC requires adding occupancy load from floor under consideration + 50% of occupancy load from floor next above + 25% of occupancy load from second floor above.)

One unit of width = 22"

NUMBER OF PERSONS PER UNIT OF WIDTH FOR VARIOUS TYPES OF OCCUPANCY

	NFPA	NBFU	BBC
PLACES OF ASSEMBLY	100	60	60
EDUCATIONAL, MERCANTILE, OFFICE, INDUSTRIAL	60	60	50
RESIDENTIAL	45	30	25
INSTITUTIONAL	22	30	25

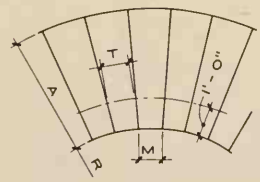
UBC "A" IN FT. = no. of persons divided by 50.

MINIMUM WIDTHS:

All codes set 44" as the minimum except for residential or light occupancy, service access, or private use, usually 36" for less than 50 persons. (NBFU says 42" for less than 40 persons; BBC says 36" for 40 or less below grade or 75 above.)

NOTE:

Widest "A", determined as above, must extend to discharge at ground level.



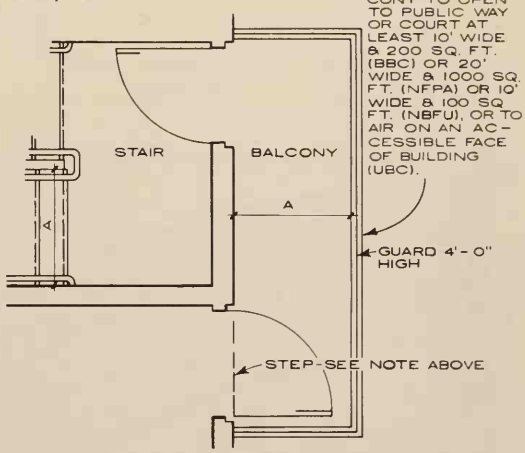
R = 2A MIN. (UBC)
R = 25'-0" MIN. (NFPA)

CURVED STAIRS

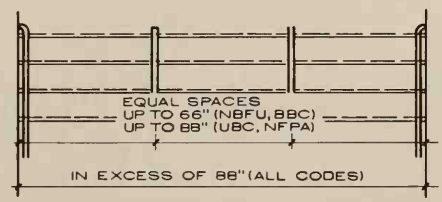
Winders and curved stairs are permitted by most codes for residences and for monumental stairs between 2 floors if not required exit stairways, T is req'd tread, and M = 6".

UBC permits curved stair as required stair if inside radius is 2 times width and M is 10".

NFPA permits curved stair if requirements are met including enclosures, min. tread width, and inside radius is at least 25'-0". Many other codes prohibit use as required stairs.



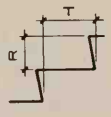
OPEN AIR VESTIBULE & BALCONY



INTERMEDIATE RAILS FOR WIDE STAIRS

TREAD AND RISER

CODES	MIN. "T"	MAX. "R"
NFPA, UBC	10"	7½"
BBC	9½"	7½"
NBFU	9½"	7¾"



Variations for residential and existing buildings.

Maximum variation in "R" for any run is 3/16".

SEE STAIR CHART DESIGN.

NOTE:

The minimum number of risers in any run of stairs is 3 (NFPA).

SMOKEPROOF ENCLOSURES (FIRE TOWERS, SMOKEPROOF TOWERS, ETC.)

One required for buildings of more than 6 stories (NBFU and BBC) or 5 stories (UBC).

Some local codes have deleted the requirement for smokeproof enclosures.

CONSTRUCTION REQUIREMENTS

Requirements of the codes cited vary, but typically stairs and stair enclosures for buildings of 4 or more stories are required to be of 2 hour incombustible construction, 3 stories and less, 1 hour.

Smokeproof enclosures and stairs therein must be of 2 hour construction.

These requirements are relaxed in varying ways for residential occupancies.

BUILDING CODES CITED

NFPA—National Fire Protection Association
NBFU—National Board of Fire Underwriters, now American Insurance Association
BBC—Basic Building Code, Building Officials Conference of America
UBC—Uniform Building Code, International Conference of Building Officials

THE BUILDING CODE IN FORCE in any jurisdiction should always be consulted to determine exact requirements, as it governs in all points of conflict.

Foster C. Parriott; James M. Hunter & Associates; Boulder, Colorado

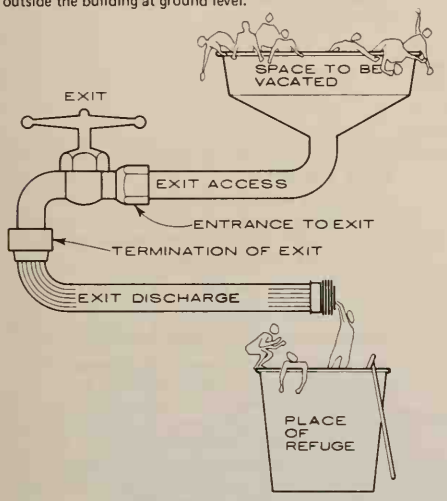
DEFINITIONS

MEANS OF EGRESS are simply systems for vacating a building. They are vertical and/or horizontal methods of conveying people with reasonable safety to a place of refuge outside at ground level and are composed of three basic elements. The terminology of each component is important.

EXIT ACCESS is that portion of a means of egress which leads to an exit entrance.

An EXIT is that portion of a means of egress which is separated from the area of the building from which escape is to be made, by walls, ceilings and doors or other means of specified fire resistance.

An EXIT DISCHARGE is that portion of a means of egress between the termination of the exit and a place of refuge outside the building at ground level.



PROPER DESIGN CRITERIA

GENERAL NOTE

The criteria indicated hereinafter are generally accepted throughout the United States but should be checked against requirements of specific code accepted by local authorities having jurisdiction.

FIRE-RATINGS

Fire-ratings are expressed as an approved time of exposure to fire and related damage. Ratings are determined by specific tests upon various construction assemblies conducted by approved laboratories. One hour fire-rated floor, wall and ceiling construction is required for protection of exits in buildings three stories or less in height; two hour construction, for those four stories or more.

UNIT OF MEASUREMENT

The unit of measurement for exits is a certain increment of width, usually 22 inches, which has been determined as the "average" shoulder width of a man.

NUMBER OF EXITS

The basic requirements of means of egress are proper design, construction and method of compartmentation. Fundamentally, every building and space within must have a certain minimum number of exits depending upon the number of occupants and the nature of its use.

LOCATION OF EXITS

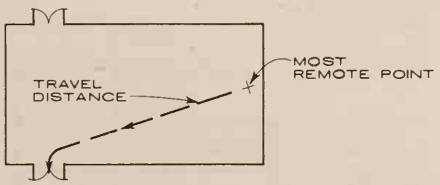
Exits should be located as remote from each other as possible; however, their exact placement is generally left to the discretion of local authorities so as to permit some freedom in design. Exits must be placed so that they do not create deadended passageways, unless it can be demonstrated that by so doing, a hazard is not created.

Douglas S. Stenhouse, AIA; Washington, D. C.

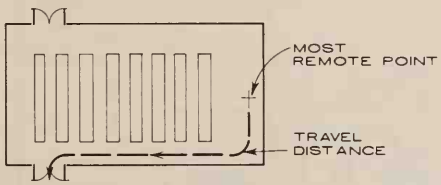
DESIGN CRITERIA (CONT'D)

TRAVEL DISTANCE

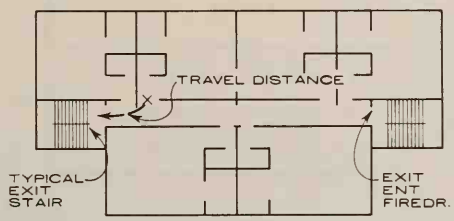
The appropriateness and maximum capacity per unit and the maximum distance one must travel to reach an exit may vary depending on the use of the building, the fire hazard and physical ability and alertness of its occupants to proceed with reasonable safety to a place of refuge outside the building at ground level. Travel distance is calculated differently depending on the use of the space.



ASSEMBLY OCCUPANCY, NO FIXED SEATING

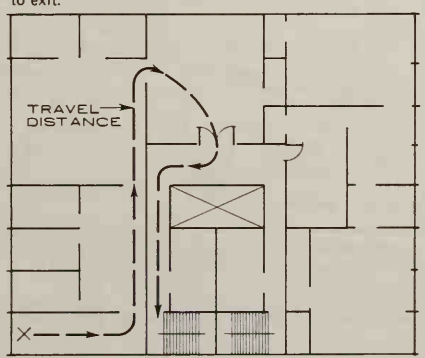


ASSEMBLY OCCUPANCY, FIXED SEATING



APARTMENT OCCUPANCY

Measures travel distance from door that leads from space to exit.



OFFICE OCCUPANCY

The allowable travel distance is usually greater, though measured from the most remote place in any office area.

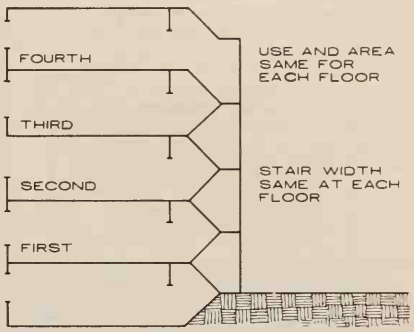
ALTERATIONS

Non-conforming structures are usually given special consideration to encourage improvement in required means of egress, construction assemblies and flamespread ratings. Variances may be permitted for surface coverings, in opening sizes and arrangement of exits depending on the type of occupancy, degree to which the Owner may be handicapped by strict interpretation of the local code, and the desire of local authorities to accept something that can be demonstrated as a considerable improvement.

DESIGN CRITERIA (CONT'D)

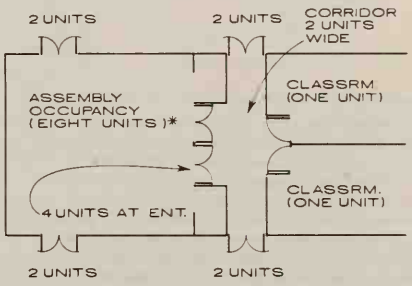
CUMULATIVE REQUIREMENTS FOR MULTISTORYED BUILDINGS

Though some codes require that the cumulative total be considered and that the width of an exit at any one floor reflect the increased load from floors above, generally for multistoried single occupancy buildings in most cities, exit requirements are not cumulative.



COMMON MEANS OF EGRESS

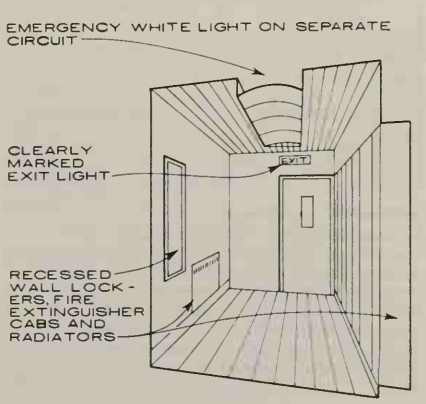
Common means of egress are generally adequate for different types of occupancies used simultaneously by different groups of people in the same building if they are designed to accommodate both groups at the same time. If the same people use different occupancies at different times, exit units for each aren't cumulative.



*Used at different times by same people who use classrooms. If different people, increase corridor, exit doors.

UNOBSTRUCTED PATH OF TRAVEL

An unobstructed path free from any projections in the path of travel must be maintained to all exits. Good general illumination and judicious use of color and materials also helps to produce a safe means of egress.

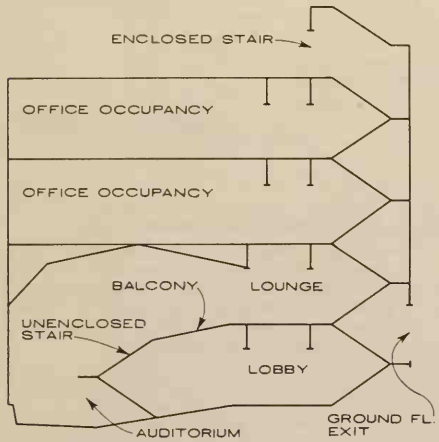


SMOKEPROOF TOWERS

Smokeproof Towers are enclosed exterior stairs separated yet accessible to a building from an open vestibule or balcony so that smoke from the building can not enter the stair itself. (Refer to Stair Dimension page for design data).

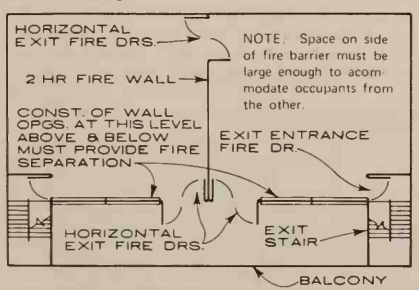
ENCLOSED AND UNCLOSED INTERIOR STAIRS

There are two types of ENCLOSED INTERIOR STAIRS (Class A & B) differing in minimum allowable width, riser height, tread width and length of run (see Stair Dimension page). UNENCLOSED INTERIOR STAIRS between balconies and main assembly floors or adjacent floors in educational occupancies may qualify (see local code) as required means of egress for balcony or floor if not connected with other required means of egress.



HORIZONTAL EXITS

Horizontal Exits may be utilized to meet one half of total required capacity of exits for separate or connected buildings except in the case of institutional occupancies where two-thirds of the required capacity is permitted. They are means, on approximately the same level, of getting from one space to another which can qualify as a place of refuge. It may be an approved fire-rated self-closing door by which occupants pass through or around a firewall or other fire barrier into another portion of the same building which affords a temporary place of refuge until they can be moved in a safe and orderly manner through a vertical exit to the ground level below and a permanent place of refuge outside the building.



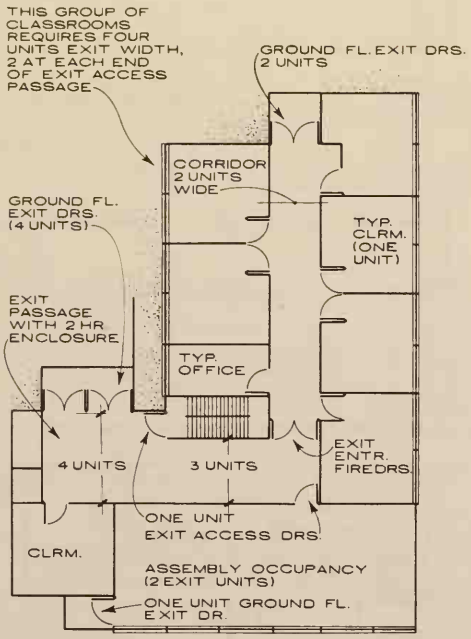
MONUMENTAL STAIRS

Enclosed, unenclosed, interior or exterior monumental stairs may be used to satisfy exit requirements or as other types of means of egress if the specifications for stairs with respect to riser and tread proportions, protection from snow, ice and fire within the building are satisfied. Curved stairs or other variations from the usual may also be accepted. (See Stair page).

Douglas S. Stenhouse, AIA, Washington, D. C.

PASSAGEWAYS

Passageways, for example, halls, balconies, ramps, corridors, lobbies, tunnels, etc., either inside or outside a building, must be wide enough to accommodate the aggregate of all means of egress discharging through them. Walking surfaces should be level with small differences taken up by ramps, large ones, by stairs.



COMPUTATION OF REQUIRED WIDTHS FOR MEANS OF EGRESS

1. ACTUAL OCCUPANT LOAD = $\frac{\text{FLOOR AREA}}{\text{USE FACTOR}}$
2. UNITS OF EXIT WIDTHS REQ. = $\frac{\text{OCCUPANT LOAD}}{\text{ALLOWABLE CAPACITY PER UNIT}}$

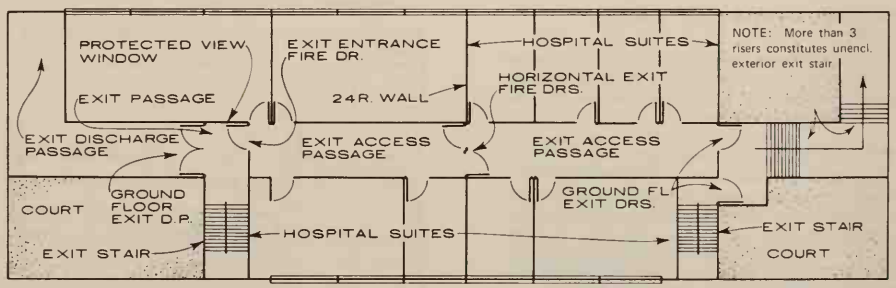
The Use Factor is expressed in square feet and represents the floor area permitted per person for the particular occupancy (consult your local code). The Allowable Capacity will vary with the type of exit used. Since exit units are usually expressed in increments of 22 inches and since the capacity varies with type of exit used, number, size and disposition of each exit will vary. Consult your local code for allowable capacities for various types of exits and other approved means of egress.

SLIDE ESCAPES

Slide Escapes are sometimes permitted in high hazard industrial occupancies to satisfy one unit but never more than 25% of the required exits in lieu of fire escapes and ladders.

UNENCLOSED EXTERIOR STAIRS

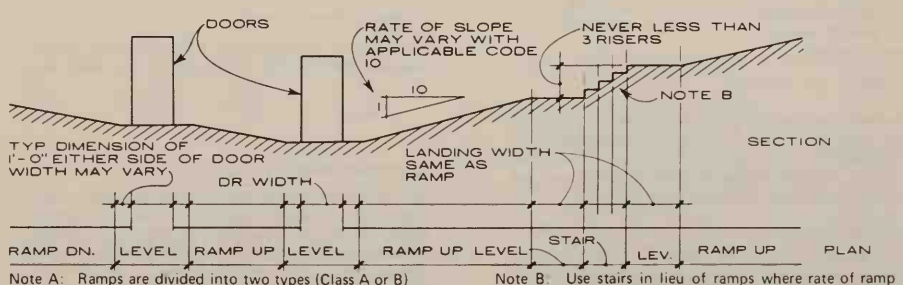
Unenclosed Exterior Stairs may be accepted as required exits under the same conditions as an interior stair if protected from accumulation of snow and ice in climates subject to same and if so arranged as to avoid any handicap to the use of the stair by persons having a fear of high places and if protected from fire within the building itself (see Fire Escape page).



Ground floor exit by way of door or other means of egress leads directly (by means of exit discharge), to place of refuge outside bldg.

A door may obviously qualify as an exit when on ground floor but not unless it complies with strict definition of specific means of egress.

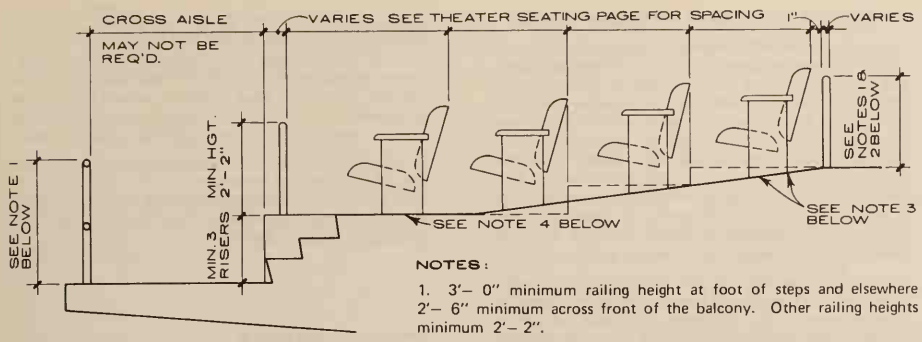
GROUND FLOOR EXITS AND DOORS



Note A: Ramps are divided into two types (Class A or B) depending on minimum width and rate of slope and the capacity per unit of width.

Note B: Use stairs in lieu of ramps where rate of ramp slope will not allow you to travel vertically as far as you might wish.

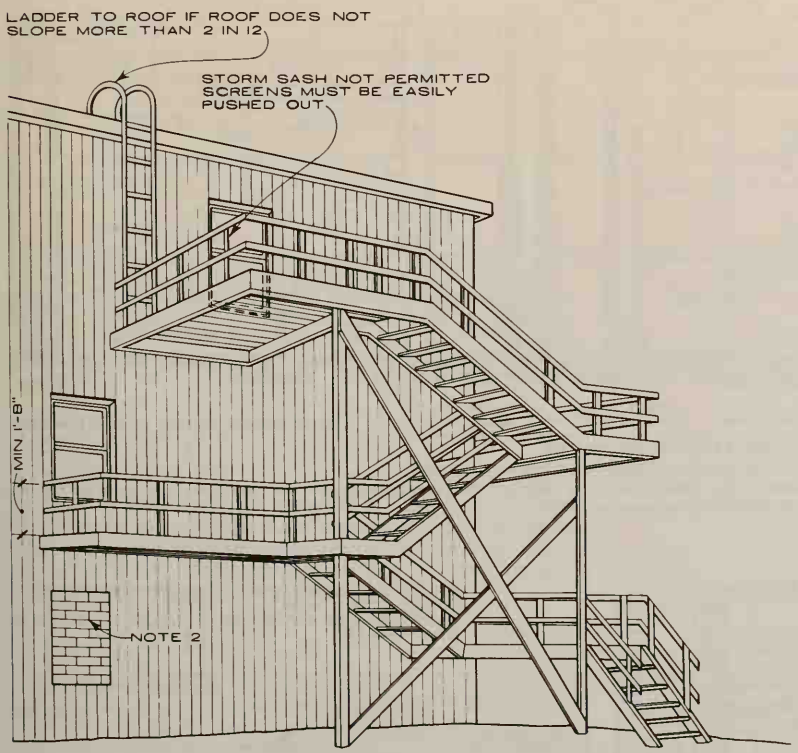
RAMPS



NOTES:

1. 3'– 0" minimum railing height at foot of steps and elsewhere 2'– 6" minimum across front of the balcony. Other railing heights minimum 2'– 2".
2. Railing may be eliminated if back of seat is 2'– 0" or greater.
3. See Theater Sight Line page for recommended maximum rate of slope; greater slopes must be accommodated by equal risers, full aisle width.
4. In most cases seats must be anchored to the floor (consult your local code).

SECTION THROUGH TYPICAL BALCONY OF PUBLIC ASSEMBLY OCCUPANCY



NOTES:

1 – An unenclosed exterior stair may sometimes be permitted when no other practical means of providing exits for older, nonconforming buildings can be found. Fire escapes as such must provide a safe, continuous, protected, unobstructed path of travel to the ground or other approved place of refuge.
2 – Brick up all existing openings below runs of stairs, bridges or landings.
3 – Fire escapes may be parallel or perpendicular to a building with respect to landings, bridges or stair runs.
4 – If circumstances warrant and officials having jurisdiction approve, a fire escape may be used to provide indirect access to the roof of an adjacent building in lieu of direct access to a place of refuge at the ground level below.

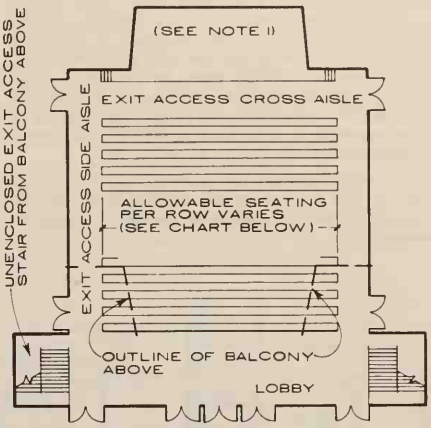
FIRE ESCAPES

Douglas S. Stenhouse, AIA; Washington, D. C.

DEFINITION OF PLACE OF PUBLIC ASSEMBLY

A place of Public Assembly is generally recognized as any space that will accommodate 100 or more persons. The number of exits required is proportional to the capacity and may vary somewhat depending on the type of exit used.

MEANS OF EGRESS FOR PUBLIC ASSEMBLY OCCUPANCIES

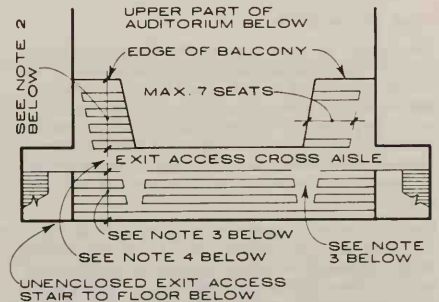


RELATION OF MAX. SEATING PER ROW TO CLEAR PASSAGE FOR CONTINENTAL SEATING

NUMBER OF SEATS PER ROW	CLEAR PASSAGE
18 OR LESS	18 INCHES
35 – 19	20 INCHES
45 – 36	21 INCHES
46 OR MORE	22 INCHES

NOTES:

1 Stages or enclosed platforms have special fire protection requirements.
2 Main entrances must accommodate one half the required number of exit units.
3 Provide one 3 unit exit door each side for each five rows (see exceptions and variations on Theater Seating page).
4 Maintain constant width for exit access cross aisle equal to widest aisle served plus 50% of all other exit access aisles.
5 Aisles must terminate in cross aisles, foyer, or at an exit and should increase in width in the direction of required exits proportional to number of persons they are required to handle.



NOTES:

1 – Furthest distance of travel must not exceed allowable travel distance (see local code).
2 – Maximum length 20'–0"; minimum width 3'–0" or 2'–6" if serving less than 60 persons. Increase 1 1/2" for each five feet of length.
3 – Minimum width 3'–6". Increase 1 1/2" for each 5 feet of length (see Theater Seating page).

BALCONY FLOOR PLAN
(CONVENTIONAL SEATING)

OBJECTIVE AND METHODS

The objective is to maintain fire compartmentation of a structure by minimizing the effects of vertical openings in a horizontal surface or series of surfaces forming a sandwich, or of horizontal openings in a vertical surface that might be intended perhaps to limit the area of spaces on the same level.

Openings may be relatively small as in the case of those for pipes, ducts, chutes and doors, or they may be larger as for escalators passing between floors or interior courtyards such as those at the Regency Hyatt Hotel in Atlanta or the Ford Foundation in New York. Enclosures for vertical openings through horizontal surfaces or horizontal openings through vertical surfaces must be constructed of certain material assemblies which are accepted by local authorities having jurisdiction over the project. (Note that Underwriters' Laboratories, Inc., publish regular reports of tests conducted on various construction assemblies. Their recommendations are accepted by most codes.)

Just as enclosures must meet certain requirements, so must openings into them incorporate accepted devices such as dampers to assist in maintaining the desirable compartmentation.

FIREDOOR TYPES & APPLICATIONS

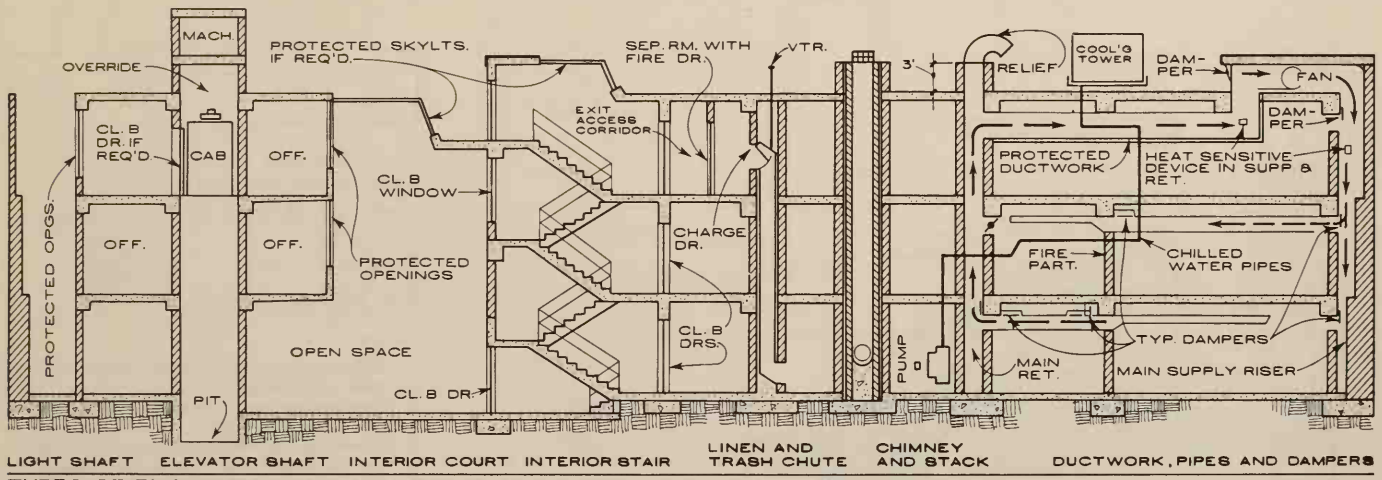
Firedoors maintain the integrity of openings through walls which have been designed to maintain fire compartmentation within a building. They should be selected on the basis of their use and the class of opening rather than upon the basis of the fire resistance of the wall in which they occur, since testing labs use different methods of evaluation resulting in hourly fire resistance labeled ratings that may not mean the same for one lab as for another. Fire doors are "labeled" or classed with respect to the openings in which they are placed. In setting up "door" or "opening" schedules, selection of frame, hardware, size, and finish should be considered as an integral affair.

Class A openings occur in fire walls and are principally used to maintain horizontal compartmentation. Doors for these openings have a fire rating of 3 hours and are installed in pairs with one door on each side of the opening. Class B openings are used to maintain fire compartmentation in vertical communication enclosures such as stairs or elevators. In the case of the latter, though desirable, few authorities require Class B elevator doors. The Class B door has 1 $^1/_2$ hour ratings. Class C openings are in corridors and room partitions and hold a $^3/_4$ hour rating, while Class D, E and F openings occur in exterior walls, the former where openings are subject to severe fire exposure ($^3/_4$ hr) and the latter two in moderate to light fire exposure conditions ($^1/_2$ hr rating). Where labeled doors are required, frames also must be labeled, since the opening is considered as an integral unit. (Refer to page on hollow metal frames and to local code for specific data.)

In order to maintain fire compartmentation, it is important that the field installation of a door and its frame, type of hardware, louvers, and glazing be done in strict accord with label requirements. Don't accept labeled construction in lieu of a labeled door.

UTILITY SHAFTS

Utility shafts shall be provided with protected enclosures for walls, bottoms of shafts not terminating at grade or tops of shafts terminating below roofs. Access doors listed by approved testing labs shall be installed in all openings, incombustible material around all pipes penetrating the enclosure.



TYPES OF ENCLOSURES FOR VERTICAL AND HORIZONTAL OPENINGS

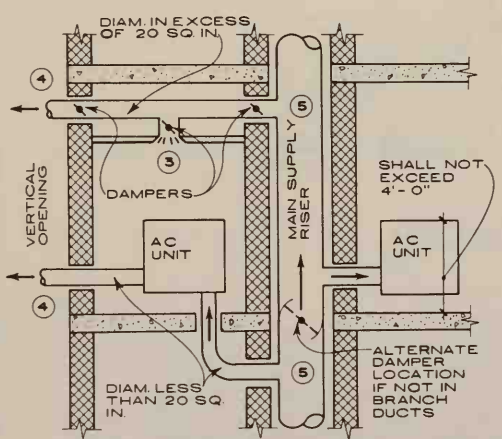
NOTE: 1. Shading and hatching are not intended to indicate any particular materials but only to clarify and make the sections more readable.

2. Some codes will not permit large vertical "open spaces" or interior courtyards. Other codes are extremely oblique in the way they allow or do not allow such spaces which are not directly compatible with codes. Check their acceptability with local authorities responsible for enforcement of codes.

FIRE DAMPERS

Fire dampers for ducts in air-conditioning systems are located to automatically seal off the circulation of air through a portion of the system and therefore isolate heat and smoke thru compartmentation. The fire damper is usually held open by a fusible link which melts at a certain temperature and causes the damper to close by gravity. There are many types of dampers manufactured, single and multiple blade types, which have been tested by approved labs.

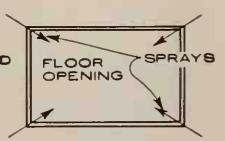
Fire dampers are required (see illustration at right) (1) where ducts pass through fire partitions that serve to restrict the spread of fire but which do not qualify as fire walls, (2) where branch ducts are taken off supply or return risers and are 20 sq. in. or more in diameter, aluminum or constructed of Class 1 materials, (3) where a duct pierces a fire-resistive ceiling, (4) where a duct penetrates a vertical opening and is 20 sq. in. or more in diameter, aluminum or constructed of Class 1 materials, (5) where a duct 20 sq. in. or more in diameter, aluminum or constructed of Class 1 materials penetrates a fire-resistive floor or where a protected enclosure is not built around a main supply or return riser of a system at one storey of a building serving only the storeys above and below, and (6) where a fresh air intake passes through an exterior wall.



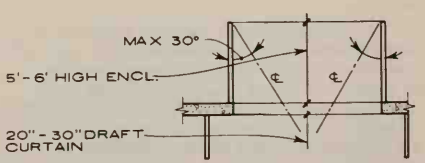
FIRE DAMPERS

Fire dampers are permitted, though undesirable, in fire walls if automatically closing fire doors are installed, one on each side. They are not required where ducts pass through non-fire walls or in one-storey exhaust systems.

NOTE: CONSULT YOUR LOCAL CODE FOR RATINGS AND APPROVED ASSEMBLIES



PLAN



SECTION

WATER SPRAY CURTAINS

Water spray curtains are used for the protection of openings in walls and floors through which conveyors or escalators pass and where fire doors are impractical. Protection is accomplished through the pressure effect and cooling action of the water spray directed from nozzles overcoming drafts caused by temperature and height differential between opening above and floor below.

Douglas S. Stenhouse, AIA; Washington, D. C.

SPACE DIMENSIONS

Room sizes, general: Minimum room sizes and or number of occupants permitted in rooms are generally governed by State or Local Codes and or lending agency standards (FHA). Space use, function, esthetics, number of occupants, economics, furniture arrangement and traffic flow should be given primary consideration in sizing rooms. Minimum room dimension is generally 7'–0".

RESIDENTIAL OCCUPANCIES

The adjacent chart summarizes the requirements of the various model codes for residential occupancies:

RESIDENTIAL OCCUPANCY DESCRIPTION	Minimum Residential Room Size ††††			
	UBC	NBC	BBC	SBC
Living Room	120 sq. ft.	Habitable	Habitable	Habitable
Living and Cooking	150 sq. ft.	Rooms	Rooms	Rooms
Living and Sleeping	150 sq. ft.	70 sq. ft.	400 cu. ft.	125 sq. ft.
Bedroom	90 sq. ft.†		Per	Per
Efficiency or Bachelor Apartment	220 sq. ft.††		Person	Person
Kitchen	50 sq. ft.	60 sq. ft. †††		
Kitchen and Dining		90 sq. ft.		

† Add 50 sq. ft. for each occupant over 2.
†† Add 100 sq. ft. for each occupant over 2.
††† Kitchen without bedroom 50 sq. ft.
†††† UBC = Uniform Building Code.
NBC = National Building Code.
BBC = Basic Building Code.
SBC = Southern Building Code.

LOBBIES

Lobby sizes should be determined by the anticipated use and number of occupants. The adjacent chart may guide preliminary assumptions:

LOBBY DESCRIPTION	PRELIMINARY ASSUMPTION WIDTH OR AREA
Elevator one side	6'–0" minimum width
	9'–0" ample
Elevator two side	10'–0" minimum width
	12'–0" ample
Theater Foyer	3 sq. ft. per person
Waiting Room	1 1/2 sq. ft. per person

CORRIDORS

Since corridors are primary means of emergency egress from buildings, State and Local Codes have established minimum width. Normal circulation dictates greater widths. Traffic load, door swings, length of corridor and type of illumination should be considered in determining corridor width. The adjacent chart may guide preliminary assumptions:

CORRIDOR DESCRIPTION		PRELIMINARY ASSUMPTION CORRIDOR WIDTH
Residential:	Bedroom Hall	3'–0" to 5'–0"
	Service Hall	3'–0" minimum
	Dormitories	5'–0" to 7'–0"
Office Buildings		5'–0" to 7'–0"
School Buildings		8'–0" to 12'–0"
Hospital		8'–0" minimum non ambulatory

STAIRWAYS

Exit stairway width is generally determined by code minimum. Some codes have the same minimum width requirement for stairs and corridors, others require stair minimums greater than corridor minimums, while others have corridor minimums greater than stair minimums. Be sure to check the local code authorities having jurisdiction.

VARIOUS OCCUPANCIES

Preliminary room size assumption may be determined by the number of occupants. The adjacent chart summarizes the requirements of the various model codes for various occupancies:

VARIOUS OCCUPANCIES DESCRIPTION		Required Square Feet Per Person ††††			
		UBC	NBC	BBC	SBC
Assembly Areas:	Fixed Seats	7	6	6	6
	Movable Seats	15	15	15	15
Educational:		–	40	40	–
	Classrooms	20	–	–	40
	Shops	50	–	–	100
Institutional		–	150	150	125
Mercantile:	Ground floor	30	30	30	30
	Basement	20	30	30	30
	Upper floor	50	60	60	60
Office		100	100	100	100

CEILING HEIGHTS

Minimum heights are governed by code. Generally accepted residential ceiling height is 8'–0", however many codes permit 7'–6" ceiling height in habitable rooms and 7'–0" in corridors. Room function (gymnasium, or bedroom), width, type of illumination, type of structure, attic or plenum requirements, duct and pipe ways should be given primary consideration in determining ceiling heights. The adjacent chart may guide preliminary assumptions:

SPACE WIDTH	PRELIMINARY ASSUMPTION CEILING HEIGHT
7' to 10'	7'–6" to 9'–0"
10' to 16'	8'–0" to 9'–6"
16' to 24'	8'–6" to 10'–0"

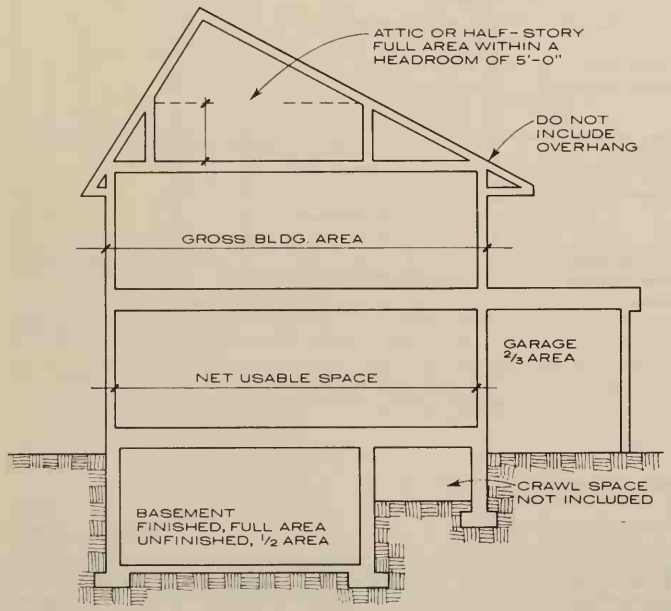
Raymond Ziegler, FAIA; Allison, Rible, Robinson & Ziegler; Los Angeles, California

GENERAL NOTE:
Various methods listed below are applicable to different purposes, e.g. preliminary cost analysis, rental income appraisal, estimation of financial value for loan requirements, and design.

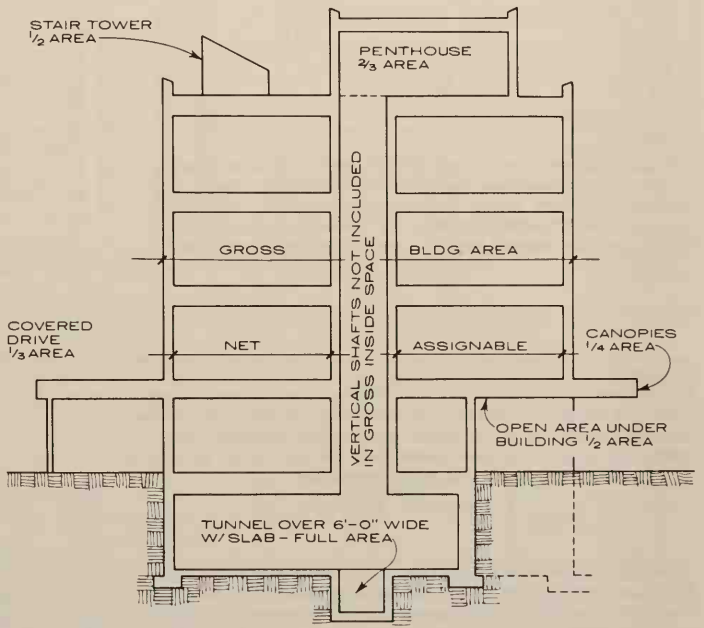
1. CALCULATION OF GROSS BLDG. AREA OR "ARCHITECTURAL AREA"
   Total sq. ft. of basic areas of the several floors of a building including basements, mezzanine & intermediate floored tiers and penthouses of headroom height, added to total percentages of partial areas.
   a. SUGGESTED STANDARDS FOR BASIC AREA
      To calculate floor areas, include the full square foot area of spaces on all floors enclosed within the face of exterior wall surfaces of the building with the addition of dormers, bays, and chimneys, including tunnels 6'–0" wide w/slab.
   b. PERCENTAGE OF PARTIAL AREAS

Garage	2/3 of area
Carport	1/2 of area
Unenclosed porch	1/2 of area
Enclosed porch	2/3 of area
Unfinished basement	1/2 of area
Covered walkways (paved)	1/2 of area
Open area under bldg. (paved)	1/2 of area
Canopies	1/4 of area
Two story room	1 1/2 of area
Penthouse (headroom height)	2/3 of area
Tunnels under 6'–0" wide w/slab	1/2 of "

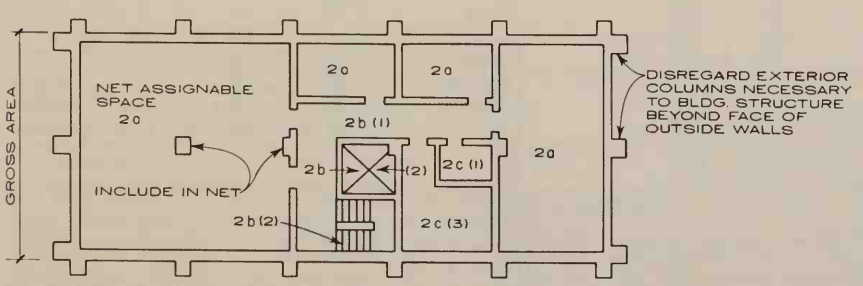
   c. EXCLUDE THE FOLLOWING:
      Unfinished attics (finished attics are included where headroom is 5'–0" or over), crawl spaces and terraces, pipe trenches, roof overhangs, chimneys.
2. BREAKDOWN OF GROSS BLDG. AREA (SIMILAR TO G.S.A. STANDARDS)
   a. NET ASSIGNABLE AREA OR "NET USABLE SPACE".
      (Include interior columns or necessary projections)
   b. CIRCULATION AREA
      (1.) Horizontal–corridors, lobbies, ent. tunnels, & bridges.
      (2.) Vertical–stairs, elev. shafts, & towers.
   c. MECHANICAL AREA
      (1.) Boiler rm. elec. vault, etc.
      (2.) Cooling towers, enclosed shafts, duct-space.
      (3.) Toilets & restroom lounge area.
   d. CONSTRUCTION AREA (STRUCTURE, WALL THICKNESSES, ETC.)
   e. PARTIAL AREAS (SEE 1.b.)
3. EXPLANATION OF FAMILIAR TERMS:
   a. "GROSS INSIDE SPACE" equals net assignable area, plus horizontal circulation plus mechanical area.
   b. "NET RENTABLE SPACE" equals net assignable plus horiz. circulation & mechanical services pertaining directly to rentable area.
   c. "TOTAL NET AREA" (GSA standards) equals net assignable plus horizontal circulation area.
   d. "BLDG. EFFICIENCY" equals percentage of net assignable in relation to "gross inside space."
4. STANDARD OF THE FEDERAL HOUSING ADMINISTRATION
   Include areas of floors above basement, measured from outside surfaces of exterior walls; include bays, dormers, utility rooms, vestibules, hall & closets.
   Do not include garage or finished attic spaces.
   In a half story measure from outside surfaces of exterior walls or partitions enclosing the areas, except do not include areas where ceiling height is less than 5'–0".
   Do not deduct for stairwells, interior light shafts, chimneys, fireplaces, thickness of partitions, or thickness of enclosing walls.
   Porches, attached terraces, balconies and projecting fireplaces or chimneys, outside the exterior walls, are not included.
   DEFINITIONS:
   Half story: If finished as living area, must be 50% or greater than 50% of the calculated area of floor below.
   Full story: Completely finished for living area, enclosed by exterior walls with a ceiling height 5'–0" min. at exterior walls.
   Attic: Unfinished or partially finished as living area when the calculated area is less than 50% of floor below.



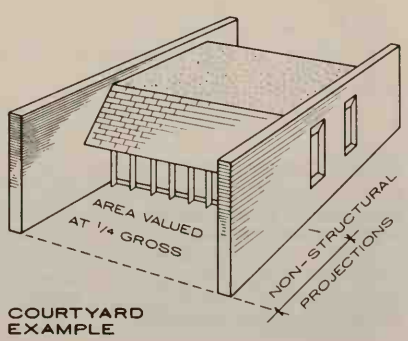
RESIDENTIAL EXAMPLE



COMMERCIAL EXAMPLE



PLAN EXAMPLE NO SCALE



COURTYARD EXAMPLE

Noel M. Knudson; Hammel, Green and Abrahamson, Inc.; St. Paul, Minnesota

ARCHITECTURAL VOLUME OF BUILDINGS

The ARCHITECTURAL VOLUME (cube or cubage) of a building is the sum of the products of the areas defined on previous page (using the area of a single story for multi-story portions having the same area on each floor) and the height from the underside of the lowest floor construction system to the average height of the surface of the finished roof above for the various parts of the building.

From AIA Document D101, 1967

CUBAGE includes the following volumes, taken in full:

The cubic content of the actual space enclosed within the outer surfaces of the exterior or outer walls and contained between the outside of the roof and the bottom of the lowest floor; bays, oriels, dormers; penthouses; chimneys; walk through tunnels; tanks, vaults, pits and trenches, if made of building construction materials (not simple earth excavations); enclosed porches and balconies, including screened areas.

The CUBAGE includes the following volumes in part:

a) Two-thirds ($^2/_3$) volume for:
Non-enclosed porches, if recessed into the building and not having enclosing sash or screens.

b) One-half ($^1/_2$) volume for:
Non-enclosed porches built as an extension to the building, without enclosing sash or screens.

Areaways and pipe tunnels.

Patio areas that have building walls extended on two sides, roof over and paved surfacing.

The CUBAGE does not include the following features:

The cubage of outside steps, terraces, courts, garden walls; light shafts; parapets, cornices, roof overhangs; footings, deep foundations, piling, caissons, special foundations and similar features. Note: In making cubic foot cost analysis, as a matter of information and reference, it is recommended that cost items such as piling, caissons, deep foundations, unusual step construction and other non-typical features be listed as factors having an effect on the unit cost without being included in the cubage.

CUBIC FOOT COST

The CUBIC FOOT COST equals the net cost divided by the total cubage.

The NET COST in usual practice includes the following:

The building construction, including built-in cabinets and furniture, all finishes and hardware; mechanical work, including plumbing, heating, air conditioning and controls; electrical work, lighting fixtures, sound and signal systems; elevators; sprinklers; equipment provided for the operation of the building.

The NET COST usually excludes the following:

Furniture and furnishings, such as ranges, laundry and kitchen equipment, clocks, lockers, files; organs; draperies, shades, blinds, awnings; non-built in furniture; roads, walks, terraces, and other site development; landscaping; sewage disposal system; power plant; wells or other water supply; utilities to the building. Also fees for Architects, Engineers and specialty consultants.

Noel M. Knudson; Hammel, Green and Abrahamson, Inc.; St. Paul, Minnesota

PRINCIPLES OF FALLOUT PROTECTION

TIME

Radiation intensity decreases 10 fold for every 7 fold increase in time.

DISTANCE

The farther fallout travels, the more radiation decays before falling to earth.

MATERIAL

Shielding is accomplished by the weight of material used as a barrier.

PROTECTION FACTOR - PF

A factor used to express the relation between the amount of fallout gamma radiation that would be received by an unprotected person and the amount that would be received by one in a shelter. For example, an occupant of a shelter with a Pf of 40 would be exposed to a dose of $^1/_{40}$ (or 2 $^1/_2$%) of the rate to which he would be exposed if his location were unprotected.

MINIMUM REQUIREMENTS FOR PUBLIC SHELTERS - OFFICE OF CIVIL DEFENSE

Protection factor	40
Area per person	10 S.F.
Volume per person	65 C.F.
Fresh air per person	3 C.F.M.
Means of egress	2
Number people per egress	200
Volume of storage per person (with water drum)	1.5 C.F.
Volume of storage per person (without water drum)	9 C.F.
Number of people per toilet	50
Light in sleeping areas (at floor)	2 F.C.
Light in activity areas (at floor)	5 F.C.
Light in administrative and medical areas (at desk)	20 F.C.

Accessible trapped water in plumbing system is taken into account when determining the amount of water to be stored.

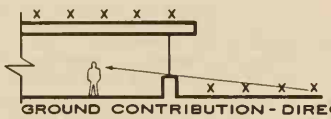
Toilets are not required by the Office of Civil Defense but if included should be based on this figure.

NOTES

The Office of Civil Defense requires that Protection Factors for all public fallout shelters be certified by an architect or engineer qualified as a Fallout Shelter Analyst.

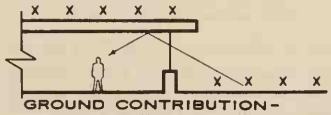
Public shelters are stocked with emergency supplies which include food, water, medical supplies, sanitary kits, etc.

Public fallout shelters are identified by a black and yellow sign.



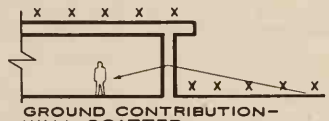
GROUND CONTRIBUTION - DIRECT

Some radiation comes directly from ground surface.



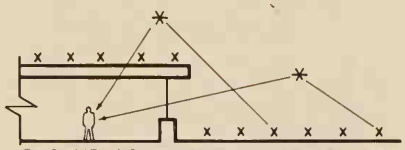
GROUND CONTRIBUTION - CEILING SHINE

Some radiation is reflected by the ceiling or other horizontal plane.



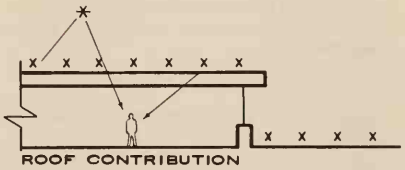
GROUND CONTRIBUTION - WALL SCATTER

Some radiation is deflected by the wall.



GROUND CONTRIBUTION - SKYSHINE

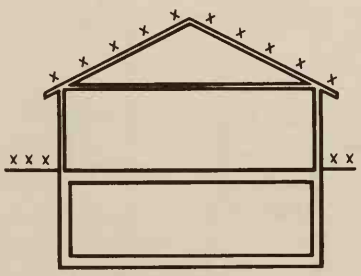
Some radiation is reflected from particles in the air.



ROOF CONTRIBUTION

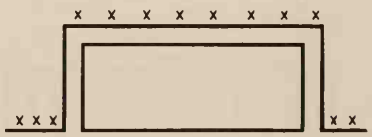
Some radiation comes directly from the roof surface.

RADIATION TYPES AND SOURCES



BELOW GROUND
AREA = 1000 S.F.

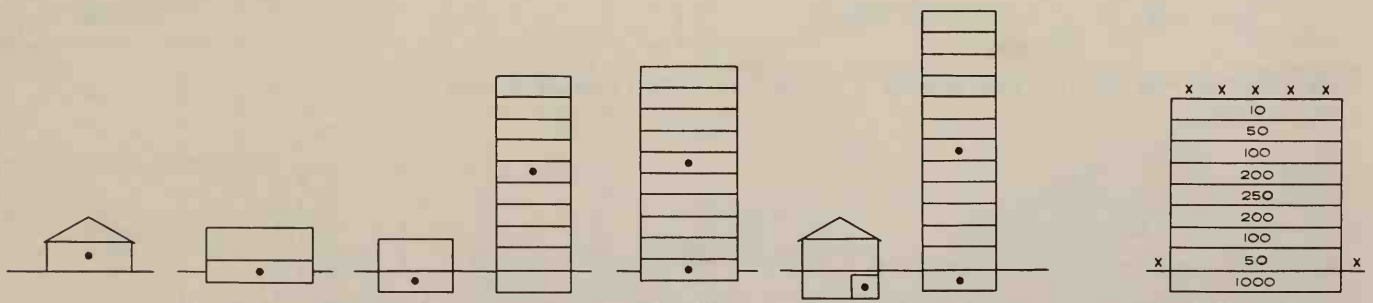
WT. OF FLOOR - PSF	CONSTRUCTION OF FLOOR	Pf
20	wood frame	20
50	4" concrete	50
125	10" concrete	220
225	18" concrete	2000



ABOVE GROUND
AREA = 1000 S.F.

WT. OF WALL - PSF	WEIGHT OF ROOF - PSF			
	50	100	200	300
50	4	5	5	5
100	7	12	15	15
200	14	40	115	145
300	15	55	345	910

APPROXIMATE Pf VALUES FOR SMALL STRUCTURES



Pf 1½-2

Above ground areas of low buildings including residences, stores, light industrial types of structure.

Pf 2-10

Small buildings having partly exposed basements (or first floor of heavy wall structures).

Pf 10-50

Central areas of some upper floors in a multistory building with light floor and wall construction. Basement in a 1 or 2 story building.

Pf 50-250

Center of some upper floors, basement, in heavy multistory type building.

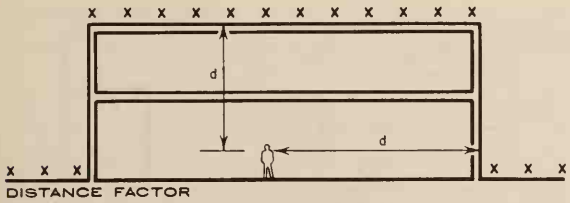
Pf 250-1000

Central portions of some upper floors in high-rise buildings (more than 10 stories) and basement in a multistory structure with heavy floor and wall construction.

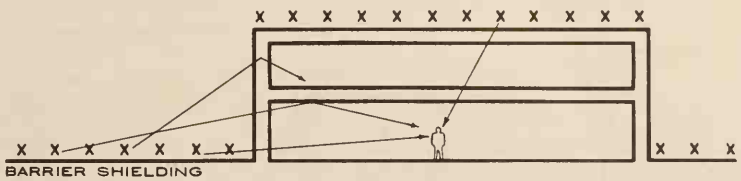
Pf VARIATION AT DIFFERENT FLOORS

APPROXIMATE Pf VALUES FOR VARIOUS BUILDING TYPES & LOCATIONS IN BUILDING

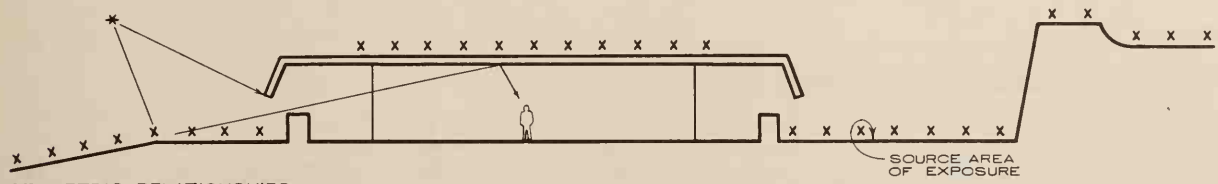
Robert Berne, AIA; Chief Architect, U. S. Office of Civil Defense; Washington, D. C.



DISTANCE FACTOR
Exposure is reduced as distance (d) from source increases.

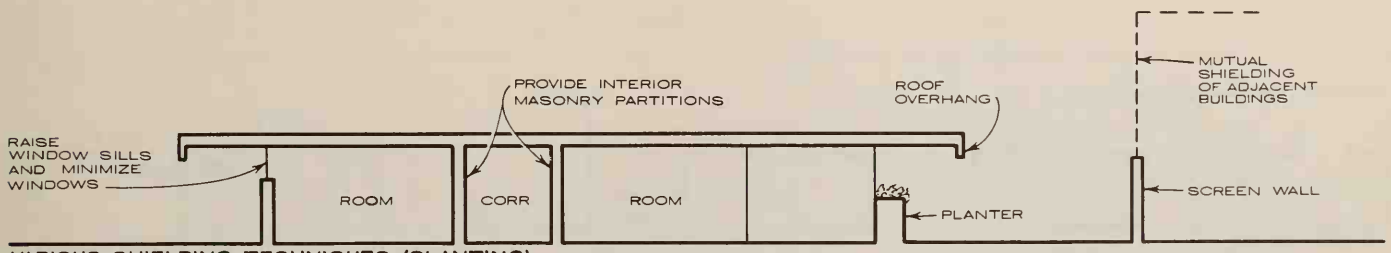


BARRIER SHIELDING
Exposure is reduced as shielding mass (weight of walls and roof) is increased.
Multiple thicknesses are cumulative in shielding value



GEOMETRIC RELATIONSHIPS
Exposure is reduced when the source area is limited.

TECHNIQUES OF EXPOSURE CONTROL



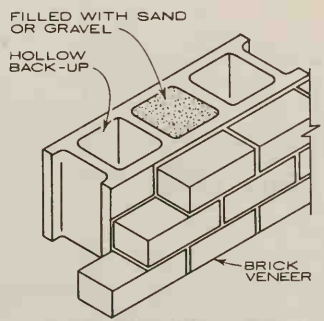
VARIOUS SHIELDING TECHNIQUES (SLANTING)

DEFINITION OF "SLANTING"

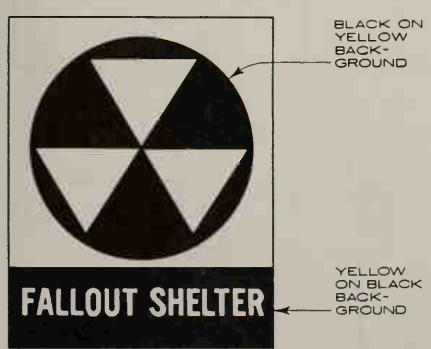
"Slanting" is defined as the incorporation, at little or no increase in cost or reduction in efficiency, of certain architectural and engineering features into all new structures to protect personnel from fallout gamma radiation in the event of an emergency. The slanting features may provide immediate improvement or may be of such nature as to facilitate later conversion of the structure for protective purposes. Thus, "Slanting" adds the protective function to the other criteria normally considered in the design of structures.

"SLANTING" IN DESIGN

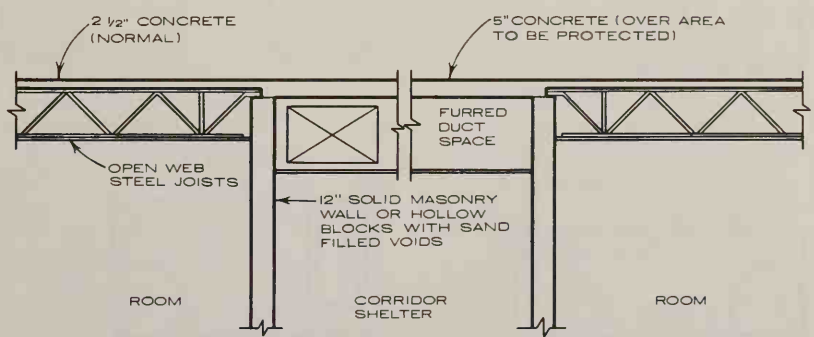
Increase sill heights
Offset entrances
Stagger doors and windows
Use masonry partitions
Use smaller window areas
Fill hollow blocks with sand
Use screen walls
Use roof fill
Use planter boxes
Roof overhangs
Increase weight of walls
Depress building in ground
Use shields for openings



INCREASE THE WEIGHT OF WALLS



PUBLIC SHELTER SIGN



INCREASE THE WEIGHT OF OVERHEAD AND WALL CONSTRUCTION

KITCHEN SPACE PLANNING

The layouts shown here, together with their general area requirements, are based on studies of furniture appliances, storage, and clearances for the average residential kitchen. They have been developed to accomodate storage, work, and required floor areas for various functions, but the location of appliances and their order should be determined by individual preferences, check clearances, traffic flow, and appliance functions rather than total square footage in determining kitchen size during early planning stages.

To simplify comparison of the various room types, basic sizes of furniture, appliances, and clearances have been standardized. However, the appliances shown in the kitchenettes are the more compact units available from some manufacturers (see Equip. pgs.) In all cases, the depth of the counter is assumed as 24", the depth of base storage units as 20", and the depth of wall storage units as 12". Their widths vary in relation to their location.

A useful rule-of-thumb to determine storage area requirements for residential kitchens is: Provide a minimum of 18 square feet of space for basic storage with an additional 6 square feet for each person usually served.

The letters A, B, and C shown below refer to the "work centers" described on another page. The asterisks(*) indicate the best locations for a wall oven if such an oven is used.

GENERAL NOTES

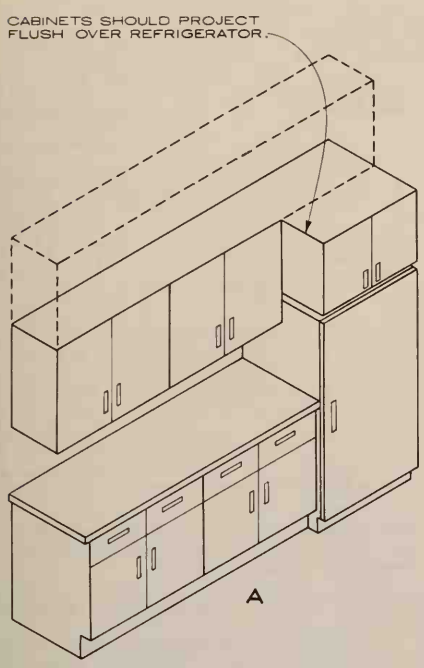
1. For equipment not shown, such as covered ranges and under-counter refrigerators see manufacturers' literature.
2. Consult local building codes for kitchenette requirements.

R. E. Powe, Jr., Hugh N. Jacobsen, AIA; Washington, D. C.

KITCHEN WORK CENTERS:

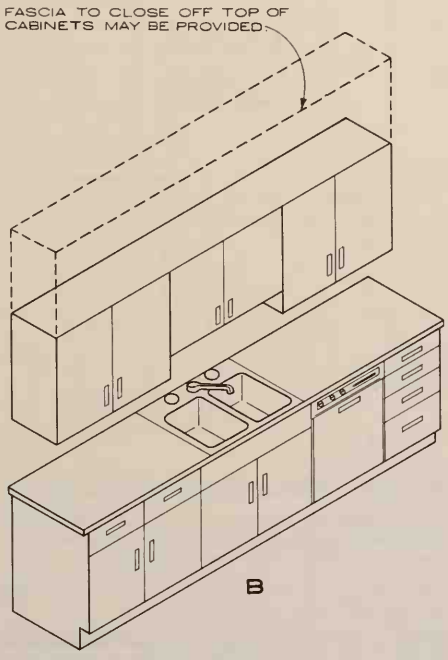
A residential kitchen may be considered in terms of three interconnected work centers, A, B and C, as shown below. Each encompasses a distinct phase of kitchen activity, and storage should be provided for those items most used in connection with each center.

The functions of the "sink center" are most common to the other two; it is recommended, therefore, that its location, if possible, be convenient to each of them (usually between them). The "refrigerator center" is best located near the entry, and the "range center" near the dining area.



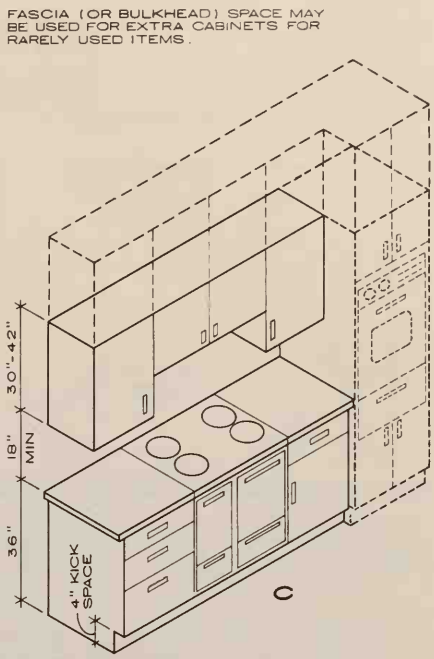
REFRIGERATOR CENTER
(RECEIVING AND FOOD PREPARATION)

Provide storage for mixer and mixing bowls; other utensils: sifter, grater, salad molds, cake and pie tins, occasional dishes, condiments, staples, canned goods, brooms and extra storage for miscellaneous items.



SINK CENTER
(FOOD PREPARATION, CLEANING AND CLEAN-UP)

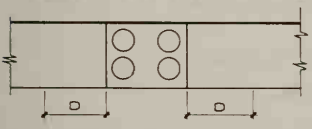
Provide storage for everyday dishes, glassware, pots and pans, cutlery, silver, pitchers and shakers, vegetable bins, linen, towel rack, wastebasket, cleaning materials and utensils, garbage can or disposal, and dishdrain. Some codes require louvres or other venting provision in the doors under enclosed sinks.



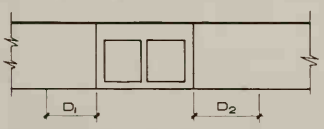
RANGE CENTER
(COOKING AND SERVING)

Provide storage for pots, potholders, frying pans, roaster, cooking utensils, grease container, seasoning, canned goods, bread bin, bread board, toaster, plate warmer, platters, serving dishes and trays.

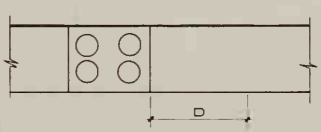
CLEARANCES AND COUNTER WIDTHS:



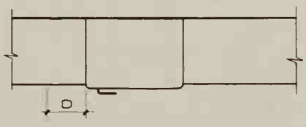
D = 18" to 24"
D = counter distance on either side of a cooking facility.



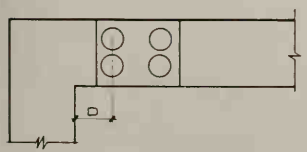
D_1 = 18" to 36"
D_2 = 24" to 36"
Provide work space on both sides of sink. If dishwasher is used allow at least 24" to the right or left.



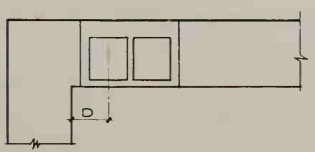
D = 36" to 42"
D = counter space between range and nearest piece of equipment.



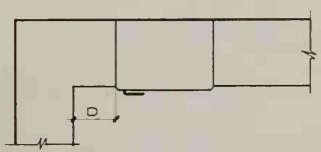
D = 15" minimum
Provide room at latch side of refrigerator for loading and unloading.



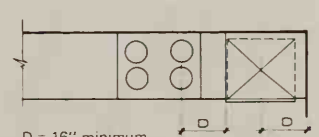
D = 14" minimum
D = clearance between the center of the front unit (or burner) and the turn of the counter.



D = 14" minimum
D = clearance between the center of the sink bowl and the turn of the counter.

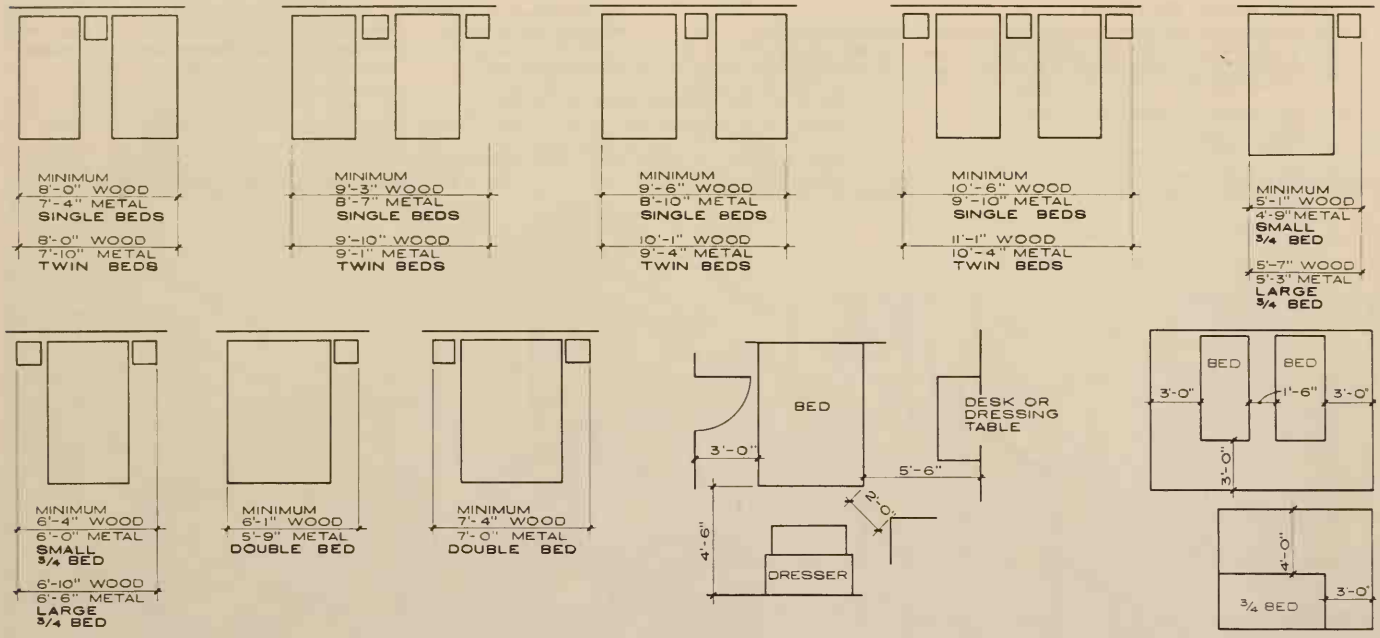


D = 16" minimum
D = clearance between latch side of refrigerator door and turn of the counter.



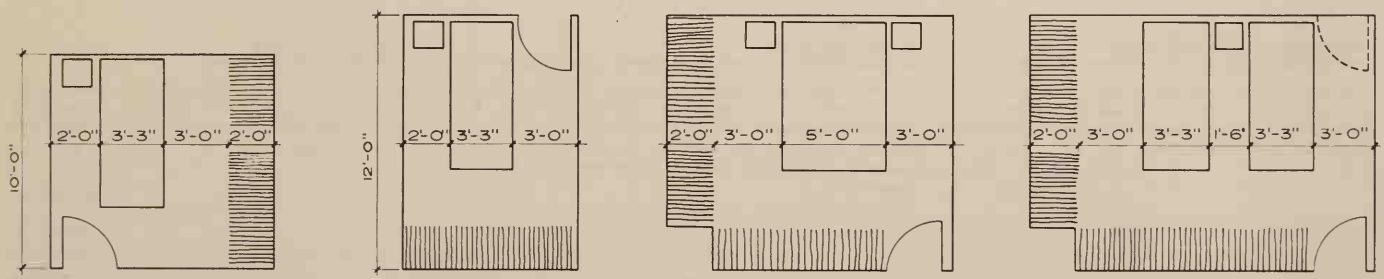
D = 16" minimum
D = clearance between center of front burner and nearest piece of high equipment or nearest wall; or between the center of a wall oven and an adjoining wall.

R. E. Powe, Jr.; Hugh N. Jacobsen, AIA; Washington, D. C.



WALL SPACE REQUIREMENTS FOR BED & NIGHT TABLE ARRANGEMENTS

The average person requires 8 linear feet of drawer space for clothing. Clearances required for the pulling out of drawers and for access and entry into room must be taken into consideration. The bedroom clearances shown are recommended for passage and are desirable for bedmaking. The diagrams below show a relationship of square foot areas required when planning bedrooms with clothes storage. Sitting, writing, and makeup areas are not included. These must be included if required.



TYPICAL BEDROOM ARRANGEMENTS

Minimum lineal feet of clothes rack is: 4' - 0' Man; 6' - 0' Woman; 8' - 0' Combination,

NOTE: CLEAR OPENINGS ARE DIMINISHED BY DOOR THICKNESS WHEN OPEN.

ADULTS CLOSETS- NO SCALE

RECOMMENDATIONS AND ADVANTAGES IN DESIGNING CLOSETS FOR ADULTS AND CHILDREN

Recommended:

No closet bi-fold door should exceed 2'-0" panel. Largest door stock in pocket and sliding door is 4'-10".

All doors should allow easy access to top shelves.

All closets should have two shelves.

Advantages:

Bi-fold doors allow 66 2/3% minimum of closet to be opened at once.

Pocket slides – 100%

Sliding doors – 50% max. (varies with no. of tracks and doors.)

Hinged doors – 90%

R. E. Powe, Jr.; Hugh N. Jacobsen, AIA; Washington, D. C.

TYPICAL LAYOUTS

This and the following page show schematic drawings of various kitchen areas. The drawings are intended to show efficient functional relationships of the main equipment and do not attempt to present design solutions to kitchen.

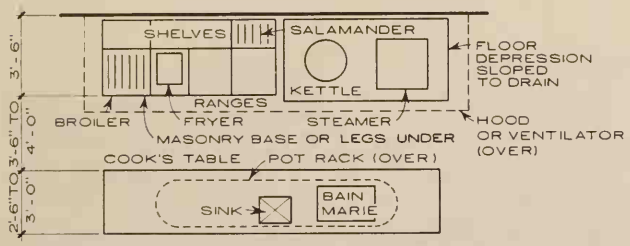
Type, quantity and layout of equipment will vary with anticipated patronage and menu. For example, large kitchens may need more items, such as ranges and kettles, than are shown under "Cooking Sections." Small kitchens may combine in a cooking area functions shown separately below, such as cooking and baking.

WORK AISLES

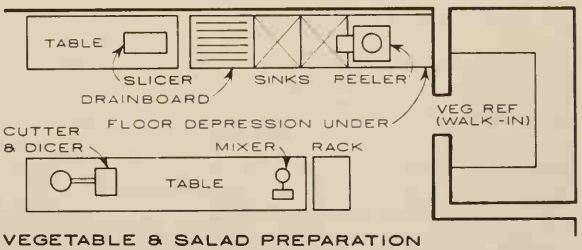
If no thru-traffic, minimum width is 3'-0".

With 2 parallel work tables, minimum aisle width is 3'– 6", preferably 4'– 0" to 4'– 6".

SCALE–ALL DRAWINGS: 1/8" = 1'–0"

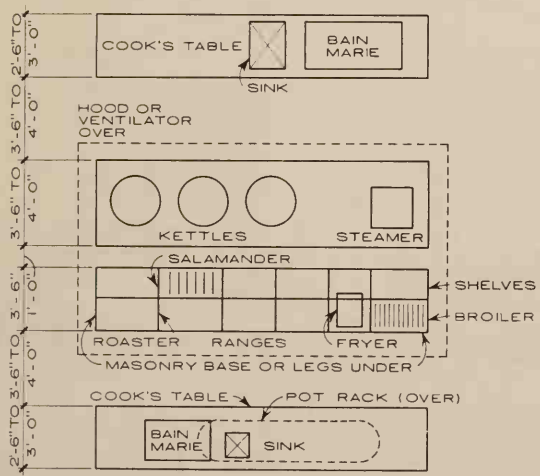


COOKING AREA AGAINST WALL

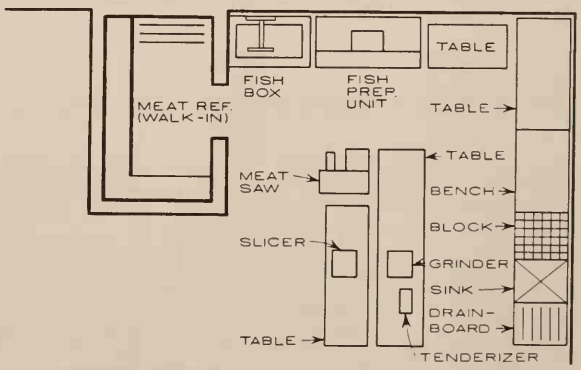


VEGETABLE & SALAD PREPARATION

May also have portable racks, cold cabinets, plate dispensers, etc.



COOKING AREA: ISLAND TYPE



MEAT & FISH PREPARATION

This arrangement is typical in places where meat and fish are prepared on premises.

Because of the availability of frozen and precut meat and fish this arrangement may be modified.

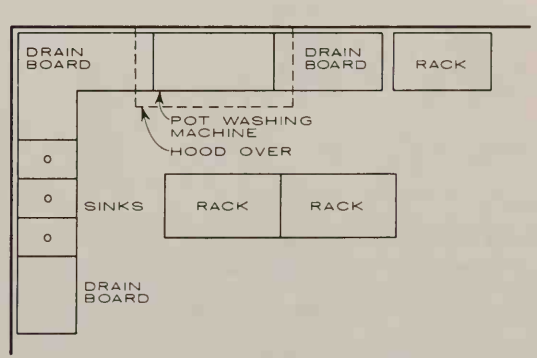
TYPICAL DISHWASHING LAYOUT



POT WASHING

NOTE MACHINE MAY BE OMITTED

GENERAL NOTES:

Many designs can be adopted.

Arrangements influenced by size of establishment and shape of space available.

Arrangements for washing glasses, silver and trays are quite similar and may be designed within dishwashing area.

Many types of machines are available for all types of operations.

Flight type (straight line conveyor) and continuous oval shaped conveyor systems are available.

Anthony J. Amendola, AIA; Forest Hills, New York

GENERAL NOTES :

Fast food service is that type provided by luncheonettes, soda fountains, and dinettes (serving simple meals), which provide counter service and by short-order sections of main kitchens.

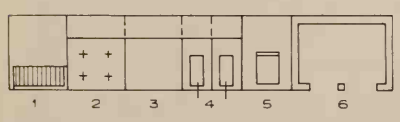
Counter service operations may have a separate kitchen with food preparation, cooking, and dishwashing areas.

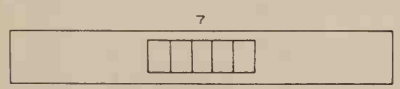
The basic installations for counter service are:

1. Back-bar
2. Front counter
3. Island
4. Combinations of above

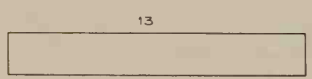
KEY TO EQUIPMENT

1. Broiler
2. Open top range
3. Fry top range
4. Deep fryer - heavy duty unit
5. Sink
6. Refrigerator
7. Cooks table with steam table inset
8. Griddle - counter type
9. Deep fryer - counter type
10. Steam table
11. Sandwich unit - refrigerator under
12. Toaster
13. Service counter
14. Soda fountain - ice cream
15. Sinks with glass rinse, disposal chute and drainboard
16. Counter work top
17. Drink mixers
18. Coffee urns
19. Griddle with broiler under
20. Salad - dessert case
21. Water and ice
22. Coffee servers
23. Milk dispensers
24. Cold pan desserts
25. Display case - overhead
26. Ice cream
27. Service counter - hot foods, sandwiches and salads





UNIT A



UNIT B

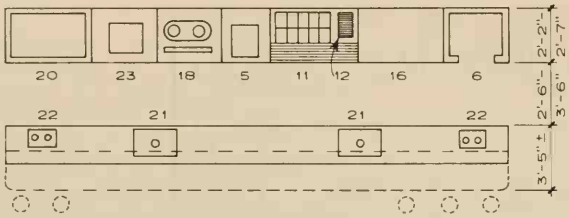
SHORT-ORDER KITCHEN

A short-order section in a main kitchen does the same type of cooking as behind-the-counter installations but usually has heavy equipment larger than that used in counters.

Unit B provides simpler service than unit A.

SCALE ALL DRAWINGS: 1/8"= 1'-0"

Anthony J. Amendola, AIA, Forest Hills, New York

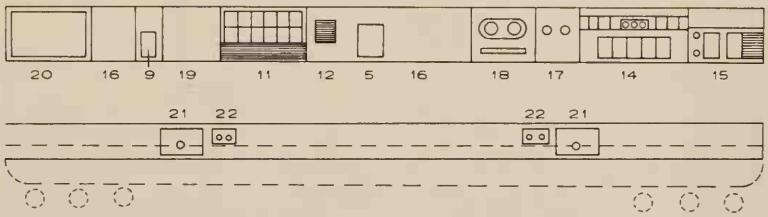


BACK-BAR INSTALLATION (SMALL)

Usually for a small operation with minimum menu and rapid customer turn-over.
Has short counter; therefore usually uses straight counter rather than bay.

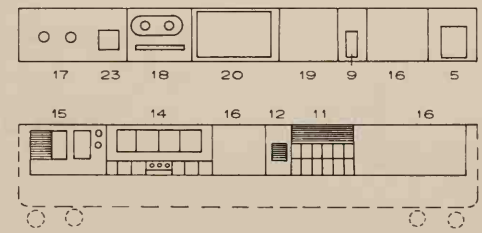
NOTE :

Dimensions of counter and work alsles are typical for all details shown.



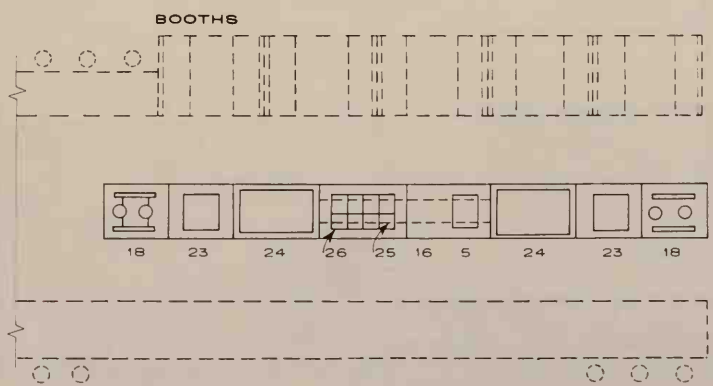
BACK-BAR INSTALLATION (LARGE)

May have entire cooking unit in back-bar installation.
Lengthy counter requires duplication of coffee-making facilities.
Bay counter seating may be used also.



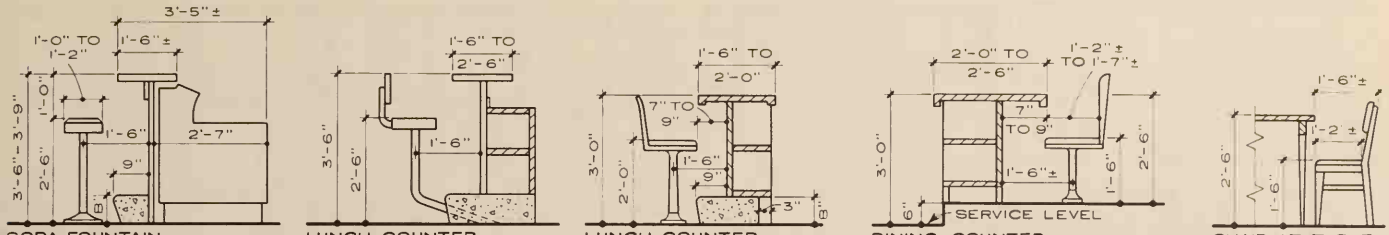
COMBINED FRONT COUNTER AND BACK-BAR INSTALLATION

Usually for operations with limited area and staff, and a larger menu.
May serve booths from waitress stand at end of counter.



ISLAND INSTALLATION

May have straight or bay counter seating;
also allows for direct booth service by counter waiters.



SECTION THROUGH COUNTERS, TABLE, AND SEAT
SCALE : 1/4"= 1'-0"

KEY TO DIMENSIONS

A. Work aisles;

Minimum width with one waitress is 2' – 3". With two or more waitresses working in one area, increase width to 2' – 6" to 3' – 0".

B. All seats are 2' – 0" to 2' – 2" o.c.; depends on style and size of seat.

C. Minimum width is 2' – 3". Recom. width is 3' – 0".

D. Back-bar width depends on the type of equipment used. With only small counter appliances, 1' – 6" to 1' – 8" may be adequate.
With reach-in refrigerator or heavy equipment; 2' – 0" to 2' – 9" will be required.

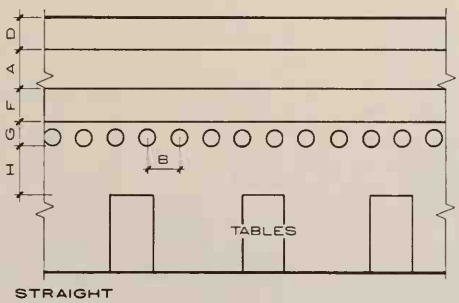
E. Distance from counter to counter, with multiple bays, is 5' – 0" to 5' – 6".

F. Front counter width varies with the type of service provided, 1' – 6" to 2' – 6".

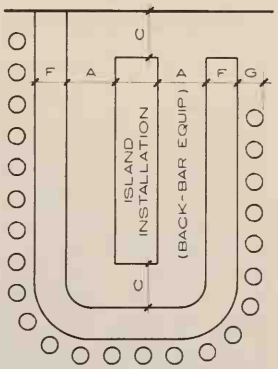
G. 1' – 3" to 1' – 6".

H. 3' – 0" – 4' – 0".

I. 1' – 3" ±



STRAIGHT



SINGLE BAY

NOTE:

Dimensions of work aisles, seating spacing, etc., do not vary with different types of counter arrangements.

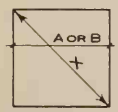
DINING ROOM / RESTAURANT	14–15	10–12
CAFETERIA	15	12
LUNCHRMS: COUNTER AND CHAIR - TABLE TYPES INCL. COUNTERS, CHAIRS TABLES	20	16

SEATING ALLOWANCES

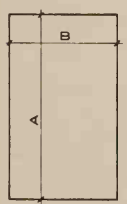
These figures are rule-of-thumb for square feet per-person (non-standardized), and are to be used only for making an approximation of seating capacities.

TYPICAL SEATING ARRANGEMENTS



SQUARE

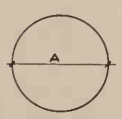
PERSONS	A OR B	X
2	1'– 8" to 2'– 6"	2'– 5" to 3'– 6"
4	2'– 6" to 3'– 0"	3'– 6" to 4'– 3"



RECTANGLE

PERSONS	A	B
2 (ON ONE SIDE)	3' – 6" to 4' – 0"	2' – 0"
2	2' – 0" to 2' – 6"	2' – 0" to 2' – 6"
4	3' – 6" to 4' – 0"	2' – 0" to 3' – 0"
6	5' – 0" to 8' – 0"	

Tables wider than 2'– 6" will seat one at each end.



CIRCLE

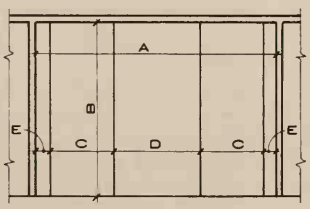
PERSONS	A
2	2'– 0"
3	2'– 6"
4	3'– 0"

Round tables are usually recommended only for seating 5 persons or more.

"A" dim. depends on the perimeter, (1'– 10" – 1'– 2" per person), necessary to seat required number. For cocktails, 1'– 6" is sufficient.

TABLES

Minimum sizes are satisfactory for drink service; larger sizes for food. Tables with wide spread bases are more practical than four legged tables.



PLAN

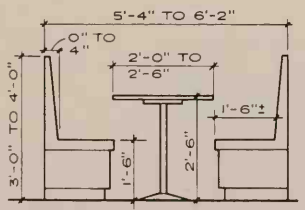
A With sloping seat back: 5'– 4" to 6'– 2". Without sloping seat back: 5'– 4" to 6'– 2".

B One person per side: 2'– 0" to 2'– 6". Two persons per side: 3'– 6" to 4'– 6". Recommended max. for serving and cleaning 4'– 0".

C 1'– 6" ±

D 2'– 0" to 2'– 6".

E 2" to 6"



ELEVATION

BOOTHS

Local regulations determine actual booth sizes. Tables are often two inches shorter than seats, and may have rounded ends. Circular booths have overall diameter of 6'– 4" ± .

DETERMINING THE MAIN FLOOR SLOPE DIAGRAM

SCALE USUALLY 1/4" = 1'-0" HORIZ., 1/4", 3/4", 1 1/2" = 1'-0" VERTICAL

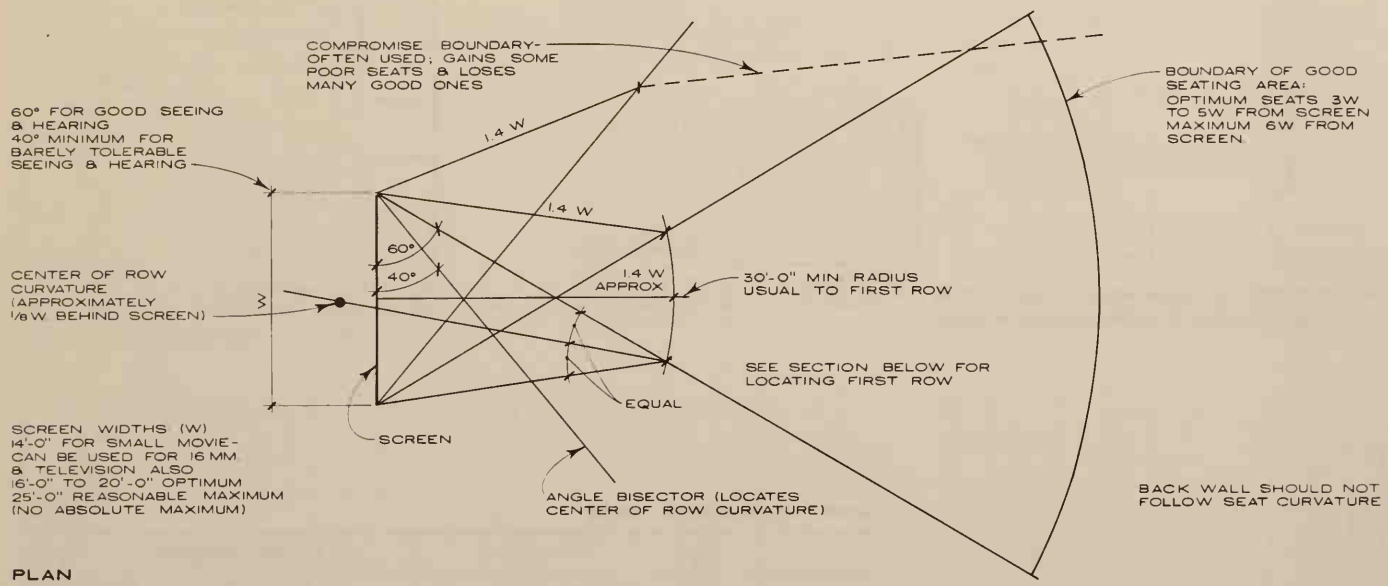
Balcony sight lines similar but start from rear row forward, maintaining uniform terrace heights to front of balcony or cross aisle.

Stagger seats in plan to allow unobstructed view between alternate rows of spectators so that min. 2/3 width of screen or acting area is in view.

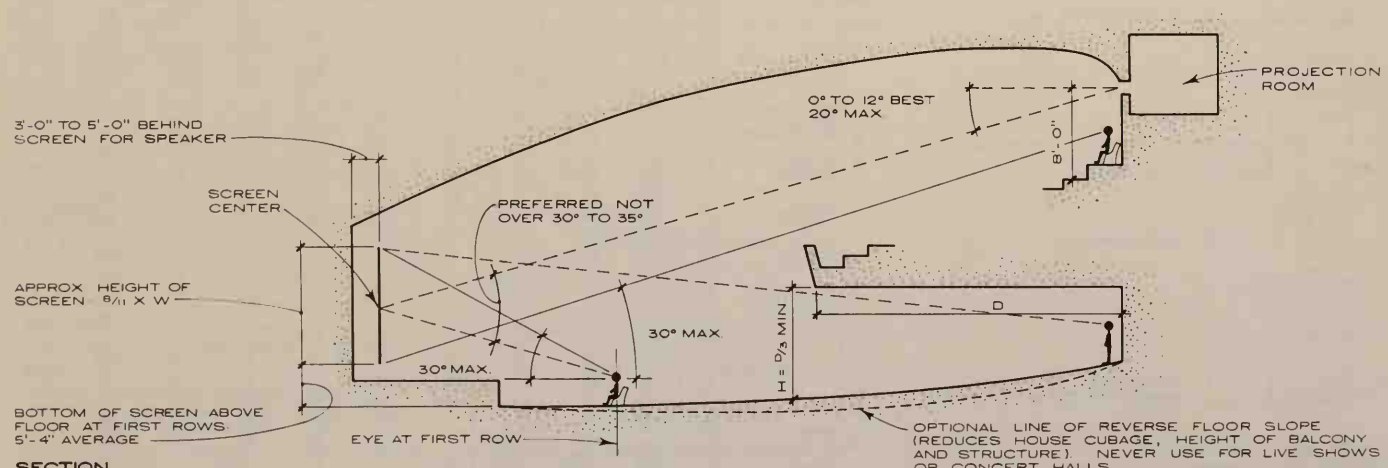
Floor curve varies only with first row location & focus height. Not affected by row spacing. Several diagrams should be made using different initial assumptions to determine the best combination of overall relationships.

Raise first row of seating behind cross aisle to clear head of people using aisle.

See local code for maximum aisle slopes permitted:
B.O.C.A. & B.B.C. allow 1:7 (1 3/4"/ft.).
U.B.C. allows 1:8
N.B.C., N.F.P.A., S.S.B.C. allow 1:10
Slopes greater than above must be in equal aisle risers full aisle width, usually allowed only in galleries & balconies.



PLAN



SECTION

SCREEN SHOWS

TOTAL NET VOLUME = 125 - 150 CU. FT. PER SEAT

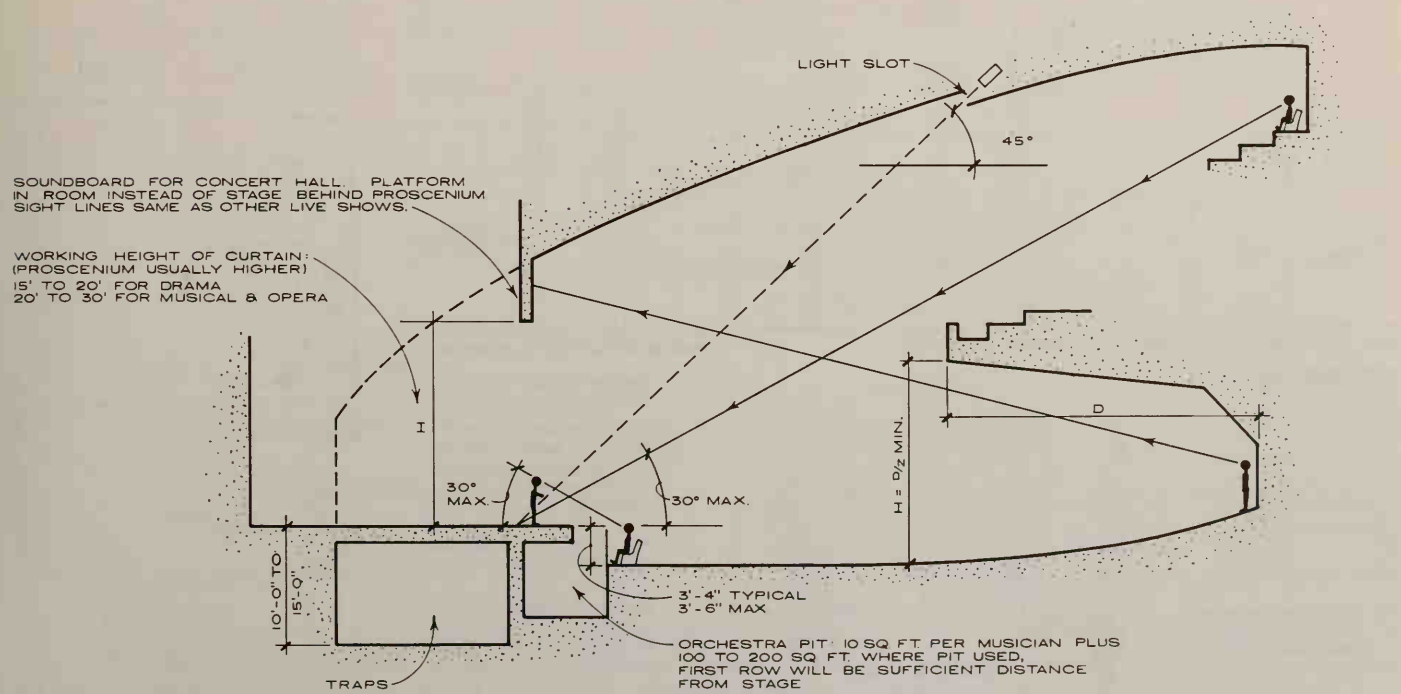
PLAN

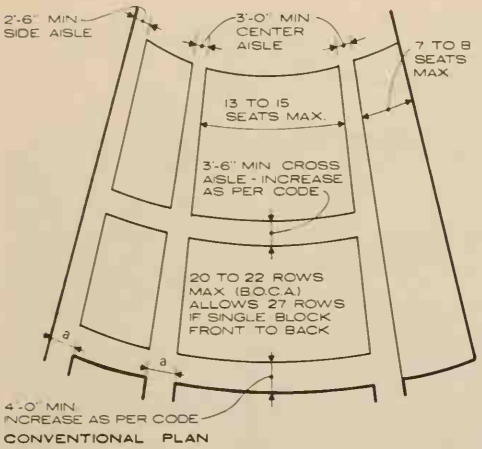


SECTION

LIVE SHOWS (DRAMA, MUSICAL, OPERA, BALLET)

TOTAL NET VOLUME (EXCLUDING STAGE) = 150 - 200 CU. FT. PER SEAT

Warren Anderson; The Perkins and Will Partnership; Chicago, Illinois



CONVENTIONAL PLAN

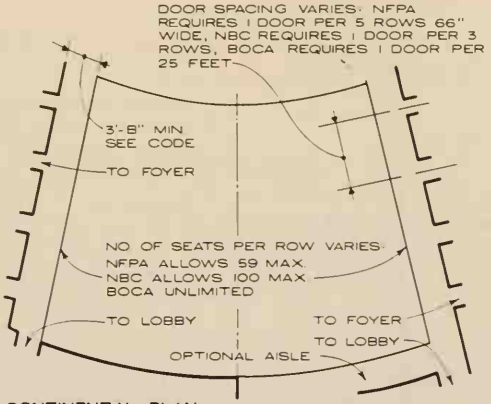
DESIGN CONSIDERATIONS:

Area: allow min. 6 to generous 8 sq. ft. per seat floor area in conventional seating layout – allow min. 8 to generous 10 sq. ft. per seat floor area in continental seating layout. Area includes all aisles, side wall areas for duct work and acoustical baffles and forestage to curtain line – for preliminary assumptions only.

Aisles: consult local code: begin with usual min. widths shown and increase at rate of 1/4" per ft. (B.B.C. and B.O.C.A.), 1 1/2" per 5'– 0" (N.F.P.A., U.B.C. and S.S.B.C.) or 22" per 100 persons (N.B.C.) to determine "a".

Exits: consult local code: generally 100 ft. max. from any point on floor to nearest exit: often increased to 133 or 150 ft. if sprinklers provided, or principal entry at grade, or aisle exit route assumed. Number of exits based on occupancy requirements per local code.
Codes specify seating as back to back.

Max. floor slope - see page on Theater Sightlines.



CONTINENTAL PLAN

Note: Many codes do not permit continental seating.

RECOMMENDED TOILET FIXTURES FOR GYM LOCKER SUITES

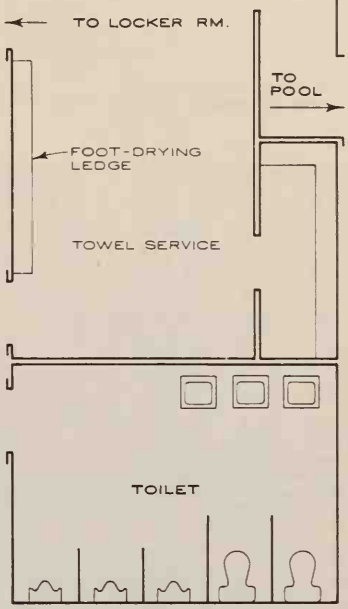
FIXTURE	NO. OF FIXTURES - BY PROPORTION	MINIMUM
TOILETS	Girls – 1 to 30 Individuals	3
	Boys – 1 to 50 Individuals	2
URINALS	Boys – 1 to 25 Individuals	2
LAVATORIES	Girls – 1 to 20 Individuals	3
	Boys – 1 to 20 Individuals	3

AUXILIARY ROOMS FOR GYM LOCKER SUITES

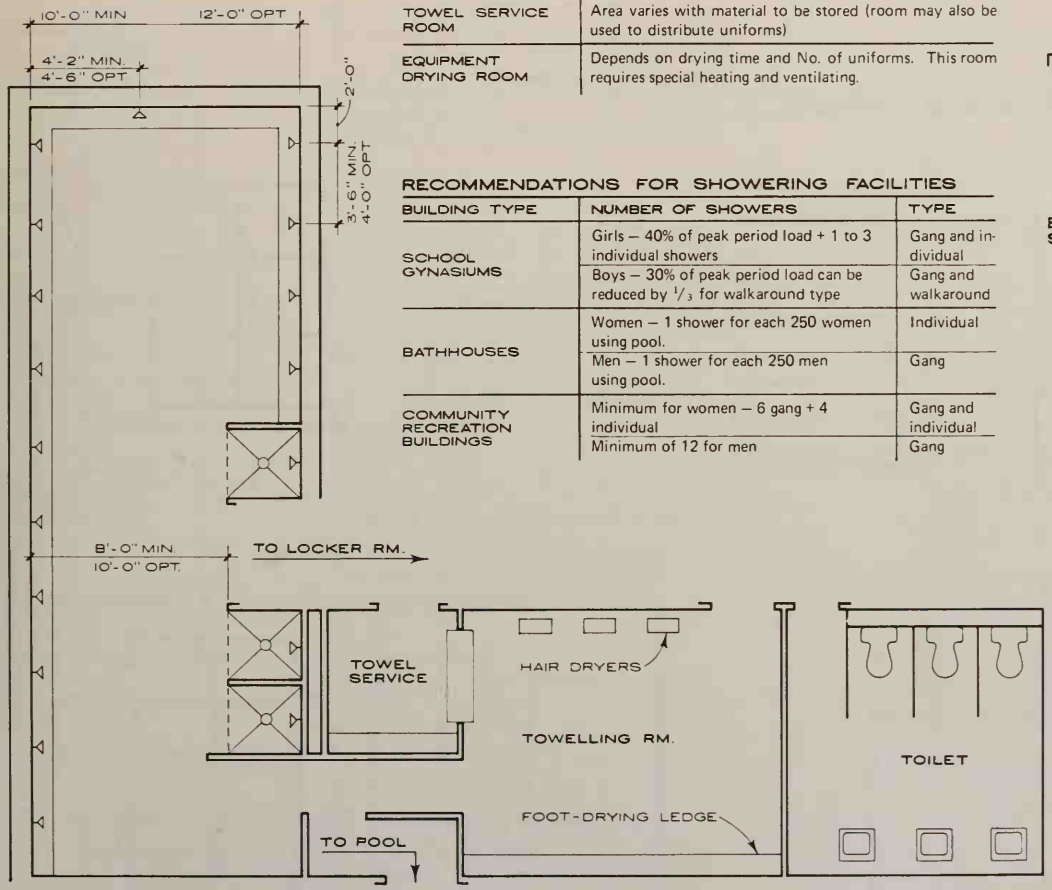
TOWELLING ROOM	
TOWEL SERVICE ROOM	Area varies with material to be stored (room may also be used to distribute uniforms)
EQUIPMENT DRYING ROOM	Depends on drying time and No. of uniforms. This room requires special heating and ventilating.

RECOMMENDATIONS FOR SHOWERING FACILITIES

BUILDING TYPE	NUMBER OF SHOWERS	TYPE
SCHOOL GYNASIUMS	Girls – 40% of peak period load + 1 to 3 individual showers	Gang and individual
	Boys – 30% of peak period load can be reduced by 1/3 for walkaround type	Gang and walkaround
BATHHOUSES	Women – 1 shower for each 250 women using pool.	Individual
	Men – 1 shower for each 250 men using pool.	Gang
COMMUNITY RECREATION BUILDINGS	Minimum for women – 6 gang + 4 individual	Gang and individual
	Minimum of 12 for men	Gang



BOYS' LOCKER AND SHOWER FACILITIES



GIRLS' LOCKER AND SHOWER FACILITIES
(SHOWING GANG SHOWERS AND INDIVIDUAL SHOWERS)

NOTES:

1. Both individual and master temperature control for gang showers. Individual temperature control usually provided for individual shower.
2. Minimum gutter drain spacing equals 10'– 0".
3. Height of shower head from floor:
   Men 6'– 1"
   Women 5'– 9"
   Children 5'– 0"
4. See other page in this series for locker planning.

MINIMUM AISLE SPACE FOR DRESSING ROOMS

	SCHOOLS	AVERAGE TRAFFIC
A	2'-0"	2'-0"
B	3'-6"	3'-4"
C	3'-0"	2'-10"
D	3'-0"	2'-10"
E	2'-6"	1'-8"
F	3'-0"	4'-0"

Rule of thumb area for locker rooms (school gymnasiums and community recreation buildings) 14 sq. ft. per person (peak period load) exclusive of locker space.

LOCKER ROOM FACILITIES

Stationary benches

Mirrors for both boys and girls.

Shelves below mirrors for girls.

Full–length mirror for girls.

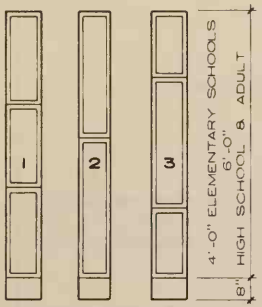
Drinking fountain

Bulletin board

Lighting located so that aisles and passages are well illuminated.

Windows located with regard to height and arrangement of lockers.

Adequate ventilation for all storage lockers.



STORAGE LOCKERS

RECOMMENDED LOCKERS FOR GYMNASIUM CLOTHING STORAGE:

1. 7 1/2" wide x 12" deep x 24" high.
2. 6" wide x 12" deep x 36" high.
3. 7 1/2" wide x 12" deep x 18" high.

DRESSING LOCKERS

RECOMMENDED DRESSING LOCKER SIZES:

12" wide x 12" deep x 48" high.

12" wide x 12" deep x 12" high.

NO. OF LOCKERS REQUIRED FOR SCHOOL GYMNASIUMS:

One dressing locker per student (peak period load) + 10% to allow for variation in class sizes and scheduling.

One storage locker per student enrolled + 10% to allow for expansion.

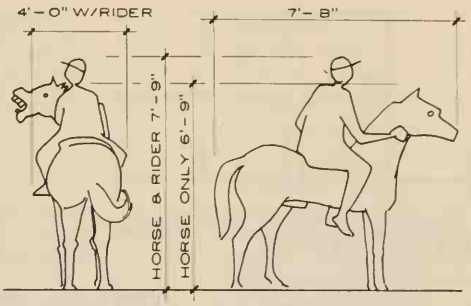
SINGLE ROW OUTSIDE — DOUBLE ROW INSIDE PASSAGE

ARRANGEMENTS OF STALLS, TACK AND FEED RMS – SCALE 1/16" = 1'-0"



CLEARANCES FOR HORSE AND RIDER

NOTES:

Double row outside arrangements with stalls back to back are sometimes used at fairgrounds. Woven wire screening between stalls is omitted in racing stables, and wood is carried to full partition height. Combination protected incandescent lighting and heat lamps, frostproof hose bib and water supply are recommended where weather conditions warrant same. Passage lighting should be strip flourescent type (40 footcandles). Windows shown are glass jalousie type with fixed inside screen (plus woven wire guard for box stalls). Hardware for stalls should be heavy-duty galvanized, surface-applied type, "T" strap hinges and slide bolts for stall doors. Provide conventional heavy-duty hardware with locks for tack, feed and tool rooms. If exterior walls of stalls are masonry, furr out and finish interior surfaces with hardwood. Passages are sized to accept machinery. A tack room serves forty stalls.

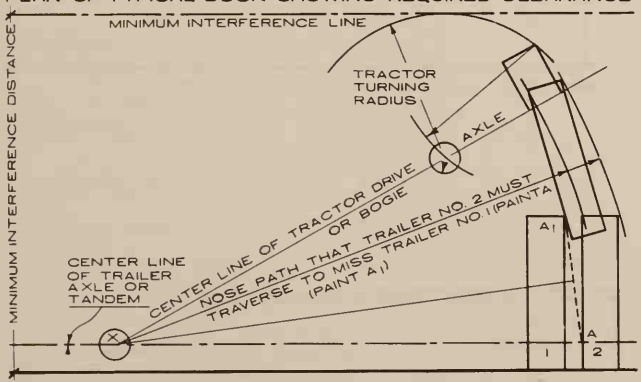
PLAN OF TYPICAL DOCK SHOWING REQUIRED CLEARANCE



DETERMINING THE MINIMUM APRON SPACE REQUIREMENT

1. Draw to scale trailers up against the loaddock at expected minimum spacings. (Use measurements of longest and widest trailer expected at dock with rear most axle or tandem position.

2. Extend trailer #2 axle or tandem centerline in direction of turn.

3. Draw chord AA, from that point on the side of trailer #2 where the axle or tandem center line intersects the side of the body, to the nose corner of the adjacent trailer (#1). This is a chord of the curve through which point trailer #2 must traverse to miss trailer #1.

4. Bisect chord AA, and extend a perpendicular line until it intersects the extension of trailer #2 axle or tandem center line at point X. This is the point about which all points on trailer #2 must rotate to miss striking trailer #1.

5. With the compass point on X, swing trailer #2's nose around until point A reaches A_1. Sketch trailer #2 into its position as shown.

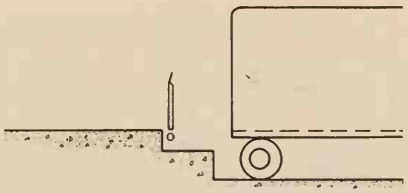
6. Through the location of the kingpin, extend a line back through point X, this line then represents the center line of the tractor drive, axle or bogie. From this drive axle center line, draw the tractor with the greatest turning radius in its proper position with respect to trailer #2 in its second position.

7. With the compass point on the tractor front bumber (opposite side from the direction of the turn) scribe an arc equal to the turning radius of the tractor so that it intersects the center line of the tractor drive axle at point Y.

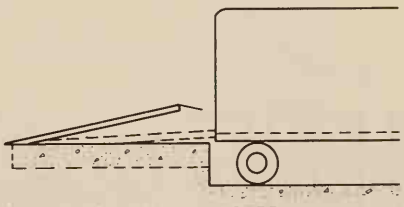
8. With the compass set at the turning radius of the tractor, place the point at Y and scribe an arc that represents the curve through which the bumber will travel.

For the result, measure the distance from the dock to a point on the curve which represents the greatest distance from the dock.

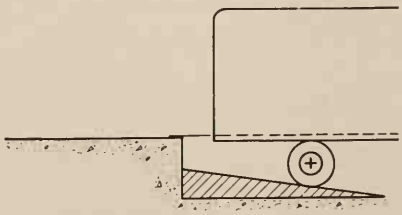
NOTE: Distances may be decreased by increasing the min. spacing between trailers or by using a saw-toothed loading platform. An additional allowance over and beyond the main, interference distance be provided to allow for a proper safety margin.



STEP - DOWN DOCK BOARD
CARRIER DOORS CAN BE OPENED AND CLOSED AT DOCK, 6' - 0" WIDTH, AND MECH OPERATED

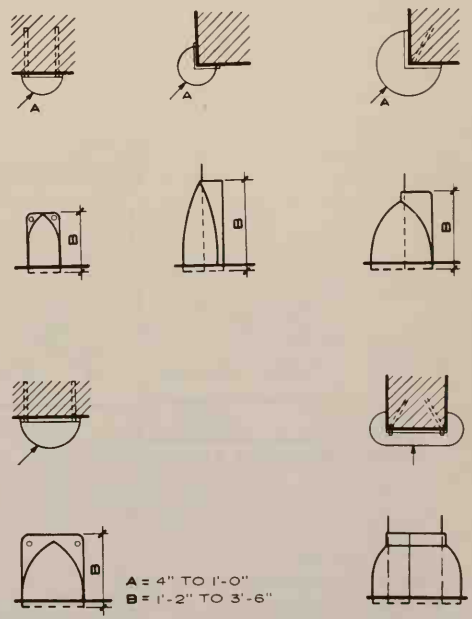


ADJUST - A - LIP DOCKBOARD
AUTOMATICALLY EXTENDING AND RETRACT RETRACTING, HINGED TIP 6 WAY ADJUSTABLE AND HAS 7' - 0" WIDTH.



LOADING LEVEL OF TRUCK MAY BE RAISED BY MOVABLE INCLINE

SECTIONS - LOADING DOCK LEVELING DEVICES
1 TO 2 NEEDED PER TERMINAL



NOTE:

Usually made of cast iron 3" minimum thickness and used to protect door jambs, walls and corner. May be combined with corner and wall guards.

ASSOCIATED REFERENCE MATERIAL AND PUBLICATIONS ON MOBILE HOMES

1. MOBILE HOME HIGHWAY MOVEMENT HANDBOOK

Legal lengths and widths, where and how to obtain permits, costs of permits, special rules for movement of oversize mobile homes.

2. THE LAW OF MOBILE HOMES

Comprehensive coverage of statutes, ordinances and court decisions relating to mobile homes. Problems of taxation, zoning, regulations of mobile homes and parks, park operators' rights, liabilities and licensing fully covered. Presents the opinions of certain attorneys general of the states concerning their respective mobile home statutes.

STANDARDS

1. U.S.A. STANDARD A119.1- FOR MOBILE HOMES

Defines the installation and material requirements for the plumbing, heating and electrical systems in mobile homes.

2. MOBILE HOME MINIMUM BODY & FRAME DESIGN & CONSTRUCTION STANDARDS

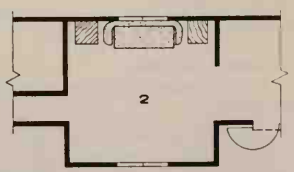
Defines the minimum design and performance criteria for the complete mobile home structure and its associated running gear.

3. WHAT MOBILE HOME STANDARDS MEAN TO YOU

Explains the significance of U.S.A. Standards A119.1 for the plumbing, heating and electrical installations in mobile homes and how they act to protect the health, welfare and safety of the owner.

TYPICAL CONSTRUCTION AND STANDARD FEATURES

1. Heavy duty I beam steel frame
2. 2 x 4 & 2 x 8 stringer with 1 x 4 cross stringers form floor section
3. Floor glued and screwed to floor stringers
4. 16'–0' x 8" wood beam construction over door and window areas
5. 3" sidewall framing studs are mortised and glued
6. 6" truss-type bows unitized by heavy duty timbers
7. Galvanized steel roofs with taped sidewall
8. Color bonded aluminum siding–metal straps tie sidewall to floor
9. Interior plywood is glued and screwed to sidewall studs for moisture protection and unitized construction strength
10. 1/2" insulation board ceiling
11. Heavy duty fiber glass insulation with vapor barrier
12. Asphalt impregnated insulation board, type bottom seal
13. Gun type furnace with silent flow, one-piece metal duct heat system
14. Inlaid linoleum or patterned tile on floors
15. Awning type windows
16. Kitchen cabinets, fixtures and appliances
17. Bathroom fixtures
18. Electrical fixtures
19. Furniture in all rooms



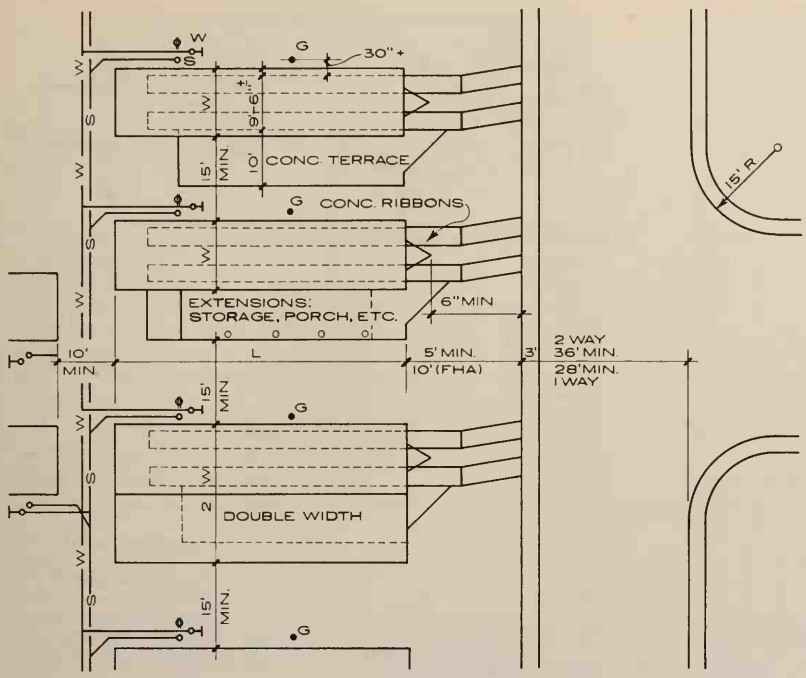
SPECIAL OPTIONS

Tip-out rooms of varying size are available in most models for either living room or rear bedroom or both. This applies to ten and twelve foot wide models.

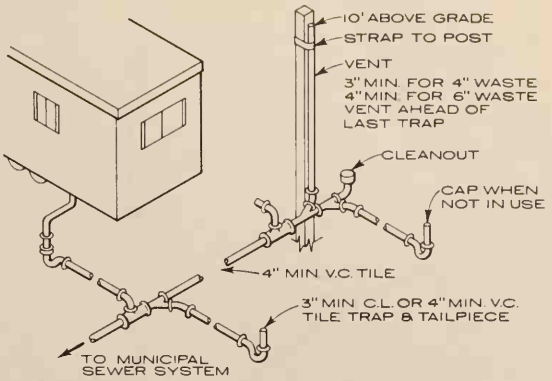
NOTE:

Publications mentioned above, and other publications, are available from Mobile Home Manufacturers Association, Chicago, Illinois.

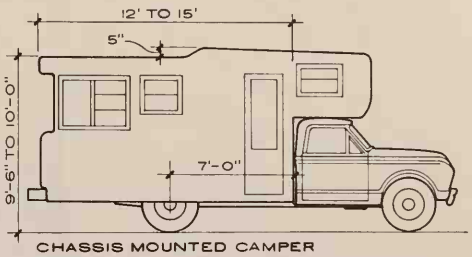
C. T. Skinner; Giffels & Rossetti, Inc.; Detroit, Michigan



PLAN (NOT TO SCALE)

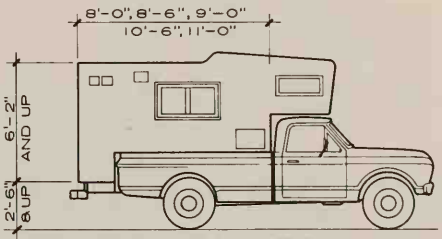


TYPICAL PLUMBING HOOKUP

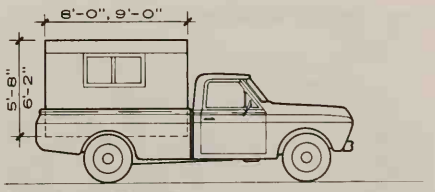


CHASSIS MOUNTED CAMPER
For trucks of 157" – 159" wheelbase, dual rear wheels. Side door, rear lounge.

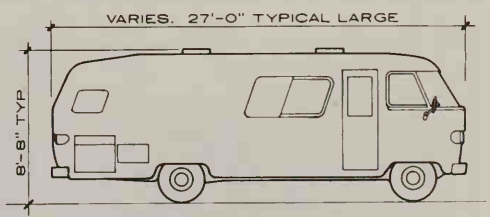
Widths: 7'– 6", 8'– 0".



SLIDE-IN, "CAB OVER" CAMPER
Made to fit 6 ½', 8', 9' pickup beds.
Widths vary. 6'– 9", 7'– 6", 8'– 0" typical.



SLIDE-IN CAMPER
Made to fit most standard pickup beds.
Widths: 6'– 4", 7'– 6".



MOTORHOME
Sizes and designs vary. Typical width 8'– 0" clear.

NOTES

Data given here are from a widely used zoning ordinance. FHA Minimum Property Standards are somewhat more restrictive in some respects. Local regulations should be consulted.

W = width. 10' or 12' standard. Some 14' models on market. Many states restrict width for highway transport.

L = length. From 46' to 60'. A 68' model available.

Utility lines: W = water, S = sewer, G = gas, = electric outlet.

Water service–400 gallons/day/unit.

Gas service–metered. Connected only after inspection and approval. Individual storage tanks outside unit, rigidly connected, at least 5' from any door.

Electrical service–metered, 110–220V., underground distribution recommended, required by some codes.

SERVICE BUILDINGS

For independent mobile homes–provide 1 lavatory and 1 flush toilet each for males and females for emergency use.

For dependent mobile homes–10 units or less:
Male: 1 w.c., 1 urinal, 1 lavatory, 1 shower.
Female: 2 w.c., 1 lavatory, 1 shower.
Same for each additional 10 units or less.
Location: 15' to 200' from dependent units.

Construction–permanent, heated, sound retardant wall separating male and female sides, well ventilated.

Many parks provide coin-operated laundry facilities for occupants, whether of dependent or independent units.

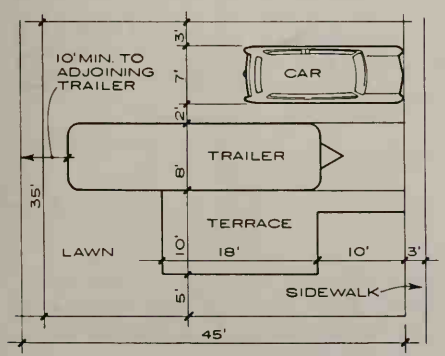
WEIGHT OF MOBILE HOME: 15 – 20 TONS.

CLASSIFICATION OF MOBILE HOMES

Independent–equipped with flush toilet and tub or shower.

Dependent–not so equipped.

REQUIREMENTS FOR MOBILE HOME PARKS



ROADS AND FACILITIES AS REQUIRED FOR MOBILE HOME PARKS

TOURING TRAILER PARK LOT

Foster C. Parriott; James M. Hunter & Associates; Boulder, Colorado

LENGTH OF CAR AND TRAILER

Maximum permissible length of motor vehicle and trailer together varies from 50' to 65', according to the various state statutes.

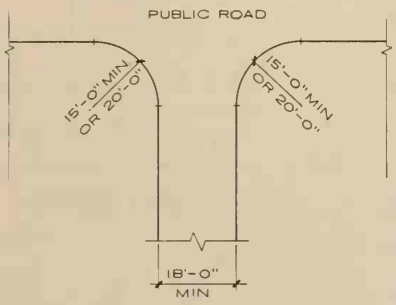
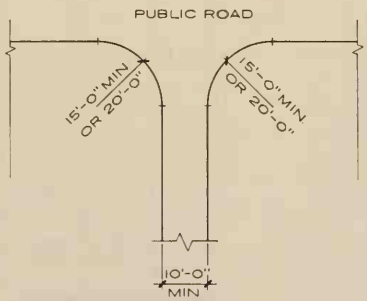
R. E. Powe, Jr.; Hugh N. Jacobsen, AIA; Washington, D. C.

GENERAL NOTES:

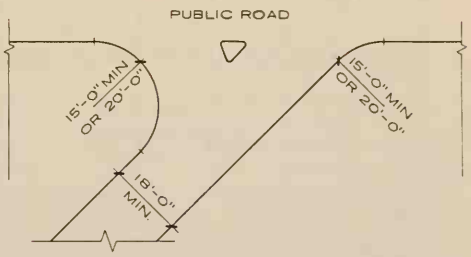
Types and sizes shown are for easy driving at moderate rate.
See page on car sizes for turning radii of cars. "R" = This radius.
Overall sizes are shown in terms of radii for preliminary assumptions.
Any decrease in radii will decrease speed of driving.



TWO CAR WIDE ROAD

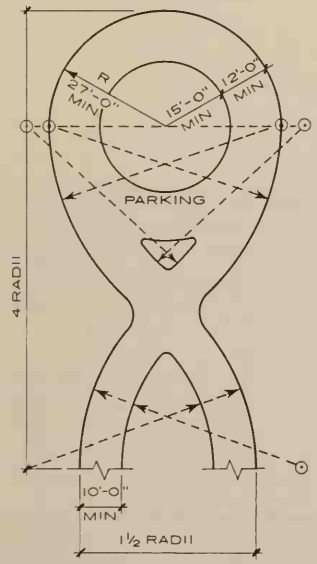


ONE CAR WIDE ROAD

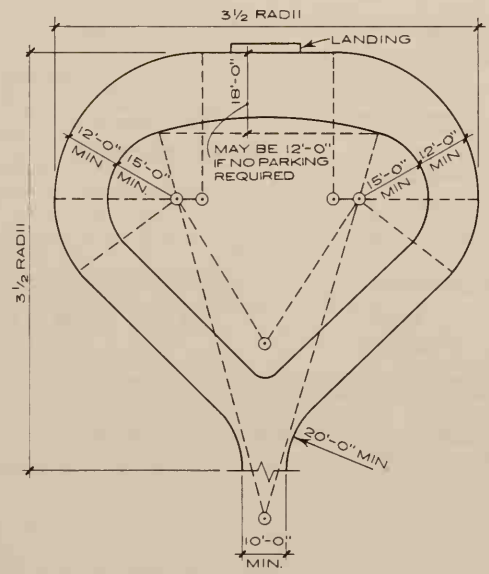


DIAGONAL ENTRANCE

PRIVATE ENTRANCE ROADS INTERSECTING PUBLIC THOROUGHFARES
SCALE: 1" = 40'-0"

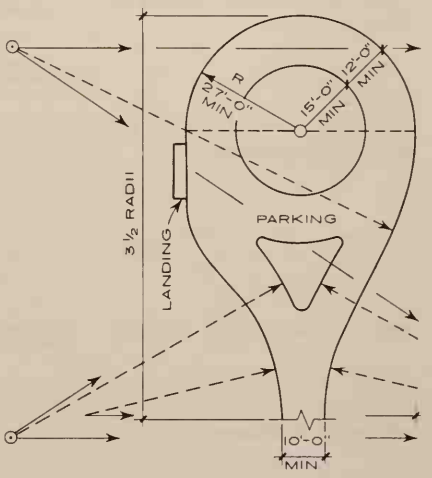


NO LANDING-CROSSOVER
LANDING MAY BE HAD BY BACKING ONLY

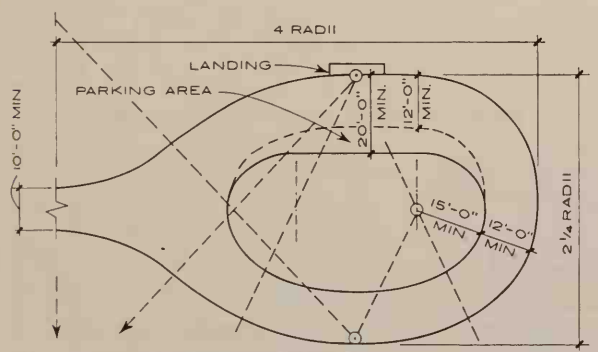


LANDING OPPOSITE APPROACH

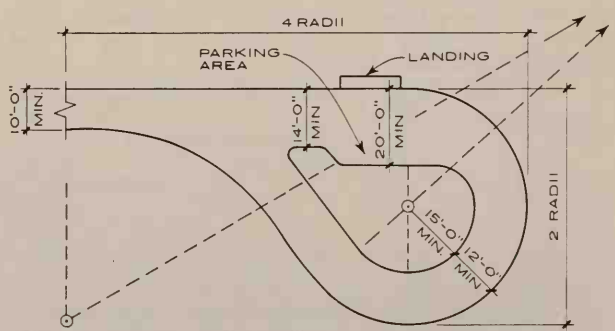
Construction point locations are found by intersecting solid arrows; dotted arrows are radii from these points for curves.



LANDING ON SIDE
LANDING AT THE END BY BACKING ONLY



LANDING ON ONE SIDE OF APPROACH
TURNAROUNDS-ONE CAR WIDTH-DOUBLE ROAD WIDTH FOR TWO CARS



LANDING ON LINE OF APPROACH

PRIVATE ROADS, DRIVES & TURNAROUNDS
SCALE: 1" = 40'-0"

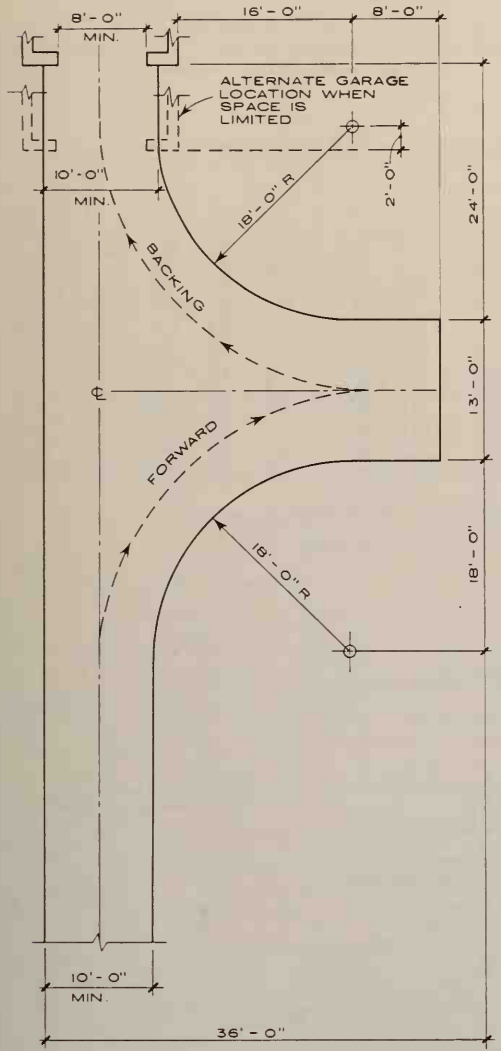
GENERAL NOTES:

All turns require 1'– 6" clearance beyond road line shown.

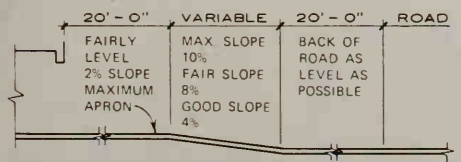
These turns are for easy driving with average size car.

Larger radii will permit faster and easier driving.

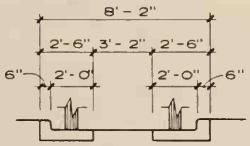
Smaller radii should be used for small cars only.



"Y" TURN FOR BACKING IN
SCALE: 1/16" = 1'-0"
Dotted line shows route going in.

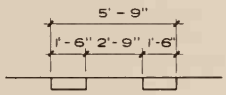


RECOMMENDED SLOPES GARAGE TO ROAD
SCALE: 1/32" = 1'-0"

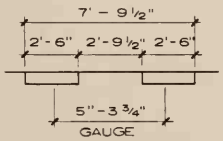


AVERAGE

Do not use curbs on narrower runways as trucks often have 5'– 10" to 6'– 0" wheel gauge.

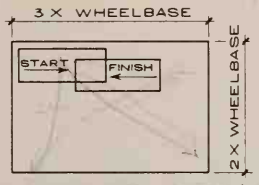


MINIMUM – ONLY FOR WOLKSWAGENS, ETC



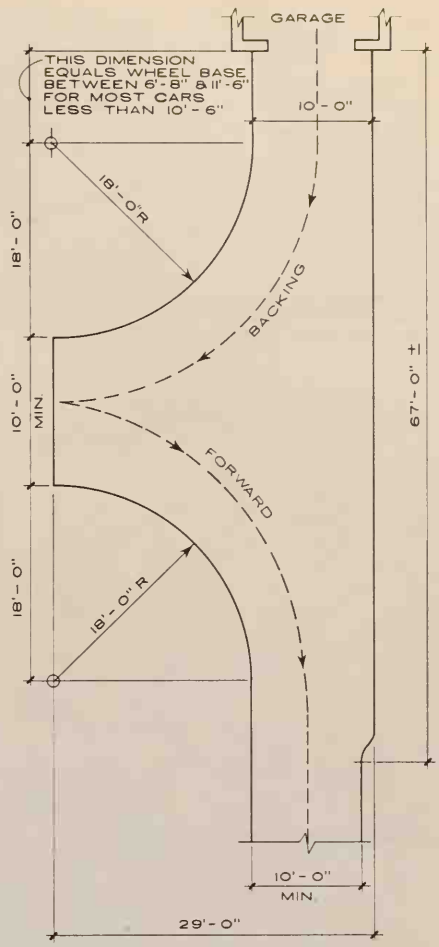
MAXIMUM

CONCRETE RUNWAYS TO GARAGES
SCALE 1/8" = 1'-0"
Widen for all turns.

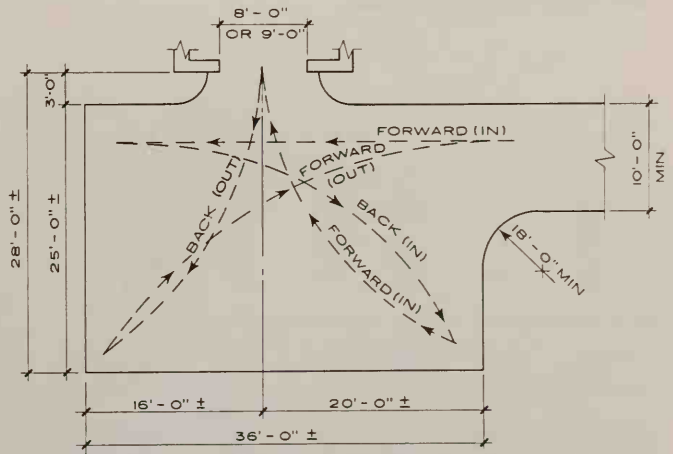


MINIMUM TURNING SPACE BACKING THREE TIMES

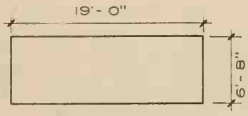
Used only when req'd by space limitations.
Wheelbase:
Minimum 7'– 10 1/2" (Volkswagens, etc.)
Maximum 11'– 1"
Normally under 10'– 6"



"Y" TURN FOR BACKING OUT
SCALE: 1/16" = 1'-0"
Dotted line shows route going out.



DOUBLE "Y" TURN REQUIRING BACKING BOTH WAYS
SCALE: 1/16" = 1'-0"
Exact size depends on car. This is for average car.
Employed only where space limitations demand its use.



AVERAGE CAR

Assumed average size. Larger cars may protrude into aisle; will have less space for door swing.

NOTE:
No allowance has been made for columns on this page. Allow 1'–0" ±

SECTION C-C

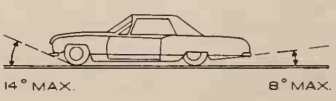
NOTE:

RAMP GRADE:

15–17% maximum on short ramps–staggered floor garage.
10–13% straight or helical ramps–used purely for travel–7 – 8% preferred
3–5% ramps in sloping floor garages, 3% preferred

NOTE: Change in grade should be equal to 1/2 ramp grade.

RAMP GRADES

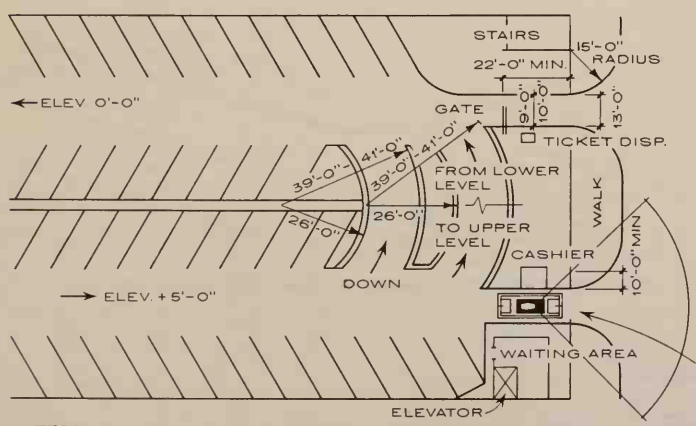


ANGLE OF APPROACH

ANGLE OF DEPARTURE

RAMPS

BREAKOVER ANGLE



NOTES:

Design Features:
Floor to floor height = 10' – 0".
Floor to clear height: 7' – 0" min.
Area per car space = 350 to 400 sq. ft.
Column spacing:
A. of 30 ft., establishes 73° angle parking, 8' – 11" x 19' – 0" stalls, 21' – 0" aisles.

B. of 31' – 0" x 28' – 0", establishes 90° angle of parking, 9' – 0" x 19' – 0" stalls, 22' – 0" aisles.

C. equal to unit depth (clear span construction). Is highly desirable, as the flexible design allows for future changes in auto dimensions.

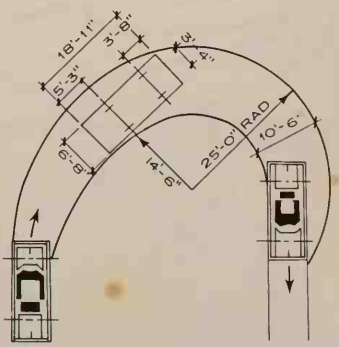
MOTORIST-PEDESTRIAN CONE OF VISION SHOULD BE UNOBSTRUCTED

NOTES:

As a general rule allow at least:
1 outbound lane for every 200 spaces
1 inbound lane for every 300 to 500 spaces
2 exits to every garage
1 elevator up to 250 spaces
2 elevators up to 500 spaces
3 – 4 elevators up to 1000 spaces

Establish down-ramp on inside; up-ramp outside.
Establish counter-clockwise circulation whenever possible.
Locate elevators, customer waiting area, and exits as close to customer's destination as possible.
Establish all elevators, stairs, and door openings away from traffic lanes.

INTERIOR GARAGE DESIGN FEATURES



NOTE:

Turning radii and vehicle dimensions for large '69 passenger car for checking garage and lot dimensions.

STANDARD TIME ZONES OF THE UNITED STATES

SUN TIME

Explanation of map.

LATITUDES: Curved horizontal lines. LONGITUDES: straight vertical lines.

TIME ZONES: Alternating vertical gray and white bands. Central longitudes of time zones are: Eastern Standard Time at 75°; Central S. T. at 90°; Mountain S. T. at 105°; Pacific S. T. at 120°. If conversion to SUN TIME is desired for site location then: 1) If Daylight Savings Time is in effect subtract one hour from local time. 2) Subtract 4 minutes for every degree of longitude if site is west of central longitude or add 4 mins. for every degree of longitude if site is east of it. 3) Correct time variations for day and months; add or subtract minutes as follows:

JAN 21	−11.4	APR 21	+1.2	JULY 21	−6.2	OCT 21	+15.3
FEB 21	−13.8	MAY 21	+3.6	AUG 21	−3.1	NOV 21	−14.1
MAR 21	− 7.4	JUNE 21	−1.5	SEPT 21	+6.8	DEC 21	+2.0

EXAMPLE: Calculate sun time at site for Columbus, Ohio at 12 noon local time on June 21st.

STEP 1. As in June, Daylight Savings Time is in effect, subtract one hour from local time to 11:00 o'clock.

STEP 2. Locate Columbus on map. The longitude is 83°. This is in the Eastern Time Zone with the central longitude of 75°. As Columbus is 8 degrees west of the central longitude: subtract 8X4 minutes or 32 minutes from 11:00 o'clock, changing the time to 10:28 o'clock.

STEP 3. To correct time variation for June 21st, subtract 1.5 minutes. The result indicates 10 hours, 26 minutes and 30 seconds; which will be the sun time at 12 noon, local time.

SHADOW CONSTRUCTION WITH TRUE SUN ANGLES

Required information: angle of orientation in relation to north–south axis, bearing angle (∠ B) and altitude angle (∠ A) of the sun at the desired time (Fig. 1).

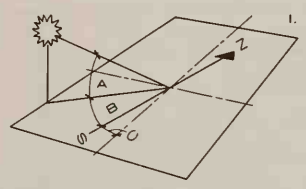
STEP 1. Lay out building axis, true south and bearing ∠ B of sun in plan. (Fig. 2).

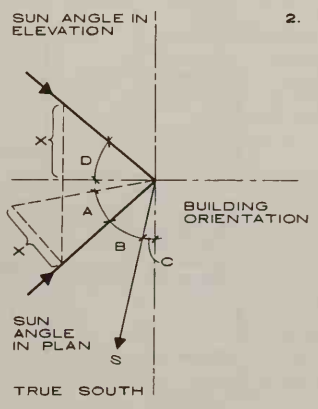
STEP 2. Lay out altitude ∠ A upon bearing ∠ B. Construct any perpendicular to ∠ B. From the intersection of this perpendicular and ∠ B project a line perpendicular to elevation plane (building orientation). Measure distance "x" along this line from elevation plane. Connect the point at distance "x" from elevation plane to center to construct sun elevation D. (Fig. 2).

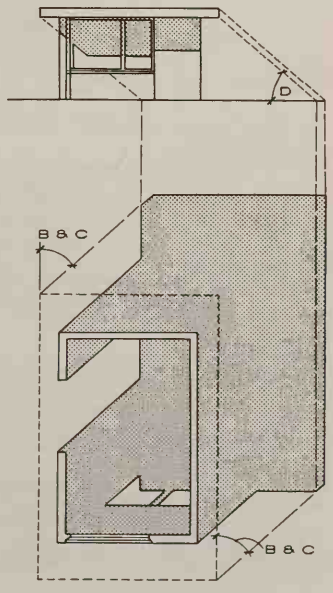
STEP 3. Use sun plan ∠ B + C and sun elevation ∠ D to construct shadows in plan and elevation in conventional way. (Fig. 3).

The figures illustrate shadow projection for a building in Columbus, Ohio (40° N. Latitude) on February 21 at 2 P.M. The sun's altitude ∠ A is 32°, the bearing ∠ B is 35 ½° West.

Methods for calculating the sun's altitudes and bearings are described on pages on Solar Angles and Solar Position Calculation.







Victor Olgyay, AIA; Associate Professor; School of Architecture, Princeton University; Princeton, New Jersey

DIAGRAM		A EXCLUDES DIRECT SUN RAYS	B RE-RADIATES HEAT	C CONTROLS SKY GLARE	D CONTROLS GROUND GLARE & HEAT	E EFFECTIVE ORIENTATION	F RESTRICTS VIEW	G HINDERS FREE AIR MOVEMENT	H CONTROLS WINTER RAYS	I MAINTENANCE (NOT CLEANING)
 1. OVERHANG	Length of overhang calculated to eliminate summer sun.	Seasonal	No	No	No	South	No	Yes	Yes	Minimum unless otherwise noted
 2. VERTICAL SCREEN (WITH OVERHANG)	Length of louver calculated to eliminate summer sun. Length of louver for sky glare dependent on amount of control desired on exterior conditions and occupants normal eye level.	Optional: Completely or seasonal.	Minimal	Yes	Some—amount varies with design.	Any direction. depends on design.	Yes—If opaque blade in louver. No—if tinted glass blade.	Slight	Depends on design	High for louver.
 3. VERTICAL SCREEN (WITHOUT OVERHANG)	Length of louver or glass panel calculated to eliminate summer sun. Length of louver for sky glare dependent on amount of control desired on exterior conditions and occupants normal eye level.	Optional: Completely or seasonal.	Minimal	Yes	Some—amount varies with design.	Any direction. depends on design.	Yes—If opaque blade in louver. No—if tinted glass blade.	No—if louvers. Yes—if glass panel unless vent slats are provided.	Depends on design	Low for glazing
 4. ADJUSTABLE EXTERIOR HORIZONTAL LOUVERS	Louvers can be adjusted to control direct rays of sun.	Optional	Minimal	No	Yes	Any direction. South is least restrictive to view.	Yes	No	Depends on design	Varies—depending on scale and materials used.
 5A. OVERHANG VERTICALLY LOUVERED	Length of overhang calculated to eliminate summer sun.	Seasonal	No	Yes	No	South	No	No	Yes	Varies—depends on material used.
 5B. OVERHANG ANGLE LOUVERED	Length of overhang and pitch of louvers calculated to eliminate summer sun and permit winter rays full penetration.	Seasonal	No	No	No	No	No	No	Yes—with louvers as shown, can permit maximum winter sun if desired.	Varies—depends on material used.
 6. EXTERIOR VERTICAL LOUVERED	If fixed louvers can be set so as to eliminate low angle sun rays for predetermined orientation. If operable, maximum control any orientation but with various amount of view interference.	Optional: Completely or seasonal depending on orientation or other factors. As desired.	Minimal Minimal	Some Can be good see J	Some Some	East or west, south with adequate overhang. Any	Yes Yes	No No	Depends on design Yes	Moderate High
 7. SPEC. GLAZING (GLASS, PLASTIC, COATED GLASS)	Heat absorbing glazing controls solar heat gain. Heat absorbing and low transmission glazing controls heat gain and sky glare. Sandwich of glass and fixed louvers can control direct sun rays and sky glare and admits greater amounts of useful daylight.	No—reduces—depending on glazing material. Seasonal	Can be substantial unless double glazing used. Low to minimal.	Yes—ideal if darker sheets used in upper portion of window. Yes	Yes Same	Any Any	No Yes	See K See K	Yes—more than others Less than 7A	Low Low

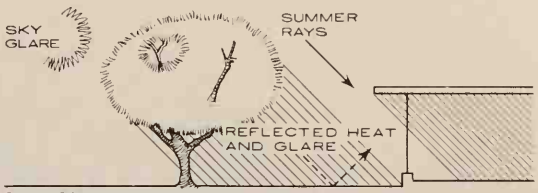
J. Stanley Sharp, AIA, Handren, Sharp and Associates, New York, New York

J EFFECT ON INTERIOR LIGHTING	K CAUTIONS	L VARIATIONS
Harsh without ideal exterior conditions, or with no glare control in glass or interior control devices.	Tends to trap warm air. High sash if open may let heat into building.	Overhang with light & heat transmission glass. Overhang with open framing with removable material (fabric, fiber glass). Trellis with plant material—permits entry of winter sun. Fixed awning—similar characteristics, except maintenance is high. Operable awning—also similar, plus lower sun angle control (west), restricts view when down.
Good	Check clearance for operating sash and window cleaning.	Addition of vertical member may be used to cut off low angle oblique rays. Adjustable vertical blinds or awnings afford good control for low sun, or glare from beach or water, without permanent restriction of view. Maintenance is high.
Good	Check clearance for operating sash and window cleaning.	Addition of vertical member may be used to cut off low angle oblique rays. Adjustable vertical blinds or awnings afford good control for low sun, or glare from beach or water, without permanent restriction of view. Maintenance is high.
Good—could be used for darkening device.		Exterior operating shutters have similar characteristics, and can be opened when not required but with loss of sky glare control.
Diffused reflected light from louvers improves quality of daylighting by reducing contrast between interior ceiling and bright sky.		Egg crate overhang instead of louvers to control oblique sun rays. Adjustable louvered awnings (questionable in cold climates) require high maintenance.
Diffused reflected light from louvers improves quality of daylighting by reducing contrast between interior ceiling and bright sky.		Egg crate overhang instead of louvers to control oblique sun rays. Adjustable louvered awnings (questionable in cold climates) require high maintenance.
Varies depending on position in room. Good—if a limited view is acceptable.	Check clearance for operating sash and window cleaning.	Narrow windows with adequate side reveals or projecting blades have similar sun and glare control. When used with adequate overhang on south will eliminate all sun in summer months.
Good (see C) w/high levels of artificial light, interior visual comfort is improved as reduces contrast between work surfaces and window area. Good—combine w/7A for ideal sky glare control w/a restricting eye level view.	Open sash may defeat sun & glare control, but is appropriate for a/c buildings. Replacement delay is probable. Open sash may defeat sun & glare control, but is appropriate for a/c buildings.	Allow only storm sash to be tinted to eliminate problem noted under B. Louvered screen placed in front of glazing would control sun but restricts view, maintenance factor if movable, and sky glare control is lost.

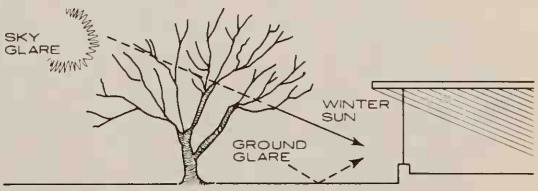
J. Stanley Sharp, AIA; Handren, Sharp and Associates; New York, New York

GENERAL NOTES:

Uncontrolled glare, generated by the sun's rays, can become uncomfortable in winter; in summer, this glare plus solar heat can be intolerable. Glare can be effectively controlled by either interior or exterior devices, but solar heat gain is best controlled by interception outside the building. Tinted glass and/or interior devices such as shades, horizontal blinds, vertical blinds, as well as various screening methods may be used to control sky glare and glare from the direct rays of the sun. However, they do little to reduce interior air temperature because the sun rays have been allowed to enter the room. Do not use any form of translucent glass where sun will fall directly on it because this will produce glare similar to the dirty windshield of a car. Objectionable glare (i.e., a brightness ratio in excess of 10:1 between peripheral vision and the immediate area of vision) can occur at any orientation, including north, through indirect sources, by reflection from various surfaces. For example, light from a slightly overcast sky or from patches of white clouds can be 30 to 300 times greater than the light reflected from a well-lighted work surface. Provisions for shielding these secondary sources are particularly important to good vision when occupants of a space must remain in relatively fixed positions.

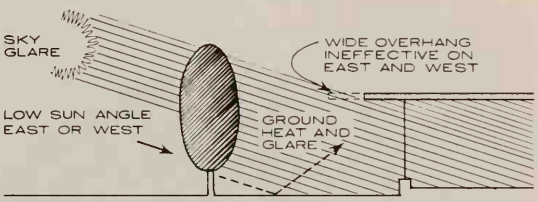


SUMMER
SUN AND GLARE AND HEAT CONTROLLED; IE EXCLUDED

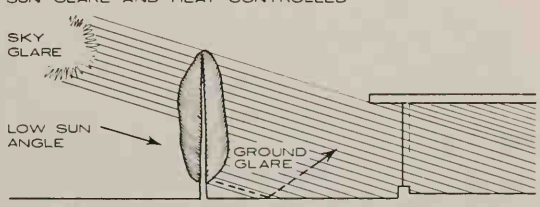


WINTER
SUN ACCEPTED- GLARE CAN BE A PROBLEM (SNOW IN PARTICULAR). CLOSELY SPACED LIMBS CAN CONTROL SKY GLARE.

SOUTH EXPOSURE



SUMMER
SUN GLARE AND HEAT CONTROLLED



WINTER
LOW SUN ANGLE NOW ACCEPTED; GLARE CONTROLLED BY DENSE BRANCH STRUCTURE, HEAT CAN BE REASONABLY CONTROLLED AS DESIRED BY INSIDE DEVICES (SHADES, BLINDS, OR DRAPES)

EAST AND WEST EXPOSURE

APPLICATIONS IN CONJUNCTION WITH PLANTING

EXAMPLES OF HOW BASIC CONTROL DEVICES CAN BE USED IN CONJUNCTION WITH NATURAL FEATURES TO ACHIEVE GOOD SEASONAL RESULTS

NOTE:

For more positive sky glare control in winter and summer, coniferous trees should be used.

SOLAR ANGLES

The position of the sun in relation to specific geographic locations, seasons, and times of day can be determined by several different methods. Model measurements, by means of sun machines or shade dials, have the advantage of direct visual observations. Tabulative and calculative methods have the advantage of exactness. However, graphic projection methods are usually preferred by architects as they are easily understood and can be correlated to both radiant energy and shading calculations.

SUN PATH DIAGRAMS

The most practical graphic projection is the Sun Path Diagram method. Such diagrams depict the path of the sun within the sky-vault as projected onto a horizontal plane. The horizon is represented as a circle with the observation point in the center. The sun's position at any date and hour can be determined from the diagram in terms of its altitude (α) and bearing angle (β). (See figure on right). The graphs are constructed in equidistant projection. The altitude angles are represented at 10^{o} intervals by equally spaced concentric circles; they range from 0^{o} at the outer circle (horizon) to 90^{o} at the center point. These intervals are graduated along the south meridian. Bearing angles are represented at 10^{o} intervals by equally spaced radii; they range from 0^{o} at the south meridian to 180^{o} at the north meridian. These intervals are graduated along the periphery. The sun's bearing will be to the east during morning hours, and to the west during afternoon hours.

SUN PATH DIAGRAMS (CONTINUED)

The earth's axis is inclined 23°27' to its orbit around the sun and rotates 15 degrees hourly. Thus, from all points on the earth, the sun appears to move across the skyvault on various parallel circular paths with maximum declinations of ± 23°27'. The declination of the sun's path changes in a cycle between the extremes of the summer solstice and winter solstice. Thus, the sun follows the same path on two corresponding dates each year. Due to irregularities between the calendar year and the astronomical data, here a unified calibration is adapted. The differences as they do not exceed 41', are negligible for architectural purposes.

DECLINATION OF THE SUN

Date	Declination	Corresp. Date	Declination	Unified Calibr.
June 21	+23°27'			+23°27'
May 21	+20°09'	July 21	+20°31'	+20°20'
Apr. 21	+11°48'	Aug. 21	+12°12'	+12°00'
Mar. 21	+ 0°10'	Sep. 21	+ 0°47'	+ 0°28'
Feb. 21	−10°37'	Oct. 21	−10°38'	−10°38'
Jan. 21	−19°57'	Nov. 21	−19°53'	−19°55'
Dec. 21	−23°27'			−23°27'

The elliptical curves in the diagrams represent the horizontal projections of the sun's path. They are given on the 21st day of each month. Roman numerals designate the months. A cross grid of curves graduate the hours indicated in arabic numerals. Eight sun path diagrams are shown at 4° intervals from 24° N to 52° N latitude.

EXAMPLE

Find the sun's position in Columbus, Ohio on February 21st 2 P.M.:

STEP 1. Locate Columbus on the map. The latitude is 40° N.

STEP 2. In the 40° sun path diagram select the February path (marked with II), and locate the 2 hour line. Where the two lines cross is the position of the sun.

STEP 3. Read the altitude on the concentric circles (32°) and the bearing angle along the outer circle (35°30'W).

CALCULATION OF SOLAR POSITION

One can calculate accurately the solar position to any locale and time by relating the spherical triangle formed by the observer's celestial meridian, the meridian of the sun, and the great circle passing through zenith and the sun. The following formulas can be used to find the altitude and bearing angles:

(1) $\sin A = \sin d \sin \ell + \cos d \cos \ell \cos t$

(2) $\cos B = \dfrac{\sin d \cos \ell - \cos d \sin \ell \cos t}{\cos A}$

where: A = altitude of the sun in degrees, measured from the horizontal.

d = declination of the sun (see page on solar angles) at the desired date. (North declinations are conventionally positive; south declinations negative.)

l = latitude of the locale; conventionally negative in the southern hemisphere.

t = hour angle of the sun in degrees, measured counterclockwise from north towards east. At solar noon it is zero and changes 15° per hour.

B = bearing angle of the sun in degrees; here measured clockwise from north towards east.

CALCULATION OF SOLAR RADIATION

To evaluate the importance of solar shading one has to know the amount of solar energy falling on the exposed surface. As the primary protection of the shading devices is from the direct solar radiation, only these energy calculations are described here.

The magnitude of solar radiation depends, first of all, on the sun's altitude. The tabulated values indicate direct radiation energies received under clear atmospheric conditions at normal incidence (ID):

Solar altitude in degrees:

5	10	15	20	25	30	35	40	45	50	60	70	80	90
67	123	166	197	218	235	248	258	266	273	283	289	292	294

Btu/sq. ft./hour

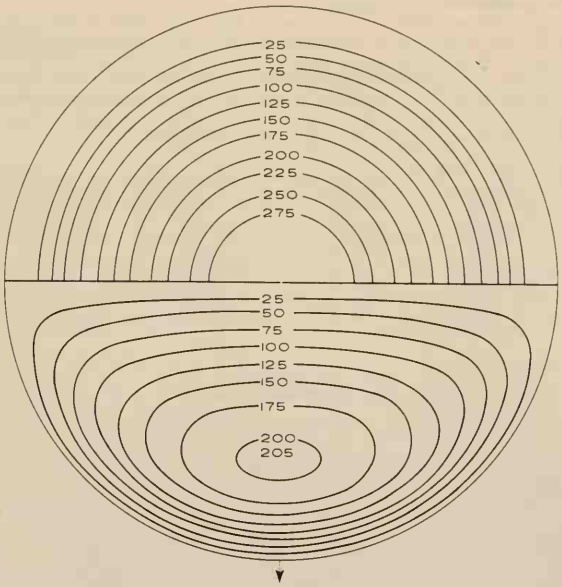
The energy received on a surface depends also on the cosine of the angle of incidence. As this is a spacial angle, it is conventional on vertical surfaces to substitute it with the functions of the altitude (∠A) and the azimuth (∠a) angles related to the normal of the surface in question. Thus, the direct radiation on vertical surfaces (R) can be defined as:

$$R = I_D \times \cos A \cos a$$

For horizontal surfaces the received direct radiation energy will be:

$$R = I_D \times \sin A$$

In the following tables calculated values of solar position in degrees, and direct radiation energies in Btu/sq. ft./hour values are shown at different orientations. The tables indicate from 24°N to 46°N latitude at 4 degree intervals.



RADIATION CALCULATOR

Radiation calculations can be performed by graphical means. The upper half of the above shown direct radiation calculator charts the energies falling on a horizontal plain under clear sky conditions. The equi-intensity radiation lines are indicated at 25 Btu/sq. ft./hour intervals. The lower half circle shows the amount of direct radiation falling on a vertical surface. The calculator can be used at any latitude and at any orientation. The calculator is in the same scale and projection as the sun-path diagrams on pages on solar angles. Transfer calculator diagram to a transparent overlay, and superimpose it on a sun-path diagram in the desired orientation: the radiation values can be read directly.

SHADING DEVICES

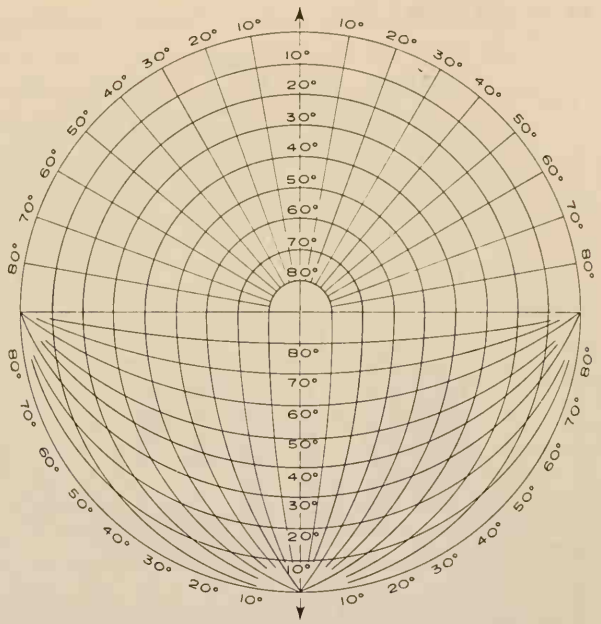
The effect of shading devices can be plotted in the same manner as the sun-path was projected. The diagrams show which part of the sky vault will be obstructed by the devices and are projections of the surface covered on the sky vault as seen from an observation point at the center of the diagram. These projections also represent those parts of the sky vault from which no sunlight will reach the observation point; if the sun passes through such an area the observation point will be shaded.

SHADING MASKS

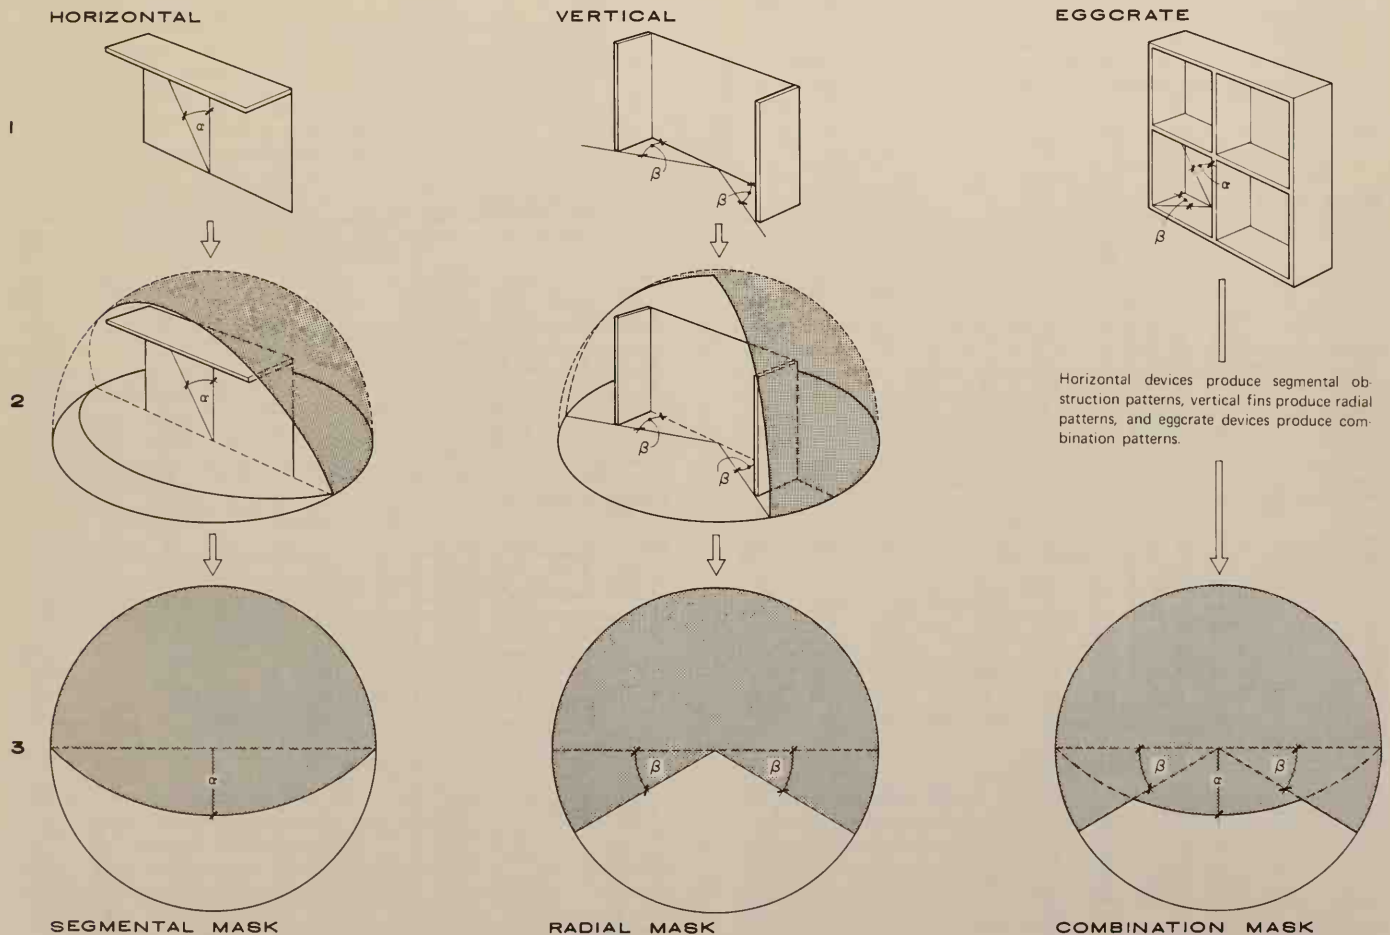
Any building element will define a characteristic form in these projection diagrams, known as "shading masks." Masks of horizontal devices (overhangs) will create a segmental pattern; vertical intercepting elements (fins) produce a radial pattern; shading devices with horizontal and vertical members (eggcrate type) will make a combinative pattern. A shading mask can be drawn for any shading device, even for very complex ones, by geometric plotting. As the shading masks are geometric projections they are independent of latitude and exposed directions, therefore they can be used in any location and at any orientation. By overlaying a shading mask in the proper orientation on the sun-path diagram, one can read off the times when the sun rays will be intercepted. Masks can be drawn for full shade (100% mask) when the observation point is at the lowest point of the surface needing shading; or for 50% shading when the observation point is placed at the halfway mark on the surface. It is customary to design a shading device in such a way that as soon as shading is needed on a surface the masking angle should exceed 50%. Solar calculations should be used to check the specific loads. Basic shading devices are shown below, with their obstruction effect on the sky vault and with their projected shading masks.

SHADING MASK PROTRACTOR

The half of the protractor showing segmental lines is used to plot lines parallel and normal to the observed vertical surface. The half showing bearing and altitude lines is used to plot shading masks of vertical fins or any other obstruction objects. The protractor is in the same projection and scale as the sun-path diagrams (see pages on solar angles); therefore it is useful to transfer the protractor to a transparent overlay to read the obstruction effect.

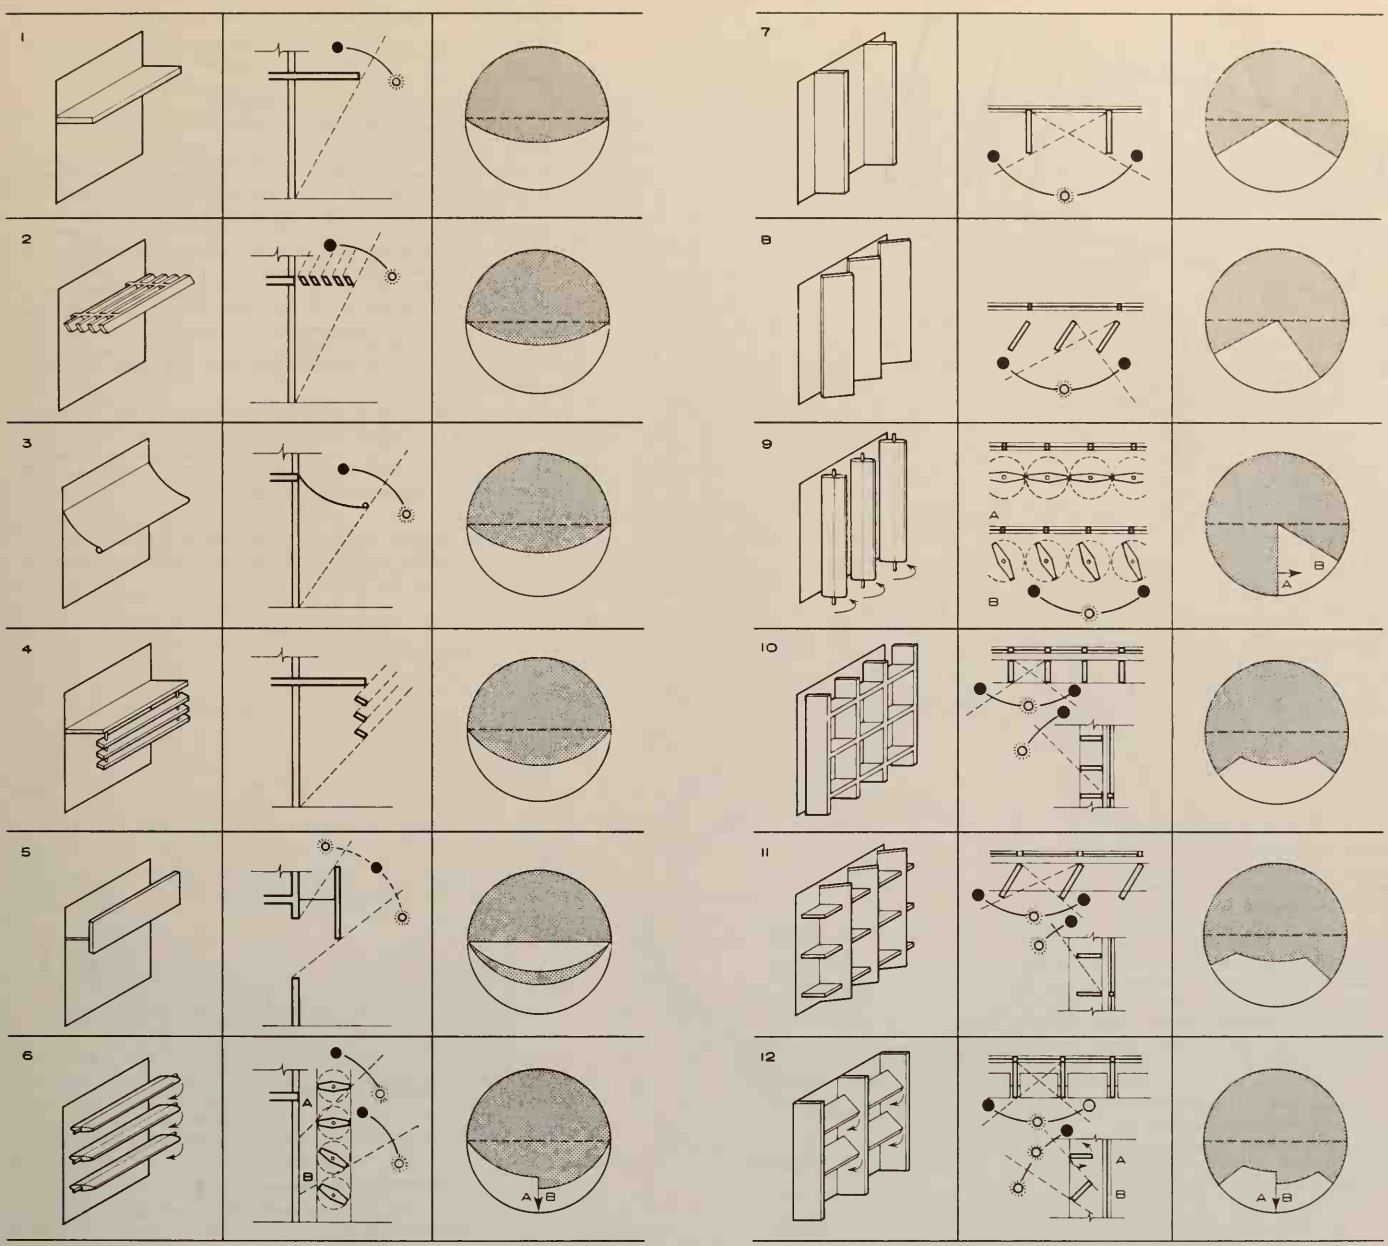


SHADING MASK PROTRACTOR



Horizontal devices produce segmental obstruction patterns, vertical fins produce radial patterns, and eggcrate devices produce combination patterns.

Victor Olgyay, AIA, Associate Professor; School of Architecture, Princeton University; Princeton, New Jersey



EXAMPLES OF VARIOUS TYPES OF SHADING DEVICES

The illustrations show a number of basic types of devices, classified as horizontal, vertical, and eggcrate types. The dash lines shown in the section diagram in each case indicate the sun angle at the time of 100% shading. The shading mask for each device is also shown, the extent of 100% shading being indicated by the gray area.

General rules can be deduced for the types of shading devices to be used for different orientations. Southerly orientations call for shading devices with segmental mask characteristics, and horizontal devices work in these directions efficiently. For easterly and westerly orientations vertical devices serve well, having radial shading masks. If slanted, they should incline toward the north, to give more protection from the southern positions of the sun. The eggcrate type of shading device works well on walls facing southeast, and is particularly effective for southwest orientations. Because of this type's high shading ratio and low winter head admission; its best use is in hot climate regions. For north walls, fixed vertical devices are recommended; however, their use is needed only for large glass surfaces, or in hot regions. At low latitudes on both south and north exposures eggcrate devices work efficiently.

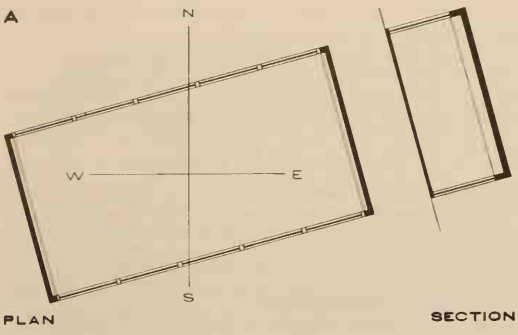
Whether the shading devices be fixed or movable, the same recommendations apply in respect to the different orientations. The movable types can be most efficiently utilized where the sun's altitude and bearing angles change rapidly: on the east, southeast, and especially, because of the afternoon heat, on the southwest and west.

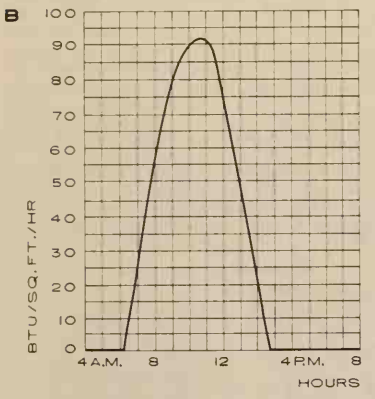
Victor Olgyay, AIA; Associate Professor; School of Architecture, Princeton University; Princeton, New Jersey

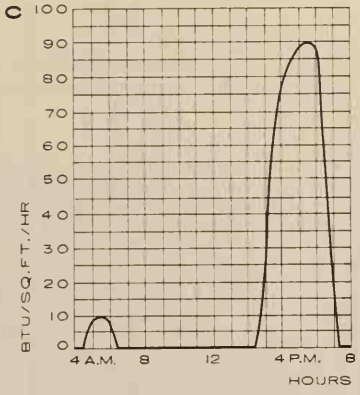
HORIZONTAL TYPES 1. Horizontal overhangs are most efficient toward south, or around southern orientations. Their mask characteristics are segmental. 2. Louvers parallel to wall have the advantage of permitting air circulation near the elevation. Slanted louvers will have the same characteristics as solid overhangs, and can be made retractable. 4. When protection is needed for low sun angles, louvers hung from solid horizontal overhangs are efficient. 5. A solid, or perforated screen strip parallel to wall cuts out the lower rays of the sun. 6. Movable horizontal louvers change their segmental mask characteristics according to their positioning.

VERTICAL TYPES 7. Vertical fins serve well toward the near east and near west orientations. Their mask characteristics are radial. 8. Vertical fins oblique to wall will result in asymmetrical mask. Separation from wall will prevent heat transmission. 9. Movable fins can shade the whole wall, or open up in different directions according to the sun's position.

EGGCRATE TYPES 10. Eggcrate types are combinations of horizontal and vertical types, and their masks are superimposed diagrams of the two masks. 11. Solid eggcrate with slanting vertical fins results in asymmetrical mask. 12. Eggcrate device with movable horizontal elements shows flexible mask characteristics. Because of their high shading ratio, eggcrates are efficient in hot climates.







EXAMPLE OF SHADING DEVICE CALCULATION

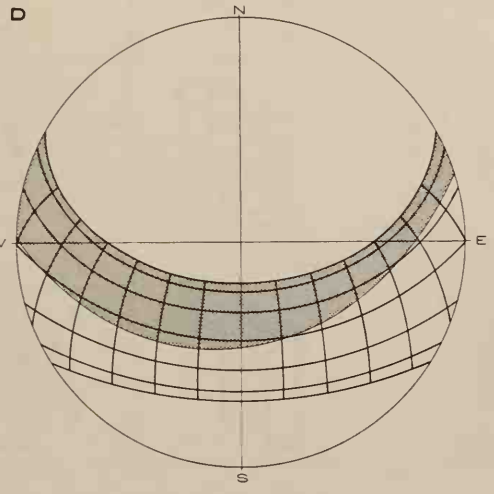
The structure in the example is located in New York, N.Y. Two sides of the building (here called north and south) are fully glazed. The two other sides are closed.

STEP 1. Position structure to true orientation (see page on orientation). The long axis of the building lies 15° north of east (see Figure A).

STEP 2. To evaluate the need for solar control, the amount of solar energy falling on the exposed glass surfaces should be calculated. New York lies nearest to the 40°N latitude. The most penetrating sun angles occur at June 21st. Superimpose over the 40° sun-path diagram (see page on solar angles) the radiation calculator (see page on solar energy calculation), and turning the calculator 15° east of south, read along the June 21st sun-path the hourly radiation impacts. Figure B shows the Btu/sq. ft./hour sun energy values falling on the south side. One can see from it that this surface receives an eight hour insolation, with energies over 90 Btu/sq. ft./hour around 11 a.m. Figure C shows the sun energies impinging on the north side. One can see from it that the early morning impact is negligible, but around 6 p.m. a considerable amount of energy falls on the surface. Conclusion: both exposed sides should be protected by shading devices.

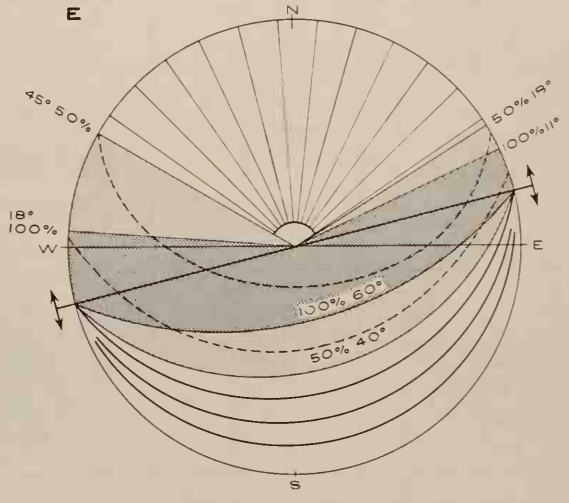
STEP 3. To determine the times when shading is needed: during cool times of the year (called "underheated period") the warming effect of the sun is desirable. During the warm times (called "overheated period") shading is needed to approach comfort conditions. For practical use the 70° temperature can be accepted as a dividing line between these two conditions.

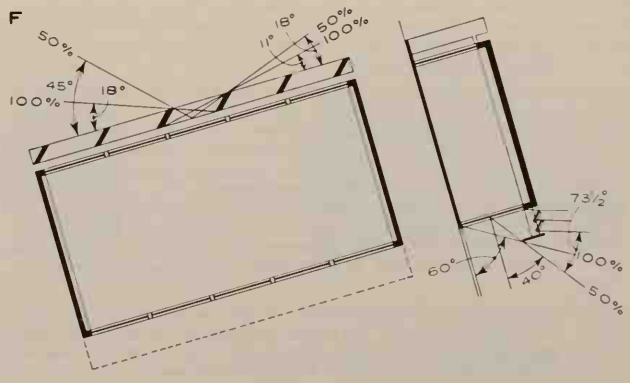
Figure D illustrates the New York (40°N latitude) sun-path diagram on which are charted all conditions throughout the year when the temperatures equal or exceed 70°F. In these overheated times, illustrated with the shaded area on the graph, shading will be needed.



STEP 4. Construction of shading mask: lay the "shading mask protractor" (see page on shading devices) over the overheated period diagram in the proper orientation; as figure E illustrates. Here the contours of the overheated period are shown by the dotted line. From the shading mask lines one can see that towards the south, devices with segmental character (overhang types) will cover conveniently the overheated period. At the north side the application of devices having radial mask patterns (fin types) will be effective.

In the figure in darker tone is shown the 100% shading effect; when the total wall surface is in shadow. In lighter tone is shown the 50% shading effect; when only half of the surface will be in shade.

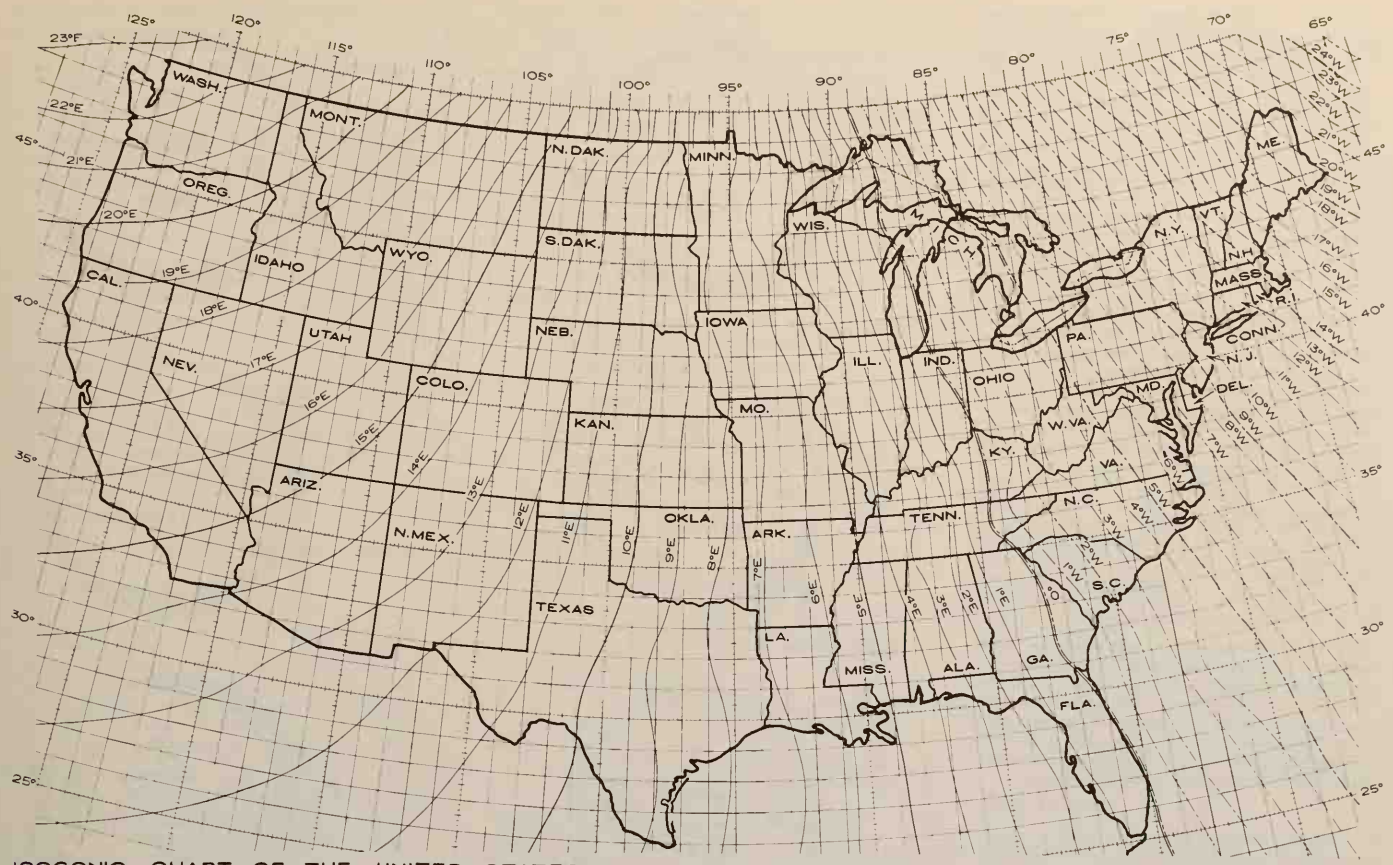




STEP 5. Design of shading devices from shading masks; the mask defines the type and the angles of the devices only, and possibilities remain for various design arrangements. In the example at the north side vertical fins will serve effectively. As the required angles in the shading mask are different towards the west (18° for 100% and 45° for 50% shading effect) as for the easterly direction (11° for 100% and 18° for 50% shading effect); the device shall be oblique to the wall surface. Figure F illustrates an application for the north side. The necessary shading angle is measured in the plan from the middle of the shading fins; the full shade giving angles are measured from the inside corners os of the shading elements.

On the south side one could apply a 60° solid overhang. However, this might be too long to cantilever. Instead, the solution here is a combination of horizontal and vertical elements, which corresponds to the same shading mask (see page on Shading Devices). In the section the 50% shading effect is measured from the middle of the glass pane; the 100% shading effect, from the bottom. The horizontal part of the shading device could be solid; however, it is constructed here with louver elements to secure ventilation. The critical angle for the louvers is 73 ½°, to correspond to the sun's highest altitude angle at this latitude. (See section in Figure F).

Victor Olgyay, AIA; Associate Professor; School of Architecture, Princeton University; Princeton, New Jersey



ISOGONIC CHART OF THE UNITED STATES
FROM U.S DEPARTMENT OF COMMERCE, COAST & GEODETIC SURVEY 1965

COMPASS ORIENTATION

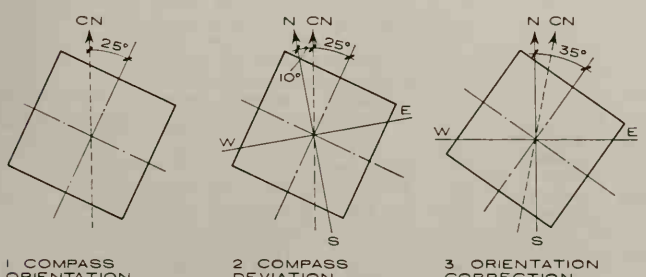
The above map is the isogonic chart of the United States. The wavy lines from top to bottom show the compass deviations from the true north. At the lines marked E the compass will point east of true north; at those marked W the compass will point west of true north. According to the location, correction should be done from the compass north to find the true north.

EXAMPLE: On a site in Wichita, Kansas, find the true north.

STEP 1. Find the compass orientation on the site.

STEP 2. Locate Wichita on the map. The nearest compass deviation is the 10^{0}E line.

STEP 3. Adjust the orientation correction to true north.
The graphical example illustrates a building which lies 25^{0} east with its axis from the compass orientation.



1 COMPASS ORIENTATION
2 COMPASS DEVIATION
3 ORIENTATION CORRECTION

ORIENTATION PRINCIPLES

Orientation in architecture encompasses a large segment of different considerations. The expression "total orientation" refers both to the physiological and psychological aspects of the problem.

At the physiological side the factors which affect our senses and have to be taken into consideration are: the thermal impacts—the sun, wind, and temperature effects acting through our skin envelope; the visible impacts—the different illumination and brightness levels affecting our visual senses; the sonic aspects—the noise impacts and noise levels of the surroundings influencing our hearing organs. In addition, our respiratory organs are affected by the smoke, smell, and dust of the environs.

On the psychological side, the view and the privacy are aspects in orientation which quite often override the physical considerations.

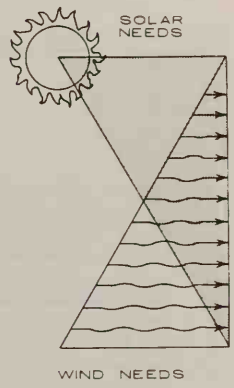
Above all, as a building is only a mosaic unit in the pattern of a town organization, the spatial effects, the social intimacy, and its relation to the urban representative directions—aesthetic, political, or social—all play a part in positioning a building.

THERMAL FORCES INFLUENCING ORIENTATION

The climatic factors such as wind, solar radiation, and air temperature play the most eminent role in orientation. The position of a structure in northern latitudes, where the air temperature is generally cool, should be oriented to receive the maximum amount of sunshine without wind exposure. In southerly latitudes, however, the opposite will be desirable; the building should be turned on its axis to avoid the sun's unwanted radiation and to face the cooling breezes instead.

At right the figure shows these regional requirements diagrammatically.

Adaptation for wind orientation is not of great importance in low buildings, where the use of windbreaks and the arrangement of openings in the high and low pressure areas can help to ameliorate the airflow situation. However, for high buildings, where the surrounding terrain has little effect on the upper stories, careful consideration has to be given to wind orientation.



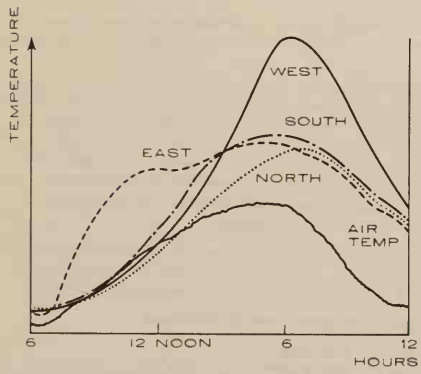
Victor Olgyay, AIA; Associate Professor; School of Architecture, Princeton University; Princeton, New Jersey

To visualize the thermal impacts on differently exposed surfaces four locations are shown approximately at the 24°, 32°, 40° and 44° latitudes. The forces are indicated on average clear winter and summer days. The air temperature variation is indicated by the outside concentric circles. Each additional line represents a 2°F difference from the lowest daily temperature. The direction of the impact is indicated according to the sun's direction as temperatures occur. (Note the low temperatures at the east side, and the high ones in westerly directions.)

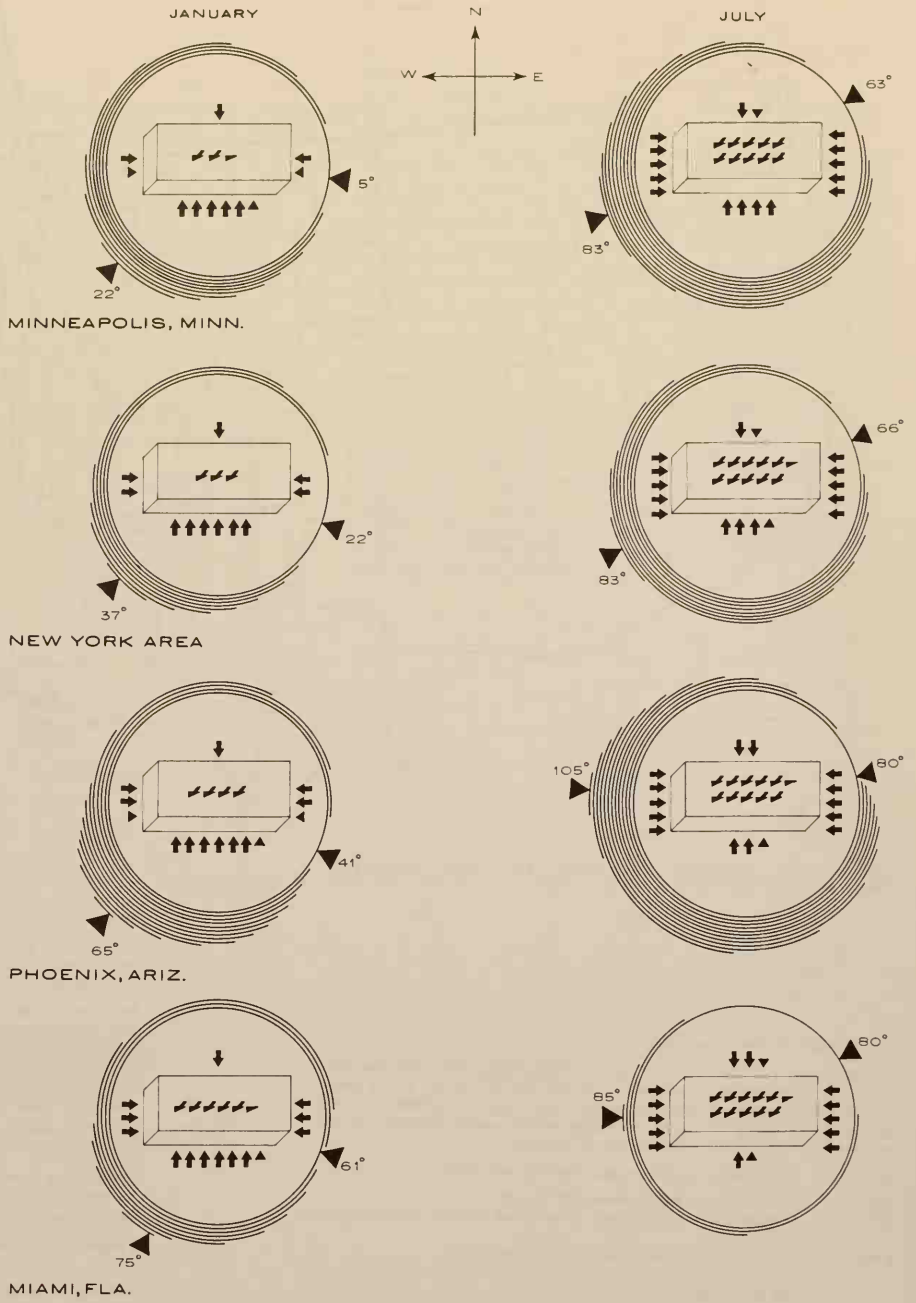
The total (direct and diffuse) radiation impact on the various sides of the building is indicated with arrows. Each arrow represents 250 Btu/sq. ft./day radiation. At the bottom of the page the radiations are expressed in numerical values.

The values show that in the upper latitudes the south side of a building receives nearly twice as much radiation in winter as in summer. This effect is even more pronounced at the lower latitudes, where the ratio is about one to four. Also, in the upper latitudes, the east and west sides receive about 2 ½ times more radiation in summer than in winter. This ratio is not as large in the lower latitudes; but it is noteworthy that in summer these sides receive two to three times as much radiation as the south elevation. In the summer the west exposure is more disadvantageous than the east exposure, as the afternoon high temperatures combine with the radiation effects. In all latitudes the north side receives only a small amount of radiation, and this comes mainly in the summer. In the low latitudes, in the summer, the north side receives nearly twice the impact of the south side. The amount of radiation received on a horizontal roof surface exceeds all other sides.

Experimental observations were conducted on the thermal behavior of building orientation at Princeton University's Architectural Laboratory. Below are shown the summer results of structures exposed to the cardinal directions. Note the unequal heat distribution and high heat impact of the west exposure compared to the east orientation. The southern direction gives a pleasantly low heat volume, slightly higher, however, than the north exposure.



ROOM TEMPERATURE IN DIFFERENTLY ORIENTED HOUSES



On orientation the following conclusions can be drawn:

1. The optimum orientation will lie near the south; however, will differ in the various regions, and will depend on the daily temperature distribution.
2. In all regions an orientation eastward from south gives a better yearly performance and a more equal daily heat distribution. Westerly directions perform more poorly with unbalanced heat impacts.
3. The thermal orientation exposure has to be correlated with the local wind directions.

RESIDENTIAL SITE STANDARDS (FHA) — 1965 ED. (SUMMARY)

Source: F.H.A. minimum property standards for one and two living units.

DESIGN

The dwelling together with any accessory buildings may be located anywhere on the lot provided:

A. No part of the front or accessory structures extend into the minimum front, rear or side yard space required.
B. The maximum F.H.A. lot coverage is not exceeded.
C. At least one of the front, rear, or side yard areas is of such size and so planned as to permit usable and reasonable private yard space for laundrydrying, gardening landscaping, outdoor living, and similar functions.

SITE CONDITIONS

The property shall be free of those hazards which may affect the health and safety of the occupants, or the structural soundness of the improvements, or which may impair the customary use and enjoyment of the property by typical occupants. These hazards may be subsidence, flood, erosion, or others.

LOT COVERAGE

Maximum area of plot which may be used for building area:

A. Detached dwelling: one family - 30%
B. Detached dwelling: two family - 35%
C. Semi-detached or end row dwelling, one or two families 35%
D. Row dwelling, one or two families - 45%
E. Note: The building area includes the total ground area of each building and accessory building, but does not include the area of uncovered entrance platforms, terraces and steps.

YARD DIMENSIONS

A. Front and rear yards: minimum distance from front or rear building line to property line, at any point, 15 feet, except garage or carport to rear property line, 5 feet minimum.

B. Side yards (the criteria providing the larger dimension shall govern).
   1. Detached dwelling; minimum distance from side building line to property line, at any point, 5 feet except:
      a) Where established controls assure at least 10 feet between adjacent structures, 3 feet minimum.
      b) Where garages or carports are adjacent to each other, 3 feet minimum.
   2. Semi-detached or end row dwelling; minimum distance from side building line to property line, at any point, 8 feet.

C. Sum of side yard: (detached dwelling)
   1. Sum of side yard dimensions on subject plot, measured along front building line:
      a) width of plot 70 feet or less - 10 feet
      b) width of plot over 70 feet - 15% of width
   2. Criteria considered only to nearest foot.

D. Other Conditions:
   1. Side yard with driveway or planned for future driveway - 8 feet clear of obstruction.
   2. Where adjacent structures have roof overhangs, distance between edge of overhangs, 6 feet minimum, except that when both structures are garages, the minimum distance between edges of overhang may be reduced to 4 feet.

DISTANCE BETWEEN BUILDINGS ON SAME PLOT

A. Minimum distance between dwelling and another dwelling on same plot, at any point - 10 feet.
B. Minimum distance between dwelling and an accessory building, at any point, 10 feet, except:
   1. Where no required windows are located in opposing walls - 5 feet minimum.
   2. Minor passageways (10 feet maximum length) no windows in opposing walls, 3 feet minimum.

COURT YARD

A. Outer courts (enclosed on 3 sides)
   1. Minimum distance between required window and another window in same living unit, opposite each other across a court - 10 feet.
   2. Minimum distance between any window and wall of another living unit, measure across court - 10 feet.
   3. Distance between opposite building walls in other cases, 5 feet minimum.

B. Inner courts
   1. Minimum area of inner court - 100 sq. ft.
   2. Minimum dimensions of inner courts same as outer courts.

ACCESS

A. Access to the property
   1. Each property, other than those in planned unit developments, shall be provided with vehicular access to the property by abutting public or private streets. Private streets shall be protected by permanent easements.
   2. The width and construction of the required street and provisions for its continued maintenance shall provide safe and suitable vehicular access to and from the property at all times.

B. Access to rear yard
   1. Each dwelling shall be provided with a means of access to the rear yard.
   2. For a row type dwelling, the access shall be by means of an alley, easement, open passage through the dwelling, or other acceptable means.

C. Access to living unit
   1. A means of access to each living unit shall be provided without passing through any other living unit.
   2. Acceptable means of access to the rear yard shall be provided for each living unit without passing through any other living unit.

FINISH GRADE IN RELATIONSHIP TO HABITABLE SPACE

The average finish grade elevation at exterior walls shall not be more than 48 inches above finish floor of a habitable room. This does not apply to basement recreation rooms not intended for year round occupancy, bathrooms, storage, or utility rooms etc.

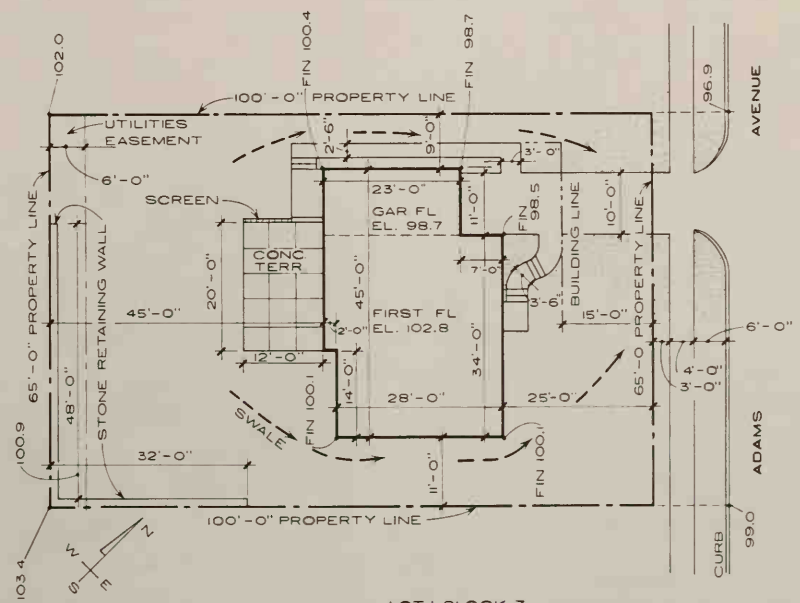
PLOT PLAN

Drawings for F.H.A. individual applications shall be submitted in duplicate and provide at least the following information.

A. Scale 1" = 20' or $^1/_{16}$" = 1'– 0" minimum.
B. Lot and Block number.
C. Dimensions of plot and north point.
D. Dimensions of front, rear and side yards.
E. Location and dimension of garage, carport, and other accessory buildings.
F. Location of walks, driveways and approaches.
G. Location of steps, terraces, porches, fences, and retaining walls.
H. Location and dimensions of easements and established setback requirements.
I. Elevations at the following points:
   1. First floor of dwelling, and floor of garage, carport and other accessory buildings.
   2. Finish curb or crown of street at points of extension of lot lines.
   3. Finish grade elevation at each principle corner of structure.
J. The following additional elevations, as applicable, shall be submitted if the topography or the design of the structure is such that special grading, drainage, or foundations may be necessary. Examples are irregular or steeply sloping sites, filled areas on sites; or multi-level structure designs.
   1. Finish and existing grade elevations at each corner of plot.
   2. Existing grade at each principle corner of dwelling.
   3. Finish grade at both sides of abrupt changes of grade such as retaining walls, sloping, etc.
   4. Other elevations necessary to show grading and drainage.
K. Indication of lot grading type and approximate locations of swales.
L. Individual water supply and sewage disposal information (including all details).

LOCAL BUILDING CODES:

The minimum F.H.A. standards do not relieve the builder of his responsibility for compliance with local ordinances, codes and regulations including established requirements of a health authority having jurisdiction.



LOT GRADING TYPE "A"
(ALL DRAINAGE TO STREET)

LOT 1 BLOCK 7
CHESTNUT HILL – BRAINARD, COLUMBIA
SCALE: 1" = —

EXAMPLE PLOT PLAN No. 1

Thomas Johnson; Sasaki, Dawson, DeMay Associates, Inc.; Watertown, Massachusetts

SITE LAYOUT

A. The house should relate harmoniously to the lot.

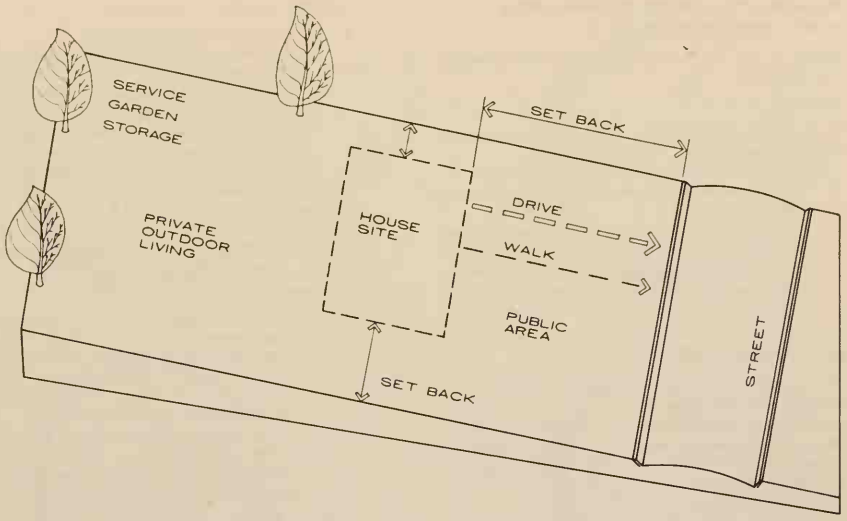
B. Observe legal setback restrictions.

C. Plan the use of space around the house.

D. Consider climate orientation—sun, wind, rain, snow, heat, shade.

E. Try to preserve existing trees and topography.

F. Plan access to house.



GRADING AND DRAINAGE

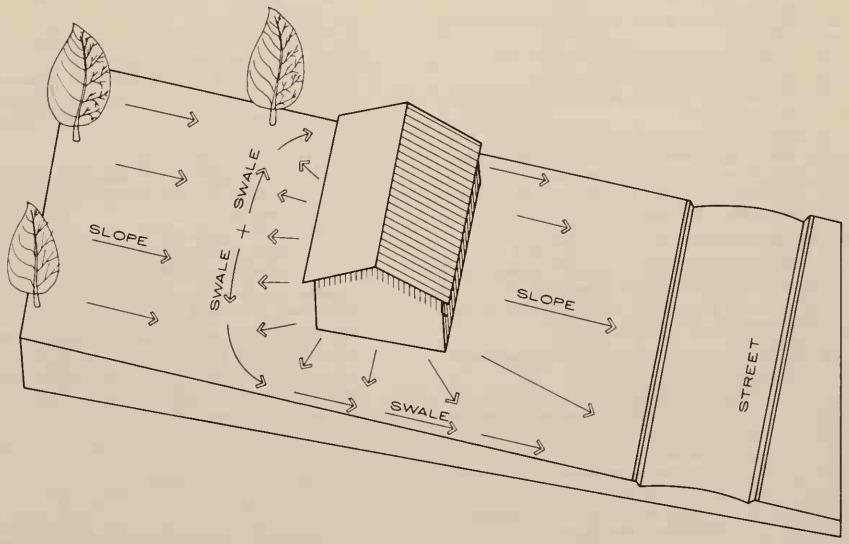
A. Drain away from the house on all sides.

B. Keep drainage swales inconspicuous.

C. Set house above, and drain to street.

D. Prevent drainage from conflicting with outdoor use areas.

E. All grades should have a minimum slope of 1% and a maximum slope of 8%.

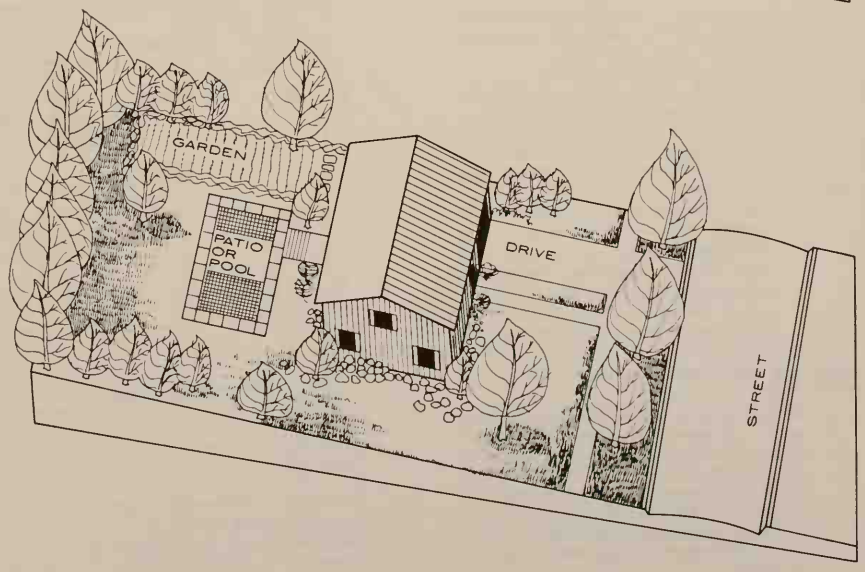


SITE DEVELOPMENT

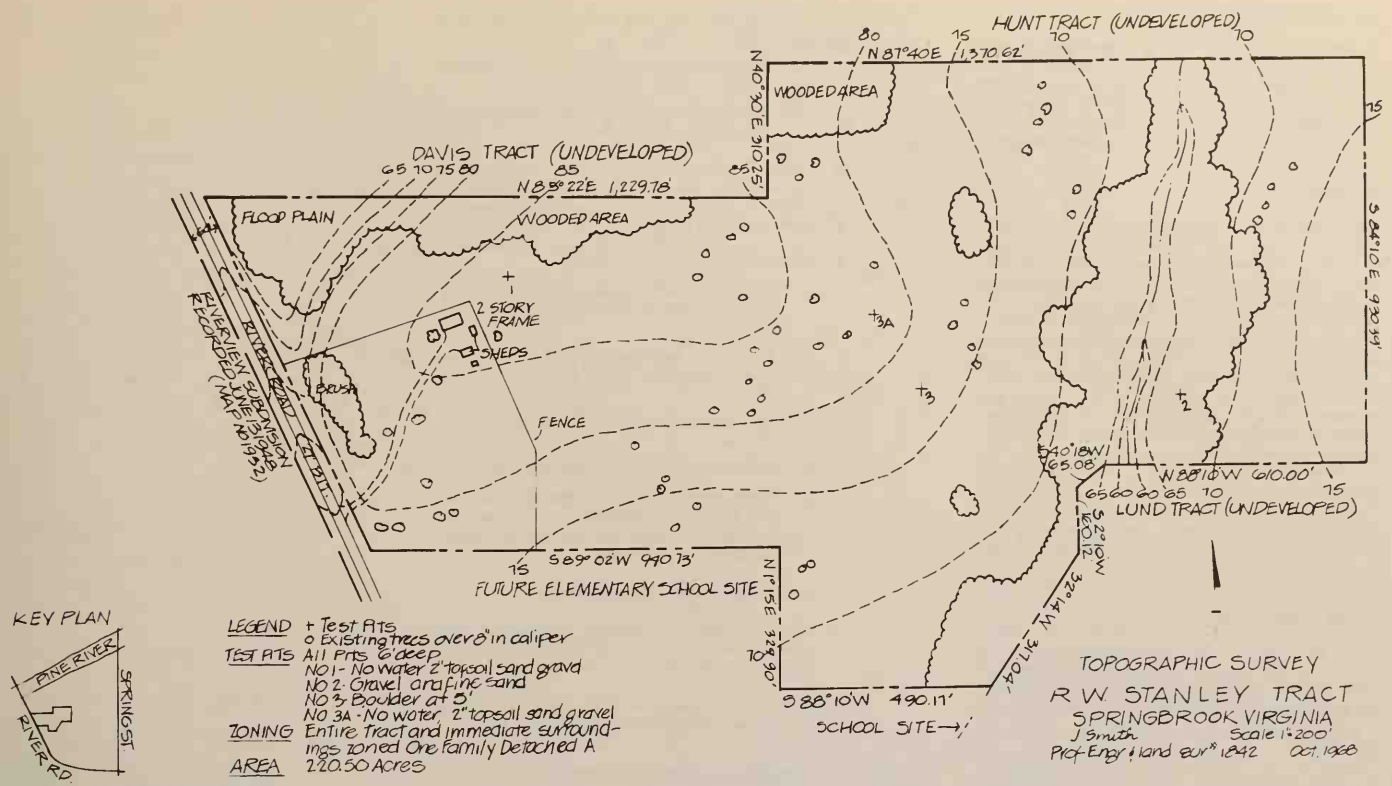
A. Open house with windows to the outdoor living area.

B. Consider special features such as pools or patios.

C, Plan for privacy, shade, wind screen, views, and decoration.



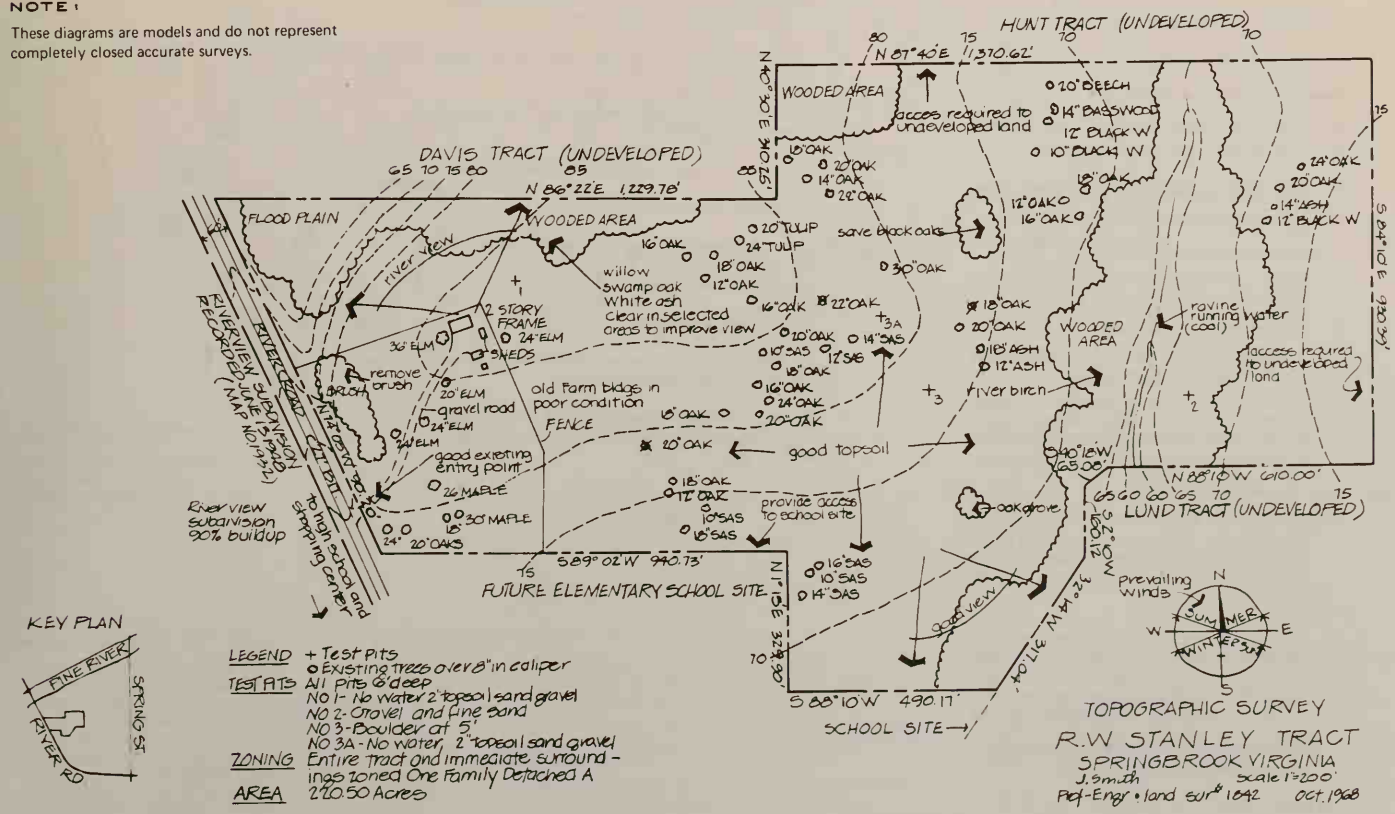
Thomas Johnson; Sasaki, Dawson, DeMay Associates, Inc.; Watertown, Massachusetts



TOPOGRAPHIC SURVEY

NOTE:

These diagrams are models and do not represent completely closed accurate surveys.



SITE ANALYSIS

Grossman and Greenan, Landscape Architects; Washington, D. C.

INTRODUCTION:

In developing a subdivision plan, it is important to recognize the myriad factors affecting a given project. It is up to the site planner to analyze and appropriately weigh the social, economic, engineering and aesthetic considerations and synthesize these factors into a balanced solution within the context of existing local zoning regulations.

ZONING

Having selected a site, the site planner must turn his attention to the prevailing zoning ordinance since this will be a principal determinant of the site's use and development. Zoning is an attempt by local authorities to legally regulate the use of land. Restrictions are placed on such factors as density of population, coverage of lots, and size and bulk of structures. Although local zoning regulations often favor a lot by lot subdivision of land, in some areas these regulations have been amended to permit cluster zoning or planned unit development. In a planned unit development, the site planner correlates the physical components of a subdivision (namely, amount of floor area, open space, livability space, recreation space and car storage of a property) with the size of the site. (See standards for subdivision planning.) The system used to measure these components is called the land use intensity ratio space. Thus, land use intensity measures dwelling units per acre while density bases its measurements on people per acre.

SITE FACTORS

Before the site planner can make a physical evaluation of the site, he must have an accurate survey of existing conditions. This may be accomplished by personally inspecting the site and graphically recording pertinent information on a topographic survey which, in most cases, is used as a base map.

A typical topographic survey includes the following information:

1. Boundary lines: bearings and distances.
2. Easements: location, width and purpose.
3. Streets on and adjacent to the tract:
   a. name and right-of-way width and location.
   b. type, width and elevation of surfacing.
   c. any legally established center-line elevations.
   d. walks, curbs, gutters, culverts, etc.
4. Utilities on and adjacent to the tract:
   a. location, size and invert elevation of sanitary, storm and/or combined sewers.
   b. location and size of water mains.
   c. location of gas lines, fire hydrants, electric and telephone poles and street lights.
   d. direction and distance to, and size of nearest water mains and sewers; show invert elevation of sewers. (This is necessary only if water mains and sewers are not on or adjacent to the tract.)
5. Ground elevations on the tract:
   a. For land that slopes more than approximately 2%, show spot elevations at all breaks in grade, along all drainage channels or swales and at selected points not more than 100 ft. apart in all directions.
   b. For land that slopes more than approximately 2%, show contours with an interval of not more than 5 ft. where ground slope is regular and such information is sufficient for planning purposes; or show contours with an interval of not more than 2 ft. where necessary because of irregular land or need for more detailed data for preparing plans and construction drawings.
6. Subsurface conditions on the tract:
   a. location and results of test made to ascertain subsurface soil, rock and ground water conditions.
   b. depth to ground water unless test pits are dry at a depth of 5 ft.
   c. location of percolation test if individual sewage disposal systems proposed.
7. Other conditions on the tract: water courses marshes, rock outcrop, wooded areas, isolated trees one ft. or more in diameter, houses, barns, shacks and other significant features.
8. Other conditions on adjacent land:
   a. approximate direction and gradient of ground slope, including any embankments or retaining walls.
   b. location of buildings, railroads, power lines, towers, and other nearby nonresidential land uses.
   c. approximate area of off-site water shed drainage into tract.
   d. owners of adjacent unplatted land.
   e. For adjacent platted land, refer to subdivision plat by name, recording date and number and showing approximate per cent built up, typical lot size and dwelling type.
9. Zoning on and adjacent to the tract.
10. Proposed public improvements: highways or other major improvements planned by public authorities for future construction on or near the tract.
11. General information including: scale, north arrow, datum, benchmark and date of survey.

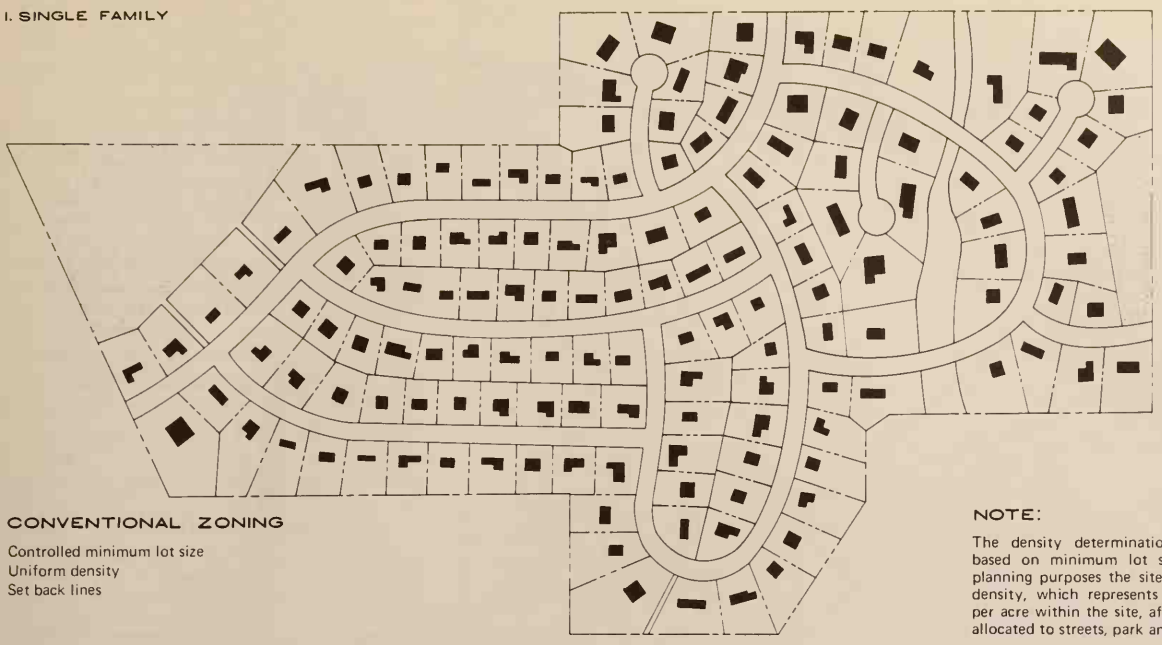
ADDITIONAL INFORMATION

To supplement and interpret the topographic survey, the site planner, in diagrammatic form, sketches on the survey map the following additional information:

1. Location and direction of best views, poor views and objectionable views.
2. Location of off-site nuisances with their bearings and approximate distances.
3. Location of logical points of ingress or egress.
4. Routes of surface water runoff.
5. Notes on flood, undrained or swampy conditions.
6. An analysis of the micro-climate.
7. A sun and wind diagram.
8. An indication of trees that should be saved, if possible, and trees that should be removed.
9. Notes on other natural features such as rock outcrop, erosion problems, natural springs, ground cover, topsoil, etc.

Grossman and Greenan, Landscape Architects, Washington, D. C.

1. SINGLE FAMILY



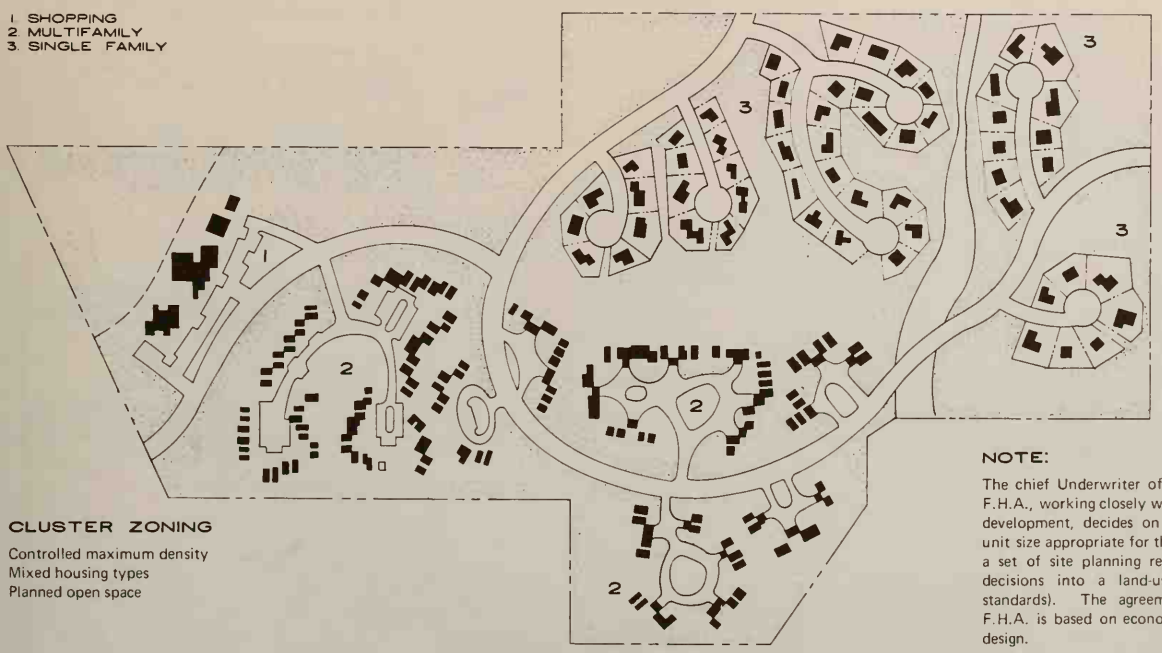
CONVENTIONAL ZONING

Controlled minimum lot size
Uniform density
Set back lines

NOTE:

The density determination for conventional zoning is based on minimum lot size requirements, however for planning purposes the site planner generally refers to net density, which represents the total number of dwellings per acre within the site, after deducting 25 percent of site allocated to streets, park and recreation areas.

1. SHOPPING
2. MULTIFAMILY
3. SINGLE FAMILY



CLUSTER ZONING

Controlled maximum density
Mixed housing types
Planned open space

NOTE:

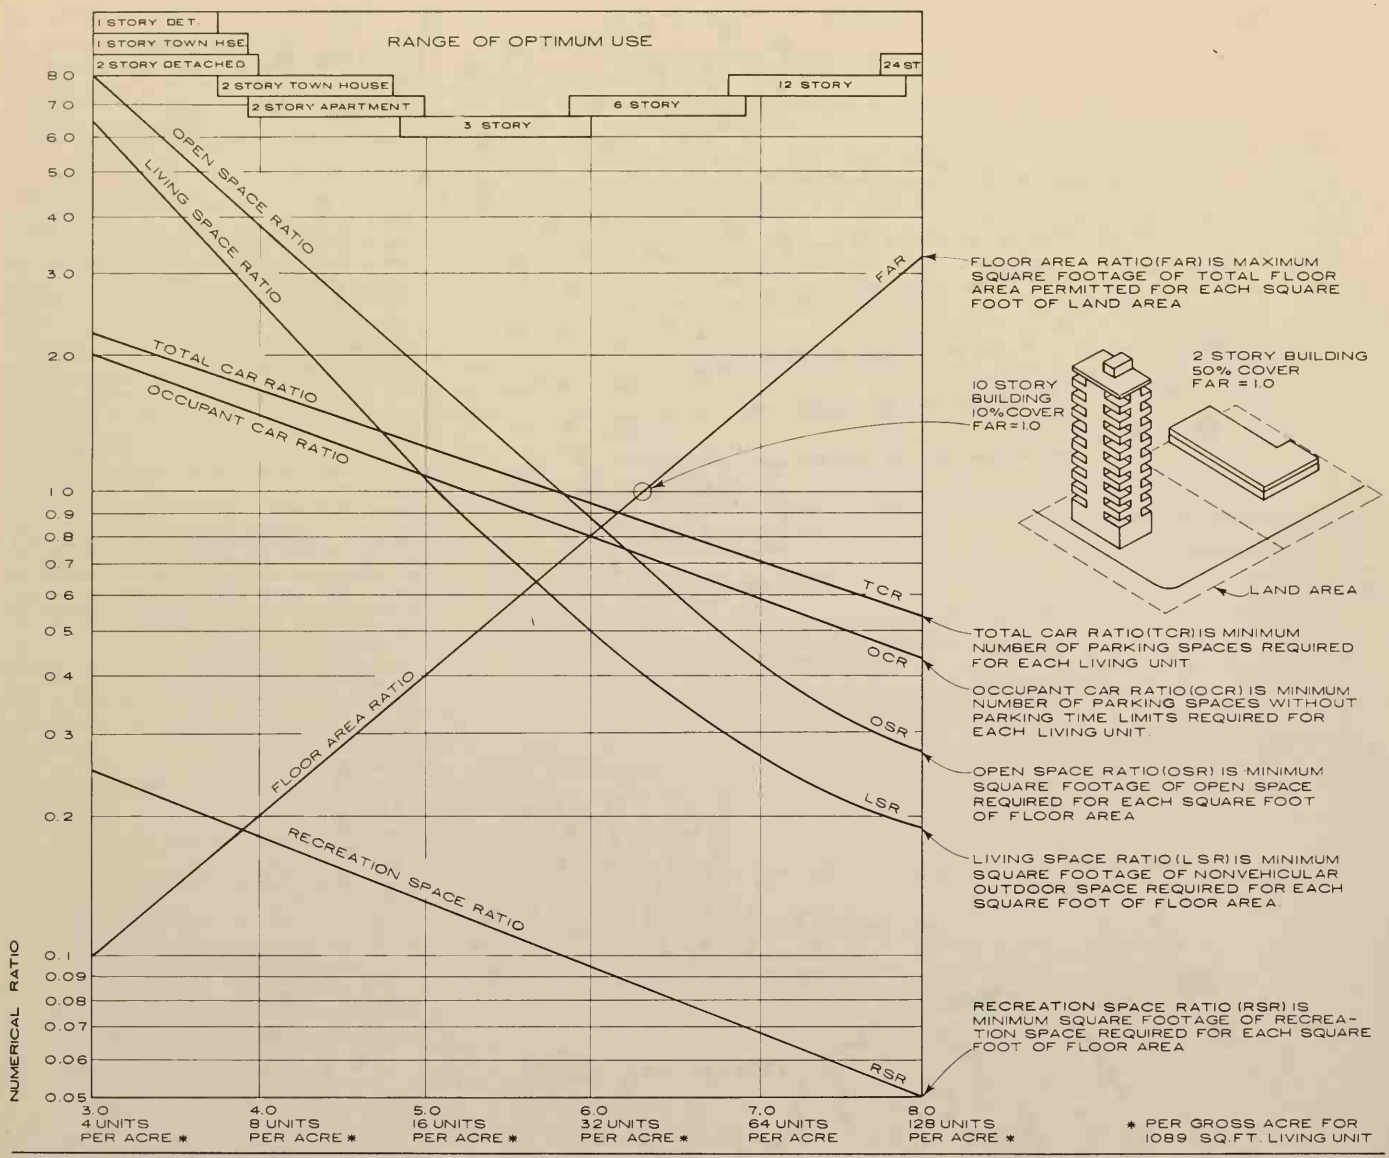
The chief Underwriter of the Regional Insuring Office of F.H.A., working closely with the sponsor of a planned-unit development, decides on the density and average living unit size appropriate for the particular site and then selects a set of site planning requirements by converting these decisions into a land-use intensity number (see site standards). The agreement between the sponsor and F.H.A. is based on economic feasibility and flexibility of design.

ADVANTAGES OF PLANNED UNIT DEVELOPMENT (CLUSTER ZONING)

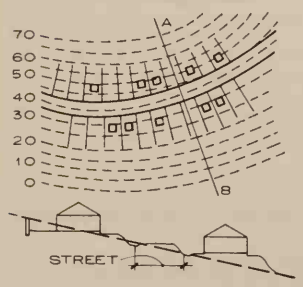
Although conventional zoning for the lot by lot type of subdivision is still the standard practice in suburbia, the amenities offered by the planned unit development (cluster zoning) are becoming more apparent. The use of extensive areas of common open space makes possible a fitting of development to the land far more effective than in subdivisions where the objective is to obtain the maximum number of individual lots as possible. Following is a list of apparent positive objectives gained from the wise employment of the planned unit development theory of subdivision design.

1. With smaller individual lots, excess land particles can be massed together to provide larger and more useful community recreational space.
2. With the use of connecting community open spaces and fewer through traffic streets, children are better protected from vehicular traffic.
3. With larger amounts of open space, the natural character of the site can be preserved.
4. With the use of clustering, row housing and multi-story housing lower priced units with ample open space can be provided.
5. With the shorter networks of streets and utilities, construction costs can be reduced.
6. With more common open space, social intercourse in a community becomes more prevalent.

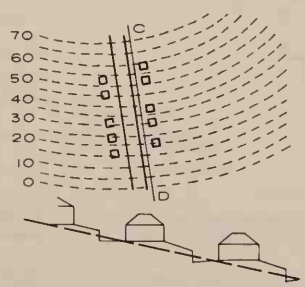
Grossman and Greenan, Landscape Architects, Washington, D. C.



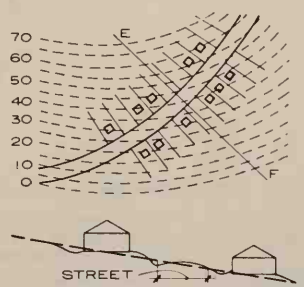
LAND-USE INTENSITY STANDARDS



SECTION A - B
FIGURE 1.
Undesirable conditions are created by streets parallel with contours.



SECTION C - D
FIGURE 2.
Streets built at right angles to contours are of excessive grade; costly retaining walls required.



SECTION E - F
FIGURE 3.
Where grades are steep, streets should be built diagonally across contours.

STREET LAYOUT ON SLOPES

Grossman and Greenan, Landscape Architects, Washington, D. C.

FINAL DEVELOPMENT PLANS

After the layout of the subdivision is determined from preliminary sketches, final development plans must be prepared. Final development plans show the final design for the location of streets, residential lots and other features in a proposed development. The following checklist is for selective use as appropriate for each development. For example, the data may be combined on fewer drawings, such as a single grading and drainage plan. All drawings should show the name and location of the development, the date of preparation or revision and when appropriate, the scale, north point, datum and approval of local authorities.

NEIGHBORHOOD GRADING PLAN

1. Subdivision layout: data from the accepted preliminary subdivision plan; include existing topography, street names, and lot numbers.
2. Proposed grading by contours or by spot elevations.

NEIGHBORHOOD DRAINAGE PLAN

1. Subdivision data as in 1, above.
2. Storm sewer plan, profiles, design criteria and specifications.
3. Plans for disposal of subsurface water as needed.
4. Details and specifications for inlets, manholes, catch basins, headwalls and surface drainage channels.
5. Adjacent contributory drainage area: if adjacent land drains into, or is diverted around the development, show data on size of adjacent drainage area, and slope of land. For any proposed diversion systems, show design flow computations and details.
6. Plans, profiles, cross-section and details of off-site outfall drainage to a point where backwater will not affect subdivision.
7. Data on necessary easements.

UTILITY PLANS

1. Water supply and sewage disposal. Public: exhibits which will enable the insuring office to determine that continuous satisfactory service will be provided. Community: complete construction plans and specifications, and details of the proposed maintenance organization.
2. Street lighting: type and location.

STREET PLANS

1. Plan and profile of each street.
2. Cross-section of each street type.
3. Details and specifications for pavement base and surfacing, curbs, etc.

OTHER NEIGHBORHOOD IMPROVEMENT PLANS

1. Protective screening
   Fences and walls: plan, details and specifications.
   Planting: plan for typical 100 ft. length of screen planting: quantities, sizes, species and specifications. (See pages on plant materials)
2. Alleys, cross-walks, entranceways, parks, etc.: plans, details and specifications.

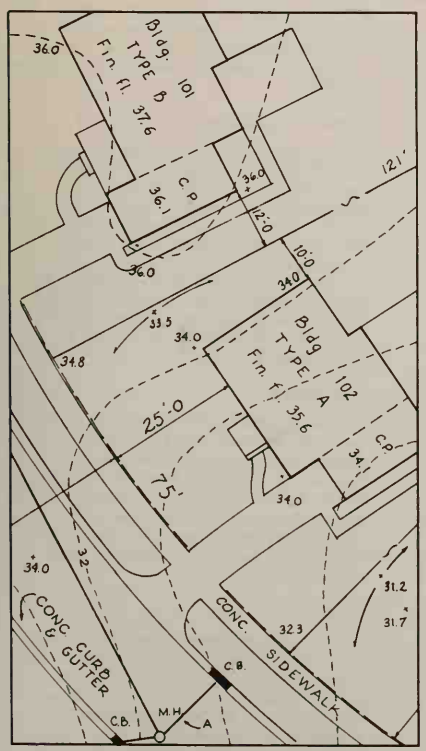
MASTER PLOT PLANS, TYPICAL PLOT PLANS AND LOT GRADING PLAN

The preceding plans do not apply where land development is for individual custom building. They do apply when the individual housing units are to be sited by the site planner. (See pages on Residential Site Standards).

THE SUBDIVISION PLAT

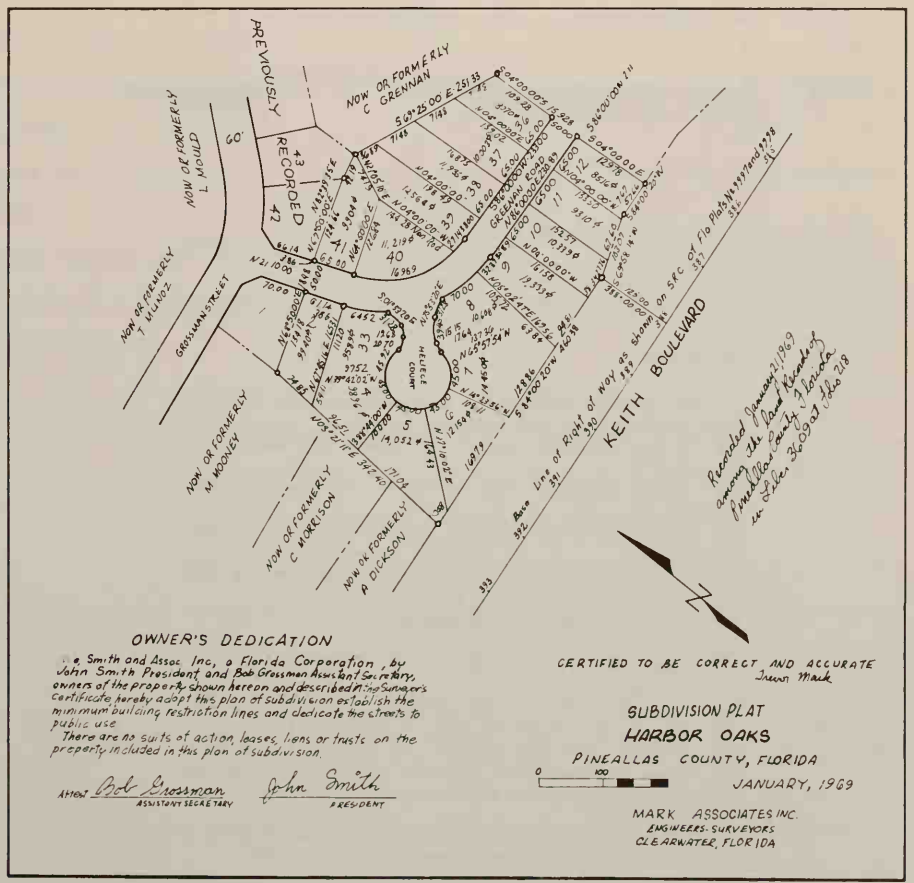
A subdivision plat, when properly prepared and filed in the public land records, establishes a legal description of the streets, residential lots and other sites in a residential development. The following checklist of information to be shown on a subdivision plat should be used when and as indicated by local F.H.A. office.

1. Right-of-way lines of streets, easements and other rights-of-way, and property lines of residential lots and other sites with accurate dimensions, bearings and curve data.
2. Name and right-of-way width of each street or other right-of-way.
3. Location, dimensions and purpose of any easements.
4. Number to identify each lot or site.
5. Purpose for which sites, other than residential lots, are dedicated or reserved.
6. Minimum building setback line on all lots and other sites.
7. Location and description of monuments.
8. Names of record owners of adjoining unplatted land.
9. Reference to recorded subdivision plats of adjoining platted land by record name, date and number.
10. Certification by surveyor or engineer.
11. Statement by owner dedicating streets, rights-of-way and any sites for public use.
12. Approval by local authorities.
13. Title, scale, north arrow and date.



Composite Development Plan in which the neighborhood grading plan, neighborhood drainage plan, master plot plan and master lot grading plan are prepared as a single combined drawing.

Grossman and Greenan, Landscape Architects; Washington, D. C.



This drawing illustrates information which should be shown on a subdivision plat. It is not intended as illustrative of required design standards or drafting technique.

This diagram is a model and does not represent a completely closed accurate survey.

USE FOR COLLECTOR OR MINOR STREETS

NOTES:

Dimension as specified elsewhere

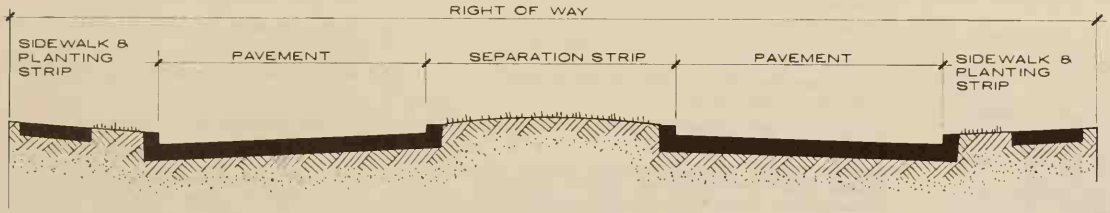
With rolled curbs, pavement width is measured from the faces of the curbs at a point 6 inches from backs of the curbs.

Pavement crown: for cement concrete 1/8 inch per 1 ft., for bituminous surface 1/4 inch per 1 ft., unless otherwise specified.

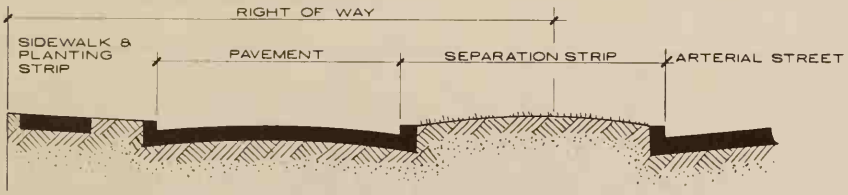
Pavement edging details as specified elsewhere

Sidewalk locations as specified elsewhere

Slope sidewalks and planting strips 1/4 inch per 1 ft. to the pavement unless otherwise specified



DIVIDED STREET



MARGINAL ACCESS STREET

STREET TYPES

Arterial – Major street for community wide use
Collector – Secondary street for traffic originating in the neighborhood
Minor – Local residential street affords principal means of vehicular access to properties
Marginal – Service street for properties fronting on an arterial street

TYPICAL STREET IMPROVEMENT STANDARDS

STANDARD A FOR APARTMENTS AND ROW HOUSES
STANDARD B FOR TYPICAL ONE-FAMILY DETACHED HOUSES
STANDARD C FOR COUNTRY HOUSES

STANDARDS			STREETS
A	B	C	
X	X	X	1. Arterial streets: widths of row, pavement and sidewalk as determined after consultation with local authorities and FHA.
X	X		2a. Collector streets: 80' r.o.w., two 22' pavements, 5' sidewalk 1' from property line.
X	X		2b. Collector streets: 80' r.o.w., 44' pavement, 5' sidewalks 1' from property line.
		X	2c. Collector streets: 60' r.o.w., 36' pavement, 4' sidewalks 1' from property line.
		X	2d. Collector streets: 60' r.o.w., 24' pavement, applicable only where typical lot is larger than one-half acre.
X			3a. Minor streets: 50' r.o.w., 36' pavement, 5' sidewalks 1' from property line.
	X		3b. Minor streets: 50' r.o.w., 30' pavement, 4' sidewalks 1' from property line.
		X	3c. Minor streets: 50' r.o.w., 22' pavement
X	X		4a. *Marginal access street: 40' r.o.w., 20' pavement, 4' sidewalks

X	X	X	5a. Streets along development boundaries: widths of r.o.w., pavement and sidewalks as determined after consultation with local authorities and the F.H.A.
X	X	X	5b. Streets connecting development with existing improved streets system: widths of r.o.w., pavement and sidewalks as determined after consultation with local authorities and F.H.A.
X	X	X	6. Street trees 3" caliper 40' to 50' apart

*4a. for one way marginal access street
*4b. for two way marginal access street r.o.w. = right of way

Grossman and Greenan, Landscape Architects, Washington, D. C.

GRADING

Planning and execution of grading involve certain basic steps pertaining to street layout, block grading and lot grading. The objective is to establish the street grades, floor elevations and lot grades in proper relation to each other and to existing topography, considering property protection, appeal and use.

STREET GRADES

Street grades should be established during the planning stage to provide proper relation between the streets and the first floor elevations of the house and to permit convenient and economical access to and drainage of lots. Proper establishment of street grades is necessary for the drainage design for both lots and streets and for the determination of the proper depth for the underground utilities. Street gradients should be sufficient for the runoff of storm water but not so steep as to be hazardous to traffic.

DRAINAGE

To prevent flooding of the streets and abutting properties, catch basins should be provided at all low points, at street intersections and at intermediate locations as necessary to prevent overloading of the street gutters. Catch basins should be connected to collections mains of adequate size with outfalls approved by the civil authorities having jurisdiction.

TREES

Existing trees on a development site should be saved whenever possible. Proposed trees should be selected for adaptability to local climate and soil conditions, for resistance to disease and insect pests, for healthy foliage that withstands dust and smoke and for a root system that will not damage nearby utility lines and paved areas. Street trees should have open growth, high branching and an ultimate size proportionate to the surroundings.

CHAPTER 2

FOUNDATIONS AND SITEWORK

SOIL BORING PROGRAMING
(CONSULT FOUNDATION ENGINEER QUALIFIED IN SOIL MECHANICS)

A. PRELIMINARY INVESTIGATION FOR SITE SELECTION:

1. Topographic or aerial map.
2. Geologic survey maps.
3. Case history of site development.
4. Soil information from existing soil borings.
5. Case history of foundations of adjacent buildings.
6. Drill minimum 2 holes, one down to 25 ft. depth & the other to hard strata. Perform standard penetration test (SPT) & note ground water level at each hole.

B. FINAL INVESTIGATION OF SOIL AFTER STRUCTURE IS ORIENTED AT THE SITE:

1. Drill a minimum of 4 SPT holes, one at each corner of building. Reference all holes to benchmark elevation.
2. Determine ground water level, PH and electro-resistivity of soil.
3. Take undisturbed soil samples & perform laboratory tests as required.

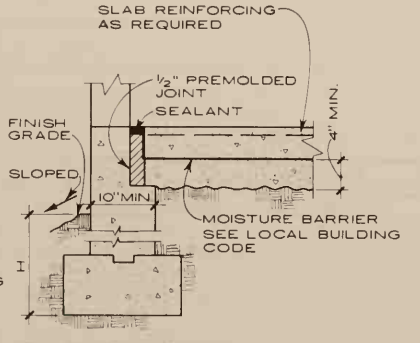
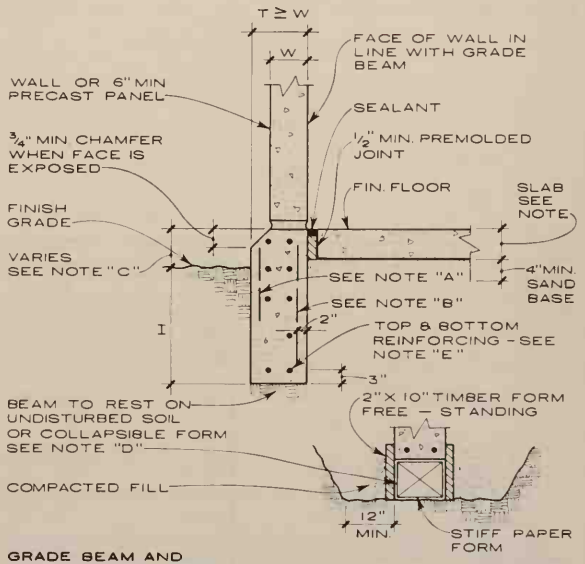
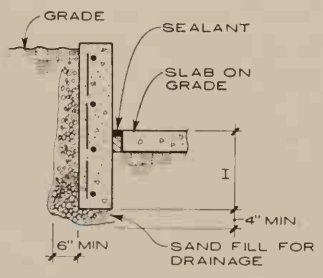
WALL FOOTINGS



PERIMETER WALL



GRADE BEAM AND COLLAPSIBLE FORM



AREA WALLS

TYPICAL GRADE BEAMS

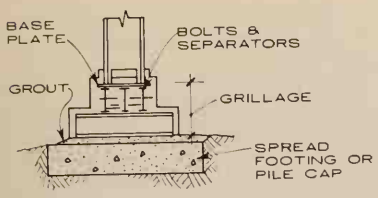
NOTES:

A. Use temperature reinforcing only when face of grade beam is exposed over 18" to weather.
B. Use main reinforcing only when finish grade is below 24" and/or finish floor surcharge load so dictates.
C. When finish grade is below finish floor, design grade beam for vertical and horizontal forces.
D. Use collapsible form when soil under beam is expansive or fat clay (CH). This provides a void which allows for periodic heaving of the soil due to increased moisture content, without lifting the grade beam.
E. Use top & bottom reinforcing for all grade beams.

GENERAL NOTES:

1. Adjoining ground to slope away from foundation in all directions and underlying soil to be preferably sand or gravel to reduce to a minimum heaving due to frost action.
2. It is good practice for foundations to extend 12" below frost line; consult local codes.

Smith, Hinchman & Grylls Associates, Inc.; Detroit, Michigan



STEEL GRILLAGE FOUNDATION

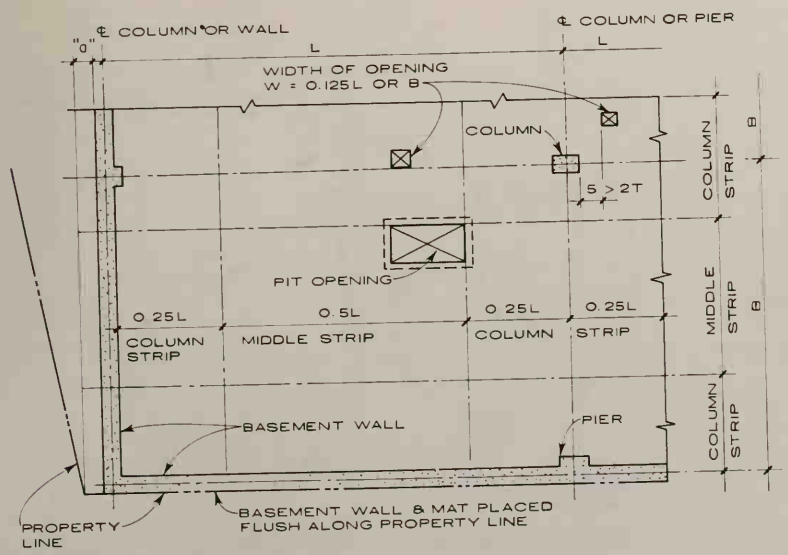
STEPPING OF ADJACENT FOOTINGS

max. steepness: 1/2 horizontal to 1 vertical, or 3/4" angle of repose of supporting soil.

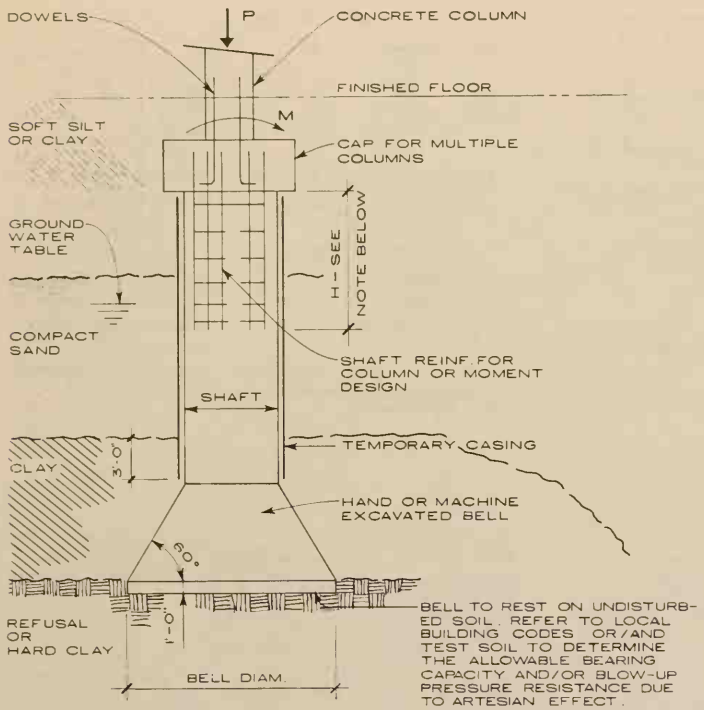


MAT FOUNDATION

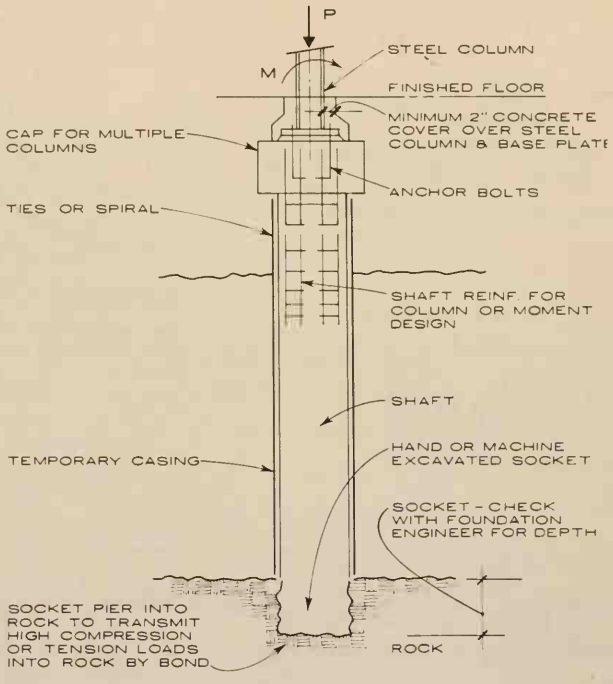
NOTES FOR MAT FOUNDATIONS:

1. Column spacing should be L = 1.33 B max.
2. Place pit (if necessary) at middle strip.
3. Adjust distance "a" to get an even pressure under mat within the allowable soil pressure.
4. Provide membrane waterproofing under mat when mat is less than 12" thick and the ground water level is above the mat.
5. Provide water stops in mat and in walls at construction joints.
6. Mat thickness, t = 0.027B L inches max.

Smith, Hinchman & Grylls Associates, Inc.; Detroit, Michigan



BELL FOUNDATION

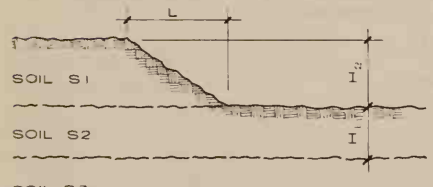


SOCKET FOUNDATION

DEEP FOUNDATIONS; DRILLED-IN-PIERS

NOTE:

1. Use temporary casing to seal-off inflow of water or sand into excavation. Delete casing when shaft is in stiff clay.
2. Grout bottom of shaft against artesian water or sulphur gas intrusion into the excavation.
3. Determine max. bearing capacity of pier by the unconfined compression strength of the soil, and verify it by load tests.
4. H is a function of the passive resistance of the soil, generated by the moment applied to the caisson cap.
5. Caissons may be used under grade beams or concrete walls.



OPEN EXCAVATION

EMBANKMENT STABILITY (CONSULT FOUNDATION ENGINEER)

NOTE:

When ground water level is above H_1 use well-point prior to excavating and as long as the hole is kept open if the soils below excavation level are permeable.

CONCRETE CRIB RETAINING WALLS

Continuous back wall anchorage types may be erected with a long radius and fishtail types with a short radius. Adverse soil conditions require wall to have extra sill units or foundation. Preliminary wall proportions: 6'– 0" high x 4'– 0" deep; 11'– 6" high x 6'– 0" deep. Walls up to 6'– 0" high may be erected plumb. Continuous back wall anchorage type with exposed "H" type headers is most commonly available.

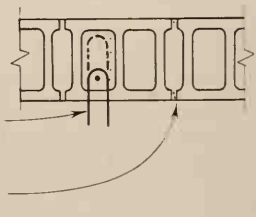
Vertical reinforcement is usually secured in place after the masonry work has been completed and before grouting. Accurately position and tie at vertical intervals not exceeding 160 bar diameters. Place wire loop extending into core in mortar joints as wall is laid up. Loosen before mortar sets. After inserting bar, pull wire loop and bar to proper position and secure wire by tying free ends. Control joints should be designed to resist shear and other lateral forces while permitting longitudinal movement.



PLAN DETAIL AT VERTICAL ROD AND CONTROL JOINT

GENERAL NOTES

Concrete masonry units for retaining wall construction shall comply with the requirements of "Specifications For Hollow Load Bearing Concrete Masonry Units," ASTM C90–64T.

Concrete for footings should be mixed in the following approximate proportions: 1 part portland cement, 2 3/4 parts of sand and 4 parts of gravel. Gravel should be well graded and not exceed 1 1/2 inches in size. Amount of water used for each bag of cement should not exceed 5 1/2 gallons unless the sand is very dry.

Mortar and grout should comply with the requirements of "Specifications For Mortar and Grout For Reinforced Masonry," ASTM C476–63. Use fine grout where grout space is less than three inches in least dimension. Use coarse grout where the least dimension of the grout space is three inches or more. Aggregates for grout shall conform to ASTM Standard Specifications C404–61.

Steel reinforcement should be clean, free from harmful rust, and should comply with applicable ASTM standards for deformed bars and steel wire.

Designs herein are based upon an assumed soil weight (vertical pressure) of 100 pounds per cubic foot. Horizontal pressure is based upon an equivalent fluid weight for the soil of 45 pounds per cubic foot.

Walls shown are designed with a safety factor against overturning of not less than 2 and a safety factor against horizontal sliding of not less than 1.5. Designs are based on the following standards: Footings (AC1 318–63) and walls (ASA 41.2–1960). Computations in the table for wall heights are based on level backfill. One method of providing for additional loads due to sloping backfill or surface loads is to consider them as an additional depth of soil, that is an extra load of 300 pounds per square foot can be treated as 3 extra feet of soil weighing 100 pounds per square foot.

Allow 24 hours for masonry to set up before grouting. Pour grout in 4 foot layers, an hour between each pour. Break long walls into panels of 20 to 30 feet in length with vertical control joints. Allow 7 days for finished wall to set up before backfilling. Prevent water from accumulating behind wall by means of 4 inch diameter weep holes at a 5 to 10 foot spacing (with screen and graded stone) or by a continuous drain with felt covered open joints in combinatinn with waterproofing.

NOTE:

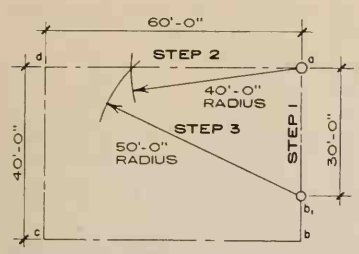
1. The "c" dimension shown on the drawing and given in Table is the grout cover over the a and b bars at top of footing elevation.
2. The key on the bottom of the footing which resists sliding may be eliminated for walls with an H dimension of 10′ and less.
3. In case the dimensions v, w, x and y shown in Table cannot be obtained with the brick used for the construction, the v, w and x dimensions should be increased and the y dimension decreased the distance required for the brick to course out.

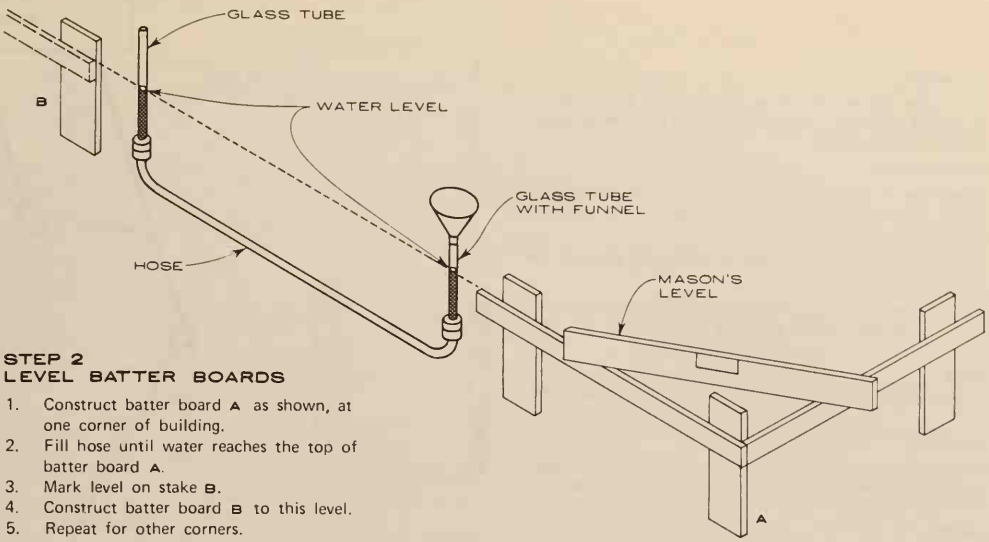
Structural Clay Products Institute; McLean, Virginia



BUILDING DIAGRAM

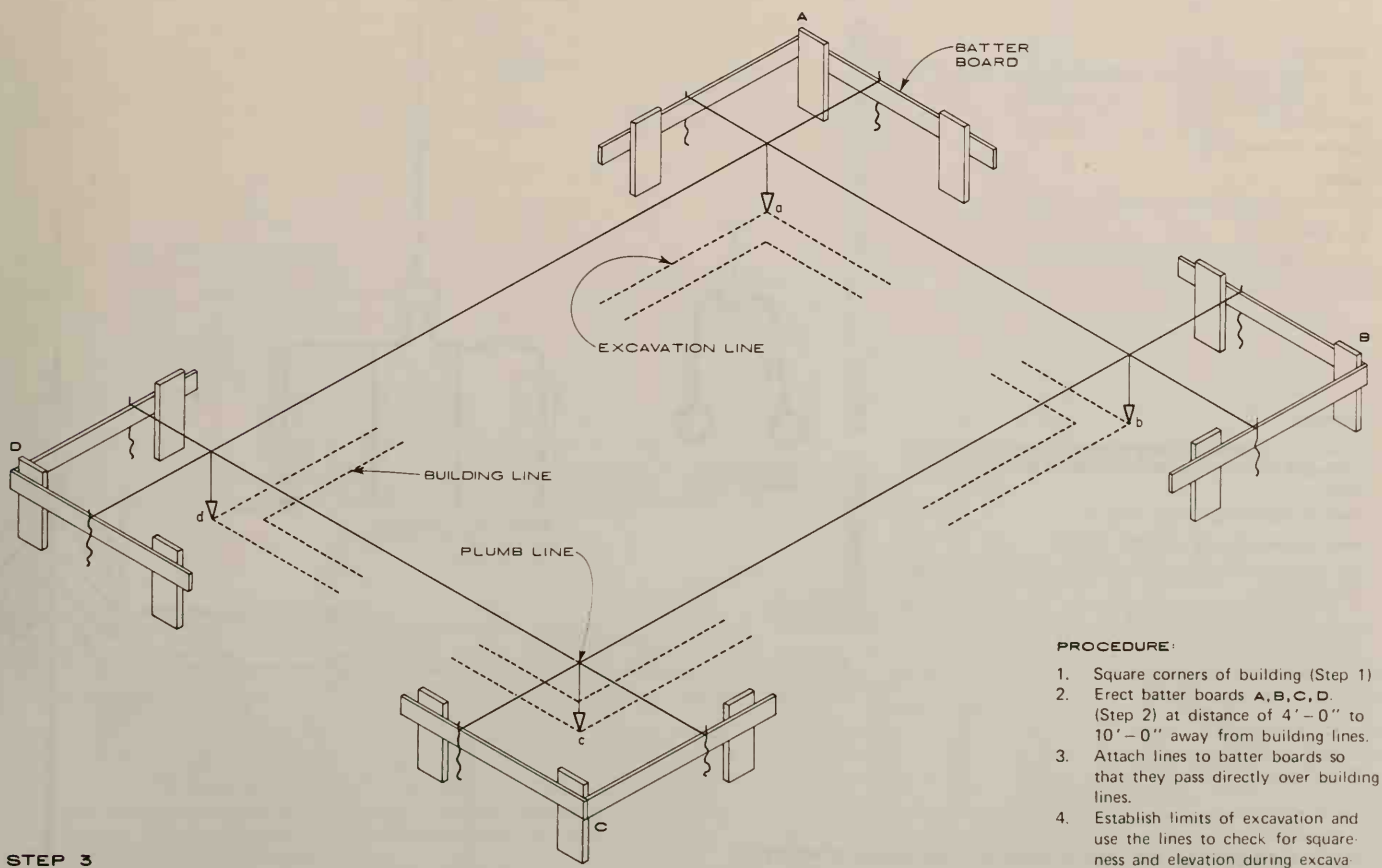
STEP 1
SQUARE BUILDING LINES WITH TAPE

1. "a" may be any corner of the building.
   "ab" may be along any side of the building.
2. See diagram.
3. See diagram.
4. Assume building is 40'–0" x 60'–0". Extend lines to full length of walls and mark corners with stakes.



STEP 2
LEVEL BATTER BOARDS

1. Construct batter board A as shown, at one corner of building.
2. Fill hose until water reaches the top of batter board A.
3. Mark level on stake B.
4. Construct batter board B to this level.
5. Repeat for other corners.



STEP 3
BUILDING LAYOUT

PROCEDURE:

1. Square corners of building (Step 1)
2. Erect batter boards A,B,C,D. (Step 2) at distance of 4'–0" to 10'–0" away from building lines.
3. Attach lines to batter boards so that they pass directly over building lines.
4. Establish limits of excavation and use the lines to check for squareness and elevation during excavation and construction.

LENGTH:

House sewer may be 50'– 0" to 100'– 0" long. Run as directly as possible. If over 300'– 0" long, place manhole at center. Longer runs are desirable.

MATERIALS:

Piping may be salt glazed clay bell and spigot, tile pipe, asbestos cement or concrete bell and spigot. If near well, or any other water supply, use cast iron.

Where trees or shrubs may cause root stoppage in clay pipe, use cast iron.

Use bituminous joints or rubber ring type joints for clay, concrete or asbestos cement pipe; use lead for cast iron pipe.

SIZE:

4" diameter for small installations; 6" is better in all cases.

GRADE:

In northern latitudes, start sewer approximately 3'– 0" below grade. In southern latitudes, sewer may start just below grade.

PITCH:

Pitch 4" sewer $^1/_4$" per foot minimum. Pitch 6" sewer $^1/_8$" per foot minimum.

LENGTH:

10'– 0" for small system, for large systems allow 40'– 0" to 50'– 0" minimum.

MATERIAL

Same as for house sewer.

SIZE:

6" unless very small system where 4" is acceptable.

PITCH:

$^1/_8$" per foot minimum. Maintain uniform pitch.

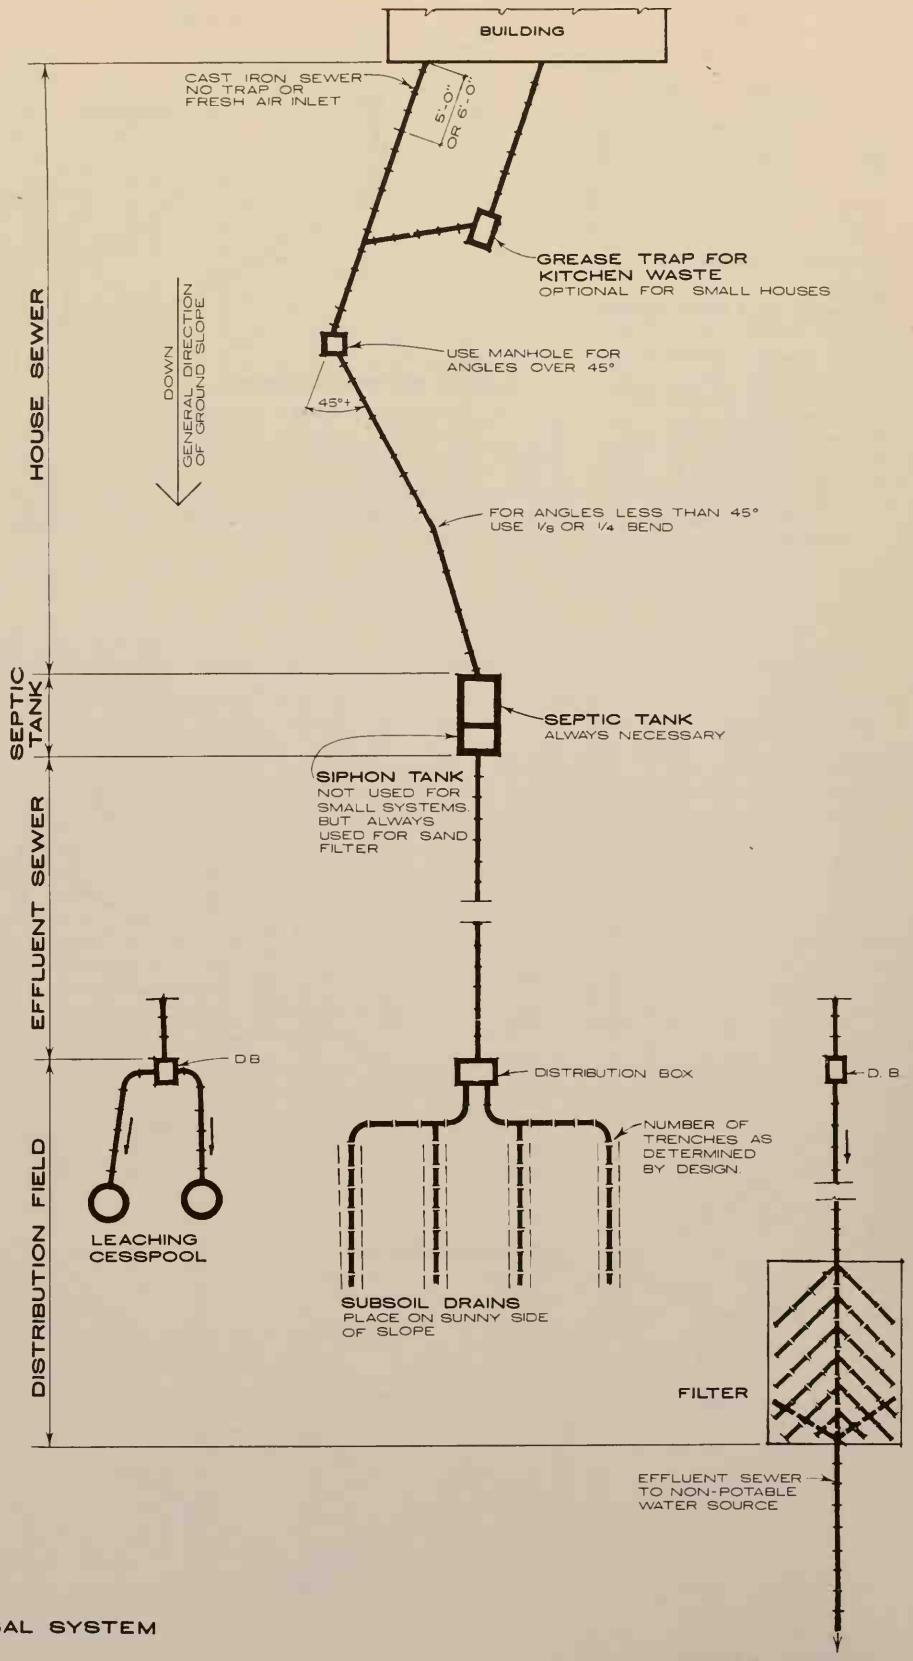
NOTES:

A distribution (absorption) field for the disposal of effluent or the filtering of effluent is required for the 3 types of disposal methods shown.

Pitch for closed joints: 5" per 100'– 0".

Pitch for open joints: 3" to 4" per 100'– 0".

For selection of disposal method, see details and tables on the following pages.



KEY DIAGRAM OF SEWAGE DISPOSAL SYSTEM

For selection of specific system of disposal see following pages.

CRITERIA FOR SELECTION OF TYPE OF DISTRIBUTION OF THE EFFLUENT

	LEACHING CESSPOOL One or more may be used as needed.	SUBSOIL DISPOSAL DRAINS Type 5.1 includes, in addition, collection tile under the distributing tile.	SAND FILTER Rectangular circular or narrow trench types. Open or closed type.
TERRAIN SLOPE OR GRADE	Applicable to any slope.	For level or slight slope.	Applicable to any slope, except filter area to be approximately level.
POROSITY OF SOIL	Soil adjacent to cesspools must be fairly porous below intake. Above may be impervious.	Top 1'–6" to 2'–0" must be fairly porous unless type 5.1 is used, and this may be used with impervious soil.	Soil may be impervious.
GROUND WATER	Water level must be at least 8'–0" below grade at cesspools. Never less than 2'–0" below bottom of cesspools.	Water level 4'–0" below bottom of trench.	Water level approximately 4'–0" below bottom of filter bed.
ORIENTATION AND LOCATION	Not important. Small area required, not less than 15'–0" from building.	If possible place field on southern slope; drains run parallel to contours. Requires large area.	Open type requires placing to leeward and away from buildings; on sunny site. Closed type requires more area than open. Small area required.
FINAL DISPOSAL OF EFFLUENT	No provision necessary.	No provision necessary, except for type 5.1 it is desirable.	Means for final disposal necessary in water course that will not pollute any potable water supply.
MAINTENANCE	Cleaned approximately every 2 years.	Cleaned only when absorbtion ceases. May be years if septic is kept in condition.	When filtering ceases remove and replace top 2".
INITIAL COST	Usually lowest cost.	More expensive than cesspools. type 5.1 is more expensive.	More expensive. Only used where other types are not possible. Open type cheaper than closed.

DESIGN OF SEWAGE DISPOSAL SYSTEMS

EXPLANATION OF TABLES BELOW

"No. of persons served" in first column refers to "Residential Work". To use tables for other types of buildings multiply this "No. of Persons Served" by the appropriate conversion factor listed in the table directly below.

TYPE OF BUILDING	GALS. OF SEWAGE PER PERSON	CONVERSION FACTORS
Residential	50	1.0 (Unity)
Camps	25	.5
Summer Cottages, small farms	40	.8
Day Schools, factories (no kitchens or showers)	15 to 25	.3 to .25
Day Schools, factories with kitchens and showers	30 to 50	.6 to .5
Institutions except hospitals	100	2.0
Hospitals	150 to 250	3.0 to 5.0

METHOD OF RELATIVE ABSORPTION DETERMINATION

Dig or bore 8" to 12" Dia. hole to a depth of 6" below bottom of proposed trench or cesspool. Presoak hole & allow to drain away. Fill hole to depth of 6" and record time it takes water to drop 1". Repeat minimum three times until 1" drop for two successive tests give approximately equal results. Last test will be stabilized absorption rate.

MINUTES REQ'D FOR WATER TO DROP 1 INCH	RELATIVE ABSORPTION	DISPOSAL METHOD RECOMMENDED
0 to 5	Rapid	Cesspool or Drains
6 to 10	Medium	Cesspool or Drains
11 to 15	Slow	Cesspool or Drains
16 to 29	Semi-impervious	Dr'ns-Collect & Filter
30 & Over	Impervious	Filter

SEPTIC AND SIPHON TANKS

NO. OF PERSONS SERVED	SEPTIC TANK					SIPHON TANK			SIPHON		CONCRETE THICKNESS		
	GALS. WORKING CAPACITY	LENGTH	WIDTH	AIR SPACE	LIQUID DEPTH	* NOT ESSENTIAL FOR THESE SIZES			SIZE	DRAWING DEPTH	WALLS	TOP	BOTTOM
						LENGTH	WIDTH	DEPTH					
1–7	750	7'–6"	3'–6"	1'–3"	4'–0"	3'–6"	3'–6"	3'–0"	3"	1'–1"	6"	4"	6"
8–10	1000	8'–0"	4'–0"	1'–3"	4'–4"	4'–0"	4'–0"	3'–0"	3"	1'–1"	6"	4"	6"
11–15	1500	9'–6"	5'–8"	1'–3"	4'–6"	4'–8"	4'–8"	3'–6"	4"	1'–5"	8"	5"	8"

Capacity of above septic tanks is based on 100 gallons flow of sewage per person for 24 hours, and is for residential work. To design tanks of larger sizes refer to local regulations. Length of tanks should be approximately twice width. Minimum depth 4'–0".

When purchasing a prefabricated septic tank, require manufacturers guarantee that the tank will treat the gals. capacity as above calculated within a 24 hour period.

If garbage destructor is used & discharges into septic tank, increase capacity for additional sludge up to 50%.

LEACHING CESSPOOL DISPOSAL

NO. OF PERSONS SERVED	FOR RAPID ABSORPTION			FOR MEDIUM ABSORPTION			FOR SLOW ABSORPTION		
	NO. OF CESS-POOLS	DIA.	DEPTH	NO. OF CESS-POOLS	DIA.	DEPTH	NO. OF CESS-POOLS	DIA.	DEPTH
1–7	1	8'-0"	8'-0"	2	6'-0"	7'-0"	2	8'-0"	7'-0"
8–10	2	6'-0"	7'-0"	2	8'-0"	7'-0"	2	8'-0"	10'-0"
11–15	2	8'-0"	8'-0"	2	10'-0"	8'-0"	3	10'-0"	8'-0"

Capacity of above cesspools based on 100 gals. flow of sewage per 24 hours, and is for residential work. Total absorptive area = Area of walls (below inlet) + area of bottom.

Total absorptive area = $2\pi R \times \text{height} + \pi R^2$

SUBSOIL DISPOSAL DRAINS — 4"

NO. OF PERSONS SERVED	LINEAL FEET ABSORPTION		
	RAPID	MED.	SLOW
1–7	160	150	195
8–10	210	200	260
11–15	320	300	390

Assuming 2' wide absorption trench for rapid absorption soil. 3' wide absorption trench bottom for medium and slow absorption soil.

SAND FILTERS

NO. OF PERSONS SERVED	AREA REQU'D IN SQ. FT.	
	OPEN	CLOSED
1–7	250	655
8–10	335	870
11–15	500	1310

These areas are based on 1.15 gal./sq.ft. per day for closed and 3 gal./sq.ft. per day for open.

HEADWALL DESIGN AS CONTROLLED BY TOPOGRAPHY

PROTECTION AGAINST TERMITES & DECAY BY SOIL POISONING (For Termite Shields see Index)

CHEMICALS AND CONCENTRATIONS

CHEMICALS	CONCENTRATIONS
Aldrin	0.5% applied in water emulsion
Benzene Hexachloride (BHC)	0.8% of gamma isomer applied in water emulsion
Chlordane	1.0% applied in water emulsion
Dieldren	0.5% applied in water emulsion
DDT	8.0% in oil solution
Heptachlor	0.5% in water emulsion

NOTES:

1. Other materials may be used provided they contain at least one of the above mentioned chemicals in the concentrations recommended.
2. Chemicals toxic to plants and animals. Should be applied by trained personnel.
3. Oil solutions shall not be used under concrete slabs or where the solution may come in contact with vapor barriers.
4. Where individual water supply systems are used well must be not less than 100 feet from treated area. Horizontal distance from treated area may be reduced to 50 feet where ground surface is effectively separated from water bearing formation by an extensive, continuous, impervious strata of clay, hardpan, rock etc.

APPLICATION - GENERAL.

Treatment shall not be made when the soil or fill is excessively wet or immediately after heavy rains, to avoid surface flow of the toxicant from application site. Surface flow of toxicants toward sources of individual water supply shall be avoided. Unless the treated areas are to be immediately covered, precautions shall be taken to prevent disturbance of the treatment by human or animal contact with the treated soil.

UNDER SLABS.

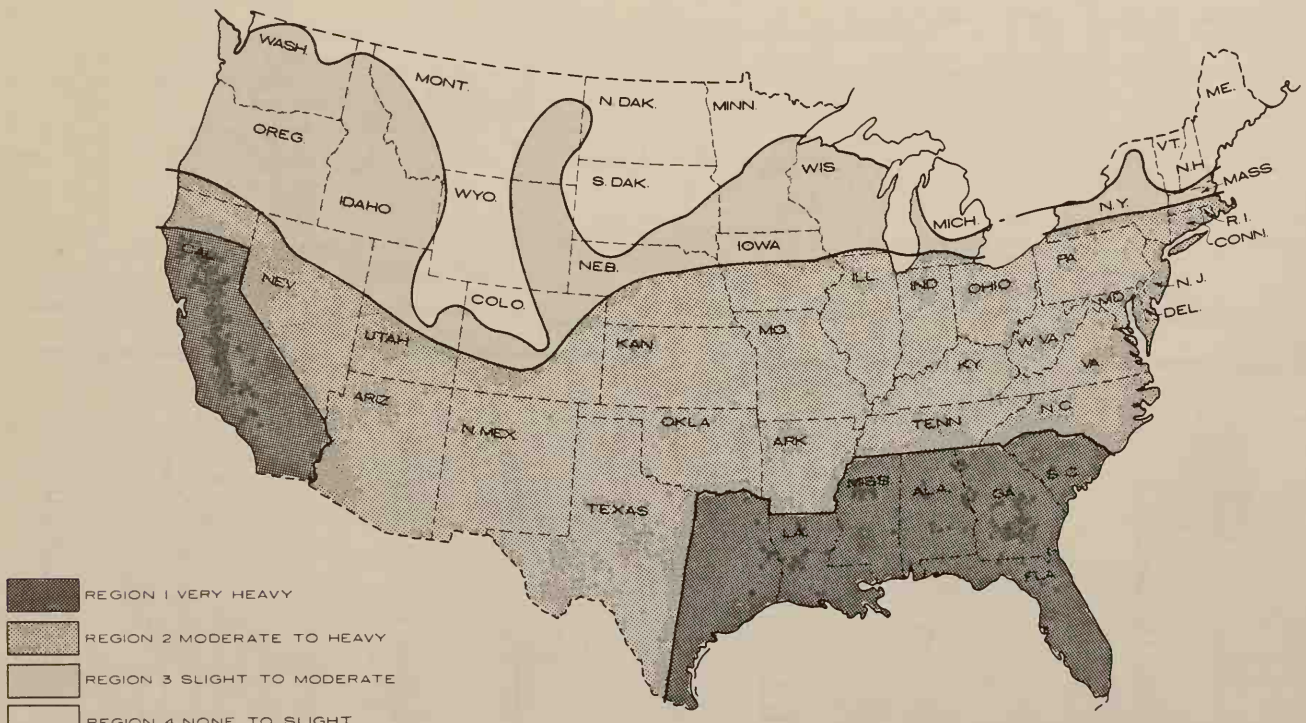
Under entire area of floor slab including porches and entrance platforms. Rate – 1 gal. per 10 sq. ft. In gravel fill of coarse material – 1 $^1/_2$ gal. per 10 sq. ft.

FOUNDATIONS.

1. Rate – 4 gal. per 10 lineal feet both sides of foundation, piers, interior foundation walls, around plumbing, etc.
   a. With concrete foundations or slab-on-grade apply to depth of one foot.
   b. With masonry foundations increase rate by multiplying by depth of foundation in feet.
2. Voids of unit masonry foundation walls and piers – 2 gal. per lineal foot to voids at bottom of foundation.
3. Application Methods:
   a. Chemical mixed with soil as it is replaced in trench – 1 ft. lifts.
   b. Chemical applied by rodding with soil injector rod inserted at 12 inch intervals – 6 inches from foundation wall. Penetration of rod to within 6 inches of top of footing. Disperse chemicals through rod under pressure according to soil type.

STANDARD SOIL CLASSIFICATION

SOIL TYPE	PRESSURE (PSI)
Granular – SW, SP, GW, GP	30 – 50
Intermediate – GM, GC, ML, SM, SC, OL, CL	50 – 150
Dense Impermeable Clays – MH, CH, OH	150 – 300



Lines defining areas approximate only. Local conditions may be more or less severe than indicated by the region classification.

GEOGRAPHIC DISTRIBUTION OF TERMITE INFESTATION

Joseph A. Wilkes, AIA; Wilkes and Faulkner; Washington, D. C.

SLOPE SITE DEVELOPMENT RELATIONSHIP

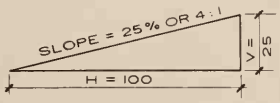
AVERAGE % GRADE	DEVELOPMENT POTENTIAL	REMARKS
0–5%	Good for building sites, parking lots, play fields, roads.	Minimum necessity for grade changing devices. Minimum excavation for development.
5–10%	Good for building sites, roads, Fair for parking lots, play fields.	Minor necessity for grade changing devices. Minor excavation for development.
10–20%	Fair for building sites & roads. Difficult for parking lots, play fields.	Moderate use of grade changing devices. Moderate excavation for development.
20–40%	Difficult for building sites & roads. Very difficult for parking lots & play fields.	Considerable use of grade changing devices. Considerable excavation for development.
40%– OVER	Conservation area or buffer zone.	Extreme use of grade changing devices. Extreme excavation for development.

NOTE: Slope site development relationships may vary with local climate, topography and soil conditions.

SLOPE TERMINOLOGY: % GRADE = $100 \frac{V}{H}$

RATIO = H : V

EXAMPLE:



SLOPE–SURFACE TREATMENT RELATIONSHIPS

SURFACE TREATMENT	MAXIMUM SLOPE	DESIRABLE MAX. SLOPE	MINIMUM SLOPE	DESIRABLE MIN. SLOPE

ZONES OF PLANT HARDINESS

Adapted from map in U. S. D. A. Publication 814

NOTE:

The zone map shows in moderate detail the expected minimum temperature of most of the horticulturally important areas of the United States. Plants are listed in the coldest zone where they will grow normally, but they can be expected to grow in warmer areas.

NOTE:

Some zones contain small pockets of other zones which because of their small scale cannot be shown on this map.

APPROXIMATE RANGE OF AVERAGE ANNUAL MINIMUM TEMPERATURES FOR EACH ZONE.

1.	−50° TO −40°	3.	−30° TO −20°	5.	−10° TO 0°	7.	10° TO 20°	9.	30° TO 40°
2.	−40° TO −30°	4.	−20° TO −10°	6.	0° TO 10°	8.	20° TO 30°		

RELATIONSHIP OF PLANT REGIONS TO URBAN AREAS

Laurence & Beatriz Coffin, Urban Planners & Landscape Architects; Washington, D. C.

PLANT REGIONS

REGION (1)	THE NORTHEAST
REGION (2)	THE SOUTHEAST
REGION (3)	THE PLAINS
REGION (4)	THE ROCKIES
REGION (5)	THE PACIFIC NORTHWEST
REGION (6)	THE PACIFIC SOUTHWEST
	AREA OF EMERGING URBANIZATION

NOTE:

Plant development is related to soil development and together are controlled by climate. The most commonly used ornamental trees and shrubs for a given area are related to the natural plant region and the hardiness zone of that area. No attempt is made here to show local conditions which would affect the selection of plant material.

PHYSICAL

CROWN: Trees increase each year in height and spread of branches by adding a new growth of twigs.

TRUNK: The tree trunk supports the crown and produces the bulk of the useful wood.

ANNUAL RINGS: Reveal age of tree by showing new growth added each year.

HEARTWOOD: This was once sapwood. It is now inactive wood giving strength and stiffness.

OUTER BARK: The outer bark protects tree from injuries.

ROOTS: The roots anchor the tree and help hold the soil against erosion.

PHYSIOLOGICAL

LEAVES: The leaves make food for the tree by combining carbon dioxide from the air and water from the soil in the presence of sunlight. Oxygen, a by-product, is released.

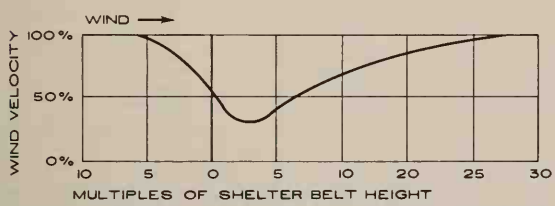
SAPWOOD: The sapwood, or xylem, carries the sap (water and nutrients) from roots to the leaves.

CAMBIUM: The cambium is a layer of cells between the bark and the wood. This is where growth in diameter occurs with the formation of annual rings of new wood inside and new bark outside.

INNER BARK: The inner bark, or phloem, carries food made in the leaves down to the branches, trunk, and roots.

ROOT HAIRS: The tiny root hairs absorb the minerals from soil moisture and send them up as nutrient salts in the sapwood to the leaves.

TREE FUNCTION



WIND RETARDATION EFFECTS:

Reduction of evaporation.

Lower temperatures in summer.

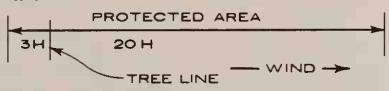
Reduce heat losses in winter.

Increase relative humidity.

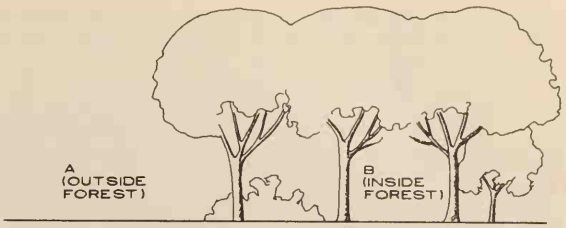
Reduce dust and snow blowing.

WIND PROTECTION:

Windward: 3 times height of trees.
Leeward: 20 times height of trees.



SHELTER BELTS–EFFECT OF TREES ON WIND



EFFECTS OF CITY GREEN-BELTS:

Observations quoted here are for temperate regions and are approximate. Greater discrepancies will occur in tropical regions. All observations will change with particular local conditions. They are only given as a working tool for the planning of urban green spaces.

AIR TEMPERATURE

A	B
90°F	75°–80°F
75°F	65°–70°F
60°F	58°–60°F
45°F	44°–48°F
30°F	29°–31°F
15°F	17°F

FLOOR TEMPERATURE

A	B
70°F	60°F
50°F	45°F
30°F	33°F
Frozen ground	Frozen depth reduced to half

LIGHT INTENSITY %

A	B
Cloudless 100%	5–50%
Cloudy 100%	15–75%

RELATIVE HUMIDITY

A	B
85%	77%
70%	75%
60%	60%

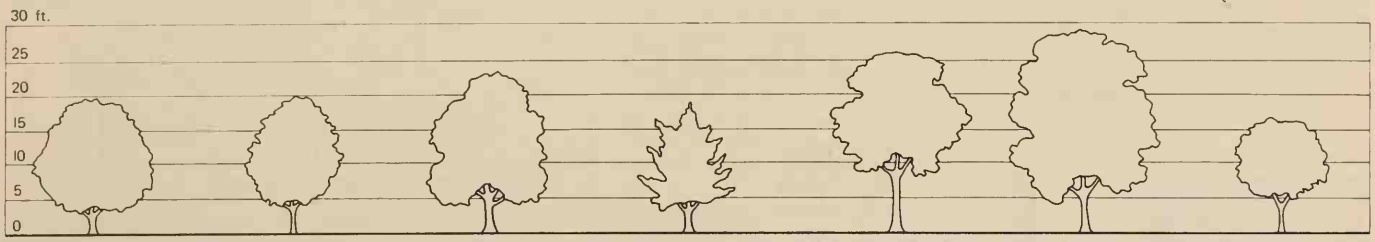
RELATIVE TEMPERATURE, HUMIDITY AND LIGHT INTENSITY OUTSIDE VS. INSIDE FOREST

TREE GROWTH AND CITY CONDITIONS

REQUIRED FACTORS FOR TREE GROWTH	AVERAGE CITY CONDITIONS IN COMPARISON WITH SURROUNDING RURAL AREA	NECESSARY CHANGES TO FOSTER TREE GROWTH IN CITIES	EFFECT OF TREES ON CITY CONDITIONS
LIGHT	Less illumination Decrease overall solar radiation		Decrease light intensity under tree canopies
AIR	More air pollution Air stagnation Formation of wind canyons	Physical control of air pollution	Purified air Dust reducing effect Wind protection
HEAT	Higher night time temperature Downtown heat islands Periodic temperature inversion		Cooling and regulatory effects
WATER	Less rainfall Lower relative humidity	Irrigation	Water conservation Relative humidity regulation
SOIL Must be capable of absorbing moisture	Ground severely compacted with poor permeability to air and water	Preparation of soil	Increase ground permeability to air and water
There must be aeration			
There must be a supply of nutrients	Soil low in organic matter	Tree feeding	Soil stability
Must be free of harmful concentration of salts	Soil affected by concentration of harmful chemicals		

Laurence & Beatriz Coffin, Urban Planners & Landscape Architects; Washington, D. C.

Silhouettes indicate specimens of natural form, but varieties or forced forms possessing compact, spreading, columnar or pyramidal characteristics are available. The height at the ten year stage of development is given as an architectural design factor to be considered in the selection of tree sizes.



Acer platanoides
NORWAY MAPLE
Zone 3
Region 1, 2, 4, 5, 6
Mature: 50' H., 40' Spr.
Street planting
Spring: Yellow
Fall: Yellow

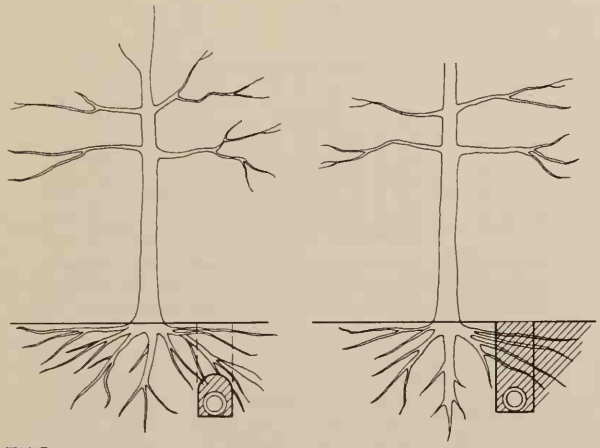
PLANTING ON STRUCTURE

NOTE: SAME DETAIL APPLIES TO LARGE PLANTERS.

PLANTING ITEM	DEPTHS		
	A	B	C
LAWNS	12"		4"
SHRUBS	24"	2"	4"
MINOR TREES	30"	2"	4"
* MAJOR TREES	36"	2"	4"

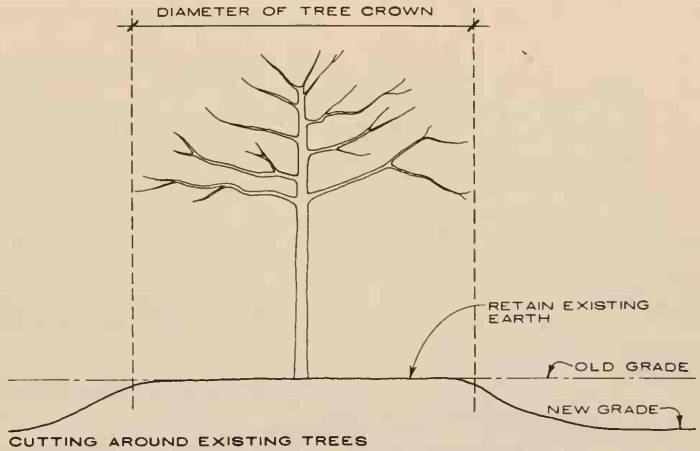
* Structural columns are usually placed directly under all major trees. Drainage to be provided within the gravel.



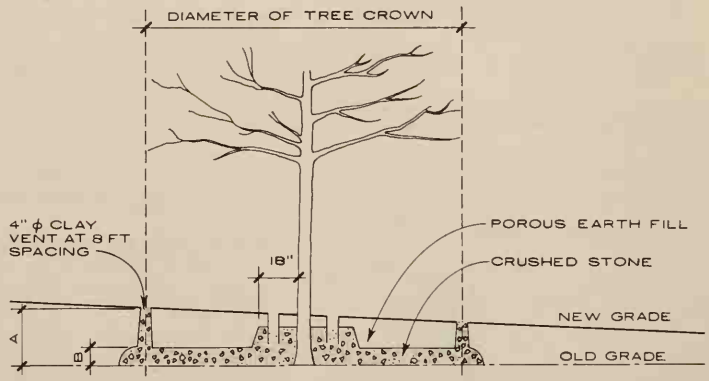
THIS NOT THIS

Fewer roots are severed by tunneling under tree than by trenching.

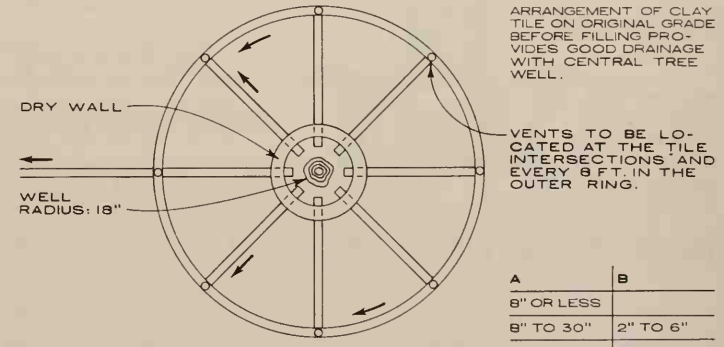
UNDERGROUND UTILITIES NEAR EXISTING TREES



CUTTING AROUND EXISTING TREES



SECTION FOR FILLS LESS THAN 30"



A	B
8" OR LESS	
8" TO 30"	2" TO 6"
30" OR MORE	8" TO 12" OR MORE

PLAN: FOR FILLS OVER 30"

FILLING AROUND EXISTING TREES

NOTES:

1. Flood plants twice within 24 hours after planting.

2. Fertilize with 2 lbs. 5-10-10 while back-filling, but not around roots.

3. Ericaceous plants to receive a surface application of aluminum sulfate @ 1/2 lb/10 sq. ft.

4. Trees for special uses should be branched or pruned naturally according to type. Where a form of growth is desired which is not in accordance with a natural growth habit, this form should be specified, such as:

BUSH FORM – trees which start to branch close to the ground in the manner of a shrub.

CLUMPS – trees with three or more main stems starting from the ground.

CUT BACK OR SHEARED – trees that have been pruned back so as to multiply the branching structure and to develop a more formal effect.

TOPIARY – trees sheared or trimmed closely in a formal geometric pattern.

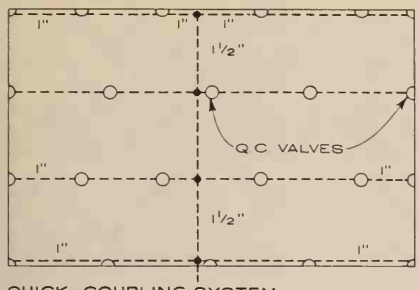
TOP-WORKED TREES – the height of stem and age of top should be specified.

5. Trees suitable for planting as street trees should be free of branches within the lower 60% of their height. Height of branching should bear a relationship to the size and kind of tree also, so that the crown of the tree will be in good balance with the trunk as the tree grows.

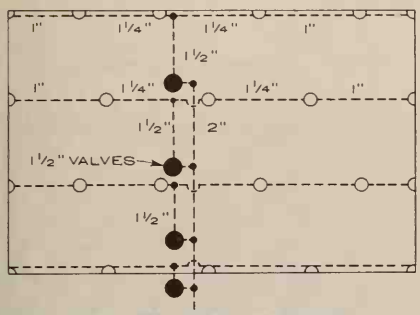
6. Container or pot grown plants should be grown in their containers sufficiently long for the new fibrous roots to have developed so that the root mat will retain its shape and hold together when removed from the container or pot.

(Notes and charts on sizes obtained from the American Association of Nurserymen, Inc.)

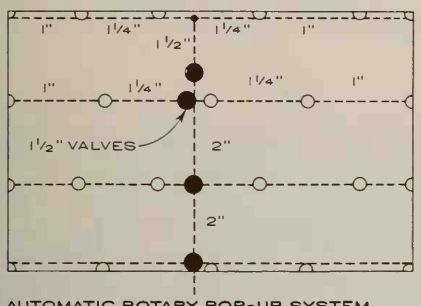
Laurence & Beatriz Coffin, Urban Planners & Landscape Architects; Washington, D. C.



QUICK-COUPLING SYSTEM
UNIT COST 1.0



MANUAL ROTARY POP-UP SYSTEM
UNIT COST 1.45



AUTOMATIC ROTARY POP-UP SYSTEM
UNIT COST 1.81

TYPICAL LAYOUTS - AREA 1.15 ACRES

GENERAL NOTES:

DESIGN FACTORS

a. Size of the supply line; b. length of supply line; c. available water pressure. These factors will govern the type of system, type of heads and pipe size to be used.

TYPES OF CONTROL

Quick coupler: this system is normally under pressure, and key is inserted where water is needed.

Manual: this system is turned on by use of a valve; all heads are in place.

Automatic: this system is operated from a central control unit. Each section is turned on for a period each day or on certain days of the week as pre-set. There are two basic types, Hydraulic or Electric, the latter being more common. The control valves are located at remote locations with control lines from the valves to the control unit. Control lines are buried with the pipe. This type of system not only cuts labor cost in operation but also pipe cost. The additional cost of this system will be paid for in about 3 to 5 years on the West Coast.

NOTE: Provide pipe sleeves under walks and thru walls for future controls and extension of system.

John Barclay; Seibert, Hunter, Shute & Plumley; Medford, Oregon

PAVEMENT THICKNESS FOR FEEDER STREETS, PARKING LOTS & DRIVEWAYS FOR TRUCKS

SUBGRADE	FULL DEPTH ASPHALTIC CONCRETE		COMBINATION – ASPHALTIC CONC. & GRANULAR BASE		
	Surface Course (Min.)	Base Course	Asphaltic Concrete		Granular Base Course
GOOD TO EXCELLENT	1 1/2"	3 1/2"	Surface Course (min.)	Base Course	
MEDIUM	1 1/2"	5 1/2"	1 1/2"	3"	5"
POOR	1 1/2"	7 1/2"	1 1/2"	3"	9" (See Note //4)

NOTE :

1. Excellent subgrade soils unaffected by moisture of frost include well-graded clean sharp sands and gravels. Good subgrade soils retain a substantial amount of load supporting capacity when wet. They include clean sands and sand gravels and soils free of detrimental amounts of plastic materials.

2. Medium subgrade soils (loams, silty sands and sand-gravels containing moderate amounts of clay and fine silts) retain a moderate degree of firmness under adverse moisture conditions.

3. Poor subgrade soils (those having appreciable amounts of clay and fine silt which becomes soft and plastic when wet and coarser silts and sandy loam) are frost susceptible.

4. On poor subgrade place 2 inches of coarse sand or stone screenings between subgrade and base to prevent intrusion of fine subgrade material into the base course.

5. Asphaltic pavements are particularly susceptible to failure if surface or subsurface drainage is inadequate. Slope surfaces at least 1/8" per foot toward properly sized inlets or ditches. Poor and medium subgrades often require underdrains properly spaced with carefully graded aggregate filters.

6. Thicknesses and pavement designs other than those shown in the tables may be required in some areas. Good asphaltic pavement design considers material availability, stability of mix designs, quality of aggregates, weights and frequency of wheel loads, temperatures and other factors.

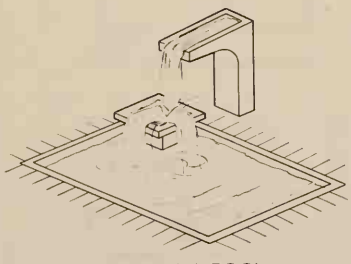
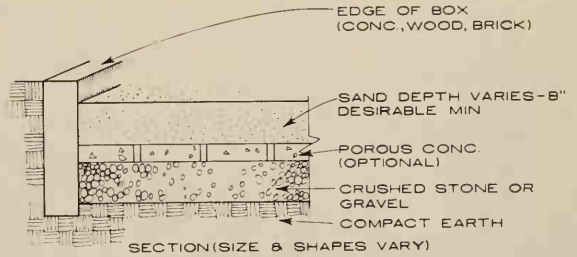
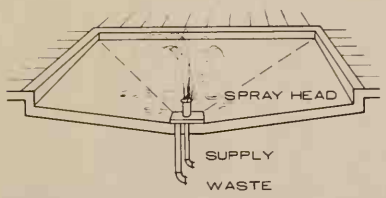
FILLED POOL



SCULPTURAL PLAY POOL



SANDBOX (GENERAL)



SPRAY POOL

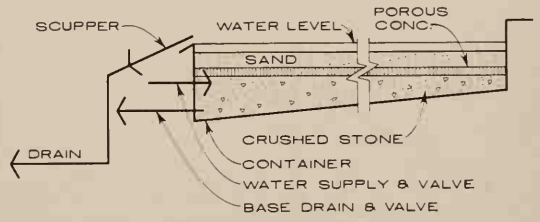
NOTES:

A. Filled & Play Pools requirements:
1. maximum depth of 24"
2. filtered and chlorinated water from recirculating system
3. maximum turn-over cycle every 4 hrs. by use of recirculating system.

B. Spray Pool (general)
No water is allowed to stand but is drained away without the use of a recirculating system.

Standards of sanitation in water treatment, circulation, etc., should be equal to those for swimming pools.

WADING POOLS



DIAGRAMATIC SECTION

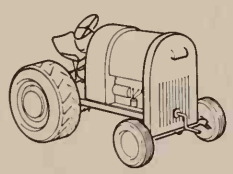
WATER WASHED SANDBOX

SANDBOXES

Water is forced up through the sand, soaking it and causing impurities to be floated away along the top to the scupper and drain.

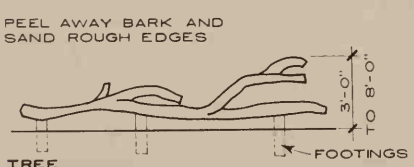
UNUSABLE ARTIFACTS

Many items unusual to the standard playground equipment line have a natural appeal to children. Items such as old cars, boats, carts, trees, logs, etc. When used discreetly and properly conditioned become a new source of playground equipment.

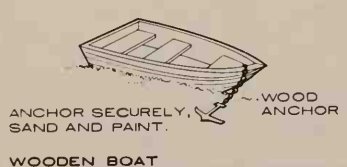


TRACTOR

1. remove all glass
2. weld all moving parts except crank and steering
3. strip all sharp objects
4. paint and secure to foundation



TREE



WOODEN BOAT

HEIGHTS OF FENCES FOR VARIOUS USES

SCALE: 1/8"=1'-0"

See note at middle right for depth of concrete bases.

MATERIALS: (Sizes given are not standard but represent the average sizes used)

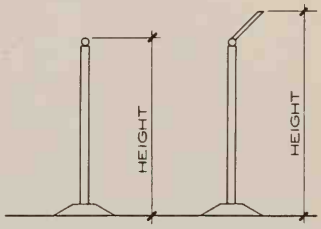
WIRE GUAGE:	Usually No. 11 or No. 9 W & M. For specially rugged use use No. 6. For tennis courts usually No. 11.
WIRE MESH:	Usually 2". For tennis courts usually 1 5/8" or 1 3/4" of chain link steel hot dip galvanized after weaving. Top and bottom salvage may be barbed or knuckled.
CORNER & END POSTS:	For lawn fences usually 2" O.D. For estate fences 2" for low and 2 1/2" for medium and 3" O.D. for heavy or high. For tennis courts 3" O.D.
LINE OR INTER-MEDIATE POSTS:	For lawn 1 3/8" or 2" O.D. round. For estate etc. 2", 2 1/4", 2 1/2" H or I sections. For tennis courts 2 1/2" round O.D. or 2 1/4" H or I sections.
GATE POSTS:	The same or next size larger than the corner posts. Footings for gate posts 3'–6" deep.
TOP RAILS:	1 5/8" O.D. except some lawn fence may be 1 3/8" O.D.
MIDDLE RAILS:	On 12'–0" fence same as top rail.
GATES:	Single or double any width desired.
POST SPACING:	Line posts 10'–0" O.C., 8'–0" O.C. may be used on heavy construction.

O.D. = Outside Diameter

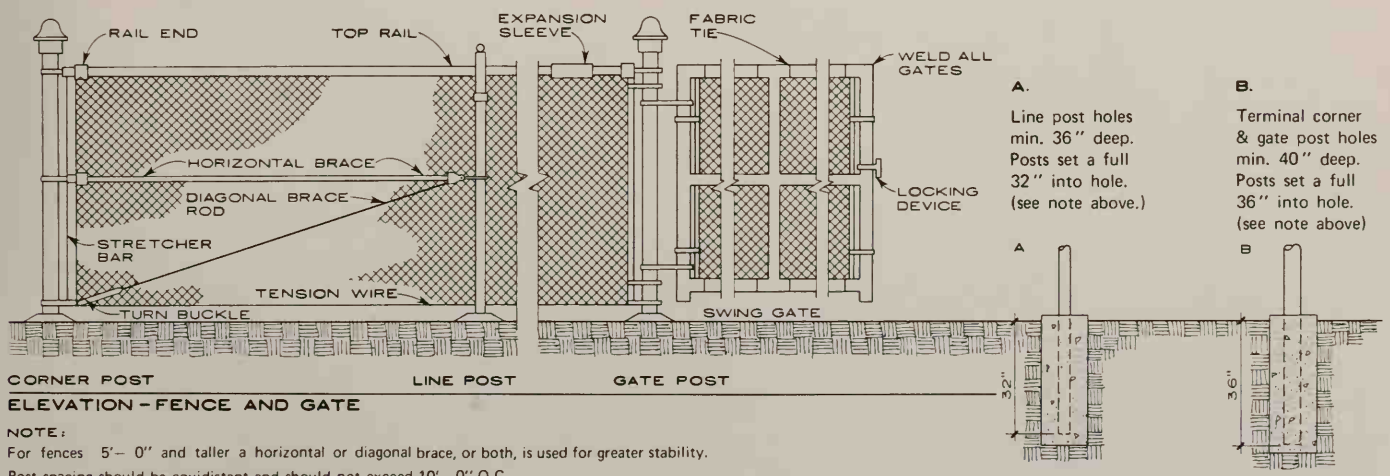
NOTE:

Bottom of concrete base to be set below frost line. (see local code). Concrete base sizes shown are recommended minimum and should be redesigned for conditions where soil is poor.

A.S.A. SCHEDULE 40 PIPE SIZES	SWING GATE OPENINGS	
	SINGLE GATE	DOUBLE GATE
2 1/2"	to 6'–0"	up to 12'–0"
3 1/2"	over 6' to 18'	over 12' to 26'
6"	over 13' to 18'	over 26' to 36'
8"	over 18' to 32'	over 36' to 64'



FENCE HEIGHT IS TO TOP OF POST OR TO TOP STRAND OF BARBED WIRE



ELEVATION - FENCE AND GATE

A.

Line post holes min. 36" deep. Posts set a full 32" into hole. (see note above.)

B.

Terminal corner & gate post holes min. 40" deep. Posts set a full 36" into hole. (see note above)

NOTE:

For fences 5'– 0" and taller a horizontal or diagonal brace, or both, is used for greater stability.

Post spacing should be equidistant and should not exceed 10'– 0" O.C.

Charles Driesen; Ewing Cole Erdman & Eubank; Philadelphia, Pennsylvania

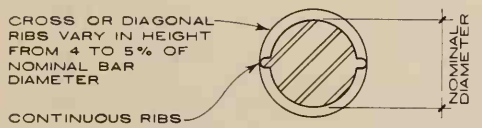
NOTE:
Bar sizes #14 and #18 are generally not carried as local warehouse stock items.



CROSS SECTION OF REINFORCING BAR

COMMON STYLES OF WELDED WIRE FABRIC – TWO WAY TYPE –

STYLE DESIGNATION	SECTIONAL AREA WEIGHT LONGITUDINAL	TRANSVERSE	LBS. PER 100 SQ.FT.
2 x 2 – 14/14	.030	.030	21
2 x 2 – 16/16	.018	.018	13
4 x 4 – 4/4	.120	.120	85
4 x 4 – 6/6	.087	.087	62
4 x 4 – 8/8	.062	.062	44
4 x 4 – 10/10	.043	.043	31
6 x 6 – 4/4	.080	.080	58
6 x 6 – 6/6	.058	.058	42
6 x 6 – 8/8	.041	.041	30
6 x 6 – 10/10	.029	.029	21

NOTE:
Style designation – First two numbers indicate longitudinal and tranverse wire spacing in inches and the later two, A.S. & W. wire gauge. The above commonly warehoused styles are furnished in (5) ft. wide by (150) ft. long smooth wire rolls; however 11 ga. fabric is furnished galvanized only.

Economic use of welded wire fabric in sheets or rolls in lieu of reinforcing varies from three tons for light weight fabric to fifteen tons for heavy weight fabric. On large jobs fabric can be made with deformed or galvanized wire, and with varying wire size and spacing.

NOTE
REBAR = REINFORCING BAR

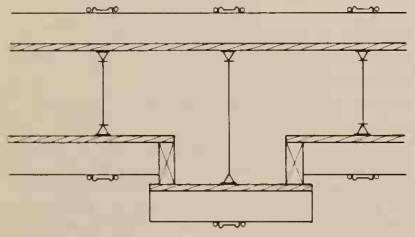
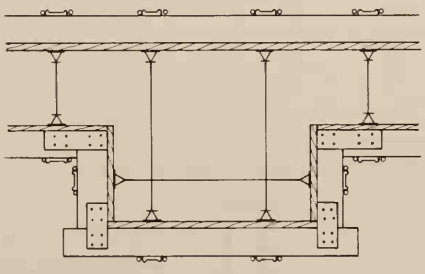
WALL FORMS

NOTE:

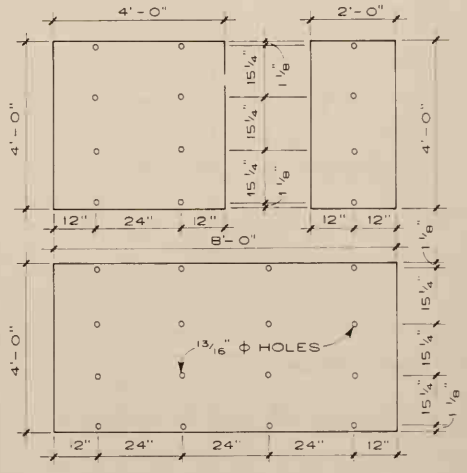
Forms can be ganged by the use of 4 X 4's lag bolted to walers in place of 2 X 4 strongbacks. Metal lifting straps bolted to the tops of the strongbacks use special vertical angle to butt forms.



PLAN OF SMALL PILASTER



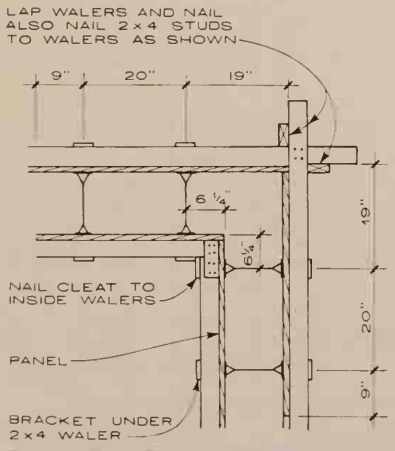
PLAN OF LARGE PILASTER



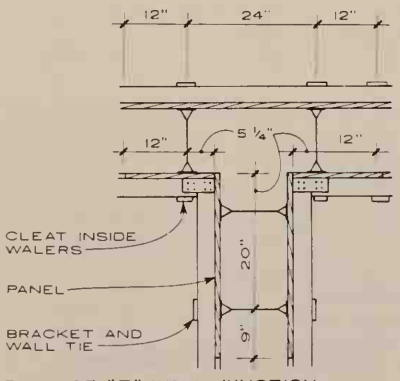
TYPICAL PANEL LAYOUT

NOTE:

Various types of steel edged with backing bar panels that interlock are also on the market with plywood faces from 3/4" to 1 1/2" thick attached to the metal frames.



PLAN OF TYPICAL CORNER FOR 12" WALL



PLAN OF "T" WALL JUNCTION FOR 12" WALL

FORM DESIGN NOTES:

Pressure depends on rate of pour—feet per hour and concrete temperature °F. Vibration of concrete is also a factor in form pressure.

Provide clean-out doors at bottom of wall forms.

Various types of form ties are on the market. Some are not suitable for architectural concrete work, i.e. can not be withdrawn from the concrete.

Various plastic cones of 1 1/2" diameter and 1/2" deep can be used and the holes are left ungrouted to form a type of architectural feature.

Consult manufacturers catalogs for form design and tie strength information.

GENERAL INFORMATION ON TYPES ON CONSTRUCTION:

1. A one way slab system is suitable for heavy loads on spans up to about 15 feet.

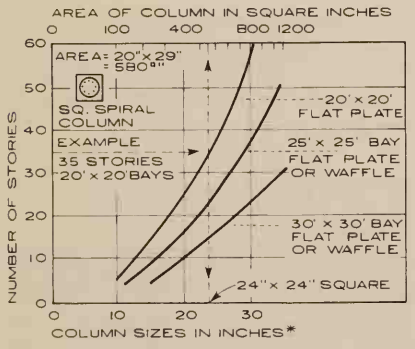
2. Pan-joist floors are economical for light loads on fairly long spans. In place of the metal or plastic pans. Paper tubes may also be used to reduce dead weight.

3. Two-way solid slabs are economical for medium to heavy loads on spans up to about 30 feet. They are justified when the ratio of long to short side of slab panel is 2 to 1 or less. Metal or plastic pans or "domes" may be used to reduce dead weight.

4. Flat slabs are girderless floor systems having drop panels and column capitals. They are well suited to carry either heavy or light loads as well as large concentrated loads, the drop panels providing the necessary increase in cross sectional area and depth to resist negative moments and shears.

5. Flat plates are girderless floor systems without drop panels or column capitals. Shear is an important consideration and in many cases special shearhead reinforcement has to be provided (two types are shown below). Domes may be used to reduce dead weight producing essentially a two-way joist system commonly referred to as a "waffle slab".

6. For the various floor systems shown the Architect can determine rather quickly which system of framing most economically suits a column spacing and superimposed loading. The graphs shown are based on designs for the dead weights of the floor systems plus the indicated superimposed loads.



PRELIMINARY SIZES OF REINFORCED CONCRETE COLUMNS

FORMULA :

The area of any column in square inches for any story is:

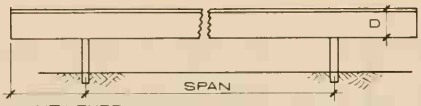
$$A = \frac{N(W_D + 1/2\ W_L)B}{k}$$

A = column area in square inches
N = number of stories above
$W_D + W_L$ = dead and live loads (psf)
B = bay area (sq. ft.)
For 8% reinforcement + f'_c = 5,000 psi.
k = 3,650 for f_y = 75,000 psi.
k = 3,170 for f_y = 60,000 psi.

NOTE: The above equation and graph are based on Working Stress Design (ACI 318-63)

*Columns are square with 8% reinforcement f'_c = 5,000 psi, f_y = 75,000 psi and moment is negligible. In addition to the dead load of the structure, graph takes into account 35 psf for partitions, mechanical and ceiling. Assumed live load is 60 psf.

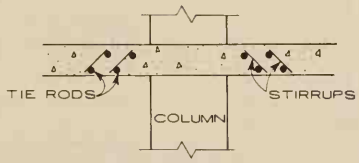
Jack A. Clark; Baume and Polivnick; Denver, Colorado
Frank Strasburger, C. E.; Strasburger & Soto; Washington, D. C.



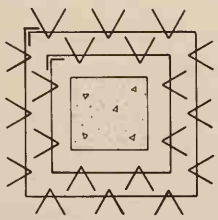
CROSS SECTION
FOLDED PLATED

Sufficient cantilever can help to counterbalance the span. The usual span to depth ratio varies from 1:10 to 1:15. Example: If span is 40' long, the usual minimum depth is about 40/10 or 4'.

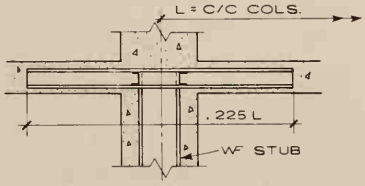
FORMULA :
Volume of concrete in Cu.Yds/Sq.Ft = th/324a.
h = ft. t = in. a = ft.



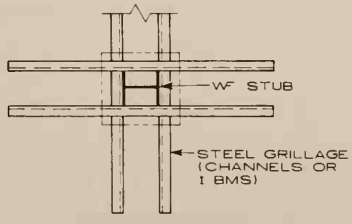
SECTION - BASKET TYPE



PLAN - BASKET TYPE



SECTION - STEEL GRILLAGE TYPE



PLAN - STEEL GRILLAGE TYPE

TWO TYPES OF SHEARHEADS USED IN FLAT PLATE CONSTRUCTION

The steel grillage shearhead is usually made up of pairs of channels or I beams as shown. In the case of concrete columns this grillage is welded to a Wide Flange stub four to five feet long and embedded in the column. In the case of steel columns the grillage is welded to the column directly.

A distinct advantage of the steel grillage shearhead over the "basket" of stirrups shown is that it will allow openings in the slab adjacent to the columns. The width of these openings depends on the distance between grillage members i.e. the stub or column size. Intermediate exterior columns have three-quarter grillages and corner columns have half grillages.

GENERAL INFORMATION ON VARIOUS CONCRETE SHELL ELEMENTS

1. Domes are especially suitable for structures where spans are long and column-free space is required. Because strength is inherent in the shape, shell roofs are being designed with thicknesses as little as 2 1/2 inches.

2. The Hyperbolic Paraboloid shell roof is, in effect a three-dimensional "sheet" of concrete in which strength and rigidity are accomplished not by increasing the thickness of the sheet but by curving in space. Despite its double curvature, the shape can be formed entirely of straight pieces. Hyperbolic-Parabolids are exceptionally adaptable to churches, auditoriums and theatres.

3. Folded Plates (F/P's) are a form of shell roof with tremendous span and load-carrying abilities. They are being used more and more to provide great areas of column free space for industrial construction. Because of their ability to cantilever, they are also used in the design of schools, stores, and hangars.

4. Long Barrel Shells as opposed to short barrel shells have a small chord compared to span. To achieve full shell action support is required along the total periphery of each barrel. In practice this support along the straight edges are never fully restrained so that some bending moments in the shell have to be considered in the design. The support or stiffener along the curved edges usually consist of arch-type ribs spanning between the supporting columns. Since cantilevers are easily achieved the visible shell edge can be made as thin as the basic shell.

5. Inverted Umbrellas are hyperbolic paraboloid shells supported by single columns. Since walls are not load bearing they can be located where desired providing for great versatility of the interior space arrangement.

NOTES:

With the exception of the four joists (Types W, X, Y, and Z) all the elements shown are prestressed and of hardrock concrete. Lightweight units are also available. To avoid needless repetition types have been indicated on table at the maximum span only for the superimposed load columns.

Since roof elements are usually used without the 3,000 p.s.i. structural topping slab the types having the topping have been omitted in the last column of the table.

When used for floor construction, topping is required to adjust for unevenness and camber in types shown.

Draped post-tension tendons pre-compress concrete to provide resistance to tensile stresses produced by flexual bending due to dead + live loads on flocr. Maximum tendon spacing should not exceed 8 times slab thickness (t).

Practical solid slab thickness 6" min. to about 10" max. without drop panels. For long spans cast-in place (not lift slabs) haunched slabs or drop panels may be used. Hollow slabs or waffle slabs can also be used to reduce dead load on long spans.

RECOMMENDED SPAN/DEPTH RATIO

FLOORS	42
ROOF	48

Check deflections, camber, and vibration.

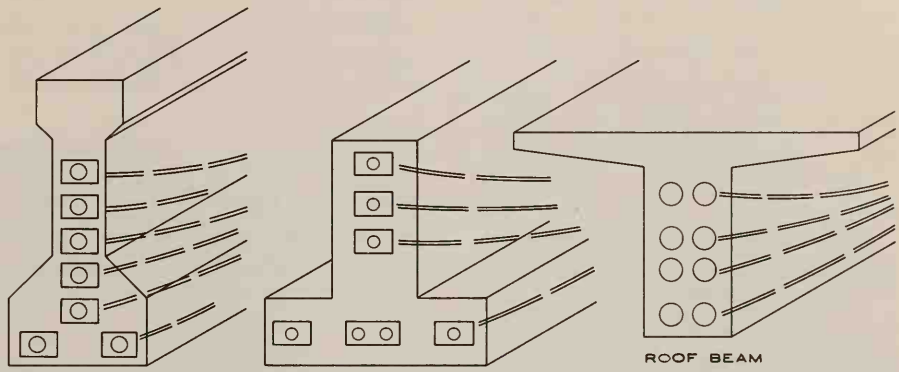
GENERAL CONSIDERATIONS :

1. Concrete strength usually 4000 p.s.i. at 28 days and at least 3000 p.s.i. at time prestressing. Hardrock aggregate or lightweight concrete used. Low slump controlled mix is required to reduce shrinkage. Shrinkage after prestressing increases prestress losses.

2. Steel usually 240,000 p.s.i. to 270,000 p.s.i. minimum strength. Size should be small enough to permit proper curvature and accurate positioning in slab.

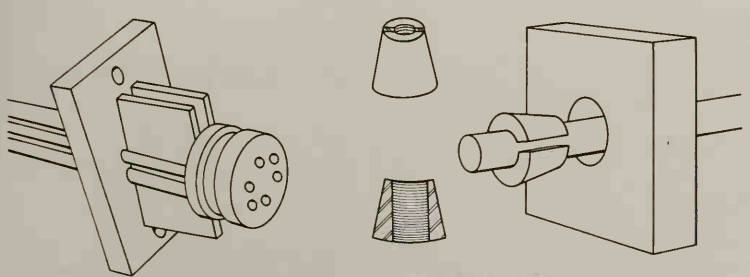
3. Tendons greased and wrapped or placed in smooth conduits to reduce frictional losses during stressing operations. Length of continuous tendons limited to about 100 feet if stressed from one end. Long tendons require simultaneous stressing from both ends to reduce friction losses. Tendons may be grouted after stressing or left un-bonded. Ultimate strength must be checked.

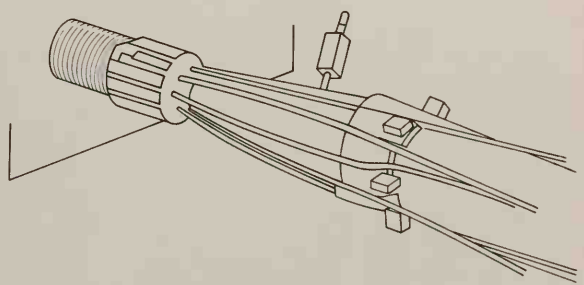
4. Minimum average prestress (Net prestress force/area of concrete) = 150 p.s.i. to 250 p.s.i. minimum average prestress required. Maximum average prestress usually 500 p.s.i. to avoid excessive creep losses.



NOTE:

Post-tensioned beams and girders are prestressed by jacking tendons against the member itself. Permits casting at site for members too large or heavy for transporting from factory to site.





NOTE:

Two-way post tensioned flat slabs average about 1 lb. of prestressing wire or strand per square foot for 24' to 28' bays. Additionally: at ordinary reinforcing steel runs about 0.5 lbs. per square foot.

Jack A. Clark; Baume and Polivnick; Denver, Colorado
Wright & Mok; Consulting Engineers; Silver Spring, Maryland

LIFT-SLAB CONSTRUCTION

GENERAL NOTES :

The lift slab method of construction basically consists of casting the reinforced concrete floor and roof slabs one on top of the other at or near ground level and, after curing, lifting to their final position by hydraulic jacks. By constructing in this manner, practically all of the structural work and a large portion of the electrical and mechanical work can be done within a few feet of the ground, thus facilitating the placement of materials and reducing the amount of labor required to perform these operations. The above applies to the following lift-shapes:

1. Space Frames (Steel or conc.)
2. Flat Slabs (Reinf. conc. postensioned, prestressed)
3. Vaults
4. Domes
5. Any structure for which in-place forming or erection is expensive or has disadvantages.

LIFT-SLAB RESTRICTIONS

1. Uniform slab thickness required.
2. Cantilevers required.
3. Columns should be located as uniformly as possible.
4. Openings must be located away from shear zone.

LIFT-SLAB ADVANTAGES

1. Forms: only slab edge and other minor forming required, most of it done at ground level.
2. Steel: reinforcing steel, postensioned, placed at ground level, no hoisting.
3. Concrete: placed at ground level, no hoisting.
4. Ceiling Treatment: no joint marks, grain markings or other blemishes to be removed by rubbing and cleaning.
5. Materials: use slabs as elevators to raise materials.
6. Electrical and Mechanical: sleeves for all floors can be set at one time.
7. Inclement Weather Protection: early erection of all slabs in any one section provides roof protection.

LIFTING METHOD (GENERAL)

Hydraulic jacks, especially designed for lift-slab construction, are placed on top of each column, ready to lift the slabs as soon as they attain required strength. Lifting rods are then connected to the steel lifting collars which are, by this time, a permanent part of the slab, occasionally two or more slabs are lifted at one time.

LIFTING COLLARS

One for each slab to be lifted, are stacked one atop another around each column at the time the columns are erected. They are made of steel and have fittings to which the lifting rods of each jack are connected.

LIFT SHAPE (GENERAL)

The concept involves the development of a structural steel skeleton in such a way that it can be fabricated on a flat plane, then lifted and "sprung" into final position for a spray coating of concrete or other material. The lift shape process is basically a technique of construction. While the lift shape technique involves a logical system of thrust and counterthrust, the structural analysis itself is not significantly different than for more conventional methods of designing thin shell concrete.

TILT-UP CONSTRUCTION

GENERAL NOTES :

Tilt up construction is a special form of precast concrete construction. Walls are cast on the site in a horizontal position, tilted to the vertical position, set in place and made an integral part of the completed structure. There are a great many different ways of designing and erecting such structures, particularly as to the details. Each designer and builder has his own methods and details which he is constantly trying to improve. It will be advantageous for the designer to consult with possible contractors before the design and construction details are definitely established. He should at least consider the personnel and equipment available in the area. Even small changes in design or construction procedure may result in appreciable saving in time and money as well as providing a better structure.

ADVANTAGES

Tilt up is adaptable to a wide range of uses and architectural effects. It has been used for many types of structures from private homes and garages to multi-story office buildings, although by far its greatest use has been for one story industrial and commercial buildings. Construction time is relatively short with this method.

DESIGN

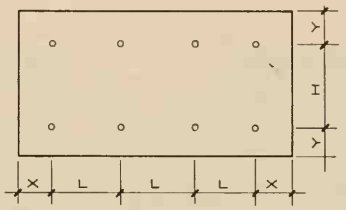
Wall panels must be designed for the conditions to which they will be subjected in the completed structure and during erection. The general design of the building will determine whether the walls are load-bearing or non-load bearing with a continuous footing or supported on the column footings only. The design for these conditions after the walls of reinforced concrete built in the conventional manner, the only difference will be in details.

LIFTING STRESSES

Tilting a wall panel creates stresses not encountered in conventional cast-in place construction and with some pick-up arrangements an exact analysis may be rather involved. The method of attaching the lifting equipment must be known in order to determine the stresses. If the attachment is to a stiff channel or angle bolted to the top edge of the panel, the latter will be designed as a simply supported slab.

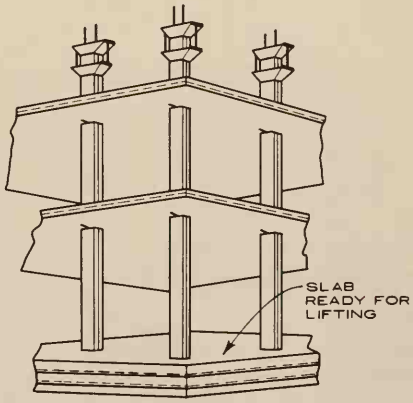
LOADS

The total load to be used in computing erection stresses must be assumed. In addition to the dead load of the slab, there is some resistance to the initial movement, the amount depending on the type of bond prevention material, surface condition of the floor, moisture condition lifting speed and possibly other factors. Experience indicates that where care is taken to prevent bond between the panel and floor, the initial resistance to movement is only slightly greater than that due to the weight of the slab.



BEST RESULTS OCCUR WHEN CANTILEVERS ARE PROPORTIONED AS FOLLOWS:
Y = 25% H MIN; 40% H MAX.
X = 25% L MIN; 40% L MAX.

PLAN OF LIFT-SLAB



SCHEMATIC ISOMETRIC OF LIFT-SLAB METHOD

NOTE :

RECOMMENDED THICKNESSES:

Panels using up to 1 1/2" maximum size aggregate:

THICKNESS OF PANEL	MAXIMUM LENGTH
2"	6'– 0"
2 1/2"	8'– 0"
3"	10'– 0"
3 1/2"	13'– 0"
4"	15'– 0"
4 1/2"	18'– 0"
5"	23'– 0"
5 1/2"	25'– 0"
6"	27'– 0"
6 1/2"	30'– 0"
7"	35'– 0"
7 1/2"	38'– 0"
8"	40'– 0"

NOTE:

If maximum 1 1/2" aggregate is used minimum thickness should be 2 1/2", preferably 3".

POSSIBLE FINISHES

Panels can be made in an infinite variety of finishes and colors depending on the type and size of aggregate and matrix color chosen by the architect. Some of the most common are: Rough Exposed Aggregate; Honed; Polished; Smooth; Stippled; and Brushed. The designer may also choose to design a sculptered pattern or to have signs cast into panel.

ECONOMY

For a more economical job the designer should pick a width and height of unit that can be transported, handled and erected with a minimum of labor and maximum re-use of the unit form. Odd size units should, if at all possible, come from a portion of the typical unit so they may be cast from the typical units mold. Be sure to consult with your local manufacturer to ascertain his limitations, total economy, in your area and recommendations for your panel.

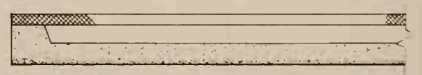
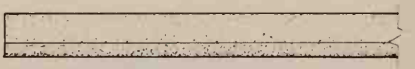
REVEAL JOINTS



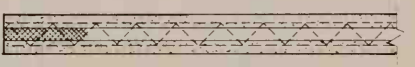
SOLID INSULATION BOARD

Solid insulation board surface applied to back of panel provides good values at reasonable cost.



CELLULAR CONCRETE

Cellular concrete has fair insulation values but requires greater thickness of the wall section.



FOAM PLASTIC CORE

Foam plastic core has fair insulation values. Used for double faced walls finished both sides. It is more expensive and requires greater handling control.

INSULATION METHODS

Jack A. Clark; Baume and Polivnick, Denver, Colorado

CONCRETE SURFACES – GENERAL

Architectural finishes are as varied and possible as the cost and effort expended to achieve them. There are three basic ways to improve or change the appearance of concrete:
1. By varying the materials, i.e. using a colored matrix and exposed aggregates.
2. Changing the mold or form by such means as a form liner.
3. By treating or tooling the concrete in the final stages of hardening by sandblasting or bush hammering.

The aim is to develop and secure maximum benefit from one of three features—color, texture and pattern—all of which are inter-related. Color is the easiest method of changing the appearance of concrete. It should not be used on a plain concrete surface with a series of panels since color matches are difficult to achieve. The exception is possible when white cement is used, usually as a base for the pigment to help reduce changes of color variation. Since white cement is expensive, many effects are tried with grey cement to avoid an entire plain surface. Colored concrete is most effective when it is used with an exposed aggregate finish.

VARYING MATERIALS AND EXPOSING SURFACES

1. Brushing surface about 18 hours after casting is least expensive method.
2. Washing and brushing surface sprayed with retarder 12 to 24 hours after casting.
3. Glue bed aggregate transfer method is used to face panels with expensive aggregates and varied textures by gluing the aggregate to a liner.
4. Sand bed aggregate transfer method is used to face panels with larger stones.
5. Hand-pressign aggregate after casting. Thismethod along with the sand aggregate method is used to double face panels.
5. Hand-pressing aggregate after casting. This method

FORM LINERS (PRESENTLY USED)

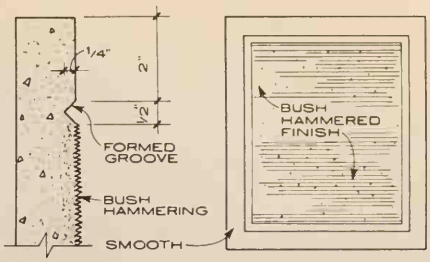
1. Sandblasted Douglas Fir or Long Leaf Yellow Pine dressed one side away from the concrete surface.
2. Flexible steel strip formwork adapted to curved surfaces (Schwellmer System).
3. Resin-coated, striated, or sandblasted plywood.
4. Rubber mats.
5. Thermoplastic sheets with high glass or texture laid over stone etc.
6. Formed plastics.
7. Plaster-of-paris molds for sculptured work.
8. Clay (sculpturing and staining concrete).
9. Masonite (Screen side).
10. Standard steel forms.
11. Wood boarding and reversed battens.
12. Square edged lumber dressed one side.

TOOLING SURFACES

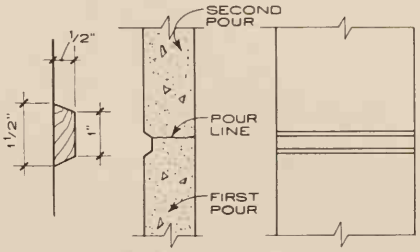
1. Stamping with various tools or rollers.
2. Brooming.
3. Rubbing.
4. Scraping.
5. Grinding.
6. Bush-hammering
7. Sandblasting.

KIND OF COMMON AGGREGATE

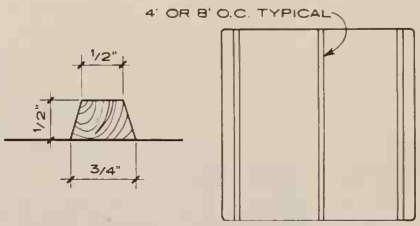
1. Quartz—clear, white, rose.
2. Marble—green, yellow, red, pink, blue, grey, white and black.
3. Granite—pink, grey, black and white.
4. "Gravels"—brown, reddish-brown.
5. Ceramic—full range.
6. Vitreous or glass—full range.



BUSH HAMMERING DETAILS

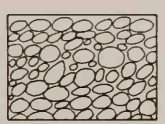


HORIZONTAL RUSTICATION AT CONSTRUCTION JOINT

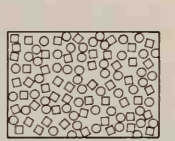


VERTICAL RUSTICATION - SMOOTH OR LIGHT SANDBLAST

PIECES OF FLAT STONE EMBEDDED IN SAND



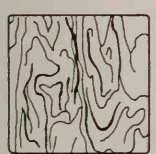
LARGE EXPOSED AGGREGATE



AGGREGATES UNIFORM IN SIZE QUARTZ, MARBLE

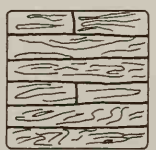
EXPOSED GRAVEL AGGREGATE PANEL

EXPOSED AGGREGATE SURFACES

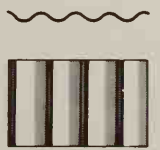


SANDBLASTED PLYWOOD

WOOD BOARDING

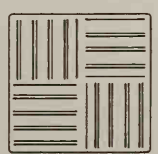


SQUARE EDGED LUMBER - DRESSED ONE SIDE

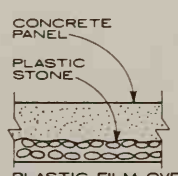


CORRUGATED VINYL PLASTIC

MOULDED PLASTIC FORM

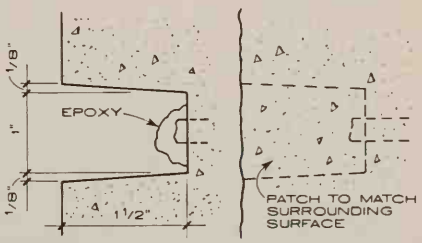


RUBBER MATTING

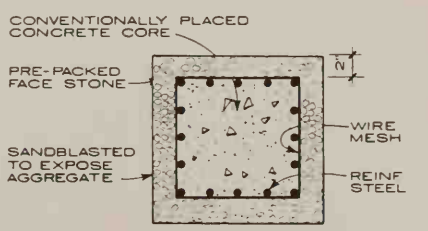


PLASTIC FILM OVER A STONE LAYER, DIMPLED CONCRETE

EXAMPLES OF TEXTURES OBTAINED BY USE OF FORM LINES



TIE-HOLE TREATMENT



ARBETON EXPOSED AGGREGATE FINISH

CHAPTER 4

MASONRY CONSTRUCTION

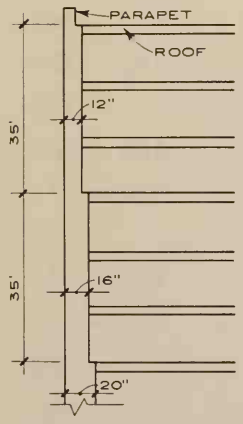
BUILDING CODE REQUIREMENTS FOR MASONRY. USAS A41.1–1953.0.

Scope: Minimum requirements for design and construction of non-reinforced masonry. Does not cover veneer or fire protection requirements.

ALLOWABLE COMPRESSIVE STRESSES IN UNIT MASONRY

CONSTRUCTION AND GRADE OF UNIT	ALLOWABLE COMPRESSIVE STRESSES; GROSS CROSS-SECTIONAL AREA (EXCEPT AS NOTED) IN PSI				
	TYPE M MORTAR	TYPE S MORTAR	TYPE N MORTAR	TYPE O MORTAR	TYPE K MORTAR
SOLID BRICK MASONRY					
8,000 plus, psi	400	350	300	200	100
4,500 to 8,000, psi	250	225	200	150	100
2,500 to 4,500, psi	175	160	140	110	75
1,500 to 2,500, psi	125	115	100	75	50
GROUTED SOLID BRICK MASONRY					
4,500 plus, psi	350	275	200		
2,500 to 4,500, psi	275	215	155		
1,500 to 2,500, psi	225	175	125		
MASONRY OF HOLLOW UNITS	85	75	70		
HOLLOW WALLS (CAVITY OR MASONRY BONDED)* SOLID UNITS:					
2,500 plus, psi	140	130	110		
1,500 to 2,500, psi	100	90	80		
HOLLOW UNITS	70	60	55		

*On gross cross-sectional area of wall minus area of cavity between wythes.



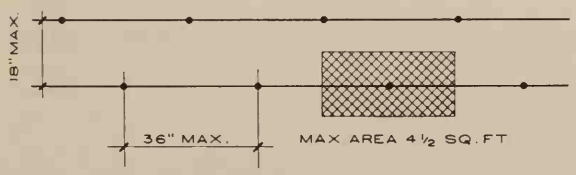
BEARING WALLS–EXCEPTIONS (see adjacent sketch)

1. Stiffened solid masonry bearing walls may be 12 inches thick for a height of 70'.
2. The top story bearing wall of a building not exceeding 35 feet in height may be 8 inches in thickness.
3. Walls of residential buildings not exceeding three stories or 35 feet in height may be eight inches in thickness.
4. Walls above roof level, 12 feet or less in height, enclosing stairways, penthouses, etc. may be of 8 inch thickness.
5. Hollow walls (metal tied or masonry bonded) shall not exceed 35 feet in height above their support, except that 10 inch cavity walls shall not exceed 25 feet in height.

EXTERIOR NONBEARING WALLS

Four inches less in thickness than required for bearing walls but not less than 8 inches except where 6 inch walls are permitted.

BEARING WALLS – MINIMUM THICKNESS



SPACING AND STAGGERING OF METAL TIES

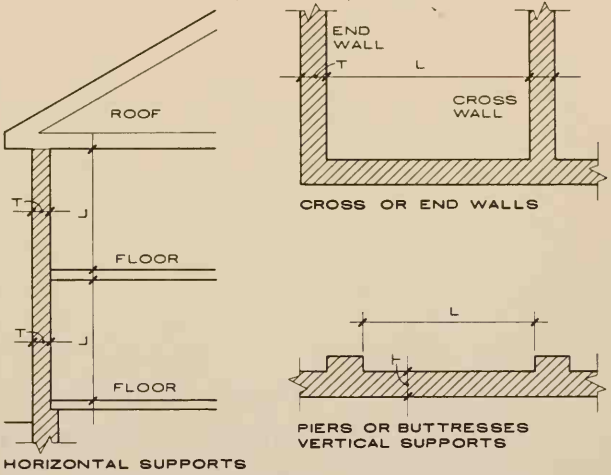
BONDING OF SOLID UNITS

Headers– 4% of wall surface maximum spacing, 24 in.

Metal ties– 3/16" diameter steel rod for each 4 1/2 sq. ft.

NOTE:

Refer to Local Building Code for local code requirements for masonry.



HORIZONTAL SUPPORTS

CROSS OR END WALLS

PIERS OR BUTTRESSES
VERTICAL SUPPORTS

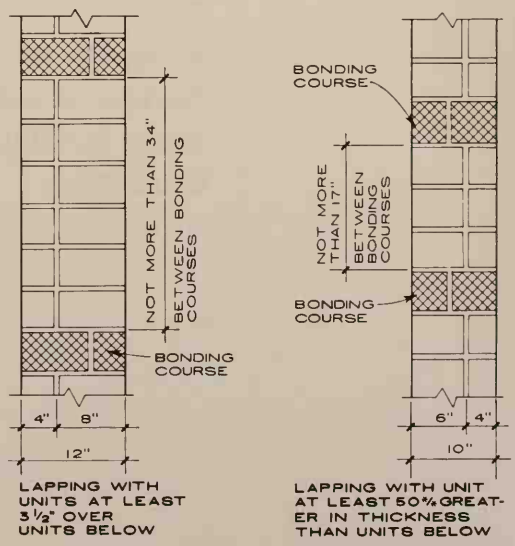
MAXIMUM RATIO OF UNSUPPORTED HEIGHT OR LENGTH TO NOMINAL THICKNESS

TYPE OF MASONRY	RATIO $\frac{L}{T}$
SOLID MASONRY BEARING WALLS	20
HOLLOW UNIT MASONRY BEARING WALLS	18
CAVITY WALLS	18*
NON-BEARING WALLS	36**

*Thickness equal to sum of the nominal thickness of the inner and outer widths.

**Based on actual thickness of partition including plaster.

LATERAL SUPPORT



LAPPING WITH UNITS AT LEAST 3½" OVER UNITS BELOW

LAPPING WITH UNIT AT LEAST 50% GREATER IN THICKNESS THAN UNITS BELOW

BONDING OF HOLLOW UNITS

Structural Clay Products Institute; McLean, Virginia

BUILDING CODE REQUIREMENTS FOR REINFORCED MASONRY, USAS A41.2 - 1960

Scope: Minimum requirements for design and construction of reinforced masonry built with solid or hollow masonry units.

COMPRESSIVE STRENGTH OF UNITS AND MASONRY

COMPRESSIVE STRENGTH OF UNITS	ASSUMED COMPRESSIVE STRENGTH OF MASONRY f'm*
1,000 to 1,500 psi	900 to 1,150 psi
Over 1,500 to 2,500 psi	1,151 to 1,550 psi
Over 2,500 to 4,000 psi	1,551 to 2,000 psi
Over 4,000 to 6,000 psi	2,001 to 2,400 psi
Over 6,000 to 8,000 psi	2,401 to 2,700 psi
Over 8,000 to 10,000 psi	2,701 to 2,900 psi
Over 10,000 to 12,000 psi	2,901 to 3,000 psi
Over 12,000 psi	3,000 psi

*Based on h/d of 2.0

NOTE:
Use gross area for masonry of solid units and net area for masonry of hollow units.

WALLS

Minimum thickness: 6 in.

Maximum unsupported height or length, 25 t

Allowable axial stress: 0.20 f'm for h/t of 10 or less, and reduced proportionally to 0.15 f'm for h/t of 25

Minimum reinforcement: 0.002 bt

MINIMUM REQUIRED STRESS VALUES

DESCRIPTION		ALLOWABLE STRESS
COMPRESSIVE:		
AXIAL	fm	See Walls & Columns
FLEXURAL	fm	0.33 f'm
SHEAR:		
BEAMS WITH NO WEB REINFORCEMENT	Vm	50 psi
BEAMS WITH WEB REINFORCEMENT	V	150 psi
BOND:		
PLAIN BARS	U	80 psi
DEFORMED BARS (ASTM A305)	U	160 psi
BEARING:	fm	0.25 f'm
MODULUS OF ELASTICITY:	Em	1.000 f'm
MODULUS OF RIGIDITY	Ev	400 f'm

COLUMNS

Minimum thickness, 12 in. (8 in. for minor columns)

Maximum unsupported height, 20 d

Allowable axial load ($PV < 0.006$)
$P = Ag\ [0.16\ f'm + 0.52\ pgf's]$ where $h/d \leq 10$
$P' = [1.3 - 0.03\ h/d]$ where $h/d > 10$

RECOMMENDED BUILDING CODE REQUIREMENTS FOR ENGINEERED BRICK MASONRY, SCPI - MAY 1960

Scope: Minimum requirements for design and construction of brick masonry of solid units both non-reinforced and reinforced.

COMPRESSIVE STRENGTH OF UNITS AND MASONRY

COMPRESSIVE STRENGTH OF UNITS, psi	ASSUMED COMPRESSIVE STRENGTH, f'm, psi *		
	TYPE M MORTAR	TYPE S MORTAR	TYPE N MORTAR
14,000 PLUS	4600	3900	3200
12,000	4000	3400	2800
10,000	3400	2900	2400
8,000	2800	2400	2000
6,000	2200	1900	1600
4,000	1600	1400	1200
2,000	1000	900	800

* Based on h/d of 5.0
Mortar shall be mixture of portland cement (I, II, III) hydrated lime (5), and sand.

ALLOWABLE STRESSES FOR NON-REINFORCED BRICK MASONRY

DESCRIPTION	TYPE M OR S MORTAR	TYPE N MORTAR
TENSION IN FLEXURE		
NORMAL TO BED JOINTS	36	28
PARALLEL TO BED JOINTS	72	56
SHEAR	50	40

Allowable stresses:
Reinforced brick masonry similar to USAS A41.2 – 1960, except flexural compressive stress equal to 0.40 f'm.

STRESS REDUCTION FACTORS, C. FOR BRICK MASONRY *

h/t	e/t		
	0 to 1/20	1/6	1/3
5	1.00	0.66	0.32
10	0.92	0.63	0.27
15	0.79	0.56	0.22
20	0.64	0.42	0.16
25	0.49	0.36	0.12
30	0.38	0.27	0.08

* The slenderness ratio h/t of walls and columns shall be limited to 30 for walls and 25 for columns.

WORKMANSHIP:

Allowable stresses shall be reduced by 1/3 when there is no engineering or architectural inspection.

ALLOWABLE VERTICAL LOADS

Non-reinforced Brick Masonry
Walls: $P = c(0.25\ f'm)\ Ag$
Columns: $P = c(0.20\ f'm)\ Ag$

Reinforced Brick Masonry
Walls: $P = (0.25\ f'm)\ Ag$ for $h/t \leq 5$
Columns: $P = (0.20\ f'm + 0.65\ pgfs)\ Ag$ for $h/t \leq 5$
$P' = P\ [1 - (h/40\ t)^3]$ for $h/t > 5$

NOTE:
Refer to Local Building Code for local code requirements for masonry.

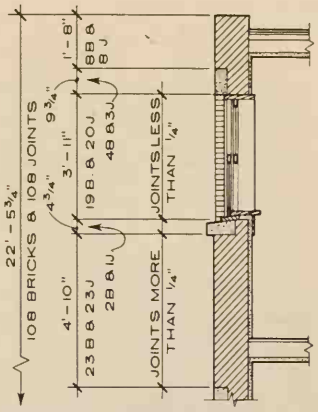
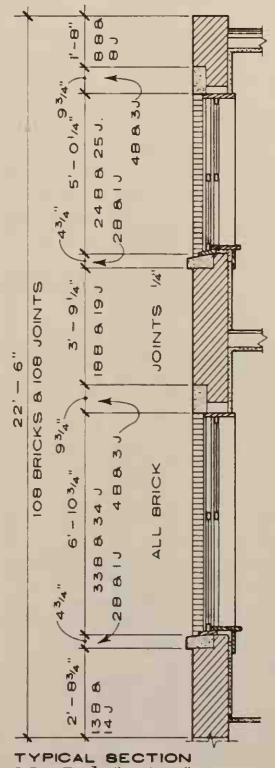
TYPICAL SECTION
SCALE : 3/16" = 1'–0"



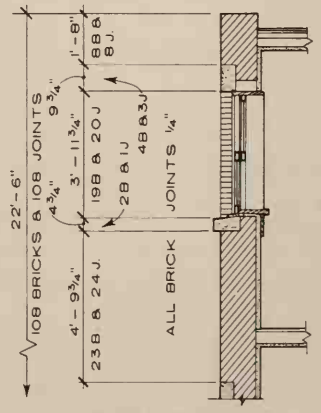
SECTION THROUGH NON-TYPICAL WINDOW
SCALE : 3/16" = 1'–0"

NOTE:
Where window, door, vent, etc., dimensions and details are predetermined, sizes of brick joints must be varied somewhat at different points of the building. In order to keep brick courses on the same line around the entire building, it is necessary to key all wall sections to each other.
* In the drawing shown, notice that the course of brick below the non-typical window sill must occur on the same line on every wall of the building – even though this window may occur on only one wall.

BRICK COURSES ADJUSTED TO DIMENSIONS



TYPICAL SECTION
SCALE : 3/16" = 1'–0"



SECTION THRU NON-TYPICAL WINDOW
SCALE : 3/16" = 1'–0"

NOTE:
Windows, doors, vents and other masonry opening details must be adjusted to achieve even brick coursing around entire bldg. Size of brick joint may be predetermined or may depend on the height of windows used.

Other details – doors, vents, etc. – must be adjusted with reference to the brick coursing.

DIMENSIONS FIXED BY BRICK COURSES

Structural Clay Products Institute; McLean, Virginia

PLAN

EXAMPLE SHOWING USE OF TABLE (WITH 1/4" JOINTS)

* T : Dimensions and no. of joints as given in above table, i.e. one joint less than the number of bricks.

** T + 1: One brick joint added to figure given in table, i.e. number of bricks and joints equal.

*** T + 2: Two brick joints added to figure given in table, i.e. one joint more than the number of bricks.

a – Brick compressive strength 8,000 psi plus.

b – Collar joints filled with mortar.

c – If loads bear on only one wythe, reduce allowable loads by 20%.

d – Brick compressive strength 2,500 psi plus.

e – Masonry compressive strength (f'm) = 3.000 psi; h/t = 25 (ASA A 41.2 – 1960)

f – Some buildings codes permit 8' – 0" (24t) for bearing partitions.

g – Waste is not included, as this will vary with the job. A waste factor of 2% is frequently applied for masonry units and 10% to 20% for mortar.

h – Assumed mortar joint thicknesses, 3/8" for brick and 1/4" for tile (horiz. cell).

i – Based on one metal tie for each 4·1/2 sq. ft. for wall area. Increase quantity by 50% if building code requires one metal tie for each 3 sq. ft. of wall area.

k – Corrected for a 15-mph wind outside and still air inside.

m – Noncombustible or no members framed into wall.

n – One unit and 3 cells in wall thickness; units at least 71% solid.

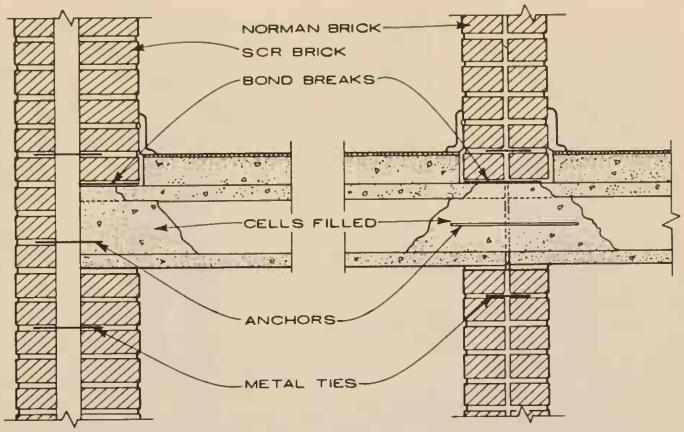
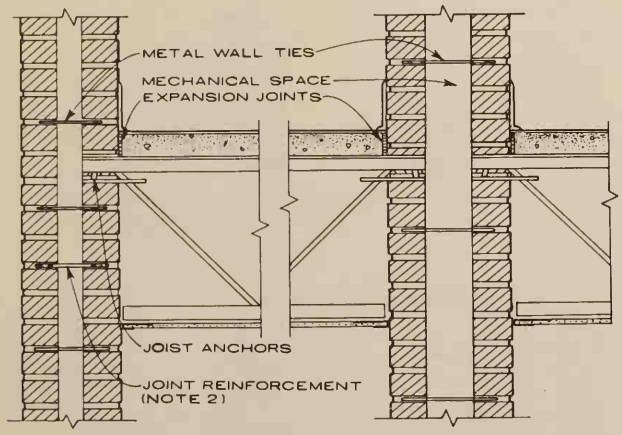
10" RBM BEARING WALLS – 8" REINFORCED CONCRETE FLOOR



12" BRICK AND BRICK CAVITY WALL WITH 8" BRICK BEARING PARTITION – PRECAST CONCRETE FLOOR

NOTE:

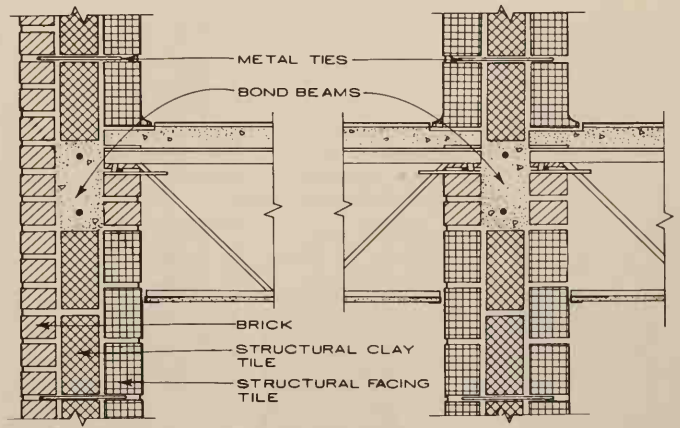
1. Cavity may be insulated.



BRICK AND BRICK CAVITY BEARING WALLS – STEEL JOIST FLOOR

NOTES:

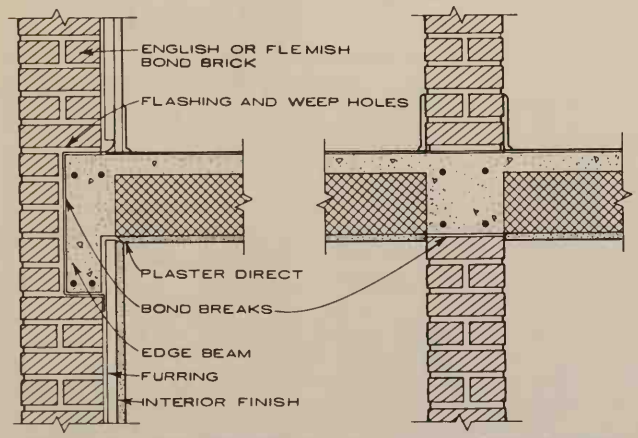
1. Cavity width may vary from 2" to 4" in nominal width.
2. Horizontal joint reinforcement may be desirable at joist bearing to act as a bond beam.
3. Insulation may be added if desired.



12" BRICK AND TILE BEARING WALLS – STEEL JOIST FLOOR

NOTE:

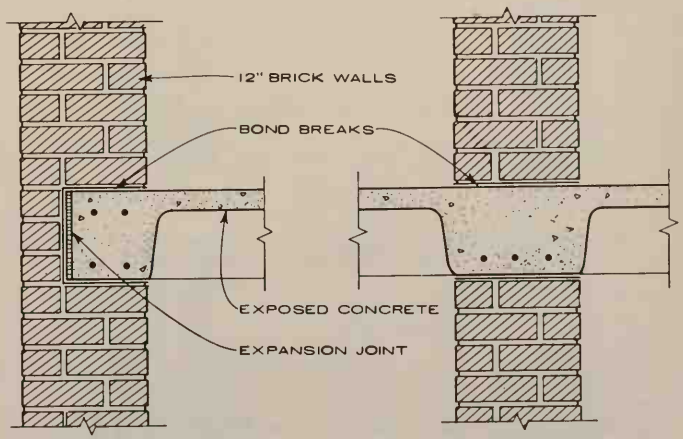
1. Bond beams are desirable at joists bearing to distribute stresses due to load and differential building movement.



8" BRICK BEARING WALLS – 8" TILE AND CONCRETE FLOOR

NOTES:

1. Metal ties may be used in lieu of masonry headers.
2. Edge beam helps control concrete curling.



12" BRICK BEARING WALLS – 8" WAFFLE FLOOR

NOTES:

1. Brick wall may be metal-tied in lieu of masonry headers.
2. Expansion joint may not be required between floor and exterior wall.

PLAN

Four inch thick Serpentine walls have been built with radii up to 20'–0" in the South.

Radii under 7'–0" are advisable in the North.

Use running bond.

No reinforcing is used in the wall.

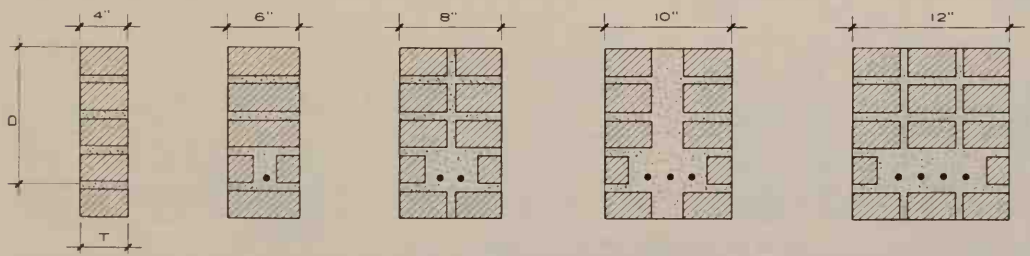
Notes:
1 It is recommended that a minimum of two courses of brick be provided above the reinforcements.
2 Table is calculated for brick units of 4,000 psi or greater in compressive strength and Type S mortar.
3 Table designed in accord with A 41.2 1960, A.S.A.



D = Required Lintel Depth (in.)
R = Required Lintel Reinforcement
L = Lintel Span (ft.)
t = Nominal Lintel Thickness (in.)

NOTES :

For economy, a double channel ⊨ with pipe separators may be substituted for a pair of interior angles: 2–6" [ ] 8.2# for 2–7" x 4" x 3/8" and under; 2–7" [ ] 9.8# for 2–7" x 4" x 7/16" 2–8" [ ] 11.5# for 2–8" x 4" x 1/2" and under; 2–9" [ ] 13.4# for 2–9" x 4"x 1/2" and under.

When masonry lighter than brick is used over interior angles floor load may be increased by the difference in weight per sq. ft. times the width of the opening. Interior angles have been designed for floor load plus brick masonry of ht. = width of opening. fs = 20,000 #/□". Deflection max. 1/700 span.

6" min. bearing required for all lintels except single angles below heavy line require 8"; below dash line, 10". Omit floor load on lintel when distance to bottom of opening is greater than width of opening. Interior and exterior angles in 8" walls and interior angles in 12" walls are bolted together when clear span of opening is over 6'–0".

NOTES :

Lintels are modular sizes. fc = 3000 #/□"; fs = 20,000 #/□". 4 in table = no. of stirrups at each end of lintel. Lintels above heavy line require bars in bottom only, location of which must be indicated on lintel

by fabricator. Lintels below heavy line require top and bottom bars of the same size and stirrups as indicated. Two piece-split lintels can be used only if above heavy line and are not to carry floor loads unless

bottom of floor construction is at least 12" above top of lintel. To use one piece lintel in 12" walls, increase reinf. to 3 bars or equiv. area and increase allowable floor loads by 50%.

Phillip R. Bates, AIA; Fresno, California

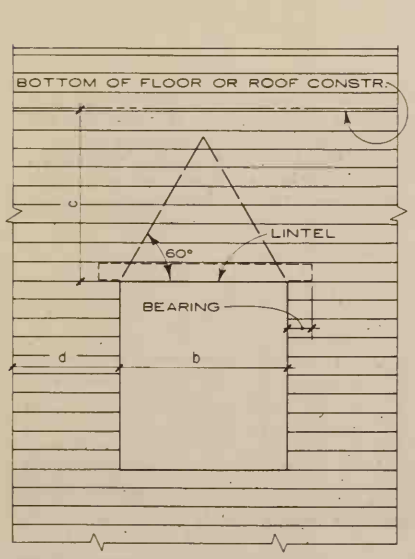
t = Nominal Lintel Thickness

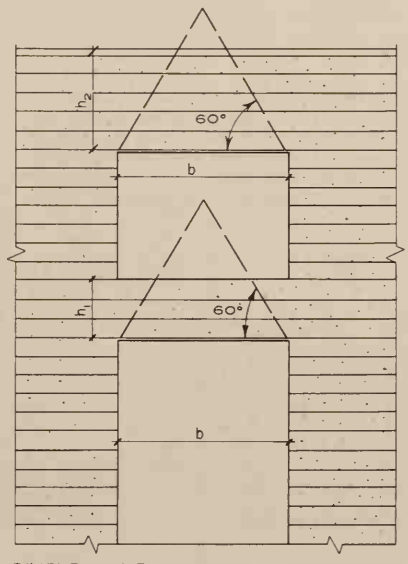
NOTES :

1. Table is calculated for tile masonry compressive strength (f'm) of 2000 psi.
2. Dead load of the lintel is included in the reinforcement requirements.
3. Table designed in accord with A 41.2–1960, A.S.A.
4. Lintel dead load assumed to be 135 pcf.

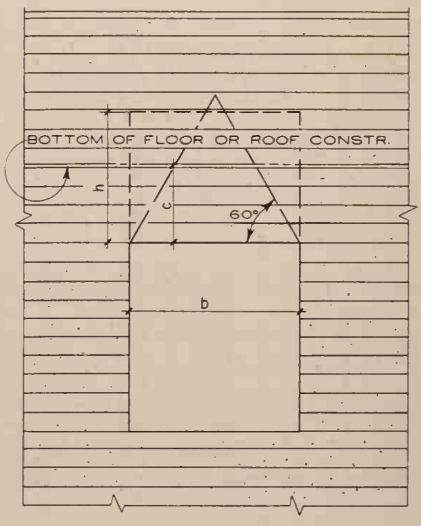
TYPICAL HOLLOW CLAY TILE LINTEL DETAILS
STRUCTURAL CLAY PRODUCTS INSTITUTE



SIMPLE LINTEL WITH ARCH ACTION
$c \geq b$; $d \geq b$
CARRIES WALL LOAD ONLY IN TRIANGLE ABOVE OPENING

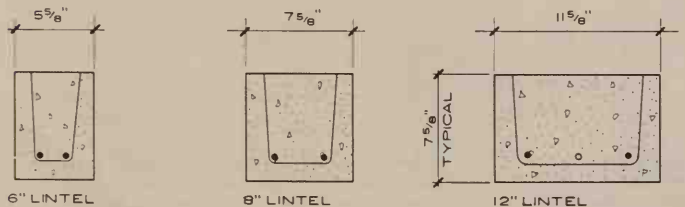


SIMPLE LINTEL WITHOUT ARCH ACTION
h_1 or $h_2 < 0.6b$
CARRIES LESS WALL LOAD THAN TRIANGLE ABOVE OPENING



LINTEL WITH FLOOR LOAD
$c < b$
CARRIES GREATER LOAD (AREA OF RECTANGLE) THAN △ ABOVE OPENING

TYPES OF LINTEL CONDITIONS – CONSULT STRUCTURAL HANDBOOKS FOR DESIGN FORMULAS



MAX. CLR. SPAN	WALL WIDTH	REBAR NO.–SIZE
6'–0"	6"	2–#3
8'–0"		2–#4
6'–0"	8"	2–#3
8'–0"		2–#4
6'–0"	12"	3–#3
8'–0"		3–#4

NOTES :
This type of lintel is used to carry concrete block or lighter wall construction only. It is not recommended to carry any floor loads.

TYPICAL CONCRETE BLOCK SHAPES

BLOCK SPECIFICATIONS AND FIRE RESISTANCE DATA

1. A solid (load bearing) concrete block is a unit whose cross-sectional area in every plane parallel to the bearing surface is not less than 75% of the gross cross-sectional area measured in the same plane. (ASTM C145–64T)

2. A hollow concrete block is a unit whose cross-sectional area in every plane parallel to the bearing surface is less than 75% of the gross cross-sectional area measured in the same plane. (ASTM C90–64T)

3. Actual dimension is $^3/_8$" to $^1/_2$" less than nominal shown.

4. All shapes shown are available in all dimensions given in chart except for width (W) which may be otherwise noted. *. Available in special sizes (does not refer to table shown)

5. Because the number of shapes and sizes for concrete masonry screen units is virtually unlimited, it is advisable for the designer to check on availability of any specific shape during early planning.

6. Screen units should be of high quality, even though they seldom are employed in load-bearing construction. When tested with their hollow cells parallel to the direction of the load, screen units should have a compressive strength exceeding 1,000 psi of gross area; a quality of concrete unit comparable to "Specifications for Hollow Load-Bearing Concrete Masonry Units" ASTM C90–65T.

7. Building codes are quite specific in the degree of fire protection required in various areas of buildings. Local building regulations will govern the concrete masonry wall section best suited for specific applications. Fire-resistance ratings of concrete masonry walls are based on fire tests made at Underwriters' Laboratories, Inc., National Bureau of Standards, Portland Cement Association, and other recognized laboratories. Methods of test are described in ASTM E119 "Standard Method of Fire Tests of Building Construction and Materials".

8. The fire-resistance ratings of most concrete masonry walls are determined by heat transmission measured by temperature rise on the cold side. Fire endurance can be calculated as a function of the aggregate type used in the block unit, and the solid thickness of the wall, or the equivalent solid thickness of the wall when working with hollow units.

9. Equivalent thickness of hollow units is calculated from actual thickness and the percentage of solid materials. Both needed items of information are normally reported by the testing laboratory using standard ASTM procedures, such as ASTM C140 "Methods of Sampling and Testing Concrete Masonry Units". When walls are plastered or otherwise faced with fire-resistant materials, the thickness of these materials is included in calculating the equivalent thickness effective for fire-resistance. Estimated fire-resistance ratings shown in the table are for fully protected construction in which all structural members are of incombustible materials. Where combustible members are framed into walls, equivalent solid thickness protecting each such member should not be less than 93 percent of the thicknesses shown. Plaster is effective in increasing fire-resistance when combustible members are framed into masonry walls, as is filling core spaces with various fire-resistant materials.

10. The following are minimum equivalent thicknesses for rating of:

	1 hr.	2 hr.	3 hr.	4 hr.
Pumice	1.8	3.0	4.0	4.7
Expanded slag	2.2	3.3	4.2	5.0
Expanded shale or clay	2.5	3.7	4.7	5.5
Limestone, scoria, cinders unexpanded slag	2.7	4.0	5.0	5.9
Calcareous gravel	2.8	4.2	5.3	6.2
Siliceous gravel	3.0	4.5	5.7	6.7

Equivalent thickness is the solid thickness that would be obtained if the same amount of concrete contained in a hollow unit were recast without core holes. Calculate fire-resistance as follows: Equivalent thickness equals the percentage of block solidity (based on aggregate type) times actual block thickness (in.). Refer to table for hour rating of wall.

SHEAR RESISTING FLUSH WALL CONTROL JOINTS

GENERAL CONSTRUCTION NOTES

There are three methods of controlling cracking in concrete unit masonry structures: product specifications which limit moisture movement (these limits are incorporated in "Q Block Specifications," the product standard of the industry's quality control program), steel reinforcement which increases crack resistance (bond beams or horizontal joint reinforcement), and control joints.

Control joints are employed in crack control to reduce restraint by accommodating movement of the masonry wall, or movement of structural elements adjacent to the wall. They are vertical separations built into the wall at locations where cracking is likely due to horizontal stress. Their spacing along the wall length will depend upon: (1) expected movement(s) of wall or other elements, (2) resistance of wall to horizontal tensile stress, and (3) the extent and location in the wall of windows, doors, recesses, chases, and other causes of stress concentration.

Generally, a control joint is placed at one side of an opening less than six feet in width and at both jambs of openings over six feet in width. Where concrete unit masonry is used as backup of other materials, extend control joints through facing if it is rigidly bonded (masonry bond). Control joint need not extend through facing when bond is flexible (metal ties).

Control joint should extend through plaster applied directly to masonry, but plaster on furring may not require vertical separation at control joint.

Provide horizontal slip plane where reinforced lintel beam terminates at a control joint. Provide horizontal slip plane at junction of roof and load-bearing masonry terminating at a control joint. Bond between roof and wall should be broken 12–15 feet back from corners, with slip plane.

Structural Clay Products Institute; McLean, Virginia

GENERAL

Natural stone is employed in a wide variety of applications in building. Today it is used most extensively as a non-structural material and in combination with other materials as a facing, a veneer, or for decorative purposes. However, its use with precast, post-tensioned, and various sandwich and panel systems is increasing.

CAST STONE

Cast stone is used in much the same manner as cut stone. It is anchored in similar fashion except that much of the anchoring may be cast into the units during fabrication.

COMPOSITION

(see chart this page)

Stone is composed of mineral aggregates in varying mixture and formed over a long period of time by one or more of three basic processes. The variations in mineral content and process of formation dramatically affect the texture, color, and physical properties of the final stone. Vast differences in porosity, hardness, and structural characteristics may occur among samples of the same stone. This is particularly true of marbles, limestones, and sandstones.

The minerals are classified into the silica, silicate, and calcareous groups. The first two of these are quartz minerals or quartz with other metallic bases and are usually found in abundance in the harder, more durable stones depending on the nature of the binder or "cement". The calcareous group is made up largely of the lime minerals which are softer and often appear as the binder for the silicas.

PROCESS OF FORMATION

Stone is grouped into three classes according to the process of formation: 1) igneous – or volcanic, 2) sedimentary, and 3) metamorphic. These processes are often interdependent and many samples are the result of more than one process.

Igneous – or volcanic stone is formed from molten material heaved near the earth's surface and slowly cooled. It is usually crystalline and homogeneous in structure. Examples are granite and traprock.

Sedimentary stone is formed in layers of deposits of shell fragments, disintegrated stone, or sand which have been cemented under pressure below the surface of the earth. Sandstone, limestone, and some so-called marbles are in this class.

Metamorphic stone is formed through reconstitution due to great heat and additional pressure. Examples are marble, slate, and schist.

QUARRYING, CUTTING AND FINISHING

Rough stone is quarried by blasting from large deposits. It is then broken to size and dressed or shipped unfinished. Cut stone and veneer is quarried in blocks up to fifty tons by channeling, wire sawing, or drilling. The block is cut into slabs or pieces of desired size by gang sawing, diamond sawing, wire sawing, or machining. Final cutting and shaping may be done by splitting, shearing, machining, or hand tooling. Surface finishing, polishing, tooling, and special treatments such as heating, flaming, and chemical application are often employed for final texture and color. The final working processes are often performed by stone fabricators who are separate from the quarry. Sealing and final cleaning is usually performed at the job site.

PRINCIPAL BUILDING STONE

Igneous Group

- granite
- traprock
- lava stones

Sedimentary Group

- limestone: dolomitic, oolitic, crystalline, travertine marble.
- sandstone: bluestone, brownstone, silica sandstone, lime sandstone, and many conglomerate varieties.

Metamorphic Group

- marble*
- slate: clay slate, mica slate
- schist
- gneiss
- quartzite

*Note: many so-called marbles are actually dolomitic limestones and belong in the sedimentary group.

KINDS, CHARACTERISTICS & PROPERTIES OF STONE

GROUP BY MINERALS	MINERAL–ARCHITECTURAL CHARACTERISTIC	FOUND IN THESE STONES
SILICA MINERALS	QUARTZ–HARD, CRYSTALLINE, GLASSLIKE FRACTURE, COLORLESS IN PURE FORM, GRANULAR OR SANDY IN DISTRIBUTION, TAKES A GOOD POLISH	IMPORTANT COMPONENT OF: GRANITE, MICA SCHIST, GNEISS, SANDSTONE
SILICATE MINERALS	FELDSPAR–HARD AND DENSE IN DURABLE ROCK, POROUS AND FLAWED IN LESS DURABLE STONE	USUALLY FOUND IN GRANITE, FOUND IN SOME SANDSTONES
	MICA–SOFT, CAUSES WEAKNESS UNLESS FINELY FLAKED AND EVENLY DISTRIBUTED, READILY SPLIT ALONG STRATA, USUALLY COLORLESS OR BLACK, HIGHLY REFLECTIVE ON SURFACE OF STONE	PREVALENT IN: SOME SLATES, GRANITE, MICA-SCHIST, LIMESTONE, SANDSTONE
	HORNBLENDE–HARD, DURABLE, CRYSTALLINE, BROWNISH-GREEN AND BLACK IN COLOR	IMPORTANT COMPONENT OF: GRANITE, GNEISS
	SERPENTINE–SOFT, SOAPY IN STRUCTURE, GREEN OR YELLOW IN COLOR	IN SOME MARBLES, ESPECIALLY SERPENTINE MARBLE
CALCAREOUS MINERALS	CALCITE–SOFT, SOLUABLE, MAY CAUSE VOIDS OR PITTING, WHITE COLOR, (ALSO CEMENTING AGENT IN LIMESTONE AND SHALE)	LIMESTONE, MARBLE, TRAVERTINE, DOLOMITE
NOTE: MANY SO-CALLED "MARBLES" AND "LIMESTONES" ARE ACTUALLY DOLOMITES DUE TO HIGH CONTENT OF DOLOMITE	DOLOMITE–HARDER THAN CALCITE, WHITE, USED IN MAKING LIME	LIMESTONE, MARBLE, DOLOMITE
	GYPSUM–SOFT, ACID RESISTANT, WHITE AND PALE COLORED	GYPSUM, ALABASTER
	PYRITES–UNDESIRABLE IN BUILDING STONE, OXIDIZES AND STAINS, GRANULAR OR DEPOSITED IN POCKETS, YELLOW COLOR	NUMEROUS STONES IN VARIED AMOUNTS

IMPORTANT: Minerals found in building stone – the presence of these minerals and the degree to which they are found in any given sample greatly affects the properties and architectural characteristics of that particular sample of stone.

RANDOM COURSED PATTERN BOND

DIMENSIONED OR ASHLAR STONE MASONRY – ELEVATIONS SHOWING FACE JOINTING

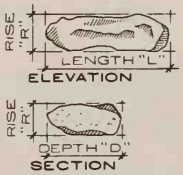
GENERAL NOTES:

A course is a horizontal row of stone. Bond is the horizontal arrangement of vertical joints. A range is a course of uniform height or rise and running across the entire face of a wall.

A perch is nominally 16'– 6" long, 1'– 0" high, and 1'– 6" thick equalling 24 $^{3}/_{4}$ cubic feet. In some localities 16 $^{1}/_{2}$ cu. ft. and 22 cu. ft. are used.

Rubble work and roughly squared stone work is laid up with field stone or rough quarry stone. All hand dressing and rough squaring is done in the field by masons.

Ashlar masonry is cut to dimensions shown on shop drawings. It is cut, dressed, and finished to precise job requirements at the mill and then shipped to the site in its finished state.



DIMENSION RATIO

TYPE OF STONE	"R"	"L"	"D"
SOFT	1	3	2
HARD	1	5	3

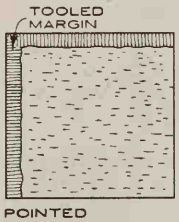
RUBBLE STONE DIMENSION LIMITS

ROCK OR PITCH FACED
Rough, "rusticated", for all stones.

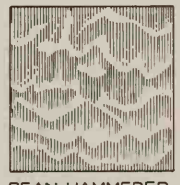
GANG SAWED
Smooth, visible saw marks, all stones.

SHOT SAWED
Rough, more marked than gang, soft stones.

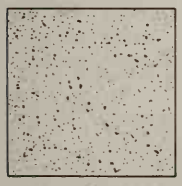
MACHINED (PLANER)
Smooth, some texture soft stones.



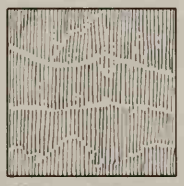
POINTED
Coarse, medium or fine, usually hard stones.



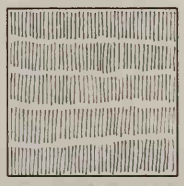
PEAN HAMMERED
Coarse, done after pointing, hard stones.



BUSH-HAMMERED
Medium texture for all stones.

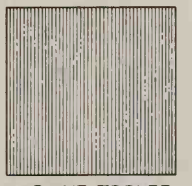


PATENT BUSH-HAMMERED
4–8 cut in 7/8" –for all stones – esp. granite.



DROVE OR BOASTED
Soft stones.

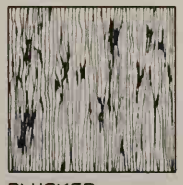
HAND TOOLED
Regular or random, for soft stones.



MACHINE TOOLED
Grooves 2–10 per inch, for all stones.

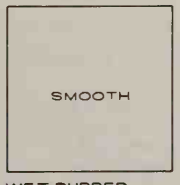
TOOTH CHISELED
Soft stones.

CRANDALLED
Regular & random – for soft stones.

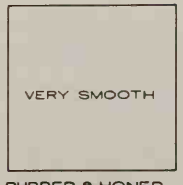


PLUCKED
Machine textured for limestone.

CARBORUNDUM
Machine finish for limestone.



WET RUBBED
Sand or carborundum grit for all stones.



RUBBED & HONED
Usually for interior marble & granite.

HONED & POLISHED
Usually for marble & granite.

ANCHOR DIMENSIONS AND MATERIALS

Standard flat stock anchors are made from strap 1" and 1 1/4" wide by 1/8", 3/16" and 1/4" thick. Lengths vary up to 6", 8", 10" and 12" standards Dovetail anchors are usually 4 1/4" overall with 3 1/2" projection from face of concrete. Bends are 3/4", 1" and 1 1/4".

Round stock anchors are made from stock of any diameter: 1/4" and 3/8" are most common for rods; 1/8" (#11 gauge) through 3/16" (#6 gauge) for wire anchors; and 1/4" and 3/8" are most common for dowels. Dowel lengths are usually 2" to 6".

Anchors should be corrosion resistant and usually non-staining. Chromium-nickel stainless steel types 302 and 304 and eraydo alloy zinc are most corrosion and stain resistant. Hot galvanized is poorest and prohibited by some building codes. Copper, brass, and bronze will stain under some conditions. Metals most commonly used are hot galvanized, eraydo alloy, brass, bronze, monel, and stainless steel.

Local building codes often govern the types of metal which may be used for stone anchors.

George M. Whiteside, III, AIA; Whiteside, Moeckel & Carbonell; Wilmington, Delaware

ANCHOR LOCATION REGLET BEARING CHECK

GENERAL NOTE:

1. Stone shall be of nominal thickness (1 1/8" ± 1/8", 2" ± 1/4", 3" ± 1/4", 4" ± 1/4", 6" ± 1/4", 8 1/4" ± 1/4").
2. A setting space of 1" larger than the nominal thickness is advisable. Back may be pargeded or slushed full.
3. 1/4" mortar joints usually used, but 3/16" or 1/8" may be used for close work.
4. Anchor material sometimes governed by local building codes.

No. 8 nonferrous wire loose anchors are let into terra cotta anchor holes and then tied around exposed truss chord.

Concrete block backing wall with truss design masonry wall reinforcement. Gage of truss rods to be determined by structural engineer.

CHOICE OF TYPE OF INSTALLATION

Anchored Type Units: 1" thick or more, exclusive of ribs;
Adhesive Type Units: 1 1/4" thick or less, including ribs.

ANCHORAGE OF TERRA COTTA

GENERAL NOTES:

The architect selects texture, ceramic finish and color of exposed surface of terra cotta.

Texture: smooth, even plane, coarse-roughened; tooled, beveled, fluted; custom-designed.

Ceramic finish: Unglazed "natural earthy colors (body colors)"; red, gray, buff, brown, black; glazed, rough type, e.g., sanded glaze (slip-resisting); glazed, smooth, e.g., matte, satin or gloss.

Ceramic glaze colors (solid or mottled):
Unlimited range:
monochrome (1 color, single-fired);
polychrome (more than 1 color) e.g., murals; low-fired colors, e.g., gold, silver, vermilion.

Special applications of terra cotta (not covered):
swimming pools
ornamental terra cotta, e.g., cornices and column capitals;
sculpture: bas-relief, e.g., sculptured patterns (standard or custom-designed) and cartouches. Free-standing sculpture.

note: sculpture, ornamental and molded pieces can be made in larger dimensions than facing ashlar.

bases and curbings, watertable and belt courses.

SPECIAL NOTES:

Grilles: these can be open, or closed back, free standing screen walls, or perforated facades. Many grille designs are available.

Shelf angles: on multi-story buildings, roughly one shelf angle per story is needed.

Insulated ("sandwich") panels: also available 1 5/8" to 2 1/4" thick, with different insulation.

Max Martin Nathan, Rogers, Butler & Burgun; New York, New York

NOTES:

1. These notes and details are for preliminary design only and presume masonry openings not over 3'– 4" wide. Verify by local FHA recommendations.

2. Bricks are either sun or kiln dried. Mortar is similar in composition to the brick. In laying up, allow time for equalizing of settlement and drying of mortar, and lay in uniform stages throughout the structure.

3. Sun baked adobe requires stucco on the exterior whereas burned adobe does not.

4. A continuous reinforced collar beam is recommended at roof plate not less than 4" thick reinforced with rods whose cross sectional area is at least 1/4 of 1% of cross sectional area of the course. When used as a lintel they should be at least 8" deep and reinforced same as collar beam. 4" deep concrete beams are recommended under window sills.

5. One story walls should be 12" thick in Arizona, 10" in New Mexico, and not exceed 12'– 0" in height; two story, 18" thick at first floor and 12" at second, not over 22'– 0" in height.

6. Fireplaces and chimneys of adobe are built similar to common brick construction. The inside of the fireplace should be lined with fire brick and the flues with flue lining. Tops of chimneys should be capped with concrete.

7. Arches can be built of adobe brick cut to the required shape or formed in special molds.

David E. Miller; Troy, New York
Richard A. Morse, AIA; Tucson, Arizona

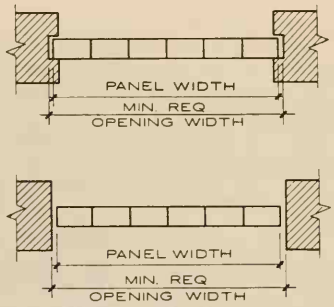
25	12'–6"	16'–8"	25'–0"

This table is based on Modular Coordination assuming ¼ " mortar joints between glass blocks.

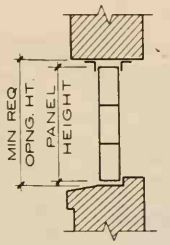
For minimum required opening height, find table dimension and add ⅜ ".

For minimum required opening width, find table dimension and add ½ ".



CHASE CONSTRUCTION

MAXIMUM PANEL AREA – 144 SQ FT
MAXIMUM HEIGHT – 20 FEET
MAXIMUM WIDTH – 25 FEET
MORTAR JOINTS = ¼ INCH



WALL ANCHOR CONSTRUCTION

MAXIMUM PANEL AREA – 100 SQ FT
MAXIMUM HEIGHT – 10 FEET
MAXIMUM WIDTH – 10 FEET
MORTAR JOINTS = ¼ INCH

ESTIMATING DATA

FOR 100 SQ. FT. OF PANEL ¼" MORTAR JOINTS

NOMINAL BLOCK SIZE	6"	8"	12"
NUMBER OF BLOCKS	400	225	100
PANEL WEIGHT, LBS.	2000	1800	1900
MORTAR VOLUME, CU. FT.	4.3	3.2	2.2

For design purposes, glass block panels weigh approximately 20 lbs. per sq. ft. installed. This applies to all sizes of blocks.

INSTALLATION

1. Sill area to be covered by mortar shall first have a heavy coat of asphalt emulsion and allowed to dry.

2. Adhere expansion strips to jambs and head with asphalt emulsion. Expansion strip must extend to sill.

3. When emulsion on sill is dry, place full mortar bed joint—do not furrow.

4. Set lower course of block. All mortar joints must be full and not furrowed. Steel tools must not be used to tap blocks in position. Mortar shall not bridge expansion joints. Visible width mortar joint shall be ¼" or as specified.

5. Install panel reinforcing in horizontal joints where required as follows:

(a) Place lower half of mortar bed joint. Do not furrow.

(b) Press panel reinforcing into place.

(c) Cover panel reinforcing with upper half of mortar bed and trowel smooth. Do not furrow.

(d) Panel reinforcing must run from end to end of panels and where used continuously must lap 6 inches. Reinforcing must not bridge expansion joints.

6. Place full mortar bed for joints not requiring panel reinforcing. Do not furrow.

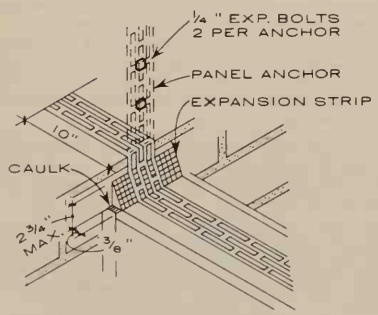
7. Follow above instructions for succeeding courses. The number of blocks in successive lifts shall be limited to prevent squeezing out of mortar or movement of blocks.

8. Strike joints smoothly while mortar is still plastic and before final set. At this time rake out all spaces requiring caulking to a depth equal to the width of the spaces. Remove surplus mortar from faces of glass blocks and wipe dry. Tool joints smooth and concave, before mortar sets, so that exposed edges of blocks have sharp clean lines.

9. After final mortar set, pack oakum tightly between glass block panel and jamb and head construction. Leave space for caulking.

10. Caulk panels as indicated on details.

11. Final cleaning of glass block faces shall not be done until after final mortar set.



PANEL ANCHOR

Dotted lines show use on existing structure.

GLASS BLOCK IN EXISTING WINDOW OPENING

Glass blocks and modules will fit nearly any existing window opening.

The drawings show typical head, sill and jamb section details for conventional window and glass block replacement. Notice how simple it is to work glass block into existing construction. It makes no difference if the opening is oddly shaped. Arches and irregular openings can be easily rebuilt to accommodate the glass blocks or modules by employing standard masonry construction techniques.

Many standard ribbon windows and ventilator attachments are available. These can be easily combined with glass blocks and modules.

GLASS BUILDING UNITS

1. These pages show elevations and sections of typical glass block panels. The large scale sections are typical head, jamb and sill details to show principles of construction only.

2. Any structural members must be calculated for safe loading, and local building codes checked for any possible restrictions on panel sizes or detail.

3. While single panels of glass block are limited to a maximum of 144 square feet, panel and curtain wall sections up to a maximum area of 250 square feet may be erected if properly braced to limit movement and settlement.

4. If chase construction cannot be used, substitute the panel anchor construction. Panel anchors are used to give lateral support for glass block panels.

5. Any glass block installation that is made in a frame construction shall have the wood adjacent to the mortar properly primed with asphalt emulsion.

6. Underwriters' Listing: glass block panels may be used for window openings subject to light fire exposure (class F openings).

7. Other types available are ornamental, sculptured and colored blocks of various sizes. Solid glass blocks (glass bricks) $2\ ^{5}/_{16}$" thick x $5\ ^{7}/_{8}$" x $8\ ^{7}/_{8}$" for installation in detention windows.

NOTE: ALL WOOD SIZES ARE NORMAL

ROUGH CARPENTRY	PENNY	INCHES	TYPE OF NAIL
1" thick stock	8	2 1/2	Common nails.
2" thick stock	16 to 20	3 1/2 or 4	Common nails.
3" thick stock	40 to 60	5 or 6	Common nails or spikes.
Concrete Forms	variable		Common or double headed nails.
Framing for general use and for large members	10, 16, 20, 60	3, 3 1/2, 4, 6	Common nails or spikes depending on size of members.
Toe nailing studs, joists, etc.	10	3	Common nails.
Spiking usual plates and sills	16	3 1/2	Common nails.
Toe nailing rafters and plates	10	3	Common nails.
Sheathing – roof and wall	8	2 1/2	Common nails, may be zinc coated.
Finished rough flooring	8	2 1/2	Common nails, may be zinc coated.

FINISH CARPENTRY			
Moldings –– Sizes as required		7/8 to 1 1/4	Molding nails (brads).
Carpet strips, shoes	8	2 1/2	Finishing or casing nails.
Door and window stops and members 1/4" to 1/2" thick	4	1 1/2	Finishing or casing nails.
Ceiling, trim, casing, picture mold, base balusters and members 1/2" to 3/4" thick	6	2	Finishing or casing nails.
Ceiling, trim, casing, base, jambs, trim and members 3/4" to 1" thick	8	2 1/2	Finishing or casing nails.
Doors and window trim, boards and other members 1" to 1 1/4" thick	10	3	Finishing or casing nails.
Drop siding, 1" thick	7 or 9	2 1/4 or 2 3/4	Siding nails (7d), Casing nails (9d).
Bevel siding, 1/2" thick	6 or 8	2 or 2 1/2	Finishing nails (6d), Siding nails (8d).

WOOD FLOORING			
See wood flooring page for nail sizes and types recommended.			Cut steel, wire, finishing, wire casing, flooring brads, parquet and flooring nails.

LATHING			
Wood lath	3	1 1/4	Blued lath nail.
Gypsum lath	3	1 1/4	Blued common.
Fiber lath			
Metal lath, interior		1	Blued lath nails, staples or offset head nails.
Metal lath, exterior	3	1 1/4	Self furring nails (double heads). Staples or cement coated.

SHEATHING OR SIDING			
Asbestos 3/8" thick		1 1/4	Galvanized roofing nail with 7/16" diameter head.
Fiber board 1/2" and 2 5/32"		1 1/2 to 2	Galvanized roofing nail with 7/16" diameter head.
Gypsum board 1/2"		1 3/4	Galvanized roofing nail with 7/16" diameter head.
Plywood 5/16" and 3/8" thick	6	2	Common nails.
Plywood 1/2" and 5/8" thick	8	2 1/2	Common nails.

ROOFING & SHEET METAL				
Aluminum roofing		1	1 3/4 to 2 1/2	Aluminum nail, neoprene washer optional.
Asbestos, corrugated or sheets		Depends on thickness		Leakproof roofing nails.
Asbestos shingles			1 to 2	See "Asbestos Cement Roofing and Siding."
Asphalt shingles				Galvanized large head roofing.
Copper cleats and flashing to wood				Copper wire or cut slating nails.
Copper cleats and flashing to prevent joints				Barbed copper nails.
Clay tile		4 to 6	1 1/2 to 2	Copper nails.
Prepared felt roofing			1 to 1 1/4	Zinc roofing nails or large head roofing nails (barbed preferred). Heads may be reinforced.
Shingles, wood	usual size	3 to 4	1 1/4 to 1 1/2	Zinc coated, copper wire shingle, copper clad shingle, cut iron or cut steel.
	for heavy butts	4 to 8	1 1/2 to 2 1/2	
Slate		Use nails 1" larger than thickness of slate		Copper wire slating nail (large head). In dry climates zinc coated or copper clad nails may be used.
Tin, zinc roofing				Zinc coated nails (roofing or slating).
Monel roofing				Monel nail.
Nailing to sheet metal				Self tapping screws, helical drive scres.

TO CONCRETE OR CEMENT MORTAR			
See following pages of fastening devices.			Concrete or cement nails (hardened), helical drive nails or drive bolts.

GENERAL NOTES:

1. Nail diameter, length, shape and surface affect holding power (withdrawal resistance and lateral resistance). See NFPA publications.
2. Materials: Zinc, brass, monel, copper, aluminum, iron or steel, stainless steel, copper bearing steel, muntz metal.
3. Coatings: Tin, copper, cement, brass plated, zinc, nickel, chrome, cadmium, etched acid, parkerized.
4. Forms: Smooth, barbed, helical, annular-ring.
5. Colors: Blue, bright, coppered, black (annealed).
6. Gauges shown are for steel wire (Washburn and Moen).
7. Abbreviations (for the following pages of fasteners only):

B	= blunt	F	= flat	O	= oval
CS	= countersunk	L	= long	PC	= pointing cone
D	= diamond	N	= narrow	R	= round

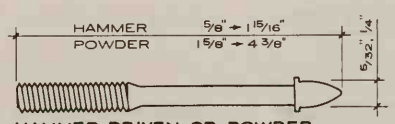
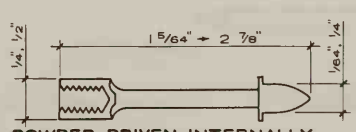
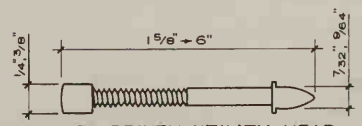
HAMMER DRIVEN OR POWDER DRIVEN PIN



HAMMER DRIVEN OR POWDER DRIVEN HEADLESS THREADED STUD



POWDER DRIVEN INTERNALLY THREADED STUD



POWDER DRIVEN UTILITY HEAD THREADED STUD

NOTE:

1. Thread sizes and lengths vary.
2. Hammer and power driven studs are intended for insertion into materials such as concrete, steel, etc.
3. Different stud heads and various attaching devices are available.

NAIL TYPE **		SIZE	MATERIAL
	BARBED NAILS	1/4" TO 1 1/2"	CEMENT COATED, BRASS, STEEL
	CASING NAILS	2d TO 40d 6d TO 10d	BRIGHT, CEMENT COATED * CUPPED HEADS AVAILABLE IN ALUMINUM
	CEMENT NAILS ALSO CALLED CONCRETE NAILS & HARDENED NAILS	1/2" TO 3"	SMOOTH, BRIGHT *OIL QUENCHED
	COMMON BRAD	2d TO 60d	BRIGHT-MAY BE SECURED WITH CUPPED HEAD, CEMENT COATED-USUALLY MADE IN HEAVY GAUGES
	CUT COMMON NAILS OR CUT COMMON SPIKE	2d TO 60d 20d TO 100d	STEEL OR IRON * PLAIN OR ZINC COATED
	COMMON NAILS (SHINGLE NAILS)	2d TO 60d	COPPER-CLAD
	COMMON BRASS WIRE NAILS	LIGHT GAUGE: 1/2", 1" TO 3 1/2" HEAVY GAUGE: 3/4"-6"	BRASS, ALUMINUM
	COMMON NAILS; (SHINGLE NAILS)	* 5/8" TO 6"	COPPER WIRE, ALUMINUM
	STANDARD CUT NAILS (NON-FERROUS)	5/8" TO 6"	COPPER, MUNTZ METAL OR ZINC
	DOUBLE HEADED	*1 3/4", 2", *2 1/4", 2 1/2", *2 3/4", 3", 3 1/2", *4", *4 1/2"	BRIGHT, CEMENT COATED, MADE IN SEVERAL DESIGNS
	DOWEL PINS	5/8" TO 2"	BARBED - *CUPPED HEAD AVAILABLE
	ESCUTCHEON PINS	1/4" TO 2"	BRIGHT STEEL, BRASS PLATED, BRASS, ALSO *NICKEL, SILVER, COPPER, ALUMINUM
	FENCE NAILS	5d TO 20d	SMOOTH; BRIGHT, CEMENT COATED (GAUGE HEAVIER THAN COMMON)
	FINISHING NAIL, WIRE	2d TO 20d	SMOOTH; * CUPPED HEADS AVAILABLE (SMALLER GAUGE THAN USUAL COMMON BRAD)
	FINISHING NAILS	STANDARD: 3d TO 20d FINE: 6d TO 10d	CUT IRON AND STEEL
	FINE NAILS	*2d & 2d EX. FINE *3d & 3d EX. FINE	*BRIGHT - SMALLER GAUGE & HEADS THAN COMMON NAILS
	FLOORING NAILS	*3d TO *20d 6d TO 20d	*BRIGHT & CEMENT COATED (DIFFERENT GAUGE) *CUPPED HEADS AVAILABLE
	FLOORING BRAD	6d TO 20d	SMOOTH; BRIGHT & CEMENT COATED CUPPED HEADS AVAILABLE

* NOT COVERED IN FEDERAL SPECIFICATIONS

** FOR LETTER CODE SEE FIRST PAGE OF THIS SERIES.

NAIL TYPE **		SIZE		MATERIAL
	PARQUET FLOORING NAIL OR BRAD	½", 1⅛", 1¼"		SMOOTH OR BARBED
	FLOORING NAILS	4d TO 10d		IRON OR STEEL (CUT)
	HINGE NAILS	HEAVY: 1/4" TO 3/8" DIA. LIGHT-3/16" TO 1/4" DIA	1½" TO 4" LONG	SMOOTH, BRIGHT OR ANNEALED
	HINGE NAILS	HEAVY-1/4" DIA. LIGHT - 3/16" DIA.	1½" TO 3" ALSO TO *4"	SMOOTH, BRIGHT OR ANNEALED
	LATH NAILS (WOOD)	2d, 2d LIGHT 3d 3d, LIGHT, 3d HEAVY 4d.		BRIGHT (NOT RECOMMENDED) BLUED OR CEMENT COATED
	GUTTER SPIKES	6" TO 10"		STEEL, ZINC COATED
	HINGE NAILS	1½" TO 3"		STEEL, ZINC COATED
	LATH NAILS (METAL)	1⅛"		BRIGHT, BLUED, ZINC COATED, ANNEALED
	LATH STAPLES	1" TO 1½"		BRIGHT, BLUED, ZINC COATED, ANNEALED
	* LATH OFFSET HEAD NAILS FOR SELF FURRING METAL LATH	1¼" TO 1¾"		BRIGHT, ZINC COATED
	MASONRY NAILS USED FOR FURRING STRIPS CLEATS, PLATES	½" TO 4"		HIGH CARBON STEEL, HEATED & TEMPERED
	MOLDING NAILS (BRADS)	⅞" TO 1¼"		SMOOTH, BRIGHT OR CEMENT COATED
	PLASTER-BOARD NAILS USED ALSO FOR WALL-BOARD ROCK LATH (5/16" HEAD)	1" TO 1¾" 1⅛" TO 1½"		* SMOOTH, BRIGHT OR CEMENT COATED, BLUED ALUMINUM
	ROOFING NAILS (STANDARD)	¾" TO 2"		BRIGHT, CEMENT COATED, ZINC COATED BARBED
	ROOFING NAILS FOR BUILT-UP ROOFING	⅜" TO 2"		STEEL, ZINC COATED
	NEOPRENE WASHER ROOFING NAILS	1½" TO 2½"		STEEL, ZINC COATED
	ROOFING NAILS LARGE HEAD	¾" TO 1¾" ALSO *2" ¾" TO 2½"		BARBED, BRIGHT OR ZINC COATED CHECKERED HEAD AVAILABLE ALUMINUM (ETCHED) NEOPRENE WASHER OPTIONAL

* NOT COVERED IN FEDERAL SPECIFICATIONS

** FOR LETTER CODE, SEE THE PRECEDING PAGE

NAIL TYPE**		SIZE	MATERIAL
	ROOFING NAILS LARGE HEAD	3/4" TO 1¼"	BRIGHT OR ZINC COATED
	*NON-LEAKING ROOFING NAIL	*1¾" TO 2"	*ZINC COATED, ALSO WITH LEAD HEADS
	CUT SHEATHING NAILS	3/4" TO 3"	COPPER OR MUNTZ METAL
	SHINGLE NAILS	3d TO 6d 2d TO 6d	SMOOTH, BRIGHT, ZINC, CEMENT COATED, LIGHT AND HEAVY ALUMINUM
	CUT SHINGLE NAILS	2d TO 6d	IRON OR STEEL (CUT) PLAIN OR ZINC COATED
	SIDING NAILS	2d TO 40d 6d TO 10d	SMOOTH, BRIGHT OR CEMENT COATED SMALLER DIAMETER THAN COMMON NAILS * ALUMINUM
	SIDING NAILS USED FOR FENCES, TANKS, GATES, ETC.	2½" TO 3"	STEEL ZINC COATED
	SLATING NAILS	3/8" HEAD 1" TO 2" SMALL HEADS 1" TO 2" COPPER WIRE 7/8"-1½"	ZINC COATED, BRIGHT, CEMENT COATED, COPPER CLAD, COPPER
	CUT SLATING NAILS, NON-FERROUS	1¼" TO 2"	COPPER, ZINC OR MUNTZ METAL
	BARGE SPIKE, SQUARE	3" TO 12" *ALSO 16"	PLAIN AND ZINC COATED USED FOR HARDWOOD
	BOAT SPIKE, SQUARE	3" TO 12"	PLAIN AND ZINC COATED USED FOR HARD WOOD
	ROOF DECK NAILS	1" AND 1¾"	GALVANIZED - NAILS STEEL TUBE
	ROUND WIRE SPIKES	10d TO 60d ¢ 7" TO 12" *ALSO 16"	SMOOTH, BRIGHT OR ZINC COATED

* NOT COVERED IN FEDERAL SPECIFICATIONS

** FOR LETTER CODE, SEE A PRECEDING PAGE IN THIS SERIES

SHEET METAL & THREADING SCREWS

SHEET METAL GIMLET POINT.

Hardened, self-tapping. Used in 28 to 6 gauge sheet metal; aluminum, plastic, slate, etc. Usual head types.

SHEET METAL BLUNT POINT.

Hardened, self-tapping. Used in 28 to 18 gauge sheet metal. Made in 4 to 14 sizes and usual heads.

THREAD CUTTING-CUTTING SLOT.

Hardened. Used in metals up to 1/4" thick. Sizes: 4 to 5/16", in usual head types. (Flat, oval, round, etc.).

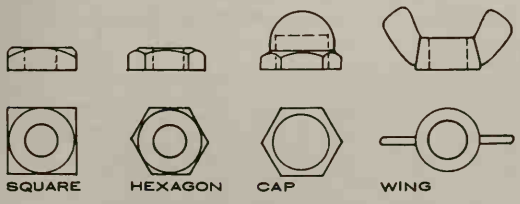
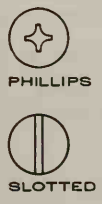
NUTS



SQUARE HEXAGON CAP WING

HEADS

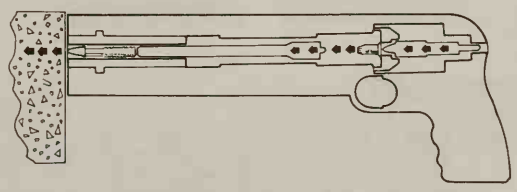


PHILLIPS SLOTTED

NUT SIZES

Square and hexagon head nuts are available for all screws and bolts listed; Cap nuts for all except nos. 2, 3, 4 (40 N.C. only), 5, and 9/16". Wing nuts for all except nos. 2, 3, 4 (40 N.C.), 5, 9/16", 5/8", 3/4", 7/8" and 1".

American Standard sizes by the American Institute of Bolt, Nut and Rivet Manufacturers. Many of listed items also stocked in aluminum, brass, copper, stainless steel, monel and bronze. Stove bolts have wider tolerances than machine screws.



POWER ACTUATED SETTING DEVICE

LOW VELOCITY PRINCIPLE

The energy from a special industrial powder charge actuates a piston inside the tool barrel. The actuated piston sets drive pins instantly at low velocity. Drilling is eliminated.

SQUARE HEAD HEADLESS

SET SCREWS

Headless type with socket or slotted top made in sizes 4 to 1/2"; in 1/2" to 5" lengths.

Square head sizes 1/4" to 1"; 1/2" to 5" lengths.

SOCKET TOP

SLOTTED TOP

CUT

Of steel and non-ferrous metals.

O.G. CAST

Made of cast metal.

WASHERS

All types for bolts and screws of all sizes.

SPRING LOCK

Of steel, monel metal, bronze and stainless steel.

EXTERNAL TOOTH ROCK

Of steel, monel metal, bronze, beryllium copper and stainless steel.

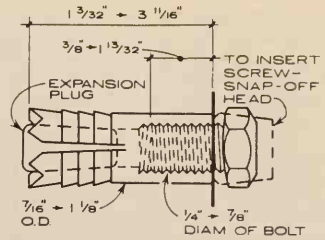
NOTE:

1. * Extension sleeve for deep setting.
2. Expansion shields and anchors shown are representative of many types, some of which may be used in single or multiple units. Many are threaded for use with the head of the screw outside, some with the head inside and some types require setting tools to install.



SELF DRILLING EXPANSION ANCHOR
(SNAP-OFF TYPE)

NOTE:

1. Refer to manufacturers for size variations within the limits shown, and for different types of bolts.
2. The anchor is made of case hardened steel and drawn carburizing steel.

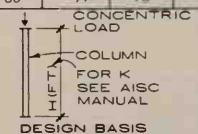
KIP = 1000 POUNDS
D = TYPE OF COLUMN
WT = WEIGHT IN LBS PER FOOT
WF = WIDE FLANGE
Φ = PIPE
X = SQUARE OR RECTANGULAR TUBING
K = EFFECTIVE LENGTH FACTOR (VERIFY WITH STRUCTURAL ENGINEERING CONSULTANT)



DESIGN BASIS

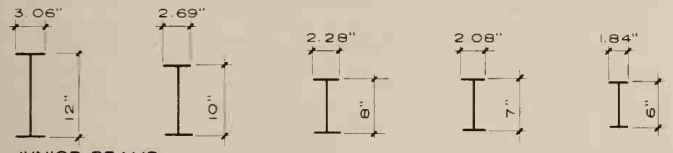
NOTE:
For additional columns and actual dimensions of pipe see "AISC Manual of Steel Construction," 6th edition.

H. Thompson, P. E.; Thompson & Czark; East Meadow, Long Island, New York

PRELIMINARY SELECTION OF LIGHTWEIGHT STEELBEAMS AND LIGHTGAGE STEEL JOISTS

The tables used on this page on depths of joists and beams are not to be used for final design but are intended to serve as an aide to the architect in speeding selection of members for preliminary design and planning. The engineering design should of course be a separate and thorough process process involving a complete investigation of the pertinent conditions.

EXAMPLE: Assume a particular clear span. By selecting a spacing and estimating the total load, a member can immediately be selected from the table. NOTE: "Total Load." = Live Load plus Dead Load. Dead Load used in tables includes weight of joist or beam. For recommended Live Loads, see page on "Weights of Materials". Local code governs.

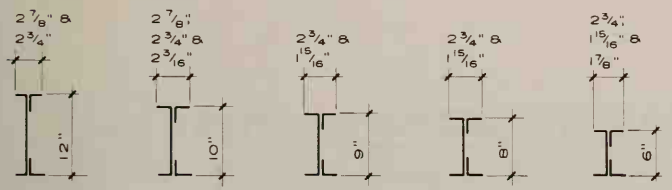


JUNIOR BEAMS

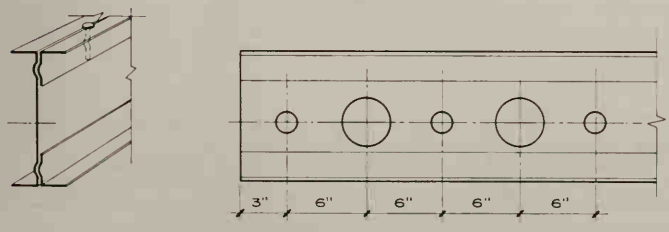
BRIDGING FOR J&L JUNIOR BEAMS

BEAM SPAN	BRIDGING SPACING
TO 14'–0"	1 row near center of span
14'–0" to 21'–0"	2 rows approx. at 1/3 points of span
21'–0" & over	3 rows approx. at 1/4 points of span

For wider spacing see manufacturer's literature



LIGHTGAGE NAILABLE JOISTS



SECTION OBLIQUE SIDE ELEVATION

Consult manufacturer's literature to determine economical members.

Jean Lesire, AIA; Arlington, Virginia

BRIDGING FOR LIGHTGAGE STEEL JOISTS

JOIST SPAN	BRIDGING SPACING
TO 14'–0"	1 row at center of span
14'–0" to 20'–0"	2 rows 1/4 span apart, symmetrical about midspan
20'–0" & over	3 rows, 1/4 span apart.

PRELIMINARY SELECTION OF OPEN WEB STEEL JOISTS

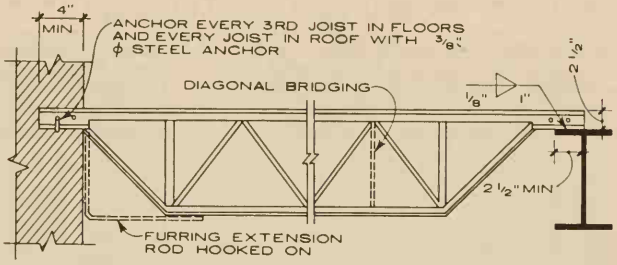
The table below on depths of Open Web Steel Joists is not to be used for final joist design but is intended to serve as an aid in speeding selection of steel joists for preliminary design and planning.

The final design must be a separate and thorough process, involving a complete investigation of the pertinent conditions. This page is not for that purpose.

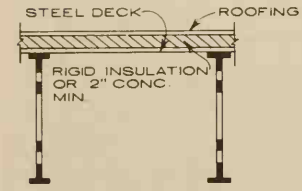
EXAMPLE Assume a particular clear span. By assuming a joist spacing and estimating the total load, a joist can immediately be selected from the table. Then proceed with preliminary design studies.

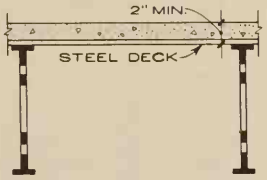
NOTE: "Total Safe Load" = Live Load plus Dead Load. Dead Load used in table below includes weight of joist. For recommended live loads, see pages on Weights of Materials. Local codes will govern.

Joint designation in table is that generally used on structural plans.



SECTION THRU JOIST BEARING





MINIMUM ATTACHMENTS: 2 welds, ea. 1" long or 1/2" bolt or rivet, or 3/16" round steel anchor fastened over beam flange.

BRIDGING SPACING

JOINT SPAN	MAXIMUM SPACING
To 14'–0"	1 row near center
14'–0" to 21'–0"	2 rows at 1/3 points of span
21'–0" to 32'–0"	3 rows at 1/4 points of span
32'–0" to 40'–0"	4 rows at 1/5 points of span
40'–0" to 48'–0"	5 rows at 1/6 points of span

NOTE: No span to exceed 24 times joist depth. Except for floors, the clear span of an H–series joist shall not exceed 20 times joist depth.

FIRE RESISTANCE RATINGS

HRS	TOP SLAB	CEILINGS
3/4	1" T & G on 2" x 2" wood strips attached to joist.	3/4" sanded gypsum plaster on expanded metal lath.
1 or 1 1/2	2" reinf. conc., or 2" precast reinf. gypsum tile.	3/4" portland cement or sanded gypsum plaster on expanded metal lath.
	2" reinf. conc.	5/8" UL listed gypsum board
2	2 1/2" reinf. conc., or 2" reinf. gypsum tile with 1/4" mortar finish.	3/4" sanded gypsum plaster on expanded metal lath.
	2" reinf. conc.	5/8" UL listed acoustical tile
	1" non-combustible insulation board over 18–22 gage steel roof deck.	7/8" vermiculite plaster on expanded metal lath.
3	2 1/2" reinf. conc., 2" reinf. gypsum tile with 1/2" mortar finish.	1" gypsum plaster, or 3/4" gypsum–vermiculite plaster on expanded metal lath.
4	2 1/2" reinf. conc., or 2" reinf. gypsum tile with 1/2" mortar finish.	1" gypsum–vermiculite plaster on expanded metal lath.

Ratings are the result of tests made in accordance with ASTM standard E119.

PRELIMINARY SELECTION OF LONG SPAN STEEL JOISTS

The table below on depths of Long Span Steel Joists is not to be used for final joist design but is intended to serve as an aid in speeding selection of steel joists for preliminary design and planning.

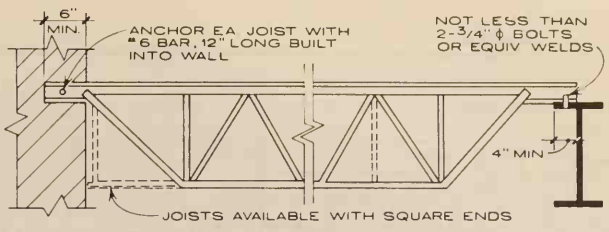
The final design must be a separate and thorough process, involving a complete investigation of the pertinent conditions. This page is not for that purpose.

EXAMPLE: assume a particular clear span. By assuming a joist spacing and estimating the total load, a joist can immediately be selected from the table. Then proceed with preliminary design studies.

NOTE: "Total Safe Load" = Live Load plus Dead Load. Dead Load used in table below includes weight of joist. For recommended live loads, see pages on Weights of Materials. Local codes will govern.

Joists will span to 96'–0" of clear opening, but from approximately 70'–0" to 96'–0" are primarily for roof construction.

Joist designation in table is that generally used on structural plans.



SECTION THRU JOIST BEARINGS

NOTE: FOR FIRE RESISTANT CONSTRUCTION SEE PAGE ON "OPEN WEB STEEL JOISTS"

BRIDGING SPACING

CHORD SIZE *	MAXIMUM SPACING
No. 02 to No. 08, incl.	10' – 0"
No. 09 to No. 14, incl.	16' – 0"
No. 15 to No. 19, incl.	21' – 0"

Joist span not to exceed 24 x depth for roofs, 20 x depth for floors.

* Last two digits of joist designation shown in load table.

NOTES:
Round steel pipe is specified by nominal inside diameter followed by the terms "standard," "extra strong" and "double extra strong").

Rectangular & square & other shaped tubing is measured by outside dimension.

STEEL SQUARE

4" × 4"	11	3/16"	1/4"	5/16"	3/8"	1/2"			

ALL DIMENSIONS ARE BW GUAGE EXCEPT AS NOTED IN INCHES.

Tubing and pipe are available in various shapes and thicknesses for aluminum and bronze. Individual manufacturer's catalogs should be consulted for these metals. Some rectangular and square tubing has round corners. Extruded tubing has sharp, square corners.

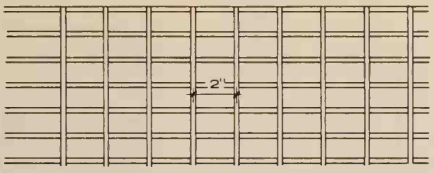
WITH SPACER BARS WELDED 4" O.C.



WITH SPACER BARS WELDED 2" O.C.

RECTANGULAR (WELDED OR PRESSURE LOCKED) 1½" = 1'-0"

NOTES:

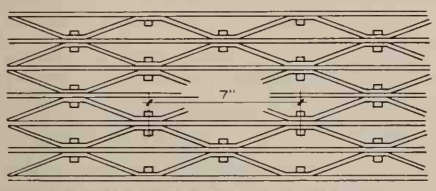
Constructed of flat bearing bars with spacer bars at right angles. Spacer bars may be square, rectangular or other shape. Spacer bars connected to bearing bars by pressing into prepared slots, or by welding. Usually with open ends, or may have ends banded with flat bars of similar size as bearing bars welded. Standard bar spacing 1 5/16" and 1 3/16". For usual bar sizes see "Table of Safe Loads for Gratings."

NOSING OF ANGLE AND ABRASIVE STRIP AND BAR ENDS

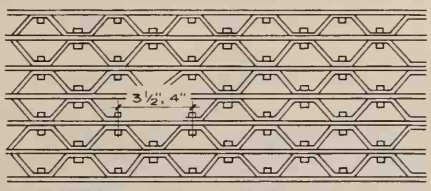
HEAVY FRONT AND BACK BEARING BARS AND BAR END PLATES

FLOOR PLATE NOSING, BAR END PLATES

TREADS



WITH SPACER BARS RIVETED APPROX. 7" O.C.
USED FOR AVERAGE INSTALLATION



WITH SPACER BARS RIVETED 3½" OR 4"
USED FOR HEAVY TRAFFIC AND WHERE WHEELED EQUIPMENT IS USED

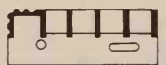
RETICULATED (RIVETED) 1½" = 1'-0"

NOTES:

Construction of flat bearing bars and continuous bent spacer or reticuline bars riveted to the bearing bars. Usually with open ends or may have ends banded with flat bars of similar size as bearing bars, welded across ends. Normal spacing of bars: ⅞", 1", 1⅛", 1 3/16", or 1¼". For usual bar sizes see "Table of Safe Loads for Gratings."

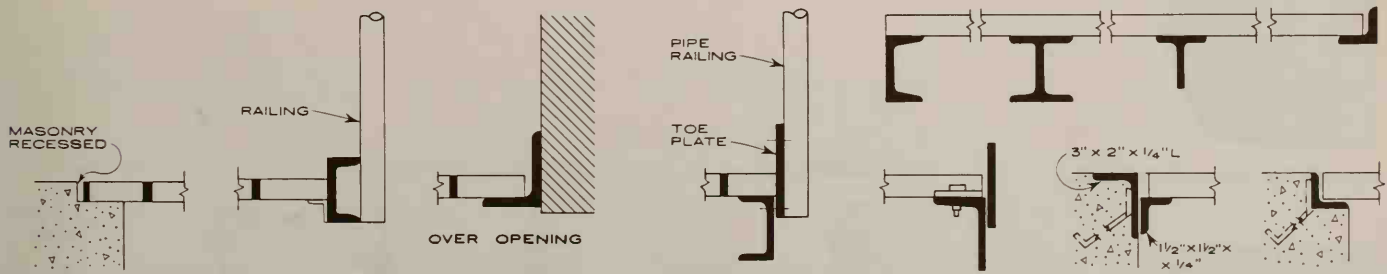
PLAIN NOSING BAR END PLATES

NOSING OF CLOSELY SPACED BARS, ANGLE ENDS



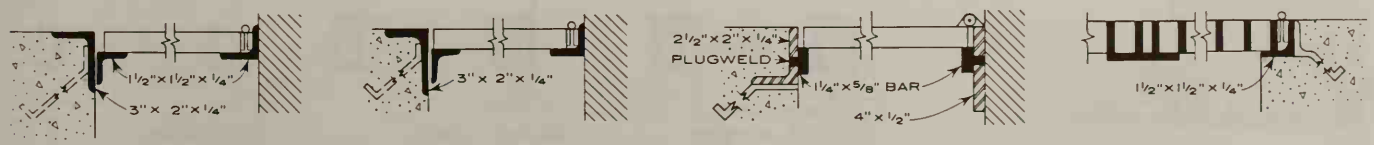
CHECKER PLATE NOSING, BAR END PLATES

TREADS



USUALLY ATTACHED BY WELDING, WHERE SUPPORT AND GRATE ARE CONSTRUCTED AS A UNIT

FIXED OR LOOSE GRATINGS 1½" = 1'-0"



SIZES OF ANGLES SUPPORTING GRATING DEPEND ON DEPTH OF GRATING BARS

HINGED AREA GRATINGS 1½" = 1'-0"

Vicente Cordero, AIA; Arlington, Virginia

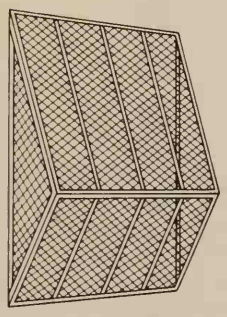
TYPES OF FRAME AND WOVEN WIRE MESH

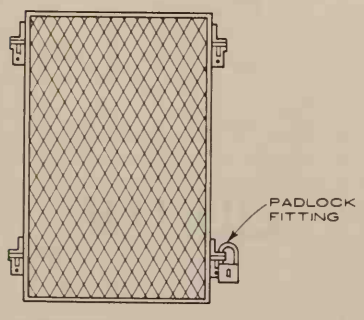
RECOMMENDED USES FOR VARIOUS MESHES AND FRAMES

1/2" mesh #16 wire square or diamond	3/8" round or 1" channel	air intake screen, bird screen, window screen	galvanize after fabrication or use bronze
1" mesh #12 wire square or diamond	3/8" round or 1" channel	basement window guard, shelving, pipe railing screens	diamond mesh for strength
1 1/4" mesh #11 wire square or diamond	3/8" round or 1" channel	same as above, also animal cages	galvanize after fabrication
1 1/4" mesh #10 wire diamond	1 1/4" channel or 1" x 1/2" x 1/8"	heavy duty partitions as for tool cribs, elevator shafts, and stock rooms	ideal for factory use where trucking is done
1 1/2" mesh #10 wire diamond	1" or 1 1/4" x 1/2" x 1/8" channel	stockrooms, toolrooms, transformers, fire escape railings, stair enclosures, locker rooms, animal runways, lockers, etc.	standard multi-purpose construction (2" mesh can be used for economy)
1 1/2" mesh #10 wire	1" channel or 1/2" round	door and window guards	usual specification for insurance protection
2" mesh #6 wire	1 1/2" x 3/4" channel	same as for 1 1/2" mesh //10 wire	for heavy duty use

Woven wire available in stainless steel, aluminum, brass, bronze, copper, monel, etc. Can be round, square, flat, pressed, or crimped.



GUARD FOR VENTILATING SASH



REMOVABLE GUARD

Abbreviations: KD = Kiln Dried in accordance with Standard Grading Rules; SR = Stress Rated

WOOD COLUMNS ALLOWABLE SAFE LOADS FOR SIMPLE SOLID COLUMNS USING SIMPLIFIED DESIGN FORMULA AND TABLE.

FORMULA DERIVATION: From Euler Column Formula

$$P/A = u\,\frac{\pi^2 E}{(L/r)^2}$$

where P = Safe Load in Pounds
A = Cross Section Area in in. sq.
L/r = Slenderness Ratio
E = Modulus of Elasticity
u = Factor for end condition
Pin end = 1

Applying reduction factor and adjustment for normal loading during formula becomes:

$$P/A = \frac{.361\,E}{(L/r)^2}$$

Provided that P/A shall not exceed value for C, allowable unit compressive stress parallel to grain (See Table Allowable Stresses)

For wood columns Slenderness Ratio is expressed as L/d where L is height in inches, d is least column dimension in inches

Formula then becomes: $P/A = \frac{.30\,E}{(L/d)^2}$ or $P = \frac{A.30E}{(L/d)^2}$

Formula is further simplified by letting $Y = \frac{A.30}{(L/d)^2}$

For square columns of heights between 6 feet and 14 feet values of Y are given in table below.

EXAMPLE: Square Wood Column Height 10 feet

Nominal 6 x 6 Douglas Fir E = 1,760,000 psi (see table)

d = 5.5 inches
A = 30.25 inches square
$L/d = 120/5.5 = 21.82$
$(L/d)^2 = 475$

$$Y = \frac{A.3}{(L/d)^2} = \frac{30.25 \times .3}{475} = .019$$

$$P = YE = .019 \times 1{,}760{,}000 = 33{,}440 \text{ pounds}$$

NOTE: Values for Y not listed in table below may be derived from formula above.

TABLE OF VALUES FOR Y FOR SQUARE WOOD COLUMNS 4 X 4, 6, 8 X 8, 10 X 10 AND 12 X 12 FOR HEIGHTS FROM 6 FEET THROUGH 14 FEET. FOR P (ALLOW. LOAD) MULTIPLY Y X E MODULUS OF ELASTICITY (See Table)

NOTES:

(The ceiling joist span lengths are based on the following):

1. Maximum allowable deflection = $^{1}/_{360}$ of the span length.
2. Dead load:
   A. Weight of joist (40 lbs. per cu. ft.).
   B. Lath and plaster ceiling (10 lbs. per cu. ft.).
3. Live load: none.

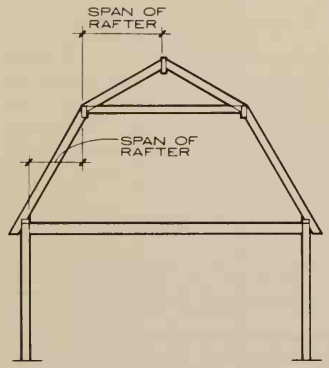
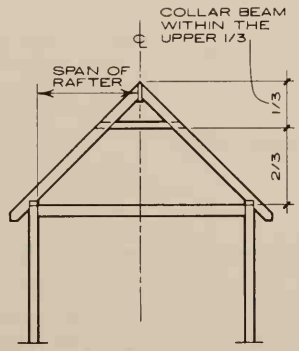
(The attic floor joist span lengths are based on the following):

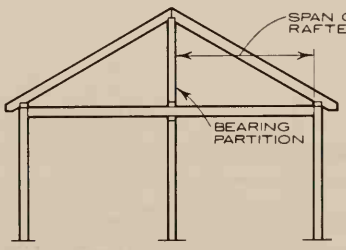
1. Maximum allowable deflection = $^{1}/_{360}$ of the span length.
2. Dead load:
   A. Weight of joist (40 lbs. per cu. ft.).
   B. Lath and plaster ceiling (10 lbs. per cu. ft.).
   C. Single thickness of flooring (2.5 to 3.0 lbs. per sq. ft.).
3. Live load: 20 lbs. per sq. ft. of floor area.



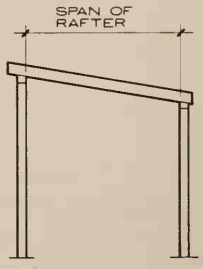
GAMBREL ROOF



GABLE ROOF



GABLE ROOF



LEAN-TO OR SHED ROOF

NOTE:

(Applicable to this and the following pages on joist and rafter sizes).

SPANS LIMITED BY DEFLECTION were computed for the assumed loads to cause a deflection not exceeding $^{1}/_{360}$ of the span. The weight of plaster itself was ignored in the assumed loads for the deflection computations, because the initial deflection from the dead load occurs before plaster sets. The influence of live loads, rather than dead loads, when the ratio of live to dead loads is relatively high, is the principal factor to be considered. Also with joisted floors, flooring and bridging serve to distribute moving or concentrated loads to adjoining members. The omission of the plaster weight in load assumption applies to deflection computations only; the full dead and live load is considered when computing for strength.

SPANS LIMITED BY BENDING STRENGTH OF PIECE: may be used where ceilings are not plastered and deflection is not objectionable.

SPANS LIMITED BY HORIZONTAL SHEAR: For the heavier loads where horizontal shear may be a factor, the tables give the horizontal shear "H" induced by the load for each beam for the spans shown. If the horizontal shear "H" shown is greater than permitted for the material used, then select another joist size or a different spacing within the proper shear limit. The following symbols appear in tables:

E = modulus of elasticity.
f = extreme fiber stress in bending.
H = horizontal shear.
L = span length between supports.

DEAD LOAD ASSUMPTIONS: The following average weights of various materials were used as the basis for dead loads in computing the span lengths. All in lbs. per sq. ft.

Finished floor	2.5
Rough floor	2.5
Roof sheathing	2.5
Plaster and lath	10.9
Roof coverings:	
Group 1 Assumed as 2.5 lbs. per sq. ft. including:	
Shingles	2.5
Copper sheets	1.5
Copper tile	1.75
Three-ply ready roofing	1.00
Group 2 Assumed as 8 lbs. per sq. ft. including	
Five-ply felt and gravel	7
Slate, $^{3}/_{16}$"	7 $^{1}/_{4}$"
Roman tile	8
Spanish tile	8
Ludowici tile	8

Joists based on average weight of wood of 40 lbs. per cu. ft.

LIVE LOAD ASSUMPTIONS: Uniformly distributed.

PARTITIONS: Spans shown are computed for the given live load plus the dead load and do not provide for additional loads such as partitions. Where concentrated loads are imposed the spans should be re-computed to provide for them.

RAFTERS AND ROOF JOISTS 20 POUND LIVE LOAD GROUP 1 ROOF COVERING

MAXIMUM ALLOWABLE LENGTHS "L" BETWEEN SUPPORTS.

From building code or other authority determine the allowable modulus of elasticity "E" (if span is to be limited by deflection) or the allowable extreme fiber stress in bending "f" (if span is to be determined by bending) for the species and grade of lumber used. Refer to the column below with corresponding value to determine the safe span for size and spacing of rafter and roof joist desired. Check span selected for deflection with spans for bending to see it does not exceed length permitted for bending stress "f" of material used.

NOTES: (For span length limited by deflection):

1. Maximum allowable deflection = $^1/_{360}$ of the span length.
2. Modulus of elasticity as noted for "E".
3. Dead load:
   A. Weight of joist.
   B. Double thickness of flooring (5 lbs.)
   C. Weight of plaster ceiling ignored.
4. Live load = 50 lbs. per sq. ft. with plastered ceiling.

NOTES: (For span length determined by bending):

1. Allowable stress in extreme fiber in bending as noted for "f".
2. Dead load:
   A. Weight of joist.
   B. Double thickness of flooring (5 lbs.)
   C. Plastered ceiling (10 lbs.).
3. Live load = 50 lbs. per sq. ft. with plastered ceiling.
   Live load = 60 lbs. per sq. ft. with unplastered ceiling.

FLOOR JOISTS LIVE LOAD = 60 POUNDS PER SQUARE FOOT

MAXIMUM ALLOWABLE LENGTHS "L" BETWEEN SUPPORTS

From building code or other authority determine the allowable modulus of elasticity "E" (if span is to be limited by deflection) or the allowable extreme fiber stress in bending "f" (if span is to be determined by bending) for the species and grade of lumber used. Refer to the column below with corresponding value to determine the safe span for size and spacing of rafter and roof joist desired. Check span selected for deflection with spans for bending to see it does not exceed length permitted for bending stress "f" of material used.

SIZE (NOMINAL) IN INCHES	SPACING (C TO C) IN INCHES	SPAN "L" LIMITED BY DEFLECTION					SPAN "L" DETERMINED BY BENDING									
		E =	1,000,000	1,200,000	1,400,000	1,600,000	f =	900	1,000	1,100	1,200	1,300	1,400	1,500	1,600	1,700	1,800

NOTES: (For span length limited by deflection):

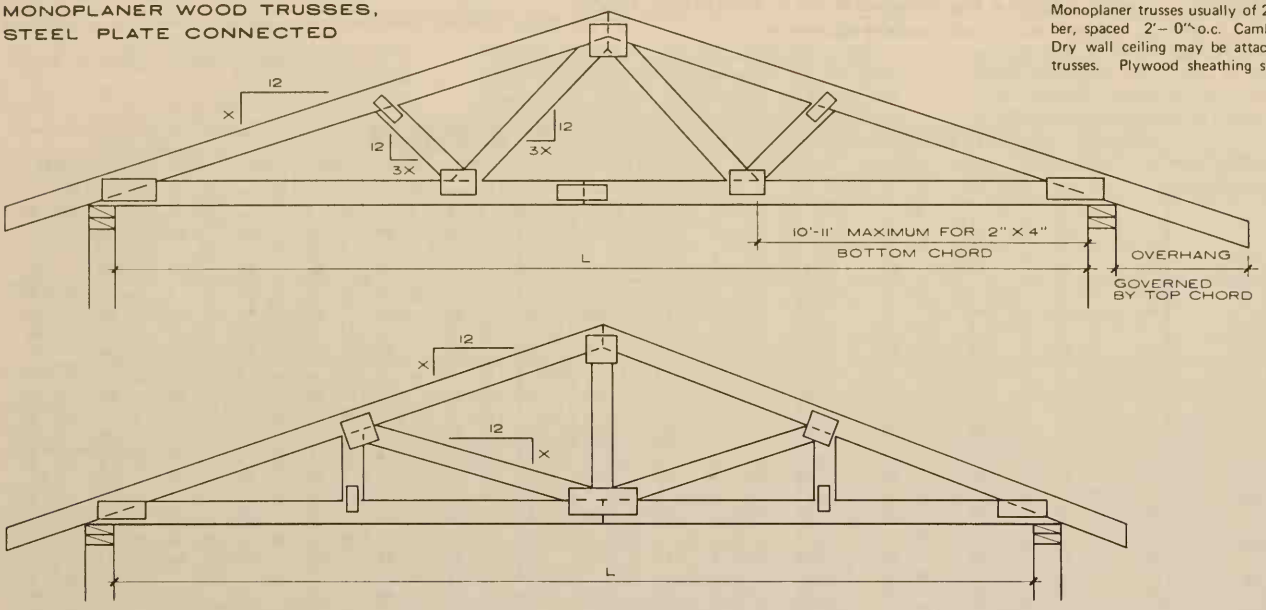
1. Maximum allowable deflection = $^{1}/_{360}$ of the span length.
2. Modulus of elasticity as noted for "E".
3. Dead load:
   A. Weight of joist.
   B. Double thickness of flooring (5 lbs.).
   C. Weight of plaster ceiling ignored.
4. Weight of plaster ceiling was included in computing horizontal shear "H" induced by load.

NOTES: (For span length determined by bending):

1. Allowable stress in extreme fiber in bending as noted for "F".
2. Dead load:
   A. Weight of joist.
   B. Double thickness of flooring (5 lbs.).
   C. Plastered ceiling (10 lbs.).
3. Live load = 60 lbs. per sq. ft. with plastered ceiling.
   = 70 lbs. per sq. ft. with unplastered ceiling.
4. Total load was considered in computing horizontal shear "H" induced by load.

MONOPLANER WOOD TRUSSES, STEEL PLATE CONNECTED

Monoplaner trusses usually of 2" nominal lumber, spaced 2'– 0"o.c. Camber as required. Dry wall ceiling may be attached directly to trusses. Plywood sheathing staggered joints.



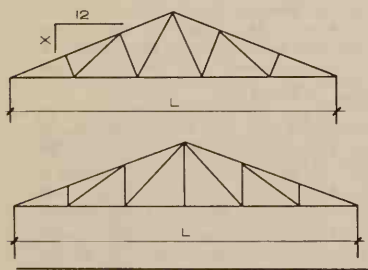
APPROXIMATE MAXIMUM SPANS (see note, right)

X	L FOR 2 X 4	L FOR 2 X 6
1½	22'	30'
2	25'	32'
2½	26'	33'
3	27'	37'
4, 5, 6	28'	40'

All web members 2 x 4.

Approximate maximum spans for 2 x 4 and 2 x 6 top chords for trusses above (4 panel) using f = 1500 psi lumber with total loading of 55 psf including wind or 47.5 psf including snow.

FOUR PANEL TRUSSES



APPROXIMATE MAXIMUM SPANS (with 2 x 6 top and bottom chords ; f = 1500 psi.)

X	L FOR PINE	L FOR FIR

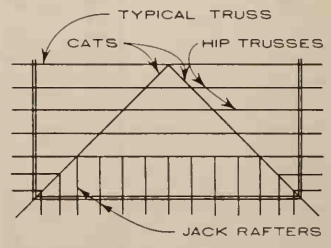
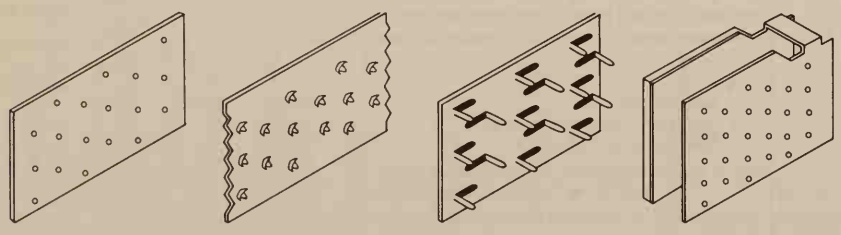
3	52'	50'
3½	60'	59'
4, 5, 6	60'	60'

All web members 2 x 4.

SIX PANEL TRUSSES



HIPPED ROOF



NAIL-ON 20 GAUGE | PRONGS 20 GAUGE | TEETH 14-20 GAUGE | SELF-CLINCHING NAILS 20 GAUGE

Plates manufactured from zinc-coated (hot dip process) sheet steel conforming to current ASTM A–93. Plates applied to both sides of joint, offset 1/4 inch with respect to each other. Where nails are required through connector plates they shall be 1 1/2 inches long with 9/32 inch head and a 0.12 inch (8d) deformed or annular ringed shank.

PLATE TYPES

GENERAL NOTES

1) Trusses designed in accordance with Truss Plate Institute Design Specifications for plate evaluation and National Design Specifications for nail values.

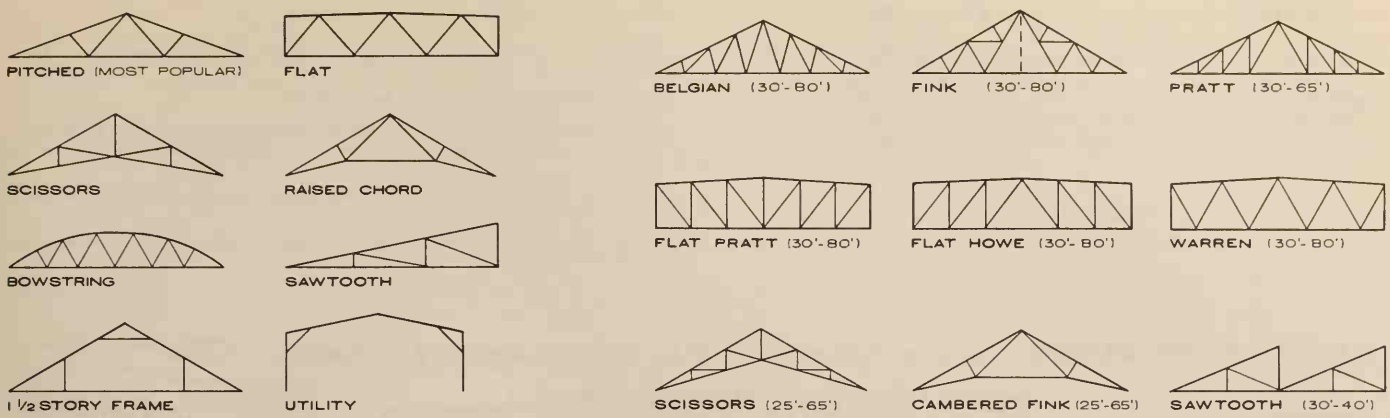
2) Plates sized for axial loads, eccentricity and net section of metal.

3) Truss members shall be clamped in a mechanical or hydraulic jig with sufficient pressure to bring members into reasonable contact at all joints during application of connector plates.

4) Provide adequate anchorage and erection bracing.

Based on National Design Specifications for stress grade lumber and its fastenings.

Joseph A. Wilkes, AIA; Wilkes and Faulkner; Washington, D. C.



LIGHT TRUSSES (TRUSSED RAFTERS)
SPACING: 2'-0" (NORMAL, BUT UP TO 4'-0")
D.L. + L.L. = 45 LBS. PER SQ. FT. (AVERAGE)
SPANS: 20'-32' (NORMAL, BUT UP TO 50')
USES: VARIED

HEAVY TRUSSES
SPACING: 15'-16' (AVERAGE, BUT ALSO 8'-20')
D.L. + L.L. = 45 LBS. PER SQ. FT. (AVERAGE)
SPANS: AS NOTED
USES: COMMERCIAL, INDUSTRIAL, RECREATIONAL, CHURCHES, ETC.

POPULAR TRUSS TYPES DEPTH TO SPAN RATIOS: PITCHED 1/6, 1/7; FLAT 1/8, 1/10; BOWSTRING 1/6, 1/8;

LUMBER:
COMPRESSION PARALLEL TO GRAIN..... 900 PSI
EXTREME FIBER IN BENDING.....1,200 PSI
MODULUS OF ELASTICITY.....1,760,000 PSI

STRUCTURAL GLUED LAMINATED TIMBER

This is an engineered, stress-rated product of a timber laminating plant, comprising assemblies of specially selected and prepared wood laminations, securely bonded together with adhesives. The grain of all laminations is approximately parallel longitudinally. The laminations shall not exceed 2 inches net thickness. They may be comprised of end joined pieces to form any length, of pieces placed or glued edge-to-edge to make wider ones, or of pieces bent to curved form during gluing.

STANDARD WIDTHS OF MEMBERS

Nominal width	3"	4"	6"	8"	10"	12"	14"	16"
Net finished width	2 1/4"	3 1/4"	5" or 5 1/4"	7"	9"	11"	12 1/2"	14 1/2"

STANDARD DEPTHS OF MEMBERS

Industry recommended practice use nominal two inch thick lumber to produce straight members and curved members having radii of curvature within the bending radii limits for the species.

Nominal one inch thick lumber is normally used when the bending radius is too sharp to permit use of nominal two inch thick laminations.

Members of constant depth normally have a depth which is a multiple of the thickness of the laminating stock used.

NOTES:

1. Beam names describe the top and bottom surfaces of the beam. The words before the hyphen describe the top surface; the word following the hyphen describes the bottom surface.
2. "S" designates a sawn surface. In general "tapered" refers to a sawn surface, and "pitched" to an unsawn sloped surface. Sawn surfaces on the tension side of a beam should be avoided.
3. Chart below applies to straight beams.

LAMINATED ROOF BEAM & PURLIN DESIGN CHART:

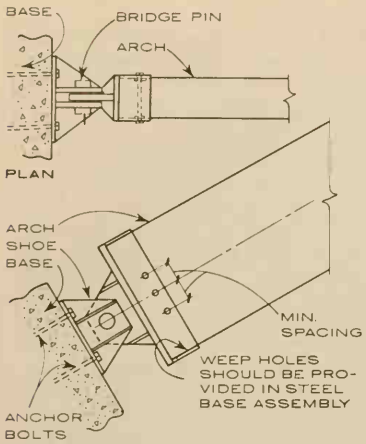
NOTES:

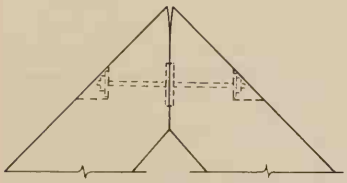
1. Sizes subject to increase if live load exceeds 75% of total load. Allowable deflection is 1/180 of the span for total load.
2. Basic allowable bending stress is 2400 psi for sections above dividing line (– – – –) and 2600 psi for sections below.
3. 15% increase for short time loading and depth effect factor applied to each section.
4. Beam weight must be subtracted from total load carrying capacity.



SIDE ELEVATION

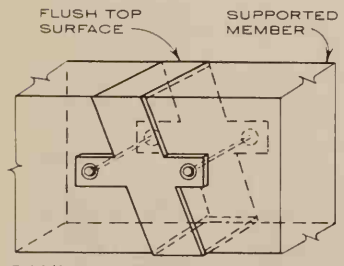
TRUE HINGE ANCHORAGE FOR ARCHES

Recommended for arches where true hinge action is desired



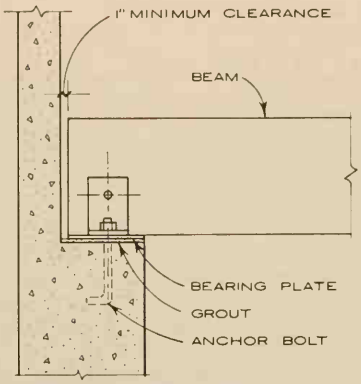
ARCH PEAK CONNECTIONS

This connection is intended for arches with a slope of 4:12 and greater, and will transfer both vertical forces (shear) and horizontal forces (tension and compression). It consists of two shear plates back to back and a through bolt or threaded rod with washers counterbored into the arch. To avoid local crushing of the peak tips of the arch due to dead load deflection, the tips are often beveled off as shown.



CANTILEVER BEAM CONNECTION–SADDLE TYPE WITH TENSION TIE ASSEMBLY

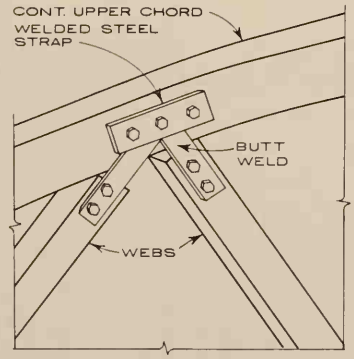
It is necessary to let the plate into the top face of the supporting member and also into the bottom face of the supported member only when both beams are of the same depth. If the supported member is of lesser depth, then it is not necessary to let the bottom of the saddle plate into the bottom face of the supported member in order to obtain end grain bearing.



BEAM ANCHORAGE

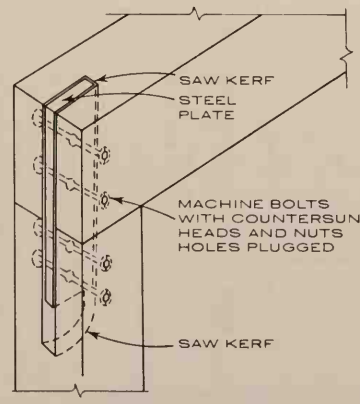
This detail is intended for anchorages which are required to resist both uplift and horizontal forces. It may have one or more anchor bolts in masonry and one or more bolts with or without shear plates through the beam.

Provide minimum of one inch clearance or impervious moisture barrier on all wall contact surfaces, ends, sides and tops (if masonry exists above beam end).

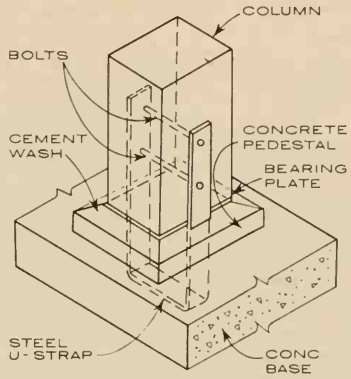


TRUSS CONNECTION MONOCHORD STEEL STRAP ASSEMBLY

Provide minimum of $\frac{1}{4}$ inch clearance between web ends and chords.

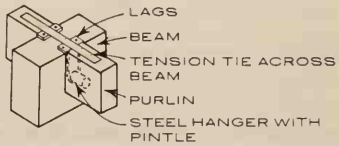


GIRDER TO COLUMN CONNECTION (CONCEALED)



U-STRAP COLUMN ANCHORAGE TO CONCRETE BASE

This detail is recommended for industrial buildings and warehouses to resist both horizontal forces and uplift. Moisture barrier is recommended. It may be used with shear plates.



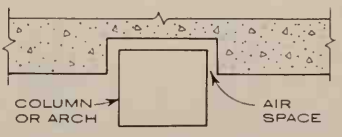
PURLIN HANGER–CONCEALED TYPE

This connection is used for light and moderate loads. Hardware is completely concealed. It is recommended for laminated and well seasoned purlins but not for unseasoned wood.

BEAM HANGER

When supported members are seasoned material, the top of the supported member may be set flush with the top of the hanger strap.

When supported members are of unseasoned material, the hangers should be so dimensioned that the top edge of the supported member is raised above the top of the supporting member, or top of hanger strap to allow for shrinkage as the members season in place. For supported members with moisture content at or above fiber saturation when installed, the distance raised should be about 5% of the members depth above its bearing point.



WOOD MEMBER SET IN MASONRY WALL POCKET

Provide minimum of one inch air space between member and wall pocket or provide adequate moisture barrier.

SIMPLE & CANTILEVERED FRAMING

This illustration shows the "positive" or downward bending that occurs in conventional framing with simple spans.

This illustration shows the combination of "positive" (downward) and "negative" (upward) bending that occurs with beams spliced at quarterpoint producing supported beam and cantilevered beam. The two types of bending counterbalance each other, which produces more uniform stresses and uses material more efficiently. In-line joists simplify plywood subflooring.

TYPICAL PLANK AND BEAM FRAMING FOR ONE STORY HOUSE

Joseph A. Wilkes, AIA; Wilkes and Faulkner; Washington, D. C.

DESCRIPTION

Use of two inch nominal thickness plank for subfloors or roofs supported on beams spaced 6 to 8 feet apart.

PRINCIPLES OF DESIGN

Two inch plank used more efficiently when continuous over more than one span.

Uses standard lumber lengths such as 12, 14 and 16 feet with beams 6, 7 or 8 feet apart.

Design permitting, end joints between supports allows use of random lengths.

ADVANTAGES OF SYSTEM

Architectural effect provided by exposed plank and beam ceiling. Added effective height of ceiling at no increase in wall height.

Fewer members permits savings in labor.

Cross-bridging not required.

LIMITATIONS OF SYSTEM

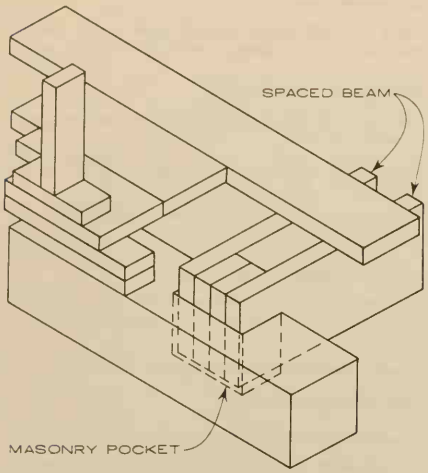
Bearing partitions and heavy loads such as bathtubs, refrigerators etc., may require additional framing. Concealment must be provided for wiring, piping and duct work.

Insulation value of two inch deck may be adequate, but where additional insulation is required it may be attached below deck or as rigid insulation above deck under roofing.

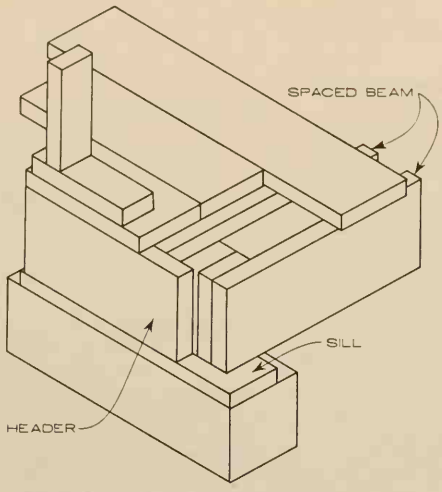
CONSTRUCTION DETAILS AND FASTENING

Members of built-up beams should be securely spiked together from both outside faces. Spaced beams should be blocked at frequent intervals, and each member should be securely nailed to blocking. Where planks butt over a single member, a nominal beam width of three or more inches is necessary to provide a suitable bearing and nailing surface for the planks. Planks should be both blind and face-nailed to the beam. In this construction posts (rather than studs) carry the loads, which are concentrated and must be designed for conditions, but not smaller than 4 x 4 inches. Built-up posts should be spiked together.

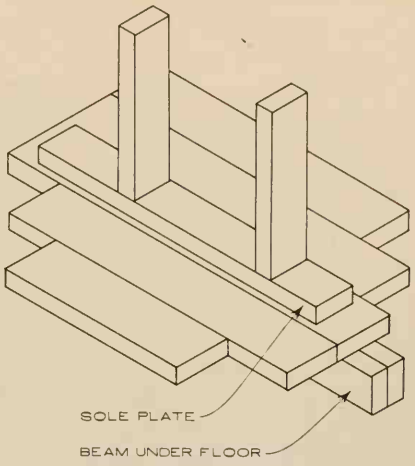
When solid beams butt at a column, a nominal column dimension of 6 or more inches parallel to direction of beam is recommended to provide suitable bearing. Spike bearing blocks to column where necessary to increase bearing surface.



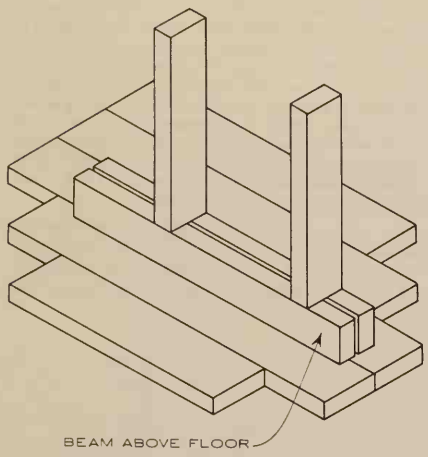
FIRST FLOOR FRAMING AT EXTERIOR WALL BEAM SET IN FOUNDATION



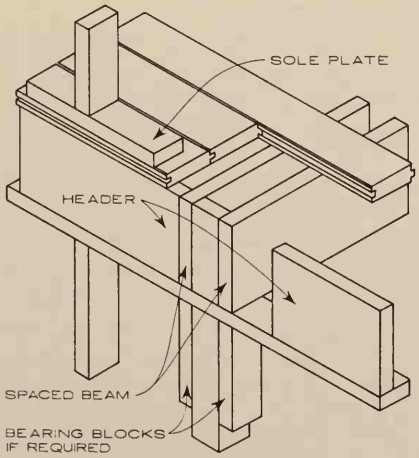
FIRST FLOOR FRAMING AT EXTERIOR WALL BEAM BEARING ON SILL



NON-BEARING PARTITION PARALLEL TO PLANK SUPPORTED BY BEAM UNDER FLOOR



NON-BEARING PARTITION PARALLEL TO PLANK SUPPORTED BY BEAM ABOVE FLOOR



SPACED BEAM BEARING AT EXTERIOR WALL

The details in this column are preferable from the standpoint of equalizing shrinkage of horizontal lumber partition supports.

Joseph A. Wilkes, AIA; Wilkes and Faulkner; Washington, D. C.

FLOOR AND ROOF BEAMS - DESIGN TABLES 40 POUNDS PSF

Required values for fiber stress in bending (f) and modulus of elasticity (E) for the sizes shown to support safely a live load of 40 pounds per square foot within a deflection limitation of $^{1}/_{300}$
1 = span in inches.

SECTION - JOISTS AT RT. ANGLES TO EXT. WALL
3/8"=1'-0"

SECTION - JOISTS PARALLEL TO EXT. WALL
3/8"=1'-0"

NOTE: SEE LAST PAGE IN THIS SERIES FOR STRUCTURAL PLYWOOD DESIGN DATA.

NOTES:

BALLOON FRAME

Studs continuous to roof, supporting second floor joists. System produces minimum vertical movement and is often selected for two story stone or brick veneer or stucco.

FIRESTOPPING

All concealed spaces in the framing should be firestopped with 2 inch thick blocking, accurately fitted to fill openings and arranged to prevent drafts from one space to another.

EXTERIOR WALL FRAMING

One Story Buildings: 2x4's, 16 or 24" o.c.
Two Story Buildings: 2x4's, 16" o.c.
Three Story Buildings: 2x4's, 16" o.c.

BRACING EXTERIOR WALLS

Suitable sheathing acts as bracing for exterior walls. Additional strength and stiffness, if required, may be provided by 1x4 members let into the outside face of the studs at a 45° angle and properly secured top and bottom and into the studs.

BRIDGING FOR FLOOR JOISTS

May be omitted when flooring is properly nailed to joists. However, where nominal depth-to-thickness ratio of joists exceeds 6, bridging should be installed at 8' – 0" intervals. (FHA also allows omission of bridging under certain conditions – see FHA publication No. 300, 1963, revised 1965.)

Joseph A. Wilkes, AIA; Wilkes and Faulkner; Washington, D. C.

SECTION - CEILING JOISTS PERPENDICULAR TO RAFTERS: FLOOR JOISTS PARALLEL TO EXTERIOR WALLS. SCALE: 3/8"=1'-0"

NOTES:

WESTERN OR PLATFORM FRAMING

Subfloor extends to outer edge of the frame and provides a flat, work surface at each floor. Common practice is to assemble walls on subfloor and tilt them into place. Arrangement of members in platform framing equilizes vertical shrinkage within the structure.

FIRESTOPPING

All concealed spaces in framing with 2" blocking, fitted to openings and arranged to prevent drafts between spaces.

EXTERIOR WALL FRAMING

One Story Buildings: 2x4's, 16" or 24" o.c.
Two & Three Stories: 2x4's, 16" o.c.

BRACING EXTERIOR WALLS

Suitable sheathing acts as bracing. Where required for additional stiffness or bracing, 1x4's may be let into outer face of studs at 45° angle secured top, bottom and to studs.

BRIDGING FOR FLOOR JOISTS

May be omitted when flooring is properly nailed to joists. However, where nominal depth-to-thickness ratio of joists exceeds 6 bridging should be installed at 8' – 0" intervals. (F.H.A. also allows omission of bridging under certain conditions-see F.H.A. publication No. 300, 1963, revised 1965.)

PLYWOOD SUBFLOORING - THICKNESS, SPAN, NAIL SPACING

NOTES 1, 3, & 4
FOR DIRECT APPLICATION OF T&G WOODSTRIP AND BLOCK FLOORING & LIGHTWEIGHT CONCRETE

PANEL IDENTIFICATION INDEX	PLYWOOD THICKNESS (INCHES)	MAXIMUM SPAN (INCHES)	NAIL SIZE & TYPE	NAIL SPACING	
				PANEL EDGES	INTERMEDIATE
30/12	5/8	12(6)	8d common	6	10
32/16	1/2, 5/8	16(7)	8d common(8)	6	10
36/16	3/4	16(7)	8d common	6	10
42/20	5/8, 3/4, 7/8	20(7)	8d common	6	10
48/24	3/4, 7/8	24	8d common	6	10
1 1/8" Groups 1 & 2	1 1/8	48	10d common	6	6
1 1/4" Groups 3 & 4	1 1/4	48	10d common	6	6

NOTES:

1. These values apply for Structural I and II, Standard sheathing and C-C Exterior grades only.
2. Identification Index appears on all panels except 1 1/8" and 1 1/4" panels.
3. In some nonresidential buildings, special conditions may impose heavy concentrated loads and heavy traffic requiring subfloor constructions in excess of these minimums.
4. Edges shall be tongue and grooved or supported with blocking for square edge wood flooring, unless separate underlayment layer (1/4" minimum thickness) is installed.
5. Spans limited to values shown because of possible effect of concentrated loads. At indicated maximum spans, floor panels carrying Identification Index numbers will support uniform loads of more than 100 psf.
6. May be 16" if 25/32" wood strip flooring is installed at right angles to joists.
7. May be 24" if 25/32" wood strip flooring is installed at right angles to joists.
8. 6d common nail permitted if plywood is 1/2".

CLASSIFICATION OF SPECIES

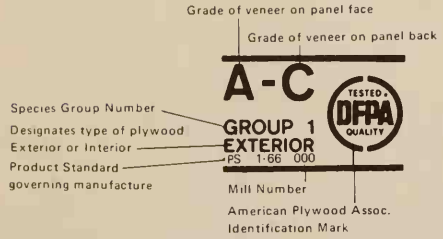
GROUP 1	GROUP 2	GROUP 3	GROUP 4
Douglas fir 1 *	Cedar, Port Orford	Alder, red	Cedar
Larch, Western	Douglas fir 2 **	Cedar, Alaska yellow	Incense Western red
Pine, Southern Loblolly Longleaf Shortleaf Slash	Fir California red Grand Noble Pacific silver White	Pine Lodgepole Ponderosa	Fir, subalpine
Tanoak	Hemlock, Western	Redwood	Pine, sugar Poplar, Western
	Lauan Red White		Spruce, Engelmann
	Pine, Western White		
	Spruce, Sitka		

* Douglas fir 1—Washington, Oregon, California, Idaho, Montana, Wyoming, British Columbia, Alberta.

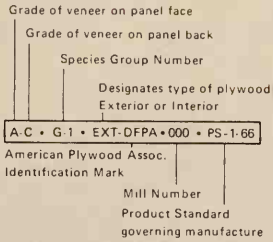
** Douglas fir 2—Nevada, Utah, Colorado, Arizona, New Mexico.

VENEERS GRADES USED IN PLYWOOD

N	Special order "natural finish" veneer. Select all heartwood or all sapwood. Free of open defects. Allows some repairs.
A	Smooth and paintable. Neatly made repairs permissible. Also used for natural finish in less demanding applications.
B	Solid surface veneer. Circular repair plugs and tight knots permitted.
C	Knotholes to 1". Occasional knotholes 1/2" larger permitted providing total width of all knots and knotholes with a specified section does not exceed certain limits. Limited splits permitted. Minimum veneer permitted in Exterior-type plywood.
C PLUGGED	Improved C veneer with splits limited to 1/8" in width and knotholes and borer holes limited to 1/4" by 1/2".
D	Permits knots and knotholes to 2 1/2" in width and 1/2" larger under certain specified limits. Limited splits permitted.



TYPICAL BACK STAMP



TYPICAL EDGE STAMP

TYPICAL DFPA GRADE TRADEMARKS

NOTE:

All the Interior grades shown are also available with Exterior glue. However these grades permit D veneer and are not an adequate substitute for Exterior type plywood which is limited to C or better veneer throughout. Also all grades shown, except Plyform, are available tongue and grooved in panels 1/2", 5/8", 3/4" and 1 1/8".

PLYWOOD ROOF DECKING TABLE. SEE INDEX FOR PAGE FOR SUBFLOORING TABLE, AND FOR WALL SHEATHING.

2 4 1	1 1/8	72	48							160 (160)	95 (95)	70 (70)	45 (45)	25 (30)
1 1/8" G 1&2	1 1/8	72	48							145 (145)	85 (85)	65 (65)	40 (40)	30 (30)
1 1/4" G 3&4	1 1/4	72	48							160 (165)	95 (95)	75 (75)	45 (45)	25 (35)

NOTE:

1. Applies to Standard, Structural I and II and C-C grades only.
2. For applications where the roofing is to be guaranteed by a performance bond, recommendations may differ somewhat from these values. Contact American Plywood Association for bonded roof recommendations.
3. Use 6d common smooth, ring-shank or spiral thread nails for 1/2" thick or less, and 8d common smooth, ring-shank or spiral thread for plywood 1" thick or less (if ring-shank or spiral thread nails same diameter as common). Use 8d ring-shank or spiral thread or 10d common smooth shank nails for 2-4-1, 1 1/8" and 1 1/4" panels. Space nails 6" at panel edges and 12" at intermediate supports. Except that where spans are 48" or more, nails shall be 6" at all supports.
4. These spans shall not be exceeded for any load conditions.
5. Provide adequate blocking, tongue and grooved edges or other suitable edge support such as Plyclips when spans exceed indicated value. Use two Plyclips for 48" or greater spans and one for lesser spans.
6. Uniform load deflection limitation: 1/180th of the span under live load plus dead load, 1/240th under live load only. First number shown is allowable live load, and allowable total load is shown with parentheses.
7. Allowable roof loads were established by laboratory test and calculations assuming uniformly distributed loads.

Joseph A. Wilkes, AIA; Wilkes and Faulkner; Washington, D. C.

EAVES VENTILATING MATERIAL

1. Ventilation of all rafter spaces required to prevent condensation and rot.
2. All vents should be protected from insect infestation by metallic or fiber glass screen cloth where perforations in material are greater than 1/10 inch.

Joseph A. Wilkes, AIA; Wilkes and Faulkner; Washington, D. C.

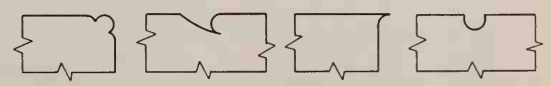
STANDING AND RUNNING TRIM PATTERNS ③ ⑤ ⑥

Numerous patterns and dimensions of trim are produced in a variety of hard and soft woods for interior and exterior use. For a complete line of patterns, sizes, and wood species available, contact lumber associations and or representatives active in area of use.

Material thickness and configuration of member are major cost factors. Size and shape variations are so numerous that indication of dimensions is not feasible.



CUSTOM DESIGN PATTERNS ④ ⑥

Custom designs can be economically manufactured if designed with thought to minimum handling, simple cutting, head adjustment, and use of standard finish sizes.

Custom design cut limitations illustrated above should be avoided, since they require a special knife or several runs through the machine.

The organizations listed below were sources for information per numbered references and are provided for obtaining information not available in area of use.

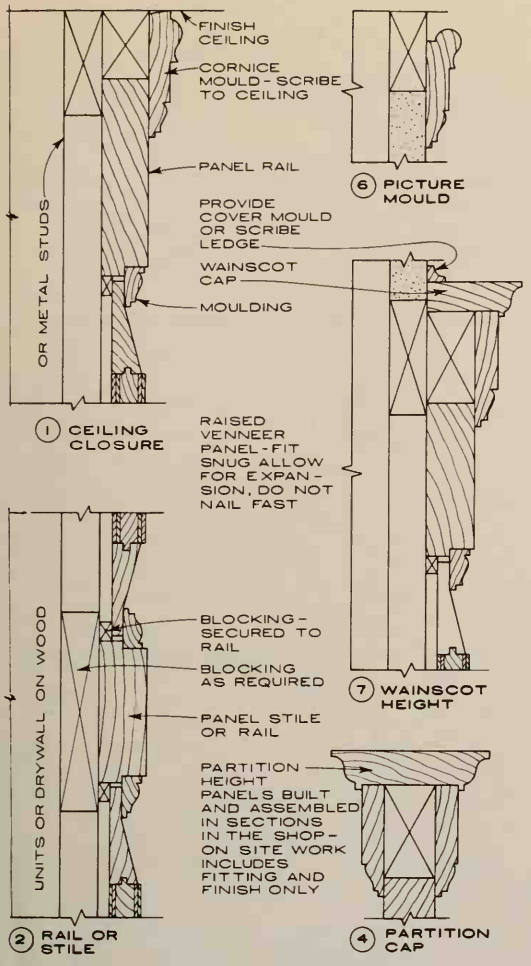
VERTICAL AND HORIZONTAL BOARD PANELING

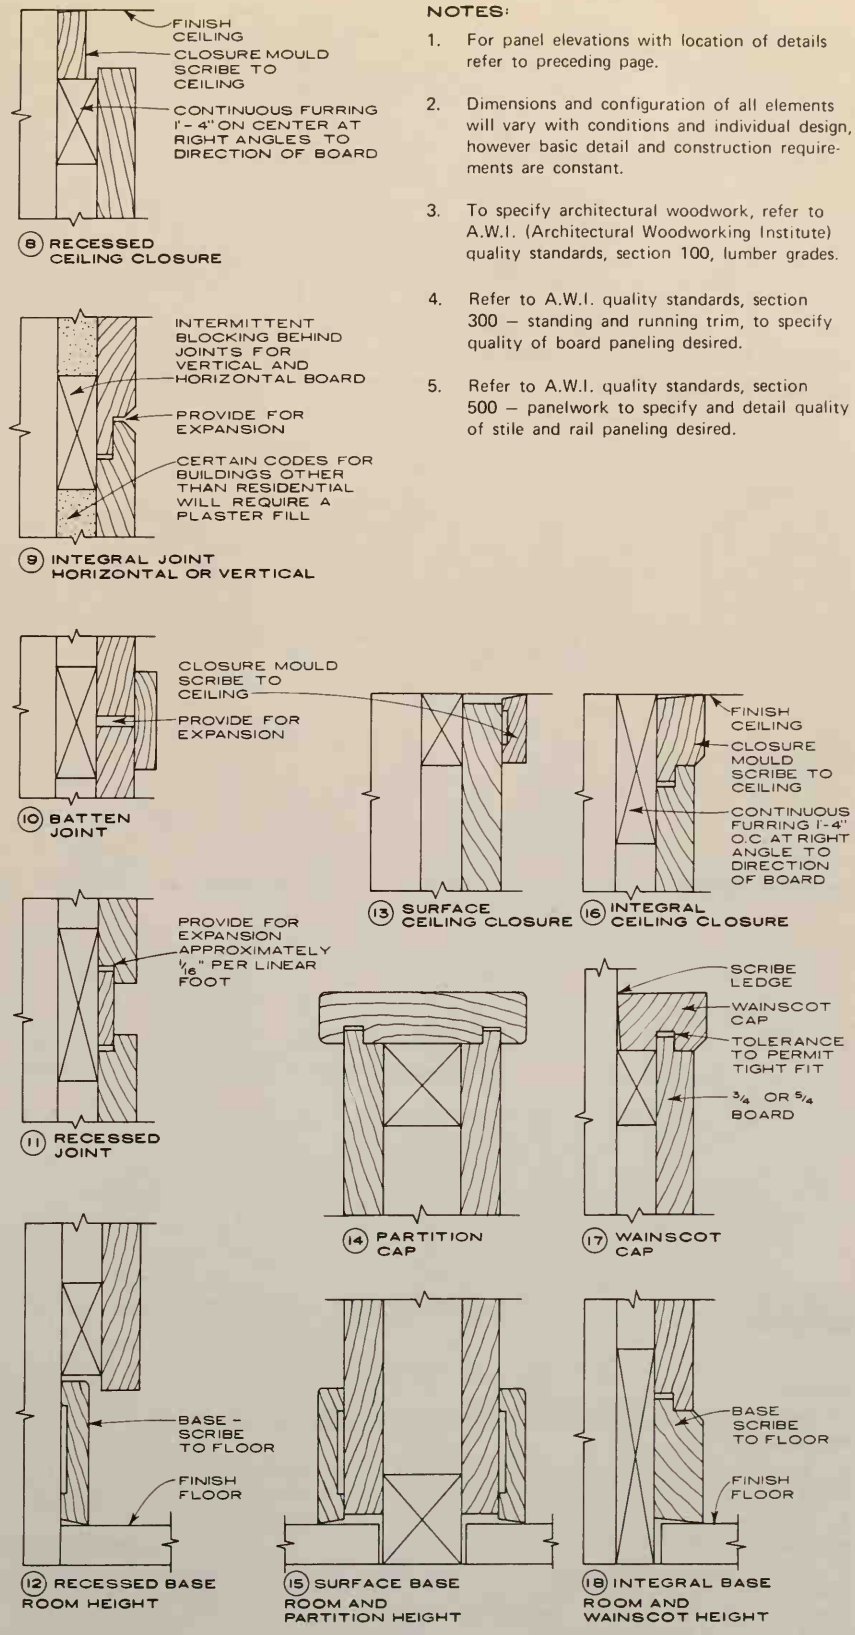
NOTES :

1. For details indicated refer to next page.
2. For information on plywood paneling, refer to interior plywood pages.
3. Basic types of stile and rail, and board paneling and their characteristics, and limitations are illustrated. Dimensions for moulds, rails, and boards will vary with conditions and design.
4. Wood paneling characteristically has poor sound qualities, check methods necessary to achieve decibel reduction required.
5. Investigate codes in force for fire rated back-up requirements of wood paneling on studs.

H. E. Heidtmann and R. Paccone; Sargent, Webster, Crenshaw & Folley; Syracuse, New York



STILE AND RAIL PARTITION DETAILS



VERTICAL AND HORIZONTAL BOARD DETAILS

NOTES:

1. For panel elevations with location of details refer to preceding page.
2. Dimensions and configuration of all elements will vary with conditions and individual design, however basic detail and construction requirements are constant.
3. To specify architectural woodwork, refer to A.W.I. (Architectural Woodworking Institute) quality standards, section 100, lumber grades.
4. Refer to A.W.I. quality standards, section 300 – standing and running trim, to specify quality of board paneling desired.
5. Refer to A.W.I. quality standards, section 500 – panelwork to specify and detail quality of stile and rail paneling desired.

NOTES:

1. Wood joints may be grouped into three classes: (1) right angle joints, (2) end joints, and (3) edge joints.

2. End joints are used to increase the length of a wood member. By proper utilization of end joints short lengths can be used which might otherwise have been wasted.

3. Edge joints are used to increase the width of a wood member. By giving narrow widths greater use of narrow stock may result.

4. A rabbet (rebate) is a right angle cut made along a corner edge of a wood member. A dado is a rectangular groove cut across the grain of a wood member. If this groove extends along the edge or face of a wood member (being cut parallel to the grain) it is known as a plough (plow).

VENEER GRADES

N	Special order "natural finish" veneer. Select all heartwood or all sapwood. No open defects. Some repairs allowed.
A	Smooth & paintable. Neat repairs permissible. Also used for natural finish in less demanding applications.
B	Solid surface veneer. Circular repair plugs & tight knots permitted.
C	Knotholes to 1". Occasional knotholes 1/2" larger within certain limits in specified section. Limited splits permitted. Mini-m veneer for Exterior-type plywood.
C	Improved C veneer with splits limited to 1/8" wide & knotholes & borer holes limited to 1/4" by 1/2"
D	Permits knots & knotholes to 2 1/2" wide & 1/2" larger under certain specified limits. Limited splits permitted.

KEY DEFINITIONS

GROUP
Refers to species used in manufacturing plywood. Species are classified into groups based on stiffness. Group number in grade-trademarks refers to species of face and back veneers.

STANDARD SHEATHING
Interior sheathing grade replacing former C-D grade. Subflooring, wall sheathing, roof decks, pallets, crates, some engineered applications.

STRUCTURAL I, STRUCTURAL II
Unsanded grades for use where strength is most important. Examples: box beams, gusset plates, stressed skin panels, shipping containers, bins. Both grades made only with exterior glue. Structural I is limited to Group I species and available in all exterior grades. Structural II permits Groups 1, 2, or 3 species.

IDENTIFICATION INDEX NUMBER
2 numbers separated by a slash appearing in grade-trademarks of all sheathing grades. Numbers indicate spacing in inches for supports, no. on left for roof decking with 35 p.s.f. minimum loading. No. on right for subflooring with 100 p.s.f. loading.

CLASS I, CLASS II
Applies only to Plyform grades. Indicates species mix permitted under Product Standard PS-166. Class I is stronger than Class II.

CLASSIFICATION OF SPECIES

GROUP 1	GROUP 2	GROUP 3
Douglas fir 1	Cedar, Port Orford	Alder, red
Larch, Western	Douglas fir 2	Cedar, Alaska yellow
Pine, Southern	Fir	Pine
Loblolly	California red	Lodgepole
Longleaf	Grand	Ponderosa
Shortleaf	Noble	Redwood
Slash	Pacific silver	
Tanoak	White	GROUP 4
	Hemlock, Western	Cedar
	Lauan	Incense
	Red	Western red
	White	Fir, subalpine
	Pine, Western white	Pine, sugar
	Spruce, Sitka	Poplar, Western
		Spruce, Engelman

NOTES FOR SPECIALTY GRADES OF PLYWOOD (See Table)

(1) Sanded both sides except for decorative or other surfaces.
(2) Available in group 1, 2, 3, or 4 unless otherwise noted.
(3) Standard 4'x 8' panel size. Others available.
(4) Also available in Structural I.
(5) Panel sizes 4'x7', 8', 9', 10'.
(6) Also horiz. lap siding 3/8 x 12, 16 to 16' long.

Foster C. Parriott; James M. Hunter & Associates; Boulder, Colorado

(1) Provide adequate blocking, T & G edges or other suitable edge support such as Plyclips when unsupported edge exceeds these lengths.

(2) Uniform load deflection limitation: 1/180 th of the span under live load plus dead load. 1/240 th under live load only.

(3) Allowable loads were established by laboratory tests and calculations assuming uniformly distributed loads.

(4) Plywood continuous over 2 or more spans; grain of face plys across supports.

(5) These spans shall not be exceeded for any load conditions.

NAIL SCHEDULE: (common)
6d nail for 1/2" thick or less; 8d nail for 1" thick or less: 10d or 8d ring-shank for 2-4-1 1 1/8" & 1 1/4". Space 6" at edges & 12" in field, spans 48" or more nail 6" at all supports.

PLYWOOD SUBFLOORING (1)

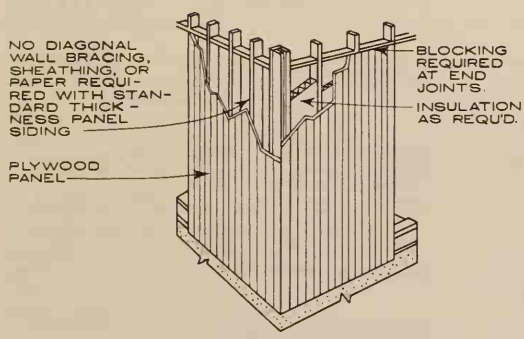
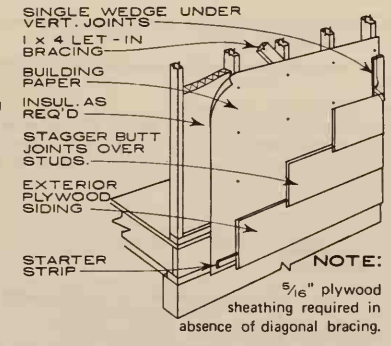
Most patterns and textures available in medium density overlay (MDO) for painting and weathering qualities. Standard width: 4'–0"

No sheathing required except for horizontal lap siding when no let-in corner bracing is used. Standard lengths: 7', 8', 9', 10'. Standard thickness: 5/8", others available.

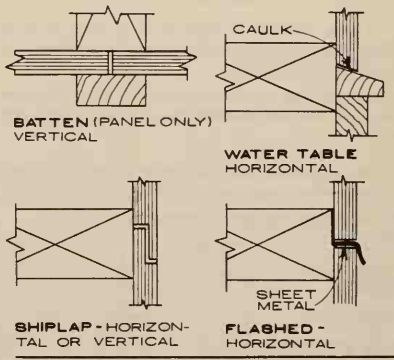
Sizes: 3/8" x 12", 16", to 16' long. 5/16" available to use w/ sheath. Other widths available.



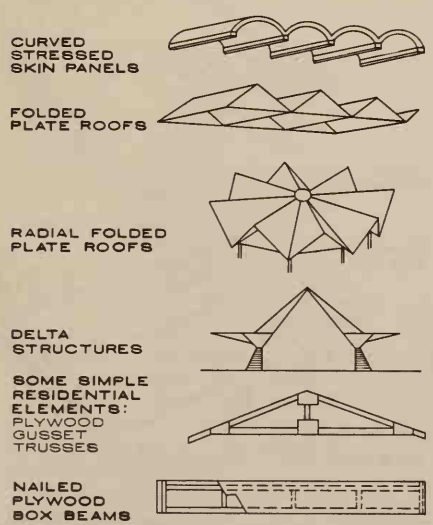
PANEL SIDING VERTICAL "APPLICAT'N"



PLYWOOD LAP SIDING "APPLICAT'N"



JOINT SUGGESTIONS



FIR PLYWOOD COMPONENTS

Glued structural assemblies of plywood and lumber. Fabrication licensed by Plywood Fabricator Service, Inc., affiliate of American Plywood Assoc.
Some basic shapes: box beams, flat stressed skin panels.

NAILING CHART FOR PLYWOOD SIDING

APPLICATION	PLYWOOD THICKESS (IN.)	MAX. SPACING OF SUPPORTS (C.–C.)	NAIL SIZE & TYPE (a)	NAIL SPACING (INCHES) Panel Edges	Intermediate
Panel Siding (b)	3/8" (c)	16"	6d Casing or Siding	6"	12"
	1/2"	24"	6d Casing or Siding	6"	12"
	5/8" or thicker	24"	8d Casing or Siding	6"	12"
Lap Siding or Bevel Siding	3/8" (d)	16"	6d Casing or Siding	One nail per stud along bottom edge	4" at vert. joint 8" at studs (siding wider than 12")
	1/2"	20"	8d Casing or Siding		
	5/8"	24"	8d Casing or Siding		

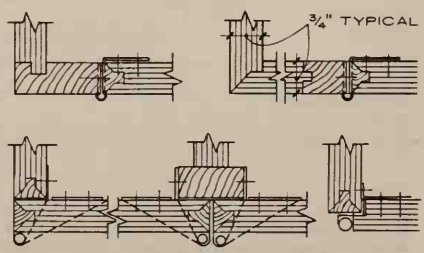
NOTES:

(a) Use galvanized, aluminum, or other non-corrosive nails. Use same schedule for panel siding and siding over sheathing.
(b) Battens applied with 8d non-corrosive casing nails spaced 12" o.c. staggered.
(c) Over separate sheathing 3/8" panel siding may be used over supports 24" o.c.
(d) Over separate sheathing 5/16" MDO plywood lap siding may be used over supports spaced 16" o.c.

FIR PLYWOOD BENDING

PANEL THK	MINIMUM BENDING RADIUS (FT.) ACROSS GRAIN	PARALLEL TO GRAIN
1/4"	2'	5'
5/16"	2'	6'
3/8"	3'	8'
1/2"	6'	12'
5/8"	8'	16'
3/4"	12'	20'

Shorter radii can be developed by selection for bending of areas that are free of knots and short grains, and/or by wetting or steaming, at the risk of possible fractures. Exterior glue is recommended.



PLYWOOD CABINET DOORS

For plywood doors or cabinets, use hardware that will screw into face of plywood, as edge has poor screw-holding properties.

Foster C. Parriott; James M. Hunter & Associates; Boulder, Colorado

TYPES OF HARDWOOD PLYWOOD

TECHNICAL	Fully waterproof bond—approx. equal strength in 2 directions.
TYPE 1 (EXT.)	Fully waterproof bond—full weather exposure, resist organisms.
TYPE 11 (INT.)	Water resistant bond.
TYPE 111 (INT.)	Moisture—resistant bond.

GRADES OF HARDWOOD PLYWOOD

PREMIUM GRADE (1)	Slight imperfections.
GOOD GRADE (1)	For natural finishes, no sharp contrasts.
SOUND GRADE (2)	For smooth painted surfaces.
UTILITY GRADE (3)	Open defects permitted but limited in size, species not selected, no matching.
BACKING GRADE (4)	Many flaws permitted, species not selected. No matching.
SPECIALTY GRADE	Non-conforming for special uses, matching, etc. Grade and type by agreement.

NUMBER OF PLIES

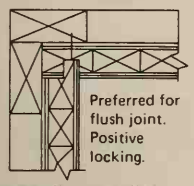
Odd number in pairs on opposite sides of core. For Technical Type, plies parallel to finish plies provide 40%–60% of total thickness.

SOME POPULAR SPECIES OF HARDWOOD VENEERS

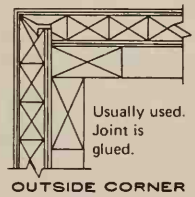
Dense: white ash, yellow birch, black maple, red oak, rosewood, teak.

Medium Dense: black ash, gum, Afr. mahogany, red maple, prima vera, American walnut.

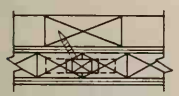
Low Density: aspen, American basswood, American chestnut, yellow poplar.



INSIDE CORNER

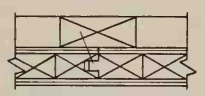


OUTSIDE CORNER



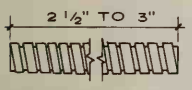
Spline usually 1/4" x 5/8". Dowels 6" to 12" o.c.

DOWEL & SPLINE



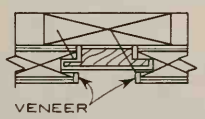
Tongue usually 1/4" wide, 5/16" deep. Dowels sometimes added.

TONGUE & GROOVE

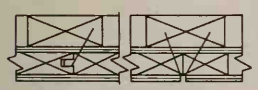


Glue spirals No. 8–10 dowels approx. 3/8".

DOWEL

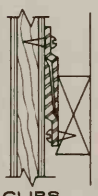


EXPOSED PLYWOOD SPLINE



2 nails, 1 face hole, colored putty. Screws hidden by joint preferred for possible removal of panels. #10 or #12 size usual.

NAILS AND SCREWS RECOMMENDED



3" x 2" clips 16" o.c. Allow 1" at ceil. to drop panel into place.

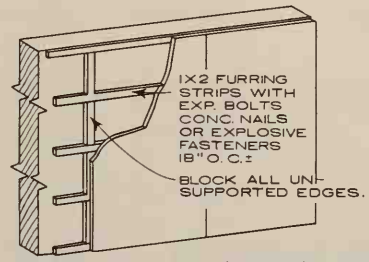
LENGTHS: 48", 60", 72", 84", 96", 120"	Tolerance ± 1/32"

THICKNESSES: 1/8", 3/16", 1/4", 5/16", 3/8", 1/2", 5/8", 3/4", 13/16", 7/8", 1"

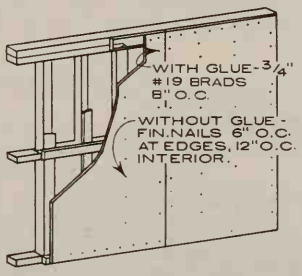
Tolerances: Unsanded panels: ± 1/32"
Sanded panels: + 0" – 1/32"
1/4" wall panels + 0" – 3/64"

Data supplied by Hardwood Plywood Manufacturers Association and by U.S. Plywood, Division of U.S. Plywood–Champion Papers, Inc.



Many city bldg. codes require spaces between furring be filled (rough plaster trowelled in) to prevent flue action. On old plaster walls furring strips required to be set in the old plaster.

OVER MASONRY WALLS



1/4" x 2" fir plywood strips used when in doubt about dryness of framing. Glue recommended for quality work. Furring often nailed thru old plaster to framing, but nailing direct to framing is recommended.

ON FRAME WALLS

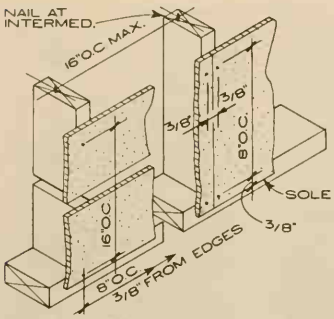
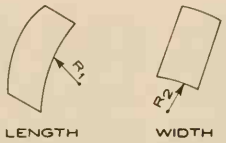
PLIES	3 at right angles, offset to provide tongues and grooves.	
APPLICATION	Laid in mastic over concrete or other suitable subfloor.	

Data supplied by Hardwood Plywood Manufacturers Association (HPMA). Samples tested under U.S. Commercial Standard CS–233–63.



NAILS AND SPACING

Nails: Flat, casing or button head. Drive screw nails to penetrate into solid wood. Drilling for nails and fasteners is unneccessary on type "U" or "F" boards on any thickness up to and including 1/4".



LENGTH WIDTH

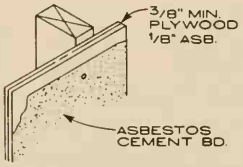
MIN. BENDING RADII

THICK.	R_1	R_2
1/8"	30"	36"
3/16"	36"	54"

(Unscored boards only.)

SIZES

Boards–4' X 4', 8', 9', 10', 12' usually 1/8" & 3/16" thick. For interior finishes–1/8" X 4' X 4' tile-like scored boards also available.



ON WOOD STUDS OVER BACKING

Asbestos cement board has an Underwriters Laboratory fire resistance rating of zero combustibility, zero flame spread and zero toxic smoke production. Backing with gyp. board increases its fire resistance and is recommended. 1/8" board should have a 3/8" min. gyp. backing. 3/8" asb. cement board may be used without backing if cats are placed behind all joints.

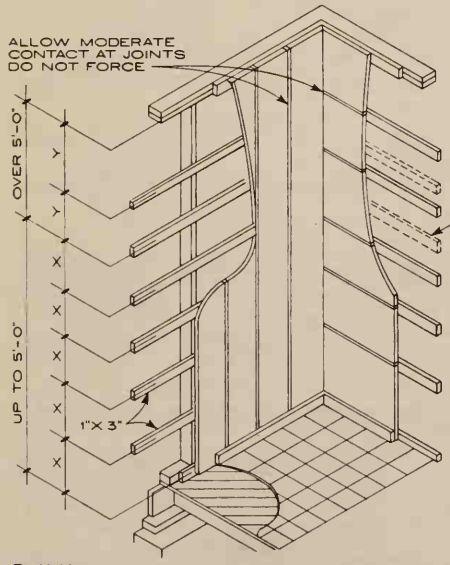
CLIPS FOR T&G JOINTS IN "NU-WOOD"

CONCEALED FASTENERS



PLANK

FIBERBOARD TILE SIZES 12"& 16" SQ., 12"X 24"& 16"X 32", 1/2" THICK, PLAIN OR PERFORATED, EDGES T & G OR WIDE FLANGE, APPLIED SAME AS FIBERBOARD PLANK. GENERALLY USED ON CEILINGS BUT MAY BE USED ON WALLS.

FOR HORIZONTAL PLANK, LATH MUST BE PROVIDED BEHIND EACH JOINT. ADDITIONAL FURRING REQUIRED WHEN 16" PLANK IS USED.

NAILS SPACED IN ACCORDANCE WITH FURRING OR 12"O.C. FOR CONTINUOUS BACKING. PLANKS MAY ALSO BE SECURED BY ADHESIVE (SEE MFR.).

FOR NAIL SIZES & TYPES, SEE MFR.'S RECOMMENDATIONS.

SPACING OF FURRING VARIES WITH PLANK THICKNESS. FOR 1/2" PLANK "X" SHOULD BE 9", "Y"=12". FOR 3/4" PLANK "X" SHOULD BE 12", "Y"=16".

VEGETABLE FIBER WALLBOARDS FOR INTERIORS – METHODS OF APPLYING INTERIOR FIBERBOARD

WALLBOARD AND FIBERBOARD SIZES

DESIGNATION		SIZES	THICKNESS
WALLBOARD, BUILDING: BOARD, STRUCTURAL: FIBERBOARD, INSULATING BOARD OR STRUCTURAL INSULATING BOARD.	PANEL	Generally available in widths of 4'–0" and lengths from 4'–0" to 12'–0" in increments of 1'–0" (no 11'–0" lengths made). Several boards are manufactured in sizes 8'–0" X 14'–0" & 16'–0" (Homasote & Upson). A 4'–0" X 14'–0" & 16'–0" is made (Upson). Largest board made is 8'–0" X 18'–0" (Upson).	3/8", 15/32 (Homasote) 1/2", & 3/4"
	PLANKS	Generally available in widths of 8", 10", 12", 16", and in lengths of 8'–0", 10'–0", 12'–0". A few planks are made in 6'–0" lengths.	1/2" & 3/4"

TYPES OF GYPSUM BOARDS

THICKNESS	WIDTH & EDGE	STOCK LENGTHS	GYPSUM BOARDS
1" or 1 5/8"	Square 6' or 8'	Clg. ht. up to 10'	Gypsum board studs are laminated strips of gypsum board cut to specified lengths and widths for use with semi-solid partition system.
1/2" or 5/8"	4' square	8', 9'	Sound type of boards are wood fiber products for use with gypsum wall board systems to reduce sound transmission. There is one type for use where combustible materials are permitted. A second type is fire-retardant treated for use in noncombustible constructions.
3/8" or 1/2" or 5/8"	4' beveled 4' square (grain patterns only)	8', 9', & 10' sp. & custom to sp. length	Gypsum board colored and textured with vinyl-surfaced material are available in many standard, special and custom colors. 5/8" thickness boards are also available in fire rated gypsum board.
3/8" or 1/2" special order	4' square	8', 9' & 10'	Paper covered gypsum board panels. See manufacturers literature for types wood grain patterns, textures, and colors that they have available.
regular 3/8" or 1/2" Fire-rated 5/8"	2' & 4' sq. 3' t. & g. & square	Up to 12' 8'	Backing board in all thicknesses is recommended for the base layer for 2-layer wallboard application. 1/2" backing board and 5/8" fire-rated board are for acoustical tile application.
1/2" 5/8" spec. order	4' tapered	8', 12'	Moisture resistant gypsum board is a wallboard specially processed for use as a base for ceramic tile and other non-absorbent wall tiles in bath and shower areas. The board is tapered on the edges so joints above the area to be tiled can be treated in the usual manner.
1/2" or 5/8"	4' square	11' (std.)	Vinyl-surfaced backing gypsum board is a waterproofed gypsum wallboard base for the application of ceramic and other non-absorbent type wall tiles in bath and shower areas. Cut-outs and joints are sealed with vinyl tape. Fittings are caulked, and tile is set, both with waterproof tile adhesive. 5/8" thickness boards are also available in fire rated gypsum board.

		2	2500	450,000	250		

Type 1 made with urea-formaldahyde resin binders suitable for interior applications.
Type 2 made with phenolic resin binders suitable for certain exterior applications.

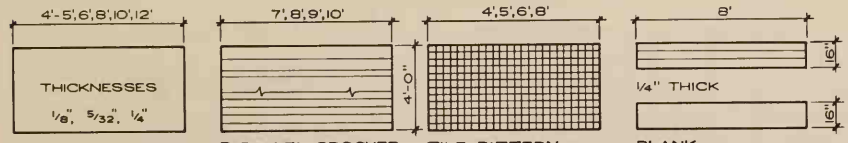
TYPES AND USES OF PARTICLE BOARD:

Corestock – bonded flakes or particles–for furniture, casework, panels, doors, etc.
Wood Veneered – for furniture, panels, dividers, cabinets, etc.
Overlaid – faced w/impreg. fiber, hardb'd, plstc. sh's, for sink tops, panels, doors, etc.
Embossed – heavily textured in patterns by heated roller–for int. panels, etc.
Filled – surface filled and sanded, ready for paint–for firm flat, true surfaces.
Exterior – made w/phenol. resins for weather resist.–for exterior covering.
Toxic-Treated – chemical-treated to resist insects, mold, decay-producing fungi.
Primed or Undercoated – factory-applied basecoat for regular or filled board.
Floor Underlayment – engineered specifically for use under carpet or resilient covering.
Fire-Retardant – particles treated w/chemicals to reduce flame-spread characteristics.

HARDBOARD - TYPES & SIZES

TYPE	USE OR DESCRIPTION	SURFACES	THICKNESSES (INCHES): 1/12	1/10	1/8	3/16	7/32	1/4	5/16	3/8
STANDARD	Normal interior, protected exterior applications (int. fin., cabinets, display, etc.)	S1S	●	●	●	●		●	●	
		S2S		●	●	●		●	●	●
TEMPERED	Where strength and wear count, for exterior use. Wainscots, work surfaces, siding, signs, etc.	S1S			●	●		●	●	
		S2S			●	●		●		
SERVICE	Moderate strength hardboard for non severe conditions (interior finish, porch ceilings, eaves, etc.)	S1S			●	●		●		●
		S2S			●	●	●	●		
TEMPERED SERVICE	Improved hardness, stiffness, water resistance for Servicegrade.	S1S								●
		S2S					●			
TREATED	Processed with special additives during manufacture and with surface treatments (oils, resins)	S1S			●	●		●		
		S2S			●	●		●		
UNDERLAYMENT	Servicegrade underlay for resilient floor coverings.	S1S					●	●		
CONCRETE FORM BOARDS	Tempered and further processed for max. performance as conc. form liner.	S1S						●		
SIDING	Treated lap or panel (see drawing)	S1S				●		●	●	
PERFORATED	Standard or tempered, unfinished or prefinished, holes 1" o.c. each way.	S1S			●			●		
TEXTURED	Patterns pressed or grooved on tempered hardboard: Tile – 4" squares; embossed leather, wd. grain, basket weave; striated; grooved.	S1S S2S			●	●				
FACTORY FINISHED	Primed or coated. Factory sealed or filled.	S1S S2S			●	●				
LAMINATED	Decorative printed – wd. gr. etc. Special purpose with adhesives.									

Standard Sizes: standard width 4', 5' also available. Standard commercial lengths 4', 6', 8', 12', 16'. 4' x 18' available.



PLAIN
Plain colors, patterns.
Textures: travertine, leather, tapestry.
Wood grains.

PARALLEL GROOVED
Wood grains.
Scoring random or 4" o.c.
1/4" thick.

TILE PATTERN
Scoring 4" o.c.
Patterns and plain colors.
Thicknesses 5/32", 1/8"

PLANK
Wood grains w/random scoring.
Plain colors with no scoring.

Finish is baked-on melamine silicone plastic. Some finishes not recommended for wet areas.

Other Products:
Ceiling tile t&g 1/4" x 12 x 12 (Barclay) 1/4 x 16 x 16 (Marlite) Plain white and pattern on white
Pegboard 5/32, 1/4 x 4' x 8'. Holes 1" o.c. both ways. Colors and patterns.
Hollow Core Panels: 5/8 x 2' x 4', 8'. Plain colors and wood grain finishes.
Trim and aluminum moldings available in matched colors, woodgrains, and patterns.

PREFINISHED PLASTIC COATED HARDBOARD PANELS

HARDBOARD NAILING REQUIREMENTS

	SIZES & TYPES OF HARDBOARD	WHERE USED	SIZE OF NAIL	TYPE	SPACING: AROUND EDGE	SPACING: IN PANEL

	1/4" & 5/16" with shadow strip	lap siding	3"	S & GB	3"	16"

C–casing nail; F–finishing; RG–ring grooved; DS–drive screw; BB–barbed box; CS–coated sinker; CC–coated casing; S–galvan. siding; GB–gal. box.

WALL TILE - METAL, ENAMELED METAL, PLASTIC, CORK, LEATHER

Aluminum – Synthetic resin enamel
Aluminum – Porcelain enamel
Steel – Porcelain enamel
Stainless Steel – Polished
Copper – Polished
Polystyrene plastic.

4 1/4 x 4 1/4
8 1/2 x 8 1/2
Some:
2 1/4 x 8 1/2 halves, doubles, 5 x 5, 10, 10 x 10, 20 (met.)

Vinyl plastic – 1/8 x 9 x 9, 12 x 12 stand. 9, 18 x 18, 24 x 24, 12 x 36, 18 x 36, 36 x 36 custom.
Cork tile – 3 x 8–9 x 9–2, 6, 12 x 12–12 x 24. 1/8 to 1/2 th.
Cork brick: 3/8 x 2 x 12 – 3/4 x 2 s.f. panel
Cork Ins. for Dec. Walls – 12 x 36 x 1/4, 1/2, 1" th.
Leather lam. to alum. 4 1/4 x 4 1/4 etc.
Adhesive to smooth, firm backing. Trim shapes.

LAMINATED PLASTIC VENEER

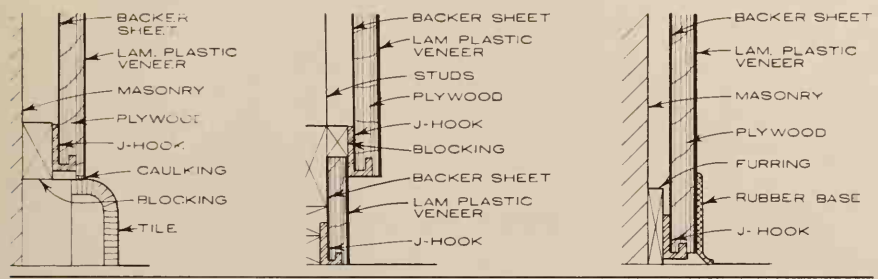
INSTALLATION NOTES:

Where panels are to be secured to wall with concealed clips, allow sufficient installation space at top.

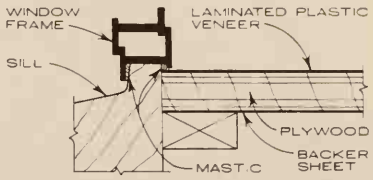
Where woodgrains are to be used, indicate direction of grain on drawings.

Show backer sheets on drawings.

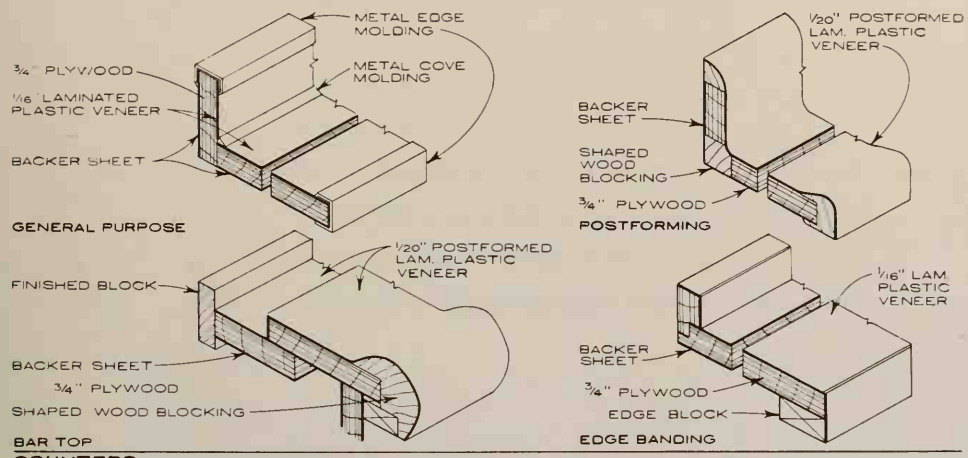
Avoid joints within panels, use stock width panel sizes. General purpose 1/16" plastic laminate can be bent cold to a 4" radius, providing epoxy thermosetting adhesives are used. Field bending using contact adhesives is not recommended for 1/16" plastic laminate; use 1/20" postforming plastic laminate instead which can be bent to a radii as small as 3/4". Edge banding grade can be bent to a 3" radius using contact adhesives at room temperatures and to a 3/4" radius at temperatures between 325° and 360°F.



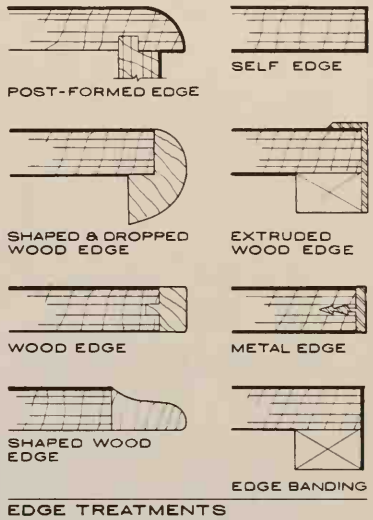
BASEBOARDS



WINDOW STOOL



COUNTERS



EDGE TREATMENTS

NOTES:

Plywood with heavily grained or rotary cut top ply should not be used as figure will show thru.

BACKING MATERIALS

Gum, Birch, Poplar, Mahogany, vertical grain fir, finished plywood; hardboard and wood particle board: hollow metal and aluminum.

ADHESIVES

Contact adhesive for field application to plywood, wood particle board, or hard board. Thermosetting adhesives under pressure for shop application.

BACKER SHEETS

1/16" or 1/32" unfinished plastic laminate should be used on opposite surface to prevent warpage.

FINISHES

Gloss, satin, furniture finish, velvet surface, low glare, oil rub and textured. Laminated plastic panels with a variety of backing materials are available.

BRAND NAMES

Consoweld, Formica, Melamite, Micarta, Nevamar, Panelyte, Pionite, Textolite and others.

Coal tar pitch 75 lbs.	A
	Slag—300 lbs./sq.	Up to 3"	45 lb. asphalt coated asbestos nailed	2—15 lb. asphalt saturated asbestos	Hot asphalt 20—25 lbs (3)	Hot asphalt 60—70 lbs. (3)	A
	Marble chips 400-500 lbs./sq.		43 lb. asphalt coated organic nailed	3—15 lb. asphalt saturated organic			
	Smooth surface (Black)	Up to 6"	45 lb. asphalt coated asbestos	3—15 lb asphalt saturated asbestos	Hot asphalt 25 lbs (3)	Hot asphalt 20 lbs. Roof coating 1—gallon Emulsion 3 gallons (3)	A available on some constructions. Consult U/L or roofing mfr.
			43 lb asphalt coated organic nailed				
	Mineral surface (Various colors)	½" to 6"	Sheathing paper over wood deck	2—15 lb. felts nailed to deck and mopped to each other.	Hot asphalt 25 lbs.	80 lb. asbestos cap sheet in hot asphalt	A
		3" to 9"	Sheathing paper over wood deck. (Limited to 15 yr. bond)			55 lb. duplex organic cap sheet in hot asphalt	None
NON-NAILABLE DECK OR INSULATION	Gravel—400 lbs./sq. Slag—300 lbs./sq.	Up to 1"	43 lb. asphalt coated organic in hot asphalt	3—15 lb. tar saturated organic felt	Coal tar pitch 25 lb.	Coal tar pitch 75 lb.	A
	Marble chips 400—500 lbs./sq.	Up to 3"	45 lb. asphalt coated asbestos in hot asphalt	2—15 lb. asphalt saturated asbestos	Hot asphalt 20—25 lbs. (3)	Hot asphalt 60—70 lbs. (3)	A
			43 lb. asphalt coated organic in hot asphalt	3—15 lb. asphalt saturated organic			
	Smooth surface (Black)	Up to 6"	45 lb. asphalt coated asbestos in hot asphalt	3—15 lb. asphalt saturated asbestos	Hot asphalt 20—25 lbs. (3)	Hot asphalt 20 lbs. or Roof coating 1—gallon or Emulsion 3 gallons (3)	A available on some constructions. Consult U/L or roofing mfr.
	Mineral surface (various colors)	½" to 6"	None	2—15 lb. felts mopped solidly to deck with asphalt	Hot asphalt 20-25 lbs.	80 lb. asbestos cap sheet in hot asphalt	
		3" to 9"	None (Limited to 15 yr. bond)			55lb. duplex organic cap sheet in hot asphalt	None

NOTES:

(1) On notes over 1" per foot back-nailing of all felts is usually required for all constructions.

(2) Except in nailed construction the coated base sheet is always applied in hot steep grade asphalt. Use 35 lbs. per square over most insulations.

(3) Type of asphalt to be used varies according to slope. Consult a manufacturers specification.

(4) Underwriters Laboratories Rated systems must be applied with materials bearing the Underwriters Laboratories label showing it as "Listed for Built-Up Roof Coverings," and must be applied strictly in accordance with Underwriters Laboratories application procedure. Not all standard specifications as shown here will meet the requirements. If Underwriters Laboratories Rating is required consult Underwriters Laboratories or roofing manufacturer before writing specifications.

	Spanish			15" x 8 3/4"	–			13" x 8"		

NOTES:

(1) Special quarry selection of sizes, thicknesses, and colors for random application is available.

(2) Exposures and weights are calculated for tile laid with 3" double headlap. Variation from this will increase or decrease total weight. To determine exposure for 3" double headlap deduct 3" from shingle length and divide result by 2.

(3) Underwriters Laboratories Rating applies only for slopes 4" per foot and over. Asbestos felt or coated felt must be used as underlayment.

(4) Many other size and shapes available in certain geographic areas. Consult local manufacturers or agents.

(5) Underwriters Laboratories Rating Class C is available.

STAINLESS STEEL	Continuous weld Standing Seam	1/4"	20" wide up to 60' long	28 ga.	72	None	Stainless steel sliding cleats spot-welded to one flange
				30 ga.	58		

NOTES:

1. Terne Plate is copper-bearing steel coated both sides with lead-tin alloy (80% lead-20% tin).
2. Terne must be shop-coated or painted one coat underside, and primed and painted two coats on exposed side. Long oil base paint is recommended.
3. Expansion seams must be provided on runs exceeding 30 feet where both ends are free to move or exceeding 15' where ends are securely fastened.
4. T-C-Z alloy will weather to dull grey. It may be painted for color on exposed side.

	5-V Crimp 1/2" deep			Width 26" Lengths 8', 10', 12'	6 and 8 oz.			
	5.3 V Crimp 1" deep			Width 29" Lengths 7'–6", 9', 10'–6"	8 oz.			
CORRUGATED PLASTIC Non-Reinforced Plastic	2.67" Corrugations 9/16" deep	1	Approx. 40	Width 50 1/2" Lengths 8', 10', 12', 16', 20'	5 and 8 oz.	1 Corrugation side lap 8" min end lap	Same as for reinforced Plastic	Same as for reinforced plastic

NOTES:

1. Panels are made of a steel core covered both sides by an asbestos felt applied in hot zinc dipping then asphalt-impregnated. A colored weatherproof coating is then applied.
2. Corrugated and mansard sheets may be used on 4" min. slope with laps unsealed and on 3" min. slope with laps sealed. V-Beam sheets may be used on 3" min. slope with laps unsealed and on 1 1/2" min. slope with laps sealed.
3. Minimum curvature radius 18".
4. Use 9" min. side lap on slopes from 2" to 3". Use 6" min. side lap on slopes above 3".
5. May be used on min. 1/2" slope when only one (1) course used on slope. When more than one course the min. slope is 4".
6. Available in limited tints from some manufactures.
7. Available in General Purpose, Type I, and Five Retardant, Type II, except 5 oz. weight only in Type I.
8. For detail product information and physical properties consult a manufacturer or:

   The Fiberglass Reinforced Panel Council

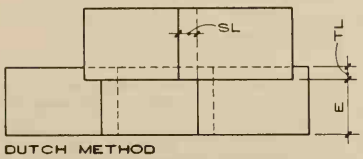
AMERICAN METHOD



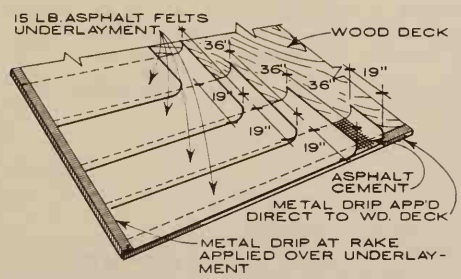
DUTCH METHOD

NOMENCLATURE: ASPHALT & COMPOSITION SHINGLES

SCHEDULE OF UNDERLAYMENT

SLOPE	TYPE OF UNDERLAYMENT
Normal slope: 4 in 12 and up	Single layer of 15 lb. asphalt saturated felt over entire roof
Low slope: 2 in 12 to 4 in 12*	Two layers of 15 lb. asphalt saturated felt over entire roof

*Square butt strip shingles only; requires "Wind-resistant" shingles or cemented tabs.



APPLICATION OF UNDERLAYMENT ON LOW SLOPE ROOFS

Use only enough nails to hold underlayment in place until shingles are laid.

NAIL TYPES

NAILING OF SHINGLES RECOMMENDATION

DECK TYPE	NAIL LENGTH
1" Wood sheathing	1 1/4"
3/8" Plywood	7/8"
1/2" Plywood	1"
Reroofing over asphalt shingles	1 3/4"

DRIP EDGE SHAPES

PREFORMED CORROSION-RESISTANT METAL

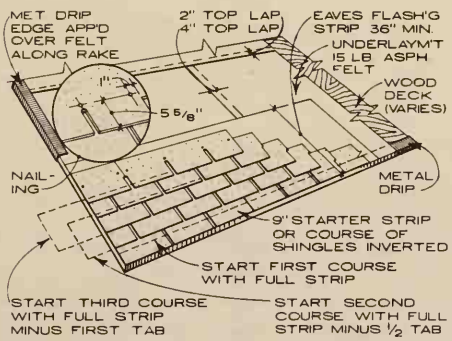
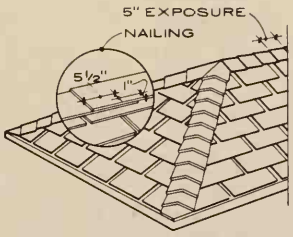
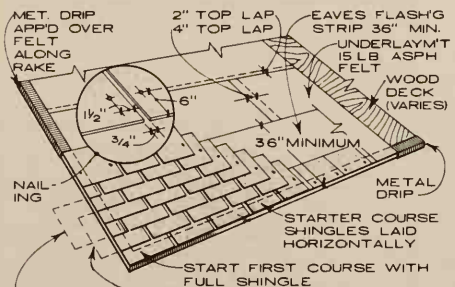
*Available in self-sealing type shingle.



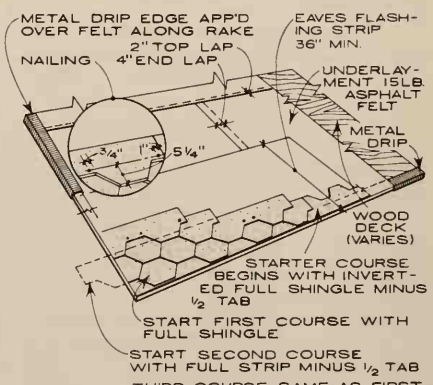
HIP & RIDGE



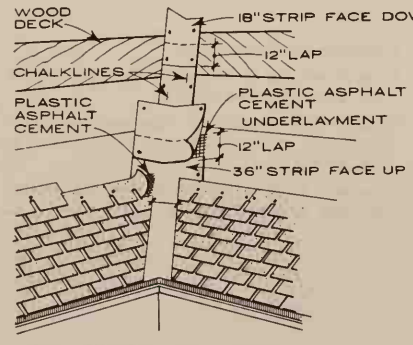
GIANT SHINGLES - AMERICAN METHOD



TWO TAB HEXAGONAL STRIP SHINGLES

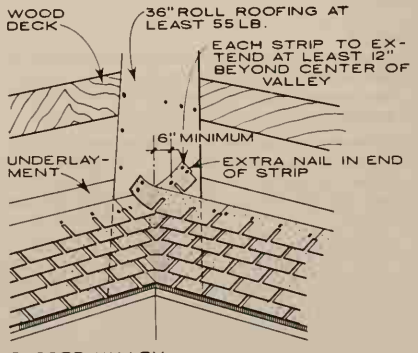


THREE TAB SQUARE BUTT STRIP SHINGLES



OPEN VALLEY

•Valley width should be 6" wide at ridge and spread wider at the rate of 1/8"/foot downward to eave. Establish valley width using chalkline from ridge to cove.

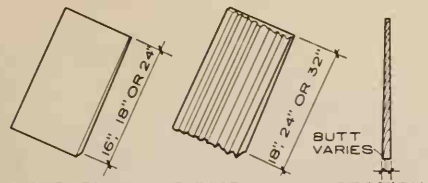


CLOSED VALLEY

APPLICATION DIAGRAMS

Developed by: Holroyd and Gray, Architects; Charlotte, North Carolina; from data furnished by: Robert M. Stafford, P. E.; Consulting Engineer; Charlotte, North Carolina

NOMENCLATURE



Species: Shingles and shakes are available in Red cedar, Redwood and Tidewater red cypress.

SCHEDULE OF SHINGLE TYPES

GRADE*	SIZE	EXPOSURE (AT LISTED SLOPES)		
		5 IN 12 AND UP	4 IN 12	3 IN 12
1, 2 & 3	24"	7 1/2"	6 3/4"	5 3/4"
1, 2 & 3	18"	5 1/2"	5"	4 1/4"
1, 2 & 3	16"	5"	4 1/2"	3 3/4"

* Grade description:

No. 1 = Premium grade: 100% heartwood, 100% clear and 100% edge grain.

No. 2 = Intermediate grade: not less than 10" clear on 16" shingles, 11" clear on 18" shingles and 16" clear on 24" shingles. Flat grain and limited sap wood permitted.

No. 3 = Utility grade: 6" clear on 16" and 18" shingles, 10" clear on 24" shingles. (For economy applications and secondary buildings.)

SCHEDULE OF SHAKE TYPES

TYPE	SIZE LENGTH & THICKNESS	EXPOSURE* 4 IN 12 SLOPE
HANDSPLIT AND RESAWN	18" x 1/2" TO 3/4"	7 1/2"
	18" x 3/4" TO 1 1/4"	7 1/2"
	24" x 3/4" TO 1 1/4"	10"
	24" x 1/2" TO 3/4"	10"
	32" x 3/4" TO 1 1/4"	13"
TAPERSPLIT	24" x 1/2" TO 5/8"	10"
STRAIGHT-SPLIT (BARN)	18" x 3/8"	7 1/2"
	24" x 3/8"	10"

* Roof slopes less than 4 in 12 not recommended for shakes without special construction. See table of "Underlayment and sheathing."

UNDERLAYMENT AND SHEATHING

ROOFING TYPE	SHEATHING	UNDERLAYMENT	NORMAL SLOPE		LOW SLOPE	
WOOD SHINGLES	Spaced	No underlayment required	5 in 12 and up	No underlayment required	3 in 12 to 5 in 12(2)	No underlayment required
	Solid (1)	No. 15 asphalt saturated felt.	5 in 12 and up	No underlayment required	3 in 12 to 5 in 12(2)	No underlayment required (3).
WOOD SHAKES	Spaced	No. 30 asphalt saturated felt (interlayment).	4 in 12 and up	Underlayment starter course; interlayment over entire roof.	Shakes not recommended on slopes less than 4 in 12 with spaced sheathing.	
	Solid (1) (4)	No. 30 asphalt saturated felt (interlayment).	4 in 12 and up	Underlayment starter course; interlayment over entire roof.	3 in 12 to 4 in 12 (2) (5)	Single layer underlayment over entire roof; interlayment over entire roof.

(1) May be desirable for added insulation and to minimize air infiltration.

(2) Requires reduced weather exposure.

(3) May be desirable for protection of sheathing.

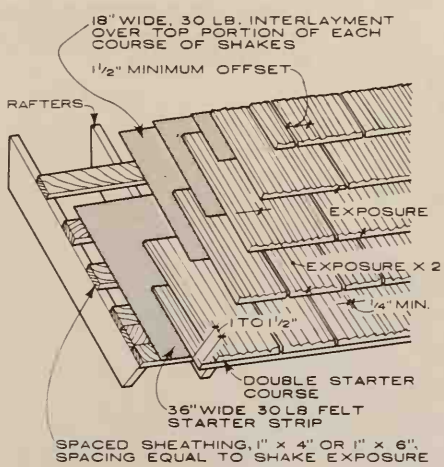
(4) Recommended for areas subject to winddriven snow.

(5) Shake exposure as follows: 10" for 32" shake, 7 1/2" for 24" shake and 5 1/2" for 18" shake.

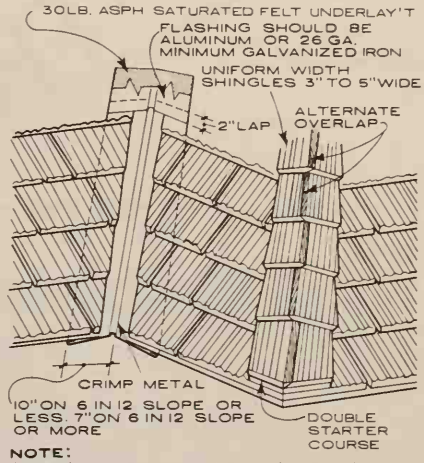
Eaves flashing: Recommended in severe climates or where design temperature is 0 degrees or colder.

A. Normal slope: Apply an additional course of underlayment. Extend from eave up to a point 12" inside interior wall line.

B. Low slope: Apply an additional course of underlayment cemented down. Extend to a point 24" inside interior wall line.



INSTALLATION OF SHAKES OVER SPACED SHEATHING (4 IN 12 MIN.)



NOTE: Copper flashing should not be used with red cedar.

VALLEY HIP & RIDGE APPLICATION OF SHAKES & SHINGLES

SHINGLES & SHAKES USED FOR ROOFING

EXPOSURE FOR SHINGLES & SHAKES USED FOR SIDING

SHINGLE LENGTH	EXPOSURE OF SHINGLES	
	SGL. COURSE	DBL. COURSE

CORNER BOARDS OUTSIDE & INSIDE CORNERS

NAILING

THICKNESS AND NAILS

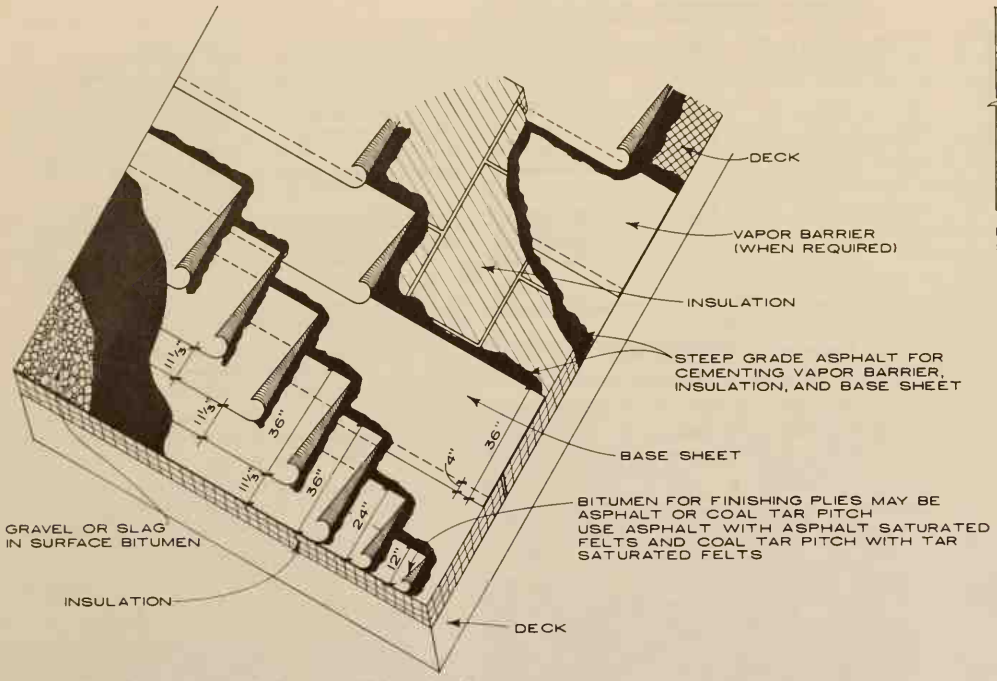
16" long	5 butts = 2"	3d
18" long	5 butts = 2 1/4"	3d
24" long	4 butts = 2"	4d
25" to 27"	1 butt = 1/2"	5 or 6d
25" to 27"	1 butt = 5/8" to 1 1/4"	7 or 8d

SHEATHING NOTES

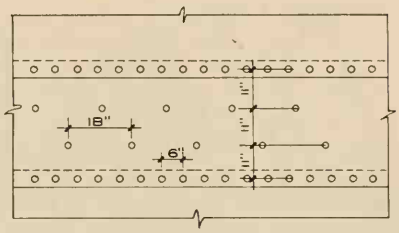
Sheathing may be strip-type, solid 1" x 6" diagonal type, plywood, fibreboard or gypsum. Horizontal wood nailing strips, 1" x 2", should be used over fibreboard and gypsum sheathing. Space strips equal to shingle exposure.

WOOD SHINGLES & SHAKES FOR SIDING

Developed by: Holroyd and Gray, Architects; Charlotte, North Carolina; from data furnished by: Robert M. Stafford, P. E.; Consulting Engineer; Charlotte, North Carolina



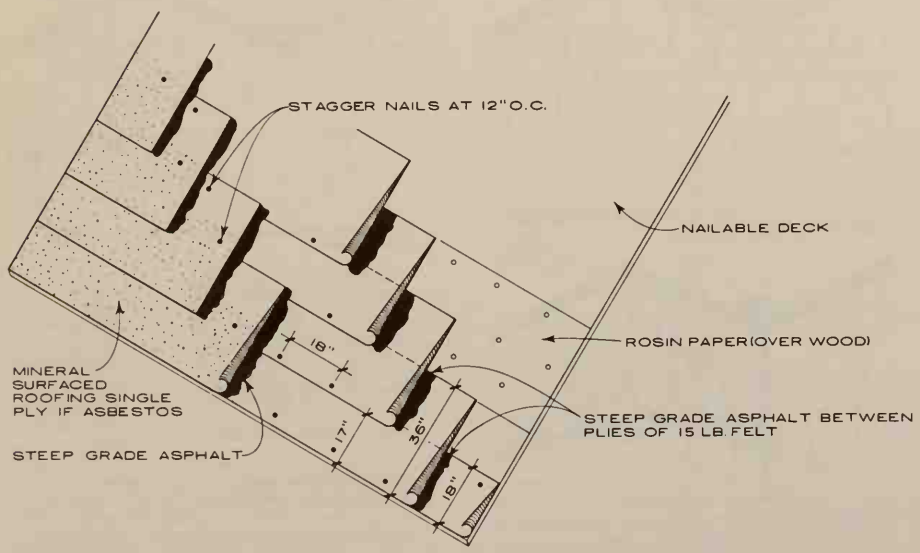
20 YEAR TYPE BUILT-UP ROOF OVER INSULATION



PATTERN FOR NAILING BASE SHEET OR VAPOR BARRIER OVER NAILABLE DECK

NOTES:

For smooth surface roofs omit gravel or slag. On slopes over 1" per foot back-nailing of all felts along top edge is usually required.



MINERAL SURFACE BUILT-UP ROOF

NOTES:

Over non-nailable deck or insulation omit rosin paper and cement solidly with asphalt.
Nailing strips must be provided.

Minimum slope for organic felt = 3" per ft.

Minimum slope for asbestos felt = 1/2" per ft.

Developed by: Angelo J. Forlidas, AIA; Charlotte, North Carolina; from data furnished by: Robert M. Stafford, P. E.; Consulting Engineer; Charlotte, North Carolina

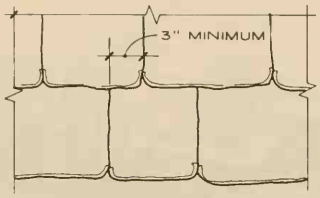
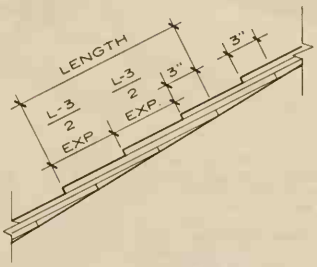
STANDARD LENGTHS AND WIDTHS OF SLATES



PROPER JOINTING



LAP AND EXPOSURE

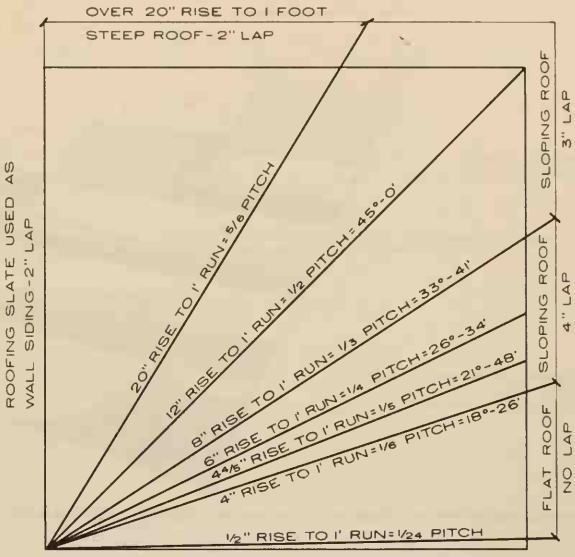


DIAGRAM OF PROPER LAP FOR RISE / RUN

PITCHED ROOF

LENGTH	WIDTH
10" *	6", 7", 8"
12" *	6", 7", 8", 9", 10"
14" *	7", 8", 9", 10", 12"
16"	8", 9", 10", 12"
18"	9", 10", 11", 12"
20"	10", 11", 12", 14"
22"	11", 12", 14"
24"	12", 14"

The above slates are split in these thicknesses: 3/16", 1/4", 3/8", 1/2", 3/4", 1", 1 1/4", 1 1/2", 1 3/4", and 2".

* 1/2" and over not often used in these sizes.

Random widths are usually used.

FLAT ROOF

LENGTH	WIDTH
6"	6", 8", 9"
10"	6", 7", 8"
12"	6", 7", 8"

1/4" to 3/8"—Promenade or heavy service.

3/16"—Ordinary and light service.
3/4" to 1 1/4"—Special terraces, walks, etc.
May be used and set in cement.

GENERAL NOTES:

Commercial Standard is the Quarry run of 3/16" thickness and includes tolerable variations above and below 3/16".

"Full 3/16 slate" or "3/16" or "not less than 3/16" indicates hand picked selection with minimum variation. On other sizes reasonable plus tolerances only are permissible, thus a 1/2" slate must be full 1/2" or slightly thicker.

"Textural" is a rough textured slate roof with uneven butts and a variation in thickness and size; generally not applied to slate over 3/8" thick.

"Graduated" is a textural roof of large size slates, and more variation in thickness, size and color.

A square of Roofing Slate means a sufficient number of slates of any size to cover 100 sq. ft. with 3" lap.

For flat roofs a square would cover more than 100 sq. ft.

Standard Nomenclature for slate color: black, blue black, mottled gray, purple, green, mottled purple and green, purple variegated, red. The above should be preceded by the word "Unfading" or "Weathering."

Other colors and combinations are termed specials.

Proper Jointing: pitched roofs.
3" minimum vertical overlap.
Horizontal overlap varies with pitch; see diagram.

Felt:
With Commercial Standard Slate use 15# saturated felt.
With textural roofs use 30# felt.
With Graduated roofs use 30# for 3/4" slate and 45#, 55#, or 65# prepared roll roofing for heavier slate.

Nail Fastening:
Refer to Section 5:01 for Slating nails.
Each slate punched with 2 nail holes.
Use nails 1" longer than thickness of slate.

GENERAL NOTES

1. Detail drawings for metal roof types are diagrammatic only. Roofing underlayments have been omitted for clarity. The indication of adjoining construction is included merely to establish its relation to the sheet metal work and is not intended as a recommendation of architectural design. Any details which may suggest an architectural period do not limit the application of sheet metal to that or any other architectural style.

2. Weights of metals and roof slopes indicated on detail drawings are minimum as recommended by the Sheet Metal and Air Conditioning Contractors' National Association and may vary from recommendations of some manufacturers.

3. Metals used must be of a thickness or gauge heavy enough and in correct proportion to the breadth and scale of the work. Provide expansion joints for freedom of movement.

4. Prevent direct contact of metal roofing with dissimilar metals which cause electrolysis.

5. The chart at right indicates comparative weights of sheet metals in relation to their common gauge number or thickness identification. The usual method of designating thicknesses of these metals is as follows:

Aluminum	thousandths of an inch
Copper	ounces per sq. foot
Monel	B & S gauge no.
Stainless Steel	U.S. Standard gauge no.
Galvanized Sheet	U.S. Standard gauge no.

To avoid any misunderstanding when specifying the gauge number of any metal, always indicate the decimal thickness of the gauge required.

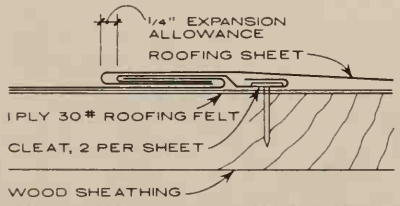
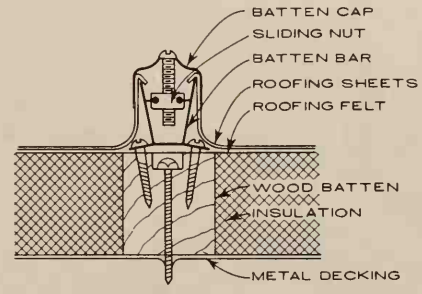
TYPE A BATTEN
FOR RAFTER LENGTHS UP TO 30 FEET

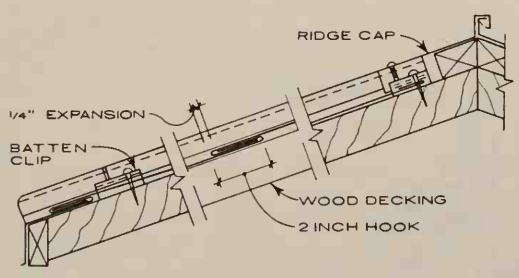


SIGHTLINE SECTION - TYPE A OR B BATTEN

Do not nail through roofing sheets. Use clips, cleats and nails for attachment. All bends and seams should be with a radius at least equal to twice the thickness of the sheet. Cleats should be spaced 10 to 12 inches o.c. The strongest joints are obtained by lock seaming or spot welding. Joints must allow for expansion of metal.



TYPE B BATTEN
FOR RAFTER LENGTHS OVER 30 FEET



SECTION THRU TYPE A BATTEN

NOTES:

Batten roof system fabricated in Aluminum, Copper, Monel Metal or Stainless Steel is adaptable for pitched roofs (minimum pitch 1 1/2 in. per ft.), barrel roof and spires. Design flexibility of batten permits use on domes and parabolic structures.

Roofing Materials:

Aluminum:
- Roof sheets; .032 in. thick, .040 in. thick minimum for domes and parabolic shaped roofs.
- Batten bars and caps; .051 in. thick.
- Standard batten spacing:
  - 34 1/2" for batten system A
  - 33 3/4" for batten system B
- Horizontal sight lines: Vary from 114 1/2 in. to 156 1/2 in. on centers to suit job conditions.
- Finishes: Variety. Consult manufacturer.

Stainless Steel or Monel Metal:
- Roof sheets; 24 gauge.
- Battens and caps: 20 gauge, all material type 302
- Standard batten spacing and sheet sizes: Same as aluminum.
- Finishes: Variety. Consult manufacturer.

Copper:
- Roof sheets; 16 ounce.
- Battens and caps; 20 ounce.
- Standard batten spacing:
  - 28 1/2" for batten system A
  - 27 3/4" for batten system B
- Standard horizontal sight line on 114 1/2 in. centers.

Sheet sizes and batten centers listed above are standards, but are variable, especially on unusually shaped roofs. Do not exceed 48 in. batten centers.

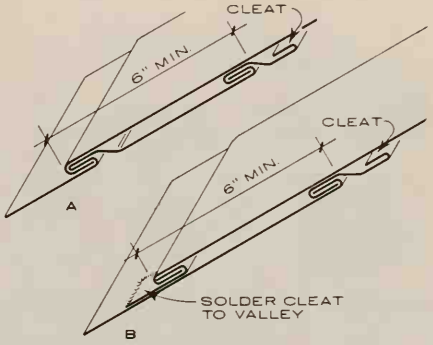
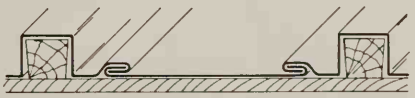
DETAIL 3- STANDING SEAM CONSTRUCTION



DETAIL 4- ROOFING AT VALLEY

A- BATTEN SEAM AND STANDING SEAM



B- BATTEN SEAM AND FLAT SEAM

DETAIL 5-COMBINATION OF ROOF TYPES

NOTES:

Standing seam roofing may be applied on slopes of 3 in. per foot or greater, and when the distance between ridge and eaves does not exceed 30'— 0". If the surface to receive the roofing is other than wood, nailing strips must be provided to receive the cleats. The surface should be thoroughly dry, smooth, and covered with the underlayment as recommended.

The spacing of seams may vary between reasonable limits to suit the architectural style of a given building. The two methods of installing standing seam roofing are the pan and the roll method. In the pan method, the sides of the sheets are formed as shown in A of detail 1. Top and bottom edges of pans are formed as shown in D, E or F of detail 3. Pans are installed with cleats spaced not more than 12 in. on center. Each pan is locked to the one below as shown in D, E or F of detail 3. The adjacent row of pans is next installed and the standing seams completed as in C and D of detail 1.

The roll method consists of a series of long sheets joined together at their ends with double flat lock seams and sent to the job in rolls. The standing seam is field formed as shown in A of detail 2. The roofing is installed in lengths reaching from the eave to the ridge and attached with cleats spaced not more than 12 in. on center. After second length is installed and cleated in place, the standing seam is formed as shown in detail 2.

H of detail 3 shows method of terminating metal roofing at the eave where roofing is locked over a continuous cleat. I of detail 3 shows method of terminating metal roofing at a built-in gutter. Roofing is loose locked to a continuous cleat and the flange on back edge of gutter. Seam terminations must be soldered. A and B of detail 3 show methods of terminating metal roofing at the ridge. C and G of detail 3 illustrate methods of terminating metal roofing at the gable. Methods of joining metal roofing to a valley are shown in A and B of detail 4.

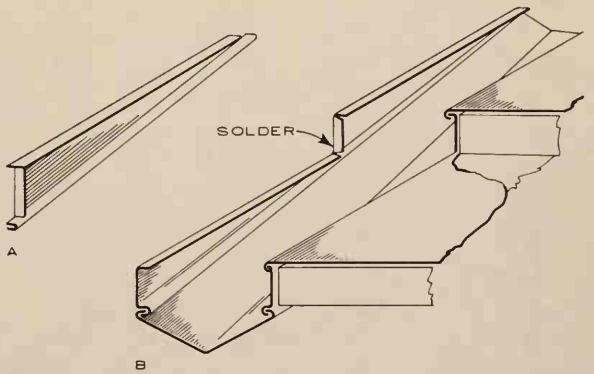
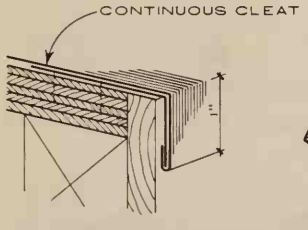
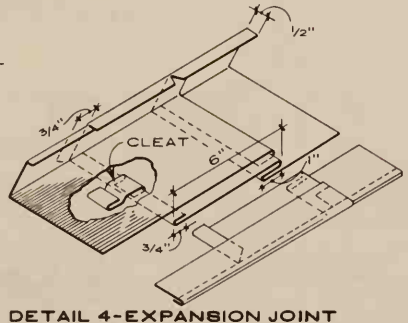
DETAIL 2-CONSTRUCTION AT BATTEN



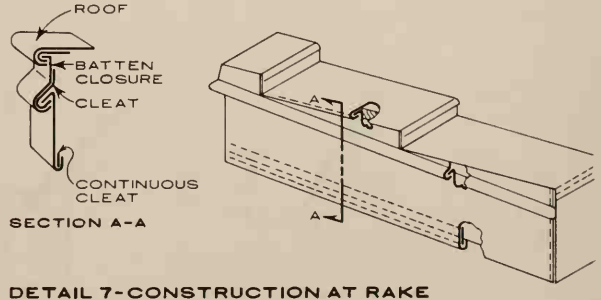
DETAIL 6-CONSTRUCTION AT CLOSURE AND VALLEY



DETAIL 3-EAVE



DETAIL 4-EXPANSION JOINT



SECTION A-A

DETAIL 7-CONSTRUCTION AT RAKE

NOTES:

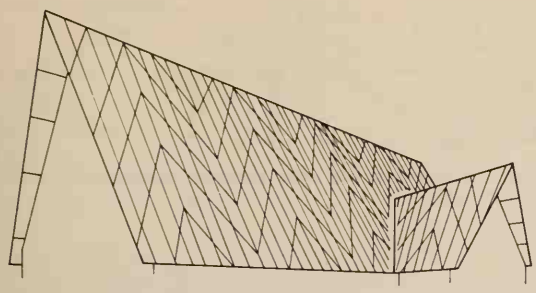
The Bermuda roof may be used for roofs having a slope greater than 2½ in. per foot. Wood framing must be provided as shown in detail 1. Dimension "D" and gage of metal will depend upon the size of sheet used. See chart.

The surface to receive the metal roofing should be thoroughly dry and covered by a saturated roofing felt. A rosin paper should be applied over the felt to avoid bonding between felt and metal.

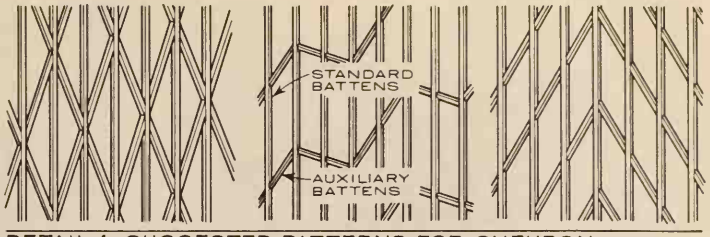
Bermuda roof is applied beginning at the eave. The first pan is hooked over a continuous cleat as shown in detail 3. The upper portion of the first and each succeeding pan is attached as shown in detail 2. Cleats spaced on 8 in. centers are nailed to batten as in A of detail 2. Joint is developed as shown in B of detail 2 and malleted against batten as shown in C of detail 2. All cross seams are single locked and soldered except at expansion joints. Cross seams should be staggered. Expansion joints should be used at least every 25 ft. and formed as shown in detail 4. Roofing is joined at hip or ridge by use of a standing seam as shown in A of detail 5. Seam may be malleted down as shown in B of detail 5.

Detail 6 shows the method of forming valleys. Valley sections are lapped 8 in. in direction of flow. Individual closures for sides of valley are formed as shown in A of detail 6 and must be soldered as indicated in B of detail 6. A method of terminating the roof at rake is shown in detail 7. The face plate (optional) is held in place by continuous cleats at both top and bottom. The batten closure is formed as a cleat to hold edge of roof pan as shown in section A–A of detail 7.

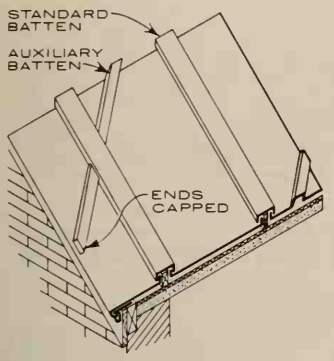
Emory E. Hinkel, Jr.; A. G. Odell, Jr. and Associates; Charlotte, North Carolina



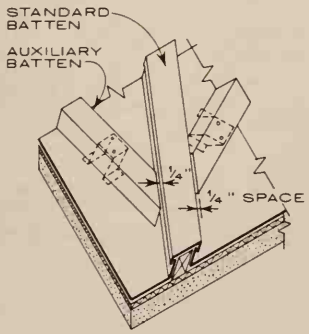
CHEVRON DESIGN METAL ROOF



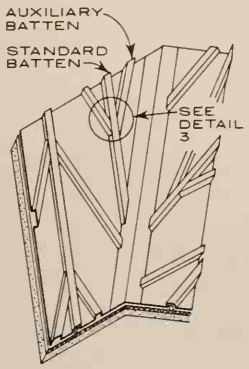
DETAIL 1- SUGGESTED PATTERNS FOR CHEVRON ROOFING



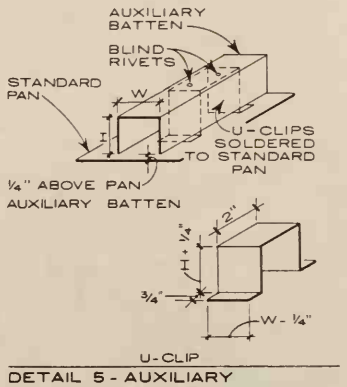
DETAIL 2- GABLE END



DETAIL 3- BATTEN INTERSECTION



DETAIL 4- VALLEY



DETAIL 5 - AUXILIARY BATTEN AND CLIP

NOTES:

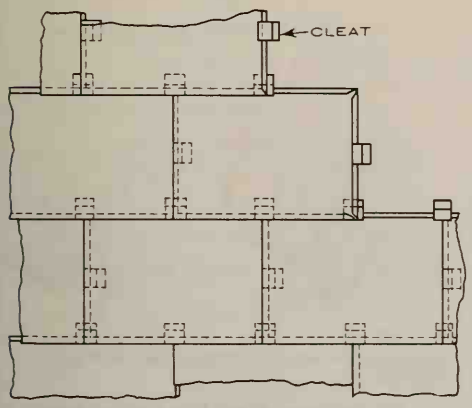
A chevron design roof or vertical wall is made by using auxiliary battens in conjunction with standard batten seam construction. Auxiliary battens are ornamental and are not a functional part of the roof. The size and shape of the auxiliary batten can vary to suit architectural appearance. The auxiliary battens are formed as channels and are held in place by metal U clips as shown in detail 5.

The U clips should be spaced not more than 2 ft. apart and not less than two clips should be used on any auxiliary batten. The clips are soldered to the metal pans and the auxiliary batten is attached to the clips with metal rivets.

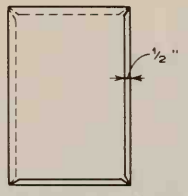
To prevent the entrapment of water in back of the auxiliary battens, the lower edge of the batten should be at least 1/4 in. above the top surface of the standard pan.

Where the end of the auxiliary batten butts the standard batten, a 1/4 in. space between the members should be provided, as shown in detail 3.

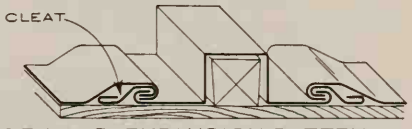
At the gable, the ends of the auxiliary battens can be left open or they can be closed by folding over a tab provided on the end of the batten.



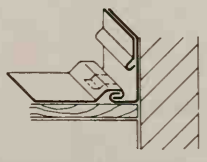
DETAIL 1- FLAT SEAM ROOF



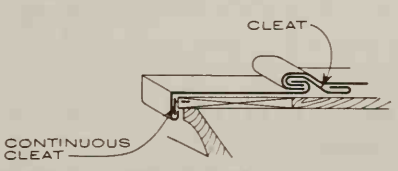
DETAIL 2- ROOFING SHEET



DETAIL 3- EXPANSION BATTEN



DETAIL 4- JUNCTION AT PARAPET WALL



DETAIL 5- ROOF EDGE

NOTES:

The flat seam method of roofing as illustrated is most commonly used on roofs of slight pitch or for the covering of curved surfaces such as towers or domes.

The joints connecting the sheets of roofs having a pitch greater than 1/2 in. per ft. may be sealed with caulking compound or white lead. The joints of roofs having a pitch of less than 1/2 in. per ft. must be malleted and thoroughly sweated full with solder.

Roofs of slight pitch should be divided by expansion battens as shown in detail 3, into sections not exceeding 30 ft. square.

The surface upon which the roof is installed should be thoroughly dry, smooth, and covered with the underlayment as recommended on another page in this series.

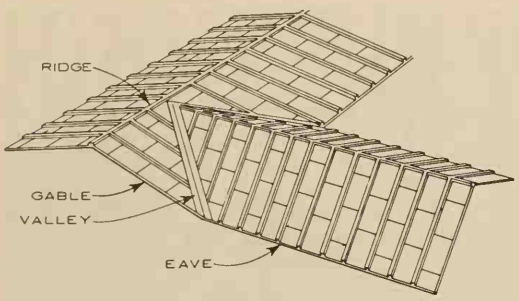
The roof is composed of pans formed from metal sheets of a size found on another page in this series.

The metal sheets may be pre-tinned if required, 1 1/2 in. back from all edges and on both sides of the sheet. Pans are formed by notching and folding the sheets as shown in detail 2.

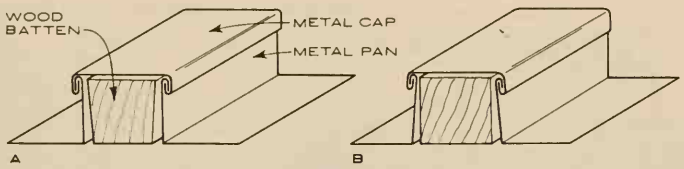
The pans are held in place by cleating as shown. After pans are in place, all seams are malleted and soldered or sealed.

Detail 4 shows the junction of a roof and a parapet wall. Metal base flashing is cleated to deck on 2 ft. centers and extended up wall. 8 in. pans are locked and soldered to base flashing. Metal counter flashing covers 4 in. of the base flashing. Detail 5 illustrates the installation of flashing at edge of roof. Flashing is formed as shown and attached to the face by a continuous cleat nailed on 1 ft. centers and cleated to the roof deck. Pans are locked and soldered or sealed to the flashing.

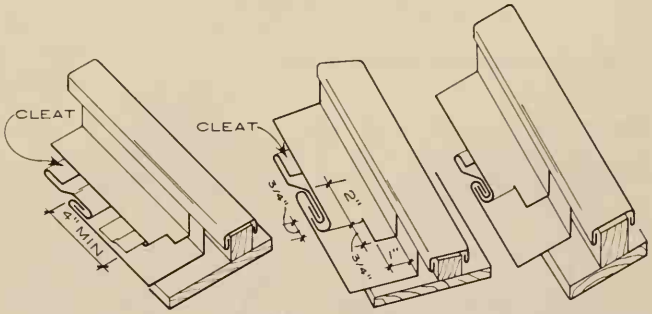
Emory E. Hinkel, Jr.; A. G. Odell, Jr. and Associates; Charlotte, North Carolina



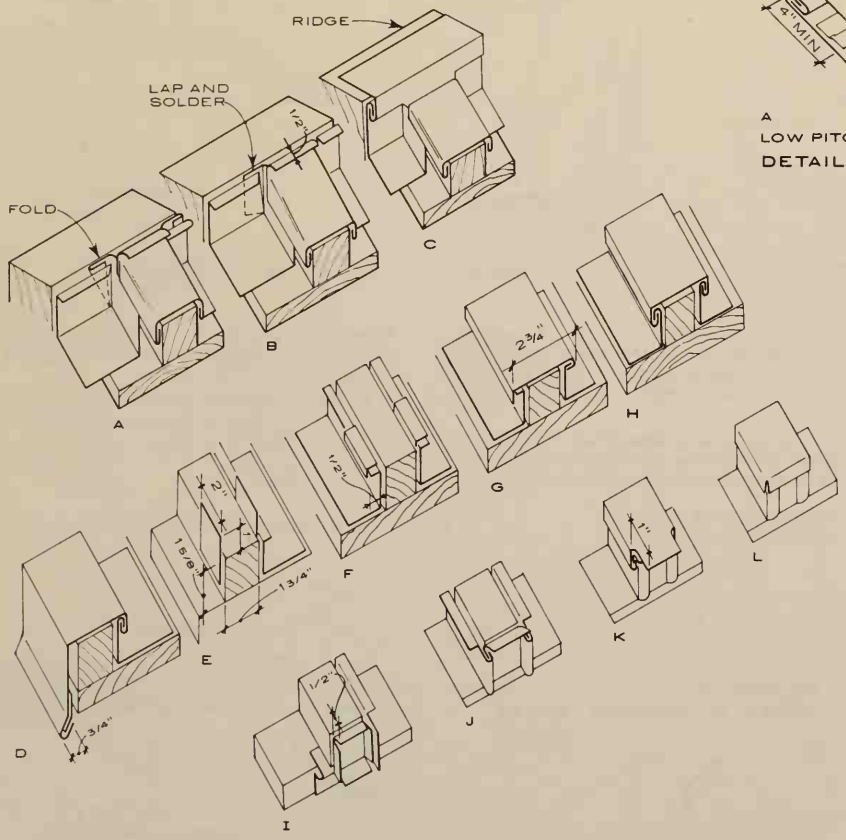
BATTEN SEAM METAL ROOF



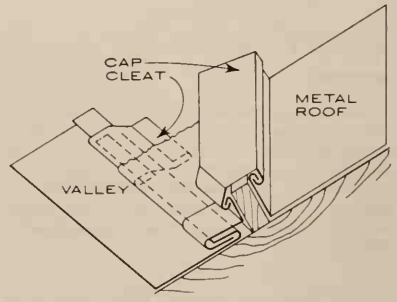
DETAIL 1-BATTEN ALTERNATES FOR METAL ROOFING



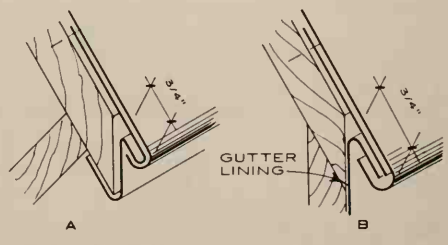
DETAIL 3- TRANSVERSE SEAM IN METAL ROOFING



DETAIL 2- BATTEN CONSTRUCTION FOR METAL ROOFING



DETAIL 4- METAL ROOFING AT VALLEY



DETAIL 5- METAL EDGE STRIP AT EAVES

NOTES:

Copper (minimum 16 oz.), terne (minimum 40 lb.), or aluminum (minimum 0.032 in.) is recommended for batten seam roofing.

Batten seam roofing may be applied on slopes of 3 in. per ft. or greater. If the surface to receive the roofing is other than wood, the battens should be bolted in place. The surface to receive the roofing should be thoroughly dry, smooth, and covered with the underlayment as recommended by the manufacturer.

The spacing of the wood battens may vary within reasonable limits to suit the architectural style and scale of the building, but the recommended maximum distance is 20 in. between battens. Care should be taken to space the battens in such a manner that waste of metal is held to a minimum.

Battens may be shaped as shown in A or B of detail 1. A is preferred as it automatically makes allowance for expansion. When battens shown in B are used, care must be taken to provide for expansion by bending the metal where it meets the batten at greater than 90 degrees.

Sheets are formed into pans with each side turned up 2 1/8 in. A 1/2 in. flange is turned toward the center of the pan as shown in F, G, and H of detail 2. At lower end of the pan, the sheet is notched and a hook edge is formed as in A, B or C of detail 3. For low pitched roofs the upper end of the sheet is formed as in A of detail 3. On steeper roofs the upper end is formed as shown in B or C of detail 3.

Pans are installed, starting at the eave, and held in place with cleats spaced not over 12 in. on center as shown in E of detail 2. Each pan is hooked to the one below it and cleated into place. After pans are in place, a cap is installed over the batten as shown in G and H of detail 2.

A, B and C of detail 2 show methods of terminating metal roofing at the ridge.

D of detail 2 shows method of joining metal roofing at the gable.

Detail 4 shows method of joining metal roofing at a valley.

I, J, K and L of detail 2 show method of closing the batten ends.

A and B of detail 5 show alternate edge strips at eaves.

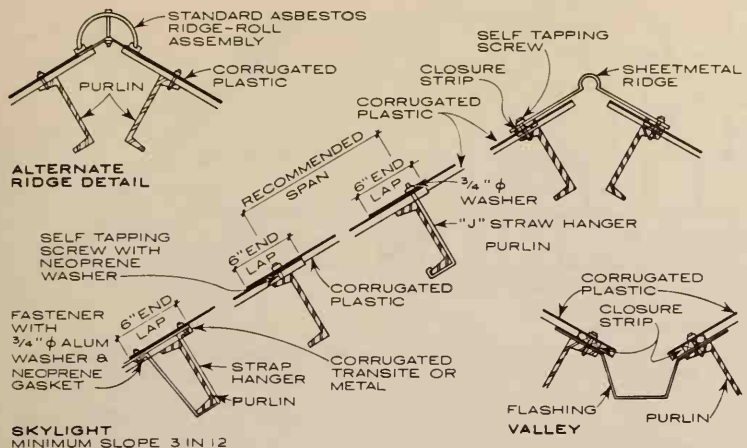
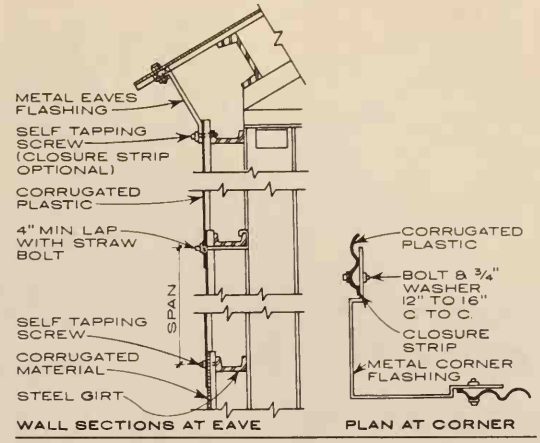
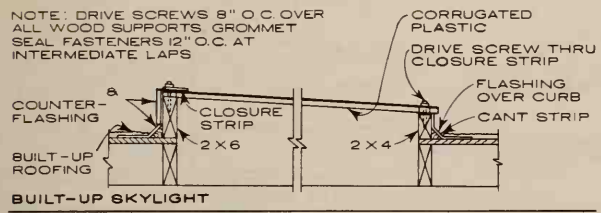
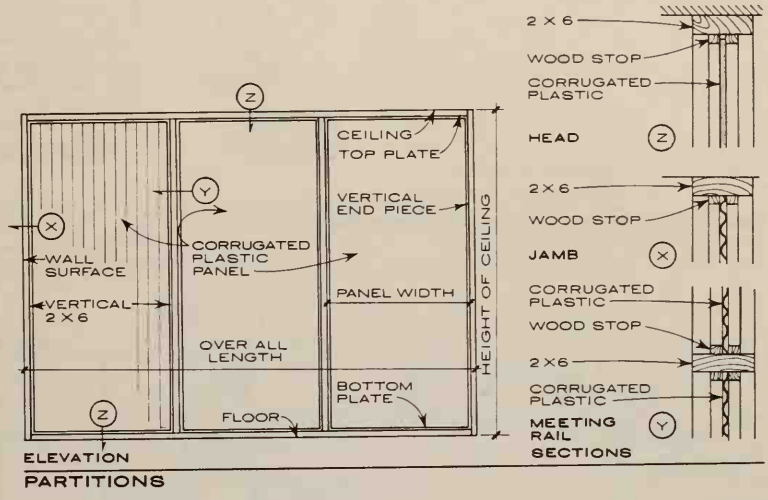
FORMED GLASS INSTALLATION DETAILS

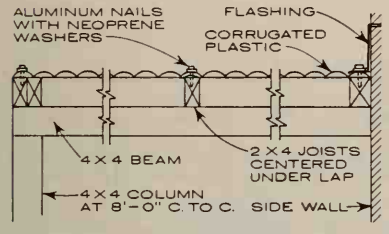
J. F. Hayes and J. W. Meade; Hayes and Hough, Philadelphia, Pennsylvania

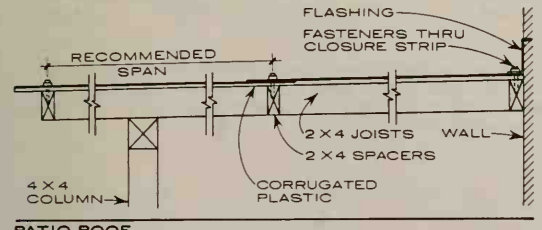


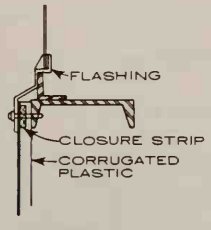


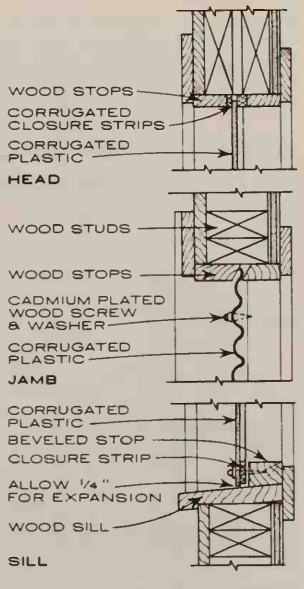


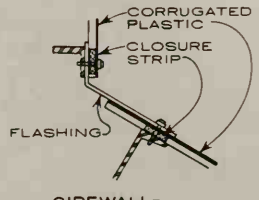


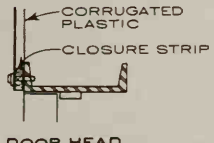










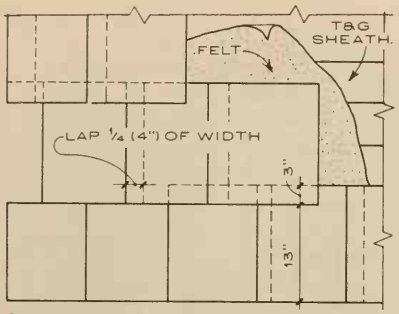


GENERAL NOTES:

Corrugated plastic should not be exposed to moisture prior to installation, and should be stored upright or on edge; may be cut with hand saw, power saw or hack saw; may be fastened with nails, screws or bolts. For weather sealing at ridges and eaves, use closure strips and metal flashing according to standard practice. At intermediate end laps use mastic. Side laps should be sealed with plastic sealing strips or mastic. For window glazing, standard procedures may be followed. If vibration or wind pressures are expected, plastic type steel sash putty is used. Heavy gauge glazing clips are recommended. See manufacturers literature for detailed methods of installation. Standard lengths 8' – 0", 10' – 0", 12' – 0", 14' – 0" depending on pattern.

TYPICAL DETAILS

J. F. Hayes and J. W. Meade; Hayes and Hough; Philadelphia, Pennsylvania



Substantially single coverage. Requires less material than American.

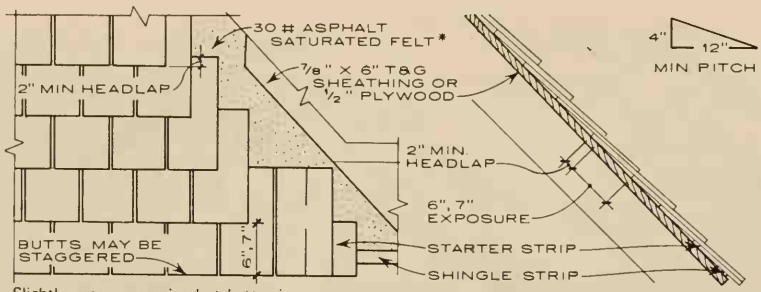
RANCH, SCOTCH OR DUTCH LAP METHOD

8" width used for "American." Exp 6", 7"

16" width used for "Dutch." Expos. 13"

12" width used for "Ranch." Some mfrs. vary slightly.

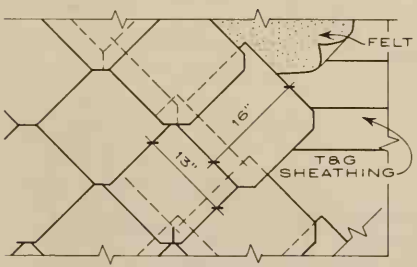
INDIVIDUAL SHINGLE



Slightly more expensive but better in appearance. See specific mfr. for dimensions.

AMERICAN METHOD

NOTE: Asbestos-cement hip and ridge shingles, ridge rolls, and starter shingles are available for all types of asbestos-cement roofing.

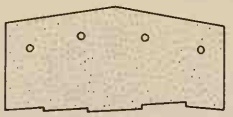


Inexpensive but not as waterproof as American.

FRENCH OR HEXAGONAL METHOD

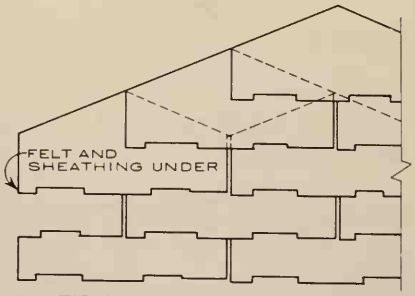
EXPOS. 13"X13"

FRENCH OR HEXAGONAL INDIVIDUAL SHINGLE



Size, design and layup varies with mfr. Gives effect of individual layup. Min. pitch 4" in 12".

MULTIPLE UNIT (AMERICAN COLONIAL) STRIP SHINGLES



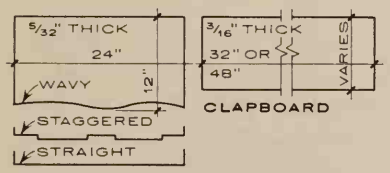
MULTIPLE UNIT METHOD

ASBESTOS-CEMENT ROOFING SHINGLES

All shingles have uniform thickness of 5/32". Use 1 1/4" galv. or aluminum needle point nails.

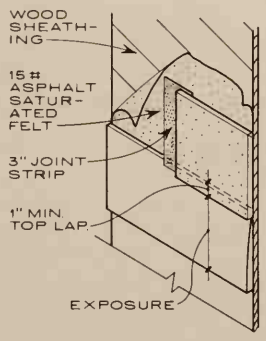
Min. slope: 4" in 12" for shingles, over single layer underlayment. 30# asphalt felt* recommended.

Consult manufacturer for slopes less than 4" in 12".



SIDING SHINGLES

Asbestos-cement siding may be applied over non-lumber sheathing using wood under coursing strips or insulating backer board. Use 1 1/4" aluminum nails or self-clinching nails. Refer to mfrs' data for proper fasteners and dimensions.



ASBESTOS-CEMENT SHEET SIZES *

TYPE	USE	SIZES 1/8"	3/16"	1/4"	3/8"
"F" (flexible)	Interiors & exteriors requiring high strength & density, smooth surface, low moisture absorption.	48"x48",96" 120"&144"	48"x48",96" 120"&144"	48"x48",96" 120"&144"	48"x48",96" 120"&144"
"U" (utility)	Interiors & exteriors general utility and construction.		48"x48",96" 120"&144"	48"x48",96" 120"&144"	48"x48",96" 120"&144"

* Both "F" and "U" width are specified in Federal Specification SS-B-775—Color: Stone grey, also available primed and prefinished in color. Sheets up to 1/4" thick do not have to be drilled for nailing. Nails: galv. or aluminum, min. length 1" plus sheet thickness. Nail 8"– 12" o.c. on all edges, 16" o.c. on intermediate studs.

ASBESTOS-CEMENT * SIDING

* The new term "Mineral Fiber" is synonymous with Asbestos-Cement.

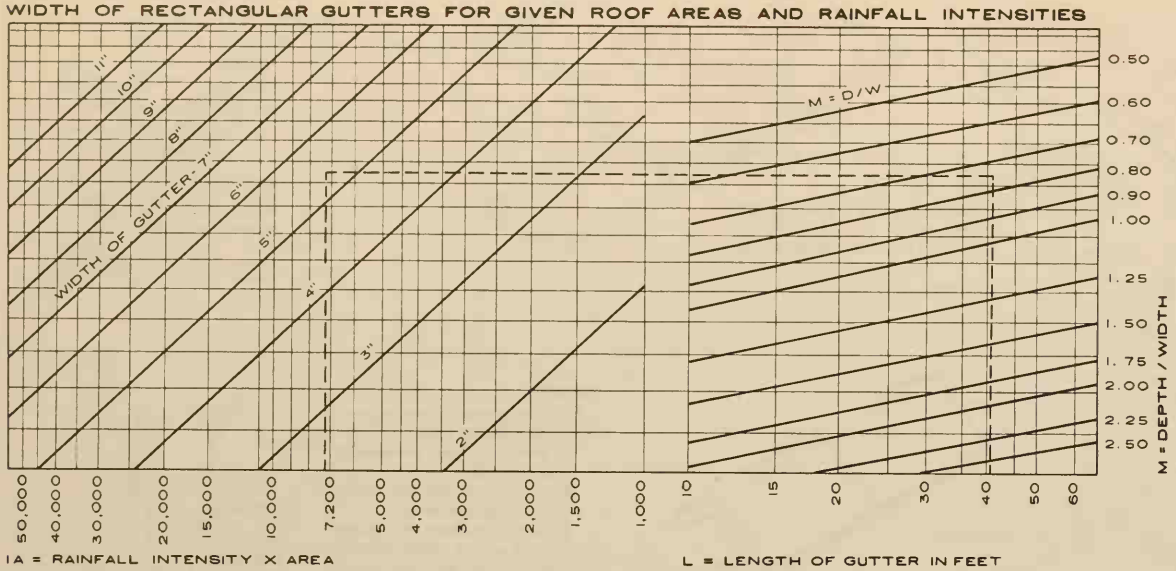
WIDTH OF RECTANGULAR GUTTERS FOR GIVEN ROOF AREAS AND RAINFALL INTENSITIES



NOTE:

The terms "leader," "conductor," and "downspout" all mean the same thing.

SAMPLE PROBLEM:

To size rectangular gutter for a building 120 x 30 ft. located in New York City. This building has a flat roof with a raised roof edge on three sides. A gutter is to be located on one of the 120 ft. sides. So that each section of gutter will not exceed 50 ft., three downspouts will be used with 2 gutter expansion joints. The area to be drained by each section of gutter will be 1200 sq. ft., the rainfall intensity from map below is 6 in., the length of each gutter section is 40 ft., and the ratio of gutter depth to width is 0.75. On chart above find the vertical line representing L = 40. Proceed vertically along this line to its intersection with the oblique line representing M = 0.75. Pass horizontally to the left to intersect the vertical line representing IA = 7200. The point of intersection occurs between the oblique line representing gutter widths of 5 and 6 in. The required width of gutter is, therefore, 6 in. and its depth need be only 4 $^{1}/_{2}$ in.

DESIGN AREAS FOR PITCHED ROOFS

PITCH	FACTOR
LEVEL TO 3 IN./FT.	1.00
4 TO 5 IN./FT.	1.05
6 TO 8 IN./FT.	1.10
9 TO 11 IN./FT.	1.20
12 IN./FT.	1.30

NOTE: When a roof is sloped neither the plan nor actual area should be used in sizing drainage. Multiply the plan area by the factor shown above to obtain design area.

INFLUENCE OF GUTTER SHAPE ON DESIGN

1. RECTANGULAR GUTTERS:

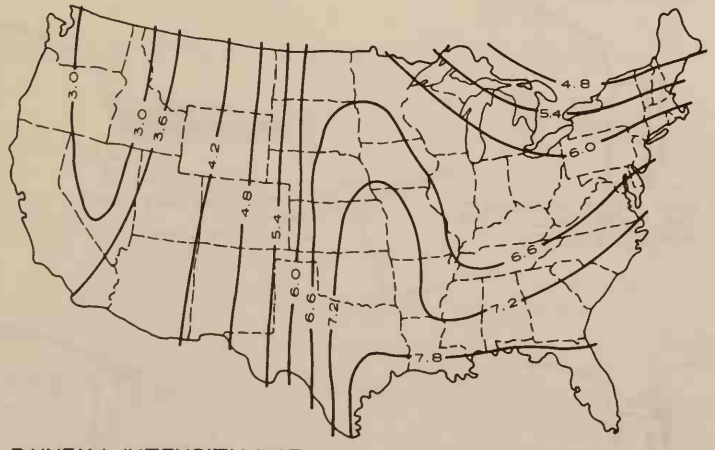
Use graph at top of page.

2. IRREGULAR SHAPES:

Determine equivalent rectangular size and use same method.

3. SEMICIRCULAR GUTTERS:

First size downspout from tables below. Then use gutter 1 inch larger in diameter.



RAINFALL INTENSITY MAP

NOTE:

Map shows hourly rainfall in inches for 5 minute periods to be expected once in 10 yrs. This is normally adequate for design but record storms have gone twice as high in some areas. For important work see local records.

DOWNSPOUT CAPACITY

INTENSITY IN IN./HR. LASTING 5 MIN.	SQ.FT. ROOF/ SQ.IN. DOWNSPOUT
2	600
3	400
4	300
5	240
6	200
7	175
8	150
9	130
10	120
11	110

GENERAL NOTES:

Most gutters are run level for appearance. However, a slope of $^{1}/_{16}$ in. per foot is desirable for drainage.

For residential work allow 100 sq. ft. of roof area per 1 sq. in. of downspout.

DEFINITIONS:

Waterproofing is a system intended to prevent the passage of water through walls and floors.

Dampproofing is to prevent the passage of moisture or collection of water vapors. A system that is not capable of withstanding hydrostatic pressures.

GENERAL NOTES:

1. Membrane, hydrolithic and chemical admixtures in concrete are typical types of waterproofing and dampproofing systems. Choice of the appropriate system depends upon the prevailing hydrostatic conditions. Consult manufacturers for system properties and uses.
2. Specify installation to conform strictly to the recommendations of the manufacturer of the system selected.
3. The details on the following pages are typical conditions only.

TYPICAL SYSTEMS

TYPE	DESCRIPTION	GENERAL USES
MEMBRANES	Tar or asphalt bitumens on and between layer(s) of felt made of rag, asbestos and wood fiber or of fabric made of cotton and glass. Butyl rubber and polyvinyl chloride sheets with laps sealed with adhesives and cements.	Exterior, below grade on walls and under floors. Under walking surfaces of roofs.
HYDROLITHIC COATINGS	Sprayed, troweled or brushed on coatings of asphaltic bitumens and plastics. Coatings of plaster or cement mixed with ferrous particles.	Exterior, below grade on walls. Interior, below grade on walls and floors.
CONCRETE ADMIXTURES	Liquid, paste or powder admixtures used integrally to render concrete impermeable.	Walls and floors above and below grade, concrete canopies and covered walks.
METAL WATERPROOFING	Plain metal sheets, and metal sheets coated with fabric and/or plastic sheets sealed by soldering, adhesives and cements. Generally the metal is lead or copper.	Shower stalls and pans, pools, around floor and roof drains. Under walking surfaces on roofs.

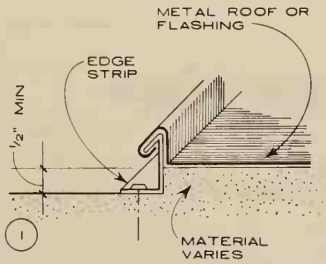
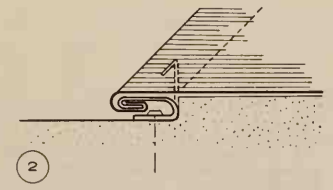
ELASTIC	SEE NOTE 7																			NOTE #7

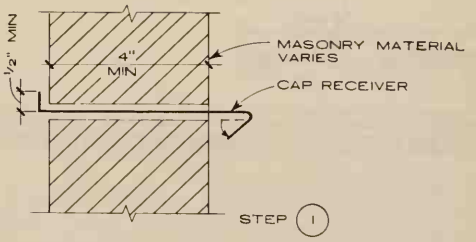
GENERAL NOTES:

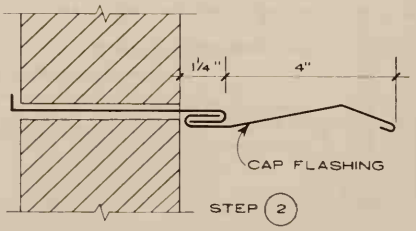
1. All sizes and weights of material given in chart are minimum. Actual conditions may require greater strength.
2. All galvanized steel must be painted.
3. With lead flashing use 16 oz. copper cleats. If any part is exposed, use 3 # lead cleats.
4. Coat zinc with asphaltum paint when in contact with redwood or cedar. High acid content (in these woods only) develops stains.
5. Type 302 stainless steel is an all purpose flashing type. Cleats not needed.
6. Use only aluminum manufactured for the purpose of flashing. Cleats not needed.
7. See manufacturers literature for use and types of elastic flashing.
8. In general cleats will be same material as flashing, but heavier weight or thicker gauge.
9. In selecting metal flashing precaution must be taken not to place flashing in direct contact with dissimilar metals that cause electrolysis.
10. Spaces marked ⊠ in chart are uses not recommended for that material.

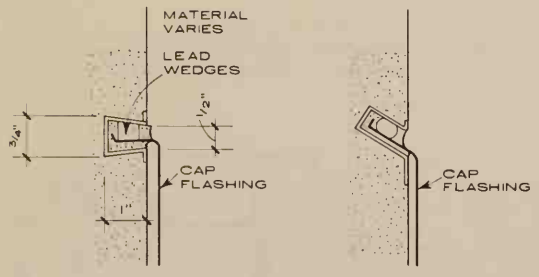




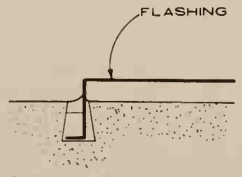
DEVELOPMENT OF EDGE (HOLD DOWN) STRIPS







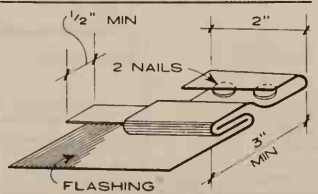
METAL REGLETS CAST IN PLACE



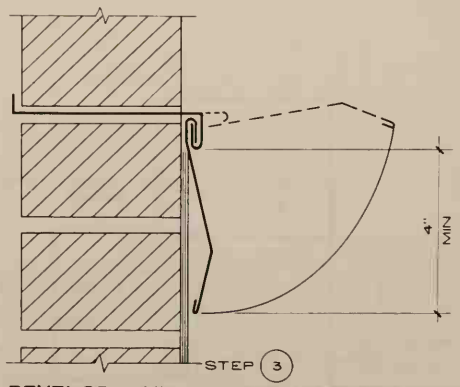
REGLET SAWED IN MATERIAL

TYPICAL REGLETS

NOTE:
Various types of metal reglets are available for cast in place & masonry work; see manufacturer's literature. Where material permits, reglets may be sawn. Flashing is secured in reglets with lead wedges at max. 12" cc, fill reglet with non-hardening waterproof compound.

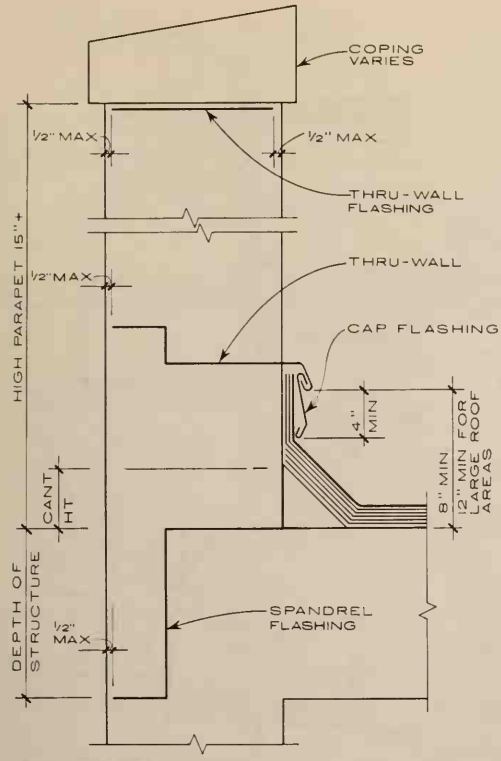


TYPICAL CLEAT



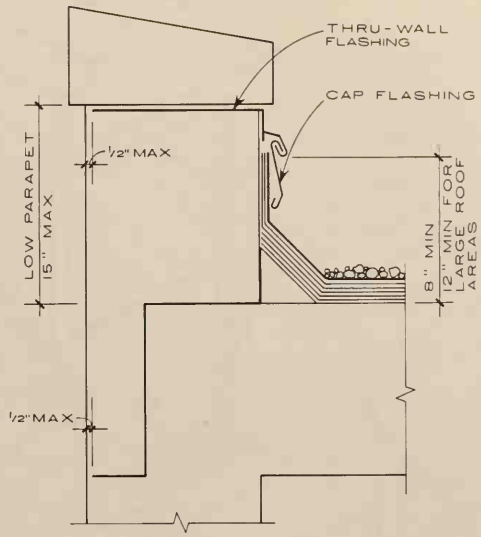
DEVELOPMENT OF CAP FLASHING

NOTE:
Hem in cap flashing recommended for stiffness; but may be omitted if heavier gauge material used.



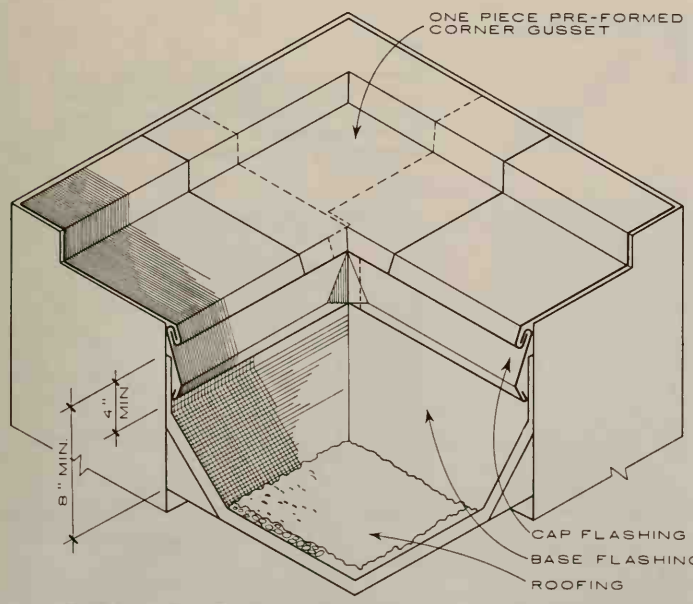
HIGH PARAPET

NOTE: WALL MATERIAL VARIES

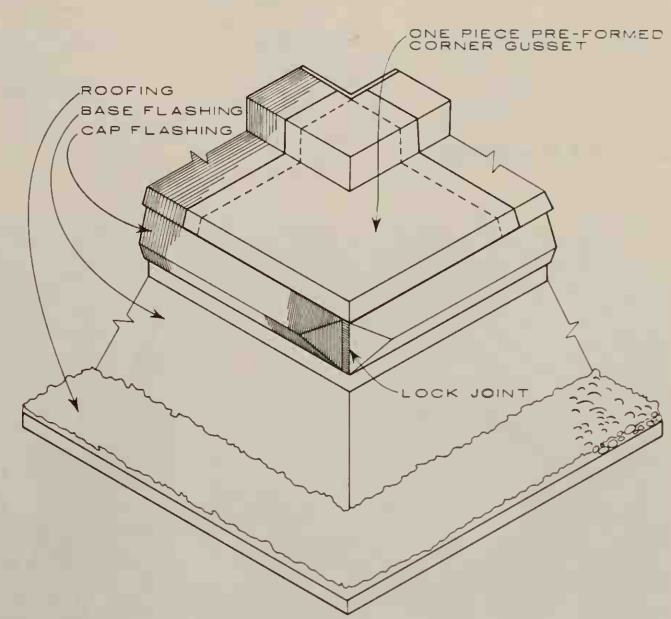


LOW PARAPET

PARAPET FLASHING



INTERIOR CORNER

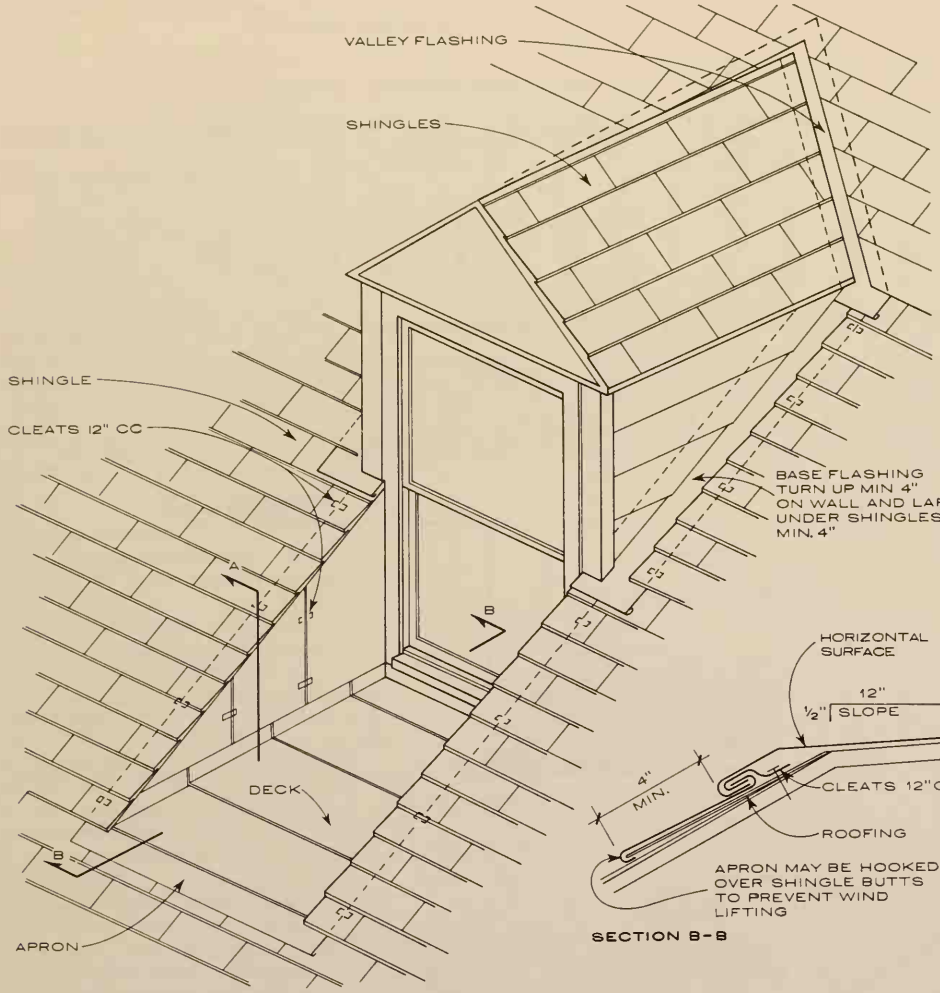


EXTERIOR CORNER

PARAPET FLASHING AT CORNERS

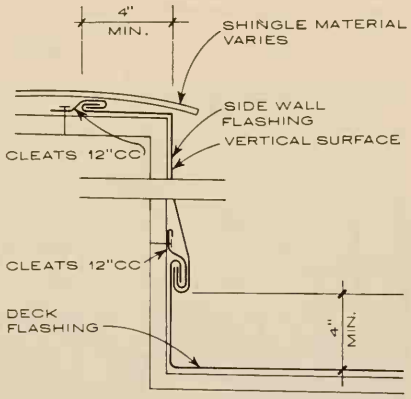
NOTES:

1. Use loose lock joints set in non-hardening compound for adjacent pieces of flashing.
2. Where flashing turns corner insert gusset and solder at corners only.
3. Lap all vertical joints min. 4". Cap flashing must lap base flashing min. 4".
4. Thru-wall flashing not recommended for earthquake areas.
5. A deformed surface pattern is recommended for all thru-wall flashing.
6. The above details presume no expansion joints needed.

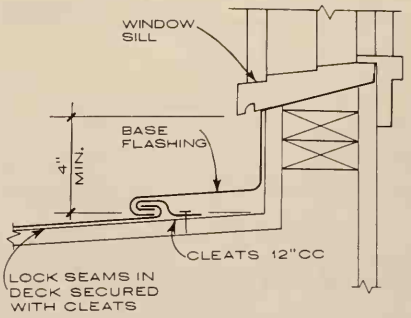


DORMER FLASHING

SECTION B-B



SECTION A-A



NOTE:

Separate pieces of base flashing are installed as each course of shingles is applied. The upper edge of each piece should extend 2" above each course of shingles. The lower edge should be 1/2" above the butts of the shingles forming the next course.

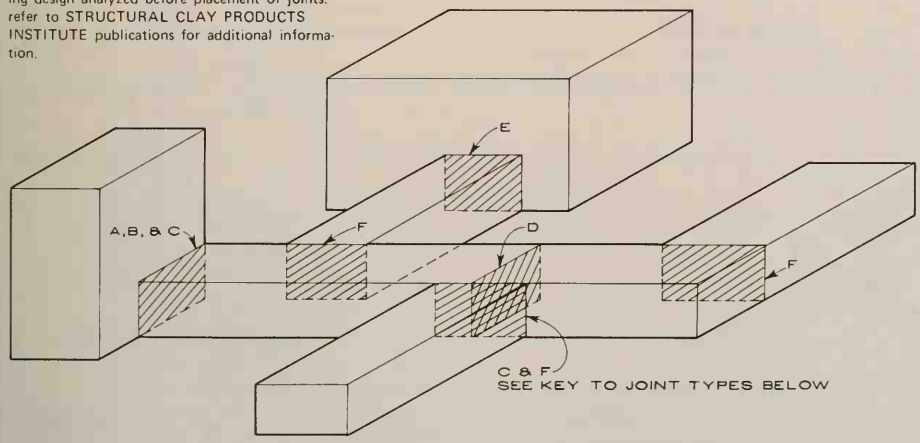
FORMULA FOR MATERIAL EXPANSION
Multiply span (in inches) of material X 100 degrees (average difference in Fahrenheit temperature between summer and winter) X the coefficient of thermal expansion of the material Span X 100° F. X coefficient of thermal expansion.

JOINT SPACING
No single recommendation on positioning and spacing of expansion joints can be applicable to all structures. Guide lines set forth here should be used with caution and each building design analyzed before placement of joints. refer to STRUCTURAL CLAY PRODUCTS INSTITUTE publications for additional information.

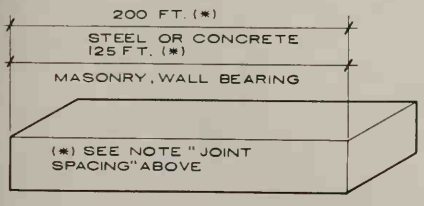
EXPANSION JOINT WIDTH
The width of an expansion joint is generally assumed as 1" (one inch). The actual amount of expansion to be expected from a given material and situation should be calculated. Where additional "skin joints" are provided in cavity wall construction (general note number 3), joint width may be reduced to 1/2" (one-half inch) to facilitate calking and a neat appearance.



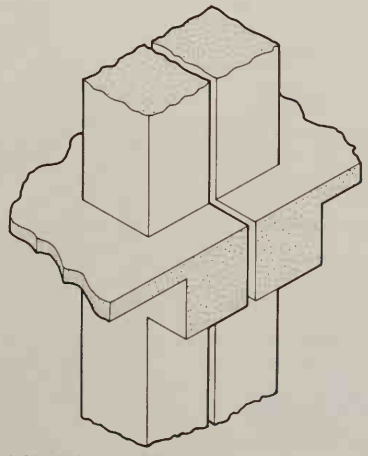
LOCATIONS OF EXPANSION JOINTS
SEE "JOINT SPACING" NOTE ABOVE

EXPANSION JOINT TYPES

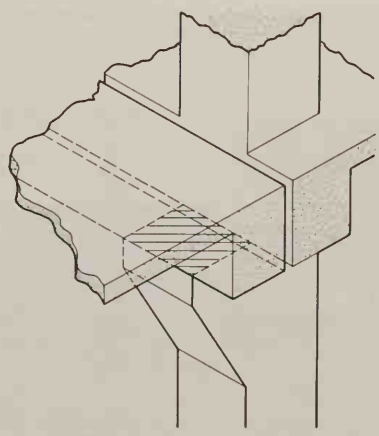
A. New building adjoining existing building.
B. Long low building abutting higher building.
C. Wings adjoining main structure.
D. Long building (exceeding maximums indicated below).
E. Long low connecting wings between buildings.
F. Intersections at wings of "L", "T", or "U" shaped buildings.



MAXIMUM ALLOWANCE WITHOUT JOINTS
(ASSUMING ENDS OF STRUCTURE ARE FREE)



DOUBLE COLUMNS



SLIP PLANE

JOINTS IN CONCRETE STRUCTURE

GENERAL NOTES:
Most architectural building materials are affected by temperature changes to the extent that movement in the form of expansion and contraction occur in response to normal temperature changes. Expansion joints are provided to allow for such movement to prevent cracks, breakage, distortation, malfunctioning or other unforseen developments which could be caused by such movement. Normally these expansion joints must occur where indicated by isometric "LOCATION OF EXPANSION JOINTS" of this page, and must provide complete separation of materials, and cut through entire building from top of footing or foundation wall to the roof and through parapet. This is accomplished by the use of double columns and girders, or by slip planes. Additional expansion joints may be required in certain other situations and building elements as follows:

1. Joints in roof may be required at more frequent intervals because of severe exposure. Where additional roof joints are provided and do not provide complete building separation, the roof slab should not be rigidly connected to the supporting structure in order for the joints to function.
2. Provide additional expansion joints thru parapet walls located between joints required by other criteria. If parapet wall is doweled to the structural frame and reinforced, these additional joints may be omitted. Joints should be placed near corners to avoid displacement of the parapet.
3. In masonry cavity wall construction, provide additional expansion joints in the exterior wythe of masonry for full height of wall including parapets, and located between joints required by other criteria. The exterior wythe of masonry in cavity wall construction shall be tied to the interior wythe or back-up material with flexible anchors in order for the joints to function.
4. Provide horizontal expansion joints at all shelf angles provided for the support of masonry walls or panels by a structural frame. Shelf angles should be interrupted at frequent intervals ot allow for thermal movement.
5. Provide expansion joints (soft joints, slip channels, etc.) at interior partitions which abutt underside of floor or roof structure above in buildings which have exterior bearing or shear walls of exposed concrete. Joints should also be provided where deflection of floor and roof slabs is anticipated to the extent that abutting partition could be crushed.
6. Expansion joints or slip planes may be required in many minor exterior elements of a building where a material occurs in such volume of length that thermal movement may create a problem; for example, metal railing, metal wall panels, curtain wall, gravel stops, glass blocks, plate glass, concrete paving, sidewalks, etc.

30 3/4	35 1/2	66 7/8	37	9 9/16	5	565	18270	17550

TYPES & SHAPES OF UNITS

NOTE:

To determine the amount of air required in CFM, divide the area volume in cubic feet by the minute air change derived from the table below.

Example: In an area 50' x 40' x 20', the calculated volume is 40,000 cu. ft. If a four-minute air change is required, the volume to be exhausted is 10,000 cubic feet per minute.

To insure quiet air intake, divide CFM requirement by desired throat velocity to obtain square foot throat area. Intake face velocities are more satisfactory when kept at 600 fpm. or below.

CFM ratings vary with manufacturer according to H.P. of motor, pulley sizes and design. Diameter of blades are considered standard up to 48 inches. Not all sizes are made by all manufacturers.

When discharging a fan into an attic space, it should be centrally located over the area to be ventilated. When the attic is unfinished, install a vertical discharge fan in the attic floor. When the attic is finished, install a horizontal fan in an outside wall of the attic so it will discharge with the prevailing winds.

ROOF SCUTTLES

Chester L. Helt, AIA; Jean G. Surratt and Associates; Charlotte, North Carolina

DEFINITIONS & SYMBOLS

BRITISH THERMAL UNIT (Btu): a common unit of heat defined generally as the quantity of heat required to raise the temperature of one pound of water one degree Fahrenheit.

DEGREE DAYS (DD): a measure based on climatic conditions of the severity of a heating period, usually an entire season. From weather records for each day the difference between 65° F. and the mean temperature is determined. The sum of these differences for all the days in the heating season is the Degree Days for that locality.

DEWPOINT: the temperature at which a cooling air-water vapor mixture becomes completely saturated (100% relative humidity) and is on the verge of some moisture condensing into water. It varies with barometric pressure.

EMITTANCE (e): a rating of the ability of a material to give off heat as radiant energy. It is equal to the amount of heat absorbed (that not reflected), so the sum of emittance and reflectance, expressed as percent, is 100%. It is also defined as the ratio of heat radiated by a material to that of a "black body" under similar conditions. It is applicable only when the surface faces an air space. See Reflectance. The same ratio applied to opaque and optically flat surfaces is called emissivity; for ordinary materials, emittance is preferred.

HUMIDITY, ABSOLUTE: the weight of water vapor in pounds per cubic foot.

HUMIDITY, PERCENTAGE: indicates the weight of moisture that air at a given temperature is holding in vapor form to what it could hold at that same temperature when fully saturated, as percent.

HUMIDITY, RELATIVE (RH): the ratio of the actual vapor pressure at a given temperature to the saturation vapor pressure at the same temperature.

ISOTHERM: designates a line on a graph joining points of equal temperature.

OVERALL HEAT TRANSMISSION COEFFICIENT (U or $1/R_T$): the reciprocal (divided into 1) of the Total Thermal Resistance. "U" has been the unit used to express heat flow through a building section including air spaces $^3/_4$ inch or greater and air films. Technically, it is heat transmission in Btu's per hour per square foot per degree F difference from air to air. While it has been used to calculate heat loss or gain, it is recommended that it be abandoned in favor of the more easily used Total Thermal Resistance (R_T).

PERM: unit of vapor transmission rate of 1 grain per square foot per hour per inch of mercury pressure difference. (from permeance)

REFLECTANCE: a rating of the ability of a material to reflect heat by radiation. It is the ratio of the radiant heat reflected by a surface to that of a "black body" (a theoretical body that absorbs all radiation falling on it) under similar conditions. No symbol is used because ratings are based on emittance. For opaque and optically flat surfaces the optimum value of reflectance is reflectivity: for ordinary materials, reflectance is preferred.

REP: a reciprocal (1/perm) which indicates resistance to water vapor transfer.

SURFACE AIR FILM COEFFICIENT (f): the heat flow in Btu per hour per square foot between an exposed surface and the adjacent air. f_i is inside surface coefficient, f_o is outside surface coefficient. It indicates the conductance of heat through the air film that clings to all surfaces. Film resistance is preferably expressed as 1/f.

THERM: a unit of 100,000 Btu of heat.

THERMAL CONDUCTIVITY (k or 1/r): the reciprocal of Thermal Resistivity. "k factor" has been the unit expressing heat flow in Btu's per hour, through one square foot of material which is exactly one inch thick for one degree F difference between its surfaces. While it has been used for comparing insulating efficiencies of homogeneous materials (uncoated solid insulation, wood, building board) it is recommended that Thermal Resistivity (r) be used to simplify calculations. Thermal conductivities of a series of materials must not be added.

THERMAL CONDUCTANCE (C or 1/R): the reciprocal of Thermal Resistance. "C" has been the unit expressing heat flow in Btu's per hour per square foot of a given thickness for one degree F temperature difference between its surfaces. While it has been used for comparing insulating efficiencies of materials and constructions of several materials of stated thicknesses, it is recommended that it be replaced by Thermal Resistance, R, to simplify calculations. Conductances of a series of materials must not be added.

THERMAL RESISTANCE (R): a unit for the rate of heat flow through a given thickness of a homogeneous or composite material, or construction assembly with or without cavities or reflective surfaces. It is measured by the temperature difference in degrees F between the two exposed faces required to cause one Btu to flow through one square foot per hour. Resistances may be added. (R = temp. diff. F/Btu for one sq. ft., hr).

THERMAL RESISTIVITY (r): a unit for the rate of heat flow through a homogeneous material exactly one inch thick. It is measured by the temperature difference in degrees F between the smooth parallel faces required to cause one Btu to flow through one square foot per hour. Resistivities may be added. (r = temp. diff. F/Btu inch for one sq. ft., hr).

TOTAL THERMAL RESISTANCE (R_T): an expression of the total resistance to heat flow through a complete building section or construction assembly, including internal air spaces with or without emittances or reflectances, and external air films. Total thermal resistance is usually expressed as R_T of typical section per sq. ft. hr. and the value for one construction may be compared directly with another on the basis of more or less heat flow for the same temperatures.

VAPOR BARRIER: a material which does not readily permit passage of water vapor. Normally, an acceptable material is rated at one perm or preferably less in many building applications.

VAPOR PERMEABILITY: a property of a material measured by the amount of water vapor (grains per square foot per hour for one inch of mercury pressure difference) which passes through an inch-thickness. Unit: perm-inch.

VAPOR PERMEANCE: similar to vapor permeability except that permeance, like conductance, is a performance of the material as tested or used regardless of thickness. Unit: Perm, is usually the unit of concern to designers.

VAPOR PRESSURE: the pressure created by water vapor in a space, whether air is present or not. Saturated vapor pressure is determined only by temperature.

VAPOR RESISTANCE: the reciprocal (1/perm) of vapor permeance. A rating of the resistance of a material or an assembly to the passage of water vapor. Unit: Rep. In a series, reps may be added.

VAPOR RESISTIVITY: similar to vapor resistance except that it is a rating of a material exactly one inch thick. Unit: Rep/inch.

THERMAL TRANSMISSION

Problems in performance of building construction (materials and their assembly are usually associated with uncontrolled or undesirable temperature or moisture or both. Combined heat and moisture flows are complex, and because of their interaction, neither should be considered independently of the other.

Most materials used in building construction have been tested to establish how much heat they will transmit under standard conditions. While those evaluations are subject to manufacturing and testing tolerances and require judgment in their final application, published test values are normally accepted for calculation purposes.

Heat transmission coefficients are usually given as conductivities (k) or conductances (C) which have their counter parts: resistivity (r) or resistance (R). Each is the reciprocal of its counterpart as given in the definitions above.

The k or C value of a material has been the basis for comparing thermal properties, but these values cannot be added to find the conductance of a building section made up of different materials. Resistivity (r) and resistance (R) values can be added and their use greatly simplifies heat flow calculations. In such calculations the symbol R is used for resistance because resistivity values are the resistance for exactly one inch of thickness only.

THERMAL TRANSMISSION (CONT.)

Traditionally, the total resistance (R_t) of a building section has been selected or computed and then converted to its reciprocal, the Overall Heat Transmission Coefficient (U) to establish a unit expressing heat passage through the section. However, that conversion is basically redundant and it introduces unnecessary chances for arithmetic errors. Design or analysis of a building section should preferably be in terms of a total resistance value (R_t) required or available. The general procedure for calculating the total resistance value (R_t) of a building section is:

1. Select the design outdoor weather and other conditions of temperature, wind direction and wind speed, sun angle, sun heat if applicable and the indoor air temperature that is to be maintained in each room during the coldest or hottest weather.

2. List all component elements of the section (including air spaces $^3/_4$" or greater except where such a space is necessary to the effectiveness of reflective material) beginning with the surface air film resistance of one face and ending with the surface resistance of the other face.

3. Against each component (except surface air films) show the thickness involved (actual, not nominal) unless test values are given as conductances.

4. Against each component, list the resistance for the thickness shown. See following tables. Resistivities can be multiplied or divided to adjust for thickness. For example, if the resistivity (for 1") is 3.70, then the resistance of $^1/_2$ inch would be 1.85 and of 2 inches, 7.40.

5. Add the resistances and divide the temperature differential (F) from inside to outside by the total resistance (R_t) of the section to determine the heat transmission rate in Btu per hour per square foot of the section.

Note: The foregoing does not include consideration of heat losses due to air infiltration through cracks and openings and ventilation air. Such losses should be computed in accordance with procedures set forth in references and used to determine design of heating plant. Nor does it consider sun loads during heating seasons.

The solution to the basic problem of acceptable heat flow rate is the selection of the most appropriate materials for the building section and design of the heating plant with a capacity at maximum output just equal to the heating loss which develops under the most severe weather conditions. Economics usually interferes with the attainment of this ideal because weather records show that most severe weather conditions do not repeat themselves every year. If heating systems were designed with adequate capacity for the maximum weather conditions on record, there would be considerable excess capacity during most of the operating life of the system.

In many cases, occasional failure of a heating plant to maintain a preselected indoor design temperature during brief periods of severe weather is not critical. Of critical importance is the nature of the occupancy and the performance of the building (sections) and heating plant expected by the owner. A basic consideration in cold weather for most healthy persons is the temperature of the indoor surface of the outer wall of the room, including windows. With indoor air temperature of 72°–75°F at 5 feet above the floor, most people will be significantly less comfortable when the wall surface temperature is 60°F than when it is 68°F. Similar considerations should be made for ceiling and floor temperatures in accordance with the tables below:

RECOMMENDED MINIMUM THERMAL RESISTANCES (R)

OUTDOOR AIR TEMP. F.	INDOOR SURFACE TEMPERATURES °F				
	60	FAIR 64	MED. 66	GOOD 68	FLOOR * MIN.
+30	2.3	3.4	5.1	10.0	1.7

WALLS	13	11	8	7
FLOOR OVER VENTED CRAWL SPACE	19	13	9	7

In selecting materials for a building section, use of an insulating material with the recommended effective thermal resistance value can eliminate consideration of the resistance of the other materials in meeting resistance requirements of the section. However, this does not eliminate the need for analysing the moisture vapor control provided by the section.

Compilation of summer cooling loads involves the same principles as in determining heating loads but adds new factors such as moisture heat load (latent heat), solar heat gain, heat from occupants, lights and equipment and time lag due to the heat capacity of the structure. It is wise to consult an expert in this field even before the orientation and fenestration of a proposed new air-conditioned building is fixed. For general design purposes it is sufficient to note that air cooling costs several times as much as air heating on a unit basis of volume and time, and that the thermal insulation installed to conserve heat in winter works equally well to reduce heat gain and cooling costs in the summer.

MOISTURE VAPOR MIGRATION

Moisture is present as vapor in ordinary air and as absorbed moisture in most building materials. It may be present in the free liquid state or as ice in the solid state within the range of temperatures encountered in many buildings. Problems involving moisture may arise from changes in moisture content, from the presence of excessive moisture, or from effects associated with its changes in state.

Design and construction of buildings must consider the behavior of moisture, particularly the change from the vapor to the liquid or solid state, known as condensation. Moisture problems involving condensation are most likely to occur in buildings in any climate where there is a source of moisture vapor at temperatures above normal, or in cooled structures, and in buildings in cold climates.

Most moisture problems in residences occur in winter and become increasingly critical as homes are built smaller and tighter. The residences must permit escape or migration of moisture vapor originating from cooking, laundering, bathing, breathing and perspiration of people as well as from humidifiers, automatic washers and dryers, and the bare earth in a crawl space or basement, or walls.

This migration must be limited to acceptable rates because moisture in air is a gas which occupies all the space along with the air.

Moisture vapor can act independently of the air since its properties do not depend on the presence of air. It exerts its own pressure, and can move about through air in a space, or move through materials under differences in vapor pressure independently of the air. Moisture vapor flows only from high toward low pressure.

Moisture in building materials usually has a marked effect upon the transmission of heat through them. Particularly, in porous materials saturated with water there is likely to be a migration of moisture to the cold side under the influence of the temperature gradient. This can occur by a process of evaporation, vapor flow, and condensation within the material, a substantial amount of heat being transferred as latent heat of vapor, particularly in the case of open fibrous material.

Moisture should not be allowed to migrate and accumulate in building construction unless place of accumulation is designed specifically to handle moisture in any of its three forms: vapor, liquid or solid.

NOTES:

a. Resistances are representative values for dry materials and are intended as design (not specification) values for materials in normal use. Unless shown otherwise in descriptions of materials, all values are for 75 F mean temperature.
b. Includes paper backing and facing if any. In cases where insulation forms a boundary (highly reflective of otherwise) of an air space, refer to appropriate table for the insulating value of the air space. Some manufacturers of batt and blanket insulation mark their products with R value, but they can assure only the quality of the material as shipped.
c. Average values only are given since variations depend upon density of the board and on the type, size and depth of perforations.
d. Thicknesses supplied by different manufacturers may vary depending upon the particular material.
e. Values will vary if density varies from that listed.
f. Data on rectangular core concrete blocks differs from the data for oval core blocks due to core configuration, different mean temperature and different unit weight. Weight data on oval core blocks not available.
g. Weight of units approx. 7-5/8 high by 15-5/8 long are given to describe blocks tested. Values are for one square foot area.
h. Thermal resistance of metals is so low that in building constructions it is usually ignored. Values shown emphasize relatively easy flow of heat along or through metals so that they are usually heat leaks, inward or out.
i. Spaces of uniform thickness bounded by moderately smooth surfaces.
j. Values shown not applicable to interior installations of materials listed.
k. Winter is heat flow up; summer is heat flow down.
l. Based on area of opening, not on total surface area.

Based on data from ASHRAE HANDBOOK OF FUNDAMENTALS, 1967, Chapters 23 and 26

Thermal resistances for combinations of materials, spaces with or without emittances or reflectances, and air films are additive while conductances (C factor) and conductivities (k factor) are not. Convert all C, k, and U factors to R values. Heat flow values are identical for both procedures, but calculations are simpler if only R values are used.

$$\text{Btu per hour, sq. ft.} = \frac{\text{Temp. diff. F}}{R}$$

TOTAL THERMAL RESISTANCE (R_T). An expression of the total resistance to heat flow through a complete building section or construction assembly, including internal air spaces with or without emittances or reflectances, and external air films. Total thermal resistance is usually expressed as R_T of typical section per sq. ft. hr. and the value for one construction may be compared directly with another on the basis of more or less heat flow for the same temperatures.

OVERALL HEAT TRANSMISSION COEFFICIENT (U or $1/R_T$): the reciprocal (divided into 1) of the Total Thermal Resistance. "U" has been the unit used to express heat flow through a building section including air spaces 3/4 inch or greater and air films. Technically, it is heat transmission in Btu's per hour per square foot per degree F difference from air to air. While it has been used to calculate heat loss or gain, it is recommended that it be abandoned in favor of the more easily used Total Thermal Resistance (R_T).

THERMAL RESISTANCE (R). A unit for the rate of heat flow through a given thickness of a homogeneous or composite material, or construction assembly with or without cavities or reflective surfaces. It is measured by the temperature difference in degrees F between the two exposed faces required to cause one Btu to flow through one square foot per hour. Resistances may be added. (R = temp. diff. F/Btu for one sq. ft., hr.)

THERMAL RESISTIVITY(r). A unit for the rate of heat flow through a homogeneous material exactly one inch thick. It is measured by the temperature difference in degrees F between the smooth parallel faces required to cause one Btu to flow through one square foot per hour. Resistivities may be added. (r = temp. diff. F/Btu inch for one sq. ft., hr.)

Siding, wood, 3/4 x 10, lapped	1.05	4.9		1.05	4.95	
Outer face of siding			0.8			0.8
Outdoor air film (15 mph wind)	0.17	0.80		0.17	0.80	
Outdoor air			0			0
TOTALS	15.41	72.0		15.41	72.0	

Heat Loss/sf = $\frac{\text{Temp. Diff., Room to Outdoors}}{\text{Total Resistance, R}} = \frac{72-0}{15.41}$ = 4.7 Btu/hr. applies to insulated areas only; studs and other materials are heat paths which increase heat loss.

Wall "A"–Full thick fibrous insulation R11, non-reflective faces, air spaces insufficient to provide any significant resistance.

Wall "B"–Reflective faced fibrous insulation, R11 with the facing; air space 3/4 in. or more in width required with the facing to provide R11; that space must not be counted a second time.

Insulation thicknesses are not specified but only the R value of the material as manufactured; proper installation is implied.

*Decimals are used to check calculations only – fractional Btu's are usually of no consequence.

MASONRY CAVITY WALL CONSTRUCTION

	WALL "A"			WALL "B"		
	R F/Btu*	°F Diff. Due to R*	Temp °F*	R F/Btu*	°F Diff. Due to R*	Temp °F*

a. Vapor transmission rates listed will permit comparisons of materials but selection of vapor barrier materials should be based on rates obtained from the manufacturer or from laboratory tests. A range of values shown indicates variation among mean values for materials that are similar but of different density. Values are intended for design guidance only.

b. Usually installed as vapor barriers. If used as exterior finish and elsewhere near cold side, special considerations are required.

c. Low permeance sheets used as vapor barriers. High permeance used elsewhere in construction.

d. Basis weight in lb. per 500 sq. ft.

Based on data from ASHRAE HANDBOOK OF FUNDAMENTALS, 1967, Chapter 19.

Owen L. Delevante, AIA; Glen Rock, New Jersey
E. C. Shuman, P. E.; Consulting Engineer; State College, Pennsylvania

BUILDING SECTION ANALYSIS FOR POTENTIAL CONDENSATION

Any building section may be analyzed by simple calculations to determine if and where condensation might occur and what might be done in selection of materials or their assembly to eliminate that possibility. The section may or may not contain a vapor barrier or it may contain a relatively imperfect barrier; the building section may include cold-side materials of comparatively high resistance to the passage of vapor (and this is highly undesirable). It is to be avoided. With few exceptions, the vapor resistance at or near the warm surface should be five times that of any component.

The table at left gives permeances and permeability of building and vapor barrier materials and those values can be used in analysis of building sections by the following simple method:

1. List the materials, without surface films or air spaces, in the order of their appearance in the building section, beginning with the inside surface material and working to the outside.
2. Against each material list the permeance (or permeability) value from the table or a more accurate value if available from tests or manufacturers data. Where a range is given, select an average value or use judgment in assigning a value based on the character and potential installation method of the material proposed for use.
3. Start at the top of the list and note any material that has less permeance than the materials above it on the list. At that point the possibility exists that vapor leaking through the first material may condense on the second, provided the dew-point (condensation point) is reached and the movement is considerable. In that case, provide ventilation through the cold-side material or modify the design to eliminate or change the material to one of greater permeance.
4. If the leakage is slight (or the difference in permeance small), judgment should be used to estimate, by the severity of the climate and the duration of cold periods, whether condensation during these transient conditions is likely to be sufficiently troublesome to warrant either ventilation or a change in design of the building section.

EXAMPLE Nº 1

	Estimated Permeance
Plaster, painted 2 coats	3.0
Vapor Barrier	1.0 (lowest)
Insulation	29.0
Wood sheathing	2.9
4" Brick veneer	1.1 (next)

In this example the vapor barrier transmits 1 grain of moisture per square foot per hour for each unit of vapor pressure difference and nothing else transmits less. However, the cold brick veneer is nearly as low in permeance so it is advisable to make certain that the vapor barrier is expertly installed, with all openings at pipes, outlet boxes or joints carefully fitted or sealed. Alternatively, the brick veneer may have open mortar joints near the top and bottom to serve both as weep holes and as vapor release openings. They will also ventilate the wall and help reduce heat gain in summer.

EXAMPLE Nº 2

	Estimated Permeance
Flat oil paint on plaster	3.0
Furred space	–
8" concrete block	2.4
4" Brick veneer	1.1 (lowest)

Vapor (under pressure) would easily pass through the interior finish, be slowed up by the concrete block and nearly stopped by the cold brick veneer. Unless this design is radically improved, the masonry will become saturated and may cause serious water stains or apparent "leaks" in cold weather. In addition, alternating freezing and thawing of condensation within the masonry wall can cause physical damage to the construction.

EXAMPLE Nº 3

	Estimated Permeance
Mineral wool ac. tile	29.0
Gypsum wallboard (susp.)	50.0
Concrete slab	2.0
Roof Insulation	29.0
Roofing, built-up	.24 (lowest)

First resistance to vapor flow occurs at the concrete roof slab which would be fairly cool because of the protection provided in the insulating value of the acoustical tile and the air space formed by the suspended ceiling. Moisture would probably condense on the underside of the slab in high humidity conditions but it is certain that some fo the vapor would continue to move through the slab, the insulation above and then condense on the underside of the cold roofing. It would flow back as water, saturating the insulation (and reducing its effectiveness), then the deck and would eventually drip to the ceiling below. This hazardous condition might not be observed for a long time because the gypsum lath and the acoustical tile would first soak up the water dripping from above.

First recommended correction is a vapor barrier on the top of the concrete roof slab with sufficient insulation above to keep the vapor barrier above the dew-point temperature of the interior air. An alternative would be a vapor barrier on the back of the gypsum lath with insulation resting on the lath and adequate venting of the air space (plenum) to the outside air.

EXAMPLES OF USE OF THIS CHART

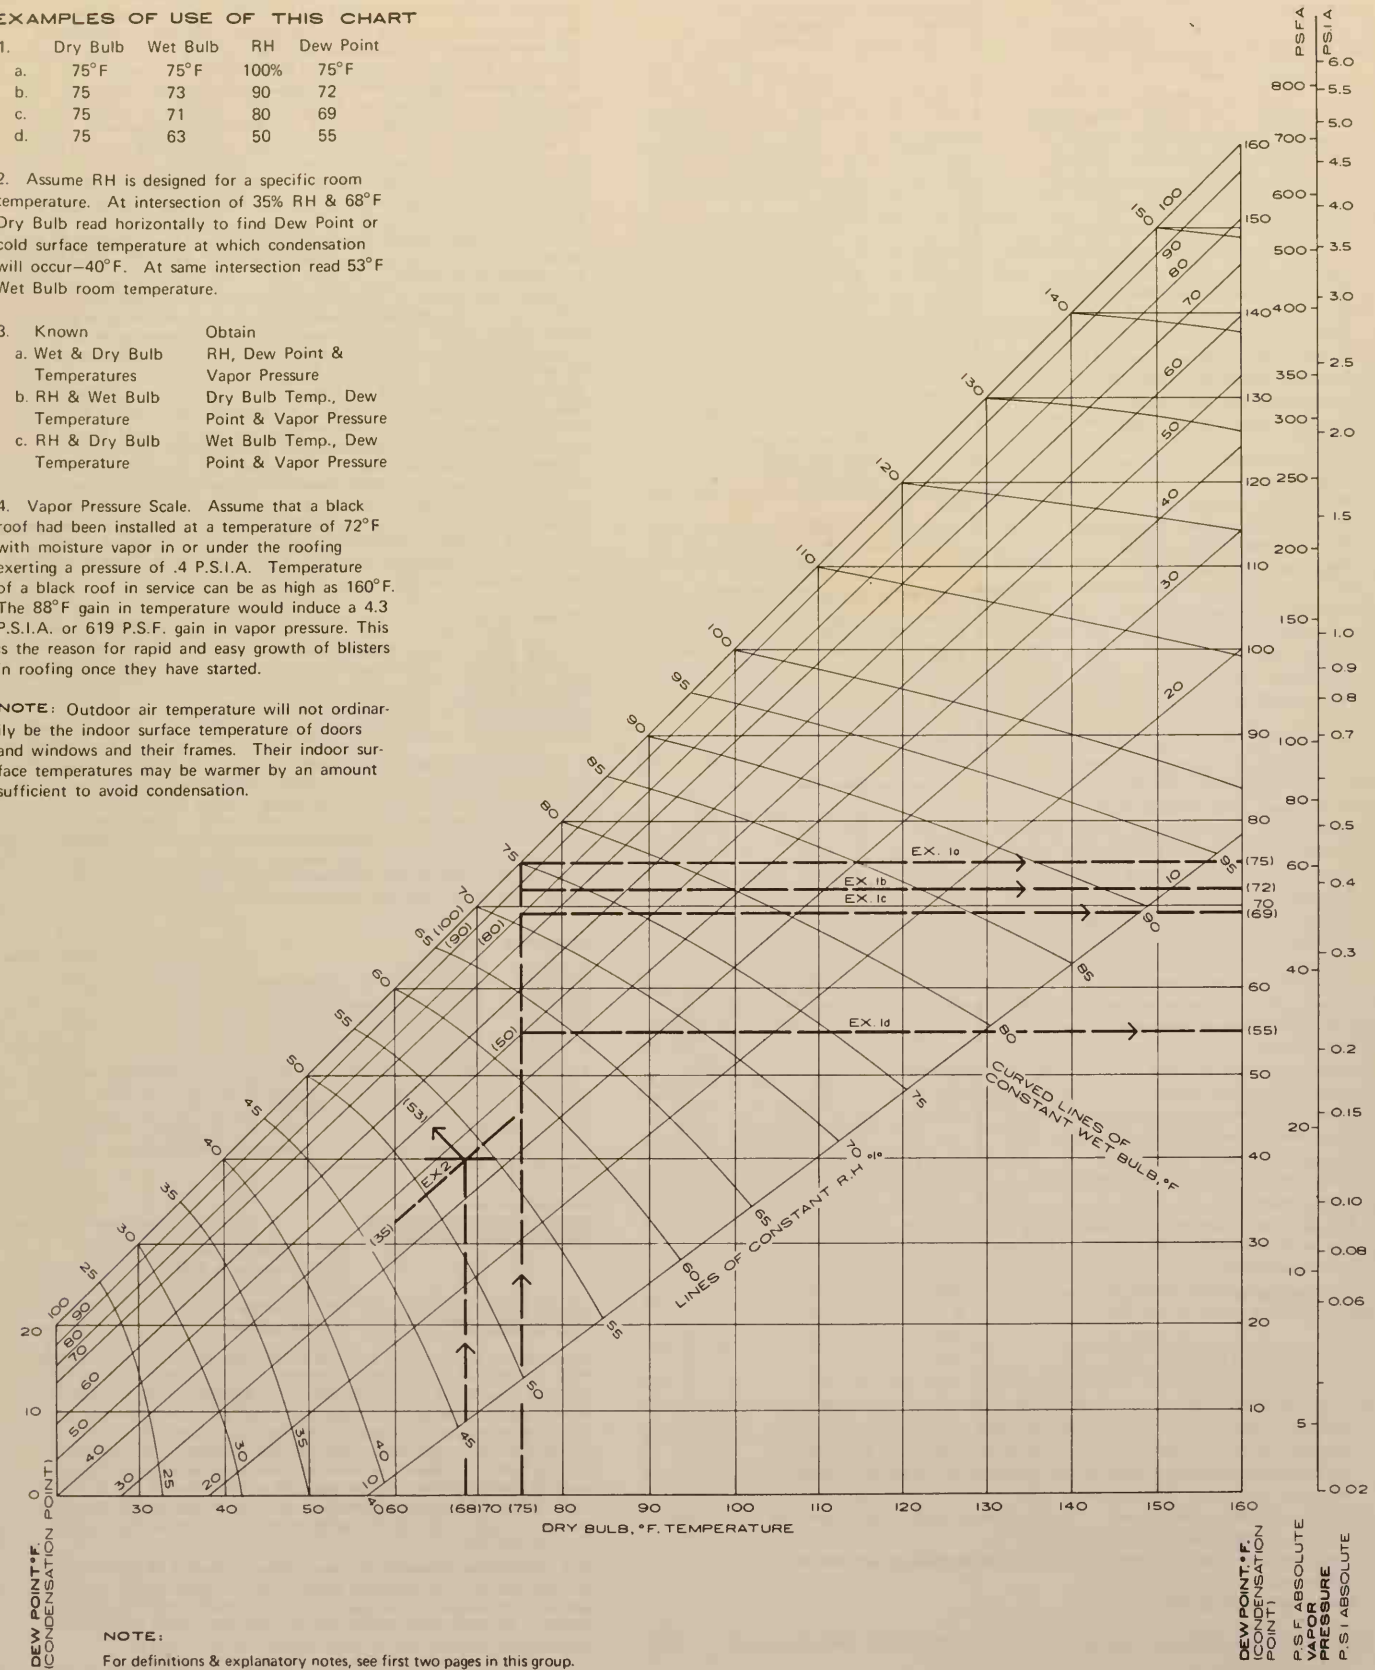
	Dry Bulb	Wet Bulb	RH	Dew Point
1. a.	75°F	75°F	100%	75°F
b.	75	73	90	72
c.	75	71	80	69
d.	75	63	50	55

2. Assume RH is designed for a specific room temperature. At intersection of 35% RH & 68°F Dry Bulb read horizontally to find Dew Point or cold surface temperature at which condensation will occur—40°F. At same intersection read 53°F Wet Bulb room temperature.

3.	Known	Obtain
a.	Wet & Dry Bulb Temperatures	RH, Dew Point & Vapor Pressure
b.	RH & Wet Bulb Temperature	Dry Bulb Temp., Dew Point & Vapor Pressure
c.	RH & Dry Bulb Temperature	Wet Bulb Temp., Dew Point & Vapor Pressure

4. Vapor Pressure Scale. Assume that a black roof had been installed at a temperature of 72°F with moisture vapor in or under the roofing exerting a pressure of .4 P.S.I.A. Temperature of a black roof in service can be as high as 160°F. The 88°F gain in temperature would induce a 4.3 P.S.I.A. or 619 P.S.F. gain in vapor pressure. This is the reason for rapid and easy growth of blisters in roofing once they have started.

NOTE: Outdoor air temperature will not ordinarily be the indoor surface temperature of doors and windows and their frames. Their indoor surface temperatures may be warmer by an amount sufficient to avoid condensation.



NOTE:
For definitions & explanatory notes, see first two pages in this group.

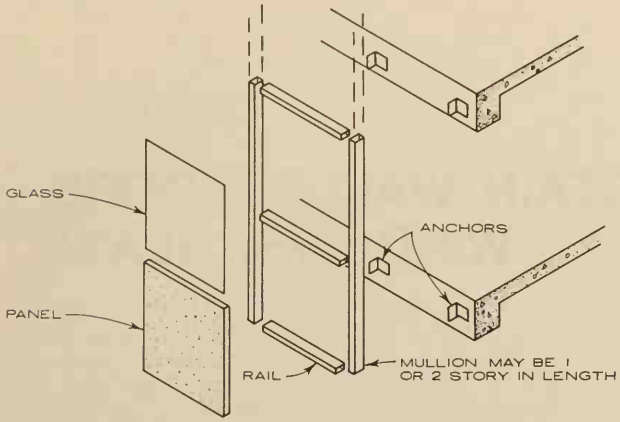
CHAPTER 8

CURTAIN WALLS, DOORS, WINDOWS, GLASS

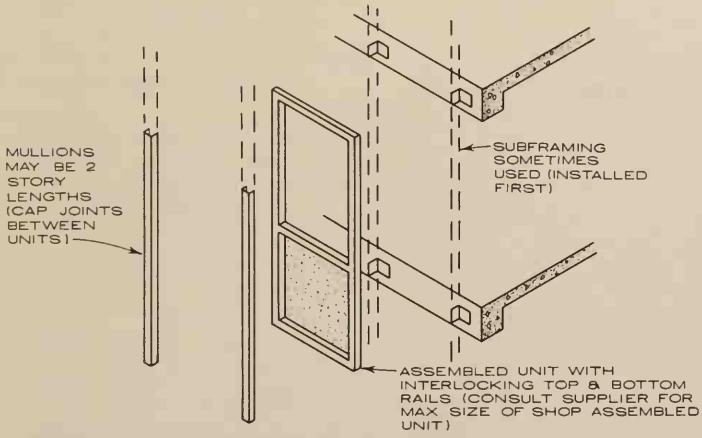
CLASSIFICATION BY NATURE OF COMPONENTS



1. GRID SYSTEM (STICK)

FRAMING MEMBERS VISUALLY PROMINENT

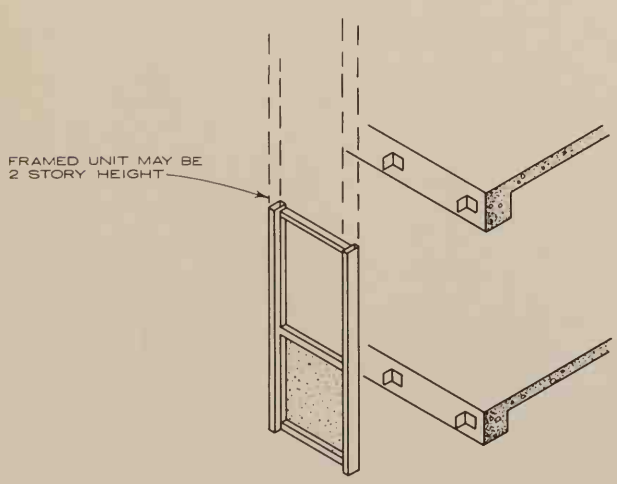
COMPONENTS INSTALLED PIECE BY PIECE



2. GRID SYSTEM (PANEL AND MULLION)

FRAMING MEMBERS VISUALLY PROMINENT

PANEL PREASSEMBLED & INSTALLED AS SHOWN



3. PANEL SYSTEM

COMPLETELY PREASSEMBLED UNITS; MAY OR MAY NOT INCLUDE INTERIOR FINISH

CLASSIFICATION BY USAGE

A CUSTOM TYPE

Walls designed specifically for one project, using specially designed parts and details. Such walls may be used on buildings of any height, but are more typical of multistoried structures. Included in this category are the highly publicized (and often more expensive) walls which serve as design pacesetters.

B COMMERCIAL TYPE

Walls made up principally of parts and details standardized by the manufacturer and assembled either in the manufacturer's stock patterns or in accord with the architect's design. This type is offered by many manufacturers and is typically used on one and two story buildings, but may be used on taller structures. Commercial walls offer lower cost because of quantity production, and also offer the advantages of proven performance.

C INDUSTRIAL TYPE

Walls in which ribbed, fluted, or otherwise preformed metal sheets in stock sizes are used, along with standard metal sash, as the principal components. This type of metal curtain wall has a long history of satisfactory performance, and, in its insulated form, finds wide use in many important buildings outside the industrial field.

GENERAL NOTES:

1. Mullions which extend through the wall and are exposed on both exterior and interior of the building, should include a thermal break (especially if they are aluminum).

2. When mullions serve as guide rails for roof mounted window washing platforms or "rigs," mullions should be designed as a track and reinforced against thrust, using information on loads from cleaning equipment manufacturer.

3/8						3/8, 1/2, 5/8, 3/4
7/16					7/16	7/16, 9/16
1/2						1/2, 3/4

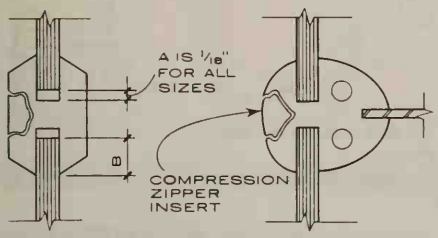
Channels available:
of 55–75 durometers @ 1/8", 3/16", 1/4", and 5/16" glass openings
of 45–75 durometers @ 3/8", 1/2", 5/8", and 3/4" glass openings
thickness varies from 1/16" to 1/2"

Tubing and Cord available:
full range of durometers, I.D. and O.D. and wall thicknesses.

Wedges and special shapes available.

ACRYLIC PLASTIC GLAZING

Glazing details essentially apply; however, greater expansion clearance and rabbet engagement depth need to be allowed for larger panes.
Sealants need to be elastic and with greater cross section; and may be used on only one side.



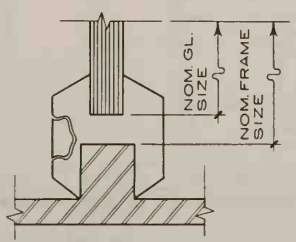
MUNTIN TYPES

NOTE: Details shown apply to thick glass including insulating glass and panels.

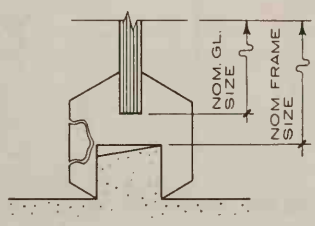
"B" DIMENSION FOR MUNTIN TYPE STRUCTURAL GASKETS

GLASS THICKNESS	3/16 OR 7/32	1/4	5/16	3/8, 1/2, OR 3/4
Up to 25 sq. ft.	1/2	1/2	1/2	5/8
Over 25 to 75 sq. ft.	1/2	1/2	5/8	5/8
Over 75 to 100 sq. ft.		5/8	5/8	3/4

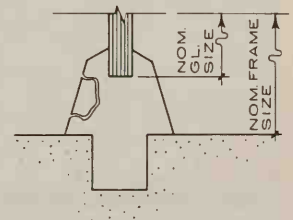
STRUCTURAL GASKETS



MOUNTING ON METAL FRAME



MOUNTING ON PRECAST BASE

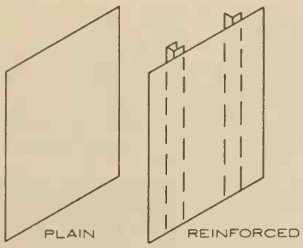


RECESSED IN GROOVE

PERIMETER TYPES

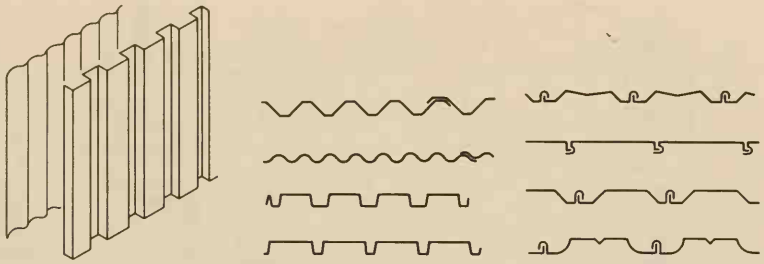
NOTE: Some authorities recommend coating lug or groove with a non-hardening sealant to prevent water being forced or blown under or around gasket.

Suspended glazing is used for large openings where visibility, unhampered by metal framing members, is desired.
Glass is hung from metal clamps and is in tension.
Max. height is limited by availability from manufacturer.
Max. widths & thicknesses are determined by wind loads.

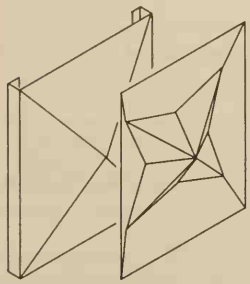


SMOOTH FLAT SHEET OR PLATE

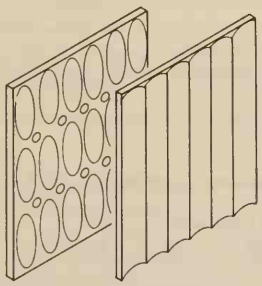
TEXTURED SHEET



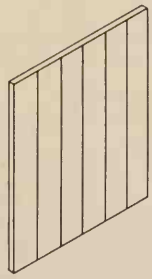
CORRUGATED OR FLUTED SHEET WITH TYPICAL VARIATIONS

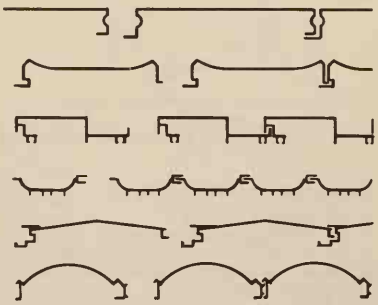


STAMPED SHEET



CAST

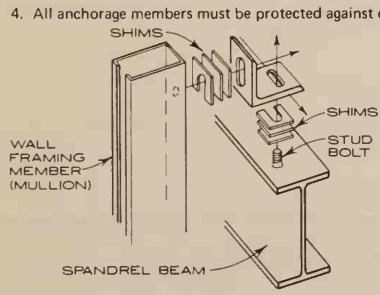


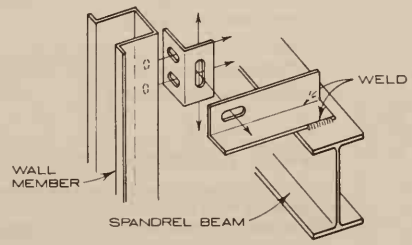


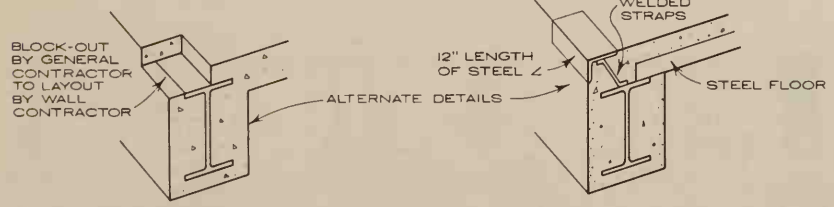
INTERLOCKING EXTRUSIONS WITH TYPICAL PATTERNS

SKIN OR FACING PANELS (ALSO KNOWN AS "SHEET TYPE" PANELS ALTHOUGH SOME ARE CAST OR EXTRUDED) INSULATION, IF ANY, IS INSTALLED SEPARATELY

1. Anchorage devices, should permit 3-dimensional adjustment.
2. Anchors must be designed to withstand wind loads acting outward as well as inward.
3. Anchors must be firmly secured in position after final assembly and adjustment of wall components.
4. All anchorage members must be protected against corrosion.



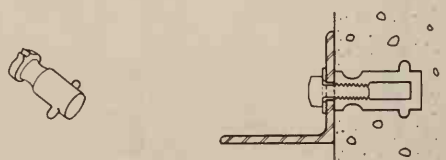




STEEL STRUCTURE

Malleable c.i. insert provides adjustable support.

Continuous galv. steel channel insert in lengths to 20' providing attachment at any point, anchorage at 4" intervals.



Threaded malleable iron insert, with bolts 1/4" to 3/4" diameter.

REPRESENTATIVE TYPES OF WALL PANELS
SCALE : 1½" = 1' - 0"

NOTE:

Types of panels shown are representative of the many assemblies of components available. Typical applied finishes available for outer sheets are acrylics, vinyls, alkyds, fluoropolymers, porcelain enamel and on aluminum only, various anodized finishes. Typical available length of sheets is 40 feet. Span and wind load must be considered in the selection of panel components and spacing of girts.

Spans given in the table are based on panel components shown, with 12 inch wide liner sheets and 20 psf wind load deflection L/180 except FA4 based on 20 psf wind load deflection L/126. Consult manufacturers for verification of data given herein and for thermal and acoustical ratings of panels designed for these purposes.

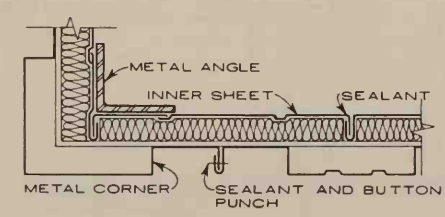
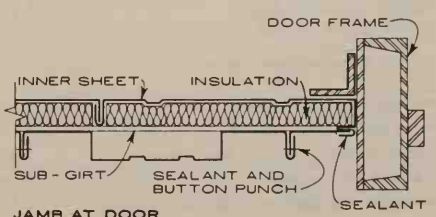
TYPES OF CLIPS FOR SECURING OUTER SHEETS



OUTSIDE CORNER



JAMB AT DOOR

ESSENTIALS OF A GOOD JOINT SEAL

1. THE SEALANT:

Must be appropriate for the application;

Must have: properly balanced adhesive and cohesive strength, elasticity
the ability to recover from compression and extension,
the ability to retain its essential properties under prolonged exposure to weather,
a reasonable curing time, and
a shelf life of at least six months;

Must be non-staining.

2. THE JOINT CONFIGURATION:

Must be sized in proportion to the amount of movement that is anticipated;

Must provide ample depth of sealant contact;

Must be designed to prevent any local overstressing of the sealant.

3. THE APPLICATION:

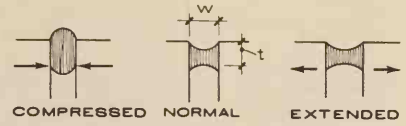
As a general rule, all contact surfaces must be thoroughly clean and dry;

A primer must be used whenever so recommended by the manufacturer;

In butt joints, the sealant must be well compacted by tooling.

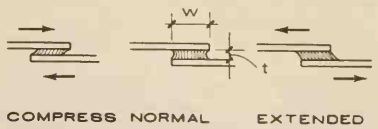
JOINT PROPORTIONS

BUTT JOINTS



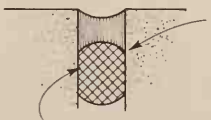
W	t
Minimum—at least 2 x maximum amount of movement expected	Minimum—$\frac{1}{4}$" or under certain conditions, in metal $\frac{1}{8}$"
$\frac{1}{4}$" to $\frac{1}{2}$"	Masonry = W; Metal $\frac{1}{4}$"
$\frac{1}{2}$" to 1"	Masonry $\frac{1}{2}$"; Metal = W/2
over 1"	Masonry—$\frac{1}{2}$"

LAP JOINTS



W	t
Minimum—2t or $\frac{3}{8}$" —whatever is less Otherwise width is immaterial	Minimums: Masonry—$\frac{1}{8}$" Metal—$\frac{1}{16}$" if placed before parts are joined; otherwise $\frac{1}{8}$"

Above dimensions should be increased if installation is made at temperatures above 90°F or below 40°F.



Top surface of back-up should be rounded. Sealant should not bond to back-up material.

Back-up material should be compressible and compatible, e.g. polyethylene foam, neoprene or butyl rope. Do not use oakum, bituminous or impregnated metals.

BACK-UP OF DEEP BUTT JOINTS

TOOLING OF BUTT JOINTS

CHARACTERISTICS OF COMMON ELASTOMERIC SEALANTS

	ACRYLIC (SOLVENT-RELEASES) (ONE-PART)	POLYSULFIDE		POLYURETHANE (TWO-PART)	SILICONE (ONE-PART)
		TWO-PART	ONE-PART		
CHIEF INGREDIENTS	Acrylic terpolymer, inert pigments, stabilizer and selected fillers	Polysulfide polymers, activators, pigments, plasticizers, inert fillers, gelling and curing agents		Polyurethane prepolymer, inert fillers, pigment, plasticizers, accelerators, activators and extenders	Siloxane polymer, pigment and selected fillers
PERCENT SOLIDS	85 – 95	95 – 100	95 – 100	95 – 100	95 – 100
CURING PROCESS	Solvent release and very slow chemical cure	Chemical reaction with curing agent	Chemical reaction with moisture in the air	Chemical reaction with curing agent	Chemical reaction with moisture in the air
CURING CHARACTERISTICS	Skins on exposed surface; interior remains soft and tacky	Cures uniformly thru out; rate affected by temperature and humidity	Skins over, cures progressively inward; final cure uniform thruout	Cures uniformly thru out; rate affected by temperature and humidity	Cures progressively inward; final cure uniform thru out
PRIMER	Generally not required	Manufacturer's approved primer required for porous surfaces, sometimes for other surfaces		Mfr's. approved primer required for most surfaces	Mfr's. approved primer required for most surfaces
APPLICATION TEMPERATURE, °F	40 – 120 must be heated	40 – 100	60 – 100	40 – 120	0 – 120
TACK-FREE TIME	1 to 7 days	6 to 24 hours	6 to 72 hours	1 to 24 hours	1 hour or less
HARDNESS, SHORE A CURED 1 TO 6 MONTHS AGED 5 YEARS	0 – 25 45 – 55	15 – 45 30 – 60	25 – 35 40 – 50	20 – 40 35 – 55	20 – 40 35 – 55
TOXICITY	Non-toxic	Curing agent is toxic	Contains toxic ingredients	Toxic; gloves recommended for handling	Non-toxic
USE CHARACTERISTICS	Excellent adhesion; poor low-temperature flexibility; not usable in traffic areas; unpleasant odor for 5 – 12 days	Wide range of appropriate applications; curing time depends on temperature and humidity	Unpleasant odor; broad range of cured hardnesses available	Sets very fast; broad range of cured hardnesses; excellent for concrete joints and traffic areas.	Requires contact with air for curing; low abrasion resistance; not tough enough for use in traffic areas

Wayne F. Koppes, AIA; Basking Ridge, New Jersey

INTRODUCTION:

The following is a selection of hollow metal details from various manufacturers. They are in no way intended to favor a manufacturer or a product. Details vary. Consult manufacturers literature.

Hollow metal is divided into a frame section and a door section. The frame section can be used with wood doors. Both sections are complete in themselves.

NOMENCLATURE

Active Leaf	The door leaf of a pair in which the lock is normally installed.
Astragal (overlapping)	A vertical molding attached to the meeting edge of one leaf of a pair of doors for protection against weather conditions and to retard passage of smoke, flame and gasses.
Astragal (split)	A vertical molding attached to both leaves at a pair of doors at the meeting edge for protection against weather conditions.
Barrier Screen	See Smoke Screen.
Beveled Edge	The edge at a door that is not at a 90° angle to the face of the door (std. bevel is 1/8" in 2").
Blank Jamb	Vertical member of frame without hardware preparation. Used when doors are furnished with push and pull hardware or surface mounted strikes and single active floor hinges.
Borrowed Light	Four-sided frame prepared for glass installation in field.
Bullnose Trim	The face & jamb width joined by a radius rather than a 90° break.
Cabinet Jamb	Frame in three or more pieces applied as the finished frame over rough buck.
Cap	See Soffit.
Cased Opening	Frame section which does not have any stops.
Covemold Frame	Frame having contour faces (exposed) simulating contour of wood frame.
Cut-Out	A preparation for hardware and/or accessories.
Double Acting Door	Type of door prepared for pivot or spring type hinge permitting the door to swing 90° in either direction.
Double Egress Frame	Double rabbeted double frame prepared to receive two single-acting doors swinging in opposite directions.
Dutch Door	Door having two separate leaves, one hung above the other. Shelf on lower leaf, optional.
Face	Exposed part of frame parallel to face of wall.
Filler Plate	A blank plate used to fill mortised cutouts.
Flat Frame	Frame having flat faces exposed.
Floor Clearance	Distance between bottom of door and finished floor.
Glass Stop	Fixed trim on a glass tight door against which glass is set.
Glazing Bead	A removable trim at glazing opening to hold glass securely in place.
Hand	Term used to designate direction in which door swings.
Handing	The swinging of the door e.g., right hand or left hand. To determine the hand of a door, view the door from the outside. The side that the hinges are on is the hand of the door. If the door swings away from the viewer, the hand is a regular hand, i.e. right or left hand. If the door swings to the viewer, the door is reverse swing, i.e. right hand reverse swing or left hand reverse swing.
Head	Horizontal frame member at top of door opening or top member of transom frames.
Header	See Head.
Hinge Backset	Distance from edge to hinge to stop on frame.
Hinge Filler Plate	Plate installed for a hinge cut-out when no hinge is required.
Inactive Leaf	The door leaf in a pair of doors which is normally held closed by top and bottom bolts.
Jamb	Vertical frame member; between door and glass or wall; between glass and door or wall. See also Mullion.
Jamb Depth	Over-all width of frame section.
Knock Down (KD) Frame	Door frame furnished by manufacturer in three or more basic parts for assembly in field.
Lock Backset	Distance from edge of door to centerline of cylinder or knob.
Masonry Box	See Plaster Guard.
Mortise Preparation	Reinforcing drilling and tapping for hardware which is to be mortised into door or frame.
Mullion	Vertical or horizontal frame member; between glass and glass, or door and door.
Muntin	Non-structural member used to subdivide an open area in frame or door.
Opening Size	Size of frame opening measured between rabbets and finished floor.
Plaster Guard	Metal shield attached behind hinge and strike reinforcement to prevent mortar or plaster from entering mounting holes.
Return	See Backband.
Reveal	That part of the backband which extends beyond finished wall.
Reveal	Distance from face of frame to surface of finished wall.
Reversing Channel	See End Channel.
Reverse Bevel	Refers to hand of door or lock when doors swing to outside.
Rough Opening	Size of wall opening into which frame is installed.
Rubber Silencer	A part attached to the stop of a frame to cushion the closing of door.
Section Width	See Jamb Depth.
Single Acting Door	Type of door prepared for a pivot type or spring-type single-acting hinge permitting the door to swing 90° in one direction only.
Smoke Screen	A door frame combined with sidelights on either or both sides of door openings, including transom opening when and if required.
Soffit	Underside of stop on frame.
Split Jambs	Frames with jamb width in two pieces.
Stilts	See Floor Struts.
Stop	Part of frame against which door closes or glass rests.
Strike Stile	Vertical member of an inactive door leaf which receives the strike.
Strut Guide	Metal piece attached inside throat of frame which guides and holds ceiling strut to frame (usually incorporated in clip).
Sub Buck	See Rough Buck.
Surface Hardware Preparation	Reinforcing or machining or both, for hardware which is applied to surface of door or frame in field.
Top & Bottom Cap	Horizontal channel used in doors which do not have a flush top or bottom.
Transom Bar	The part of a transom frame which separates the top of the door from the transom.
Trim	(1) See face. (2) An applied face.
Trimmed Opening	See Cased Opening.

James W. G. Watson, AIA; Ronald A. Spahn and Associates; Cleveland Heights, Ohio

LABELED OPENINGS

The letters A, B, C, D, and E, used by labeling agencies and codes, refer to location of opening.

A. Walls between separate buildings; fire walls; curtain and division wall to high hazard contents (transformer vaults, film storage vaults, etc.).

B. Openings for vertical shafts (stairwells, elevators, fire partitions, refuse vaults, incinerator rooms, incinerator chutes, walls and partitions within stage enclosures, separating garage from other occupancies.)

C. Openings in corridors and room partitions.

D. Openings in exterior walls subject to severe fire exposure.

E. Openings in exterior walls subject to moderate fire exposure.

NOTE:
Labeled frames (except w/sidelights and/or transoms) are neither classified A, B, C, D, or E, nor are hour rated.

Labeled frames may be shipped prior to labeled doors.

LABELED FRAMES

A fire door frame shall be of a design and construction that when in combination with a suitable fire door and hardware, the assembly will protect the opening in which it is installed against the passage of flame and in certain wall constructions against the passage of heat.

Design, construction and installation must be tested in accordance with ASTM Designation E–152.

Consult local codes and/or governing authorities for requirements concerning fire resistivity; design size conformance to test prodecures and identification of such.

Labeling is a service which may be satisfactory to governing authorities as identification of compliance with their regulations.

Where permitted, certain proprietary devices and systems exceeding stated limits may be available.

Consult manufacturer's literature.

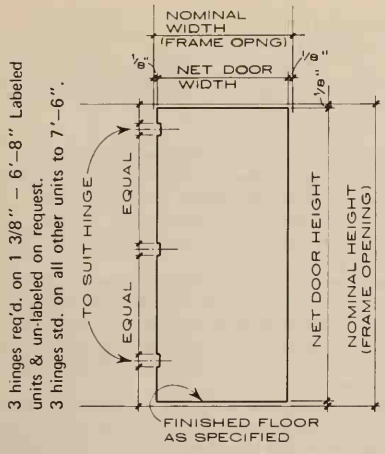
FRAME REQUIREMENTS

1. Maximum size: S/sw is 4'– 0" x 10'– 0", Pr/sw is 8'– 0" x 10'– 0".
2. Jamb depth: 2 5/8 " minimum.
3. Stop: 5/8 " minimum.
4. Face: 1 1/4 " minimum.
5. Anchors: approved masonry, steel stud, wood stud, plaster partition, expansion bolts, 3 min./jamb < 90".
6. Gauge: 16 gauge minimum.

James W. G. Watson, AIA; Ronald A. Spahn and Associates; Cleveland Heights, Ohio

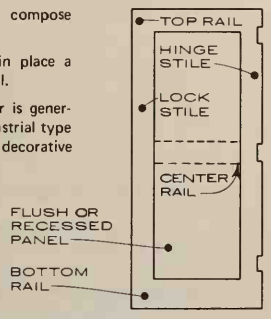


STANDARD DOOR & DOOR CLEARANCE

Tubular stiles & rails compose structural elements.

Stiles and rails hold in place a flush or recessed panel.

A recessed panel door is generally considered an industrial type door. May be used for decorative purposes.

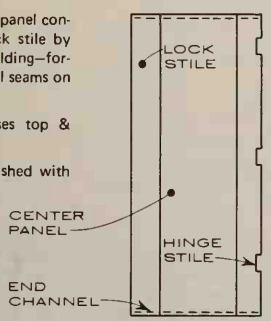


STILE & RAIL CONSTRUCTION

Relatively wide center panel connected to hinge & lock stile by interlocking and/or welding—forming 2 exposed vertical seams on door face.

Inverted channel closes top & bottom.

Exterior door is furnished with cap.



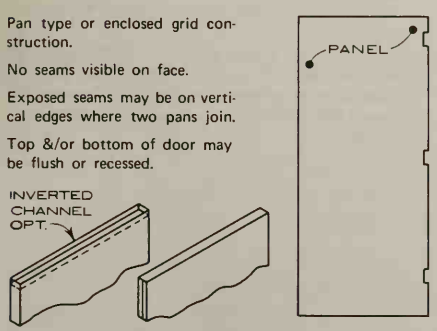
STILE & PANEL CONSTRUCTION

Pan type or enclosed grid construction.

No seams visible on face.

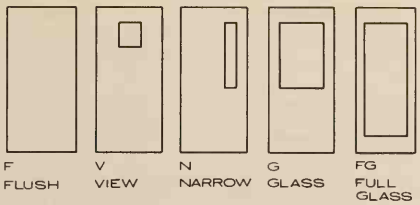
Exposed seams may be on vertical edges where two pans join.

Top &/or bottom of door may be flush or recessed.



FLUSH CONSTRUCTION

DOOR TYPES



NOTE:

Door types may be imposed on any door construction. Verify with manufacturer.

Divisions are made of stiles and rails or muntins.

Areas defined are filled with glass, screening, louvers, recessed or flush panels.

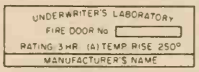
LABELED DOORS



A firedoor shall be of a design and a construction that when in combination with a suitable firedoor frame & hardware the assembly will protect the opening in which it is installed against the passage of flame & in certain wall constructions against the passage of heat.
Design, construction & installation must be tested in accordance with ASTM Designation E–152.
Consult local codes &/or governing authorities for requirements concerning fire resistivity; design size, conformance to test procedures & identification of such.
Labeling is a service which may be satisfactory to governing authorities as identification of compliance with their regulations.
Where permitted, certain proprietary devices & systems exceeding stated limits may be used. Consult manufacturer's literature.

RATING–GLAZING REQUIREMENTS

A* 3 hr. rating; no glazing permitted.
B* 1 1/2 hr. rating; 100 sq. in. of glazing per door leaf.
C 3/4 hr. rating; max. 1296 sq. in. of glazing per light. Max. dim. per light – 54". Min. dim. per light – 3".
D 1 1/2 hr. rating; no glazing permitted.
E 3/4 hr. rating; Max. 720 sq. in. of glazing per light. Max. dim. per light – 54".

NOTE:
All hardware used on U.L. labeled doors must be approved & listed by U.L. Laboratories & be as classified by NFPA.
All labeled doors must be used with labeled frames.
Max. door sizes correspond to max. frame opening sizes.
U.L. Oversize Certificate available for oversize openings.
See table of U.L. size requirements on following page.
A fire label on a door indicates that that door has been considered from the fire protection viewpoint without reference to electrical or accidental hazard features (which are covered by separate listings).

*A, B & D doors are available with Heat Transmission Ratings of: 250°F
650°F
NOT RATED
*Available on Composite Doors only.

11'-0"	2'-6" + 6'-0" + 2'-6"	131"
12'-0"	6'-0" + 6'-0"	143"

Note: To combine doors for oversized opening: use full units (4-fold) in multiples or in combination with half units (2-fold); many variations of width and panel effects may be obtained. Consult manufacturers' literature.

James W. G. Watson, AIA; Ronald A. Spahn and Associates; Cleveland Heights, Ohio

GENERAL NOTES FOR ALL WOOD DOORS:

Kiln dried wood, moisture content @ 6 – 12%.

Type 1 doors: Fully waterproof bond ext. and int.
Type 11 doors: Water resistant bond. Int. only.

Tolerances: Height, width, thickness, squareness and warp per NWMA STANDARDS and vary with solid vs. built-up construction.

Prefit: Doors @ $^1/_{16}$" less in width and $^1/_8$" less in height than nominal size, $\pm$ $^1/_{32}$" tolerance, with vertical edges eased.

Premachining: Doors mortised for locks and cut out for hinges when so specified.
Grading:

Premium: For transparent finish. Good/custom: For paint or transparent finish. Sound: For paint, with 2 coats completely covering defects.

FLUSH WOOD DOORS:

CORE MATERIAL
SOLID CORES:

Wood block, single specie, @ 2 $^1/_2$" max. width, surfaced two sides, without spaces or defects impairing strength or visible thru hdwd. veneer facing.

HOLLOW CORES:

Wood, wood derivative, or class A insul. board.

FINISHED EDGES:

Hdwd. edge strips on stiles to match face. Hdwd. or soft end strips on top and bottom st
Hdwd. edge strips on stiles to match face. Hdwd. or soft end strips on top and bottom rails.

TYPES OF WOOD FACES:

Standard thickness face veneers @ $^1/_{20}$" – $^1/_{36}$", bonded to hardwood, crossband @ $^1/_{10}$" – $^1/_{16}$". Most economical and widely used, inhibits checking, difficult to refinish or repair face damage, for use on all cores.

$^1/_8$" Sawn veneers, bonded to crossband, easily refinished and repaired.

For use on staved block and stile and rail solid cores. $^1/_4$" Sawn veneers: same as $^1/_8$" but without crossband on stile and rail solid cores with horizontal blocks. Decorative grooves can be cut into faces.

LIGHT & LOUVER OPENINGS:

Custom made to specifications. Wood beads and slats to match face veneer. 5" min. between opening and edge of door.

Hollow core: Cut-out area max. $^1/_2$ height of door. Door not guaranteed with openings greater than 40%.
Exterior doors: Weatherproofing required to prevent moisture from leaking into core.

FACTORY FINISHING:

Partial: Sealing coats applied, final job finish.
Complete: Requires prefit and premachining.

SPECIAL FACING:

High or medium-low density overlay faces of phenolic resins and cellulose fibers fused to inner faces of hardwood in lieu of final veneers as base for final opaque finish only.

$^1/_{16}$" min. laminated plastic bonded to $^1/_{16}$" min. wood back of two or more piles.

$^1/_8$" hardboard, smooth one or two sides.

SPECIAL CORES:
SOUND INSULATING DOORS:

Transmission loss rating @ 35 – 42 decibels. Thicknesses @ 1 $^3/_4$", 2 $^1/_4$", 2 $^1/_2$", and 3". Barrier faces separated by a void or damping compound to keep faces from vibrating in unison. Special stops, gaskets, and threshold devices required. Mfrs. requirements as to wd. frames and wall specs.

FIRE RATED DOORS:

"B" label @ 1 $^1/_2$ and 1 hr., "C" label @ $^3/_4$ hr.

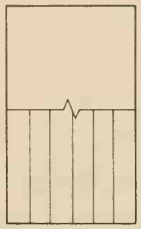
LEAD LINED DOORS:

See U/L requirements. Optional location within door construction of $^1/_{32}$" to $^1/_2$" continuous lead sheet from edge to edge which may be reinforced with lead bolts.

GROUNDED DOORS:

Wire mesh located at center of core, grounded with copper wire through hinges to frame.

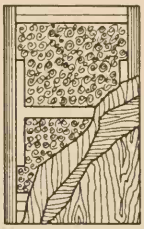
TYPES OF FLUSH DOORS



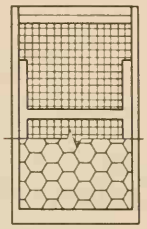
PLAIN: SOLID/HOLLOW
"V" GROOVE: SOLID

TYPES OF HOLLOW CORES:

LADDER:
Horizontal strips, equally spaced, flat or arched, notched into stiles.

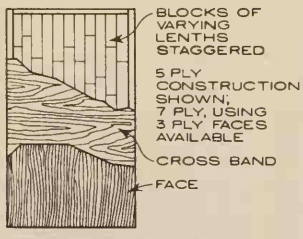


IMPLANTED BLANKS:
Spirals or other forms separated or joined, implanted between & supporting outer faces of door.



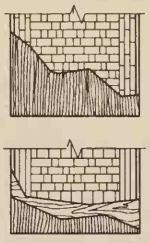
MESH:
Interlocked, horizontal & vertical strips, equally spaced, notched into stiles, or expandable cellular or honey-comb core.

TYPES OF SOLID CORES:



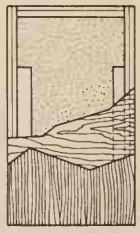
CONTINUOUS BLOCK STAVED CORE:
Bonded staggered blocks bonded to face panels. Most widely used & economical solid core.

FRAMED BLOCK STAVED CORE:
Non-bonded staggered blocks laid up within stile rail frame, bonded to face panels.



STILE AND RAIL:
Horizontal blocks when cross banding is not used. Vertical panel blocks when cross banding is used.

PARTICLE BOARD:
Extremely heavy, more soundproof, not yet covered by (1964) commercial standards.



MINERAL COMPOSITION:
Lightest weight of all cores. Details, as cut-outs, difficult. Low screw holding strength.

STOCK OPENING & LOUVER DETAIL
SCALE: 3"=1'-0"

GLASS & WOOD PANEL DOORS

CONSTRUCTION

Solid pine or built-up stiles, rails and vertical members or mullions, doweled as in NWMA std.

BUILT-UP MEMBERS

Core as in solid core of flush doors.
Edge and end strips as in flush doors.
Face veneers: Hdwd. @ 1/8" min.

PANELS

Flat: 3 ply hdwd. or soft.
Raised–2 sides: Solid hdwd. or soft or built-up of 2 or more plies.

STICKING, GLASS STOPS & MUNTINS

Cove or bead or ovolo, solid, matching face.

KEY TO SELECTED STD. TYPES BELOW

Ponderosa pine: Numbered series.
Hardwood veneer: Lettered series.
Entrance doors of stock designs also available in addition to exterior doors shown.

JALOUSIES

1 3/4" rim type door as in panel door construction with square sticking and fitted with full or half alum. framed inserts housing 4" high clear or obscure glass louvers.
Usual widths @ 2'– 6", 2'– 8", and 3'– 0".
Heights standard.

Simultaneous louver activation outward (similar to venetian blind) by roto operator.

Full frame with 17 louvers with double operators for top 9 and lower 8.

Half frame with 8 louvers–single operators.

Left or right side operation with jambs punched for both and metal plate to cover side not used.

Storm sash/screens on interior.

DUTCH DOORS

Divided door with top half independent of lower. Horiz. meeting rail w/ or w/o interior shelf. Provide WS, separate locking devices and joining hardware for both leaves to act in unison.

SCREEN / STORM DOORS

1 1/8" screen, storm or combination doors. 1" greater height than nom. due to sill bevel. Combination: Interchange screen/glass inserts.

See index for garage doors and for hardware for doors.

CENTRAL OPEN — ONE WING COLLAPSED FOR NIGHT SWING DOOR (RARE) — FULL PANIC COLLAPSED POSITION (ALL DOORS)

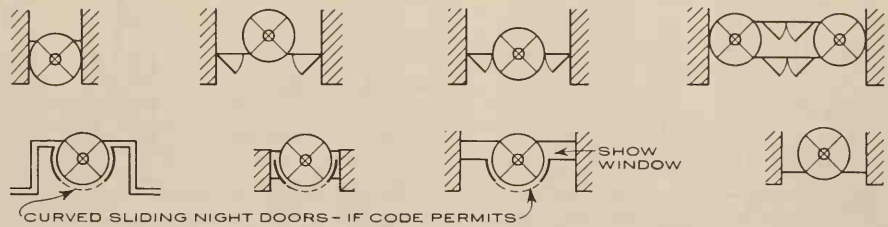
NOTE :

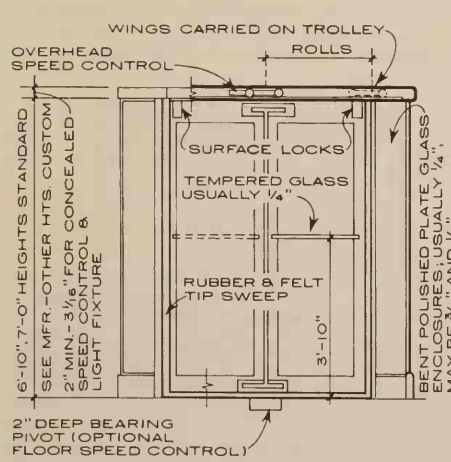
Preset emergency device allows doors to collapse under 60# – 180# pressure.

Curved sliding night doors available for security.

Enclosure walls and wings may be designed to roll aside.

PLANS SHOWING LOCKED & FOLDED WING POSITIONS





ELEVATION & SECTION 1/4" = 1'-0"

LAYOUT TYPES

DESIGN CONSIDERATIONS

Theoretical capacity each way = 2880 per hr.

Practical capacity = 2000 per hr. For general use, allow 6'– 6" diameters. Use 7'– 0" dia. for hotels and department stores. Motor drive optional with constant low speed or 1/4 point mechanism. Stainless steel, aluminum or bronze finish available. Wall enclosure may be all metal, all glass, partial glass or housed in construction. Provide heating and cooling source integral with or immediately adjacent to enclosure.

Codes may credit 50% of legal exiting requirements by means of revolving doors. Some do not credit any and require hinged door adjacent. Integral exit fixture required if freestanding legal exit.

SIZE LIMITATIONS:

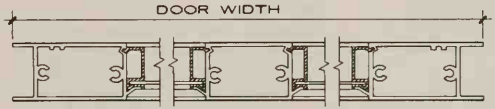
2" Track – not to exceed 336 sq. ft., 24'– 2" wide or 16'– 1" high.

3" Track – not to exceed 384 sq. ft., 24'– 2" wide or 16'– 1" high.

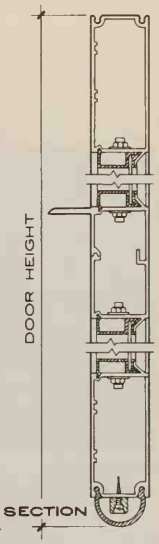
Stiles and rails of extruded aluminum. Stiles are bolted to rails with 1/4" rods the length of the stile.

NOTE:

Number of panels varies from 2 for doors up to 8'– 11" wide through 8 for widths from 21'– 0" to 23'– 11"; number of vertical sections varies from 4 for doors up to 8'– 6" high, through 8 sections for doors from 14'– 2" to 16'– 1" high. Number of panels and sections depend on increments in height and width established by manufacturer.



HORIZONTAL SECTION



SECTION

HEAVY DUTY ALUMINUM

ELEVATION

SIZE LIMITATIONS:

2" Track – not to exceed 340 sq. ft., 26'– 2" wide or 16'– 1" high.

3" Track – optional.

Stiles and rails made of extruded aluminum.

Doors made of fiberglass fastened to both the rails and stiles.

NOTE:

Number of stiles varies from 2 for doors up to 12'– 2" wide, through 7 for widths from 22'– 3" to 26'– 2"; number of vertical sections varies from 4 for doors up to 8'– 1" high, through 8 sections for doors from 14'– 2" to 16'– 1" high. Number of stiles and sections depends on increments in height and width established by particular manufacturers.

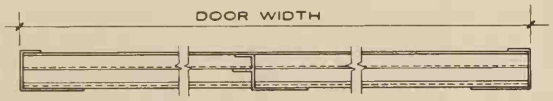
SIZE LIMITATIONS FOR STANDARD SIZES ON STANDARD TRACK:

20 ga., 2" track—not to exceed 240 sq. ft., 24'— 2" wide or 16'— 1" high.
3" track—not to exceed 600 sq. ft., 33'— 2" wide or 25'— 1" high.
24 ga., 2" track—not to exceed 340 sq. ft., 26'— 2" wide or 16'— 1" high.



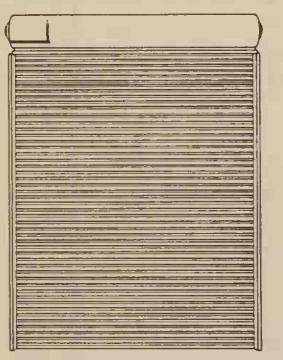
HORIZONTAL SECTION

SECTION

GENERAL INFORMATION:

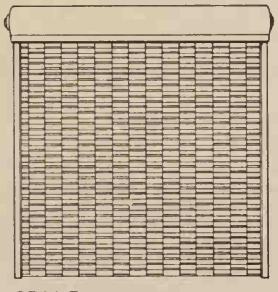
1. Standard commercial doors are designed to 20 #/ft.^{2} wind load.
2. All doors are available with sash sections or sash openings in standard section.
3. Doors are available using 20 or 24 gauge steel sections on the top and bottom and intermediate fiberglass sections.
4. Larger openings can be enclosed by using 2 or more doors with removable or swing up center posts. When the center posts are removed or raised, the entire opening is clear.
5. Doors of larger sizes can be manufactured with special engineering.

COMBINED DOOR - 20 AND 24 GAUGE STEEL AND FIBERGLASS



CURTAIN

Available in sizes listed below.



GRILLE

Available in sizes listed below: galvanized or stainless steel or aluminum.

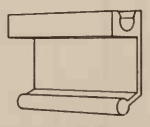
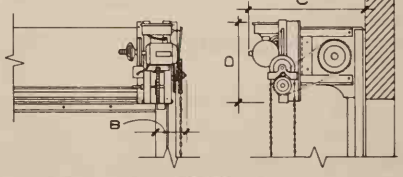
ROLLED SLAT

Available in galvanized, stainless steel and aluminum.



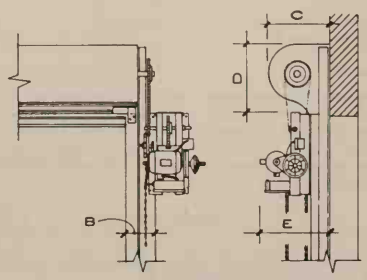
EXTRUDED ALUMINUM SLAT

For use with rolling counter doors.



HOOD MOUNTED OPERATOR

Dimension "D" will be 23" minimum.
Dimension "C" will increase 15".



WALL MOUNTED OPERATOR

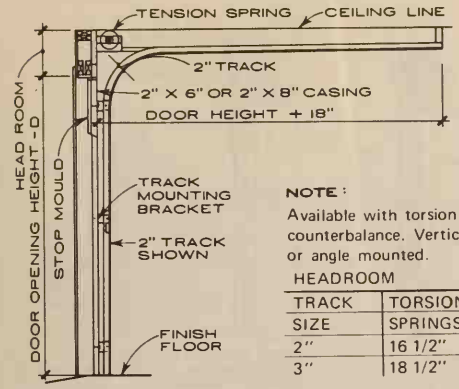
Dimension "B" will increase by 12".
Dimension "E" will be 20" for all doors.

NOTE:

Doors can be manufactured to be installed under the lintel and between the jambs when side or headroom are less than the above dimensions. Also doors can be manufactured to be installed on outside of building. This type door approved for V.L. Class A fire rating.

ROLLING METAL DOORS & GRILLES

Eugene Patrick Holden; Dale E. Selzer, AIA, Architect; Dallas, Texas

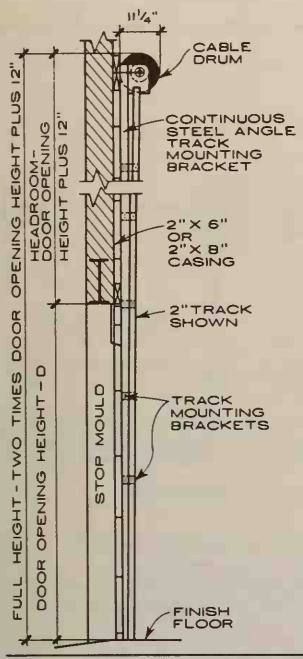


NOTE:
Available with torsion or extension spring counterbalance. Vertical tracks can be bracket or angle mounted.

HEADROOM

TRACK SIZE	TORSION SPRINGS	EXTENSION SPRINGS
2"	16 1/2"	18"
3"	18 1/2"	22"

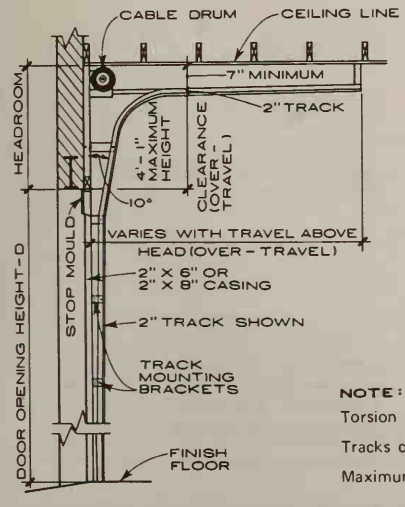
STANDARD HEADROOM TRACK - 2" OR 3"



NOTE:
Torsion spring or weight counterbalance.

Tracks can be bracket or angle mounted.

FULL VERTICAL TRACK - 2" OR 3"

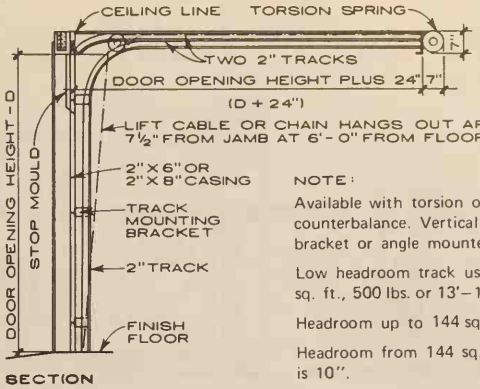


NOTE:
Torsion spring counterbalance only.

Tracks can be bracket or angle mounted.

Maximum usable headroom is 11'–6".

LIFT CLEARANCE TRACK - 2" OR 3"



SECTION

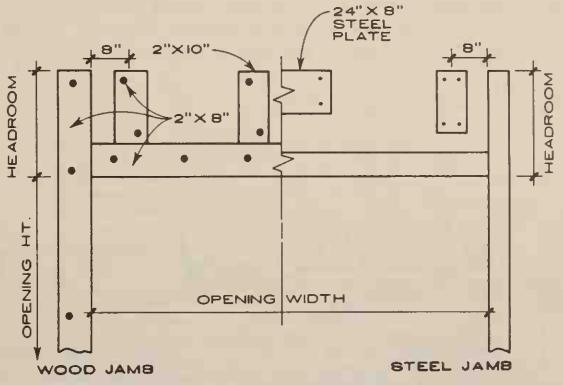
NOTE:
Available with torsion or extension spring counterbalance. Vertical tracks can be bracket or angle mounted.

Low headroom track used on doors to 180 sq. ft., 500 lbs. or 13'–1" high.

Headroom up to 144 sq. ft. is 6 1/2".

Headroom from 144 sq. ft. to 180 sq. ft. is 10".

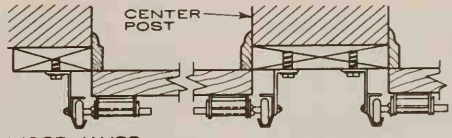
LOW HEADROOM TRACK - 2"



All pads and plates to be flush with wood or steel jambs.

Wide or heavy doors which require more than two springs will require pads additional to those shown in the above detail.

INTERIOR ELEVATION OF DOOR OPENING



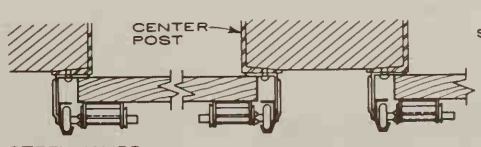
WOOD JAMBS

NOTE:
For weight counterbalance doors, additional sideroom is required.

See note for asterisk at Table for Steel Jamb sideroom below.

SIDEROOM

TRACK SIZE	SIDEROOM	FOR DOORS		CENTER POST
2"	3"	to 12'–1" high		6"
2"	3 1/2"	12'–2" to 14'–1"	*	7"
2"	4 1/2"	14'–2" to 16'–1"	*	9"
3"	5"	to 320 sq. ft.	*	10"
3"	5 1/2"	over 320 sq. ft.	*	11"



SEE NOTE ABOVE

STEEL JAMBS

SIDEROOM

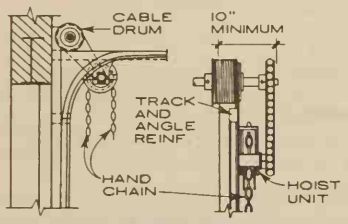
TRACK SIZE	SIDEROOM	FOR DOORS		CENTER POST
2"	4"	to 12'–1" high		8"
2"	4 1/2"	12'–2" to 14'–1"	*	9"
2"	5 1/2"	14'–2" to 16'–1"	*	11"
3"	6"	to 320 sq. ft.	*	12"
3"	7"	over 320 sq. ft.	*	14"

* 16 ga. steel doors over 168 sq. ft. Use 3" angle mounted track with 7" sideroom, 14" center post.

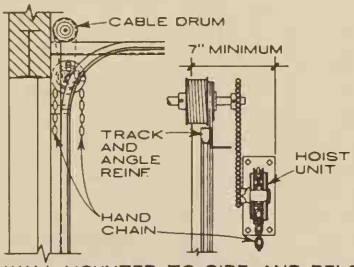
Eugene Patrick Holden; Dale E. Selzer, AIA, Architect; Dallas, Texas

NOTE:

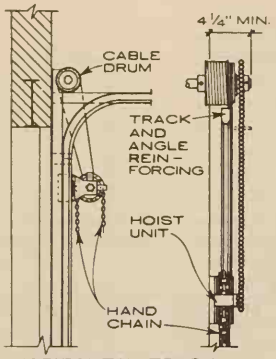
If door is not electric operated, a chain hoist is recommended for all doors exceeding 160 sq. ft. or 13'–0" high. For 16 ga. steel use chain hoist on doors exceeding 120 sq. ft. or 12'–0" high.

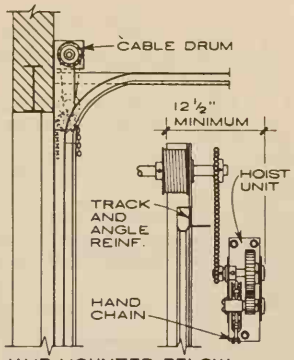


MOUNTED ON AND BELOW HORIZONTAL TRACK REINFORCING ANGLE



WALL MOUNTED TO SIDE AND BELOW HORIZONTAL TRACK AND CABLE DRUM

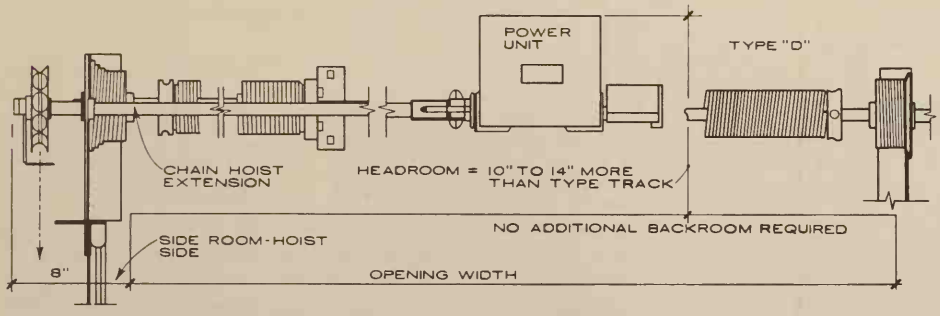




JAMB MOUNTED BELOW HORIZONTAL TRACK AND CABLE DRUM
FOR LARGE OR HEAVY DOORS

CHAIN HOIST OPERATORS - MINIMUM SIDE ROOM CLEARANCE

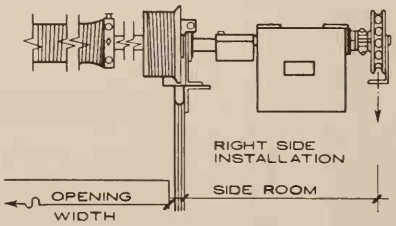
NOTE: All chain hoist operators require additional sideroom clearance. Operator may be mounted on left or right side as shown; on the left greater sideroom is required. Dimensions shown are from door jamb to projection of operator.



CENTER MOUNTED OPERATOR

NOTES:
CENTER MOUNTED
Same principle as side mounted operator except power unit is located on front wall above door opening. No additional sideroom is needed. Needs from 10" to 14" additional headroom; 3" additional sideroom on chain hoist side.

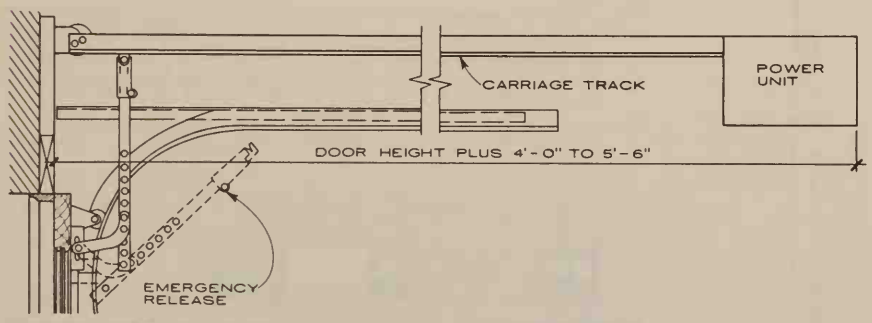
NOTES:
SIDE MOUNTED
Power unit is mounted on inside front wall to the right or left of the door and is connected to the crosshead shaft with a drive chain and sprockets or an adjustable coupling. Power is applied to the shaft to raise the door. The door closes by its own weight with the speed controlled by the operator.



SIDEROOM WIDTHS FOR HEAVY COMMERCIAL USE – 20" FOR 2" TRACK AND 21" FOR 3" TRACK. FOR INDUSTRIAL USE, WIDTHS ARE 23" FOR 2" TRACK AND 24" FOR 3" TRACK.

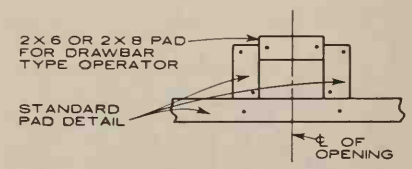
SIDE MOUNTED OPERATOR

No extra headroom required. Needs 20" to 24" of sideroom on mounting side.
Side mounted operators are available with direct coupled or chain drive, depending on installation condition.



DRAWBAR TYPE OPERATOR

NOTE:
Power unit is mounted between, above and to the rear of horizontal tracks of door. A chain-driven carriage slides forward and back in its own tracks, which run from power unit to front wall above door. An arm linking the carriage and the door applies force to open and close the door as the carriage moves backward and forward. Door requires a minimum of 2" additional head room above tracks plus 1" to 3 1/2" more at power unit. No additional sideroom is required.



PAD DETAIL FOR DRAWBAR TYPE OPERATORS

Drawbar type is not recommended for use on extra large doors nor with lift clearance track installations. Emergency chain hoists are not normally used on drawbar type operators.

ELECTRIC MOTOR OPERATORS NO SCALE

Available in all standard voltages, frequency and phase. Control can be by 2 or 3 button push button station, pull switches, photoelectric, radio control (single or multiple), time delay closing and/or reversing or stop only safety switch. For Operator Selector chart see manufacturers data.

SCALE 1 1/2" = 1'-0"

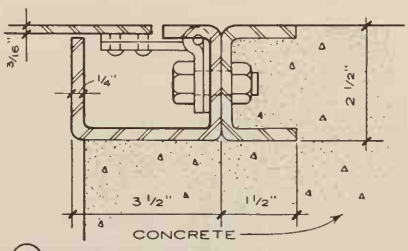
4A ALTERNATE DETAIL
FOR HEAVY DUTY AND LARGE DOORS I BEAM MAY BE USED IN PLACE OF CHANNEL

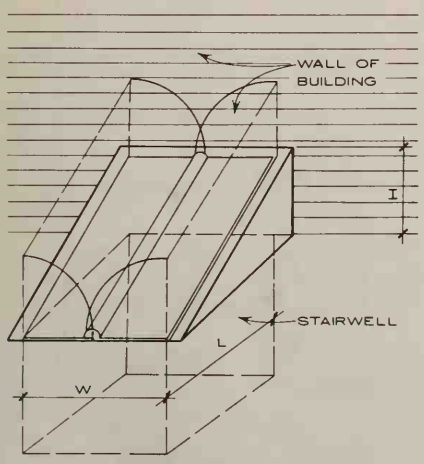


4B ALTERNATE DETAIL

DETAILS - ALTERNATE DRAIN AND GUTTER SCALE 3" = 1'-0"

NOTE: SIDEWALK DOORS

Doors are usually of steel reinforced with angles, tees, or bars; and may also be of aluminum floor plate for weight reduction, and of safety type metal. Frames are usually of structural slopes with anchors into masonry or floor construction. Hinges can be set flush or on the surface and may be of cast iron, or steel, fitted with brass or bronze pins. Lifting handles are usually set flush and are essential where doors are to be operated from above. Locking is usually by a heavy barrel bolt on the underside. Guard bars and chains are required to hold doors in open position and to protect the opening. Door leaves of floor plate for ordinary construction may be 3/16" or 1/4" thickness with stiffeners to support the load. Plates of greater thickness may be used in order to handle greater live loads and possible deflections.

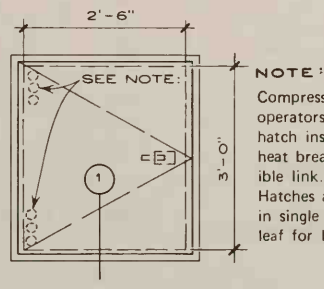


CELLAR DOOR OPENINGS

TYPE	LENGTH	WIDTH	HEIGHT
A	4'-6"	3'-4"	2'-6"
B	5'-0"	3'-8"	1'-10"
C	5'-8"	4'-0"	1'-7 1/2"

DOORS ARE MADE TO FIT THE ABOVE OPENINGS. THEY ARE MANUFACTURED TO ORDER.

CELLAR DOORS



NOTE:
Compression spring operators open smoke hatch instantly when heat breaks 160° fusible link.
Hatches are available in single leaf or double leaf for larger openings.

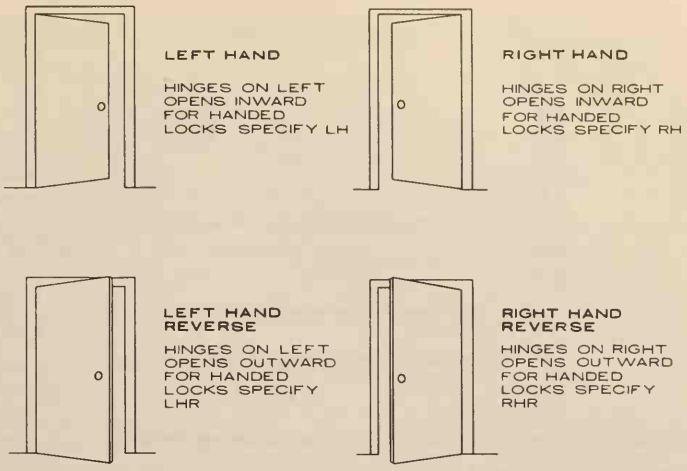
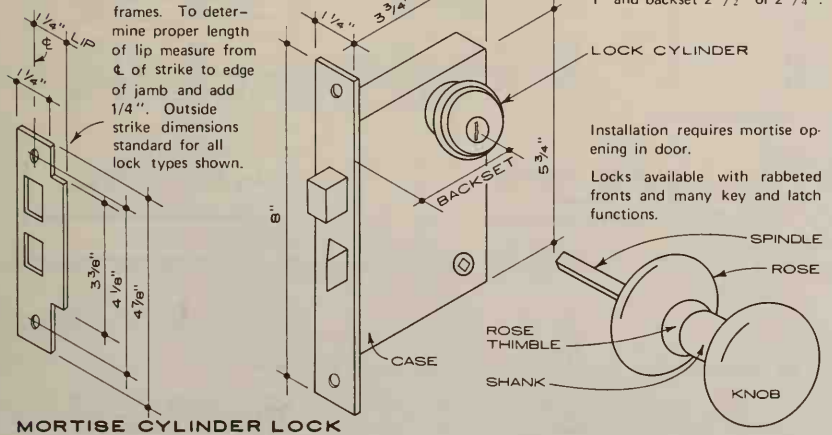
RECOMMENDED DOOR HARDWARE LOCATIONS



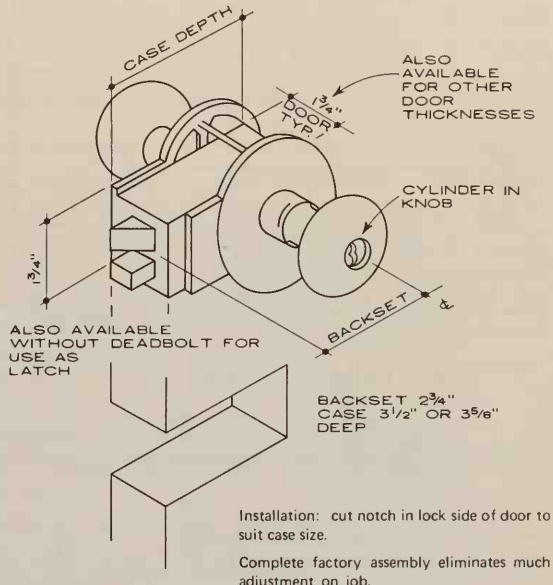
HANDS OF DOORS

Face the outside of the door to determine its hand. The outside is the street side of an entrance door and the corridor side of a room door. The outside of a communicating door is the side opposite the hinges.

American Standards Association Lock Strikes A–115V–1959 for metal door frames. To determine proper length of lip measure from ℄ of strike to edge of jamb and add 1/4". Outside strike dimensions standard for all lock types shown.



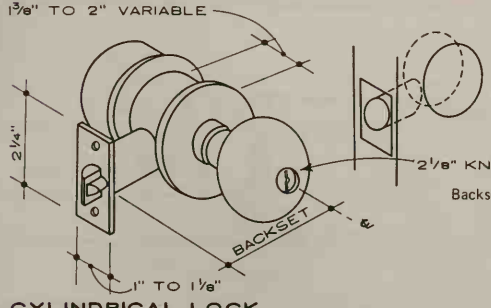
MORTISE CYLINDER LOCK



Installation: cut notch in lock side of door to suit case size.

Complete factory assembly eliminates much adjustment on job.

UNIT LOCK



Installation: 2 1/8" hole in door face. Door edge requires 7/8" or 15/16" hole for standard lock, 1" hole for heavy duty lock.

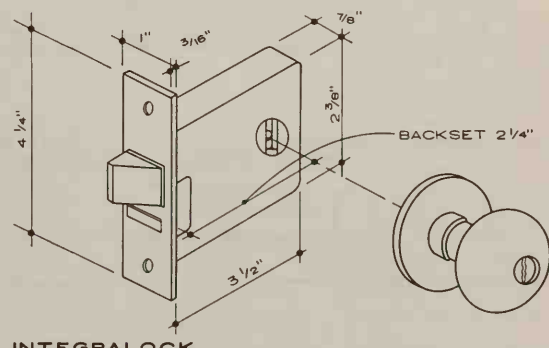
2 1/8" KNOB MAX FOR 2 3/8" BACKSET

Backsets: Standard Type Lock — 2 3/8" (Regular), 2", 2 3/4", 3 3/4", 5", 7", 8", 10", 18"

Heavy Duty Type Lock — 2 3/4" (Regular), 3 3/4", 5", 6", 7", 8", 18", 19", (42" Special)

CYLINDRICAL LOCK

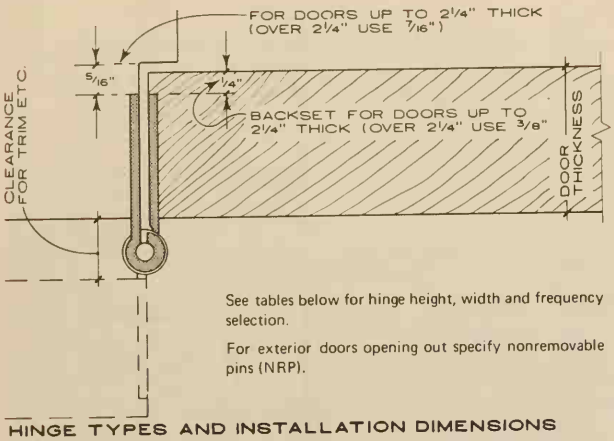
Available in standard type (residential & light commercial) & heavy duty-type (institutional commercial)



INTEGRALOCK

Mortise type installation. Combines features of mortise and cylinder locks.

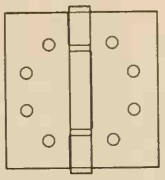
F. J. Trost; SMS Partnership, Architects; Stamford, Connecticut
American Society of Architectural Hardware Consultants; Mill Valley, California



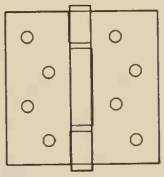
See tables below for hinge height, width and frequency selection.

For exterior doors opening out specify nonremovable pins (NRP).

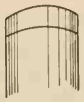
HINGE TYPES AND INSTALLATION DIMENSIONS



TEMPLATE



NON-TEMPLATE (FOR WOOD DOORS)



STANDARD FOR ALL HINGES

ROUNDED TO AVOID ATTACHING WEARING APPAREL ETC.

BUTTON TIP **HOSPITAL TIP**

CONSULT MANUFACTURERS FOR OTHER AVAILABLE TIPS

NOTE:

1. Use 2 hinges on doors less than 5'– 0" high. Add 1 hinge for each additional 2'– 6" of door height. Always specify 3 hinges per door.
2. Use ball bearing hinges on doors equipped with closers.
3. Use high frequency hinges on high frequency openings, average frequency hinges on average frequency openings, low frequency hinges on low frequency openings.
4. 2 or 4 ball or oilite bearings available on most hinge types (4 for extra heavy).

HINGE SELECTION TABLES

HINGE HEIGHT–DETERMINED BY DOOR WIDTH AND THICKNESS

DOOR THICKNESS	DOOR WTH.	HINGE HGT.
3/4" to 1 1/8" CABINET	to 24	2 1/2
7/8" & 1 1/8" SCREEN OR COMB.	to 36	3
1 3/8"	to 36	3 1/2
1 3/4"	to 36	4
	over 36-41	4 1/2
	42 to 48	4 1/2*
2", 2 1/4", 2 1/2"	to 42	5
	over 42	6
TRANSOMS		
1 1/4" & 1 3/8"		3
1 3/4"		3 1/2
2", 2 1/4", 2 1/2"		4

NOTE: Height of a hinge is always first dimension not including tips.

* Extra heavy hinges should be specified for heavy doors and doors where high frequency service is expected. Extra heavy hinges should be 4 1/2", 5", & 6" sizes.

HINGE WIDTH–DETERMINED BY DOOR THICKNESS AND CLEARANCE REQUIRED

DOOR THICKNESS	CLEARANCE REQUIRED *	HINGE WIDTH
1 3/8	1 1/4	3 1/2
	1 3/4	4
1 3/4	1	4
	1 1/2	4 1/2
	2	5
	3	6
2	1	4 1/2
	1 1/2	5
	2 1/2	6
2 1/4	1	5
	2	6
2 1/2	3/4	5
	1 3/4	6
3	3/4	6
	2 3/4	8
	4 3/4	10

* NOTE: Clearance is computed for door flush with casing.

GENERAL NOTES:

1. The word "window," as used in the following pages, includes the frame as well as fixed and movable units within the frame.

2. All dimensions are window dimensions (W.D.) unless otherwise noted.

3. A ventilator is a movable unit of a window, vertical or horizontal, hinged or pivoted.

4. Size of any single glass area is determined by:
A. the location of window
B. the strength of glass
C. the manufacturer's standards.

5. Windows may be obtained which vary from the standard sizes shown; in this case consult manufacturer for possible changes in details and price.

6. "Western" refers to the states of California, Oregon, Utah, Washington, Idaho, Nevada, and Arizona.

7. "Eastern" refers to states other than the "Western" states.

8. Number of muntins shown is not standard, but may vary in number and size.

9. Aluminum window classification:
A. The Architectural Aluminum Manufacturer's Association (AAMA) designates all windows as either Architectural or Residential. Architectural refers to windows suitable for either commercial or monumental type buildings; Residential refers to windows suitable for residential type buildings only.
B. Alloy, thickness, weight and shape vary among manufacturers, but all windows must meet minimum AAMA test specifications in order to be certified in either of the two categories. No simple chart (as shown below for steel) is available for aluminum.

STEEL WINDOW CLASSIFICATION BY THE STEEL WINDOW INSTITUTE:

	MINIMUM DEPTH OF ANY FRAMING MEMBER (INCHES)	MINIMUM WEIGHT OF WINDOW (LBS./LINEAL/FOOT) OR MINIMUM THICKNESS OF ANY SECTION THROUGH WINDOW (INCHES)
STANDARD INTERMEDIATE	1 1/4	3.0
HEAVY INTERMEDIATE	1 5/16	3.5
HEAVY CUSTOM	1 1/2	4.2
RESIDENTIAL	1	2
ARCHITECTURAL PROJECTED	1 3/8	1/8

10. All elevations are shown from the outside. In vertical sections, the outside of the building is shown to the left; in horizontal sections, the outside is below the detail.

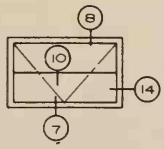
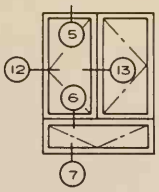
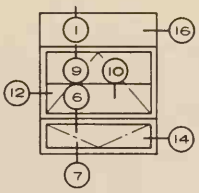
CASEMENT



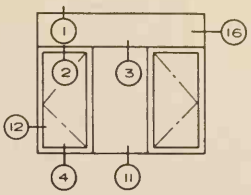
PROJECTED



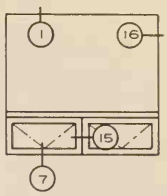
COMBINATION (CASEMENT – PROJECTED)



COMBINATION (PROJECTED – FIXED)



COMBINATION (CASEMENT – FIXED)



COMBINATION (PROJECTED – FIXED) ALSO KNOWN AS "CLASSROOM"

A CASEMENT, PROJECTED, OR COMBINATION WINDOW

(casement, projected, fixed) is used where maximum light and ventilation are important factors.

High-up projected-out sash needs chain or motor operators to open and close. Hand operated sash hardware, whether inward or outward opening, must be within arm reach of average person standing on floor, or else have some mechanical or nonmechanical device (a pole) to extend arm reach.

See Index for pages on "Dimensions of the Human Figure."

INDUSTRIAL STEEL WINDOWS

Industrial steel windows (projected, pivoted, fixed) consist of either "commercial projected" or "horizontal pivoted" windows and are used in industrial buildings, warehouses, etc., because their cost is usually less than similar windows. They may be hand operated or mechanically operated in groups.

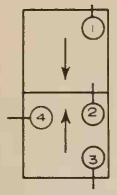
STEEL SECURITY WINDOWS

A steel security window (projected, fixed) is a hopper type window used where protection is required. It is similar to an industrial window except that the narrowly spaced security bars (which are in a common frame with the window) remain fixed while the ventilator moves. Screens available if required.



DOUBLE HUNG

A Dougle Hung Window (or single hung window) is used where maximum light and flush interior and exterior bldg. appearance are important factors.

A Single Hung Window (not shown) is generally the same as a double hung window except that the frame for the upper fixed light is an integral part of the head and jamb members.

AWNING

AN AWNING WINDOW is one whose movable units consist of a group of hand operated or gear operated outward projecting ventilators, all of which move in unison. It is used where maximum height and ventilation is required in inaccessible areas such as upper parts of gymnasiums or auditoriums. Hand operation is limited to one window only, while a single gear operator may be connected to two or more awning windows.

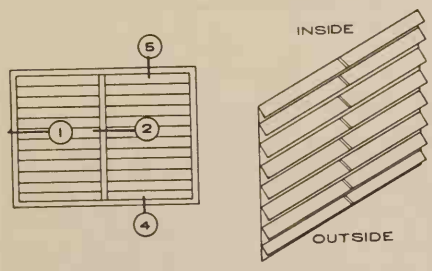
VERTICAL SECTION (STEEL)
SCALE: 1½" = 1'-0"



JALOUSIE

A JALOUSIE WINDOW (ALUMINUM) consists of a series of operable overlapping glass louvers which pivot in unison. It may be combined in the same frame with a series of operable opaque louvers for climate control. It is used mostly in residential type constructions in southern climates, where maximum ventilation and flush exterior and interior appearance is desired.

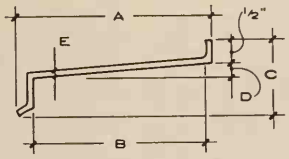
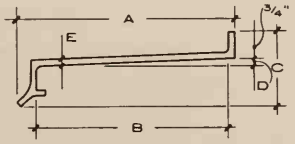
EXTRUDED ALUMINUM SILLS



For Lug Sills
Extend into brick joints at window jambs and allow 1/4" space for expansion at ends.

For Continuous Sills
At joints allow 1/4" to 3/8" expansion and flash joints.



Used for continuous line of windows. Provide 1/4" to 3/8" expansion space at jamb or butt joints of continuous sills.

Sills may be made to fit posts or mullions, and may be mitered at corners. Sills over eight feet in length should have central anchorage to keep them in proper position.

* Non-warehouse items

Refer to aluminum manufacturers catalogs.

OTHER TYPES OF HARDWARE:

1. Concealed cam hardware.
2. Hardware with removable handles for A.C. buildings. Also key locks.
3. Sliding window hardware.
4. D. H. window hardware (sweeplock).
5. Telescoping adjuster.
6. Chain, pole & cord operated hardware.
7. Hardware for security windows.
8. Heavy duty, electrical powered hardware for group window control.

FINISHES INCLUDE:

1. Steel: diecast, lacquered & painted.
2. Aluminum: wide range of finishes and colors. Generally match window finish.
3. Bronze
4. White bronze & nickel bronze

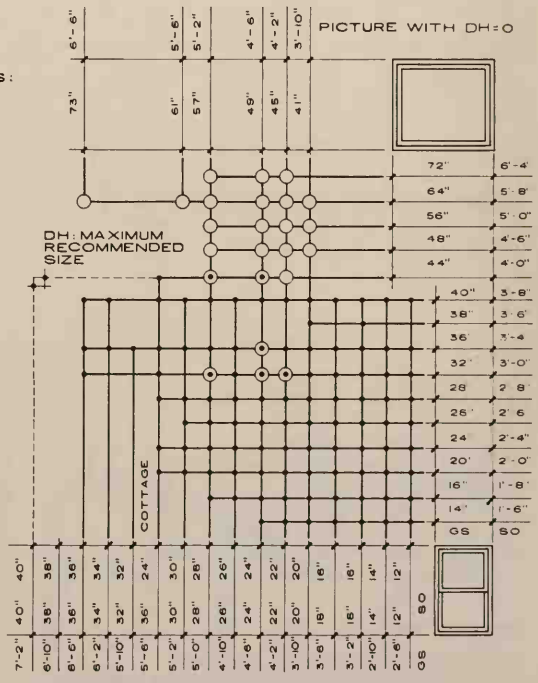
STOCK SNAP-IN BARS AND GRIDS



TYPICAL STANDARD SIZES (5 MANUFACTURERS)

CONSTRUCTION

Bars & muntins separate gl. opngs. w/i single sash. Bars: hor. or vert., full wth. or hgt. of gl. opng. Muntins: H or V, from stile or rail to bar, bar to bar. Bars & muntins also diagonal. Acrylic plastic or wd. snap-in bars & grids avail, in reg. or diamond patterns for 1-light sash.

1-light sash: single pane of glass w/o bars & muntins. Divided light or "cut-up" sash: glass panes separated by bars & muntins.

Sticking: solid, of any design allowing reqd. rabbet for type of glass & thickness of sash.

Storm sash (double glazing) may be applied to outside or inside of sash or outside of frame.

Screen sash applied to outside or inside of frame, depending on window type.

Storm & screen sash in outside of frame @ 1" greater than SO height w/ 14° bevelled bot. edge. 3/4" screen may have oval bottom edge. Height further increased with 2-piece sill.

DH: half-sliding or full screens available.
DH/S: combination self-storing storm-screen sash available w/ 1 half-screen & w storm panels.
Alum. frames for storm & screen sash available.

NAILING-EXTERIOR FASTENING

Hot dip galvanized or non-staining metal.

WEATHERSTRIPPING

Mfrs. option, of rigid durable material suitable for normal continuous operation; installed in frame, sash, or both which meets allowable air infiltration stds. @ 25 mph wind pressure.

Usual materials are S.S., anodized alum., vinyl plastic or molded fiber lined with felt or neoprene rolled into retention grooves.

GLAZING & GLAZING METHODS

ss & ds wdw. gl. w/ 1 1/8", 1 3/8", & 1 3/4" sash. ssB, unless otherwise specified, 76 U.I. max.
dsB: 100 U.I. maximum.
Face puttying, adhesive bedding, or wood stop glazing.

3/8" & 7/16" ins. gl. w/ 1 3/8" & 1 3/4" sash. 1/16" clearance each side. 1" insulating glass w/ 2 1/4" & thicker sash. 1/4" clearance each side. Wood stop or flexible vinyl glazing w/ ins. gl. Storm sash deleted w/ use of insulating glass.

SCREENING

Alum., galv. stl. or brz.: grooved w/ spline or tacked. Vinyl coated fiber cloth: grooved w/ spline only. Each with flush or applied mitered stops. 18x14 or 18x16 mesh.

HARDWARE

All hardware, including operating devices, fasteners, etc. to be non-rusting metal or steel with rust-resistant finish.

DOUBLE HUNG & SINGLE HUNG

Pulleys with cords and sash weights obsolete.

Spring counterbalance: clock spring w/i revolving drum wrapped w/ tape or cord attached to stiles of sash. 2 per sash, overhead or jamb installation. Flat space-saving overhead type also available.

Tension spring balance or pretensioned spiral balance with inner torque rod: tube enclosure, with attaching arms to sash. 1 or 2 per sash, vertically housed in stile rout or incorporated in jamb liner weatherstripping.

Adj. pressure WS of flexible vinyl or metal w/spring compression action, or rigid w/ compress. spring backing.

Sash activated by application of pressure, with hold at any position by release of pressure. Sash may be removable with all types.

Provide sash lock and sash lift.

HORIZONTAL SLIDING

Top of sill & head jamb with track or guide of molded plastic or metal which requires no paint or finish and permits easy operation of sash. Also provides weatherstrip.

Meeting stile lock w/ handle & recessed finger grips.

Continued.

MALTA CASEMENT

Spring tension alum. Ws makes contact with sash and frame at all points.

SCALE ALL DRAWINGS 1 1/2" = 1'-0"

HDWE. & OPERATING MECHANISMS

CASEMENT

Outswinging or inswinging:
Hinged always as viewed from the outside. Usual fastening to side jamb by extension; double acting or concealed supporting arm hinges. Supporting arms provide friction for manual operation.

Outswinging: for mechanical operation provide holding or friction device to hold sash open at any predetermined position. More sophisticated devices are roto worm gear or folding push bar with locking device.

Side jamb lock, 2/sash @ 2'– 8" or higher. Plunger type sash lock for inswinging sash.

AWNING & HOPPER

Sash usually hinged on sliding tracks on side jambs, allowing in or out operation of sash and provides friction for manual operation.

A: push bar operator w/ locking device for sash activation and holding, or roto or lever operator. 2 or more sash/frame: roto operators w/ torque bar activates all sash in unison.

Manual operation: provide sash lock, plunger type for H.

NAILING - EXTERIOR FASTENING

Hot dip galvanized or non-staining metal.

STANDARD LAYOUTS & OPENING SIZES

Dimensions always given as width x height.

GS = glass size (in.): clear dimensions between stiles and rails inclusive of muntins and bars.

SO = sash opng. (ft. and in.): OA dims. of sash.

RO = rough opng. (ft. and in.): frame opening in wall required to receive window unit.

Sash stiles @ 2" nominal width.
Sash meeting stile @ 1" nominal width: S only.
Sash top rail @ 2" nominal width.
Sash meeting rail @ 1" nominal width: DH/SH.
Sash bottom rail @ 3" nominal width.
Window frame sill bevel @ 2".

RO fitting allow: at side and head jambs @ $^{3}/_{4}$".

SO width = gl. width(s) + stiles involved.
SO height = gl. width(s) + rails involved.

RO width = SO + side jambs + fitting allowance
RO height = SO + head jamb + fitting allow. + sill bevel.

The above dimensions serve as a rough rule of thumb, only, for all window types. Act. stile and rail face dims. vary due to cut-ups of sash. Size variations due to mfrs., WS installations, and with DH/SH with type of balance used.

MODULAR SIZES

CS 163–64 list opng. sizes for all sash except pl. rail & barn sash as conforming to modular coordination.

Mfrs. sizes subscribe only w/ DH and by-passing S. Glass widths @ 4" intervals and glass heights @ 2".

SO widths: GS + 4": DH and total GS + 5": by-pass S.

SO heights: total GS + 4" + 2": DH and GS + 4": by-pass S. Mfrs. additions and omissions as dictated by demand.

C/A/H: wide variance of available sizes and not applicable to modular coordination.

B: modular width @ 2 bldg. blocks of 16" long ea.
B: modular hgt. @ 1 $^{1}/_{2}$, 2, 2 $^{1}/_{2}$, and 3 bks. @ 8" high.

DOUBLE HUNG WINDOWS

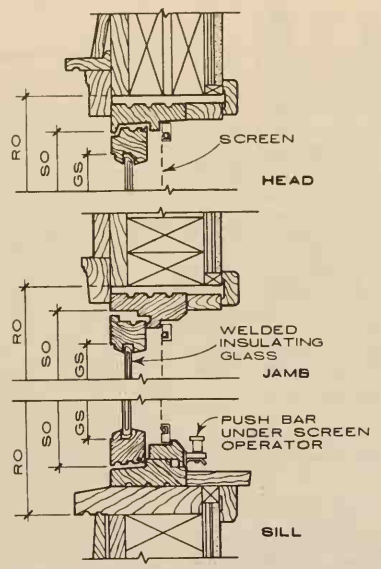
Frame with operative top and bottom sash which may be removable or pivoted.

Standard DH unit with upper and lower sash @ same GS and meeting rail at center of opening.

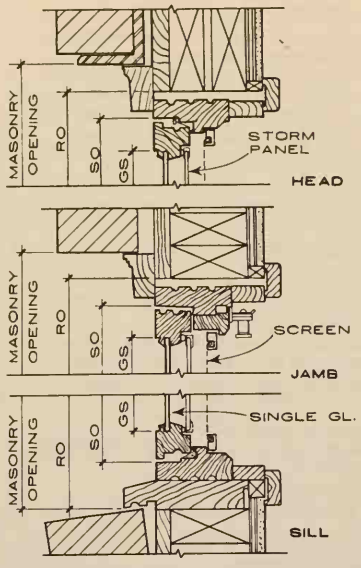
Front or cottage type: top sash smaller than bottom sash and meeting rail above center of opng.

Meeting rail: bot. rail of top sash and top rail of bot.

Check rail: usual meeting rail for DH windows. 1 $^{3}/_{8}$" thks. of meeting rail increased to compensate for $^{1}/_{2}$" parting stop separating sash. Bevelled and dadoed projections of ea. rail w/ WS. GS @ 12" x 12" – 44" x 40" for 1–light sash. Widths greater than 40" seldom used and sizes greater than 44" x 40" cannot be properly balanced.



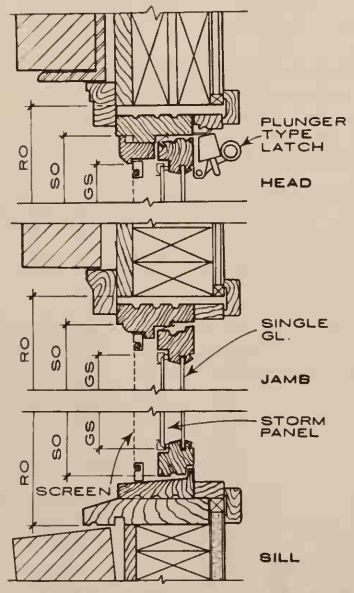
USED AS AWNING - FRAME WALL



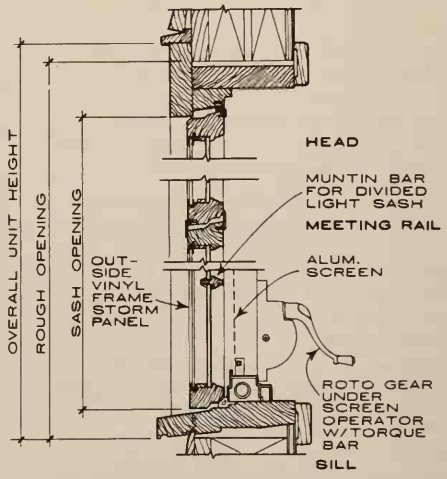
USED AS CASEMENT - BRICK VENEER

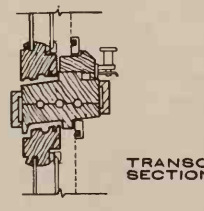
CONVERTIBLE WINDOWS: AWNING - HOPPER - CASEMENT; MULTI-PURPOSE

Spring tension S.S. Window stripping at all sides of sash.

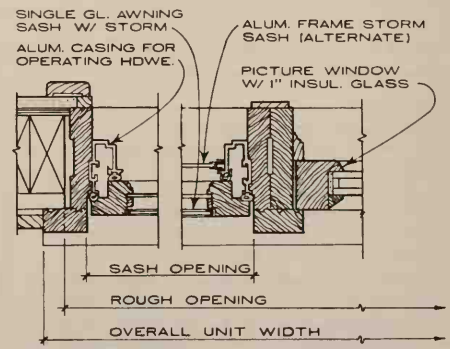


USED AS HOPPER - BRICK VENEER





SCALE : 1 $^{1}/_{2}$" = 1' – 0"



MULTIPLE AWNING SASH WITHIN SINGLE FRAME

Vinyl tubular window stripping at head, jambs and sill. Solid overlap vinyl W.S. at meeting rails.

Operating hdwe. enclosed in alum. casing. All sash react in unison, 70° opening. Lower sash first to open, last to close for partial ventilation.

All sash locked in unison with pressure seal to weather stripping.

PLAIN RAIL DH WINDOW

1–1/8" sash, either one fixed, other operative.
Meeting rail thks. same as stiles and jamb w/o parting stop, so no separation between sash.
Movable sash slides against fixed sash.
Movable sash w/ bolts that engage holes in side jambs for holding sash open at any one of a number of predetermined positions.

SINGLE HUNG WINDOWS

Frame w/ stationary top sash or top section of frame glazed w/ bottom check rail and operative bottom sash which may be removable.
GS: 1–light sash @ 20"x16" – 44"x26".

HORIZONTAL SLIDING WINDOWS

Frame with all sash operative or one or more operative sash with stationary sash.
Operative sash may be removable.
L, R, or center portion of frame may be glazed & w/ meeting stile(s) in lieu of stationary sash.
Stiles, rails & meeting stiles: 1–3/8" min. face dim.
SO for 2 sash/frame @ approx. 3'x2' – 5'–6:x6'.
Commercial Standard limits glass height to 50".

CASEMENT WINDOWS

Frame with one or more outswinging, inswinging, or stationary sash.
French casement extends to floor.
Stiles & top rail @ 1"–2", bottom rail @ 3" nom.
Alternate: "Full Bound" sash.
Outswinging: screen inside, regular or self-storing flexible type with operation similar to a window shade.
SO range for 1 sash/frame @ 1'–4"x2'–2" – 2'x6'.

AWNING/HOPPER WINDOWS

Frame with 1 or more operating sash.
Awning: bottom of sash swings outward.
Hopper: top of sash swings inward.
Stiles and rails @ 1–1/2" – 2".
Awning/hopper sash may be used as casement.
Glass size: 1–light sash @ 27"x14" – 48"x32".

BASEMENT WINDOWS

Inswinging sash: awning or hopper type.
1, 2, or 3 light sash: modular & non-modular.
Non-modular SO @ 1'–8"x1'–4" – 3',4:x2'–4".

MISCELLANEOUS WINDOW TYPES

BARN OR UTILITY SASH:
Single sash window unit @ 1–1/8" or 1–3/8" thk.
Raised through split head jamb with ploughed runways in side jambs.
Spring bolts hold sash open in predetermined positions.

HOTBED SASH:
Used in plant cold frames & other greenhouse activities.
3–light @ 1–3/8" or 1–3/4" thick.

TRANSOM SASH:
1–light @ 1–3/8" thick.

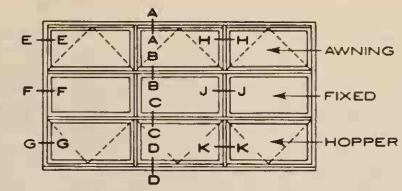
WINDOW JALOUSIES:
Wood sash frame with alum. insert frame housing 4" high clear or obscure glass louvers.
SO: 1'–7"x2'–0–1/4" – 3'–1"x6'–11–3/4", used singly, or as mullion, triple units or greater.

VINYL CLAD WINDOW UNITS:
DH/SH/HS/C/A/H & P windows.
Sash & ext. portions of frame encased in vinyl.

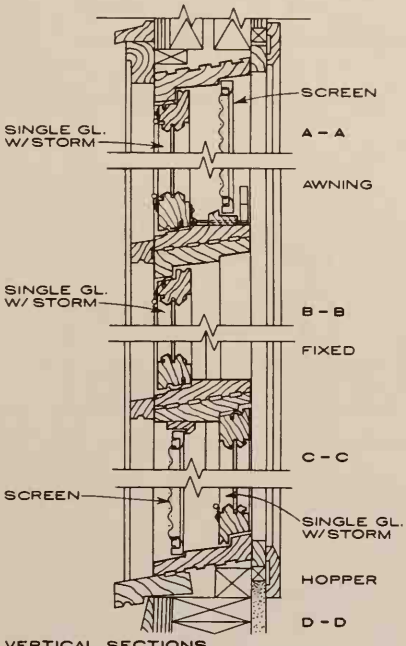
FIRE WINDOWS:
Sash glazed with wired glass @ 1/4" min. thk.

BOW WINDOWS:
DH/C/A/H/P & combinations of adjoining stock units from 3 to 8 wide, usually 5, installed on 12'–15' radius, joined by special mullions.
Head soffit and window seat may be included.

STANDARD WINDOW HEIGHT:
6'–8" above fin. fl.
DH not recommended for use over counter or sink.



ELEVATION

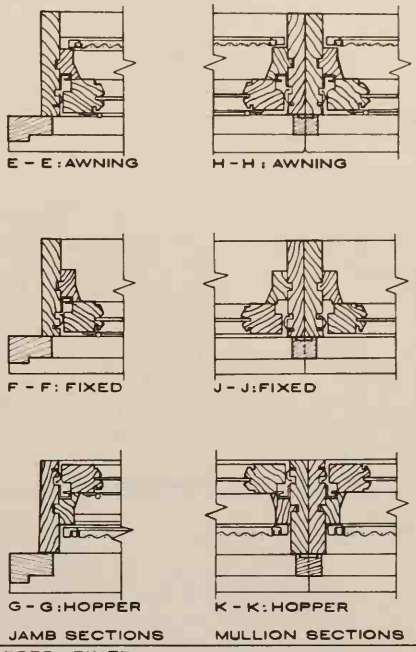


VERTICAL SECTIONS

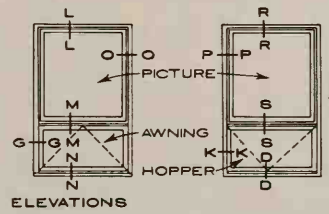
SCALE: 1½" = 1' – 0"

CARADCO COMBINED UNITS

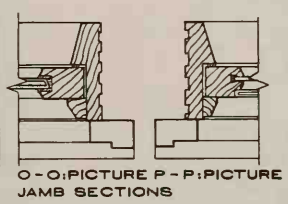
Spring tension alum. WS at all sides of sash.
Hopper version of these units can be used as casements–singly, in series, & combined with picture units.



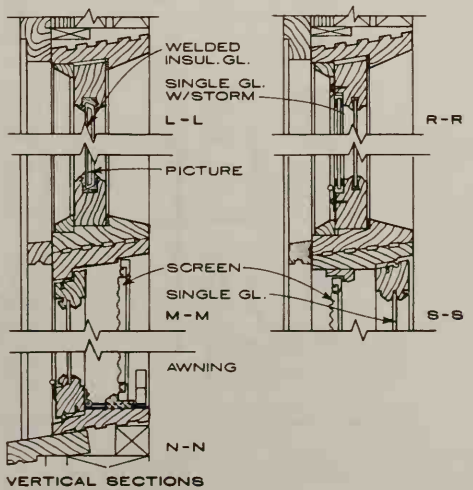
CARADCO COMBINED UNITS : AWNING – HOPPER – FIXED. PICTURE WITH AWNING/HOPPER



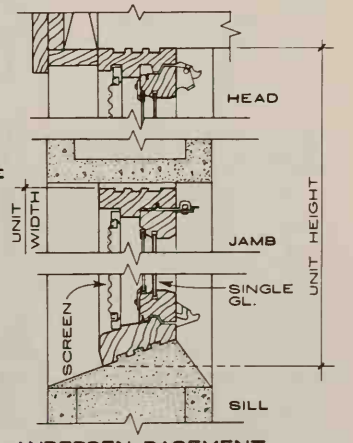
ELEVATIONS



O – O : PICTURE P – P : PICTURE
JAMB SECTIONS



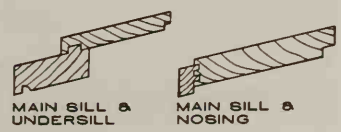
VERTICAL SECTIONS

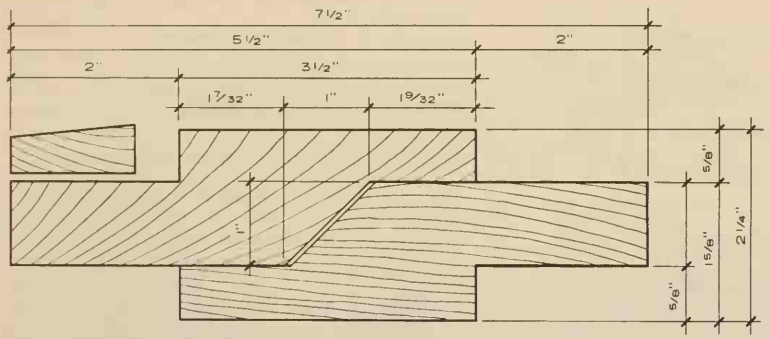


ANDERSEN BASEMENT

Modular sizes:
2 blks. wide x 2, 2 1/2, or 3 high.

1 light glazing only.
Removable sash & dual purpose hinges for opening from top or bottom.

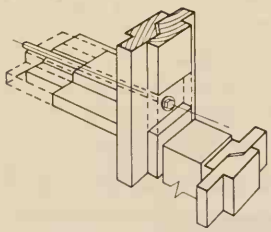




WOOD FRAME MEMBER
SCALE: HALF FULL SIZE

NOTE:

The following details illustrate how a 2" x 6" member (nominal dimension) may be milled in a single shape which can then be used to form most parts of the frames for windows, doors, and glass, including their heads, jambs, sills, mullions and posts. Members may be cut to a shape other than this and used equally well; the profile shown is an example only of this method of a multiuse wood frame member.



TENSION ROD DETAIL

Tension rods may be placed thru transom pieces to decrease deflection of transom under excessive glass or panel loads.

BASIC TYPES OF GLASS

Type of glass	Thick in.	Wt./ s. f.	Quality	Max. stock size in.	Remarks
SHEET GLASS					
Made by a flat or vertical draw process which produces transparent, natural flat fired polished surfaces. Inherent surface wave is negligible in sizes less than 50 u.i. For larger sizes install with wave running horizontal for minimum distortion.					
STANDARD		oz.			
Picture	1/16	16	AA,A,B	90 u.i.	
Window ss	3/32	19	AA,A,B	90 u.i.

also available in 9/16 – clear, bronze, gray; 13/16 – clear and 1-1/8 – clear standard thicknesses.					

VARIATIONS OF BASIC TYPES OF GLASS

TEMPERED GLASS Standard types and max. sizes given in above table. Process of reheating and sudden cooling of base glass which greatly increases mechanical strength and resistance to thermal stresses.
3-5 times as strong as base glass.
Cannot be altered after tempering.
Special limitations as to placement size and configuration of cutout areas. Pulverizes when broken.

HEAT STRENGTHENED GLASS – Std types and max. sizes given in above table.
As per tempered glass above, except:
Twice as strong as base glass.
Does not pulverize when broken.

BENT GLASS
Cylindrical and conic shapes bent to desired curvature. Within limits.
Shapes must be supported during tempering process.
Twice as strong as base glass.

PATTERNED GLASS
Semitransparent rolled glass varying from almost clear to almost obscure. Greater obscurity achieved by special patterns and finishes. Diffusion types with permanent glare reducing finish applied to pattern size or both sides of glass not recommended for partitions.
Decorative types as per table below.

1/8	1.75	comm.	48 x 120	Special finishes available: 1 or
1/8	2.0	comm.	96 x 132	2 sides – satin, frosted, and glare
7/32	3.6	comm.	96 x 132	reducing. Max. sizes may vary in
3/8	5.0	comm.	60 x 144	some instances. Also available in SHGC, tempered and white translucent glass.
3/8	6.3		50 x 144	Structural corrugated @ 1 " o.a.

Approved by National Board of Fire Underwriters as a fire retardant glass.

1/4	3.5	comm.	72 x 130	Max. sizes vary with mfgrs. Square or diamond pattern, hexagonal (vert. or hor. chicken wire.) polished or various types of patterned glass.

Type of glass	Thick in.	Wt./ s. f.	Quality	Max. stock size	Remarks
MIRRORS					
Regular	AS,	SG,	FG, and	PG	clear and SHGC glass PG: avail. with copper back max. size @ 84 " x 120 "
One-way	1/8	as PG	as PG	30 x 80	clear and SHGC plate, safety
	1/4	as PG	as PG	30 x 80	plate, tempered plate; for greater thicknesses consult mfr. for stock sizes.

SPANDREL GLASS
Clear sheet, float, plate or wire glass.
Opaque with vitreous color fire-fused to back.
Glass is heat strengthened in the process.
2-5 times as strong as base glass.
Fire-fused surface always faces back-up wall
Unless with integral insulation and vapor barrier 1/2 " air space is required between spandrel glass and back-up.
Variety of standard colors available.
Special finishes available.
Pinholes and nonuniformity of color apparent if used without back-up.

Thick. in.	Wt./ s. f. lbs.	Max. stock size	Remarks

1-1/4	3.9	72 x 168	HRP vapor barrier applied to 1/4 " spandrel glass
1/4	3.3	72 x 168	PG,FG both spandrel and vision areas
9/32	3.62	72 x 168	HRP in one panel

LAMINATED GLASS
SAFETY GLASS
Tough transparent plastic sandwiched under heat and pressure between 2 layers of sheet or plate glass.
When fractured particles tend to adhere to plastic
Plastic tinted to control glare, light and heat.
Thicker plastic for sound absorption.

Thick. in.	Wt./ s.f. lbs.	Max. stock size	Type of glass	Remarks
3/16	2.42	15 s. f.	ss + ss	clear
7/32	2.49	15 s. f.	ss + ss	clear or tinted

5/16	3.5	66 x 120	1/8 " PG + 1/8 " PG	clear, also sound control @ 46 x 144, clear or tinted.

also available in thicknesses of 3/8", 1/2", 5/8", 3/4", 7/8" and 1" with maximum size @ 72 x 138 clear or tinted PG.

BULLET RESISTING GLASS
Safety glass with laminations of 3-5 layers of plate glass.
Thickness range @ 3/4 " – 3 ".
Max. stock size @ 72" x 138 " at thicknesses thru 1-3/16 ".
Beyond 1-3/16 " thickness max. size determined by weight.

CATHEDRAL (ART) GLASS
1/8" thickness, max. size @ 32 x 84, many colors and patterns.

INSULATING GLASS
Two pieces of glass, separated by hermetically sealed air space.
Glass edge: 3/16 " air space with sheet glass.
Metal edge: 1/4 or 1/2 ' air space with sheet, float, plate, or patterned glass.
Tempered, laminated and wired glass available in limited size range.
Triple glazing insulating glass available for special applications.

SPECIAL PROPRIETARY GLASS by Corning Glass Works
Flexible Glass–"Chemcor"; chemically tempered. 3-5 times strength of heat tempered glass can be bent, returns to original shape on release of pressure.
Ceramic Glass–"Pyroceram": opaque, produced in sheets, white or colored.

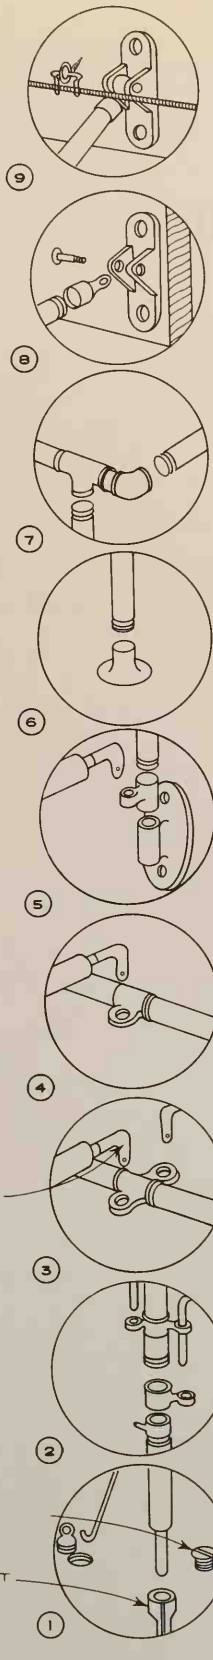
TERRACE OR ROOF AWNINGS



NOTES: TERRACE OR ROOF AWNINGS

To provide complete sun protection and shade, the overall length of the awning bar should extend 3 inches past the glass line on both sides. For proper sun shade protection, awnings should project at least as far forward from the face of the window as the bottom of the window is below the front bar of the awning.

The wall measurement of an awning is the distance down the face of the building from the point where the awning attaches to the face of the building (or from the center of the roller in the case of the roller type awning).

The projection of an awning is the distance from the face of the building to the front bar of the awning in its correct projected position.

Right and left of an awning are your right and left as you are facing the awning looking into the building.

Framework consists of galvanized steel pipe, with non-rattling fittings. Awning is lace-on type canvas with rope reinforced eave. Protector hood is galvanized sheet metal or either bronze, copper, or aluminum.

Roller type awnings are also available as well as pre-enameled aluminum and concealed recess awnings. Pre-enameled aluminum is corrugated and is available in a wide range of colors.

Concealed recess awnings require a recess box (size depending on measurements of awning) with hinged type fascia cover in the front construction of the building. Sizes of members should be checked by calculation for conditions not similar to those shown on this page.

NOTES: CANOPIES

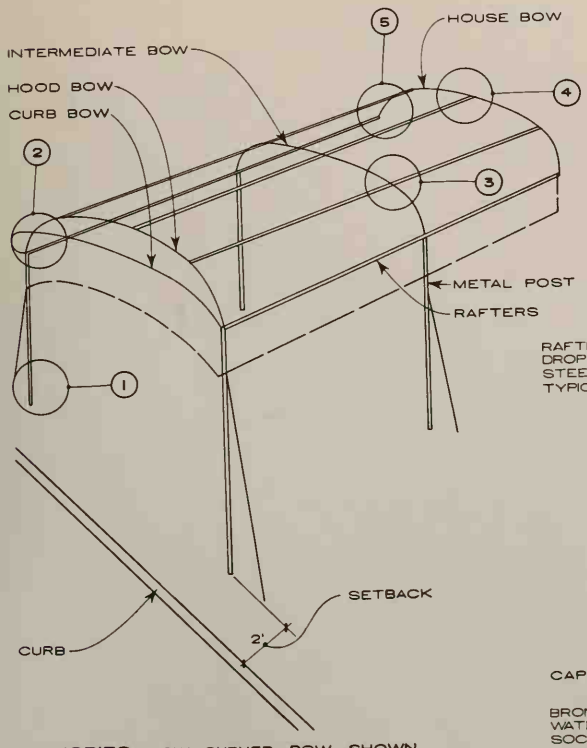
Nylon adjusted to frame with leather straps or rope reinforced lashing eave.

Spans:

Frames up to 6'– 0" width require 5 rafters.
Frames 6'– 0" to 8'– 0" width require 7 rafters.
Frames 8'– 0" to 11'– 0" width require 9 rafters.
Frames 11'– 0" to 15'– 0" width require 11 rafters.

Canopy frame specifications:

Uprights: 1 1/4" galvanized pipes.
Rafters: 1" galvanized pipe to 15'– 0" length.
Bows: 1" body bows; 3/4" head bows.
Side braces: 5/8" steel or brass.



CANOPIES - LOW CURVED BOW SHOWN

NOTE:

CONSULT LOCAL BUILDING CODE FOR LIMITATIONS ON HEIGHT AND SETBACK.

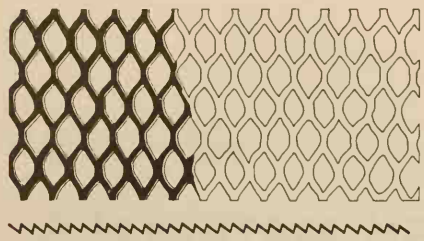
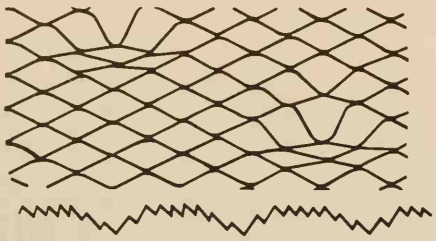
FINISH MATERIALS



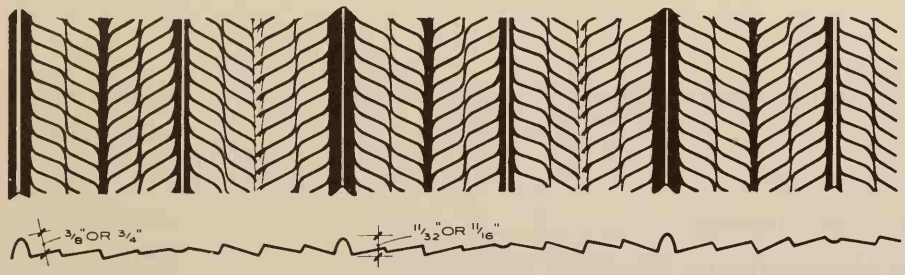
2.5 AND 3.4 LBS. PER SQ. YD.; 24" & 27" WIDE x 8'-0" LONG

DIAMOND MESH EXPANDED METAL LATH



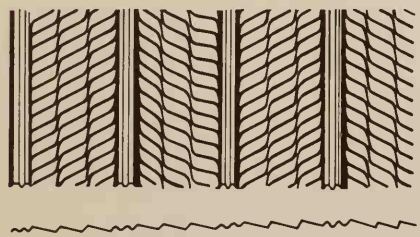
¼" DEEP "DIMPLES" 1½" OR 1¾" O.C.; 24" & 27" WIDE x 8'-0" LONG

SELF-FURRING DIAMOND MESH LATH



3/8" AND 3/4" DEEP RIBS; 4½" AND 6" O.C.; 27" AND 24" WIDE; 8' AND 8', 10' AND 12' LONG RESPECTIVELY

RIB EXPANDED METAL LATH



2.75 AND 2.4 LBS. PER SQ. YD., 24" W. x 8' L.

FLAT RIB EXPANDED METAL LATH

GYPSUM LATH:

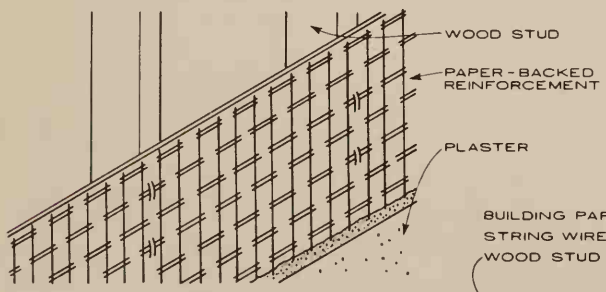
Gypsum lath is composed of an air-entrained gypsum core sandwiched between two sheets of fibrous absorbent paper and used as a basecoat for gypsum plaster. See page on SPECIAL SYSTEMS.

PLAIN GYPSUM LATH is 3/8" and 1/2" thick, 48" lg. and 16" wide (16 1/5" in the Western U.S.).

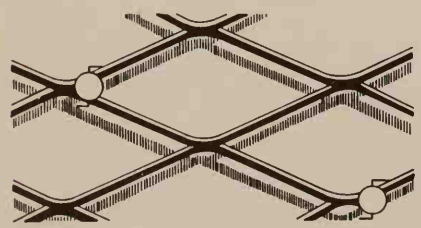
PERFORATED GYPSUM LATH is plain gypsum lath with 3/4" diameter holes punched 4" o.c. in both directions to provide mechanical key to plaster.

INSULATING GYPSUM LATH is plain gypsum lath with aluminum foil laminated to the backside.

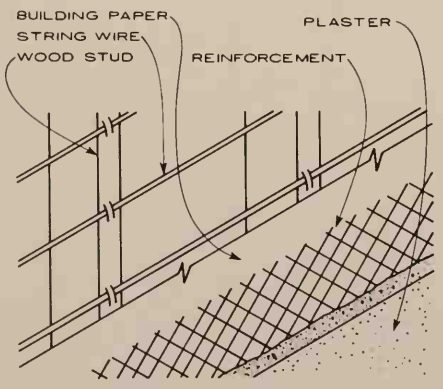
LONG LENGTH GYPSUM LATH 16" and 24" wide, in lengths up to 12' is available insulated or plain with square or vee-jointed T & G edges.



SELF-FURRING PAPER-BACKED REINFORCING



STUCCO MESH
1 3/8" x 3/8" DIAMOND MESH; 48" W. x 8'-2" L.



STRING WIRES & BUILDING PAPER

MISCELLANEOUS LATHING SYSTEMS FOR OPEN WOOD FRAME CONST.

DEFINITIONS

AGGREGATE—Inert material used as filler with a cementitious material and water to produce plaster or concrete. Usually implies sand, perlite or vermiculite.

BASECOAT—Any plaster coat applied prior to the application of finish coat.

BEAD—A strip of galvanized sheet metal with a formed projected nosing and one or two perforated and (in some cases) expanded flanges. The nosing serves as a ground to establish plaster thicknesses while the flange(s) provide a means for attachment to the plaster base.

CALCINED—Having had water driven off chemically or by heat, altering chemical and physical characteristics of a material.

CLIP—A device made of wire or sheet metal for attaching various types of lath to the substructure and lath sheets to one another.

FIBERED—Pertaining to basecoat plaster containing animal, vegetable or glass fibers of sufficient length to increase cohesiveness of mix.

FURRING—Elements used to maintain space between finished and unfinished surfaces.

GAUGING—Cementitious material, usually calcined gypsum, Keene's cement or portland cement combined with lime putty to provide and control set.

GROUND—A formed metal shape or wood strip that acts as a combined edge and gauge for various thicknesses of plaster to be applied to a plaster base. Wood grounds are also used as a nailing base for various types of trim.

GYPSUM—Hydrous calcium sulphate, a natural mineral in crystalline form.

GYPSUM READY-MIXED PLASTERS—Basecoat or finish coat plasters with ingredients combined at mill and requiring only addition of water at job. Basecoat plaster mixes contain calcined gypsum and an aggregate. Finish plasters contain finely ground calcined gypsum and various proprietary products to influence color and texture.

HYDRATED LIME—Dry, relatively stable lime, produced by heating quicklime with just enough water to satisfy its chemical affinity for water under conditions of its hydration.

KEENE'S CEMENT—Any hydrous calcined sulphate, finish plaster composed of calcined gypsum and an accelerator used as gauging for lime putty.

LIME—Obtained by burning various types of limestone, consisting of oxides or hydroxides of calcium and magnesium.

LIME PLASTER—Basecoat plaster of hydrated lime and an aggregate.

LIME PUTTY—Material resulting from mixing hydrated lime with water to form a thick paste.

NEAT PLASTER—Basecoat plaster, fibered or unfibered, used for job mixing with aggregates.

PERLITE—Siliceous volcanic glass containing silica and alumina expanded by heat for use as a lightweight plaster aggregate.

PLASTER—Cementitious material or combination of cementitious materials and aggregate that when mixed with suitable amount of water forms a plastic mass that sets and hardens when applied to a surface. May denote exterior or interior use.

PORTLAND CEMENT—Manufactured combination of limestone and an argillaceous substance.

SCREED—A device secured to a surface which serves as a guide for subsequent applications of plaster. Thicknesses and widths vary with the thicknesses desired for each operation.

STUCCO—Plaster used in exterior applications. The term does not connote any specific combination of materials.

VERMICULITE—Micaceous mineral of silica, magnesium and alumina oxides made up in a series of parallel plates or laminae and expanded by heat for use as a lightweight plaster aggregate.

GENERAL NOTES:

No attempt is being made in these pages to recommend thicknesses, proportions or mixes of various plastering materials and finishes. Systems and methods of application vary widely depending upon local traditions and innovations promoted by the industry. The list of definitions above is provided to familiarize one with the basic terms used in the trade. Consult your local plastering sub-contractor and industry representatives for specific data.

See page on Gypsum Block Partitions.

3¼" PREFAB	20'-0"	17'-0"	16'-0"	14'-0"

NOTES:

1–When overall height of furring exceeds dimension "B" recommended for specific stud heights, install horizontal bracing as recommended in braced framing table.

2–Horizontal stiffeners (not less than 3/4" cold-rolled channels) spaced the same distance vertically as attachments to the wall are recommended for all unbraced (free-standing) furring. For stud spacing less than 16" O.C. use maximum spacing for stiffeners of 4'–6" O.C. vertically, 3'–6" O.C. for stud spacing greater than 16".

3–Wall furring using long length gypsum lath should not exceed 12'–0" in height and horizontal bracing should be located at intervals not greater than 3'–0" vertically.

4–Where regular-sized sheets of insulating gypsum lath are used, horizontal bracing should be placed at intervals not greater than 4'–6" vertically.

DOUBLE ROW OF 3/4" CHANNELS HORIZ. BRACED		3"			14'
		4"			16'
		5"			20'

Plaster thickness is computed thus:
1. 3/4" from stud face or 5/8" from face of metal lath.
2. For 3/8" rib expanded metal lath laid up with ribs against studs, add 1/2"
3. For 3/8" gypsum lath with 1/2" plaster, add 1/4".

NOTES for use of table:
1. 24" spacing of studs not recommended for rib expanded metal lath less than nominal 3/8" or for gypsum lath less than 1/2"
2. Maximum heights are indicated for partition lengths < 1 1/2 x height. For greater lengths reduce height 20%.
3. Horizontal bracing for double row channel studs shall be spaced vertically no greater than 4'-0" o.c.

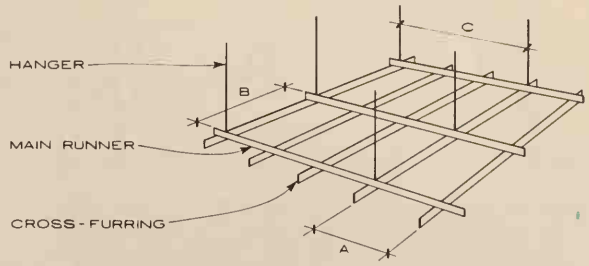
SPACING AND SELECTION OF FURRING AND SUSPENSION SYSTEM COMPONENTS



HOW TO USE TABLES

1. Select lath and plaster system.
2. Determine spacing of cross-furring channels ("A").
3. Determine spacing of main runner channels ("B").
4. Determine hanger support spacing for main runner ("C").
5. Calculate area of ceiling supported by hanger.
6. Select hanger type from table.

NOTES ON ORNAMENTAL PLASTER

Historically, Moorish, Bavarian, Italian, French and English craftsmen have left us a heritage of ornamental plaster work, for which there is increasing interest and demand. The entire subject is discussed in great detail in a rare but informative book entitled, Plastering by William Millar, published in 1897 by B. T. Batsford, London, England. Very briefly, the following are basic types of ornamental plasterwork still being employed by the trade.

RUNNING A CORNICE:

This type of field work is accomplished over basecoats formed to approximate the desired profile. Metal lath is wire-tied or welded to steel flats, pencil rods and bent furring channels. The final white coat finish is laid down by dragging a 22 gage sheet metal, wood-backed form across on guides, working from a scaffold. This form is precisely shaped to produce the final profile, allowing 1/8" tolerances for bedding any precast ornament that may be set in place by coating surfaces with a latex compound and thin coat of lime putty.

PRECAST ORNAMENT:

Castings of complete cornices, pediments, arches, columns, rosettes, ceiling and wall panels can be made in the shop with glue, gelatin, silicone rubber and plaster moulds, depending on whether they are intended for reuse or are designed so that they can be separated and refitted together again. Waste moulds are generally made of plaster with inside surfaces greased to reduce bond and absorption. Rubber and gelatin moulds are used for repetive castings. Where detailed, in-depth castings must be made, small individual moulds are bound together by a mother mould. Hemp fiber, burlap or mosquito netting, depending upon the thickness of the casting, are used for reinforcement.

SCAGLIOLA AND GRAFFITO:

These are, respectively, imitation marble and two-dimensional fresco-type work requiring considerable artistry.

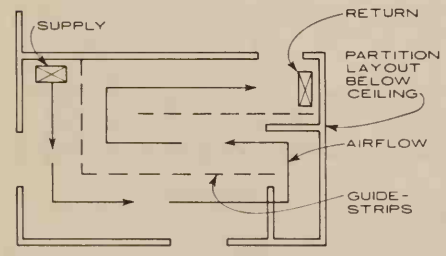
GUIDE STRIP AND SUSPENSION DETAILS

NEW SYSTEMS OF PLASTERING

Technological advances have provided the plaster trade several new systems highly competitive with traditional drywall. None, like drywall, are recommended for excessively moist areas, but they are claimed to be neater, cleaner operations that are installed quickly, the finish coat directly over the base coat after the latter has had a chance to set. Installations can be made on masonry by using special furring channels with foam insulation in between channels at exterior walls. The systems involve spraying an aluminum sulphate catalyst over a lath base which must be damp before the base coat is applied. Finish coats may be trowelled smooth, floated or textured, and their appearance is identical to conventional plastering systems. One system employs a two-coat 1/16" base and finish on standard gypsum lath with conventional beads and corner lath. Other veneer systems use special lath boards 4' wide, 8, 9, 10 and 12 feet long, covered with an absorptive paper. Either 3/8", 1/2" and 5/8" thick lath board may be used with the two-coat veneer system, but 1/2" and 5/8" thicknesses only on one-coat jobs. Two-coat systems have 1/16" base and finish coats. One-coat systems are a minimum 3/32" thick. Both require special glass-coated fiber "tape" and beads.



PLAN SHOWING GUIDE STRIPS & AIR FLOW

PLASTER CEILING PLENUMS FOR WARM AIR RADIANT HEATING IN CLG.

Warm air circulated through wall and ceiling plenums is another method of providing the benefits of radiant heat. It may be used to great advantage in buildings that require a great deal of ventilation, and it is relatively simple in comparison with other types of radiant heating systems. Dampers are installed in supply ducts to provide individually regulated room temperatures. Various systems of attachment are employed for suspending the lower ceiling from supports above. The gage of the wire hangers will vary depending upon the support system and spacing.

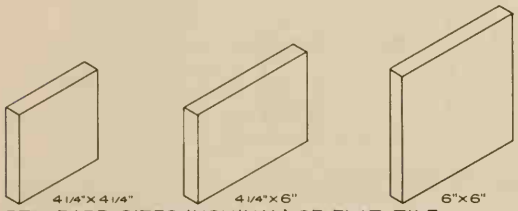
PLASTER TO METAL JOINT TECHNIQUE

Douglas S. Stenhouse, AIA, Washington, D. C.

GLAZED WALL TILE

Nominal thickness = $^{5}/_{16}$", Actual = $^{5}/_{32}$" to $^{1}/_{8}$".

Normally used on interior walls or where freezing temperature will not be encountered. For exposure to freezing use frost proof glazed tile. For light or moderate traffic on floors use an extra duty crystalline glaze.

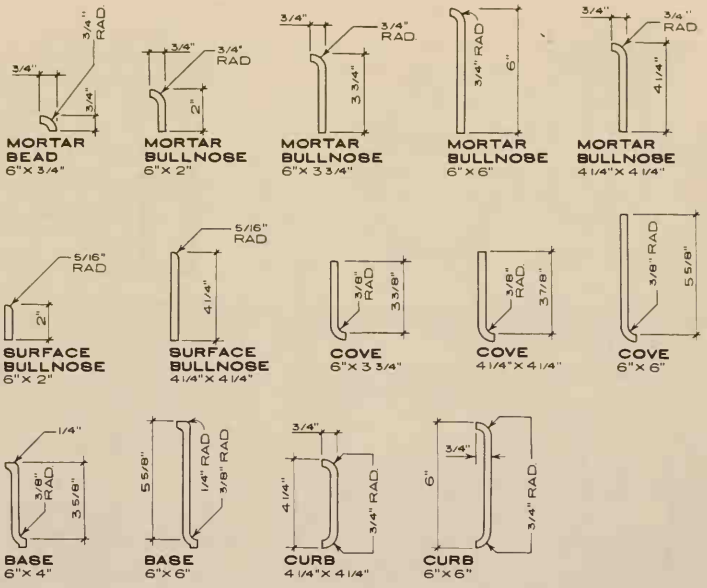


STANDARD SIZES (NOMINAL) OF FLAT TILE

Actual tile size is $^{1}/_{16}$" less (joint size);

Special sizes available from some manufacturers: 4 $^{1}/_{4}$" x 8 $^{1}/_{4}$", 6" x 9", 6" x 12", 3" x 3", 3" x 6", 4" octagon, 1 $^{1}/_{8}$" x 1 $^{1}/_{8}$".

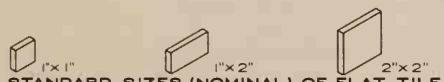
Shapes shown to the right are standard trimmers. Special trimmer shapes are available from some manufacturers.



CERAMIC MOSAIC TILE

Nominal thickness = $^{1}/_{4}$", Actual = $^{1}/_{16}$" to $^{5}/_{16}$".

Available in porcelain and natural clay type. Porcelain mosaics have clear bright colors and have low absorption (.05% or less). Natural clay mosaics have muted earthy colors and have water absorption of .05% to 3.0%.

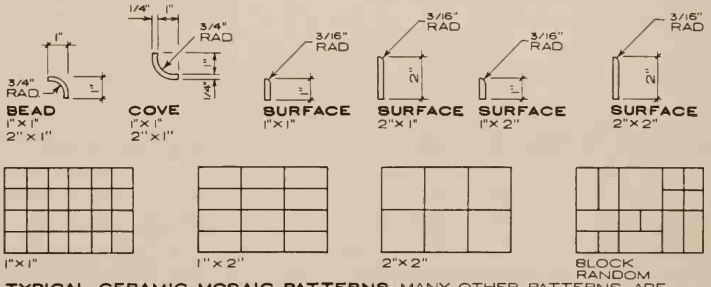


STANDARD SIZES (NOMINAL) OF FLAT TILE

Actual tile size is $^{1}/_{16}$" less (joint size).

Special shapes available from some manufacturers.

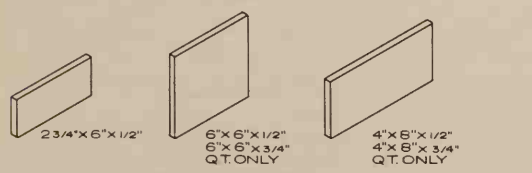
Shapes shown to the right are standard trimmers. Special trimmer shapes are available from some manufacturers.

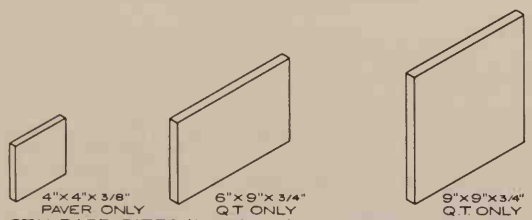


TYPICAL CERAMIC MOSAIC PATTERNS MANY OTHER PATTERNS ARE AVAILABLE.

QUARRY TILE AND PAVERS

Quarry tile is produced from natural clays and shales by the extrusion process. A paver is similar in size to a quarry tile but is produced by the dust pressed method with materials similar to those used for ceramic mosaic tile.





STANDARD SIZES (NOMINAL) OF QUARRY TILE AND PAVERS

Actual tile size is $^{1}/_{4}$" to $^{1}/_{8}$" less (joint sizes).

Special shapes available from some manufacturers.

Shapes shown to the right are standard trimmers. Special trimmer shapes are available from some manufacturers.

16 x 20	19	22	24	26	29	24	11
16 x 22	21	23	25	28	30	26	12
16 x 24	21	24	27	29	32	27	13
18 x 20	21	23	25	28	30	26	12

To find number of rolls needed, calculate square footage and divide by 30 (sq. ft. per roll). Subtract $^2/_3$ roll for each door and window opening.

VINYL WALL COVERING

Federal Specification CCC-W-408, issued May 8, 1963, provides for vinyl coated wall covering standard requirements. The following notes are taken from that specification.

There are three types and two classes of vinyl wall covering:

Type I	Light Duty	7 ounces per sq.yd.	For use as a maintenance-free covering for areas not subjected to abrasion or wear traffic, and for ceilings.
Type II	Medium Duty	13 ounces per sq.yd.	For general use in areas where there is average traffic and scuffing.
Type III	Heavy Duty	22 ounces per sq.yd.	For use only as wainscoat or lower wall protection for areas exposed to damage by moveable equipment or to abusive conditions such as exist in hospitals.

Class I Regular Finish
Class II Mildew-Resistant Finish

Composition may be of three layers, the first being a supporting material of cotton cloth, non-woven fiberglass, asbestos, or other suitable material. Supporting material for Class 2 must be mildew-resistant treated. The second layer is a coating compound of plasticized polymerized or copolymerized vinyl-chloride resin which is applied to the outside of the supporting material in a continuous film. This layer is integrally pigmented. A clear coating may be added as a third layer if it is necessary in order to meet the physical requirements noted in the specification.

TYPE	Pieces per Roll	Yardage per Roll
Type I	Single piece	Not less than 72 square feet plus 1 foot tolerance.
Type II	2 pieces	Not less than 15 yards or more than 45 yards.
Type III	4 pieces 6 pieces	15 to 30 yards Over 30 yards

NOTE: All pieces to be in 3-yard lengths or multiples thereof.

The specification also includes requirements and test procedures as to breaking strength, tear strength, hydrostatic resistance, abrasion resistance, flame resistance, char length, colorfastness to light, shrinkage, cold crack, blocking, heat aging, and crocking. Manufacturers should be able to supply all information concerning specification requirements and test data upon request.

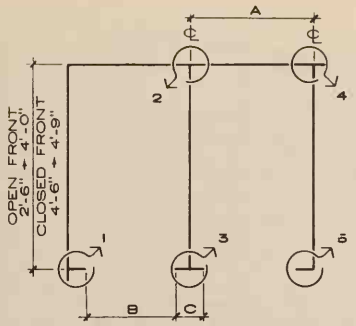
SPACE REQUIREMENTS



PLAN OF STANDARD W.C. COMPARTMENT
(TYPICAL FOR METAL OR MARBLE)

GENERAL NOTES:

1. Compartment types: ceiling hung (marble or metal), overhead braced, wall hung (metal only).
2. Metal finishes: baked-on enamel, porcelain enamel, stainless steel.
3. A = Standard compartment widths: 2'-6", 2'-8", 2'-10", 3'-0" (2'-10" is most frequently used).
4. B = Standard door widths: 1'-8", 1'-10", 2'-0", 2'-2", 2'-4", 2'-6". (2'-0" metal doors are standard with marble compartments). Non-standard sizes which are sometimes used: 1'-11", 2'-3", 2'-5".
5. C = Standard pilaster widths: 3", 4", 5", 6", 8", 10", 1'-0". Non-standard sizes which are sometimes used: 2", 7", 1'-2".

GENERAL PLANNING DATA

GENERAL NOTE FOR HARDWARE

Door hardware for toilet stalls may be adjusted to hold door open when stall is not in use. A 30° angle is frequently used.

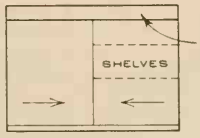
CONVENTIONAL

Surface or recessed mounted cabinets. Cabinet depth 4"– 6"

Mirror sizes:

14 x 20	For mirror with
16 x 20	frame, add 1/4"
16 x 22	to both mirror di-
16 x 24	mensions. Available
18 x 24	with 5" shelf.



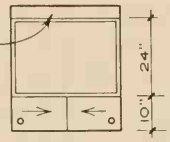
SLIDING MIRROR

Recessed cabinet, single or double sliding mirrors.

Mirror size each side:

14 x 20	18 x 30
15 x 20	24 x 30
18 x 20	30 x 36

Available with recessed vanity cabinet below.
Cabinet depth 4 1/4".

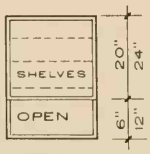


VANITY

Surface mounted mirror with projecting vanity cabinet below. Proj. 4 1/2".

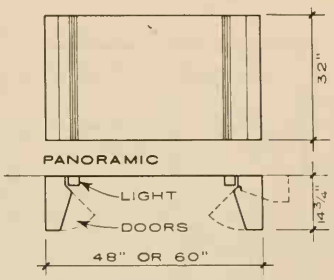
Mirror sizes:

18 x 24	36 x 24
24 x 24	42 x 24
30 x 24	48 x 24



HOTEL

Recessed mounted cabinet.
Contains plug outlet, bottle opener, razor blade disposal.
Cabinet depth 3 1/2".



PANORAMIC

Surface mounted hinged mirror or louvered door cabinets.
Reversible to lay flat against wall as shown dotted.
Cabinet depth 3 1/2" – 7 1/4".

GENERAL NOTES:

See kitchen & laundry layout pages for locations of washers & dryers and wall chases for pipes & vents and for dishwasher locations.

Where clearances of doors of machines (when open) may be a problem, check manufacturers catalog for "open-door" dimension.

All dimensions given are actual ones but certain variations in body design may affect actual depths of models. Check all units for exact voltage. Some units available with gas.

Urn stands are made to accommodate the number and sizes of urns set upon them. Urns are made in many designs and sizes for coffee, tea, chocolate, water, fruit juices, etc. They may be heated by gas, steam, or electricity. "Combination" type urns are available for holding both coffee and water in one unit.

VARIATIONS OF TYPE STACKING

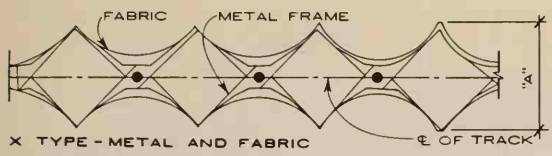
NOTES:

1. Panel thickness, width, height, finish and acoustic quality vary dependent upon size of opening, usage and manufacturer.

2. Enclosures for movable partitions vary. See manufacturers literature for required clearances in pockets.

3. Overhead structure must be sufficient to support movable partition and must be properly anchored and braced.

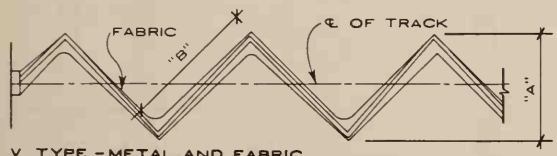
4. Leaf type partitions are recommended where rigidity and flat plane storage are important factors.



X TYPE - METAL AND FABRIC

"X" Type door is built of a metal frame with a vinyl fabric covering. Various insulation materials produce a wide range of acoustic properties.

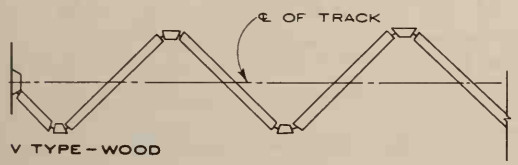
Dimensions given vary according to manufacturer. "A" Dimension varies from 3 1/4" – 8 1/2".



V TYPE - METAL AND FABRIC

"A" Dimension varies from 3 1/2" – 10 3/8" in extended position:

"B" Dimension varies from 2" – 4 5/8".



V TYPE - WOOD

"V" Type door is available in metal with fabric covering or in solid wood panels.

TYPICAL ACCORDION PARTITIONS

"X" and "V" Types may be installed on a curved track with a minimum radius of 3'– 6".

All "X" and "V" partitions are ceiling supported and may be manually or power operated.

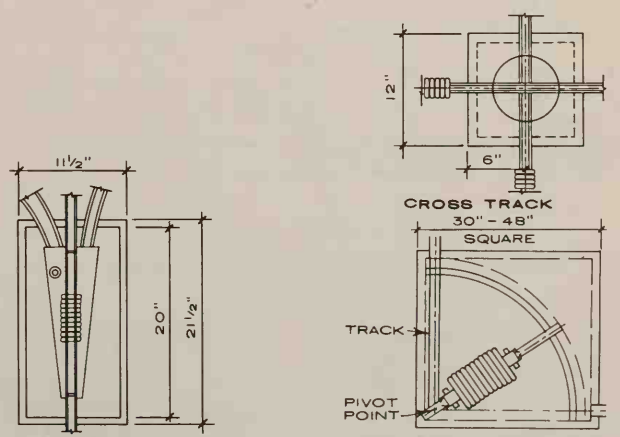
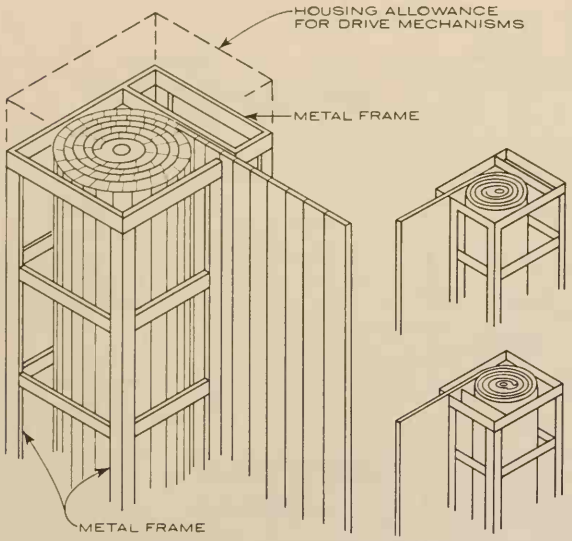
TYPES OF MEETING POSTS



TRACK - SWITCHES

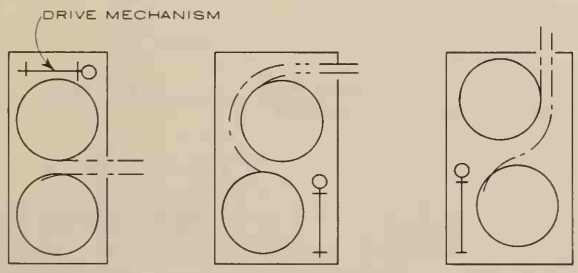
GENERAL NOTES

1. Panel thickness, width, height, finish and acoustic quality vary, dependent upon size of opening, usage and manufacturer. Dimensions given vary according to manufacturer.
2. Enclosures for operable partitions vary. See manufacturer's literature for required clearances in pockets.
3. Overhead structure must be sufficient to support operable partition and must be properly anchored and braced.
4. The accordion type partition is recommended for small openings, which does not however, preclude its use for large openings.

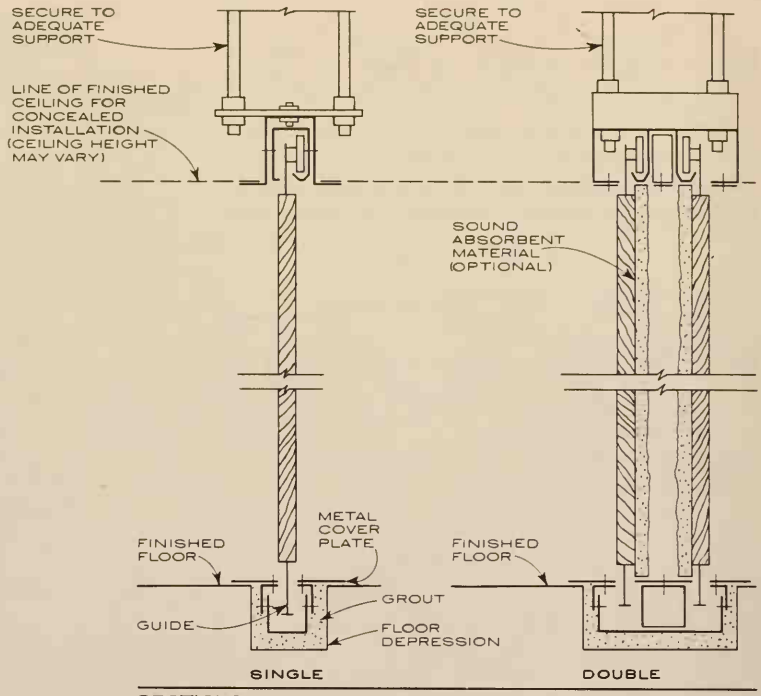


COILED PARTITION

METAL FRAME IS STANDARD MANUFACTURER'S EQUIPMENT WITH ALL COILED PARTITIONS



DOUBLE PARTITION COIL BOXES
(USED MOSTLY FOR ACOUSTIC PURPOSES)



SECTIONS

LEAD STILE

NOTES:

1. All coiled partitions are ceiling supported and may be operated by one of the four following methods:
   A. Full manual: Manually extended and manually retracted.
   B. Manual-mechanical: Manually extended and retracted by hand crank.
   C. Full mechanical: Extended and retracted by hand crank.
   D. Electrical: Electric motor extends and retracts.
2. Required floor depression = $2\ 3/4$" below finished floor (if operating mechanism is overhead). Floor depression = 5" to 6" (if operating mechanism is below floor).
3. Minimum radius for coiled partition tract = 2'– 0".
4. Standard material is wood strips, but other materials may be substituted or used in conjunction with wood, such as metal strips, metal grilles, etc.
5. This is the most flexible partition for curved installations.

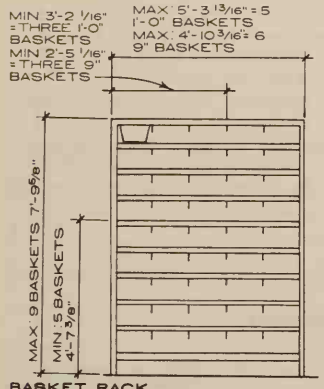
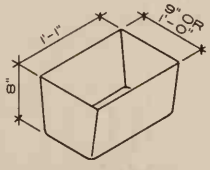
DOOR VARIATIONS



BASKET RACK NOTE:

Basket racks are arranged in single row or double (back to back) row. Single row depth is 1'–1 1/4".



LOCKER BASKETS

MATERIALS:

1. Sides and bottom of perforated steel with louvered ends.
2. All surfaces of wire mesh with perforated steel ends.
3. All surfaces of wire mesh.

COMBINATION NOTE:

Standard combination shown has a capacity of twelve 9" baskets and two single tier lockers. However, a variety of combinations for different capacities are available.

GENERAL NOTES:

1. Locker frame and door is usually of no. 16 gauge steel; sides, back, top and bottom of no. 20 to no. 24 gauge steel. Finishes vary.
2. The standard locker types may be varied as follows:
   - A. Door types as shown.
   - B. Sides of perforated sheet steel or expanded mesh to meet specific ventilation requirements.
   - C. Optional equipment includes sloped top, closed base, 6" legs and a variety of interior fittings such as hooks, shelves, partitions, etc.

Geddes, Brecher, Qualls, Cunningham, Architects; Philadelphia, Pennsylvania

BOOK CAPACITY

No definite formula can be given for finding the number of books per gross stack room areas. Many variables must be considered: size and kind of books (folios, bound periodicals, etc.); number and width of aisles; stairways, lifts, carrels, etc.; whether calculations are based on ultimate capacity. Variance has been found to run from 13½ – 19 books/sq. ft., according to local conditions. For rough rule of thumb, allow 16 books/sq. ft. of gross area.

SHELF CAPACITY & WIDTH

TYPE OF BOOK	VOLS. PER LIN. FT.	SHELF WIDTH

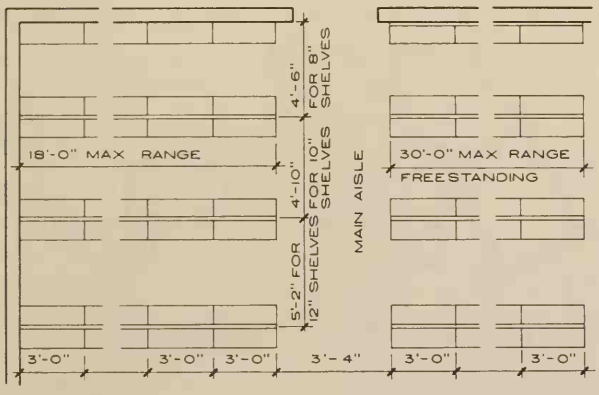
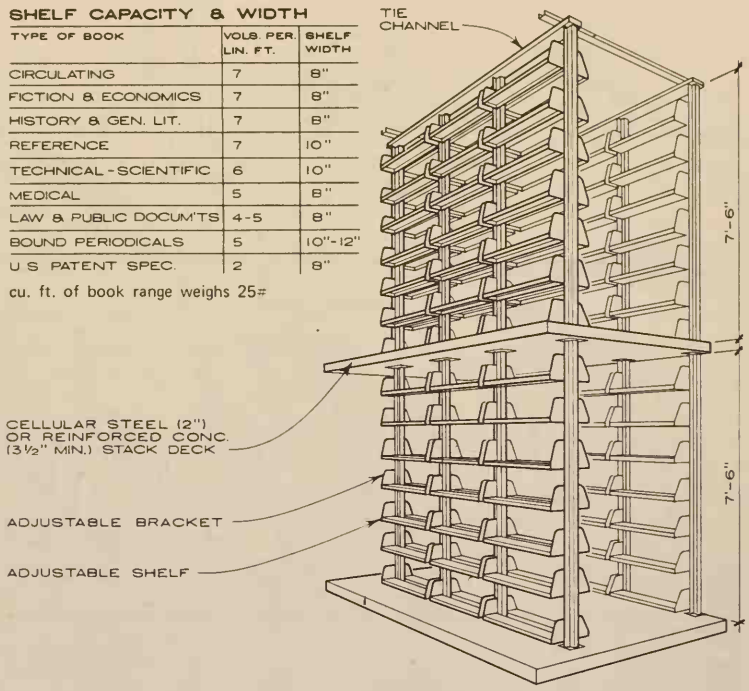
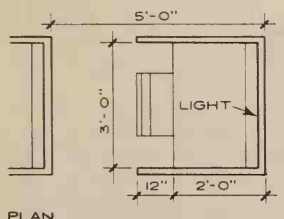
cu. ft. of book range weighs 25#



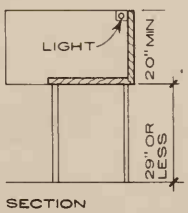
STACK RANGES SCALE- ⅛" = 1'-0"



MULTI-TIER BOOKSTACKS



PLAN



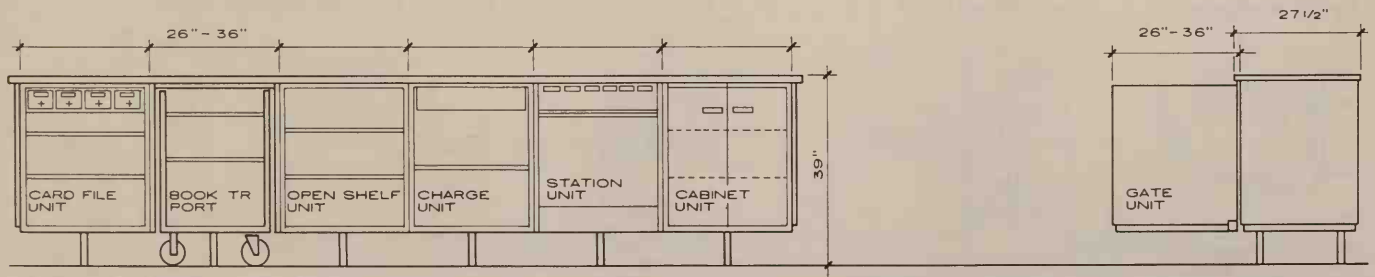
SECTION

STUDY CARRELS SCALE- ¼" = 1'-0"

Dimensions for study carrels indicated here have been found to give students enough enclosure so that they are not easily disturbed by other activities. Less enclosure than this will result in student distractions. The principal light source should be from the ceiling. However, a supplementary individual light will usually be needed to reduce shadows on the working surface caused by side panels & bookshelves.

Standard tables: 3'– 0" x 5'– 0"
3'– 0" x 7'– 6"
3'– 4" x 10'– 0"
Small reading tables: 4'– 0" diameter.
Tables used in colleges, libraries, etc., made to order – 3'– 6" wide and desired length.

SEATING & SPACING OF TABLES



SECTIONAL CHARGING DESKS SCALE- ¼" = 1'-0"

Circulation desks are available in modular units varying in widths between 26" & 36" and include station units, charge machine units, card file units, book return units, book truck ports, shelving & cabinet units, gate units, and end & corner units.

GENERAL PLANNING NOTES

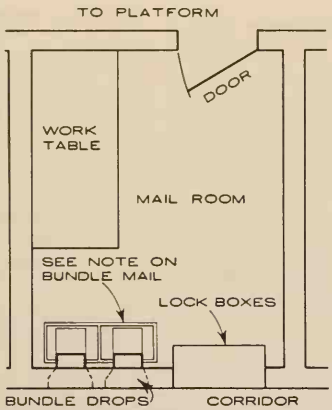
While planning is in the early stage, consult with the Post Office Department, Washington, D.C. for suggestions and guidance regarding facilities to provide the best possible service.

For methods of providing the security required for mail rooms, the architect is referred to the local postmaster.

It is suggested that off-the-street loading and unloading be provided.

Mail Room – General – A security type room is necessary to protect the mail until delivered. The mail room should be located at the platform level and if possible have its own access door to the platform for off-hour service and building security, except where there is call window or lock box service, in which case the mail room should be located at the principal building entrance level. A thirty-inch (30") security type door to the platform should be provided. Standard interior environmental conditions should be provided in this space. Mail room door locks may be conventional Builder's Hardware. The Post Office Department will change tumblers of the locks and retain all keys.

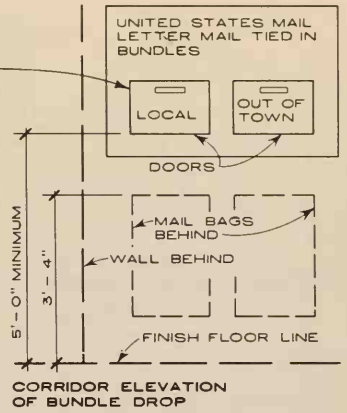
The size of mail room and services provided by the Post Office from a mail room will vary depending upon the size and occupancy of the building. The Post Office Department has established criteria and definitions of building sizes according to delivery manpower requirements: Small – 100,000 sq. ft. or less of leasable office space, Medium – 100,000 to 200,000 sq. ft. of leasable office space, and Large – over 200,000 sq. ft. and six floors (levels).



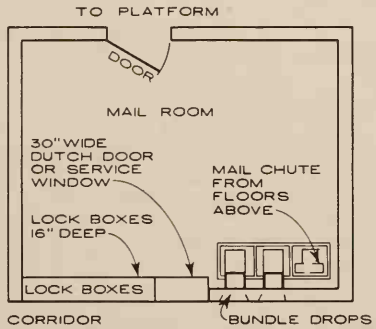
PLAN – SMALL OFFICE BUILDING

BUNDLE MAIL:

Bundle mail drop and/or letter drop chute. Provide in accordance with section 153.6 of Postal Manual. The mail chute from floors above may terminate in the mail room.



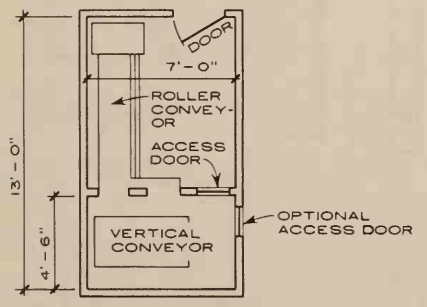
CORRIDOR ELEVATION OF BUNDLE DROP



PLAN – MEDIUM SIZE AND LARGE OFFICE BUILDINGS

For small office buildings a planning factor of $^1/_2$ sq. ft. of mail room for each 1,000 sq. ft. of leasable office space is generally adequate with a minimum size of 36 sq. ft. A lock box section should be considered when there are more than 10 tenants.

In a medium sized office building the planning factor for the mail room size is 1.5 sq. ft. for each 1,000 sq. ft. of leasable space. Planning should include provision for lock boxes and also for a Dutch door to serve as a service window for providing other services to tenants. The backs of all lockboxes in the mail room shall have secure doors with a suitable fastening device. These doors can be hinged or sliding type. The best location for the mail room is near the elevators and adjacent to the truck platform. Where 100 or more tenant firms are expected, the lockboxes may be omitted.



PLAN – AT EACH MULTI-TENANT FLOOR

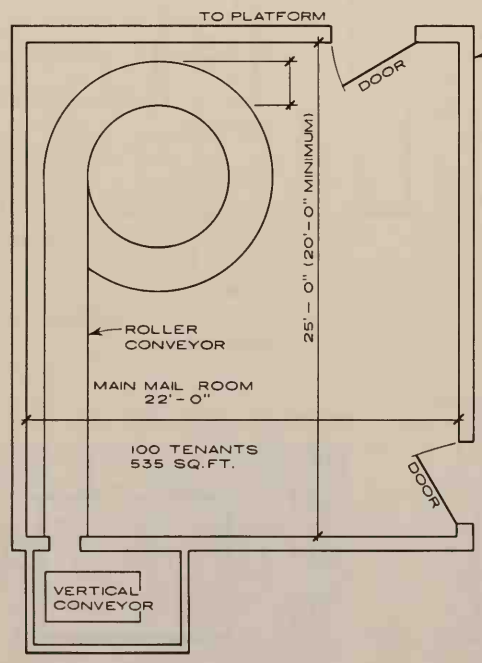
Additional small areas will be required on each multi-tenant floor for servicing by vertical conveyor. The central mail room at the platform level would house the terminal of the vertical conveyor.

See also, page on Mail Chutes and page on Miscellaneous Conveyors, for additional information.

NOTE:

For Vertical Conveyors and Tray Storage for handling of mail in large office buildings see catalogs of manufacturers of conveying equipment.

Robert S. Dame, R. A.; Kensington, Maryland



PLAN – VERY LARGE OFFICE BUILDINGS

Main Mail Room – 150 tenant firms – the plan is the same however, the dimensions would be 26 feet by 27 feet (20' Min.) or a minimum of 670 sq. ft. and so on, see table below.

In a large office building the main mail room will provide additional services and the planning factor should be approximately 3 sq. ft. per 1,000 square feet of leasable space. This may be reduced substantially where there are several single tenant floors or multi-floor tenants. Use planning factor or data from Space Requirements Table, whichever is smaller.

SPACE REQUIREMENTS TABLE FOR MAIN MAIL ROOM WITH VERTICAL CONVEYOR.

NUMBER OF TENANT FIRMS IN BUILDING	SPACE REQUIRED IN SQUARE FEET
50	400
51 – 100	535
101 – 150	670
151 – 200	805
201 – 250	940
251 – 300	1075
301 – 350	1210
351 – 400	1345
401 – 450	1480
451 – 500	1615

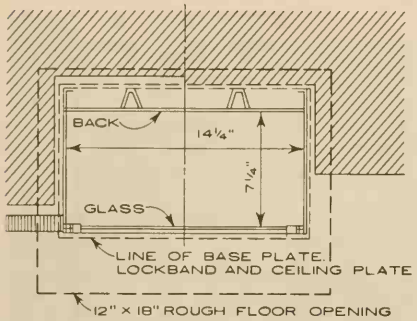
GENERAL NOTE:

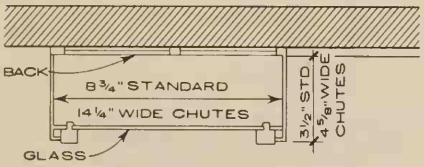
Supply alphabetical directory of all persons receiving mail in installations of 15 receptacles or more. Government approved mailboxes are made in 3 – 12 units to a gang. Each gang supply with mounting for a master lock. Push buttons for telephones can be installed in frame with mailboxes, but must be accessible for maintenance without access to mailboxes.

Mailboxes must be constructed to receive long letter mail 4 1/2" wide and bulky magazines 14 1/2" long, and 3 1/2" in diameter. Post Office recommends rear loading type boxes with a mail room 3'–0" wide to permit undisturbed loading. For detailed Post Office regulations see P.O.D. publication 17.

Franz W. Krebs, AIA; Silver Spring, Maryland

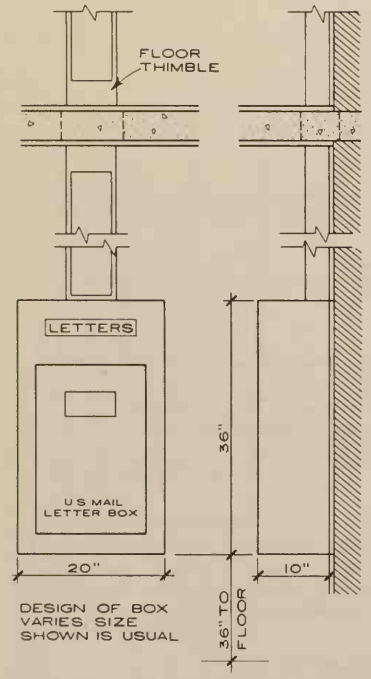


PACKAGE CHUTE - PLAN



MAIL CHUTE - PLAN

1. May be recessed.
2. Use wide chutes for 8" x 10" envelopes.

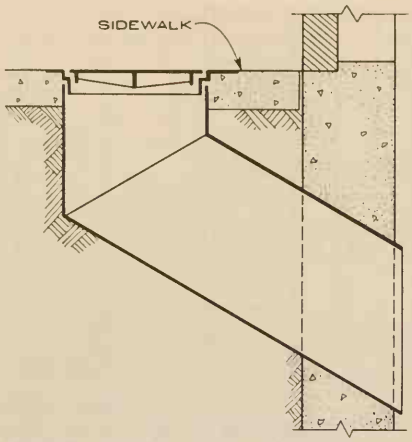


ELEVATIONS

MAIL CHUTES AND BOXES

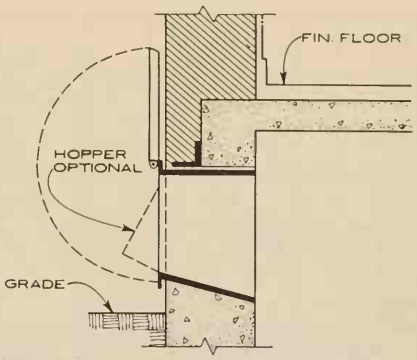
NOTES:

Rough floor opening 8" x 12" for single chute, and 8" x 24" for double chute. Box must be withing 100' of main entrance. Chute of aluminum, bronze or stainless steel. Glazed front may be used in public buildings hotels, railroad stations, business and office buildings four stories and over, apartment houses of forty families or over with permission of Post Office Department. Main entrance must be unlocked during business hours.



SIDEWALK COAL CHUTE - SECTION

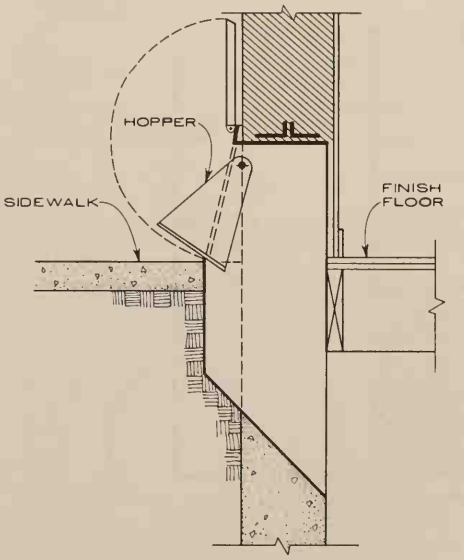
Coal chute of cast iron ring and cover placed outside of building and connected to coal storage by steel hopper of 12 or 14 guage.



FOUNDATION COAL CHUTE - SECTION

Used where the coal room ceiling is high enough above grade to allow space for the chute.

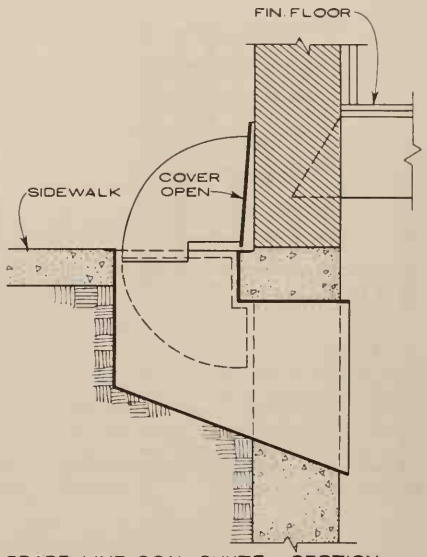
TYPE OF DOOR	NOMINAL DOOR SIZE	
	WIDTH	HEIGHT
SOLID STEEL OR GLAZED 3 LIGHTS	24"	18"
	33"	24"



FOUNDATION COAL CHUTE - SECTION

Used where the first floor is on or near grade level. Body of the chute extending down into the foundation.

TYPE OF DOOR	NOMINAL DOOR SIZE	
	WIDTH	HEIGHT
SOLID STEEL	25"	18"
	33"	22"



GRADE LINE COAL CHUTE - SECTION

Used where the first floor is on or near grade level.

	21"	26"
	27"	32"

COAL CHUTES

NOTES:

Coal chutes are not made as catalog items. Above details are construction guidelines. Coal chutes are usually constructed of steel or malleable iron, and are set into building walls during construction. The sizes given are nominal.

DUST CHUTES

NOTES ON CHUTES:

Fire underwriters recommend:

1. Linen chutes should extend full diameter thru the roof as specified on the rubbish chute, and be capped with a metal skylight glazed with thin plain glass.
2. Intermediate automatic sprinklers are recommended at alternate floors.

Chutes are fabricated from #18 Ga. aluminized steel, or aluminum. One expansion joint per story; intake doors stainless steel, side or bottom hinged with or without underwriters Class B label.

Discharge Type A aluminized steel (no underwriters label), or type H hopper with or without underwriters Class B label.

Chutes are usually secured to floor with clamp type supports $^{3}/_{16}$" x 1 $^{1}/_{4}$" steel.

Riser of dust chutes 8" or 10" diameters. Aluminum dry parts, stainless steel wet.

Franz W. Krebs, AIA; Silver Spring, Maryland

FIRE CLASSIFICATION

CLASS A
Incipient fires on which quenching and the cooling effect of water is of prime importance. Fires of wood, paper, textile and rubbish.

CLASS B
Incipient fires on which blanketing or smothering effect of extinguishing is of prime importance. Fire of gasoline, oil, grease and fat.

CLASS C
Incipient fires in electrical equipment where the use of non-conducting extinguishing agent is needed.

OCCUPANCY CLASSIFICATION

CLASS I
Light hazard occupancies (schools, offices, and public buildings) require one unit of extinguishing capacity for every 2,500 square feet of floor area for use on Class A fires and one unit for every 625 square feet for use on Class B fires.

CLASS II
Ordinary hazard occupancies (dry goods and warehouses) require one unit of extinguishing capacity for every 1,250 square feet of floor space for use on Class A fires and one unit for every 625 square feet of floor area for use on Class B fires.

CLASS III
Extra hazard occupancies (paint shops, etc.) require additional units of extinguishing capacity beyond the requirements specified for ordinary hazard occupancies at the discretion of local authorities.

NOTES:
1. Classifications from the National Board of Fire Underwriters.
2. In all cases check the requirements of local codes.

FIRE HOSE RACK & REELS

NOTE:

Recommended hose size for use with building standpipes should not exceed 1 1/2" in diameter and 75 feet in length. A larger hose used by amateurs is likely to tangle and cause excessive water damage.

A connection for 2 1/2" hose should be available to each station for the use of firemen. Many codes require 2 1/2" outlets at all standpipes.

By using a reducing coupling 1 1/2" hose can be attached. When a 2 1/2" stream is required the coupling may be removed. Industrial installations use 2 1/2" hoses and train personnel in the use of the heavier equipment. Valves may be located 5'– 6" above floor (check local code).

Unlined woven linen hose is recommended for use on standpipe installations. Cotton rubber lined hose is standard for fire department and heavy equipment hose.

Tables show rack & reels for 1 1/2" & 2 1/2" linen hose only. Consult manufacturer's literature for rack & reel dimensions when other types & sizes of hose are used.

BELL SYSTEMS DESCRIPTIONS

CLASSIFICATION:
PEAL . . . . . .2–8 BELLS
CHIME . . . . .9–22 BELLS
CARILLON . .23+ BELLS

PLAYING METHOD
1. MANUAL
   - Keyboard levers "batons"
   - Electric console
2. AUTOMATIC
   - Roll Player
   - Programed hour strike
   - Swinging bell ringer

BELL STRIKE MECHANISMS:
1. Wire cables connecting bell clapper to clavier keyboard.
2. Electric operated hammer fastened adjacent to bell. The above playing methods and bell strike mechanisms can be interchanged to provide an automatic as well as a manually operated system.

CLOCK SYSTEMS DESCRIPTIONS

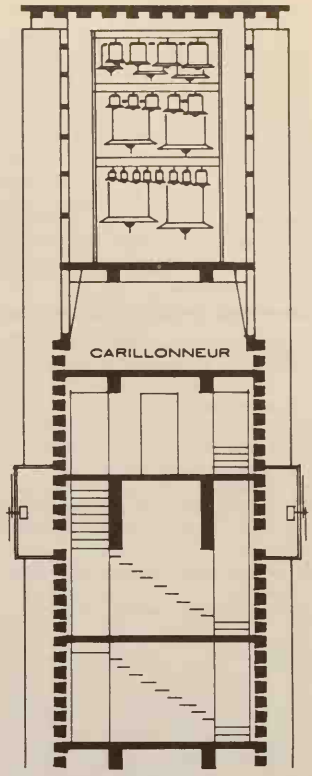
SYSTEM 1
One electric master clock programmed to control secondary clocks. Secondary clocks with self-correcting reset devices to keep all clocks coordinated.

Master clock programmed to control bell strike mechanisms on the quarter, half, and full hour.

SYSTEM 2
One synchronous electric motor driven clock with mechanically operated shafts direct to indicators on clock face.

Movement size correlated to size and quantity of clocks.

Clock dial design and size is unrestricted. A minimum clock dial radius is equal to 1/15 of its height above the ground.



SECTION

GENERAL INFORMATION

Provide maximum wall openings at belfry area.

Provide separate areas for both bell and clock movements.

Provide vibration isolators at each bell support to prevent vibration to structure.

Cast bronze bells of:
- 80% pure copper
- 20% pure tin

The minimum space below the largest bell to the belfry floor should equal the large bell diameter.

BELL DATA — FOUR OCTAVES

A' = 435 VIBRATIONS

A. Quincy Jones, FAIA, and Associates, Architects; Los Angeles, California

NOTES:

Data processing equipment on this page is shown to assist the architect with sizes in planning and to indicate the degree of variation in size and design of equipment. Many other variaties of equipment by other manufacturers are available.

Each installation is unique and equipment is constantly changing. Flexibility in planning and accessibility to supporting mechanical systems are requirements. Pedestal floors provide support for uniform or concentrated loads. Space below floor serves as plenum, duct space, electrical cables for computers, etc. Equipment supplier must be contacted at initial planning.

GENERAL DESIGN REQUIREMENT:

1. Heating and electrical system: separate from building to minimize shut downs. Temperature 60°–90°, humidity 20%–80% with filtered, dust-free air.
2. Walls: non-combustible and sound treated.
3. Floors: accessible and non-combustible and to retard sound vibration.
4. Ceiling: acoustic type and non-combustible.
5. Lighting: 60 to 80 foot candles desirable, 40 ft. candles minimum. Avoid direct sunlight.
6. Doors: large enough to accomodate equipment.
7. Fire detection system.

VARIOUS SUGGESTED INSTALLATION METHODS

Stewart R. James; Kilham Beder & Chu; New York, New York

TWO CHANNEL EXTRUDED ALUMINUM TRACK – CORD PULL FLUSH, RECESSED OR BRACKET MOUNTED

	GRABER	KIRSCH
MAXIMUM LENGTH – TWO WAY DRAW	42'– 0"	32'– 0"
MAXIMUM LENGTH – ONE WAY DRAW	30'– 0"	16'– 0"
MAXIMUM LENGTH – MULTIPLE DRAW	60'– 0"	64'– 0"
MAXIMUM FABRIC WEIGHT – TWO WAY	110 lbs.	80 lbs.
ONE WAY	75 lbs.	80 lbs.
MULTIPLE	150 lbs.	160 lbs.
PROJECTION & BRACKETS REQUIRED	48" apart at ends 24" projection ¾" to 5"	No brackets space screws 16" on centers
CURVE	12" radius	Cannot be curved
PLEAT SPACING	4" to 6"	4" to 6"
CEILING POCKET FOR DRAPERY ONLY	5" front to back minimum	

HAND PULL – RARELY USED EXCEPT FOR HOSPITAL CUBICLES

NOTES:

Fullness of fabric lining and pleating determine exact width at gathering space (bunching). For 100% fullness (double width): Basic allowance = 1/3 of window width. For bunching this includes overlap and pulleys.

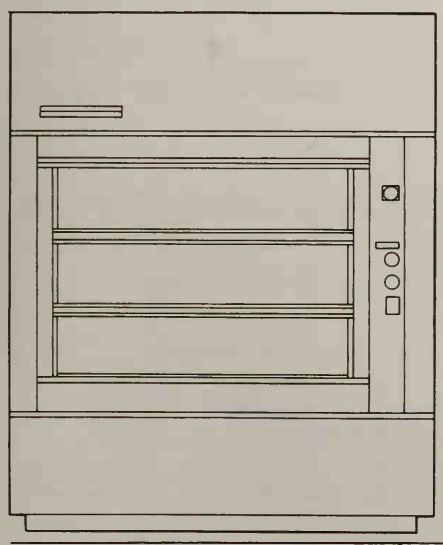
SPECIAL FILING CASES



AUTOMATED RETRIEVAL SYSTEM

An automated system which allows for the retrieval of records in a matter of seconds. Records are stored in the unit on carriers. Each carrier is individually suspended and equally spaced on a conveyor system. The operator sits or stands at a posting board and at the touch of a button the proper carrier moves into position so that a record may be pulled or filed. In the event of card trays, where there may be 2–6 trays per carrier, the correct tray slides forward.

Records which may be stored in these units include file folders, binders, reference books, ledgers, tape reels, microfilm, and cards.

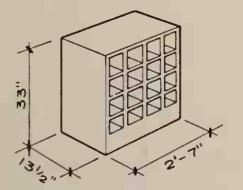
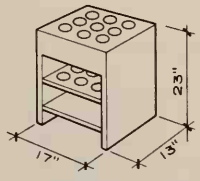
PORTABLE (COLLAPSIBLE) COAT AND HAT RACKS



OVERSHOE RACK



UMBRELLA RACK

NOTE:

Allow 3/4 sq. ft. per person which allows for coat on hanger, hat, umbrella and overshoes. Allow approximately 20% of hanger capacity for overshoe - umbrella racks. Standard hanger spacing is 3" o.c. (4 per lin. ft.). Capacity may be increased 25% by spacing 2 1/2" o.c. (5 per lin. ft.). Use of hooks increases capacity to 8 per lin. ft.

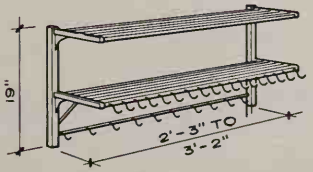
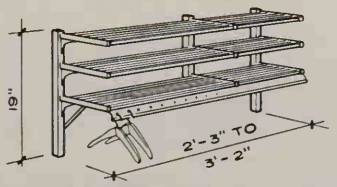
UMBRELLA & OVERSHOE RACK

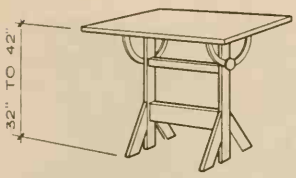


HOOK-WALL RACK

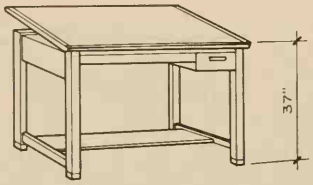


HANGER-WALL RACK

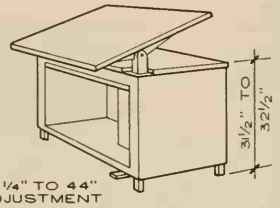
J. C. Mayer; William B. Tabler, FAIA; New York, New York



Adjustable metal or wood legs.



Drafting &/or engineering table available in wood, steel or in combination. Various drawer and pedestal arrangements available. See manufacturer's literature.



Adjusts to desired height by foot pedal, takes any stop, vertical or horizontal.

Draftsmen use drawers and reference area behind them.

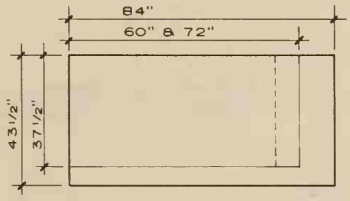
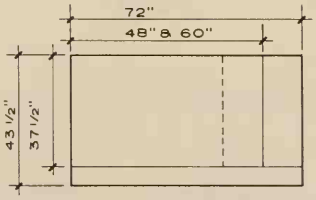
BASIC TABLE

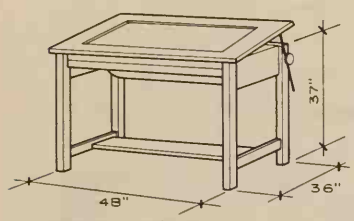


PLAN
TYPICAL DRAFTING TABLE



PLAN
"AUTO-SHIFT" DRAWING TABLE

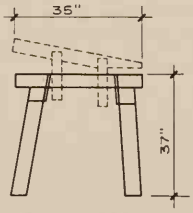
"Auto-shift" provides drawing and reference in only 36 sq. ft. per man.



Variation of tracing table available on base similar to basic table.
TRACING TABLES

Tracing tables are obtainable with 22" x 24" or 24" x 36" glass tracing units.

Portable boards available with tracing areas up to 24" x 36 3/4".



Adjustable trestles or horses available; adjust from 39" to 47" in height.

GOOD	88 SQ. FT.	93.50 SQ. FT.
EXCELLENT	90.75 SQ. FT.	96.75 SQ. FT.

NOTES:

Dimensions shown are based on the use of 3' x 5' and 3' x 6' drafting tables. If larger tables are used they will replace reference areas and the total areas will not increase. Provide one large table for detailing, reference, and wrapping.

The draftsman requires 80 to 100 footcandles of light on his board or approximately 6 watts per square foot. Avoid sharp contrasts of light in drafting room. The board illumination should never be more than seven times as bright as the surroundings. Fluorescent trough fixtures are most practical when hung diagonally to tables.

For the medium-sized architectural drafting office 100 square feet per man is ideal. This includes areas for drafting, reference, plan storage, aisle and supply. Reception, office, conference, and wash rooms are not included.

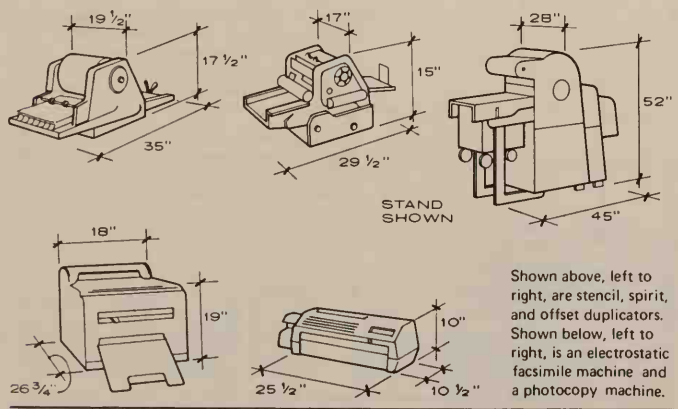
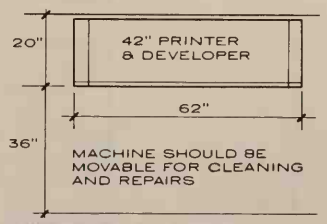
FILING AND STORAGE EQUIPMENT



Shown above, left to right, are stencil, spirit, and offset duplicators. Shown below, left to right, is an electrostatic facsimile machine and a photocopy machine.



PRINTER & DEVELOPER

The process used determines the requirements of space, light, plumbing and ventilation.

For reproduction of tracings a printing and developing unit is necessary. The printer is above the developing unit. With the two units and the proper chemicals and paper, blueprints, black and white and bluelines, and other types of copy are possible.

When choosing equipment the size and type process is determined by the individual requirements of the office.

The machines should be ventilated for heat and chemical fumes. The 42" machine is the most commonly used in medium sized offices.

8"	20'	17'	25'	22'	30'	27'	35'	31'	42'	37'	48'	43'	54'	48'	60'	53'	72'	64'	84'	75'	95'	85'

THE 2 X 2 SLIDES ARE 23MM X 34MM MASKS–HORIZONTAL FORMAT
THE SUPERSLIDES ARE 38MM X 38MM

To find projector-to-screen distance required to fill screen with image for other slide types listed below, multiply the distance given for 2 x 2 slides of corresponding lens focal length by the factors given below:

30 x 30 mm mask
126 (26 1/2 x 26 1/2 mm)
Single frame filmstrip (17 1/2 x 23 mm)
3 1/4 x 4 in. slides (3 in. wide mask)
2 3/4 x 2 3/4 slides (2 1/4 in. square mask)

EXAMPLE 1:
given:
8' wide screen
6" lens focal length
2 x 2 slides
find:
distance required from projector to screen to fill screen width with image.
from table = 36'

EXAMPLE 2:
given:
8' wide screen
5" lens focal length
single frame filmstrip
find:
distance required from projector to screen to fill screen width with image. (from table for 2 x 2) – 30' x 1.48 = 44.4'

SCREEN TYPES AND SIZES:

Tripod screens: 30" x 40" to 72" x 96". Bottom of screen to floor usually 3' to 4' (adjustable).

Table or wall-hung screens: 18" x 24" to 36" x 36".

Ceiling or wall-hung: 30" x 40" to 72" x 96" and 6' x 8' to 15' x 20'.

Electrically operated: 6' x 8' to 12' x 12' and 11' x 14' to 18' x 18'.

Lace and grommet: custom made to any size. Economical in large size for stages having fly lofts, not recommended otherwise.

To determine screen size for cinemascope projection, first find the proper size for conventional projection, and double the width, minimum height – four feet.

Polarized transluscent screens are used for rear projection, of glass or plastics.

DETAIL 22

Morris Winkler, Curtin, Kane, Gere and Ashley, AIA; Syracuse, New York

GENERAL NOTES:

Choose quiet, protected site; orient building with doors and windows facing away from noise sources.

Arrange building spaces with noisy equipment and noisy activities together, away from quiet spaces.

Choose quiet mechanical equipment.

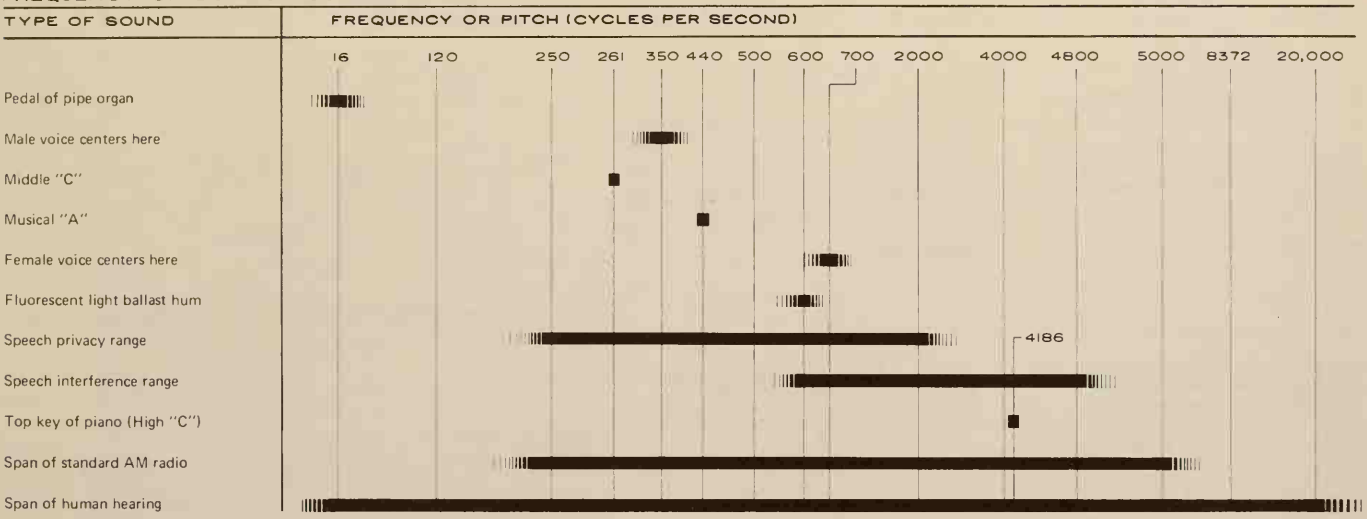
Consider acoustical properties of all materials, systems and constructions before choosing any.

THE NATURE OF SOUND

Sound is a vibration in an elastic medium; its production requires a source and a path; it travels to a receiver (the human ear, usually).

Air, fluids, and building materials are paths; materials possess mass, and therefore inertia; their oscillating motion when excited by acoustical energy is governed by laws of motion.

FREQUENCY OF COMMON SOUNDS



RELATIONSHIP OF SOUND INTENSITY, LEVEL, AND LOUDNESS

INTENSITY (RELATIVE ENERGY - UNITS)	SOUND PRESSURE LEVEL (DECIBELS)	LOUDNESS
100,000,000,000,000	140	Jet aircraft and artillery fire
10,000,000,000,000	130	Threshold of pain
1,000,000,000,000	120	Near elevated train
100,000,000,000	110	Inside propeller plane
10,000,000,000	100	
1,000,000,000	90	Full symphony or band
100,000,000	80	Inside auto at high speed
10,000,000	70	Conversation, face to face
1,000,000	60	Inside general office
100,000	50	
10,000	40	Inside private office
1,000	30	Inside bedroom
100	20	Inside empty theater
10	10	
1	0	Threshold of hearing

NOTE:

The decibel number represents a ratio (actually 10 x the logarithm) of the Intensity measured to a reference intensity roughly equivalent to the threshold of hearing.

SUBJECTIVE EFFECT OF CHANGE IN SOUND PRESSURE LEVEL

CHANGE IN SOUND PRESSURE LEVEL	CHANGE IN APPARENT LOUDNESS
3 dB	Just perceptible
5 dB	Clearly noticeable
10 dB	Twice as loud (or 1/2)
15 dB	Big change
20 dB	Much louder (or quieter)

Glenn A. Kahley, Vincent G. Kling and Associates; Philadelphia, Pennsylvania
Lyle F. Yerges, Consulting Engineer; Downers Grove, Illinois

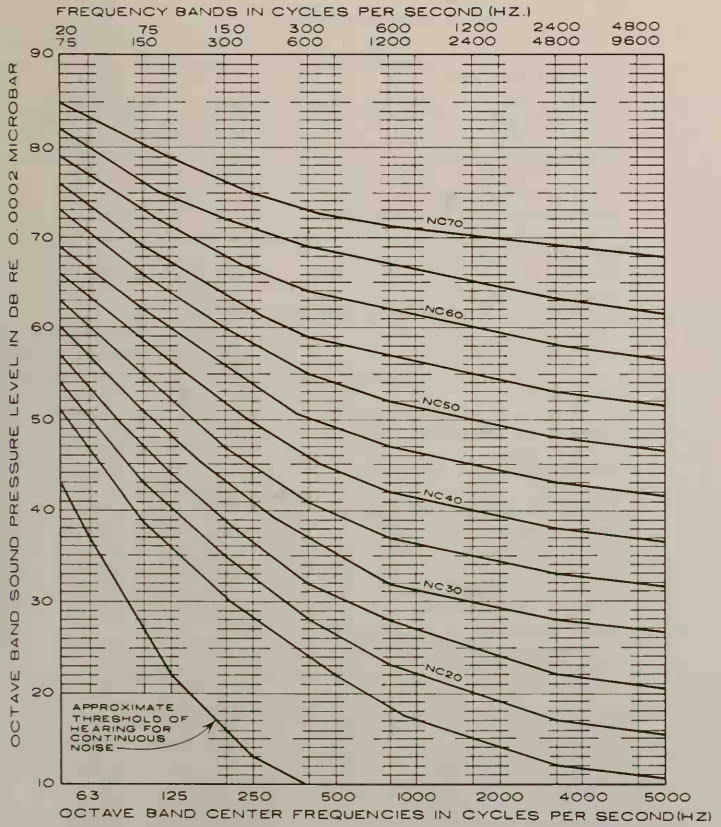
FACTORIES	NC40 – 65

NOTE: Each noise criteria curve is a code for specifying permissible sound pressure levels in eight octave bands. It is intended that in no one frequency band should the specfied level be exceeded.

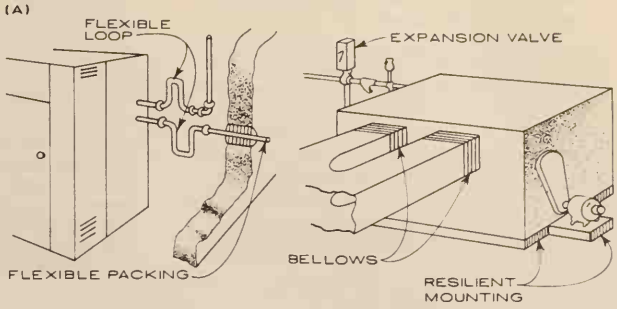


THE NC – CURVES (NOISE CRITERIA) BASED UPON HUMAN RESPONSE TO SOUND PRESSURE LEVEL AND FREQUENCY*

* COURTESY T J SCHULTZ, JOURNAL OF THE ACOUSTICAL SOCIETY OF AMERICA 43.637

2. NOISE SOURCES–INTERIOR AND EXTERIOR– DETERMINE CONTROL PROVISIONS

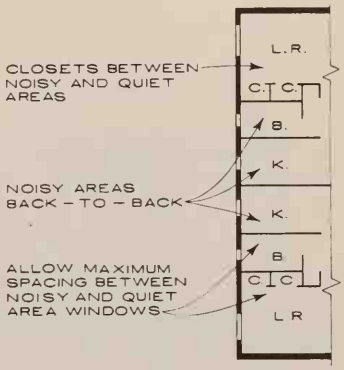
(A)



NOTE:
Avoid or minimize noise sources. Choose quiet equipment. Use vibration isolation, sound absorbent duct lining, resilient pipe connectors. Design for low flow velocities in pipes and ducts.

(B)

Orient spaces to minimize transmission problems. Space windows of adjoining apartments maximum distance apart. Place noisy areas back-to-back. Place closets between noisy and quiet areas.



3. ACOUSTICAL DESIGN

(A)

Choose materials, systems, and construc-tions to control sound transmission.

(B)

Design shapes, areas, volumes and surfaces to accomplish desirable interior accoustical conditions.

(C)

Economic factors:

"Build in" good acoustics.
Choose simplest construction meeting criteria.
Law of diminishing returns quickly limits benefits of increasing any variable (such as weight, thickness, etc.)
It is much cheaper to avoid noise problems in original design or in choice of equipment than to correct them later.

Hussein A. Saleh; Vincent G. Kling and Associates, Philadelphia, Pennsylvania
Lyle F. Yerges, Consulting Engineer, Downers Grove, Illinois

STC-rating number (see another page in this series for explanation) in this chart indicates approximate center of a range; for example:

STC-37 means STC-35 to less than STC-40
STC-42 means STC-40 to less than STC-45 etc.

Test procedures and variables in construction require a tolerance of approximately ± 2 to 3dB. The ear recognizes 3 dB change as just noticeable.

All STC-numbers are based upon laboratory data. Actual field installations usually test approximately 3 to 5 dB lower.

Performance criteria assume normal background level in "Room Being Considered" and average construction cost range for building.

For low-cost construction or high background level, criteria may be reduced 3 to 5 points. For high-cost construction or low background level, criteria may be increased 3 to 5 points.

The following table is a fairly reliable, conservative guide for choosing partition constructions. It assumes no holes, "leaks" or significant "flanking paths"; a so-called normal spectrum of background sound in the room; no unusual or extreme extraneous noise conditions; and no "special" conditions or highly critical uses for the spaces. For auditoriums, theaters, recording studios, music schools, and similar areas; for large hotels, apartments, dormitories and similar buildings; and for any structure where the amount of wall construction is large enough to make the economic multiplier very large, professional advice is the only safe economical course.

BACKGROUND SOUND (often referred to as "masking"):

A. Low background level. . .Under NC-25. Quiet suburban or residential areas. No ventilating or mechanical equipment sounds. Little or no traffic noise.

B. Normal or average background level . . . NC-25

Continued on next page.

SOUND ISOLATION CRITERIA

TYPE OF OCCUPANCY	WALL, PARTITION, OR PANEL BETWEEN ROOM CONSIDERED	AND ADJACENT AREA	SOUND ISOLATION REQUIREMENT
Executive areas, doctors' suites, confidential privacy requirements	Office	Adjacent offices	STC 47
		General office areas	STC 42
		Corridor or lobby	STC 47
		Washrooms and toilet areas	STC 47
		Exterior of building	STC 42
		Kitchen and dining areas	STC 47
		Manufacturing areas and mechanical equipment rooms	STC 52
Normal office areas, normal privacy requirements.	Office	Adjacent offices	STC 37
		General office areas	STC 37
		Corridor or lobby	STC 37
		Washrooms and toilet areas	STC 42
		Exterior of building	STC 37
		Kitchen and dining areas	STC 42
		Manufacturing areas and mechanical equipment rooms	STC 47
Any normal occupancy, using conference rooms for group meetings or discussions	Conference Rooms	Other conference rooms	STC 42
		Adjacent offices	STC 42
		General office areas	STC 42
		Corridor or lobby	STC 42
		Washrooms and toilet areas	STC 47
		Exterior of building	STC 37
		Kitchen and dining areas	STC 47
		Manufacturing or other noisy interior areas	STC 47
Normal business offices, drafting areas, banking floors, etc.	Large General Office Areas	Corridors or lobby	STC 32
		Exterior of building	STC 32
		Data processing areas	STC 37
		Manufacturing areas and mechanical equipment areas	STC 42
		Kitchen and dining areas	STC 37
Office in manufacturing, laboratory, or test areas	Shop and Laboratory Offices	Adjacent offices	STC 37
		Manufacturing, laboratory, or test areas	STC 42
		Washrooms and toilet areas	STC 37
		Corridor or lobby	STC 32
		Exterior of building	STC 32
Motels and urban hotels	Bedrooms	Adjacent bedrooms, separate occupancy	STC 47
		Bathrooms, separate occupancy	STC 47
		Living rooms, separate occupancy	STC 47

		Exterior of building	STC 42

Hussein A. Saleh, Vincent G. Kling and Associates; Philadelphia, Pennsylvania
Lyle F. Yerges, Consulting Engineer; Downers Grove, Illinois

to under NC-35. Some distant traffic noise or light street traffic. Some ventilating air sound and occasional low level mechanical equipment sounds.

C. High background level . . . over NC-35. Street noise and traffic sounds. Noisy central ventilating system or window air conditioner unit.

Note: All of these background levels assume no unusual sounds such as persistent pure tones, distinct and unusual signals, strongly perceptible vibration, or similar stimuli.
All exterior or other areas which are the source of "extraneous" noise are assumed to have a normal or usual noise level and type of noise for such areas.

If extraordinarily high noise levels exist, as in the near vicinity of engine test stands, airports with heavy jetplane traffic, or near heavily traveled highways with heavy truck traffic, or in similar circumstances, increase all isolation requirements by up to 5 points – or consult a qualified acoustical consultant.

FLOORS should provide isolation against:

AIR-BORNE SOUND at least equal to that of the partitions and preferably 3 to 5 points better.

STRUCTURE-BORNE (IMPACT) SOUND: at least equal to the FHA criterion of (see 9th Pg. in this series) (for floors immediately above the following spaces)

Multi-family dwelling rooms, hotels, motels etc.	INR = 0
Single family dwelling rooms	No requirement
School classrooms	INR = –5
Offices	INR = –5
Auditoriums, lecture rooms, and similar spaces	INR = +5
Radio studios, music areas, and similar spaces	Use professional consultants.

SOUND ISOLATION CRITERIA

TYPE OF OCCUPANCY	WALL, PARTITION, OR PANEL BETWEEN ROOM CONSIDERED	AND ADJACENT AREA	SOUND ISOLATION REQUIREMENT
Apartments, multiple dwelling building	Living Rooms	Adjacent living rooms, separate occupancy	STC 47
		Bathrooms, separate occupancy	STC 47
		Bathrooms, same occupancy	STC 42

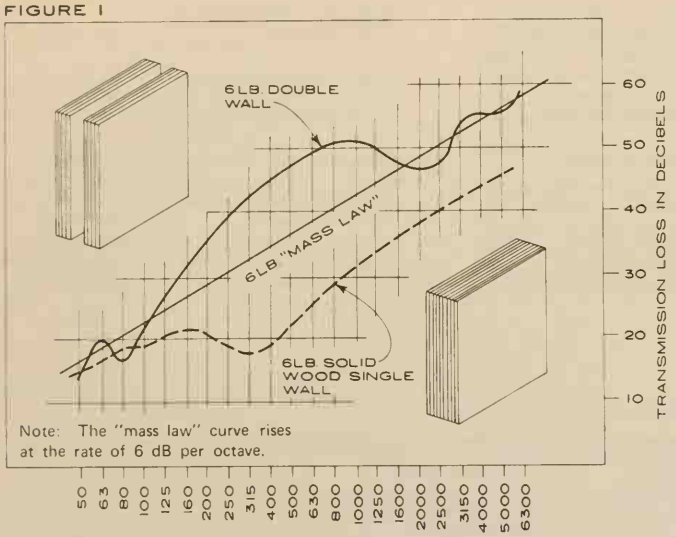
FIGURE 1



EXPLANATORY NOTES:

TRANSMISSION LOSS (TL) refers to attenuation of sound passing through construction when tested according to ASTM E90–66T. The actual graph of the test provides the best rating method.

Sound Transmission through walls or floors and ceiling varies with the frequency of sound and the weight (or mass) and stiffness of the construction.

For all solid panels, a dip occurrs in the Transmission Loss curve; this is the "coincidence dip", related to the stiffness and mass of the wall.

Theoretically, the Transmission Loss varies at the rate of 6dB per doubling (or halving) of the weight of the construction. For example:

Weight–lb./sq. ft.:	5	10	20	40	80	160
TL@ 400 c.p.s. –dB:	33	39	45	51	57	63

A single solid panel behaves less well than the "mass law" would predict; a true double wall with separate, unconnected wythes performs better than the "mass law" predicts.

The Transmission Loss tends to increase about 5dB for each doubling of the air space between wythes (minimum effective space approximately 2"). For example:

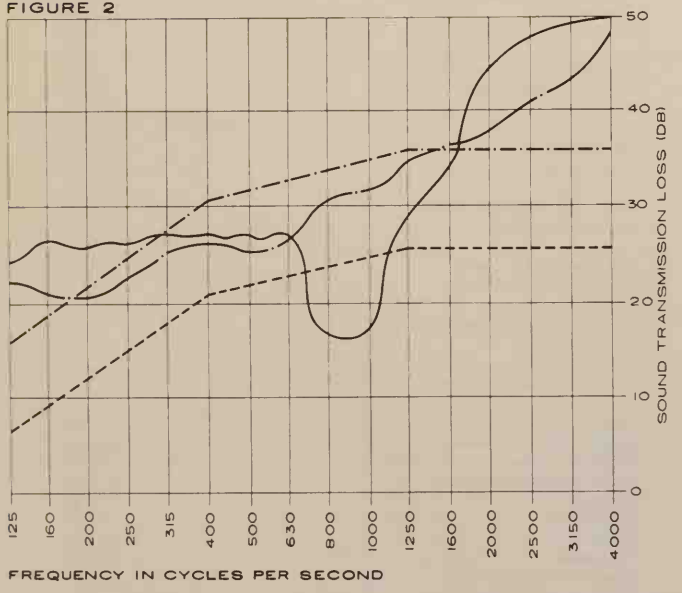
Air Space (inches):	3	6	12	24	48
TL (decibels):	40	45	50	55	60

Resilient attachment of surface "skins" to studs or structural surfaces provides same effect as separates wythes.

Soft, resilient, absorptive materials in the cavity between wythes, particularly for light-weight staggered-stud construction, improves Transmission Loss.

"Visco-elastic" (somewhat resilient but not fully elastic) materials, such as certain insulation boards, etc. –"dampen" or restrict the vibration of panels. When used with rigid panels (such as gypsum boards), they increase Transmission Loss appreciably. Installation details recommended by manufacturers should be followed.

FIGURE 2



DEFINITIONS

ATTENUATION: reduction or lessening (from root word meaning "to thin out as a string or fiber").

CENTER FREQUENCY OF AN OCTAVE BAND: the frequency in the center of the entire 2/1 range of the octave.

NOISE REDUCTION: This refers to the actual difference in Sound-Pressure Level between two spaces being considered. It is what the ear hears and what we are actually interested in. It is dependent not only on the Transmission Loss of the walls, floors and ceilings, but also the Sound Absorption present in the room being considered.

OCTAVE: a frequency ratio of 2/1. For example, from Middle "C" (261) to one octave higher (522) or one octave lower (130).

SOUND TRANSMISSION CLASS (STC): a rating system which compares the TL test curve for a construction with a "standard contour" which reflects known subjective response to the TL performance. The contour is fitted to the test curve of the constructions, and the relative vertical position of the contour determines the Sound Transmission Class and compares the rank-order constructions. See Figure 2 for example.

Figure 1 compares two constructions with identical numerical average TL but widely differing effectiveness. The relative position of the standard contours indicates a 10-point superiority for one construction.

SOUND TRANSMISSION CLASS CURVE: a three-segment "contour", shaped to match approximately the ear's evaluation of the importance of the sound pressure in the frequency ranges spanned by the segments of the curve. The contour is matched to the actual results of an actual test, and the rating of the construction is given according to the vertical position of the contour.

The SOUND TRANSMISSION LOSS at all frequencies, from 125 to 4000 cps, is important (in varying degrees), so a single number or an average is meaningless. The shape of the entire TL curve (from a test) as related to the standard contour is important. Deep dips (as in curve A) are deadly, but the numerical average misses this dip; the contour properly evaluates its effect. The STC rating is a numerical rank-ordering of the vertical position of the contour as the contour is fitted to the test curve.

Allan R. Niemeyer; Vincent G. Kling and Associates, Philadelphia, Pennsylvania
Lyle F. Yerges, Consulting Engineer; Downers Grove, Illinois

The STC-RATING of ordinary "base constructions" is listed in the following tables. The tabulated results represent reasonable averages of many tests by several laboratories and testing agencies. While the values may differ slightly from published data from a specific laboratory or manufacturer, they are conservative and representative of the particular construction described. (See another page for further explanation and qualification.) For any construction with unique details or characteristics, refer if possible to actual laboratory test data and the qualifying descriptive details of the test specimen.

SOUND TRANSMISSION LOSS - STUD FRAMED WALLS AND PARTITIONS

BASE CONSTRUCTION		WEIGHT (lb/ft²)	STC RATING	PLANS (NO SCALE)
	1/4" PLYWOOD – NAILED TO STUDS	2 1/2	24	
	1/2" WOOD FIBERBOARD – NAILED TO STUDS	3 1/2	28	2" x 4" WOOD STUDS 16" O.C. (UNLESS OTHERWISE NOTED)	1/2" GYPSUM BOARD – NAILED TO STUDS (JOINTS TAPED AND SEALED)	5 3/4	32		3/8" GYPSUM LATH-NAILED TO STUDS – 1/2" SANDED GYPSUM PLASTER (2 COATS)	15	35		METAL LATH-NAILED TO STUDS – 7/8" SANDED GYPSUM PLASTER (3 COATS)	20	37	3 5/8" MET. STUDS 24" O.C.	5/8" GYPSUM BOARD-SCREW ATTACHMENT TO STUDS (JOINTS TAPED AND SEALED)	6	39	3 1/4" METAL STUDS 16" O.C. (UNLESS OTHERWISE NOTED)	3/8" GYPSUM LATH-CLIPPED TO STUDS – 1/2" SANDED GYPSUM PLASTER (2 COATS)	15	40		METAL LATH-CLIPPED TO STUDS – 3/4" SANDED GYPSUM PLASTER (3 COATS)	19	37	
NOTE:

Combinations of channels or similar sections to produce a similar air space between opposite surfaces provide approximately the same STC ratings. Arrangements of channels or studs to produce completely independent (non-connected) wythes provide approximately the same improvement in STC rating (10 points) as staggered studs.

MODIFICATIONS TO BASE CONSTRUCTION

MODIFICATION	STC RATING IMPROVEMENT	PLANS (NO SCALE)
SURFACE SKIN WEIGHT	Doubling 1 Side = +3 points Doubling 2 Sides = +5 points	RESILIENT ATTACHMENT OF SURFACE	To 1 Side = +6 points To 2 Sides = +10 points	STAGGERED STUDS	+9 points	SLOTTED STUDS	+8 points	RESILIENT DAMPING BOARD LAYER UNDER SURFACE SKINS	Surface adhesively applied according to specific procedures recommended by the Gypsum Board Manufacturer +10 points.	ABSORPTION IN CAVITY	+5 points	

Cumulative improvement of any combinations of these modifications is calculated thus: largest number +1/2 next largest +1/2 next largest etc.

EXAMPLE:

Given a "Base Construction," such as 1/2" Gypsum Board on wood studs = STC – 33.

Change to:

Staggered studs (+10 points) = 10 points

Add:

Absorption in cavity (+5 points) 1/2 x 5 points = 2 1/2 points

Add:

One additional 1/2" gypsum board to one side only (+3 points) 1/2 x 3 points = 1 1/2 points

Total 14 points

Therefore, "Base Construction" increases from STC 33 to STC 47.

Sterlin G. Daniel, Vincent G. Kling and Associates; Philadelphia, Pennsylvania
Lyle F. Yerges, Consulting Engineer, Downers Grove, Illinois

SOUND TRANSMISSION LOSS–WALLS AND PARTITIONS OF MASONRY AND CONCRETE

BASE CONSTRUCTION		WEIGHT (lb./ft.^{2})	STC RATING	PLANS (NO SCALE)
WALLS OF CONCRETE MASONRY UNITS	4" LIGHTWEIGHT *	20	36	
	4" DENSE	30	38	
	6" LIGHTWEIGHT *	28	41	
	6" DENSE	43	43	
	8" LIGHTWEIGHT *	34	46	
	8" DENSE	55	48	
	12" LIGHTWEIGHT *	50	51	
	12" DENSE	80	53	
SOLID BRICK WALLS	4" BRICK †	38	41	
	8" BRICK †	80	49	
	12" BRICK †	120	54	
SOLID CONCRETE WALLS	6" REINFORCED DENSE CONCRETE	75	46	
	8" REINFORCED DENSE CONCRETE	95	51	
	12" REINFORCED DENSE CONCRETE	145	56	

*Sealed against air leakage with 2 coats of sealer paint both sides or similarly sealed.
†Careful workmanship: Air-tight joints and surface sealed.

MODIFICATIONS TO THE BASE CONSTRUCTIONS PRODUCE CORRESPONDING IMPROVEMENTS IN STC RATING

MODIFICATION	STC RATING IMPROVEMENT		PLANS (NO SCALE)
SAND FILLED CORES		+ 3 points	1/2" SANDED PLASTER (OR SIMILAR SURFACE SKIN)	1 Side 2 Sides	+ 2 points + 4 points	RIGIDLY FURRED SURFACE SKIN	1 Side 2 Sides	+ 7 points + 10 points	RESILIENTLY ATTACHED SURFACE SKIN	1 Side 2 Sides	+ 12 points + 15 points	ABSORPTION IN CAVITY	1 Side 2 Sides	+ 3 points + 5 points	
DIVIDING WALL INTO SEPARATE WYTHES WITH 4" AIR SPACE		+ 15 points	
FORMULA:

Cumulative improvement of any combination of these modifications is calculated thus: Largest number + next largest number + next largest number, etc.

EXAMPLE:

Given a base construction such as 4" Lightweight Block = STC-36

Add:

Resilient plaster skin one side = 12 points

Add:

Sand in cores = 3 points

Add:

Plaster on opposite side = 2 points

Total 17 points

Therefore "base construction" increases from STC-36 to STC-53.

Josue S. Gutierrez; Vincent G. Kling and Associates; Philadelphia, Pennsylvania
Lyle F. Yerges, Consulting Engineer; Downers Grove, Illinois

SOUND TRANSMISSION LOSS – STUDLESS AND SPECIAL DRYWALL CONSTRUCTION

	BASE CONSTRUCTION	WEIGHT (lbs./ft.^{2})	STC RATING	PLANS (NO SCALE)
STUDLESS CONSTRUCTION	2" PANEL, SANDED GYPSUM PLASTER ON METAL LATH*, WITH OR WITHOUT IMBEDDED CHANNELS	18	34		2 1/2" PANEL, SANDED GYPSUM PLASTER ON SEPARATE LAYERS OF GYPSUM LATH	19	38	SPECIAL DRYWALL CONSTRUCTION	2 1/4" SOLID LAMINATED GYPSUM BOARD	10	30	
	5/8" GYPSUM BOARD LAYERS LAMINATED TO 1 5/8" x 6" GYPSUM STRIPS	7	34	
	DOUBLE SOLID DRYWALL – 2 SEPARATE WYTHES OF 1/2" GYPSUM BOARD LAMINATED TO 1" GYPSUM BOARD WITH 1 1/8" AIR SPACE	14	46	

* Gypsum lath instead of metal lath provides approximately the same STC rating.

NOTES: 1. To calculate the effect of variations in weight or air space, See "Control of air borne sound transmission."
2. For the effect of other construction variables, see a preceding page on "Sound Transmission."

WINDOWS AND GLAZING

CONSTRUCTION	THICKNESS	WEIGHT (lbs./ft.^{2})	STC RATING
D.S. GLASS	1/8"	1 1/2	21
PLATE GLASS	1/4"	3.2	26
INSULATING GLASS	1"	6 1/2	32
LAMINATED ACOUSTICAL GLASS*	9/32"	3 1/4	36
GLASS BLOCK	3 3/4"	20	40
SPACED GLASS (1/4"–2" AIR SPACE- 1/4")	2 1/2"	6 1/2	42

* "Acousta-Pane 36"

SOLID SINGLE SHEET MATERIALS

CONSTRUCTION	THICKNESS	WEIGHT (lb./ft.^{2})	STC RATING
ALUMINUM	0.025	.35	19
PLYWOOD	1/4"	.73	22
CELLULOSE FIBERBOARD	1/2"	.75	22
PLATE GLASS	1/4"	3.2	26
SHEET STEEL	18 GAGE	2.0	30
LEAD	1/16"	3.9	34

DOORS*

CONSTRUCTION	THICKNESS	WEIGHT (lb./ft.^{2})	STC RATING
HOLLOW CORE WOOD	1 3/4"	3 1/2	26
SOLID CORE WOOD	1 3/4"	5	29
HOLLOW METAL	1 3/4"	5	30
PACKED METAL	1 3/4"	7	32
SPECIAL ACOUSTICAL	1 3/4"	6	35
SOLID CORE WOOD	2 1/4"	7	32
SPECIAL ACOUSTICAL	2 1/2"	8	38

* Fully gasketed, all edges and bottom. "Leaky" gaskets or no gaskets can reduce STC RATINGS by 5 to 15 points.

MOVABLE AND OPERABLE PARTITIONS

STC ratings range from STC-18 to STC-44 (up to STC-55 for special double wall assemblies) depending upon construction, weight, and tightness of seals and closures.

Generally, performance parallels comparable fixed wall construction if edges and perimeters are well sealed.

HOLES AND OPENINGS

Holes and openings, such as door undercuts and louvers, perimeters of pipes and ducts, and similar joints however small, seriously degrade transmission loss performance of constructions.
One square inch of opening transmits as much sound as about 100 sq. ft. of a 40 dB wall.
High frequencies escape through small holes, all frequencies through long cracks.

FORMULA:

Cumulative improvement of any combinations of these modifications is calculated thus: largest number + next largest + next largest, etc.

EXAMPLE:

Given a "Base Construction" such as Double Solid Drywall (STC = 46)

Change to:

TRIPLE SOLID DRYWALL 
Add:
2 Air Spaces of 1 1/8" = 5 points

Add:
1 Layer of 1" Gypsum Board in cavity = 2 points

Add:
Absorption in one cavity = 5 points
Total = 12 points

Therefore, "Base construction" increases from STC-46 to STC-58.

William Lukens, Vincent G. Kling and Associates; Philadelphia, Pennsylvania
Lyle F. Yerges, Consulting Engineer; Downers Grove, Illinois

GENERAL NOTES:

In addition to "air-borne" sound transmission, floors are subject to impact or structureborne transmission of noises such as footfalls, dropped objects, scraping furniture.

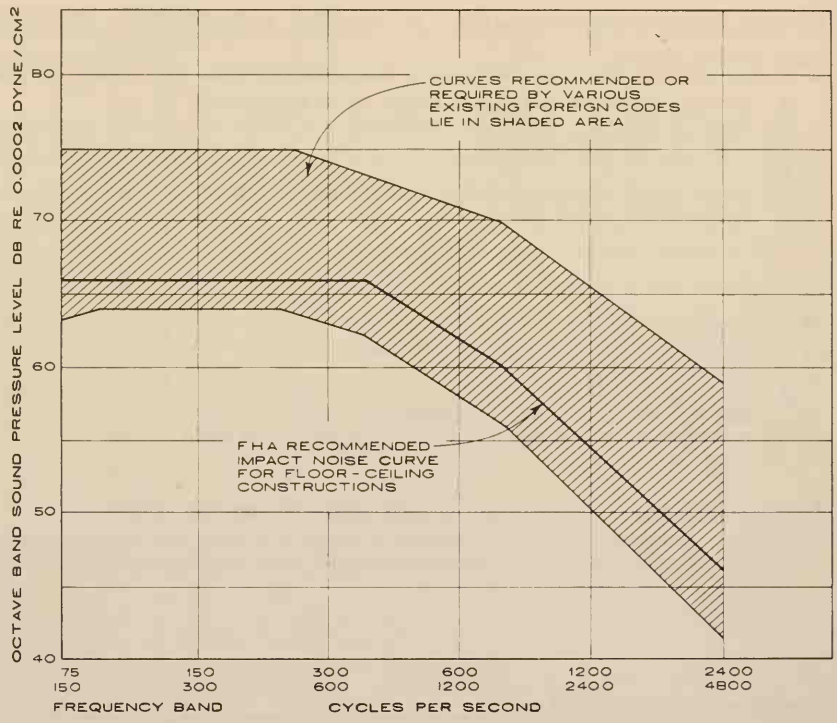
Impact noise rating INR refers to a rating system which compares the effectiveness of floor constructions in isolating against transmission of impact sounds to spaces below the floor. It is based upon an international standards organization test method which employs a tapping machine of known performance characteristics.

A "standard contour" which reflects subjective response to noise is fitted to the curve of the noise level measured in the room below the floor. The relative vertical position of the contour determines the impact noise rating and compares and rank-orders constructions.

The tapping test method is based upon experience gained largely from tests of the heavy masonry floor constructions widely used in european apartment and multi-family buildings. It tends to over-rate the effectiveness of floor coverings such as carpet; it does not appear to evaluate properly the effect of heavy, slow impacts nor of low-frequency impact sound; and it does not reflect accurately the performance of lightweight floor constructions such as the more common U'
the more common U.S. woodjoist floors and similar systems.

While some government agencies include INR requirements in their specifications', the method has not been adopted in this country, and it has not been accepted as an ASTM standard.

Field measurements of sound pressure levels in the room underneath a floor construction on which a standard tapping machine is operating should not exceed this curve by more than the tolerances specified in section III—A—3 of the text of F.H.A. no. 750 guide, Impact Noise Control in Multifamily Dwellings.



IMPACT NOISE CURVE

STRUCTURAL FLANKING

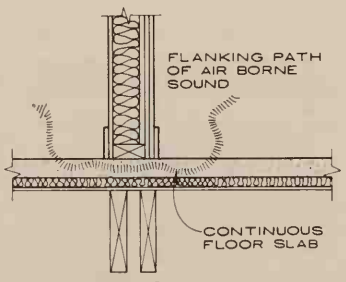
Edge attachment and junctions of walls, partitions, floors and ceiling can cause large differences in TL performance. The transverse waves set up in continuous, stiff, lightweight walls or floors can carry sound a long distance from the source to other parts of the structure. Curtainwalls and thin concrete floors on bar joists are particularly subject to this weakness.

Properly designed discontinuities, such as shown in adjacent sketches, are helpful in reducing structural flanking.

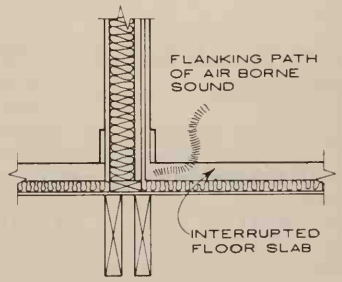
A resilient joint between wall and partition or partition and floor can often appreciably improve TL performance.

Flanking via inter-connected air volumes, as in balloon framing, can reduce TL as must as 10 dB.

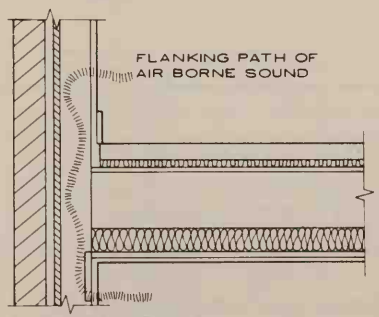
Continuous pipes, conduits or ducts can act as transmission paths from room to room. Care must also be taken to isolate such services from the structure.



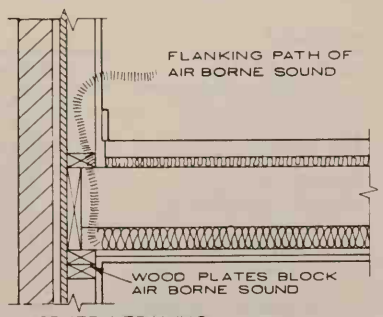
POOR ISOLATION



ADEQUATE ISOLATION



BALLOON FRAMING



WESTERN FRAMING

Herman DeJong; Vincent G. Kling and Associates; Philadelphia, Pennsylvania
Lyle F. Yerges, Consulting Engineer; Downers Grove, Illinois

For a discussion of STC-rating of floor constructions, see "Control of Air Borne Sound Transmission" and "Sound Transmission Loss" pages.

The INR (Impact Noise Rating) of constructions in the following tables follows the procedure of the FHA No. 750 guide, since this rating system now has considerable acceptance in the United States, and the system is reasonably comparable with European systems.

SOUND TRANSLATION LOSS AND IMPACT NOISE RATINGS – WOOD FRAMED FLOORS

2" x 10" WOOD JOISTS – 16" O.C. UNLESS OTHERWISE NOTED

BASE CONSTRUCTION	WEIGHT (lb./ft.^{2})	STC RATING	INR RATING	SECTIONS
1/2" PLYWOOD SUBFLOORS AND STANDARD OAK FLOORING – NAILED TO JOISTS	8	25	–28	
DITTO – PLUS 5/8" GYPSUM BOARD CEILING NAILED TO UNDERSIDE OF JOISTS	10	37	–17	DITTO – EXCEPT 3/8" GYPSUM LATH AND 1/2" SANDED PLASTER	15	39	–15	DITTO – EXCEPT METAL LATH AND 7/8" SANDED GYPSUM PLASTER (3 COATS)	17	39	–15	
MODIFICATIONS TO BASE CONSTRUCTION

MODIFICATION	STC RATING IMPROVEMENT	INR RATING IMPROVEMENT	SECTIONS
RESILIENT SUSPENSION OF CEILING	+10	+8	
"FLOATING RAFT" – ROUGH FLOORING AND FINISH FLOORING ON 1" x 3" SLEEPERS RESTING ON BUT NOT NAILED THROUGH RESILIENT FIBER BOARD	+10	+8	
STAGGERED JOISTS – CEILING INDEPENDENT OF FLOOR	+8	+7	RESILIENT DAMPING BOARD LAYER BETWEEN SUBFLOOR AND FINISH FLOOR UNDERLAYMENT (UNDERLAYMENT ADHESIVELY APPLIED TO DAMPING BOARD)	+7	0 to +2	
ABSORPTION IN CAVITY: (**ONLY WHEN CEILING RESILIENTLY SUSPENDED OR ON STAGGERED JOISTS; LITTLE OR NO IMPROVEMENT IN RIGID CONSTRUCTION)	+3	+7*	VINYL TILE	0	0	
3/32" LINOLEUM	0	+5	
1/4" CORK TILE	0	+10 to +15	
CARPET AND PAD	0	+20 to +25	

FORMULA

Cumulative improvement of any combination of these modifications is calculated thus: largest number + next largest number + next largest ... etc.

EXAMPLE:

A base construction such as 2" x 10" joists, with 1/2" plywood subfloors and standard oak flooring with 5/8" gypsum board ceiling nailed to joists (STC = 37, INR = –17)

		STC	INR
		37 points	–17 points
Add:	Resilient suspension of ceiling =	10	+ 8
Add:	Heavy carpet on thick pad =	0	+25
	Total	47 points	+16 points

Therefore, "Base Construction" increases from STC = 37, INR = –17 to STC = 47, INR = +16.

MODIFICATIONS TO CONCRETE FLOOR "BASE" CONSTRUCTION

MODIFICATION	STC RATING IMPROVEMENT	INR RATING IMPROVEMENT	SECTION – NO SCALE
"FLOATING RAFT": ROUGH FLOORING AND FINISH FLOORING ON SLEEPERS RESTING ON RESILIENT FIBER BOARD OR BLANKET ON RUBBER OR SPRING CLIPS.	+12	+20	DITTO – BUT SLEEPERS DIRECTLY ON CONCRETE; NO RESILIENT MATERIAL.	+7	+15	"FLOATING" CONCRETE TOPPING ON 1" THICK GLASS FIBER MAT OR EQUIVALENT.	+10	+15	SUSPENDED CEILING ON RESILIENT RUNNERS. RESILIENT CLIPS, OR WIRE HANGERS, SUSTANTIAL AIR SPACE.	+12	+8	RIGIDLY FURRED CEILING SKIN; VERY SMALL AIR SPACE.	+7	0	
1/2" SANDED PLASTER OR SIMILAR SURFACE SKIN	+2	0	
RESILIENT DAMPING BOARD UNDER FLOORING	0	+10	† ABSORPTION IN CAVITY: (ONLY WHEN CEILING RESILIENTLY SUSPENDED; LITTLE OR NO IMPROVEMENT IN RIGID CONSTRUCTION)	+3	+5†	WOOD FINISH FLOORING AT LEAST 1/2" THICK, SET IN MASTIC	0	+7	
VINYL TILE *	0	0	
CARPET AND PAD *	0	+20 TO +30	
3/32" LINOLEUM	0	+3 TO +5	
1/4" CORK TILE	0	+10 TO +15	

* Except on concrete on steel joists or concrete on cellular metal floors, where values are: Vinyl tile – STC improvement = 0, INR improvement = +5, Carpet and Pad – STC improvement = 0, INR improvement = +25 to +40.

FORMULA:

Cumulative improvement of any combination of these modifications is calculated thus: largest number + next largest number + next largest number...etc.

EXAMPLE:

Given a "Base Construction" such as 6" Reinforced Dense Concrete, bare surface, (STC = 46, INR = –17).

		STC	INR
Add: "Floating Raft"	=	+ 12 points	+ 20 points
Add: 3/32" Linoleum	=	+ 0	+ 4
	Total	12 points	24 points

Therefore, "Base Construction" increases from STC = 46, INR = –17 to STC = 58, INR = +7

NOTES ON SOUND ABSORBENTS

Sound absorbents convert acoustic energy into heat by internal friction of vibrating air within their porous structure. Their efficiency depends upon their thickness, density, (weight and amount of interconnected porosity) surface (% open), and their mounting method (particularly the air space behind them).

See graphs below.

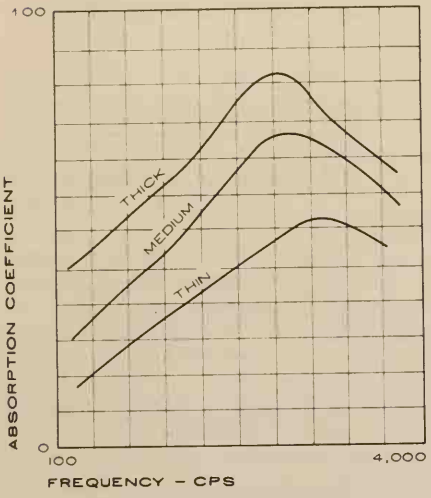
All building materials and furnishings absorb some energy. Particularly effective are:

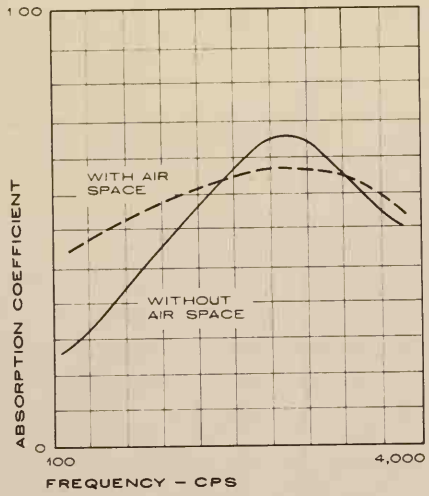
1. Carpets (especially on felt pads) unless carpet has heavily starched or latex back coating.
2. Heavy gathered draperies and fabrics.
3. Upholstered furniture.
4. Acoustical absorbents.

Thin paneling materials (glass, plywood 1/4" or less, sheet metal) with deep air space behind them are fairly effective absorbers in low frequencies (under 300 cps.)

Sound absorbents are used to:

1. Control noise (unwanted sound) within a space;
2. Control unwanted reflections (echoes and "flutters") from surfaces; and
3. Control reverberation (persistence of sound after source has ceased; high speed, multiple reflections within space) within a space.

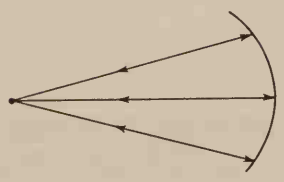




ROOM ACOUSTICS

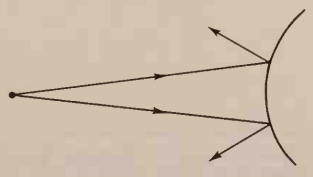
Room acoustics (within a space) are influenced by:

1. Shape and configuration
2. Room cubic volume and
3. Amount of absorption present.



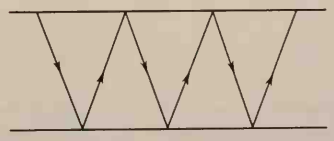
1. FOCUSED BY CONCAVE SURFACES

Avoid such configurations, if possible, or make the radial very short or long. Like an optical lens, such surfaces make "hot spots" which are very objectionable.



2. DIFFUSED BY CONVEX SURFACES

Where possible, use convex surfaces and deep texture on large surfaces to diffuse sound pleasantly, just as matte finish surfaces diffuse light into soft pleasant reflections. Texture, however, must be very deep—about 6" or so, to diffuse sound; fine sandpaper surfaces have almost no effect in sound diffusion.



3. REFLECTED BETWEEN PARALLEL SURFACES

If surfaces are about 70' away or more, distinct echoes may be reflected from them. Avoid having direct sound and reflected sound following paths more than 50' different in length. Large parallel surfaces as little as 20' apart can produce rapid, repeated reflections called "flutter".

EFFECTS OF SURFACE FORM ON SOUND ENERGY

Lyle F. Yerges, Consulting Engineer, Downers Grove, Illinois

ACOUSTICAL DESIGN

For a discussion of architectural acoustical design of spaces, refer to a publication of the Acoustical Materials Association, "The Use of Architectural Acoustical Materials—Theory and Practice", or to textbooks or reference books. Do not assume that adequate acoustical design involves covering the entire ceiling of a space with acoustical tile. In many cases this can be a mistake with serious consequences.

ACOUSTICAL MATERIALS

Acoustical materials are applied plasters, fibrous matrices, tiles, lay-in panels, blankets, boards, or hanging units which are specifically designed to absorb sound. Materials vary in type, appearance, composition, and performance.

For a detailed listing of available materials, their characteristics and performance, refer particularly to the current edition of the annually published Bulletin of the Acoustical Materials Association, "Performance Data of Architectural Acoustical Materials."

SOUND ABSORPTION COEFFICIENT

Sound Absorption Coefficient of a material is the ratio of sound absorbing effectiveness (at a specific frequency) of one square foot of the material to one square foot of a perfectly absorbtive material. It is expressed in a decimal value (such as .70) or in percent. Normally, acoustical absorbents are tested at 125, 250, 500, 1000, 2000 and 4000 cycles.

NOISE REDUCTION COEFFICIENT

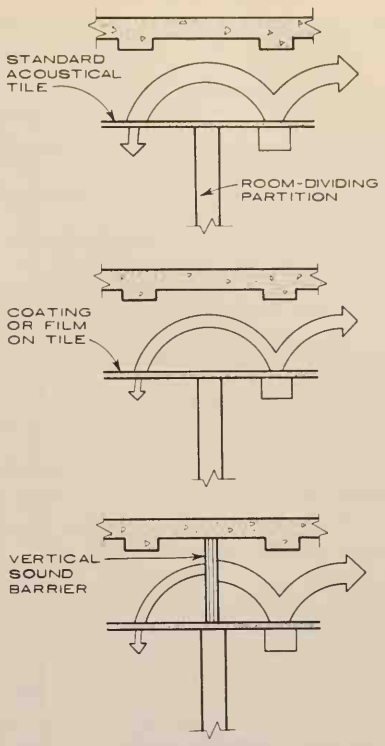
An arithmetic average, to nearest .05, of the four middle frequencies (250–2000) is called the Noise Reduction Coefficient. The resulting number is a good means of comparing the performance characteristics of similar products and in calculating anticipated reductions in noise levels (if the noise is predominantly at those frequencies).

SOUND TRANSMISSION LOSS OF SOUND ABSORBENTS

Most sound abosrbents are lightweight and porous. As a result, they usually have low TL values. Like blotters, they absorb but they don't prevent transmission through them. Unless partitions go to the structural slab above, only the TL up through the ceiling, over the top of the partition and down through the ceiling on the other side can be considered.

SOUND ATTENUATION FACTORS

The Acoustical Materials Association, in the above Bulletin, publishes Sound Attenuation Factors (roughly, the TL via the path through the ceiling, over the top of the partition) for the more commonly used acoustical materials. The ceiling STC should equal the STC–contour for the partition between the spaces under consideration.



SOUND TRANSMISSION THROUGH CEILINGS

CONSIDERATIONS FOR THE ACOUSTICAL DESIGN OF SPACES

1. Don't assume that acoustical design means covering the entire ceiling with acoustical tile.
2. Don't use "pure" geometric shapes. Concave, circular, or elliptical surfaces, cubical rooms, etc. require special consideration.
3. Don't surround the acoustical "source" with absorbent materials.
4. Don't penetrate or pierce walls, floors, or enclosing partitions unless absolutely necessary.
5. Don't ignore the mechanical and electrical systems; they not only generate noise, but they provide "leaks" and paths for sound transmission.
6. Don't assume that sound control is some form of applied "treatment" or hardware accessory.
7. Don't choose equipment based upon initial cost alone, assuming that problems which may arise can be cheaply corrected later with acoustical materials.

1. Do use absorptive materials on surfaces which might otherwise cause objectionable reflections.
2. Do use diffuse, convex surfaces designed to distribute sound to listening areas.
3. Do keep the "sending" or source end of a room hard and reflective.
4. Do maintain the integrity of walls and enclosing surfaces; seal all holes and openings.
5. Do consider the mechanical and electrical equipment as an integral part of the building's acoustical design.
6. Do use qualified professional advice on any space with acoustically critical requirements.
7. Do avoid noise problems by choosing quiet equipment, acoustically adequate constructions; choose all materials for their acoustical properties as well as for their other characteristics.

Daniel S. Briggs; Vincent G. Kling and Associates; Philadelphia, Pennsylvania
Lyle F. Yerges, Consulting Engineer; Downers Grove, Illinois

NOTES:

1. This table lists conservative "rule-of-thumb" recommendations for the use of absorption in common occupancies. For further information, refer to publications of the Acoustical Materials Association, various books and publications, or to a qualified acoustical consultant.

2. Or an equivalent amount of distributed absorption provided by carpets, draperies, furnishings, etc.

3. Sidewall treatment advisable in addition to ceiling treatment to reduce reflections, flutter, or echo, to further reduce noise, or to control reverberation.

4. Highly complex applications, usually requiring services of an acoustical consultant. May require special forms or types of absorption, or, in some instances, none at all.

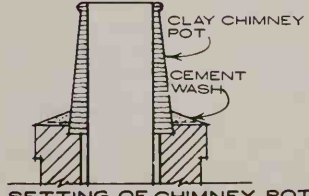
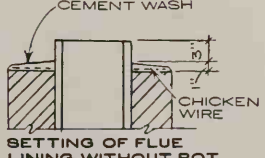
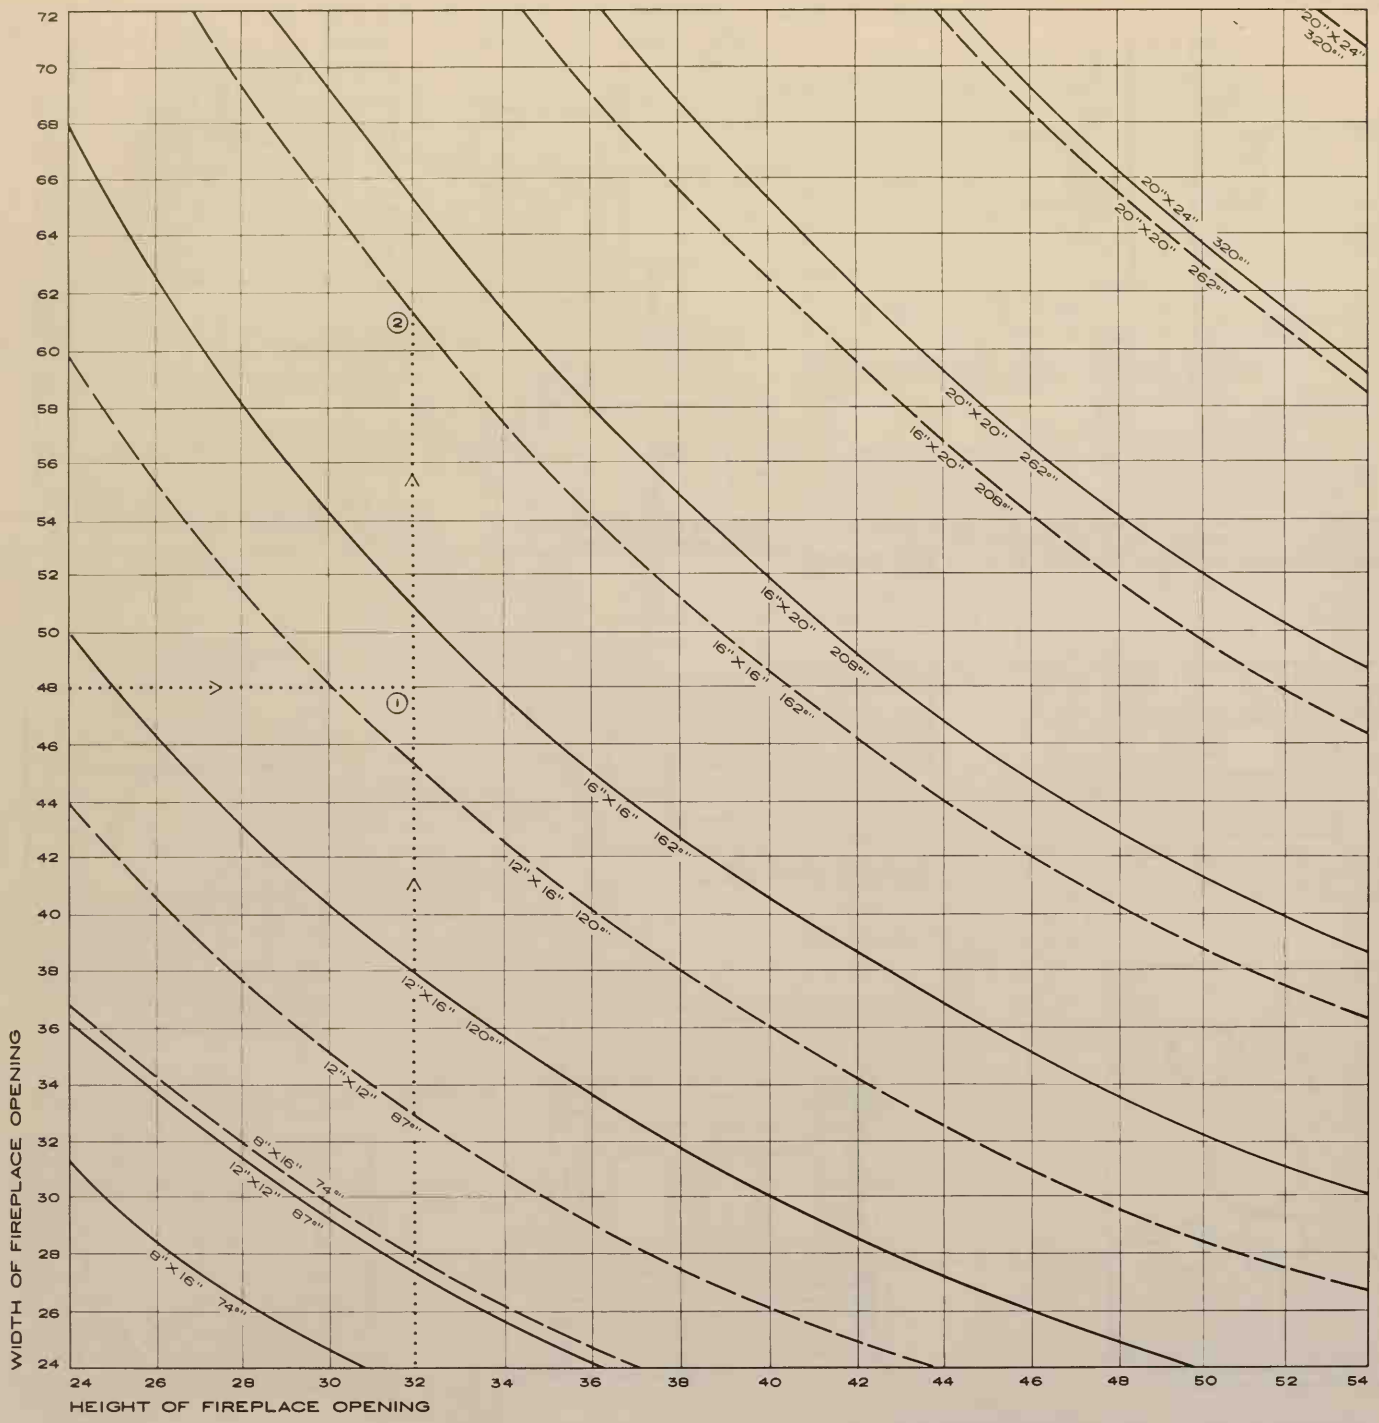
FLUE FROM GAS BURNING EQUIPMENT



SETTING OF CHIMNEY POT



SETTING OF FLUE LINING WITHOUT POT



——— Recommended flue size – 1/10 of fireplace area.

– – – Recommended minimum flue size 1/12 of fireplace area.

NOTE.

Charts are based on net flue areas.

Modular flues only made in rectangular sizes. If round flue is desired for modular chimney, use non-modular round flue.

If flue is less than 20 feet high, it is advisable to use the next larger flue size unless intersection ① falls well below the fireplace area curve.

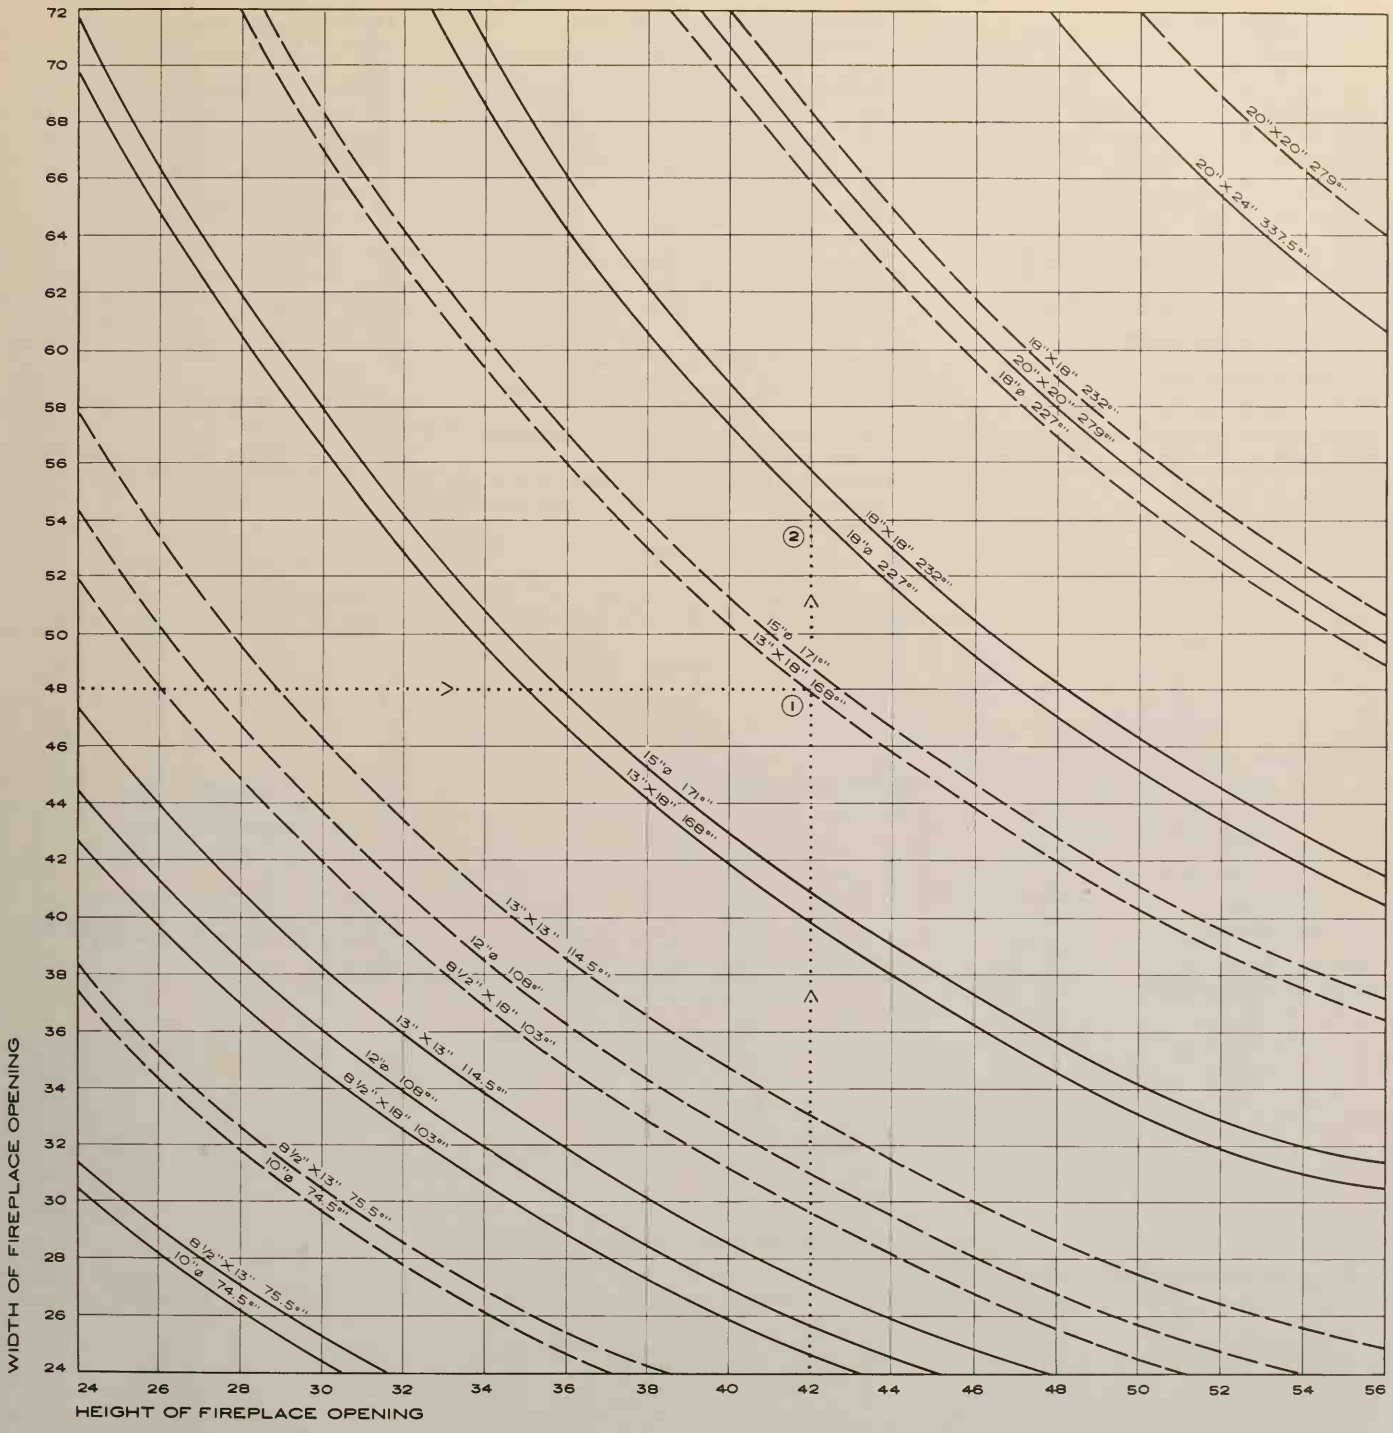
PROBLEM

Find proper modular flue size, at 1/12 fireplace area, for a fireplace 48" wide and 32" high.

SOLUTION

① Find intersection of 48" width with 32" height of fireplace.

② Proper flue size is nearest curve (for 1/12 area) above intersection, in this case, 16" x 16".



——— Recommended flue size - $^1/_{10}$ of fireplace area.

— — — Recommended minimum flue size $^1/_{12}$ area of fireplace.

EXPLANATION OF CHIMNEY HEIGHT:

The F.H.A. measures height of chimney from the throat and the Department of Agriculture measures it from the hearth; despite discrepancy, these charts have long been used measuring from either point, and their validity is not in doubt. Measuring from either point gives results of sufficient accuracy for good fireplace design.

NOTES:

Charts are based on minimum net inside flue areas.

For chimney less than 35' high, use $^1/_{10}$ ratio for flue, over 35', use $^1/_{12}$ ratio. If flue is less than 20' high, it is advisable to use next larger flue size, unless intersection ① falls well below the curve.

Smallest flue recommended for any fireplace is 10" diameter.

PROBLEM

Find proper flue size at $^1/_{10}$ fireplace area for fireplace 48" wide and 42" high.

SOLUTION

① Find intersection of 48" width with 42" height of fireplace.

② Proper flue size is nearest curve (for $^1/_{10}$ area) above intersection, in this case, 18" ø. For rectangular flue, continue to next curve for $^1/_{10}$ area: 18" x 18".

ROUND FLUE LININGS

AREA (sq. in.)	A	T	LENGTH
26	6"	5/8"	2'– 0"
47	8"	3/4"	2'– 0"
74.5	10"	7/8"	2'– 0"
108	12"	1"	2'– 0"
171	15"	1 1/8"	2'– 0"
240	18"	1 1/4"	2'– 0"
298	20"	1 3/8"	2'– 0"
433	24"	1 5/8"	2'– 0"
551	27" *	2"	2'– 6"
683	30" *	2 1/8"	2'– 6"
829	33" *	2 1/4"	2'– 6"
989.5	36" *	2 1/2"	2'– 6"

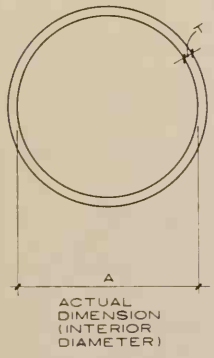
* Not available in some localities

Areas shown are net inside areas.

Wall thicknesses shown are minimum required.

Nominal flue sizes for round flues is interior diameter, outside dimensions for non-modular rectangular flues. Nominal dimensions for modular flue linings are actual dimensions plus 1/2".

Verify with local manufacturers for available types and sizes of flue linings.



ROUND

RECTANGULAR FLUE LININGS

STANDARD

AREA (sq. in.)	A	B	T
22	4 1/2"	8 1/2"	5/8"

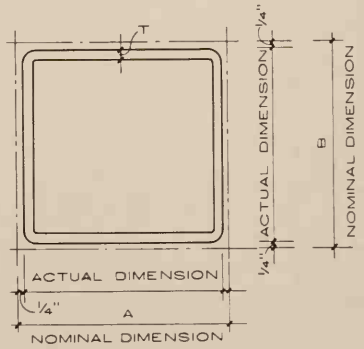
385	24"	24"	1 5/8"

All flue linings listed above are 2'– 0" long, also available, on request, in 12" lengths.

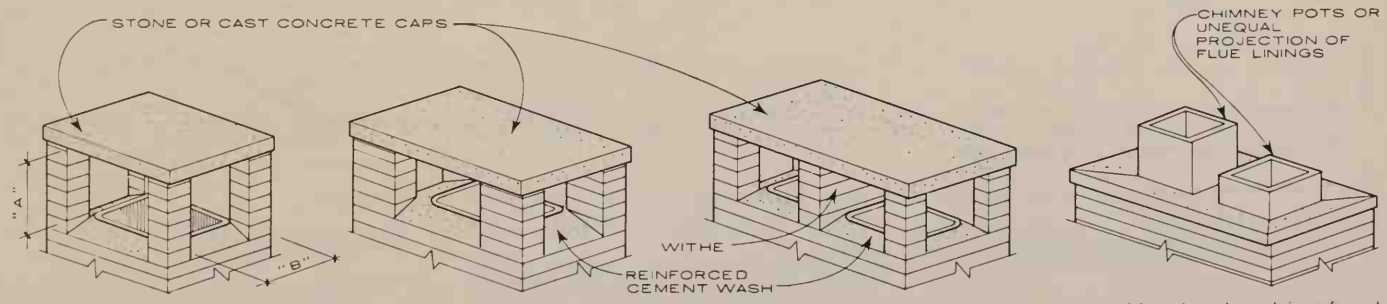
For proper flue sizes for fireplaces using modular flue linings see page titled: Modular Flue Sizes for Fireplaces.



Cross section of flue lining shall fit within rectangle of dimension corresponding to nominal size.

MODULAR

CLAY FLUE LININGS



Chimney hoods to prevent downdraft due to adjoining hills, buildings, trees, etc.

"A" should be 1/4 greater than "B" in all hooded chimneys.

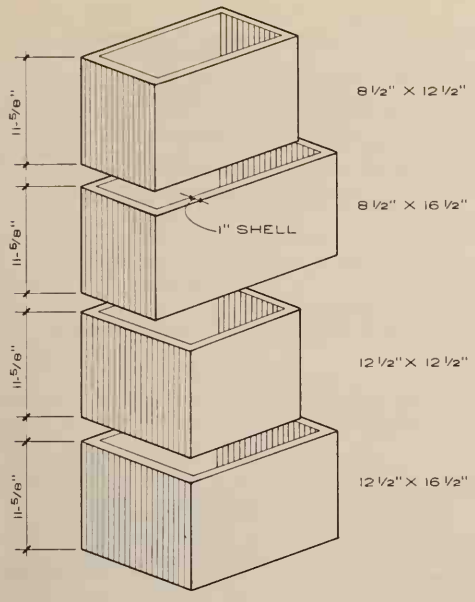
Chimney hoods also serve as water protection for seldom used flues.

Withe between flues is the best method of preventing downdraft.

Unequal projection of flues above the stack is a safeguard against smoke pouring out of one flue and down the other.

CHIMNEY HOODS & POTS

Robert B. Martin, AIA, Lincoln City, Oregon



Recommended by the International Conference of Building Officials as required by the Uniform Building Code.

Internally mixed brick red color.

60	92	36	76	28	32	32	80	13 x 18	16 x 20

NOTES: Figures given are nominal sizes to conform to modular dimensions. The thickness of facing will vary with material used. The wall back of the Heatsaver as shown is 4" thick. If this is an exterior wall it should be 8", and dimension M increased 4".

Q and R measurements can be determined by adding wall thickness to flue size dimensions. Since wall thickness can vary, Q and R are not given in the table. Minimum wall thickness is 4". On the 28" unit only, the R measurement cannot be more than 20", or the warm air opening through the casing, as shown on the drawing, will be distorted.

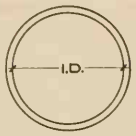
HEAT CIRCULATOR FIREPLACE

Robert B. Martin, AIA; Lincoln City, Oregon

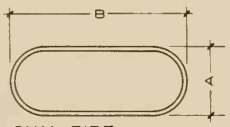
Listed by Underwriters Laboratories, Inc., as acceptable for venting all listed gas appliances equipped with draft hoods.

Sized from 3 inches I.D. to 24 inches I.D.

Can be installed from 1 to 3 inches from combustible construction. (See current Underwriters Laboratories, Inc., Gas and Oil Equipment List for distances for each manufacturers product.)



ROUND PIPE



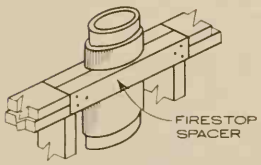
OVAL PIPE

TYPE B GAS VENTS

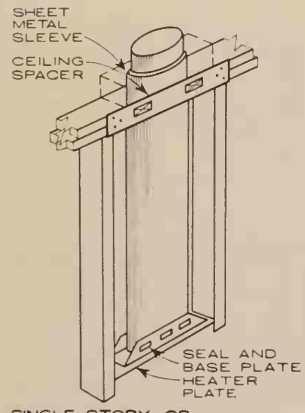
NOTE:
SEE ANOTHER PAGE IN THIS SERIES FOR FLUES FROM GAS BURNING EQUIPMENT

Oval pipe of 4 and 6 inch sizes listed as acceptable for use in 2 x 4 stud walls and 2 x 6 stud walls, studs on 16 inch centers.

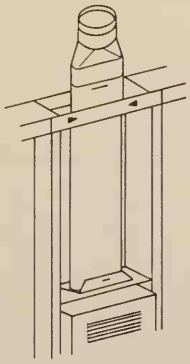
Engineered capacity tables for properly sizing vent systems available from vent manufacturers. Parts available in straight lengths, adjustable lengths, fixed and adjustable elbows, tees, increasers, adaptors, round to oval and oval to round, flashings, storm collars and caps.



MULTI-STORY UPPERFLOORS



SINGLE STORY OR FIRST FLOOR OF MULTI-STORY

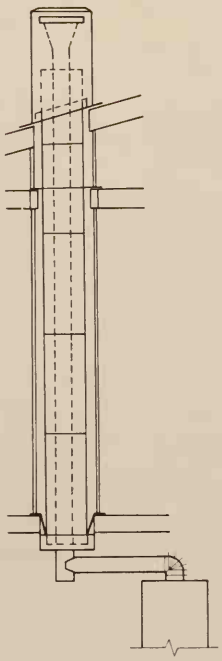


Similar to type B 4" oval except additional parts are supplied. The only vent acceptable for use in 2 x 4 walls for venting listed gas fired vented wall furnaces.

Consists of pipe-base plate, seal, ceiling spacer and fire stop spacer. Type BW gas vents shall have listed capacity not less than that of the listed vented wall furnaces to which they are connected.

TYPE BW GAS VENTS CHIMNEYS

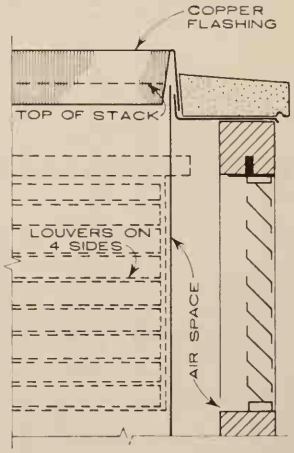
Chimneys consisting entirely of factory made parts which are designed to be assembled with other parts of the same model without requiring field construction. Produced in sizes from 6" I.D. to 12" I.D. Listings for 1" or 2" distance from enclosure walls and roof structure.



Approved for use with residential and industrial low heat appliances using solid, liquid or gaseous fuel including domestic type incinerators, fireplace stoves, and when so listed, may be used with masonry fireplaces.

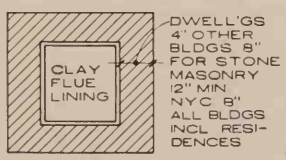
Maximum allowable height determined by U.L. listing varies from 8' to 60'.

FACTORY BUILT CHIMNEY



Min. thickness for masonry enclosed metal smoke stack: 154 □" or less =16 U.S. ga. (1/16"), 154 □" to 201 □" =14 U.S. ga. (5/64"+), 201 □" to 254 □" =12 U.S. ga. (7/64"-) 254 □" and over. =10 U.S. ga. (9/64"-)

TOP OF METAL SMOKESTACK WITH BRICK SURROUNDS

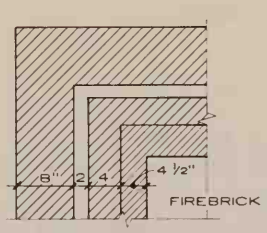


Chimneys for stoves, cooking ranges, warm air, hot water and low pressure steam heating furnaces, low heat industrial appliances, portable type incinerators, fireplaces.

LOW HEAT APPLIANCES

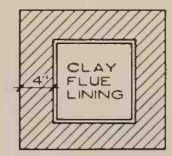
Chimneys for high pressure steam boilers, smoke houses, and other medium heat appliances other than incinerators. Continue firebrick up 25' min. N.Y.C. firebrick up 50' min.

MEDIUM HEAT APPLIANCES

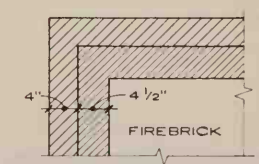


Chimneys for cupolas, brass furnaces, porcelain baking kilns, and other high heat appliances.

HIGH HEAT APPLIANCES



For domestic type incinerators where firebox or charging compartment is not larger than 5 cu. ft.



FOR RESIDENCE BLDGS., INSTITUTIONAL BLDGS., CHURCHES, SCHOOLS & RESTAURANTS.

For apartment house type incinerators. Continue fire brick up 10' above roof of combustion chamber for grate area 7 □' or less; 40' above for grate area exceeding 7 □'.

CHIMNEYS FOR INCINERATORS

MINIMUM CHIMNEY REQUIREMENTS

Robert B. Martin, AIA, Lincoln City, Oregon

GENERAL NOTE :

Based on advice of the late Frederick N. Whitley, fireplace and chimney specialist.

The open floor plan makes useful multi-opening and free standing fireplaces. Design requirements for such fireplaces vary from those of conventional fireplaces. The following rules of thumb are given to aid in achieving proper function of these newer fireplaces.

Trouble factors encountered in the design for most fireplaces are:

1. Flue too small
2. Damper throat too narrow
3. Omission of smoke shelf
4. Smoke chamber inadequate in volume

Proper functioning of fireplaces is dependent not only on fireplace and flue design, but also on the following:

1. Height of flue and its projection above various types of roof.
2. Neighboring and adjoining conditions, such as terrain, trees and buildings.
3. Wind directions and climate

Certain cross draft conditions within a room may cause the following types of fireplace to smoke without regard to the design of chimney or fireplace.

1. Fireplace open front and side
2. Fireplace open front and back
3. Fireplace open three sides (one long and two short sides)
4. Fireplace open three sides (two long and one short side)
5. Fireplace open four sides.

Rules of thumb design data follow, below and to right:

D (damper at bottom of flue, Section A) = free area of flue

D (damper closer to fire, Section B) = twice free area of flue. Set damper a minimum 8" (preferably 12") from bottom of smoke chamber. Operatable part of damper when open should extend entire length of smoke chamber as shown.

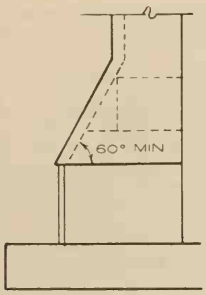
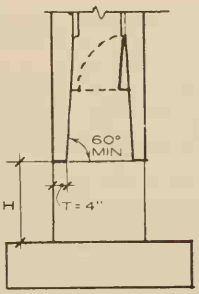
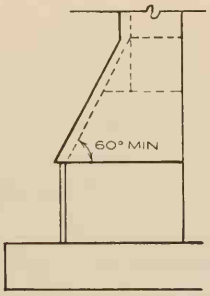
FLUE : free area = $^{1}/_{12}$ of H x (L plus 2W)



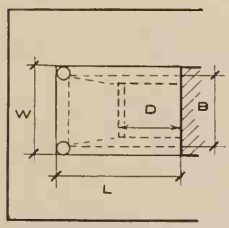
ELEVATION A



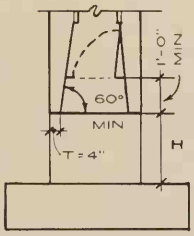
SECTION A



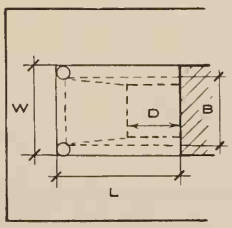
ELEVATION B



PLAN A



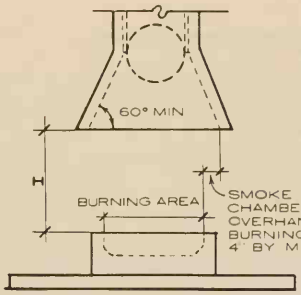
SECTION B



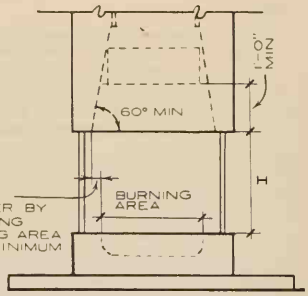
PLAN B

FIREPLACE OPEN THREE SIDES
(TWO LONG AND ONE SHORT SIDE)

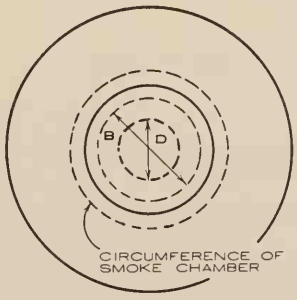
1. H = height from top of hearth to bottom.
2. B (depth) of burning area) = $^5/_6$ H minus 8", but never less than 24".
3. W (width of fireplace) = B plus T plus T.
4. D (damper at bottom of flue, Sect. A) = free area of flue.
5. D (damper closer to fire, Sect. B) = twice free area of flue. Set damper a minimum of 12" from bottom of smoke chamber. Operatable part of damper when open should extend entire length of smoke chamber, as shown.
6. Flue: free area = $^1/_{12}$ of H x (2L plus W).



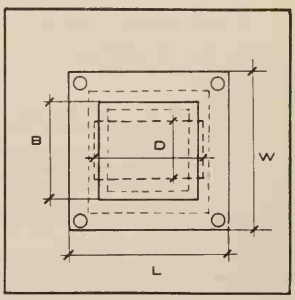
ELEVATION A



ELEVATION B



PLAN A



PLAN B

FIREPLACE OPEN FOUR SIDES

1. H (height from top of hearth to bottom of facing) must never exceed the longest dimension of the burning area. It is recommended that H never exceed 28".
2. B (burning area, circular fireplace, Elev. A) = 32" minimum diameter.
3. B (burning area, square or rectangular fireplace) = 24" minimum dimension.
4. D (damper at bottom of flue, Elev. A) = area of flue.
5. D (damper closer to fire, Elev. B) = twice flue area. Set damper a minimum of 12" from bottom of smoke chamber. Operatable part of damper when open should extend entire length of smoke chamber, as shown.
6. Flue, circular fireplace: free area = $^1/_{17}$ of H x 3.14 x (B plus 8").
7. Flue, square or rectangular fireplace: free area = $^1/_{12}$ of H x (2L plus 2W).

GENERAL NOTES:

In addition to proper damper and flue size, the flue height and fresh air necessary to support combustion are factors which should not be overlooked in fireplace design. The following rules of thumb make allowance for these factors:

1. In a one story flat roofed building the flue should extend 8'– 0" above the roof.
2. In a flat roofed building of two or more stories the flue should extend 6'– 0" above the roof.
3. In a one story pitched roof building the flue should extend 4'– 0" above the roof ridge.
4. In a pitched roof building of two stories or more the flue should extend 4'– 0" above the roof ridge.
5. Fresh air to support combustion and proper draft is often supplied by crack leagage around doors and windows. It can also be supplied by leaving a space between the floor and the bottoms of doors in the room where the fireplace is located. However, in air-conditioned buildings, where cracks and crevices are weatherstripped and insulated, it is more of a problem to supply the proper quantity of fresh air. The following formulas indicate the quantities of fresh air necessary for the various fireplaces. Letters shown in formulas are on the diagrams for each fireplace.

Fireplace open front and side: cubic feet per minute of fresh air = (L plus W) x H x 60. Fireplace open front and back: c.f.m. fresh air = 2L x H x 60.

Fireplace open three sides (one long and two short sides): c.f.m. fresh air = (L plus 2W) x H x 60.

Fireplace open three sides (two long and one short side): c.f.m. fresh air = (2L plus W) x H x 60.

Fireplace open four sides:
Circular: c.f.m. fresh air = 3.14 x (B plus 8") x H x 60.

Square or rectangular: c.f.m. fresh air = (2L plus 2W) x H x 60.

NOTE:

Consult local building codes on all details of fireplace construction and chimney heights.

This and the following pages show examples of special fireplaces. Variations in design may be achieved by use of different dampers.

1. Low dampers with separate lintels and more elaborate masonry work. Two dampers often required.
2. High dampers with integral lintels and a minimum of masonry work.

Relative costs will vary with each condition.

PRECAST CONCRETE FIREPLACE

COURTESY OF DON SCHOLZ

Robert B. Martin, AIA, Lincoln City, Oregon

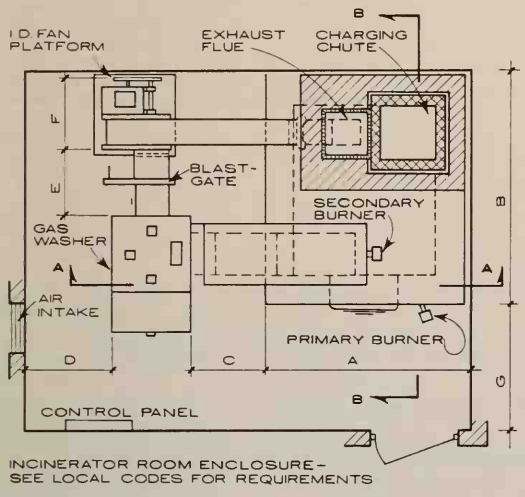
The automatic flue fed incinerator is designed for incineration of all types of waste including ordinary household rubbish, kitchen garbage, pathological waste and others. The system incorporates two flues, a charging flue and an exhaust flue. In some cases, existing boiler flues can be utilized as the exhaust flue.

The heart of the flue fed system is the gas washer. Its functions are to eliminate fly ash and to reduce temperatures of exhaust gases to 600°F maximum, so that the induced draft fan can handle them properly. Manufacturers should supply test reports by an independent organization.

A good incinerator will have automatic start up of entire system when the temperature rises in the combustion chamber. If matches or cigarettes are thrown down the chute igniting the rubbish prematurely; rather than allow emission of smoke out of the hopper doors, the entire system is reactivated and will operate as intended until such time as the temperature decreases and the system automatically shuts down.

Economy is a factor that should be considered in choosing incineration equipment. For example, a time cycle which allows the ignition burner to operate on predetermined settings. These settings can be from 30 seconds to 30 minutes (usually for 60 seconds every hour) and allow the burner to operate as it is intended—merely to ignite rubbish which has been charged into the incinerator. The incinerator design indicated below is recognized by leading air pollution authorities. One of the design features is use of a firebrick lined steel breeching to complete secondary combustion, rather than the use of the two pass system. This feature allows the utilization of the full output of the burner in completing combustion. This design completely eliminates any possibility of smoke emission from hopper doors.

Operation should be continuous and automatic, thereby eliminating set charging periods, thus increasing convenience to the tenants and avoiding storage of refuse inside apartments.



NOTE:
PATENT ON THIS INCINERATOR DESIGN IS PENDING

NOTE :

Vault doors, walls, floors and ceilings are always chosen to conform with insurance requirements. The maximum rating for a vault including the doors is a No. 10R classification. For further information see "Manual of Burglary Insurance" issued by the National Bureau of Casualty Underwriters, N.Y.C. and "Merchandise Vaults and Safes" issued by the National Board of Fire Underwriters, N.Y.C. Various types of wall, floor and ceiling construction and door thicknesses are possible. For the most commonly used types, see classification table. The average minimum vault size is 8'– 6" x 12'– 0".

NOTE:

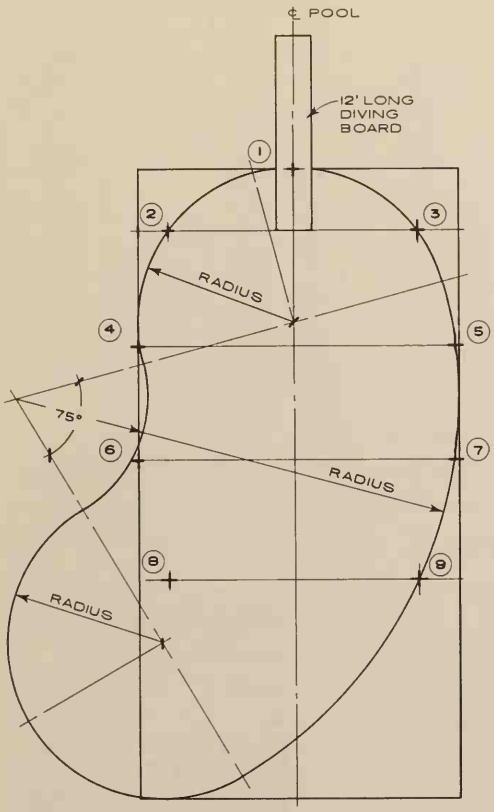
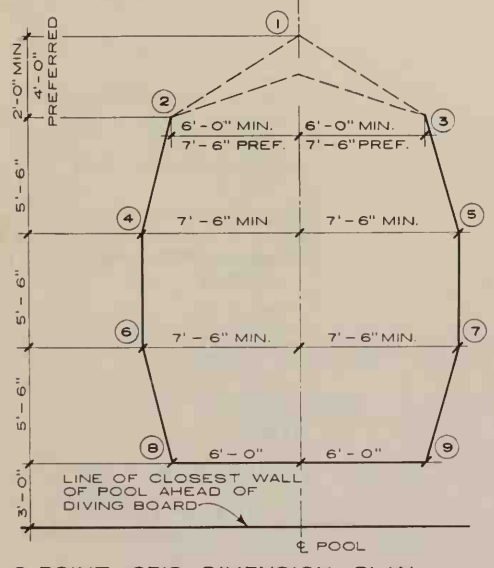
The drawings below illustrate the use of a 9-point dimension grid which expresses the minimum desirable dimensions to be used when either specifying or designing a kidney or rectangular shaped pool for residential use.

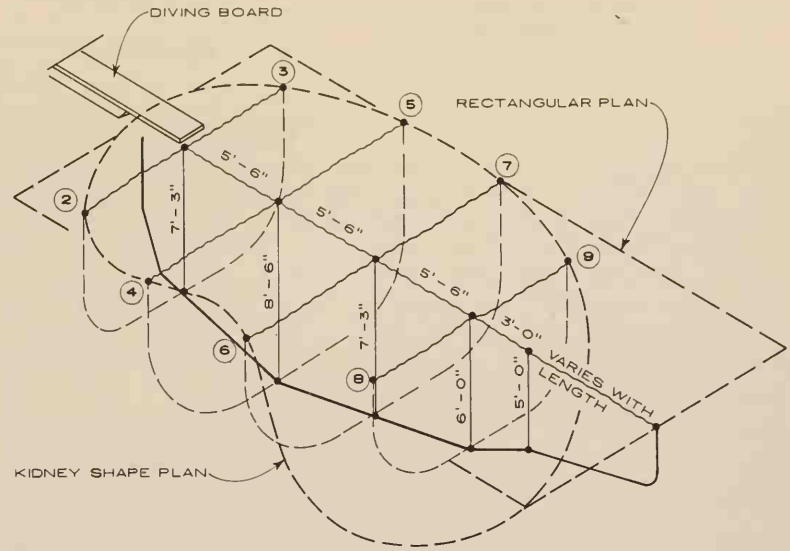
Width, length, and depth dimensions may apply to any shape residential pool.

The minimum length with diving board and wading area is 30'. The average length of a residential pool is 40'.

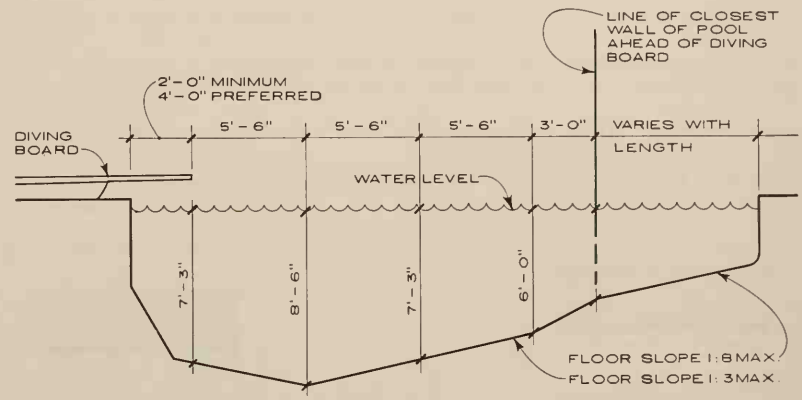




9 POINT GRID DIMENSION PLAN



ISOMETRIC OVERLAY VIEW



LONGITUDINAL SECTION AT CENTERLINE

PERMITS AND RESTRICTIONS:

Required in most areas from building, health, plumbing, and electrical departments and zoning board. Check for setback restrictions and easements covering power and telephone lines, sewers and storm drains.

SITE CONSIDERATIONS:

Check the site for the following conditions, any of which will increase the cost considerably:

1. Fill more than 3' below pool deck.
2. Hard rock which will require drilling and blasting.
3. The presence of underground water or springs neccessitating pumping.
4. Accessibility of the site for mechanical equipment, minimum entry 8'– 0" wide x 7'– 8" high, with a grade easy enough for a truck to reach the site.
5. Locate the pool where it will get the most sun during swimming season. Place deep end if possible, so a diver dives away from, not into, the afternoon sun. Avoid overhanging tree branches near the pool.
6. The slope of the site should be as near level as possible; a steep slope requires retaining walls for the pool.

CONSTRUCTION AND SHAPES.

Pools may be made of reinforced concrete, either poured on the job, precast or gunite sprayed; concrete block, steel, aluminum, or plastic with or without block back-up. Concrete, aluminum, and steel pools are available in any shape: rectangular, square, kidney, oval, or free-form. Complete plastic installations and plastic pool liners with various back-ups are available only in manufacturers' standard shapes and sizes.

For practical purposes a rectangular pool is the most satisfactory giving the longest swimming distance.

POOL CAPACITY:

(Rule of Thumb): 36 sq. ft. for each swimmer, 100 sq. ft. for each diver. Pool 20' x 40' accomodates 14 persons at a time but since not everyone is in pool at once, pool and surrounds adequate for 30 – 40 people.

FILTER REQUIREMENTS:

Filter shall be sheltered, motor and electrical equipment shall be waterproofed.

Kenneth Jacobsen; R. Jackson Smith, AIA; Eggers & Higgins; New York, New York

GENERAL

Public pools are generally considered as those belonging to municipalities, schools, country clubs, hotels, motels, apartments, and resorts. Permits for their construction are required in most areas from local and state Boards of Health as well as the departments of Building, Plumbing and Electricity.

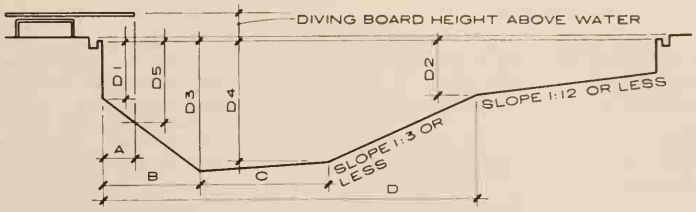
Community pools should be integrated with existing and projected recreational facilities, such as picnic areas and parks, for maximum usage. Transportation access should be good, and there should be ample parking space. In a hot climate, enough shade should be provided, particularly in the lounging areas, and so located that it can be easily converted to spectator space by erection of bleachers.

Most local codes require that public pools have: (1) multiple unit filters, (2) mechanical chlorination, (3) a prescribed floor slope, (4) scum gutters in very large pools.

POOL DESIGN

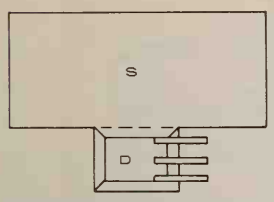
Formerly most public pools were designed to meet competitive swimming requirements. The trend today is to provide for competitive dimensions and also design for all-around use. The following should be considered:

1. Ratio of shallow water to deep water. Formerly 60% pool area 5' deep and less was considered adequate. Now 80% is considered more realistic.
2. Ratio of loungers to bathers. Generally, no more than one-third of people attending a public pool are in the water at one time. Consequently the 6' to 8' walks formerly surrounding pools and used for lounging have been enlarged so that lounging area now approximates pool size.
3. For Capacity Formula see "Public Swimming Pool Capacity" diagram on another page.

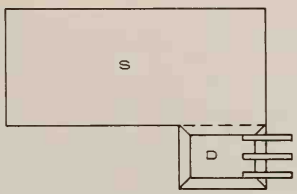


RECOMMENDED DIMENSIONS

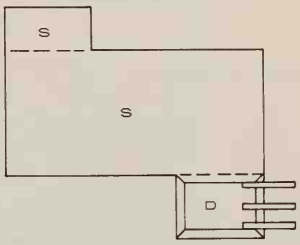
BOARD HEIGHT ABOVE WATER		D1 (3)	D2	D3	D4	D5	A	B	C	D
24 inches	MIN	5'–0"	4'–6"	8'–0"	8'–0"		2'–6"	6'–0"	6'–0"	24'–0"
	MAX		5'–6"				4'–0"	10'–0"		
1 meter	MIN	5'–0"	4'–6"	8'–6"	8'–0"	7'–6"	5'–0"	6'–0"	9'–0"	30'–0"
	MAX		5'–6"				6'–0"	10'–0"		
3 meters	MIN	5'–0"	4'–6"	12'–0"	11'–6"	8'–6"	5'–0"	6'–0"	9'–0"	35'–0"
	MAX		5'–6"				6'–0"	10'–0"		



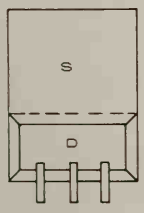
"T" SHAPED POOL
Provides large shallow area(s). Diving area off to one side. Water in large part of pool from 3'–6" to 5'–0" deep, adequate for regular competitive events.



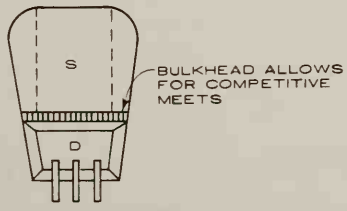
"L" SHAPED POOL
These two shapes generally desired for large 50 meter pools.



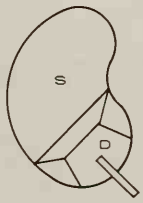
"Z" SHAPED POOL



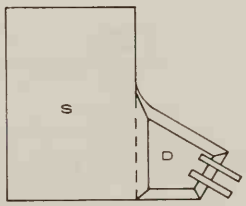
RECTANGULAR POOL
Standard design. Good for competitive swimming & indoor pool design. Shallow area often inadequate.



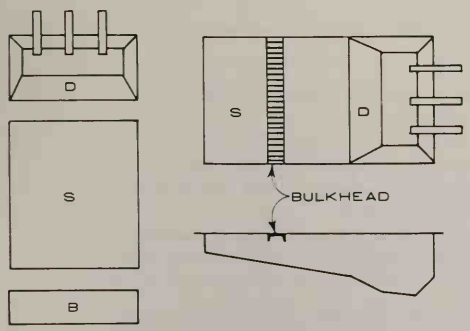
FAN – SHAPED POOL
Successful where there is a high percentage of children. Largest area for shallow depth. Deep area can be roped off or separated by bulkhead.



FREE – FORM POOL
Kidney & oval shapes are the most common free-forms. Use only where competitive meets are not a consideration.



MODIFIED "L" POOL
Provides for separate diving area. Shallow area with 4'–0" min. depth may be roped off for competitive meets.



MULTIPLE POOLS
Separate pools for beginners, divers and swimmers. Ultimate in desirability especially if pool is intended for large numbers of people. Variation at left shows single pool and bulkhead over it with advantage that swimmers are kept out of area reserved for beginners. Both designs may use common filtration system.

WADING POOLS
Generally provided in connection with community and family club pools. Placed away from swimming area to avoid congestion. If near swimming pool, wading area should be fenced off for children's protection. To add play appeal provide spray fittings and small fountains in pool. Also provide seats and benches for adults who accompany children to pool.

PUBLIC POOL SHAPES

NOTE: S = Swimming Pool, D = Diving Pool, B = Beginners Pool

Kenneth Jacobsen; R. Jackson Smith, AIA; Eggers & Higgins; New York, New York

LENGTH OF POOLS:

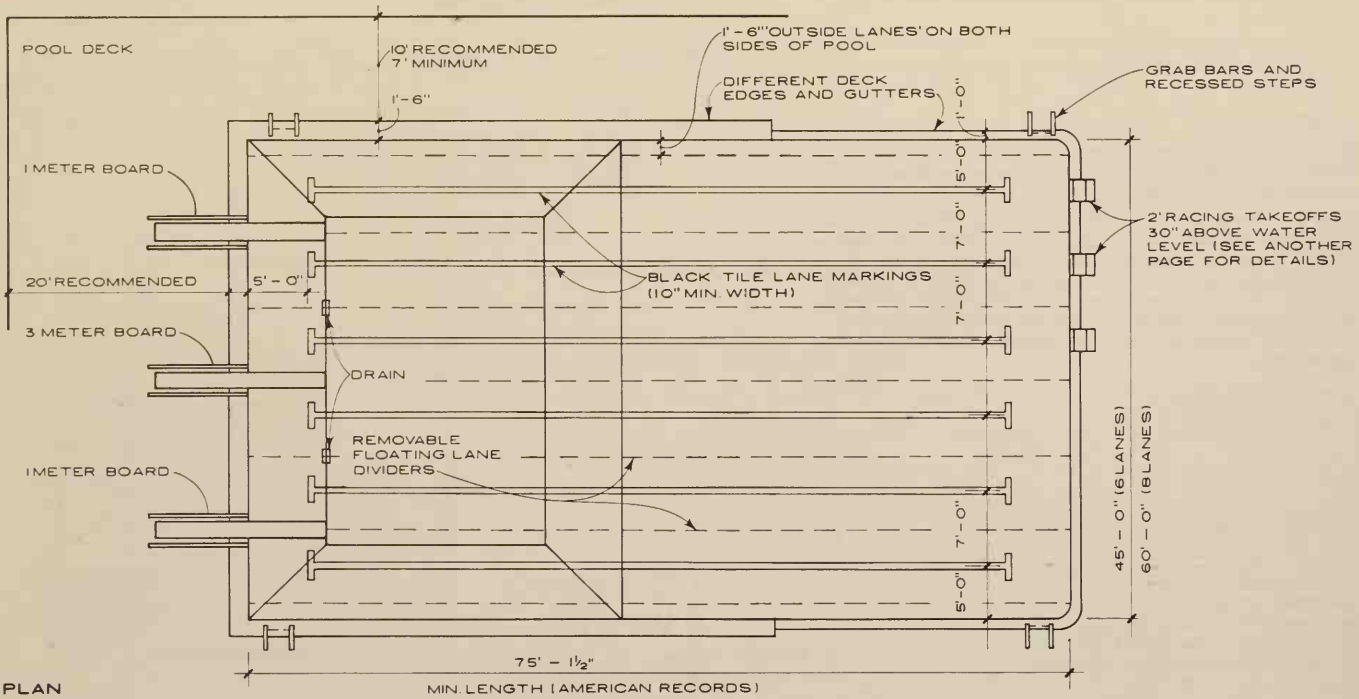
25 yards is the minimum length for American records, and meets interscholastic and intercollegiate requirements. (Pool should be 75'–1 1/2" long to allow for electronic timing panels at one end.)
50 meters (164'–0 1/2") is minimum for world (F.I.N.A.) records. Add 3 1/2" for electronic timing devices.

WIDTH OF POOLS:

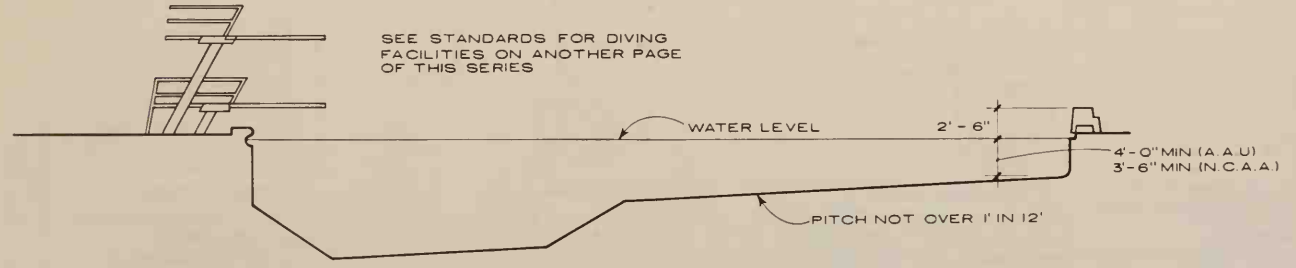
Drawing below shows 7' lanes. 6' lanes with pool width a multiple of 6' also meet general racing requirements. Strictly competitive pools should have 7' lanes.
Min. width of 25 yard pool is 36' (6' lanes) or 42' (7' lanes). With outside lanes, min. widths are 38' or 45'. 60' width (8 lanes) is desirable.

NOTE:

Gutters at sides of pool are desirable to reduce wave action in swimming meets or water polo. See lighting standards and diving board standards on other pages of this series for additional requirements for competitive pools.

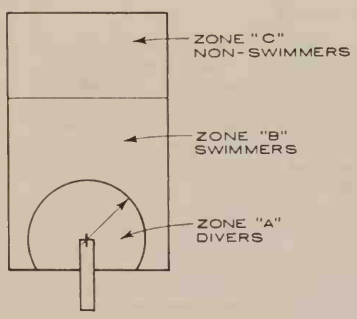


PLAN



LONGITUDINAL SECTION

25 YARD POOL



Swimming pool capacity requirements vary from one locality to another: check local regulations. The following is suggested by the American Public Health Association.

FORMULA DERIVATION:

ZONE "A"	Diving area defined by 10' radius from diving board or platform. 12 divers per board; 2–3 in water, the rest on shore. Or allow 300 sq. ft. of pool water surface per board.
ZONE "B"	Swimming area; 24 sq. ft. per swimmer. Based on volume displaced by each swimmer (4/5 square of average ht.) and adjusted by the number of swimmers using pool at one time. (2/3 total swimmers).
ZONE "C"	Non-swimmer area. 10 sq. ft. per person. Based on volume displaced by person (1/2 area allowed per swimmer) and adjusted by number not using water–50% (in some pools with large number of non-swimmers, figure may be as high as 75%).

FORMULA: $\text{Max. pool capacity} = \frac{12 \times \text{No. diving boards or platforms} + \text{Area Zone "B"}}{24} + \frac{\text{Area Zone "C"}}{10}$

PUBLIC SWIMMING POOL CAPACITY

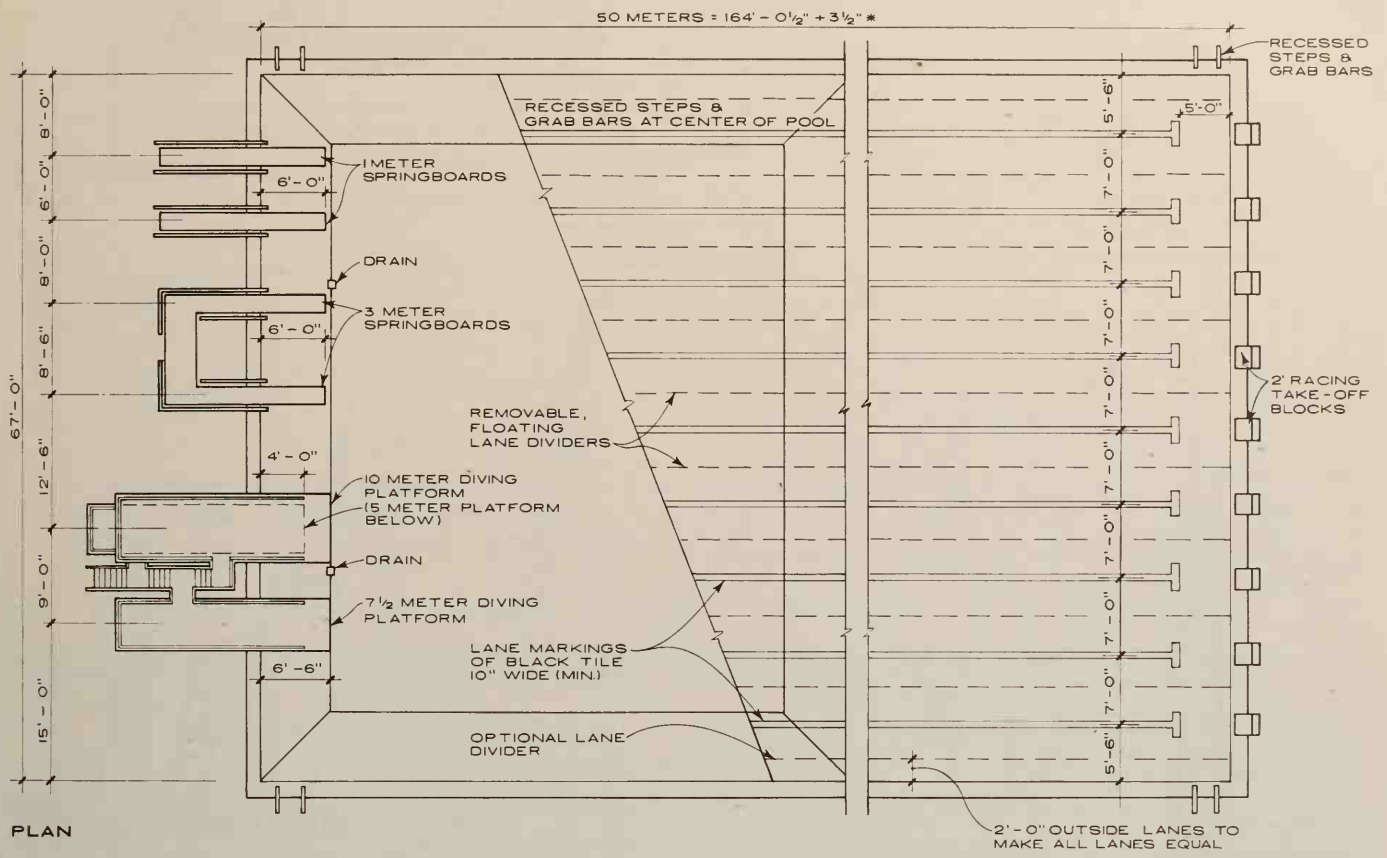
Kenneth Jacobsen; R. Jackson Smith, AIA; Eggers & Higgins; New York, New York

GENERAL NOTES:

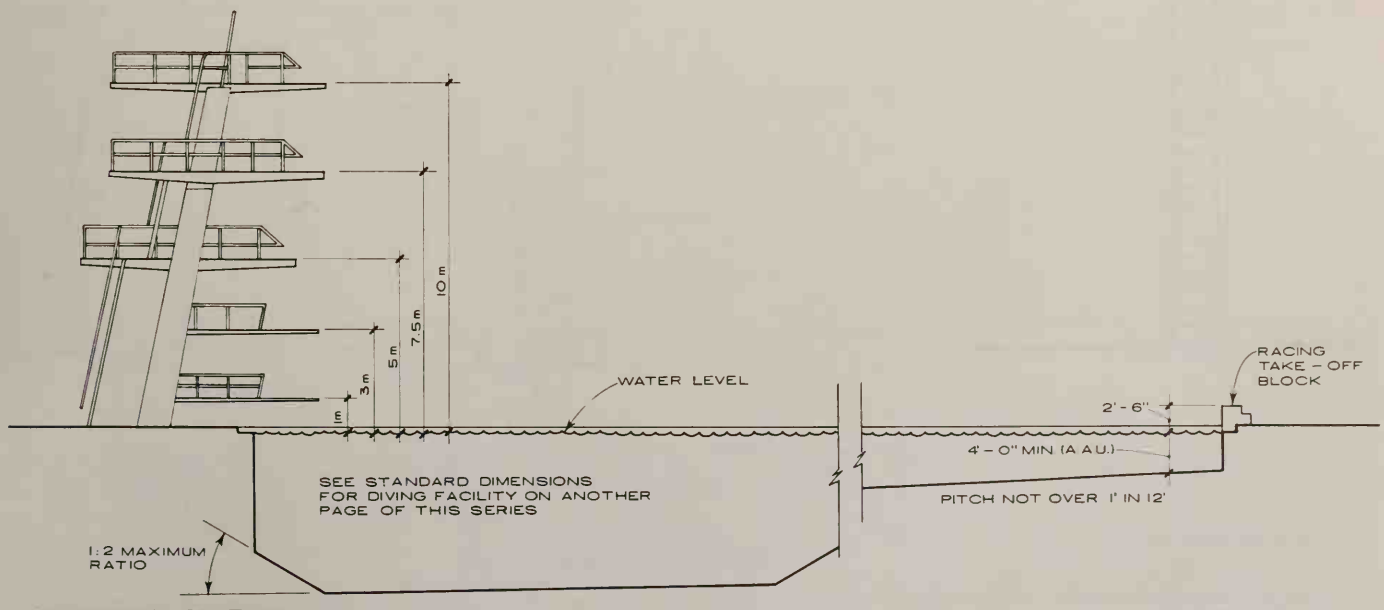
For judging competitive meets, A.A.U. officials recommend the springboard and diving platform arrangement indicated below in plan. Diving dimensions meet A.A.U. and F.I.N.A. standards. Fifty meters is minimum length for world records.

NOTE:

* Length should be 164'–4" allowing an extra 3–1/2" to compensate for possible future tile facing, structural defects and electrical timing panels.



PLAN



LONGITUDINAL SECTION

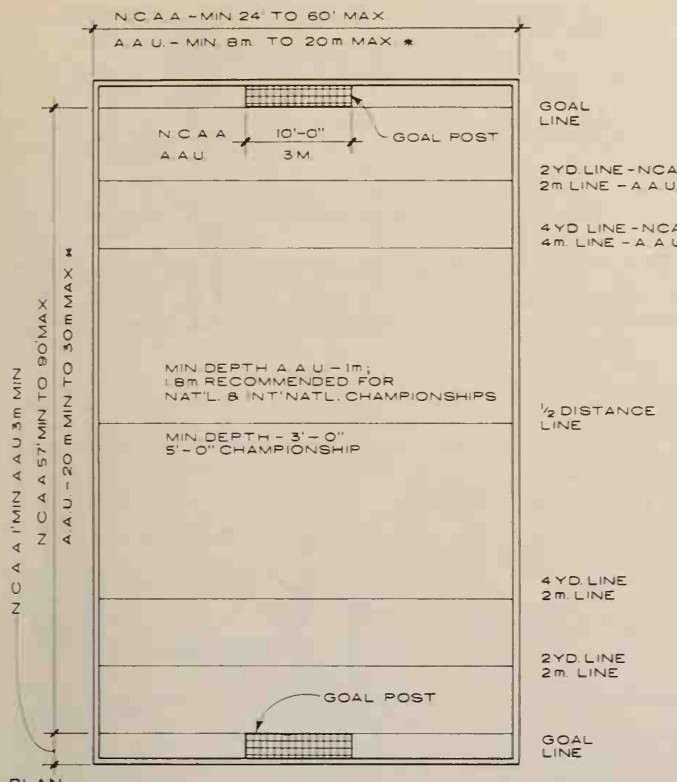
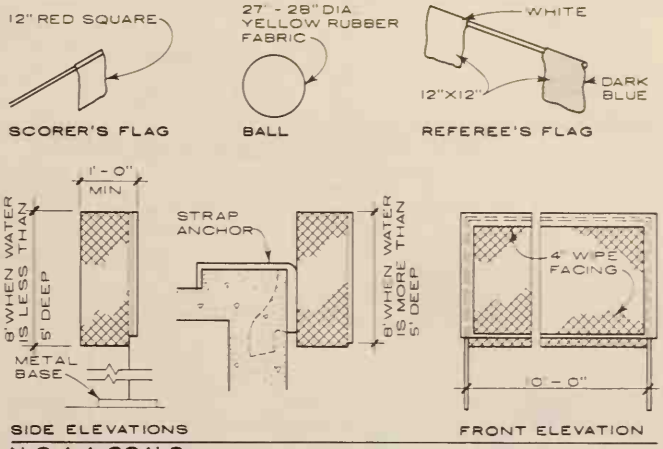
Kenneth Jacobsen; R. Jackson Smith, AIA, Eggers & Higgins; New York, New York



PLAN

* For womens' matches, the A.A.U. recommends measurements of 25 m. x 17 m.

One meter equals 3.28 ft. To obtain equivalent dimensions in feet, multiply by 3.28. A.A.U. figures are expressed in meters.



N.C.A.A. GOALS

NOTES:

Distinctive marks must be provided on both sides of field of play indicating goal lines, 2 & 4 yd. (or meter) lines, and 1/2 distance between goal lines. These must be clearly visable from any position within the field of play. Allow sufficient space on walkways so referees may move freely from end to end of field of play. Provide space at goal lines for goal judges.

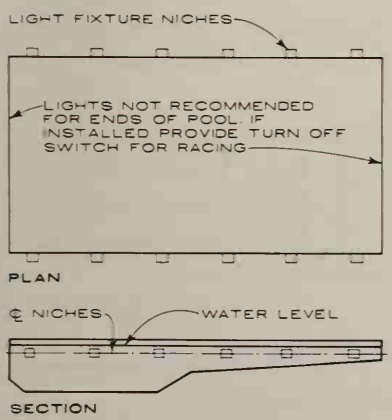
GOAL REQUIREMENTS

Posts and crossbar, rigid and perpendicular. A.A.U., wood or metal, 3" sq., painted white; N.C.A.A., metal, 1 1/2 dia., painted yellow or orange. Nets to hang loosely on frame.

For A.A.U., the underside of the crossbar must be 0.90 meters above water surface when water is 1.50 meters or more in depth, and 2.40 meters from the bottom of the bath when the depth of the water is less than 1.50 meters.

Frames are custom made with bracing placed where necessary. It is recommended that they be collapsible for easy storage. Anchorage methods depend on pool design, with those above commonly used, or brass couplings may be placed in pool walls to which frame is attached. If pool is longer than required length, one of the goals may be floated & anchored with guy wires.

WATER POLO



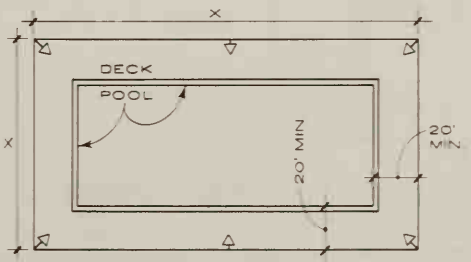
NOTES FOR WET AND DRY NICHE UNDERWATER LIGHTS

Underwater lighting type and distance "A" should be in accordance with NEC and NFPA regulations. Cite N.B.F.U. grounding requirements.

Underwater lights will require 0.5 to 2.0 watts per sq. ft. of water area and should be sized accordingly.

Box connections for dry or wet niches should be a minimum of 4'-0" away from the side wall of the pool and 8" above the deck. Low voltage wiring should be used for all dry or wet niche lighting fixtures. This requires a transformer located, by code, a specific distance away from pool wall and above deck.

UNDERWATER POOL LIGHTING



PLAN OF OUTDOOR POOL

OVERHEAD FLOOD LIGHTING

NOTE:

Distance "X" for spacing of lights not to exceed four times the actual mounting height of lamp in light fixture.

INTERIOR ABOVE WATER LIGHTING

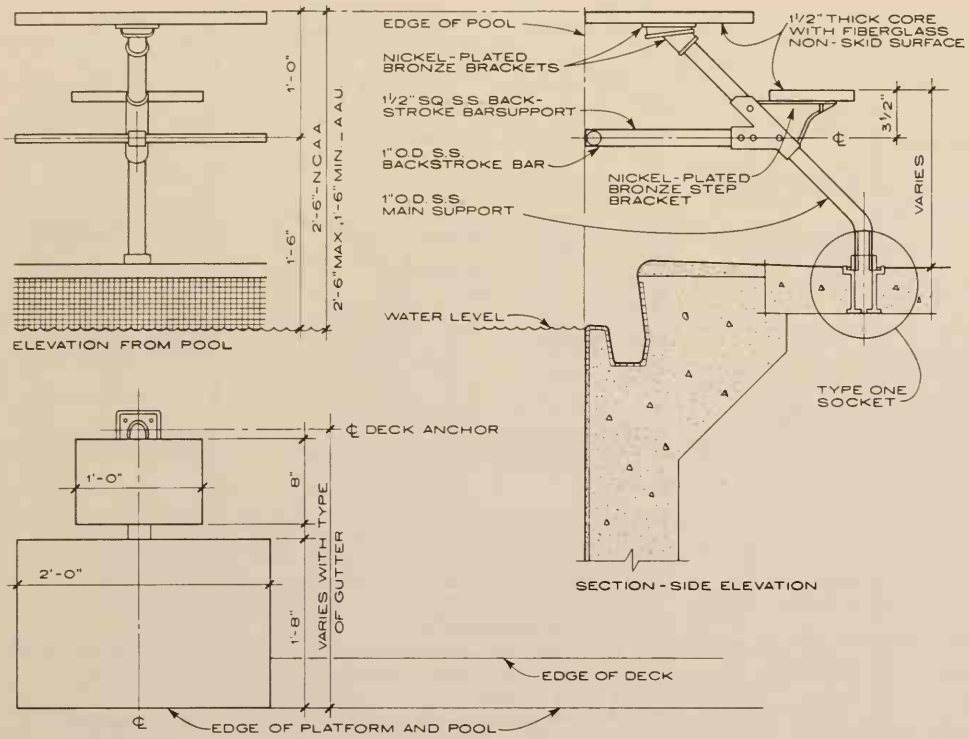
The A.A.U. states that "sufficient over head lighting be installed with concentration directly over finish line. 40 foot-candles at a height of 3 ft. above the water surface is recommended. Buildings housing indoor pools should not have windows facing pool-ends, to prevent glare at finish and turns."

OUTDOOR ABOVE WATER LICHTING

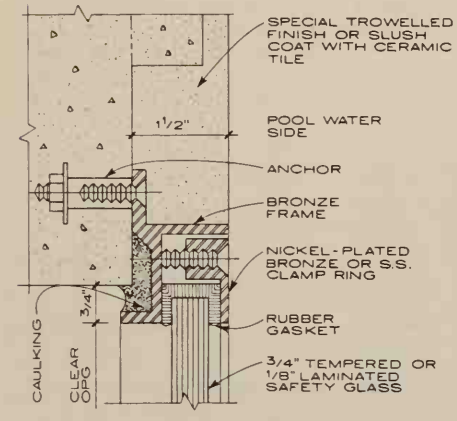
Flood lights should be mounted at least 20 ft. above the water. Select lamps to allow 1.0 watt per sq. ft. min. for floodlights. Consult A.A.U. or N.C.A.A. for specific requirements for championship meets. A.A.U. rules for championship meets require a minimum of 40 foot-candles 3 feet above the water surface.

SWIMMING POOL LIGHTING

Kenneth Jacobsen; R. Jackson Smith, AIA; Eggers & Higgins; New York, New York

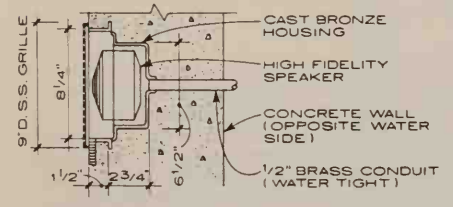


STARTING PLATFORM SCALE: 3/4" = 1'-0"



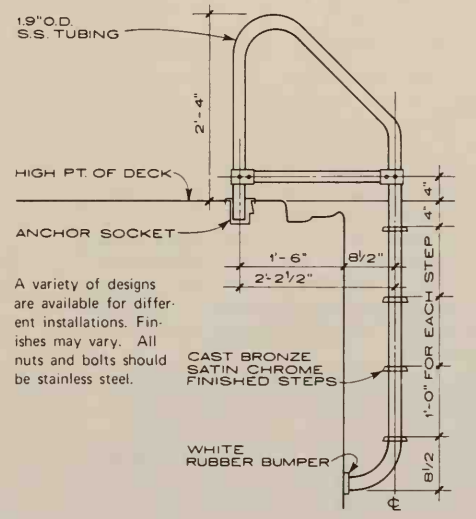
UNDERWATER OBSERVATION WINDOW

Standard rectangular type available for 2'–0" X 2'–0" up to 3'–0" X 5'–0" clear openings. 1'–6" diameter round type also standard.



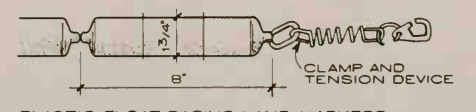
UNDERWATER SPEAKER

(Underwater wet niche lights are similar)



A variety of designs are available for different installations. Finishes may vary. All nuts and bolts should be stainless steel.

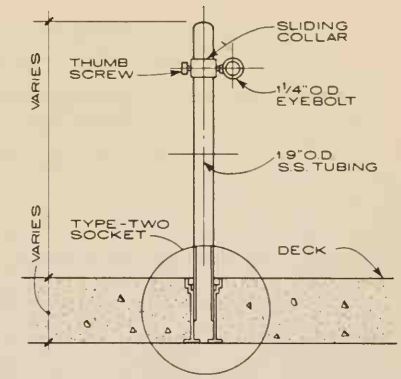
LADDERS AND GRAB RAILS



PLASTIC FLOAT RACING LANE MARKERS

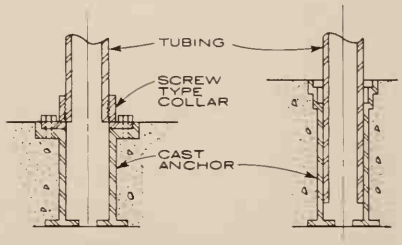
OTHER MISCELLANEOUS EQUIPMENT

Wet and dry niche underwater lights, lifeguard chairs, slides, pennant marking lines, inlet fittings also available. Standard drain fittings may be used.

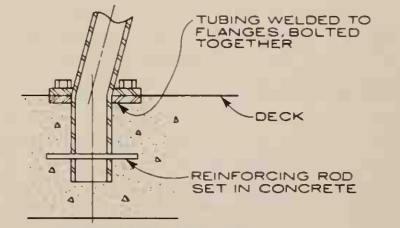


DECK STANCHION

Used to hang splash curtains, backstroke warning and other types of finish line markers. Various types of eyebolt anchorages (top, side, fixed or adjustable) are available.

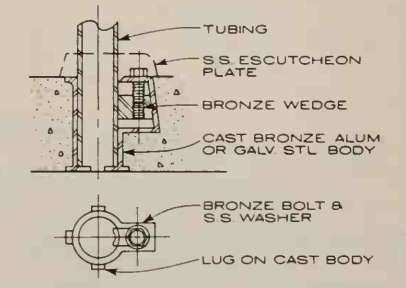


TYPE ONE TYPE TWO

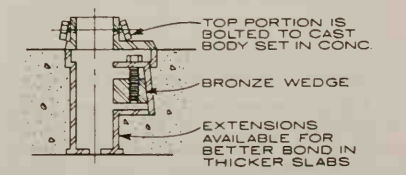


FLANGED BASE SOCKET

(For diving stands and lifeguard chairs)



ANCHOR SOCKET



CLAMP FLANGE ANCHOR SOCKET

DECK SOCKET DETAILS

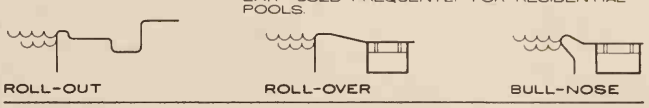
CONVENTIONAL TYPES OF SCUM GUTTERS

Exit from pool more difficult as swimmers must raise themselves 12" to 16" rather than 2" to 3" for more contemporary types. Some Boards of Health disapprove of fully recessed types, claiming them to be difficult to clean and dangerous to those who may catch an arm or foot in same.

THESE TYPES COMBINE GUTTER AND DECK DRAINS ELIMINATING PIPING PROVIDING EASY EXIT USED FREQUENTLY FOR RESIDENTIAL POOLS.

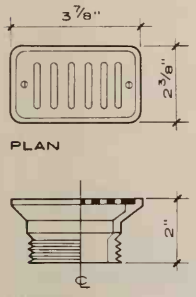


CONTEMPORARY TYPES OF GUTTERS

Pools can be flooded easily to carry off floating foreign matter. If used for competitive swimming meets, platforms or take-off blocks are required to raise swimmer minimum 1'– 6" above water level. Even in conventional type gutter pools, portable rather than permanent starting blocks are used.

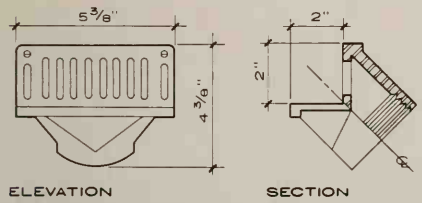
TYPES OF SWIMMING POOL GUTTERS

Swimming pool gutters serve four basic purposes: (1) to drain off surface debris, (2) to dampen surface waves for racing, (3) to act as an overflow thereby keeping water level even, and (4) to provide an exit from the pool water to the deck. Different types may be combined around pool perimeter.

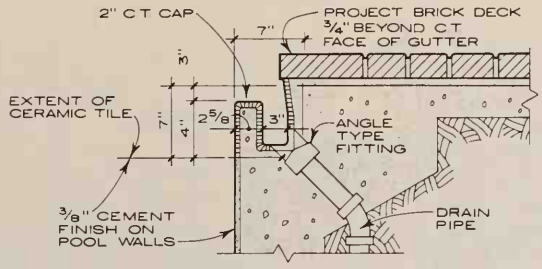


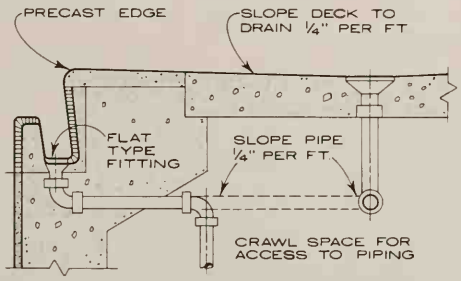
FLAT TYPE FITTING

BOTH TYPES OF FITTINGS, SHOWN ARE AVAILABLE TO FIT DIFFERENT PIPE DIAMETERS, THE MOST USUAL BEING 2" OR 3" I.D.

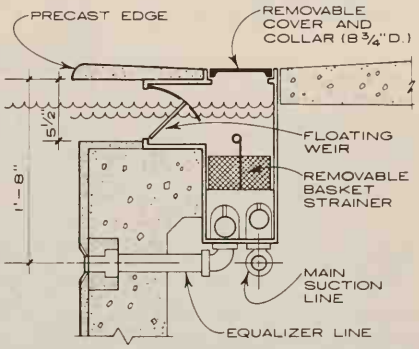


ANGLE TYPE FITTING





SCUM GUTTER DETAILS



SURFACE SKIMMER

NOTES:

Gutter water may or may not be recirculated depending on health department regulations. If not recirculated, overflow must be wasted to sewer. If recirculated, it must be connected to a surge tank which holds water displaced by bathers in the pool. This volume equals one gallon per square foot of pool surface. The surface skimmer operates by suction of filter pump. It is not approved by all Boards of Health. (See pages on Filter Systems).

PLAN
NO SCALE

CROSS SECTION
NO SCALE

NOTE :

1. Illustrations show heaters for 35° temperature differential. Determine exact space requirements by choosing fueling system, calculating heat loss in BTUs and selecting unit.
2. Water supply and fill pipe required with either system when make-up is added ahead of filter. In skimmer type pool more usual method is to add make-up water directly to pool with fill spout. (see Note 11 below)
3. Gas chlorination system is illustrated. For smaller pools indicated in tables, liquid type sodium hypochloride system is often used. For larger outdoor pools large storage tanks filled with sodium hypochloride may be delivered to a site by tank trucks. A hypochlorinator type diaphragm feed pump is used with muriatic acid in lieu of soda ash for PH control.
4. Provide louvered-type door sized to accommodate equipment. Ceiling light and exhaust fan should be connected to same switch. Consult local code for further information and details.
5. Lift and circulating pumps should be end-suction close-coupled centrifugal types, the former rated at 15 feet total loss of head, the latter at 35, including 20 feet of suction lift for above pool water level applications, 45, below. Pool piping designs, accumulated losses of piping runs, differential filter pressures, additions of special valves or equipment will also affect pump capacity and therefore size required.
6. Lift pump and check valve not shown in high rate permanent media filter room layout. Need for lift pump or even pit depends on relation of pool water level to circulating pump which must be flooded by pool water. One layout shows above deck room with pool water level below the floor of equipment room and circulating pump. High rate system shows above deck room with the pool water level below level of floor of equipment room but above level of circulating pump, thus requiring no lift pump and check valve.
7. Dry type body feeder supplies diatomaceous earth during filter operation to extend length of filter run by keeping filter cake porous.
8. Provide method for replacing equipment, if necessary sizing entrance to accept same.
9. Main line valves to be butterfly, gate, plug type without high head loss characteristics.
10. Consult codes to find size of backwash sump, drain, type of permissible sewer connection.
11. Influent lines shown may originate from main drain at deepest point of pool and from skimmers or scum gutters depending upon pool design. Consult local code to determine if influent from scum gutters may be returned to filters or wasted. If recirculated, a surge tank is required. Locate in filter room. Water make-up is controlled by float valve in surge tank.
12. Effluent lines may run in any direction and are shown as they are for convenience of the illustration only. Piping arrangements and locations of all equipment also may vary. The layouts indicated are for preliminary guidance in design only.
13. Floor, deck and pit drains should not be connected to the filter system but directly or indirectly to sewer.
14. Check local health, plumbing and public safety codes for acceptability of basic systems.

DESCRIPTION OF HIGH RATE PERMANENT MEDIA (SWIMMING POOL) WATER FILTRATION SYSTEM:

The vacuum type filter consists of a permeable surface supporting a layer of diatomateous earth. This layer of filter aid, due to its myriad of microscopic openings, produces a brilliantly clear water and a fresh, sterile media after filter is backwashed. Vacuum type filters are constructed of relatively few elements with an open type tank which permits complete visual inspection and ready access to the filter elements at all times. Pump horsepowers are usually smaller compared to other systems. To prepare the filter for operation, an initial filtering mat of diatomaceous earth known as precoat is manually placed on the elements at the start of the filter run. To maintain porosity–and therefore effectiveness of the filter coat–and to provide longer filter runs at normal rates of flow, additional diatomite, known as body feed, is introduced continuously throughout the filter run. A gas chlorinizer and soda ash or caustic feeder or a hypochlorinator are used to provide water sterilization and to maintain PH control.

Note: Booster pump sizes indicated are generally at their limit of capacity and should be verified to provide necessary 2 1/2 to 1 pressure ratio at injector point and effective chlorination.

DESCRIPTION OF DIATOMACEOUS EARTH VACUUM (SWIMMING POOL) WATER FILTRATION SYSTEM:

Here are some of the basic principles employed in Hi-Rate filtration: (1) Parallel flow, with very close control of velocity and hydraulic balance inside, enables the filter to achieve flow rates up to 20 GPM/sq. ft. of filter area, (2) High backwash rates without loss of media, and (3) The depth of filtration produced in a High Rate enables most of the bed volume to be used to store collected solids. This provides the filter a large dirt holding capacity in spite of its reduced surface area. A single lever control with adjustable linkage insures positive valve operation with complete shutoff. The simplest systems can be automated at an exceptionally low cost because they utilize a simple reverse flow for cleaning. Complicated operations such as draining, sluicing, or precoating are not required before the filter returns to service. The rugged, dependable and effective High Rate filter can be economical, yet simple, manual or fully automated system.

Douglas S. Stenhouse, AIA; Washington, D. C.

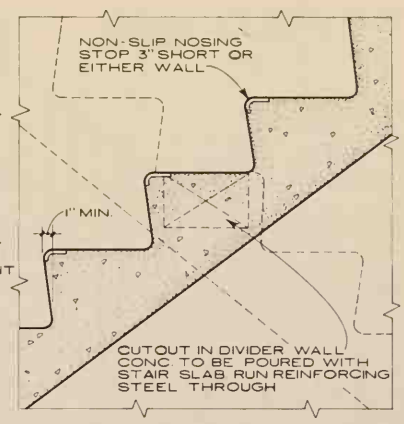
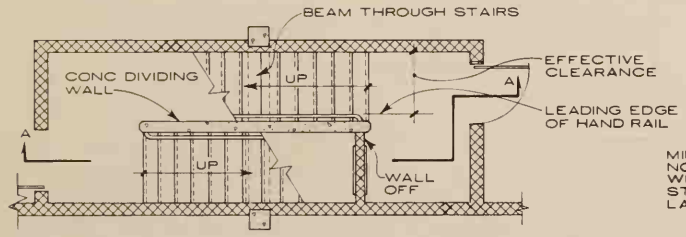
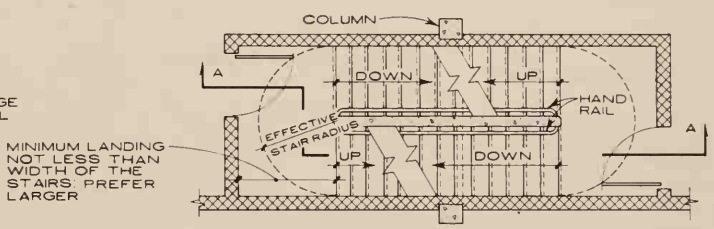
DETAIL "C"



DETAIL "D"



FIRST FLOOR PLAN



SECOND FLOOR PLAN

When columns are located as shown, tie in with stair beam reinforcing. Columns are not mandatory. Check governing code for permissible encroachment of door into effective stair radius, usually it is 6" On upper floors, doors must swing into the well and in the direction of the downward personnel flow. All doors on the first floor must always swing out of the stair well. Check governing codes to determine stair width, number of continuous risers, etc.

SCISSOR STAIRS

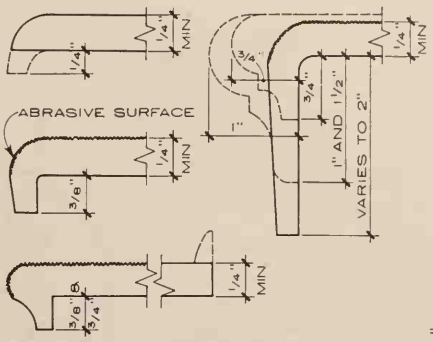
EXTRUDED NOSINGS

For use on wood steps with the following finishes: vinyl, cork, rubber, etc. All with saturated felt paper under to align with nosing.

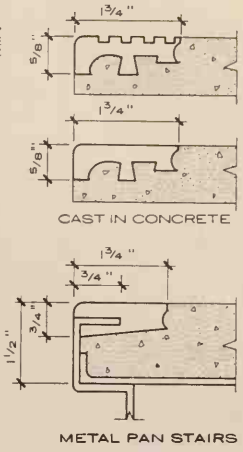
EXTRUDED SAFETY TREADS

For use on concrete or wood steps, recessed or surface mounted. Surface mounted type is 7" or 8" deep with beveled back edge.



CAST ABRASIVE SAFETY TREADS

For use on concrete steps applied abrasive tread is at full depth on old work; but can be full depth or recessed at varying depths on new work.



1. Extruded types: Aluminum and aluminum with abrasive filler in lengths; as required up to 12'– 0".
2. Cast Types: Iron, aluminum, or bronze, and are made to order to exact size.
3. Types shown are used on new or old work. Old work: Fill worn surfaces to level.
4. Nosings and treads come with factory drilled countersunk holes, or with riveted strap anchors, or with wing type anchors.
5. Wood Application: Secure with wood screws.
6. Concrete Application: Secure with adhesive shields and screws, or with strap or wing anchors.
7. Nosings for concrete stairs: steel, bronze, brass and aluminum rolled, drawn or extruded cast abrasive.

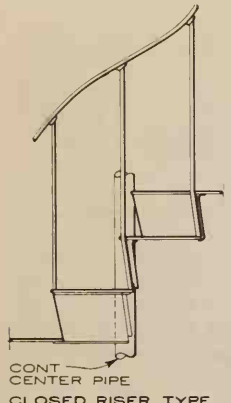
OPEN RISER TYPE



CLOSED RISER TYPE

GENERAL NOTES:

1. C.I., stl, or alum. stairs are identified by treads. When al. treads are specified all parts are alum.
2. Center pipe may terminate at platform, or be capped above well rail, or be extended and secured to clg.
3. Balusters: 1 Per tread. 3/4" bar or 3/4" O.D. for stl/al, 15/16" for C.I. At quarter points 1 1/4" O.D. for C.I.
4. Formed steel floor plate tread is welded to steel collar and web for cantilever type, or to steel collar and riser assembly for open riser type.
5. Cantilever treads are secured and held in position by set screws in the hub, or welded.
6. Plated screw and bolt fasteners for stl and C.I. stairs. SST fasteners for al. stairs.
7. Platform sizes are 1" larger than stair radius and anchored to suit well opening construction.
8. Design refence must be made to state or local laws and ordinances.

TYPICAL FIRE ESCAPE DETAILS

GENERAL NOTES: 4 BASIC TYPES

1. Vertical ladders with platforms at exit door & windows. This type used only for industrial buildings of low height.
2. Stairways supported on brackets attached to building walls with platforms at exits. This type used for any height building permitted by code. Lowest section may be counter-balanced or drop ladder. Fire escape stairs may be used as required means of exit only in existing buildings, subject to provisions of occupancy chapter applying....."not more than 50 percent of required exit cpaacity in any case." (NFPA 1.01 Life Safety Code 1966). (5-9111)
3. Free-standing stairways independently supported on steel columns, with platforms & walk-ways at exits. This type used on buildings where the construction cannot be attached to.
4. Chute-fire escapes, used chiefly for buildings where persons are under institutional care.

A-On all fire escapes, design reference must be made to state or local laws & ordinances.

B-Frames for platforms may be angles as shown, or channels bolted to brackets; grating can be bolted, welded to or set in frame loose. Alternate bracket may be round or square steel, usually 1" or 1 1/4".

GENERAL NOTES

DOORS

Insulation thicknesses vary with the box temperature, the type of insulation and conditions in surrounding areas and outside. In temperate climates cooler boxes at temperatures above 32° usually do not require floor insulation. Penetration of insulation by pipes, conduit, and hangers should be kept to an absolute minimum. Rods or pipes through ceiling insulation should be insulated 3'– 0" above ceiling. Protection of insulation from damage from trucks and abrasion by stored goods is extremely important. Punctures in insulation finish allow moisture penetration with resulting drop in insulating efficiency and destruction of insulation structure.

INSULATION

Refrigerator doors are available in a wide variety of types and finishes including sliding, overhead types and special vestibule doors to minimize refrigeration losses where long periods of opening will prevail. Consult manufacturers for door selection.

VENTILATION

All spaces above suspended ceilings must be well ventilated. Freezers on slab on grade must be vented or heated below the slab.

ASEISMIC DESIGN CONCEPT

Earthquake forces result from very erratic vertical and horizontal vibratory motion of the ground on which the structure rests. For the most part, the vertical forces are neglected by the codes owing to the combination of safety factors inherent in the vertical framing members. The horizontal forces may vary in direction, intensity and duration and are affected materially by geological conditions.

Seismic forces are assumed to act as static horizontal loads on a structure as a function of the mass multiplied by certain factors for different types of resisting elements. Resisting elements may be moment resisting frames or shear walls or a combination of both.

The configuration of a structure and its fundamental period affects its earthquake resistance considerably. Symmetry in plan is very desirable. Unusual shaped plans result in highstress concentration areas and must be specifically designed for. Structural elements must be tied together to make them respond to earthquake motion as a unit; or structural separations may be required.

Most building materials are adaptable to use as resisting elements. Brittle materials must be avoided, unless properly reinforced. Ductile materials are most desirable. Up-to-date codes require that all buildings over 160 feet high must have "ductile" moment resisting frames.

Earthquake resistant structures can be designed, however, to result in minimum structural damage and maximum safety within economic limits. Aseismic knowledge and design is being steadily improved, and there is no substitute for sound structural engineering experience and judgment.

The data set forth herewith is a very brief resume of "Recommended Lateral Force Requirements and Commentary" prepared by the Seismology Committee of the Structural Engineers Association of California, 1967. These requirements have been adopted by several codes.

DEFINITIONS

SPACE FRAME is a three dimensional structural system composed of interconnected members, other than bearing walls, laterally supported so as to function as a complete self-contained unit with or without the aid of horizontal diaphragms or floor bracing systems.

SPACE FRAME – VERTICAL LOAD-CARRYING: a space frame designed to carry all vertical loads.

SPACE FRAME – MOMENT RESISTING: a vertical load-carrying space frame in which the members and joints are capable of resisting design lateral forces by bending moments.

SPACE FRAME – DUCTILE MOMENT RESISTING: A space frame-moment resisting complying with special requirements for a ductile moment resisting space frame.

BOX SYSTEM is a structural system without a complete vertical load-carrying space frame. In this system, the required lateral forces are resisted by shear walls as hereinafter defined.

SHEAR WALL is a wall designed to resist lateral forces parallel to the wall. Braced frames subjected primarily to axial stresses shall be considered as shear walls for the purpose of this definition.

LATERAL FORCE RESISTING SYSTEM is that part of the structural system to which the lateral forces are assigned.

TOTAL LATERAL FORCE OR BASE SHEAR FORMULA

$V = ZKCW$

V = Total lateral force or shear at the base.

Z = Numerical coefficient dependent upon the zone as determined by the seismic zone map.

K = Numerical coefficient set forth in Table A.

C = Numerical coefficient dependent upon the fundamental period of vibration of the structure determined by properly substantiated technical data or by arbitrary code formula.

W = Total dead load. (Plus 25 percent of storage and warehouse live loads.)

TABLE A

HORIZONTAL FORCE FACTOR "K" FOR BUILDINGS OR OTHER STRUCTURES

TYPE OR ARRANGEMENT OF RESISTING ELEMENTS	K
All building framing systems except as hereinafter classified.	1.00
Buildings with a box system as defined	1.33
Buildings with a dual bracing system consisting of a ductile moment resisting space frame and shear walls designed with the following criteria: 1. The frames and shear walls shall resist the total lateral force in accordance with their relative rigidities considering the interaction of the shear walls and frames. 2. The shear walls acting independently of the ductile moment resisting space frame shall resist the total required lateral force. 3. The ductile moment resisting space frame shall have the capacity to resist not less than 25 percent of the required lateral force.	0.80
Buildings with a ductile moment resisting space frame designed in accordance with the following criteria: The ductile moment resisting space frame shall have the capacity to resist the total required lateral force.	0.67
Elevated tanks plus full contents, on four or more cross braced legs and not supported by a building.	3.00
Structures other than buildings.	2.00

CHAPTER 14

ELEVATORS AND CONVEYING SYSTEMS

ELEVATOR is a hoisting or lowering mechanism which moves in guides in a vertical position.

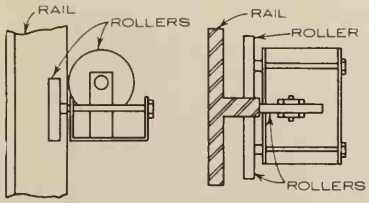
CONTROL PANEL registers calls and governs response of elevator(s) to them.

MOTOR–GENERATOR supplies direct current to motor. Used with generator-field control.

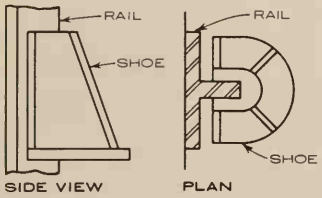
GENERATOR–FIELD CONTROL uses an individual generator for each elevator, so that the voltage applied to the hoisting motor is adjusted by varying the strength of the generator-field. Allows wide range of speeds, including high speeds, and permits smooth acceleration and retardation of car.

MACHINE BEAMS are structural supports for elevator machines.

GUIDE RAILS, with guide shoes, serve to guide car in vertical direction and prevents sideways or twisting motion.



ROLLER GUIDE SHOE



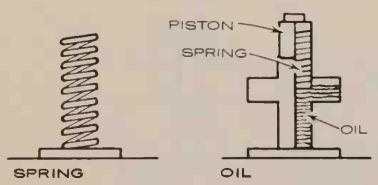
FIXED GUIDE SHOE

GUIDE SHOES are fastened to car frame and counterweight at top and bottom. They fit guide rails.

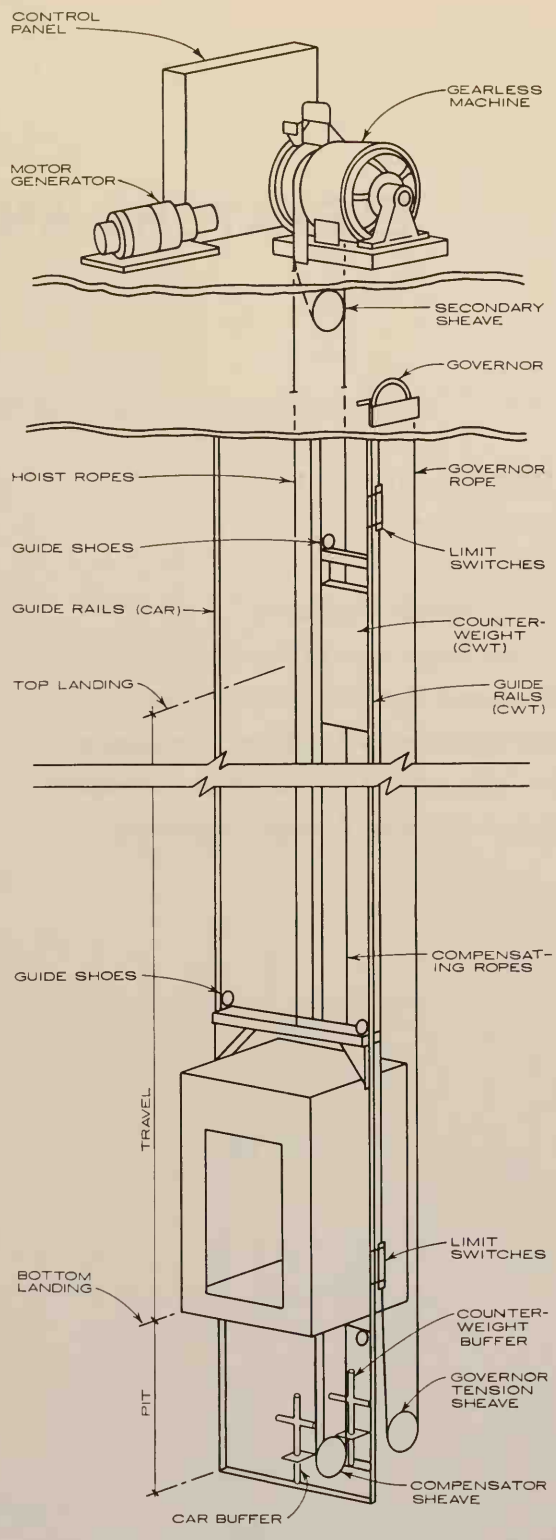
TRAVEL is the vertical distance between the bottom and top terminal landings.

COMPENSATION: ropes or chains hung from bottom of car to bottom of counterweight, to balance the weight of the hoist ropes.

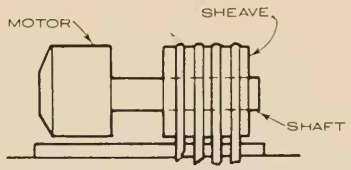
PIT is that portion of a hoistway extending below the level of the bottom landing to provide for over-travel and clearance and for parts which require space below the bottom limit of car travel.



BUFFER is a device to absorb impact of car or counterweight at the lower limits of travel



COMPONENTS OF A TYPICAL ELECTRIC ELEVATOR



GEARLESS MACHINE is one in which power is transmitted directly to the driving sheave without intermidiate gears or mechanism.

SECONDARY SHEAVE provides double wrap of ropes for traction and leads ropes over to counterweight.

GOVERNOR stops car and (if required) counterweight in case of emergency by actuating the safety.

SAFETY is a device incorporated in the bottom beam of the car frame and counterweight. Exerts retarding force in case of overspeed, by gripping guide rails.

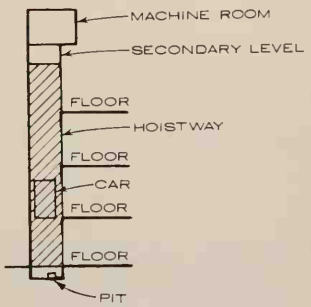
LIMIT SWITCHES are automatic devices which stop the car within the overtravel, independently of the operating device.

OPERATING DEVICE: the car switch, push button. wheel, level, etc. which enables the operator to actuate the control.

HOIST ROPES are steel wire ropes used for suspension of car and counterweight.

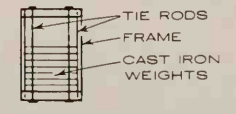
TENSION SHEAVE gives stability in governor's ropes.

CAR is the load-carrying unit, including its platform, frame and enclosure.



HOISTWAY, DIAGRAM

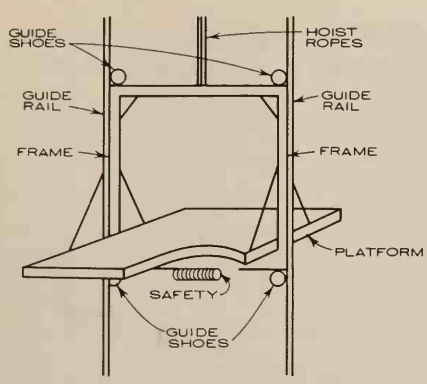
HOISTWAY is any vertical opening or space in which an elevator or dumbwaiter is designed to operate.



COUNTERWEIGHT balances the weight of the car, and usually equals weight of car plus 40% of car capacity.

CAR–LEVELLING DEVICE is any mechanism or control which will move the car to within a limited zone, and stop it at the landing.

LANDING ZONE is 18 inches above or below a landing.



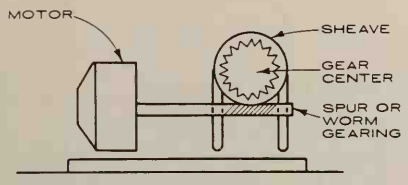
TYPICAL FRAME & PLATFORM

CAR FRAME is the supporting frame to which the platform, upper and lower set of guide shoes and the hoisting cables are usually attached.

CAR PLATFORM is the structure which supports the floor of the car and directly supports the load.

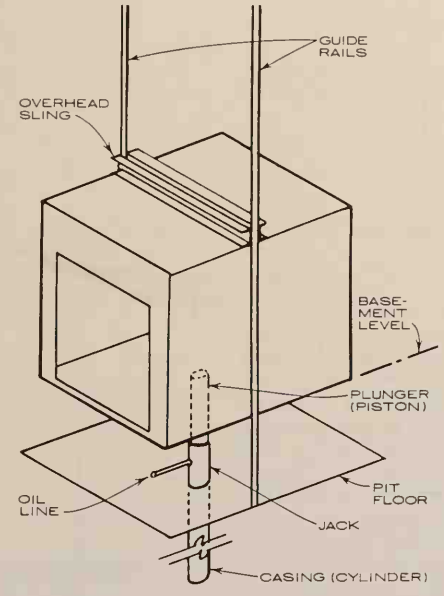
RATED SPEED is that speed at which the elevator is designed to operate with rated load in the car.

RATED LOAD is that load which the elevator is designed to carry dependent on platform area.

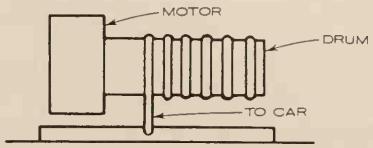


GEARED MACHINE is one in which power is transmitted to the driving sheave or drum through worm or spur gearing. It uses rheostatic as well as generator-field control.

RHEOSTATIC CONTROL is a direct current system of control by varying resistance and reactance in the field circuit of the hoisting motor. Alternating current motors start across the line.



HYDRAULIC ELEVATOR is one in which the motion of the car is obtained from a liquid (usually oil) under pressure. The plunger must extend below basement level a minimum distance equal to travel. Used where travel is short, required speed is low, and where overhead machine room is not desired.



WINDING DRUM MACHINE is one in which the ropes are fastened to and wound on a drum. No counterweight is required, but it is not permitted on passenger elevators.

TRACTION MACHINE is one in which the motion of the car is obtained by means of friction between the traction sheave and the hoisting cables.

HALF-ROUND AND DOUBLE WRAP TRACTION SHEAVE provides least wear and least traction.

UNDERCUT "V" TRACTION SHEAVE produces the highest wear and the best traction.

UNDERCUT HALF-ROUND TRACTION SHEAVE provides high wear and high traction.

PASSENGER ELEVATORS: PRELIMINARY SELECTION.

The data given on this, and the following pages, is to assist in the selection of passenger elevators for office buildings, industrial buildings, hotels, department stores, apartment houses, and hospitals. The results of the calculations will give general information on the economical number, characteristics, and groupings (local or express) of elevator installations. The cost of various installations must also be considered. A competent elevator engineer should be consulted before any decision is made.

The selection of elevators will depend on factual information concerning the particular building, and certain other determinations, as follows:

A. Factual information
   1. building characteristics
      a. number of floors
      b. floor-to-floor heights
      c. travel
      d. location
   2. population characteristics (the temp of the traffic)

B. Determinations
   1. average round-trip time
   2. interval
   3. passenger-carrying capacity of the system.

The total round-trip time depends on the various times involved in the operation of an elevator, such as running time, number of stops, time required in passenger loading and unloading, and so on. Calculations of the times governing round-trip time are expressed in the Round-Trip Time graphs given on a following page.

The interval is the average time a passenger must wait for an elevator. Minimum intervals are given below. The desirable interval depends on the type and location of the building. In large buildings, the maximum interval is 30 seconds. For small buildings, 40 seconds is usually satisfactory. Intervals longer than 40 seconds are permissible only in hospitals, apartment houses, or buildings where one or two elevators will provide more than adequate passenger-carrying capacity.

The passenger-carrying capacity of an elevator is expressed as the percentage of the building population than can be carried one way in a period of time, usually five minutes. Exception: the passenger-carrying capacity of department store elevators is generally expressed as the number of people that can be carried in one hour. Elevator capacities are given in the tables below.

CONT. ON NEXT PAGE

PRELIMINARY SELECTION (CONT.)

SAMPLE PROBLEM

Given: type of building: office
number of floors: 20 (above ground floor)
floor-to-floor height: 12 feet
total population: 2000 (see Speed and Travel Table, a following page)
maximum interval: 30 seconds

SOLUTION

1. Find the total travel (equal to the number of floors above ground floor times the floor-to-floor height) = 20 x 12 = 240 feet.

2. Find the required passenger-carrying capacity. This equals the maximum number of people expected to arrive or depart in any five minute period. Where this figure is not known, the following assumptions may be made:

TRAFFIC	PERCENT OF POPULATION
light	12
average	13
heavy	14 for first 30 floors, 12 in any tower section. (Requirements for a single occupancy building may vary.)

Assume light traffic. Use 13% of 2000 population, or, 260 people.

3. Use Speed and Travel Table to select an elevator capacity. The table for Office Buildings indicates that the minimum speed for a travel of 240 feet is 700 feet per minute. This speed is available with any capacity from 2500 to 4000 pounds. Select the 3000 capacity for trial.

4. Using the selected capacity and the number of floors (above ground floor), find from the Round-Trip Time graphs the round-trip time in seconds. Graph "C", for a 3000-pound capacity, indicates that the round-trip time for a 700 feet per minute elevator, for 20 floors, is 148 seconds.

5. Find the number of passengers per trip, normal peak, from Elevator Capacities Table below. For 3000-pound capacity, the normal peak is 16 passengers per trip.

6. Find the number of passengers one car can carry in five minutes by using the following formula:

$$\text{passenger cap. per car, 5 min.} = \frac{60 \times 5 \times \text{number passengers per trip}}{\text{round-trip time (seconds)}}$$

$$= \frac{60 \times 5 \times 16}{148}$$

$$= 32.5 \text{ people for 5 min.}$$

7. Find the number of cars required in the bank elevators (divide the required passenger-carrying capacity by the number of passengers one car can carry in 5 minutes) $\frac{260}{32.5} = 8$ cars

8. Check the result by finding the interval. The determined interval should be equal to or more than the minimum given in the Minimum Interval Table below, and should not exceed the given maximum interval:

$$\text{interval} = \frac{\text{round-trip time}}{\text{number of cars in bank}}$$

$$= \frac{148}{8}$$

$$= 18.5 \text{ seconds}$$

The minimum interval for a 3000 pound capacity elevator is 18 seconds; the given maximum interval was 30 seconds. Therefore eight 3000-pound, 700 feet per minute elevators is one acceptable solution.

9. Another trial may be made with a larger selected capacity to determine if fewer cars can be used. Using a 4000 pound capacity, the solution would be seven 4000-pound, 700-feet per minute elevators.

It may be determined if the use of local and express cars would result in a better solution by figuring separately the required number of elevators for the local floors and the express floors.

In all cases, the cost of the various types of installations will affect a final decision.

10. When population of the building is unknown, a different approach must be used. From "Office Buildings, etc." on the Speed and Travel Table page, find the appropriate square foot area per person. For example, use 90 sq. ft. per person.

11. The area on which calculations are based is the net usable area. This is roughly 75% of the total floor area and does not include such items as partitions, mechanical equipment rooms, etc. Assume total floor area is 240,000 sq. ft. Then net usable area = 0.75 x 240,000 = 180,000 sq. ft.

12. With 90 sq. ft. per person and a net usable area of 180,000 sq. ft., the population density may be estimated at 2000 persons.

13. Refer to the Capacity and Interval Table below. Assume 14% of the population must be handled in five minutes. Read down under 14% to the figure 2000. To find required car size, read left to car capacity, in this case, 4000 lbs.

14. With this information, return to step 4 to complete the preliminary selection.

ELEVATOR CAPACITIES

WEIGHT CAP POUNDS	PASSENGER CAPACITY	PASSENGERS PER TRIP NORMAL PEAK
1200	7	6
2000	14	10
2500	16	13
3000	19	16
3500	22	18

NOTES

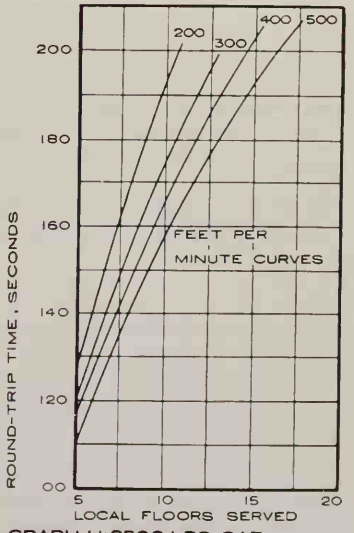
1. Round-Trip time graphs shown are based on an assumed floor to floor height of 12 feet.

2. Basically, Type "A" and "B" control systems are alike, differing in the use for which they are intended. Type "A", which has a supervisory system with six traffic patterns, is intended for buildings with heavy traffic such as hotels, office buildings, etc.

3. Type "B" is essentially intended for buildings with light or moderate traffic such as apartment houses and small office buildings.



GRAPH H: 2500 LBS. CAP.
TYPE "B" CONTROL

SPEED AND TRAVEL TABLE

TYPE OF BUILDING

OFFICE BUILDINGS, HOTELS AND INDUSTRIAL BUILDINGS

Where expected population or density per floor is unknown, assume one person for each given square foot area, as follows:

SQUARE-FOOT AREA — GOVERNING CONDITIONS

80 (for one person) – for lower floors, single occupancy buildings

90 (for one person) – for lower floors, buildings in congested areas (heavy traffic)

100 (for one person) – for lower floors, buildings in business sections of average cities (average traffic)

110 (for one person) – for lower floors, buildings in business sections of small cities or outlying districts of larger cities (light traffic)

*10 (for one person) – for buildings of over 20 floors, or where upper floors have smaller areas.

*25 (for one person) – for buildings of over 30 floors, in any tower section.

*Add to base figure of Square Foot Area for lower floors.

CAPACITY POUNDS

APARTMENT HOUSES

Elevator selection may be based on the number of bedrooms or on traffic studies.

The traffic depends on the class of tenant and location of the building in relation to the business center and schools. The heaviest traffic peak may be:

1. the morning downpeak (approximately 50 percent of the population must be handled in 1½ to 2 hours).
2. the after school peak (where the number of school children in the building is large).
3. the evening peak (to local amusements).

A passenger-carrying capacity (for five minutes) of 7 percent of the population is satisfactory due to the smaller and more extended peak in an apartment house. For low-cost housing, percent of population varies from 3.6 to 6.2.

HOSPITALS

In large hospitals a bank of passenger elevators may be installed separately from the service elevators. If so, select passenger elevators as for office buildings. For selection of elevators for combined passenger and vehicle use, see notes on the "Hospital Elevators" in "Building Planning and Design Standards" by H.R. Sleeper. Intervals should not be longer than one minute. An automatic control system is recommended. It should have an optional feature allowing attendant operation. At least one elevator should be on the emergency electric power system.

DEPARTMENT STORES

Each department store presents a traffic problem because of the use of electric stairways and the distribution of merchandise. Therefore, round-trip time must be separately calculated for each installation.

Electric stairways handle the majority of traffic. Only ten to twenty percent of the population should usually be considered in planning the elevator installation. For approximation figure one person per 25 square feet of merchandising area, above first floor.

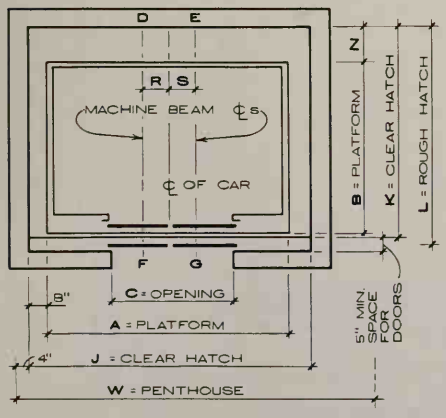
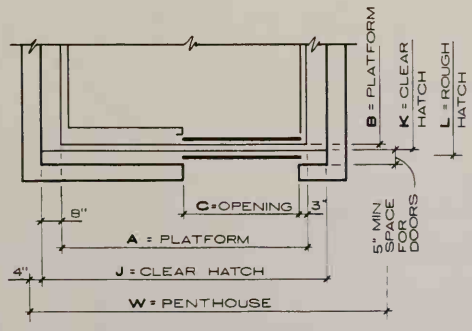
* RHEOSTATIC A-C CONTROL

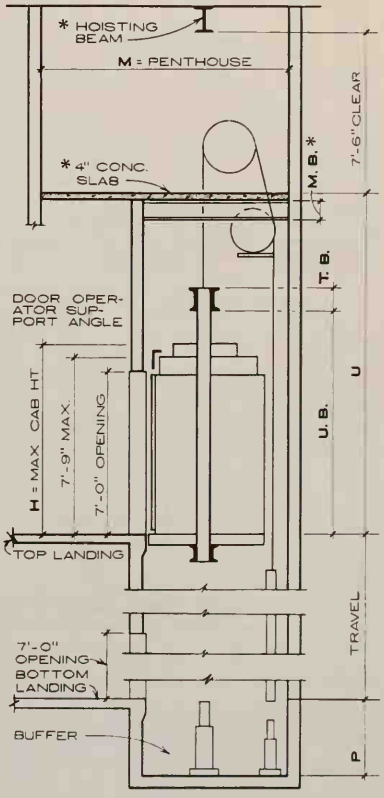
Reactions shown for D, E, F and G include allowance for impact. Weight of concrete slab is not included.



TYPICAL PLAN



ALTERNATE PLAN SINGLE SPEED FOR 2,000 LB. AND 2,500 LB CAPACITY ONLY. CENTER OPENING DOORS ALSO AVAILABLE.



HOISTWAY SECTION

NOTES:

1. If required by local codes, pit depth and penthouse clearances may be increased.
2. The following items by owner; i.e., not normally in elevator contract:
   - A. Penthouse access door, windows, light and adequate ventilation.
   - B. Light outlet in hoistway located 4'– 0" above center of travel.
   - C. Other items marked *.
3. Reactions shown are typical. Location & magnitude will vary to some extent with different mfgrs.
4. Buffer: Spring for speeds to 200 FPM. Oil for speeds over 200 FPM.

   - B. Light outlet in hoistway located 4'– 0" above center of travel.
   - C. Other items marked. *

PRELIMINARY SELECTION

The following explanations and examples are to serve as guides in choosing a freight elevator and its carrying capacity for various conditions.

The carrying capacity per hour is determined by the normal load of the elevator and the time required per round trip. The round trip time is made up of the following four elements, as shown below on the Time Curve (All time is in seconds):

1. Running Time: equals the distance travelled divided by the car speed chosen. May be read directly from the Time Curve.

2. Accelerating and Retarding Time: the additional time required to accelerate and retard the car for each stop.

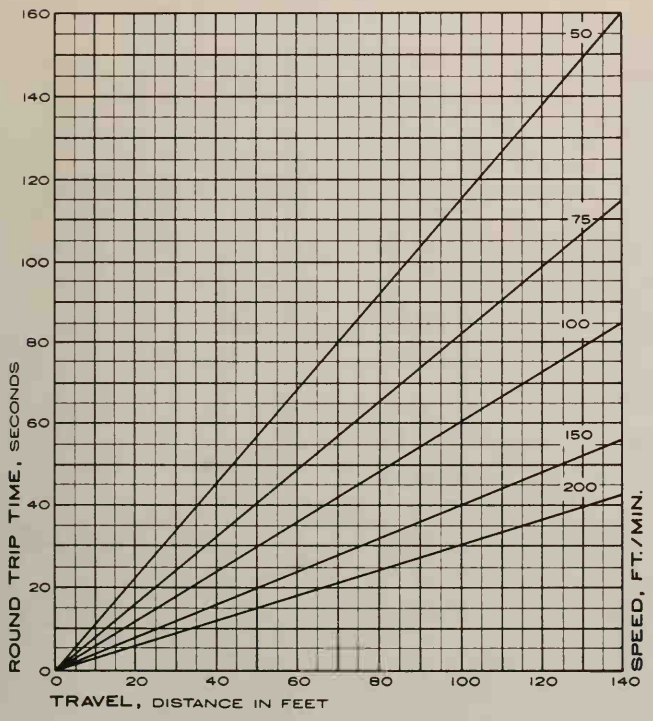
3. Door Time: the time required to operate car gate and hoistway doors for each stop.

4. Loading Time: the time required to load and unload the car. Varies greatly with the type of material handled and the method of handling used.

NOTE:

It is recommended that whenever practical a study be made of the loading and unloading operations of a similar elevator. If local studies on a similar elevator determine more closely the loading time, such figures should be used in preference to those given in the Time Curve.

It is advisable to add 20% to the calculated roundtrip time.



TIME CURVE

NOTES:

Running Time:
Add per stop, acceleration and retardation:
Rheostatic controls = 2 1/4 sec.
Generator field controls = 1 3/4 sec.

Add per stop, door operation:
Manual = 16 sec.
Power = 8 sec.

Add per stop, loading and unloading:
Hand truck = 25 sec.
Power truck = 15 sec.

SAMPLE PROBLEM NO. ONE

Given: a 5-story building

Floor	Height
1 to 2	18 feet
2 to 3	16 "
3 to 4	16 "
4 to 5	16 "

Total travel distances: 66 feet

Material to be handled:

1. 225,000 pounds in pallets between 1st and 4th floors on power trucks. A power truck is 6' – 0" long, 4' – 0" wide, and weighs 3500 pounds empty, 6500 pounds loaded.

2. 75,000 pounds in and out between various floors by hand truck and package.

Total: 300,000 pounds in and out of building per day.

SOLUTION

Capacity and size: The capacity of the elevator depends on the weight of the loaded power truck. A 6000 pound rating could be used if the truck remains on the floor but it provides no reserve. From the General Data table on the following page, the 8'– 4" x 10'– 0" platform size 8000 pound rating would be selected. (It is not necessary, with a 6'– 0" x 4'– 0" power truck, to go to the 8'– 4" x 12'– 0" platform size, which also has an 8000 pound rating.)

Type of equipment: Leveling equipment is desirable to assure accurate landing at the floors to facilitate moving the power truck on and off the car. The weight of material to be moved per day will cause this elevator to be quite active, and thus generator field equipment should be considered.

Door operation: Power operated doors are desirable where elevator is quite active.

Speed selection: See General Data Table, on a following page. The recommended speed for 5 floors (66 feet travel), with generator field controls, is 150 feet per minute.

Calculation of time: For 3/4 service between first and fourth floors:

With loaded power truck on elevator

Running Time	20 sec.
Acceleration and Retardation	1 3/4 "
Door Operation	8 "
Loading and Unloading	15 "
Total time one way	44 3/4 sec. Use: 45 sec.

Round trip time = 2 x 45 = 90 sec. plus 20% = 108 sec.
225,000 lbs. = 75 trips. 75 trips x 108 sec. = 2 hours 15 min.
3,000 lbs/trip

With power truck remaining on floor (assume 2 pallets per trip)

Running Time	20 sec.
Acceleration and Retardation	1 3/4 "
Door Operation	8 "
Loading and Unloading	90 " (varies widely)
Total time one way	119 3/4 Use: 120 sec.

Round trip time = 2 x 120 = 240 sec. plus 20% = 288 sec.
225,000 lbs. = 38 trips. 38 trips x 288 sec. = 3 hours 3 min.
6,000 lbs./trip

The balance of the service is moving 75,000 pounds between first and various floors by hand truck and package. Assume an average load of 1500 pounds; average travel first to third floor, 34 feet; and an average of 3 stops per round trip.

Running Time	14 sec.
Acceleration and Retardation (average)	2 5/8 "
Door Operation (average)	12 "
Loading and Unloading (2 hand trucks)	50 "
Total time one way	78 5/8 sec. Use 80 sec.

Round-trip time = 2 x 80 = 160 sec. plus 20% =192 sec.
75,000 lbs. (1st to 3rd fl.) = 50 trips. 50 trips x 192 sec.
15,000 lbs./trip = 2 hours 40 minutes

Total time to move 300,000 pounds in and out of building is:

a. If power truck remains on elevator with load:
2 hrs. 15 min. plus 2 hrs. 40 min. = 4 hrs. 55 min.

b. If power truck remains on floor:
3 hrs. 3 min. plus 2 hrs. 40 min. = 5 hrs. 43 min.

PRELIMINARY SELECTION (CONT.)

SAMPLE PROBLEM NO. TWO

Given: a 3-story building

Floor	Feet
1 to 2	18
2 to 3	16
Total Travel distance	34

material to be handled:

1. miscellaneous freight, some to be moved in hand trucks and some in package form.
2. hand truck size is 4'– 6" long, 2'– 6" wide; truck weight 250 lbs., load weight 750 lbs.

total: 20,000 lbs. in and out of building per day (8 hrs.)

SOLUTION

Capacity and size: From the General Date Table, the 6'– 4" x 8'– 0" car would be chosen, to accommodate two hand trucks per trip or 45 square feet for loads of miscellaneous packages. The 3000 pound capacity elevator would be preferable for possible greater loads in the future.

Type of equipment: It is evident that this elevator will not be very active so rheostatic controls will be considered.

Door operation: Because this elevator will not be very active, manually operated doors will be chosen.

Speed selection: See General Data Table. The recommended speed for 3 floors (34 feet travel) with rheostatic control is 75 feet per minute.

Calculation of time: For service from first to third floor without an intermediate stop. Refer to Time Curve on preceding page.

Running Time	27	sec.
Acceleration and Retardation	2 1/4	sec.
Door Operation	16	sec.
Loading and Unloading	50	sec.
Total time one way	95 1/4	sec. Use 95 sec.

Round trip time = 2 x 95 = 190 sec. plus 20% = 228 sec.

$\frac{20{,}000 \text{ lbs./day}}{15{,}000 \text{ lbs./trip}}$ = 13 trips x 228 sec. = 50 minutes.

If most of the material is carried in package loads, the two types of handling should be figured separately, and the total used. Package loading time will increase the trip times, and will vary greatly.

GENERAL DATA FOR TYPICAL FREIGHT ELEVATORS

TYPES AND USES					CONTROL SYSTEM		
TYPE OF TRAFFIC	METHOD OF LOADING	CAPACITY (LBS)	MAX. RISE NO. OF FLOORS	TYPE OF ELEVATOR	GENERATOR FIELD FLOORS	RHEOSTATIC FLOORS	ELEVATOR SPEED FT/MIN
VERY LIGHT	Manual*	2500	3 (or 30') to sidewalk level	Sidewalk		2	50
		2500	3(or 35') inside bldg.	Self supporting	2 or 3 (10,000 pound cap.)	3 or 4	75
LIGHT		2500 to 3500	6, 7 or more				
MEDIUM	Manual* or Automobile**	3500 to 8000	Any no. of floors	General Purpose	2 or 3	5 to 8	100
					4 or 5		150
HEAVY		8000 to 10,000			6 to 10		200
	Industrial or Auto Truck	8000 to 20,000 & more		Truck			

*Includes uses of hand trucks and small, slow speed electric pallet trucks.

**Includes passenger cars and light trucks.

NOTE:

1. If one of the floors exceeds 20 feet in height, the next higher speed is desirable.
2. Higher speeds available if needed.

SECTION THROUGH FREIGHT HOISTWAY SHOWING DOOR TYPES

1. For Q values shown above, see following page, "Freight Elevators, Geared. Capacity = 4,000 to 10,000 pounds. Speed = 50 to 200 feet per minute. Roping = 2:1".
2. Pass type doors are required for a 7'– 0" high opening when the floor to floor height is less than 11'– 0", for an 8'– 0" high opening when the floor to floor height is less than 12'– 6".

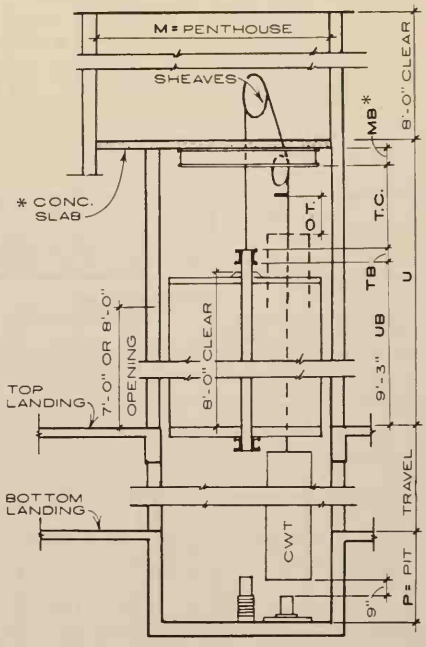
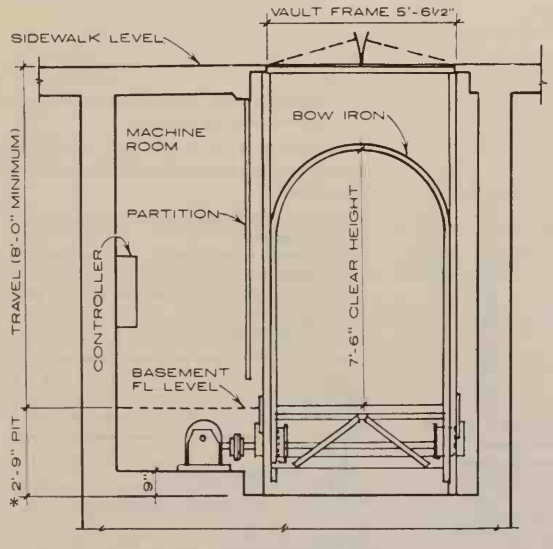
PLAN NO. 2 FRONT & REAR OPENING

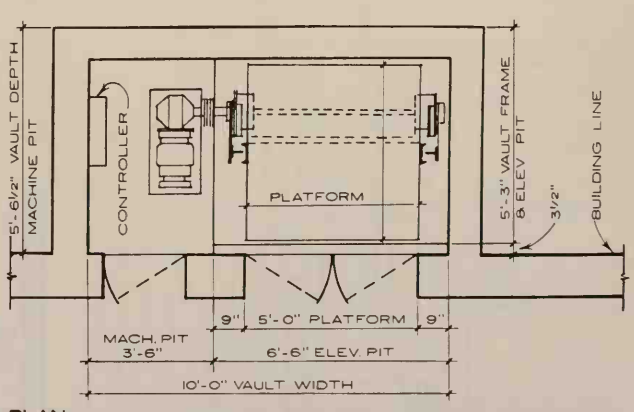


HOISTWAY SECTION

SIDEWALK ELEVATORS



SECTION (INCREASE PIT DEPTH IF TRAVEL IS OVER 15'-0")



PLAN

Layout is for 15' – 0" travel between sidewalk and basement levels. Standard capacity is usually 2000 lbs. Control is of continuous pressure push button type with Up-Down buttons in each car. Maximum standard platforms are 5' – 0" x 5' – 0" or equivalent, with minimum front-to-back dimension 4' – 0". Where local codes or special conditions of travel and capacity govern, special car sizes and capacities can be provided.

E = 5" motorized doors, 3" manually operated.
Speeds up to 200 f.p.m. available.

DESIGN CONSIDERATIONS

Data shown is general and should be confirmed with manufacturer before beginning final drawings. Car size, speed and capacity can be furnished to meet practically any requirement.

Elevator and hoistway construction shall meet American Standard Safety Code, local and state building codes.

Structure need only support horizontal loadings for guide rail brackets—vertical car loads supported through jack to pit floor.

Provide adjacent space to house power unit and controller. Consider sound installation if adjacent areas occupied.

Hydraulic elevator systems eliminate need of penthouse, load brakes, load supporting columns; provide relatively quiet, smooth, maintenance-free operation for maximum 60 ft. travel. Can be added to existing buildings by segmental drilling in completed shaftway.

FREIGHT ELEVATOR HATCHWAY DOORS:

Vertical bi-parting counterbalanced doors and gates generally used, fire doors where required by code.

Dimensions shown on Section refer to regular vertical bi-parting hatchway doors with 5" clearance. Where floor heights are less than 11'– 9" (for 7'– 6" opening height), bypass or "pass" type doors are used. These require a minimum spandrel height of 10", clearance of 5 1/2" minimum to 6 3/4" maximum is needed instead of standard 3 1/2" to 5". Clearance varies with manufacturer. "Pass" doors require special fire flap, splay pan and sill.

Platform sizes available from 2'–3" wide x 2'–7" deep to 3'–5" wide x 4'–4" deep. Standard door 7'–0" high.
* Contingent upon type of safety.

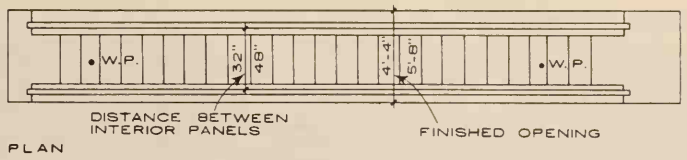
GENERAL NOTES

All dimensions should be verified with the particular dumbwaiter manufacturer.
Clear opening dimension (E): upper landing same as car width: lower landing (for car removal), car width + 4".
Maximum allowable size for dumbwaiters: 48" height; 9 sq. ft. floor area.
* See local code for minimum override dimension.
** Counterweight can be located at either side of hoistway.
† Dimension D allows clearance for hatchway doors only. Consult manufacturer for additional clearance required for car gates. Hinged hatchway door also available.

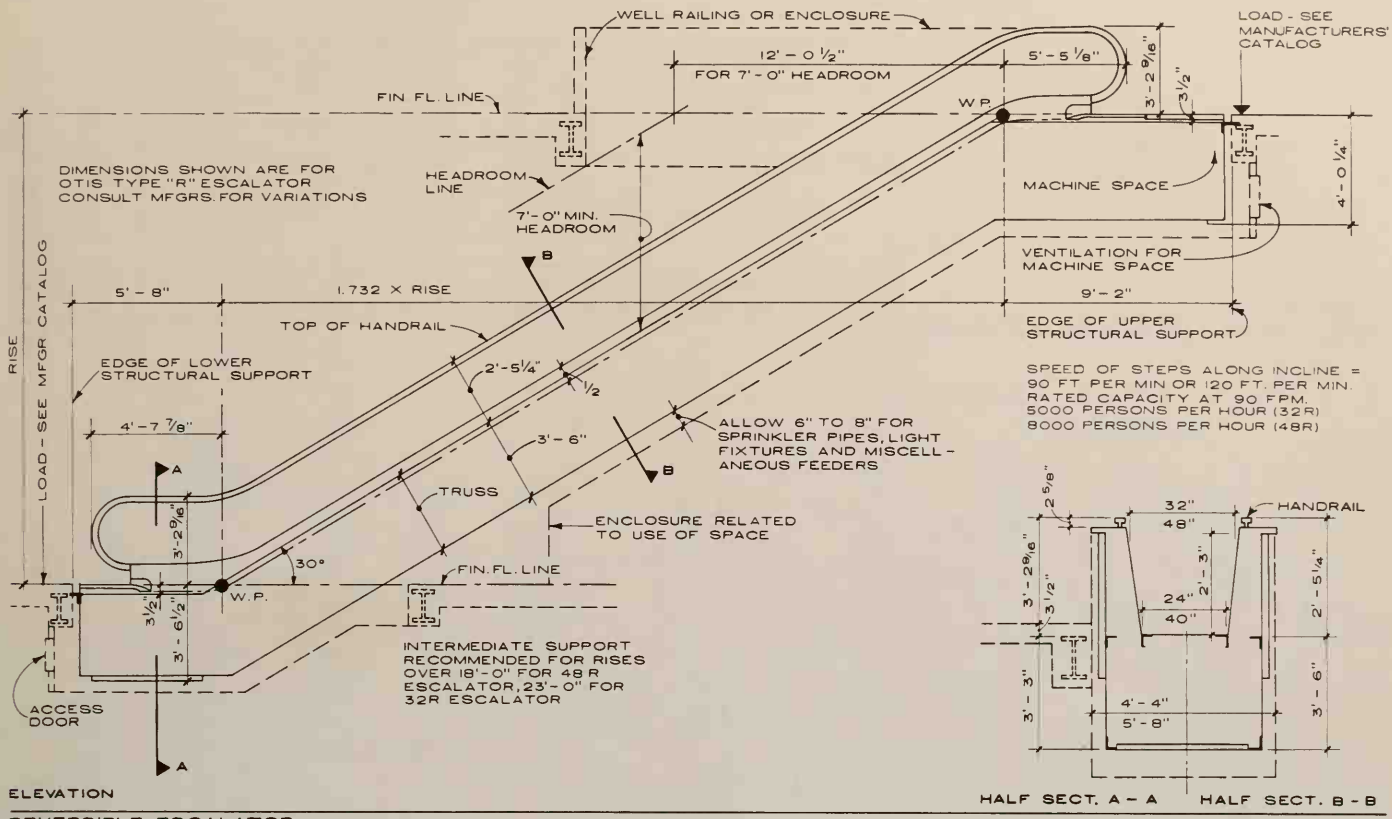
Roy F. Deng; The Perkins and Will Partnership; Chicago, Illinois

Escalators are the most efficient form of vertical transportation for very heavy traffic and where the number of floors served is limited, normally five to six floors maximum. Escalators are not usually accepted as required exit.

Owner provides and installs: All supports including bearing plates if concrete beams are used, manhole and ladder to pit for basement stairways, lamp receptacles and convenience outlet in machine room and at each access door, light and power supply, vent grilles and various other items described in manufacturers catalogs.



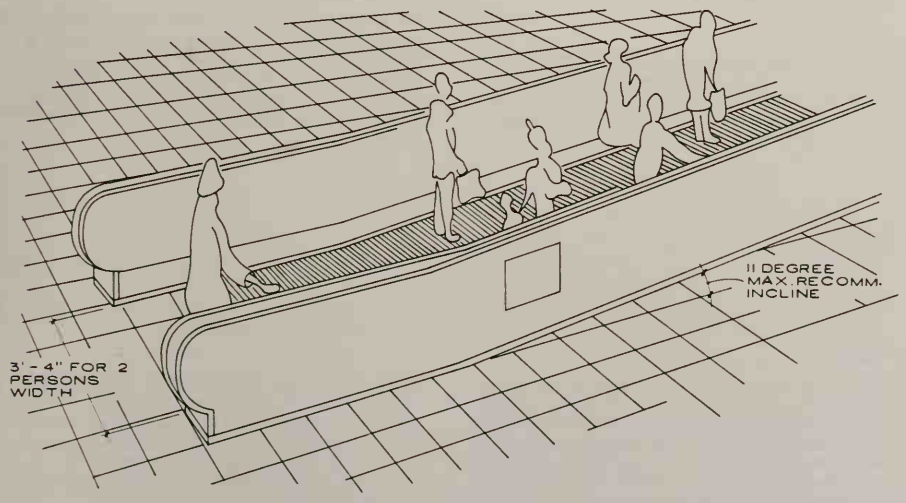
PLAN



ELEVATION

HALF SECT. A – A HALF SECT. B – B

REVERSIBLE ESCALATOR



A further step in the development of horizontal and vertical transportation in the extension of the principal lanes of circulation or transportation is the continuous moving passenger conveyor or belt.

The conveyor operates at speeds of either 90 or 120 feet per minute, with 120 feet per minute being the maximum. The safety codes under certain conditions allow a 15 degree incline and speeds up to 180 feet per minute.

Moving passenger conveyors will be found most useful in buildings where large groups of people must move long distances horizontally and go up or down a short rise, such as in air or other transportation terminals, connections between terminals, stadiums, and arenas.

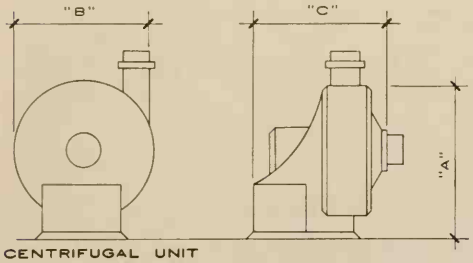
MOVING PASSENGER CONVEYORS

GENERAL NOTES:

Pneumatic Tube Systems: Use of pneumatic tube systems, under vacuum or pressure, allows transmission of paper, small articles and liquids in "carrier" tubes to and from predetermined stations.

Applicable systems are commercial offices and stores; industrial plants, warehouses and air and rail stations; banks; hospitals and laboratories. Care should be taken in the latter instances to exclude services in areas where centrifuge action in transmitted liquids is undesirable.

Installation of Systems: Systems can be placed anywhere in or about the area served, exposed or furred in structure, outside or underground. Lines exposed to weather or through refrigerated spaces must be protected and insulated to prevent condensation in the system. Subsurface installations should be placed in corrugated pipe below the frost line, and tubing should be mill wrapped and joints welded and protected with mill wrap tape and pressure tested.



CENTRIFUGAL UNIT

CENTRIFUGAL EXHAUSTERS AND BLOWERS (This chart shows only extremes for each case.)

VACUUM	RPM	HP	A	B	C

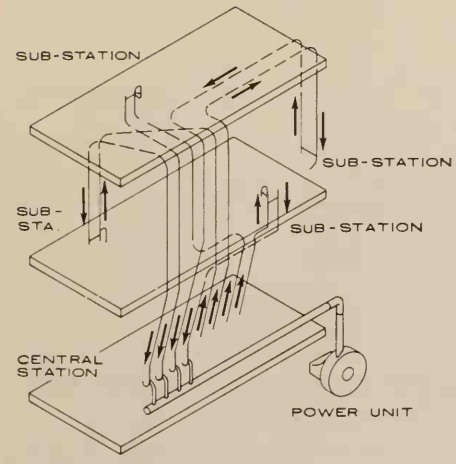
		75 max.	80	67	60

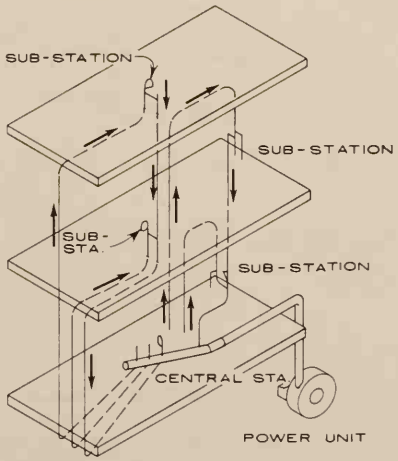
Used indoor or outside, centrifugal types operate on vacuum or vacuum and pressure combinations. Quieter than most types, they are recommended except where long lines are to be used or where reversible action is required. Sizes vary with horsepower of motor, vacuum and r.p.m.

POWER UNITS FOR VACUUM OR PRESSURE



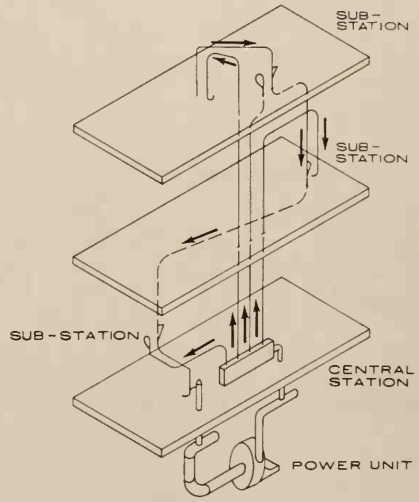
VACUUM TYPE INDEPENDENT TWIN LINE

This system may dispatch carriers from all stations simultaneously with continuous, nearly unlimited transaction. It may have any number of stations since independent lines run to and from all stations. It is considered to be most efficient, low in maintenance cost, and is the quietest system.



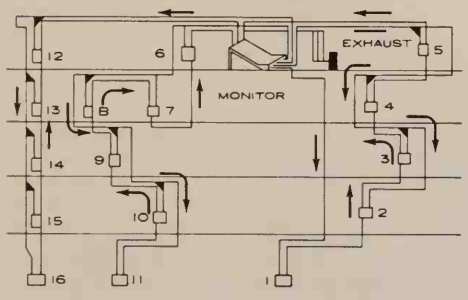
VACUUM TYPE COMBINATION LINE

This system may dispatch carriers from the central station to all sub-stations via separate lines, but return lines are common. Where intermittent service is satisfactory, such as in mail order houses and industrial plants, this system may be used to advantage.



VACUUM - PRESSURE TYPE COMBINATION LINE

This system utilizes both vacuum and pressure. It is economical of power and of length of return lines. It is necessary that the number of open ends be the same for the vacuum as for the pressure lines. Provides quick service. Its use is restricted to mercantile houses, drug, grocery and meat packing plants, and similar types of buildings.



NOTE:

This system operates automatically once the carrier's adjustable ring is set for the proper destination. Within seconds electromechanical switching carries the carrier to the correct station. First, the carrier travels by vacuum to the central station where it is automatically tested to determine the correct line and station. This is done by relays and selectors which establish the path the carrier is to follow to reach its destination. If the carrier is set by mistake for a nonexistent station, it will be discharged into a "reject" tube at the central station. A signal light and bell will indicate an error. This system provides for quicker delivery with less chance of error. It yields economy of length of line. Typical buildings which might find this type suitable are hotels, airline terminals, railroad stations, hospitals, industry.

AUTOMATIC SELECTIVE SYSTEM

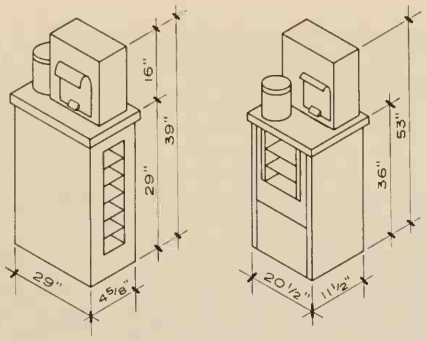
DOWN DISCHARGE TERMINALS

GENERAL NOTES:

A carrier, placed in the sending side of the loop at any one of 16 sending-receiving stations shown at right, will be conveyed swiftly and directly to any one of the other 15. No human element enters to delay or impede the carrier's transit. An Automatic Monitor, in a matter of seconds, transfers the carrier to its correct receiving tube . . . then, an electrically controlled deflector in the receiving tube, delivers the carrier into its ordered station. Such a system has much to recommend it to any user. First, an Automatic System eliminates operating personnel at a Central Station. Not only does this automatic device speed carrier delivery but also permits 24 hour a day communications service, 7 days a week without supervision. Second, by grouping sending-receiving sub-stations along one or more twin-tube loops, 2 airtubes can service all 5 sub-stations as illustrated. The same 2 airtubes could service all 10 sub-stations if that maximum number were located on a given loop. This design effects a tangible saving in space, materials and labor. It also sharply reduces problems encountered when installing a system in existing structures.

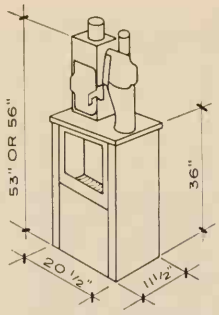


PEDESTALS FOR 2 1/4" PNEUMATIC TERMINALS

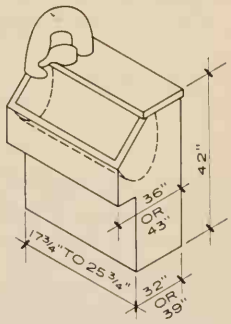
Down Discharge Terminals can be recessed in walls with only dispatching and receiving doors exposed. Can be used for all automatic selective systems.

Pedestal for 2 1/4" Pneumatic terminals have steel cabinet bases with carrier storage under top. Sending inlet on opposite end.

Pedestals for Down Discharge closed receiver terminals for conventional or automatic systems are supplied with base units 20 1/2" wide, 11 1/2" deep, 36" to countertop and an overall height of 53" on 2 1/4" and 3" systems or an overall height of 56" on 4" systems.
conventional or automatic systems are supplied with base



PEDESTAL FOR DOWN DISCHARGE CLOSED RECEIVER TERMINAL



PEDESTAL FOR OVER DELIVERY CARRIER RECEIVING STATION

Pedestal for Over delivery carrier receiving stations have belt sling type pocket sizes available for 2 1/4", 3" and 4" two station systems. 2 1/4" and 3" system pedestals are 18" wide and 36" deep; 4" system pedestals are 26" wide by 43" deep.

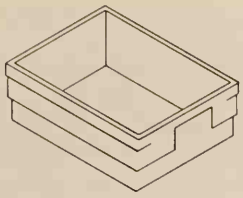
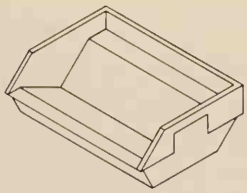
LOCKING MAIL TRAY



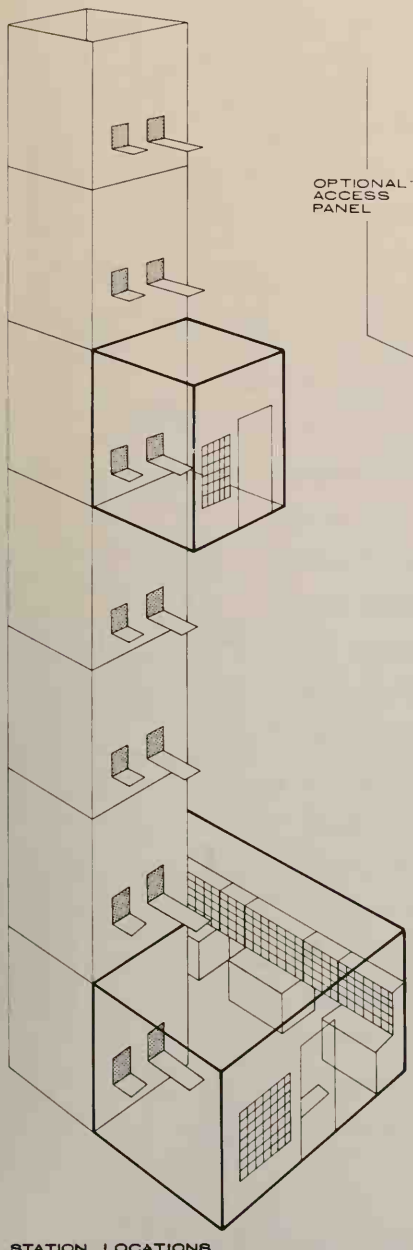
BASIC MODULE TRAY



BOOK TRAY

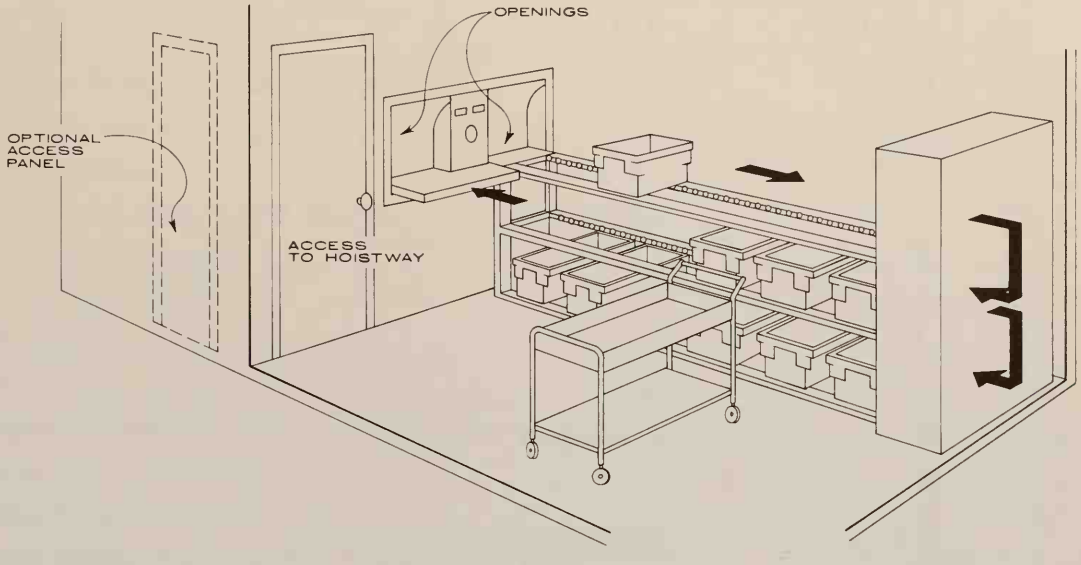
PLASTIC TRAY MODULE TYPES

Fiberglas plastic tray modules are available for all types of services. Standard trays are 16 1/2" long, 12" wide, and 10" high. Also available with locking covers and special compartmental inserts, they can be used for mail distribution in offices as well as in hospital service where special sterilization trays are used. Book trays are available with special sloped bottom form for easy reference stacking, having applications in libraries. Sizes and types are also available for other special services.



STATION LOCATIONS

Stations can be on any or all floors. Mail systems can be developed thus with central station at grade floor and substations at any upper or lower floors.



SELECTIVE VERTICAL CONVEYORS

Bulk transmission between vertical and horizontal points in large structures can be accomplished by continuous electric conveyors with automatic loading and unloading at selected substations on any floors. With hourly capacities up to 18 tons, records and mail in office buildings, books in libraries, and bulk packaging and basic patient needs in hospitals can be carried throughout structures.

Several selective verticals can be interconnected with horizontal conveyors to effect a unified three-dimensional conveyor system; carrying modules can be routed automatically from one vertical to another. Remote substations can be connected to the main system by horizontal conveyors in ceiling spaces, with short vertical drops to selected substation work areas.

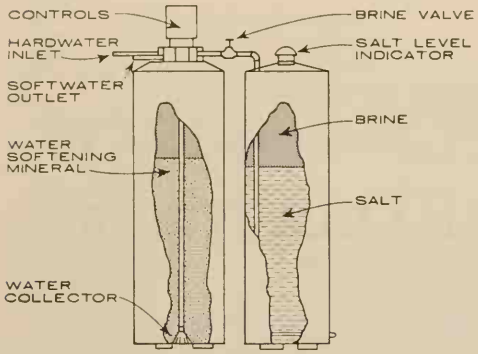
MECHANICAL / ELECTRICAL

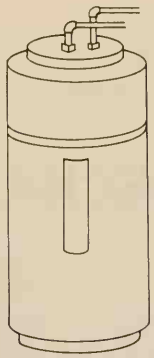
ARCHITECTURAL GRAPHIC STANDARDS AND THE UNIFORM SYSTEM

Within the limits of Architectural Graphic Standards' fundamental emphasis on graphic presentation of design and construction information, the contents of this edition are arranged in Chapters substantially paralleling the sixteen Divisions of the Uniform System for Construction Specifications, Data Filing & Cost Accounting.



SOFTENER BRINE TANK

CROSS - SECTION OF TYPICAL TWO TANK WATER SOFTENER SEMI - AUTOMATIC



TANK - IN - TANK AUTO. MODEL

NOTES:

Water hardness is caused by calcium and magnesium salts and is usually expressed in grains per gallon. For example: New York City 1–5 grains (low); Grand Rapids, Mich. 9 grains (5–9 moderate); Jacksonville, Fla. 18 grains (over 9 high); well water 0–50 grains.

A water softener is typically one tank for manual operation and two adjacent or concentric tanks with automatic controls.

To determine the proper size softener for a residence, use this formula:

No. of people x 50 gal. (75 if 3 or more baths) = Gal. of water used/day;
Gal. of water/day x No. of days of service = Gal. of soft water needed;
Gal. of soft water x Hardness (grains/gal. = Capacity of softener needed.

If the capacity found necessary by this formula is too large, reduce the number of days of service and the softener will need to be regenerated more often. The table given lists data for residential size softeners. If a softener is needed for use in another building type, consult a manufacturer. Rental equipment with service plans are available in some areas, and responsibility for design adequacy should be assumed by the renting company.

When water supplies contain suspended matter, a filter should be placed at the hard water inlet. The softening process often may remove any taste the water can have, but filters can also correct bad taste, acidity, or odor problems which are caused by other salts and minerals.

TYPICAL MANUFACTURERS' DATA

Characteristics	Expressed In	Models		
Regeneration Method	—	Fully-Auto.[1]	Semi-Auto.[2]	Manual[3]
Capacity	grains	18,000	25,000	50,000
Service flow rate	gallons	10	7.5	8
Rinse flow rate	gallons	.7	.5	1.0
Ion exchanger	cu. ft.	1.0	.85	1.7
Salt per regeneration	pounds	5.5	10	30
Regeneration time	minutes	60	120	90
Service piping	inches	1	3/4	3/4
Waste piping	inches	3/8	3/4	1/2
Pressure range	pounds	25-100	25-100	25-100
Electric current	volts	110-60cy	110-60cy	—
Resin tank diameter	inches	9-3/16	9	12
Bed area	sq. ft.	.442	.44	.78
Shipping weight	pounds	100	116	197
Floor space	inches	22x30	11x15	13x18
Overall height	inches	43-3/4	44-3/4	54

1. Complete regeneration by time clock.
2. Manually operated switch to start regeneration.
3. Complete manual regeneration by adding dry pellet type salt directly into the softener.

DIAGRAMMATIC SECTION

NOTES:

1. Where connection to a municipal water supply or public water system is not possible, it is essential that certain precautions be taken in the development of individual water supply. Consideration must be given to the geological and bacteriological factors affecting the quantity and quality of available water.

2. The minimum quantity of water to provide for domestic use should be not less than 50 gallons per person per day. Well and pumping equipment should be adequate to provide a minimum quantity of water at the rate of 5 gallons per minute for domestic use.

3. The well should be chlorinated after construction to remove any pathogenic bacteria and other disease-producing organisms. The water should be tested by the State or Local Health Department for possible bacteriological contents.

WELL CONSTRUCTION

Select a tank of approx. 5000 gals. capacity which must not exceed 8'–0" in width. No limit as to height or length.

8'–0" wide x 12'–0" long = 718 gals. per ft. of height.

$\frac{5000}{718}$ = 7 ft. high — tank required.

EXAMPLE

V. Peruchietti; Giffels & Rossetti, Inc.; Detroit, Michigan

MINIMUM NUMBER OF FIXTURES REQUIRED (SEE GENERAL NOTES)

THE FIGURES SHOWN ARE BASED ON ONE FIXTURE BEING THE MINIMUM REQUIRED FOR THE NUMBER OF PERSONS INDICATED OR ANY FRACTION THEREOF

TYPE OF BUILDING[1]	WATER CLOSETS	URINALS[5]	LAVATORIES[5]	BATH TUBS OR SHOWERS	DRINKING FOUNTAINS[6]
ELEMENTARY SCHOOLS	One for each 30 males One for each 25 females	One for each 25 males	One for each 35 persons		One for each 40 persons
SECONDARY SCHOOLS	One for each 40 males One for each 30 females	One for each 25 males	One for each 40 persons		One for each 50 persons
GYMNASIUMS — HIGH SCHOOLS	One for each 50 males One for each 30 females	One for each 25 males	One for each 20 persons	One for each 2.5 males One for each 3.3 females	
GYMNASIUMS — COLLEGES	One for each 25 males One for each 25 females	One for each 12 males	One for each 25 persons	One for each 4 males One for each 3 females	
OFFICE BUILDINGS OR PUBLIC BUILDINGS	NO. OF PERSONS / CLOSETS Up to 15 / 1 16 to 35 / 2 36 to 55 / 3 56 to 80 / 4 81 to 110 / 5 Add one (1) closet for each additional 40 persons	Whenever urinals are provided for men, one water closet less than the number specified may be provided for each urinal, except that the number of water closets in such cases shall not be reduced to less than 2/3 of the minimum specified.	NO. OF PERSONS / LAVATORIES Up to 15 / 1 16 to 35 / 2 36 to 60 / 3 61 to 90 / 4 91 to 125 / 5 Add one (1) lavatory for each additional 45 persons		One for each 75 persons
MANUFACTURING, WAREHOUSE WORKSHOP & LOFT BUILDINGS MINES, FOUNDRIES ETC.[2]	NO. OF PERSONS / CLOSETS Up to 9 / 1 10 to 24 / 2 25 to 49 / 3 50 to 74 / 4 75 to 100 / 5 Add one (1) closet for each additional 30 persons.	Same as for Office and Public Buildings.	NO. OF PERSONS / LAVATORIES[3] Up to 100 / One for each 10 persons Add one (1) lavatory for each additional 15 persons[4]	One for each 15 persons who may be exposed to excessive heat or to skin contamination with poisonous, infectious or irritating material.	One for each 75 persons
DWELLINGS OR APARTMENT HOUSES	One for each apartment or dwelling unit		One for each apartment or dwelling unit	One for each apartment or dwelling unit	
	Laundry Tubs—One single compartment tub for each apartment or dwelling unit or a multiple compartment tub for each 10 apartments. Kitchen Sinks—One for each apartment or dwelling unit.				
DORMITORIES[7]	Male: 1 for each 10 persons Female: 1 for each 8 persons Over 10 persons add 1 fixture. For each 25 additional males add 1. For each 20 additional females add 1.	1 for each 25 men. Over 150 persons add 1 fixture for each additional 50 males.	1 for each 12 persons (separate Dental Lavatories should be provided in community toilet rooms). Add 1 lavatory for each 20 males and 1 for each 15 females.	1 for each 8 persons. In the case of Women's Dormitories, additional bath tubs should be installed at the ratio of 1 for each 30 females. For over 150 persons, add 1 fixture for each 20 persons.	One for each 75 persons
THEATERS & PLACES OF PUBLIC ASSEMBLY	NO. OF PERSONS / CLOSETS MALE / CLOSETS FEMALE Up to 100 / 1 / 1 101 to 200 / 2 / 2 201 to 400 / 3 / 3 Over 400 add one (1) closet for each 500 additional males and one (1) for each 300 females.	NO. OF MALES / URINALS Up to 200 / 1 201 to 400 / 2 401 to 600 / 3 Over 600 add one (1) urinal for each 300 additional males.	NO. OF PERSONS / LAVATORIES Up to 200 / 1 201 to 400 / 2 401 to 750 / 3 Over 750 add one (1) lavatory for each additional 500 persons.		One for each 100 persons

GENERAL NOTE:

Consult local codes and follow same if their requirements exceed these recommendations.

1. Hospitals, Sanitariums, Hotels and Lodging Houses etc. are not included and must be considered individually.
2. As required by the American Standard Safety Code for industrial sanitation in manufacturing establishments.
3. Where there is exposure to skin contamination with poisonous, infectious, or irritating materials, provide one lavatory for each 5 persons.
4. Twenty four (24) linear inches of wash sink, or eighteen (18) inches of circular basin, when provided with water outlets for such space, shall be considered equivalent to one lavatory.
5. Special requirements applicable to water closets, urinals and lavatories over and above those listed, should be made by the administrative authority concerned with spaces where food or drink is prepared or served.
6. Drinking fountains shall not be installed in toilet rooms.
7. Laundry Trays, 1 for each 50 persons. Slop Sinks, 1 for each 100 persons.

Smith, Hinchman & Grylls Associates, Inc.; Detroit, Michigan

HOT WATER CONSUMPTION

Figures given are in gallons of water per hour per fixture and are based on a final temperature of 140°F (except as noted)

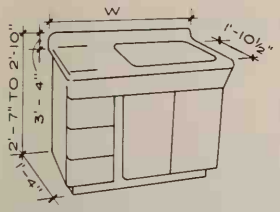
LEGEND & NOTES

Vit. Ch. = Vitreous China
En. C.I. = Enameled Cast Iron
En. Steel = Enameled Steel
p = may have vitreous china leg or pedestal in addition to wall brackets.

* Made in oval rim only
L = may have 2 chrome legs & wall brackets
C = Chair support
Sizes under "with legs" are supported by legs & brackets; they may not be used with bracket support alone.
† = made in rectangular rim only.
Height — finished floor to sink, 2'–6" to 2'–8" (Standard 2'–7").

Lavatories shown with bevelled rect. rims; others have rounded corners or D-shaped (oval) rims. Basins—rectangular or oval, or other shapes (see mfr.). Flat back may have bevelled, rounded or D-shaped corners.



Units may have drawers, hampers, or combinations.

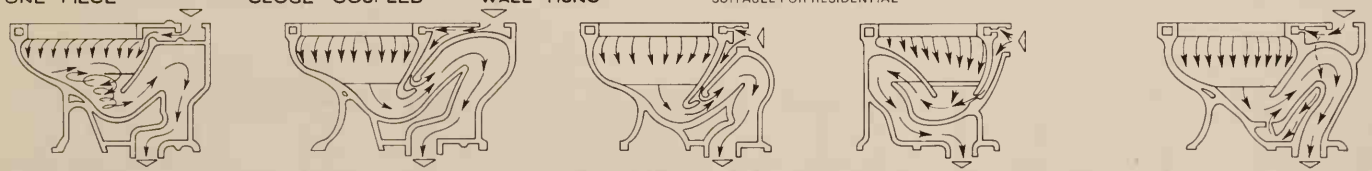
NOTE
Dimensions include seat
For closed-front seats, Add 1" to 8. With seat cover, add 3/4" to height. 00 = most common.
* — Commercial Standard CS-20-63 for vitreous china fixtures (all of vitreous china except where noted).
Allow 3 3/4" to 4 3/4" behind wall for valve. For concealed carrier for wall-hung, allow 2 5/8" min. If foot (chair) support is necessary, allow 1" min. 4'-8" max (usual 2", 2 1/2") below finished floor.

SUITABLE FOR RESIDENTIAL



SIPHON - VORTEX (S-V)
Quiet, extremely sanitary. Water directed thru rim to create vortex. Scours bowl. Folds over into jet; siphon.

SIPHON - JET (S-J)
Sanitary, efficient, very quiet. Water enters thru rim and thru jets in up-leg of trapway. Jet acts as siphon in down-leg.

REVERSE - TRAP (R-T)
Same as siphon-jet except that closet size is smaller.

WASH - DOWN (W-D)
Minimum cost. Simplest design. With round front bowl and front trapway only. Head formed in up-leg overflow, creating siphon.

BLOWOUT (BO)
Noisy but highly efficient and water-saving. Strong jet into up-leg forces contents out. Use with DFV only.

WATER CLOSETS

NOTE: Allow 2 5/8" min. for concealed carrier for wall hung urinals. If foot (chair) support is used allow 1" min., 4 1/8" max. (usually 2", 2 1/2") below finished floor.

* Air cooled condensers are used for normal room temperatures, water cooled units for high room temperatures and larger capacities. Certain models are available in explosion proof construction.

** Additional fountains can be attached low on the side for use in elementary schools. Some models are available in 30" height for primary grades. Some models available with cold and hot water.

° Bubbler fixtures can replace glass fillers on cafeteria models for use in schools.

† Max. water storage for cafeteria types is 40 gals.; for remote types, 300 gals. Cooling capacity is based on 90° room temperature and 80° inlet water temperature. Power: 110, 115, 230 volts; 50 to 60 cycles, single phase A.C., otherwise transformer is used.

†† For use with multiple fountains shown below.

NOTE:

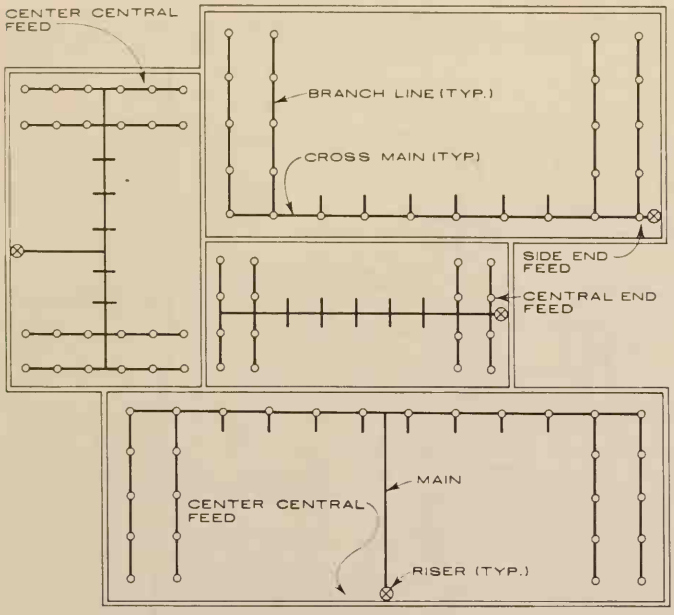
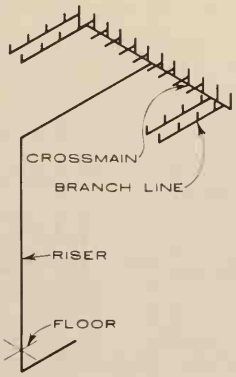
Local Codes should be consulted for pipe sizes, materials, and other requirements in plumbing systems.

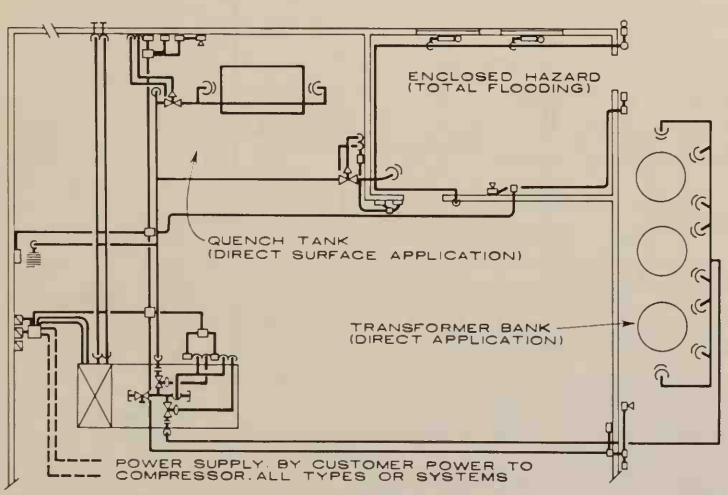
Sargent, Webster, Crenshaw & Folley, Syracuse, New York



PLAN OF TYPICAL LAYOUT OF SPRINKLERS & RISERS FOR STANDARD WET & DRY SYSTEMS



TYPICAL A.S.R. ISOMETRIC



PLAN OF LOW PRESSURE CO_2 SYSTEMS

TYPES OF SYSTEMS

A. WET PIPE SYSTEM

A system employing automatic sprinklers attached to a piping system containing water and connected to a water supply so that water discharges immediately from sprinklers opened by a fire.

B. DRY PIPE SYSTEM

A system employing automatic sprinklers attached to a piping system containing air under pressure; the release of which, as from the opening of sprinklers, permits the water pressure to open a valve known as a "dry pipe valve." The water then flows into the piping system and out the open sprinklers.

C. PRE - ACTION SYSTEM

A system employing automatic sprinklers attached to a piping system containing air that may or may not be under pressure, with a supplemental heat responsive system of generally more sensitive characteristics than the automatic sprinklers themselves installed in the same areas as the sprinklers. Actuation of the heat responsive system, as from a fire, opens a valve which permits water to flow into the sprinkler piping system and to be discharged from any sprinklers which may be open.

D. DELUGE SYSTEM

A system employing open sprinklers attached to a piping system connected to a water supply through a valve which is opened by the operation of a heat responsive system installed in the same areas as the sprinklers. When this valve opens, water flows into the piping system and discharges from all sprinklers attached thereto.

E. COMBINED DRY PIPE & PRE-ACTION SPRINKLER SYSTEM

A system employing automatic sprinklers attached to a piping system under air pressure supplemented with a heat responsive system (NAD). N.A.D.S. operate tripping devices and air exhausters, simultaneously allowing valves to open and water to flow into the system.

F. LIMITED WATER SUPPLY SYSTEM

A system employing automatic sprinklers and conforming to these standards but supplied by a pressure tank of limited capacity.

G. FOAM SYSTEMS

The principal use of foam is for the extinguishment of fires involving flammable liquids. Foam is light and has both adhesive and cooling characteristics. This enables it to flow easily across a burning surface, sealing itself if broken and preventing reignition of surfaces already extinguished.

H. CO_2 SYSTEM

I. HOSE STANDPIPE SYSTEMS

Class I for use by fire departments and those trained in handling heavy fire streams. Class II for use by building occupants until the arrival of the fire department and building occupancy.

TYPES OF CO_2 APPLICATIONS

1. **TOTAL FLOODING SYSTEM** consists of a fixed supply of carbon dioxide normally connected to fixed piping with nozzles arranged to discharge carbon dioxide directly on the burning material.

2. **LOCAL APPLICATION SYSTEM** consists of a fixed supply of carbon dioxide normally connected to fixed piping with nozzles arranged to discharge carbon dioxide directly on the burning material.

3. **HAND HOSE LINE SYSTEM** consists of a fixed supply of carbon dioxide supplying hose lines.

4. **STANDPIPE SYSTEM & MOBILE SUPPLY** consists of a mobile supply of carbon dioxide capable of being quickly moved to position and connected to a system of fixed piping supplying fixed nozzles and/or hose lines that may be used for either total flooding or local application.

PREPARATION FOR FIRE PROTECTION SYSTEM

1. Determine classification of building.
2. Check National, State and Local codes for requirements.
3. Check with authorities having jurisdiction.
   - A. State and Local Fire Marshals.
   - B. Inspection Bureaus.
   - C. Factory Insurance Association or Factory Mutual when they have jurisdiction.
4. Check available water supply.
5. Check space requirements for equipment.

Standard lengths of iron soil pipes = 5'–0" laying lengths

150# SWP malleable fittings are used on water and vent piping.

300# SWP malleable fittings are used for severe service.

125# SWP cast iron screw fittings are used for sprinkler and steam piping.

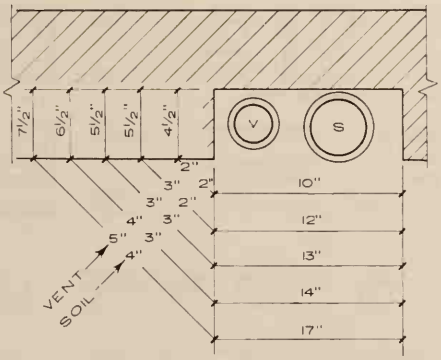
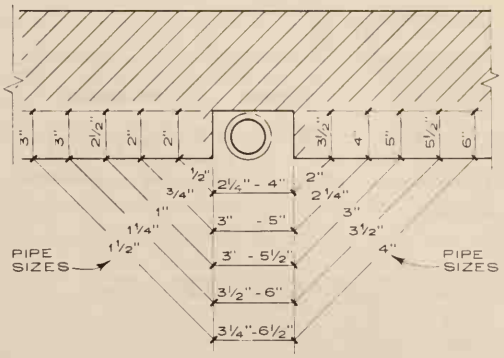
ONE SOIL, WASTE OR VENT



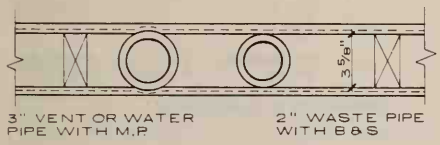
TWO SOILS, WASTES OR VENTS



WATER PIPES

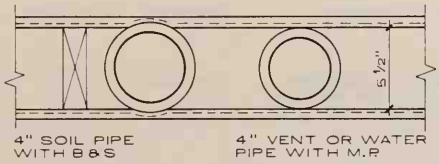
RECOMENDED CHASE SIZES FOR VARIOUS PIPE SIZES

NOTE: ¾" covering included. For 1" cover add ½" to dimension. For size of chase with several pipes, add width req'd. for each.



3" VENT OR WATER PIPE WITH M.P
2" WASTE PIPE WITH B&S

4" STUD



4" SOIL PIPE WITH B&S
4" VENT OR WATER PIPE WITH M.P

6" STUD

WOOD STUD PARTITIONS WITH ¾" LATH & PLASTER

NOTE:

Partitions with ¾" lath & plaster are shown with certain maximum pipes encroaching on the lath & plaster. When rigid board such as gypsum or plaster board is used, the extreme diameter of the bead or bell of the pipe fitting should come within the actual dimension of the wall core.

See "Diameters of Fittings – Across Face Outside."

FITTING ABBREVATIONS

M.P.: malleable pattern

UNHEATED	FLAT ROOF Slope less than: 3/12	1/300 Uniformly distributed at eaves. Free circulation through all spaces required.	Required on warm side in top story ceiling.		
	GABLE ROOF Slope over: 3/12	1/300 At least two louvers on opposite sides near ridge.	Required on warm side in top story ceiling.	Considered unnecessary	
	HIP ROOF	1/300, 1/600 Uniformly distributed at eaves and 1/600 at ridge with all interconnected.	Required on warm side in top story ceiling.	Considered unnecessary	
HEATED	GABLE OR HIP ROOF		Recommended on warm side in top story ceiling, dwarf walls, sloping part of roof and attic story ceiling.		Considered necessary if insulation is omitted.

*The figure given indicates that the clear opening of vents totaled should be 1/300 of the building area at eave line.

**It is recognized that in many areas increased ventilation may be desirable for summer comfort. For winter comfort, insulation is recommended between a living space and a loft or attic ventilated at these rates.

ATTIC SPACE VENTILATION AND VAPOR BARRIER REQUIREMENTS TO PREVENT CONDENSATION

CRAWL SPACE VENTILATION RECOMMENDATIONS:

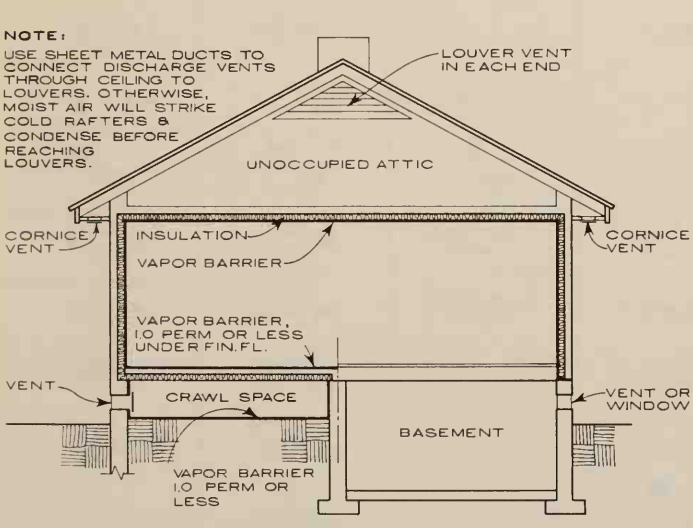
Crawl spaces under dwellings where the earth is damp and uncovered require a high rate of ventilation. At least four openings, one at each corner as high as possible, should be provided. Their total net area may be calculated by formula, at right:

$$a = \frac{2L}{100} + \frac{A}{300}$$

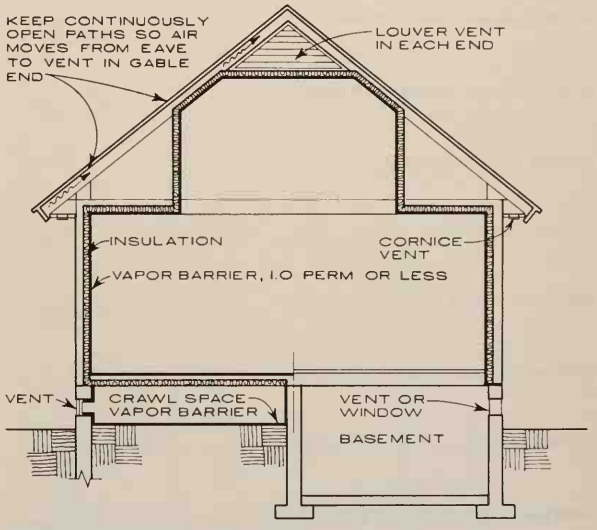
L = the perimeter of the crawl space in linear feet.

A = the area of the crawl space in square feet.

a = the total net area of all vents (or the gross area if 4-mesh screen is used) in square feet.



GABLE ROOF WITH UNOCCUPIED ATTIC
CORNICE VENTS NOT REQUIRED IF AREA IS SMALL



GABLE ROOF WITH OCCUPIED ATTIC - CORNICE VENTS REQUIRED TO CREATE "STACK EFFECT" TO RIDGE

TYPICAL ATTIC AND CRAWL SPACE VENTILATION APPLICATIONS

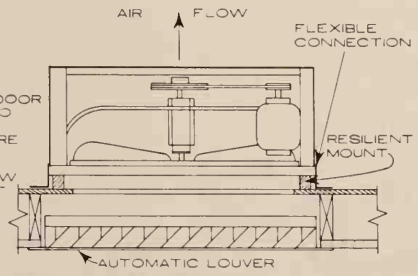
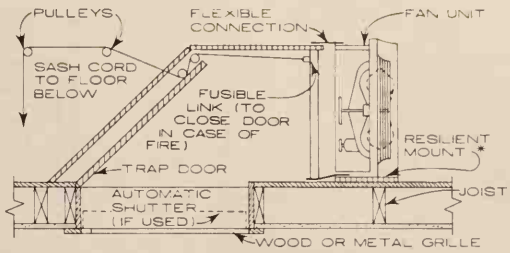
HORIZONTAL DISCHARGE



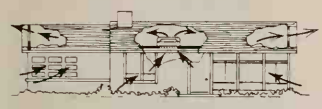
VERTICAL DISCHARGE



SUCTION BOX

* Resilient mounts can be neoprene pads, rubber-in-shear isolators, or steel springs. The selection depends on the type of construction and the degree of isolation desired.

** Platform may be eliminated where the fan unit can be suspended from roof.



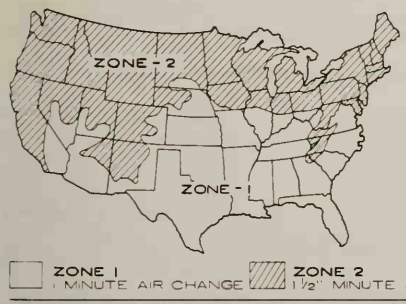
VERTICAL DISCHARGE-LOW ROOF INSTALLATION

SUCTION BOX INSTALLATION

HORIZONTAL DISCHARGE-GABLE INSTALLATION

HORIZONTAL DISCHARGE-BASEMENT INSTALLATION

TYPICAL VENTILATING INSTALLATIONS AND APPLICATIONS



NOTE:

Air quantity for ventilation in cu. ft. per min. (CFM) can be obtained by dividing building volume with number of minute air change.

VENTILATION REQUIREMENT ZONES

MINIMUM GROSS OUTLET AREAS FOR ATTIC FAN DISCHARGE OPENING

TYPE OF OPENING	Gross Area per 1000 CFM Free Air Fan Delivery
Wood louvers with 1/2" hardware cloth. 40% minimum free area.	2.27 sq. ft.
Metal louvers with 1/2" hardware cloth. 50% minimum free area.	1.82 sq. ft.
Plain opening covered with 1/2" hardware cloth. 80% minimum free area.	1.14 sq. ft.
Automatic or manual shutters, 90% minimum free area.	1.01 sq. ft.

Note: If opening is covered with #16 mesh screen, double the gross area of the opening.

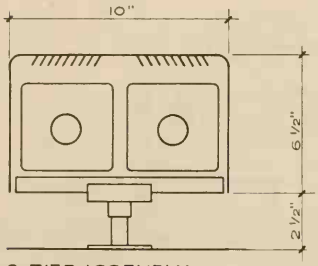
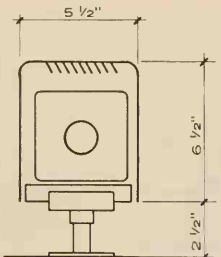
* Belt drive fans are quieter and easier to maintain than direct drive type.

@ Fan should be selected for minimum static pressure drop (S.P.) of 0.1". Where ductwork is required upstream or downstream from the fan, centrifugal blowers should be used.

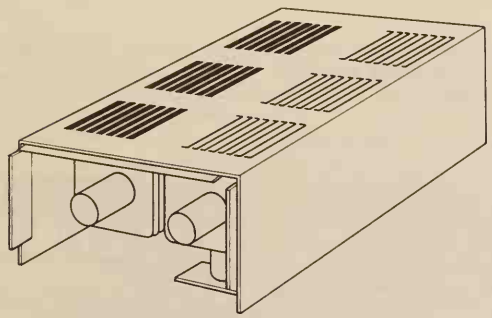
Tseng - Yao Sun, P. E.; Ayres, Cohen and Hayakawa, Consulting Engineers; Los Angeles/San Francisco, California



2-TIER ASSEMBLY

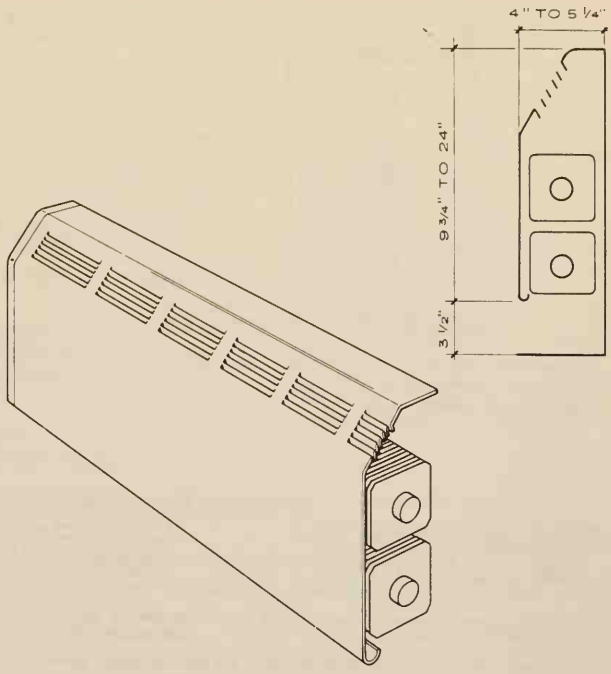


1-TIER ASSEMBLY



FREE STANDING INSTALLATION

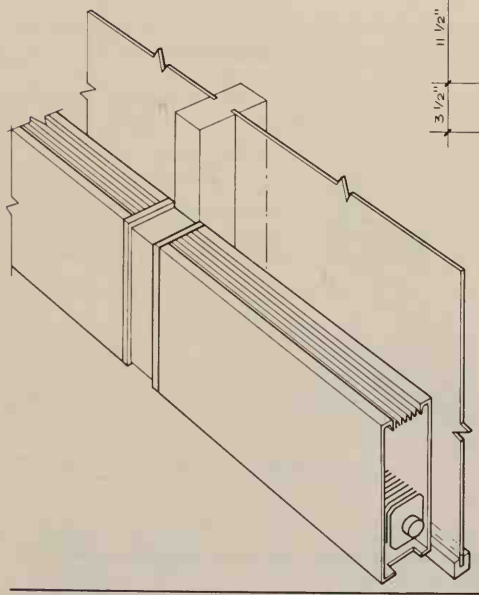
Units are designed for use in areas where exterior walls are glazed from floor to ceiling, and wall hung units cannot be used. They can be installed away from the window and have a low silhouette.

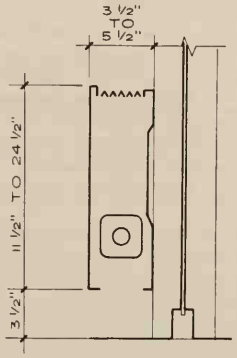


WALL OR SILL INSTALLATION

Units are commonly used in commercial applications where capacity ranges are required. They can be supplied with sloping top enclosures (as shown) or flat top with front grille.

2 tiers of finned-tube shown, 1-tier and 3-tier assemblies are also available.

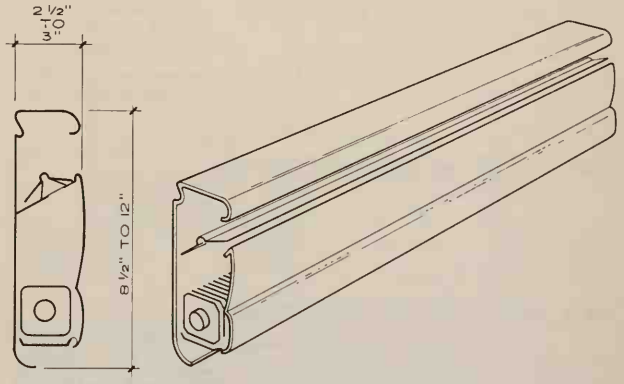




WINDOW WALL INSTALLATION

Units can be mullioned or wall mounted. When installed 30" above the floor, they can also serve as a physical barrier at the glass line.

1 tier of finned-tube shown, 2-tier assemblies are also available.



BASEBOARD INSTALLATION

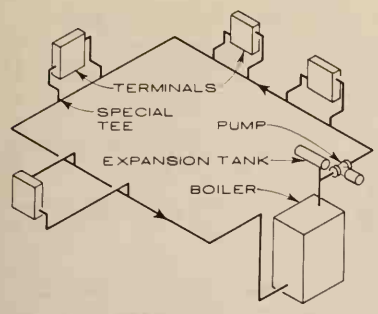
Units are commonly used in residential applications. They are the smallest finned-tube radiation available, have limited capacity ranges, and are available with only one-tier of finned-tube.

GENERAL NOTES:

Finned-tube radiation is generally used in the colder climates. Their function is to maintain the desired air temperature in the space by introducing heat to the room via radiation and convection. In general, they should be placed at the areas of the greatest heat loss such as under windows, at exterior walls and near door openings to offset the heat losses.

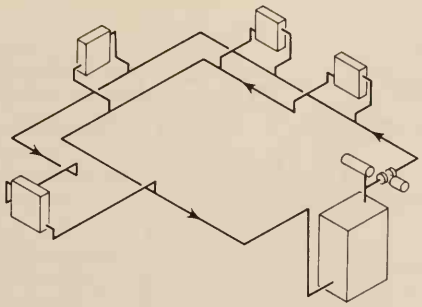
All units are designed for use in low pressure steam and low temperature hot water heating systems. They can be installed as continuous elements or divided into sections of various lengths.

Tseng - Yao Sun, P. E.; Ayres, Cohen and Hayakawa; Consulting Engineers; Los Angeles/San Francisco, California



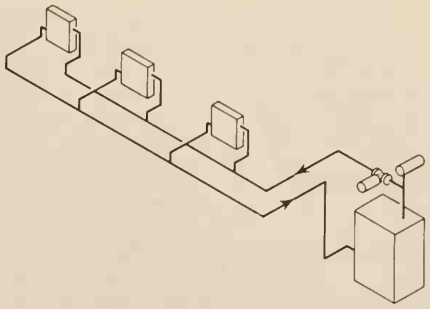
ONE PIPE SYSTEM

Supply and return flow through the same main. Special tee fittings are required to divert water into each terminal.



TWO PIPE SYSTEM – REVERSE RETURN

Supply and return flow through separate mains. The pipe length from the boiler through any terminal and back to the boiler is approximately the same.

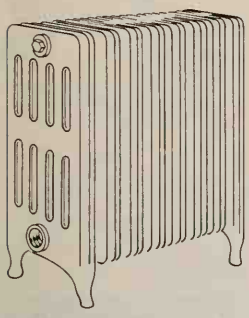


TWO PIPE SYSTEM - DIRECT RETURN

Supply and return flow through separate mains. The pipe length from the boiler through each terminal and back to the boiler varies. Balancing devices must be used to get proper flow through each terminal.

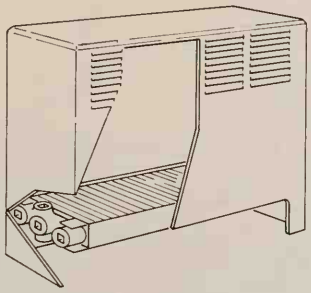
HYDRONIC HEATING SYSTEMS — HOT WATER

NOTE : SEE LOWER PORTION OF THIS PAGE FOR RADIANT PANEL HEATING APPLICATION



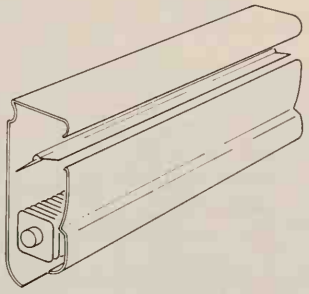
CAST IRON RADIATOR

This type of cast iron radiator is no longer manufactured and is shown here for reference purpose only. A few small tube cast iron radiators designed for recessed installations are available.



CONVECTOR

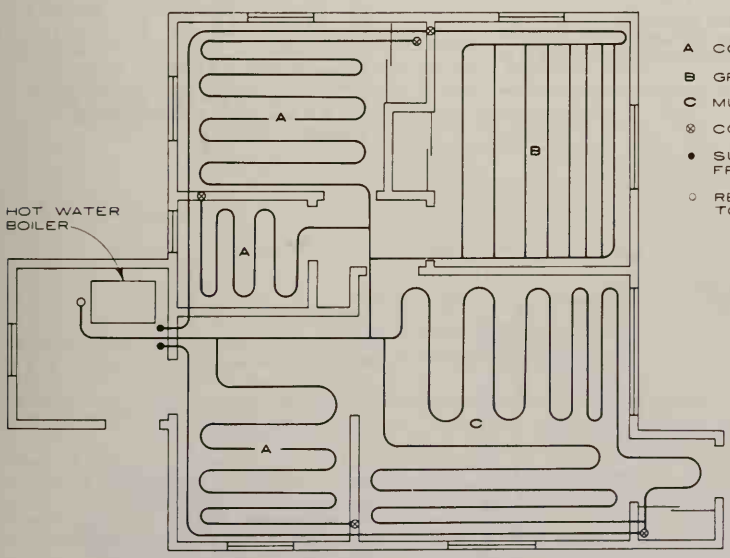
Wide variety of enclosures are available. Many are designed for installation in wall recesses or under the window cabinets.



FIN TUBE RADIATION

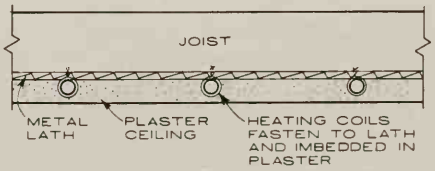
See page on Fin Tube Radiation for type and applications.

HYDRONIC HEATING TERMINALS — HOT WATER

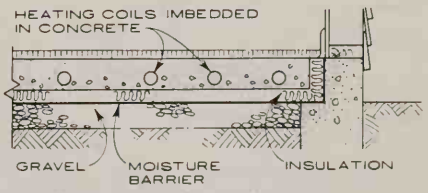


TYPICAL RADIANT PANEL LAYOUT WITH VARIOUS COIL PATTERNS

A CONTINUOUS COIL
B GRID
C MULTIPLE COIL
⊗ CONTROL VALVE
• SUPPLY MAINS FROM BOILER
○ RETURN MAIN TO BOILER



RADIANT CEILING APPLICATION



RADIANT FLOOR APPLICATION

NOTE :

The continuous coil pattern (A) is commonly used in residential applications because it is easy to install in small irregular shaped rooms. Its use in large rooms is restricted by the high friction loss in the long coils. The grid pattern (B) offers lower friction loss and excellent thermal distribution. The multiple coil pattern (C) is the combination of A and B.

RADIANT PANEL HEATING APPLICATION

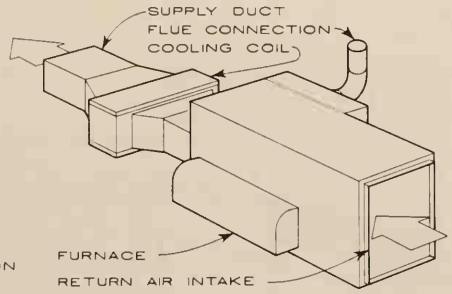
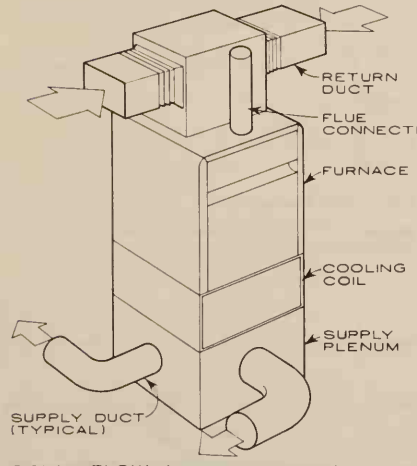
UP FLOW (HIGH BOY)

BASEMENT (LOW BOY)



HORIZONTAL



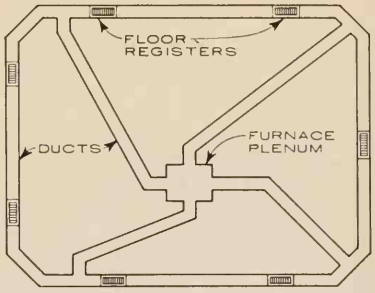
DOWN FLOW (COUNTER FLOW)

FLOOR AREA REQUIRED BY WARM AIR FURNACE

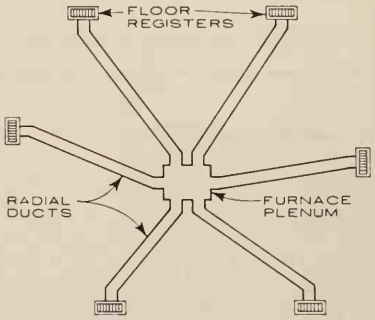
OUTPUT CAPACITY BTUH	FURNACE FLOOR AREA SQ. FT.*
UP TO 52,000	2.4
52,000 - 84,000	4.2
84,000 - 120,000	6.6
120,000 - 200,000	13.1

*Based on net floor area occupied by the up or down flow furnace. Low boy unit requires 50% more floor area. Space for combustion air should be added as required by local codes.

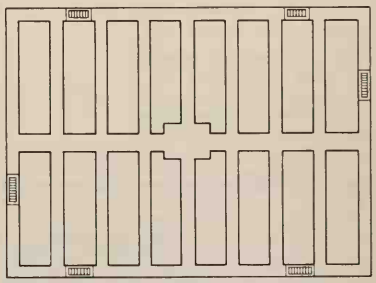
VARIOUS TYPES OF WARM AIR FURNACES



PERIMETER LOOP SYSTEM

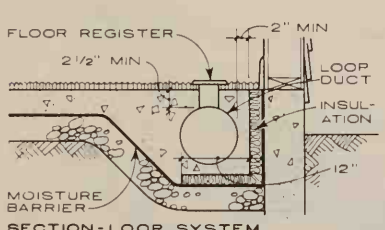


PERIMETER RADIAL SYSTEM

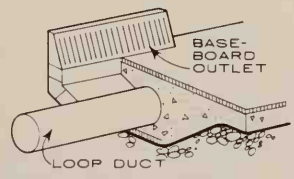


PERIMETER LATERAL SYSTEM

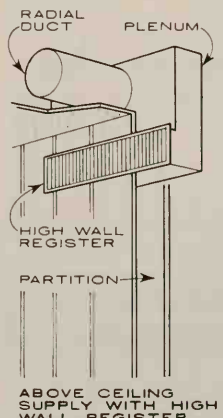
VARIOUS TYPES OF DUCT SYSTEM IN CONCRETE SLAB



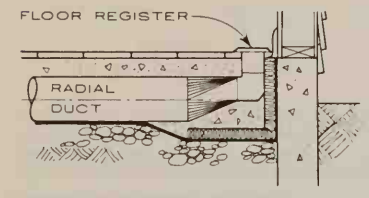
SECTION-LOOP SYSTEM



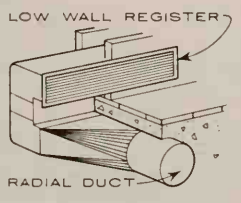
LOOP SYSTEM WITH BASEBOARD OUTLET



ABOVE CEILING SUPPLY WITH HIGH WALL REGISTER



SECTION-RADIAL SYSTEM



RADIAL SYSTEM WITH LOW WALL REGISTER

VARIOUS TYPES OF AIR OUTLETS

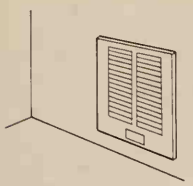
NOTE:

Warm air furnace units are designed primarily for residential, small commercial or classroom heating. Cooling can be added to these units by installing a cooling coil downstream from the furnace with refrigerant compressor and condenser remotely located outside of the building.

Duct system from the furnace unit can be either above the ceiling or in the floor slab. Above ceiling distribution systems are usually the radial type with high wall registers. Perimeter loop and perimeter lateral systems in floor slabs provide good air distribution. There are less temperature variations across the floor with perimeter lateral systems than radial or perimeter loop systems.

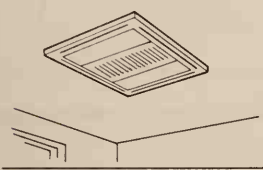
Duct systems may also be installed below the living spaces in a crawl space or basement.

Tseng - Yao Sun, P. E.; Ayres, Cohen and Hayakawa; Consulting Engineers; Los Angeles/San Francisco, California



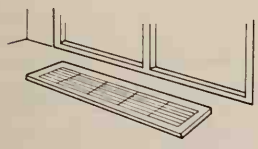
Dimension Range:
Height: 9" to 24" Width: 10" to 18"
Depth: 2" to 6" (Can be recessed in wall)
Capacity Range: 750 W to 4000 W
Form of Heat Transfer:
Radiation—convection or forced air.

WALL HEATER



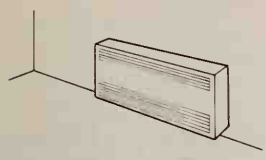
Dimension Range:
Length: 10" to 14". Width: 8" to 14"
Depth: 4" to 8" recessed
Circular shape available
Capacity Range: 500 W to 1500 W
Form of Heat Transfer:
Radiation—Convection or forced air.

CEILING HEATER



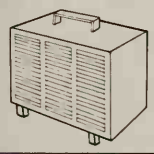
Dimension Range:
Width: 5" to 6" Length: 14" to 108"
Depth: 8" to 10"
Capacity Range: 300 W to 2000 W
Form of Heat Transfer: Convection.

FLOOR HEATER



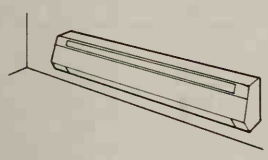
Dimension Range:
Height: 11" to 32" Length: 24" to 96"
Depth: 3" to 7"
Capacity Range: 1000 W to 4000 W
Form of Heat Transfer: Convection.

CONVECTOR



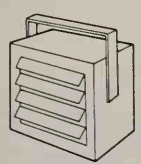
Dimension Range:
Height: 7" to 24" Width: 10" to 72"
Depth: 2" to 12"
Capacity Range: 500 W to 5000 W
Form of Heat Transfer:
Radiation: Convection or forced air

PORTABLE HEATER



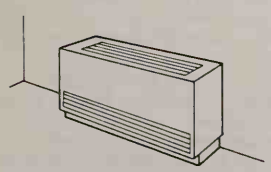
Dimension Range:
Height: 4" to 9". Length: 24"-120"
Depth: 2" to 3"
Capacity Range: 300 W to 3500 W
Form of Heat Transfer:
Convection.

BASEBOARD HEATER



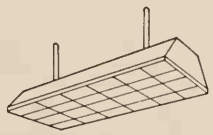
Dimension Range:
Height: 12" to 26". Width: 12" to 52"
Depth: 6" to 22"
Capacity Range: 1.5 KW to 50 KW
Form of Heat Transfer: Forced air.

UNIT HEATER



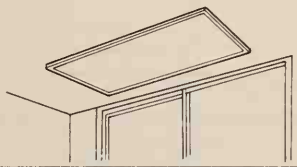
Dimension Range:
Height: 26" to 32". Width: 48" to 104"
Depth: 11" to 26".
Capacity Range: 1 KW to 36 KW
Form of Heat Transfer:
Forced air.

UNIT VENTILATOR



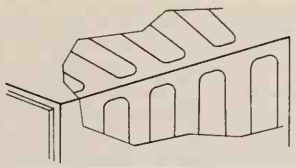
Dimension Range:
Width: 4" to 12". Length: 14" to 86"
Height: 3" to 16"
Circular shape available
Capacity Range: 500 W to 7000 W
Form of Heat Transfer: Radiation.

INFRARED HEATER



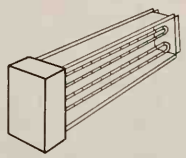
Dimension Range:
Width: 24" to 48". Length: 48" to 144"
Depth: 1"
Capacity: 500 W to 1000 W
Form of Heat Transfer: Radiation

RADIANT HEATING PANEL



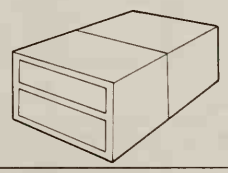
Dimension Range: Not applicable
Capacity Range:
Varies with coverage.
Form of Heat Transfer:
Radiation with some convection.

RADIANT HEATING CABLE IN WALL & CEILING



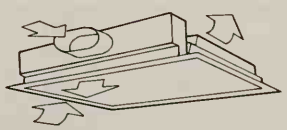
Dimension Range:
Varies with duct sizes.
Capacity Range: 0.3 KW to 2000 KW
Form of Heat Transfer:
Forced air.

DUCT INSERT HEATER



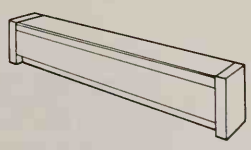
Dimension Range: Varies.
Capacity Range: 2 KW to 100 KW
Form of Heat Transfer:
Forced air. Heat from refrigeration cycle.

HEAT PUMP



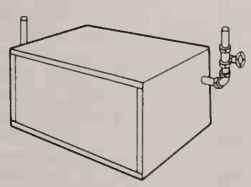
Dimension Range: Not applicable. Shown with fluorescent light, can be applied to incandescent lights.
Capacity Range: Varies with air velocity and shape of the light fixture.
Form of Heat Transfer: Forced air.

HEAT-OF-LIGHT



Dimension Range:
Height: 9" to 10". Length: 23" to 107"
Depth: 3" to 4"
Capacity Range: 300 W to 2000 W
Form of Heat Transfer:
Convection (Indirect heat)

HYDRONIC BASEBOARD



Dimension Range: Varies.
Capacity Range: 6 KW to 40 KW
Form of Heat Transfer:
Heats water for remote hot water heating systems.

ELECTRIC BOILER

* Basis for load Calculations:

1. Design procedures: American Society of Heating, Refrigeration and Air Conditioning Engineers, 1966 Guide and Data Book.
2. Building location: Sea level, 40° N. Latitude.
3. Building description: 12 feet floor to floor, curtain wall.
4. Design Conditions:
   Outdoor Summer: 93° F. DB, 75° F. WB, 20° F. Daily Range
   Winter: Varies, See above table.
   Indoor Summer: 75° F. DB, 50% RH
   Winter: 75° F. DB, RH Varies.
5. Heat Transmission Coefficients:
   Curtain Wall: U = 0.18
   Glass, 1/4" Clear Plate:
   U Summer = 1.06
   U Winter = 1.13
   Inside shading devices on glass equal to light colored Venetian blind or light colored semi-open weave drapery. Shading Coefficient: 0.55.
6. People: 100 Sq. ft. per person (Sq. ft. = 90% gross area)
7. Lights: 4 Watts per sq. ft. (sq. ft. = 90% gross area) 75% of light load (3 watts per sq. ft.) to occupied space and 25% to ceiling plenum return air.
8. Supply air quantities: Required for the sum of instantaneous peak cooling loads based on 20° F. differential at outlets. Minimum of 0.8 cfm per sq. ft. in interior areas (other than 15 ft. from building perimeter).
9. No internal heat gains (light or people) credited to heating load.
10. Fixed outside air quantity equal to 15% of supply air.
11. Load through roof (2000 sq. ft.◊ per ton, 0.28 cfm per sq. ft.◊ and 0.1 t Btu per hr. per sq. ft.◊) not included.
12. Heat loss through ground floor perimeter (0.81 △t Btu per hr. per linear ft. of perimeter) not included.

◊ Roof area.

DOUBLE DUCT SYSTEM **SINGLE DUCT SYSTEM**

NOTES:

Space requirements are for schematic studies only and are based on the following assumptions. See related page for illustration on use of tabulated data.

1. All air double duct or single duct up feed systems shown in diagram at left. Shaft around supply ducts used for return air.
2. No exhaust duct in shaft. Shaft areas at each floor include allowances for miscellaneous protrusions (pipe risers, branch duct take-offs, recesses for fire hose cabinets, drinking fountains or electric panel). Single story building, 5 sq. ft.; multistory building, 15 sq. ft.
3. Main riser ducts and shaft sized as follows:

   High Velocity: Round ducts, 3500 fpm average velocity.

   Low Velocity: Rectangular ducts, 1:2 aspect ratio, 1600 fpm average velocity.

   Return Air: 1000 fpm average velocity.
4. All supply riser and branch ducts insulated, 2" thick.
5. Ceiling space defined as depth required between top of ceiling suspension system (or top of recessed light fixture, if used) and bottom of structural element (including fireproofing, if used). Space base on ceiling plenum return (no return air ducts) and 1:4 aspect ratio rectangular supply air ducts. Depth can be appreciably reduced if duct crossovers can be arranged to utilize the space between beams.

NOTES :

a. Machine room area includes space for chiller or chillers, 2 chilled water pumps, 2 condensing water pumps, tube pulling space and electric control panels. No space allowed for cooling tower or air cooled condenser.

b. Two chillers each sized for 50% of total load.

c. Net equipment dimensions. Space for architectural screening excluded. Add 3 ft. in height for structural supports under cooling tower. Cooling towers, single cell, sized for 95°/85°F water, 75°FWB. Air cooled condenser sized for 40°F suction/110°F condensing, 100°F outside air.

d. Operating weight includes weight of equipment plus its contents. Add 15% for weight of pipes, expansion tank and pumps. If concrete bases are used, add 2 times the weight of the equipment.

e. Operating weight of reciprocating chiller. Direct expansion machine weighs 2400 lbs.

f. Reciprocating chiller weighs 6500 lbs. and direct expansion machine weighs 3900 lbs.

g. Reciprocating chiller weighs 19400 lbs.

h. Boiler room area includes space for hot water boiler or boilers, tube pulling space, circulating pumps and one tankless domestic hot water generator. Use same data for steam boilers.

i. Add 15% for weight of pipes, expansion tank and pumps.

j. Fan room area includes space for single fan supply system. If return air fan is used, add 30%. If fan room is located on roof or at perimeter of building, areas can be used directly. If fan room is located within building core, additional space is required for outside air, relief or exhaust air shafts.

k. Equipment weight includes fan, coils, filters, plenums and ducts in the fan room.

ILLUSTRATION ON USE OF THE TABULATED DATA IN PAGES OF THIS SERIES TO DETERMINE ROUGH LOADS AND SPACE REQUIREMENTS FOR AIR CONDITIONING SYSTEM

Building Description: 5 story office building, Shape IV, 84 ft x 144 ft, 40% glass with indoor shading device. 20°F winter outdoor temperature.

Gross Area of Building:
84 x 144 x 5 = 60,500 sq. ft.

Roof Area:
84 x 144 = 12,096 sq. ft.

Ground Floor Perimeter:
84 x 2 + 144 x 2 = 456 ft.

Air Conditioning Load and Supply Air Quantities:
From table, preceding page, for building shape IV, 40% glass with indoor shading device: 292 sq. ft/ton, 1.61 cfm/sq. ft.
Building Cooling Load:
(60500/292) + (12096/2000) = 213 tons
Air Quantities:
Cfm for typical floors:
12096 x 1.61 = 19,500 cfm
Cfm for floor under roof:
19500 + 12096 x 0.28 = 22,900 cfm
Total cfm for building:
(4 x 19500) + 22900 = 100,900 cfm

Heating Load:
From table, preceding pg., for building shape IV, 40% glass at 20°F outdoor temperature:
42.6 Btu/Hr./Sq. ft.

Building Heating Load:
60500 x 42.6 = 257.730 Btu/Hr.
Add roof plus floor slab
(12096 x 0.1* + 456 x 0.81**) (75-20)
= 86500
Total:
257730 + 86500 = 344,320 Btu/Hr. or
344 MBH

Refrigeration Machine Room Size:
From table above, using centrifugal chillers: 620 sq. ft.
Cooling tower size: 19 ft x 13 ft x 9 ft high.

Boiler Room Size:
From table above, using 2 Boilers:
380 sq. ft.

Fan Room Sizes:
Scheme A: One fan room per floor using packaged unit.
From table above, 320 sq. ft. for typical floor and 430 sq. ft. for floor under roof.
Scheme B: One central fan room in basement using double duct system.
From table, 1600 sq. ft.

Duct and shaft space Requirements:
From page titled above, using one central fan room in basement and double duct system.

Scheme A: One shaft, low velocity system.
1st floor: 197 sq. ft.
2nd floor: 162 sq. ft.
3rd floor: 126 sq. ft.
4th floor: 90 sq. ft.
5th floor: 44 sq. ft.
Maximum ceiling space required: 38 in.

Scheme B: Two shafts, high velocity system, each shaft serving half of floor.
1st floor: 81 sq. ft.
2nd floor: 69 sq. ft.
3rd floor: 56 sq. ft.
4th floor: 43 sq. ft.
5th floor: 23 sq. ft.
Maximum ceiling space required: 30 in.

Tseng · Yao Sun, P. E. and Kyoung S. Park, P. E., Ayres, Cohen and Hayakawa; Consulting Engineers; Los Angeles/San Francisco, California

CLEARANCE IN MECHANICAL EQUIPMENT ROOMS

TYPE OF BUILDING AND TOTAL GROSS FLOOR AREA	PERCENTAGE – FLOOR AREA REQUIRED FOR MECH. SPACE	MIN. CLEAR HEIGHT -- AIR HANDLING EQUIPMENT	MIN. CLEAR HEIGHT – HEATING PLANT	MIN. CLEAR HEIGHT – REFRIGERATION PLANT
COMMERCIAL BUILDINGS				
10,000 Sq. Ft.	10%	8'–0"	8'–0"	8'–0"
50,000 Sq. Ft.	8%	9'–0"	10'–0"	9'–0"
100,000 Sq. Ft.	6%	10'–0"	12'–0"	14'–0"
INSTITUTIONAL BUILDINGS				
10,000 Sq. Ft.	12%	8'–0"	10'–0"	8'–0"
50,000 Sq. Ft.	10%	10'–0"	12'–0"	12'–0"
100,000 Sq. Ft.	8%	10'–0"	14'–0"	14'–0"

NOTES:

1. The height clearances indicated above are the recommended minimum for preliminary design. These requirements vary depending on the following:
   a) type of refrigeration plant
   b) type of heating plant
   c) built-up units versus packaged units
   d) main equipment room on roof, main equipment in basement, separate equipment room on each floor, or a combination of all three.
2. When blocking in equipment in mechanical equipment rooms for preliminary layout be sure to allow clearances for the following:
   a) tube removal for fire tube boilers
   b) tube removal for chillers, condensers, converters, etc.
   c) coil removal for air handling systems
   d) adequate access for maintenance of filters, traps, controls, etc.
3. The percentage of total gross floor areas indicated as being required for mechanical space are average and are based upon integral heating and refrigeration plants. If the building is served by an external central plant, the percentages will be reduced.

CLEARANCE IN CEILINGS FOR LOW VELOCITY DUCTWORK

APPROXIMATE AREA SERVED PER SHAFT OR LOCAL EQUIP. ROOM	WITH RETURN AIR DUCTWORK		NO RETURN AIR DUCTWORK (see note five)		DEDUCT IF SYSTEM SERVES INTERIOR AREAS ONLY (NOTE 6)
	WITH LIGHTING BELOW CEILING	RECESSED LIGHTING FLUORESCENT	WITH LIGHTING BELOW CEILING	RECESSED LIGHTING FLUORESCENT	
2500 Sq. Ft.	20" to 30"	24" to 34"	14" to 18"	18" to 22"	4" to 6"
5000 Sq. Ft.	30" to 36"	34" to 40"	18" to 22"	22" to 26"	4" to 7"
10,000 Sq. Ft.	36" to 44"	40" to 48"	22" to 26"	26" to 30"	6" to 8"

NOTES:

1. Clearances given above are between top of ceiling construction and underside of structure for floor above.
2. Variations in required clearances, as indicated depend upon the location of the supply source: if located at the extremity of the area served, greatest clearance should be used: if located at the center of the area served, smallest clearance should be used.
3. It is generally preferable to have upturned beams around a duct shaft, as this permits smoother take-offs.
4. Clearances indicated do not allow for piping. If considerable piping must run in the ceiling, where ducts are largest (such as toilet wastes or rain conductors which must run horizontally at the top floor) clearances must be increased.
5. The clearances listed under "No Return Air Ductwork" are predicated on: a) a central return. This is not feasible for areas larger than 2500 sq. ft., and is not permitted in schools, hospitals, etc. b) utilizing space above ceiling as return air plenum. Building structural system must be suitable. Floor above must be fireproof construction.
6. If low velocity duct system serves interior area only, then the amounts indicated may be deducted from appropriate clearances. These applicable if a separate system serves the perimeter.

Smith, Hinchman & Grylls Associates, Inc.; Detroit, Michigan

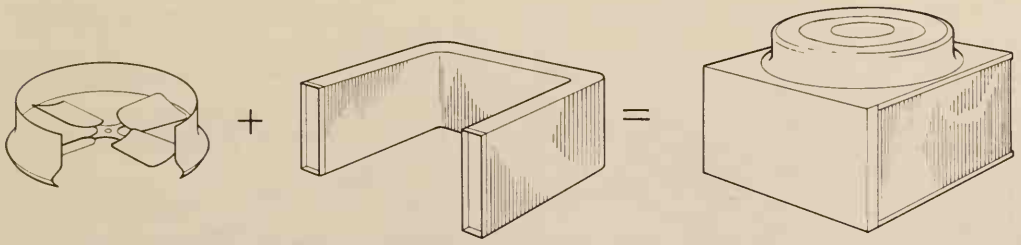
FILTER FAN COIL FAN COIL UNIT

FAN COIL UNIT

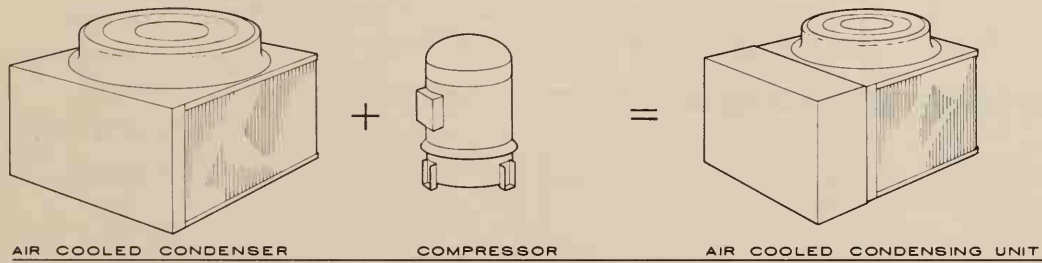
Fan coil unit can be placed in horizontal (as shown) or vertical position. It can be located above ceilings, on roofs, in closets or below window sills. Coil can be cooled either by chilled water or by direct expansion refrigeration. The unit is the indoor portion of the unitary air conditioner.



FAN CONDENSING COIL AIR COOLED CONDENSER

AIR COOLED CONDENSER

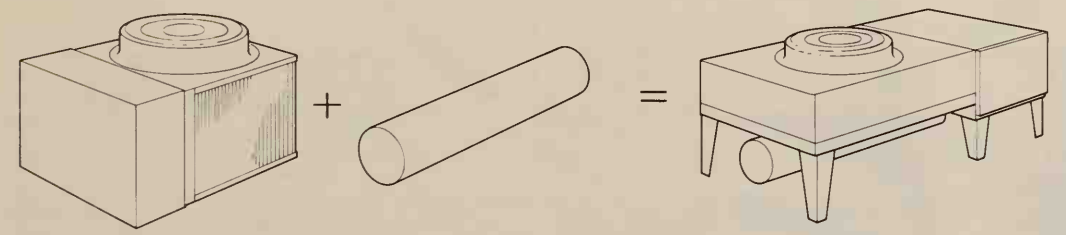
Air cooled condenser is designed to condense the hot refrigerant gas to a liquid by passing air over a condensing coil. The unit is generally placed outdoors, but can be located indoors if air intake and exhaust ducts are extended to the outside. It is available with centrifugal blowers in lieu of propeller fans (as shown) where required to offset the resistance of long duct runs. Water cooled condensers connected to cooling towers and evaporative condensers are also available.



AIR COOLED CONDENSER COMPRESSOR AIR COOLED CONDENSING UNIT

AIR COOLED CONDENSING UNIT

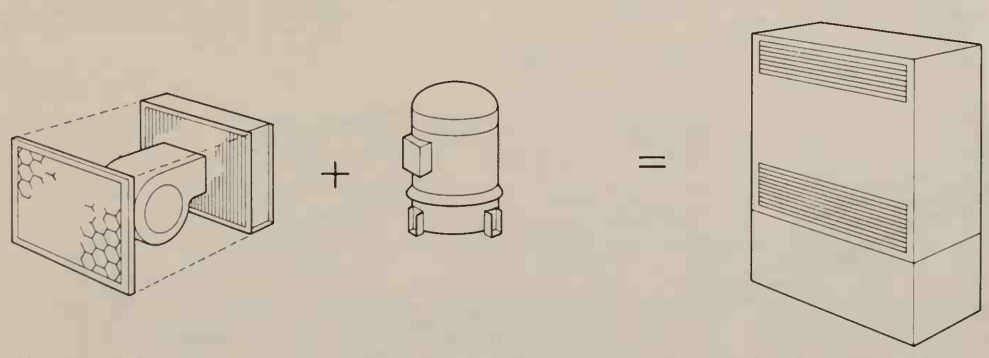
Air cooled condensing unit is the complete outdoor portion of a unitary air conditioner. The unit coupled with a fan coil unit using a refrigerant coil becomes a complete unitary air conditioner. Units with centrifugal blower are also available.



AIR COOLED CONDENSING UNIT EVAPORATOR AIR COOLED WATER CHILLER

AIR COOLED WATER CHILLER

Air cooled water chiller is another type of the outdoor portion of a unitary air conditioner. The refrigerant in the evaporator chills water that is then pumped to the coil in the fan coil unit. The fan and coil unit is the indoor portion of the unitary air conditioner.



FAN COIL UNIT COMPRESSOR AIR CONDITIONER

AIR CONDITIONER

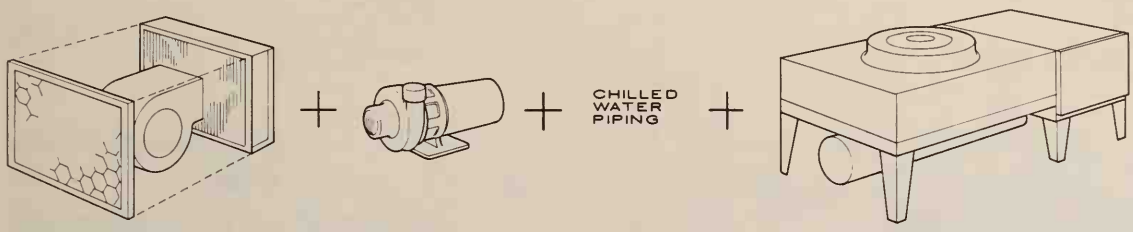
Air conditioner is another arrangement of the indoor portion of the unitary air conditioner. The unit coupled with the air cooled condenser becomes a complete unitary air conditioner. The unit is usually floor mounted.

Tseng · Yao Sun, P. E., Ayres, Cohen and Hayakawa, Consulting Engineers; Los Angeles/San Francisco, California

FAN COIL UNIT — AIR COOLED CONDENSING UNIT

FAN COIL UNIT PLUS CONDENSING UNIT

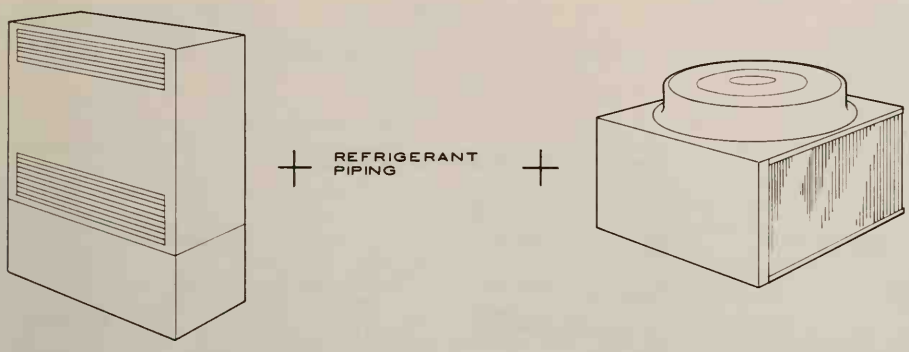
Direct expansion refrigeration coil is used in the fan coil unit. Liquid and suction refrigerant piping connect the fan coil unit (indoor portion) to the air cooled condensing unit (outdoor portion). Multiple fan coil units can be served by a single condensing unit.



FAN COIL UNIT — PUMP — AIR COOLED WATER CHILLER

FAN COIL UNIT PLUS WATER CHILLER

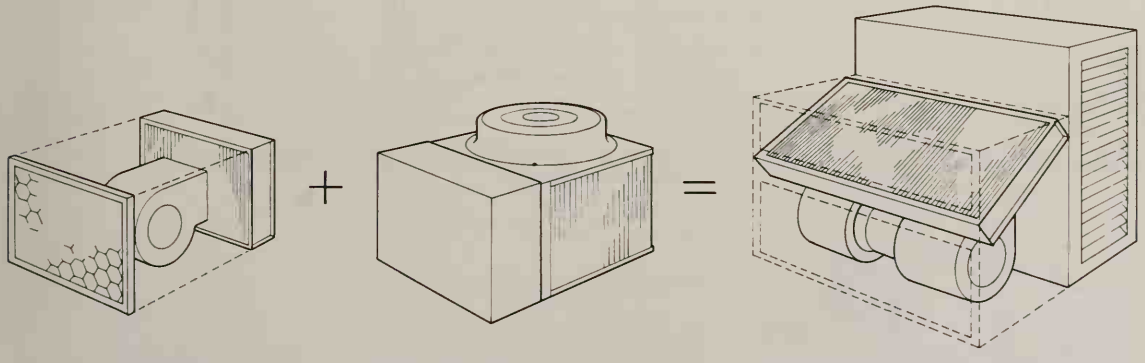
Chilled water coil is used in the fan coil unit. A pump is required to circulate chilled water between the fan coil unit (indoor portion) and the water chiller (outdoor portion). This arrangement is generally used where the system requires multiple fan coil units.



AIR CONDITIONER — AIR COOLED CONDENSER

AIR CONDITIONER WITH REMOTE CONDENSER

Hot gas and liquid refrigerant piping connect the air conditioner (indoor portion) to the air cooled condenser (outdoor portion). Each air conditioner must be served by a single condenser.



FAN COIL UNIT — AIR COOLED CONDENSING UNIT — SINGLE PACKAGE AIR CONDITIONER

SINGLE PACKAGE AIR CONDITIONER

No external piping required for the package other than the drip pan drain line. The package is generally installed on a roof or through an exterior wall.

DEFINITION OF THE UNITARY AIR CONDITIONER

A complete, pre-assembled air conditioning system consists of one or more matched factory-made assemblies which normally include an evaporator or cooling coil, a compressor and condenser combination, and may include a heating function* as well.

*The integral heating components of unitary air conditioner can be:

1. Hot water or steam coils using an auxiliary boiler.
2. Electric resistance heaters.
3. Direct-fired furnaces using either gas or oil as fuels.

Heating can also be achieved by making the refrigeration system operate as a heat pump by reversing the function of the evaporator and the condenser during the heating season.

Tseng · Yao Sun, P. E.; Ayres, Cohen and Hayakawa; Consulting Engineers; Los Angeles/San Francisco, California

NOTES APPLY TO VARIOUS SYSTEMS :

* These systems furnish cooling only. Heating, if required, must be provided by other means.

◊ Unit provides cooling only unless designed as a heat pump.

§ These systems include a gas fired warm air furnace for heating. They are commonly used in residences and classrooms. See page on Warm Air Heating.

✣ Unit is a single package air conditioner coupled with a gas fired furnace for heating. It is commonly used in single story office, school and industrial buildings. It can also be modified for indoor applications with ducts from condenser extended to the outside.

See pages on Unitary Air Conditioning Components and Systems for components and definition of such systems.

EMERGENCY POWER

Basic solutions

1. Battery operated emergency & exit lighting trickle charged.
2. Emergency power & lighting fed from a source ahead of the main secondary circuit breaker or disconnect device.
3. Gasoline, diesel powered or natural gas engine generator sets.

The first two items are usually required for applications in low rise office buildings and retail stores where a minimum of power is required for lighting for egress in the event of power failure and for fire alarm.

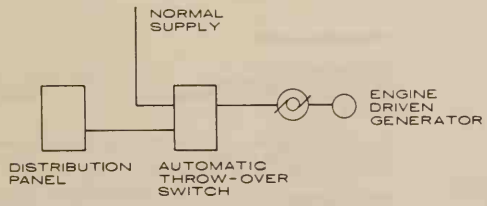
The installation of an engine driven generator set is usually recommended for hospitals, experimental laboratories and high rise office buildings and retail stores.

Sets are available in sizes from 3 KILOWATT to 3000 KILOWATTS with the smaller units generally being gasoline fueled and the larger units diesel driven, all larger sizes requiring fuel storage tanks which should be located outside of building.

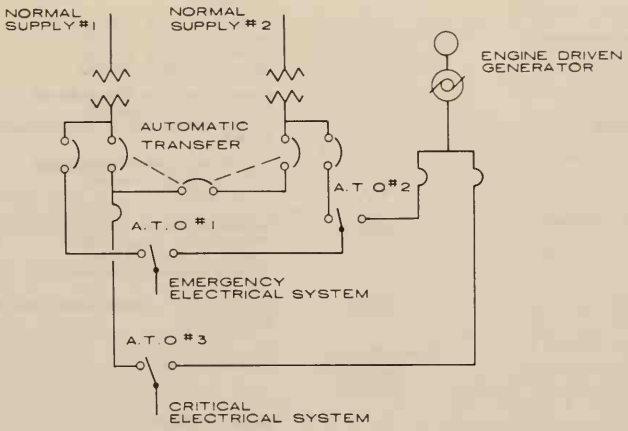
Essential services only should be fed from the standby power source. In offices and stores these should include power to operate one elevator of a bank, and all down escalators besides emergency and exit lighting. Elevator control should be arranged to operate any one in the group.

In hospitals these services should include mandatory requirements covered by NFPA Bulletin 76 current edition and any critical items requested by the hospital authorities.

An emergency automatic throw-over switch of thoroughly reliable design should be provided, fed from a normal supply source. Both the switch and the generator should be sized for the connected load of the emergency requirements.



STANDARD EMERGENCY CONNECTIONS



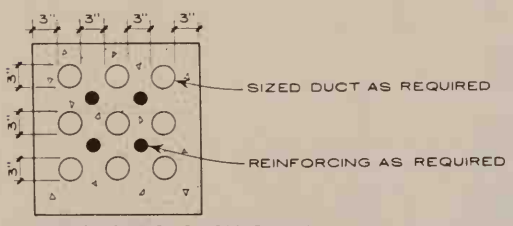
RECOMMENDED HOSPITAL EMERGENCY CONNECTIONS

SITE UTILITIES

In modern practice of supplying electric power to major building sites it is usual for the electric utility company to provide primary service to the project, underground to the primary substation incoming line disconnects or protective devices. These are usually located in the basement and are ideally situated on the outside wall of the building from which the service is to come. This is also true of major telephone service.

The underground duct banks illustrated below are normally supplied as two, three or four ducts wide with as many below as required. Fibre and Poly-vinyl Chloride thin wall duct may be used for concrete encased requirements except under buildings, roadways and rail roads where galvanized iron conduit is preferable.

For low voltage up to 600 volt parking lot and site lighting thick wall direct burial Poly-Vinyl conduit is acceptable.



UNDERGROUND DUCT BANK

36	41
40	44

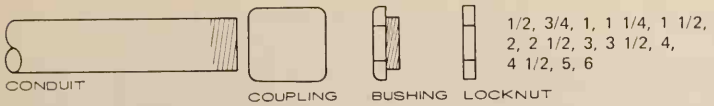
STANDARD FUSE SIZES

Plug Fuse: 1, 3, 5, 6, 8, 10, 15, 20, 25 and 30 amperes.
Cartridge: 1, 3, 6, 10, 15, 20, 25, 30, 35, 40, 50, 60, 70, 80, 90, 100, 110, 125, 150, 175, 200, 225, 250, 275, 300, 325, 350, 400, 450, 500, & 600 amperes.

Standard knife switches are rated at 30, 60, 100, 200, 400 & 600 amps, and take cartridge fuses up to and including their rating.

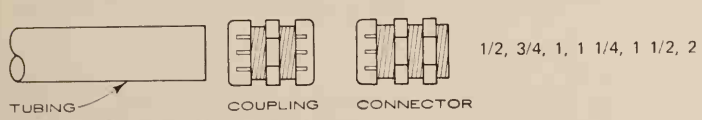
Circuit breakers at 50 (trip at 15, 20, 30, 40, 50); 100 (trip at 15, 20, 30, 40, 50, 70, 100); 225 (70 – 225, increment 25); 600 (125 – 350, increment 25 & 400, 500, 600 amp.)

Smith, Hinchman & Grylls Associates, Inc.; Detroit, Michigan



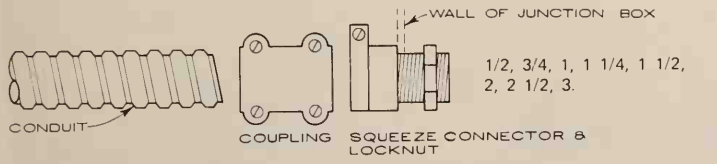
1/2, 3/4, 1, 1 1/4, 1 1/2, 2, 2 1/2, 3, 3 1/2, 4, 4 1/2, 5, 6

RIGID CONDUIT
For fireproof construction.
See page on "conduits" for graphic size & weights.



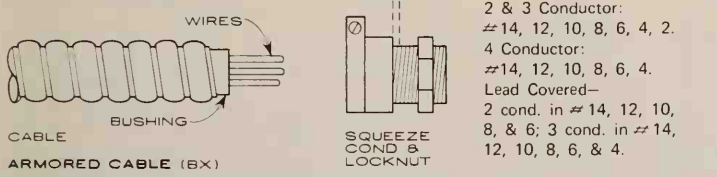
1/2, 3/4, 1, 1 1/4, 1 1/2, 2

ELECTRICAL METALLIC TUBING
For fireproof construction. Same use as Rigid Conduit above. Walls are thinner, therefore economical.



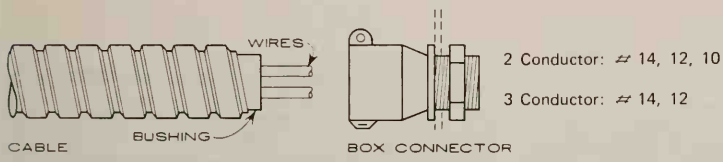
1/2, 3/4, 1, 1 1/4, 1 1/2, 2, 2 1/2, 3.

FLEXIBLE CONDUIT
For fireproof construction.



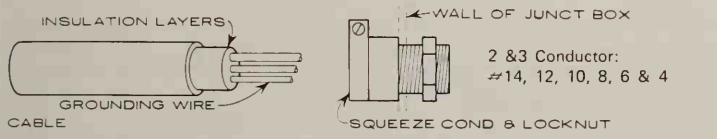
2 & 3 Conductor:
#14, 12, 10, 8, 6, 4, 2.
4 Conductor:
#14, 12, 10, 8, 6, 4.
Lead Covered—
2 cond. in #14, 12, 10, 8, & 6; 3 cond. in #14, 12, 10, 8, 6, & 4.

ARMORED CABLE (BX)
For frame construction. Lead covered for wet locations.



2 Conductor: #14, 12, 10
3 Conductor: #14, 12

FLAT ARMORED CABLE (OVALFLEX)
For plaster extensions



2 &3 Conductor:
#14, 12, 10, 8, 6 & 4

NON-METALLIC SHEATHED CABLE
For frame construction, where permitted, is cheapest.

		Stairway	Casual Desk Work	Testing	Inspection	Inspection	Inspection	Severe Office Tasks	Testing
		Dining	Cafeterias	Inspection		Counter Displays	Display Lighting		Very Severe and Prolonged Visual Tasks
				Rough Assembly			Severe and Prolonged Seeing Tasks		
							Medium Severe Office Tasks		

C.U. = Coefficient of Utilization M.F. = Maintenance Factor

$$\text{NUMBER OF FIXTURES REQUIRED} = \frac{\text{F.C. (Desired)} \times \text{Room Area}}{\text{C.U.} \times \text{M.F.} \times \text{Lamps/Fixture} \times \text{Lumens/Lamp}} = \frac{\text{Total Lumens}}{\text{Lumens per Fixture}}$$

$$\text{AVERAGE FOOTCANDLES} = \frac{\text{Lamp Lumens} \times \text{C.U.} \times \text{M.F.}}{\text{Area Room (Sq. Ft.)}} = \frac{\text{Lumens per Lamp} \times \text{C.U.} \times \text{M.F.}}{\text{Area per Lamp (Sq. Ft.)}} = \frac{\text{Lamp Lumens per Fixture} \times \text{C.U.} \times \text{M.F.}}{\text{Area per Fixture (Sq. Ft.)}}$$

$$= \text{Total Watts per Sq. Ft.} \times \text{Overall Lumens per Watt} \times \text{C.U.} \times \text{M.F.}$$

$$\text{AREA PER LAMP (SQ FT.)} = \frac{\text{Lumens per Lamp} \times \text{C.U.} \times \text{M.F.}}{\text{Footcandle Level Desired}}$$

$$\text{AREA PER FIXTURE (SQ. FT.)} = \frac{\text{Lumens per Lamp} \times \text{Number of Lamps per Fixture} \times \text{C.U.} \times \text{M.F.}}{\text{Footcandle Level Desired}}$$

$$\text{TOTAL WATTS PER SQ. FT.} = \frac{\text{Footcandle Level Desired}}{\text{Overall Lumens per Watt} \times \text{C.U.} \times \text{M.F.}}$$

TYPICAL EXAMPLE

Room Size 25' x 40'. Ceiling Height 9'. Office Area 70 FC
2' x 4' Recessed Troffers With 4 — 40 W. T12 (3100 Lumens) Lamps Each.
From I.E.S. Tables Room Index = E And C.U. = 0.67 (Plastic Lens).

$$\text{NO. OF FIXTURES} = \frac{70 \times 25 \times 40}{0.67 \times 0.7 \times 4 \times 3100} = 8.4 \text{ (Use 8 Fixtures)}$$

$$\text{TOTAL WATTS/SQ. FT.} = \frac{8 \times 200\text{W/Fixture}}{25 \times 40} = 16$$

SOME USEFUL FORMULAS FOR GENERAL LIGHTING DESIGN

* See the Lighting Handbook of the Illuminating Engineering Society and manufacturers' lamp and fixture data for Tables giving values of coefficient of utilization, maintenance factor, lumens per lamp etc.

GENERAL NOTES :

Sizes given are nominal, in inches. Length = maximum over-all length in inches. Number after lamp shape symbol = number of eighths of an inch in diameter (PS–30). Standard voltage of 115 to 125 is assumed. All fluorescent lamps require auxiliary equipment. Wattages of lamps vary with different manufacturers.

PANELS CIRCUITS & MISCELLANEOUS

- LIGHTING PANEL
- POWER PANEL
- WIRING, CONCEALED IN CEILING OR WALL
- WIRING, CONCEALED IN FLOOR
- WIRING EXPOSED
- HOME RUN TO PANEL BOARD.

  Indicate number of circuits by number of arrows. Any circuit without such designation indicates a two-wire circuit. For a greater number of wires indicate as follows: /// (3 wires) //// (4 wires), etc.

- FEEDERS

  Use heavy lines and designate by number corresponding to listing in feeder schedule.

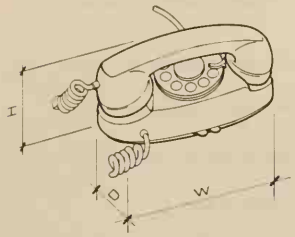
- WIRING TURNED UP
- WIRING TURNED DOWN
- G — GENERATOR
- M — MOTOR
- I — INSTRUMENT (SPECIFY)
- T — TRANSFORMER (OR DRAW TO SCALE)
- CONTROLLER
- EXTERNALLY OPERATED DISCONNECT SWITCH

Frederick R. Brown, P. E.; Ayres, Cohen and Hayakawa; Consulting Engineers; Los Angeles/San Francisco, California

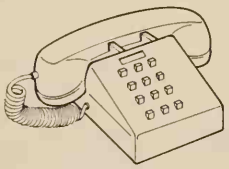
GENERAL NOTES:

Telephone equipment as shown is typical. A large variety of special equipment is available, and its use is determined by the requirements of the telephone service desired.

Telephone companies provide design and engineering assistance without charge. The local telephone company should be consulted in advance for any type of telephone installation. Large installations are custom designed to meet many diversified types of service requirements, with space and facilities provides as needed for housing equipment.



8 1/2"W x 5 1/2"D x 5"H
PRINCESS ®



5 1/2"W x 8 1/2"D x 5"H
PUSH BUTTON

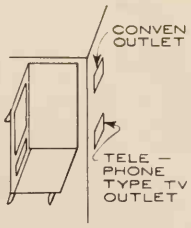
ROTOR CABLE



SET LOCATION

ANTENNA SYSTEMS FOR TELEVISION AND FM RADIO

NOTES:

1. Television and FM Radio distribution systems are the same for horizontal, "motel type" and for vertical "hotel type" installations. Summary information shown can be used as a guide for small residential as well as for large systems.

2. TV signals in apartment houses, hotels, institutions and other large buildings go directly from the antenna installation to the amplification and distribution point at roof lever or, after a short cable run, to the basement.

3. For details of Master Antenna Television (MATV) systems, consult a local MATV installer.

4. Locate the amplifiers, power supplies, mixers, filters and related equipment as close to antenna as project conditions permit. Distribution line amplifiers, if necessary, may be located in closets, shafts or similar areas accessible for service.

5. Runs to TV tapoffs are usually 75 ohm coaxial cable and should be in conduit if possibility of stress or accidental cutting exists.

6. Reminder: Roof mounted antennas may need special structural support, and amplifier locations will require access to power.

7. Locate towers, mast and mounts to assure a signal path free of obstructions and of sufficient size to support the antennas required. The number of antennas depends on the number of broadcast stations which can be received.

8. A small tower or guyed mast may be used for either residential or commercial antenna installations. If on a roof top, a base or saddle must be provided to prevent damage to the roof.

9. If a rotor is used (for residential installations only) on the antenna, the down lead is a low voltage cable and may be routed in a manner to comply with low voltage wiring.

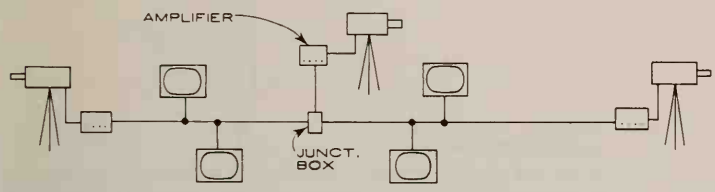
10. Adequate ventilation must be provided at TV set location. See TV set manufacturer for details and specifications.

11. A power outlet should be provided near the TV set location. This same power outlet may be used to provide power to the antenna rotor if used.

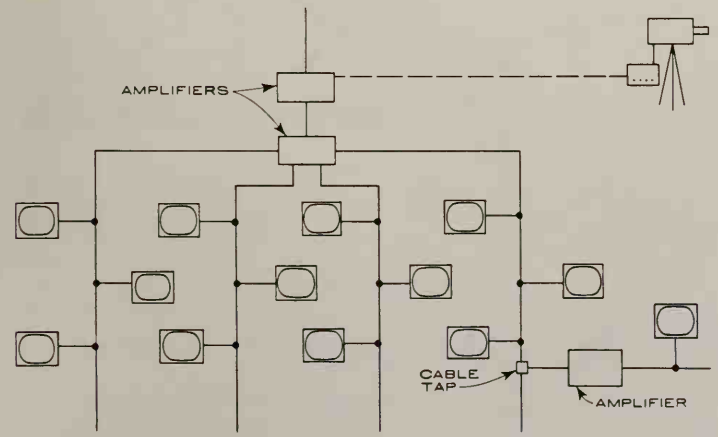
12. The down lead from the antenna or from the rotor may be terminated in an outlet box at the TV set location.

13. If a coaxial cable is used from the TV antenna to the outlet box, a Set Matching Transformer (illustrated above) will be required at the TV set.

14. For details and specifications see Community Antenna Television (CATV) and MATV suppliers and installers.



CLOSED CIRCUIT TV:
CAMERA / MONITOR ARRANGEMENT



CLOSED CIRCUIT TV
CAMERA AND DISTRIBUTION SYSTEM

NOTES:

1. Closed Circuit Television is a system wherein a live pick-up camera signal is fed to a standard television set or a video monitor used as a picture monitor.

2. The pick-up camera signal can be transmitted over coaxial cable by either direct video signals or by modulated (AM) radio frequency signals.

3. Closed Circuit Television cameras are used for observing remote or in accessible locations, for security viewing of restricted areas, or for viewing a hazardous environment.

4. One Closed Circuit Television camera can be called to feed several TV set picture monitors, or several Closed Circuit Television cameras may feed one TV set picture monitor by a switching arrangement.

5. Closed Circuit Television camera or cameras may be added to any Master Antenna system (MATV) or to any Community Antenna Television system. This may be done by considering the camera signal as an additional channel antenna. The Closed Circuit Television camera modulated radio frequency signal is fed into the television distribution system on any unused TV channel.

6. Any number of cameras may be fed into a TV distribution system, depending on the number of TV channels the TV distribution system can accommodate.

7. Video signals from a Closed Circuit Television camera may be fed to a TV picture monitor by coaxial cable up to 2500 feet from the camera. For video cable lengths over 2500 feet, consult your local installer or manufacturer.

8. Video tape (VTR) and film/slide systems may be operated in addition to Closed Circuit Television cameras. The video signal from video tape recorders or from film/slide systems is distributed in the same manner as for Closed Circuit Television.

9. If video tape recorders (VTR) and film/slide equipment are to be operated in conjunction with live Closed Circuit Television cameras, adequate space must be provided for equipment and operators.

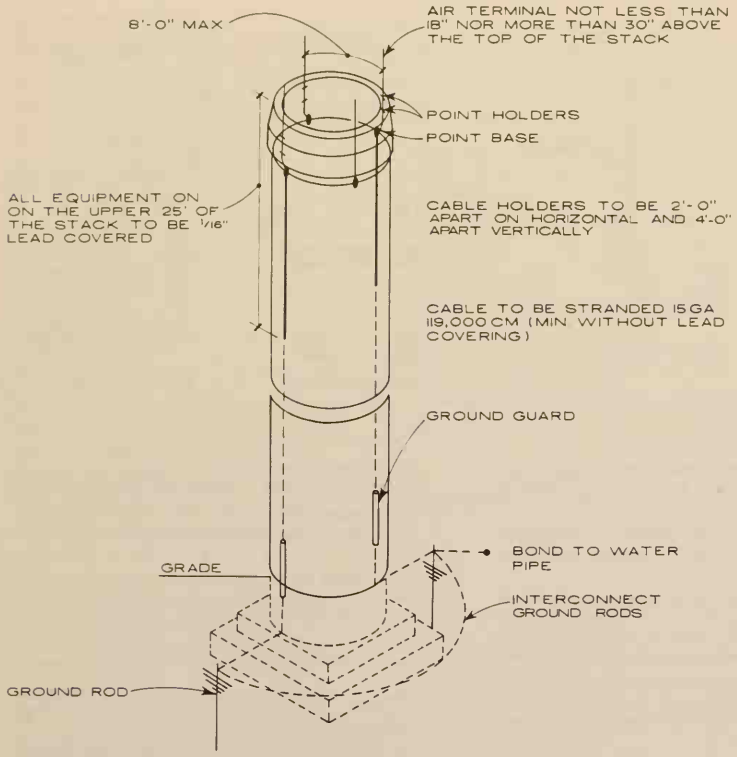
10. Power must be provided for the operating equipment and numerous small pieces of associated equipment.

11. For video tape operation, it is desirable to control the dust and humidity, both in the operating area and in the storage area.

12. Adequate lighting must be provided for Closed Circuit Television camera pick-up locations.

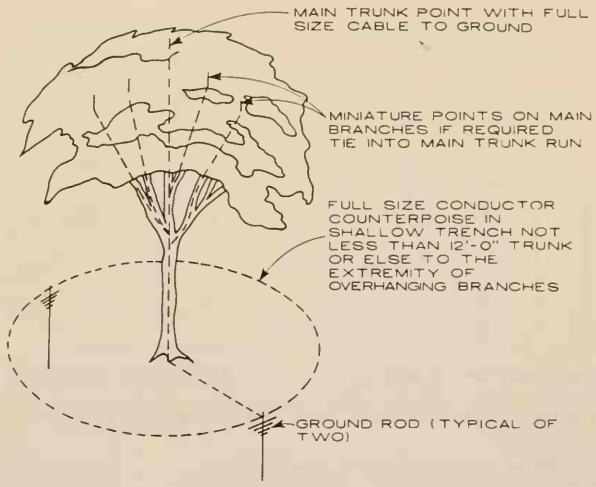
13. The audio or sound associated with the Closed Circuit Television system must be treated in the same manner as the television signal when cabled separately, otherwise the audio or sound is transmitted as a part of the television signal.

Virgil D. Duncan, P. E.; Raleigh, North Carolina
The National Association of Broadcasters; Washington, D. C.

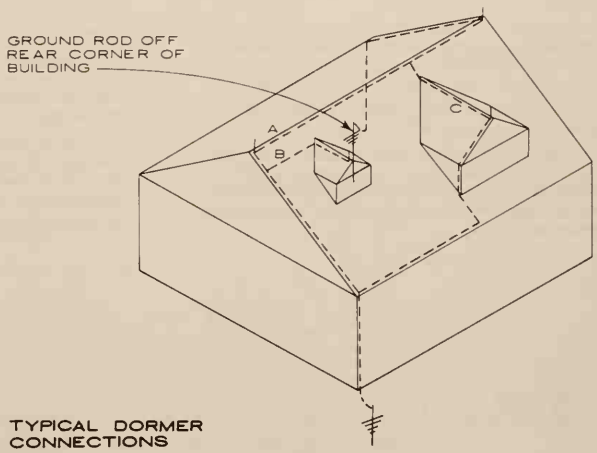


TYPICAL SMOKESTACK INSTALLATION

If stack is partly or entirely of reinforced concrete, reinforcing shall be made electrically continuous and bonded to system top and bottom.



TYPICAL TREE INSTALLATION

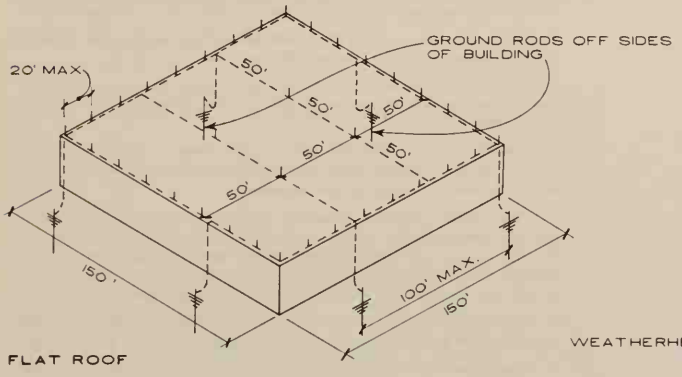


TYPICAL DORMER CONNECTIONS

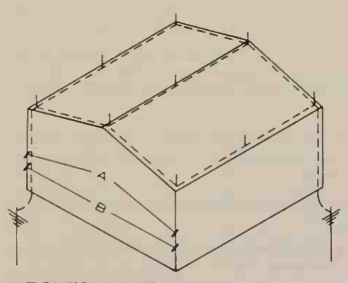
A. No dead ends on main ridge or dormers as high or higher than main ridge.

B. Total conductor less than 16' –0" (dead end allowable).

C. Conductor exceeds 16' thus requiring continuation to ground.



FLAT ROOF



PITCHED ROOF

TYPICAL AIR TERMINAL & CONDUCTOR LAYOUTS

A = 40' or less and 1/8 pitch or less.
B = more than 40' and 1/4 pitch or less.

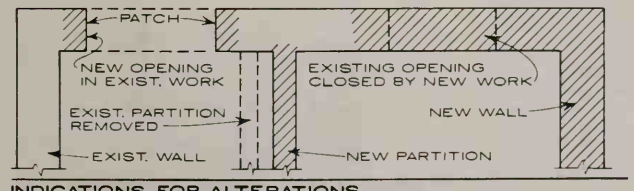
DIMENSIONS (NOT OF THE MODULAR CO-ORDINATION METHOD)



INDICATIONS FOR ALTERATIONS

Fred A. Norris; Campbell Aldrich & Nulty; Boston, Massachusetts

NOTES:

- Show size at doors and windows, only if there is no door or window schedule.
- Due to regional variations, use local standards when dimensioning thickness of block, brick, tile, lumber, studs, etc.

For vertical dimensioning, see Index for pages where Brick, Wood Frame, Steel, Masonry and Concrete construction are shown.

MODULAR COORDINATION:

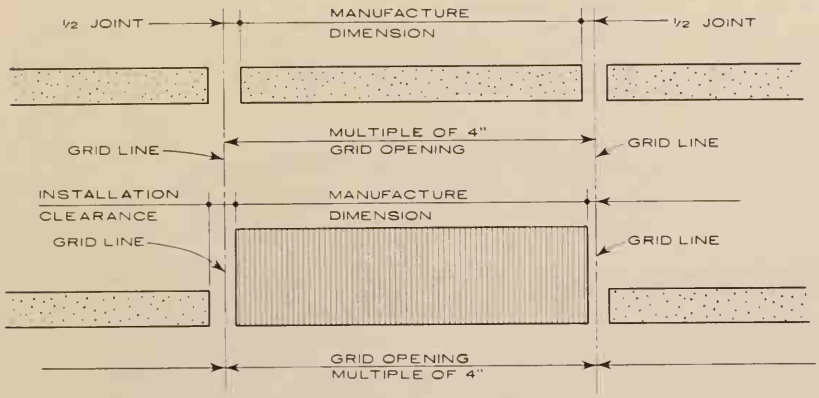
Modular Coordination is the term given to the dimensional coordination of building materials and products. Building Industry agreement on American Standards Association standard A62.1 sponsored by the American Institute of Architects, Associated General Contractors of America, National Association of Homebuilders, and the Producers' Council, Inc., established 4 inches as the basic module for U.S. building materials and products. A similar Canadian standard, (A 31) has been adopted. International standards activities have established the 4" basic module for foot–inch countries and 10 cm (almost 4") for metric countries.

Modular Measure is a synonym for Modular Coordination but also implies use of a drafting method (modular drafting or modular dimensioning) as a means of effecting Modular Coordination.

Since adoption of the ASA standard in 1945 and introduction of Modular Drafting in 1946, the drafting system has increased in acceptance and use among architectural offices. Surveys of architectural firms reflect present acceptance of modular construction planning principles, extensive use of the modular drafting system, and a higher-than-average use of modular dimensioning by design award-winning firms.

Modular Construction results from architectural planning based on the use of modular sized building materials and products. The joint-centerline concept of modular products permits accommodation of those materials into buildings designed with planning modules of some multiple of 4" (e.g. 3'– 0", 40", 5'– 4", etc.) The vast majority of all buildings are currently planned to use materials with modular dimensional characteristics.

DIMENSIONAL CHARACTERISTICS OF MODULAR BUILDING PRODUCTS:



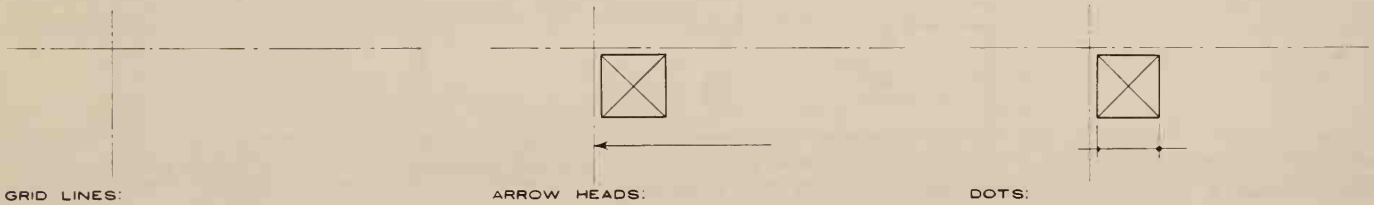
REPEATING ELEMENTS:

(Decking, Masonry Units, Acoustic Tile, etc.) A modular product is measured from centerline of typical installation joint to the centerline of the next joint. When a series of such products are installed, each joint centerline falls on a dimensional increment of four inches. Tables and charts of sizes of modular products are included throughout this issue of Graphic Standards.

ISOLATED COMPONENTS:

(Bathtubs, Unit Air Conditioners, Grilles, etc.) Installation tolerances for isolated components include one-half the minimum joint dimensions of adjacent modular materials plus the prefabricated installation clearance. Most components in this category are sized, or provided with adapters, to adjust to the installation characteristics of anticipated adjacent materials. Integral elements should not extend beyond the "grid opening".

MODULAR DRAFTING CONVENTIONS:



GRID LINES:

Are used to establish reference planes four inches apart in all three dimensions. Grid lines are imaginary and can be thought of as dimensional egg-crates running throughout the structure. The grid lines are partially or entirely shown on large-scale details but will not be shown at all on small scale plans.

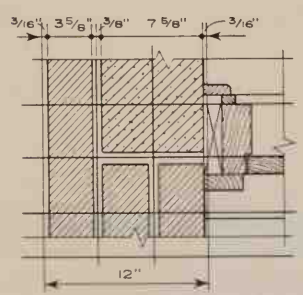
ARROW HEADS:

Indicate all dimensions referenced to grid-line locations. This feature of modular drafting is the key to the efficiencies resulting from the use of the system. Preliminary drawings can be fully dimensioned as small scale working drawings knowing that the materials will fit when fully detailed. A number of personnel can proceed with the detailing using the single small scale plan reference without the necessity of frequent checking with each other for dimensional reference points.

DOTS:

Are used to indicate off-grid locations for dimensions. (Half-dots may be used whenever drawing space is limited.) Generally, such dimensional reference points occur when it is critical to show the measured distance to the actual face of a material. Dots are also used for joint centerlines if those points occur off the grid-lines. Column centerlines frequently are located between grid-lines to accommodate more dimensionally critical enclosure and finish materials.

MODULAR DIMENSIONED WORKING DRAWINGS:

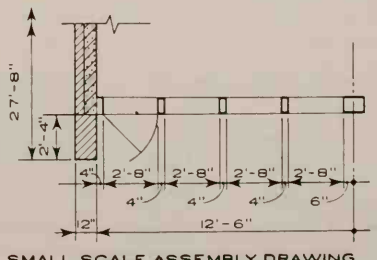


LARGE SCALE RELATIONSHIPS

The large-scale detail at the left and the small-scale assembly drawing on the right illustrate modular drafting conventions as used at two different scales.

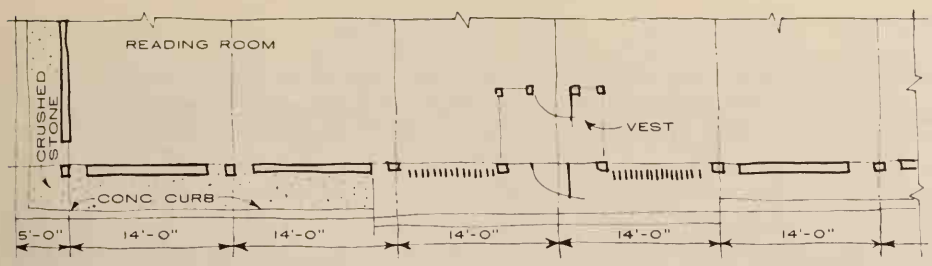
Large-scale details show the relationship of the components to the grid. Some architects prefer not to draw the entire grid on such details but include only those used as dimensional reference points on the small-scale drawings.

Small-scale assembly drawings such as plans, sections and elevations diagram the relationship of components. Since modular products are normally 4" multiples to joint centerlines, most dimensions are in multiples of 4". Arrowheads indicate dimensions are to grid-lines.



SMALL SCALE ASSEMBLY DRAWING

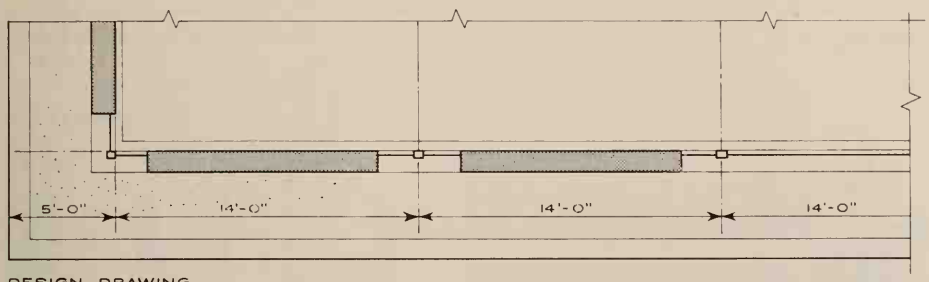
Byron C. Bloomfield, AIA, Madison, Wisconsin



SCHEMATIC DRAWING

SCHEMATIC DESIGN

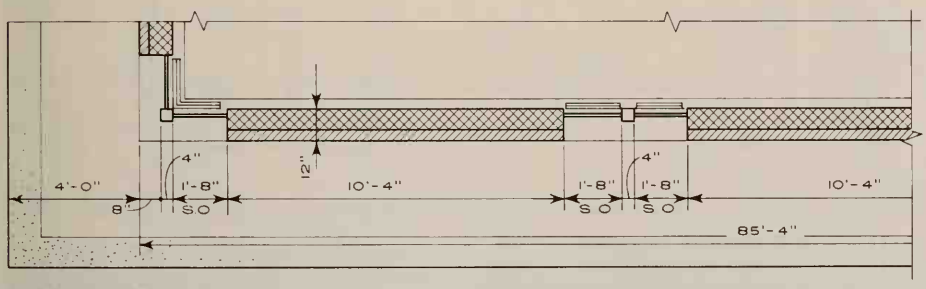
Modular schematic drawings differ little from conventionally used planning techniques where the structure is reflected in the planning. The structural grid may be derived from design studies which have indicated the best planning grid for the particular building type. Basic dimensions are assumed to be multiples of 4" making it necessary to indicate only a few dimensions such as column spacing and overall dimensions. Components such as doors, windows, etc., are understood to be modular for easy adjustment in the preliminary and working drawing phases of the project.



DESIGN DRAWING

DESIGN DEVELOPMENT

Modular design development drawings require few dimensions since all important component dimensions such as door widths, windows, walls, etc., are assumed to be modular and can be easily scaled to 4" increments during conversion to working drawings. Column and overall dimensions are generally useful for client discussions and area calculations. Absence of excessive dimensions improves the communicative value of the drawings for discussions of plan functions. Ability to scale the drawings enables a number of personnel to develop the working drawings with a minimum of checking with each other.



WORKING DRAWING

WORKING DRAWING

Modular working drawings adhere to the principle that the plan should reflect the relationship of assemblies throughout the structure. The plan indicates the materials of each assembly and identifies the basic dimensional relationships among such elements. Arrowheads provide grid-line reference points for large-scale details found on subsequent sheets among the working drawings. Since modular materials and components are normally even increments of 4" from joint centerline to joint centerline, working drawing dimensioning is grossly simplified and chances of error reduced.

PARALINE DRAWING includes pictorial types in which parallel lines of the object are parallel in the drawing. The most important of these are isometric, dimetric, and oblique drawings.

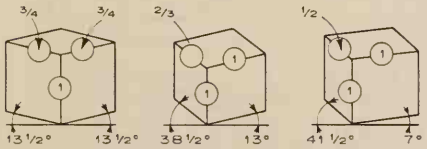
ORTHOGRAPHIC DRAWING includes all drawing types in which the projectors are perpendicular to the plane of projection. The most common are multi-view, isometric, dimetric, and trimetric.

AXONOMETRIC DRAWING includes paraline types on which measurements can usually be made only on axis direction lines. Widely used axonometric drawings are isometric and dimetric.

OBLIQUE DRAWING has one set of planes parallel to the plane of projection. The parallel projectors are at an oblique angle to show three dimensions of the object. Measurements can be made in any direction on planes parallel to the plane of projection.

AXIS LINES are the three mutually perpendicular lines which meet at the corner of a box shape and all lines parallel to them.

SOME TYPES OF DRAWINGS

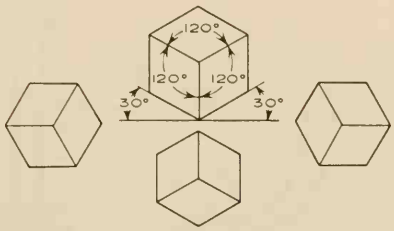


DIMETRIC SCALES–ANGLES FORMULA

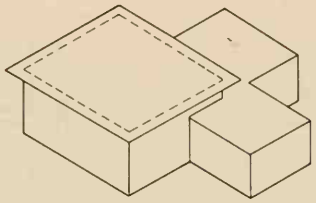
$$\text{Cos } a = \frac{-\sqrt{2H^2 - V^2}}{2H}$$ In this formula:

a = one of two equal angles between the projection of axes. H = one of two equal scales. V = third scale. A = a – 90° = angle with horizontal of two equal axes of symmetrical dimetric. A = one angle with the horizontal of unsymmetrical dimetric. B = 90° – 2A = second angle with horizontal of unsymmetrical dimetric.

THE FORMULA ABOVE can be used to work out the various combinations of scales and angles for dimetric drawing. Three of the most useful of these scales and angles are given on the diagrams of cubes above. The scales are relative ones with the larger scales given as 1 and the smaller ones as fractions.



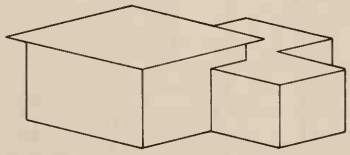
THE THREE ISOMETRIC AXIS must be kept 120° apart since they are required to be at the same angle to the plane of projection in order to be foreshortened equally and to be at the same scale. When one axis is horizontal or vertical the other two axes can be drawn with the 30° x 60° triangle on the T–square. These four positions are illustrated above. The vertical position of one axis is widely used. It allows the top or bottom of the object to be shown. The axes can be at any angle if they are kept 120° apart.



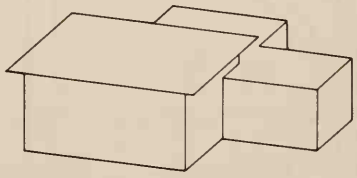
ADVANTAGES of isometric drawing: Use of one scale on the three axes; use of a standard triangle; fairly easy to dimension; and looks neat when dimension lines, arrows, and numerals are kept in isometric forms.

DISADVANTAGES: Equal importance is given to each of the three visible planes. There is no opportunity to emphasize complex and important areas and subordinate blank unimportant ones. Only one picture effect is possible with the three visible planes and unsatisfactory line relations cannot be avoided.

ISOMETRIC DRAWING – MEASURE ON AXES ONLY – ONE SCALE

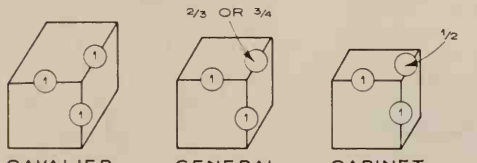


SYMMETRICAL DIMETRIC DRAWING is very useful to reduce the top or bottom area of the object which may be large and blank in an isometric. Only the setup having a common fractional scale relation which can be found on standard scales is illustrated here. When it is desired to make the top or bottom area of a symmetrical dimetric larger than in isometric, it may be found that plan oblique drawing is better for the purpose. Symmetrical dimetric gives equal emphasis to the two wall areas. When one wall area should be emphasized in a paraline drawing, either unsymmetrical dimetric or elevation oblique drawing can be used.

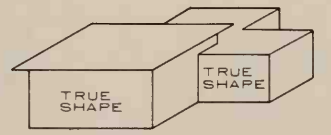


UNSYMMETRICAL DIMETRIC DRAWING allows emphasis on one or two of the three planes represented and subordination of the other two or one. It allows for a great deal of variation in the relative importance of the three sets of areas for best pictorial effect. This type of paraline drawing is for many objects the most natural and best in its pictorial effect. A symmetrical dimetric setup of scales and angles can be turned with one of the two equal axes in a vertical position for unsymmetrical dimetric. When the two equal scale axes are turned to produce equal angles with the horizontal the setup is symmetrical.

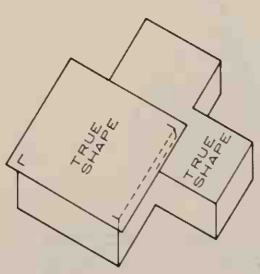
DIMETRIC DRAWING – MEASURE ON AXES ONLY – TWO SCALES ARE REQUIRED



OBLIQUE DRAWINGS ARE CLASSIFIED according to scale used on the receding lines as Cavalier Oblique Drawings, General Oblique Drawings, and Cabinet Oblique Drawings. Cavalier Oblique is easy to draw since the one scale is used on all axes. However the receding lines appear too long. Cabinet Oblique uses one half scale on receding lines which appear too short. General Oblique drawing uses a scale in between full and half scale to obtain better proportions which give a more satisfactory representation of the appearance of the object. Two thirds and three fourths scale give good proportions and either may be used on the receding lines.



IN ELEVATION OBLIQUE DRAWING a set of vertical planes is parallel to the picture plane and has lines and areas drawn true shape. Any angle can be chosen for the receding lines which are drawn from the true shape areas. It is therefore possible to show top or bottom and either side of the object attached to the front in varying amounts. A low angle of receding lines shows more of the side and less top or bottom while a large angle with the horizontal will show more of the top or bottom and less of the side. Some irregular wall plane shapes are explained better in oblique drawing than in other types of pictorial drawing.

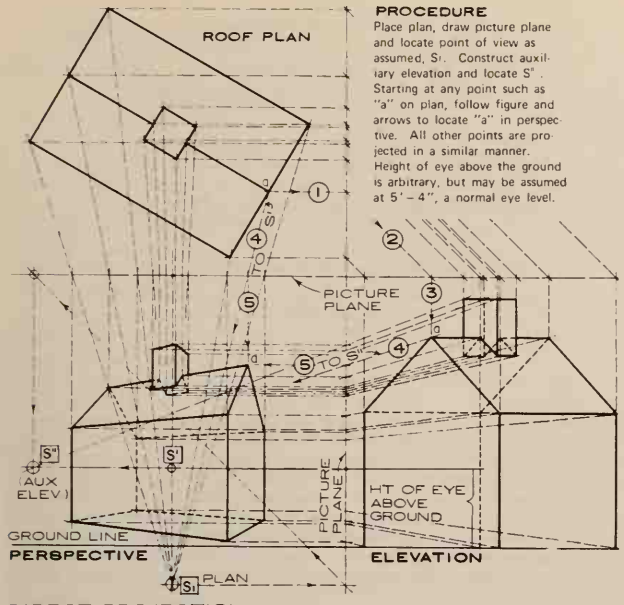


PLAN OBLIQUE DRAWING has plan planes true shape. Turn the plan of the object to a satisfactory angle and then draw verticals, which are the receding lines. The plan can be turned at any angle. Therefore both wall planes can be given equal emphasis, or one can be subordinated.

OBJECTS WITH IRREGULAR or unusual plan shapes sometimes explain more clearly in plan oblique than any other type of pictorial drawing.

OBLIQUE DRAWINGS—MEASURE ON AXES OF RECEDING AREAS—ANY DIRECTION ON TRUE SHAPES

C. Leslie Martin; University of Cincinnati; Cincinnati, Ohio



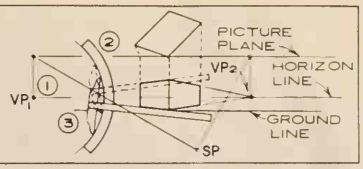
PROCEDURE

Place plan, draw picture plane and locate point of view as assumed, S_I. Construct auxiliary elevation and locate S". Starting at any point such as "a" on plan, follow figure and arrows to locate "a" in perspective. All other points are projected in a similar manner. Height of eye above the ground is arbitrary, but may be assumed at 5'-4", a normal eye level.

DIRECT PROJECTION

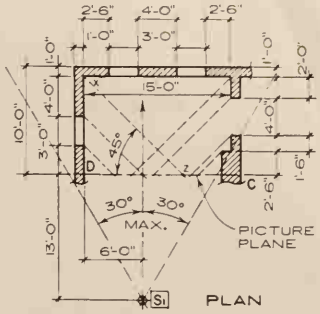
PROCEDURE WHEN VANISHING POINTS ARE OFF BOARD

1. Draw any arc from VP_1.
2. Place a cardboard cutout against curve of circle.
3. Place head of t-square against cutout, making sure both ends of head are always touching cutout, and then draw lines.

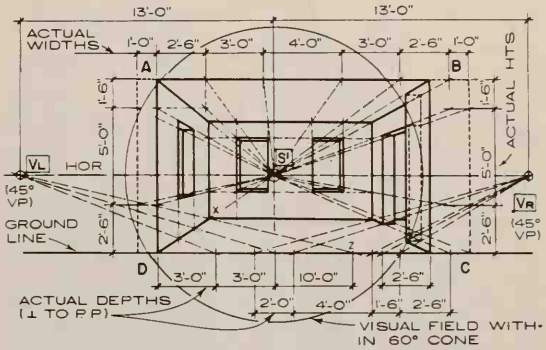


PROCEDURE (ONE POINT)

Draw A.B.C.D., section which is cut by P.P., at any desired scale, and locate S' (point of view in elevation) on line of sight from S_I. Locate the 45° vanishing points V_L and V_R on either side of S' and as distant as S_I is from the picture plane. All lines parallel to P.P. will remain parallel and all plane figures parallel to P.P. will show their true shape. Vertical lines will be vertical in perspective. Horizontal lines parallel to P.P. will be horizontal. Horizontal lines perpendicular to P.P. will vanish at S'. Horizontal lines at 45° to F.P. (used to measure distances ⊥ to P.P.) will vanish at 45°VPs.



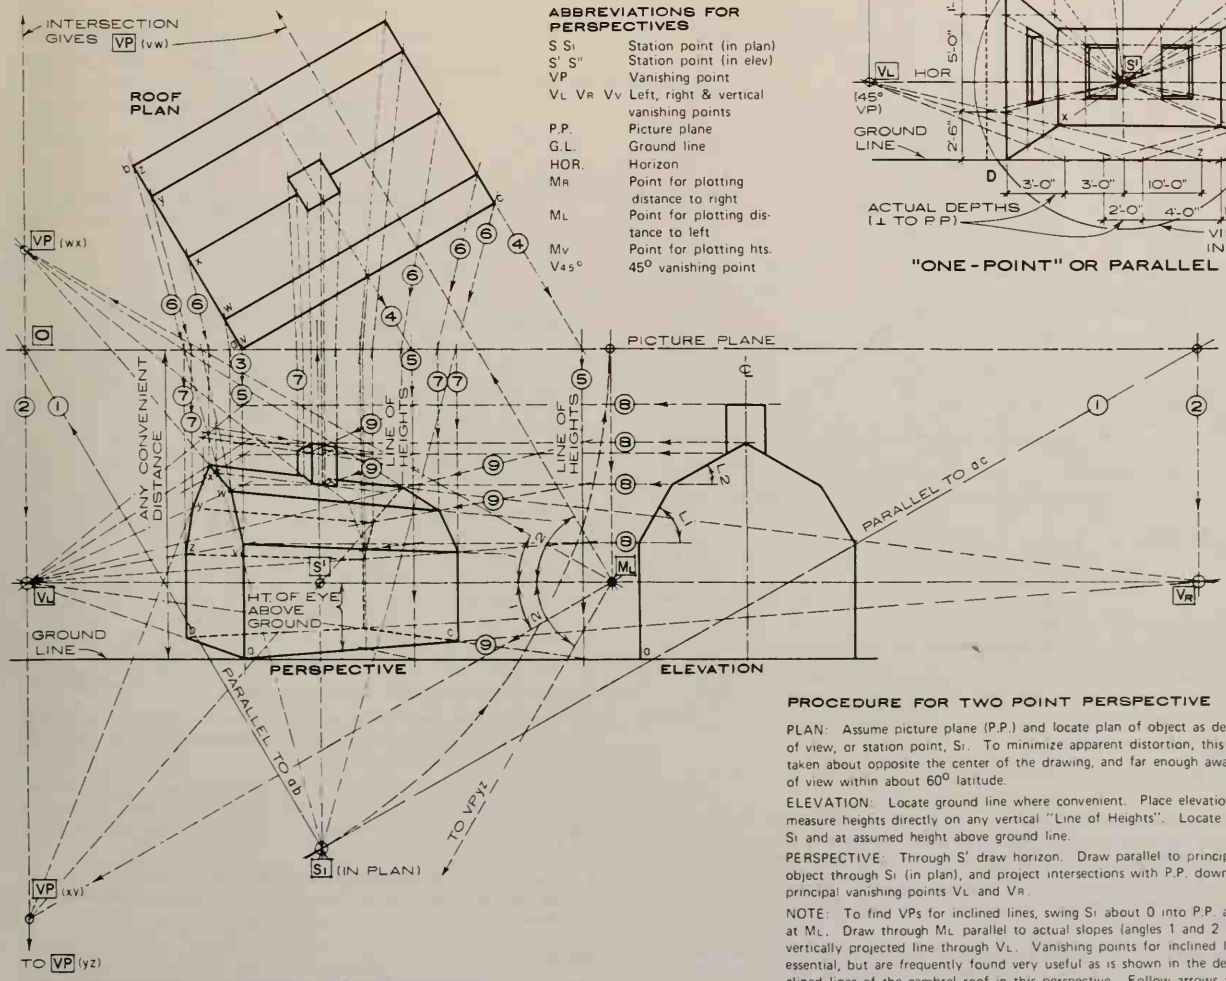
HALF SCALE DRAWING OF ASSUMED CONDITIONS



"ONE-POINT" OR PARALLEL PERSPECTIVE

ABBREVIATIONS FOR PERSPECTIVES

S S_I	Station point (in plan)
S' S"	Station point (in elev)
VP	Vanishing point
V_L V_R V_V	Left, right & vertical vanishing points
P.P.	Picture plane
G.L.	Ground line
HOR.	Horizon
M_R	Point for plotting distance to right
M_L	Point for plotting distance to left
M_V	Point for plotting hts.
$V_{45°}$	45° vanishing point



TWO POINT OR ANGULAR PERSPECTIVE ALSO KNOWN AS "OFFICE METHOD"

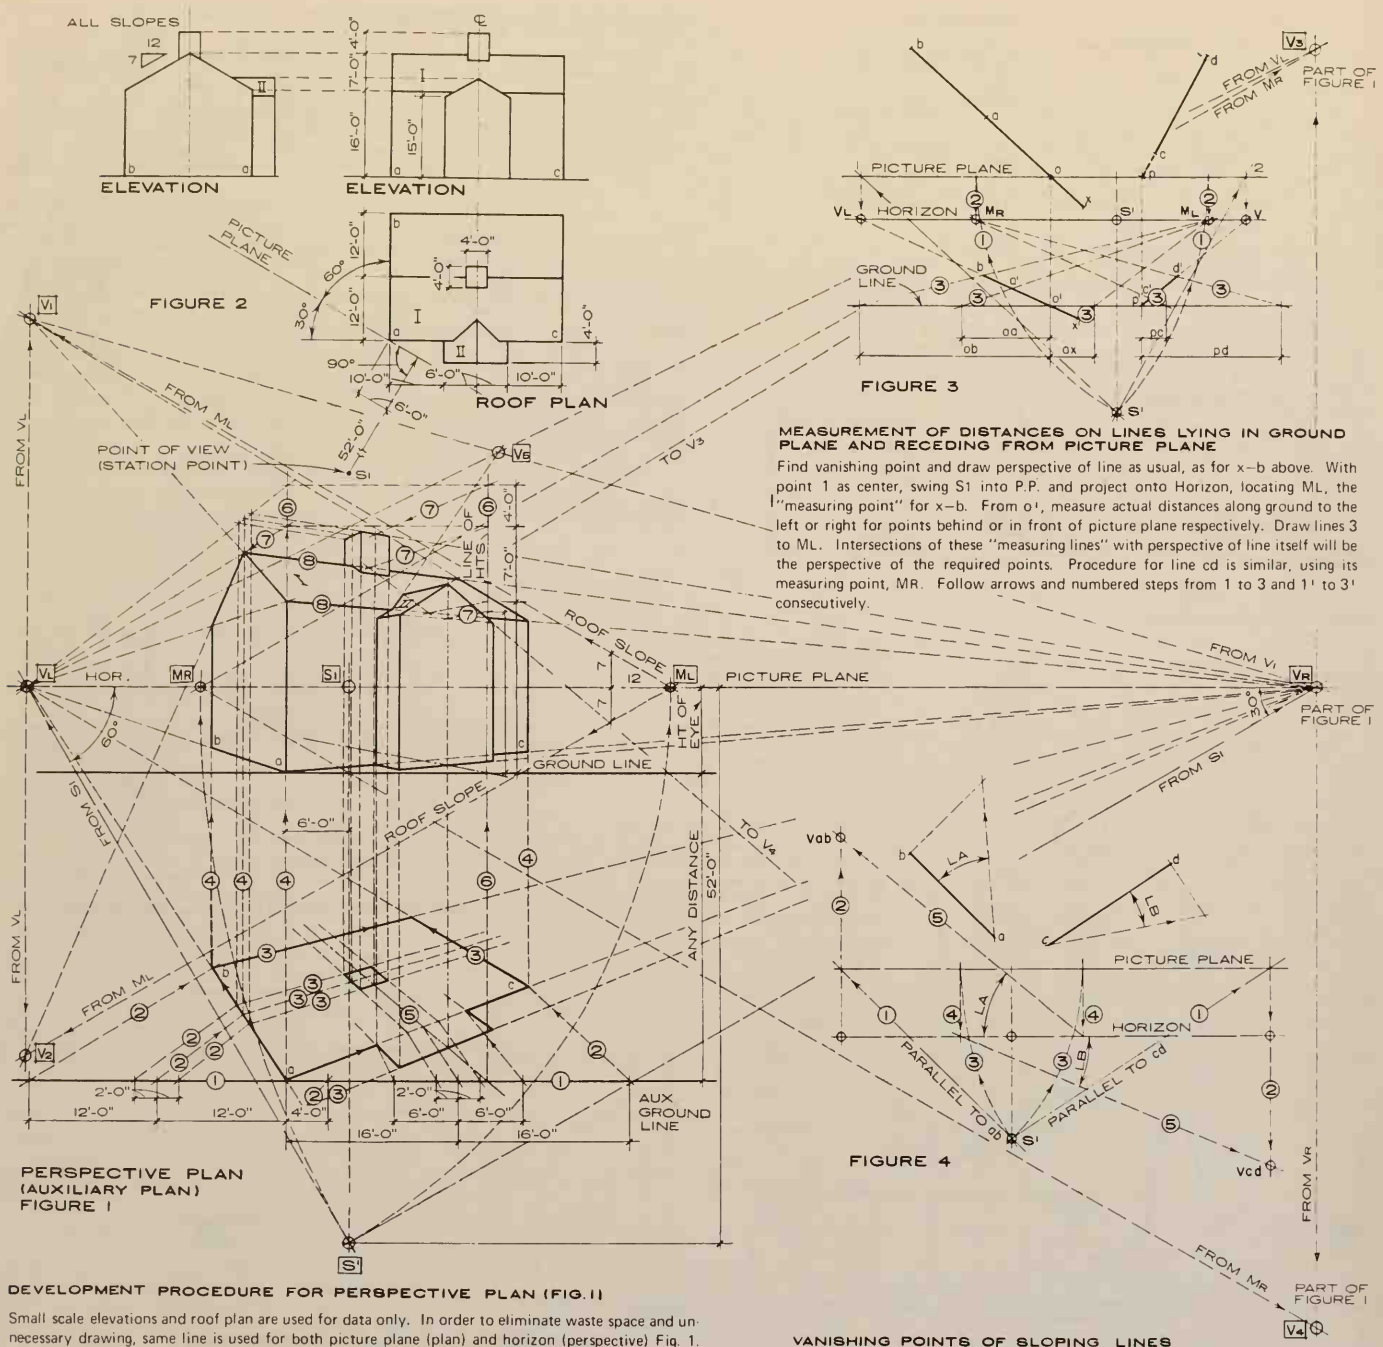
PROCEDURE FOR TWO POINT PERSPECTIVE

PLAN: Assume picture plane (P.P.) and locate plan of object as desired. Assume point of view, or station point, S_I. To minimize apparent distortion, this point is commonly taken about opposite the center of the drawing, and far enough away to keep the field of view within about 60° latitude.

ELEVATION: Locate ground line where convenient. Place elevation as indicated, or measure heights directly on any vertical "Line of Heights". Locate S' on vertical through S_I and at assumed height above ground line.

PERSPECTIVE: Through S' draw horizon. Draw parallel to principal horizontal lines of object through S_I (in plan), and project intersections with P.P. down to the horizon, giving principal vanishing points V_L and V_R.

NOTE: To find VPs for inclined lines, swing S_I about 0 into P.P. and project to horizon at M_L. Draw through M_L parallel to actual slopes (angles 1 and 2) to intersection with vertically projected line through V_L. Vanishing points for inclined lines are not absolutely essential, but are frequently found very useful as is shown in the determination of the inclined lines of the gambrel roof in this perspective. Follow arrows and numbered lines. See figures 4 and 1 on following page.



MEASUREMENT OF DISTANCES ON LINES LYING IN GROUND PLANE AND RECEDING FROM PICTURE PLANE

Find vanishing point and draw perspective of line as usual, as for x–b above. With point 1 as center, swing S1 into P.P. and project onto Horizon, locating ML, the "measuring point" for x–b. From o', measure actual distances along ground to the left or right for points behind or in front of picture plane respectively. Draw lines 3 to ML. Intersections of these "measuring lines" with perspective of line itself will be the perspective of the required points. Procedure for line cd is similar, using its measuring point, MR. Follow arrows and numbered steps from 1 to 3 and 1' to 3' consecutively.

DEVELOPMENT PROCEDURE FOR PERSPECTIVE PLAN (FIG. 1)

Small scale elevations and roof plan are used for data only. In order to eliminate waste space and unnecessary drawing, same line is used for both picture plane (plan) and horizon (perspective) Fig. 1.

Locate S1 and draw S1 VL and S1 VR at angles made with P.P. by principal horizontal lines of building, thus locating the vanishing points VL and VR.

Locate ML and MR as shown in Fig. 3 or by laying off the distances VL ML = VL S1 and VR MR = VR S1.

Locate Vanishing points for roof lines V1, V2, V3, V4 as in Fig. 4. Draw V1 VR, the "vanishing trace" of main roof plane I and V3 VL correspondingly for secondary roof plane II. The intersection of these lines, V5, is the vanishing point for the line of intersection of the roof planes (the valley line).

Starting with the corner of the building, point a, draw perspectives of ab and ac. Measure the distances along these lines as described in Fig. 3. (The auxiliary or "sunken" plan gives better intersections and keeps the drawing cleaner).

Complete the plan in perspective by carrying lines to proper vanishing points. Verticals are drawn and heights are measured as usual. (See Two Point or Angular Perspective, known as "Office Method.")

Follow numbers and arrows consecutively from 1 to 8 inclusive.

VANISHING POINTS OF SLOPING LINES

It is frequently very useful to have available the vanishing point for a series of inclined parallel lines; the diagram above shows a procedure for directly locating any such points. Two cases are illustrated.

1. The line ab slopes upward from a to b at the angle A. Starting at S1, follow arrows and numbered steps 1 to 5 inclusive, locating Vab, which is the vanishing point for ab and all the lines parallel to it. Line cd slopes downward from c to d at the angle B.

2. Proceed as above, following arrows and numbered steps 1' to 5' inclusive. Vcd is the required vanishing point. Note that line 5 is drawn upward while 5' is downward.

NOTE:

Figures 3 and 4 are for general use, but are shown on this sheet in order to clarify important steps in the construction of Figure 1.

THREE POINT PERSPECTIVE BY DIRECT PROJECTION

SETTING UP THE WORKING LAYOUT – FIG. 1

1. Set Station Point in relation to plan. Its location fully determines the perspective.

2. From S_P in plan, draw the Central Visual Ray CVR_P toward center of interest of the object. Actually S is above (or below) the plan and CVR is at a slope. Line CVR_P is a vertical plane seen on edge; imagine this plan revolved into the paper about line CVR_P.

3. The height of S is laid off in this revolved plane. Choosing proper height is as important as location in plan (and an artistic judgment).

4. CVR_A at true slope is again drawn toward the center of interest (center of Forecourt Fig. 1.)

5. Still in the revolved view, edge view of Picture Plane PP_A is drawn at right angle to CVR_A. Its distance from S_A is arbitrary and determines only the scale of the drawing: as the distance increases the vanishing points spread and the size of the perspective increases.

6. Draw horizontally (i.e. parallel to CVR_P) from S_A to PP_A; this locates the Horizon.

7. Draw vertically (i.e. perpendicular to CVR_P) from S_A to PP_A; this locates the vanishing point of the verticals

8. Back in plan view, draw the Horizon through point (#6 above) at right angles to CVR_P.

9. Draw lines through S_P parallel to lines of building, to locate V_L and V_R on Horizon.

PROJECTING THE PERSPECTIVE – FIG. 2

10. If steps 1–9 are done at reduced scale (as in Fig. 1), transfer Horizon, Station Point, vanishing points to plan drawn at working scale. Mount plan with Horizon horizontal. V_V is located at a distance from Horizon taken from Fig. 1 along PP_A (indic. on drawing).

11. Draw a semi-circle on $V_L - V_V$ as a diameter.

12. Swing S_P onto this with V_L as center, locating S_L. Check: $V_R - S_L$ should be at right angles to $V_L - V_V$.

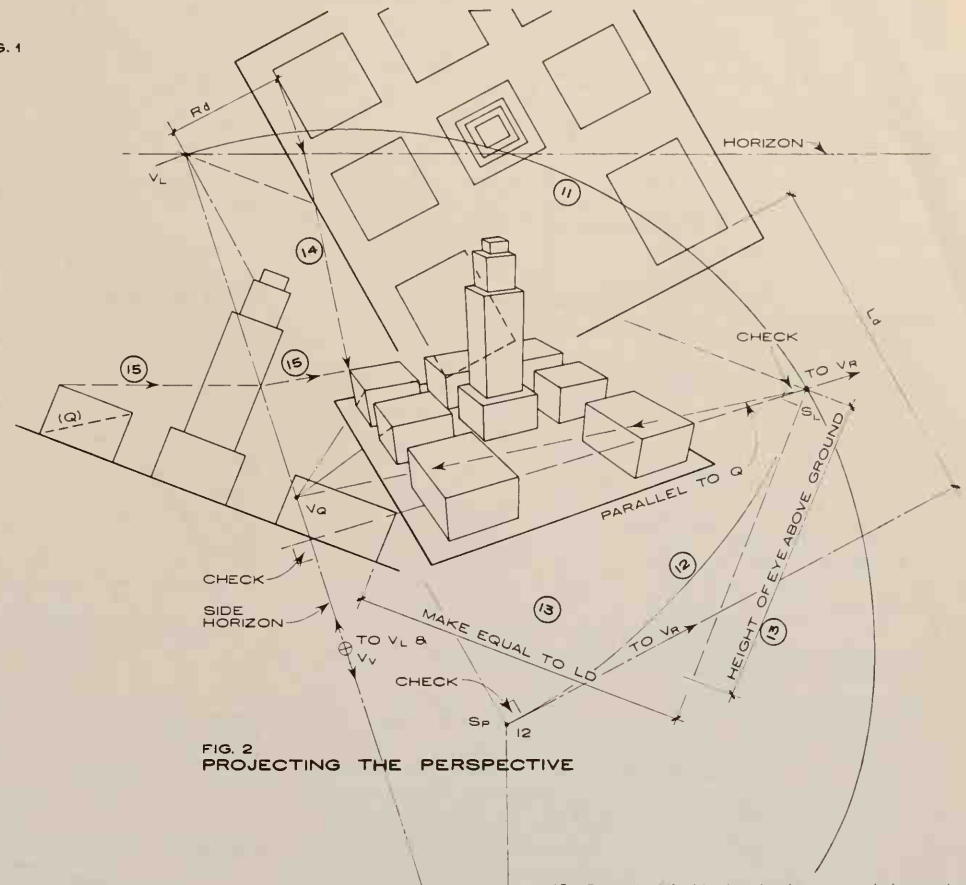


FIG. 2
PROJECTING THE PERSPECTIVE

13. Draw the left-side elevation in proper relation to the $V_L - S_L - V_V$ triangle using the height and L_d from Fig. 1. Proceed with clean sheet of paper.

14. Project points in plan (which represent vertical lines) first to Horizon from S_P and from there to V_V.

15. Project points in side elev. (which represent horiz. lines) first to side Horizon $V_L - V_V$ from S_L, and from there to V_R. Continue until the perspective is finished.

NOTES

1. Step 13 is critical; the L_d and Horizon ht. must accurately match the corresponding distances in the working layout and in the plan.

2. Accuracy: The method is mathematically true and the perspective will be as accurate as the working layout, and the plan and elevation used.

3. Either the left side or the right side elevation (labeled Front elevation in Fig. 1) may be used or both for a cross-check. The elevation looking from the short leg of the $V_L - S_P - V_R$ triangle, as in Fig. 1, is usually more convenient.

4. Vanishing points of inclined lines are found in same manner as in two-point perspective: see diagonal (Q) in Fig. 2.

5. The experienced delineator may omit steps 1 through 9 and start with an assumed $V_L - V_R - V_V$ triangle. S_P will be found on the vertical through V_V and a semi-circle on $V_L - V_R$ as a diameter; V_V as before. Note 1 above must be carefully observed and CVR must be aimed toward center of interest both in plan and elevation to avoid distortion.

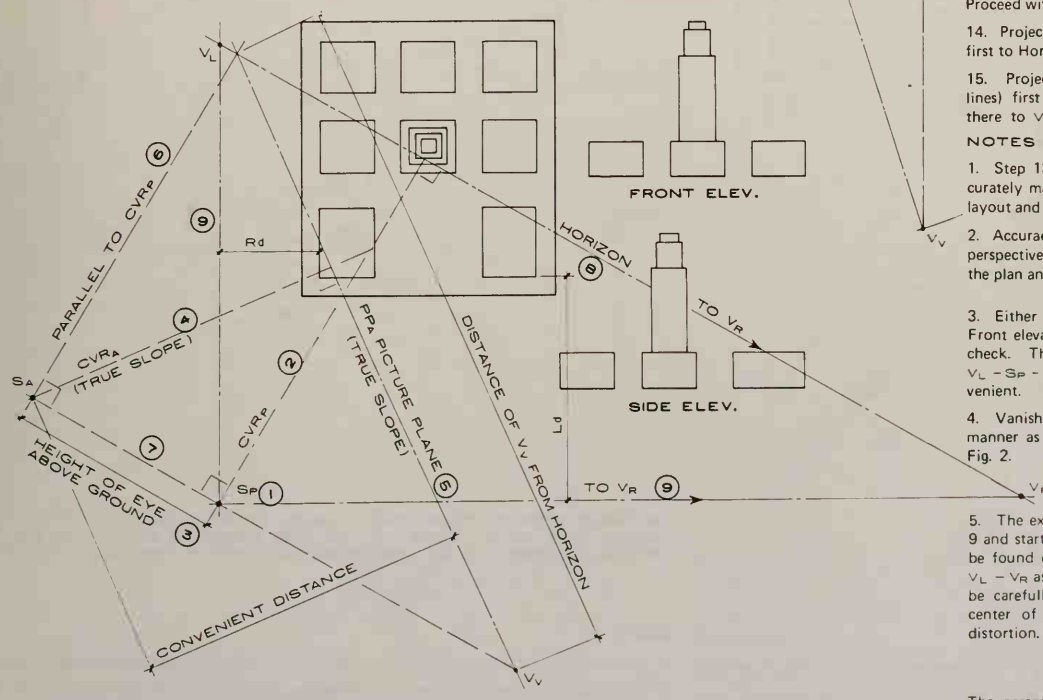

FIG. 1 (AT 2/3 SCALE OF PERSPECTIVE)
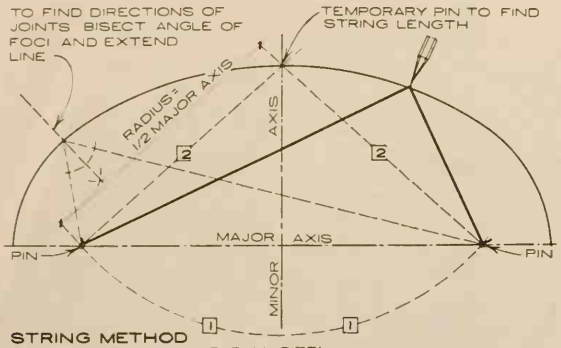
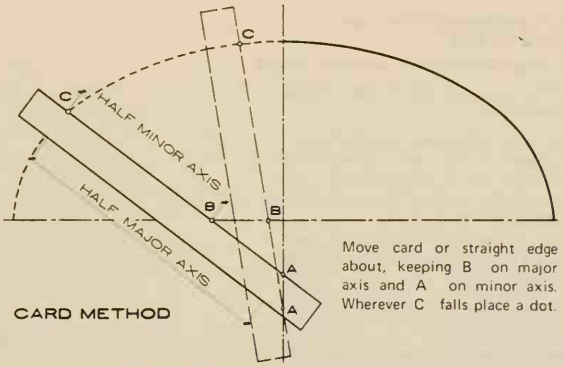
SETTING UP THE WORKING LAYOUT

The perspective method on this page was developed by Andre Halasz, A.I.A.

Charles L. Clarke; Seibert, Hunter, Shute & Plumley; Medford, Oregon

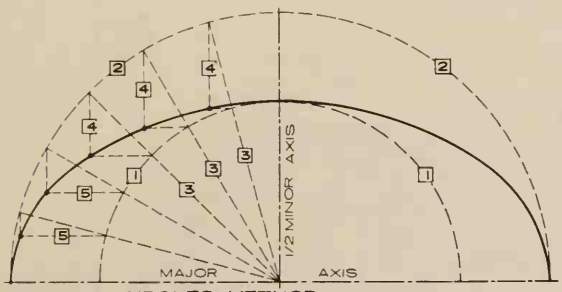


STRING METHOD
(FOR LARGE SCALE AND FULL SIZE)

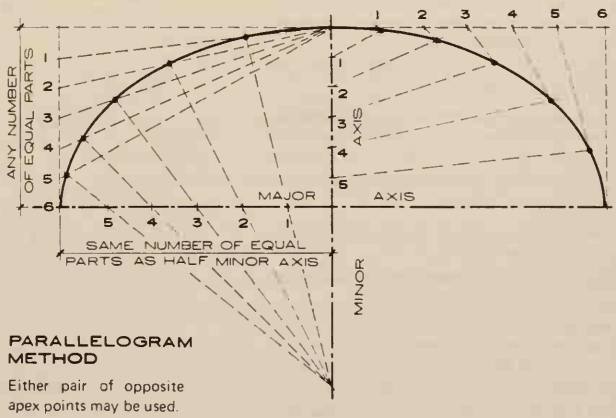


CARD METHOD

Move card or straight edge about, keeping B on major axis and A on minor axis. Wherever C falls place a dot.

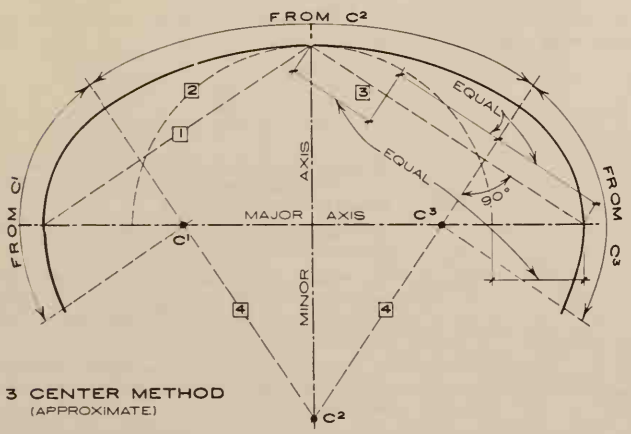


AUXILIARY CIRCLES METHOD

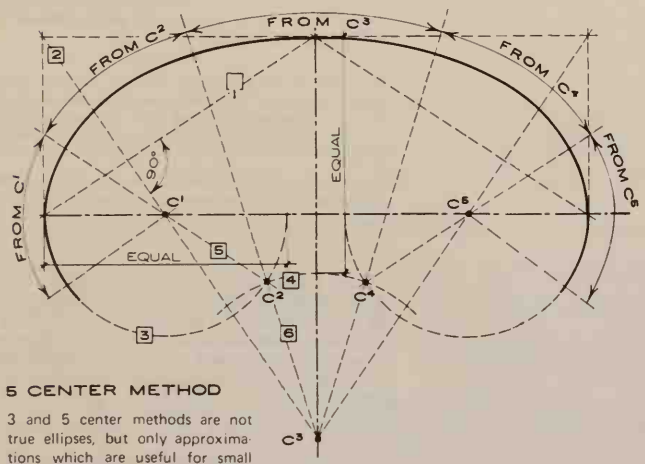


PARALLELOGRAM METHOD

Either pair of opposite apex points may be used.

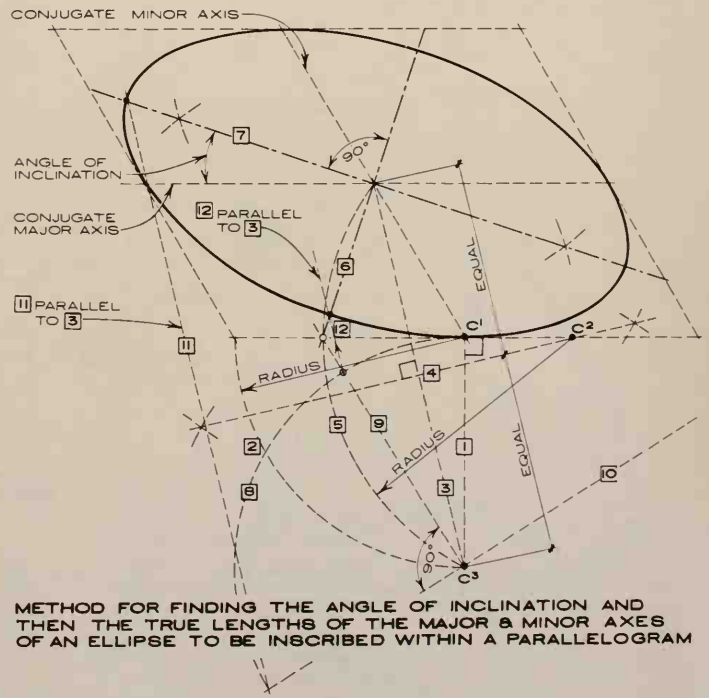


3 CENTER METHOD
(APPROXIMATE)



5 CENTER METHOD

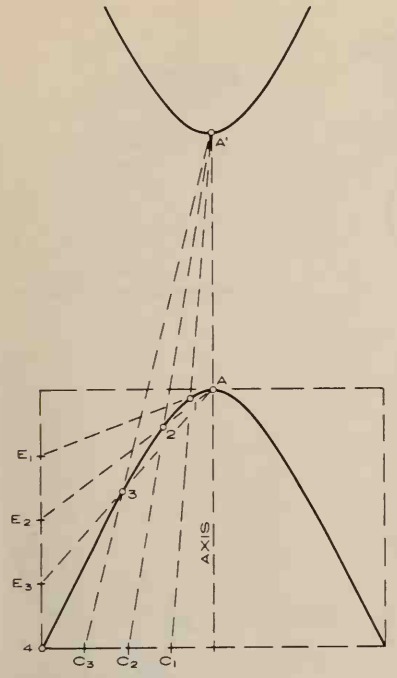
3 and 5 center methods are not true ellipses, but only approximations which are useful for small scale drawings.



METHOD FOR FINDING THE ANGLE OF INCLINATION AND THEN THE TRUE LENGTHS OF THE MAJOR & MINOR AXES OF AN ELLIPSE TO BE INSCRIBED WITHIN A PARALLELOGRAM

NOTE:

1. Using the conjugate axes, the ellipse can be drawn directly by using the parallelogram method.
2. Using the true lengths of the axes, the ellipse may be drawn with any one of the methods illustrated on this page.

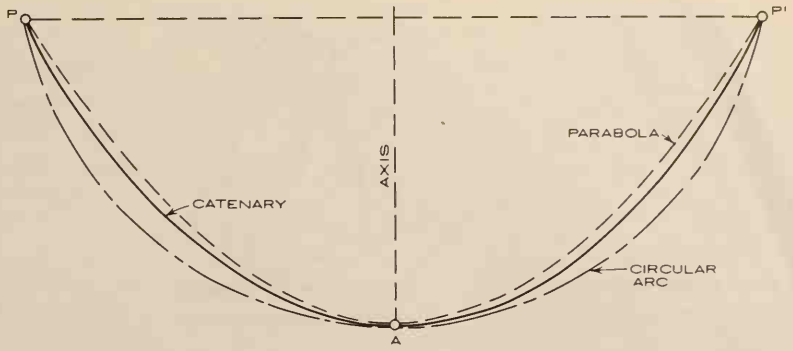


HYPERBOLA
PARALLELOGRAM METHOD

GIVEN:
Axis, two apexes (A and A') and a chord.

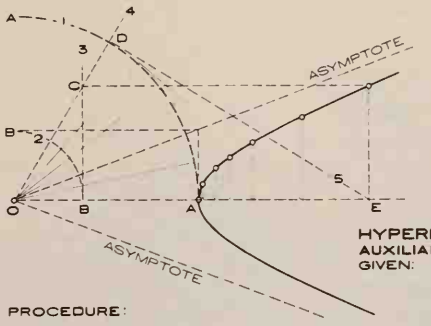
1. Draw surrounding parallelogram.
2. Divide chord in whole number of equal spaces (C_1, C_2, C_3, etc.).
3. Divide edge of parallelogram into same integral number of equal spaces (E_1, E_2, E_3, etc.).
4. Join A to points E on edge; join A' to points C on chord. Intersection of these rays are points on curve.

This method can be used equally well for any type of orthogonal or perspective projection, as shown by example of ellipse.



CATENARY

A catenary curve lies between a parabola and a circular arc drawn through the same three points, but is closer to the parabola. The catenary is not a conic section. The easiest method of drawing it is to tilt the drafting board and hang a very fine chain on it, and then prick guide points through the links of the chain.

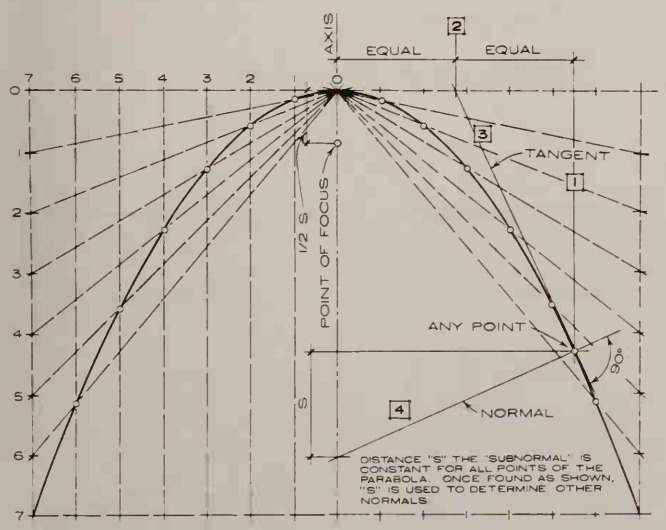


HYPERBOLA
AUXILIARY CIRCLES METHOD

GIVEN: Axis, Apex, Asymptotes (tangents at infinity)

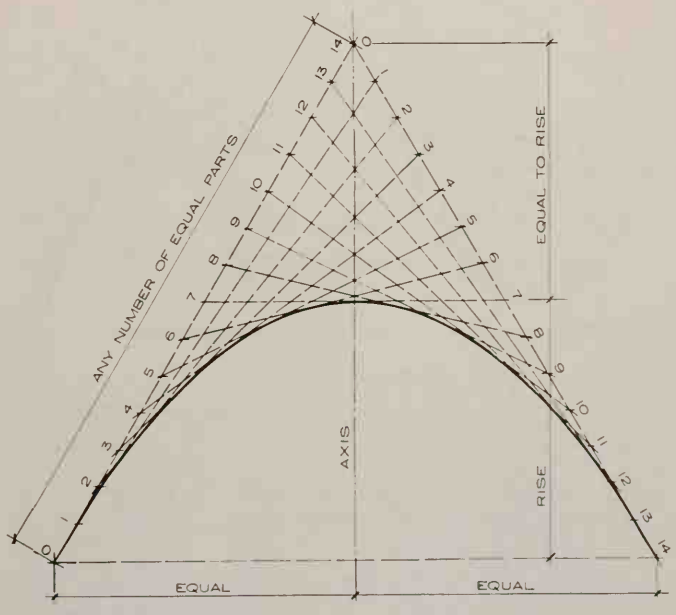
PROCEDURE:

1. Draw auxiliary circles with OB and OA as radii: note $\frac{OB}{OA}$ = slope of asymptote.
2. Erect perpendicular 3 where circle 2 intersects axis.
3. Draw any line 4 through 0, intersecting circle 1 at B and line 3 at C.
4. Draw line 5 through C parallel to axis.
5. Draw tangent 6 at D, intersecting axis at E.
6. Erect perpendicular 7 at E, intersecting 5 at P, a point on hyperbola.



PARABOLA
PARALLELOGRAM METHOD

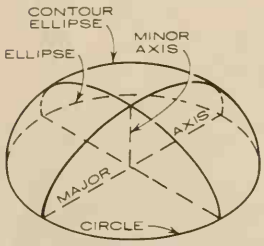
This method is comparable to the "Parallelogram Method" shown for the hyperbola above and the ellipse on previous page. The other apex 'A' is at infinity.



PARABOLA
ENVELOPE OF TANGENTS

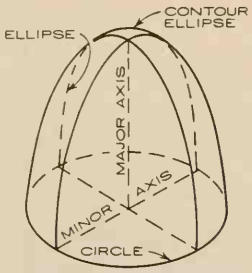
This method does not give points on the curve, but a series of tangents within which the parabola can be drawn.

H. Seymour Howard, Jr., AIA; Oyster Bay, New York



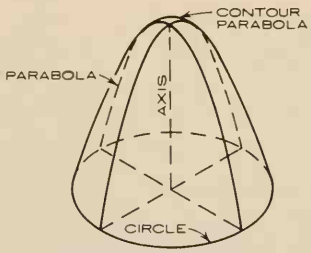
OBLATE SPHEROID

An ellipse rotated about its minor axis.



PROLATE SPHEROID

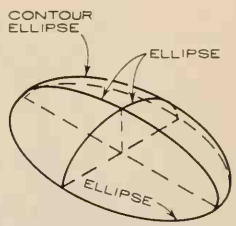
An ellipse rotated about its major axis.



PARABOLOID OF REVOLUTION

A parabola rotated about its axis.

The elliptic paraboloid is similar, but its plan is an ellipse instead of circle, and vertical sections are varying parabolas.

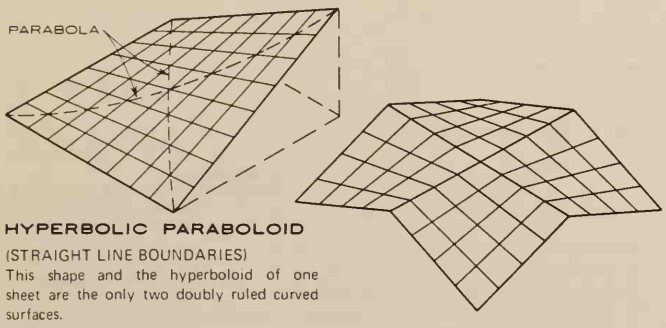


GENERAL ELLIPSOID

NOTES:

1. The dome shapes shown above are SURFACES OF POSITIVE CURVATURE, that is, the centers of both principal radii of curvature are on the same side of the surface.

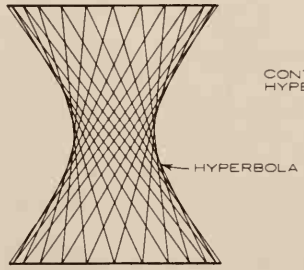
2. SURFACES OF NEGATIVE CURVATURE (saddle shapes) such as those shown below, are surfaces in which the centers of the two principal radii of curvature are on opposite sides of the surface.



HYPERBOLIC PARABOLOID

(STRAIGHT LINE BOUNDARIES)

This shape and the hyperboloid of one sheet are the only two doubly ruled curved surfaces.



ELEVATION

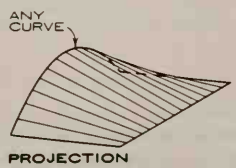
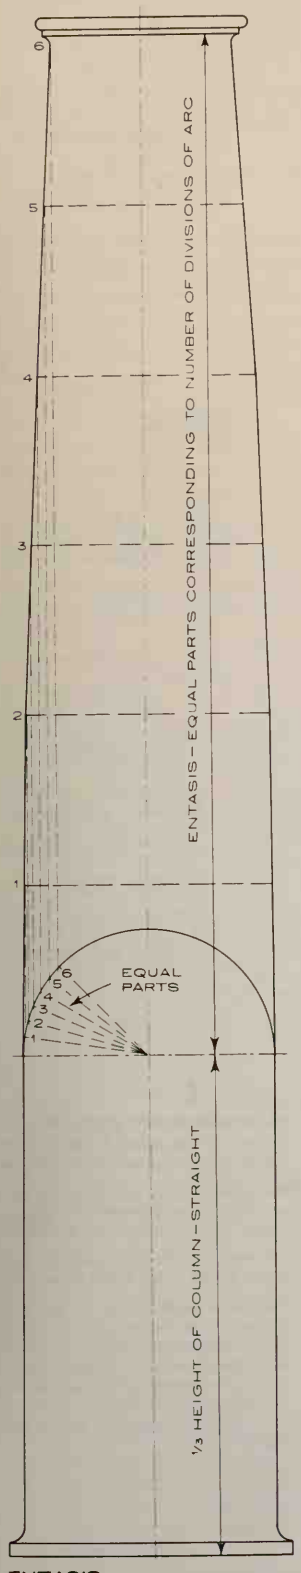
CONOID

(SINGLY RULED SURFACE)



PROJECTION



ENTASIS

Divide height into 8 parts and describe circle between 4th and 5th parts as eye of volute; inscribe square in eye as shown; through the center and parallel to sides of square, draw lines bisecting the latter and divide each line, from center to side of square, into 3 equal parts. These points are the centers of arcs required and are taken in order of succession starting at No. 1 shown on enlarged drawing of eye. The limits of each separate arc are obtained by producing the straight line joining two successive central points, starting with arc No. 1.

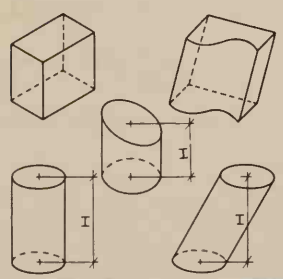
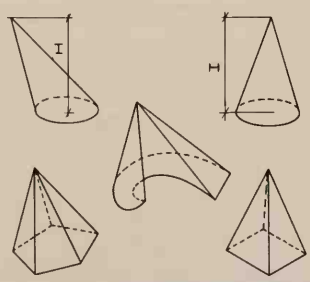
VOLUME = AREA OF SECTION × $2\pi R$
SURFACE = PERIMETER OF SECTION × $2\pi R$ (CONSIDER THE SECTION ON ONE SIDE OF AXIS ONLY)

VOLUMES AND SURFACES OF DOUBLE-CURVED SOLIDS



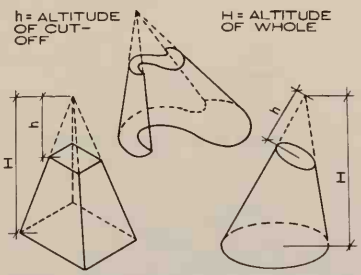
ANY PRISM OR CYLINDER, RIGHT OR OBLIQUE, REGULAR OR IRREGULAR.
Volume = area of base x altitude

Altitude = distance between parallel bases, measured perpendicular to the bases. When bases are not parallel, then Altitude = perpendicular distance from one base to the center of the other.



ANY PYRAMID OR CONE, RIGHT OR OBLIQUE, REGULAR OR IRREGULAR.
Volume = area of base x 1/3 altitude

Altitude = distance from base to apex, measured perpendicular to base.



ANY FRUSTUM OR TRUNCATED PORTION OF THE SOLIDS SHOWN
Volume: From the volume of the whole solid, if complete, subtract the volume of the portion cut off.

The altitude of the cut-off part must be measured perpendicular to its own base.

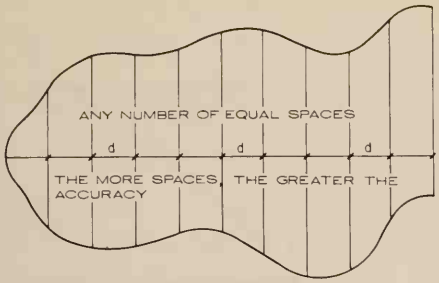
SURFACES OF SOLIDS
The area of the surface is best found by adding together the areas of all the faces.

The area of a right cylindrical surface = perimeter of base x length of elements (average length if other base is oblique).

The area of a right conical surface = perimeter of base x 1/2 length of elements.

There is no simple rule for the area of an oblique conical surface, or for a cylindrical one where neither base is perpendicular to the elements. The best method is to construct a development, as if making a paper model, and measure its area by one of the methods given on the next page.

VOLUMES AND SURFACES OF TYPICAL SOLIDS



TO FIND THE AREA OF AN IRREGULAR PLANE FIGURE

1. Divide the figure into parallel strips by equally spaced parallel lines.
2. Measure the length of each of the parallel lines.
3. Obtain a summation of the unit areas by one of these 3 "rules".

TRAPEZOID RULE

Add together the length of the parallels, taking the first and last at $^1/_2$ value, and multiply by the width of the internal "d". This rule is sufficiently accurate for estimating and other ordinary purposes.

SIMPSON'S RULE

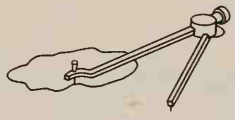
Add the parallels, taking the first and last at full value, second the, fourth, sixth, etc. from each end at 4 times full value, and the third, fifth, seventh, etc. from each end at 2 times the value, then multiply by $^1/_3$d. This rule works only for an even number of spaces and is accurate for areas bounded by smooth curves.

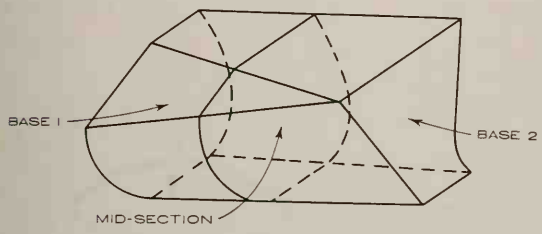
DURAND'S RULE

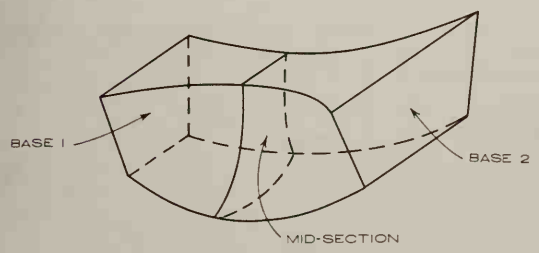
Add the parallels taking the first and last at $^5/_{12}$ value, the second from each end at $^{13}/_{12}$ value, and all others at full value, then multiply by d. This rule is the most accurate for very irregular shapes.

NOTE

Irregular areas may be directly read off by means of a simple instrument called a Planimeter.





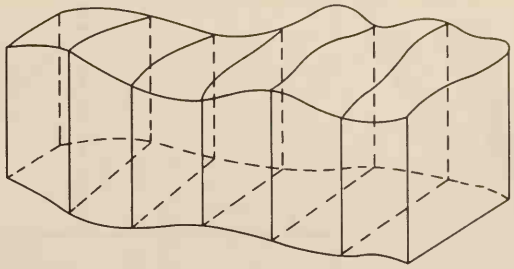


TO FIND THE VOLUME OF AN IRREGULAR FIGURE BY THE PRISMATOID FORMULA

Construct a section midway between the bases. Add 4 to the sum of the areas of the 2 bases and multiply the quantity by the area of the mid-section. Then multiply the total by $^1/_6$ the perpendicular distance between the bases.

V = [(area of base$_1$ + area of base$_2$ + 4) (area of midsection) x $^1/_6$ perpendicular distance between bases.

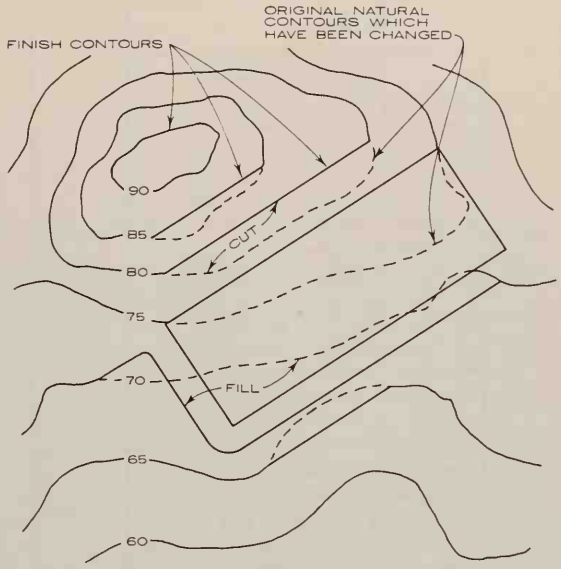
This formula is quite accurate for any solid with two parallel bases connected by a surface of straight line elements (upper figure), or smooth simple curves (lower figure).



TO FIND THE VOLUME OF A VERY IRREGULAR FIGURE BY THE SECTIONING METHOD

1. Construct a series of equally spaced sections or profiles.
2. Determine the area of each section by any of the methods shown at left (preferably with a Planimeter).
3. Apply any one of the 3 summation "rules" given at left, to determine the total volume.

This method is in general use for estimating quantities of earthwork, etc.



TO FIND THE VOLUME OF CUT AND FILL DIRECTLY FROM THE CONTOUR PLAN

1. Draw "finish" and "original" contours on same contour map.
2. Measure the differential areas between new and old contours of each contour and enter in columns according to whether cut or fill.
3. Add up each column and multiply by the contour interval to determine the volume in cubic feet.

EXAMPLE

CONTOUR	CUT	FILL
85	300	
80	960	
75	2,460 – 2 = 1,230	3,800 – 2 = 1,900
70	20	2,200
	9,200 x5	6,800 x5
TOTALS	46,000 cu. ft.	34,000 cu. ft.

NOTE:

1. Where a cut or fill ends directly on a contour level use $^1/_2$ value.
2. The closer the contour interval, the greater the accuracy.

This method is more rapid than the sectioning method, and is sufficiently accurate for simple estimating purposes and for balancing of cut and fill.

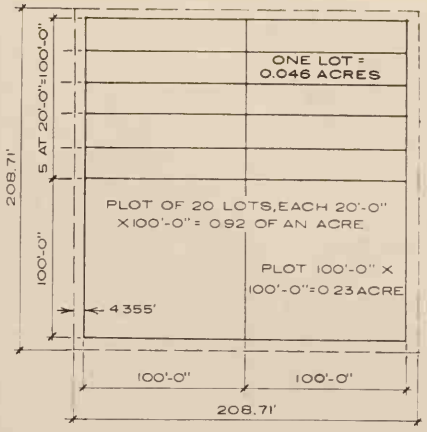
CHORDS

When estimating the area available for lots on a large site development, it is safe to assume that 20% of the entire site will be streets. To estimate the total number of lots, of a given size, which a site will yield, use the following formula:

$$\text{Number of lots} = \frac{\text{Total site (acres)} \times 34{,}848 \text{ (80\% of an acre in sq. ft.)}}{\text{Width of lot (ft.)} \times \text{Depth of lot (ft.)}}$$

Find the number of 60'– 0" x 120'– 0" lots which can be placed on a 50 acre site.

$$\text{Number of lots} = \frac{50 \times 34{,}848}{60 \times 120} = 242 \text{ lots}$$



ONE ACRE = 43,560 SQ. FT.

AVERAGE WEIGHTS OF MATERIALS :

SOIL, SAND & GRAVEL	LBS. PER CU. FT.
Cinders or Ashes	40–45
Clay, damp & plastic	110
Clay, dry	63
Clay & gravel, dry	100
Earth, dry & loose	76
Earth, dry & packed	95
Earth, moist & loose	78
Earth, moist & packed	96
Earth, mud, packed	115
Sand or gravel, dry & loose	90–105
Sand or gravel, dry & packed	100–120
Sand or gravel, dry & wet	118–120

STONE	LBS. PER CU. FT.
Granite	175
Limestone	165
Marble	165
Sandstone, bluestone	147
Slate (See also stone veneer)	175

BRICK & BLOCK MASONRY (INCL. MORTAR)	LBS. PER SQ. FT.
4" brickwork	35
4" concrete block stone or gravel	34
4" concrete block lightwt. aggregate (avg.)	22
6" concrete block stone or gravel	50
6" concrete block lightwt. aggregate (avg.)	31
8" concrete block stone or gravel	58
8" concrete block lightwt. aggregate (avg.)	36
12" concrete block stone or gravel	90
12" concrete block lightwt. aggregate (avg.)	58

CONCRETE	LBS. PER CU. FT.
Stone, reinforced	150
Stone, plain	144
Slag, plain	130
Cinder, reinforced	100–115

METALS	LBS. PER CU. FT.
Aluminum, cast	165
Brass, red	546
Brass, yellow, extruded bronze	528
Bronze, commercial	552
Bronze, statuary	509
Copper, cast or rolled	556
Iron, cast gray	450
Iron, wrought	485
Lead	710
Monel metal	552
Nickel	555
Stainless steel, rolled	492–510
Steel, rolled	490
Zinc, rolled or cast	440

LIGHT WEIGHT CONCRETE	LBS. PER CU. FT.
Concrete, Aerocrete	50–80
Concrete, cinder fill	60
Concrete, Haydite	85–100
Concrete, Nailcode	75
Concrete, Perlite	35–50
Concrete, Pumice	60–90
Concrete, Vermiculite	25–60

TILE—STRUCTURAL CLAY (INCL. MORTAR)	LBS. PER SQ. FT.
4" hollow	23
6" hollow	33
8" hollow, 5" unit ht.	42
8" hollow, 8" unit ht.	38
8" hollow, 12" unit ht.	34
12" hollow, 5" unit ht.	66
12" hollow, 8" unit ht.	55
12" hollow, 12" unit ht.	49

WOOD (12% MOISTURE CONTENT)	LBS. PER CU. FT.
Birch, red oak	44
Cedar, northern white	22
Cedar, western red	23
Cypress, southern	32
Douglas Fir (coast region)	34
Fir, commercial, white; Idaho white pine	27
Hemlock	28–29
Maple, hard (black & sugar)	42
Oak, white	47
Pine, northern white sugar	25
Pine, long leaf southern	29
Pine, ponderosa; Spruce: eastern & sitka	28
Pine, short leaf southern	36
Poplar, yellow	28
Redwood	28
Walnut, black	38

MORTAR & PLASTER	LBS. PER CU. FT.
Mortar, masonry	116
Plaster, gypsum, sand	104–120
Plaster, gypsum, perlite	50–55
Plaster, Portland Cement, sand	104–120
Plaster, Portland Cement, perlite	50–55
Plaster, Portland Cement, vermiculite	50–55

TILE—STRUCTURAL FACING (INCL. MORTAR)	LBS. PER SQ. FT.
2" facing tile	16
4" facing tile	30
6" facing tile	41

FUELS & LIQUIDS	LBS. PER CU. FT.
Coal, piled anthracite	47–58
Coal, piled bituminous	40–54
Gasoline	75
Water at 4°C	62.4
Water, ice	56

STONE VENEER (NO MORTAR)	LBS. PER SQ. FT.
2" granite, 1/2" parging	30
4" granite, 1/2" parging	59
6" limestone facing, 1/2" parging	55
4" sandstone or bluestone, 1/2" parging	49
1" marble	13
1" slate	14

MacKnight, Kirmmse, French & Sizing; Syracuse, New York

AVERAGE WEIGHTS OF MATERIALS:

PARTITIONS	LBS. PER SQ. FT.

Corrugated glass	6.3
Corrugated iron	1.2–1.7
Deck, steel without roofing or insulation	2.2–3.6
Fiberglass panels (2 1/2" corr.)	5–8 oz.
Galvanized iron	1.2–1.7
Gypsum tile, 3"	17
Lead 1/8"	6–8
Monel metal	1.2–1.5
Plank, cinder conc. 2"	15
Plastic sandwich panel, 2 1/2" thick	2.6
Shingles, asbestos cement	2.6
Shingles, asphalt	1.7–2.8
Shingles, wood	2–3
Slate, 3/16" to 1/4"	7–9.5
Slate, 3/8" to 1/2"	14–18
Stainless steel	2.5
Tile, cement flat	13.0
Tile, cement ribbed	16
Tile, clay mission	13.5
Tile, clay shingle type	8–16
Tile, clay flat with setting bed	15–20

INSULATION	LBS. PER SQ. FT.
Bat, blankets, per 1" thickness	.1–.4
Boards, vegetable fiber	1.5–2
Cork board per 1" thickness	.58
Foamed board insulation per 1" thickness	2.6 oz.

GLASS	LBS. PER SQ. FT.
Polished plate 1/4"	3.28
Polished plate 1/2"	6.56
Double strength 1/8"	26 oz.
Sheet A, B, 1/32"	45 oz.
Sheet A, B, 1/4"	52 oz.
Spandrel glass app. same as window glass	
Insulating glass 1/8" plate with air space	3.25
1/4" wire, glass	3.5
Glass block, 4"	20

PORCELAIN ENAMEL PANELS	LBS. PER SQ. FT.
Porcelain on alum. lam to 1/8" cem. asb. & backed with aluminum foil	2.25–2.5
Porcelain on alum. unbacked "pan-type"	1.0
Porcelain on steel panel, double faced, lam. to 1 1/8" insulating core	4–6.5
Porcelain on steel panel, unbacked "pan-type"	2.5–3

SUSPENDED CEILING MATERIALS	LBS. PER SQ. FT.
Mineral fiber tile 3/4", 12" x 12"	1.2–1.57
Wood fiber tile 3/4", 12" x 12" or 12" x 24"	.78–1.07
Mineral fiber board 5/8", 24" x 24"	1.4
Wood fiber board 5/8", 24" x 48"	.87
1", 24" x 48"	1.18
Acoustic plaster on gyp. lath base	10–11

LIVE LOADS	LBS. PER SQ. FT.
In general see building codes for specific requirements

MISCELLANEOUS WEIGHTS & MEASURES

WATER

1 cu. ft. weighs 62.4 lbs.
1 cu. in. weighs .0361 lbs.
1 gallon weighs 8.33 lbs.

LEAD

Sheet lead @ 1/64" thickness = 1 lbs./sq. ft. approx.
Sold by weight in lbs./sq. ft.

BOARD FEET

1 board foot = 144 sq. in. = volume of board 1 ft. square and 1" thick

No. of board feet in a log:

$$\text{Board Ft. Vol.} = \frac{(D'' - 4)^2 L}{16}$$

D = smaller diameter of log.
L = length of log in feet.
4 = slab deduction allowance.

Above formula appropriate for rough approximation only

CEMENT

Natural
1 bag = 85 lbs. ASTM-64.
1 barrel = 4 bags = 340 lbs.

Portland
1 bag = 94 lbs. ASTM-65
1 barrel = 4 bags = 376 lbs.

Bag and bulk only.
Barrel is a trade term.

SAND & LIME

Sand – damp or moist, not wet:
105-115 lbs./cu. ft. 110 lbs. average.

Structural lime:
Hydrated – slaked, as dry powder
30-40 lbs./cu. ft. 35 lbs. average.
1 bag = 50 lbs.

Quick – unslacked:
65-75 lbs./cu. ft. 70 lbs. average
1 bag = 80 lbs.

ROMAN NUMERALS

ARABIC:	1	5	10	50	100	500	1000	50,000
ROMAN:	I	V	X	L	C	D	M	$\overline{L}$

RULES:

1. If no letter precedes a letter of greater value, add the number represented by the letters.
Example:
XXX represents 30.
VI represents 6.

2. If a letter precedes a letter of greater value, subtract the smaller from the greater add the remainder or remainders thus obtained to the numbers represented by the other letters.
Example:
IV represents 4.
XL represents 40.
CXLV represents 145.

3. A bar placed over a letter multiplies value by 1000.

One calorie of heat energy is required to raise 1 c.c. of water 1°C. (As measured between 3° and 4° C.).

Foster C. Parriott, James M. Hunter & Associates; Boulder, Colorado

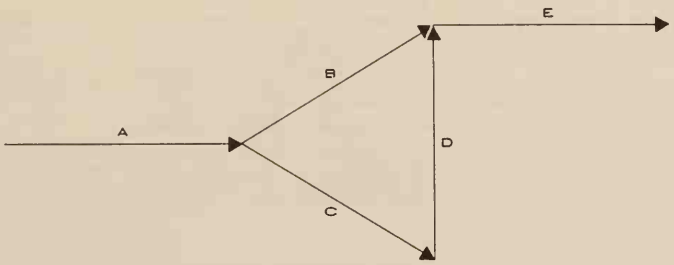
DESCRIPTION

CPM (Critical Path Method) is a form of scheduling operations against time periods and resources. Other names for variations of CPM are CPP (Critical Path Planning), PERT (Program Evaluation and Review Technique), PERTCO (Program Evaluation and Review Techniques Cost), PEP (Program Evaluation Procedure), and LESS (Least Cost Estimating and Scheduling). All are somewhat similar and are tools whose purpose it is to assure management that detailed analytic planning and evaluation of complex operations are carried out by those charged with them. Furthermore, it helps to:

a. flag the critical activities which, if delayed, would delay the final completion of the project. These are called critical operations.
b. show the number of spare days that the noncritical operations possess, making it possible to adjust their duration to the convenience of the project. These spare days are known as "float".
c. show the most economical scheduling for each operation in order to vary completion dates ("normal" versus "crash" programs). This, in turn, makes it possible to select a desirable optimum completion date.
d. assess time and cost effects on a project due to changes in the work, strikes or other forced work stoppages.
e. provide a salutary effect on a project in that it discourages procrastination, delayed decisions or second-guessing.

OPERATION

It is important to remember that in C.P.M. the planning and the scheduling functions are two distinct and different operations. The first is started by putting all necessary activities down on paper. All activities are then connected in their required sequence of execution with arrows. This is called the network diagram, or the arrow diagram, or the model.

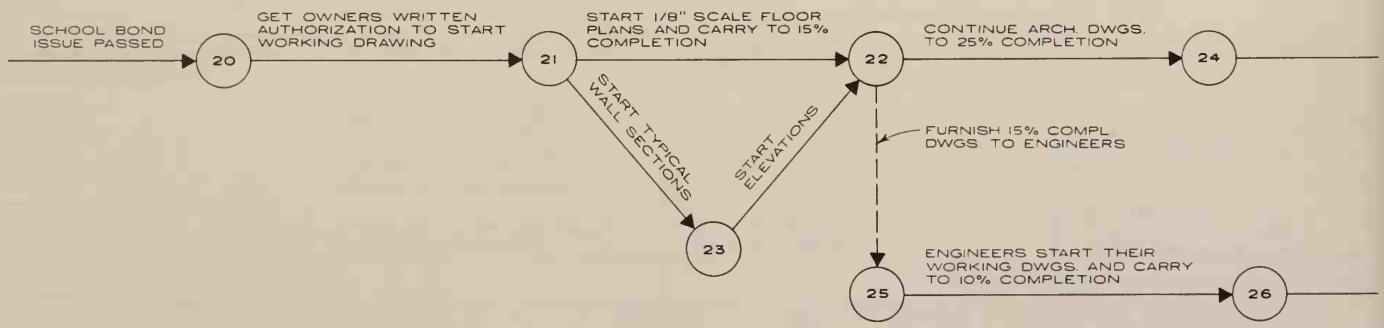


SIMPLIFIED NETWORK MODEL

The length of the arrows have no significance; the point to remember is that time flows from the tail of the arrow to its head, and most important, that no new activity can be started until activities indicated by all previous arrow-heads are completed. With that in mind, the following interpretations of the network can be made:

a. Operation B and C cannot start until A is completed.
b. Operation B and C can start simultaneously and can be performed concurrently.
c. Operation D cannot start until C is completed.
d. Operation E cannot start until both B and D are completed.

We can now translate this into an actual network.



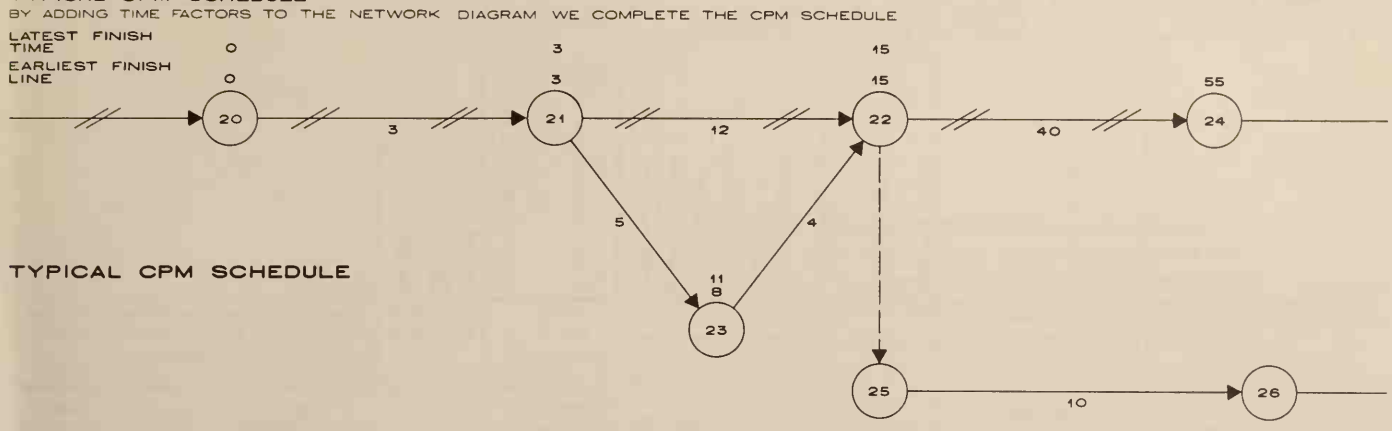
TYPICAL NETWORK DIAGRAM

Note that former operation A is now labeled 20–21, C is labeled 21–23, etc. Numerical sequence of the numbers has no significance whatever. We have essentially the same diagram; its sequential nature is now evident. This is referred to as the logic of arrow diagramming.

The broken line with an arrow which appears at 22–25 is called a Dummy Activity. It has no duration, but is inserted to insure that the activity at its head will not commence until the activity at its tail is completed.

The network model now shows the relationship of sequences of activities, but does not indicate time factors. This is accomplished in the second phase, the "Schedule", which superimposes duration times over the network for each separate activity, and determines which activities are critical and where float occurs.

Gustave R. Keane, FAIA, Eggers and Higgins, Architects–Planners; New York, New York



1. Duration time, in working days, for each activity is noted below each arrow line (for instance, 12 days for 21–22).

2. Duration times are added consecutively for each activity and noted above each nodule. This addition gives us the "earliest finish time" for each activity, i.e. the least number of working days in which all preceding activities can be completed.

3. After establishing all earliest finish times for all activities, the right hand end is reached. We now go back again and by subtracting duration times from the lesser of the right side totals we establish "latest finish times" for each activity and enter them above the "earliest finish time". The difference is called "Float" and shows permissible flexibility (if any) in scheduling each activity.

For example, there is a 3 day period of "float" which can be used to adjust either the start of 21–23, or 23–22, or the intensity with which these activities are carried out (man power). If earliest finish and latest starting times are the same, it means that there is no float and that the activity is, therefore, on the critical path.

4. The critical path is indicated on the arrow line with an appropriate mark or a special color. In this illustration it is marked thusly:
Phase II, the scheduling, is now complete. In many cases, this will be a sufficient excursion into C.P.M., because on comparatively simple projects the influence of lost days on the critical path can be easily ascertained by observation of the network schedule.

COMPUTER UP-DATING; MONITORING

On complicated projects where many parallel activities take place during the construction stage, and where several parties share the responsibility for scheduled completion, the use of Phase III, Computer Up-Dating and subsequent Monitoring is indicated.

The computer input consists of a prescribed form on which all planned, started and completed activities and their time increments are entered. The computer output (print out) shows "Earliest Finish", "Latest Finish" and "Float" times. "Latest Finish Time" is sometimes called "Latest Starting Time". Depending on the complexity of the project the computer runs are made bi-monthly or even monthly.

Monitoring is accomplished by visually comparing the originally scheduled completion times for each activity with the times shown on the computer print-out. This indicates what effect deviation from the original schedule will have on the completion date. It makes it possible to adjust the original schedule to make up time.

The speed of the computer makes it economical to ascertain the impact of a large number of inputs regarding the speeding up of individual activities on the total completion time. By adding costs of the different alternate solutions to the imput the computer print-out will furnish a clear picture of the influence of each activity decision on the final total cost of the project.

This Up-Dating and Monitoring also allows exact determination of the time changes due to change orders, delays, or other factors. It provides a precise project record with detailed recordings of the job progress at pre-determined time intervals, and may be valuable in settling later conflicts, and in evaluating claims of delay by any of the parties responsible for timely completion of the project.

PORTION OF CPM
