Preface

David H. Smith (USA)

This Preface describes the editors' aims and how the book was written and edited. The scope of scholarship and authorship is as fully interdisciplinary and multi-national as we could achieve, with contributors born in 73 countries. We wanted to provide a genuinely international perspective on the topics of our 54 review chapters. We also wanted to demonstrate conclusively the global nature of our fast growing, interdisciplinary field and emergent *interdiscipline* of voluntaristics (Smith 2013, 2016). Our other, but not lesser, priority has been to have high-quality and interesting text for each chapter that follows our theoretical chapter format, with large sets of relevant chapter references. We believe we have accomplished these goals, but the reader or reviewer will have to be the judge.

This Handbook has been created mainly to inform interested academics and scholars worldwide about the latest theory and research bearing on volunteering, civic participation, and nonprofit membership associations. Faculty teaching university undergraduate or graduate school courses on nonprofits, associations, volunteering, philanthropy, pro-social behavior, political participation, social movements, cooperatives, self-help groups, religious congregations and participation, trade associations, labor unions, professional associations, social or institutional history, social and recreational groups, arts and culture, and the like will find this Handbook useful as an intellectual background and context. Thus, our Handbook will also appeal to many graduate students who are taking courses on topics in voluntaristics such as the foregoing or those who plan to write master's theses or doctoral dissertations on voluntaristics topics. Sophisticated practitioners and policy-makers in the nonprofit sector will also find useful information in its many pages, especially in the chapter sections "Usable Knowledge."

We recognize that scientific expertise and frontline practice vary considerably in these topical areas across the different regions of the world. Nonetheless, Smith (2013) has estimated that upwards of 20,000 academics and other researchers in more than 130 nations are routinely conducting research, publishing articles or books, presenting conference papers, participating in relevant researcher associations, and or teaching about various aspects of the voluntary nonprofit sector (VNPS), its constituent groups and nonprofit organizations (NPOs, including both voluntary associations and nonprofit agencies: Smith 2015b, 2015c), and its individual participants, such as informal and formal volunteers as well as paid staff.

The 203 contributors to the Handbook represent many academic disciplines and professions. While the majority of contributors are, or formerly were, university faculty members, some are still post-graduate, usually doctoral, students, and a few are full-time nonprofit agency leaders, government officials, researchers in for-profit organizations, policy-makers, or other practitioners. The contributing academic experts participating in the Handbook work in the fields of nonprofit sector studies/civil society, sociology, psychology, economics, political science, anthropology, geography, history, public administration, business management, nonprofit management, social work, volunteer administration/management, philanthropy, leisure studies, time use research, international relations, disaster research, cooperatives, religion, social movements, marketing, information technology, and other fields. Most contributors have doctoral degrees in one or another academic disciple or professional field, including the social-behavioral sciences, social professions, and history. As noted above, some contributors are still doctoral students – usually from non-Western and/or Global South birth-countries, but not always.

The Handbook's scope in scholarship and authorship is as fully multinational as we could achieve, with contributions from experts who were born in 73 different countries, as noted earlier. The nations with the largest numbers of our 203 contributors were the United States (42; 20.6%), United Kingdom (20; 9.9%), China (13; 6.4%), Canada (8; 3,9%), and Russia (7; 3.4%). The geographic distribution of these 73 nations was as follows: Africa: 10; Central Asia (including Russia): 4; Central America, Caribbean, and Mexico: 3; Eastern Asia: 12; Eastern Europe: 11; Middle East: 6; North America: 2; Oceania: 3; South America: 4; and Western Europe: 18.

Smith (2013) has suggested using the term *voluntaristics* (or *altruistics*) to refer to the global, interdisciplinary field of research on such VNPS phenomena, a label that is analogous to the term *linguistics*, referring to the scholarly study of all human languages. *Voluntaristics* is a neologism, a new word, and hence does not have any of the historical connotations of any of the alternative terms/labels (except for *altruistics*, which is also a neologism). For instance, the term *philanthropy* in English has far too elitist and narrow a connotation to be suitable to refer to all VNPS phenomena. Smith (2013) makes a case for the value of the terms *voluntaristics* and *altruistics*, but it is too early to tell if either of these neologisms he invented (in March 2013 and December 2012, respectively) will generate greater consensus. After informally testing these two terms with various colleagues and faculty audiences, he now favors *voluntaristics* as more neutral.

Many other labels/terms for the interdisciplinary field have been used in the past 40+ years, including Nonprofit/Not-for-Profit/Third/Voluntary/Civil Society/Charitable/Tax-Exempt/Social Sector Studies, Philanthropic Studies, Charity Studies, Voluntary Action Research/Studies, Nonprofit Organization

(NPO) Studies, Nongovernmental Organization (NGO) Studies, Civil Society Studies, Civil Sector Studies, Nonprofit and Voluntary Sector Studies, Nonprofit and Voluntary Action Studies, Civic Engagement/Participation Studies, Social Movement Studies, Altruism and Morality Studies, Pro-Social Behavior Research, Mutual Aid/Self-Help Studies, Cooperative Studies, Social Solidarity/Solidarity Economy Studies, and Social Economy Studies, among others (Smith 2016; see an alternative but partially overlapping list of 18 names by Van Til 2015). Smith (2016) provides a much longer list of relevant terms as keywords referring to aspects of voluntaristics.

The global interdisciplinary field of voluntaristics as one context of this Handbook

The first named editor, David Horton Smith, is the founder of the global, organized field of voluntaristics, having founded the Association for Research on Nonprofit Organizations and Voluntary Action (ARNOVA; www.arnova.org) in 1971, initially with a different name, the Association of Voluntary Action Scholars (see Smith 1999a, 2003, 2016). ARNOVA was the first interdisciplinary and international association of researchers focused on voluntaristics and has served (directly or indirectly) as the model for all subsequent interdisciplinary voluntaristics researcher associations worldwide at various levels of geographic scope (Smith 2016).

Smith (2013:638) has noted, "About 55 similar interdisciplinary altruistics researcher associations have been founded worldwide (48 described here; including 9 defunct), 25 of them national in geographic scope, but seven covering a world region and 11 global" (see ibid., table 1; to be updated periodically on www.icsera.org, under Resources). Smith (2013:640) continues, "Many of them publish their own academic journals, and nearly all have their own websites and newsletters for members. All active ones have meetings, seminars, or conferences at least biennially, usually annually, but sometimes more often."

Sometimes the diffusion of the essence of ARNOVA, as an interdisciplinary voluntaristics researcher association and social invention, has occurred directly. Some founders of similar subsequent associations have learned of ARNOVA's existence and activities as a social invention and initial model through written media, or they have experienced one of its annual conferences that began in 1974 (e.g., Diana Leat, co-founder of the [UK] Association for Research on Voluntary and Community involvement [ARVAC]; Mark Lyons, co-founder of the Australian and New Zealand Third Sector Research [ANZTSR] association; Nauto Yamauchi, co-founder of the Japan Nonprofit Organization Research Organization [JANPORA]; Innocent Chukwuma, co-founder of the Association for Research on Civil Society in Africa [AROCSA]; Smith 2016).

Most times, however, especially in the past 10–15 years or so, the diffusion has been indirect. Other founders of interdisciplinary voluntaristics researcher associations have learned from one or more earlier associations besides ARNOVA as models (Smith 2016). This has often occurred by a founder attending a conference or reading an academic journal of another voluntaristics researcher association and deciding to found an association as a result. The latter, more common, indirect diffusion of this social innovation manifests what DiMaggio and Powell (1983) have termed *institutional isomorphism* and *mimetic processes* (*mimesis*) in existing organizational fields.

Smith also founded and was first Editor-in-Chief of ARNOVA's academic journal, *Nonprofit and Voluntary Sector Quarterly* (*NVSQ*), originally named the *Journal of Voluntary Action Research* (Smith 2003). *NVSQ* was the first interdisciplinary and international academic journal centrally dedicated to publishing research on voluntaristics, and it has served as a model for most subsequent voluntaristics journals, especially the general ones. In 2014, *NVSQ* had a Thomson-Reuters Journal Impact Factor of 1.49, highest of any core voluntaristics journal, while *Voluntas* had an Impact Factor of 1.24 for 2014.

Smith (2013:638) further noted that there are "[o]ver 100 academic journals that [primarily] publish research on altruistics or its sub-topics." Some 61 of these are designated as "*core* or *primary* altruistics [voluntaristics] journals [that] have relevant terms like *civil society, third sector, social economy, philanthropy*, *social movements*, *nonprofit organizations, participation, engagement*, etc. in their titles or sub-titles." That number of core journals now nears 70 (see www.icsera.org, under Resources). Casting a still wider net for academic journals that publish articles on topics in voluntaristics, Jackson et al. (2014:803) found that 4,053 academic journals listed in the SCOPUS article database had published 21,327 voluntaristics articles using a short list of such topics as keywords in the 12-year period, 2000–2011 (cf. Smith 2016:28). If a longer list of keywords were used with the same database for the past 20 years, it is likely that at least 100,000 articles would be identified, representing at least 50,000 different individual authors (cf., Smith and CHEN 2017).

Finally, much data gathered in the past few years suggest that the interdisciplinary socio-behavioral science field of voluntaristics has been growing exponentially since about the mid-1990s (Bekkers and Dursun 2013; Jackson, Guerrero, and Appe 2014; Shier and Handy 2014; Smith 2013; Smith and Sundblom 2014). Various measures of growth of the voluntaristics field all show rapid, recent, global growth: interdisciplinary associations, sections (subgroups) of academic discipline associations, core/primary academic journals, academic journals publishing relevant articles, dissertations and masters' theses, and research-information centers (see graphs in Smith 2016).

The prior research literature on voluntaristics as another context of the Handbook

The rapidly growing interdisciplinary, global, socio-behavioral science field of voluntaristics is one larger intellectual context of the present Handbook. But how does our Handbook fit into the extant research literature? Why is it needed? Here are the answers: No previous handbook on voluntaristics topics has ever tried to be truly international in its authorship. Until the present Handbook, this gap has been especially obvious regarding a handbook on associations or volunteering, let alone on both. The North American understanding of a handbook is that it is a large, highly multi-authored compendium of chapters with significant theoretical structure as a book that reviews either the state of research or the state of practice in a field or topical area. Only libraries and institutions usually buy encyclopedias, while many individual academics or practitioners or both buy handbooks and/or recommend them to their institutional libraries for purchase.

We must note that the research literature on volunteering, citizen participation, and membership associations, even in some of the sub-fields, is now so voluminous that even individual Handbook chapter teams could not possibly cover all relevant documents even in English, let alone in all major languages. For example, Part IV on factors affecting individual participation could easily have been a long book in itself. Musick and Wilson (2008) wrote just such a book, but a new, updated one is needed every five years or so, given the pace of growth of research and theory in voluntaristics.

The contributors to the Handbook

We contacted by mail or in person relevant experts born in 92 countries, seeking their participation. As editors, we have invited and gained participation from leading experts born in 73 countries to co-author chapters for this Handbook.[1] The first named editor (Smith) contacted well more than 600 experts in order to find the 203 final, separate, individual contributors who are now involved. He received significant help in identifying lead, second, and subsequent co-authors from his two co-editors, from various lead or second authors, plus help from a few outside colleagues (see the Acknowledgments). Many university faculty and other researchers who were contacted pleaded other pressing tasks when declining, even though intellectually interested. Furthermore, several experts who agreed to participate were unable to complete their work in a timely way or wrote text of insufficient quality to be included.

Our general plan was for each chapter to be written by a team of experts from different world regions, so that our research reviews and conclusions would reflect not just high-income, developed, Western European, North American,

and other Anglo-nations (Australia, New Zealand), but also various other world regions with different characteristics. Most research on the topics of our Handbook has studied people in WEIRD nations – Western, Educated, Industrialized, Rich, Democratic nations (cf. Henrich, Heine, and Norenzayan 2010). This Handbook is outstanding in its non-WEIRD nation outreach, both for contributors and for references.

We needed to select lead and second authors for each chapter who were both highly competent in writing English and also experts on the specific topics of their chapters. These criteria led to a preponderance (about 76.6%) of contributors from WEIRD nations as lead and second authors. Among the 105 lead and second authors for the 54 literature review chapters, 25 (23.8%) were from non-WEIRD nations. The fact that Smith was a lead or second author of 18 of these 54 review chapters skews the results somewhat toward the WEIRD nations, given that he was born in the United States.

Even when experts from non-WEIRD nations were not among the pair of lead and second authors, subsequent co-authors from the 73 nations were asked to vet the chapters from the viewpoint of their own birth-nation and/or world region. In addition, lead authors sought written text and reference inputs from all of their co-authors from various world regions and nations.

We do not believe that our attempt at including multi-national and multi-world-region perspectives for each review chapter was fully successful, but it was a start in the right direction. We had no direct funds at all from anyone or from any organization for the work of this Handbook (although many contributors may have been supported financially to some extent by their universities or other institutions). That situation made more thorough approaches to multi-national reviews and generalizations impossible. However, the greatest obstacle was not inadequate world region representation on the author team of each chapter, but rather the scarcity of relevant, high-quality research available for various world regions for each chapter. That was an irremediable problem, no matter how much funding we might have had.

In practice, the lead author was the chapter team leader and sought inputs from all of his or her team of co-authors. The lead author usually wrote a first draft of the chapter, with substantial inputs from the second author. Then the lead author was an editor of all materials from co-authors for the given chapter. In some cases, a third author made especially significant contributions. Otherwise, subsequent co-authors after the first two are listed in alphabetical order by surname. In some cases, the term *with* is used for one or more co-authors after the lead author, to indicate very minor written inputs to the final chapter text. Because of the costs involved, only lead and second authors will automatically receive free physical copies of the Handbook from the publisher.

Some initially planned chapters had to be dropped when there was insufficient research literature to merit a chapter for the Handbook. We are grateful

to those volunteer professionals, listed below, for giving those chapters a try, even though the chapters did not come to fruition: Nancy Macduff (Episodic Volunteers); Colin Rochester and Norman Dolch (Volunteers in Small Paid-Staff Nonprofit Agencies); Keith Seel (Board-Policy Volunteers); Stephen Block, Ruth Simsa, and Vladimir Yakimets (Dysfunctions in Associations); and Martii Muukonen (Incentives and Ideology).

In some instances, planned chapters were attempted but were ultimately dropped due to insufficient world region variety in inputs, insufficient adherence to editorial guidelines, word count limitations, or other substantive content problems. We are grateful to their initial draft authors: Patrick Rooney, Michael Kramarek, Lin TAO, and Andri Soteri-Proctor (Special Methodology); Robert A. Stebbins, Steinunn Hrafnsdottir, and Geoff Nichols (Social Leisure and Recreation); Daniela Bosioc, Lars-Skov Henriksen, Amer Afaq, and Zhibin ZHANG (Infrastructure Organizations); David H. Smith, Uzi Sasson, and Jurgen Grotz (Impact of Associations on Human Societies); and Antonin Wagner (Afterword).

Analytical structure and standard chapter format and editing

Unlike most edited books and many handbooks, this volume has a rigorous theoretical structure and plan. Each chapter was written to fulfill that larger analytical plan, which was created in early 2011 and then revised many times. The structure of the Handbook has been mainly the responsibility and work of the first editor, Smith. He also sought and received some inputs from his co-editors, Stebbins and Grotz, as well as from various lead authors and a few outside colleagues (see Acknowledgments). However, Smith accepts full responsibility for the final set of chapters and chapter topics included, the names and content of each part of the book, the names of all chapters, the ordering of parts of the book, the ordering of chapters within parts, and the standard format of most chapters.

When suitable contributors could not be found, when they were invited but declined to help, or when initially selected contributors could not do the necessary work to a high-quality standard, especially lead or second authors, the first editor, Smith, took on the additional reviewing and writing burden specifically in order to maintain and complete the overall theoretical structure of the Handbook that he had planned. This initially unexpected/unplanned, replacement chapter, or additional chapter section, reviewing, writing, and editing that Smith needed to do substantially lengthened the overall writing/editing process by perhaps three years. All this was, however, quite necessary to achieve the topical coverage we now have, and our variety of national and world region coverage, incomplete as it still is.

Originally, Smith was slated to be lead author on four chapters and to contribute to no others. Then, as also later, Smith was expected to recruit about 85% of our contributors from the 73 birth-countries. These inputs from experts born in so many different nations on all continents likely make our Handbook unique among all handbooks ever published on any topic. Smith was a substantive/content contributor to 41 of the 58 chapters (including the Preface, Introduction, and Appendix). Smith's final contribution includes 14 chapters (or other chapter-like documents) as lead author, 4 as second author, 6 as third author, and 17 as a more subsequent co-author, editing them all one or more times. This set of chapter co-authorships results in Smith being substantively involved, sometimes in only minor ways (e.g., 500 words), in the writing of about 71% of all the chapters.

This depth and breadth of involvement by Smith in the substantive writing process deserves a further word of explanation: Since Smith ended up so deeply and pervasively involved, why did he not simply plan to write the whole book himself, given his 50-year+ breadth/depth of knowledge about the topics included? The answers are simple.

Nearly 72 in 2011 (thus 77 now), Smith was uncertain he had the additional 10–15 years of life that would have been needed to write the book alone. More importantly, he wanted the Handbook to demonstrate the global nature of voluntaristics by including contributors from many countries and regions throughout the world. Further, he wanted to involve many known colleagues who were world-class experts on various specialized facets and sub-topics of the Handbook that were not Smith's specialties.

Within the vast majority of chapters, the content follows a standard analytical format: introduction, definitions, historical background, key issues, usable knowledge, future trends and needed research, cross-references, references, and sometimes endnotes. We borrowed and adapted this format from the *International Encyclopedia of Civil Society*, edited by Anheier, Toepler, and List (published by Springer in 2010). However, as noted above, the Usable Knowledge section is an invention by Smith for our Handbook.

As suggested earlier, the research literature on the VNPS topics of the Handbook and of nearly any chapter in it has multiplied beyond the reach of any individual to keep up with. For example, on the Google Scholar database (accessed April 21, 2015) of journal articles and books, the keyword *volunteer* generates 1,520,000 hits or documents, with many old documents and documents not relevant to the Handbook; the keywords *voluntary association* generate similarly 1,880,000 hits; and the keywords *civic participation* generate 779,000 hits.

Because of this information overload, we started our contributor outreach process by trying to recruit a top expert in each topical area – a wise approach that guided our selection of lead and second authors for chapters. Many of

our chapter leads thus are world-class experts on their topics, but we have not always been so fortunate. Such top experts were often too busy with their own projects to be willing to join our Handbook project. As our next choice, we have sought bright younger scholars, who were more eager to be involved.

In terms of the substantive chapter content, each lead author has had to be very selective. Our initial editorial instructions to lead authors were to produce a chapter with 5,000 words of text and 1,000 words of references. These limits were later expanded, in order to include the intellectual richness of the research literature for certain key chapters and their detailed text. Thus, leads and other contributors have been in part affected by personal or professional preferences in their topical areas for concepts, variables, hypotheses/generalizations, theories, and documents/references to read, discuss, and cite. For these reasons, no chapter in the Handbook pretends to be exhaustive or comprehensive with its discussion or citation of documents and references. Thus, expert readers may expect to find that some of their own favorite documents, including one's own publications, have neither been cited nor discussed. However, such topical experts would find various ones of their favorite documents discussed, as well as others at least cited or listed in the chapter references without citations in the chapter text.

A full set of references for each chapter is available free of charge on the website of the sponsoring nonprofit research organization, the International Council of Voluntarism, Civil Society, and Social Economy Researcher Associations under Resources (ICSERA; www.icsera.org). There is no consolidated, master bibliography for the Handbook, because single chapter bibliographies are more coherent substantively and better for interested readers to browse.

In sum, one of our two top priorities and goals in writing and editing this Handbook has been to include a very broad, multi-national range of scholars in order to provide a genuinely international perspective on the topics of each of the 54 review chapters. In addition, we have wanted that broad range of international scholars as contributors to demonstrate conclusively the global nature of our fast-growing, interdisciplinary field and emergent *inter-discipline* of voluntaristics (Smith 2016). We believe we have accomplished both of these goals quite well, but readers and reviewers may judge for themselves.

Our other, but not lesser, top priority and goal has been to have high-quality and interesting text for each chapter that follows our theoretical chapter format, with large sets of relevant references for each chapter. We believe that we have also accomplished that major goal, but the reader will have to be the judge. At the very least, we argue that the substance of this Handbook will be useful to many voluntaristics scholars, educators, and students for many years to come. We also argue that this volume fills a previous gap in the voluntaristics handbook research literature.

Unlike most other handbooks, this Handbook has a kind of latent, intellectual advocacy purpose. As Smith indicates in the Introduction (and at length previously in Smith 2000:chapter 10), many major scholars in the field of voluntaristics and their followers have for decades seriously distorted the overall theoretical perspective of the nature of the VNPS, seeing it mainly or solely as a set of NPOs as paid-staff based nonprofit agencies (Smith 2015c), mainly or totally ignoring voluntary associations (Smith 2015b). The Introduction, and indeed the entire Handbook, is an attempt by Smith once again to broaden their *flat-earth maps* (Smith 1997). We strongly advocate adding much more emphasis on associations, and also on volunteering and civic participation, to expand the *round-earth paradigm* of the VNPS that Smith (2000:chapter 10) has been suggesting since he founded the organized field of voluntaristics in 1971 (Smith 2016). Many other distinguished voluntaristics scholars share this broader, round-earth perspective and paradigm (e.g., Cnaan and Park 2016; Rochester 2013; Van Til 2015).

Finally, for all the work done by the editors of this Handbook, in the end the "soil and earth" (quoting Jurgen Grotz, our Managing Editor) of this book are its 203 contributors – the *sine qua non* of its existence, without whom the Handbook would not exist. *We three Editors are thus immensely grateful for the estimated 30+ person-years of volunteer professional effort/work they have collectively contributed to this massive, interdisciplinary, multi-national, collaborative endeavor over the past five years*, continuing still over the next few months or so of production of the volume (e.g., answering copy editor queries, proofing typeset chapters). We firmly believe that entire global field of voluntaristics will be in their debt for many years to come.

Note

1. We have had to set some rules for ourselves in writing contributors' names in order to standardize the process and make the form of contributors' names be used consistently across individuals:

    (1) We use first and last names (surnames, family names), but omit middle names, using the middle initial when known.
    (2) We usually hyphenate Hispanic surnames (e.g., Batista-Silva), for practical reasons of alphabetization, even though hyphens are not used in Hispanic cultures.
    (3) We consistently hyphenate British double surnames (e.g., Ellis-Paine), even though this practice is not followed in Britain.
    (4) We hyphenate double surnames used to indicate the surnames of both spouses (e.g., More-Hollerweger), as some modern people do.
    (5) We use diacritical markings to the extent that we know them (e.g., René), at least in the lists of chapter authors and the References.
    (6) We place Chinese surnames in all capital letters, because there have been many confusions/errors about surnames in the course of our work regarding which of

two Chinese names is the surname. Naturally, the Chinese do not do this. Furthermore, we place the surname second, contrary to the usual Chinese practice of putting the surname first. When a Chinese surname is preceded by a Western first name, we use upper/lower case for the surname, since confusion is less likely.

Editors

David H. Smith, PhD

Born in 1939, David is Research and Emeritus Professor of Sociology, Boston College, Chestnut Hill, USA; Honorary Visiting Professor, Centre for Studies of Civil Society and the Nonprofit Sector, National Research University Higher School of Economics, Moscow, Russia; Honorary Visiting Professor in Sociology, School of Health Sciences, University of East Anglia, Norwich, UK; Honorary Visiting Professor in the School of Arts and Sciences, City University London, London, UK; and Visiting Scholar, Institute for Philanthropy, Tsinghua University, Beijing, China.

David earned his PhD in Sociology from Harvard University (1965). He founded the global Association for Research on Nonprofit Organizations and Voluntary Action (ARNOVA; www.arnova.org) and *Nonprofit and Voluntary Sector Quarterly* (*NVSQ*) journal (both in 1971). In 2010, he became Founding President/CEO of ICSERA (International Council of Voluntarism, Civil Society, and Social Economy Researcher Associations; www.icsera.org), a global, nonprofit sector, infrastructure institute, and association of associations. Recently, he founded the *Voluntaristics Review*, a journal of lengthy survey/review articles (2016). Both the journal and this Handbook are sponsored by ICSERA.

The author of *Grassroots Associations* (2000), first co-author of *A Dictionary of Nonprofit Terms and Concepts* (2006; 2nd edition 2017), and author/editor of 18 other books, David recently invented S-Theory (Synanthrometrics) – an integrative, interdisciplinary, and quantitative theory of individual behavior, especially pro-social behavior like volunteering, drawing on recent research in many socio-behavioral sciences, biology/neuroscience, and interdisciplinary fields. S-Theory may be termed *The Theory of Everyone* because it aspires to explain any behavior of anyone, even though it is applied mainly to volunteering as one type of pro-social behavior. Survey research in Russia has strongly confirmed this theory. His book on S-Theory is going to be published in 2017: *S-Theory (Synanthrometrics) as "The Theory of Everyone": A Proposed New Standard Human Science Model of Behavior, Especially Pro-social Behavior.*

David was co-recipient of the 1975 national Hadley Cantril Memorial Award (for the outstanding US book contribution in the behavioral and social sciences) and later was co-recipient of the ARNOVA (Lifetime Achievement) Award for Distinguished Contribution to Nonprofit and Voluntary Action Research in 1993, the first year it was awarded. He was honored with a bio entry as one

of 139 outstanding nonprofit sector leaders, theorists, and researchers from all of world history and all nations in the *International Encyclopedia of Civil Society* (2010). His bio has been in the annual Marquis' *Who's Who in the World* since 2001.

Robert A. Stebbins, PhD, FRSC

Robert A. Stebbins, born in the United States in 1938, received his PhD in Sociology in 1964 from the University of Minnesota, USA. He has taught in the departments of sociology at Presbyterian College (1964–1965), Memorial University of Newfoundland (1965–1973), University of Texas at Arlington (1973–1976), and University of Calgary (1976–1999). In 2000 he was appointed Professor Emeritus and Faculty Professor in the Faculty of Social Sciences at the University of Calgary, Canada. Dr Stebbins served as President of the Social Science Federation of Canada in 1991–1992, after having served as President of the Canadian Sociology and Anthropology Association in 1988–1989. He was Vice-President of the Canadian Association for Leisure Studies from 1993 to 1996.

Stebbins' principal contribution to the fields of leisure studies and voluntaristics is his *serious leisure perspective.* It revolves around a typology of leisure, based on the ways people experience and are motivated to pursue particular free-time activities. From qualitative/exploratory research on 21 different amateur, hobbyist, and volunteer activities, he inductively generated over a period of 42 years the aforementioned perspective. Today, its three forms – serious, casual, and project-based leisure – along with its many types and subtypes, constitute a main orientation for research and analysis in the interdisciplinary field of leisure studies. In recognition of this contribution, Stebbins was elected, in 1997, Fellow of the Academy of Leisure Sciences and, in 1999, Fellow of the Royal Society of Canada.

His 50 books published or in press include *Volunteering as Leisure/Leisure as Volunteering: An International Perspective* (2004), *Between Work and Leisure: The Common Ground of Two Separate Worlds* (2004/2014), *Serious Leisure: A Perspective for Our Time* (2007/2015), *A Dictionary of Nonprofit Terms and Concepts* (2006; with David Horton Smith and Michael Dover), and *Leisure and the Motive to Volunteer* (Palgrave, 2015).

Jurgen Grotz, PhD

Jurgen Grotz, born in Germany in 1963, received his MA in Sinology (1992) from Phillips University, Marburg, Germany, for work on disability in China, and his PhD in Sinology in 1996 from the University of London, UK, for his work on Chinese writing systems for visually impaired persons. He is a visiting research fellow at the University of East Anglia, UK, and a member of the Association for Research in the Voluntary and Community Sector (ARVAC), UK, in

which he served first as Secretary and Editor and then as Vice Chair and Chair between 2007 and 2013.

His 35 years of active engagement in the voluntary and community sector and 25 years of applied policy and practice research in Germany, China, and the United Kingdom have offered him insights into a great variety of subjects, such as volunteering in public services with particular reference to the relationship between the state and the voluntary sector when reviewing the effectiveness of the English Compact, and the negative sides of volunteering, for example, during the Volunteer Rights Enquiry of Volunteering England.

He has worked for the Royal National Institute for the Blind, the Big Lottery Fund, Volunteering England, and is currently Research Manager at the Institute for Volunteering Research, National Council for Voluntary Organisations, UK, where he is responsible for research into all aspects of volunteering from micro-volunteering to employer-supported volunteering and local volunteering infrastructure.

He has written numerous reports on applied research, has contributed a background paper to the project on "The State of the World's Volunteerism Report 2011" by the UN Volunteers (2011), and regularly contributes to the academic debate at conferences or in print. His recent publication is (with Mary Corcoran) "Deconstructing the Panacea of Volunteering in Criminal Justice" in *The Voluntary Sector and Criminal Justice* (edited by A. Hucklesby and M. Corcoran; Palgrave). He is also a regular reviewer for *Voluntary Sector Review*.

Benny Subianto (Indonesia) is a Program Consultant at Harvard University, Kennedy School of Government, Indonesia Program, Jakarta, Indonesia.

Dan Sundblom (Finland) is a doctoral student at Åbo Akademi University, Turku, Finland.

Lars Svedberg (Sweden) is Professor in the Department of Social Sciences at Ersta Sköndal University College, Stockholm, Sweden.

David Swindell (USA) is Associate Professor and director of the Center for Urban Innovation, Arizona State University, Tempe, AZ, USA.

Kuang-Ting TAI (Taiwan) is a doctoral student at the School of Public Affairs, Arizona State University, Tempe, AZ, USA.

Lars Torpe (Denmark) is Associate Professor in the Department of Political Science, Aalborg University, Aalborg, Denmark.

Anastasiya S. Tumanova (Russia) is Professor in the Faculty of Law, in the National Research University Higher School of Economics, Moscow, Russia.

Agnes Uhereczky (Hungary) is Director of Confederation of Family Organisations in the European Union (COFACE), Brussels, Belgium.

Jan W. van Deth (The Netherlands) is Professor in the Department of Political Science, University of Mannheim, Mannheim, Germany.

Stijn Van Puyvelde (Belgium) is a postdoctoral research associate in the Department of Business Administration, Public & Nonprofit Management at the University of Mannheim, Mannheim, Germany.

Denise R. Vienne (USA) is Adjunct Professor at the School of Public Administration, Florida Atlantic University, Boca Raton, FL, USA.

Marcelo Vieta (Argentina) is Assistant Professor in the Department of Leadership, Higher, and Adult Education, OISE, University of Toronto, Toronto, Canada.

Mirta Vuotto (Argentina) is Professor in the Faculty of Economic Sciences, University of Buenos Aires, Buenos Aires, Argentina.

Lili Wang (China) is Associate Professor at the School of Community Resources and Development, Arizona State University, Tempe, AZ, USA.

Stephen L. Wearing (Australia) is Associate Professor in the Management Discipline Group, University of Technology Sydney, Sydney, Australia.

Lore Wellens (Belgium) is Consultant at Omni Care Consult, Antwerp, Belgium.

Howard J. Wiarda (USA), recently deceased, was Dean Rusk Professor of International Relations at the University of Georgia, Athens, GA, USA.

Dwight Wilson (USA) is Assistant Professor in the Department of Political Science and International Affairs, University of North Georgia, Dahlonega, GA, USA.

John Wilson (UK) is Professor Emeritus in the Department of Sociology, Duke University, Chapel Hill, NC, USA.

Michael Woolcock (Australia) is Lead Social Development Specialist at the World Bank and Lecturer in Public Policy at Harvard University, Cambridge, MA, USA.

Fengshi WU (China) is Associate Professor at S. Rajaratnam School of International Studies, Nanyang Technological University, Singapore.

Lei XIE (Hong Kong, China) is Lecturer in the Department of Politics, University of Exeter, Cornwall, UK.

Pengjie YU (China) is Associate Research Fellow at Dongguan Academy of Social Sciences, Guangzhou, China.

Yingying ZENG (China) is a doctoral student at the School of Public Policy and Administration, University of Delaware, Newark, DE, USA.

Ting ZHAO (China) is a post-doctoral research fellow at the School of Political Science and Public Administration, East China University of Political Science and Law, Shanghai, China.

Annette Zimmer (Germany) is Professor in the Department of European Social Policy and Comparative Politics, University of Münster, Münster, Germany.

Siniša Zrinščak (Croatia) is Professor in the Department of Sociology, University of Zagreb, Zagreb, Croatia.

Preface

David H. Smith (USA)

This Preface describes the editors' aims and how the book was written and edited. The scope of scholarship and authorship is as fully interdisciplinary and multi-national as we could achieve, with contributors born in 73 countries. We wanted to provide a genuinely international perspective on the topics of our 54 review chapters. We also wanted to demonstrate conclusively the global nature of our fast growing, interdisciplinary field and emergent *interdiscipline* of voluntaristics (Smith 2013, 2016). Our other, but not lesser, priority has been to have high-quality and interesting text for each chapter that follows our theoretical chapter format, with large sets of relevant chapter references. We believe we have accomplished these goals, but the reader or reviewer will have to be the judge.

This Handbook has been created mainly to inform interested academics and scholars worldwide about the latest theory and research bearing on volunteering, civic participation, and nonprofit membership associations. Faculty teaching university undergraduate or graduate school courses on nonprofits, associations, volunteering, philanthropy, pro-social behavior, political participation, social movements, cooperatives, self-help groups, religious congregations and participation, trade associations, labor unions, professional associations, social or institutional history, social and recreational groups, arts and culture, and the like will find this Handbook useful as an intellectual background and context. Thus, our Handbook will also appeal to many graduate students who are taking courses on topics in voluntaristics such as the foregoing or those who plan to write master's theses or doctoral dissertations on voluntaristics topics. Sophisticated practitioners and policy-makers in the nonprofit sector will also find useful information in its many pages, especially in the chapter sections "Usable Knowledge."

We recognize that scientific expertise and frontline practice vary considerably in these topical areas across the different regions of the world. Nonetheless, Smith (2013) has estimated that upwards of 20,000 academics and other researchers in more than 130 nations are routinely conducting research, publishing articles or books, presenting conference papers, participating in relevant researcher associations, and or teaching about various aspects of the voluntary nonprofit sector (VNPS), its constituent groups and nonprofit organizations (NPOs, including both voluntary associations and nonprofit agencies: Smith 2015b, 2015c), and its individual participants, such as informal and formal volunteers as well as paid staff.

The 203 contributors to the Handbook represent many academic disciplines and professions. While the majority of contributors are, or formerly were, university faculty members, some are still post-graduate, usually doctoral, students, and a few are full-time nonprofit agency leaders, government officials, researchers in for-profit organizations, policy-makers, or other practitioners. The contributing academic experts participating in the Handbook work in the fields of nonprofit sector studies/civil society, sociology, psychology, economics, political science, anthropology, geography, history, public administration, business management, nonprofit management, social work, volunteer administration/management, philanthropy, leisure studies, time use research, international relations, disaster research, cooperatives, religion, social movements, marketing, information technology, and other fields. Most contributors have doctoral degrees in one or another academic disciple or professional field, including the social-behavioral sciences, social professions, and history. As noted above, some contributors are still doctoral students – usually from non-Western and/or Global South birth-countries, but not always.

The Handbook's scope in scholarship and authorship is as fully multinational as we could achieve, with contributions from experts who were born in 73 different countries, as noted earlier. The nations with the largest numbers of our 203 contributors were the United States (42; 20.6%), United Kingdom (20; 9.9%), China (13; 6.4%), Canada (8; 3,9%), and Russia (7; 3.4%). The geographic distribution of these 73 nations was as follows: Africa: 10; Central Asia (including Russia): 4; Central America, Caribbean, and Mexico: 3; Eastern Asia: 12; Eastern Europe: 11; Middle East: 6; North America: 2; Oceania: 3; South America: 4; and Western Europe: 18.

Smith (2013) has suggested using the term *voluntaristics* (or *altruistics*) to refer to the global, interdisciplinary field of research on such VNPS phenomena, a label that is analogous to the term *linguistics*, referring to the scholarly study of all human languages. *Voluntaristics* is a neologism, a new word, and hence does not have any of the historical connotations of any of the alternative terms/labels (except for *altruistics*, which is also a neologism). For instance, the term *philanthropy* in English has far too elitist and narrow a connotation to be suitable to refer to all VNPS phenomena. Smith (2013) makes a case for the value of the terms *voluntaristics* and *altruistics*, but it is too early to tell if either of these neologisms he invented (in March 2013 and December 2012, respectively) will generate greater consensus. After informally testing these two terms with various colleagues and faculty audiences, he now favors *voluntaristics* as more neutral.

Many other labels/terms for the interdisciplinary field have been used in the past 40+ years, including Nonprofit/Not-for-Profit/Third/Voluntary/Civil Society/Charitable/Tax-Exempt/Social Sector Studies, Philanthropic Studies, Charity Studies, Voluntary Action Research/Studies, Nonprofit Organization

(NPO) Studies, Nongovernmental Organization (NGO) Studies, Civil Society Studies, Civil Sector Studies, Nonprofit and Voluntary Sector Studies, Nonprofit and Voluntary Action Studies, Civic Engagement/Participation Studies, Social Movement Studies, Altruism and Morality Studies, Pro-Social Behavior Research, Mutual Aid/Self-Help Studies, Cooperative Studies, Social Solidarity/Solidarity Economy Studies, and Social Economy Studies, among others (Smith 2016; see an alternative but partially overlapping list of 18 names by Van Til 2015). Smith (2016) provides a much longer list of relevant terms as keywords referring to aspects of voluntaristics.

The global interdisciplinary field of voluntaristics as one context of this Handbook

The first named editor, David Horton Smith, is the founder of the global, organized field of voluntaristics, having founded the Association for Research on Nonprofit Organizations and Voluntary Action (ARNOVA; www.arnova.org) in 1971, initially with a different name, the Association of Voluntary Action Scholars (see Smith 1999a, 2003, 2016). ARNOVA was the first interdisciplinary and international association of researchers focused on voluntaristics and has served (directly or indirectly) as the model for all subsequent interdisciplinary voluntaristics researcher associations worldwide at various levels of geographic scope (Smith 2016).

Smith (2013:638) has noted, "About 55 similar interdisciplinary altruistics researcher associations have been founded worldwide (48 described here; including 9 defunct), 25 of them national in geographic scope, but seven covering a world region and 11 global" (see ibid., table 1; to be updated periodically on www.icsera.org, under Resources). Smith (2013:640) continues, "Many of them publish their own academic journals, and nearly all have their own websites and newsletters for members. All active ones have meetings, seminars, or conferences at least biennially, usually annually, but sometimes more often."

Sometimes the diffusion of the essence of ARNOVA, as an interdisciplinary voluntaristics researcher association and social invention, has occurred directly. Some founders of similar subsequent associations have learned of ARNOVA's existence and activities as a social invention and initial model through written media, or they have experienced one of its annual conferences that began in 1974 (e.g., Diana Leat, co-founder of the [UK] Association for Research on Voluntary and Community involvement [ARVAC]; Mark Lyons, co-founder of the Australian and New Zealand Third Sector Research [ANZTSR] association; Nauto Yamauchi, co-founder of the Japan Nonprofit Organization Research Organization [JANPORA]; Innocent Chukwuma, co-founder of the Association for Research on Civil Society in Africa [AROCSA]; Smith 2016).

Most times, however, especially in the past 10–15 years or so, the diffusion has been indirect. Other founders of interdisciplinary voluntaristics researcher associations have learned from one or more earlier associations besides ARNOVA as models (Smith 2016). This has often occurred by a founder attending a conference or reading an academic journal of another voluntaristics researcher association and deciding to found an association as a result. The latter, more common, indirect diffusion of this social innovation manifests what DiMaggio and Powell (1983) have termed *institutional isomorphism* and *mimetic processes* (*mimesis*) in existing organizational fields.

Smith also founded and was first Editor-in-Chief of ARNOVA's academic journal, *Nonprofit and Voluntary Sector Quarterly* (*NVSQ*), originally named the *Journal of Voluntary Action Research* (Smith 2003). *NVSQ* was the first interdisciplinary and international academic journal centrally dedicated to publishing research on voluntaristics, and it has served as a model for most subsequent voluntaristics journals, especially the general ones. In 2014, *NVSQ* had a Thomson-Reuters Journal Impact Factor of 1.49, highest of any core voluntaristics journal, while *Voluntas* had an Impact Factor of 1.24 for 2014.

Smith (2013:638) further noted that there are "[o]ver 100 academic journals that [primarily] publish research on altruistics or its sub-topics." Some 61 of these are designated as "*core* or *primary* altruistics [voluntaristics] journals [that] have relevant terms like *civil society, third sector, social economy, philanthropy*, *social movements*, *nonprofit organizations, participation, engagement*, etc. in their titles or sub-titles." That number of core journals now nears 70 (see www.icsera.org, under Resources). Casting a still wider net for academic journals that publish articles on topics in voluntaristics, Jackson et al. (2014:803) found that 4,053 academic journals listed in the SCOPUS article database had published 21,327 voluntaristics articles using a short list of such topics as keywords in the 12-year period, 2000–2011 (cf. Smith 2016:28). If a longer list of keywords were used with the same database for the past 20 years, it is likely that at least 100,000 articles would be identified, representing at least 50,000 different individual authors (cf., Smith and CHEN 2017).

Finally, much data gathered in the past few years suggest that the interdisciplinary socio-behavioral science field of voluntaristics has been growing exponentially since about the mid-1990s (Bekkers and Dursun 2013; Jackson, Guerrero, and Appe 2014; Shier and Handy 2014; Smith 2013; Smith and Sundblom 2014). Various measures of growth of the voluntaristics field all show rapid, recent, global growth: interdisciplinary associations, sections (subgroups) of academic discipline associations, core/primary academic journals, academic journals publishing relevant articles, dissertations and masters' theses, and research-information centers (see graphs in Smith 2016).

The prior research literature on voluntaristics as another context of the Handbook

The rapidly growing interdisciplinary, global, socio-behavioral science field of voluntaristics is one larger intellectual context of the present Handbook. But how does our Handbook fit into the extant research literature? Why is it needed? Here are the answers: No previous handbook on voluntaristics topics has ever tried to be truly international in its authorship. Until the present Handbook, this gap has been especially obvious regarding a handbook on associations or volunteering, let alone on both. The North American understanding of a handbook is that it is a large, highly multi-authored compendium of chapters with significant theoretical structure as a book that reviews either the state of research or the state of practice in a field or topical area. Only libraries and institutions usually buy encyclopedias, while many individual academics or practitioners or both buy handbooks and/or recommend them to their institutional libraries for purchase.

We must note that the research literature on volunteering, citizen participation, and membership associations, even in some of the sub-fields, is now so voluminous that even individual Handbook chapter teams could not possibly cover all relevant documents even in English, let alone in all major languages. For example, Part IV on factors affecting individual participation could easily have been a long book in itself. Musick and Wilson (2008) wrote just such a book, but a new, updated one is needed every five years or so, given the pace of growth of research and theory in voluntaristics.

The contributors to the Handbook

We contacted by mail or in person relevant experts born in 92 countries, seeking their participation. As editors, we have invited and gained participation from leading experts born in 73 countries to co-author chapters for this Handbook.[1] The first named editor (Smith) contacted well more than 600 experts in order to find the 203 final, separate, individual contributors who are now involved. He received significant help in identifying lead, second, and subsequent co-authors from his two co-editors, from various lead or second authors, plus help from a few outside colleagues (see the Acknowledgments). Many university faculty and other researchers who were contacted pleaded other pressing tasks when declining, even though intellectually interested. Furthermore, several experts who agreed to participate were unable to complete their work in a timely way or wrote text of insufficient quality to be included.

Our general plan was for each chapter to be written by a team of experts from different world regions, so that our research reviews and conclusions would reflect not just high-income, developed, Western European, North American,

and other Anglo-nations (Australia, New Zealand), but also various other world regions with different characteristics. Most research on the topics of our Handbook has studied people in WEIRD nations – Western, Educated, Industrialized, Rich, Democratic nations (cf. Henrich, Heine, and Norenzayan 2010). This Handbook is outstanding in its non-WEIRD nation outreach, both for contributors and for references.

We needed to select lead and second authors for each chapter who were both highly competent in writing English and also experts on the specific topics of their chapters. These criteria led to a preponderance (about 76.6%) of contributors from WEIRD nations as lead and second authors. Among the 105 lead and second authors for the 54 literature review chapters, 25 (23.8%) were from non-WEIRD nations. The fact that Smith was a lead or second author of 18 of these 54 review chapters skews the results somewhat toward the WEIRD nations, given that he was born in the United States.

Even when experts from non-WEIRD nations were not among the pair of lead and second authors, subsequent co-authors from the 73 nations were asked to vet the chapters from the viewpoint of their own birth-nation and/or world region. In addition, lead authors sought written text and reference inputs from all of their co-authors from various world regions and nations.

We do not believe that our attempt at including multi-national and multi-world-region perspectives for each review chapter was fully successful, but it was a start in the right direction. We had no direct funds at all from anyone or from any organization for the work of this Handbook (although many contributors may have been supported financially to some extent by their universities or other institutions). That situation made more thorough approaches to multi-national reviews and generalizations impossible. However, the greatest obstacle was not inadequate world region representation on the author team of each chapter, but rather the scarcity of relevant, high-quality research available for various world regions for each chapter. That was an irremediable problem, no matter how much funding we might have had.

In practice, the lead author was the chapter team leader and sought inputs from all of his or her team of co-authors. The lead author usually wrote a first draft of the chapter, with substantial inputs from the second author. Then the lead author was an editor of all materials from co-authors for the given chapter. In some cases, a third author made especially significant contributions. Otherwise, subsequent co-authors after the first two are listed in alphabetical order by surname. In some cases, the term *with* is used for one or more co-authors after the lead author, to indicate very minor written inputs to the final chapter text. Because of the costs involved, only lead and second authors will automatically receive free physical copies of the Handbook from the publisher.

Some initially planned chapters had to be dropped when there was insufficient research literature to merit a chapter for the Handbook. We are grateful

to those volunteer professionals, listed below, for giving those chapters a try, even though the chapters did not come to fruition: Nancy Macduff (Episodic Volunteers); Colin Rochester and Norman Dolch (Volunteers in Small Paid-Staff Nonprofit Agencies); Keith Seel (Board-Policy Volunteers); Stephen Block, Ruth Simsa, and Vladimir Yakimets (Dysfunctions in Associations); and Martii Muukonen (Incentives and Ideology).

In some instances, planned chapters were attempted but were ultimately dropped due to insufficient world region variety in inputs, insufficient adherence to editorial guidelines, word count limitations, or other substantive content problems. We are grateful to their initial draft authors: Patrick Rooney, Michael Kramarek, Lin TAO, and Andri Soteri-Proctor (Special Methodology); Robert A. Stebbins, Steinunn Hrafnsdottir, and Geoff Nichols (Social Leisure and Recreation); Daniela Bosioc, Lars-Skov Henriksen, Amer Afaq, and Zhibin ZHANG (Infrastructure Organizations); David H. Smith, Uzi Sasson, and Jurgen Grotz (Impact of Associations on Human Societies); and Antonin Wagner (Afterword).

Analytical structure and standard chapter format and editing

Unlike most edited books and many handbooks, this volume has a rigorous theoretical structure and plan. Each chapter was written to fulfill that larger analytical plan, which was created in early 2011 and then revised many times. The structure of the Handbook has been mainly the responsibility and work of the first editor, Smith. He also sought and received some inputs from his co-editors, Stebbins and Grotz, as well as from various lead authors and a few outside colleagues (see Acknowledgments). However, Smith accepts full responsibility for the final set of chapters and chapter topics included, the names and content of each part of the book, the names of all chapters, the ordering of parts of the book, the ordering of chapters within parts, and the standard format of most chapters.

When suitable contributors could not be found, when they were invited but declined to help, or when initially selected contributors could not do the necessary work to a high-quality standard, especially lead or second authors, the first editor, Smith, took on the additional reviewing and writing burden specifically in order to maintain and complete the overall theoretical structure of the Handbook that he had planned. This initially unexpected/unplanned, replacement chapter, or additional chapter section, reviewing, writing, and editing that Smith needed to do substantially lengthened the overall writing/editing process by perhaps three years. All this was, however, quite necessary to achieve the topical coverage we now have, and our variety of national and world region coverage, incomplete as it still is.

Originally, Smith was slated to be lead author on four chapters and to contribute to no others. Then, as also later, Smith was expected to recruit about 85% of our contributors from the 73 birth-countries. These inputs from experts born in so many different nations on all continents likely make our Handbook unique among all handbooks ever published on any topic. Smith was a substantive/content contributor to 41 of the 58 chapters (including the Preface, Introduction, and Appendix). Smith's final contribution includes 14 chapters (or other chapter-like documents) as lead author, 4 as second author, 6 as third author, and 17 as a more subsequent co-author, editing them all one or more times. This set of chapter co-authorships results in Smith being substantively involved, sometimes in only minor ways (e.g., 500 words), in the writing of about 71% of all the chapters.

This depth and breadth of involvement by Smith in the substantive writing process deserves a further word of explanation: Since Smith ended up so deeply and pervasively involved, why did he not simply plan to write the whole book himself, given his 50-year+ breadth/depth of knowledge about the topics included? The answers are simple.

Nearly 72 in 2011 (thus 77 now), Smith was uncertain he had the additional 10–15 years of life that would have been needed to write the book alone. More importantly, he wanted the Handbook to demonstrate the global nature of voluntaristics by including contributors from many countries and regions throughout the world. Further, he wanted to involve many known colleagues who were world-class experts on various specialized facets and sub-topics of the Handbook that were not Smith's specialties.

Within the vast majority of chapters, the content follows a standard analytical format: introduction, definitions, historical background, key issues, usable knowledge, future trends and needed research, cross-references, references, and sometimes endnotes. We borrowed and adapted this format from the *International Encyclopedia of Civil Society*, edited by Anheier, Toepler, and List (published by Springer in 2010). However, as noted above, the Usable Knowledge section is an invention by Smith for our Handbook.

As suggested earlier, the research literature on the VNPS topics of the Handbook and of nearly any chapter in it has multiplied beyond the reach of any individual to keep up with. For example, on the Google Scholar database (accessed April 21, 2015) of journal articles and books, the keyword *volunteer* generates 1,520,000 hits or documents, with many old documents and documents not relevant to the Handbook; the keywords *voluntary association* generate similarly 1,880,000 hits; and the keywords *civic participation* generate 779,000 hits.

Because of this information overload, we started our contributor outreach process by trying to recruit a top expert in each topical area – a wise approach that guided our selection of lead and second authors for chapters. Many of

our chapter leads thus are world-class experts on their topics, but we have not always been so fortunate. Such top experts were often too busy with their own projects to be willing to join our Handbook project. As our next choice, we have sought bright younger scholars, who were more eager to be involved.

In terms of the substantive chapter content, each lead author has had to be very selective. Our initial editorial instructions to lead authors were to produce a chapter with 5,000 words of text and 1,000 words of references. These limits were later expanded, in order to include the intellectual richness of the research literature for certain key chapters and their detailed text. Thus, leads and other contributors have been in part affected by personal or professional preferences in their topical areas for concepts, variables, hypotheses/generalizations, theories, and documents/references to read, discuss, and cite. For these reasons, no chapter in the Handbook pretends to be exhaustive or comprehensive with its discussion or citation of documents and references. Thus, expert readers may expect to find that some of their own favorite documents, including one's own publications, have neither been cited nor discussed. However, such topical experts would find various ones of their favorite documents discussed, as well as others at least cited or listed in the chapter references without citations in the chapter text.

A full set of references for each chapter is available free of charge on the website of the sponsoring nonprofit research organization, the International Council of Voluntarism, Civil Society, and Social Economy Researcher Associations under Resources (ICSERA; www.icsera.org). There is no consolidated, master bibliography for the Handbook, because single chapter bibliographies are more coherent substantively and better for interested readers to browse.

In sum, one of our two top priorities and goals in writing and editing this Handbook has been to include a very broad, multi-national range of scholars in order to provide a genuinely international perspective on the topics of each of the 54 review chapters. In addition, we have wanted that broad range of international scholars as contributors to demonstrate conclusively the global nature of our fast-growing, interdisciplinary field and emergent *inter-discipline* of voluntaristics (Smith 2016). We believe we have accomplished both of these goals quite well, but readers and reviewers may judge for themselves.

Our other, but not lesser, top priority and goal has been to have high-quality and interesting text for each chapter that follows our theoretical chapter format, with large sets of relevant references for each chapter. We believe that we have also accomplished that major goal, but the reader will have to be the judge. At the very least, we argue that the substance of this Handbook will be useful to many voluntaristics scholars, educators, and students for many years to come. We also argue that this volume fills a previous gap in the voluntaristics handbook research literature.

Unlike most other handbooks, this Handbook has a kind of latent, intellectual advocacy purpose. As Smith indicates in the Introduction (and at length previously in Smith 2000:chapter 10), many major scholars in the field of voluntaristics and their followers have for decades seriously distorted the overall theoretical perspective of the nature of the VNPS, seeing it mainly or solely as a set of NPOs as paid-staff based nonprofit agencies (Smith 2015c), mainly or totally ignoring voluntary associations (Smith 2015b). The Introduction, and indeed the entire Handbook, is an attempt by Smith once again to broaden their *flat-earth maps* (Smith 1997). We strongly advocate adding much more emphasis on associations, and also on volunteering and civic participation, to expand the *round-earth paradigm* of the VNPS that Smith (2000:chapter 10) has been suggesting since he founded the organized field of voluntaristics in 1971 (Smith 2016). Many other distinguished voluntaristics scholars share this broader, round-earth perspective and paradigm (e.g., Cnaan and Park 2016; Rochester 2013; Van Til 2015).

Finally, for all the work done by the editors of this Handbook, in the end the "soil and earth" (quoting Jurgen Grotz, our Managing Editor) of this book are its 203 contributors – the *sine qua non* of its existence, without whom the Handbook would not exist. *We three Editors are thus immensely grateful for the estimated 30+ person-years of volunteer professional effort/work they have collectively contributed to this massive, interdisciplinary, multi-national, collaborative endeavor over the past five years*, continuing still over the next few months or so of production of the volume (e.g., answering copy editor queries, proofing typeset chapters). We firmly believe that entire global field of voluntaristics will be in their debt for many years to come.

Note

1. We have had to set some rules for ourselves in writing contributors' names in order to standardize the process and make the form of contributors' names be used consistently across individuals:

    (1) We use first and last names (surnames, family names), but omit middle names, using the middle initial when known.
    (2) We usually hyphenate Hispanic surnames (e.g., Batista-Silva), for practical reasons of alphabetization, even though hyphens are not used in Hispanic cultures.
    (3) We consistently hyphenate British double surnames (e.g., Ellis-Paine), even though this practice is not followed in Britain.
    (4) We hyphenate double surnames used to indicate the surnames of both spouses (e.g., More-Hollerweger), as some modern people do.
    (5) We use diacritical markings to the extent that we know them (e.g., René), at least in the lists of chapter authors and the References.
    (6) We place Chinese surnames in all capital letters, because there have been many confusions/errors about surnames in the course of our work regarding which of

two Chinese names is the surname. Naturally, the Chinese do not do this. Furthermore, we place the surname second, contrary to the usual Chinese practice of putting the surname first. When a Chinese surname is preceded by a Western first name, we use upper/lower case for the surname, since confusion is less likely.

Editors

David H. Smith, PhD

Born in 1939, David is Research and Emeritus Professor of Sociology, Boston College, Chestnut Hill, USA; Honorary Visiting Professor, Centre for Studies of Civil Society and the Nonprofit Sector, National Research University Higher School of Economics, Moscow, Russia; Honorary Visiting Professor in Sociology, School of Health Sciences, University of East Anglia, Norwich, UK; Honorary Visiting Professor in the School of Arts and Sciences, City University London, London, UK; and Visiting Scholar, Institute for Philanthropy, Tsinghua University, Beijing, China.

David earned his PhD in Sociology from Harvard University (1965). He founded the global Association for Research on Nonprofit Organizations and Voluntary Action (ARNOVA; www.arnova.org) and *Nonprofit and Voluntary Sector Quarterly* (*NVSQ*) journal (both in 1971). In 2010, he became Founding President/CEO of ICSERA (International Council of Voluntarism, Civil Society, and Social Economy Researcher Associations; www.icsera.org), a global, nonprofit sector, infrastructure institute, and association of associations. Recently, he founded the *Voluntaristics Review*, a journal of lengthy survey/review articles (2016). Both the journal and this Handbook are sponsored by ICSERA.

The author of *Grassroots Associations* (2000), first co-author of *A Dictionary of Nonprofit Terms and Concepts* (2006; 2nd edition 2017), and author/editor of 18 other books, David recently invented S-Theory (Synanthrometrics) – an integrative, interdisciplinary, and quantitative theory of individual behavior, especially pro-social behavior like volunteering, drawing on recent research in many socio-behavioral sciences, biology/neuroscience, and interdisciplinary fields. S-Theory may be termed *The Theory of Everyone* because it aspires to explain any behavior of anyone, even though it is applied mainly to volunteering as one type of pro-social behavior. Survey research in Russia has strongly confirmed this theory. His book on S-Theory is going to be published in 2017: *S-Theory (Synanthrometrics) as "The Theory of Everyone": A Proposed New Standard Human Science Model of Behavior, Especially Pro-social Behavior.*

David was co-recipient of the 1975 national Hadley Cantril Memorial Award (for the outstanding US book contribution in the behavioral and social sciences) and later was co-recipient of the ARNOVA (Lifetime Achievement) Award for Distinguished Contribution to Nonprofit and Voluntary Action Research in 1993, the first year it was awarded. He was honored with a bio entry as one

of 139 outstanding nonprofit sector leaders, theorists, and researchers from all of world history and all nations in the *International Encyclopedia of Civil Society* (2010). His bio has been in the annual Marquis' *Who's Who in the World* since 2001.

Robert A. Stebbins, PhD, FRSC

Robert A. Stebbins, born in the United States in 1938, received his PhD in Sociology in 1964 from the University of Minnesota, USA. He has taught in the departments of sociology at Presbyterian College (1964–1965), Memorial University of Newfoundland (1965–1973), University of Texas at Arlington (1973–1976), and University of Calgary (1976–1999). In 2000 he was appointed Professor Emeritus and Faculty Professor in the Faculty of Social Sciences at the University of Calgary, Canada. Dr Stebbins served as President of the Social Science Federation of Canada in 1991–1992, after having served as President of the Canadian Sociology and Anthropology Association in 1988–1989. He was Vice-President of the Canadian Association for Leisure Studies from 1993 to 1996.

Stebbins' principal contribution to the fields of leisure studies and voluntaristics is his *serious leisure perspective.* It revolves around a typology of leisure, based on the ways people experience and are motivated to pursue particular free-time activities. From qualitative/exploratory research on 21 different amateur, hobbyist, and volunteer activities, he inductively generated over a period of 42 years the aforementioned perspective. Today, its three forms – serious, casual, and project-based leisure – along with its many types and subtypes, constitute a main orientation for research and analysis in the interdisciplinary field of leisure studies. In recognition of this contribution, Stebbins was elected, in 1997, Fellow of the Academy of Leisure Sciences and, in 1999, Fellow of the Royal Society of Canada.

His 50 books published or in press include *Volunteering as Leisure/Leisure as Volunteering: An International Perspective* (2004), *Between Work and Leisure: The Common Ground of Two Separate Worlds* (2004/2014), *Serious Leisure: A Perspective for Our Time* (2007/2015), *A Dictionary of Nonprofit Terms and Concepts* (2006; with David Horton Smith and Michael Dover), and *Leisure and the Motive to Volunteer* (Palgrave, 2015).

Jurgen Grotz, PhD

Jurgen Grotz, born in Germany in 1963, received his MA in Sinology (1992) from Phillips University, Marburg, Germany, for work on disability in China, and his PhD in Sinology in 1996 from the University of London, UK, for his work on Chinese writing systems for visually impaired persons. He is a visiting research fellow at the University of East Anglia, UK, and a member of the Association for Research in the Voluntary and Community Sector (ARVAC), UK, in

which he served first as Secretary and Editor and then as Vice Chair and Chair between 2007 and 2013.

His 35 years of active engagement in the voluntary and community sector and 25 years of applied policy and practice research in Germany, China, and the United Kingdom have offered him insights into a great variety of subjects, such as volunteering in public services with particular reference to the relationship between the state and the voluntary sector when reviewing the effectiveness of the English Compact, and the negative sides of volunteering, for example, during the Volunteer Rights Enquiry of Volunteering England.

He has worked for the Royal National Institute for the Blind, the Big Lottery Fund, Volunteering England, and is currently Research Manager at the Institute for Volunteering Research, National Council for Voluntary Organisations, UK, where he is responsible for research into all aspects of volunteering from micro-volunteering to employer-supported volunteering and local volunteering infrastructure.

He has written numerous reports on applied research, has contributed a background paper to the project on "The State of the World's Volunteerism Report 2011" by the UN Volunteers (2011), and regularly contributes to the academic debate at conferences or in print. His recent publication is (with Mary Corcoran) "Deconstructing the Panacea of Volunteering in Criminal Justice" in *The Voluntary Sector and Criminal Justice* (edited by A. Hucklesby and M. Corcoran; Palgrave). He is also a regular reviewer for *Voluntary Sector Review*.

Bonfas Owinga (Kenya) is a doctoral candidate at City University London, London, UK.

Tye-kyu Park (South Korea) is Professor in the Department of Economics at Yonsei University, Seoul, South Korea.

Yevgenya J. Paturyan (Armenia) is Senior Lecturer in the Department of Political Science and International Affairs, American University of Armenia, Yerevan, Armenia.

Helene Perold (South Africa) is Director of Helene Perold and Associates, Johannesburg, South Africa.

Anne B. Pessi (Finland) is Professor at the Faculty of Theology, University of Helsinki, Helsinki, Finland.

Victor Pestoff (USA) is Professor Emeritus at Ersta-Sköndal University College, Stockholm, Sweden.

Rumen G. Petrov (Bulgaria) is Senior Lecturer in the Department of Social Work, New Bulgarian University, Sofia, Bulgaria.

Alexei Pikulik (Belarus) is IMARES Professor at the European University at St Petersburg, St Petersburg, Russia.

Cristian Pliscoff (Chile) is Associate Professor at the Institute of Public Affairs, University of Chile, Santiago, Chile.

Tereza Pospíšilová (Czech Republic) is Assistant Professor in the Faculty of Humanities, Charles University, Prague, The Czech Republic.

Lionel Prouteau (France) is Professor Emeritus in the Faculté de Droit et des Sciences Politiques, University of Nantes, Nantes, France.

Mikulas Pstross (Czech Republic) is a doctoral student at the School of Community Resources & Development, Arizona State University, Tempe, AZ, USA.

Jack Quarter (Canada) is Professor in the Department of Leadership, Higher and Adult Education, Ontario Institute for Studies in Education (OISE), University of Toronto, Toronto, Canada.

Paloma Raggo (Canada) is Assistant Professor at the School of Public Policy and Administration, Carleton University, Ottawa, Canada.

Monika Rajcsanyi-Molnar (Hungary) is Associate Professor and Vice-Rector at the College of Dunaujvaros, Dunaujvaros, Hungary.

SarahJane Rehnborg (USA) is Associate Director of the RGK Center for Philanthropy, University of Texas, Austin, TX, USA.

Heather Rimes (USA) is Graduate Research Assistant at the School of Public and International Affairs, University of Georgia, Athens, GA, USA.

John P. Robinson (USA) is Professor Emeritus in the Department of Sociology, University of Maryland, College Park, MD, USA.

Colin Rochester (UK) is a partner in Practical Wisdom R2Z Research Consultants and a Visiting Senior Fellow at London School of Economics and Political Science, London, UK.

Krishna Roka (Nepal) is Visiting Assistant Professor in the Department of Sociology and Social Work, University of Wisconsin-Stevens Point, Stevens Point, WI, USA.

Joyce Rothschild (USA) is Professor at the School of Public and International Affairs, Virginia Tech, Blacksburg, VA, USA.

Savaş Z. Şahin (Turkey) is Associate Professor in the Department of Political Science and Public Administration, Atilim University, Ankara, Turkey.

Marina Saitgalina (Russia) is Assistant Professor in the Department of Political Science, Oakland University, Rochester, MI, USA.

Boguslawa Sardinha (Portugal) is Director of the Departamento de Economia e Gestão in the Instituto Politécnico de Setúbal, Setubal, Portugal.

Uzi Sasson (Israel) is Chairperson of the Social Involvement Unit, Beit-Berl College, Kfar Saba, Israel.

Aida Savicka (Lithuania) is Researcher at the Lithuanian Culture Research Institute, Vilnius, Lithuania.

Hans P. Schmitz (Germany) is Associate Professor in the Department of Leadership Studies, University of San Diego, San Diego, CA, USA.

Per Selle (Norway) is Professor in the Department of Comparative Politics, University of Bergen, Bergen, Norway.

Itamar Y. Shachar (Israel) is a doctoral student at Ghent University, Ghent, Belgium.

Aminata Sillah (Liberia) is Teaching Fellow in the Department of Public Administration, University of North Texas, Denton, TX, USA.

Kalinga T. Silva (Sri Lanka) is Senior Professor in the Department of Sociology, University of Peradeniya, Peradeniya, Sri Lanka.

Karla W. Simon (USA) is Professor of Law at Columbus School of Law, Catholic University of America, Washington, DC, USA.

David H. Smith (USA) is Research and Emeritus Professor in the Department of Sociology, Boston College, Chestnut Hill, MA, USA, and Honorary Visiting Professor at the National Research University Higher School of Economics, Moscow, Russia.

Joonmo Son (South Korea) is Researcher in the Department of Sociology, National University of Singapore, Singapore.

Andri Soteri-Proctor (UK) is Copywriter and Editor at Dr Proctor's Research and Writing Surgery, Manchester, UK.

Roger Spear (UK) is Professor in the Department of Public Leadership and Social Enterprise, The Open University, Milton Keynes, UK.

Robert A. Stebbins (USA) is Professor Emeritus in the Department of Sociology, University of Calgary, Calgary, Canada.

Benny Subianto (Indonesia) is a Program Consultant at Harvard University, Kennedy School of Government, Indonesia Program, Jakarta, Indonesia.

Dan Sundblom (Finland) is a doctoral student at Åbo Akademi University, Turku, Finland.

Lars Svedberg (Sweden) is Professor in the Department of Social Sciences at Ersta Sköndal University College, Stockholm, Sweden.

David Swindell (USA) is Associate Professor and director of the Center for Urban Innovation, Arizona State University, Tempe, AZ, USA.

Kuang-Ting TAI (Taiwan) is a doctoral student at the School of Public Affairs, Arizona State University, Tempe, AZ, USA.

Lars Torpe (Denmark) is Associate Professor in the Department of Political Science, Aalborg University, Aalborg, Denmark.

Anastasiya S. Tumanova (Russia) is Professor in the Faculty of Law, in the National Research University Higher School of Economics, Moscow, Russia.

Agnes Uhereczky (Hungary) is Director of Confederation of Family Organisations in the European Union (COFACE), Brussels, Belgium.

Jan W. van Deth (The Netherlands) is Professor in the Department of Political Science, University of Mannheim, Mannheim, Germany.

Stijn Van Puyvelde (Belgium) is a postdoctoral research associate in the Department of Business Administration, Public & Nonprofit Management at the University of Mannheim, Mannheim, Germany.

Denise R. Vienne (USA) is Adjunct Professor at the School of Public Administration, Florida Atlantic University, Boca Raton, FL, USA.

Marcelo Vieta (Argentina) is Assistant Professor in the Department of Leadership, Higher, and Adult Education, OISE, University of Toronto, Toronto, Canada.

Mirta Vuotto (Argentina) is Professor in the Faculty of Economic Sciences, University of Buenos Aires, Buenos Aires, Argentina.

Lili Wang (China) is Associate Professor at the School of Community Resources and Development, Arizona State University, Tempe, AZ, USA.

Stephen L. Wearing (Australia) is Associate Professor in the Management Discipline Group, University of Technology Sydney, Sydney, Australia.

Lore Wellens (Belgium) is Consultant at Omni Care Consult, Antwerp, Belgium.

Howard J. Wiarda (USA), recently deceased, was Dean Rusk Professor of International Relations at the University of Georgia, Athens, GA, USA.

Dwight Wilson (USA) is Assistant Professor in the Department of Political Science and International Affairs, University of North Georgia, Dahlonega, GA, USA.

John Wilson (UK) is Professor Emeritus in the Department of Sociology, Duke University, Chapel Hill, NC, USA.

Michael Woolcock (Australia) is Lead Social Development Specialist at the World Bank and Lecturer in Public Policy at Harvard University, Cambridge, MA, USA.

Fengshi WU (China) is Associate Professor at S. Rajaratnam School of International Studies, Nanyang Technological University, Singapore.

Lei XIE (Hong Kong, China) is Lecturer in the Department of Politics, University of Exeter, Cornwall, UK.

Pengjie YU (China) is Associate Research Fellow at Dongguan Academy of Social Sciences, Guangzhou, China.

Yingying ZENG (China) is a doctoral student at the School of Public Policy and Administration, University of Delaware, Newark, DE, USA.

Ting ZHAO (China) is a post-doctoral research fellow at the School of Political Science and Public Administration, East China University of Political Science and Law, Shanghai, China.

Annette Zimmer (Germany) is Professor in the Department of European Social Policy and Comparative Politics, University of Münster, Münster, Germany.

Siniša Zrinščak (Croatia) is Professor in the Department of Sociology, University of Zagreb, Zagreb, Croatia.

Introduction

David H. Smith (USA) with Robert A. Stebbins (USA)

Formal volunteering takes place in an overwhelming variety of membership associations (MAs) worldwide, as well as in volunteer service programs (VSPs). MAs focus on every topical area, idea, belief, issue, and problem in contemporary nations having non-totalitarian political regimes. In writing/compiling this Handbook, the editors are acting on their belief that MAs are the central, vital, and driving force of the global Voluntary Nonprofit Sector (VNPS) – its "soul" and the roots of its values, passions, and ethics (Eberly and Streeter 2002; Rothschild and Milofsky 2006; Smith 2017b). While the review chapters written for this volume are intended to be objective, scientific treatises, we Editors are motivated significantly by our values and passions for MAs and their volunteers, acting in their leisure time, and what they do for the world. Not all of MA impacts are beneficial for people and societies in general (see Handbook Chapters 52 and 54), but *most* impacts are beneficial in the longer term in our view (see Handbook Chapters 52 and 53; Smith 2017b).

Four themes are covered in this chapter: (1) The interdisciplinary field of voluntaristics (Smith 2013, 2016a) is one intellectual context of the Handbook. (2) There is a huge global scope and variety of MAs. (3) Most voluntaristics scholars tend to ignore MAs. (4) Volunteering can be viewed as unpaid productive work, but more nuanced, value-driven, and humanistic views better represent volunteering as satisfying leisure in people's lives.

The Palgrave Handbook of Volunteering, Civic Participation, and Nonprofit Associations reviews research on volunteering, civic participation, and voluntary, nonprofit MAs, as its title indicates, and does so in the theoretical context of *voluntaristics* research (Smith 2013, 2016a). Smith (2013) has suggested using the term *voluntaristics* (or *altruistics*) to refer to the global, interdisciplinary field of research on all kinds of phenomena related or referring to the voluntary, nonprofit sector (VNPS). *Voluntaristics* is a label that is analogous to the term *linguistics*, referring to the scholarly study of all human languages. Smith now prefers the term *voluntaristics* over the other new term he has suggested,

altruistics (Smith 2013, 2016a), and over all other terms, including the term *philanthropy*, which is too narrow, conventional, and elitist.

A. Voluntaristics as an interdisciplinary field of research and emergent interdiscipline

[Note: The following Sub-Section #1 quotes from Smith (2016a), with permission.]

> Voluntaristics research includes the study of both collective and individual phenomena of the VNPS and harks back to the early definitions of *voluntary action research* by Smith (1972a; see also Smith, Reddy, and Baldwin 1972a). Rochester (2013) has recently called for a renewal of the concept of voluntary action, in order to have a more ample and balanced view of the VNPS and its phenomena.

> The following is a brief overview of the subject matter or phenomena of interest in voluntaristics research:

> (a) Voluntaristics studies the VNPS itself as a whole in various nations, examining it over time and through various historical transformations, sometimes qualifying as civil society. Voluntaristics research gives attention to VNPS relations with other sectors, such as the household/family sector, the business/for-profit sector, and the government/public sector (Commission on Private Philanthropy and Public Needs 1975; Cornuelle 1965; Ehrenberg 1999; Florini 2000; Frumkin and Imber 2004; Gunn 2004; Levitt 1973; Lewis 1999; O'Neill 2002; Rochester 2013; Salamon 1999, 2003; Smith, Baldwin, and White 1988; Smith, Reddy, and Baldwin 1972a; Van Til 2015 [see also Handbook Chapters 2 and 3]).

> (b) Voluntaristics studies the various main types of nonprofit organizations (NPOs), as highly complex formal groups, in the VNPS. But voluntaristics also studies looser collectivities, such as social networks, informal groups, and semi-formal groups, which may collectively be termed *informal nonprofit groups* (NPGs) in the VNPS. Smith (2015a, 2015b) argues that the two main types of formal groups in the VNPS are voluntary associations or MAs and nonprofit agencies (NPAs) or voluntary agencies (Volags).

> MAs by definition have a membership that ultimately controls the group, and MAs usually serve their members, not non-members or the general welfare and public interest (Smith 2015a). Local, all-volunteer MAs, called grassroots associations (GAs), are the most common type of MAs in every society ever studied carefully, from ten millennia ago to the present (Smith 1997b, 2000, 2014, 2015a). In MAs, the ultimate power is bottom-up, residing with the members who elect top leaders.

By contrast, NPAs usually have no members, but operate mainly with paid staff as employees, and often have a VSP, as a department that supplies volunteers to help achieve the NPA's goals (Smith 2015b [see also Handbook Chapter 15]). NPAs mainly serve non-member recipients and often the general welfare and public interest in their society. However, the power is top-down in NPAs (not bottom-up, as in MAs). The board of directors or trustees makes all major policy decisions and with VSP volunteers having essentially no power (Smith 2015b).

The often-used/cited *structural-operational definition* of the VNPS put forth by Salamon (1992:6), and identically by Salamon and Anheier (1992:125), is far too narrow, focusing only on highly structured and formally registered and/or incorporated NPOs. This definition omits the vast majority of NPGs in the world, which are usually small, informal, all-volunteer, unincorporated, unregistered GAs (Smith 2014). The structural-operational definition also ignores all of individual volunteering and citizen participation as voluntary action (Cnaan and Park 2016; Smith 1975, 1981, 1991, 1993a, 1997a, 1997b, 1997c, 2000, 2004, 2010a, 2014; Smith, Reddy, and Baldwin 1972a; Van Til 2015 [see also Handbook Chapters 9 and 31]), which is simply unacceptable to anyone who knows and appreciates the VNPS.

Voluntaristics studies the many and various types of volunteering and citizen participation *by individual persons*, whether done as individuals *not* acting as members of any organized group or context (termed *informal volunteering*; see Handbook Chapter 9), or done as members of some group or organization (termed *formal volunteering*; Cnaan and Park 2016; Rochester 2013; Smith 1975, 1981, 1991, 1993a, 1997a, 1997b, 1997c, 2000, 2004, 2010a, 2014; Smith, Reddy, and Baldwin 1972a; see also Handbook Chapters 3 and 31). Cnaan and Park (2016) make by far the most comprehensive inventory of types of citizen participation ever published, including formal volunteering, association participation, charitable giving, pro-environmental behaviors, various political and social behaviors, and supporting or helping others (informal volunteering).

Their definition of *civic participation* is as follows:

> We define civic participation/engagement as any activity of any individual, alone or with others, that is performed outside the boundaries of the family and household that directly or indirectly attempts to promote the quality of life of others, and that may make the community or society a better place to live in.

Smith's (2016b) currently preferred definition of *volunteering* is similar in many ways to Cnaan and Park's definition of *citizen participation,* but takes a smaller scale view of the intended positive outcomes. Smith defines the relevant term as follows:

> Volunteering is defined as any activity of any individual, alone or with others, as a solitary act or as a member of some informal group or formal organization, that is performed without compulsion/coercion and mainly without direct remuneration/payment that directly or indirectly attempts to improve the satisfactions and quality of life of one or more others outside the boundaries of the immediate family and household.
>
> (p. 1)

B. Definition, scope, and variety of membership associations and associational volunteers

MAs exist in an overwhelming variety of forms, structures, sizes, and geographic scopes.

In the Handbook Appendix, *MAs*, or simply *associations*, are defined as follows:

> *association (voluntary association, membership association, nonprofit association)*
>
> A relatively formally structured *nonprofit group that depends mainly on *volunteer *members for *participation and activity and that usually seeks *member benefits, even if it may also seek some *public benefits (cf. Smith 2015a). Associations nearly always have some degree of formal structure, but most of them are informal groups, not organizations (see *formal group; Smith 1967). An association is frequently referred to as a "voluntary association," but some scholars recently have termed them "membership associations" or "nonprofit associations," as in this Handbook's title. Associations are the most common type of nonprofit organization in the United States (Smith 2000:41–42) and in all other nations or earlier types of societies ever studied. Their total numbers are never reflected accurately in government statistics and registries of nonprofit organizations. Hence, many scholars unknowingly make false statements about "all nonprofit organizations" or "the nonprofit sector" based on samples from such incomplete government NPO registries. Many other scholars simply ignore associations because of their myopic focus only on nonprofit agencies with paid staff.

By definition, MAs use the "associational form of organization," essentially being groups defined by having a membership that controls the group leadership, with *bottom-up* power, rather than the *top-down* power present in nonprofit agencies (Smith 2015a, 2015b), as in business corporations and government agencies. In the Handbook Appendix, this special, democratic form of organization is defined as follows:

associational form of organization

Manner of operating a *group (Smith 1967) that usually involves having *official members who are mostly *volunteers, some elected *formal non-profit leaders, often a *board of directors with *policy control, financial support mainly from annual *dues or donations (but may also include *fees and occasionally *grants), often one or more *committees as part of the *leadership, and regular face-to-face meetings attended by active *official members and informal participants. Form used in *associations, *transnational associations, *national associations, *state associations, and *grassroots associations (Smith 2000).

Among the various types of *formal volunteers* that exist, active as part of some sponsoring group or organization, by far the most important and frequent globally are *association volunteers*, *not* volunteers in Volunteer Service Programs (VSPs) as the volunteer departments of many paid-staff-based, nonprofit agencies (Smith 2015b). This Handbook mainly focuses on association volunteers, although some other types of volunteers are also treated briefly: informal volunteers in Handbook Chapter 9; stipended volunteers in Handbook Chapters 10 and 11; tourist volunteers in Handbook Chapter 12; online/virtual volunteers in Handbook Chapter 13; spontaneous/crisis volunteers in Handbook Chapter 14; and volunteers in VSPs in Handbook Chapters 15–17.

In the Handbook Appendix, association volunteers, often labeled as *active members* of associations (vs. inactive/passive/nominal members), are defined as follows:

active member (of an association)

A member of a *nonprofit group who regularly provides *services that help meet the *operative goals of that group (Smith 2000:7), also termed technically an "analytic member." Any active member of an association is an associational volunteer. Contrasts with inactive members (passive members, nominal members, "paper" members) who do nothing except pay dues/fees to the group. Also termed an *association volunteer* or *associational volunteer*. Often overlooked by scholars and lay people who only consider volunteer service programs, ignoring associations as the principal global context of *formal volunteering for the past 10,000 years (Smith 1997).

As suggested in the title of our Handbook, other terms like *civic participation* or *civic engagement* (basically synonyms) also capture the kind of usually (but not always) pro-social behavior and activities that are a prime focus of this volume. In the Handbook Appendix, *civic engagement* is defined as follows:

civic engagement (civic participation, civic involvement, community involvement)

1. Act or result of performing local *voluntary action based on a felt civic duty, responsibility, or obligation (see *civic obligation/responsibility) fulfilled by working toward amelioration of a *community concern. Such terms as *citizen engagement* and *civil engagement* are, at bottom, synonymous with *civic engagement*, as variations of the first term. Other synonyms alter the second term, using *involvement* or *participation*.

2. Recently, the term *civic engagement* (or synonyms as above) has been used more broadly by some to include all forms of volunteering, formal and informal, and other participation (as social involvement or social participation), whether focused on a community concern or not, political or not (e.g., Cnaan and Park 2016).

Based on the current global population and the estimated global prevalence of seven associations per thousand population, Smith (2014) estimated that there are about 56 million nonprofit groups (NPGs) in total worldwide at present, including both MAs and NPAs. Of these, about 49 million (roughly 88%) are GAs. An estimated one billion people now are members of one or more MAs, and even more will become members sometime during their lifetimes. The estimated income of all NPGs in the world was at least USD 4.2 trillion in 2011, which is equivalent to the fourth rank among nations in GDP. The cumulative monetary value of time contributed by active MA members as volunteers was at least USD 500 billion in 2005, according to one research-based estimate (see Handbook Chapter 44). MAs also have cumulative global incomes and assets in the hundreds of billions of US dollars. Many associations strongly support the economic systems and economic development in their own nations and globally.

There are MAs, especially GAs, focused on every topical area, idea, belief, issue, and problem in contemporary nations having non-totalitarian political regimes. Beginning mainly 10,000 years ago as social clubs, MAs now tackle every type of problem and potential benefit for members or for the larger society, often having significant societal and historical impacts (Smith 2017b). Sometimes these impacts are unintentionally negative or harmful to members or non-members or both, but MAs can also be *intentionally* harmful (Smith 2017a). The members of MAs mainly participate during their leisure time, as *serious leisure,* and sometimes as *casual leisure* (Stebbins 1996, 2007). But MAs can, and often do, serve economic and occupational needs and goals, as well as conventional political, social movement (activist), religious, health, education, social welfare, self-help, economic development, and indulgent leisure needs and goals.

Most MAs in any nation are conventional and law-abiding, but some break the law on a long-term basis as deviant voluntary associations (DVAs; Smith

2017a). However, social movement associations in particular, though initially seen as DVAs, often turn out to be the *positive* "dark energy" of the VNPS (op. cit.). Such DVAs frequently foster positive social innovation and socio-cultural change in their own nations and sometimes in the world as a whole (e.g., Smith 2017a). *Governments and businesses mainly run and control the world, but certain DVAs change the world permanently*, including changing government regime structures and entire national business and economic systems. Smith (2017b) documents extensively such impacts of MAs in his forthcoming review article. Although "values, passions, and ethics" are central in the VNPS, as Rothschild and Milofsky (2006) have argued, NPAs almost never have such powerful, far-reaching, and historical impacts as do certain MAs.

Voluntary, nonprofit MAs constitute a persisting and persistent *third force* to be reckoned with in the world, and in every contemporary nation, beyond governments and the business sector. MAs are "the soul of civil society," as Eberly and Streeter (2002) have pointed out usefully. Nonprofit agencies and foundations are simply not. This crucial, innovative force of MAs can even be active in totalitarian dictatorships, where some independent MAs usually exist underground in secrecy. Many MAs as Deviant Voluntary Associations (DVAs) have overthrown such totalitarian or authoritarian regimes of emperors, kings, juntas, and other dictators (cf. Smith 2017a, 2017b).

MAs as a whole cannot sensibly be ignored as irrelevant, weak, or unimportant, however small specific MAs may be, however many MAs are in existence at a given time in a given nation, and however much MA existence and activities are apparently controlled or suppressed by the government. MAs are a key form of human group that has unlimited potential, for both good and bad societal outcomes and impacts, as history has clearly demonstrated (Smith 2017a, 2017b).

C. Membership associations are neglected by many voluntaristics scholars

Paid-staff NPAs serving non-members have a much shorter history than MAs, dating back only 2,500 years or so (Smith 2015b:261–262), rather than at least 10,000 years, and perhaps 25,000 years in a few cases (Anderson 1971). Smith (2015b) writes the following about early NPAs [quoted here with permission of the author]:

The first NPA in history was probably the museum of Ennigaldi-Nanna, founded *c*.530 BC by a Babylonian princess in Ur, now Iraq (Smith 2015b: 262). Other very early NPAs were the first hospital at the Temple of Aesclepius at Epidaurus in Greece, from *c*.430 BC (ibid. p. 261), while Plato's Academy in Athens was likely the first proto-college, from *c*.387 BC (ibid.). There are several other examples of early NPAs of various types,

such as libraries, monasteries (but not religious congregations, which are associations), secondary schools, colleges, universities, almshouses, and orphanages. However, *NPAs have existed in substantial numbers for only the past two centuries* (Chambers 1985; Critchlow and Parker 1998; Harris and Bridgen 2007; Katz 1986; Smith 1997b, 2015b:262; Smith, Stebbins, and Grotz 2016:chapter 1).

Generally, when studying NPOs, voluntaristics scholars have focused mainly on NPAs as *the largest*, *most visible*, *bright matter of the NPO universe*, much as early astronomers focused only on apparently brighter stars and close planets in the solar system. This astrophysical myopia has subsequently been corrected by astronomers, leading to the current view that the more visible, bright, and reflective matter of the universe (stars, planets, moons, asteroids, comets, gas, etc.) constitutes only about 4% of all the matter estimated to be actually present (Nicholson 2007; Panek 2011). By contrast, the dark matter of the universe, of unknown composition at present – hence the term *dark* – is estimated to account for about 23% of the matter-energy of the universe, with the rest (73%) being dark energy, also of unknown composition at present (Panek 2011:12).

Smith (2000:12–15) developed an astrophysical metaphor as well as a map-making metaphor to help convey to readers both the myopia and the inadequate comprehensiveness of the research and theory by most voluntaristics scholars. Smith (1997c) has referred to GAs as "the Dark Matter Ignored in Prevailing 'Flat-Earth' Maps of the Sector." Smith (1997a) titled a related article, "Grassroots Associations Are Important: Some Theory and a Review of the Impact Literature." In a later publication, Smith (2000:chapter 9) provides many examples of the impact of GAs, which were updated in Smith (2010a). Similarly, in his chapter in the *International Encyclopedia of Civil Society*, Smith (2010b) expands his review of research on the impact of MAs to cover supra-local MAs. In the present Handbook, Chapters 52 and 53 review research regarding the impact of volunteering and association participation on the volunteer-participant, while Smith (2017b; see also Smith 2017a) focuses on all other kinds of impact – in particular, on long-term and historical impacts on the larger society, which are often ignored.

When defined very restrictively, as by Salamon (1999) and identically by Salamon and Anheier (1992), so-called NPOs omit nearly all of the NPOs in the world and in any nation – GAs, and many all-volunteer or unincorporated supra-local MAs. Based on empirically grounded estimates by Smith (2000:42) and Smith (2014), drawing on extensive prior research by himself and others, the widely used Salamon–Anheier definition of the VNPS and NPOs omits about 88% of the NPOs (mostly GAs) in the United States and similarly 88% of all GAs worldwide. The Salamon and Anheier NPO/VNPS narrow definition thus omits virtually all of the world's nearly 50 million GAs, as the most common type of NPO in all of the past ten millennia all over the earth, very rarely

incorporated or government-registered. However, this narrow definition also omits the many supra-local MAs that have few or no paid staff and that lack formal incorporation or government registration. Unincorporated and non-government-registered NPAs are also omitted (Smith 2000:38), amounting to additional millions of NPOs worldwide. Moreover, the Salamon and Anheier definition also omits all those NPGs that are fundamentally deviant MAs, as DVAs (Smith 2017a), often operating secretly or underground to avoid being smashed by government, hence never initially incorporated or registered with the government. Nevertheless, DVAs have fostered revolutions, civil wars, guerrilla wars, and terrorist attacks, and have changed history in many countries (Smith 2017b).

The narrow Salamon and Anheier structural-operational definition of the VNPS and NPOs adheres to the *bureaucratic fallacy* in their total omission of voluntary action by individuals. In taking this approach, those authors are implicitly asserting that only NPOs undertake actions in the VNPS, not individuals, which is clearly incorrect. Their approach to studying the VNPS and NPOs would have us do the following as voluntaristics scholars:

(a) Ignore the humane core values, passion, and commitment of individuals that have motivated volunteering, civic participation, and social movement organizations (SMOs) in prior centuries (e.g., Colby and Damon 1992; Eberly and Streeter 2002; O'Connell 1983; Rothschild and Milofsky 2006; Wuthnow 1991; see also Handbook Chapters 17, 24, and 36).

(b) Ignore the transformative and charismatic leaders who have invented and established the many innovative types of NPOs in the past ten millennia (e.g., Barker et al. 2001; Bryson and Crosby 1992; De Leon 1994; Stutje 2012; see Handbook Chapters 1 and 36), including the social movements and SMOs that have helped create positive socio-cultural change in the past 200+ years.

(c) Ignore all of the other kinds of influences on volunteering, civic participation, and social movement, individual activism besides motivations, including thus biology, social statuses and roles, and various geographic levels of social context (e.g., Musick and Wilson 2008; Smith 1994; see Handbook Chapters 25–31).

(d) Ignore *informal* volunteering, with no NPO, or even any MA/GA, involved, even though informal volunteering pre-dated formal volunteering by over 100,000 years, and perhaps 190,000 years (see Handbook Chapters 9 and 51). Although neglected in the Salamon and Anheier definition of the VNPS, informal volunteering was estimated by Salamon et al. (2011) to be twice as frequent as formal volunteering in many nations studied.

(e) Ignore *informal social networks* and social capital in relation to volunteering, civic participation, and MAs, especially GAs (see Handbook Chapters 6 and 7).

Fortunately, the very recent work of a group of European voluntaristics scholars, led by Salamon, has finally redressed most of the imbalance by including individual, formal, and informal volunteering in their recent *consensus* definition of the VNPS (see http://thirdsectorimpact.eu). Their definition still omits SMOs, political activism, protest activity, and DVAs (Smith 2017a, 2017b), but is now mostly in line with the definitions of *voluntary action* and the VNPS suggested by Smith, Reddy, and Baldwin (1972a) 44 years ago. "Better late than never."

D. Volunteering as unpaid productive work or more?

The volitional conception of volunteering clashes with the economic conception (Stebbins 2013). The latter is largely descriptive, portraying volunteering as, at bottom, intentionally productive unpaid work. One problem with this blanket depiction is that by no means all such work is voluntary, as seen clearly in the domain of non-work obligation (here activities are by definition disagreeable, the agreeable ones being essentially leisure; Stebbins 2009:chapter 1). Moreover, since they are essentially leisure, some other kinds of unpaid work hardly resemble paid work. Still, the economic conception does steer attention to an important sphere of life beyond employment and livelihood.

Note further that the unpaid work in question is intentionally productive. In volunteering, volunteers intend to generate something of value for both self and other individuals, including their group or community, if not a combination of these. Such volunteer work is supposed to produce results, thereby showing the utility of volunteering. But now, on the explanatory level, the definitional ball gets passed to leisure.

Stebbins (2013) presented the following definition of the work–leisure axis of volunteering. For him, volunteering is

> un-coerced, intentionally-productive, altruistic activity framed in socio-cultural-historical context and engaged in during free time. It is also altruistic activity that people want to do and, using their abilities and resources, actually do in either an enjoyable or a fulfilling way (or both). If people are compensated, the amount of payment in cash or in-kind is significantly less-than-market-value.

The *free time* in which all this unfolds constitutes the temporal context of leisure: *those hours not spent performing either paid work or unpleasant, non-work obligations*. *Activity* (and core activity) is substituted for *work* in this definition, because the first is the more precise term for what people do in and get from their leisure and volunteering (Stebbins 2009). The adjective *intentionally-productive* is added to distinguish the beneficial social

consequences of volunteering, which are absent in some kinds of leisure (e.g., walking in a park, reading for pleasure or self-improvement, people watching from a sidewalk cafe).

E. Plan of this Handbook

Part I, bearing on the historical and conceptual background of volunteering and nonprofit MAs, opens with a chapter on the ten-millennium-long (or in some cases longer) history of associations and formal volunteering. This leads to one chapter on theories of association and volunteering and then another on typologies and classifications. Chapters 4 and 5 examine, respectively, leisure and time use perspectives on volunteering and volunteering in relation to other leisure activities. Chapter 6 examines associations and social capital, while Chapter 7 reviews research on associations and social networks. The final chapter of Handbook Part I, Chapter 8, discusses hybrid associations.

In Handbook Part II, we explore in depth the major analytic aspects and types of volunteering. Chapter 9 studies informal, unorganized volunteering. The rich variety of volunteering in the 21st century is evident in Chapters 10 and 11 on, respectively, stipended (partially paid) transnational and stipended national service volunteering. Chapter 12 looks into voluntourism, or volunteer tourism, which is followed by a chapter on volunteering online. Spontaneous volunteering in emergencies is the subject of Chapter 14. The nature of volunteering is further addressed in the final two chapters of Part II – bearing on the many volunteer service programs (VSPs) and the changing nature of VSP volunteering.

With parts I and II as background, the Handbook turns in Part III to the major activity areas (or goal and purpose types) of volunteers and volunteering. In Chapters 17 through 24 the contributors focus separately on eight of these, constituting a reasonably complete survey of the main types of such volunteering. One criterion underlying our decision to include them was the presence of enough theory, research, and application to justify a chapter.

In Part IV, the Handbook moves to the enduring question of volunteer motivation: why people start, continue, and/or stop volunteering. In broad terms, this section centers on the many motivational conditions (personal, genetic, social) that lead people to engage in this activity. These conditions are considered separately in Chapters 25 through 31. Chapter 31 discusses how far we have come in pulling together theoretically the contents of the preceding six chapters, presenting a new, comprehensive S-Theory, invented by Smith. The theory was tested and has performed well using data from an interview survey of a large, national sample of adult Russians in 2014.

Part V of the Handbook moves to a more descriptive level in studying the internal structures of associations. The chapter titles (Chapters 32–37) show just how involved this issue is. These associations may be local or grassroots micro-associations. They may be supra-local and national associations, as meso-associations. The transnational associations or INGOs are seen as macro-associations. Governance and internal structure and leadership and management are the subjects of Chapters 35 and 36. Chapter 37 discusses the life cycles of individual associations.

Handbook Part VI brings us to the practical realm of leading or serving on the board of nonprofit MAs. There are several internal processes of associations (Chapters 38–44). They include acquisition and retention of members, attraction of resources, and prevention of over-bureaucratization and mission drift. Self-regulation is critical to successful associations. Additionally, there are matters of accountability, information and technology, and the economic bases of associational operations.

Handbook Part VII examines the external environments of associations. Chapter 45 focuses on civil liberties and freedoms as variable association contexts, while Chapter 46 discusses pluralism, corporatism, and authoritarianism as alternative government regime contexts of associations. Legal, registration, and various tax issues are considered in Chapter 47. Associations also have relationships (some of them collaborative) with other groups (see Chapter 48). Chapter 49 focuses on public perceptions of, and trust in, associations and volunteers, followed by a chapter that examines the prevalence of associations across territories, and that rounds out this part of the Handbook.

All this brings us to Part VIII – the scope, trends, and impacts of associations. Chapter 51 provides extensive global data on the scope of and trends in associations and volunteering. The main impacts considered are those on volunteers. The nature and impacts of misconduct and associational deviance are also examined.

In conclusion, Handbook Part IX, we focus on some general theoretical conclusions and on needed future research, as this concern emerges from our overall conclusions. There is a wealth of research reported in this Handbook, which, however, shows vividly how much more there is to do.

History of Associations and Volunteering

Bernard Harris (UK), Andrew Morris (USA), Richard S. Ascough (Canada), Grace L. Chikoto (Zimbabwe), Peter R. Elson (Canada), John McLoughlin (UK), Martti Muukkonen (Finland), Tereza Pospíšilová (Czech Republic, formerly part of Czechoslovakia), Krishna Roka (Nepal), David H. Smith (USA), Andri Soteri-Proctor (UK), Anastasiya S. Tumanova (Russia), and Pengjie YU (China)

A. Introduction

This chapter examines the history of the topics in its title, with major emphasis on the history of associations. This Handbook is very clearly about *associationalism* writ large, not about associations and social welfare only (Smith 2015c). The latter issue is one key piece of the total puzzle, but we aim to cover the whole range of association types and time periods. Volunteering seems to be a characteristic of our species, with *informal* (unorganized) volunteering probably going back to our origins 150,000–200,000 years ago. *Formal* volunteering in associations can only be traced back about 10,000 years to the origins of associations in which to do such volunteering (Anderson 1971; Bradfield 1973). Volunteering in formal volunteer service programs (VSPs) as departments of other organizations is very recent historically, only going back to the mid-1800s (Smith 2015b; see Handbook Chapter 15). We know very little about the long history even of formal volunteering, since volunteering leaves few physical or written traces and was seldom mentioned by historians as a phenomenon until the past few hundred years.

The chapter is structured around major historical periods in which associations have existed, beginning about 10,000 years ago, when many human societies settled down in villages from being small, nomadic, hunter-gathering bands. Thus, we discuss associations in (1) preliterate horticultural societies, (2) ancient agrarian societies, (3) recent pre-industrial societies, and (4) industrial and post-industrial societies.

Associations have left more traces than volunteering in the historical, archeological, and anthropological records. Many anthropologists have included descriptions of associations in their ethnographic accounts of various preliterate societies (e.g., Anderson 1971; Bradfield 1973; Goldschmidt 1959; Lowie 1950:chapter 13; Ross 1976; Schurtz 1902; Smith 1997; Webster 1908). The history of associations (voluntary associations, common interest associations) is very important because associations were clearly the first form of nonprofit organizations (NPOs) to arise. They still dominate this sector in all societies in terms of numbers of separate groups and members/staff (e.g., Smith 2000:chapter 2, 2014, 2015c). Paid-staff nonprofit service agencies (voluntary agencies) now dominate the nonprofit sector in developed/industrialized and post-industrial/service societies in terms of wealth, income, and influence (Smith 2015d). This latter, familiar form of NPOs arose thousands of years after associations and has come to prominence only in the past 100–200 years in modern societies, with the exception of major world religious NPOs (ibid.).

The strict interpretation of the term *history* refers to *written* history. This chapter uses the broader interpretation of history as a thick description of all prior events. Further, this chapter is primarily concerned with social and institutional history and the history of daily life, rather than with political or economic history, although we do deal with some economic and political history also. We will begin, thus, with the *reconstructed history* of associations based on anthropology and archaeology, before going on to the works of professional and amateur historians. Our interest is in summarizing the interdisciplinary history of associations without concern for the academic disciplines of those who have contributed to this knowledge.

B. Definitions

This chapter accepts the general definitions presented in the Appendix of this Handbook. Various specialized terms for associations and types of associations will be introduced in context as they arise in the chapter text. A set of nine chapters discussing in detail the issues and alternative definitions of *voluntary associations* was presented long ago in Smith, Reddy and Baldwin's book (1972: Part One). A recent set of definitions of *association* and related concepts can be found in Smith, Stebbins, and Dover (2006:23 and passim).

The main problematic issue about defining an association concerns the extent to which membership is either voluntary or coerced. In 20th-century research, trade/labor unions and religious congregations have sometimes been omitted from the category of associations on the grounds that joining is either hereditary (in the case of religious congregations) or compulsory (in the case of closed-shop unions). That approach to defining associations has largely been overcome by current researchers and theorists, who usually include both

religious and economic associations (such as unions, professional associations, trade associations) as specific purpose-activity types of associations.

The problem of definition remains for associations in preliterate societies. In some small horticultural villages, which were independent societies, there was often only one association, usually for adult males. Hence, joining and membership were largely ascriptive (automatic, coercive). Such associations, whether unique or multiple in their existence, have been called *sodalities* by anthropologists (e.g., Lowie 1950:chapter 13).

Other anthropologists and sociologists have referred to such associations as *common interest associations*, avoiding the issue of voluntary versus coercive/ascriptive joining and membership (Smith, Stebbins, and Dover 2006:48). Lowie's (1950) review of prior ethnographic research on sodalities in preliterate societies makes it clear that two or more such associations were often present in a village society, especially a large village, making joining and membership truly voluntary. Research he reviewed also notes the presence of separate structures (buildings, in a loose sense) as *clubhouses* in various societies, as do other authors discussing sodalities in preliterate societies (e.g., Bradfield 1973; Ross 1976:48–51; Schurtz 1902; Webster 1908).

C. Historical background

Because this whole chapter is about the history of associations and volunteering, this section is the main part of the chapter, and Section D, on key issues, is omitted. The various chronological time periods that are discussed below become the key issues in this chapter, answering the question, "What associations were present in various historical time periods?" This chapter is an extensive elaboration of the kind of meta-history of associations first presented in Smith (1997).

1. Anthropology and the pre-history of associations in preliterate societies

According to Robert Anderson (1971:209), "the history of formal common interest associations during the first million years of human existence lends itself to brief statement: there were virtually none." He then qualified this statement by adding that, as Walter Goldschmidt (1959:155–156) had suggested, "in a few instances a kind of religious sodality may have cut across band and family ties, as in the totemic groups of some Australian aborigines today." He also claimed that "although rare, the common interest associations of hunting nomads invariably unite individuals in terms of religious beliefs" (Anderson 1971:209). However, other authors have found evidence for the existence of different types of association among members of hunter-gatherer/fisher societies. Johnson and Earle (2000:178) have described the formation of voluntary associations of whale hunters in Eskimo Tareumiut society, and Lynn Gamble (2002)

has highlighted the role played by specialist associations of canoe builders (the *Brotherhood of the Tomol*) among the Chumash Indians of southern California – both being examples of preliterate economic/occupational associations.

One of the main problems raised by attempts to reconstruct the history of associations over such long periods is the lack of direct evidence for the most distant past. This has led previous authors, such as Anderson (1971), Bradfield (1973), and Ross (1976), to infer the extent of associational activity among preliterate societies in millennia long ago from more recent anthropological evidence. However, it is generally accepted that formal associations became more prevalent following the development of settled agriculture beginning about 10,000 years ago (Nolan and Lenski 2006). Because agriculture was very simple, essentially gardening, such societies are usually termed *horticultural societies*, in contrast to more developed agriculture of later *agrarian societies,* which supported large, ancient civilizations eventually (ibid.; also, Johnson and Earle 2000). Smith (1997:191) attributes the development of associations within horticultural societies to the fact that they were typically much larger than hunter-gatherer societies, inhabited permanent settlements, and were characterized by greater craft specialization and more complex status systems (also, Nolan and Lenski 2006).

Various attempts have been made to develop typologies of voluntary associations, based on anthropological evidence. In *Social Organization*, Lowie (1950:294–309) identified a number of different types of associations, based on examples of the pastoral societies with which he was familiar: men's tribal associations (including tribal clubs and tribal secret societies); more exclusive secret societies; exclusive clubs for the elite but not practicing secrecy; age classes/associations (including separate associations for spinsters and bachelors); and economic sodalities (including different types of guilds/associations for workers in different economic specialties). However, Smith (1997:192) has questioned whether many *tribal associations* or *exclusive clubs* can really be regarded as *voluntary* associations (vs. often *compulsory* common interest associations) and also the extent to which we can extrapolate from the experience of contemporary economic guilds or associations to the more distant past (on typologies, see also Handbook Chapter 3).

2. Associations in ancient agrarian societies

Although much of the evidence for associations in preliterate societies has been derived from anthropological sources, we have much more direct evidence for the existence of associations in ancient, partially literate, agrarian societies. Such societies had a more advanced agricultural economy (using irrigation, fertilizer, deep plows, enhanced seeds, insecticides, etc.; Johnson and Earle 2000). Much of this evidence comes from various types of inscriptions, honorific degrees, membership lists, funerary monuments, religious dedications,

legal and fiscal documents, and literary accounts (see, e.g., Ascough, Harland, and Kloppenborg 2012; Kloppenborg and Ascough 2011:3–4).

(a) China

In the case of China, Ross (1976:73–85) identifies five different types of association which can be considered as at least partially voluntary. The first was the *tsu*, which can be traced back at least as far as the *Shang* dynasty (123 BCE). Although this was "a formally-organised agnatic descent group tracing its origin in a certain locality to a specific ancestor" (p. 73), Ross argued that it could be regarded as a quasi-voluntary association because there was the possibility of exit and membership could be extended to non-family members by the invention of fictive genealogical links. The *tsu* served partly as a means of ancestor worship, but also as a source of mutual aid, providing a range of services, including education, care of the elderly, and burial assistance, to its members.

The welfare functions of the *tsu* were complemented by those of the *hui* and the *she*. The term *she* can be dated back to the 6th century BCE and was used to describe an association of 20–50 households that provided each other with a series of different kinds of practical support, including help with farm work, various kinds of welfare assistance, and opportunities for collective worship. The *she* became incorporated into the machinery of local government from the 13th century CE onwards (Ross 1976:76–77). The term *hui* refers to a number of different kinds of village-based associations providing a range of specialist services, including temple maintenance, worship, crop-watching, canal and granary repair, and even drama presentation. There were also more general *hui*, providing support for the village as a whole (Ross 1976:77–78).

Ross also examined the evidence for the existence of economic associations, or guilds, in ancient China. He drew particular attention to a *guild of bankers* which could be traced back to 200 BCE (Ross 1976:79). However, Morse (1909:9) claimed that the Bankers Guild of Ningpo traced its *craft* back to pre-Christian times, and Moll-Murata (2008:213) suggests that there is little evidence for the existence of European-style guilds in China before the late 16th century CE. There is rather more evidence for the antiquity of secret societies in China. According to Chesneaux (1972:2), the oldest of these organizations can be traced back to the struggles of Liu Pang and his *sworn brothers* against the *Ch'in* dynasty in the 3rd century CE, and to the Yellow Turbans' campaign against the *Han* four centuries later.

(b) India

There appears to be rather less evidence of voluntary associations in ancient India. Ross (1976:85–91) attributes this to the effects of the caste system and to the particular nature of village organization during the very long caste period. However, Drekmeier (1962:18–19, 275–277) argues that "guilds

of woodworkers, weavers, weapon-makers, hunters and other crafts and professional groups are mentioned in the Vedas" and that they became increasingly important from the fifth and sixth centuries BCE onwards. In addition to their economic functions, they also exercised a high degree of control over social aspects of their members' lives and played an important part in political life.

(c) Mesopotamia

In the Babylonian and Assyrian empires (3000–650 BCE), artisans organized associations, often linking persons in extended families that shared a common trade (Mendelsohn 1940b; Weisberg 1967). Other occupational associations were formed primarily among slaves. In all cases, the predominant focus of the groups was not economic but social (including the care of widows of workers) and religious in that cult played a part in group life.

(d) Ancient Palestine

Evidence for large and well-equipped, collectively owned occupational associations in ancient Palestine suggests that neighborhood associations formed around common occupations and provided members with practical enticements such as insurance against lost tools, religious rites, and social interactions (Mendelsohn 1940a; Ross 1976:117–128). A distinguishing feature of associations throughout the Levant was the emphasis on feasting and drinking, hence being mainly social clubs. The focus on business transactions, burial of members, banqueting, and (especially) drinking took on ritual forms and came to be known as the *marzĕaḥ* (Greenfield 1974). From the 4th century BCE through to the 3rd century CE, *marzĕḥîm* were predominantly formed by wealthy businessmen who not only met for social and commercial purposes but collectively-owned permanent meeting places along with fields, vineyards, and burial grounds. The Jewish community that lived at Qumran from the 1st century BCE through to the mid-1st century CE is a particularly ascetic sectarian example of such associations (Weinfeld 1986).

More in keeping with the voluntary unencumbered tradition of associations, however, are the Jewish synagogues of the 2nd century BCE. These began as groups in Palestine, gathering in any available building for reading, teaching, and discussion centered on the *Torah*, the five books of the Hebrew Bible (part of the "Old Testament" of the Christian Bible) (Harland 2003). Eventually, such groups began to own a specific meeting place. In both their origins and their development, these religious associations look similar to the array of Hellenistic associations within their broader cultural context (Runesson 2001). After the destruction of the second temple in Jerusalem in 70 CE, synagogues became the central focus of Jewish religious and social life, with the Rabbis taking on an increasingly dominant leadership role and a broad-based membership. In the

Diaspora, synagogues served to unite Jewish immigrants who were displaced from their home towns and extended families (Runesson 2001).

(e) Ancient Greece

Associations in the Greek world date back at least to the laws of Solon in late 6th-century BCE Athens that allowed the formation of associations that did not interfere with the interests of the state (Ascough, Harland, and Kloppenborg 2012; Kloppenborg and Ascough 2011; Kloppenborg and Wilson 1996). The majority of these associations centered on a common cult and chose specific deities such as Bendis or Athena as their patron. They took on characteristics of already extant associations organized around extended families, such as the Attic *brotherhoods* (*phratriai*) that focused on veneration of an ancestor or a hero.

Associations grew in size, scope, and importance from the 4th century BCE as other deities and heroes from Greece and its newly conquered territories became the foci for cult activity (Arnaoutoglou 2003; Ascough, Harland, and Kloppenborg 2012; Kloppenborg and Ascough 2011; Kloppenborg and Wilson 1996). There were also social and political clubs in Athens in these times (Calhoun 1970; Jones 1999). The expanded empire allowed for ease of movement for foreign traders, merchants, slaves, and noncitizens. Excluded from citizenship rights in Greek cities, these foreigners formed associations to provide themselves a sense of identity, often joining together on the basis of common ethnicity, common cult, or common occupation, and sometimes even on the basis of living in the same neighborhood. Although much of the extant data come from urban centers, enough evidence has come to light to suggest that cultic and occupational associations thrived in small villages and towns (Kloppenborg and Ascough 2011:3).

(f) Ancient Rome

Rome began its eastward expansion in the 2nd century BCE and in the process adopted and adapted Greek ways, including the formation of associations by both elites and non-elites. Of particular note is the influence of eastern deities such as Isis and Cybele, who became focal points for cult activity among small private associations. The increasing dislocation of individuals and families, through trade or as a result of war, also intensified the trend of associations forming in order to address the need for a sense of belonging in a foreign urban center. Merchants and artisans formed associations based on similarity of trade, not in order to control the economic sector, but to provide opportunities for social interaction and business networking (Kloppenborg and Ascough 2011:5; Waltzing 1895–1900).

In 186 BCE, concerns around abuses and immoral behavior in the Dionysos cult led the Roman Senate to ban associations, although they continued to flourish unrestricted. In late Republican Rome suspicions of associations being

involved in political activity were proved true as Clodius attempted to use associations (*collegia*) to influence the political process in 58 BCE, resulting in further restrictions on associations. Nevertheless, these laws seem rarely to have been enforced and in the Imperial period the number and influence of private associations continued unabated (Harland 2003:161–173).

In the post-Constantine period in Europe and the Levant, the predominant form of association quickly became Christian, with emphasis on churches and monasteries, and thus tended to fall under the authority of the political and religious authorities (Duchesne 1912; Harrison, Humfress, and Sandwell 2014:chapters 9, 10). As such, they were less voluntary than had been the case during earlier times. The exception was para-ecclesial associations formed by charismatic leaders and/or their followers, usually around a heterodox belief or practice. Once they drew the attention of the authorities, however, they were shut down, often violently, and their teachings and practices deemed *heretical*. There is thus little evidence for such groups outside of their condemnation by the authorities (cf. Smith 1997:200). This is not to say that many did not exist, but it was in their own best interest not to draw attention to themselves through the erection of inscriptions or the issuing of documents, as had been the practice of their predecessors in the Graeco-Roman period.

3. Associations in recent pre-industrial societies

Anderson (1971:213) also argued that, with the exception of the merchant guilds of medieval Europe, "a trough of quiescence, when the importance of associations was comparatively reduced" lay "between the crest of association in Neolithic communities and modern industrial nations," and that "perhaps 90 per cent of the total population [of pre-industrial societies] had no personal involvement in voluntary associations of any kind" (p. 215). However, the evidence from Western Europe in the Middle Ages (pre-1000–c.1500) suggests a very different picture (Hughes 1974). Almost every new form of institution created in the Middle Ages was the outcome of associational initiatives: the great universities, such as Bologna and Paris, sprang respectively from associations of students and teachers (Hartson 1911: esp. 17–24; Rüegg 1992:6; Verger 1992:37–39) and many of the great religious orders, such as the Cistercians and Franciscans, sprang from the initiatives of associations of lay people, as did associations that came to be seen as heretical.

To modern eyes, one of the most interesting forms of voluntary association in medieval Europe was that of the *béguines*. These associations of religious women, not entirely subject to Church control, flourished in the Low Countries, northern France and western Germany. Living together in a *béguinage*, as an intentional community, members pursued a frugal life of prayer and chastity, combined with religious teaching and charitable action that included caring for the poor and ill and those "explicitly rejected by the

social body" such as lepers, as well as laying out and preparing the dead (Simons 2001:61–87). These communities enabled women to spend some years engaging in meaningful, fulfilling activity, while remaining outside the marriage market. *Béguinages* also provided competitive labor in the enormous textile industry, spinning, preparing, and finishing cloth (Simons 2001:115). In the industrialized, textile cities of the Low Countries, they seem to have acted "as institutional supports for … women, offering companionship, mutual assistance, medical aid, and instruction, as well as relief in hard times" (Simons 2001:116). The Church's attitude to *béguines* was ambivalent. In the early 14th century there was much persecution by local bishops with accusations of heresy. But with support from senior churchmen and local elites, they thrived, surviving beyond the Reformation. There were more than 1,700 *béguines* in Belgium in the mid-1820s (Neel 1989; Simons 2001).

The most fundamental form of association in the medieval West was the fraternity or guild. Contemporaries used numerous terms, usually with no sharp distinction, to describe these groups. These included *fraternitas* (brotherhood), *consortium*, *confratrium*, *compagnia*, and, in northern Europe, variations of the word *gild*. Despite their religious branding, fraternities are thought to have derived from pre-Christian associations, drinking and convivial guilds in northern Europe, and *conviviae* (feasting groups) and *collectae* in southern Europe (Reynolds 1984:69).

Described by Duparc (1968) as "the basic cells of medieval society," fraternities and guilds touched almost every locality in Europe. They provided a *locus* for creating a sense of shared identity and belonging (focused on neighborhood, a church, and a patron saint), mutual help, and building crucial networks that went beyond one's own kin (Rosser 2009). These were mostly male organizations (Kowaleski and Bennett 1989; but see also Bainbridge 1996:47; Reynolds 1984:68).

Although there was great variation, for instance in membership criteria or religiosity (more pronounced in southern Europe, see, e.g., Black 1989; Terpstra 1995; Weissman 1982), there were several universal features: attachment to a specific church, often with a specific altar or chapel there; contribution to the upkeep of the church; an annual celebration on the feast day of the group's patron saint, involving a religious ceremony, the Mass, followed by a communal meal, often sumptuous and involving the distribution of food among members; obligations to mutual support; and a commitment to pay fees that was enforceable in church courts.

Practical benefits for members were material and spiritual: payment if needed for proper burial, where potential lack of such burial was a cause of great anxiety and a potential source of shame right into the 18th century and beyond; intercessory prayers by the fraternity's hired priest for living and dead members, reducing the time they would spend in Purgatory before entering heaven;

insurance against flood and fire (Reynolds 1984:68); modest payments to indigent members (Barron 1985:26–27; Richardson 2008); discounted loans and rents (Farnhill 2001:67); and dispute resolution without going to a civic or royal court.

The most far-reaching benefit was the opportunity to increase social capital and build links of trust beyond one's own kin, especially in the great mercantile cities where fraternities generally included members residing outside the religious parish and even the city. Fraternities were crucial in a society where sentiment and personal trust underpinned economic activity, with much business based on pre-existing social ties, which would have been breached by the use of a formal contract (Weissman 1982:24–25).

Economically and politically, merchant guilds (exclusive organizations for the leading merchants) and craft or trade guilds (which controlled particular crafts and trades), which in many cases grew out of informal or more open fraternities, had an enormous impact on medieval Europe (Gadd and Wallis 2006; Keene 2006; Lucassen, Moor, and van Zanden 2008). Some of the earliest economic guilds included the *ministeria* of Pavia (c.1000); the English craft guilds recorded in 1130–1131 as paying dues to the crown (Keene 2006:12–13); the *fraternitas* of weavers in Cologne, referred to in a charter of 1149 (Epstein 1991:52); and the 23 fishermen who were granted corporate hereditary rights over the wholesale fish market by the Bishop of Worms in 1106 (Epstein 1991:53).

The immense secondary literature on European merchant and trade guilds, which began as scholarship in the 19th century, continues to expand. The prevailing view among historians until c.1990 was that medieval guilds were restrictive and monopolistic, cramping innovation and growth. A new generation of historians, including S. R. Epstein (1991, 1998, 2008; Epstein and Prak 2008), has contended that guilds were a source of innovation and through apprenticeships and training an engine for building human capital, a view rejected by Ogilvie (2007, 2008).

Fraternities created a community based on place (involving a church and a patron saint), but engaging outsiders in terms of kinship and residence. They were part of a vibrant social economy of active self-help and mutual help, involving fundraising for churches, the maintenance of communal facilities, and the support of neighbors in distress (Bainbridge 1996; Bennett 1997; Dyer 2004, 2012; French 1997; Moisà 1997).

Medieval fraternities operated in a society in which the boundaries between personal and public were configured very differently from those of modern times. It was a world in which friendship had formal, public obligations, rather than being a matter of sentiment, personal liking, and choice (Althoff [1990] 2004; Haseldine 1999). Private groups, private courts, and fraternities were not seen as fundamentally different from baronial, royal, or civic courts. They were seen as different only in degree (Reynolds 1984:152). The private and voluntary

associations of the Middle Ages exercised powers of judgment and punishment over their members and in some settings were indistinguishable from other institutions of governance.

Across Europe fraternities often operated in effect as local authorities, with guild officers acting as representatives of a town community in the interstices of legal or enforced authority (Duparc 1968; Reynolds 1984:70). Fraternities were fluid and adaptable, with their members able to assume new roles and goals as circumstances changed. In the cathedral city of Lichfield, England, the Guild of St Mary was in 1387 an association that among other activities controlled the behavior of its members, with adulterous brothers being first admonished and then expelled if they did not reform. A century later the association had assumed wider responsibility within the city for "dealing with disturbers of the peace such as night-walkers, rioters, prostitutes and scolds" (Kettle 1984:169). Likewise, neighborhood fraternities could re-create themselves as trade fraternities more concerned with the regulation and membership of a type of business, such as brewing (Barron 1985:15–16).

Although guilds and fraternities disappeared as institutions in northern, Protestant Europe during the Reformation, it seems that in many respects the administration and social organizing of localities continued. As Barron (1985) hinted, those who had been active or leaders in these organizations continued, under new doctrinal rules, to run local affairs in much the same way as they had done before. They mobilized local energies to provide mutual support, to maintain the fabric of the church, and to relieve and help the poor. In England, merchant guilds became the basis for the emerging system of municipal government. In Germany, the merchant guilds of Lübeck and Bremen laid the foundations of an international trading network known as the Hanseatic League (Richardson 2008).

The history of merchant guilds followed a somewhat different trajectory in the Eastern Empire, where "some *collegia* appear to have survived from Antiquity until the Middle Ages, where ... sources reveal an unbroken tradition of state management of guilds from ancient times" (Richardson 2008). However, the number of guilds declined during the thirteenth and fourteenth centuries, before re-emerging under the Ottomans. The reasons for this revival are not entirely clear but "it is more or less agreed that craft guilds with similar characteristics and functions [to those which existed under the Byzantine guild system] existed with greater or lesser differences in almost all principal towns and cities of the seventeenth-century Ottoman Empire" (Yildirim 2008:77).

New directions of scholarship point to active merchant and trade guilds beyond those of medieval Europe (Lucassen, Moor, and van Zanden 2008). In medieval and early modern India, although there were a number of different types of collective association, such as the *kharkhana*, "guilds fulfilling the minimum formal characteristics – a written charter establishing a right to conduct

business and accepted by members, as well as the local or supralocal government authority – were rare, if not unknown, even in the context of urban crafts or commerce" (Roy 2008:97–98). In China, the government ordered the creation of various kinds of business associations as early as the 8th century. There is some evidence for the establishment of voluntary associations from the 12th century onwards (Moll-Murata 2008:218; but see also Golas 1977:555). However, the main function of these associations was to coordinate the merchants' and artisans' obligations to the government, rather than to regulate access and homogenize markets for their members. As a result, it is now generally agreed by scholars that there is little evidence of formal guild-like associations before the later years of the *Ming* dynasty in the 16th and 17th centuries (Golas 1977; Moll-Murata 2008).

Different forms of trade association also existed in other parts of Asia. In medieval Japan (defined here as the period between 794 CE and 1573), the dominant form of association was the *brotherhood* or *zu*. The members of a *zu* paid taxes to local lords or patrons in return for the right to trade in various markets, secure exemptions from other tolls and taxes, and be able to move freely. As Mary Louise Nagata (2008:128–129) has explained, individual merchants or groups of merchants competed with each other for the right to join a *zu*, and the brotherhoods competed with each other for new members. During the early modern period, the *Tokugawa* Emperors abolished many of the previous brotherhoods in an effort to undermine their patrons but also established new brotherhoods of their own in strategically important industries, such as those associated with the mining and working of precious metals. However, the most important form of trade association in this period was the *kabu nakama* or stock society. The government issued stock in a particular trade or industry, and individual merchants purchased shares which entitled them to operate a business in that industry. The stock societies performed some of the same functions as a guild, such as contract-enforcement and the policing of members, but they had little political influence and were essentially associations of business owners rather than of individual craftsmen or artisans.

4. Associations in industrial and post-industrial societies

As previous sections have shown, we can trace the history of voluntary associations back to ancient societies, if not further. However, it seems likely that the number and range of such associations has increased very substantially over the last two to three centuries. A number of different factors have contributed to this, including the industrial revolution, population growth, greater goal/interest differentiation, improvements in transport and communications, and a greater orientation toward collective goals (Boulding 1953; Smith 1973b, 1997; Smith and Baldwin 1983).

As Robert Morris (1990) has shown, the 18th and 19th centuries witnessed a remarkable efflorescence of voluntary association activity in the United Kingdom. A wide range of voluntary associations emerged for purposes of recreation, education, social networking, mutual aid, and social action, together with what might be regarded as associations designed for the promotion of élite self-interest (see Table 1.1). Although precise information is often elusive, it also seems clear that the number and percentage of individuals who belonged to voluntary associations continued to increase. In 1945, for example, it was estimated that more than six million people belonged to trade unions and that nearly nine million were affiliated to friendly societies (Beveridge 1948:87–88). Approximately half the population belonged to some form of voluntary associations at the end of the 20th century (Grenier and Wright 2006:31; see also Hilton et al. 2012).

Voluntary associations also played important roles in other parts of Western Europe. In France, it has been estimated that the number of *sociétés de secours mutuels* (mutual aid societies) increased from 2488 in 1852 to 13,673 in 1902, and that the number of friendly society members increased from just under 30,000 to more than two million (Mitchell 1991:184). In eastern Lombardy, more than 500 *societàs di soccorso mutuo* (mutual aid societies) were formed between 1860 and 1914 (Tedeschi 2012:48–54). More than 600 friendly societies were registered in Spain in 1887, although this figure is likely to be a substantial underestimate (Rodríguez and Pons 2012:69). The number of trade unionists in Western Europe also increased. By 1914, it has been estimated that more than 10% of the non-agricultural workforce were affiliated to trade unions in Denmark, Germany, the Netherlands, and Norway (Friedman 2008).

In Imperial Russia, the development of voluntary associations was much more closely associated with the activities of the state. During the 1760s, Catherine the Great authorized the formation of English language clubs and the Free Economic Society to stimulate agricultural improvement and promote economic development (Tumanova 2008:35–38). The 19th century also saw the formation of a wide range of professional and scientific societies, including the Russian Geographical Society (1845), the Russian Technical Society (1866), and the Pirogov Society of Russian Physicians (1883). A large number of additional associations were formed in different parts of the country to promote social welfare, public health provision, town planning, education, science, and physical culture (Bradley 2009; Tumanova 2008:41, 44, 49). In 1905, the Russian people acquired the formal right to freedom of association, and this led to the growth of a number of trade unions (Tumanova 2008:164–171).

The murderous wars and revolutionary disturbances of 1914–1922 caused widespread social dislocation and imposed new burdens on the voluntary sector. This led to the creation of a large number of new associations for the assistance of peasants, people with disabilities, children, students, and artists.

Table 1.1 Voluntary associations in Britain (c. 1750–1950)

	Pre-1780	1780–1890	1890–1950
Recreational groupings	Taverns Coffee hours Fraternities	Clubs and Institutes Union Sporting associations (football, rugby, etc.)	Church societies Youth associations (Scouts, Guides, Boys' and Lads' Brigades) Rambling associations
Information and self-education	Edinburgh Society for the Encouragement of Arts, Sciences, Manufactures and Agriculture Select Society for Promoting the Reading and Speaking of the English Language in Scotland	Literary and Philosophical Societies Scientific societies Mutual improvement societies	
Mutual aid	Friendly societies	Friendly societies Cooperative societies Building societies Trade unions	Friendly societies Cooperative societies Building societies Trade unions
Coercive organizations		Proclamation Society Society for the Suppression of Vice Volunteer yeomanry Societies for the Suppression of Beggars	
Social action	Voluntary hospitals	Anti-slavery societies Anti-Corn Law League Visiting Societies Voluntary hospitals Educational societies (Sunday schools, elementary schools, adult education societies) Temperance societies Bible and missionary societies Reform societies (e.g., Female Political Union)	Church societies Visiting associations Dorcas societies Soup kitchens Political associations (especially labor groups) Women's Cooperative Guild
Polymorphic networks	Masonic lodges Manufacturers' associations		

Note: The term *coercive* is derived from Morris (1990:407–411). The voluntary organizations listed in the table were founded during a period of considerable social and political instability. Morris described them as coercive because they were "intended to achieve stability through coercion" (ibid. 407).
Source: Derived from Morris 1990.

The Russian Red Cross Society was engaged in the care of the wounded and sick people, and those harmed by natural disasters (Tumanova 2011:287, 308–314).

Although a large number of new associations, such as the Association of Atheists, the "Down with Illiteracy" Society, and the Association of Friends of Soviet Cinema, were formed during the Soviet period, it would be difficult to characterize these as either independent or voluntary. This was probably still true of the *new wave* of voluntary associations established during the thaw of the 1960s. The pace at which new associations were established reached a new level of intensity during the second half of the 1980s, and accelerated further following the collapse of the Soviet Union in 1991 (Lelchuk 1988:422, 429–431).

The assumption that voluntary associations developed after the collapse of Communism from scratch (*de novo*) in other post-Soviet countries has also been challenged (Devaux 2005; Pospíšilová 2011; Skovajsa 2008). Various forms of civil society organization, such as charities, guilds, and both religious and secular foundations, existed in different parts of central and eastern Europe as far back as the 13th century. The number of patriotic and nationalist associations in countries such as Poland, Hungary, Czechoslovakia, Romania, and Bulgaria increased dramatically during the 19th century (Bradley 2009; Frič et al. 1998; Kuti 1996; Leś, Nałęcz and Wygnański 2000; Valkov 2009). Communist regimes abolished or nationalized many civil society organizations and the rest functioned under direct state control. However, as in Russia itself, the relaxation of state control in all these countries allowed new forms of voluntary association to emerge from the 1980s onwards. Many of these organizations took the form of self-help groups associated with such issues as alcohol and drug abuse, while others were concerned with environmental issues (Carmin and Fagan 2010; Císař 2010; Gabrhelník, and Miovský 2009; Pickvance 1998).

Voluntary associations also played important roles in various parts of Africa, especially in response to colonization and the subsequent racially and ethnically segregationist policies of colonial governments. Gleaning from the literature, at least three dominant factors stand out as having influenced the formation and structure of voluntary associations: principles of reciprocity and solidarity in pre-colonial rural communities; the advent of missionary societies in Africa; and colonization, and the subsequent urbanization and industrialization (e.g., Graham et al. 2006; Kanyinga et al. 2004; Kiondo et al. 2004; Little 1957; Nyangabyaki et al. 2004). Equally influential are the idiosyncrasies and contextual factors inherent in each country, such as the apartheid regime in South Africa (Swilling et al. 2004).

"Early African associational life" had "a strong normative and moral basis" exemplified by "cultural notions of belonging, togetherness, and caring for one another" (Graham et al. 2006:8–9). The diversity of words and concepts found in different African cultures speaks to the voluntary traditions that continue

to sustain community life in the present day. Concepts from different parts of Africa describe the varieties of cultural ethos that have underpinned and continue to underpin voluntarism in Africa, for example, *ubuntu/botho* (fostering humaneness), *kujitolea* (meaning *service* in Kiswahili), *tirelo* (something done for others in Tswana), *vabatsiri* (meaning *those who help others* in Shona), and *harambee* (meaning *self-help* in Kenya) (Graham et al. 2006).

From these philosophies emerged traditional cultural beliefs, practices, and support systems that are based on the principles of collective responsibility, solidarity, and reciprocity (Graham et al. 2006; Patel et al. 2007). An ancient example of this type of collectivistic social safety net institution is Zimbabwe's cultural practice of *Zunde raMambo*, which involved community members working in their neighbors' fields once a week or plowing a plot set aside by the chief for the benefit of the needy (Graham et al. 2006; Patel et al. 2007:24). In the case of South Africa, the traditional tendency to self-organize in order to cope with life-threatening situations among the indigenous Khoi and San communities and the Bantu tribes "carried over into the modern civil society sector and manifest[ed] itself in the proliferation of separatist churches, unions, service and civic organizations, herbalist associations, and traditional tribal organizations" (Swilling et al. 2004:115).

Whereas Christian Missionary Societies introduced more formal civil society institutions in Tanzania, Kenya, Uganda, and other parts of Africa, colonial rule and its segregationist policies provided the impetus for the emergence of formal indigenous voluntary associations. The introduction of colonial rule in Kenya in 1895 brought new forms of voluntary (nonprofit) organizations, including settler associations, social clubs, and sporting associations (Kanyinga et al. 2004). Indigenous political associations such as the Kikuyu Central Association also formed to resist colonial exploitation and native land appropriations, although such associations tended to develop along ethnic lines (Kanyinga et al. 2004). In response to similar exploitations, the local clan leaders in Uganda formed the *Bataka* Association (Nyangabyaki et al. 2004). The burgeoning Indian population led to the emergence of Muslim associations from the 1930s, with the East African Muslim Welfare Society forming in 1945, culminating in the recognition of Islamic laws in schools, welfare services, and development agencies (see Nyangabyaki et al. 2004).

In South Africa, the first African political association, Imbumba Yama Afrika, formed in 1882, with other black organizations such as the *Ethiopian* church movement forming in 1892 (Swilling et al. 2004). Other self-help and mutual aid associations formed during this period included the Afrikaner Bond, the Boer Farmers' Protection Association, the Union of South Africa (1910), and the South African Native National Congress (SNNC), which later transformed into the African National Congress (ANC) (Swilling et al. 2004). In all, Swilling et al. (2004) note that two types of organizations emerged in response to the

apartheid regime and its subsequent social policies: *organizations of survival* such as informal saving clubs (*stokvels*), sports clubs, and other non-political associations; and *organizations of resistance*, comprising civic associations and trade unions. In Tanzania, the emergence of trade unions, peasant cooperatives, civil servant associations, and sports clubs is largely attributed to urbanization and industrialization, with trade unions and peasant cooperatives later becoming instrumental in the movement for national independence in the 1940s (Kiondo et al. 2004).

Membership associations in the South Asian region, especially India and nearby countries, have a very long history that can be divided into three periods: pre-colonial, colonial, and post-colonial. In the pre-colonial period, voluntary associations were abundant in the region. They were mostly self-help groups based on the religious values of *karma*, which is widely accepted by the three major religions practiced in the region: Hinduism, Islam, and Buddhism (Fernando 2011). The development of membership associations during the colonial period was heavily influenced by missionary organizations whose primary objective was to spread Christianity. They also worked with many poor and indigenous communities, undertaking both development work and advocacy (Haider 2011). The development of membership associations in the more recent past has been closely associated with the role of non-governmental organizations, but many of these associations are neither spontaneous nor self-formed, and their role has become increasingly controversial (John 2005). According to one recent study of the role played by NGOs in Nepal:

> local people had mixed perceptions of NGOs with a majority expressing dualistic views. On the one hand, they praised the NGOs for their work; on the other hand, they criticized them for not addressing local issues, catering to needs of donors and political leaders, implementing short-term projects, and making money from the projects.
>
> (Roka 2012:112)

China's civil-society organizations also have a long history (Smith with Ting, 2016), but they have often been used as adjuncts to the system of local government, and after 1949, they were strongly controlled by the Communist Party (Cai 2005; Yu 2002). However, the economic reforms of the late-1970s ushered in a new period of economic growth, which, after the death of Mao and the Reform and Opening, also facilitated a marked increase in voluntary association prevalence (Smith with Zhao 2016; Wang 2011), together with an explosion of academic interest (Zhang and Zhou 2008).

The development of voluntary associations in Canada and the United States was shaped by the circumstances under which they were settled and by the distinctive nature of their religious traditions (Ellis and Noyes 1990; Hall 2006;

Hammack 1998). As early as 1685, a *Bureau des Pauvres* was established in Quebec City to provide relief to survivors of the Great Fire of 1682, and to new immigrants, wounded soldiers, and plague victims (Bélanger 2000; Reid 1946).

In colonial America, religious congregations that rejected the practice of state-established churches were important early models of voluntary associations. This trend of forming new religious associations has continued to the present (Finke and Stark 2005), enhanced in the 18th century by the religious efflorescence of the First Great Awakening (Hall 2006). The 19th century and early 20th century also saw the formation of very large numbers of fraternal associations, such as the Ancient Freemasons, Elks, Moose, and Oddfellows (Kaufman 2002). In colonial times, associations also provided a fertile training ground for the establishment of anti-British political associations, such as the Sons of Liberty, during the 1760s (Bullock 1996).

The centrality of these associations in the Revolutionary cause gave pause to the first generation of American leaders, who cautioned against the formation of self-interested *factions* as detrimental to the republican order, based on broad public interest, which they hoped to achieve in the United States (Neem 2008). However, the organizational impulse was reinforced during the early years of the 19th century by the organizational and moral fuel of American Protestantism in the Second Great Awakening. Not only were Americans energetically creating new churches helter-skelter (Finke and Stark 2005), but this phase of evangelism encouraged direct reform efforts, accelerating, most notably, membership in the anti-slavery and temperance movements (Scott 1992). It was such activity that caught the eye of Alexis de Tocqueville, whose observations on American voluntary activity in *Democracy in America* helped cement the image of voluntary action as a key element of American political culture (De Tocqueville 1835; T. Smith 1980). The reorganization of the US postal system in the 1840s also facilitated the nationalization of voluntary organizations, linking citizens agitating for causes such as anti-slavery across the country (John 1995). Skocpol, Ganz, and Munson (2000) describe historical aspects of the development of national and sub-national associations in the United States, emphasizing the role of organizers and a kind of multi-level pattern of territorial organizing from the beginnings of the nation onward.

In both Canada and the United States, voluntary associations played a central role in efforts to improve social conditions and gave women a vital opportunity to participate in social life (see also Prochaska 1980). Women provided much of the volunteer workforce for the US Sanitary Commission, a quasi-public voluntary association formed in the North in 1861 to coordinate medical services for wounded Union soldiers. Upper-middle-class women also played a central role in the activities of the various Charity Organization Societies, which sprang up in many northeastern and mid-western cities during the latter years of the 19th century (Ginzberg 1990). Such women were also the driving force behind

many arts and cultural associations that sprang up in the late 19th and early 20th centuries (Blair 1994; McCarthy 1991). A wide range of voluntary associations, such as the Montreal Hygiene Committee, the Social Hygiene Council, and the Moral and Social Reform Council, also emerged in Canada during this period. Like their American counterparts, these groups often appeared to take a particularly individualistic and moralizing approach to the resolution of social problems (Elson 2008, 2011).

Immigration also shaped the world of volunteers and voluntary agencies. In late-19th and early-20th century Canada, ethno-cultural groups formed volunteer organizations such as libraries and reading clubs to preserve their language and culture, including music, dance, and sport (Lautenschlager 1992). In the United States, immigrant groups formed voluntary associations to preserve their linguistic and cultural heritage and to provide various kinds of welfare support, including building societies and burial funds (Beito 2000; Cohen 1990). African-Americans also established their own network of charities and civic associations when excluded from whites-only institutions (Gordon 1991). Activists in the Progressive Era, such as Jane Addams, used voluntary institutions such as settlement houses as a means to ease urban social tensions by connecting native-born middle- and upper-class volunteers with working-class immigrants (Davis 1984).

By the 1920s, the United States enjoyed a rich network of voluntary institutions, though in many associations the volunteers were increasingly displaced by professional staff (Lubove 1965). With the onset of the Great Depression, President Herbert Hoover hoped that civic-minded members of trade associations, professional societies, and charitable institutions might carry the burden of need during the downturn, but these organizations proved unequal to the task (Romasco 1965). While the expansion of the public safety net through the New Deal during the 1930s displaced some voluntary agencies, the decade also saw new venues for volunteers emerge – President Roosevelt's public endorsement of the March of Dimes campaign for polio research foreshadowed an explosion of health-related charities that would attract many middle-class volunteers in the postwar era (Morris 2009; Zunz 2012).

Nonetheless, the landscape of voluntarism in the United States did change dramatically in the postwar era, and particularly since the 1960s. Social and political causes such as the civil rights movement in the 1960s often drew on large numbers of grassroots participants and created new voluntary organizations. With their successes, though, such groups became increasingly focused on using professional staff to achieve and sustain their goals, while connections to individual members attenuated. Demographic changes such as increasing education and employment opportunities for women shifted the availability and composition of the pool of volunteers, while the passing of the Second World War generation has diminished membership in many traditional

fraternal and veteran organizations. Moreover, shifts in public policy, such as government contracting rather than directly providing social services, have created a nonprofit sector where the lines between public and voluntary are again quite blurry. Whether this portends good or ill for democratic participation, civic engagement, and the social safety net remains to be seen (Putnam 2000; Skocpol 2003).

Hall (2006) wrote a fine historical overview of the development of voluntary associations and other NPOs in America for the period 1600–2000. Two amateur historians, Ellis and Noyes (1990), wrote a history of Americans as volunteers, with much attention to voluntary associations. Some other historical overviews of voluntary associations in North America and in Europe include publications by Arai (2004), Bradley (2009), Gadd and Wallis (2006), Hammack (2002), Harris and Bridgen (2007), Hartson (1911), R. Morris (1990), A. Morris (2009), Schlesinger (1944), D. Smith (1973d: Part One; 1997), D. Smith and Baldwin (1974), and C. Smith and Freedman (1972:chapters 1–3). D. Smith (2013) has also described how the structures of associations have tended to change in the past 200 years or so.

5. The history of volunteer service programs (VSPs)

Although our Handbook is mainly about volunteering in associations, some chapters deal also with volunteering in VSPs (e.g., Handbook Chapters 15–17). Where associations are relatively, or completely, independent collective entities (groups or organizations), VSPs as collective entities are always dependent on some larger parent organization, which effectively owns them (cf. Smith 2015b, 2015d). Where associations are nearly always parts of the voluntary nonprofit sector (VNPS), VSPs by contrast are *usually* parts of that sector, but may instead be parts (actually *departments*) of businesses (e.g., a volunteer program in a for-profit hospital) or government agencies (e.g., a volunteer program in a government operated and owned national park). Brudney (2005) gives an overview of several recent types of VSPs, with most of them being topics of the Handbook chapters here.

Smith (2016b) has recently written a brief history of VSPs (the following paragraphs are quoted from that paper, with permission):

> Volunteers have been present in VSPs linked to government agencies/units for many centuries, usually without being termed VSPs by historians or others. Examples are volunteer militias, juries, local police patrols, and councils of local leaders (Smith 2015a). More recently, local draft (Selective Service) boards in the United States for wars in the 20th century have been composed of volunteers (J. Davis 1968; Perri 2013). Hence, such boards have been VSPs, *not* associations, since they have been government agencies.

In the past many centuries, state (*established*) churches in European countries have been quasi-government agencies. Although usually structured as strict hierarchies, with the power at the top and flowing downward, such churches in capital cities and in other cities and towns have usually had affiliated VSPs, again without historians using this technical term to describe them (Lynch 1992; Sirota 2014). For instance, there have been choirs, altar attendants, and affiliated VSPs that organized celebrations for specific saints on their feast days (birthdays) and on other religious holidays. Sometimes more independent confraternities of laypeople, as associations, have instead done the latter organizing, as noted earlier. State churches also set up charities and ran social welfare programs that were sometimes VSPs, rather than associations (e.g., Sirota 2014).

When relatively independent NPOs as nonprofit agencies have arisen in past centuries, such as hospitals, almshouses, libraries, museums, private schools, and universities in the UK, many of these have had VSPs, again without use of the terminology by historians (Gray 1967; Jordan 1959). Unlabeled VSPs have been even more frequent in the past two centuries in NPO health and social welfare agencies of most types in the United States, including settlement houses (Carter 1961; Chambers 1985; A. Davis 1984; Ellis and Noyes 1990; Katz 1986; Manser and Cass 1976; O'Neill 1989; Sieder 1960; Trattner 1973).

Further, various art, music, and other cultural NPO agencies arising in the past two centuries in the United States (e.g., orchestras, theaters, ballet companies, opera companies) have often had VSPs affiliated to them, either to help select presentations and/or to help with fund-raising and publicity (Blair 1994; Ellis and Noyes 1990; Ginzberg 1990; McCarthy 1991). Similar historical patterns of VSPs exist in other modern countries (e.g., Malcolmson and Malcolmson 2013; Olate 2007; D. Smith 1974).

6. Recent development of the concept of a nonprofit/voluntary/third sector

Although associations have manifested or demonstrated the VNPS as distinct from the family/household, business/private, and government/public sectors for about 10,000 years, the *concept* of the VNPS is very recent historically. Cornuelle (1965:26–27) wrote the first book articulating the concept of the *independent sector* or *third sector*, as he called it alternatively. In the 1970s, several other authors wrote books and articles elaborating on and promoting alternative VNPS terms, such as the *voluntary sector*, *nonprofit sector*, or *third* sector (cf. Smith 2016).

Smith and his colleagues defined and fostered attention to the term *voluntary sector* in various early publications (Smith 1973a, 1973c; 2016; Smith, Reddy and Baldwin 1972). The Filer Commission used this term in the title of its summary report, bringing much wider recognition to the term *voluntary sector* than had Smith's prior publications (Commission on Private Philanthropy and Public Needs 1975).

Levitt (1973) wrote the first book to use the term *third sector* in its title, while clearly referring to the independent sector or third sector concept invented by Cornuelle (1965). Very few authors followed up in using Cornuelle's term *independent sector* in articles or books, but his label *third sector* has become very popular indeed, in spite of being numerically incorrect (see Smith, Stebbins, and Dover, 2006:90, *fourth sector*).

Smith (1973a) used the term *nonprofit sector* early in the 1970s, but it became fairly common only later in the 1970s and in the 1980s in America (Salamon and Abramson 1982; Smith 2016; Weisbrod 1977). In the 1980s, the term *civil society* was promoted and became popular in some academic circles for referring to the sector (Ehrenberg 2011; Naidoo and Tandon 1999; Ndegwa 1996; Smith 2016). Similarly, the terms *social economy* and *solidarity economy* referring to the sector came into wide use only in the 1990s and later, especially among more economics-oriented academics in our field (Laville 2010; Quarter 1992; Sayer and Walker 1992; Smith 2016; Van Til 1988). Hall (1992), a professional historian, gave his interpretation of *inventing the nonprofit sector* as a concept, and Smith (2016) has given his version, as a direct participant in this history.

E. Usable knowledge

Pessimists say that "the only thing we learn from history is that people learn nothing from history." While probably true in general, we *can* learn some things from the history of associations sketched here. First, contrary to the perceptions of most people and scholars in our field, associations always have been and still continue to be the dominant form of NPOs in all countries since their beginning about 10,000 years ago. As such, associational life in all countries is important to encourage and protect. The association as a form of human group has proved itself to be useful and valuable in all human societies in the past ten millennia. The history of associations also suggests that this form of human group is exceedingly versatile in terms of goals that can be achieved, with the types of purposes for associations expanding especially in the past millennium, particularly since the Industrial Revolution beginning about 1800 in some countries (Boulding, 1953; D. Smith, 1973b). D. Smith (1973c) pointed out many positive impacts of associations for any human society, including serving as a latent resource that can be mobilized in various natural and man-made crises (see also Smith 2017).

F. Future trends and needed research

In recent years, voluntary associations have attracted increasing amounts of attention in all parts of the world, usually growing in numbers with population size and economic development, among other causal factors (Schofer and Longhofer, 2011; D. Smith 2016; D. Smith and Shen, 2002). In those countries that lack a strong tradition of voluntary organizations, voluntary associations are seen as critical to the formation of social capital (Hamrin 2006). Meanwhile, in other countries, concerns have also been expressed about the impact of both individualism and state action on levels of voluntary social activity (Couton and Cormier 2001; Putnam 2000). It is obviously difficult to draw any categorical conclusions from such a brief and sweeping survey as this chapter has been able to offer. However, while the *forms* of voluntary association may change, there is little evidence to suggest that the associational impulse is truly imperiled, contrary to Putnam's theses (Putnam 2000; Smith and Robinson 2017).

Future research is needed on many world regions and time periods not covered here. In terms of world regions, historical research is particularly needed for Asia, Africa, Eastern Europe, and Latin America. Regarding time periods, much more research is needed regarding ancient agrarian societies in various world regions and societies, for the so-called medieval period of Western history but in non-Western regions/societies, and for preindustrial and industrial societies in the regions noted above as lacking in research. Of special importance will be comparative historical studies of several or many societies in any world region or time period, seeking to understand broader trends (e.g., Bradfield 1973; Ross, 1976; D. Smith, 1997).

Theories of Associations and Volunteering

David H. Smith (USA), with Stijn Van Puyvelde (Belgium)

A. Introduction

This chapter reviews key theories relevant to the other Handbook chapters and also relevant to potential chapters not included here. Smith's basic contention is that most voluntaristics scholars (Smith 2013) view relevant theory far too narrowly, seriously limited by (a) academic discipline blinders and also (b) avoidance of topics reflecting social deviance and/or social conflict. As a corrective to such intellectual limitations, we include here brief reviews of theories that deal with (a) and (b). Many more theories of individual participation in volunteering and citizen participation are reviewed in Handbook Chapter 31, as relevant micro-theories.

We distinguish among (a) *macro-theories* that deal with the nature of the nonprofit sector as a whole, (b) *meso-theories* that explain aspects of nonprofit membership associations (MAs) as organizations or that explain looser collectivities like social movements or social conflict/protest campaigns, and (c) *micro-theories* that explain membership and participation by individuals as volunteers/members/participants/activists or that explain pro-social behavior more generally. Main sections here discuss (I) the nonprofit sector and the incidence-prevalence of associations within it; (II) conventional all-volunteer associations, distinguishing local (grassroots) associations from supra-local associations (state/province, regional, national, and transnational associations); (III) conventional paid-staff associations; (IV) deviant voluntary associations (DVAs); (V) other informal collective conflict and protest; (VI) membership, civic participation, and volunteering by individuals; (VII) general human behavior by individuals, with applications to sociality and association volunteering; and (VIII) prospects of developing a general theory of nonprofit sector phenomena.

B. Definitions

This chapter accepts the definitions of concepts and terms in the Handbook Appendix. The key definition for the entire Handbook is that an *association* (an *MA*) is "[a] relatively formally structured nonprofit group that depends mainly on volunteer members for participation and activity and that primarily seeks member benefits, even if it may also seek some public benefits" (see Appendix). In addition, MAs use the *associational form of organization*, defined as

> a manner of operating a group that usually involves having official members who are mostly volunteers, some elected formal nonprofit leaders, often a board of directors with policy control, financial support mainly from required annual dues (but may also include donations, fees and occasionally grants), often one or more committees as part of the leadership, and regular face-to-face meetings attended by active official members and informal participants.

In large, supra-local MAs, the face-to-face meetings may be infrequent, as in annual conferences or less frequent meetings, and usually only attended by a minority of all official members. Telephone and computer-mediated conference calls as *virtual meetings* are increasingly replacing face-to-face (in-person, real) meetings, especially for leaders of supra-local associations.

In addition, we note that when analyzing MAs, one must distinguish *all-volunteer associations* from *paid-staff associations*, where the latter involve one or more paid-staff individuals. *Local* all-volunteer MAs, also known as *grassroots associations* (GAs), are locally based, significantly autonomous, volunteer-run, formal nonprofit groups that use the associational form of organization (Smith 2000: ix). *Supra-local* all-volunteer MAs are similar to GAs, except for having a larger territorial base or scope. Such associations are one kind of supra-local nonprofit group, defined by Smith, Stebbins, and Dover (2006:223) as a "nonprofit group that serves a territory larger than a local community, such as a state, province, region, or nation" or a world region or the whole world.

We further distinguish *conventional* or *mainstream MAs* from *unconventional, fundamentally deviant associations*. *Deviant voluntary associations* (DVAs) are defined as local or supra-local MAs having one or more goals, or normative means of achieving one or more goals, that are seen to violate the current moral standards and norms of the surrounding society (Stebbins 1996:3; see also Handbook Chapter 54). For additional definitions of terms and concepts, see the Handbook Appendix and Smith, Stebbins, and Dover (2006).

In addition, MAs need to be distinguished carefully from formal *Volunteer Service Programs* (VSPs; Smith 2015b; see also Handbook Chapters 15–17).

Where MAs are relatively or completely independent collective entities (groups or organizations), VSPs as collective entities are *always* integrally dependent on some larger, parent organization, which effectively owns them. Where associations are nearly always parts of the nonprofit sector, VSPs by contrast are *usually* parts of that sector, but *only* when located in nonprofit agencies (Smith 2015b). VSPs may instead be parts (actually *departments*) of businesses (e.g., a volunteer program in a for-profit hospital) or government agencies (e.g., a volunteer program in a government-operated and government-owned national park). This distinction between associations and VSPs becomes especially important when we consider volunteering and volunteers, who can participate in either kind of context. Although there are similarities between associational and service program volunteers, there are also important differences (see Handbook Chapters 15 and 16).

Even more than DVAs, which use the associational form of organization, *informal collective conflict and protest* that expresses strong emotions is widely ignored by voluntaristics scholars. Yet riots, insurrections, rebellions, revolutions, and other forms of collective protest clearly involve voluntary action, as much as do more formal social movement organizations (SMOs)/MAs as DVAs (e.g., Anderson and Herr 2007; Ness 2009; Record 2007). There is a fast-growing interdisciplinary field of conflict and conflict resolution studies that includes such informal collective activities, and that needs to be seen as overlapping in part with voluntaristics, broadly understood (Bercovitch, Kremenyuk, and Zartman 2008; Coleman, Deutsch, and Marcus 2014).

Although volunteering is defined in the Appendix, based on Smith, Stebbins, and Dover (2006), here is a more recent, alternative definition by Smith (2016b), based partly on Cnaan (2004) and Cnaan and Park (2016):

> Volunteering is (a) a noncompulsory, voluntary (free will) activity or effort that is (b) directed by an individual toward a person, people, or situations outside one's household or close family that is (c) intended to be beneficial to another person or persons, group/organization, the local community, the larger society, and/or the ecosystem at some scale of magnitude, (d) with the activity being unpaid (unremunerated) financially or in-kind to the full, current, market value of the activity performed, leaving a *net cost* to the volunteer.

Definitions of terms and concepts are an important part of theory. There have been very few published attempts to define the full range of terms and concepts in the field of *voluntaristics* or *altruistics* (see Smith 2013b for the introduction of these terms), as a new way to refer to the entire field of nonprofit and voluntary sector/voluntary action research using a single word, as for nearly all academic

disciplines. Salamon (1997) made a relatively early attempt at defining terms, but we do not know how many terms/concepts were defined there. The next major attempt was by the Donors Forum of Chicago, published in Volume 2 of the three-volume encyclopedia edited by Burlingame (2004:533–541). This set of 96 concepts/terms focuses entirely on philanthropy and foundations. Hence, terms such as *associations*, *volunteer*, and *volunteering* are excluded.

Anheier and List (2005) made a somewhat more comprehensive attempt the next year. This volume had extensive inputs from advisory committees and contributors from many nations (see pp. vii–x). The resulting *Dictionary* defined "about 348 conceptual terms" (p. xiv). Nevertheless, no references are given to lodge the definitions in the research and theory of our field. Instead, a brief, select bibliography of 43 items is presented at the end of the book.

By far, the most comprehensive dictionary document is *A Dictionary of Non-profit Terms and Concepts* (Smith, Stebbins, and Dover 2006; a second, expanded edition is contracted and in process for 2017). This reference work defines 1,212 terms and concepts found to be useful in past research and theory on the nonprofit sector, with cross-references to an additional 555 terms (for a total of 1,767 terms included). About 1700 references lodge the definitions in the research literature of our field. The entries reflect the importance of associations, citizen participation, philanthropy, voluntary action, nonprofit management, volunteering, volunteer administration, leisure, and political activities of nonprofits. They also reflect a concern for the wider range of useful general concepts in theory and research that bear on the nonprofit sector and its manifestations in the United States and elsewhere. This dictionary supplies some of the necessary foundational work needed for a general theory of the nonprofit sector (see the book review by Jeavons 2008).

C. Historical background

The relevant theories of associations, civic participation, and volunteering have generally been recent in historical origin (cf. Smith 2016a). Those discussed here have all been constructed since approximately 1950, and most have appeared only in the past couple of decades (Smith 1975, 1994; Musick and Wilson 2008). Theories of informal collective social conflict, especially revolutions and rebellions, go back into the 19th century (e.g., Marx and Engels 1896) and even earlier (Kort 1952, referring to Aristotle 2,400 years ago), but detailed theories arose mainly in the first half of the 20th century (e.g, Adam 2013; Brinton 1938; Case 1923; Reeve 1933). By *theory*, we mean more than just general or specific talk or writing about a subject. We refer to a clear set of five or more *propositions* about how some phenomenon occurs or operates, and we term similar but smaller sets of propositions (one to four) *models*.

D. Key issues

I. Macro-theories: The nonprofit sector and its associations

1. Nonprofit sector nature, origins, and structure

Abzug (2004) discusses and critiques sector theories, with special attention to the voluntary nonprofit sector (VNPS), contrasting the VNPS with the informal (underground, black market) sector. Wagner (2012) distinguishes the *third sector* and *civil society* as somewhat different perspectives on the VNPS. Smith (2016a) has recently reviewed the development of VNPS terminology. Billis (see Handbook Chapter 8) discusses the distinctive nature of the VNPS and issues of sector overlap, blurring, and hybridity with other societal sectors. In section C, #6, Handbook Chapter 1 reviews briefly the history of the VNPS concept.

Anheier (2005) offers an overview of various economic, sociological, and political science approaches that address the origins of the nonprofit sector. From an economic perspective, a number of demand and supply theories have been developed to explain the existence of nonprofit organizations (NPOs) in general, including the *contract or market failure theory*, the *public goods or government failure theory*, *entrepreneurship theories*, and *stakeholder theories* (see also, Anheier and Ben-Ner 2003). In contrast to these economic approaches, the *interdependence or voluntary failure theory* developed by Salamon (1987, 1995) argues that the relationship between the nonprofit sector and the government is not one of conflict or competition, but rather one of partnerships and extensive government support to NPOs. More specifically, given that voluntary action may be limited, sporadic, unorganized, and inefficient, there also exists *voluntary failure* besides market and governmental failure. As a consequence, the government may intervene by providing, for example, a more stable stream of resources.

In addition, the *social origins theory*, developed by Salamon and Anheier (1998), argues that cross-national variations in size and composition of the nonprofit sector actually depend on the type of nonprofit regime in each nation. In particular, they distinguish four types of nonprofit regimes (liberal, social democratic, corporatist, and statist) based on two key dimensions: extent of governmental social welfare spending and economic scale of the nonprofit sector. Each type reflects a particular constellation of social factors, policies, and policy-making, which leads to the development of a certain form of nonprofit sector. In sum, by taking a comparative-historical approach, the authors move away from the emphasis on microeconomic models and identify circumstances in which cooperative nonprofit–state relationships are most likely to emerge (Anheier 2005).

Smith has been developing and testing for 40 years a theory of association prevalence across territories using different data sets and territorial levels of analysis (Smith 1973, 2011, 2013a; Smith and Baldwin 1983, 1990; Smith and

Shen 2002). Each of these publications reports analyses that explain substantial amounts of the variance in association prevalence, unlike many other theories, including that of Salamon and Anheier (1998) who provide no results from a multiple regression analysis. The most succinct version of Smith's general theory of voluntary association prevalence (Smith and Shen 2002) sets out three broad types of societal factors: (1) *societal background factors* (greater population size and more favorable historical–cultural–environmental interface); (2) *aspects of basic societal structure* (more permissive political control, greater modernization, more developed organizational field, and greater ethno-religious heterogeneity); and (3) *societal mobilization factors* (aggregate resource mobilization for associations and aggregate social cohesion). Schofer and Longhofer (2011) later developed and tested a similar theory (they added some variables compared to Smith and Shen [2002], and omitted others). Both the latter research and that of Smith and Shen (2002) explained from 70% to 89% of the variance in association prevalence. None of the other theories mentioned above even comes close to this level of successful explanation/prediction.

2. Nonprofit sector's relationship to the other sectors in society

The relationship of the nonprofit sector to other societal sectors has been studied and discussed by various scholars. First of all, Smith (1991) suggested that the nonprofit sector really consists of two distinct subsectors, or that these two subsectors can be seen as the fourth and fifth sectors of society: (1) the member-benefit sector and (2) the non-member-benefit sector. The member-benefit sector consists mainly of nonprofit associations (Smith 2015a), while the non-member-benefit sector consists mainly of nonprofit agencies (Smith 2015b). Smith argues that these two sectors operate very differently, with their constituent groups/organizations usually having internally focused versus externally focused goals.

Chapter 46 of this Handbook, by Wiarda et al., discusses at length the relationship of the nonprofit sector, particularly associations, to the larger political regime structure of a society (the government, public, or statutory sector). Pluralism, corporatism, and authoritarianism are three principal types of such relationships. In Chapter 8, Billis discusses differences among three sectors he identifies, including the associational sector, and their interrelationships.

3. Nonprofit organization incidence-prevalence-exit rates

(a) Major perspectives on NPO prevalence.   Three broad theoretical perspectives have been used to explain the existence of NPOs in general and the variations in size of the nonprofit sector across different geographical areas: demand theories, supply theories, and theories of social structure.

(i) *Demand theories* suggest that NPOs arise in the economy to correct market and governmental failures. In brief, demand for NPOs exists because they can be entrusted to provide collective goods in case of demand heterogeneity and limited governmental supply and to guarantee the quality of services in case of information asymmetry (Anheier 2005; Hansmann 1987).

(ii) *Supply theories* argue that NPOs are typically formed by entrepreneurs who want to exercise control over the organization and maximize non-monetary returns (Anheier 2005; Badelt 1997).

(iii) *Social structure theories* suggest that variations in nonprofit sector size can be explained by factors such as population size, employment structure, political culture, and social cohesion (Corbin 1999; Grønbjerg and Paarlberg 2001; Smith and Baldwin 1983; see Handbook Chapter 50).

(b) Complications in NPO prevalence explanations.   As consumers may demand goods and services from NPOs for the same reason that entrepreneurs form a nonprofit firm, it may be necessary, when examining differences in nonprofit sector size, to analyze demand and supply factors simultaneously (Ben-Ner and Van Hoomissen 1991; Marcuello 1998). Socio-economic characteristics that may simultaneously affect demand for and supply of NPOs include income, education, and population heterogeneity (poverty, unemployment, and racial and religious diversity in the population). For example, a higher income and higher level of education may not only imply less demand for NPOs (higher capability to choose a reliable for-profit provider in case of information asymmetry), but also imply greater supply of NPOs (higher capability to create a nonprofit firm).

4. Association incidence-prevalence-exit rates

A detailed discussion of the topic of this sub-section is available in Chapter 50, which is mainly concerned with this issue. Theoretical and empirical literature on voluntary association prevalence has mainly focused on societal factors to explain differences in prevalence rates. The simplest summary is as follows: Two key and substantially overlapping theories of association prevalence have been tested on data for one-third to two-thirds of the nations in the world (Schofer and Longhofer 2011; Smith and Shen 2002). Key factors leading to greater association prevalence in a nation were population size, educational levels, wealth levels (GDP per capita), civil liberties/democracy, non-associational organizational field, resource organizations/mobilization for associations, historical interface/momentum, state expansion, and political instability, Both theories were able to explain large amounts of the variance (70%–89% of the R^2) in prevalence, adjusting for statistical degrees of freedom. Other studies by Smith and associates at the societal and lower territorial levels (states/provinces,

municipalities) have also born fruit (Smith 1973, 2011, 2013a; Smith and Baldwin 1983, 1990), as have studies by others at the county and municipality levels (e.g., Lincoln 1977; Wollebæk 2010). Nonetheless, there are few models or theories of association incidence (formation) or exit (death) rates.

II. Meso-theories: All-volunteer conventional associations

1. Voluntary associations in theoretical context

Organization theorists and researchers have largely ignored voluntary associations. The extensive review of the organizational research literature by Tolbert and Hall (2010) continues in its tenth edition to virtually ignore about 50 million associations in the world, as estimated by Smith (2014b) from many empirical studies. In addition, handbooks and encyclopedias on NPO theory and research have only devoted a tiny amount of their space to nonprofit associations (Anheier 2005; Anheier et al. 2010; Burlingame 2004; Powell and Steinberg 2006). Although some general theory about associations exists (Knoke 1990; Smith 2000, 2017a, 2017c), a review of the research literature on membership associations (Tschirhart 2006) concluded that association research remains a largely unintegrated set of findings needing a more comprehensive theory.

Therefore, in this section, we discuss some economic theories of nonprofit organizations (see, e.g., Hansmann 1987) to determine whether the propositions and empirical findings of these theories can be useful in analyses of nonprofit associations. In particular, we investigate how theories about the objectives, formation, and prevalence of voluntary associations fit the broader economic theories of nonprofit organizations.

2. The life cycles of all-volunteer associations

The topic of this sub-section is dealt with at length in Handbook Chapter 37. In summary, here we may say that there has been only a modest amount of research on this subject and few attempts to develop related theories.

3. Internal structures and processes in all-volunteer associations

In his book *Grassroots Associations*, Smith (2000; see also Smith 2004, 2010a, 2010b, 2015a) constructed the first comprehensive general theory of associations having 100+ hypotheses/propositions, with a central focus on GAs versus paid-staff nonprofits. Smith's theory is the first to fill the large theory gap identified by Knoke (1986:2) in his review of research and theory on associations: "Put bluntly, association research remains a largely unintegrated set of disparate findings, in dire need of a compelling theory to force greater coherence upon the enterprise." Tschirhart (2006:536) has stated that "such earlier assessments still hold today." However, her review of research on membership associations was optimistic that theory about grassroots associations (Smith 2000) could form the kernel of a broader theory of associations.

Smith's (2000) theory of GAs covers several major areas of structure and process presented here as selected propositions (general hypotheses) from each chapter of Part II of his book. Smith derived the 100+ hypotheses of his theory inductively by reading about 2,000 published books and articles and citing 948. He also drew on 60 years of participant observation experience in a wide variety of GAs in his life.

(a) Founder choices.   Table 3.1 in Smith (2000:89) indicates that GAs (and hence all-volunteer associations in general) tend to have the following characteristics:

• located in the voluntary nonprofit sector (VNPS),
• mostly focus on member benefits in their goals,
• have an informal group style of operation and structure,
• are high in operational autonomy relative to external organizations,
• are moderate in their local territorial scope of activity and membership base (supra-local associations would have correspondingly different and larger territorial scope),
• have diffuse goals,
• have conventional (not unconventional, deviant) goals,
• use conventional means to achieve them, and
• have some socio-demographic membership criteria (requirements for entry).

(b) Ideology and incentives.   Table 4.1 in Smith (2000:105) indicates that GAs (and hence all-volunteer associations in general) tend to have the following characteristics:

• moderate conventional ideology (while DVAs tend to have strong deviant ideologies),
• strong sociability incentives for members,
• similarly strong purposive incentives (satisfactions from pursing valued collective goals),
• similarly strong service incentives (satisfactions from helping others),
• moderate informational incentives (learning new information),
• moderate developmental incentives (personal growth),
• sometimes strong other incentives for members,
• usually weak utilitarian (economic) incentives, and
• weak other work organization incentives.

(c) Structure.   Table 5.1 in Smith (2000:124) indicates that GAs (and hence all-volunteer associations in general) tend to have the following characteristics:

- a small locality base/territory (or a larger one, in supra-local all-volunteer associations),
- substantial autonomy in their structure,
- operate mainly with volunteer work/labor (no paid employees),
- have mainly informal tax exemptions (not registered with the national Internal Revenue Service in the United States, for example),
- are only informally organized (not incorporated with the government as legal persons),
- practice significant internal democracy (members elect top leaders),
- have mainly member-benefit goals (rather than goals to benefit non-members and/or the general public),
- are more likely to be polymorphic (branches of some larger association),
- have substantial socio-demographic homogeneity of members, and
- have few economic resources of money or personnel.

(d) Processes and operations. Table 6.1 in Smith (2000:147) indicates that GAs (and hence all-volunteer associations in general) tend to have the following characteristics:

- evening and weekend timing of meetings, events, and other activities;
- intermittent activities (not continuous activities, such as daily activity from 9 a.m. to 5 p.m. Monday through Friday in the United States);
- low professionalism of both leaders and members;
- low (usually no) external funding from major gifts/donors, grants, or contracts;
- broad, intermittent political activity, if any (unless they have explicit political goals);
- low external power in their communities;
- only low to moderate prestige locally as groups/organizations;
- more likely to be fundamentally deviant or to have deviant leaders/members temporarily;
- distinctive group action norms;
- do mainly informal (personal) recruitment;
- do informal socialization of new members (not formal training);
- members leave mainly by voluntary termination (not ejected or fired/sacked by the group);
- do low or moderate horizontal collaboration with external groups/organizations, if any;
- younger age as groups (low in longevity or life span of group).

(e) Leadership and group environment. Table 7.1 in Smith (2000:165) indicates that GAs (and hence all-volunteer associations in general) tend to have the following characteristics:

- require leadership as essential to their existence, even if collective/egalitarian leadership,
- elect their top leaders (rather than appointing them, except for lower-level leaders like committee chairs and committee members),
- volunteer (not paid) leaders,
- leaders who practice low professionalism (enjoying their leisure, rather than making a job of it),
- higher-status males as leaders in all-male or usually in mixed-gender groups,
- leaders who emphasize consideration (personal relationships and kindness),
- leaders who do not supervise their followers or sub-leaders closely (instrumental accomplishments are usually secondary to positive and close interpersonal relationships),
- do only loose and vague priority setting for the group,
- acquire funds and new members in a routine manner (rather than pursue these strategically),
- obtain leaders only from among existing members (not selected from outside the group),
- low levels of selectivity for leaders (few requirements, beyond willingness to serve and significant time spent in the group),
- more leader quality problems (because of low leader selectivity), and
- few (or no) relations with the government at any territorial level, especially for local (vs. supra-local) associations.

(f) Life cycle changes. The Conclusion of Chapter 8 in Smith (2000:192–193) indicates that as GAs (and hence all-volunteer associations in general) get older and pass through their life cycle, they tend to have the following characteristics:

- increase in size and complexity,
- still often resist increasing complexity (see Handbook Chapter 40),
- a greater number and proportion of leaders,
- acquire paid staff with age (may become paid-staff associations),
- acquire greater assets and income/revenue,
- achieve greater *good will* and public recognition,
- more collaboration and have more other relationships with other groups/organizations,
- more external fund-raising (seek large donations/gifts, grants, and contracts from external persons and organizations),
- more likely to change their group goals (goal succession),

- more likely to displace their original goals in favor of sheer group mainte-nance/survival/growth (goal displacement), and
- more likely to survive (be active) at any subsequent time as they continue to live.

(g) Impact and effectiveness.   Table 9.1 in Smith (2000:212) indicates that GAs (and hence all-volunteer associations in general) tend to have the follow-ing characteristics:

- to provide their members with a high level of felt social support,
- provide members with high levels of felt information gained,
- provide members with high levels of felt socio-political activation,
- provide only moderate external political influence (if any),
- provide members with more economically valuable contacts (social capital),
- provide members with greater happiness/satisfaction,
- provide members with better health, and
- support the economic system of their society.

Smith has also written several other articles that analyze empirical data, or theorize based on literature reviews, the aspects/factors for GAs (and hence all-volunteer associations in general) that promote *greater impact and effec-tiveness* (Smith 1985, 1986, 1990, 1997a, 1997b, 1999a, 1999b, 2015a; Smith, with Eng and Albertson 2016; Smith and Shen 1996; Smith and Smith 1979a, 1979b, 1979c). Smith (1999a, 1999b) stated a set of generalizations that were empirically derived hypotheses about GA effectiveness, hence consti-tuting a theory of such phenomena focused on internal and also external impacts.

III. Meso-theories: Paid-staff conventional associations

In this section, we discuss the paid-staff association, which is a special form of NPO that has natural persons or organizational representatives as members, uses the associational form of organization, and relies on both volunteers *and* paid staff to reach organizational goals (Smith 2010b). However, the theoretical literature on structures and processes in this type of associations is most lim-ited, compared with that on general NPOs (meaning nonprofit agencies) and voluntary associations (Smith 2015a, 2015b). The main goal of this sub-section is therefore to identify the key governance issues, tensions, structures, and processes in paid-staff associations. For a detailed discussion of internal struc-tures and processes in all association types and a multi-theoretical approach to associational governance, including the governance of paid-staff associations and association leadership, see Handbook Chapters 35 and 36.

By reviewing some main theoretical perspectives on corporate governance and discussing how they can be usefully extended to analyze association governance, Cornforth (2004) identifies three governance tensions that boards of membership associations face. First, tension exists between *representative* and *expert* boards. Should board members act as representatives for particular membership groups or as experts that use their professional expertise and skills to improve the performance of the association? Second, tension arises over conformance and performance board roles. Whereas the conformance role accentuates the importance of monitoring associational performance and being accountable to external stakeholders, the performance role emphasizes the importance of board involvement in the association's strategy and top management decisions. Since these roles require board members to behave in different ways, how much attention should boards of associations pay to these contrasting roles? Moreover, is it possible to combine these roles without experiencing difficulties or compromising one of them?

Third, there is also a tension between monitoring and controlling managers, on the one hand, and acting as a partner to them and supporting them, on the other hand. For example, if control is excessive, intrinsic motivation may be crowded out. Too little control, however, may increase opportunism. Since boards of associations may experience pressure to simultaneously control and coach their managers, to what extent should they perform each function to improve associational performance?

Although association board members are typically elected from within the membership, boards of associations are not without means to mitigate the aforementioned governance tensions (Cornforth 2004:21–26). In sum, boards can

(1) *improve the board's competency* by improving the quality of training and support available to both current and potential board members, as well as by using co-options to fill gaps in skills and experience among current board members;
(2) *focus their attention on important board processes*, such as the way in which longer-term issues are given priority on the board's agenda; and
(3) *regularly review their relationships with the management of the association* by discussing and negotiating roles and responsibilities and by analyzing how well they are working together to improve the performance of the association. As such, governance issues related to board composition, board roles, and internal structures and processes in paid-staff associations may at least be partially resolved.

Spear (2004), in contrast, investigates member influence and managerial power in membership associations. First, in examining the extent of

member influence over the board, he considers five issues: (1) proportion of users/consumers with member rights, (2) member participation, (3) effects of association size and age on member participation, (4) coalition formation among members, and (5) board functioning. Second, in exploring managerial power in membership associations, he analyzes a number of internal factors (reward structures, information systems, and monitoring) and also a number of external factors (market for corporate control, legislation and regulatory frameworks protecting members' interests, and the professionalization of the managerial labor market) that influence associational governance. In sum, he finds that low member participation, lack of coalition formation, and insufficient board control result in weak member control.

This situation is exacerbated by the absence of an external market for corporate control and weak legislation for protecting member rights, although the latter may vary from country to country. Consequently, Spear (2004) argues that (a) there are serious questions about the extent to which board members of paid-staff associations may be considered representative and that (b) the managers of paid-staff associations may have more power than their counterparts in similar-sized private sector organizations. To improve this situation, a number of countervailing measures are provided that reduce managerial power and develop good board practices in nonprofit associations. These include (1) *regulation or voluntary self-regulation* to improve governance standards, (2) *improving the board's competency* through increased member participation and training of board members, and (3) using *effective incentive structures for managers* (Spear 2004:54–55).

IV. Meso-theories: Deviant voluntary associations (DVAs)

The general study of fundamentally deviant voluntary associations (DVAs) is in its infancy, not only in regard to theory, but also in regard to systematic comparative study. DVAs are MAs whose main goals, or means of achieving them, violate one or more current moral norms of the society in which they are embedded or operate (Stebbins 1996:3). Hence, the deviance involved is fundamental and enduring regarding the goals, or means of goal attainment, in DVAs, unlike temporary deviance in conventional associations (see Handbook Chapter 54).

There are many case studies of DVAs (see references in Smith 2017a, 2017c) by historians, anthropologists, and other social scientists. However, there have been very few attempts to develop theories or models explaining how DVAs of specific types or DVAs in general function (but see Smith 2017a, 2017c; see also Handbook Chapter 54).

1. Theories of Social Movement Organizations

One exception to the foregoing generalization about DVAs is theory about social movements and their constituent social movement organizations

(SMOs), which are usually DVAs. Many scholars have developed, with varying degrees of generality, models and theories of social movements and SMOs in the past half-century (e.g., Buechler 2011; Gamson 1990; Laraña, Johnston, and Gusfield 1994; Lofland 1996; McAdam and Snow 1997; Morris and Mueller 1992; Snow, Soule, and Kriesi 2004; Zald and McCarthy 1987). We will consider only two examples here.

(a) Zald and Ash-Garner's theory of SMOs. Zald and Ash (1966; in slightly revised form as Zald and Garner 1987) presented a theory of SMO growth, decay, and change with 17 propositions. This was unusual, because it seems to be the first orderly and extensive set of propositions about SMOs as DVAs ever to be published. To have a flavor of their theory, consider these sample propositions:

  (i) "Proposition 5: [SMOs] with relatively specific goals are more likely to vanish following success than [SMOs] with broad general goals" (Zald and Garner 1987:130).
 (ii) "Proposition 8: A becalmed [SMO] is most likely to follow the Weber-Michels model [of goal displacement, oligarchy, and organizational maintenance] because its dependence on and control of material incentives allows oligarchization and conservatism to take place" (Zald and Garner 1987:131).
(iii) "Proposition 13: Exclusive [SMOs] are more likely than inclusive [SMOs] to be beset by schisms" (Zald and Garner 1987:135).

(b) Gamson's theory of effective SMOs. Gamson ([1975] 1990) presented and tested a general theory of SMO effectiveness and impact, based on careful coding of published qualitative material describing a random sample of 53 US SMOs from 1800 to 1945. He did not state all his propositions as such, but they can be inferred from hypotheses in his text and graphs reporting data testing them. For present purposes, we focus on his dependent variable *new advantages* as the outcome/impact criterion. Here are a few of the propositions, with statements of the propositions and numbering by the present first author. Note that all of these might be true of all DVAs and perhaps of all groups in general:

  (i) Proposition 2: SMOs that focus mainly or solely on a single issue tend to achieve more new advantages than multiple-issue SMOs (Gamson 1990:46).
 (ii) Proposition 8: SMOs that use selective incentives (special inducements or constraints for members only) to recruit and retain members tend to achieve more new advantages than SMOs that rely only on solidarity incentives, such as appeals to values or group loyalty (Gamson 1990:69).
(iii) Proposition 15: SMOs that have both more bureaucratic structure (written constitution or equivalent, formal list of members, three or more levels

of internal divisions/levels) and greater centralization of power/authority tend to achieve more new advantages than SMOs that are less formally organized (Gamson 1990:91–95).

(iv) Proposition 17: SMOs that avoid factionalism (serious internal splits) tend to achieve more new advantages than SMOs that experience factionalism (Gamson 1990:105).

2. Smith's general theory of DVAs

From general reading of the research literature, mainly qualitative case studies on DVAs, and from teaching for many years a course on DVAs (Smith 1996), Smith inductively generated 51 hypotheses about DVAs in general (Smith 2017a). With the collaboration of Robert Stebbins, Smith sought support for these hypotheses by additional, more formal content analysis of qualitative published research on a wide variety of DVAs, mostly using books rather than articles (ibid.). Using this content analytic process over the course of two years, Smith developed an additional 37 hypotheses, for a total of 88 hypotheses, which were also subjected to content analysis for empirical support.

The set of documents that were content-analyzed were selected purposively to include coverage of 24 common sense (natural language) categories of DVAs as expressed in two independently published books for each type (Smith 2017a). Most books described DVAs in North America, especially the United States, but some books reached back up to 800 years and described DVAs on other continents, mostly Europe. These *final* 24 DVA types, winnowed down theoretically from a larger set of 57 initial categories/types, fall into three broader, constructed categories: (a) political influence/liberation DVA types (e.g., social movement groups, terrorist groups, vigilante groups, citizen militia groups, extremist political parties); (b) religious/salvation/occult DVA types (e.g., new religions [*cults* and deviant sects], medieval heresy groups, witches' covens, religious communes, doomsday/suicide/massacre groups); and (c) hedonic satisfaction DVA types. Category "c" has two sub-categories: (1) negative emotional expression (e.g., hate groups, motorcycle outlaw gangs, juvenile delinquent gangs) and (2) positive emotional expression (e.g., group sex/swingers' groups/group marriage, transvestite groups, nudist/naturist groups, gay/lesbian groups, and some secular communes).

The 88 inductively generated DVA hypotheses were clustered by topic into several broader categories, which are chapters in Smith (2017a). From four of these broad categories, we present here illustrative hypotheses that were strongly supported by the content analytic process (ibid.).

(a) Origins phase

(i) "Hypothesis OR.5: During their origins phases, [DVAs] usually follow significant aspects of the organizational pattern of some prior, similar,

group predecessor, which was linked to one of more of the founder-activists of the current [DVA] by that person's life experience, often as a member or participant."

(ii) "Hypothesis OR.9: If successfully established, new DVAs are nearly always fundamentally deviant from one or more societal moral norms from the time period of their origins, rather than starting as conventional associations and shifting later to become DVAs."

(b) Joining and membership

(i) "Hypothesis JM.12: Members of DVAs are particularly attracted to solidary (sociability) incentives and rewards provided by such groups – a sense of belonging, community, acceptance, caring, and support."

(ii) "Hypothesis JM.17: DVAs often involve high commitment by members, developed through mechanisms of commitment built into group structure [and processes]."

(c) Ideology

(i) "Hypothesis ID.1: DVA ideologies try to create a *fictive reality* that opposes and rejects aspects of mainstream society, its norms and beliefs."

(ii) "Hypothesis ID.5: DVA ideologies are often based on the beliefs and values of the group's founders, which are preserved with modest changes over time."

(d) Structure and leadership

(i) "Hypothesis SL.4: Obedience and conformity by DVA members in meetings and other collective events tend to be high."

(ii) "Hypothesis SL.8: DVAs seek isolation and secrecy from conventional society to some significant degree [often operating underground]."

(iii) "Hypothesis SL.23: Insofar as leadership is present, leaders are usually promoted from or emerge from within the DVA, rather than being brought in from outside."

(V) Meso-Theories: Informal Collective Conflict/Protest

As noted in this chapter's Introduction and Definitions sections, the overlap between (a) research on informal (or semi-formal) collective conflict/protest and (b) voluntaristics research is usually ignored by voluntaristics scholars, but also by social conflict scholars (e.g., Anderson and Herr 2007; Bercovitch, Kremenyuk, and Zartman 2008; Coleman, Deutsch, and Marcus 2014; Ness 2009; Record 2007). Such mutual ignorance does not serve theory or research in either field. Because of the vastness of the research field of informal collective conflict and protest, we can only scratch the surface of relevant theory

here (but see especially Smith 2017d for more details on such research and theory). It is important to remember that conflict and protest are not necessarily harmful to society, but instead often have positive outcomes, as Coser (1956) explained at length long ago. See also Smith (2017d) for many positive societal and historical outcomes of social conflict as impacts of MAs and related informal collectivities.

1. Gurr's Theory of Why People Rebel Violently

Among various theories of informal collective conflict/protest that have been presented over the past century or two, Gurr's (1969) theory of *why people rebel* is outstanding for its extensiveness and deep roots in the empirical literature up to the date of its publication. Although Gurr has done much additional work on social conflicts (e.g., Goldstone et al. 2010; Gurr 1980; Gurr, Jaggers, and Moore 1990), as have many others (e.g., Jenkins and Schock 1992; Oberschall 1978; Van Zomeren, Postmes, and Spears 2008), Gurr's 1969 theory remains impressive (cited by about 6,000 other scholars), with 82 hypotheses and corollaries, showing the lasting value of high quality and extensive theory. Here are a few interesting propositions from that theory, for most of which the intellectual linkages are clear to general voluntaristics research, especially on DVAs, but also on participation in MAs generally:

> "H:V.1: The potential for collective violence varies strongly with the intensity and scope of relative deprivation (RD) among members of a collectivity." [p. 360]

> "H:ID.1: The intensity of RD varies strongly with the average degree of perceived discrepancy between value expectations and value capabilities." [p. 361]

> "H:VC.3: Perceived value capabilities vary strongly and inversely with the rate of a group's past experience of value loss." [p. 362]

> "H:JV.2: The intensity and scope of normative justifications for political violence vary strongly with the historical magnitude of political violence in a collectivity [or population]." [p. 363]

> "H:RI.1: Regime institutional support varies strongly with the proportion of a population belonging to regime-oriented organizations." [p. 365]

> "H:T.1: The likelihood of turmoil increases as the ratio of dissident to regime coercive control approaches zero [in a population or society]." [p. 366]

2. Chenoweth and Stephans' Theory of Nonviolent Resistance

Although research on *violent* social conflict involves a huge literature over centuries, there is also a recent but significant research on *nonviolent* approaches

to conflict resolution, which was given a great impetus by the life and career of Gandhi (cf. Juergensmeyer 2005). In addition to practical books on how to do nonviolent resistance successfully (e.g., Nagler 2014; Sharp 2012; Sharp and Paulson 2005), there are many empirical studies and also various handbooks/summaries on the nature and effectiveness of nonviolent resistance/social conflict (e.g., Engler and Engler 2016; Nepstad 2011; Record 2007), often enunciating general principles/hypotheses.

Chenoweth and Stephan (2011) examined 323 nonviolent and violent social conflicts occurring from 1900 to 2006 in all world regions and political regime types, finding that the nonviolent approaches were more successful: 53% of the time versus 27% for violent/armed approaches. These findings are consistent with Gamson's (1990) results about greater success of nonviolent American social movement organizations in the period 1800–1945. Here we state briefly some of the key conclusions reached by the authors about effective nonviolent resistance:

- Domestic and transnational legitimacy of the movements involved are improved by a nonviolent approach, usually leading to more participation by the population in the movement.
- Broader population participation in the movement puts more pressure on the government to make some or all of the political changes sought.
- Government regimes find it harder to oppress/repress nonviolent movements, and such oppression/repression can often backfire and generate sympathy for the movement in the general population.
- The population usually perceives nonviolent movements/approaches as less extreme, improving their popular appeal to and support or tolerance by the general population.
- With more popular support, nonviolent movements can often extract more concessions from the government regarding key political change issues in bargaining.
- Government regime officials (e.g., civil servants, security forces, judiciary officials) are more likely to shift to the side of a nonviolent movement than to shift toward supporting a violent change-oriented movement.

VI. Micro-theories: Association membership, participation, and volunteering

The micro-theories relevant to this part of this chapter are presented at length in Handbook Part IV and will not be repeated here. Handbook Chapter 31 gives an overview of the most comprehensive theories and models of participation that have been tested empirically. Very substantial portions of the variance (40%–70%) in volunteering and participation can be explained by the best of these theories, such as S-Theory (e.g., Smith 2017b).

Rochester's (2013) recent book is one example of renewed interest in theories about volunteering and voluntary action (see also Rochester, Paine, and Howlett 2010). Rochester (ibid.:chapter 8) discusses three paradigms of volunteering, as different contexts all of which are needed for a *round earth* map of volunteering (Smith 2000:chapter 10)– a dominant *nonprofit paradigm* involving VSPs; a *civil society paradigm*, involving self-help and mutual aid in associations; and a *serious leisure paradigm*, involving arts, culture, sports, and recreation activities also in associations.

Smith (2015a, 2016b) prefers a different but related approach. He distinguishes five analytical types of volunteering, based on the external context of each type, as follows, with types #2 and #4 corresponding to Rochester's three paradigms, but adding #1, 3, and 5 in the list below (quoted with permission of the author from Smith 2016b):

(1) *Informal volunteering* (INV), where there is no relevant external group or organization as a context and role guiding the individual's volunteer activity (see Handbook Chapter 9);

(2) *Formal association volunteering* (FAV), where the individual is acting in a role as a volunteer member or participant in an external association (see most chapters of this Handbook);

(3) *Formal board volunteering* (FBV), where the individual is acting in a role as a volunteer member or participant in a policy-making board, commission, or similar elite unit of some larger organization, whether an NPO or not (not the subject of a chapter of this book, given insufficient research literature);

(4) *Formal service-program volunteering* (FSPV), where the individual is acting in a role as a service-providing volunteer as part of some VSP, that is a non-autonomous, volunteer department of some larger, parent organization in any sector of society (see Handbook Chapters 15–17 and parts of other chapters); and

(5) *Stipended service volunteering* (SSV), where the individual is acting in a role as a service-providing volunteer as part of some volunteer service program (VSP) but receives significant payments, either financially or in kind, which still leave a net cost to the volunteer relative to the market value of the activity performed (as in the US Peace Corps as a trans-national SSV, or a domestic SSV program, such as VISTA; see Handbook Chapters 10 and 11).

VII. Micro-theories: General human behavior, especially pro-social behavior

Psychologists, sociologists, and other social scientists have been seeking general theories of individual human behavior for the past 80 years or more.

An example of an early proto-theory in psychology is Lewin's pseudo-equation for behavior:

$$B = f(P, E),$$

where B = behavior, P = person, and E = environment (Lewin [1936] 2008). It is not clear whether Lewin sought to quantify his pseudo-equation, which seems more like a heuristic device. In sociology, Homans' (1961) exchange theory is a more recent but still early example. In political science, Almond and Verba's (1963) Civic Culture model of political participation is an early example.

In Handbook Chapter 31, Smith with Van Puyvelde briefly review various recent theories and models in three social-behavioral sciences and some fields of biology that are converging toward a common theoretical approach to explaining human individual behavior. In the past three years, Smith (2014a, 2015c, 2017b) has used his view of such convergence to construct S-Theory (Synanthrometrics). S-Theory is presented as a comprehensive, quantitative, interdisciplinary, and consilient theory of human behavior and proposed as a new Standard Human Science Model.

S-Theory is exceedingly complex and therefore difficult to summarize effectively. It posits a Basic Behavior Equation (BBE) in various forms that are hypothesized to explain and predict the complexity of nearly all instances of individual human behavior, including sociality and voluntary action.

Quoting with permission from Smith (2017b):

S-Theory can be summarized in a Brief Basic Behavior Equation (Brief BBE) in deterministic form [Smith 2017b: Proposition P2]. This equation asserts that human behavior (P below) results from the joint effects of three Mega-Independent Variables (Mega-IVs): the individual's Body (B), external Environment (E), and Psyche, psychological system, or mind (Ψ, pronounced as *psi* or *sigh*), as follows:

$$P = B + E + \Psi. \tag{1}$$

The most comprehensive version of the BBE in S-Theory [Smith 2017b: Proposition P4], termed the General BBE/*Comprehensive* Version (General BBE/*CV*), contains the following 19 Key Macro-Independent Variables (Macro-IVs) that collectively are hypothesized to explain and predict nearly all of human behavior (P below):

P (position or behavior) = [seven *Relevant-Body* IVs (BIF, CAP, ASC, BGR,

CBC, BSR, SBF)] + [five *Relevant-Environment* IVs (PPM, EDF, SBS, CE, GBP]

+ [seven *Psyche* IVs (M, A, G, I, C, π, S)] (2)

or a bit more simply:

$$P = [\text{BIF} + \text{CAP} + \text{ASC} + \text{BGR} + \text{CBC} + \text{BSR} + \text{SBF}] + [\text{PPM} + \text{EDF} + \text{SBS}$$
$$+ \text{CE} + \text{GBP}] + [M + A + G + I + C + \pi + S]. \tag{3}$$

The following are the contents (and brief labels) for all 19 Key Macro-IVs comprising the three Mega-IV types:

(A) *Seven Relevant-Body (R-B) Key Macro-IVs*:

(1) BIF = Body Internal Functioning-health at present
(2) CAP = Conscious Alertness Phase at present (Alert-Awake, Distracted-Awake, Transitional, Light Sleep, Deep Sleep, Stupor/Coma)
(3) ASC = Altered State of Consciousness (e.g., drunk, drugged, hypnotized, in shock, sexually aroused, enraged, or psychotic), *if any* (a Threshold IV)
(4) BGR = Behavior Genetics Relevant (various genetic behavior-dispositions relevant at present to a given behavior DV)
(5) CBC = Current Body Chemistry-neurology (including especially the following)

  (a) CEO = Current External-origin (non-human-DNA-based) Organisms and chemicals (e.g., bacteria, viruses, parasites, fungi, allergens, poisons)
  (b) CHS = Current Hormones and Secretions
  (c) CNC = Current Neuro-Chemistry
  (d) CNP = Current Neuro-Physiology

(6) BSR = Body Structure and (body-linked socio-cultural) Roles indicated at present (e.g., age, gender, race-ethnicity, abnormal height or weight, facial disfigurement, body deformity, varieties of able vs. disabled [blind, deaf, mute, paraplegic, quadriplegic, amputee, birth defect victim, brain-damaged, physiological psychotic]).
(7) SBF = Superficial Body Features (especially including the following)

  (a) BE = Body Emissions (excretions, external secretions, odors, sounds) at present
  (b) BSA = Body Surface Appearance features (hair on head and body, skin color and texture, tattoos, scars, pimples, moles; visible deformities, abnormalities) at present
  (c) CAB = Clothing and Adornments on the Body at present (technically a part of the MIcro-Environment/MIE, but listed here for practical reasons), *if any* [a Threshold IV]

(B) *Five Relevant-Environment (R-E) Key Macro-IVs*, some of which refer to the MIcro-Environment (MIE):

(1) PPM = Physical Permissiveness of the MIcro-Environment/MIE (extent to which the MIE limits normal, gross, motor activity of the body)
(2) EDF = Environment Driver Factors (objectively present, noxious or dangerous stimuli or situations in the MIE that are likely to influence the individual to escape the MIE or to ameliorate/eliminate these stimuli if either is feasible; for instance, sufficient cold, heat, wind, moisture, noxious gas, sound, brightness of light, other extreme radiation, unpleasant smells, etc.; also, dangerous animals, people, situations, etc.)
(3) SBS = Socio-cultural Behavior Setting (a socio-culturally meaningful situation or behavior setting that is *physically-objectively present* [vs. perceived by the individual] in the MIE or larger socio-cultural environment, with associated-linked normative expectations for behavior)
(4) CE = Control (i.e., objectively likely over the) Environment, especially the MIE, by the individual)
(5) GBP = General Bio-Physical environment (including the Natural Non-human Biological environment/NNB, the Built-Artificial Environment/BAE, and the Human Population Environment/HPE).

(C) *Seven Psyche (Ψ) Key Macro-IVs*:

(1) M = Motivations/dispositions
(2) A = Affects/emotions
(3) G = Goals/values
(4) I = Intellectual capacities/skills
(5) C = Cognitions/perceptions/beliefs
(6) π (pi) = Pain level felt, if any (a Threshold IV)
(7) S = Self (both the conscious and unconscious, unique, organizing pattern of the other six Psyche IVs, which are termed the *Life Stance IVs/LS*, M, A, G, I, C, π)

If or when S-Theory receives sufficient empirical confirmation and/or expert approval, this theory may be seen as a proposed *new Standard Human Science Model* or SHSM (using the term *Standard Model* as in particle physics). This SHSM seeks to make sense of the huge number and variety of variables that significantly affect human behavior. However, unlike the SSSM, the new SHSM, based on S-Theory, gives biological and psychological variables their rightful place in this model.

The new SHSM is intended to replace the narrower Standard Social Science Model (SSSM) identified and discussed by Tooby and Cosmides (1992).

Edward Wilson (1999:204–207) has suggested some key elements of an SHSM, all of which S-Theory includes as consilience. The SHSM also implements the central interdisciplinary recommendation of the Gulbenkian Commission on the Social Sciences (Mudimbe 1996). The first author would prefer to use the label *new Standard Human Science Model* (NSHSM), because the word *Human* is much more appropriately interdisciplinary than the word *Social*.

VIII. Toward a general theory of nonprofit sector phenomena

While at present there is no general theory of nonprofit sector phenomena, we clearly need one. Anheier et al. (2014) seem to working on such a theory, but it does not cover all relevant phenomena and they have yet to test it. From the theories reviewed and referred to in this chapter (and many others in Handbook Chapter 31), it should be evident now that the theories of associations and of volunteering/participation have come a long way in the past decade or two, contrary to the earlier conclusion of Tschirhart (2006). There has also been much useful theory proposed in the past few decades regarding the size and nature of the nonprofit sector as a whole and its relationship to other sectors of society (Anheier 2005:chapter 6; Boris and Steuerle 2006; Clemens 2006). In addition, the theory of nonprofit agencies has made much progress. For instance, there is a reasonably advanced economic literature on the role, behavior, and governance of paid-staff nonprofit agencies (e.g., Anheier and Ben-Ner 2003; Cornforth 2012; Hansmann 1987; Jegers 2009; Steinberg 2006; Van Puyvelde et al. 2012).

A general, multi-level theory of associations is probably within our grasp in the near future, meaning the next ten years or so. Such a theory will need to integrate the various levels of association theories reviewed here and in some subsequent Handbook chapters. (cf., Smith 2015a, 2015b, 2017d).

E. Usable knowledge

Based on the results of research/theory on association prevalence, such prevalence can be increased in a territory by stimulating more resource/support organizations and by increasing civil liberties/democracy, as the most easily affected factors. Given the inductive theory of GAs and supra-local all-volunteer associations presented, association founders can use the following as a checklist for key decisions about their new associations: member versus non-member benefits in their goals, informal versus formal group style of operation and structure, high versus low operational autonomy relative to external organizations, large versus small scope of their territorial activity and membership base, diffuse versus focused goals, conventional versus unconventional (deviant) goals and means to achieve them, and the restrictiveness versus inclusiveness

of socio-demographic membership criteria. In fact, founders and leaders of such associations may use all the propositions of the Smith's theory of GA structures and processes as a practical checklist. As for paid-staff associations, a number of measures were suggested to improve their governance, including improving board competency, using effective incentive structures for managers, and implementing various board processes such as self-regulation and long-term priority setting.

For DVAs, particularly SMOs, the theories presented here have much practical utility for SMOs seeking optimum impact in securing new advantages (e.g., single issue focus, selective incentives for participation, more bureaucracy, avoid internal factions). Smith's theory of DVAs also suggests many useful factors to consider in forming or leading such an association. For instance, if founders have ultimately deviant goals in their society, they should begin their group as a DVA, not as a conventional association expecting to be able to convert to a DVA later on.

F. Future trends and needed research

One key future trend we see is a growing interest in developing and testing theory, even rather general theory, in our field of voluntaristics. Such theory, however, tends to be general *within* the levels of macro-, meso-, and micro-theories. Nonetheless, a clear need exists for a general theory of nonprofit sector phenomena that integrates all three levels. Such general theory must also take into account the distinctions made in this chapter between and among different association types. The distinction between conventional and unconventional (deviant) associations is crucial, as is that between all-volunteer and paid-staff associations. The distinction between local and supra-local associations of any kind is also quite important. Moreover, although not discussed here, the distinction among associations in terms of their member types is important: individuals only, groups or organizations only (as in federations), or both types of members. Many other theoretical points and issues need to be included, as identified in passing in the many chapters of this Handbook. This is especially true for the need to distinguish among five different contexts and types of volunteering, as suggested here, in theories of participation and volunteering.

Probably the most important agenda for future empirical research is much further testing and elaboration of the various theories sketched in this chapter, as well as testing competing or alternative theories not mentioned here, but sometimes dealt with in Handbook Chapter 31. More extensive treatment of theories of volunteering and participation will be found in Chapter 31 and earlier chapters in Part IV of the Handbook. The S-Theory sketched here may be compared with the more narrowly focused theories of

volunteering and participation discussed in Chapter 31 (Smith 2014a, 2015c, 2016c).

Typologies of Associations and Volunteering

David H. Smith (USA), with Robert A. Stebbins (USA), Jurgen Grotz (Germany), Pradeep Kumar (India), Janice L. H. Nga (Malaysia), and Stijn Van Puyvelde (Belgium)

A. Introduction

This chapter reviews prior research and theory on both purposive-activity and analytical-theoretical typologies of associations and volunteering, with some attention to related typologies of nonprofit agencies and of nonprofit organizations (NPOs) generally. After sketching the history of such typologies, Smith presents several improved purposive-activity and analytical-theoretical typologies, including a Tenfold Purposive Typology of associations, a Membership Typology of associations, an Analytical Typology of associations, and a Territorial Scope Typology of associations. Also presented is a new, Smith Analytical Typology of Volunteering and a Typology of Volunteer Activities, from Rochester et al. (2010). Some examples of special typologies used in other nations are given. Usable knowledge, future trends, and needed research are also discussed. An extensive set of references is provided.

Typologies (sets of types) are an important part of theorizing in all the sciences, and in scholarship more generally (Rich 1992), although "existing typologies of organizations are typically limited." Typologies also have important practical utility, by summarizing and simplifying a more complex set of phenomena (Carper and Snizek 1980; Doty and Glick 1994). Human thinking/cognition depends in a very deep way, at the level of brain processing of information, on categorization. Our perceptions are structured into categories from the beginning of our lives, and our socio-cultural systems prescribe the socially accepted categories to use, or at least to consider using.

Unfortunately, all categories or typologies relating to human thinking, emotions, dispositions, and behavior are *fuzzy* – meaning imprecise, with unclear/flexible boundaries, unlike most categories in the physical and biological sciences. Such imprecision in human phenomena seems ultimately

unavoidable, because all human psychological phenomena involve probabilities (or *probability fields*, as in quantum mechanics), not deterministic relationships. These imprecisions can also be seen as socio-behavioral science equivalents of *Heisenberg's uncertainty principle* in quantum mechanics. Smith (2017) sees this socio-behavioral science uncertainty principle as rooted in an *observation awareness reactivity* (OAR) trait of humans.

Winch (1947) distinguished two different types of typologies or taxonomies (synonyms). *Heuristic* typologies are constructed from theory, deduction, experience, and/or intuition. They often distort empirical phenomena by "positing extreme forms of relevant characteristics" (p. 68). Empirical typologies are constructed on the basis of observed clustering of characteristics, often through factor analysis techniques. McKelvey (1975:509) suggested "some guidelines for using multivariate analyses to aid the development of classifications." Vakil (1997) further suggests that typologies of nonprofit organizations (NPOs), long hampered by problems of definition, need to distinguish essential (core, central) from contingent (peripheral, non-essential) characteristics.

One might have expected that researchers and theorists in the field of organization studies would have considered NPOs, including both associations and agencies, in their theories and typologies. Unfortunately, this has seldom been the case. Older standard texts on organizations spend only a few pages on NPOs (e.g., Blau and Scott 1962; Caplow 1964). In their index, March and Simon (1958) do not even mention NPOs, voluntary organizations, or associations.

Scholars of NPOs, associations, and volunteering have been constructing *purposive-activity* typologies of such groups for many decades, as reviewed in the next section. This chapter will review two main kinds of typologies of associations and of volunteers*: purposive-activity typologies* and *analytical-theoretical typologies*. The first author proposes here original typologies of both types.

More recent overview texts on organization studies also generally neglect NPOs and associations (e.g., Hatch 1997; Scott and Davis 2003; Tolbert and Hall 2010). Recent handbooks on organizations similarly give little attention to NPOs, especially to associations (e.g., Baum 2005; Clegg et al. 2006; Tsoukas and Knudsen 2007). In a national sample study of all types of work organizations (i.e., organizations with one or more employees), Kalleberg et al. (1996:47) included NPOs, finding nonprofit units to be about 7% of the unweighted sample.

However, some of the older texts, monographs, and articles on organizations made useful contributions to analytical typologies that included NPOs, voluntary organizations, and/or associations (e.g., Blau and Scott 1962; Scherer 1988). The seminal book by Etzioni (1975) is by far the most important of these. His entire book focuses on understanding *all* organizations in terms of their *compliance structures*. Etzioni (p. xv) defines *compliance* as "a relationship consisting of the power employed by superiors to control subordinates and the orientation

of the subordinates to this power," combining a "structural and a motivational aspect." He sees compliance as "the organizational equivalent of social order" (p. xvii). Compliance involves power, which Etzioni defines (p. 4) as "an actor's ability to induce or influence another actor to carry out his directives or any other norms he supports."

Three types of power are distinguished, being characteristic of three different types of organizations (p. 5):

> *Coercive* power rests on the application, or the threat of application, of physical sanctions such as infliction of pain, deformity, or death . . . .
>
> *Remunerative* power is based in control over material resources and rewards [such as money and valuable things] . . . .
>
> *Normative* [or "persuasive," "manipulative"] power rests on the allocation and manipulation of symbolic [and emotional] rewards and deprivations . . . .

Along with corresponding types of involvement (alienative, calculative, and moral), these different forms of power tend to pervade and dominate whole organizations, leading to three correspondingly different types of organizations in terms of compliance structures: coercive, utilitarian, and normative organizations. Within society in general, prisons and the military are coercive organizations, businesses are utilitarian organizations, and NPOs tend to be normative organizations (Etzioni 1975:chapters II and III). Zald and Jacobs (1978:403) suggested improving the clarity and measurability of the various types of compliance structures by defining a property space with four continuous dimensions: "negative and positive utility, probability of delivery, transferability, and collective goods," all of which are based on power-dependence.

Although Etzioni does not put it this way, NPOs, or *voluntary organizations* in his terms, can be divided into two ideal types (see Smith 2015a, 2015b):

(1) Nonprofit *agencies,* relying mainly on paid staff (e.g., a nonprofit hospital, museum, or university), are often *dual organizations attempting to combine normative and remunerative compliance structures* (Smith 2015b). But of the two bases of compliance, utilitarian compliance usually dominates in large agencies (e.g., with ten or more full-time, paid staff), though normative compliance may dominate in some smaller agencies.

(2) By contrast, in all-volunteer NPOs, usually voluntary (membership) *associations,* especially grassroots associations (Smith 2000, 2015a; see Handbook Chapter 32), the *normative compliance structure usually dominates*, since there is no pay for work. Because all-volunteer nonprofit *agencies* are rare, voluntary (membership, nonprofit) associations are the main kind of organization and NPO where the normative compliance structure is found.

Put another way, the *voluntariness (normative-voluntary character) of the voluntary, nonprofit sector (VNPS) is mainly found in voluntary associations, not in the paid employees of nonprofit agencies*. Volunteers in volunteer service programs (VSPs), as departments (units) of nonprofit agencies, government agencies, and some businesses (especially for-profit health organizations, such as hospitals), also manifest some voluntariness, but volunteers in VSPs lack any power over the larger, parent organization, by contrast with the power/authority situation in voluntary associations (Smith 2015a, 2015b; see also Handbook Chapters 15 and 16).

This extension of Etzioni's analysis here supports the thesis in Smith (1991) that the nonprofit/third/voluntary sector is comprised in every nation of two quite distinct subsectors (or a fourth and fifth sector): (1) the non-member-benefit subsector/sector and (2) the member-benefit subsector/sector (see also Smith 1993). These two types of subsectors/sectors also generally correspond to (1) nonprofit agencies operated mainly by paid staff and (2) voluntary associations operated mainly and often solely by volunteers. The recent encyclopedia entries by Smith (2015a, 2015b) further support this *Dual Subsector Model* of the nonprofit sector, where the two subsectors may also be seen as separate sectors.

Scherer (1988:475) has suggested a related but interesting alternative typology that can be applied to all organizations, in his view. He notes that some critics "have become concerned about the unsuitability of available models for the study of organizations which affirm values or involve strong commitments," contrary to Weber's rational bureaucracy model. His point is well taken for various types of NPOs, especially associations, including religious denominations, which were Scherer's central interest. Scherer (p. 475) suggested that organizations (or groups) generally fall into four categories, as models: *market*, *bureaucracy*, *clan*, and *mission*, referring to businesses, government agencies, families, and NPOs, respectively. Many other analytical typologies, often only single dimensions, have also been suggested as crucial for organizational classification.

B. Definitions

This chapter accepts the definitions in the Handbook Appendix. However, we emphasize that an association by definition must have a membership, contrary to uses of the term *association* by some other scholars (e.g., Skocpol 1999).

This chapter refers frequently to NPOs, a category of organizations (and groups) which includes both *nonprofit agencies*, usually paid staff based (Smith 2015b), and also *nonprofit, voluntary associations*, usually volunteer based (Smith 2015a). The term *NGOs*, referring to non-governmental organizations, is also used sometimes. Although the term *NGOs* is roughly synonymous with the term *NPOs*, the term *NGOs* is the preferred English term in certain nations (e.g., China) and more generally preferred in referring to transnational

or international associations (as in the term INGOs – International Non-Governmental Organizations; see Handbook Chapter 34).

Adam Habib (University of the Witwatersrand, Johannesburg, South Africa; personal communication via Ram Cnaan) has suggested that the dominant sector in a society affects which term will be preferred – *NPOs* or *NGOs*: In modern, capitalist, and democratic societies, where the business sector is dominant, the term *NPOs* will likely be preferred. In traditional and developing/transitional societies, especially in socialist or communist nations, where the government regime is only weakly democratic or is non-democratic and government is the dominant force in society, the term *NGOs* is likely to be preferred.

The term *NGOs* is paradoxically often used even when the NPOs being referred to are clearly influenced by, often founded by, or even controlled at present by the government of a nation (e.g., the oxymoronic term, *GONGOs* – government-organized non-governmental organizations; Wu 2002).

In addition, we define a *typology* as a set of categories or types.

Purposive-activity typologies list various different main purposes and activities of an association (or other NPO). Such typologies are based on common language names or labels (and simplistic, lay perceptions) such as *health* or *religion*, not on theory in the socio-behavioral sciences.

Analytical typologies list various different theoretical variables/dimensions or categories that are useful for understanding the basic structures and processes of an association, irrespective of its purposive type(s).

Organizational goals are the outcomes or end-states that an association seeks to achieve. The *purposes* and *mission(s)* of an organization are basically synonyms for goals.

Official goals are the goals an association formally stated as its ostensible, explicit, or public mission, whether or not the group actually dedicates significant resources to achieving them presently or recently (e.g., in the past 12 months).

Operative goals are the goals an association actually seeks at present or has sought recently by allocating significant resources to their achievement, whether stated or admitted publicly or not. Operative goals are implicit, often non-obvious, covert, and sometimes even secret.

Compliance structure of an association is how the leaders persuade or induce their subordinates to follow directives/suggestions and/or follow norms that the leaders favor (Etzioni 1975).

C. Historical background

1. Purposive-activity typologies

Purposive-activity typologies refer to typologies that classify NPOs according to their major, common sense (superficial, phenotypic) kind(s) of activities or

purposes. Such purposive typologies of NPOs in general go back only a few decades. Smith (1972b) compiled the most extensive list of all terms in the English language referring to NPOs, voluntary organizations, and voluntary associations by content analysis of a dictionary. Smith (1972a) also presented an early typology of volunteers, and Smith, Baldwin, and White (1980) presented one of the first purposive typologies of associations, with 18 main categories or types. Another purposive typology, the National Taxonomy of Exempt Entities (NTEE) was developed in the early 1980s by the National Center for Charitable Statistics/NCCS, originally part of INDEPENDENT SECTOR, but since 1996 part of the Urban Institute in the United States (Sumariwalla 1987; www.ncss.urban. org). Rudney (1987:57) described NPO employment using 20 sub-categories of NPOs. Van Til (1988:87) presented a *map* (really a typology) of the voluntary sector that included eight main purposive types and five subtypes under one of these main types. O'Neill (1989:4) developed a brief set of nine categories of NPOs. Salamon and Anheier (1992) reviewed other purposive typologies in existence at the time, then developed their own version: the International Classification of Nonprofit Organizations (ICNPO). The European Values Survey (EVS) (and later, the World Values Study (WVS); Inglehart et al. 2010) developed a 15-category purposive typology of associations (Halman 2003:188) in the 1980s.

Smith (1996) examined both the NTEE and ICNPO, finding them to be inadequate for the study of *voluntary associations* (usually being designed to categorize only nonprofit, paid-staff-based, agencies), unlike the purposive typology of Smith, Baldwin, and White (1980). He suggested several improvements that could be made to the ICNPO to make it useful for classifying associations, but these ideas seem never to have been implemented.

Various earlier attempts by academics to develop a purposive typology specifically for voluntary associations date back to the early community studies in the United States in the 1930s (e.g., Warner and Lunt 1942). Since about 1950, various surveys and even historical studies have constructed purposive typologies of associations (e.g., Almond and Verba 1963; Hausknecht 1962; Knoke 1986; Verba, Schlozman, and Brady 1995:63; Wright and Hyman 1958).

Van Deth (2008:219) summed up the general situation very well when he wrote, "[N]o generally accepted typology or characterization of voluntary associations is available for cross-national comparisons."

2. Analytical-theoretical typologies

Scholars in organization studies have been identifying relevant analytical types and variables/dimensions worth measuring for several decades (e.g., Kalleberg et al. 1996; March and Simon 1958; Price and Mueller 1986; Pritchard 1990). Recent overview volumes on organizational measurement indicate a wide range of analytical types/variables, some of which are also relevant to NPOs (Baum

2005; Clegg et al. 2006; Swanson and Holton 2005; Tsoukas and Knudsen 2007). In general, organizational measurement is more advanced in organization studies, management, and public administration than in NPO studies or voluntaristics (Smith 2013).

Analytical or theoretical typologies of NPOs as single dimensions go back to the 19th century, as with purposive typologies, but mainly tend to be 20th century constructions. Historical studies that offer analytical insights on one or another particular type of paid-staff nonprofit agency have been frequent (see references in O'Neill 1989; but also see some overview volumes such as Axinn and Levin 1982; Commission on Private Philanthropy and Public Needs 1977; Hall 2006; Hammack 1998; Kramer 1981; National Center for Charitable Statistics 1985; Rudney 1987; Weisbrod 1977). Various recent overview volumes suggest many analytical types/variables relevant to nonprofit agencies (Paton 2003; Poister 2003; Saul 2004).

Warner (1972) discussed ten characteristics of voluntary associations that might serve as aspects of analytical typologies. In the same year, C. Smith and Freedman (1972:2–10) reviewed a variety of analytical types/variables for classification for voluntary associations – size, internal political structure, dependence on outside control or resources, societal functions, sources of support, location, the classes and characteristics of their members, intimacy among members, main dependence on one or another kind of incentives (material, solidary, or purposive), and main type of beneficiary.

Fox (1952) described three types of voluntary associations on the basis of functions performed by them. He examined 5000 US associations and classified them as Majoral, Minoral, and Medial associations. He defined Majoral associations as those that serve the interests of the established institutions of society, while Minoral associations refer to institutions which serve the minorities of the population. Medial associations do some of both.

Rose (1954) developed a typology of voluntary associations based on functional aspects – the *social influence* and the *expressive* type. According to him, social influence associations are those associations that are designed to act as interest and pressure groups attempting to affect government policies and practices. By contrast, expressive associations mainly fulfill emotional needs of members as a substitute for primary groups, such as the family.

Gordon and Babchuk ([1959] 1966) developed a related, influential typology of associations, contrasting the instrumental with the expressive/emotional type. In addition, they discussed the degree of accessibility of associations, according to their relative openness versus high selectivity in allowing members to join. These authors further pointed to the important, related aspect of degree to which the association confers prestige on its members versus do not confer prestige (and by extension, may confer stigma, or highly negative prestige).

D. Key issues

1. Goals and purposes in associations

The concept of an organizational goal can be quite complicated (Simon 1964). As noted in Section B above on Definitions, associations, like other organizations, can have both official/stated and also unofficial/operative goals or purposes (Bonikowski and McPherson 2007; Perrow 1961). The older the association or other organization, the more likely it is that there are important *un*official goals and that substantial association resources are devoted to achieving them, diverted from achieving official goals.

In the ultimate state of *unofficial* goal dominance, the situation is termed *goal displacement* (Van Buren 1981). In this situation, the original mission or central goal of an association is permanently displaced in favor of some new goal(s). Occasionally this occurs in an association because the original goal has been achieved (e.g., Sills 1957). But more often goal displacement occurs because the leaders have their own ideas about the appropriate current and future operative goals, irrespective of the original and current stated goals and of the preferences of the membership. As Ridder (1979:256) correctly pointed out, goal displacement usually occurs when "the interests of the inner circle [formal and informal leaders] become removed from the actual organizational goals." However, goal displacement can also occur inadvertently when external cooperation pressures unexpectedly cause such displacement because of resource limitations (e.g., Dubbs 2009).

So far, very little general theory exists about the goals of associations. Although Tschirhart (2006) provides an overview of ways to categorize associations by their purposes, no attempts have been made to model association goals from an economic perspective. Knoke (1990:56) makes a distinction between three general categories of association goals: (1) member servicing, (2) legitimation, and (3) public-policy influence. These three types of purposes are also present in the general nonprofit literature. While most economic models of nonprofits' organizational objectives have focused on the maximization of quality and/or quantity of service (e.g., Hansmann 1981; Newhouse 1970), some studies have showed that survival and legitimacy (DiMaggio 1987) as well as the welfare of the membership (Canning et al. 2003; Hansmann 1986) are also important objectives of nonprofit organizations, which is in line with the categories of association goals proposed by Knoke (1990).

First, although associations may want to maximize the quality of the services offered to their members and/or non-member beneficiaries, the realization of this objective might be hindered if the most powerful members can influence the association to act primarily in *their* (elite) interests, promoting goal displacement (Ridder 1979:256). Consequently, some researchers have explored

governance problems and governance structures in nonprofit membership associations (Kreutzer 2009; von Schnurbein 2009).

Second, legitimacy can be defined as "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995:574). Nonprofit organizations may change their policies, practices, and structures to enhance their legitimacy. Some authors have stressed the connection between the legitimacy of nonprofit organizations and their survival from a neo-institutional perspective (Abzug and Galaskiewicz 2001; Anheier 2005; Hager, Galaskiewicz, and Larson 2004). Following this line of reasoning, Fernandez (2008) investigated causes of dissolution among voluntary associations and found that associations with lower socio-political legitimacy dissolved younger (i.e., earlier in their life cycles).

Third, in line with general nonprofit literature and the social movements literature, associations may also have a significant advocacy role or even a primary advocacy role (Anheier 2005; Berry 1997; Gamson 1990; Tarrow 1998). They may use their power – which depends on their resources, their total number of members, and their prestigious or powerful members – to obtain access to policy-makers and to influence public policy decisions in such a way that the situations of their members and non-member beneficiaries are improved (Balassiano and Chandler 2010).

This advocacy approach, let alone a social change-oriented approach, occurs far more often in nations with enduring democratic features and stronger civil liberties. When democracy and civil liberties are fragile, weak, or temporary in a nation, and especially in authoritarian or totalitarian political regimes, both advocacy and especially social-change activities by associations (or any NPOs) are suppressed. In such instances, the associations involved are refused government registration and funding, and, if registered already, are dropped from registration and may be forcibly dissolved by the government (e.g., Allen 1984; Teets 2014; Wang 2011:210).

2. Purposive-activity typologies of associations and Smith's new Tenfold Typology

(a) Overview

Research and theory regarding both associations and volunteering have long been hampered by the lack of consensus on purposive-activity types. Researchers studying volunteering, and especially those who have studied associational volunteering and membership associations more narrowly, have developed a variety of *non*-systematic typologies for use in their interview schedules and in subsequent analyses. The EVS 1999–2000, for instance, has used 15 categories or types (Halman 2003:188). The National Opinion Research

Center at the University of Chicago has used a similar purposive typology of associations since 1972 (Marsden 2012). Hougland (1979) used data on a US statewide sample of individuals in North Carolina to derive clustering of purposive types of associations by factor analysis of participation patterns in different purposive types of associations.

A smaller but still extensive set of categories or types is often useful in analyzing and studying volunteering and association volunteering specifically. Van Der Meer, Te Grotenhuis, and Scheepers (2009) reviewed some earlier attempts at such classification. They suggested a three-category purposive typology of voluntary associations: (1) leisure associations (sports, culture, and social); (2) interest associations (trade unions, professional/business, and consumer); and (3) activist associations (environmental, humanitarian/peace). Using European Social Survey data collected in 2002, they demonstrate the analytical utility of this typology, which shows important differences in the causes and consequences of associational involvement.

Alternatively, Davis-Smith (2000) has offered a four-type classification including mutual aid, philanthropy, political participation, and social movement activism. Rochester, Ellis-Paine, and Howlett, with Zimmeck (2010) suggested that leisure volunteering would need to be added to these to make the list more comprehensive.

In this chapter, Smith proposes a new purposive typology of associations that aims to be comprehensive and a candidate for consensus. This typology incorporates elements of most prior schemes, but resolves their differences by *analyzing the roots of their prior lack of consensus*. Prior typologies of association purposes have always conflated some *purposive* types with *membership* types, making the typology an analytical hodgepodge.

For instance, some prior so-called purposive typologies include among their types such categories as youth, senior citizens, consumers, veterans (military, patriotic), nationalities-ethnic groups, alumni, women's groups, and neighborhood-homeowners groups. All of these category labels refer mainly to the *type of members involved*, not to their substantive purposes. For instance, a women's group could be a social club with sociability purposes, a service group with philanthropic helping goals (e.g., a rape crisis center), a conventional advocacy group with political goals for women to be achieved through the existing political regime/system, or a social movement organization with radical social change purposes affecting women and using protest or direct action strategies. The other categories of members listed above can have a similar range of possible purposes to be pursued by the members of the category stated.

(b) The Smith Tenfold Typology of Association Purposes-Activities

The presently proposed Tenfold Typology of Association Purposes is an extension of that earlier seven-category scheme proposed by Smith (e.g., UN

Volunteers 2010), and incorporated into Smith and Grotz (2011), as well as into Grotz (2010). The Tenfold Typology here splits the Leisure type into three subtypes of substantial importance and adds the Community Improvement-Development type, previously and needlessly ignored.

The empirical basis for the new Tenfold Typology lies in all earlier, imperfect typologies that conflate membership characteristics with purposes, as noted above, but is also based on data about participation from a few major surveys. Data from 50 societies on the percentage reporting participation in the Tenfold Types are given in parentheses below, from the 1999–2001 wave of the WVS/EVS (Dekker and Halman 2003:63). Where the 14 WVS/EVS categories differed, data were placed where the category labels best fit into the Tenfold Typology. An *Other* category/type at the end of the ten substantive types allows for missing types with small percentages of participants in recent surveys.

The proposed Smith *Tenfold Typology of Association Purposes* is as follows:

(1) Philanthropic/charity-social service-health/medical-education associations (7% = social welfare; 4% = health related)
(2) Political influence-advocacy-rights associations and parties (4% = political parties)
(3) Social movement organizations/associations and activism (3% = environment, conservation; 2% = peace movement)
(4) Community improvement-protection-economic development-poverty alleviation associations (4% = local groups; 2% = Third world development and human rights [some may fit also in #3]).
(5) Occupational-economic support associations (farmers, factory workers [trade unions]), white-collar workers (employee associations; unions), professionals, businesses-employers associations (3% = labor unions; 3% = professional associations)
(6) Religious-ideological-morality associations (12%)
(7) Self-help-support-improvement-personal growth associations (5% = Youth Work)
(8) Sports-recreational-exercise associations (8%)
(9) Arts-music-culture-study associations (7%)
(10) Sociability-conversation-conviviality associations (3% = Women's groups [some of these may fit also in #3])
(11) Other associations (e.g., hobby-games-garden-plants-animals leisure associations; environmental-ecology-flora/fauna preservation associations, automobile-trailer-caravan-travel leisure associations; investment-financial management clubs; residential associations [monasteries, communes]; family concerns-planning-birthing-child-rearing associations; infrastructure-support associations; deviant voluntary associations)

Note that all of the WVS/EVS main categories are accommodated in the Ten-fold Typology, plus *Other*. However, some of those earlier categories would need to be revamped to use the present typology in future research.

- Specifically, the *Environment, conservation* category would need to be split into environmental movement/social change associations (new type #3) versus environment political influence associations (new type #2) versus conservation associations with a basic service purpose (new type #1), not political influence or social change advocacy.
- *Peace movement* associations would need to be split similarly.
- *Third world development and human rights* associations would need to be split similarly.
- The infrequent but important, related transnational understanding-exchange associations belong in new type #7, as do inter-ethnic/racial understanding associations.
- Women's groups would also need to be split among service purposes (new #1), political influence (new #2), social change activism (new #3), and sociability (new #10). Some so-called *women's groups* might fit into other new categories, when properly studied.
- More careful future research should also include in new type #7 the various addiction-recovery 12-step groups, like AA, now omitted. Other kinds of informal support groups should also be included in type #7 (e.g., as studied in Wuthnow 1994).
- Farmers' and peasants' associations are also now omitted by the WVS/EVS, but belong in new type #5, common in agrarian/ preindustrial societies.
- Infrequent hobby-games associations might be added as a new type #11, but it is preferable to see them put into new type #10, as a kind of social fun in many cases. However, such associations and volunteering (as contrasted with leisure activities) are very infrequent and thus do not merit a new type.
- Implicitly, an *Other* category could handle the foregoing hobby-games volunteering associations and other purposive types that are infrequent.
- But we do not suggest that *Other* is a useful additional purposive type here. Ten types are necessary and sufficient as a comprehensive but detailed typology of volunteering and associations.

(c) The need for multiple coding of purposive types of any single association

Smith has pointed out (see Smith, Baldwin, and White 1980:1–5) that for proper coding of the purposive type of any association in the research process, the purposive typology being used usually *needs to be applied sequentially multiple times*. Associations usually have at least two purposes, often more. Therefore, in performing classification of any association in research, it is recommended that the foregoing Tenfold Typology be applied up to four times for any specific

association. However, the coding may stop after two type-codes if no more are warranted.

(d) Contemporary leisure theory and the Tenfold Typology

Types 8, 9, and 11 fail to square with contemporary leisure theory. This inconsistency has originated in data gathered according to earlier, simplistic definitions of purposiveness. The Serious Leisure Perspective defines as serious leisure the activities comprising these three types (Stebbins 2007, 2015). These activities encourage the establishment of purposive associations. According to the serious leisure perspective (SLP), such leisure is pursued not only for the love of the core activities that lie at the very center of each pursuit but also for the rewarding experience and resulting self-fulfillment that follows (see the Handbook Introduction for a fuller explanation). Associations are formed to enhance and enable these pursuits which, though powerfully attractive in their own right, also benefit significantly from formal and informal organization of crucial resources, training, services, opportunities, social support, and the like. Moreover, part of the social world that emerges around each pursuit is made up of such entities. Immersion in this world is itself exciting, another important reason for engaging in that leisure.

Amateurism in art, science, sport, and entertainment constitutes one of the three major forms of serious leisure. Looking across these four types, we find a vast range of purposive associations of the sort just described. Hobbyism is the second form of serious leisure. It has five types: *collecting, making, or tinkering with things* (e.g., quilters, craftspeople, do-it-your-selfers, gourmet cooks, animal breeders); *hobbyist participation in activities* or those who engage in rule-based activities not inherently interpersonally competitive (e.g., orienteering, barbershop singing, recreational fishing, mountain climbing); *hobbyist participation in sport*, or interpersonally competitive physical activity with no established professional counterpart (e.g., Ultimate Frisbee, curling, marathon running, dog and dog-sled racing).

The fifth type is the *liberal arts hobby*. Enthusiasts here are attracted to the systematic acquisition of knowledge for its own sake. Many of them accomplish this by reading voraciously in a field of art (fine and entertainment), sport, cuisine, language, culture, history, science, philosophy, politics, or high-culture fiction, poetry, and essays.

Were our data on purposive associations collected with the SLP as a conceptual guide, we could reconfigure types 8, 9, and 11 as Amateur associations (8) and Hobbyist associations (9). The associations mentioned in type 11 seem subsumable in the newly proposed types 8 and 9 and, according to the SLP, in the volunteer types of 1 through 7. Volunteers in these seven may be of the casual or of the career volunteer variety. The latter is the third form of serious leisure.

How empirically grounded is the SLP? On what grounds can we claim that types 8, 9, and 11 in the older tenfold typology fit poorly the leisure reality? The SLP, which has been under development since l973 first as a substantive grounded theory, is now a formal grounded construction (see www .seriousleisure.net/history; especially Stebbins 2014, listed in the References). Today, there are over 1,000 theoretical and empirical works bearing substantially on the Perspective (see the Bibliography on that website). In short, the SLP now presents a valid picture of contemporary leisure in many parts of the world that argues for its inclusion in future attempts to create a typology of volunteering-association purposes.

3. The Smith membership typology of associations

As noted earlier, one key reason for the confusion and non-consensus among purposive typologies of associations has been the conflation by typology-constructors of the association's purpose (or main activities) with the association's typical members. To avoid that confusion, Smith suggests here to add the following membership types as an *additional* aspect of typology for classifying associations – *not* seeking to replace the purposive typology. Smith derived the set of membership types below from earlier purposive typologies and from empirical research by himself and by others. Each type is intended to be mutually exclusive of the other types. Some additional membership types might be added, but the ones below seem to be most common:

 (a) Women's associations
 (b) Ethnic-racial-nationality associations
 (c) Veterans and active military associations
 (d) Immigrants-hometown associations
 (e) Youth-children associations
 (f) Parents' associations
 (g) Elderly-retired-pensioners associations
 (h) Medical patients-disabled associations
 (i) Alumni associations
 (j) Lodges-fraternal-sorority/sisterhood associations
 (k) Residents-homeowners-tenants associations
 (l) Students-school associations
(m) Consumers associations.

4. Analytical typologies of associations (theoretical variables)

In fact, purposive typologies are quite simplistic, only rarely useful for theory-based research, and thus need usually to be supplemented for research purposes by various, more analytical typologies and variables. Using only purposive types to classify associations or volunteering is roughly equivalent to classifying

animals by the color of their skin/hair; by the common sense types of food they eat; or by whether they swim, walk, tunnel, glide, fly, or are stationary. Combining the Linnaean taxonomy approach as a classification scheme for animals and plants, with knowledge of internal biology and evolution, has led to the current, scientifically useful, classification of animals (and plants) in biology. We need to do the same kind taxonomy in studying associations and volunteering, as with other NPOs.

(a) Smith key structure-process typologies of associations (key theoretical variables)

Smith proposes here the following set of *key structure-process analytical typologies* of associations, although many of the elements also apply to other NPOs and to organizations in general. Decades ago, Smith, Seguin, and Collins (1973) provided an extensive (alternative, but overlapping) set of analytical types, which has served in part as a basis for selecting the ones below. The types below have stood the test of time in research, to the extent they have been studied. All are based on empirical research on associations, mostly in the United States, and with varying frequencies. Future researchers can make a case for adding other types to the set below. These types or theoretical variables are roughly ordered in declining order of importance.

- Relatively Independent Association (RIA) versus Volunteer Service Program (VSP), as a department of some parent organization (Smith, Stebbins, and Dover 2006:23, 244).
- Structural type of members: individual persons versus organizations versus both (Smith, Seguin and Collins, 1973).
- Conventional-mainstream-acceptable versus unconventional-*outsider*-marginal-deviant in goals or means to achieve them (Bonikowski and McPherson 2007; Smith 1995; Smith, Stebbins, and Dover 2006:58, 68).
- Residential association for members (as in monasteries and communes) versus non-residential association (Smith, Stebbins, and Grotz, 2016: chapter 22).
- Socio-cultural change seeking versus integrative-establishment-*status quo*-oriented (Rose, 196:58).
- Average level of membership activity/strength; for instance, average total hours per month of member activity serving the association, including meeting attendance (Bonikowski and McPherson 2007).
- Internal, member-focused goals versus external, non-member-focused goals versus both (Smith 1993).
- Degree of formalization: high versus low bureaucratization and centralization (Gamson 1990; Smith, Seguin, and Collins 1973).
- Legally incorporated (as a *legal person*) with some level of government versus not (Fishman and Schwartz 2000; Smith, Stebbins, and Dover 2006:113).

- Formal registration with some level of government versus not (Fishman and Schwartz 2000).
- Exemption from certain government taxes (especially income taxes) versus not (Ott 2001:chapters 10, 11, and 12; Weisbrod 1992).
- Leadership quality-quantity-commitment: Many committed, high-quality leaders versus some such leaders versus only one or two such leaders versus no such leaders in evidence/essentially or completely leaderless (Bryman et al. 2011; Bryson and Crosby 1992; Handbook Chapter 36).
- Presence and effectiveness of board of directors (Fishman 2007; Handbook Chapter 35).
- Degree of socio-political power and influence (Rose 1966:57).
- Degree of participatory democracy versus authoritarian hierarchy at present: regular election of top leaders by all members versus oligarchy versus autocracy (Smith, Stebbins, and Dover 2006:65, 163; Warren 2001).
- Extent of rotation of individuals in top leadership positions (Smith, Stebbins, and Dover 2006:65, 163; Warren 2001).
- Size of paid-staff, administrative component/structure, relative to membership and resources (Akers and Campbell 1970).
- Amount of paid-staff work time relative to volunteer work time in accomplishing association goals/mission (Smith 2000:26).
- Number of levels of bureaucracy (Gamson 1990).
- Degree of emphasis on instrumental/task-oriented/bureaucratic versus expressive-emotional-social-personal-charismatic leadership styles (Mason 1984:chapters 2, 3; 1996).
- (If an RIA) Polymorphic, as a branch/chapter/franchise/unit of some higher-level association versus monomorphic, not structurally linked to some higher-level association, which holds significant authority (Smith, Stebbins, and Dover 2006:146, 176).
- (If an RIA is polymorphic) Extent to which the larger, parent association has a corporate, high power approach to its lower affiliates versus a more federated (e.g., national or international) authority structure, allowing lower-level units more independence and control (Sills 1957).
- Instrumental versus expressive goals/purposes (Gordon and Babchuk 1966; Harp and Gagan 1971; Rose 1954).
- Degree of emphasis on social-expressive-enjoyable activities versus on activities with instrumental-task-accomplishment goals, often externally focused (Mason 1996).
- Extent of cooperative activity/collaboration with other groups (Smith, Seguin, and Collins 1973).
- Formal relationship(s) with some local network, federation, or umbrella organization as horizontal integration: two or more local links, one local link, no local links (Smith, Seguin, and Collins 1973).

- Sponsorship by some local nonprofit or other organization, such as a school, church, museum, and so on: sponsored versus not sponsored locally (Smith, Stebbins, and Dover 2006:218).
- Degree of voluntariness versus social pressure versus coerciveness of joining (Smith, Seguin, and Collins 1973).
- Extent of freedom of association and autonomy permitted to the association by governments at different territorial levels (Smith, Seguin, and Collins 1973).
- Membership size (Smith, Seguin, and Collins 1973).
- Age of association (Smith, Seguin, and Collins 1973).
- Life cycle stage: New (less than three years old) versus Young (four to seven years old) versus mature (eight to ten years old) versus older (11 or more years old; Smith 2000:chapter 8).
- Wealth of association (Smith, Seguin, and Collins 1973).
- Income of association (Smith, Seguin, and Collins 1973).
- Average wealth/income of members (Smith, Seguin, and Collins 1973).
- Degree of membership homogeneity versus heterogeneity in demographic factors (Smith, Seguin, and Collins 1973; Stolle 1998).
- Majoral versus Minoral versus Medial associations, in terms of serving established institutions and majority people in a society versus serving minority and marginal interests and people (Fox 1952).
- Value or benefit of the association for members: pleasure in performance; satisfactions from sociability/social relations; symbolic satisfactions from affirming a belief system or values; productive satisfactions from producing goods, services, or changes in some object, collectivity, and so on (Warriner and Prather 1965).
- Main types of incentives used: normative, social, lobbying, utilitarian, occupational, and informational (Knoke 1988:311).
- Goal multiplicity: one primary goal versus two main goals versus three or more goals (Smith, Seguin, and Collins 1973).
- Average level of internal cohesion/solidarity: low, medium, high (Bonikowski and McPherson 2007).
- Extent of usual member interaction: face-to-face regularly in meetings versus annual or less frequent conferences/conventions versus no in-person meetings/interactions (Skocpol 1999, 2003, 2004).
- Average level of member commitment to the group: low, medium, high (Wiener 1982).
- Extent of internal efficiency versus dysfunction of operations/activities (Block 2004).
- Extent of achievement of official, stated, overt goals, or mission (Bonikowski and McPherson 2007; Perrow 1961).

- Extent of achievement of unofficial, de facto, operational goals (Bonikowski and McPherson 2007; Perrow 1961).
- Organizational capacity, in terms of human resources, accommodation, management, financing, and external orientation (Balduck, Lucidarme, Marlier, and Willem 2015).
- Local versus cosmopolitan orientation (Richmond 2003).
- Nature of prime beneficiaries of activities: public-at-large, as commonweal organizations versus public-in-contact or clients, as service organizations versus members themselves, as mutual benefit associations versus owners/managers of organization as economic, business, or profit-oriented organizations; Blau and Scott 1962:42–43).
- Clarity versus permeability of associational boundaries (Smith 1992).
- Support versus opposition by external entities, organizations, agencies, and so on (Bonikowski and McPherson 2007).
- Location in local population ecology of associations (McPherson and Rotolo 1996).
- Degree of accessibility: very open to new members versus highly selective and restrictive or elitist (Gordon and Babchuk 1966).
- Transparency and openness of policies, membership, and activities versus secrecy (Smith, Seguin, and Collins 1973).
- Degree of prestige conferral: high versus low prestige versus stigma, as negative prestige (Gordon and Babchuk 1966; Smith, Stebbins, and Grotz 2016: chapter 53).
- Indigenous origin and control versus foreign origin or current foreign control (Wang 2011).

Smith, Seguin, and Collins (1973) also list over 25 other typological dimensions/categories not among the 55 listed above. In a lengthy chapter, Smith, Reddy, and Baldwin (1972) discussed many aspects of various types of voluntary action, including associations as one subtype.

(b) Specialized typologies of associations

Various theorists have suggested special typologies for particular purposive types of associations. For instance, Sherraden et al. (2006) present a typology of international voluntary service associations. Feld and Jordan, with Hurwitz (1994:23–24), distinguish different types of international non-governmental organizations (INGOs as associations), stressing the importance of *regional versus global* INGOs. Hall (1988) distinguishes between *community* and *other worldly* religious communes as residential associations. Acik (2013) derived three types of civic engagement (polity volunteering) by analyzing the European Social Survey: political activism, association involvement, and political consumerism

(boycotting, signing petitions, etc.). Borkman (1991) distinguishes between *support groups* and *self-help groups* as mutual aid associations. Schubert and Borkman (1991) make further distinctions among analytical types of self-help groups: *unaffiliated, federated, affiliated, hybrid, and managed*. Walker et al. (2011) distinguish between *membership* and *non-membership* advocacy organizations in the United States. Only the former are truly associations, although Skocpol (1999) has called them *associations without members*, which we consider to be an error. By definition, associations *must* have members (Smith, Stebbins, and Dover 2006:23), as this is distinctive and essential in the associational form of organization (p. 24).

(c) Smith Territorial Scope Typology of associations

In addition to the foregoing, Smith also proposes the following Territorial Scope Typology of associations to be applied simultaneously with purposive, membership, and analytical typologies. Some purposive typologies conflate territorial scope with purposive type when they include *international associat*ions as a distinct type. That is clearly an error. Territorial scope of an association has nothing to do theoretically with its purposive-activity type.

- Single building-condominium
- Building complex-residential development
- Neighborhood or census tract
- Community, town, or city
- Metropolitan area or county
- Region of a province or state
- Province or state
- Region within a nation
- Nation
- Bi-national
- Multi-national world region
- Global-worldwide

5. Variations in association and NPO/VSP typologies in other nations

(a) India

Following Rose, Oommen (1975) classified Indian voluntary associations into two broad categories. The first he called *extension of traditional structure*, such as religious and caste associations. The second he called *newly introduced into the society*, such as youth clubs, cooperatives, and trade unions. Sharma (1996) rejects Oommen's classification on the ground of over simplification of this complex nonprofit sector. Shah and Chaturvedi (1983) divided the secular NGOs of India into three categories: techno-managerial, reformist, and radical.

Desai and Preston (2000) did the same with four categories of urban NPOs. Hirway (1995) classified the voluntary organizations of Gujrat as welfare-oriented, development NGOs, and NGOs working for empowerment. Iyengar (1998) identified four main types of modern voluntary associations, based on their functional strategies: Gandhian, delivery organizations, professional organizations, and mobilizing organizations. Here, the term grassroots *delivery organization* refers to those associations that facilitate the implementation process for government or other organizations' programs. Many grassroots associations have emerged as delivery organizations during last three decades in rural India (Kumar 2005). The legal status of voluntary associations reveals four different types or laws under which associations are registered: The Societies Registration Act (1860), Co-operative Society Act (1912), The Company Act, section 25 (1956) for nonprofit activities, and The Indian Trust Act (1982). All the foregoing Acts are available at http://indiacode.nic.in/.

(b) Malaysia

In Malaysia, *non-governmental organizations* or *NGOs* is a common term that refers to all types of civil society organizations (CPPPN 1998:440; Hodgkinson and Painter 2003:2; Martinez 2001:474; Marwell 2004:266; Mitlin et al. 2007:1699, 1701; Nga 2009:1; Suandi 1991:I, 19). Weiss and Hassan (2003:42, 43) claim that Malaysian NGOs play an important role in political, social, and economic reforms, even though very few of them are truly independent from the government. Farouk (2011:99,100) makes useful comments on the associational life of main community ethnic groups (i.e., Malay, Chinese, and Indian). In general, the associational life of the dominant Malay community is mainly related to their religion, Islam. The second largest ethnic group, the Chinese community, has a vibrant associational life and they are most active in Huay Kuan and Kongsi groups (based on clan/dialect/kinship/ region), followed by temple organizations. The Indian community is also active in associational life, especially in unions, caste organizations, trade organizations, and guilds.

In Malaysia, the Registrar of Societies (ROS) is delegated to register and monitor activities of voluntary associations. The ROS can accept or reject any application of new associations. However, several types of associations are exceptions, such as youth associations, that are to be registered with Registrar of Youth and Sports (ROY), under the enforcement of Youth Societies and Youth Development Act 2007. Some other associations are established in accordance to Parliament Act. Many new associations are established and registered every year. ROS reported that in year 2014 (as of September 2014), 3,515 applications have been approved (66%), 1,813 applications were rejected (34%), and there are 154 applications under review pending decision (ROS: 1 October 2014). NGOs in Malaysia can be distinguished as national or state level. They can be categorized as follows by purposive-activity types: Religious, Social

welfare, Social/Recreational, Women, Culture, Mutual benefits, Trade, Sport, Youth, Educational, Political, Employment, and General.

(c) West and East Africa

Little (1965:3) studied several nations in *West Africa* (especially Sierra Leone, Nigeria, Ghana, and the Gambia) with anthropological/ethnographic methods, drawing on his own field research and that of others. Defining voluntary associations (p. 1) as "institutionalized groups in which membership is attained *by joining*," he identifies various purposive types of associations in West African towns/cities, some traditional (in chapters 2 and 3), and some more modern (in Chapter 4). The traditional types include tribal associations/unions (referring to tribes *back home*), syncretist cults, occupational or economic mutual benefit/aid associations (*not* organized around tribal identities), including rotating credit associations (p. 51), and recreational/entertainment associations (for drumming, dancing, and social gatherings/parties).

In Chapter 4, Little (1965) described a variety of types of modern, non-indigenous purposive types of associations, all of which have been initially imported by colonial administrators and settlers. The most common types were Christian church-related associations of all kinds (pp. 66–67), social clubs (p. 77), and sports clubs (e.g., for cricket; p. 82). In addition, there were non-denominational Christian youth groups like the YMCA and YWCA (p. 71), benevolent societies (p. 73), and higher status, common interest, cultural-social associations (e.g., literary and debating clubs; p. 77; exclusive dining clubs; p. 79; lodges and fraternities; p. 81).

Wamucci (2014:109) describes various types of associations in *East Africa* (Kenya, Uganda, and Tanzania) in *pre-colonial* times as including "a combination of kinship, age groups, lineages, self-help groups, trade associations, and communal labor groups." After achieving independence in the 1960s, the types of associations that had been active in advocating and promoting independence (trade unions, ethnic groups, and resistance movements; p. 111) "all gradually reverted to single-party political structures," with little freedom of association. This was true especially in Kenya "from 1982–1991 – a period when Kenya was a one-party state" (p. 112).

In the 1990s, Kenya and Tanzania allowed more freedom of association, and Uganda followed in 2005, leading to a greater variety of association purposive types, including multi-party sets of political associations. Most associations and other NPOs are based in urban areas, and "more established organizations with a mass membership base, such as trade unions and cooperatives, or ethnic associations, are far less visible and have much less influence" (p. 121).

Although "CSOs [Civil Society Organizations] are generally perceived as democratic, efficient, less corrupt, and rooted in the grassroots," there is "some disconnect between these perceptions and reality" (p. 121). Hence, as

elsewhere, there is a dark side to associations in East Africa. In addition to accusations of internal inefficiency and lack of internal democracy, CSOs in these nations also have problems of over-dependence on their governments and on international donors (p. 171). However, Wamucci (2014:122) concludes, "The single undisputable commonality is that NGOs [including many associations] have grown in size and that they have been instrumental in social-economic development." Other chapters in Obadare's (2014) handbook further elaborate on various typologies of African associations and nonprofit agencies.

(d) Peru

Sanborn and Portocarrero (2005) reported on a national survey of adults in Peru that investigated volunteering and also giving to charities. The authors developed an extensive purposive typology with 41 categories (p. 68), which fit into 10 main types. However, the empirical results showed that only 12 of these purposive types had 4% or more of the respondents participating in them (p. 70). Some five of these 12 types were VSPs (see Handbook Chapter 15), not associations. Among the types of associations, these were the top participation types and frequencies: parish groups (20%); neighborhood organizations (12%); glass-of-milk committees (12%); sports clubs (10%); religious groups or associations (6%); parishes, synagogues, and mosques (6%); and music, artistic, and cultural groups (5%). In addition, 42% of persons volunteering were members of the various associations for which they volunteered.

Because of the wording of the relevant interview questions, it is likely that association volunteers were underestimated in general. The focus was on volunteers and volunteering, with corresponding words in Spanish, rather than on associations and civic participation, including membership, contributions, meeting attendance, committee work, event attendance, and holding offices. This is a central limitation of most or all of the Johns Hopkins-based surveys (e.g., Salamon, Sokolowski, and Associates, 2004.) There are similar surveys cited in three other South American countries (p. 66).

6. Purposive-activity typologies of volunteering

Purposive typologies for *volunteers/volunteering* in associations have mirrored purposive typologies for *associations*. Researchers have generally classified purposive types of volunteers in terms of the purposive types of associations in which volunteers have participated (e.g., Halman, 2003:188, for the EVS). However, researchers focusing on VSPs have tended to use different purposive typologies (e.g., Davis-Smith 1994). For instance, Hodgkinson and Weitzman (1988) created a 15-category purposive typology of volunteering in VSPs, similar to the principal categories of the NTEE. Maki and Snyder (2016) devised an eight-category typology of volunteering activities. Research shows that both purposive and analytical types of associations can have significant effects on the

level of individual association participation (e.g., Gray, Khoo, and Reimondos 2012; Maloney, van Deth, and Rossteutscher 2008; Stolle 1998).

Davis-Smith (2000), of the Institute for Volunteering Research (of Volunteering England), developed an initial conceptual map of volunteering. This typology was absorbed into the UN Volunteers broad definition of volunteerism for the International Year of the Volunteer in 2001. Later, this typology, including traditional service-delivery, mutual aid and self-help, and civic participation, was carried over into the *2011 State of the World's Volunteerism Report* (Leigh et al. 2011:5–6).

Rochester et al. (2010:10–16) highlighted three related but different purposive types and contexts of volunteering as perspectives: (1) The *dominant paradigm* that views volunteering as altruistic and philanthropic service to others who are less fortunate – a social welfare approach. (2) An alternative *civil society paradigm* that emphasizes self-help and mutual aid done through associations, often as advocacy or activism, rather than via volunteer service programs as departments of other organizations. (3) The *serious leisure paradigm* that emphasizes the intrinsic satisfactions of volunteering, not altruism, usually pursued though arts-culture associations or sports-recreation associations.

Grotz's (2010) initial version of a volunteering associations typology included only those three purposive/context types of volunteering from Rochester et al. Smith has relabeled these three types as the Traditional Service Type, the Mutual Aid Type, and the Leisure Type (omitting the term *serious*, as unnecessarily narrow). Smith also added four other types of volunteering: Civic Engagement (conventional political), Activism (social change oriented), Religious, and Occupational Support.

7. Analytical typologies of volunteering

(a) Various analytical typologies of volunteers/volunteering

For many scholars, volunteering means unpaid, non-coerced, voluntary service for others outside one's household/family that is done through a VSP (see Handbook Chapters 15 and 16). A VSP is a department of some parent organization (e.g., a paid-staff nonprofit agency, a government agency, or a for-profit business like a proprietary hospital or nursing home). Omitting *by definition* associational volunteering is far too narrow a view of volunteering (e.g., as Musick and Wilson 2008 do). That view results in the inaccurate conclusion that there is very little formal volunteering for many developing as well as for some developed countries. Wollebaek and Selle (2003:167) noted that nearly all volunteering in Norway, for instance, involves membership in associations. Volunteering in attached VSPs is a very recent social invention (in past 100–150 years), while associational volunteering goes back at least 10,000 years (Smith 1997; Handbook Chapter 1).

Although purposive typologies of volunteering/volunteers have been more common, there have also been various *analytical types*/variables of volunteers/volunteering identified by scholars in the past 50 years and more. Chapin (1928) constructed the first analytical typology of volunteering in associations, distinguishing membership versus attendance at meetings/events versus contributions versus committee membership versus office(s) held. He combined these with weights into a total participation scale (the Chapin Scale) that received much use in research for decades. Evan (1957) later used empirical data to improve the scale and typology. Alexander et al. (2010) distinguished *associational intensity*, time spent on associational volunteering, from *associational scope*, the number and type of associations that individuals are involved in. Cnaan and Amrofell (1994) identify ten major facets or dimensions of volunteering, which constitute a typology. Dolnicar and Randle (2007) used factor analysis of data on Australians who volunteered for two or more associations to derive four analytical types of volunteers: altruists, leisure volunteers, political volunteers, and church volunteers (although these have a purposive tone). Hustinx and Lammertyn (2003) distinguish *collective* versus *reflexive* styles of volunteering in VSPs.

Bekkers and de Witt (2014:7) distinguish eight groups or types of volunteers in terms of stages/phases of an individual volunteering career over years or longer: (1) non-volunteers, (2) new volunteers, (3) sustained volunteers, (4) loyal volunteers, (5) job-hopping volunteers, (6) intensifying volunteers, (7) extensifying volunteers, and (8) former volunteers. These categories can overlap in some instances for any given individual, but comprise a useful way of thinking about a multi-year or even lifetime sequence of volunteer roles. This typology differs from the typology of volunteering phases within a particular volunteer role and organization, as described by Haski-Leventhal and Bargal (2008).

Selle and Strømsnes (2001) showed that even *passive membership* in associations has distinctive effects and needs to be considered as a type of participation, rather than being seen only as non-participation. Maloney (1999) has referred to such passive membership as *checkbook participation*, referring to an older form of making payments to an association.

(b) Smith analytical typology of volunteers/volunteering

Smith proposes here five, main, analytical-theoretical types of volunteering, based on the external context of each type. Each of these five categories is an *ideal type*, often not fitting perfectly with reality, but instructive and of heuristic value, nonetheless. There are also subtypes under four of these types. Types 2 to 5 are varieties of formal volunteering (FV), but FV is usually viewed as including *only* types #2, #3, and #5, with type #5 being seen as *quasi*-volunteering (Smith, Stebbins, and Dover 2006:191). To clarify that quasi-volunteering is a kind of

FV broadly defined, *quasi-volunteering* might be replaced with the term *formal quasi-volunteering* (FQV). Similarly, the narrower, usual version of FV might be termed *formal non-stipended volunteering* (FNV). Hence, FV is composed of FNV plus FQV.

(1) *Informal volunteering* (INV), where there is no relevant external group or organization as a context and role guiding the individual's volunteer activity (Smith, Stebbins, and Dover 2006:118–119; see also Handbook Chapter 10A). There are two main subtypes of informal volunteering:

  (a) *Routine INV*, as in helping people in one's normal daily life (see Handbook Chapter 9). Can be one-time, episodic, or regular in timing. Usually done in person, but may involve local travel for errands.
  (b) *Crisis INV*, as in helping people in emergencies, disasters, and sociopolitical crises (see Handbook Chapter 14). Usually is one-time and short term in timing; usually done in person on site.

(2) *Formal association volunteering* (FAV), where the individual is acting in a role as a volunteer member or participant in an external association (Smith, Stebbins, and Dover 2006:88). FAV can vary in its usual timing or periodicity. Usually done in person, but sometimes can be done online/virtually (see Handbook Chapter 13).

  (a) *One-time FAV*, as in volunteering to help with some specific association meeting or fund-raising event;
  (b) *Episodic FAV*, as in multiple short time periods of FAV, as in working on an association committee;
  (c) *Regular FAV*, as in participating regularly in association meetings or other regular association events (e.g., social events and sports events).

(3) *Formal board volunteering* (FBV)*,* or policy volunteering (PV), where the individual is acting in a role as a volunteer member or participant in a policy-making board, commission, or similar elite unit of some larger organization, whether a nonprofit organization or not (Smith, Stebbins, and Dover 2006:29, 176). Usually is regular, involving in person attendance at board meetings one or more times per year for some hours.
(4) *Formal service-program volunteering* (FSPV), where the individual is acting as a service-providing volunteer as part of some VSP, that is a non-autonomous, volunteer department of some larger, parent organization in any sector of society (Smith, Stebbins, and Dover 2006:184–184, 209; see Handbook Chapters 15 and 16). FSPV can vary in its usual timing or periodicity. Usually done in person, but sometimes can be done online/virtually (see Handbook Chapter 13).

    (a) *One-time FSPV*, as in volunteering to help with some public event, such as the Olympics;

    (b) *Episodic FSPV*, as in multiple short time periods of FSPV;

    (c) *Regular FSPV*, done regularly for some specific time period each week or month.

(5) *Formal stipended service volunteering* (FSSV), where the individual is acting in a role as a service-providing volunteer as part of some VSP but receives significant payments, either financially or in kind, which still leave a net cost to the volunteer relative to the market value of the activity performed (Smith, Stebbins, and Dover 2006:220–221. There are two main subtypes of FSSV, both usually involving full-time service/work for six months or a year. Always done in person on site.

    (a) *Domestic FSSV*, done within a specific nation by citizens, usually with an anti-poverty and community development focus, as for the US VISTA FSSV (see Handbook Chapter 11).

    (b) *Transnational FSSV*, done by citizens of one nation in another nation, as in the US Peace Corps program (see Handbook Chapter 10).

7. Dingle typology of formal volunteering activities

Based on Dingle (2001), Rochester et al. (2010:27–29) summarized a typology of the kinds of activities that formal volunteers can engage in. However, though distinctive, the types are not necessarily mutually exclusive. A particular volunteer may engage in two or more types below in a single day or week, or even simultaneously.

  (a) Community activity
  (b) Emergency response
  (c) Community peacekeeping
  (d) Social assistance
  (e) Personal assistance
  (f) Children and youth
  (g) Human rights, advocacy, and politics
  (h) Economic justice
  (i) Religious volunteering
  (j) Education
  (k) Health care
  (l) Environment
 (m) Data collection
  (n) Promotion of knowledge
  (o) Promotion of commerce

(p) Law and legal services
(q) Culture
(r) Recreation.

Rochester et al. (2010:51) also present a typology of 13 types of activities that *informal* volunteers can engage in.

E. Usable knowledge

The various new typologies presented in this chapter have special practical utility for leaders and policy-makers concerned with associations and/or volunteers, as well as for researchers and theorists, in describing or keeping records on any set of associations or volunteers and their activities. These new typologies, based on a careful review of many prior ones, constitute a distinct advance by eliminating prior theoretical conflation/confusion of separate dimensions.

However, in research it will be important to use and code for several parallel typologies simultaneously, as presented here, to fully describe and understand any given association or set/sample/list of associations: Smith's new purposive-activity typology, membership typology, territorial scope typology, and key analytical typology. The same process is needed in research on volunteers, coding individuals using a purposive typology of volunteering, Smith's analytical typology of volunteering, and the typology of volunteering activities noted above, for either formal or informal volunteering.

This chapter has tried to make clear that the *analytical typology* of associations is the most important one for both research and practical/policy purpose. That typology focuses on the equivalent of the *genotypes* (internal structures and processes), rather than on superficial *phenotype*s (external features/appearances), to use words from biology.

F. Future trends and needed research

It is likely that purposive typologies will continue to proliferate, although consensus on two or three of them would be useful. The US Internal Revenue Service now uses the NTEE for classifying all NPOs. The ICNPO has been fairly widely used in other research contexts, but mainly where the focus is on *paid-staff nonprofit agencies*. When classifying associations, the NORC and WVS/EVS purposive typologies are widely used. The typologies by Smith presented in this chapter seem to be the most carefully designed to classify associations, avoiding conflation of different analytical dimensions.

The most important type of future research needed is highly cross-cultural/cross-national research testing the value of the various analytical typologies/dimensions presented here both for associations and for volunteers.

The various types identified, especially the analytical typologies, need to be studied simultaneously in the same research project with a large, broad, representative sample of associations (e.g., using hyper-network sampling for local associations, and national directories/lists for national associations) to see whether and under what conditions the types/variables identified here significantly affect the operations and impacts of associations and the activities of volunteers. No such research project has yet been done using all or even most of the analytical typology dimensions listed here and/or in Smith, Seguin, and Collins (1973). Such research can replicate prior, narrower, research on the significant effects of different types of associations or volunteers. Clearly, it will be best if such research is carried out in a broad sample of nations.

Leisure and Time-Use Perspectives on Volunteering

John P. Robinson (USA), Jonathan Gershuny (UK), David H. Smith (USA), Kimberly Fisher (UK), Chang-Won Lee (South Korea), and Robert A. Stebbins (USA)

A. Introduction

Taking a time-use perspective, this chapter examines where volunteering fits in people's daily, weekly, and annual time use in different countries and world regions. Within a person's total time-use pattern, the central focus is on free time and the portion within it that is devoted to volunteering and associational activity. Formal volunteering (FV), whether for service programs or associations, is most often a kind of serious leisure, defined below. Such activity has its own temporal requirements that have to be coordinated with other use of free time, as well as with paid work and non-work obligations (such as family care or personal care, like sleep). Informal volunteering (INV) – volunteering done more spontaneously by individuals without any organizational auspices – is also discussed, as is the travel related to FV and INV. Substantial attention is devoted to options in time-use measurement and methodology, and to the special value of such methods to enhance and overcome biases in survey interview methodology.

B. Definitions

The definitions of the Handbook Appendix are accepted here, with special emphasis on FV through some group or organization as the larger context, and on INV, where no such group or organization is involved from the perspective of the individual. The latter presents more measurement difficulties since it may occur spontaneously, in many guises, and without the presence of formal organizations.

Free time (discretionary time) is defined in Smith, Stebbins, and Dover (2006:92) as "time left over after work and other, nonleisure obligations have been met. Some scholars treat *free time* as synonymous with *leisure*. Others,

however, distinguish it from leisure, noting that boredom can occur in the former but not, by definition, in the latter."

Leisure/leisure time is defined in Smith, Stebbins, and Dover (2006:133) as

> uncoerced activity undertaken within free time.... Uncoerced activity, including volunteer action, is thus something people want to do and, at a personally satisfying...level using their abilities and resources, succeed in doing.... Further, as uncoerced activity, leisure is an antithesis to work as an economic function; a pleasant expectation and recollection; a minimum of involuntary obligations; a psychological perception of freedom; and a range of activity running from inconsequence and insignificance to weightiness and importance.

Leisure activity is defined in Smith, Stebbins, and Dover (2006:133) as "what a person does in free time, such as watch television, play tennis, or volunteer for the Red Cross.... Sometimes referred to as *discretionary activity*."

Serious leisure is defined in Smith, Stebbins, and Dover (2006:208) as "the systematic pursuit of an amateur, hobbyist, or volunteer activity that participants find so substantial, interesting, and fulfilling...that, in the typical case, they launch themselves on a (leisure) career centered on acquiring and expressing its special skills, knowledge, and experience."

Time use refers to both a theoretical and a methodological perspective on human behavior and human daily life. Methodologically, time use refers to the collection of information about how individuals use **all** of their time in a usual day or week of their lives. Information is gathered for each individual respondent on identifiable activities in a given day or week. Theoretically, time use refers to a perspective on human activity or behavior that sees human life as a series of activities in specific contexts, often with other people present. *Time diary* refers to a specific methodology for studying time use that asks individual respondents to report sequentially in a personal format what they did across a specific day, (usually) as well as where, with whom, and with what other activities were done at the same time (simultaneous or secondary activities). *Time diaries* thus refer to an individual's total time use in a given day (or week, year, or whole lifespan). As noted above, such diaries record the type of activity, along with other aspects of the time period such as spatial context, other people present, and concurrent/simultaneous activities.

Experience sampling refers to a more recent, technology-dependent, methodology for studying time use, one that signals respondents by a pager (or mobile device) at random moments across the day to record what they were doing, where, with whom, and often their psychological state (satisfaction, fatigue, etc.) during the activity.

C. Historical background

Pentland et al.'s (1999:5–8) helpful historical overview of time-use studies cites the US study *How Working Men Spend Their Time* (Bevans 1913) and the UK study *Round about a Pound a Week* (Pember-Reeves 1913) as "the earliest published accounts of time use." Prominent use of diaries was also a feature of farm and urban households studied by the US Department of Agriculture in the 1920s and 1930s (Harms and Gershuny 2014). Among other early milestones in time-use research were the studies in the United States by Lundberg and Komarovsky (1934) and by Sorokin and Berger (1939).

The first comprehensive multinational diary study in 1965 was conceived and coordinated by the Hungarian mathematician and sociologist Alexander Szalai, as described in his pioneering volume *The Use of Time (*1972). Following his example, comparable national time-diary data have been collected in more than 40 countries over the last three decades, including virtually all Eastern and Western European countries. In the United States, the first national diary study was conducted as part of the Szalai project in 1965, and it has been replicated at roughly decade intervals since then (1975, 1985, 1992–1995, 1998–2001). Academic survey firms conducted these periodic national time-diary surveys, which provide a base from which to make trend comparisons with the current comprehensive American Time-Use Survey (ATUS).

That ongoing *ATUS* from the US government's *Bureau of Labor Statistics* has now collected over 150,000 daily diaries continuously across the year since 2003, using *yesterday* diaries based on the recall of what respondents did yesterday. The ATUS employs a Census Bureau sample, with highly detailed activity categories, as described at www.bls/tus.gov and archived at www.atus-x. The ATUS code has expanded its list of activity categories to more than 400, with more than 40 subdivided codes for volunteering and religious activity, as detailed at ATUS.

D. Key issues

1. Alternative ways of measuring time use

(a) Interview questions

There are several approaches to measuring people's use of time and their specific time spent on different activities. The most common, until recently, was to ask respondents directly in the form of *stylized* time-estimate questions, such as "How many hours did you spend working at your job last week?" or "How many days a week do you do voluntary work?" Robinson and Smith (2012) compared several of these stylized national survey questions on formal volunteer activities for the United States in their Table 4.1. These questions generated marked variability in estimated levels of US FV rates – from less than 30% annually to almost 70% of the adult population.

Table 4.1 ATUS hours per week on different activities (age 15+, 2003–2013)

Other	1.32	1.00	1.19	1.46	1.38	1.42	1.70	2.43	2.05	1.67	2.18	0.9
Total	168	168	168	168	168	168	168	168	168	168	168	

Nonetheless, these individual stylized questions have the advantage of being simple, direct, relatively inexpensive, and brief to ask. Nevertheless, such time-estimate questions often do not match independent records of actual time spent (e.g., Chase and Godbey 1983; Hadaway, Marler, and Chaves 1993), and when aggregated across activities for a given week add up to more than the 168 hours actually available (Hawes, Talarzyk, and Blackwell 1975; Verbrugge and Gruber-Baldine 1993). By far, the most ambitious and insightful pair of FV and INV volunteering questions were devised for the 2006 European Social Survey (ESS), which were then applied to national probability surveys in 23 Eastern and Western European countries. Respondents were also asked a broad set of well-being questions, as described in the comprehensive analysis of Plagnol and Huppert (2010).

Plagnol and Huppert first established that there was a strong association between FV and INV, so that the two did not substitute for each other and that INV was notably the more prevalent form of volunteering. They further documented that the demographic predictors of INV and FV were prevalent at different rates across the 23 countries, despite cross-national compositional differences. They further found stronger correlations between volunteering and six different types of well-being in countries with higher rates of volunteering, although the relation was strongest in countries with lowest volunteering. They cite other studies that also could not establish the direction of causality, from volunteering to well-being or the reverse, but that the direction could depend on each country's *welfare regime*. Special attention was devoted to the markedly low rates in formerly Soviet countries in that connection.

(b) Direct observation

Other volunteer time measurement methods involve more *observational* approaches, using clocks and stopwatches to quantify anthropologists' field notes (e.g., McSweeney and Freedman 1980). Prominent examples in the US context include Levine's (1997) recording of walking speeds, or time to conduct simple economic transactions at a bank or post office across different cities or countries, and Barker and Wright's (1948) extremely detailed account of just *One Boy's Day*. A related method involves observations on site, as in Hadaway, Marler, and Chaves (1993) head counts of attendees at churches and Barker and Barker's (1961) head counts at various *behavior settings* in small towns. Television rating firms often verify program ratings by *telephone coincidental* surveys, asking those who answer what they were doing and which programs they were watching when the phone rang. Perhaps the most extensive and intensive example of time observation is from Holmes and Bloxham (2009), using observers who *shadow* (follow) respondents and electronically record their media and other daily activities every ten seconds across the day.

(c) Experience sampling

Another holistic approach is the Experience Sampling Method (ESM; Schneider 2006), pioneered by Csikszentmihalyi and his colleagues (Csikszentmihalyi and Larson 1987; Hektner, Schmidt, and Csikssentmihalyi 2007). Using this method, respondents report on their activities at 8–12 random moments during a day when alerted by an electronic paging device or cell phone. A limitation of the ESM technique so far is that it has only been used with convenience samples with limited generalizability. Also, this method is unlikely to achieve high cooperation rates from respondents in more typical survey settings. That is why it has not been used to generate accepted population estimates of time use. This cooperation-rate problem has been largely avoided in time-diary studies, with Robinson and Godbey (1999) and Abraham et al.'s (2006) analyses providing large-scale examples.

2. Time-diary methodology as a preferred approach

In contrast to the foregoing, the time diary is a micro-behavioral technique for collecting self-reports of an individual's daily behavior in an open-ended fashion on an activity-by-activity basis. Individual respondents keep or report these activity accounts for a short, manageable period, such as a day or a week – usually across the full 24 hours of the previous day. In that way, the technique capitalizes on the most attractive measurement properties of the time variable: (a) All 24 hours of daily activity are potentially recorded, including activities in the early morning hours, when few respondents are awake. (b) The 1,440 minutes of the day are equally distributed across respondents, thereby preserving the *zero sum* property of time that allows various trade-offs between activities to be examined – that is, if time on one activity increases, it must be *zero-ed* out by decreases in some other activity. (c) Respondents are allowed to use a time frame and an accounting variable that is highly familiar and understandable to them and accessible to the way they probably store their daily events in memory.

The open-ended nature of the activity reporting means that these activity reports are automatically geared to detecting new and unanticipated activities. For example, in recent decades, new activity codes had to be developed to accommodate aerobic exercises, use of e-mail, texting, tweeting, Facebook, iPods and other new communications technologies, and media.

These largely open-ended diary reports are coded using a basic activity-coding scheme. The simplest and most basic coding scheme was developed for the 1965 Multinational Time Budget Project of Szalai (1972), as shown in outline form in Figure 4.1. Although it has been superseded by the more elaborate activity codes in the ATUS and MTUS data collections described in the next section, the Szalai code has several attractive features. First, it has been tested,

00–49 Nonfree time

00–09 Paid work main job
00 Unemployment
01 (Not used)
02 (Not used)
03 Second job

found to be reliable, and has been used in several countries around the world. Second, and because of this, extensive prior national normative data are available for comparison purposes. Third, it can be easily adapted to include new code categories of interest to researchers who are looking into different scientific questions from various disciplines. The location coding can be aggregated to estimate time spent in travel, outdoors, or at home, all-important parameters for analyzing time-use trends.

When aggregated, time-diary data have been used to provide generalizable national estimates of the full range of alternative daily activities in a society, from *contracted* paid work time for an employer, to the *committed* time for unpaid housework and family care giving, to *personal* care for body and mind, and to all the types of activities that take place in *free* time. The multiple uses and perspectives afforded by time-diary data have led to a recent proliferation of research and literature in this field (Robinson and Harms 2015).

3. Methodological evidence on the accuracy of time diaries

Two important criteria of social-science measurement quality are reliability and validity. Reliability refers to the ability of a measurement instrument to provide consistent results from study to study or under different conditions (telephone vs. mail; open code vs. closed code, etc.). That is, do we get similar results using the same diary approach? Validity refers to the ability of an instrument to provide data that agree with estimates provided by other methods (such as using observation or electronic pagers, as noted above).

(a) Reliability

In two studies, estimates from time diaries were found to produce reliable and replicable results at the aggregate level. For example, Robinson (1977) found a 0.95 correlation between time-use patterns found in the 1965 national time diaries (N = 1,244) and the aggregate figures for the single site of Jackson, Michigan (n = 788). Similar high correspondence was found for the American data and for time-diary data from Canada, both in 1971 and in 1982 (Harvey and Elliot 1983).

Reliability has also been demonstrated using several different diary approaches. Thus, a correlation of .85 was found between time expenditure patterns found in the 1965–1966 US Jackson time study using the *tomorrow approach* (in which respondents filled out their diary for the following day), and time expenditures for a random one-tenth of the sample, who also filled out a *yesterday diary* (a diary for the previous day). This indicates that respondent's yesterday diaries, which can be obtained in a single interview, generate the same basic figures as the more expensive tomorrow diary, which requires another visit by the interviewer. In a smaller replication study in Jackson (MI)

in 1973, an aggregate correlation of .88 was obtained between these same measures (Robinson 1977), another indicator that not much daily activity is missed in either diary approach.

Further support for the reliability of the diaries comes from Gershuny (2003) and Michelson (2006), as well as from the convergent time figures obtained from the telephone, mail-back, and personal interviews in the 1985 national study, and from the overall national results and those obtained in 1986 in Jackson, Michigan, in 1987–1888 in California, and in 1986 and 1992 in Canada (Robinson and Godbey 1999, Appendices A, B, and C). The basic reliability of diary data is further evident in the striking year-to-year stability in Table 4.1.

(b) Validity

Almost all diary studies depend on the self-report method rather than on some form of observation. Thus, questions arise about the accuracy of the diaries. Several studies bear directly on the validity of the time diary, in the sense of there being an independent source or quasi-observer of reported behavior.

The first of these studies involved the low TV viewing figure from the 1965 time diaries relative to standard television rating-service figures. In a small-scale study (Bechtel, Achepohl, and Akers 1972), the television-viewing behavior of a sample of 20 households was monitored over a week's time by means of a video camera. The camera was mounted on top of that set, thus allowing the video camera/microphone to record all the behavior that took place in front of the television screen. The results indicated that both rating-service methods of television exposure produced estimates of viewing that were 20–50% higher than primary or secondary viewing activities as reported in time diaries or observed by the camera (Allen 1968).

Three more general validity studies examined the full range of activities, not just television viewing, and employed larger and more representative samples. A 1973 random sample of 60 residents of Ann Arbor and Jackson, Michigan, kept pagers/beepers for a one-day period and reported their activity whenever the beeper was activated (some 30–40 times across the day). Averaged across all 60 respondents (and across waking hours of the day) the correlation of activity durations from the beeper and from the diaries was .81 for the Ann Arbor sample and .68 for the Jackson sample (Robinson 1985). In a second study, a telephone sample of 249 respondents interviewed as part of a 1973 national panel survey were asked to report their activities for a designated particular *random hour* during the previous day – with no hint from the interviewer about what they had previously reported for that hour in their diary. An overall correlation of .81 was found between the two aggregate sets of data – that is, between the activities reported in the random hours and in the diary entries previously reported for those same random hours (Robinson 1985). In a third

study, Juster (1985) compared the *with whom* reports in the 1975–1976 diaries of respondents with those of their spouses across the same day. Juster found more than 80% agreement between these independently obtained husband and wife diaries about the presence or absence of their spouse during daily activities. In a separate analysis, a .92 correlation was found between time spent on various home energy-related activities and aggregate time-of-day patterns of energy use as measured by household utility meters.

More recently, some preliminary studies using the *shadow technique* have been conducted with student samples. The students shadow (*follow)* someone they know across an 8- to 12-hour period of the waking day, recording all the things each person does during that observation period. The next day the student then asks the shadowed person for an unrehearsed account of the same activities. Although the samples so far have been very small and highly unrepresentative, with some highly variable individual reporting, agreement at the aggregate level on most activities across the day is ± 10%. While some respondents have difficulty recalling their activities, people who overestimate, say housework, seem to be balanced out by those who underestimate housework. In other words, there do not seem to be activities that are systematically overestimated or underestimated, despite these individual errors in recall. Holmes and Bloxham (2009) conducted far more systematic and sophisticated shadow studies of non-student populations.

Methodological studies in other countries further attest to the basic generalizability of time-diary data (e.g., Gershuny 2000; Michelson 2006). Nonetheless, further careful and well-controlled methodological studies need to be conducted to provide more definitive evidence on diary measurement validity. One promising line of development to enhance validity is the application on new smaller technologies, like body cameras, accelerometers and hand-held recorders (Robinson and Harms 2015).

4. US and international patterns of leisure and volunteering

Multinational time-use tables for several (mainly European) countries are reported in Szalai (1972:114) for circa 1965 and in Fisher and Robinson (2011:295–302) for data collected in 1998–2005. Obviously, people spend the largest chunks of their time either sleeping or doing necessary work in their jobs, usually a paid job in modern societies. *Our concern in this chapter is with free time, the temporal site of FV*. Lacking a multinational visual for aggregated data from many nations, Table 4.1 from Robinson (2015) basically updates the 1985 pie-chart display in Robinson and Godbey (1997:125), in displaying 2003–2013 ATUS weekly changes in ATUS hours, organized with work and productive activities at the top, through personal care in the middle, to free-time activities at the bottom.

For example, in an average week, the bottom part of Table 4.1 shows Americans spent about half of their free time watching TV as a primary activity, by far the commonest leisure activity in Table 4.1. Moreover, Table 4.1 does not include the multiple additional hours of secondary activity TV watching, nor for reading and other media activities (IT use, radio, recordings) (Robinson and Godbey 1997:124). Socializing with others outside the home (talking, interacting) takes up roughly another 25% of free time on average, with the remaining time divided between other media, fitness, relaxing, religion, hobby and various other pursuits.

Thus, the first conclusion from Table 4.1 is that *FV consumes less than 5% of the average free time of Americans, and an even smaller part of their average time awake, with another 5+%* spent on INV, coded under family care. But amount of time spent on an activity can be a misleading indicator of either its importance to the individual or its psychological benefits or happiness that result from participation. Sexual activity is routinely rated as the most pleasurable use of time, but consumes relatively little time on average (Hektner, Schmidt, and Csikszentmihalyi 2007:128; Robinson and Godbey 1999:115–116). Sleep is a time-consuming biological necessity, but may not be pleasurable for insomniacs. One's paid work or occupation is a social necessity for most working-age adults, but again it is not pleasurable for many, perhaps most, workers. In general, various forms of leisure result in both more enjoyment and also more positive affect (happy feelings) than work or combined work and leisure (e.g., Hektner, Schmidt, and Csikszentmihalyi 2007:203; Robinson 2014; Robinson and Godbey 1999:374).

Given that the percentage of leisure time, let alone of all waking time, devoted to volunteering is small, how much time is spent on FV in time use studies? FV is mainly labeled as *clubs and organizations* in Table 4.1, which totals about 5% of leisure time use in 2003–2013. More refined codes might show a little additional FV under the present codes for religion, social, other free time, or even work activities, but probably not much more. Instead, Table 4.1 points to the almost larger amount of time devoted to INV in the family care category, labeled as *care to non-household members* (mainly children) in the family care section in the upper part of Table 4.1.

The conclusion about very little free time, let alone waking time, being devoted to FV or IV is also essentially valid for cross-sections of the time of adult populations in other nations (e.g., Fisher and Robinson 2011:207–210; Szalai 1972:114). But in the present ATUS, as in earlier experience-sampling studies, *people report that volunteering is highly satisfying,* coming in third after sexual activity and partying (Robinson 2014, 2015). Hektner, Schmidt, and Csikszentmihalyi (2007:128) in their sample of 107 working adults found that lovemaking generated the highest motivation and also the highest positive affect (happy feelings), compared with many other activities. The far greater

time spent watching TV in the ATUS, for instance, was associated with much lower levels of positive affect, as did working, idling, chores, resting, and hobbies (Robinson 2014).

5. Individual choice of FV rather than other kinds of leisure

The many types of reasons why people start, continue, or stop formal volunteering/FV are described at length in the chapters of Handbook Part IV, so it is not reviewed here. However, few such studies have focused on the differential explanation/prediction of choosing FV as leisure rather than other forms of leisure. The research and theory in Handbook Chapter 5 is the only chapter that directly considers this issue. One general conclusion of that chapter is that, in any society at any time in history since FV began to occur (see Handbook Chapter 1; mainly in the past 10,000 years, when associations arose in horticultural-village societies), some individuals tend to choose FV as a form of leisure because that activity is favored by the socio-cultural norms and values as a proper, high-prestige way to spend some leisure time. And in any society, some individuals are more disposed to follow norms than others, usually the higher prestige and higher socio-economic status individuals.

However, as Handbook Chapter 5 also suggests, various other high-prestige, societally desirable ways of doing proper (appropriate, socio-culturally approved) leisure also usually exist besides FV. In the United States and United Kingdom, high-prestige leisure activities include certain forms of outdoor recreation and sports activity (especially golf, tennis, and skiing in modern societies), certain forms of reading (especially of serious books and newspapers in literate societies), political participation (including voting, political discussion, political campaign activity, attending political meetings, etc.) in democratic societies, religious congregation activity (especially in religious vs. atheistic societies), arts and *high-culture* activity attendance (e.g., ballet, opera, art museums, and classical music concerts), and participation in some games and hobbies (e.g., chess, bridge, and collecting expensive art/crafts). In addition, engaging in sociability with friends, work colleagues, and co-members of one's religious congregation or clubs, is usually a higher-prestige form of leisure than the usual socializing within the home and family, with neighbors, or in bars. Differential explanation among these various higher prestige leisure activities is not well researched or understood.

Another relevant conclusion here from Handbook Chapter 5 is that FV, like some other types of societally approved leisure activities, is more likely for individuals who are high on the Active-Effective Character set of personality traits and attitudes. Such individuals tend to have more energy, more need for achievement, greater sense of personal efficacy (internal locus of control), and tend to seek productive activities for satisfactions in their leisure or free time, rather than more purely enjoyment/expressive and passive leisure. Hence, such

individuals tend to do more FV, more political participation, more high-prestige games and hobbies, more prestigious outdoor recreation and sports (especially competitive sports), and more arts and high-culture activity attendance.

Although altruism may be involved in some FV, especially in Volunteer Service Programs (Handbook Chapter 15) and in philanthropic service programs and associations (Handbook Chapter 17), most individuals also have self-interested motives for volunteering in various other kinds of associations (e.g., occupational associations, self-help groups, social movement associations, conventional political advocacy associations and campaigns, social leisure associations, and even religious congregations – as many such participants seek personal salvation in the afterlife; see Handbook Chapters 30 and 31). Smith (1981) has argued that there is no *pure*, selfless altruism for volunteering, as even the apparently most selfless volunteers get the psychic benefits of high self-esteem and a warm glow feeling (see research on neurochemicals in Handbook Chapter 25) from their volunteering.

6. Leisure choice spillover from, versus compensation for, one's main occupation or work activity

In their attempts to clarify the meanings of the concepts of *spillover* and *compensation*, Kando and Summers (1971:83–86) theorized that work affects leisure in two ways. First, the skills, knowledge, and life-style off the job are so attractive that workers, even when off the job, seek leisure opportunities that permit them to experience the benefits of using their skills and knowledge. We say, here, that work *spills over* into leisure. Alternatively, work may leave people feeling deprived of an important value, such as an opportunity for self-expression or self-actualization, for which they try to compensate by means of corresponding leisure that is different from their work activities.

These notions of spillover and compensation make good common sense but are yet to be convincingly verified by research. The relationship between work and leisure, it turns out, is enormously complicated. After reviewing this literature, Kelly (1987:147–153) concluded that at least four elements must be considered in studying the work–leisure relationship. First, whether they are in the work sphere or the leisure sphere, members of a society have been socialized in the same overarching culture. As they move in and out of their work and leisure activities, they carry with them values that apply to both. They also carry certain ways of thinking and modes of interacting with others. Second, the demands of work and its schedules are bound to affect leisure. As Kelly (1987:152) puts it: "After eight hours of heavy lifting, few steelworkers are interested in three sets of tennis." Third, our monetary resources for leisure are determined by our paychecks. Furthermore, some work roles carry certain leisure expectations, such as belonging to a prestigious country club or meeting at a particular bar after hours. Fourth, skills, modes of communication, and

styles of interaction developed in work or leisure may carry across to the other sphere.

Recent research (e.g., Rodell 2013) on corporate volunteers indicates clearly that volunteering in this context is more likely for employees who find their jobs less meaningful. In general, the more meaningful a volunteer role/task seemed, the more likely corporate employees would volunteer. In a review of research on employee volunteering, there is some additional evidence supporting the compensation hypothesis in regard to volunteering in relation to one's paid job, if any (Rodell, Breitsohl, Schroeder, and Keating 2016). It is unclear whether volunteers in general are compensating for less meaningful jobs.

7. National differences in time use for volunteering and for leisure generally

(a) Historical, societal, and political changes

Robinson and Godbey (1999:285) concluded from international time-use surveys that, since the l960s, people have gained a few hours per week of free time, with the data suggesting that this trend will continue. They observed further that in seven Western countries free time is now greater than work time, though the opposite is true for five Eastern European countries, especially for women.

Historically, female participation in civil society has been severely limited in traditional (agrarian, pre-industrial) societies past and present, compared to their greater participation in the more modern, industrial, and post-industrial societies. Musick and Wilson (2008:365) found that men are more likely to volunteer than women, though the gap between the two sexes is narrower in higher-income countries. They concluded that women in more affluent societies have greater freedom to participate in civil affairs than elsewhere.

Employment is another factor in the rate of volunteering. Musick and Wilson (2008:366) examined volunteer rates among people with and without jobs and found their rates of work and volunteering diverged substantially in low-income countries. That is, people without work volunteered less than those with work. In the more affluent countries the two rates tended to be similar (Plagnol and Huppert 2010).

(b) Demographic differences

Cushman, Veal, and Zuzanek (2005:289–290) also noted that employed women have less free time than men, and that women use less of their free time in sports and more in arts and cultural activities.

The range of leisure activities pursued declines with age. Among the exceptions here are watching television, engaging in certain arts activities, and playing particular sports like golf and bowling, in which older people are more active. Socio-economically, surveys have consistently revealed that the

economically and educationally more affluent are more active than less advantaged people (e.g., Plagnol and Huppert 2010).

8. Volunteering careers

Stebbins (2006:15–17) has suggested the concept of *volunteering careers* or *career volunteering,* pointing out how, for some people (usually a small minority of all volunteers), the commitment to volunteering generally or to being a volunteer in some specific Volunteer Service Program (VSP) or association is a long-term commitment with several steps of career advancement over time. Smith, Stebbins, and Dover (2006:36) define *career volunteering* as follows: "volunteering as serious leisure (as opposed to casual leisure), where career volunteers find (nonwork) careers in the acquisition of special skills, knowledge, or training and, at times, two or three of these, as they relate to a volunteer role or a set of such roles." Thus, career volunteers *in a VSP* may serve under a contract: a formal agreement setting out their duties to the agency or organization benefiting from their services, as well as the obligations of the latter toward the former. Such explicit contracts rarely exist for individual career volunteers *in associations*. However, higher leadership roles in associations usually have consensual contracts, and in larger associations, explicit role definitions for their incumbents (e.g., for a President, Vice-President, Secretary, Treasurer).

Career volunteers, as with other serious leisure participants, are committed to their activities; that is, they have a deep involvement in and psychological attachment to the core activities comprising their volunteering. Such commitment, as an attitude, is born of the many powerful rewards that they experience in the course of pursuing those volunteering activities. The rewards are motivators, providing an impetus for investing time and effort in the volunteer activity, regardless of its short-term costs and benefits (Mannell 1993:128). Although seemingly illogical according to common sense, serious leisure is characterized empirically by an important degree of positive commitment to a pursuit (Stebbins 2012:51–52). This commitment is measured, among other ways, by the sizeable investments of time and energy that career volunteers make in this kind of leisure over the period of many years. Perhaps the best source on career volunteers is Daniels' (1988) *Invisible Careers*.

E. Usable knowledge

Time-diary data provide an unprecedented, detailed, and comprehensive ability to incorporate precise figures on time spent on both formal and informal volunteer activity (FV and INV) in the same reliable and valid instrument, especially when compared to the usual interview approaches to measuring FV or INV separately. Table 4.1 reinforces the finding from Plagnol and Huppert (2010) and

Havens and Schervish (2001) that interview data on INV greatly underestimated the amounts of time spent by individuals on INV.

Hence, one key piece of usable knowledge is methodological: *Time spent on either FV or INV (but especially INV) will usually be determined more accurately by time-diary methods than by self-report survey questions.* Methodological research described in this chapter also suggests that time-diary methods will also be more reliable and valid for determining other kinds of participation by individuals – for instance, the many aspects of the Leisure General Activity Pattern described in Handbook Chapter 5.

In addition, because of the open-ended nature of time-diary methods, new types of leisure and volunteering that emerge in the future are more likely to be identified and incorporated into the same time accounts by the single-diary approach, as contrasted with complex survey interview questions. However, experience-sampling methods can also be valuable for such identification of new types of leisure and volunteering to supplement time-diary reports.

F. Future trends and needed research

Given the special methodological value of time-diary methods, we expect that future researchers studying volunteering will increasingly make use of these methods, especially for the study of INV. The fine-grained data obtained by time diaries permit precise computation of time trends in real time, where interview data are less precise and reliable. Robinson and Smith (2012) provide one recent example of such trend research on INV using time-diary data. The determinants of INV especially need to be studied carefully using time-diary measures of INV.

In regard to future research needed, the major (perhaps unsolvable) obstacle encountered lies in the multinational context (perhaps even more problematic for the current time-estimate interview questions) and the issue of cross-national comparability of what is to be regarded as *true* volunteer or helping behavior. This methodological problem also affects cross-time analyses, as illustrated in the current debate on whether social capital is declining, or just assuming new forms (e.g., Putnam 2000; Smith and Robinson 2017). Nonetheless, convening a group of experienced cross-national collaborators to tackle this question would be most fruitful.

Another important avenue for needed research is the alertness of time-use researchers to new and emerging forms of time use, especially leisure and volunteering activities. If time-use researchers neglect to update their coding categories to include such new forms, these activities will be missed and not considered properly. The updated leisure coding categories included in the list of all activities presented in Figure 4.1 is an example for the past, but such nuanced updating needs to continue routinely for the foreseeable future.

5
Volunteering as Related to Other Leisure Activities

David H. Smith (USA), with Sarah Dury (Belgium), John Mohan (UK), and Robert A. Stebbins (USA)

A. Introduction

Volunteering is done in leisure time and is usually categorized as *serious leisure* by Stebbins (1996), but is sometimes casual leisure. We review here whether volunteering is essentially independent of other leisure activities or is causally associated with some other leisure activities. Volunteering types cluster empirically among themselves in survey data and with other socio-culturally approved leisure activities in a seldom-noticed leisure general activity pattern (LGAP). The existence of the LGAP can be explained mainly by three factors: (1) pressure of social norms (social conformity) regarding approved ways to spend leisure time; (2) social contagion among an individual's close people, influencing the person to engage in other LGAP activities; and (3) the Active-Effective Character (AE-C), as a combination of personality and attitude factors. People high on LGAP are often the *civic core* in modern societies, a small proportion of people doing most of the active leisure/civic activities.

The objective of this chapter is to disentangle how social scientists study individual leisure activities and activity domains of adults all over the world. In recent years, many different forms of leisure participation have been studied as dependent variables (DVs). Broader patterns of relationship among leisure activities, termed *leisure domains*, have not been properly clarified. The LGAP is a subtle but pervasive pattern of statistical clustering among socio-culturally preferred leisure (free time, discretionary time) activities in any society at a certain historical time period. As such, it is a theoretical construct, but one that has received very little scholarly attention – far less than it deserves. This clustering has been present in hundreds of studies, but it has rarely been perceived as the LGAP and as a coherent meta-variable theoretical construct. Existence of the LGAP calls for reinterpretation of every prior empirical study that has

attempted to explain participation in any specific domain or type of individual leisure activity, such as volunteering, political participation, neighboring activity, outdoor recreation, and movie and event attendance.

The LGAP is also important theoretically as a key element in understanding all individual leisure activities in a coherent and systematic manner. Because the LGAP may relate to similar socio-cultural conformity in the realms of work and of personal obligations (self-care, home care, family care), this pattern of coherence has even broader potential implications for understanding human activity across the hours, days, months, and years of human lives in all areas. Yet, research that combines measures from a wide variety of socio-culturally approved leisure activity domains into a single LGAP Index has scarcely begun. Instead, nearly all of prior research has examined a specific form of leisure activity, or a narrow leisure domain (e.g., volunteering, political participation, outdoor recreation), as the DV, without consideration of the larger context of other leisure activities and leisure domains of the same individual.

B. Definitions

The definitions in the Handbook Appendix are accepted in this chapter. The concepts of *leisure time* and *leisure activity* are defined in the Appendix. We define below a few other key terms used in this chapter.

Leisure may be defined as "Un-coerced, contextually framed activity engaged in during free time, which people want to do and, using their abilities and resources, actually do in either a satisfying or a fulfilling way or both" (Stebbins 1996:2). *Leisure activity* refers to activities done as leisure.

Free time is "time away from unpleasant (disagreeable) obligation, with pleasant obligation being essentially leisure." This term is roughly a synonym for *leisure time*.

The *leisure general activity pattern* (LGAP) is defined here by Smith as "the positive and statistically significant inter-correlations of individual participation in most kinds of socio-culturally approved leisure activities in a given society at a certain historical period."

A *leisure activity domain* or *type* is a relatively coherent set of leisure activities of a similar nature and purpose, such as political participation, volunteering-giving, outdoor recreation, friendship activity, engaging in hobbies and games, attending movies-events, or arts-music-culture participation.

C. Historical background

The *leisure general activity pattern* (LGAP) was first identified and named by Smith (1969), although the initial name omitted *leisure* and used the term *syndrome* in place of *pattern*. This early, representative, random, sample survey of 304

adults in eight Massachusetts cities and towns provided data on 23 leisure activities, mainly dealing with volunteering, interpersonal relations, reading books/non-fiction magazines/newspapers, political activities, religious attendance, and going to movies/concerts/sports events. A Principle Components Analysis (PCA) first factor extracted showed the clear presence of the LGAP, with 16 items of the 23 loading .30 or higher on that factor (and all 16 loaded .35 or higher when the PCA was done only on these 16 items). *This clustering is present in hundreds of studies, but that clustering has very rarely been perceived as the LGAP and as a coherent meta-variable theoretical construct, requiring understanding and explanation.*

A few earlier researchers in the mid-20th century noted aspects of the LGAP, but they did not understand its theoretical significance, recognize its breadth of appearance in empirical studies, or give it an appropriate, distinctive label. For instance, Heinila (1959) showed that there was a clustering of various types of leisure and sports participation in his study of Finnish adults. Allardt et al. (1958) as well as Ahtik (1962) noted the "cumulative nature of leisure activities" in their surveys. The national sample research by Proctor (1962:36–37) of US adults found significant evidence that outdoor recreation activities were associated positively with several other types of leisure activity.

Many researchers have continued to see evidence of the LGAP more recently, usually without understanding its theoretical significance, its breadth of inclusiveness in terms of leisure activity types, or the extent to which it is an enduring pattern in human societies. When studied empirically in the past, the LGAP has usually involved only two or three individual leisure activity domains being measured, rather than many. Such prior studies use a variety of labels for the LGAP when they observe it, but very rarely use the *LGAP* label.

In Smith, Macaulay, and Associates (1980:chapter 19), Smith discussed an earlier version of this LGAP concept as part of the General Activity Model. In Smith (1994:255), he reviewed substantial evidence for the existence of the LGAP, referring then to the concept/construct still as the *General Activity Model*. Subsequently, Smith has referred to the positive clustering of socio-culturally approved leisure activities in a society as the *LGAP*, and has seen the General Activity Model as a broader set of ideas, as in Smith, Macaulay, and Associates (1980:chapter 19).

D. Key issues

1. What leisure activities are the usual empirical components of the LGAP?

Leisure researchers sometimes refer to these patterns of positive interrelationship by the term *substitutability*. Hendee and Burdge (1974:157) define leisure activity *substitutability* as "interchangeability of recreational activities in satisfying participants' motives, needs, and preferences." Such substitutability

really means positive covariation (e.g., positive inter-correlations) of individual participation in different leisure activities and leisure domains as an observed empirical pattern.

Substitutability researchers mainly focus on recreation and sports as leisure, not on a broader range of activities, such as those referred to above (in Section C) as part of the LGAP. It is quite clear from time diary research (e.g., Juster and Stafford 1985; Pentland et al. 1999; Robinson and Godbey 1997; Szalai 1972) that leisure time is often spent in other activities than recreation or sports. Television viewing, socializing (interaction with friends), and home communication (conversation) are particularly important in terms of relative time use (Robinson and Godbey 1997:125), followed by reading, hobbies, adult education, and recreation/sports/outdoors.

This positive covariation/inter-correlation of elements (items, domains) of the LGAP is rather small in magnitude (e.g., usually $r = .20–.30$), although usually statistically significant in samples of 200 individuals or more from the general population. This concept of substitutability needs to be broadened to include the positive covariation of *non*-recreational leisure activities, as mentioned above. The idea of substitutability also needs to be rethought in theoretical terms, because it ignores the causal underpinning of the positive covariation.

Too many sociologists and other social scientists fail to see that many important activities of theoretical interest are in fact performed during leisure time and offer direct gratifications consistent with the definition of leisure activity: political participation (e.g., voting in different types/levels of elections, political discussion, contacting government officials, attending a political meeting, working as a volunteer in a political campaign, signing petitions, joining a march or protest event; Verba, Schlozman, and Brady 1995:544); volunteering (e.g., voluntary association participation, service program volunteering, online volunteering, cyber group participation, voluntourism, informal volunteering/helping, informal care of family/kin, charitable giving); mass media consumption (e.g., reading newspapers, magazines, and books; TV watching; watching DVDs or streaming movies; radio listening; CD and tape music listening; listening to audiobooks); social/electronic media use, reading and contributing to blogs online; adult education; religious activity (e.g., attending religious services, helping with such services or the maintenance of a religious building, teaching religion to youth, visiting invalids to perform special religious services); conversation and socializing with family/relatives, interpersonal friendship activity (conversation, socializing, attending events together, social eating and drinking); hobbies; playing cards or other games; playing video games; sexual activity; attendance at high-culture events (e.g., classical music concerts, ballet, opera, plays/theater); performing art or music at home or in other amateur settings; dancing (e.g., ballroom dancing, square dancing, line

dancing, modern dance, ballet); outdoor sports and recreation; exercise; hiking; camping; hunting/fishing; gardening; attendance at movies/sports events/pop concerts; attending auto races or motorcycle races; and so on (Bartko and Eccles 2003; Dury et al. 2016; Godbey 2007; Goodale and Godbey 1988; Kelly 1996; Larson and Kleiber 1993; Leitner and Leitner 2012; Proctor 1962; Robinson and Godbey 1997; Smith and Einolf 2017; Smith and Robinson 2017; Townsend 1973; Wilson 1980).

On the contrary, individual political activities are rarely seen as the voluntary, unpaid, leisure activities they actually are for most such activities and most people. Few people in the general population are paid or coerced to vote, contact officials, attend political meetings, belong to a political association, or discuss politics. There has also been evidence for several decades showing the positive and statistically significant inter-correlations within the domain of individual political activities (Almond and Verba 1963; Verba and Nie 1972:347–352; Verba, Nie, and Kim 1971:328; Verba, Schlozman, and Brady 1995:544).

Verba and Nie (1972:345) analyzed data from 2,549 interviews with a US national adult sample accessed in 1967. They reported (pp. 57–62) that their 13 political participation variables have a statistically significant mean correlation of .25. All 13 load .45 or greater on the first factor obtained in a Principal Components Analysis. Some of these variables can also be seen as measures of association participation, even though politically oriented (membership in political clubs, form a group to work on local problems, active membership in community-problem-solving organizations).

Similar internal coherence has been found for various measures within the domains of association participation, formal volunteering in service programs, informal helping/volunteering, and giving (Bekkers 2005; Bekkers and Wiepking 2011:16–17; Einolf 2011; Hank and Stuck 2008; Hodgkinson 2003; Musick and Wilson 2008:270–275; Plagnol and Huppert 2010; Wilhelm and Bekkers 2010; Wilson 2000; Wilson and Musick 1998). Burr et al. (2005) used US national sample panel data to show that care-giving, which may be seen as obligatory (i.e., not leisure) for close relatives, is also significantly related to formal volunteering.

Einolf (2011:10) reports moderate and significant correlations among nationally aggregated measures of formal volunteering, informal volunteering (helping a stranger), and charitable giving using aggregated data for nations, based on a Gallup World Poll performed on representative samples of adults in 153 nations of the world in 2010. Using data from the European Social Survey for 2006, Plagnol and Huppert (2010) similarly found formal and informal volunteering rates of 23 nations to be positively and significantly correlated, based on representative survey sample interview data aggregated by nation. Such national sample survey research using aggregated data on leisure activities by nations shows the transnational existence of aspects of the LGAP.

When religious activities have been measured in large, representative samples of the population of the United States, such activities also cohere in a religious LGAP. For instance, long ago Stark and Glock (1968:177) showed that key dimensions of religious activity cohered significantly (with the exception of ethical behavior). We have already noted that outdoor recreation measures cohered significantly in a US national sample, also long ago (Proctor 1962:36–37). Subsequent national sample research that has focused on arts-culture activity and on sports-recreation expressive/social leisure has further confirmed such coherence (Smith and Robinson 2017).

Smith suggests referring to the internal coherence of socio-culturally approved leisure activities *within* a given domain (e.g., volunteering, politics, religiosity, recreation-sports, art-music-culture, sociability-socializing) be termed a *micro-LGAP*. Similarly, the internal coherence of socio-culturally approved leisure activities across *different* activity domains may be termed the *macro-LGAP*. However, such internal coherence should *not* be interpreted as indicating that there are no major sub-clusters of activities within either level of LGAP. Much research also shows such sub-clusters exist (e.g., Verba and Nie 1972:347–352).

The fact is, there is both unidimensionality at one empirical level (results of Principle Components Analysis, un-rotated, first factor loadings) and also multi-dimensionality at another empirical level (either oblique or orthogonal rotated factors and their loadings) for LGAP data and various other kinds of socio-behavioral science data (e.g., the study of personality and attitudes). Smith (1982) refers to this common situation in social science as *fundamental intrinsic duality*, roughly analogous to the wave-particle duality in quantum physics.

2. What leisure activities usually do not fit with the LGAP empirically?

Less socio-culturally approved or neutral individual leisure activities in North America and Europe include watching TV, listening to the radio or CDs/tapes, watching DVDs at home, drinking alcohol (especially in excess), resting/relaxing, napping, and thinking/doing nothing. The expectation of the LGAP/General Activity Theory is that being less socio-culturally approved as leisure in modern, post-industrial societies, such less-approved or neutral variables and their domains will not correlate with LGAP as significantly and positively as do the more clearly socio-culturally approved types of leisure activity that are more central to the LGAP in US society. Low positive or even low negative correlations are expected with an LGAP Index or with specific socio-culturally approved leisure activity domains or items. In pre-modern, pre-industrial, and agrarian societies and sub-cultures, where such *passive* leisure is more socio-culturally valued, these activities, when present, may cohere better with the central core of the LGAP (although this is purely speculative).

Socio-culturally neutral or optional leisure activities do not tend to be part of the LGAP positive manifold (set of positive, directionally aligned correlations), according to the LGAP theory (e.g., television viewing or resting/napping). The research by Chambré (1987:84–85), using a US national sample of the elderly, is one of very few national sample survey studies that show that these kinds of neutral/optional leisure activities do not correlate positively with more socio-culturally approved leisure activities. She found that "watching television, listening to the radio, sitting and thinking, and doing nothing" were "negatively associated with the rest of the [LGAP] items."

These four items are distinctive by being more *passive and/or solitary in nature*. The other 11 items include a wide range of LGAP activities, such as social interactions with neighbors or friends, recreation, hobbies, going to movies, reading, and walking or exercise. These LGAP items correlated negatively with the four *neutral/optional* leisure activities. In fact, given the negative correlations, these passive/solitary activities may be seen as at least mildly disapproved.

Some more *clearly disapproved (and sometimes illegal)* leisure activities in modern, Western, and even traditional societies likely include using illicit drugs, excessive alcohol use, excessive gambling, use of sex workers, recreational vandalism, and the like. Clearly *dis*approved leisure activities in any society and historical time period are expected to correlate negatively with specific socio-culturally valued leisure activity domains and with an LGAP Index, according to Smith's General Activity Theory (Smith 1980, 1983; Smith and Einolf 2017).

No published studies could be found that show the correlations of seriously *dis*approved (deviant) leisure activities with more approved LGAP activity measures. Leisure activities that are more clearly disapproved in a society (e.g., illicit drug use, use of sex workers, excessive gambling, getting drunk, dog-fight and cock-fight attendance, or recreational vandalism in America) are hypothesized to have significant, often substantial, negative correlations with socio-culturally approved LGAP variables. Overall, the results of Chambré give strong support to the LGAP with a broad range of leisure activity measures (each of which is based on a single interview item). Her results also show that less-approved or neutral leisure activities do *not* cohere with the LGAP measures, as predicted by General Activity Theory.

3. How widespread is the empirical evidence for the LGAP in contemporary societies and nations?

Many researchers have reported evidence for parts of the LGAP more recently without seeing the whole picture, from the present perspective. Most such studies have focused only on two or three of the following elements of the hypothesized LGAP. These elements include such leisure activities as formal program volunteering, informal helping/volunteering, association participation, giving money or objects, political activity, and religious participation

(Bekkers 2004:chapter 5, 2005; Chambré, Dekker 2004; Dekker, Koopmans, and van den Broek, 1997; Dury et al. 2016; Hodgkinson 2003; Kawachi and Kim 2006; Mannarini, Legittimo, and Talo 2008; Michel 2007; Musick and Wilson 2008:chapter 12; Nishide and Yamauchi 2005; Parboteeah, Cullen, and Lim 2004; Reed and Selbee 2001; Scheufele and Shah 2000; Townsend 1973; Verba, Schlozman, and Brady 1995:chapter 12; Wilhelm and Bekkers 2010; Wilson 2000; Wilson and Musick 1998).

Research bearing on the LGAP is widely scattered and uses highly variable terminology. Thus, it is very difficult to do a thorough review of the relevant research literature. The studies cited above mainly were done on samples of adults in the United States. However, many studies also show evidence of aspects of the LGAP in other nations: Canada (Reed and Selbee 2001); United Kingdom (Fahmy 2003); Australia (Alexander et al. 2010); Netherlands (Bekkers 2004); Belgium (Dury et al. 2016; Hustinx et al. 2012); Sweden (Fröding, Elander, and Eriksson, 2012); Japan (Nishide and Yamauchi 2005; Taniguchi 2010), and Russia (Smith 2015), for example. There is also substantial evidence of the LGAP in multi-national research in Europe (Badescu and Nelle 2007:170–171; Dekker, Koopmans, and van den Broek 1997; Hank and Stuck 2008; Kohli, Hank, and Künemund 2009).

Smith and Einolf (2012, 2017) and Smith and Robinson (2017), using Principal Components [factor] Analysis or PCA, have recently shown that there is very convincing and consistent evidence for the existence of the LGAP in a total of five national US representative samples over about 35 years, nearly to the present.

(a) Smith and Einolf (2012, 2017) studied the LGAP for two representative national samples of the United States in different years. First, they used survey data from the 1995 wave of the MacArthur Foundation's Midlife in the United States (MIDUS) study. The measures of LGAP used were the following: (a) hours per month of formal service program volunteering; (b) frequency of attending association meetings; (c) hours per month spent assisting others (informal volunteering); (d) frequency of social contact with neighbors, friends, and family; (e) hours per month spent on emotional support activity for close people (as in d, but also with spouse); and (f) religious activity, combining frequency of religious service attendance and attendance at religious meetings.

Unlike most other studies cited above, a Principal Components [Factor] Analysis was performed, finding that a single, first, un-rotated factor of LGAP emerged. This factor included all six of the LGAP measures, each with loadings of .40 or greater on the factor. The PCA also showed that a measure of time spent doing household chores (*not* leisure, but an obligatory home-care chore) was moderately included in the General Activity factor, with a loading of .38. This result confirms the suggestion of Hank and Stuck (2008) that an underlying *productive activity dimension* may be present. This is a strong empirical

confirmation of a broad LGAP in national representative sample survey data for the United States. These 1995 results highlight that when people are engaged in one type of socio-culturally approved leisure activity, they are also more likely to be active in other types, confirming the LGAP theory.

(b) Smith and Einolf (2017) also analyzed the General Social Survey data for 2002, with a representative national sample of adults in the United States. The LGAP leisure activity measures used were the following: (a) a factor-derived index of formal volunteering, (b) a factor-derived index of informal volunteering, (c) a factor-derived index of religious participation, and (d) and a factor-derived index of Internet use. Unlike the prior studies factor analyzing LGAP variables, this research used more reliable indices, rather than single items. All four of the LGAP-relevant indices loaded .43 or greater on the first PCA factor extracted, confirming even more strongly the existence of the LGAP. Unusually, this research included Internet use, which was not included in earlier studies, because historically non-existent then.

Further, the PCA included a factor-derived index of TV-watching and relaxing/napping, as a neutral, less social-approved, leisure activity. This index loaded a weak .06 with the LGAP Index, as General Activity Theory predicts. This is perhaps the first study to use PCA on LGAP items/indices and to include a neutral leisure item or index, confirming that it is not empirically a part of the LGAP in this data set. An item measuring the number of hours worked (for pay) last week was also included. Hours worked had only a weak, positive, factor loading of .20 with the LGAP indices. The size and direction of that finding gives insignificant but interesting support for the *productive activity* suggestion by Hank and Stuck (2008) of the core of the LGAP.

(c) A third, national, from the United States, representative sample set of data on the LGAP was also analyzed by Smith and Einolf (2017). Called a "National Study of Community Involvement," these data were collected largely in the first half of 1973 in approximately one-hour interviews with a national, representative, urban sample of adult US citizens ($N = 2,622$) residing in 42 cities and towns of 10 metropolitan areas of the contiguous 48 states. The completion rate of intended interviews was .76.

As part of the interview, there were some 40 questions that inquired about the respondent's community participation and other leisure activity. LGAP indices were created for each of five leisure activity domains, based on factor analyses of the items in each domain: voluntary association participation, political participation, neighboring, recreational activity, and friendship activity. The five activity domain indices together were then subjected to PCA, and the first factor examined.

All five LGAP domain indices loaded .30 or higher and in the same direction on this first factor, again confirming the existence of the LGAP in national sample US data, but this time back in the early 1970s. This research, like the

prior research, is stronger confirmation of the LGAP by using reasonably reliable indices of the LGAP domains, rather than single, less reliable, survey items. Cronbach's alpha ranged from .57 to .73, with greater reliability for the indices with more items.

(d) Smith and Robinson (2017) analyzed two different US national representative sample data sets to seek the LGAP through PCA factor analysis of relevant, socio-culturally approved, survey leisure items. LGAP-related items from the General Social Survey for 1993 were subjected to PCA, as in the prior studies above. The first PCA factor again was clearly the LGAP, with 10 socio-culturally approved leisure items loading .30 or higher in the same direction: attend sports events, visit art museums and galleries, attend musical events, see movies, do art activities, dancing, perform theater, do sports, voting, and camping. Gardening and hunting/fishing were near misses, with loadings of .28 and .29. In a purified PCA on just the LGAP items, all 12 of the above items loaded .30 or higher.

Like the research in #b above, the initial PCA also included some likely neutral leisure activities in terms of social approval. Three different items about TV viewing had very weak (and in one case negative at −.16) loadings on the first LGAP factor. Use of a Video-Cassette Recorder (listening to music, as passive leisure) had a significant *negative* loading of −.45. Hence, this analysis further confirms the General Activity Theory hypothesis that neutral or negative, mainly passive and unproductive, leisure activities will *not* load positively and significantly on the LGAP first factor from PCA.

(e) Smith and Robinson (2017) also analyzed US national representative sample data from the 2008 Survey of Public Participation in the Arts. Following the approach used above, a PCA was performed on nine LGAP items: volunteering, community activity, voting, attending movies, attending sports events, doing sports, doing outdoor recreation, exercising, and gardening. The first PCA factor was clearly LGAP, with all nine items loading .41 or higher on the LGAP. Auto racing and hunting/fishing were omitted from the final LGAP PCA, having been weaker but positive in an initial PCA. The latter findings suggest that these two forms of leisure activity are less socially approved than the final, nine LGAP items.

(f) Hodgkinson (2003:46–47) reported data from the 1999–2002 wave of the European Values Surveys/World Values Surveys from 48 counties (with data reported separately for East and West Germany and for Britain and Northern Ireland) on all inhabited continents except Australia. These results gave extensive multi-national support to the existence of the LGAP *using nationally aggregated data*, although neither inter-correlations nor factor analyses were reported. Her Table 3.2 shows that more volunteering is systematically and significantly associated with attending religious services, being a member of a voluntary organization, having signed or being willing to sign a petition, and discussing politics frequently. Future analyses of these EVS/WVS

data are likely to show the hypothesized, statistically significant, LGAP inter-correlations among these items and a strong, LGAP, unrotated, first PCA factor. Such research needs to be done to test further the LGAP and General Activity Theory.

(g) Using data on over 27,000 people in representative samples from 11 European nations, only Hank and Stuck (2008) seem to be aware of the generality and importance of the LGAP – which they refer to as *linked productive activities*. Their sophisticated data analysis gives the strongest multi-national support to the existence of the LGAP using *data on individuals as the level of analysis*, *rather than national aggregate data from individuals*. Their data came from the 2004 Survey of Health, Aging and Retirement in Europe (SHARE). The central focus was on determining whether three aspects of the LGAP (though they did not use this term) were related in terms of substitution (*crowding out*) or complementarity (*spillover*, or an underlying common determinant). The three LGAP aspects were single-item measures of volunteer work (*done voluntary or charity work* in past month), informal helping/volunteering (*provided help to family, friends or neighbors* outside the household), and informal care (*cared for a sick or disabled adult* outside the household). These were all seen as *productive activities*.

Their results were unequivocal. A complementary relationship was found among volunteer work, informal helping, and informal care in each country "independent of the general level of participation in a country" (Hank and Stuck 2008:1289). In each of the 11 nations, bivariate associations between all pairs of LGAP variables were *strong*. *Most importantly, multivariate probit models showed that these associations between pairs of LGAP activities were clearly present even with many control variables taken into account.* Hank and Stuck (2008:1286–1287) conclude:

> In all models, we find a strongly positive and highly significant correlation between the [LGAP] dependent variable and *other productive* [LGAP] *activities*. That is, even if other individual characteristics [demographics, employment, education, health, and country] are controlled for, there is evidence for an increase in the probability to be active in one domain with parallel productive [LGAP] engagement in other domains. This relationship holds in similar ways across various countries or regional clusters.

Such findings seem to have no known parallel in the published literature relevant to LGAP (but see also Dury et al. 2016). The multivariate analyses by Hank and Stuck (2008) make it clear that *the LGAP is not an artifact of social background variables, including socio-economic status*. This finding confirms Smith's Conformity Hypothesis and disconfirms Wilson's Social Resources Hypothesis as underlying the LGAP (see Section D, 3, [1] above). The very large sample, roughly representative for 11 Western European nations, lends strength to these results, supporting the existence of the LGAP for the limited set of three related variables.

However, the research in #a–#e above extends the range of LGAP beyond *productive activities* to other socio-culturally approved activities, like friendship activity, neighboring activity, and recreational activities, which seem more *expressive or consummatory*, rather than productive. Much earlier, Butler and Gleason (1985) suggested the Productive Activity Hypothesis, as an interpretation of successful aging. In this hypothesis, older persons who are engaged in a variety of productive activities *beyond* gainful employment, such as the LGAP activities, live longer, are healthier, and more satisfied with their lives.

4. What explains the existence of the LGAP and the empirical patterns usually observed?

I. Overview of Smith's General Activity Theory

Smith (1980, 1983) presented two earlier, extensive discussions of the General Activity Model. Most recently, Smith (in Smith and Einolf 2017) has summarized General Activity/LGAP Theory briefly, as follows, quoted here with permission of the authors:

> Many types of socio-culturally approved leisure activities in any society at any historical time period are correlated positively among themselves for various theoretical reasons:
>
> *(A) Social pressure (social conformity) hypothesis:.*
>
> (a)　In any society or culture, members are socialized into how to spend their sleep time, work time, and leisure time *correctly* or *properly*, according to local customs.
>
> (b)　As a result, in any given society at any historical time period, each society/ culture specifies a set of positive, active, and usually productive and/or satisfying activities that its members should engage in during their leisure time.
>
> (c)　These prescribed leisure activities are termed *socio-culturally approved leisure activities,* or more briefly, *LGAP activities.*
>
> (d)　Socio-culturally approved leisure/LGAP activities in a given society tend to co-vary positively as individual behaviors. That is, they tend to be positively and significantly inter-correlated, once their directions are properly aligned (i.e., so that a high number means a higher participation level).
>
> (e)　This positive co-variation of LGAP activities results from shared socialization and social control processes in any society, both of which push many individuals toward engaging mainly in LGAP activities.
>
> *(B) Social contagion (LGAP momentum hypothesis).*
>
> (f)　Participation in one or more LGAP activities, especially several, tends to lead to further participation in such activities, rather than in neutral or negative (disapproved) leisure.

(g) LGAP activities promote other LGAP activities for various reasons, but most centrally because such activities are integrative: LGAP activities by an individual affirm the normative and value system of the society, in turn leading to positive feedback from others and little or no negative feedback (i.e., social control and negative sanctioning).

(h) LGAP activities also promote other LGAP activities by increasing the likelihood of encountering others, especially close people, who will ask and encourage the individual to engage in such LGAP activities.

(C) Active-Effective Character/Active-Prosocial Character hypothesis:.

(i) In addition, both selected personality traits and attitude variables lead some persons in any society to be especially active in socio-culturally approved leisure activities (cf. Smith, Stebbins, and Grotz 2016: Chapter 30).

(j) The set of relevant personality traits and attitude variables conducive to high levels of general activity in socio-culturally approved leisure activities is termed the *Active-Effective Character* (A-EC) or more recently, the *Active-Prosocial Character* (cf. Smith, Stebbins, and Grotz 2016: Chapter 30).

(k) In many contemporary nations/societies, various measures of volunteering (e.g., association participation, volunteer service program participation, board-policy volunteering) thus tend to be positively and significantly inter-correlated with charitable giving, political participation, friendship activity, neighboring activity, outdoor recreation, and so forth.

(l) These positively correlated and socio-culturally approved leisure activities are labeled collectively as the Leisure General Activity Pattern or LGAP.

(m) However, such other socio-culturally approved leisure activities (as the LGAP) do not usually *cause* higher levels of association participation and volunteering. Instead, all types of positive/productive leisure activity in the LGAP set tend to be caused by other underlying variables, as suggested above.

(n) Key psychological variables/dispositions that foster high general activity and LGAP are listed in Smith (1980, 1983), and also in Smith, Stebbins, and Grotz (2016: Chapters 30 and 31).

(o) A few pieces of research on behavioral genetics, mentioned in Handbook Chapter 25 (Section D, 8, b), suggest that aspects of the LGAP (labeled "civic engagement" in one study; Dawes et al. 2015) are substantially heritable (genetically based).

Smith and Einolf (2017) conclude: "In sum, there are three key, underlying explanations for the LGAP, according to Smith's General Activity Theory (Smith 1980, 1983):

(A) Pressure of social norms in a society (or other socio-cultural system) regarding the approved (proper, correct) way for individuals to spend leisure time.

(B) Social contagion among an individual's close people, influencing the person to engage in other LGAP activities (LGAP Momentum), once he or she is established as socially integrated and societally conforming in general (not an outsider/deviant).

(C) High levels on the A-EC as a combination of personality and attitude factors that motivates individuals to be civically and pro-socially engaged in their society, with this complex of psychological dispositions varying among individuals within and across societies."

II. Detailed Explanations of the Three Roots of LGAP

(A) Pressure of social norms (Social conformity hypothesis). The present General Activity Theory argues that people in any human society (anywhere and anytime) are generally socialized and directly influenced to participate in socio-culturally approved activities in virtually all aspects of time use and human life. The culture and social structure of each society prescribe the preferred ways of doing nearly any activity. *Social pressure* may be broadly defined to include socialization, imitation and following significant others as models, conformity to norms, obedience to authorities, accepting direct social influence from others, and responsiveness to social control activities by others.

Social pressure in all societies influences most adults to engage in socio-culturally approved *work* activities. What is acceptable work in a society varies greatly by age, gender, and the level of societal complexity (Nolan and Lenski 2006:chapter 4; Turner 2003), among other factors. In developed nations (with high per capita income, and a highly educated population), such work activities would include being active in an acceptable (non-criminal) paid occupation or in unpaid homemaking (e.g., a spouse not in the paid work/labor force), as contrasted with receiving welfare payments, receiving unemployment compensation, or being incarcerated in a residential institution (prison, mental hospital). However, in developed nations, retirement (no paid work) is also acceptable for older persons, as is being disabled and receiving disability income for people of all ages, to a lesser extent.

Social pressure in all societies influences nearly all normally functioning (i.e., healthy, non-retarded) adults to engage in socio-culturally approved *personal obligatory* activities. The latter category includes self-care, family-care, and home-care (including yard maintenance) activities. Such activities are promoted rather than letting adults ignore personal cleanliness and appropriate dress/appearance, ignore child care, spouse care, and other family care, or ignore minimal care for one's dwelling (inside and outside) and its immediate physical surroundings (yard, grounds).

Such personal obligation activities occupy significant amounts of time in the daily time budgets of nearly all adults (Gershuny 2000; Robinson and

Godbey 1997; Szalai 1972). For instance, Szalai (1972:114) reported that total housework, household care, child care, and personal needs activities across 16 nations had a median of over 6 hours per day (omitting sleep, as passivity/inactivity) in time use data. Robinson and Godbey (1997:107, 113, 115) found the same 6 hours for these personal obligation activities (again omitting sleep) for adult Americans in 1985 [my computation from summary data on household care and personal care, subtracting 8 hours for sleep]. Social scientists pay little theoretical attention to such obligatory personal activities, however, except in the context of studying disabilities or women's roles, more recently.

Given the relatively low absolute levels of LGAP domain index correlations, the effects of LGAP are not likely to be large. But such effects seem to be very consistent, pervasive, and have substantial theoretical importance. Now that the existence of the LGAP is indisputable from the present data, as with much prior data, we need future research and theory that delves into the origins of this phenomenon.

The preferred present theoretical argument for the roots of the LGAP is the *Social Conformity Hypothesis* (or, alternatively labeled, the *Normative Hypothesis*). This Hypothesis argues that human societies socialize and use social influence and social control processes on people to encourage most normal adults to perform *leisure* activity roles that are preferred or acceptable in the given society (or sub-culture). These socialization and social influence/control processes lead most people in any society to perform productive, usually paid (for adult males, and increasingly for adult females), *work* roles that are preferred or acceptable in the given society (or sub-culture). The same is true for socialization and social influence/control processes that lead to performing socio-culturally approved *personal obligation* activities in a given society and sub-culture (self-care, home-care, and family-care activities).

(B) Social contagion hypothesis (LGAP momentum). One major alternative to the present Social Conformity Hypothesis for observed aspects of the LGAP is Wilson and Musick's (1998) *Social Resources Hypothesis*. These authors were concerned with explaining volunteering specifically, but argued that various other forms of social capital could be seen as social resources that facilitated and thus explained such volunteering. In their later book (Musick and Wilson 2008:267), these authors (in reverse order) provide more recent evidence that volunteering is significantly related to various measures of social resources: (a) informal social networks ("friendships and regular contacts with neighbors and kin residing outside the household"), (b) formal social networks ("memberships in 'secondary' associations, such as clubs, political parties…"), and (c) church attendance (membership in religious congregations). Musick and Wilson (2008:460) consequently argue that "participation breeds participation." These data generally support the existence of the LGAP. Musick and

Wilson also adduce recruitment effects and social integration effects as partial explanations for their social resource findings, but do not fully explain the LGAP.

Insofar as Musick and Wilson argue for social integration as a partial cause of the LGAP, they are agreeing with the Social Conformity Hypothesis discussed in the prior sub-section. But when they argue (p. 460) that "participation breeds participation," and note the influence of recruitment on participation, they are referring to what we term the Social Contagion Hypothesis. This Hypothesis is *partially* based on socially integrated individuals, who are involved in one or more LGAP activities initially, also being recruited by close people and other peers to get involved in other LGAP activities. However, such individuals may also engage in other LGAP activities because of self-initiated cognitive dissonance/consistency motivations. For instance, once involved in one type of volunteering (or political activity, or some other initial LGAP domain) and satisfied with such activity, an individual may engage in one or more other types of volunteering out of cognitive consistency motivation. For instance, if an individual becomes a service program volunteer, he or she may also join an association and become active, or vice versa, feeling that both types of leisure are psychologically compatible.

Further, the Social Contagion Hypothesis argues that there are social structural and cultural influences on engagement in additional LGAP activity *domains* once the person gets involved in the first domain or other domains. For instance, activity in politics can lead to a socio-cultural reputation for LGAP activity that results in corresponding expectations by others that one will get involved in other LGAP domains such as volunteering, friendship, or neighboring.

(C) The Active-Effective Character (Active-Prosocial Character).   Hank and Stuck (2008:1289) state that their finding of highly significant correlations of the error terms of all three multivariate probit equations (dealing separately with volunteer work, informal helping, and informal care) in an analysis of data on 27,000 plus individuals in 11 Western European nations

> indicates the presence of unobserved joint determinants of all three [productive leisure] activities. We interpret this finding as further evidence for the existence of a *general motivation to be active . . .*, which appears to be independent of a specific domain of activity and significant for the individual's decision about his or her productive [leisure] engagement, even when relevant individual resources, such as education or health, are controlled for.
>
> (Emphasis added)

The A-EC construct is a leading candidate for such a general *motivation to be active* (Smith 1975:258, 1980:466–485, 1983:85–90, 1994:255). The initial

version of the Active-Effective Character Hypothesis grew out of an attempt by Smith (1966) to theorize the *ideal participant* in voluntary associations, from the theoretical perspective of personality and social structure fit. Literature reviews on who participates in such associations and why they do so led to further development of the hypothesis by Smith (1975:258, 1980:466–485, 1983:85–90, 1994:255). Smith changed the label from *ideal participant* to *active participant*, and still later to the A-EC. Smith later expanded the scope of relevance of the A-E Character construct from association participation to the whole of the LGAP.

Character is used here as a term referring to the total pattern of relatively enduring psychological dispositions of a person, roughly in the sociological sense initiated by Gerth and Mills (1964). Character is thus far broader than the concept of personality or self. This theoretical construct of *character* involves several types and levels of trans-situational relevance of psychological dispositions, including personality traits, values, perceived socio-cultural system expectations, personal expectations, general and specific attitudes, and activity intentions.

Examples of personality traits included are efficacy (internal locus of control), emotional stability (low neuroticism), high self-esteem (ego strength; effective ego defense, effective ego expression), assertiveness (high extraversion), stimulation need/curiosity (high openness to new experience), prominence need, warmth/intimacy need (high agreeableness), morality, flexibility, energy/activation, deliberateness (high conscientiousness), practicality, and self-actualization need. Note that these include all five of the *Big Five* personality traits (Digman 1990). Space constraints here prevent describing the various attitude variables included (but see Smith 1983).

Given the breadth and complexity of the A-EC as a theoretical construct, it is not surprising that empirical evidence supporting its relevance is fragmentary and incomplete. Most elements of the model have been supported empirically for one or more types of leisure activities, but invariably in different studies. Townsend (1973) found that, among a small sample of American college freshmen, indices of general positive attitudes toward different domains of approved leisure activities were significantly correlated with their respective indices of association activity, political activity, media exposure, and interpersonal activity. In Smith, Reddy, and Baldwin (1972), chapters 12 and 13 review research on attitudes and personality factors, respectively, that influence association participation, confirming various aspects of the A-EC model. Several later literature reviews support the relevance of the A-EC model as a whole to various types of leisure activities, especially political activity, association participation, volunteering, sports, outdoor recreation, religious activity, mass media consumption, and giving (Bekkers and Wiepking 2011; Smith 1975:258, 1980:466–485, 1983:85–90, 1994:255; Smith, Macaulay, and Associates 1980:chapters 4, 5, 8, 10, 12, 17, 19; Smith and Theberge 1987; Verba, Schlozman, and Brady 1995).

This A-EC Hypothesis gives an empirical foundation to the observation by Burr et al. (2005:S255) "that in the population of older persons there may be a class of individuals who could be characterized as 'super helpers' or 'doers.'" The present A-EC Hypothesis extends that suggestion to the entire population at any age and to all kinds of socio-culturally approved activities, not just helping activities. Some evidence noted earlier (Dawes et al. 2015) suggests that aspects of the LGAP are genetically based, and this might occur because of the heritability of the A-EC, but this is just a hypothesis.

The time use phenomenon of "the more, the more" noted by Robinson and Godbey (1997:299–301) is also relevant to the concept of some people as *doers*. From time use data on a national sample of Americans collected in 1985, they conclude, "Those most active in productive [meaning paid jobs or home-making] work also seem to be most active in free time, paradoxical as that may seem."

The Canadian national sample survey research reported by Reed and Selbee (2001) on the *Civic Core* is also directly relevant. They show that a small minority of the adult population, termed the *Civic Core*, performs the majority of voluntary civic activity (such as volunteering hours, number of association types participated in, and amount given to charity). Although those authors do not refer to either the LGAP or the A-EC, their findings are consistent with a subset of the Canadian adult population being quite high on the A-EC and hence becoming the Civic core as a result. Direct testing of this hypothesis by Smith is needed.

In another paper based on the same Canadian survey data, Reed and Selbee (2003:102–103) identify a *distinctive ethos* (values, perceptions, beliefs) that characterizes "people who manifest a higher or more generalized level of prosociality" (p. 102), even when socio-demographic variables were controlled (p. 103). They argue that this coherent ethos "is indicative of something more than just sociality – of a syndrome of generosity mixed with civic engagement and concern for the common good." To the present authors, this again sounds like the A-EC with a different label, emphasizing values rather than personality traits.

Using data from three waves (2007–2010) of a national survey of adults in England and Wales, Mohan and Bulloch (2012) replicated the Canadian results of Reed and Selbee (2001). They defined, as did Reed and Selbee, a threshold for membership of the civic core on any one dimension of pro-social behavior, namely being one of the smallest subset of the population that accounted for two-thirds of the total effort contributed. Thus, 7.5% of the population accounted for two-thirds of the total number of hours volunteered, while 10% of the population was responsible for two-thirds of total charitable donations. Combining dimensions of behavior, it was found that around three-tenths of the adult population accounted for at least four-fifths of money given to charity in the preceding four weeks, the hours spent volunteering through

formal organizational structures, and numbers of types of association in which individuals participated. Importantly from the perspective of policy, the civic core tends to share distinctive characteristics.

People whose commitment to these pro-social (LGAP) voluntary activities qualifies them for membership in the civic core tend to be high in several types of dominant statuses (see Handbook Chapter 28), especially managerial and professional occupations, to be more likely to possess high levels of formal education, are likely to be aged 45–64 years, more actively practicing a religion, and more likely to be long-term residents (at least ten years) in their neighborhoods. Furthermore, geographical covariates available in the survey data were used to show that those in the civic core were more likely to be found in the most prosperous neighborhoods in England and Wales, reflecting processes of residential socio-economic segregation. Unsurprisingly, therefore, given that the great majority of voluntary organizations in England and Wales are active at the neighborhood level (see Handbook Chapters 32, 50, and 51), the two distributions – of voluntary organizations, and of the civic core – overlap with and reinforce one another.

Peterson (1993; Peterson and Kern 1996) coined the term *cultural omnivore* to refer to people who enjoyed participation in a broad range of arts, music, and other high status cultural activities, rather than specializing in only one or a few types of such participation. Cultural omnivores are examples of the LGAP approach in one domain, similar in the cultural participation leisure domain to the Civic Core identified by Reed and Selbee (2001) in the volunteering/civic leisure activity domain.

Hustinx et al. (2012) expanded the scope of Peterson's cultural omnivore concept to the *civic omnivore* concept, "characterized by a *blended civic taste pattern*" that involves a wide variety of types of participation, traditional and new – really the LGAP with a different label, from our perspective here. Studying the leisure activities of Dutch and Belgian university students, the authors measured separately the following types of LGAP activities (in their Table 1): formal volunteering outside the university and separately, inside the university; informal volunteering; donating money to charity; online participation/volunteering; conventional political participation, and separately unconventional (protest, activism) participation, and political consumerism (boycott participation).

While they failed to do a PCA factor analysis on the results, the authors performed a multivariate Latent Class Analysis. One of the five classes of respondents that resulted was labeled *civic omnivore*s (about 17% of the sample), because they participated most frequently in 22 of 25 specific types of leisure (LGAP) activities measured (in their Table 2). Another class of respondents was basically unengaged (least engaged) in most types of activities, with the three other classes engaged in different purposive categories of participation.

An additional logistic regression analysis on the civic omnivores explained about 21% of the variance in their omnivore leisure participation using a country variable (more for Belgians than the Dutch), gender (more for males), having volunteering models in their family, being encouraged to volunteer, more generalized trust, more nonmaterial/pro-social (vs. selfish) values, and more use of television for entertainment. Also significant were the influences of various close people who suggested the instrumental or, separately, the social benefits of volunteering.

Additional evidence for the A-EC Hypothesis comes from Scheufele and Shah (2000). They have suggested that aspects of the LGAP may result from a set of personality traits they term the *Strong Personality*. This concept is similar to, but much narrower than, the A-EC concept, suggested much earlier by Smith (1980:466–485, 1983:85–90, 1994:255). Various independent inventions of this same concept speak to the need for more theory and research bearing on its utility and value, and more visibility of the A-E C concept in the research literature.

Yang, Gong, and Huo (2011) analyzed longitudinal, national, US sample data on helping and social capital. They proposed the concept of a *proactive personality* to understand and predict who would be most likely to have high civic engagement (p. 108).

Proactive personalities, they argue, tend to have greater *personality strength* – "an amalgam of self-confidence and opinion leadership." The personality strength concept was borrowed from the earlier research of Noell-Neumann (1999). In her research in Germany, she showed that people with high personality strength were more engaged in their communities. Yang et al. (2011:table 3) also showed a small but statistically significant effect of personality strength on civic participation, controlling for some attitude variables. Thus, there is empirical evidence for the influence of the A-EC on the LGAP of individuals, as hypothesized by General Activity Theory.

Verba and Nie (1972:194), in their national sample study of participation in America, similarly derived a sense of the A-EC, and gave this tendency the label *participation proneness*. Participation prone citizens are people "who for personality or other reasons" tend to become active in associations, in political campaigns, political discussions, and the like.

Smith (2016b) recently found very powerful confirmation of the *existence* of the A-EC in national sample survey research in Russia. With data from 2,000 adult respondents to a survey interview, Principal Components factor analysis showed that 14 personality trait items all loaded .43 or higher on the A-EC first factor extracted. These items were designed to measure such traits as extraversion, agreeableness, openness to new experience, conscientiousness (from the Big Five), efficacy, optimism, altruism, and energy. When combined into an index weighting these equally, the Cronbach alpha reliability was a very

high .85. In a Stepwise OLS Multiple Regression Equation, the Active-Effective Character Index was added third of 15 significant predictors of the LGAP Index, and had a Beta weight of .16, statistically significant below the .000 level, as part of the explanation of 46% of the variance in LGAP. This finding strongly confirms Smith's theory about the A-EC personality influences on the LGAP. No one has ever shown this before.

As part of General Activity Theory, this A-EC complex of psychological dispositions is hypothesized to also be socio-culturally preferred in developed, modern and post-modern societies. The fact that such societies tend to produce a higher percentage of people with an A-EC as a *modal personality,* or more broadly a *modal character* (Inglehart 1997; Inkeles 1997:chapter 1) helps account in part for the large increase in certain forms of leisure activity such as association participation and political participation in such societies relative to less developed societies.

Smith (1980, 1983, 1994) has argued that intelligence, especially verbal-linguistic and social-interpersonal intelligences (Gardner, 2011), are also important aspects of psychology that favor the LGAP. Because such intelligences and formal educational attainment are closely correlated and indeed causally linked, the linkage of intelligence with the LGAP is often embedded in the positive correlations of formal education measures with LGAP measures. Such correlation does not indicate causation *per se.* But without higher intelligence, succeeding at higher education is not possible, hence, there is some causality involved in terms of selection effects.

5. How does the level of societal complexity/development affect the presence of the LGAP?

General Activity Theory predicts that the LGAP will be found in human societies of every level of complexity, from nomadic hunting-gathering bands, to horticultural-village societies, to agrarian-developed agriculture societies (pre-industrial societies), to industrial societies, to post-modern, service and information societies (Nolan and Lenski 2006). Research has indicated that leisure activities have been present in all societies, although the variety is far greater in more complex societies (Brown 1991:140; Kelly 1996:chapter 8). However, the present authors know of no quantitative empirical research on the LGAP in any pre-industrial/agrarian, let alone preliterate, societies. Goodale and Godbey (1988) review the historical development of leisure, but their essentially qualitative research does not permit determining if the LGAP was present in earlier societies and cultures.

6. How can one measure the LGAP in an index for individuals?

Researchers who study various types of individual participation in leisure activity domains tend to do so assuming that each domain can be understood in

isolation from other leisure activity domains. Empirical evidence from many studies indicates that this is rarely the case. Most socio-culturally approved individual leisure activity domains measured by independent survey items tend to cohere empirically in the LGAP.

In order to measure the LGAP, an index must be constructed, combining relevant, socio-culturally approved, leisure activity data for various domains using a substantial sample of individuals (preferably 200 respondents, at least, for adequate reliability). It is vital for an LGAP Index to be combined from measures of a *variety* of different leisure domains, to the extent feasible.

Lacking such variety of domain measures, one can use different measures within the same domain as a stopgap or default option. For instance, some studies reviewed here combine different measures of philanthropic activity – informal volunteering, formal volunteering in associations and/or in service programs, and giving to charities. Other studies combine various subtypes of political participation into a single index – voting, writing officials, signing a petition, attending a political meeting, engaging in political discussion, and so on.

The leisure activity items should focus on participation in the type of leisure versus non-participation (or use a brief spectrum of general terms, such as *none, some, much participation*), *not* the specific amount of time involved. Prior research by Smith and Robinson (2017) indicates that the former approach yields better LGAP results, probably in part because time use data generally refer to a single day.

To begin constructing an LGAP Index, the researcher needs to identify a wide range of socio-culturally approved, neutral, and disapproved leisure activities at the present time in a given society or smaller socio-cultural system. The best way to do this is to use a representative panel of raters (individuals) to assess the degree of cultural approval-disapproval of a fairly large and representative set of leisure activities (e.g., N = 50). For each potential LGAP item, a Likert scale can be used for responses by the raters (e.g., strongly approved, approved somewhat, neutral, disapproved somewhat, strongly disapproved in the society). The scores by raters can be averaged, and the more approved items on average can be used in seeking an LGAP Index. Socially neutral and also stigmatized/negative leisure activity measures should also be included in the study, but *not* in the final LGAP Index. A simpler, less expensive, but less valid approach is to use the judgments of the researcher or of a few colleagues regarding socio-cultural approval levels and directions.

Appropriate data should be gathered, usually by interviews of a representative sample of respondents, and then prepared for statistical analysis using a computer program package (e.g., SPSS). The next step is to align the low-high directions for each leisure item so that a high score on any such item indicates higher participation. Then any missing data for any item should be set to the mean for that item, using SPSS.

Using the directionally aligned items, a Principal Components Analysis (PCA) can be performed using SPSS. The first factor (component) extracted *without* rotation to simple structure should be examined. Those leisure activity items with a factor loading of .30 or above on the first factor represent the LGAP in the specific data examined. *Only* these items should be combined into the LGAP Index. It is preferable to have at least five such items, and 8–10 is even better, for achieving higher index/scale reliability.

The next step in constructing an LGAP Index is to compute the *standard score (z-score)* for each item for all respondents. SPSS can also compute a correlation matrix for all these items, and the average correlation can be calculated. The greater is the number and percentage of statistically significant and positive correlations (e.g., at the .05 level one-tailed), the stronger is the LGAP in one's data.

Then the final Index is constructed by taking the average of the standard scores for all the high-loading items from the PCA, using SPSS. The Alpha reliability of the Index can also be computed using SPSS. An Alpha of .60 or higher is good; one of .80 or higher is excellent.

The LGAP manifests itself empirically in positive and statistically significant inter-correlations (a positive manifold) among such leisure activity single-item measures (with directions aligned for high activity), and also among all relevant, multi-item indices with appropriate reliability and validity (directions aligned). From the computations above, the size of the average correlation among one's LGAP items is shown. The size of the Alpha reliability coefficient is another measure of the degree of statistical coherence of the LGAP in one's data.

7. Using an LGAP Index, what is the best way to assess statistically the empirical importance of the LGAP in explaining various leisure activity types/domains?

Statistically, one can predict a composite LGAP Index of several leisure time activity domains as a DV by computing *first order* multiple regression equations with relevant independent variables (IVs). Predicted scores can then be created from the initial regression equation for each respondent as a summary LGAP explanatory variable. The latter variable will represent the best current attempt to predict the dependent multi-domain LGAP Index with available IV predictors of a general sort (i.e., not leisure domain-specific).

These LGAP predicted scores can then be used in a *second order* regression equation with the other IVs as $N + 1$ predictors (where N = original number of predictors and 1 = additional predicted score as a predictor). In these second order regressions, all *specific* leisure domains (or activity measures) of interest should be used as DVs, one at a time, such as associational participation or political activity. Domain-specific IVs can also be added to the second order

regression equation. For instance, one can add measures of attitudes toward volunteering as predictors when examining volunteering as the DV.

In the results of any second order regression equation, it is expected that the prior LGAP predicted score generally will be statistically significant and positive if one is predicting a domain that is part of the LGAP as a DV. Other statistically significant predictors will represent domain-specific results of interest, over and above the predictors incorporated into the LGAP predictor scores from the first order regression equation. These latter significant predictors will show how the specific leisure activity domain differs from the larger LGAP in terms of prediction and explanation.

This general *two-order regression* procedure can be repeated for all specific activity domains of interest as DVs, or for more specific activity items/measures that are parts of such domains as separate DVs. The procedure can also be applied to other aspects of individual activity than leisure where a general factor is demonstrable as a predictor and explanatory variable.

Relying on ordinary least squares (OLS) regression analysis, the presently suggested version of two-order regression analysis is *not* the same as *two-stage least squares* (2SLS) regression analysis (Wooldridge 2005).

8. How are elements of the LGAP misused in explaining socio-political participation/leisure as types of dependent variables?

Many researchers, including the first author (Smith 1966, 1975, 1994), Musick and Wilson (2008), and Taniguchi (2010), have misused measures of socio-political participation/leisure as IVs to explain and predict volunteering or other dependent participation variables. The present chapter shows that such leisure/civic participation IVs, most of which are socio-culturally approved leisure activities, are NOT conceptually independent of the participation DVs. Hence, it is not correct procedure to use LGAP components/activities simply as IVs. Instead, the much more complicated statistical procedure in Section D, #8 above, should properly be used.

9. What are the implications of the LGAP for interpretation of prior research on various leisure activity types/domains?

Because all prior research on socio-political participation DVs, as socio-culturally approved leisure activities, omits consideration of the impact of the LGAP, no such prior research study draws accurate conclusions. This is especially true when LGAP variables/domains have been used as predictors of another such variable/domain as a DV. Hence, where possible, all prior research data still available needs to be reanalyzed using the procedure suggested in Section #8, if feasible. *The above conclusion has potentially significant, possibly substantial, implications for all prior research on all kinds of leisure items and leisure domains as DVs, including volunteering, civic and political participation.*

10. Why has the LGAP been ignored for so long by socio-behavioral scientists?

The LGAP has long been ignored for several likely reasons:

(a) The LGAP effect is small, even though pervasive, and most researchers have either not noticed the LGAP or felt it was trivial.

(b) Properly analyzing data to take account of the LGAP is tedious, and most prior researchers have either not understood how to do this or have not cared to take the necessary trouble to do it properly.

(c) Up until the present, there has been no standard terminology for the LGAP, so that one cannot easily search social science article/book databases for relevant research using well-established keywords.

(d) The LGAP likely has various personality/psychological determinants (i.e., the A-EC), and most sociologists are uncomfortable with such variables and psychological explanations for participation of various types.

(e) Although not treated here, the LGAP likely also has some genetic/biological influences relating to energy/activation and to general sociality/conformity (Smith 2016a), and again, most sociologists are uncomfortable with such variables and explanations for explaining participation of various types.

E. Usable knowledge

The practical implications of the present results are far-reaching. Among other implications, all prior research on particular leisure activity domains or specific measures within such domains that has ignored the presence of the LGAP (an almost universal circumstance) may be misleading and inaccurate, in part at least. A more appropriate approach to analyzing specific leisure activity domains, such as voluntary association participation or friendship activity, has been described briefly above. Where possible, such analyses should be re-done, using an approximation of the presently suggested statistical approach. Similarly, future research on any aspect of the LGAP should take into account the broader LGAP, both theoretically and empirically.

F. Future trends and needed research

General Activity Theory makes no specific predictions about future trends in the prevalence of the LGAP. There is no empirical research on trends in LGAP for any nation, so that approach permits no reliable statements about future LGAP trends either. As an educated guess by the first author, LGAP is at least likely to remain steady in its prevalence, rather than declining or rising sharply in the next 25 years.

As to needed research, the existence of the LGAP seems clearly demonstrated in many nations, although more research is needed to demonstrate the LGAP in agrarian/pre-industrial and earlier, preliterate, horticultural societies. However, all the various hypotheses about the *individual origins of the LGAP* need to be tested. These should include testing hypotheses about the existence of (A) social pressure and social conformity as key influences on the individual engaging in socio-culturally approved leisure, but also (B) various general personal preferences (favorable general and specific attitudes) for (a) more physical activity in leisure time, (b) more mentally challenging activity in leisure time, (c) more productive activity in leisure time, (d) more con-social (collective vs. isolated) activity in leisure time, (e) more pro-social (socially beneficial) activity in leisure time, and (f) more emotionally involving and personally committed activity in leisure time.

Alternative hypotheses about the societal origins and nature of the LGAP should also be pursued. It will be especially important to derive contrasting sub-hypotheses from the Social Resources Hypothesis and the Social Conformity Hypothesis in order to do differential testing of these. Most, but not all, of the present empirical results could be seen as confirming both of these, although some research favors the Social Conformity Hypothesis.

Future research should measure the LGAP whenever any specific, socio-culturally valued, individual leisure activity, such as volunteering or political activity, is the object of explanation, analyzing the results as suggested in Section D, 8 above. The fullest possible range of leisure activity domains should be studied for potential LGAP involvement: political participation (e.g., voting in different types/levels of elections, political discussion, contacting government officials, attending a political meeting, working as a volunteer in a political campaign, signing petitions, joining a march or protest event; Verba, Schlozman, and Brady 1995:51); volunteering (e.g., voluntary association participation, service program volunteering, online volunteering, cyber group participation, voluntourism, informal volunteering/helping, charitable giving); mass media consumption (e.g., reading newspapers, magazines, and books; listening to audiobooks); social/electronic media use; reading and contributing to blogs online; adult education (especially when done for enjoyment, not occupational advancement); religious activity (e.g., attending religious services, helping with such services or the maintenance of a religious building, teaching religion to youth, visiting invalids to perform special religious services); conversation and socializing with family/relatives; interpersonal friendship activity (conversation, socializing, attending events together, social eating and drinking); hobbies; playing cards or other games; sexual activity; attendance at high-culture events (e.g., classical music concerts, ballet, opera, plays/theater); performing art or music at home or in other amateur settings; dancing (e.g., ballroom dancing, square dancing, line dancing, modern dance, ballet);

outdoor sports and recreation; exercise; hiking; camping; hunting/fishing; gardening; attendance at movies/sports events/pop concerts; recreational travel and tourism; and so forth. Some aspects of religious activity (especially church attendance, and helping in worship services or Sunday school) seem to fit the LGAP; some do not (prayer, meditation), especially the less active and more solitary aspects of religiosity.

Neutral and less socio-culturally approved individual leisure activities need to be studied also, to investigate their empirical relationships to the LGAP: watching TV, watching DVDs and steaming movies at home, listening to the radio or CDs, playing video games (popular with youth, but much less so for adults), recreational shopping, drinking alcohol (e.g., by oneself, with family, with friends, in a bar or pub), resting/relaxing, napping, thinking/doing nothing.

Some *clearly disapproved leisure activities* in many societies, like using illegal recreational drugs, non-marital sexual activity among married people, excessive alcohol use/getting drunk, excessive gambling, use of sex workers, recreational vandalism, attending cock-fighting or dog-fighting events, watching bare-knuckle fighting, and the like need to be included in LGAP research as well. Clearly *dis*approved leisure activities in any society are expected to correlate negatively and significantly with the socio-culturally valued leisure activity measures that comprise the LGAP. Measuring such variables as the above will permit differential testing of the socio-cultural approval hypothesis put forth here, as contrasted with alternative explanations of the LGAP, such as physical activity level preferences, productive leisure preferences, and the like.

The social preference structure for leisure activities likely varies markedly when considering children (age 2–12 years), youth (age 13–19 years), and various age categories of adults. This is especially true for young adults versus mature adults versus the retired and elderly. Hence, the composition of the LGAP can be expected to differ among broad age categories and also by sex, socio-economic status, health/illness status (healthy vs. ill/injured vs. disabled vs. invalids and the institutionalized). Naturally, there will also be variations by nation, world region, economic development status, extent of civil liberties, ethnic-religious subcultures, and so forth (see Hank 2011).

For newly emergent domains of leisure activity in the past couple of decades, like Internet surfing, sending personal emails, texting, tweeting, using social media like Facebook, and playing computer games, the fit with the LGAP is less clear and requires future empirical inquiry. But most of these are likely to be socio-culturally approved and hence part of the LGAP, given the general positive attitudes toward computers, mobile phones, and their use in the United States. These activities and others in the contemporary world of leisure have been analyzed according to the Serious Leisure Perspective, today a formal, grounded theory (see Introduction to the *Handbook* and www.seriousleisure .net).

The degree of public preference for different leisure activities (i.e., their degree of socio-cultural approval-disapproval on a continuum) should be addressed directly by panels of representative raters or by surveys of the general public. Such leisure preferences are likely to change over time in societies (Agrikoliansky 2001; Bauman 1999; Inglehart 1997), especially if (a) there are major long-term changes in the social structure of a society (e.g., changes in economic development level or in basic political structure), or (b) there are major technological changes (e.g., widespread use of personal computers, the Internet, social media, cell phones).

Specific leisure activity domains may change in their constituent activities over the long term. Goodale and Godbey (1988) review the history and evolution of leisure. Similarly, new activity domains like leisure computer use (surfing the Web) and social/electronic media use (texting, tweeting/Twitter, Facebook, etc.) may arise, and existing domains may decline in importance or even vanish from the LGAP in a given society. Although popular in pre-industrial societies, attending public hangings, attending bare-knuckle boxing events, and attending dog-fighting/cock-fighting are rare leisure activities for people in industrial and post-modern societies. Social and political participation by youth has changed in recent decades in post-industrial, service-information societies. Youth tend to be less attracted to the main earlier modes for actively participating in social and political life (Inglehart 1997). Online volunteering has become much more common (Hustinx et al. 2012; Handbook Chapter 13).

Multi-national surveys should be re-analyzed or performed anew to examine the existence and nature of the LGAP in different societies. It will also be important to determine the approximate importance of the LGAP as an IV (i.e., as a predictor score) for explaining variance in the various leisure activity domains in different nations and at different periods of history going forward. For instance, the LGAP may be more important in explaining association participation or volunteering in service programs than in explaining friendship or neighboring activity.

Much more future research is needed to determine the roots of the LGAP, in terms of both individuals and societies. The Social Conformity Hypothesis and the Social Resources Hypothesis are both consistent explanations of most of the empirical LGAP results reported here. Other alternative explanations also need to be investigated, particularly the Social Contagion Hypothesis, the Active-Effective Character Hypothesis, and the Productive Activity Hypothesis, among others. The role of behavioral genetics as a basis for the LGAP merits a great deal more exploration. A full explanation of the LGAP may involve two or more of these in combination.

6
Associations and Social Capital

Jan W. van Deth (The Netherlands), Bob Edwards (USA), Gabriel Bădescu (Romania), Alisa Moldavanova (Ukraine), and Michael Woolcock (Australia)

A. Introduction

Associations provide institutionalized opportunities for social exchange and the strengthening of pro-social attitudes and social skills. Social capital – such as trust, norms, and networks – is a by-product of associational involvement. In trustful relationships transaction costs are decreased for all participants because fewer resources are required for compliance. In this way, social capital provides an attractive solution to the collective-good dilemma. The causal relation between associational involvement and social capital is mainly explained by learning processes. Positive effects are especially expected from *bridging social capital* based on involvement in heterogeneous networks that reinforce tolerance, openness, and outer-directedness. *Bonding social capital* in homogenous networks strengthens feelings of exclusivity and inner-directedness. Increasingly, attention is drawn to feasible *dark sides* of and to modes of *negative social capital*.

Besides, the expectation that social capital will have *pro-social* functions implies an implicit ideological baggage that undermines its utility as an analytical concept. Empirical evidence about the impact of associational involvement on participants is scarce but suggests significant self-selection effects. Various parts of the world vary widely in levels and modes of associational involvement, with very high levels of associational involvement in the United States and North-Western Europe. Outside these areas associational engagement frequently is a necessity imposed by economic hardship. Due to its principally voluntary character, the use of associational involvement for policy purposes is limited. Yet civil society organizations have played central roles in regime transformations in many countries in the developing world. Associational involvement is changing rapidly and it may become more difficult to solve collective-good problems as adherents of social capital anticipate.

People join sports clubs to play sport, unions to defend their interests, cultural societies to discuss novels, or local organizations to meet their neighbors. Important as these activities are for their own sake, associational involvement has long been regarded to have more far-reaching consequences for society. Since associations provide institutionalized opportunities for social exchange and social networks, they are expected to be highly relevant for the development of pro-social attitudes and norms of reciprocity (mainly trust and civic norms), the advancement of social skills, and the likelihood of political mobilization. Consequently, associations and associational involvement are crucial for solving collective-good problems efficiently and without coercion, especially in democratic societies. The concept of *social capital* has been introduced to refer to norms, networks, and pro-social attitudes.[1] By strengthening social capital, associational involvement directly and indirectly contributes to almost every aspect of our lives: "social capital makes us smarter, healthier, safer, richer, and better able to govern a just and stable democracy" (Putnam 2000:290).

Following the observations of American society by Alexis de Tocqueville ([1840] 1990: Second Book), in the early 19th century many authors presumed that voluntary associations were of crucial importance for collective decision-making. Participating in the activities of these organizations keeps people in touch with each other on a regular basis and potentially brings them in contact with those from different walks of life. As a consequence, participants usually develop skills and competences to collaborate as well as mutual trust and pro-social norms. In this way, social capital results in a general decrease of transaction costs for all participants because, in trustful relationships, fewer resources are required to guarantee compliance than in other contacts. In societies where social capital is widely available, people will be much more willing to contribute to the production of collective goods than in societies where trust and networks are less developed and will have access to a broader array of (non-redundant) information.

Especially because only a few of these associations explicitly aim at improving skills and norms, these benevolent consequences are a *by-product* or an *externality* of associational involvement (cf. Putnam 1993:176). Evans and Boyte (1992) point to associations as *free spaces*, providing people with the opportunity to develop the deliberative skills and the attitudes of democratic citizens. Various authors, however, argue that these *by-products* can be detrimental for society when social capital makes it easier to attain criminal or non-democratic goals. In general, social capital is seen as a *by-product* of associational involvement – an expectation directing attention toward more general features of associations and associational involvement, instead of the peculiarities of specific organizations, networks, or social exchanges.

B. Definitions

This chapter accepts the general definitions in the Handbook Appendix.

Some special definitions are also needed. Social capital is, first of all, a form of capital; that is, a resource characterized by "a potential capacity to produce profits and to reproduce itself in identical or expanded form" (Bourdieu 1986:241). Secondly, social capital is distinguished from other modes of capital such as financial capital or human capital by its relational nature: the *potential capacity* for profits and reproduction is restricted to shared experiences and collaborations. Bourdieu (1986:243) argued that social capital is "made up of social obligations ('connections')," which become relevant in relations between individuals within specific groups. Coleman summarized the common elements of the various definitions of social capital more generally: "They all consist of some aspect of social structure, and they facilitate certain actions of individuals who are within the structure" (1990:302).

By focusing on its pragmatic effects, social capital is *defined by its functions*. According to Putnam, social capital refers to "features of social organization, such as trust, norms, and networks, that can improve the efficiency of society by facilitating coordinated actions" (1993:167). Portes presents an even more general functional definition of social capital as the "ability to secure benefits through membership in networks and other social structures" (1998:8). Since the exact form of social capital is irrelevant as long as the functions are performed, the concept can be adapted to many different situations and specific needs (van Deth 2003).

A first function of associational involvement is provided by the neo-Tocquevillean emphasis on the socialization of citizens for civic and political participation and support for democracy (Putnam 1993). Second, others would emphasize public and quasi-public functions of associations in providing important social welfare services and support (Salamon 2003). Third, associational involvement offers people a venue, relatively autonomous from both state and market, from which distinct, often marginalized, groups represent their interests in contentious public debates and mobilize challenges to state or corporate actions (Cohen and Arato 1992; Foley and Edwards 1996). Fourth, associational involvement builds mobilization capacity by producing social and cultural resources (Edwards, Foley, and Diani 2001). Finally, associational involvement enables communicative action by demonstrating in the practice of their groups and organizational activities the very kinds of social relations people hope to see writ large by broad patterns of social transformation (Evans and Boyte 1992; Polletta 2005). What some writers (e.g., Oldenburg 1999) have called *third places* – that is, venues where people regularly gather outside of home and work – also serve this role.

Two conceptual distinctions are made here to study social capital further. First, virtually all approaches start with a distinction between structural aspects

(i.e., connections or embeddedness in networks) and cultural aspects (i.e., obligations, or social norms and values, and particularly trust), which enable efficient cooperation. Most authors will include both aspects in their conceptualization, though some place a stronger emphasis on one of them (Paldam 2000). Whereas economically and sociologically oriented approaches prefer a focus on relational and structural aspects (cf. Granovetter 1973; Lin 2001), political science approaches usually stress cultural aspects, especially trust (cf. Fukuyama 1995; Uslaner 2002). In this way, cultural approaches focus mainly on trust and the link through various regime types to social, economic, and political outcomes (Norris 2012). Network analysts in particular have adopted versions of the social capital concept more in keeping with the social structural versions enunciated by Coleman, Bourdieu, and Lin in that they emphasize individual and organizational social ties in predicting individual advancement or collective action (e.g., Burt 2005).

A second conceptual distinction concerns the question of whether social capital is an individual property – that is, a property of individuals to be found in networks of individual citizens – or a collective good (or collective property) that requires special measures when people are to be excluded from their *consumption*. The latter variant depicts social capital as networked access to resources available to individuals or groups through a web of relationships. Since the most interesting aspect of social capital lies in its *combination* of individual and social resources, Esser (2008) stresses the need to distinguish clearly between *relational capital* (resources of an individual actor) and *system capital* (performance of an entire network). This distinction has important consequences: "Actors can invest in relational capital by means of 'individual' actions [...], whereas they cannot invest individually in system capital, because that is a case of 'collective' action" (Esser 2008:47). Esser's idea of *system capital* is very similar to the much more widely used concept *civil society*, which refers to the set of voluntary associations in a society (aggregated or macro-level). Civil society can be understood as "dynamic webs of interrelated nongovernmental institutions" (Keane 1998:6).

C. Historical background

The term *social capital* has been seen as having various meanings at least since the 19th century. Use of the term to connote the idea that specific resources can be used to facilitate cooperation started with Hanifan's (1916) analyses of the functioning of a rural school district in West Virginia. Scholars from various disciplines independently coined the expression in the middle decades of the 20th century. But it was the work of James Coleman (1988, 1990) on sociological theory in the late 1980s and the work of Pierre Bourdieu and Robert Putnam (following Marxist and Structural-Functionalist approaches respectively) that brought social capital to prominence in both the scholarly and public domains.

Whereas Bourdieu (1986) was mainly interested in exploring the reproduction of social inequality by looking at transfers of resources among families and social groups, Putnam (1993, 1995) explored the opportunities for social integration under different circumstances (Siisiäinen 2000). His claim that a decline in voluntary association membership is a main cause of social and political stalemate in the United States (Putnam 2000) contributed strongly to the revival of Tocquevillean approaches (Stolle and Hooghe 2005). A third branch of social capital research originated with social network analysts working out ways to measure one's position within a network and how that position affects access to resources. This approach explains outcomes like status attainment in a career, or the pace of advancement within a given firm (Lin 2001; Lin and Erickson 2008), but has been scaling-up and applying relational approaches to collective action (Diani and McAdam 2003). Finally, several authors have presented *institutional* approaches to social capital (Rothstein and Stolle 2008; Stolle and Hooghe 2003). These approaches dispute the presumed direction of the causal relationship and stress the relevance of constitutional and political contexts for associational involvement (Offe 1999; Serageldin and Grootaert 2000; Sztompka 1998; Woolcock and Narayan 2000).

D. Key issues

The idea that social cooperation and cohesion can be improved efficiently without coercion or special measures by government is very appealing. For Putnam (1993), *making democracy work* does not require particular political efforts, but rather it is an unintended consequence of involvement in sports clubs, cultural associations, and interest groups. This line of argument (and the broader set of issues accompanying it) attracted attention from hundreds of scholars and politicians. Indeed, over the course of roughly two decades (1988–2008), social capital went from relative obscurity to a routinized concept in everyday social science discourse and research (Woolcock 2010). Restricting the discussions here to the impact of associational involvement on social capital, the key issues are the following:

1. How can we depict the relationships between associations and social capital? What theories or models of associational involvement and social capital exist?

At the individual level, associational involvement is assumed to offer opportunities (1) to learn social skills, (2) to meet other people and get access to networks, and (3) to develop pro-social norms and values, especially trust. Although these opportunities are not equally available in every association, the exact aims, goals, or character of the association is irrelevant. Instead, institutionalized aspects of associations are of crucial importance: contacts offered on

a regular basis enable continuous learning processes and the development of trust and norms of reciprocity. In this way, networks provided by associations are different from social contacts with relatives, friends, or neighbors, which usually do not offer institutionalized contacts and are, therefore, less likely to develop social skills and pro-social norms. At the macro-level, the availability of a dense and active civil society offers easy access to all kinds of networks. However, especially for advanced welfare states, a *crowding-out* effect could have exactly the opposite result when people withdraw from associational involvement exactly because civil society functions well (van Oorschot and Arts 2005).

The causal relation between associational involvement and social capital is mainly explained by learning processes under specific conditions. Neo-Tocquevillean approaches in particular rely on the idea that direct contacts with other people will almost automatically result in improved skills and personal trust (the *contact hypothesis*; Stolle and Harell 2013). Yet even if the direct consequences of associational involvement for individual skills and attitudes are theoretically founded, it usually remains unclear how these orientations result in broader, pro-social attitudes. General ideas such as a *spill-over* effect (accumulated personal trust will eventually strengthen social and political confidence) at the individual level and a *rain-maker* effect (everybody gains from a trustful environment) seem plausible, but usually lack a well-developed theoretical basis and direct empirical confirmation (Uslaner 2002:chapter 5).

2. Which features of associations are relevant for strengthening social capital?

A second key issue moves the discussions about the relevance of structural aspects of organizations further and stresses the importance of *the nature of the contacts offered.* Associational involvement will have different consequences for social capital depending on whether (1) the relationships are horizontal or hierarchical, and (2) whether the norms and values encountered are homogenous or heterogeneous. The terms *bonding* and *bridging* social capital are widely used in the literature to cover associations that offer combinations of these aspects (Coffé and Geys 2007).[2] *Bonding social capital* consists of exclusive ties of solidarity between *people like us* and is restricted to enabling people to *get by*. *Bridging social capital* is based on trust and reciprocal connections between people with different social backgrounds (Putnam 2000). Whereas bonding social capital strengthens feelings of exclusivity and inner-directedness, bridging social capital is expected to reinforce tolerance, openness, and outer-directedness. For that reason, bridging modes of social capital are considered to be much more important for pro-social norms than bonding social capital, and the consequences of associational involvement for social capital strongly depend on this distinction (Stolle 1998; Stolle and Rochon 1998). In addition to the

nature of the contacts, several other association features – size, resources, networks, professionalization – seem to be relevant for social capital (Maloney and Rossteutscher 2007). Warren (2001) in particular developed a detailed scheme to classify association aspects with respect to their impact on social capital.

Empirical evidence about the impact of association features on the skills and attitudes of participants is scarce and mainly restricted to interviews with activists and volunteers. Several scholars have especially challenged the notion that face-to-face contacts are required to create social capital in voluntary associations (cf. Freitag 2003; Wollebæk and Selle 2007). Using information about a large number of associations with extensive interviews with activists, Maloney and van Deth (2010b:240) conclude that "associations do not generate democratic orientations among active citizens [to] anywhere near the extent to which the social capital/neo-Tocquevillean thesis suggests." However, the importance of associations "lies not in socializing individual active members but in institutionalizing social capital" (Wollebæk and Strømsnes 2008:250). This seems especially true for devalued or marginalized social groups, which create and perpetuate alternative institutions to build capacity to resist and oppose a hegemonic mainstream.

3. Who gets involved?

Joining associations does not, of course, depend only on features of associations – individual preferences (attitudes), resources, and personality traits seem to be highly relevant as well.[3] It appears to be especially determined by *social homophily*; that is, by the fact that people tend to prefer contacts with friends who are similar to them. Mouw (2006:99) shows that "when the problem of endogenous friendship choice is taken into account [...] the resulting estimates of social capital effects are modest in size." Comparing activists, volunteers, and average citizens in various European countries, Maloney and van Deth (2010b:239) reach a similar conclusion and reject mono-causal explanations. The growing availability of panel data in this area will enable a further disentanglement of selection, adaption, and socialization effects (Hooghe and Quintelier 2013).

4. Does context matter?

The exact functioning of social capital depends not only on features of associations and the personality traits and attitudes of individual citizens but also on the wider social, economic, and political context (Dudwick et al. 2006). On a global scale, consistent patterns of associational involvement and social capital seem to persist (Freitag and Bühlmann 2009; Rossteutscher 2008). These variations and patterns are related to structural differences between countries (Schofer and Longhofer 2011; , and Shen 2002). A closer look, however, shows remarkable distinctions between various parts of the world and within Europe.

European countries differ widely in the levels and modes of associational involvement, with very high levels of associational involvement in North-Western Europe and much lower levels in Southern and Eastern Europe (Adam 2008; Dekker, Koopmans, and van den Broek 1997; Gesthuizen et al. 2013; Morales and Geurts 2007; Mascherini, Vidoni, and Manca 2011; Morales 2009; van Deth and Kreuter 1997; van Deth, Montero, and Westholm 2007; Van Ingen and Kalmijn 2010). These substantial inter-country differences in Europe mainly stem from income inequality and economic factors (Ferragina 2012). Migration has stimulated renewed interest in the opportunities for associational involvement and for social cohesion and integration (Fennema and Tilly 2005; Morales and Giugni 2011; Strömblad and Adman 2010).

Comparing associational engagement and social capital among Western and ex-communist countries in Eastern and Central Europe, a wide and non-decreasing gap appears (Letki and Evans 2005, Pichler and Wallace 2007). This gap has been attributed to differences in the socio-political contexts and to the historical legacies of the communist regime (Aasland, Grødeland, and Pleines 2012; Kaminska 2010; Lasinska 2013; Rose, Mishler, and Haerpfer 1998). Three major orientations help explain the weakness of civil society in the post-communist national contexts: (1) a sense of distrust of any kind of public organization, (2) a general satisfaction with one's own personal networks, accompanied by deteriorating relations within society overall, and (3) disappointment with post-communist institutional developments (Howard 2003). Associational engagement seems to be a necessity imposed by economic hardship, rather than an indicator of civic engagement (Rose-Ackerman 2001), whereas forced volunteering during Soviet times might have dampened people's intrinsic motivation for associational involvement (Plagnol and Huppert 2010).

The welfare state in the United States has been less universalistic and less robust and has provided a thinner social safety net than its counterparts in Western Europe (Alesina, Glaeser, and Sacerdote 2001). Thus, voluntary associations play a larger social welfare role in the United States than in Europe. The apparent decline in civic engagement and social trust in the United States in several recent decades have inspired great concern (Putnam 2000). The greater social welfare role of associations in the United States in conjunction with a now 30-year trend of welfare state retrenchment, increasing economic insecurity among middle-class Americans, and markedly increased economic inequality (Neckerman 2004) makes the *crowding-out* hypothesis seem implausible. Crowding-out also seems implausible to explain increases over the last several decades in youth sports leagues (Lemann 1996), given that the state's steady retreat from more and more communal endeavors leaves a growing gap to be filled by parental donations and involvement.

The idea of a strong causal link between voluntary association participation and trust has found limited support from empirical research. Though some analysts have argued that social diversity diminishes social trust (Putnam 2007), Rothstein and Uslaner (2005) found that patterns of social and economic inequality explained cross-national variations in generalized social trust. Moreover, Uslaner (2011) found that the lack of generalized trust in socially diverse parts of the United States is attributable to long-standing patterns of residential segregation and not to social diversity per se. Other research has found a clear inverse relationship between economic inequality and social trust among the states of the United States (Wilkinson and Pickett 2009).

The role of civic participation in shaping socio-economic outcomes in developing countries is, not surprisingly, as varied as the countries themselves. Building on the initial work of Knack and Keefer (1997), Easterly, Ritzen, and Woolcock (2006) show that *good institutions* were indeed reliable predictors of economic performance but were more likely to emerge in socially cohesive societies (see Edwards 2011:chapters 10–15). Beyond providing broad descriptive accounts of who does and does not participate in countries ranging from India and China to those in Latin America and the Middle East, these analyses share a common focus in seeking to understand the particular historical and political dynamics shaping state–society relations (Evans 1996; Tsai 2007). Virtually every country in the developing world has experienced some form of wholesale institutional transformation during the last 25 years, whether because of rapid implosion or explosion of economic growth, civil war and its aftermath, or a transition from autocracy to democracy. In each case, civil society organizations have played central roles, whether in promoting change itself (see Anderson 2011, on the so-called Arab spring), in mediating communal conflict accompanying change (see Varshney 2002 on India), or in consolidating hard-won advances in human rights and the rule of law (see Peerenboom 2007, on China).

5. Does associational involvement have negative impacts on society?

The concept of social capital has been invented to deal with problems of social collaboration efficiently. Almost by definition, the outcomes are expected to be beneficial – or at least less unpleasant and less disagreeable than the use of formal rules, force, or violence to obtain similar goals. Yet associational involvement does not necessarily result in benign forms of social capital and the consequences of social capital are not always positive for society or for specific social groups (Encarnación 2003; Foley and Edwards 1997; Levi 1996). These feasible *dark sides* of associational involvement and social capital (over-involvement, reproducing social inequality, conformist biases, exclusion, etc.) and modes of *negative social capital* (incivility, distrust, old-boys networks, protection of vested interests, closed shops, anti-social attitudes, corruption, etc.; Smith 2012) suggest a fifth key issue.[4]

Since associational involvement enhances social capital generally, this mechanism benefits any association or social network, regardless of its criminal, destructive, harmful, or nondemocratic character. Frequently mentioned examples of *uncivil society* are associations that aim primarily at social exclusion or harm to non-members, such as the Mafia, Skinheads, the Ku Klux Klan, the Serbian Resistance Movement (SPOT), the Slovak National Movement, or the Nation of Islam (Levi 1996; Smith with Eng and Albertson 2016; van Deth and Zmerli 2010; see also Handbook Chapter 53). Furthermore, *dark sides* of social capital are most likely to be observed in bonding, inward-looking, and isolated social networks (Li, Savage, and Pickles 2003; Paxton 2002).

While these approaches focus on potential undesirable effects of associational involvement, a different perspective is based on the acknowledgment that some associations produce *negative* modes of social capital, because the associations as such are anti-social, exclusive, or nondemocratic: "Negative associational capital involves negative mental states or activities in suppression of voluntary associations by nonmembers, whether on behalf of some government, corporation, formal nonprofit, informal group or by individuals" (Smith 2012). People involved in these associations show "a substantial, net, level of *dis*trust and *non*-cooperativeness" (Smith 2012; emphasis in original).

Empirical research corroborates the potentially *dark sides* and *negative modes* of social capital as a consequence of associational involvement under specific conditions (van Deth 2010). An obvious example of *negative social capital* in the Central and East European context is the issue of low social trust and pervasive corruption (Karklins 2002). Corrupt networks at both the top levels of government and at the grassroots limit access to public resources to a relatively small group of people who are affiliated with the network. In many cases these networks actually date from the communist period (Rose-Ackerman 2001; Sandholtz and Taagepera 2005). Not surprisingly, low levels of trust in public institutions are the product of ordinary people's frustration with a corrupt system.

6. How are associational involvement and social capital related to public policy?

With its strong emphasis at the revival of civic life and its doubts about the prospects of state intervention, social capital became a very attractive alternative to conventional policy approaches in the 1990s. Organizations such as the World Bank and the OECD (as well as several national governments) started programs based on social capital (see Bebbington et al. 2006), while politicians as different as Bill Clinton, Tony Blair, and Gerhard Schröder showed interest in a *Third Way*. Yet a principal complication of using associational involvement for policy purposes is its principally voluntary character. For that reason, many policies focus on building networks for some immediate cause (housing,

pollution, etc.), presuming that social capital will be obtained as a *by-product* or *externality* (Halpern 2005). Sirianni and Friedland (2001) discuss a nation-wide network of US federal, policy-mandate, citizen advisory boards, watershed management commissions, and the like, which form a substantial portion of the local infrastructure of environmentalism in the United States. The expansion of similar local venues – like neighborhood watch associations or advisory boards – has been incentivized by federal crime control legislation promoting community policing or emergency preparedness.

Government interventions with associational involvement are not always benevolent or beneficial. In Central and Eastern Europe, many associations tend to be sponsored from abroad and, consequently, are top-down with only weak connections to local communities and the motivations of the local people to participate in them. These interventions contrast with the bottom-up, grassroots-style associations that characterize civil society in the Western world (Petrova 2011; Wallace, Pichler, and Haerpfer 2012). In addition, a couple of ex-communist countries have undertaken significant efforts to criminalize pro-democracy NGOs, on the one hand, and to promote a government-friendly civil society, on the other (Silitski 2007). Some of the major associations in the Eastern Europe/CIS region are still sponsored by the state or used by powerful politicians to achieve their personal goals and were *privatized* by their managers and used as tax shelters (Rose-Ackerman 2001; Sampson 2002).

7. How to deal with the ideological nature of associational involvement and social capital?

Debates about social capital have had a strong normative flavor from the very beginning. Putnam's diagnoses of the decline of American civil society and Bourdieu's concern with inequality in France were based on sincere worries about social cohesion and social reproduction, respectively. The *Western* bias in these approaches has been criticized convincingly (Sampson 2002). The gullible expectation that social capital will have only *pro-social* functions loads the notion of social capital with an implicit ideological baggage that undermines its utility as an objective analytical concept (Edwards and Foley 1998; Fine 2003).

Fine (2010) provides a frontal attack on the ideological nature of social capital, based especially on his depiction of the neo-Tocquevillean approaches as being part of a *neo-liberal* or *capitalist* response to *failures* of the modern state. In his view, pleadings for associational involvement, volunteering, and civic behavior are instrumental to concealing the weaknesses of the state to regulate capitalism effectively. Associational involvement produces a *new spirit of capitalism* based on an *ideology of activism,* which ignores the political economy completely. It sets forth a vision of an a-political (or at least non-partisan) version of social capital and civil society to solve collective problems cooperatively and without conflict. Any solution to national problems that advocates such

an a-political, non-conflictual approach is speaking from the vantage point of a dominating mainstream (neo-liberal, corporate capitalist) perspective.

8. How are relationships between associational involvement and social capital changing?

Conventional modes of associational involvement, such as membership, seem to have declined over decades (Putnam 2000). However, many researchers have challenged Putnam's decline thesis with other empirical data and types of analyses, both in the United States and especially for other developed nations (Smith and Robinson 2016). A simple decline thesis, therefore, is not generally valid – gradual changes in the nature of associational membership seem to be more important. Professionalization of leadership is driving out volunteer membership and leadership as the natural basis of many associations, threatening the Tocquevillean idea of associations as *schools of democracy* (Maloney 2012; Skocpol 2004). However, national empirical data on associations in the USA, analyzed by Walker, McCarthy, and Baumgartner (2011), firmly contradict the Skocpol (2004) hypothesis.

In addition, changing demands and expectations, and the retreat of the state, are modifying the ways associational involvement and social capital are related. In a recent analysis, Geys (2012) found evidence for a "temporal instability in the engagement-values relation" and a weakening of the relationship between generalized trust and *connected* associations. All these findings suggest that associational involvement is changing and, consequently, that it may become more difficult to solve collective-good problems on the basis of trust and reciprocity.

The gradual decline of conventional modes of associational involvement in some nations and by some measures also implies challenges for new modes of problem solving and networking. Firstly, professionalized, supporter-based, memberless organizations can be much more effective (and powerful) than internally democratic, membership-based associations and so preserve the interests of their members efficiently (Jordan and Maloney 1997). Secondly, the rise of new social media – especially Facebook and Twitter – offers opportunities for networking and social capital unthinkable until recently. Although the impacts of these digital technologies are highly debated, reliable empirical evidence on their consequences is still scarce and ambivalent, with advocates of skeptical and optimistic interpretations still fighting (Bimber, Stohl, and Flanagin 2008; Boulianne 2009).

E. Usable knowledge

As an aspect of social capital, associational involvement facilitates cooperation and contributes to common solutions not based on coercion. The British government has based a number of social, educational, and health policies on these arguments (Halpern 2005), and the same applies to the development of a local

infrastructure of environmentalism in the United States (Sirianni and Friedland 2001). As mentioned, both the World Bank and the OECD have developed extensive support programs aiming to strengthen networks and associations at the community level. Under specific conditions, associational involvement and the existence of a vibrant civil society are able to mitigate corruption and to strengthen democracy (Grimes 2012). This last example shows that the usable knowledge in this area can also be negative: even in cases where associational involvement does not have positive consequences itself, it can help to alleviate negative social and societal developments.

F. Future trends and needed research

Associations provide institutionalized opportunities for social exchange and are expected to strengthen pro-social attitudes and norms of reciprocity. Social capital is a *by-product* of associational involvement and is usually defined by its functions. Whereas cultural approaches mainly focus on trust, social-structural versions emphasize individual and organizational ties. Empirical evidence about the impact of associational features on the skills and attitudes of participants is scarce but suggests significant self-selection effects. Various parts of the world vary widely in the levels and modes of associational involvement with very high levels of associational involvement in the United States and North-Western Europe. Due to its principally voluntary character, the use of associational involvement for policy purposes is limited. Yet civil society organizations have played central roles in regime transformations in many countries in the developing world. Debates about social capital and associational involvement are usually based on presumed benevolent or beneficial consequences, but increasingly attention is drawn to feasible *dark sides* of associational involvement and social capital and to modes of *negative social capital*. Associational involvement is changing rapidly and it may become more difficult to solve collective-good problems on the basis of trust and reciprocity as the early adherents of social capital anticipated.

Various questions about the relationships between associational involvement and social capital are still unanswered: How to deal with reciprocal relationships? What explains the genesis of social capital in associations? Many of these discussions would gain if a solution could be found for one of the main puzzles: How to explain the inconsistent micro-macro results? Empirical analyses reveal that associational involvement has a clear impact on trust and pro-social norms at the aggregate or macro-level, but this relationship is only fairly weak at the individual level (Meulemann 2008; van Deth 2008; Wollebæk and Selle 2012). A second challenge is provided by the Western bias in the conceptualization of social capital. Since social capital depends on the social, political, and historical contexts, it may take a different form in non-Western democracies

(Sampson 2002) or authoritarian societies. Until now, no equivalent concepts have been presented to deal with this problem. Thirdly, it is necessary to explore, both theoretically and empirically, the actual outcomes, successes and failings, of international development programs specifically designed to support the emerging civil society of associations and social capital in developing democracies. The slow pace of democratic progress in some of these countries indicates that a more nuanced approach to understanding the impacts of social capital and civic engagement may need to be developed in order to produce a qualitative change.

G. Cross-references

Chapters 2, 9, 23, 25–31, 45, 46, 52, and 53.

Notes

1. Easy access to much of the literature is provided by Social Capital Gateway (SCG; www .socialcapitalgateway.org/).
2. Others have also argued that a subset of bridging ties should be given a separate designation as "linking social capital."
3. For the debate about the mobilization and personal benefits and incentives for involvement, see Handbook Part IV "Influences on Starting, Continuing, and Stopping Association Participation and Volunteering," and especially Handbook Chapter 52, "Volunteering Impacts on Volunteers and Association Members."
4. The term "bad social capital" is avoided here. Social capital can be put to socially beneficial or destructive purposes, but in itself it is neither good nor bad.

7
Associations and Social Networks

Vincent Chua (Singapore) and Bonnie H. Erickson (Canada)

A. Introduction

This chapter underscores the reciprocal relationship between social networks and associations. While much is known about how individual social capital, defined here as the valuable resources in a personal network, is related to the advancement of individual careers, much less is known about how individual social capital, especially social network involvement, is related to participation in voluntary associations. This brief chapter reviews some literature on the latter and argues that social network involvement and participation in voluntary associations are reciprocally related: the more connected a person is, the more likely he/she is to join an association. Yet once joining an association, he/she is likely to forge friendships with fellow members, becoming even more connected than before. Thus, access to social capital as social networks can increase a person's participation in associations, because well-connected people get more invitations to join associations. And joining an association may expand a person's circle and increase his/her social network involvement. The chapter ends by proposing new areas for research, focusing especially on longitudinal research, issues of reciprocal causality, and non-Western contexts.

The chapter reviews the bidirectional relationship between social capital/networks and associations. It first asks whether access to such social capital increases participation in associations. It then switches to consider whether participation in associations increases access to social capital/networks. It proposes that both directions matter, but that more research is required to establish the precise nature of the reciprocal causality. Social capital is integrally related to social networks, hence the chapter title.

B. Definitions

We accept the general definitions in the Handbook Appendix. While the term *social capital* has many interpretations, we focus on individual social capital

defined as the valuable resources embedded in personal (social) networks (Lin 2001). Social capital in this sense is the extent to which a person knows others in a variety of social positions associated with different kinds of resources. Much of the research on social capital focuses on knowing people in a wide range of occupations, but other social positions such as gender and/or race are also important (Erickson 2004; McDonald, Lin, and Ao 2009). Knowing people in a variety of occupations and other status positions pays off in many ways, including success in the labor market (Chua 2014; Erickson 2001; Knoke 2012; Lin 2001), political activism (Tindall and Cormier 2008), a wide range of knowledge (Erickson 1996) and psychological mastery (Erickson 2009). All these outcomes are valuable to individual life chances, including occupational success, political efficacy and activism, and better health. Since advantaged people are more active in associations, and associations are a powerful source of social capital (Chua 2013; Erickson 2004), associational life represents an important mechanism through which powerful groups store up social capital.

C. Historical background

The first important contribution to the study of the reciprocal relationship between social capital and association activity is the seminal article by Booth and Babchuk (1973), which found that social networks are the most common route to joining associations. Three-quarters of the time, respondents reported, they joined a group entirely or primarily because of the influence of a friend or acquaintance. Next, McPherson and Smith-Lovin (1987) began to examine the implications of associations for networks. People like to associate with people like themselves (the *homophily principle*). When friends recruit friends into an association, the members of an association are more like each other than a random sample of the population.

Once in an association, the homophily principle continues to operate: people select close friends who are even more like them than the average member is. Homophilous choices are especially frequent in larger associations because of the larger number of similar others. Next, McPherson, Popielarz, and Drobnic (1992) advanced the study of the effects of networks on joining associations. Though their network data was limited to close ties, they were able to show that people with larger networks were more likely to join a new association, because they know more people who might recruit them. The more close ties a person has in an association, the more likely he/she is to become attached to it and stay. By contrast, the more close ties a person has outside an association, the more likely it is that he/she will be tempted away by other recruitment attempts and leave. The authors argue that networks and association participation co-evolve, but acknowledge that lack of longitudinal data prevented testing these dynamics, a problem persisting to this day.

D. Key issues

1. Does access to social capital/networks increase participation in voluntary associations?

Participation in voluntary associations is strongly related to individual social capital in the sense of knowing a wide range of people, as has been shown in research for several different nations (Son 2013). Knowing people from a wide range of occupations (e.g. physician, lawyer, teacher, bus driver) significantly increases a person's political participation in the Netherlands (Bekkers, Völker, van der Gaag, and Flap 2008). In addition, for both men and women, diversity of contacts with males bolsters individual civic engagement (e.g. engaging in formal meetings to talk about community, education, welfare, consumerism and environment) in Japan (Miyata, Ikeda, and Kobayashi 2008). In Canada, there is a strong correlation between the diversity in a person's network and the number of different kinds of associations a person belongs to (Erickson 2004).

While the direction of causality is not clear, social capital seems very likely to be a source of voluntary association activity and volunteering. People usually join an association through their networks, and being asked to volunteer is a critical first step in participation (Bryant et al. 2003). As well, people who are more integrated, such as the middle class, the married, those with children and friends, are more likely to volunteer than those who are isolated (Musick and Wilson 2008). Put another way, people with various *dominant statuses* in a society are more likely to volunteer than are people with more subordinate statuses (see Handbook Chapter 34).

Networks rich in social capital may increase motivation to join associations because they expand cultural capital in many ways including knowledge of various things (Erickson 1996) that can be pursued in associations. Further, social capital may make a person an attractive target for recruitment efforts. Assuming that voluntary associations have a mission of some kind, they may wish to be highly selective of prospective members (Schlozman, Verba, and Brady 1999). Elite clubs are a case in point: these are places for networking between similar members; often a screening process determines membership (Kadushin 1995).

The effect of social capital is not limited to elite groups. Most voluntary associations rely heavily on personal resources and the vital contributions of members to survive (Bagetta, Han, and Andrews 2013). Thus, most associations are keen to recruit new members who may contribute their social capital to the group.

2. Does participation in voluntary associations generate more social capital/networks for individuals?

Voluntary association activity is a powerful source of social capital. When a person joins an association, the probabilities of meeting new friends and contacts

increases significantly (Kalmijn and Flap 2001; Prouteau and Wolff 2008). Members of an association share some kind of common interest that is important to them, but at the same time may differ in their occupations and other social positions, making it easy to form ties to people different from oneself.

The extent to which associations generate social capital varies with the kind of association, the networking resources of the person, and how the person joined the association. An association cannot add much to network diversity if the association is homogenous, as many are (Miller and Smith-Lovin 1987). Large associations are likely to include many people similar to the focal person, who can follow the homophily principle and make new ties with similar others instead of adding to diversity (Miller and Smith-Lovin 1987). Associations with high levels of member activities give members more chances to get to know each other. Smaller, more active, and more socially mixed groups are the best source of diversity. Since different kinds of associations recruit from different demographic categories, the richest of all sources of social capital is membership in multiple kinds of associations (Erickson 2004).

Associations provide potential social capital, but taking advantage of the potential is easier (a) if the new member joins through a friend or acquaintance (who can introduce the new member to association activities and people) and (b) if the new member has networking skills honed in an already diverse network (Erickson 2009). Organizations are "not merely places…where nodes and ties happen to exist." Rather, they "constitute sets of institutional rules, norms and practices" that affect how people interact with other members and the kinds of relationships they forge (Small 2009:v). The activities designed by organizational leaders create a context for friendships to form: when childcare organizations make it mandatory for parents to help organize excursions, parents invariably meet other parents (Small 2009). When associations are themselves linked with other associations, members in both get a chance to meet one another. In short, institutional links foster individual links (Small 2009).

While studies of the effects of associational activity on personal networks generally consider a Western context, there is growing research in Asia and Europe. In China and Taiwan, voluntary associations are a major source of routine job information (Son 2013). Among urban Chinese in the Mainland, party membership significantly increases access to social capital (Bian 2008). In Singapore, voluntary associations are a source of access to all kinds of social capital: ties to well-educated persons, ties to the wealthy, ties to males, ties to members of the dominant ethnic group, ties to non-kin and weak ties (Chua 2013). Clearly, in both East and West, social participation is a robust predictor of access to individual social capital. Using national sample survey data in France, Prouteau and Wolff (2008) showed in a regression analysis that active volunteering in an association increased the probability of making new friends.

E. Usable knowledge

As do the home and workplace, associations constitute a third locus of daily activity, including religious congregations. The norms governing associational life typically center upon community building and a culture of egalitarianism (Thornton, Ocasio, and Lounsburg 2012), both of which are conducive for the formation of social capital. Voluntary associations are exemplars of a kind of democracy, where members of different ranks and roles get to meet, however causally or formally. These encounters facilitate flows of information and influence that may turn out to be especially advantageous for lower ranking members (Lin 2001).

Hence, one practical application of the research reviewed in this chapter is to see joining and participating in new associations as a way to build individual social capital. Such capital can be useful to nearly any individual for various personal goals, including but not limited to finding a better job.

F. Future trends and needed research

What trends do scholars see in the contributions of associations to social capital? Putnam (2000) argues that association activity is declining and thus social capital is declining with it. However, much research suggests that this trend may be limited to the United States and may not even hold there (Smith and Robinson 2016). Skocpol, Cobb, and Klofstad (2005) also see decline because of the rise in types of associations that do not contribute to network diversity: homogeneous associations devoted to the narrow interests of special groups, especially narrow occupational groups; associations with mostly inactive members who just join up and write checks; associations run top-down by professionals, instead of associations with active local branches run by the members democratically and actively. Again the truth of these arguments is not yet clear. For example, the day care center studied by Small (2009) was a top-down group, but the professionals in charge used their leverage to make parents be active and meet each other. The lack of systematic research over time means that trends are hard to assess and causality is even harder.

Social networks and voluntary association activity seem to be reciprocally related. While being part of the Rotary Club in America and elsewhere opens up opportunities for making new friends, a person's membership in that club is limited by his/her prior contacts who may be club members. In other words, the factors of time, networks, and association participation must be disentangled, and this calls for longitudinal research (Erickson 2004).

There also is a need to disentangle aspects of substantive content. Granted that associations and networks are coevolutionary, what kinds of associational activity go with what kinds of social capital? The "bewildering array of different

kinds of groups" (McPherson and Ranger-Moore 1991:37) presents a formidable challenge, but we cannot assume that there are singular forms of association and social capital. To illustrate, occupation-based associations cannot add much to occupational variety in one's network, but may add to gender or race variety; ethnic associations do not add to ethnic variety, but may add to gender or occupational variety.

Overall, we know relatively little about the linkages between social networks and associations. Three areas calling for systematic study are: (1) the concern with causality, (2) the identification of specific mechanisms linking different kinds of social networks with different kinds of association, and (3) the interrelationship between social networks and associations in non-Western contexts.

8
Hybrid Associations and Blurred Sector Boundaries

David Billis (UK)

A. Introduction

This chapter, in keeping with the objectives of the Handbook, focuses on membership associations. However, in so doing, it offers a different perspective on several fundamental issues by utilizing an emerging theory of organizational hybridity. This reveals three interdependent *sectors* (third, public, and private), each of which overwhelmingly consists of organizations that share common principles. Yet each sector also contains *hybrids*: organizations that have also absorbed significant features of their neighboring sectors. Despite this, hybrids nevertheless retain their prime adherence to the principles, *the rules of the game*, of one sector. This prime sector accountability becomes particularly problematic in turbulent times; but awareness of the nature of hybridity, and ways of controlling and managing it, is essential for organizational maintenance, change, and even survival.

And what of associations? The analysis adopts a decision-making approach to the nature of ownership and membership and concludes that the core organizational principles of the association provide the raison d'être for the entire, *normal*, third sector. They represent the heartland, organizationally, numerically, and historically of this sector. Thus the majority of paid-staff nonprofits probably fall within this normal sector, albeit as minority occupants. Analogies are hazardous, but perhaps akin to the relationship between the comparatively few high-profile, professional football/*soccer* teams and the vast number of unpaid voluntary clubs and groups that play to the same rules provide the historic origins of most of the larger clubs, and arguably respond to several similar needs such as belonging, community, and passion.

This chapter follows the same general format of the book. However, there is as yet no substantial body of research and literature. Consequently there is a somewhat different emphasis than in subsequent chapters: This is inevitably more of a research account, which draws substantially on my own systematic work in this area over more than 30 years.

B. Definitions

This chapter accepts the set of general definitions in the Handbook Appendix.

To assist clarity of presentation, this section defines some of the key terms central to this chapter on hybridity. Where there are significant differences from the definitions offered in the Appendix, these will be noted, while trying to avoid unnecessary detail not essential to the main theme. Most of these working definitions will be fleshed out in the body of the chapter.

The sector and ideal types

Sectors can be regarded as collections of formal organizations that have different ways of responding to social need. This is reflected in the distinctive *rules of the game* or *principles* (sometimes called organizational logic) of organizations within the sector (market forces, collective choice, unique mission). (For more extensive discussion of sectors, see Handbook Chapter 3.)

Organizations also possess five *core elements* (ownership, governance, operational priorities, human resources, and other resources).

The sector concept is an *ideal type* (Weber and Parsons 1964). It must be sufficiently close to empirical reality to be useful in policy and practice. The term *third sector*, despite valid objections (Handbook Chapter 3), is adopted here as the least misleading and least culturally embedded term to describe the more encompassing hybrid approach adopted in this chapter.

Hybrid organizations

Hybrids are formal organizations that have significant characteristics of more than one sector (public, private, and nonprofit). Hybrids may be:

Organic – growing over time, or
Enacted – established immediately as a hybrid.

In addition, they may also be

Shallow – the impact of other sectors is limited on their organizational principles and elements, or
Entrenched – core principles and elements of public and/or private sectors have become embedded in the association.

Principal owners

Principal Owners are those people that can in effect close the organization down, transfer it to another sector, or make other fundamental boundary and mission changes.

The prime sector approach

The key hypothesis of the *prime sector approach* is that despite hybridity, organizations will have primary adherence to the principles of one sector.

C. Historical background

The notion of *sector* remains a powerful analytical and practical tool for policy and practice. The sector concept arose in the mid-1960s and gained wider attention in the 1970s (Smith 2016; see also Handbook Chapter 3). Yet, despite this power, sector boundaries have long been described as *blurred* or *messy*. Surprisingly, attempts to take a more conceptual approach to sector boundaries have been sporadic and isolated. Only toward the end of the last century did the study of hybridity and hybrid organizations began to engage scholars in several countries.

In fact, the burgeoning nonprofit literature, in its concern with sector tensions and contradictions, had hinted at the eventual arrival of hybridity as a concept. Typical comments included accusations that some nonprofits were perhaps *for profits in disguise* and others were *agents of government policy*. In addition to the studies of organizational problems and tensions, there was a valuable body of research concerned with the distinctive features of the sector, for example (Kramer 1981; Lohmann 1992; D. Smith 2000; Van Til 1988). However, much of the literature did refer to the criticality of associational characteristics and this important thread was never lost (D. Smith 1997; J. Smith, Rochester, and Hedley 1995), even if often overshadowed in public and academic arenas by the paid staff nonprofits.

Nevertheless, even in 1990, there were only slim pickings for nonprofit researchers worried about sector hybridity. For more substantial fare, it was necessary to search in the longer established public administration literature. There, over several decades can be found important, albeit intermittent literature (Bozeman 1987; Koppell 2003; Lan and Rainey 1992; Musolph and Seidman 1980; Perry and Rainey 1988; Rainey et al. 1976; Skelcher 2005). The public administration approach to hybridity is primarily occupied with the private sector, its most powerful and invasive neighbor.

In the past decade or so, there has been accelerated interest in hybridity by scholars with interests in different aspects, for example Cornforth and Spear (2010) and S. Smith (2010) on governance. They are also taking different theoretical approaches. At this stage, it is possible only to note some of the emerging configurations. Thus, a substantial interest in hybridity is found within the social enterprise movement, which has hybridity built into its title (Aiken 2010; Czischke 2012; Defourny 2001; Defourny and Nyssens 2012; Evers and Laville 2004; Mullins and Pawson 2010; Nyssens et al. 2006; Pestoff 1998). The political sociology approach of Evers (1995) leads to doubts about the clear-cut nature

of the third sector as a *sector* and argues that all third sector organizations are hybrids. Brandsen et al. (2005) suggest that the third sector does exist as a sector or domain and is characterized by hybridity.

D. Key issues

This section discusses five issues: associations as the core ideal type for the sector, ownership and membership, prime accountability, paid staff, and organizational change.

1. What is the core of the third sector?

In order to answer this question, which is a key research and practice issue, an approach is developed which first briefly explores the nature of sectors and their interrelationships. A starting point is to define a sector as a collection of formal organizations (Appendix) that represent a distinct organizational approach to the resolution of human need. That is to say, by (a) the market as represented by the private sector, (b) collective choice as represented by the public sector, and (c) group-defined as represented by independent, mission-driven groups (See discussion in Warren 2001:109–110.)

Formal organizations can usefully be analyzed utilizing the five elements detailed in Table 8.1 (ownership, governance, operational priorities, human resources, other resources). The three sectors each have distinctive principles similar to *institutional logics* (Thornton and Ocasio 2013). Formal organizations are underpinned by the powerful concept of *organizational accountability*. Individuals and groups have the authority to carry out specific duties and can be held to account if they fail to carry out those duties. In associations, such notions can feel uncomfortable, since they often constitute an environment dominated by face-to-face relationships and driven by members sharing a broadly common mission. It may be preferable, in some cases, to utilize the less bureaucratic sounding word *responsibility*. Nevertheless, working relationships can get too cozy and taken-for-granted. Changes in the internal and external environment can pass almost unnoticed, until the point at which problems can transmute into a crisis.

Table 8.1 presents ideal models of the sectors and, following a broad Weberian approach, such ideal types rarely exist. In reality, organizations within any sector will vary in the degree to which they meet the model.

For associations, their legitimate and enduring role in our social fabric rests on the core principles of the ideal model: the existence of a membership; some elected system of governance; demonstrable commitment and response to a distinctive mission; work based on volunteering; and other resources under the control of the association. This integrated, unique chain of principles enables the association to operate with genuine independence; to serve the needs of its

Table 8.1   Ideal-type sectors and accountability

Core Elements	Private sector principles	Public sector Principles	Association principles
1. Ownership	Shareholders	Citizens	Members
2. Governance	Share ownership	Public elections	Private elections
3. Operational priorities	Market forces and individual choice	Public service and collective choice	Commitment about distinctive mission
4. Distinctive human resources	Paid employees in managerially controlled *Firm*	Paid public servants in legally backed *Bureau*	Members and volunteers in *Association*
5. Distinctive other resources	Sales, fees	Taxes	Dues, donations, legacies

own members or others which it wishes to help, and to exercise its voice when and where it wishes; and to have a competitive advantage in the provision of some services (Billis and Glennerster 1998).

This is not just a theoretical argument, but is supported by both the scale of associations and their history. For example, in the United Kingdom, it has been calculated that "in 2010 no less than two thirds of the total number of 900,000 UK civil society organizations were unincorporated" (NCVO 2012). These are organizations, which do not have legal structures, and are set up as an agreement between a group of people who come together for a reason other than to make a profit (e.g., a voluntary group or sports club). And, just over 50% of the UK active voluntary organizations were defined as *micro,* with an annual income of less than GBP 10,000. Consequently, they most likely do not employ a full-time member of staff. A further 32% were classified as small, with an annual income of less than GBP 100,000. These figures provide a reminder of the vast scale of tiny and small inhabitants of the sector (cf. D. Smith 2000:chapter 2).

The historical case for the ideal model of the third sector is also robust. Many third sector organizations, including some of its most prominent representatives, have their origins in the desire of one, or a few people, to respond to social need. This is true also of "pioneering social enterprises, which informally invent new responses to social demands, often relying on volunteering in the first place" (Defourny and Nyssens 2012:12).

2. Who owns nonprofits? Principal owners/members in associations

It is widely argued in the literature that nonprofits do not have owners. Heavily influenced by economists (primarily concerned with for-profit firms), discussions of ownership have concentrated on two criteria: the possession of residual decision rights and the allocation of residual returns/income or assets. Not

only does this not ring true for the third sector, but its utility has also been questioned with respect to the public sector (Wamsley and Zald 1976).

Although in Table 8.1 ownership has been retained as a key building block, I shall redefine it just in terms of decision-making accountability. Thus, in organizations it is possible to differentiate between (a) people who may constitute the formal/legal ownership, many of whom may be inactive, (b) the *active owners,* for example, those who do vote at board meetings, and government elections, and (c) the *principal owners*, those that can close the organization down, transfer it to another sector (Weisbrod 1998), or who can change the fundamental boundary and mission of the organization. Of course, legal definitions are the final arbiter, but the organizational path to those final decisions may well have been predetermined.

In membership associations, often small and grassroots, the concept of ownership (rather like that of accountability) is unlikely to be a topic of daily conversation. But in its redefined version, which emphasizes decision-making, ownership is quietly omnipresent in the form of associational members. Even in the heyday of the egalitarian, democratic, kibbutz communes when all major decisions were taken weekly supposedly by the entire membership, the three levels of decision-making could be discerned. There were a few members who hardly appeared at these meetings, and the majority of members were certainly *active*. Even so, there was always a small group whose opinions carried greater weight by virtue of their personal characteristics which might include powers of persuasion, professional experience, past and present track record in elected posts, and the general acceptance perhaps of their role in representing a significant group of members (veterans, youngsters, ideological and political preference, and so on).[1] These *principal owners/members* are what Putnam (2000) calls *machers*, a Yiddish word to describe "people who make things happen in the community" (page 93). Given the sometimes-assertive style of a *macher* (Hemming 2011:115) compared with the often-consensual nature of decision-making in many associations, it is probably better to see them as a form of *macher-lite*. Yet, while all this is a far cry from Michels (1962*) iron law of oligarchy*, it serves to temper over-idealistic views of associational governance and decision-making (Knoke 1990:12–16).

Reframing the nature of ownership, and freeing it from its economic, market-based definition, enables it to be used as a generic term covering all three sectors. In this new usage, associations do have owners: they are the members and serve as a key building block in the ideal model (Table 8.1). In the hybrid association, the position is more complex.

3. Why is understanding hybridity important for associations? The concept of prime sector accountability

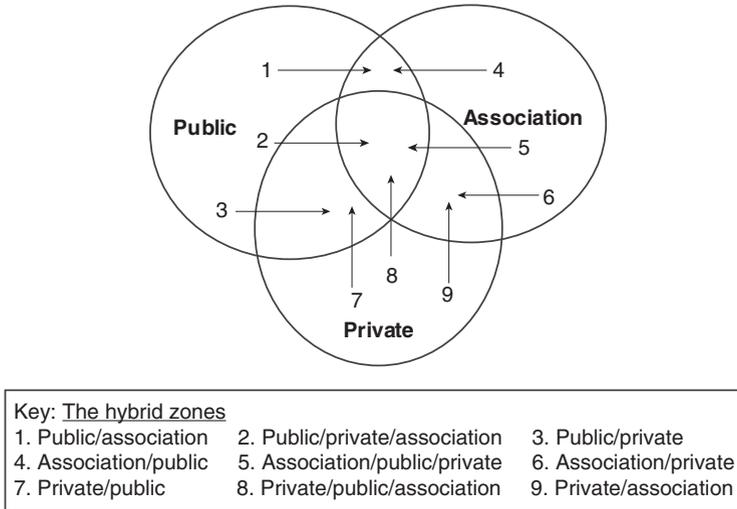
The particular theory of hybridity summarized in this section derives from the inadequacy of traditional organizational theory when faced with the problems


Figure 8.1   The three sectors and their hybrid zones

encountered in associations. These inadequacies were first exposed at a work-shop with directors of voluntary organizations (Billis 1979). It became clear that the widely used generic models of management with their clear-cut division between paid employees and governance structures did not ring true in the associational setting. A partial Venn diagram was used as an explanatory tool. In later years, the anthropological work of Edmund Leach (1976) on boundaries was adopted for work in the nonprofit sector. Over several decades of trial and error, a triple Venn diagram and theory of the sectors and their boundaries was developed. The research path can be tracked in Billis (2010) and the diagram is represented in Figure 8.1.

Figure 8.1 illustrates both the ideal models of the sectors and their nine hybrid *zones*. In building this model, what I have called a *prime sector approach* has been adopted. The essence of the argument runs as follows. Organizations have primary adherence to the basic principles of one sector. Despite this, some may adopt significant aspects of the principles and elements of adjacent sectors and become hybrids. They may successfully and beneficially manage the competing sector logics for long periods of time. Indeed, in favorable circumstances (economic, political, social) sector identity may be unproblematic. But, internal and external factors may result in increasing intensity of hybridity and the competing sector principles become intolerable. Market, collective choice and distinctive mission collide in a destructive, irreconcilable mess.

Figure 8.1 demonstrates that every sector has three types of proactive hybrid relationships with its neighbors. Thus, in the case of associations, the decision to accept or develop significant non-distinctive resources, such as government

grants and contracts, or the sale of goods and services, lies in the hands of the principal owners of the association. These actions may signal a move into either zone 4, 5, or 6. The move into hybridity is often, but not necessarily, accompanied by the appointment or increase in the number of paid staff (see following section).

4. What then is the place of paid staff?

The starting ideal model of the association has no, or little, room for paid staff. Indeed the domination of paid staff in many nonprofits is such that it is tempting to see such organizations as a distinct sector from that of the association (as earlier suggested by D. Smith 1991). The role of paid staff is not a new challenge for the association model. More than a century ago, Michels's 1911 study of political parties presented a powerful indictment of the *special interests* of the *body of employees* which "involves a necessary conflict with the interests of the collectivity" (Michels 1962:53).

Certainly, paid staff may have different motivations and expectations from those of volunteer leaders and members. Paid staff bring with them additional legal obligations for the association and a new, often foreign, lexicon of approaches typical of the private and public sectors. Included are concepts such as salaries, career progression, pensions, managers, staff appraisal, working hours, and so on. Paid staff, unlike volunteers, are dependent on their organization for their livelihood. Not surprisingly, especially in the early days of their arrival, association members and paid staff may indeed see each other as aliens from another planet rather than comrades in arms.

Hybridity theory offers a path whereby, under certain conditions, volunteers, members, and paid staff might all be seen as part of the same mission-driven enterprise. It might prove neither necessary nor useful to cast paid staff adrift from a unitary definition of the sector. This will require taking into account the amended definition of ownership and rethinking the position of paid staff and members in hybrid associations. My argument is that in nonprofits, paid staff may also be part of the active membership. In common with other active members, paid staff may demonstrate their genuine commitment to organizational purposes through their freely given and un-coerced contributions to the operation and governance of the organization (Billis 2010:62).

There is research to support this hypothesis. An important comparative study of incentives in the public and private sectors (Burgess and Ratto 2003) argues that if the welfare of the clients is the sole goal of the organization itself, workers will internalize the objectives of the organization. Setting financial rewards based on performance may actually be counterproductive, in that it may send the signal that the relationship between the paid workers and the organization is a pure market relationship. From more recent research, it appears that

(as perhaps might be expected), "the intrinsic motivation of public and non-profit employees may, though similar in multiple aspects, not be identical" (Lee and Wilkins 2001). In line with the ideal model, it seems that "participation in volunteering is positively associated with nonprofit employment, while the intention to serve the public and public interests increases the likelihood of public sector employment" (p. 53). To these comments can be added the findings of the work of Bacchiega and Borzaga (2001), who suggest, in their analysis of social enterprises, that "incentives for workers are not based exclusively on monetary rewards; rather, they derive mainly from workers' involvement in shaping and sharing the organization's goals and mission" (p. 274).

There is sufficient research and anecdotal evidence to suggest that decoupling paid-staff-led associations from the main associational territory has its downside, since staff are highly likely to internalize the mission and goals of the association. Apart from anything else, such decoupling would lead to further fragmentation of an already fragmented area of study, without first exploring whether mission and staff interests can be sufficiently aligned to regard all or some of them as members.

There are undoubtedly problems, particularly when the incursion of paid staff is so great that it requires substantial quantities of non-typical resources, such as government contracts and/or sales of services and products to support the meaning operational staff infrastructure. To do justice to the issue, it is most usefully considered within the context of change discussed in the following section.

5. Change: Hybridity and mission drift

There are a number of reasons to expect that associations will be less susceptible to exogenous forces toward hybridity than other inhabitants of the broader nonprofit sector. For example, in their succinct analysis of organizational change in associations, Minkoff and Powell (2006:591–611) conclude that:

> Small, minimalist nonprofits, especially those that are volunteer supported, may fly below the radar screen of external influences, and they are so deeply engaged in day-to-day survival that they are possibly shielded from or unaware of many external pressures. (p. 608)

And, in another study, Rochester and Torry (2010:130) argue that in the case of faith-based associations at the local level, their non-negotiable theological principles provide a *significant barrier* to hybridization.

Despite this, there remain specific challenges facing the association. Overwhelmingly dependent on volunteers for its work and governance, resource pressures can contribute to a slide into a hybrid zone (see Figure 8.1). Thus, the same essay by Minkoff and Powell (2006) also provides several cases of

organizational sliding into hybridity and the consequent impact on mission. For example, how opening a for-profit grocery store to generate revenue changed the "whole nature of the organization without [us] really knowing it" (p. 592). (See also Handbook Chapter 40.)

Research supports the widespread experience of practitioners regarding the nature of a familiar first step on the slippery hybridity slope: "the initial decision to employ the first paid staff member…was a decisive milestone in the history of each of the associations we studied" (Kreutzer and Jager 2011:645). Even so, this milestone might, but not necessarily, indicate the beginnings of a sliding into "shallow hybridity" (Billis 2010:58–59). The impact might depend on the nature of the staff employed. Accordingly, the appointment of non-member, paid, qualified professionals, as in the case of the Kreutzer and Jager case studies, is likely to have a significant impact. It can highlight the difference between associational principles and that of the hierarchical structures of medium and large professionally staff organizations, familiar in the public and private sectors. In addition, it appears from their case studies that the paid staff were expected to take on major operational roles.

On the other hand, when the first paid staff undertake supporting roles and are also members of the association, then the impact on mission and operations of the association might be less dramatic.

A further distinct state of hybridity can occur when associations either consciously or through inertia increase their reliance on non-typical sources of revenue such as government grants and trading. These types of resources may reach the point where they represent a flow of income, which results in the eventual establishment of a structure of managerial levels of paid staff. That is to say, first-line managers are themselves managed by managers and so on up to the director. At that point, hybridity becomes *entrenched* in the association. Maintenance of the structure itself becomes a major task for the association.

It is this type of entrenched hybridity that causes (with some justification) the most *angst* among those concerned with the preservation of core associational principles. It is this stage also when the concepts of prime sector adherence and the identity of principal owners will be particularly useful. Fundamental questions of organizational identity may arise (see the following section).

E. Usable knowledge

1. The associational core

For association leaders, the theory of hybridity presents the association as an organization with distinctive principles of governance and operation, which underpin its strengths. It provides a map highlighting where these principles are particularly susceptible to the pressures toward shallow or entrenched hybridity.

For public policy-makers, the creation of hybrid multi-sector institutional forms is an attractive proposition. Particularly so, if the resource savings and democratic ideals, seemingly related with grassroots community groups and volunteering, can be harnessed in tandem with entrepreneurial trading and (modest) public money. The associational baby can be thrown out with the (hybrid) bath water. It is essential for public policy-makers to understand hybridity.

2. Hybridity and principal owners/decision-makers in associations

Emphasizing the role of the principal decision-makers facilitates reflection on key questions, such as: Who really make the most important decisions in the association? What is the role of members and volunteers in the decision-making process? To what extent do current arrangements of governance and decision-making reflect the mission and needs of the association?

3. Prime sector accountability

Figure 8.1 presents a map of the hybrid zones adjacent to associations. It enables and encourages members and leaders to consider the potential longer-term impact of their decisions. For example, a book club that accepted the use of accommodation from a private health company found that it now had to work within external time and membership constraints. To what extent were they becoming an arm of the company's leisure services, rather than a self-governing, membership-owned association?

4. Paid staff, members, and mission drift

This chapter draws on a problem-driven, collaborative methodology intended to develop usable knowledge (Billis 1984). One of the fundamental problems for associations is the place, if any, of paid staff, allied with the vexed question of mission drift (see Handbook Chapter 40). The analysis of principal owners, members, and role of paid staff presented earlier is intended to confront these real, fundamental, and complex problems. It explores the conundrum of whether the roles of *member* and *volunteer* (Ellis Paine et al. 2010) can be reconciled with the contractual expectations of a paid staff. It raises for discussion the conditions under which paid staff associations might usefully be seen as hybrid members of the broader association sector.

F. Future trends and needed research

Sector hybridity is likely to receive increasing scholarly attention in the future, and similarly the phenomenon itself will likely become more frequent and obvious in various societies/nations. The following broad suggestions for basic,

applied, and policy research are made in the light of the key issues discussed earlier.

1. Basic research

The development of better theories and concepts of hybridity, and their relevance for increasing ranges of associational situations, both nationally and internationally.

Analysis of the implications of the core role of associations as presented here for current paradigms of third sector research: for example, *nonprofits*, *NGOs*, *civil society organizations*, *voluntary organizations*, and *social enterprises*.

Further study of the concept of *ownership* and *membership* in associations.

2. Applied research

Problem-driven international case studies in the applicability of the models and concepts. In particular qualitative studies analyzing the following:

The pressures on associations toward hybridity, the nature of the bulwarks against hybridity. Are there potential benefits?

The role of principal owners in mission drift and strategic organizational change;

The role of paid staff at different levels and settings as potential *members* and *owners*.

3. Policy research

Examining the impact of public policy in possibly increasing shallow and entrenched hybridity in associations:

Examining the relationship between public policy and transparent accountability when associations become involved in new government-funded hybrid organizational arrangements.

Part II
Special Types of Volunteering

This page intentionally left blank

9
Informal, Unorganized Volunteering

Christopher J. Einolf (USA), Lionel Prouteau (France), Tamara Nezhina (Russia), and Aigerim R. Ibrayeva (Kazakhstan)

A. Introduction

Informal volunteering, or helping individuals in a way not coordinated by an organization, is the most common type of human helping behavior but one of the least studied. The psychological motives for informal volunteering are similar to those for formal volunteering, but income and socio-economic status do not affect informal volunteering. Informal volunteering is common in both wealthy and poor countries, and welfare state service provision does not crowd out informal volunteering. Little is known about the individual and social benefits of informal volunteering, and the state of knowledge is not yet complete enough to inform policy. However, using existing informal helping networks can make development and other projects more effective. Future research should collect better data on informal volunteering, particularly longitudinal and comparative data.

B. Definitions

This chapter accepts the set of definitions in the Handbook Appendix. *Informal volunteering* is defined as unpaid, voluntary work/volunteering not coordinated by an organization or institution. It is evident in helping individuals living outside one's household, informal political participation, informal religious activity, and membership in informal mutual assistance groups is relevant. Surveys have measured person-to-person helping activities, including providing child care, cooking meals, doing household repairs, giving directions, listening to a friend's problems, and offering advice.

  Much informal volunteering is reciprocal, with people taking turns helping one another through time, or with members of informal groups helping each other. Most informal volunteerism is directed at people one knows and only rarely at strangers (Amato 1990). Informal volunteering is often not completely voluntary, since it occurs in social groups with strong norms of reciprocity and

mutual assistance. When members of these groups refuse to help others, they risk losing status and friendships. They may even be ostracized from the group.

No consensus exists on typology or classification of informal helping behaviors. Some even refuse to regard these behaviors as volunteering (Musick and Wilson 2008). One paper used factor analysis to classify informal volunteerism into two types, person-oriented and task-oriented helping. Person-oriented informal volunteering includes helping a homeless or hungry person, child or teen, disabled person, or immigrant. It includes helping one's neighborhood, bringing together people of one's ethnic background, advancing the rights of a minority group, babysitting without pay, and helping someone move. Task-oriented informal volunteering includes taking care of animals or pets, housework, yard work, shopping or driving to appointments, helping with a business, making food, and doing home renovations (Finkelstein and Brannick 2007). Another factor analytic article reported a distinction between helping strangers and helping people known personally (Einolf 2008).

C. Historical background and theoretical perspectives

Three perspectives – social capital, social networks, and evolutionary theory – help explain why people participate in informal volunteering. Informal volunteering may be seen as a type of social capital, since it helps establish the networks, norms, and trust that facilitate cooperation among individuals (Putnam 2000; see also Handbook Chapter 6). Social networks theory examines how individuals help others, expecting that they will later receive help in return (direct reciprocity; see Handbook Chapter 7). Or how they help members of a group, expecting that other group members, not necessarily the person receiving help, will later reciprocate (indirect reciprocity; Ekeh 1974). Evolutionary biology explains the existence of informal volunteering by the survival value it provided for our hominid ancestors. It also helps explain some features of informal volunteering, such as the tendency to help family more than friends, acquaintances, or strangers.

Informal volunteering predates the earliest formal voluntary associations, being present in all human societies (Gouldner 1960; Haidt and Joseph 2004; Komter 2005; Malinowski 1922; Mauss 1990; Smith 1997). This suggests that informal volunteering is partially instinctive (as aspect of behavior genetics) among human beings, not learned behavior present only in some cultures (Haidt 2001, 2003; see also Handbook Chapter 25). Informal helping even predates the evolution of modern humans, with evolutionary biologists considering it an important aspect of humans' evolution as social animals (De Waal 1996; Sober and Wilson 1998).

Informal volunteering, compared with formal volunteering or state assistance, has historically been the most important way that people received

assistance when they needed it. In preindustrial Europe, individuals in local communities provided for each other's needs through traditional forms of mutual assistance. With industrialization and urbanization in the 19th century, these traditional networks broke down being progressively and partially replaced by formal voluntary and mutual aid associations (Egerton and Mullan 2008; Finlayson 1994; Owen 1965). These formal voluntary networks did not provide perfectly for human needs. So by the turn of the 20th century, most European societies began developing welfare states. The nonprofit sector lived on, identifying gaps in service and new needs (Finlayson 1994) and partnering with the state to provide services more effectively (Kendall 2003; Kendall and Knapp 1996; Lewis 1995). Informal volunteerism seems to have become less important as societies industrialized, continuing to exist in the form of small favors, but no longer essential for survival.

D. Key issues

The key issues in understanding informal volunteering include measuring it accurately, discerning its causes, determining its relationship to formal volunteering and governmentally provided services, and measuring whether it benefits volunteers themselves and society in general. The key practical questions about informal volunteering are whether and how governments and nonprofits should encourage informal volunteering, and whether and how institutions can use existing networks of informal volunteering to build participation in formal programs.

1. Measuring informal volunteering

Whereas many surveys measure participation in formal volunteering, only a few ask about informal volunteering, and these exist almost exclusively in industrialized countries. Only three recent cross-national surveys produce informal volunteering information: the 2004 wave of the Eurobarometer, the 2001 wave of the International Social Survey Programme (ISSP), and the 2010 Gallup World Giving Index (WGI). The 2004 Eurobarometer surveyed 29 countries in Europe, and the ISSP surveyed 27 countries, most being highly industrialized countries in Europe or former British colonies. The Gallup WGI included only one question on informal volunteering, and detailed information on its methodology is unavailable. Still, it does have a broad coverage (153 countries).

Surveys tend to underestimate the prevalence of informal volunteering, since the commonplace nature of informal volunteering leads people to fail to recall it. A study in the United States found that people reported almost three times as much informal volunteering in time diaries as they did in surveys (Havens and Schervish 2001). Whereas time diary studies have the most accurate measures of

informal volunteering, these exist in only some countries. Moreover, methodological differences make cross-country comparisons difficult.

Informal volunteering is more common than formal volunteering. Time diary studies in the United States (Havens and Schervish 2001), the United Kingdom (Windebank 2008), and France (Windebank 2008) show that people spend more time on informal volunteering than formal volunteering. The WGI found that more people reported having helped a stranger in the last month (an average of 45% across countries) than having done formal volunteering (20%). In the 2004 Eurobarometer study, participation in informal volunteering ranged from 56 to 92%, while participation in formal volunteering ranged from 10 to 51%. In the 2001 International Social Survey Program, 65.7% of respondents had helped someone with housework during the past year, 78.9% had consoled a depressed person, and 35.6% had helped someone find a job. A study of informal volunteering in southern Africa (Wilkinson-Maposa and Fowler 2009) shows that such volunteering is the most common type among poor people in that region.

The gap between informal and formal volunteering seems even higher in non-industrialized countries. These countries lack the high rates of formal volunteering found in industrialized countries, but have similar rates of informal volunteering. In the WGI, formal volunteering correlated positively and significantly with gross domestic product (GDP), but informal volunteering had no significant correlation. The top ten for formal volunteering in the WGI were all industrialized nations, but for informal volunteering both industrialized and developing countries composed the top 10. These countries, in order, were Liberia, Sierra Leone, Sudan, Canada, Kuwait, Guyana, the United States, Kenya, and Australia, with Colombia and New Zealand tied for tenth place. Interestingly, these 11 countries include four highly developed, stable democracies (Canada, the United States, Australia, and New Zealand), and five countries that have had experience with violent conflict (Liberia, Sierra Leone, Sudan, Kuwait, and Colombia). This suggests two conditions that may encourage assistance to strangers: generosity stemming from peace and prosperity and mutual assistance given in reaction to violence and hardship.

Country-specific studies of informal volunteering are rare outside the United States, the United Kingdom, and Australia, but some do exist for Mexico, the Philippines, Russia, Kazakhstan, and southern Africa. In Mexico, a nationally representative study found two-thirds of adults engaging in some form of volunteering. It was about evenly split between formal and informal volunteering (Butcher 2010). A focus-group study of volunteering in the Philippines (Fernan 2002) revealed that respondents spent an average of five hours per week in formal volunteering and 8.2 hours per week in informal volunteering. Respondents defined informal volunteering to include some activities familiar to respondents in industrialized countries, such as participating in

community clean-ups (37%), helping someone in non-emergency situations (33%), counseling (33%), and helping someone in an emergency situation (30%). Respondents also defined informal volunteering to include praying for someone, which 41% did in a typical week, and lending money (33%).

A nationally representative survey in Russia (Mersianova and Yakobson 2009) found that 50% of respondents received assistance from individuals they knew personally, including family (85%), friends and acquaintances (65%), neighbors (30%), co-workers (28%), members of ethnic groups (3%), people in similar circumstances (14%), and their parish (9%). The most common type of volunteering was informal, reported by 13% of respondents, followed by volunteering through work (4%), for a housing committee (3%), with social movements (2%), and for a religious organization (1%) (Mersianova and Korneeva 2011). Common types of informal volunteering are helping with household chores, received by 24% of respondents, occasional help with shopping, cleaning, and child care (19%), regular child care (10%), providing special information (10%), resolving family conflicts (7%), help finding medical assistance (7%), and helping someone find employment (6%). As in the Philippines, a common form of helping was short-term loans of small amounts of money (28%) or longer loans of large amounts (12%).

A large-scale survey (1,200 respondents) in Kazakhstan found 55% of the respondents provided assistance to the individuals they knew personally. The most common type of volunteering (82%) was financial, emotional, and resource assistance to the family, friends, neighbors, and co-workers. 95% of the respondents do not consider the assistance to social network members as volunteering (BRIF Centralnaya Asiya 2002).

In southern Africa, formal and informal volunteering exist in a situation of some conflict, with informal volunteering representing traditional society and formal volunteering operating as a less popular and largely state-sanctioned activity. Before the colonial period, "traditional cultural beliefs and practices encouraged collective responsibility, solidarity, and reciprocity." Here people relied extensively upon traditional networks for support (Patel et al. 2007:13). Colonialism redirected, interfered with, and broke up these traditional practices. After independence, many countries established formal volunteering programs through youth service movements. But by the 1980s these had declined, as the victims of poor administration, corruption, and nepotism. Despite negative interference from colonial rulers and post-colonial governments, informal volunteering remains powerful in southern Africa. In Botswana, for example, informal volunteering includes organizing weddings and burials, cooperating on farming and home construction, providing emotional support, and participating in community clean-ups. These are usually organized by a community leader or village headman and involve informal roles and flexible time commitment (Patel et al. 2007:22).

Little survey data exists on informal helping in Africa, and in any of the waves of the Afrobarometer study, no questions are asked about informal helping. Nonetheless, Pelser, Burton, and Gondwe (2004) conducted a nationally representative survey in Malawi. It revealed that helping neighbors was common not only in rural areas, where traditional structures still existed, but also in urban neighborhoods, where one might expect traditional social arrangements to be disrupted. They found that 98.4% of survey respondents knew the name of their next door neighbors, 91.5% would let their neighbors look after their house while away, and 87.6% would let their neighbors watch their children for an evening.

Salamon, Sokolowski, and Haddock (2011) used Johns Hopkins Project data to estimate the global numbers of formal and informal volunteers, and their economic value (see Handbook Chapter 51, Section D, #6). Quoting from Handbook Chapter 51: "The results indicate about 971 million people volunteer in a typical year worldwide (p. 22), with 36% being formal volunteers and 64% being informal volunteers." Such findings are consistent with other multi-national research results reviewed above (see also Handbook Chapter 51).

To sum up, informal volunteering is usually much more common than formal volunteering, but its prevalence is often underestimated on surveys (see Handbook Chapter 51). Its commonplace and episodic/occasional nature make people fail to recall it. Hence, time diary methodology provides much better estimates of informal volunteering than do survey interview questions (Havens and Schervish 2001; see also Handbook Chapter 4). Informal volunteering does not vary as much by country as formal volunteering. Nor does it correlate with the country's level of economic development the way formal volunteering does. More time diary studies and more studies in developing nations are needed to enhance understanding of the prevalence and nature of informal volunteering outside the industrialized world.

2. Correlates of informal volunteering

Turning to empirical work on informal volunteering, researchers have examined the relationship between informal volunteering and demographic variables (gender, age, race, and ethnicity), childhood experiences, socio-economic status, resources, motivations and values, and social capital and family structure.

Concerning demographics, studies in Great Britain (Egerton and Mullan 2008), Australia (Hook 2004), Sweden (Gundelach, Frietag, and Stadelmann-Steffen 2010), and Europe (Einolf 2011; Hank and Stuck 2008) find that women do more informal volunteering than men. Qualitative studies have argued that informal helping are more common among marginalized racial and ethnic groups, such as African-Americans in the United States (Chatters et al. 2002; Lee, Campbell, and Millar 1991; Rozario 2006) and indigenous people and non-English-speaking immigrants in Australia (Kerr et al. 2001). There

has been, however, little survey research on race, ethnicity, and informal volunteering. One US survey found that African-Americans were no more likely than whites to engage in informal volunteering, but that blacks did volunteer more hours. Asian-Americans' and Latinos' informal volunteering behavior resembled whites' (Einolf 2011). Another US study found that 41% of African-Americans 45 and older engaged in informal volunteering, as opposed to only 36% of whites (Rozario 2006).

Only two studies have examined the role of childhood experiences. A Canadian study found that people active in religious organizations in their youth were more likely to be informal volunteers as adults (Jones 2000). A US study found children who were active in a religious organization, went door-to-door to raise money, did volunteer work, belonged to a youth group, participated in organized sports, and participated in student government, were more inclined toward informal volunteer work as adults. The association between these childhood experiences and adult informal volunteering was strong even among people 50 and older, indicating that childhood experiences may have effects that persist over the life course (Perks and Haan 2011).

Whereas many studies show that people of high socio-economic status are more likely to engage in formal volunteering, the literature is divided on the relationship between socio-economic status and informal volunteering. Some studies find that people with low income and education are more likely to engage in informal volunteering, including studies in the United Kingdom (Egerton and Mullan 2008; Li, Pickles, and Savage 2005; Williams 2004) and Sweden (Henning and Lieberg 1996). But an analysis of Swiss data found no correlation between education and informal volunteering, and a positive relationship between occupational prestige and informal volunteering (Gundelach, Frietag, and Stadelmann-Steffen 2010). Cramm and Nieboer (2015), studying an elderly Dutch sample, found more informal volunteering for the more educated, which is a rare result.

Informal volunteering requires good health and free time. In the United States and Europe, informal volunteering correlates positively with health (Einolf 2011), and Swiss data show that as health problems develop informal volunteering declines in old age (Gundelach, Frietag, and Stadelmann-Steffen 2010). Cramm and Nieboer (2015), studying an elderly Dutch sample (70 years+), found in their panel data that declining physical health/physical functioning over two years led to a decline in informal volunteering. People working part time or not at all do more informal volunteering than those working full time (Gundelach, Frietag, and Stadelmann-Steffen 2010).

The same psychological traits that motivate formal volunteering also motivate informal volunteering. These include empathic concern (Einolf 2008; Finkelstein and Brannick 2007); the six motivations of Clary and colleagues' (1998) "Volunteer Functions Inventory" (Finkelstein and Brannick 2007); scope

of one's moral obligations (Einolf 2010); and role identity, moral obliga-
tion, and generative concern, which has to do with helping younger people
(Finkelstein and Brannick 2007).

Turning to social capital, people reporting more frequent social contact with
others and higher levels of trust also engage in more informal volunteering
(Einolf 2011). Children can bring people into networks of mutual assistance,
where one study found that people with school-aged children engage in more
informal volunteering (Gundelach, Frietag, and Stadelmann-Steffen 2010).

Smith and Mersianova (2016) studied informal volunteering using a two-item
index with data from a random sample of 2,000 adult Russians. They tested
a very wide range of potential explanatory variables, based on Smith's com-
prehensive S-Theory of human pro-social behavior (see Handbook Chapters 2
and 31). Using an OLS multiple regression they were able to explain an unusu-
ally high 50.8% of the variance in informal volunteering. The most important
statistically significant predictors (0.05 level or below, two-tailed), in declining
order of beta weight size, were intention to volunteer more in the future, higher
level of active-pro-social personality (a 14-item index with alpha = 0.85), more
personal goals of helping locally, more personal goals of helping various types
of individuals (e.g., friends, neighbors, strangers), seeing volunteering as more
important to oneself, lower social anxiety, parents volunteered more, more
problems with depression and anxiety, asked to volunteer by more types of
people, work part-time (if employed), participated in more high school clubs,
and higher in empathy. An index of socio-economic status was not significant,
nor was formal education, but higher job prestige was weakly significant (0.05
level, with beta weight = 0.04). Thus, more psychological variables dominated
as significant predictors of informal volunteering in these Russian data. (See
Handbook Chapter 31 for similar results on formal volunteering in Russia.)

In summary, informal volunteering resembles formal volunteering in its
positive relationship with childhood experiences, health, free time, pro-social
personality traits, trust, empathy, pro-social goals and intentions, social net-
works (especially being asked to volunteer more), and the presence of children
in the household. Unlike formal volunteering, for which gender composition
varies across countries, informal volunteering is more common among women.
It may also be more common among racial and ethnic minorities. Unlike formal
volunteering, informal volunteering does not correlate positively with income
and education, and in some studies is actually more common among people of
lower socio-economic status.

3. Informal volunteering and the welfare state

Informal volunteering might have either a complementary or a competing
relationship with formal volunteering and governmentally provided social
services. At the individual level, people only have a limited amount of

time, so time spent in formal volunteering might preclude spending time in informal helping. On the other hand, many individual traits and characteristics predict both formal and informal volunteering. Thus the two behaviors may have a positive relationship. Plagnol and Huppert (2010) used national sample survey data on 23 European nations to show that formal and informal volunteering were significantly and positively related to each other, not competing with each other, at the level of national aggregate data. Governmental provision of services through welfare-state policies might *crowd out* informal helping, making it unnecessary. On the other hand, governmental provision for basic human needs might create prosperity and security, conditions that foster individual relationships and the *crowding in* of informal volunteering.

At the individual level, empirical studies from a number of countries show that the same people who do formal volunteer work tend also to do informal volunteer work. Much of this research is cross-sectional, including studies in Canada (Rajulton, Ravenera, and Beaujot 2007), Denmark (Henriksen, Koch-Neilsen, and Rosdahl 2008), the United States (Burr et al. 2005; Einolf 2011; Hinterlong 2008), and Europe (Einolf 2011; Hank and Stuck 2008). Using path analysis on panel data from the United States, Wilson and Musick (1997) found that formal volunteering encouraged informal volunteering, but not the reverse. Informal volunteering also correlates with charitable giving, voluntary association participation, and political activity (Einolf 2011), and with civic participation, socializing with friends and family, and participation in sports and recreation with friends (Rajulton, Ravenera, and Beaujot 2007). These findings support Smith's Leisure General Activity Pattern/LGAP (see Handbook Chapter 5).

At the level of society, several have examined whether governmental assistance crowds in or crowds out informal volunteering. Studies of service provision to the elderly in France and Israel (Litwin and Attias-Donfut 2009) found no evidence for the crowding-out hypothesis: as elderly people age and develop health problems, government agencies provide more support while family, friends, and neighbors maintain their assistance. Two European studies, using cross-sectional, national-level data, also found no evidence for the crowding out hypothesis (Kääriäinen and Lehtonen 2006; Van der Meer, Scheepers, and te Grotenhuis 2009). An analysis of the 26 Swiss cantons – they are culturally similar but have widely varying welfare policies – found no relationship between type of welfare services and informal volunteering (Gundelach, Frietag, and Stadelmann-Steffen 2010). Finally, an analysis of data from the Eurobarometer, WGI, and International Social Survey Programme surveys showed a positive relationship at the country level between informal volunteering and both formal volunteering and state spending on social-welfare programs (Einolf 2012).

Studies of informal volunteering in the former Soviet Union reveal that personal networks play an important role, because of failures in the formerly powerful state sector and an emerging, weak, and poorly understood nonprofit sector. Under the Soviet regime people received comprehensive social and economic assistance from the government. Though citizens still expect such service today, governments have cut budgets for essential public services, among them health care, transportation, and free public housing, due in part to pressure from international development institutions such as the World Bank and the International Monetary Fund. Without a developed nonprofit sector to fill gaps, citizens have turned to traditional networks of family, neighbors, clan members, and coworkers (Nezhina and Ibrayeva 2012). These informal networks root in pre-Soviet peasant village gatherings, clan affiliations, and neighborhood councils (Abylkhozhin 2007; Kara-Murza 2005). During the Soviet period, people formed informal networks to trade favors and exchange scarce commodities, a practice viewed then and now as corrupt, illegal, and repulsive (Ledeneva 2009). But people also formed, and continue to form, positive social-support networks, based not on narrow self-interest but on loyalty, friendship, and trust.

A recent survey (Nezhina and Ibrayeva 2012) found that most people considered government the best place to seek help in both Russia (66%) and Kazhazkstan (44%), followed by family and friends (49%/42%), with nongovernmental associations a distant third (23%/13%). In Kazhakhstan, the senior members of the group dictate the norms and control charitable behavior of group members, who are expected to provide financial, emotional, and resource assistance to those who are in need. If a member refuses to provide a support, it usually causes ostracism and social isolation and sometimes *moral terror*. In Uzbekistan, community councils (*mahalla*) govern informal volunteering to help families gather the harvest, build a house, or prepare for wedding or funeral (Powell 2009).

4. Benefits of informal volunteering

As non-market productive activity, informal volunteering should be considered in the generation of aggregate income measures, as recommended by Stiglitz, Sen, and Fitoussi (2009). Attempts to assign monetary value to informal volunteering labor are very rare, though Egerton and Mullan (2008) compute a monetary value for informal volunteering in the United Kingdom, and Ironmonger (2000) conducts the same exercise in Australia. Both studies found that informal volunteering contributes more value to the economy than formal volunteering and that women contribute much more value than men.

As a type of social capital, informal volunteering would seem to have positive effects on society, though no research has tested this hypothesis. At the individual level, studies seeking evidence of benefits of informal volunteerism for

volunteers have shown mixed results. On the positive side, two studies show positive correlations between informal volunteering and good health. One used a sample of elderly people in Sweden (Jegermalm 2009), the other used a sample of members of religious congregations in the United States (Krause 2009). A French study found that informal volunteering correlated negatively with depression, but not as much as formal volunteering (Wahrendorf et al. 2008). Nevertheless, a study of American teenage members of the Presbyterian Church found no relationship between informal volunteering and mental and physical health, while formal volunteering and helping out within the family did correlate with good health (Schwartz et al. 2009). Similarly, research on American retirees revealed that good health correlated with formal volunteering, but not with informal volunteering (Moen and Fields 2002).

These inconsistent results may indicate that some other factors mediate the relationship between informal volunteering and positive outcomes. In a study of the psychological benefits of informal volunteering, Windsor, Antsey, and Rodgers (2008) found that moderate amounts of both formal and informal volunteering correlated positively with good emotional affect and life satisfaction among the elderly, but that spending over 800 hours per year helping others had a negative correlation. One study of American elderly populations found that informal volunteering improved life satisfaction for women, but not for men (Antonucci et al. 1994). Another study of elderly people in the United States found that informal volunteering benefited white women and black men, but not white men or black women (McIntosh and Danigelis 1995).

All of these studies are cross-sectional, making causality difficult to determine. Informal volunteering might cause one to be healthy and happy, or healthy, happy people might be more inclined to become informal volunteers, or both. Reciprocal causality may also have a suppressive effect, as unhappy or unhealthy people might seek out volunteer opportunities as a way of coping. A US study used a three wave, eight-year longitudinal data set and sophisticated statistical methods to better establish causal relationships (Li and Ferraro 2005). The authors found that formal volunteering helped prevent depression, but informal volunteering had no effect. They also found that formal volunteering encouraged informal helping, but not vice versa. They concluded that depressed people sought out formal volunteering as a coping mechanism, but depression did not lead individuals to seek out informal volunteering.

Five other longitudinal studies found that a mix of productive activities in old age predicted positive health and emotional outcomes. However, three of these studies included informal volunteering in a composite variable that included other productive activities, making it impossible to isolate the effect of informal volunteering from other actions (Ayalon 2008; Baker et al. 2005; Hinterlong 2008). Two other studies focused on widows, finding that

informal volunteering helped protect them from depression and helped with the grieving process (Brown et al. 2008; Li 2007).

5. Informal volunteering and public policy

Governments and nonprofit organizations are increasingly realizing the importance of social capital in development and making use of existing informal support networks in establishing development projects. Most research on social capital and development has looked at formal voluntary associations, finding strong evidence that voluntary participation correlates with the success of particular projects and economic development in general (Khan, Rifaqat, and Kazmi 2007). Only a few studies have examined the role of informal local helping networks in implementing their own interventions. These include a Heifer Project International program in rural Tanzania (De Hann 2001), agricultural extension projects in rural Mali (Reid and Salmen 2002), a project encouraging the adoption of new fertilizer technology in rural Tanzania (Isham 2002), World Bank programs for indigenous people in Latin America (Uquillas and Nieuwkoop 2003), and rural development in Bangladesh (Mondal 2000) and Pakistan (Khan, Rifaqat, and Kazmi 2007). Nearly all these studies found that making use of existing helping networks assisted the project in being successful and had good outcomes for participants. Microcredit programs such as the Grameen Bank in Bangladesh have also used informal helping networks as a basis for recruiting participants. While some authors criticize these programs for having negative outcomes for women (Goetz and Gupta 1996; Parmar 2003), they have been successful in alleviating poverty.

Several other studies have found that using informal volunteering networks may contribute to the success of public programs in industrialized countries. Biglan and Hinds (2009) found that community psychology programs in the United States have successfully used existing non-kin support networks to help implement programs designed to reduce negative youth behaviors, such as alcohol, drug, and tobacco use. Budde and Schene (2004) analyzed the use of informal social support networks in the United States to prevent violence and help victims of violence. Jupp (2008) found that informal volunteerism networks contributed to the success of community groups in public housing projects in England.

The above programs used existing informal volunteering networks to start formal programs, but did not try to increase informal volunteering itself. Williams (2004) argues that groups that want to reach poor people should encourage informal volunteering, not formal volunteering, as informal volunteering is the one type of volunteering poor and marginalized people are likely to engage in. Nonetheless, there has been so little research on initiatives to encourage informal volunteering that it is not yet possible to make

recommendations as to whether governments or nonprofits should encourage it or how they could most effectively do so.

E. Usable knowledge

Given how little is known about informal volunteering, including a lack of consensus on how to define and measure informal volunteering, practitioners and policy-makers should be careful in applying scientific knowledge to the subject. With this warning in mind, the current research demonstrates that informal volunteering seems to be more common than formal volunteering. At the country level, informal volunteering does not vary as much as formal volunteering and does not correlate with the country's level of economic development the way that formal volunteering does. Informal volunteering does correlate positively both with formal volunteering and with government provision of social welfare services, indicating that these institutionalized forms of helping may create environments conducive to more informal, person to person helping.

Like formal volunteering, informal volunteering is a type of pro-social behavior and correlates with pro-social activity in childhood, resources of health and free time, trust and social networks, and pro-social personality traits, intentions, goals, and self-image. Unlike formal volunteering, informal volunteering does not correlate with status position, so that whites, males, highly educated people, and high-income people are not more likely to engage in informal volunteering. Some research shows negative correlations with these status markers, while other research shows no correlation.

The most useful finding for policy-makers in government and nonprofit organizations has to do with the role of informal volunteering networks as a source of recruitment for more formal projects. In rural development projects, microcredit banks, and social service projects among poor populations living in industrialized nations, informal volunteering networks have proven to be an efficient way to recruit and motivate participants in formal projects. Few poor people in industrialized countries already do formal volunteering, but many do informal volunteering, so projects that look for informal volunteers play to the existing strengths of poor people.

F. Future trends and needed research

There is no known reason why informal volunteering should significantly decline globally in the future. Informal volunteering does not really compete much with formal volunteering; rather, both are part of the leisure general activity pattern (LGAP), with much relevant supporting data reviewed in Handbook Chapter 5 and also some data reviewed above.

Given the scarcity of published studies on informal volunteering, virtually every topic covered in this chapter requires more research. Existing studies focus mainly on the United States, Canada, Australia, New Zealand, and Europe; there is very little research on the rest of the world, and almost no cross-national comparative survey research. The more extensive research in Russia is thus an exception. Before such cross-national research can occur, researchers would need to agree upon a definition of informal volunteering, a typology to classify informal volunteering behaviors, and effective ways to measure them. Also needed is more research on the causes and correlates of informal volunteering, and more longitudinal research on the effects of informal volunteering on volunteers.

Perhaps the most striking gap in the literature on informal volunteerism is our lack of knowledge on the role it plays in society. There has been, during the last two decades, an immense amount of research on social capital, but almost all of it focuses on formal volunteering, political activity, and membership in formal voluntary associations. Social networks researchers study informal volunteering, but their studies often do not distinguish actual helping behaviors from potential sources of help, or helping behaviors from purely social interactions.

Finally, theorists of informal volunteering, social networks, and social capital should move beyond simplistic rational choice models that assume people cooperate only out of self-interest. Recent research in psychology, comparative primatology, and evolutionary biology suggests that helping others is an instinctive act, the legacy of hundreds of millions of years of primate evolution in social groups. People are more likely to help family members or people from whom they can expect direct or indirect reciprocity, but people also help total strangers in situations where they do not expect a return of the favor, out of empathy, moral duty, or because it feels good to help others. An evolutionary perspective provides tools that can help researchers generate hypotheses about how the motives for helping and the amount of help offered vary among persons and situations.

Stipended Transnational Volunteering

*Benjamin J. Lough (USA), Peter Devereux (Australia), Helene Perold
(South Africa), and Agnes Uhereczky (Hungary)*

A. Introduction

This chapter explores the ever-evolving forms of stipended transnational volunteering (STV). When transnational volunteering is stipended or mandatory, it can be considered a hybrid between employment, volunteering, and/or compulsory service. This chapter provides a brief historical background, as well as contemporary trends of STV. The section on usable knowledge focuses on the provision of stipends and other financial supports to transnational volunteers, as well as how their rationale has become increasingly affected by the outcomes and priorities of donors or development projects. The section on future trends also discusses the slowly growing movement toward more South–North and South–South transnational volunteer placements. This chapter also explores research needed to better understand the differences between stipended volunteering for development cooperation and volunteering for intercultural understanding and global citizenship.

A key difference from other types of volunteering is the usually long-term nature of STV, which tends to range from four months up to two or more years (allowing for renewal of formal commitments). Due to this more lengthy time commitment and hence the lack of opportunity for volunteers to earn a separate income, transnational volunteer programs often need to support volunteers with stipends, scholarships, or other financial support such as medical insurance, housing, or incentives like tuition waivers on completion. In addition, some sending countries use transnational volunteer service programs as alternatives to military obligations or as conditions for individuals to receive unemployment benefits, college credit, or other benefits, which by most definitions would not be counted as volunteering (Ascoli and Cnaan 1997; Brown 1999; Carson 1999; Handy et al. 2000). This reflects a parallel issue with

stipended national volunteer service covered in Handbook Chapter 11. Likewise, to the degree that volunteer service is compulsory or mandatory, it may be considered a hybrid between work obligation and volunteering.

In most other respects, transnational volunteering generally follows the definition of formal volunteering presented in the Appendix of this Handbook, including (1) formal commitment via an organization, (2) the intended beneficiary is someone other than the volunteer or his/her family, and (3) the action is deliberate and planned (non-spontaneous) in nature (Handy et al. 2000).

Although the focus of this chapter is on transnational volunteering, it will not provide an overview of volunteer tourism or travel volunteering, which is covered in Handbook Chapter 12 and tends to be of short duration. The definition of short-term transnational volunteerism varies, but there is growing consensus that volunteers serving for four months or less are considered short term (Beckers and Sieveking 2001; Engle and Engle 2003). Short-term volunteers are much less likely to receive stipends, and volunteers often carry the costs or fund-raise for the volunteer experience (McMillon, Cutchins, and Geissinger 2009). Although the motivations of short-term volunteers are sometimes called into question (Söderman and Snead 2008), lack of compensation and free will are not typically issues of major concern.

B. Definitions

The definitions in the Handbook Appendix are accepted here generally. In addition, we define below the following special terms used in this chapter.

1. Hybrid volunteering

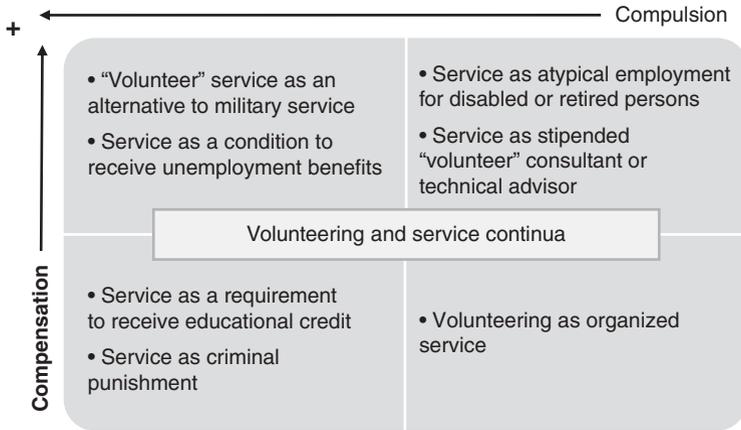
By definition, hybrid forms of volunteering include any substantial deviation from the definitional requirements outlined in the Appendix of this Handbook (see also Billis 2010). The definitional requirements of non-remuneration (or low remuneration; the *net cost* approach to defining a volunteer, as in Handy et al. 2000) and free choice are particularly relevant to this chapter. As one example, because volunteer service is sometimes a formal alternative to military service, which is mandatory, most scholars do not consider such roles to be a true form of volunteering. Likewise, because many long-term volunteer programs provide a monthly stipend or end-of-service award, some consider this type of volunteering to be a form of employment. In each of these cases, the person not meeting these definitional requirements would be *serving others* but may not be considered a *volunteer* by some scholars, because their activities are defined by either compulsion or substantial compensation (Salamon and Sokolowski 2001). Subsidizing costs of volunteering on the grounds of inclusiveness of participants is commonly considered much less problematic than compulsory service. Figure 10.1 provides an illustration of how these two


Figure 10.1　Legitimacy continua of volunteering and service
Source: Adapted from Kuti (2004).

requirements interact to create hybrid forms of volunteering. Only activities falling under quadrant 4 (Q4) were classified as pure forms of volunteering by Handy et al. (2000).

2. Quasi-volunteering

According to many scholars, payment *significantly* below market wages is sufficient to warrant classifying activities as volunteering rather than employment (Moskos 1988; Smith, Reddy, and Baldwin 1972; Wilson 2000). Smith, Stebbins, and Dover (2006:191) refer to people who receive significant or substantial compensation for their services, but still below market value, as *quasi-volunteers.* This argument for STV being quasi-volunteering is based on the assumption that the people participating in these programs are not *primarily* motivated by financial gain (Leigh et al. 2011; UNGA 2002; Unger 1991). Indeed, some transnational volunteers incur substantial financial and other costs associated with their service (Braham 1999), especially opportunity costs regarding alternative, more remunerative forms of time use. On the other hand, definitional boundaries are also muddled as many transnational volunteers receive non-monetary benefits such as college credit, job skills, certificates, and so on as incentives for serving.

3. Stipended national service volunteering (SNSV)

Although not the subject of this chapter (see Handbook Chapter 11), as a side note on the topic of hybridism, full-time stipended national service volunteering (SNSV) follows a definition consistent with STV, except that it is performed by citizens within their national borders. Although community-based and local

volunteering are also performed within national borders, SNSV is distinguished from other forms of volunteering because it is typically long term, is usually facilitated by the state, and is highly sensitive to state–society relations (Anheier and Salamon 1999; Nesbit and Brudney 2010). National volunteering is also considered hybrid under conditions where volunteers receive stipends or other financial incentives, when volunteering is offered as an alternative to military service, when it is a precondition to receive unemployment benefits or educational credits, or as a form of criminal punishment (McBride et al. 2011; Warburton and McDonald 2002). Research on national service often refers to SNSV as *civic service* – defined as formal volunteering through a structured program. While this definition is wide, scholarship on civic service most commonly refers to volunteering performed at the national or transnational levels (Davis Smith and Paine 2007; McBride and Sherraden 2007).

4. Stipended transnational volunteering (STV)

The terms *transnational volunteering* and *international volunteering* are often used interchangeably. We use the term *stipended transnational volunteering* (STV) to describe the type of volunteers that receive a modest (subsistence) stipend to work as part of international/transnational development programs funded by national/international or multilateral aid programs, both governmental and nonprofit.

   We adopt a definition of STV, set forth by Sherraden, Lough, and McBride (2008), as an organized, long-term period of voluntary engagement and contribution to society across international borders with little or no monetary compensation. STV may include unilateral forms, where volunteers from one country serve in a different country, or multilateral forms, where volunteers from different nations serve together in one country (Perry and Imperial 2001; Sherraden et al. 2006).

5. International volunteer cooperation organizations (IVCOs) and networks

STV is facilitated and implemented by International Volunteer Cooperation Organizations (IVCOs), also known as International Voluntary Service Organizations (IVSOs; Sherraden et al. 2006). The United Nations Volunteers Program and Voluntary Service Overseas are two prominent IVCOs among many that coordinate STV and that followed on from the Volunteer Graduate Scheme, first begun at Melbourne University, Australia, in 1951. International volunteer service networks (IVSNs) also play an important facilitative role as they coordinate the work of IVCOs operating in different countries. IVSNs coordinate research, organize conferences, and engage in advocacy for STV in national and international policy arenas. The most prominent global IVSNs for STV are the International Forum for Volunteering in Development and the

Coordinating Committee for International Voluntary Service (CCIVS). However, many national and regional service networks also facilitate STV within countries and geographic regions.

STV is facilitated by both public and private IVCOs, commercial and nonprofit. While private nonprofit IVCOs remain a dominant facilitator of STV (McBride, Benítez, and Sherraden 2003), IVCOs are increasingly being funded by regional bodies and national governments aiming to expose their citizens (particularly young people) to life in other parts of the world. The British, German, Canadian, Norwegian, Australian, and French governments mostly provide grants to domestic commercial, civil society, and faith-based organizations to facilitate STV placements, while the United States, South Korean, and Japanese governments publicly administer the majority of their transnational volunteer programs. In the United States, about half of all STV placements are sponsored by religious organizations (Lough 2013; Rieffel and Zalud 2006). Data from other countries are unavailable to substantiate whether this figure is similar in other parts of the world. It is likely that many religiously based IVCOs ask volunteers to cover their own costs, though support or stipends for volunteers also frequently come through congregational contributions (Rochester and Torry 2010).

C. Historical background

The earliest forms of STV in the 19th century were enlightenment-based efforts, often performed under a religious purpose of improving local conditions, along with propagating religious values and promoting education (Smith and Elkin 1981). Thus, early missionary service and North–South work camp movements were the earliest expressions of transnational volunteering. Perhaps the most prominent transnational volunteer movement outside the domain of the state arose with the formation of the International Committee of the Red Cross (ICRC) in 1864 (Boissier 1985).

Nation states have also been directly involved in organizing transnational volunteering. State efforts, such as Service Civil International, began with work camps and volunteer programs devoted to reconstructing sections of Europe shattered by World War I in the 1920s (Rosenstock-Huessy 1978). In addition to providing relief to post-war countries, volunteers supplied emergency assistance and economic relief to India and other developing countries in the 1930s and 1940s (Devereux 2008). With decolonization after World War II, the world entered an era of development in the 1950s, where the newly independent colonies' primary goal was to develop economically (Sachs 1992). The focus on economic development was embedded in the growth of large NGOs worldwide, as well as in the Bretton Woods institutions of 1944 and the United Nations in 1945. It was within this system of international cooperation and regulation that most contemporary STV programs emerged (Lough 2015).

According to a study conducted by McBride, Benítez, and Sherraden (2003), the majority of STV programs today are facilitated by nonprofit organizations. Most of these smaller, private/nonprofit, volunteer-sending organizations began to arise during the same decades as volunteer-sending governmental organizations, during the 1950s–1970s. While an increasing number of people seemed to be interested in traveling and volunteering overseas, even if they did not have specific skills, relatively few organizations existed to facilitate international placements (Roberts 2004). Consequently, private and commercial volunteer-sending organizations arose to meet this demand. Habitat for Humanity (founded in 1976) and *Médecins Sans Frontières* (founded in 1971) are a few of many large, nonprofit programs in the United States, Germany, the United Kingdom, Japan, and Scandinavia that emerged during the late 20th century. However, in host countries, the receiving and management of international volunteers fell generally on host governments or organizations in an ad hoc fashion.

D. Key issues

1. Scale of STV programs

The impact of globalization and internationalization in the late 20th and early 21st centuries has apparently seen a steady increase in the scale of STV and in the forms that it takes. Over the last few decades, STV has mushroomed in Germany, France, Japan, South Korea, the United Kingdom and the United States. All of these nations have scaled up programs in order to send significant numbers of volunteers (mostly young people) to different parts of the world (Allum 2007; Lough and Allum 2011).

Although comprehensive summary figures of actual or historical numbers of transnational volunteers serving across countries have not been compiled, it appears that the scale of both public and private programs is increasing significantly. As will be discussed in Section E, demands from potential volunteers, as well as the forms and funding of transnational programs, may be driving this increase and may also affect their outcomes.

Research on short-term STVs conducted in Tanzania and Mozambique in 2010 (Perold et al. 2012) demonstrated that although local host organizations accepted transnational volunteers – even when their requests for specific skills were not met by the sending organization – the organizations incurred considerable costs by having to draw on their limited human and financial resources to host and manage the large influx of volunteers. This situation is different from more traditional transnational volunteer assignments, where well-qualified and experienced volunteers spent on average two years working for a local institution and were largely accountable to this local institution, even if facilitated by an IVCO (Devereux 2010; Rehnstrom 2000).

2. Headquarter locations of STV-sending organizations

The majority of STV organizations are headquartered in the Global North and place volunteers in countries in the Global South (referred to as the *North–South model*). Although summary figures are unavailable, a 2010 survey by VOSESA provided a glimpse of the current directionality and geographic scope of transnational volunteerism. The 61 volunteer cooperation organizations that responded to the survey were headquartered in Germany, the United Kingdom, France, Switzerland, Canada, Ireland, the United States, Norway, South Africa, South Korea, Finland, Hungary, Ghana, and New Zealand, and 89% sent volunteers to African countries (VOSESA 2010). Only two sending organizations were headquartered in the Global South, and these were small programs that mostly sent volunteers to other countries in Africa.

As one notable exception to the predominant North–South service model, the United Nations Volunteer (UNV) Program operates in over 135 countries worldwide, and 81% of the 6807 skilled volunteers sent by UNV in 2012 came from countries in the Global South (UNV 2013). In fact, when UNV was founded in 1970, a Special Voluntary Fund was created at the same time to fund the mobilization of skilled developing country volunteers. In recent years, a number of countries or regions in the Global South have developed small transnational volunteer programs (e.g., the African Union Youth Volunteer Corps or the ECOWAS volunteer program). These programs are highlighted in greater depth in Section E of this chapter.

3. Compensation in transnational volunteering

Historically, STV programs have been motivated by humanitarian, cross-cultural understanding, or faith demonstration/propagation purposes, without significant financial recompense to volunteers. The focus was strongly on the benefit to intended beneficiaries, for example as part of an aid program or development project. As the many benefits of STV to the volunteers became more evident, including its utility in preparing citizens for global work, the ability of volunteers to pay for STV experiences became an important barrier or exclusionary factor. Because STV is not affordable for every potential participant, the issues of cost-reimbursement, pocket-money, allowances, and stipends became important policy concerns. One justification for stipends, therefore, is to lower the total costs of participation and to increase inclusion (McBride et al. 2011).

4. Directionality of STV

As noted earlier, STV has been dominated by an aid model, where volunteers from countries in the Global North are placed in countries in the Global South (hereafter referred to as North–South). In contrast, South–South programs place volunteers from one developing country in another developing country (Fulbrook 2007). South–South and South–North programs create

opportunities for citizens in developing countries to volunteer abroad and to strengthen national capacities. They also attempt to change prevailing geopolitical stereotypes and imbalances.

A study conducted by VOSESA in Tanzania and Mozambique (Perold et al. 2012) found that host organizations are keenly aware of the imbalances between themselves and northern-sending organizations and may view transnational volunteering as perpetuating a colonial legacy. This can constrain the potential for learning and reciprocity between foreign volunteers and their hosts (Baillie Smith and Laurie 2011; Heron 2007). On the other hand, other studies have noted the recognition by local hosts of the stand that transnational volunteers can challenge the transfer mode common in conventional aid, through an explicitly reciprocal model that encourages exchange, mutual learning, and accountability (Devereux 2010; Pinkau 1978).

Although the UNV program has a long tradition of recruiting the majority of its volunteers from the South, other IVCOs have only recently started facilitating South–South and South–North volunteer programs. Today, a number of the largest sending agencies, including VSO in Britain, Progressio in the UK and Ireland, Fredskorpset in Norway, and Canada World Youth have all begun promoting South–South and South–North volunteer programs, particularly among volunteers from the South with specialized skills.

There has been an increasing focus on transnational aid effectiveness over the last ten years through the development of the Paris Principles of Aid Effectiveness in 2005 and the Busan Partnership for Effective Development Cooperation, agreed at the High Level Forum in 2011.[1] These processes have emphasized South–South as well as triangular cooperation. The South–South approach is particularly attractive and taking hold in the developing world itself, particularly in African countries such as South Africa, but also among emerging/transitional economies such as Brazil or Thailand.

5. Changing patterns of funding for STV

Early volunteers received little government funding, and thus were often reliant on community or church resources, along with financial contributions by individual volunteers (Braham 1999). With the scaling up of longer-term STV programs in the 1960s, including NGOs like AVI and VSO, and public programs such as the US Peace Corps, the Korean KOICA, or Japanese JOCV, there was a shift toward greater reliance on government funds. A common feature of most long-term STV programs is relatively high administrative and operational costs, compared to short-term programs, which can recoup up to 100% of funds from participating volunteers. Strategic reasons for funding public volunteer programs are often aimed at making these opportunities more accessible to a wider range of income groups in the sending countries and the relative

cost effectiveness of these programs compared to traditional forms of technical assistance.

Reliance on public funding for STV can hit hard when aid funds are cut – as happened in 2010 in the United Kingdom, with new government priorities. Former block grants for IVCOs were not renewed, which immediately affected many formerly government-supported IVCOs in the United Kingdom. For example, funding for one of the largest IVCOs, VSO, was gradually reduced from 2010 to 2014. VSO is currently expected to receive no more than 40% of government funds toward their overall volunteer program (excluding project grants; DFID 2011).

6. Shifts in transnational volunteering priorities

As the example above illustrates, there has been an incremental shift in STV priorities away from technical assistance and development in partner countries and toward the education and global citizenship of volunteers. Globalization has resulted in a growing sense of interdependence among countries around the world. This is evident in the impact of the 2008 global financial crisis and a growing concern worldwide about the environmental impact of industrialization, urbanization, and increased consumption.

In part to counter these trends, governments and civil society organizations increasingly emphasize global citizenship as a key priority of STV. Governments have realized the importance of developing an informed citizenry that is able to reposition their countries within the global political economy. Contrary to the earlier aid paradigm, in which the development of communities was ostensibly the primary intention of most long-term transnational volunteer programs, many now believe that government support, particularly for short-term volunteers in these programs in the 21st century, is partly intended to equip their own citizens with the skills and insights needed to strategically engage with foreign countries (Baillie Smith and Laurie 2011; Heron 2011; Lough and Allum 2011; Lyons et al. 2012). Thus, they look for opportunities through which people can learn more about, and influence actors in, communities that are very different from their own. In this context, STV emerges as one means by which cross-national and cross-cultural experience can be gained.

Another aspect of *global citizenship* derives from pressures experienced by young people seeking to find their place in society – within their home countries and within the world. For example, more people today study and work in countries other than those in which they were born, and the children of multifaith and mixed race relationships often seek opportunities to trace their family origins (Terrazas 2010).

The requirements of global work may also be seen as driving the type of volunteer programs now promoted by the German and UK governments for their youth (Jones 2011). New global employment opportunities require a

more international repertoire of skills and experiences from workers, including internships and fellowships. Young volunteers are often secondary school graduates who have not yet embarked on post-secondary school studies and often have very little experience. The prospect of a paid *gap year* in another part of the world is often appealing to school leavers. From the perspective of the host organizations in southern countries, however, the prospect of hosting a young, inexperienced (albeit well-educated), first-world volunteer may be less attractive.

7. Growth in commercialized, short-term STV

As described earlier, there has been much growth in commercial gap year and other short-term volunteer programs. The trend from long-term development cooperation toward shorter-term volunteerism focused on national priorities has perhaps been more noticeable as IVCOs found it harder to recruit long-term volunteers (Rockliffe 2005). However, this trend has been exacerbated by globalization and the massive growth in privately funded volunteer tourism and commercial gap-year volunteering, as well as by the growth in government-supported youth volunteering. As Simpson (2004) noted, commercial gap-year companies often focus more on attracting volunteers on the basis of benefits to the volunteers. Commercial programs may have less incentive to utilize a social justice pedagogy, which is important to achieving real change for development. Although programs vary widely, commercial programs often place a greater emphasis on *the bottom-line*, and may devote fewer resources to the preparation, in-country support, and debriefing that are important for meaningful understanding and interaction in development. These combined trends exhibit a general neo-liberal influence on programs globally (Smith and Laurie 2011).

8. Diaspora volunteering

Although often not stipended, diaspora volunteering, or the skilled volunteer work of expatriate nationals or emigrant communities in their country of origin, has grown significantly over the last few years and is receiving increasing attention from aid and STV agencies (Leigh et al. 2011; Stuart and Russell 2011). An indication of the volume of one such program is the over 600 diaspora members that VSO UK facilitated to volunteer in their country of origin for periods varying from a month to a year through 22 different organizations in the United Kingdom between 2005 and 2009 (Stuart and Russell 2011). These programs build on both the technical skills of the expatriate nationals as well as on their detailed understandings of culture and language. They also link with values associated with volunteering that aim to connect people in mutually beneficial relationships globally. However, there are also sensitivities to working with diaspora volunteers, given issues related to how returning expatriates

may be perceived, including politically (Leigh et al. 2011; Stuart and Russell 2011).

9. Impacts of stipended transnational volunteering

Because STV has been traditionally regarded as something that people from wealthy countries in the Global North do in poorer countries in the Global South, many transnational volunteers are motivated by the goal of making a difference while using the volunteer opportunity to explore countries and cultures other than their own. Much of current thinking about the impacts of STV comes from the perceptions of volunteers. Far less is known from the perspectives of host communities and organizations.

From the perspective of host communities, capacity building, international social capital, and other resources emerge as key benefits to host organizations and communities (Devereux 2010; Lough 2012; Perold et al. 2012). Communities also value the less tangible contributions made by volunteers, including trust, accountability, ownership, creativity, optimism, an increased motivation for local volunteers to engage, diversity in project management and administration, a human rights orientation, relative cost-effectiveness, and slightly higher sustainability of their work compared to other development professionals (Devereux 2010; Lough 2012). A survey conducted of volunteers from northern countries serving in southern countries showed that most of the respondents felt they had made a lasting contribution to their host organization or to the community in which they served, mainly through skills transfer (Perold et al. 2012). A few also provided money or other resources directly to the host organization or host community.

On the other hand, the study also showed that transnational volunteering could be seen as a process embedded within the historic neocolonial relations between the Western world and the African continent (Perold et al. 2012). Stereotyped perceptions held by host organizations or host communities of STV, on the one hand, and perceptions of the host organizations and communities held by the transnational volunteers, on the other, demonstrate that STV occurs within a complex ecology that reflects North–South power dynamics (see also Heron 2007; Lough 2012). Skills transfer and the attainment of social capital may thus be compromised by persistent notions of dependence and perceived exploitation, which explains why transnational volunteers are not always seen as benevolent actors but are sometimes viewed as instruments of Western imperialism or agents of neo-colonialism.

E. Usable knowledge

The provision of stipends to support STV has many implications for policy, practice, and research. By providing stipends, educational awards, living

allowances, and other incentives and benefits to transnational volunteers, hybridized forms of transnational volunteering may affect the motivation, activity levels, and commitment of volunteers. On the surface, it may seem that stipended transnational volunteers make fewer financial sacrifices than other volunteers. However, because transnational service is typically full-time, takes place in distant locations, and frequently occurs under harsh conditions, volunteers often incur high opportunity costs compared to many forms of domestic volunteering. Financial support has been reported as a significant barrier – particularly for long-term volunteers and volunteers from minority and low-income groups (Jones 2004; Sharma and Bell 2002). Financial supports are often necessary in practice for the sake of inclusion and access, as well as for retention of volunteers and sustained service in host communities.

As one potentially detrimental implication of the link between financial support and transnational volunteering, funders increasingly require evidence of impact or the *aid effectiveness* of STV. These funding pressures have created mixed signals and blurred signposts about the purposes and potentials of STV. Because stipended transnational volunteers often serve within development aid programs, their perceived value is often bound together with the outcomes and priorities of development projects. In reality, the greatest value of STV may lie in areas outside of traditionally conceived development outcomes, such as mutual accountability, reciprocity, and solidarity (see Devereux 2010; Lewis 2005; Lough 2012). Despite the fact that funding for STV often comes from bilateral aid budgets, policy and practice may need to more accurately recognize and distinguish the value of STV as complementary to, but not the same as, other goals and targets of development cooperation.

Viewing STV through a more polished lens may also help clarify the value and contributions of stipended short-term volunteers. Although scholarship is often critical of the trend toward shorter-term placements for young people, these discussions are typically filtered through the lens of development cooperation rather than through a lens of mutual understanding, support, and human solidarity (areas which are more typical of volunteer scholarship generally). Studies that divorce the potential benefits of STV from typical criticisms of inappropriate development cooperation (i.e., paternalism, dependency, colonialism, etc.) generally provide a more positive view of the contributions of short-term volunteers that have no pretense of development impact. Although these views are commonly represented in literature on volunteer tourism (see Handbook Chapter 12), they rarely find support in the scholarship of STV.

Given the current predominance of the North–South model, the slowly growing trend for more South–North and South–South programs is encouraging. Studies suggest that STV can be most productive when it is designed on the basis of reciprocity between servers and hosts (Perold et al. 2012; Pinkau 1978).

Southern-led STV programs are generally designed to focus on expanding critical consciousness among volunteers and partner organizations as an explicit outcome.

One complication of South–North volunteering is that visa and travel restrictions often make these initiatives difficult. As stipended programs, much financial support is also needed to further develop South–North volunteer placements. Perhaps because STV is closely tied to development cooperation, governments from the North often do not see the relevance of South–North placements to this aim. Hence, they are often unwilling to finance individuals from the South to volunteer in Northern organizations and communities. Given these complications, South–North volunteering still operates at a slow pace. More work is needed to highlight the benefits of South–North placements, and greater advocacy and research are needed to study and convey these benefits to governments and civil society organizations.

F. Future trends and needed research

STV is a kind of stipended volunteering (quasi-volunteering) that is growing in popularity generally in the world, as youth and retired people become interested in spending one or more years abroad helping others less fortunate than themselves. This trend for STV fits with related trends of increasing *gap years* abroad (during one's university education) and *volunteer tourism* (see Handbook Chapter 12).

Because the trends in STV are rapidly evolving with globalization and internationalization, research lags behind practice. With a few exceptions (Pinkau 1978; Rehnstrom 2000; Woods 1980), research on the impacts of STV has only just begun in the past few years. Most studies focus on evaluating single volunteer programs rather than assessing STV more generally. Nonetheless, research on the impacts of STV has recently emerged as an important priority for funders, sending organizations, host organizations, and communities. Research on STV for development is gaining ground as bilateral aid agencies and IVSNs have begun funding exploratory research to understand impacts of multiple program models.

Given the diversity of STV programs, research is needed to understand differences between long-term STV for development cooperation and short-term STV for intercultural understanding and global citizenship – along with the many nuanced forms of STV residing in the spectrum between these two types. Knowledge of effective practices is also needed to better understand how to achieve the different aims behind these diverse forms, along with the variables associated with different outcomes (see Sherraden, Lough, and McBride 2008). Although much can be learned about STV for intercultural understanding from research in the related, and more developed, field of international

service learning (Bringle, Hatcher, and Jones 2010), STV typically lacks the reflective and pedagogical programming of service learning. With the growth of IVSNs, rich opportunities for cross-national and comparative research are finally becoming realistic possibilities.

In comparison with other forms of volunteering, hybrid volunteering generally receives relatively little scholarly attention. Indeed, researchers know nearly as much about domestic/national stipended volunteering as they do about transnational stipended volunteering. Much more research is needed to compare the benefits and challenges of STV with SNSV, as well as to understand the interface and complementarities between these two hybrid forms of volunteering. New programs that combine both national and international stipended volunteer opportunities, such as the United Kingdom's recently reconceived International Citizen Service, provide fertile ground for comparison and learning.

Stipended National Service Volunteering

Thomas A. Bryer (USA), Cristian Pliscoff (Chile), Benjamin J. Lough (USA), Ebenezer Obadare (Nigeria), and David H. Smith (USA)

A. Introduction

Stipended national service volunteering (SNSV) is a hybrid form of volunteerism. These national/domestic government-sponsored or supported initiatives have an anti-poverty or economic development focus, providing a subsistence living allowance to volunteers working full time for one year, sometimes longer. We mainly review SNSV in specific programs in three countries as examples: VISTA (Volunteers in Service to America) in the United States, Servicio Pais in Chile, and the Nigerian National Youth Service Corps (NYSC), plus some key research elsewhere. This chapter addresses the following questions: (1) What are the substantive policy or quality of life areas of focus for SNSV? (2) What financial or non-material support is provided to the volunteers? (3) Who pays for the material/financial support provided to the volunteers? (4) Who volunteers for SNSV programs? What motivates and triggers individual involvement? (5) What are the known impacts in society resulting from SNSV programs?

SNSV is similar to but also contrasts with stipended transnational full-time service volunteering (stipended transnational volunteering/STV), as reviewed in Handbook Chapter 10. Unlike the usual part-time volunteering (serious leisure; Stebbins 2007) reviewed in other Handbook chapters, SNSV programs provide a modest living allowance to volunteers as they work full time to help alleviate poverty. There is some scholarship of these programs but also significant gaps in knowledge about the operation and efficacy of these programs.

A common critique of SNSV is that such stipended service is not truly voluntary and strays in motivation and activity from the notion of concern for others toward self-interest (Stukas, Snyder, and Clary 1999). As for the subject of the prior chapter on STV, the proper way to view SNSV in this chapter is as a *hybrid type of quasi-volunteering*, where the net value of services provided by the

SNSV volunteers, though partially remunerated, is still significantly more than the partial remuneration received (cf. Smith, Stebbins, and Dover 2006:191).

B. Definitions

This chapter accepts the general definitions of the Handbook Appendix.

In addition, some special definitions are needed. SNSV is not considered to be true volunteering by many critics, given the significant financial benefit received by participants. For such observers, SNSV may instead be restricted to the category of low-paid service work (jobs). However, SNSV may also be a significant sacrifice for many participants, at least in opportunity cost: Volunteers usually give a year of full-time service for a modest living allowance, which can be seen alternatively as a hybrid form of volunteering. *Quasi-volunteering* (Smith, Reddy, and Baldwin 1972:168–169) is also an appropriate term for SNSV, so long as there is a significant difference between the stipends/remuneration received and the economic value of the services provided. In academic and policy circles, SNSV is often referred to as *civic service*, a term which was popularized by sociologist Charles Moskos after his influential book on the subject (1988).

The hybridity of SNSV results from participants combining a volunteer spirit and motivation to help less fortunate people with very modest remuneration to support their living expenses while involved in full-time service work, often in stressful and demanding contexts. SNSV is formalized, structured, and requires a substantial commitment from the volunteer, the host agency (local organizational context of volunteering), and the sponsoring government or nonprofit entity. This definition is consistent with that offered in Handbook Chapter 10 in discussion of stipended transnational service volunteering. SNSV is differentiated from that type of stipended volunteering by the restriction to service within, rather than across, national borders.

C. Historical background

1. SNSV in the United States

The idea of SNSV has been around since before 1887, when the writings of Edward Bellamy recommended mustering an *industrial army* into low-wage national service to complete public works projects (MacDonald 2003). William James further popularized the notion in 1906, when he argued for national service as the *moral equivalent of war* (Eberly and Sherraden 1990; James 1910).

The first concrete action by the federal government to support SNSV began with the creation of the Civilian Conservation Corps in the 1930s (Egan 2009). In an effort to simultaneously preserve and rebuild an expanding acreage of national forests, the Franklin Roosevelt administration launched the CCC. In the 1960s and 1970s, US leaders sought a domestic program parallel to the transnational volunteering enacted through the Peace Corps. SNSV became

a major federal government initiative during the War on Poverty with the creation of VISTA in 1964 (Marshall and Magee 2005).

The Commission for National and Community Service, a US federal office, was created during the George H. W. Bush administration to support full-time service and encourage service learning in schools. In 1993, during the Clinton administration came the Corporation for National and Community Service and AmeriCorps. VISTA was subsumed under the new AmeriCorps program, which remains the key facilitator of SNSV in the United States today.

2. SNSV in Chile

SNSV has also existed in Latin America for several decades. Morris (1974) reviewed research on SNSV programs and related domestic, development assistance volunteering without stipends in many such nations, including Bolivia, Brazil, Colombia, Costa Rica, Cuba, Chile, the Dominican Republic, El Salvador, Mexico, Nicaragua, Panama, Peru, and Puerto Rico.

In Chile, Servicio Pais was launched much more recently in 1995. In the case of Servicio Pais, it was created by the National Council for Overcoming Poverty (NCOP) in the context of a new strategy to address the issue of poverty in Chile.

In 1994, the Chilean President Eduardo Frei Ruiz-Tagle appointed a group of politicians, social actors, scholars, and business leaders to put forward an agenda of policies and programs to address the key issue of poverty in Chile in the NCOP. The idea was to come up with a new and innovative agenda of social interventions to change the traditional and assistential approach to increase the quality of living of those in need. The Council presented the report "La Pobreza en Chile: Un desafio de equidad e integración Social" (Poverty in Chile: An equity and social integration challenge) (NCOP 1996). The Foundation for Overcoming Poverty (Fundacion para la Superacion de la Pobreza) was created after the presentation of this report to start an agenda of social programs from the civil society. Servicio Pais is one of the most important programs in this social intervention strategy. It has placed more than 5,000 volunteers since its implementation in 1995.

3. SNSV in Nigeria

The Nigerian National Youth Service Corps (NYSC) was a child of political expediency, inaugurated at the end of a bitter and bloody Civil War (1967–1970) with the aim of repairing the ruptured bonds of nationhood. As students of the voluntary service landscape in sub-Saharan Africa will recall, a similar situation existed in the immediate post-Apartheid era in South Africa. Nigeria, still smarting from the trauma of *ethnic engineering*, felt a need to expose young people to other "people in different parts of the country with a view to removing prejudices, eliminating ignorance, and confirming at first hand the many similarities of all … ethnic groups" (Federal Ministry of Women's Affairs and Youth

Development 2002; cited in Obadare 2007:42). But while there may be no better time than the immediate aftermath of a social breakdown to introduce an SNSV, the Nigerian experience suggests that perpetuating a raison d'etre can be a political conundrum as soon as the initial glow fades. Obadare (2007, 2010) has written a brief monograph on the NYSC in Nigeria that describes the early history of this program.

As the Civil War retreats deeper into the recesses of collective memory in Nigeria, and as the number of participants in the program continues to rise (250,000 Corps members were deployed in 2011 alone), criticisms of the NYSC's logistical travails have morphed into serious questioning of its continued existence. Some pessimists fear that, if its current fiscal and logistical challenges prove overwhelming, the Federal Republic of Nigeria may be forced to follow the path of the government of Botswana which, in April 2000, eliminated the *Tirelo Setshaba*, the Botswana national service program, after 20 years of existence (Molefe and Weeks 2001).

Yet, anxieties regarding the possible elimination of the NYSC, while legitimate, must be balanced by the recognition that context is key, and that the current challenges of the program are most probably connected with the current political turmoil in Nigeria. Currently, continued interest in the NYSC and a definite desire to see it succeed conjoins with undeniable SNSV program fatigue among the volunteers, the state, local communities, and other intended beneficiaries. One reason for this situation, as previously stated, is that this SNSV has become part of the political furniture, justifying the program has been increasingly difficult given its expense, and that this SNSV has emanated from a distant and ever-receding postwar milieu. Among the NYSC corps members, the feeling of fatigue is deepened by overall disillusionment with the state of affairs in the country in general.

D. Key issues

In this section, we review some key questions with respect to SNSV and the research bearing on them. While the examples here focus primarily on programs in the United States, Chile, and Nigeria, SNSV programs now exist in many nations. However, few have been carefully studied by social scientists. For an investigation of key issues in other countries, McBride and Sherraden (2007) provide chapters in their book focused on SNSV programs in Israel, Chile, Denmark, and England, as well as additional countries in Africa and Latin America (see also Eberly 1992).

1. What are the substantive policy or quality of life areas of focus for SNSV?

National service aims to help disadvantaged and underserved communities through engaging civil society in "tasks that neither the marketplace nor

government can provide" (Moskos 1988). For example, Servicio Pais is a national program oriented to serve marginalized communities by engaging young professionals from different disciplines. It is conceived as a social intervention program, because it combines the resources and capabilities of public and private organizations, such as municipalities and foundations, with the capacities of young professionals and those living in these communities. It is oriented to foster local communities along with helping young professionals to gain experience and instill a social commitment among them. This program, administered by the Foundation for Overcoming Poverty (Fundacion para la Superacion de la Pobreza), concerns a one-year period of young professionals (volunteers) working in these underserved communities developing an intervention program, designed and implemented with local communities to foster their capacities and to create the conditions for long-term interventions.

Similarly, AmeriCorps VISTA is focused on the range of issues related to poverty: education, homelessness, health and nutrition, and so on. Like volunteers with Servicio Pais, VISTA members reside in the communities in which they are serving, effectively living in poverty while serving those in poverty. Sagawa (2010) describes many purposive/goal areas besides poverty reduction in which SNSV programs in the United States are active and effective, including education, health, crises/disasters, and the environment. Thus, while SNSV government programs usually focus on poverty reduction and community development as consensus goals, similar SNSV programs run by nonprofit or lower-level governments often seek many other kinds of goals, at least at times.

The key aspect of these and other SNSV programs is the link created between local communities and volunteers. It is understood that local communities are active subjects able to get involved in the solution of their own problems, with the support of volunteers to make things happen. This link is grounded in the fact that volunteers live with communities for the whole time the project takes place.

2. What financial or other material or non-material support is provided to volunteers of national service programs?

In addition to regular living stipends described in Section B, national service is often incentivized through student loan forgiveness and other educational benefits. Young professionals participating in the Servicio Pais program receive a salary of 450,000 Chilean Pesos (USD 900+) per month for a whole year. They also receive health insurance and an increase in their salary according to the conditions of the place where the job is developed. There are areas in Chile where the standard of living is higher, particularly in isolated zones. They also receive support to fulfill their duties, in terms of mentoring during the time they serve. Finally, they are involved in an online diploma (certificate) to help them in their social intervention programs.

Similarly, VISTA members are paid at a rate of 110% of the poverty level for the community in which they are serving, which is roughly the same as the stipend given to Chilean volunteers. They also receive access to health services and an educational grant of approximately USD 5600 at the completion of their year of service. President Lyndon Johnson said the following in the swearing in of the first 20 VISTA members in 1964: "Your pay will be low; the conditions of your labor often will be difficult, but you will have the satisfaction of leading a great national effort, and you will have the ultimate reward which comes to those who serve their fellow man" (Corporation for National and Community Service 2006).

Because many national volunteers are graduates of secondary schooling with comparatively advanced skills, entitlements are often criticized as a form of middle-class welfare (Bandow 1990b). At the national level, amid a global economic crunch, the financial demands of national service programs have to be measured against the competing demands of other social welfare programs and investments. Some critics emphasize that the tasks volunteers are often asked to perform are not needed, according to market standards – thus volunteers are being paid to perform tasks that would otherwise fail to justify remuneration.

3. Who pays for the material support provided to volunteers of national service programs?

Funding that supports SNSV programs is often a combination of public and private dollars. For instance, funding for Servicio Pais is provided by the Foundation for Overcoming Poverty which is a not-for-profit organization backed by public entities and private companies. VISTA in the United States is federally funded, with cost sharing by local governments, nonprofit organizations, and other private entities that wish to donate to support more VISTA presence in communities. Additionally, some colleges and universities in the United States offer to match the education grant provided to VISTA members, thus allowing nearly USD 12,000 in education benefits for members who pursue additional education after completion of their service.

4. Who volunteers for national service programs? What motivates and triggers individual involvement?

Volunteers in Servicio Pais are young professionals committed to overcome poverty and improve capacities of under-served communities. No systematic data or empirical analysis has been generated to understand the reasons for being involved in this program. It is well known that people involved in this program tend to have a social commitment.

Since 1994, there have been over 800,000 AmeriCorps and VISTA members who have served in the United States with over one billion hours of service (Corporation for National and Community Service 2013). Members come from

a range of socio-economic backgrounds, across ages, and educational back-grounds without any bias in gender or race (Simon 2002) and maintain an active commitment to service and the idea of giving back to society.

5. What are the known impacts resulting from national service programs?

The list of interventions and outcomes emerging from SNSV exceeds the pages of this chapter. However, in this section we summarize the main impacts on volunteers, beneficiaries, institutions, and communities. The difficulty of measuring outcomes associated with volunteerism presents perhaps the most significant challenge for continued support to SNSV entities and programs (Reingold and Lenkowsky 2010; Sherraden and Eberly 1982).

Perry and Thomson (2004) offer one of the most comprehensive assessments of national service impact. They unpack impact into four categories: server (or volunteer) outcomes, beneficiary outcomes, institution outcomes, and com-munity impacts. They synthesized research on national service programs from 115 publications and 139 studies found within the publications dated up to June 2000. Most of the studies were of peer-experimental design, meaning two groups were measured against each other in post-test only, and the group mem-bers were not randomly assigned. Thus, there was no control for environmental factors. The next most often-used study design was simple pre-test and post-test without control groups. Given these limitations in study design, Perry and Thomson identify findings that were more or less consensus findings across the 139 studies.

(a) Impact on volunteers

In the domain of server or volunteer outcomes, they found strong positive out-comes in the areas of skills development, education opportunity, self-esteem, satisfaction from serving, and health. In other words, national service volun-teers were found, after their period of service, to have developed competency in new skills, found and pursued additional higher education, enhanced their self-esteem (at least for senior citizen volunteers), were overall satisfied with their experience, and enhanced their health and well-being. They found a weak posi-tive relationship (meaning some studies showed positive and others showed no relationship) with the outcome of civic responsibility. This is a normatively dis-appointing finding, in that volunteerism is generally thought to cultivate more selfless and outward-looking behavior. Given the mix of studies included in the synthesis, this is clearly an area for more rigorous analysis. The final outcome in this domain showed no relationship between the act of national service volun-teering and tolerance for diversity. This does not mean the effect was negative but that the act of service did not alter ideas about diversity.

As three recent studies of the voluntary service scene in Africa demon-strate (Caprara et al. 2012; Obadare 2014, Perold 2013), SNSVs throughout

the continent are seen as pivotal to many youth strategies. However, such programs do not have unalloyed positive consequences. National service in Eritrea, for example, has reportedly disruptive effects on volunteers. Studies by Mayer and Schoepflin (1989) and Araia (2002) show that the Eritrean SNSV program resulted in deep and often negative behavioral changes in volunteers connected with their experience in the course of service. Likewise, the SNSV program in Botswana was seen as, in the apt words of a participant, *a year of forgetting* rather than a year of learning, as envisaged at its conception (Molefe and Weeks 2001:106). Volunteers with *Tirelo Setshaba* in Botswana expressed weariness about a program that was increasingly seen as an impediment and an unnecessary delay in the journey to tertiary education. Eliasoph's (2013) qualitative study found similarly negative outcomes of SNSVs and other volunteer projects in the United States.

Research on VISTA and related US national service programs has suggested a number of potential benefits for volunteers. Those who participate in SNSV are more likely to continue volunteering, to engage civically and politically in their community, and to seek a career in government or nonprofit service (Nesbit and Brudney 2010). There remain questions, however, as to the lasting impact of SNSV on pressing social issues.

(b) Impact on beneficiaries

Beneficiary outcomes include two examples in Perry and Thomson's (2004) study. In the studies analyzed, two outcomes were examined: education and senior care. In both areas, the studies showed positive outcomes for the client population, meaning a general sense that the national service volunteers helped enhance educational achievement and behavior and make senior citizen well-being stronger. There are other population groups that potentially benefit from national service volunteer activities, such as the homeless, impoverished, financially illiterate, and so on. Additional research is necessary across more social domains.

(c) Impact on institutions/VIOs

The third domain – institutional outcomes – consists of changes to the institution of volunteerism and the volunteer-hosting organizations (Volunteer-Involving Organizations/VIOs; Leigh et al. 2011). Perry and Thomson (2004) identified discussions of three such outcomes across the 139 studies: service expansion, service quality, and institution creation. Methods used to analyze these data were not rigorous and studies were few to draw and definitive conclusions, making this also an area in need of further research.

(d) Impact on communities

Fourth is the domain of community impacts. These go beyond outcomes for a client population. Instead, the outcomes embedded within this domain

are strengthening community, improving benefit–cost ratios, and volunteer leveraging. The one strong positive outcome, consistently found across studies in the sample gathered by Perry and Thomson (2004), was the positive benefit–cost ratio: the dollar cost of implementing the national service volunteer program were consistently outweighed by the benefits achieved, though benefits were calculated differently across cases. There were mixed findings – some positive and some null – for the other two areas. National service volunteers were not demonstrably always successful at recruiting additional volunteers (volunteer leveraging), and there were no consistent findings on broader community strength and social capital outcomes.

Every volunteer with Servicio Pais has to develop an Intervention Plan (PTI), which is designed and implemented with local communities. In so doing, the program is able not only to address social problems but also to create capacities in the community in order to make them play a key role in their own future. By contrast, among the local communities in Botswana, there has been constant chafing at the perceived corruptive influence of volunteers, who were said to have brought with them some of the worst aspects of urban life, including alcoholism, sexual incontinence, and drugs.

(e) The influence of context on the impacts of SNSV

For the most part, scholars of SNSVs have taken program positive outcomes for granted, very often with scant consideration for the historical context of their origination, the objectives they were intended to achieve, and the actual experiences of similar programs in comparable national contexts. Based on mainly qualitative research interviews and focus group discussions, Obadare (2007, 2010) adds an important element to the study of SNSVs. His findings show that the general assumption of positive outcomes for participants needs to be revised in consideration of the larger, prevailing, socio-political ecology of the sponsoring nation. These conditions have a significant effect on participant outcomes, which can be negative as well as positive.

Given that SNSV is a public program, some are concerned that the government may use volunteer service as a way to co-opt civil society when important social and political contexts are not taken into consideration. A good example is China's national youth service, which was established during Mao Zedong's Cultural Revolution with the goals to prevent the *bourgeois liberal* ideas of young people (Bandow 1990a).

Virtually without exception, research on SNSV impacts in the United States tends to find both immediate and longer-term positive outcomes for participants/volunteers, but few negative outcomes. Obadare (2007, 2010, 2014), writing about the SNSV in Nigeria, sees far more negative effects and also problems in other African SNSV programs. As can be seen above, there are some signs that volunteerism and national service can be impactful with clear institutionalization and devotion of dedicated resources to the effort (Bass 2013;

Khazei 2010; Sagawa 2010). However, there are also failures in a couple of components. First, there is inconsistency in measurement of impacts across time and space. Second, as Frumkin and Jastrzab (2010) observed, there is inconsistency in how national service is defined, both currently and historically (Bass 2013). Third, measurements of SNSV impact have not uniformly been pursued with rigor. This situation leaves open to question even those findings that have been advanced and relied upon for championing national service as a policy program and initiative.

6. What do we learn from other major books or reports on SNSV?

In addition to documents cited above, there are many other relevant publications that we lack time and word-count to review and discuss here at any length. The concept and actuality of SNSV programs has stirred much political and even philosophical debate, especially in the United States, with many resulting early publications of interest (e.g., Boyte and Kari 1996; Eberly 1988; Evers 1990; Marshall 1988; Moskos 1988). Some see SNSV as a wonderful social innovation that helps both the recipients and the volunteers themselves. Others decry SNSV as a waste of public money that decreases recruitment to the military in relatively peaceful periods without youth conscription (Roux 1991).

Some critics suggest that there are more effective ways to promote volunteering and a *spirit of civic mindedness* in a democratic nation than using public tax dollars to support volunteer service (Roux 1991). According to these authors, effective alternatives include decentralized community-, church-, and school/university-based service programs, which may also carry the potential to be more intrinsically motivated (e.g., Elkin and Soltan 1999; Furco and Billig 2002; Kielsmeier et al. 2009; Mann and Patrick 2000; Mohan 1994; Sagawa 2010:190; Schudson 1998; Spring, Grimm, and Dietz 2009). In response to the important question of public benefit, a good overview of government interests in SNSV can be found in Brav, Moore, and Sherraden (2002). Likewise, the Corporation for National and Community Service (2013) researches how funding for SNSV can increase employment prospects in the economic sector.

There have been quite a few technical evaluations of SNSV in the United States done by external contractors, nearly always by commercial (rather than university-based) research contractors, funded by SNSV government program officials (e.g., Abt Associates 2001; Aguirre International 1999; General Accounting Office 1995; Neumann and others 1995). More recently, the U S Corporation for National and Community Service has done many in-house evaluations of the impact of SNSV though its Office of Research and Policy Development (Corporation for National and Community Service 2007a, 2007b, 2008, 2009).

Some books and reports have focused on the impact of SNSV on recruiting for the armed services (the military), or on *civilian service* as an alternative to

military service for youth – sometimes on *citizen soldiers* as an alternative to conscription (the draft) of youth for military service (Eberly and Sherraden 1990; James 1910; Magee and Nider 2002; Toomepuu 1989). There is some evidence that SNSV reduces voluntary recruitment to the military by a small amount, but other evidence consistently shows the various positive effects of SNSV that outweigh such minor military recruitment decreases.

A book by Sagawa (2010) is one of the best recent overviews of extant SNSV in America, treating not just SNSV federal government programs but also many nonprofit sector and lower-level government versions of stipended volunteering to meet community needs and to develop the character and citizenship skills and civic inclinations of participants. Her Appendix lists many high-quality stipended volunteer program opportunities with contact websites.

In perhaps the most comprehensive global survey to date, McBride, Benítez, and Sherraden (2003) completed research with a sample of 210 civic service programs in 57 different countries in 2003. While not all of these programs would meet the definition of SNSV, the majority are representative of national service. This report presents findings on the geographic distribution of national service programs and their various goals, activities, and forms, an overview of the demographic characteristics of those who volunteer, and the economic and political structures that support the service experiences.

Frumkin and Jastrzab (2010) wrote a high-quality book describing the treatment of SNSVs in America. Based on extensive research by the authors, they focus extensively on the benefits of SNSV for different kinds of participants involved, including individual volunteers, the local community, and volunteer-involving organizations as well as the general public. The authors also make a variety of suggestions for the improvement of SNSV programs.

Van Til and Ledwig (1995) give an extensive but concise analysis of the structure and meaning of SNSV programs as a guide to the development and management of such programs. The authors focus both on the underlying values and also on operational considerations of SNSV programs. They briefly review relevant legislation (to the date of publication) and suggest perspectives on SNSV from the viewpoints of different stakeholders. In a more recent chapter, Van Til (2000:chapter 4) gives his assessment of the value and impact of AmeriCorps – citing both qualitative and quantitative research on its impact from a Gallup Poll survey on the topic. He summarizes (p. 50), "AmeriCorps, we found in our study, is a program largely invisible to the American public, but one that rests on a broad, if shallow base of public support." The national survey data (p. 62) showed that most people, often a large majority, saw many beneficial impacts of AmeriCorps that far outweighed its costs. When respondents are informed of what it does, they usually show positive support for it. Nonetheless, the SNSV has negative outcomes as well (pp. 62–63) and is a politically contentious issue in the United States at the national level (pp. 65–67).

E. Usable knowledge

SNSV has the potential to engage hundreds, even thousands, of citizens per year in many nations. Though there is a direct cost associated with support for stipended volunteers, the return on the relatively small investment is potentially large, both economically and socially. To fully take advantage of SNSV requires clear strategy, measurable outcomes, and sustainable partnerships across community-based organizations (Bryer 2014).

No single prescription for developing partnerships for volunteerism exists, but we can adapt practices from other research literatures on collaborative governance. Specifically, to set up SNSV programs one needs to (1) identify problems or information needs that can be addressed through full-time volunteers, (2) identify possible collaborators or community agencies that are stakeholders regarding that problem or need, (3) specify the skills, resources, relationships, or information each potential collaborator possesses, including what resources they can provide to assist the professional development of volunteers, and (4) determine the values and preferences of collaborators to forge a partnership that is responsive to unique needs in the community (Bryer and Toro 2013).

Another recommendation based on the research literature is to engage institutions of higher education to provide access to professional development, knowledge resources, and an accepting community for volunteers. The efficacy of this approach has been seen in the examples of several US-based universities, including Tulane University and the University of Central Florida (Bryer, Augustin, Barve, Gracia, and Perez 2013).

F. Future trends and needed research

Given the various positive features and impacts of SNSV programs for many countries, it is likely that such programs will generally persist and perhaps even grow in popularity over time. However, some existing SNSV programs will likely be ended, especially where the results/impacts seem mixed or negative to national leaders. SNSVs may be more successful and appropriate in industrial or even post-industrial nations, where some poverty persists, than in pre-industrial/agrarian societies, where poverty is more endemic. Also, the greater the financial pressure/scarcity felt by national leaders, the more likely an existing SNSV will be canceled and new SNSVs not begun.

Practically, SNSV is perpetually at risk of losing funding and support from government legislators. The return on investment is more often documented in anecdotal terms rather than through systematic and consistent research over time and place. Thus, advocates of SNSV face an ongoing challenge to justify any national program's existence, particularly in times when every public dollar

is scrutinized. This represents the most significant research gap and the area for further empirical study within and across nations. The SNSV programs are generally supported on principle, given their apparent *feel-good* character. But much more attention needs to be paid to rigorous longitudinal studies of the impact of SNSV using control groups to the extent possible.

Volunteer Tourism and Travel Volunteering

Stephen L. Wearing (Australia), Angela M. Benson (UK), and Nancy McGehee (USA)

A. Introduction

This chapter explores the nature of volunteer tourism and travel volunteering as part of the larger section of this book on the purposive types of volunteers and volunteering. This new type of volunteering now constitutes a burgeoning segment of the alternative tourism industry that goes far beyond both the traditional notion of volunteering and traditional mass tourism. This chapter explores many key debates that underpin volunteer tourism, in particular the various issues and dimensions evident in various cultural contexts. We also provide an understanding of the reasons why some consumers use their tourism leisure time to volunteer. Our focus will be on international volunteer tourism, excluding domestic tourism volunteering.

Volunteer tourism (or *voluntourism*) is a relatively recent phenomenon, but despite this, it is one of the major growth areas in contemporary tourism. This demand has been met by a proliferation of organizations from the private, public, and nonprofit sectors offering a range of projects that can be pursued worldwide. This chapter, as part of the critical discourse on volunteer tourism, begins with a discussion of the definition of volunteer tourism, which is then placed in historical context.

Section D of this chapter is devoted to the examination of seven issues critical to volunteer tourism. These are its sustainability and potential commodification, the altruistic/egoistic paradox, the importance of inclusion of the host community's perspective in volunteer tourism, the role of religion, and the North and South geo-political nature of the phenomenon. The authors make no claims that this is either an exhaustive or comprehensive assessment of the issues currently associated with volunteer tourism. However, we do believe we have selected key issues that are discussed through a broad social science lens. Section E of this chapter examines some of the more recent initiatives

and trends in volunteer tourism, though it is important to note that the extent to which these will become mainstream is still unclear. What is apparent is the need for additional empirical data so that further, more meaningful, debates can occur. There is little doubt that our understanding of volunteer tourism has grown over the last decade, but it is still limited. Clearly, there is still much to be done.

B. Definitions

This chapter accepts the set of general definitions in the Handbook Appendix.

Wearing made the first attempt to define volunteer tourists as those who "volunteer in an organized way to undertake holidays that might involve aiding or alleviating the material poverty of some groups in society, the restoration of certain environments or research into aspects of society or environment" (Wearing 2001b:1). Since then the definition has evolved with other authors refining it around their research perspective. For example, McGehee and Santos (2005:760) define volunteer tourism as "utilizing discretionary time and income to travel out of the sphere of regular activity to assist others in need." Brown (2005) offered a tour operator's perspective of volunteer tourism as a "type of tourism experience where a tour operator offers travellers an opportunity to participate in an optional excursion that has a volunteer component, as well as a cultural exchange with local people" (p. 480). In this definition, we find a variation from Wearing (2001b) where the entire trip was focused on the volunteering component.

The conceptualization of volunteer tourism has been further expanded in the literature to include terms such as *volunteer tourism* or *volunteering for development*. Clemmons (www.voluntourism.org) provides a definition of volunteer tourism in the mainstream media in a way that gives equal credence to both the volunteer and travel experience as "the *conscious*, seamlessly integrated combination of voluntary service to a destination and the best, traditional elements of travel – arts, culture, geography, history *and recreation* – in that destination." These varying definitions and conceptualizations reflect the growing debate and critique within the study of tourism.

C. Historical background

The concepts of volunteering and tourism both have long histories. The history of formal volunteering and associations in general is reviewed in Handbook Chapter 1, going back many millennia. Volunteer tourism and travel volunteering are much more recent as phenomena, going back only a couple of decades. While there are a small number of fragmented articles prior to the new millennium, the book by Wearing (2001b) inspired the articles that followed.

According to the Centre International de Recherches et d'Études Touristiques (CIRET 2012), there were 444 documents on volunteer tourism circa 2011–2012. Put into perspective, 288 documents existed on backpacking, 530 on wine tourism, and 5,700 on sustainable tourism.

While the literature on volunteering generally has grown extensively (e.g., Smith 2016), a sociological inspection of tourism volunteers has been largely lacking. While one might expect to find that research in volunteer tourism is part of the wider discourse on volunteering and the nonprofit sector, this has not been the case. Instead, papers on volunteer tourism are predominantly published in tourism and service sector journals. This chapter will hopefully act as a catalyst to a wider and more collaborative discourse that will cross the boundaries between volunteering per se and volunteer tourism.

Volunteer tourism appears to have emerged in advanced industrial societies, at least in part, due to the *time poor* phenomenon: individuals are working longer hours than ever before, with less discretionary time at their disposal. They have less time in their daily lives to participate in established volunteer programs in-country that may require a commitment of one to two years. As a result, there has been an increased desire to use holiday time to participate in humanitarian and ecological projects. Originally, not for profit volunteer organizations designed projects that focused on serving communities in need, but now, opportunities to engage in a volunteer tourism experience seem to be endless. Projects on offer are wide ranging, including cultural/historical restoration, education, conservation, wildlife, sport, ecological, health, medical assistance, journalism, and archeology While these projects are offered all over the world, projects to developing countries still dominate the marketplace. Despite the variety of project types and locations, there is a common rhetoric surrounding volunteer tourism that centers on transforming societies, engaging in poverty reduction and working toward long-term sustainability.

D. Key issues

Not surprisingly, the rapid expansion of volunteer tourism has resulted in a range of issues surrounding the aforementioned discussion. In this section, we address ourselves to seven key issues. In this way, we can view volunteer tourism outside the restricted framework of commercial and industrial activity within which much of its discourse is presently confined.

1. What does volunteer tourism involve and where does it take place?

In their research, Callanan and Thomas (2005) found that generally volunteer tourist sessions were short term, with the majority lasting less than four weeks. International volunteer tourism generally aligns itself with ideas of development and humanitarian aid. Wearing (2001a) suggested that these could

include, but are not limited to, scientific research (wildlife, land, and water), conservation projects, medical assistance, economic and social development (including agriculture, construction, and education), and cultural restoration.

Volunteer tourism and travel volunteering have become global phenomena, with future market predictions indicating growth in size and value (Mintel 2008; Tourism Research and Marketing [TRAM] 2008). While the global tourism market has slowed, the volunteer tourism, travel volunteering, and gap tourism markets appear to be more robust and still flourishing (Lee and Woosnam 2010). Despite this positive outlook, UK organizations indicate that their numbers are stagnating, because of the proliferation of companies in the sector. Mintel (2008) estimated that this market reached USD 150 million in 2006. TRAM (2008) maintains that "the total expenditure generated by volunteer tourism is likely to be between £832 million ($1.66 billion) and £1.3 billion ($2.6 billion)" (p. 42) "with a total of 1.6 million volunteer tourists a year" (p. 5).

2. How is volunteer tourism related to public policy?

Since the 1980s, there has been growth of new forms of tourism, which are small in scale, independent, and potentially self-sustaining.[1] These niches were seen as sharply different from the conventional mass packaged tours made popular in the 20th century.[2] Based on the principles of sustainability, Pearce (1992) saw these two forms of tourism as polar opposites. Nevertheless, the critique of alternative tourism forms made most recently by Butcher and Smith (2010) argues that in many instances alternative forms of tourism are no better than mass tourism in offering sustainable solutions. Moreover, all forms of tourism hold potential for negative impact on both the environment and the host communities. Brandon (1993:134) has argued that "ecotourism has led to numerous problems rather than provide the substantial benefits that may have been intended." The reason behind this is that the amount of communication and contact between tourists and the host community is much greater (e.g., Macleod 2004). Consequently, the debate is no longer about mass tourism and alternative forms of tourism as polar opposites. Rather, all forms of tourism should work toward sustainability, for it has the potential to minimize their deleterious impact (e.g., Wearing and Neil 2009).

Weaver (2012), among others, views this as *convergence* and believes this is the route to a broad tourism framework (as opposed to a narrow mass or alternative framework). Undoubtedly, much of the tourism sector now embraces sustainability as a principle and has changed its management and operational practices accordingly. Nonetheless, as a sector it has been slow to engage with sustainability. What we must bear in mind about this rhetoric is the growth and dominant power of package holidays, multinational chains, and global tourism networks, which are still very much in evidence.

So, has there really been a fundamental shift in the tourism sector or just a blurring of boundaries? Weaver (2007) indicates that many tourism organizations have adopted an incremental, adaptive, paradigm nudge rather than a transformational paradigm shift.[3] Furthermore, Mowforth and Munt (2003) caution that sustainable tourism is not always an appropriate solution, pointing out that sustainability is "socially and politically constructed and reflects the interests and values of those involved" (p. 18).

As a result of increased media and academic attention, volunteer tourism has come under the spotlight, with critics arguing that volunteer tourism is just another form of commodification, displaying all the signs of mass tourism market. Furthermore, while volunteer tourism is discussed as part of the sustainable tourism development paradigm, the evidence to support such a supposition is limited. That is, it appears as case studies focused on a single dimension (or impact) at one moment in time. For volunteer tourism to be considered sustainable, it must be measured according to the three basic criteria for evaluating sustainability: economic, social, and environmental. Each of these has, however, its own methodologies and requires certain capabilities. Moreover, the tools, methodologies, and capabilities that comprise a holistic approach to evaluating the combined social, economic, and environmental contributions are still in their infancy.

3. What challenges are being faced by volunteer tourism?

One main challenge is the tendency toward commodification of volunteer tourism (Godfrey and Wearing 2012). This is a complex process. The volunteer tourism market may offer substantial business opportunities, but the organizations involved are different from other businesses in their goals and objectives, and subsequently their evaluation. In addition, it is difficult to find common ways to investigate such a wide spectrum of organizations engaged in the business of volunteering (e.g., NGOs, INGOs, for-profit enterprises, church groups, international agencies, and now broker organizations). There is also a movement toward more economically efficient models. This includes organizations that provide a *cradle-to-grave approach*; they are responsible for the volunteer from point of departure to return home. Other organizations privilege the *Harvard supply chain model*, where the entire process is outsourced and divided into segments handled by different organizations. The Harvard model has been touted as the more efficient and effective, but there is yet little evidence to support this. A major criticism of this model is anchored in a concern with the lack of sustained, meaningful, two-way engagement with communities benefiting from volunteer projects. Segmenting the volunteer travel process across a variety of providers could jeopardize the crucial interaction between the destination community and volunteer tourists.

Many commercial volunteer tourism organizations advertise to potential volunteers the benefits to be gained by purchasing the experiences being offered. Nonetheless, these organizations need to understand what attracts the volunteer tourist, which is a challenge, since volunteer tourists are not a homogeneous set (e.g., Andereck et al. 2012). The good news for volunteer tourism organizations is that although there are differences across studies, most found altruism to be a common, major motivator.

Another challenge revolves around consideration for the host community. The nature of the volunteer tourism experience is such that volunteers work in collaboration with members of the community, usually in developing countries. In fact, it is often argued that interaction between host and guest is more profound in volunteer tourism than in other forms of tourism (Zahra and McIntosh 2007). Stoddart and Rogerson (2004:317) note that "volunteer tourists are 'new tourists' in search of an experience which is beyond that offered by mass tourism." The experiences in volunteer tourism are, compared with traditional tourism, seen to be more meaningful between the players of different cultural backgrounds. Therefore, volunteer tourism is aligned with a wider range of values and behaviors than mainstream tourism. It has degrees of altruism and conservation of community benefits and development. Volunteer tourism generally attempts to act positively for both the environment and the host community. This makes the host communities that participate in volunteer tourism with their input and interaction an even more essential part of volunteer tourism than in mass tourism.

Research focusing directly on the host community includes the following. Clifton and Benson (2006), in a case study in Indonesia, explored the socio-cultural impact on and economic benefits to host communities. Higgins-Desboilles (2003) investigated the possibility that tourism might contribute to the socio-cultural development of Australia and foster social justice and reconciliation within the divided society of indigenous and non-indigenous Australians. Singh (2002) reported a case study in the Himalayas. It examined the interrelationships that developed between host community residents and volunteer tourists (cited in McGehee and Andereck 2008). Most recently, Zahra and McGehee (2013) focused on the impact of volunteer tourism on a host community in the Philippines using a community capitals perspective. The following themes emerged from these studies: (1) increasing local residents' sense of pride in their culture; (2) causing economic change, including income generators, income leakages, and dependency; (3) satisfying curiosity of the *other*; (4) reinforcing stereotypes; and (5) rationalizing poverty.

In sum, there is generally widespread community support for volunteer tourism (Gray and Campbell 2007). One main reason for this is that the community does not view the actors as tourists but as volunteers. Therefore, the volunteer tourist experience is not commodified. And the experience fails to

bring with it the negative environmental impact and loss of local control that usually accompanies traditional tourism. This is supported by Devereux's (2008) study in Cambodia, which showed that locals appreciate volunteers' attempts to understand them through face-to-face interaction (see also research by Higgins-Desboilles 2003 and Clifton and Benson 2006).

4. What motivates and triggers individual involvement?

Lacking a published, quantitative, research profile of the volunteer tourist, we must create a composite one from existing research. Thus, women are generally more likely to participate in volunteer tourism than men (e.g., Stoddart and Rogerson 2004). Some researchers found that the majority of volunteer tourists are between the ages of 35 and 44 (Brown 2005), though the age range runs from early 20s to senior citizens (e.g., Coghlan 2008). It appears that they come from a variety of walks of life and that their education levels vary, but with most volunteer tourists having earned a university degree (McGehee 2002; Stoddart and Rogerson 2004). They may be professional, retired, managerial, trade or service work, students, civil service, medical, financial, or homemakers (e.g., Coghlan 2008). A minority of these volunteers also volunteer in their home communities (e.g., McGehee et al. 2009). Many have international travel experience (McGehee 2002).

A question often asked when examining the impact of volunteer tourism programs is whether such tourism is (1) providing the opportunity for an individual to have a narcissistic holiday, (2) enabling a deep exploration of oneself through learning about other people and cultures, (3) facilitating sincere altruism, or (4) a combination of these. In general, research reveals the presence of overlapping motives subject to change across time and place. It suggests that the volunteer tourist is motivated to serve for a variety of reasons, some altruistic, some egoistic. For example, Wearing (2001b) found seven motivational categories explaining why individuals choose to participate in volunteer tourism: altruism, travel and adventure, structure of program, right time and right place, personal growth, cultural exchange and learning, and professional development. Work by Benson and Seibert (2009) and Brown (2005) produced a similar list. Yet, in their large-scale study of *potential* volunteer tourists, Andereck et al. (2012) found five clusters of respondents. While they were similar in some ways, including interest in altruism, they differed in their desire to find adventure, spend time with other volunteers versus the community, and experience cultural immersion. So, whereas the study of volunteer tourist motivation is still nascent, one trend does seem to hold: altruism and self-interest are common dispositions there.

What in detail is this motivational pattern? Some research has found that altruism was the key motivation of volunteer tourists; others argue that altruism is an aside to the personal gain that can come from the experience. In addition

to the aforementioned research, Callanan and Thomas (2005), among others, concluded that volunteer tourism is an altruistic pursuit. Still, many authors disagree with this proposition. For example, Hustinx (2001:65) states that "volunteers are not 'born altruists'; they can adopt any position on the continuum between pure altruism and pure egotism."

These authors argue that the classic altruistic, self-sacrificing approach to volunteering is being replaced with a self-interested search for fulfillment and identity (Hustinx 2001; Rehberg 2005; see also Smith 1981). This interplay of altruism and egotism stands out among the most predominant and oft-studied volunteer to developing countries: the young Western traveler. It appears that many seek self-discovery (e.g., Lepp 2008), change in values and beliefs (e.g., Jensen 2003), and "cultural identity transformation" (Jensen 2003).

Turning to another motivator, travel is frequently embraced as a means of satisfying curiosity and accumulating experiential knowledge of the *other* (Matthews 2008). Locals are constructed as anchor points for an experience; they remind travelers of their location and ensure the latter that they are not simply set loose in an increasingly homogenized world. Elsrud (2001) argued, however, that backpackers and independent travelers are concerned with otherness as authenticity, but only in so far as it affords increased status or cultural capital. To create common bonds between volunteer tourists and their host community, the voice of the other must be heard. Otherwise, these tourists risk falling into mere sightseeing, curiosity, objectification, inferiorization (i.e., seeing or creating inferiority), and exploitation (Wearing 2002).

5. What are the main factors influencing success and impact in volunteer tourism?

A number of studies in volunteer tourism have examined at the community level the economic impact of volunteer tourism. Clifton and Benson (2006) determined that though limited in duration due to seasonality, *research ecotourism* (i.e., volunteer tourism) still spawned income-generating activities within the host community. Examples of income generators included direct employment of local residents, rental accommodations for the volunteers, and sales of handicrafts and food. Nevertheless, the number of local residents able to benefit economically from the presence of volunteer tourists depended on the assets or personal skills of the former. For instance, direct employment most often required competence in English or boat-handling skills. Additionally, only local residents who owned their homes could collect rent from participants. Selling handicrafts and food was open to the greatest number of residents.

In contrast, Zahra and McGehee (2013) found the host community to be indifferent to financial capital, sometimes even experiencing income leakages related to the presence of volunteer tourists. Interviews with local residents revealed that they would often buy a soft drink or cake to express appreciation

to a volunteer tourist. But they would not do this for their own family, being too poor to afford these items. Another example of such income leakage was the practice of community members of giving volunteers crafts they would normally sell to other tourists.

McGehee and Andereck (2008) studied two volunteer tourism organizations, one in a rural community in Appalachia (USA) and one located in an urban area in Baja California, Mexico. One theme common to the two was their potential for generating among the local residents an economic dependency on volunteer tourism. Both organizations, to preserve the dignity of local residents and mitigate dependence on outside sources, refused to give any free handouts.

6. Can involvement in volunteer tourism have a negative impact on participants?

One potential negative outcome of volunteer tourism is the reinforcement of stereotypes. While cultural exchange and learning have been found to be a primary motivate for volunteer tourists, the quality of interaction between them and host communities can vary significantly. Raymond and Hall (2008) argued that positive contact with the *other* during a volunteer tourism experience cannot be assumed to lead to long-term international understanding and respect between the two cultures. The authors noted that several interviewees implied that the positive relationships they had developed with individuals from different countries were simply *exceptions to the rule*, not a normal occurrence. International volunteering may in fact reinforce existing stereotypes, supporting the belief that the volunteers and host community have little in common (Simpson 2004). One instance tends to occur when volunteer tourists inappropriately assume the role of expert or teacher when working with the host community, regardless of their experience or qualifications (Raymond and Hall 2008). This stereotype harmonizes with the idea of Westerners as being racially and culturally superior to locals.

Another possible negative impact is the rationalization of poverty. Simpson (2004) found that volunteers commonly remark on how happy locals appear despite an absence of wealth. Interviews conducted by Raymond and Hall (2008) produced similar findings, where one participant said, "they don't know any better and they haven't had what we have so to them that's quite normal and they're happy being like that." This rationalization of poverty undermines the positive ethic commonly associated with volunteer tourism.

7. What are the main barriers or obstacles to engaging in volunteer tourism?

One obvious barrier is low income and wealth, because volunteer tourism abroad is usually more expensive than domestic tourism. And tourism anywhere is generally more expensive than vacationing while staying at home.

In addition, there are significant fees for volunteer tourism when arranged by some third-party business.

According to McGehee and Andereck (2008), the role of organized religion in volunteer tourism often seems to be the *elephant in the living room* that no one wishes to discuss. Of course, there are many secular volunteer tourism organizations having no connection to organized religion and many volunteers who practice any number of religions. Yet, were one to examine the roots of volunteer tourism, one would probably find some form of the early mission and relief work of the Catholic and Protestant Christian churches.

When it comes to religion, the relationship between the *voluntoured* host community and volunteer tourists is complex. Sometimes the relationship appears to be contradictory, as with the case of the two communities of McDowell County, West Virginia, USA, and Tijuana, Mexico. Census statistics report low levels of church attendance or association with organized religion in McDowell County (quickfacts.census.gov/qfd/states 2002), but interviews with residents reveal support for the church-based volunteers who work through local religious-based organizations, such as the McDowell Mission (McGehee and Andereck 2008).

Meanwhile, in the survey conducted in Tijuana, a culture known for high rates of church attendance and affiliation, respondents were asked to rank their preferences for the type of volunteers they would like to see in their community. Whereas it is important to note that all categories were ranked favorably, *faith-based organizations* came last, after college students, corporate teams, fellow Mexicans, and senior citizens. During interviews with Tijuanan residents, many referred to getting *the God talk*, as if this were the expected price they would have to pay in exchange for volunteer work. Interestingly, residents' lack of enthusiasm for volunteer tourists associated with organized religion does not spill over to many of the volunteer organizations that are well-established within the community but never proselytize. The common thread in the host's reactions in both communities is that acceptable organizations have permanent offices and full-time employees located in town (McGehee and Andereck 2008).

Another obstacle is the geo-political ideology of the North-South Flow of Volunteer Tourism. For almost 30 years, neoliberalism has been the ascendant political ideology and policy agenda of the Global North. This ideology has increasingly underpinned the economies and development work of the Global South. Volunteer tourism is in danger of becoming yet another form of neo-colonialism if it is unable or unwilling to move beyond the dominant hegemony that pervades the primary tourist-sending markets. North-sponsored volunteers and community-based projects face a challenge: can they find grassroots support from their national and local governments and resist *from*

below, battling thus the new fetishism of touristic commodities encouraged by free market neoliberalism *from above*?

Unfortunately, volunteer tourism could follow the model of relations between capital and labor in the West, where on-ground activities are out-sourced and capital profit is the main aim. If it does occur, volunteer tourism risks becoming a source of cheap labor for the enterprises from the North, where ineffective volunteer tourism projects lack of relevance to host communities and serve only to efficiently move the volunteer through a community and satisfy the promotion brochures. The impact of this political economy on the South's emerging sites of volunteer tourism and the resultant beneficiaries from these relations is critical. *Hard* neoliberal agendas create the necessary environment for commodification of social relations, increasing the grip of international capital (cf. Chang 2005). Volunteer tourism, if commodified, could enable the global ruling class to expand the reach of globalization into communities and individual lives.[4]

E. Usable knowledge

The voluntourism companies need to be conscious of what attracts their clients, which is a challenge, given that volunteer tourists are not a homogeneous lot (e.g., Andereck et al. 2012). In this regard, findings from research have made it clear that both self-interested and altruistic tendencies motivate these participants. Moreover, some tourists volunteer in this special way so that they may enjoy unusual personal experiences (a distinctive self-interested goal).

The nature of the volunteer tourism experience is such that participants work in collaboration with their host community – usually those in developing countries – to help achieve that group's developmental goals. It is often argued that, in the volunteer tourism experience, the interaction between host and guest is more profound than in other types of tourism. The voluntourism companies will want to facilitate this kind of interaction in ways appropriate to the local culture, but also in ways attractive to their clients.

Finally, it is also vitally important that these organizations ensure that the host community sees their client-volunteer tourists not as tourists but as volunteers. In other words, it is best to avoid commodifying this kind of tourist experience. As well, it is important to avoid as much as possible any harmful environmental impact or loss of local control, both of which frequently accompany traditional tourism.

In the final analysis, providing volunteer touristic experiences that are consonant with the spirit of volunteer tourism requires in many respects a dramatically different business approach. That of today's traditional, mainstream, commodified tourist organization simply will not do.

F. Future trends and needed research

There can be little doubt that tourism volunteering is on the rise in modern and post-modern, higher-income nations. Travel, especially foreign travel, is a frequent leisure aspiration, goal, and vacation practice for middle- and higher-income individuals and families in many developed nations of the world. As developing and transitional nations continue to develop, we may expect more people in these nations to begin to see the attractiveness of voluntourism.

We also see some areas needing research. One is that of volunteer tourism and corporate social responsibility (CSR). While much of the CSR program falls under mainstream volunteering and philanthropy, the relationship between organizations offering volunteer tourism opportunities and organizations seeking to engage in CSR activities seems to be growing. These partnerships appear to be a *win-win* situation, since the corporation has an opportunity to engage in CSR activities while the volunteer organization furthers its aims and objectives. For example, the Earthwatch European office has in the past been particularly successful at developing corporate partnerships. As part of this ongoing strategy, it became one of the "HSBC Climate Partnership" partners in a project worth USD 100 million over a period of five years.[5] The project consisted of HSBC employees (in total 2,200 employees) from across the business spending two weeks at one of the five Regional Climate Centres set up around the globe to carry out field work to establish the health of the forests. The HSBC suggests that this equals 63,000 days of volunteering time. While this example is shown in a positive light as indicated by the online reports, it is too early to tell the extent to which these types of projects will become the norm.

A second area for research is government and national-level involvement. According to Benson (2011), limited research exists on the extent to which government acts as passive recipient, active facilitator, or some combination thereof. Without discourse and empirical evidence, it is difficult to engage in meaningful discussion on the issue. There is a growing number of worthy initiatives, but the extent to which they will be taken up by other countries is unclear.

A third area needing research is how the motivations and influences on volunteer tourism are similar to and/or different from similar factors affecting formal volunteering. Most research on voluntourism makes little or no attempt to understand how such leisure activity fits with more standard types of volunteering, with other types of leisure, or specifically with the Leisure General Activity Pattern (see Handbook Chapters 4 and 5).

G. Cross-references

Chapters 4, 5, 10, 30, 34, 49, and 52.

Notes

1. Examples of new forms of tourism include: responsible tourism (Wheeler 1991); ecotourism (Wearing and Neil 1999, 2009); new tourism (Mowforth and Munt 2003), and alternative tourism (Mieczkowski 1995).
2. Mass tourism can be characterized as a standardized, rigid package with no flexibility, mass marketing to an undifferentiated clientele, consumed en masse and with little regard for the effects on the destination or host communities.
3. As might be represented, for example, by *slow travel* (see Dickinson et al. 2011).
4. We also note the recent literature that points to the complex issues of indigenous and grass roots tourism across rich and poor countries (Butler and Hinch 2007; Connell and Rugendyke 2008).

Online and Virtual Volunteering

Helen K. Liu (USA), Yvonne D. Harrison (Canada), Jackie J. K. Lai (Hong Kong, China), Grace L. Chikoto (Zimbabwe), and Karina Jones-Lungo (El Salvador)

A. Introduction

The advent of information and communication technologies (ICTs) has transformed conventional in-person volunteering on-site into online volunteering and civic participation at a physical distance. This chapter reviews online volunteering in terms of what, where, when, who, and why. Through four cases, namely Online Volunteering (United Nations), VolunteerMatch, Virtual Volunteering Projects, and GoVolunteer, this chapter proceeds to explore the nature, scope, context, type of work performed, demographics, and motivations of online volunteers. It concludes that online volunteering will continue to increase for its cost-effectiveness but at the expense of time and operational cost in adopting ICTs. This chapter concludes with the future trends of online volunteering.

Traditional definitions often identify volunteers as those who donate their time for the common good, to help someone, or participate in some organization without full financial remuneration (Bussell and Forbes 2002), without coercion, and for recipients outside their own household and immediate family. The definition in the Handbook Appendix is similar. Volunteering work may include facilitating the goals and development of a nonprofit organization, in any community that focuses on social, cultural, or even political concerns.

The recent development of information and communication technologies (ICTs) has opened up new platforms and contexts for volunteering, apart from the conventional in-person, on-site pattern. While in traditional volunteering, each step of the process is executed through face-to-face interaction, it is now possible to search for volunteer opportunities, select an organization for which to volunteer, and perform specific types of work at a physical distance from the organization through modern ICT tools. Many leaders believe that the use of ICTs will increase the efficiency of the volunteer management process and

of the supply of volunteers, including people from the ICT community, youth, and those who are out of the workforce or who face time and travel restrictions.

Recent books on the topic include those by Adams and Smith (2008), Kollock (1999), Rheingold (2000), and Song (2009). Also available are a number of book chapters (Murray and Harrison 2005, Harrison and Murray 2007; Leigh et al. 2011), journal articles (Brudney 1999; Harrison, Murray, and MacGregor 2004; Peña-López 2007), research reports (Murray and Harrison 2002), and practical guidelines on how to develop and manage this type of virtual volunteering (Ellis and Cravens 2000). Characterized by low cost and elimination of the requirement of co-presence, this chapter synthesizes the growing literature on virtual volunteering with regard to the nature, scope, context, and type of online volunteer work performed as well as the demographics and motivations of online volunteers. The main focus here is on service volunteering, rather than online advocacy volunteering, sometimes termed *clicktivism*.

B. Definitions: What, where, who, and why

This chapter accepts the general definitions of the Handbook Appendix. In addition, several key features of online volunteering are discussed. Online volunteering is also termed *virtual volunteering*, as a synonym.

1. What

(a) *Taxonomy of online volunteering.* Various terminologies have been used in a taxonomy of online volunteering. Similarly, the United Nations defines the term *online volunteer[ing]* as "tasks completed, in whole or in part, by a person via the Internet from a home, work, university, cyber café or telecenter computer" (United Nations Volunteers 2004). The Virtual Volunteering Project, one of the first few major initiatives in the area, adopted the term *virtual volunteer* to describe the person who completes "volunteer tasks, in whole or in part, via the Internet and a home or work computer" (Cravens 2000). Another commonly used term is *cyber-volunteer*. The prefix of *cyber-* suggests a loose connection between volunteering and computer use, based on the term *cyberspace*, which is used to refer to the content of the World Wide Web (WWW). Other similar terms include *e-volunteers*, *tele-volunteers*, and more recently, *micro-volunteering*. The latter is volunteering through smart phone technology and social media applications (Paylor 2012). These terminologies reveal the divergence in conceptions of online volunteering in terms of scope and labeling.

(b) *Types of online volunteering.* Peña-López (2007) identified four major types of involvement in online volunteering, namely online advocacy, online assessment and consultancy, online-offline volunteers, and pure online volunteers.

(i) Online advocacy concerns campaigns via the Internet that promote political change or foster human rights. Specifically, the online platform has been distinctively used as a new means to promote political plans and ideas (Liu 2016). The tactics of protesting online are manifested in four main forms, including petition, boycott, email campaigns, and letter-writing campaigns. Some have suggested that the increasing availability of online activism (sometimes referred to disparagingly as *clicktivism*) may lead to the emergence of a "digital repertoire of contention" (Earl and Kimport 2011). A review of the literature suggests that online advocacy of the micro-volunteering kind, where volunteers use mobile devices to donate their time or money to causes in which they believe, is the most prevalent (see Paylor 2012). Examples of this type of volunteering can be found in recent social and political movements (e.g. Arab Spring, Occupy Wall Street), election campaigns (e.g. US President Barack Obama's 2008 and 2012 election campaigns), and disaster relief efforts (e.g. Hurricane Katrina and the Haiti earthquake).

(ii) Online assessment and consultancy is the second type. Online portals or forums allow people to seek assistance and advice from those who have expertise or knowledge-information specialties of a particular kind. While some platforms contribute to nonprofit goals, others simply provide room for cooperation. By commenting on and giving feedback regarding enquiries, volunteers, in this sense, are of a reactive kind. Because the expert volunteers may gain social recognition, this type of online volunteering helps to build a knowledge network that is flexible, immediate, and far-reaching. The advantages are more obvious where the portal is cross-disciplinary or transnational and where it is within everybody's reach.

(iii) The third type of online volunteering is to have online volunteers for *offline* projects. As jobs are increasingly virtual, offline volunteers may be converted into online volunteers when they are allocated roles or when they work at jobs that use ICTs online. Such a transition from in-person volunteering to online volunteering moves on-site volunteer work to home and very often reduces the time and problems associated with traveling.

(iv) Pure online volunteering is the full version of volunteering that takes place on the WWW. For instance, through Internet interaction, a team of people would conduct online projects. By extending the recruitment of volunteers online in addition to allocating online responsibilities, as in the second and third types of online volunteering, online volunteers eventually take up more responsibilities than the relatively passive offline activities. While this model may hint at the future

development of online volunteering, currently online assessment and online-offline projects remain the most common forms of online volunteering. Empirical research from Canada suggests that it is the least common type of online volunteering (Crompton and Vézina 2012; Murray and Harrison 2002b, 2005).

(c) *Expanded typology of virtual volunteering.* In addition to the use of ICT to perform work, Murray and Harrison (2002) included another aspect of the volunteer process in their typology of virtual volunteering in Canada – those who use ICT to find volunteers or to look for volunteer work. They found that a very small percentage (4%) of traditional on-site volunteers actually use ICT to find volunteer work, with significantly more (18%) using it to perform it. In a study conducted prior to the 2010 national survey of volunteering in Canada, Crompton and Vézina (2012) reported similar findings, with volunteers using ICT more often to perform volunteer work (25% in 2010, up from 20% in 2004) than to search for it (14%, up from 8% in 2004).

   While the use of ICT to find volunteer opportunities among the Canadian population of volunteers is low, Murray and Harrison (2002) found that the use of the Internet and Web-based recruitment applications to search for volunteer opportunities was very high, although very few prospective volunteers were landing jobs through them (only 5%). Of the volunteers who did land jobs, 65% went on to perform their jobs using some combination of online and offline work. These findings support the assertion that Veenhof et al. (2008) made about Internet users in Canada, that is, those who spend time online tend to be "civically and socially engaged using the Internet to find out about opportunities and make contact with others" (p. 4).

2. Where

To summarize, four broad conclusions can be drawn from the research on virtual volunteering in Canada:

  (i) The demand for virtual volunteering as a means of finding work among those who already have a volunteer position is low;
 (ii) ICT's promise to reach a new supply of volunteers who are looking for ways to engage civically is high;
(iii) Most virtual volunteering that goes on in nonprofit and voluntary organizations involves a blending of online and onsite work; and
(iv) Pure virtual volunteering where people use ICT tools to find and to perform volunteer work in isolation is very rare (i.e. at a physical distance from others).

Volunteer activity can be a single act or a continuous pursuit. Many online volunteers work from their homes. While some agencies prefer to set up their own websites and recruit volunteers online, a number of volunteering matching sites have been developed to bridge agencies and prospective volunteers. These opportunities spread across areas including religion, human services, education, health, arts and culture, and youth development.

(a) *Individual Nonprofit Agency Use*. Internet solicitations provide a new means for agencies to recruit volunteers. Many agencies today have their own websites for requesting money donations and assistance from volunteers. The quality of work and the dependability of volunteers who are recruited online are usually found to be similar or higher than the quality achieved via traditional means (Murray and Harrison 2002). However, agency gains so far are only modest. The fact remains that online volunteers are an insignificant proportion of the total population of nonprofit agency volunteers (Finn 1999; Crompton and Vézina 2012). Despite increases in Internet technology, nonprofit and voluntary associations continue to depend on the work of on-site volunteers.

(b) *Online Volunteering Sites*. Online volunteer-matching sites are emerging. They usually help to match people who are searching for volunteering work or roles online with nonprofit or other agencies that are recruiting volunteers. Prominent sites include *Online Volunteering* (United Nations), *Volunteer Match*, *Virtual Volunteering Projects*, and *GoVolunteer*. Some provide more specialized volunteer roles or tasks instead of providing the full range of volunteer roles and tasks. For example, *Just Volunteers* is a hub for volunteers specifically in the criminal justice area, while *ServeNet* aims to provide volunteering opportunities for youth

Many of these online volunteering sites are connected with international communities and offer volunteering opportunities worldwide. The United Nations-initiated *Online Volunteering* calls for participation in volunteer initiatives that mostly seek to remedy political turmoil, crises, and natural disasters. *Nabuur* is another example that serves as an international online platform linking volunteers with local communities in Africa, Asia, and Latin America. Internet links to sign online petitions are also available.

The work assigned to online volunteers mostly involves creating or managing websites for nonprofit organizations, including larger associations. Other common types of work include desktop publishing, performing online research and project management, providing technical assistance, policy analysis, language translation, fundraising, and online marketing and advocacy campaigns (Cravens 2000; Murray and Harrison 2002, 2005).

(c) *Online communities or discussion groups.* Online communities and discussion groups are major arenas of online volunteering. Cases have shown that both implicit and explicit volunteers create social capital that provides the key to online communities' success. In a study of the Internet Chess Club, volunteers were found to strengthen the group's core tenets and also to improve its website software features as well as to provide a critical buffer among sub-communities within the association (Ginsburg and Weisband 2002).

   Reviews of research have further proposed that online discussion groups are a product of the combination of their respective structural and social dynamics. The availability of resources changes communication activities, which, in turn, differentiates coping strategies. As a result, the attraction and retention of members in these associations are affected (Ridings and Wasko 2010).

   One must note that online volunteering is not necessarily isolated from on-site volunteering as previously mentioned. While the Internet serves as a platform to form new social connections with other volunteers and host agencies, the geographical location of the groups or organizations may affect why people initially choose them for volunteering. Older online volunteers tend to combine interaction on the Internet with physical visits to the host agency or association (Mukherjee 2011). This fits with the two-pronged approach to build social capital with both face-to-face and virtual interaction, as Putnam (2001) suggested. The relationship between the agency or association's geographical site and individual engagement in online volunteering is nonetheless often ignored.

3. When

The concept of *time* takes a different shape and meaning in the context of online volunteering. In the same way in which it can be argued that the *space* where volunteerism takes place has been redefined, as mentioned above, a major characteristic that distinguishes online volunteering from its face-to-face counterpart is the maximization of time as a valuable asset.

   (a) Online collective volunteering expedites team interactions at the convenience of each team member, thus maximizing the scarce time of busy contributors. Creation of a (face-to-face) meeting frequently demands a tremendous amount of logistic coordination since both parties have to be physically present at the same time and at the same place, while on the Internet messages can be sent by email, and participants can read and send messages at their own convenience (Amichai-Hamburger, 2008). Furthermore, volunteering over the internet is an attractive alternative for individuals who dispose of limited time and schedule to serve. Ana Maria DaSaravia (2005), an online volunteer from

Brazil who translates diverse research work on street children in Latin America from Spanish into Portuguese, describes her online volunteering effort: "It has opened my eyes to the many apparently small contributions a common citizen like myself can make in her spare time, from the comfort of her home" (http://www.onlinevolunteering.org/stories/story_det.php?id=1401). While at certain occasions it may still be advisable to convene members of the virtual volunteering team for a direct interaction, either over the phone or face-to-face if feasible, project continuity and follow up can easily be enabled over the internet.

(b) Online volunteering eliminates travel-commuting time, while delivering real-time services. Knowledge transfer is an area that has enormously benefitted by the elimination of time and space barriers. In the past, teaching or mentoring remote communities in developing countries was impossible unless the individual with the knowledge had the willingness and time to travel to the destination in need. Nowadays online volunteers, or e-mentors, connect through the Internet with trainees or mentees in distant locations. One example is CUSO International that recruits virtual volunteers from all over the world to work with mentees from countries such as El Salvador, Guatemala, Honduras, Nigeria, Ethiopia, Cambodia, and Indonesia, among others.

(c) Online volunteering enables the provision of services 24 hours a day, seven days a week. One example is the National Sexual Assault Online Hotline (NSAOH), an innovative model using volunteers to deliver sexual assault crisis services through an online hotline. Use of online services provides volunteers as well as users with 24/7 access to services and eliminates geographic and time barriers to participation (Finn and Hughes, 2008).

It is well known that the most valuable asset is time. For that reason, online volunteering, e-mentoring and e-volunteering are the wave of the future for busy professionals (Ensher, Heun, and Blanchard, 2003; Amichai-Hamburger 2008).

4. Who

The online context of volunteering requires a re-examination of the traditional understanding of who are volunteers. Online volunteering enables people to do volunteer work anywhere with computers and opens the door to volunteering for those who are prevented from volunteering by different time constraints, physical and physiological limitations, and personal obligations (Ellis and Cravens 2000; Murray and Harrison 2002, 2005).

While female volunteers are usually more active in the conventional offline nonprofit agency setting (Wymer 1998), the percentage of male volunteers is substantial in online volunteering studies, particularly in those with a technology focus. For instance, in an applied distributed-computing environment, such as MalariaControl.net, more than 80% of the online volunteers were males (Krebs 2010). However, the research on virtual volunteering out of Canada

suggests that women use the Internet to search for volunteer opportunities more than men do. Virtual volunteering also varies by age, education, and employment status. Compared with traditional volunteers, virtual volunteers in Canada tend to be young, educated, and unemployed (Murray and Harrison 2002, 2005).

Most online volunteers are in their 20s or 30s. They often participate in projects such as *Virtual Volunteering Project* and *BOINC* (Cravens 2000; Krebs 2010), thus making them younger than the average in-person volunteer. Some academics argue that older adults are generally passive consumers of information technologies and would be deterred by unfamiliar Internet technologies (Czaja and Lee 2007). Others consider physical distance between the volunteer and the on-site volunteering venue as a major barrier that contributes to high dropout rates among older volunteers, and thus, they remain optimistic about the prospect of elderly participation in online volunteering (Mukherjee 2011). In fact, while some may only participate in online volunteering due to its virtual interface, many combine interaction online with prospective physical visits to the host agency. Nonetheless, older adults face a different set of barriers to online volunteering than do younger people, such as convoluted website interfaces, small font size, and poor machines.

One's initiative to volunteer is closely linked with the volunteering experience of one's friends and family, as well as one's own prior volunteering experiences. With in-person volunteering, young people whose parents habitually volunteered have a higher chance of volunteering (Shure 1988). A similar tendency exists even when volunteering is done online. In one study, many people who were online volunteers for an agency already had a family member or friend working there (Cravens 2000). At the same time, elderly online volunteers have reported being introduced to online volunteering by their adult children (Mukherjee 2011). Online volunteers may also be completely new to volunteering (Murray and Harrison 2005).

5. Why

Motivations for online volunteering differ in various contexts, but altruism has played a significant role. For projects with specific foci, volunteers primarily get involved for a particular cause and/or for the desire for solidarity or sociability (Krebs 2010; see Handbook Chapters 30 and 31).

The case may be slightly different for open-source initiatives. Wikipedia volunteer administrators seem largely driven by motivations to learn and create, and at the same time, they desire to create a public repository for all knowledge. On the other hand, gaining social prestige or powerful qualifications within online communities often ranked lowest among the reasons for which people got involved (Baytiyeh and Pfaffman 2010). Some research has suggested a distinction in motivational goals between software contributors and

content contributors. While content contributors have altruistic motives, software contributors put greater emphasis on gaining a reputation and enriching themselves (Oreg and Nov 2008). Individuals have demonstrated their willingness to contribute when their uniqueness was recognized and when they were given specific and challenging goals (Ludford, Cosley, Frankowski, and Terveen 2004). Thus, socially rewarding techniques based on uniqueness and dissimilarity may be manipulated to increase online participation (Hoisl, Aigner, and Miksch 2007). It is also the case that those who search for and perform their work online are motivated to volunteer to find paid employment (Murray and Harrison 2005).

C. Historical background

If we embrace a broad notion of online volunteering, as suggested, online volunteering may be as old as the Internet itself (Cravens 2000; Peña-López 2007), which means that such volunteering only goes back about two decades. However, there is evidence that the development of the WWW in 1994 has produced a new supply of volunteers and types of volunteer positions (Murray and Harrison 2002, 2005).

A recent trend of adopting new technologies, such as wiki and the interactive Web, has emerged as a solution to resolve complex issues. Web 2.0 technology allows individuals and organizations to utilize the "wisdom of the crowd" (Surowiecki 2005) and to create a new mass collaboration trend in producing services and products, sometimes called "co-production" (Tapscott and Williams 2008). Online volunteerism emerges in this recent historical context. Cases such as Wikipedia, Linus, and InnoCentive have shown how those mass collaborations in production fundamentally change the current world through openness, peering, sharing, and acting globally (Tapscott and Williams 2008).

D. Key Issues

1. Current state of online volunteering

While online volunteering encompasses volunteering in cyber-groups (virtual associations), service programs in nonprofit agencies, and online activism, it is extremely difficult to ascertain the population size of current online volunteers. This is especially problematic as numerous volunteering websites operate independently on both a global, national, and local level. Nevertheless, despite its huge potential to bring in a new supply of volunteers, the study by Murray and Harrison (2002) revealed that among prospective volunteers who were actively looking for volunteer opportunities through the Internet, very few were recruited through it. The problem, as they reported, is not one of a lack of supply but rather one of a lack of demand to bring online volunteers into Canadian

volunteer programs. A study in early 2000s based on Volunteer Canada, an online platform that promotes Canadian volunteerism, revealed that online volunteering was quite infrequent relative to all volunteering. Volunteer programs with managers of volunteer resources who had been serving in their roles more than five years were particularly at risk. Other factors associated with effective online recruitment tool use were managerial attitudes toward ICT; involvement of managers in the design, development, and evaluation of ICT (i.e. online recruitment tool); and experience with ICT in volunteer management work directly or indirectly [e.g. experience of others] (Harrison and Murray 2007).

There is no single model or type of group or agency using online volunteers. In fact, neither the features of organizational sector, size of budget, size of volunteer programs, and money spent on IT in the volunteer program, nor the extent of formal policies and guidelines on IT matters, were found to have a significant association with the use of online volunteers (Murray and Harrison 2002). However, a significant portion of nonprofit agencies involving online volunteers had a specific technological focus, most commonly building community networks and free-nets, as part of their mission (Cravens 2000).

Non-governmental organizations (NGOs) often face major shortages of labor and various resources, and thus, are usually most in need of online volunteers. The range includes NGOs that work on specific community goals persistently all the way to spontaneous groups formed during crises. Many international institutions also actively recruit volunteers online through global volunteering sites such as *OnlineVolunteers*, *Nabuur*, *Hacesfalta.org*, and *Global Volunteer Network*. Volunteering tasks in service programs primarily focus on computer-related applications, such as desktop publishing and website development and maintenance (Bussell and Forbes 2002; Murray and Harrison 2002). Yet research, writing, and editing are also listed as common tasks for online volunteers. Direct service delivery, database management, volunteer management, social media communications, lobbying, and consulting are also included (Murray and Harrison 2002).

Engagement in volunteering in cyber groups is more dynamic and context-dependent in nature. Often, volunteer effort involves increasing ties and personal relations with other community members; socializing new members to shared norms, expectations, and responsibilities; handling disputes; and administering the group. In addition, online volunteers contribute by improving software and by managing daily flows and the member database.

Nonprofit agencies using online volunteers generally mirror the same geographic distribution as the online volunteers do. In the *Virtual Volunteering Project* based in the United States, virtual volunteering seems to have taken hold, especially with agencies in Western states, such as Washington, Oregon, and Arizona. Furthermore, California, New York, and Canada were of the

highest rank in having the largest number of agencies and individuals who participated in online volunteering (Cravens 2000). Though it is far from surprising to learn that many online volunteering projects are initiated by developed countries, such as Australia, the US, and Canada, it is telling to know that more than 40% of the online volunteers under the *United Nations Volunteering Service* are from developing countries. Every volunteering site may have a very different composition of volunteering demographics. It would definitely be too hasty to generalize globally about the nationality and regional distribution of online volunteers.

2. Comparison between online volunteering and in-person or on-site volunteering

(a) Special aspects of online volunteers

Online volunteers in traditional volunteer groups were likely to spend more time volunteering than were traditional volunteers, as many may volunteer via the Internet in addition to on-site volunteering. Simultaneously, virtual volunteers were more likely to have no prior volunteer experience when compared with on-site volunteers. They are also more likely to be newer to volunteering than many on-site volunteers are. Yet, including the factors of work quality and dependability, online volunteers were found to be meeting a similar or higher standard as did their face-to-face counterparts (Murray and Harrison 2002).

While altruism is a dominant motivation for in-person volunteerism, it is particularly obvious in online volunteering, where egotistic motives such as social and psychological goals are downplayed. Reasons such as wanting to wear a uniform, mixing with celebrities, enjoying travel opportunities, and maintaining health and fitness that may motivate on-site volunteering are no longer applicable for virtual volunteering. Online volunteers in service programs are usually eager to earn recognition for their work and to learn what difference they have made (Cravens 2000). Thus, established literature has stressed the significance of acknowledgements practice such as certification upon completion of tasks and the provision of feedback to online volunteers (Ellis and Cravens 2000).

While there is much research documenting the impact of in-person volunteering on the volunteer (see Handbook Chapter 52), there is virtually none on the similar impact, if any, on the online volunteer. Lack of in-person social and emotional contact with others, including recipients, may severely limit such impacts on online volunteers. Similarly, the impact of online service volunteering on recipients, nonprofit agencies (Smith 2015b), membership associations (Smith 2015a), and the larger community and society (Smith 2017) has not been properly studied and demonstrated, unlike the situation for in-person volunteering.

(b) Contexts of online volunteering

The selection of online volunteers usually takes place individually by the organizations after receiving applications through the connecting websites. Organizations may invite volunteers that they have recruited through their individual websites or local online volunteering sites for interviews. However, for recruitment based on individual assignment, it is common practice that organizations would simply ask volunteers for more information and commence the project right afterward. The supervision of online volunteers may be performed by general staff, or by staff who specialize in volunteer resources. Yet, previous studies have found that organizations with staff who are primarily responsible for volunteers, including online volunteers, are usually more successful in managing them (Cravens 2006). However, some managers of volunteer resources are more successful in recruiting volunteers online than others are (Murray and Harrison 2002). The retention of volunteers, however, is more difficult because online assignments are primarily taken on a single task basis. Some organizations have expressed their concern about inadequate assistance on existing websites. At the same time, organizations often complain that many online volunteers are not responsive to follow-up emails or simply vanish or quit responding altogether after submitting their applications or taking up their tasks (Serviceleader.org 2000).

3. Advantages and disadvantages of online volunteering

There are many advantages of online volunteering, compared with traditional in-person volunteering. As recognized in the *Virtual Volunteering Guidebook*, this approach "allows people to complete volunteer work via a home or work computer because of time constraints, personal preference, a disability, or a home-based obligation that prevents them from volunteering on-site" (Ellis and Cravens 2000). Old people and the disabled, people who have been victims of prejudice in the traditional on-site volunteering setting, may now become online volunteers without such problems.

On the other hand, online volunteering has special advantages for nonprofit agencies and larger associations. Relatively cost-free labor has been identified as the primary reason for many organizations to involve volunteers online (Cravens 2006). However, there are the costs of recruitment, training, and supervision even when volunteers are not paid. Networking with volunteers, especially those from the global community, contributes to bringing fresh perspectives and introducing new expertise that the organization staff or association leaders do not possess. Through online volunteering, the scope of an organization's work is often enlarged to include a broader spectrum of people and experience. Online volunteering is also credited with bringing additional publicity, new funding opportunities, a high level of volunteer commitment,

and the ability to present information in a user-friendly way and in a concise format.

Nonetheless, the disadvantages of online volunteering should not be overlooked. Major disadvantages include the problem of volunteers dropping out after receiving assignments, and the time required to recruit, orient, manage, and support online volunteers. Sometimes, online volunteers want more communication and tasks than the organization can provide. For cross-border online volunteering work, organizations were also dissatisfied with volunteers who may not have spent sufficient time familiarizing themselves with the community or the organization being served. However, these disadvantages are commonly cited as disadvantages of volunteers working face-to-face as well (Cravens 2006). From a broader perspective, the impact of online volunteering remains undemonstrated, as noted above in section #2, a.

4. Challenges and sustainability of online volunteering

Online volunteering is still a new concept and practice for many nonprofit agency and association leaders, so several issues remain. It is questionable whether the new technologies really engage people who are not already participating in volunteering. Does online volunteering only provide an additional alternative for the existing on-site volunteers? Are people who show less interest in on-site volunteering more likely to participate in online volunteering? Does the old crowd of people dominate the online volunteering as always, either through an online channel or through the traditional face-to-face channel? Research in the late 1990s found that the overwhelming majority of online volunteers also volunteer in on-site settings (Serviceleader.org 2000). On the other hand, in the traditional volunteer groups, there were few fully online volunteers and mostly volunteers who did some combination of online and on-site tasks (Murray and Harrison 2002).

It has been disputed that social media allow people who want to volunteer, but do not have time, to become engaged due to the efficiency of the Internet. However, evidence suggests a demand side problem regarding the capacity of volunteer programs to make full use of the Internet and volunteer management ICT applications available to them (Murray and Harrison 2002). Given the anonymity of the Internet, previous research has encountered difficulties in identifying the demographics of online volunteers, especially their ages and ethnicities, when data can only be collected on a voluntary basis (Cravens 2000). Other research points to a new supply of younger, educated volunteers who are using the Internet pragmatically to search for volunteer work that may ultimately help them to find jobs (Murray and Harrison 2002).

Secondly, the sustainability of online volunteering should not be automatically presumed. Both volunteers and nonprofit organizations have cited lack of face-to-face contact as an important, if not the most significant drawback, of online service (Cravens 2000). Some informed research actually suggests that

the key to a successful online volunteering project rests on effectiveness of involving such volunteers in traditional, face-to-face situations also (Ellis and Cravens 2000). This points to an inherent instability in shifting volunteering online and the challenge of sustaining it.

How to stay in touch and connected in the online setting is a big challenge to both the volunteers and host agency or association. The supervision of work and progress, problem solution and crisis management, and the effectiveness of coordination are complicated by the more remote home setting of work, where prompt and timely assistance and communication may be difficult when the people involved have had little or no direct personal contact.

5. A case example: Volunteer Match

Volunteer Match (www.volunteermatch.org) is probably the Web's largest volunteer engagement network. The Virtual Volunteering Project was launched in 1996 to encourage and assist in the development of volunteer activities that can be completed off-site via the Internet. The Project was started by Impact Online (IOL), which is a nonprofit that was set up in 1994 and dedicated to increasing volunteerism through the Internet. The Project commenced with a two-year pilot phase and eventually developed into Volunteer Match, one of the most popular online databases of volunteer opportunities in the United States.

As a pioneer in online volunteering, Volunteer Match offers a variety of online services to support not just nonprofit organizations and volunteers, but also more than 150 business leaders committed to civic engagements. By March 2013, it had over 13,000 active volunteer opportunities, 91,529 participating organizations, and about 6,700,000 successful referrals since 1998. Emphasizing the building of community, relationships and partnerships, the site works with nonprofits, businesses, as well as government, and aims at creating a strong and mutually supportive community. The Project has attracted funding from 13 foundations and numerous individuals and has helped to provide more than USD 3.8 billion worth of volunteer services.

Notably, Volunteer Match has a well-established learning centre which offers over 20 free *webinars* for collaborating nonprofits. Extensive training topics cover both volunteer engagement theories and practical guidelines. A series of training videos presenting short tools have been created to assist users and familiarize them with the use of the service. In addition, books and research papers are available for further academic study of online voluntarism. Interested organizations and volunteers may access the Volunteer Resource Library, which provides a comprehensive set of freely accessible documents online.

6. Assessment of the impacts of online volunteering

Apart from the desire to get involved in a particular cause and to contribute to wider community, online volunteers, in particular those involved in open

source websites, are often motivated by constructionism or *learning by making*. Contributors themselves acquire skills by engaging in personal creation and innovations. Website design for Wikipedians, for example, empowers contributors to create something new and to overcome challenges autonomously (Baytiyeh and Pfaffman 2010). Volunteers both have fun and gain knowledge through online participation (Oreg and Nov 2008).

Needless to say, the contribution of online volunteers can potentially be invaluable to recipients of volunteer services, which the organizations would not have the resources to obtain otherwise. This is true especially in light of the cuts in welfare funding to nonprofit organizations in many nations and the constantly increasing demand to meet social needs (Lipsky and Smith 1989). Through online volunteering, the more efficient use of human resources is now possible through redistribution and high accessibility of different opportunities. *VolunteerMatch*, having successfully connected volunteer service worth USD 3.8 million, is a promising illustration of the capacity of virtual volunteering.

For beneficiary agencies, online volunteering helps to outsource tasks to willing and specialized expert volunteers. At the same time, these nonprofits relieve work demands on existing paid staff or volunteer leaders, enabling them to focus on other tasks (Cravens 2000). The input of new ideas and perspectives brought by online volunteers is widely recognized, especially on international virtual volunteering sites (Dhebar and Stokes 2008). The online platform is also useful in involving the minorities of a society, who are most in need but often dispersed geographically (Murray and Harrison 2005). In *JustVolunteers*, which concerns the rather sensitive area of the criminal justice system and supporting prisoners, the Internet empowers collaboration between nonprofit organizations and individuals who are in need of service in the criminal justice system and those who are willing to volunteer for this particular cause (Peña-López 2007).

Volunteerism has long been identified as an important form of social capital (Putnam 2000). Greater outreach through online volunteering has increased the social capital of a network with broader classes of benefits available. The connectivity with other communities and constituencies within and outside of the nonprofit sector across geographical boundaries aspires to a greater and wider conception of society and global community at large (Brainard and Brinkerhoff 2004).

Online volunteering is still very closely connected to offline, in-person volunteering today. While it is more common to use the online volunteering sites as a recruitment platform, most service delivery and other volunteering still relies on offline and on-site activities. Even for tasks that can be completed online independently, nonprofits are recommended to consider setting up occasional "live meetings by phone or on site to facilitate the teambuilding process and

incorporation of the volunteer, even if all interactions may be done by online communication" (Ellis and Cravens 2000).

The Internet is distinguished by being an ideal medium for presenting non-profit agency and association needs to a vast audience in a timely manner with low cost. Accessibility to a large population, reduction of communication time, and the resulting higher cost-efficiency make online volunteering an increasingly attractive option to many nonprofit leaders in an age of information technology. The worldwide nature of the Internet, with countless connection points, also implies a potentially great bank of human and capital resources to all kinds of nonprofits, agencies, and associations.

Nevertheless, a lack of experience and attitudes toward the efficacy of ICT in volunteerism may hinder the benefits of online volunteering (Harrison and Murray 2007). The true cost of website development and maintenance may be substantially greater than the actual benefits gained (Finn 1999). Significant staff time is spent on online activities and the staff training required may give rise to obstacles in effective communication, teambuilding, and recognition of contributions. However, when managed effectively, ICT use in volunteerism can lead to numerous benefits (e.g. recruit new supply of volunteers, increased civic engagement, and path to finding paid employment; Murray and Harrison 2005).

Where on-site volunteering is irreplaceable in providing face-to-face service, the growing trend of online volunteering opens up possibilities of delegating a substantial amount of volunteering tasks that do not require direct human interaction or creating opportunities for enhanced civic engagement. At the moment, the Internet has at least proven itself to be a powerful recruitment forum for conducting traditional on-site volunteering.

7. Conclusions

Several broad conclusions can be drawn from the research on virtual volunteering:

(a) The promise of online volunteering to reach a new *supply* of volunteers who are looking for ways to engage civically is high;

(b) Most virtual volunteering that occurs in VSPs of nonprofit organizations and voluntary associations involves a blending of online and onsite work;

(c) Pure virtual volunteering, where people use ICT tools to find and to perform volunteer work in isolation (i.e. at a physical distance from others) is very rare;

(d) The demand for virtual volunteering as a means of finding work is low among those who already have a volunteer position;

(e) Online advocacy volunteering, including social movement mobilization and participation, is probably the most important aspect of online volunteering for the future (although not treated here).

E. Usable knowledge

On a domestic level, evaluation of the Virtual Volunteering Project indicates that nonprofits have more success with online volunteering when they also involve their online volunteers in traditional, face-to-face settings (Ellis and Cravens 2000). Volunteers and nonprofits that operate online volunteering sites have pinpointed the lack of face-to-face contact as the biggest problem. Common difficulties involve infrequent response and communication by volunteer-involving organizations (VIOs). Online volunteers also complained that they do not know how their work has made a difference for the organization. While many who signed up for online opportunities are not followed-up by VIOs, volunteer managers in VIOs also expressed problems in reaching the volunteers. Many VIOs do not have a system to manage, screen, and supervise their online volunteers. In fact, having a VIO staff person primarily responsible for managing online volunteers has been found to be the key to success. It may also be necessary for VIOs to have a technology focus to guarantee achievement. On a technical level, the development of clearly written task descriptions and a good communication process for delivering assignments to online volunteers are very widely cited by VIOs as elements of success.

Findings in the international online volunteering context are similar. Successful online volunteering more often results from at least one VIO staff person being responsible for the involvement of online volunteers, being comfortable with working online, having basic experience in volunteer management, and being committed to support volunteer management. Furthermore, excellent literacy level, comfort with bureaucracy/protocol, openness to diversity of views and working styles, and having a broad understanding of *community* also have contributed to successful involvement of online volunteers (Cravens 2006).

Organizations that are embarking on online volunteering projects may refer to instruments such as *The Virtual Volunteering Guidebook* (Ellis and Cravens 2000) for detailed guidance.

F. Future trends and needed research

Online volunteering has become an increasing trend in the past decade or two. This trend is likely to continue and even increase, given the cost-effectiveness of online versus in-person, on-site volunteering. However, online volunteering has its clear limitations and costs. The research on online volunteering suggests it occurs most often in conjunction with on-site volunteering. Further, online

volunteering can only be used well with a limited set of tasks and requires nonprofit staff time and resources to be effective. It is not totally *free* and without costs to the Volunteer-Involving Organization (VIO). Very importantly, the actual impacts of online volunteering on volunteers, recipients, nonprofit agencies, membership associations, and the larger community and society remain to be demonstrated. Citing numbers of participants, volunteer hours involved, and the imputed monetary value of such donated time does not show genuine outcomes and impact, only inputs and outputs.

Currently, only limited research has explored the motivation and preferences of online volunteers among people of different demographics. The level of youth and elderly engagement, as well as variance in ethnicity, gender, age, geographical location, and education level, deserve more attention. Such knowledge is essential to recruiting online volunteers from under-represented groups among online volunteers. At the same time, more attention should be devoted to understanding the factors that influence adoption and the impact of online volunteering on individuals, for example, on employability.

The cultural dimension of online volunteering may also have a significant implication in perception and practice for both volunteers and VIOs. While current research predominantly focuses on online volunteers in Western countries, similar motivations and demographics may not apply to those from Asia, Latin America, and Africa. The change of administrative cultures within VIOs through participation in recruiting volunteers online is another under-explored area.

Ultimately, demand side challenges with regard to the capacity of VSPs and membership associations to manage online volunteering remain an inevitable question for the future of online volunteering. What are the keys to successful, long-term sustainability of an online mentoring relationship? What are the relevant qualities of the success of VIOs using online volunteers? While online volunteering experience covers a wide scope of activities, different factors may be at play in understanding and motivating volunteers to contribute in content, in software, or in taking up leadership roles in online administration. The distinctive characteristics of online mentoring, micro-volunteering, and crowd-sourcing experience may suggest very different tactics for volunteering websites and organization practice.

Spontaneous Volunteering in Emergencies

Benigno E. Aguirre (Cuba), Jesus Macias-Medrano (Mexico), José Luis Batista-Silva (Cuba), Grace L. Chikoto (Zimbabwe), Quintus R. Jett (USA), and Karina Jones-Lungo (El Salvador)

A. Introduction

Volunteering in emergencies, crises, and disasters nearly always occurs, despite being ignored by some professional emergency managers and government officials. Unfortunately, when crisis/disaster plans are written up to try to mitigate and respond to future incidents, the untrained disaster volunteer and the emergent process of which she/he is a part, is usually not included explicitly among the explicit dimensions of the plan. This is true even though the importance of the work of disaster volunteers and the resources available to them are probably unsurpassed by any of the other types of participants in the societal response. Recognized or not, much volunteer helping behavior takes place, ranging along a continuum from official actions by formally trained and certified volunteers to unofficial actions by spontaneous volunteers who operate outside the formal and planned disaster response. The inability to *manage* such spontaneous volunteering is a key reason for this neglect by emergency/crisis/disaster professionals.

B. Definitions and a typology

The general definitions in the Handbook Appendix are accepted in this chapter.

This section provides some additional definitions of terms used in this chapter. However, there is no widely accepted definition of emergency volunteers and volunteering.

1. *Crisis* (*emergency, disaster*): A crisis is a situation that poses an immediate risk to the health, life, property, or environment of a collectivity of people, and that requires some type of intervention and at times the use of outside resources.

2. *Emergency volunteer*: An emergency volunteer is a person who volunteers to assist the victims in the aftermath of a significant crisis or disaster. Such volunteers are either informal or formal. Emergency volunteering occurs at every level and in every area of community life struck by a hazard.

3. *Informal emergency volunteering* is carried out by neighbors, kin, or others near the incident and represents acts of disinterested assistance to those in need of help. Such volunteers are members of civil society rather than of organizations responding to disasters, and may be either trained or untrained to respond to the disaster-created demands.

4. *Formal emergency volunteering* is done by people, at times on the staff of organizations, who are trained to carry out specific emergency-related activities by organizations that are officially approved to respond to the disasters. The literature discusses much more frequently trained volunteering by individuals, groups, and complex organizations than the assistance performed by untrained volunteers, despite the fact that the informal volunteers are hugely significant in many disasters.

The following suggested dimensions can help us better define this field of crisis volunteering. As a *main dimension*, the proposed typology identifies the *extent of destruction* caused by the crisis/disaster incident triggering volunteer activity. This spectrum ranges potentially from accidents and minor emergencies, to complex community emergencies, to crises affecting organizations, to disasters, and then to catastrophes. Volunteering has sharply different connotations in each of these types of crises. For example, at present almost nothing is known about volunteering in catastrophes as a type of social crisis, other than to note their extraordinary destructiveness. Quarantelli (2006; see also Rodriguez et al. 2006) has argued that, in comparison with disasters, catastrophes have a much greater physical impact that curtails the effectiveness of elected officials and the means to respond to the crisis, and that may require international assistance. By way of contrast, disasters are more circumscribed incidents that often destroy the facilities of first responder organizations and that require the assistance from other national organizations that are outside the impacted areas (Quarantelli and Dynes 1977). When destruction is severe or widespread, helping responses come from more distant locations and national and other non-local governmental and international humanitarian agencies become involved more thoroughly in the societal response. Extra-local mass media, especially cable TV, socially construct the immediate and ongoing situation, during which most everyday community functions are sharply and concurrently interrupted (Quarantelli, 2006.)

The *second dimension* of the suggested typology identifies the *levels of social structure*, arranged in terms of increasing complexity from individuals, to

groups, to complex organizations, to whole communities, and even entire societies.

The third and *final dimension* of the typology is the *level of training of the volunteers.* The spectrum of possibilities ranges from emergent volunteers with no training on the tasks enacted during the crisis, to professional-skill-level volunteers who have well-established, relevant, professional identities along with appropriate specific skill sets for the tasks at hand (e.g., in public health, injury prevention, decontamination), to official volunteers who are required to act under the supervision of governmental agencies. One example of professional volunteers is paramedic squad volunteers, with extensive first-aid/responder training (e.g., Gora and Nemerowicz 1985).

The purpose of the typology is to underscore that different types of volunteers are more likely to appear in different spaces in the typology. Thus, very destructive incidents impacting an entire society will bring about much greater relative presence of international trained volunteers as well as official volunteers. By way of contrast, automobile accidents do not usually involve volunteers, and if they do, they would most probably be informal volunteers. Comparing and contrasting what is known about these types would help us more crisply and profoundly define disaster volunteering.

C. Historical background

Since emergencies, disasters, and other collective crises are as old as the human species, we will look in this section at the far more recent history of society's attempts to identify emergencies/disasters/crises and hence to better manage them. For example, some people question whether the volunteer is truly a volunteer, a worker, or a person filling an obligation of citizenship (see the Cuban case in Section D). Furthermore, there is no accepted definition of disaster. Decades since the start of the Cold War and the possibility that American cities might experience nuclear attack by the Russians, a civil defense perspective materialized. During this time (1950s to 1970s), the definition that was accepted by most scholars assumed the existence of a well-functioning community, with the hazard coming from outside the society, which for a while interrupted the normal functions of the community. Since the 1980s this definition has been challenged by, among others, scholars from Latin America. They emphasize in what came to be known as a version of the disaster management approach, the social and cultural origins of society's vulnerabilities and power differentials revealed by disasters (Maskrey, 1993). According to this newer understanding, the causes of disasters come from inside the society in the form of vulnerabilities and risks that are largely left unremedied and that at some point generate the crisis. Most recently, continuing the logic

of vulnerability analysis, scholars have emphasized the political economies of disasters and the many interactions between society and environment (Oliver-Smith and Hoffman, 1999). They argue that the traditional distinction between society and environment is false, for modern post-industrial society internalizes the environment, in effect, making it social.

In the United States, the federal government has made the American Red Cross (ARC) responsible for coordinating the activities of organizational volunteers in disasters. Nevertheless, despite the ARC's many worthwhile efforts, the difficulties it faced in the Hurricane Katrina experience show that this arrangement is far from optimal or efficient. It typically misses the very important voluntary activities of local organizations, especially local associations, and emergent groups that become active when a crisis materializes. These difficulties reappear to varying degrees in different incidents.

Given insufficient space to fully document these problems, an example based on the first author's field notes must suffice: the Federal Emergency Management Agency's (FEMA) urban search and rescue system and the difficulties it faced when trying to integrate volunteers that proved critical in its response in the aftermath of the Columbia Space Shuttle accident of February 1, 2003. Operations took place in a wilderness area, not the setting contemplated by governmental plans and previous disaster operations. This meant, in the words of one of our respondents, that "we were kind of making up the game rules, the game plan, as we went along." The incident's urban search and rescue, in what became a search for shuttle parts and human remains, covered a very large geographical area, primarily in six counties (Navarro, Anderson, Cherokee, Nacogdoches, San Augustine, and Sabine) in central Texas, a region estimated to be 160-mile long and 35-mile wide. The incident was a federalized activity, but it could not have been done without the assistance of agencies from local and state governments, professional and volunteer firefighters, and local search and rescue teams, as well as the many local churches that provided food and shelters to the searchers. Altogether, over the 90 days of operations, 20 incident management teams were brought in. The search ended in May 1, 2003, 100 days after the shuttle explosion. As our study of this response shows, very often it is volunteers – in this case, individuals, groups, and community organizations/associations and churches who are the silent heroes in the response. In these and other incidents, official disaster plans usually break down, and in their place all types of volunteers fill the gap and make things happen.

The prior example illustrates the emergent response that can naturally occur after a disaster and the variety of actors who might be involved. In this case, there were a number of governmental actors at all levels. But there were also non-governmental actors who filled the gaps in the plans, including spontaneous volunteers who at time formed emergent groups (which often, but not always, disappear after the response is over; Alexander, 1974).

Crisis and disaster situations originate from complex interactions of conditions and decisions whose combination often produce escalated and devastating effects (Perrow 1981). Due to gaps between preparation and the unfolding situation, there are emergent aspects – to a varying extent – in every crisis and disaster response. Actors must engage in *sense-making* if the gap between preparation and the situation is significant (Weick 1993). Other characteristics of response include coordinated action among governmental and non-governmental organizations (Kapucu 2006a; Kapucu et al. 2010), which are often carried out using the Incident Command System (ICS), as well as emergent groups from the civilian population (Stallings and Quarantelli 1985; Zurcher 1968)

D. Key issues

1. What motivates and triggers individual involvement?

Crisis and disaster volunteering occurs when an incident, often caused by a hazard whatever its origins and etiology, leads to disruption of established patterns and functioning of a social system. In the United States as well as elsewhere, disaster volunteering is motivated most often by feelings of sympathy and empathy with the victims' suffering. Such volunteering is implemented most frequently through personal decision-making using personal resources. Crises and disasters are also responded to by existing governmental programs that train volunteers. There are training programs that incorporate volunteers with the various agencies participating in disaster preparedness, response, reconstruction, and recovery activities. Most often, however, persons become *ad hoc,* informal volunteers due to the need to respond to the suffering of victims. Often under the guidelines of religious organizations, volunteers assist in building or rebuilding housing and other structures during the reconstruction phase of a disaster (Jeavons, 1993).

2. Where does volunteering in crisis and disaster situations take place?

The immediate response to disaster has been termed the *mass assault phase,* in which volunteers assist others less fortunate than they are. This phase is an emergent situation, involving numerous individual and organizational actors with varying degrees of experience working with each other and with varying degrees of collective planning and training for the disaster event they are all encountering. To the extent there is an absence of formal, planned, and organized disaster preparation, there might likely be a greater reliance on spontaneous volunteering in a disaster response, for emergent collective behavior occurs in most disasters.

A typology developed at the Disaster Research Center (DRC) at University of Delaware, Newark, captures the degrees of variation in the stability and change

of organizations involved in disaster response (Dynes 1970; Quarantelli 1966). Organizational response is said to involve either routine (stable) or non-routine and irregular (emergent) tasks and structures carried out in the wake of disasters. A cross-tabulation of the type of group and the type of response produces four groups or types of responders: (1) established groups, with regular tasks and old organizational structures; (2) expanding groups, with regular tasks and new organizational structures; (3) extending groups, with non-regular tasks and old structures; and (4) emergent groups of volunteers performing new tasks and creating new structures. Emergent, religiously grounded groups often include people who in the aftermath of the crisis start to work together for the first time to solve problems. Such groups may also originate from members of pre-existing religious and other civic and professional organizations in the community (emergent groups). In both cases, they are doing something together that is new to them. It also takes the form of expanding and extending organizations.

This DRC typology suggests that responders will include groups that use existing structures and systems, groups that change existing structures and systems as they respond, and groups whose genesis is tied to the event's pressures. While the initial articulations of the typology were focused on community level variations in the types of organizations/groups observed, later fieldwork explored the internal systems and dynamics that created these different end types. As a result, both stable and novel (emergent) behaviors within organizations, and stable and emergent groups in communities, were observed.

Latin America and the Caribbean are two areas prone to potentially disastrous natural phenomena, while exhibiting varying (yet still under-evaluated) conditions for either planned or spontaneous volunteering after a disaster. In these areas, there are found a number of emerging economies and societies at different levels of development. These countries share similar historical conditions of conquest, colonization, and internal differentiation that have defined their national profiles even as they had different experiences after independence from Spain and Portugal. There have been several attempts to understand the impact of disasters in these societies, starting with the pioneering writings of Hewitt and Sheehan (1969) and culminating with the information collected by the international disaster database EM-DAT. In 2011, according to this source, Latin America and the Caribbean accounted for the second largest number of fatalities (7% of the world total) after Europe (10.5%). The similarities in the response to disasters in this region correspond to the cultural development of the societies and their long experience with authoritarian states, and to the impact of the United States and other developed countries.

3. What are the main barriers or obstacles to volunteering in crisis and disaster situations?

The role of so-called *spontaneous volunteers* in search and rescue activities as well as in the post-impact period of disaster quite often reflects larger unresolved

issues of political representation in these societies. Until very recently, the importance of volunteers in disasters was largely unrecognized and seemingly neglected by policy-makers as well as by social and political scientists. The period of the so-called Cold War influenced Latin American countries to adopt a civil defense or protection bureaucratic model influenced closely by the United States. It was a *dual use* approach involving military and paramilitary organizations in tasks focused on national security and *natural disasters* (see Dynes 1994). As was true in the United States in the late 1980s and 1990s, this situation began to change. Studies examining the outcomes of international efforts in the aftermath of the 1990 International Decade for Natural Disasters Reduction (IDNDR), showed the desirability of making changes to the ways government ministries were organized, including a rethinking of the disaster management model and the adoption of a risk management approach known in Spanish as *Gestión del Riesgo*. It explicitly concerned itself with the creators of vulnerability and risks, their victims, who were most often other members of society who suffered from disasters, and with finding effective mitigation efforts in the context of economic development of the region (Celis, Ostuni, Kisilevsky, and Fernández 2008; Seguinot, Batista, and Sánchez 2008).

Fortunately, the present-day acceptance of a modified risk management approach to disaster, with its emphasis on solutions based on local socio-economic development and participation of local populations as enactors and volunteers in the development project, has appealed to both the political left and right in the region (Freeman, Paul, Linneroot-Bayer, Mechler, Pflug, and Fugate 2011; Gellert 2012; Inter-American Development Bank 2010; Lavell 2007). While these changes have taken place, the old civil defense and emergency management perspectives continue to exert influence, possibly caused in part by the re-militarization of disaster-related organizations in the aftermath of the September 11 terrorist attacks on the United States.

Recently, under the initiative of the United Nations (FISCRMLR 2010; UNV 2011), there has been official action highlighting and encouraging the role of volunteers in tasks related to disaster prevention, response, and mitigation, as well as the incorporation of community actors. Most Latin American governments have made efforts to improve disaster-related organizations as well as to bring about changes in the relevant legal frameworks, with provisions that recognize spontaneous volunteers and attempt to coordinate their activities with governmental emergency management systems and voluntary non-governmental organizations (see FISCRMLR 2010; SNPAD – Colombia; SINAPROC – Mexico; SIFEM – Argentina; SINAPRED – Nicaragua; SINAGER – Honduras; CONRED – Guatemala; SISRADE – Bolivia).

Research by Dynes, Quarantelli, and Wenger (1988, 1990), using a representative random sample of the population of Mexico City, examined volunteerism in the aftermath of its 1985 earthquake. They showed that more than a million people volunteered to participate in the society's response to this disaster and

that the types of participation observed were determined to a large extent by the social class, gender, and age of the volunteers. They also documented the importance of the emergent organizational system that characterized this response, as well as the ways the ministries of the Mexican state assisted the work of the volunteers. Subsequently, others have questioned the value of the concept of volunteer in understanding disasters in the region.

Aguirre et al. (1994a, 1995; see also Macías and Calderón 1994), in their detailed qualitative study of the gasoline explosions in Guadalajara, Mexico, in 1992, observed the importance of the roles of both spontaneous volunteers and those who were already formally organized. They also documented the social system that emerged as the societal response to this crisis. They were able to show how volunteering was part of the pre-existing social capital of the victims and their families and how traditional social relationships helped guide volunteer activities (see also Barrios 2007).

Aguirre (1994a, 1994b) had already made important observations about this subject in his research on warning, evacuation, and search and rescue in Puerto Rico and Mexico. Other authors have conducted research on several instances of disasters in Latin America and considered the role of spontaneous volunteers in the *social response*. This is the case for the monograph by Kates and others (1972) about the earthquake in Managua, Nicaragua, in 1972, in which they documented the importance of spontaneous volunteers. They also documented the conflict between spontaneous volunteers and personnel of organizations and public and private institutions in the immediate post-impact period of the disaster. Barrios (2007) analyzed the case of a landslide that hit the community Santiago Atitán in the Lake of the same name, Guatemala, caused by the rains from Hurricane Stan in 2005. He observed and identified the role of relatives and neighbors in the early activities of search and rescue. The same case was analyzed by Hinshaw (2006), who noted the cooperative role of volunteers from several communities helping in the evacuation of Tzununa in the same lake. Hinshaw studied volunteers of a non-governmental organization called Pro-Lago, who played an important role in the advanced stage of community recovery.

Another study that examined spontaneous volunteers in disasters was done about the floods in Santa Cruz de la Sierra, Bolivia of 1983 reviewed by Antelo (1985), who noted the importance of the joint intervention of organizations of rescuers and spontaneous volunteers: "thousands of families had been rescued from the waters by groups of rescue workers, volunteers and personnel from institutions that participated in the complex rescue operations" (109). In the case of the flooding of the Gran Resistencia River in Argentina, in 1983, Caputo et al. (1985) also noted the actions of *voluntary* evacuation of the affected population and mentioned the role of non-governmental organizations and volunteers in the activities of supplying food to the population evacuated that

resided in shelters, as well as in the development of some recovery programs. Disaster associated with earthquakes, such as the Alto Mayo earthquake in Peru, of May 29, 1990, were studied by Maskrey (1992) and Duval and Medina (1992); they noted the role of spontaneous volunteers in the removal of debris and in the search for shelters.

Spontaneous volunteering occurs in counterpoint to government/state-controlled volunteering. Cuba offers an example. While the structural control and organization of volunteers is the norm, Cubans engage side by side with it in spontaneous volunteering in situations that are not disasters. These are instead potential high-risk unexpected incidents such as traffic accidents that are not the usual sort of incidents that seem relevant to civil defense. People traveling or living near roads where traffic and train accidents occur are the first to respond. Yet another set of spontaneous volunteers is composed of the people who come to shelters to help elderly victims and look after small children, clean floors, and wash clothing. Perhaps the most important type of spontaneous volunteers, given the very serious deficit of housing on the island, are neighbors, friends, and kinfolk who offer shelter to victims who have lost their homes to high wind or water (Delgadillo, 2005). As severe storms approach, it is customary in Cuba to cut off electric services (Batista, 2010a, b). Neighbors who have battery-operated radios usually share information with others about the strength and movement of the storm.

Of growing relevance to the issue of who engages in spontaneous volunteering in Latin America is the diffusion of personal mobile telecommunication and media devices and the increasing adoption of internet platforms and applications. As a result of these developments, photos, videos, and other information about the most destructive crises and disasters are shared across longer distances more rapidly and with more rich content. If the disaster is not very remote from a metropolitan area and the nation is sufficiently covered by the global communications network, ground-level and first-hand accounts of a catastrophic situation can be quickly disseminated, enabling many more potential volunteers to be engaged at a much greater distance from where an event occurs.

4. The importance and relatively marginal situation of faith-based organizations' response to disaster

Moore (2006:4), writing about the aftermath of the Katrina experience, adds that many nonprofit organizations practiced their charity without "regard for funds or the potential future strain on normal operations." Some continued serving even though they had sustained damage. As proof of the difficulties they encountered, Pipa (2006; see also Chaves and Tsitsos 2001) reports that more than half the nonprofits and religious organizations in Louisiana were deemed ineligible by FEMA to receive reimbursements for providing relief after

Hurricane Katrina. Arguably, one of his most insightful comments was that "there was no effective coordinating structure charged with integrating and facilitating the efforts of the many nonprofit and religion-sponsored organizations and religiously inspired philanthropists who responded to Katrina." In his words, the "domestic response architecture does not adequately plan for this type of stratified response" in which the efforts of local faith-based organizations and groups are critical. S. Smith (2006:6; see also Sharkey, 2007) points out that the Red Cross was slow in distributing funds to minority communities in rural Louisiana and Mississippi, for it lacked contacts with local faith-based organizations, welfare agencies, and other organizations that could have assisted it.

Koenig (2006:97–108) lists the obstacles that typically make more difficult the involvement of faith-based organizations with secular disaster response organizations. They include: lack of information, knowledge, and personal relationships, and excessive focus on the immediate crisis. There is also a failure to consider the whole person and to assess and understand the importance of spiritual needs and the need for counseling during long-term recovery (the assumption here is that only professional mental health is required). Additionally, the fact that clergy can facilitate access to victims is often unrecognized. Within faith-based organizations other barriers exist: lack of training for and information about disaster-response programs; stigmatized images about mental health care; reluctance to collaborate with other faith-based organizations and communities; and theological differences. However, the greatest obstacle is jealousy about *who gets the credit* for making a difference, which leads to competition and conflict (Koenig 2006:105). None of these difficulties seems insurmountable.

Pipa (2006), probably the most informative report to date on the involvement of religion-sponsored organizations in delivering social services during the Katrina incident (see also chapters in Boris and Steuerle 2006), is based on interviews with more than 50 leaders of nonprofit churches, governments, and foundations. Pipa found that FEMA's relationship with the nonprofit sector was weak, which created difficulties during this crisis. Moreover, largely unresolved conflicts existed between FEMA and the American Red Cross over their roles and responsibilities in coordinating the nonprofit sector during the crisis. He concludes that local nonprofit agencies and religious congregations played a key part in the response and improved the safety and well-being of victims (for at one point they sheltered as many evacuees as the American Red Cross).

5. Who gets involved in volunteering in crisis and disaster situations?

There are numerous and complex motivations at the individual level to explain why a person chooses to help others who are less fortunate or in need of help (e.g., see Handbook Chapters 30 and 31). One significant motivation to

consider is a person's religious faith. The importance of faith in mobilizing people and resources in the aftermath of disasters is nowhere clearer than in Katrina, although there are many other examples. According to S. Smith (2006, see p. 7 for additional references) more than 10,000 volunteers from across the country helped reconstruct communities along the Gulf Coast. Approximately 56% of the USD 3.3 billion contributed for Katrina relief was raised by faith-based organizations. Most of this assistance went to help their local units deliver social services, such as emergency assistance, food, shelter, and building reconstruction, and to send their own groups of volunteers to the areas impacted by the storm.

Perhaps the most prominent recent demonstration of voluntarism was after the September 11 attack in the United States in 2001. In response to the unprecedented event of multiple commercial aircraft being simultaneously hijacked and used to cause mass destruction to New York City, extensive spontaneous volunteering occurred. According to US National Commission on Terrorist Attacks upon the United States (2004), private citizens played a significant role in the emergent response to the crisis – either to notify others of what was occurring or to help those in need. As news of the crisis rapidly spread through mass media and other types of communication, the capacity of potential volunteers grew. There are documented incidents of complex emergent volunteer organizational forms, such as a spontaneous volunteer boatlift of over hundreds of thousands of people from lower Manhattan after the collapse of the World Trade Center towers (Kendra and Wachtendorf 2006).

6. What are the main factors that influence volunteer success and impact in crisis and disaster situations?

The Katrina catastrophe provides one context in which to study disaster response and reconstruction. It helps clarify the practical and policy-related implications of accepting the propriety of faith-based organizations and groups' operations during disasters as a key organizing motif to understand voluntarism in disaster contexts. Religious organizations are one of the central mediating institutions of democracy, providing a middle ground between the spheres of private life and such mega-structures as community and governmental bureaucracy (Berger and Neuhaus 1977:3). As such, religious organizations facilitate the integration of the individual and the state, creating political loyalty in people and making governing structures more receptive to their needs.

As documented by McCarthy and Castelli (1997:19), religion-sponsored social service provision, mostly of emergency food, clothing, and shelter, is extensive, amounting to approximately 20% of congregational income. It is primarily local, with resources spent in the community where it is raised. It is also almost always distributed on the basis of need rather than religious affiliation. Furthermore, there is ample evidence that religion-sponsored social

services occur in the context of extensive relationships with government and other sectors of the society (pp. 43–50). Cnaan and Boddie (2002) and Cnaan, Wineberg, and Boddie (1999) have written even more extensively about social service provision by churches and other religious bodies in the United States.

E. Usable knowledge

The successful integration of disaster volunteers in the various efforts to mitigate the effects of disasters is still an unrealized goal. Improvements in this area can be brought about if attention is paid to the voluntarism of religious organizations and their importance as a major institution in society. Spiritually guided, philanthropic, volunteer group activities in disaster response and reconstruction are massive, as exemplified by the extensive involvement of religious organizations and spiritually guided philanthropic groups (ROSGGs) in the delivery of social services during the Katrina catastrophe. Fagnoni (2005:5, 2006), in the US Government Accountability Office report to Congress on charities in the aftermath of Rita and Katrina, alludes to the need for better inter-organizational coordination between faith-based organizations and FEMA. He holds that the former should educate the public about available disaster recovery services, involve them in planning for future disasters, and ease access to aid for eligible victims.

With the Katrina experience and other important incidents in its past, the recent *whole community* approach advocated by Craig Fugate (2011), Director of FEMA, acquires added urgency. In what can be a potentially important welcomed shift in policy, in the section of his report entitled "Engaging Non-Governmental Organizations," he stated that "government can and will continue to serve disaster survivors. However, we fully recognize that a government-centric approach to disaster management will not be enough to meet the challenges posed by a catastrophic incident. That is why we must fully engage our entire societal capacity." FEMA's new policy framework recognizes the role of individual and community resources in its published *Whole Community Approach to Emergency Management* (Federal Emergency Management Agency, 2011).

However, this framework deliberately takes a holistic approach and points broadly to public–private partnerships for communities to enhance their resilience in advance of crisis. Although it has recognized the importance of volunteers, it has not identified the ROSGGs as the key institutional axis to organize most aspects of voluntarism in disaster-related activities in the United States. For, while other institutions may play a part in disaster-related activities, none has the social and cultural reach of religion or the proved history of exercising charity when disaster strikes (Hall, 1994, 2008a, 2008b; Smith, 1978; Wald, 2003.). At the same time, having ROSGGs lead these responses would

raise additional issues, given the nation's constitutional precedents of separating church and state, but we trust that a solution can be worked out given the national interests involved (Kennedy, 2002).

F. Future trends and needed research

We may expect increasing research attention in the future to the role of volunteers and volunteer groups, especial emergent volunteer groups and activities, in crises and disasters. There is growing attention in disaster research on the persons and organizations operating at local levels, such as the needed collaborations between official local responders with community-level actors (Brudney and Gazley 2009). There is also growing attention to communicated infrastructures for networked intergovernmental and inter-organizational responses (Kapucu 2006b) to manage the networked collaboration that takes place in response to disaster and crisis situations. However, significant gaps remain.

Social science research about disasters in Latin America and the Caribbean has not developed sufficiently. Most researchers have not adopted disaster as a main line of interest, nor has the study of volunteering become an important subject of investigation (Lavell 2004). The scant social scientific knowledge about volunteers in disasters in Latin America may be traced to the weak development of the social sciences in *field studies of disaster* in this region. Unfortunately, to date there is, with a few exceptions, no research or field research specifically focusing on people affected directly and indirectly by disasters or on the role of participants who in the English-language literature are identified as spontaneous volunteers.

However, there are a number of studies reflecting the interests of international financial organizations and humanitarian assistance (see Linayo 2011; Durán et al. 2002). There is also research on the economic impact of disasters on development (Chervériat 2000), on climate change (Mendoza 2009), and on the El Niño phenomenon (Franco 1991; González 2008), all conducted in conjunction with studies framed in a risk management approach to disasters (Lavell 2005). In general, the dominant approach is doing studies that examine the aftermath of disasters by quantifying the losses caused by them, rather than doing studies to develop theory to understand the impact of various mitigation efforts and document the typical collective behavior that emerges in disaster situations (Koko 2003). It is not surprising then that research interests like the role of the spontaneous volunteer are seen as marginal.

Formal Volunteer Service Programs

Jeffrey L. Brudney (USA), Young-joo Lee (South Korea), Suad A. Bin Afif (Saudi Arabia), Nick Ockenden (UK), and Aminata Sillah (Liberia)

A. Introduction

This Handbook focuses primarily on volunteering in and the operations of associations. Because some other topics are sufficiently relevant and important, however, the Handbook covers them as well. Volunteer service programs (VSPs) is one such subject. Although VSPs are rarely found in associations, these efforts are included in the Handbook because they engage a multitude of volunteers and illustrate important facets and contexts of volunteer involvement.

This chapter examines VSPs from a multinational perspective. VSPs are housed most often in nonprofit organizations and government agencies and are intended to assist these parent entities toward goal achievement (cf. Smith, Stebbins, and Dover 2006:244). The Handbook Appendix notes, "Volunteer programs can be properly seen as departments of the larger organization that operates them. They usually have a volunteer administrator or volunteer manager." VSPs take into account the motivations and interests of volunteers, but they tend to view volunteers from the perspective of the parent organization, conceiving of them as important but unpaid human resources. This chapter elaborates the definition of VSPs, their origin and historical background, as well as key issues, including the scope of VSPs, recommended best practices, the impacts of VSPs, and the challenges and barriers to sustaining them. The chapter perceives an optimistic future for VSPs, especially if resource constraints that limit their operation and effectiveness can be overcome.

The scope of the chapter is ambitious, covering VSPs in the United States, Western Europe, several countries of Asia, and the Middle East. For our purposes, Western Europe excludes Greece, Turkey, and the former communist countries of Eastern Europe (including the Balkans).

B. Definitions

This chapter follows the general definitions provided in the Handbook Appendix. Smith, Stebbins, and Dover (2006:244) describe a VSP as "a program

designed for service volunteers to work within a larger nonprofit group, for-profit organization, or governmental agency, which runs the program" (cf. Brudney 2016; Lauffer and Gorodezky 1977). Brudney and Lee (2008) define a volunteer program more simply as "a systematic effort to involve volunteers in the work, outputs, and outcomes of an organization."

Conceptions of *volunteering* and, therefore, of VSPs differ substantially across the countries of Western Europe, and frequently within them. The definition of volunteering used here is set out in the Appendix. Perhaps the most crucial difference between associations and VSPs is that associations are essentially independent and autonomous, while VSPs are neither. Instead, VSPs usually constitute departments (subunits) of larger, often nonprofit, organizations that supply a volunteer labor force to serve the purposes of the larger organization. Whereas members of associations usually have the right or authority to elect top leaders and officers, participants in VSPs do not. In addition, while most associations serve their members, VSPs serve non-members who are clients or customers of the larger organization, or people who are otherwise the focus of its activities.

C. Historical background

Whereas associations have existed for at least 10,000 years, VSPs have a much shorter history, probably several centuries, not millennia (Smith 2016; see Handbook Chapter 1). Although fixing their point of origin is elusive, in the late 1960s and early 1970s a spate of works appeared in the United States that spawned a reconceptualization of volunteers as an organization- or client-serving resource managed and led in support of organizational purposes, that is, a VSP. Perhaps the best known of these works, albeit not the first, is that of Marlene Wilson (1970). Her influential text appeared shortly after important books by Harriet H. Naylor (1967) and Anne K. Stenzel and Helen M. Feeney (1968). These books were widely used in the 1970s, while paving the way for new ones published in the 1980s that built on their foundations (exemplified by Jane Mallory Park 1983). Disciplinary treatments of volunteer management soon followed, for example, in social work (Schwartz 1984) and in the public sector (Brudney 1990).

In themselves these publications do not mark the origin of VSPs; they had existed long before. Handbook Chapter 1 indicates that, while existing in small numbers for centuries, VSPs mainly date back to the 19th century (cf. Smith 2016). Yet, they do signal the beginning of serious scholarly and practitioner attention to volunteers as capable human resources who could be marshaled in pursuit of organizational clients and missions. By contrast to previous research and commentary, they tend to view the volunteer–organization relationship from the perspective of the organization and consider the needs of that entity

for assistance, labor, and support; the possibilities for integrating volunteers into the agency workforce successfully; and the contribution that these new non-paid human resources could make to meeting those needs and furthering organizational goals. These studies are concerned with balancing the motivation and engagement of volunteers with the demands and priorities of the organizational workplace.

D. Key issues

1. Scope of volunteer service programs (VSPs)

Whereas associations proliferate around the world, VSPs operate mainly in developed countries, such as the United States and those of Western Europe. Most of these programs are sponsored by nonprofit organizations, an arrangement that may have given birth to mistaken beliefs that VSPs have ancient roots, and provide the dominant context for volunteering, though neither belief is correct (Ellis and Campbell 2006; Smith 2000:45–55). Nevertheless, in the United States and other developed countries, VSPs are prevalent in nonprofit organizations. Based on a nationwide survey of charities, Hager (2004) and Hager and Brudney (2004) found that 80% of US charities involve volunteers in their operations or service delivery.

In a comprehensive study, *Volunteering in the European Union*, GHK Consulting likewise suggests that most volunteering across Europe takes place within the voluntary and community sector, also referred to as the *third sector* (GHK 2010). In the majority of cases, this sector has grown considerably over the past two to three decades. GHK estimates that approximately 92 to 94 million adults participate in volunteering across the European Union.

By contrast, in countries of the Middle East and in nations of the former Soviet bloc, VSPs are comparatively rare. In the Arab world non-governmental organizations (NGOs) are fewer in number; found mostly in urban areas, related to an urban educated elite; and bear a patronage, rather than democratic, relationship with government (Kandil 1994). Compared with other areas of the world, the number of volunteers is less, and participation is weaker and more limited in non-governmental organizations. Here the majority of volunteers attend general assemblies and pay membership fees. Volunteers often lack management, guidance, attention and training before volunteering (Kandil 1994). In Arab countries like Tunisia, Sudan, Morocco, Palestine, Kuwait, Egypt, Lebanon, Bahrain, Oman, and the United Arab Emirates, NGOs tend to have a hierarchal structure encompassing the president of the board cabinet, the board cabinet, members of the general assembly, paid employees, and volunteers (Al-Baz 1997).

In Asia, countries vary widely in ethnicity, culture, religion, environment, historical background, and economic and political systems. Because

the diversities among these countries influence the levels and forms of civic engagement including volunteering (Costa and Kahn 2003), it is as difficult to generalize about volunteer programs in these countries as it is to generalize about Asian cultures. With that caution in mind, Asian countries lag somewhat behind Western, developed nations concerning citizen participation in formal volunteer programs, despite increased participation in recent years. The formal nonprofit sector in most Asian countries is still young and developing. Moreover, its relationship with government varies greatly across nations.

Overall, volunteering in Asian countries seems correlated with the levels of economic development and democracy attained: More people participate in volunteer programs in countries with greater economic development and prosperity. A survey conducted by the Society for Participatory Research in Asia (PRIA) reported that 2.8% of the total adult population in four states in India (Maharashtra, Meghalaya, Tamil Nadu, and West Bengal) volunteered in 2001 (Srivastava et al. 2003). By contrast, approximately 20.3% of the total population in South Korea volunteered in 2005 (World Volunteer Web 2005). The Japanese Ministry of Internal Affairs and Communication stated that 28.9% of Japanese people aged 10 or older volunteered in 2005 (Yoshizoe 2007).

Notwithstanding this cross-national variation and diversity, volunteerism in the nonprofit sector continues to grow in many Asian countries. The Voluntary Action Network India (VANI) has been an active promoter of volunteerism and voluntary organizations in that country and globally. In response to the remarkable volunteer involvement after the 1995 Kobe earthquake, a new *NPO Law* was passed in Japan sanctioning the status of nonprofit organizations, which contributed to the growth of volunteerism in the Japanese nonprofit sector. The Japan NPO Center was established in 1996 as an infrastructure organization to support volunteer organizations, akin to the Independent Sector organization in the United States (Imada 2010). The Japanese government funds volunteer centers nationwide, which are responsible for promoting, registering, and administering volunteer activities (Avenell 2010). National government, local governments, and quasi-autonomous NGOs also engage in state–nonprofit collaborations in Japan. The Cabinet Office of the Government of Japan (2000) reports that in 1999 more than 9 out of 10 Japanese were members of neighborhood associations.

Although volunteering occurs mostly in the private sector, the political and economic systems in certain nations restrict citizen-based volunteering. Instead, government may encourage or even mandate young people to participate in *volunteering* as a method of political education (Roker, Player, and Coleman 1999). In China, for instance, the centralized, communist government imposes tough restrictions on private voluntary activities. Until the early 2000s, governmental or quasi-governmental imperatives drove Chinese voluntary organizations and their structures and activities (Tuan 2005). Volunteering

also takes a very different form from its common definition, motivated by government appeals and organization of volunteer activities. That is, citizens are *required* to participate in many government-initiated programs (Tuan 2005). The result is an overwhelmingly high rate of volunteering in China. According to the Chinese government, more than 85% of the population aged 18 years and older volunteered in 2001. That same year more than 9 out of 10 youth volunteered (Tuan 2005).

Activities in Asia in which volunteers participate differ somewhat across national boundaries. For instance, helping youth, children, and the disabled was the most common type of volunteering in South Korea, followed by environmental protection and crime prevention (The Social Report 2009). By contrast, for Japanese volunteers, community improvement was the most common type, followed by conservation activities and safety promotion (Yoshizoe 2007). In India, social service and religion were the two main areas of volunteer work, accounting for 46.5% and 22%, respectively, of the total time volunteered in 2001 (Srivastava et al. 2003). Health and sports programs were the next most common type of volunteer activities. Young Chinese adults are organized by quasi-autonomous non-governmental organizations to work in poverty alleviation, disaster relief, and other nationwide development programs (Yang 2005).

Volunteering and service to others has deep cultural and historical roots in the African context. The act of helping others is shaped by various cultural traditions and reflects the diversity of religion, cultural practices, and beliefs. Organized, formal structures for volunteering are often lacking in the African context, and where available, are underdeveloped. In fact, formal volunteering as an organized activity was introduced in Africa by various missions – religious, medical, and so on (Van Reken 1987). By the 20th century, NGOs had taken over the formal organizing of volunteers (Bashford 2006) in order to help alleviate poverty and other disasters. The growth of formal and informally organized volunteering initiatives has been spurred by the growth of indigenous NGOs in response to the declining human development situation (Fowler 1995). Preliminary research on volunteering in the African context suggests that there is a paucity of information and research in this area of inquiry. Volunteer management is therefore a novel idea, and where available, is often undertaken by NGOs.

As noted above, VSPs in the Middle East are comparatively rare. Where they exist, they focus around prominent areas of volunteering, including: alleviating poverty, facilitating employment, assisting families, protecting children, providing health care, helping the disabled, providing education services, developing community infrastructures (Mamser 2002), and supporting sport clubs (Kinsawi 1997). Further details about these activities can be found in field studies in the Arab world (Al-Baz 1997; Al-Sufti et al. 2005) in Saudi Arabia

(Afif 2009; Al Shubaiki 1992); in Jordan, Morocco, Yemen, Palestine, Egypt, and Kuwait (Naffaa et al. 1999); and in women philanthropic organizations in the Arab Gulf countries (Al Hiji 2000).

2. (Best) practices of volunteer service programs

An area that has attracted considerable attention from researchers and especially practitioners considers the practices that VSPs might utilize to assist organizations most effectively. Perhaps the definitive research on this subject was performed by Hager (2004) and Hager and Brudney (2004). These researchers conducted a nationally representative survey of charities in the United States and queried them regarding their use of nine *best practices* for volunteer management culled from the literature: regular supervision and communication with volunteers, liability coverage or insurance protection for volunteers, regular collection of information on volunteer numbers and hours, screening procedures to identify suitable volunteers, written policies and job descriptions for volunteer involvement, recognition activities such as award ceremonies for volunteers, annual measurement of the impacts of volunteers, training and professional development opportunities for volunteers, and training for paid staff in working with volunteers.

Despite the rhetorical support offered by the literature, the US survey findings showed that most charities had not adopted the recommended volunteer management (best) practices to a *large degree*. With the exception of "regular supervision and communication with volunteers" (adopted by 67% of charities), less than half the charities that manage volunteers had adopted the volunteer management practices advocated by the field. The survey polled a representative sample of religious congregations that use volunteers as well, and, in every case, they had adopted the recommended practices *to a large degree* less often than had the charities. In both the charities and the congregations, however, the rate of adoption of the recommended best practices for volunteer management to *some degree* or to a *large degree* was considerably higher.

In the European context, volunteer management practices vary according to the nature of the VSP and the organization, as well as cross-nationally. In many countries, volunteering has been undergoing professionalization and formalization over the last decade, as evidenced by an increase in volunteering policies, strategies, and procedures for organizations, as well as processes such as interviews and criminal record checks. In the United Kingdom, this trend has contributed to an improved volunteer experience: In the 2007 National Survey of Volunteering in England, 31% of volunteers felt that their volunteering could have been much better organized (Low et al. 2007), a substantial decrease from 71% in the 1997 National Survey (Davis-Smith 1998).

Standards for volunteer management exist in many European countries. In the United Kingdom and Ireland, Volunteering England (now part of the

National Council for Voluntary Organisations) developed the "Investing in Volunteers Standard" as a quality mark, which has been widely adopted by organizations (http://iiv.investinginvolunteers.org.uk/). In Austria, the network of ten volunteer centers has agreed on a set of ten standard criteria for advanced quality volunteer management. In Spain, a Code of Ethics for Volunteering and Volunteer Organisations exists, designed by the Platforma del Voluntaiado de Espana in 2000.

Despite the development of *quality standards* for VSPs in Europe, apprehension exists that such procedures may lead to over-formalization, which potentially could put off some volunteers from participating and harm the organization. Although research has yet to explore this issue on a European-wide level, a challenge surrounding possible over-formalization of volunteering is the potential impact it can have on smaller, grassroots organizations (although these organizations are less likely to offer VSPs). A 2008 study by the Institute for Volunteering Research (IVR), "Volunteering to Lead," identified a fear among these groups that inappropriate application of these policies and processes could stifle, perhaps even terminate, smaller organizations, which tend to function with a more informal, organic approach to volunteer management, often based on peer-support and generally helping out (http://www.ivr.org.uk /component/ivr/volunteering-to-lead).

The concept of *volunteer management* is new in many Asian countries, and nonprofit organizations often lack the financial and human resources to manage volunteers. In India, the vast majority of nonprofit organizations (75%) have one or no paid employees, implying that most organizations are unable to support a dedicated position of volunteer administrator. The situation is somewhat better in nations with a higher level of economic prosperity. For instance, more than half of crime prevention organizations in Japan closely coordinate volunteer activities and receive formal training (Avenell 2010). In Korea, a number of nonprofit organizations recruit volunteers for service organizations, including the Federation of Volunteer Efforts in Korea, Korea Federation of Volunteer Centers, and Volunteering Culture Korea. In China, two government-affiliated organizations, the Community Service Volunteers organization (established by the Ministry of Civil Affairs) and the China Young Volunteer Association (under the leadership of the Chinese Communist Youth League), constitute the two largest volunteer organizations and engage the younger Chinese population in VSPs.

A lively area of debate swirls around whether the recommended *best* practices for volunteer management might differ in their adoption and/or effectiveness by different types of volunteer programs: for example, a volunteer center versus a corporate volunteer program versus a public or nonprofit agency, and so on (Brudney and Meijs 2012). Brudney and Meijs (2009) propose a new *regenerative model* of volunteer programs that encourages their managers to consider *best*

practices within the larger context of how they might affect the sustainability of volunteering in a society.

3. Impacts of volunteer service programs

The impacts of volunteering are at least twofold, on the recipients of volunteer services and on the volunteers themselves (Wilson 2012; see also Handbook Chapter 52). Although statistical information on the impacts of volunteer programs in Asian countries is not available, scholars point out that volunteers in Asia play an important social and economic role. For example, Srivastava and Tandon (2005) observe that volunteers are the driving force of India's nonprofit sector since they account for more than 80% of the sector's workforce. To improve the lives of residents in the present and future, international and local volunteers work in economic development and education for youth (Sherraden, Lough, and McBride 2008). Volunteer programs also help strengthen social connections and trust and promote citizen engagement in public affairs.

At the same time volunteering also brings positive results for individual volunteers, such as social recognition, career building, and better health and self-esteem. Research finds that participation in volunteer programs especially increases older adults' well-being (Brown et al. 2003; Dabelko-Shoeny, Anderson, and Spinks 2010), and these benefits become more important in several Asian countries with the rapid aging of the population. In addition, an increasing number of Asian business corporations have realized that employee VSPs can help develop a stronger workforce, enhance corporate reputations, and invest in the communities in which their businesses are located, as well as improve employee morale and motivation (Tuffrey 1995).

One way to quantify the impact of volunteering programs on society is to assign a financial value to their efforts. Such economic valuation remains controversial, however, since this activity is unpaid, and the appropriate methodology is problematic. Despite these demurs, the economic *impact* of volunteering for individual countries can be large, indeed. Applying the average industrial wage to volunteering figures from the 2002 national survey, the replacement cost of volunteer labor in Ireland could be valued at EUR 382.2 million. In England, figures from the 2007 national survey of volunteering put the value at GBP 38.9 billion (Low et al. 2007). In the United States, according to the Corporation for National and Community Service, in the year ending in September 2015 about 62.6 million Americans, or 24.9% of the adult population, gave 7.9 billion hours of volunteer service worth an estimated USD 184 billion (http://www.volunteeringinamerica.gov/).

GHK (2010) presents a summary of the percentage of GDP contributed by VSP volunteering for different countries:

- A tiny percentage of GDP in Slovakia, Poland, and Greece (less than 0.1%)
- Below 1% of GDP in Bulgaria, Czech Republic, Italy, Hungary, Lithuania, Malta, Portugal, Romania, and Slovenia
- Between 1% and 2% of GDP in Belgium, France, Germany, Ireland, Luxembourg, and Spain
- More than 2% of GDP in the United Kingdom, Finland, and Denmark
- A significant share in Austria, the Netherlands, and Sweden (between 3% and 5%) (p. 11)

In 2000, IVR undertook an assessment of the "Volunteer Investment and Value Audit" (VIVA) in three European countries. The VIVA toolkit creates a ratio of the financial amount invested in volunteering in an organization (e.g., salaries of paid staff, out-of-pocket expenses) against the financial value of the volunteers (total volunteering hours multiplied by a wage figure). The study worked with eight organizations in the United Kingdom, Denmark, and the Netherlands. Ratios varied from 1:1.3 to 1:13.5 (for every one British Pound (GBP) invested in volunteering, it generated a return of between GBP 1.30 and GBP 13.50), showing volunteering to be a highly cost-effective activity across different countries. The small size of the sample meant it was impossible to unearth any notable differences between the countries. If anything, the study showed more similarities than differences (Gaskin 2000).

Beyond economic valuation methods, researchers believe that the wider community and society benefit from VSPs in a number of ways, including development of bridging and bonding social capital, trust, and improved services. Nevertheless, it is often extremely challenging to discern the part played by volunteering. Meanwhile, far less rigorous evidence has been generated in this area (at least on outcomes and impacts as opposed to outputs of VSPs).

Other approaches consider the effects of VSPs on realizing the objectives of host organizations and, in this way, furthering their impact on clients and the larger society. Hager and Brudney (2004) offer an example from the United States. Their survey research showed that substantial majorities of a large, representative sample of charities regard volunteers as beneficial to their operations. They increase the quality of services or programs provided; achieve cost-savings; increase public support for agency programs or improve community relations; provide services or levels of service that the agency otherwise could not deliver; and offer more detailed attention to the people served. Remarkably, more than 90% of the sample found volunteers beneficial to their operations in each of these ways to a *moderate extent* or *great extent*.

Another conception of the impact of VSPs is their role as springboard to paid work. The relationship between volunteering and employment has long

been of interest to government and policy makers, but has been of particular relevance since the global recession and economic downturn began. Evidence for a direct link remains limited, however, and it is very difficult – if not impossible – to attribute the role of volunteering. A study by IVR in 2008 exploring the work of volunteer centers in England on the employability agenda concluded that volunteering can improve individuals' employability by helping them acquire hard and soft skills (with emphasis on gains in confidence and self-esteem), but failed to identify a direct link (http://www.ivr.org.uk/images/stories/Institute-of-Volunteering-Research/Migrated-Resources/Documents/G/A_Gateway_to_Work.pdf).

Research suggests positive impacts for volunteers from participating in VSPs. For example, based on an analysis of 245 questionnaires received from volunteers involved in the Pilot Action program of the European Volunteer Service program (as well as the views of hosting organizations and sending organizations), Davis-Smith (2004) reports that "the key finding was that EVS could be seen to have a positive influence on the lives of the volunteers," and that "volunteers spoke of becoming more assertive, more communicative, more socially aware and caring, more tolerant, and of having learned new skills in leadership, responsibility, and foreign language" (p. 74S). Similarly, a study by proMENTE Social Research (2007) of youth voluntary service in Europe identified a wide range of positive impacts, including that "everyone benefits from voluntary service equally: there are no major differences between impact according to socio-economic categories of volunteers," and that "youth voluntary service has the potential to increase tolerance, active citizenship and a sense of being European" (p. 8).

4. Challenges and barriers to sustaining volunteer service programs

One of the biggest challenges to sustaining VSPs in Asian and Arab countries is the lack of economic and social infrastructure to support these programs. As mentioned above, Asians' volunteering has been concentrated in the informal sector of the economy. Consequently, understanding of volunteer programs and their management falls short compared with Western countries. Compared with OECD member countries where the nonprofit sector and volunteer input account for a significant part of the national economy, the nonprofit sector in many developing countries lacks the resources to sustain effective volunteer programs (Salamon et al. 1999). Although governments and nonprofit organizations in some countries such as Japan and Korea have started educational and training programs for volunteers and volunteer administrators, they lack consistent public policies for the nonprofit sector to sustain these programs (Srivastava and Tandon 2005).

Another barrier to sustaining VSPs in Asia is inequity within society. The same applies to the Arab world. Most of all, discrimination against women by

limiting their participation inhibits the growth of volunteer programs. Until recently in Asia, women's rights had not been protected at the same level as men's. In certain countries, prevailing cultural and religious beliefs involve subordination and mistreatment of women (Cooper and Traugott 2003). In many national contexts, including the United States and Canada, women are more active volunteers than men (Hodgkinson, Weitzman, Noga, and Gorski 1992; Mesch et al. 2006), and the literature provides several reasons why women volunteer more (Donoghue 2001; Wilson and Musick 1997). However, the opposite holds true in many Asian countries where men volunteer at a higher rate than women (Lee and Seong-Gin 2011). In the Indian state West Bengal, for instance, women accounted for only 3% of the volunteer population in 2001 (Srivastava et al. 2002). The extremely low rate of participation of women does not suggest that Asian women are less charitable than men. Rather, social barriers and prejudice in many Asian countries against women's participation in any outside work including formal volunteering prevent women from contributing their time and energy to social causes.

Another inequity that undermines volunteer programs is discrimination according to social class. The literature suggests that class position reflects fundamental differences in the nature and quality of economic, cultural, and social resources (Bourdieu 1986; Giddens 1973). These factors, in turn, contribute to different levels and forms of participation in VSPs. In India, for instance, the caste system remains despite economic and political development, and it limits lower caste people's access to education and other resources and, therefore, prevents their participation in volunteer programs (Dabhi 2009).

Lastly, government suspicion and disapproval of grassroots organization in certain parts of Asia and the Middle East also prevent the development of VSPs in the private sector. For example, the central government of China restricts and regulates management of social and nonprofit organizations run by local people. Such government regulation inhibits growth of the nonprofit sector in that country. Although non-governmental or nonprofit grassroots organizations began appearing in the 1990s (Zhu 2005), citizen-initiated activities in China still remain informal with very limited scope. Government suppression of nonprofit organizations combined with religious and political conflicts in certain regions including India, Pakistan, Tibet, China, and many other parts of Asia hinder growth of the voluntary sector.

The strong traditions of mutual help in many Asian cultures combined with rapid industrialization and economic development imply that they have much potential for cultivating VSPs. As evidence, some Asian countries are even developing international aid programs (Cave 2012). With the increase in westernization in some countries younger generations are becoming interested in participating in formal volunteer programs. The high rate of Internet use also opens the possibility of online volunteering. Furthermore, governments are

establishing policies and laws supporting volunteer programs. Interest in corporate social responsibility has also continued to increase (Lee and Higgins 2001). These trends seem to portend an optimistic future for volunteering in Asian countries.

Although the situation is generally better with respect to VSPs in Western Europe, important challenges exist there as well:

- One of the biggest challenges is lack of funding for volunteering, leaving many VSPs and volunteer management more generally to be under-resourced. Because of the economic downturn in Europe and the Eurozone financial crisis, major increases in investment in volunteering in any country are unlikely. In the United Kingdom alone, it has been estimated that recent spending cuts by government (in an attempt to reduce public deficit) amount to a reduction in income for the voluntary and community sector of somewhere between GBP 3.2 and GBP 5.1 billion (New Philanthropy Capital 2011). The same problems of adequate finance and leadership pervade VSPs housed in charities in the United States (Hager 2004; Hager and Brudney 2004).
- Many countries are experiencing stable or increasing levels of volunteering. Part of the challenge may be less about the demand from the population than about the supply of volunteering opportunities from organizations with little funding to develop suitable opportunities or invest in volunteer management. Here lies a possible mismatch between volunteer supply and organizational demand.
- As often happens in VSPs, tensions can arise between the roles of volunteers and paid staff. Duplication of roles can lead to job substitution, a problem exacerbated by economic challenges that may drive organizations with VSPs to consider hard choices between employment security and service delivery. A study by IVR of volunteering in six large UK National Health Service (NHS) Trusts found that some staff felt that volunteers were used as cheap labor to fill roles that should have been occupied by paid employees (Teasdale 2008). Evidence suggests that this tendency can occur in smaller organizations as well, most recently in England in libraries and museums that have experienced large funding cuts (Ockenden, Hill, and Stuart 2012).
- Although very limited research examines the negative side of volunteering, some work has appeared. The UK study on "Pathways through participation: what creates and sustains active citizenship?" (Brodie et al. 2011) uncovered that people can suffer burn-out, stress, family breakdown, and other disagreeable effects from volunteering (http://www.ivr.org.uk/component /ivr/Pathways_through_Participation). Such untoward consequences may be particularly evident in smaller organizations, where the stressors are

often stronger. A number of high-profile cases in England show vol-
unteers going *on strike* as a reaction to labor practices deemed unfair.
This movement contributed to the development of the Volunteer Rights
Enquiry (http://www.volunteering.org.uk/policy-and-campaigns/volunteer
-rights-inquiry-3r-promise).

E. Usable knowledge

Housed most often in nonprofit organizations and government agencies,
VSPs recruit and mobilize volunteers to assist these entities. VSPs deliver a
huge amount of effort, and organizations in Western, developed nations have
learned to take advantage of the skills, labor, and interests of volunteers. VSPs
are emerging but are less common in counties in Asia, and even less so in the
Arab world.

VSPs must be carefully organized and managed to yield benefits for organi-
zations, as well as volunteers. Research suggests that funding invested in VSPs
generates a strong return. To facilitate these beneficial outcomes for host agen-
cies and citizen volunteers, scholars have proposed best practices to guide the
management of VSPs. However, research suggests that adoption of these provi-
sions is less robust than might have been anticipated, given their endorsement
in the literature.

One of the reasons may be that lack of funding seems an endemic problem
for VSPs worldwide. This problem is ironic because at the very time that govern-
ment is calling on nonprofit organizations and their volunteers to step into the
breach created by public sector cutbacks, VSPs suffer funding cutbacks of their
own, which limit their ability to respond. This limitation is particularly frustrat-
ing, because statistics suggest that the motivation and volume of volunteering
in many countries are at least remaining stable, and in some nations increas-
ing, but that VSPs may have lost the capacity to engage volunteers successfully.
Reduced funding also exacerbates tensions between paid staff and volunteers
in VSPs, so that employees become more concerned with job substitution, and
volunteers experience adverse effects, such as stress and burnout. It is difficult
to attend to the welfare of clients when the service providers must deal with
problems of their own.

We recommend that nations adopt policies to support VSPs so that their
operations can be most effectual for paid staff, volunteers, and clients. We rec-
ommend further that practices and policies in some countries that condone
inequities in participation based, for example, on gender or social class, be
amended so that all citizens may enjoy the benefits of VSPs. Finally, we rec-
ommend changes in policy where governments restrict or closely regulate the
birth and operation of nonprofit (non-government) organizations and citizen
participation, thus limiting the growth and success of VSPs.

F. Future trends and needed research

Despite the limitations we have noted, we see the future of VSPs as bright. In 2009, Brudney speculated on whether the looming worldwide recession would usher in an era of *dark times* that would limit volunteering as other human needs predominated (2009:8). Fortunately, that scenario does not seem to have materialized.

What we do find, though, is an era of flux where VSPs seem to go out of existence as resources and interests wax and wane, to be replaced by other new VSPs. Developments in the new information technologies such as the Internet and smartphones facilitate the organization of VSPs and likely reduce the amount of funding and effort required. Although the raw number of VSPs worldwide has probably not changed much over the past several years, the causes and organizations served through these efforts have likely undergone considerable transformation. The key issue for VSPs is sustaining volunteer energy (Brudney and Meijs 2009).

To monitor these trends and assist VSPs, research on several topics seems appropriate and warranted. First, what circumstances lead to the formation of VSPs, and what factors help to sustain them? Second, do universal best practices exist that can be applied to VSPs in general, or do different types of VSPs (differentiated by nation, goals, host organizations, motivations of volunteers, etc.) call for different approaches? Third, how much job substitution occurs in VSPs with volunteers supplanting paid staff, and does substitution also take place in the other direction with paid staff replacing volunteers? Fourth, what adverse effects might volunteers suffer from due to over-involvement in VSPs? Fifth, how are the influences on and motivations of volunteering in VSPs similar to or different than those factors affecting formal volunteering in associations and informal volunteering outside of an organized context?

Finally, scholars and practitioners have struggled to arrive at the value of volunteer efforts for VSPs and for the larger society. More convincing and articulate ways to demonstrate this value would hopefully be persuasive to funders in all sectors. Thus, research is needed on creative ways to assess the impact of VSPs on the critical problems that they are intended to address.

Changing Nature of Formal Service Program Volunteering

Lesley Hustinx (Belgium), Itamar Y. Shachar (Israel), Femida Handy (India), and David H. Smith (USA)

A. Introduction

Most other chapters in this Handbook focus on volunteering in associations, but this chapter focuses instead mainly on volunteering in volunteer service programs (VSPs). As discussed at length in Handbook Chapter 15, VSPs are essentially volunteer departments of other, larger, controlling, parent organizations, such as nonprofit agencies or government agencies.

Where the member volunteers of voluntary associations have great collective power, electing their top leaders, the volunteers in a VSP have little or no power in the VSP or in their larger, parent organization, and do not elect the top leaders of their VSP or their parent organization. This marked structural difference in authority and power structure has major implications for volunteers and the volunteering experience in these two distinct kinds of volunteering settings (see Smith 2015a, 2015b).

Volunteering encompasses individual and social dimensions: it is a practice that involves an investment made by the individual to contribute to other people outside one's household, and often to the more general, collective welfare. When conducted through formal organizational settings, volunteering becomes an encounter point between those individual endeavors and collective arrangements or social institutions.

In this chapter, we identify three main mechanisms that affect the formations and features of formal VSPs: volunteers' biographical characteristics, the organizational settings where formal volunteering takes place, and the broader institutional environments in which these settings operate. In recent decades, we have witnessed significant transformations in these three mechanisms, which also led to transformations in the nature of volunteering. We argue that volunteer participation has been transitioning from *traditional*, *classical*, or *collectivistic* types to *modern*, *new*, or individualistic ones. The chapter will

explore these transformations and their implications for the changing ways in which volunteer activity takes place. In this analysis, we take into account not only individual behaviors but also the ways in which these behaviors are organized, directed, and governed.

B. Definitions

The following special definitions are important for understanding this chapter, while accepting generally the definitions of the Appendix of this Handbook.

Biographical transformations: Similar trends in the life course of a significant number of individuals that result from broader societal transformations and change their availability and willingness for volunteering.

Organizational transformations: Changes within formally delineated volunteer-involving organizations, including the introduction of innovative volunteer management tools.

Institutional transformations: Restructuring of cross-sectoral and interorganizational relations that influence organizational transformations and activity.

Collective volunteering: A style of volunteering initiated and coordinated by groups, in which the objectives of the individual group members are subordinated to collective goal setting. Collective volunteers are core members of the organization with a strong organizational attachment.

*Reflexive volunteering***:** A style of volunteering framed through the individual world of experience, in which the nature of involvement depends on individual preferences and needs. Reflexive volunteers conduct more specialized roles and activities, demand a high level of flexibility, and they have relatively weak feelings of identification with the organization or belonging to a volunteer group.

Institutionally individualized volunteering: This concept refers to the growing institutionalization of more individuated forms of volunteering. Volunteer organizations decreasingly approach volunteers as members of a group, as traditionally has been the case, but as individuals with individualized conditions, preferences, and needs for which highly individualized volunteer opportunities have to be offered.

Third Parties: Volunteering is traditionally conceptualized as consisting of three types of actors: volunteers, volunteer organizations, and beneficiaries. The concept of *third parties* describes additional, external parties, such as governments, educational institutes, and corporations, which become involved in initiating and facilitating volunteer activities, and in enhancing volunteering in general.

Hybrid forms of participation: Participation in hybrid organizational settings that mingle roles and rationalities of civil society, state, and market. Examples are corporate volunteering, civic internships, workfare and social activation programs, and alternative community sentences.

C. Historical background

As discussed in Handbook Chapter 1, *informal volunteering* goes back 150,000 to 200,000 years, as long as our species has existed. However, *formal volunteering*, through some group or organization, mainly in grassroots, local, all-volunteer associations, goes back only about 10,000 years. In marked contrast, *VSP volunteering is very new in history*, beginning mainly in the 19th and 20th centuries, and mainly in wealthier, industrial, and post-industrial nations (cf. Smith 2016). VSP volunteering is not present to any significant extent in the current developing or transitional nations where most humans live. Thus, VSP volunteering, while important and growing, is only a small fraction of all current formal volunteering in the world, and was essentially nonexistent until very recently. VSP formal volunteering is now only found frequently in a small number of economically and educationally advanced nations. This larger context is crucial to understanding the meaning and implications of the present chapter and the phenomena it examines. *In brief, when the term "volunteering" is used below in this chapter, it refers mainly to this very special, recent, rather small segment of all of the world's current formal volunteering and specifically to the volunteers who are involved in VSPs* (cf. Smith 2014, 2016).

In recent decades, there has been a growing conviction that the nature of volunteering is undergoing radical change as a result of broader social transformations. Volunteer participation has been transitioning from *traditional*, *classical*, or *collectivistic* types to *modern*, *new*, or *individualistic* ones (Eckstein 2001; Hustinx 2010a; Hustinx and Lammertyn 2003; Jakob 1993; Wuthnow 1998). Compared with traditional volunteering as a lifelong and demanding commitment, modern volunteering takes place on a more episodic, non-committal, and self-oriented basis.

This transformation is usually described in problematic terms. *Serious volunteering* (Putnam 1995:70) is declining, and the new generation of volunteers lacks the type and degree of involvement that the average organization needs. The core diagnosis holds that the *ethos* of the volunteers, that is, their subjective dispositions and preferences, has changed dramatically (Hustinx 2010a). As a consequence of processes of individualization and profound value change, the willingness to volunteer is allegedly eroding or transforming into unfavorable terms. Modern volunteers demand a considerable amount of autonomy and freedom in their roles and responsibilities. The willingness to participate increasingly depends on personal interests and needs, instead of traditional values such as service to others and a sense of duty to the community. In their quest for self-realization, volunteers demand a substantial freedom of choice and a clear set of tasks with tangible results. In addition, they tend to take a more instrumental view of volunteering, using it primarily to further their own interests. For example, young people would have an increasing propensity to volunteer for résumé-building motivations (Handy et al. 2010).

While these (alleged) changes on the side of volunteers have been intensively discussed among scholars and practitioners, remarkably less attention has been devoted to how broader organizational and institutional changes affect the nature of volunteering as well (Hustinx 2010b). First, organizations (especially nonprofit and government agencies) have changed the way they structure their demand for volunteer labor in order to cope with the changes on the part of individual volunteers. In recent years, such volunteer-involving organizations have introduced innovative management practices to attune the volunteer activities to the personal preferences and needs of volunteers, and also have started to apply more explicit marketing and recruitment efforts (Meijs and Brudney 2007). Second, new institutional strategies have recently increased to encourage volunteering. *Third parties* such as governments, corporations, and institutions of higher education are increasingly involved in the mobilization of volunteers and the organization of their activities (Haski-Leventhal, Meijs, and Hustinx 2010). Secondary and university students, for example, often have to participate in volunteer activities as part of their study curriculum and get a more explicit return for their contribution (e.g., study credits). Such interventions typically influence the dimensions of free choice and non-remuneration that have been traditionally seen as essential to our understanding of volunteering (Handy et al. 2000; Hustinx, Cnaan, and Handy 2010; Smith, Stebbins, and Dover 2006:244–245).

D. Key issues

To grasp the complex and changing nature of volunteering, it thus is indispensable to consider different, but mutually connected, levels of analysis: changes in the individual biography of volunteers on the one hand and changes in the organizational and institutional environment of volunteering on the other hand. We focus on several frameworks that have dealt with these different levels of analysis, and identify five key analytical issues.

1. The changing biographical embedding of VSP volunteering: From collective to reflexive styles of volunteering

The shift from *traditional* to *modern* types of volunteering has been linked to broader changes in the biography of volunteers. People's biographies are changing as a result of broader processes of modernization and individualization. These processes involve a gradual removal from traditional and fixed social configurations, such as the nuclear family with its gender-specific role divisions, status-based classes, local neighborhood, and church community. As a result, collectively prescribed identities and patterns of behavior are progressively eroding, and individuals are becoming the autonomous and active designers of their own lives. The standardized collective biography

is replaced by a plurality of individualized *do-it-yourself biographies* (Beck and Beck-Gernsheim 1996). This shift is often described as a process toward increased *self-reflexivity*, which involves a change from the former collective monitoring of agents to the autonomous, active, and permanent self-monitoring of individual life narratives (Beck and Beck-Gernsheim 1996).

Hustinx and Lammertyn (2003) coined the notions of collective and reflexive styles of volunteering to conceptualize this biographical shift and its influence on volunteer activity. Based on an extensive literature review, they have delineated the analytical differences between both ideal-types.

Collective volunteerism has its roots in a local community or a relatively closed group of reference. Being an expression of volunteers' group belonging, the objectives of the individual association volunteers are self-evidently subordinated to collective goal setting (Eckstein 2001; Jakob 1993; Wuthnow 1998). This collective and stable biographical context coheres with specific volunteer dispositions and motivations. The close association between group affiliation and volunteering results in strong organizational attachments and loyal cooperation. Collective volunteers are core members of the organization; they are very dedicated to the organization's values and goals and feel responsible for the organization as a whole (Pearce 1993). They engage in all necessary tasks and roles needed for maintaining the organization. Since collective volunteering is rooted in a communal orientation, volunteers' prime motivation is an obvious sense of duty or responsibility to a local community or more abstract collectivity. Very often, this prototype is embedded in a religious tradition of benevolence and altruism, or inspired by a coordinating ideology or value system (Jakob 1993).

Because of weakening social ties and eroding collective forms of conduct, the individual world of experience is the principal frame of reference for reflexive volunteering in VSPs. Reflexive volunteering is embedded in an autonomously monitored life course, where reflexive volunteers adopt more conditional and self-oriented dispositions in the context of highly individualized situations and experiences. Volunteering serves as a tool for active biography construction, and personal goal setting can offer new directions when coping with biographical uncertainty (Hustinx 2010a; Jakob 1993). In their personal search for an optimal biographical fit, reflexive volunteers demand a high level of flexibility and are primarily focused on the activities offered. This results in weak organizational attachments and very pragmatic attitudes. They are primarily interested in providing professional and efficient services, rather than belonging to a volunteer group or association. VSP volunteering has thus become a highly specialized role (Wuthnow 1998).

It is important to note that, in reality, the ideal types of collective and reflexive styles of volunteering coexist and interact in multiple ways (Hustinx and

Lammertyn 2003). For example, in an empirical study of Red Cross volunteers in Belgium, Hustinx (2005) found five distinct styles of volunteering that reflected complex and distinct interactions among multiple structural and cultural indicators of volunteering. Volunteers with similar levels of participation could perform highly diverging volunteer roles and embrace heterogeneous motivational and attitudinal dispositions. Hustinx (2005), for instance, identified two completely different categories of board members, which were both significantly more involved in a number of vital volunteer activities (e.g., coordination of meetings, decision making, and organization of activities, administrative tasks, training, and lecturing); nevertheless, despite their comparable job responsibilities, they differed greatly in their intensity of involvement (episodic and limited hours versus unrestricted) and level of organizational attachment (formal and distant versus unconditional but also critical toward the organization).

2. Institutionally individualized VSP volunteering

While the modern, more individualized styles of volunteering have been primarily attributed to the uprooting of individuals from their traditional collective roots – thus interpreting changes in the nature of volunteering primarily in terms of the *growing independence* of volunteers – this perspective fails to account for the *changing interdependence* between volunteers and their organizational and institutional environment (Hustinx 2010b; Hustinx and Meijs 2011). Individualized forms of living and acting remain strongly dependent on social institutions such as the education system, labor market, and welfare state (Beck 1992; Beck and Beck-Gernsheim 1996). Rather than a complete dis-embedding or removal from collective sources of authority and standard ways of living, these modern institutions constitute the new control structures in which individuals are *re-embedded*. Rather than a process of complete individual liberation, individualization stands for the historical institutionalization of the "principle of individual assignment of claims and contributions" through legislation, welfare state, and labor market (Beck 2007:682). The addressee of modern institutions is the individual and not the collective to which she or he traditionally belonged (ibid.); thus, individualization should be understood in terms of "institutionally dependent individual situations" (Beck 1992:130) or the "institution-dependent control structure of individual situations" (Beck 1992:131).

Inspired by Beck's general theory of individualization, Hustinx (2010b) introduced the notion of "institutionally individualized volunteering" to further our understanding of how modern volunteers become intertwined with their organizational and institutional environment in more complex and contingent ways. This term can be defined as the growing institutionalization of more individuated forms of volunteering:

> The focus lies on new organizational forms and control structures that have as their primary frame of reference no longer the collective but the individual: volunteers are no longer approached as members of a group, as traditionally has been the case, but as individuals with individualized conditions, preferences and needs.
>
> (Hustinx 2010b:169)

Consequently, rather than merely focusing on individual-level changes that allegedly find their reflection in new and more independent modes of involvement, it is important to understand how modern volunteering increasingly becomes institutionalized as an individualized program, for example, through innovations in volunteer management that address volunteer activities in terms of individual assignment and choice. In this case, it is the volunteer organization that facilitates and even stimulates more individualized and episodic styles of volunteering.

Hustinx (2010b) develops an analytical model that distinguishes between *primary* and *secondary* processes of re-structuring, or forms of institutionally individualized volunteering. Primary processes are situated within the context of classical voluntary associations. A typical example of primary re-embedding are the efforts done by many volunteer organizations to suit the more individualized needs and preferences of the volunteers. Secondary processes refer to the institutionalization of individualized volunteering through external or third parties, such as governments who try to activate long-term unemployed through compulsory volunteer programs. In the following sections, we further elaborate on these organizational and institutional changes.

3. Organizational change: Innovations in volunteer management

As a result of the (perceived) individualized preferences of volunteers, organizations and VSPs are changing their management approaches, from the traditional *membership model*, in which a core group of volunteers performs all volunteer tasks, to a *program-based model* (Meijs and Hoogstad 2001). In this latter model, VSP volunteers make a limited and clearly defined contribution to a specific goal, without any further organizational attachments. Lichterman (2006) termed this type of participation, which has become prominent in the United States recently, as a *plug-in* style volunteering: short-term, target-oriented, and professionally supervised participation in a loosely structured organizational environment, that enables individual VSP volunteers to constantly shift between various tasks, positions, and organizations (cf. Eliasoph 2011:117–118). Lichterman juxtaposed this to an older style of participation in American civic clubs, in which the long-term, active commitment to the organization predominated (Lichterman 2009).

While collective volunteering was a self-evident expression of community belonging and group identity, resulting in long-term and strong organizational attachments (mainly to voluntary associations), today's reflexive or plug-in volunteers need to be (re-)enchanted through attractive *volunteering menus* that glorify the process of choice (Hustinx 2010b). VSPs are purposely tailored to the more individualized interests of (potential) volunteers, and a more limited and clearly defined contribution is demanded. VSP volunteers are responsible for a particular task and are recruited to work toward a specific goal (Meijs and Hoogstad 2001).

An illustration of this new management approach is the concept of *winning volunteer scenarios*, developed by Meijs and Brudney (2007). These authors approach volunteer management using the metaphor of a *slot machine*. They define a volunteer scenario as a combination of the *Assets* of a volunteer, the *Availability* of volunteers, and a particular volunteer *Assignment* offered by the organization. Their management techniques seek to optimize winning volunteer scenarios, which is equivalent to getting AAA on the slot machine and winning the prize. The focus on the three As is useful in designing strategies in the changing world of volunteers (as described above), as it guarantees an optimal individual match for the volunteer. The model offers flexibility of adaptation in a variety of organizational contexts and from multiple perspectives.

Short-term volunteer opportunities in VSPs allow volunteer-involving organizations to fulfill many responsibilities that would be too burdensome for regular volunteers. For example, the Ronald McDonald House in Philadelphia (the United States) serves to look after families whose children are in local hospitals undergoing treatment. While it is largely run by volunteers who work on a regular basis, nightly dinner preparations for houseguests is primarily staffed by volunteers who work only occasionally – from once a year to once a month on an *ad hoc* or episodic arrangement. Using short-term volunteers distributes the burden of providing daily meals across a large volunteer group and allows the organization to provide daily meals in the least cost fashion (Haski-Leventhal, Hustinx, and Handy 2011).

Paradoxically, enabling more individualized and non-committal involvements requires a much more strict organization of volunteer activities, and thus incurs considerable costs to the organization (Handy and Srinivasan 2004). While volunteers experience more choice and self-determination, this flexibility stems from a deliberate restructuring of organizational settings and a more strict organization. Institutionally, individualized volunteering here refers to the more strict and rational organization and management of volunteers on the one hand and the simultaneous presentation of activities in a volunteer-centered way on the other.

However, this does not go without a danger: projects and activities are increasingly tuned to the preferences of the volunteers, instead of putting the

organizational targets and the interests of the beneficiaries first. By narrowing down organizational objectives to the private interests and goals of the individual members or volunteers, organizations risk to drive a wedge between voluntary activity and organizational work. Eliasoph (2011) describes the harmful effects that *plug-in* volunteers, who wish to have a "rewarding, intimate experience" (p.145), had on the disadvantaged youth they worked with. She shows that volunteers who did not interact with the youth, but rather took care of the organizational and financial stability of the organization, were much more helpful to the beneficiaries. Furthermore, Lichterman (2009) shows that flexible, optional and output-oriented volunteering in loose organizational networks fails to fulfill its ideals of nurturing social capacities among participants and circumvents the development of collective civic action.

4. Institutional change: Third-party involvement

Besides innovative VSP management approaches within nonprofit organizations (especially nonprofit agencies; Smith 2015b), in recent years there also has been an increase in more top-down interventions by external parties, such as governments, educational institutes, and corporations. These *third parties* (Haski-Leventhal, Meijs, and Hustinx 2010) use deliberate strategies to enhance and facilitate participation in VSP volunteering. New forms of volunteering that result from this third-party involvement are highly diverse, including funded VSPs for disadvantaged or minority groups, volunteering through employee-based VSPs, and new forms of *collective orchestration* (Hustinx 2010b) of VSP volunteering through mass events like national service days.

   An important trend in recent years has been the increasing popularity among governments of public policies geared toward promoting and facilitating VSP volunteering and civic participation. Particularly since the United Nations announced 2001 as the International Year of Volunteers, volunteerism has gained priority on the public policy agenda. Governments across the Western world have amplified attempts to encourage, support, and sustain volunteer participation in the population, for example, through the establishment of national task forces (Haski-Leventhal et al. 2010). Besides the more general promotion of volunteering as a valuable and desirable activity, policy makers are using volunteering as a key instrument in their active citizenship and social inclusion agendas. The aim is to counter the (alleged) lack of civic-mindedness among citizens through revitalizing the ethos of voluntarism. In some cases, these governmental efforts include mandatory programs or coercive elements that call into question the association of such programs with voluntary participation in civic life (Hustinx and Meijs 2011).

   Besides governments, corporations are becoming active players in initiating and designing VSP volunteer activities. Employer-supported VSPs have now been established in many companies globally as a way to engage employees

in realizing a company's Corporate Social Responsibility goals (Voort, Glac, and Meijs 2009). In the last three decades, corporate volunteering has become popular as national and multinational companies encourage their workers to volunteer in the adjacent communities in order to build relationships and garner local goodwill. Corporate volunteering includes activities such as team assignments or individual volunteering, and can be done in person or over the Internet such as through e-mentoring. Corporate volunteer activities can range from single day events to multiple days or even more long-term events. In each case, the outcomes differ for employees, employers, and other stakeholders (Meinhard, Handy, and Greenspan 2010; Muthuri, Matten, and Moon 2009).

5. New modes of governing volunteers: A critical perspective

The increasing involvement of third parties in facilitating volunteer activities via VSPs contributes to the proliferation of new and hybrid settings of participation. Corporate volunteering, workfare and social activation programs, civic internships, and service learning, as well as alternative community sentences, are all examples of participation settings that mingle roles and rationalities of civil society, state, and market. These hybrid settings contain a civic component, but usually do not result from the purely voluntary activity of citizens, as perceived by the classical civil society perspective. As VSPs, not independent associations, they are frequently initiated and sometimes even imposed by third parties that pursue their own institutional agendas. This signifies a broader institutional change in the relations between the voluntary sector and other sectors, in particular the government and for-profit sectors (Dekker 2009; Eliasoph 2009, 2011; Hustinx 2010b). Here the boundaries between what exactly constitutes volunteering and what not are increasingly blurred.

As a result, the classic civil society thesis seems less adequate for the study of these newly emerging hybrid forms of VSP participation (Dekker 2009). In contrast to the conventional idea of civic participation as an individual and voluntary act, the analytical lens should shift to the strategic *making* of these new types of VSP participation through a complex ensemble of institutions, organizations, individuals, and technologies. Individual acts are pushed in desired directions by means of neoliberal, self-regulatory governing techniques through which individuals align their personal choices with the goals of powerful actors (Rose 1999). VSP volunteering is increasingly subject to such governmental techniques, exercised by alliances of state, market, and nonprofit actors and embodied through hybrid participation settings (Hustinx 2010b).

This evolution is driven by institutional logics and power dynamics. Importantly, market principles are increasingly intruding the public and third sectors through *new public management*. As a result, privatization of welfare services is expanding, and nonprofit agencies offering such services are increasingly confronted with a new contract culture, based on competitive tendering,

outsourcing, and output performance (Bode 2006). A prominent example of welfare marketization combined with state intervention in volunteering is the increasing subjection of welfare recipients to forced forms of volunteering (Krinsky 2007). Furthermore, a corporate managerial logic is becoming a major source of influence on organizational practices in the nonprofit sector: corporate-inspired techniques of management are adopted not only for managing the paid workforce and the overall organizational development but also for managing the volunteer workforce (Shachar 2014).

The implications of these broad transformations on the nature of volunteering, and on the experiences of volunteers and their beneficiaries, still require additional theoretical and empirical exploration. Even so, Eliasoph (2009, 2011) provided an exceptional ethnographic study of the hybrid arena of North American empowerment projects. She shows how the growing emphasis on short-term contracting, competition, and output measurement has led to organizing short-term projects with a predictable success rate, stronger formalization, top-down steering, and instrumentalization of volunteer activities – all of which discipline those who are supposed to be empowered through these programs. Another small number of studies explored the hybrid arena of corporate volunteering in the United Kingdom, Israel, and France. In this arena, the simultaneous shaping of the employees' workplace behavior and relations, as well as their civic participation and identity, posits corporate volunteering as an efficient technique of governing the employees/volunteers (Baillie-Smith and Laurie 2011; Barkay 2011; Bory 2013). Simonet and Krinsky (2012) further describe the hybrid arena that stretches the continuum of volunteers and regular workers in the maintenance of NYC parks; they indicate how the introduction of volunteers, interns, welfare recipients, and other irregular workers/volunteers to the park sector affected the overall labor organization within it and contributed to a deregulation of the urban labor market.

In this context, policy makers are also introducing community service programs for high school graduates as a possible remedy to the increasing unemployment among young people, even though these programs largely fail to challenge structural inequalities (Simonet 2010). The introduction of such programs aligns with the increasing popularity of service learning programs in institutions of higher education, especially in the United States (e.g., Jacoby and Associates 2003; Marullo and Edwards 2000). Such programs are aimed to combine curricular and pedagogical aims with tangible benefits for communities outside educational institutions. They are developed through partnerships with NGOs, state actors, and private companies, and are being professionalized through assessment processes and constant exchange of ideas and practices. Similarly to the other hybrid forms of participation described above, this emerging trend demonstrates how community engagement is becoming a subject

of institutional interventions that shape and govern the civic socialization of young people.

Following the notion of a *neoliberal communitarian citizenship* (Van Houdt, Suvarierol, and Schinkel 2011), we claim that many of the hybrid forms of participation posit the right to citizenship, welfare, and employment as a reward to be attained through *voluntarily* demonstrating the desired forms of civic participation. Some programs posit volunteering as a form of currency to pay back to society, such as in the form of a community service penalty. For example, Transport for London has introduced *Earn Your Travel Back* – a program for young people whose travel card has been confiscated as a result of antisocial behavior. This program offers them the choice to earn back the card by volunteering for a minimum number of hours (Strickland 2010). In this sense, volunteering is not simply a means to reinvigorate active citizenship, civic responsibility, and community engagement, but it frequently involves dynamics of power, coercion, and disciplining. In particular, a bifurcated volunteering field seems to be emerging, where facilitating mechanisms exist for *strong* (i.e., higher educated, economically active, civically minded) volunteers, yet increasing disciplinary measures are taken toward *weak* (i.e., lower educated, economically inactive, civically disengaged) volunteers (Hustinx, De Waele, and Delcour 2015). This new situation requires more nuanced attention by scholars and practitioners alike.

E. Usable knowledge

Our discussion of VSP volunteering reveals two important tensions in the organization of volunteer work, which have practical implications on the work of volunteer managers and other professionals in the nonprofit sector. First, there is a growing tension between the goals of volunteer involving organizations (VIOs) and the individual preferences and needs of VSP volunteers. Often volunteer managers of VSPs struggle with finding a balance between meaningful organizational functioning and volunteers' particularized demands. For example, initiating episodic volunteer opportunities to meet volunteer preferences may pose a threat to organizational stability and increase costs of recruiting and managing volunteers in VSPs. Thus, before undertaking a diversification of VSPs, volunteer managers should conduct a cost/benefit analysis, examine if they are able to recruit and manage sufficient volunteers in all their programs, and consider how to deal with conflicts that may arise between core and episodic volunteers when assigning desirable assignments.

A second tension that occurs between an organization's autonomy and core mission results from increasing third-party VSP interventions. External institutional processes influence and constrain the supply of volunteers. For example, an increase in corporate volunteering programs or government sponsored

programs that mandate volunteer experience has led organizations to confront new groups of volunteers, who often are involved on a one-off basis (e.g., corporate volunteers as part of a team-building activity) or reluctant to serve (e.g., social activation of long-term unemployed or community service for high school students). Some of the new categories of volunteers demand special professional care and expertise for which volunteer organizations are ill equipped; in turn, this could affect the organization's mission (Hustinx, De Waele, and Delcour 2015). Thus, organizations relying on volunteer labor in VSPs need to consider carefully while recruiting volunteers if and how they can be integrated into the organizations' missions.

Volunteer managers' ability to recruit and manage VSP volunteers is thus dependent not only on developing new managerial techniques and recruitment strategies but also on their interaction with external institutions and their ability in setting new agendas when introducing new types of volunteers in the organization. If managers do not act carefully, volunteer labor may become very costly to integrate and the organizations may incur the risk of mission drift and mission creep, as a result of following the governmental and third-party social policy agendas.

Policy-makers should remember that VSP volunteering is not a universal solution for all social ills. Volunteering policies are part of the broad apparatus of governmental tools and are mutually connected to policies in other areas. Promoting VSP volunteering too extensively, and using compulsory and disciplining techniques, might lead to suffocating citizen participation instead of nurturing it.

F. Future trends and needed research

Although solid, comparable multi-national data are lacking, VSP volunteering and VSPs as VIOs (see Leigh et al. 2011) seem to be growing rapidly in recent decades in many nations, especially more developed nations, but also to some extent in developing/transitional nations.

The biographical, organizational, and institutional changes in VSP volunteering, which are discussed in this chapter, are interesting not only in themselves: exploring the relations between them can foster an enriching stream of future research. There is still a need to better assess how these various changes relate to each other in terms of temporality, mutual influence, and degree of dominance. In addition, there is a need to explore empirically how these changes are perceived and dealt with by volunteers, volunteer managers, and policy makers.

Exploring these relations and how individual agents experience them can be of interest to more theoretically oriented social scientists, who may find it a useful terrain not only for exploring major contemporary social trends but also for reflecting on the grand sociological problems of the relations between

individuals and institutions, structures, and agents. At the same time, more pragmatic scholars of volunteering may find this a useful direction for a deeper understanding of contemporary formations and patterns of volunteering, of how they were created, and how relevant individuals perceive them. In this way, we can also learn if there is a need to try and alter these formations of volunteering, and what are the most suitable ways to do so.

Among the problems that still need to be further studied are the changes in individual's motivations to volunteer in the face of organizational, institutional, and technological transformations, as well as changes in the costs and benefits of volunteering to individuals and organizations. The wide range of biographical, organizational, and institutional shifts, and the emergence of new and surprising organizational actors and volunteering patterns, may change the relationships among volunteers and organizations in even more radical ways than we currently expect. Scholars have to be attentive to such changes and continue to develop new theoretical and methodological tools to study them.

Traditional Philanthropic Service Volunteering

Angela Ellis-Paine (UK), Steinunn Hrafnsdóttir (Iceland), Chul-Hee Kang (South Korea), Laila Kundziņa-Zwejniec (Latvia), Sarah Jane Rehnborg (USA), Kalinga T. Silva (Sri Lanka), and David H. Smith (USA)

A. Introduction

Traditional philanthropic volunteering (TPV) has dominated volunteering practice, research, and policy for the past century (e.g., Joseph 1989; Leigh et al. 2011). Closely related to the concept of *service*, TPV has a number of defining features: it represents a *gift relationship*, with a direct beneficiary who is generally outside of the giver's immediate family; is non-compulsory, largely unremunerated, and often motivated by altruistic impulses; and it occurs largely within a range of nonprofit and public sector social welfare organizations, particularly those within the fields of health, education, and social care.

Most TPV occurs in volunteer service programs (VSPs) as the volunteer departments of larger, parent organizations, usually nonprofit agencies (Smith 2015b) or government agencies, but sometimes also larger businesses (e.g., in corporate volunteer programs). (See also Handbook Chapters 15 and 16.) However, there are also some kinds of membership associations (MAs) that involve TPV (Smith 2015a).

This chapter examines definitional challenges and features of TPV. Following a brief historical overview, we examine some of the key issues facing TPV, including rates of participation, motivation, organizational characteristics, challenges, and variations in the concept. We conclude the chapter by drawing out implications for practitioners and by sketching a future research agenda.

B. Definitions

The set of general definitions in the Handbook Appendix is accepted here.

Defining volunteering, per se, is a tricky business (Bussell and Forbes 2001), although progress has been made in recent years (see Smith, Stebbins, and Dover, 2006). Work to develop "the taxonomy of volunteer work is in its infancy" (Musick and Wilson 2008:33), which is perhaps not surprising given

the complexity of the task (but see Handbook Chapter 3, for recent and prior progress). Volunteering, therefore, is often poorly defined and rarely differentiated, leaving discussions on volunteering "characterized by a woeful lack of precision in terminology and of clarity in thinking" – according to one observer two decades ago (Sheard 1995:115). Smith, Stebbins, and Dover (2006) are more sanguine, having carefully defined over 1,212 nonprofit terms and concepts (see Handbook Appendix for over 80 examples).

Studies that look at variety within volunteering and among volunteers are limited (e.g., Dolnicar and Randle 2007; Van Der Meer, Te Grotenhuis, and Scheepers 2009). General volunteering surveys tend to use a range of categories to delineate different volunteering domains – categorizing volunteering according to the groups of people being served (e.g., young people, disabled people), the types of organizations involved (e.g., church, school), or the causes being served (e.g., environment, health) (Musick and Wilson 2008). We are not aware of any surveys that include "TPV" as a specific category (but see Handbook Chapter 3 for a comprehensive analytical treatment of these complexities and a new set of theoretical typologies of volunteering and associations, including TPV). Indeed, despite describing the form of volunteering that appears to most closely align to lay perceptions, TPV is itself not a commonly used term. There are, in short, no standard definitions of TPV that we can draw on. Here, we provide a definition by exploring different aspects within the concept and by highlighting what TPV is not as much as what it is.

The term *philanthropy* is broadly defined as a gift of money, goods, or, as in this case, time to groups and individuals, outside of the family, for public purposes (see, e.g., Salamon and Anheier 1992; Smith, Stebbins, and Dover 2006). In the book *Voluntary Action,* William Beveridge (1948) distinguished between two main impulses within voluntary action – mutual aid and philanthropy. He argued that the difference between them was one of motivation: "The first [mutual aid] motive has its origin in a sense of one's own need for security against misfortune, and the realization that, since one's fellows have the same need, by undertaking to help one another all may help themselves. The second [philanthropy] motive springs from … social conscience, the feeling which makes men who are materially comfortable, mentally uncomfortable as long as their neighbors are materially uncomfortable" (Beveridge 1948:9; quoted in Penn 2011:18).

In the run up to the International Year of Volunteers in 2001, work led by the United Nations Volunteers provides us with a fourfold classification of volunteering, one of which is philanthropy (Davis-Smith 1999). Here the distinguishing factors are a combination of motivation, purpose, and beneficiary type:

– Philanthropy or service – where volunteers are recruited by an organization
  to provide a service to an external third party, who is the primary beneficiary

– Mutual aid or self-help – where the primary beneficiaries are within the group as people with shared problems or concerns work together to address them
– Participation – where the activity is political or providing governance, with the focus of the volunteering being involvement in decision-making
– Advocacy and campaigning – where the primary aim is political/policy change, achieved through collective action.

Rochester, Ellis Paine, and Howlett (2010) argue that at least one more category should be added to this list – serious leisure (see Stebbins 2007) – where volunteering is primarily a leisure time activity and motivations are essentially intrinsic.

Alternatively, as part of the Johns Hopkins Comparative Nonprofit Sector Project, Salamon and Sokolowski (2001) divide volunteering into two key roles, reflecting the organizational bases in which they are conducted: *service* (which we read as philanthropic) – volunteering in health, social service, and development and housing; and *expressive* – volunteering in culture, sport, recreation, environment, political expression, advocacy, labor unions, and professional associations. Wilson and Musick (2008) also divide volunteering according to organizational field, although they have three categories: *service* – volunteering in social welfare, youth work, sports, health, and arts; *advocacy* – volunteering in labor unions, professional associations, political, local community activism, third world, environment, women's groups, and peace movement; and *religious* – volunteering in religious organizations. In contrast to other categorizations, sports and arts are included as part of service.

Each of these categorizations of volunteering recognizes philanthropic (or service) volunteering, although each focuses on a slightly different aspect, or defining feature, of it. Together they provide us with a greater sense of what philanthropic volunteering is and how it differs from other types of volunteering, although the varying boundaries between definitional constructs suggest the complexity of the field and fluid nature of service and participation (see also Handbook Chapter 3).

Within this framework, the term *traditional* as a descriptor of TPV suggests a conceptually *formal* activity conducted largely within nonprofit agencies with paid staff (Smith 2015b), rather than within mainly volunteer-operated associations and member benefit groups (Smith 2015a) or on a one-to-one *informal* basis. This paradigm views volunteering as essentially an altruistic act, a gift of time whereby people volunteer in order to help those less fortunate than themselves mainly in the field of social welfare, broadly defined, and mainly in professionally staffed, formally structured organizations within both the nonprofit and public sectors, where volunteers are treated as unsalaried labor (Rochester, Ellis Paine, and Howlett 2010). It has been argued that this is a *flat-earth* view (Smith 2000), as it is blind to the true extent and nature of

philanthropic volunteering that goes on beyond, and indeed within, formal organizational settings. We suggest, therefore, that the *traditional* part of TPV relates to the (biased) way in which philanthropic volunteering has traditionally been conceptualized and reported, especially within academic discourses, rather than the much more diverse way it has, in reality, manifested.

From these different definitions we suggest that *traditional philanthropic volunteering* and *traditional service volunteering* could be used interchangeably. Both imply several distinguishing features of this type of volunteering: TPV can be conceptualized as a *gift relationship*; there is a direct intended beneficiary to whom the service is provided; the beneficiary is outside of the giver's immediate family, household, or membership group (although family members or close friends may also benefit); TPV is motivated (in part at least) by altruistic impulses; TPV occurs within a range of non-member benefit nonprofit agencies, which may also be termed here *welfare organi*zations – particularly within the fields of health, education and social care – which are often formally structured and professionally staffed and within which volunteering is often viewed as unsalaried work. Volunteering within such organizations (including those within the voluntary sector and public sector) often occurs through discrete volunteer departments and/or volunteer service programs (Smith, 2015b; see also Handbook Chapter 15).

Given the definitional complexity, the lack of concurrence among researchers, and the general underuse of TPV as a distinct concept within the literature, this chapter has to rely on the evidence of volunteering within the organizational fields associated with TPV as a proxy. This is not ideal. Not all volunteering that takes places within educational settings, for example, is TPV – it may also, for example, be governance or advocacy; nor is all volunteering that takes place within health-related organizations TPV, where advocacy and campaigning may also be common. We believe, however, that it is the best that can currently be done. Furthermore, it should be noted that developments taking place in a number of countries challenge these boundaries. Privatization of healthcare settings in the United States, for example, has blurred the lines between the nonprofit and for-profit sectors. Many people who may fall within our classification structure of TPV may well serve in proprietary hospitals or nursing homes. Likewise, many nonprofits have emerged out of religious structures forming the category of *faith-based* organizations, blurring lines between religious volunteering and service in the arenas of health, education, and social care.

C. Historical background

Handbook Chapter 1 provides a comprehensive historical overview of volunteering and associations. Smith (2016) reviews the rather recent history of volunteer service programmes (VSPs), where most TPV occurs (see also

Handbook Chapter 15). Formal volunteering, or more specifically TPV as a subtype of such volunteering, has a complex history and has followed different developmental trajectories around the world, making it difficult to provide a comprehensive history. We can, however, gain an insight by looking at a number of individual countries.

In the United Kingdom, for example, charitable organizations can be traced back to the 12th and 13th centuries (see Handbook Chapter 1), although the Victorian period is particularly associated with the development of philanthropic volunteering, reflected in the explosion of voluntary organizations at that time (Davis-Smith 1995). Philanthropy was not, however, the only form of voluntary action taking place, with self-help and political participation significant, although often overlooked (ibid.). This bias toward philanthropic volunteering is something that has continued, skewing our understanding of both the extent and diversity of volunteering. Nevertheless, TPV continues to be a significant form of service in the United Kingdom, and elsewhere. Similar stories with varying timelines could be told for the development of TPV in other Western countries, including, for example, the United States, Canada, and Australia, where the early absence of governmental services led pioneers to organize voluntarily for the common good.

Elsewhere, however, TPV has developed rather differently. In the Baltic countries, for example, it has a much more recent history. Given the suppression of voluntary activity during Soviet occupation and the subsequent outlawing of political and ideological organizations in the late 1980s, environmental organizations became key sites for the development of civil society and volunteering. During the last 20 years, however, TPV has taken root in the Baltic region, supported financially and practically by international interests, although it remains a minority activity. As of 2005, only 3% of Lithuania's population engaged in volunteering, with 55% of those volunteers engaged in the fields of health and social care (Zaltauskas 2010), suggesting that a considerable proportion of volunteers were engaging in TPV. Growing government interest in volunteering, including the consideration of legal frameworks, may further facilitate, or indeed stifle, TPV (see Fonovič and Ender, 2010; Zaltauskas 2010).

In the Nordic countries, volunteering has traditionally been concentrated within the fields of sports and culture and focused on the provision of advocacy, voice, and leisure, rather than welfare service provision, and as such TPV as a specific form of volunteering was arguably underdeveloped. Recent developments within the Nordic welfare regimes, toward more welfare pluralism, and increased emphasis on charities providing public services could increase volunteering involvement within service provision, potentially increasing the scale of TPV (see below) (Hrafnsdottir, Kristmundsson, Jónsdottir 2014; Wijkström 2011).

The development of TPV in South Asia has been influenced by a complex blend of anti-colonialism, missionary, and religious ideas. In India, for example, the modern concept of volunteering evolved from the religious reform movement of late 1800s and the freedom struggle against colonial rule in early 1900s led by Mahatma Gandhi (Bornstein 2009; Gandhi 2012). Local practices of TVP were influenced by Gandhian notions of non-violence (*ahimsa*) and truthful action (*satyagraha*) initially deployed as indigenous strategies for resisting colonial rule and cultural domination by the West. The practices of selfless service (*seva*) and gifts of labor for public good (*shramdan*), introduced by Gandhi and his followers as community mobilization strategies, were later adopted by several nonprofit organizations. Meanwhile, in Sri Lanka the development of volunteering has been influenced by a combination of Gandhian ideas of selfless sacrifice and Buddhist notions of social service, with, for example, Shramadana work camps established for students from urban schools in marginalized rural communities with the dual aims of serving communities while also educating the young volunteers.

Volunteering is on the increase in Asia, contributing to Asia having some of the highest reported rates of volunteering: the 2013 World Giving Index reports that six out of the top ten countries in terms of the proportion of people volunteering are Asian (Charities Aid Foundation 2013). The reported increase in philanthropic volunteerism in selected Asian countries may be attributed to the continuing influence of some religious and communitarian values; the increased ability of some people to donate part of their time for the welfare of others due to increased wealth in sections of the population; and gradual erosion of state services in education, health, and social welfare in light of neoliberal reform agenda in these countries (Bain and Company 2013; Bornstein 2009).

In South Korea, general foreign philanthropic support – received in response to the economic hardships after the Korean War – has influenced the development of volunteering. From the 1950s to the 1970s, it was difficult to find TPV. However, the 1988 Seoul Olympic Games provided new opportunities for TPV, with the government developing and expanding diverse opportunities for volunteering. Simultaneously, in the late 1980s, a democratic transformation and rapid economic growth promoted diverse types of civic participation, including TPV (Kang, Auh, and Hur 2016).

Japan also has a unique history of TPV development (e.g., Pekkanen 2006), influenced by natural disasters, such as earthquakes and tsunamis. According to the Japan Fundraising Association (2013), in 2011 30.2% of the population over 15 years of age participated in volunteering activities. Of those who volunteered, the percentage of citizens who participated in disaster-related volunteer activities was relatively high (19.9%) due to the influence of the Great East Japan Earthquake in 2011, giving an indication of the influence of disasters

on the development of TPV in Japan. Among different fields of volunteering, citizens' participation related to neighborhood community association was the most popular; volunteering for community associations had the largest scale in terms of time.

Whether TPV has been on the increase or on the decline in recent years clearly varies between countries and regions. Societal and organizational changes occurring in many parts of the world, such as greater individualization and secularization, are changing the nature of volunteering in general, with a move away from what may have been perceived to be more traditional forms of volunteering (Hustinx and Lammertyn 2003). Volunteering is increasingly conceptualized as more of an exchange than as a gift relationship, with the altruistic and religious motivations associated with TPV losing ground to a range of less selfless motives (Anheier and Salamon 1999), more associated with other forms of volunteering.

The fields in which people volunteer and the ways in which they engage are also changing. This may mean that the ways in which people volunteer change and/or that the fields and organizational types that they engage in change, again potentially indicating a shift away from the fields associated with TPV and suggesting a revision of the definitional structures offered here.

US data from the biennial Independent Sector Surveys from 1990 to 2001, for example, indicate that environmental volunteering has been a major growth area, as has volunteering in arts-based organizations, work, youth, international, and foundation-related organizations. Meanwhile, volunteering within the fields of health, education, religion, human services, and recreation for public benefit (i.e., those associated with TPV) declined during the 1990s (Wilson and Musick 2008). Analysis of other US surveys, however, creates a more complex picture. Analysis of US Population Surveys, for example, found that volunteering in education and youth services had increased by 65% between 1989 and 2002–2005; social and community service also saw an increase, while volunteering in hospitals and other health services declined (Grimm et al. 2006).

When we examine the historical background of TPV in Canada, we see a different picture. Reed and Selbee (2000) analyzed data from two national surveys in 1987 and 1997 conducted by Statistics Canada. They asked participants to give a maximum of three organizations for which they had volunteered and used thirteen categories to describe the type of work performed by the various organizations. While all the organizations we associate with TPV are in the top five in terms of highest percentage of Canadians volunteering with them, sports and recreation are the most popular, followed closely by religious organizations. In terms of change over time, the research showed distinct trends for the three main organizational types associated with TPV. Solely evaluating the first organization cited, volunteering within health organizations rose by 27% and volunteering in social services organizations rose by 11%; conversely,

education and youth development decreased by 36%. Both arts and culture and environmental and wildlife organizations saw an increase of over 90%. This suggests that, while TPV in some fields has decreased and in others it has increased, the scale of change has been dwarfed by that found within fields not associated with TPV.

In South Korea, a growing trend of service-oriented volunteering is consistently observed. According to the biannual report by the Center on Philanthropy of the Beautiful Foundation (2008), citizen volunteering was mainly concentrated on service volunteering for charity organizations, including social service agencies (36.9%). Secular volunteering through religious organizations was also concentrated on service field (12.5%). Relatively small percentages of participants volunteered in the fields of environment (9.4%), culture and art (4.0%), health (3.5%), and political organizations (2.0%). The report by the Philanthropy Research Center (2013) also shows a similar pattern of volunteering.

D. Key issues

In this section we explore a number of key issues associated with TPV: how it varies, who it involves, what motivates it, how it is organized, what impact it has, and what challenges it is facing.

1. How does TPV vary across societies?

Volunteering is a social institution, shaped by economic, social, cultural, and political forces (Anheier and Salamon 1999). It would be fair to assume, therefore, that volunteering as a whole varies across countries and between organizations. We might assume that individual forms of volunteering – such as TPV – also vary on a range of different scales. Here we focus in particular on variations in the dominance of TPV across countries and world regions.

As part of the John Hopkins Comparative Nonprofit Sector Project, Salamon and Sokolowski (2001) divide volunteering into two key roles – service (volunteering in health, social service, and development and housing) and expressive (culture, sport, recreation, environment, political expression, advocacy, labor unions, and professional associations). They then look at the prevalence of these roles across four regime types: social-democratic, liberal, corporatist, and statist. Here we look at a few specific examples, using service volunteering as a proxy for TPV.

The United States is classified under the liberal regime, defined as low government social welfare spending and a relatively large nonprofit sector (which includes religious and faith-based organizations). Salamon and Sokolowski's research highlighted a high level of volunteering in general and of service dominated volunteer roles in particular. They attribute these characteristics

to the liberal regime because it has limited government involvement, galvanizing the need for a service sector to address social problems. Furthermore, they found the highest concentration of volunteers in fields directly associated with TPV: social services (37% of volunteers), health (14%), and education (13%).

Mexico is classified as a statist regime where there is a small but increasingly emergent nonprofit sector and low government welfare spending. In statist regimes, it is argued, nonprofits can be seen as a threat to government hegemony and thus the sector is constrained by government regulations and a complex bureaucracy. Contrary to their prediction, the authors found no dominant field of service: the expressive and service roles were equal, each comprising 49% of the volunteers. In general, it has been suggested that a majority of volunteering within Mexico is outside of formal organizational settings (e.g., Butcher 2012), or it occurs within religious structures as part of a *participation* mentality and not formally noted as *volunteering*. Together, this suggests that TPV is neither the dominant nor the recognized form of volunteering.

South Korea is also classified as a statist regime. However, unlike Mexico, the Korean central and local governments have built partnerships with nonprofit sector in dealing with social problems. Since the 1988 Seoul Olympic Games, the South Korean government has attempted to strengthen the voluntary sector by mobilizing diverse resources from the private sector, as it has needed reliable partners in solving social problems such as poor relief (Kang, Auh, and Hur 2016). In this social atmosphere, South Korea adopted the legislation entitled "Framework Act on Volunteer Service Activities" in 2005 in order to promote citizen participation in volunteering. Because solving social problems, such as poverty, is a major issue in South Korea, volunteers are concentrated within service-orientated nonprofit organizations, which have played a major role in serving humanitarian needs. In general, although South Korea is closest to a statist regime, a majority of volunteering in South Korea is found within formal organizational settings.

In the Nordic countries, social welfare is largely provided by government, resulting in a majority of volunteering being directed to culture, sport, and leisure-based organizations (Arnesen, Folkestad, and Gjerdi 2013; Hrafnsdóttir , Jonsdóttir, and Kristmundsson 2014; Matthies 2006). In recent years, however, government strategies of welfare reform have resulted in the voluntary sector starting to play an increasing role in the delivery of public welfare services, and so the number of volunteers in these areas could be growing. In a study of participation in formal voluntary work in Iceland, where findings from three waves of the European Values Study (EVS) were used to measure voluntary work in Iceland and a comparison made with the other Nordic countries, 5.4% in the Nordic region on average did voluntary work for welfare associations in the year 1990/1992 compared to 5.7% on average in 2008/2010. This suggests

that TPV may be on the increase (Hrafnsdottir, Jonsdottir, and Kristmundsson 2014), although some caution is needed in interpreting the survey data.

Based on her ethnographic research in India, Bornstein (2009) argued that Indian and by implication South Asian forms of philanthropy were impulsive rather than purposive or instrumentally rational as was the case in institutionalized philanthropic actions in the West. This, in turn, poses challenges for its possible use in organized philanthropy with clearly anticipated development or social welfare outcomes.

2. Who does TPV involve?

We know quite a lot about who volunteers in general, but less about the detail of who does what and when (Gray, Khoo, and Reimondos 2012). There are lingering stereotypes about who volunteers, reflecting entrenched class-based and cultural assumptions (Wilson, Hendricks, and Smithes 2001), and these are closely associated with TPV: volunteers are often presented as middle age, middle class, and female. These stereotypes are generally not, however, always borne out by the data (Sheard 1995). In this section we pull together findings from various surveys and studies which have analyzed volunteer demographic characteristics by organizational or activity type and so provide an insight into the characteristics of traditional philanthropic volunteers.

As previously discussed, Wilson and Musick's (2008) analysis of data for 58 countries from the World Values Study 1999–2001 identifies three types of volunteering: service, advocacy, and religious. They found that service volunteers (most closely aligned to TPVs) were more likely to be male, single, working part time, highly educated, affluent, and frequent churchgoers. Sex differences between volunteering types have been borne out in other studies, although not always reaching the same conclusion. In a study of volunteering within Nordic countries, different profiles of volunteers emerged according to organizational type: the study found that it was common for women to volunteer in social services, health (aligned with TPVs), and religious organizations and men in sports and rescue services (Haberman 2001; Hrafnsdottir, Kristmundsson, and Jónsdottir 2014). In Sri Lanka, the Sarvodaya Movement relies heavily on volunteers in its programs of preschool education, public health, and community development. A vast majority of these volunteers are moderately educated rural youth, with women outnumbering men in many of the sectors (Bond 2004; Macy 1983).

According to the Philanthropy Research Center at the Community Chest of South Korea (2013), in 2011 21% of all volunteers in South Korea were involved in TPV. Of those participants, there was no significant gender difference in levels of participation – 52% were female – although women's average yearly time spent for volunteering (26.3 hours) was slightly higher than men's (23.2 hours). Adolescents were the most prolific in TPV: about 78% of adolescents between 13 and 19 years of age did TPV. Some of this is the effect of the "Student

Volunteer Activity Point System," introduced and regulated by the Ministry of Education (South Korea) since 1996. Older adults (over 65 years), however, spent the largest amount of time doing volunteering – 46.8 hours on average per year, compared to 14.4 hours for adolescents. Kang, Yu, and Park (2012) reported effects of another interesting variable in volunteering in South Korea: employment status. They found being unemployed was significantly related to volunteering (see also Lee and Hwang, 2013), whereas being employed was significantly related to donation, controlling for other variables.

Using a slightly different categorization and focusing specifically on volunteering in Australia, Gray, Khoo, and Reimondos (2012) identify three main types of organization that people volunteer for welfare and community; education and training; sport and recreation. We can assume that within the first two categories TPV dominates and therefore the analysis gives us an insight into who is involved in TPV. They found that different people tend to volunteer for different groups:

- People who volunteer for welfare, community, and health organizations tended to be women and more likely than those in other organizations to be in older aged groups (especially 55–64 years old), not to have school-aged children living at home, and more likely not to be employed or providing care for someone who is ill or disabled. There was a strong positive association between volunteering in these organizations and higher levels of education, and volunteers were more likely to be religious than those volunteering for sports and recreation organizations.
- Volunteering for education, training, and youth development groups appears to be strongly associated with middle adulthood when people have young children living at home; higher rates of volunteering were found among females and those aged 35–44, and among those who have partners, particularly partners who volunteer and those with school-aged children. There was a strong educational gradient, with participation in these organizations increasing with educational qualifications. There was also an association with religiosity, although it was not as strong as for welfare and community groups.
- People who volunteer for sport and recreation organizations were more likely to be male, aged 35–44, have a partner who also volunteers, have a school-aged child, and be employed either full time or part time. Volunteering in these organizations was highest among those with diploma/vocational qualification, declining among those with either less or more educational qualifications.

Whether or not these studies provide us with an accurate picture of who gets involved in TPV is questionable – without consistent classifications it is not possible to associate a particular group with a particular domain of volunteering

(Musick and Wilson 2008). It is apparent, however, that TPVs are likely to be different from the conventional political volunteers of Handbook Chapter 23, from the protest-activist volunteers of Handbook Chapter 24, and from the self-help volunteers of Handbook Chapter 18.

3. What motivates and triggers TPV involvement?

A relatively large body of literature has been developed by social scientists from a range of different disciplines trying to explain volunteering and philanthropic behavior more generally (see Handbook Part IV). Whereas some studies have sought an explanation in terms of pre-dispositions to volunteer, others have focused on motivations for involvement and others on triggers or institutional factors. Few, however, have systematically sought to distinguish why people get involved in specific or different styles of volunteering.

At the beginning of this chapter we suggested that one of the defining features of TPV was that participants were motivated by altruistic impulses, and this is to some extent borne out by the available evidence. One of the best known and used instruments to assess volunteer motivation is Clary and Snyder's Volunteer Functions Inventory (VFI), which identified six categories of motivation: values, understanding, enhancement, career, social, and protective (Clary, Snyder, and Ridge 1992, 1996). Various studies have been undertaken making use of the VFI to explore how motivations vary between organizational types, giving us an insight to the motivations that drive TPV.

Exploring motivations among volunteers in Nordic countries, for example, Habermann (2001) found that motivations varied according to the types of organizations that volunteers participated in. The *cause* function was found to be the most important motive in sports clubs (non-TPV), whereas the *values* function was the most important in social and patient associations (the category most closely aligned to TPV), reflecting the altruistic impulses associated with TPV. Findings from a smaller study, focusing on volunteering in two welfare organizations in Iceland, reinforced the significance of the *values* function, suggesting that volunteers within these types of organizations may be driven more by helping behavior than in other types of organizations (Juliusdottir and Sigurdardottir 1997; see also Hrafnsdóttir 2006).

Similarly, analysis of the Independent Sector's National Survey (2,671 in-home interviews) in the United States found a significant correlation between the *values* function and volunteers in the area of health. Volunteers in education, however, were more likely to cite *understanding* and *enhancement* functions (Clary, Snyder, and Stukas 1996). This suggests that even within TPV, motivations vary by organizational type. With other studies finding that motivations vary by demographics (see, e.g., Hwang, Grabb, and Curtis 2005; Yeung 2002), we are reminded that individual TPVs are likely to express a range of motivations for getting involved.

Taking a rather different approach and in a very different context, research by Glenton et al. (2010) into a female community health volunteer program in Nepal, which we might assume falls within TPV, found that the primary motivation of volunteers was a sense of obligation to the community, followed closely by religious merit (*dharma*). The study highlighted the importance of recognition and support from the community to sustain motivation and performance. In Sri Lanka, studies have found that while a philanthropic motive is important when joining a volunteer service, participants also enjoy the freedom of movement they gain through their volunteering and the possible advantage they have when looking for salaried employment (Macy 1983). Others have suggested that the outpouring of sentiments during devastating natural disasters and wars in Sri Lanka may also serve as a trigger for enhanced volunteerism in relief and in long-term development operations (Silva 2009; Simpson 2009).

Looking across all these studies we might conclude that values are the predominant function driving participation, reflecting the altruistic impulses associated with TPV. However, it is far from being the only motivation. Most studies highlight mixed motives – individual traditional philanthropic volunteers motivated by a range of factors, but also differences in motivation within TPV according to organizational type, volunteer demographics, and volunteering stage.

This last study quoted above also reminds us of the importance of external factors driving participation. As Bryant et al. (2003) argue, with volunteering there is a need to look not just at the supply of volunteers but also the demand – not just at individual motivations but also at the actions taken by organizations to recruit volunteers. Being asked to volunteer is, for example, regularly shown by surveys to be one key reason that people get involved (see, e.g., Low et al. 2007; see also Handbook Chapter 27). It is also important to remember that, once started, the reasons for staying involved will differ again (see, e.g., Gidron 1985; Locke, Ellis, and Davis Smith 2005).

4. How is TPV usually organized?

Handy (1998) distinguishes between three different types of volunteering organizational settings and provides an insight into the ways in which volunteers are organized and managed therein: *mutual support*, where people with mutual enthusiasms come together; *campaigning or cause specific*, where people seek change; and *service delivery*, where the volunteering is organized along professional lines, with formalized roles. Equating Handy's *service delivery* to TPV, this reflects our suggestion at the start of this chapter that most TPV occurs within relatively bureaucratic, formally structured organizations, which are professionally staffed and within which volunteering is treated as unsalaried work, most notably through a work-based model of volunteer management (Rochester, Ellis Paine, and Howlett 2010). In contrast, a more "home-grown" (Zimmeck 2001),

less bureaucratic approach to volunteer management is more typical elsewhere. As noted earlier, much of the TPV reviewed here occurs in volunteer service programs (VSPs; cf. Smith 2015b, 2016; see also Handbook Chapters 15 and 16), rather than in membership associations (Smith 2015a)

The organization of volunteering according to a work-based approach is typified by a number of key characteristics. In their analysis of more than 1,700 nonprofits in the United States, including 541 congregations, Hagar and Brudney (2004) identified nine *best practices* associated with effective volunteer engagement in VSPs. These practices include "regular supervision and communication with volunteers, liability coverage or insurance protection for volunteers, regular collection of information on volunteer numbers and hours, screening and matching for volunteers to assignments, written policies and job descriptions for volunteers, recognition activities, annual measurement of impacts of volunteers, training and professional development opportunities for volunteers, and training for paid staff in working with volunteers" (p. 8). Furthermore, the authors note that while not all organizations fully employ these practices, those that do generally find that the benefits accrued from effective management continue to justify greater investment in volunteer coordination, including the employment of a volunteer coordinator to oversee service.

The degree of formalization within volunteer management practices, however, varies considerably, even within TPV. While the *volunteering industry* (mainly, VSPs) has grown rapidly over the past decade in countries such as the United States, Canada, the United Kingdom, and Australia, formalized volunteer management practices remain underdeveloped in many other countries, such as those within the Nordic region. In Sri Lanka, the Sarvodaya Movement has evolved a kinship model for promoting mutual understanding and cooperation among paid and unpaid community workers, but this is clearly distinct from the bureaucratic mode employed in public, private, and even other nonprofit sector organizations in the country (Macy 1983).

5. What impact does TPV have?

With the dominance of *values*-based, altruistic motivations driving TPV, the emphasis is on the impact this type of volunteering has on others, rather than on the volunteers themselves. This is not, of course, to suggest that it does not have an impact on the participants, just that this is not the main emphasis. Here we look at evidence of the impact of TPV – or at least of volunteering within fields and organizations associated with TPV – on different stakeholder groups:

- Impact on the volunteers: Although not the most significant motivating factor, taking part in TPV has been found to make a difference to the volunteers themselves. Volunteers may gain in terms of skills development; self-esteem

and enjoyment; social interaction (Farrell and Bryant 2009); and mental and physical well-being (Morrow-Howell 2010; Morrow-Howell, Hong, and Tang 2009). In conflict settings, TPV may also create opportunities for social mobility for persons from disadvantaged backgrounds and even for some ex-militants who are otherwise prevented from getting back to civilian life (Moore 1993).

- Impact on service users: Evidence from the health field, for example, suggests that volunteers have a significant impact on patients and other recipients, including improving the quality of care and the experience of using a service (Naylor et al. 2013); improved general well-being and lowering levels of social exclusion (e.g., Casiday et al. 2008; Sevigny et al. 2010); and improved health-related behaviors (Casiday et al. 2008; Kennedy 2010).
- Impact on volunteer involving organizations: Within the field of health and social care, volunteering has been found to impact upon organizations through enhancing service delivery (Paylor 2011); improving the engagement of hard-to-reach communities (Kennedy 2010); and improving the quality of interactions between professionals and service users (Paylor 2011).
- Impact on communities and societies: Beyond individuals and organizations, TPV can contribute to broader economic and social policy goals (GHK 2010). It has been found, for example, to have a positive impact on community resilience (Paylor 2011); social cohesion; and the development of social capital.

A positive impact of TPV is not, however, inevitable. Some studies suggest that TPV can be deviant (see Handbook Chapter 53), ineffective, and lead to negative outcomes for volunteers (Grotz 2011; see Handbook Chapter 52). Ensuring volunteers are appropriately supported and the activities appropriately managed can be critical (Casiday et al. 2008).

6. What challenges is TPV currently facing?

Volunteering as a whole is changing, especially volunteering in volunteer service programs (VSPs; Hustinx and Lammertyn 2003; see also Handbook Chapter 16). The context within which volunteering occurs is also changing. These changes are creating a number of particular challenges for TPV, as one specific form of volunteering.

Fundamental changes in the structure and functioning of welfare organizations in certain countries are affecting TPV. Moves toward welfare pluralism with an increasing role for voluntary organizations in the delivery of public services have particular implications for volunteering (see, e.g., Ellis Paine and Hill 2016; Kristmundsson and Hrafnsdóttir 2012; Wijkström 2011). The developments, however, may lead to somewhat contradictory challenges for TPV.

On the one hand, the increasing role for voluntary sector agencies in providing welfare services could arguably lead to an increase in TPV. As well as a potential increase in the overall number of volunteers, in some cases these developments have also led to an increase in the diversity and complexity of volunteer roles (Gaskin 2005; Hutchison and Ockenden 2008; Wijkström 2011). The recent economic crisis has heightened this development and brought particular attention to it, leading to questions of job substitution as paid workers are replaced by volunteers as part of cost-cutting exercises (GHK 2010).

However, a number of the developments associated with welfare pluralism have arguably had rather a different impact. The rise of the contract culture, with associated professionalization of services and formalization of organizational and management structures, has changed the nature of the spaces available for volunteer participation. Indeed, within countries such as the United Kingdom and Australia and those within the Nordic region, it has been suggested that the developments within the voluntary sector have resulted in a growing division between *grassroots welfare organizations*, with their associational, membership model of volunteering and *corporatist welfare organizations* (or *hybrid organizations*) with their TPV model and which are growing increasingly large and effectively losing their voluntary aspects as volunteers are being displaced by paid staff or, where they remain, their roles and terms of engagement are changing (Billis and Harris 1992; Matthies 2006; Milligan and Fyfe 2005; Wijkström 2011).

The increasing formalization of some voluntary roles may deter potential volunteers and put increasing pressure on those who stay to deliver to a particular standard within a particular time period and to be accountable (Matthies 2006; Wilson, Hendricks, and Smithies 2001). In Denmark, for example, volunteer roles within schools were transformed from being a form of additional and informal help within the class to being written into the curriculum with associated monitoring requirements; these developments led to additional controls and performance measurements on volunteer effectiveness, which in turn led some volunteers to quit (GHK 2010).

In some cases, the developments have led to the replacement of volunteers with paid staff (Cloke, Johnsen, and May 2007), or at least a change in the ratio of paid staff and volunteers (Ellis Paine, Ockenden, and Stuart 2010), the emergence of a hierarchy of roles in which paid staff get the risky, high-profile roles with volunteers left with or opting for *ancillary tasks* (Gaskin 2005; Geoghegan and Powell 2006), and an associated shift in power dynamics between the two groups (Weeks et al. 1996). In Australia, for example, Stirling and Bull (2011) reported that ambulance services have developed over recent years from being small locally organized volunteer-led groups to large professional organizations with a mix of paid staff and volunteers. This had led to a pressure to professionalize volunteer management practices and an associated loss of voice for

volunteers within the organization. This finding led Stirling and Bull to con-clude that service volunteers are likely to be closer to a cheap secondary labor force than powerful active citizens because rather than collective agency being their main focus, helping and service are – this had meant that they were unable to resist the changes that had adversely affected them.

The growth in formal volunteer management practices also creates a chal-lenge for TPV. As studies from England have found, while professionalization and formalization are contributing to a general improvement in the volunteer experience, for some the introduction of the work-based model of volun-teer management has meant that volunteering feels too much like paid work and has become off-putting and alienating (Gaskin 2003; Leonard, Onyx, and Hayward-Brown 2004; Low et al. 2007).

The formalization of governmental intervention in volunteering has in some places resulted in the growth of service volunteering in VSPs and has ques-tioned the altruistic motivations of volunteering. In South Korea, where the government-dominant model has been established to promote citizens' par-ticipation in volunteering, formalization of volunteer management systems, such as formal certification programs of volunteering at national and local lev-els, has brought unexpected results (Korea National Council on Social Welfare 2012). Such formalization effort has contributed to increasing students' volun-teering for resume building and to decreasing citizens' participation in informal volunteering, which is essential for balanced development of volunteering.

7. How is TPV different from other types of volunteering?

As indicated in the above sections, it appears that TPV and TPVs are different from other forms of volunteering and the people who engage in them, although it is easy to fall into the trap of exaggerating these differences. A key aspect of these differences is that TPV mainly occurs in VSPs, not in independent MAs. Here are some specific TPV differences:

– Different demographics: To some extent the stereotyped view of who vol-unteers – well educated, middle class, middle aged, women – is true within TPV, although there is far more variety within TPVs and particularly between different types of organization than this suggests, and indeed some studies have found, for example, that men rather than women dominate TPV-type roles.
– Different motivations: TPVs are more likely to be motivated by the *values* function (of the Volunteer Functions Inventory/VFI; Clary et al. 1998) than other types of volunteers, although motivations vary according to volunteer demographics and organizations being served.
– Different types of organization: TPVs are found in organizations within both the voluntary and the public sectors as well as within hybrid organizations.

They are, by definition, concentrated within formal, bureaucratic welfare organizations.
– Different types of behavior: Reflecting their dominant motivations, their demographic backgrounds, and the characteristics of the organizations within which they are based, TPVs behave and are treated more like unsalaried staff than members.
– Different types of management: TPVs are likely to be regarded by their organizations as unsalaried staff – as resources to be deployed through formal management structures, which is a rather different approach to viewing volunteers as owners, members, or co-producers in associations (Ellis Paine, Ockenden, and Stuart 2010).

E. Usable knowledge

Emerging from the above discussions about TPV are a number of implications for policy-makers and practitioners. Over the past decade or so, governments around the world have shown an increasing interest in volunteering. Arguably, it is TPV that has been of most interest to policy-makers, representing a form of volunteering which (unlike campaigning and advocacy) is more about consensus than conflict (see, e.g., Milligan and Fyfe 2005). Indeed, it has been suggested that in Canada, government intervention in volunteering has resulted in the growth of service volunteering at the expense of more politically challenging forms of activism (Arai 2004). Careful thought needs to be given to what role governments could or should play in promoting volunteering.

For practitioners, the following implications emerge:

– Numbers: TPVs represent a significant core group of volunteers. Although there is no consensus, some figures suggest that the numbers of TPVs are declining or at least that the proportion of total volunteers that they represent is reducing. Given the scale of change in volunteering over recent years, it is easy to be distracted by new forms of participation and the demands of a new breed of volunteers. Practitioners, however, ignore their longstanding core group of volunteers at their peril. When attempting to recruit new TPVs, practitioners should emphasize on opportunities to fulfill the values function, while also recognizing that volunteers seldom come (or stay) with just one motivation.
– Diversity: TPVs are not drawn equally from across populations. TPVs tend, for example, to be better educated and more affluent than average. Attention should be paid to the barriers which may exist to participation, enabling a wider cross-section of the population to engage in TPV.
– Management: Consideration is needed as to the most appropriate style of management for TPVs in VSPs. Increasing formalization and

professionalization of the nonprofit sector have affected TPVs. While these changes may enhance the organization of volunteering, there is a risk that they may go too far and become off-putting. In Gaskin's (2003) words, practitioners must ensure a *choice blend* of formalized volunteer management practices, delivered in a flexible and supportive way.

F. Future trends and needed research

TPV seems to be fairly stable in its absolute frequency, but perhaps declining as a percentage of all formal volunteering, which is on the rise globally (see Handbook Chapters 50 and 51).

Although we have found many studies that are relevant, few focus specifically on TPV. Indeed, studies into volunteering tend to either be very general, failing to define or differentiate different volunteering activities, or very specific – focusing on very specific issues or developments or on individual organizational case studies, with little in between.

A further analysis of the salience of different types of volunteering – including TPV – around the world, with regard to the political context, welfare models, and nonprofit sector size, would be worthwhile. Further research into the scale of TPV and trends in its development at national and regional scales would also be beneficial. At a much smaller scale, further research is needed of volunteering within and across organizations to understand whether/how different forms of volunteering coexist, attract different groups of participants, are motivated by different factors, require different forms of management, and result in different outcomes.

Self-Help and Mutual Aid Group Volunteering

Carol Munn-Giddings (UK), Tomofumi Oka (Japan), Thomasina Borkman (USA), Grace L. Chikoto (Zimbabwe), Jürgen Matzat (Germany), and Rolando Montaño-Fraire (Mexico)

A. Introduction

This chapter explores a type of formal volunteering, carried out in groups, by peers who share a problematic health, economic, or social condition or situation. Peers meet together in self-help/mutual aid groups (SH/MAGs) to alleviate or improve their own circumstances. Of particular importance are the reciprocal social relationships in these groups – active participants both give and receive support. The chapter traces the broad history of SH/MAGs, reflecting similarities and differences in the co-authors' regions of the world. The benefits that accrue to people active in SH/MAGs are highlighted at a personal, collective, and community level. The authors explore how self-help/mutual aid is enabled, given the challenges currently facing this form of volunteering, including global economic austerity and the dominance of *professional* and paternalistic modes of help.

We use the dual term SH/MA to emphasize a distinguishing feature of this type of volunteering: SH/MA is an activity based on a kind of reciprocity known as the helper principle. This means that those involved in self-help are themselves helped and enabled while helping others (Riessman 1965).

Citizens meet face-to-face, by phone, or online in groups to engage in a series of freely given exchanges of stories, support, and advice. The process is one of patterned reciprocal exchange. Some studies of SH/MA groups suggest that the reciprocity in groups is not always *direct*, but rather entails what is termed *serial reciprocity*. Here a new member receives support and advice from peers, then *repays* this at a later stage of personal development. This is done by reciprocating the support either to the established peers or to a new member of the group (Richardson and Goodman 1983).

Through their social relations, a community of peers emerges in SH/MA groups. In the best outcomes, no status distinctions separate members. All people present share a common goal of alleviating or improving their own circumstances. In addition, either intentionally or otherwise, all share the goal of improving their broader community (whether based on geography or interest).

SH/MA groups rarely appear in the research literature on volunteering, though their type of activity shows some common features with other types of volunteering such as *gifting* to each other their time, labor, or other skills. Additionally, group leaders are catalysts; they encourage peer volunteers to meet and exchange stories and coping strategies. People attend SH/MAGs voluntarily, providing as members unpaid assistance and emotional support to other members, sometimes doing this outside of meetings (Borkman 2004).

B. Definitions

This chapter accepts the definitions in the Handbook Appendix. However, we focus here on SH/MA groups (SH/MAGs), for which there is no single accepted definition. Nevertheless, researchers tend to agree on three core characteristics: (1) SH/MAGs are run for and by people (nearly always volunteers) who share the same health, economic, or social problem or issue; (2) the primary source of participants' knowledge about their issue is direct experience; and (3) these groups operate *predominantly* in the nonprofit sector. Note that SH/MAGs usually spell out *SHGs* as *self-help groups* with a hyphen, but sometimes the unhyphenated version *self help* appears in publication titles or text.

By using the term SH/MA and focusing on groups, we distinguish this type of activity from individual *self-help* or *self-care*. The latter often involves personal use of a range of books, audio-tapes, DVDs, and TV programs generally written or presented by *experts* rather than peers. Peer- or member-led SH/MAGs are also distinguished from *professionally-led support groups*, although peer led groups can evolve from groups initially instigated by a professional. In SH/MAGs, management and ownership of the group are controlled by those sharing the experience of the issue/problem. Although the distinction between peer-led and professionally/expert-led groups is important, many SH/MAGs run for and by members call themselves *support groups*.

Another definitional distinction is that of *12-step* and *non-12-step* group. Originating in America, many SH/MAGs are based on the 12-step program established by Alcoholics Anonymous (AA). This program, developed primarily for people with addictions, entails adoption of and adherence to a set of *spiritually-informed steps*, the first being members' acceptance of their life-long addiction. Group meetings and *mentors* (often called *sponsors)* with the same addiction facilitate recovery from addiction.

To the United Nations Volunteers (UNV), SH/MAGs are one of four types of volunteering; mutual aid or self-help, philanthropy or service to others, political participation or campaigning, and social movement activism/advocacy – all of which are distinguished by their final purposes or outcomes (UNV 1999; Leigh et al. 2011). As a general rule of thumb, less formal and more "informal support systems and networks of mutual aid and self-help" are more likely to be a feature of less economically developed nations (UNV 1999:5). In line with other forms of volunteering in this Handbook, SH/MAGs can also be seen as a form of grassroots association (GA), as defined by Smith, Stebbins, and Dover (2006:102; see also Handbook Chapter 32).

Compared with other types of volunteering and associations in this Handbook, SH/MA is a most under-researched area with few large-scale or cross-national studies (e.g., Mäkelä et al. 1996; Wuthnow 1994). To ensure comparable subject matter in this chapter, we concentrate specifically on face-to-face SH/MA groups that reflect the authors' world regions and accessible research accounts.

C. Historical background

Mutual support as voluntary action has always been part of human society in one form or other, with anthropologists dating the existence of mutual associations to as early as the Neolithic period – at least 10,000 years ago (UNV 1999; Smith 1997b; see also Handbook Chapter 1). Handbook Chapter 9, on Informal Volunteering, deals with such mutual support as informal helping. Kropotkin (1914) argued long ago that as a result of evolution, mutual aid was built into human genetics. Many more recent authors have echoed his point, with convincing biological and especially genetic evidence (Smith 2016). The form SH/MA takes is linked to the economic, social, and political conditions in which it appears.

Early forms of SH/MA reflected the need for material support. In the medieval and feudal periods, SH/MA was traced to fraternities, confraternities, and religious guilds in the United Kingdom, Europe, and the Nordic countries (Davis-Smith 1995; Jaakkola 1993). Some of the oldest forms of single-issue SH/MAGs can be observed in countries with strong traditions (e.g., Japan). One example is the emergence in mid-13th century of self-help for the blind; they developed independent, hierarchical mutual-help guilds (Groemer 2001).

A tradition of *Tontine* guides self-help rotating credit systems in West and Central Africa; and in Senegal, self-help has been organized around *Mbootaay* groups, translated, "to nurture" (UNV 1999). In Kenya, the *harambee* tradition (translated "let's all pull together"), together with the tradition of interconnectedness embodied in *mtu ni wati,* translated, "a person is because of other people," continue to play key roles in influencing community volunteerism

and mutual help initiatives around health, water, agriculture, and education provision (Caprara et al. 2012; UNV 1999).

Single-issue groups in health and social care constitute a key development in the SH/MA form. They have mainly appeared since the 1950s as part of worldwide social movements centered on civil rights and the rights of women, gays, and the disabled. Most studies of single-issue SH/MAGS were published from the 1970s on, mainly in North and South America, Japan, Europe, and Scandinavia. They cover every conceivable condition from physical to mental health and addiction (Chenhall and Oka 2009).

Although not all SH/MA health groups consider themselves political, their existence still challenges the dominant medical model. Here physicians have the power to name and identify chronic diseases. Therefore, these SH/MAGs became more concerned with emotional aid and, like broader social movements, generated within themselves new perspectives about previously stigmatized or marginalized identities (Borkman and Munn-Giddings 2008).

In addition, the 12-step movement brought explicit recognition that experientially based support of peer mutual aid differs from both kin and professional support. According to Wuthnow (1994), 12-Step groups account for a third of all SH/MAGs in the United States. The influence of AA on other nations is also notable, although it tends to be much lower in Europe. For example, Janßen and Schneider (2013) give an account of 2,800 AA Groups compared to approximately 5,000 non-AA groups for alcoholics, whereas the total number of self-help groups in Germany is estimated at 70,000 to 100,000 (Matzat 2002). The forms that 12-Step groups take in any society can be determined by its national, cultural, political, and welfare systems. AA arose concurrently in the United States and Canada. Although their health-care systems differ, both are open, vibrant civil societies.

By contrast, Montaño-Fraire (1998) notes that autonomy is an essential part of SH/MA, which can be difficult to achieve in less democratic societies. The culturally specific interpretation of 12-step group texts influenced by the Catholic character of Spanish-speaking Latin American cultures offers an example. Here Mexican SH/MAGs have been transformed from a horizontal peer buddy system into a vertical, hierarchical "godfather" (*padrino*) system. Rather than being simply experienced peers, long-term members become surrogate fathers. This process undermines autonomous democratic structure pushing it toward one that is hierarchical (Robbins 1991).

The effect of cultural and political influences on the form that SH/MA takes is also noted by Oka (2013a). He observes that in Japan during the 1920s to 1950s, SH/MAGs were actively influenced by one of two opposing ideologies: Marxism and political conservatism. An example of influence by the former was the "Buraku" liberation movement (Neary 1989). Influenced by Marxist and socialist ideas, Buraku organized aggressive social action against the discriminatory

attitudes of Japanese authorities and society in general (Amos 2007). As the first Japanese anti-discrimination movement, it provided the prototype for later liberation movements for people with physical disabilities, leprosy, and tuberculosis.

We may conclude that political and welfare systems as well as cultural traditions help explain the shape that SH/MA and SH/MAGs take in any country (see Matzat 2010, for a detailed reflection on Germany).

D. Key issues

1. What does SH/MAG volunteering involve and where does it take place?

SH/MAGs are part of what Smith (1997a) terms the "dark matter" of the voluntary sector – the often hidden or unobserved grassroots (local, all-volunteer) associations. In SH/MAGs, people meet with others living in the same or similar circumstances or conditions to discuss and share ways of coping. This is usually done face-to-face, but as use of the Internet increases, some SH/MAGs hold "virtual" meetings online where members discuss issues. Depending on their own finances, face-to-face groups are likely to meet in a variety of places, including homes of members, churches (very common in the United States), community halls and rooms lent by individuals or organizations. As a result many groups fall "under the radar" of official understandings of or statistics on voluntary action and nonprofit organizations (see sections D 2 and 3 below).

Many groups meet weekly or monthly, but limiting conditions of members force some to meet less often. Meetings typically last an hour or two. Still, this pattern varies. For example, in Latin America, the bond of members to specific groups promotes intense participation. For many years, this bonding has been the driving motive for some SH/MAGs to hold several meetings per week, often one a day. There are also *24-hour groups* in Latin America; they commonly start early and continue late into the night every day of the year.

In Zimbabwe for example, Chikoto observed three urban-based women's SH/MAGs in 2012 (two were spinoffs of the original group with one or two common members) – commonly known as *Roundtables* or *Stokvels* in South Africa (G. Chikoto, personal observation, January 3, 2013). The ten members in the original group belonged to the same church, as well as lived within the same geographic area (the spinoffs extended beyond the original groups' geographical boundaries). All three groups were formed in response to the adverse impact the economic downturn was having on families. The ten members meet once a month at each member's home on a rotating basis. At each meeting, each member brings predetermined items of grocery (e.g., rice, cooking oil, sugar, and soap) and USD 20. Once pooled together, these items are divided and shared between two members, one of which is the host. The group also maintains an

emergency fund from which any member can borrow and repay with interest, within a specified period of time.

Apart from Rotating Savings and Credit Associations (ROSCAs; see for example, Anderson and Baland 2002; Benda, 2012; Chamlee-Wright 2002; Gugerty 2007; van den Brink and Chavas 1997), other types of SH/MAGs found in Africa include funeral societies (see Dercon et al. 2006), and health insurance groups (see De Weerdt and Dercon 2006), not to mention more formally incorporated groups such as the National Farmers Association of Zimbabwe (Bratton 1989).

At the core of the processes in all SH/MAGs is the sharing of one's own experience in what may be termed *a sharing circle*. One person narrates his or her story while others comment or juxtapose their own accounts (the order for this is flexible in some groups but, as prescribed by a chair, more formal in others). The sharing of these stories tends to illuminate not only how members are feeling but also how they coped (or failed to) with their situation. Typically, members discuss not only the problem/issue that brought them to the group, but other aspects of their lives as well (their relationships, work, etc.). The latter provides the broader context for understanding the impact on their lives of their health or social condition.

The type of knowledge exchanged is what Borkman (1976:446) calls "experiential knowledge." It is subjective. Such knowledge is based on *truths* learned from personal experience with a phenomenon. They differ from the *truths* acquired by discursive reasoning, reading, formal education, observation, or reflection on information provided by others.

A critical feature of the way in which SH/MAGs work is that members are learning together and building a collective knowledge base that remains in the group even after they leave it. The difference between an individual's experience of a health or social condition and this collective knowledge tends to be much underestimated by professionals and policy-makers. Yet, it is crucial in understanding how some groups have come to re-define their situation or condition. This creates *liberating meaning perspectives*, which challenge mainstream and/or professional understandings of their condition (e.g., Noorani 2012; Rappaport 1993).

2. How widespread are SH/MAGs in the world?

The anarchic, informal nature of SH/MAGs makes it difficult to count groups and members. Moreover, the dispute over definitions, and therefore over inclusion and exclusion criteria, force us to treat national estimates with great caution. To get a flavor of the data available, consider estimates in the United Kingdom and the Nordic countries, which suggest that less than 1 person per 1,000 population participates in SH/MAGs (Elsdon, Reynolds, and Stewart 2000; Karlsson 2002; Mehlbye and Christofferson 1992). In Germany, Matzat (2010) estimated that 100,000 SH/MAGs exist there (population: 82 million).

In Mexico, there are over 21,500 groups in a population of over 112 million and over 14,000 AA groups in the largest of four AA associations (Central Mexicana de Servicios Generales 2001).

The figures are much higher for the United States and Canada. Gottlieb and Peters (1991) reporting on a 1987 Canadian study, where people affiliated with SH/MAGs were regarded as volunteers (which is unusual), found that 20 per thousand (2%) of the population participated. Archibald (2007:2) estimated that 10–15 million people attended an SH/MAG in the United States. With a population at the time of around 313 million, this equals 32–48 people per thousand population (Archibald 2007:2). Wuthnow (1994:76) estimated in 1991 that there were 8–10 million members of 500,000 SH/MAGs in the United States.

In Africa, SH/MAGs are similarly under the radar, so participation rates are uncertain. The literature (e.g., Fafchamps and Ferrara 2012) suggests that SH/MAGs are ubiquitous in rural and urban Africa. Information on ROSCAs also suggests widespread participation. For instance, Bouman (1995) estimated a 50–95% participation rate in ROSCAs in rural Cote d'Ivoire, Liberia, Nigeria, and Togo. Based on a survey in Kenya, Kimuyu (1999) estimated that some 45–50% of the people participated in a ROSCA in Central Kenya. Based on a sample of urban Zimbabweans market traders, Chamlee-Wright (2002) found that 76% participated in a ROSCA, even though 77% had bank accounts.

3. Joining and participating in an SH/MAG

People who join SH/MAGs do so to be with others experiencing the same health problem or social situation. This goal distinguishes SH/MAG volunteering from other forms of volunteering. Diminishing social support and isolation (because of their condition/situation) may be key incentives prompting people to join groups, become active members and get more information bearing on their situation. Their assumption is that group members will be empathic (Charlton and Barrow 2002; Trojan 1989).

A common assumption about the motivation to join an SH/MAG is that people do so primarily because they lack support from existing social networks. This is especially true for countries or areas of countries where governmental support is limited. Studies in countries where there is (or has been) a strong welfare state usually show that people who attend SH/MAGs have the same welfare and family support as non-members, but are looking for something qualitatively different from their peers (Munn-Giddings 2003).

Since SH/MAGs are informal, and often "below the radar" of official statistics, demographic data on them is generally deficient We do know, however, that women in Canada, the United States, and the United Kingdom constitute the majority of members of most groups (Elsdon, Reynolds, and Stewart 2000; Gartner 1985; Gottlieb and Peters 1991). Black and minority ethnic (BAME)

groups tend to be under-represented in these countries, not only in SH/MAGs but also in professional treatment (Powell and Perron 2010). Migrants also tend to be under-represented, mainly because of language barriers but also because of cultural and religious traditions. Additionally Seebohm, Munn-Giddings, and Brewer's (2010) research in the United Kingdom indicate that people from BAME communities often prefer to organize around activities rather than single issues. Wuthnow (1994:47) conducted in 1991 a national representative survey of support groups of all kinds, including self-help groups. He found that membership was greater for women, people over 50, college graduates, higher income categories, Hispanics (vs. blacks or White Anglos), and residents of the West (vs. other US regions).A unique feature of the nature of SH/MAGs in Africa is how the poor help the poor (Caprara et al. 2012; Wilkinson-Maposa, Fowler, Oliver-Evans, and Mulenga 2005), suggesting a great deal of homogeneity within groups/MAGs (e.g., across income levels, gender, issue). The various African traditions of *harambee*, *tontine*, *mbootaay*, and *mtu ni watu* noted earlier, all demonstrate the significance and value of solidarity and reciprocity embodied in traditional family and community mutual help (Caprara et al. 2012; Wilkinson-Maposa et al.), as important motivators for participation in risk-sharing SH/MAGs.

Studies on risk-sharing strategies such as ROSCAs (Fafchamps and Ferrara 2012) highlight a variety of motivations for participation. For instance, based on a study in Kenya, Gugerty (2007) found that ROSCAs are likely to be attractive to those lacking a strong capacity to commit to future behavior on their own; hence ROSCAs provide a commitment mechanism. Participation in a ROSCA also allows the poor to commit to savings (Gugerty 2007), in addition to allowing them to cope with income shocks (Fafchamps and Ferrara 2012).

4. How are SH/MAGs formed and organized?

The concept of group is defined in the Handbook Appendix. SH/MAGs tend to be informal in structure and non-bureaucratic. These groups have both active members (they participate, possibly filling a special role like chair or treasurer) and passive members. The latter, sometimes termed *sleeping* or *paper members*, are officially part of the broader membership (e.g., mailing list), but rarely if ever attend meetings.

In North America and some parts of Europe and Scandinavia, two types of groups are evident, each having a sharply different organizational structure and evolution. The *Polymorphic* SH/MAGs conform to the definition of polymorphic nonprofit group presented in the Appendix (see also Schubert and Borkman 1991; Smith, Stebbins, and Dove 2006:178). The 12-step/tradition anonymous groups such as AA with their group template of informal rules and an egalitarian structure based on the 12 traditions exemplify this type of group (Alcoholic Anonymous World Services 1952). This template is available for any

alcoholic wanting to start a new group. New meetings and groups of AA can easily be convened following the 12 traditions as guidelines for organizing and running them.

Informal SH/MAGs – the core self-help activities are conducted here – are all unincorporated. The administrative/business part of SH/MAGs is left to formal organizations having a conventional nonprofit associational structure (e.g., legally incorporated and registered with the government). These service nonprofits, usually covering a metropolitan area, are directed by representatives from various local unincorporated SH/MAGs. The national-level SH/MAG service nonprofit organizations are also legally incorporated.

The *Monomorphic* SH/MAGs conform to the definition of monomorphic nonprofit group found in the Appendix (see also Smith, Stebbins, and Dover 2006: 146). Some groups are unique and isolated, either emerging spontaneously from the grassroots or convened as an offshoot of some other activity. For example, some professionally-led educational sessions inspire participants to find a common issue and organize their own group.

The two types evolve very differently. The polymorphic SH/MAGs, formed under federated or affiliated national organizations, usually persist as groups for many years. They have clear guidelines and a template for how to operate and maintain the group per se.

The monomorphic SH/MAGs, on the other hand, if they evolve, usually evolve into either a hierarchical nonprofit organization or a form of egalitarian, legally incorporated cooperative structure (thus becoming a self-help *organization*). In the second situation, they are vulnerable to co-optation by professionals, who change goals, eliminate volunteers in favor of professional paid staff, and drop the self-help ethos and practices (Archibald 2007).

How SH/MAGs form may be conditioned on their function and purpose. The formation of ROSCAs, for example, appears to rely on pre-existing social connections which are utilized to reduce the risk of failure, ex ante (van den Brink and Chavas 1997). Whereas South Africa's *stokvels* have been formed on a referral basis (Musonza 2012), the ROSCA observed by Chikoto in 2013 exemplifies a group formed on the basis of belonging to the same religious organization but more importantly, having had prior experience of mutual assistance in the past, albeit ad hoc (e.g., a assisting at a church member's funeral or wedding). Hence members knew each other well enough to rely on the threat of sanctions such as social ostracism and peer pressure as credible and effective strategies for reducing opportunistic or undesirable behavior (see van den Brink and Chavas 1997).

The informal structure of SH/MAGs enables them to form and survive even in communities with restrictive civil societies, among them Japan (Laratta and Borkman 2012). Post-communist countries like Croatia and Slovenia (Dill and Coury 2008) limit the kinds of groups that may form. This gives primacy to professionally-run support organizations.

Considering that face-to-face SH/MAGs are usually formed within specific geographical locations (e.g., specific towns/villages or specific churches within an identifiable neighborhood), members within an SH/MAG are likely to meet, interact, and socialize outside of the group.

5. To what extent do SH/MAG members/leaders meet informally outside of regular meetings?

Most SH/MAGs not only allow but even encourage their members to get together outside of meetings as sponsors/buddies, as experts with extensive SH/MAG experience. Further, SH/MAG members meet even more informally as acquaintances or friends. Mutual aid friendships often develop from these external involvements. The growth in some countries of social media contact within SH/MAGs highlights another avenue for external involvement (ESTEEM 2012).

As an example, the American Self-Help Clearinghouse was regularly asked how groups provide support outside of meetings. In response, this organization developed a list of such activities, including sponsors/buddies, telephone trees, telephone lists, visitation programs at hospitals, newsletters, online message exchanges, and group/organizational liaisons (see http://www.mededfund.org/NJgroups/SupportBetweenGpMeetings_Am.pdf).

6. What are the main factors that influence the impact/success of SH/MAGs?

Determining what may count as "success" in an SH/MAG is a political matter. For example, in the current economic climate, we are aware that funders of groups often examine such criteria as numbers of attendees at meetings and rates of use of services. Since these criteria rarely interest SH/MAG members, emphasis on them tends to confuse their understanding of the role and function of their group (ESTEEM, 2012).

Another way to understand success is to consider the impacts or benefits attributed to group membership over time. Table 18.1 summarizes some common findings on both the individual/ interpersonal levels and the collective level of contributions to community and society. The findings are from self-reports and objectively measured outcomes.

Additionally, a number of studies suggest that attendance at an SH/MAG leads to improvements in health, management of health, or both (e.g., Barker and Pistrang 2002, Pistrang, Barker, and Humphries 2008; see also Handbook Chapter 52).

7. How is volunteering changing in SH/MAGs and similar groups?

There are a number of factors affecting the nature and form of SH/MAGs at present. First, the global economic climate is affecting both the type of support

Table 18.1   Benefits attributed to SH/MAGs

Individual and interpersonal benefits:

Improved confidence, self-esteem, emotional well-being, sense of empowerment

Sharing of experience and coping mechanisms; mutual support; friendship

Gain information, practical coping tips, and new skills

Improve symptoms and health-promoting behaviors, reduce distress of chronic conditions (heart and lung disease, sickle cell, diabetes, HIV, mental illnesses, substance abuse disorders)

Reduce costs of medical and psychological treatment and rates of re-hospitalization

More discerning and cooperative patients for physicians and other clinicians

Opportunities to help others

Parent groups of sick children have increased self-esteem and social support, less distress, reduced child mistreatment, and improved caretaking abilities

De-stigmatized and de-medicalized identities (mental illnesses, alcohol, and other drug disorders)

Collective level that benefits community and society:

De-stigmatized and de-medicalized identities (mental illnesses, grieving, alcohol, and other drug disorders)

Change "patients" into self-determining service-users/consumers

Critique/deconstruct and influence professional practices and services, medical diagnoses/conditions (personality disorder-UK, mental illnesses, postpartum depression, grieving-Japan)

Contribute to national health social movements in the US and UK (women's health, AIDS, disability, mental illnesses)

Source: Adapted from Munn-Giddings and Borkman (2005), SCRA resolution (2013), and Borkman and Munn-Giddings (2008).

and the nature of support that people need. For example, in Japan, Oka (2013a) notes that many people rather than going to SH/MAGs for help with their difficulties, now tend to choose less costly measures. Many people prefer to access information from group websites instead of encountering real members in meeting places. Also, online groups are springing up to fill this gap, while offering interesting cross-national forums.

Nevertheless, in developing nations such as Mexico, access to the Internet is restricted to the more affluent members of society. In addition, online groups may be unattractive in some cultures. For example, in a comparative study of Japanese and Koreans, Ishii and Ogasahara (2007:252) found that, compared with Koreans, Japanese tend not to regard personal relations via the online community as "closely associated with the real-world personal relations."

Another effect of the present-day economic downturn is that people's problems are often more complicated and severe than earlier. Some large self-help

groups are losing members and have let many people attend meetings who do not contribute socially and financially to the group (e.g., without paying membership fees, donating or doing volunteer work). Many would-be SH/MAG members are now jobless, family-less, friendless, and surviving on welfare in an individualized (atomized) society (Ronald and Hirayama 2009; Suzuki et al. 2010). Because SH/MAGs have traditionally been organized around a single issue, they may not help people with multiple problems.

In the United States, the success of SH/MAGs has vaulted them into mainstream health and social services. But success has also pushed SH/MA to accommodate professional services, amounting to cooptation (Borkman 2011). Many member-led groups are disappearing or being converted to support groups run by professionals. In the last 15 years, public discussion uses the term *support groups* – an ambiguous, generic term – to signify both professionally-controlled and led groups and member-owned and member-led groups.

In Mexico, new forms of SH/MAGs have emerged in the context of social, economic, and political instability. Montaño-Fraire (1998) notes a cultural and political trend back to religion, which is manifesting itself in a novel and fast-growing series of 4th and 5th step groups. These smaller groups, largely unassociated, are more akin to strict Catholic-run organizations than to any of the region's other self-help groups. These include participation in rigid spiritual retreats, which may last several days and have the form of the centuries-old Catholic model.

8. What current challenges are being faced by SH/MA volunteering and SH/MAGs?

The impact of the recent worldwide recession might be seen as providing a common challenge to SH/MAGs. However, the form these adaptations took was varied. For example, in the United States, Borkman (2011) has observed a large increase in the number of support groups led by professionals sponsored by hospitals and health-care institutions. In the United Kingdom, the situation is more complex. National policies actively promote and explicitly advocate support for SH/MAGs, which on one level may be a belated recognition of the value of these groups vis-à-vis the broader agenda of civic involvement. Nonetheless, an environment of austerity budgets and a move in some areas (e.g., mental health) to replace some professionally led groups by SH/MAGs or by 1:1 peer support, the unique contribution of SH/MAGs risks being misunderstood. Thus, they are sometimes seen as an inexpensive version of professionally led support groups, if not as a service replacement.

Montaño-Fraire (1998) notes that Mexico faces, in common with other countries of the periphery, daunting challenges: social, economic, and political instability; disregard for the rule of law; and an educational environment where knowledge and empowerment are felt to threaten established interests and

paternalistic modes of interaction and education. Popular disbelief in science reflects a mistrust of research as the only source of objective knowledge. This is often the norm among the poor and those with limited education living in Mexico and other Spanish-speaking countries in Latin America.

These changes have implications for research. In the United States, research on SH/MAGs by social scientists has slowed to a trickle. Conversely, in Europe and the Nordic countries, there is renewed interest in SH/MAGs in relation to broader issues of user-involvement (Matzat 2010). Recently, European and Nordic research networks have emerged, with the potential to coordinate previously disparate but related SH/MAG research. Language barriers exist, however, since most research publications are rarely available in English, and English-language studies are rarely translated. This situation means multi-national conversations among researchers can be challenging.

9. What are the main barriers to SH/MA volunteering and SH/MAGs?

The earlier sections allude to some key barriers/obstacles for SH/MAGs, namely, that government leaders and health professionals alike often fail to understand the fundamental nature and ethos of this type of peer volunteering. Such people may take measures that could damage or undermine the very essence of SH/MAG volunteering. An example from Japan centers on the differences between professionally-led and peer-led SH/MAGs devoted to post-suicide trauma. Professionals regard long-term and even lifelong grief as pathological, prescribing psychological grief care to overcome it. By contrast, peer-led SH/MAGs advocate *living with grief* as their liberating meaning perspective (Oka 2013b).

Across much of the globe, debates and policies are encouraging (for both humanitarian and economic reasons) citizen participation and an enriched civil society, including the formation of SH/MAGs of various types. SH/MAGs grow by themselves anyway. Yet, if further development is wanted, government can promote such growth by providing conditions and structures enabling this outcome.

In some countries, explicit policies underpin and promote SH/MA. For example, in Norway, a national plan for self-help is embedded in governmental plans for fostering resource centers and projects. Other countries have enabling infrastructures such as self-help clearinghouses (once described in recommendations to WHO-Euro 1982). These organizations, prevalent in Germany and some other European countries, network and provide information and developmental support to SH/MAGs. In Germany, perhaps more than any other country, self-help groups, self-help organizations, and self-help clearinghouses are accepted in society, as both people-made contributions to the national health and social system and fora for citizen representation in consultation and decision-making bodies. Consequently, they are financially supported (mainly

by the statutory health insurance funds), and they have legal status in some committees. Joint efforts of self-helpers, experts supporting them, researchers presenting positive results, and politicians of various parties (conservatives, social democrats, and the *Green* party) led to this development (Matzat 2002, 2010). Nonetheless, such governmental intervention is sometimes unwelcome. In Mexico (Montaño-Fraire 1998), the general mistrust of public policy and of people proffering professional expertise (including charitable initiatives) stirs resistance from SH/MAGS and their leaders.

Significant differences can be observed between SH/MAGs and professionals, possibly reflecting the presence or absence of welfare systems in different countries. Karlsson (2002) refers to a continuum between conflict and consensus models. The SH/MAGs toward the left of the political continuum typically grow from disillusionment with existing professional services or their lack. The United States and Mexico are found here. Conversely, SH/MAGs in countries whose welfare systems actively support SH/MA are more likely to fall toward the right of the continuum, particularly some Nordic and other European countries. General as it is, this scheme hides the nuances in any system.

Finally, many people with special behavioral problems or illnesses prefer to keep these issues to themselves, because of the social stigma attached to them (e.g., alcoholism, drug addiction, sex addiction). That is the basic reason why so many SH/MAGs use the anonymous format, with only first names (never surnames; but often the first initial of a surname) used in meetings and real identities protected. Even with this personal privacy format, many people with problems are reluctant to join HS/MAGs because of felt stigma, and ignorance of the details of the anonymous format (Rudy 1986).

10. Can involvement in SH/MAG have negative impacts on members/participants/volunteers?

The SH/MA literature still has a small research base, written (naturally) mostly by advocates. There are few concerted critiques or discussions of possible disadvantages of SH/MAGs. The literature that exists tends to discuss *negative potentials of groups* from either a medicalized perspective (ignoring the social aspects of groups) or raises concerns about possible privatization of what could or should be public concerns and its impact over time on SHG facilitators.

As noted earlier, tensions are likely to arise between professionals and SH/MAGs. Health professionals (without empirical evidence) may not alert service users to relevant groups, fearing *misinformation* or increased emotional distress believed to result from attendance. Wilson (1995), bolstered by more recent studies (ESTEEM 2012), concluded that some health professionals found it difficult to perceive SH/MAGs beyond their own paid-professional frame of reference.

From a different perspective, contemporary policy and practice interests (e.g., integrating previously institutionalized groups into the community) raise concerns that single issue groups may be perceived as stigmatizing. SH/MAGs may be seen as actually increasing isolation from mainstream society, rather than reducing it (Wann 1995). Similarly, some feminists argue that self-help is an apolitical variety of identity politics (Kitzinger and Perkins 1993), stressing private and therapeutic solutions over public and institutional ones. Taylor (1996) and Borkman (1999) strongly reject this view contending it is a partial and inaccurate understanding of SH/MAGs that fails to perceive or acknowledge the broader impact of group membership.

11. How is SH/MAG volunteering different from other types of volunteering?

Whereas Section 1 outlined some similarities with other forms of volunteering, there are also some distinctive aspects of self-help volunteering. While self-helpers are, on the one hand, free-will volunteers (nobody forces or pays them), they are, on the other hand, not completely free to choose their altruistic activities. That is, the *type* of SH/MAG they join is constrained by either their health condition or their socio-economic situation. Additionally, the relationship between helper and helpee develops over time. People apt to join an SH/MAG are usually in despair, fear, confusion, and helplessness. They expect and hope for support from others who are (at least at that moment) in better psychological condition, have more knowledge and experience, can give good advice, and perhaps provide a decent model from which they may learn.

But over time, having developed their own coping style, SH/MAG members/ volunteers often come to serve other participants. Now they are helpers. In these groups and organizations, long-term members continue to participate, because they have learned and internalized the mechanism of sharing as a basis for continued personal wellbeing. Thus participation is motivated, at least initially, more by fundamental self-interest than by purported good Samaritan activity. But continued participation as a peer-helper brings out the social altruistic rewards that accompany the personal psychic benefits.

12. What theories or models of self-help volunteering and SH/MAGs exist?

In relation to their internal workings, a number of group dynamics theories (Forsyth 2006) help explain group processes in SH/MAGs, exemplified by those about organizational change and development which bear on informal groups and formal organizations. Brown and Lucksted (2010) review the theoretical foundations of mental health self-help, covering among others, behavior setting theory, role theory, empowerment theory, helper-therapy principle, experiential knowledge, social comparison theory, and the social support theories. Humphreys and Rappaport (1994) discusses spirituality change,

life history and identity change, friendship-networks, and politicization and empowerment as useful theoretic frameworks for understanding SH/MAGs for alcohol or drug problems.

Borkman's (1976, 1999) decades of research on groups focuses on what is theoretically distinctive about SH/MAGs. She developed the concept of experiential knowledge. She also explored the relevance of collective experiential knowledge that accumulates in groups over time emphasizing its potential not only to help individual members cope with or face their particular condition but also to begin to challenge commonly held assumptions and views about their situation. This is illustrated in Rappaport's (1993) research on identity and norm creation through the development of SH/MAG narratives. New detailed work on discursive practices in SH/MAGs (Noorani 2012) demonstrates how techniques produced in groups render, for example, the experiences of mental distress both understandable and communicable.

Other theories tend to situate SH/MAG activities in relation to their broader civic role. They consider whether the development of SH/MAGs (a) is indicative of a retreat from civic life, as people focus increasingly on their own narrow concerns (Bauman 1999) or (b) creates spaces for reflection on the reality of current politics. This alternative centers on questions of identity, ways of living and personal services. In the case of ROSCAs, references have been made to Robert Putnam's social capital as being central to their success (e.g., Benda 2012; Grootaert and van Bastelaer 2002).

More recently, some scholars have returned to Habermas' (1984) theory of lifeworld activities and communicative spaces as a way of theorizing the types of conversations and processes in SH/MAGs and their nuanced implications for the civic role of groups (Chaudhary, Avis, and Munn-Giddings 2012).

E. Usable knowledge

The most important idea for practitioners and policy-makers to grasp is the uniqueness of SH/MAGs. Such groups are not a substitute for professional services, but rather an activity that provides something that cannot be replicated in professional-client relations. This uniqueness resides in the experiential knowledge, peer-helping social relations, and special, non-hierarchical processes of these groups. Professionals and policy-makers have much to learn from SH/MAGs: Sometimes the knowledge generated within them challenges our pre-conceptions of a health condition or problem situation. At other times, such knowledge can complement and inform professional service development.

Policies that support facilitative infrastructures, such as clearinghouses that link groups and provide them with resources, can nurture this type of volunteering. Equally, facilitative and sensitive practitioners can help an SH/MAG to

blossom. Conversely, policies and practices that fail to recognize the ethos of these groups, particularly the importance of their reciprocal member relations, may be damaging.

These suggestions sound simple. Yet, in nations, where hierarchical relations prevail (e.g., Japan), these principles and practices can be difficult to enact. Similarly, in countries facing economic and political turmoil (e.g., Mexico), SH/MAGs may fill in for professional services but also risk being perceived as politically threatening (unless they adopt a traditional role and format). Finally, existing guidance based on research and practice knowledge could be collated, shared, and adapted across nation states to inform practitioners and policy-makers (ESTEEM 2012; Phillis Silverman in Katz 1992:85; Wilson 1995).

F. Future trends and needed research

Lacking accurate, quantitative data on trends in SH/MAGs for virtually all nations, we cannot say anything concrete about future trends. However, anecdotal evidence suggests that SH/MAGs are growing in numbers globally, and so are the numbers of their participants.

We believe that more cross-national research could illuminate the specific ways that national policies and cultural practices shape the forms of self-help and its SH/MAGs. Given the distinctiveness of SH/MAGs, we must also develop and apply research methods more fitting to the principles of self-help activity. There should be more participatory action research involving self-helpers that is driven by their own as well as academic agendas. It should be conducted on the micro-level (e.g., to benefit the participating SH/MAG), the meso-level (e.g., how to change doctors' behavior in local health units), and the macro-level (e.g., how to make members' voices heard in legislative processes).

Comparative studies of the nature and type of support members get from face-to-face groups vis-à-vis online and professionally-led groups are important in making the case for each (see Barker and Pistrang 2002). More in-depth study of the motivations of SH/MAG members/volunteers is needed, examining psychological variables as well as the demographics of participation. Of special importance is determining whether the motivations for SH/MAG volunteering are different from the motivations for formal volunteering in general, and how. However, it is rare for researchers to study SH/MAGs along with other types of MAs, so that comparative data are lacking. Studying SH/MAG volunteering using S-Theory would be useful, as part of a larger study of formal volunteer motivation (cf. Smith 2015). Also lacking are rigorous studies of SH/MAG impacts on their members (but see Zemore and Pagano 2008, as one exception).

Finally, it is important to build on the new and innovative studies of the next generation of SH/MA researchers. Examples are: Noorani's (2012) detailed look at the techniques and processes underlying the development of experiential

knowledge and Boyce's (2012) study examining the highly stigmatized area of self-harm and the role SH/MAGs play for their members.

Participation in Trade and Business Associations

Marina Saitgalina (Russia), Ting ZHAO (China), Robert A. Stebbins (USA), and David H. Smith (USA)

A. Introduction

This chapter focuses on trade and business associations (TBAs) and their general importance in contemporary societies. Such associations differ from other associations studied in this Handbook by having collective or organizational members, usually for-profit businesses, not individual persons as members. Topics reviewed include trade association activities, origins, member motivations, internal structures, factors affecting impact/success, types of positive and negative impacts, variations among types, changes occurring, current challenges, barriers to participation, public policy impacts, and theories. TBAs are major supporters for the business sector in nearly all contemporary societies and often have a powerful influence on government laws and policies in democratic nations.

   We will examine how such organizations are similar to and different from other types of organizations covered in this part of the Handbook. TBAs (including chambers of commerce) are one type of occupational-economic association. Occupational-economic associations in general date back about 2,500 years in human history (see Handbook Chapter 1). Other types than TBAs include consumer and producer/worker cooperatives, farmers'/peasants' associations, trade/labor unions, certain civic clubs (e.g., Rotary, Kiwanis, Lions), professional associations, and academic-scientific-scholarly societies. Worker and consumer/service cooperatives are covered in Part III of this Handbook, but we lack the word count/print space to cover the other types of occupational-economic associations here.

B. Definitions

Most of the key terms in this chapter are defined according to their entries in the Appendix, which are accepted here. The umbrella concept of occupational-economic associations, however, warrants special attention. One

of the oldest purposive types of voluntary associations, this kind of association has as its main goal(s) the protection, maintenance, and enhancement of the occupational and/or economic and financial interests/benefits of its members. Unlike most purposive types of associations, occupational-economic associations in the past century or two have included associations with collective or organizational members, as well as individual persons as members. Guilds in ancient Rome were one of the earliest examples of occupational-economic associations (Waltzing 1895), but guilds were also present in other ancient civilizations in urban areas (see Handbook Chapter 1). In contemporary nations, occupational-economic associations accounted for over 6% of individual member participation circa 2000, according to survey data reported in Dekker and Halman (2003:63), based on the World Values Survey/European Values Study wave of 1999–2001, covering 50 societies. Three percent was labor union participation and 3% was professional association participation.

Within this broad category of occupational-economic associations, we find farmers'/peasants' associations, trade/labor unions, certain civic clubs (e.g., Rotary, Kiwanis, Lions), professional associations, and academic-scientific-scholarly societies as major subtypes with *individual members*. The major subtype of occupational-economic associations with *organizational members* is the trade/business association (TBA, or TBAs) or associations of businesses of a certain type (e.g., the American Association of Manufacturers).

C. Historical background

The historical background of occupational-economic association volunteering as a phenomenon is covered in detail in Chapter 1 of this Handbook (see also Smith 1997). As suggested above, such associations arose quite early in the history of associations and the Voluntary Nonprofit Sector (VNPS), going back perhaps 2,500 years, or even earlier.

Research on occupational-economic associations in general also goes far back into history, with the detailed research on *collegia* (occupational-professional associations) in ancient Rome being one fine example (Waltzing 1895). Handbook Chapter 1 also has many references to more recent but still centuries-old research (see references in Drekmeier 1962; Kloppenborg and Ascough 2011; Morse 1909; Ross 1976; Weisberg 1967). This research from prior millennia and centuries mainly consists of histories of occupational-economic associations, largely focusing on guilds of merchants or craftsmen until the rise of trade unions and employers associations beginning with the Industrial Revolution circa 1800 (Smith 1997).

D. Key issues

Thirteen key issues related to TBAs are discussed in this section.

1. What do TBAs do and where does activity take place?

There are different names used worldwide to describe TBAs. And though different names identify some differences between them, they all embody a type of entity that is established with activities geared toward the improvement of a particular industry or type of business (Reilly, Hull, and Braig Allen 2003). This purpose differs substantially from, for example, that of civic associations, many of whose missions have charitable, advocacy, or political priorities.

Generally, across different countries authors have mentioned a handful of essential roles that TBAs should play to stay relevant to their society and industry. These roles include information and knowledge exchange, licensing, standardization and certification, and consequent activities such as training, improving effectiveness and efficiency of their industry or profession, and increasing general awareness about the importance of the aforementioned activities (Pedraza, Vajaradul, and Alvarez 2011). Pedraza et al. (2011) identified these four roles as specifically applicable to all occupational-economic associations in the Pacific and Latin American regions. Greenwood, Suddaby, and Hinings (2002) indicated that occupational-economic associations, TBAs included, are significant regulatory entities as well as agents of change. In Gråbacke and Kristoffer's (2013) study of trade associations in Denmark and Sweden, their effect on the clothing industry was mixed, for there was growth of the industry itself but a decline in domestic manufacturing.

This pattern of essential roles of TBAs fails to hold in China. In his study of business associations in Yantai, a coastal city in eastern China, Foster (2001) found 38 business associations, or 14% of the total of 267 associations, with memberships including nearly all the major enterprises operating in most industrial and commercial sectors. The link between the association and its membership is exceptionally weak, however. Business associations tended to be concerned mainly with trying to entice their members to take an active interest in the associations and its activities. Those few TBA members who manage to attain high positions in the leadership structure of the association can become actively involved in forging close and beneficial links with the sponsoring government agency and with other members. The benefits for most members of participation in Yantai's business associations are therefore limited.

2. Who starts TBAs, how, and why?

All TBAs emerge where there is a need for coordination that would reduce transaction costs, increase industrial quality, protect property rights, and so on (Doner and Schneider 2000). To ensure that such goals are met, there is need for a strong institutional structure that also includes density of membership in an industry, assured by offering selective benefits. This describes well these associations that have emerged in developed countries.

TBAs in developing countries, on the other hand, oftentimes follow different paths of creation. According to Schneider (2010), the emergence of TBAs in Latin America is to a large extent a result of the state operating with a delegated mandate to help deal with economic recessions. Park (2009) argued that, although TBAs can be self-organized to take collective action on a problem, their cooperation with government is indispensable for successfully dealing with emerging financial stressors.

As examples in China, consider the Self-Employed Laborers Associations (geti laodongzhe xiehui), the Private Enterprises Association (si ying qiye xiehui), and the All-China Federation of Industry and Commerce (gongshanglian). Unger (1996) found that at the district level, these groups seemed democratic and *bottom-up* when selecting their leaders, even though those elected were pre-selected by the officials themselves. The overlapping of Federation and Association personnel is repeated at the national level of these two types. Indeed, a TBA can be largely state corporatist at the national level, but much less stringently so at the local level of operation.

Nevertheless, a significant degree of associational autonomy does sometimes occur on a regional level in developing countries. Thus, Yu, Zhou, and Jiang (2012) studied the TBAs in Wenzhou, a city in east China. They found that 87.1% of these associations were established to meet the demands of markets and industrial development, while 4.8% and 3.2% of them were set up because of government decentralization and the needs of large-sized enterprises, respectively. After studying Chinese Associations in general, Ma (2006) concluded that TBAs in Wenzhou are bottom-up organizations, in which the enterprises themselves, which are mostly private, established associations to protect and represent their interests.

In short, trade associations can emerge in bottom-up fashion in developed countries, but in developing countries, they often see the light with the help or instigation of governmental interests.

3. What motivates and triggers individual firms' involvement in TBAs?

Individual firms' involvement with TBAs is triggered by an array of factors, ranging from workplace experiences to social relationships outside of it (Beynon, Davies, and Davies 2012). Generally, prospective TBA members weigh costs and benefits of their involvement in terms of the selective benefits they will receive, as well as broader industrial support and advancement that this relationship can yield (Perry, 2012). For Umapathy, Jamba, and Ritzhaupt (2010), individual firm involvement is motivated by such benefits as networking, information sharing, development programs, and community services, in addition to considering such costs as time, travel, solicitations, and the like. Pyle (2005) also noted that members of TBAs in contemporary Russia enjoy

such benefits as networking, new technology, and training. These benefits also attract new members.

By contrast, because the primary members of TBAs are firms not individuals, their motives for being involved in associations often differ from those characterizing individuals as members of associations. Hedberg (2011) investigated firms' motives for engaging in associational membership in post-communist countries. She found that under strict regulatory conditions firms are, when dealing with the state, driven to cooperate with others to reduce risks of uncertainty. Specifically, the author mentioned such benefits as information dissemination and arbitration mechanisms that help compensate for inadequate legal and enforcing systems in those countries. Heritier and Eckert (2008) came to the same conclusion in their study of European countries, where legislative threat was a primary reason for initiating associations in the paper and plastic recycling industry. Another study by Yakovlev and Govorun (2011) focusing on Russia found that "larger companies, firms located in regional capital cities, and firms active in investment and innovation" (p. 6) are the ones joining business associations more so than others.

4. How are TBAs organized?

Yep (2010) studied the Self-Employed Labourers Associations (SELA, geti laodongzhe xiehui), Private Enterprises Association (PEA, si ying qiye xiehui), and All-China Federation of Industry and Commerce (FIC, gongshanglian) in the local branch of Huantai, a coastal county in eastern China. He found that SELA adopts an automatic membership system under which whoever registers as the owner or worker of a private/individual enterprise becomes a member. By contrast, the admission policy of the PEA and FIC is much more stringent. Involvement and approval of the local party organization is an indispensable part of the member admission process of these business associations.

Pearson (1994) examined the Chinese Association for Enterprise with Foreign Investment (CAEFI). She learned that the national organization has 40 sub-associations (in provinces, municipalities directed under the center, and autonomous regions) and local associations (in provincial or municipal jurisdictions containing large numbers of foreign-funded enterprises). Membership in the association is usually held by the enterprise itself, though individuals may join in some TBAs. Membership appears to be voluntary, since there have been no signs of coercion to join. Nevertheless, CAEFI and its branches are closely tied to the Chinese state with respect to establishment, leadership, and functions.

Suzuki (1995) mounted a study of the peak (umbrella) TBA in Japan (Japanese Industrial Club, Japanese Economic Federation and Japanese Federation of Economic Organization) and the peak TBA in the United States (i.e., National Association of Manufacturers). His goal was to compare inter-organizational

collective action and hierarchy. He found that the Japanese peak associations restricted their membership and exercised authority over their members based on prestige and state support. In contrast, the US association tried to maximize its membership and could not exercise authority over its members.

Kim (1997) investigated the role of TBAs in the textile industry in South Korea. He discovered that the executive vice chairmen and the executive directors of major TBAs are mostly recruited from retired government bureaucrats. In general, executive vice chairmen originate from the bureau director level, whereas executive directors come from the division director level.

The research reported in this section suggests that TBAs vary considerably across the planet according to the ways they are organized. Thus, they seem more likely to face some sort of state control if they are national than if they are local or regional. The degree of control these TBAs have over their members also seems to vary, running from little to considerable control. And variation in this regard occurs depending on whether an association's members are organizations or individuals, with more control likely if the members are individuals (e.g., in professional associations).

5. How else do TBAs vary systematically?

Variations in TBAs within one nation, and more generally in TBAs across different countries, have been studied by Andersen, Curtis, and Grabb (2006) and Curtis, Grabb, and Baer (1992). They found that the level of a country's economic development, which triggers the influx of both material and human resources, gives a boost to industries and professions and their corresponding occupational-economic associations. Another factor affecting systematic differences in TBAs is such industry characteristics as composition and heterogeneity (Perry 2012).

Schaede (2000) examined membership and budget in Japanese TBAs. A database consisting of 1,153 associations in 28 industries was created, based on the biannual publication *Dantai Meikan,* the *Association Directory*, for 1990/91. As of 1991, the median size of membership for the 1,153 associations was 78, while the median annual budget amounted to roughly USD650,000. A median of 20 directors (i.e., presidents of the member companies dispatched to serve on the association's board of directors) was supported by a median of four employed TBA staff. Reflecting the differences in size and number of association members, budgets varied significantly across the several types of associations (Schaede 2000:37).

In sum, all TBAs also vary generally by the level of national economic development, nature and degree of association composition and heterogeneity, size of budget, and size of board of directors.

6. What are the main factors that influence the "success" and impact of TBAs?

Knack (2003) investigated the conflicting claims of Olson (1982) and Putnam (1993) concerning the impact of associational memberships on generalized trust and economic performance. On the one hand, Olson argued that associations act as special interest groups lobbying for preferential policies and imposing disproportionate costs on the rest of society. He maintained that organizations representing the interests of large groups of persons, such as consumers and taxpayers, will not emerge, but that organizations representing the interests of smaller groups will often succeed eventually in overcoming difficulties of collective action, with adverse consequences for economic performance. He included TBAs in this set.

On the other hand, Putnam (1993) saw memberships in horizontal associations in a more favorable light, as a source of generalized trust and social ties conducive to governmental efficiency and economic performance. Associations, he observed, "instill in their members habits of cooperation, solidarity, and public-spiritedness" and participation in civic organizations creates "a sense of shared responsibility for collective endeavors" (Putnam 1993:89–90). Nevertheless, using cross-national data, Knack (2003), in studying the impact of associational memberships on generalized trust and economic performance, found little support for Olson's view of the impact of groups and only mixed support for Putnam's perspective.

Explaining the growth of some Sub-Saharan (Mauritius, Zimbabwe, and Zambia) African TBAs, Bräutigam, Ranker, and Taylor (2002) mentioned three factors essential for success that should be present in both business and government: leadership, ideas or ideology, and capacity. The authors also noted that these external and internal factors played a substantial role in forming business–government relations in the Asian region. Another factor mentioned is associational lobbying activities and effectiveness in representing and advocating for the interests of members and the industry (Govorun 2010). The author found that TBAs can be an effective lobbying tool in Russia for member-firms to use, making membership in their association enduring and attractive. Elsewhere, Schneider and Doner (2000) identified four conditions necessary for a TBA's success both to sustain itself and to be a powerful player in the policy arena. These are stable membership, essential selective benefits, established membership connections, and healthy membership–staff relations.

Unger's (1996) study, described earlier in this chapter, also revealed that an association's degree of autonomy or subordination, effectiveness or ineffectiveness is determined by the combined impact of the following multiplicity of factors: the central government's policy toward each association; genre of agency chosen by the government to stand in a supervisory capacity over an

association; location and bureaucratic level at which the branches of an association operate; and strategic status of the TBA constituency. Among the other relevant factors are the voluntary or compulsory nature of an association's membership (the more elite a constituency the more likely membership in its association is voluntary) and an association's sources of income.

It is evident that there are several essential factors for success that should be present in both TBAs and the government: leadership, ideas or ideology, and capacity. A TBA's degree of autonomy and level of effectiveness (especially in lobbying) are also important.

7. How are TBAs changing?

A main trend worldwide is internationalization, of which there are two main variants: Europeanization and globalization (Schneider and Grote 2006). Europeanization is the internationalization of Europe, whereas globalization is internationalization on a world scale. An increase in cross-border transactions, social and political linkages, culture transfers, and the like are manifestations of internationalization. These processes affect TBAs, as they do many other economic organizations.

For instance, Raynolds (2004:730) describes globalization as it has unfolded for many of the world's organic food TBAs. She observes that in many of the Latin American countries, interest in regulating organic quality claims has come largely from producers seeking access to and legitimacy in North American markets. Citing Scialabba (2000), Raynolds notes that producers in Latin America (as well as in Africa and Asia) have joined with exporters and are now certifying organizations to form organic trade associations that work with Northern distributors to create South–North trade circuits. Many of these individuals and groups have also joined the International Federation of Organic Agriculture Movements (founded in 1972) to enhance their position in Northern markets. Since internationally traded items lose their valuable organic labels if they do not adhere to import country or Codex standards, organic trade associations in the South have typically supported local certification systems which apply Northern standards.

Off-shoring – a distinctive expression of internationalization – is bringing another major change to trade and business associations. Klein (2005) writes that "offshoring is moving any business process to a foreign location. It isn't necessarily the same thing as outsourcing, by the way. You could still own that process and offshore it." "Outsourcing," she says, "is allowing any third party to take on a function in your organization." The latter is an old process, whereas the former is much more recent, a child of internationalization.

Between 2000 and 2005, Hahn, Doh, and Bunyaratavej (2009) examined a data set of more than 850 information technology and software off-shoring projects in 55 host countries across the world. From the Duke and Archstone off-shoring study of 2005, the authors learned that competitive pressure was

cited by 71% of executives surveyed as a motive to off-shore. The Hahn, Doh, and Bunyaratavej (2009) study revealed that the competitive environment, as represented by the move by all participants toward country locations with greater risk, creates a climate in which firms feel pressure to consider those same riskier locations. It was concluded that this is especially likely in newly internationalizing and emerging industries, such as information systems. Moreover, and in line with Issue 7, the clustering of firms in a given industry appears to mitigate some of the risks for assets achieved by creating a large and growing constituency that can leverage its influence by establishing trade associations. A prominent example is the National Association of Software and Service Companies in India, a trade association that represents both foreign and domestic firms, many of them involved in information systems off-shoring.

8. What special challenges are currently being faced by TBAs?

After studying the industrial TBAs in the city of Wenzhou, Yu, Zhou, and Jiang (2012) found that the common constraints facing industrial associations were shortage of competent professionals and funds, legal status, relations between the government and the association, self-development, function orientation, and the administrative system. Data from their survey on these constraints revealed that the biggest one was "lack of support from the government" (72.9% of respondents), followed by "lack of funds" (62.7%) and "human resources" (42.4%). The other constraining factors were less important. They included "administrative system," "membership density," and "support from members," accounting for 10.2%, 13.6%, and 23.7%, respectively. The lack of governmental support and shortage of funds and competent professionals have become the leading constraining factors inhibiting further development of TBAs (p. 107).

TBAs in Mozambique were concerned about the quality of services offered by private firms in that country (Rebella and Carrilho 2003). Representatives of these firms have taken training courses and attended seminars in this area outside the country. Nonetheless, the private sector involvement in both the setting of standards and the provision of services to improve equality is quite limited. No consultants or consulting agencies exist that specialize in business development. Thus, it falls to firms and TBAs to give priority to activities that raise quality and to become more active in the production and implementation of activities planned jointly with National Institute of Standardization and Quality at the Ministry of Industry and Trade.

9. What are the main barriers or obstacles to TBAs?

On the organizational level, a main obstacle that TBAs face is the governmental regime. In some countries, TBAs share this fate with professional associations, as Moore and Salloukh (2007) found in their historical analyses of Jordan, Kuwait, and Syria. In post-Mao China, TBAs have been described by a dualism of

cooperation and opposition (Pearson 1994).TBAs, though hardly autonomous under state oversight, have been growing in prominence and also becoming increasingly adversarial in representing their industrial interests. The Farmer's Professional Association (Shen et al. 2006) exemplifies this trend.

Porter (1998) has identified another important obstacle to the effectiveness of trade associations, one that is inherent in them. He notes that

> in the past, collective action in the private sector has focused on seeking government subsidies and special favors that often distort competition. But executives' long-term interests would be better served by working to promote a higher plane of competition. They can begin by rethinking the role of trade associations. (p. 88)

These entities often do little more than lobby the government, compile some statistics, and host social functions. They are missing an important opportunity, because they have become set in their ways.

Porter holds that TBAs are capable of providing forums for the exchange of ideas and focal points for collective action in overcoming obstacles to productivity and growth. TBAs can take the lead in such activities as establishing university-based testing facilities and training or research programs; collecting cluster-related information; offering forums on common managerial problems; investigating solutions to environmental issues; organizing trade fairs and delegations; and managing purchasing consortia.

10. Can involvement in TBAs have negative impacts on members/participants?

The answer to this question is "Yes, they can." For example, Lenox and Nash (2003) examine four environmental self-regulatory programs run by TBAs in the chemical, textile, and pulp and paper industries. They studied a sample of over 4,000 firms within these industries, finding evidence that, in at least one self-regulation program, more polluting firms tended to join, whereas in another association, cleaner firms were more likely to join. Their findings have important implications for firm managers. On one hand, more polluting firms may seek to undermine program enforcement so as to allow their own entry and continued membership. However, any benefit they receive will probably be temporary, as their presence as polluters drives down the value of participation. On the other hand, firms with superior environmental performance should establish strict monitoring and sanctioning mechanisms. This would ensure that self-regulatory programs do not attract polluting firms that have a negative effect on the value of TBA membership. Cleaner, less polluting firms gain from preventing adverse selection into self-regulatory programs.

In another example of negative impact, Bresser (1988) discusses some possibilities for combining collective and competitive strategies. Combinations can be problematic, however, if competitive intentions are disclosed through the information links resulting from these strategies. Thus TBAs provide member organizations with special services at low costs. For instance, they may distribute trade statistics, provide credit references on customers, offer legal and technical advice, or help collect bills. In addition, these associations can aid in removing decision-making uncertainty stemming from interdependence. Since trade statistics generally include prices quoted in recent sales transactions as well as cost developments, member organizations have the opportunity to coordinate their market behavior and thus implement a collective strategy.

Nevertheless, the dissemination of statistical information provided by TBAs may have the *negative impact* of undermining the desire of focal organizations to maintain secrecy regarding their competitive strategies. While firms are often in favor of price and cost reporting activities, they run the risk that other sensitive information about their competitive strategies may also be revealed. TBAs sometimes analyze industry trends regarding product development or marketing strategies, thereby allowing competitors to anticipate each others' moves. Moreover, a focal organization may have little control over the kind of information being disseminated, because trade associations are often dominated by a few powerful organizations.

11. How are TBAs different from other types of volunteering and associations?

Park (1987) found in South Korea an important difference separating TBAs from other types of voluntary associations, namely, the substantial levels of governmental control of these groups. A singular peak or comprehensive association of business exists in the Korean Chamber of Commerce and Industry, which provides for the compulsory membership of businesses in the chamber. The most influential business organization is the Federation of Korea Industry, whose membership is strictly limited to big enterprises and its leadership positions occupied by a tiny circle of the richest businessmen. The interests of small businesses are supposed to be represented by the Small and Medium Industry Cooperatives. All TBAs are extremely susceptible to governmental manipulation, and they spend most of their energies reacting to various drafts prepared by the government rather than initiating their own policies. TBA leaders are occasionally consulted in the decision phase of the policy process, but their effective ability to initiate rational policy is viewed somewhat contemptuously by governmental policy-makers.

Park (1987) says that many big businessmen have other channels through which they can influence the government: personal relationships, power brokering, outright corruption, and political contributions to politicians or the

ruling party. In the professional sector, relatively prestigious or highly income groups such as medical doctors, accountants, lawyers, and pharmacists have created their own associations without help from government, and these have been financially independent and autonomous in their activities. But, for relatively alienated and lower income professionals such as artists, writers, educators, and news writers, their associations were created on the initiative of government and rely heavily on it for their finances. They are usually led by people acceptable to government.

Park (1987) then turns to the peasant/small farming sector where the only nationally organized association for general peasant interests is the Federation of Agricultural Co-operatives (FAC), and approximately 93% of the peasants are members of co-ops. The FAC was designed to provide services rather than to represent peasant interests before the government. Basically, the FAC has four functions: collective sales, collective purchase, credit service, and technical advice, guidance, and education. The FAC is operated as a governmental agency, and the government supervises its organizational activities. About 70% of its budget depends on borrowing from the government. Moreover, all co-operative leaders at each level are appointed by the president of FAC, who is appointed by the government. Apropos this cozy arrangement, the Korean Catholic Peasant Association and the newly organized Christian Peasant Association are not favorably viewed by government and are at least indirectly repressed. Their memberships are small, but they sometimes attract national attention because of their ability to create and gain attention to political issues.

12. How are TBAs related to public policy?

East Asia provides numerous examples of TBAs helping to expand and deepen government policy changes, such as infrastructure innovation, property rights protection, and even reduction of government corruption (Doner and Schneider 2000). For instance, in the 1970s, the Thai Gem and Jewelry Traders Association successfully took the initiative to reduce government corruption in one of its operation cycles. The Philippines offers another positive example. Here business associations such as the Philippine Chamber of Commerce and Industry and the Makati Business Club are actively influencing national economic reforms (Mikamo 2013).

The New Zealand Wool Brokers Association has become a prominent policy player in its own country (Ville 2007). On the individual level, Menon and Daftary (2011) found that, compared with membership in social associations, involvement in unions, civic associations, and professional groups was positively related to individual political activity in both Brazil and India.

In his study of Yantai, China, Foster (2001) found that under authoritarian rule there, TBAs provided opportunities for a segment of the business community to gain significant power over the general population of firms and develop close ties with state leaders. After conducting surveys of large

companies in China about their lobbying strategies on national government economic policies, Deng and Kennedy (2010) concluded that the TBAs are less active compared with the large companies, but apparently more influential. The authors contrast the lobbying behavior (information strategy, public relations strategy, trust-building strategy) and lobbying targets (e.g., State Council Agencies, local government) of the large companies and national TBAs. Both the large companies and the national business associations believed they have a substantial effect on Chinese public policy.

After studying the industrial associations in Wenzhou, Yu, Zhou, and Jiang (2012) found that there are three primary channels used by TBAs to participate in making public policy. Two are formal and one is informal. Policy participation primarily involves policy advocacy and formal participation in the policy-making process.

In Japan, Schaede (2000) found two types of TBAs: peak and core. A core association is the central group for a narrowly defined industry at either the national or regional level. A peak association is the umbrella organization, or federation, for several core associations on the national level or in a more broadly defined industry. Japanese TBAs are separated into associations dominated by large companies, and cooperatives consisting exclusively of small and medium-sized enterprises. The umbrella organization, headed by Keidanren and the large industry federations, are in charge of overall business representation in the policy-making process. They represent business interests through three primary routes: *shingikai* (government deliberation councils) participation; informal interest group pressure on politicians and bureaucrats; and contributions to political campaigns. At the level of core associations and cooperatives, the primary associational function lies in the economic and regulatory realm (p. 67). The informality of Japanese policy-making is often assumed to be much more extensive than in Western countries. A more informal way to influence politics is through personal contacts with regulators and politicians (p. 61).

Clearly, effective influence on government with reference to a TBA's mandate is desirable for the association. Depending on the society and its culture, this can be achieved in a variety of ways, among them helping to expand and deepen government policy changes, such as innovations in infrastructure, protection of property rights, and reduction of government corruption. Lobbying pressure on politicians and contributions to political campaigns are some of the other means of TBA influence.

15. What theories or models of TBAs exist?

Two major and opposing approaches can be identified here. One is Olson's (1965) rent-seeking motivation of coalitions, where individuals cooperate to selfishly advantage only themselves. This approach emphasizes individual opportunism. There is an alternative approach set out by Doner and Schneider

(2000), who stress the ability of TBA activity to resolve collective action problems.

Seen from the above-mentioned studies on TBAs in East Asian countries (primarily China, Japan, and Korea), most of the authors use corporatism and civil society to explain state–society relations or criticize their limitations. Besides these two dominant theories or models, some studies (e.g., Foster 1996, 2001, 2002) use an institutional perspective. The latter may someday be shown to have the greatest explanatory power.

E. Usable knowledge

Issues 6, 8, 9, and 10 contain information that may be considered usable knowledge for readers of this chapter. In this regard, Schneider and Doner (2000) identified four conditions necessary for a TBA's success both to sustain itself and to be a powerful player in the policy arena. These are stable membership, essential selective benefits, established membership connections, and healthy membership–staff relations. In Issue 8, we observed that it falls to firms and TBAs to give priority to activities that raise quality and to become more active in the production and implementation of activities.

In Issue 9, Porter enjoins TBAs to rethink their role. These entities often do little more than lobby the government, compile some statistics, and host social functions. But having become set in their ways, they are missing an important opportunity. Porter holds that TBAs are capable of providing forums for the exchange of ideas and focal points for collective action in overcoming obstacles to productivity and growth. Associations can take the lead in such activities as establishing university-based testing facilities and training or research programs; collecting cluster-related information; offering forums on common managerial problems; investigating solutions to environmental issues; organizing trade fairs and delegations; and managing purchasing consortia.

Nevertheless, the dissemination of statistical information provided by TBAs may have the negative impact of undermining the desire of focal organizations to maintain secrecy regarding their competitive strategies (Issue 10). While firms are often in favor of price and cost reporting activities, they run the risk that other sensitive information about their competitive strategies may also be revealed. TBAs sometimes analyze industry trends regarding product development or marketing strategies, thereby allowing competitors to anticipate each others' moves. This is to be avoided where possible.

F. Future trends and needed research

Industrial capitalism in various free and constrained guises will likely continue to expand globally in most nations. Because of financial rewards in such

nations, TBAs of all kinds will likely also continue to proliferate in future decades. What is in some ways remarkable is the growth and effectiveness of TBAs as a distinctive form of occupational-economic association, with for-profit businesses as organizational/collective members, even in authoritarian regimes such as China or Russia. TBAs are a kind of institutional hybrid organizational form, with elements of the business sector as well as of the nonprofit sector often combined successfully.

Unlike all other major types of associations, *occupational-economic associations*, in general, and especially TBAs, in particular, as discussed in this chapter, *are ultimately focused on self-serving, for-profit goals, not on various other types of possible goals that motivate other types of associations and volunteering by their members*. This is *not* to say that member motivations and goals of all other association purposive types are purely altruistic (e.g., Smith 1981). Our point is that the self-serving, non-altruistic focus-goal-motivation is clearest and most blatant in TBAs and in occupational-economic associations more generally, as compared to most other types of associations (see Handbook Chapter 3).

Smith (1981) cogently argued that *all volunteering involves some self-serving motivations, and the same can be said for all associations and association types*. What varies is the *degree* of self-serving versus collective, other-serving (unselfish, altruistic) motivation and its implementation versus *lip service* (mere talk). This aspect of volunteer motivation and association goals needs much more research across all association purposive/goal types.

More generally, much more research is needed on the internal structure and processes/operations of TBAs and how these factors affect external relations, especially with government, but also with other businesses. In particular, research reviewed here suggests that we need to know much more about the extent to which TBAs can be and are independent of government in various nations, and why this is or is not the case. Some TBAs, especially very large, wealthy, or peak associations, are not independent of their national governments, even in non-authoritarian nations. While more frequent in nations practicing corporatism (see Handbook Chapter 46), such cozy dominance relationships can also occur in supposedly pluralist political regimes.

Participation in Worker Cooperatives

Marcelo Vieta (Argentina), Jack Quarter (Canada), Roger Spear (UK), and Alexandra Moskovskaya (Russia)

A. Introduction

This chapter discusses different models of worker cooperatives ranging from those that are predominantly economic associations, or a form of employee ownership, to those that are more collectivist and emphasize workplace democracy, community commitment, and cooperative ideals. Worker cooperatives that focus upon employee ownership are primarily a variation of a business corporation; worker cooperatives with a more collectivist orientation are primarily a form of cooperative, but with members who are employees rather than consumers of a service or primary producers such as farmers. More recently, hybrid arrangements have been created that integrate a worker cooperative within a business corporation and a cooperative, a multi-stakeholder cooperative or social cooperative. Takeovers of abandoned investor-owned businesses resulting in worker cooperatives are a growing phenomenon in South America.

At first glance, it may seem odd to include a chapter about worker cooperatives within a Handbook on Volunteering, Civic Participation, and Nonprofit Associations, but there are commonalities. Worker cooperatives are member associations, and generally involve high levels of member participation in decision-making, probably more than the norms for nonprofit membership associations. Worker cooperatives are close to the subset of nonprofits that earn their revenues from selling their services in the marketplace. In addition, worker cooperatives must adhere to the first cooperative principle of the International Cooperative Alliance (ICA) – *voluntary* and open membership – and must be open to workers willing to accept, voluntarily, the responsibilities of membership.

As will be seen in the discussion of the worker cooperative models under Key Issues, there are differing worker cooperative models ranging from those without share capital, which have the character of a nonprofit, to those with share capital, that are analogous to a business partnership. Most worker cooperatives fall between these extremes, with some characteristics of a nonprofit, particularly democratic decision-making, and some characteristics of a business.

B. Definitions

In addition to the definitions in the Handbook Appendix, which are suitable for this chapter, we add the key concept of worker cooperative. *A worker cooperative, also referred to as a labor-managed firm* (Vanek 1977)*, is a voluntary association of employees who own the cooperative and operate it democratically*. The employees who belong to the cooperative are its members with one vote each, like citizens in a political democracy (Ellerman 1990). A worker cooperative is an anomaly that differs from the predominant arrangements for cooperatives based either upon consumers of a service (see Chapter 21) or upon producers, typically farmers. In both consumer cooperatives and producer cooperatives, the employees normally have a conventional employment relationship with the cooperative and usually are not members. In a worker cooperative, in contrast, the employees are members and responsible for the firm's governance (Hansmann 1996).

Consumer cooperatives (see Handbook Chapter 21) have had greater appeal because they demand much less from members than a worker cooperative. In a consumer cooperative, members typically pay a nominal fee to join, norms for participation are minimal, and members can choose to purchase the service elsewhere. Worker cooperative members experience a form of double jeopardy: their job is tied to the firm's success, and they may have a financial stake that is at risk. Therefore, exiting may be difficult (Dow 2003). In addition, members of a worker cooperative are expected to make time commitments that are in excess of the normal job requirements through participating in committees, the annual general meeting, and possibly serving on the board of directors; these can thus be additional voluntary activities linked to membership in a worker cooperative.

A worker cooperative also differs from the predominant business arrangement based upon the sovereignty of private property, often in the form of shares, and which seldom engages employees in strategic management. When a business practices democracy, it is usually limited to decisions specific to the employees' workspace and is referred to as participatory management or workers' participation (Bayat 1991). These arrangements differ from a worker cooperative, which typically engages the employee-members in the strategic direction of the firm, including decisions about expansion, asset sales, closure, and election of the board of directors from among their group.

C. Historical background

Informal worker cooperatives have existed from the early 1800s in the United Kingdom and France, but the Rochdale Co-operative Manufacturing Society, a cotton mill started in Rochdale, England, in 1854, is believed to be the first

formal worker cooperative. Since then, the need for private capital has proven to be a major challenge in developing worker cooperatives, particularly in more capital-intensive sectors. This issue was noted by the early 20th-century cooperative theorist, Beatrice Potter (2004). This problem influenced the international cooperative movement to emphasize consumer cooperatives rather than worker cooperatives.

Worker cooperatives were also formed in North America in the latter part of the 19th century. The Knights of Labor, an influential labor confederation, was active in organizing worker cooperatives for their members in the 1880s (Kealey and Palmer 1987). In the United States, Leland Stanford, who made a fortune in the railroad business and served as the governor of California and as a US senator, unsuccessfully put forward a bill in 1886 to create a legal framework for incorporating worker cooperatives and later endowed Stanford University to promote cooperatives and worker ownership (Altenberg 1990).

The worker cooperative also had an early history in France, inspired by the Paris Commune of 1871, which led to worker takeovers of abandoned firms, a practice which has recurred periodically, especially during times of economic downturns or political instability (Bayat 1991; Vieta 2013, 2014).

In Russia, the abolition of serfdom in 1861 and some civil reforms by the tsarist government directly stimulated peasant credit cooperatives and had an important influence on the creation of worker cooperatives, other forms of cooperatives and voluntary associations. In the period following the failed attempt to overthrow the tsar (1905), enthusiasm for developing cooperatives spread. By 1917, just prior to the Russian Revolution, there were an estimated 63,000 cooperatives in Russia with 24 million members (Fain 1998). About 780 of these were worker cooperatives. The first worker cooperatives appeared even before the abolition of serfdom, but their greatest development was early in the 20th century in the processing of agricultural products (e.g., butter-making, cheese and potato processing, and flax milling). Worker cooperatives continued to grow, and by 1932, there were estimated to be 18,600 with about 1.6 million members including forest products and fishing (Fain, 1998).

The late 19th and early 20th centuries represented the first wave of worker cooperatives. A second wave emerged, more international in scope, starting in the 1970s, eventually including countries in Europe (especially in the south), Argentina, Brazil, Venezuela, Uruguay, United States, Canada, and India (Shaffer 1999). Many factors have given rise to the second wave, including the idealism of the 1960s and 1970s in Western democracies, Perestroika in the former Soviet Union, deteriorating economic conditions in countries such as Argentina, and the publicity received by the striking success of the Mondragón Cooperative Corporation in the Basque Region of Spain (discussed in the next section).

D. Key issues

In this section, we discuss five models of worker cooperatives, followed by the circumstances through which they originate and then other key issues that flow from the discussion.

1. Five worker cooperative models

(a) Model 1: Share-capital worker coop

This is the oldest arrangement for worker cooperatives and it requires that the members purchase shares, though there is only one vote per member. In share-capital cooperatives, outgoing members normally sell their shares to incoming members at a price determined by the market. In a successful company, the purchase price for incoming members can become very high. Therefore, these co-ops can have difficulty recruiting new members and often either become either dependent on hired labor or are sold to private owners (Ben-Ner 1984; Ellerman 1990). Therefore, this model is vulnerable to the market forces that imperil a business and also vulnerable to the consequences of success. The degeneration of a firm into a dependence upon hired labor or its sale is most likely if a group of the members coming to retirement are going to have difficulty realizing the proper value for their shares through a sale to new members. Forestry and plywood cooperatives in the United States have encountered these challenges (Greenberg 1986) as have worker cooperatives in Israel and Western Europe (Russell 1995). The use of this structure may be one reason why so few worker cooperatives are found in the United States (Artz and Kim 2011). However, if worker cooperatives are treated simply as an economic association of employee owners, there may be more advantageous models such as Employee Stock Option Plans (ESOPs). An ESOP is a trust fund analogous to a defined contribution pension plan to which retiring owners gain tax advantages for selling their company (Kruse, Freeman, and Blasi, 2010) and currently embraces about 10% of the US workforce (ESOP Association 2011). However, only a small subset of these ESOPs has a structure that approximates a worker cooperative.

(b) Model 2: Share-capital worker cooperatives with indivisible reserves

Within Europe and Latin America, adaptations to the share-capital worker cooperative have attempted to overcome the long-term weaknesses of the individual share-ownership model and have developed a model more aligned with cooperative values and less with employee ownership (Dow 2003) – a more socially and economically collective model preferred by the ICA. One solution requires that a portion of the asset value of the cooperative be collectively owned as an indivisible reserve. A certain percentage is mandatory in many European countries. In Italy, the law requires that at least 30% of annual profits be allocated to an indivisible reserve (Corcoran and Wilson

2010; Fici 2013). This arrangement allows the cooperative to keep membership entry fees at affordable levels and to have a stable core of finance that can serve as security for bank loans. Moreover, it creates the basis for employee-members' democratic control (Zevi 1990). The maintenance of an indivisible reserve has allowed Italy's cooperatives to gain tax breaks through providing a public good of jobs for future generations – a form of intergenerational solidarity. This more collective orientation can also be seen in the limited distribution constraint on dividends in Italy's worker cooperatives (an attribute recognized in the ICA principles), and the asset lock where upon dissolution the assets pass to another cooperative rather than to the members. Italian cooperatives with an indivisible reserve (called "prevalently mutualistic" cooperatives) also commit 3% of their profits into cooperative development funds and are members of local *consorzi* (consortia) that strengthen management and marketing capabilities (Fici 2013).

(c) Model 3: The Mondragón model

The Mondragón model was started in 1956 amidst desperate conditions in post-war Europe as a small firm manufacturing paraffin heaters. This is *the major* example of a group of worker cooperatives, which has evolved into a mid-level transnational corporation, the Mondragón Cooperative Corporation. This Corporation had USD 19.4 billion of revenue (EUR 14.1 billion) and a workforce of more than 80,000 in 2012 (http://www.mondragon-corporation.com/eng/). Mondragón is a bifurcated arrangement: Within the Basque country, it has a cooperative structure; elsewhere, where more than two-thirds of the employees are situated, Mondragón's subsidiaries, often partnerships with other businesses, have a conventional employment arrangement without the rights of membership. Mondragón has recently introduced associate membership within its foreign subsidiaries and has introduced some of its cooperative practices, such as open information on finance, worker committees, and profit sharing.

Within the Basque country, Mondragón's structure has adapted the share-capital model to conform more to the ICA model with its collective features (Irízar and McLeod 2010; Whyte and Whyte 1988). Within the Mondragón system, the investment by new members is independent of the market value of the firm, the usual measure for share value in a share-capital cooperative, and is fixed at the equivalent of one year's salary or EUR 15,200 in 2012. This arrangement makes entry more affordable to new members. Members of the cooperative each have an account that is retained in the firm until they leave, at which point it is paid to them (or converted into an annuity). The account includes their initial investment and their accumulated share of the firm's annual net income or profits plus interest, which is usually 6%. They also receive a pension.

Normally, 70% of the annual net profit is paid to the members of the cooperative, but it is divided equally between the individual's account and a collective indivisible reserve account that represents the collective wealth of the cooperative. In addition, 20% of the annual net income is set aside immediately for the collective reserve account (which if there was a liquidation would not pass to members but would go toward public benefit). The combination of these factors has given the corporation a vast pool of wealth to invest in expansion and development.

Within the complex Mondragón corporate structure, there is a financial division – the *Caja Laboral Popular* (or *Working People's Bank*) – that shares with outside banks financing the system's development, in effect mobilizing the local population's savings. This arrangement has helped Mondragón overcome weaknesses that have plagued share-capital worker cooperatives: the availability of reasonably priced capital for expansion and the maintenance of the initial member investment at an affordable amount. The *Caja Laboral* also addresses another worker cooperative weakness – entrepreneurship – by providing venture capital for new cooperatives and technical assistance through its Entrepeneurial Division.

Other noteworthy features of Mondragón are its heavy investment in research and development through a series of research centres – Ikerlan, Ideko, and Garaia – and in education, initially through a technical school and then through Mondragón University. Like the Italian coops, Mondragón cooperatives are organized into industrial groups, which facilitate the exchange of labor. These groups are tightly linked to the overall Mondragón federal body.

Mondragón has a strong, collectivist value system of creating employment and development in the Basque country. For example, normally 10% of the net income is dedicated to an Education Fund to promote cooperatives, the cooperative university, and general community development. This amount of community contribution is staggering compared to the average corporation, where 1% is considered excellent. Mondragón is a bold and highly successful initiative in community economic development, much like the cooperative network in the Emiglia-Romagna region of northern Italy (Logue 2006). However, Emiglia-Romagna and other integrated systems of cooperatives (see Wilkinson and Quarter 1996) are based upon consumer, financial and producer cooperatives, with some large worker cooperatives; Mondragón is based upon an integrated system of worker cooperatives, with some other forms of cooperatives included. Mondragón's worker cooperative core makes it unique.

(d) Model 4: Non-share worker cooperative

Non-share worker cooperatives represent an idealization of the cooperative model – high levels of member participation and a strong collectivist orientation – that is, the anti-thesis of capitalist business. Non-share worker

cooperatives shun equity investments by members as a means of financing because of the concern that member equity creates a capitalist dynamic with greater preoccupation with share values than the conditions of work. Most non-share worker cooperatives are micro-businesses in alternative services, such as whole foods, and have a strong sustainability ethic and are often rooted in broader social movements. These organizations are democratic collectives, similar to other nonprofit collectives, and with a membership that is likely to accept wage flexibility at times of crisis.

In the United Kingdom, the non-share worker cooperative was inspired by the alternative economic and social movements in the 1970s that led to the formation of the Industrial Common Ownership Movement (ICOM). ICOM was founded in 1971, with encouragement from an eccentric industrialist and devout Quaker, Ernest Bader, who in 1951 converted his privately held chemical firm into a non-share worker cooperative called the Scott Bader Commonwealth and gave it to his employees (Hoe 1978; Quarter 2000). By 2001, when ICOM merged with Co-operatives UK, ICOM had 2,000 member cooperatives. However, that was the high point for the movement. In general, this form of organization has remained on the social margins, albeit still of great practitioner and intellectual interest.

Non-share worker cooperatives tend to be small because they finance their development through loans and retained earnings, without member equity investment and often without the benefit of indivisible reserves (Ellerman 1990). Some economic disadvantages to this approach are: the coop can be burdened with debt payments that are a financial drain; the ability to raise external financing is hindered by a lack of member investment; and a non-share structure creates a disincentive to retain the firm's earnings for modernizing equipment, because such investments become social property over which workers have no claim. In summary, the non-share worker cooperative tends to be underfinanced (Vanek 1977). Not having shares may also be unfair to the founding members because even though their labor has contributed to developing the cooperative, if they departed before the firm has earned a good income, they are unlikely to receive an appropriate financial return for their labor and would have subsidized those who entered the firm after them. However, non-share worker cooperatives emphasize their social advantages of a highly democratic and egalitarian workplace; they may view themselves as a radical collectivist organization that is part of a political movement to change the economy. To ensure this commitment, upon dissolution their assets are transferred to another cooperative.

(e) Model 5: Hybrid worker cooperatives

At first glance, a hybrid arrangement could be viewed as compromising the ideals of a worker cooperative, but there are some apparent advantages, given the

struggle of worker cooperatives to establish a presence in modern economies. There are two relevant categories of hybrids: a worker cooperative within a business corporation; and the multi-stakeholder cooperative where employees are one of several categories of people who may be members (Spear 2010). We shall discuss each of these in turn.

(i) A Worker Cooperative within a Business Corporation. This arrangement may seem unusual, but it has existed within Québec since 1985, encouraged by provincial legislation and a tax credit program. This program allows the employees of an existing company to form a worker cooperative, and then to purchase a portion of the stock and enter into an agreement with the other shareholders (Canadian Co-operative Association 2011). The employees are members of the worker cooperative and govern it according to the cooperative principle of one member/one vote. In addition, the cooperative has representation on the board normally proportional to its company stock. The worker–shareholder cooperative makes it possible for groups of employees to participate economically in larger, better financed enterprises than is usual for worker cooperatives. Some worker–shareholder cooperatives are buyouts of financially troubled companies, but most involve companies in good financial shape.

There are variations of this arrangement in Argentina (Ruggeri 2009) and in France, where a worker cooperative, known as SCOP (Société coopérative ouvrières de production), need not own a company in its entirety, but must own a minimum of 51% (Craddock and Kennedy 2006). Again, this recognizes the challenges that groups of workers have in financing ownership arrangements of any scale. However, there are also risks of degeneration and less member democracy in these arrangements (Côté 2001).

(ii) Multi-stakeholder Cooperative. One of the first initiatives of this sort was Eroski, founded in 1958 and currently the Retail Division of the Mondragón Cooperative Corporation and among the largest retailers in Spain and the south of France. Eroski has two stakeholders or membership classes: the workers and the consumers. Both in the general assembly and the board of directors, the votes are split evenly between these classes of members, but the chairperson of the board must be a consumer (Irizar and McLeaod 2010).

This hybrid arrangement has also taken root among cooperatives in social services – typically referred to as social cooperatives. In Italy, these social cooperatives have grown in popularity (Borzaga, Depedri, and Tortia, 2010; Defourny 2001), often serving people with disabilities and on the social margins. These cooperatives have a strong collectivist orientation with tight *asset lock* rules ensuring that the firm's assets are always engaged in *socially entrepreneurial* activity that meets the interests both of their multi-stakeholder members and

of the broader local community, while protecting the co-op's members during economic downturns. In the Type-B social cooperative, a unique form of state-supported *work integration* co-op, at least 30% of employee-members must consist of otherwise unemployed or unemployable people who benefit also from national insurance contribution exemptions. The co-op receives exemptions from certain taxes and the organization must focus on "programs, activities, and services related to labor force integration" (Gonzales 2010:227).

Type-A social cooperatives provide other social services such as care for children, the elderly and disabled, and immigrant integration. Most of Italy's social cooperatives also rely on member and non-member volunteers (Becchetti and Borzaga 2010). Both Type-A and Type-B social cooperatives have highly constrained distribution rights and therefore may be considered like nonprofit social enterprises, incorporated as a cooperative, with membership also open to users, volunteers, community leaders, and employees. This model, or variations of it, has been picked up in Sweden, the United Kingdom, Belgium, France, and Poland. The terminology also varies by country. For example, Québec refers to such organizations as solidarity cooperatives (*les coopératives de solidarité*; Girard 2008); in France, they are referred to as SCIC (Société coopérative d'intérêt collectif).

2. How worker cooperatives originate

Worker cooperatives originate in differing ways, the most common being a start-up of a new enterprise via *social entrepreneurship*, which includes collective risk sharing and workers' pooling of start-up funds (Connel 1999; Spear 2010). The challenges for worker co-op start-ups tend to be financing and, as for small businesses in general, surviving the early years in a highly competitive market and drawing a decent income for the members (Ben-Ner and Jones 1995; Sauser 2009).

Worker buyouts of failing firms are another way that worker co-ops emerge. They often generate more publicity than start-ups, particularly if the firm is high profile – as in the case of Chicago's former Republic Windows and Doors. This buyout resulted through a workers' occupation and conversion to the New Era Windows worker co-op (Alperovitz 2011). Buyouts also draw publicity if many jobs or the survival of an entire community is at stake (Jensen 2011, 2012), as has been the case recently in Italy, France, Spain, Greece, and Argentina. But buyouts are more precarious than planned start-ups, because businesses fail for a reason, and often the workers have to take large wage sacrifices to make the business viable (McCain 1999).

Conversions of healthy companies into worker co-ops – either via a retiring owner's selling or bequeathing the firm to employees – have better prospects and come about for many reasons, including idealism by the owner (Erdal 2011) or the desire of retiring owners to see their firm continue (Quarter 2000).

Conversions of businesses into worker cooperatives have also been facilitated by ESOP legislation in the United States (Freeman 2007). The Marcora law in Italy (Legge Marcora), and the *pago único* (single payment) model and the Sociedades laborales (SALs) in Spain – where workers can draw advances on their unemployment insurance to contribute capital into a new worker cooperative or a buyout – also facilitate such conversions, specifically for transforming failed or failing capitalist businesses. In 2008 in Spain, for instance, there were 17,637 SALs providing 133,756 jobs, while Marcora law co-ops in Italy have seen a resurgence in recent years (CentroStudi 2012; Vieta, Depedri, and Carrano, Vieta, Depedri and Carrano 2016).

Perhaps the most fascinating dynamic is the worker-recuperated enterprise in Argentina (Atzeni and Ghigliani 2007; Ruggeri 2009; Vieta 2010, 2013, 2014; Vieta, Larrabure, and Schugurensky 2012), in which hundreds of businesses abandoned during the sharp economic downturn in the late 1990s and early 2000s were taken over – uninvited – by groups of employees, who struggled to save jobs and make the business successful. Over 95% of these firms have become non-share worker cooperatives, a recognized business model that facilitated restarting the business and made it possible to access some government subsidies and value-added tax exemptions on revenues (Ruggeri 2009). Only around 9% of these firms have since closed; nevertheless, they subsequently experience hardships in raising capital and renewing aging machines (Rebón 2007; Ruggeri 2010). Although there have in recent years been reforms to Argentina's bankruptcy laws, which now make it easier for employees to take over troubled firms, the government still lacks consistent policies for assisting worker-recuperated firms. Given these challenges, in recent years these firms have been assisted by cooperative federations, some unions, and myriad community groups and social movements (Ruggeri and Vieta 2015).

Underscoring how worker co-ops often emerge in moments of distress (Birchall 2003, 2012 Briscoe and Ward 2005), similar experiences, but with more state support, exist in Uruguay, Brazil, Venezuela, and to lesser extents in Paraguay, Peru, Mexico, and Bolivia (Novaes 2007; Vieta and Ruggeri 2009). Older worker takeovers, dating back to the 1970s and 1980s, have also existed in Spain, France, the United Kingdom, and Italy, emerging from similar situations of market crises and severe unemployment (Jensen 2011; Paton 1989; Vieta et al. 2016). And, as direct responses to the lingering post-2008 crisis, most recently new worker-recuperated firms have emerged again in Southern European countries, including experiences in Serbia, Greece, and Turkey (Jensen 2011, 2012; Vieta 2013). These are fascinating examples of grassroots-driven and social movement-affiliated worker cooperatives with strong labor struggle dimensions.

Another arrangement that leads to the development of worker cooperatives is through a government initiative, as occurred in the former Soviet

Union under Perestroika and more generally in Eastern Europe as communism collapsed (Ellerman 1990). Soon after the fall of the Soviet Union, worker cooperatives were converted mostly into conventional businesses. Examples of government initiatives are new cooperatives and cooperative-like labor-managed firms in Chavez's Bolivarian Revolution and, since 2013, with Cuba's new, "non-agricultural co-ops" in sectors such as tourism, public transport, and construction, which have been encouraged by the economic reforms of the Sixth Congress of the Communist Party (Donéstevez-Sánchez 2013; Vieta 2012; Vieta, Larrabure, and Schugurensky, 2012). It is too early to determine the outcome of the experiments in Venezuela and Cuba (Malleson 2014; Piñeiro-Harnecker 2013).

3. Why members/people participate

As can be seen from the discussion of the five models, worker cooperatives are associations of members with the common contribution of labor (Webb and Cheney 2014). But compared to most nonprofit associations, they have a greater economic emphasis. They earn their revenues from the market, though some – such as social cooperatives in Italy – also obtain government revenues, like nonprofits that function in partnership with government programs (Gonzales 2010).

Generally, worker cooperatives have high levels of member participation compared to other nonprofit associations. The financial investment by members and the link between member employment and the firm's success probably enhances member participation (Webb and Cheney 2014).

Although the motivations for joining differ, research in the United Kingdom suggests that worker cooperatives may appeal more to workers with social and political motivations (Cornforth et al. 1988). More recent research into participation in worker co-ops emerging out of moments of distress – especially from takeovers – is also suggesting that workers' strong sense of camaraderie arising from having to self-manage a firm and overcoming crises and difficulties together radicalize some workers as they informally learn to self-manage firms cooperatively "through struggle" (Vieta 2014; also see: Delahaye 2005; Jensen 2012; McCain 1999; Paton 1989). In that respect, their members' motivations to participate may be similar to members of nonprofit associations or ideologically driven collectives.

However, research undertaken in US plywood worker cooperatives gives a different perspective and suggests that the motivations are largely monetary and that the members are conservative in their orientation (Greenberg 1986), and research in Israel (Russell 1995) found that the members were very pragmatic. The difference between these findings may reflect the circumstances of these worker cooperatives. The UK study and research into workplace takeovers and conversions were undertaken with the non-share type of worker cooperatives

(model 4), a very idealistic approach that seemed to attract young activists or distressed workers threatened by job loss and permanent unemployment; the US and Israeli research was undertaken with share-capital worker co-ops, and, in the case of the plywood co-ops, with buyouts of conventional firms where they had mostly consolidated and entered a mature stage of development by the time of the research. Put simply, there does not appear to be one motivation for why members participate and the variation seems to be related to the different models that we presented above.

4. Impact of worker cooperatives

The impact of worker cooperatives varies. In countries such as Spain and Italy, their impact has been very significant. Worker cooperatives in Spain are widespread, with over 18,000, including the Mondragón Cooperative Corporation and providing 221,844 jobs (2008). Italy also has some of the largest worker cooperatives in Europe with 25 cooperative groups each having an annual turnover greater than EUR 100 million (CentroStudi 2012; Euricse 2011). In other parts of the world such as the United States and Canada, the worker cooperative is but a fringe player in the economy (Artz and Kim 2011; Quarter, Mook, and Armstrong 2009).

As noted, worker cooperatives are businesses that are normally based upon more collectivist values than conventional businesses (also see: Ben-Ner and Ellman 2013; Navarra 2010; Pérotin 2006). They function within the context of modern capitalism, but the fit is not ideal and seems not to appeal to business leaders, nor to management faculties, in most business schools (Whitman 2012). They seem not to be an ideal fit within the communist or state-controlled economies either, though there are episodic examples (Ellerman 1990; Fain 1998; Harrington 2013; Piñeiro-Harnecker 2013).

Given this lack of fit with any of the predominant ideologies, it could be argued that worker cooperatives represent a utopian ideal that is achieved by groups of determined workers in response to appropriate social conditions (Melnyk 1985). Examples include the economic despair resulting in Argentina's workplace takeovers by ex-employees, mentioned above (Atzeni and Ghigliani 2007; Ruggeri 2009; Vieta 2010; Vieta, Larrabure, and Schugurensky 2012), or the post-war destruction in the Basque region of Spain that led to the birth of the Mondragón Cooperative Corporation (Whyte and Whyte 1988). It is impossible to predict whether worker cooperatives will become more salient in the future, although increased interest in labor-managed and community-owned organizational forms might be pointing to a revival in worker cooperatives (Atzeni 2012; Alperovitz 2011; Curl 2009; Vieta 2010, 2013; Webb and Cheney 2014). There is also increased recognition that worker cooperatives and labor-managed firms show strong resilience during economic troughs, varying wages rather than furloughing worker-members, as workers express intrinsic

psycho-social benefits from owning and controlling their firms (Birchall 2003; Birchall and Kettilson 2009; Pérotin 2012). At minimum, they continue to represent an ideal to which select groups of workers subscribe and are willing to work toward.

E. Usable knowledge

Worker cooperatives vary, but their norm is an idealistic attempt at putting a democratic workplace into practice. Nonprofits struggling with issues of member participation can learn from worker cooperatives – in particular, how to engage a membership in decision-making and the experience of an employee board of directors elected by other employees.

For nonprofit housing social enterprises, worker cooperatives are a model that they could adopt. In every country, there are umbrella associations for worker cooperatives who can assist with development. An innovative model of social enterprises being structured as worker cooperatives is Common Ground, an organization in Toronto set up to employ the persons with intellectual disabilities, and operating services in catering, coffee outlets, and cleaning (Quarter, Mook, and Armstrong 2009).

Social cooperatives created in Italy also are a structure that nonprofit leaders could utilize for both social services and for creating employment opportunities for persons on the social margins. The social cooperative is analogous to a nonprofit that works with government programs and also relies heavily upon volunteers. It is an idea with legs, existing in Italy since the late-1980s and having been picked up in other parts of Europe and the world increasingly since the early 2000s; it is also an outstanding example of community mobilization. Their multi-stakeholder governance represents a model that nonprofit organizations can study and utilize, especially as they engage different constituencies on their board.

F. Future trends and needed research

It is difficult to predict whether worker cooperatives will grow in the future. At this point, they remain on the economic margins, even more so than other forms of cooperatives. Nevertheless, understanding the participative governance and the member commitment in worker cooperatives could be of value to nonprofits.

For businesses engaged in market activity, worker cooperatives demonstrate that a company that is governed by its employees can be successful in competitive markets. Possibly, this important lesson may influence the functioning of conventional businesses, especially given the interest and deployment of workplace participation models in recent decades (Cheney et al. 2010).

Another central concept for cooperatives and nonprofit associations is membership. The assumption is that membership leads to greater employee commitment, but is it membership per se or engagement in the organization? Worker cooperatives generally demand a high degree of member engagement. Recent research suggests that more engagement means more commitment to the firm (Cheney et al. 2010), more participation in the interests of surrounding communities (Pateman 1970; Pérotin 2012), and even increases in employee health and well-being (Erdal 2011; Wilkinson and Pickett 2010). The idea that members' engagement with their jobs is related to the success of their organization and to the well-being of workers and communities is tantalizing. But more longitudinal and comparative research, across regional and national boundaries and economic contexts, needs to be carried out in this regard.

Relatedly, do organizations that make greater demands of their members achieve greater commitment to the organization than organizations with nominal demands? This would be another issue worth exploring. Cooperatives and nonprofit associations generally are based upon the premise that membership involves a commitment, but does it, if the membership fee is nominal and participation is optional, as in other forms of cooperatives? By definition, and via anecdotal evidence, worker cooperatives seem to be organizational models primed for increased workers' participation and commitment. And, finally, another issue that has been barely researched and that would be worth exploring is the comparative benefits of the different models of worker cooperatives presented in this chapter.

Volunteering in Consumer and Service Cooperatives

Victor Pestoff (USA), Akira Kurimoto (Japan), Caroline Gijselinckx (Belgium), Ann Hoyt (USA), and Mirta Vuotto (Argentina)

A. Introduction

This chapter deals with consumer co-ops (co-operatives), while the preceding Chapter 20 deals with Worker Co-ops. Consumer and service co-ops basically differ from Producer/Worker co-ops by virtue of the economic relation their members have with the cooperative, as consumers versus producers or workers, and the related interests and benefits they promote. We review research on Consumer Co-op historical developments in Asia, Latin America, Europe, and North America. Other topics reviewed include activities of co-ops, origins, locations, getting involved, volunteering, sustainability, current challenges, internal organization, variations among co-ops, relations with other co-ops and national coordinating bodies, barriers to participation and effectiveness, and relations to public policy. The chapter provides definition of special terms, suggestions for usable knowledge, and ideas for future research.

Co-ops have long been regarded as a special type of organization that operates on the market, but with the aim of serving the social or cultural needs of their members rather than generating profit for investors. They are organizations that attempt to unite associative and business elements by bringing together various stakeholders and pursuing a variety of goals. They are subject to the same tensions that are inherent in all hybrid organizations and clearly illustrate the challenges of balancing various interests and pursuing multiple goals. Learning from their strengths and weaknesses is important, as many voluntary organizations today are encouraged or forced to pursue their own economic activities in order to achieve their goals and some of them attempt to become social enterprises (Defourny and Nyssens 2014).

B. Definitions

This chapter accepts the set of definitions in the Handbook Appendix.

The Appendix defines a co-operative as "a group engaged in cooperation as a process wherein a number of people collaborate in an economic activity so that all may share in the benefits of their efforts." It continues that a co-op "[u]sually has a participatory management, and functions as an association" (ibid.). Craig (1993) distinguishes between five types of cooperation: automatic, spontaneous, traditional, directed, and contractual. The latter is the prevalent form of cooperation in modern societies and is both formal and voluntary. The worldwide body for co-operatives, International Co-operative Alliance (ICA), defines co-ops as "an autonomous association of persons united voluntarily to meet their common economic, social and cultural needs and aspirations through a jointly-owned and democratically-controlled enterprise." They are based on the values of self-help, democracy, equality, equity, and solidarity. However, by combining both business and associational pursuits, they open themselves to tensions and conflicts that, if not resolved successfully, can lead to their demise.

Unfortunately, there is little dialog between scholars doing research on co-ops and researchers focusing on other types of voluntary associations. One reason for this is perhaps the dominance of economists in the American tradition of nonprofit sector research. An economic-legal emphasis on the *non-distribution constraint* usually excludes co-ops. This chapter seeks to contribute to a greater understanding of the similarities between voluntary associations, more generally, and cooperatives, particularly consumer co-ops. Moreover, co-ops normally apply a limited and fixed interest rate on member's modest shares and the annual surplus is divided according to their participation in the economic affairs of the co-op or returned as a member dividend. Furthermore, this is combined with the rule of "one member/one vote" in their internal decision-making. Taken together, these three features can successfully reduce or eliminate a profit-maximizing motive. However, social or solidarity co-operatives are nonprofit organizations in which no profits are shared. What motivates them is the delivery of services at a good price, often not only to members but also to the larger community. Today, in many countries and cases, the concept of *member* has opened to encompass all persons who contribute, in one way or another, to the operation of the co-operative (Gijselinckx 2012; Smith 1972, 2010).

C. Historical background

Because the consumer culture is a recent phenomenon in history, characterizing industrial and post-industrial societies, consumer co-ops have arisen only recently in history (beginning in the 1800s), compared to many other activity or goal types of associations. Craig (1993) discusses five stages of co-operative development from the 19th century on. Stage I, from 1817 to 1840, involved the experiments with co-operative communities by Robert Owen, William King,

and Charles Fourier. Stage II, from 1844 to World War I, was the era of spreading the ideas and model of the Rochdale weavers, who opened the first co-op shop in England in December 1844. Consumer co-ops became the dominant form of cooperation, overshadowing efforts to establish worker and housing co-ops and later agricultural co-ops.

In Stage III, from Word War I to the 1950s, agricultural, housing, and workers co-ops challenged the dominance of consumer co-ops. Then, in Stage IV, from the 1950s to the 1970s, mergers became the order of the day for consumer co-ops in industrialized countries, where many traditional consumer co-ops disappeared under heavy market pressure. Finally, in Stage V, from the 1970s to present, social service co-ops, utility co-ops, integrated producer/consumer health food co-ops, and so on increased notably in many countries. Meanwhile, during the 1990s, large multinational wholesale and retail companies expanded. These processes exacerbated the forms of competition in the retail sector and emphasized the customer–client profile instead of membership. This became a worldwide phenomenon, brought on by globalization and led co-ops to copy extensively from successful models in private enterprises that could provide greater legitimacy and cost savings. Below, we note developments in various regions.

1. An overview of consumer co-op developments in Europe

Since the inception of the co-operative movement, Europe has experienced major social, economic, and political developments that have had an impact on the attractiveness of the consumer co-operative model. Differences can be observed between different areas and countries with different political regimes, welfare state models, and civil society models, as well as different internal markets, living conditions, culture, demography, and geography. Thus, the legacy of half a century of state socialism and communism in Central and Eastern European countries had a prevailing negative influence on the development of co-operatives in those countries until recently.

The history of the consumer co-operative movement in Europe reflects a slow but steady shift from a class to a society-wide focus. The first co-operatives – established roughly from the mid- to late 19th century, such as worker, consumer, credit, and so on – were firmly tied to social movements in many European countries. In the course of the 20th century, two related developments can be observed: the weakening of class ties in traditional co-operatives, mainly due to changes in social structure, and the progressive shift from member benefits to more general social goals. Today co-operatives can cater to the needs of a whole community, such as water or electric co-operatives, credit unions, social service co-ops, and some types of agricultural co-ops. Similarly, the membership base of the older co-operatives became more and more heterogeneous (Mori 2014).

Since the 1970s, many European consumer co-operatives have disappeared, under the pressure of a highly competitive market, or they have undergone major transformations in an attempt to meet the exigencies of the market. Thus, we can see the growth of social co-operatives linked to the crisis of the welfare state that reflects citizens' progressive loss of confidence in the government and regulatory bodies in many European countries (ibid.). Also, a renaissance of co-operative awareness can be noted in some mature consumer co-operatives.

2. An overview of consumer co-op development in Asia

Most of the South and South East Asian territory was colonized in the 19th century by the European powers, while East Asia experienced a different trajectory under the pressure of Europe. The British Empire gave India the Co-operative Credit Societies Act in 1904 that became a prototype of co-operative legislation in the developing countries and had a lasting impact long after their independence, while Japan's Industrial Co-operative Act in 1900 adopted a similar top-down approach. The evolution of consumer co-operatives depended on the gradual rate of industrialization, urbanization, and formation of the working class, and they had a slow start in the overwhelmingly agrarian societies that characterized the Asian region until the 1960s.

After the 1960s, Asia revived as a major industrial power with strong governmental support. Four dragons, later labeled as NIES (newly industrialized economies; Singapore, Hong Kong, Taiwan, and South Korea), followed Japan. Then ASEAN nations took off transforming previous battlefields into markets by the export-driven industrialization. But, following the financial crisis in 1997–1998, hyper economic expansion was witnessed in China, India, and Vietnam since the 2000s.

Such an economic expansion resulted in the emergence and expansion of the working and middle classes in the region. They expressed dissent to the authoritarian governments, which were both interventionist and protectionist, and were often associated with military intervention in politics. So, citizens urged a shift to more democratic regimes, pursued political reforms either through the parliamentary channels or by mobilized demonstrations on the streets, and they succeeded in changing the political leaders in the late 1980s.

Under such circumstances, consumer co-operatives started growing in some countries. First, the Japanese co-ops increased their membership and turnover with double-digit growth since the mid-1960s. They developed a business model that combined neighborhood groups of housewives and home delivery (joint buying clubs). Housewives started the clubs to obtain pure milk for their children from reliable suppliers that later became consumer co-ops. The management skills were often provided by university co-ops, which found new

possibilities outside their campus. This housewife-centered model was copied by some movements elsewhere, like India, South Korea, and so on.

Currently, the impact of consumer co-operatives varies largely from country to country. They represent an important part of Asian food retailing and society. While the Japanese movement showcased the development based on consumer participation, its turnover stagnated in the shrinking retail market since the mid-1990s. The market share of co-ops is growing in Singapore and Vietnam, while it is stagnant or declining in other Asian countries.

3. An overview of consumer co-op developments in Latin America

European migration made a decisive contribution to the formation of institutions and national identities in Latin America. The European influence, from the colonial period until the mid-20th century, produced migratory flows whose direct presence is still noted in most Latin American countries. Consumer co-operatives began developing, foremost in countries receiving large migratory flows from Europe, such as Argentina, Uruguay, Brazil, and Chile. However, today consumer co-operatives are not very important in Latin America,[1] but one trend can clearly be identified since the mid-20th century. In the Latin American countries where co-ops were most highly developed, their massive commercialization, together with repeated economic crises and aggravated inflationary processes, had a negative impact on them and generally led to a decline of the consumer co-op movement.

Due to this competitive environment and uncertain situations, co-operatives adopted isomorphic mechanisms of institutional change (Bager 1997; Birchall 2000; Bradza and Schediwy 2003), but these mechanisms undermined their identity. In Argentina and Brazil, for example, these processes led to the disappearance of many small co-operatives, leaving room for the consolidation of larger organizations (Coop in Brazil[2] and La Obrera[3] in Argentina). The influence of market logic promoted economic goals and strategies that privileged the enterprise and weakened ties among its associates and employees. In these cases, the consumer-client profile was given priority over the relationship between the co-operative and its members. Similar to the trends in other countries, particularly Europe, the case of consumer co-operatives in Latin America appears to replicate this situation.

In consumer co-operatives, the employees are mainly affiliated to the Retail Workers Union, although in some cases they may also be members of the co-op and therefore are "owners." Their relationship with co-operatives is established by collective bargaining agreements and through negotiations between their union and the co-operatives. Bargaining is generally guided by the economic information provided by the co-operative to the union. These collective bargaining agreements can set wage rates and economic benefits, and so on. However, the most important aspect of a collective agreement is job security

and good salary levels, sometimes above those of the commercial retail sector. It should be noted that when the workers are also members in the co-operative, they receive an additional compensation that comes from the distribution of the co-op's surplus.

4. An overview of consumer co-op developments in North America

Co-operatives and mutual help societies arose early in the new world in the form of mutual insurance companies starting already in the mid-1700s. A century later, farmers, miners, and urban laborers, predominantly from Northern Europe, who were familiar with co-operative models, quickly adapted them to the North American context. By the end of the 19th century, there was a wide variety of co-operatives in both countries. Expanding on their experience with agricultural co-ops, farmers organized retail grocery and clothing stores, funeral societies, and health care, utility, insurance, credit, and service co-operatives. Urban workers were most successful at organizing credit unions and housing co-operatives, particularly in New York and Quebec.

In the United States, consumer interest in co-operatives has ebbed and flowed. During the Depression of the 1930s, middle-class interest in consumer co-operatives grew rapidly, fueled by a need to save money, combined with a strong sense of disillusion with a profit-making system. In the 1930s and 1940s, the US government also played a strong role in supporting and promoting consumer co-operatives in food, housing, and utilities.

Following World War II, general prosperity, a conservative political environment, and the development of multi-store supermarkets and centralized shopping centers lured consumers away from smaller, independent retailers and co-operatives. Relatively few US retail food co-operatives survived, and those that did developed co-operative supermarkets in urban areas and were often associated with a university. However, by the mid-1990s, nearly all of them and their associated wholesale societies had failed (Fullerton 1992). Enthusiasm for co-operatives waned in the 1980s, but it revived again in the 2000s as a consequence of the Great Recession, public distrust of large multi-national corporations, repeated food safety violations, and a strong interest in developing locally sustainable communities.

Similar social, political, and economic forces impacted the Canadian consumer co-operatives, but the Canadian experience has significant differences. Two types of consumer co-operatives are unique to Canada: multipurpose and multi-stakeholder. Multipurpose co-operatives provide a wide variety of consumer goods and services, particularly among the aboriginal people of the Arctic north. They can operate a retail store, provide cable TV and local transportation services, and sell furniture and appliances. Multi-stakeholder co-ops are found primarily in Quebec and often provide social services. Their members include consumers, workers, and others who support the goals of the

co-op. Retail goods, leisure, transportation, and communication co-ops are among the more than 500 multi-stakeholder co-ops in the province.

By the 1960s, Canadian retail consumer co-operatives had become a major force in many communities, had a national presence, influenced both provincial and national legislation on behalf of co-operatives and had strong educational, technical, and intellectual support from numerous universities. However, their influence in most provinces declined over the past 50 years as a result of competition from better capitalized multinational corporations, shifting consumer loyalties, new technologies, and, recently a more conservative political environment.

D. Key issues

Consumer co-operatives face a number of key issues or challenges that will determine whether they survive and thrive or face gradual demise. These issues are related to their hybrid character: being at once a member organization and an enterprise, having both social and economic objectives. The two main schools concerning the development and future of consumer co-ops reflect their dilemma as hybrid organizations. According to the associational or democratic school (see Böök 1992; Craig 1993; Pestoff 1991, 2012, among others), co-operatives are primarily associations that pursue social goals by economic means. In the business school (see Birchall 1999; Birchall and Simons 2001, 2004; Gijselinckx 2012, among others), co-operatives are mainly business firms that have some unique social and associational features. Both these interpretations were included in a recent volume called *The Co-operative Model in Practice: International Perspectives* (McDonnell and Macknight 2012). The associational school focuses on the role of co-operatives as membership associations in a rapidly changing world, their members dramatically changing needs and the need to strategically balance various stakeholders and goals (Pestoff 2012). The business school considers co-operatives as a "member-owned business" that need to modernize and professionalize in order to meet the growing competition from private firms (Birchall 2012).

We will briefly note some key issues facing the consumer co-ops before turning to important generic issues for better understanding co-ops as voluntary associations. The first set of key issues and challenges facing the consumer co-ops in various parts of the world is related to their unique identity as organizations that attempt to combine associative and business elements. This is reflected in (1) tensions between the associative and business parts of the co-ops or the logic of cooperation and the logic of bureaucratic organizations. When they come into conflict, the latter often squeezes out the former. This leads to a loss of co-op identity, declining member participation, less solidarity with the co-op movement, and eventually a loss of business. This, in turn, is related

to (2) mobilizing members by facilitating and expanding their participation in all parts of the co-op, on both the associational and business sides, which, in turn, reflects (3) the relationship between the members and the management of co-ops. This can be seen in attempts at (4) promoting innovations of organizational structure to facilitate communications and promote greater membership participation. Furthermore, this is also seen in (5) expanding the relationship with employees, perhaps even turning consumer co-ops into multi-stakeholder organizations; as well as (6) how should co-ops best account for their economic and social responsibility, and finally (7) women's changing gender roles as housewives, consumers, activists and board members, and so on.

A second set of issues is related more closely to economic and financial aspects of co-operatives. It concerns (8) financing operational capital, investments, as well as (9) realizing economies of scale and other advantages, for example in co-operative networks and second (or even third) tier co-operatives. This emphasizes the challenges mentioned above, since it stretches the relationship between members and management in decision-making structures.

A final set of issues is related to cooperation with various organizations in their environment. Here it is important to consider (10) relations between the established and newer forms of consumer co-ops, including health and social service co-ops, energy and utility co-ops, ecological food co-ops, joint production and consumption co-ops, and so on; and also (11) promoting greater cooperation among and between co-ops of all kinds; and (12) relations with other types of voluntary associations and nonprofit organizations, including worker co-ops, labor unions, social enterprises, social movement organizations, and nonprofit agencies.

Today issues of sustainability and climate change are very important for the future of consumer co-ops. They need a holistic view of sustainability based on three pillars: economy, society, and environment. The engagement of a co-operative and especially of its members in this direction can help to ensure that all three relevant aspects are taken into consideration. Sustainable consumption and production are key objectives, especially since 2009, when the European Community of Consumer Co-operatives (EuroCoop)[4] engaged in a program of action against climate change. Thus, the common European framework can help reinforce previous initiatives of co-operatives at a national level.

Many consumer co-ops have in fact intensified their efforts to source more goods bearing sustainability certifications in the areas of ecological production; sustainable fishing; organic farming, and sustainable managed forests. The Co-operative Identity Working Group of EuroCoop (2013) emphasizes bio- and eco-production as a way to answer sustainability and climate change issues and meet new members' motives and values, particularly for younger persons whose basic needs are fulfilled.

1. What does consumer co-op volunteering involve and where does it take place?

The extent of volunteering in consumer co-ops remains uncertain. According to the best of our knowledge, there are no official, public or private directories, lists, registries, or online databases that include most consumer co-ops. EuroCoop does have an overview of consumer co-ops, primarily in retail, for some countries. In 2011, there were 5,138 consumer co-ops in 18 countries throughout Europe, with nearly 27.4 million members (EuroCoop 2011). The Japanese Consumer Co-operative Union (JCCU) served 590 consumer co-ops with 26.7 million members in 2011; however, only a minority of its members are active as volunteers. Member participation in more than economic terms (as a customer) is a key challenge for Japanese consumer co-operatives.

2. Challenges of co-op participation

More important for participation than size is the nature of the co-operative endeavor. While participation appears low in many traditional retail co-operatives, it is normally much higher in new co-operatives operating in the fields of energy, organic food, and Fair Trade and social services. Thus, European consumer co-operatives face a difficult challenge to renew their membership. In particular, young people are not necessarily attracted by formal participation, except for economic rewards and dividends. However, informal participation opportunities provide a major tool to attract younger members and promote innovative forms of informal and tailored participation. This might lead to a renewal in formal participation (EuroCoop 2011).

Members' participation nowadays appears more stimulated by personal values and motives than satisfying their basic needs, although some differences can be observed. Thus, in countries experiencing severe economic crisis, such as Greece, we now find cooperation between producers and consumers as a response to urgent basic food needs. Moreover, members' motives have shifted over time: formal participation was more easily understood by members until the 1980s; but starting in the 1990s, new members seemed more interested in issues like Fair Trade, environmental issues and climate change, locally sourced products, and so on (EuroCoop 2011).

(a) Participation in decision-making: voting

EuroCoop notes that there is no clear correlation between size and participation in Europe. Some mass-membership co-operatives suffer from very low participation, for example, Coop Italia, while others have more voting members, for example, the SOK in Finland. Equally, members in some small co-operatives may be very committed, like the CCU in Bulgaria, while others are less active, like Fenacoop in Portugal.

(b) Elected members (sitting on boards and committees)

Through a process of amalgamations in the 1980s and 1990s, many elected offices simply disappeared. Not surprisingly, the average age of elected officers is high: for example, in Sweden it is 62 years, in the United Kingdom it is 56 years (EuroCoop 2011). However, education and training of elected members is crucial for good governance of a co-operative, and it also provides an incentive to potential candidates, as they feel more confident to participate if there is a support system available to them (EuroCoop 2011).

3. What does volunteering in consumer co-ops involve?

Birchall and Simons argue that there are three types of participation in co-operatives (Birchall 1988, 1999; Birchall and Simmons 2001, 2004). They are: (a) taking part in decision-making of the co-op; (b) carrying out tasks that further the co-op's aims; and (c) taking part in the social life of the co-op. We will consider each of them briefly.

(a) Taking part in the decision-making of the co-op encompasses active participation in formal and informal structures and chains of decision-making. This is voluntary and (often) without remuneration. It can also involve participation in the board of directors, a committee of control, other advisory committees, user groups, attending the Annual General Meeting (AGM), and the General Assembly. Sometimes there are also informal decision-making structures.

(b) Carrying out tasks that further the co-operative aims involves all kinds of unpaid services that members can volunteer for. Particularly in small co-ops, this is often crucial to the organizations' survival, but even in larger co-ops it can be important as a supplement to paid work. These tasks can involve co-production of the services provided to/with members. Numerous examples can be found, like in housing co-operatives where tenants/members are involved in the management of their homes; in health-care co-ops where beneficiaries or their families volunteer in the co-operative facilities; child care co-ops where parents offer support in terms of logistics, administration, practical support at peak hours; co-operative village shops where members voluntarily work at the shop or take care of the transport of the products to the village; or it can be an active contribution to the social activities arranged by the co-op in order to create a wider sense of community (Birchall 1988, 1999; Birchall and Simmons 2001, 2004).

4. Who starts consumer co-ops, how, and why?

Traditional consumer co-ops were established in general and specialist retailing, housing, pharmaceutical distribution, and insurance. More recently, consumer co-ops have been established in utilities, especially sustainable energy, telecom

and water, education and social and health care. Co-operative village shops and community co-operatives are set up in order to meet local needs, particularly in remote areas. However, one important difference can be observed between the traditional and newer coops. The traditional co-ops tend to be established by local elites, often from the labor movement, that set up co-ops *for* the people. Newer co-ops are often established *by* the people themselves, whether organized in civil society organizations, or in informal groups. Elsewhere the state may even promote the establishment of consumer coops, as often is the case in China.

Consumer coops, as other coops, are usually borne out of necessity, when market or government failures are observed and a vacuum needs to be filled (Van Dijk and Klep 2005). However, to get people involved, it is important to have (or develop) a strong sense of community, shared values, and shared aims (Birchall 1999; Simmons and Birchall 2005). Thus, in Greece and other European countries facing severe crises, many social ventures have been developed bottom-up to create local or national exchange markets based on virtual currencies, co-ops, fair trade unions, social health clinics, social schools, and many more. In Japan, a similar phenomenon is found in the Sanchoku model.

5. Who gets involved as volunteers and leaders of consumer co-ops?

In co-operatives, members are involved as volunteers and leaders, although in large-scale co-ops professional management is often engaged. An overview of research on this topic provides a detailed classification of theories about membership and volunteering in co-operatives. They include: (a) mutual incentives theory that combines individual and collective motivations; (b) a synthesis of sociological and political science theories; (c) an individual focused approach of social exchange theory, benefits, habits, costs, satiation, and opportunity costs; (d) a collective focus based on theories of social cooperation, sense of community, shared values, shared goals, the participation chain; (e) resource-based theories; (f) mobilization theories; and (g) a combination of theories about motivations and mutual incentives (Birchall 1999; Birchall and Simmons 2001, 2004; Simmons and Birchall 2005).

6. What motivates and triggers individual involvement?

Informal and formal participation are usually intertwined, as informal participation often precedes formal participation. Informal participation enables consumer-members to become aware of being part of a co-operative community of people, through which they are able to solve problems important to them by their combined effort (EuroCoop 2011).

7. How are consumer co-ops organized?

Consumer co-operatives take different legal forms in different countries, depending on whether national laws recognize their unique role and provide

a special status to them. Their core characteristics are that they are member owned, member controlled, and they benefit their members. They are usually registered under national laws, with the exception of joint purchase associations or groups that are often not incorporated. They often enjoy tax exemptions, with different regimes in different countries. Their meetings comprise an Annual General Meeting once a year, board meetings, and meetings of various committees more frequently. They must balance the interests of several stakeholders, in order to survive on the market. Thus, they often strive to promote efficiency, where the leading principle is the lowest price for the best quality products. Moreover, professionalism is growing in co-ops, and large co-ops often employ professional management that, at least in theory, is controlled by the members.

8. How else do consumer co-ops vary systematically?

They vary from very small local village co-ops to large co-op conglomerates with more than USD26.8 billion turnover. These large co-ops are organized around local co-op societies, where member participation and volunteering is organized – often multi-stage in decision-making. Their revenues come mainly from the market. Social and health-care co-ops, as well as co-ops tackling poverty and social exclusion, also receive government grants or public tenders for providing such services. They also receive private gifts and donations, but also rely on voluntary work by members.

9. What are the main barriers or obstacles to consumer co-ops and their members/volunteers?

The lack of knowledge about co-operatives, what they are, and how they function comprises a major hurdle. Few colleges or universities anywhere in the world provide courses on co-operatives, how they are organized, and what they do, in spite of the popularity they share among some academics. Robert Dahl often mentioned worker co-ops when discussing democracy, while Robert Putnam (1993) used credit unions as a major illustration of the role of civil society in promoting sustained economic, political, and social development. Unfortunately, few academic conferences, even among specialists in the third sector, include streams or panels on co-operatives. However, the ICA, CIRIEC, and the European EMES[5] research network held international research conferences in recent years that help to gradually spread knowledge about co-operatives and social enterprises, particularly to younger scholars.

In Central and Eastern European countries, the legacy of communism and state-socialism weighs heavy on co-operatives of all sorts and has resulted in reduced trust in most collective enterprises, including co-operatives. In other parts of Europe, the image of co-operatives is often considered old-fashioned, although this appears to be changing in times of crises and financial turmoil.

10. How are consumer co-ops and their members/volunteers related to public policy?

In the United Kingdom, the Co-operative and Labour Party fielded candidates in General Elections and held seats in Parliament for most of the 20th century. For several decades, the Swedish consumer co-ops were a mainstay of the Swedish government's active consumer policy, similar to its active labor policy, supported by trade unions. However, when Sweden joined the European Union, it abandoned this policy and the consumer co-ops no longer have a privileged position in terms of consumer policy today.

E. Usable knowledge

1. Historically, consumer co-ops developed in conjunction and harmony with their environment. Their roots are often found in the urban/industrial working class and they developed in close collaboration with the labor movement and other working-class organizations in many parts of the world. However, during the past 150 years, society has also changed significantly, so today consumer co-ops must learn to adapt to major social changes, broaden their social base, and develop new allies and skills to meet new challenges and opportunities of tomorrow. As retail commerce becomes more competitive, they must consider re-orientating their retail business in order to address their members and societies' changing needs and values for sustainable consumption. Consumer co-ops should learn how to promote co-operative solutions to major social needs and citizens' growing dependence on welfare services, such as education, childcare, elder care, handicap care, health care, and so on. This will help them meet their members' needs and interests, as well as those of other citizens. Voluntary organizations also need to develop strategies for adapting and adjusting to major social changes in their environment in order to thrive and survive.

2. Consumer co-ops are hybrid organizations with multiple and sometimes conflicting goals and stakeholders. They must learn to balance them in order to thrive and survive. Today, many voluntary organizations are attempting to expand their economic base in order to pursue their goals. However, they could gain many insights into the benefits and risks of becoming hybrid organizations. They could, therefore, learn some valuable lessons by studying how the consumer co-ops succeeded or failed to balance various interests as hybrid organizations.

3. Consumer co-ops must successfully balance their associational and commercial interests in a fashion as not to lose their unique social and democratic identity and values. Today, when many voluntary organizations are trying to develop new economic sources of income and become social enterprises, they too must learn to balance their traditional associational and newly won

commercial interests, in a fashion as not to lose their unique social identity and retain the support of their members.

F. Future trends and needed research

The worldwide trend is toward bigger, but fewer, consumer co-ops in most countries, which is seen as an answer to economic exigencies. A loss of cooperative identity in the future is likely if this trend is not combined with innovative organizational structures for effective member participation and reflexive renewal of the co-operative identity by members and management alike. Organizational democracy and business efficiency need to be balanced, amplifying the commitment of co-operative social responsibility to articulate an integrated vision (ecological, economical, and social) that responds to the current challenges and reaffirms its co-operative identity. This invites them to think about the roots of the co-operative in their local environment and as a key element to its future development. In order to build a cohesive culture, for mature co-operatives, it was previously necessary to reference and actualize the historical purposes of the organization whose legitimacy is obvious. The need to strengthen organizational effectiveness requires an awareness of co-operative identity and an ability to act like a democratic organization of consumers (Böök 1992; Craig 1993; Pestoff 1991, 2012).

With regard to needed research, we suggest the following:

1. We need more research on the unfolding transformation from an industrial to a service society and what consumer co-ops can do to promote their members changing needs under these changing circumstances? How can the co-op model provide a valuable economic opportunity to voluntary organizations in order to promote their members interest?
2. In the changing welfare mix, how can consumer co-ops promote and assist their members to become co-producers of long-term welfare services that the latter use on a daily basis? Co-production is the mix of efforts from public sector professionals and citizens who use such services. How can consumer co-ops promote collective and democratic solutions to the changes between the state and its citizens, and thereby promote a viable co-operative alternative to rapid commercial privatization of welfare services seen in many countries today?
3. We need large sample studies that include both volunteers in consumer co-ops as well as participants in regular voluntary associations, focusing on the differences in motivations and other influences on why individuals volunteer. The comprehensive S-Theory discussed in Handbook Chapter 31 should be applied in this effort.

G. Cross-references

Chapters 17, 20, and 44.

Notes

1. Today there are only 123 consumer co-operatives in Brazil and 47 in Argentina, or only about 2% of existing co-operatives.
2. The largest consumer co-operative in Latin America was created in 1950 for the purpose of selling products to employees working in a textile company. The co-operative has 1,600,000 members and 28 stores located in São Paulo, Brazil.
3. In 1920, the consumer co-operative was created by workers trying to avoid intermediaries and speculation on the price of bread. The co-operative has 1,017,314 members and 90 stores located within several provinces.
4. Created in 1957, the European Community of Consumer Co-operatives, Euro Coop, represents more than 4,500 local and regional co-operatives which are based on 29 million consumers-members across 18 European countries (website: www .eurocoop.coop).
5. EMES provides graduate level training through its PhD Summer Schools every second year.

Volunteering in Religious Congregations and Faith-Based Associations

Ram A. Cnaan (USA), Siniša Zrinščak (Croatia), Henrietta Grönlund (Finland), David H. Smith (USA), Ming HU (China), Meme D. Kinoti (Kenya), Boris Knorre (Russia), Pradeep Kumar (India), and Anne B. Pessi (Finland)

A. Introduction

This chapter juxtaposes the vast knowledge regarding volunteering and voluntary associations with the world of religion. We start with the premise that more people volunteer within, and on behalf of, religious organizations than in any other organizational setting in the United States and certain other nations. We review the history of religion and religious volunteering, followed by a typology of the various forms of religious volunteering. We discuss how religious associations are formed, distinguishing between local religious congregations and faith-based organizations. Given the importance of local religious congregations, we discuss congregational volunteering, lay-leadership, and member volunteering in these voluntary associations. One section looks at monasteries/convents and communes/intentional communities as residential religious associations. We conclude with new challenges and relevant policies that affect religious volunteering.

Religion in all its forms and variations has been part of human societies since the earliest times. As soon as societies were formed and people divided labor by expertise and capabilities, religion became an integral part of human existence. It was and has been evolving and transforming ever since. What is important in this Handbook is the centrality of religion in the history and development of human compassion, welfare, and volunteering. The principle of compassion (to treat all others as we wish to be treated ourselves) exists in all world religions and spiritual traditions, and this principle motivates and mandates helping others. In fact, many services in the fields of health and social welfare have been provided by religious bodies, clergy, and lay leaders alike, and these are motivated by religion in most parts of the world.

Religious organizations are among the oldest human organizations (Bellah 2011). Throughout history believers have provided their religious organizations with donations and volunteer work. This chapter focuses mainly on contemporary religious volunteering and related associations, particularly local religious congregations and other faith-based associations. Religious volunteering is similar to all other types of volunteering with one important caveat: it is done under the auspices of religious organizations and influenced by religion and faith. We will discuss the impact of faith versus participation in a religious organization as a motivating factor that enhances volunteering. In addition, the chapter will focus on religious volunteering as an influence on secular volunteering. Where possible, we will use cross-national data.

B. Definitions

This chapter accepts the general definitions set forth in the Handbook Appendix.

Religion is notoriously difficult to define, especially in a way that captures the full range of religions and their expressions in the huge variety of human societies and cultures in which religion has manifested itself, as studied mainly by anthropologists. However, we cannot duck the obligation to define religion here, if only tentatively. Typical of many limited, Western, developed society definitions is that by Johnstone (1992:14): "[R]eligion can be defined as a system of beliefs and practices by which a group of people interprets and responds to what they feel is sacred, and, usually supernatural as well." In an alternative textbook on the sociology of religion, Hamilton (1995:chapter 1) reviews the problem of definitions of religion in much greater depth, with extensive anthropological examples from preliterate tribes, noting that definitions including the sacred or the supernatural as essential do not really fit some religions very well, and these come from a modern and Western cultural perspective (pp. 13–15).

Looking at all the options, the definition of Bellah (2011:1) seems the best, even though it still mentions the *sacred*: "Religion is a system of beliefs and practices relative to the sacred that unite those who adhere to them in a moral community." He goes on to define the *sacred* very broadly as a "realm of non-ordinary reality," enlarging on Durkheim's definition of "the sacred as something set apart or forbidden" (p. 1). Note that neither divine beings nor the supernatural are entailed, although this definition includes both of these concepts when relevant.

This definition can be supplemented by the theoretical and empirical work of Stark and Glock (1968:14–16), with others in a larger project, who identified five key dimensions of *religiosity* or *religious commitment*. Either of these latter terms refer to being significantly, often deeply, concerned with some existing

religion or with religious ideas and/or practices more generally, possibly one's own, personal religious philosophy. The five dimensions or facets of religion identified and studied were "belief, practice, knowledge, experience, and consequences" (p. 14). This chapter focuses especially on the two of these dimensions of religiosity – religious practice and consequences of religiosity for daily life.

Distinctively, in this chapter we use generally the neutral term *congregation*, which is more commonly used in North America. A congregation is a local place and community of worship in which people come to worship in a joint manner and follow a specific set of agreed-upon norms and rules. *Congregation* is thus a generic term that includes churches, mosques, synagogues, temples, meeting houses, house churches, storefront churches, wards, and so forth for all religions. Congregation also implies that the people who attend know each other to a certain degree and form a community of fellowship. Congregations can be seen as religious grassroots associations, as defined in the Appendix. However, it is important to note that in some parts of the world people come to worship not as a community but as individuals, as is the case in most Hindu and Taoist temples.

Religious volunteering is similar to other purposive types of formal volunteering with one distinguishing feature: it is done under religious auspices and/or is motivated by religious-related factors, mainly religiosity as a personal commitment to some religion or to religious ideas and/or practices more generally or personally. Religious volunteering includes sheer attendance at and participation in co-producing religious services, as well as more specific service roles in a congregation, both during worship services and at other times.

C. Historical background

Religious associations are one of the oldest types among all associations, having been found in various (pre-European contact) preliterate tribes and hence probably originating as early as 10,000 years ago (Anderson 1973; Bellah 2011; Smith 1997; Tyler ([1873]1903; see also Handbook Chapter 1). Religious associations made an early appearance in ancient agrarian civilizations as well (Bellah 2011). For instance, religious cults as types of local associations were present in ancient Egypt circa 5,000 years ago (Shafer 1991). There were religious buildings (temples, shrines, synagogues, etc.) in all ancient civilizations (Dillon 1996). Each such building had a corresponding religious association, formal or informal, of people who participated in worship, as well as many people who helped with the building's upkeep and preparation for religious services (e.g., Gutmann 1975). Regardless of society, people provided the religious organizations of their locale with goods such as food and labor. While the labor was not defined as volunteering, it is what we define today as volunteering (see the Handbook Appendix).

Almost every faith tradition in the world has clear tenets that ask adherents to behave ethically, not to cheat, not to harm others, and to exhibit charitable behavior (Cnaan, Wineburg, and Boddie, 1999). Helping the needy and seeking out justice are essential tenets of most religions. Members in good standing of religious congregations often demonstrate it by donating money and by performing tasks that are required or desired by the religious group.

Such religious volunteering was directed toward places of worship that were originally and usually very local in nature. People in small villages/towns congregated for religious purposes in some building and supported it as needed. In Judaism, first the community supported the holy temple and then other places of worship and also places for studying religious texts (Gutmann 1975). Community members were expected to donate and volunteer. Christians, for example, initially met in member's houses known as *house churches* (Banks 1994). The host family provided the place and related labor. As with other ancient religions and with increased social acceptance, within a century or two, Christian churches were built (Esler 2000; Hinson 1999). These edifices soon became centers in which members worshiped and associated with other members. Other major world religions, such as Islam (Berkey 2002; Lapidus 2002) and Buddhism (Reat and Reat 1994), followed similar paths to social acceptance, and local congregations had their own holy buildings. In earlier historical periods, such behavior was not labeled as volunteering. Furthermore, in many societies, such religious activity posed a threat to the ruling classes, who attempted to minimize free association and the right of people to assemble and produce goods without public supervision. As such, religious volunteering is a socially constructed modern phenomenon.

Research on religious congregations and related volunteering goes back millennia (e.g., early documents cited in Bellah 2011; Berkey 2002; Borgeaud 1988; Dillon 1996; Duchesne 1912; Fowler 1911; Godwin 1981; Gutmann 1975; Lapidus 2002; Reat and Reat 1994; Shafer 1991; Zaidman and Pantel 1992). As we come toward the present day, such research has intensified, from studies of medieval heresies and dissent in Europe (Lambert 1992; Moore [1977] 1994) or the Crusades (Wolff and Hazard 1962) to extensive research on denominations in America (Finke and Stark 2005; Greeley 1972; Littell 1962; Niebuhr [1929] 1957) and on specific congregations (Cnaan et al. 2006; Harris 1998).

One interesting recent approach to research on religion has been to study its evolution, as partly biological and partly cultural, for these have been intertwined in the past 50,000+ years (Bellah 2011; Broom 2003; Wade 2009; Wilson 2003; Wright 2009). Similarly, recent biological studies have investigated how neuroscience and the functioning of the brain can help explain religious belief and faith (e.g., Alper 2008; Newberg, D'Aquili, and Rause 2002; Newberg and Waldman 2007; Shermer 2012).

D. Key issues

1. Types of religious volunteering

Several different types of religious volunteering can be distinguished.

(a) First, volunteer work for and within the religious organization to enhance the religion. Such volunteering includes activities such as missionary work, Sunday school teaching, and sweeping the floor after services (Belanovsky 2012). The running of any congregation is often predicated on the availability of volunteer members to support its work (Harris 1998; Hodgkinson, Weitzman, and Kirsch 1988). Cnaan and Curtis (2013) showed that congregations are highly dependent on volunteer work. Indeed, congregations and faith-based organizations are very efficient at enlisting such volunteer labor.

(b) Second, one can volunteer through a religious congregation or group to support social services, such as having a congregational-based day-care or an Alcoholics Anonymous (AA) support group. Such volunteer work under religious auspices attempts to improve the quality of life of others, including counseling, staffing a food kitchen, helping ex-prisoners, and helping an environmental cause (for Russian social volunteering, see Knorre 2012).

(c) Third, one can volunteer to do political activity either to serve one's congregation or religion or as a reflection of those affiliations (Dalton and Klingemann 2007:chapter 25; Smidt et al. 2008; Wilcox and Robinson 2010). The role of the religious right in American politics is one recent example (Wilcox and Robinson 2010).

(d) Fourth, one can be motivated by religious motives to do secular volunteering as good deeds outside his or her place of worship. For example, one can help an environmental organization on one's own volition or as a member of a religious congregation. In both cases, the environmental volunteer work will be similar, but the latter type of volunteer is likely to perform the task along with friends from the congregation or as an expression of religious faith.

2. Religious volunteering patterns

(a) *Congregational-support volunteering*: Religious participation and religious faith are linked, but are two different phenomena. In the United States, while about four in five report that they never doubt the existence of God, only two in five attend places of worship on a regular basis (Pew Forum on Religion & Public Life 2012). In a study of volunteers to social services in the United States, Cnaan, Kasternakis, and Wineburg (1993) found that the key explanatory variable for who volunteers is congregational attendance and not level of personal faith.

According to the Eurobarometer Survey,12% of Europeans volunteered in religious or church organizations (European Parliament Special Eurobarometer 75.2, 2011). Participation levels in religious volunteering are relatively high at least in Austria (14% of active volunteers), Finland (16% of active volunteers), Ireland (26% of active volunteers), and the United Kingdom (24% of active volunteers). The overall volunteering rate in European Union countries is 23%. High levels of participation in religious or church organizations are more common in countries with a strong religious tradition, where the church is actively involved in the community (Volunteering in the European Union 2010).

The operation of the religious congregation is usually predicated on the availability of volunteer members to support or perform its work. Cnaan and Curtis (2013) showed congregations are highly dependent on volunteer work. Chaves (2004:223) found that 40.4% of all religious congregations had no full-time paid staff and that the median number of full-time paid staff was 1. Some 23.5% of congregations had no paid staff at all (p. 224), hence depending entirely on volunteers, including for their clergy or lay leaders. In the Philadelphia Census of Congregations, Cnaan and his colleagues (2006) found that more than a third of the congregations (38.6%) reported having no full-time clergy. Indeed, congregations and faith-based organizations are very efficient at enlisting such volunteer labor.

Hodgkinson, Weitzman, and Kirsch (1988) report the results of an earlier national sample survey of American congregations. In their data (p. 33), "34 percent of total congregations reported that they had no full-time paid employees," which was far more likely in smaller congregations. In addition, "42% of total congregations reported engaging one or more nominally paid employees" (p. 35), who were thus quasi-volunteers. Further, more than 99% of congregations reported using volunteers other than clergy each month, with 57.5% of congregations reporting having 25 or more volunteers each month (p. 36). An average of 36.2 volunteers were reported per congregation (p. 37). Findings from Chaves (2004), Cnaan and colleagues (2006), and Hodgkinson, Weitzman, and Kirsch (1988) confirm the assertion of Cnaan and Curtis (2013) noted above.

(b) *Congregation-based service volunteering*: One can volunteer through a religious group to support social services, such as having a congregational-based day-care or AA support group. For example, Cnaan et al. (2006) reported how Big Brothers/Big Sisters of America and a parallel reentry program (Rational Emotional Spiritual Therapy/R.E.S.T.) each recruited eight to ten volunteers from local congregations. The volunteers were all religiously affiliated and motivated, but the service and supervision were social and separate from any congregation. Cnaan, Wineberg, and Boddie (1999) and Cnaan and Boddie (2002b) review many studies of such social welfare volunteering by members of religious congregations.

(c) *Congregation-linked and/or religion-linked political activity*: One can do political activity linked to one's congregation or to one's religion/denomination more generally (Smidt et al. 2008). Smidt et al. present a highly nuanced and well-supported empirical approach to examining how religion affects political participation. Their key concept is the degree to which one's personal religious expression approach is private versus public, with attending worship services and getting involved in a congregation being the more public type of expression versus private prayers, and so forth (ibid.:chapter 7). Using data from two national sample surveys, the authors show that both religious tradition and one's form of religious expression (especially the public form) are statistically significant predictors of political participation in the context of many other demographic variables as controls in a multiple classification analysis (ibid., p. 221).

(d) *Religion-linked secular volunteering*: Finally, one can be motivated by religious motives to do good deeds as secular volunteering outside his or her place of worship. For example, one can help an environmental organization on his or her own volition or as a member of a religious congregation. In both cases, the environmental volunteer work will be similar, but the latter is likely to perform the task along with friends from the congregation or as an expression of being a person of faith.

Ample research in the United States shows that religious people, especially those who attend places of worship and do more voluntary work within their congregations as well as in wider society (Bekkers 2004; Bowen 1999; Lam 2002; Park and Smith 2000; Ruiter and De Graaf 2004). Such research found that the norm of congregational volunteering spills over to volunteering in secular organizations. In a study of volunteering in 53 countries, Ruiter and De Graaf (2006) found that in more religious communities, people are more involved in volunteering even if they themselves are not religious. In other words, percentage of congregation goers in a given society is strongly and positively correlated with percent of members in that society who volunteer. This implies that when other people in one's social network volunteer; the likelihood that an individual will also volunteer increases. Ruiter and De Graaf (2006) also found that across countries, non-Christians volunteer more than Christians and that among Christians, Protestants volunteer more than Catholics.

However, Ruiter and De Graaf (2006) found that religious participation only weakly explains secular volunteering rates among nations. With very few exceptions, when controlling for religious volunteering, church membership shows negative rather than positive effects on secular volunteering. As noted above, this is not the case in the United States, where Putnam, Campbell, and Garrett (2010) found that "religion boosts total volunteering so substantially that in addition to their higher rate of religious volunteering, regular churchgoers are also much more likely to volunteer for secular causes" (p. 445). Putnam et al.

(2010) also found that churchgoers are more likely to donate blood, give money to a homeless person, help someone find a job, help someone outside their own household with housework, and offer a seat to a stranger.

It is much more difficult to assess the scope of religious volunteering in faith-based organizations. A huge part of post-Hurricane Katrina volunteer work came from religious organizations (Michel 2007; Pant et al. 2008). It is also the case worldwide that after earthquakes, cyclones, and military devastations, religious organizations such as World Vision International or Catholic Relief Services are among the first to come with supplies and volunteers (Bane 2011). While there is no way to assess the scope of this volunteering, all observers agreed that religious-affiliated volunteers were the first on the ground, provided invaluable services, were the largest group of helpers, and kept sending volunteers years after the disaster. In the American context, Wuthnow (2009) reported that a large number of American Christians are personally involved in the developing world, with perhaps 1.5 million per year participating in direct short-term missionary or humanitarian efforts overseas. For a detailed analysis of the role of religion in international development volunteering and organizations, see Heist and Cnaan (2016).

Similarly, it is difficult to assess the scope of international religious volunteering. Rieffel and Zalud (2006) estimated that, in 2006, out of 43,000 Americans engaged in international volunteering, only 8,000 were affiliated with specific religious organizations, such as Caritas international, Habitat for Humanity, Catholic Relief Services, and the Presbyterian Hunger Program. However, this estimate excludes missionaries whose primary goal is to propagate the religion of the sending agency, such as the many missionaries sent annually by The Church of Jesus Christ and Latter-day Saints (LDS Church) or the Assemblies of God. If one adds missionaries to this statistics, then the majority of international volunteers are religious.

What is close to impossible to assess is the scope of religiously motivated social volunteering. What people do outside religious circles but highly influenced by them was not studied and can only be guessed. But religious volunteering also enhances people in the community to volunteer. In Cnaan and colleagues (2006), it was found that congregational social programs are carried out, on average, by eight congregational members and five non-members who just joined the program as volunteers but who are not affiliated with the congregation.

3. The formation of religious organizations

Many religious congregations are affiliated with a national or even international religion or denomination. Most world religions and denominations use missionaries and follow members' locations. They decide where to build a new congregation and what faith-based nonprofit organization (NPO) to establish.

This affiliation with central bodies does not mean that lay leaders do not have a say. Local adherents of a certain religion or denomination can pressure and finance the formation of a local (polymorphic) branch of the larger association. Only in rare cases are the religious places of worship and/or the faith-based organizations unique and unlinked (monomorphic). This is usually the case of independent churches, cults, charismatic churches, new gurus, and religious innovations. The latter form of forming religious organizations often involves a quest for "true" faith and leads to a more strict type of religious organization. Iannaccone (1994) argued that the strictness of religions reduces free riding and stimulates additional commitment from members. Members are expected to volunteer more hours, donate more money, and fully adhere to the religious rules. Individuals who are not willing or who are unable to display the high level of commitment expected of members of strict congregations either do not join the faith in the first place or drop out.

In some countries like the Unites States, Canada, and in Western Europe, the process of starting new congregations or faith-based organizations is ongoing and does not reflect fast growth. However, in other parts of the world and especially in African countries and in ex-communist countries, congregations and faith-based organizations are quickly growing and evolving, and as such they find it more difficult to establish a culture of congregational-related volunteering, so the majority of the burden is on leaders (Črpić and Zrinščak 2005).

4. Members and leaders as volunteers

In most cases, people join religious groups either through birth and family tradition or through conversion. As Pond and Smith (2009) demonstrated, converts are stricter and more committed to their faith than those who were born into the faith. These individuals take the teaching and expectations of their new religion more seriously and record higher rates of volunteering. A related group is that of new immigrants. New immigrants tend to search for a congregation composed of people like themselves; that is, of the same origin and of the same station in life and in this context often volunteer to help their own members and also volunteer in wider society to get local experience and social connections (Foley and Hoge 2007; Handy and Greenspan 2008). Similar findings are reported for the Netherlands (Carabain and Bekkers 2011). Finally, studies of American congregations found that the more a person is in a leadership position the more likely the person is to volunteer for and through the congregation (Cnaan et al. 2006).

5. Motivations for religious volunteering

In many countries (especially nations with high proportions of religious residents), religious people volunteer more than others. Religious practice is

associated with increased levels of volunteering in general in the European context. In a study by Voicu and Voicu (2009), religious practice was one of five main predictors of volunteering in almost all Western European societies alongside with education, social network, income, and age. Also individual country-level studies confirm the connections between religious practice and volunteering (Vermeer and Scheepers 2012; Yeung 2004). For example, in the Netherlands, volunteers are almost three times as likely as non-volunteers to be active in religious activities (Dekker and Halman 2003).

Furthermore, as we noted above, it is the people who are affiliated with congregations that volunteer at higher rates and not just people strong in their faith. This is also the case in Europe, including in ex-communist countries, although there are significant differences among different European countries in that respect (Bahovec, Potočnik, and Zrinščak, 2007). So what is the process? To understand religious volunteering, one needs to understand group dynamics and processes, as well as the impact of norms and values. Congregations are the places where people hear about being pro-social, where they see people act altruistically, where they find out about many needs, and where they are asked to volunteer. In most congregations, and especially in the United States, congregations hold volunteering as a mark of belonging and acting according to the group's norms. So the proposed model starts with the religious teaching and goes through wanting to be a valued member of the group (congregation) and meeting its behavioral expectations.

Drawing on Cnaan and colleagues (2002), the following flow of influences and development takes place in a congregation to produce high levels of volunteering:

Religious Beliefs and Religious Meaning ---->Congregational Attendance ---->

Formation of Face to Face Links and learning what the other congregants do ---->

Congregational Involvement (wanting to be part of the group)---->Acceptance of Group Norms for Serving/Volunteering ---->Volunteering in the Context of the Congregation and the community

There are two classical explanations as to why religious congregation members are more pro-social and volunteer more in other associations. We will distinguish between faith as a motive for volunteering and membership as a motive, but we will take the debate one step further to include culture as a critical component. In studying what moves people to be pro-social and generous, the literature distinguishes between "religious conviction" or "faith" and "community" or "social networks" as two distinct explanations (Jackson et al. 1995; Putnam, Campbell, and Garrett 2010; Ruiter and De Graaf 2006; Wuthnow 1991). The former refers to religious beliefs and norms that support generosity.

The latter refers to embeddedness within a religious group, such as a congregation, that exerts clear and measurable expectations, places social pressure, and provides a forum for personal solicitations. However, we argue that the two polar positions are both insufficient. To reach the high level of commitment that is required for such high rate of donations and volunteering, a strong set of norms and an organizational climate that sustains giving are required. The norms that are sustained and amplified in congregations are the sources of both the focus on religious volunteering and the opportunities to do good deeds.

6. Organization of religious congregations and other faith-based associations

Cnaan and Curtis (2013) have recently asserted that local religious congregations are membership associations, as other scholars have noted 40+ years ago (e.g., Robertson 1966; Scherer 1972), but many voluntaristics scholars still tend to ignore this, as previously (cf. Smith 1983). Congregations in most countries are organized around a religious leader(s) who is (are) assisted by lay leaders. In most contexts, these are the congregational leaders and then there are the members. Most congregations are characterized by a large level of informality and are not necessarily organized in a logical organizational structure. Some congregations are more formal, and without a formal ceremony (often baptism) a person cannot be counted as a member. When volunteers are needed the clergy often make a pitch from the pulpit or lay leaders talk with prospective volunteers. Lay leaders are by default volunteers, and they often energize others, including non-members, to join the congregational activities. Volunteerism both for the congregation and for social causes is secondary to the primary purposes of providing worship opportunities and teaching the tenets of the faith. Given that they have to provide the same level of transparency and accountability as other NPOs, they are usually first and foremost NPOs and then religious. Regarding volunteers, faith-based organizations treat them like other NPOs, and it starts with official recruitment. The difference is that non-religious NPOs cannot access congregations to be allowed to recruit volunteers.

   In some European countries, the majority of Christian churches have a privileged position, either financially and/or by being close to political power. In these countries, we find that state churches, for example, have the right to collect membership fees through taxation. This has resulted in financially secured churches that emphasize professionalism and can be bureaucratic. Thus, opportunities and needs for volunteering can be lower compared to other contexts, although many European churches have tried to increase volunteering in recent years as church memberships have been in decline and secularization and professionalism have become powerful. Minority churches are in a different position in relation to financial resources and are often more dependent on the activity of members at all levels. In their study based on a

sample of 24 European countries, Traunniuller and Freitag (2011) concluded that state support and government involvement in religion weakens religious volunteering (i.e., crowding it out).

Religious voluntary contributions of both time and money have acted as a strong force within Hinduism and Buddhism, but less than in Christianity and Islam (Salamon and Anheier 1997). Early Indian voluntarism was very much inspired by religious beliefs, ideology, and sacred writings. According to the *Bhagwad Gita*, charity is valid if it takes account of *desh* (place), *kal* (time), and *patra* (recipient). Sen (1993) found that religious-based philanthropy was very active during the 1950s in India. Besides the domestic religious contributions (29%), external contributions made up nearly half (48%) of total foreign funding directed toward religious NGOs for different welfare activities in India (Government of India 2012). The followers of all major religions of the world live in India, and there are strong impulses for religious voluntarism. There is a deeply rooted religious history of Hinduism involving charity in India, with later shifts to socio-religious reform from the 15th century onward (e.g., sufi, the Nirankari Movement, Namdhari Movement, Atmiya Samaz, Brahma Samaz, Theosophical Society, Ram Krishna Mission, Anjuman-Himayat-i- Islam, and so on; Sundar 2002).

In the South Asian region, Hindu voluntary organizations (NPOs) emerged across India and Nepal mainly in two forms (Sundar 2002). First, some religious NPOs developed as trusts for temples where huge individual cash or in-kind regular contributions were made as tribute. Other forms of NPOs working for betterment of poor people, like Bhartiya Vanvasi Kalyan Parishad, also arose. Similarly, Sikh religious organizations with egalitarian principles provided community food and active participation either in *gurudwara* or in other localities. Dera Sachha Sauda, a Sikh NPO, extended its welfare programs in the northwestern region of India. Christian NPOs are also spread across India, such as the Christian Auxiliary for Social Action, World Vision of India, especially in southern India and the tribal belt. Their contribution to education has been widely acknowledged. Islamic NPOs and their contributions involve both obligatory and voluntary contributions, called *zakat* and *sadaqa*, respectively (Sundar 2002). Furthermore, there is also a major focus in Indian Islam on *madrasa* activities (Islamic educational institutions).

7. Success and impact of religious congregations and faith-based organizations

As noted above, Cnaan and colleagues (2006) found that congregational social programs are carried out by non-members who have just joined the program as volunteers but who are not affiliated with the congregation. In addition, in societies where the number of actively religious people is high, we find higher rates of volunteering among people who are not affiliated with religious groups.

This is known as the spillover effect (Ruiter and De Graaf 2006). This implies that religious volunteering is capable of influencing the immediate society to be more pro-social and to be further engaged in volunteerism. However, this is not the case in all countries; for instance, this finding has been challenged by Lim and McGregor (2012). In Russia, for example, the Russian Orthodox Church does not focus on enhancing volunteerism and as such, its impact on the rest of society in this regard is limited (Knorre 2012).

Religious communities cannot survive without heavy reliance on volunteers. The number of functions that are to be carried out – from maintenance to music, from bookkeeping to teaching the faith to new members, and from securing the premises to spiritual counseling – mostly relies upon volunteers. Congregations that cannot foster the spirit of volunteering are required to purchase these services and, unless they are very affluent, are doomed to collapse. Thriving religious groups produce high levels of volunteering and are able to get members engaged even in programs outside the congregation (Ammerman 2005). Faith-based organizations from schools to international relief organizations are all performing with heavy reliance on volunteers. Their access to congregations and to their potential volunteers is a major advantage over other NPOs. For example, when a Mormon relief organization needs 100 volunteer to ship emergency supplies, all they have to do is call local clergy and the volunteers will be there early the next day (Rudd 1995).

8. Religious residential communities

One very special kind of religious association is a religious residential community. Such a community, as defined here, is a set of adults, and sometimes their children, who have chosen to reside together because of religious reasons and have formed an association to pursue their version of the right way to live to please God or serve some other religious ideal. The joint residence may be in a single, usually large, building or in a complex of buildings in close proximity on a single plot of land (owned by the community or by one or more early members or founders). In every case, there is some special kind of moral, life-style ideology about the best/right way to live one's life according to the association's religious principles/values. There is an explicitly religious ideology, usually involving a deity or revered religious leader. Although not usually considered to be associations, intentional communities qualify according to our definition, but these are simply residential associations. Religious intentional communities are the main focus here.

One may ask, what is the nature of volunteering in religious intentional communities? First, there may be informal volunteering in such residential associations, as in any other context of daily life. Second, the entire daily activity pattern of residents can be viewed as quasi-volunteering (Smith, Reddy, and Baldwin 1972:168–169). Quasi-volunteering is volunteering where the volunteer receives significant remuneration for work done, but still significantly

less than the market value of such work. In religious intentional communities, there is rarely any pay, but participating members receive payment in kind in the form of lodging, food, clothing, and sometimes a special, luxury object (e.g., a wristwatch). Participants also receive substantial psychic benefits (ibid.), such as a sense of belonging, of serving God, of helping each other live the right way, and so on. This *net cost approach* to defining volunteering has been substantiated as fitting with popular/lay conceptions of volunteering in several nations (Handy et al. 2000).

Third, some ordinary formal volunteering can *in theory* occur in a religious intentional community, but this seems to be very rare in practice. For instance, a small group of participants in a commune could decide to form a singing or theater group, if this were permitted. Those who participated in the sub-group would then be formal volunteers in that group, helping co-members to enjoy the recreational activity and possibly also performing for the enjoyment of non-member commune participants, as a service to them. Unfortunately, suitable ethnographies could not be found to see if such recreational subgroups of religious residential association participants actually have existed.

Christian monasteries and convents, as intentional communities, go back two millennia (Dunn 2003), continued through the European Middle Ages (Venarde 1999), and continue to the present day in most nations with a substantial Christian population. Similar, very long, monastic (intentional religious community) traditions exist in other world religions (e.g., Benn, Meeks, and Robson 2011; Herrou 2013). Communes, as intentional communities, have arisen in the West in the past three centuries (especially in America, France, and Britain), usually based on some religious ideology and faith (Holloway 1951; Kanter 1972). In the past 60 years, communes have spread to many nations of the world, often with more secular than conventionally religious ideologies, but always with some moral ideology as a secular religion (Oved 2012; Zablocki 1980).

We could find no comparative, social scientific studies of monasteries and convents, but a few such studies exist for religious communes. Kanter (1972:chapter 4) compared long-lived (*successful*) versus short-lived (23 of 30 being religious) communes in the 19th century in the United States in terms of many structural mechanisms, such as aspects of sacrifice (e.g., abstinence, austerity) required, degree of personal investment required (physical residence, financial investment, irreversibility of investment), renunciation of outside relationships and limitations on leaving the commune physically, group ritual, communal sharing and labor, and other factors. Many such *costly* factors clearly distinguished successful from unsuccessful communes. Sosis and Bressler (2003) did a further quantitative test of the role of cooperation mechanisms in commune longevity.

Many of the commitment mechanisms examined in both studies can be seen as relevant to why conservative, stricter but often new Christian

churches in America have been growing in recent decades and also in past centuries, while more liberal and mainline ones have been declining (Finke and Stark 2005:249–253). Studying religious intentional communities as residential associations is important for understanding the depth of commitment that can be achieved by religious associations, as contrasted with most (not all) other purposive types of associations. Social movement/activist associations (Handbook Chapter 24) and deviant voluntary associations (DVAs; Handbook Chapter 53) are two other purposive types of associations that can generate similar depth of commitment and cause huge changes in their members lifestyles, social relationships, and perspectives on the world. Some DVAs have also been religious communes as intentional communities, such as the Peoples Temple, Jim Jones' suicidal commune eventually located in Guyana (Layton 1998), and the Branch Davidians, led by David Koresh (Breault and King 1993).

9. Challenges faced by religious volunteering and associations

In many parts of the world, secularization is one of the biggest challenges to religious volunteering (Ruiter and De Graaf 2004). This is especially the case in Western Europe. Societal processes like individualism, professionalization, secularism, old and new types of solidarity, and diverse communities are all chipping at religious commitment and by extension at religious volunteering. As part of modernity and post-modernity, increasing individualization processes have led people to focus on their own lives and careers. Accordingly, people reject old binding organizations such as congregations and engage in activities that are self-gratifying, including volunteering. However, these types of volunteering are short-lived, sought to satisfy and enhance the individual volunteer needs, and done without commitment to the organization (Hustinx and Lammertyn 2003). Furthermore, in societies where modernity-type individualism is on the rise, religious communities are shrinking and often congregations and faith-based organizations are merged or outright closed. In such contexts, volunteering tends to decline and religious volunteering becomes negligible.

   In ex-communist countries where religion was prohibited or suppressed, as was in general suppressed any civic initiatives we observe the reverse phenomena. In post-communist European countries, China, and Russia, religiosity has a renaissance and more people openly practice their faith, belong to a religious community, and slowly engage in volunteer work (Mitrokhin 2006). This trend, however, is in its infancy and often faces political opposition, and its future impact is unclear.

10. Main barriers to religious volunteering

Two key barriers are identified that limit the scope and magnitude of religious volunteering. First, as noted above, there has been a decline in interest in

religion in many Western countries, and without the individual religiosity component, religious volunteering rarely takes place. This can be viewed as an issue of supply. Second, in many parts of the world, religious organizations, particularly if they are part of the public welfare and funded mainly by the state (state-based religion; *state churches*), prefer to rely on professionals and avoid the reliance on volunteers. This is also true for many faith-based organizations and especially the large-scale ones. This can be viewed as an issue of demand. While the supply issues are similar to problems facing many NPOs, for religious groups conversion and retention are strongly associated with maintaining a volunteer pool. As for the demand issue, in some instances it is indeed wiser to rely on professionals; however, often it is not the case. Directors of faith-based organizations should know the merit of working with religious volunteers and how to recruit them from local congregations. In some parts of the world such as Russia, various religious nonprofits are also discouraged from collaborating with congregations or with other faith-based organizations and as such are discouraged from using religious volunteers (Knorre 2012).

11. Religious volunteering and public policy

In some countries, most notably the United States, United Kingdom, and Australia, governments changed policies to encourage religious organizations to use volunteers and help poor and needy people. In the United States, the passage of Welfare Reform in 1996 introduced charitable choice that was predicated on transferring welfare contracts to religious organizations that employ volunteers (Cnaan and Boddie 2002a). In England, the Blair government pushed for what they called welfare mix (Taylor 2004), and in Australia the Howard government transferred welfare services to churches, instructing them to use religious volunteers (Garran 2004; Maddox 2005). Though religious charitable organizations had been important parts of the welfare state in many European countries for a long time, recently and despite the secularization process "the role of the churches in the delivery of welfare is expanding rather than contracting" (Bäckström and Davie 2011:155). Other governments around the world are also looking to religious bodies and their pools of volunteers and assess how to harness them into the public social services delivery system.

In other countries, like China and Russia, religion is still not fully embraced by the government and although many religious organizations provide social services and also use volunteers, governments view it with suspicion and there is no interest in recognizing religious services and religious volunteering. However, in congregations, volunteering that sustains the place of worship is accepted and allowed. Furthermore, in many such countries religious volunteers are engaged in the provision of many public goods, but without any special public policy or legal arrangement.

E. Usable knowledge

Community leaders and directors of secular organizations should pay close attention to the phenomena described in this chapter. If high levels of volunteerism are found in religious congregations, these are good sites for recruitment. Almost all NPOs are in need of hardworking volunteers. Collaboration with religious organizations may enable the recruitment of a group of volunteers and not just one at a time. In times of disaster, governments and large organizations such as the Red Cross should approach religious congregations in the area and faith-based service organizations to help in the recovery process. There is no other group of people who can give so much for so long as religious volunteers responding to disaster. Most importantly, it is not faith alone that brings people to volunteer. It is the group experience of belonging to a place of worship that values volunteering and service that produces this high rate of religious volunteering. People who are religiously strong but practice their faith alone are as active in volunteering as all others in society.

F. Future trends and needed research

Religion produces much energy among its active adherents. In the name of religion, people volunteer to do wonderful deeds such as helping strangers in times of disaster and also the most horrible deeds such as killing, maiming, and suicide bombing. In both cases, members of the religious group are giving themselves, their time, and their resources in a manner unparalleled. Since the dawn of civilization, religion managed to extract labor from its members. While in some countries secularization is on the rise, in other countries religiosity is on the rise. It is unlikely that in the 21st century religion and religious organizations will not play central roles in most countries. The challenge, thus, for most religious groups and governments is how to channel the energy embedded in religious participation into pro-social targets.

Comparative multi-national research is needed in all key world regions that seeks to understand and explain the full set of motivations and influences on religious volunteering and other religious activities. This needs to be done in the context of studying many other types of associations, so that valid comparisons can be made and also so that the mutual influences of religious and secular associations can be carefully studied. Current research rarely has large samples from such a variety of nations. The insights and research on motivations and other influences from Handbook Chapters 30 and 31 should be utilized, along with Handbook Chapters 25–29. Comparative multinational research is also needed in all key world regions, which seeks to understand and explain the internal structure and functioning of religious congregations in such societies. At present, only the United States has been well-studied

in this regard with large sample surveys of congregations (e.g., Chaves 2004; Hodgkinson, Weitzman, and Kirsch 1988).

Political Parties and Political Volunteering/Participation

Annette Zimmer (Germany), David H. Smith (USA), and Abdalhadi Alijla (Palestine)

A. Introduction

Political volunteering refers to civic engagement, citizen participation, political association and political party involvement, political campaign activity, political meeting attendance, voting, and other participation in conventional political activities (vs. in social movements, activism, protest, other unconventional political activities; see Handbook Chapter 24). We also examine briefly the nature of political parties and political pressure (interest) groups, their internal structures, membership, activities, external relationships and collaboration, and impacts. The S-Theory of Smith (2016c, 2017a, 2017b) is applied as a comprehensive, interdisciplinary model of why people do political volunteering. Related multivariate models like the Civic Voluntarism model of Verba, Schlozman, and Brady (1995) explain much variance in political volunteering/participation. Even in strong democracies there is a tendency for political volunteering to be done mainly by higher status and more educated people.

In this chapter, we suggest an approach that distinguishes among at least three dimensions that have a significant impact on who, how, and why a person takes part voluntarily in political life, in the public domain, and in community affairs:

1. a top-down dimension focusing on the polity environment that sets the frame and provides legitimacy for political volunteering;
2. a bottom-up dimension highlighting the social embeddedness of political volunteering by focusing on the links between the individual citizens and society at large; and
3. a cultural dimension that locates political volunteering in a certain regional environment and/or social milieu that is defined through a specific spirit of time.

There is no doubt that – depending on the era, region, and hence culture – instruments, motives, forms and purposes of political volunteering

differ significantly. However, before going further into detail, we want first to discuss some definitions and then provide a sketch of the historical development of when, why, and where political volunteering as an activity of individuals as well as groups became an established aspect of democracies, quasi-democratic states, and even corporatist and authoritarian states.

B. Definitions

In general, this chapter accepts the set of definitions in the Handbook Appendix. It is not possible to provide an encompassing definition of all those civic or political activities that – directly or indirectly – aim at influencing one or both of (a) the political realm – specifically policy, politics, and the polity at the different levels of government (local, regional, national, international), and/or (b) the societal sphere in terms of community building at home or in a broader and international context. Therefore, some definitions specifically address the genuine political context. These are covered by the terms *political participation* and less frequently, but important here, *political volunteering* (Matonyte 2011; Rod 2010). In contrast, those civic activities seeking to further the well-being of the community as regards neighbors, friends, and more generally all those people with whom a person is sharing a common interest are summarized under the terms *civic engagement*, *civic activity*, or *civic action* (Moro 2010).

In common with the other chapters in Part III, this chapter is concerned centrally with volunteering in formal groups, usually termed *organizations* (Smith, Stebbins, and Dover 2006:164–165). Common examples of the kinds of conventional political associations and volunteering this chapter is concerned with are *political parties*, *political pressure or interest groups*, and *political campaign groups*, as studied in political science and political sociology. In addition to some focus on the structure/processes of political associations, this chapter is mainly concerned with volunteering in such *political* associations, by which is meant volunteering in organizations that are somehow involved in seeking to influence or achieve the goals of the polity, government, and political processes in a nation or society at any territorial or geographic level. Further, by contrast with the next chapter on social movement and unconventional (activist, protest) political volunteering, this chapter focuses on political volunteering in conventional political activities in a nation or society. By *conventional* is meant political activities that are broadly acceptable to the political regime and leaders in power at that time. Thus, conventional political activities can vary markedly over historical time and across nations/societies at the same time in history.

The meaning and the modes of both citizen participation and civic engagement have significantly changed over time. It is not possible to detach the notion and the modes of civic engagement and political volunteering from

time and societal environment. As a European, one has a certain idea of what it means to become and remain active in politics. This does not necessarily correspond with the concept of citizen participation in North America. Neither does political volunteering mean the same in Russia, Eastern Europe, or nations in Africa, Latin America, or Asia. Even between individual countries there are marked differences as regards the epistemology of civic engagement, citizen participation, and political volunteering. While it is normal to go on strike in France, citizens are very reluctant to engage politically in this way in neighboring Germany. Moreover, the meaning of civic engagement and, in particular, political volunteering varies across historical periods in any nation or society. Compared to today, it was very different for a woman to engage in politics through political volunteering in the 18th century or earlier. As regards women, still today political rights and eligibility to participate in the public domain are very unevenly distributed among nations around the world. Hence all things considered, how are we to come to grips with such a fuzzy set of ideas, concepts, and distinctive approaches?

C. Historical background

Political volunteering is closely connected to the development of modernity in the sense of modern statehood and a democratic or liberal society. Of course, in ancient Greece and in the Roman Republic, engagement in politics constituted an important segment of a free nobleman's life. The notion of civil society goes back to citizen participation and political volunteering at the Agora in Athens or the Forum Romanum in Rome. However, we should not forget that in ancient Greece and Rome, the privilege to participate in the public domain was restricted to a relatively small and elite segment of society, perhaps only 10% (e.g., Osborne 2010). Political parties, political campaign groups, and political pressure/interest groups in the modern sense have arisen only in the past two centuries or so, and then mainly in authentic multi-party democracies of one degree or another.

Political parties and political pressure/interest groups only arose as part of the *Industrial Revolution* (Polanyi 1944), and especially the *organizational revolution* that accompanied it (Boulding 1953). One new kind of organization that began to arise often in Western European nations was the constitutional monarchy, or parliamentary democracy, as a wholly new form of government organization. Prior to this time (*c.* 1800), nearly all nations/societies had been led by autocratic, divine right emperors, kings, queens, dukes, and the like who could act virtually without restraint on their personal attitudes, wishes, and whims. Now there was a parliament or legislature that debated and enacted laws, serving as the main policy-making body and the enforcer of its own laws, delegating enforcement powers to various, less powerful, government agencies. Only

in this new parliamentary/legislative context did political parties and pressure groups now make sense. The same was true, without the history of monarchies, in the United States, and to a lesser extent in certain other colonial regimes (e.g., Canada, Australia, New Zealand).

D. Key issues

1. The top-down perspective: The nexus between citizen participation and the political regime

In the early 1990s, two seminal books were published *The Third Wave: Democratization in the 20th Century* by Samuel Huntington (1991) and *The End of History and the Last Man* by Francis Fukuyama (1992). Both prognosticated a bright future for civic engagement and citizen participation in accordance with the Western model of democratic government and market economy. After the crumbling of the Berlin Wall, it was indeed widely assumed that democratic governance of the liberal pluralistic kind is the one and only institutional frame under which civic engagement, citizen participation, and political volunteering can take place. Moreover, is was also assumed that any nation, state or community around the world was moving toward the *one-size-fits-all model* of a liberal pluralist regime providing citizens with a standard repertoire of legitimate means for civic engagement, citizen participation and political volunteering. Accordingly, these features are very closely related to the political system of the Western Hemisphere, which is based on a market model of decision-making and policy formulation. Competition between individuals, groups, and organized interests constitutes the core or the driving force of this model.

Its constitutional setting has been developed in the course of time. It is based on a combination of market economy and representative democracy. Key features of this model of democratic governance are parties and elections, pluralistic societal organizations, and numerous associational groups that are active at the local, regional, national, and international level of governance representing interests, ideas, and claims. The repertoire of civic engagement, and political volunteering enhanced by liberal democracy of the Western style, is very much in accordance with the features of Robert Dahl's (1989) polyarchy that, however, had been broadened by new forms that had become popular through the social movements since the late 1960s and the technological revolution since the 1990s. The repertoire encompasses the following features and opportunities for civic engagement, citizen participation, and political volunteering:

(a) taking part in elections,
(b) running for office,

(c) being a member or supporting an organization influencing politics (party, union, NGO),

(d) being affiliated with a social movement,

(e) taking part in protest activities (rallies, strikes),

(f) using tools of e-government (e.g., signing petitions through the Internet).

"Citizen participation…reflects the way that people use the opportunities existing within a political system" (Almond et al. 2007:63). Frequency and intensity of citizen participation across nations and regions vary significantly, partly due to the character of the political region, and partly due to the political culture of the region.

2. Structures and processes in political parties, pressure/interest groups, and political campaign organizations

Given the new existence of parliamentary or legislative democracies, beginning mainly in the early 1800s, political parties of the modern variety arose for several good reasons (Aldrich 2011): to regulate which people should become candidates for elective offices at different territorial levels, especially national leaders; to mobilize voters for specific candidates; and to mobilize public support for key policies and legislation once in office. Parties have a crucial role to play in democracies, but this role has been changing in recent decades, especially beyond the Western democracies (Cheeseman 2015; Diamond and Gunther 2001; Webb 2009). The idea of political parties has appeal even in dictatorships and authoritarian states, where one party rules and sham elections are held regularly (e.g., Brooker 1995; Magaloni 2008). Nonetheless, parties continue to be essential features of genuine democracies and involve millions of participants as political volunteers (e.g., Dalton 2013; Maisel and Berry 2010; Sartori 2005). Related to the party and electoral system are political campaign organizations (temporary associations) in which many volunteers work to help elect the candidates of their choice (Hetherington and Larson 2009; Medvic 2013).

Another key feature of genuine democracies is the active, effective presence of political interest/pressure groups (e.g., Cigler and Loomis 2007; Nownes 2012). The interest level of political scientists in pressure/interest groups as a topic of study varies over time without relationship to their continuing importance in the polity (Baumgartner and Leech 1998). Many pressure groups are operated by business associations, which have for-profit businesses as collective members. However, many other groups are operated by individuals, often volunteers, although there are usually paid staff at the top (Ainsworth 2002). In spite of having a negative public image in the United States, many pressure groups represent the public interest, not special business or occupational interests (Grossman 2012). On the whole, however, pressure groups tend to operate

to benefit the wealthier, more educated people in a society and their interests and organizations (Bartels 2012 Schlozman, Verba, and Brady 2013).

3. Variations in political volunteering across nations

The political science literature differentiates between *traditional* and *new forms* of citizen participation. Traditional forms are by and large connected to the feature of membership and made possible through the concept of freedom of association. The coming into being of the concept was closely linked to modernity in terms of both the development of modern statehood and societal differentiation. Today, the concept of participation constitutes an integral part of the majority of the constitutions of modern democracies, including the Universal Declaration of Human Rights of the United Nations, stipulating that (a) everyone has the right to freedom of peaceful assembly and association and (b) no one may be compelled to belong to an association (Article 20).

Currently, citizen participation and civic engagement are increasingly disentangled from the notion of membership, and hence becoming more and more volatile and individualized. Compared to those avenues for civic engagement that are facilitated and made possible through the institutional setting of the respective political regime, currently more societal-based forms of activity that are not necessarily aiming at having an impact on the broader political environment are gaining importance. This trend is clearly reflected in the worldwide discourse on the importance of civil society.

The prognosis of the success of the Western model failed. The forecast put forward by famous political scientists did not come through. Instead, the world of today's political regimes is more complex than previously assumed. In accordance with political scientist Juan Linz, we can at least distinguish between democratic, authoritarian, and *sultanistic* regimes (2002). Even democratic regimes differ significantly as regards the opportunities for citizens getting engaged in political affairs. Doubtlessly, non-democratic, autocratic, or authoritarian regimes tend to limit and to control public spheres where people might become active as political volunteers.

But this is not to say that there are *no chances* for civic engagement in authoritarian regimes. Indeed, it is a feature of today's complexity that we can observe a growing number of so-called *hybrid regimes* in which civic engagement and citizen participation are possible, but are simultaneously limited and restricted (Diamond 2008). Elections take place and hence voting is a regular civic activity in these regimes. However, members of opposition groups might be hindered even by force to run for office. By law, it may be allowed to form and to join associations, and certain associations are not allowed to operate because they are in political opposition to the current political regime or are receiving foreign donations, and they are therefore declared to be unconstitutional. Any civic

activity that constitutes a potential threat to the regime is not considered to be legitimate. Finally, *sultanistic* regimes, by definition, are applying pre-modern modes of governance and control. Free-will constitutes a foreign word, and the right to associate is not respected or even understood. Instead, civic activity is based on bonds of kinship and clientelism.

4. The bottom-up perspective: From civic culture to social capital

Making things happen is the keyword for the bottom-up perspective of civic activity research. Accordingly, the opportunity structure provided by the state or government is not the point of departure. Instead, researching civic activity from a bottom-up perspective translates into going to the very roots of civic activity by asking the question of who and how he or she gets civically active in order to achieve societal change. Here is a key problem of the social sciences, specifically the so-called micro–macro problem or the *so-what-question* is addressed: How is society at large and government in particular affected by civic engagement, citizen participation and community-related activities? Results of surveys show that worldwide engagement in politics is not a central concern of (even) the very active population enjoying volunteering.

Indeed, people by and large prefer non-political engagement covering a broad spectrum of activities from leisure and sports to altruistic and service related actions. However, there are prominent advocates, ranging from Alexis de Tocqueville ([1832] 2000) to Robert Putnam (1993), who convincingly argue that whenever people get active in public, and whenever they are working together in order to follow a common interest, they are simultaneously working on behalf of their community. This means that any activity that goes beyond privacy and which is not directly related to market or commercial issues has at least in the long run a societal as well as a political impact.

In accordance with de Tocqueville ([1832] 2000, Almond and Verba ([1963] 1965), and Putnam (1993), many social scientists and political philosophers perceive civic engagement in its multifaceted forms as a driving force of societal development and democratic governance. Against this background, it becomes understandable that a downturn in civic engagement and citizen participation, predicted by Putnam (1995) in the mid-1990s, seemed to pose a definite threat to the well-being of modern society and democratic governance. However, as it turned out, civic engagement globally had not diminished at all, according to many studies (e.g., Smith and Robinson 2016). On the contrary, the world has witnessed an *associational revolution* (Salamon 1994) since the mid-1970s. Smith (2016b) sees this as the *fourth*, global, associational revolution, not as the first one, as Salamon seems to state or imply (see Handbook Chapter 50). Moreover, citizens worldwide have become more active and increasingly engaged in community affairs.

However, it also became clear that the modes and forms of citizen participation and civic engagement have changed quite significantly during the last decades. In a nutshell, at least in the Western Hemisphere, the classical form of civic engagement was based on the notion of membership (see Handbook Chapter 1, for the 10,000-year history of association membership). In particular, in Europe the universe of voluntary associations from unions to sports clubs was divided along ideological and normative lines for a long time. The cleavage structure of Western, and in particular European, societies was replicated in organizational infrastructures composed of numerous voluntary associations that were part of ideological camps and societal milieus, such as the social-democratic, the Catholic, the Calvinistic, or the liberal milieu. In the United States, cleavages were not organized primarily on ideology but on ethnicity and on community feelings of the migrant populations. Nowadays, civic engagement and citizen participation are far more individualized than they used to be some decades ago.

As clearly worked out by Theda Skocpol (1999, 2003), the modes of organizing civic activities have changed dramatically: "Where once cross class voluntary associations held sway, national public life is now dominated by professionally managed advocacy groups without chapters and members. And at the state and local levels 'voluntary groups' are, more often than not, nonprofit-institutions through which paid employees deliver services and coordinate occasional volunteer projects" (Skocpol 2003:7). The significant change of civic engagement does not show in the results and figures of large-scale surveys. However, research at the local level, as well as at the organizational level, indicates that the infrastructure of civic activity, political volunteering, has become highly professionalized in many instances. Accordingly, central sources of funding have shifted from membership dues to donations acquired through fund-raising campaigns, again organized and put in place by professionals. The transition "from membership to advocacy" (Skocpol 1999:462) is a worldwide phenomenon. The so-called *old organizations* – unions, parties, traditional charities – are particularly affected by the new trend.

The *new organizations* of civic engagement, sometimes termed *non-governmental organizations* (NGOs), differ from the traditional membership associations in terms of organizational structures, funding, and working procedures. Instead of working mainly with volunteer members, they are professionalized with paid staff. Instead of relying on membership dues, they operate on external funding. Moreover, instead of being multi-level, federated associations, with local branches, state associations, and national peak associations, NGOs are by and large hierarchically structured organizations with only a national entity – no state or local branches. Hence, for many people citizen participation no longer constitutes a by-product of membership in these

advocacy organizations that have no real members, but instead citizen participation is often a loosely affiliated component of a professionalized NGO that might widely use the Internet for its political campaigns pressing for single issues. A further new development is related to *community organizing* taking place at the local level. Again, there are professional *organizers* who, supported by donations and foundation funds, aim at empowering local citizens to get active on behalf of certain community issues. Currently, the most prominent representative of this new mode of getting civic engagement started is US President Barack Obama, who used to work as a community organizer in Chicago.

Skocpol's thesis, as described in prior paragraphs, has been put to extensive, quantitative, empirical testing with national sample data on associations in the United States by Walker, McCarthy, and Baumgartner (2011). They found no evidence for Skocpol's thesis, which has been based mainly on qualitative examples and special samples of associations or non-associational nonprofits. Specifically, national advocacy associations continue to grow and proliferate, with no evidence of non-associational (i.e., memberless) non-profit advocacy agencies (NPOs) crowding out or diminishing the numbers of such advocacy associations. Advocacy NPOs without members (which are *not*, by definition, associations at all) also continue to grow. Clearly, advocacy is increasingly popular for all types of organizations in the US nonprofit sector.

Despite the significant transformation of civic life suggested above, the active citizens who volunteer on a regular basis for local associations (GAs) and who are interested in community affairs as well as in politics in general have not changed significantly since the early 1950s, when the first surveys were conducted investigating the socio-economic background of those who are civically engaged. Civic engagement, citizen participation, and political volunteering constitute core domains of well-educated members of the middle class. Compared to the 1950s, female participation has significantly increased with respect to every mode of activity, from voting up to taking part in protest drives. However, this is due to the fact that women's access to institutions of education has become much easier than it used to be worldwide since the late 1960s.

5. S-Theory used as a multivariate, interdisciplinary model of political volunteering/participation

Smith (2014, 2015, 2016c, 2017a, 2017b) has recently developed a very general, quantitative, interdisciplinary, and comprehensive theory for the explanation of human individual behavior, especially pro-social behavior and voluntary action. His S-Theory (or Synanthrometrics) is presented briefly in Handbook

Chapters 2 and 31. [The next paragraphs of this Section #5 are quoted from Smith (2017b), with permission.]

"Perhaps because political science lacks a single, overarching, and quantitative theory of political behavior, this academic discipline has been fairly receptive to new independent variable (IV) types that can help explain political behavior. Such receptivity has been enhanced also by the fact that after 50 years of trying, not all that much of the variance (30%–50%) in voting and other important dependent variable (DV) types of political behavior could be explained by traditional Socio-Cultural Roles (demographics) combined with political ideology (as Felt General Attitudes). The part of political science focused on explaining political participation has been termed *behavioral politics*. The subfield called *political psychology* has been the most active in pursuing new types of IVs to help explain such behavior, usually with a quantitative analytical strategy.

A recent, high-quality handbook on political behavior is a good place to begin here (Dalton and Klingemann 2007). Use of socio-cultural roles and demographics as traditional IVs to explain political participation is a baseline starting point in the quantitative theory of political behavior, as in S-Theory. For instance, the Handbook has chapters on such demographic factors as social class (Chapter 24), religion (Chapter 25), race (Chapter 26), and various other dimensions of *political cleavage*, new and old (Chapter 28). *Political cleavages* is the general term for effects on political participation of these kinds of socio-cultural roles and demographic categories. Similarly, another traditional starting point in explaining political behavior has been the focus on political beliefs, values, and ideology (Chapters 3, 8, 12, and 22) and party preferences, especially left–right orientations (Chapter 11) as Felt General Attitudes/FGAs in S-Theory. But there has also long been a focus on preferences for specific political parties (*partisanship*; Chapter 29), and more recently, a focus on preferences for specific leaders as personalities (Chapter 30). Both of these IVs are Felt Specific Attitudes/FSAs, in the Motivation/M IV as part of the Psyche mega-IV in S-Theory.

Chapter 27 reviews economic models of voting, showing how political science is reaching out in the direction of economics, but not for basic economic theory. This approach (p. 518) focuses instead on how voters assess the current economic situation in their nation or smaller territory, then either voting to approve present leaders, if the situation is seen as good, or voting to elect other/new leaders, if the current situation is seen as bad or negative. However, voters can also assess the probable future economic situation and take that perception into account (p. 526). Empirical studies support both approaches, finding retrospective and prospective

cognitive effects on voting, even with other IVs/factors controlled statistically (p. 532). Such research validates the inclusion in S-Theory of Cognitions/C as part of the Psyche Mega-IV and also validates inclusion of the Mega-IV of Environment/E, particularly the macro-context of the individual. Chapter 31 examines more sophisticated multivariate statistical analyses, which use *multi-level models* to assess separately the effects of individual factors and contextual (especially macro-context) factors. Statistically significant effects of both the individual factors and macro-contextual factors of various kinds have been found in recent research. Such research and theory further validates the inclusion of the Cognitions/C Macro-IV in the Psyche Mega-IV and also the Mega-IV of the Environment/E in S-Theory.

Chapter 3 reviews research and theory showing the importance of Affect/A or emotions in political psychology and choice, validating the inclusion of the Affect IV as part of the Psyche in S-Theory. That chapter also reviews research and theory on the improving methodology of political psychology, moving gradually beyond self-report measures from survey interviews to the use of implicit measures that tap unconscious and emotional influences (p. 92). This validates the recommended S-Theory methodological practice of measuring both explicit/conscious (self-report) and implicit/unconscious (usually sub-liminal) version of all Psyche IVs (Mlodinow 2012; Smith 2017b: chapter 8; Vedantam 2010). Dalton and Klingemann (2007: chapter 10, p. 190) note the importance of personality traits, seen here as the S-Theory IV/T, and also of certain modern values, which are Felt General Attitudes/FGAs, both seen in S-Theory as Meso-IVs embedded in Motivation/M, as one Macro-IV in the Psyche Mega-IV.

Insofar as political behavior has had key theories, *Rational Choice Theory* (RCT), borrowed from economics, has long been a favorite one (Chapter 32, pp. 610–611). However, Chapter 23 reviews research on a particularly interesting and new aspect of individual decision-making. It is now clear from much research that the psychological approach to decision-making is superior to the economic RCT approach, because political choice has at least two levels: (1) choice among the ballot alternatives offered (e.g., the menu of specific available choices in voting), at the individual level of analysis, and (2) choice among alternative *menus of choices* that might be offered to voters (the variety of possible menus as options for those leaders who construct for all voters a specific menu of choices for a specific voting process), as determined by the nature of the political system and by current political leaders. Economics never deals with the level #2 choices, only with the level #1 choices, and most political scientists have done the same, until very recently.

These two different levels of choices are captured in S-Theory by including both the full range of Macro-IVs (M, A, G, I, C, π, S) comprising the Psyche Mega-IV of individuals, but also including the Environment/E Mega-IV. This more nuanced approach to political decision-making includes both the "attributes of the chooser, but also ... the properties of choice sets" (p. 439).

Multivariate theories of voting and of other key types of political participation by individuals have become very sophisticated. Recent empirical-statistical results generally support the Mega-IVs of the Environment/E, and especially the various Macro-IVs comprising the Psyche/Ψ in S-Theory (Dalton and Klingemann 2007:630–633, 667–669, 793–794; see also Leighley 2012). Turning to two specific multivariate research examples, based on national sample survey data in the United States, the excellent study by Verba, Schlozman, and Brady (1995:389) *explained 45% of the variance in a highly reliable index of overall political participation*, using demographics, some of the S-Theory Psyche Macro-IVs, and one Environment IV (recruitment by others, as a Micro-Environment IV), but no Body IVs. *With voting intention as the DV, the multivariate theory of Marcus, Neuman, and MacKuen* (2000:121) *explained 69% of the variance*, using national samples of the United States. The latter authors contrast the superior explanatory power of their *affective intelligence theory* over the traditional RCT approach (p. 132).

Although survey research cannot adequately assess implicit (unconscious) versions of the S-Theory Psyche IVs, other researchers and theorists make it clear that such implicit IVs are potentially important IVs in explaining political participation (e.g., Lakoff 2008:196–197 and chapter 16; Marcus 2013:168–174). This further validates the S-Theory methodological proposition that appropriate implicit measures of all Psyche IVs need to be obtained, to fully explain behavior (Smith 2017b: Chapter 8). Similarly, survey research finds it difficult to measure directly most relevant Body IVs, depending on self-report, but they are nonetheless important factors potentially affecting political behavior, as for any other kind of behavior. For instance, Tuschman (2013:401) makes a strong case that three measurable clusters of personality traits clearly affect an individual's political orientation (e.g., right–left on the party and ideology spectrum), which in turn influence voting. Further, "Each of the three personality clusters has roots that reach even deeper into evolutionary origins." At the level of the brain and neurology, Hatemi and McDermott (2011:chapters 4 and 11, especially) show clearly that there are neurobiological influences on much political behavior, contrary to the long-prevailing and still current *sociocultural transmission paradigm* in political science, as in sociology."

Smith (2016f) analyzed Russian national sample survey data (see Handbook Chapter 31 for a description of S-theory and the methodology used in the Russian research; N = 2,000) using his S-Theory to predict political activity/volunteering as a criterion variable. Political activity/volunteering was measured by the respondent's answer to a question about how much leisure time in the past 12 months had been spent in "political activities like political meetings or campaign work," with five fixed answer options, ranging from *very often* to *never*. Some 24.3% of the variance was explained, a very substantial and highly significant result statistically, with 15 significant predictors (.05 level, two-tailed). The most powerful predictors, in declining order of beta weight strength, were as follows: β = .22 do more socially approved leisure; β = .19 not socialize in bars; β = .17 more local helping goals; β = .16 more formal volunteering.

6. Deviant political parties and deviant political volunteering

In any contemporary society with one or more political parties, there can be one or more deviant, stigmatized parties as well as the mainstream, acceptable one(s). In a one-party state, such as China, only the dominant party (e.g., the Communist Party of the Peoples' Republic of China) is mainstream and acceptable, and all others are stigmatized as *deviant* and potentially harmful to the party-state (unless actually dominated by the one party). This situation of dominance was true in the Soviet Union and the Nazi Third Reich, as well as in all other one-party states (e.g., Brooker 1995; Brown 2011; Magaloni 2008). Apparent exceptions usually involve sham (fake) opposition parties controlled by the party-state, as in China today, not genuine and independent parties. Even in multi-party nations, there may be deviant, stigmatized political parties, as for the Communist Party in the United States.

Hitler's Nazi Party (NSDAP), formed in 1918 by others, began with him in full control in 1921 as a revolutionary party, seeking to overthrow the democratic Weimar regime. After a failed coup attempt in 1923, Hitler went to prison, and was released a few years later only with his promise to not engage in violence, only to use the ballot box. When he ascended to being Chancellor of Germany by the appointment of President van Hindenberg in 1933, Hitler performed another, this time successful, coup, and installed the Nazi Party as the sole legal party until Germany was defeated by the Allies in 1945 (Smith 2017c).

Many other nations have had revolutionary political parties active within their borders, often as underground or guerrilla movements. Daniel Ortega and his Sandinistas were successful in Nicaragua, as was Robert Mugabe and his Chimurenga guerrilla movement in Zimbabwe (Smith 2017c). But as often

elsewhere, both leaders installed brutal, long-term dictatorships, which many citizens have found to be little, if any, improvement over the previous authoritarian regimes. Dictatorships are easy to install, hard to dislodge, and appeal widely to revolutionary and guerrilla leaders in nations with little or no experience of democracy in their histories (e.g., Bueno de Mesquita and A. Smith 2012).

Alijla (2011) wrote an interesting socio-political analysis of Hamas in Palestine as a political party, armed militia (some would say, terrorist group), and social movement. He emphasized that Hamas initially depended mainly on political volunteers to accomplish it goals and routine activities as a voluntary political association. He points out that Hamas involved informal political institutions (North 1990; O'Donnell 1993, 1996), rather than formal ones, as is often the case when new associations and institutions arise and seek formal power in any society. Alijla's study of volunteering for Hamas is the first one focused on political party volunteering in an informal political institution in Palestine. The quasi-formal volunteering principles discussed seem to apply to many other cases of militant Islamic resistance movements, guerrilla, terrorist groups, and informal political parties (cf. Smith 2017c). All of the foregoing are viable, if deviant, approaches to gaining greater political power, public recognition, and donations of money and other resources in a situation where resources are scarce for many poor people and there is a dominating regime or opposition to the given association's aims.

E. Usable knowledge

The cumulated research on why people do political activity/volunteering, as summarized and organized by S-Theory and tested on Russian national sample survey data, can be very useful to leaders of political parties and for specific campaigns in trying to mobilize more volunteers and also more favorable voters to support a given candidate or issue/cause on the ballot. For idealists who seek greater political participation by the poorer and less educated segments of the population in any nation or by other people effectively excluded from full participation because of gender, ethnicity/race, or religious affiliation, the same S-Theory determinants/influences can be useful, where relevant determinants can be manipulated, in encouraging more involvement than usual.

Much research, not reviewed in detail here, focuses on how to set up and run a successful election campaign or even form a new political party or, more likely, a new pressure group or a local branch of an existing one. Where national or state/province political parties or pressure groups already exist, it is fairly

easy to set up a new, local branch (if one does not already exist), simply by showing both interest and competence to the appropriate higher-level leaders.

F. Future trends and needed research

Where permitted by civil liberties enforced in a nation or other territory, we can expect the continued growth not only of local branches of political parties but also, and especially, of various kinds of interest/pressure groups at all territorial levels.

As noted in Section F of Handbook Chapter 32:

"Given the well-understood determinants of association prevalence, as revealed by the research of Smith and Shen (2002) and of Schofer and Longhofer (2011), the main future trend for [local associations] is increasing prevalence in the world. Association prevalence for groups with all territorial levels of geographic scope (local, supra-local, national, and international) will likely increase in all world regions and for all nations that have increasing population size (which includes the vast majority of nations). Growing formal education levels and GDP per capita levels in many nations also portend greater association prevalence, as do strengthening national governments and increasing civil liberties in many nations."

All of the foregoing association prevalence growth factors (see Handbook Chapter 50) apply to political associations, especially at the local level, and hence also to political volunteering by active members of these associations. Insofar as Skocpol's thesis about increasing professionalization of advocacy organizations at the national level is correct, and also if such organizations tend to drive out genuine membership associations in the advocacy area, then there should be some decline in national advocacy associations. However, careful, systematic, quantitative research testing the Skocpol thesis does *not* confirm her qualitative conclusions (Walker, McCarthy, and Baumgartner, 2011). There may be more professional advocacy organizations these days, but such organizations, as NPOs (*not* as associations), are not driving out genuine advocacy associations on the national scene in the United States, contrary to Skocpol's claim.

We need much future research on this last noted issue, not just in the United States, but also in other nations. We also need research testing the full range of S-Theory independent variables (IVs) or predictors as explanations of various kinds of political participation/volunteering, and with a reliable composite index of such activity as a dependent variable (DV) as well. The insights of

Handbook Chapter 5 needs to be applied to understanding political volunteering/participation, investigating the extent to which such activity is actually part of the larger Leisure General Activity Pattern that is so well documented in that chapter. The results of the Smith (2017c) survey research in Russia, as described above, clearly suggest that political activity/volunteering is part of the LGAP, as expected. All of these types of future research need to be done on large samples of nations, not just in the United States and in a few European nations. Too much socio-behavioral science research is based only on samples from Western, Educated, Industrialized, Rich, and Democratic (i.e., WEIRD) nations that are clearly unrepresentative of humans on earth (Henrich, Heine, and Norenzayan 2010).

Social Movements and Activist-Protest Volunteering

Jacob Mwathi Mati (Kenya), Fengshi WU (China), Bob Edwards (USA), Sherine N. El Taraboulsi (Egypt), and David H. Smith (USA)

A. Introduction

Scholars of volunteering have long excluded the radical, political forms of formal volunteering from their analytical gaze, especially more contentious social movements and collective activist-protest volunteering. This false dichotomy hinders scholarship by perpetuating analytical blinders. The present chapter helps remedy this oversight by reviewing research and theory highlighting overlaps between conventional volunteering, including conventional political volunteering, and unconventional, social movement activism as volunteering. Conventional political volunteering and unconventional political activism are both means for inclusion, participation, accountability, and change (sometimes even democratization) of polities. Both conventional political volunteering and protest activism rely on commitment, values, solidarities, and often altruism, as ordinary citizens seek solutions to collective problems/issues.

We therefore conclude that scholarship on conventional volunteerism and unconventional, protest volunteering need to pursue more integrated analytical approaches. Many books and articles attempting to describe and discuss volunteering and the voluntary nonprofit sector (VNPS) in general omit political forms of volunteering and their corresponding associations, especially social activist-protest volunteering and social movement organizations (SMOs) as associations (e.g., Heinrich and Fioramonti 2008; O'Neill 2002; Powell and Steinberg 2006; Salamon 1999, 2012; Salamon, Sokolowski, and Associates 2004; Taylor 2010). Edward's (2011) *Oxford Handbook of Civil Society* is an unusual and very welcome exception, with its Chapter 6 focused on social movements (SMs). Smith, Macaulay, and Associates' much earlier (1980) edited volume was also an exception, with chapters examining the determinants of both conventional and unconventional/protest political activity, often similar.

Smith (2000:chapter 10) has critiqued all of VNPS scholarship, seeing (circa 2000 AD/CE) a wide variety of *flat-earth maps or paradigms* being widely used that omit many important topics or *territories* that should be included in a more accurate *round-earth paradigm* of the VNPS. Relevant here is Smith's description of the *Status Quo/Establishment Flat-earth Paradigm* (p. 235), which he suggests, "ignores social movement [Voluntary Groups/VGs, usually associations], protest, and advocacy volunteering." As first Editor-in-Chief of this Handbook, Smith has been careful to include a chapter such as this one on activist-protest volunteering – *unconventional* political volunteering, as well as Handbook Chapter 23 on conventional political volunteering.

Whereas Chapter 23 deals with conventional political volunteering, this chapter focuses on unconventional types of political volunteering by exploring linkages between social movement activism, collective protest, and volunteerism. Conventional political volunteering is concerned with *routine power* or *established power*, while unconventional political volunteering is concerned with *disruptive power* (Piven 2008). It is fair to say that the vast majority of scholarship on *volunteering* focuses only on *routine power* or *authority*, if power is studied at all, and *disruptive power* is generally ignored. As for the Handbook as a whole (except for Chapter 9 on informal volunteering), the focus here is on formal activist volunteering *in associations* or other collective contexts, not on individual/solitary acts of resistance or protest.

The central task for this chapter is to move beyond existing conceptual and analytical pigeonholes, overcoming traditional academic blinders, forced by this false dichotomy between the world of volunteerism and the world of social movement activism. We will do this by exploring in Section D how the two concepts are closely linked and how they are mutually reinforcing components of social change and development. The roots of this false dichotomy lie partly in the history of our field in study of philanthropy, which tends to be genteel and elitist in its approach. Another intellectual root of the false dichotomy is the persistent overemphasis on civility by civil society scholars (see more of this critique in the Handbook Introduction).

B. Definitions

The set of definitions of general terms in the Handbook Appendix are accepted here. But there are some special terms that also need definition.

Musick and Wilson (2008:541), citing Anheier and Salamon (1999), argue that the different words that describe volunteering in different languages have different histories and carry different cultural and political connotations. The contextual differences involved in the conception of volunteerism bring to fore a distinction between practices of volunteerism and values of volunteerism. But if a core set of values is maintained, then a diversity of

practices including voluntary participation, advocacy, campaigning, protest activity, and awareness-raising (all key aspects of both political volunteerism and social advocacy), still qualify as volunteering. This is where volunteerism overlaps with social activism. That said, and because of definitional confusion, Kleidman (1994:264) argues for a "range of voluntariness" that varies according to the "amount of compensation and sacrifice" (cited in Musick and Wilson 2008:541) and whose range, includes a number of values such as social solidarity, free will, benefits to community, and no expectation of financial compensation commensurate with the service.[1] Benefits to others must be aimed at people outside the household and immediate family, according to Smith, Stebbins, and Dover (2006:245).

As defined in the Handbook Appendix, a *Social Movement Group* (SMG) is:

> A nonprofit group that is usually a small, often independent, unit in a larger social movement. Based on a shared ideology and common goals but not usually a common bureaucratic structure or even formal affiliation with the larger movement, an SMG tries to effect change (or maintain the status quo, in "anti-movements") on a particular issue. The SMG is actually a subtype of political nonprofit. [Often] incorrectly referred to as social movement organizations, most SMGs are informal or semiformal groups.

The Appendix further states that a *social movement organization (SMO)* is, "A nonprofit social movement group that is formally organized. SMOs are usually associations, not nonprofit agencies." SMGs and SMOs tend to have loose network ties and horizontal peer-to-peer relationships, as opposed to hierarchical structures of, say, political parties (Mannarini, Legittimo, and Talò 2008; see also, Lofland 1996). Both volunteerism and activism are multidimensional and contextual at the same time. Moreover, there is considerable overlap between these two concepts. Social movements (SMs) are larger congeries of SMOs and various less formalized collective protest groups, plus individual acts of protest and resistance.

C. Historical background

Activist volunteering in SMOs (usually associations) and other collective protests go far back into history, at least four millennia. They arose first in ancient agrarian societies (cf. Nolan and Lenski 2006), such as ancient Greece, Rome, and China, but did not exist earlier in preliterate societies. Boot's (2013) book, *Invisible Armies*, is perhaps the best survey of guerrilla warfare, insurgencies, collective protests, and incipient or full-fledged, usually violent, SMs over this long period of time. For instance, most people in the West are aware of the Roman slave rebellion led by Spartacus c. 73 B.C. (Shaw 2001).

Fewer are aware of the Sicarii as an underground, revolutionary association in Jerusalem c. 70 A.D., which used assassinations to resist the Roman occupation of Israel. More will recall the Sicarii's last stand and mass suicide at Masada, by the Dead Sea (Brighton 2009). There were periodic rebellions of slaves and people of the underclasses generally in nearly all ancient civilizations, although not all have received sufficient, if any, historical treatment. Historians in the distant past have usually been part of the status quo and establishment, which has frowned on "memorializing" any collective resistance to absolute power.

For the past 500 years, historians have been more likely to record and describe, as collective protest and resistance, such events as revolutions, revolts, rebellions, insurrections, riots, demonstrations, protests, and marches. This has been done especially well for Europe (Goldstone 1993; Hobsbawm 1965; Tilly 1996) and America (Danver 2010), but also done for such events elsewhere as well (Goldstone 1993; Piven 2008). Some of these "collective activist events" were spontaneous, short lived (a day or two), and very poorly organized, if organized at all. Others were planned, of longer term (weeks, months, even years), and organized by single associations or larger social movements as cooperating sets of two or more associations and other groups. The latter, more organized activist events and their associations are the forerunners of contemporary social movements and formal activist volunteering. Some collective activist events have been local, others national, or even international, with the last two decades registering a proliferation of international protest actions commonly dubbed as anti-globalization protest movement(s) or terrorism. Included here are the democratization struggles of the last two decades in the developing world and the earlier decolonization struggles in Africa, Asia, and Latin America. Also included are various terrorist campaigns, especially recently (Schmid 2011).

The origin of social movements in various parts of the world has been explained by different theories (cf. Buechler 2011; Staggenborg 2010.). Whereas earlier collective behavior theory conceived of movements as part of deviance and disorganization symptomatic of social malfunction, today's dominant political opportunities model views them as extensions of politics by other means because they are part of the ever-present political processes and organizations competing over interests in modern pluralistic societies (Buechler 2000, 2011). For the resource mobilization and political process theorists, social movements are created to tap new political resources and opportunities available in modern democratic societies. They, like other forms of political struggle, can be analyzed in terms of conflicts of interest (Buechler 2000; McCarthy and Zald 1977; Oberschall 1973; Tilly 1978; Voss and Williams 2012). These theorists emphasize that social movements develop only when individuals with grievances are able to mobilize sufficient resources to take action (Edwards and McCarthy 2004). The bottom line is that social movements create

substantive political uncertainty in democratic systems as they promote demo-cratic accountability of the elected to the citizenry (Schedler 2001:19, cited in Habib 2008).

Over the past 200 years, and especially in the 20th century, activist asso-ciations and social movements, more generally, have become increasingly sophisticated in structure and strategies/tactics. The social movement – a social innovation – has spread around the world (Tilly and Wood 2008). The develop-ment of social movements has gone hand in hand with the evolution of their tactics and strategies. Whereas, in previous centuries violence had been the norm, the 20th century movements have used a variety of nonviolent strate-gies and tactics (Ackerman and DuVall 2001; Zunes, Asher, and Kurtz 1999). And, where in prior centuries issues of economic status, class, and power had been central, in the 20th century new social movements have arisen with a different focus: identity, rights, and justice for such categories of humankind as women, minority ethnic groups, disabled people, gays and lesbians, and people concerned with the environment (Larana 1994).

D. Key issues

1. Where does SM/SMO dissent and activism take place?

Volunteerism and social activism foster inclusion by offering opportunities for participation of people from diverse backgrounds and circumstances to influ-ence policies affecting their lives. Volunteerism and activism also foster good governance, efficiency, and accountability. Indeed, in many parts of the world, changes in the forms and quality of governance from authoritarianism to democracy have been steered to a large extent by voluntary activism instead of violent revolution. In South Africa, for instance, a vibrant volunteer-led civil society coupled with social movement activism helped end the discredited apartheid system. In sub-Saharan Africa, the move from single-party dicta-torships to semblances of multipartyism was spearheaded in early 1990s by unconventional mass dissents. Volunteerism and activism are therefore forms of active citizenship and possible means to *deepening democracy* (UNDP 2002) or *democratizing democracy* (Giddens 1998). Here, there is broadening public participation in processes of governance, aiding citizens' direct role in pub-lic decision making, as well as engaging more deeply with political issues and effecting greater responsiveness from government.

Furthermore, both volunteering and social activism are actions undertaken without pay; they are voluntary to the extent they are founded on individual free will and conviction. A key characteristic of volunteer and social activism initiatives is their reliance on commitment and capacities of ordinary people. While leadership, as shall become clear later in the chapter, is key in chan-neling collective outrage into collective action, the principal engine for such

commitment is the willingness of citizens to search for solutions to collective problems (Mati 2012). This commitment is exemplified through an activism based on core values that generate, among citizens, the unique solidarities needed in a united cause.

2. What has been the long-term impact of SMs and SMOs on human societies?

In a forthcoming publication, Smith (2017) examines in some detail the impact of associations on societies and history. In Section D, #2 there, the following conclusions are reached regarding protest-activist volunteering in SMSs and SMOs, quoted here with permission:

> SMOs and often their larger SMs have achieved many, remarkable, socio-cultural changes in their own societies in the past 200-plus years, and often in global human society. Lofland (1996:348–353) has usefully suggested a rather comprehensive set of analytical categories/types of possible SMO effects, outcomes, or impacts: (a) changes in governments, laws, policies, policy systems; (b) winning acceptance; (c) new or enlarged movement establishment; (d) new items of mainstream culture; (e) shifts in norms, cultural images, and symbols; (f) changes in the interaction order; (g) The shape of strata (socioeconomic status) structures; (h) cultural clarification and affirmation; (i) entertainment and spectacle; (j) violence and tyranny; (k) scholarly trade (academic pursuits/activities studying the SMO/SM); and (l) models for later SMOs.
>
> The early and exemplary, systematic, comparative research by Gamson (1990; first edition published in 1975) studied a *random* sample of 53 American SMOs (termed *challenging groups*), all of them MAs (usually national MAs published documents about each SMO, using a standardized set of questions that investigated various hypotheses and theories about the causes of SMO impact/effectiveness. From among the (much-later published) set of 12 potential kinds of impact listed and discussed by Lofland (1996), as above, Gamson (1990:28–29) independently chose versions of #a and b, which he called *new advantages* and *acceptance*.
>
> One very striking result of Gamson's research was that *fully 49% of the SMOs sampled from this period of US history achieved new advantages, as an indicator of SMO success*. Virtually no one would have guessed this high success rate in advance. Given his random sampling of SMOs, these results can be generalized to all major, American SMOs in this time period of 145 years. Most of the book explores the significance of various factors of resource mobilization and organizational structure/process associated with the two measures

of SMO success. But *the central result for present purposes is the great effectiveness of SMOs as a type of MA in a democracy like the United States over the time period studied.*

There is a huge research literature, including histories, that documents the impact of the many human rights–based SMOs in the United States and elsewhere in democratic nations (cf. Anderson and Herr 2007. Snow et al. 2013; Snow, Soule, and Kriesi, 2004). The 29 chapters of the social movements handbook edited by Snow, Soule, and Kriesi (2004) give a brief overview of this literature. Chapters 24–29 and their references document the impacts of such major SMs as the labor, women's/feminist, environmental, peace/antiwar, ethnic/nationalist, and various religious movements. Careful reading of social and institutional history in industrial and postindustrial nations, for instance, clearly indicates that the life situations, life opportunities, and general life satisfactions have been substantially greater for factory workers, women, consumers of the environment, conscientious objectors, a variety of racial–ethnic groups, and members of many minority/fringe religions since relevant SMs and SMOs have been active seeking such outcomes. Less clear is that the improvements have been the direct results of SM/SMO activity, but research such as Gamson's (1990) and studies of many single SMs/SMOs suggest that *these movements have indeed had a significant long-term impact.*

In addition to tying to understand participation in and the dynamics of SMs/SMOs, scholars have studied the outcomes and consequences of specific, single SMs/SMOs for the past seven decades and more. In many cases, the researchers involved have concluded that the SM/SMO has had some significant, positive impact on the targets of benefits – the kinds of people who were to be helped.

In the past two decades or so, many other scholars have studied *comparatively* the outcomes, consequences, and impacts of SMs/SMOs, following the path-breaking research of Gamson ([1975] 1990). We can only mention here a few documents that seem to be the best summaries of this SM/SMO outcomes/consequences/impacts literature. Amenta et al. (2010) conclude their review of the political consequences of SMs/SMOs as follows:

> In the past decade there has been extensive research on the political consequences of movements. The biggest and best-studied movements have been shown to be politically influential in various ways, and movement protest is especially influential in helping to set policy agendas' [of government legislatures and executive agencies]. On page 293, Amenta et al. (2010) present a table of the impact (influence) results from their comparative content analysis study of nine main SM types, based on articles in five relevant, high-quality journals published in 2001–2009. For

seven of the nine SMs, the authors found evidence of moderate or strong influence. For five less well studied, non-US SMs (names not reported), they found such evidence for all five SMs. Hence, overall they found moderate or strong influence for 12 SMs out of 14 examined. The two SMs with weak or no influence were the nativist/ supremacist SM and the antiwar SM. The main positive outcome types were single or multiple policy changes by the government.

An earlier review by Burstein and Linton (2002:381) of research on political organizations in general, including SMs/SMOs, stated similarly as follows:

Everyone who studies democratic politics agrees that political parties, interest groups, and social movement organizations (SMOs) strongly influence public policy' in a variety of ways (specified). The authors also stated (p. 382), 'They seem indispensable [as organizational forms] to democratic policy making; no democratic polity in the modern world is without them . . . .

Many other scholars have reached roughly similar conclusions (Gillion 2013; Giugni 1998, 2004; Giugni, McAdam, and Tilly. 1999; Meyer [2007] 2014; Meyer, Jenness, and Ingram 2005; Minkoff 1995, 1997; Snow, Soule, and Kriesi 2004:Part V; Skrentny 2004; Tarrow 1998; Tilly 2004). Most of Gamson's (1990) conclusions about the internal, mobilizing factors affecting success/failure have been confirmed, but there are still major theoretical and methodological difficulties and nuances of interpretation (Giugni 1998; Jenkins and Klandermans 1995; Meyer 2007). In particular, other scholars have argued for the significant, sometimes substantial effects of external factors, such as public opinion, culture, opportunity, and political party support (Amenta et al. 2010; Banaszak 1996). In sum, many SMs and SMOs have long had a powerful and enduring impact on their own societies and often on global human society as a whole.

3. What are the main factors influencing success and impact of SMs/SMOs?

Both conventional political volunteering and social protest-activism are tools for development and, particularly, for responding to society's challenges and needs. Here, both political volunteering and social activism benefit not just the activist or political volunteer but also the community at large or sections thereof, facing disadvantage or discrimination. Thus, participation in political volunteering and social activism has noticeable impacts on both individual volunteers and communities or sections of a society, sometimes on the whole society (see prior section).

At the individual level, serving as a volunteer social activist can help people take their first step to long-term involvement in politics, development, and

eventually political engagement and participation. In a study of 19 European countries, Dekker, Koopmans and Van den Broek (1997) reported that involvement in formal voluntary associations was negatively related to participation in protests. Under repressive conditions (e.g., the recent Arab awakening), protests are a more common form of political participation, since the state can more easily intimidate individuals in organized groups than those in non-institutionalized situations.

Political volunteering provides leadership, defines areas for engagement, mobilizes individuals, and keeps social activism relevant to local communities. In societies with strong traditions of activism, perceived state transgressions are not tolerated as protesters soon pour into the streets in peaceful protest when more subtle means (e.g., town hall meetings, protest letters, and petitions) are ineffective. These forms of collective action create difficult uncertainties for those in political power, forcing them to respond to popular demands. In the process, social movement activism can help expand freedoms and challenge power structures in society.

There is ample evidence that, through volunteer engagement especially in social movements, citizens successfully carry out such tasks, even in situations of limited space for autonomous action and ability to critique the state. Social movements have been widely celebrated for their ability to put on the collective agenda issues considered irrelevant by mainstream institutions and to broaden and extend ideas of citizenship to groups formerly excluded. Examples forcing significant concessions and social change include the women's movement, civil rights movement, antiapartheid movement, and the recent Arab Awakening.

Here, the question arises as to how does the national political context shape these relationships? Whereas the political context is a key determinant of the type of volunteer activism that may emerge, Kenny (2003) argues that volunteerism is embedded in the idea of a liberal democratic society. Nonetheless, this view fails to acknowledge that certain forms of volunteerism such as political advocacy and social movement activism emerge in many parts of the world transitions from *oligopolistic authoritarian*ism to democratic rule. Indeed, even under totalitarian communist regimes of Eastern Europe, volunteering did not completely disappear. It was a disguised volunteer action that sustained the pro-democracy movements in those same countries (Chimiak 2006). Drawing further from examples of Spain and South Africa, Smith argues that certain forms of civic participation and political engagement thrive better under conditions of tyranny and adversity. Volunteerism is therefore not limited to liberal democratic societies. Even in democracies, movements use so-called extra-institutional means to achieve their objectives.

Protests and collective actions are more likely to take place in political contexts where opportunity for public consultation with the state remains low and/or ineffective or the institutions are highly mistrusted (Uslaner and Brown

2005). In such situations, collective discontent resorts to direct confrontations, sabotage, even damage to symbols of power of the targeted institutions, all in a quest to elicit responsiveness and raise the state's willingness to meet citizen needs (Mannarini, Legittimo, and Talò 2008). In a sense, protests have become the only language forcing state institutions to respond as seen in the volatile South African context. As a result, the present, a time of great mistrust of political institutions and their occupiers, is an age of riots and uprisings (Badiou 2012; Tarrow 1998). In China for instance, government estimates indicate that there have been more that 700,000 "collective incidents" (*quntixing shijian*) since the mid-2000s, while in South Africa, Bond (2010:1, cited in Mottiar and Fowler 2012) states that since 2005 there are over 8,000 Gatherings Act incidents per year.

4. What motivates and triggers individual involvement in SMs/SMOs?

To understand the role volunteers play in SMOs and activism, we must analyze the agency of volunteer activist leaders and social movements as social structure. Scholarship on the relationship between the two places agency (demonstrated by leadership and membership in social movements) is a key factor in generating social movements, as well as in their ongoing operations. Scholars such as Osaghae (2008), Tilly (2004), and Tarrow (1998) make this link in their analysis of the question *why* and *how* social discontents translate into collective action groups and social movements. For Osaghae (2008:195), the answer lies in a deeper analysis of the "historical context of the struggles, the social basis of the movements, the nature of leadership of the movements, how the constituency of interests is mobilized...." Leadership therefore plays an indispensable role in the three distinct phases of a movement: incubation, action, and institutionalization (Katumanga 1999; Nasong'o 2007).

Activist volunteers, where their activism is strongly resisted by the government of their society, often risk life and limb, jobs/income, assets, and harm to family and friends (Grotz 2011). In such cases, commitment is central to a citizen's choice to participate in social activism and collective dissent. Stern et al. (1999:81) explain such commitment with the value–belief–norm theory of social movement support. Here, "individuals who accept a movement's basic values, believe that valued objects are threatened, and believe that their actions can help restore those values experience an obligation (personal norm)...." Further, such individuals participate in collective action in the belief that their actions will deliver public good that may not necessarily be limited to their immediate small group. Thus, these activists are also led by broader altruistic concerns.

5. What starts SMs/SMOs?

Activist leaders are responsible for catalyzing collective discontent into social movements by providing "a body of organising principles and slogans around

which people are organized for action" (Nasong'o 2007:21) while "mobiliz[ing] resources and found[ing] organizations in response to incentives, risks, and opportunities...." (Morris and Staggenborg 2004:173). These catalysts/"men and women of words" (Nasong'o 2004)/"social movement entrepreneurs" (McCarthy and Zald 1977) utilize their charisma, oratory capacity, and the power of written word, to publicise existing social dysfunctions and discontents of people and philosophize on how these can be fixed (Katumanga 1999). Social movement entrepreneurs seek to "undermine the existing belief systems and institutional arrangement while simultaneously promoting hunger for faith among masses" (Nasong'o 2007:21).

Moreover, activists must overcome existing patterns of resource inequality by accessing a range of resources from a variety of sources. They redirect those resources into coordinated action leading to social change (Edwards and McCarthy 2004). Volunteers and members play similarly diverse roles within the spectrum of SMOs. They range from the much-discussed "check-book," or paper, members who do no more than pay a membership fee and receive e-mail notifications to volunteers who make core decisions about organizational governance and strategy (Foley and Edwards 2002).

Even without strong social movement traditions in which protest actions are not specifically led in a sustained manner by a social movement, leadership is crucial. In China, for instance, collective resistance is often led by local leaders, who negotiate with authorities regarding further collective actions. These leaders are volunteers, and they allocate all sorts of voluntary tasks among the most engaged individuals. Such has been reported in the "popcorn protests" in South Africa. Everywhere these protests tend to be short lived, usually winding down after public resentment is addressed by establishing a formal or informal association to safeguard the fruit of the resistance.

Committed activists launch many of the dissent and activist organizations. These volunteers get the movement's actions under way by "taking the ideology and words of the ideologues and translating them into comprehensible terms for the masses in distress" (Nasong'o 2007:21). Committed activists help explain why some movements develop and others fail (McAdam 1982; Tilly 1977). They form the core of the organization with the highest levels of commitment and greatest sacrifice for the movement. They also appeal to outsiders, the "bystanders, conscience constituents... third parties...and the audiences who collectively comprise public opinion" supporting the movement (Downey and Rohlinger 2008:12).

6. Who gets involved in SMs/SMOs?

Volunteering and activism reflect individual choices and appeals at different times to people of different persuasions, demographics, gender, ethnicities, and religions. Despite these generalities, research has also shown that certain demographics (age, gender, socio-economic status) are more inclined to participate in

social movement activism than others (Mannarini, Legittimo, and Talò 2008). These authors argue that as people grow older, their interest in conventional politics and their willingness to take an active role increases. For them, young people are more likely to participate in militant protest politics because they have "progressively distanced themselves from the traditional channels of politics, and rejected party affiliation and voting as the main modes for actively participating" (p. 96).

Furthermore, Mannarini, Legittimo, and Talò (2008) citing literature from several Western democracies hold that women are also more likely to take part in unconventional forms of social activism than men. The same is true even in sub-Saharan African countries where, for instance, culture has been invoked in designing protest strategies. An example of this is a protest by elderly mothers of Kenyan political prisoners that started in March 1992. The Mothers of Political Prisoners, as a way of cursing the Moi/KANU state that had imprisoned their sons, resorted to publicly stripping naked after being violently attacked by police while protesting peacefully (Maathai 2006). In Egypt, the period leading to the January 25 Revolution witnessed an increase in volunteerism within associations and non-governmental organizations (NGOs) such as Resala, a youth-led organization established in 1999 and currently operating in approximately 14 governorates, has 100,000 youth volunteers from across the country. According to a 2007–2009 field study by Ibrahim and Hunt-Hendrix (2011:4) of "youth-led social service organizations in Egypt," youth are carving out "safe spaces" of volunteerism and community service to practice citizenship while flying under the radar of state security. Volunteering was a pathway to practicing democracy in an undemocratic environment, thereby setting the stage for the mass mobilization seen in the Revolution.

For instance, social movement scholars such as Osaghae (2008), Buechler (2000), Gurr (1970), Davies (1962), and Geschwender (1968) argue that collective action results when people subjectively judge or perceive themselves as lacking resources enjoyed by a particular reference group in society. McCarthy and Zald (1977) add that social movements are more likely to emerge when individuals with grievances are able to mobilize sufficient resources to take action. For its part, activist volunteering, according to CIVICUS, IAVE, and UNV (2008:6), is driven by a "desire to help others…interest in changing policies, raising awareness and empowering disadvantaged groups. While these actions may be undertaken for a combination of reasons, altruistic as well as self-interests, what binds people together is the common desire to be active citizens - to give as well as trying to change the conditions producing human suffering."

Personality traits can also influence protest participation (Opp and Brandstätter 2010). For instance, Brandstätter and Opp (2014) did a panel study of a sample of citizens of Leipzig, Germany. From multivariate analyses, they

concluded that the tendency to participate in protest was positively affected by the Big Five traits of more openness to new experience, lower neuroticism, and lower agreeableness, plus an attitude variable, higher reciprocity orientation. These predictors could explain 35% of the variance in protest tendencies, showing that such predictors are quite important irrespective of demographic factors.

To the attitudinal and personality side of social movement involvement, we must add its structural counterpart. Four structural factors have long been seen to affect who participates and who does not: first is one's availability as this varies across the life course; second is having a history of prior activism; third is holding membership in non-movement organizations; and fourth is being in contact with a movement member.

Several decades of research on social movement involvement in North America and Europe highlight four structural facilitators of participation and activism (Brady, Verba, and Schlozman 1995; Norris 2002; Wiltfang and McAdam 1991). First, the likelihood of participation ebbs and flows over a lifetime, following the rhythms of everyday life especially the demands of work and family obligations. People who are young, single with no dependents tend to have fewer competing demands on their time and are thus more likely to participate in social movements. A similar pattern appears for some older individuals with grown children and fewer demands from work. Many key activists in the Southern civil rights movement in the United States during the 1950s and 1960s depended little on the local white power structure for their livelihoods. Thus, ministers, funeral home operators, beauty salon operators, and barbers were more likely to be public leaders than, for example, school teachers who risked losing their jobs if publically associated with the movement.

Second, people who participate in non-movement organizations/associations are more likely to participate in social movements, partly because they have been socialized into participatory norms and routines and are members of extensive social networks of communication (Smith et al. 1980:chapters 4, 5). Third, participation in non-movement groups increases one's likelihood of having prior contact with a movement activist or participant and thus of being invited to participate in movement activities. Finally, those with a prior history of social movement involvement are much more likely to participate in subsequent social movements (Morris 1984).

Faith and religiosity also play a crucial role in social mobilizations and whether people participate in social activism and protests. In Egypt, for instance, El Taraboulsi, Khallaf, and Farouky (2013:17) shed light on faith-based motivations behind volunteering. Although mosques and churches have always been involved in the mobilization of resources and giving, their role was unleashed during and after the intense days of the January 2011 Revolution. It also came hand in hand with an interfaith citizen movement that called

for solidarity of all Egyptians irrespective of religion to bring down autocracy and build an Egypt where citizens enjoy equal rights. With the Muslim Brotherhood coming to power, this movement has, however, been challenged. It is currently enmeshed in a dialectical battle over definitions of citizenship in the constitution and in the role of religion in the new Egypt.

Networks and socialization also pull people into or out of activism. Friends and family are especially influential. Being among them people develop an interest in or a cynicism toward either conventional or unconventional forms of participation. This comes through "sharing of opinions and gathering of information on politics and social life within one's own family, or within one's own circle of friends or peers, positively affects the likeliness to become actively involved in...the public sphere" (Mannarini, Legittimo, and Talò 2008:98; see also Verba, Sholozman, and Brady 1995).

Yet, these very same processes of socialization and strong social ties of family, friends, and neighborhood can, at times, inhibit participation through competing loyalties and conflicting identities. For example, marriages of many female leaders in local antitoxic waste and environmental justice movements in the United States have been strained as these activists have become publically identified with protest or advocacy against the employer of their husbands or extended family members (Edwards 1995). Similarly, participation in Lesbian, Gay, Bisexual and Transgender (LGBT) activism and volunteering requires one to "come out" and publically embrace their sexuality. All too often this process causes rifts with immediate family members and other community attachments.

7. What are the main barriers or obstacles to SMs/SMOs?

The political context is crucial in determining opportunities and threats for growth of social movement activism (Tarrow 1998). Moreover, as already noted, the presence or absence of trust in a political system and its institutions determines the preference for conventional (e.g., participation in political party systems) or unconventional political participation (e.g., protests) (Mannarini, Legittimo, and Talò 2008). In China for instance, the failure of collective action resistance to crystallize into social movements is attributed to existing political structure and context. Grassroots NGOs, the main forms of social organizations, are highly alert and cautious about not being directly involved in collective actions or mass protests. Most volunteers for these prototype SMOs are victims themselves, families, friends, and people directly affected by the specific policies or failed projects who take high risks in participating in these protests.

8. How are SMs/SMOs and protests organized and coordinated?

Context matters in how protests and social movement activism is organized. In more open and democratic political systems, where the state tolerates

dissent, social movement activism and protest action is most likely to happen in non-clandestine ways. Political opportunity theorists argue that the mix of political opportunities and threats is a key condition favoring or hindering social movement emergence and mobilization (Tilly 1978; McAdam 1982). That said, even in constrained political environments, citizens still subvert the state and are able to organize protests. Such is premised on disruptive power that is ever present even in supposedly weak citizens (Piven 2008). The exercise of disruptive power requires innovations in organizing protests and social movements.

One dimension of this is the capacity of the subaltern class to organize among themselves into movements and build alliances with professional middle-class associations to challenge power elites. The Kenyan constitutional reform struggles exemplify such organizations and interclass alliances pushing for change (Mati 2012). The Arab awakening exhibited mobilizations from below as well as ties with middle-class professionals. In Egypt's Tahrir Square, Tunisia's Habib Bourguiba Avenue, and Libya's Martyrs' Square, for instance, as protests broke out, citizen activists were faced with escalating needs on the ground for food, shelter, and medicine. To meet them, they had to organize and mobilize themselves. In Tahrir Square, protestors divided themselves into taskforces, each focusing on a particular need, maintaining security within the square, providing food and shelter, and developing makeshift hospitals.

Such initiatives were later consolidated into organized popular committees, or *legan sha'beyya*, to protect neighborhoods and fill the vacuum left by the absent state. A survey of philanthropic practices in Egypt shows how the 18 intense days of the Revolution saw the emergence of ad hoc services that continued to grow steadily post Mubarak (El Taraboulsi, Khallaf, and Farouky 2013). Social media were crucial in networking and sustaining those services. Given the popularity of Internet and mobile-driven social media access, one of the most prevalent forms of volunteerism was the collection of donations through SMS, e-mail, Facebook, and/or Twitter campaigns circulated among friends, family members, and anyone with access to social media via a smartphone or an Internet-ready computer. In Libya, a case in point is Hanaa Habashi (Naomidea), who won an American prize as one of the world's most courageous women. Naomidea, using various means, acted as the world voice of the Libyan Revolution. Women were active in all fields: media, military, and humanitarian aid.[2]

The media have traditionally been a critical ally in social movement mobilizations, organization, and coordination. Most recently social movements and activist associations have turned to the Internet as a new strategy for mobilization and advocacy, to promote their causes (Earl and Kimport 2011; Hands 2011). These new media have contributed in many parts of the world to the expansion of democratic space and even the defeat of political regimes.

In Egypt, for instance, even before the 2011 "revolution" part of the mainstream media reported that volunteers were taking part in e-campaigns with an aim to shape public opinion and transform society, culture, and politics. An example of this is Waqfeyat al Maadi Community Foundation (WMCF), which was founded in 2007 to revive and modernize the institution of *Waqf* within the Egyptian society. During the 18 days of the Egyptian Revolution, the Foundation established itself as an open platform, where the youth of the popular committees (activist volunteers) could discuss needs, exchange ideas, and explore a path forward (El Taraboulsi, Khallaf, and Farouky 2013).

Sacred spaces such as churches, mosques, and temples have also been important over the years in mobilizing against repressive regimes in such countries as Kenya in 1990s (Mati 2012) and, most recently, during the Arab Uprising. In a report by the Arab Center for Research and Policy Studies on the role of religion in the Revolution, Khalil (2012) describes how "Egyptian mosques, as is the case of Syria and Yemen, were places for organization and mobilization" for the "disaffected and angry, places to assemble and protest" against the regime.

E. Usable knowledge

Volunteering and protest activism promote social change not only by "influencing political processes such as agenda-setting policy-making, decision-making and representation, but also because it can change relationships between people from different parts of society" (CIVICUS, IAVE, and UNV 2008:5). Indeed social activism is itself, a reading of a crisis of confidence with political institutions and power elites to lead. Nevertheless, in such situations, volunteering and activism may offer a way of reengaging citizens with the broader political process and even achieve fundamental changes in society (Smith 2017).

Social movement activism and participation often lead to the formation of enduring SMOs and less formal movement infrastructures of communication and social relations. The very existence of such movement social capital becomes a preexisting resource for subsequent movement mobilizations. Existing movement mobilizing structures enable communities to mobilize more quickly and easily for subsequent campaigns, protests, advocacy, and the like than would be the case were each new campaign to "start from scratch." Thus, the enduring structure of past social movements is a resource worth preserving for the broader community, which it may tap for any purpose, but especially for movement purposes.

A study of several developing countries by Huntington and Nelson (1976) reported that people involved in voluntary associations are up to five times more likely to make political demands than those without such membership. This is so because participation in social movement activism endows individuals with skills necessary for monitoring and opposing government

policies through collective mobilization and associational representation. This way social movements act as schools of democracy that "teach civic skills" and foster civic attitudes. It is worth emphasizing that social movement participation socializes volunteers, enhancing their capacity for citizen engagement in all the same ways attributed to more traditional forms of civic engagement.

F. Future trends and needed research

While political and social activists have managed to push for the frontiers of citizen participation in a variety of areas of human rights and social justice, there has been a growing trend of SM growth borne out of what Bond (2007) calls *elite pacting.* In the developing world, there has been a general decline in volunteer protest activism, especially with the *NGOization* of activism and participation, which equals to a few unaccountable NGO elites based on per diem solidarity (Tajudeen 2007) dominating the spaces for participation that ultimately lead to slippery paths for citizen participation. Moreover, in more politically closed regimes such as China, while the mushrooming of NGOs signals new avenues for engagement in the policy process, it is collective social mobilizations that appear to attract quicker state responses (e.g., Steinhardt and Wu 2016).

Moreover, the three-sector model of state, market, and civil society has lost (or is losing, if you prefer) its relevance as an analytic framework, though it remains useful as a heuristic for guiding discussion. Organizations, movements, and issue campaigns that span sectors or operate in all three sectors are blurring boundaries if not erasing them entirely. Such trends should be investigated empirically to see whether and if so in what ways social movement volunteering is actually different from "traditional" volunteering. Is voluntary action in pursuit of social justice through structural social change fundamentally different than the volunteering done in charity or community service?

Throughout the world, the lines between social movement activism and more communal forms of collective/associational endeavor are blurring rapidly, if not already gone. For example, in the United States, the second wave of the women's movement in the 1970s and 1980s established thousands of feminist and other women's organizations around the country. These functioned as alternative communities, alternative institutions, being created mostly to facilitate everyday life and not necessarily or primarily for "movement" purposes. Yet, these organizations and institutions built the movement and became launching pads for mobilizing issue campaigns. The same holds for the LGBT movement, which was community building since the late 1960s. The "alternative food" movements are another good example of actively engaging in state-oriented, market-oriented, and civil society–based activities and organization building.

Membership means many things to many nonprofit, advocacy, and SMOs (cf. Smith 2010). Generally, more is better, so groups seem to do what they

can to develop and/or claim larger memberships. Yet, in one representative sample of an SMO population (Edwards and Foley 2003; Foley and Edwards 2002), the investigators asked about what groups required of people to be *members*. They included about a dozen different criteria, among them, to pay dues, attend meetings, be on a mailing list, make organizational decisions, and vote for organizational leaders. These were factor analyzed into four or five distinct, empirical "definitions" of membership, including some SMOs with no members of any kind, only supporters. Clearly, we need to better understand empirically (quantitatively and qualitatively) what concepts such as membership and participation actually mean. And what is an SMO? There is no consensus in the literature. This chapter uses a definition that incorporates extra-institutional, or confrontational, tactics as a defining characteristic.

A substantive trend and very important research question concerns the relationship between "cyber activism" and "face-to-face" activism or what some are calling "in real time (IRT)" voluntary/movement activity and "in real life (IRL)" activity. To play devil's advocate, can one really mobilize a revolution with social media and smart phones? We think not, which is not to deny that they are very important, transformative new tools. But, we suspect that a search of historical records would yield equally rapturous discussions of the impact of international postal service by sailing ship.

Although social movement research has been a burgeoning growth area in the past couple of decades, there is still much more to be done (cf. Anderson and Herr 2007; Snow, Della Porta, Klandermans, and McAdam 2013; Snow, Soule, and Kriesi 2004). The many contributors to the book by van Stekelenburg (2013) have much to say about needed future research on SMs and SMOs, as do the concluding sections of the handbooks and encyclopedias just cited. The seminal research project of Gamson (1990) on the period of 1800–1945 in America particularly needs to be replicated for many or most nations of the world.

Part IV

Influences on Volunteering and Association Participation

This page intentionally left blank

25
Physiological Correlates of Volunteering

René Bekkers (The Netherlands), Sara H. Konrath (USA), and David H. Smith (USA)

A. Introduction

We review research on physiological correlates of volunteering, a neglected but promising research field. Some of these correlates seem to be causal factors influencing volunteering. Volunteers tend to have better physical health, both self-reported and expert-assessed, better mental health, and perform better on cognitive tasks. Research thus far has rarely examined neurological, neurochemical, hormonal, and genetic correlates of volunteering to any significant extent, especially controlling for other factors as potential confounds. Evolutionary theory and behavioral genetic research suggest the importance of such physiological factors in humans. Basically, many aspects of social relationships and social activities have effects on health (e.g., Newman and Roberts 2013; Uchino 2004), as the widely used biopsychosocial (BPS) model suggests (Institute of Medicine 2001). Studies of formal volunteering (FV), charitable giving, and altruistic behavior suggest that physiological characteristics are related to volunteering, including specific genes (such as oxytocin receptor [OXTR] genes, Arginine vasopressin receptor [AVPR] genes, dopamine D4 receptor [DRD4] genes, and 5-HTTLPR). We recommend that future research on physiological factors be extended to non-Western populations, focusing specifically on volunteering, and differentiating between different forms and types of volunteering and civic participation (cf. Cnaan and Park 2016; Smith 2014; see Handbook Chapter 31: Section D, #1).

In what way could the physiology of volunteers be different from non-volunteers? We discuss six sets of physiological correlates: in the areas of health, cognition, neurology, neurochemicals, hormones, and genetic factors. The chapter is written from a growing awareness that most of the research on volunteering in the social sciences has ignored physiological aspects of human sociality (Baerman 2008; Von Scheve 2011), while a comprehensive explanation

of volunteering clearly requires an integration of physiological aspects (Smith 2016a; more generally, see Freese, Li, and Wade 2003). An important part of research on volunteering is conducted by sociologists, as the reviews by Smith (1994) and Wilson (2000, 2012) show. In the spirit of Durkheim (1897), who sought to establish sociology as a science of human behavior separate from biology, sociologists "have allowed the fact that we are social beings to obscure the biological foundations upon which our behavior ultimately rests" (Massey 2002; also see Pinker 2003; Van den Berghe 1990).

Perhaps the neglect of physiological correlates of social behavior by many social scientists is in part a result of fear that evidence may be found that indeed there are such physiological correlates. Such knowledge could be dangerous to those who view nearly all of human behavior patterns as socially learned (i.e., the result of socialization into socio-cultural systems; see Pinker 2003). The holocaust reminds us that knowledge on physiological correlates of human behavior can be very dangerous when it gets into the wrong hands or is misinterpreted (Benton 1991). While sociologists have only recently become more open to biosocial explanations of social behavior (Freese 2008), economists have been more open to behavioral genetics since the 1970s (Bowles and Gintis 2001). Similarly, in demography (D'Onofrio and Lahey 2010) and criminology the acceptance of biological factors is growing (Boisvert and Vaske 2011; DeLisi et al. 2008; Ishikawa and Raine 2002). In the past five years an impressive body of evidence on physiological correlates of political attitudes and behavior has been amassed (Fowler and Dawes 2008, 2013; Hatemi et al. 2009; A. Smith et al. 2009).

We have set ourselves the ambitious task of reviewing the literature and weeding out the false positives by seeking out replicated research results. We seek to contribute to a correction of the ignorance of physiological correlates of volunteering by reviewing the evidence on genes, hormones, neurological phenomena, and health as correlates of volunteering. We distinguish between physiological causes of volunteering and the physiological consequences of volunteering. While the health consequences of volunteering on volunteers have been studied quite extensively in social epidemiology and gerontology (see also Handbook Chapter 52), very little attention has been paid to physiological causes of volunteering, other than the effects of sex and age, mediated by social role expectations.

B. Definitions

The general definitions in the Appendix of the Handbook are accepted in this chapter. The chapter will focus generally on *formal volunteering*, done through some association or organization, not *informal volunteering*, done directly with no association or organization involved (Handbook Chapter 9). To date, few

studies have directly assessed physiological correlates of volunteering, especially while controlling for other important factors. There is more research on physiological correlates of related social behaviors, such as voting, giving to charitable organizations, and money transfers to specific other individuals. To some extent the results of these studies can be generalized to volunteering, because they share a common core: they are all forms of prosocial behavior, which have collective benefits but are costly for individuals. The willingness to sacrifice one's own resources for the benefit of others lies at the foundation of voting (Fowler 2006), as well as other forms of prosocial behavior like charitable giving and blood donation (Bekkers 2004; Ferguson, Farrell, and Lawrence 2008; Lee, Piliavin, and Call 1999), and also helping strangers, which may be seen as informal volunteering (Ottoni-Wilhelm and Bekkers 2010). Civic duty (Loewen and Dawes 2012), social capital (Putnam 2000), and the moral principle of care (Ottoni-Wilhelm and Bekkers 2010), but not necessarily the prosocial personality (Bekkers 2004), are among the variables that could explain why volunteering is positively correlated with other forms of prosocial behavior. However, volunteering also differs from other forms of prosocial behavior in its dependence on time, energy, and physical strength as resources. These unique features are in part physiological – hence this chapter.

C. Historical background

The current review draws primarily upon what has been called *biosocial research* (Udry 1995) in a variety of disciplines that are normally not considered to belong to the social sciences, such as behavior genetics, neurology, and gerontology. An implicit assumption in much of the literature is that biological traits and phenomena are fairly stable over time at the population level. From a long-run historical perspective, it is clear that this is not the case: huge population health gains have been realized in the past centuries, and relationships obtained in high-income countries do not necessarily generalize to low- or middle-income countries (Calvo, Piliavin, and Call 2012).

Research on human evolution in relation to prosocial behavior has been common for several decades. A forthcoming paper by Smith (2017a) summarizes the situation as follows, quoted with permission here:

Sociology and many sociologists have long struggled with, and often fought against, the approach of sociobiology/biosociology and the relevance of various biological variables and processes in their theories (Degler 1991; Francis 2005; Kitcher 1987; Machalek and Martin 2004; Richter 2005; Segerstrale 2001). Pearson (1996) sensibly uses sociological analysis to explain this resistance by many sociologists to considering biological and evolutionary influences on human behavior. He cites two commonly given reasons:

(1) the initial and continuing liberal-radical and reformist (often implicit) ideology of sociology as an academic discipline, and (2) a doctrinaire, seemingly irrational (hence likely emotional), insistence on *only* considering social and cultural influences, while denying biological influences on human behavior.

Smith's (2017b) S-Theory is avowedly multi-disciplinary, seeking comprehensive and integrative explanation of human behavior, including social solidarity and prosociality, irrespective of traditional academic discipline boundaries. Human biological evolution significantly explains why there is so much social solidarity and prosociality in *surviving* human societies everywhere in all time periods, to the best of our knowledge. Most fundamentally, social solidarity and prosociality have been helpful and even necessary for the survival and reproduction of the human species (Barash 1977; Brown, Brown, and Penner 2011; E. Wilson 1975, 2004, 2013). At the very minimum, human infants require some informal care as prosociality from their mothers, as do all mammals, in order to survive and reproduce. Prosocial behavior has been helpful or necessary in other species of social animals as well, including the hypersocial insects like ants, termites, and bees (Dugatkin 1999; Gadagkar 1997). Human customs and social structure, including norms for socializing young humans and norms for social control processes to discourage deviance and promote conformity, further contribute to the presence of prosocial behavior in every society ever studied (Brown 1991).

The human species, *homo sapiens,* is clearly a species of social animals (Barash 1977:chapters 5, 10; Brooks 2011; De Waal 1996, 2008; Dugatkin 1997, 1999, 2006; Gadakar 1997; Macedo and Ober 2006; J. Q. Wilson 1995:chapter 6). Species of social animals are fairly common among mammals, especially primates, and exist even among birds, fish, and insects (Dugatkin 1997). In all such social animals, the survival of individual members depends on prosocial (other-benefiting) behavior not just by one or both of the parents, but also by other individuals of one's local group (pack, herd, band, school, nest, hive, etc.). This dependence on the prosocial behavior of parents and other caregivers is especially crucial during the early period of growth and maturation of social mammals. Without such informal mutual aid, the many species of social animals cannot survive, and individual members similarly are not likely to survive very long, particularly members of primate species like humans, gorillas, chimpanzees, etc.

Many books (and many hundreds of articles) in the past two decades have made strong cases for the evolution of human prosociality and underlying behavior genetics (Axelrod 2006; Barber 2004; Boehm 2012; Bowles and

Gintis 2011; Brown, Brown, and Penner 2011; de Waal 1997, 2008; Dugatkin 1997, 1999, 2006; Gadagkar 1997; Hauser 2006; Henrich and Henrich 2007; Joyce 2007; Macedo and Ober 2006; Nowak and Coakley 2013; Nowak with Highfield 2011; Ridley 1996; Sober and Wilson 1999; Sussman and Cloninger 2011; Thomasello 2009; Wilson 1975, 2004, 2013; Wright 1995). Because prosociality and its related factors (morality, virtue, cooperation, social sol- idarity, reciprocity, altruism, etc.) are so important to human survival as a species, these have been included in current human genetics by evolution over millions of years, including earlier hominid evolution.

Penner et al. (2004:14.5–14.8) provided a brief summary of the main, proposed, evolutionary concepts and models that seek to explain how prosociality, and thus corresponding prosocial behavior, became aspects of human genetics. Principal evolutionary processes noted are kin selection, group selection, and reciprocal altruism, although group selection is still controversial.

The next level of biosociological explanation deals with specific genes or gene networks that influence prosociality, altruism, and social soli- darity, especially through influences on prosocial behavior and behavior dispositions (e.g., Avinun, Israel, Shalev, Gritsenko, Bornstein, and Ebstein 2011; Dawes, Settle, Loewen, McGue, and Iacono 2015; Penner et al. 2004:14.8–14.9). A half-century ago there was little evidence for behavioral genetics and the heritability of any types of human prosocial behavior and behavior dispositions. Now it is difficult to find *any* general types of such behavior or dispositions that *lack* demonstrated genetic heritability in twin studies (Baker 2004; Ebstein et al. 2010; Freese, Li, and Wade 2003; Freese and Shostak 2009; Plomin et al. 2008). The summary statement by Freese (2008) is accurate and indicative: "Accumulating evidence from behavioral genetics suggests that the vast majority of individual-level outcomes [behav- iors, activities, decisions] of abiding sociological interest are genetically influenced to a substantial degree." McGue and Bouchard (1998; see also Bouchard and McGue 2003) state similarly, "Twin and adoption studies indi- cate that most behavioral characteristics are heritable" (p. 1). These authors add, "Behavioral genetic research supports the heritability, not the genetic determination of behavior" (p. 1). Genes *influence* many human behaviors, but do not *determine* them. In nearly all instances there is an interaction of genes with the environment and social experiences, which suggests a vital role for biosociology and sociologists in understanding human social behavior.

In addition to the influences of evolution and genetics on behavior, research in the past few decades on epigenetics has demonstrated that genes are

expressed differently in animals, including humans, in different environments, from the mother's womb onwards (e.g., Almond and Currie 2011; Nathanielsz, Liggins, and Bensadoun 1996; Francis 2011; Tollefsbol 2010). Simple physiological maturation/development explains much of the expression of prosocial genetics in human behavior. However, epigenetic effects often occur as interactions between an individual's genetics and specific environments experienced by that individual. Such epigenetic changes can be transmitted to subsequent generations in many cases, affecting prosocial behavior, as many other types of behavior.

D. Key issues

1. Six sets of physiological correlates

While few studies have examined physiological correlates of volunteering directly, many correlates of volunteering have physiological aspects. Also, many studies on other forms of prosocial behavior have documented biological correlates. Therefore, the chapter takes a broader view, discussing six types of biological correlates of volunteering and related behaviors and traits:

(a) health correlates, including physiological measures;
(b) cognitive performance, including intelligence tests;
(c) neurological correlates: brain size and activity measured using fMRI techniques;
(d) neurochemicals, including dopamine and serotonin;
(e) hormones, including oxytocin, testosterone, and cortisol;
(f) genetic factors, including specific genes (such as OXTR genes, AVPR genes, DRD4, 5-HTTLPR).

2. Data and methods

Biosocial research typically relied on small samples, until biomarkers were collected among respondents in several large US national panel surveys, such as AddHealth, Midlife in the United States (MIDUS), the Wisconsin Longitudinal Study (WLS), the National Social Life, Health, and Aging Project (NSHAP), and the Health and Retirement Survey (HRS). Recently, health data have also been collected and made available for researchers in the British Household Panel Survey (BHPS) and the Whitehall II Study. Each of these panel surveys also includes measures of volunteering. To date, very few scholars have used these data to investigate physiological correlates of the dynamics in volunteering. We expect more work to be published in the near future.

While the empirical evidence on physiological correlates of volunteering is fairly limited, the body of evidence on physiological correlates of human

prosociality in the biosocial sciences has exploded in the past decade due to the development of cheaper and faster techniques to collect biomarkers from DNA and hormone levels with noninvasive procedures, such as collecting saliva (D'Onofrio and Lahey 2010). In earlier research, hormone levels could only be identified with blood samples. Genetic association studies require the collection of DNA material such as hair, nails, or saliva.

The collection of neurological data still requires expensive and impractical equipment located mostly in (university) hospitals, that only specialized personnel can handle. The methods include PET (positron emission tomography), fMRI (functional magnetic resonance imaging), EEG (electroencephalography), and TMS (Temporary Magnetic Stimulation). The noisy fMRI machines require research participants to lie still in a confined space that does not allow for natural social interaction. This lowers the ecological validity of the research. The location of the equipment in hospitals implies that research participants need to be recruited and paid specifically for the study. Participants can only be run one by one, increasing the costs and time required to collect fMRI data.

In the near future, collecting data on physiological correlates of volunteering will become much cheaper and more convenient. The spread of smartphones will allow for the collection of several physiological measures, such as heartbeat, physical location, movement, and emotional states (Lakens 2013).

3. Health correlates

Volunteering may help delay the decline, maintain, or even improve the health of volunteers (see Handbook Chapter 52). At the same time, health facilitates volunteering. Teasing out the direction of causality is difficult and requires longitudinal panel data at the individual level. Even if longitudinal data are available, it is of paramount importance to check whether health conditions at base line influence the selection of individuals into and out of volunteering. Ignoring health-based selection is almost certainly leading to an overestimation of the health benefits of volunteering (Li and Ferraro 2005). The use of fixed effects models is one possible strategy to deal with such selection bias (Halaby 2004). Such models analyze the variance over time within individuals, ignoring differences between individuals.

(a) Subjective well-being

Research on the relationship between volunteering and well-being (Ryff 1989) has a long history (e.g., Carp 1968). Like prosocial spending (Aknin et al. 2013), volunteering is associated with higher well-being in many cultures worldwide (Calvo et al. 2012; Plagnol and Huppert 2010). A meta-analysis involving 29 studies from the 20th century found that on average volunteers scored higher on measures of well-being than non-volunteers, even when adjusting for health or socio-economic status (Wheeler, Gorey, and

Greenblatt 1998). In addition, volunteers who engaged in directly helping others had higher well-being than those who engaged in more indirect tasks. We recommend an updated meta-analysis that includes more recent studies. Longitudinal studies confirm that volunteering at one time point predicts higher life satisfaction, happiness, self-esteem, and psychological well-being, at a later time point (for reviews, see Konrath 2014a; Konrath and Brown 2012; Handbook Chapter 53). These results are typically consistent when potential confounds are considered and controlled statistically. Confounds are important to consider, since people with higher well-being are more likely to volunteer (Thoits and Hewitt 2001). Experimental and quasi-experimental interventions to increase volunteering behavior produce more positive affect and higher self-esteem compared to control groups (Hong and Morrow-Howell 2010; Midlarsky and Kahana 1994; Switzer et al. 1995). Such results lend confidence to the conclusion that volunteering actually causes some positive emotional outcomes 53.

(b) Mental health

Volunteers have lower anxiety and depression than non-volunteers (Benson, Clary, and Scales 2007; Handy and Cnaan 2007; Hunter and Linn 1980; Smith 2017a), with the direction of causation unclear. Dury et al. (2015:1120), however, found lower mental health in volunteers, with many other predictors controlled in a large sample (N = 8,349) of older Belgians. People who volunteer at one time point tend to have fewer depressive symptoms at a later time point, even when controlling for potential third variables (Kahana et al. 2013; Lum and Lightfoot 2005; Schwingel et al. 2009; Thoits and Hewitt 2001). This finding has been confirmed cross-culturally (e.g., in Singapore; Schwingel et al. 2009). Experimental interventions to increase volunteering behavior produce fewer depressive symptoms compared to control interventions (Hong and Morrow-Howell 2010; Switzer et al. 1995).

   All of the foregoing studies suggest that volunteering causes better mental health, over and above selection effects leading people with better mental health to be more likely to become volunteers (see Handbook Chapter 53). However, at the extreme of poor mental health, especially for people incarcerated as in-patients in institutions, poor mental health clearly reduces volunteering, based on minimal or non-existent volunteering opportunities for in-patients in such institutions (e.g., only some group meetings at times for alcohol or drug addiction recovery, by Alcoholics Anonymous or Narcotics Anonymous).

   The type of volunteering may be a factor in mental health outcomes. For example, one study found that volunteer firefighters had more symptoms of posttraumatic stress compared to control participants (Wagner and O'Neill 2012). Thus, the potential for vicarious traumatization must be considered in

high-risk volunteer positions (e.g., crisis counseling for victims of sexual assault and violence; Baird and Jenkins 2003; see also Handbook Chapter 52).

(c) Subjective health

Self-reported measures of health are strong predictors of longevity (Idler and Benyamini 1997), and volunteers score higher on self-reported measures of health, usually with confounds controlled (Benson, Clary, and Scales 2007; Brodie et al. 2009; Dury et al. 2015; Harris and Thoresen 2005; McDougle et al. 2013; Oman, Thoresen, and Mcmahon 1999; Shmotkin, Blumstein, and Modan 2003; see also Handbook Chapter 52). Volunteering is associated with higher subjective health in many cultures worldwide (Erlinghagen 2010; Hank 2011; Kumar et al. 2012; Lee, Saito, Takahashi, and Kai 2008). Gesthuizen and Scheepers (2012) used survey data from 17 nations (mainly Anglo and Western European) to show that self-reported early health problems (starting before primary education) had a significant negative association with frequency of association participation per year, with many demographic predictors controlled (p. 71).

In a national cross-sectional survey of UK adults, Low et al. (2007:65) found that ex-volunteers gave poor health as a reason for stopping volunteering 14% of the time. Similarly, 22% of respondents who had not volunteered in the past 12 months but wanted to help said that illness or disability was a reason (p. 68). As age increased, larger percentages stated health reasons for not volunteering; at 65+ years, 62% mentioned this reason – far more than at earlier ages.

Moreover, longitudinal studies confirm that volunteering predicts higher self-reported health at a later time point, even when controlling for plausible confounds (Lum and Lightfoot 2005; Luoh and Herzog 2002; Morrow-Howell et al. 2003; Piliavin and Siegl 2007; Thoits and Hewitt 2001; Van Willigen 2000). Hence, to some significant extent volunteering may cause better subjective health in individuals (see also Handbook Chapter 52).

However, there may be limits on the number of years that such health effects last, since one 30-year longitudinal study found null results (Moen, Dempster-McClain, and Williams 1989). The people who are most likely to receive health benefits from volunteering are older adults, compared to younger adults (Van Willigen 2000), and people who are less socially integrated, compared to those who are more socially integrated (Piliavin and Siegl 2007).

(d) Objective physical functioning/health

Physical functioning indicators include objective tests (e.g., strength, agility, walking speed) and health indicators (e.g., functional limitations, physician-diagnosed health conditions, nursing home residence rates, doctor visits for physical illness, overnight hospital visits). Studies find that volunteers show better physical functioning (Choi and Tang 2014). Such research indicates

that people who volunteer tend to be self-selected for better physical health and functioning. This is a clear direction of causality at the poor physical health extreme. Both short-term and long-term in-patients in hospitals, nursing homes, rehabilitation clinics, and the like have minimal or non-existent opportunities to volunteer. This limitation of volunteer opportunities is true also of bed-bound or homebound people (i.e., invalids) in poor health at home or elsewhere. Disabled people who are mobile in wheelchairs, scooters, or other personal vehicles also tend to have fewer volunteer opportunities, given physical access difficulties for many buildings, including homes, in many nations.

Health limitations can have very deep roots, dating back to birth and even prenatal conditions (Almond and Currie 2011; Nathanielsz, Liggins, and Bensadoun 1996). The *fetal origins hypothesis* has had substantial confirmation in research (ibid.). Low birth weight limits life chances (Black, Devereux, and Salvanes 2007; Oreopoulos et al. 2008). There is evidence that low birth weight is often transmitted to the mother's children, especially for people in poverty (Currie and Moretti 2007; Nathanielsz et al. 2003). There are many demonstrable longer-term effects of both birth weight and other, more direct aspects of the fetal environment, such as malnutrition. Especially important longer-term effects include intelligence level, educational outcomes, employment status, and socio-economic level (Almond and Currie 2011; Currie and Moretti 2007; Oreopoulos et al. 2008). Given such results, it is highly likely, though so far undemonstrated empirically, that fetal conditions and birth weight, as related to such conditions, affect longer-term prosocial behavior, including volunteering.

In order to avoid health-selection effects, it is important to control for initial/baseline indicators of physical functioning/health when trying to isolate effects of volunteering. Longitudinal studies often find that volunteering predicts having fewer functional limitations at a later time point, even when controlling for a number of plausible confounds (Choi and Tang 2014; Lum and Lightfoot 2005; Luoh and Herzog 2002; Morrow-Howell et al. 2003). In addition, another longitudinal study found that volunteering reduced doctor visits for physical illness and fewer overnight hospital stays in a nationally representative sample of older adults, even when adjusting for covariates (Kim and Konrath 2016). However, other studies have found that volunteering is unrelated to the later number of physician-diagnosed health conditions or nursing home residence rates (Lum and Lightfoot 2005). Experimental interventions to increase volunteering behavior increase participants' physical strength and balance, halt declines in walking speed over time, and produce fewer falls and functional limitations compared to control interventions (Fried et al 2013; Hong and Morrow-Howell 2010). Because there is limited cross-cultural

research on physical functioning indicators, it is unclear whether these results would generalize widely across cultures.

(e) Health risk behaviors

Health risk behaviors include smoking, drinking, extremes of Body Mass Index (BMI), physical activity, and preventative healthcare utilization (e.g., getting flu vaccines). Among adolescents, pregnancy, school failure, and problem behaviors at school are also considered health risk behaviors. Compared to non-volunteers, volunteers report engaging in fewer health risk behaviors, such as smoking, drinking, or sedentary lifestyles (Harris and Thoresen 2005; Musick, Herzog, and House 1999; Oman, Thoresen, and Mcmahon 1999; Shmotkin, Blumstein, and Modan 2003). Among teens, volunteering is associated with fewer risky behaviors (e.g., alcohol, tobacco, and drug use; antisocial behavior; violence) and more beneficial ones (e.g., physical activity, school success; Benson, Clary, and Scales 2007; Murphey et al. 2004; Uggen and Janikula 1999). In a longitudinal study, volunteering predicted more preventative healthcare utilization (e.g., flu vaccine, cholesterol test) in a nationally representative sample of older adults, even when adjusting for covariates (Kim and Konrath 2016). Experimental interventions to increase volunteering behavior produced increased physical activity among older adults (Fried et al. 2004; Tan et al. 2009), and decreased rates of pregnancy, school failures, and problem behaviors at school among adolescents (Allen et al. 1997; Switzer et al. 1995). It is unclear whether the links between volunteering and health risk behaviors would generalize widely across cultures.

(f) Basic physiological measures

Research has clearly shown that volunteering is associated with better physical health. Yet knowledge about physiological pathways to such outcomes (e.g., cardiovascular measures, hormones, biomarkers) remains sparse. Elevated resting pulses and blood pressure (i.e., hypertension) are both risk factors for cardiovascular disease and later mortality, even when controlling for other lifestyle-based risk factors (Chobanian et al. 2003; Gillum, Makuc, and Feldman 1991). Only two known studies have examined the link between volunteering and such cardiovascular variables, finding that in nationally representative samples of older adults, volunteers have lower resting pulses and lower blood pressure compared to non-volunteers, controlling for plausible confounds (Burr, Tavares, and Mutchler 2011; Konrath 2013). C-reactive protein as a biomarker of systemic inflammation is also associated with cardiovascular disease (Van Lente 2000). Volunteers have lower c-reactive protein levels compared to non-volunteers (Konrath 2013). This effect was confirmed in an experimental study that found that adolescents who were randomly assigned to a four-month volunteering program had marginally lower inflammatory

biomarkers (c-reactive protein and interleukin 6) than waitlist control-group participants (Schreier 2012; Schreier, Schonert-Reichl, and Chen 2013). They also had lower levels of cholesterol and a lower BMI. However, there was no effect of the intervention on blood pressure. All these studies used real-time physiological assessments conducted by trained personnel. More studies are needed. In particular, it is unclear whether the physiological consequences of volunteering would generalize across cultures.

(g) Longevity

Ultimately, the better health of volunteers may reduce their mortality risk (see also Handbook Chapter 52). Indeed, a meta-analysis of 14 longitudinal studies conducted from 1986 to 2012 found that volunteering at one time point was associated with a 47% reduction in mortality risk (24% for adjusted models) a few years later (Okun, Yeung, and Brown 2013). This meta-analysis also found that the mortality risk benefits associated with volunteering are especially strong for people who are more religious. Other research finds that the reasons why people volunteer can also affect whether they experience lower mortality risk after volunteering (Konrath et al. 2012). Even when adjusting for covariates, people who volunteer for more other-oriented reasons (e.g., compassion) have a significant mortality risk reduction, but those who volunteer for more self-oriented reasons (e.g., to learn something new, or to feel good about themselves) have a marginally *higher* risk of mortality. Although there are some experimental studies that assess health consequences of volunteering, we know of none that assesses mortality risk. Moreover, there are only limited cross-cultural studies examining longevity benefits of volunteering.

4. Cognitive performance

Several US surveys show that membership and active participation in voluntary associations are positively related to verbal ability measured in a vocabulary test, but once the level of education is controlled, verbal ability does not have much predictive value for the number of memberships in associations (Hauser 2000). Data from the Wisconsin Longitudinal Study (WLS) reveal this pattern over a long period of time. Performance on an intelligence test in 1957 was positively associated with social participation some 35 years later, but this relationship disappeared completely when the level of education in 1975 was controlled. While volunteers typically perform better on cognitive tests than non-volunteers, this difference is often reduced when the level of education is controlled statistically (Bekkers and Ruiter 2008; Carabain and Bekkers 2011 2012). Intentions to volunteer in a scenario experiment conducted among a random population sample in the Netherlands were not correlated with performance on a vocabulary test when the level of education was controlled (Bekkers 2010).

The foregoing results do *not* necessarily mean that intelligence (cognitive performance) is unrelated to volunteering as a causal factor, while educational attainment is the causal factor. Intelligence affects how much education a person gets, especially in broad terms, such as high school degree versus college/university degree versus advanced degrees. In theory and substantially in practice, level of education and performance on cognitive tests measure the same aspects of a person's mind. Years of education also measure basic aspects of cognitive performance, including the knowledge and cognitive abilities underlying such performance. Insofar as volunteer roles require intelligence, people with higher intelligence will likely self-select themselves more into volunteering than people with low intelligence. The same is true for levels of education. In sum, disentangling education from cognitive performance (intelligence) is important but rarely feasible in practice.

Studies of social participation programs for older adults have generally found higher cognitive performance among volunteers (Krueger et al. 2009; James et al. 2011). However, this finding does not prove that volunteering enhances cognitive performance, because the difference may well be a reflection of a higher level of education at entry into the program or intelligence level at entry. Collapsing volunteer work with other forms of social participation, Aartsen et al. (2002) found no additive cognitive performance benefit of social participation.

Using data from the Fullerton Longitudinal Study, Reichard et al. (2011) found that intelligence measured by Wechsler Adult Intelligence Scale-Revised (WAIS-R) was positively correlated with non-work leadership positions, such as in a religious group, community service group, or sports organization, but this study did not include a measure of the level of education achieved.

Offering a different view of intelligence and cognitive abilities as influences on volunteering and association participation, Section D #9 of Handbook Chapter 30 is quoted here as relevant, with permission:

> Gesthuizen and Scheepers (2012), included in their cross-national research one overall measure for cognitive competence connected to formal education as a determinant of volunteering. They created an index of cognitive competence (general intelligence) based on performance measures that referred to prose, document, and quantitative literacy. With various other demographic factors, including formal education, controlled statistically in multilevel regression analyses, the authors showed that cognitive competence of the individual was a significant predictor of frequency of association participation per year as [Formal Volunteering] FV (p. 70). Formal education of the individual and of his/her parents were still statistically significant, but were much reduced in strength as predictors of FV. Thus, much of the apparent influence of formal education on FV, found nearly everywhere,

is likely a result of educational selectivity for more cognitively competent individuals.

There are very few national sample surveys studying FV that include measures of intellectual capacities. Most researchers seem either uninterested in this variable or unaware that it can be simply measured in a survey interview by a few vocabulary items. The US national sample survey by Brady, Verba, and Schlozman (1995) is an exception, focusing on the explanation of political participation, which is a kind of prosocial behavior done in leisure time. Verbal intelligence was measured by a 10-item vocabulary test, which correlated r = .51 with formal education (p. 273). In an OLS regression analysis (p. 280), verbal intelligence was a significant predictor of overall political participation, which included a few direct FV measures like political meeting attendance. Formal education was included as a predictor but was not statistically significant.

In the national sample survey of FV by Russian adults reported by Smith (2015, 2016c), the verbal intelligence measure was six-item antonyms test (alpha = .66). The bivariate correlation of intelligence with a highly reliable, six-item measure of FV (alpha = .91) was r = .17 (significant at the .001 level, two-tailed). When verbal intelligence was entered into an OLS regression with 57 other potential predictors of FV, it remained significant (.05 level), though weak in beta weight strength, but formal education was insignificant.

Social intelligence has also been studied a bit, but not much, in relation to FV. Clearly, this kind of intelligence should theoretically have some positive association with FV, especially for leadership roles. In 1939, Chapin was the first researcher to examine how social intelligence relates to FV, finding a positive relationship in a convenience sample. Very recently, Carl and Billari (2014) used US national sample data to show that trust and *verbal* intelligence are significantly and fairly substantially correlated, as has been shown elsewhere several times. In seeking explanations for this finding, one hypothesis advanced was that more intelligent people are better able to assess the trustworthiness of other people, hence showing social intelligence. This needs to be tested with direct measures of emotional intelligence as well as verbal intelligence.

Voluntary associations can differ markedly in the extent to which membership and participation requires greater education and higher cognitive performance/intelligence. For instance, social clubs and sports associations seem to make few such demands, while paramedic ambulance squads, groups of docent volunteers in museums, alumni associations, professional associations, and scholarly scientific societies make substantial demands. Unfortunately, no one has studied this issue so far, to our knowledge.

5. Neurological correlates

Brown, Brown, and Penner (2011) review various findings from recent neuroscience that demonstrate generally the influence of neurology and neuro-chemistry on prosocial behavior of all kinds, including volunteering. From the *social brain hypothesis* (Dunbar 1998), it is likely that volunteering as a social activity is facilitated by the large cognitive capacity of humans and the human brain, viewing us as a species. Brain volume across species clearly determines the capacity to process information required to maintain social relationships, and this is true to a lesser extent across human individuals (Dunbar 1992). One study among 58 US adults found that the relative size of the amygdala (adjusted for total intracranial volume) is positively correlated with the size and complexity of social networks (Bickart et al. 2011a, 2011b). Another study on 40 US adults found that the size of the prefrontal cortex is positively cor-related with the size and complexity of social networks (Powell et al. 2012). The prefrontal cortex is of particular importance for human sociality and con-sciousness (Dunbar 1998), in part because of its involvement in understanding the intentions of others (Lewis et al. 2011; Walter et al. 2004). The prefrontal cortex consists of two areas: the dorsal prefrontal cortex, which is involved in higher order cognitive functions such as planning, and orbital prefrontal cortex, which is involved in mood, affective behavior, and social cognition.

Thus far, no studies have specifically investigated brain activity specifically in relation to volunteer work. Because of the heterogeneity of tasks that volunteers can perform, this would not make much sense. However, many studies have investigated brain activity involved in functions and conditions correlated with volunteering, such as social acceptance (Eisenberger, Lieberman, and Williams 2003), empathy (Singer et al. 2008; see also Brown, Brown, and Penner 2011), and altruism (Avinun et al. 2011; Swain et al. 2012). A growing number of stud-ies are using fMRI to investigate cognitive functioning in older adults recruited in volunteer programs (e.g., Carlson et al. 2009). These studies typically find enhanced cognitive functioning among volunteers.

While fMRI studies are not yet common in research on volunteering, several studies have found differential neural activation in reward areas when making charitable donations (Harbaugh, Mayr, and Burghart 2007; James and Boyle 2014; Moll et al. 2006). Such studies could be conducted among volunteers – for instance, while they are thinking about their volunteer job versus a control activity, or contrasting volunteers with different motives for volunteering.

6. Neurochemicals

Brown, Brown, and Penner (2011) review some of the research on neurochem-istry as an influence on prosocial behavior. More specifically, dopamine is a neurotransmitter involved in the experience of pleasure. Originating in the

midbrain, dopamine produces neurons that consecutively go to the nucleus accumbens and the prefrontal cortex (Eisler and Levine 2002). It is not specific for social experiences. It is involved in all kinds of positive moods, including those as a result of substance abuse and other addictive behaviors. The warm glow of giving (Andreoni 1990), often cited by volunteers as a motive for volunteering, may reflect that volunteering is a pleasurable experience leading to the production of more dopamine. Obviously, the finding that volunteers self-report warm glow does not show why volunteering is a pleasurable experience. Also it does not prove that volunteering produces warm glow. The warm glow may be specific to donors. In a study on the relationship between blood donation and charitable giving, blood donors reported a stronger warm glow as they gave more to charity, but non-donors did not. This finding suggests that donating generates less of a warm glow to non-blood donors (Ferguson et al. 2012, Study 3).

7. Hormones

(a) Oxytocin

Oxytocin (OXT) is a neuropeptide that is released during childbirth, breastfeeding, and sexual activity, especially intercourse (Carter 1992, 1998; MacDonald and MacDonald 2010). It is also implicated in more general social interactions, friendship/affiliation, trust, empathy, altruism, and in stress regulation (Feldman 2012; Heinrichs et al. 2003). For example, one experimental study found that nasally administered OXT (compared to a placebo) caused male participants to donate significantly more money to a charitable cause (Barraza et al. 2011). OXT has also been shown to promote cognitive and emotional facets of empathy, including altruistic caregiving (Swain et al. 2012; Wu, Li, and Su 2012). Many other studies have conceptually replicated these OXT results (De Dreu 2012; Zak and Barraza 2013; Zak, Stanton, and Ahmadi 2007). However, we know of no work that explicitly links OXT with volunteering behavior. Such research would be promising, as long as future researchers are aware that OXT is only linked with prosociality in certain groups of people and under certain contexts (Bartz et al. 2011).

(b) Vasopressin

Arginine vasopressin (AVP) is another neuropeptide implicated in social behavior. Compared to OXT, much less is known about its role in prosociality in humans. However, in rats, AVP injections are associated with prosocial tendencies, compared to placebo controls (Ramos et al. 2013). In humans, there are no known studies directly examining prosocial tendencies or volunteering specifically, yet studies on related processes are emerging. For example, experimentally administered doses of AVP in males produced a better recall of emotional faces (Guastella et al. 2010). But AVP gave inconsistent findings with respect to actually identifying the emotional expressions (impaired performance: Uzefovsky

et al. 2012; no effects: Kenyon et al. 2013). Moreover, there may be sex-specific results of AVP effects, with one study finding that after nasally administered AVP (compared to placebos) males see faces as more unfriendly, while females see them as friendlier (Thompson et al. 2006). This area is ripe for future research.

(c) Cortisol

Cortisol is a stress hormone that is associated with increased cardiovascular mortality risk (Kumari et al. 2011; Vogelzangs et al. 2010). Although there have been studies examining the effect of other prosocial behaviors on cortisol levels (e.g., Field et al 1998; Smith et al. 2009), there is only one known study examining cortisol in relation to volunteering. This experimental study found that a four-month volunteering program had no effect on adolescents' cortisol levels compared to a waitlist control condition (Schreier, Schonert-Reichl, and Chen 2013; Schreier 2012). More research is needed to examine the relationship between cortisol and volunteering.

(d) Testosterone

Testosterone is a male sex hormone, but it is also present to a lesser degree in women. There has been some research on testosterone and prosocial tendencies, but no study that we know of specifically examines testosterone and volunteering. Experimentally administered testosterone produces less facial mimicry of emotional facial expressions (Hermans, Putman, and Van Honk 2006), decreases the ability to recognize emotional facial expressions (i.e., cognitive empathy; Van Honk and Schutter 2007; Van Honk et al. 2011), and reduces trust in others, especially among highly trusting people (Bos, Terburg, and Van Honk 2010). Several studies examine the effect of testosterone on generosity in economic games (e.g., the Ultimatum Game), with contradictory results. Two find that testosterone administration causes less generosity (Boksem et al. 2013; Zak et al. 2009), two find that testosterone administration causes more generosity (Eisenegger et al. 2010; Van Honk et al. 2012), and another finds null results (Zethraeus et al. 2009). One study finds that even as testosterone lowers initial generosity, it simultaneously increases reciprocal generosity – giving to others who first gave to the self (Boksem et al. 2013). Some contradictory results may be due to beliefs about how testosterone affects people (Eisenegger et al. 2010), and these need to be considered in all testosterone administration studies.

8. Genes

Genes have long been implied as biosocial causes of behavior. Turkheimer (2000) summarized the results of *many* thousands of studies in behavioral genetics in three laws, the first being that "everything is heritable." While this law may not be true in its extreme formulation, almost every aspect of usual

human social behavior that has been studied with behavioral genetic data has indeed been found to have some genetic origins, including the size of social networks (Fowler, Dawes, and Christakis 2009; Freese 2008; McGue and Bouchard 1998), and even mobile phone use (Miller et al. 2012). Specific political party preference seems to be one of the few exceptions (Hatemi et al. 2009). Also, general prosocial tendencies and volunteering are subject to genetic effects (Ebstein et al. 2010). Before we discuss these findings, we go into the methodology used to obtain estimates of genetic effects.

(a) Biometric models

Behavioral genetic models, also called biometric models, decompose variance in human behavior by using samples of individuals with systematically different genetic similarity such as twins and siblings. Building on several assumptions, the variance in phenotypic traits can then be decomposed into effects of additive genetic factors (a^2), shared environmental (c^2) and unique environmental components (e^2). These models show that many traits have substantial genetic heritability (Turkheimer's first law), and that additive genetic factors typically explain more of the variance than shared environmental factors (the second law). On the other hand, however, there are few traits that have exclusively genetic origins. In fact, behavioral genetics tells us how amazingly complex the interplay between nature and nurture is in determining human behavior, as revealed by research on epigenetics in particular (e.g., Almond and Currie 2011; Nathanielsz, Liggins, and Bensadoun 1996; Francis 2011; Tollefsbol 2010). Most traits in humans are genetically complex, meaning that there is a complex of many genes associated with the trait. There are only a few traits that are determined by a single gene. An example is phenylketonuria (PKU), a disorder caused by a deficiency of the enzyme phenylalanine hydroxylase, giving rise to developmental delays and eczema. Thus far, the search for effects of specific genes on human behavior has been disappointing. Genome Wide Association Studies (GWAS) have failed to identify genes with substantial effects on specific human differences of interest to social scientists (Turkheimer 2012). Typically, all single nucleotide polymorphisms (SNPs) combined explain less variance than is estimated in biometric models. The discrepancy between the sizable genetic heritability estimates from biometric models and the much smaller variance explained by all SNPs combined is called the "missing heritability problem" (for a discussion, see Turkheimer 2011).

Many studies have investigated altruism and related aggregate constructs of prosocial tendencies with biometric models, often including volunteering as well as informal forms of prosocial behavior and prosocial values and attitudes. While most studies have found genetic effects on prosocial tendencies (e.g., Rushton 2004; Rushton et al. 1986; Koenig et al. 2007; Gregory et al. 2009), some have not (Krueger, Hicks, and McGue 2001; Bouchard and Loehlin 2001).

More generally, estimates of genetic effects have varied widely from 0% up to 50%. Knafo-Noam (2015) studied genetic effects on five facets of prosocial personality among Israeli twins, concluding that prosocial personality has high (69%) heritability.

Four studies have specifically investigated volunteering using behavioral genetic models. Son and Wilson (2010) used the MIDUS twins and siblings samples to estimate genetic variation in the number of volunteer hours. The best-fitting biometric models included no genetic effects for males and a relatively small genetic variance component (.30) for females. Gibson (2001) analyzed data from a small sample of New Zealand twins, finding that the higher educated twin of a monozygotic pair typically spent less time volunteering than the lower educated twin. This finding suggests that the relationship between education and volunteering in the general population is positive due in part to genetic effects.

Bekkers (2014) also used the MIDUS twin sample to analyze religion and education as mediators of unique environmental effects on volunteering. The analysis was limited to monozygotic twin pairs to exclude genetic sources of variance. All differences within monozygotic twin pairs must be due to unique environmental factors. The study concluded that education did not explain any variance in volunteering among monozygotic twins. This finding implies that the relationship between education and volunteering, one of the most commonly found relationships in the literature (Smith 1994; Musick and Wilson 2008), is mostly due to genetic effects, likely general intelligence. The conclusion for religion, another common correlate of volunteering, was very different: the strength of religiosity was positively related to the number of hours volunteered, implying that genetic effects cannot explain the relationship.

Very recently, Dawes et al. (2015) performed "a population-based longitudinal study of 1197 monozygotic (MZ) and 684 dizygotic (DZ) like-sex twin pairs born between 1972 and 1984 and their parents." Data were gathered when the twins were 11, then at age 14 and 17. Three types of prosocial behavior were measured: voting (in national or state elections), charitable donating (done regularly), and formal volunteering (for community or public service activities), each measured by a single questionnaire item. When subjected to principal components analysis, all three items loaded highly on a single dimension, called *civic engagement*. The factor scores were used to measure this composite, underlying dimension.

Heritability scores were statistically significant (.05 level) for all three separate measures and for the total civic engagement score, as follows: voting = .27, donating = .28, volunteering = .33, and civic engagement = .41. Hence, *behavior genetics significantly affect all four civic engagement measures*. All three single measures were inter-correlated, suggesting the presence of the Leisure

General Activity Pattern (LGAP) identified by Smith (see Handbook Chapter 5). This is the first significant empirical evidence for the heritability of the LGAP, however limited in scope, and hence is quite important theoretically.

Covariation between civic engagement measures and psychological traits was computed. Verbal IQ was significantly correlated genetically with civic engagement (r_g = .39) and voting (r_g = .39), but not with volunteering or donating. A higher order personality trait of positive emotionality (related to extraversion) was correlated genetically with civic engagement (r_g = .53), volunteering (r_g = .49), and donating (r_g = .52), but was not quite statistically significant for voting. Looking at ordinary Pearson correlations, Verbal IQ was correlated significantly with volunteering (r = .07), donating (r = .14), voting (r = .23), and civic engagement (r = .18). Positive emotionality was also correlated significantly with volunteering (r = .27), donating (r = .26), voting (r = .19), and civic engagement (r = .33).

(b) Specific genes involved in the genetics of volunteering:

Which genes are likely to be involved in volunteering? Several specific genes have been studied in detail as candidates that could play a role in prosocial behavior: DRD4 genes, OXTR genes, AVPR genes, and serotonin transporter (5-HTTLPR) genes. No study thus far has specifically examined these genes in conjunction with volunteering, however.

DRD4 genes enable the production of the D4 dopamine receptor protein, which is involved in the expression of emotions and for the stimulation of cognitive faculties (Schmidt et al. 2001). Song, Li, and Arvey (2011) found a weak negative relationship between DRD4 7R and paid-work job satisfaction. Future research could test whether this relationship holds for unpaid work as well. Jiang, Chew, and Ebstein (2013) provide a summary of papers investigating relationships between DRD4 variants and prosocial behaviors. Bacher-Melman et al. (2005) and Anacker et al. (2013) find negative relationships, that is, lower altruism scores in the presence of the dopamine receptor D4 7-repeat allele (DRD4 7R). Zhong et al. (2010) find an association with fairness in the ultimatum game. Knafo, Israel, and Ebstein (2011) did not find a relationship, but found a more complicated pattern: children with a DRD4 7R allele were more susceptible to positive parenting practices than children without this allele. One interpretation of this finding is that an environmental factor (positive parenting) is able to repair lower prosociality among children with a specific genetic risk factor (the DRD4 7R).

Several findings in studies of other social behaviors are consistent with the more general interpretation that individuals with the DRD4 7R are more susceptible to social influence. Using the AddHealth data, DeLisi et al. (2008) report an association between DRD4 polymorphisms and age of first criminal arrest among adolescents from low risk families, but not among high risk families. Settle et al. (2010) found that among participants in the NLSAH with the

D4 7-repeat allele, the number of friendships in adolescence was significantly associated with liberal political ideology, while there was no such association among those without the gene variant. Sasaki et al. (2013) show that the influence of priming participants with religion positively affects the willingness to volunteer for environmental causes among those who carry the D4 2 or 7-repeat allele but not among those carrying other variants.

Reuter et al. (2011) examined another dopaminergic candidate polymorphism for altruistic behavior, the functional COMT Val158Met SNP, and found that the Val allele (representing strong catabolism of dopamine) is associated with more charitable giving toward poor children in a developing country.

(c) OXTR genes

Oxytocin receptor (OXTR) genes are also implicated in prosocial traits and behaviors (e.g., Swain et al. 2012; for reviews, see Ebstein et al. 2012; Kumsta and Heinrichs 2013). For example, people with GG genotypes (in rs53576) are more sociable, empathic, and trusting than A-allele carriers (Krueger et al. 2012; Rodrigues et al. 2009; Tost et al. 2010). They are also rated as more empathic by observers (Kogan et al. 2011). Yet these effects are not found for all potential OXTR SNPs: only four out of ten SNPs in one study (rs2254298, rs2268491, rs237887, rs4686302: Wu, Li, and Su 2012), and only three out of 15 SNPs in another (rs1042778, rs2268490, rs237887: Israel et al. 2009). A meta-analysis of OXTR effects revealed weak relationships across the board (Bakermans-Kranenburg and Van IJzendoorn 2014). Clearly, the specific SNP within the OXTR gene is important. Behaviorally, OXTR GG genotypes are related to better emotion recognition performance (rs53576, rs2254298, and rs2228485: Lucht et al. 2013; Rodrigues et al. 2009; Wu and Su 2013) However, their effects on generosity within economic games (e.g. Dictator Game, Trust Game) are either limited (e.g. to three out of 15 possible OXTR SNPs: Israel et al. 2009) or non-existent (Apicella et al. 2010).

These inconsistent main effects might reflect underlying interactions with contextual variables. For example, although one study found no main effect of the OXTR SNP (rs53576) on prosocial behavior (including volunteering), there was an interaction between genotype and levels of environmental threat in predicting prosociality (Poulin, Holman, and Buffone 2012). Another study found that an OXTR gene (rs2254298) interacted with volunteering status to predict mortality risk (Konrath 2016). Specifically, the widely documented decline in mortality risk for volunteers was only found for OXTR A-allele carriers, and not GG carriers. Research is needed to better understand factors that may influence the relationship between OXTR genes, prosociality, and health. In addition, more cross-cultural research is needed, considering one study finding that the OXTR genotype had opposite effects in the US and Korea (Kim et al. 2011).

(d) AVPR genes

AVPR genes have also been implicated in prosocial traits and behaviors. Participants with longer versions of the AVPR1a RS3 gene scored higher on prosocial traits and allocated more money to others in the Dictator Game than those with short versions of this gene (Knafo et al. 2008). Similar to OXTR genes, AVPR genes may best predict prosocial behavior in concert with contextual factors (Poulin, Holman, and Buffone 2012).

(e) 5-HTT genes

5-HTT genes regulate the function of the neurotransmitter serotonin. One common polymorphism in the promoter region of the gene (5-HTTLPR) has been linked not only to aggressive behavior (the short variant; Duman and Canli 2010), but also to voting (the long variant; Fowler and Dawes 2008). The 5-HTTLPR was one of the first to be discovered as interacting with environmental conditions (life stress) in depression (Caspi et al. 2003). Carriers of the short variant suffer more adverse consequences of childhood maltreatment (Karg et al. 2011). Song, Li, and Arvey (2011) found a weakly positive relationship between 5-HTTLPR and paid work job satisfaction. Whether this relationship holds for unpaid work as well remains to be seen in future research. Colzato et al. (2013) showed that intake of a tryptophan food supplement, containing an amino acid that is found in food such as fish, soybeans, eggs, and spinach, and a biochemical precursor of serotonin, increases trust in an economic game. Stoltenberg, Christ, and Carlo (2013) found that the association between 5-HTTLPR triallelic genotype and helping behavior was mediated by anxiety in social situations. Students carrying the S' allele reported lower rates of helping others, partly as a result of higher levels of social avoidance.

9. Discussion

We should be careful not to reify physiological differences (Dar-Nimrod and Heine 2011). An image of brain activity or a correlation between genetic polymorphisms and volunteering does not imply causality. The rules for causal inference also apply to physiological data: correlates may reflect a causal influence of physiological properties, but they may also be observed as a result from social behavior influences on physiological functioning or selection on some third variable. Only studies that use random assignment of participants to treatment and control groups allow for easy causal inference on the effect of a specific cause (Shadish, Cook, and Campbell 2002; Firebaugh 2008). However, brain activity or hormone levels are usually not manipulated. Primate studies in which group size was varied show that network size determines the grey matter volume and prefrontal cortex activity (Sallet et al. 2011). Thus, the correct interpretation of a study showing a correlation between prefrontal cortex and network size is *not* that brains cause networks, as suggested in the causal

model of one study (Powell et al. 2012: Figure 1). The same study does acknowledge that the causal direction of the relationship between prefrontal cortex and network size may run in both ways. An adequate representation of the association between the volume of grey matter in the brain with the number of social contacts in online social networks is that "social network size is reflected in human brain structure" (Kanai et al. 2012). Lesion studies on patients with damage to specific parts of the brain (e.g., Shamay-Tsoory, Aharon-Peretz, and Perry 2009) show that specific cognitive and social functions are impaired. From such studies, however, we cannot conclude how individual differences in brain volume and activity among healthy individuals determine cognitive and social functioning.

Another shortcoming is that participants in fMRI studies are almost exclusively originating from Western countries (Chiao and Cheon 2010). The use of samples from WEIRD (Western, Educated, Industrialized, Rich, and Democratic) countries reduces the potential for generalization of research findings to all of humanity (Henrich, Heine, and Norenzayan 2010). Cross-cultural evidence on health correlates of prosociality (Calvo et al. 2012) is very important in this respect. Also within WEIRD countries, participants in studies that include physiological measurements are not random samples of the population. The Henrich, Heine and Norenzayan diagnosis warning echoes McNemar's (1946) warning that the practice in psychology to use students as research participants was creating a "science of the behavior of sophomores." Within this particular population, a volunteer bias is likely to occur such that individuals who are more sociable, less conventional, and more interested in the study will be more likely to participate (Rosenthal 1965; Rosnow and Rosenthal 1976). In longitudinal research on health, selective participation based on health status and deterioration is an additional problem. These problems reduce the potential for generalization of the findings to broader populations.

E. Usable knowledge

The fact that volunteers are in better health and ultimately live longer than non-volunteers demonstrates the potential relevance of physiological correlates of volunteering (see also Handbook Chapter 52 for similar results, often based on longitudinal studies). If proven to be causal, the link between health and volunteering bears the promise of a huge physical welfare (benefit) advantage of volunteering. Programs that encourage volunteering, specifically among the elderly and among those at risk for health problems, could improve health and promote longevity. The role of oxytocin in producing positive emotional feelings, even when those feelings result from spraying OXT into the nostrils, has practical applications. However, such applications are very manipulative, and clearly unethical if done without conscious choice by the recipient of the OXT.

F. Future trends and needed research

Our review suggests a considerable potential for discovery in future research on physiological correlates of volunteering, and even causal relationships. In our view, some of the findings we have reviewed are downright exciting (e.g., Dawes et al. 2015; Knafo, Israel, and Ebstein 2011). The current phase of biosocial research is one of discovery, mapping hitherto uncharted territory where "Here be dragons" used to be written. Just like the first maps drawn by cartographers were notoriously unreliable, new findings in biosocial science often fail to replicate in future studies (Freese 2011). The burgeoning literature in the biosocial sciences carries the risk of the "decline effect" (Lehrer 2010; Schooler 2011): promising discoveries of associations between physiological characteristics and prosocial behavior will prove to be more complicated than initially conceived, or worse still: they may not be replicated in other samples. Attempts to replicate often fail, as in a recent replication effort of genes previously reported to be involved in intelligence shows (Chabris et al. 2012). We should thus be careful not to generalize from single genetic association studies. The results may be false positives as a result of a low statistical power (Davis-Stober and Dana 2013). Therefore, we encourage the use of meta-analytic methods to uncover reliable patterns and moderators of gene-behavior associations. Some of these problems are also inherent in fMRI studies (Vul, Winkielman, and Pashler 2009). There is also abundant evidence that non-significant findings are disappearing from the universe of journal publications in the social sciences (Fanelli 2012). Replication and open access publication of all relevant findings are therefore important to the advancement of knowledge in this area.

While the body of research on health and physiological correlates of volunteering is sizable, research on neurochemicals, hormones, and genes has often examined other forms of prosocial behavior such as charitable donations. Future research on these physiological correlates should focus specifically on volunteering. We should be careful not to conclude from correlational evidence that volunteering promotes health because reverse causation (health promotes volunteering) is often difficult to rule out as an explanation of the findings. Nevertheless, there is some promising experimental evidence that establishes volunteering as a causal factor in health promotion. Ideally, the effects of design features of such programs should be evaluated through randomized control trials.

Another aim for future research is to broaden the evidence base beyond samples from Western, Educated, Industrialized, Rich, and Democratic (WEIRD) countries. Henrich, Heine, and Norenzayan (2010) have shown that people from such nations are usually atypical of humans on earth on many dimensions. Both research from non-WEIRD countries and cross-national

comparative research are required to obtain knowledge on physiological correlates of prosociality in human nature.

Finally, we encourage researchers to consider the wide variety of forms of volunteering and civic participation (Cnaan and Park 2016; see Handbook Chapter 3). Collapsing all volunteers into one group masks differential associations between physiological characteristics and helping in-group versus out-group members, between volunteering for religious and non-religious groups, between intellectual and practical tasks, between volunteers with different motives, and between volunteering at different levels of intensity. Future research is much needed on various types of volunteering. Both formal and informal volunteering require future study, as does volunteering in volunteer service programs versus voluntary associations. Volunteers in different purposive and analytical types of associations (see Handbook Chapter 3) also need separate study.

Conducive Macro-Contexts Influencing Volunteering

Doug Baer (Canada), Lionel Prouteau (France), David Swindell (USA), Aida Savicka (Lithuania), David H. Smith (USA), and Kuang-Ting TAI (Taiwan)

A. Introduction

This chapter reviews research on variables that affect *rates of formal volunteering* in various sets of territories (nations, provinces/states, counties/districts, communities), usually doing multilevel statistical modeling that simultaneously controls relevant, respondent-variables at the level of individuals. Most attention is given to country-level variables regarding macro-context effects. Results have been less consistent than at the individual level of analysis. At the country level, volunteering rates (referring hereinafter always to formal volunteering/FV) tend to be higher for nations with stronger current democracies, longer time as democracies, more welfare state expenditures per capita, higher and more Protestant religiosity, higher levels of average education, and higher gross domestic product (GDP) per capita. But being part of the Eastern (former communist) Bloc in Europe is a negative factor. In communities, often with inconsistent results, ethnic–racial heterogeneity has negative effects. Special methodological issues are discussed.

In the past three decades, research into the factors leading to individual differences in the likelihood and extent of volunteering and civic engagement has led to a set of stable and well-known findings, with the literature on individual differences now having been summarized by a number of excellent reviews (Dekker and Van Den Broek 2005; Halpern 2005; Musick and Wilson 2008; Smith 1994; Wilson 2000, 2012; see Handbook Chapters 25, 27–31). Research devoted to the *social context* of volunteering has taken a bit longer to develop and mature. Part IV of this Handbook distinguishes three levels of the social context of volunteering: *micro*-level context (e.g., being asked to volunteer by someone not in a group or organization to which one belongs), *meso*-level context (e.g., influences of the networks, groups, or organizations to which one belongs), and *macro*-level context (e.g., effects of the geographic territory within

which one lives or in which one is located temporarily). The micro-level and meso-level factors are reviewed in Handbook Chapter 27.

This chapter focuses on the last of these three levels: the macro-context of volunteering. Geographers have done some general work on this issue, but without much influence. Although *macro-context* can refer to many different levels of social-territorial aggregation (e.g., neighborhoods, towns/cities, metropolitan areas, counties/districts, regions, provinces/states, countries, world regions), scholars have developed a very large body of comparative research over the past decade that examines factors leading to differences between countries. This has been made feasible in part by the existence of large sample, standardized, cross-national social surveys of volunteering (such as the Eurobarometer, the Afrobarometer, the European Social Study, and the World Values Survey).

An important further development in the study of contextual effects has been the widespread adoption of quantitative methods for multilevel models (also known as *mixed-effects models*) in the social sciences, especially in sociology, economics, and education (Gelman and Hill 2007; Heck and Scott 2000; Raudenbush and Bryk 2002). Applied to the study of volunteering, these models have allowed investigators to look for systematic factors affecting differences in volunteering rates between neighborhoods, cities, counties, states/provinces, or whole countries without the statistical estimation bias or aggregation fallacy problems associated with simpler forms of statistical modeling. Multilevel models typically control for *compositional* differences by including variables such as gender, education, income, and age in the analysis as *Level 1* variables, referring to individuals.[1]

This review will proceed by first examining cross-national studies and reviewing their findings, after which studies involving smaller geographic units will be examined. There are some broad similarities in the types of macro-context effects that scholars have studied across different sized territorial units, leading to some general hypotheses regarding the effects of macro-context factors such as aggregate wealth, inequality, ethnic/racial, and/or religious heterogeneity, to name the most important ones. The review will conclude by examining some persistent difficulties in this form of research, and then outlining some potential future lines of investigation and methods of inquiry.

B. Definitions

The general definitions in the *Handbook* Appendix are accepted here. Note that the term *volunteering* in this chapter refers to *formal* volunteering/FV (where the volunteering is done as part of some group or organization), not to *total* volunteering (combining formal and informal volunteering) nor to *informal* volunteering (where no group or organization is involved).

C. Historical background

Handbook Chapter 1 reviews the historical background of formal volunteering and of voluntary associations, in which such volunteering mainly takes place. Handbook Chapter 1 also looks briefly at the very recent history (past 100+ years) of volunteer service programs (VSPs) as sites or venues of formal volunteering.

As noted in this chapter's Introduction, research about macro-context effects on volunteering rates, holding other variables constant, is very recent, going back only several decades. The review of contextual and organizational influences on FV by Smith and Reddy (Smith, Reddy, and Baldwin 1972:chapter 14) noted under bio-physical environmental determinants that weather and climate can affect FV, giving some extreme qualitative examples. However, Michelson (1971) performed a quantitative study showing that FV and other social participation are more frequent in Toronto (Canada) in warmer June than in colder February. Qualitative variations in cultural context and national societies are mentioned as likely affecting FV.

Under the heading of social structural macro-context determinants of FV, several early studies are described. The earliest quantitative study was probably that by Bell and Force (1956). They surveyed samples of adult males in four San Francisco census tracts, two higher in socio-economic status (SES), and two lower (based on aggregate data by tract on education and occupation). With education or occupational level controlled for individuals, they still found significant differences favoring more FV in the higher SES tracts. Based on the studies reviewed, net macro-context effects on FV seem to be generally small (a few to 17 percent), compared to the net effects of individual level predictors. A related early study by Betz (1973) showed that individual participation in Parent Teacher Associations (PTAs) affiliated with 36 elementary schools in Knoxville, Tennessee, was significantly affected by the socio-economic status (SES) of the neighborhood, with more average FV for higher SES neighborhoods.

Since about 1990, more sophisticated research on macro-context has been done, likely for two main reasons. Large research projects have been gathering relevant data on many different places (e.g., cities, states/provinces) in the same study, often on whole nations, with both individual level and macro-context data. Also, computer programs have become increasingly available to perform multilevel, multivariate analysis, thus simplifying and making more accurate the disentangling of context from individual level effects.

D. Key issues

1. Between-country differences

As Curtis, Baer, and Grabb (2001) note, early investigations of between-country differences often focused on the apparently unique position of the United

States as a country with unusually high rates of voluntary engagement. Explanations sometimes took the form of *US exceptionalism* (Hodgkinson 2003; Lipset 1996), tracing a historical legacy of a *volunteer culture* in the United States and relating this to processes related to the US Revolution, the absence of a feudal past, and other historical factors. These explanations have fallen somewhat short in explaining the facts in some other countries such as Canada and the Scandinavian countries. These countries also exhibit relatively high levels of voluntarism despite the absence of the same historical configurations said to have led to a culture of civic engagement in the United States (Curtis, Grabb, and Baer 1992). This suggests that there are multiple explanations that led to these macro-level volunteerism effects.

Much of the research that has followed has placed an emphasis on factors said to apply across countries – such as differences in levels of wealth, differences in the level of *democracy* (however defined), and differences in the form of the state/economy relationship. Mascherini, Vidoni, and Manca (2011) used European Social Survey data on FV to cluster nations according to their levels of FV membership. Their analysis suggested distinct Northern European and Mediterranean and Eastern European clusters, with remaining nations hard to classify. If there is a limitation in the contemporary and recent comparative literature, it might be that the pendulum has turned almost entirely from the search for country-specific unique explanations in its quest for generalizing statements regarding between-country differences.

(a) Regime types

One approach to the study of between-country differences is grounded in the works of Esping-Andersen (1993, 1999) or the adaptation of these works to the field of the study of civic engagement (Janoski 1998). This approach makes distinctions between liberal democracies (the United States, Canada, Australia, Japan), social democracies (Scandinavian countries and the Netherlands), and conservative (or *traditional*) welfare regimes (France, Germany, Italy, Belgium), where the differentiation surrounds the nature of welfare provision (minimalist, universalist, conditional/ patriarchal, respectively). Among those countries it was designed to describe, the approach has the advantage of predicting between-country differences in overall civic engagement rates fairly well. Not all countries fit neatly into the typology, however.[2] At the level of aggregated data, Janoski (1998:134) notes that both liberal democratic and social democratic nations, at the opposite extremes when it comes to the degree of state welfare provision, have high rates of volunteerism, whereas the traditional countries have low rates. These findings are more or less supported by multilevel models (Baer 2007; Curtis, Baer, and Grabb 2001; Hank 2011; but see Meulemann 2008), though to some extent religious tradition can also be used to explain many of the between-country differences.[3]

One can find an alternative regime-type categorization in the works of Schofer and his colleagues (Schofer and Fourcade-Gourinchas 2001; Schofer and Longhofer 2011). Here, *statism* plays an important role (with countries in the initial variant of this approach being classified into a binary classification scheme), as does *corporateness*. Contrary to its usage elsewhere, *statism* does not refer to the extent of the state's involvement in the economy per se, but rather refers to the existence of a well-developed (state) bureaucratic elite and a long history of authoritarian rule. *Corporateness* refers to systems that empower individuals as members of broader collectives under social configurations, which often arise as a result of the modernization of countries having had a feudal past (clearly not the case in Canada, the United States, or Australia).

Like the *welfare regime* typology, this scheme explains many, but not all, of the differences among the countries it identifies. It has the slight advantage of being easily applied beyond Western European and North American countries. *Statism* suppresses voluntary engagement, while to a lesser extent *corporateness* encourages it (except possibly in the case of new social movement associations).

Zhou (2012) presents a related, but somewhat different, categorization by distinguishing between democratic regimes and authoritarian regimes on one hand and *strong states* versus *weak states* on the other. Strong, democratic states are more engaged in voluntary activities. This categorization works in models involving mixtures of developed and developing countries, but may be less useful in examining differences between Sweden and Germany, for example (though a more refined, multiple-category or continuous version of the *state capacity* variable might accomplish this).[4]

(b) State involvement in the economy

Few multilevel modelers have followed up on the state typologies described above, though some, in order to account for the especially low civic engagement rates in former East bloc countries, have employed an *East bloc* dummy variable (Paxton 2007). Rather, the trend in recent research has been to construct *continuous variables* to represent processes underlying the earlier categorization schemes. Instead of distinguishing strong from weak welfare states, other researchers use the percentage of GDP associated with state activities or, better yet, the percentage of GDP devoted to state welfare activities.[5]

Research employing the state GDP variable typically frame the discussion around the *crowding out thesis* (Fukuyama 1999; Stadelmann-Steffen 2011) and its antithesis, the *crowding-in hypothesis* (Gundelach, Freitag, and Stadelmann-Steffen 2010; Stadelmann-Steffen 2011). The crowding out thesis argues that when the state engages in activities that could otherwise be performed by voluntary associations, dependencies develop, voluntary associations wither and, importantly, people lose the ability to work together. The contrary hypothesis, though, is that universal welfare states decrease perceived cultural

distances between the majority and those at the bottom (Stadelmann-Steffen 2011:317), promote civic engagement by reducing economic insecurity (which may deflate the willingness of individuals to help others), and make voluntary engagement more attractive by providing matching financial resources (hence stronger outcomes) that complement volunteer efforts (Chambré 1998; Salamon 2003).

Some evidence in support of the crowding out thesis exists, but it is not strong. With a sample of 44 countries from the World Values 2000 dataset, Anderson and Paskevicuite (2006) report that state expenditure has a negative impact *on memberships,* but the coefficient in their model is only statistically significant at p<.10. In a study of 28 European countries using Eurobarometer data, Gesthuizen, van der Meer, and Scheepers (2009) report an effect in the opposite direction for membership, but again the coefficient is not significant at p<.05. They report no significant effect in the case of volunteering. Using European and World values data, Hackl, Halla, and Pruckner (2012) find a negative and statistically significant relation between public social expenditure and volunteering. Using European Social Survey (2002) data and a composite measure for voluntary engagement, van Ingen and Dekker (2011) report that welfare state expenditures have a *positive* effect on volunteering, as do Gelissen, van Oorschot, and Finsveen (2012: Table 2) from Eurobarometer data. Drawing on European values data 2008, Prouteau and Sardinha (2015) find a positive and significant correlation in the countries of the European Union between, on the one hand, the per capita total government expenditure and, on the other hand, aggregate volunteering, as well as three types of volunteering, that is, the ones dedicated to social, leisure, and advocacy activities.

These results follow from earlier work by van der Meer (2009) using the same European and World Values Survey data, from Ruiter and de Graaf (2006) using World Values data, and from Oorschot and Arts (2005) using European Values data.[6] Although not making use of multilevel models and not even focused on volunteering at the individual level, Schofer and Longhofer's (2011) examination of longitudinal aggregate data from the Encyclopedia of Associations database for 140 countries suggests a positive relationship between what the authors call *state expansion* (very close to a measure of state engagement in the economy) and associational densities for all four of the association types they analyzed (social/political, trade, professional, cultural).

Some discrepancies in these findings may be explained by the set of countries selected in each case. Since it is fairly well known that liberal democratic (mostly Anglo) countries have smaller welfare states yet high levels of civic engagement, one might expect a positive correlation between state activity and voluntary engagement within continental Europe. However, there might actually be a curvilinear relationship (hence no correlation or even a negative correlation) due to certain datasets containing a wider array of countries.

Generally, the crowding out thesis is not consistently supported and is often refuted in empirical cross-national investigations.

An important emerging finding on the effects of state welfare provisions is that there are interaction effects among welfare expenditure and other variables. Specifically, increases in state welfare expenditure are associated with increases in the civic engagement among those with low levels of income or education, while the increases are shallower (or even slight decreases) for those who are better off. There is, in other words, greater *participatory inequality* among those countries with lower levels of state welfare expenditure. Van der Meer (2009) reports this interaction for three types of associations: leisure, interest (e.g., trade unions, professional, consumer), and activist. His work used a sample that consisted of European countries only and did not have voluntary engagement with *social service*–type associations as a dependent variable, the area where one might most expect a negative impact. It might thus still be the case that, in some limited areas, *crowding out* occurs.

(c) Ethnic/racial heterogeneity

Another major area of investigation for multilevel modelers is that of the impact of ethnic heterogeneity on voluntary engagement. The impetus for much of this work probably comes from Putnam (2007), who argued that diversity might reduce both bridging and bonding social capital (interaction and engagement with dissimilar and similar others, respectively). As Anderson and Paskevicuite (2006:785) note, the view that people are less engaged in a social system with heterogeneous populations is pervasive. Much of the work on the impact of ethnic and, especially, racial heterogeneity, has been done at the sub-national level, comparing neighborhoods and cities, where arguably processes of in-group/out-group comparison are more likely to operate. Entire countries might have large minority populations, but if these are geographically segregated to particular regions, it is not clear that *heterogeneity* matters in the same way that it does within cities and neighborhoods. Ethnic heterogeneity is also sometimes measured as the proportion of the population consisting of immigrants, which may be a more suitable measure of *diversity* (see Kesler and Bloemraad 2010:338).

Findings concerning a heterogeneity effect at the national have been mixed. Based on 44 countries, Anderson and Paskevicuite (2006) find that neither linguistic nor ethnic diversity affect membership levels in 21 established democracies, but that linguistic heterogeneity has a *positive* effect in less democratic countries. Based on 28 European countries, Gesthuizen, van der Meer, and Scheepers (2009) find no significant effect for *ethnic fractionalization*. But they do find some positive effects for *migrant stock* (number of people born outside the country) and for *net migration* (average over a number of years) on both memberships and participation in voluntary associations. However, all of

these effects with the exception of the effect of migrant stock on memberships become non-significant when additional controls for inequality, social welfare expenditure, wealth, and democratic history are introduced. Many of the country-level variables are moderately to highly correlated, so it is reasonable to expect that it would be difficult to separate some of the effects being tested in this model with the additional controls.[7] Studying the size of the immigrant population, Kesler and Bloemraad report a positive effect for a "percentage foreign-born" variable (2010:334).[8] Based on the paucity of studies, evidence is lacking to confirm or to disconfirm the claim that heterogeneity is bad for civic engagement. However, much of the additional research activity on this question has occurred *within* countries involving comparisons across cities and other substate political units, as discussed below.

(d) Economic development

The idea that beyond individual levels of wealth (as measured by personal or family income), the aggregate wealth level of a country will have an effect on voluntary engagement is commonly found as implicit in models which include some measure of gross domestic product as a *level-2* variable in the analysis. Conceptually, we might expect this variable to be much more important in analyses that include less developed countries than in analyses consisting entirely of advanced Western economies.

Tests of the importance of economic development measures have generally suggested a positive association between GDP and volunteering, though in some cases no significant effect is observed with other level-2 variables in models. Gesthuizen, van der Meer, and Scheepers (2008:627), Stadelman-Steffin (2011), and Zhou (2012) all found a positive relationship in all or most models. In a different investigation, Gesthuizen, van der Meer, and Scheepers obtained conditionally positive results (2009: Table 4), where they observed a positive relationship for participation but not for simple memberships. Similarly, van der Meer (2009) found a positive effect, but only for one of three types of associations (activist organizations). Kesler and Bloemraad (2010) as well as Lim and MacGregor (2012) observed an absence of significant relationships. Of these two, the Lim and MacGregor study had the most statistical power because they included 138 countries. As with some other analyses, though, they used *gross national income per capita* rather than a logged version of this variable, which may have been more appropriate, given the range of levels of economic development across countries.[9] Finally, in Schofer and Longhofer's (2011) analysis of aggregated data in panel form, the log of national wealth had a positive effect in most of the models reported across different association types. They include separate analyses for low-GDP countries, but focus on association prevalence rates (see Handbook Chapter 50), as contrasted with volunteering rates for territories. Smith and Shen (2002) earlier had found similar GDP results in OLS

regression analyses for many larger nations. One slight issue in the literature is that variations in currency exchange rates may imply that a particular country's reported GDP, translated to US dollars, accurately reflects living costs. Van der Meer (2009) reports that the measures used in his analysis corrected for price differences.

(e) Democracy

In the literature on volunteerism, *democracy* is measured in two basic ways: through years of continuous democracy in a polity and through some index of democracy (such as that found in Bollen 1998, which entails items such as the degree of press freedom, and whether elections are contested) to reference the extent of *democracy* in a country. A democratic and open society seems to bear an obvious relationship to associational engagement, but this may not apply to all forms of voluntary association engagement. Empirical findings have pointed to either a positive relationship (Gesthuizen, van der Meer, and Scheepers 2009; Gesthuizen, van der Meer, and Scheepers 2008; Hank 2011; Schofer and Longhofer 2011; Smith and Shen 2002), non-significant results (Anderson and Paskeviciute 2006; Lim and MacGregor 2012), or positive results for some types of associational activities but no results for others (Baer 2007). One might even expect a certain amount of *organizational displacement* in non-democratic or less democratic polities, as some types of civic engagement are negatively sanctioned, whereas others (such as leisure) do not face such sanctions. Yet, *years of democracy* have a reported positive effect within Europe (van der Meer 2009: Table 3.4) and in the world more generally (Smith and Shen 2002)

To be sure, there is a small literature surrounding one particular transition to democracy – that of Eastern Europe. Here, the argument is that years of communist government, in which *voluntary* associations were associated in the public mind with political repression, have left a populace with a very cynical orientation toward civil society organizations – at least in the case of those older members of these societies. Indeed, Fidrmuc and Gërxhani (2008: Table 8) report a strong negative effect of former East bloc status, seeming to confirm claims regarding the hollowed-out nature of East European civil society, even decades after the fall of the Iron Curtain (Howard 2002, 2003; Kuti 2004). In some exploratory analyses, Ruiter and Baer (2007) modeled the cohort-related effects of "number of years under communist rule" and found that these effects were negative and statistically significant. However, Fidrmuc and Gërxhani (2008: Table 9) present a final table in their analysis of European countries where the *new member* variable (representing former East bloc countries) is significant and *positive* controlling for GDP per capita, inequality, a measure of *non-corruption* and a measure of *economic freedom*. The authors conclude, "the East-West gap can perhaps be attributed largely to the different levels of economic development attained by old and new member countries"

(2008:282). But this unexpected positive finding goes beyond that and remains without a satisfying explanation.[10]

(f) Social inequality

As with ethnic diversity, social inequality may work at different levels, given that within-country variability (across cities, across regions) may well be fairly large in many countries. At the level of cross-national analysis, in one of the few studies where some measure of inequality is included in the analysis, scholars usually observe a negative effect (Gesthuizen, van der Meer, and Scheepers 2009; Gesthuizen, van der Meer, and Scheepers 2008).[11] As Kesler and Bloemraad (2010) note, inequality can undermine a sense of shared fate or solidarity, destroy the positive dispositions leading to trust and civic engagement and amplify out-group threat which makes interaction more difficult for all but a handful or organization types. These authors ask the question of whether the effect of immigration might vary across types of societies. They first distinguish between what one might call immigrant friendly (not their terminology) or *multiculturalist* societies and those that are not, based on the presence/absence of various policy measures. In *unequal* societies that are *non-multiculturalist*, the impact of immigration is negative: as the percentage of foreign- born goes up, organizational membership rates are expected to decline. This effect is abated if the society is multiculturalist to the point that an increase in the percentage foreign born has no effect. In more egalitarian societies, the impact of immigration is consistently positive, but much more so if the society is also multiculturalist.

(g) Religious tradition and religiosity

In addition to an individual's own religious identity, national religious context also influences level of voluntary association participation. In a study of voluntary association participation in 33 countries, Curtis, Baer, and Grabb (2001) found that volunteerism tends to be high in nations that have multi-denominational Christian or predominantly Protestant religious compositions. The observation that Protestant societies or *mixed Protestant/non-Protestant* societies have higher levels of voluntary engagement fits cases such as the United States, Canada, the Nordic countries, and the Netherlands, that all fit this pattern (Dekker and Van den Broek 2006). Hodgkinson (2003), citing the case of the Philippines (Catholic, poor, but high engagement) warns us that we might not always find consistent explanations. The conceptual claim with respect to Protestantism is that Protestant churches have what Lam (2006:178), following Lenski, describes as "extra familial orientations" that "encourage ... participation in associational activities" as opposed to Catholicism which stresses family relationships.

Where religion is entered into multilevel models, it is not always included alongside a consistent set of context variables allowing for easy comparisons.

At the individual level, religiosity, usually measured as frequency of church attendance, is strongly correlated with voluntary association engagement, even when associations that are religious in nature are excluded (Bekkers and Theo 2008; Lam 2002; Paik and Navarre-Jackson 2011; Ruiter and De Graaf 2006; van Ingen and Dekker 2011; van Tienen et al. 2011). Lam (2006) explores the possibility that there may be *additional* context effects using 29 countries from the 1990 World Values Study dataset. Living in a Catholic country predicts much lower membership probabilities (over and above a slight but significant difference between the expected probabilities of Protestants and Catholics at the individual level), as does living in a country with *Other* (non-Protestant) as the dominant religion. Reconceptualizing the model to include *percent Protestant* instead of dummy variables for *Catholic* and *Other* countries (with Protestant as the reference) yields the same finding.

While individual religiosity predicts more volunteerism, individuals in more devout countries – whether religious themselves or not – are more prone to join associations and to volunteer (Ruiter and De Graaf 2006). There is also an interaction effect: the impact of church attendance goes *down* in countries that are more devout. That is, church attendance matters more in countries where fewer people go to church. Volunteering is low, as we might expect, for individuals who do not go to church themselves in countries that are secular or even average in religiosity. But in religious countries, everyone, including the non-churchgoer, is more likely to be engaged. This is referred to as a *network spillover* effect. Lim and MacGregor (2012) criticize this finding on the grounds that their data (with a dataset using 138 countries as opposed to 53) gives, if anything, opposite results. They find that country-level church attendance has a negative effect on the predicted probability of volunteering among non-churchgoers. In addition, these authors find a curvilinear relation between country-level religiosity and volunteering, the latter being higher among both secular countries and the highly religious ones. Prouteau and Sardinha (2015) show that, in the European Union, the relation between country-level religiosity and volunteering is significantly negative. This result still holds when two outliers are removed, except for advocacy volunteering. The discrepancy between datasets could be a function of different processes in more developed countries (more represented in the 53 nation analysis) as opposed to less developed countries (proportionately higher in the representation of data points in the 138 country analysis). The findings in the larger sample may be more reflective of processes in non-Christian countries.[12]

(h) Cultural values

Using Hofstede's (2001) delineation of major cultural value dimensions on which societies may differ, Luria, Cnaan, and Boehm (2015) studied five such cultural value dimensions in 66 countries in relation to pro-social behavior.

They found greater pro-social behavior on average in countries higher on individualism (vs. collectivism), but lower on power distance, uncertainty avoidance, and future orientation. There were also variations in pro-social behavior by cultural value dimensions for specific types of pro-social behavior.

(i) Trust

Glanville, Paxton, and Wang (2016) performed a multi-level analysis using the European Social Survey data on 19 nations, with 30,000 respondents in 160 regions. Results showed that regional level trust was associated with more volunteering, and this effect was stronger when social ties were combined with trust in explaining volunteering. Effects on informal volunteering were weaker.

2. Community effects

Communities in which individuals reside form another type of macro-context that has been subject to investigation by multilevel modelers. Whereas earlier community case study models might typically attempt to compare a small handful of cities on the basis of variability in some key attribute, multilevel studies typically work with large numbers of cities or neighborhoods – usually in the hundreds, seeking to investigate many of the issues discussed above (ethnic/racial heterogeneity, income inequality, religiosity/religious tradition, etc.) along with some new ones (e.g., city size, degree of urbanization, city population stability, and wealth). By far, the majority of investigations have involved American cities or neighborhoods, but research has also been conducted in Belgium, Canada, the Netherlands, and other countries.

(a) Inequality

Findings regarding the effect of inequality in community studies are mixed. In the Hooghe and Botterman (2012) investigation, it is not statistically significant, but this may be a function of the small number of cities in the study. Alesina and La Ferrara (2000) report negative effects of community-level inequality (controlling for median household income, community size, and ethnic/racial heterogeneity) on voluntary participation. Negative findings have also been observed in studies with fairly small groups of cities in Belgium and the United States in models without controls for other community-level variables (Hooghe and Botterman 2012; Rotolo 2000). In a very large-sample study with over a million respondents and 1,076 US counties, Lim and MacGregor (2012) use the percentage of the population households in poverty as a measure that is similar, but not identical, to the inequality measures employed elsewhere. Controlling for religious attendance, they observe a negative effect. But when they break down the sample separately into non-churchgoer, occasional churchgoer, and weekly churchgoer categories, the poverty measure is non-significant in each.

In a Canadian study, Duncan (2010) finds no significant income inequality effect in itself: on average, unequal neighborhoods are no different than those that have income equality across the neighborhood. However, he does find an *interaction* between income and inequality for a 0/1 member/non-member variable, and no interaction when the dependent variable is the count of membership types. With positive coefficients for inequality and for income but a negative interaction coefficient, the implication is that income differences in memberships are smaller in unequal neighborhoods (the rich are less likely to be members, but the poor are more likely, in each case in relation to someone with the same income living in a more *equal* (income homogenous) neighborhood). A few non-multilevel studies show an absence of an overall inequality effect (Coffé and Geys 2006; Costa and Kahn 2003).

Inequality effects are not consistent. But when they occur, the relationship is negative. Unfortunately, most within-country studies – whether multilevel or otherwise – have not incorporated any measure of community inequality in the analysis.

(b) Ethnic/racial heterogeneity

Overall, most research involving ethnic heterogeneity or racial heterogeneity leads to the conclusion that these have negative consequences for cities or neighborhoods within a country relative to civic engagement and volunteerism. An early multilevel study published by Alesina and La Ferrara (2000), using US Metropolitan Statistical Areas and larger population PMSAs (areas containing cities with populations of at least 50,000), found negative effects for race heterogeneity and ethnic heterogeneity (in separate models), even with controls for inequality (which itself predicted negative effects). More recently, Rotolo and Wilson (2014) used multilevel models to assess the impact of social heterogeneity on volunteering in 248 US cities, with data on nearly 200,000 respondents. They found (p. 429)

> the predicted negative effect of social heterogeneity on volunteering. However, the effects vary by volunteering type. Race heterogeneity is negatively related only to secular volunteering, racial segregation is negatively related to both general volunteering and secular volunteering, and income inequality is negatively related to all types of volunteering.

Hooghe and Botterman (2012) conducted their study in Belgium with a fairly small level-2 sample of 40 communities. They used two different measures of heterogeneity in a set of models that entered community-level variables one at a time because of this small level-2 N. Relatively few demographic variables exhibited statistical significance. However, one heterogeneity variable – the

percentage of non-Belgian foreigners in the community – did have a significant negative effect on active memberships but not on passive memberships. In Canada, Andersen and Milligan (2011) report no significant effect of the percentage of immigrants in a community[13] without aggregate-level controls, but they find it exhibits a *positive* effect when community racial heterogeneity (itself exhibiting a negative effect) is included in the model. Their analysis was restricted to association *memberships* and did not consider volunteering or active memberships separately.

Some studies not using multilevel methodology report negative relationships between community heterogeneity and volunteering or voluntary association activity (Coffé and Geys 2006; Putnam 2007[14]). Putnam refers to this relationship as *hunkering down* (2007:155, 157, *et passim).* Costa and Kahn (2003) report mixed results when using fragmentation at the respondent's birthplace and racial fragmentation (present location) in the same model, with inequality (measured by a GINI coefficient) as a control variable. Using data from two surveys with volunteering as the dependent variable, birthplace fragmentation has a significant negative impact in one survey but not in the other. At the same time, racial fragmentation is significant in a different survey but not in the same survey where birthplace fragmentation is significant. They observe no significant effects for memberships when using two different surveys (except for a p<.10 finding with respect to the negative impact of racial fragmentation on membership in one survey for the period 1952–1972). In yet another study using aggregated date only, Coffé and Geys' investigation of 307 Belgian cities finds that *diversity in nationalities* in a city has a negative effect on a social capital index, one of the components of which is the number of associations in the community (the others are voter turnout and crime rate per capita) (2006).

The one problem with findings claiming a *constriction* or *hunkering down* effect is that studies typically do not take into consideration an alternative explanation: volunteering rates might be lower in cities and/or neighborhoods with large numbers of immigrants not because of the immigrant proportion per se, but because these cities lack residential stability. Stated in other terms, any level of in-migration (and, to a lesser extent, out-migration) may have a negative impact on the stability of a community, whether it is from a majority ethnic group (keeping the community homogeneous, but unstable) or from a minority or immigrant group. In other words, if one were to control for residential stability when assessing the effect of heterogeneity, one might find that there are no independent heterogeneity effects and that the uncontrolled findings are an artifact of this third variable. Hooghe and Botterman's own findings (2012: Table 4) suggest that population mobility has a suppressing effect in its own right. Unfortunately, perhaps because of small Ns, the latter is not taken into account.

Swindell and Tai (2014) used their unique dataset of 224 US urban counties to conduct a county-level analysis of several common hypotheses about volunteerism derived from individual-level studies. Unlike previous studies, however, their models include measures of ethnic heterogeneity, as well as measures of the percent foreign-born population and the number of recent residential movers. Even controlling for foreign-born population and residential stability, heterogeneity exhibits a significant negative relationship with county-level volunteerism and with number of weeks in which volunteering occurs, though no relationship with the aggregate number of volunteer hours.

(c) Immigrant civic engagement

The Swindell and Tai (2014) county-level study included an array of socio-economic and demographic characteristics in trying to isolate the effect of ethnic heterogeneity. One of the context variables in the models was the percentage of foreign-born living in the neighborhood. While this measure did not capture the length of time foreign-born residents had been in the county (i.e., a county-level average length of time in place), the inclusion of foreign-born along with heterogeneity tries to disentangle the effects of the two concepts. Their results suggest that more foreign-born residents in a county is associated with lower levels of volunteerism on all four measures of volunteerism they modeled (and was more pronounced than the negative influence of heterogeneity).

The study of voluntary association engagement *among* immigrants, as opposed to the effect of diversity on the entire population, is fairly new. Using the neighborhood as the contextual unit, Tong (2010) examined factors predicting both adolescent volunteering and subsequent adult volunteering among immigrants. Immigrants living in higher-income neighborhoods volunteered much more as adolescents. When the respondents were divided into poor and rich neighborhoods, there was an interaction between the proportion of foreign-born in the neighborhood and the duration of migration (length of time the respondent had been in the country). While one might normally expect people who had been in the country longer to volunteer more, in poor neighborhoods migration duration had no significant effect. In wealthy neighborhoods, it was conditional upon the percentage of foreign born in the neighborhood: in neighborhoods with low proportions of foreign-born residents, being in the country longer meant a greater propensity to volunteer. But in neighborhoods with very high proportions of foreign-born residents (especially over about 32%), the reverse was true, with people in the country for longer periods of time actually volunteering *less* (Tong 2010:134). Extending the analysis to the same respondents in early adulthood, the distinction between poor and wealthy neighborhoods varies. First, a similar pattern exists among adults in wealthy neighborhoods. But in poor neighborhoods, as the

number of foreign-born residents in a neighborhood increases, the length of time one has been in the country matters more (in a positive direction).

Baer (2008) conducted another context study investigating the impact of the size of immigrant communities on volunteering, meeting attendance, and number of memberships among immigrants in 140 Canadian cities. Mostly, the presence of a large as opposed to a small immigrant group (measured by relative group density as opposed to absolute numbers) made no difference for many immigrant groups. However, it did have a negative impact on some groups, most notably immigrants from Great Britain, France, and Poland. Rather than providing a springboard for more voluntary engagement through immigrant group-specific organizations, the presence of large numbers of same-origin fellow immigrants in the community suppressed civic engagement. But the opposite was true for Chinese immigrants: for meeting and association activity, and for numbers of memberships, having a *larger* community of Chinese immigrants was an important predictor of greater associational involvement. Findings such as this, though, do not speak to the mechanisms or pathways to civic engagement and suggest a need for more group-focused research using a variety of methods. Overall, the study of factors leading to immigrant civic engagement is important in countries such as Canada where immigrant numbers are high and where the successful connection between immigrants and their communities is deemed to be important.

(d) Other effects

Many of the other social context variables that have been considered tend to appear only in single studies rather than having been replicated in analyses using different samples in different countries. Population density or the percentage of the population in an area defined as *urban* as opposed to *rural* have negative effects where any effects are observed (Freitag 2006; Lim and MacGregor 2012; Oliver 2000), though some results are non-significant and thus inconclusive (Hooghe and Botterman 2012).[15] With or without controls for other aggregate factors, city size has negative consequences in some studies for some associational variables (Baer 2008; Coffé and Geys 2006; Oliver 2000; Rose 2002) but not for others (Baer 2008; Rose 2002). Furthermore, in some cases involving both multilevel studies (Alesina and La Ferrara 2000) and single-level studies (Baglioni et al. 2007; Hooghe and Botterman 2012; Swindell and Tai 2014) there is no clear pattern. Coffé and Geys (2006) suggest that some of the effects of population size may be accounted for by population stability/instability or residential mobility, leading to a question that remains open for further investigation.

The study of the impact of religious heterogeneity or differences in religiosity across cities or regions within countries is not as well developed as it has been in the case of between-country analyses. One extensive investigation by

Lim and MacGregor (2012) suggests that, at least in the United States, the proportion of mainline Protestants often has a positive effect, the proportion of evangelical Protestants has a negative effect, and overall (aggregate) levels of religious attendance have, if anything, a negative impact, net of the (usually positive) impact of religious service attendance at the individual level.

Studying 141 municipalities in Belgium with multilevel regressions on 67,144 older respondents, Dury, Willems, De Witte, De Donder, Buffel, and Verté (2016) found greater FV among in communities with greater neighborhood connectedness, neighborhood satisfaction, home ownership, and local services.

Gesthuizen and Scheepers (2012) performed one of the most important multilevel studies in its theoretical implications. Using data from 17 nations (mostly Anglo and western European), they had an extensive and cross-nationally comparable measure of cognitive competence or general intelligence, as well as data on education, formal volunteering (FV), and other factors. They showed that country differences in the proportion of higher educated people affected FV, controlling individual level education and cognitive competence, among other factors. Most importantly, they showed that cognitive competence accounted for much of the effect of formal education on FV, which has never been done before with such methodological sophistication.

3. Methodological concerns

The popularity of multilevel models may have overshadowed other important issues in the examination of context factors, as investigations are often shaped by the statistical tools available. The push toward multi-level modeling has possibly distracted researchers and pulled them away from spending more time examining how processes work differently for different *types* of organizations (see Handbook Chapter 3). To be sure, the multilevel literature includes some investigators who make distinctions, but there has been little work to examine which distinctions work best or how patterns of associational involvement relate to each other (e.g., do sports volunteers also tend to volunteer for community associations, or is there no connection?). Multilevel models also have their own particular methodological issues.

A first issue that one can see especially in cross-national studies is the problem of small numbers of *level 2* cases. Some cross-national studies discussed here have had as few as 20 nations. When this happens, the capacity of the model to disentangle the effects of different context variables is limited, especially if these are any more than very modestly correlated with each other. Far too often, there is a tendency for multilevel modelers to include far too many intercorrelated context variables into their models and emerge, not unsurprisingly, with few variables appearing to have any effect at all. The alternative, while not conceptually satisfying, is to enter these variables *one at a time* or perhaps in small numbers, as did Hooghe and Botteman (2012). At the very least,

investigators must choose regressors/predictors that are not too highly correlated, giving up on the desire to discern separate effects among variables that are conceptually similar, while not being identical.

The reverse, though, is also a problem. Lim and MacGregor (2012) correctly note that with 138 countries in their analysis, they have more statistical power than researchers with "small level-2 N" studies. But this comes at a price: when multilevel modelers extended their world beyond processes operating in European and advanced industrial countries, results became more difficult to sort out as a function of varying measurement reliabilities, questionnaire interpretations, fundamental differences in processes across widely divergent types of societies, and scaling issues with variables that have widely different scores in different societies.

The problem of small numbers of aggregated units is usually less a problem with city studies than with country studies, though Rotolo (2000) conducted an analysis with only ten cities, which is far less than the minimum 30 count sometimes suggested by multilevel modelers. With small numbers at this level comes the great likelihood that a small handful of cases will be unduly influential, which was the concern of the debate between van der Meer, Grotenhuis, and Pelzer (2010) and Ruiter and de Graaf (2010) concerning the latter's findings. Few multilevel modelers employ residual diagnostics (which are more difficult to obtain in some software packages than others), but all would be well advised to read van der Meer et al.'s comments carefully. Identifying outliers can lead to more nuanced analyses that pay attention not only to the possibility of *rogue data*[16] but also to the possibility that, due to a confluence of historically unique circumstances, a particular country may not *belong* in a model, or at the very least, would require the identification of hitherto unrecognized variables to be adequately *explained*.

Another problem, though not unique to multilevel modeling, is the inclusion of inappropriate or causally inconsequential variables, usually at the individual level. In some fields of study, some modelers may be under the impression that *more is better*, and the study of volunteering is no exception. Duncan (2010) includes *sense of belonging* as a predictor, but leaves the reader asking, "What does it mean to talk about voluntary engagement *net* of that which is predicted by sense of belonging?" There may well be a causal relationship between the variables, but the direction of causality is not self-evident in the direction implied by the regression model. Furthermore, in many cases, researchers may want to assess the *total effects* of context variables, so the inclusion of intervening variables makes no sense.

In general, one might argue that attitude variables do not make sense as independent variables in models predicting volunteering, unless these are lagged variables in a panel design. This includes post-materialist value items (Schofer and Fourcade-Gourinchas 2001), left party support (Freitag 2006), and

feelings of responsibility, income satisfaction and trust in others (Gelissen, van Oorschot, and Finsveen 2012). The inclusion of trust as an individual-level predictor is potentially problematic because of the presumed strong association between trust and voluntary engagement in the social capital literature (thought the extent of this is a matter for empirical investigation).

However, given evidence of the stability of general attitudes over years, examining the correlations of attitudes with volunteering can at least be suggestive (see Handbook Chapters 30 and 31). Further, since attitude predictors play an important role in predicting volunteering, it is unlikely that such measures are totally spurious (cf. Smith 2015, 2016). Random or spurious attitude data would not produce such strong multivariate regression results.

Religious involvement (religiosity) might conceivably fall into the same category as a variable that does not belong on the "X" (independent variable) side of equations, though this notion might be challenged by some multilevel modelers in the field. What if, though, one conceptualizes going to church as yet another form of voluntary association meeting attendance? Why the *special status* for religious engagement? Why would we say that religious service attendance is causally prior to, say, working for a community association in the way that we would not say that working for a community association might lead to running for politics or working for a political party, or that working for a community association might lead, in the opposite direction, to religious attendance? The message here is that including religiosity as an independent variable is likely to reduce the variance that can be explained by other factors; *volunteering net of religiosity* is not the same as *total volunteering*. More advanced simultaneous equation models allowing causation to flow in both directions through feedback mechanisms or time series studies may be necessary to resolve these questions.

E. Usable knowledge

Most of the macro-context research-based conclusions reviewed here are of little use to most association and volunteer service program (VSP) leaders, managers, and administrators. First, macro-context findings are more mixed than other predictors, and thus less conclusive, about what to do in practice. Second, leaders' particular associations or VSPs are located in some specific macro-context and are not likely to be moved. Third, many of the macro factors are more difficult to change with policy or programmatic interventions. However, macro-level leaders/policy makers at state/province or national levels considering the formation of new polymorphic association branches can find useful facts here to guide such decisions according to macro-context probabilities of positive effects on association or even VSP formation and survival rates.

F. Future trends and needed research

Future research on macro-contextual predictors of volunteering will likely continue to increase, as has been the trend in recent decades. The words *social context* have become an accepted part of the research lexicon in the social sciences. Many major journals now seem to be reluctant to publish cross-national or comparative community studies without the statistical approach that has opened the door for a variety of sophisticated researchers exploring questions left unanswered a decade ago because scholars were not sure how to go about studying them. This chapter highlights some tentative findings, though these have hardly endured the validation through replication that has previously emerged with individual-level studies of volunteering. Ethnic heterogeneity has negative consequences – in most studies in most contexts. Income inequality is bad for volunteering – at least when comparing countries. Levels of economic development predict voluntary association engagement – up to a point and with certain countries and when one does not factor in some competing variables.

Almost all of the research on social context effects thus far has concentrated on the effects of geography, that is, of geographically contiguous areas or territories, usually defined by political boundaries (the nation or the city). A next logical step for multilevel modelers would be to extend analyses to social units other than those defined geographically, such as occupations or immigrant group characteristics (including country-of-origin characteristics, possibly varying by time of immigration). A small step in this direction can be found in the work of Dill (2009), who examined school effects on later-life adult volunteering. Another positive step is found in Harlow-Rosentraub, Wilson, and Swindell's evaluation study of 1,500 participants in the Legacy Corps for Health and Independent Living program (2011). They found that attracting and involving Baby Boomers into voluntary activities supporting critical community needs lead to sustained increases in volunteerism and joining behavior among participants for several years after completion of the program. Such research moves into *meso*-context effects, as reviewed in Handbook Chapter 27.

Another future direction to take is examining the relative contribution of different contextual levels. This is probably most critical in determining whether, for *community effects*, it is the neighborhood, the city, or the larger region (e.g., country, canton, county/district, and metropolitan area) that matters most. But one can also ask the question of whether community effects differ systematically across countries. For this sort of analysis, more complex three-level or even four-level models with very large samples would be required. A final suggested direction for future research would involve the marriage of multiple-indicator modeling (e.g., *latent class models*) with multilevel modeling so that simple yes/no measures of association membership or volunteering or simple

counts of the number of associations respondents are engaged in are replaced with models which do not assume that all types of associations are equivalent. Even those researchers who group or cluster association types (e.g., *leisure* vs. *political*, or *old social movement* vs. *new social movement)* have tended to do so without any empirical investigation of the appropriateness of these groupings. More analytical typologies, as in Handbook Chapter 3, could be used. Methods are available to improve upon this, both in single-level and in multilevel modeling.

G. Cross-references

Chapters 27, 28, 45–51.

Notes

1. For income, where it is often the case that 20%–30% of respondents refuse to answer the question on many surveys, some researchers simply drop cases (e.g., Anderson and Paskeviciute 2006), while others use imputation techniques which will reduce bias or at least provide better estimates of how variable results might be. Age is often employed as a categorical variable or as a *quadratic* to account for the curvilinear relationship with volunteering, in which volunteering typically *peaks* in the 50–60 age range.
2. Japan is an exception; as a country in the *liberal democratic* category such as the United States, its low rates of civic engagement are not well explained. The typology does not include former East bloc European countries, but it is not uncommon for these to be assigned to a separate fourth category (see Curtis, Baer, and Grabb 2001).
3. This clustering of countries has some overlap with the more or less empirically derived clustering used by Mascherini, Vidoni, and Manca (2011), which separates Scandinavian (*northern*) countries from east and southern countries (called *eastern*) and these two from all the rest which are *borderline* and *possibly closer to the Northern group*.
4. Zhou's work did not involve multilevel modeling; rather, it examined aggregate membership data from the Yearbook of International Organizations in its investigation of INGO engagement.
5. This form of variable construction is not without problems in, for example, the provision of health services. A fully state-paid medical insurance scheme may or may not count in the calculation for those portions of the actual service provision that takes place in private doctors' offices. A measure that just involves state involvement in the economy, as opposed to state provision of social services, runs the danger of giving high numbers to countries with relatively large rates of military expenditure.
6. Oorschot and Arts (2005) do not employ multilevel models in their analysis.
7. The correlation between ethnic fractionalization and diversity was .541 and, more importantly, the correlation between wealth and net migration was .759. These correlations might not be excessive in large N models, but with only 28 effective cases at level 2, it means that it is difficult to *tease out* effects with many variables in the model. This issue in multilevel modeling will be discussed below.

8. Whether a society is *multiculturalist* in policy orientation or not also matters, but in a complex way involving differences in social inequality; these will be discussed below.

9. Across the literature, authors exhibit inconsistency in checking the functional form of the GDP/volunteering relationship. Still, one would expect that if effects are really strong, they will appear regardless of the functional form chosen.

10. It is possible that the finding is an artifact of highly correlated aggregate variables measuring substantively similar constructs.

11. Oorschot and Arts (2005) report the *opposite* effect, but do not use the more appropriate mixed model methodology and control for welfare state variables which might be said to constitute social inequality.

12. There is also an exchange between van der Meer, Grotenhuis, and Pelzer (2010) and Ruiter and De Graaf (2010) regarding the status of three influential cases in the original analysis, in which the latter argue that findings are, in fact, robust across the appropriate treatment of these three cases.

13. Community was defined using Census units which come closer to defining neighborhoods than cities, though in the case of smaller cities and towns, the two would be coincident.

14. Putnam's main emphasis was on *trust* as a key element of *social capital*, but he also alludes to findings regarding volunteering and civic engagement (2007:150, footnotes 21 and 22). While the reported analysis was not multilevel, notes suggest that additional analyses using multi-level models yielded similar results.

15. The Hooghe and Botterman findings from Belgium are more limited than the Lim and MacGregor findings from the United States, though, because of the limitations of using aggregate-only data.

16. For example, in one WVS wave, half the Spanish cases corresponding to one but not both agencies collecting data are missing across some but not all of the types of voluntary associations but coded in such a way that they would not be picked up by missing data flags, leading to lower than correct estimates of volunteering in a country with numbers which were already fairly low if the data were used *as is* by most stats packages.

Conducive Meso- and Micro-Contexts Influencing Volunteering

Rebecca Nesbit (USA), Alisa Moldavanova (Ukraine), Carlos E. Cavalcante (Brazil), Veronique Jochum (Belgium), Lin NIE (Hong Kong, China), and Savaş Z. Şahin (Turkey)

A. Introduction

This chapter reviews how interpersonal influences, institutional influences, the volunteer experience, life events, and practical considerations affect starting or stopping formal volunteering. Interpersonal exchanges and relationships affect volunteering by providing an opportunity for people to be asked to volunteer, by providing an incentive to volunteer for organizations that benefit a friend or family member, by providing emotional and practical support for volunteering, and by socializing people into the volunteer role. Institutions directly influence volunteering by actively sponsoring or facilitating participants' volunteering, socializing people to volunteer, and providing individuals with the skills and resources necessary for volunteering.

Volunteers' experiences with their host organization shape their commitment to and reduce withdrawal from the organization. These kinds of micro- and meso-context influences were often ignored until the last couple of decades. Social psychology researchers note that situational factors affect human behavior, often more than dispositional factors (Zimbardo 2007). In this chapter, we discuss research pertaining to the effect of situational influences on formal volunteering.

B. Definitions

We begin our discussion with definitions of terms relevant to this chapter, accepting the general set of definitions in the Handbook Appendix.

Micro-contexts: the setting and characteristics of interpersonal relationships; situations involving dyadic interpersonal exchanges.

Meso-contexts: setting and characteristics of institutionally bounded relationships; situations involving exchanges between a person and an institution, organization, group, or others embedded within an institution.

Situational variables: characteristics of dyadic interpersonal exchanges; characteristics of the institutions, organizations, or groups where interpersonal exchanges are embedded; other events, experiences, or contexts that affect an individual's perception of the desirability of or limitations on volunteering.

Institutions: the set of rules and norms that govern groups of people; institutions can include formal organizations, informal associations, or groups of people that regularly interact and have their own informal norms or formal rules that govern their actions within the group. For the purposes of this chapter, institutional-level influences are synonymous with meso-level contextual factors.

C. Historical background

Research exploring situational variables' influence on the decision to join or participate in membership associations (MAs) first appeared in the late 1960s and early 1970s (see Booth and Babchuk 1969; Smith 1975; Smith and Baldwin 1975), actively calling attention to gaps in our understanding of the relationship between situational influences and associational volunteering (Heshka 1983; Smith 1975; Smith and Reddy 1972). Since that time, scholars have increased the breadth of situational variables considered, but research still fails to illuminate a deep comprehension of the mechanisms by which situational variables influence volunteering and the factors that condition people's responses to situational influences.

D. Key issues

The main issues covered in this chapter include interpersonal influences, institutional influences, the volunteer experience, life events, and practical considerations. We conclude this section with a discussion of the relative strength of these influences among themselves and in comparison to other influences described elsewhere in the Handbook. For each issue, we briefly review research from North America and Western Europe, and we also highlight key research from other world regions where it is applicable.

1. Interpersonal influences: The micro situations

Interpersonal interactions strongly influence an individual's choice to commence or continue volunteering. This effect occurs through several mechanisms – both direct and indirect. First, through interpersonal interactions people can be asked to volunteer or learn about volunteer opportunities.

Second, and closely related to the first point, interpersonal interactions open the doorway for involvement in organizations that benefit a family member or friend. Third, interpersonal relationships often provide emotional and practical support necessary for sustained volunteering. Fourth, interpersonal relationships socialize people by shaping their attitudes, personality traits, motivations to volunteer, and personal resources. We briefly review some of the empirical research related to these four mechanisms by which interpersonal influences affect volunteering choices. In this review, we include research pertaining to a wide range of relationships, including both kinship and non-kinship relationships.

(a) Being asked to volunteer

Many people need the jump-start of being asked to volunteer to propel them into volunteer work. Those asked to volunteer are four times more likely to volunteer than those who have not been asked (Bryant et al. 2003), even when controlling for socio-economic status and church attendance (Musick and Wilson 2008:290). This holds true outside of North America and Europe (e.g., Aravena 2004; Corcoba, Urrutia, and Espanés 2006; Smith 2015). People who are more socially integrated and belong to dominant status groups (middle class, married people, racial majorities, those with children, those with more friends) are more likely to be recruited for volunteer work than those who are more socially isolated (singles, older people, minorities, or unemployed persons; Bryant et al. 2003; Musick and Wilson 2008:291). This is likely due to the increased social ties, more organizational memberships, and more heterogeneous social networks that integrated and connected people enjoy (Musick and Wilson 2008; Wilson and Musick 1997a, 1998), which increase the chances that a person will be asked to volunteer.

People who tend to be less socially connected to mainstream society (unemployed, single, lower socio-economic status, minorities, the elderly) are not only less likely to be asked to volunteer, but they are also less likely to positively respond to an invitation to volunteer (Musick and Wilson 2008:295). In general, recruitment messages are more powerful and successful when they come from a person with whom one has a close relationship, such as family and friends, rather than a colleague or acquaintance (Paik and Navarre-Jackson 2010). But recruitment attempts from social superiors, such as a boss, or from fellow religious congregation members, also tend to be successful (Bekkers 2010; Musick and Wilson 2008:309–310). Being asked to volunteer is an important precursor for volunteering, but not all people are likely to be asked to volunteer and the source of the recruitment message also matters.

(b) Volunteering to benefit family members

Many people volunteer for organizations that their family members or friends are involved in or benefit from (Ministerio Secretaría General de Gobierno 2005;

Smith 1994). The classic example is when parents volunteer for organizations that their children are involved in or benefit from, such as schools, sports organizations, or youth groups (Musick and Wilson 2008). However, involvement triggered by children's participation in organizations often discontinues after the child is no longer involved with those organizations (Brodie et al. 2011). It should also be noted that the relationship between having children and volunteering is fairly complicated and depends on a host of other factors, such as the number of children, their ages, the parents' marital status, and the type of volunteer work (Musick and Wilson 2008; Wilson 2000). Families can be a prime source of volunteer labor for many organizations.

(c) Providing emotional and practical support

Volunteering requires practical, intellectual, and emotional resources – resources that can often be provided through a person's relationships. Volunteers cite practical resources such as good health, transportation, time and money as important conditions for volunteering (Brodie et al. 2011). It is sometimes feasible for another person to provide some of these resources. For instance, many parents in higher socio-economic classes deliberately facilitate their children's volunteering through providing transportation and financial support rather than encouraging their children to work in a part-time job (Brodie et al. 2011). Interpersonal exchanges also provide emotional support for volunteering. Some individuals cite a lack of confidence as a barrier to volunteering, particularly individuals who feel excluded in other areas of their lives (Davis-Smith et al. 2004). When someone is asked to volunteer, he or she can participate in a conversation about the volunteer work that might alleviate the potential volunteer's anxieties or uncertainties about volunteering by providing additional information about the volunteer role and the benefits of volunteering (McAdam and Paulsen 1993; Midlarsky and Kahana 1994). Such inputs by others can be particularly important when the person has little experience with volunteer work, when the work requires a larger time commitment or when it is risky (Rotolo and Berg 2010). In these instances, a person might have additional qualms that can be alleviated through a conversation with a trusted individual who has firsthand knowledge about volunteering or a particular organization or volunteer assignment. Being personally helped by a volunteer also increases the likelihood of volunteering (Chang 2007).

Interpersonal exchanges can have a negative effect on volunteering as well. One person's bad experience with volunteering can discourage another person from taking up the volunteer role. Or, a spouse, family member or friend, might be jealous of the volunteer's time and resent the amount of time the person spends volunteering, which can cause tensions in the relationship and a reduction of volunteer activity (Brodie et al. 2011:42). Family opposition can hinder volunteering (Shen et al. 2007). In Asian communities, traditional filial

principles discourage older family members from doing volunteer work because it reflects negatively on how the younger generations are caring for their elders (Chong 2010). An individual's relationships can affect his or her volunteer activity by providing (or reducing) resources for volunteering.

(d) Socialization effects

Finally, interpersonal relationships also shape people's motivations to volunteer and attitudes toward volunteering. For instance, when one spouse in a couple volunteers, then the other person is likely to volunteer as well (Musick and Wilson 2008). Parents also socialize their children to volunteer; many empirical studies demonstrate an intergenerational transfer of volunteering behaviors from parents to children, particularly from mothers to their children (Bekkers 2007, 2005; Mustillo, Wilson, and Lynch 2004; Smith and Baldwin 1975; Son and Wilson 2011; Suanet et al., 2009; Sundeen and Raskoff 1994; Wilhelm et al. 2008).

In fact, empirical evidence supports socialization effects in a variety of kin and non-kin relationships (McLellan and Youniss 2003). Families play a vital role in instilling a culture of volunteerism (Brodie et al. 2011); volunteers tend to have other volunteers in their families (Butcher 2010; Institute for Communication and Development 2009). A wide variety of kinship and non-kinship relationships affects how individuals are socialized to volunteer (or not).

It is also important to note here that culture matters. In many cultures, especially among recent immigrants, social ties tend to reinforce informal helping directed toward others in the cultural group rather than formal volunteering through an organization (Ecklund 2005). Volunteering may be an unknown concept. The philanthropic preferences of communities of color establish informal giving and helping behaviors as more desirable than formal volunteering through an organization (Davis-Smith et al. 2004). In the Middle East, women are volunteering at higher rates because they have been discriminated against in other venues and it is more socially acceptable for them to participate through volunteering (Daly 2010).

(e) Conditioning variables

Although empirical evidence about the four ways interpersonal relationships can affect volunteering is mounting, we need more research to investigate the effect of moderating, mediating, or intervening variables on the choice to volunteer (what we call conditioning variables). When investigating the impact of interpersonal relationships and exchanges on volunteering, important conditioning variables include characteristics of the relationship, such as the length of the relationship, closeness, amount of contact, relative power, legitimacy, salience, the visibility of each other's actions, degree of similarity, relative importance of the relationship, and the ability to control other's

actions. Other important conditioning variables can include the social background variables and personality and attitudinal variables discussed in other chapters of the Handbook.

2. Institutional/organizational influences: The meso-situations

Participation in various institutions directly and indirectly affects volunteering. Joiners tend to be volunteers – no matter their age (Liu and Besser 2003). Institutions directly influence volunteering through three channels: First, many institutions actively sponsor, arrange, facilitate or mandate volunteering among their participants. Second, institutional culture can support and sustain volunteering and socialize people to volunteer. Third, institution members can develop new skills, gain knowledge or increase other resources that facilitate their volunteer involvement. Institutions' indirect influence on volunteering pertains to the interpersonal interactions that take place within institutional boundaries. Because we discussed interpersonal influences in the previous section, we will focus this section on the three direct effects mentioned above. We note that most empirical studies' theory and data prohibit disentangling direct versus indirect institutional effects on volunteering, so we focus this brief review on empirical research that provides the most circumstantial evidence for direct effects. Our review looks at a broad range of institutions, but the bulk of the empirical research focuses on schools, religious congregations, places of employment, and membership associations.

(a) Arranging, facilitating, or mandating volunteering

Some institutions arrange, facilitate, or even mandate volunteering for institution members. The most well-known example is schools. During the past two decades schools have made more concerted efforts to get students to volunteer by arranging or requiring volunteering and service and often integrating those activities into the curriculum through service-learning (see Billig 2002). Studies show a positive relationship between schools encouraging and facilitating volunteering and the likelihood of students choosing to volunteer (Sundeen and Raskoff 1994). Mandatory volunteering requirements also yield positive effects on attitudes toward volunteering and volunteer work in later life, particularly for those students who would be unlikely to volunteer without a requirement (Metz and Youniss 2003). Aside from schools, many other types of institutions can facilitate volunteering. Many religious congregations or places of employment organize volunteer work for their members or respond to calls for volunteer groups to help other organizations (McBain 2007). Some religious congregations generate enormous amounts of volunteer labor to sustain the congregation (Lukka and Locke 2003). Chinese community centers play important roles in advocating for volunteers and arranging

volunteering opportunities (Li 2010). Corporations and other employers are also increasingly interested in arranging volunteering opportunities for their employees (Boccalandro 2009).

(b) Culture and socialization

Institutional/organizational culture can communicate that volunteering is acceptable and desirable. Some institutions, such as churches and schools, can actively teach or preach about the virtues of volunteering and being involved. Religious congregants tend to volunteer for both religious and secular organizations, irrespective of their social background (e.g., gender, race, age, and socio-economic status; Musick and Wilson 2008:279). Religious values are an effective mechanism for launching volunteering (Einolf 2011a). Religious denomination matters, however. Those involved in conservative Protestant denominations are less likely to volunteer for other organizations because most of members' voluntary efforts are directed at maintaining the congregation itself (Wilson and Janoski 1995). The type of religion also matters. In the Middle East, Islamic values around religious giving open the door for volunteering (Mason 2004; Montagu 2010), even the potential for more radical or extreme forms of voluntarism, such as suicide bombers (Lankford and Hakim 2011). Secular nonprofits in the Middle East even incorporate *da'va* – ways of doing things based on Islamic principles (Atia 2012). However, the fact that different religious organizations affect people's volunteering in different ways suggests a strong culture or socialization effect that different institutions might have upon volunteering.

Other institutions have an effect similar to religious congregations, such as places of employment. Public and nonprofit sector workers are more likely to volunteer than private sector employees or those who are self-employed (Wilson and Musick 1997b). This seems to indicate more acceptance and support of volunteering in these environments, possibly because of increased exposure to volunteers' societal contributions (Paylor 2011). People with higher-status occupations are more likely to volunteer than those with lower-status occupations, particularly women (Smith 1994; Wilson and Musick 1997a), possibly because volunteering helps them to move up the career ladder.

However, state-structured and forced volunteering in the communist era of many Central and Eastern European countries have decreased people's intrinsic motivations to volunteer and have created serious cultural skepticism about volunteer work (Kaminska 2010; Voicu and Voicu 2009). Education systems in these countries still have traces of the former communist regimes and do not encourage personal responsibility for solving societal problems (Koshmanov and Ravchyna 2010), so their ability to socialize people to volunteer work is still limited.

(c) Increasing resources that support volunteering

Within institutions, individuals can develop their personal resources – skills, knowledge, and other resources – that enable their volunteering activities. Schools contribute to individuals' overall levels of knowledge and resources, which are related to volunteer work. Education is one of the strongest predictors of volunteerism (Smith 1994; Syvertsen et al. 2011). In the workplace, an employee can learn new skills and gain other resources that can be translated into volunteer work. Religious congregations can be important arenas for minorities to develop the skills necessary for volunteering (Musick et al. 2000). Institutions can provide individuals with the knowledge and resources necessary for volunteering.

(d) Conditioning variables

Characteristics of the institutions/organizations themselves and the properties of the relationship between an individual and the institution constitute important conditioning variables for the effect of institutions on volunteering. Institutional characteristics include such things as outputs, structure, authority systems, how decisions are made, ideology, size, relationships to other institutions, and degree of openness (Smith 1975). Certainly, institution type is also particularly important (Musick and Wilson 2008:272). Some institutions that might influence volunteering have been relatively understudied, such as volunteer centers (see Brudney 2002), the military (see Nesbit and Reingold 2011), and jails and prisons. The person's relationship to the institution also matters. This includes such factors as the recency of the experience, the length of institutional involvement, the salience of the institution in the person's life, the overall quality of the experience, the intensity of involvement, the nature of a person's involvement, perceived effectiveness of institution, interest in institutional activities, degree of social integration, and the services, goods or benefits received from involvement. Changing from one institution to another can also affect volunteering, such as shifting from one religious congregation to another (see Nesbit et al. 2012) or leaving high school and starting college.

3. The volunteer experience

Volunteers' experiences with their host organization shape their commitment and reduce withdrawal from the organization. Some of the most important aspects of the volunteer experience are the nature of volunteer work, volunteer management, volunteer appreciation and social integration of volunteers. Organizations must design volunteer work to meet volunteers' motivations; when volunteers' motivations are not met in their work, their commitment to the organization decreases (Stukas et al. 2009). Volunteers also value flexible volunteer positions (Boezeman and Ellemers 2009). Beyond the actual work

that volunteers perform, volunteers are also concerned with how they are managed, supervised and communicated with. In particular, they are also more satisfied when they receive adequate training, ongoing supervision, and real support in their assignments (Wu 2005); these efforts help to decrease volunteer burnout (Chong 2010). Unfortunately, many nonprofit organizations lack the capacity to manage volunteers (Hager and Brudney 2004), and nonprofit organizations in developing countries are particularly vulnerable (Regulska 1999; Toepler and Salamon 2003). Individuals in these countries may view nonprofit organizations as stable sources of employment rather than a venue for volunteering (Rose-Ackerman 2001).

Volunteers also want their contributions to the organization to be acknowledged and appreciated by other organization members (Boezeman and Ellemers 2009) and they want to feel and see that their work has an impact (Brodie et al. 2011). Non-monetary rewards (certificates or souvenirs) or in-kind support (travel reimbursements) are also linked to willingness to volunteer (Wu 2005). Finally, volunteers' social integration affects their experience. Positive social interactions with other volunteers and staff lead to greater volunteer satisfaction and reduced turnover (Boezeman and Ellemers 2009; Brodie et al. 2011; Wu 2005).

Researchers are just beginning to address the importance of the volunteer experience and volunteer management. We expect many of the same conditioning variables as reported above for institutions and interpersonal influences to affect the volunteer experience. Organizational size, in particular, is related to volunteer management (Brewis, Hill, and Stevens 2010). In addition, another important set of conditioning variables might be the type of volunteer work being done (direct service, leadership, support activities). Changes in leadership at the organization or of the volunteer program can also strongly influence volunteers' decisions.

4. Life events and periods

Life events can often affect volunteering through affecting people's resources – available time and money, personal mental and physical health, or emotional support. We consider four broad categories of events – occupational changes, changes in household/family structure, changes in personal health or the health of a family member, and moving.

(a) Occupational changes

Retiring from one's primary occupation is one major occupational change that can affect volunteering. The preponderance of the research evidence provides support for the continuity theory of volunteering in retirement – that those who volunteered before retirement are likely to continue volunteering in retirement and those who did not volunteer before retirement are unlikely

to being volunteering after retiring (Musick and Wilson 2008). Although the volunteering patterns do not seem to change with retirement, available time to volunteer or motivations to volunteer might shift, causing a change in the type of volunteer work sought (Gallagher 1994). The effect of retirement on volunteering depends on the timing of retirement, the person's previous occupation, working during retirement, and perceptions of the retirement status (Musick and Wilson 2008). The effect of retirement on volunteering also depends on culture; in Asian cultures retirees are discouraged from working outside the home, even just as voluntary labor (Chong 2010). Other occupational changes can also be important. Losing one's job can open up more time for volunteering. Indeed, many people see volunteer work as an opportunity to network and keep their skills sharp during times of unemployment (Low et al. 2007). Shifting from unemployment to work might decrease volunteering. The transition between education (either high school or college) and entering the workforce or beginning a career also affects volunteering; youth volunteering tends to decrease when they begin working fulltime (Lee 2010). Older adults' encore careers might also influence the decision to volunteer.

(b) Changes in household/family structure

Changes in the family or household structure can also trigger new volunteer involvement or a reduction in volunteering. Having a baby reduces the likelihood of volunteering (Nesbit 2012). Divorce and widowhood can also disrupt volunteering, especially for women and those without children (Butricia, Johnson, and Zedlewski 2009; Musick and Wilson 2008). But volunteering can also be a positive means of coping with loneliness after losing a spouse (Miranda and Mayne-Nicholls 2011). Other important life events that could affect volunteering might be getting married or becoming an empty nester, but empirical evidence is limited.

(c) Changes in health

A personal illness or the illness of a family member also affects the resources that a person can devote to volunteering. When a close family member gets ill, an individual might need to devote more time to caregiving and thus stop volunteering because of lack of time (Brodie et al. 2011). Changes in one's personal health, both physical and mental, can also disrupt volunteering because the person may no longer be capable of continuing in the volunteer role (Brodie et al. 2011; Butricia, Johnson, and Zedlewski 2009). This is particularly true for older adults. Retirees who are volunteers finally quit volunteering when extreme old age or poor health prevent them from continuing (Wilson and Musick 1997a).

(d) Moving

Moving to a new location can disrupt volunteering. People who move to a new geographic location, especially when it is outside of the previous community, will quit volunteering (Brodie et al. 2011; Institute for Communication and Development 2009). However, in the new location many people will seek out new volunteering opportunities. There is also evidence that after a move, people seek to replicate their volunteering behaviors, although they are not always successful at doing so (Nesbit et al. 2012). Moving to a new community has a substantial effect on volunteering because volunteering is strongly place-based. Living in more than one place during a year and owning more than one home (i.e. snowbirds) will also disrupt or reduce volunteering.

(e) Conditioning variables

We expect several variables to condition the effect that these life events have on volunteering. First, social background and personality variables could be important moderators, especially in the occupational changes. Interpersonal variables are expected to be important when there is a change in family structure. These can include things such as the nature and closeness of the relationship with others in the family/household, the volunteering behaviors of others in the family/household, and the amount of support for volunteering the person received from the others to volunteer. The person's age and stage of life when these events happen also appears to matter. Personal volunteering habits can be particularly important – how long the person has volunteered, the nature of their experience, and the salience of their volunteering to them. If the person has strong volunteering habits before the life event, the event might be less disruptive to their volunteering (see Nesbit et al. 2012).

5. Practical considerations

Practical matters affect the volunteer decision, including such things as weather, availability of transportation, proximity to the volunteer organization, convenience of organization's location, the availability of child care, personal health, language fluency, previous experience with volunteer work, the presence of stipends or incentives to volunteer, and available time. Each of these things can affect a person's ability to connect with a volunteer organization and to sustain that connection. Personal convenience issues, such as proximity to host organizations, drive many volunteering decisions (Chang 2007; Wu 2009). Transportation problems, such as not having own transportation, price of travel, traveling after dark, availability of public transportation and lack of parking can affect participation (Brodie et al. 2011).

Language and cultural barriers can also reduce volunteering (Brodie et al., 2011). Those who have had little previous experience with volunteering are more likely to stop volunteering than those with robust volunteering habits

(Butricia, Johnson, and Zedlewski 2009). Stipends and incentives can be important facilitators in helping low-wage earners to volunteer (McBride et al. 2011). Available time and the other activities a person chooses to spend time on also affect volunteering choices (Institute for Communication and Development 2009); the perception of a lack of time can be psychological hurdle (Davis-Smith et al. 2004). However, increased personal well-being does not always lead to more volunteering, especially in the Central and Eastern European context (Regulska 1999). Practical considerations can have a strong influence on volunteering.

6. Relative strength of micro- and meso-context variables

Despite the fact that the situational variables discussed in this chapter have received comparatively little attention, they tend to have fairly strong effects on volunteering compared to other sets of variables, such as social background and personality. It is challenging to find many empirical studies that include some or all of the different sets of variables that might affect volunteering. However, despite a great deal of empirical evidence about the importance of social background variables for volunteering, when interpersonal and institutional situational variables are included in the model, the strength of the social background variables is reduced (Smith 1975), with the possible exception of education (Berger 1991). The most important situational variable is being asked to volunteer (Berger 1991; Musick and Wilson 2008; Smith 1994:252). Adding recruitment to statistical models doubles the explanatory power of the models (Musick and Wilson 2008:293). Many of variables shown to be related to volunteering in previous studies, such as joining groups, are no longer statistically significant when volunteer recruitment is included in the models. Interpersonal influences seem to be stronger than socialization influences from religious institutions (Chang 2007).

The recent national sample research on Russian adults by Smith (2015), testing Smith's S-Theory of human behavior (2017), controlled about 50 potentially confounding influences on formal volunteering (measured by a highly reliable six-item index) while examining several micro-context predictors. Of the nine single items and indices measuring micro-context, only two reached statistical significance with the other predictors in an OLS regression equation (N = 2,000). Stronger by far was a five-item index of being asked to volunteer by more types of people (family, friend, neighbor, etc.) with a beta weight of .10 (significant at below the .001 level, two-tailed). Much weaker (beta weight of .03) was the availability of transport for the individual (.05 level). Hence, micro-context factors have significant associations with formal volunteering in these data with many other predictors controlled. However, other micro-context predictors, significant in studies reviewed in this chapter, did not survive as significant with many other predictors controlled.

E. Usable knowledge

This review of the literature suggests several implications for research and practice. First, this chapter highlights the powerful effect of being asked to volunteer on the decision to volunteer. This is both theoretically interesting for researchers and practically important for those wishing to encourage volunteering. This chapter also illustrates that although we know that interpersonal exchanges and institutional arrangements affect volunteering, research has yet to unlock the precise mechanisms or channels that lead to volunteering or continuation of volunteering.

One practical implication of this study is that much of this information can be used by volunteer-involving organizations (VIOs; cf. Leigh et al. 2011). How volunteers are managed and supervised matters. Organizational and work design issues influence volunteers' decisions. This suggests that VIOs would benefit from more professionalized volunteer management practices and awareness. Savvy volunteers manager can help provide emotional support to ensure continued volunteering during a major life event, and they can be mindful of practical issues that might deter volunteers.

This research also informs public policy. Personal influence is paramount in getting people to volunteer. Those seeking to increase volunteering need to focus more on encouraging and rewarding people for asking others to volunteer. In addition, public policy-makers can facilitate volunteering among groups that are disadvantaged and lack the skills and resources to volunteer. Perhaps they can help address some of the practical issues (language barriers, lack of transportation or child care) that hinder volunteering.

F. Future trends and needed research

In this chapter, we have reviewed the micro- and meso-contexts and situations that influence starting and stopping volunteer work. These situational variables have all been under-studied relative to other predictors of volunteering, such as social background and attitudinal variables, despite evidence that situational variables can be powerful predictors of volunteering. Fortunately, research on situational predictors of formal volunteering has been growing the past two decades, and such growth is likely to continue. One aim of this chapter is to outline the main situations that influence volunteering, including interpersonal exchanges, institutional arrangements, the volunteer experience, life events, and practical considerations, and to discuss the ways that these situations influence the decision to volunteer.

We encourage researchers to further explore how the conditioning variables discussed in this chapter affect the relationship between situational influences and volunteering. Future research can further unpack the relative strength of

the situational variables compared to other sets of variables typically used in volunteering research. The recent results of Smith (2015) show that micro-context (especially, being asked to volunteer) continues to be important when *many* other predictors are controlled, but only a couple of micro-context predictors survive with such controls. This research highlights the importance of studying meso- and micro-context predictors while including a wide range of other predictors, as suggested by S-Theory (Smith 2017). Finally, researchers need to expand their consideration of volunteering beyond a simple binary variable to focus on decisions volunteers make about the type of organization they choose to volunteer for and the volunteer roles or tasks that they perform.

Conducive Social Roles and Demographics Influencing Volunteering

David H. Smith (USA) and Lili Wang (China)

A. Introduction

This chapter reviews evidence that social statuses, roles, and other demographic variables influence formal volunteering (FV) and association participation. Dominant status theory (DST) predicts greater participation for individuals with a more dominant (valued and preferred by the socio-cultural system) social status or set of these, such as higher socio-economic status (SES) or involvement in a higher status religion (Smith 1994). The validity of Smith's revised dominant status theory (RDST), as stated here, is compared with the validity of Wilson's (2000) resource-capital theory (R-CT), which predicts more volunteering for individuals who have more of various kinds of resources-capital. Although differential validation is difficult, we argue that RDST is superior in giving a more nuanced approach to resources that explains their variations in explanatory/predictive power across contemporary societies and over historical time in any society. Recent research by Smith (2016b) on Russian national sample interview data confirms that the psychology of RDST is far more important than the resources of R-CT.

The literature on determinants of voluntary association participation and volunteering has identified numerous social background and social role/demographic factors associated with an individual's propensity or decision to participate and volunteer. These include age and life-cycle stage, gender, race/ethnicity, length of full-time education, income, wealth, occupational prestige, home ownership, car and recreational vehicle/boat ownership, marital status, family size, school-age children in the household, local rootedness, religious identity/role, political identity/role, and so on. One attempt to find a linking thread among this series of variables is DST, which posits that "people participate more in volunteer roles when they are characterized by socially

approved or 'dominant' statuses" (Smith 1994:254; see also Smith 1975, 1983; Smith, Macaulay, and Associates 1980:chapter 18).

Several other theories have also been developed to explain broad patterns of voluntary association participation and volunteering, such as the Interdisciplinary Sequential Specificity Time Allocation Lifespan (ISSTAL Model; Smith, Macaulay, and Associates 1980:Chapter 18), the General Activity Model (GAM; Smith 1994; Smith, Macaulay and Associates 1980:chapter 19), and the R-CT (Wilson 2000).

This chapter will assess the relative explanatory power of key social status (background; demographic) variables found in prior multivariate analyses, such as those noted two paragraphs above. We will also address the causal relationship among these variables and how their impacts vary by different types of volunteer participation. Based on the literature review, we will address the validity of the Smith's RDST (as first presented in this chapter) compared with Wilson's R-CT (2000).

B. Definitions and theories

This chapter accepts generally the definitions of terms in the Handbook Appendix.

A social status is defied here as a social identity or position with a distinctive name in common language in some socio-cultural system, such as in a society or smaller social or territorial unit, such as a group, organization, or community. Some common examples of social statuses are woman, professor, priest, husband, chess player, homeowner, citizen, and teenager. A social role is defined as a set of normative expectations for thoughts, motives, feelings, words, and deeds that are associated with some specific social status. People in a given social status are expected to fulfill the associated role in relevant situations.

The RDST, as stated here by Smith for the first time, posits that individuals with a more socio-culturally approved or dominant social position and role (or set of them) in a given society and historical time period are more likely to volunteer or participate in associations, as suggested previously in the simpler DST (Smith 1975, 1983, 1994; Smith, Macaulay and Associates 1980:chapter 18). One example of such a dominant status is white ethnicity/race in the United States and other Western nations. More generally, in modern (industrialized) and post-modern (information-service) societies, dominant statuses include middle age, higher education, greater occupational prestige, greater income, greater wealth (including major possessions such as owning a home, having a vacation home, owning one or more cars or other regular vehicles [especially more expensive ones], owning a recreational vehicle, owning a boat or yacht), belonging to a more highly approved religion (or atheism, an anti-religious

ideology in atheistic societies), adhering to a more prestigious political party, being legally married, having the appropriate number of children (never zero; usually a few children, but not many), more school-age children in the household, longer time in the community, being native-born (not an immigrant from another nation), speaking and writing well the dominant language(s), having more friends, and participating in highly approved leisure activities (e.g., in the United States today, foreign travel, golf, tennis, board/policy volunteering, and attending a ballet or opera).

The other end of the spectrum from *dominant* statuses involves *subordinate* statuses, with less, little, or no socio-cultural approval. In the extreme, subordinate statuses are stigmatized (highly disapproved) and punished in many societies, even with death. Some examples of highly stigmatized subordinate statuses in nearly all societies are murderers, rapists, thieves, revolutionaries, terrorists, traitors, and the mentally ill. There are also specialized subordinate statuses in various societies and historical time periods. For instance, accused witches were executed in Europe in the Middle Ages and even later. Heretics in Catholic counties in Europe (especially Spain and France) were similarly executed. Native-Americans in the American colonies and United States were treated similarly for hundreds of years from about 1600 to 1900. Blacks and gays/lesbians in the United States have also received such treatment until rather recently (perhaps 1960+).

In post-modern societies, where gender equality is sought and often approximately attained, RDST predicts modest or small sex differences in voluntary participation/volunteering. However, in industrial societies, and especially in pre-industrial agrarian societies, where large gender differences in social power, prestige, and wealth favor males, RDST predicts males will participate significantly more than females. Thus, the significance of gender/sex as a predictor for volunteer participation should depend on the degree of male dominance versus gender equality in a given society at a given historical period. National sample data on political participation in seven nations tend to support these predictions (Verba, Nie, and Kim 1978:235, 268)

People with dominant statuses are seen by RDST to volunteer and participate more because they are more likely to conform to socio-culturally approved forms of activity in all aspects of daily life, including paid/remunerated work, family/household activity/chores/work, and leisure activity. In the realm of leisure activity, this socio-cultural system/societal conformity usually means more volunteering and association participation in modern societies. Such an outcome is especially likely in nations/societies where there is substantial freedom of association and assembly (see Handbook Chapter 45), as well as other civil liberties, thus usually found in functioning democracies (Schofer and Longhofer 2011; Smith and Shen 2002). Autocracies of various kinds (dictatorships, divine right monarchies) tend to fear associations and formal volunteering as potential threats to the monopoly of power held by a single

party, oligarchical group, or dictator, or in earlier societies by an emperor, king, or queen (e.g., Fisher 1974; Swanson 1974). Societies in which corporatism prevails (see Handbook Chapter 46) are likely to be intermediate in volunteering and active association participation levels between democracies and autocracies.

The R-CT argues that the decision to volunteer is jointly influenced by various types of resources or capital available to an individual, including social capital, human capital, and cultural capital (Musick and Wilson 2008; Wilson 2000; Wilson and Musick 1997a. The term *resources* or *capital* is used to imply that these factors are essentially economic inputs that facilitate the productive activities of volunteering (Wilson and Musick 1997a). Social networks or social ties, including family connections (i.e., marital status, parental status), friendship networks, and organizational memberships, are forms of social capital that tend to foster collective action (Wilson and Musick 1997a).

Thus, R-CT fundamentally asserts, though usually implicitly not explicitly, that *mere possession* of or access to more resources or capital actively promotes use of these to do more volunteering. Unfortunately, R-CT gives no clear *theoretical* definition of what factors/traits are resources in a given society at a given historical time period, unlike RDST. R-CT also fails to explain why people with more of the resources it identifies tend to *use* these in volunteering, rather than using them in more economically remunerative activities (paid work, self-employment). Nor does R-CT explain why people with more resources use them in volunteering rather than preserving or hoarding them, as many wealthy people do with financial resources such as money in the bank, stocks, bonds, and real estate. However, RDST can be properly seen as a refinement of R-CT, rather than totally different, with more nuances and able to explain the relevance of specific resources and explain historical changes in which resources are most relevant.

In R-CT, *human capital* is typically measured by an individual's level of education, which enables a person to successfully perform a job. Income and health status are also possible measures of human capital (Wilson and Musick 1997a). *Cultural capital* includes religion, language, acculturation, citizenship, and race/ethnic background (Sundeen, Garcia, and Raskoff 2009; Wilson and Musick 1997a). But R-CT does not explain, for instance, why certain racial characteristics or ethno-religious characteristics are resources in a given society at a given historical period, or how these factors change over time or vary across societies and nations in explaining/predicting volunteering. By contrast, RDST does have such explanations.

C. Historical background

Sociological study of the importance of social statuses, roles, and demographics for voluntary association participation (as formal volunteering) began in

the 1920s and 1930s in the United States. Community studies (ethnographies) by Lynd and Lynd (1929), Lundberg, Komarovsky, and McInerny (1934), and Warner and Lunt (1941), as examples, consistently found that association participation was more extensive for adults of higher SES. In addition, higher SES people tended to participate in different types of associations and in different specific associations in their communities.

As a result of these *qualitative* community studies, other sociologists began in the 1940s to do *quantitative* studies of how social statuses affect association participation. The earliest surveys focused on samples of adults in specific US cities or towns (e.g., Bushee 1945; Komarovsky 1949; Mather 1941). By the 1950s, there were some national sample surveys bearing on the impact of social statuses on association membership and participation, reviewed by Wright and Hyman (1958). Hausknecht (1962) wrote the first book analyzing the impact of social roles/demographics on association participation, finding greater participation for higher education, income, and occupational prestige (but not using any significance tests). The author (p. 22) noted several *non*-US surveys, including some national sample surveys, which found similar results. The bibliographies of both Hausknecht (1962) and Babchuk and Gordon (1962) include many other early quantitative studies in the United States and to some extent elsewhere. From the 1960s onward to the present, broad explanatory research on association involvement has nearly always included social status and demographic variables.

D. Key issues

This section will review research on how various clusters of social status/role, social background, and demographic factors (approximate synonyms) have been correlated with association membership and volunteering in prior research, especially research in the present century. The dependent variables (DVs) studied have varied across studies. The most common DVs for samples of individuals have been the number of association memberships (or membership types), association meeting or event attendance, amount of time spent in association volunteering activity per month, holding a leadership role in an association, committee involvement, duration of membership, and decision to exit the association.

1. Revised Dominant Status Theory and Resource-Capital Theory

Lemon, Palisi, and Jacobson (1972) invented Dominant Status Theory (DST) in its initial form. They defined a *dominant status position* as "that category on a social dimension which is accorded the highest amount of value in relation to other categories by the members of a group or society" (p. 32). Smith (1975:254) brought greater academic attention to DST by discussing it at some

length in his 1975 chapter in the *Annual Review of Sociology.* Smith (1983:86) elaborated DST (DST 1.1), stating that a dominant status really means that the status position (category) on a social dimension is a category that is *socio-cultural system-valued/preferred,* by which he meant, valued or preferred by most people in a socio-cultural system. Where Lemon et al. failed to suggest how a status position *becomes dominant*, Smith filled in that theoretical gap. Smith (1983:86–87) also extended substantially the set of dominant statuses, using his expanded definition. Both the reviews of research in Smith (1975) and Smith (1994) generally confirm the DST, but there are some exceptions. Smith (in Smith, Macaulay and Associates 1980:512–520) discussed at length many statuses/roles that were designated as dominant in the United States and many other Western post-industrial societies.

People with high SES, as a central dominant status, often have high social capital (i.e., social connections), human capital (i.e., education and income), and cultural capital (i.e., language, citizenship, valued religion) as well. Thus, the R-CT and the DST overlap in many ways in their explanations of voluntary participation and volunteering. This overlap makes differential validation difficult. In this chapter, Smith elaborates DST into Revised Dominant Status Theory, or RDST, for the first time. For various social status variables, such as gender and occupational prestige, the research findings suggest that the RDST provides a better explanation of how these factors influence the propensity to participate and the types of organizations people participate in.

Another significant issue, with unclear implications and almost never discussed, is that DST was developed from the study of association participation and volunteering in associations, while R-CT was developed mainly by studying volunteering in volunteer service programs (VSPs; see Handbook Chapter 15). The empirical results are often similar, but not identical.

Perhaps a theoretical reconciliation of these two theories will involve accepting that the various resource factors identified by the R-CT are reflections of the *current* dominant statuses in a given society and culture at a given time period in its history. The proponents of R-CT have not yet clearly identified the causal processes that lead some factors (characteristics, traits) to be viewed as resources and other factors not to be viewed as resources in any given society in any specific historical time period. The RDST *does* permit such causal explanation and accounts reasonably for changes in the statistical power of various factors/traits as resources to predict/explain volunteer participation over longer historical time periods as well as cross-national variations in their statistical power at the present.

Smith, for the first time here, revising and elaborating his version of DST into Revised DST (RDST, as DST 2.0), argues that particular factors *become resources* in a given place and time when they are associated with dominant statuses. *Dominant statuses* can now be defined in more detail as factors

or characteristics of individuals in a given society/culture at a given historical time period that facilitate the individual's (or family's) acquisition and maintenance of power, wealth, income, prestige, highly valued services (including access to deferential-respectful behavior by others and to sexual activity), valuable productive buildings and equipment (manufacturing plants, retail and wholesale stores, trucks, machinery, electronics, buildings to rent, etc.), highly valued dwellings and land (large tracts of land, islands, water bodies, castles, palaces, mansions, larger houses or apartments/condominiums), expensive cars-trucks-recreational vehicles for personal travel (and easy access to public or private transportation systems for such travel), expensive boats or yachts, airplanes and especially larger and more expensive ones, expensive clothing, expensive furniture, expensive jewelry and watches, expensive art objects and artifacts of all kinds, and highly valued experiences, including expensive vacations, attendance at exclusive social or entertainment events or venues, special invitations to and seats at public events and ceremonies, special and socio-culturally important/valued friends and/or acquaintances, special food-meals-drinks, preferred-valuable objects, preferred and highly valued scenery/views), and highly valued bodily appearance, including highly valued aspects of one's face, teeth, lips, nose, eyes, hair (amount, color, hair style), height, weight (especially in proportion to height; Body Mass Index in the normal range), extent of muscles versus fat, proper posture, lack of deformities/sensory disabilities or other visible disabilities, and both physical and mental health, whether visible as appearance or not.

Essentially every aspect of human life, the human body, experiences, and the biophysical environment (including external objects or situations defined as possessions) can be seen in some society at some time as relevant to a dominant status, because the valuable nature of such statuses is mainly the result of socio-cultural systems, with only a few evolutionary survival-reproduction aspects (e.g., eating any nutritious food at all vs. starving).

The RDST argues basically that individual (or family) factors/traits *become resources for or facilitators of* (to use less economically oriented words) *volunteering* in a given society at a given historical time period to the extent that they clearly affect voluntary participation by being significantly associated with the differential provision of socio-culturally valued benefits/experiences to individuals (or families) who have, own, manifest, or control access to one or more of these factors/traits and their related benefits/experiences. These socio-culturally valued benefits ultimately reduce to positive experiences, rather than merely to things or wealth, as the erroneous economic (e.g., R-CT) approach indicates. This is a profound theoretical statement of RDST, with many deep and extensive implications for understanding the factors/traits that explain/predict formal volunteering and association participation in any society at any historical

time period. In a sense, RDST deepens R-CT explanations, while retaining the importance of resources.

According to RDST, over time such factors/traits of differential provision of socio-cultural benefits and valued experiences to individuals (and families) tend to develop into enduring and often dominant social positions (statuses). These dominant statuses are usually accompanied by social roles with widely accepted norms that specify how individuals are socio-culturally, thus *normatively* not just probabilistically, expected to think, perceive, feel, plan, and act, given their incumbency in such positions and access to the relevant factors/traits.

In this RDST, when the circumstances in a given society/culture change, formerly dominant statuses can decline or vanish over time, and at any time new dominant statuses can arise. For instance, in preliterate hunting-gathering societies, skill in hunting large animals for food was a dominant status factor, especially for men (Nolan and Lenski 2006). When most successful human societies shifted to being settled horticulturalists in settled villages (ibid.), skill in farming and raising domestic animals became dominant status factors, and hunting skills declined in importance. In industrial and post-industrial service/information societies, such hunting (or fishing) and farming skills are of minor importance, in general, and are thus not dominant. *RDST explains why these changes have taken place in the importance of specific statuses and resources. R-CT does not do so.*

To take a more recent example of socio-cultural change, for most of the time in human agrarian and industrial societies (not necessarily in earlier preliterate societies), women as a social status category have been in a subordinate status relative to men. But as industrial societies have moved toward post-industrial, service and information societies in terms of the occupational distributions and the division of labor, the women's movement has created socio-cultural changes that have made men and women more nearly equal as statuses (but still rarely reaching full equality in most societies/nations). Being male is much *less* a dominant status in advanced service-information societies and in some late industrial societies. In some service-information societies, being male is perhaps no longer a dominant status at all (e.g., Iceland). These changing sex/gender roles account for some of the variation in the empirical findings regarding the association of gender/sex with participation both across nations and over time in a given nation. Here again, RDST seems superior to the R-CT in explaining volunteer participation and in the changes in the statistical power of specific resources to explain such participation over historical time periods.

Power over other people has always been important in human societies, as has been power over conspecifics (others of the same species) in social groupings of lower animals (herds, packs, prides, hives, pods, etc.). In preliterate societies, power over people (social power) usually came not only from

physical size and strength but also from agility, intelligence, verbal skills, inter-personal skills, and other traits (Sahlins 1972). However, as the complexity of societies has advanced from simpler preliterate societies to ancient agricultural civilizations, then to industrial and post-industrial societies, the importance of physical size and strength has greatly declined, without vanishing, as confer-ring dominant status, except among children temporarily, and in the lower SES levels of society, in the *underworld* (criminals and other *outsiders*; Becker 2008), and in the incarcerated/prisoners of all societies.

In more advanced and complex societies, power has been increasingly based in significant degree on *one's position in organizational hierarchies* (*organiza-tional dominant status*; a new RDST concept here). Height, weight, and physical strength are no longer very important (beyond a certain mid-range of limits, *little people* whose adult height is below about 4 feet 10 inches still have prob-lems; very tall people above about 6 feet 6 inches also usually have problems; there is also a mid-range of acceptable weight that is important – people who are very fat or very thin have problems). The reduction in the importance of substantial height (e.g., above 6 feet) and of substantial strength in modern and post-modern societies also gives women much more of a chance to be socially powerful.

The simplest initial, organizational/societal hierarchies were preliterate chief-doms, with inherited dominant power statuses of the leaders. Later, divine right monarchies were the key organizations, again with largely (but often disputed) inherited positions in the hierarchy as dominant statuses. With the rise of government and business bureaucracies (and hybrid government-business orga-nizations, such as the English, later British, East India Company, 1600–1874), as powerful organizations in late preindustrial, industrial, and post-industrial societies, social power has been more finely distributed and could usually be achieved by actions in one's lifetime, rather than simply socially inher-ited from one's family. However, the descendants of nobility (in societies with such social distinctions) and the wealthy have always had preferred high-power/prestige/income-dominant statuses/positions in such government and business organizational hierarchies, as well as in nonprofit organizations (NPOs).

As another example, in preliterate societies, formal education did not exist, hence such education was not a dominant status. However, after the invention of writing and the advancement of agricultural practices (Nolan and Lenski 2006), formal education arose as a practice in all ancient agricultural civiliza-tions such as Greece, Rome, India, and China (Trigger 2007). In these societies, however, formal education was very rare, confined to an economic or social (class) elite, usually done by private tutoring not schools, but conferring a dominant status of high prestige. In modern industrial and post-industrial societies, governments have instituted (often mandatory) mass education to

prepare most people to be able to hold semi-skilled or skilled factory and related jobs.

But higher education, begun in some societies about 1200 AD/CE or earlier (e.g., the University of Bologna and Oxford University; Rashdall 1895), began to prepare an elite for the higher prestige occupations, namely the professions of ministry, law, teaching, medicine, and later engineering, the sciences, university teaching, nursing, public administration, management, and so on. The nobility and non-noble wealthy merchants/bankers often paid for private tutors to educate their children, especially male children. Centuries later, about 1800 and thereafter in the West, government-supported mass formal education became gradually widespread as various nations industrialized.

By about 1850, having formal education, and especially having a university education, became a dominant status in most industrial societies. Now, in post-industrial societies, post-graduate education has higher prestige and is a still more dominant status. The prestige level of one's specific university also has an important impact as part of one's education as a dominant status. This fact is easily explained by RDST but not by R-CT. In America, the Ivy League national (and international) universities have very high prestige, when compared to the low prestige of little known, small, four-year colleges (let alone the still less prestigious junior or two-year colleges) that only recruit students locally or mainly from their own state. For-profit universities or colleges are even lower in prestige, often seen in the United States as deviant *diploma mills* (Stewart and Spille 1988).

There are similar, clear, if approximate prestige rankings within every nation regarding universities and colleges, and recently also an international ranking system as well. But in *all* modern and post-modern societies, *formal education has clearly and permanently become a general dominant status* – a form of human capital or an individual, productive resource that allows the more educated individual to achieve various other dominant statuses.

More than any other dominant status or resource in modern and post-modern societies, formal education enables an individual to rise in the social power/prestige hierarchy above his or her birth family's position or to maintain an already high position from their birth family. That is why education is usually a significant, consistent, and often substantial factor in explaining and predicting volunteering in modern and post-modern societies/nations. Unlike the influence of sex/gender, the explanatory/predictive power of education as a dominant status has not faded much with the passing of historical time in the past century or two. RDST can explain this, where the simpler R-CT does not. RDST can also explain why, in certain highly developed post-modern societies, education has indeed declined as a predictor of FV (e.g., van Ingen and Dekker 2011a, 2011b).

However, from the time of advanced agricultural societies, beginning about 5,000 years ago in Egypt, then in China and elsewhere, monetary income and wealth, plus major possessions (including real estate/land, buildings, and movable smaller possessions), have also conferred prestige and thus became dominant statuses *not* necessarily associated with dominant statuses in organizational hierarchies (Trigger 2007). In preliterate societies, especially in the small and nomadic tribes that were present all over the earth until 10,000 years ago, there was no money and few possessions – very rarely land as a possession (Sahlins 1972). The financial aspect of such possessions has depended on the invention and spread of money as a social innovation in human societies (Ferguson 2002, 2009), especially the dominance of money since about 1700 (Ferguson 2002).

In contemporary nations everywhere, being rich/wealthy in assets and/or income is also a key dominant status, because money can buy so many things and services worldwide that confer still further dominant statuses – highly valued land, buildings, physical improvements/changes in land or buildings, objects, more valued services, higher education for one's children (or oneself), valued changes in one's body and appearance, better health care and medicines, more valued experiences, and so on. But many people in most societies still distinguish *good money* (i.e., properly acquired and hence legitimate money) from *bad money* (improperly acquired money, as by theft, fraud, coercion, crime, etc.). Thus, sheer income or wealth *alone* does not *always* confer socio-culturally dominant status if obtained in a socio-culturally defined illegitimate manner.

This matter of monetary income is also an area where the RDST seems clearly better than the simpler R-CT: Illegitimate income still has the same magnitude as a *resource* as does legitimately obtained income of the same amount. But the more nuanced RDST suggests that the level of current socio-cultural approval strongly affects how much the sheer amount of income or recent wealth as a resource will affect voluntary participation. Unlike R-CT, the RDST predicts that illegitimate income or wealth of a given known magnitude will have a much weaker, if any, effect on voluntary participation than will legitimately obtained income and/or recent wealth of the same magnitude. Convicted criminals and non-convicted accused-criminals could be studied when they had substantial *bad money*. Their participation could be studied retrospectively, as contrasted with matched samples of individuals with the same amount of *good money*.

However, societies adjust to crooks, immoral businesspeople, and other societal deviants over long periods of time, so that bad money can over time become good money – usually for descendants. The process of *bad money* becoming *good money* takes time, if it happens at all. There is a spectrum, of course. The American *Robber Barons* of the later 1800s and early 1900s, like John D. Rockefeller, Senior (Chernow 2007), often turned to philanthropy when older, and they and their descendants eventually became American

aristocrats with high family prestige. In the field of philanthropy, there is the notion of *tainted money*. One could do survey interviews inquiring into public attitudes toward various kinds and levels of *tainted money* (the same idea as *bad money*). Researchers could use hypothetical portraits/sketches of people with different kinds/levels of tainted money versus untainted money, seeking approval-disapproval ratings from representative samples of respondents.

As another example of dominant status issues, speaking well the dominant language(s) of a given society/culture/nation at a given time tends *not* to distinguish well among volunteers and non-volunteers in most contemporary societies. There is likely some distinctiveness of having good English grammar and vocabulary in English-speaking nations, for instance, so that such people are likely to participate more. However, this language facility goes along closely with more education, higher SES, and higher verbal intelligence in general, so language skill/ability is seldom *separately* measured in volunteering research. But when individuals from another society/culture with a quite different dominant language emigrate to that society/culture, their skill in the new, host country's dominant language(s) becomes a dominant status and relevant resource factor in explaining differential volunteering for such immigrants versus native speakers of the dominant language. So facility with the dominant language in any society is indeed a little-studied dominant status factor.

In sum, knowledge of the dominant statuses as socio-culturally approved factors/traits adds much insight to the sheer R-CT view of factors affecting volunteer participation. Most importantly, *RDST clearly explains changes in the dominance of various factors/traits/resources in any given society/nation over historical time periods*, *where the simplistic R-CT cannot do so*. Since RDST incorporates most of useful aspects of R-CT, RDST seems more broadly useful, more nuanced, deeper and richer in content, and thus likely superior to R-CT. RDST also tends to be superior when there are differential predictions made by the two competing theories regarding volunteering, as shown in various sections of this chapter.

2. Parental SES, religiosity, and participation

Youths' propensity to participate in voluntary associations is partly shaped by their family, school, and religion. The socialization theory posits that the family provides the context for socialization of the behavior, moral and ethical values, and attitudes of youth (Sundeen and Raskoff 1994). Parents act as role models for their children, and thus parental volunteerism is often found to be positively associated youth voluntary participation and volunteering (Bekkers 2007; Caputo 2009; Janoski and Wilson 1995; Smith and Baldwin 1975). Parents can also promote voluntary participation and volunteering by transmitting and providing their children with higher SES and skills that facilitate volunteering, and by integrating their children in communities

that provide greater opportunities for participation (Bekkers 2007; Janoski and Wilson 1995).

In a study of young adults' voluntary participation using a subsample of the National Longitudinal Survey of Youth (NLSY 97) in the United States, Caputo (2009) found that parental volunteerism is a robust predictor of youth activism and voluntary participation. Using data from the Family Survey of the Dutch Population 2000, Bekkers (2007) found significant relationships between current volunteering and parental volunteering in the past. While the transmission of volunteering for religious and quasi-religious associations is due largely to the transmission of religion and social status from parents to their children, parental volunteering for quasi-religious associations increased the likelihood of children's volunteering for secular associations, even controlling for parental and children's religion, education, wealth and personality characteristics. Janoski and Wilson (1995) tested the family socialization and status transmission theories of volunteerism using three-wave panel data and found that status-transmission theory explains participation in self-oriented associations (e.g., business/professional and union groups), while family socialization explains participation in community-oriented associations (e.g., community volunteers, fraternal, church-related, and service organizations).

The effect of parental SES, parental religion, and parental volunteering on their children's subsequent adult volunteering is as expected by RDST. In nearly all societies, having a higher SES parent confers more dominant status on the children. Similarly, having parents who adhere to a more dominant religion confers dominant status on the children. This parental status conferral is even more important for children in highly religious societies. And having parents who volunteered more does the same, as one minor kind of dominant status.

3. Prior high participation/formal volunteering

Earlier active volunteering in schools, as a dominant status in RDST, usually increases one's adult volunteering. Most schools in Western nations, especially the United States, organize voluntary extracurricular activities, such as clubs and student government. These activities not only build human capital but also provide encouragement and opportunities for participation and volunteering (Oesterle, Johnson, and Mortimer 2004).
