# Foreword

As one who has been privileged to be involved both as an academic and legal practitioner in food law globally, it is an honor to be invited to write a foreword to a text that is much needed and that serves as a significant benchmark in the developing field of food law. This foreword will endeavor to promote the need for international food law as an academic discipline, frame international food law, and then describe how this text fleshes out this framework.

## I. Academic Discipline

The modern global food system, which is governed in part by international law, is comprised of a series of systems on local, national, and international levels that produce, manufacture, and distribute foods in diverse and complicated ways and affects the lives of humans and animals in profound and unique ways. This author recalls when walking in the asparagus fields of Ica, Peru, being repeatedly asked by farm laborers, “what is Thanksgiving in America?,” a question prompted by the extra long harvesting hours spent by the workers and their families in the fields during the late November holiday.

The complexities of these modern food systems have motivated countries in recent years to strengthen their legal regimes over food. Robust law development is aimed at regulating food safety, marketing (labeling and advertising), and nutrition. Examples include the US 2011 Food Safety Modernization Act<sup>1</sup> and China’s 2015 Food Safety Law,<sup>2</sup> both of which mandate the use of innovative, preventive tools to ensure safe food produced and imported into these respective countries.

---

<sup>1</sup>Food Safety Modernization Act (FSMA), PL 111-353, § 106, 124 Stat. 3885, 3897 (2011) (codified in scattered sections of 21 U.S.C.).

<sup>2</sup>Food Safety Law (promulgated by the Standing Comm. of Nat’l People’s Cong., Feb. 28, 2009, revised April 24, 2015, effective Oct. 1, 2015).

In addition to the regulation of food commerce, vast and profound consequences of the modern food systems have precipitated additional regulatory innovations. For example, to address concerns about nutrition and obesity, innovative regulations include the UK front-of-packing labeling regime,<sup>3</sup> Poland's innovative ban on both the advertising and sale of unhealthy foods in schools,<sup>4</sup> and Mexico's recent national tax on sugar-sweetened beverages.<sup>5</sup> In addition to public health regulation, laws that address environmental costs, food security, and food equity are promoted in numerous countries.

This quest to develop legal tools to address problems and challenges generated by the modern food systems has given rise to courses and programs in food law around the world.<sup>6</sup> While courses have been slow to incorporate international law into the food law curriculum, it appears that law programs are trending toward international analysis. For example, the esteemed Renmin University of China School of Law, which oversees the Center for Coordination and Innovation of Food Safety Governance, joined recently with the University of California-Los Angeles (UCLA) School of Law's Resnick Program for Food Law and Policy and East China University of Science and Technology (ECUST) in December 2015 to sponsor an Asia-Pacific Food Governance Symposium. Also, in October 2015, the University of Tuscia in Italy, which houses the European Food Law Center, hosted a conference addressing food law trends in the EU, the USA, and Asia. These conferences portend the development of international food law as a field of study and discipline, which is imperative if the legal academy is to help improve the modern global food system, from the farm to the table.

## II. Framing International Food Law

The starting point in understanding international food law is to square it with the definition of international law: law that “consists of the rules and principles of general application dealing with the conduct of States and of international organizations in their international relations with one another and with private individual, minority groups and transactional companies.”<sup>7</sup> The sources of international law

<sup>6</sup>See Baylen J. Linnekin & Emily M. Broad Leib, *Food Law & Policy: The Fertile Field's Origins and First Decade*, 2014 Wis. L. Rev. 557 (2014) (documents the history of the development of food law in American law schools).

<sup>7</sup>Robert Beckman and Dagmar Butte, Introduction to International Law, International Law Students Association, <https://www.ilsa.org/jessup/intlawintro.pdf>.

link to the International Court of Justice (ICJ), which is a permanent international court located in the Hague, the Netherlands, and the principal judicial organ of the UN.<sup>8</sup> Article 38(1) of the *Statute of the International Court of Justice* enumerates the sources of international law: (1) international conventions or treaties, (2) international custom, and (3) general principles of law.

There are numerous international agreements relevant to food. These agreements attempt to regulate how governments relate to one another on a host of issues, in which regulation ultimately affects the legal relationships between stakeholders in the global food supply chain and the food consumed by consumers. Trade agreements are among the most common types of international agreements that contribute to international food law and that enable a robust food commerce system.

The foundational trade agreement that impacts food is the General Agreement on Tariffs and Trade of 1947 (GATT). In addition to GATT, other WTO rules and agreements that today provide the legal framework for international trade for food were also produced during the Uruguay Round. These agreements include the Agreement on Sanitary and Phytosanitary Measures (SPS) and the Agreement on Technical Barriers to Trade (TBT Agreement). The SPS and TBT agreements are intended to facilitate food trade. Additional significant trade agreements that impact food include the Agreement on Agriculture (AA) and the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS).

The World Trade Organization's (WTO) dispute resolution forum has been used to resolve high-profile food regulation disputes, including prohibitions of meat treated with growth hormones<sup>9</sup> and a moratorium on approving the import of GMO food products.<sup>10</sup> The current WTO trade negotiations (the Doha Round) commenced in November 2001, but have stalled, significantly reducing its chances of success and prompting countries throughout the world to pursue bilateral and regional trade agreements as an alternative, many of which resolve food regulatory issues.

International custom and general principles of law also have important roles as sources of international food law. For example, some scholars of international law advocate the right to food as customary international law, concluding that the right to food or the right to be free from hunger has achieved customary status.<sup>11</sup>

---

<sup>8</sup>To be clear, the ICJ has jurisdiction only over states that have consented to it. For example, the court cannot hear a dispute between two more state parties when one of the parties has not accepted its jurisdiction. Also, the ICJ does not have jurisdiction over disputes between individuals or entities that are not states. I.C.J. Stat. art. 34(1). ICJ also lacks jurisdiction over matters that are governed by domestic law instead of international law. *Id.* at art. 38(1).

<sup>9</sup>See Appellate Body Report, *EC Measures Concerning Meat and Meat Products (Hormones)*, WT/DS26/AB/R, WT/DS48/AB/R (January 16, 1998), para. 181.

<sup>10</sup>Panel Report, *EC—Measures Affecting the Approval and Marketing of Biotech Products*, WT/DS291/R, WT/DS292/R, WT/DS293/R (September 9, 2006).

<sup>11</sup>Wieke Huizing Edinger, *Food, Safety and the Behavioural Factor of Risk*, 5 *Eur. J. Risk Reg.* 491, 494 (2014).

Alternatively, these scholars assert that general principles of law within the scope of Article 38 have extended to the right to food.<sup>12</sup>

An interesting and significant aspect of international food law is the harmonization of national food regulatory regimes. The SPS Agreement names the Codex Alimentarius Commission (Codex) specifically as the organization that is “to harmonize sanitary and phytosanitary measures on as wide a basis as possible”<sup>13</sup> by setting “international standards, guidelines or recommendations.”<sup>14</sup> Although use of Codex standards creates favorable presumptions under the international legal instruments, states are not required to implement Codex standards into national regulation.<sup>15</sup> The differences that arise in the regulation of food in any particular country depend on a number of variables: the type of legal system (i.e., civil, common law, etc.), historical precedence in regulating food, cultural orientation to food, and available resources.

Comparative analysis of sovereign food regulatory systems is indispensable to the grasping of international food law. It is important to remember, however, that comparative law is more than just drawing comparisons. It is the study of the relationship of one legal system and its rules with another. The nature of any such relationship is discoverable only by a study of the history of the system or of the rules. It is also about the nature of law and the nature of legal development: otherwise known as jurisprudence. Hence, comparative law involves history and jurisprudence.<sup>16</sup> The value of comparative food law is to provide a deeper knowledge of food regulatory regimes and to provide impetus for improving and harmonizing these regimes.

### III. Contributions of Text

This text assembles an impressive group of scholars that tackle complicated issues arising from the modern food systems by applying international law and norms. Such a text benefits scholars, teachers, students, practitioners, and policy makers.

This text addresses squarely the core international food law source—the GATT/SPS/TBT construct—by identifying and examining the legal barriers to trade and the major inconsistencies between the USA, EU, and Association of Southeast Asian Nations. This text also reviews TRIPS in the context of agriculture innovation. A novel examination of the normative capacities and activities of the World

<sup>13</sup>Agreement on the Application of Sanitary and Phytosanitary Measures (SPS Agreement), Introduction (April 15, 1994), Marrakesh Agreement Establishing the World Trade Organization, Annex 1A, 1867 U.N.T.S. 493, 33 I.L.M. 1125.

<sup>14</sup>SPS Agreement, art. 12, para. 4.

<sup>15</sup>MICHAEL T. ROBERTS, *FOOD LAW IN THE UNITED STATES*, 27 (2015).

<sup>16</sup>MARY ANN GLENDON, ET AL., *COMPARATIVE LEGAL TRADITIONS* 2–8 (2007).

Health Organization (WHO) related to food is made by focusing on the WHO's articles of its constitution.

The text also moves beyond the GATT regime and addresses the application of international law and norms to the consequences of the global food system. For example, the text specifically addresses animal welfare, climate change, food waste, and aquaculture issues. The text also draws interesting and significant links between public health (including medicine and dental) and food policy, agriculture and environmental stewardship, marine conservation and food safety, and food and energy. These linkages provide important conceptual and legal frameworks from which to teach public health and environmental conservation. Woven into these linkages are interdisciplinary analyses from the fields of law, science, medicine, public policy, and public health.

The text provides a very helpful survey of food laws in countries around the world, including New Zealand, Australia, the EU, Sweden, Norway, the Americas, Canada, Brazil, Mexico, Africa, Asia, China, India, Russia, and Israel. More than merely stating the law in these countries, this text addresses cutting-edge food law and policy developments. While the text does not engage in comparative analysis (a single text can only cover so much), it sets the table for comparative scholarship. The text starts interesting comparative conversations about norms in food and agricultural policy by addressing ethical considerations in food production.

The organization of the text is conducive to learning. The text commences with two introductory sections that build on each other. Then, a section is devoted to each continent. Each section has an introduction to help orient students who will use this book as a textbook or to guide practitioners engaging in self-study. Within each section, chapters address emerging in food law and policy in those areas of the world. Some topics that are too new or undeveloped to merit a chapter are included in textboxes. Illustrations in several chapters help condense information and make it more accessible for students. Case studies are sprinkled throughout the text, including treatment of food law topics in Brazil, Nepal, and Senegal.

In short, the text is a novel approach to international food law and should serve as a useful start and framework for an introductory course on international food law. The text also will be a good guide to practitioners who wish to address a specific topic or who are simply looking for context in which to evaluate a particular issue or line of thought. Finally, the text will be an important resource and benchmark for scholars who wish to explore law and policy topics related to food and the problems of the modern global food system.

Michael Roberts

# Preface

This book is our first and it is just the beginning. We set out with a table of contents as a list for the book that we wished we could have had in law school. Two years later, we have filled this table of contents with the wide array of topics and chapters covered in this first edition. It was a long process that we could only complete with the help of our families, friends, mentors, and editing interns.

We provide many different viewpoints, all of which are the authors' and not ours, but we selected these views to spark further research and scholarship, to provide an overview and an introduction into the intricacies of our field. Nobody else has attempted to put a similar book together because of the enormous amount of work and high level of professional difficulty that this interdisciplinary and international book encompasses both in scope as in complexity. Therefore, we consider this a start and by no means an all-encompassing version of what a book with this title could be. Instead, this is a comprehensive and carefully selected compilation of topics that are at the forefront in the cutting-edge field of food law and policy, which is still being developed through the law and remains an emerging field in many parts of the world. At best, this book is a global snapshot.

We hope that our work herein will inspire many academics, practitioners, and students, that it will stimulate further scholarship, and that it will set the stage for sustainable, environmentally friendly, climate-resilient, diverse, kind, and conscientious law and policy development in this wonderful field of food law and policy. Onward!

# Acknowledgments

We thank the academic advisors, Prof. Dr. Kirk Junker, Prof. Jan M. Levine, Prof. Dr. Bernd van der Meulen, Mrs. Elizabeth Kucinich and Former Congressman Dennis Kucinich, Attorney Andrew Kimbrell, Attorney Alyssa Kaplan, Professor Tim Lang, Prof. Anne deLaire-Mulgrew, Prof. Isabella Perricone, Prof. Janice Freedman-Bellow, our colleagues and friends at the Center for Food Safety in Washington, D.C., and all of our accomplished colleagues who contributed to this breakthrough work of scholarship and who taught us how to make this book a reality. The authors who drafted chapters and textboxes for *International Food Law and Policy* are at the forefront of their field and helped us to create the book that we wished we could have had as students embarking upon the field of international food law. Gabriela Steier created the basis for this volume when she was still in law school. As one of the leading scholars in food law, she is contributing to this rich and varied field of studies with this seminal work. She thanks Kiran Patel for his support throughout the editing of this book and for his enthusiasm to embark upon this journey.

Our special thanks go out to our families, who supported and encouraged us during the years of planning, conceptualizing, and editing *International Food Law and Policy*. We especially thank Prof. Dr. Liviu Steier, Dr. Regina Steier, Mrs. Fany Sontag, Dr. Michael J. Nathenson, Mr. Kanti Nema Patel, Mrs. Damyanti Patel, Mr. Pritesh Patel, and our dear friend, Atty. Alyssa Kaplan. Many heartfelt thanks extend to little Morrice Nathenson Steier for his patience while Mami was working on editing this book.

This book would not have come together as quickly without the help of our editing interns. We thank all of these young professionals and our students for their help and support in creating the book that we all wish we had had for our studies (in alphabetical order): Alex Cherry, Christina Papillo, Daisy Zhang, E. Cody Samit-Shaw, Eva Saul Crawford, Ilana Madorsky, Kimia Shahi, Liza Howard, Marianne Flanagan, Mary Kate Engstrom, Nandini Shroff, Sabrina Rearick, and Tracy Bratt.

Many thanks go to Dr. Brigitte Reschke at Springer for believing in us and for her support and patience with this amazing piece of legal scholarship!

# Editors and Contributors

## About the Editors

**Gabriela Steier**, co-founded Food Law International, LLP, (FLI) in 2012. FLI has grown into an LLC under Prof. Steier's guidance. She is Editor in Chief of the textbooks *International Food Law and Policy* (Springer 2017) and *International Farm Animal, Wildlife and Food Safety Law* (Springer 2016) and author of *Advancing Food Integrity: GMO Regulation, Agroecology, and Urban Agriculture* (forthcoming with Taylor and Francis).

She is an attorney licensed in the USA and focuses on food law, and policy, climate change, animal welfare, international trade, and GMO issues domestically and in the European Union. Prof. Steier has lectured on these topics and continues her research widely. She holds a B.A. (Cum

Laude) from Tufts University, a J.D. from Duquesne University, and an LL.M. in Environmental Law focused on Food and Agriculture Law from the Vermont Law School and she has nearly completed a Doctorate (Dr. iur.) in Comparative Law at the University of Cologne in Germany. She speaks six languages.

Founding Partner of FLI, Prof. Steier continues her research in comparative law and focuses on food safety and sustainable food production. She worked as an LL.M. Fellow in Food and Agriculture Law at the Vermont Law School. Before joining the Vermont Law School, she completed a fellowship at the Center for Food Safety on Capitol Hill in Washington, DC, a national non-profit public interest and environmental advocacy organization working to protect human health and the environment by promoting organic and sustainable agriculture.

She is a distinguished legal scholar and has published widely on international food law, policy, and trade and has earned several awards for her work. Steier joined the Duquesne University School of Law in Pittsburgh, PA, as an Adjunct Professor teaching a breakthrough new course in “food law and policy” in 2015 and she also teaches “climate change law.” As Visiting Professor at the University of Perugia, Italy, she also teaches EU-US comparative food law at the Department of Political Sciences. Additionally, as an experienced editor and with her numerous publications ranging from peer-reviewed articles in international medical journals to law reviews, Prof. Steier has gained widespread interdisciplinary interest and some of her articles have been on the Top Ten List on SSRN for several months and her work has been on Amazon.com’s top lists in environmental law.

**Kiran K. Patel**, was Partner and Co-Founder of Food Law International, LLP, (FLI) until summer 2017 and served as co-editor of *International Food Law and Policy* and *International Farm Animal, Wildlife and Food Safety Law*. He is also a registered U.S. patent attorney (licensed to practice in New York and before the US Patent and Trademark Office) practicing as an Associate Attorney at Kramer & Amado, P.C. at, in the Washington, D.C. area, focusing on patent law, particularly the preparation and prosecution of patent applications in a wide range of technological fields, including the areas of electrical engineering and computer science. He also works in the chemical arts, biochemical compounds, mechanical devices and

medical devices, including drug compositions and compounds. He joined Duquesne University School of Law as an adjunct professor teaching the intellectual property and environmental law section in the course “Food Law and Policy” in 2015. As a visiting professor at the University of Perugia, in Perugia, Italy, he also supports Prof. Steier by teaching about the intersections between food law and US intellectual property law.

Patel earned his bachelor of science (BS) in biology with *honors* from Drexel University in Philadelphia, PA. Subsequently, Patel earned his juris doctor (J.D.) at Duquesne University School of Law in Pittsburgh, PA, on a *McDonagh Scholarship* and an *Academic Award Scholarship* and his master of laws (LL.M.) in intellectual property law (specializing in patent law) as a *Dean’s Merit Scholar* at the Benjamin N. Cardozo School of Law in New York, NY. Patel is currently pursuing his masters of science (M.S.) in electrical engineering and computer science at Johns Hopkins University School of Engineering.

## Contributors

**Getachew Mengistie Alemu** is an intellectual property lawyer who drafted most of the present intellectual property laws of Ethiopia, headed the Ethiopian Intellectual Property Office as its first director general until August 2008, and taught intellectual property law to undergraduate and postgraduate students of the law school of Addis Ababa University for more than 12 years. After leaving government office, Mr. Getachew Mengistie Alemu has been serving as an IP consultant and attorney and involved in a number of projects supported by regional and international organizations aimed at strengthening the intellectual property systems and promoting the use of intellectual property as a tool for development in African countries. He had authored or coauthored a number of works, which are published in books, international journals, and workshop proceedings. He is a frequent speaker in regional and international intellectual property forums.

**Stephen B. Balogh** earned his doctorate degree from SUNY College of Environmental Science and Forestry (ESF). As a visiting assistant professor at ESF and adjunct at the Whitman School of Management at Syracuse University, he taught courses about energy systems, urban ecology, and sustainable enterprise. His research concentrates on food and energy flows in urban ecosystems and developing a social-ecological systems framework for sustainability and resiliency planning. His dissertation is entitled “Feeding and Fueling the Cities of the 21st Century.” He has published nine papers and coauthored three book chapters on various topics related to energy, including the nexus of energy and the economy, social-ecological metabolism of cities, the importance of high-quality energy to societal development, the energetic efficiency of agricultural systems, and trade-offs involved in creating an urban green economy. He is currently employed as a postdoctoral researcher at US Environmental Protection Agency in the Atlantic Ecology Division.

**Stan Benda** is a graduate of the Royal Military College, and was a commissioned officer in the combat arms (armour corps). He was an exchange student at West Point. He was senior counsel with the Federal Department of Justice (of Canada). His primary duties were representing Agriculture Canada: the Intellectual Property Secretariat (technology transfer/licensing) as well as the International Science Section. In the latter instance, he acted before the UN FAO (Food and Agriculture Organization) on the International Treaty on Plant Genetic Resources for Food and Agriculture. He is an adjunct professor at Osgoode Hall Law School where he teaches LL.B. and LL.M. students. He is assistant professor at Ryerson University, Ted Rogers School of Management. There he teaches intellectual property law, information and technology law, business law and international trade law. Dr. Benda is also the part-time vice chair of the Ontario Agriculture, Food and Rural Affairs Appeal Tribunal. His LL.M. is in intellectual property. His Ph.D. (Osgoode) pertains to risk assessment, regulation and the labeling of genetically modified crops.

**Michael Blakeney** is Winthrop Professor of Law at the University of Western Australia and visiting professor of Intellectual Property and Agriculture at Queen Mary University of London. He has held academic positions at universities in Australia, Italy, Singapore, UK, and USA. He formerly worked in the Asia Pacific Bureau of the World Intellectual Property Organization. Professor Blakeney has advised the Asian Development Bank, Consulting Group for International Agricultural Research, European Commission (EC), European Patent Office, Food and Agricultural Organization, World Intellectual Property Organization, and a number of university and public research institutes on intellectual property management. He has directed EC projects concerned with the establishment of an IP infrastructure in a number of new EU Member States and EU Applicant States. He has also directed and been a consultant in a number of projects to assist developing countries to become members of the World Trade Organization.

**Harry Bremmers** studied business economics at Tilburg University (till 1977) and Dutch law at the Erasmus University in Rotterdam (till 1993). There he was appointed as assistant professor till 1993 at the economics and the law faculty. He graduated with a Ph.D. in 1994 on a legal-economic subject (effects of environmental law on content of financial reports). From 1993 to 2010, he occupied a full-time position at the business administration group of the Social Sciences Department of Wageningen University, the Netherlands. Since 2010, he is associate professor at the law and governance group of Wageningen University. He participates in national and international projects at the interplay of law and economics and has published on a broad range of legal and economic topics.

**Alexander Bruce** is an associate professor (reader) of law at the Australian National University. Alex is currently completing a DPhil in Comparative Theology at the University of Oxford. He is also a Buddhist monk ordained into the Tibetan tradition of His Holiness the Dalai Lama. Alex is one of Australia's leading authorities in competition and consumer law as well as the emerging field of animals and the law. He has published texts in all these areas of law. Before joining the ANU, Alex was a senior lawyer with the Australian Competition and Consumer Commission and has worked with the United Nations in capacity-building competition and consumer policies in several African countries. His research interests focus on the relationship of sentient beings to the economic structures of society (competition law), whether as consumers of goods or services (humans) or as resources (animals), and the regulation of corporate activity (through the Australian Competition and Consumer Commission), as well as the broader philosophical and religious assumptions associated with that relationship.

**Luciana Della Coletta** is an environmental engineer and earned her PhD in Sciences from University of São Paulo, Brazil, in 2015. Her research has focused in biogeochemistry cycling in terrestrial ecosystems. Currently, she is a lecturer at the Federal Institute of Education, Science and Technology, Brazil, and teaches classes in natural resources management for undergraduate students.

**Nicola Conte-Salinas** is a lawyer admitted to the Bar in Germany. She specializes in German and European Food Law, in particular in nutrition and health claims. She also advises and assists food companies in questions relating to the law against unfair competition, as well as in the area of contract law, in particular as regards general terms and conditions. She has been working in the food law practice of KWG from 2009 to 2015. Since September 2015, Nicola is the team leader for food law with one of the leading German retailers. Nicola is a regular speaker at food law seminars and conferences and author of various publications on food law issues. Nicola graduated from the University of Trier (Germany) and received a Diploma in Legal Studies (with distinction), as well as a Diploma in Higher Education from the University of Wales, Cardiff (UK). She advises and represents clients in German and English.

**Zach Corrigan** is the senior staff attorney for Food & Water Watch. He has been an advocate for sustainability and environmental conservation for more than a decade. He began working on seafood safety issues in 2002 when he served as a staff attorney for the US Public Interest Research Group. There, he was a lead advocate for limiting people's exposure to mercury from contaminated fish by fighting for more stringent EPA rules to curb mercury emissions from power plants. In 2004, Corrigan became a legislative representative for Public Citizen and, shortly thereafter, Food & Water Watch. In May 2006, he became the staff attorney for the organization, working with all of its teams to pursue litigation, regulatory, and legislative solutions for all of the issues on which Food & Water Watch works. He graduated from the University of Wisconsin and earned his J.D. from Northeastern University School of Law in Boston. He is a licensed attorney in the District of Columbia and Massachusetts.

**Abhijeet Das** (at the time of co-authoring the article, *Senior Associate at LexCounsel Law Offices*) has 7 years of experience and has been providing support and advice to a broad spectrum of domestic and foreign clients in their respective sphere of activities. He has extensive experience on the Indian corporate and transactional laws and has represented many global and Indian entities in various transactions, *inter alia*, in relation to transactional documentation, advisory and coordination of transactions, including mergers, acquisitions, amalgamations and asset purchase arrangements. He has actively assisted multiple clients in due diligence exercises in private equity transactions as well as title verifications of real estate. Further, he has been active in the areas of intellectual property and provides transactional guidance vis-à-vis a diverse range of intellectual property assignment and licensing arrangements. In the recent years, he has also been engaged extensively in drafting various copyright development agreements, service level agreements, user agreements for website and mobile applications, etc. In the practice areas of labour and employment, Abhijeet has helped various entities in formulation/standardization of employment contracts, employee manuals and policies on standard employment practices, including leave policies, prohibition of harassment, employment benefits, discipline and grievance, confidentiality, intellectual property rights, anti-bribery obligations and social media. He has also dealt

with pre and post termination restrictive covenants, concerning confidentiality, non-disclosure, non-solicitation and protection of trade secrets. Advisory on legal and regulatory issues pertaining to clinical trials, especially with reference to drafting, revising and negotiating clinical trial agreements is another aspect that he tackles on a regular basis. He has advised various pharmaceutical companies and institutions on various legal issues under the drugs regulatory regime in India.

**Daniel de Castro Victoria** is a researcher at Embrapa Agriculture Informatics, has an undergrad degree in Agronomy Engineering from University of São Paulo (2002), a master's degree from University of São Paulo (2004) and doctors degree from Center for Nuclear Energy in Agriculture (CENA—USP—2010). Research interests include geoprocessing, remote sensing, agrometeorology, land use, and cover change and hydrological modeling.

**Carly Dunster** is a sole practitioner and food lawyer at Carly Dunster Law, where she provides affordable and accessible legal and consulting services to those seeking to build more sustainable food systems. She has worked with many food and urban agriculture initiatives in Toronto, including the Toronto Underground Market, Food Truck Eats, the Food Constellation at the Centre for Social Innovation, and The Depanneur. She is a member of the Toronto Food Policy Council, as well as the Toronto Street Food Project, a group advocating for a friendlier regulatory structure for diverse street food in the city of Toronto. She has sat on the Metcalf Advisory Committee for their Environment Program's Sustainable Food Systems funding stream. She has spoken at a number of conferences on the practice of food law, including the Urban Agriculture Summit and the National Student Food Summit, and before students participating in the Laws in Action Within Schools Program, among others. She works as a capacity-builder in the small- and medium-sized food sector and also spends a significant amount of time convincing other lawyers to specialize in food.

**Wele Elangwe** is a legal specialist for the Maryland Agricultural Law Education Initiative (ALEI) and student services coordinator for the School of Graduate Studies at the University of Maryland Eastern Shore (UMES). She is an internationally trained lawyer with experience working with several law firms, the United Nations, and Catholic charities. She is knowledgeable in common law and civil law and procedure as well as business law, international law, and human rights law. She holds an LL.B. from the University of Buea and a maitrise en droit in business law from University of Yaoundé II in Cameroon and an LL.M. in international law from Indiana University and is pursuing a Ph.D. in organizational leadership at UMES. Wele has authored several reports submitted to the United Nations as well as published with the African Development Bank. Wele recently presented and won first place faculty oral presentation at the 5th annual UMES research symposium in April 2014.

**Yassi Eskandari-Qajar** directs policy at the Sustainable Economies Law Center (theselc.org). The Oakland-based Sustainable Economies Law Center aims to cultivate community resilience and grassroots economic empowerment through

its unique approaches to legal education, research, advice, and advocacy. Yassi has co-authored several influential publications on local policy, including *Regulating Short-Term Rentals: A Guidebook for Equitable Policy* (2016) and *Policies for Shareable Cities* (2013). Yassi completed her legal education through apprenticeship in the California State Bar's Law Office Study Program, and received her undergraduate degree in Conservation & Resource Studies from the University of California, Berkeley.

**Bill Eubanks** is a partner at the public interest environmental law firm Meyer Glitzenstein & Crystal, where he litigates precedent-setting impact cases in federal appellate and trial courts. He specializes in litigation concerning public lands preservation, natural resource conservation, and wildlife and biodiversity protection. His notable cases include successfully challenging oil spill response strategies harmful to marine wildlife in the Gulf of Mexico after Deepwater Horizon, significantly curtailing environmentally damaging off-road vehicle use in Florida's Big Cypress National Preserve, prevailing in the nation's first federal lawsuit challenging an industrial wind energy project on environmental grounds, and coauthoring briefs in four recent US Supreme Court cases involving climate change, genetically engineered crops, naval sonar use, and logging road stormwater runoff. In addition to his litigation successes, Eubanks is a recognized legal scholar, having published numerous law review articles on diverse environmental law and policy topics and having recently coauthored and coedited a textbook titled *Food, Agriculture, and Environmental Law*. He also serves as an adjunct environmental law professor at American University's Washington College of Law, George Washington University Law School, and Vermont Law School.

**Thomas Faunce** has a joint appointment in the ANU College of Law and College of Medicine, Biology and the Environment. He was the recipient of an Australian Research Council Future Fellowship (2010–2013) investigating how nanotechnology could help resolve some of the great public health and environment problems. He has been awarded numerous competitive grants in the field of health technology regulation and has published over 100 refereed articles, over 25 book chapters, and 3 monographs in this field. His most recent research involves governance strategies for globalizing artificial photosynthesis—a field in which he has organized major international conferences and published with leading scientists in the field.

**Jessica Fanzo**, PhD is the Bloomberg Distinguished Associate Professor of Global Food and Agriculture Policy and Ethics at the Berman Institute of Bioethics, the Bloomberg School of Public Health, and the Nitze School of Advanced International Studies at the Johns Hopkins University. She also serves as the Director of the Global Food Ethics and Policy Program at Hopkins, and the Co-Chair of the Global Nutrition Report. Prior to joining Johns Hopkins, Jessica served as an Assistant Professor of Nutrition in the Institute of Human Nutrition and Department of Pediatrics and as the Senior Advisor of Nutrition Policy at the Center on Globalization and Sustainable Development within the Earth Institute at Columbia University. Prior to coming to academia, Jessica held positions in the United

Nations World Food Programme and Bioversity International, both in Rome, Italy. Prior to her time in Rome, she was the Senior Nutrition Advisor to the Millennium Development Goal Centre at the World Agroforestry Center in Kenya. Her area of expertise is on the linkages between agriculture, nutrition, health and the environment in the context of sustainable and equitable diets and livelihoods. She was the first laureate of the Carasso Foundation's Sustainable Diets Prize in 2012 for her work on sustainable food and diets for long-term human health. Jessica has a PhD in nutrition from University of Arizona.

**Magnus Friberg** is a lawyer in Sweden with Setterwalls Advokatbyrå and has some 20 years' experience in advising Swedish and international clients. His areas of expertise include consumer protection, marketing practice legislation, and industry codes. He also handles product regulatory legislation particularly in the field of life sciences legislation including food and pharmaceuticals. He provides advice to Swedish as well as foreign clients in these areas and also represents them before authorities and courts, and he is also a much appreciated lecturer. He earned his degrees from Lund University (LL.M.) 1990, University of Copenhagen, EC Law. He has been a practicing lawyer since 1990.

**Anel Gildenhuis** is a lecturer at the Faculty of Law, North-West University (Potchefstroom Campus), South Africa. Her research focus is on food security, the right to (have access to sufficient) food, human security, and framework legislation. In her doctoral thesis (2011) "Voedselsekerheid as Ontwikkelingsdoelwit in Suid-Afrikaanse Wetgewing: 'in Menseregte-gebaseerde Benadering'" ("Food Security as Developmental Goal in South African Legislation: A Human Rights-Based Approach") (North-West University (South Africa)), she applied a human rights-based approach to discuss various means to accommodate food security, as a developmental goal, in South African national legislation.

**Hans-Ulrich Grimm** is Germany's foremost journalist covering food-related topics. He was born in the Allgäu and is a journalist in Stuttgart. He studied in Heidelberg history, German, and education and was a journalist and editor of the news magazine Der Spiegel. He has been a freelance writer since 1996. The total circulation of his books is one million copies. They have been translated into many languages. For his books, he researched worldwide such as in Europe, the USA, Japan, China, and the South Seas. He inspected food factories and interviewed researchers, politicians, and nutritionists and their patients. He is searching for good food, with dedicated farmers, good gardeners, and talented chefs.

**Nora Ourabah Haddad** has a background in economy and holds a degree in Business Administration from the High Business School of Grenoble, France (Ecole Supérieure de Commerce) and a Masters of Business and Administration in International Management from Laval University in Canada. From 2000 until 2010, Ms. Ourabah Haddad worked as Senior Policy Officer at the International Federation of Agricultural Producers (IFAP) on Policy analysis and formulation related to food security, sustainable agriculture, and rural development, as well as on developing the institutional, leadership and knowledge capacity building of

agricultural and rural organizations. She worked on several projects aiming at strengthening farmers' organizations. One of her main responsibilities was to promote agricultural and rural development working closely with national and international policymakers (from both developed and developing countries) and to encourage them to develop investments in agriculture and rural areas. She developed several publications and policy papers reflecting the view of farmers' organizations worldwide. Prior to joining IFAP, Ms. Ourabah Haddad worked for a USDA funded program, the National Center for Food and Agricultural Policies (NCFAP). Ms. Ourabah Haddad joined FAO in 2010 as Rural Institutions Officer and soon became Team leader of rural institutions and people's empowerment. In 2013, she moved to the position of cooperatives and producer organizations coordinator within the division for communication, partnerships and advocacy. She co-authored several publications and articles on rural institutions, collective action, and rural development. Since May 1 2016, she was appointed by the Director General as FAO Representative to the Sultanate of Oman.

**Charles A.S. Hall** is a systems ecologist who received his Ph.D. under Howard T. Odum at the University of North Carolina at Chapel Hill. Dr. Hall is the author/editor of 13 books and some 300 scholarly articles and was awarded last year the distinguished Hubbert-Simmons Prize for Energy Education. He is best known for his development of the concept of EROI, or energy return on investment, which is an examination of how organisms, including humans, invest energy into obtaining additional energy to improve biotic or social fitness. He has applied these approaches to fish migrations, carbon balance, tropical land use change, and the extraction of petroleum and other fuels in both natural and human-dominated ecosystems. Presently he is developing a new field, biophysical economics, as a supplement or alternative to conventional neoclassical economics, while applying systems and EROI thinking to a broad series of resource and economic issues. In his latest book, *Energy and the Wealth of Nations*, Hall and coauthor Kent Klitgaard explore the relationship between energy and the wealth explosion of the twentieth century, the failure of markets to recognize or efficiently allocate diminishing resources, the economic consequences of peak oil, the EROI for finding and exploiting new oil fields, and whether alternative energy technologies such as wind and solar power meet the minimum EROI requirements needed to run our society as we know it.

**Randy Hayes** has been described in the *Wall Street Journal* as "an environmental pit bull." He is executive director at Foundation Earth, a new organization working to eradicate ecological externalities that threaten the biosphere's life support systems. Foundation Earth promotes a true cost economy. As a former filmmaker and Rainforest Action Network founder, he is a veteran of many high-visibility corporate accountability campaigns and has advocated for the rights of indigenous peoples. He served 7 years as president of the city of San Francisco's Commission on the Environment and as director of sustainability in the office of Oakland's mayor, Jerry Brown (now governor). As a wilderness lover, Hayes has explored the

High Sierras, the Canadian Rockies, and the rainforests of the Amazon, Central America, Congo, Southeast Asia, Borneo, and Australia.

**Denis Herbel** graduated with a degree in rural economics from Institut des Hautes Etudes de Droit Rural et d'Economie Agricole (Paris), in management at IAE (Rennes Business School), and in economics of commodity markets at Grenoble University (France). He has been working on development in Africa for 30 years. He specialized in agricultural cooperatives and producers' organizations (farmer collective action) in developing countries. He is the coauthor of different publications and papers on the subject. He has been working as advisor for producer organizations and cooperatives within the Partnerships, Advocacy and Capacity Development Office of FAO.

**Peter Sousa Hoejskov** is technical officer for food safety at the World Health Organization (WHO) Division of Health Security and Emergencies (DSE), Regional Office for the Western Pacific Region (WPRO) in Manila, Philippines. He assists countries in the Western Pacific Region in strengthening national food safety systems and their capacity to prepare for and respond to food safety incidents and emergencies. Mr. Hoejskov joined WHO in 2011, and before taking up his assignment in the Regional Office for the Western Pacific, he worked as a technical officer for food safety and noncommunicable diseases in the WHO Division of Pacific Technical Support (DPS) based in Suva, Fiji. Prior to joining WHO, Mr. Hoejskov worked as international technical advisor for the Food and Agriculture Organization of the United Nations (FAO) in Bangladesh (2010–2011) and as food quality and safety officer at the FAO Regional Office for Asia and the Pacific in Bangkok, Thailand (2006–2009). Mr. Hoejskov holds a master of science degree with specialization in food quality and safety, an AP degree in international trade and marketing with focus on international food laws and regulations, and a certificate in public health and nutrition promotion. Mr. Hoejskov is guest lecturer at the Food Law Internet Certificate Program offered by the Institute for Food Laws and Regulations and the College of Agriculture and Natural Resources at Michigan State University, USA.

**Sam Jennings** has a background in microbiology, and her work with the consultancy Berry Ottaway & Associates Ltd. spans almost 20 years. Her role covers scientific, technical, and regulatory aspects within the food industry, especially the dietary/food supplements and functional food sectors. She provides advice to industry and plays an active role in the development of European Community food legislation. She also liaises with governments across the world on topics particularly relating to dietary/food supplements. Sam is Technical Advisor to the Council for Responsible Nutrition UK (CRN UK) in the UK. She has been Chair of the International Technical Group (2012–2017), and is a member of the Scientific Council under the auspices of the International Alliance of Dietary/Food Supplement Associations (IADSA). Sam has co-authored chapters for three books, one of which has been translated and published in China and Russia.

**Ronit Justo-Hanani** is a visiting scholar at the University of California, Berkeley. She holds a bachelor's degree in law (LL.B) and master's degree in ecology and environmental studies (MSc) and has completed her Ph.D. requirements at the Faculty of Life Sciences affiliated with *Edmond J. Safra Center* for Ethics, Faculty of Law, Tel Aviv University. After her master's degree, she was awarded a UNESCO fellowship to study for a year at the Sheffield Institute of Biotechnology Law and Ethics, at the University of Sheffield, UK, where she studied GMO and agricultural biotechnology regulation with Prof. Kinderlehrer. She then moved back to Israel, where she wrote her Ph.D. dissertation on regulatory policies on nanotechnology risk in the EU and the USA. She also wrote several research reports on GMO regulation and policy for the Israeli Ministry of Agriculture and Rural Development. Her academic and policy work spans regulatory policies for biodiversity and ecosystems management, agricultural biotechnology, and environmental science policy.

**Roland Kölcsény-Rieden** was born in 1966 and is attorney-at-law (D, H) and mediator. He specializes in real estate law, corporation law, mergers and acquisitions, and food law. He attended the Faculty of Law at the University of Munster, Germany, and University of Bonn, Germany, and had his nostrification of German state examination and completion of Hungarian doctorate at the Peter Pazmany Catholic University, Budapest. Roland was an associate at the Oberlandesgericht in Cologne, had internships at Lewalder & Partner in Bonn and Krasznai & Partner in Budapest 1997, and is an attorney in the international partnership of Nörr Stiefenhofer Lutz in Munich and Budapest. From 2000, at Köves Clifford Chance Pünder in Budapest, he is a member of the real estate department and the head of the "German Desk." From 2003, he is a member of the Kölcsény-Rieden & Bánki partnership in cooperation with e/n/w/c Eiselsberg Natlacen Walderdorff Cancola Rechtsanwälte GmbH from Vienna. From April 1, 2006, he is a managing partner at BKRU. From June 3, 2008, he is a managing partner at Kölcsény-Rieden, Haslwanter & Partners Law Firm, a member of the COLAW International Legal Alliance. Roland speaks German, English, and Hungarian

**Anatoly Kutysenko** graduated from the Department of Physics, Moscow State University, in 1996 and obtained a master's degree in biochemistry from McGill University in 2003. Prior to joining the private sector in 2004, he worked for McGill University and the National Research Council of Canada. Anatoly has previously worked at the various quality and regulatory management positions in Cargill and Mars and is currently heading the technical regulatory and quality department in Amway Russia and Kazakhstan.

**Sara Lavenhar** graduated in 2014 from Columbia University with a bachelor's degree in environmental science with a special concentration in sustainable development. While studying at Columbia, Sara began to conduct research into the food industry and became passionate about sustainable agriculture. She has had the opportunity to work with nonprofits like the Community Alliance for Global Justice and the Mangrove Action Project (MAP) to address challenges of food sovereignty

and conservation. In a formal research setting, Sara investigated the microbiology of rooftop farms as a way to improve the efficiency and sustainability of urban agriculture for her senior thesis project. Sara is also an avid writer, cook, and archer. She intends to pursue a graduate degree and career in sustainable agriculture to promote and advocate for a healthy food system.

**Ching-Fu Lin** is Assistant Professor of Law at National Tsing Hua University (NTHU), where he teaches international health law, food law and policy, and international law and global governance. Professor Lin received his LL.M. and S. J.D. from Harvard Law School, with the honor of John Gallup Laylin Memorial Prize (best paper in public international law) and Yong K. Kim Memorial Prize (best paper in East Asian legal studies). He also holds a double degree in law (LL. B.) and chemical engineering (B.S.) from National Taiwan University. Before joining NTHU in 2015, Professor Lin served as Visiting Fellow at Graduate Institute of International and Development Studies in Geneva, Switzerland. He has also been Peter Barton Hutt Student Fellow at Petrie-Flom Center for Health Law Policy, Biotechnology, and Bioethics as well as Visiting Scholar Coordinator at East Asian Legal Studies Program, Harvard Law School. Active in legal academia, Professor Lin has been invited to lecture in many academic settings, such as Summer Academy in Global Food Law and Policy in Spain, Brescia University School of Law in Italy, and World Food Law Program and the United Nations Food and Agriculture Organization in the United States. His legal scholarship has appeared in numerous journals and edited collections, including *Virginia Journal of International Law*, *Columbia Science and Technology Law Review*, *Food and Drug Law Journal*, and *Journal of World Trade*.

**Silvia Rafaela Machado Lins** University of São Paulo, CENA, Piracicaba, SP, Brazil. She has a Bachelor in Biology from the Federal University of Alagoas, a Master and Doctor of Science in Applied Ecology at ESALQ/USP. She works with tropical ecosystems ecology, specifically with the nutrients' cycles in the Coastal Atlantic Forest, Brazil.

**Nina Charlotte Lindbach** is a senior associate at Haavind in the business area of technology, media, and IPR. Lindbach joined the firm in 2013 and primarily assists clients within the intellectual property sector. She graduated from the University of Bergen, Faculty of Law, in 2013.

**Hulló Livia** was born in 1983 (attorney-at-law (H), LL.M. (master of laws)). Hullo specializes in consumer protection law, food law, competition law, European law, administrative law, and commercial law. She attended the Faculty of Law, University of Szeged, and she also studied, under Erasmus scholarship, at the Ludwig Maximilian University (LMU) of Munich, Munich, Germany. From 2004 to 2006, she pursued German and European commercial law studies at the University of Szeged and at the University of Potsdam. From 2007 to 2008, she studied comparative administrative law and European law studies (LL.M.) at the German-speaking Andrassy Gyula University, Budapest, Hungary. From 2008 to 2013, Hullo was a trainee at Kölcsey-Rieden, Haslwanter & Partners Law Firm and in 2013 became a

partner at Kölcsey-Rieden, Haslwanter & Partners Law Firm, a member of the COLAW International Legal Alliance. Hullo speaks Hungarian, English, and German.

**Rebecca Lopez-Garcia** is the principal in Logre International Food Science Consulting, based in Mexico City. Dr. López-García works in the areas of food safety, toxicology, and regulatory compliance around the world. Rebecca has participated as a consultant in international cooperation projects with organizations such as the United Nations Food and Agriculture Organization (FAO) and the United States Agency for International Development (USAID). She is the lead instructor of Latin American food laws and regulations in the International Food Law Certificate Program of the Institute for Food Laws and Regulations (IFLR) at Michigan State University. Rebecca López-García holds a Ph.D. degree in food science/toxicology from Louisiana State University and a certificate in international food law from Michigan State University. She is a certified food scientist (CFS) by the Institute of Food Technologists and a certified quality auditor (CQA) by the American Society for Quality.

**Marcelin Tonye Mahop** is working as independent/freelance consultant based in London, UK. Dr. Mahop's interests extend to intellectual property policy and development (IP and agriculture, IP and pharmaceutical innovations, IP and biodiversity and traditional knowledge, management of IP) and to genetic resources policies including seed regulations and access to and utilization of biological and genetic resources and community rights. He earned the University of London Ph.D. in 2007. He has held research positions at Queen Mary University of London; Brunel University in London, UK; and Wageningen University in the Netherlands. He is published in international journals. Dr. Mahop is the author of *Intellectual Property, Community Rights and Human Rights: The Biological and Genetic Resources of Developing Countries*, published by Taylor & Francis in 2010, and coeditor of *Extending the Protection of Geographical Indications: Case Studies of Agricultural Products*, published in 2012 by Taylor & Francis. He is the lead author of a 2014 handbook of the African Agricultural Technology Foundation (AATF) which provides an overview of the plant variety protection regimes of 32 - sub-Saharan African countries and is the lead researcher and lead author of a major January 2013 report that explores seed systems and plant variety protection regimes in five sub-Saharan African countries.

**Aude Mahy** is a counsel and admitted to the Brussels bar and specialized on (international) commercial law and European and Belgian food law. Aude presides the Loyens & Loeff Food & Beverages team. In this capacity, she advises and assists food business operators on various matters such as nutrition and health claims, labeling issues, market practices and advertising, food safety (including additives and other issues with respect to the composition of foodstuffs), placement on the market, importation in the European Union, etc. This involves close collaboration with the relevant authorities and also includes dispute resolution before the courts. Aude is an active member of the European Food Law Association (EFLA)

and of the Food Lawyers Network (FLN). She cooperates with the European Food and Feed Law Review (EFFL—Lexxion as the legal publisher) as a correspondent for Belgium and is a regular speaker at seminars and conferences on food law topics. She is mentioned as an expert in food law by the Legal 500 EMEA directory (editions 2014, 2015, 2016, and 2017). She graduated from the law faculty of the Université Libre de Bruxelles and completed a certificate in EU food law at the University of Michigan. Aude works in French, English, Dutch, and Spanish.

**Silvia Fernanda Mardegan** is assistant professor of the Federal University of Pará. She graduated as biologist at Londrina State University, and holds her masters in ecology from the National Institute for Research in the Amazon, and doctoral degree in applied ecology from the University of São Paulo. Her research interests are ecosystem processes related to nitrogen and carbon cycles in natural and disturbed areas.

**Luiz Antonio Martinelli** is full professor of the University of São Paulo. He graduated as an agronomist and earned his master and doctoral degrees also at the University of São Paulo. He is an expert in biogeochemistry of tropical forests and agriculture and development in developing countries.

**Ikechi Mgbeoji** is educated in Canada, Germany, and Nigeria, Prof. Dr. Ikechi Mgbeoji earned a doctorate degree in law from Dalhousie University, Halifax, Canada. His master's degree earned him the Governor General of Canada Academic Gold Medal. Ikechi is a full professor at Canada's Osgoode Hall Law School, York University, where he teaches patent law, international aspects of intellectual property law, and public international law. Ikechi is the author of four books and dozens of articles in reputable law journals.

**Dimpy Mohanty** is Partner at the Delhi Office of LexCounsel Law Offices and has over 18 years of experience advising and representing in the general corporate and commercial practice area as well as in the specialized practice areas *inter alia* of Labour & Employment and Life Sciences and Biotechnology. Her Life Sciences and Biotechnology practice includes advice on issues such as classification of BAFS, OTC, and herbal health products and cosmetic products, permitted, restricted, and prohibited ingredients, labeling and registration requirements, Indian food and drug laws including as applicable to companies engaged in the manufacture, distribution, import and export of ice creams, health supplements, cosmetics and medical devices and obtaining registration of products under the applicable laws. Dimpy is also active in the regulatory practice area and has experience in liaising with ministries including for invitation based comments/suggestions on the consolidated FDI Policy and participating in discussions held in this regard. She has been invited to speak at conferences and seminars included those hosted by the International Bar Association.

**Julius T. Mugwagwa** is a research fellow in the Development Policy and Practice (DPP) Unit and INNOGEN Institute in the UK. He received undergraduate and postgraduate training in biological sciences, biotechnology, and business

administration in Zimbabwe before attaining a Ph.D. in science, technology, and innovation policy at the Open University in 2008. Julius has worked in a number of sectors including veterinary research, pharmaceutical production and quality assurance, medicine control, agricultural biotechnology research, and biotechnology/biosafety governance. He is a past recipient of a Leverhulme Early Career Fellowship (2009–2011) and currently (2013–2015) a holder of a research fellowship under the UK Economic and Social Research Council (ESRC) Future Research Leaders Scheme. Julius' ongoing research focuses on innovation systems in health and agricultural biotechnology, with a special interest in governance and adoption of technological and institutional innovations at sectorial, national, and cross-national levels, using concepts such as “multi-layered governance” and “policy gridlocks.” His recent intellectual contributions include the concepts of “policy kinetics” and “innovative spending.”

**Kennedy Mwacalimba** holds a Ph.D. in public health and policy from the London School of Hygiene and Tropical Medicine (2011). His core expertise is in the areas of policy analysis, epidemiology, public health, and risk analysis. His areas of interest include multi-sectorial risk management policy development, the sociology of risk, zoonosis risk assessment, cost-benefit analysis of zoonotic disease control, food safety, and international livestock and livestock product trade.

He is a former faculty member in public health at the University of Zambia, where he lectured in public health, epidemiology, livestock economics, environmental health, and food safety. He was also the course developer of the emerging and re-emerging diseases course and course leader of the health economics, policy, implementation, and evaluation course under the MSc in One Health Analytical Epidemiology hosted jointly by the Schools of Veterinary Medicine and Medicine of the University of Zambia. He is now an independent policy researcher based in Indianapolis, Indiana, where he conducts independent medical and pharmaceutical policy, livelihood impact, and One Health research. He has also worked as an independent policy researcher based in Indianapolis, Indiana, where he conducted independent medical and pharmaceutical policy, livelihood impact, and One Health research. He is now Associate Director, Outcomes Research for Zoetis (US Operations).

**Michael J. Nathenson** is Instructor in Medicine at the Dana Farber Cancer Institute at Harvard Medical School in Boston. He previously completed a sarcoma fellowship at the MD Anderson Cancer Center in Houston, Texas. Prior to that, he worked as a hematology oncology fellow at the University of Maryland Greenebaum Cancer Center in Baltimore, Maryland. He is a contributing author to the textbook *International Food Law and Policy*. He holds a BS from Brandeis University and an M.D. from Tufts University. He completed training in internal medicine at the University of Pittsburgh Medical Center and is boarded in internal medicine and in hematology/oncology.

**Uche Ewelukwa Ofodile** is a professor of law at the University of Arkansas School of Law in Fayetteville, Arkansas, where she teaches a broad range of courses including international trade law, international investment law, intellectual

property law, the right to food, public international law, and business and human rights. Professor Ewelukwa also teaches in the law school's *LL.M. program in agriculture and food law* offering courses such as "the right to food," "intellectual property issues in food and agriculture," and "corporate social responsibility in the food and agricultural sector." Professor Ofodile is widely published. Her articles have appeared in many highly rated journals including *Michigan Journal of International Law*, *Minnesota Journal of International Law*, *Transnational Dispute Management*, *Vanderbilt Journal of Transnational Law*, *Yale Human Rights and Development Law Journal*, the *University of Miami Law Review*, and the *Cornell Journal of International Law* (forthcoming). Professor Ofodile is the recipient of several fellowships including a fellowship from the Carnegie Council on Ethics and International Affairs. In 2014, she received the *Outstanding Year-in-Review (YIR) Contribution Award* from the American Bar Association Section of International Law for the section on "Corporate Social Responsibility" that she edited and coauthored. Professor Ofodile was also the winner of the *2009 Human Rights Essay Award* from the Academy on Human Rights and Humanitarian Law, American University Washington College of Law. Professor Ofodile presently serves as the secretary general of the African Society of International Law and is on the advisory board of the *African Journal of Legal Studies* and the Africa International Legal Awareness, a nonprofit organization working to build capacity and promote sustainable economic development in African countries.

**Raymond O'Rourke** is a qualified Barrister and a specialist food regulatory and consumer affairs lawyer. He worked for many years in legal firms both in Brussels and Dublin and now has his own law practice. He has written two books European Food Law (3rd edition) (2005) Thomsen/Sweet & Maxwell and Food Safety & Product Liability (2000) and numerous articles on food and consumer protection law issues. He is presently Vice-Chair of the Management Board of the European Food Safety Authority (EFSA) and also is Chairman of the Consumers Association of Ireland (CAI).

**Janelle Orsi** is a lawyer, advocate, writer, and cartoonist focused on cooperatives, the sharing economy, urban agriculture, shared housing, local currencies, and community-supported enterprises. She is cofounder and executive director of the Sustainable Economies Law Center (SELC), which facilitates the growth of more sustainable and localized economies through education, research, and advocacy. Janelle has also worked in private law practice at the Law Office of Janelle Orsi, focusing on sharing economy law since 2008. Janelle is the author of *Practicing Law in the Sharing Economy: Helping People Build Cooperatives, Social Enterprise, and Local Sustainable Economies* (ABA Books 2012) and coauthor of *The Sharing Solution: How to Save Money, Simplify Your Life & Build Community* (Nolo Press 2009), a practical and legal guide to cooperating and sharing resources of all kinds. In 2014, Janelle was selected to be an Ashoka fellow, joining a robust cohort of social entrepreneurs who are recognized to have innovative solutions to social problems and the potential to change patterns across society. In 2010, Janelle was profiled by the American Bar Association as a legal rebel, an attorney who is

“remaking the legal profession through the power of innovation.” In 2012, Janelle was one of 100 people listed on The (En)Rich List, which names individuals “whose contributions enrich paths to sustainable futures.”

**Peter Berry-Ottaway** is a food scientist and technologist with considerable experience in food law. During a career spanning over 50 years in the food industry, Peter has been involved in a very wide range of food sectors and products and accumulated considerable experience in the areas of food product development and food safety and control. In 1974, he formed a scientific consultancy specializing in food science, technology, nutrition, and food law. Peter has played an active role in the development of European Community food legislation and works with governments across the world. He is the author, editor, or contributor of numerous books and papers on food science, food technology, and food law and for 8 years was the editor in chief of the *International Review of Food Science and Technology*. Peter has been appointed chair of a number of expert committees and working groups. He has been involved with Codex Alimentarius Committees for nearly 30 years.

**Alexey Petrenko** is the general manager of EAS Strategic Advice, the global regulatory consultancy, in Russia and CIS. He is an expert in the Russian regulatory system and legislation covering food safety, sanitary requirements, and technical regulations. He also specializes in legislation of the customs union of Russia, Belarus, and Kazakhstan. Alexey had an extensive experience of working for and with large international companies and NGOs, e.g., the US-Russia Business Council and the American Chamber of Commerce, on a number of projects assisting US and EU businesses in Russia and beyond. Alexey holds a Ph.D. in organic chemistry from the University of Hull, UK.

**Andreas Popper** studied law at the Universidad “Pontificia de Salamanca” in Spain and at the Ludwig Maximilian University of Munich in Germany. He has earned his master’s degree in intellectual property and transnational law at “Temple University” in Tokyo. After his time as assessor at the Higher Regional Court of Munich, he was an assistant to Prof. Dr. Kigawa in Tokyo and started his career at firms in Germany, Spain, the UK, and Belgium working mainly on EU foreign trade, anti-dumping, and regulatory matters. Since 1994, he spent an increasing amount of time in Japan, and in 2003, he became counselor for East–west relations at the Miyazaki (South Japan) local government. Subsequently, he worked in Tokyo at the law department of Sonderhoff & Einsel Law and Patent Office and as representative director of the Japanese subsidiaries of IQS Avantiq AG, a global branding specialist, and of Inovia Holdings Pty Ltd, a coordinator of PCT national stage applications. During his first years of work, he recognized the links between regulatory legislation and intellectual property law. In 2007, he cofounded the naexasCompass Group in Tokyo, to engage in the intersection between intellectual property law, product compliance, foreign trade, and import duty policies. Since then, he supported the strategic planning and implementation of global branding and market entry projects of medium- and large-sized enterprises. By 2014, his firm established offices in Tokyo, Shanghai, Singapore, the USA, and the EU. He is

invited as expert speaker to conferences, seminars, and round tables of organizations such as the International Trademark Association (INTA), the Pharmaceutical Trade Marks Group (PTMG), and the International Bar Association (IBA).

**Alfredo Quarto** is the executive director and cofounder of the Mangrove Action Project (MAP), is a veteran campaigner with over 35 years of experience in organizing and writing on the environment and human rights issues. Formerly an aerospace engineer, his experiences range over many countries and several environmental organizations, with a long-term focus on forestry, indigenous cultures, and human rights. Prior to MAP, he was the executive director of the Ancient Forest Chautauqua, a multimedia traveling forum with events in 30 West Coast cities on behalf of old-growth forests and indigenous dwellers. Alfredo has published numerous popular articles, book chapters, and conference papers on mangrove forest ecology, community-managed sustainable development, and shrimp aquaculture. He lives on a small, organic farm in Port Angeles, Washington, and is conversant in Spanish.

**Michael Roberts** is the founding executive director of the newly established Resnick Program for Food Law and Policy at the UCLA School of Law. He is well versed in a broad range of legal and policy issues from farm to fork in local, national, and global food supply systems. He is a prolific author, having contributed to books and having written several articles on food regulation, trade, and policy issues. Roberts has published the first major treatise on food law, titled *Food Law in the United States*, Cambridge University Press. He is also coeditor of *Food Law & Policy*, a new casebook to be published by Wolters Kluwer. He has guest lectured on food law subjects at various law schools in the USA, Europe, and Asia, with frequent visits to the Renmin University School of Law (Beijing), East China University of Science and Technology (Shanghai), and the University of Tuscia European Food Law Center (Viterbo, Italy). He is a research fellow for Renmin University's Center for Coordination and Innovation for Food Safety. In 2000, He left his law practice and enrolled in the LL.M. program on agricultural law at the University of Arkansas School of Law, the only such program in the USA. Since then, Roberts has engaged in a variety of professional capacities related to food law and policy. A few years after completing the LL.M. program, he was invited to join the University of Arkansas School of Law as a research professor of law and as the director of the National Agricultural Law Center, where he taught food law and policy and founded the law school's *Journal of Food Law and Policy*. He is the former first chair of the Lex Mundi (world's largest association of private law firms) international agribusiness practice group. Roberts also was of counsel in Washington, DC, with Venable LLP, as a member of the firm's food and agricultural law practice group, and special counsel to the Roll Global farming and food companies headquartered in Los Angeles, where he was responsible for global food regulation, trade, and public policy. He was also a visiting scholar and consultant to the United Nation's Food and Agriculture Organization (FAO) in Rome. Roberts serves on the Los Angeles Food Policy Council's Leadership Board and chairs the Los Angeles Garden School Foundation. He also serves on the advisory board for

the World Food Law Institute and serves on the editorial board for MDPI's *Laws*, an open access scholarly journal.

**Mariagrazia Rocchigiani** graduated in political science at the University of Rome La Sapienza, and she holds a master's degree in "sources, instruments and methods of social research." She has been working on development and food security topics for 11 years first at the UN World Food Programme (WFP) and then for the UN Food and Agriculture Organization (FAO). Since 2013, she has been working as a cooperatives officer within the Partnerships, Advocacy and Capacity Development Office of FAO where she focuses on organizational strengthening topics for producers organizations and cooperatives at global, regional, and national level.

**Bernard Rollin's** scholarly interests include both traditional philosophy and applied philosophy. In addition to numerous articles in the history of philosophy, philosophy of language, ethics, and bioethics, he is the author of *Natural and Conventional Meaning* (1976); *Animal Rights and Human Morality* (1981, 1993, & 2006); *The Unheeded Cry: Animal Consciousness, Animal Pain and Scientific Change* (1988 & 1998); *Farm Animal Welfare* (1995); *The Frankenstein Syndrome* (1995); *Science and Ethics* (2006); and *Putting the Horse Before Descartes* (2011). He has edited two volumes of *The Experimental Animal in Biomedical Research* (1989 & 1995). He is one of the leading scholars in animal rights and animal consciousness and has lectured over 1500 times all over the world. He is a weight lifter, horseman, and motorcyclist.

**Giorgio Rusconi** was born in Como, Italy, on May 31, 1971. He graduated from the State University of Milan (J.D.) in 1997 and was admitted in Italy in 2000. In 1996, thanks to a scholarship awarded by the European Commission, he attended the International Faculty of Comparative Law of Strasbourg, in France, obtaining a *doctorate* in comparative law. Giorgio has been assisting Italy-based multinational companies and inbound clients and dealing, inter alia, with food, drugs, cosmetics, and agricultural law with respect to a wide range of legal services toward food, drugs, and agricultural businesses including product liability, labeling and advertising, regulatory matters, and litigation. He has acquired significant experience in the field of food and drugs law as well as agriculture law, assisting his clients in connection with product liability matters, labeling and advertising, and applicable legislation, as well as in litigation, providing legal advice, among others, within advertising projects or for the creation of labels, both at the national and international level (for instance, verifying the presence of all information required by law, the choice of a trade name, or the wording adopted or ensuring that the label bears no misleading nutritional claim), providing assistance both out of court in drafting contracts for companies operating at all levels in food industry and in litigation before all authorities responsible for controlling food hygiene and safety. The approval of TV advertisements and marketing campaigns also constitutes work in this area. Storyboards are examined and clients assisted in their relationship with advertising agencies, as well as deal with legal issues concerning comparative

advertising. Clients are represented in different legal proceedings concerning commercial disputes on labeling (unfair competition, industrial property), summary proceedings and injunction proceedings, actions for damages and criminal proceedings (e.g., defending company directors prosecuted for deception), and administrative proceedings. He is secretary general and founding member of FLN—*Food Lawyers Network Worldwide*—an international pool of professionals set up to the purpose of sharing opinions and enhancing exchange of views and experiences by lawyers with expertise on food law from all over the world as well as offering integrated legal services to multinationals operating in food industry.

**Gunnar Sachs**, Maître en droit (Paris) and Doctor of Law (Dr. iur.), is partner in the Düsseldorf office of the global law firm Clifford Chance and Expert Lawyer for Intellectual Property Law, with long-standing experience in the food, healthcare, chemicals, and consumer goods sectors. He is an active member of the firm's worldwide industry groups "Consumer Goods & Retail" as well as "Healthcare, Life Sciences & Chemicals." He worked as a recognized EU expert in the EU-China Project as well as in the EU-Turkey Project on the Protection of Intellectual Property Rights and is a member of the German Association for Food Law and Food Science (BLL), the German Association for the Protection of Intellectual Property (GRUR) as well as of the German China Desk and Franco-German cross-border team of Clifford Chance. Gunnar Sachs represents national and international clients from regulated sectors, including the food industry. In addition to his daily work as a lawyer for Clifford Chance, he has also worked as external general counsel for and has assumed the direction of the German legal departments of one of the biggest US retail and multichannel companies and the world's leading TV shopping network, as well as of a leading US biotechnology company, which gave him further helpful insights into the relevant markets. During his legal clerkship, Gunnar Sachs has worked, inter alia, for the World Trade Organization in Geneva; for the French Ministry of Economics, Finance and Industry in Paris; for the French Ministry of Defense in Paris; for the Embassy of the Federal Republic of Germany in Paris; for the German Institution for Arbitration in Berlin/Bonn; as well as for the State Parliament of North Rhine-Westphalia in Düsseldorf. As a student and doctorate scholarship holder of the Konrad Adenauer Foundation, he has studied at the universities of Münster, Cologne (Dr. iur.), and Paris (Maître en droit). He is also a sought speaker at relevant food law events all over the world and has lectured at the University of Düsseldorf. Further, Gunnar Sachs is author of a handbook on "ethics for arbitrators" and coauthor of the WiKo legal commentary series on medical devices law, as well as coauthor of a handbook on medical devices law.

**Liviu Steier** is a specialist in prosthodontics and in endodontics. He has been appointed visiting professor at Tufts Dental School and the University of Florence and was clinical associate professor and the clinical and course director of the MSc in endodontics at Warwick Medical School, the University of Warwick. Steier holds various memberships and fellowships. He serves in the editorial board for the *Brazilian Dental Journal*, *Reality Esthetics*, and *Reality Endo*, in the scientific

advisory board for the *Journal of Endodontics*, and as a reviewer for the *Journal of Photomedicine and Laser Surgery*. He has published commissioned chapters in three books and numerous articles and abstracts in international peer-reviewed dental journals. Steier maintains, together with his wife, a private practice in Mayen, Germany.

**Regina Steier** is a general dental practitioner in dental practice in Germany. She published together with her husband Prof. Dr. Liviu Steier and serves as clinical fellow teacher at Warwick Medical School—the University of Warwick. With her excellent clinical skills, she has gained widespread international acclaim in the field of dentistry.

**Juanjuan Sun** obtained her doctor of laws at Nantes University, France. Focusing on food law, the subject of her thesis is about the international harmonization of food safety regulation in light of the American, European, and Chinese Law. Currently, she is the postdoctor at China Renmin University as well as a researcher of the European food law program Lascaux, the Center of *Cooperative Innovation for Food Safety Governance*, and the China Food Safety Law Research Center.

**Victor Tutelyan** is the director general of the Institute of Nutrition of the Russian Academy of Sciences. He is a leading Russian expert in toxicology and nutrition and Russia's top regulator in safety and quality of foods. Tutelyan is an appointed expert of the World Health Organization (WHO) in food safety, a member of Codex Committee on Food Additives and Codex Committee on Contaminants in Food, the chair of WHO's collaborative center for monitoring food contamination, and a board member in the Institute of Life Sciences. He authored more than 500 papers including 8 monographs, 12 patents, and 60 regulations. He supervised 6 doctorships and 35 Ph.D.s.

**Marie Vaale-Hallberg** is an associated partner of Haavind law firm situated in Oslo, Norway. Vaale-Hallberg joined the firm in 2011 and primarily assists clients within the food and drink sector, but she also gives advice concerning intellectual property and contract law. Vaale-Hallberg's particular interest in the food industry awoke when working as in-house counsel at TINE SA, the biggest dairy company in Norway, owned by Norwegian farmers. In this period, Vaale-Hallberg dealt with, e.g., food law, regulatory issues, R&D, intellectual property, and marketing, but she also gained valuable commercial insight working as company secretary to the company's top management from 2009. She graduated from the University of Oslo, Faculty of Law, in 2003. Between her graduation and employment with TINE, Vaale-Hallberg worked as an associate within another Oslo-based law firm, Wiersholm. Marie Vaale-Hallberg is a member of the Food Lawyers Network and country correspondent for the *EFFL (European Food and Feed Law Review)*.

**Bernd van der Meulen** is private consultant in food legal affairs and professor of Food Law at Wageningen University (the Netherlands). Wageningen University teaches an MSc specialization in Food Law and Regulatory Affairs which combines legal and scientific know-how. The food law curriculum includes courses in EU

Food Law; Food, Nutrition and Human Rights; Intellectual Property; US American Food Law, Chinese Law on Food and Agriculture and Comparative Food Law. Van der Meulen has a background in Public Law which comprises Administrative Law, Human Rights, European Law, International Law and Competition Law. His core competence is in the legal dimension of the Life Sciences in general and in Food Law in particular. For some of his books, see the European Institute for Food Law Series: <http://www.wageningenacademic.com/series/227-1871-3483>.

**Rochus Wallau** studied law, philosophy and Germanic studies at the University of Bonn. After several years as a criminal defense lawyer in the field of economic and environmental criminal law, Rochus gained experience as a consultant for food law in the Federation of Food Law and Food Science e. V. (BLL) in Berlin. Rochus has been working in the food law practice in the law firm of KWG from 2009 to 2014, consulting clients in the area of general national and European food law and specializing in the area of the law of consumer information, Food Criminal Law and the law governing administrative offences. Since August 2014, Rochus is the head of the department for food law and quality management with one of the leading German retailers. He is a lecturer for food law at the Geisenheim University. Rochus is a regular speaker at food law seminars and conferences. Rochus is the author of numerous publications on current food law, criminal law and criminal procedural issues. He advises clients in German and French.

**Watu Wamae** is an analyst in the innovation and technology policy team at RAND Europe since 2010. She is also a visiting fellow at the Open University and at the African Centre for Technology Studies. Prior to joining RAND, Watu worked both in academia and government and has significant experience informing innovation strategy and policy. In her previous appointments, she worked closely with governments at the national, regional, and pan-African levels. Watu continues to inform policy making in Africa and is a member of the Technical Experts Group for the African Observatory on Science, Technology and Innovation, which is a multidisciplinary team of five leading scholars and practitioners of science, technology, and innovation policy. She is also involved in a number of research networks and is a board member of the African Network for the Economics of Learning, Innovation, and Competence Building Systems whose main focus is to strengthen research capacity in Africa.

**Bart Wernaart** teaches law and ethics at Fontys University of Applied Sciences. He is also a professional musician (drums, mallets, and percussion), composer, and conductor. He earned his Ph.D. degree in 2013 at Wageningen University. Prof. Dr. B.M.J. van der Meulen is professor of law and governance at Wageningen University.

**Jörn Westhoff** was born in 1965 in Germany. He studied law, theology, and East Asian politics and culture at Ruhr-University in Bochum, Germany, as well as Japanese business and labor law at FernUniversität in Hagen, Germany. He also received legal training in St. Louis (Miss.), USA, and Tokyo, Japan. As a specialist for international business law, Jörn Westhoff worked as an assistant to Prof. Dr.

Toichiro Kigawa, Tokyo in 1996. In 1997, he took up a position within the Pricewaterhouse group in Düsseldorf, Germany, where in 1998 he joined a law firm specialized in international business law. In 2001, Jörn Westhoff was recruited as head of the legal department for a major German-Japanese law and patent office in Tokyo, Japan. In 2012, he returned to Germany and took his current position with Dr. Wehberg und Partner, a cooperation of internationally oriented lawyers, tax accountants and CPA in Hagen, Germany, where he is one of the seven senior partners. Additionally, in 2013 he was appointed professor for German and international business law at FOM University of Applied Science in Essen, Germany. In 2014, he was granted the title “Certified Specialized Lawyer for International Business Law” by the lawyers’ chamber. Jörn Westhoff is an associate of the Chartered Institute of Arbitrators, London, a group a lawyers offering services as counsel or arbitrator in private international arbitration. Jörn Westhoff has published widely on Asian and German business law both in English, German and international journals and compilations.

## Food Law International Interns

**Daisy Zhang** was an intern with Food Law International, LLP. She earned her Master’s of Public Health (MPH) from CUNY School of Public Health, New York, and her Bachelor’s of Science (BS) in Biological Sciences from University at Buffalo, NY.

**Kimia Shahi** earned her bachelor’s degree from the University of California, Los Angeles in 2009. She studied History of Western and Near Eastern countries. In 2015, she successfully completed her master’s degree in food studies at the New York University. Having lived in Iran and America, she researched production methods, national and international policies, and movement of food commodities across the globe. In particular, she focused on Iran under the imposed economic sanctions. Kimia is an up-and-coming law candidate and is expected to begin in fall of 2018. She aspires to use her knowledge, skills, and lived experience to eliminate regional instability, lift struggling societies out of poverty, and help the global community reach self-sufficiency.

**Eva Saul Crawford** grew up in Cleveland, Ohio. Her interest in sustainable food systems and international food regulation was sparked while working on a small, organic farm in Erfurt, Germany, during college. After receiving her B.A. in sociology from Beloit College, she moved to New York where she is currently working in communications at a nonprofit, intercultural exchange organization and running a local CSA. At the time of writing, Eva is pursuing her master’s degree in food studies at New York University, with the goal of working in food policy.

**Liza Howard** is a master’s candidate in the Food Studies Department at New York University. After completing her undergraduate degree in international development, she studied French in France before moving to the USA to continue her

education. Her research interests include organic food policy, cultural constructions of taste, and food education for children.

**Sabrina Rearick** was an intern for Food Law International, LLP. She pursued her J.D. at Duquesne University School of Law in Pittsburgh, Pennsylvania. At Duquesne, she served as a member of law review and worked as a research assistant for the associate dean. In 2014–2015, she was the recipient of the Dean’s Scholarship for Excellence for her academic performance during her first year. Sabrina graduated magna cum laude from Westminster College in 2014 as a part of the 3+3 early admissions program with a B.A. in political science. She is highly interested in sustainability, particularly in regard to community development and food.

**Nandini Shroff**, MPH currently works as a grants and research manager at the Institute for Family Health. She is primarily responsible for research and grant management. Her project portfolio ranges from women’s health to chronic diseases research. Nandini’s public health interests include health disparities and women’s health with a particular emphasis on reproductive and sexual health. Nandini received her B.A. in history with a dual minor in anthropology and economics from the City College of New York. She earned her MPH at Hunter College in New York. She is currently a doctoral candidate at the CUNY Graduate School of Public Health and Health Policy.

**Ilana Madorsky** was an intern for Food Law International LLP. Her portfolio of research includes food access policy programs and the use of intermediated markets to support regional food systems. After living on a permaculture farm in Modi’in, Israel, she moved to New York where she is currently working at NYU School of Law. Ilana received her BS in Society and Environment, with honors, from UC Berkeley, and her MA in Food Studies from New York University.

**Christina Papillo** is a legal assistant at Katzke & Morgenbesser LLP in New York City and worked as an editorial intern at Food Law International, LLP. She works in executive compensation law and has experience in foreclosure litigation, commercial litigation, and intellectual property law. Christina is pursuing a juris doctor degree at Fordham University School of Law where she serves as an associate editor for the *International Law Journal*. She has a Master of Arts in Food Studies and a Bachelor of Science in Media, Culture and Communication, both from New York University. She focuses her education on food and agricultural law, with a specialization in international food systems and industrial farm animal production. She has performed field work in the United Kingdom, Hong Kong, and Ireland focusing on legal barriers to a nation’s food system and its effects to food access. She plans to become a food and agriculture attorney, aspiring to provide guidance to small farmers and small food businesses on complex laws governing food production.

**Victoria Yam** holds a B.A. in French and German from the University of Rochester and an M.A. in German and Scandinavian studies from the University of Massachusetts, Amherst. She has lived in the cities of Berlin, Cologne, and

Heidelberg, Germany. Recently, she has taught as an adjunct instructor of both English and German at the University of Cologne, University of Massachusetts at Amherst, and Deutsches Haus at New York University. Victoria is the translator of the German-Mexican cookbook, *Authentic Mexican Cooking: 80 Delicious, Traditional Recipes for Tacos, Burritos, Tamales, and Much More*, coauthored by Scott Myers and by Gabriele Gugetzer, and has translated a variety of texts from German to English on a wide range of topics, including texts on psychoanalysis, excerpts from eighteenth- and nineteenth-century German literature, and personal biographies. In addition to translating in her spare time and working as a freelance instructor of German, Victoria's interests include international programs within study abroad and cultural sensitivity/minorities studying abroad. Victoria serves full-time as part of the administrative team at New York University's Department of German.

**Alexander J. Cherry** is an undergraduate Bachelor's candidate and Dean's List student of International Relations and Environmental Studies, with focuses on Global Health, Nutrition, the Environment, Food Systems, Sustainability, and Communications at Tufts University in Medford, Massachusetts. He has recently completed a semester-long program at the Umbra Institute, located in Perugia, Italy, studying Food and Sustainability. An avid traveler and lover of the outdoors, he can often be found working in a garden, rock climbing, hiking, or skiing.

## Global Food Law and Policy

Gabriela Steier

This first section of the book lays the groundwork to ascertain the complexities of international food law and policy. It introduces the multitude of facets of the international regime governing food safety, security, regulation, and policy, while considering various perspectives of what is at stake, such as consumer protection, animal welfare, global governance, and democracy.

First, Dr. Hans-Ulrich Grimm, a German best-selling investigative journalist with deep insights into the depth of the system, explains the absurdities of the current food system and traces them back to their roots in industrialization, deregulation, and globalization. This chapter sets the stage for all the chapters that follow in this part and in Part II of this book by explaining how malnutrition, obesity, food insecurity, and fraud, relate back to law and policy.

Second, Prof. Bernard E. Rollin from Colorado State University, describes how animal welfare and ethics play a role in the current food system. He links industrial agriculture, animal husbandry, land stewardship, and the need for sustainability to the philosophical and ethical pillars upon which the food system depends if any positive changes are to be made possible in the future.

Third, Ching-Fu Lin, from the National Tsing Hua University, Institute of Law for Science and Technology, Harvard University, Petrie-Flom Center for Health Law Policy, Biotechnology, and Bioethics, and National Taiwan University, Asian Center for WTO & International Health Law and Policy, shares his expertise surrounding the global governance of food through the World Health Organization (WHO), Food and Agriculture Organization of the United Nations (FAO), the Codex Alimentarius, and the World Trade Organization (WTO). In his chapter, he introduces the international cooperation in food safety around the world.

Fourth, Dr. Bart Wernaart and Prof. Dr. Bernd van der Meulen from Wageningen University, a leading academic institution in food law and policy from the Netherlands, give a lesson on the Right to Food. They explain the concept of adequate food, which encompasses food supplies, food safety, and cultural acceptability considerations. Based on case studies from the Netherlands and from Belgium, these concepts are then illustrated and contextualized.

In the fifth and sixth chapters, Professor Michael Blakeney, one of Australia's experts on intellectual property in food, teaches about the international intellectual property infrastructure and agricultural innovation. He describes how treaties, TRIPS and SPS, govern patenting of genetically modified crops (GMOs) and plant variety rights. His introduction of the International Convention for the Protection of New Varieties of Plants (UPOV) is a key prerequisite to understanding the critical evaluations of food system regulation and governance of GMOs in light of environmental protection, agrobiodiversity, and regulatory integrity. In Chap. 6, Professor Blakeney provides a detailed overview of the legal intricacies of bilateral and plurilateral agreements protecting trademarks and geographical indications. He explains how international intellectual property rights play into food trade and puts them in context with WIPO, GATT, and other leading treaties of global significance.

Finally, in Chap. 8, the esteemed and experienced Peter Berry Ottaway and Sam Jennings from England, analyse international barriers to food trade by contextualizing inconsistencies in food legislation, agricultural regulation, and food safety protection. This chapter focuses on some of the most prevalent aspects of international dissonance, thereby illustrating how the national laws come together when food becomes a commodity of global significance.

What all of these leading chapters have in common are astute introductions in the international framework of food law and policy and revelations as to the gaps of the food system. For the reason that what is being regulated is just as important as what is left out of legislative considerations, the shortcomings identified by these chapters roll out a vast array of opportunities for stake-holders around the globe to contribute creative solutions to the problems that are currently unresolved.

# Chapter 1

## Information-Domination in the European Food Industry: Focus on Germany

Hans-Ulrich Grimm

**Abstract** Food safety is of vital importance for all people. Their lives and health depend on it. Food laws ought to serve to ensure food safety and the protection of consumer health, but currently they often fail to meet this standard. Presently, food laws do not meet many of the most significant threats, including Non Communicable Diseases (NCDs), such as heart disease, diabetes, Alzheimer’s, and cancer. 35 million people worldwide will die from these types of diseases every year, according to the World Health Organization (WHO). In most cases, the causes of these diseases can be traced to modern, processed foods, fast food, take away food, and soft drinks. Conventional food laws treat these foods, however, as completely “safe”. Food components associated with health risks in the long-term, such as sugar, salt, and some chemical additives, are not considered in the current conception of “food safety”. The blame for these health consequences is taken by no one, and the responsibility for treating these diseases lies solely on the backs of the consumers. For these new realities, existing food laws and policies are inadequately prepared. Moreover, the manufacturers of these products are increasingly dominating the decision-making chain at both global and regional levels. The interests of consumers play only a minor role. Critics, therefore, are calling to bring the protection of consumer health to the fore again and to create the necessary legal conditions where significant changes can occur. The concept of food safety ought to be adapted to the new circumstances.

### 1.1 Introduction: What Is The Purpose Of Food Law?

Food safety is of vital importance for all people. Their lives and their health depend on it. Food laws ought to, therefore, serve to ensure food safety and the protection of public health, but currently they often fail to meet this standard. Current laws were designed in an era where hazardous conditions and threats in the overall food system were very different from those that exist today. For example, recent globalization

e-mail: [grimm@food-detektiv.de](mailto:grimm@food-detektiv.de)

has increased the threat of people's exposure to common pathogens found in food, namely viruses and bacteria, resulting in increased disease transmissions. Furthermore, noncommunicable diseases (NCDs), the magnitude of the threat of which was not known until recently, continue to threaten lives. The WHO predicts that 35 million people each year will die of NCDs such as heart disease, diabetes, Alzheimer's disease, and cancer.<sup>1</sup> Rather than common pathogens, the so-called Western diet—the modern, processed diet consisting of fast food, frozen meals, and soft drinks—is considered to be the root cause of NCDs. Under the current system, the food products that fall into this category are fully considered “safe.” However, within these products are certain components, such as sugar, salt, and some artificial chemicals, which are not currently considered within the concept of “food safety” in the technical sense but have been increasingly linked to the contraction of such diseases. The blame for these health consequences is taken by no one, and the responsibility for treating them lies solely on the backs of the consumers.

Law and politics are still inadequately prepared for the new food risks of the industrialized and highly-processed modern diets. Moreover, the manufacturers of these products are increasingly dominating global policy making and the chain of command of enforcement in food safety, security, and governance, on both a regional and a global level. In many regions of the world, democratic decision-making structures are being marginalized by industry lobbying and the dominant global regulatory entities. This is problematic because only specific, globally-active transnational corporate conglomerates are participating in the decision-making process and regulatory governance, with little leeway for any other significant influence. These political trends threaten the very nature of democracy itself.

Consumers themselves are the only ones concerned about the protection of their own health. The classic function of food law, consumer protection, steps into the background against the influence of powerful economic interests—more precisely, the particular interests of specific industry groups. Consequently, critics demand that the protection of consumer health be brought to the foreground again, and argue, therefore, that the creation of the necessary legal requirements to ensure these protections is paramount. Moreover, the concept of food safety should be readily adaptable to future circumstances. Current research maintains that our food can in fact be entirely safe. Nevertheless, every year, hundreds of thousands of people die from diet-related illnesses. Logically, this is an unsustainable situation.

## **1.2 Globalization and Food Safety: Increasing Risks, Missing Liability**

In the system of global mass production, microscopic risk factors—pathogens, pollutants, and some additive chemicals—are becoming more widespread. When losses or damages occur, an investigation is prompted, but it is often impossible to

---

<sup>1</sup>World Health Organization (2010).

isolate the specific cause. This is because in massive transnational food corporations with global operations divided into highly specialized and hard-to-trace supply chains, identifying the point source of contamination can be a nearly unsolvable task.

Previously, health risks in food products were most often locally confined. However, with increased globalization what was once local can now be easily spread around the globe. According to the Swiss Federal Office of Public Health (*Bundesamt für Gesundheit, BAG*), the risk of international outbreaks increases as a result of the globalized traffic of goods.<sup>2</sup> Consumers are confronted with a completely new scenario where a distinctive risk factor is created by industrial production. Previously, scientists in labs could determine pathogenic causes of illnesses with a microscope—now, researchers must take in the whole picture of the entire system. When viewed on this level, it becomes clear that the whole globalized food industry has become unhealthy. Unfortunately, this new world of industrially produced food is spreading all over the globe. And in its wake, new health risks are rising.

*Food Quality News* Industry Services has indicated that food safety fears are often exacerbated by globalization.<sup>3</sup> Microbiologist and professor Michael Doyle of the University of Georgia has warned that “sanitation practices for food production are not universally equivalent throughout the world. Importing foods can bring more diseases from areas where they are indigenous to locations where they are rare or do not exist”<sup>4</sup> (adapted).

Anxiety among consumers has also been growing in recent decades since China has been flooding the world with seemingly endless cheap goods and food products, including some risky products such as polluted shrimp, contaminated honey or sweets, and baby formula with blacklisted chemicals. In an international forum in Beijing in 2007, 600 delegates from 45 countries adopted a declaration, the Beijing Declaration on Food Safety, which championed global food transparency improvements and data-collecting programs on public consumption habits in order to assess and monitor the spread of food-borne illnesses. “This is not the first international agreement related to food safety... but it’s the first time that we have countries getting together and saying, ‘let’s recognize that it’s a joint responsibility and we should work together to improve it,’” stated Jørgen Schlundt, Executive Director of the WHO’s Food Safety Department.<sup>5</sup> Schlundt saw the collective declaration as “a significant step forward”. Yet the concept of “food safety” still leaned toward the traditional health threats of food, and the declaration itself aimed at contamination

reduction to protect consumers from “health risks posed by biological, chemical and physical hazards in food as well as by conditions of food”.<sup>6</sup>

Illness caused by contamination was, until now, seemingly the biggest threat. However, over the past couple of decades an entirely new form of food supply has been established, for which this old concept of food safety is no longer adequate. “Through social and economical upheavals and technical innovations,” claims an Austrian government study, “the kind of food supply and diet forms in the last 150 years has drastically changed.”<sup>7</sup> Today, “consumers are transitioning more and more from raw material buyers to buyers of preprocessed, commercialized convenience products, right up to frozen foods.” Previously food would come from local neighborhoods and be consumed shortly thereafter, but food products can now be brought into supermarkets from great distances and sit in stock or on the shelf for long periods of time before being brought to the fridge for further cooking, processing, and finally, consumption. “Generally speaking, prepared dishes are consumed in the household right after their preparation,” the study notes. “On the contrary, with convenience products, . . . lies a more or less temporal and spatial tension between the processing or fermentation of the foods in manufacturing plants and the consumption by consumers.” (adapted). Consequently, food must be adapted for this intermediate period, most notably through preservation. Chemical changes undergone during these food preservation processes create a new material composition that may affect the human body differently than the unprocessed version would have, as numerous studies on “nutrition transition” demonstrate with the evolution from traditional to modern, processed food.<sup>8</sup>

Because many ingredients now undergo preservation techniques for increased shelf life, a particular challenge for the human body is to process and adapt to the addition of these preservatives, flavor enhancers, artificial flavors, and artificial colors, as well as elevated levels of sugar and salt. These substances place the body under metabolic stress, which is unsurprising as they are not added for nutritional purposes, but for increasing the product’s shelf life. In the Western diet, it is not only added pollution, corruption, and contamination that can lead to illnesses, but also the recipe of ingredients. In other words, the threat in food safety is now more than ever before a man-made one.

<sup>8</sup>Popkin (1993), pp. 138–157.

In fact, beyond just the West, the world of soft drinks, snacks and sweets, powdered soups, fruit yogurts, hamburgers and frozen pizzas threatens serious risk for large parts of the global population as these products reach new markets. Allergies and food sensitivities are the most obvious problems associated with such industrial ingredients in food. But many additives have been linked to the development of health impairments in any consumer, not just those with preexisting risk factors. Flavor enhancers such as glutamate are listed as a suspicious trigger of weight gain. Additionally, hyperactivity (ADHD), learning disorders, and migraines can also be caused by food additives. Sugar, and even some artificial sweeteners, are suspected to be a carcinogen. Preservatives can damage the skin and upset the immune system. Additionally, a consumer who eats more fast food and frozen meals ages faster and has a higher probability of becoming sick from depression.<sup>9</sup> These risks constitute a huge burden for humanity, and according to international food experts are the biggest cause of this emerging conceptual parallel world of NCDs. According to the United Nations' calculations, 35 million people worldwide will die from these diseases with the majority stemming from food and 14 percent from tobacco consumption.<sup>10</sup>

Food's threat against health has acquired a new character and unprecedented prevalence. Yet the counter-measure protections and regulations of federal governments and other public authorities have also declined. Food supervision as a public operation is in its present form in no way proportional to the magnitude of the threat.

### **1.3 Strict Laws in the Middle Ages: Fraud Has Always Existed, but, Historically, It Used To Be Punished**

In the past, consumer protection against the threat of inadequate food was of far higher priority. Producers who endangered consumer health with their products were prosecuted and severely punished. Swindling and forgery were pervasive in the European Middle Ages, but the authorities would intervene with all of their commanding power. Violations of food safety were not only viewed as fraud against citizens, but also as public health risks.<sup>11</sup>

In order to protect citizens from food-borne illness, an abundance of rules and regulations were established for bakers, butchers, innkeepers, and wine handlers.<sup>12</sup> For example, bakers tended to cheat a little with the sizes of their baked goods by

---

<sup>12</sup>Bitsch I: Gesundheitsschädigung und Täuschung im mittelalterlichen Lebensmittelverkehr. In: Irmgard Bitsch, Trude Ehlert und Xenia von Ertzdorff (Hgg.): Essen und Trinken in Mittelalter

adding plaster or clay to make their bread heavier. Since lighter-colored bread was considered more valuable, they would also lighten the color with limestone, ground bones, or even poisonous substances like lead and aluminium.

Furthermore, fraudulent bakers might regularly prepare two kinds of bread: one that complied exactly with the legal weight specifications and was examined by a controller, and the other that was sold to customers. The latter was somewhat lighter. Additionally, lighter bread was baked on holidays because the bread controllers were not on duty during these days. In those stricter times, it was even viewed as fraud when old baked rolls were sold as “fresh.”

Another example is wine, which counted as a staple food, and was strictly controlled. In fact, the entire supply chain, from the wine growers and makers to the merchants and finally to the innkeepers who sold it, was monitored. In Cologne, for example, unannounced visits from inspectors called “wine observers” safeguarded against counterfeited products. At that time, claims Austrian historian Bettina Pferschy-Maleczek, “the law forbade wine adulteration” because it was “viewed . . . as a kind of wine falsification. This was considered fraud or theft, since it was essentially a misappropriation of buyers’ money.”<sup>13</sup>

Consequently, city or municipal authorities established long lists of forbidden substances for foods. For example, by the end of the fifteenth century in the southern German city of Ulm, limestone, mustard, and bacon, were blacklisted. Furthermore, clary sage, perry or apple cider were not allowed to be paired with white lead, mercury, impatiens, and sulphuric acid. Many of these additives were commonly steeped in the wine in a small pouch and later removed. Enforcing these bans was, of course, difficult for the lack of chemical methods in order to regulate the water content in the wine. Misconduct was often hard to prove, and thus usually went unpenalized. According to fraud researcher Pferschy-Maleczek, “one simply had to trust and hope in a godly justice that would discover the culprits and assign punishment in the afterlife.”

Some transgressions, however, could be proven—and these were strictly punished. Fraudulent bakers had to endure a “baking baptism,” also known as “bread christening” or “shed.” For punishment and to the amusement of the public, they were shoved in a cage and submerged in a local river. In Alsatian Strasbourg, France, reports indicate bakers submerged in the River Ill. In Vienna, delinquents were plunged into the Danube, and in the year 1550, one of these punishments turned out to be fatal. In the so-called bakers’ gallows, in which bread swindlers were chained and hung, some even faced unintended death.

Wine adulterators were also prosecuted and punished with fines, banishment from the city, closure of the cellar, and revocation of their liquor license. In the

---

und Neuzeit. Vorträge eines interdisziplinären Symposions vom 10. - 13. Juni 1987 an der Justus-Liebig-Universität Gießen. Sigmaringen 1987.

<sup>13</sup>Pferschy-Maleczek B: Weinfälschung und Weinbehandlung in Franken und Schwaben im Mittelalter. In: Schrenk C, Weckbach H (Hrsg.): Weinwirtschaft im Mittelalter. Verlag Stadt Heilbronn 1997.

1380s in Rothenburg, Bavaria, an adulteration conviction meant that the culprit would not only lose his adulterated wine product, but also the hand he used to make it. On occasion, wine adulterators feared even the death penalty, as proven by the public execution lists of several cities. In 1486, for example, in the upper Swabian city of Ravensburg, a man named Martin Geßmeister was beheaded because of wine adulteration.

These harsh punishments were not without consequences. Back then, wine was a basic food product in many places, as drinking water fountains were frequently polluted or infested with disease or pests. In these times, the demand for “natural” goods had already emerged. In 1419, Frankfurt am Main, for instance, created a provision that stated that no one should prepare wine in any way other than how God had intended for man to produce it. Strict penalties were developed for the protection of foods’ integrity. For this purpose, food law is ultimately a matter of crucial significance. Protection against fraud is likewise the protection of health. Back then, these negative health consequences were usually directly apparent: stomach aches, cramps, indigestion, and even infertility and miscarriages.

Food fraud really took off, however, in the next few centuries. The technological innovations and new production methods of the industrial revolution made fraud and deception possible on a large scale. Aromas and flavor enhancers, for example, were used to imitate existing ingredients, as in ice cream or in industrial fruit yogurts. Similarly, food colorings could be used for deception even in high quality products such as whiskey or balsamic vinegar.

At the same time as the technical possibilities of deception were increasing, the propensity of governments to prosecute such fraudulences was decreasing. British historian Bee Wilson verifies in detail that the falsification of food, formerly strongly enforced, became increasingly tolerated during the industrial age, which was representative of the minimal governmental intervention typical of the time period.

In her book about food swindling in past centuries, *Swindled*, Wilson criticizes governments’ tendencies to intervene less and less in the cases of food falsifications. She states that early on, governments have seen swindling as a threat to economic order and to their own authority. Adulteration is also a threat to civilized politics. Thus, governments have sought to police food fraud because permitting it would undermine their legitimacy and authority. A society in which swindling is permitted is one in which fundamental trust between buyers and sellers has broken down. It is therefore a vital political concern to stop it.

Nonetheless, for the past two hundred years many governments have allowed defrauders to get away with outrageous crimes. This is a story of corruption and greed, of the indifference some humans beings will exhibit towards their own actions that threaten others if it means that they are making money. According to Wilson, it is also a failure of politics; a story of the deep reluctance of post-industrial governments to interfere with the markets of food and drink products—something earlier governments were happy to do—to the extent that those markets have become dishonest and dangerous.<sup>14</sup>

---

<sup>14</sup>Wilson (2008), p. xiii.

## 1.4 The Dwindling State: A Ministerial Perspective on Industry Responsibility

Separate from the traditional system of locally produced food, of fresh carrots, potatoes, chickens, apples and pears, an industrial parallel system was established, with products flowing through a global supply chain, containing numerous chemicals, and producing different effects on the human body. This modern parallel world has not only substantially changed the nature of food products, but also the role of the state in its regulation. Previously, wherever there was pre-industrial food production, surveillance and control were essential tasks for the state. Ultimately, it was (and arguably still is) a question of life and death.<sup>15</sup> However, generally speaking, the more falsified food products grew, the larger the means of manipulation grew, the more the potential magnitude of health hazards grew, but the more countries' regulatory systems withdrew themselves and surrendered quality control to agents of the industry. The global corporations themselves are now largely responsible for the "safety" of their creations.<sup>16</sup> Along this process, the interests of consumers have by and large disappeared.

In the era of globalization, the small-time, locally-constrained frauds, the cheating of bakers, and the wine adulterations of vintners and innkeepers have been supplanted by large-scale manipulations, with high-tech methods and the support of researchers. The role of the State is being re-defined, beginning with lobbying, which allows the offenders to play a part in the legislative process and to contribute to the legalization of the most shrewd deception maneuvers in the food system. Additionally, the largest globally active corporations sell their products all over the world; they dominate global flavor development and ensure that children from all over the globe grow up accustomed to the same flavor chemicals. The power of nations over their own food supply is concurrently decreasing: they have forfeited their sovereignty when it comes to the nutrition of their population. In this industrial parallel world of food, the hazardous products of the food industry are dominating more and more in even the most remote territories.

In the Kingdom of Tonga, for example, a small island state in the South Pacific, there are still coconuts and bananas, carrots, and potatoes for sale in the public market hall of its capital Nuku'alofa. Yet in the stores, products are displayed from the parallel world: the 2-min noodles from Maggi (owned by Nestlé) in plastic packs, alongside other instant noodles from Indonesia and China. In the supermarkets, the South Pacific looks just like China or the U.S. or Europe. There are the Nestlé-noodles. There is the chocolate-spread Nutella. There are "Pringles" brand potato chips. And there are advertisements for Coca-Cola displayed at every bus stop<sup>17</sup>.

---

<sup>15</sup>EuGH, Urteil vom 26. Oktober 1995 - C-51/94.

<sup>16</sup>Refer to: Grimm (2014).

<sup>17</sup>Grimm (2010).

The very real consequences of this universally available industrial food display can be seen in the nation's hospitals. The control over new food products is slipping away entirely from the authorities. In fact, in an orderly kingdom like Tonga, there are even exact numbers on these imports. For example, they have increased the amount of imported instant noodles from 271 to 664 tons from 1996 to 2006, and snacks, chips and the like have increased from 99 to 341 tons. "Previously, people died of tuberculosis, typhoid fever, and malnutrition," says Dr. Malakai Ake, who is a doctor in Tonga and cooperates closely with the World Health Organization (WHO). "Today, we have created a new problem" he explains, where the four "top killers," i.e. the most important causes of death in Tonga, are heart diseases, hypertension, diabetes, and cancer. The climbing rate of these illnesses is directly correlated to the importing rates of these highly processed, unhealthy food products, the doctor claims. These diseases are hallmarks of the globalized industrial highly-processed food system that serves corporate interests before those of the consumer.

The Tongan royal administration clearly perpetuates this unfortunate system of priorities: "we don't know too much about additives," is the dismissive excuse of health officials responsible for food additives (see footnote 17).

Consumer protection should nevertheless be guaranteed. Ultimately, manufacturers are the first step in the chain of responsibility for the safety of their products. In this vein, the Beijing Declaration on Food Safety developed a set of principles for jurisdictions around the world to follow on the subject of food safety based on the idea that, "production of safe food is primarily the responsibility of the food industry."<sup>18</sup>

This position is, however, based on the traditional notion of food safety, which identifies safety risks only with illness pathogens and focuses on making producers ensure that their products are free from such unwanted risks. Yet this guideline only barely grasps what are the true triggers of modern illnesses—the intentionally added ingredients of normal industrial products such as sugar, salt, food additives. These ingredients are regarded as harmless—but only up to a certain amount. Accordingly, it is extremely important to have an overview of the scale of commonly consumed quantities in order to be able to assess the threat against the population. Food corporations of course cannot carry out this oversight. This is where the authorities ought to be responsible for food safety.

The Beijing Declaration on Food Safety thus formulated the state authorities' role in an attempt to "establish competent food safety authorities [to function] as independent and trusted public health bodies within a comprehensive production-to-consumption legislative framework." In a country like Tonga, this is not so easy because the small population is unable to control all of the chemicals that the industry uses to preserve their products and create artificial flavors and colors. Responsible authorities fit in a small "Ministry of Agriculture and Food, Forests and Fisheries - Food Division Vaololoa." Thus, the power of authorities to regulate food

---

<sup>18</sup>Beijing Declaration on Food Safety, a.a.O.

has noticeably diminished compared to the large industrial power of Big Food and Big Ag.

The European Union, by contrast, has a different attitude about the role of governmental institutions in monitoring and enforcing food safety. European food safety agencies have far more power to protect against risks and have even attempted to use their authority to gather data about consumer health risks from the overconsumption of “safe” food additives. In 1995, they mandated that member states implement a monitoring system which collected data about consumer quantities.<sup>19</sup> The European Commission’s report states that the “European Parliament and Council Directives 94/35/EC, 94/36/EC and 95/2/EC require each Member State to monitor the consumption and usage of food additives. The Commission is required to submit a report on this monitoring exercise to the European Parliament and Council.” Unfortunately, nothing came of this ordinance, although some countries did attempt to comply and engage in provisional inquiries. These inquiries yielded some partially significant evidence of transgressions over safe consumer quantities and portion sizes.

Other member states ignored the regulations—for years at that. The Federal Republic of Germany, for example, had indeed evaluated the consumption of a variety of food products in a so-called “national consumer study.” Yet data about the consumption levels of food additives has not been collected, despite clear guidelines from the European parliament. For Professor Gerhard Rechkemmer, president of the Federal Research Institute for Nutrition and Food, the highest governmental nutrition research institution in Germany, and the man responsible for the “national consumer study,”. He believes that ingredient lists are the intellectual property of the corporations that create them, and that the government does not have the right to demand this information, placing the burden of safety protection solely on these companies. He says, “The companies should have the information of how many food additives are present. No company can be forced to state their exclusive formulations for particular products. They ultimately have authorship of a certain composition. That is something upon which the manufacturer has a particular claim, if it has developed such products, not to be disclosed to the public.”<sup>20</sup> Rechkemmer knows the wants and needs of the food industry very well, because he is not only an officer of the Ministry of Nutrition and as such, subordinate to the German government, but also a high-ranking official in the International Life Sciences Institute (ILSI), which with members such as Coca-Cola, Monsanto, Nestlé, and others, is the most important and influential lobby and policy think-tank associated with Big Food.

---

<sup>19</sup>The European Commission: Report from the Commission on Dietary Food Additive Intake in the European Union [http://ec.europa.eu/food/fs/sfp/addit\\_flavor/flav15\\_en.pdf](http://ec.europa.eu/food/fs/sfp/addit_flavor/flav15_en.pdf).

<sup>20</sup>Grimm (2012).

Rechkemmer is the highest governmental nutrition researcher in German for ILSI Europe, a member of the Board of Directors, and a member of the Board of Trustees, alongside leading managers from companies like Nestlé and Monsanto, for ILSI Global.<sup>21</sup> Thus the highest German governmental nutrition researcher is working two positions at once, one on behalf of the State, and the other in a position for the food industry. In his position working for the German state, he advocates with enormous vigor for the interests of the industry, and has represented the group in public events and conferences.<sup>22</sup>

By appointing industry leaders into high-level governmental positions meant to check the power of the same businesses from which they came, Big Food has fully taken over and weakened the food safety sector, under the radar of the global public. They are creating interest-focused arrangements between the industry lobby associations and the State's duties. This is surprisingly consistent throughout all types of political systems worldwide: the global food corporations have simply taken over.

Moreover, China's "Leading Food Safety Expert" is a high-ranking ILSI operative: Prof. Junshi Chen, senior research professor at the National Institute of Nutrition and Food Safety of the Chinese Center for Disease Control and Prevention.

He was the keynote speaker at a conference of the American Chamber of Commerce on May 30, 2013 at the Hotel Mandarin Oriental in Shanghai.<sup>23</sup>

The American Chamber of Commerce proudly pointed out the variety of activities of their keynote speaker: "Chen also serves as head of the Expert Advisory Committee on Food Safety of the Chinese Ministry of Public Health, is an member of the WHO Expert Advisory Panel on Food Safety, director of the International Life Science Institute (ILSI) Focal Point in China and adjunct professor in the Division of Nutritional Sciences at Cornell University in Ithaca, New York."<sup>24</sup>

Chen is also the presiding board member on the executive committee of food additives for Codex Alimentarius, a global institution established by the Food and Agriculture Organization within the United Nations, which determines internationally recognized food laws.<sup>25</sup>

The lobby association ILSI has become a top steering institution, through which the interests of the the most influential industrial factions can be found in the global regulation of food.

## 1.5 The Power of Transnational Corporations: How Industry-Lobbying Is Taking Over Governmental Duties

Multinational food corporations have focused their interests in a globally-active lobbying institution, which is taking over governmental duties. The International Life Sciences Institute (ILSI), has gone widely unnoticed by consumers and the public but risen massively in importance in the global politics of food.

ILSI has abolished the borders between state and economy. It has substantial influence on laws and regulations, and even official consumption recommendations.

ILSI is widely unknown among the public. The transnational corporations themselves that compose the association are more prominent. These include<sup>26</sup>:

Ajinomoto  
 Barilla  
 BASF  
 Bayer  
 Cadbury  
 Campbell Soup  
 Cargill  
 Cereal Partners Worldwide  
 Clasado  
 Coca-Cola  
 Danisco  
 Danone/The Dannon Company  
 Dow  
 DSM  
 FrieslandCampina  
 Frutarom  
 Givaudan  
 General Mills Inc.  
 H.J. Heinz Company Herbalife International of America, Inc.  
 H J Heinz  
 International Nutrition Company—INC  
 Kellogg Co.  
 Kraft Foods Group  
 Mars, Incorporated  
 McCain Foods  
 McDonald's  
 McNeil Nutritionals  
 Mead Johnson Nutrition

---

<sup>26</sup>[http://www.ilsi.org/Documents/ILSI\\_2013\\_Member\\_List.pdf](http://www.ilsi.org/Documents/ILSI_2013_Member_List.pdf).

Mondelez International  
Monsanto  
Naturex  
Nestlé  
PepsiCo International  
Premier Foods  
Procter & Gamble  
Red Bull  
Roquette Frères  
Sensus  
Seven Seas  
Solae Europe  
Soremartec Italia—Ferrero Group  
Südzucker/BENEÓ Group  
Swiss Quality Testing Services  
Syral  
Tate & Lyle  
Tetra Pak  
Unilever  
Valio  
Wild Flavors  
Wimm-Bill-Dann Foods  
Yakult Europe

This is no ordinary lobbying group, but lobbying in a new dimension. ILSI is the most influential institution in the worldwide food industry, a globally operating network which creates the foundations for laws and regulations, as well as bans and recommendations. ILSI also sets standards for what people should eat, like necessary vitamin maximum and minimums consumption levels. It also sets standards for food safety.

ILSI is also not really representative of the vast majority of food manufacturers worldwide. Common bakers, gardeners and chefs are not members here. There are only the big transnational corporations. ILSI is an army of Big Food, a powerful association of the big boys, of those companies which dominate the global food supply with increasing power—especially throughout the so-called “Western diet.”

ILSI is the most influential authority in the process of creating regulations for global food production, and it crafts them to serve the interests of its member corporations. These corporations are responsible for peddling the industrially manufactured products considered by independent researchers to be the leading causes of the “noncommunicable disease” epidemics worldwide, but especially in the Western world.

ILSI’s influence extends across the globe. It is a world-spanning network operating on every continent. There are ILSI regional branches for Europe, North America, Argentina, Brazil, Mexico, South Africa, South Asia, Japan, Korea, China, and even the Northern and Southern Andes.

ILSI is the leading authority for centralized establishments all over the world. For example, ILSI Europe was given responsibility for creating the standardized nutritional recommendations (project abbreviation: EURRECA) for Europe, as well as the European Commission's concerted action efforts on food safety (Food Safety in Europe, FOSIE).

In a project called PASSCLAIM, ILSI developed the policies governing how the European food authority EFSA evaluates food manufacturers' health assertions.

ILSI was even financially supported to develop the official standards for food benefit and risk assessments (Benefit-Risk Analysis of Foods, abbr. BRAFO),<sup>27</sup> for the European Union.

Benefit-risk analysis of food products is incredibly important to accurately understanding and working to combat the threat of noncommunicable diseases.

The ILSI-Benefits-Risk-Project, however, focused far more research on oily fish, which are of relatively low-level importance as a global health risk, compared to the truly high-risk food products produced by its members.

The correlation between high consumption levels of processed foods such as soft drinks and the epidemic of noncommunicable diseases was completely ignored by this project.

This is because ILSI exists to protect the interests of its member corporations. For example, the leader in the world market for soft drinks, Coca-Cola, sat in the steering committee for BRAFO, along with the World Health Organization (WHO) and the European Food Safety Authority (EFSA).

This is the ILSI method: they set the topics and control the debates, and ensure that public-sector researchers at state universities and governmental organizations are following their lead. ILSI is gaining interpretational sovereignty with increasing frequency and is laying the groundwork for future decisions even more favorable to its member corporations.

ILSI cannot, of course, make any decisions administered by governments and parliaments. However, they write the texts and have infiltrated supposedly neutral institutions.

## 1.6 What Is ILSI Doing with EFSA? Examples of the Influence

The European Food Safety Authority (EFSA)'s deep ties to ILSI are often the center of critique. Many scientists who have acquired high level positions at EFSA are simultaneously working for the ILSI. Juliane Kleiner, for instance, leader of the Department of Scientific Strategy and Coordination, was a senior scientist for 7 years with ILSI Europe for Food Safety.<sup>28</sup>

---

<sup>27</sup>Hoekstra et al. (2012).

<sup>28</sup><http://www.efsa.europa.eu/en/staffdirectory/staff/julianekleiner.htm> Accessed on 5 May 2015.

The most prominent example of personnel concurrence was Hungarian Diána Bánáti—she was temporarily the chairperson of the EFSA supervisory board and at the same time, a board member at ILSI. In May 2012, she was pressured into resignation from EFSA and fully switched to ILSI as their scientific director.<sup>29</sup>

These troubling industry connections have belonged to Project EFSA since its inception.

For years, Matthias Horst, the head lobbyist of the management board for the German food industry and chief executive officer of the National Association of the German Nutrition Industry (BVE) and of the Association for Food Law and Food Science (BLL), sat in on the EFSA council.

In 2014, yet another lobbyist, Jan Mousing, executive director of the Danish Agriculture & Food Council, an organization which, in his own words, “represents the farming and food industry of Denmark,” was appointed to the management board.

Furthermore, the EFSA watchdogs are often closely related to industry. For instance, EFSA expert Professor Klaus-Dieter Jany, previously at the Karlsruhe Federal Research Institute for Nutrition (now the Max Rubner Institute), is regarded as an established friend of the genetics industry and had actively supported the GenTech corporation Monsanto. Numerous other EFSA scientists have already stepped in as consultants for food companies. More than half of the 209 EFSA experts have ties to the industry, as reported by the organization Corporate Europe Observatory (CEO).<sup>30</sup>

ILSI’s influence on EFSA is traceable in its internal decisions. In the field of genetic engineering, consumers view feeding studies to be important for risk assessment. ILSI, however, is against feeding studies, so the EFSA is as well.

As the CEO report illustrates, some key phrases from ILSI papers can be found copied word-for-word in EFSA policy briefs.<sup>31</sup>

These economical expertise of these industry voices could arguably be an asset to the EFSA in its efforts to protect consumer health. However, as the EU-Act 178/2002 states, central, superior, and independent governmental government oversight is necessary for the serious protection of consumer health, as described below:<sup>32</sup>

1. This Regulation provides the basis for the assurance of a high level of protection of human health and consumers’ interest in relation to food, taking into account in particular

<sup>32</sup>Regulation (EC) No 178/2002 of the European Parliament and of the Council of 28 January 2002 <http://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX:32002R0178> Accessed on 22 April 2014.

the diversity in the supply of food including traditional products, whilst ensuring the effective functioning of the internal market. It establishes common principles and responsibilities, the means to provide a strong science base, efficient organizational arrangements and procedures to underpin decision-making in matters of food and feed safety. The authorities, as Article (34) provides, “take on the role of an independent scientific point of reference in risk assessment and in so doing should assist in ensuring the smooth functioning of the internal market.”

Thus the centralized regulatory bodies are obliged to set uniform safety standards on food, which will be used throughout the European community, while working to avoid economic ruin from overregulation providing too many obstacles to free market trade of food and feed.

The protection of health is thus placed in rhetorical opposition to economic stability in the internal food markets. When viewed in this way, it makes sense why the EFSA would choose to not actively proceed against problematic products.

## **1.7 The Aspartame Case Study: Controversial Artificial Sweetener Politics of EFSA**

One example of EFSA’s compromised ability to protect consumer health due to its deep industry ties is the case study of the controversial sweetener aspartame. The substance is 200 times sweeter than sugar and is particularly popular among figure-conscious people as well as parents who wish to safeguard their children from tooth decay caused by sugar.

Aspartame is lightly added to soft drinks like Cola, sugar-free gummies, and some dairy products such as milk drinks, yogurt, and quark. Fruit desserts, ice cream, canned goods and jam together with soups, snacks, and deli salads are also likely to contain the artificial sweetness of E951 (the EU codename for aspartame).

New scientific studies suggest, however, that the substance can have some serious side effects. Aspartame, like glutamate, can interfere with the control mechanisms of the brain. It can also cause acute disorders, headaches, dizziness, and even temporary amnesia. This sweetener is especially dangerous during pregnancy, as some scientists think, in some circumstances, that it can harm the brain of the developing child.<sup>33</sup>

In 1997 in the medicine journal “The Lancet,” physician and author H.J. Roberts from West Palm Beach, Florida, summarized his research findings over the years thusly: “I believe that our society faces a preventable medical disaster if aspartame products are not promptly removed from public use.”<sup>34</sup>

---

<sup>33</sup>Refer to Grimm (2003).

<sup>34</sup>Roberts (1997), p. 362.

Professor John Olney from Washington University in St. Louis in Missouri had also already previously cautioned against possible consequences, like the development of brain tumors.<sup>35</sup>

Digestion of aspartame releases aspartate, which, like its chemical relative glutamate, is a neurotransmitter. At a certain dosage, aspartate can be harmful to brain cells and also appears to be a neurotoxin. Therefore it is considered to be, like glutamate, a risk factor for diseases like Parkinson's, multiple sclerosis, as well as depression and epileptic seizures.

Just like glutamate, aspartate can additionally ease the crossing of aluminium through the blood-brain-barrier, which can increase susceptibility to Alzheimer's disease. Aspartate also impedes the access of glucose in the brain, which is problematic because it is the most important source of energy for brain activity.

Aspartame is especially risky for children, because their blood-brain-barriers are still not fully formed, and thus harmful substances can invade more easily than with adults.

During aspartame's first authorization period in the united States, numerous irregularities existed, according to an official U.S. government statement known as the Bressler Report.<sup>36</sup>

This report explicitly lists many abnormalities and inconsistencies throughout submitted investigations on the manufacturers' side.

In three manufacturer-established studies, the report found incredible flaws, sloppiness, and even falsifications. Additionally, FDA regulations were often ignored.

Here are some particular excerpts from the report:

In one study, 98 of the 196 animals died but were not autopsied until as much as one year later. Because of the delay, much of the animal tissue could not be used and at least 20 animals had to be excluded from postmortem examinations.

The original pathology sheets and the pathology sheets submitted to the FDA showed differences for 30 animals.

One animal was reported alive at week 88, dead from week 92 through week 104, alive at week 108, and finally dead at week 112.

An outbreak of an infectious disease was not reported to the FDA.

Tissue from some animals were noted to be unavailable for analysis on the pathology sheets, yet results from an analysis of this "unavailable" tissue was submitted to the FDA.

There was no documentation of the age or source of the test animals.

There was no protocol established until one of the studies was well underway.

Animals were not permanently tagged to prevent mix-ups.

Some laboratory methods were changed during the study, but not documented.

Given such dubious methods, it should be no surprise that the responsible FDA expert committees refused for years to approve aspartame.

---

<sup>35</sup>Olney et al. (1970), pp. 609–610; Olney (1996), pp. 1115–1123.

<sup>36</sup>[http://www.fda.gov/ohrms/dockets/dailys/03/Jan03/012203/02P-0317\\_emc-000202.txt](http://www.fda.gov/ohrms/dockets/dailys/03/Jan03/012203/02P-0317_emc-000202.txt) accessed on 22 April 2014.

When Ronald Reagan became the U.S. president, he fired the former head of the FDA and appointed a man by the name of Arthur Hull Hayes. He determinedly worked towards the substance's approval. An FDA panel comprised of three experts had already delivered their verdict—and voted against aspartame. Hayes subsequently ordered an additional panel, increased the professional lineup to five people, but the approval was again denied three against two. At this point Hayes added another aspartame advocate to the panel, which then resulted in a deadlock where he had the possibility to cast the deciding vote in favor of its approval.

On the FDA websites, there is a detailed chronology of the background of the approval. There, it is noted that:

On January 21, 1981, the day after Ronald Reagan takes office as U.S. President, G.D. Searle [a large pharmaceutical company] reapplied for the approval of aspartame. G.D. Searle submitted several new studies along with their application. It was believed that Reagan would certainly replace Jere Goyan, the FDA Commissioner. G.D. Searle president Donald Rumsfeld's connections to the Republican party were also thought to play a part in Searle's decision to reapply for aspartame's approval on the day after Ronald Reagan was inaugurated.

In 1981, aspartame would be approved for dry food, and in 1983 for drinks as well. Shortly after Hayes had enforced the approval, he left the FDA, and took on an assignment with the PR firm Burson-Marsteller, a public relations company that was, at the time, working for NutraSweet's parent company Monsanto.

Certain bitterness remained with officials of the supervisory authority.

The FDA toxicologist Adrian Gross spoke before the U.S. Congress that, first and foremost, the behavior of former aspartame manufacturer G.D. Searle during the procedure had absolutely not promoted his confidence in the safety of the product:

They [G.D. Searle] lied and they didn't submit the real nature of their observations because, had they done so, it is more than likely that a great number of these studies would have been rejected simply for inadequacy. What Searle did, they took great pains to camouflage these shortcomings of the study. They would selectively filter and present to the FDA only what they wished it to know; they also used other questionable methods such as how when animals would develop tumors while they were under study, well, they would remove these tumors from the animals.

The FDA expert deemed the approval of the artificial sweetener via his administration as illegal—and it reminded him of the actual duty of the bureau—the protection of consumers. He said, “And if the FDA violates its own laws who are left to protect the health of the public?”

Furthermore, decades after the approval, there were new scientific reports about health risks.

Danish researchers from the State Serum Institute in Copenhagen have pointed out the increasing danger for preterm births in women who drank light lemonade. The baby might not only arrive early, but also enter the world with an increased risk of disease.<sup>37</sup>

---

<sup>37</sup>Englund-Ögge et al. (2012), pp. 552–559.

The Ramazzini Institute in the Italian city of Bologna has also pointed out the risks for various types of cancer scientifically linked to artificial sweeteners—leukemia, lung, lymph node, and liver cancers. These connections were noted with a partial daily dosage of 20 mg of aspartame per kilogram of body weight—only half of the acceptable limit for artificial sweeteners.<sup>38</sup>

Yet despite this knowledge, the European food authority EFSA sees no reason to take action against the widespread sweetener.

EFSA multiple times evaluated the results from the Ramazzini studies and still came to the conclusion that there was “no evidence” of cancer-causing or mutagenic effects from aspartame.

The EFSA experts did not doubt that lab animals suffered from various types of cancer in the course of their lives, but they linked them to other comorbidities—pneumonia, for example.

There was therefore no reason to reconsider this approval, according to EFSA in 2009. In 2013, the authority confirmed their previous stance once again: “The Panel concluded that aspartame was not of safety concern at the current aspartame exposure estimates or at the ADI of 40 mg/kg bw/day. Therefore, there was no reason to revise the ADI of aspartame.”<sup>39</sup>

Critics view EFSA decisions to be strongly influenced by the numerous industrial affiliations of the EFSA experts who had participated in the aspartame assessment at various stages.

Some of the chairmen of the EFSA expert panels—such as the long-standing John Christian Larsen of ILSI—were actively involved in the aspartame decision of 2009 while concurrently serving for that industry lobby organization. Other members of the EFSA panels who had always argued in favor of the harmlessness of aspartame, such as the Dutch professor Ivonne Rietjens, the Frenchman Jean-Charles Leblanc, the Brit Susan Barlow, the chairwoman of an earlier aspartame assessment, the Italian Riccardo Crebelli, and the Swedish Kettil Svensson all also served ILSI.

The French professor Dominique Parent-Massin, who had also sat in on the panel of the 2013 decision, was representative of three active ILSI member corporations, the aspartame corporation Ajinomoto, the key aspartame customer Coca-Cola, and the Danish sweetener-suppliers Danisco.

Professor Karl-Heinz Engel had ties to the aspartame manufacturer Ajinomoto, while he played a part in an EFSA aspartame decision. He also holds the position of chair of general food technology at the Technical University of Munich, where from 2001 to 2004, he employed an Ajinomoto employee as a doctoral student in his laboratory whose research project was financed by Ajinomoto. Professor Engel himself had also already participated in workshops

<sup>39</sup>Scientific Opinion on the re-evaluation of aspartame (E 951) as a food additive EFSA Panel on Food Additives and Nutrient Sources added to Food (ANS) EFSA Journal 2013;11(12):3496. <http://www.efsa.europa.eu/de/efsajournal/doc/3496.pdf>.

co-financed by Ajinomoto and Monsanto concerning the topic of “Safety of DNA in Food” at ILSI Europe in Brussels in 2000.

The EFSA expert panel were aware of these relationships but judged there to be no conflict of interest, since Engel’s ties to Ajinomoto, as well as the work of his doctoral student, had nothing to do with aspartame. “Because no other direct or indirect funding took place through Ajinomoto, the chairmen and the panels have agreed that this cannot be seen as a conflict of interest,” according to the EFSA scientific panel on the assessment of the Ramazzini Foundation aspartame study.<sup>40</sup>

## 1.8 Codex Alimentarius: Democracy on Hold at the World Government of Food

The most important regulation entity in the world of globalized food supply is the Codex Alimentarius, an establishment of the Food and Agriculture Organization (FAO) and the World Health Organization (WHO). The Codex Alimentarius is, so to speak, the world government of food.

The rules that the Codex sets in respect to food are far more important than anything conceived in Vienna, Washington, Berlin, Bern, or Brussels on the subject. The rules of the Codex Alimentarius apply to 185 countries around the globe. The Codex sets standards for all types of food products trafficked all over the globe based on hygiene, additives, food labeling, and much more.

There are 16 subgroups known as “Codex Committees” for each of these categories of standards. The official seat of the Codex Alimentarius is in Rome, and sessions take place all over the world.<sup>41</sup> The Codex Alimentarius is also the most important organization for defining the global rules of food safety.

Thus the participants of the Beijing WHO conference on food safety promoted the international harmonization of these measures in consultation with the standards of the Codex Alimentarius (see footnote 6):

Develop transparent regulation and other measures based on risk analysis to ensure safety of the food supply from production to consumption, harmonized with the guidance of the Codex Alimentarius Commission and other relevant international standards-setting bodies.

Despite its Roman-sounding Latin name, the Codex Alimentarius has only existed since 1962, and since then, the Codex committees have devoted themselves to setting universal standards for food, from principles on genetically-engineered food and organic goods to others on the quality of products such as fruit juices, margarine, soup, poultry, cornflakes, sugar, chocolate, and cheese, among several others. The Codex members issue hygiene guidelines, determine the limits for toxins in vegetables and for drug residues in meat, regulate the radioactive exposure

---

<sup>40</sup>Refer to: Grimm (2013).

<sup>41</sup>Refer to: Grimm (2014).

of seasonings, and investigate health risks that could spring from food, such as allergies. They also decide what goes on the label.

Previously, Codex decisions were non-binding. Yet since the liberalization of trade, they are actually in effect all around the globe. During this process the Codex Alimentarius Commission evolved into the informal world government in respect to food. The Codex Alimentarius is structured as an establishment of member states and only the official delegates of the nations are eligible to vote. However, representatives of globally active corporations virtually dominate this sphere.

During this process, the present industry representatives have played an essential role over the past few decades.

The statistics of an English consumer organization reveal the following: from 1989 to 1991, 2578 delegates participated in the expert panel sessions, from which merely 26 were dispatched from environmental or consumer organizations. Altogether, 105 countries were represented compared to 108 transnational companies. In the panel “Food Additives and Contaminants,” as it was formerly called, the industry dispatched, for example, almost twice as many delegates as all of the EU governments put together (see footnote 41).

This was also the case in the time that followed. For instance, at a panel session from April 21–25, 2008 in Beijing, 262 delegates are listed, the majority of which were company and industrial association representatives.

In Germany’s delegation, for example, there was a representative from Europe’s biggest sugar corporation, Südzucker.

In the seven-person Swiss delegation, five industry representatives sat equally next to only two government officials. The industry representatives came from the food multinational Nestlé, the additive corporation Ajinomoto, the vitamin global leader DSM, the flavor corporation Givaudan, and a consulting firm for which various clients work.<sup>42</sup>

The industry has, of course, a huge vested interest in setting global policies preferable to its business capability. For example, for decades, rules and regulations for flavor have been determined with significant collaboration of the concerned lobby, which includes the flavor industry association (the International Organization of the Flavor Industry, abbr. IOFI), the individual flavor manufacturers, and also the general food industry lobby groups.

At the Codex panel session from November 5–11, 1985 in the Dutch capital The Hague, for example, national delegations were stuffed with industry representatives compared to those actually representing the nation’s government.<sup>43</sup> In Germany’s delegation, the government was hopelessly in the minority, supplied only three of

---

<sup>42</sup>Joint FAO/WHO Food Standards Programme Codex Alimentarius Commission: Report of the Fortieth Session Of The Codex Committee on Food Additives. Beijing, China 21-25 April 2008.

<sup>43</sup>Joint FAO/WHO Food Standards Programme Codex Alimentarius Commission: Report of the Fortieth Session Of The Codex Committee on Food Additives. The Hague, 5-11 November 1985.

twelve national delegates. The German flavor industry was represented by one representative, with another two from its lobby organization. There was a representative from the German food industry lobby organization (the German Federation of Food Law and Food Science, BLL), as well as the usual Südzucker; moreover, Coca-Cola was allowed to represent Germany, together with the chemical corporation BASF. The Unilever global corporation was also represented in the German delegation, with two representatives who also sat in at the table of the Dutch delegation.

In the Swiss delegation, moreover, the governmental representatives from Bern were similarly the minority compared to the seven industry representatives. Two of these were from flavor corporation Givaudan, two more from the pharmaceutical giant Roche, and one from the flavor company Firmenich. In the U.S. delegation, the flavor corporation IFF was present, along with Coca-Cola. Beside them was the aspartame manufacturer Searle, General Foods, and Pfizer. Governmental representatives were also a minority in that delegation.

The food industry was even represented in the three-person “technical administration” of the Codex committee by way of the British-Dutch food multinational Unilever. In Santiago in 2010, the subcommittee responsible for health food and diets (“Codex Committee on Nutrition and Foods for Special Dietary Uses”, CCNFSDU) held a meeting, which dealt with health food products, vitamins, ready-made yogurts, and baby food.<sup>44</sup>

Nestlé was independently present at that session in Santiago and also represented in several other delegations, frequenting the Swiss, but also the Chilean and Mexican delegations with two representatives in each case.

Coca-Cola traveled with the American delegation, per usual, but also was present at the Chilean delegation, as well, as well as the German delegation, where a Südzucker manager was also present, just like in Beijing two years prior.

The pharmaceutical company Abbott was a member of the U.S. delegation, in which three representatives were from Mexico and from Chile.

Of course, Kellogg was also present (Mexico), as well as the Japanese additive corporation Ajinomoto (Switzerland), the Dutch vitamin world leader DSM (Chile/Switzerland), along with Herbalife (Chile), Dannon (France, the Netherlands), and Kraft Foods (Brazil).

In this system dominated by industry representatives, consumer interests play no noteworthy role in the decisions. At the Codex Committee panel session on food additives in Beijing 2008, there were only three consumer representatives among 262 delegates, for instance (see footnote 42).

---

<sup>44</sup>Codex Alimentarius Commission: Report Of The Thirty Second Session of The Codex Committee on Nutrition And Foods For Special Dietary Uses. Santiago, Chile, 1-5 November 2010.

## 1.9 The Predicament of the Consumer: Dwindling Influence, Increasing Personal Responsibility

The consumer, the citizen, who in democratic countries is supposedly sovereign, the subject of legal protection, is subject to double the pressure in the age of globalized food safety.

On the one hand, the consumer's influence on food is dwindling, and so is the possibility of their participation in establishing laws with global significance like the Codex Alimentarius. The consumers are underrepresented, and as a sovereign entity, they are also largely disempowered compared to the broad and impermeable scope of influence of the transnational corporations in the decision-making process.

Considering the complexity of modern processed food, and the broad, impenetrable supply chain, the law will continue to be limited, according to Frankfurt law Professor Wolf Paul's theory of "culinary self-determination." Paul stated that "the freedom of flavor and food is governed by one's own wishes and judgement." However, the "reign over food and drink" is now out of the hands of the individual consumer, and one's autonomy and self-determination is reduced to an unprecedentedly small size during times of industrial food production.<sup>45</sup>

On the other hand however, the consumers are carrying the full weight of responsibility for their hygienic well-being and health to a higher and higher extent. While countries have assumed a certain kind of monitoring and concern for classic illness pathogens, like viruses and bacteria, they reject to take on such a role where causes for "noncommunicable diseases" are concerned. It is solely up to the consumer to make that "healthy choice." Determining which food options are "safe" and choosing those over the widely-available alternatives is treated completely as the consumer's responsibility.

This means that if a consumer gets sick (from a non-communicable disease), or develops obesity, or dies prematurely due to their legally approved diet, it is the consumer's own fault. The manufacturer or authorities bear no responsibility. As actors in the vast realm of the consequences of these food products, they have withdrawn themselves.

Thus an entirely new situation prevails in the age of industrial food production: food products can now be legally considered entirely safe—and nevertheless, health is being unprecedentedly jeopardized.

Take soft drinks, for example: they are deemed to be completely safe, according to the current provisions on food safety, yet they are likely responsible for 180,000 deaths each year, according to calculations by the Harvard School of Public Health.<sup>46</sup> However, consumers themselves are the only ones legally responsible for their own protection against these health hazards.

---

<sup>45</sup>Paul W.: Die kulinarische Selbstbestimmung: eine menschenrechtliche Apologie des Feinschmeckers. In: *Zur Autonomie des Individuums: liber amicorum Spiros Simitis*; Simon D [Hrsg.] 2000.

<sup>46</sup><http://www.hsph.harvard.edu/news/hsph-in-the-news/roughly-180000-deaths-worldwide-linked-to-sugary-drink-consumption/>.

Illustrating this point, the responsible state authority in Germany, the Federal Institute for Risk Assessment (BfR), officially believes the view that food today is “safer and obviously qualitatively better” than ever before.<sup>47</sup> If people have regarded “food as a potential threat against their health,” then they are “profoundly wrong.”

Instead, claims BfR department head Gaby-Fleur Böhl, “the quality and safety of food is steadily increasing.” She elaborates: “Although, from a natural scientific point of view, food is significantly safer and obviously qualitatively better nowadays in comparison to former times. This fact is diametrically opposed to the decreased trust in these goods.”

The definition of “safe,” from the regulator’s perspective, solely means that food products “are free from disease-causing pathogens, bacteria, or viruses” as well as “chemical pollutants.” This is what manufacturers are responsible for.

From governmental viewpoint, sugar or additives do not threaten safety, even if they are in excess very unhealthy. However, the burden of maintaining this safety is not the responsibility of the manufacturers who utilize these, but rather one of the consumers who consume these, according to risk manager Böhl. “With each food product, I have to decide how much and how often I myself will consume this. Sugar can be harmful. We don’t need to talk about that. The dosage determines toxicity. And through their own food habits, people can control how much they will gain from a single food product.”<sup>48</sup>

The respective EU statutory regulation defines a food ‘hazard’ as<sup>49</sup>: “a biological, chemical or physical agent in, or condition of, food or feed with the potential to cause an adverse health effect.”

In Article 14, “Food safety requirements” are listed.

Here, each common form risk is mentioned:

4. In determining whether any food is injurious to health, regard shall be had:
  - (a) Not only to the probable immediate short-term and/or long-term effects of that food on the health of a person consuming it, but also on subsequent generations;
  - (b) To the probable cumulative toxic effects.

Yet for the official safety assessment, the first considerations are clearly for the traditional criteria, i.e. those which can lead to short-term health hazards:

5. In determining whether any food is unfit for human consumption, regard shall be had to whether the food is unacceptable for human consumption according to its intended use, for reasons of contamination, whether by extraneous matter or otherwise, or through putrefaction, deterioration or decay.

Ernährungssicherung und Lebensmittelqualität: Herausforderungen für Agrarmärkte, pp. 183-198. <http://ejournals.duncker-humboldt.de/doi/abs/10.3790/vjh.81.4.183>.

<sup>48</sup>Personal communication via E-mail on 25 April 2013.

<sup>49</sup>Regulation (EC) No 178/2002 Of The European Parliament And The Council of 28 January 2002 <http://eurlex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2002:031:0001:0024:EN:PDF> Accessed on 6 May 2014.

This understanding of food safety corresponds to the reasoning about the risks of the past, and does not account for the new health hazards that originate from food products. This then implies: the concept of food safety itself is not a top priority. The actual legal concept of food safety does not account for new threats against life and health via these “noncommunicable diseases.”

This is notable in Article 19 on the subject of “Responsibilities for food: food business operators,” It dictates:

1. If a food business operator considers or has reason to believe that a food which it has imported, produced, processed, manufactured or distributed is not in compliance with the food safety requirements, it shall immediately initiate procedures to withdraw the food in question from the market where the food has left the immediate control of that initial food business operator and inform the competent authorities thereof. Where the product may have reached the consumer, the operator shall effectively and accurately inform the consumers of the reason for its withdrawal, and if necessary, recall from consumers products already supplied to them when other measures are not sufficient to achieve a high level of health protection.

With products of the “Western diet”—fast food, soft drinks, and candy—it is difficult to believe that after years of unobjectionable sale, manufacturers will suddenly nurture concerns about the safety of their products. Especially since officially, the components are considered to be harmless.

Take sugar, for example: since 1958, the GRAS status (“Generally Recognized as Safe”) has been in place in the U.S., and in 1983, the FDA conferred both the GRAS predicate as well on high fructose corn syrup (HFCS). Despite increasing consumption quantities and newer insights about health risks, and despite the contribution of sweet substances to the obesity epidemic and to the so-called metabolic syndrome, the FDA still affirmed their safety assessment of these substances both in 1996 and in 2004.<sup>50</sup>

## 1.10 The Environment Must Change: Food Law and Food Safety in the Twenty-First Century

Critics are demanding that food elements with high hazard potential be more closely regulated, calling for a revision of the GRAS status.

Another suggestion would be regulations facilitating “healthy choices” on the part of the consumer with financial policy funds through taxes on unhealthy products like sugar.

In the *New England Journal of Medicine*, Yale Professor Kenny D. Brownell and Thomas Frieden, the director of the Center for Disease Control and Prevention (CDC), the highest U.S. health surveillance agency, proposed a tax on soft drinks.<sup>51</sup>

---

<sup>50</sup>Lustig (2014), p. 242.

<sup>51</sup>Brownell et al. (2009), pp. 1599–1605. Brownell and Frieden (2009), pp. 1805–1808.

They offer “approaches to designing a tax system that could promote good nutrition and help the nation recover health care costs associated with the consumption of sugar-sweetened beverages.”

A penny per ounce or 11 cents for every 0.3L tax can reduce consumption by 13 % if it follows the cigarette tax model, and in 10 years, would save 50 billion dollars in healthcare costs. The state currently earns about 150 billion dollars per year.

“Health related food taxes could improve health”, says Mike Rayner from the Department for Public Health at the elite University of Oxford. Together with his colleague Oliver Mytton, he had postulated in a sensational article, among other things, a sugar tax. The Oxford team argued that governmental interventions like taxation can be justified if the free market fails at its duty to promote good health and well-being.

“Existing evidence suggests that taxes are likely to shift consumption in the desired direction.” The tax would have to certainly be palpable, “at least 20% to have a significant effect on population health.”<sup>52</sup>

Taxes like these have already been established in Denmark, Finland, France, and Hungary. Studies have also showed, for instance, that for every 10 % additional tax on soft drinks, it is estimated that there will be about an eleven percent decrease in consumption.

Moreover, the UNO special correspondent for diet and nutrition, Olivier de Schutter, wants to do away with the present-day form of subsidies for the agrifood industry because they were what had initially caused unhealthy foods and sweet soft drinks to become significantly cheaper than fresh products; and due to lack of money, those of a poorer background were then forced to eat unhealthy foods.

The Special Rapporteur concludes that current food systems are deeply dysfunctional. The world is paying an exorbitant price for the failure to consider health impacts in designing food systems, and a change of course must be taken as a matter of urgency.

Tax payers were similarly asked to pay up in multiple ways: “Taxpayers pay for misguided subsidies that encourage the agrifood industry to sell heavily processed foods at the expense of making fruits and vegetables available at lower prices; they pay for the marketing efforts of the same industry to sell unhealthy foods, which are deducted from taxable profits; and they pay for health-care systems for which noncommunicable diseases today represent an unsustainable burden.”

He therefore postulated a rerouting of these finance flows:

Review the existing systems of agricultural subsidies, in order to take into account the public health impacts of current allocations, and use public procurement schemes for school-feeding programmes and for other public institutions to support the provision of locally sourced, nutritious foods, with particular attention to poor consumers.

---

<sup>52</sup>Mytton et al. (2012), p. e2931.

Furthermore, advertisements should be legally regulated, he stated in his report at the UN human rights committee. This is the most effective way to prohibit marketing strategies of unhealthy foods that are addressed towards children.<sup>53</sup>

“The environment must change,” says Professor Kelly D. Brownell, director of the Center for Food Policy and Obesity at Yale University in the U.S. state of Connecticut.<sup>54</sup>

Brownell coined the concept of “toxic food environments”. For him, there is a causal relationship that exists between the environment and rampant obesity. The only solution lies in the change of these environments, Brownell claims<sup>55</sup>: “As a society, we have two options,” he says, “we can wait several thousands of years so that we will evolve to adapt to our toxic environment. Or, we can change our own environment so that that it no longer makes us sick.”

# Chapter 2

## Agriculture, Ethics, and Law

**Bernard Rollin**

**Abstract** The development of human civilization was directly dependent on the creation of a secure and predictable food supply by way of plant and animal agriculture. Both forms of agriculture required sustainability. In animal agriculture, this was assured by *good husbandry*, i.e. respect for animals ‘needs and natures’. The development of civilization and technology paradoxically led to the undoing of this ancient contract with animals, and of sustainability in plant agriculture. Industry and the search for profit and productivity supplanted husbandry and stability. Industrial agriculture for animals supplanted agriculture as a way of life. The loss of husbandry was pervasive throughout animal agriculture, and turned good husbandry and animal welfare into major moral issues, rather than a presupposition of raising animals. This in turn led to a societal demand for a new ethic for treatment of animals in agriculture. As Plato pointed out, new ethics evolve out of established ethics, so society turned to its ethic for humans, *mutatis mutandis*, as a basis for a new animal ethic and as a way of assuring respect for animal nature or *telos*. The chartering of the Pew Commission on Industrial Farm Animal Production created a vehicle for exposing the general public to the numerous problems growing out of industrial animal agriculture. These problems fell into five interconnected categories: antimicrobial resistance; environmental despoliation; rural sociology; human and animal health; and animal welfare. Though the Commission offered numerous recommendations for remedying these problems, none have as yet been legislatively mandated.

### 2.1 The Rise of Traditional Agriculture

The development of human civilization was directly dependent on the creation of a secure and predictable food supply. Such a food supply freed peoples from the uncertainties and vagaries of depending on hunting and gathering, and enabled the

---

B. Rollin (✉)  
Colorado State University, Fort Collins, CO, USA  
e-mail: [Bernard.Rollin@colostate.edu](mailto:Bernard.Rollin@colostate.edu)

establishment of communities. Predictability regarding food was assured by the development of both plant and animal agriculture, which operated synergistically. Cultivation of crops and plants secured human ability to depend on (barring catastrophes of weather) foods of plant origin, and on a steady and local source of animal feed. Animal agriculture in turn provided a source of labor for crop production, as well as a predictable reservoir of animal protein for human consumption. The secure food supply ramified in the ability to develop manufacturing, trade, commerce and, in Hobbes's felicitous phrase, the "leisure that is the mother of philosophy," construed in the broadest sense as speculative thought, science, technological innovation, art and culture.

Presuppositional to the development of both agricultures was the concept of sustainability, i.e. assurance that the conditions and resources necessary to them were indefinitely renewable. As children, we might have learned about balanced aquariums. If we wished to keep a fish tank where the fish lived and we did not want to keep tinkering with it, we needed to assure that the system in question was as close to a "perpetual motion" machine as possible, a system that required little maintenance because all parts worked together. That meant including plants that produced oxygen and consumed carbon dioxide, enough light to nourish the plants, or rather plants that thrived in the available light source, water that was properly constituted chemically, scavengers to remove wastes. When such a system worked, it required minimal maintenance. If something were out of balance, plants and animals would die and require constant replacement. The fish tank is aimed at being a balanced ecosystem. Thus, it represents a model of traditional approaches to cultivation of land, wherein one sought to grow plants that could be grown with indefinitely available resources. This model conserved and maximized these resources, and which would not die out or require constant enrichment. Hence, the beauty of pastoral agriculture, where pasture nourished herbivores and herbivores provided us with milk, meat, and leather and their manure enriched the pastoral land, in a renewable cycle.

Cultivation of land evolved locally with humans. If one did not attend to the constraints imposed by nature on what and how much can grow in a given region, the region would soon cease to yield its bounty, by virtue of salinization, depletion of nutrients, overgrazing, or insect infestation. Thus, over time, humans evolved to, as one book put it, "farm with nature," which became, like animal husbandry, both a rational necessity and an ethical imperative. Local knowledge, accumulated over a long period of trial and error, depicts how much irrigation was too much, what would not grow in given soils, what weeds left standing protected against insects, and where shade and windbreaks were necessary. Thus, accumulated wisdom was passed on—and augmented—from generation to generation, and was sustainable, i.e. required minimal tweaking or addition of resources. The genius of agriculture was to utilize what was there in a way that would endure. If the land did not thrive, you did not thrive. Traditional agriculture was inherently sustainable; through trial and error, over a long period, it evolved into a "balanced aquarium."

Not surprisingly, precisely isomorphic logic applied to sustainability in animal production. The maxim underlying continued success in rearing animals was *good*

*husbandry*, which represented a unified synthesis of prudence and ethics. Husbandry meant, first of all, placing the animals into the optimal environment where they could maximally fulfill their physical and psychological needs and natures. The husbandman then augmented animals' ability to survive and thrive by watching over them, providing protection against predators, food during periods of famine, water during times of drought, shelter during extremes of climate, assistance in birthing, medical attention, and generally ministering to whatever needs the animals had. So powerfully ingrained was this imperative in the human psyche, that when the Psalmist searches for a metaphor for God's ideal relationship to human beings, he can do no better than seizing upon the conceit of the Good Shepherd.

We want no more from God than what the Good Shepherd provides for his flock.<sup>1</sup> As we know from other passages<sup>2</sup> in the Old Testament, a lamb on its own would live a miserable, nasty, and short life by virtue of the proliferation of predators—hyenas, raptors, wolves, bears, lions, foxes, jackals and numerous others. With the care and ministrations of the Shepherd, the animal lives well until such time as humans take its life, in the meantime supplying us with milk, wool, and, in the case of some domestic animals, the labor that became indispensable to the working of the land for crops.

The history of Western civilization cannot overestimate the power of this symbiotic image. In Christian iconography, for thousands of years, Jesus is depicted both as Shepherd and as the lamb, a duality built into the very foundations of human culture. The pastor, a word harking back to *pastoral*, tends to his flock; the members of his congregation are his sheep. Moreover, when Plato discusses the ideal political ruler in the *Republic*, he deploys the shepherd—sheep metaphor: The ruler is to his people as a shepherd is to his flock. Qua shepherd, he exists to protect, preserve and improve the sheep; any payment tendered to him is in his capacity as wage earner. So too the ruler; this again illustrates the power of the concept of husbandry on the human psyche.

Animal agriculture was indispensable to the subsequent development of society and culture. Husbandry agriculture is the *ancient contract* that was presuppositional to that entire evolutionary process. In one of the most momentous ironies in the history of civilization, this ancient contract with the animals, as well with the Earth, in terms of sustainability, contained within it the seeds of its own undoing. It was in virtue of a secure and predictable food supply that humans could proceed with the trade, manufacturing, invention and the general flourishing of culture.

By the late nineteenth century, industrial proliferation and innovation had reached a point where sustainability and good husbandry seemed to be no longer essential presuppositions of civilization. The ancient contract, which we may characterize as animal husbandry, and stewardship with regard to the land, was the presuppositional bedrock upon which economics, art, and culture rests. With the

---

<sup>1</sup>Rollin (2002).

<sup>2</sup>Cooper (n.d.).

profound *hubris* of Icarus, who challenged inherent human limitations, with blind and abiding faith in the humanly crafted tools, which repeatedly show themselves as impotent in the face of natural disaster, we thumbed our noses at both morality and prudence. As the ancients crafted the tower of Babel, we began to overreach the constraints imposed on us by the natural world. In both crop and animal agriculture, the ancient values of sustainability, stewardship, and husbandry inexorably gave way to modernist values of industrialization, productivity, and efficiency. The symbiotic partnership between humans and the Earth, and between humans and animals, rapidly transmutes into patent exploitation with no respect or attention to what priceless elements are lost.

Science and technology enabled extraction of greater crop yields than hitherto imagined. Instead of farming depending on idiopathic wisdom, local knowledge, know-how—passed from generation to generation—it is now conceived through technology, as applied science, as nomothetic,—law like—and in principle applicable to any locale. As in animal agriculture, capital and machinery supplanted knowledgeable labor. Farms got bigger and bigger; thus, food was plentiful and consequently, cheap.

With these gains came major costs, albeit costs that were not immediately obvious, and long term. If you forget about having a balanced aquarium, then you must pump resources in regularly to compensate for the loss of balance. *Sustainability* is abandoned. The new form of agriculture requires a great deal of fuel in order to run the machinery and make the chemicals. This new form requires massive amounts of water, as well. “Only 75 % of modern agriculture’s consumption of water is replenished” (Dawkins).<sup>3</sup> These chemicals, fertilizers, pesticides, herbicides, and fuels left residue; they pollute both the air and water, which leads to the disturbance and death of fragile eco-systemic health. Growing crops requires land. As a result, forests had to be cleared, which uprooted and impoverished endogenous ecosystems, annihilated species, and lost wild plants.

Powerful and plentiful agricultural chemicals had negative health effect on workers and citizens. Indiscriminate use of pesticides predictably and inexorably led to inadvertent selective breeding of super-pests, highly resistant to these chemicals—even as the massive use of antibiotics in confinement animal agriculture both to promote growth and to mask the effects of bad husbandry led to the evolution of antibiotic-resistant pathogens. In addition, pesticides non-selectively killed off both desired pests, and their natural enemies.

As farmer debt load increased, increasing numbers of small farmers lost their farms, unable to afford the infrastructure required. As a result, they went out of business, and so died the little communities they inhabited, their culture, and their way of life.

---

<sup>3</sup>Dawkins and Bonney (2008).

## 2.2 Traditional Agriculture and Ethics

Was there a formalized ethic dictating how agriculturalists comported themselves in traditional agriculture? Self-interest is the most powerful motivator and sanction. Failure to practice good husbandry towards animals, and good stewardship towards the land would necessarily erode productivity, and thus harm producer self-interest. Hurting animals through any medium would diminish productivity in terms of weight gain, reproductive success, and ability to work, strength, endurance, coat quality, and every other expectation directed towards the animals. If self-interest did not move certain people, it is doubtful that enunciation of any ethic or laws mirroring that ethic would have any more success.

The only ethic in addition to the pragmatic teaching of husbandry in traditional agriculture was a prohibition against deliberate *cruelty*, aimed at sadists and psychopaths who were heedless of considerations of self-interest. Buttressing husbandry, the ancient biblical ethic even allowed for a violation of the Sabbath to help animals in distress.

Though no special additional ethic regarding animal treatment was historically necessitated, husbandry was widely taught in schools and by parents, both in actual lessons, and in behavior modeled for children by their parents and other elders. During this time, both “animal smarts” and “wisdom of the soil” were passed on through generations, in a ceremonious manner that we may call “the agricultural birthright.” There was no shame, but rather pride in being a third or fourth or fifth or tenth generation agriculturalist, raising animals and/or crops on the same land multiple generations of your family had stewarded.

## 2.3 The End of Husbandry, Stewardship, and Sustainability

Industrialization of animal agriculture marked a genuine and major revolution in Western culture that has been insufficiently attended to by historians. First and foremost, the industrialization of animal agriculture was a complete transformation in values. Traditional agriculture has solid roots in husbandry of animals, good stewardship of the land, and was a sustainable way of life, more than it was a way of making a living. As industrial agriculture developed, the supreme values became efficiency and productivity. Traditional agriculture enabled people to live a life solidly enmeshed in, and extremely conscious of, one’s dependence on nature. Industrialized agriculture is solidified in a hubristic rebellion against natural constraints. No longer was the agriculturalist forced to work with physical and animal nature. Instead of carefully and methodically putting square pegs in square holes, round pegs in round holes, while generating as little friction as possible, the industrial agriculturalist took it upon himself to force square pegs into round

holes, round pegs into square holes by utilizing “technological sanders”<sup>4</sup> to grind the pegs in order to force fit them into contexts in which they did not naturally fit. Such sanders are epitomized by the liberal use of antibiotics that allow us to force animals into environments where they would sicken and die without the “technological fix” afforded by the drugs. Instead of seeking the healthiest possible environment for the animals, we worked our magic on highly pathogenic environments, and highly pathogenic conditions, such as crowding. The animals experienced major insults to their natural needs and natures and suffered in the sacrifice of good health and welfare, while at the same time the pathogens occupying their environmental niche mutated in the face of the selective pressures inherent in excessive antimicrobial use, generating new and dangerous drug-resistant pathogens wreaking havoc with both animal and human health.

Small, independent family farmers, whom Thomas Jefferson acknowledged as serving as the backbone of democracy by keeping control of the food supply away from governments and plutocrats, became slaves to large corporate entities, which were the only structures rich enough to capitalize agriculture according to the emerging mantra of “get big or get out.” Capital in the form of machinery, huge buildings, and vast numbers of animals replaced “animal-smart” labor, and labor became unskilled manual labor, rather than applied husbandry knowledge. The number of small farms decreased exponentially. To take one depressing example, between 1980 and 1995, the U.S. lost 80 % of the small hog farmers who dominated the industry, only to have them replaced by five gargantuan mega-corporations who produced 95 % of U.S. pork. Citizens who complained about any of the issues mentioned were often shadowed and intimidated by company “security” police. Correlatively, thriving, rural communities based in small hog operations became ghost towns, as small operations were forced to sell to large corporate entities at pennies on the dollar.

As a result of the industrialization of animal agriculture, farm life went from being the stereotypical “healthy outdoor way of life” to a pathogenic one. The proliferation of animal wastes caused noxious air and water pollution, danger due to farm machinery accidents, and infections resulting from animal crowding and overuse of antibiotics. Animal wastes went from fertilizing pasture in a sustainable cycle in extensive agriculture to being a major source of water, ground, and air pollution in industrial agriculture.

The question naturally arises as to why, after thousands of years of successful animal agriculture based in husbandry, it was so quickly supplanted by industrial agriculture and its attendant problems. In fact, industrialization of animal agriculture in the U.S. occurred for a variety of understandable and even *prima facie* laudable reasons that are worth recounting.

1. When industrial agriculture began, in the early twentieth century, the U.S. was confronted with a variety of new challenges related to food. In the first place, the great economic Depression and Dust Bowl (severe drought) had soured many

---

<sup>4</sup>“Veterinary Care for Laboratory Animals – Animal Research in a . . .” <<http://www.ncbi.nlm.nih.gov/books/NBK91520/>>.

people on farming, and even more dramatically, had raised the specter of starvation for the American public for the first time in U.S. history. Vivid images of bread-lines and soup kitchens drove the desire to assure a plentitude of cheap food. By the late 1960s and 1970s, the U.S. had large-scale industrialized animal agriculture with much bigger units compared to Europe.

2. Better jobs were to be found in cities, and rural people flocked to them in hopes of a better life, creating a potential shortage in agricultural labor.
3. Correlative with the growth of cities and suburbs came encroachment on agricultural land for various forms of development, raising land prices and moving acreage once available for agriculture out of that pool.
4. Many people who would otherwise have been happy with a slow, rural way of life were exposed to greater sophistication by virtue of military service in World Wars I and II, and thus were dissatisfied with an agrarian existence.
5. Demographers predicted a precipitous and dramatic increase in population, which turned out to be accurate.
6. With the success of industrialization in new areas, notably Henry Ford's application of the concept to the automobile, it was probably inevitable that the concepts of industrialization would be applied to agriculture. (Ford himself had already characterized slaughterhouses as "disassembly lines").<sup>5</sup>

Thus was born an industrial approach to agriculture, with machines taking the place of labor. The traditional Departments of Animal Husbandry in agricultural schools symbolically marked this transition by changing their names to Departments of Animal Sciences, a field defined in textbooks as "application of industrial methods to the production of animals."

In this transition, as we have just seen, the traditional bedrock values of agriculture, husbandry, sustainability, agriculture as a way of life, not only a way of making a living, were transmuted into values of efficiency and productivity. With human labor replaced by machinery, in turn requiring large amounts of capital, farm units grew larger, eventuating in the mantra of the 1970s "get big or get out." Agricultural research stressed producing cheap and plentiful food, and moved in unprecedented directions. With animals confined for efficiency and away from forage, much research was directed towards finding cheap sources of nutrition, in turn leading to feeding such deviant items to animals as poultry and cattle manure, cement dust, newspaper, and most egregiously, bone meal to herbivores; the latter of which created BSE or "Mad Cow Disease."<sup>6</sup> Animals were kept under conditions alien to their natural needs for the sake of productivity.<sup>7</sup>

Industrial agriculture replaced good husbandry, which we have characterized as putting square pegs into square holes, round pegs into round holes, while producing

<sup>7</sup>"Improving Animal Welfare," written by Temple Gandhi, page 26 of ebook. Direct Quoting.

as little friction as possible, with technological “sanders” such as antibiotics, hormones, extreme genetic selection, air handling systems, artificial cooling systems, and artificial insemination designed to force animals into unnatural conditions while they nonetheless remained productive.

Consider, for example, the egg industry, one of the first areas of agriculture to experience industrialization. Traditionally, chickens ran free in barnyards, able to live off the land by foraging and express their natural behaviors of moving freely, nest-building, dust-bathing, escaping from more aggressive animals, defecating away from their nests, and, in general, fulfilling their natures as chickens. Industrialization of the egg industry, on the other hand, meant placing the chickens in small cages, in some systems with six birds in a tiny wire cage, so that one animal may stand on top of the others and none can perform any of their inherent behaviors, unable even to stretch their wings. In the absence of space to establish a dominance hierarchy or pecking order, they cannibalize each other, and must be “debeaked”, producing painful neuromas since the beak is innervated. The animal is now an inexpensive cog in a machine, part of a factory, and the cheapest part at that, and thus totally expendable. If a nineteenth century farmer had attempted such a system, he would have gone bankrupt, with the animals dead of disease in a few weeks. Some genetic lines of pigs and chickens are so highly selected for egg and meat production that they have less disease resistance.

The steady state, enduring balance of humans, animals, and land is lost. Putting chickens in cages and cages in an environmentally controlled building requires large amounts of capital and energy and technological “fixes”; for example, to run the exhaust fans to prevent lethal build-up of ammonia. The value of each chicken is negligible, so one needs more chickens; chickens are cheap, cages are expensive, so one crowds as many chickens into cages as is physically possible. The vast concentration of chickens requires huge amounts of antibiotics and other drugs to prevent wildfire spread of disease in overcrowded conditions. Breeding of animals is oriented solely towards productivity, and genetic diversity—a safety net allowing response to unforeseen changes—is lost. Bill Muir, a genetics specialist at Purdue University, found that commercial lines of poultry have lost 90 % of their genetic diversity compared to noncommercial poultry. Dr. Muir is extremely concerned about the lack of genetic diversity (Lundeen 2008). Small poultry producers are lost, unable to afford the capital requirements; agriculture as a way of life as well as a way of making a living is lost; small farmers are superseded by large corporate aggregates. Giant corporate entities, vertically integrated, are favored. Manure becomes a problem for disposal, and a pollutant, instead of fertilizer for pastures. Local wisdom and know-how essential to husbandry is lost; what “intelligence” there is hard-wired into “the system”. Food safety suffers from the proliferation of drugs and chemicals, and widespread use of antimicrobials to control pathogens in effect serves to breed—select for—antibiotic resistant pathogens as susceptible ones are killed off. Above all, the system is not balanced—not sustainable—constant inputs are needed to keep it running, and to manage the wastes it produces, and create the drugs and chemicals it consumes. And the animals live miserable lives, for productivity has been severed from well-being.

One encounters the same dismal situation for animals in all areas of industrialized animal agriculture. Consider, for example, the dairy industry, once viewed as the paradigm case of bucolic, sustainable animal agriculture, with animals grazing on pasture giving milk, and fertilizing the soil for continued pasture with their manure. Though the industry wishes consumers to believe that this situation still obtains—the California dairy industry ran advertisements proclaiming that California cheese comes from “happy cows”, and showing the cows on pastures—the truth is radically different. The vast majority of California dairy cattle spend their lives on dirt and concrete and, in fact, never see a blade of pasture grass, let alone consume it. So outrageous is this duplicity that the dairy association was sued for false advertising and a friend of mine, a dairy practitioner for 35 years, was very outspoken against such an “outrageous lie”.

In actuality, the life of dairy cattle is not a pleasant one. In a problem ubiquitous across contemporary agriculture, animals have been single-mindedly bred for productivity; in the case of dairy cattle, for milk production. Today’s dairy cow produces 3–4 times more milk than 60 years ago. In 1957, the average dairy cow produced between 500 and 600 pounds of milk per lactation. Fifty years later, it is close to 20,000 pounds. (Colorado Dairy Facts 2005; NASS; Milk Production and Milk Cows 2006). From 1995 to 2004 alone, milk production per cow increased 16%. The result is a milk bag on legs, and unstable legs at that. A high percentage of the U.S. dairy herd is chronically lame (some estimates range as high as 30%), and these cows suffer serious reproductive problems. Whereas, in traditional agriculture, a milk cow could remain productive for 10, 15, or even 20 years, today’s cow lasts slightly longer than two lactations, a result of a metabolic burnout and the quest for ever-increasingly productive animals, hastened in the U.S. by the use of the hormone BST to further increase production. Such unnaturally productive animals naturally suffer from mastitis, and the industry’s response to mastitis in portions of the U.S. has created a new welfare problem by docking of cow tails without anesthesia in a futile effort to minimize teat contamination by manure. Still practiced, this procedure has been definitively demonstrated not to be relevant to mastitis control or lowering somatic cell count (Stull et al. 2002). (In my view, the stress and pain of tail amputation coupled with the concomitant inability to chase away flies, may well dispose to more mastitis.) Calves are removed from mothers shortly after birth, before receiving colostrum, creating significant distress in both mothers and infants. Bull calves may be shipped to slaughter or a feed lot immediately after birth, generating stress and fear.

The intensive swine industry, which through a handful of companies is responsible for 85% of the pork produced in the U.S., is also responsible for significant suffering that did not affect husbandry-reared swine. Certainly the most egregious practice in confinement swine industry and possibly, given the intelligence of pigs, in all of animal agriculture, is the housing of pregnant sows in gestation crates or stalls—essentially small cages. The *recommended* size for such stalls, in which the sow spends her entire productive life of about 4 years, with a brief exception we will detail shortly, according to the industry is 0.9 m high by 0.64 m wide by 2.2 m

long—this for an animal that may weigh 275 or more kilograms. In reality, many stalls are smaller. The sow cannot turn around, walk or even scratch her rump. In the case of large sows, she cannot even lie flat but must remain lying on her sternum. The exception alluded to is the period of farrowing—approximately 3 weeks—when she is transferred to a “farrowing crate” to give birth and nurse her piglets. The space for her is not greater, but there is a “creep rail” surrounding her so the piglets can nurse without being crushed by her postural adjustments.

Under extensive conditions, a sow will build a nest on a hillside so excrement runs off; forage an area covering 2 km a day; and take turns with other sows watching piglets and allowing all sows to forage. With the animal’s nature thus aborted, she goes mad, exhibits bizarre and deviant behavior such as compulsively chewing the bars of the cage. She also endures foot and leg problems and lesions from lying on the concrete in her own excrement.

These examples are sufficient to illustrate the absence of good welfare in confinement. In general, all animals in confinement agriculture (with the exception of beef cattle who live most of their lives on pasture, and are “finished” on grain in dirt feed lots, where they can actualize much of their nature), suffer from the same generic set of affronts to their welfare absent in husbandry agriculture:

1. *Production Diseases*—By definition: a production disease is a disease that would not exist or would not be of serious epidemic import were it not for the method of production. Examples are liver and rumenal abscesses resulting from feeding cattle too much grain, rather than roughage. The animals that get sick are more than balanced out economically by the remaining animals’ weight gain. Other examples are confinement-induced environmental mastitis in dairy cattle, weakness caused by beta-agonists to increase muscle mass in pigs and “shipping fever” in beef cattle. There are textbooks of production diseases, and one of my veterinarian colleagues calls such disease “the shame of veterinary medicine,” because veterinary medicine should be working to eliminate such pathogenic conditions, rather than treating the symptoms.
2. *Loss of Workers who are “Animal Smart”*—In large industrial operations such as swine factories, the workers are minimum wage, sometimes illegal, often migratory workers with little animal knowledge. Confinement agriculturalists will boast that “the intelligence is in the system” and thus the historically collective wisdom of husbandry is lost, as is the concept of the historical shepherd, now transmuted into rote, cheap, labor.
3. *Lack of Individual Attention*—Under the husbandry systems, each animal is economically valuable. In intensive swine or poultry operations, the individuals are worth little. When this is coupled with the fact that workers are no longer caretakers, the result is obvious.
4. *The lack of attention to animal needs determined by their physiological and psychological natures*—As mentioned earlier, “technological sanders” allow us to keep animals under conditions violative of their natures, thus severing productivity from assured well-being.

## 2.4 The Demand for a New Ethic

The regnant ethic, born of necessity for the vast majority of agricultural history, was *good husbandry*. The advent of industrialized agriculture vitiated the relevance of husbandry to what agriculture has become. As confinement agriculture proliferated and came to dominate animal agriculture, the public began to realize that what they thought was “Old Macdonald’s Farm,” bucolic and pastoral, was no longer even related to that image. Public awareness began in Europe, specifically in Britain with the publication of journalist Ruth Harrison’s seminal exposé of agricultural industrialization, *Animal Machines*. So powerful was the impact of this book during the mid 1960s, that the British government was compelled to charter the Brambell Commission, a group of ethnologists and biologists, charged with critically examining confinement agriculture (Brambell 1965). The Commission concluded that no system of production that failed to meet animals’ basic needs and natures was morally acceptable. Though the Brambell Commission recommendations enjoyed no regulatory status, they served as a moral lighthouse for European social thought. In 1988, the Swedish Parliament passed, virtually unopposed, what the *New York Times* call a “Bill of Rights” for farm animals, abolishing in Sweden, in a series of timed steps, the confinement systems currently dominating North American agriculture (New York Times 1988). Much of northern Europe has followed suit, and the European Union moved in a similar direction with sow stalls for example, which were eliminated by 2011 (Rollin 2004).

People in the United States who found themselves morally concerned about the treatment of animals in confinement systems by industrialized agriculture found no moral recourse for effecting reform, and no legal grounds for challenging these systems. Attempts to utilize state anti-cruelty laws to attack modalities like veal crates and sow stalls had no traction. According to the legal history of anti-cruelty legislation in the United States, nothing accepted by an industry or “ministering to human needs” could ever count as cruel, with cruelty laws serving only to capture and punish sadistic, deviant, unnecessary practices. The anti-cruelty wrench could simply not fit the nut that needed to be turned.

Fueled by an ever-increasing social concern, a new societal ethic for animals began to emerge in the United States. In a study commissioned by USDA to answer why this took place, I distinguished a variety of social and conceptual reasons (Rollin 1995):

1. Changing demographics and consequent changes in the paradigm for animals:  
Whereas at the turn of the century, more than half the population was engaged in producing food for the rest, today only some 1.5 % of the U.S. public is engaged in production agriculture (AMC 2003). One hundred years ago, if one were to ask a person in the street, urban or rural, to state the words that come into their mind when one says “animal”, the answer would doubtless have been “horse”, “cow”, “food”, “work”, etc. Today, however, for the majority of the population, the answer is “dog”, “cat”, “pet”. Repeated studies show that almost 100 % of the pet-owning population views their animals as “members of the family” (The

Acorn 2002), and virtually no one views them as an income source. Divorce lawyers note that custody of the dog can be as thorny an issue as custody of the children!

2. We have lived through a long period of ethical soul-searching

For almost 50 years society has turned its “ethical searchlight” on humans traditionally ignored or even oppressed by the consensus ethic—blacks, women, the handicapped, other minorities. The same ethical imperative has focused attention on our treatment of the non-human world—the environment and animals. Many leaders of the activist animal movement in fact have roots in earlier movements—civil rights, feminism, homosexual rights, children’s rights and labor.

3. The media has discovered that “animals sell papers”

One cannot channel-surf across normal television service without being bombarded with animal stories, real and fictional. (A *New York Times* reporter recently told me that more time on cable TV in New York City is devoted to animals than to any other subject.) Recall, for example, the extensive media coverage a number of decade ago of some whales trapped in an ice-floe, and freed by a Russian ice-breaker. This was hardly an overflowing of Russian compassion—an oxymoronic notion applied to a people who gave us pogroms, the Gulag, and Stalinism. Rather, someone in the Kremlin was bright enough to realize that liberating the whales was an extremely cheap way to score points with U.S. public opinion.

4. Strong and visible arguments have been advanced in favor of raising the status of animals by philosophers, scientists and celebrities (Singer 1975; Rollin 1981; Regan 1983; Sapontzis 1987).

5. Changes in the nature of animal use demanded new moral categories

In my view, while all of the reasons listed above are relevant, they are nowhere near as important as the precipitous and dramatic changes in animal use that occurred after World War II. These changes were the huge conceptual changes in the nature of agriculture we have described, and second the rise of significant amounts of animal research and testing. The latter was also not conceptually able to be captured by the anti-cruelty laws. But ethical concepts do not arise *ex nihilo*.

Plato taught us a very valuable lesson about effecting ethical change. If one wishes to change another person’s—or society’s—ethical beliefs, it is much better to *remind* than to *teach* or, in my martial arts metaphor, to use *judo* rather than *sumo*. In other words, if you and I disagree ethically on some matter, it is far better for me to show you that what I am trying to convince you of is already implicit—albeit unnoticed—in what you already believe. Similarly, we cannot force others to believe as we do (*sumo*); we can, however, show them that their own assumptions, if thought through, lead to a conclusion different from what they currently entertain (*judo*). These points are well-exemplified in twentieth century U.S. history. Prohibition was *sumo*, not *judo*—an attempt to forcefully impose a new ethic about drinking on the majority by the minority. As such, it was doomed to fail, and in fact

people drank *more* during Prohibition. Contrast this with Lyndon Johnson's civil rights legislation. As himself a Southerner, Johnson realized that even Southerners would acquiesce to the following two propositions:

All humans should be treated equally, and black people were human—they just had never bothered to draw the relevant conclusion.

If Johnson had been wrong about this point, if “writing this large” in the law had not “reminded” people, civil rights would have been as ineffective as Prohibition!

So, society was faced with the need for new moral categories and laws that reflect those categories in order to deal with animal use in science and agriculture and to limit the animal suffering with which it is increasingly concerned. At the same time, recall that western society has lived through almost fifty years of extending its moral categories for *humans* to people who were morally ignored or invisible—women, minorities, the handicapped, children, citizens of the third world. As we noted earlier, new and viable ethics do not emerge *ex nihilo*. A plausible and obvious move is for society to continue in its tendency and *attempt to extend the moral machinery it has developed for dealing with people, appropriately modified, to animals*. This is what has occurred. Society has taken elements of the moral categories it uses for assessing the treatment of people and is in the process of modifying these concepts to make them appropriate for dealing with new issues in the treatment of animals, especially their use in science and confinement agriculture.

What aspect of our ethic for people is being so extended? One that is, in fact, quite applicable to animal use, is the fundamental problem of weighing the interests of the individual against those of the general welfare. Different societies have provided different answers to this problem. Totalitarian societies opt to devote little concern to the individual, favoring instead the state, or whatever their version of the general welfare is. At the other extreme, anarchical groups such as communes give primacy to the individual and very little concern to the group—hence they tend to enjoy only transient existence. In our society, however, a balance is struck between these two extremes. Although most of our decisions are made to the benefit of the general welfare, fences are built around individuals to protect their fundamental interests from being sacrificed to the majority. Thus, we protect individuals from being silenced even if the majority disapproves of what they say; we protect individuals from having their property seized without compensation even if such seizure benefits the general welfare; we protect individuals from torture even if they have planted a bomb in an elementary school and refuse to divulge its location. We protect those interests of the individual that we consider essential to being human, to *human nature*, from being submerged, even by the common good. Those moral/legal fences that protect the individual humans are called *rights* and are based on plausible assumptions regarding what is essential to being human.

It is this notion to which society in general is looking in order to generate the new moral notions necessary to talk about the treatment of animals in today's world, where cruelty is not the major problem but where such laudable, general human welfare goals as efficiency, productivity, knowledge, medical progress, and product

safety are responsible for the vast majority of animal suffering. People in society are seeking to “build fences” around animals to protect the animals and their interests and natures from being totally submerged for the sake of the general welfare, and are trying to accomplish this goal by going to the legislature. In husbandry, this occurred automatically; in industrialized agriculture, where it is no longer automatic, people wish to see it legislated.

As a mainstream movement, this new ethic does not try to give human rights to animals. Since animals do not have the same natures and interests flowing from these natures as humans do, human rights do not fit animals. Animals do not have basic natures that demand speech, religion, or property; thus according to them these rights would be absurd. On the other hand, animals have natures of their own and interests that flow from these natures, and the thwarting of these interests matters to animals as much as the thwarting of speech matters to humans. The agenda is not, for mainstream society, making animals have the same rights as people. It is rather preserving the common-sense insight that “fish gotta swim and birds gotta fly,” and suffer if they don’t.

This new ethic is *conservative*, not radical, harking back to the animal use that necessitated and thus entailed respect for the animals’ natures. It is based on the insight that what we do to animals *matters* to them, just as what we do to humans matters to them, and that consequently we should respect that mattering in our treatment and use of animals as we do in our treatment and use of humans. *And since respect for animal nature is no longer automatic as it was in traditional husbandry agriculture, society is demanding that it be encoded in law.* Significantly, in 2004, no fewer than 2100 bills pertaining to animal welfare were proposed in U.S. state legislatures.

With regards to animal agriculture, the pastoral images of animals grazing on pasture and moving freely are iconic. As the 23rd Psalm indicates, people who consume animals wish to see the animals live decently, not live in pain, distress and frustration. It is for this reason, in part, that industrial agriculture conceals the reality of its practices from a naïve public—witness Perdue’s advertisements about raising “happy chickens,” or the California “happy cow” ads. As ordinary people discover the truth, they are shocked. When I served on the Pew Commission and other commissioners had their first view of sow stalls, many were in tears and all were outraged.

Just as our use of people is constrained by respect for the basic elements of human nature, people wish to see a similar notion applied to animals. Animals, too, have natures, what I call *telos* following Aristotle—the “pigness of the pig”, the “cowness of a cow”. Pigs are “designed” to move about on soft loam, not to be in gestation crates. If this no longer occurs naturally, as it did in husbandry, people wish to see it legislated. This is the mainstream sense of “animal rights”.

As property, strictly speaking, animals cannot have legal rights. But a functional equivalent to rights can be achieved by limiting property rights. When I and others drafted the U.S. federal laws for laboratory animals, we did not deny that research animals were the property of researchers. We merely placed limits on their use of their property. I may own my car, but that does not mean I can drive it on the

sidewalk or at any speed I choose. Similarly, our law states that if one hurts an animal in research, one must control pain and distress. Thus research animals can be said to have the *right* to have their pain controlled.

In the case of farm animals, people wish to see their basic needs and nature, *teloi*, respected in the systems that they are raised. Since this no longer occurs naturally, as it did in husbandry, it must be imposed by legislation or regulation. A Gallup poll conducted in 2003 shows that 75 % of the public wants legislated guarantees of farm animal welfare. This is what I call “animal rights as a mainstream phenomenon.” Legal codification of rules of animal care respecting animal *telos* is thus the form animal welfare takes where husbandry has been abandoned.

Thus, in today’s world, the ethical component of animal welfare prescribes that the way we raise and use animals must embody respect and provision for their physical and psychological needs and natures. It is therefore essential that industrial agriculture phase out those systems which cause animal suffering by violating animals’ natures and replace them with systems respecting their natures. This would not be difficult to incorporate into a national law governing future constraints on animal agricultural systems, though no one has yet proposed such a radical and innovative set of changes to agriculture.

## 2.5 The Pew Commission on Industrial Farm Animal Production

While animal welfare is probably the best-known issue emerging from the industrialization of agriculture, numerous other profound problems for agriculture also emerged from this revolutionary approach to raising animals. The best and most probing account of these problems, including animal welfare, has been provided by the Pew Commission on Industrial Farm Animal Production, in a 2008 report entitled *Putting Meat on the Table* (The report may be found online at [pcifap.org](http://pcifap.org)). This report received more than 800 positive editorials in the U.S. media. The rise of societal interest in where food comes from, expressed as the “slow food” movement, the organic movement, the rise of specialty groceries such as Whole Foods and Sunflower, and many restaurants focusing on local “natural” and humane food, coupled with burgeoning concern about animal welfare, led to the chartering of the first commission to systematically explore confinement agriculture under the Johns Hopkins University School of Public Health Center for a Livable Future, funded by The Pew Charitable Trusts. The commission can be seen as articulating society’s nascent concerns about industrialized animal agriculture in a variety of areas.

The Pew Commission began when the Johns Hopkins School of Public Health, the best-funded school of public health in the U.S., garnering 25 % of federal research money in public health, was completing a study of water quality in the chicken industry in the Delaware-Maryland-Virginia area, home to a large segment

of the poultry industry. Investigators from Hopkins were disturbed by much of what they found. Particularly disturbing was the presence in the water of cutting-edge human antibiotics, designed to be used as a last resort in human disease. They reported back to the Director of the Hopkins Center for a Livable Future, a unit concerned with health and sustainability, Dr. Robert Lawrence. He successfully petitioned the \$6 billion Pew Charitable Trust to fund a study of industrial animal agriculture and issue a report.

The Chairman of the Commission was the former governor of Kansas, John Carlin, who was raised on a dairy farm and was a wise politician. The remaining commissioners, chosen for their knowledge in areas relevant to Commission concerns, were acknowledged as experts in their fields. This choice assured our credibility, which, undoubtedly, the industry would attack. Commission Members included: a former veterinary school dean and highest ranking veterinarian in the Public Health Service; a former executive director of the Catholic Rural Life Conference, an expert in rural sociology; founder and CEO of the first food service company to address issues of food ethics, catering 250 million meals a year; a former South Dakota state senator; a former U.S. Secretary of Agriculture; the Founding Director of the Center for Alternatives to Animal Testing at Johns Hopkins School of Public Health; a Professor Emeritus of Health Behavior and Health Education at the University of North Carolina School of Public Health; a rancher and former president of the Montana Stockgrowers Association; a Distinguished Fellow, Leopold Center for Sustainable Agriculture, Iowa State University; Dean of the University of Iowa, College of Public Health; Paulette Goddard Professor of Nutrition at NYU and best-selling author on food issues; the founder of Niman Ranch, a company supplied by 600 family-farmers producing humane meat; a University Distinguished Professor at Colorado State University; a leading expert in infectious disease at Harvard Medical School and Harvard School of Public Health; an expert on animal welfare in theory and practice, and a Senior Vice President at Cargill.

The Commission met for over 2 years on multiple occasions across the U.S., gave five congressional briefings, and released its final report in May of 2008. It was funded to hire whatever expert consultants were required, liberally used expert witnesses, and all of the final conclusions established by consensus, which was not easy, assured a united front.

In deliberations, five problematic interconnected areas associated with CAFOS (Confined Animal Feeding Operations) were the focus:

1. Antimicrobial resistance was very likely augmented by massive use of antibiotics in CAFOS to promote growth, prevent disease, and compensate for poor husbandry. As early as the mid-1940s, promotion of antibiotic resistant pathogens was foreseen as a Darwinian consequence of indiscriminate antibiotic use. An estimated 70 % of the antibiotics produced in the U.S. are used in CAFOS (Davies and Davies 2010).
2. Environmental despoliation and farm waste: CAFOS produce huge volumes of animal waste that often exceed the capacity of the land to absorb them,

especially in inappropriate areas such as flood plains. CAFOS also pollute air (as in large dairies), and contribute antibiotics, hormones, pesticides and heavy metals to water pollution. They utilize huge volumes of fossil fuel and water. Despite all this, they are not regulated as polluting industries.

3. Rural Sociology—CAFOS have replaced the independent, self-sufficient family farmer that Jefferson saw as the backbone of American democracy. In barely 40 years, the U.S. has lost over 80 % of its small hog farmers to a handful of huge corporate entities. This loss has increased rural poverty and degradation of small communities. Poor people often bear the brunt of CAFO pollution. Small farmers furthermore lack the resources to be able to compete with large corporations.
4. Other Public Health Issues—High confinement operations serve as incubators for pathogens, sources of antibiotic resistance that reduces the human armamentarium against infectious disease, and adversely affect the physical and mental health of people living near them. Workers in CAFOS suffer more health problems and can spread disease in communities.
5. Animal Welfare—CAFOS harm most relevant dimensions of animal welfare, from health of the animals to the ability to express their natural behaviors, including basic movements such as standing up and turning around or being with others of their own kind. The vast majority of farm animal diseases are “production diseases,” i.e. diseases that would not be a major problem if animals were extensively raised ([Pew Commission](#)).

Obviously, all of these categories connect to the others (e.g. pollution and health). Through the research on the above issues the Pew Commission found that research on all of these issues is largely industry-sponsored, which requires getting results congenial to industry interests.

One of the most significant findings of the Commission was exploding the widespread belief that industrial agriculture is the source of cheap food. While creating animal products that are cheap at the cash register, the claim of cheapness excludes what economists call “externalization of costs”—or passing the hidden costs of production to the public. For example, pollution cleanup is passed to the public, as are the health costs of living near pathogenic CAFOS. As an additional example, every man, woman and child living near the mega-dairies in California’s Central Valley spends \$1500 more on health care than if the dairies were not there.

The Commission concluded with six basic recommendations, which a lobbyist for the industry who is a friend of mine called “a blueprint for the future of agriculture”:

1. Phase out and ban the non-therapeutic use of antimicrobials
2. Improve disease tracking by a national animal identification system
3. Improve regulations of CAFO waste
4. Phase out intensive confinement of farm animals within 10 years (!)
5. Increase competition (reduce monopoly) in livestock production
6. Create publically funded research grants

The Pew Report demonstrated to the public the close connection between all of these issues. Now, environmentalists must be concerned about confinement of animals, and people concerned about rural life and public health must also see the relevance of animal welfare. As one member of the Commission said to me on our last day, “I used to think animal welfare was a fringe issue. Thank you for showing me the centrality of animal welfare to everything else.” In the fate of the animals we raise is reflected our own fate—as I tell farmers, “the same forces that put animals in tiny boxes also put you in (financial) boxes.”

## 2.6 Conclusion

Despite the extensive positive media coverage the Pew Commission and report received, as of November of 2013, not a single Commission recommendation had been legislatively instituted by the U.S. Congress, showing the extraordinary power of the agricultural industry to block reform in all of the areas discussed earlier. One can only hope that educated consumers can move the industry, as occurred with Smithfield and sow stalls.

# Chapter 3

## The WHO in Global Food Safety Governance: A Preliminary Mapping of Its Normative Capacities and Activities

Ching-Fu Lin

**Abstract** The past decades have witnessed a surge of foodborne illnesses of diverse sources on every continent of the world, a testament of the complexity of the transformed supply chain of production, distribution, and consumption as well as the importance of global food safety governance. While the global health community continues to look to the WHO to address problems as such, the organization is arguably losing its institutional legitimacy for persistent governance inertia. The mandates and normative tools assigned by the WHO Constitution empower the WHO to actively engage and provide leadership in the governance of food safety, but the organization has comfortably nested in a soft approach, abstaining from assuming any international agreement for over 60 years. This chapter examines the WHO's normative capacities given by its Constitution and normative activities in practice to evaluate its influences in shaping and reshaping global food safety governance. While the mapping of this chapter resonates to the critiques that the WHO has not employed to the necessary extent the normative authority partly due to ossified bureaucracy, power politics, and budgetary weakness, this chapter further argues that the clear and enduring gap between the normative capacities and activities may ultimately render the organization's institutional legitimacy vulnerable and compromise its relevance as a whole. As a preliminary conclusion, this chapter offers a couple of recommendations for a stronger pivotal role in global food safety governance. It suggests that the WHO take active steps to build functional links with multiple stakeholders and partners, such as WTO and non-state actors, some of which have emerged as valid alternatives to the organization. The WHO needs to further solidify such functional links to coordinate efforts in global food safety, which may merit a more formal inter-institutional framework.

### 3.1 Introduction

The past decades have witnessed a surge of foodborne illnesses of diverse sources, be it biological, chemical, or radiological, on every continent of the world. Documented outbreaks ranging from bovine spongiform encephalopathy (BSE) in beef, dioxin in pork, melamine-contaminated dairy products, and *E. coli* contaminated cucumbers have attested the increasing importance and complexity of global food safety governance and its public health, social, and economic implications. A 1999 World Health Organization (WHO) report suggests that every year, foodborne illnesses result in 1.5 billion cases of diarrhea in children and over 3 million premature deaths.<sup>1</sup> Contaminated food and water in developing countries are also responsible for 1.8 million children deaths.<sup>2</sup> Even so, according to a 2013 WHO report on advancing food safety initiatives, due to the fact that foodborne illness cases are frequently “under-reported,” the total number and burden of the global food safety problem has yet to be quantified.<sup>3</sup>

The production, distribution, and consumption of food, moreover, have been transformed alongside the globalization of economic activities, advancements in food science, development of transportation technology, and integration and consolidation of agri-food industries, and the creation of the World Trade Organization (WTO).<sup>4</sup> Such transformed patterns have also posed new challenges to food safety, evidenced in the intensified scale, severity, frequency, and impact of foodborne illness outbreaks. Therefore, risks posed by unsafe food products can originate from a producer in one country and quickly spill over to many others, evolving from a local problem to a global concern within a short period of time. This necessitates effective and efficient international cooperation beyond unilateral efforts of individual countries—including standard setting, information sharing, technical and financial assistance, and collective responses to cross-border outbreaks.

The WHO is generally regarded as the first appropriate international body to play a crucial role in international cooperation of food safety governance, since such normative activity is within the ordinary understanding of the agency’s public health authority and mandates.<sup>5</sup> WHO member states have recognized that ensuring food safety constitutes an essential and priority public health function.<sup>6</sup> The broad

<sup>5</sup>Constitution of the World Health Organization, Articles 2, and 19–23, July 22, 1946, 62 Stat. 2679, 14 U.N.T.S. 185 [hereinafter WHO Constitution].

<sup>6</sup>WHO, *supra* note 3, p. 11.

mandates and normative tools assigned to the WHO by its Constitution empower the WHO to actively engage in and provide leadership in global food safety governance. Part II of this chapter examines the normative functions of the WHO in ensuring food safety as an essential component in the broader context of achieving public health across the globe. After reviewing the normative functions of the WHO, Part III looks at the agency's normative activities on the ground, that is, what influences the WHO has in shaping and reshaping global food safety governance. This chapter points out the origins and repercussions of the clear and enduring gap between the normative capacities and activities of the WHO, and concludes by offering a few recommendations for a stronger pivotal role in global food safety governance.

### 3.2 Normative Capacities of the WHO

The WHO, headquartered in Geneva, has a decentralized structure with six regional offices and more than 190 member states. Established in 1948, the WHO is not only the principal institution but also the largest specialized agency and normative institution responsible for addressing global health issues.<sup>7</sup> The World Health Assembly (WHA), composed of all of the WHO member states, serves as the highest legislative organ that makes overall policy and adopts a variety of legal instruments including recommendations, regulations, and conventions. The WHO's central objective proclaimed by Article 1 of its Constitution is the "attainment by all peoples of the highest possible level of health."<sup>8</sup> The Constitution gives the WHO and WHA normative capacities to exercise and to fulfill this very objective. In particular, the authority derives from paragraphs (k), (o), (s), (t), and (u) of Article 2 along with Articles 19–23 of the Constitution. Specifically, the Constitution empowers the WHA to engage in three types of normative activities: Conventions and agreements (Article 19),<sup>9</sup> regulations (Article 21),<sup>10</sup> and nonbinding recommendations and standards (Article 23).<sup>11</sup>

---

<sup>7</sup>*Id.* Articles 18, 19, 21, and 23.

<sup>8</sup>*Id.* Article 1.

<sup>9</sup>*Id.* Article 19.

<sup>10</sup>*Id.* Article 21–22.

<sup>11</sup>*Id.* Article 23.

### 3.2.1 *Adopting Conventions and Agreements*

#### Article 19

The Health Assembly shall have authority to adopt conventions or agreements with respect to any matter within the competence of the Organization. A two-thirds vote of the Health Assembly shall be required for the adoption of such conventions or agreements, which shall come into force for each Member when accepted by it in accordance with its constitutional processes.

The WHO's normative capacity of treaty making is enshrined in Article 19 of the Constitution. As set by this provision, the WHA has the authority to adopt international conventions or agreements "with respect to any matter within the competence of the Organization" by a two-thirds vote. Such matters that fall within the agency's competence are set forth by Article 2, which provides over 20 functions of the WHO, ranging from facilitating "work to eradicate epidemic, endemic and other diseases" to setting and promoting "international standards with food, biological, pharmaceutical and similar products."<sup>12</sup> Article 19 stipulates the threshold (a two-thirds vote) for the WHA to pass any international conventions and agreements, yet such a procedural constraint leaves the WHA with relatively broad discretion in formulating substantive elements of a treaty. Examples of such broad discretion include the types of convention, structures and processes, and conditions for ratification, deposit, and entry into force.<sup>13</sup> While a treaty adopted under Article 19 of the Constitution does not bind WHO member states without their consent, Article 20 requires member states to affirmatively "take action relative to the acceptance of such convention or agreement" within 18 months after the WHA's adoption of the treaty.<sup>14</sup> More specifically, a WHO member state has to "notify the Director-General of action taken," and provide "a statement of the reasons" if it decides not to accept the convention or agreement.<sup>15</sup>

### 3.2.2 *Promulgating Regulations*

#### Article 21

The Health Assembly shall have authority to adopt regulations concerning:

- (a) sanitary and quarantine requirements and other procedures designed to prevent the international spread of disease;
- (b) nomenclatures with respect to diseases, causes of death and public health practices;
- (c) standards with respect to diagnostic procedures for international use;
- (d) standards with respect to the safety, purity and potency of biological, pharmaceutical and similar products moving in international commerce;
- (e) advertising and labelling of biological, pharmaceutical and similar products moving in international commerce.

---

<sup>12</sup>*Id.* Article 19.

<sup>13</sup>Burci and Vignes (2004), p. 124.

<sup>14</sup>WHO Constitution, *supra* note 5, Article 20.

<sup>15</sup>*Id.*

The WHO's normative capacity of promulgating regulations is found in Article 21 of the Constitution. Article 21 specifies five particular aspects where the WHO can exercise such normative capacity, ranging from sanitary and quarantine rules related to the prevention of the international spread of disease, disease nomenclatures, to standards regarding the safety of biological or pharmaceutical products in the flow of international trade.<sup>16</sup> In spite of the limited scope of authority specified above, Article 22 features an "opt-out" mechanism where regulations adopted by a simple majority vote under Article 21 automatically bind all WHO member states "except for such Members as may notify the Director-General of rejection or reservations within the period stated in the notice."<sup>17</sup> The authority to adopt binding international regulations with a simple majority vote and the unusual "opt-out" design together constitute the most impressive normative capacity of the WHO—a "quasi-legislative" power in international law.<sup>18</sup>

### 3.2.3 *Making Non-Binding Instruments*

#### Article 23

The Health Assembly shall have authority to make recommendations to Members with respect to any matter within the competence of the Organization.

The making of recommendations, guidelines, standards, or voluntary instruments under Article 23 of the Constitution is arguably the softest normative capacity of the WHO. Article 23 instruments are adopted by the WHO for pragmatic reasons, such as reduction of negotiation costs in sensitive issues, flexibility in varied national or regional circumstances, and adaptability to rapid scientific changes. In the context of public health, the need for reducing negotiation costs and increasing flexibility and adaptability appears manifest and renders such voluntary approach preferable. Article 23 is therefore the most frequently exercised normative power the WHO has employed to deal with global public health issues. All in all, while Article 23 has arguably the weakest legal binding force, it has been the most prolifically used of the three normative capacities.<sup>19</sup>

<sup>16</sup>WHO Constitution, *supra* note 5, Article 21.

<sup>17</sup>*Id.* Article 22.

<sup>18</sup>Fidler (1998) and Gostin (2007).

<sup>19</sup>Burci and Vignes (2004), p. 141.

### 3.3 Normative Activities of the WHO

With regard to normative activities in food safety, the WHO has relied on its Article 23 authority and refrained from adopting any legally binding instruments for over 65 years. This part of the chapter discusses the major normative activities the WHO has engaged in for promoting global food safety and its lack of success in addressing the problem.

The Department of Food Safety and Zoonoses (FOS) is in charge of leading and coordinating efforts in a large variety of areas. Its authority covers foodborne diseases, food hygiene, food technologies, microbiological risks, chemical risks, international food standards (Codex Alimentarius Commission, CAC), International Food Safety Authorities Network (INFOSAN), antimicrobial resistance, as well as zoonoses and intersectoral collaboration at animal-human-ecosystems interface.<sup>20</sup> As elaborated in the WHO's Strategic Plan for Food Safety Including Foodborne Zoonoses 2013–2022—which builds on the WHA's resolution WHA63.3 in 2010—the FOS should work in close collaboration with all the regional and country offices under an overarching framework composed of three essential strategic directions.<sup>21</sup> These three essential strategic directions adequately lay out the normative activities the WHO has engaged in on the ground.

#### 3.3.1 *WHO Scientific Advice and the Codex Alimentarius Commission*

The WHO does not make international food safety standards, although it has the normative capacity, scientific expertise in the field, and the convening power over its 194 member states. Rather, the WHO participates *indirectly* in the CAC through ways of providing scientific advice and risk assessment.

The CAC is an international governmental body established under the two resolutions adopted by the Eleventh Session of the Food and Agriculture Organization of the United Nations (FAO) Conference in 1961 and the Sixteenth WHA in 1963.<sup>22</sup> The WHO and the FAO also adopted the Statutes and Rules of Procedure for the Commission,<sup>23</sup> which has 185 members (184 member countries and

---

<sup>20</sup>For further details, see World Health Organization, Department of Food Safety and Zoonoses (FOS) Areas of Work, at [http://www.who.int/foodsafety/areas\\_work/en/](http://www.who.int/foodsafety/areas_work/en/).

<sup>21</sup>WHO, *supra* note 3.

<sup>22</sup>Food and Agriculture Organization of the United Nations (hereinafter FAO) and WHO, *Understanding the Codex Alimentarius* 13 (3d ed. 2006).

<sup>23</sup>The Statutes of the Codex Alimentarius Commission (Statutes) provide the legal basis for the Commission's work and formally reflect the concepts behind and reasons for its establishment. The Rules of Procedure of the Codex Alimentarius Commission (Rules of Procedure) describe and formalize working procedures appropriate for an intergovernmental body.

1 member organization as well as 24 active committees and task forces.<sup>24</sup> The mandate of the CAC is twofold: To develop international food standards, guidelines, and recommendations to “protect the health of consumers” as well as to “ensure fair practices in food trade.”<sup>25</sup> It has formulated international standards for a wide range of food products and specific requirements covering pesticide residues, food additives, veterinary-drug residues, hygiene, food contaminants, and labeling and certification systems.

WHO (and FAO) scientific advice serves as the basis for CAC food standards and relevant measures taken by states along the food supply chain and international trade.<sup>26</sup> Scientific experts from diverse backgrounds convene in the standing institutions—the Joint FAO/WHO Expert Committee on Food Additives (JECFA), the Joint FAO/WHO Meeting on Pesticide Residues (JMPR) and the Joint FAO/WHO Expert Meeting on Microbiological Risk Assessment (JEMRA)—all of which are jointly administered by the WHO and the FAO, to prepare scientific evaluation and risk assessment.<sup>27</sup>

The WHO’s scientific role in the CAC has been increasingly outweighed by that of the WTO, which explicitly refers to the CAC as the international standard-setter for disciplining WTO members’ food safety regulatory measures in the international trade regime.<sup>28</sup> With the backing of the WTO’s mandatory dispute settlement system, binding adjudicatory decisions, and retaliation mechanism,<sup>29</sup> the CAC is now commonly regarded as a quasi-legislator,<sup>30</sup> and its standards are *de facto* mandatory especially in WTO food safety disputes.<sup>31</sup> The CAC has therefore

---

<sup>24</sup>FAO/WHO, *Codex Members and Observers*. In addition to the Committee on General Principles and six regional coordinating committees (Africa, Asia, Europe, Latin America and the Caribbean, the Near East, North America and the Southwest Pacific), subsidiary bodies directly related to food safety include, *inter alia*, the Codex Committees on Contaminants in Foods, Food Additives, Food Hygiene, Pesticide Residues, Residues of Veterinary Drugs in Foods, Food Import and Export Inspection, and Certification Systems.

<sup>25</sup>FAO/WHO, *supra* note 22, p. 25.

<sup>26</sup>WHO, *supra* note 3, pp. 14–19.

<sup>27</sup>For example, the WHO calls for, selects, and enlists qualified experts to consider scientific evidence and perform toxicology risk assessments in the JECFA (and the FAO enlists scientists to evaluate residues). The JECFA evaluation reports, regarded as authoritative reviews of all available evidence and information concerning a given food safety risk, form the basis of CAC standards. *Ad hoc* expert meetings are convened when the WHO needs to assess issues in emergency or regards emerging and complex risks. WHO, *supra* note 3, pp. 14–19.

<sup>28</sup>World Trade Organization (hereinafter WTO), Agreement on the Application of Sanitary and Phytosanitary Measures, Annex 1A, The Legal Texts: The Results of the Uruguay Round of Multilateral Trade Negotiations 59 (2000), 1867 U.N.T.S. 493 (1994) [hereinafter SPS Agreement], Article 3.1 & Annex A.3. The SPS Agreement specifically refers to three international standard-setting bodies, now oft-called “Three Sisters:” The Codex Alimentarius Commission (CAC) dealing with food safety, the International Plant Protection Convention (IPPC) dealing with plant health, the World Organization for Animal Health (OIE) dealing with animal health.

<sup>29</sup>*See, e.g.*, Matsushita et al. (2006); WTO (2008), pp. 103–140.

<sup>30</sup>Trachtman (2006); Alemanno (2007), pp. 262–267; Silverglade (2000).

<sup>31</sup>Charnovitz (2002).

encountered controversial issues of “politicization of science”<sup>32</sup> where CAC member states have tended to evaluate proposed food safety standards for their potential impact on trade interests and act strategically,<sup>33</sup> and in some cases, have let trade interests overshadow food safety and public health. The CAC, despite being an international organization jointly established by the WHO and FAO, often becomes an extended WTO battlefield of public health versus international trade. As the international trade regime wields the most significant influence on CAC and food safety issues, the role of the WHO seems likely to fade.

### 3.3.2 *International Cooperation in Information Exchange*

The WHO facilitates international cooperation mostly in the area of information exchange and cross-sectoral coordination. After the serious BSE outbreak in the 1990s, the Fifty-Third WHA passed in 2010 Resolution WHA53.15 which urged member states to integrate food safety into their public health functions. The goal was to design systematic preventive measures that would reduce the occurrence of foodborne illnesses and support the development of science in the assessment of risks related to food.<sup>34</sup> Resolution 53.15 led to the WHO’s later creation of INFOSAN, a voluntary international network of food safety authorities vis-à-vis food safety management. The FOS administrates the INFOSAN platform together with the FAO for rapid and timely exchange of food safety information and shares technical information on foodborne disease surveillance.<sup>35</sup> The FOS also endeavors to establish cross-sectoral linkages among relevant government agencies at the national level, such as the food safety, health, agriculture, and trade sectors to facilitate communication.<sup>36</sup>

Food safety risks and incidents in one country usually pose a public health concern to other countries because of the globalized pattern of food production and consumption. The WHA recognized the importance of having a mechanism by which states can exchange information on food safety issues, through Resolution 53.15. The Resolution requested that the Director-General “put in place a global strategy... for the efficient gathering and exchange of information in and between countries and regions.”<sup>37</sup> In 2004, the WHO inaugurated INFOSAN, a global network of 102 national food safety authorities (at the time of creation), to promote the exchange of food safety information and to improve collaboration among food

---

<sup>32</sup>See Lin (2013).

<sup>33</sup>Veggeland and Borgen (2002), pp. 22–23.

<sup>34</sup>World Health Assembly (hereinafter WHA), Resolution WHA53.15, § 1(1)–(5).

<sup>35</sup>WHO, *supra* note 3, p. 23.

<sup>36</sup>WHO, *supra* note 3, p. 23.

<sup>37</sup>*Id.* § 2(4).

safety authorities at national and international levels.<sup>38</sup> As of today, the information-sharing system has increased to 181 country members.<sup>39</sup>

Under INFOSAN, member states are expected to designate one or more INFOSAN Focal Points and one INFOSAN Emergency Contact Point at the national level.<sup>40</sup> The role of the INFOSAN Focal Points is to receive notes and messages, WHO guidelines along with other important food safety information from INFOSAN, and to circulate the information to other government agencies, actors in the food industry, and nongovernmental organizations (NGOs).<sup>41</sup> The INFOSAN Contact Points serve to notify INFOSAN of food safety incidents, to respond to such notification by sending INFOSAN emergency alerts, and to exchange information during a food safety crisis.<sup>42</sup> At the international level, the WHO facilitates information exchange among members, verifies the extent of the problem, disseminates scientific knowledge, and provides food safety advice via INFOSAN during foodborne disease outbreaks or food contamination events.

While INFOSAN serves as a practical platform on which its members can cooperatively address food safety incidents through a wide variety of information-sharing strategies, there are two major weaknesses with the network. First, the voluntary nature of INFOSAN means possible non-adherence, which could in turn, bring about unexpected or unmanageable food safety crises. The lack of binding rules and a compliance mechanism renders the WHO powerless to strengthen coordination.<sup>43</sup> The INFOSAN framework imposes no legal obligations on WHO member states (and other members) to either promptly notify the network of urgent food safety incidents or to provide export and import data. Participating member states are merely expected to follow the relevant guidelines and principles, which are simply recommendations rather than requirements. While countries in general do not have difficulty designating Focal Points and Emergency Contact Points for INFOSAN, they have diverse concerns and broad discretion as to whether, when, and to what extent to provide information. In effect, political and economic considerations usually exacerbate the delay or concealment of internationally significant public-health information—as countries want to minimize the self-harm that would likely occur if they notify the world of their food safety outbreaks.<sup>44</sup> For instance, in the melamine-tainted milk incident, the Chinese authorities arguably delayed in notifying INFOSAN of key information which

---

<sup>38</sup>WHO (2004), pp. 1–4. For background information on INFOSAN, see WHO, *International Food Safety Authorities Network (INFOSAN)*.

<sup>39</sup>*Id.* There are also other non-country members within the INFOSAN framework, such as advisory group members, WHO regional food safety advisors; FAO regional food safety officers, or other regional food safety authorities.

<sup>40</sup>WHO (2006), pp. 1–6.

<sup>41</sup>*Id.*, p. 2.

<sup>42</sup>*Id.*, p. 4.

<sup>43</sup>Ruger (2014).

<sup>44</sup>*See e.g.* Forrest (2000).

aggravated the incident's scope and severity.<sup>45</sup> Despite the variety of considerations members have about information sharing, they face no legal responsibility when they decide not to notify or continue to share key information. To address this issue, 47 countries and regions, and 13 international organizations adopted, by consensus, the Beijing Declaration on Food Safety that urges all countries to actively notify the WHO of food safety incidents in a timely manner.<sup>46</sup>

Second, the additional notification requirements of the International Health Regulations (IHR)<sup>47</sup> and other mechanisms such as the Global Early Warning System for Major Animal Disease, including Zoonoses (GLEWS) may weaken the effectiveness of INFOSAN and emergency responses. For example, when certain food safety outbreaks such as the avian influenza virus H5N1 may pose a serious international public health risk as per the IHR decision instrument (Annex 2), affected member states have a legal obligation to notify the IHR to facilitate information exchange so that the WHO is able to coordinate a global response (subject to a set of binding obligations, which however might not be relevant and tailored to food safety problems).<sup>48</sup> And such public health emergencies of international concern (PHEIC)<sup>49</sup> may, in principle, also fall within the scope of INFOSAN Emergencies, which operates pursuant to a different set of algorithms. Meanwhile, INFOSAN members are not legally obliged to notify.<sup>50</sup> Furthermore, food safety incidents that do not qualify as PHEIC are outside the IHR terrain but might be classified as INFOSAN Emergencies. Operating under the overarching IHR umbrella, these overlapping scopes, disparate algorithms, different criteria and requirements, and inconsistent memberships between INFOSAN and the IHR may cause fragmentation in food safety governance. Such fragmentation may render

---

<sup>45</sup>According to the information provided to the INFOSAN by China on September 29, 2008, parents of the infants who consumed contaminated Sanlu formula filed complaints with the company as early as December 2007, and the company had detected melamine in its products in June 2008. The company only reported its findings to the local government in August 2008 and then a further delay prolonged the inadequate response to September 9 of that year, when the incident was reported to the provincial government. Some suggest that China was trying to cover up the incidents to protect its national image before the Olympic Games. *See e.g. China Milk Scandal Widens, More Recalls*, Canberra Times (Oct. 2, 2008).

<sup>46</sup>High-Level International Food Safety Forum, *Report on High-Level International Food Safety Forum*, G/SPS/GEN/838 (Nov. 26–27, 2007).

<sup>47</sup>WHO, International Health Regulations [hereinafter IHR] (2005). For a discussion of the 2005 IHR, see Baker and Fidler (2006), Gostin (2004a, b), Hardiman (2003).

<sup>48</sup>The 2005 IHR is aimed at resolving problems of infectious diseases and therefore may be unsuitable for foodborne illness outbreaks. For example, Articles 21, 30, 31 and 32 deal with health measures and treatments to cross-border travelers, which is generally not applicable in the area of food safety. IHR, Articles 21, 30–32.

<sup>49</sup>IHR, Article 1, Annex 2. “Public health emergency of international concern” means an extraordinary event that is determined, according to the decision instrument in Annex 2, to constitute a public health risk to other States through the international spread of disease and to potentially require a coordinated international response.

<sup>50</sup>WHO (2006), p. 5.

cross-sectoral coordination at the national level extremely challenging and frustrate the effectiveness and the promptness of countries in risk management and risk communication as a whole.

Indeed, food safety governance requires multidisciplinary risk regulation, and may have implications for the international spread of human or animal diseases. The comprehensive information sharing and emergency response system then, suggests the inseparability of IHR, GLEWS, and INFOSAN to a certain extent. However, the balance between efficiency and effectiveness here has not been clarified by the WHO, the FAO, or the OIE, and a more streamlined approach throughout multiple interfaces is desirable.

### 3.3.3 *Capacity Building Leadership and Assistance*

Finally, the FOS helps the WHO provide leadership in assisting member states in building a risk-based and integrated food safety system at the national level.<sup>51</sup> Specifically, the FOS and the WHO regional offices help member states analyze their food systems and legal frameworks to build, update, or refine necessary legal and technical infrastructures and therefore improve member states' capacity to respond to food safety incidents.<sup>52</sup>

Capacity building serves as a fundamental and necessary supporting infrastructure for the first two normative activities. As pointed out in its report on advancing food safety initiatives, the WHO admits that “[m]any Member States still lack the necessary surveillance capacity for outbreak detection, assessment and response.”<sup>53</sup> In particular, many developing countries are poorly equipped in terms of basic institutional framework, trained personnel, as well as technical and financial resources. In addition, many commentators have called for attention to developing countries' insufficient participation in the CAC international standard-setting process.<sup>54</sup> Multinational food companies have increasingly stretched their supply chains to many developing countries, such as Argentina, Brazil, China, India, and Indonesia, which together account for a major share of the global food supply.<sup>55</sup> Without an adequate core capacity in their food safety systems, these countries are unable to reasonably ensure the safety of food products that are exported and transported worldwide. Inadequate capacity translates into the inability of a country to control, monitor, and to notify the international community when a foodborne outbreak occurs.<sup>56</sup> Therefore, capacity building assistance to countries in need is of

---

<sup>51</sup>WHO, *supra* note 3, pp. 25–28.

<sup>52</sup>*Id.*

<sup>53</sup>*Id.*, p. 21.

<sup>54</sup>*See generally* Livermore (2006).

<sup>55</sup>Keener (2010), pp. 139–40.

<sup>56</sup>Lin (2011).

crucial importance in the overall effectiveness of the WHO's normative activities in global food safety governance.<sup>57</sup>

The FOS leads capacity building programs mostly in collaboration with the WHO regional offices, aiming to promote participation in the CAC activities, to enhance surveillance and information-sharing capacity, and to help member states establish new or strengthen existing food safety regulatory systems based on risk, science, and relevant international standards.<sup>58</sup> In order to prepare member states' abilities to perform core functions and identify and solve problems in their food system, such as preventing, detecting, and managing food safety incidents, a set of modern food safety laws and a well-founded enforcement structure are needed. Subsequent core capacity development at the domestic level, such as training of inspection personnel, increasing laboratory competence, referencing to international standards and codes of good practices, and strengthening emergency response preparation,<sup>59</sup> empowers the states to collectively limit global foodborne illness burden.

### 3.4 The Gap Between Normative Capacity and Activity and the Marginalization of the WHO in Global Food Safety Governance

The role of the WHO in global food safety governance has been ancillary, for the organization has rather engaged in non-binding normative activities with a technical, scientific, and supplementary orientation at both national and international levels. First, the WHO has not employed to the necessary extent the normative authority given by the Constitution,<sup>60</sup> partly ensuing from the ossified bureaucracy, power politics, and budgetary weakness that make it a "compromised," if not an "irrelevant" organization.<sup>61</sup> The WHA, represented by all member states, has not exercised the Article 19 treaty-making capacity until the adoption of the Framework Convention on Tobacco Control (FCTC) in 2003.<sup>62</sup> As to its normative capacity to promulgate international regulations, the WHO has promulgated two international regulations under Articles 21(a) and 21(b)—the World Health

<sup>57</sup>As put by a leading scholar in global health law, "[c]apacity building must be a central focus of any effective global health governance regime." Gostin (2007), p. 378.

<sup>58</sup>WHO, *supra* note 3, pp. 25–28.

<sup>59</sup>Milen (2001).

<sup>60</sup>See Sridhar and Gostin (2011); Fidler (1998), p. 1079; Taylor (1996).

<sup>61</sup>Ruger (2014), p. 697. As criticized by Jack C. Chow, the WHO has become "outmoded, underfunded, and overly politicized. In a world of rapid technological change, travel, and trade, the WHO moves with a bureaucracy's speed. . . . Taken together, these myriad dysfunctions are rendering the WHO closer and closer to irrelevancy in the world of global health." Chow (2010).

<sup>62</sup>WHO (2005).

Regulations in 1948 (the Nomenclature Regulations)<sup>63</sup> as well as the International Health Regulations (IHR) which was first adopted in 1951 as the International Sanitary Regulations (ISR), renamed in 1969, and significantly revised in 2005.<sup>64</sup>

Second, with regard to global food safety issues, the WHO has clearly preferred a flexible and non-binding approach through the provision of recommendation, guidelines, scientific advice, and information exchange, while abstaining from assuming any international agreement for over 65 years. There are no multilateral agreements under the WHO aimed at setting legal rights and obligations of member states regarding international cooperation, technical assistance, or risk management and communication so as to facilitate global food safety governance. In 2010, the WHO Executive Board finally suggested that the WHA adopt a resolution recognizing the need for an international agreement on global food safety.<sup>65</sup> In the same year, however, the sixty-third WHA did not accept such suggestions and refrained from assuming leadership in coordinating the various initiatives in global food safety governance. The Resolution WHA63.3 can thus be interpreted as a mere repetition of the existing INFOSAN mechanism. The Resolution again urged member states “to participate fully as members of the INFOSAN in its activities,” and asked the Director-General to strengthen the existing strategy for food safety and the INFOSAN emergency function.<sup>66</sup> Nothing in the Resolution recognized the importance of an international agreement or an overarching framework dedicated to global food safety governance.

The WHO’s role in global food safety governance seems to continue to be limited to the scientific and technical realm, as the organization is reluctant to assume leadership in this area of global health priority. The clear gap between the WHO’s normative capacities given by its Constitution and normative activities on the ground may ultimately make the organization’s institutional legitimacy vulnerable.<sup>67</sup> To be sure, the WHO’s predilection for voluntary and supplementary approach may in the end provide a stronger moral basis for food safety governance as opposed to legal compulsion, but it may also make the organization ill-prepared for future international treaty administration and marginalize its role in coordinating global efforts. As the pivot of global health law and governance, the WHO needs first to take active steps to build functional links between itself and other stakeholders and partners, such as the WTO and multiple non-state actors (public health, trade, agriculture, science, and industry), some of which have emerged as

<sup>64</sup>Gostin (2004a, b).

<sup>65</sup>WHO, *Advancing Food Safety Initiatives*, p. 2, EB126.R7 (Jan. 21, 2010).

<sup>66</sup>WHA, Resolution WHA63.3, WHA63/2010/REC/1 (May 21, 2010).

<sup>67</sup>The institutional legitimacy of an international organization justifies its position to exercise authority in a given field. The gap between the WHO’s mandate and performance have a potential impact on the agency’s institutional legitimacy and may in turn weaken its normative capacity to articulate in practice. For more discussion on institutional legitimacy in the global context, see Rocheleau (2011), pp. 562–564.

potential alternatives to the WHO in this issue area. The WHO needs to further solidify such functional links to coordinate efforts in global food safety, which may be challenging without an international agreement or an alternative inter-institutional framework especially when the WHO Constitutions has substantial procedural barriers to inter-institutional coordination.<sup>68</sup> Regrettably, the WHO has yet to show its political will and practical capability of fostering an overarching framework to coordinate future international cooperation efforts in global food safety governance.

## Chapter 4

# The Right to Food in International Law with Case Studies from the Netherlands and Belgium

Bart Wernaart and Bernd van der Meulen

**Abstract** In this chapter, the enforceability of the right to adequate food is discussed in the context of industrialized countries. The right to food as a human right can be considered the fundament of food law. Human rights in themselves occupy a special position in the field of law. On the one hand they encompass rights of a high moral value which goes beyond the boundaries of a State or the consent of a State to be bound by it. On the other hand, human right agreements are put in the form of international treaties, whose effect is greatly depending on the willingness of its member States to act in compliance with their commitments. Therefore, enforcing an international human right in a domestic court, such as the right to adequate food, is not *per se* a matter of course. Two issues appear to be highly influential in determining whether an international human right can be effectively invoked in a domestic court. The first is the alleged difference between civil and political rights on the one hand, and economic, social and cultural rights on the other hand. Traditionally, it is assumed that the first type of rights require government abstaining and are therefore enforceable. The latter type implies government action and are not enforceable due to a margin of discretion the national governments enjoy in implementing these rights. However, there are sound arguments to oppose this traditional approach in human rights typology. These arguments are frequently pointed out in the context of the United Nation's specialized institutions as well as in literature. The second issue is the working of the domestic constitution that usually regulates the effect of international law in the domestic legal order. A case study of two industrialized countries who are favorable to human rights—the Netherlands and Belgium—was conducted. Where normally the right to food is addressed in the context of developing countries, poverty and large scale hunger, the selected countries do not suffer such constraints. Instead, the circumstances within these countries would allow an enforceable right to food to work. The case

study reveals that the coincidental constitutional context of a country may be of greater influence to the enforceability of internationally recognized human rights, rather than the content of the rights in itself. In both countries the right to food can hardly be enforced through the domestic courts, in contrast to what these countries communicate in the international arena.

#### **4.1 Introduction: The Right to Adequate Food Law Between the Markets and Human Rights**

From this book, food law emerges as a building consisting of a wide variety of doors and windows, rooms and corridors. Can it be argued that this building of food law rest on a foundation? If so, what would this foundation be? Legal economists would be inclined to approach this question from the perspective of market failure. If the market fails to ensure values such as the safety of food, legislators need to take action. From a human rights perspective, however, this legal economic approach is flawed due to its Darwinistic nature. In Darwinism as in liberal economics, development hinges on a struggle to live with a survival of only the fittest. The notion of survival of the fittest implies the perishing of those who do not qualify as fittest. From the human rights perspective, it is not acceptable to simply give up on those who are unable to make their dollar count in the marketplace. If we want food law to protect each and every consumer not just the economic majority, the market economy cannot be the sole foundation of food law. In addition—or instead—human rights can be seen as the underlying notion of justice of any legal system and of food law as well. At the very least, human rights provide a yardstick to gauge when the effects of the market economy need to be re-considered because of the costs they inflict on the most vulnerable members of society.

This analysis explores to what extent the human right to adequate food can be viewed as, or can be developed into, the fundamental foundation of food law.

As will be elaborated below, the concept of an adequate food encompasses three elements: (1) food supply: there has to be a sustained quantity and quality of food that is sufficient to maintain a healthy and active life; (2) food safety: food should be free of adverse substances; (3) Cultural acceptability; food should be acceptable to the consumer, and adjusted to the consumers' way of life and beliefs, which includes foods that may be kosher, halal, GMO free, among other characteristics.

With regard to the sustained availability of food, three state obligations are distinguished: the obligation to respect the rights of people to feed themselves; the obligation to protect people in their exercise of this right from the interference by other people and finally; the obligation to provide food in situations where people through no fault of their own are unable to feed themselves.

From a legal perspective, it is important to distinguish state obligations regarding the population at large and from those regarding the individual. Ensuring food security for the population at large requires policies on agriculture and social security. However, it can only be maintained in any meaningful way that

**Table 4.1** Aspects of the right to food

	Respect		Protect		Fulfill	
	Collective	Individual	Collective	Individual	Collective	Individual
<b>Availability</b>	Land Rights Policies	Legal Protection Against Expropriation			Agricultural Policy Social Security Policy	Justiciability of the Right to Food
<b>Safety</b>			Food Safety Law	Product Liability Law	Promote Healthy Eating Habits/ Education	
<b>Acceptability</b>	Consumer Autonomy and Freedom of Choice		Food Labeling Law/Misleading Advertising Directives		Culture Conscious Food Aid	

individuals have rights if the legal systems provides them with remedies that they can invoke in a court of law. The state’s obligations regarding the food supply are represented in Table 4.1.

Some of the state’s obligations have tentatively been filled in the table. Others have been left blank for the moment. The table can be seen as an invitation for further research on the interrelatedness of the human right to food and food law. As the table demonstrates, the food law can largely be understood as the legislator living up to the obligation to protect the population at large from the hazards of unsafe food. Apart from the fact that it is seldom framed as living up to human rights obligations, this obligation is relatively unproblematic.

In this chapter, we will first establish where the right to food fits within the human rights system. Then we will elaborate on the enforceability of the right to food, using two case studies. The case studies feature two Western, developed countries, generally favorable to human rights, and avoid the discussion in the context of underdevelopment, poverty and large-scale hunger. In such context, questions regarding the functioning of human rights may drown in economic adversity. In economically developed countries, the question regarding the human right to food can be approached as a more purely legal question. It will be seen that states tend to argue that the right to food needs to be realized through policy. This means that they place emphasis on collective obligations and deny accountability in the courts of law. In so far as this discussion focusses on enforceability, it places emphasis on the individual dimensions outlined in Table 4.1, and how they impact availability, safety, and acceptability.

## 4.2 Human Rights

In (international) law, human rights occupy a special position. On the one hand, they reflect fundamental values on which societies are built, and therefore have a high moral content that transcends the boundaries of the state's consent to be bound by them. Simply because a person is born, she/he has the right to live a life with human dignity, and therefore, the place where a person is born should be irrelevant. On the other hand, human rights are usually expressed in the form of international treaties. It is generally accepted in the law on treaties<sup>1</sup> that the sovereignty of the state is respected, and therefore, a state cannot be bound by international agreements without its consent. In terms of legal philosophy, human rights balance somewhere between natural law and legal positivism.<sup>2</sup>

Since the World War II, an impressive global system that aims to protect human rights has been adopted. This is done on a global level under supervision of the United Nations, but also on a regional level on most continents of the world, supervised by bodies installed for this purpose. On a global level, the Universal Declaration of Human Rights (UDHR), adopted by the UN General Assembly in 1948,<sup>3</sup> can be seen as a starting point for the development of internationally recognized human rights. In 1966, based on this declaration, two treaties were adopted: The International Convention on Civil and Political Rights (ICCPR), and the International Convention on Economic, Social and Cultural Rights (ICESCR).<sup>4</sup> Since then, also treaties that aim to protect particular groups of individuals were adopted, in which most human rights are specified to their particular situation or problem. The member states of the UN sign and ratify these treaties, and consequentially, human rights are mostly (but certainly not exclusively) formulated as obligations to these states, in varying degrees of compliance. To encourage states to implement the ratified human rights accordingly, reporting mechanisms have been implemented in most human rights treaties. Such mechanisms oblige the ratifying states to periodically submit reports on the measures taken to implement the human rights at issue. Occasionally, but with considerably less enthusiasm, additional complaint procedures were adopted through which other states, and in some cases also individuals and/or NGO's, can file complaints against the ratifying state on the implementation of particular rights. An overseeing body (most already existing to monitor the periodic reports) is usually appointed to receive and comment on these complaints.

On the regional level, in Europe, Africa and the Americas, human rights treaties with equivalent human rights compared to the global documents have been adopted, but specified to the particularities of each continent. Europe and the Americas roughly adopted the same structure as the global human rights system, separately

<sup>4</sup>A/RES21/2200 (1966).

addressing civil and political rights on the one hand, and Economic, Social and Cultural (ECOSOC) rights on the other. In Africa, all human rights were adopted simultaneously. Also on the regional level, reporting and complaint procedures have been installed.

The right to adequate food is firmly embedded in the global and regional human rights system, mostly stipulated in the sphere of ECOSOC rights, and in specialized treaties aiming to protect particular groups of individuals. Indeed, from many wells the right to food thus streams throughout the international human rights system, with its final goal to benefit the final rights holder: the individual.<sup>5</sup> Notwithstanding the wide recognition of the right to food, and the many attempts to further clarify its content, this human right is perhaps more urgently recalled, and more often violated than any other human right.<sup>6</sup> It is not without reason thus, that the matter of state obligations and enforceability of human rights (more specifically, ECOSOC rights) is especially discussed in the context of the right to adequate food.<sup>7</sup>

### 4.3 The Enforceability of the Right to Adequate Food

The usual approach toward law, especially when adopted in a domestic parliament, is that violations of law can be brought before a court. The court then will have to decide whether the contested action, or lack of action, is in violation with the democratically established legal standard. Such proceedings can be found in the spectrum of private law, in which one individual sues the other individual, and in the spectrum of public law, in which legal conflicts between an individual (or a group of individuals) and a government can be brought before a court of law. Since human rights mostly address the relationship between the state and the individual, most case law and academic debate on the enforceability of human rights, concerns this relation. However, there is an increasing debate concerning the horizontal effect of human rights, between citizens and/or companies and citizens.<sup>8</sup>

Whether or not the right to food should be an enforceable right is a matter that is heavily debated in the international arena. On the one hand, specialized institutions such as the Committee on Economic, Social and Cultural Rights, and the special rapporteurs on the right to adequate food defend the position that the right to food

<sup>8</sup>OECD, *OECD Guidelines for Multinational Enterprises* (2011) Enterprises and Social Policy, adopted by the Governing Body of the International Labour Office at its 204th Session (Geneva, November 1977) as amended at its 279th (November 2000) and 295th Session (March 2006); and in more than one occasion in: *The voluntary guidelines to support the progressive realisation of the right to adequate food in the context of national food security*, adopted by the 127th session of the FAO Council, November.

should have at least, to some extent, an effect in the domestic courts. On the other hand, intergovernmental institutions seem to be reluctant in recognizing enforceability of internationally embedded ECOSOC standards fearing this would affect their sovereignty.

There are two major points of discussion regarding the matter. The first is related to the alleged distinction between civil and political rights on the one hand, and ECOSOC rights on the other hand, in line with the two UN treaties, the ICCPR and the ICESCR. A traditional approach toward human rights and state duties is that civil and political rights basically require governmental abstaining, and are enforceable through courts, whereas ECOSOC rights call for government action, which may not be enforced in court. This concerns both international and national standards. The matter will be discussed into more detail below. A second reason for debate is the fact that human rights are recognized in international legal texts. The constitutional system of a country plays a decisive role in determining how these rights have effect in the domestic legal order. It has always been a challenge for international human rights institutions to ensure that the international agreements on human rights are indeed complied with by their member states. Especially due to the fact that existing reporting and complaints procedures prove to be greatly dependent on the states' willingness to cooperate, and as a result are not as effective as originally foreseen. It is therefore no matter of course that individuals may have legal remedies against violations of the internationally embedded right to adequate food in either the national or the international arena (or both). This will be discussed in light of two case studies in Sect. 4.4.

## 4.4 The Right to Adequate Food in International Law

### 4.4.1 *A Brief History of the Development of the Right to Food Since World War II*

After the World War II, the United Nations was founded, with its main objective to maintain peace and security. Within this context, the right to food has been developed over decades. Three main drivers within the United Nations have been responsible for further clarifying the concept of the right to food.

The first is the treaty body of the ICESCR: the Committee on Economic, Social and Cultural rights. This Committee, in its capacity as overseeing body of the ICESCR reporting and complaints procedures, regularly adopts General Comments. These Comments are authoritative interpretations of the ICESCR Articles. Of particular importance are General Comment 3<sup>9</sup> and 9<sup>10</sup> on state obligations and

---

<sup>9</sup>E/1991/23, annex III at 86 (1991).

<sup>10</sup>E/C.12/1998/24 (1998).

domestic application of ICESCR Provisions, and general Comment 12<sup>11</sup> and 15,<sup>12</sup> on the right to food and the right to water. Furthermore, the Committee comments on the submitted periodic country reports.

The second driver is the work done within FAO context. Most famous are the adoption of the World Food Summit declarations<sup>13</sup> and the work that resulted from these summits, such as the adoption of the voluntary guidelines.<sup>14</sup> Also, much research has been conducted under the aegis of the FAO that is relevant for this topic.<sup>15</sup>

The third driver is the work done by the Special Rapporteurs. The Human Rights Council<sup>16</sup> and its predecessor, the Committee on Human Rights,<sup>17</sup> has regularly mandated special rapporteurs to investigate a particular human rights issue. In this light, Jean Ziegler has functioned as Special Rapporteur on the right to food in the period 2000–2008.<sup>18</sup> Since 2008, he is succeeded by Olivier De Schutter,<sup>19</sup> and another Special Rapporteur, Catarina de Albuquerque, was appointed to examine the right to safe drinking water and sanitation.<sup>20</sup> The Sub-Commission on the Promotion and Protection of Human Rights,<sup>21</sup> and its successor, the Advisory Council,<sup>22</sup> also installed mandates on the right to food and the right to water. Mr Asbjørn Eide<sup>23</sup> has functioned as Special Rapporteur on the right to food, and Mr El Hadji Guissé as Special Rapporteur on the right to drinking water.<sup>24</sup> The special rapporteurs report frequently on their research.

It is important to note here that in the sphere of the first and third driver, recommendations (or authoritative interpretations) are made by expert organizations, while in the sphere of the second driver, decisions are adopted in the context

of intergovernmental relations, mostly based on voting procedures that require unanimous approval.

#### **4.4.2 *The Right to Food in UN Law, Regional Law, and Domestic Law***

As stated above, the right to food is firmly embedded within the international and regional human rights system.

On a global level, within the context of the UN, the freedom from want is mentioned in the preamble of the most important general human right treaties.<sup>25</sup> Furthermore, the right to an adequate standard of living, including adequate food, is specifically stipulated in Article 25 UDHR,<sup>26</sup> and later as a treaty provision in Article 11 ICESCR. Also, the right to food is recognised as an independent right in documents that aim at the protection of a particular group of individuals. The right is stipulated in Article 27 of the International Covenant for the Rights of the Child,<sup>27</sup> Article 28 of the Convention on Persons with Disabilities.<sup>28</sup> In the particular context of healthcare and pregnancy, the right is recognized in Article 12 (2) of The Convention on the Elimination of All Forms of Discrimination against Women,<sup>29</sup> and Article 24 (2) of the International Covenant for the Rights of the Child.<sup>30</sup> Furthermore, the right to food is stipulated in several Articles of the Geneva Conventions and protocols<sup>31</sup> on humanitarian law that stipulate the right to food in the specific context of the beneficiaries of the treaties.<sup>32</sup>

<sup>30</sup>A/RES/44/25 (1989) *Convention on the Rights of the Child*, Article 27.

<sup>31</sup>First Geneva Convention for the Amelioration of the Condition of the Wounded and Sick in Armed Forces in the Field (1949), Articles 32 (2) jo Article 27; Third Geneva Convention Relative to the Treatment of Prisoners of War (1949), Articles 20, 26, 28, 46, 51, 72; Fourth Geneva Convention relative to the Protection of Civilian Persons in Time of War (1949), Articles 15, 23, 49, 50, 55, 59, 76, 87, 89, 100, 108, 127; Protocol Additional to the Geneva Conventions (1949) and relating to the Protection of Victims of International Armed Conflicts (1977), Articles 54, 69, 70; Protocol Additional to the Geneva Conventions of 12 August 1949, and relating to the Protection of Victims of Non-International Armed Conflicts, 8 June 1977, Articles 5, 14, 18.

<sup>32</sup>In the four Geneva Conventions and their three protocols the human right to adequate food is recognized for the following groups of persons: medical personnel of a neutral country assisting one of the parties to a conflict, prisoners of war in general, prisoners of war who are being evacuated or transferred, civilians, detained civilians, and persons whose liberty is restricted. The starvation of civilians as means of pressure is forbidden in national and international armed

In line with the idea that human rights are “universal, indivisible and interdependent and interrelated,”<sup>33</sup> the right to food is often inextricably linked to other basic rights. There is an obvious link between the non-discrimination principle and the right to food. The Committee on Economic, Social and Cultural Rights underlined that “discrimination in access to food (. . .) constitutes a violation of the Covenant.”<sup>34</sup> Such discrimination, especially in the sphere of the granting of social benefits, might be brought before a court more effectively than a direct violation of an ECSOC right.<sup>35</sup>

Another clear link exists between the right to food and the right to self-education. The right to food is frequently mentioned in a problem-specific context, such as land access in rural areas,<sup>36</sup> or access to resources in poor fishing communities,<sup>37</sup> indigenous people<sup>38</sup> and women.<sup>39</sup>

---

conflicts, as well as the deliberate destruction of foodstuffs and drinking water. Forced displacements of civilians leading to starvation are prohibited. There are also international rules concerning the protection of humanitarian assistance in occupied territories and during non-international armed conflicts. Also shipment/delivery of means of existence—including food—for prisoners of war or detained civilians should be allowed. In case of the establishment of a neutralized zone, the delivery of food supplies for (among others) the wounded and sick combatants or non-combatants and civilians should be agreed upon amongst the conflicting parties.

See also Lidija Knuth, *The right to food and indigenous people, how can the right to food help indigenous people?* Rome: FAO, 2009, especially Section 1.3.1.

<sup>39</sup>For instance: A/58/330, 28 August 2003, Jean Ziegler, *Report of the Special Rapporteur on the right to food to the General Assembly*, especially Section 22; A/CONF.177/20, Beijing, China, 4–15 September 1995, *Report of the fourth world conference of women*; A/HRC/RES/7/14, 27 March 2008, Human Rights Council Resolution, Sections 4–5.

The right to health(care) is often related to the right to adequate food. Unhealthy eating habits or malnutrition lead to bad health, and bad health may prevent an individual from consuming adequately.<sup>40</sup> In the context of pregnancy and health, the right to give (or receive) breastfeeding is stipulated in the ICRC, and the ESC.<sup>41</sup> The right to adequate food during pregnancy is stipulated in Article 12 (2).<sup>42</sup>

Enjoyment of the right to food could be considered a prerequisite to realise the right to life. Article 6 ICCPR implies, according to the Human Rights Committee, a duty for Member States to “take all possible measures to reduce infant mortality and to increase life expectancy, especially in adopting measures to eliminate malnutrition and epidemics.”<sup>43</sup> Furthermore, to withhold (access to) food with the purpose to destroy life is in violation with Article II (c) of the Convention on the Prevention and Punishment of the Crime of Genocide.<sup>44</sup>

There is a strong interrelationship between the right to adequate food and the right to social security. This can be demonstrated by referring to two successive provisions of the ICRC. Article 26 ICRC stipulates that the State Parties “shall recognise for every child the right to benefit from social security (. . .) the benefits should (. . .) be granted, taking into account the resources and the circumstances of the child and persons having responsibility for the maintenance of the child (. . .).”<sup>45</sup> Article 27 ICRC states that “parents or other responsible for the child have the primary responsibility to secure, within their abilities and financial capacities, the conditions of living necessary for the child’s development.” The State Parties “shall take appropriate measures to assist parents and others responsible for the child to implement this right and shall in case of need provide material assistance and support programmes, particularly with regard to nutrition, clothing and housing.”<sup>46</sup> Especially in industrialized countries, the right to food is both in case law and in country reports mostly discussed in light of the domestic system of social security. Furthermore, it is important to note here that in some international human rights

<sup>46</sup>A/RES/44/25 (1989) *Convention on the Rights of the Child*, Art. 27.

treaties the choice was made not to include the right to food, but instead the right to social security.<sup>47</sup>

More than once, the interrelationship between the right to food and the right to education is stipulated. The combination of sound education and food are often considered to be key factors for successfully developing a country.<sup>48</sup> The CESCR emphasized that the right to education should imply, among others things, sanitation for both sexes and clean drinking water.<sup>49</sup>

Furthermore, elements of the right to food may relate to the right to freedom of thought, conscience and religion. In an interesting case, the European Court of Human Rights ruled that Article 9 European Convention on Human Rights, may under certain circumstances imply the obligation of a State to take into consideration the dietary wishes of a prisoner, coming forth from religious motives.<sup>50</sup>

On the regional level, the right to food is specifically stipulated in Africa, the Americas and the Islamic world.<sup>51</sup> In Africa, Article 15 of the additional protocol to the African Charter on Human and peoples' rights on the rights of women in Africa, stipulates the right to food security for women.<sup>52</sup> Also, the African Charter on the Rights and Welfare of the Child<sup>53</sup> stipulates the right to adequate food in Articles 14 and 20. Furthermore, in the African Union Convention for the Protection and Assistance of Internally Displaced Persons in Africa (Kampala Convention),<sup>54</sup> States Parties pledge themselves to provide internally displaced persons with adequate humanitarian assistance, including food and water,<sup>55</sup> and members of armed groups "shall be prohibited from denying internally displaced persons the right to live in satisfactory conditions of dignity, security, sanitation, food, water, health and shelter (. . .)"<sup>56</sup> In the Americas, the right to food is recognized in Article

<sup>56</sup>African Union Convention for the Protection and Assistance of Internally Displaced Persons in Africa (Kampala Convention) (2009), Article 7 (5) (c).

12 of The San Salvador Additional Protocol to the American Convention on Human Rights.<sup>57</sup> In the Islamic world, the right to food is stipulated in Article 17 of The Cairo Declaration on Human Rights in Islam,<sup>58</sup> and more in particular recognized in case of armed conflict (Article 3), and for children (Article 7). In Europe, the right to food is not explicitly recognized in a regional treaty. However, the European Social Charter stipulates ECOSOC rights, including most rights that closely relate to the right to food, including the right to social security (Article 12).<sup>59</sup>

In several countries, the right to food is recognized in the national constitutions. According to a FAO right to food study in 2011,<sup>60</sup> the right to food is recognized explicitly in the Constitution of 23 Countries. Furthermore, it is recognized implicitly in the constitutions of 33 countries, through a broader right or a directive principle. In addition, the right to food has effect in at least another 51 countries, due to the effect of international law in the domestic legal order. Considering all this, the right to food appears to be positive law in 107 countries. However, the fact that a right is part of positive law in a country does not necessarily mean that it is effectively implemented as such, or enforceable through the courts. To establish such things, a more in-depth analysis of the legal reality of states would be required, instead of a dogmatic comparison of constitutions.

#### ***4.4.3 The Meaning of the Right to Adequate Food***

Article 11 ICESCR is often considered to be the earliest recognition of the right to food as a legally binding provision, and has the broadest scope, for the Covenant in which the right is stipulated addressed ‘the right to everyone, and not a specific group’. Therefore, the content of the right to food is most often discussed in light of this Provision:

1. The States Parties to the present Covenant recognize the right of everyone to an adequate standard of living for himself and his family, including adequate food, clothing and housing, and to the continuous improvement of living conditions. The States Parties will take appropriate steps to ensure the realization of this right, recognizing to this effect the essential importance of international co-operation based on free consent.
2. The States Parties to the present Covenant, recognizing the fundamental right of everyone to be free from hunger, shall take, individually and through

<sup>59</sup>European Social Charter (revised) (1996) Strassbourg, in: European Treaty Series 163.

<sup>60</sup>Knuth and Vidar (2011).

international co-operation, the measures, including specific programmes, which are needed:

- (a) To improve methods of production, conservation and distribution of food by making full use of technical and scientific knowledge, by disseminating knowledge of the principles of nutrition and by developing or reforming agrarian systems in such a way as to achieve the most efficient development and utilization of natural resources;
- (b) Taking into account the problems of both food-importing and food-exporting countries, to ensure an equitable distribution of world food supplies in relation to need.

Article 11 of the ICESCR was written in close cooperation with the FAO, which proposed Section (b), to provide for a legal basis for their ‘freedom from hunger campaign’ that was set up in 1960. It explains why sub (a) refers to ‘the right to adequate food,’ and sub (b) refers to ‘freedom from hunger.’<sup>61</sup> The finally adopted version of Article 11 ICESCR was a compromise between countries who supported strong wordings that would include clear obligations and countries that preferred a larger margin of discretion for member states to implement the right in a way that suits best considering the particularities per country. Since the adoption of this provision, many attempts have been undertaken to further clarify the meaning of the right to adequate food. Especially because the wordings of Article 11 ICESCR, and other equivalent Articles, are perceived to be relatively vague by many countries, contributing to a denial of legal effect in these countries. Therefore, the Committee on Economic, Social and Cultural Rights stated in General Comment 12 that, “the right to adequate food is realised when every man, woman and child, alone or in community with others, has physical and economic access at all times to adequate food or means for its procurement.”<sup>62</sup> In addition, the CESCR emphasized that the right to adequate food implies that Member States ensure: “The availability of food in a quantity and quality sufficient to satisfy the dietary needs of individuals, free from adverse substances, and acceptable within a given culture; and the accessibility of such food in ways that are sustainable and that do not interfere with the enjoyment of other human rights.”<sup>63</sup> According to the CESCR, food should be adequate and sustainable, meaning that food is, “to a large extent determined by prevailing social, economic, cultural, climatic, ecological and other conditions,” and implies, “long-term availability and accessibility.”<sup>64</sup>

Furthermore, especially considering the second Section of Article 11 ICESCR, formulated in a negative understanding, the right to food has a certain minimum core that is the absence of hunger (insufficient quantity of food) and malnutrition

(insufficient quality of food).<sup>65</sup> Lastly, it is generally accepted that the right to adequate food includes the right to water,<sup>66</sup> and the right to (give or receive) breastfeeding.<sup>67</sup>

#### **4.4.4 Enforcing the Right to Food: Human Rights and State Obligations**

In general, human rights obligations are state obligations, and formulated as such. Of course, the realisation of human rights is not the sole responsibility of a government: all actors in society should contribute to the realisation of human rights,<sup>68</sup> with a primary responsibility for the individual who seeks to enjoy her/his human rights.<sup>69</sup> However, the international human rights system is shaped in a legal form, in which countries, through ratification of those documents, take the responsibility to implement human rights. In case of the right to food, Article 11 ICESCR specifies that this should be done by states individually and through international cooperation (the so called extra-territorial obligations<sup>70</sup>).

As already pointed out above, a traditional approach toward human rights implies that civil and political rights on the one hand bring mostly negative obligations for the state, while on the other hand ECOSOC rights imply positive obligations for the State. This distinction may be traced back to the choice made to split the rights stipulated in the UDHR in to two groups, separately recognized in UN treaties: the ICCPR and the ICESCR. While originally it was the intention to adopt one legally binding treaty stipulating the UDHR rights, the choice was made to draw two Covenants instead of one. This was mainly due to different perceptions of state duties between Eastern and Western countries and also between developing and developed countries.<sup>71</sup> This distinction has led to a widely accepted perception that civil and political rights, due to the fact that they imply government abstaining,

<sup>71</sup> Ssenyonjo (2009).

are better suited for enforceability in the domestic courts, while ECOSOC rights, implying government action, are not, due to the margin of discretion of governments to determine what kind of action the particularities of their country requires. While this perception is (with some exceptions<sup>72</sup>) widely shared amongst the UN member states, the specialized institutions within the UN have tried to nuance this perception with compelling arguments. This is mostly done by introducing a typology of duties that can be applied to all human rights, without distinction. Inspired by various authors,<sup>73</sup> this typology was introduced in the UN human rights system and applied to the right to food by Asbjørn Eide in his capacity as Special Rapporteur.<sup>74</sup> In short, it is suggested that three different types of State Obligations are implied by all human rights: the duty to respect, the duty to protect and the duty to fulfill. In General Comment 12, the CESCR used this terminology to further clarify the State duties that come forth from ratifying the right to food:

The obligation to respect existing access to adequate food requires States' parties not to take any measures that result in preventing such access. The obligation to protect requires measures by the state to ensure that enterprises or individuals do not deprive individuals of their access to adequate food. The obligation to fulfill (facilitate) means the state must pro-actively engage in activities intended to strengthen peoples' access to and utilization of resources and means to ensure their livelihood, including food security. Finally, whenever an individual or group is unable, for reasons beyond their control, to enjoy the right to adequate food by the means at their disposal, states have the obligation to fulfill (provide) that right directly. This obligation also applies for persons who are victims of natural or other disasters.<sup>75</sup>

While this typology is widely used amongst the UN institutions, especially when overseeing the various reporting mechanisms, it is mostly rejected by the member states.

## 4.5 The Enforceability of ECOSOC Rights

In a traditional approach, ECOSOC rights require government action, and human right articles stipulating these rights are usually not considered sufficiently specific to be enforced through domestic courts. This is due to the fact that such an article cannot take into account all particularities of each country around the globe, and therefore, governments need a margin of appreciation to implement the right to food, through government action, the way that best suits the needs of their specific country, and with the resources that are available. This is often taken as an argument in court to deny enforceability of ECOSOC rights when a claimant tries to seek legal remedies against an alleged violation of the right to food. This view is often substantiated by referring to Article 2 ICESCR, stipulating that,

Each State Party to the present Covenant undertakes to take steps, individually and through international assistance and co-operation, especially economic and technical, to the maximum of its available resources, with a view to achieving progressively the full realisation of the rights recognised in the present Covenant by all appropriate means, including particularly the adoption of legislative measures.

In their General Comments 3 and 9, the CESCR oppose such a traditional approach towards the enforceability of ECOSOC rights. First of all, the CESCR defends the position that Article 2 ICESCR should not be thus understood that Member States are given some sort of *carte blanche* to implement ECOSOC rights as they see fit, without any consequences. Rather, the CESCR argues that Article 2 implies immediate core obligations concerning the ECOSOC rights stipulated in the ICESCR, requiring Member States “to ensure the satisfaction of, at the very least, minimum essential levels of each of the rights is incumbent upon every State Party.”<sup>76</sup> Next to that, the obligation to progressive realisation should “not be misinterpreted as depriving the obligation of all meaningful content.” This means that the States have an obligation of conduct, that is to “move as expeditiously and effectively as possible” towards full realisation of the ICESCR rights. This also means that “any deliberate retrogressive measures in that regard would require the most careful consideration and would need to be fully justified by reference to the totality of the rights provided for in the Covenant and in the context of the full use of the maximum available resources.”<sup>77</sup> All this should contribute to the final goal, the realisation of ECOSOC rights: the obligation of result.

Second, the CESCR argued that phrase “all appropriate means” in Article 2 (1) ICESCR would imply “the Provision of judicial remedies with respect to

---

<sup>76</sup>E/1991/23, annex III at 86 (1991), 14 December 1990, CESCR, *General Comment 3: The Nature of States Parties’ Obligations*, especially Section 10.

<sup>77</sup>E/1991/23, annex III at 86 (1991), 14 December 1990, CESCR, *General Comment 3: The Nature of States Parties’ Obligations*, Section 9.

rights which may, in accordance with the national legal system, be considered justiciable.”<sup>78</sup> The Committee underlined that:

In relation to civil and political rights, it is generally taken for granted that judicial remedies for violations are essential. Regrettably, the contrary assumption is too often made in relation to economic, social and cultural rights. This discrepancy is not warranted either by the nature of the rights or by the relevant Covenant Provisions.

The CESCR added that, “there is no Covenant right which could not, in the great majority of systems, be considered to possess at least some significant justiciable dimensions.”<sup>79</sup> The Committee even suggested that many ICESCR Provisions “are stated in terms which are at least as clear and specific as those in other human rights treaties, the Provisions of which are regularly deemed by Courts to be self-executing.”<sup>80</sup> A provision is self-executing when it can be applied by a court without the need for any additional domestic legislation. The Committee listed ‘by way of example’,<sup>81</sup> some ICESCR Provisions that “would seem to be capable of immediate application by judicial and other organs in many national legal systems.”<sup>82</sup> These Provisions are: 3, 7 (a) (i), 8, 10 (3), 13 (2) (a), (3) and (4), and 15 (3) ICESCR. The Committee underlined that it deemed arguments that would indicate that these provisions were not self-executing “difficult to sustain.”<sup>83</sup> To conclude, the CESCR emphasizes the fact that there is no reason to assume that ECOSOC rights have no justiciable dimensions, and defends the position that at least some Articles are formulated sufficiently specific so that its content can be self-executing. As it seems, the CESCR uses the term self-executing to emphasize the possibility of direct application of the standard by a court, without the need of additional domestic legislation, while the term ‘justiciability’ is used in a broader context, underlining the possibility of any legal effect through the ECOSOC standard. The latter could also be indirect application, or the use of the standard as an interpretative standard.

## 4.6 The Enforceability of the Right to Adequate Food

In the list of self-executing provisions of the Committee, the right to adequate food was not included. However, the list was never meant to be exhaustive. It only addresses the possible self-executing nature of these provisions, and not necessarily any other legal effects that may fall under the scope of the broader concept of ‘justiciability’. Within the three UN drivers as discussed above, there seem to be varying positions with regard to the enforceability of the human right to adequate food. On the one hand, the specialized institutions (labelled above as the first and third driver) seem to defend the position that the right to food should have some sort of legal effect in the domestic legal orders of the UN member states. On the other hand, the institutions in the second driver, usually taking decisions based on intergovernmental procedures, mostly requiring unanimous approval, seem to deny or even oppose such legal effect. The latter is no surprise, since in the second driver, the direct influence of UN member states, usually denying enforceability of ECOSOC rights in general, is most clearly reflected.

Although cautiously, the Committee in their General Comment 12, seems to defend the position that the right to food should have legal effect in the domestic legal order of the UN member states. The CESCR underlined that implementing the right to food, “can significantly enhance the scope and effectiveness of remedial measures (...)” and, “Courts would then be empowered to adjudicate violations of the core content of the right to food by direct reference to obligations under the Covenant.”<sup>84</sup> However, a more straightforward approach can be noticed when the CESCR comments on the reports submitted by the member states. Especially during the sessions in which country delegations engage in a dialogue with members from the Committee and in their concluding observations, the CESCR is quite specific in their expectations: all ICESCR provisions, including the right to food, should be enforceable in the domestic courts.<sup>85</sup>

Also the rapporteurs on the right to food, perhaps in the strongest wordings, defend the position that the right to food should have legal effect in the member states. Jean Ziegler argued that “the right to food can be considered as justiciable by its very nature, and is therefore equal to civil and political rights.”<sup>86</sup> Ziegler’s successor, Olivier De Schutter, shares this view, and argues that states should adopt a framework legislation, “ensuring that the right to food is justiciable before national Courts or that other forms of redress are available (...)” This would

<sup>84</sup>E/C.12/1999/5, 12 May 1999, CESCR, *General Comment 12, Right to Adequate Food*, Section 33.

<sup>85</sup>Wernaart (2013).

<sup>86</sup>E/CN.4/2002/58, 10 January 2002, Jean Ziegler, report of the Special Rapporteur on the right to food, Section 49.

encourage, “Courts or other monitoring mechanisms, such as the human rights institutions (. . .) to contribute to ensure compliance with the right to food.”<sup>87</sup>

However, especially in the context of the FAO hosted World Food summits, and the resulting Voluntary Guidelines, such enthusiasm towards legal effect of the right to food is not always shared. In the World Food Summit declarations, the matter of enforceability is simply ignored. The Voluntary Guidelines, finally adopted after stiff negotiations,<sup>88</sup> only, “invite” states “to consider (. . .) whether to include provisions in their domestic law (. . .) that facilitates the progressive realisation on the right to food in the context of national food security,”<sup>89</sup> or “to include provisions (. . .) to directly implement the progressive realisation of the right to food.”<sup>90</sup> Regarding the enforceability of the right to food through juridical remedies, the guidelines merely underline that, “administrative, quasi-judicial and judicial mechanisms to provide adequate, effective and prompt remedies accessible, in particular, to members of vulnerable groups may be envisaged”<sup>91</sup> and, “States that have established a right to adequate food under their legal system should inform the general public of all available rights and remedies to which they are entitled.”<sup>92</sup>

To conclude, the specialized UN institutions expect the right to food to be enforceable, while the member states seem to be reluctant in accepting this.

## 4.7 A Right to All and a Right to Each

In literature, but also within the framework of most human rights institutions, debates on the right to adequate food almost exclusively focus on developing countries. Understandable, and rightfully so, because it is in developing countries that peoples’ right to adequate food most often fails to be realized. The right to food is then often discussed in light of feeding the population at large, i.e. a government

obligation towards all, due to structural problems that surpass the matter of enforceability. However, in industrialized countries, it should—hypothetically—not be a problem to guarantee the right to food to each individual and to hold the government accountable in a court of law. It is to be expected that this right is invoked by the most vulnerable in society. The right to food should be a last resort when all existing social security legislation does not offer adequate protection to the individual. But it should also provide a yardstick to judge the adequacy and shortcomings of the social security system. In the first sense, the right to food functions as an individual right, in the second as a meta-law to which the lower law must conform. Here, the matter of enforceability plays a significant role. The concept of human rights was developed with the strong moral idea that due to the mere fact that a person is born, she/he has a right to lead a life in dignity.<sup>93</sup> Adequate food is a necessity to lead a dignified life. As discussed above, the specialized UN institutions strongly defend the position that the right to food implies that individuals should be empowered to bring violations of their rights before a court of law. This view is widely contested among the Member States.

#### ***4.7.1 Case Studies: The Netherlands and Belgium***

In light of the discussion on the enforceability of the right to food, it may be enlightening to address, by way of example, the specific context of two industrialized countries and their approach to enforceability of the right to food: the Netherlands and Belgium. Both countries are relatively prosperous countries, have a stable democratic foundation, a functioning and accessible judiciary, and an extensive system of social security. Furthermore, both countries periodically report that they fully fulfill their duties that come forth from ratification of the right to food.<sup>94</sup> In these circumstances, one might expect that an individual would be able to claim her/his rights in court, when the individual falls through the cracks of the system of social security. The above mentioned FAO research suggests that in both countries, the right to food is indirectly embedded in the Constitution, and the constitutional mechanisms of both countries ensure that international law has supremacy over national law, and therefore, the right to food, as ratified by the Netherlands and Belgium is directly applicable in the national legal order of these countries.<sup>95</sup> However, as will be discussed in this section, the case law in both countries shows otherwise, and with some minor exceptions, the right to food turns out not

<sup>95</sup>Knuth and Vidar (2011), Chapter 6.

to be an enforceable right at all. Explaining this legal practice may lead to valuable insights in the functioning and effects of the global human rights system.

#### 4.7.1.1 The Enforceability of the Right to Food in the Netherlands: Case Law Analysis

The Dutch Courts unanimously reject direct effect of Article 11 ICESCR. Although some variations to the theme can be found, there seem to be three main arguments why the courts consider the Article is not suitable for direct application. One relating to the treaty provision itself; one to Dutch constitutional law; and the last to the national interpretation of the provision at the time of ratification. First, the Article is, ‘not binding on all persons,’ as required by the Constitution for direct effect.<sup>96</sup> Second, the Article is not sufficiently precise for concrete use, and therefore further national legislation is required. Third, the legislator, in their ratification bill, considered that ICESCR rights in general would have no direct effect.<sup>97</sup> From this we can learn that the structure embedded in the Dutch Constitution<sup>98</sup> determines the scope of the competencies of the courts, and that the influence of the Legislature should not be underestimated. In general, the Courts state such arguments without taking into consideration the particularities of the case. Mostly, the cases concern people who support their claim to certain social benefits with a reference to the rights enshrined in Article 11 ICESCR. While there are also cases concerning people on low incomes, prisoners, elderly and disabled persons, a majority of the case law concerns the position of asylum seekers. In most cases, these asylum seekers reside illegally in Dutch territory, and for this reason are by Dutch legislation<sup>99</sup> excluded from all social benefits, except urgent medical care. The courts prefer to solve the matters by using domestic legislation. There are hardly any references to the authoritative interpretations of the CESCR, and when they are considered, they do not carry any weight of significance.<sup>100</sup>

---

<sup>96</sup>Kingdom of the Netherlands, Const. Art. 93, 94.

<sup>97</sup>Council of State of 19 April 2007, LJN BA4289; Central Court of Appeal 14 March 2011, NJB 2011, 755.

<sup>98</sup>Kingdom of the Netherlands, Const. Art. 93 94.

<sup>99</sup>The Dutch Linkage-Act. Wet van 26 maart 1998, *Stb.* 1998, 203, tot wijziging van de Vreemdelingenwet en enige andere wetten teneinde de aanspraak van vreemdelingen jegens bestuursorganen op verstrekkingen, voorzieningen, uitkeringen, ontheffingen en vergunningen te koppelen aan het rechtmatig verblijf van de vreemdeling in Nederland.

<sup>100</sup>Central Court of Appeal, 3 July 1986, TAR 1986, 215, and Central Court of Appeal, 22 December 2008, LJN: BG8789.

Somewhat different is the case law on Article 27 ICRC. While in general, also here the courts have the tendency to deny its direct application,<sup>101</sup> in some circumstances, the courts muster a milder approach, and use the article as an important interpretative norm, for instance in evaluating the margin of appreciation of the local administration in granting social assistance to children.<sup>102</sup> On several occasions, the Central Court of Appeal considered that in their decisions, the local administration had to take into account Article 27 ICRC when children were involved.<sup>103</sup> However, this approach towards Article 27 seems to be the exception to the rule, and is certainly not applied in case of illegally residing children.<sup>104</sup>

No case law of significance could be found on any other article stipulating the right to adequate food.

#### 4.7.1.2 Dutch Qualified Monism

In essence, the Netherlands has a monistic system when it concerns the effect of international norms in the domestic legal order. In general, this means that international norms have direct effect in the domestic legal order, without the need for the adoption of further domestic legislation. However, the Dutch understanding of monism is limited to articles that are, ‘binding on all persons.’<sup>105</sup> The courts then are obliged not to apply domestic law that is in violation with international provisions that are binding on all persons.<sup>106</sup> Oddly enough, it has never been clear who eventually determines when an international provision meets the requirements of being binding on all persons: the legislature or the judiciary. The official viewpoint of both the legislature and the judiciary is that it is the judiciary that has a final say in determining whether or not an international provision is binding on all persons. It is often portrayed that the court then evaluates this based on criteria that relate to the substance of the provision: its nature and content, as well as its wording. The opinion of the legislature could be used by the courts as a source of

<sup>105</sup>Const. Art. 93.

<sup>106</sup>Const. Art. 94.

inspiration, but the courts are autonomous in their decision on direct applicability. However, as can be observed in the case law on the enforceability of Article 11 ICESCR, the legal reality is somewhat different. The judiciary seems to greatly value the opinion of the legislature. From the parliamentary documents of the constitutional reforms and the ratification bills to human rights treaties, it can be deduced that it is the deliberate intention of the legislature to communicate its view on direct applicability of international standards, and also expects the courts to follow that view.<sup>107</sup> This has resulted in an established practice in which the Courts first considers the viewpoint of the legislature, and almost indiscriminately apply this to the case. Only when the legislature is unspecific or silent on the matter, the courts consider the substance of the provision. In case of the right to adequate food, as well as most ECOSOC rights, the legislature was very clear in its view: these rights are not binding on all persons, and therefore not suitable for direct application through the courts. Their main arguments pretty much resemble the usual concerns that are used in the global arena to deny enforceability of ECOSOC rights. That is mostly that most ECOSOC Provisions are not addressed to individuals but to the State,<sup>108</sup> and/or are focussed on the progressive realisation through implementation measures,<sup>109</sup> leaving a wide margin of discretion to the legislature. This was most clearly discussed during the parliamentary debates on the ratification bill of the ICESCR and ICRC. The Government argued that

many provisions concerning substantive rights, embedded in Part III of the International Covenant on Civil and Political Rights, have, due to the content and wording of these provisions, and following the example of most provisions stipulating substantive rights of the European Convention, direct effect and can be applied by the Courts without the need for further legislation.' '(...) partly due to this, civil and political rights on the one hand, and economic, social and cultural rights on the other, are embedded in two separate documents, because in general the first group of rights is suitable for direct application, while the realisation of the second group often requires implementing measures.<sup>110</sup>

This approach of the Dutch Government, and taken into considering its apparent influence on case law, explains why the enforceability of the right to food—and ECOSOC rights in general—is consistently permanently denied by the courts, without any significant reference to the particularities of the case.

### 4.7.1.3 Dutch Reporting Behavior

Overall, the Netherlands have an extensive reporting duty, having ratified most global human rights instruments. In the UN arena, several issues can be distinguished that characterise the Dutch reporting behaviour towards enforceability of the right to adequate food. First of all, the Netherlands consistently report that they generously fulfill all the obligations that relate to the right to adequate food.<sup>111</sup> This is mostly substantiated by listing facts of the Dutch system of social security. Second, the Netherlands consistently report that in its view, ECOSOC rights are not suitable for enforceability. This has been a major cause for fierce debate between Dutch delegations and the Committee on Economic, Social and Cultural Rights. As also observed in the previous Section, the Dutch Government usually considers ECOSOC rights in general as non-enforceable rights. Therefore, especially during the reporting cycles on the implementation of the ICESCR Provisions, the matter of enforceability of ECOSOC rights is only discussed at the more general level, and not at the level of specific Provisions. The Dutch Government and Delegations mainly emphasize that there is a difference between on the one hand fulfilling the obligations that come from ratification of the rights enshrined in the treaty, and on the other hand, guaranteeing the enforceability of these rights.<sup>112</sup> The first would be a responsibility of the governments, while the latter would be up to the Judiciary to decide. A reasoning that was considered by especially the CESCR as incorrect, for it is a country that signs and ratifies a treaty that includes the Judiciary. Therefore, the State is responsible for ensuring that ECOSOC Provisions are enforceable.<sup>113</sup> The Dutch government repeatedly underscored that the Dutch Constitutional system is of a monistic nature, and as a result, the direct effect of ‘eligible treaty Provisions is sufficiently guaranteed.’<sup>114</sup> However, the Dutch Government, despite criticism of various UN bodies in different degrees of urgency, also here persisted in its view that ECOSOC rights in general are not suitable for enforceability in the Courts. For instance, in their third periodic report on the implementation of the ICESCR Provisions, the Government argued that

the nature and content of the Covenant, as well as the wordings of the Articles, indicate that it is aimed at the gradual implementation and increasing achievements of objectives by means of legislation and further implementation measures. As a result, most Provisions cannot be applied directly. All the more because, where further implementation laws are required, this implies a certain freedom of choice for the national Legislature regarding the way in which the rights to be guaranteed are given substance.<sup>115</sup>

Throughout the reporting procedures, although expressed in various ways, the essence of this argumentation remained the same.

## 4.7.2 *The Enforceability of the Right to Food in Belgium*

### 4.7.2.1 *Belgian trias politica*

The Belgian constitutional context is characterized by a complex organization of the Legislature and Judiciary. As a result of profound differences amongst the Belgian people in language culture and economics, three main Legislators co-exist with equal and exclusive powers: the Federal Government, the centrally organized legislator representing all Belgian people, the Community Governments, representing the language groups,<sup>116</sup> and the Region Governments, representing the different economic regions in the country. The Belgian organization of the Judiciary is mostly based on functionality considerations. The Judiciary mainly consists of a subjective contentieux in which courts rule *inter pares*, and an objective contentieux, in which courts rule *ergo omnes*. However, throughout the years the rulings of both contentieux seem to converge. For instance, rulings in the objective contentieux (Council of State and Constitutional Court) result in effect for individuals, and in the subjective contentieux, especially in preliminary injunction procedures, courts rule on the basis of a balancing of interests rather than subjective rights.<sup>117</sup> While the results of rulings in both contentieux converge, the reasoning patterns are usually different, and these differences are highly relevant in light of the discussion on enforceability of the right to food.

In the objective contentieux, the constitutional court plays a rather distinctive role. Originally, the court was installed to rule in matters of conflict between the three highest legislative powers of Belgium as a court of arbitration. Throughout the years however, the competencies of this court were broadened gradually,<sup>118</sup> and as a result of several constitutional reforms, the court was authorized to review domestic legislation against the non-discrimination principle, and the right to equal treatment of different forms of education, as embedded in the Belgian Constitution.<sup>119</sup> The latter reflects the primary reason for this broadening of competencies; that is the protections of minorities in education, a rather sensitive topic in Belgian, considering the variety in language culture. Later, the competencies were broadened according to the already established legal practice, and the court was able to review national legislation directly against all rights stipulated in Chapter II of the Constitutional Act, in which most fundamental rights are enshrined. The Court established a legal practice in which national legislation was not only reviewed against constitutional provisions, but also indirectly against equivalent international human rights provisions. It is essentially in this light that the right to food plays a role in case law.

---

<sup>116</sup>Except the Brussels-Capital area, that falls under the combined authority of the Dutch and French Community.

<sup>117</sup>Maes (2003), no. 28–49.

<sup>118</sup>Alen (2005).

<sup>119</sup>Belgian Const. Art. 10, 11, 24.

In Belgium, it is generally accepted that the constitutional system is a monistic system, appearing from case law.<sup>120</sup> In the landmark Franco-Suisse Le Ski ruling, the Court of Cassation ruled that international standards that have direct effect prevail over contradicting national standards. Whereas only in the subjective contentieux individuals can invoke international standards, the courts in the objective contentieux do not engage in discussions on the functioning of international standards in the domestic legal order. As discussed above, the Constitutional Court basically reviews national standards indirectly against international standards in matters ergo omnes. This means that the debate on Belgian monism, and the criteria to determine whether or not an international Provision has direct effect exclusively plays a role in the sphere of the subjective contentieux. The courts within the subjective contentieux apply randomly either a subjective or an objective criterion to establish whether or not an invoked international standard has direct effect. When applying a subjective criterion, the court considers whether it was the intention of the State Parties to give such a direct effect to the provision. This can usually be deduced from the addressee of the provision: individuals or the State. In case of the first, the standard would have direct effect. In applying an objective criterion, the court considers whether the invoked standard is specific enough to deduce particular entitlements from its meaning. This means that the wider the margin of appreciation, the less likely it is that a court would rule that the Provision has direct effect.

#### 4.7.2.2 Case Law Analysis<sup>121</sup>

In the subjective contentieux, the courts mostly deny direct effect to ECOSOC Provisions, without offering much of an explanation. The courts of last instance in this contentieux—the Court of Cassation and the Council of State—have the tendency to prefer to circumvent the issue of direct effect, and only rule on the matter when it is absolutely necessary. The general impression is that ECOSOC rights, but also specialized treaties such as the CEDAW and ICRC are entirely non enforceable. There are however some minor exemptions, in which the courts seem to apply international ECOSOC Provisions, or use such Articles as an interpretative standard.<sup>122</sup> However, due to the rather casuistic approach of the courts and the scarcity of such exemptions, it is hard to deduce a consistent approach towards the direct effect of ECOSOC rights.

<sup>120</sup>Van Eeckhoutte and Vandaele (2002).

<sup>121</sup>Wernaart (2013), Chapter 12.

<sup>122</sup>Court of Cassation (1996) Arresten van het Hof van Cassatie, 1996 (446) (Article 12 ICESCR); Council of State, 13 December 2000, case no. 91625; Council of State, 30 October 1995, case no. 56106 9Art. 13 ICESCR); Council of State, 22 March 1995, case no. 52424; Council of State, 3 December 2002, case no. 113168 (Art. 8 ICESCR); published at: [www.raadvst-consetat.be](http://www.raadvst-consetat.be).

Since the Constitutional Court, due to its function within the sphere of the objective contentieux is not restricted to matters of direct effect, it is able to review national legislation indirectly against international Provisions. The origin of this practice can be found in several cases in which the court reviewed several domestic standards against the discrimination Provisions in the Constitution, in conjunction with international Provisions that stipulate the right to education (such as Article 13 ICESCR).<sup>123</sup> Since then, the court reviewed against numerous international provisions, including those that stipulate the right to adequate food.

Most cases in which the right to food plays a role concern the status of aliens, mostly illegally residing foreigners. In these cases, mostly a particular domestic provision<sup>124</sup> was reviewed against Constitutional and international standards. The disputed domestic article excludes foreigners from social benefits—except urgent medical care—when they reside on Belgian territory illegally. In a landmark ruling,<sup>125</sup> the Court ruled that the national provision is not in violation with the invoked constitutional and international standards. In essence, the domestic Provision was considered to be a proportionate mean to realise the justified aim of restricting immigration. In a series of rulings, the Constitutional Court further nuanced this balancing of interests, in cases in which particular groups of individuals claimed they should be exempted from this general principle, for various reasons. The Court ruled inter alia that this principle should not be applied to illegally residing aliens who were incapable of leaving the territory due to medical impossibility,<sup>126</sup> to children of illegally residing aliens,<sup>127</sup> to their parents,<sup>128</sup> and to illegally residing parents whose child could not leave Belgian territory due to a medical impossibility.<sup>129</sup> In general, it can be observed that claims based on ICRC Articles seem to be more successful than claims based in ICESCR Provisions.

However, the effect of the international standard in itself should not be overestimated, for it seems that these provisions only play a minor role in the considerations of the court. The focus of the Constitutional Court is rather inwards, and the court prefers to solve the matters using domestic legislation instead of international.

#### 4.7.2.3 Belgian Reporting Behaviour

The Belgian Government also has a very extensive reporting duty. With regard to the implementation of the right to food, and ECOSOC rights in general, the

<sup>123</sup>Constitutional Court, 33/92, 7 May 1992, in particular consideration B.8.2.

<sup>124</sup>Article 57 § 2 of the '*organic law of 8 July 1976 on public centres for social welfare*'.

<sup>125</sup>Constitutional Court, 51/94, 29 June 1994.

<sup>126</sup>Constitutional Court, 80/99, 30 June 1999.

<sup>127</sup>Constitutional Court, 106/2003, 22 July 2003.

<sup>128</sup>Constitutional Court, 131/2005, 19 July 2005.

<sup>129</sup>Constitutional Court, 194/2005, 21 December 2005.

following observations can be made. First, the Belgian reports primarily focus on all kinds of initiatives that were undertaken by the authorities to improve the human rights implementation embedded in the ratified treaties. The government seems to be very cautious in reporting on points for improvement. Second, Belgium hardly reports on the right to food as an individual right, and rather enlightens on the functioning on its system of social security. Third, an important issue that is frequently discussed during the reporting cycles seems to be the status of foreigners, in particular illegally residing aliens, and their access to social security. In fierce debates between the Belgian Delegations and the various UN committees the matter was discussed.<sup>130</sup> Especially the Committee on the Rights of the Child seems not convinced that the Belgian legislation on social security is in line with the ICRC.<sup>131</sup> Fourthly, it seems that the complex organization of the Belgian *trias politica* causes difficulties in the communication between the Belgian Government and the UN treaty bodies and leads occasionally to misunderstanding.<sup>132</sup> For example, the role of the Constitutional Court is not always clear to the committees, while the Belgian Government seems not to be bothered to nurture the impression that from the case law of the Constitutional Court it appears that some ECOSOC rights, including the right to food, have direct effect in the Belgian domestic order.<sup>133</sup>

Considering the function and the substance of the case law of this court, this impression is simply inaccurate. Furthermore, the Belgian Delegations seem to be not fully informed about the actual status of the domestic case law regarding the enforceability of ECOSOC rights. During the reporting cycles, the Delegation suggested that the CEDAW had direct effect in Belgium,<sup>134</sup> and did not correct the impression of the Committee on the Rights of the Child that the entire ICRC had direct effect in the Belgian legal order.<sup>135</sup> Finally, Belgium made an interpretative declaration to Article 2 ICRC,<sup>136</sup> in which they underlined that the non-discrimination principle would not guarantee foreigners similar rights compared to Belgian nationals. It is remarkable that while the Committee on the Rights

<sup>130</sup>E/C.12/BEL/CO/3 (2008).

<sup>131</sup>CRC/C/BEL/C/3-4, 18 June 2010, Sections 74–77.

<sup>132</sup>E/C.12/BEL/3, 21 September 2006, Section 7; E/C.12/BEL/CO/3, 4 January 2008, Section 11; Mr Citarella, CRC/C/SR.1523, 11 June 2011, Section 48; Mrs Kapalata, CEDAW/C/SR.559, 25 June 2005, Section 51.

<sup>133</sup>Mr Deneve, E/C/12/2000/SR.64, 27 November 2000, Section 38; E/C.12/BEL/Q/3/Add.1, 1 November 2007, Section 51.

<sup>134</sup>Mrs Paternotte, CEDAW/C/SR.559, 25 June 2005, Section 32.

<sup>135</sup>CRC/C/15/Add.38, 20 June 1995, Section 6; Mr Ahmed, E/C/12/2000/SR.64, 27 November 2000, Section 34; Mr Deneve, E/C/12/2000/SR.64, 27 November 2000, Section 38.

<sup>136</sup>With regard to Article 2, Section 11, according to the interpretation of the Belgian Government non-discrimination on grounds of national origins does not necessarily imply the obligation for States to automatically grant foreigners the same rights as their nationals. This concept should be understood as designed to rule all arbitrary conduct but not differences in treatment based on objective and reasonable considerations, in accordance with the principles prevailing in democratic societies.

of the Child does not necessarily oppose such a reasoning,<sup>137</sup> the Belgian Government nevertheless persists in maintaining the declaration.<sup>138</sup>

## 4.8 Conclusion

Human rights, and in particular the human right to adequate food, can be seen as a basis for food law, recognizing justice as its basic principle on which all other law is built. While the right to food is firmly embedded in the global human rights system, and is frequently—with utmost of urgency—emphasized, the meaning of this right in terms of state obligations, and in particular enforceability, is not a matter of course. There are many valid arguments to substantiate that a human right without individual entitlements, and thus legal means to bring violations of a right before a court, would be a hollow concept. However, with some exceptions, member states are reluctant in giving up part of their sovereignty for the sake of implementing internationally embedded ECOSOC rights through guaranteeing their direct effect in the courts. Also in industrialized countries in which theoretically the circumstances should allow each individual to enjoy the human right to adequate food, enforceability is not self-evident. The case study of the Netherlands and Belgium demonstrates that in both countries, it is the coincidental constitutional circumstances that greatly determine the possibility of enforceability of such rights, rather than its content or urgency. Not inconsequently, problems relating to mass immigration play a significant role in this viewpoint. It is remarkable that in the international arena, both countries seem to communicate that they generously fulfill the obligations coming forth from ratifying the right to adequate food, which seems to hardly be in line with the domestic legal reality. Where the normative value of the right to food and other ECOSOC rights seems to be uncontested, its legal effect is limited.

Only if food lawyers around the globe recognize and endorse in word and action that food law has a foundation in human rights is this state of affairs likely to ever change.

## Intellectual Property and Food Labelling: Trademarks and Geographical Indications

Michael Blakeney

**Abstract** This chapter looks at the international intellectual property regimes for the protection of trademarks and geographical indications (GIs), both of which play a role in food labelling. It is important for those involved in the marketing of food that they have to deal with harmonised trademark and GIs rules, so that they do not require a multiplicity of labels to comply with a multiplicity of rules. As this chapter explains a high level of harmonisation is achieved by the World Trade Organization (WTO) Agreement on Trade Related Aspects of Intellectual property Rights (TRIPS). As compliance with TRIPS is an obligation of all WTO members, this chapter focuses on the trademark and GIs provisions of TRIPS, while mentioning the other international instruments which deal with these subjects.

### 5.1 Introduction

Food Labelling typically involves either the use of trademarks to indicate the manufacturing origin of that food or the use of geographical indications to indicate the place of origin of that food. In both cases, the trademark or geographical indication will serve as a warranty of the quality of the designated food because the owner of those indications seeks repeat purchases by consumers. The global marketing of food that carries trademarks or geographical indications is facilitated by the international intellectual property system established by a number of international agreements and conventions. These agreements oblige countries to implement norms for protection set out in those instruments, thereby enabling marketers to deal with harmonised rules in relation to proprietary labelling.

The first of these international conventions was the 1883 Paris Convention for the Protection of Industrial Property, which contained norms dealing, inter alia, with trademarks and indications of product source. Supplementing the Paris Convention was the 1891 Madrid Agreement for the Repression of False or Deceptive

Indications of Source of Goods<sup>1</sup> and the 1958 Lisbon Agreement on the Protection of Appellations of Origin and their International Registration.<sup>2</sup> The administration of these conventions was undertaken by an administrative agency of the Swiss Government: the Bureaux Internationaux Réunis pour la Protection de la Propriété Intellectuelle (BIRPI). The BIRPI, however, was succeeded on July 14, 1967, with the creation of the World Intellectual Property Organization (WIPO) as a specialised agency of the United Nations.

A century after the promulgation of the Paris Convention, the United States sponsored the negotiations within the Uruguay Round of the General Agreement on Tariffs and Trade (GATT). The Uruguay Round of GATT commenced in 1986 and resulted in the Agreement on Trade-related Aspects of Intellectual Property Rights (TRIPS), which came into effect in 1995. The U.S. made the proposal that intellectual property rights (IPR) regulation be shifted to the GATT because of its disillusionment with WIPO as an effective custodian of the international IPR system.<sup>3</sup> The WIPO's inability to propose an effective means to deal with the apparently exponential growth in the global trade in counterfeit and pirated goods had caused the U.S. to turn to the GATT. In comparison with the WIPO, GATT was better equipped to handle the emerging problem with the ability to remove tariff preferences from developing countries involved in questionable trade practices and the ability to bring defaulting countries before the dispute resolution system.

The TRIPS Agreement was an annex to the Uruguay Round agreement of GATT which established the World Trade Organization (WTO). Members of the WTO are obliged to implement the IPR rules, which are set out in the TRIPS Agreement. Articles 15–20 of the TRIPS Agreement contain provisions dealing with trademarks. Articles 22–24 contain provisions dealing with geographical indications, and Articles 41–61 contain the machinery for the civil, administrative and criminal enforcement of IPRs.<sup>4</sup>

As the WTO had 159 members on March 2, 2013,<sup>5</sup> most countries have had to implement the rules regarding trademarks and geographical indications contained in the TRIPS Agreement. Therefore, the TRIPS agreement has effectively established global rules that have an impact upon the labelling of food products.

## 5.2 Trademarks

### 5.2.1 Introduction

Trademark law developed from the common law action of passing off, which was an action to prevent the unfair competitive practice of misappropriating another's commercial reputation. A trademark was considered to be the quintessential symbol of a commercial reputation. Trademarks thus serve to protect commercial reputation. They are also used to facilitate advertising and product promotion through their ability to distinguish and identify goods and services. This is particularly important in markets where there is a proliferation of homogenous goods, as it allows purchasers to identify the goods of a particular trader. In the market for agricultural products, which tend to be homogenous and unpackaged, there has been some success in the marketing of products sold with an associated trademark such as "Chiquita" bananas and "Jaffa" oranges. In the market for packaged foods, branding plays a very important role in product differentiation.

A trademark is a concise way in which to refer to a product. Given the expense of advertising, trademarks serve a particularly important function in advertising and product promotion. The use of a trademark reduces the amount of information that needs to be communicated. The development of an advertised brand acts as a powerful incentive for the advertiser to offer goods of a consistently high standard because the brand will secure repeat purchases and cover the advertising spending. Further, consumers can use trademarks to identify goods, which will meet their needs, therefore creating an additional incentive for manufacturers and distributors to meet the reasonable expectations of consumers with regard to product quality. Accordingly, the use of trademarks tends to encourage trademark owners to maintain consistent standards of quality for goods and services offered under their marks.<sup>6</sup> Thus, a trademark serves as a form of "shorthand" upon which consumers can rely in making rational product selections. In jurisdictions where there is no consumer protection legislation or legislation regarding standards in relation to foodstuffs, the trademark performs a valuable function, by indicating quality, likely safety, and fitness for purpose.

The "goodwill" inherent in a trademark can be a valuable intangible property asset belonging to the trademark owner. The law recognizes this value and allows the trademark owner to prevent unauthorized uses of the trademark, which might tend to diminish the value of the mark. The trademark owner has the ability to protect its investment in creating the goodwill through infringement proceedings. The value of this goodwill can be used as security in raising new capital or in attracting further licensing.<sup>7</sup>

<sup>6</sup>Geographical Indications Trade, Nov. 2013, Free Essays- UK Law Essays <http://www.ukessays.com/essays/law/geographical-indications-trade.php?cref=1>.

<sup>7</sup>International Trademark Association Internet Subcommittee (Aug. 18, 1997) Inta "White Paper" The Intersection of Trademarks and Domain names. Available via [www.ntia.doc.gov/legacy/ntiahome/domainname/not-emailed/INTA-whitepaper.htm](http://www.ntia.doc.gov/legacy/ntiahome/domainname/not-emailed/INTA-whitepaper.htm).

For developing countries and least developed countries (LDCs), trademarks can be used first as a form of self-funded consumer protection since the trademark proprietor will be the person most vigilant in the policing of deceptive practices and in taking enforcement action against counterfeiters. They can also be used to facilitate the penetration of lucrative overseas markets. This will ultimately generate tax revenues, which can be used to underpin food purchases.

## 5.2.2 *Registered Trademarks*

Trademarks are typically protected by a system of registration. For the most part, trademark law is nationally based, but WTO Members are obligated to comply with the TRIPS Agreement. The TRIPS Agreement defines trademarks in Article 15 (1) as:

Any sign, or any combination of signs, capable of distinguishing the goods or services of one undertaking from those of other undertakings, shall be capable of constituting a trademark. Such signs, in particular words including personal names, letters, numerals, figurative elements and combinations of colors as well as any combination of such signs, shall be eligible for registration as trademarks. Where signs are not inherently capable of distinguishing the relevant goods or services, Members may make registrability depend on distinctiveness acquired through use. Members may require, as a condition of registration, that signs be visually perceptible.<sup>8</sup>

Most trademark laws allow separate registrations for a mark in respect of each of the 45 categories of goods and services laid down in the International Classification of Goods and Services, which was established in accordance with the Nice Classification (NCL) established in the Nice Agreement of 1957<sup>9</sup> and its subsequent revisions. Registration of a mark may be permitted with the disclaimer of some elements of the mark. For example, in a word mark there may be a disclaimer of those words, which would be common to the relevant trade.

The application process usually requires an examination by the granting office to ensure compliance with the formal registration requirements, as well as with the substantive requirement of distinctiveness. There also has to be a check as to whether a mark is in conflict with prior rights. After the publication of an application, most countries provide for an opposition process whereby an interested third party may protest the registration of a mark, usually on the grounds of prior rights or deceptive similarity with another mark. Upon acceptance of a mark, registration is conferred for a term of between 10 and 20 years, with a possibility for renewal. A mark will expire if a renewal is not sought. Expungement of a mark may also be sought where its use becomes deceptive or where the mark becomes generic of

---

<sup>8</sup>TRIPS Agreement, 4, Art. 15(1).

<sup>9</sup>Nice Agreement Concerning the International Classification of Goods and Services for the Purposes of the Registration of Marks (June 15, 1957) [www.wipo.int/classifications/nice/en/](http://www.wipo.int/classifications/nice/en/).

goods or services. For example, the marks “Vaseline” and “gramophone” are two examples of marks, which became generic descriptions of the type of goods to which they were appended.

A controversial requirement of some trademark laws is the requirement that registration of a trademark is contingent upon its use or a bona fide intention to use, upon or in close association with, the classes of goods or services in respect to which it is registered. A similar requirement provides for the removal of the registration after a prescribed period of non-use. Protection without registration may be extended to “well-known marks,” i.e. those with a significant reputation in a country. Such marks invariably have a substantial international reputation through prior advertising and use.

Registration of a mark confers protection against emulation by traders using identical or substantially similar marks. Most systems of registration permit assignment or licensure. A system of registered users may be provided to record trademark licences. In the event of infringement of a registered mark, a trademark proprietor may seek relief in the form of injunction, compensation orders, and seizure of infringing goods.

### 5.2.3 *Criterion of Distinctiveness*

The touchstone for registration referred to in Article 15.1 of the TRIPS Agreement and under the Paris Convention is the criterion of distinctiveness. For example, Article 6 *quinquies*, of the Paris Convention allows the denial of registration to trademarks, which “are devoid of any distinctive character.”<sup>10</sup> Most trademark laws have differentiated between marks, which are inherently distinctive, and those, which may subsequently become distinctive through use. This differentiation is recognized in Article 15.1 of the TRIPS Agreement, which provides that “where signs are not inherently capable of distinguishing the relevant goods or services, Members may make registrability depend on distinctiveness acquired through use.”<sup>11</sup>

A trademark is generally understood as being inherently distinctive if its association with the products in respect of which it is used is arbitrary or fanciful. Trademark laws based on statutes deriving their origin from the UK Trademarks Act 1875, list as inherently distinctive: word marks which comprise names represented in a special form; surnames or invented words; and marks which are otherwise inherently distinctive, such as device marks. As a general rule, a mark will be considered insufficiently distinctive if it is descriptive of the products or of

---

<sup>10</sup>Paris Convention for the Protection of Industrial Property (Paris Convention) (Mar. 20, 1883) Art. 6 *quinquies*, Sec. B(2) available at [http://www.wipo.int/treaties/en/text.jsp?file\\_id=288514#P145\\_20374](http://www.wipo.int/treaties/en/text.jsp?file_id=288514#P145_20374).

<sup>11</sup>TRIPS Agreement, 4, Art. 15(1).

the qualities of the products in respect of which it is used. It is possible for a descriptive mark of this nature to become distinctive where, through use, the description attracts the secondary signification of emanating from a particular enterprise. The Paris Convention disallows protection to marks, which consist of:

[A] sign or indication, which may serve in the course of the relevant trade to designate the kind, quality, quantity, intended purpose, value, place of origin, or the time of production, or have become customary in the current language or in the *bona fide* and established practices of the trade of the country where protection is claimed.<sup>12</sup>

Therefore, a mark for a product containing some quality that is viewed as customary will be found insufficiently distinctive and will not be available for trademark registration.

### 5.2.4 Geographical Marks

A particular problem for food products is the tendency for traders to desire the use of geographical marks to indicate the origin of their products. As a general rule, trademark laws invariably refuse to allow geographical marks to be registered on the ground that they are insufficiently distinctive. Both the Council Regulation (EC) No 40/94 of December 20, 1993, on the Community trademark<sup>13</sup> (Community Trademark Regulation), and the First Council Directive 89/104/EEC of December 21, 1988, to approximate the laws of the Member States relating to trademarks<sup>14</sup> (Trademarks Directive), provide grounds for refusal of registration or invalidity of trademarks which:

- (a) are devoid of any distinctive character;
- (b) consist exclusively of signs or indications, which may serve, in trade, to designate the kind, quality, quantity, intended purpose, value, geographical origin, or the time of production of the goods or of rendering of the service, or other characteristics of the goods or service;
- (c) consist exclusively of signs or indications, which have become customary in the current language or in the *bona fide* and established practices of the trade;
- (d) are of such a nature as to deceive the public, for instance as to the nature, quality or geographical origin of the goods or service<sup>15</sup>;

Additionally, both instruments limit the effects of a trademark by providing that the registered trademark shall not entitle the proprietor to prohibit a third party from using in the course of trade:

---

<sup>12</sup>Paris Convention, 10.

<sup>13</sup>Council Regulation No 40/94, Community Trademark Regulation of Dec. 20, 1993, O.J. (L 011) 14.1 (EC).

<sup>14</sup>First Council Directive 89/104/EEC, Trademarks Directive of Dec. 21, 1988, O.J. (L 040).

<sup>15</sup>Community Trademark Regulation, 13, Art. 7(1); Trademarks Directive, 14, Art. (3).

- (a) his own name or address;
- (b) indications concerning the kind, quality, quantity, intended purpose, value, geographical origin, the time of production of the goods or of rendering of the service, or other characteristics of the goods or service; . . . provided he uses them in accordance with honest practices in industrial or commercial matters.<sup>16</sup>

Article 15(2) of the Trademarks Directive, under the heading “Special provisions in respect of collective marks, guarantee marks and certification marks,” provides:

By way of derogation from Article 3(1)(c), Member States may provide that signs or indications, which may serve, in trade, to designate the geographical origin of the goods or services may constitute collective, guarantee or certification marks. Such a mark does not entitle the proprietor to prohibit a third party from using in the course of trade such signs or indications, provided he uses them in accordance with honest practices in industrial or commercial matters; in particular, such a mark may not be invoked against a third party who is entitled to use a geographical name.<sup>17</sup>

The case law indicates that it must first be ascertained whether the relevant public as a geographical term knows the term. Secondly, the relevant public must understand it as a reference to the geographic place used in connection with the claimed goods or services. In other words, the geographic term must not be understood as having a mere suggestive or fanciful association with the relevant products, e.g. Mont Blanc would not be understood as a place of production for writing instruments. Thirdly, the geographical place must be currently associated, in the mind of the relevant public, with the category of goods in question, or the geographical name must be liable to be used in future by the undertakings concerned as an indication of the geographical origin of that category of goods.<sup>18</sup> In this assessment, regard must be given to the degree of familiarity amongst the public with the geographical name, the characteristics of the place designated by the name, and the category of the goods concerned.<sup>19</sup>

Registration is also excluded for those geographical names, which are liable to be used by undertakings.<sup>20</sup> However, the registration of geographical names is not excluded when the public is unlikely to believe that the category of goods concerned originate there.<sup>21</sup>

---

<sup>16</sup>Community Trademark Regulation, 13, Art. 12; Trademarks Directive, 14, Art. (3). Art. 6.

<sup>17</sup>Trademarks Directive, 14, Art. (3). Art. 15(2).

<sup>18</sup>*Windsurfing Chiemsee* [1999] [2000] 2 WLR 205, [1999] EUECJ C-108/97, [2000] Ch 523, [1999] ECR I-2779, paras 31, 37.

<sup>19</sup>Id. at para. 32.

<sup>20</sup>Case T-295/01, *Nordmilch eG v Office for Harmonisation in the Internal Market (Trademarks and Designs)* (OHIM,) EUECJ (Oct. 15, 2003) at para. 31.

<sup>21</sup>Id. at para. 33.

Community trademark law allows geographical marks to acquire the distinctiveness necessary for registration through use in the course of trade.<sup>22</sup> This means that registrable geographical marks will have attracted the secondary meaning of having the origin of the applicant undertaking.

### 5.2.5 *Well-Known Marks*

A special protective regime exists for marks, which are considered to be “well-known. This regime is created by Article 6bis(1) of the Paris Convention, which permits the countries of the Paris Union

...to refuse or to cancel the registration, and to prohibit the use of a trademark which constitutes a reproduction, an imitation, or a translation, liable to create confusion, of a mark considered by the competent authority of the country of registration or use to be well-known in that country as being already the mark of a person entitled to the benefits of this Convention and used for identical or similar goods.<sup>23</sup>

The Article also applies “when the essential part of a mark constitutes a reproduction of a well-known mark or an imitation likely to create confusion therewith.” A period of 5 years from the date of registration is allowed by Art. 6bis(2) for the cancellation of unauthorised registrations of well-known marks,<sup>24</sup> but in relation to marks “registered or used in bad faith,” Art. 6bis(3) provides that no time limit shall be fixed for requesting the cancellation or the prohibition of an unauthorized well-known mark.<sup>25</sup>

Article 16.2 of the TRIPS Agreement provides that “[i]n determining whether a trademark is well known, account shall be taken of the knowledge of the trademark in the relevant sector of the public. . . .”<sup>26</sup> Market survey evidence is typically used to demonstrate the public repute of a brand.<sup>27</sup> The audience surveyed will be critical to a finding of repute. Article 16.2 also refers to “knowledge. . .obtained as a result of the promotion of the trademark,” in determining whether a mark is well known. Thus, evidence of the amount of advertising spends and the extent of dissemination of advertising to the relevant target audience will have a bearing on the renown of a brand. The availability of widely distributed international journals and advertisements appearing in magazines distributed in airlines flying to the subject country are particularly useful in practice.<sup>28</sup>

<sup>22</sup>For example, the Community Trademark Regulation, Article 7, states: 3. Paragraph 1(b), (c) and (d) shall not apply if the trademark has become distinctive in relation to the goods or services for which registration is requested in consequence of the use which has been made of it.

<sup>23</sup>Paris Convention, 10, Article 6bis(1).

<sup>24</sup>Paris Convention, 10, Article 6bis(2).

<sup>25</sup>Paris Convention, 10, Article 6bis(3).

<sup>26</sup>TRIPS Agreement, 4, Art. 16.2.

<sup>27</sup>See Examples in Blakeney (1994), pp. 481–486.

<sup>28</sup>TRIPS Agreement, 26.

Other factors that will be taken into account in assessing the renown of a trademark are: (1) the registration history of a mark, including its date of first registration in the subject country; (2) the global extent of registration of a mark; (3) findings of repute by trademark offices in opposition hearings and by courts; and (4) the value of a mark as an asset on the books of a company.

### ***5.2.6 Collective and Certification Marks***

A special type of registered trademark is a collective mark, which may be registered by an association whose members may use it if they comply with the requirements fixed in the regulations concerning the use of the collective mark. Thus, the function of the collective mark is to inform the public about certain particular features of the product for which the collective mark is used. An enterprise entitled to use the collective mark may also use its own trademark in addition to the collective mark. In the U.S., collective marks are used by agricultural cooperatives of produce sellers. The collective mark owner is an organization, which does not sell its own goods, or renders services, but instead promotes the goods and services of its members.

Another type of registered trademark is a certification mark, which may only be used in accordance with defined standards. The main difference between collective marks and certification marks is that the former may be used only by particular enterprises, for example, members of the association, which owns the collective mark, while the latter may be used by anybody who complies with the defined standards. Another important requirement for the registration of a certification mark is that the entity which applies for registration is “competent to certify” the products concerned. Thus, the owner of a certification mark must be the representative for the products to which the certification mark applies.

In the U.S., agricultural producers typically use collective and certification marks in much the same way as geographical indications are used in Europe. U.S. State governments typically encourage the registration of certification marks to benefit agricultural producers. For example, the certification mark VIDALIA is owned by the State of Georgia’s Department of Agriculture and is “intended to be used by persons authorized by certifier, and . . . in connection with which it is used are yellow Ganex type onions and are grown by authorized growers within the Vidalia onion production area in Georgia as defined in the Georgia Vidalia Onion Act of 1986.”<sup>29</sup> Similarly, FLORIDA CITRUS is owned by the State of Florida’s Department of Citrus and certifies that goods bearing the mark “either consist of citrus fruit grown in the State of Florida, under specified standards, or are processed or manufactured wholly from such citrus fruit.”<sup>30</sup> Non-U.S. agricultural producers

---

<sup>29</sup>U.S. Reg. No. 1,709,019.

<sup>30</sup>U.S. Reg. No. 1,559,414.

also have registered certification marks in the U.S. For example, the Thai Ministry of Commerce of Thailand has registered THAI HOM MALI RICE, “harvested in Thailand per the standards set by the Ministry of Commerce of Thailand in ‘Regulations of the Department of Foreign Trade Re: Usage of the Certification Mark of Thai Hom Mali Rice.’”<sup>31</sup> Similarly, the Tea Board of India has registered DARJEELING to certify, “that the tea contains at least 100 % tea originating in the Darjeeling region of India and that the blend meets other specifications established by the certifier.”<sup>32</sup>

The leading U.S. case involving the enforcement of a geographical indication as a certification mark is *Community of Roquefort v William Faehndrich, Inc.*<sup>33</sup> The case held that the designation “Roquefort” was not a generic designation of blue cheese and that the owner of the certification mark was entitled to prevent the use of the mark on all cheeses not made in the French city of Roquefort.

The system of registered certification marks is a departure from the trademark principle that no one can obtain an exclusive right in geographic names that other traders might legitimately wish to use. In Europe, the preference is for such marks to be registered as geographical indications.

## 5.3 Geographical Indications

### 5.3.1 Introduction

Marks indicating the geographical origins of goods were the earliest types of trademark. Until the commencement of the industrial revolution in the eighteenth century, the principal products entering international trade were agricultural products. In competition to earn revenues from the developing trade, it became apparent that the products of particular regions were more saleable than comparable products from other regions because of their superior quality. This superior quality resulted either from natural geographic advantages, such as climate and geology (e.g. Seville oranges, Kentish hops, Bresse poultry), or from recipes and food processing techniques local to a region (e.g. Roquefort cheese, Parma ham, Burgundy wine, Frankfurter sausages). In each case, the commercial attractiveness of these products was attributable to the traditional knowledge of the local communities. To protect the commercial reputation of these communities, local legislators passed laws to prevent the adulteration of local produce by the addition of inferior introduced goods or ingredients.

The legislation, which sought to protect the commercial reputation of traders in discrete geographical localities, evolved principally in Europe into systems for the

---

<sup>31</sup>U.S. Reg. No. 2,816,123.

<sup>32</sup>U.S. Reg. No. 2,685,923.

<sup>33</sup>*Community of Roquefort v. William Faehndrich, Inc.* 303 F. 2d 494 (Cir. 2,1962).

protection of geographical indications. As demonstrated below, these systems permit products emanating from the region to carry the geographic indication. Producer representatives from those regions police the use of geographic indications.

The evolution of the trademark system at the time of the Industrial Revolution did not result in the disappearance of geographic marks. Particularly in Europe, substantial processed foods markets and markets for alcoholic beverages remain dependent upon the continued recognition of geographical marks. These marks are protected typically within a *sui generis* system for the protection of geographical indications (GIs).

### 5.3.2 Modern GIs Protection

GIs may serve as indications of source, referring to the fact that a product originates in a specific geographical region. However, more frequently a GI is used as a sign that indicates that a product originates in a specific geographic region only when the characteristic qualities of the product are due to the geographical environment. The geographical environment includes both natural and human factors. A GI is a generic description, applicable to all traders in a particular geographic location referring to goods, which emanate from that location. Thus, a GI may be distinguished from a trademark, which is a sign that distinguishes the products of a specific trader from those of its competitors. In comparison to GIs, trademarks are not likely to be descriptive and cannot be generic.

The right to protect a geographical indication from wrongful appropriation is enjoyed by all traders from the particular geographical location, whereas a trademark is protected from wrongful appropriation only by the registered proprietor of that mark. Generally, GIs are monitored and protected by producer associations from the relevant region.

Unlike trademarks, geographical indications are not freely transferrable from one owner to another. This is because a user of a GI must have the appropriate association with the geographical region and must comply with the production practices of that region. GIs are obtained through registration. Typically, a specification is filed indicating the relevant geographical area and the product quality characteristics attributable to that area. A body representing the producers of that area usually files the application for registration. This body will also usually be responsible for bringing actions against wrongful users of the GI.

Geographical indications are becoming increasingly relevant for food marketing.<sup>34</sup> A study undertaken for the European Commission) estimated the worldwide sales value of products sold under geographical indications registered in the EU at

---

<sup>34</sup>Echols (2008); Anders and Caswell (2009), pp. 77–93; Bramley and Bienabe (2012), pp. 14–37.

€54.3 billion in 2010 and marked increases of 12 % between 2005 and 2010.<sup>35</sup> Some 43 developing countries and LDCs depend on exports of a single agricultural commodity for more than 20 % of their total revenues from merchandise exports. For example, Benin depends on cotton for over 80 % of its merchandise exports earnings. Ethiopia relies on coffee for over 70 % of agricultural exports.<sup>36</sup> The use of geographical indications, sometimes together with “fair trade” trademarking, could assist developing countries in their ability to market their food products in international trade and to support the sustainability of their agriculture.

A number of case studies of European food products have indicated that premium prices may be charged when a GI is used. For example, Bresse poultry in France receives quadruple the commodity price of poultry meat. Italian “Toscana” oil gains a 20 % premium above commodity oil; and milk supplied to produce French Comté cheese sells for a 10 % premium.<sup>37</sup> A case study of Comté cheese in France has indicated that French farmers receive an average of 14 % more for milk destined for Comté and that dairy farms in the Comté area have become more profitable since 1990, and now are 32 % more profitable than similar farms outside the Comté area. The retail price of Comté has risen by 2.5 % per year (against 0.5 % for Emmental), while the wholesale price has risen by 1.5 % a year (no change for Emmental).<sup>38</sup> In another example, the GI protection of ‘Lentilles vertes du Puy’ is said to have increased the production of lentils from 13,600 quintals in 1990, to 34,000 quintals in 1996, and 49,776 quintals in 2002 and reported that the number of producers has almost tripled from 395 in 1990, to 750 in 1996, and 1079 in 2002.<sup>39</sup>

However, some studies surrounding the designation of origin labelling have produced results indicating that consumers do not value the quality signal provided by the PDO label. For example, it was observed that at the same price, only a small proportion of consumers would prefer to buy a similar Camembert brand with a Protected Designation of Origin (PDO) label than without it. They noted that brand appeared to be more relevant information in the consumer’s valuation of available products.<sup>40</sup>

There are fewer studies of premium prices for origin products outside Europe. However, some studies do exist, such as examples of the use of origin brands (certification marks in the Peoples Republic of China). The price of “Zhangqiu Scallion” per kilogram was raised from 0.2 to 0.6 yuan before the use of the

<sup>40</sup>Bonnet and Simioni (2001), pp. 433–449.

certification mark to 1.2–5 yuan in 2009. “Jianlian” lotus seed was registered as a GI in 2006, leading to a rise in price from 26–28 yuan per kilogram to 32–34 yuan per kilogram.<sup>41</sup>

## 5.4 Paris Convention for the Protection of Industrial Property, 1883

### 5.4.1 *Scope*

Article 2(3) of the Paris Convention provides that “industrial property shall be understood in the broadest sense and shall apply not only to industry and commerce proper, but likewise to agricultural and extractive industries and to all manufactured or natural products, for example, wines, grain, tobacco leaf, fruit, cattle, minerals, mineral waters, beer, flowers, and flour.”<sup>42</sup>

### 5.4.2 *Seizure of Goods Bearing a False Indication of Source*

Article 9(1) of the Paris Convention provides for the seizure, upon importation, of all goods unlawfully bearing a legally protected “trademark or trade name”. Article 9(3) provides that “seizure shall take place at the request of the public prosecutor, or any other competent authority, or any interested party, whether a natural person or a legal entity, in conformity with the domestic legislation of each country.”

Article 10(1) provides for the application of the provisions of Article 9 “in cases of direct or indirect use of a false indication of the source of the goods or the identity of the producer, manufacturer or merchant.” Unlike Article 9(1), which catches misleading indications, Article 10(1) requires the indications to be factually false and specifies that the indications may not be misleading. Although the provision only speaks of “indications of source,” it is understood that it includes “appellations of origin,” as referred to in Article 1(2).<sup>43</sup> As Article 10(1) refers to any direct or indirect use of a false identification, the false indication does not have to be expressed in words and appear on the product. Therefore, Article 10(1) includes the use of a false indication in advertising or on business documents.

The only sanction referred to in Article 10(1) is the seizure of the goods concerned, but no further civil or criminal sanctions are envisaged. Additionally, the obligation to seize goods on importation only applies to the extent that such a measure has been adopted under national law. Under Article 10(2), any

<sup>41</sup>Kireeva et al. (2009).

<sup>42</sup>Paris Convention, 10, Article 2(3).

<sup>43</sup>Pfüger (2011).

... producer, manufacturer, or merchant whether a natural person or legal entity, engaged in the production or manufacture of or trade in such goods and established either in the locality falsely indicated as the source, or in the region where such locality is situated, or in the country falsely indicated, or in the country where the false indication of source is used, shall in any case be deemed an interested party.

Therefore, any person engaged in the production, manufacturing, or trade of a protected good may bring suit to enforce Articles 9 and 10 of the Paris Convention.

## 5.5 Repression of Unfair Competition

Article 10*bis* also affords protection against false or misleading indications of source as a means of repressing unfair competition. Article 10*bis* (2) defined an act of unfair competition as “any act of competition contrary to honest practices in industrial or commercial matters.”<sup>44</sup> In its various trademarks determinations, the European Court of Justice (ECJ) has observed that the requirement to act in accordance with honest practices in industrial or commercial matters “constitutes in substance the expression of a duty to act fairly in relation to the legitimate interests of the trademark proprietor.”<sup>45</sup>

### 5.5.1 *Madrid Agreement for the Repression of False or Deceptive Indications of Source of Goods, 1891*

#### 5.5.1.1 Seizure of Goods Bearing a False or Misleading Indication

The original form of Paris Convention prohibited the use of false geographical indications. However, a number of signatory nations proposed a more comprehensive form of regulation for false geographical indicators, as it was considered significant intellectual property abuse. Their eventual response was the 1891 Madrid Agreement concerning the protection of geographical indications. Article 1(1) of the Madrid Agreement provided that all goods “bearing a false or misleading indication” to signatory country, or to a place in that country “shall be seized on importation.” Article 1(2) also provided for seizure “in the country where the false or deceptive indication of source has been applied, or into which the goods bearing the false or deceptive indication have been imported.” Where the laws of a country

<sup>44</sup>Paris Convention, 10, Article 10*bis*.

<sup>45</sup>See Case C-63/97 *Bayerische Motorenwerke AG v Deenik* (1999) ECR I-905 at 61; Case C-100/02 *Gerolsteiner Brunnen GmbH & Co v Putsch GmbH* (2004) ECR I-691 at 24; Case C-245/02 *Anheuser-Busch Inc v Budejovicky Budvar np* (2004) I-10989 at 82, Case 228/03 *Gillette Co v LA-Laboratories Ltd Oy* (2005) ECR I-2337 at 41; and Case C-17/06 *Céline SARL v Céline SA* (2007) ECR I-7041 at 33.

do not permit seizure upon importation, Article 1(3) provides that such seizure shall be replaced by prohibition of importation. In the absence of any special sanctions ensuring the repression of false or deceptive indications of source, Article 1(5) provides that, “the sanctions provided by the corresponding provisions of the laws relating to marks or trade names shall be applicable.”<sup>46</sup>

Article 2(1) provides that seizure shall take place at the insistence of the customs authorities. The customs authorities shall immediately inform the interested party, whether an individual person or a legal entity, in order that such desiring party may take appropriate steps in connection with the seizure effected as a conservatory measure. However, the public prosecutor or any other competent authority may demand seizure either at the request of the injured party or *ex officio*; the procedure shall then follow its normal course. Goods in transit are excluded from seizure by Article 2(2).<sup>47</sup>

### 5.5.1.2 Prohibited Use of Deceptive Indications in Advertising Etc

Article 3*bis* provides that signatory countries will undertake to prohibit the use, in connection with the sale or display or offering for sale of any goods, of all indications in the nature of publicity capable of deceiving the public as to the source of the goods. This includes indications and displays appearing on signs, advertisements, invoices, wine lists, business letters or papers, or any other commercial communication.<sup>48</sup>

### 5.5.1.3 Exception of Indications of Name and Address

Article 3 provides that the Madrid provisions shall not prevent the vendor from indicating his name or address upon goods coming from a country other than that in which the sale takes place. However, in such cases the address or the name must be accompanied in clear characters by an exact indication of the country or place of manufacture or production, or by some other indication sufficient to avoid any error as to the true source of the wares.<sup>49</sup>

<sup>48</sup>Madrid Agreement, 46, Art. 3*bis*.

<sup>49</sup>Madrid Agreement, 46, Art. 3.

#### 5.5.1.4 Generic Indications

Article 4 permitted the courts of each signatory to decide what appellations do not fall within the provision of the Agreement on account of their generic character. However, Article 4 also excluded from reservation regional appellations concerning the source of products of the vine.<sup>50</sup> This provision has been noted as the explanation of why the Agreement failed to attract the accession of significant trading nations such as the U.S., Germany and Italy.

### 5.5.2 *International Convention on the Use of Appellations of Origin and Denominations of Cheeses (“Stresa Convention”), 1951*

The parties to the International Convention on the Use of Appellations of Origin and Denominations of Cheeses<sup>51</sup> (Stresa Convention) included the major cheese producing countries of Europe.<sup>52</sup> At the 1951 Stresa Convention, the countries “pledge[d] themselves to prohibit and repress within their respective territorial confines the use, in the language of the state or in a foreign language, of the ‘appellations d’origine,’ denominations and designations of cheeses contrary to the principles stated in Articles 2–9 inclusive.” The Convention, which entered into force on September 1, 1953, applies to all specifications, which constitute false information as to the origin, variety, nature or specific qualities of cheeses, which are stated on products, which might be confused with cheese. The term “cheese,” according to Article 2.1 of the Convention is reserved for “fresh and matured products obtained by draining after the coagulation of milk, cream, skimmed or partially skimmed milk or a combination of these,” or by “products obtained by the partial concentration of whey, or of buttermilk, but excluding the addition of any fatty matter to milk.”<sup>53</sup>

Article 3 provides that the appellations of origin of those cheeses “manufactured or matured in traditional regions, by virtue of local, loyal and uninterrupted usages” which are listed in Annex A are exclusively reserved to those cheeses. This is true regardless as to “whether they are used alone or accompanied by a qualifying or even corrective term such as ‘type,’ ‘kind,’ ‘imitation,’ or other term.”<sup>54</sup> Annex A

<sup>50</sup>Madrid Agreement, 46, Art. 4.

<sup>51</sup>International Convention on the Use of Appellations of Origin and Denominations of Cheeses (Stresa Convention) (1951).

<sup>52</sup>The Stresa Convention was ratified by Austria (June 12, 1953); Denmark (August 2, 1953); France (May 20, 1952); Netherlands (October 29, 1955); Norway (August 31, 1951); Sweden (January 27, 1951) and Switzerland (June 5, 1951).

<sup>53</sup>Stresa Convention, 51, Art. 2.

<sup>54</sup>Stresa Convention, 51, Art. 3.

lists: Gorgonzola, Parmigiana Romano, Pecorino Romano and Roquefort. Annex B lists a number of designations for cheese, which are prohibited by article 4.2 for products, which do not meet the requirements, provided by contracting parties in relation to “shape, weight, size, type and colour of the rind and curd, as well as the fat content of the cheese.” Listed in Annex B are Asiago, Camembert, Cambozola, Danablu, Edam, Emmental, Esrom, Fiore Sardo, Fontina, Gruyère, Pinnzgauer Berkäse, Samsöe, and Svecia.<sup>55</sup>

The Stresa Convention came into force prior to the EEC Treaty and its regime providing for the free movement of goods.

### ***5.5.3 Lisbon Agreement for the Protection of Appellations of Origin and their Registration, 1958***

#### **5.5.3.1 Introduction**

The Lisbon Agreement established an international system of registration and protection of appellations of origin among members of the Lisbon Union that comprised signatory states. Article 1(2) obliged parties to the Lisbon Agreement to protect on their territories “the appellations of origin of products” of signatory countries, “recognized and protected as such in the country of origin” and registered at the International Bureau of WIPO.<sup>56</sup> Article 4 of the Agreement provides that the Agreement does not exclude the protection already granted to appellations of origin in each of the countries of the Lisbon Union by virtue of other international instruments, such as the Paris and the Madrid Agreement for the Repression of False or Deceptive Indications of Source on Goods, “or by virtue of national legislation or court decisions.”<sup>57</sup>

The Lisbon Agreement failed to attract support from more than a few nations, receiving only 28 signatories by September 2013. An examination of all current appellations on the Lisbon register reveals that 11 countries hold 97.5 % of all entries, with the top 3 holding over 78 %. France alone holds 62.5 % (almost 90 % of which were for wines and spirits).<sup>58</sup> One problem lay in the fact that accession was confined to those nations, which protected appellations of origin “as such.” Thus, states, which protected the appellation of origin form of intellectual property under trademark, unfair competition, or consumer protection laws, were locked out.

---

<sup>55</sup>Stresa Convention, 51, Annex A and B.

<sup>56</sup>Lisbon Agreement for the Protection of Appellations of Origin and their International Registration (Lisbon Agreement) (Oct. 31, 1958). Art. 1(2), available at [www.wipo.int/treaties/en/text.jsp?file\\_id=285856](http://www.wipo.int/treaties/en/text.jsp?file_id=285856).

<sup>57</sup>Lisbon Agreement, 56, Art. 4.

<sup>58</sup>Gervais (2010), pp. 67–126.

Also, the Agreement did not make an exception for geographic indications, which had already become generic in member states.

### 5.5.3.2 Protected Indications

Article 2(1) of the Agreement defined “appellation of origin” to mean “the geographical name of a country, region, or locality, which serves to designate a product originating therein, the quality and characteristics of which are due exclusively or essentially to the geographical environment, including natural and human factors.”<sup>59</sup> The country of origin is defined in Art. 2(2) as “the country whose name, or the country in which is situated the region or locality whose name, constitutes the appellation of origin which has given the product its reputation.”<sup>60</sup> Thus, the Agreement protects appellation of origin designations based on geographical indicators of quality and reputation.

### 5.5.3.3 Breadth of Protection

Article 3 of the Lisbon Agreement requires that “[p]rotection shall be ensured against any usurpation or imitation, even if the true origin of the product is indicated or if the appellation is used in translated form or accompanied by terms such as ‘kind ‘type,’ ‘make,’ ‘imitation,’ or the like.” As will be seen below, this language was included in Article 23 of the TRIPS Agreement to provide for additional protection for wines and spirits. The Acts of the Lisbon Conference define usurpation as the “illicit adoption” or counterfeiting of an appellation.<sup>61</sup>

### 5.5.3.4 Registration

Article 5(1) provided for the registration of appellations of origin at the International Bureau of WIPO, at the request of the IP offices of the countries of the Lisbon Union, “in the name of any natural persons or legal entities, public or private, having, according to their national legislation, a right to use such appellations.” Thus international protection is based upon the existence of a national registration. Article 5(2) requires the International Bureau, to notify, without delay, the relevant offices of the various countries of the Lisbon Union of such registrations and to be publishing such registrations in a periodical.<sup>62</sup>

---

<sup>59</sup>Lisbon Agreement, 57, Art. 2(1).

<sup>60</sup>Id. at Art. 2(2).

<sup>61</sup>*Actes De La Conference Reunie A Lisbonne Du 6 Au 31 Octobre 1958* BIRPI, Geneva, 1963.

<sup>62</sup>Lisbon Agreement, 57, Art. 5(1)-(2).

Article 5(3) provides for an IP office of a member country to “declare that it cannot ensure the protection of an appellation of origin whose registration has been notified to it.” This notification must be made within a period of 1 year from the receipt of the notification or registration to the International Bureau of WIPO and must contain an indication of the grounds therefor. The declaration will be upheld “provided that such declaration is not detrimental, in the country concerned, to the other forms of protection of the appellation which the owner thereof may be entitled to claim under Article 4.”<sup>63</sup> Article 5(4) provides that the Offices of the countries of the Union may not oppose such declaration after the expiration of the 1-year period from receipt of the notification.<sup>64</sup> Article 5(5) requires the International Bureau of WIPO to notify the office of the country of origin as soon as possible of any declaration made Article 5(3) by the office of another country. Article 5(5) provides that “the interested party,” when informed by the national office of the declaration made by another country, “may resort, in that other country, to all the judicial and administrative remedies open to the nationals of that country.”<sup>65</sup> The Lisbon Agreement does not define what is meant by “interested party,” although Article 8 envisages that legal action required for ensuring the protection of appellations of origin may be taken in each of the countries of the Lisbon Union “by any interested party, whether a natural person or a legal entity, whether public or private.”<sup>66</sup>

Where an appellation, which has been granted protection in a given country pursuant to notification of its international registration, has already been used by third parties in that country from a date prior to such notification, Article 5(6) provides that the competent office of that country “shall have the right to grant to such third parties a period not exceeding 2 years to terminate such use.” The country granting such extended time must advise the International Bureau accordingly during the 3 months, following the expiration of the period of 1 year provided for in Art. 5(3).<sup>67</sup>

### 5.5.3.5 Duration of Protection

The Lisbon Agreement does not clearly define the duration of protection of a registered appellation of origin. Article 7, which is sub-headed “Period of Validity,” provides “(1) Registration affected at the International Bureau in conformity with Article 5 shall ensure, without renewal, protection for the whole of the period referred to in the foregoing Article.” Yet Article 5 makes no specific reference to a time period for protection. Its only reference to time periods relates to the process of declaring that certain appellations cannot be protected. However, since Article 7

---

<sup>63</sup>Id. at Art. 5(3).

<sup>64</sup>Id. at Art. 5(4).

<sup>65</sup>Id. at Art. 5(3)-(5).

<sup>66</sup>Id. at Art. 8.

<sup>67</sup>Id. at Art. 5(6).

(1) refers to an absence of renewals, it is assumed that an appellation is protected for as long as it remains an appellation in the relevant country of origin.<sup>68</sup>

### 5.5.3.6 Generic Appellations

Article 6 provides that an appellation which has been granted protection in one of the countries of the Lisbon Union, pursuant to the procedure under Article 5, cannot be deemed to have become generic in that country as long as it is protected as an appellation of origin in the country of origin.<sup>69</sup>

### 5.5.3.7 Enforcement

Article 8 of the Lisbon Agreement provides that legal action required for ensuring the protection of appellations of origin may be taken in each of the countries of the Lisbon Union under the provisions of national legislation:

1. At the instance of the competent Office or at the request of the public prosecutor; or
2. By any interested party, whether a natural person or a legal entity, whether public or private.<sup>70</sup>

## 5.6 The WTO TRIPS Agreement

The protection of geographic indications was a key demand of European negotiators at the Uruguay Round of the GATT. The competing positions were those of the EU and Switzerland, which proposed a French-style of protection, and those of the U.S., which favoured the protection of geographic indications through a certification mark system. As a result of the competing views, Section 3 of Part VII of the TRIPS Agreement covers four main topics: (a) protection of geographical indications (b) geographical indications and trademarks; (c) additional protection for geographical indications for wines and spirits; and (d) Review of Section 3. These topics are examined together below with an account of geographical indications disputes under the TRIPS Agreement.

---

<sup>68</sup>Id. at Art. 5 and 7.

<sup>69</sup>Id. at Art. 6.

<sup>70</sup>Id. at Art. 8

### 5.6.1 *Definition*

Article 22.1 of the TRIPS Agreement defines geographical indications for the purposes of the Agreement as “. . . indications which identify a good as originating in the territory of a Member, or a region or locality in that territory, where a given quality, reputation or other characteristic of the good is essentially attributable to its geographical origin.”<sup>71</sup> This definition expands the Lisbon Agreement concept of appellation of origin to protect goods, which merely derive a reputation from their place of origin without possessing a given quality, or other characteristics, which is due to that place.<sup>72</sup>

In its only determinations to date on geographical indications under the TRIPS Agreement the WTO Dispute ruled that a “designation of origin” and “geographical indication,” as defined in EC legislation in different terms, were a subset of geographical indications as defined in Article 22.1.<sup>73</sup> Thus, the TRIPS definition permits Members of the WTO to protect the geographical indications of goods where the quality, reputation, or other characteristic of goods is attributable to their geographical origin.

### 5.6.2 *Permitted Methods for the Protection of Geographical Indications*

Article 22.2 of the TRIPS Agreement requires that “in respect of geographical indications,” Members of the WTO shall provide the “legal means” for “interested parties” to prevent:

- (a) the use of any means in the designation or presentation of a good that indicates or suggests that the good in question originates in a geographical area other than the true Place of origin in a manner, which misleads the public as to the geographical origin of the good;
- (b) any use which constitutes an act of unfair competition within the meaning of Article 10*bis* of the Paris Convention (1967).<sup>74</sup>

<sup>71</sup>TRIPS Agreement, 4, Art. 22.1.

<sup>72</sup>Blakeney, Michael. Geographical Indications and TRIPS. University of Western Australia – Faculty of Law Research Paper No. 2012-09.

<sup>73</sup>European Communities – Protection of Trademarks and Geographical Indications for Agricultural Products and Foodstuffs, Complaint by the United States, Report of the Panel (“*Panel Report, EC-Trademarks and Geographical Indications (US)*”), WT/DS174/R, March 15, 2005, para. 7.738; European Communities-Protection of Trademarks and Geographical Indications for Agricultural Products and Foodstuffs, Complaint by Australia, Report of the Panel (hereinafter “*Panel Report, EC-Trademarks and Geographical Indications (Australia)*”), WT/DS290/R March 15, 2005, para. 7.711.

<sup>74</sup>TRIPS Agreement, 10, Art. 22.2.

### 5.6.3 “Interested Parties”

In *EC-Trademarks and Geographical Indications (US)* the Panel explained that the obligation in [Article 22.2](#) is to provide certain legal means to “interested parties” who are nationals of other Members in accordance with the criteria referred to in [Article 1.3](#). The interested parties must qualify as “nationals of other Members,” in accordance with the criteria referred to in [Article 1.3](#). The Panel pointed out that these persons can be private parties, which is reflected in the fourth recital of the preamble to the agreement and reads “[r]ecognizing that intellectual property rights are private rights”.<sup>75</sup>

Although the term “interested party” is also used in [Article 10\(2\) of the Paris Convention \(1967\)](#), as incorporated in the TRIPS Agreement, by Article 2(1) of the TRIPS Agreement, in *EC-Trademarks and Geographical Indications (US)*, the Panel observed that [Article 10\(2\) of the Paris Convention \(1967\)](#) did not set out a criterion of eligibility for protection for the purposes of the TRIPS Agreement. Article 10(2) of the Paris Convention did however provide guidance on the interpretation of [Articles 22 and 23 of the TRIPS Agreement](#).<sup>76</sup>

### 5.6.4 *Non-Diminution of Geographical Indications Protection*

Article 24.3 of the TRIPS Agreement requires that in implementing the geographical indications provisions, a WTO Member shall not diminish the protection of geographical indications that existed in that Member immediately prior to the date of entry into force of the WTO Agreement.<sup>77</sup>

In *EC-Trademarks and Geographical Indications* the Panel found that the scope of [Article 24.3](#) was limited to the implementation of Section 3 of Part II of the TRIPS Agreement on geographical indications, and did not apply to the implementation of Section 2 of Part II on trademarks.<sup>78</sup> The Panel interpreted the phrase “the protection of geographical indications that existed in that Member immediately prior to the date of entry into force of the WTO Agreement” to mean the state of protection of individual geographical indications immediately prior to January 1, 1995.<sup>79</sup>

<sup>75</sup>Panel Report, *EC-Trademarks and Geographical Indications (US)*, 73 at paras. 7.742–7.743.

<sup>76</sup>Id. at para. 7.170.

<sup>77</sup>TRIPS Agreement, 10, Art. 24.3.

<sup>78</sup>Panel Reports, *EC-Trademarks and Geographical Indications (US)*, 73 at paras. 7.631–7.632, and (*Australia*) paras. 7.631–7.632.

<sup>79</sup>Id. at para. 7.636, and (*Australia*), para. 7.636.

### 5.6.5 *Geographical Indications and Trademarks*

The geographical indications provisions of the TRIPS Agreement sought to reconcile the two existing systems of protection for geographical indications: on one hand recognizing the novelty of geographical indications protections, and on the other the long-standing protection of registered trademarks. In *EC-Trademarks and Geographical Indications* the Panel recognized that the rights provided for in Article 22.2 and Article 16.1, concerned with trademark protection, could lead to a conflict between private parties. Notably, they considered that the treaty provisions themselves did not conflict.<sup>80</sup>

Article 22.3 of the TRIPS Agreement provides for *ex officio* action by a WTO Member. Additionally, if its legislation permits, *ex officio* action at the request of an interested party, to refuse or invalidate the registration of a trademark which contains or consists of a geographical indication with respect to goods not originating in the territory indicated, if use of the indication in the trademark for such goods in that Member is of such a nature as to mislead the public as to the true place of origin. In *EC-Trademarks and Geographical Indications* the Panel confined Article 22.3 to the resolution of conflicts between geographical indications and later trademarks, but not prior trademarks.<sup>81</sup>

Additionally, Article 22.4 provides that the protection under paragraphs 1, 2 and 3 of Article 22 shall be applicable against a geographical indication, which, although literally true as to the territory, region or locality in which the goods originate falsely represents to the public that the goods originate in another territory.<sup>82</sup>

Cognizant of the fact that for most countries the protection of geographical indications will be an innovation, Article 24.4 exempts from this form of protection trademarks which have been “applied for or registered in good faith,” or where the rights to the trademark “have been acquired through use in good faith” either before the implementation of the TRIPS provisions, or before the geographical indication is protected in its country of origin.<sup>83</sup>

Article 24.5 provides that in a situation where a trademark has been applied for or registered in good faith, or where rights to a trademark have been acquired through use in good faith either: (a) before the date of application of these provisions in that Member as defined in Part VI; or (b) before the geographical indication is protected in its country of origin; measures adopted to implement the geographical indications provisions contained in Section 3 of the TRIPS Agreement shall not prejudice eligibility for or the validity of the registration of a trademark, or the right to use a trademark, “on the basis that such a trademark is identical with, or similar to, a geographical indication.”<sup>84</sup>

<sup>80</sup>Id. at paras. 7.623–7.624, and (*Australia*), paras. 7.623–7.624.

<sup>81</sup>Id. at para. 7.622, and (*Australia*), para. 7.622.

<sup>82</sup>TRIPS Agreement, 10, Art. 22.4.

<sup>83</sup>Id. at Art. 24.4.

<sup>84</sup>Id. at Art. 24.5.

In *EC-Trademarks and Geographical Indications* the Panel interpreted Article 24.5 as an exception to geographical indications protection, and rejected arguments that it impliedly limited trademark rights or impliedly preserved any trademark rights that it does not specifically mention.<sup>85</sup>

Article 24.7 provides that a Member may provide that any request made under the section in connection with the use or registration of a trademark must be presented within 5 years after the adverse use of the protected indication has become generally known in that Member, or after the date of registration of that trademark, provided the registration has been published and “provided that the geographical indication is not used or registered in bad faith.” Similar to the analogous provision in most trademark laws, Article 24.7 preserves “the right of a person to use, in the course of trade, that person’s name or the name of that person’s predecessor in business, except where such name is used in such a manner as to mislead the public.”<sup>86</sup>

### ***5.6.6 Use of Terms Common in the Trade***

Article 24.6 provides that nothing contained in Section 3 of the TRIPS Agreement, containing the geographical indications provisions, shall require a WTO Member to apply its provisions in respect of a geographical indication to any other Member. The provision applies to goods or services for which the relevant indication is identical with the term customary in common language as the common name for such goods or services in the territory of that Member.<sup>87</sup>

### ***5.6.7 Additional Protection for Geographical Indications for Wines and Spirits***

In addition to the general protection for geographical indications for wines and spirits contained in Article 22, Article 23 accords further protection to geographical indications for wines and spirits. Article 2.1 provides that

Each Member shall provide the legal means for interested parties to prevent use of a geographical indication identifying wines for wines not originating in the place indicated by the geographical indication in question or identifying spirits for spirits not originating in the place indicated by the geographical indication in question, even where the true origin of

---

<sup>85</sup>Panel Reports, *EC-Trademarks and Geographical Indications (US)*, 73 at para. 7.609 and (*Australia*) para. 7.609.

<sup>86</sup>TRIPS Agreement, 10, Art. 24.7.

<sup>87</sup>Id. at Art. 24.6.

the goods is indicated or the geographical indication is used in translation or accompanied by expressions such as “kind”, “type”, “style”, “imitation” or the like.<sup>88</sup>

Article 23.2 provides that the registration of a trademark for wines or spirits which contains or consists of a geographical indication “shall be refused or invalidated, *ex officio* if a Member’s legislation so permits or at the request of an interested party, with respect to such wines or spirits not having this origin.”<sup>89</sup>

### 5.6.8 Multilateral System

Article 23.4 provides that to facilitate the protection of geographical indications for wines, negotiations shall be undertaken in the Council for TRIPS concerning the establishment of a multilateral system of notification and registration of geographical indications for wines eligible for protection in those Members participating in the system.<sup>90</sup> Preliminary work was initiated at the Council’s meeting in February 1997.<sup>91</sup> Paragraph 18 of the Doha Ministerial Declaration, adopted on November 14, 2001, provided that

[w]ith a view to completing the work started in the Council for Trade-Related Aspects of Intellectual Property Rights (Council for TRIPS) on the implementation of Article 23.4, we agree to negotiate the establishment of a multilateral system of notification and registration of geographical indications for wines and spirits by the Fifth Session of the Ministerial Conference.<sup>92</sup>

Article 24.1 of the TRIPS Agreement provides that WTO Members “agree to enter into negotiations aimed at increasing the protection of individual geographical indications under Article 23.”<sup>93</sup> In addition, Article 24.2 contains a general obligation for the Council for TRIPS to keep under review the application of the provisions of Section 3 of the TRIPS Agreement, which contains its geographical indications chapter, and that “the first such review shall take place within 2 years of the entry into force of the WTO Agreement.”<sup>94</sup>

As will be seen below, there has occasionally been confusion between the negotiations for a multilateral system for wines and spirits and between the general reviews of the geographical indications provisions. The general review of the provisions includes the possibility of extending the protection conferred upon wines and spirits to other products including food products.

---

<sup>88</sup>Id. at Art. 23.1.

<sup>89</sup>Id. at Art 23.2.

<sup>90</sup>Id. at Art. 23.4.

<sup>91</sup>Council for Trade-Related Aspects of Intellectual Property Rights, (TRIPS Council) Minutes of Meeting, Centre William Rappard, IP/C/M/12 (Feb. 27, 1997).

<sup>92</sup>Doha Ministerial Declaration, (Nov. 14, 2001) WT/MIN(01)/DEC/1, para. 18.

<sup>93</sup>TRIPS Agreement, 4, Art. 24.1.

<sup>94</sup>TRIPS Agreement, 4, Art. 24.2.

In June 2005, the EC submitted a proposal to amend the TRIPS Agreement to provide global protection for GIs in a multilateral system of registration. This proposal sought to bring international protection for GIs into conformity with the European Union. The EC submission set out provisions for a centralized register that would be compulsory and have legal effect.<sup>95</sup> The EC proposal aimed at preserving each WTO Member's prerogative to determine whether a certain sign, indication, or geographical name met the TRIPS definition of a geographical indication.<sup>96</sup> Opponents of the EC proposal included the U.S., Australia, Argentina, Australia, Canada, Chile, Ecuador, El Salvador and New Zealand. These countries opposed the extension of GIs protection, taking the position that the international protection of GIs was adequate as it stands, and such a drastic development would only serve to undermine future gains in market access for non-European food and agricultural products.<sup>97</sup> Concern has also been expressed about the additional costs and administrative burdens of implementing a distinct system of GI protection in addition to the TRIPS obligations. The opposing countries instead advocated for a system of voluntary notification and registration with no obligation to protect registered GI's.

## 5.7 The TRIPS Revision

Article 24.1 of the TRIPS Agreement provides that WTO Members "agree to enter into negotiations aimed at increasing the protection of individual geographical indications under Article 23." It also provides that the provisions of paragraphs four through eight of Article 24 "shall not be used by a Member to refuse to conduct negotiations or to conclude bilateral or multilateral agreements." It concludes with the observation that in the context of such negotiations, "Members shall be willing to consider the continued applicability of these provisions to individual geographical indications whose use was the subject of such negotiations."<sup>98</sup> Article 24.2 requires the Council for TRIPS to keep under review the application of the provisions of Section 3, containing the geographical indications provisions, and that the first such review shall take place within 2 years of the entry into force of the WTO Agreement.<sup>99</sup>

---

<sup>95</sup>Communication from the European Communities. The communication, dated, is being circulated to the General Council, to the TNC and to the Special Session of the Council for TRIPS at the request of the Delegation of the European Commission. (TN/IP/W/11) of June 13, 2005. This new proposal maintains the level of ambition of the EC as regards both "extension" and the multilateral register of GIs, as contained in its earlier proposals in documents IP/C/W/107/Rev.1 (on the GI register) and IP/C/W/353 (on "extension").

<sup>96</sup>Paragraph 3.2(a).

<sup>97</sup>See Communication from Argentina, Australia, Canada, Chile, Ecuador, El Salvador, New Zealand and the United States, [TN/IP/W/9, 13 April 2004](#).

<sup>98</sup>TRIPS, Article 24.1.

<sup>99</sup>TRIPS, Article 24.2.

A submission by Turkey on July 9, 1999, prior to the Seattle Ministerial, proposed the extension of the multilateral register to products other than wines and spirits (see footnote 5). The African group of countries endorsed this proposal. On August 6, 1999, a document from Kenya filed on behalf of the African Group noted that at the Singapore Ministerial, Article 23.4 negotiations concerning a multilateral register for wines had been extended to include spirits, and that

Considering that Ministers made no distinction between the two above-mentioned products, the African Group is of the view that the negotiations envisaged under Article 23.4 should be extended to other categories, and requests, in this regard, that the scope of the system of notification and registration be expanded to other products recognizable by their geographical origins (handicrafts, agro-food products).<sup>100</sup>

Paragraph 18 of the Doha Ministerial Declaration, adopted on November 14, 2001, noted “that issues related to the extension of the protection of geographical indications provided for in Article 23 to products other than wines and spirits will be addressed in the Council for TRIPS pursuant to paragraph 12 of this declaration.”<sup>101</sup> In paragraph 39 of the Hong Kong Ministerial Declaration, Ministers *inter alia* “[took] note of the work undertaken by the Director-General in his consultative process on all outstanding implementation issues under paragraph 12 (b) of the Doha Ministerial Declaration, including on issues related to the extension of the protection of geographical indications provided for in Article 23 to products other than wines.”<sup>102</sup>

On June 29, 2001, a joint communication was sent to the TRIPS Council by Argentina, Australia, Canada, Chile, Guatemala, New Zealand, Paraguay and the United States (Joint Communication) in opposition to the proposals for an extension for the protection of GIs for wines and spirits under TRIPS to all products.<sup>103</sup> The Communication argued that the advantages of Article 23 protection was overstated and, relevantly for the current project, that the proposals for the extension of the TRIPS wines and spirits provisions to all products had insufficiently addressed the costs and burdens of this extension. It stated that, “[t]hese new costs and burdens include administration costs, trade implications for producers, increased potential for consumer confusion, potential producer conflicts within the WTO Members and a heightened risk of WTO disputes.”<sup>104</sup>

As was mentioned in the preceding section, in July 2008, a group of WTO members called for a “procedural decision” to negotiate the multilateral register and the extension of Article 23 in parallel, together with a proposal to require patent

applicants to disclose the origin of genetic resources or traditional knowledge used in their inventions.<sup>105</sup> In relation to GI-Extension the proposed text was that

1. Members agree to the extension of the protection of Article 23 of the TRIPS Agreement to geographical indications for all products, including the extension of the Register.
2. Text based negotiations shall be undertaken, in Special Sessions of the TRIPS Council and as an integral part of the Single Undertaking, to amend the TRIPS Agreement in order to extend the protection of Article 23 of the TRIPS Agreement to geographical indications for all products as well as to apply to these the exceptions provided in Article 24 of the TRIPS Agreement *mutatis mutandis*.

On April 19, 2011, a Communication from Albania, China, Croatia, European Union, Georgia, Guinea, Jamaica, Kenya, Liechtenstein, Madagascar, Sri Lanka, Thailand, Turkey and Switzerland proposed that Section 3 of TRIPS be amended by removing the reference to Wines and Spirits in the heading of Article 23 and by deleting all the references to wines and spirits in that Article. The result would render Article 23 applicable to all goods.<sup>106</sup>

On April 21, 2011, WTO Director-General Pascal Lamy circulated a [report](#) on his consultations on geographical indications extension and proposals dealing with the [relationship between the TRIPS Agreement and the Convention on Biological Diversity](#). In relation to extension he described the “state of play” as characterised by “divergent views” and “with no convergence evident on the specific question of extension of Article 23 coverage: some Members continued to argue for extension of Article 23 protection to all products; others maintained that this was undesirable and created unreasonable burdens.”<sup>107</sup> The Director confirmed that trademark systems were legitimate forms of protecting geographical indications, and that they were in line with the general principle that Members are entitled to choose their own means of implementing their TRIPS obligations. On this basis, he reported that extension proponents sought guarantees that the trademark system could and would protect their GIs at the higher level for all goods.<sup>108</sup>

## 5.8 The TRIPS GIs Disputes

A number of WTO Members had argued that the EU scheme for the protection of GIs was TRIPS-deficient in a number of areas. For example, the statement of the U.S. to the WTO on the WTO trade policy review of the EU expressed the concern that “foreign persons wishing to obtain protection for their GIs in the EU itself face a non-transparent process that appears to come into some conflict with the EU’s TRIPS obligations,” and that “EU rulemaking processes are often perceived by third countries as exclusionary, allowing no meaningful opportunity for non-EU parties to influence the outcome of regulatory decisions”.<sup>109</sup> On June 1, 1999, the U.S. requested consultations with the European Communities pursuant to Article 4 of the *Understanding on Rules and Procedures Governing the Settlement of Disputes* (DSU) and Article 64 of the TRIPS Agreement regarding EC Council Regulation (EEC) No 2081/92 of July 14, 1992, on the protection of geographical indications and designations of origin for agricultural products and foodstuffs. The U.S. and the EC held consultations on July 9, 1999, and thereafter, but have thus far failed to resolve the dispute.

On the August 18, 2003, the U.S. and Australia requested the establishment of a WTO dispute settlement panel to review the consistency of the EU Regulation 2081/92 with the rules of the TRIPS and GATT Agreements. The U.S. and Australia argued that the EC Regulation was discriminatory and in violation of the national treatment obligations and the most-favoured-nation obligations in Articles 3 and 4 of the TRIPS Agreement and Articles 1 and 3 of the GATT 1994. The U.S. and Australia argued that: (1) Regulation 2081/92 did not provide the same treatment to other nationals and products originating outside the EC that it provided to the EC’s own nationals and products; (2) the EU did not accord immediately and unconditionally to the nationals and products of each WTO Member any advantage, favour, privilege or immunity granted to the nationals and products of other WTO Members; (3) the EU diminished the legal protection for trademarks; (4) the EU did not provide legal means for interested parties to prevent the misleading use of a geographical indication; (5) it did not define a geographical indication in a manner that was consistent with the definition provided in the TRIPS Agreement; (6) the EU was not sufficiently transparent in its registration procedures; and (7) did not provide adequate enforcement procedures.<sup>110</sup>

The U.S. and Australia claimed that the EU Regulations imposed two requirements which contravened the national treatment principle contained in Article 2 (2) of the Paris Convention as incorporated by Article 2.1 of the TRIPS Agreement: (1) the requirement that enterprises seeking to register GIs possessed a commercial establishment in the EU; and (2) the requirement that GIs located in the territory of

<sup>109</sup>WTO Trade Policy Review of the European Union, Statement by the United States to the WTO, July 24, 2002.

<sup>110</sup>Evans and Blakeney (2006), available at [www.gaileevans.com/EvansGIsAfterDohaJIEL06.pdf](http://www.gaileevans.com/EvansGIsAfterDohaJIEL06.pdf).

a WTO Member outside the EU could only be registered if that Member had adopted a system for GI protection that was equivalent to that in the European Communities and provided reciprocal protection to products from the European Communities.<sup>111</sup>

The Panel Report in the dispute was adopted at a meeting of the Dispute Settlement Body on April 20, 2005. Concerning the discriminatory conditions regarding the registration of foreign GIs and requirement for reciprocity of protection, the Panel decided in favour of the U.S. and Australia. Pursuant to Article 19.1 of the DSU, the Panel recommended that:

- (a) The European Communities bring the Regulation into conformity with the TRIPS Agreement and GATT 1994.
- (b) The European Communities could implement the above recommendation with respect to the equivalence and reciprocity conditions, by amending the Regulation so as for those conditions not to apply to the procedures for registration of GIs located in other WTO Members.

In an affirmation of the GI as intellectual property, the Panel endorsed the European principle of their coexistence with all but the most famous of prior trademarks. The Panel found that Article 14(2) of the Regulation was a “limited exception” permitted by Article 17 of TRIPS because it only allows use by those producers who are established in the geographical area of products that comply with the specification.

On the critical issue of whether the nationals of other WTO Members were accorded less favourable treatment than the European Communities’ own nationals, the Panel ruled that the conditions in the Regulations modified the effective equality of opportunities to obtain protection with respect to intellectual property in two ways. First, GI protection was not available in respect of geographical areas located in third countries which the Commission had not recognized. It was confirmed that the European Commission had not recognized any third countries. Second, GI protection under the Regulation could become available if the third country in which the GI is located enters into an international agreement with the EU. For the Panel, both of those requirements represented a significant “extra hurdle” in obtaining GI protection, which did not apply to geographical areas located in the European Communities. The significance of the hurdle was reflected in the fact that currently, no third country had entered into such an agreement or satisfied those conditions (see footnote 54). Accordingly, the Panel found that the equivalence and reciprocity conditions modified the effective equality of opportunities with respect to the availability of protection to persons wishing to obtain GI protection under the EU legislation, to the detriment of those wishing to obtain protection in respect of

---

<sup>111</sup>European Communities-Protection of Trademarks and Geographical Indications for Agricultural Products and Foodstuffs. WT/DS174/R (Mar. 15, 2005), available at [www.global-trade-law.com/WTO.Geographical%Indicators%20Case.Conclusions%20\(March%202005\).htm](http://www.global-trade-law.com/WTO.Geographical%Indicators%20Case.Conclusions%20(March%202005).htm).

geographical areas located in third countries, including WTO Members. This was held to be less favourable treatment.<sup>112</sup>

The Panel noted that, while the Regulation did not prevent a foreign national from producing goods within the territory of the European Communities, the different procedures, which applied to foreign nationals compared with those of the E, were perceived as disadvantageous to the nationals of other Members.

## 5.9 TRIPS Enforcement

### 5.9.1 Introduction

Article 41.1 of the TRIPS Agreement imposes upon Members of the WTO a general obligation to make available the enforcement procedures listed in the Agreement “so as to permit effective action against any act of infringement of intellectual property rights [covered by the Agreement].” These procedures are also required to include “expeditious remedies to prevent infringements and remedies which constitute a deterrent to further infringements.” Consistent with the general trade liberalization objectives of the WTO, these procedures are required to be “applied in a manner as to avoid the creation of barriers to legitimate trade and to provide for safeguards against their abuse.”

In amplification of the latter qualifications, Article 41.2 requires that “[p]rocedures concerning the enforcement of intellectual property rights shall be fair and equitable.” More specifically, the paragraph requires that procedures “shall not be unnecessarily complicated or costly, or entail unreasonable time-limits or unwarranted delays.” Article 41.3 requires that “[d]ecisions on the merits of a case shall preferably be in writing and reasoned, and they “shall be made available at least to the parties to the proceeding without undue delay.” Due process is also required by the paragraph, which insists, “[d]ecisions on the merits of a case shall be based only on evidence in respect of which parties were offered the opportunity to be heard.”

Article 41.4 requires an opportunity for judicial review of final administrative decisions and “the legal aspects of initial judicial decisions on the merits of a case”. However, paragraph four provides that there is “no obligation to provide an opportunity for review of acquittals in criminal cases.”<sup>113</sup>

---

<sup>112</sup>CITE.

<sup>113</sup>TRIPS Agreement, 4, Art. 41.1–41.4.

### 5.9.2 *Civil Procedures*

In relation to the intellectual property rights covered by the TRIPS Agreement, Article 42 requires Members to make available civil judicial procedures for the enforcement of those rights to rights holders, including federations and associations having legal standing to assert such rights. This will be important for those geographical indications, which are held or supervised by consortia. Article 42 also requires that these procedures are fair and equitable, in that defendants are entitled to “written notice which is timely and contains sufficient detail, including the basis of the claims.”

Further, Article 42 also requires representation by independent legal counsel. All parties to such procedures “shall be duly entitled to substantiate their claim and to present all relevant evidence,” without the procedures imposing “overly burdensome requirements concerning mandatory personal appearances.” Finally, Article 42 provides that the procedure “shall provide a means to identify and protect confidential information, unless this would be contrary to existing constitutional requirements.”<sup>114</sup>

### 5.9.3 *Discovery and Interrogatories*

As is conventional in civil proceedings in most jurisdictions, Article 43.1 provides for procedures in the nature of discovery and the administration of interrogatories, once a party has “presented reasonably available evidence to support its claims and has specified evidence relevant to substantiation of its claims which lies in the control of the opposing party.” A particularly acute concern in patent actions is that these pre-trial procedures may result in trade secrets being revealed. Article 43.1 provides that the production of evidence may be compelled, “subject in appropriate cases to conditions which ensure the protection of confidential information.”<sup>115</sup> In the UK, a plaintiff is required in these circumstances to show that there are “formidable grounds” for suspicion that the defendant is infringing a plaintiff’s rights.<sup>116</sup> Where there are concerns about the disclosure of trade secrets to a commercial rival, the court may require that an independent expert conduct inspection of discovered evidence.

In the event that a party to a proceeding “voluntarily and without good reason refuses access to, or otherwise does not provide necessary information within a reasonable period, or significantly impedes a procedure relating to an enforcement action,” Article 43.2 permits Members to accord the judicial authorities “the authority to make preliminary and final determinations, affirmative or negative on

---

<sup>114</sup>TRIPS Agreement, 4, Art. 42.

<sup>115</sup>TRIPS Agreement, 4, Art. 43.1.

<sup>116</sup>*Wahl & Anor. v. Buhler-Miag (England) Ltd.* (1979) FSR 183.

the basis of the information presented to them.” This will include “the complaint or the allegation presented by the party adversely affected by the denial of access to information.” Article 43.2 does, however, provide the opportunity for the parties to be heard on the allegations or evidence.<sup>117</sup>

#### 5.9.4 Seizure Orders

Compelling a defendant to respond to interrogatories or requests for discovery presupposes the sort of defendant who may not be typical of the worst sort of infringer of intellectual property rights. For example, in cases where the defendant is conducting clandestine infringement activities on a large scale, the defendant will not usually remain available to answer interrogatories or to discover documents. Indeed, on detection, relevant evidence will immediately be removed or destroyed. To deal with this situation, the English Court of Appeal in *Anton Piller v Manufacturing Processes*<sup>118</sup> approved a procedure whereby on an *ex parte* application *in camera*, an order would be granted to an applicant. This order mandates that the defendant, advised by his legal representative, grant access to the applicant to inspect the defendant’s premises to seize, copy, or photograph material, which may be used as evidence of the alleged infringement. The defendant may be obliged to provide any infringing goods and tooling, and may also be obliged to provide information about sources of supply and destination of infringing products.

Because of the exceptional nature of an *Anton Piller* order and its impact upon an individual’s civil rights, further safeguards have been imposed. After the demonstration that there is a very strong *prima facie* case of infringement, the courts have insisted upon proof that there is a strong possibility that evidence in the possession of a defendant is likely to be destroyed before an application *inter parts* can be made. Additionally, the British courts have insisted upon the safeguards of the attendance upon a search. According to these principles, searches must be conducted during business hours by both parties’ legal representative, and sometimes, must be under the supervision of a neutral supervising solicitor who has experience in the execution of these orders. Refusal to comply with an *Anton Piller* order will result in a contempt of court. On the other hand, the use of the order for abusive purposes may result in the grant of substantial compensation to a defendant.

In the *Anton Piller* case itself, the Court of Appeal predicted that such orders would be extremely rare,<sup>119</sup> however, with the burgeoning of the large-scale copyright piracy and trademark counterfeiting, which precipitated the adoption of trade-related intellectual property rights as a matter for GATT, the use of this procedure has become increasingly common. Infringement of geographical

<sup>118</sup>*Anton Piller v Manufacturing Processes* (1976) RPC 719.

<sup>119</sup>*Id.* at 725 per Ormrod, LJ.

indications rights have not yet attracted the use of *Anton Piller* orders, but with the increase in particular of wine label counterfeiting, such orders may provide a remedy in the future.

The *Anton Piller* order is adopted in the scheme provided in Article 50 of the TRIPS Agreement for the making of “provisional measures” by the judicial authorities.

Article 50.1(b) provides that the judicial authorities shall have the authority “to order prompt and effective provisional measures: to preserve relevant evidence in regard to the alleged infringement.”<sup>120</sup> As with the *Anton Piller* order, Article 50.2 permits the judicial authorities “to adopt provisional measures *inaudita altera parte* where appropriate, where there is a demonstrable risk of evidence being destroyed.”<sup>121</sup> Also the judicial authorities may have authority pursuant to Article 50.3 “to require the applicant to provide any reasonably available evidence in order to satisfy them with a sufficient degree of certainty that the applicant is the right holder,” and that an infringement has occurred or is imminent.<sup>122</sup> Additionally, Article 50.5 provides that to assist the authority, which will enforce the provisional measure, “the applicant may be required to supply other information necessary for the identification of the goods concerned.”<sup>123</sup>

As measures to prevent abuse and to protect a defendant’s rights, Article 50.3 provides for an applicant to be ordered “to provide a security or equivalent assurance” and Article 50.4 provides that where provisional measures have been adopted *inaudita altera parte*, notice must be provided to the affected parties “without delay after the execution of the measures at the latest.” Paragraph 4 also provides for “a review, including a right to be heard” upon the request of the defendant “with a view to deciding, within a reasonable period of notification of the measures” whether they should be “modified, revoked or confirmed.” Additionally, if proceedings leading to a decision on the merits of the case have not been initiated within a reasonable period, Article 50.6 permits the defendant to request the revocation of the provisional measures or for a determination that they cease to have effect.

Similar to the safeguards which have been developed in relation to the *Anton Piller* procedure, Article 50.7 provides for the compensation of a defendant where “the provisional measures are revoked or where they lapse due to any act or omission by the applicant, or where it is found subsequently that there has been no infringement or threat of infringement of an intellectual property right.”<sup>124</sup>

### 5.9.5 Injunctions

Injunctive relief is an important civil remedy for the preservation of intellectual property rights. This is particularly true where infringement may damage or undermine the establishment of a commercial reputation immediately upon the launching of a new product. Similarly, it has marked importance where the widespread counterfeiting of a trademarked product may have the effect of destroying the distinctiveness of a proprietor's mark, thereby rendering the trademark registration voidable. Article 44 permits the conferral of power upon the judicial authorities "to order a party to desist from an infringement, *inter alia*, to prevent the entry into channels of commerce in their jurisdiction of imported goods that involve the infringement of intellectual property rights."

The injunctions which may be granted under Article 44 are grounded upon infringing conduct. Where proof of consumer deception is the central feature of the infringement, the remedy proffered by Article 44 may be rendered nugatory where a sufficient time is required to provide an opportunity for consumers to become deceived.<sup>125</sup> After this has occurred, it would be futile to hope that this deception can be undone. In this circumstance, the provision of interlocutory relief is essential.

### 5.9.6 Interlocutory Injunctions

Article 50.1 provides that the judicial authorities "shall have the authority to order prompt and effective provisional measures. . . (a) to prevent an infringement of any intellectual property right from occurring." The trade-related context of this remedy is emphasised by the supplementary particularization in sub-paragraph (a) that provisional measures may be taken to prevent the entry into the channels of commerce in their jurisdiction of goods including imported goods immediately after customs clearance.

As is mentioned above, a provisional order of particular utility in an intellectual property context is the grant of interlocutory injunctions for the purpose of freezing the status quo until a trial of the merits can take place.

As a matter of practice, the interlocutory injunction, although it is only intended to have a preservative effect, will actually be the basis of the final determination of parties' rights. It is very seldom that after the interlocutory hearing, the defeated party will proceed to the determination of final relief. If an appeal is to be taken, it will usually be on the issue of interlocutory relief. Provision is made in Article 50.6 for a defendant to request that provisional measures be revoked "if proceedings leading to a decision on the merits of the case are not initiated within a reasonable period, to be determined by the judicial authority. Where such a period is not

---

<sup>125</sup>TRIPS Agreement, 4, Art. 44.

determined, Article 50.6 prescribes 20 working days or 31 calendar days, whichever is the longer.<sup>126</sup>

A provisional order, interlocutory, or interim injunction is of particular utility in an IPR enforcement context to freeze the status quo until a trial of the merits can take place. As a matter of practice although these orders are intended to have a preservative effect, for the purpose of avoiding the infliction of uncompensable damage upon a right holder, until the merits can be decided, in most cases the provisional measures will actually be the basis of the final determination of parties' rights. In cases of egregious counterfeiting or piracy, the defendant is not likely to appear to oppose the grant of a provisional order. Even in contested IPR enforcement actions, it is very seldom that after the interlocutory hearing, the defeated party will proceed to the determination of final relief.

In the U.S., to obtain a preliminary injunction the applicant must establish

- (1) irreparable harm and (2) either (a) a likelihood of success on the merits, or (b) sufficiently serious questions going to the merits of its claims to make them fair ground for litigation, plus a balance of the hardships tipping decidedly in [its favor].<sup>127</sup>

The grant of all injunctive relief in common law countries is discretionary. The defendant's conduct is taken into account in disqualifying relief. Even a small delay, without reasonable grounds, in seeking the freezing of the status quo may debar an applicant from relief.

### 5.9.7 *Final Injunctions*

As is mentioned above, it will be usual that interlocutory relief will restrain allegedly infringing conduct. Although the courts are only obliged to ascertain whether there is a serious question to be tried, in practice these cases have begun to approximate final deliberations on the merits. Article 44 permits the judicial authorities 'to order a party to desist from infringement, *inter alia*, to prevent the entry into channels of commerce in their jurisdiction of imported goods that involve the infringement of an intellectual property right'.

The remedy of injunction is usually granted on a discretionary basis. Among the factors considered are whether: (a) damages provides an adequate remedy; (b) the order will require constant supervision by the court; (c) the applicant has engaged in some discrediting conduct, such as its own infringing activity; and (d) the applicant has delayed in seeking its remedy or has acquiesced in the respondent's conduct.

Another discretionary ground which is contained in Article 44 is that Members are not obliged to accord the remedy of injunction 'in respect of protected subject matter acquired or ordered by a person prior to knowing or having reasonable

<sup>126</sup>TRIPS Agreement, 4, Art. 50.6.

<sup>127</sup>*Monserate v. N.Y. State Senate*, 599 F.3d 148, 154 (2d Cir. 2010). *Applied Most Recently In Louboutin v. Yves Saint Laurent America, Inc.*, 778 F.Supp.2d 445 (S.D.N.Y. 2011).

grounds to know that dealing in such subject matter would entail the infringement of an intellectual property right'. It is difficult to see the justification for this qualification and how it will operate in practice.<sup>128</sup> Article 50 permits the grant of provisional measures to prevent an infringement occurring on the application of a single party, where appropriate. A respondent may at that time discover that the products which it has purchased are infringing, but it cannot be enjoined from selling those products under Article 44, since it acquired the knowledge of infringement after the date of the contract of acquisition. Some sense may be made of this qualification by virtue of the fact that the respondent would still be liable to pay damages if it persisted in distributing infringing products.<sup>129</sup>

### 5.9.8 Damages

Article 45.1 provides that the judicial authorities shall have the authority to order 'the infringer to pay the rights holder damages adequate to compensate for the injury...suffered because of an infringement of that persons intellectual property right by an infringer who knowingly, or with reasonable grounds to know, engaged in infringing activity'.

Similarly to Article 13(1) of the Enforcement Directive,<sup>130</sup> Article 45.1 provides that the obligation to pay damages may be imposed only on infringers "*who knowingly or with reasonable grounds to know*" engaged in an infringing activity.<sup>131</sup>

### 5.9.9 Knowledge

Article 45.1 provides for compensation orders against infringers "who knowingly, or with reasonable grounds to know, engaged in infringing activity." A general standard of reasonableness is usually applied to the question of guilty knowledge. The courts have taken the view, for example that a person who copies a new product ought to have inquired whether it was patented.<sup>132</sup> Conventionally, the existence of relevant knowledge is sought to be established by the delivery of a cease and desist letter to an infringer. A continuation of infringing activity after receipt of such a letter is evidence of guilty knowledge.

<sup>128</sup>TRIPS Agreement, 4, Art. 44.

<sup>129</sup>TRIPS Agreement, 4, Art. 55.

<sup>130</sup>Directive 2004/48/EC of 29 April 2004 on the enforcement of intellectual property rights.

<sup>131</sup>TRIPS Agreement, 4, Art. 45.1.

<sup>132</sup>*Lancer Boss Ltd v. Henley Fork lift Co Ltd* (1975 RPC 301).

Article 45.2 permits Members to authorise the judicial authorities ‘to order the recovery of profits and/or payment of pre-established damages even where the infringer did not knowingly, or with reasonable grounds to know, engage in infringing activity’. This sort of remedy is usually ordered in cases of unfair competition or passing off.<sup>133</sup>

### **5.9.10 Other Remedies**

Article 46, under the justification of creating an effective deterrent to infringement, allows Members to empower the judicial authorities “to order that the goods which they have found to be infringing be, without compensation of any sort, disposed of outside the channels of commerce in such a manner as to avoid any harm caused to the rights holder.” Alternatively, where existing constitutional requirements so permit, the infringing goods may be destroyed. A constitutional obstacle, which exists in some jurisdictions, is the obligation to provide “just terms” for any goods, which are compulsorily acquired.

A supplementary power, which is conferred upon the judicial authorities, is the power “to order that materials and implements, the predominant use of which has been in the creation of the infringing goods” is similarly disposed of outside the channels of commerce in such a manner as “to minimise the risks of further infringements.”

In considering requests for orders to dispose of or destroy infringing goods and equipment used to produce such goods, the judicial authorities are required to take into account “the need for proportionality between the seriousness of the infringement and the remedies ordered as well as the interests of third parties.” In the case of counterfeit trademark goods, Article 46 indicates, “the simple removal of the trademark unlawfully affixed shall not be sufficient, other than in exceptional cases, to permit the release of goods into the channels of commerce.”<sup>134</sup>

### **5.9.11 Right of Information**

A particularly useful innovation is the authority, which is conferred by Article 47 “to order the infringer to inform the right holder of the identity of third persons involved in the production and distribution of the infringing goods or services and of their channels of distribution.” Article 47 counsels the exercise of this power where it is not “out of all proportion to the seriousness of the infringement.” No guidance is provided as to how seriousness is to be evaluated or whether the

---

<sup>133</sup>TRIPS Agreement, 4, Arts. 45.1 and 45.2.

<sup>134</sup>TRIPS Agreement, 4, Art. 46.

touchstone of seriousness is damage to the party seeking the information, or whether from the perspective of the public interest in suppressing wrongful acts. For example, the large-scale counterfeiting of low quality trademarked goods may be of minimal concern to a trader producing high quality products, which are not likely to be confused with the counterfeiter's products. However there may be a public interest in the protection of consumers from the poorer quality goods. There may also be a more fundamental public interest in inculcating an ethos of commercial morality.

A limiting condition in Article 47 is that information will not be provided if it is out of proportion to the seriousness of the infringement, although no guidance is provided as to the test of proportionality.

TRIPS Article 47 provides that the information, which may be provided to a right holder, is "the identity of third persons involved in the production and distribution of the infringing goods or services and of their channels of distribution."<sup>135</sup> Article 8(1) of the EU's Enforcement Directive is even more broadly drawn. Although it commences with the qualification of justification and proportionality it provides that the competent judicial authorities may order that information on the origin and distribution networks of the goods or services which infringe an intellectual property right be provided not only by the infringer, but also by any other person who:

- (a) was found in possession of the infringing goods on a commercial scale,
- (b) was found to be using the infringing services on a commercial scale,
- (c) was found to be providing on a commercial scale services used in infringing activities, or
- (d) was indicated by the person referred to in point (a), (b) or (c) as being involved in the production, manufacture or distribution of the goods or the provision of the services.<sup>136</sup>

Article 8(2) of the Enforcement Directive then itemises the type of information, which may be provided, including:

- (a) the names and addresses of the producers, manufacturers, distributors, suppliers and other previous holders of the goods or services, as well as the intended wholesalers and retailers,
- (b) information on the quantities produced, manufactured, delivered, received or ordered, as well as the price obtained for the goods or services in question.<sup>137</sup>

The general qualification to the information, which may be provided under laws implementing the Directive is that, the information applies in respect of acts carried out on "a commercial scale". This term is not defined in the substantive part of the Directive but in Recital 14, which states that acts carried out on a commercial scale

---

<sup>135</sup>TRIPS Agreement, 4, Art. 47.

<sup>136</sup>EU Enforcement Directive 8(1).

<sup>137</sup>EU Enforcement Directive 8(2).

“are those carried out for direct or indirect economic or commercial advantage; this would normally exclude acts carried out by end consumers acting in good faith.”<sup>138</sup>

### ***5.9.12 Indemnification of the Defendant***

Where “enforcement measures have been abused,” Article 48.1 provides that the judicial authorities shall have the authority to order a party “at whose request enforcement measures were taken” to provide “adequate compensation for the injury suffered because of such abuse” to a person wrongfully enjoined or restrained. Article 48.1 also provides for the applicant to be ordered to pay the defendant’s “appropriate attorney’s fees.”<sup>139</sup>

### ***5.9.13 Criminal Sanctions***

Article 61 provides that Members shall provide for criminal procedures and penalties “to be applied at least in cases of wilful trademark counterfeiting or copyright piracy on a commercial scale.” The expression “at least” leaves it open for criminal penalties to be imposed in cases concerning other IPR offences, such as where a law might criminalise geographical indications infringements. Among the criminal sanctions, which are listed in the Article, are: “imprisonment, and/or monetary fines sufficient to provide a deterrent, consistently with the level of penalties applied for fines of a corresponding gravity.” Also in appropriate cases, Article 61 provides for “the seizure, forfeiture and destruction of the infringing goods and any materials and implements the predominant use of which has been in the commission of the offence.”

Article 61 also provides for criminal procedures and penalties to be applied in other cases of infringement of intellectual property rights, “in particular where they are committed wilfully and on a commercial scale.”<sup>140</sup>

### ***5.9.14 Border Measures***

A key feature of the TRIPS Agreement was the obligation of Members to introduce border measures for the protection of intellectual property rights. It is obviously more effective to seize a single shipment of infringing products at the border rather

---

<sup>138</sup>EU Enforcement Directive, Recital 14.

<sup>139</sup>TRIPS Agreement, 4, Art. 48.1.

<sup>140</sup>TRIPS Agreement, 4, Art. 61.

than to await its distribution in the market. The stratagem of utilising border seizure to control the trade in infringing goods was foreshadowed in the Paris Convention, which in Article 9(1) provides that “all goods unlawfully bearing a trademark or trade name shall be seized on importation into those countries of the Union where such mark or trade name is entitled to protection.” It was envisaged in Article 9 (3) that this seizure would take place at the request of “the public prosecutor, or any other competent authority, or any interested party.” The Paris Convention contains no provisions providing for the seizure upon importation of other intellectual property infringements.<sup>141</sup>

The key border control provision of the TRIPS Agreement is Article 51, which requires Members to:

adopt procedures to enable a right holder, who has valid grounds for suspecting that the importation of counterfeit trademark or pirated copyright goods may take place, to lodge an application with competent authorities, administrative or judicial, for the suspension by the customs authorities of the release into free circulation of such goods.

As a footnote to this provision, the term “counterfeit trademark goods” is defined to mean:

any goods, including packaging, bearing without authorization a trademark which is identical to the trademark validly registered in respect of such goods, or which cannot be distinguished in its essential aspects from such a trademark, and which thereby infringes the rights of the owner of the trademark in question under the law of the country of importation.

In addition to the suspension of release of goods involving a suspected counterfeit trademark, or which are pirated copyright goods, Article 51 also provides that an application for suspension may also be made in respect of other intellectual property rights infringements, such as carrying ornamentation which infringes a registered design or involving production in breach of a patented process.<sup>142</sup>

## 5.10 Protocol to the Lisbon Agreement

As was noted above, the Lisbon Agreement, 1958, failed to secure much support beyond the countries of the Mediterranean. The failure of the negotiations in the TRIPS Council to settle the operating principles as well as the details for a multilateral system for the registration of geographical indications, has led to an examination of the possibility that the Lisbon Agreement might be modified to become an acceptable registration option. At least one author has suggested a protocol to the Lisbon Agreement as a means of achieving this result. The simplest approach would be to “establish a new international register, possibly limited to wines and spirits, to be administered by WIPO, thus relying on the expertise of the

---

<sup>141</sup>Paris Convention, 10, Art. 9(1) and 9(3).

<sup>142</sup>TRIPS Agreement, 4, Art. 51.

Lisbon staff” and on WIPO’s “experience in administering international intellectual property registration systems.”<sup>143</sup> The protocol would mirror the current registration process but apply to GIs as defined in TRIPS definition with no substantive protection norms and leaving it to the WTO dispute system to deal with conflicts.<sup>144</sup> Alternatively, a protocol has been suggested that mirrors not just the administrative provisions of the current Lisbon system but also the substantive GIs provisions of TRIPS, including conflicts between GIs and trademarks.<sup>145</sup> To deal with the extension issue, the register might contain two distinct domains: one for wines and spirits for which TRIPS Article 23 protection would apply; and one for all other products, for which TRIPS Article 22 protection would apply.<sup>146</sup>

In September 2008, the Assembly of the Lisbon Union established a Working Group on the Development of the Lisbon System to explore possible improvements to the procedures under the Lisbon System to make it more attractive for users and prospective new members. Since 2009, the Working Group has engaged in a full review of the Lisbon International Registration System involving its possible extension to geographical indications in addition to appellations of origin. Various sessions of the Working Group considered drafts of proposed changes to the Lisbon system, culminating at its sixth session, in December 2012. In the sixth session, the Working Group on the Development of the Lisbon System (Appellations of Origin) requested the International Bureau of WIPO to prepare a Draft Revised Lisbon Agreement that would take the form of a single instrument covering both appellations of origin and geographical indications. The instrument would provide for a high and single level of protection for both, while maintaining separate definitions, on the understanding that the same substantive provisions would apply to both appellations of origin and geographical indications.<sup>147</sup> In advance of the seventh session of the Working Group, The Organization circulated a list of GIs of US products for an International Geographical Indications Network (oriGIN).<sup>148</sup> One function of this list may have been to indicate to US negotiators the significance of GIs for US industry. The list comprised various certification marks, which had been registered in the US for agricultural products.

A Draft Agreement and associated Regulations were presented to the Seventh Session of the Working Group, which was held April 29 to May 3, 2013.<sup>149</sup>

## 5.11 Bilateral and Plurilateral Agreements

In the last decade it has become also a practice to incorporate provisions for the protection of specific geographical indications in some free trade agreements (FTAs), which contain provisions, modifying the TRIPS provisions dealing with trademarks and geographical indications. For example, the Trans-Pacific Partnership Agreement (TPPA) currently under negotiation between Australia, Brunei Darussalam, Canada, Chile, Japan, Malaysia, Mexico, Peru, New Zealand, Singapore, USA and Vietnam contains a number of trademarks and geographical indications provisions, which supplement those of the TRIPS Agreement.<sup>150</sup>

# Chapter 6

## Agricultural Innovation: Patenting and Plant Variety Rights Protection

Michael Blakeney

**Abstract** This chapter describes the international patent and plant variety rights systems which are regulated by the Trade Organization (WTO) Agreement on Trade Related Aspects of Intellectual property Rights (TRIPS) and the International Convention for the Protection of New Varieties of Plants (UPOV). It looks at the jurisprudence around plant and DNA patenting and plant breeding. The chapter also looks at the impact upon agricultural innovation of the International Treaty for Plant Genetic Resources for Food and Agriculture.

### 6.1 International Intellectual Property Infrastructure

The international intellectual property rights (IPR) regime based upon the World Trade Organization (WTO) Agreement on Trade-related Aspects of Intellectual Property Rights (“TRIPS Agreement”) establishes global intellectual property norms. The TRIPS Agreement obliges the 159 member states of the WTO<sup>1</sup> to implement such norms by requiring the provision of legal protection for newly developed plant varieties and enabling the patenting and commodification of DNA. A key provision of the TRIPS Agreement in the context of food and agriculture is Article 27.1, which establishes a patenting regime extending to all WTO members. The provision provides that, “patents shall be available for any inventions, whether products or processes, in all fields of technology, provided that they are new, involve an inventive step and are capable of industrial application.” The provision also requires that, “patents shall be available and patent rights enjoyable without discrimination as to the . . . field of technology.” Additionally, Article 27.3(b) of the TRIPS Agreement requires that WTO Members “shall provide for the protection of

plant varieties either by patents or by an effective *sui generis* system or by any combination thereof.”

Although the TRIPS Agreement does not prescribe a specific *sui generis* system for the protection of plant varieties, most countries have adopted the 1991 version of the International Convention for the Protection of New Varieties of Plants (“UPOV”). UPOV provides for the protection of new plant varieties which are “distinct”, “uniform,” and “stable.”

Originally, under the 1978 version of UPOV, propagating material which had been harvested by farmers and retained for further planting or for sale was exempted from protection. Article 15 (2) of the 1991 version of UPOV Convention confined the farmer’s seed saving exception to the use of saved material for propagating purposes on farmers’ own holdings and in reasonable quantities. UPOV 1991 also contains a breeder’s exception that permits the use of protected varieties for the purpose of breeding new varieties. As is indicated below, the seed saving and breeding exceptions become irrelevant where a new variety can be patented.<sup>2</sup>

The UPOV Convention has 71 signatories as of December 5, 2012.<sup>3</sup> Only a few countries have adopted alternatives to UPOV 1991 despite numerous commentaries and proposals for the adoption of alternative *sui generis* models.<sup>4</sup>

## 6.2 Patenting of DNA

The modern biotechnological revolution has enabled the engineering of desirable genetic traits from useful local species. These include: (1) pest control traits such as insect, virus and nematode resistance as well as herbicide tolerance; post-harvest traits such as delayed ripening of spoilage prone fruits; (2) agronomic traits such as nitrogen fixation and utilisation, restricted branching, environmental stress tolerance, male and/or seed sterility for hybrid systems; and (3) output traits such as plant colour and vitamin enrichment. The production of transgenic plants has become possible through the development of a number of enabling and transformation technologies.<sup>5</sup>

A key issue around the patenting of genetic resources was whether a DNA sequence could be characterised as an “invention.” In the early history of patent law, an invention was thought to involve some kind of technical innovation, and a distinction was drawn between patentable inventions and non-patentable discoveries. In 1980 the United States Supreme Court ruled in a 4:3 majority decision that a bacterium genetically engineered to degrade crude oil was an invention in the

---

<sup>5</sup>Blakeney (2012b).

landmark case, *Diamond v Chakrabarty*.<sup>6</sup> This decision provided the legal underpinning for the U.S. biotechnology industry. The European Parliament's belated response. In 1998, The European Parliament responded with its belated Biotechnology Directive, providing in Article 3.2 that, "biological material which is isolated from its natural environment or produced by means of a technical process is deemed to be an invention even if this material previously occurred in nature."<sup>7</sup>

The patentability of genetic materials and gene fragments, such as expressed sequence tags (ESTs) and single nucleotide polymorphisms (SNPs), as well as enabling gene-based technologies led to what has been described as a "genomic gold rush" in the 1990s as vast numbers of gene-based patent applications were filed, particularly in the USA.<sup>8</sup> Significant misgivings were expressed by numerous commentators. Probably the most influential among these was the suggestion that genetic research tool patents could create a "tragedy of the anticommons" in which multiple patent owners would tie-up genetic materials in a thicket of IP patent rights.<sup>9</sup> The 'tragedy of the anticommons' was perceived to be a particular problem for the genetic improvement of crops since patenting is an incremental process and each new patent would constrain a researcher's "freedom to operate." The effect of the patentability of genetic materials and gene fragments therefore could particularly restrain public agricultural research institutes.<sup>10</sup>

Two recent US cases have questioned of the patentability of genetic material. In *Association for Molecular Pathology v. USPTO*,<sup>11</sup> a United States District Court Judge for the Southern District of New York delivered a summary judgement invalidating patents related to the BRCA 1 and 2 breast and ovarian cancer susceptibility genes, which had been patented by the company Myriad Genetics.<sup>12</sup> He ruled that DNA sequences in isolation were insufficiently distinct from naturally occurring genes in the body and were thus products of nature rather than inventions. He observed that DNA represents the physical embodiment of biological information, distinct in its essential characteristics from any other chemical found in nature and that DNA in an "isolated" form alters neither this fundamental quality as it exists in neither the body nor the information it encodes.<sup>13</sup>

<sup>12</sup>*Association for Molecular Pathology et al v. United States Patent and Trademark Office et al*, 09 Civ. 4515, March 29, 2010.

<sup>13</sup>*Ibid* at 121.

This decision was successfully appealed to the U.S. Court of Appeals for the Federal Circuit (CAFC) in Washington, D.C.<sup>14</sup> The Court of Appeals ruled that the District Court Judge had failed to consider whether the isolated DNAs were markedly different from naturally occurring DNAs, and improperly focused on whether the isolated DNAs had the same informational content as native DNA sequences. Nevertheless, the CAFC held that the District Court was correct in holding that Myriad's claims directed to comparing and analysing gene sequences were not patentable, as these claims contained no transformative steps and covered only patent ineligible abstract steps.

This reasoning was evaluated recently by the U.S. Supreme Court, in *Mayo Collaborative Services v. Prometheus Laboratories, Inc.*<sup>15</sup> The case concerned patents obtained by Prometheus which instructed doctors in the use of thiopurine drugs to treat autoimmune diseases. Mayo had developed its own diagnostic test, which Prometheus claimed infringed its patents. Justice Breyer, delivering the opinion of the Court, noted the long held view of the Supreme Court is such that laws of nature, natural phenomena, and abstract ideas are not patentable. He quoted from the Court's decision in *Diamond v Chakrabarty* that "a new mineral discovered in the earth or a new plant found in the wild is not patentable subject matter." The Court held that Prometheus' process was not patent eligible because the laws of nature recited by Prometheus' patent claims (i.e. the relationships between concentrations of certain metabolites in the blood and the likelihood that a thiopurine drug dosage will prove ineffective or cause harm) were not themselves patentable. The implications of the Supreme Court decision in *Prometheus Laboratories* regarding DNA patenting have yet to be worked out in the food and agriculture context, but as is explained below, DNA patenting has become an important feature of agricultural innovation.

### 6.3 DNA Patenting and Agriculture

The cultivation of GM crops has on occasion led to IPR liability for farmers, where genetically modified (GM) seed is patented and the cultivation of that seed by the patentee is unauthorized. The types of cases invoking IPR liability are divided between those where farmers knowingly cultivate patented GM seed and those where the cultivation of patented seed is apparently inadvertent, for example, where crops are pollinated by wind or insect-borne pollen.

An example of the first category of case in which a farmer knowingly cultivates patented GM seeds, is *Monsanto Co. v. Scruggs*.<sup>16</sup> The case concerned Monsanto's patented Roundup Ready ("RuR") glyphosate tolerant seeds. The RuR seeds were

---

<sup>14</sup>The Association of Molecular Pathology & Ors v. The USPTO and Myriad Genetics Inc, \_F.3d\_ (CAFC, 2011).

<sup>15</sup>132 S.Ct. 1289 (2012).

<sup>16</sup>342 F. Supp 2d 584 (2004).

licensed to seed companies, who were obliged to sell the seed only to growers who signed technology license agreements acknowledging Monsanto's patent and agreeing to the condition that these seeds could only be used by growers for a single commercial crop, i.e. growers could not save seed produced from a harvested crop for replanting during the following growing season. Scruggs purchased a small quantity of RuR soybeans and cotton seeds for cultivation without signing a technology licensing agreement. After cultivation, Scruggs saved seed for further plantings. The Court decided that Monsanto's patent had been infringed by Scruggs. Scruggs raised the defence that neither Monsanto's biotechnology nor the plants in their fields were covered by the patent and that the first sale of the seed embodying the invention exhausted the patent rights of Monsanto. The Court noted that Monsanto did not make an unrestricted sale of its seed technology, but rather licensed its technology to seed companies with a proviso: subsequent sales of seed containing its transgenic trait must be limited to growers who obtained a license from Monsanto and for only a single growing season.<sup>17</sup>

A more recent variant of these facts occurred in *Monsanto Co v Bowman*,<sup>18</sup> where a farmer, Bowman, purchased commodity seeds from a local grain elevator which were not subject to a technology agreement. Bowman first applied glyphosate to the crops grown from these seeds. He then identified those which were glyphosate resistant and saved them for re-planting in subsequent years, enabling Bowman to utilize glyphosate-based herbicide. As a response, Monsanto filed a patent infringement claim against Bowman. In September 2009, the District Court in Indiana granted summary judgment on patent infringement for Monsanto and awarded damages of \$84,456.

Bowman appealed to the Court of Appeals for the Federal Circuit. Bowman argued that Monsanto's patent rights were exhausted under the first sale doctrine in relation to all second-generation Roundup Ready soybean seeds that were present in the grain elevators. The Court of Appeals held that there would be no impact even if Monsanto's patent rights in the commodity seeds were exhausted, because once a grower, like Bowman, planted the commodity seeds containing Monsanto's RuR technology he created a newly infringing article upon development of the next generation of seed. It observed that "The fact that a patented technology can replicate itself does not give a purchaser the right to use replicated copies of the technology. Applying the first sale doctrine to subsequent generations of self-replicating technology would eviscerate the rights of the patent holder."<sup>19</sup>

The Supreme Court endorsed this reasoning, explaining that under the patent exhaustion doctrine, Bowman could resell the patented soybeans he purchased from the grain elevator, consume the beans himself, or feed them to his animals; however, "The exhaustion doctrine does not enable Bowman to make *additional* patented soybeans without Monsanto's permission (either express or implied)."<sup>20</sup>

---

<sup>17</sup>Ibid. at 591.

<sup>18</sup>569 U. S. \_\_\_\_ (2013).

<sup>19</sup>657 F. 3d, at 1348 (2010).

<sup>20</sup>569 U. S. \_\_\_\_ (2013) at 6.

Therefore, Bowman was denied protection under the exhaustion doctrine because he reproduced Monsanto's patented invention.

A case of apparently inadvertent infringement by a farmer is illustrated by the Canadian litigation between Monsanto Canada, Inc. and Percy Schmeiser. Schmeiser grew canola commercially in Saskatchewan. He had never purchased Monsanto's patented RuR Canola nor did he obtain a licence to plant it. Yet, in 1998, tests revealed that 95–98% of his 1000 acres of canola crop was made up of RuR plants. The origin of the RuR plants is unclear, but they may have been derived from RuR seed that blew onto or near Schmeiser's land. Regardless of the origin, Monsanto brought an action for patent infringement. In finding patent infringement, the trial judge ruled that the growth of the seed, the reproduction of the patented gene and cell, and the sale of the harvested crop constituted taking the essence of Monsanto's invention and using it without permission.

The Federal Court of Appeal ruled 5:4 that Schmeiser's saving and planting of seed, subsequently followed by the harvesting and selling of plants containing the patented cells and genes appeared to constitute "utilization" of the patented material for production and advantage within the meaning of s. 42 the Canadian *Patent Act*.<sup>21</sup> The argument that the infringing seed had merely grown as the result of wind pollination, or through the pollinating activities of birds and bees, was rejected by the majority Judges as denying "the realities of modern agriculture." Instead, the judges focused on the issue of sowing and cultivation, "which necessarily involves deliberate and careful activity on the part of the farmer". They noted that Schmeiser had actively cultivated RuR Canola as part of his business operations. Thus, in light of all of the relevant considerations, Schmeiser had used the patented genes and cells, and infringement was established.

## 6.4 Patenting of Stress-Tolerant Genes

DNA patenting has become of crucial significance for agriculture since the identification of stress tolerant genes which are of assistance in developing crops that are better able to tolerate climate change. In 2010, the Action Group on Erosion, Technology and Concentration ("ETC") conducted a study that, "examined patents containing claims concerned with abiotic stress tolerance (i.e. traits related to environmental stress, such as drought, salinity, heat, cold, chilling, freezing, nutrient levels, high light intensity, ozone and anaerobic stresses."<sup>22</sup> The study noted "a dramatic upsurge in the number of patents published (both applications and issued patents) related to 'climate-ready' genetically engineered crops from June 30, 2008 to June 30, 2010." They identified 262 patent families and 1663 patent docu-

---

<sup>21</sup>*Monsanto Canada, Inc. v. Schmeiser*. [2004] 1 S.C.R. 902, 2004 SCC 34.

<sup>22</sup>ETC Group (2010).

ments.<sup>23</sup> The ETC report contrasted the ownership of patent families by public sector institutions, holding 9% of the total, with the private sector, which holds 91% of the total. The report pointed out that “just three companies – DuPont, BASF, Monsanto – account for two-thirds (173 [patents] or 66%) of the total.” This level of market concentration gives cause for concern in regards to the positive role of competition.<sup>24</sup>

Additionally, the market dominance of these private corporations has an important influence upon the sort of biotechnological research which is undertaken. For example, the dominance of private corporations in biomedical and agricultural research may direct research towards Northern concerns away from Southern food priorities.<sup>25</sup> Further, it has been estimated that only 1% of research and development budgets of multinational corporations is spent on crops of interest that would be useful in the developing world.<sup>26</sup> Major corporations almost entirely neglect five of the most important crops essential to the poorest, arid countries, which include sorghum, millet, pigeon pea, chickpea and groundnut.<sup>27</sup>

## 6.5 The UPOV Convention

### 6.5.1 Introduction

The UPOV Convention defines “plant variety” in terms of a plant grouping within a single biological taxon of the lowest known rank, which grouping can be:

- defined by the expression of characteristics (such as shape, height, colour and habit) resulting from a given genotype or combination of genotypes;
- distinguished from any other plant grouping by the expression of at least one of the said characteristics; and
- considered as a unit with regard to its suitability from being propagated unchanged.

Generally, under plant variety rights legislation the plant breeder is conferred an exclusive right to do or to licence the following acts in relation to propagating material of the variety:

- produce or reproduce the material;
- condition the material for the purpose of propagation;
- offer the material for sale;

---

<sup>23</sup>Ibid, Appendix A.

<sup>24</sup>Eg see Lesser (1998).

<sup>25</sup>Alston et al. (1998).

<sup>26</sup>Pingali and Traxler (2002).

<sup>27</sup>Human Rights Council, Report of the Special Rapporteur on the Right to Food, Jean Ziegler, A/HRC/7/5, 10 January 2008, para 44.

- sell the material;
- import the material;
- export the material;
- stock the material for the purposes described above.

The protection under this legislation is afforded to a “breeder” or persons claiming through the breeder who is defined in Article 1 (iv) of the UPOV Convention as the person who bred, “or discovered or developed a variety.” “Breeding” is generally defined as including the discovery of a plant together with its use in selective propagation so as to achieve a result.

The general duration of plant variety rights under legislation based on the UPOV Convention is 25 years in the case of trees and vines and 20 years for any other variety. During these periods, the breeder or other licensee or owner of the right is entitled to exclusivity in its exploitation and commercialisation.<sup>28</sup>

### 6.5.2 *Criteria for Registrability*

A plant variety is considered to be registrable if it has a breeder, is distinct, uniform, and stable, and has not been, or has only recently been, exploited. A plant variety is considered distinct if it is clearly distinguishable from any other variety whose existence is a matter of common knowledge. This issue was considered by the European Court of Justice of the First Instance in a case concerning a PVP application for a variety of the species *Plectranthus ornatus*.<sup>29</sup> The applicant’s competitors successfully opposed the registration of the plant variety on the ground that it was not distinct from a wild variety originating in South Africa. This was regarded as a matter of common knowledge because the plant variety had been marketed for years in that country and was also found in private gardens.<sup>30</sup>

Additionally, some of the comments made by the court give insight to the questionable novelty of inventions derived from traditional knowledge. In deciding the question of common knowledge, the Court took into account the academic literature referring to the fact that *P.*, originally native in Ethiopia and Tanzania, was “cultivated and semi-naturalised” in South Africa.<sup>31</sup>

A variety is considered uniform if it is uniform in its relevant characteristics on propagation, subject to the variation which may be expected from the particular features of its propagation. A plant variety is stable if its relevant characteristics remain unchanged after repeated propagation. A plant variety is taken not to have

been exploited if it or propagating material has not been sold to another person by or with the consent of the breeder.<sup>32</sup>

### 6.5.3 *Farmer's Privilege ("Seed-Saving" Exception)*

Seed saved by a farmer from harvested material and treated for the purpose of sowing a crop on that farmer's own land is usually excepted from plant variety rights. Article 15(2) of the UPOV Convention provides as an optional exception that "each Contracting Party may, within reasonable limits and subject to the safeguarding of the legitimate interests of the breeder, restrict the breeder's right in relation to any variety in order to permit farmers to use for propagating purposes, on their own holdings, the product of the harvest which they have obtained by planting, on their own holdings, the protected variety. . . ." It should be noted that although this is colloquially defined as the "seed-saving" exception, Article 15(2) of UPOV refers to "the product of the harvest". The language of Article 15(2) can be contrasted with Article 9.3 of the International Treaty for the Protection of Plant Genetic Resources for Food and Agriculture, which provides that "Nothing in this Article shall be interpreted to limit any rights that farmers have to save, use, exchange and sell farm-saved seed/propagating material, subject to national law and as appropriate."

The use in Article 15(2) of the term "product of the harvest" instead of "seed" has raised questions about the proper scope of the exception. One of the aims of the farmer's privilege exemption was to achieve a balance between encouraging the development of new crops and avoiding the alienation of farming communities for whom saving seed was a traditional practice.<sup>33</sup> Under this rationale, it has been suggested that the exemption might not be appropriate for economies where farming is a quasi-industrial activity performed by a small minority of the population or where plant breeding has become an industrial activity. According to a former head of UPOV, the intention behind the exception was to provide UPOV member states with the opportunity to balance local interests and access to new crops and medicinal varieties against the interests of the breeder on a species by species basis.<sup>34</sup> At the time of the 1991 Diplomatic Conference, it was recommended that the provisions laid down in Article 15(2) "should not be read so as to be intended to open the possibility of extending the practice commonly called 'farmer's privilege' to sectors of the agricultural or horticultural production in which such a privilege is not a common practice on the territory of the Contracting Party concerned."<sup>35</sup>

<sup>34</sup>Greengrass (1991).

<sup>35</sup>*Records of the Diplomatic Conference for the Revision of the International Convention for the Protection of New Varieties of Plants*, UPOV, Geneva, 1991, Recommendation Relating to Article 15(2), p. 63.

Some countries have clarified the scope of the exception in their national legislation. For example, Costa Rica<sup>36</sup> and the Dominican Republic<sup>37</sup> exclude “fruit, ornamental and forest species” from farmer’s privilege “where planted for commercial ends”. Mexico limits the exception to “grain for consumption or seed for sowing”.<sup>38</sup>

An example of the farmer’s privilege in an industrialised setting appears in Article 14 of the European Community Plant Variety Rights Regulation. Article 14 gives farmers the right to use farm saved seed without the consent of the owner (right holder) of the variety in question. However, the farmer, with the exception of small farmers, must pay the holder an equitable remuneration which shall be sensibly lower than the amount charged for the licensed product.<sup>39</sup> If the parties cannot agree upon the level of the remuneration, such remuneration should be 50 % of the amounts charged for the licensed production of propagating material.<sup>40</sup>

## 6.6 Critiques of the PVP System

Over the last two decades, commentators on the PVP system have begun to question to its relevance, raising the possibility that it might have become “the Neanderthal of intellectual property systems”.<sup>41</sup> One reason for this critique is the impact of patents upon PVP, described above. At a more fundamental level it is observed that PVP in focussing upon a phenotypic paradigm, based upon “characteristics” and “features”, has become outmoded as plant breeding moves towards a genotypic approach, based on genetic modification and molecular breeding techniques.<sup>42</sup> Mark Janis and Stephen Smith argue that plants should be reconceptualised as datasets that breeders manipulate to express particular characteristics, which could be better regulated by unfair competition laws rather than by a *sui generis* PVP scheme.<sup>43</sup>

It should be noted that critiques of PVP systems have tended to be intuitive, rather than empirically based, as there is an absence of data of the impacts of the genotypic approach upon PVP systems, as well as a general shortage of data of the impacts of PVP upon the development of new plant varieties. Some recent attempts have been made to redress the latter deficiency. In 2005 UPOV (2005) published a

<sup>41</sup>Fowler (1994).

<sup>42</sup>Janis and Smith (2007).

<sup>43</sup>Ibid at pp. 1607–14. See also Sanderson (2007).

report on the quantitative impacts of plant breeder's rights in Argentina, China, Kenya, Poland and the Republic of Korea.<sup>44</sup> The Report concluded that:

Individual country reports have demonstrated increases in the overall numbers of varieties developed after the introduction of PVP. New, protected varieties have been developed for a wide range of crops including, for example, staple crops in the agricultural sector (e.g. barley, maize, rice, soybean, wheat), important horticultural crops (e.g. rose, Chinese cabbage, pear), traditional flowers (peony, magnolia, camellia in China) forest trees (e.g. poplar in China) and traditional crops (e.g. ginseng in the Republic of Korea).<sup>45</sup>

It has been generally assumed that the availability of PVPs has increased the number of varieties released and planted.<sup>46</sup> However, it is uncertain as to whether the availability of protection caused the increase in varietal release, as well as whether this is an economic good.<sup>47</sup>

Data measuring the impact of PVPs upon investment in plant breeding in developed countries suggests that this is uneven. For example, Lesser and Mutschler assessing US utility patent applications from 1970 to 2000, found that the overall increase in the use of utility patents in the mid-1990s could be attributed to two crops: corn and soybeans,<sup>48</sup> where patented GM technology has become important,<sup>49</sup> but insignificant, for example, in the case of wheat.<sup>50</sup> An Australian study of PVP applications in Australia from 1987 to 2007 observed a notable decrease in the number of applications for the period 2003 to 2007.<sup>51</sup> This was tentatively attributed to changing environmental conditions such as drought and increased salinity which effected plant breeding investment either by reducing the level of plant breeding, or by focusing breeding programs on developing particular traits (for example, drought resistance and salinity tolerance) in new plant varieties. In Australia the highest number of PVP applications (61 %) came from the nursery sector, which is perceived to be particularly vulnerable to changing climatic conditions.

## 6.7 Patenting of Plant Varieties

UPOV allows the protection of new varieties of plants which are distinct, uniform and stable. A variety is considered to be new if it has not been commercialized for more than 1 year in the country of protection. A variety is distinct if it differs from all other known varieties by one or more important botanical characteristics. A variety is uniform if the plant characteristics are consistent from plant to plant

<sup>51</sup>Sanderson and Adams (2008).

within the variety. A variety is stable if the plant characteristics are genetically fixed and therefore remain the same from generation to generation, or after a cycle of reproduction in the case of hybrid varieties.

The 1991 version of UPOV recognizes the right of breeders to use protected varieties to create new varieties. However, this exception is itself restricted to such new varieties as are not “essentially derived” from protected varieties. The drafters added this restriction to prevent second generation breeders from making merely cosmetic changes to existing varieties in order to claim protection for a new variety. The most contentious aspect of the 1991 Act is the limitation of the farmers’ privilege to save seed for propagating the product of the harvest they obtained by planting a protected variety “on their own holdings,” “within reasonable limits and subject to the safeguarding of the legitimate interests of the breeder.” This is contrasted with earlier versions of UPOV which permitted farmers to sell or exchange seeds with other farmers for propagating purposes.

The seed saving privilege and the permitted development of non-essentially derived new varieties from protected material were compromises built in to the legislation to account for public policy concerns. One concern was that food security would be compromised if individuals were permitted to privatise food varieties by locking up breeding material and preventing farmers from seed saving for further harvests. However, from the perspective of plant breeders, any derivation of new varieties from their protected varieties, whether essential or non-essential, was inconvenient for them and any seed saving by farmers deprived them of new sales. Consequently, they looked to patent law, which does not contain these exceptions, to protect their new varieties.<sup>52</sup>

In the USA, plant varieties can be protected under a system of plant patents, or under a system of utility patents or under the Plant Variety Protection Act (PVPA).<sup>53</sup> The Plant Patent Act makes patent protection available to new varieties of asexually reproduced plants. Under this scheme, a plant variety must be novel and distinct and the invention, discovery, or reproduction of the plant variety must not be obvious. One of the disadvantages of the scheme is that only one claim covering the plant variety is permitted in each application.

The Federal Circuit Court of Appeals resolved any potential conflict between patent protection and protection under the Plant Variety Protection Act (PVPA) in its decision in *Pioneer Hi-Bred International Inc. v. J.E.M. Ag Supply Inc.*<sup>54</sup> Pioneer’s patents covered the manufacture, use, sale, and offer for sale of the company’s inbred and hybrid corn seed products as well as certificates of protection under the PVPA for the same seed-produced varieties of corn. The defendants argued that the enactment of the PVPA had removed seed-produced plants from the realm of patentable subject matter the Patents Act. The Federal Circuit rejected this

argument noting that the Supreme Court held that “when two statutes are capable of co-existence, it is the duty of the courts . . . to regard each as effective.”<sup>55</sup>

The issue was further clarified in *Monsanto Co. V. McFarling*,<sup>56</sup> which concerned Monsanto’s patent for glyphosate-tolerant plants, including the genetically modified seeds for such plants, the specific modified genes, and the method of producing the genetically modified plants. Monsanto required that sellers of the patented seeds obtained a “Technology Agreement,” from purchasers in which they agreed that the seeds were to be used “for planting a commercial crop only in a single season,” that the purchaser would not, “save any crop produced from this seed for replanting, or supply saved seeds to anyone for replanting.” Mr. McFarling, a farmer in Mississippi, purchased Roundup Ready soybean seed in 1997 and again in 1998; he signed the Technology Agreement for both purchases. He saved 1500 bushels of the patented soybeans from his harvest during one season, and planted them as seed in the next season instead of selling these soybeans as crop. The saved seed retained the genetic modifications of the Roundup Ready seed. Mr. McFarling did not dispute that he violated the terms of the Technology Agreement but claimed that the contractual prohibition against using the patented seed to produce new seed for planting violated the seed saving provision of the PVPA as he had produced only enough new seed for his own use the following season. The Court declined to limit the patent law by reference to the PVPA, and Mr. McFarling was found to have infringed Monsanto’s patent.

## 6.8 Patenting of Plant Breeding Methods

In addition to patenting the products of plant breeding, some patent laws allow for the patenting of plant breeding methods. For example, in the U.S. a patent has been obtained for the “selective increase of the anticarcinogenic glucosinolates in brassica species,”<sup>57</sup> and an application has been published concerning a “method for breeding tomatoes having reduced water content.”<sup>58</sup> These demonstrate the possibility that methods of crop breeding to withstand climate stress can be privatized in the U.S., permitting so-called methods patents.

On the other hand, European patent legislation excludes “essentially biological processes for the production of plants or animals” defined in Article 2.2 of the EU Biotechnology Directive as consisting “entirely of natural phenomena such as crossing or selection.” This exclusion resulted in the denial of patent protection for the same methods for breeding brassica and tomatoes that were able to be patented in the U.S.<sup>59</sup> The Board of Appeals of the European Patent Organization

<sup>58</sup>US Patent Application 20,100,095,393, April 15, 2010.

<sup>59</sup>Blakeney (2012a).

(EBA) observed that with the creation of new plant varieties, for which a special property right was going to be introduced under the subsequent UPOV Convention in 1960, the legislative architects of the European Patent Convention were concerned with excluding from patentability the kind of plant breeding processes which were the conventional methods for the breeding of plant varieties of that time. These conventional methods predominantly included those based on the sexual crossing of plants deemed suitable for the purpose pursued and on the subsequent selection of the plants having the desired trait(s). These processes were characterised by the fact that the traits of the plants resulting from the crossing were determined by the underlying, natural phenomenon of meiosis. On the other hand, processes for changing the genome of plants by technical means, such as irradiation, were cited by the EBA as examples of patentable technical processes. The EBA pointed out that the provision of an explicit or implicit technical step in a process based on the sexual crossing of plants and on subsequent selection does not cause the claimed invention to escape the exclusion from patentability if that technical step only serves to perform the process steps of the breeding process.

A process leaves the realm of plant breeding and is not excluded from patentability in Europe if the process of sexual crossing and selection includes an additional step of a technical nature that by itself introduces a trait into the genome or modifies a trait in the genome of the plant produced so that the introduction or modification of that trait is not the result of the mixing of the genes of the plants chosen for sexual crossing. This principle applies only where the additional step is performed within the steps of sexual crossing and selection, independently from the number of repetitions. Otherwise, the exclusion of sexual crossing and selection processes from patentability could be circumvented simply by adding steps which do not properly pertain to the crossing and selection process. This includes upstream steps dealing with the preparation of the plant(s) to be crossed or downstream steps dealing with the further treatment of the plant resulting from the crossing and selection process. The EBA noted that for the previous or subsequent steps *per se* patent protection was available. Patent Protection is also available for genetic engineering techniques applied to plants which differ from conventional breeding techniques, as they work primarily through the deliberate insertion and/or modification of one or more genes in a plant.<sup>60</sup>

## 6.9 Patenting of Genetic Resources (GRs)

One problem with determining the legal protection of genetic resources through IPRs or any other law, is the fact that scientific constructs do not always lend themselves to legal categorization. For example, Article 27.3(b) of the TRIPS Agreement provides that WTO Members may also exclude from patentability: “plants and animals other than micro-organisms, and essentially biological

---

<sup>60</sup>Blakeney (2012a).

processes for the production of plants or animals other than non-biological and microbiological processes.” It has been noted that the division between plants and animals on the one hand and micro-organisms on the other is not as scientifically certain as the legal categories seem to suggest.<sup>61</sup>

Additionally, a number of international organizations, with varying levels of scientific competence, are now concerning themselves with IPRs and genetic and biological resources. At its sixteenth session, held from May 3 to 7, 2010, WIPO’s Intergovernmental Committee on Intellectual Property and Genetic Resources, Traditional Knowledge and Folklore (IGC) Member States identified the need for a glossary to clarify the meanings of key terms related to genetic resources in order to facilitate negotiations of the Committee.<sup>62</sup> The Secretariat prepared a document drawing definitions from previous glossaries of the IGC and from existing United Nations and other international instruments, as well as taking into account definitions and glossaries which can be found in national and regional laws and draft laws, multilateral instruments, other organizations and processes and in dictionaries.<sup>63</sup>

## 6.10 Traditional Agricultural Knowledge and Farmers’ Rights

The traditional knowledge of Indigenous peoples throughout the world has played an important role in identifying biological resources worthy of commercial exploitation. For example, the search for new pharmaceuticals derivable from naturally occurring biological material has been guided by ethno biological data.<sup>64</sup> Examples of traditional knowledge with an agricultural application include: “mental inventories of local biological resources, animal breeds, and local plant, crop, and tree species,” as well as plants which are indicators of soil salinity, seed treatment, and storage methods and tools used for planting and harvesting.<sup>65</sup> Additionally, significant contributions have been made by the knowledge of indigenous peoples and farmers in the development of new crops types and biodiversity conservation, e.g. crops resistant to climate change.

The economic value of biological diversity conserved by traditional farmers for agriculture is difficult to quantify.<sup>66</sup> It has been suggested that “the value of farmers’ varieties is not directly dependent on their current use in conventional

<sup>65</sup>Hansen and van Fleet (2007).

<sup>66</sup>E.g. see Brush (1994).

breeding, since the gene flow from landraces to privately marketed cultivars of major crops is very modest” because “conventional breeding increasingly focuses on crosses among elite materials from the breeders own collections and advanced lines developed in public institutions.<sup>67</sup>” On the other hand, those collections and advanced breeding lines are often derived from germ plasm contributed by traditional groups. An increasingly significant economic value of biodiversity is the extent to which it provides a reservoir of species available for domestication, as well as genetic resources available for the enhancement of domestic species. The modern biotechnological revolution has enabled the engineering of desirable genetic traits from useful local species. It is estimated that about 6.5 % of all genetic research undertaken in agriculture is focussed upon germ plasm derived from wild species and land races.<sup>68</sup>

Traditional knowledge is particularly important in the development of farming systems adapted to the local conditions and farming practices. Development of this knowledge may enable the utilization of marginal lands, contribute to food security in enabling access to food in remote areas, and contribute to the management of the environment by preventing erosion, maintaining soil fertility, and agro biodiversity.

## 6.11 Traditional Knowledge and Prior Art

An alternative approach to the protection of traditional knowledge as a category of intellectual property, is its recognition as part of “prior art.” Prior art calls into question the novelty and creativity of inventions which are the subject of patent applications. Patent examiners have practical difficulties in identifying relevant traditional knowledge as prior art, arising from the fact that they do not have access to traditional knowledge information in classified non-patent literature. Further, there are no effective search tools for the retrieval of such information.

The WIPO Intergovernmental Committee on Intellectual Property and Genetic Resources, Traditional Knowledge and Folklore (IGC) has begun to address practical measures to establish linkages between IP Offices and traditional knowledge documentation initiatives.<sup>69</sup> The draft Substantive Patent Law Treaty, which was submitted to the fifth session of the WIPO’s Standing Committee on the Law of Patents (SCP), held in Geneva from May 14 to 19, 2001, contained two alternatives for a draft article on the definition of prior art. The draft provisions on the definition of prior art provide that any information made available to the public, anywhere in the world, in any form, including in written form, by oral communication, by display and through use, shall constitute prior art, if it has been made available to the public before the filing date, or, where applicable, the priority date.

## 6.12 Disclosure of the Source of GRs, Access and Benefit Sharing: Recent International Developments

One of the foundational tasks of the WIPO IGC has been the formulation of guidelines on the IP aspects of access and benefit-sharing in relation to GRs. A drafted set of guidelines was submitted to the seventh session of the IGC in November 2004, which sought to provide assistance in the negotiation of contracts for access to genetic resources and related information, including traditional knowledge, and for benefit-sharing arrangements.<sup>70</sup> This document has been through a number of drafts, the most recent of which was prepared for the third Intersessional Working Group, which met from February 28 to March 4, 2011.<sup>71</sup> This document, together with other documents prepared on the subjects of traditional knowledge and traditional cultural expressions, are to be taken into account in “text-based negotiations” by the IGC, ultimately with to the goal of formulating an international treaty.

At the Seventeenth Session of the IGC, which met in Geneva, December 6 to 10, 2010, the Secretariat identified the options which were then under consideration.<sup>72</sup> There were three categories of options: (1) those concerning the defensive protection of genetic resources; (2) those in relation to disclosure requirements; and (3) those concerning the IP aspects of access and benefit-sharing.

In relation to defensive protection, one category of options was the compilation of an inventory of existing periodicals, databases and other information resources which document disclosed genetic resources, with a view to discussing a possible recommendation that certain periodicals, databases and information resources may be considered by International Search Authorities for integration into the minimum documentation list under the Patent Co-operation Treaty. The second option concerned the extension of the Online Portal of Registries and Databases, established by the Committee at its third session, to include existing databases and information systems for access to information on disclosed genetic resources. A third option was for the formulation of recommendations or guidelines for search and examination procedures for patent applications to ensure that they better take into account disclosed genetic resources.

Options on disclosure requirements included the development of a mandatory disclosure requirement. Alternatively, it was proposed that the IGC could consider whether there is a need to develop appropriate (model) provisions for national or regional patent or other laws which would facilitate consistency and synergy between access and benefit-sharing measures for genetic resources and between national and international intellectual property law and practice. Another disclosure option was the development of guidelines or recommendations concerning the

---

<sup>70</sup>WIPO (2004) WIPO Doc., WIPO/GRTKF/IC/17/INF/10.

<sup>71</sup>WIPO (2011) WIPO Doc., WIPO/GRTKF/IWG/3/12.

<sup>72</sup>“Genetic Resources: Revised List of Options and Factual Update” WIPO/GRTKF/IC/17/6, September 15 (2010b).

interaction between patent disclosure and access and benefit-sharing frameworks for genetic resources.

On May 6, 2010, the delegations of Australia, Canada, New Zealand, Norway and the United States of America submitted a working document<sup>73</sup> on GR for the seventeenth session of the IGC held December 6 to 10, 2010. Comments on this document<sup>74</sup> were made by the Delegations of Chile, Colombia and the Russian Federation and a number of accredited observers, which resulted in a revised document identifying five objectives with underlying principles.<sup>75</sup> On December 8, 2010, the Delegation of Angola submitted the proposals of the African Group.<sup>76</sup> This suggested the commencement of negotiations on a mandatory disclosure requirement and an appropriate way to ensure prior informed consent and fair and equitable benefit sharing, in line with the Nagoya Protocol. The African proposal suggested that negotiations be based upon two current proposals on a mandatory disclosure requirement,<sup>77</sup> and the incorporation of the “internationally recognized certificate of compliance” as stipulated in the Nagoya Protocol, together with any other submission that may be tabled by member countries. In relation to the option for guidelines and recommendations on defensive protection, the African Group proposed consideration of the use of available databases on GR and/or associated Traditional Knowledge (TK).

The African Group proposed a number of amendments to the Submission made by Australia, Canada, New Zealand, Norway, and the United States of America. The common position between all groups of countries is that the objectives of the mandatory disclosure requirement should be: (1) the use of GRs and associated TK should be on the basis of benefit sharing; (2) patents should not be granted for inventions that are not novel or inventive in light of genetic resources and/or associated traditional knowledge; (3) patent offices should have available the information needed to make proper decisions on patent grant; (4) the principles developed should consistent with other international and regional instruments and processes; and (5) IP should maintain a role in promoting creativity and innovation. At the Third Intercessional Working Group of the IGC, which met from February 28 to March 4, 2011, a Working Group was appointed to review and rationalize the various Objectives and Principles which had been received by the IGC. The Working Group had a goal of clarifying the key and divergent policy positions

and issues that the IGC would need to make informed decisions. This report<sup>78</sup> is to be transmitted to the IGC for its consideration at its 18th session (May 9 to 13, 2011).

### **6.13 Farmer's Rights Under the International Treaty on Plant Genetic Resources for Food and Agriculture (ITPGRFA)**

The concept of Farmers' Rights was developed as "a counterbalance to intellectual property rights."<sup>79</sup> This was a moral commitment by the industrialised commitment to reward "the past present and future contributions of farmers in conserving, improving and making available plant genetic resources particularly those in centres of origin/diversity". Farmers' rights were intended to promote a more equitable relation between the providers and users of germplasm by creating a basis for farmers to share in the benefits derived from the germplasm which they had developed and conserved over time.<sup>80</sup>

The first international enactment of Farmers' Rights occurred in the FAO International Treaty on PGRFA.<sup>81</sup> The preamble to the Treaty acknowledges that "the conservation, exploration, collection, characterization, evaluation and documentation of plant genetic resources for food and agriculture are essential in meeting the goals of the Rome Declaration on World Food Security and the World Food Summit Plan of Action and for sustainable agricultural development for this and future generations." It also acknowledges that PGRFA "are the raw material indispensable for crop genetic improvement" and affirms "that the past, present and future contributions of farmers in all regions of the world, particularly those in centres of origin and diversity, in conserving, improving and making available these resources, is the basis of Farmers' Rights."

The Preamble outlines that that "fundamental to the realization of Farmers' Rights, as well as the promotion of Farmers' Rights at national and international levels" are the rights "to save, use, exchange and sell farm-saved seed and other propagating material, and to participate in decision-making regarding, and in the fair and equitable sharing of the benefits arising from, the use of plant genetic resources for food and agriculture."

Under Art. 5.1 (c) the Contracting Parties agree, subject to national legislation, to promote or support, as appropriate, farmers and local communities' efforts to manage and conserve on-farm their plant genetic resources for food and agriculture

---

<sup>78</sup>Draft Objectives and Principles Relating to Intellectual Property and Genetic Resources Prepared at IWG 3', WIPO/GRTKF/IWG/3/17, March 16, 2011.

<sup>79</sup>IWG (2011) Draft Objectives and Principles Relating to Intellectual Property and Genetic Resources Prepared at IWG 3, WIPO/GRTKF/IWG/3/17.

<sup>80</sup>Glowka (1998).

<sup>81</sup>International Treaty on PGRFA.

and in Art. 51 (d) to promote *in situ* conservation of wild crop relatives and wild plants for food production, by supporting, *inter alia*, the efforts of indigenous and local communities.

In Art. 9(1) of the Treaty the Contracting Parties “recognize the enormous contribution that the local and indigenous communities and farmers of all regions of the world, particularly those in the centres of origin and crop diversity, have made and will continue to make for the conservation and development of plant genetic resources which constitute the basis of food and agriculture production throughout the world.”

Article 9.2 of the WTO International Treaty on PGRFA envisages that “the responsibility for realizing Farmers’ Rights, as they relate to Plant Genetic Resources for Food and Agriculture, rests with national governments” and that national legislation should include measures relating to:

- (a) protection of traditional knowledge relevant to plant genetic resources for food and agriculture;
- (b) the right to equitably participate in sharing benefits arising from the utilization of plant genetic resources for food and agriculture;
- (c) the right to participate in making decisions, at the national level, on matters related to the conservation and sustainable use of plant genetic resources for food and agriculture.

Finally, Article 9.3 provides that the Article shall not be interpreted “to limit any rights that farmers have to save, use, exchange and sell farm-saved seed/propagating material.”

An assumption of Article 9 is that the landraces used by traditional farmers are a dynamic genetic reservoir for the development of new varieties and for the transmission of desirable genetic traits. The traditional knowledge of local and indigenous communities is similarly perceived. Farmers in subsistence systems have tended to utilize a diverse selection of crop species in order to assure their annual harvests and thus to guarantee a minimal level of production and to prevent food shortage. In many instances, seed production has involved the collection and domestication of locally known, wild varieties. Modern agricultural practices depend on crop species that promote productivity and resistance to disease that can only be maintained with the continuous input of new germ plasm. The diversity of landraces and the associated information on their specific qualities contribute invaluable information to formal breeding processes. It has been noted that the loss of biological diversity is paralleled by the loss of traditional knowledge. Where a plant variety becomes extinct, then the entire body of knowledge about its properties is condemned to irrelevancy.

As a means of remunerating these groups for their past contributions to the development of plant genetic resources for food and agriculture production, there can be little argument, except about the quantum and distribution of this remuneration. Inevitably, any calculation of the equitable share, which traditional farmers and indigenous communities might enjoy under a Farmers’ Rights or Traditional Knowledge regime, will be arbitrary. However, the intellectual property system is

no stranger to arbitrary calculations; thus, the 20 year length of a patent term is intended to provide an opportunity for the compensation of all inventors, whatever the area of technology. Similarly the 25 years exclusivity which the UPOV Convention provides for new varieties of trees and vines, takes no account of variations in R & D costs between the different varieties.

The principal ways in which plant genetic resources are translated into food and agriculture production is through plant breeding and plant patenting. Standing at the heart of a Farmers' Rights regime is the concept of the equitable benefit sharing of benefits with farmers for their contribution to innovations in plant breeding and plant patenting.<sup>82</sup>

Article 9.2 obliges the Contracting Parties to the Plant Genetic Resources Treaty "to take measures", subject to their national legislation to protect and promote Farmers' Rights. The content of these rights is defined in the balance of that provision and embraces the protection of traditional knowledge, equitable benefit sharing and the right to participate in decision making. The Treaty leaves open the legal context within which Farmers' Rights are to be enacted.

The only measure which has been implemented to provide for Farmers Rights is the International Fund for Plant Genetic Resources, which was envisaged in the Undertaking which preceded the Treaty. This Fund was to operate as a means of capacity building in the field of agricultural biotechnology in developing countries rather than as a reward to individual farmers or farming communities for their contribution to the development or improvement of plant varieties. However, to date this fund has not been established because funds were not made available by donor countries.

## 6.14 Recent Developments on Farmers' Rights

At its Third Session in Tunis in 2009, the Governing Body of the ITPGRFA adopted a resolution on Farmers' Rights (Resolution 6/2009), in which it requested the Secretariat to convene regional workshops on Farmers' Rights, subject to the agreed priorities of the Programme of Work and Budget and to the availability of financial resources. The aim of the workshops was to discuss national experiences on the implementation of Farmers' Rights as set out in Article 9 of the International Treaty, involving, as appropriate, farmers' organizations and other stakeholders.<sup>83</sup>

The fourth session of the Governing Body of the ITPGRFA held from March 14 to 18, 2011, in Bali, Indonesia adopted a resolution on Farmers' Rights that, *inter alia*:

<sup>82</sup>Blakeney (2007).

<sup>83</sup>IT/GB-4/11/Circ. 1 (2010) Fourth Session of the Governing Body. Global Consultations on Farmers' Rights in 2010.

- requests the Secretariat to convene regional workshops on Farmers' Rights, subject to availability of funding;
- encourages parties to submit views, experiences and best practices on the implementation of Farmers' Rights;
- invites parties to consider convening national and local consultations on Farmers' Rights with the participation of farmers and other stakeholders;
- requests the Secretariat to collect and submit these views, as well as reports from regional workshops to GB 5; and
- encourages parties to engage farmers' organizations and relevant stakeholders in matters related to the conservation and sustainable use of PGRFA, through awareness raising and capacity building.<sup>84</sup>

## 6.15 International Proposals for the Protection of Traditional Knowledge

The first international consideration of the protection of traditional knowledge (TK) occurred in a joint UNESCO/WIPO World Forum on the Protection of Folklore that convened in Phuket, in April 1997. The meeting was comprised of representatives of organizations of indigenous peoples calling for the promulgation of an international convention to protect Traditional Knowledge. WIPO responded in its 1998–1999 biennium by instituting a schedule of regional fact-finding missions “to identify and explore the intellectual property needs, rights and expectations of the holders of traditional knowledge and innovations, in order to promote the contribution of the intellectual property system to their social, cultural and economic development.” Australia was chosen as the first port of call for such expert, fact-finding mission, which visited Darwin and Sydney from June 14 to 18, 1998. During 1998 and 1999, similar expert missions visited, Peru, South Africa, Thailand, and Trinidad and Tobago. Finally, in November 1999, WIPO convened a World Forum on Traditional Knowledge.<sup>85</sup>

Following the failure of the Seattle Ministerial in November 1999, WIPO became the focus of agitation for the inclusion of traditional knowledge within the international intellectual property regime. In a Note dated September 14, 2000, the Permanent Mission of the Dominican Republic to the United Nations in Geneva submitted two documents on behalf of the Group of Countries of Latin America and the Caribbean (GRULAC) as part of the debate on in the WIPO General Assembly on “Matters Concerning Intellectual Property and Genetic Resources, Traditional

---

<sup>84</sup>Earth Negotiations Bulletin (2011) Summary of the Fourth Session of the Governing Body of the International Treaty on Plant and Genetic Resources for Food and Agriculture: 14–18 March 2011. 9(550) <http://www.iisd.ca/download/pdf/enb09550e.pdf>.

<sup>85</sup>WIPO/IP/CAI/1/03/12 (2003) Intellectual Property, Traditional Knowledge, and Genetic Resources.

Knowledge and Folklore.”<sup>86</sup> The central thrust of these documents was a request for the creation of a Standing Committee on access to the genetic resources and traditional knowledge of local and indigenous communities. “The work of that Standing Committee would have to be directed towards defining internationally recognized practical methods of securing adequate protection for the intellectual property rights in traditional knowledge.”<sup>87</sup>

In order to clarify the future application of intellectual property to the use and exploitation of genetic resources and biodiversity, and also to the use of traditional knowledge, it was suggested that the Committee should clarify: (a) the notions of public domain and private domain; (b) the appropriateness and feasibility of recognizing rights in traditional works and knowledge currently in the public domain, and investigating machinery to limit and control certain kinds of unauthorized exploitation; (c) recognition of collective rights; (d) model provisions and model contracts with which to control the use and exploitation of genetic and biological resources, and machinery for the equitable distribution of profits in the event of a patentable product or process being developed from a given resource embodying the principles of prior informed consent and equitable distribution of profits in connection with the use, development and commercial exploitation of the material transferred and the inventions and technology resulting from it; (e) the protection of undisclosed traditional knowledge.<sup>88</sup>

## 6.16 WIPO Intergovernmental Committee

At the WIPO General Assembly, the Member States agreed on the establishment of an Intergovernmental Committee on Intellectual Property and Genetic Resources, Traditional Knowledge and Folklore. Three interrelated themes were identified to inform the deliberations of the Committee: intellectual property issues that arise in the context of (1) access to genetic resources and benefit sharing; (2) protection of traditional knowledge, whether or not associated with those resources; and (3) the protection of expressions of folklore.<sup>89</sup>

Despite this agreement, the work of the IGC has been very slow in practice. During the first 10 years of its existence, the IGC has concentrated on the formulation of “objectives” and “principles” which should animate the protection of

<sup>87</sup>*Ibid.*, Annex I, 10.

<sup>88</sup>WIPO/IP/UNI/DUB/04/10 Intellectual Property, Traditional Knowledge, and Genetic Resources: Policy, Law, and Current Trends.

<sup>89</sup>WIPO Matters Concerning Intellectual Property and Genetic Resources Traditional Knowledge and Folklore. WPO Doc, WO/GA/26/6, August 25, 2000.

TCEs and TK.<sup>90</sup> The African group of countries at WIPO were in the forefront of agitation to accelerate the international negotiations. A true reflection of their appreciation of the realistic likelihood of action was the promulgation by a diplomatic conference on August 9–10, 2010, in Swakopmund, Namibia, organized by the African Regional Intellectual Property Organization (ARIPO) of a Protocol on the Protection of Traditional Knowledge and Expressions of Folklore. The Protocol was meant to “protect creations derived from the exploitation of traditional knowledge in ARIPO member states against misappropriation and illicit use through bio-piracy.” The protocol is also intended to prevent the “grant of patents in respect of inventions based on pirated traditional knowledge . . . and to promote wider commercial use and recognition of that knowledge by the holders, while ensuring that collective custodianship and ownership are not undermined by the introduction of new regimes of private intellectual property rights.”

A brief palpitation of enthusiasm on the international front was generated in October 2010, when the 17th session of the IGC, to be held December 6–10, 2010, was identified as the occasion for the first text-based discussion of the establishment an international TK and EC regime. However, the results of this session were not so exciting.<sup>91</sup> An “informal drafting group” was set up to provide a text on Traditional Cultural Expressions for the next meeting of the IGC on May 9–13, 2011. Further proposals for the protection of TK were made by a number of countries, and were considered by an Intercessional working group which met from February 21 to 25, 2011.

The slowness of the developments at WIPO reactivated Pacific considerations for a regional solution. The Pacific Island states made a decision to avail themselves of technical assistance being made available by the EU as part of the Partnership Agreement between the members of the African, Caribbean and Pacific (ACP) Group of States and the European Union (EU). The “Cotonou Agreement” was signed on June 23, 2000, and continued for a 20-year period from March 2000, to February 2020. Two EU projects were initiated under this Agreement. The first, entitled: “Technical Assistance to the Pacific Regional Action Plan for Traditional Knowledge Development,”<sup>92</sup> has a specific objective of providing technical assistance for the establishment of national systems of protection for TK in six of the member states of the Pacific Islands Forum (namely Cook Islands, Fiji, Kiribati, Palau, Papua New Guinea and Vanuatu). The second project aims to provide technical assistance to study the “Feasibility of a Reciprocal Recognition and Enforcement Mechanism,” for TK between Fiji, PNG, Solomon Islands, the so called Melanesian Spearhead Group (MSG) countries.<sup>93</sup>

---

<sup>90</sup>The most recent contribution in this regard is a document of 7 June 2010 on the ‘Protection of Traditional Cultural Expressions/Cultural expressions of Folklore: Revised Objectives and Principles’, which was prepared for the 17th meeting of the IGC in December 2010, WIPO/GRTKF/IC/17/4Prov.

<sup>91</sup>See Decisions of the Seventeenth Session of the IGC, 10 December 2010 at [http://www.wipo.int/meetings/en/details.jsp?meeting\\_id=20207](http://www.wipo.int/meetings/en/details.jsp?meeting_id=20207).

<sup>92</sup>Project No: 9.ACP.RPR.007.

<sup>93</sup>Blakeney (2011b).

The Terms of Reference for the latter project recognized that a regional approach would operate as a parallel, viable, and faster alternative to the international developments. Additionally, any future collective arrangement would not preclude other countries from the wider Pacific region to participate in the system. These developments would instruct and inform global treaty making processes currently taking place in institutions such as WIPO and possibly lead to engagement with other like-minded regions given the slow impetus to conclude a global regime for TK at WIPO, the World Trade Organization (WTO), and the Convention on Biological Diversity (CBD).

Both projects have been productive. National mapping of TK and EC has been conducted in the target states, draft IP laws and policies have been formulated for Fiji, PNG and the Solomon Islands, and a collaboration treaty has been drafted for the MSG states. The Treaty was submitted to the 18th Melanesian Spearhead Group Leaders' Summit in Suva on March 31, 2011, which "agreed in principle pending decisions by members on the signing of the Treaty". The Government of Fiji proposes to sign the Treaty in May 2011, and the Governments of PNG and Vanuatu are currently undertaking in-country consultations on the Treaty before their Governments sign the Treaty.

## 6.17 Substantive Patent Law Treaty

In an endeavour to reach a consensus on substantive patent law issues, a Committee of Experts and WIPO's Standing Committee on Patents (SCP) considered a draft Patent Law Treaty (PLT) prepared by the International Bureau of WIPO. The draft PLT dealt with various procedural aspects of patenting. At the third session of the SCP in September 6–14, 1999, the delegation of Colombia proposed the introduction into the PLT as a means of achieving some global harmonization of patent registration procedures. The article provided that:

1. All industrial protection shall guarantee the protection of the country's biological and genetic heritage. Consequently, the grant of patents or registrations that relate to elements of that heritage shall be subject to their having been acquired made legally.
2. Every document shall specify the registration number of the contract affording access to genetic resources and a copy thereof whereby the products or processes for which protection is sought have been manufactured or developed from genetic resources, or products thereof, of which one of the member countries is the country of origin.

This proposal generated a heated debate about whether it raised a matter of procedural or substantive patent law. An agreement was eventually reached to defer consideration of this proposal to the occasion of the discussion of a proposed

Substantive Patent Law Treaty.<sup>94</sup> The SCP requested the International Bureau to include the issue of protection of biological and genetic resources on the agenda of a Working Group on Biotechnological Inventions, to be convened at WIPO in November 1999. The following month, the Working Group recommended the establishment of nine projects related to the protection of inventions in the field of biotechnology. The Working Group decided to establish a questionnaire for the purpose of gathering information about the protection of biotechnological inventions in the Member States of the WIPO, including certain aspects regarding intellectual property and genetic resources.<sup>95</sup>

An alternative approach to the protection of traditional knowledge is the recognition of such knowledge as part of “prior art.” Prior art calls into question the novelty and inventive of inventions which are the subject of patent applications. The practical difficulty that patent examiners have in identifying relevant traditional knowledge as prior art arises from the fact that they do not have access to traditional knowledge information in classified non-patent literature. The problem is exacerbated because there are no effective search tools for the retrieval of such information. The WIPO IGC has begun to address practical measures to establish linkages between IP Offices and traditional knowledge documentation initiatives. A number of the characteristics of traditional knowledge present difficulties in identifying the effect of prior art on technological information. These include:

- (a) The transmission of traditional knowledge through oral communication. This requires the codification and fixation of traditional knowledge into what it is not.
- (b) Traditional knowledge systems tend to dynamic evolution without necessarily being identified as “new”.
- (c) Traditional knowledge is expressed in local languages and its expression is contingent upon such languages.
- (d) The transfer of knowledge from oral into written, printed, and electronic forms may involve a cultural, semantic, and symbolic transformation of the knowledge, which may affect the value of databases as a tool for the conservation of culture and knowledge.
- (e) As knowledge must be in the public domain to be considered as prior art, this may provide some difficulties in those communities where knowledge is to be kept confidential.<sup>96</sup>

The draft Substantive Patent Law Treaty, which was submitted to the fifth session of the WIPO’s Standing Committee on the Law of Patents (SCP), held in Geneva from May 14 to 19, 2001, contained two alternatives for a draft article on the definition of prior art. The draft provisions on the definition of prior art provide

that any information made available to the public, anywhere in the world, in any form, including in written form, by oral communication, by display and through use, shall constitute prior art, if it has been made available to the public before the filing date, or, where applicable, the priority date.<sup>97</sup>

## 6.18 TRIPS Agreement

One contemporary impetus for the formulation of international positions on the protection of traditional knowledge is the debate concerning review of Art. 27.3 (b) of the plant variety provision of the TRIPs Agreement.<sup>98</sup> Review of this provision was mandated by the TRIPs Agreement itself, and was to be completed by the end of 1999. Developing country participants in the review process have suggested. These provisions provide for equitable sharing of the benefits of the utilization of traditional medical knowledge with indigenous peoples.<sup>99</sup>

The African Group of countries proposed the inclusion of this issue in the Ministerial Conference to set the agenda for the Seattle Round of the WTO.<sup>100</sup> On July 25, 1999, a federation of Indigenous Peoples groups issued a statement for the purposes of the review, pleading for a legislative structure which, “Builds upon the indigenous methods and customary laws protecting knowledge and heritage and biological resources” and which prevents the appropriation of traditional knowledge and integrates, “the principle and practice of prior informed consent, of indigenous peoples as communities or as collectivities.” The Statement concluded with an affirmation of the commitment of Indigenous Peoples “to sustain our struggle to have our rights to our intellectual and cultural heritage and our lands and resources promoted and protected.”

On October, 4, 1999, Bolivia, Columbia, Ecuador, Nicaragua, and Peru specifically proposed that the Seattle Ministerial Conference establish a mandate within the framework of the Round:

- (a) To carry out studies, in collaboration with other relevant international organizations in order to make recommendations on the most appropriate means of recognizing and protecting traditional knowledge as the subject matter of intellectual property rights.
- (b) On the basis of the above-mentioned recommendations, initiate negotiations with a view to establishing a multilateral legal framework that will grant effective protection to the expressions and manifestations of traditional knowledge.

<sup>99</sup>See Blakeney (1998/1999).

<sup>100</sup>*Communication to the WTO from Kenya, on behalf of the African Group*, WT/GC/W/3026, August 1999.

(c) To complete the legal framework envisaged in paragraph (b) above in time for it to be included as part of the results of this round of trade negotiations.<sup>101</sup>

A communication of August 6, 1999, from Venezuela proposed that the Seattle Ministerial should consider the establishment, “on a mandatory basis within the TRIPS Agreement a system for the protection of intellectual property, with an ethical and economic content, applicable to the traditional knowledge of local and indigenous communities, together with recognition of the need to define the rights of collective holders.”<sup>102</sup>

A practical proposal for the integration of traditional knowledge with intellectual property rights can be found in India’s suggestion that material transfer agreements be required where an inventor wishes to use biological material identified by traditional knowledge. That obligation would be incorporated through inclusion in Article 29 of the TRIPs Agreement, the requirement that the country of origin of source material be identified in patent applications.<sup>103</sup> Following the failure of the Seattle Ministerial, this agitation for the inclusion of traditional knowledge within the international intellectual property regime shifted to WIPO until it was picked up again at the Doha Ministerial.

Following the Doha approach, amendments have been proposed to the TRIPS Agreement (Art. 29*bis*) that would require WTO Members to oblige patent applicants to disclose the source of any traditional knowledge and to provide evidence of compliance with the source country’s legal requirements of prior informed consent for access and fair and equitable benefit sharing arising from the utilization of the traditional knowledge. The African Group of Countries have proposed that as part of the review of Art. 27.3(b), TK should be protected as a “category of intellectual property rights”.<sup>104</sup> The scheme of protection which they proposed would include the grant of rights to local or traditional communities concerning (1) respect for those communities on the commercialization of TK; (2) prior informed consent to the use of that TK; (3) full remuneration; and (4) the prevention of unauthorized third parties from utilizing that TK and incorporating that TK into any article or product.

Debate is still continuing within the TRIPS Council as to the whether it has a mandate to amend TRIPS by the inclusion of an Art. 29*bis* or whether that discussion is to be confined to the implementation of the existing text.

## 6.19 Convention on Biological Diversity

The Rio Declaration stated in Principle 22 that ‘Indigenous peoples and their communities. . .have a vital role in environmental management and development because of their knowledge and traditional practices’. Chapter 26 of Agenda 21 detailed the relationship which conference participants recognised between indigenous peoples and their lands. The Agenda, at para. 26.3(a), required governments:

- to establish a process to empower indigenous peoples and their communities’ through measures that include:
- recognition of their values, traditional knowledge and resource management practices with a view to promoting environmentally sound and sustainable development;
- enhancement of capacity—building for indigenous communities based on the adaptation and exchange of traditional experience, knowledge and resource-management practices, to ensure their sustainable development;
- establishment, where appropriate, of arrangements to strengthen the active participation of indigenous peoples and their communities in the national formulation of policies, laws and programs relating to resource management and other development processes that may affect them.

## 6.20 Conclusion

The application of IPRs to genetic resources has become a pronounced feature of agricultural innovation in the past decade. The Food and Agriculture Organization of the United Nations (FAO) Panel of Eminent Experts on Ethics in Food and Agriculture has observed that, “while most innovation for food and agriculture does not depend on IPRs, the acquisition and exercise of IPRs in this field raise a variety of ethical concerns.<sup>105</sup>” These concerns include the fact that “IPRs protection may just mean the lack of access to innovations for the poor” and concerns regarding the “patenting of merely isolated genes, the basic building blocks of life”, which “are not invented, but are part of nature.” Further, the ability of individuals and corporations to obtain proprietary rights over agricultural innovations has important implications for food security.<sup>106</sup> This is increasingly important as the expenses and general transactional costs of patenting have tended to concentrate such IPRs in a few hands. In effect, IPRs on genetic resources may impede the use of these resources for further research and breeding by third parties during the term of protection, and thereby inhibit the development of new products and the capacity

---

<sup>105</sup>FAO (2005).

<sup>106</sup>Blakeney (2009).

to address emerging problems, such as agricultural stresses caused by climate change.

The IPRs landscape confronting countries is dominated by the TRIPS Agreement. However, that Agreement contains a number of flexibilities. First, it allows the exclusion of plants and animals (whether genetically modified or not) from patent protection. Secondly, the criteria under which patents are granted, i.e. novelty, and inventive step and industrial applicability, may exclude materials identified through the application of traditional knowledge or genetic resources which exist in nature (even if isolated), as well as microorganisms. Article 30 of the TRIPS Agreement provides that, "Members may provide limited exceptions to the exclusive rights conferred by a patent, provided that such exceptions do not unreasonably conflict with a normal exploitation of the patent and do not unreasonably prejudice the legitimate interests of the patent owner, taking account of the legitimate interests of third parties." Thus, patent laws may allow third parties to undertake research and breeding during the patent term and farmers may be granted the right to save and re-use seeds where plant varieties, or certain components thereof, are subject to patent protection, in a way similar to the 'farmer's privilege' under PVP.

Over the last few years, there has been a significant amount of patenting in relation to genetic material which might be useful in permitting organisms to resist the stresses of climate change. This patenting mirrors the high market concentration levels which have already been observed in the seed industry and the control of patent thickets by a small number of companies. It should be noted in this regard, both in relation to patent rights and PVP that national laws may provide for compulsory licenses in situations of national emergency. There is also a possibility for the intervention of the competition authorities to remedy abuses in the exercise of patent rights.

The practical effects of the application of IPRs to genetic resources, is reflected in the actions which are brought for infringements of IPRs. To date, these actions have mainly been brought against farmers who have cultivated patented GM crops without the permission of the relevant rights holder, as well as actions against importers of products containing patented GM ingredients. Potential IPR liability lies against governments, research institutes (international and national) and seed breeders who supply or utilize proprietary technologies. The TRIPS Agreement establishes machinery to deal with international trade in infringing goods. This machinery is currently being supplemented by the proposed Anti-counterfeiting Trade Agreement (ACTA), of which the final text was settled on 3 December 2010.

## Chapter 7

# Textbox: Cross-Contamination, Genetic Drift, and the Question of GMO Co-existence with Non-GM Crops

Gabriela Steier

**Abstract** Genetically Modified Crops (GMOs or GE crops) cannot co-exists with organic and heirloom crops. GMOs decimate their organic ancestors at the expense of agrobiodiversity and with little regard for environmental consequences. The pollen of monoculture plants cross-pollinates plants of the same species that may be quite far away in a process called genetic drift. This would be natural and necessary if it were not for the unnatural and dangerous traits that are inserted into GMOs through human hands, thereby often recklessly infiltrating organic or heirloom plants with GMO traits.

The pollen of most agricultural crops, especially in monocultures on vast and flat areas, is light enough to travel many kilometers and, thereby, cross-pollinate plants of the same species that may be quite far away. This so-called cross-pollination is naturally necessary in many cases to combine genetic material and make the seeds of the respective plant species viable for recombination and proliferation of genetic material. Such traveling plant genetic material through the wind or via pollinators is called genetic drift. Nonetheless, where GM crops are planted, such as sugar beets, corn, wheat or rape, organic and non-GM crops are cross-contaminated by the pollen of GM plants, thereby unintentionally but often recklessly infiltrating plants with GMO traits.

Unfortunately, the dangerous cross-contamination of non-GM crops with GM pollen is inevitable anywhere around the world, because wind and pollinators, such as insects (e.g. bees and butterflies), birds and bats, carry seeds from GM field test sites or GM agricultural fields to organic and non-GM fields. Thus, co-existence is merely a way of masking the disastrous infection of organic and non-GM crops with unpredictably dangerous GMOs. The EU has buffer zones in place that strive to prevent the few GMOs that are grown in the European territory to cross-contaminate other crops. In the US, however, any preventive measures are likely to be less effective because there are massive field test sites, which often remain

undisclosed and vastly underregulated, and because GMOs, such as corn, soy, wheat, and citrus are broadly planted across the nation. Some of the largest field test sites are in Hawaii, Florida and California. Even when buffer zones or isolated field test sites are maintained and when pollen-impermeable mesh bags are placed on blossoms and flowering crops, genetic drift is facilitated by nature's little helpers, namely by pollinators. This natural and crucial carrying of plant genetic material from one plant to another is one of evolution's ways to ensure biodiversity, plant resistance to climate change and survival of the uncountable organisms, including humans, dependent on these plants for food. However, the dangerous cross-contamination by GMOs which are engineered to withstand high levels of toxic pesticide and fertilizer applications threaten these very qualities that wind and insect pollination are naturally designed to accomplish.

In addition, the genetic engineering for pest or pesticide resistance of GMOs also threatens vital pollinators by facilitating monocultures and increased pesticide and fertilizer, mainly synthetic, uses where GMOs are cultivated. While pesticide-producers and monoculture advocates claim to increase crop production, the planting of industrial scale GMOs endangers food safety and sustainability around the world. In the case of insect pollination, for example, similar to bird and bat pollination, which plays a major role in global agriculture and shows how dependent our food production system is on these most useful and vital little creatures, GMOs, intensive agriculture and monocultures cause a decline in pollinator populations. The FAO, for example, estimates that at least one-third of the world's agricultural crops depend upon pollination provided by insects and other animals. In fact, bees, birds and bats increase outputs of 87% of the leading food crops worldwide. Approximately 80% of all flowering plant species are specialized for pollination by animals, mostly insects. Nonetheless, GMOs, monocultures, intensive agriculture and pesticide use endanger pollinators and cause devastating consequences for the global food supply system while claiming to improve crop yields. Such myths of improved crop yields, however, externalize the consequences of unsustainable agriculture focus on short-lived profits for BigFood and BigAg and fail to take the bigger picture into account: environmental conservation and social integrity.

New and emerging legislation should address this bigger picture around the world and support food safety for a greener future rather than maintain current short-sighted profit margins and trade balances at the cost of unpredictably great damage to the planet. Therefore, reducing, isolating and restricting the cultivation of GMOs would not only promote sustainable agriculture and conserve pollinators, it would also promote a safer food supply systems around the world. The better GM crop cultivation can be controlled and restricted, the safer our food supply system will become.

Co-existence of GM and non-GM crops is not possible due to genetic drift and cross-contamination. Stricter laws that regulate and ban GMOs from agricultural systems, however, may be the most powerful way to protect food safety for the future and to reshape the food industry through a top-down (government to producer) approach.

# Chapter 8

## Continuing Legal Barriers to International Food Trade

Peter Berry-Ottaway and Sam Jennings

**Abstract** International trade in food has been ongoing for millennia. However, despite the activities of certain global organisations whose aim is to harmonise food standards to ensure free trade, there are numerous barriers to trade that occur worldwide. These include inconsistencies in food legislation between countries or regions; inconsistencies in agricultural and production practices; barriers relating to the accepted composition of, and ingredients in, foods; differences in acceptance of new technologies, such as food irradiation, genetic modification and nanotechnology; and health risk scares owing to contamination, adulteration or communicable diseases. Whilst the need for a fully harmonised global trade in food has not been disputed, the reality is that it is not likely to be achieved within the next two decades.

### 8.1 Introduction

The international trade of foods and food components can be traced back over millennia. Even though most food then was produced, traded and consumed locally, historically, there has been an emphasis on global trade in foods and food ingredients, as can be seen with spices. By the second half of the nineteenth and the first half of the twentieth centuries, significant volumes of foods were being shipped across the world. Records show, in the early twentieth century, Australia exported around 684,000 tons of meat (including beef, mutton and lamb) of which about 50 % of this amount went to South Africa, 20 % to the Philippines and 15 % to the United Kingdom.<sup>1</sup> Since the late twentieth century, both developed and developing countries have had to place a greater reliance on the importation of food from other countries. This reliance was particularly important during and after the Second

P. Berry-Ottaway (✉) • S. Jennings  
Berry Ottaway & Associates Ltd, Hereford, UK  
e-mail: [boa@berryottaway.co.uk](mailto:boa@berryottaway.co.uk); [spj@berryottaway.co.uk](mailto:spj@berryottaway.co.uk)

World War (1939–1945) when Europe had to become reliant on substantial food imports, primarily from North America.

A rapidly increasing world population, combined with increased urbanization and changes in agricultural policies led to a greater reliance on food importation in most parts of the world. Imports to be used in processing included commodities such as grains and meats, processed foods, specialist food ingredients and food additives. In the early twenty-first century, world food trade is estimated as being between US \$300 and \$400 billion per year.<sup>2</sup>

Food security, which is defined by the Food and Agriculture Organisation (FAO) as ‘a condition that exists where all people, at all times, have physical and economic access to sufficient, safe and nutritious food to meet their dietary needs and food preferences for an active and healthy life,<sup>3</sup>’ has become a key concern for governments. One commitment made by governments in the Rome Declaration on World Food Security in 1996 was, ‘We will strive to ensure that food, agricultural trade and overall trade policies are conducive to fostering food security for all, through a fair and market-oriented world trade system’.<sup>4</sup>

The United Kingdom (UK) is an example of a country with a strong reliance on global food sourcing, and which is in the top ten of world economies. UK government data for 2011 shows that 48.25 % of the country’s food supply was based on imports. Just over 20 % of the total food requirements came from five European Union countries (Netherlands, Spain, France, Irish Republic and Germany). Smaller, but economically significant, volumes came from a further 19 countries from across the globe, while food imports were recorded in smaller quantities from a further 144 countries. This data indicates that over 85 % of the countries in the world contributed to the food supply of the UK in 2011.<sup>5</sup>

## 8.2 Inconsistencies Causing Barriers to Trade

### 8.2.1 *Inconsistencies in Food Legislation*

Food legislation does not usually develop in a logical way. In most cases it is the result of a reactive response to circumstances, particularly those related to consumer protection, such as safety, adulteration or contamination.

Within most countries, food laws tend to develop around a cultural and parochial framework, and over the past century, little cognisance has been given to

<sup>5</sup>Department of the Environment, *Food and Rural Affairs of the United Kingdom Food Statistics Year Book* (2011).

international trade. Globally, this has resulted in numerous disparate laws embracing the same areas of control.

This problem is well illustrated by the European Union (EU) where full harmonization of food legislation across the member states has not been achieved despite 45 years of intensive effort. Between 1965 and 2000, agreement in several legislative areas could not be reached when the European Community was relatively small, and today many of the same issues are still being discussed in the early twenty-first century.

For example, important legislation on Nutrition and Health Claims for Foods was finally adopted at the end of 2006 after 26 years in gestation, with many compromises and poorly constructed requirements. The result has been that more than 10 years after its adoption, it has not been possible for the legislation to be fully implemented.<sup>6</sup>

During the time the Nutrition and Health Claims legislation was being discussed in the EU, work was in progress in a number of countries across the globe to develop legislation in the same area. Work to develop guidelines on health claims was initiated in Codex Alimentarius, (adopted in 1997), in an attempt to aid global harmonisation in this area.<sup>7</sup>

Although the Codex Alimentarius Commission has been developing and adopting detailed technical Standards and Codes of Practice for over 50 years, there are still major inconsistencies in the technical food legislation between the major economic blocs such as the United States of America (USA), the European Union (EU) and the Association of South East Asian Nations (ASEAN). Many individual countries across the world also have legislation that is not compatible with the major blocs.

Multi-national food companies often have to modify the formula of processed foods to comply with the legal requirements of a particular market. Food additives and chemical contaminants provide numerous examples where differences in legislative requirements between the major economic blocs, such as the USA and the EU, can have a significant effect on product development.

Differences in the permitted substances and maximum levels of use are particularly common in the food additive categories of preservatives, antioxidants, colors, sweeteners and emulsifiers. Although the USA and EU are active participants in the Codex Alimentarius Committee on Food Additives (CCFA) and are collaborating on the development of the Codex General Standard for Food Additives (GSFA), which is intended to harmonize the use of food additives across the world, these differences are significant enough to result in barriers to trade. The GSFA contains a comprehensive list of additives that are toxicologically acceptable for use in foods, together with specific provisions for the use of each additive in each of the recognized food categories.<sup>8</sup>

---

<sup>6</sup>European Parliament and Council Regulation (EC) No 1924/2006 on nutrition and health claims made on food. Official Journal of the EU. L404 of December 30, 2006.

<sup>7</sup>Codex Alimentarius, *Guidelines for Use of Nutrition and Health Claims*, CAC/GL 23 (1997).

<sup>8</sup>Codex General Standard for Food Additives (GSFA) Codex STAN 192-1995 as amended (2014).

In most cases, the provisions will include a maximum level of a specific food additive in a particular food category. The objective of the GFSA is to harmonize the use of food additives worldwide. However, due to the current disparate national approaches to the control of food additive usage, the achievement of the objective may still be a long way off.

### ***8.2.2 Inconsistencies in Agricultural and Production Practices***

Inconsistencies between major trading blocs in their approaches to agricultural and production practices can result in almost insurmountable barriers to international trade. This can be illustrated by the use of the hormone, recombinant bovine somatotropin (rBST). This substance is a veterinary medicine derived from a biotechnological process using recombinant DNA technology. The first patent for rBST was granted in the 1970s. Research going back to the late 1930s showed that the administration of rBST to lactating cows increased the milk yield by preventing mammary cell death. Until the mid-1980s, use in the dairy industry was limited, as the only source of the hormone was from dead cows. In the United States of America (USA), the Food and Drug Administration (FDA) had approved more than one source of rBST for use on dairy herds by 1994. The use in milk production in the USA was not without controversy, and there were a number of public campaigns to control the use of rBST. Some retailers made a point of marketing milk as being 'rBST free', although it was legal to use the hormone.<sup>9</sup>

The manufacturers of rBST then requested marketing authorization of their products as a veterinary medicine for use in the European Union (EU). These applications were originally referred to the EU Committee of Veterinary Medical Products (CVMP) in 1987, for assessment of the quality, safety and efficacy of the products.

In 1990, EU Regulation 2377/90 was adopted. This regulation introduced maximum residue limits (MRLs) for veterinary residues of active substances intended to be administered to 'food producing animals'. These residue limits applied not only to the milk but also to the meat and by-products of the animals.<sup>10</sup> Also in 1990, the European Council introduced a moratorium on the marketing of rBST, which was extended to the end of 1993.

Although the EU CVMP issued a positive opinion in 1993, which was in favor of the use of rBST, the European Commission proposed that the marketing of rBST should be prohibited. The moratorium was extended to the end of 1999. One of the

<sup>10</sup>European Council Regulation (EEC) No 2377/90 laying down a Community procedure for the establishment of maximum residue limits of veterinary medicinal products in foodstuffs of animal origin. Official Journal of the EU. L 224 of August 18, 1990.

reasons for extending the moratorium was political, based on the potential conflict of increasing milk production from the use of rBST with the strict EU-wide milk quotas on production.

In April 1999, the US FDA issued an analysis of the European report indicating that the findings did not appear to be consistent with the current state of scientific knowledge. The FDA maintained its determination that food products derived from cows treated with rBST were safe for consumers of all age groups, including infants. The Royal College of Physicians and Surgeons of Canada also concluded that there was no public health issue with the use of rBST on cows. Notwithstanding a number of reports from both national and international scientific committees, the Council of the European Union decided in December 1999 to an indefinite ban on the use of rBST in the European Union, effective beginning January 1, 2000. The reasons given in the ban were based on animal welfare, with the statement 'rBST is not used in cattle for therapeutic purposes, but only to increase milk production'. The European Commission concluded that scientific uncertainty remained over the use of rBST and further scientific studies were needed.<sup>11</sup>

The EU ban did not prohibit the production of rBST in the European Community provided that it was only exported to third countries. EU-based companies buying, producing or marketing rBST-based substances have to keep special registers, which must be made available to government authorities on request.

Curiously, the legislation imposing the EU ban did not prohibit the import into the European Community of meat or dairy products derived from rBST treated cows. This saga lasted for over 10 years and caused disagreements and barriers between the authorities in the USA and EU. It appears, in retrospect, to have had the science significantly influenced by politics, particularly in the EU. Issues used to justify the ban include internal agricultural policy on milk production, public health concerns, fears about a consumer backlash and finally, animal welfare concerns.

The long-running controversy has resulted in a situation where the USA and about 20 smaller countries have introduced legislation authorizing the use of rBST in cattle, while the use is not permitted in the EU, Canada, Japan, Australia and New Zealand. In addition, Codex Alimentarius has not yet approved the safety of rBST.

Another area of the food supply where there has been considerable controversy resulting in international barriers to trade is the genetic modification (GM) of foods and food ingredients. The World Health Organisation (WHO) defines genetic modification as:

Genetically modified foods are foods derived from organisms whose genetic material has been modified in a way that does not occur naturally, e.g. through the introduction of a gene from a different organism.<sup>12</sup>

---

<sup>11</sup>European Commission, *Commission proposes ban on market release and use of BST in the Union as of 1st January 2000*, EC Press release No IP/99/758 (1999).

<sup>12</sup>World Health Organization, *Genetically Modified Food* (2014).

GM, which is also known as genetic engineering or recombinant-DNA technology, was first applied in the 1970s. GM techniques can include:

- transferring genes from one organism to another;
- moving, modifying, deleting or multiplying genes within a living organism;
- modifying existing genes or constructing new ones, and incorporating them into a new organism.

A considerable amount of research into GM technology was carried out in the 1970s and 1980s. Some of the early food applications were the development of GM microorganisms to increase various factors such as the production rate and yield in fermentation processes used to manufacture a range of food ingredients. This use went virtually unnoticed until serious health problems arose during the production in Japan of the amino acid, tryptophan, in 1992. A number of human deaths and permanent disabilities were eventually attributed to a small number of batches of tryptophan, which had been produced using a GM version of the fermentation organism. A detailed investigation carried out by the authorities in the USA and Japan eventually concluded that the health problems were caused by a metabolite formed during the fermentation, which had not been removed by the subsequent filtration and clean-up stages. It was also concluded that the clean-up failure was due to the increased production rate overloading the process.<sup>13</sup>

While the GM organism itself was exonerated, the fatal consequences of its use had an impact on the scientific community around the world, as many at the time had not realized the extent of the commercialization of GM technology in the food sector.

The first commercially grown GM food crop was a tomato created in California, USA, in the early 1990s. The technology produced a tomato that took longer to decompose after being picked and therefore had an extended shelf-life. Called the 'FlavrSavr' tomato, it was sold internationally, including into Europe where it could be found on supermarket shelves by the mid 1990s.<sup>14</sup>

The major turning point in the international acceptance of GM foods occurred in the second half of 1996. Prior to this period, much of the commercial focus of GM food technology in the USA had been to introduce pesticide and herbicide resistant varieties of the major food crops such as maize, soya and rape. These particular varieties had the advantages of both reducing the workload on the farms and increasing the yield of the crops, particularly in view of the huge areas of these crops that were planted each year.

The first large-scale pilot planting of the modified maize and soya was scheduled for the 1996 season. The agreement between the seed suppliers and the US FDA was that all seeds from these test crops were to be isolated from other crops until tested and approved.

---

<sup>13</sup>Institute of Food Science and Technology UK, *Addition of Micronutrients to Food* (1997).

<sup>14</sup>*The Case of the FlavrSavr tomato*. California Agriculture, 54, (4) 6–7 (2000).

Unfortunately, this did not happen. It was discovered that a proportion of the test crops of both maize and soya had been added indiscriminately to the bulk of the unmodified crop, to the extent that many thousands of tons of unmodified maize and soya had been contaminated with the GM varieties to some degree.

This problem was exacerbated by the discovery that a significant quantity of the GM contaminated crop was destined for the European Union for use as both human and animal food. When the European Commission received the information that some of the contaminated maize and soya was already in transit, the Commission refused entry into the EU until the safety had been assessed.

When the news broke in Europe, there was a widespread public and media reaction, mainly in a number of northern states of the EU. The European protests then spread to the United States and other countries and led the national farmers' associations in the USA to warn their members of the economic risks of planting genetically modified crops. Some American-based food companies such as Gerber, Heinz and Nestle banned the use of GM crops in their products.

The European Union first of all instituted an informal prohibition on the import of all food derived from GM technology, and then followed this with a series of laws introducing the requirements for scientific safety assessments and official authorization, and the labelling of foods containing approved GM sources.<sup>15,16</sup>

A number of countries outside the EU also instituted strict controls or outright bans on foods and food ingredients derived from GM technology.

Public opinion against GMOs (genetically modified organisms) gained momentum worldwide through the late 1990s and early 2000s. This public reaction was so strong that European food companies would not manufacture or import foods in the EU if there was any suspicion of the food or any of its ingredients being involved in GM technology. A large dichotomy emerged between public acceptance in the USA and the EU and many other countries, with American consumers in general, being unconcerned.

In 2002, Zambia shocked the world by prohibiting the entry of GM maize into the country during a regional food shortage. The Zambian government's reason was that the maize was unacceptable on two counts: the first was that the Zambian government scientists considered that GM maize was of unproven safety; and the second was that as the maize was in the form of viable seeds, they could potentially be planted, thus providing a threat to Zambian agriculture and public health. The issue escalated when three neighboring African countries, Malawi, Mozambique and Zimbabwe, also banned the import of food-relief GM maize. South Africa offered to mill the maize seed to prevent it being grown and to ship the maize-meal

---

<sup>15</sup>European Parliament and Council Regulation (EC) No 1829/2003 on genetically modified food and feed. Official Journal of the EU. L 268 of October 18, 2003.

<sup>16</sup>European Parliament and Council Regulation (EC) No 1830/2003 concerning the traceability and labelling of genetically modified organisms and the traceability of food and feed products produced from genetically modified organisms and amending Directive 2001/18/EC. Official Journal of the EU. L 268 of October 18, 2003.

to the four countries. Three accepted this route, but Zambia rejected the import of the maize in any form.<sup>17,18</sup>

Although the EU subsequently introduced an authorization and labelling procedure for GM crops and food ingredients, there has been a great reluctance amongst both food manufacturers and consumers to accept GM foods.

Food manufacturers in Europe and many other countries have spent a very considerable amount of money and human resources on the 'Identity Preservation' procedures to guarantee that all imported foods and ingredients have not been derived from GM technology.

In retrospect, it can now be considered that the accidental, or deliberate, act of adding the GM trial seeds to the bulk of the 1996 harvest, has set back the acceptance and consequently the research into the GM technology of foods a number of decades. The result is that the world is now split between those economic blocs that accept, and even encourage, the development and production of GM foods and those who ban or very strictly control their use.

The sad consequence of the barriers to international trade that have been built up, is that the potential benefits of GM technology in terms of sustainable food supply, in both over-populated and developing countries, have been suppressed.

The introduction of new technologies, as illustrated by both the use of Bovine Somatotropin and genetic modification, needs to be carefully managed in order to gain consumer acceptance. Decades of research can be negated overnight by the public misunderstanding of the intention of the technology and the creation of a real or imagined health issue.

What is emerging is that the acceptance of scientific developments appears to show national and cultural trends. For example, when comparing the attitudes of consumers in the USA and the EU, the Americans, in general, appear to embrace new technologies in the food sector more enthusiastically than their European counterparts. The Europeans have developed a consciousness of potential health concerns, as can be seen in the general food law legislation, which includes the Precautionary Principle, while Americans tend to have a greater acceptance of the potential benefits of a new technology, such as improved quality, increased shelf-life or reduced cost. Thus, the benefit:concern ratio can be quite different between the two continents.

An analysis of the success of the recent introductions of new food technologies has indicated that too little regard has been given to the national and cultural aspects of consumer acceptance. This has led to protective legislation, and ultimately to barriers in international trade.

<sup>17</sup>Zambia bans GM Food Aid, *New Scientist*, October 30, 2002.

<sup>18</sup>Zambia and Genetically Modified Food Aid. Case study # 4-4 of the program: *Food policy for developing countries: The role of the government in the global food system* (2007).

### 8.3 Compositional Barriers to International Food Trade

A surprisingly large number of trade barriers arising in processed foods can be attributed to the way different legal regimes regulate the composition of the food. These can be as simple as differences between countries in the approved coatings for the waxing of lemons to reduce dehydration, or as complex as a plethora of different issues that can arise in a compounded food containing a number of components.

#### 8.3.1 *Food Additives*

As previously mentioned, inconsistencies between the food additive legislation of different economic blocs and individual countries has hindered the import and export of food products for many decades.

The problems arise for a number of reasons. One is from incompatible historic lists and maximum levels still used by countries. Probably the most important one is the national differences in their philosophical approaches to the use of food additives, which are mainly due to public health and safety concerns. Certain groups of additives have been particularly vulnerable to such concerns, such as synthetic colors, preservatives, antioxidants and intense sweeteners.

For example, the European Union has had a long-standing concern about a range of colors (mainly the azo dyes). Part of this concern relates to those colors, such as Sunset Yellow FCF, which may have an adverse effect on activity and attention in children.

The EU has for many years had strict controls on the use of the azo colors in foods. These controls include not only a restricted list of foods in which these colors can be used, but also relatively low maximum levels of use in these food categories. There are also restrictions on the total cumulative amounts of certain colors when used in combinations.

In 2008, following research suggesting a link between certain azo colors and 'Attention Deficit Hyperactivity Disorder' (ADHD) in children, a labelling requirement was placed on products intended for the European market that contained any of six colors. In 2008, EU legislation was amended to require the label statement '[name or E number of color] may have an adverse effect on the activity and attention in children'. This statement must appear on the label of all products intended for sale in the EU, including imported products (European Parliament and Council, 2008).<sup>19</sup>

The low levels and labelling requirements have generally not been adopted outside the EU.

---

<sup>19</sup>European Parliament and Council Regulation (EC) No 1333/2008 on food additives. Official Journal of the EU. L 354 of December 31, 2008.

A subsequent amendment removed Quinoline Yellow, Sunset Yellow FCF, Ponceau 4R and Cochineal Red A from the original table relating to maximum limits for combined colors. These four colors had specific maximum levels set for them in each relevant food category.

Another area of general inconsistency between countries in food additives legislation is that concerning intense sweeteners. Here an already confused situation was made worse with the introduction of a number of new sweeteners such as sucralose, stevia and trehalose.

The two earliest intense sweeteners, saccharine and cyclamate, became very controversial from the 1960s onwards. In 1969, following a single study showing that very high doses could cause bladder tumours in rats, cyclamates were prohibited in the USA and the UK.<sup>20</sup>

After several scientific reviews, the EU approved the use of cyclamates as sweeteners in foods in 1996, but with limitations on the foods in which they can be used and maximum levels of use in each category.<sup>21</sup> The USA continued with its ban, as did a number of other countries. The consequence was that in order to ensure trade across borders, large multinational companies were encouraged to search for intense sweeteners that would be more acceptable. Saccharine had already become controversial and another intense sweetener to enter the market was aspartame. Aspartame is a methyl ester of the aspartic acid/phenylalanine dipeptide and, as a low-calorie intense sweetener, is about 200 times sweeter than sugar, weight for weight.

Aspartame was approved by the FDA for use in dry food products in the USA in 1981, following a previous approval and stay of approval in 1974 and 1975, respectively.<sup>22</sup> It was approved in the UK and several other EU member states in 1982, and subsequently approved for use across the EU in 1994. During the period from the early 1980s to the mid-1990s, food products containing aspartame could not be traded across the EU, due to differences in controls. Current EU legislation restricts aspartame to specific product categories with maximum levels of use for each category<sup>18</sup>.

As aspartame contains phenylalanine, it is contra-indicated for patients suffering from Phenylketonuria. This being so, EU legislation requires that food and drinks containing aspartame have the warning statement 'contains a source of phenylalanine' on the product label. This labelling requirement is not required in many other countries where the use of aspartame is approved. As a consequence, products imported into the EU from these countries require customized labels or label over-stickers in order to comply.

---

<sup>20</sup>*Cyclamate sweeteners*, JAMA 25;236(17):1987–9 (1976).

<sup>21</sup>European Parliament and Council Directive 96/83/EC amending Directive 94/35/EC on sweeteners for use in foodstuffs. Official Journal of the EU. L 48 of February 19, 1997.

<sup>22</sup>United States General Accounting Office, *Food and Drug Administration Food Additive Approval Process Followed for Aspartame* (1987).

Since its FDA approval in 1981, aspartame has remained controversial. This controversy has continued into the twenty-first century and is largely centred on its safety due to several conspiracy theories relating to its approval by the FDA in the light of studies implying that high doses induced brain tumors in rats.

As a result of the controversy, there have been over 200 studies carried out on the sweetener, and a number of safety reviews carried out by both national and international expert committees.

An equally complex situation is emerging with a more recent intense sweetener, Stevia. Stevia is derived from the plant genus *Stevia* (family Asteraceae) which contains about 240 species. The plant of commercial concern is principally *Stevia rebaudiana*, extracts of which can have about 300 times the sweetness of sugar.

One of the first commercial cultivations of stevia took place in Japan following the controversies over saccharine and cyclamate. Steviosides were extracted from the plant leaves to produce the first stevia sweetener in Japan in 1971. It was widely used in Japan from the 1980s. Although used in Japan, China and some other Asian countries, stevia was not approved for use as a sweetener in other parts of the world for another two decades.

In the USA, the FDA accepted the addition of stevia leaves and extracts to dietary supplements from 1995, but only approved its use as a sweetener in foods (i.e. as a food additive) in 2008.<sup>23</sup> The EU permitted the use of steviol glycosides as a sweetener in specified categories of foods with specified maximum levels per category from 2011, but the general use of stevia leaves and extracts in foods is still prohibited. The steviol glycosides permitted as sweeteners in the EU must be in compliance with a detailed specification.<sup>24,25</sup>

Although stevia is currently permitted in a number of countries, there are significant inconsistencies in the permitted substances. The USA authorized Rebaudioside A as a sweetener; Brazil, stevioside extract; Russian Federation, stevioside; Mexico, mixed steviol glycoside extracts (not separate extracts); Australia and New Zealand, all steviol glycosides; and the EU, specified steviol glycosides. These differences have continued to result in barriers to international trade.

### 8.3.2 *Novel Foods and Ingredients*

A particularly difficult issue that can disrupt international food trade is that of novel foods and ingredients, including those resulting from novel technologies. These difficulties arise from the large variation in the levels of safety assessment required by countries before the new food or ingredient can be placed on the market. A consequence of these differences in requirements is that those countries that are less stringent tend to have the higher number of innovations.

Currently, one of the areas with the most stringent safety assessments is the EU, which has had legislation in place since 1997.<sup>26</sup>

In simple terms, the EU Novel Foods legislation prohibits any food, food ingredient or the product of a novel technology entering the EU market unless it has undergone a detailed safety assessment by the official EU scientific committee and has been approved by the European Commission. All approvals are published in the Official Journal of the EU, accompanied by any conditions of use or other specific requirements.

Only those foods or ingredients which can be demonstrated to have been sold in a significant amount in one or more EU member states before May 15, 1997 are exempt from the assessment. However, there is a provision in legislation adopted in 2006 for exempt foods or ingredients to be subject to this official assessment if a safety concern arises.

The data requirements for an application for approval of a novel food in the EU are considerable and include a full toxicological profile, detailed composition of the food or ingredient, confirmation of the consistency of the production process, and estimated intake/consumption data relevant to the EU member states. The cost of obtaining the data and the preparation and management of the application can be in excess of US \$250,000. Although the time taken to assess the application is given in the law, the clock is stopped each time the reviewing committee calls for additional information and only restarts when the requested information is submitted by the applicant. Experience has shown that the time from initial application to publication in the Official Journal can be from 2 to 7 years. The food cannot be placed on the EU market until the application is approved. Due to the complexity of the process, the application normally has to be made by the manufacturer of the food or ingredient and not by companies or individuals wanting to import the food or ingredient into the EU.

The effect of the EU novel foods legislation is that since its introduction in 1997, it has effectively inhibited innovation by the smaller companies. In the 19 years after the law came into force, only a relatively small number of applications had been authorized.

In 1997 the United States FDA issued a proposed rule that would establish a notification procedure whereby any person could notify the FDA of a determination

---

<sup>26</sup>European Parliament and Council Regulation (EC) No 258/97 concerning novel foods and novel food ingredients. Official Journal of the EU. L 43 of February 14, 1997.

by that person that the particular use of a substance is Generally Recognized as Safe (GRAS). For a substance to fall under the classification of GRAS in the USA, the scientific information about the use of the substance must be widely known and there must be a consensus amongst qualified experts that the data and information given for the substance indicates that it is safe under the conditions of intended use.

The GRAS notification program established by the FDA provided a voluntary mechanism whereby a person may inform the FDA of a determination that the use of a substance is GRAS, rather than petition the FDA to affirm that the use of the substance is GRAS.<sup>27</sup> The FDA then evaluates the submission to ascertain whether the notification provides a sufficient basis for the GRAS determination. The FDA can query any of the detail and may consult with other agencies.

Following this evaluation, the FDA can respond in three ways. The first is a letter stating that the FDA does not question the basis for the notifier's determination of GRAS. This letter may also contain conditions of use or specific labelling requirements. The second type of response is when the FDA concludes that the notification does not provide a sufficient basis for a GRAS determination. For example, it does not include appropriate data or information, or because the available data and information supplied raises questions about the safety of the substance. A third response can be where the FDA, at the notifier's request, ceases the evaluation of the GRAS notification. The FDA maintains an inventory of the notifications and its responses. In the first 8 years from its introduction, over 200 GRAS notices were filed.

Australia and New Zealand have introduced a novel foods assessment procedure that is based on the EU law. In Australia and New Zealand, novel foods and ingredients cannot be placed on the market until assessed by a scientific committee using the official safety assessment guidelines. A novel food or ingredient cannot be sold by any form of retail sale in Australia and New Zealand, until approved and the approval is published by the government.<sup>28</sup>

Canada has also introduced a law that requires a formal assessment and approval of a novel food or ingredient. The Canadian law not only encompasses all foods and ingredients derived from genetic modification, but can also include new techniques for food preservation and processing. It is argued that new processing methods can alter the nutritional and toxic characteristics of a food.<sup>29</sup>

Other countries are also moving towards more control of new foods and ingredients. In October 2013, China's law on 'Administrative measures for safety of new food materials', came into force. The new system requires not only a safety

<sup>29</sup>Regulations Amending the Food and Drug Regulations (948—Novel Foods). Canada Gazette Part II, Vol. 133 No. 22 of October 27, 1999.

assessment by a panel of experts, but also includes public comment solicitation. A positive assessment can lead to approval and an official notification.<sup>30</sup>

In Japan, there is no term for or definition of a novel food, but there is a safety control built into the Japanese legislation on 'Foods for Specific Health Use (FOSHU)'.

The move towards controls on new foods, ingredients and technologies in the major economic blocs and major countries has led most other countries to assess their own legislative situation. The laws operating in this area in the EU are generally regarded as being the most stringent, and there is currently no mutual recognition of approved substances between the EU and other non-EU countries. For example, a number of novel foods and ingredients accepted in the USA as self-affirmed GRAS have not been allowed into the EU until the full EU assessment procedure has been carried out and the application approved. In many of these situations, the EU assessment has required a greater amount of detailed data than was presented for the US GRAS notification. Until some form of mutual recognition or agreement on minimal standards between countries is achieved, the problems that currently arise with trade in innovative foods and technologies will continue.

### ***8.3.3 Addition of Micronutrients to Foods***

Another area where there continues to be major inconsistencies between the national food legislation of countries is where micronutrients and some other substances are often added to foods.

The food categories most affected are fortified foods and drinks, food/dietary supplements, weight control products and some health foods.

The major problems preventing international trade in such products relate to both the chemical forms used to supply the micronutrients and the quantities added to the products. Developments through the second half of the twentieth century have resulted in a number of chemical forms being used to supply the 13 recognized vitamins. For example, over ten chemical forms of vitamin C (ascorbic acid) are in use worldwide, but far fewer are permitted in the legislation of many countries.

The situation with the chemical salts used to supply nutritional minerals and trace elements has become very complex. The EU permits over 20 forms of magnesium for the nutritional enhancement of foods. However, many more are in use in the USA and far fewer in some other countries. The consequence of these differences in the permitted lists is that one of two approaches are taken; either a nutritionally enhanced product is developed specifically for a particular market, or a 'common denominator' approach is applied, where multi-national companies use a

---

<sup>30</sup>Administrative Measures for Safety Review of New Food Materials. National Health and Family Planning Commission Decree No. 1. May 31, 2013.

significantly reduced list of those sources permitted in all the intended national markets.

Similarly, the maximum levels of micronutrients that can be used differ significantly between countries.

Within the EU, this issue has not yet been addressed in the harmonized food legislation, which means that national legislation still applies. This has resulted in many EU member states imposing low maximum levels of vitamins and minerals in products, many based on arbitrary limits based on the Recommended Daily Allowance (RDA). There is no consistency among the countries following this route, with some having a  $1 \times$  RDA limit for all the vitamins and minerals, while others can range between 1 and  $3 \times$  RDA depending on the micronutrient. Other countries, such as the UK, control these levels on the basis of a scientific assessment on consumer safety. The result has been that, within the EU, there are significant barriers to trade in food/dietary supplements, even those containing just vitamins and minerals. This problem is repeated worldwide and supplements, particularly, are one of the most difficult product categories to trade across borders.

In the context of fortified foods and supplements there is a surprising barrier to international trade, which is that the methods for calculating vitamin activity vary between countries. For decades, this has resulted in re-formulation or re-labelling of products traded between the USA and the EU.

While a number of vitamins are affected, the most extreme example is found in beta-carotene in its role as pro-vitamin A. Beta-carotene is a substance of plant origin that can be metabolized in the body to form vitamin A. It is particularly favored by vegetarians and vegans, as all other natural sources of vitamin A are of animal origin.

On a theoretical basis, the beta-carotene molecule contains two molecules of vitamin A (as retinol). In the USA, the convention is to take the conversion factor that  $2 \mu\text{g}$  of beta-carotene is equivalent to  $1 \mu\text{g}$  of retinol. However, in Europe the conversion factor is based on studies on biological activity, which indicates that the ratio is 6:1, or three times less than that calculated in the USA. These conversions obviously make a large difference in label claims between the two continents.

Other vitamins where there are significant differences in quantification between the USA and the EU are thiamin (vitamin B<sub>1</sub>), where the EU calculation works out at 78 % of the American value and pyridoxine (vitamin B<sub>6</sub>), where the EU reports only 82 % of the amount calculated by the US convention.

Another area relating to supplements and health foods and for which there is no agreement across the world is the addition of botanicals and botanical extracts to products sold under food law. In many countries, such products are subject to medicine law due to their traditional use in herbal remedies.

In the USA, the 'Dietary Supplement and Health Education Act' (DSHEA), adopted in 1994,<sup>31</sup> permitted botanicals as dietary supplement ingredients and,

---

<sup>31</sup>Dietary Supplement and Health & Education Act. Public Law 103-147; 108 stat. 4325-4335 103d Congress 2nd Session (October 15, 1994).

subsequently following the DSHEA, there was a rapid market growth in supplements containing botanicals, mainly botanical extracts.

In the EU and many other countries, the governments have taken a more cautious approach. Many still have a differentiation between supplements and traditional herbal medicines and tend to place products containing botanicals and their extracts in the latter category.

There have been moves in the EU at the national level to develop permitted lists of botanicals considered acceptable for use in supplements. The EU member states taking the lead in this area are Belgium, France and Italy. However, many other countries in Europe maintain strict national controls.

A problem that is challenging governments across the world is how to define and accommodate botanical extracts into food legislation.

In relation to the number of extracts in the commercial market, relatively few have an internationally agreed composition. Those that have an internationally agreed upon composition are normally well-established medicinal herbs used in traditional herbal remedies. For the majority of botanicals used in supplements and drinks, there is no standard extract, and for any particular botanical, a wide range of extraction ratios and extraction solvents can be found on the market. Many of these are produced for commercial advantage and may not have a well-established scientific basis. Analysis of a range of extracts, all purporting to represent the same botanical source, can have a disparity in chemical composition, and there can be no similarity between these extracts. This has been causing safety concerns among the authorities and in some cases has raised issues as to whether some of these extracts should be defined as novel foods.

## **8.4 Technological Barriers to International Trade**

### **8.4.1 *Food Irradiation***

A food preservation technique that has been controversial for a number of decades is irradiation. Irradiation is the exposure of foods or food ingredients to ionising radiation from such sources as gamma rays from radionuclides or x-rays generated from machine sources.

The main commercial purpose of irradiation is to kill pathogenic bacteria in food. It has also been used commercially to delay the ripening of fruit and to delay sprouting in vegetables such as potatoes.

Although irradiation has been an established preservation method since the 1970s, there has, over the years, been a considerable amount of consumer opposition in some parts of the world. As a consequence, it has been banned in some countries, permitted with strict controls in some countries and accepted with few controls in others.

The reasons for consumer concerns have been found to fall into two categories. The first is a simplistic one, in that some people perceive a health risk associated with radioactivity and therefore wish to avoid all irradiated foods. The second also relates to a health concern, which is that an unscrupulous food business operator may use irradiation on microbiologically contaminated meats and vegetables that may then enter the market. The more sophisticated end of this concern is that any toxins produced by a high biological loading would remain in the food.

For some time, illegally irradiated foods and food ingredients have been one of the main causes of potential imports being rejected at EU borders. Much of the rejected product originated from the USA, Russia or China.

Since 1999, there has been EU-wide legislation controlling the use of irradiation on foods. While the EU permits the irradiation of specified groups of foods, there are strict conditions as to where and how the irradiation can carry out, together with a maximum dosage level for each of the permitted categories. There are controls on both the traceability of irradiated product and the documentation that is required to accompany the consignment. In addition, foods and ingredients that have been irradiated must have a statement on the label saying that they have been irradiated.<sup>32</sup>

One of the main criteria in the EU rules is that the irradiation can only be carried out in EU authorized premises. Some, but certainly not all, facilities in countries outside the EU have been approved. If the premises are not approved by the EU, any food processed in them is automatically illegal in the EU, even if it meets the other criteria.

The introduction of a simple, non-destructive and relatively cheap test for irradiation in food, the Photo Stimulated Luminescence (PSL) method has changed the dynamics of illegal irradiation. Prior to the widespread introductions of PSL, which is now used by both government enforcement agencies and industry, the testing of foods for suspected irradiation was both time consuming and costly. This was exploited by some companies deliberately supplying irradiated ingredients to food manufacturers. Owing to its simplicity in use, a large number of foods and ingredients can be tested for irradiation by PSL in a single day, giving both the authorities and manufacturers far greater control. The problems that still exist in international trade are mainly due to the differences in legislation, particularly between the USA, the EU and certain Asian countries, as to which foods can be irradiated.

### 8.4.2 *Genetic Modification Technology*

The unfortunate effects of the mismanagement of the introduction of genetic modification (GM) into the global food sector has already been described. The after effects of the emotions generated in the late 1990s persisted into the second decade of the twenty-first century.

Notwithstanding these setbacks, GM technology has progressed, and a large number of foods and ingredients resulting from GM technology have become available. Much of the production of enzymes used for food processing uses GM microorganisms, as do the fermentation processes involved in the production of other food additives, such as amino acids and flavorings. Also, the number of plant and animal species for which there are GM forms is very considerable, with a number of vegetables, fruits and even fish with a GM counterpart, developed for either commercial or humanitarian reasons. An example of the latter is the development of 'Golden Rice', a rice variety enhanced with beta-carotene for use in regions where vitamin A intakes are well below the levels required for health. Unfortunately, in the commercial world in which we exist, there is far less funding for humanitarian projects than there is for the commercial exploitation of GM technology.

As discussed earlier, there is an imbalance in the levels of legislative control between countries on food and food ingredients derived from GM. This has meant that, for the foreseeable future, international trade in foods derived from GM technology will be seriously inhibited by the major differences in legislative approaches.

A major global initiative on genetically modified organisms (GMOs) came to fruition in 2000, with the adoption of the Cartagena Protocol by more than 130 countries, in Montreal, Canada.

The objective of this protocol was to ensure an adequate level of protection for the transfer, handling and use of GMOs that may have adverse effects on the environment and human health, specifically focusing on trans-boundary movements.

The Cartagena Protocol was the first agreement to mandate the need for consent of an importing country prior to trade in certain GMOs, to allow for assessment of potential risks posed by such an import on the biodiversity and human health in the importing country.<sup>33</sup>

### 8.4.3 Nanotechnology

A relatively recent technology with applications in the food sector is nanotechnology. Nanotechnology is described as the ‘Engineering of functional systems at the molecular scale by controlling the shape and size of materials at the nanometre scale’. Nanoscience is defined as ‘the study of phenomena and the manipulation of materials at the atomic, molecular and macromolecular scales, where the properties differ significantly from those of the material at a larger scale’.

The term ‘nano’ is derived from the Greek word for ‘dwarf’ and, to put the science into perspective, a nanometre (nm) is one-billionth of a metre, or approximately one hundred-thousandth the width of a human hair.

The electronics industry uses nanotechnology in its search for greater miniaturization of computer chips and enhanced data storage. Nanostructures are already being used in coatings, reinforced composites and certain polymers.

While some nanostructures are formed naturally in foods, such as in some food proteins, or are produced from conventional processing, such as the formation of foams and emulsions, there have been serious concerns over the relatively uncontrolled introduction of food ingredients deliberately engineered to produce nanoparticles for technological benefits.

One of the technological advantages of food ingredients reduced to nanoparticles is that, in powder form, they have a far greater collective surface area than their conventional counterparts.<sup>34</sup> This has a great advantage for certain applications such as the use of titanium dioxide as an opacifying food colorant or silicon dioxide as an anti-caking agent.

The introduction of deliberately engineered nanotechnology into the food industry in the first half of the first decade of the twenty-first century caused consternation within some governments. The UK government commissioned an independent expert scientific study into the current and future developments in nanoscience and nanotechnology. The report, published in 2004, addressed concerns about safety to humans of nanoparticles and the possible need for regulation and labelling of foods incorporating deliberately engineered nanotechnology. One of the main concerns was on the, then unknown, effects of the nanoparticles on the human gut. This was directly related to the very small particle size and the increased surface area of these particles.<sup>35</sup>

Concerns were also raised with the EU, and the European Commission commenced discussions on the regulation of nanotechnology for use in food, and the status of this technology in context of the EU Regulation on Novel Foods. An immediate problem faced by the EU authorities was to agree an accurate and workable definition of an engineered nanomaterial intended for use in food. This

---

<sup>34</sup>*Nanotechnology in Foods – A European Perspective*, International Review of Food Science and Technology, International Union of Food Science and Technology (2008).

<sup>35</sup>Nanoscience and nanotechnologies: opportunities and uncertainties. The Royal Society & The Royal Academy of Engineering (2004).

task became more complex than they first thought, particularly as other countries were also looking at the same problem.

Within the EU, it was considered that the control of nanotechnology impacted two legislative areas, the novel foods rules and those on the provision of food information to the consumer, i.e. food labelling. The culmination of these discussions is that an engineered nanomaterial is currently defined in European food law as:

any intentionally produced material that has one or more dimensions of the order of 100 nm or less or that is composed of discrete functional parts, either internally or at the surface, many of which have one or more dimensions of the order of 100 nm or less, including structures, agglomerates or aggregates, which may have a size above the order of 100 nm but retain properties that are characteristic of the nanoscale.<sup>36</sup>

By derogation, natural substances in nanoform are excluded. Material intended for food use that fall into the above definitions are classified as novel foods in the EU, and are therefore required to undergo a safety assessment and authorization as required by the EU Regulation on Novel Foods.

The EU Regulation on Food Information for Consumers lays down specific labelling requirements for food derived from nanotechnology and which fall into the scope of the definition (see footnote 35). However, the accuracy and applicability of the definition of engineered nanomaterial is still being discussed by the EU authorities, and could be revised in the relatively near future.

While the EU definition has been written into EU food law, it is not necessarily the same as those definitions applying in other countries.

This problem has been further compounded by the term ‘nano’ becoming a marketing ‘buzz-word’ in the 2000s, particularly in the USA. This term was erroneously applied to foods and supplements where the particular materials did not fall into any definition of a nanomaterial. This caused unnecessary concern amongst the authorities globally, particularly those dealing with imported food products.

In the USA, the policy has been not to specifically legislate for nanotechnology used in food, but to issue a guidance document for manufacturers, suppliers and importers on the FDA’s current thinking on whether FDA-regulated products contain nanomaterials or otherwise involve the application of nanotechnology.<sup>37</sup>

This policy obviously differs from the approach taken by the EU authorities, and in July 2013, the Transatlantic Trade and Investment Partnership (TTIP),<sup>38</sup> which took place in Washington D.C. in the USA, agreed to harmonize standards for food safety, nutrition and nanotechnology, which will be among the first of the

---

<sup>37</sup>Considering whether an FDA-Regulated Product involves the Application of Nanotechnology—Guidance for Industry (2011).

<sup>38</sup>The Office of the United States Trade Representative, Transatlantic Trade and Investment Partnership (T-TIP) (2013).

collaborative research priorities to come out of the talks. Following these talks, the planned activities include access to each other's scientific information and exchange of experts.<sup>39</sup> It is hoped that this initiative will succeed in bringing two major economic blocs to a common view on the handling of nanotechnology.

#### ***8.4.4 Emerging Technologies***

Recent history has shown that the way countries handle innovative technology in the food industry can seriously affect the viability of the technology. Innovators have failed to appreciate that there can be significant disparities in the way different nationalities embrace the concepts.

This has been illustrated by the introduction of GM technology, where American farmers and consumers were far more enthusiastic about GM foods and ingredients than their European counterparts. As a consequence, a large gulf has developed between the two continents, and there is very little trade between them in foods and ingredients derived from GM. Unless carefully managed, a similar situation could occur with nanotechnology and any other innovation.

### **8.5 Health Risk Barriers to International Trade**

All governments will defend their food legislation on the basis that it is necessary for the protection of the health of their nation. However, there can be large differences in the approach to the risk assessment, risk management and risk communication.

The situation is never static and unexpected health risks will always emerge as scientific knowledge advances. For example, advances in analytical techniques and toxicology have relatively recently identified an increasing number of substances with carcinogenic potential that can be found in foods. Serious communicable diseases have been found to be carried in animals common in the human food chain, and there have been a number of problems associated with the deliberate or accidental adulteration of foods. Each of these introduce serious challenges to national authorities tasked with protecting the health of their citizens.

---

<sup>39</sup>European Commission, *The Transatlantic Trade and Investment Partnership* (2014).

### **8.5.1 *Chemical Contaminants***

The Codex Committee on Contaminants in Foods (CCCF) have already identified a large number of chemical contaminants in foods that could pose a health risk to the consumer unless their levels are controlled. Some of these substances have only recently been identified as toxicants.

Some, such as dioxins and polychlorinated biphenyls (PCBs) can be found in fats and oils from both animals and plants, and have to be regulated at picogram levels (that is, one trillionth of a gram). Unfortunately, there is not yet universal agreement between countries on the actual maximum levels that should be applied.

A group of toxic substances that are currently receiving attention are the mycotoxins. Mycotoxins are produced by moulds (fungi) when they proliferate on plants. Many cash crops are susceptible to mould contamination, particularly during harvesting and storage under certain climatic conditions. While growing on the plant matter, the moulds can produce toxic metabolites (mycotoxins), which can be carried through into animal feed or human food. A number of mycotoxins that are associated with food sources have already been identified, and controls on their levels have been instigated in a number of countries.

Another group of food contaminants of concern are the polycyclic aromatic hydrocarbons (PAHs). These are mainly found as by-products of combustion and are particularly prevalent in the atmosphere around areas of heavy industry. PAHs can be found in plant matter and plant oils and some have been found to be potentially carcinogenic.

Legislation on PAH levels in plant oils and plant foods varies widely across the world, with some countries imposing monitoring and controls, and with no current controls in others.

### **8.5.2 *Communicable Diseases and International Trade***

A major barrier to international trade is the transmission of a communicable disease, whether it be between plants used as food crops or between animal species.

The risk of plant diseases being rapidly transferred from country to country and continent to continent is very great, and many countries impose strict controls not only on bulk food plant sources, such as wheat, maize and soya, but also on the personal import of plant matter by individuals such as passengers on ships and aircrafts.

Similar restrictions apply to trade in animals, meat and ingredients of animal origin. The EU, for example, has introduced stringent controls on all products of animal origin. These rules cover a wide range of animal sources.

The severe effect an animal disease can have on international food trade can be illustrated by the case of Bovine Spongiform Encephalopathy (BSE), which became more popularly known as Mad Cow Disease. BSE is attributed to an aberrant protein known as a prion. It has been found that the prions are not destroyed

when meat or material containing them are heat-treated, even at temperatures over 600 °C (about 1100 °F), and they have the ability to transfer the disease between animals. BSE is a type of transmissible spongiform encephalopathy (TSE), and transmission of the disease can occur when healthy animals come into contact with contaminated tissue from other animals with the disease.<sup>40,41</sup>

In BSE the disease affects the brain, spinal cord and digestive tract of the infected cattle and it can be transmitted to humans by eating these parts of the infected carcasses. In humans it became known as new-variant Creutzfeldt-Jakob disease (nvCJD). BSE in cattle was first identified in the UK in 1986. Laboratory tests confirmed the presence of the disease in 1987, and later that year the British Ministry of Agriculture, Fisheries and Food accepted that it had to deal with a new communicable disease.

It was later estimated that over 450,000 animals infected with BSE had entered the human food chain before the first controls on high-risk offal were in place in 1989. It has also been shown that around 160 people had died of nvCJD in the UK, and a further 44 elsewhere, in the 22 years between the first identification of the disease in 1987 and 2009.<sup>42</sup>

A British inquiry into the cause of BSE concluded that the cattle, which are naturally herbivores, had been fed parts of other cattle in the form of meat and bone meal added to their feed. There was also an indication that meat from sheep suffering from the disease scrapie could have also been involved.

After the cause of BSE, and subsequently nvCJD, had been identified, there were serious concerns about bovine by-products used in human foods and medicines. A widespread ingredient in the food chain was gelatine, and a large proportion of this originated from bovine sources. Similarly, a number of medicines from bovine sources, such as bovine insulin, were identified.

The EU introduced a ban on exports of British beef in 1996. This ban stayed in place for almost exactly 10 years and included trade to other EU countries. However, cases of BSE were eventually recorded in the majority of EU countries, although none were near the scale of that in the UK. The first reported case in North America was in Canada in 1993, and in the same year a case was found in the USA. A subsequent investigation confirmed that the cow was of Canadian origin. The first domestic case in the USA was in Texas in June 2005.<sup>43,44</sup>

<sup>43</sup>*Bovine Spongiform Encephalopathy and Canadian Beef Imports*. CRS (USA) Report for Congress No RL 32627, March 11, 2005.

<sup>44</sup>Center for Disease Control, *BSE Cases in North America, by Year and Country of Death, (1993–2008)*. Center for Disease Control and Prevention, Department of Health and Human Services (2008).

Japan, with 36 confirmed cases, was the only country outside of Europe and the Americas to have cases not related to imports. These cases resulted in a change to Japanese food safety policy and the establishment of the Food Safety Commission in 2003. As more and more countries revealed that they had confirmed cases of BSE, other countries introduced bans or placed severe restrictions on the import of beef. Japan halted beef imports from the USA after the discovery of the first case in the US. The same happened in Indonesia and eventually 65 countries had introduced full or partial restrictions on the imports of beef from the USA. Some of these restrictions were due to concerns that the US testing regimes for BSE were less rigorous than those used nationally.

### **8.5.3 Food Adulterants**

Historically, there has always been the risk of deliberate adulteration of food. In most cases the reason foods are adulterated is economic and relates to the addition of cheaper 'fillers' to high value foods such as olive oils, fish oils, and spices. One of the first European food laws, created around the twelfth century, imposed severe penalties on those who added ground chalk to flour. Over 2500 years ago, a law in India prohibited the adulteration of grain, scents and medicine, and throughout the nineteenth century a number of countries introduced legislation to protect consumers from such practices. A centuries old global problem is that the adulteration tends to be ahead of the detection methods available to the authorities at that point in time.

Olive oil, due to its market value, has been a victim of adulteration and manipulation for many years, and there are now detailed specifications for olive oils obtained from different regions. Similarly, there have been cases of the adulteration of fish oils, mainly with less expensive vegetable oils.

A good example of a serious public health impact of food adulteration were the Chinese melamine problems, which started in China in 2007 and eventually affected consumers in many other countries.

Melamine is a synthetic substance, which in combination with formaldehyde can make a hard-wearing plastic that has been used to manufacture work-tops, white boards and durable tableware. Significant to the food adulteration, melamine has a very high nitrogen content (66.6 % w/w).

The problem first came to light in 2007, when there was an epidemic of kidney failure affecting thousands of cats and dogs in North America. Investigations showed that melamine and its analogue, cyanuric acid, were present in a rice protein concentrate and wheat gluten imported into the USA from China. These ingredients were widely used in pet foods for their binding and thickening properties.

A year later, in 2008, melamine was discovered in dairy products exported from China. Melamine was found in liquid milk in China and in dried milk, which was also being used to manufacture infant formula. The high levels of melamine in the milk, baby milk and other dairy-based products resulted in severe health effects and

illness in nearly 300,000 Chinese infants and young children. The deaths of six children were attributed to melamine contaminated milk.

A Chinese government investigation indicated that the contamination was intentional and was probably occurring at the milk collection centers. It appears that the milk was being watered down and the melamine was being added to increase the milk's measured protein content. As stated earlier, melamine has a very high nitrogen content; the test for protein in milk is achieved by determining the nitrogen content and multiplying that value by a factor to give the protein content of the milk. Any increase in the nitrogen level would give a corresponding increase in the measured protein.<sup>45</sup>

Once the cause was identified, the Chinese government introduced emergency measures requiring all companies in the dairy industry to test their milk and dairy products for the presence of melamine.

However, by the time the problem was discovered, Chinese dairy products had been exported across the world and by the end of 2008, a number of countries had introduced controls on melamine limits for dairy products. These included the USA, the EU, Canada, Australia, New Zealand and many Asian countries. Many nations also implemented inspection and surveillance programs directed at products containing milk and milk containing ingredients exported from China.

It would appear from the investigations that the melamine problems were caused by a relatively small number of people for personal gain. However, the ramifications of their actions caused an international safety alert, which severely interrupted trade in dairy products.

A similar situation occurred with the illegal use of a broad-spectrum antibiotic known as Chloramphenicol in foods originating from Asia. Chloramphenicol is normally used as a topical antibiotic against both gram positive and gram negative bacteria. Unfortunately, it is widely available in Asia and has been found to be extensively used for both livestock and aquaculture. When ingested, chloramphenicol has been associated with a number of adverse conditions, including leukaemia, and its use with humans is strictly controlled in most countries. The illegal use of chloramphenicol in a wide range of foods and ingredients exported from Asia has been of international concern for a number of years. Many countries, including the EU, have had to introduce controls and surveillance for chloramphenicol residues in imports. Foods found to be contaminated include animal by-products, vitamin pre-mixes and enzyme preparations.<sup>46</sup>

As with the melamine issue, the problems with chloramphenicol have placed a major burden on countries around the world and have resulted in a high level of additional testing, and destruction of food products, with a consequential cost.

### ***8.5.4 European Union: Rapid Alert System for Food and Feed (RASFF)***

As early as 1979, the European Commission introduced the Rapid Alert System for Food and Feed (RASFF) to provide the food control authorities in the member states with a procedure for the exchange of information and measures taken on food safety issues. Initially, this was an informal procedure.

In 2002, the RASFF was incorporated into law as part of the general food law requirements. This law requires that when a member state has any information about a serious health risk deriving from human food or animal feed, it must take the required action.<sup>47</sup>

The member states are required, in particular, to notify the European Commission if they identify a risk or potential risk, and to take such measures as instigating a withdrawal or recall of a food from the market to protect consumer health. This is particularly important when rapid action is required.

Member states are also to notify the Commission if they have agreed with a responsible food operator that a food or feed should not be placed on the market, if this measure is taken due to a serious risk to health. The Commission also requires notification of all rejections of food or feed at any border post in the EU, if there is an inherent health risk.

In 2006, animal health and environmental risks in relation to animal feed were added to the scope of the law. This also includes notifications about risks from pet food.

In order for the system to work effectively, each member state has a designated contact point that is responsible for sending that country's RASFF notifications to the Commission. The notifications summarize the issue and consolidate the information received from the national inspection agencies and laboratories. The Commission has templates to ensure the notifications from the member states are consistent in content.

The Commission is responsible for informing countries outside the EU, if a food which is the subject of the notification has been exported to, or imported from, that country.

Summaries of the notifications are regularly published by the European Commission and appear in the public domain. These reports are routinely accessed by the authorities in many countries outside the EU and it provides the basis of a global alert system.<sup>48</sup>

## 8.6 The Impact of Codex Alimentarius on Reducing Barriers to International Trade

In the late 1950s, the United Nations (UN), the World Health Organization (WHO) and the Food and Agriculture Organization (FAO) recognized the need to harmonize standards and controls internationally, to allow international trade, while maintaining the highest levels of food safety and consumer protection.

The deliberations resulted in the establishment of the Codex Alimentarius Commission (CAC) by WHO and FAO in 1963. The objectives of the CAC were to produce harmonized international food standards, guidelines and Codes of Practice to protect the health of the consumers and to ensure fair practices in the food trade. The Commission also had the responsibility for promoting the coordination of all food standards work undertaken by governmental and non-governmental organizations.

At the first session of the CAC in 1963, delegates from 30 countries and 16 international organizations were present at the meeting. By the 35th session, there were 145 member countries and 34 governmental and non-governmental organizations, and on its 50th anniversary in 2013 there were 185 member countries, plus the EU, and 221 observer organizations. It was estimated that Codex Alimentarius now covers 99 % of the world's population.<sup>49</sup>

The Codex Alimentarius organization plays a pivotal role in international food trade. Codex standards are taken into account in the development of national and regional food legislation, food products conforming to Codex standards are able to move more freely in international trade, and, since 1995, the standards form the basis for arbitration on food cases brought before the World Trade Organization (WTO).

The WTO was a consequence of the Uruguay Round Agreements that emerged from the General Agreement on Trade and Tariff (GATT) discussions held over 7 1/2 years between 1986 and 1994. There are two important agreements under the WTO that came out of the Uruguay Round: the Technical Barriers to Trade (TBT) agreement and the Sanitary and Phytosanitary (SPS) agreement.<sup>50</sup>

The TBT agreement seeks to ensure that technical regulations and standards (e.g. packaging, labelling and analytical procedures), do not create unnecessary barriers to trade.

Article 2 of the TBT Agreement reads:

With a view to harmonising technical regulations on as wide a basis as possible, Member States shall play a full part, within the limits of their resources, in the preparation by appropriate international standardising bodies of international standards for products for which they have either adopted, or expect to adopt technical regulations.

The SPS agreement contains the following:

---

<sup>49</sup>Codex Alimentarius International Food Standards.

<sup>50</sup>World Trade Organization.

Article 2.2 of the SPS Agreement reads:

Members shall ensure that any sanitary and phytosanitary measure is applied only to the extent necessary to protect human, animal or plant life or health, is based on scientific principles and is not maintained without sufficient scientific evidence.

Article 3.1 of the SPS Agreement reads:

To harmonise sanitary and phytosanitary measures on as wide a basis as possible, members shall base their sanitary and phytosanitary measures on international standards, guidelines or recommendations, where they exist, except as otherwise provided for in this agreement.

Codex Alimentarius has 17 active technical committees, each dealing with a specific aspect of food trade. The 'horizontal' committees, such as the Codex Committee on Food Additives, the Codex Committee on Food Labelling and the Codex Committee on Contaminants in Food, deal with the issues within their remit affecting all categories of food. There are also commodity committees, which deal with specific food categories, such as the Codex Committee on Fish and Fish Products and the Codex Committee on Fats and Oils. Each Committee has specific tasks related to the development of Codex standards, guidance and Codes of Practice within their remit. This system ensures that the work is carried out by international experts in their respective fields.

The most important criterion for all Codex deliberations and decisions is that they must be based on an impartial assessment of all available scientific data. Decisions should not be influenced by national politics. Standards, Guidelines and Codes of Practice, are only adopted after consensus by the relevant Committee and endorsement by the Codex Alimentarius Commission.

While the Codex process can obtain international approval for the standards, which are then incorporated into the legislation of many countries, the procedural aspects of this work means that it can take a number of years between the initiation of the work on a standard and its adoption. Most committees only meet annually, and in a few cases biannually, and the procedure requires that the work progresses through a series of steps and consultations. The speed of progress can often be a disadvantage in a rapidly changing commercial environment, as some standards can take many years to come to fruition.

Although Codex Standards and Codes of Practice have no legal basis in international laws, an increasing number of countries world-wide are incorporating relevant standards into their national legislation. As a consequence, conformity to the standards are being used as the basis for accepting imports from other countries.

## 8.7 Conclusion

As can be seen from the range of issues discussed above, a number of factors can jeopardize the international trade in foods and food commodities.

Despite many efforts to harmonize food legislation both within and between economic blocs, free trade has not been achieved for many foods and trade barriers can be formed for a variety of reasons.

While the need for a fully harmonized global trade in food has not been disputed, the reality is that it is not likely to be achieved within the next two decades.

# Part II

## Interdisciplinary Facets of International Food Law

Gabriela Steier

Food systems are far-reaching, global in scope, pervasive, and ubiquitous. Therefore, food law cannot be confined by statutes as it must cover the breadth of food systems. Food law, as Gabriela Steier is coining it in this work, is a dynamic, cross-disciplinary, colorful, complex, and complicated field that provides fascinating intricacies that challenge lawyers, policy makers and regulators to think critically and creatively and, most importantly, to collaborate with professionals from other disciplines and from all over the world. This section of *International Food Law and Policy* is instructive as to how these non-legal disciplines fit into food law.

Part I and this part build on each other. While Part I provides a general overview of the various consideration of international food law and policy, this part completes the broad picture by including some of the most important interdisciplinary aspects of the field and even some marginalized by many academics. The editors hope that, by including these chapters, scholars, students, practitioners, and anyone interested will be able to draw new connections and find inspiring solutions to the challenges of the current food system.

In Chap. 9, Professor Jessica Fanzo from Columbia University, New York, links nutrition to food law and policy. She highlights the role of food policies and nutrition goals and outcomes and links food policy, public health, and nutrition science. Her illustrations from around the world drive home the universality of importance of these links, and provide a solid basis to understand various later chapters.

Dr. Michael Nathenson, a brilliant oncologist devoted to the highest patient care, explains how food choices affect the number one leading cause of deaths, cancer. In Chap. 11, he explains which information is relevant, reliable, and instructive, and why. His description of various connections between cancer therapy and food choices bridge the topics of food policy, public health, medicine (oncology), and introduce scientific concepts into the broader food law field. In Chap. 12, a textbox, Gabriela Steier presents recent scientific studies that link agricultural pesticides and carcinogens.

Next, Prof. Dr. Liviu Steier, Dr. Regina Steier, and Gabriela Steier, compiled the first ever analysis of the legal implications of food systems, public health and dental care in Chap. 13. Professors and highly-acclaimed practitioners of dental medicine, Prof. Dr. Liviu Steier and Dr. Regina Steier, joined forces with their daughter, an attorney and editor of this book, to explain how and why mass-medication of caries through fluoridation is a food policy issue ripe for review.

In Chap. 15, Professors Charles Hall and Steve Balogh, breakthrough scholars and widely published and renowned systems ecologists with extensive academic experience, offer cutting edge insights into the connections of food law, energy and the environment. Their chapter rounds up (with a cherry on top!) the section about the interdisciplinary aspects of food law and policy around the world.

Of special note is Chap. 18, written by Professors Faunce and Bruce, explores whether global governance of new renewable energy and climate change mitigation technologies such as artificial photosynthesis may accelerate transition to such a reformed global food system in an epoch conveniently termed the Sustainocene. Here, readers are introduced to some aspects of the geoengineering debate.

Finally, this section also includes three textboxes about emerging topics that are new and important. In Chap. 17, Dr. Denis Herbel, Mariagrazia Rocchigiani and Nora Ourabah Haddad from the FAO introduce cooperatives' and producer organizations' roles in achieving food security by highlighting the importance of smallholder farming. Randy Hayes, a thought leader from the Center for Food Safety and Foundation Earth in Washington, D.C., explains in Chap. 16 the need to internalize ecologic externalities, which may affect food sticker prices in the future. To conclude the section, Gabriela Steier outlines the theory of planetary boundaries in food and agriculture law, which bring climate change issues into the realm of food law (Chap. 10).

# Chapter 9

## Food Policies' Roles on Nutrition Goals and Outcomes: Connecting of Food and Public Health Systems

Jessica Fanzo

**Abstract** Nutrition exists when food security is combined with a sanitary environment, adequate health services, and proper care and feeding practices to ensure a healthy life for all household members. Despite increased attention to undernutrition, it remains a devastating multi-faceted problem for infants, young children, and women around the world, resulting in increased morbidity, mortality, and long-term disability. Undernutrition can also lead to poor health into adulthood, which affects social and economic development of nations. On the other end of the malnutrition spectrum, overweight and obesity are growing problems, linked to changing diets and activity patterns, which also lead to serious health problems and impact the economies of nations. This chapter attempts to unpack the importance of food and agriculture policies on nutrition outcomes and why engagement of food and public health systems remain critically important. External pressures, such as climate variability and population growth, that tax these systems are discussed, as well as the globalization of our food system and why that has shifted dietary patterns and nutrition and health status trends. The multi-sectoral integration of food and health systems and its importance to improve nutrition is demonstrated through three models. Three very brief case studies are presented that help exemplify some of the food and health system trends that influence policy and ultimately, nutrition outcomes.

### 9.1 Introduction

Historically, malnutrition is broadly thought of as a lack of sufficient food. However, in light of rapidly changing economic landscapes in and between nations, multiple “burdens of malnutrition” contribute to poor health and development. For example, children who do not consume adequate calories and micronutrients over

---

e-mail: [jfanzo1@jhu.edu](mailto:jfanzo1@jhu.edu)

long periods—beginning in utero—do not achieve full genetic potential in cognitive, reproductive and immune development. The latest series on nutrition in the renowned peer-reviewed journal, *Lancet*, emphasized chronic malnutrition over acute malnutrition in terms of the overall detrimental effect on society. Micronutrient deficiencies of essential vitamins and minerals, such as iron, zinc, folic acid, Vitamin A and other, are also gaining importance as the scientific community proves links to disease and inhibited growth. It is, therefore, important to understand to connect food and public health systems to the role of food policies on nutrition goals and outcomes.

### ***9.1.1 What Is the Triple Burden of Malnutrition?***

Nutrition, by definition, exists when food security is combined with a sanitary environment, adequate health services, proper care and feeding practices to ensure a healthy life for all household members.<sup>1</sup> This definition may seem quite similar to the food security definition posed by the World Food Summit of 1996 that states: *Food security exists “when all people at all times have access to sufficient, safe, nutritious food to maintain a healthy and active life.”*<sup>2</sup> However, there are definitions, on the one hand, and then there are the implications on how these definitions are translated into policies and programmatic implementation, on the other hand. Nutrition is often forgotten in the food security mandate. Thus, food and agriculture policies are generally less attuned to ensuring nutrition is central in their ultimate outcomes.

Not getting the right amount of food and nutrients or the right types of nutrients can lead to undernutrition or overweight, which, in turn, has serious deleterious effects on health, development, and productivity. Despite increased attention to undernutrition, it remains a devastating multi-faceted problem for infants, young children, and women around the world, resulting in increased morbidity, mortality, and long-term disability. Undernutrition can also lead to poor health into adulthood, which affects social and economic development of countries on large scales. Overweight and obesity are also growing problems, linked to changing diets and activity patterns, which can lead to serious health problems including increased risk of non-communicable diseases such as diabetes, cardiovascular disease and strokes.

The global burden of malnutrition can be described as a “triple” burden<sup>3</sup> in which countries, communities and households may be burdened with three manifestations of malnutrition: undernutrition (often in the form of chronic or acute), overnutrition (overweight and obesity) and/or micronutrient deficiencies. In FAO’s State of Food and Agriculture 2013 report, countries were classified as having one,

---

<sup>1</sup>World Bank (2006).

<sup>2</sup>FAO (1996).

<sup>3</sup>FAO (2013).

two or three of these burdens and in different combinations. There are very few countries that do not have at least one malnutrition insufficiency or a combination.<sup>4</sup>

Global prevalence of stunting, which reflects chronic undernutrition during the early stages of life causing children to fail to grow to their full genetic potential, both mentally and physically, has declined to 35 % in children under 5 years of age since 1990, which is a reduction of 2.1 % per year.<sup>5</sup> Yet, there are still an estimated 150 million children who remain moderately or severely stunted.<sup>6</sup> Wasting, which reflects acute malnutrition and is a strong predictor of mortality among children, impacts 50 million children under 5 years of age, with the highest burden in South Asia. There has been an 11 % decrease since 1990.<sup>7</sup> On the other end of the malnutrition spectrum, an estimated 43 million children under 5 years of age are overweight, and two-thirds of those children reside in low- and middle-income countries.<sup>8</sup> Prevalence of low body mass index (BMI) in adult women has decreased in Africa and Asia in the last 4 decades, but still exceeds 10 % in the two regions. At the same time, prevalence of overweight and obesity has increased in all regions.<sup>9</sup> According to the world's leading medical journal, the Lancet, "[d] efficiencies of essential vitamins and minerals continue to be widespread and have significant adverse effects on child survival and development, as well as maternal health."<sup>10</sup> Thus, indicators of malnutrition have far-reaching effects world-wide.

### ***9.1.2 Why Food and Agriculture Policies Should Have Nutrition Goals and Outcomes***

Where policies exist that support nutrition-sensitive approaches and where active government processes stimulate joint agriculture nutrition approaches, there is a relatively high likelihood of success in implementing such programmes and projects with the theoretical implication of improved, nutrient-rich and balanced diets, and eventually, improved health status of consumers. However, the sustainability of such initiatives relies heavily on sustained political will.<sup>11</sup>

The WHO maintains that "[a]griculture remains the largest employment sector in most developing countries and international agriculture agreements are crucial to

a country's food security."<sup>12</sup> A recent report published by the UN Nutrition Sensitivity of Agriculture and Food Policies, however, concluded that the "complex role of how agricultural policies can effectively address nutrition is not yet well understood."<sup>13</sup> Additionally, the UN Standing Committee on Nutrition found that "[t]here is considerable conceptual knowledge on this topic, but little understanding of how to carry concepts and policy objectives into effective implementation and delivery of food-based approaches that impact nutritional status of populations."<sup>14</sup> By focusing on the entire human lifecycle, nutrition-sensitive agriculture and food policies should consider the nutrients and determinants that are important for development, growth, and maintenance of health at various stages of life. The approach should encompass the entire food system—a complete array of activities covering all stages of the food supply chain ranging from input distribution, on-farm production, marketing, processing, and storage. The goal should be to produce healthy and safe food containing essential micronutrients and to increase year-round, affordable access for both rural and urban communities, as the consumers.

Food policies and programs are relevant to ensure that food systems from production to processing to consumption are directed to ensuring improved dietary patterns and nutrition outcomes. Debate continues between those who argue that agricultural policy should play a large role in producing nutritious food and those who believe that it is more important for agricultural policy to focus on economic development and "feeding the planet" in the form of bulk calories.<sup>15</sup>

This chapter attempts to unpack the importance of food and agriculture policies on nutrition outcomes and why engagement of food and public health systems remain critically important. External pressures that tax these systems will be discussed, as well as the globalization of our food system and why that has shifted

dietary patterns and nutrition and health status trends. The multi-sectoral integration of food and health systems and its importance to improve nutrition will be demonstrated through three models. Finally, four case studies will be presented that help exemplify some of the agriculture, food and health system trends that influence policy and ultimately, nutrition outcomes.

## 9.2 External Pressures on Food and Public Health Systems

### 9.2.1 *How Climate Variability Impacts Food and Public Health Systems*

There is clear and convincing evidence for anthropogenic climate change.<sup>16</sup> The warming of the earth will have devastating consequences including more extreme weather conditions, rising seas leading to salination of agriculture and drinking water sources, and acidification of oceans, in which many people rely on for their diets and livelihoods. These effects will impact food security, nutritional outcomes and public health. The increased climate variability will intensify the severity and frequency of natural disasters. Both floods and droughts are and will continue to occur more frequently.<sup>17</sup> Predicting weather patterns will become much more difficult as the variability related to climate change increases.<sup>18</sup>

Climate change is having, and will have, very different effects depending on where people live and which resources are available to them. The poor will be impacted the most and suffer the greatest repercussions. Risks of food insecurity and health will also impact the poorest nations—ironically, those who had made the least anthropogenic contribution to climate change.<sup>19</sup> These changes are also likely to have the greatest impact in many low resource regions' agricultural outputs, reducing yields of crops, soil fertility, and forest and animal productivity, which may lower income, resiliency and subsequently, reduced access to sufficient, nutrient dense foods and impaired nutritional status of communities.<sup>20</sup> Unstable agriculture output could increase global prices for food and their volatility,<sup>21</sup> while urban areas will be especially vulnerable in accessing food.<sup>22</sup>

The poorest communities, especially female headed-households, will feel the consequences of rising food prices most strongly.<sup>23</sup> Increases in food costs force

<sup>23</sup>Popkin et al. (2012).

people to reduce the quantity and nutrient-quality of food consumed, preferentially affecting those who are in need of nutrient dense foods like young children and pregnant or lactating women.<sup>24</sup> In addition, diminished biodiversity, which is an important source of diverse diets, may, “increase the risk of disease being transmitted to human beings, a phenomenon termed the dilution effect.”<sup>25</sup> Thus, it has been estimated that 80 % of the burden of disease related to climate change will affect children and that by 2050, with a potential projection of a 20 % increase in malnutrition.<sup>26</sup> Climate variability, according to the UN Office for the Coordination of Humanitarian Affairs, “could eliminate much of the improvement in child malnourishment levels that would occur with no climate change.”<sup>27</sup> In fact, some studies estimate an even greater impact with stunting increasing by as much as 30 % compared to a scenario in which climate is stable.<sup>28</sup>

Additionally, the disease burden will also be impacted with a warmer world, which will in turn, effect the public health system. As global temperature rises, health impacts will change. With increasing severity of heat waves, heat-related stress will increase short-term mortality from stroke, respiratory and cardiovascular incidents.<sup>29</sup> Rising temperatures will also increase the spread and transmission of vector and rodent-borne diseases as well as density, pathogen maturation and replication within mosquitos resulting in increases in infections of malaria, dengue fever and other vector born diseases.<sup>30</sup> It is estimated that malaria, diarrhea and protein-energy malnutrition together cause more than 3 million deaths each year.<sup>31</sup>

### ***9.2.2 How Population Growth Will Impact Food and Public Health Systems***

It is nearly certain that the world’s population will continue to increase. Over the past decade, our global population has increased from 6 billion to 7 billion. Historically, most of the growth in population has occurred post industrial revolution following the boom in services and industry. It is estimated that by 2050, the world’s population will continue to grow to 9 billion, which begs the question of

<sup>30</sup>Costello et al. (2009).

<sup>31</sup>WHO (2004).

how much our planet and humanity can sustain and what the boundaries are of our food and health systems? (see Chap. 16).

The patterns of population growth are nuanced. Overall, fertility rates are declining and child survival is increasing. Explanations for these trends are analogous to the question of what came first, the chicken or the egg? Have declines in fertility resulted in increased child survival because families take care to invest in their few children, or has child survival, through improved primary care health systems led to declines in fertility because families are realizing that the children that they do have, not only survive, but also thrive? Although the trend is overall positive, the continued population growth and its resulting pressure will have impacts on our food and public health systems. Results will include pressures upon public health, sustainable food production, environmental conservation, and the prevention of climate change as a challenge of industrial food production.

As global populations expand, the health system will be increasingly strained. In high-income countries, the population is aging due to extended life expectancy. A UN Task Team, led by senior experts from over 50 UN entities and international organizations, the Department of Economic and Social Affairs, and the UN Development Programme, found that, “[t]he number and proportion of older persons aged 60 years or over are rising in all countries. Globally, the number of older persons aged 60 years or over is projected to increase from 810 million now to more than 2 billion in 2050.”<sup>32</sup> With this longevity, comes increasing prevalence of expenses to treat chronic diseases in which the health sector must be in consistent demand.

At the same time, rapid economic growth and an emerging middle class in low- and middle-income classes will increase the demand for health services. Some countries will struggle to meet this demand.

Demographic changes in the past decades have led to the largest generation of youth in the world today. Globally there were 1.2 billion young people aged 15–24 in 2010. High-fertility countries in sub-Saharan Africa are projected to experience a rapid increase in the population aged 15–24, from 173 million at present to 362 million by mid-century.<sup>33</sup>

Thus, more of the world’s population lives in urban areas than rural, resulting in a new set of challenges for governments and the health and food systems. In many low-income countries situated in sub-Saharan Africa, Asia, Latin America and even parts of the high-income world, like America and England, urbanization has resulted in slums with little access to health services, decent food shopping areas, or sanitation services. Data suggests that “[a]s urban populations swell, so do the incidence of illness such as hypertension, heart disease, obesity, diabetes and asthma.”<sup>34</sup> As urban migration occurs, many cities are ill equipped to build a

---

<sup>32</sup>UNDESA/UNFPA (2012).

<sup>33</sup>UNDESA/UNFPA (2012).

<sup>34</sup>KPMG, Trends, risks and opportunities in healthcare, available at <http://www.kpmg.com/Global/en/IssuesAndInsights/ArticlesPublications/care-in-a-changing-world/Pages/trends-risks-opportunities.aspx> (last accessed May 2014).

healthy, functional food system. Some researchers examined food insecurity amongst slum dwellers in Nairobi and found that “[o]nly one household in five is food-secure, and nearly half of all households are categorized as food-insecure with both adult and child hunger.”<sup>35</sup> Thus, current trends point toward increased food *insecurity*.

Food insecurity, however, is not only a conundrum of low-income countries. The effects of food insecurity are also felt in wealthy cities. In New York City, for example, one of the wealthiest cities in the world, more than 1.3 million residents, including one in five children and one in ten seniors (over the age of 60), live in households that lack sufficient food.<sup>36</sup> In the last 5 years, the number of city residents experiencing food insecurity has increased by more than 200,000 and the city’s food pantries and soup kitchens reported a 10 % increase in demand, while 63 % reported food shortages in 2013.<sup>37</sup> A recent study has also shown that food insecurity was significantly associated with increasing body mass index in women not receiving food assistance in New York City.<sup>38</sup> This study further demonstrates that, “in an urban population, overweight and obesity are very common as is food insecurity”<sup>39</sup> and there is often a correlation between the two.<sup>40</sup>

With population pressures in the future will also come the necessity to ensure that enough food is produced and that the food produced is not wasted. An estimated 30–50 % of the world’s food is never consumed, but, instead, wasted or disposed of somewhere along the value chain between the producer and the consumer.<sup>41</sup> In high-income countries, most of the food waste that occurs is with the consumer or the retailer, such as food markets, restaurants, convenience stores. In low-income countries, most of the food wasted is due to post harvest losses and a lack of infrastructure, transport and technology.

In order to ensure that enough food is available for the growing populations around the world and that food is not wasted, policy makers and consumers may need to better think about how food is grown, transported and distributed in an equitable and efficient way. In this process, nutrition is often forgotten or lost. Thus, changes in the types of food we eat, as well as shifts in our diet, will drive a new market of and demand for how food is grown, processed and consumed. While population is increasing, overall wealth amongst that growing population is also booming, particularly in places like India, China and Brazil. This diet will shift

towards more meat, dairy products, oils and processed food consumption and away from the more sustainable plant-based diets. Consequently, despite the need to grow more crops in a sustainable way, there is also a need to ensure that the food is available and accessible in a more equitable way. It follows that the food that is grown, provided and sold should be of better nutritional quality while consumers demand more nutritious foods.<sup>42</sup>

### ***9.2.3 Potential Future Pandemics: Consequences for Food Supplies and Public Health***

A pandemic is a global disease outbreak that represents a top global catastrophic risk<sup>43</sup>

Outbreaks are usually the result of rapidly transmitting pathogens. Many of these pathogens are still emerging and little is known about the potentiating implications, many of which originate from animals (termed zoonotic). Some concerning pathogens arose over the last decade—including severe acute respiratory syndrome (SARS), West Nile Virus and the H5N1 avian flu. According to the World Bank, “every year, 2.3 billion human infections occur in developing countries by zoonotic diseases, and 2.2 million”<sup>44</sup> people die as a result.<sup>45</sup> The food supply and the risks that come along with it are intricately linked to health outcomes that are also connected to the consumption of animal products.

Those that suffer the most are the poor and fragile communities, often because of the lack of public health services and their proximity to animals and livestock. The pathogens causing zoonoses result in diseases that can have profound impacts on food security, nutrition outcomes and livelihoods of these poor households. The World Bank states that “[p]andemic prevention requires robust public health systems (veterinary and human) to detect contagion early, ensure correct diagnoses, and respond rapidly to defend against contagion.”<sup>46</sup> Prevention also requires oversight of the food system to do early screenings, oversight and governance of quality controls and assurances. To ensure better response systems, in 2008, the WHO, and the Food and Agriculture Organization (FAO), coordinated by the World Bank and UN System Influenza Coordinator, prepared a global strategy for using “One Health” approaches to reduce health risks at animal-human-environment

interfaces.<sup>47</sup> This multi-sectoral and disciplinary coordination is crucial to both food and health system integration to reduce pathogen risk.

## 9.3 Our Globalized Food System

### 9.3.1 *The Impact of Food Policies on Diets and Nutrition Outcomes*

*Nutrition-sensitive agriculture* involves the design and implementation of nutrition-based approaches within agriculture, sustainable farming, crop systems, value chains and market places.<sup>48</sup> Ultimately, nutrition-sensitive agriculture is aimed at improving the nutritional outcome of a population by maximizing the positive impact of food and agricultural systems and their value chains on nutrition while minimizing the potential for negative externalities on the sector's economic and production-driven goals.<sup>49</sup> It is agriculture with a nutrition *lens* and should not detract from the sector or consumer goals.<sup>50</sup> What is clear is that changing agricultural systems should not only meet basic caloric needs, but also the micronutrient and dietary quality needs of communities.<sup>51</sup>

There are five crucial entry points to improve nutrition-sensitive agriculture approaches<sup>52</sup> with two entry points in particular: (a) enabling policies and government structures expressing the political will to fight malnutrition and micronutrient deficiencies, and (b) appropriate mechanisms for inter-sectoral and inter-organizational collaboration within the countries. Studies have shown that for nutrition-sensitive agriculture programmes to be successful, partners from different sectors must be considered as active players.

Policies and processes of global market integration can influence long-term dietary change, but there is a need to look beyond the health sector.<sup>53</sup> Policies also need to focus on the promotion of healthy, high-quality diets over the long-term among populations living in lower income countries. Some researchers noted that there were few comprehensive sets of policies addressing obesity and diet-related chronic diseases in the developing world.<sup>54</sup> This remains true today. There is also very little that existing policies do to address the forces and institutions of the

---

<sup>53</sup>Hawkes (2006).

<sup>54</sup>Hawkes (2006).

global marketplace that can have more detrimental effects to the health of populations.<sup>55</sup>

Since the WHO adopted the Global Strategy in 2004, governments are increasingly beginning to implement food policies to encourage healthier eating. Although the main strategy has been to provide information for consumers, countries have made notable steps in reformulating food products, establishing school food standards, nutrition labeling, restricting food marketing to children, promoting fruits and vegetables, and more recently, implementation of food taxes. However, when it comes to national food and agricultural policies, the focus remains mainly on producers. The policies are also not designed with public health in mind. For example, the relationship between population nutrition and chronic disease risk is often ignored in most agriculture policies,<sup>56</sup> which was corroborated by other analyses. One particular supporting analysis points out that current food policies are largely incompatible with good public health, but interventions that include food producers, processors, and food providers can markedly improve a population's dietary health. Such an improvement would require cooperation between farming and commercial food producers in order to counter the current trends in food supplies and to reshape the nutrition transition.<sup>57</sup>

In the WHO nutrition policy review,<sup>58</sup> the most commonly reported policy activities in food security and agriculture were research (59%) and supply of seeds (55%), subsidized sales and construction of irrigation systems (48%), construction of rural infrastructure (42%), price control (41%), international agreements to increase domestic food production (41%), production credit from state-owned banks (39%) and subsidized food for vulnerable groups (38%).<sup>59</sup> The main policy goals of these programmes were to increase output and farm incomes, followed by improving the quality of the products. Few of the broad policy goals explicitly mentioned nutritional goals, such as combating undernutrition, reducing overweight or obesity, or promoting a healthy diet.

### ***9.3.2 The Importance of Linking Food Policy to Public Health: Dietary Health Guidelines and Nutrient Needs***

Increasingly, countries are developing and adopting dietary guidelines to promote healthy diets for their populations. These guidelines are often structured into select food groups and the recommended relative amounts to consume in order to obtain essential nutrients or to reduce risk of non-communicable diseases. Most guides

---

<sup>55</sup>Hawkes (2006) and Verstraeten et al. (2012).

<sup>56</sup>Nugent (2004).

<sup>57</sup>Wang and Lobstein (2006).

<sup>58</sup>WHO (2013).

<sup>59</sup>Id.

recommend a diet based on staples of cereals or starchy roots, combined with high vegetable and fruit consumption, moderate levels of animal and vegetable protein and small amounts of fat, salt and sugar. Many combine this dietary pattern type approach with physical activity recommendations.<sup>60</sup> Although many countries have developed their own set of guidelines, many countries have based their guidelines on those developed by the World Health Organization (WHO).

In the United States, dietary guidelines are updated every 5 years based on the latest science as well as some food policy. These guidelines are quite detailed and visual and, in their development, involve a public consultation. A study that compared the 2005 U.S. dietary guidelines to the food system supply that is available for the country, found that food supply does not, on average, equal the recommended dietary guidelines.<sup>61</sup> The volume supplied surpasses the volume required by some two-thirds in the case of grains, and by half for both fats and sugar, while the volume of protein supplied is more than twice as high as the amount required. Similarly, the amount of oil supplied is three times as high as the amount needed, while dairy supply exceeds requirements by one-fifth. Fruit supply stands at less than three quarters of the required amount. Only vegetables come close to the recommended levels. The authors of this study also found that this imbalance between supply and demand, or better, need, is even worse for the least developed countries.<sup>62</sup> In addition, there is an issue with what dietary guidelines recommend to what is possible within the planetary boundaries. For example, increasing consumption of fish rich in omega three fatty acids may quickly deplete the natural marine resources that contain these essential nutrients. Thus, changing diets may have massive implications on our environment and planet. The IOM has recently recommended that U.S. dietary guidelines be more thoughtfully based on environmental as well as nutritional considerations and consider more sustainable diet options (see Chap. 10).<sup>63</sup>

In middle- and high-income countries, attention and publicity is increasing to promote better quality of diets in terms of both nutrition and sustainability. However, it is clear that the cost of such diets is currently high<sup>64</sup> and even basic diets in much of the world remain costlier than daily wages due to increased food prices.<sup>65</sup> In South Africa, a middle-income country, a nutritious and healthy diet costs 69 % more than a typical South African diet.<sup>66</sup> Even in high-income countries, many people cannot meet the dietary guidelines because the cost is prohibitive or consumers do not know how to shift toward better diets. In particular, fresh fruit and vegetable recommendations are difficult to satisfy because fresh produce is more

<sup>65</sup>Brinkman et al. (2010).

<sup>66</sup>Temple and Steyn (2011) and Keats and Wiggins (2014).

expensive across the globe. Conversely, the least expensive food alternatives are often also the least healthy and least sustainable—ultra-processed, high in sugar and fat, and high in energy cost for every dollar spent.<sup>67</sup> To some extent, this seemingly cheaper sticker price is due to the externalization of the food producers costs (see Chap. 16). Thus, sustainable and plant-based diets geared toward public health must become less costly so that consumers can have realistic alternatives to fast and processed foods.

### 9.3.3 Food Safety and Food Utilization

Food safety is of utmost concern as our global food system becomes more globalized, and the “movement” of foodstuffs is increasingly reaching most geographical pockets across the planet. Food pathogen outbreaks, for instance, that occur in one area can have devastating health impacts in another. Contaminated food is, therefore, a major cause of acute diarrhea, malnutrition and mortality in low- and middle-income settings, particularly among children who become vulnerable to diarrheal diseases when transitioning from breast milk to complementary foods.<sup>68</sup> Solving problems of contaminated food requires a multi-disciplinary approach involving experts in clean water resources, sanitation, public health, epidemiology, nutrition and of course, agriculture, as the major food source.

Some studies suggest that environmental enteropathy afflicts many children in the developing world.<sup>69</sup> Environmental enteropathy is a syndrome that causes changes in the small intestine of individuals who lack basic sanitary facilities and are chronically exposed to fecal contamination. This, in turn, decreases the ability of the intestinal tract to absorb critical nutrients necessary for optimum growth and development, leading to serious consequences in nutritional status. Environmental enteropathy is often seen in young children when complementary foods are introduced along with breastfeeding. Not only are children eating more solid foods, but they also have increased exposure to the outside environment itself, leading to an increased risk of consuming contaminated foods. The provision of toilets and community led sanitation, hygiene programs, and improved systems can reduce the incidence of enteropathy.<sup>70</sup> Therefore, robust community public health programs are critically important to nutrition improvements and consuming food is not the only pathway to better nutrition.

Notably, food toxins can be process-induced or naturally occurring, which is considered poisonous and can cause disease. There are many types of toxins but one in particular, aflatoxin, is receiving a significant amount of attention because of its

---

<sup>67</sup>Aggarwal et al. (2012) and Keats and Wiggins (2014).

<sup>68</sup>Motarjemi et al. (1993, 2012).

<sup>69</sup>Humphrey (2009).

<sup>70</sup>Guerrant et al. (2008) and Motarjemi (2000).

deleterious effects. Aflatoxins are fungal metabolites that contaminate staple food crops in many developing countries and have been loosely associated with growth impairments in children, i.e. stunting as a measure of chronic undernutrition. Foodborne aflatoxin exposure, for instance, in maize and groundnuts, is common in Africa and Asia.<sup>71</sup> More evidence is needed on how post-harvest storage and handling can control aflatoxin, which could indirectly have an impact on the nutritional status of households.<sup>72</sup> Thus, food toxins, whether process-induced or naturally occurring, should be addressed to improve nutrition outcomes as a whole.

This area of work is critically important in the infant and young child feeding interventions, and public health, education, and agriculture all play critical roles in ensuring food safety and nutrient availability. Most of the studies examine in this field, however, the contamination of foods with *Escherichia coli*. There are four major categories of diarrheagenic *Escherichia coli*: enterotoxigenic (a major cause of travelers' diarrhea and infant diarrhea in low-income countries), enteroinvasive (a cause of dysentery), enteropathogenic (an important cause of infant diarrhea), and enterohemorrhagic (a cause of hemorrhagic colitis and hemolytic uremic syndrome). Besides manifesting distinct clinical patterns, these categories of *E. coli* differ in their epidemiology and pathogenesis.<sup>73</sup> However, succinct outcomes need to be found as well as studies conducted to determine the effect of contaminated food directly on diarrhea incidence and indirectly on anthropometry measures. A lot of work still needs to be done in exploring connection, associations and correlations in young child feeding interventions, and public health, education, and agriculture but the evidence supports the need for overall improved food safety and nutrient availability.

## 9.4 Bridging Sectors and Disciplines

### 9.4.1 *Integration of Sectors Across Food and Health Systems for Nutrition*

The interactions between health, nutrition and agriculture are mutual: agriculture affects health and health affects agriculture—both positively and negatively.<sup>74</sup> Consequently, multi-sectoral approaches are vital to ensure improvements in food security and nutrition for individuals, households and communities.<sup>75</sup> However, integration across diverse sectors and distinct systems is complex. There are, at a minimum, three key sectors that need to engage, collaborate and contribute to

---

<sup>71</sup>Khlangwiset et al. (2011).

<sup>72</sup>Wild (2007) and Leroy (2013).

<sup>73</sup>Levine (1987).

<sup>74</sup>Hawkes and Ruel (2006).

<sup>75</sup>World Bank (2012a, b).

nutrition improvements: agriculture, health and environment sectors. These three sectors link nutrition with the functioning of and effectiveness of food, health, water and sanitation systems.<sup>76</sup>

A robust primary health care systems approach, complemented by improved water and sanitation, can improve nutritional status. The infectious disease burden, for example, impedes consumption and the body's ability to metabolize nutrients, resulting in poor nutrient absorption and nutritional deficiencies. Consequently, one of the most important premises to improve nutrition is to control and prevent the most common childhood infectious diseases by expanding immunization programs, providing diarrhea and malaria control, treating infected patients, and decreasing parasitic burden. The backbone of some of these programs is a clean water supply, hygiene and sanitation improvements at the household and school levels.<sup>77</sup> The importance of clean water must not be understated and plays a role across a variety of food law and policy aspects.

Synergistically, if food production systems are inadequate, there can be negative effects on health. Thus, sound food production systems can improve the overall health of communities. After all, health is considered a primary goal and endpoint of food systems.<sup>78</sup> Similarly, poor health and dysfunctional health systems can limit agricultural productivity. Conversely, good or improved health and nutrition allow for improvements in agriculture outputs.<sup>79</sup> With improvements in agricultural production, in turn, household income can potentially increase and with that, more can be spent on household healthcare and other goods. Additional income can also be used to purchase higher-quality food toward a more diverse diet. Changes in agricultural production can also result in the introduction of new foods into diets.<sup>80</sup> Thus, the feedback loop between food and public health affects multiple sectors. A multi-sectoral approach, therefore, is the foremost method to address these concerns because it brings together a coherent range of strategies with the aim of enhancing food and nutrition security. These necessarily include interventions in agriculture and business development, healthcare, clean water, hygiene and sanitation, basic infrastructure, gender equality, and education.

To strengthen food and health systems and to achieve integrated synergies, there needs to be thoughtful integration between interventions or approaches, especially when an already existing collection of distinct vertical programs exists.<sup>81</sup> "Every intervention, from the simplest to the most complex, has an effect on the overall system, and the overall system has an effect on every intervention."<sup>82</sup> Services,

<sup>82</sup>de Savigny and Taghreed (2009).

interventions and solutions that are bundled or packaged across food, health and environmental systems can be more effective and advantageous.<sup>83</sup>

Recent calls for greater attention to hunger and under-nutrition highlight the importance of integrating technical interventions with broader approaches to address underlying causes of food insecurity while incorporating perspectives from agriculture, health, water and sanitation, infrastructure, gender and education.<sup>84</sup> Such an approach would inherently build on the knowledge and on the capacities of local communities to transform and improve the quality of diets for better child health and nutrition, as well. Moreover, such approaches also highlight the interdependence and the bidirectional relationships that exist between hunger and nutrition and a host of other health development challenges.<sup>85</sup> Recent research, for instance, has documented potential synergies between health and economic interventions, suggesting multi-sectoral approaches which may generate a wider range of benefits than single sector approaches acting alone.<sup>86</sup> Even while addressing broader determinants, a political priority is to address primary causes of hunger and under-nutrition in an equitable manner.

Evidence also suggests that increasing economic growth alone, while necessary and important, is unlikely to be sufficient to address hunger and under-nutrition. Food and nutrition security are complex and require efforts across a spectrum that include enhancing food production while simultaneously increasing access and utilization with substantive political commitment to address the most vulnerable populations with an equitable, basic human rights lens approach.<sup>87</sup> Therefore, addressing food and nutrition insecurity are inextricably linked to the wider progress towards the new Sustainable Development Goals. Durable gains will hinge on concurrent steps to reduce poverty, improve access to education, empower women and girls, and facilitate access to basic infrastructure including safe water and sanitation, energy, transport, and communication. Working on multiple fronts simultaneously has the potential to leverage synergies and catalyze gains that extend beyond those achieved through sector specific programs working in isolation.<sup>88</sup>

### 9.4.2 *Econutrition as an Integration Model*

Ecologists, nutritionists and agronomists work in multi-dimensional systems, composed of organisms, energy, and the physical environment interacting at various spatial and temporal scales, which can be described in terms of composition, structure, functions, and resilience.<sup>89</sup> Though many ecologists have focused on the relationship between biodiversity and ecosystem functioning, there has been little focus on the role that ecosystems play in providing the essential elements of human diets. The same can be said for nutritionists and agronomists. Usually, experts stick to their own sectors without thinking of the role of their discipline on other sectors. More research is now in progress demonstrating how the combination of environment, communities, agriculture and human beings impact human nutrition and livelihoods.<sup>90</sup>

Econutrition is a discipline that integrates environmental health and human health, with a particular focus on the interactions among the fields of agriculture, ecology and human nutrition.

As humans modify their environment, they select and protect some species, crops and foods and exclude and eradicate others to achieve management goals and to maximize the provisioning of ecosystem services or optimize for nutrient diversity where increasing species richness increases the capacity of the agroecosystem to meet the entirety of human nutrition needs.<sup>91</sup>

The notion that nutrition, human and agricultural productivity, and environmental sustainability are interrelated has thus been coined as “econutrition.”<sup>92</sup> It is the goal of econutrition to tackle malnutrition, where much can be gained by linking agriculture and ecology to human nutrition and health. Integrated and mixed agriculture systems such as the rice-fish aquaculture systems, poultry-orchard systems, livestock-cover crop systems all provide benefits for food production, ecological, diet and nutrition.<sup>93</sup>

Econutrition type approaches are being piloted that integrate ecosystems services, with food production and nutrition. For example, ecological complementarity that also results in net nutritional benefit comes from the Mesoamerican “three sisters”—the combination of corn (a grass), beans (a nitrogen-fixing legume), and squash (a low-lying).<sup>94</sup> Integrated and mixed agriculture systems such as the rice-fish aquaculture systems, poultry-orchard systems, and livestock-cover crop systems also provide food production, ecological, diet and nutrition benefits.<sup>95</sup>

---

<sup>89</sup>DeClerck et al. (2011).

<sup>90</sup>Remans et al (2011c).

<sup>91</sup>DeClerck et al. (2011).

<sup>92</sup>Deckelbaum et al. (2006).

<sup>93</sup>Fanzo and Hunter (2013).

<sup>94</sup>DeClerck et al. (2011).

<sup>95</sup>Fanzo and Hunter (2013).

One such example of mixed farming systems was implemented in Northern Malawi. Legumes were promoted in a maize-dominated farming society to improve soil health (nitrogen fixing from legumes) while improving child nutrition (consumption of legumes rich in protein and micronutrients). The agriculture intervention was paired with consistent community and household education and the delivery mechanism was done through the local primary health care system, i.e. the local hospital. After 6 years of intensive interventions, child growth improved with underweight and stunting levels decreasing. This project demonstrated the impact that using agriculture approaches, delivered through the health system, can impact nutritional outcomes.<sup>96</sup> Therefore, econutrition approaches have promising effects and great potential to reverse many of the food-related problems around the world.

### 9.4.3 *Ecological Public Health*

Building on the econutrition approach, Rayner and Lang (2012) developed an “ecological public health” model. This model addresses the divisions that often happen with human health and the integrity of the natural environment. Moreover, this model links disciplinary boundaries and “champions a rebalancing of what is meant by health activity”<sup>97</sup> with preventative approaches being central. Four dimensions are stressed. These are:

- **The Material**—physical and energetic infrastructure
- **The Biological**—bio-physical processes and elements
- **The Cultural**—how people think and how collective consciousness applies
- **The Social**—interactions between people and their mutual engagement as collectives

Time, human action and institutions shape these dimensions. The outcomes, ultimately, that this model is geared toward are sustainable health futures. Nutrition fits squarely in this model because it plays a significant role in altering public health as well as the ecosystems that support nutrition. Nutrition “refers to massive changes not just in what people eat but in how food systems operate: turning precious food into cheaper calorie commodities which can be marketed and sold.” Nutrition is not just a health problem but also a larger systemic issue that demands action from many different sectors.<sup>98</sup>

---

<sup>96</sup>Kerr et al (2010).

<sup>97</sup>Rayner and Lang (2012).

<sup>98</sup>Rayner and Lang (2012).

### 9.4.4 Sustainable Diets

In recent years, a number of initiatives and studies have focused more directly on the question of diets and their impacts on human health, the environment, and food systems. In 2010, the FAO led an effort to develop the following consensus definition for Sustainable Diets: those diets with low environmental impacts, which contribute to food and nutrition security and to [a] healthy life for present and future generations. Sustainable diets are protective and respectful of biodiversity and ecosystems, culturally acceptable, accessible, economically fair and affordable; nutritionally adequate, safe and healthy; while optimizing natural and human resources.<sup>99</sup>

While elaborate, this definition reflects the important recognition that the health of human beings cannot be isolated from the health of ecosystems.<sup>100</sup> Thus, sustainable diets promote environmental and economic stability through low-impact and affordable, accessible foods, while supporting public health through adequate nutrition. Importantly, sustainable diets help promote sovereignty and preserve tradition involving culturally sensitive and acceptable foods.<sup>101</sup>

In order to advance commitments to sustainable diets as a central aspect to sustainable development, one must address the gaps in our understanding of what constitutes a sustainable diet for different populations and contexts. Additionally, it is important to understand how these diets can be assessed within the global food system and how environmental sustainability in global consumption patterns and dietary goals can be achieved. Finally, it is necessary to examine how (sustainable) diets can help transform the health of populations, while promoting economic development and the slowing of environmental degradation.<sup>102</sup> Although many of these processes are underway, they are not yet receiving due political attention or support. This lack of political attention is partly due to the complex web of interactions between food systems, manufacturers, the environment, public health, and consumer behavior and the challenges policy makers face in making appropriate choices whether they are in government, commerce or civil society.<sup>103</sup>

## 9.5 Case Studies

In this next section, four case studies are presented. In three studies, a political analysis was done in several middle- and low-income countries<sup>104</sup> in three major regions of the world, Africa, Asia and Latin America, to determine how nutrition is

---

<sup>99</sup>Burlingame and Dernini (2012).

<sup>100</sup>Johnston et al. (2014).

<sup>101</sup>Macdiarmid et al. (2011) and Burlingame and Dernini (2012).

<sup>102</sup>Johnston et al. (2014).

<sup>103</sup>Lang and Barling (2013).

<sup>104</sup>Fanzo et al. (2014).

integrated into food and agriculture policies, with particular focus on “nutrition sensitive” agriculture policies. These case studies demonstrate the opportunities and challenges of countries undergoing a triple burden of malnutrition, and how difficult it can be to integrate nutrition, public health and agriculture in policy and in practice.

The last case study highlights a particular project, the Millennium Villages Project in integrating not only just nutrition into public health and agriculture, but also, nutrition into a wider development framework to achieve the Millennium Development Goals (MDGs). This case study illustrates how impactful integration of multiple sectors can be to achieve results in the most difficult of settings.

### ***9.5.1 Case Study Brazil: A Country in Transition***

The major food commodities grown in Brazil include coffee, oranges, and soybeans. Notably, the Brazilian diet is shifting from traditional foods that are freshly prepared to ultra-processed foods.<sup>105</sup> Traditional foods include rice and beans as well as roots like cassava. These foods are being replaced with foods that are energy-dense and rich in salt, sugar, and fat. In fact, it has been observed that the reduction in consumption of traditional foods as well as fish, eggs, and vegetables has coincided with increased consumption of soft drinks, cookies, sausages, alcohol, and pre-made meals. Brazil has two agricultural models that define the food system. The agribusiness model focuses on large-scale monocultures grown primarily for export. Conversely, the family-farming model focuses on smallholders and domestic, diversified production. Although, the agribusiness model is the dominant model nationally, accounting for two thirds of agrarian production, the family-farm model is growing and is responsible for 70 % of the food consumed in Brazil.<sup>106</sup> Further and future-oriented support for family-farms is likely to be more beneficial for eonutrition and food safety in Brazil than industrial agriculture.

Brazil is currently undergoing a nutrition transition. Within the past few decades, there has been a decrease in under-nutrition as well as large increases in overweight and obesity. Simultaneously, within Brazil’s policies and programs, there is a strong emphasis on increased food production focusing on better food storage, concerns for vulnerable groups, empowerment of women, and explicit nutrition objectives and indicators. Some of these policies contain elements of commitments towards the over-nutrition agenda, including nutrition education and focus on nutrient-rich foods, increase of access to markets, and promotion of dietary diversification. The resulting dichotomy between the two main agricultural models parallels the nutrition challenges in Brazil. Logically, then, there is a dominance

---

<sup>105</sup>Monteiro et al. (2011).

<sup>106</sup>de Oliveira (2013).

of the agribusiness model, which reduces the ability of policies to target the most undernourished populations. It also is linked to the consumption of highly processed foods, which lead to obesity. Essentially, the policies that focus on family farming have more nutrition-sensitive interventions, but face challenges in implementation and sustainability, especially in competition with agribusiness approaches.<sup>107</sup> As part of the nutrition transition in Brazil, a variety of challenges must, therefore, be overcome.

Brazil is an upper middle-income South American country with a population of 190 million and a rapidly growing economy. On average, per capita income increased by 22 % between 2004 and 2008 and roughly 30 million people have entered the middle class. Currently, Brazil is moving through the second stage of the nutrition transition. This means that most people have access to adequate calories, but not to adequate amounts of micronutrients. The typical diet in Brazil is unfortunately transitioning away from traditional and minimally processed foods—such as the combination of rice and beans—to energy-dense processed foods that are low in micronutrients.

Nevertheless, Brazil has made significant progress in combating chronic under-nutrition. Between 1989 and 2006, the prevalence of childhood stunting under 5 years of age fell from 19.6 to 6.7 %. Similarly, the prevalence of underweight among children under 5 years of age decreased from 5.4 to 1.8 %. However, the prevalence of under-nutrition is higher among low-income groups and among traditional peoples and communities.

As is typical for a country moving through the second stage of the nutrition transition, the decrease in the prevalence of under-nutrition has been accompanied by an increase in the prevalence of overweight and obesity. Between 1989 and 2006, the prevalence of overweight adults and adolescent males increased from 29.9 to 50.1 %. Correspondingly, the prevalence of obesity increased from 5.4 to 12.4 %. Over the same time period, the prevalence of overweight females increased from 41.4 to 48.0 % and the prevalence of obesity increased from 13.2 to 16.9 %.

An UNSCN analysis of the nutrition sensitivity of food and agriculture policies and programs in Brazil reviewed nine policies, plans, and programs in various administrative sectors, which provide helpful examples in support of the aforementioned policies and food-related concerns outlined in this chapter.

### 9.5.1.1 Areas of Focus

There are two distinct and often contradictory models of agriculture in Brazil, namely the agribusiness model and the family-farm model. The agribusiness model accounts for 26.9 % of Brazil's GDP, and enjoys substantial political and financial support. The family farm model only accounts for 33 % of agrarian production, but it employs 74.4 % of rural workers and is responsible for 70 % of

---

<sup>107</sup>de Oliveira (2013).

the food consumed in Brazil. In general, policies and programs focused on the agribusiness model are much less nutrition sensitive than policies and programs focused on the family farm model.

Except for the Agriculture and Livestock Plans, all of the policies analyzed for this case study are associated with the family-farm model.

### National Food and Nutrition Security Policy and Plan

The National Food and Nutrition Security Policy and the accompanying implementation plan take a comprehensive approach to improving food and nutrition Security in Brazil. The policy recognizes adequate food as a human right and seeks to sustainably improve access to food, especially among the most vulnerable members of society. Other policy objectives include: the creation of nutrition education processes, development and promotion of sustainable food systems, and increased integration of food and nutrition in all levels of health care. The plan also includes interventions targeting food production and supply, healthy eating education, and strengthening of family farming.

### The Harvest Plan for Family Farming

The Harvest Plan for Family Farming is the overarching plan for the implementation of agricultural policy through the Ministry of Agriculture and Development. Its goal is to increase production, income, and use of technology within the family farming model. There are a number of nutritionally sensitive programs within the Harvest Plan for Family Farming, including the National Program for Strengthening Family Farming (PRONAF) and the Food Purchase Programme (PAA).

While all of the above programs meet many of the nutrition-sensitive criteria, the PAA, in particular, is an innovative program that simultaneously achieves improved food security for family farmer food producers and food insecure individuals while also securing additional funding for further food sensitive interventions. The PAA facilitates government purchase of nutritious food from family farms outside of the administrative procurement protocol typical for government purchases. This creates a source of dependable income for small-scale family farmers and improves food security through poverty reduction. The purchased food is then distributed to food insecure households and individuals as well as government institutions including hospitals, health care centers, and schools, where the food is used in the National School Feeding Programme. Finally, the program also stipulates that any income generated from the sale of food purchased through the PAA must be used solely for programs that combat hunger and improve FNS.

### 9.5.1.2 Successes, Challenges and the Way Forward in Brazil

Brazil has made great progress towards combating chronic malnutrition and promoting food and nutrition security. The right to adequate food is recognized in the Brazilian Constitution, and it is clear that there is substantial drive to see this right fulfilled both on the part of the government and that of civil society.

Nonetheless, the current policy in Brazil poses substantial challenges to the advancement of food and nutrition security and efforts to reduce the prevalence of overweight and obesity. Three such challenges are the apparent dichotomy between the agribusiness and family farming models, the struggle to achieve meaningful land reform, and the powerful lobby and legislative forces opposing some of the proposed food and nutrition initiatives. In the face of these challenges, however, the policies and programs analyzed are generally nutrition sensitive and provide a useful roadmap for improving nutrition in Brazil.

- ***Agribusiness versus Family Farming***

Stakeholders interviewed assert that the agribusiness model, which is dependent on monocultures and the extensive use of pesticides and genetically modified organism seeds, does not coexist harmoniously with the family-farm model. Agribusiness has had large positive effects on Brazil's economic growth and is powerful and well funded. Many stakeholders see the decision to prioritize agribusiness as diametrically opposed to promoting food and nutrition security.

- ***Land Reform***

Many stakeholders identified land concentration as a major hurdle to guaranteeing food and nutrition security among the most vulnerable groups in Brazil. While traditional and indigenous groups have access to social support programs, the right to land is critical for them to ensure long-term, sustainable food security. There has been progress toward family farming and settling of landless families since 2003, but the agribusiness model favors land concentration and, in recent years, land reform has been removed from the government's agenda.

- ***Regulation and Legislative Challenges***

Civil society plays a very important role in Brazil, and is in part responsible for many of the food and nutrition security advancements in the country, such as through the National Food and Nutrition Security Council (CONSEA). However, agriculture laws, as well as food and nutrition policies and regulations sometimes face powerful opposition from pro-agribusiness lobbyists and politicians in addition to wealthy national and transnational corporations (BigAg and BigFood). This is evidenced by the successful derailment of a regulation that intended to set limits on the advertisement of foods with low nutritional values to children.

### 9.5.1.3 Moving Toward Nutrition-Sensitive Agriculture in Brazil

All of the food and agriculture policies analyzed in this case study are nutrition sensitive to some degree. The plans that are related to promotion of the family farming model are especially nutrition sensitive. As a group, the policies and plans are strongest when it comes to taking a sustainable approach to improved food and nutrition security, increasing food production, targeting the most vulnerable, expanding access to markets, and improving food processing and storage. The current policies and plans, however, lack sufficient emphasis on increasing production of nutrient rich foods, improving processing to retain nutritional value, reducing post-harvest losses, and integrating nutrition education.

### 9.5.2 Case Study Nepal: A Landlocked, Post-Conflict Country with Great Momentum

In Nepal, the major crops are paddy (unmilled rice), wheat, maize, millet, barley, and legumes. Cereal crops are predominant in agricultural production, with 72 % of all agricultural households cultivating paddy, 64 % cultivating maize, and 57 % cultivating wheat. The Nepali diet varies depending on the landscape—the Terai (fertile lowland plains) population consumes rice and wheat, the Hill population consumes maize and millet, and the Mountain diet consists largely of millet, maize, and barley. The main Nepali cash crops grown are sugarcane, oilseeds, potatoes and pulses. Thus, the agricultural sector has diversified into fruits, vegetables, spices and condiments.

Overall, while the food system still focuses on the production of cereal crops, the percentage of households with holdings of fruits and vegetables is increasing. This trend has supplemented and changed farmer income, as well as increased the nutrition content of domestically produced foods and diets. However, this trend would have greater effect with an increase in the share of land used to cultivate the aforementioned crops.<sup>108</sup>

The government of Nepal has also a demonstrated commitment to improving food and nutrition security, which is evident in the planning structure and policies across sectors that emphasize the need for improved nutrition. For instance, The country's programs and policies look toward diversification of production, increase of production of nutritious foods, improvements in post-harvest processes, and increases in women's income. These programs and policies could be further strengthened by focusing on additional nutrition education, managing natural resources, and empowering women through multiple channels, such as improving labor and time-saving technologies, access to extension services, and supporting their rights to land and employment.

---

<sup>108</sup>Fanzo and Andrews (2013).

However, there are also areas where nutrition-sensitive policies in Nepal are particularly weak. For example, there is little effort to assess the context and cause of malnutrition at the local level and to incorporate local insights and observations into sub-national planning. The Food and Nutrition Security Plan focuses on vulnerable groups, but there could be additional policy support to expand markets and market access to these groups. The plans could also elaborate on specific measures needed to increase equitable access, availability, and consumption of quality food, particularly in those areas that are geographically difficult to reach.<sup>109</sup>

In summary, Nepal is a low-income country with a population of about 27 million. It is located in southern Asia and is bordered by China on the north and India on the east, south, and west. Agriculture dominates Nepal's economy, accounting for 34 % of the GDP and employing 70 % of the workforce. Nepal is currently in the first stage of the nutrition transition, meaning that the typical diet is low in calories and micronutrients and under-nutrition is prevalent. Staple foods, such as grains including rice, wheat and maize, which are high in energy but low in micronutrients, account for 72 % of the caloric intake of the typical Nepalese diet.

Nepal has made significant strides in improving the nutrition situation over the past decade, reducing the prevalence of stunting for children under 5 years of age from 57 to 41 %. Moreover, the prevalence of underweight for children under 5 years of age fell from 43 to 29 %, and the prevalence of maternal anemia by 50–23 %. However, the Government of Nepal (GoN) recognizes that chronic malnutrition is still a serious problem. The major policies analyzed in the UNSCN case study seek to address this problem through a variety of nutrition-specific and nutrition-sensitive interventions.

A UNSCN analysis of the nutrition sensitivity of food and agriculture policies and programs in Nepal reviewed ten policies and programs in various administrative sectors. The main areas of focus are outlined in the following section.

### 9.5.2.1 Areas of Focus

The National Planning Commission (NPC), which is the advisory body for formulating development plans in Nepal, is responsible for leading the coordination of the three main plans: (1) the Multi-sectoral Nutrition Plan for Nepal (MSNP), (2) the Agriculture Development Strategy (ADS), and (3) the Food and Nutrition Security Plan of Action (FNSP).

#### Multi-Sectoral Nutrition Plan for Nepal (MSNP)

The MSNP sets specific reduction goals for the prevalence of stunting, underweight, and wasting among children under five and undernutrition among women

---

<sup>109</sup>Fanzo and Andrews (2013).

ages 15–49. In essence, the plan intends to accomplish these goals through interventions that focus on reducing diarrheal and other diseases that inhibit nutrition absorption, providing nutrition-focused maternal education, increasing the availability and consumption of nutrient-dense foods, and expanding capacity of national and local government to improve maternal and child nutrition among other factors. Under the MSNP, the Ministry of Agriculture and Development is responsible for increasing “consumption of diversified foods, especially animal source foods, particularly among pregnant women, adolescent girls, and young children”.<sup>110</sup> They intend to increase production of foods rich in micronutrients, promote ideal Infant and Young Child Feeding (IYCF) practices, expand the percentage of children receiving immunizations and micronutrient supplements, and improve the distribution systems to reach subsistence farmers in rural areas.

Upon critical examination, the MSNP could be stronger, from an agricultural perspective, if it focused more on consumption and utilization activities of food security, indigenous food’s role in improving nutrition, integration of food technology in improving IYCF practices through nutrient-dense complementary foods, and working toward food-based dietary guidelines and the introduction of a food labeling system.

#### Agricultural Development Strategy (ADS)

The ADS is long-term strategy to increase agricultural sector growth over the next 20 years. It focuses on four strategic components: governance, productivity, profitable commercialization, and competitiveness. At the same time, ADS strives to promote inclusiveness, sustainability, multi-sectoral development, and market connectivity infrastructure. The ADS assessment report demonstrates a clear understanding of the difference between food sufficiency and food and nutrition security. Notably, nutrition remains 1 of the 12 thematic focuses of the ADS, while improving food and nutrition security are even included in the ADS vision statement. Thus, the four strategic components of the ADS are supposed to improve food and nutrition security both directly as well as indirectly through poverty reduction, agricultural trade surplus, and higher income for rural households. Nonetheless, the focus on profitable commercialization within the ADS remains cause for concern, as the commercialization of rice directly contradicts efforts within the FNSP to diversify diets. Additionally, the budget for agriculture in Nepal has historically been low and it is unclear if the plans can be accomplished without a significant increase in funding.

---

<sup>110</sup>MSNP (2012).

## Food and Nutrition Security Plan of Action (FNSP)

The FNSP was developed as a collaborative effort between the GoN and the Food and Agriculture Organization to ensure that food and nutrition security was a part of the ADS. The FNSP is a 10-year plan that is intended to be the government's primary document for food security interventions. It will serve as a complement to the ADS and eventually become an entity of the ADS.

The FNSP seeks to reduce hunger and poverty by improving sustainable agriculture-based livelihoods, especially among Nepal's poorest households. Thus, the nine components of the FNSP focus mainly on increasing food availability and are:

- (1) Agriculture Crops,
- (2) Fisheries,
- (3) Food Quality and Safety,
- (4) Forestry,
- (5) Gender Equity and Social Inclusion,
- (6) Horticulture,
- (7) Human Nutrition,
- (8) Legislation, and
- (9) Animal Health and Production.

The FNSP fills in gaps in the ADS by focusing on the most vulnerable and by promoting diversification of production systems. However, the FNSP would benefit from additional focus on access to and utilization of foods at the household level. It is the focus on production that ignores consumer-side factors that affect nutrition such as affordability, purchasing power, consumption and behavioral changes.

### 9.5.2.2 Successes, Challenges and the Way Forward in Nepal

The GoN has aggressively pursued ambitious policies to address chronic malnutrition in the country. Political will to improve the nutrition situation is critical to success, and the GoN has showed the commitment necessary to make a positive impact on chronic malnutrition. One demonstration of this success was the recently drafted Multi-sectoral Nutrition Plan for Nepal that truly represents multiple sectors of the GoN.

All three major policies have explicit nutrition objectives, nutritional impact measurements within the monitoring and evaluation systems, and opportunities for multi-sectoral collaboration. These plans all include activities or interventions that increase food access by diversifying production and income, increasing production of nutritious foods (with a focus on local foods rich in micronutrients and protein), improving processing and reducing post-harvest losses, increasing market access, and improving storage and preservation of food. The plans could be strengthened by a greater focus on incorporating nutrition education into interventions, long-term management of natural resources, and empowering women through increasing

income, improving labor technologies and supporting their right to land, education, and employment. Finally, the plans are also weak in assessing the causes and context of malnutrition at the local level to maximize the effectiveness of interventions within the heterogeneous localities in Nepal and increasing equitable access to resources.

While the three major policies and plans analyzed in this case study have nutrition-sensitive elements, Nepal faces implementation challenges including a lack of capacity and insufficient coordination between plans and ministries. There is a lack of nutrition-related human resources at all levels of government in Nepal, which is a major obstacle to effective implementation of nutrition-sensitive interventions. The Government of Nepal is aware of this scarcity and is working with NGOs and the donor community to build the necessary capacity at the local and central levels. Even the MSNP and the ADS have built-in capacity objectives to help address this gap.

There is a large potential for collaboration within the plans, but it is not immediately evident that this potential is being fulfilled. Many stakeholders are unaware of their role in the MSNP and the ADS. The plans also do not take advantage of many opportunities for multi-sectoral coordination. In fact, the ministries are seen as secondary and are underutilized. For example, the Ministry of Education is not engaged in the nutrition education initiatives of the FNSP.

### Toward Nutrition-Sensitive Agriculture in Nepal

All of the plans are ambitious with many outcome measures and target groups. To make substantive improvements, Nepal must focus on several key populations: children under two, pregnant and lactating women and the landless. If nutrition actions focused on these three populations within Nepal, coordination and impact of the plans would be optimized.

High-level government officials play a decisive role in the successful implementation of these plans. These officials must coordinate all actions across ministries and government offices, channel donor and civil society efforts, and develop compelling narratives around nutrition as a poverty reduction priority. However, issues that repeatedly emerge include transient government and mandates which prove challenging for Nepal. Without a constitution, stable government and long-term positions in ministries, priorities shift. If Nepal can make a measurable impact in a short time with these new plans, it is in the best interest for Presidents to continue the work. It is also important for food and nutrition security to be embraced as a major objective of long-term national development strategies.

Finally, long lasting change takes time. Nepal's current food and agriculture plans are ambitious, and commendable. At the same time, Nepal is a young country, and faces a long path towards development and economic security. Under-nutrition reduction takes time. With that said, nutrition goals and targets should be aggressive, but also realistic and achievable in the appropriate time scales.

### 9.5.3 *Case Study Senegal: Improving Subsistence Agriculture Through Better Nutrition*

As a largely rural country, Senegal relies predominantly on rain-fed, subsistence agriculture. Despite the fact that 75 % of the workforce is represented in the agricultural sector, Senegal remains a net food importer, particularly of rice. The main vegetable cash crops are green beans, tomatoes, melons, and mangoes. Other major commodities include peanuts, cotton, grains, and fish. In fact, fishing offers the biggest contribution to the Senegalese economy. Senegal has a traditionally diverse diet, including several forms of grains (millet, sorghum, rice), proteins (fish, goat, beef, ox), vegetables (carrots, lettuces, leaves), and starches (sweet and regular potatoes, cassava). Soil fertility and water issues are major barriers to agriculture in Senegal.

The Senegalese diet includes fruits, vegetables, meats, and grains. However, a primary constraint for Senegalese agriculture is water. The country depends on water as an agricultural input, but its proximity to the increasingly dry Sahel region makes the country subject to inconsistent rainfall and frequent droughts.<sup>111</sup> There are some approaches addressing the nutrition-vulnerable population and the use of agricultural programs as vehicles to deliver nutrition interventions but these are poorly developed in the agricultural sector.

Senegal's policies contain a number of objectives targeting vulnerable populations, empowering women, increasing production and diversification, improving the processing of agricultural products, and collaborating with other sectors. Policy commitments are nascent and clear nutrition objectives are absent in the national agricultural policy. Production of nutrient-rich foods, including nutrient value preservation, reduction in post-harvest losses, nutrition promotion and education, as well as market expansion and access carry the least focus in the analyzed policies. Coordinated action for nutrition has been high on the political agenda for the country for a long time, yet coordination is weak and delivery platforms are not used effectively.<sup>112</sup>

Thus, Senegal has followed many African neighbors by steadily improving life expectancy and health outcomes since 1995. Mortality for children under 5 years of age has decreased on average 6.4 % annually since 2000. Disparities exist particularly between rural and urban populations in Senegal. For instance, Senegalese children in rural areas face a 2.4-fold increased risk of dying compared to children who are living in an urban environment.

Malnutrition still underlies approximately one third of all child mortality. Overall, under-nutrition has decreased, from 28.5 % stunted and 16.4 % wasted in 1986 to 15.5 % stunted and 9.7 % wasted in 2012 in children under 5 years of age. Both wasting and stunting are much more prevalent in rural areas than near Dakar and

---

<sup>111</sup>Lachat (2013).

<sup>112</sup>Lachat (2013).

other cities, where overweight and obesity is rising. In fact, a study from a rural, central region showed that 15 % of surveyed children were severely deficient in iodine, showing a lack in coverage or consumption of iodized salt. Vitamin A coverage is very high across Senegal, reaching 97 % of children under 5 years of age in 2009. Anemia was estimated to be higher than 40 % in 2005 with more than 80 % of children under 5 years of age, almost 60 % of women and more than 70 % of pregnant women being affected. Anemia rates improved to 34 % of women in reproductive age in 2012.

A UNSCN supported analysis of the nutrition sensitivity of food and agriculture policies in Senegal reviewed 13 policies in various administrative sectors.

### **9.5.3.1 Areas of Focus**

Senegalese agricultural policies and programs have a strong emphasis on food security. Nutrition objectives are largely absent in agricultural policies, even though there are several elements of the key recommendations on nutrition-sensitive agriculture built in to policy papers on food security. On average, the policies incorporated many of the key recommendations. The best covered item across policies is a sustainability approach, referring to the maintenance or improvement of the natural resource base, i.e. water, soil, air, climate and biodiversity. Conversely, the highest scoring policies are the Food Security Programs. For instance, the National Strategy and Priority Programmes for Food Security and the National Strategy for Food Security is rich in nutrition-sensitive approaches with a few exceptions, such as a focus on production of nutrient-rich foods and expanding markets, on the one hand, and access of nutrient rich foods, on the other hand.

### **9.5.3.2 Senegal's Agricultural Pastoral Orientation Law**

The main agricultural program in Senegal is the Agricultural Pastoral Orientation Law. This law is by far the most robust national policy paper on Agriculture in Senegal, but it does not include key nutrition components or objectives. The main objective of the current agricultural programs is to ensure availability of food, which also aims to diversify food production in the country. Key informants noted that the current agricultural programs in which they were involved had no explicit nutritional goals. The main objective of the current agricultural programs is to ensure availability of food, with a first level of post harvest transformation. In addition to this, the programs aim to diversify food production in the country. Thus, regulators generally perceived food security or dietary diversity as the finality of their work, but essentially looked at this from an angle of food production and food availability.

The present administrative organization of the government of Senegal is not conducive to joint nutrition and agriculture programming and policy

implementation. Agriculture, in the large sense, falls under the Ministries of Agriculture and Rural Equipment, Livestock and Fisheries and Maritime Affairs, while human nutrition is a matter for the Ministry of Health and Social Action. The current agricultural programs generally do not target the nutritional vulnerability or nutritional profile of communities.

A formal structure called the *Call Against Malnutrition (CLM)* was established in 2001 that reports directly to the Prime Minister's Office and was tasked with nutrition coordination at the national level. The CLM coordinates its activities with seven Ministries (Health, Education, Economy and Finance, Decentralization, Trade, Industry and Agriculture), National Association of Rural Advisors and the Civil Society. Senegal signed up to the *Scaling Up Nutrition Movement* in 2011 and aims to accelerate investment in nutrition, especially through the involvement of the Agricultural sectors. Senegal has begun to develop of a new national nutrition policy as of 2013.

In 2011, the government pledged to increase annual funding for nutrition to 2.8 billion FCFA per year in 2015. This direct investment will be strengthened to ensure full coverage of children and women in effective nutrition intervention programs. Following the *National Policy Paper on Nutrition* in 2001, the country is currently initiating the development of a multi-sectoral strategic plan for nutrition, called "*Lettre de Politique de Nutrition*" for 2013–2018. Some of the policies have specific monitoring and evaluation systems.

### 9.5.3.3 Successes, Challenges and the Way Forward in Senegal

There is a clear recognition from the highest levels of government in Senegal that nutrition is important for the development of a healthy nation. Stakeholders understand that nutritional goals can be built into agricultural plans at a national level, and they are willing to fund proven interventions. Overall, the nutrition sensitivity of the agricultural policy documents integrated several key recommendations but missed out on others. Targeting the vulnerable population groups, empowerment of women, increases of the production, diversification and improvement of processing of agricultural products, collaboration between sectors and sustainability approaches were all present in the large majority of the policy documents. Current agricultural programs are also reported to engage and target women in terms of wellbeing, empowerment and livelihoods.

Current agricultural programs, however, do not have explicit nutritional goals and are not monitored using nutritional indicators. Technical agencies collaborate typically at the implementation level and there is little joint thinking to share experiences and inform policy development upstream. Stakeholder interviews showed a misunderstanding of what nutrition is within the agricultural sector. Most of the respondents stated that they incorporated nutrition in their programs, as they (1) worked with food scientists for primary transformation of agriculture produce, (2) simply produced the food that people eat, or (3) looked at food safety, Such as postharvest reduction of aflatoxins in peanuts. Most of the programs barely

considered how agricultural production was used in dietary intake. Although interviewees reported that data was collected on these concerns, the compilations were information on national food consumption levels, not individual food consumption data. In terms of dietary quality, the concerns of the respondents were mainly focused on ensuring enough dietary protein intake, dietary diversification, or increasing food availability.

Senegalese agricultural policies lacked aspects of incorporating nutrient-rich foods, nutrient value preservation, and preservation of nutritional quality of produce. Areas that were also weak within policies were reduction of post-harvest losses, nutrition education and promotion, food storage improvements, and market expansions and market access. All of these components were missing in more than half of the policies reviewed.

Various regions of the country suffer from persistent high rates of malnutrition despite a significant increase in agricultural productivity and income. Current agricultural programs insufficiently consider nutritional aspects and utilization of crops. Food availability at the macro level (regional—national level) has received the bulk of the attention of the agricultural sector but food availability at the individual level has received much less.

### Moving Towards Nutrition-Sensitive Agriculture in Senegal

There are a number of experiences with value chain approaches within the food system in Senegal, such as fruit and vegetable value chain or innovation platforms for the incorporation of local cereals in bread. The choice selection of seed varieties, for example, is conducted on the basis of commercial, i.e. yield, pest resistance and appearance indicators only. Consequently, promoting crop varieties on the basis of micronutrient composition is considered a promising strategy to address micronutrient deficiencies and promote local foods.

Finally, there is a general willingness and enthusiasm to incorporate nutrition objectives into the overarching agricultural framework for Senegal. Nutrition can be built into the Agricultural Pastoral Orientation Law as a formative direction towards nutrition-sensitive agriculture. The initiative to develop a Policy Letter on Nutrition and the upcoming revision of the Orientation Law are opportunities to institutionalize nutrition-agricultural linkages in Senegal. Building nutrition capacity among government leaders in various sectors, particularly in agriculture, will address the knowledge gap and confusion that exists around nutrition-sensitive agriculture. Currently, nutrition is too poorly understood by the various professionals at the agricultural ministries to enable proactive dialogue.

### ***9.5.4 Case Study Millennium Villages Project: Integration of Food and Health Systems for Nutrition***

The Millennium Villages Project is attempting to address the root causes of extreme poverty by taking a holistic, community-led approach to sustainable development. In essence, the project focuses on the community level, through community-led development. With the help of new advances in science and technology, project personnel work with villages to create and facilitate sustainable, community-led action plans that are tailored to the villages' specific needs and designed to achieve the Millennium Development Goals (MDGs). The MDGs, in turn, reflect an understanding of the many interconnected factors that contribute to extreme poverty. Additionally, the MDGs include time-bound and measurable targets to address income poverty, hunger, disease, lack of adequate shelter and exclusion—while promoting gender equality, education and environmental sustainability.

The Millennium Villages (MVs) are demonstration and testing sites for the integrated delivery of science-based interventions in health, education, agriculture and infrastructure. By integrating these different sectors and interventions, it was originally thought that nutrition improvements would be seen. The aim of the Project is to accelerate progress towards the MDG targets, including MDG 1—to eradicate extreme poverty and hunger. The range of interventions adheres to a cost ceiling of \$110 per capita sustained over a 5–10 year period, reflecting the full value of contributions from government, external donors, local communities, and the Project itself.<sup>113</sup>

Solutions like providing high-yield seeds, fertilizers, medicines, drinking wells, and materials to build school rooms and clinics and improving food and nutrition security. Improved science and technology such as agroforestry, insecticide-treated malaria bed nets, antiretroviral drugs, the Internet, remote sensing, and geographic information systems is included to enrich this progress. Over a 10-year period, community committees and local governments build capacity to continue these initiatives and develop a solid foundation for sustainable growth. To date, the Millennium Villages project has reached over 500,000 people in 79 villages. Clustered into 12 groups across 10 African countries (Ethiopia, Ghana, Kenya, Malawi, Mali, Nigeria, Rwanda, Senegal, Tanzania, and Uganda), the villages are located in different agro-ecological zones that reflect the range of farming, water, and disease challenges facing the continent.

The MVs are situated in 'hunger hotspots', where at least 20% of children are malnourished and where severe poverty is endemic. The MVs were chosen to reflect a diversity of agro-ecological zones, representing the farming systems found in over 90% of sub-Saharan Africa. Sites range from slash-and-burn in rainforest margins to pastoralism in deserts, reflecting varied levels of population density, soil conditions, climate instability, water access, disease profiles,

---

<sup>113</sup>Sanchez et al. (2007) and Remans et al (2011a).

environmental degradation, nutritional deficiencies and food availability, market access, education levels, cultural traditions and religious norms.<sup>114</sup>

The MVP model employs a three-pronged food and nutrition security approach. First, *clinical interventions* focus on persistent macro and micronutrient deficiencies in children, including vitamin A supplementation, treatment of severe acute malnutrition and regular growth monitoring. For cases of moderate malnutrition, families receive nutrient-rich flour and other food commodities. In addition, basic maternal health interventions such as basic antenatal care and institutional delivery are supported by efforts to promote adequate weight gain and improve coverage with iron and folic acid supplementation. These interventions are “core” to most nutrition programs in the developing world and for the most part, sit in the public health sector’s responsibilities. However the MVP three-pronged nutrition approach called for more integration of other sectors to address the root causes of undernutrition.

This integration of other sectors was found in the second and third prongs. Second, *education and behavior-based interventions* include homegrown school meals programs, gardens and nutrition activities after school, along with de-worming and environmental enteropathy reduction campaigns. Balanced school meals have been demonstrated both to increase school attendance as well as improve learning outcomes. Food and nutrition education and increased knowledge for women is also a critical intervention addressed. As previously shown, such interventions are important to food safety and food utilization for optimal nutrition outcomes.

Finally, *household, community and livelihood-based interventions* engage longer-term realities of food and livelihood security. These consist of subsidized seed and fertilizer interventions to increase agricultural productivity; the introduction of high-value crops, and; agro-processing initiatives and microfinance programs to stimulate small-business development. Taken together, these efforts are an attempt to enhance nutritional intake and diet diversity, while affording households the additional income required addressing nutritional needs in a sustainable fashion. A community health worker program to promote exclusive breastfeeding and locally appropriate complementary feeding, home-based fortification, and proper food storage techniques complemented this approach. Without integrating the “food and agriculture” element, nutrition and food security achievements in these communities would be sub-par.

Three years after the start of the program in 2005–2006, consistent improvements were observed by researchers at Columbia University in household food security and diet diversity, whereas coverage with child care and disease-control interventions improved for most outcomes. The prevalence of stunting, or chronic undernutrition in children <2 years old at year 3 of the program was 43 % lower (adjusted OR: 0.57; 95 % CI: 0.38, 0.83) than at baseline. These findings provide encouraging evidence that a package of multi-sectoral interventions has the

---

<sup>114</sup>Sanchez et al. (2007) and Remans et al (2011a).

potential to produce reductions in childhood undernutrition.<sup>115</sup> What these data show is that multi-sectoral approaches are vital to ensure improvements in food security and nutrition for individuals, households and communities. By integrating different sectors—such as livelihood and agriculture based interventions, public health and education—major and rapid reductions in undernutrition can be made, in poor settings.

The Millennium Villages and other project that integrate sectors to improve nutrition have been important in informing larger scale initiatives such as the Millennium Development Goals Achievement Fund. The Millennium Development Goals Achievement Fund (MDG-F) was established in 2007 as a comprehensive development cooperative mechanism to help achieve the Millennium Development Goals (MDGs). The program was large—with 130 joint programs in 50 countries with the highest burdens of undernutrition—working with different UN agencies, governmental institutions, the private sector, communities and civil society entities. The Children, Food Security and Nutrition thematic area was the largest of the MDG-F and received over US\$ 135 million to support 24 joint programs, implemented through the collaboration of several UN agencies.<sup>116</sup>

The joint programs of the MDG-F promoted multi-sectoral coordination to address food and nutrition security. Three case studies were analyzed for Peru, Brazil and Bangladesh by Levinson and Balarajan (2013). According to the authors, there were three major findings. First, convergence is important. Convergence that combines nutrition-specific and nutrition-sensitive interventions can be jointly targeted to vulnerable geographical areas and populations living in these areas. Second, the results-based incentives to sub-national governmental bodies and encouragement of more proactivity and accountability to demonstrate results related to reductions in undernutrition are critically important. Third, active and sustained civil society advocacy at the policy and programmatic levels is essential. At the policy level, this advocacy serves to ensure political and administrative commitment to nutrition and food security. At the programmatic level, advocacy helps to ensure adequate budgeting, well-designed and implemented programs that meet the needs of the population.<sup>117</sup>

## 9.6 Conclusion

The global community needs to better engage across the key sectors of agriculture, health and environment/ecology to improve nutrition. This engagement does not just need single, vertical interventions but bundled solutions that engage and revitalize food and health systems. More solutions are needed that ensure resilience

---

<sup>115</sup>Remans et al. (2011b).

<sup>116</sup>Levinson and Balarajan (2013).

<sup>117</sup>Levinson and Balarajan (2013).

of communities and sustainability of not only our food production and supplies, but also our diets, that take into account climate variability, food safety and population pressures.

New approaches and ways of thinking, that integrate sectors, such as the sustainable diets approach, econutrition and multi-sectoral integration could all be solutions to make nutrition improvements. The four case studies help illustrate how sectors can be integrated, albeit not without challenges. In the case of Brazil, Nepal and Senegal, there is commitment to integrate nutrition into agriculture and food policies but more needs to be done.

We are rapidly approaching 2015 and the shift to a post-2015 agenda. The Millennium Development Goals (MDGs) have brought much-needed attention to a number of priority areas in sustainable development policy however nutrition must be more central to the post-2015 goals and the strategies put forward to achieve food security. This will require countries to position nutrition objectives explicitly within their broader public health and agriculture agendas.

The case studies demonstrated that there is some level of commitment to achieving positive nutrition outcomes, as well as an understanding, to varying degrees, that the agricultural public health sectors have pivotal roles in achieving nutrition objectives. As we move forward into the post-2015 era, good practices and transferable lessons can be drawn from each country case study. The studies collectively highlight the importance of a supportive policy environment, well-developed human resources, and effective systems for planning, implementation, and monitoring impact for creating successful, nutrition-sensitive agriculture policies and programs.

## Chapter 10

# Textbox: Planetary Boundaries in Food and Agriculture Law

Gabriela Steier

**Abstract** Visualizing the limits of sustainable food policy and agriculture law in light of how much pollution the planet can absorb, or how many resources the planet can recover, help in appreciating the multitude of factors that must be included in legislative proposals and legal frameworks around the globe. The planetary boundaries do just that. Taking the planetary boundaries into consideration in promoting sustainable food policy and shaping agriculture law toward more environmentally responsible practices will help avoid some of the climate change and ecological losses that current food systems often provoke. The benefits of at least steering clear of those points exceeding the planetary boundaries will inform positive ways to reshape diet, nutrition, public health, environmental integrity, and energy conservation.

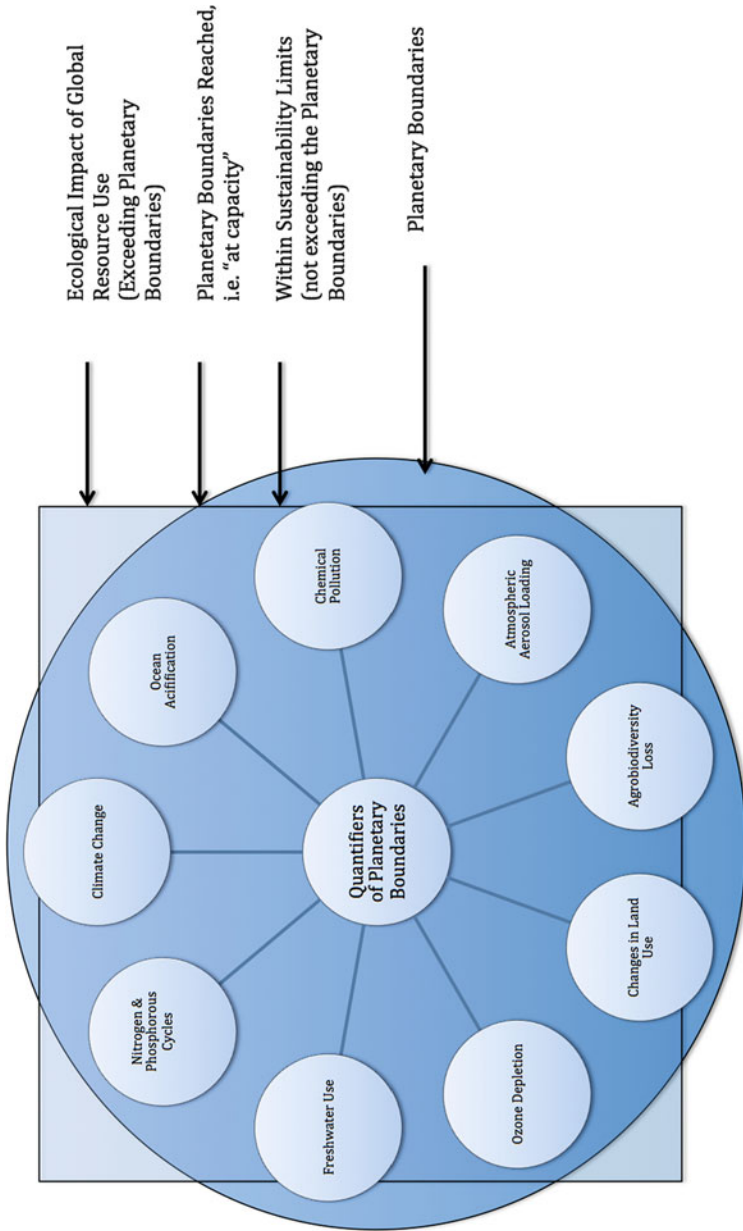

Diet and nutrition are inextricably connected. Similarly, diet and public health are closely linked. In the present interdisciplinary study, it is also important to consider that environmental integrity, energy conservation, and climate change play vital roles in this network of concerns. All of these factors impact food policy and agriculture law—and should play even greater roles as food laws around the world develop.

Therefore, visualizing the limits of sustainable food policy and agriculture law in light of how much pollution the planet can absorb, or how many resources the planet can recover, help in appreciating the multitude of factors that must be included in legislative proposals and legal frameworks around the globe. The planetary boundaries according to Rockström, Steffen et al.,<sup>1</sup> thought-leaders in the field who have contributed greatly to the study of how to improve the planet's ecological resilience, are the foremost model to conceptualize at least some of the quantifiers of how much the planet can absorb and recover from. Figure 10.1 is a

e-mail: [g.steier@foodlawinternational.com](mailto:g.steier@foodlawinternational.com)

**Fig. 10.1** The ecological impact model of the planetary boundaries. This figure illustrates the planetary boundaries (*large circle*) as they are partially exceeded by global resource use (*large square*). As the quantifiers of the planetary boundaries (*light circles*) are pushed past sustainable limits, the planet is “at capacity.” Beyond this point, i.e. where the *square* extends beyond the *large circle*, resource use is no longer sustainable and the ecological footprint exceeds the rates at which resources could either be recovered, restored or the planet maintain ecological balance. Where the *square* is within the *large circle*, the planetary boundaries are within sustainable ranges. The closer to the center the *square* may be, the more sustainable the resource use, i.e. renewable resources. Although this simplified and generalized schematic view is not based on any data and does not reflect any specific levels of resource uses, the general trend has been that the planetary boundaries are increasingly exceeded because intensive agriculture is largely unsustainable and depletes the planet’s resources on a large scale

simplified version of how these planetary boundaries may be visualized and focuses on some of the most pressing boundaries that damage the global ecosystems and environmental integrity. For the purpose of the present study on food law and policy, the list of the planetary boundaries is adapted to include only nine of these considerations, which each have a multitude of applications in food policy and agriculture law, as the following examples can merely begin to indicate:

1. **Agrobiodiversity Loss**—for example through the proliferation of GMO monocultures and the patenting of indigenous plants
2. **Changes in Land Use**—such as through the expansion of CAFOs
3. **Ozone Depletion**—as a consequence of processing and packaging fast food
4. **Freshwater Use**—for agricultural uses on monocultures
5. **Nitrogen and Phosphorous Cycles**—for instance in synthetic fertilizer and pesticide production and uses
6. **Climate Change**—as a result of industrial and centralized agriculture, unsustainable farming practices, and increased food mileage accumulation
7. **Ocean Acidification**—through industrial waste run-off and acid rain
8. **Chemical Pollution**—from food processing, transportation, and processing
9. **Atmospheric Aerosol Loading**—through greenhouse gas emissions

Although the planetary boundaries find application in various industries and across several fields of study, they are particularly useful in food law and policy because nearly every consideration surrounding diet, nutrition, public health, sustainable food production or energy use can be connected to the model of quantifying how resilient the planet is in the face of the challenges posed by these interdisciplinary issues. The dietary guidelines for Americans, for example, are a classic example of the compromises, greenwashing and industry lobby's domination over the recommendations of what consumers in the US should eat. In 2015, a revised version of the current [myplate.gov](http://myplate.gov) recommendations is due and the advisory committee, composed of hopefully independent experts, proposed a shift away from processed and industrially produced food toward a more sustainable diet based on plants.<sup>2</sup> This shift, were the BigFood and Big Ag industry to let it pass, would turn away from animal-based protein and food sources, the production of which has especially damaging effects on the environment and wastes energy on multiple levels. Industrial animal production or CAFOs, in the US, for example, cause substantial damage to soil, pollute water, promote climate change, and yield unsustainable food products. In contrast, a shift toward a generally organic whole-foods plant-based diet would prevent some of this environmental damage and reduce a variety of public health complications and diseases, such as malnutrition, obesity and cancer.<sup>3</sup>

---

<sup>2</sup>See Chapter 4–6 in USDA and DHHS, Scientific Report of the 2015 Dietary Guidelines Advisory Committee (February 2015), <http://www.health.gov/dietaryguidelines/2015-scientific-report/PDFs/Scientific-Report-of-the-2015-Dietary-Guidelines-Advisory-Committee.pdf>.

<sup>3</sup>See Oxfam's GROW Report at [https://www.oxfam.org/sites/www.oxfam.org/files/file\\_attachments/cr-growing-better-future-170611-en\\_0.pdf](https://www.oxfam.org/sites/www.oxfam.org/files/file_attachments/cr-growing-better-future-170611-en_0.pdf). See also Steier (2012).

Consequently, taking the planetary boundaries into consideration in promoting sustainable food policy and shaping agriculture law toward more environmentally responsible practices will help avoid some of the climate change and ecological losses that current food systems often provoke. The benefits of steering clear of the “at capacity” point (see Fig. 10.1) or from exceeding the planetary boundaries will inform positive ways to reshape diet, nutrition, public health, environmental integrity, and energy conservation.

# Chapter 11

## Food and Nutrition in Cancer Prevention and Treatment

Michael J. Nathenson

**Abstract** This chapter focuses on the interface of food, nutrition and oncology. Cancer is one of the major leading causes of death in the United States and throughout the world. The best treatment for cancer is still prevention. This chapter provides an introduction to cancer, clinical trials, and reviews the evidence that exists for the influence of physical activity, weight, and especially nutrition, including both macronutrients and micronutrients, on the risk of cancer development and on the success of cancer treatment. Additionally, this chapter discusses the difficulties and problems involved in developing and conducting large population based clinical trials examining the connection between nutrition and cancer. This, unfortunately, often results in conflicting results or results which are not clinically applicable. Overall, altering physical activity, weight, and diet is predicted to reduce the incidence of cancer by one third to one half. More support is needed to fund ongoing clinical trials, including trials that focus on the impact of GMO foods and pesticides on the risk of development of cancer. Finally, the consumers must become better educated on the relationship between exercise, weight, and diet on the development of cancer, in an effort to change population habits to reduce cancer incidences.

### 11.1 Introduction to Cancer

The two major leading causes of death in the US are cancer and cardiovascular disease, both of which are influenced by diet and lifestyle. The purpose of this chapter is to provide an introduction to cancer, clinical trials, and review the evidence that exists for the influence of physical activity, weight, and especially nutrition on the risk of cancer development and success of treatment.

### ***11.1.1 Epidemiology and Overview of Cancer***

Cancer is one of the major causes of death throughout the world. Worldwide there are 14.1 million new cases of cancer per year, with 8.2 million deaths per year. In addition there were at least 32.6 million people living with cancer in 2012.<sup>1</sup> In the United States alone there were an estimated 1,665,540 new cases of cancer with 585,720 cancer related deaths in 2014.<sup>2</sup> Cancer is the leading cause of death in people less than 85 years old in the United States. The lifetime risk of developing cancer is 1:3 for women and 1:2 for men in the United States.<sup>3</sup> This represents a huge burden of disease. To decrease the morbidity and mortality associated with cancer requires a multi-layer approach. This approach must include understanding cancer on a molecular and genetic level, improving screening for cancer, improving the local and systemic therapies for cancer, and improving our prevention of cancer through lifestyle modifications that can reduce the risk of developing cancer.

A tumor is a descriptive term for a growth or swelling, as is a neoplasm or new growth. These terms are not equivalent with cancer, as tumors and neoplasms can be benign or malignant. Only malignant tumors or neoplasms are considered cancer. Cancer is defined as a tumor or growth with malignant potential; the ability to spread beyond the primary site. Cancer is a heterogeneous disease with many different specific types. The two largest categories of cancer are carcinomas and sarcomas, the naming of which comes from the original ancient Greek description; *karkinos*- meaning crab, *-oma* meaning growth, and *sarx*- meaning flesh. Carcinomas are very infiltrating crab like tumors, and include the most common tumor types, including breast carcinomas, colon adenocarcinomas, prostate adenocarcinomas, lung adenocarcinomas, and lung squamous cell carcinomas. Sarcomas are much less common tumors of bone, nerve, muscle, fat, and connective tissue. Table 11.1 shows the ten leading types of cancer and Table 11.2 shows the ten leading causes of cancer related deaths in 2014.

Over the last 60 years, the field of oncology has moved from treating cancer with surgery alone, to the development of radiation therapy and chemotherapy, which has led to the ability to cure some cancers. For example cancers of the blood (leukemia and lymphoma) as well as testicular cancer can be cured with chemotherapy alone. Combined therapy with surgery, radiation and chemotherapy can lead to the cure of some early stage solid tumors, for example breast cancer. Unfortunately, for many other types of cancer, such as pancreatic and lung cancer, the existing therapies of surgery, radiation and chemotherapy have little impact on the overall mortality of patients suffering from these diseases (see footnote 3).

Patients with these types of cancers, more often than not, die of their disease. This death rate results in a huge impact on our society in terms of lives lost, emotional stress, loss productivity, cost of treatment and disease symptoms. The

field of oncology still has a very long way to go in order to cure these patients. In fact, it is still quite true that the easiest cancer to treat is the cancer that never occurs at all. There are many causes of cancer including use of tobacco products, alcohol, infectious agents—particularly certain bacteria or viruses—sun exposure, exposure to other forms of radiation, air pollution, weight and obesity, physical activity,

unsafe sex, chemical exposure, and exposure to carcinogens in food and beverages. An estimated 1/2 to 2/3 of cancer deaths are preventable by modification of these risk factors, and an approximate 1/3 of cancer deaths in the United States are preventable by modification of weight, physical activity and diet.<sup>4</sup> In addition it has been suggested that people with a body mass index (BMI) of less than 30, who have more than three and a half hours of physical activity weekly, have never smoked, and have a prudent diet, have a one third reduced risk of developing cancer.<sup>5</sup> Both the American Cancer Society (ACS) and the American Institute for Cancer Research (AICR) published guidelines for reducing the risk of cancer by modifying diet, weight and physical activity.<sup>6</sup> Table 11.3 shows a summary of the ACS and AICR guidelines. Results from the EPIC study, a large nutritional study, show a reduction in the risk of cancer when there was concordance with the AICR recommendations.<sup>7</sup> Unfortunately these recommendations are poorly implemented, and the rates of obesity and tobacco use in the US are still unacceptably high.<sup>8</sup>

A physician can have an impact on only one patient at time. In contrast, government regulation and public awareness campaigns can have a massive impact. For example, the decline in smoking combined with the increased tax on cigarettes has the potential to result in a decreased incidence of lung cancer. Public education with the goal of changing diet, increased physical activity, weight loss, use of sun protectants, but decreased the use of tobacco products and alcohol can greatly reduce the incidence of cancer in our society. Government regulation plays a key role as well. There are over 100 preventable human exposures associated with human cancers identified.<sup>9</sup> The government has an important role to protect the public from exposure to carcinogens in everyday products and foods, an area where there is much room for improvement.

### ***11.1.2 Cancer Biology, Carcinogenesis and Carcinogens***

Cancer is, in essence, a genetic disease that results from uncontrolled cell growth as the result of accumulating genetic mutations from exposure to intrinsic and environmental carcinogens. Historically, cancer was once thought to be caused by viruses. For, example the Rous sarcoma virus. Research into these viruses identified genes that could influence the development of cancer. These genes were found to be

**Table 11.3** ACS and AICR guidelines for weight, physical activity and diet

American Cancer Society Recommendations	American Institute of Cancer Research Recommendations
Be as lean as possible throughout life without being underweight, avoid excess weight at all ages	Be as lean as possible without becoming underweight
Get regular physical activity, get at least 150 min of moderate intensity or 75 min of vigorous intensity activity each week	Be physically active for at least 30 min a day
Limit intake of high-calorie foods and drinks	Avoid sugary drinks, limit consumption of energy-dense foods
Eat a healthy diet with an emphasis on plant foods, eat at least 2.5 cups of vegetables and fruits each day	Eat more vegetables, fruits, whole grains and legumes
Limit how much processed meat and red meat you eat	Limit Consumption of red meats and avoid processed meats
Drink no more than 1 alcoholic drink per day for women, or 2–3 per day for men	Limit alcoholic drinks to 2 for men and 1 for women a day
	Limit consumption of salty foods and foods processed with salt
	Don't use supplements to protect against cancer

American Cancer Society, ACS Guidelines on Nutrition and Physical Activity for Cancer Prevention; American Institute for Cancer Research, Recommendations for Cancer Prevention

carried by viruses, but had originated from their host cells; this insight led to the discovery of oncogenes and tumor suppressor genes. Oncogenes are genes, which require mutations to become active and induce the formation of cancer. Tumor suppressor genes, such as the well-known *tp53* gene, are genes that must be inactivated, through mutation for the development of cancer.<sup>10</sup> It is now known that mutations can occur through a variety of mechanisms, from exposure to UV rays from the sun or other forms of ionizing radiation, to exposure to viruses, such as the human papilloma virus that causes cervical cancer, to inherited genetic disorders, to exposure to carcinogens in our environment. The development of cancer or carcinogenesis, is a multistep process over time, which requires the accumulation of multiple mutations over a period of months to years. This is best illustrated by the well-understood carcinogenesis of colon cancer, which requires multiple mutations over a period of several years. The first gene to be mutated is the *APC* gene leading to hyper-proliferation of colon cells, the mutations in *K-ras* and the *DCC* genes leading to the development of an adenoma, and final mutation in *tp53* leading to the development of adenocarcinoma. In fact, some cancers may accumulate hundreds of mutations.

Cancer cells acquire, through these mutations, the ability to have self-sufficiency in growth signals, to have insensitivity to anti-growth signals, to have limitless replicative potential, to be able to invade tissues and metastasis, to cause sustained

<sup>10</sup>Cooper (1995).

angiogenesis, and to evade apoptosis, which includes evasion of the immune system. These are the six hallmarks for a cancer cell, which lead to their malignant potential.<sup>11</sup>

The development of mutations in a normal cell is a balance of the number of new mutations, the effectiveness of the DNA repair mechanisms, and pathways that are responsible for preserving the integrity of our genome. The baseline mutation rate that occurs with normal cell divisions, even without exposure to external carcinogens, is estimated to be approximately 1 in 9 billion. These mutations result from endogenous causes: oxidative stress, inflammation, and errors in DNA replication. There are multiple DNA repair mechanisms to correct mutations that occur, such as homologous recombination, non-homologous end joining, nucleotide excision repair, base excision repair, trans-lesion synthesis, and mis-match repair. The development of mutations can be increased by inheriting deficiencies in a DNA repair pathway or exposures to carcinogens in the environment, such as UV light, ionizing radiation, smoking tobacco, infectious agents, medications, and diet.

The amount of carcinogens in our diet is very difficult to study and define. There are complex interactions between micronutrients, nutrients in our diet, with physical activity and cellular mechanisms and processes. There are carcinogens that naturally exist in our environment and food at low levels. Additionally, there are carcinogens that are formed during the cooking and preparation of meals. Finally, there are carcinogens that are introduced into the environment by humans. All ingested nutrients are filtered by the liver and many possible carcinogens are removed. This complex interaction makes it difficult to determine the exact cause of cancer in many cases, and to study the effect of diet or nutrition, physical activity and weight on the development of cancer. Well-designed clinical trials can help improve our understanding, of these complex interactions and start to determine the effect of nutrition, weight, and physical activity on the development of cancer.

### ***11.1.3 Principles of Clinical Trials***

Scientific evidence can be ranked by its level of quality (Fig. 14.1 in Chap. 14). The lowest quality evidence is expert opinion or practice guidelines which are inherently biased. Only slightly better are case reports, case series or retrospective reviews which are greatly limited by selection bias, small sample size, and lack of a control arm. The next level of evidence consists of case-control studies or prospective or retrospective cohort studies. Thus, the highest quality of evidence is meta-analysis, systematic reviews, and randomized controlled trials (RCTs). Systematic reviews and meta-analysis can be impaired by the quality of the smaller studies from which they draw. The gold standard, highest quality evidence, therefore comes from double blinded randomized controlled trials.

---

<sup>11</sup>Hanahan and Weinberg (2000) and Hanahan and Weinberg (2011).

These are large studies, usually of several hundred patients, powered to detect statistically significant differences between two populations. The study design is prospective with a control group, and group receiving the study intervention. Patients are randomly assigned to either the control or intervention group, thereby controlling the variances in the human population that could affect the results of the study. These studies are usually blinded so that the patients and treating physicians are not aware into which group patients have been randomly assigned, which helps to eliminate bias. With these controls in place RCTs are the least biased of the different clinical trial designs. If a randomized controlled trial does not meet the criteria above, then there are problems with its internal validity. External validity is also important, for example where randomized controlled studies can still be influenced by the patient selection. If a very specific patient population is selected then the results of the study are only applicable to that population.

Unfortunately RCTs are expensive to conduct, require a large support staff, years of follow-up, and, in terms of studies evaluating the effect of weight, physical activity, and nutrition on the development of cancer, it is very difficult to enforce a specific intervention over long periods of time. For example, in a RCT evaluating dietary fiber intake and the development of colon cancer, it is difficult to standardize the amount and frequency of fiber intake, as well as ensure patient compliance for 5 years. Finally, there are ethical considerations, conceivably asking a patient to undertake an intervention that could increase their risk of cancer is not morally viable.

Observational studies are another option, which take advantage of natural events, or exposures that occur, rather than imposing an intervention. Consequently the same ethical considerations as with RCTs do not apply. It is important to note that these types of studies help to show association, but do not prove causation, which is a very important distinction. Association does not prove causation. There are at least three types of non-causal associations. Random associations are associations that occur by chance when there is no actual link between exposure and outcome. Artificial associations occur due to a defect or error in the study design. Indirect associations happen when there is a third variable linking exposure and outcome. Once these non-causal associations have been ruled out, then the association is likely causal, though this is still not proof of causation. Epidemiologists have created a standard guideline for evaluating causal associations by a specific set of criteria. These criteria include the temporality, strength, dose response, replicability, and specificity of the association, as well as the influence of cessation of the exposure, biologic plausibility of the relationship, lack of alternative explanations, and consistency with other knowledge.<sup>12</sup> The more of these criteria are met, the more likely the association is truly causal for observational studies.

Types of observational studies include case reports, case series and cross-sectional studies, which are hindered by the lack of a control group and biases, as well as retrospective and prospective cohort studies and case control studies. In

---

<sup>12</sup>Gordis (2013), ch 14.

prospective cohort studies, the exposure or event has already occurred. However, in this type of studies, the outcome has not yet occurred. In retrospective cohort studies the exposure or event and outcome have already occurred. Conversely, in case-control studies, the key difference is the outcome that is identified first. The patients in this type of study are retrospectively examined for the exposure. Such a design is useful in a situation where the outcome is very rare.

Most studies examining the impact of diet, weight and physical activity on the prevention of cancer are observational, cross-sectional, retrospective cohort, or prospective cohort studies. There are specific difficulties associated with these studies, including multiple confounders, difficulty in quantifying carcinogen exposure, selection bias, reporting bias, poor patient compliance, insufficient follow-up, and difficulty in standardization of nutrients or vitamin dose. In addition, most studies focus on one nutrient rather than the inter play of an entire diet, as it naturally occurs in the human body. The human liver is a very good filter and eliminates many toxins and carcinogens that are ingested, but those substances can nonetheless reach the systemic circulation. So, a carcinogen seen in the lab (in vitro) by the standard ames test, may not be carcinogenic in the human body (in vivo). An additional difficulty, assuming the study is well designed, well conducted, and has statistically significant results, is the clinical significance of those results. For example, let's assume a study of 10,000 people is conducted, with 5000 people randomized to each arm. The intervention is eating one orange a day. The outcome under investigation is the prevention of scurvy, a disorder that results from low vitamin C levels.

The results show a 20% reduction in the risk of developing scurvy with consuming one orange a day, which is statistically significant. Based on these results, it is convincible to recommend that everyone eats one orange a day. However, the absolute risk reduction is important. If 5 out of 5000 people develop scurvy in the control group, and 4 out of 5000 people develop scurvy in the intervention group, this is a 20% relative risk reduction, but the absolute risk reduction is 1 person in 5000. This is not clinically significant, it makes no sense to have 5000 people eat one orange a day to prevent 1 incidence of scurvy. As a result, even if a study is well designed, well conducted and has statistically significant results, the results may not be important enough to recommend changes to people's behavior or clinical guidelines.

Overall, the world of clinical trials is complicated because it is difficult and expensive to conduct well-designed, ethical, and well-conducted studies, the results of which have to undergo vigorous evaluation before the results can be considered valid. There are numerous studies evaluating the effect of weight, diet, and physical activity on the development of cancer, which will be reviewed below. Following the hierarchy of credibility of clinical trials (Fig. 14.1 in Chap. 14), the highest quality evidence stems from RCTs or systemic reviews. Unfortunately, there are only a few RCTs evaluating the effect of weight, diet, or physical activity on the development of cancer, because they are too expensive, too large to conduct, too difficult to implement an intervention, and not ethical to conduct. Those RCTs that do exist evaluate the effect of a pill or vitamin supplement, which, as stated above, do not

take into account the complicated workings and processing within the human body. Most studies about the effect of diet, physical activity and weight are observational and hindered by one or more of the difficulties discussed above. Finally, the large systematic review and meta-analysis, which are considered high quality evidence, draw mostly from the observational studies that exist and are therefore limited by the quality of those studies.<sup>13</sup> This is why the current body of literature regarding the influence of weight, physical activity and diet is at times conflicting. To help clarify these issues, larger populations, with better assessment strategies and more funding are needed. This can be accomplished through government support and regulation, and public awareness campaigns. The rest of this chapter will focus on describing and evaluating the existing evidence for the influence of weight, physical activity and nutrition on the development and treatment of cancer.

## 11.2 Weight, Physical Activity and Cancer

Obesity is a worldwide epidemic. In the US alone, the number of people with a Body Mass Index (BMI) of greater than 25, which is defined as overweight, is above 60% in most states.<sup>14</sup> How much a human weighs is directly linked to their metabolism, and what, how much, and how often he or she eats. Overall reviews have suggested evidence for decreased risk and prevention of cancer with weight reduction.<sup>15</sup> As much as a one third risk reduction in the development of cancer has been reported with a BMI <30, never smoker, prudent diet, and >3.5 h a week of physical activity.<sup>16</sup> The American Institute for Cancer Research Expert Report<sup>17</sup> reported that concordance with these recommendations would lead to decreased cancer risk by one-third. Similar results were seen in the EPIC study.<sup>18</sup> The American Cancer Society guidelines on nutrition and physical activity in 2012 recommend at least 150 min of moderate intensity or 75 min of vigorous intensity activity each week, with limiting sedentary behavior, maintaining a healthy weight, and eating a healthy diet by choosing whole grains instead of refined grain, eating at least 2 and a half cups of vegetables and fruits each day, with limiting the amount of processed and red meat. Arguably these interventions can be considered insufficient; however it is important to note that even these recommendations are not followed by most of the American public. In fact, the implementation of cancer prevention guidelines is difficult to enact for a variety of factors, such as skepticism that cancer can be prevented, to disagreement among experts, to the interventions

<sup>17</sup>Wiseman (2008).

<sup>18</sup>Romaguera et al. (2012).

deployed too late in life to show effectiveness, and the complexity of successful implementation.<sup>19</sup>

Weight and BMI have been directly linked to the increased incidence of specific cancers including: esophageal, thyroid, renal, endometrial, gallbladder, rectal, melanoma, pancreatic, leukemia, multiple myeloma, non-Hodgkin's lymphoma,<sup>20</sup> prostate cancer,<sup>21</sup> colon cancer,<sup>22</sup> and breast cancer.<sup>23</sup> This represents the majority of the most common cancers in the US, with the exception of lung cancer. Breast cancer, in particular, is a hormonally driven disease. Adipose or fat tissues have aromatase enzymes, which increase the peripheral production of estrogen and, therefore, increase the risk of the development of breast cancer. In fact, there are aromatase inhibitors that are currently used in the treatment of both localized and metastatic breast cancer.

Increased physical activity alone has been linked to the reduced risk of certain cancers<sup>24</sup> including breast cancer<sup>25</sup> and colon cancer.<sup>26</sup> For invasive and non-invasive breast cancers, the California teachers study showed a decreased risk with more than five hours versus less than one half hour per week of physical activity, in mostly estrogen receptor negative breast cancer.<sup>27</sup> Another prospective cohort study showed that more than seven hours versus less than one hour per week resulted in an 18 % decrease in risk of invasive breast cancer.<sup>28</sup> A third prospective cohort study showed a 23 % decrease in risk of breast cancer with increased physical activity in premenopausal women.<sup>29</sup> Meta-analyses of these and other prospective studies have confirmed these results.<sup>30</sup>

For colon cancer, a meta-analysis showed a 24 % decrease in risk of colon cancer with increased physical activity.<sup>31</sup> Similar results were seen in a second meta-analysis.<sup>32</sup> Another study showed that the risk of colon cancer decreases with increasing hours of physical activity.<sup>33</sup> Observational cohort studies have shown

similar results.<sup>34</sup> Also, a Japanese cohort study reported a decreased risk of colon, liver, pancreatic and stomach cancers with increased physical activity.<sup>35</sup>

There even is evidence that physical activity reduces the risk for prostate cancer,<sup>36</sup> though this is indirect evidence and less robust than that reported for breast and colon cancer. There was a large cohort study showing a decreased risk in the rare subset of aggressive prostate cancer with increased physical activity.<sup>37</sup>

Thus, while some amount of physical activity has been associated with a reduction in risk for invasive cancer, with the best data for colon and breast cancer, the optimum duration, frequency, and intensity of the exercise or physical activity is as of yet unknown. In addition, the extent to which physical exercise at a young age versus older age impacts the risk of invasive cancer is unknown. Much research is still required, but it is plain that cancer can be reduced in the US and throughout the world by a decrease in weight and increase in physical activity.

Nutrition and diet are even harder to study than weight and physical activity. It is easy to measure weight and to assign physical activity into broad categories, so that general trends can be observed. However, it is much more difficult to study the specifics of individual diets, or to have patients keep to a diet for a study. The interactions among food as well as cellular processes within the human body, makes studying these factors much more complicated. The following sections focus on the conflicting role of food in cancer and the conflicting data that exists.

## 11.3 Effect of Food on Cancer

### 11.3.1 *Introduction to Food, Diet, and Nutrition in Oncology*

The human diet is highly complex and varied. It can be classified by food groups or by types of nutrients. In fact, the main food groups in most oncology-related studies are fruits and vegetables, grains, dairy, and meats. Meat can be divided into processed and non-processed meat or into fish, chicken, and red meat. Some fruits and vegetables are high in fiber. If classified by nutrients, food can be divided into macronutrients and micronutrients. Macronutrients break down into the categories of lipids (fat), protein (meats and legumes), and carbohydrates. Lipids include saturated and unsaturated fatty acids, which include olive oil and omega-3 fatty acids. Carbohydrates can be further sub-divided into foods with high glycemic load and low glycemic load. Micronutrients include Vitamins A (retinoids and beta-carotene), D (cholecalciferol and ergocalciferol), E (tocopherols), K (phyloquinones), C (ascorbic acid), B12 (cyanocobalamine), B1 (thiamine), B2 (riboflavin), B3 (niacin), B5 (pantothenic acid), B6 (pyridoxine), B7 (biotin), B9

<sup>36</sup>Antonelli et al. (2009).

<sup>37</sup>Patel et al. (2005).

(folic acid), calcium, iron, and selenium. There are other nutrients that have been studied in cancer prevention and treatment, which do not fit into specified categories, which include flavonoids and soy, lycopene and alpha linoleic acid. Specific herbal supplements, such as garlic, have been investigated as well as specific diets. Most studies, however, have been observational or meta-analyses. Nonetheless, some randomized controlled trials have been conducted using specific micronutrient supplementation. The difficulty with these randomized controlled trials is that there may be differences in the effect of micronutrients when absorbed in pill form versus absorbed in diet form with other micronutrients. Thus, the results of these studies can, at times be conflicting, with no clear answers. In the subsequent sections, macronutrients will be discussed first and then micronutrients.

### 11.3.2 *Dietary Fat*

The history of the development of recommendations for dietary fat in the prevention of cancer is instructive and revealing about the role that dietary fats play in cancer development. Studies in mice, for instance, lead to international observational and migration studies that suggested an increased risk of colon, breast and prostate cancer with dietary fat.<sup>38</sup> This led to a change in national recommendations, such as the recommendation of reduced dietary fat intake from the national cancer institute and the recommendation from the committee on diet, nutrition and cancer of the National Academy of Sciences to reduce dietary fat to 30% of total daily calories. Unfortunately the previous studies were filled with confounders. For example, in breast cancer, the study populations were skewed by differences in physical activity, differences in diet other than fat intake, and differences in age at menarche, later age of first birth, lower parity, and higher post-menopausal body weight, all of which could potentially impact the risk of developing breast cancer.<sup>39</sup> Later prospective observational studies showed no effect on dietary fat and breast cancer.<sup>40</sup> This discrepancy led to the reversal of national guidelines. Consequently, dietary fat is not currently included in the ACS and AICR recommendations shown in Table 11.3.

As a result, there is currently no overall conclusive evidence for the increased risk of breast cancer from increased dietary fat intake. In addition to the prospective observational studies, the main RCT was negative,<sup>41</sup> as were three meta-analyses.<sup>42</sup> There was a second meta-analysis suggestive of a possible association of dietary fat and increased risk of breast cancer. This association, however, was certainly not

**Table 11.4** Summary of evidence for increased risk of prostate and colon cancer with increased dietary fat

Cancer	Prospective cohort studies	Randomized controlled trial	Critical appraisal	Pooled analysis of case-controlled studies
Prostate cancer	Two Positive <sup>a</sup> Two Negative <sup>b</sup>		One Negative <sup>c</sup>	
Colon cancer	Two Positive <sup>d</sup> One Negative <sup>e</sup>	One Negative <sup>f</sup>		One Negative <sup>g</sup>

<sup>a</sup>Giovannucci et al. (1993) and Veierod et al. (1997)

<sup>b</sup>Schuurman et al. (1999) and Severson et al. (1989)

<sup>c</sup>Fleshner et al. (2004)

<sup>d</sup>Slattery et al. (2001) and Willett et al. (1990)

<sup>e</sup>Stemmermann et al. (1984)

<sup>f</sup>Howe et al. (1997)

<sup>g</sup>Beresford et al. (2006)

overwhelming enough to change clinical recommendations, especially considering the other negative studies.<sup>43</sup>

Similarly, there has been negative data for the association of lung,<sup>44</sup> ovarian,<sup>45</sup> and endometrial<sup>46</sup> cancer with dietary fat intake. For colon and prostate cancer, the data is somewhat contradictory, but overall negative (see footnote 40). Table 11.4 summarizes the existing data for the role of dietary fat and the risk of prostate, and colon cancer. Thus, while initial associations suggested an increased risk of cancer with increased dietary fat, further work has indicated no conclusive evidence to support such an association. On further examination of these studies, one of the confounders may have been the increased intake of animal products, particularly red meat. People with a diet high in fat, also tended to have a diet high in red meat, thus the possible association seen with dietary fat and cancer was an indirect association, with animal products being the unknown third variable.

### 11.3.3 Red Meat

The American diet historically has been high in red meat and animal fat. Beef, a type of red meat, is an American staple food. Many American companies have been built on beef and red meat, including the numerous fast food chains serving hamburgers and other processed red meats. Recently there have been investigations, which suggested the increased risk of cancer with red meat. Particularly three prospective cohort studies showed an increased mortality in those with an increased consumption of red meat, including death from cancer and cardiovascular

<sup>43</sup>Boyd et al. (2003).

<sup>44</sup>Smith-Warner et al. (2002).

<sup>45</sup>Prentice et al. (2006b).

<sup>46</sup>Bandera et al. (2007).

disease.<sup>47</sup> Possible explanations for this increased risk include the production of carcinogens when meat is cooked, particularly heterocyclic amines or polycyclic aromatic hydrocarbons.<sup>48</sup> There are those that may have increased susceptibility to these carcinogens due to polymorphisms in the N-acetyltransferase (NAT2), an enzyme involved in the detoxification of many drugs and toxins.<sup>49</sup>

An alternate explanation was proposed by Dr. Harald zur Hausen at the American Society of Clinical Oncology meeting in 2014; he hypothesized the existence of an infectious agent, likely a virus, which has, specificity for American cattle and after ingestion by human's, resulted in an increased risk of colon cancer.<sup>50</sup> Neither hypothesis has been conclusively proven. Nonetheless, whatever the mechanism, numerous studies have shown an increase in the risk of colon cancer with increased red meat and processed meat.

There have been suggestions of increased risk for breast, pancreatic, and endometrial cancer as a result of red meat consumption, as well. For renal, prostate, stomach, and lung cancer the evidence is less convincing. Conversely there were several prospective cohort and meta-analyses that suggested no association between red meat and cancer. It should be noted that these studies were funded by National Cattlemen's Beef Association and the National Pork Board, so even though the evidence seems to be of high quality, the results are suspiciously biased. In addition an analysis of five prospective studies for mortality in vegetarians versus non-vegetarians showed a difference in mortality from cardiovascular disease, but no difference in mortality from cancer.<sup>51</sup> Unfortunately, such a study would fail to account for possible cofounders that result from other variations with the diet of vegetarians and non-vegetarians. Table 11.5 summarizes the evidence for the association of cancer and red meat. Presumably, vegetarian diets are higher in plants, fruits and vegetables. Another source of extensive investigation is the role of fruits and vegetable in the American diet and the risk of cancer.

### ***11.3.4 Fruits and Vegetables***

Over the last 30 years, research into the role of fruits and vegetables in decreasing the risk of cancer has produced conflicting reports. In some studies, there is, nonetheless, suggestion of minimal benefit to prevent cancer onset. Overall, there is no definitive evidence for the reduction of cancer risk. For example, a study comparing vegetarians to non-vegetarians showed no difference in cancer outcomes (see footnote 58). Some prospective cohort studies, such as the Greek cohort of the EPIC study, did show a risk reduction with increased vegetable intake in women.

<sup>k</sup>Michaud et al. (2003)

<sup>l</sup>Alexander and Cushing (2009)

<sup>m</sup>Lonkhuijzen et al. (2010)

<sup>n</sup>Key et al. (1999)

However, the hazard ratio (HR) (an estimation of the strength of the association) was 0.91, indicating on a 9% risk reduced with increased vegetable intake. A hazard ratio of one indicates no difference. When fruits and vegetable intakes were combined, the hazard ratio was 0.90 for women and 0.94 for men and women. Though, these hazard ratios barely met statically significance.<sup>52</sup>

The full European EPIC study showed similar results with a benefit seen in women with 100 g/day of vegetable intake, and a HR of 0.98, and benefit in men and women with a fruit and vegetable intake combined of 200 g/day and a HR of 0.96. Though again these barely met statically significance.<sup>53</sup> Also, a cohort study of the elderly showed a benefit in cancer risk reduction in elderly women, but not for men, with increased fruit and vegetable intake.<sup>54</sup> Conversely the NIH-AARP study showed no statistically significant benefit from fruit and vegetable intake

<sup>52</sup>Benetou et al. (2008).

<sup>53</sup>Boffetta et al. (2010).

<sup>54</sup>Shibata et al. (1992).

overall in men, women, or both, after adjustment for smoking intake.<sup>55</sup> The Nurse's health study showed no evidence of benefit for cancer risk reduction with increased fruit and vegetable intake.<sup>56</sup> The Japanese public health study showed no benefit to overall cancer reduction with fruits and vegetables either.<sup>57</sup>

With all of these studies, there are major limitations. First, there are geographical differences in diet. Different fruit and vegetables have varying amounts of micronutrients and could have different effects on the reduction of cancer. The types of fruits and vegetables consumed differ between the United States, Japan and even within Europe. The cited studies combining all types fruits and vegetables would not be able to detect this difference. Even if a difference is detected, however, it is unclear how much fruit and vegetables need to be eaten on a daily basis. Thus, each study has used different amounts.<sup>58</sup> In addition, none of these studies differentiated between organically grown fruits and vegetables versus those grown conventionally (with pesticides,) nor did they differentiate between genetically modified organisms (GMOs) and non-GMOs. So, again, to what extent these differences make an impact on cancer risk is unknown.

Furthermore, the risk of specific cancers may be affected differently by the consumption of fruit and vegetables. Table 11.6 summarizes the data for the decreased risk of development of certain cancers with increased fruit and vegetable intake; with the most evidence existing for the relationship of fruit and vegetable intake and the reduction of colon cancer risk.<sup>59</sup> In conclusion, much more research and funding are still needed to help answer questions about the possibility to prevent cancer through a plant-based organic diet because these studies are difficult to conduct on humans.

Another aspect that requires further research is the role of fiber. Fruits and vegetables are high in fiber, but evidence examining the role of fiber and the risk of cancer is currently limited to colon cancer. Early results and some prospective trials were negative.<sup>60</sup> However, a prospective study in the EPIC cohort showed an effect with 40 % reduction in the risk of colon cancer.<sup>61</sup> Then a pooled analysis showed an effect, but only in the univariate analysis.<sup>62</sup> A meta-analysis of prospective studies was positive as well,<sup>63</sup> though a Cochrane database review was

negative.<sup>64</sup> Overall this evidence suggests that high fiber intake can decrease the risk of colon cancer.

A third aspect of fruit and vegetable intake, which also applies to any food high in carbohydrates, is the glycemic load and glycemic index of the food. The glycemic index (GI) is a ranking of carbohydrate rich food based on the rise in blood glucose levels after ingestion. The glycemic load (GL) is the glycemic index multiplied by the carbohydrate content of the food ingestion, which gives an estimation of the actual rise in blood glucose levels. The effects of GL and GI are controversial, with much of the evidence being contradictory, so no definitive recommendation can be made regarding the risk of cancer.<sup>65</sup> This is another area that should be further investigated, particularly since the American diet has a high incidence of high glycemic index foods.

<sup>64</sup>Asano and McLeod (2002).

<sup>65</sup>Shikany et al. (2011), Kabat et al. (2008), Hu et al. (2013), George et al. (2009b), Mulholland et al. (2009), and Romieu et al. (2012).

### 11.3.5 Dairy

The last major food group is dairy—although an argument against categorizing dairy as a food group can be made quite successfully. In terms of cancer prevention, unfortunately, most of the studies involving dairy are inconclusive. Dairy products are usually high in calcium, which may be a confounder in these studies. As the role of calcium and vitamin D in the risk reduction of cancer is still being extensively studied, the overall the role of dairy intake and cancer has been studied in ovarian cancer. Thus, in ovarian cancer, there were three meta-analyses that were negative.<sup>66</sup> In breast cancer a pooled analysis did not suggest an association.<sup>67</sup> Also, a meta-analysis with longer follow-up did not show any statistically significant results.<sup>68</sup> Nonetheless, there is a suggestion of a decreased risk of breast cancer in those premenopausal patients with increased calcium intake through low fat dairy products.<sup>69</sup> This suggests that more applicable results might be attained from examination of the effect of specific micronutrients, and other specific supplements or foods.

### 11.3.6 Other Nutrients

A variety of other nutrients have been studied within the context of their relation to cancer. Unfortunately the evidence is limited. There has been no overall benefit with omega-3 fatty acids, fish, garlic, linoleic acid or lycopene.<sup>70</sup> There is a suggestion of benefit with olive oil,<sup>71</sup> and a decreased risk of breast cancer with higher consumptions of flavonoids.<sup>72</sup> Also, there is suggestion of a decreased risk of lung cancer in female non-smokers with increased soy intake in the Shanghai Women's health study.<sup>73</sup> However, the baseline soy intake in the United States is very low compared to that in Asian countries, so it is difficult to compare across countries. A soy meta-analysis confirmed that the decreased risk of breast cancer in an asian population with high soy intake, but no effect in US population.<sup>74</sup> These studies are still preliminary and need to be further confirmed. Compared to the

<sup>74</sup>Wu et al. (2008).

studies of macronutrients, it is much easier to perform randomized controlled trials for micronutrients, because these can be included in a pill or supplement.

### ***11.3.7 Micronutrients***

Micronutrients intake has been studied in the prevention of cancer, and during the treatment of cancer. For the prevention of cancer, extensive studies, prospective and randomized controlled trials have been completed—some yielding negative results<sup>75</sup> and some positive results.<sup>76</sup> A systemic review by the National Institute of Health (NIH) suggested there was insufficient evidence to recommend daily multivitamin supplementation for cancer prevention.<sup>77</sup> A systematic evidence review by the U.S. Preventive Service Task Force reported similar results.<sup>78</sup> In regards to patients undergoing treatment for cancer, there is high use of vitamin supplements,<sup>79</sup> and there have been several reviews of cancer and vitamins.<sup>80</sup> Unfortunately, vitamin supplements may not be a good thing; there was increased cancer related mortality in male smokers with multivitamin use.<sup>81</sup> Also, a second study of patients with prostate cancer showed increased mortality in patients using multivitamins.<sup>82</sup> The role of food in cancer treatment is not limited to vitamin supplements.

## **11.4 Food as Medicine in Cancer Treatment: Food and Herb Uses During Cancer Treatment**

While, multivitamin supplements cannot be recommended for patients undergoing cancer treatment, the significance of weight loss in patients with cancers is of paramount importance. In the majority of cancers, the amount of weight loss is of prognostic value. In other words the more weight loss a patient has, the shorter their survival is likely to be. Cachexia is the medical term for severe weight loss, from Greek kakos—meaning bad, and hexis—meaning condition. Nutritional interventions geared to maintaining or increase weight during the treatment of cancer can

<sup>78</sup>Fortmann et al. (2013).

<sup>79</sup>Velicer and Ulrich (2008).

<sup>80</sup>Mamede et al. (2011) and National Institutes of Health (2007).

<sup>81</sup>Watkins et al. (2000).

<sup>82</sup>Stevens et al. (2005).

improve treatment outcomes.<sup>83</sup> In addition, there is a relationship between adequate nutrition and quality of life in cancer patients.<sup>84</sup> Specific diets have been tried in cancer patients as well as the Gerson, macrobiotic, and Kelley-Gonzales diets. Selected vegetable and herb mixes have been tried with soybeans, mushrooms, mung beans, red dates, scallions, garlic, lentils, leek, hawthorn fruit, onions, ginseng, angelica, dandelion, senegal root, licorice, ginger, olives, sesame seeds, and parsley. Though, none of these have been definitely proven to be of benefit. At the present time, just a balanced, nutritious diet is recommended for patients diagnosed with cancer.

In addition to diet, up to 90 % of patients will use one complementary and alternative therapies (CAM) for their cancer ranging from diet to vitamin supplements, as above, to herbal medications, to other therapies such as acupuncture, hypnotherapy, aromatherapy, meditation, Reiki (therapeutic touch), or support groups.<sup>85</sup> Although only one study showed shortened survival with CAMs, patients should be wary of fad treatments that have failed to show any benefit and have just shown harm, such as Koch therapies, Hoxsey, krebiozen, laetrile and Di bella.<sup>86</sup> In addition, herbal medications can have unwanted side effects and toxicities that can worsen a patient's quality of life. For examples St. John's Wort causes nausea, ginkgo can cause vomiting and headaches, while ginseng often results in diarrhea, headaches, and nausea. Herbal medications can interact with chemotherapy, as well, such as by increasing toxicity and interfering with the chemotherapeutic effect. For, example green tea inhibits cytochrome p450, an enzyme important in drug metabolism, and results in a decreased effect of bortezomib, an important treatment for multiple myeloma, a cancer of plasma cells. Green tea is the most widely used CAM,<sup>87</sup> however there is only limited data for its efficacy with both positive and negative studies.<sup>88</sup> St John's wort, a common herbal supplement, increases the activity of cytochrome p3A4 and therefore decreases the activity of irinotecan, taxanes, and imatinib, chemotherapeutic agents used in the treatment of many cancers. It is therefore recommended that herbal supplements and food such as black cohosh, echinacea, garlic, ginkgo, ginseng, green tea, grape seed, grapefruit, kava kava, milk thistle, soy, valerian, and St. John's Wort be avoided during cancer treatment.<sup>89</sup>

Conversely, some of the most effective chemotherapeutics have come from plants, such as taxols from the pacific yew plant, etoposide from mayapple, and vinca alkaloids from periwinkle. Also, traditional Chinese medicine such as, Huachansu, Fufangkushen and Shenqifuzheng can improve nausea, increase the white blood cell count while on chemotherapy, but have shown no evidence of

<sup>89</sup>Meijerman et al. (2006) and Mathijssen et al. (2002).

activity against cancer.<sup>90</sup> Therefore, CAMs should be taken with great care and not without the treating physician's knowledge.

## 11.5 Conclusion and Future Directions

At the very least, the ACS and AICR recommendations should be followed to help decrease the risk of developing cancer by one third to one half. Though this is really a bare minimum of what should be done, not even these recommendations are met on a national basis. To further understand how the American diet should change and how it can prevent cancer, more research is needed. Though research alone is not sufficient, more support is needed for awareness campaigns to help educate Americans to change their diets toward an organic whole foods plant-based diet, low in saturated fats, simple sugars, and animal protein. In addition to Americans changing their diet, changes to food laws and regulation are needed. Federal Drug Administration (FDA) regulation of food and herbal supplements are quite inadequate. A new generation of medical practitioners, scientists, policy makers, and consumers needs to be trained to be aware of these problems and look for solutions.

# Chapter 12

## Textbox: Pesticides and Cancer in Conventionally-Grown Versus Organic Food

Gabriela Steier

**Abstract** Scientific publications have proven the links between pesticides in food and cancer prevalence. Conventionally-grown foods are often high in pesticides as compared to their organic counterparts. Pesticides are not only dangerous for the environment, but also for public health. One of the most dangerous diseases induced by pesticides are various types of cancers, such as: bladder cancer, bone cancer, brain cancer, cervical cancer, colorectal cancer, eye cancer, gallbladder cancer, kidney or renal cancer, larynx cancer, leukemia, lip cancer, liver or hepatic cancer, lung cancer, lymphoma, melanoma, mouth cancer, multiple myeloma, neuroblastoma, oesophageal cancer, ovarian cancer, pancreatic cancer, prostate cancer, soft tissue sarcoma, stomach cancer, sinonasal cancer, testicular cancer, thyroid cancer, and uterine cancer.

Conventionally-grown foods are often high in pesticides as compared to their organic counterparts. Pesticides are not only dangerous for the environment, but also for public health. One of the most dangerous diseases induced by pesticides are various types of cancers, such as: bladder cancer, bone cancer, brain cancer, cervical cancer, colorectal cancer, eye cancer, gallbladder cancer, kidney or renal cancer, larynx cancer, leukemia, lip cancer, liver or hepatic cancer, lung cancer, lymphoma, melanoma, mouth cancer, multiple myeloma, neuroblastoma, oesophageal cancer, ovarian cancer, pancreatic cancer, prostate cancer, soft tissue sarcoma, stomach cancer, sinonasal cancer, testicular cancer, thyroid cancer, and uterine cancer.<sup>1</sup>

Although advocacy groups for a more sustainable, organic, plant-based whole-foods diet have long warned that conventional and intensive agriculture is high in carcinogenic pesticides, which persist in foods that people consume, a recent study finally offers conclusive and specific evidence. The renowned medical journal, *the Lancet Oncology*, published the findings of “17 experts from 11 countries [meeting] at the International Agency for Research on Cancer (IARC; Lyon, France) to assess the carcinogenicity of the organophosphate pesticides tetrachlorvinphos, parathion, malathion, diazinon, and glyphosate.”<sup>2</sup> This group of organophosphate pesticides are highly toxic substances, similar and sometimes overlapping with those used in chemical warfare agents used in World War II.<sup>3</sup>

Some of the key findings include the following, which are directly cited from the study<sup>4</sup>:

- The insecticides tetrachlorvinphos and parathion were classified as “possibly carcinogenic to humans.” . . . Tetrachlorvinphos is banned in the European Union. In the USA, it continues to be used on animals, including in pet flea collars.
- For parathion, associations with cancer in several tissues were observed in occupational studies, but the evidence in humans remains sparse. . . Parathion is rapidly absorbed and distributed. Parathion metabolism to the bioactive metabolite, paraoxon, is similar across species. Although bacterial mutagenesis tests were negative, parathion induced DNA and chromosomal damage in human cells in vitro.

<sup>4</sup>Guyton et al. (2015), internal citations omitted.

- The insecticides malathion and diazinon were classified as “probably carcinogenic to humans.” . . . Malathion is used in agriculture, public health, and residential insect control. It continues to be produced in substantial volumes throughout the world. There is limited evidence in humans for the carcinogenicity of malathion. Case–control analyses of occupational exposures reported positive associations with non-Hodgkin lymphoma in the USA, Canada, and Sweden, although no increased risk of non-Hodgkin lymphoma was observed in the large Agricultural Health Study cohort (AHS). Occupational use was associated with an increased risk of prostate cancer in a Canadian case–control study and in the AHS, which reported a significant trend for aggressive cancers after adjustment for other pesticides. Diazinon has been applied in agriculture and for control of home and garden insects. . . Support for an increased risk of leukaemia in the AHS was strengthened by a monotonic increase in risk with cumulative diazinon exposure after adjustment for other pesticides. Multiple updates from the AHS consistently showed an increased risk of lung cancer with an exposure–response association that was not explained by confounding by other pesticides, smoking, or other established lung cancer risk factors.
- Glyphosate is a broad-spectrum herbicide, currently with the highest production volumes of all herbicides. It is used in more than 750 different products for agriculture, forestry, urban, and home applications. Its use has increased sharply with the development of genetically modified glyphosate-resistant crop varieties. Glyphosate has been detected in air during spraying, in water, and in food. There was limited evidence in humans for the carcinogenicity of glyphosate. Case–control studies of occupational exposure in the USA, Canada, and Sweden reported increased risks for non-Hodgkin lymphoma that persisted after adjustment for other pesticides. . . Glyphosate has been detected in the blood and urine of agricultural workers, indicating absorption. Soil microbes degrade glyphosate to aminomethylphosphoric acid (AMPA). Blood AMPA detection after poisonings suggests intestinal microbial metabolism in humans. . . The Working Group classified glyphosate as “probably carcinogenic in humans.”<sup>5</sup>

All of this evidence supports the fact that pesticides used in conventional and intensive agriculture are not only carcinogenic for farm workers or people living in close proximity to farm land, but also linger in food and pose a cohort of dangers to public health. The Centers for Disease Control and Prevention, for example, reported that 29 different pesticides can be found in human bodies.<sup>6</sup> A Consumers Union paper cited USDA data that found a substantially higher accumulation of pesticides in conventionally grown produce:

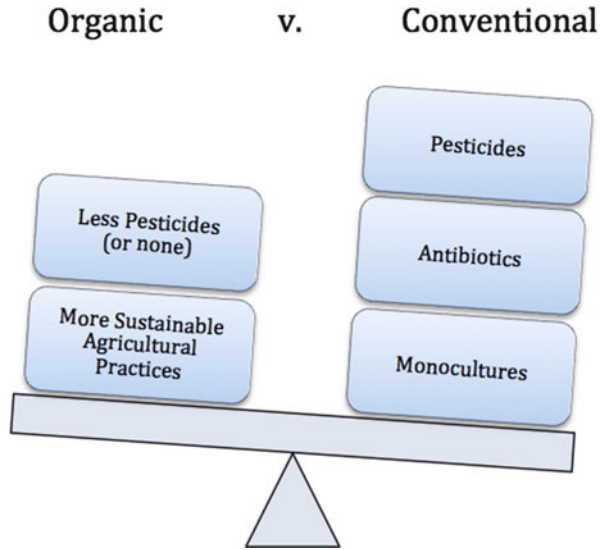

The USDA data showed that 73 percent of conventionally grown foods had at least one pesticide residue, while only 23 percent of organically grown samples of the same crops

**Fig. 12.1** Organic versus conventional agriculture

had any residues. More than 90 percent of the USDA’s samples of conventionally-grown apples, peaches, pears, strawberries and celery had residues, and conventionally-grown crops were six times as likely as organic to contain multiple pesticide residues.<sup>7</sup>

Thus, buying organic may be the only tenable method to reduce one’s exposure to pesticides, albeit not eradicating the dangers entirely (See the above figure provided by author).

The Consumer Report *From Crop to Table: Pesticide Use in Produce* reveals some of the most pressing risks of pesticide uses in food and described some of the US regulations—or lack thereof—under US law.

# Chapter 13

## Intersections of Dental Health and Food Law: The Conflict of Systemic Flouridation as a Public Health Instrument to Prevent Tooth Decay

Liviu Steier, Regina Steier, and Gabriela Steier

**Abstract** Prevention of tooth decay via administration of flourides in drinking water, milk, and salt has been performed by governments around the world over the last decades. The literature was scrutinized to validate benefits and disadvantages of systematic flouridation for the individual as well to identify the legal background.

Regulation of maximal dose and most beneficial application methodology were identified. A great number of countries have interrupted systematic use in favor of local application due to general health hazards generated while others continue despite seriously breaching valid law.

The most important finding of this chapter is that local application of flouride best contributes to decay prevention in conformity with biomedical ethics best complementing general health.

### 13.1 Introduction

Dental caries is an infectious disease, which constitutes a continuously growing and global public health threat—some even call it a pandemic.<sup>1</sup> In a textbook on international food law and policy including public health, the laws and policies encompassing dental and oral health must not be overlooked. Although several

chapters in this book focus on food production, consumption and trade, food intake starting at the mouth plays, an integral role in a complete interdisciplinary analysis. Eating and drinking, after all, bridge the production and consumption of food aspects. On the most basic level of logic, one cannot eat well with decayed teeth, so that nutrient intake is impaired by diseased mouths.<sup>2</sup> Those laws affecting what consumers eat and drink, consequently, should be rooted in scientifically sound data and analysis. Notwithstanding the firmly-established place of public health and nutrition policy within the food law framework, dental health should figure into any comprehensive analysis, especially in light of regulatory frameworks affecting oral health. The laws addressing dental caries as an infectious disease, therefore, use the scientific data to promulgate guidelines and treat dental decay as a pandemic.

One of the instruments to treat the pandemic of dental decay is fluoridation, i.e. the artificial addition of fluoride to water, milk, salt, tablets, toothpastes and other topical agents. Within the scope of this book are, of course, the fluoridation of water, milk and salt, all of which are undeniably ubiquitous sources of nutrition and hydration in every country and for every person around the world. Governments around the world have added fluoride to tap water and monitored fluoride levels in milk and salt with dental health in mind for over 70 years. Essentially, the addition of fluoride to water, milk and salt is a governmental instrument of public health intended to strengthen tooth enamel and to halt the pandemic of rampant caries spread. The corresponding goal is oral health improvement combined with topical fluoride application and the protection of socio-economic interests. However, medical and scientific publications document the conflicts and the dangers of systemic fluoridation, where local application prevents tooth decay but ingestion fails to accomplish the same goal.

After decades of systemic water, milk and salt fluoridation in various countries around the world, the question of the efficacy of systemic fluoridation remains highly controversial and its efficacy has not been conclusively proven. For the reason that scientific data has not conclusively proven the efficacy of systemic fluoridation, the fact that governments continue to support this practice begs the question of whether this long-standing practice is truly in the public's best interest or whether it serves a different, possibly unintentional, purpose. This chapter analyzes and explains the conflict that permeates not dentists' and dental organizations understanding of the problem but also demonstrates how lay people aid in making executive decisions that affect public health in various ways. As food and water are inextricably intertwined, this chapter sheds light on a marginalized issue that warrants more attention than popular knowledge suggests.

This chapter sheds light on the premise that fluoridation is an effective public health measure, instrumentizing legal recommendations and regulations worldwide, to reduce oral diseases. Notwithstanding the intentions behind the schemes of mass-medicating entire countries through fluoridation of water, milk and salt, it remains a systematic medication. The successes and dangers associated with

---

<sup>2</sup>Touger-Decker and van Loveren (2003).

systemic versus topical fluoridation and the globally deep-rooted policy framework will be weighed against governmental authority and consumers' rights to chose not to be systematically medicated as part of a larger contagious pandemic.

### ***13.1.1 Dental Caries and Systemic Fluoridation***

The prevalence of dental caries as an omnipresent disease around the world validates its interdisciplinary relevance within public health, socio-economic concerns and food law. The US Surgeon General acknowledges dental caries as a severe national economic impact, thereby invoking aspects of food law because dental decay is a threat of substantial magnitude. Further statistical evidence supports the social and economic impact of tooth decay where a study published in the *American Journal of Dentistry* found that “[e]pidemiologic data from different countries show[s] an increase in dental caries prevalence affecting all ages.”<sup>3</sup> As a result, the socio—economic impact of dental decay gave rise to the need of addressing caries disease as a high-priority national and international public health problem. Notably, a report of the US National Health Interview Survey in 1981, 4.87 million dental conditions caused 17.7 million days of restricted activity, 6.73 million days of bed disability, and 7.05 million days of work loss, according to the report.<sup>4</sup> Moreover, dental caries in pre-school children has an impact on psychological and social aspects of the their lives<sup>5</sup> while school children experienced dental pain, missed classes and performed poorly in coursework due to dental discomfort.<sup>6</sup> In the US, in the year 2000 alone, the national annual cost of dental treatment exceeded \$60 billion according to the Health Care Financing Administration. The figure has not really changed over the past 15 years and, therefore, dental treatment costs permeate both social and economic avenues. These avenues, in turn, implicate food law and policy because they affect the mouths and chewing processes of consumers in the first step of food digestion, the ultimate goal of the entire food production chain (Fig. 13.1).

Thus, in a discourse “from farm to fork,” as food law and policy often describe the food production chain, it is important to follow the path of food once it reaches the fork and, thereby, the mouth. This figurative speech is important but the connections have not been made until the writing of this chapter.

<sup>6</sup>Jackson et al. (2011).

**Fig. 13.1** Extension of fluoride accumulation in the farm to fork (to teeth) chain. Following the path from food production to consumption, a.k.a. from farm to fork, the pathway can be extended to digestion and nutrition and, thereby, to teeth. Through this extension of the fluoride dissolution, administration and distribution pathway, oral health becomes an integral step in the public health and regulatory understanding of fluoride accumulation

### ***13.1.2 Tooth Decay and Predisposing Factors of Cavity Rates***

The connections between food law, nutrition and dental decay lie in the food-related predispositions, such as a high-sugar and high-carbohydrate diet. Susceptibility to dental decay is directly related to an increased intake of carbohydrates. Although other factors also play important roles, such as the diminished salivary production associated with negligent oral hygiene and other major caries predisposing factors,<sup>7</sup> they are beyond the scope of this chapter.

First and foremost, dental caries is “an oral infectious disease of the teeth in which organic acid metabolites produced by oral microorganisms lead to demineralization and destruction of the tooth structures.”<sup>8</sup> Even though a variety of terms have emerged over the years, such as tooth decay and cavities, the disease is a bacterially-induced destruction of enamel and dentin, the hard tissue of the tooth. The consumption of carbohydrates and sugars, which bacteria break down into

<sup>7</sup>Gupta et al. (2013); van Houte (1994), pp. 672–681.

<sup>8</sup>Touger-Decker and van Loveren (2003), pp. 881S–892S.

acids in a process called fermentation, generate a reduced pH level and facilitate the demineralization of protective healthy tooth tissue. The results are the common dental lesions, a.k.a. “holes in teeth.”

Predisposing factors of dental decay have been widely studied. Scientific literature describes the major etiologic and predisposing factors involved in caries as follows: (a) the availability of cariogenic bacteria, (b) the intake of fermentable carbohydrates, (c) a susceptible tooth and host, (d) time<sup>9</sup> (e) individual, social, and community risk indicators.<sup>10</sup> The resulting socio economic burden on oral health imposes substantial complications for individual suffering from tooth decay. Notably, the World Health organization (WHO) finds that “the major risk factors relate to unhealthy lifestyles (i.e. poor diet, nutrition and oral hygiene and [the] use of tobacco and alcohol), ... limited availability and accessibility of oral health services” and “poor living conditions.”<sup>11</sup> Therefore, dental decay is preventable to a large degree and falls squarely within the realm of public health and socio-economic regulatory decision-making.

The wide array of factors, including diet and nutrition, affect the severity of an individual’s caries prevalence. In fact, the variables associated with dental caries are considered risk indicators, that likely predict the disease prevalence.<sup>12</sup> Figure 13.2 illustrates this Caries Balance and displays some of the most widely accepted factors. The scale tips toward caries rather easily. Public health and caries prevention measures, therefore, can directly impact the various factors by addressing the predictors listed in Fig. 13.2. Consequently, food policy can and should consider these factors in making dietary recommendations and setting nutrition goals.

### 13.1.3 Prevalence of Tooth Decay

The prevalence of tooth decay has been increasing. Especially developing countries<sup>13</sup> and lower-income populations have a higher prevalence of tooth decay but have limited, if any, dental care that can treat caries or halt the spread of infections.<sup>14</sup> From any age groups, elderly populations are most affected by tooth decay and loss.<sup>15</sup> The WHO estimates that, globally, about one third of people aged 65–74 have no natural teeth.<sup>16</sup> Of course, tooth loss correlates with poor nutrition choices

**Fig. 13.2** The caries balance. Protective and pathological factors shift the balance between re- and demineralization of tooth enamel off the baseline and, ultimately, caries. This balance is based on Adrian Lussi, Elmar Hellwig, Joachim Klimek, Fluorides—Mode of Action and Recommendations for Use, 122 Schweiz. Monatsschr. Zahnmed. (Nov. 2012) (citing Featherstone J D B: The science and practice of caries prevention. 131 JADA 887–889 (2000))

or availability because of their deteriorated capability to chew solid foods, such as whole grains, fresh fruits and vegetables. Therefore, the prevention of caries impacts whether nutritional goals are met.

All age groups, however, are affected by caries. If left untreated, caries and tooth aches can even be fatal.<sup>17</sup> The WHO found that, globally, between 60 and 90 percent of school children and adults suffer from tooth decay.<sup>18</sup> In the US, about one half of all children between the ages of five and nine have at least one cavity and one filling of a primary or permanent tooth.<sup>19</sup> The caries prevalence increases to nearly 80 percent for teenagers and reaches almost 85 percent in adults.<sup>20</sup> Table 13.1 provides the caries prevalence in a selection of countries<sup>21</sup> and illustrates the wide reach of this infectious disease.

Caries, as the data shows, is an infectious disease that can lead to severe health detriments and must be prevented and treated. As a logic and immediate

consequence of tooth decay, the ability to eat and food choices work in conjunction with other factors to impact nutrition outcomes. The high prevalence of caries, therefore, justifies why governments all over the world address this public health threat—although it remains questionable whether aggressive water fluoridation is the best method to battle caries.

### 13.1.4 Fluoride: The Panacea

In 1901, Dr. Frederick S. McKay from Colorado Springs, identified the causal interrelation between water components (here fluorine)<sup>22</sup> and anomalies in tooth structure for the first time.<sup>23</sup> He distinguished fluorosis, the ingestion of excessive amounts of fluorine, in his research.<sup>24</sup> Then, in 1930, H. V. Churchill identified Fluoride as originating cause for fluorosis through spectrographic analysis.<sup>25</sup> Several years later, in 1945, scientists agreed on acceptable levels of fluoride implementation in water and the first prospective field studies using water fluoridation to reduce dental caries were initiated. Since then, water fluoridation has come a long way and has reached the peak focus of international attention and public health programs. Despite its limitations, current research, ranking high in scientific evidence, proves that fluoride exposure reduces dental caries between 25 and 27 % in children and as well as in adolescents.<sup>26</sup> Nearly 100 years of research yielded conclusive results that fluoridation may aid in the reduction of dental decay. Over

<sup>22</sup>To simplify, fluorite is the primary mineral source of fluorine, the noble gas F. Organic fluorides used in tooth pastes are mineral salts, which are not the same form of the cytotoxic F gas because salts are not as highly volatile. A lot more remains to be said about the various chemical forms and properties of F and how they affect the body, but such an analysis is outside the scope of this book.

the decades, different patterns of fluoridation have been researched, systemic and topical ones. The crux consists in the proper selection of the best fluoridation approach with the highest decay prevention and the least adverse side effects for humans.

The American Academy of Pediatric Dentistry published guidelines on fluoride therapy. Through these guidelines, it is clear that fluoridation of water is a major strategy to address caries prevalence in children and adults. Thus, according to the American Academy of Pediatric Dentistry, the “[w]idespread use of fluoride has been a major factor in the decline in prevalence and severity of dental caries in the US and other economically developed countries. When used appropriately, fluoride is both safe and effective in preventing and controlling dental caries.”<sup>27</sup> This is not to say, however, that there are no downsides to fluoridation of drinking water, which is merely one of many methods to make fluoride available for caries prevention. Consequently, the guidelines acknowledge that “[f]luoridation of community drinking water is the most equitable and cost-effective method of delivering fluoride to all members of most communities”<sup>28</sup> but it is not necessarily the safest or most effective method to contain the caries panacea. Of interest for this chapter, therefore, is the effect of cookie-cutter fluoride treatment as a public health and food safety concern.

### 13.2 The Safety of Fluoridation and the Avenues of Systemic Fluoridation

Understanding the protective mechanism of action of fluoride is a prerequisite to select the best fluoridation approach for public health. Government agents making executive decisions and even dental professionals often lose sight of the basic mechanism of action: Teeth have a hard and a soft tissue structure. The hard tissue component is build by the highly mineralized enamel and the organic matrix rich dentin and cementum. Calcium deficient material with different ions is more abundant in the hard structure building a less resistant apatite when compared to hydroxyapatite. Thus, local and targeted application of fluoride can strengthen the tooth structure. However, systemic application fails to protect tooth structure because the fluoride does not dissolve as needed.

Enamel, the outermost hard and mineral-based shell of the tooth, is characterized by its content of 3 % carbonate versus 5 % in dentin. Enamel accounts for its availability of flourhydroxyapatite where around 5 % of the OH groups are replaced by flouride, stabilizing the apatite structure alongside calcium, phosphate, hydroxyl and fluoride ions. The flourhydroxyapatite concentration drops towards the inside of the tooth. Conversely, the presumed steady state of calcium ions made available

---

<sup>27</sup>American Academy of Pediatric Dentistry, Guidelines on Fluoride Treatment (2013).

<sup>28</sup>Id.

by saliva, enamel, and fluoride ions are responsible for the barrier against acid attack. Any imbalance of these minerals favors the dissolution of phosphate and hydroxyl ions, which then leads to hard tissue dissolution.

Demineralization through high sugar intake and insufficient oral hygiene are the decisive factors in decay propagation. Systemic fluoridation approaches, like water, milk and salt fluoridation favor the incorporation of fluoride into the mineral components with a minimal ability to dissolution when compared to topical approaches. Topical or local approaches grant a higher level of fluoride saturation around the enamel inhibiting effective demineralization. This has been scientifically proven. Thus, fluoride, on the most basic level, helps to prevent demineralization.

On a larger scale, the intention to combat tooth decay has freed simultaneous fluoridation paths with little consideration for the cumulative levels of fluoride in the body, which can add up quite significantly and lead to toxicity. Therefore, several countries subscribe to the concept of systemic water fluoridation parallel to the availability of fluoridated milk, salt, tablets and topic products. All of these avenues of fluoridation have cumulative effects on the body, especially in countries with high population density, such as India and China, as is described in greater detail below. To simplify, some countries add fluoride to their tap water and others remove fluoride. How these regulations of water fluoride levels play out is explained as follows.

Various countries regulate fluoride levels based on differing scientific data. For example, for tap water in the European Union, the upper levels of fluoride have been set at 1 mg/l. The European Food Safety Authority (EFSA) recommends,

[a]n upper tolerable intake level (UL) of 0.1 mg/kg BW/day for fluoride has been derived by the EFSA Panel on Dietetic Products, Nutrition and Allergies (NDA) (EFSA 2005) based on a prevalence of less than 5% of moderate dental fluorosis in children up to the age of 8 years as the critical endpoint, i.e. 1.5 mg/day for children 1-3 years of age, and 2.5 mg/day for children aged 4-8 years. For adults, an UL of 0.12 mg/kg BW/day was based on a risk of bone fracture, which converts on a body weight basis into 7 mg/day for populations aged 15 years and older, and 5 mg/day for children 9-14 years of age.<sup>29</sup>

In contrast, in the US, upper levels have been set by the US Department of Health and Human Services at 0.7 mg/l. The Australian The Health (Fluoridation) Act 1973 set the levels at 1.5 mg/l, while in UK it is the Water Act of 2003 with set value at 1 mg/l. Such variations illustrate the inconclusive bases for government-regulated fluoridation of water. It follows that the regulations are unlikely at ideal levels and commutations can quickly result in overdoses of fluoride. The dangers of systemic fluoridation, then, are evident from the high variability and likelihood of accumulation.

---

<sup>29</sup>European Commission, Critical review of any new evidence on the hazard profile, health effects, and human exposure to fluoride and the fluoridating agents of drinking water, [http://ec.europa.eu/health/scientific\\_committees/environmental\\_risks/docs/scher\\_o\\_139.pdf](http://ec.europa.eu/health/scientific_committees/environmental_risks/docs/scher_o_139.pdf)

Notably, the safety data of fluoridation is of utmost importance for food safety and public health because regulatory measures are based on this data. When fluoride levels from water, milk and salt accumulate in the bodies of consumers, the upper tolerance levels can be quickly reached and lead to toxic levels with severe side-effects. Therefore, regulators must be aware of the safety data and upper tolerance levels of fluoride before systemic fluoridation passes safety thresholds. Sodium fluoride (SF), the fluoride form most commonly occurring in food, is classified as a “hazardous product for the human health and the aquatic environment.”<sup>30</sup> In its safety data sheet Solvay North America, a large salt producer, writes, “[s]odium fluoride is used for water fluoridation, as a metal surface treatment and cleaner, as a glass etchant, and for pH adjustment in industrial textile processing or laundries. . . Sodium fluoride is also used as a wood preservative and an insecticide.”<sup>31</sup> This variety of fluoride uses, consequently, means that there are several ways for fluoride to come into the water supply, adding to the cumulative effects of water fluoride levels.

Three important interdisciplinary effects of fluoridation should be understood at the onset: the method of action, the dosage, and the safety data. These three considerations are important because the method of action determines the dosage and the dosage, in turn, determines the safety. The better the methodological application of fluoride, the lower the required dosage and the safer the fluoridation as a whole. It is, therefore, important to consider all three factors in determining the safety of fluoridation for public health and policy purposes.

First, the method of action of water fluoridation is directly on the tooth structure. Local replacement of the hydroxyl ion from the hydroxyapatite by Fluoride generates the more stable and caries-resistant fluorapatite of the tooth’s natural crown, which is surrounded by enamel. This is significant for dental health because the crystalline composition of enamel is hydroxyapatite, a component prone to acidic attack generated by bacterial fermentation. Fluoridation, as a caries prevention treatment, wards off acid attack directly to the tooth but it is not a measure to improve overall nutrition and protect teeth as shown on the caries balance in Fig. 13.1.

Second, the upper levels of fluoride, though varying nationally, is usually limited to one source and fails to recognize other sources of fluoride that also add to the cumulative levels of a population’s fluoride intake. Various countries regulate fluoride levels based on differing scientific data. Such variations illustrate the inconclusive bases for government-regulated fluoridation of water. It follows that the regulations are unlikely at ideal levels and accumulations can quickly result in overdoses of fluoride. The dangers of systemic fluoridation, then, are evident from the high variability and likelihood of accumulation.

---

<sup>30</sup>Sodium Fluoride Material Safety Data Sheet, [http://www.nfc.umn.edu/assets/pdf/msds/sodium\\_fluoride.pdf](http://www.nfc.umn.edu/assets/pdf/msds/sodium_fluoride.pdf)

<sup>31</sup>Solvay, [http://www.solvaynorthamerica.com/SiteCollectionDocuments/PDF/PS\\_SodiumFluorideFinal.pdf](http://www.solvaynorthamerica.com/SiteCollectionDocuments/PDF/PS_SodiumFluorideFinal.pdf)

Third, the safety data of fluoridation is of utmost importance for food safety and public health. When fluoride levels from water, milk and salt cumulate in the bodies of consumers, the upper tolerance levels can be quickly reached and lead to toxic levels. Therefore, regulators must be aware of the safety data and upper tolerance levels of fluoride before systemic fluoridation passes safety thresholds. Sodium fluoride (SF), the fluoride form most commonly occurring in food, is classified as a “hazardous product for the human health and the aquatic environment.”<sup>32</sup> In its safety data sheet Solvay North America, writes<sup>33</sup>: “Sodium fluoride is used for water fluoridation, as a metal surface treatment and cleaner, as a glass etchant, and for pH adjustment in industrial textile processing or laundries. . . . Sodium fluoride is also used as a wood preservative and an insecticide.” Multiple avenues and reasons of fluoride accumulation exist. Therefore, regulators and government agencies should exercise extreme caution in supporting mass-medication of entire states or regions through fluoridation of water.

### ***13.2.1 Tablets***

One way of administering fluoride is through tablets as nutrition supplements. Recently, an increased risk of mild fluorosis in anterior teeth has been identified as a result of fluoride tablets consumption.<sup>34</sup> The Cochrane systematic Review<sup>35</sup> concluded that, “[t]he effect of fluoride supplements was unclear on deciduous teeth. When compared with the administration of topical fluorides, no differential effect was observed.” The WHO acknowledges the lack of scientific evidence in regards of the adequate quantity to be administrated.<sup>36</sup> In other words, taking fluoride supplements probably does little to prevent tooth decay.

### ***13.2.2 Milk***

It is widely—and erroneously—believed that milk is a source of fluoride for healthy teeth. In 1996, the WHO published a book entitled “Milk fluoridation for the prevention of dental caries” edited by Bánóczy et al.<sup>37</sup> based on studies performed

<sup>37</sup>Bánóczy et al. (2009).

in Bulgaria, Chile, China, Russia and the United Kingdom. Open questions conclude the publication and the authors could not reach a consensus, which illustrates the conflict of systemic fluoridation. Newer and higher level scientific research published in 2005<sup>38</sup> also failed to identify sufficient scientific support in favor of milk fluoridation. A request for labeling has been made by the WHO to label milk packages accordingly. Thus, there is no scientific support for the common belief that milk or fluoridation of milk contributes to dental health.

### **13.2.3 Salt**

Another source of fluoride is table salt. In France and Germany, for example, 35–60 % of domestic salt is fluoridated.<sup>39</sup> However, to prevent undue accumulation of fluoride in the body, the WHO recommends utilization of either fluoridated water or fluoridated salt for caries prevention and warns of multiple concomitant sources of fluoridation.<sup>40</sup> The maximal dose should not exceed 200 mg F/kg salt. In response to these maximal dosages and warning levels, a request for regular homogeneity checks and concentration labeling on the package has been made by the WHO. This request further supports that mass-medication through fluoride addition to common food and drink items, such as water, milk and salt, remain doubtful in terms of safety and efficacy.

### **13.2.4 Ready-to-Feed (RTF) Infant Food and Drinks**

An additional major source of fluoride are infant formulas and baby foods. A recently published study<sup>41</sup> reviewed 122 infant foods and 25 drinks for F concentration manufactured by 12 companies. The identified F concentration ranged up to 1.200 µg/g. The American Dental Association's Council on Scientific Affairs<sup>42</sup> recommends utilization of F free water for the restitution of RTF infant formula milks.<sup>43</sup> A request for labeling has been made by the WHO because the safety of these high and fluctuating concentrations of fluoride in infant formulas and baby foods are not yet well-understood and regulated.

### 13.2.5 *Other Food Sources of Fluoride*

In addition to the aforementioned paths of fluoride accumulation in the body, there are several other avenues through water and food, but also through air, medicines, and cosmetics. Fluoride is also naturally available in soil, even though it often does not leach into ground water reservoirs. Long-term applications of phosphorus fertilizers, however, accompanied by intensive irrigation likely raise the fluoride concentration in ground water<sup>44</sup> (see Fig. 13.1). Through fertilizer use and other farming practices, fluoride levels can also be higher in some foods and drinks than one may expect. In India, tea,<sup>45</sup> wheat,<sup>46</sup> spinach, cabbage, and carrots,<sup>47</sup> for example, showed elevated fluoride levels.

Fluoride pollution of the environment, such as through fertilizer use, cigarette smoking<sup>48</sup> or aluminum production, may interfere with and add to water fluoridation, which result in higher total fluoride intakes through food and drinks which far exceed safe limits. Modern industrialization contributes to Fluoride pollution via manufacture of semiconductors and integrated circuits,<sup>49</sup> production of hydrofluoric acid, the activities of phosphate fertilizer plants, textile dyeing, from plastic factories<sup>50</sup> and the production of enamel, glass, brick and tile works and several others. All of these add to fluoride pollution of water and accumulate in water supplies that reach consumers directly, thereby causing widespread fluorosis.

### 13.2.6 *Water Fluoridation*

One of the largest sources of fluoride is fluoridated water, the main subject of this chapter. Global trends indicate that the more impurities and pollution exist in water, the higher the fluoride levels. These higher fluoride levels are, however, not a result of intentional public health measures against dental decay. Systematic water fluoridation is, nonetheless, societies' response to the tremendous impact dental caries

has put on national economies around the globe because it increases healthcare costs.<sup>51</sup> In developing countries, for example, access to clean water is not guaranteed. Thus, it is estimated that out 200 million people from 25 nations are likely to be exposed to fluorosis, an excess of fluoride intake which likely correlates with high fluoride levels in drinking and tap water. In India alone 66 million people suffer from fluorosis although the fluoride levels are as low as 0.5 ppm,<sup>52</sup> numbers similar to one tenth of the Chinese population. A systematic review revealed that despite lower than standard level concentrations of fluoride in water, Iran also has high levels of fluorosis.<sup>53</sup> In Kenya, in turn, a daily fluoride intake of less than 0.03 mg F/kg body weight produces dental fluorosis.<sup>54</sup> Scientific studies demonstrated that in midlatitude areas, such as China, the Middle East, Africa and southern Asia, fluorosis could be endemic.<sup>55</sup> Consequently, fluoridation and endemic fluorosis are indicative of areas with low water quality, high levels of impurities and pollution, and not—as many people erroneously believe—of progressive public health measures against dental caries. Once again, the distinction between local application of fluoride must be contrasted with the systemic mass-medication of populations, whether it is intentional or not.

### ***13.2.7 Topical Fluoride Use for Caries Prevention***

Topical fluoride use through gels, liquids or toothpastes are direct application on the enamel, i.e. the outermost hard shell of the teeth. The goal is a targeted and controlled application to strengthen and remineralize enamel. According to some of the highest evidentiary level dental research, topical fluoride use is beneficial to prevent tooth decay.<sup>56</sup> Dental professionals use, recommend and prescribe topical fluorides for individuals at risk of developing dental caries. The current maximal strength guidelines are set based on scientific data.<sup>57</sup> Although the fluoride concentrations used in dentistry are much lower than those accumulated through a variety of sources from foods and the environment, there has not been any research that succeeded to summarize the total concentrations and intakes of fluoride from different sources and considered the overall and accumulated side effects.

### 13.3 Side Effects of Systemic Fluoridation

Systemic Fluoridation can and often does lead to a variety of side effects, such as dental fluorosis, higher risks of hip fractures and other chronic effects.<sup>58</sup> Nonetheless, there remains some controversy through differing interpretation of data<sup>59</sup> in regard to fluoridation side effects.

#### 13.3.1 Dental Fluorosis

Dental fluorosis<sup>60</sup> is a disturbance of tooth formation with aesthetic consequences that become visible as white stains on the teeth. The excess of fluoride leads to hypomineralization of the enamel and developmental disruptions in the natural mineralization and remineralization processes.<sup>61</sup> Water fluoridation is a globally growing concern because of the raised fluoride levels that accumulate in the body. One of the consequences of these raised water fluoride levels is dental fluorosis.<sup>62</sup> Although “the predominant cariostatic effect of fluoride is not due to its uptake by the enamel during tooth development,”<sup>63</sup> excess levels of fluoride still damage teeth. Therefore, water fluoridation is among the identified risk factors<sup>64</sup> of fluorosis. A 2006 review by the US National Research Council revealed the occurrence of moderate dental fluorosis at water level fluoridation levels of 0.7–1.2 mg/l.<sup>65</sup> Governments should act according to the scientific data that clearly outlines the risks of water fluoridation. The fluoridation recommendations of the US Centers for Disease Control and Prevention (CDC), for example, contradict the actual research in the field of fluorosis as a risk and consequence of water fluoridation<sup>66</sup> but the data, as mentioned above, remains controversial. The WHO states that “there are some undesirable side-effects with excessive fluoride intake. Experience has shown that it may not be possible to achieve effective fluoride-based caries prevention without some degree of dental fluorosis, regardless of which methods are chosen to maintain a low level of fluoride in the mouth.”<sup>67</sup> Recent research, however,

<sup>67</sup>WHO (2014).

emphasizes the need to review the available data to avoid a further spread of fluorosis.<sup>68</sup>

Flouride ingestion can result from any of the previously mentioned sources and government agencies as well as many public health professionals fail to act on the available data about the warning signs of fluoride overdoses. Based on the aforementioned, fluoride dietary supplements, such as those administered to small children, represent the most likely reason for the increased ingestion levels. Public health researchers acknowledge that it remains difficult to identify the exact amounts of fluoride that are ingested and to trace them back to their sources. Consequently, researchers have requested that public health authorities educate the public on fluoride sources and continuously revise the guidelines for fluoride supplementation based on the most scientifically sound data.<sup>69</sup>

### ***13.3.2 Bone Weakening Through Fluorosis and Other Fluorosis Induced Diseases and Degeneration***

High fluoride levels negatively impact human health beyond dental fluorosis. Fluoride ions can alter the mineral structure of the bone by substituting hydroxyl groups in the carbonate-apatite, thereby, creating fluorohydroxyapatite, which can possibly weaken the bone. Studies support the weakening effects that excessive fluoridation may have on bone. For example, studies performed in the US in the early and mid-90s demonstrated a small but significant increase in hip fractures within an elderly population.<sup>70</sup> A study performed in China “concluded that long-term fluoride exposure from drinking water containing more or equal to 4.32 ppm increases the risk of overall bone fractures as well as hip fractures.”<sup>71</sup> In the US, water fluoridation levels starting at 1.5 mg/l showed correlation with bone fractures. Notably, in those areas where the correlation was evident, a daily intake of 1.4 mg/day of fluoride could be a reason for stage I skeletal fluorosis.<sup>72</sup> Additionally, data supports low risks of hip fractures in population exposed to fluoridated drinking water (concentrations around 1 ppm) in the UK.<sup>73</sup> Therefore, the risks associated with water fluoridation and its cumulative effects can be quite dangerous from a public health perspective.

<sup>72</sup>Doull et al. (2006).

<sup>73</sup>Hillier et al. (2000), pp. 265–269.

Fluoride intake can also affect the heart, liver, kidneys, gastrointestinal tract,<sup>74</sup> lungs, brain, blood, and hormones in potentially health threatening ways. In fact, fluoride has a potential neurotoxic<sup>75</sup> effect as well as teratogenic actions,<sup>76</sup> which disturb embryologic development.<sup>77</sup> A systematic review that investigated the possible association between the occurrence of Down's Syndrome and water fluoridation concluded that the available evidence was inconclusive<sup>78</sup> but did not rule the connection out.

### **13.3.3 Labeling Requirements**

Due to its lack of efficacy and side effects fluoride supplements should not be prescribed or offered under the age of three, although the latest suggestions mark the age of six<sup>79</sup> unless prescribed by a dentist. The WHO, however, requests adequate labeling, child proof packaging, and indications of maximal doses per package not exceeding 120 mg.<sup>80</sup> For more information on nutrition and supplement labeling, see Chap. 16.

## **13.4 The Ethics of Water Fluoridation**

At the core of the ethical controversy of water, salt, milk and other common types of fluoridation is the lack of consumers' consent to mass-medication. When governments and public health agencies make the decision for the general public, whether in the public's best interest or not, to fluoridate essential food and drink items, such as those mentioned in this chapter, ethical questions must be addressed. This is especially the case where these decisions to mass-medicate are not founded on sound data and science. Even worse, when such mass-medication as fluoridation occurs based on outdated sources or scientifically controverse principles, public health and environmental threats arise that can be difficult to control. As has been shown in this chapter, fluorosis and other negative health impacts arise from mass-medication with fluoride—a dangerous practice in the western world. In countries

<sup>79</sup>Wright et al. (2014), pp. 182–189.

<sup>80</sup>WHO Technical Report on Fluorides and Oral Health (1994).

with already high fluoride levels in drinking water, such as China and India, fluoride is a rather threatening problem for public health that remain inadequately addressed. Organizations such as the FDA and EFSA, for example, must review the regulations that are in place and update them to bring fluoridation back to safe levels and must stop propagating the myth that the fluoridation of drinking water decreases dental decay—the cost is simply too high.

The key considerations in systemic fluoridation are the negative influence upon tooth formation in children up to the age of 3–6 years in addition to the already mentioned side effects. There are different preconditions in the different countries of the world that make general recommendations for fluoride intake obsolete because some countries have high fluoride levels in drinking and tap water and others have low levels. One example of this controversy occurred in Australia, where the respective government agencies evaluated the fluoridation versus fluorosis evidence. These evaluations gave rise to the recently escalated political debate.<sup>81</sup> The goal of these evaluations was to investigate whether there is sufficient evidence to continue to support water fluoridation in the future. The researchers of the study suggested the application of proportionality “to resolve the conflict between the ethical principle of beneficence (prevention of dental caries) and . . . non-maleficence ([to] reduce an increased risk of fluorosis and possibly hypothyroidism and bone fractures) in the water fluoridation controversy.”<sup>82</sup> Efficiency in caries prevention by water fluoridation has to be bigger than possible harm generation. Thus, the researchers juxtaposed caries reduction worldwide induced by water fluoridation and topical application of fluorides. They identified a higher efficiency in the latter and concluded that the evidence is not sufficient to support systemic fluoridation. Thus, in Australia, the evaluation of the data resulted in conclusions against mass-medication through water fluoridation.

Similar debates evolved in other parts of the world. In Canada, for example, the debate about water fluoridation raised questions of basic human rights and freedom of choice.<sup>83</sup> The mass-medication through water-fluoridation is so concerning to a number of Canadians, that these ethical considerations surface, as mentioned above. Correspondingly, in the EU, surveys of European citizens’ attitudes towards water fluoridation have been initiated in different population groups of 16 member countries.<sup>84</sup> The results of these surveys showed that a clear majority voted against systemic fluoridation. Therefore, pursuant to democratic principles, water fluoridation as mass-medication should not continue in the EU.

In the UK, a lawsuit shed further light on the ethics of water fluoridation. Where fluoride is used to prevent or to treat incipient disease, here dental caries, fluoride has to be regarded as medicine under British law. Thus, the authority in charge, here the state, which mass-prescribes systematic water fluoridation has to obey to the

---

<sup>81</sup>Awofeso (2012), pp. 161–172.

<sup>82</sup>Id.

<sup>83</sup>Cohen and Locker (2001), pp. 578–580.

<sup>84</sup>Griffin et al. (2008), pp. 95–102.

same ethical rules applied to any health care worker. Therefore, the court in the aforementioned UK lawsuit<sup>85</sup> concluded that fluoridated water should be treated as medicine and falls squarely within the Medicines Act of 1968. Pursuant to this precedent, the state's mass-prescriptions of fluoride to the public should follow the same laws that other drugs must follow under the Medicines Act even though this is currently not the case yet.

One of the fundamental principles underlying the UK precedent and the debates in the EU, Canada and in Australia involve biomedical ethics. The fathers of biomedical ethics, Beauchamp and Childress, introduced four principles that apply to health care workers: (a) respect of patient autonomy, (b) beneficence, (c) nonmaleficence, and (d) justice. According to these well-established principles, patient can refuse medical treatment under the principal of informed consent, which is also supported by the Council of Europe Convention on Human Rights and Biomedicine 1997.<sup>86</sup> The problem here is that the cookie-cutter mass-medication of the public through water fluoridation violates these basic biomedical ethics principles. From an ethical point of view, therefore, systematic water fluoridation could be considered to oppose the all philosophical principles,<sup>87</sup> and various ethical rules that strip the public and individual consumers of basic rights.

## 13.5 Regulation of Water Fluoridation Around the World

### 13.5.1 *The WHO Approach to Water Fluoridation*

Despite the vast amount of scientific data bemoaning water fluoridation as an ineffective and dangerous public health measure, the WHO has supported water fluoridation for several decades. In fact, the “WHO established a guidance value for naturally occurring fluoride in drinking water of 1.5 mg/L based on a consumption of 2 L water/day, and recommended that artificial fluoridation of water supplies should not exceed the optimal fluoride levels of 1.0 mg/L (WHO 2006).”<sup>88</sup> In a coalition of large associations, “[t]he WHO Oral Health Programme, jointly with the FDI World Dental Federation (FDI) and the International Association for Dental Research (IADR), have embarked on an action plan for the promotion of using fluoride, particularly focusing on the disadvantaged and under-served population

<sup>87</sup>As stated by the “John Harris Centre for Social Ethics & Policy University of Manchester” in November 1989, <http://www.bfsweb.org/facts/ethics/ethicsharris.htm>

<sup>88</sup>European Commission, Critical review of any new evidence on the hazard profile, health effects, and human exposure to fluoride and the fluoridating agents of drinking water.

groups.”<sup>89</sup> Although this program may appear to be a public health measure, it fails to take high-value scientific evidence and geographical differences into account, thereby, promoting a one-size-fits-all approach to caries prevention that has been shown to backfire through dangerous fluorosis levels around the world.

Contradicting its own program, the WHO already found that systemic water fluoridation should not follow a global cookie-cutter uniform set of fluoridation recommendations because fluoride exposure differs greatly around the world. These differing local availabilities of fluoride have been well-documented and support the position against the aforementioned mass-medication:

[I]t is known that water is normally the major source of fluoride exposure, with exposure from diet and from burning high fluoride coal also major contributors in some settings. Fluoride occurs at elevated concentrations in many areas of the world including Africa, the Eastern Mediterranean and southern Asia. One of the best-known high fluoride areas extends from Turkey through Iraq, Iran, Afghanistan, India, northern Thailand and China. However, there are many other areas with water sources that contain high fluoride levels and which pose a risk to those drinking the water, notably parts of the rift valley in Africa. Many of these areas are arid and alternative sources of water are not available.<sup>90</sup>

Therefore, it is important to use both sound science as a basis for fluoridation recommendations—if any—and to adapt these recommendations to the localities around the world. As long as this is not the case, overexposure and fluorosis will continue to be likely and dangerous consequences of uncontrolled fluoridation around the world. A more streamlined approach should be instituted to evaluate the scientifically relevant and to use sound data to help redirect caries prevention efforts and steer them away from mass-medication through water fluoridation.

### ***13.5.2 Water Fluoridation in the USA***

Several agencies regulate water fluoridation in the USA but there is no single streamlined approach to what a safe level of fluoridation may be, especially because the current regulatory framework is based on several decade old data that has long needed an overhaul. The Centers for Disease Control and Prevention (CDC), a government agency, declares that water fluoridation “has been a safe and healthy way to effectively prevent tooth decay” for over 65 years and also recognized water fluoridation as “one of 10 great public health achievements for the 20th century”<sup>91</sup>—a rather sad prospect by comparison, especially in light of the dangers that water fluoridation has proved to pose. Official recommendations by the US

<sup>89</sup>WHO, Oral Health: Global consultation on oral health through fluoride, [http://www.who.int/oral\\_health/events/Global\\_consultation/en/](http://www.who.int/oral_health/events/Global_consultation/en/)

<sup>90</sup>WHO, New WHO report tackles fluoride in drinking-water, <http://www.who.int/mediacentre/news/new/2006/nw04/en/index.html>

<sup>91</sup>Centers for Disease Control and Prevention, Community Water Fluoridation, <http://www.cdc.gov/fluoridation/>

Department of Health and Human Services (DHHS) have set the level of fluoride level in water at 0.7 mg/l,<sup>92</sup> which contrast other agency recommendations: “For values 0.1 mg/L above control range to 2.0 mg/L – Leave the fluoridation system on. For values 2.1 mg/L to 4.0 mg/L – Leave the fluoridation system on. For values 4.1 mg/L to 10.0 mg/L – Turn off the fluoridation system immediately.”<sup>93</sup> Thus, there is clearly no true consensus and this chapter has demonstrated that water fluoridation should not be a one-size-fits-all approach.

The Environmental Protection Agency is empowered to regulate fluoride in drinking water under the Safe Drinking Water Act. Adverse effects of water fluoridation, however, are proven to be suspected world wide and the EPA failed to act on the science supporting the dangers of water fluoridation. For example, in a 1998 case filed by EPA scientists against the agency itself, the petitioners called the “process by which EPA Arrived at the [recommendations] for fluoride . . . irrational.”<sup>94</sup> On the same note, a report by the National Research Council released in 2006, performed by request of the EPA, confirmed the need to lower the maximum level of safe fluoride to zero.<sup>95</sup> Nonetheless, drinking water continues to be fluoridated in the US.

### 13.5.3 Water Fluoridation in the European Community

The EU has issued a Directive on the quality of water intended for human consumption, namely Council Directive 98/83/EC (1998). In this Directive, the European Commission has included a list of chemical parameters that are safe in drinking water, where a fluoride level (both natural and as a result of fluoridation) for water intended for human consumption of less than 1.5 mg/l was determined.<sup>96</sup> Although this level is still high, it is substantially lower than the levels determined to be safe in other parts of the world.

### ***13.5.4 Water Fluoridation in Australia***

In Australia, the Health (Fluoridation) Act of 1973 regulates the safe and effective addition of fluoride into drinking water supplies<sup>97</sup> and works in conjunction with the Australian drinking water guidelines and the Safe Drinking Water Act of 2003.<sup>98</sup> The dosage not allowed to be exceeded was set at 1.5 mg/l, the same level as in the EU.

### ***13.5.5 Water Fluoridation in South Africa***

Attributing water quality and health problems to water fluoridation, the South African Research Commission simply but most notably states that “fluoridation of groundwater is not advisable.”<sup>99</sup> Thus, some governments are firmly opposed to water fluoridation despite the aforementioned contradictions within the WHO’s recommendations.

### ***13.5.6 Water Fluoridation in United Kingdom***

Water fluoridation in the UK is regulated by paragraph 58 of the Water Act 2003. The Act limits the “the concentration of fluoride in the water supplied to premises in the specified area is maintained at the general target concentration of one milligram per litre.” Moreover, individual (health care) authorities are empowered to request water fluoridation from water suppliers to further ascertain whether water fluoride levels are safe.<sup>100</sup>

### ***13.5.7 Water Fluoridation in Israel***

Similar to lawsuits in the US, UK and the EU, several lawsuits have been brought by concerned parties in an effort to update water fluoridation regulation. As a result of such litigation in Israel, the Supreme Court of Israel ruled against adding fluoride to drinking water in an opinion on July 29, 2013.<sup>101</sup> In 2014, the Minister of Health

decided to stop water fluoridation because “fluoridation can cause harm to the health of the chronically ill,” including “people who suffer from thyroid problems.”<sup>102</sup> This breakthrough approach is evidence of progressive and scientifically-sound risk-benefit analysis, while simultaneously taking the ethics of water fluoridation into concern. Israel’s cessation of water fluoridation sets a positive example for regulators around the world.

## 13.6 Conclusion

Many reasons speak for the inclusion of caries in any well-rounded discussion on public health and food policy. This chapter shows that the socio-economic impacts of caries prevalence affect individuals, public health, economic systems and international policies. One of the major public health measures taken against caries is water fluoridation, a government-regulated mass-medication following a one-size-fits-all approach. The various health concerns arising from this mass-medication include fluorosis and other health complications resulting from the systemic fluoridation of drinking water. While the US Center for Disease Control called the decrease of caries prevalence by half through fluoridation of water one of the greatest achievements since 1980,<sup>103</sup> other data tie caries into discussions of public health and food policy as socio-economic aspects and reveal well-founded and strong objections to water fluoridation because it poses a number of health threats.

In essence, this chapter analyzes the role of law and regulations in addressing public health and food policy concerns in light of fluoride deficiencies or accumulation through water and food fluoridation. The three fold problems, therefore, are the questionable outcome of water and food fluoridation, the associated health hazards resulting from fluoride accumulation, and the ethical implications of mass-medicating the public based on scientifically ambiguous data. As a result, this chapter presents the various measures taken around the world to address these three problems and illustrates how an interdisciplinary approach to food law, policy and regulation can have broad global application.

This chapter identifies that caries causes socio-economic costs and that the regulatory remedy in response to these rising costs around the world is fluoridation. There are, however, two major approaches to fluoridation: (1) Systemic fluoridation and (2) topical fluoridation. Systemic fluoridation is regulated through governments and international entities, such as the WHO. These governmental measures have both ethical and medical problems as consequences of mass-medication of the public. By comparison, the topical fluoridation approach remains an individualized

---

<sup>102</sup>Israel Will End Fluoridation in 2014, Citing Health Concerns, [http://fluoridealert.org/articles/israel\\_fluoridation/](http://fluoridealert.org/articles/israel_fluoridation/)

<sup>103</sup>Griffin et al. (2001), pp. 78–86, 79 (citing Ripa (1993), pp. 17–44; CDC, Fluoridation of public drinking water to prevent dental caries (1999), pp. 933–940).

and more targeted preventive measure against caries because it can be applied either by the dental professional or the individual consumer. However, obstacles to proper topical fluoridation treatments for public health remain both consumer or patient education and individual healthcare costs. At the same time, those individuals choosing topical fluoridation have little avenues to avoid being mass-medicated and fluoride accumulation by the government as long as water fluoridation remains a public health practice.

# Chapter 14

## Textbox: The Hierarchy of Scientific Evidence

Gabriela Steier and Liviu Steier

**Abstract** Not all studies are the same. Various types of publications and articles have different scientific weight. This short summary provides an overview of the scientific evidentiary value of various types of publications with the goal to create transparency in the level of bias of any given study so that readers may, in turn, determine the attention and importance they can give the study. Practically speaking, the more bias, the less evidentiary value a study or publication has and vice versa. A figure illustrates this concept and simplifies it.

In determining the validity of the scientific data, i.e. whether information in a medical publications and studies is scientifically sound, a variety of methods can be applied to grade publications and studies hierarchically. The goal is to create transparency in the level of bias of any given study so that readers may, in turn, determine the weight they can give the study. Practically speaking, the more bias, the less evidentiary value a study or publication has and vice versa. Figure 14.1 illustrates this relationship.

Figure 14.1 illustrates the five most common types of scientific evidence, systematic reviews, randomized clinical trials and observational studies, uncontrolled observational studies, case reports and case series, and expert opinions. With increasing bias, the scientific evidentiary value, i.e. the level of scientifically sound information, decreases. Conversely, with decreasing bias and controls, the evidentiary value increases. Understanding the hierarchy of scientific evidence is crucial to implementing the proper scientific data in policy and legislation based upon what should be scientifically sound.

# Chapter 15

## Food and Energy

Stephen B. Balogh and Charles A.S. Hall

**Abstract** There is nothing more critical to human existence than food. While a proper climate and water are arguably as important as food, they are usually present, but food shortages from population expansion, climatic extremes, conflict, and concentration of output in the hands of the powerful are a nearly constant characteristic of one part or another of the world's human population for as far back as we have records—and probably far before that. For example, huge famines occurred in China in the sixth and twentieth century AD, and many centuries in between, most of Europe in the fifteenth century, Ireland in the middle of the nineteenth century, Bosnia, Philippines, and Sudan during this past century and countless other locations all over the world. But we in most of the developed world live today in a situation of incredible food affluence, and famine seems to have left much of the world except for areas of political-military conflict. How has this come to be? The most general answer is the application of fossil fuel technology and its ancillary technologies, most notably the production of nitrogen fertilizer and substitution of mechanical work for human and draft animal labor, to food plant production. This has allowed an enormous expansion of food production and has allowed us to think about food from many other perspectives, including aesthetic, moral and political. We examine human food production over millennia with a particular focus on energy: the quantity and quality of the energy of the food and also of the energy required to produce it.

### 15.1 Introduction: Food as a Global Issue

For most of humanity's existence, extreme hunger and starvation have been constant companions. There are records of millions of people starving in China, India, Egypt, Russia, and elsewhere, as recently as the twentieth century. In many smaller

nations and city-states, starvation has occurred periodically since human settlement began. Today, however, mass starvation is rare. There are two general ways to view this reduction in food shortage: from the “BigAg” perspective, which consists of industrial food producers, synthetic pesticide and fertilizer developers, and large food corporations, or, in the alternative, from the perspective of concerned consumers, environmental conservationists, and sustainability advocates.

From BigAg’s one-sided point of view, the collective ability of today’s farmers to meet—for the most part—the food demand of some seven billion people is allegedly a triumph of technological advances and human ingenuity. Artificial fertilizers, pesticides, novel cropping methods, and bioengineering have seemingly tripled yields of staple and commodity crops in the past half-century. This increase has increased per capita food availability by about 25 % from the 1960s to 2009<sup>1</sup>—despite the fact that these statistics play out differently around the world. Although agricultural output has increased during a period when the total area in farms has decreased<sup>2</sup> and per capita wheat, rice, and coarse grain production has risen over the last decade in all regions except Oceania (Australia and the South Pacific), food shortages continue to persist in many parts of the world. Despite this, the United Nations Millennium Development Goal to halve the proportion of the population that is chronically hungry and malnourished by 2015 may be within reach.<sup>3</sup> But the same advances that are publicized as agricultural breakthroughs are also the culprits of many challenges of the modern food system. The fact that anyone remains hungry in 2016 is more a consequence of resource distribution, politics, and a preference for higher animal protein diets and a high level of wastage in the food distribution, preparation and disposal systems, rather than intrinsic limits to agricultural production. Therefore, the alleged limits of agricultural production need not be resolved through biotechnology and synthetic pesticides or fertilizers alone. Instead, policy changes and a careful look at resource use and distribution may yield much more promising solutions.

From a biophysical and ecological perspective, however, modern farming has become increasingly unsustainable and is pushing the planetary boundaries. Perhaps most importantly, each kilogram of food produced through industrial agriculture is less and less a function of sunlight, soil, water, and labor inputs, as it should naturally be; instead, it is the product of fossil fuel inputs, chemicals, and biotechnology. These fossil fuel inputs can be either direct, in the form of diesel to run tractors, or electricity to pump irrigation water; or indirect, through petrochemical fertilizers and pesticides, as well as energy embodied in farm machinery and other infrastructure. Because of this dependence on petroleum, access to food markets, along with the price of food, is tied directly to changes in energy prices—especially oil.<sup>4</sup> Thus, the question “will we be able to produce enough food to meet the

---

<sup>1</sup>Food and Agriculture Organization (2013), p. 124.

<sup>2</sup>Food and Agriculture Organization (2013), p. 124.

<sup>3</sup>Food and Agriculture Organization (2013), p. 67.

<sup>4</sup>Baffes and Dennis (2013), p. 2.

demands of a growing and urbanizing population?” becomes, instead, a question of whether humanity will be able to continue to find and extract increasing amounts of oil and natural gas at a low cost.

The paradigm shift of asking another question entirely alters our view of the food production system. Furthermore, other issues associated with this heavy industrialization include growing pest resistance to pesticides, fertilizer saturation, soil depletion and toxification, and reduction of cultivar diversity and crop ecosystems. The collective long-term effects of the “new conventional” farming system, relying on oil, biotechnology, and industrialization of food production are difficult to predict but allude to a dangerous future. Rapid urbanization has changed how we produce and consume food. Since more than half of people around the world live in urban areas, humanity’s dependence on petroleum for transporting food has increased. As cities grow, some of the most fertile land is being paved over with impermeable surfaces and is no longer available for food production. Moreover, as people move increasingly from rural areas to cities, their diets change. Greater income usually leads to higher protein demand and the transition to a more “global” diet that eschews locally produced food for cheaper, more processed imports and higher amounts of dairy, eggs, and meat. China, for example, has seen a four to tenfold increase in meat and milk consumption from 1980 through the 2000s.<sup>5</sup> The production of dairy and meat products is much less efficient than for staple grains such as rice and wheat. In fact, the former requires a much larger energy input for the amount of food produced, and this increases pressure to expand agricultural output. Consequently, rapid urbanization contributes to starvation and malnutrition when energy-intensive farming is the method of producing food.

### ***15.1.1 Starvation and Malnutrition***

The most important requirement for food production is to sustain our growing population. Large-scale starvation, while once common, is now relatively rare due to improved efficiencies in transporting food from areas of abundance to scarcity. This approach has historical precedence: for example, while starvation once occurred frequently in India, the completion of the national railroad system essentially eliminated the problem in the 1880s. Starvation still occurs in contemporary societies, but it tends to be linked to war, political instability, or strife rather than actual crop failure.<sup>6</sup> In other words, the planet can produce enough food to avoid human starvation, but it is not always distributed to where it is needed. This contradicting relationship is due to the industrialization of agriculture (and warfare) and increased urbanization.

---

<sup>5</sup>Food and Agriculture Organization (2009), p. 11.

<sup>6</sup>See Riley (1993); Devereux (2007).

Malnutrition, as opposed to starvation, is much more common and pervasive than starvation. Malnutrition, occurs when there is enough food, but not enough of the kinds that humans require to be healthy. Most fundamentally, malnutrition occurs when there are enough calories to survive, but not enough calories or nutrients for the body to do all the functions required for optimum well-being. A secondary issue to malnutrition is lack of protein: in general, plant—and especially animal—protein tends to be more expensive, both monetarily and energetically, than carbohydrates. This is because, ultimately, it is much more expensive for plants or humans to fix (take out of the air) nitrogen than carbon.<sup>7</sup> Paradoxically, a portion of the population in developed nations are over-fed and malnourished, with many people consuming up to 3700 kcal in protein-rich diets that lack sufficient potassium, calcium and vitamin D.<sup>8</sup> Thus, malnutrition can occur even when obesity becomes a problem. Thus, the sociological and environmental shifts must be considered in examining the problems of food security.

### ***15.1.2 Food and the Environment***

It is easy to look upon agroecosystems and see green, sustainable environments in harmony with nature; indeed, that is how they are often portrayed in the popular press. Yet at the most basic level, agriculture and the natural environment are intrinsically at odds. The very purpose of agriculture is to redirect the land's energy flow from diverse, sustainable ecosystems to simplified monocultures that require continual inputs of human and fossil energy to maintain their highly productive state. Natural ecosystems, on the other hand, usually maintain or build soils, are in carbon balance with the atmosphere, and retain nutrients. Agroecosystems, in contrast, typically lose soil and nutrients while adding carbon to the atmosphere. Depending upon local geography and cultural practices, agriculture also has a detrimental impact on water, air and soil quality: fresh and salt water bodies become eutrophied by excessive nutrients from farmland runoff; changes in land use increase greenhouse gas emissions; livestock and crop production contribute to global climate change; and tilling, fertilizers, and pest control lead to soil erosion and degradation.

Industrial agriculture also disrupts traditional farming systems that have developed over millennia and are tied to local environmental conditions and social structures. Perhaps most significantly, erosion from industrial agriculture is reducing our one-time allotment of arable soils.<sup>9</sup> Net soil losses under industrial farming are one to two orders of magnitude greater than soil production or erosion under

---

<sup>7</sup>On the most basic level, nitrogen fixation is required for the production of plant protein, while carbon fixation is part of the process of producing sugars and other carbohydrates.

<sup>8</sup>United States Department of Agriculture (2010), p. 8.

<sup>9</sup>Pimentel (2006).

native vegetation.<sup>10</sup> Excess fertilizers enter fresh water bodies and eventually end up in the ocean, leading to eutrophication and disruption of biogeochemical nutrient systems. These ecological impacts have energy costs, too, as nutrient-poor soils require increasing inputs of energy-intensive fertilizers. They also disrupt fresh and salt-water fisheries, leading trawlers to fish more intensively in order to maintain catch levels.

The water required to produce various food and forage crops ranges from 500 to 2000 liters (L) per kilogram of crop produced. A hectare of US corn, for instance, transpires more than 5 million L of water during the 3-month growing season. If irrigation is required, more than 10 million L of water must be applied to this crop.<sup>11</sup> It is possible that water, as opposed to energy, will limit agriculture in the future. Agriculture places enormous demands on global water resources, and climate change may further alter the distribution and amount of precipitation received in the current arable lands. Today, however, energy is still a limiting factor of production: water-pumping infrastructure and desalinization, for example, require significant energy inputs. Nonetheless, it is beyond the scope of this chapter to examine the potential impacts of climate change on agricultural production, other than to say that they are large, controversial, and act to increase some crops while decreasing others.

### 15.1.3 *The Politics of Food*

Since the agricultural revolution, higher incomes and social statuses have been linked to a higher quality and higher calorie diet. As nations become economically wealthier, their diets—and especially those of their richest populations—become much more protein-dense. Consequently, these diets became more energy intensive to produce. Still, while relatively affluent middle class Chinese urbanites dine on pork, or American workers lunch on hamburgers from the drive-thru window, countless poorer people around the world subsist on rice or sorghum mixed with a few scraps of vegetables. The evolution of agriculture has not brought positive impacts to the global population across the planet and continues to show discrepancies in terms of food safety and food security world-wide.

That this inequity in access to high-quality foods persists would likely surprise few readers. The world's poor, however, also face disproportionate environmental impacts from the shift to a "Western" diet by a growing middle class. Subsistence farmers in tropical nations, for example, have been forced from their traditional lands and their customary agricultural practices (such as *swidden*, or "slash and burn" farming). These techniques are replaced by large monocrop systems with outputs destined for export, such as soybean farming in Brazil.

---

<sup>10</sup>Montgomery (2007), p. 13268.

<sup>11</sup>Pimentel and Pimentel (2003), p. 660S.

The replacement of traditional century-old farming practices with intensive crop-monocultures is driven by economic incentives. During the 1980s, international financial institutions implemented neoliberal policies in the global south to provide development loans. However, their policies also eliminated trade barriers and flooded local markets with cheap, subsidized grains from the U.S. and Canada, which destabilized local production systems.<sup>12</sup> Many developing nations continue to rely on agricultural exports to generate income in order to run their economies and pay the interest on longstanding development loans. All of this has implications for each nation's food security and self-sufficiency.

Fad diets and changes in taste in Western countries also affect distant ecosystems and cultures. A recent example of this is the introduction of quinoa as a high-status food and healthy substitute for processed grains in the United States. Traditionally consumed as a staple food in Peru and Bolivia, Americans now import nearly 68 million pounds of quinoa per year.<sup>13</sup> Some scholars consider this an economic boon to poor farmers in the region who now have access to lucrative health food markets in the U.S. Yet others decry the disruption to local markets and the inability of the local poor to afford this once ubiquitous crop—the price of which has increased sevenfold from 2012 to 2014.<sup>14</sup> While the debate continues over costs and benefits to local farmers in Peru and Bolivia, it is clear that voluntary (or perhaps marketing-influenced) changes in Western diets have real implications for the diets and economies of far-flung cultures.

#### ***15.1.4 The Morality of Diet***

What, then, should a moral person eat? Worldwide, an estimated two billion people live primarily on a meat-based diet, while an estimated four billion live primarily on a plant-based diet.<sup>15</sup> For some, this is a purely economic decision: they would consume meat if it were available and affordable. Yet, for others, the decision to eschew meat stems from religious, cultural, or moral beliefs. About one third or more of the 1.2 billion people living in India exist on a vegetarian diet. Another tenth of the population eats only grains, vegetables and some eggs. Certainly, there are also millions of relatively affluent people who are vegetarian for moral and environmental reasons, such as a desire to reduce resource consumption or concern about the welfare of animals raised for food. Other considerations for a moral diet include: the environmental impacts of food production (including, but not limited

---

<sup>12</sup>See, e.g. Costa Rica as described in Hall et al. (2000).

<sup>13</sup>Washington Post (2013).

<sup>14</sup>World Bank (2014).

<sup>15</sup>World Bank (2014).

to, greenhouse gas emissions, eutrophication, and pollution of water bodies); health impacts to humans, such as antibiotic resistance in bacteria; the often cruel treatment of livestock; the wages paid to farmers for their labor; and the protection of non-renewable and renewable resources, such as soil erosion.

The decision about what to eat is ultimately complex and nuanced; the growing global population, resource constraints—especially from peak petroleum production—and the increasing inability of the ecosphere to assimilate the wastes from our economy all complicate this process. Notably, however, the number of children one chooses to have, and at what age, may impact the food production system far more than what foods one decides to eat for a multitude of reasons explained hereinafter. Throughout this chapter, the goal is to educate the reader on the relation between fossil and natural energies and the contemporary food system, and provide insight for those looking to reduce the energy impact—and greenhouse gas emissions—of their diet. Ultimately, the morality of diet lies within one’s food choices and the large-scale consequences of the accumulation of an individual’s dietary decisions on the market and the planet. In other words, this chapter provides an outline that connects food choices with one’s environmental footprint.

## 15.2 Food as Energy

Human bodies are, at their essence, biological machines. To operate well, these machines require daily inputs of water, fuel, and the essential chemical compounds that they cannot synthesize alone. Thus, whether one is rich or poor, the “work” one must do each day requires securing sufficient resources of fuel (food energy), water, and nutrients. Government agencies, intergovernmental organizations (such as, the United Nations), and non-governmental organizations (NGOs) research and provide suggestions about the amount and variety of food that humans should consume to meet dietary needs. These usually take the form of recommended daily allowances of calories,<sup>16</sup> along with macro- and micro-nutrients. They can also be presented as informal food-based dietary guidelines, such as “eat a variety of fruits and vegetables each day.” It is telling that in our age of relative abundance, these guidelines often *warn* against overconsumption of calories,<sup>17</sup> rather than providing minimal daily energy consumption requirements. This oddity, especially in light of the problems associated with starvation and malnutrition, seem illogical. However, upon deeper reflection about the connections between the current food industry and the rising numbers of malnutrition, the links fall into place.

---

<sup>16</sup>Measured in kcal, where 1 kcal = 4.184 kJ.

<sup>17</sup>United States Department of Agriculture (2010), p. 8.

### ***15.2.1 How Food Is Measured***

Macronutrients provide the bulk energy content of food. These chemical compounds are grouped into three major classes: carbohydrates, proteins (and their amino acid components), and fats. The total combustible energy in food can be measured by using bomb calorimetry. Simply put, the food is combusted in a chamber full of oxygen submerged in a known volume of water, and the resulting increase in water temperature is measured. Although there are slight differences in the amount of energy per unit of mass for different compounds, it is generally accepted that 1 g of carbohydrates or protein contains about 4 kcal, while fats contain about 9 kcal of available energy. However, not all of the ingested chemical energy in food is available to the body. Insoluble fiber, for example, is combustible, but it passes through the digestive tract without being metabolized. More complex adjustments must be made to bomb calorimetry results to determine the energy available to humans in foodstuffs.<sup>18</sup>

The unit of energy typically used to measure the available energy in food is the kilocalorie. A calorie is defined as the amount of heat needed to raise 1 g of water by 1 °C at 15 °C. A kilocalorie is 1000 cal. One kilocalorie (kcal, dry weight) is equivalent to approximately four BTU, or 4.18 kJ ( $10^3$  J—note Joules are the SI standards for energy and should be used for ALL energy calculations and representation, but calories are entrenched for food). A British Thermal Unit (BTU) is approximately equivalent to the energy found in the tip of a matchstick. Thus the digestion of each kcal of food liberates the energy contained in four matchsticks. There are usually about 4 to 9 kcal per (dry) gram of food, or 112–255 kcal per ounce, with the lower values characteristic of carbohydrates and proteins, and the higher values of fats. Using these metrics, a person needs roughly half to 1 kg of food per day, including food wasted. Thus, in a deeply simplified model, the planet must produce nearly 1 kg of food for per person per day. Some of this food will be wasted and some additional energy and water is needed to prepare and process the food. Thus, energy goes into producing food and food is, in turn, used to produce energy. The vast complexities within this seemingly simple equation, however, give rise to a universe of considerations that are crucial to understanding the modern food system.

### ***15.2.2 The Fate of Ingested Food: Food as Physiological Energy***

Due to incomplete digestion, not all of the gross energy available in food is available to the body. For every 100 units of gross energy ingested, approximately

---

<sup>18</sup>Food and Agriculture Organization (2003), p. 5.

three-quarters are assimilated into the blood in the form of simple sugars, amino acids, and fatty acids. The remainder of the energy is lost through egestion as feces and combustible gases. Other energy losses occur through the urine, as well as through the catabolism (breakdown) of protein and evaporation from the body's surface.<sup>19</sup> Metabolizable energy (ME) is the energy that remains after accounting for these important losses. Of this metabolizable energy, some must be used to run the processes of digestion, absorption, and intermediary metabolism, and is thus unavailable for other metabolic processes. The digestive tract is home to some 800 species of bacteria, which are important for the metabolism or generation of several vitamins, in addition to helping ferment indigestible carbohydrates. Additionally, the bacteria recirculate compounds excreted in bile from the liver.<sup>20</sup> The gut flora, in turn, uses some of the metabolizable energy in these processes. Correspondingly, the net metabolizable energy (NME) accounts for losses due to the aforementioned processes, while the remaining energy—that which passes from the gut into the bloodstream—becomes available for basal metabolism, active metabolism,<sup>21</sup> growth, and reproduction. About one percent of ingested energy is used for growth and reproduction.<sup>22</sup>

### 15.2.3 Human Energy Requirements

Today, humans require on average 2000–2500 kcal<sup>23</sup> for proper nutrition.<sup>24</sup> Depending upon their weight, sex, level of activity, and other factors, they can require as little as 1000 kcal (for children 2–3 years old) and up to 3200+ kcal (for active male adults) per day. This energy requirement is appreciably lower than the 3000 kcal/day estimated by some academics for modern and historical hunter-gather populations.<sup>25</sup> The notably higher levels of kcal for hunter-gatherers can be attributed to their greater levels of activity and higher resting metabolic rates. A modern human would have to walk nearly 19 km (12 miles) per day in addition to their current daily activities in order to expend the energy used by their typical !Kung or Ache counterpart.<sup>26</sup> The fact that the average human requires one-third less food energy than our Paleolithic ancestors (and modern hunter-gathers) can be attributed principally to our present use of fossil fuels for labor, transportation, and air-conditioning. Nonetheless, the variations in diet also change how much

<sup>26</sup>Kious (2002), p. 1.

nutrition a person can actually get from his or her diet. Arguably, an organic, locally-sourced, whole-foods plant based diet will provide more nutrients and more food for a certain amount of calories than a comparatively unsustainable processed-food animal-protein based mainstream meal that is not locally sourced. Thus, energy quality and nutrition also play a major role in the considerations at the heart of this chapter.

### ***15.2.4 Energy Quality and Nutrition***

Not only do humans need energy, they need the right kind of it. Thus, adequate nutrition depends on proper food safety and security—and vice versa. Centuries ago, when hunter-gatherers obtained their food, the hunters had to be good animal trackers, and the gatherers had to know where to search according to the season. Essentially, these populations got their food through their own energy investments. Similarly, early farmers had to understand many things about where and when to plant, cultivate and harvest. By contrast, with contemporary and intensive agriculture, food producers need not just human labor energy outputs and accumulated knowledge, but energy in the form of petroleum for tractors and transport, natural gas to fix nitrogen for fertilizer, and electricity for pumped irrigation. In addition, farmers seek affordable energy, i.e. energy that does not require a lot of energy to produce, such as in the form of fuels with a high-energy return on investment (EROI).<sup>27</sup>

The bulk of human food needs are met through the production and consumption of staple crops, mainly corn, wheat, and rice—all highly productive grasses. While cultivars vary by geographic region and culture, their structure and function—high carbohydrate (high energy) and high yield per effort (high efficiency)—vary little. Protein requires more energy per gram to produce, often substantially more. Vegetables, necessary for good nutrition, are more energy intensive than grains. Thus a complete diet requires a mix of both high efficiency staple crops, as well as higher quality foods that need a greater energy investment for production. If we were to eat the most energy efficient diet, it would probably still not be sufficiently nutritious. On the other hand, a modern diet too rich in proteins and fats is also energy intensive and early agriculture probably decreased the nutritional status of humans. Academic and scientific opinions vary greatly, and there is no consensus at this time about the optimal diet that combines good nutrition along with a low energy cost. Progressive thinkers suggest that a locally-sourced organic whole-foods plant-based diet may be the best approach for public health and environmental integrity<sup>28</sup> although further quantification of this is needed.

<sup>28</sup>T. Colin Campbell and Jacobson (2013).

Thus far, this chapter focused mostly on the nutritional requirements of the individual. Now, however, the focus shifts to a larger, more comprehensive, question: how should we look at food and energy for an entire country, or region, or the world? Nearly everyone asking this question goes back to the first important paper on this topic by Thomas Malthus.

### 15.2.5 Thomas Malthus's Question

A discussion of the resource versus population issue always starts with Thomas Malthus and his 1798 publication *First Essay on Population*:

I think I may fairly make two postulata. First, that food is necessary to the existence of man. Secondly, that the passion between the sexes is necessary, and will remain nearly in its present state. . . ., increases in a geometrical ratio. Subsistence increases only in an arithmetical ratio. Slight acquaintances with numbers will show the immensity of the first power in comparison of the second.<sup>29</sup>

Malthus continues with a very dismal assessment of the consequences of this situation for humans including even more disheartening and inhumane solutions that disadvantage poorer populations. Most people agree, however, that Malthus' premise has not held up between 1800 and the present, as the human population has expanded by about seven times along with concomitant increases in nutrition and general affluence—albeit the latter occurred only recently. In *The End of Food*, Paul Roberts (2008) reports that malnutrition was quite common throughout the nineteenth century. It was only in the twentieth century that cheap fossil energy allowed a sufficient level of agricultural productivity to avert famine. Many scholars have made this argument—that humans' exponential escalation in energy use, including that used in agriculture, is the principal reason that the food supply has grown parallel to the human population. Since Malthus' time, therefore, we have avoided wholesale famine for most of the Earth's people due to the expansion of fossil fuel use. This was something that Malthus could not have foreseen.

The first twentieth century scientists who argued consistently with Malthus' concern about population and resource distribution were ecologists Garrett Hardin and Paul Ehrlich. Hardin's essays in the 1960s on the impacts of overpopulation include the famous *Tragedy of the Commons*, in which he discusses how individuals tend to overuse common property to their own benefit even when it is disadvantageous to all parties involved.<sup>30</sup> Hardin wrote other essays on population, coining such phrases as “freedom to breed brings ruin to all” and “nobody ever dies of overpopulation,” the latter implying that overcrowding is rarely a direct cause of

---

<sup>29</sup>Malthus (1798).

<sup>30</sup>Hardin (1968).

death, but rather it leads to disease or starvation or living in dangerous areas such as periodically hurricane-flooded deltas, which, in turn, kill people as a result of overpopulation. This idea is exemplified in an essay about the thousands of people in coastal Bangladesh who drowned in typhoons over the past centuries. Hardin argues that the residents knew this region would be inundated every few decades, but they lived there anyway because they had no other place to go in such a crowded country. The typhoon pattern recurred in 1991 and 2006, thus supporting Hardin's argument that overpopulation causes other problems, which then lead to death.

In *The Population Bomb* (1968), ecologist Paul Ehrlich argues that continued population growth will wreak havoc on food supplies, human health, and nature, and that Malthusian processes (such as war, famine, pestilence, and death) will sooner rather than later bring the human populations "under control" and down to the carrying capacity of the world. During the time of Ehrlich's work, agronomist David Pimentel and others,<sup>31</sup> ecologist Howard Odum, and environmental scientists John and Carol Steinhart quantified the energy dependence of modern agriculture and showed that technological development is almost always associated with increased use of fossil fuels. Other ecologists, including George Woodwell and Kenneth Watt, discuss in depth how people negatively impact ecosystems.<sup>32</sup> Kenneth Boulding,<sup>33</sup> Herman Daly and a few other economists begin to question the very foundations of economics,<sup>34</sup> including its dissociation from the biosphere necessary to support it and, especially, its focus on both growth and on infinite substitutability—the idea that something will always come along to replace a scarcer resource.<sup>35</sup> More recently, Lester Brown and others provide convincing evidence that food security is declining, partly because of distributional issues and partly because of declining soil fertility, desertification, and a decrease in the availability of fossil-fuel derived fertilizers.<sup>36</sup>

On another note, Jay Forrester is the developer of a series of interdisciplinary analyses and thought processes, which he calls system dynamics. He describes the impending difficulties posed by continuing human population growth in a world of finite resources. His analysis became known as the Limits to Growth model.<sup>37</sup> His computer models were refined and presented to the world by Forrester's students Donella Meadows, Dennis Meadows, and their colleagues in 1972.<sup>38</sup> They showed

<sup>36</sup>See generally Brown (2009a, b).

<sup>37</sup>Also known as the "Club of Rome" model, after the organization that commissioned the publication.

<sup>38</sup>Meadows et al. (1972)

that exponential population growth and resource use, in combination with finite resource and pollution assimilation, will lead to serious global economic instabilities, eventually resulting in a large decline in the material quality of life and the overall human population.<sup>39</sup> Around the same time as Forrester's writing, geologist M. King Hubbert predicted in 1956, and again in 1969, that oil production from the coterminous United States would peak in 1970 before declining. Although his predictions were dismissed at the time, U.S. oil production in fact peaked in 1970, and natural gas did so in 1973.<sup>40</sup> These predictions provided frameworks for an understanding of past and future food production challenges.

Before considering the present and future possibilities with respect to food, one must examine food production from the widest possible perspective. This analysis begs the questions: How has the present human food situation developed? Are Malthus' ideas still valid? Has the temporary availability of fossil fuels delayed the implementation of the "Malthusian dilemma," or have technological conditions changed the limits of food production? How can we understand the relation of human population and food over a long period of time? The following sections explore some of these issues.

## 15.3 History of Humans and Food

### 15.3.1 *The Prehistory of Human Society: Living on Nature's Terms*

Agriculture, by its definition, is a manipulation and cultivation of nature's abundance of foods. It is, therefore, important to understand the relationship between human evolution and food system evolution. In fact, people sufficiently similar to the modern human have been on Earth for roughly half a million years and have benefitted from nature's supply of food. Yet, scholars understand very little about how these people made their living, what they did day to day, or how they interacted with each other. The only existing evidence of their lives consists of human bones, the bones of their prey, and an occasional tool. Scientists are relatively certain that these early humans survived by hunting and gathering, i.e. by exploiting whatever food nature provided along with what could be obtained using relatively simple tools such as spears and baskets. Most of what we know about our hunter-gatherer ancestors is derived principally from anthropological studies of remaining hunter-gatherer cultures such as the !Kung, a group that still lives in the Kalahari desert of Southern Africa, as well as in towns and cities.<sup>41</sup> Nonetheless, all of those who examine what life must have been like for our ancestors, are indebted to the work of

---

<sup>39</sup>Hall and Day (2009), p. 220.

<sup>40</sup>Hall and Day (2009).

<sup>41</sup>Lee (1969)

Richard Lee, who studied the !Kung while they were relatively unaffected by modern civilization. Many academics believe that modern hunter-gatherers are the best mirror in which to see what life must have been like for our ancestors over the half million years between the evolution of our species and the development of agriculture.

Life for a hunter-gatherer is essentially about taking nature as it is found and finding ways to support oneself on those resources. Since most early human hunter-gatherers lived in tropical environments, the key issue was gaining needed energy from food. For the !Kung, this meant that women predominantly gathered mongongo nuts while men hunted. Mongongo nuts were a critical and abundant resource; today, they still provide the largest portion of energy and protein for the !Kung, in addition to nutrition from game. Life was good for the !Kung, at least before their major contact with outside civilizations.

According to Lee's studies, the !Kung spend far fewer hours working each day than most people living in industrial societies, and a lot of their time is spent in leisure activities. Life for the !Kung is not quite that simple however. Desert living is constrained by the need for water and food. In their homeland of Botswana, there are relatively few waterholes and it is essential to set up camp near one of these. As a result, the !Kung periodically exhaust the food resources near their present waterhole and must move to a new water source and establish a new camp. Mongongo trees are spread around part of the Kalahari desert and initially the !Kung have a relatively easy time obtaining the food they need from relatively short excursions from their camp. As time goes on, however, they deplete the nuts within easy reach so that each day they have to make a longer and longer trip to gather enough mongongo nuts to feed their families. At some point when they have gathered all the mongongo nuts within a day's hike, they have to make a much further overnight trip to get them. This has the effect of greatly increasing their energy expenditure and lowering their energy return on investment (EROI). Their energy investment is much greater because they need a lot of food both going and coming back, and may end up eating a substantial portion of the food they set out to gather. At this point, it is usually desirable to make the investment of moving to a new water hole.

It is becoming clear that our stone-age hunter-gatherer ancestors, just like hunter-gatherers today, were truly remarkable hunters. This had the net effect of drastically reducing the populations of the large birds and mammals of the earlier world. As humans spread about the world, they encountered, in each new place, large and presumably tasty herbivorous animals of the sort that no longer exist anywhere on Earth today. For example, the new arrivals to North America roughly 12,000 years ago found giant beavers, rhinoceros, two species of elephants, camels, and many other now unfamiliar creatures. Likewise, human arrivals in Australia found giant flightless birds, while the first humans in what is now contemporary Italy encountered enormous turtles. None of these large animals are there today. Furthermore, with the exception of those in Africa, there are few animals left larger than 100–200 kg—although such sizable animals were abundant prior to human contact.

There are two competing hypotheses for what caused the extinction of those large animals. First, since the climate was warming rapidly 10,000 years ago, it is possible that they succumbed to some effect of climate change. The second hypothesis is that humans hunted these animals to extinction. These large animals had no previous reason to be afraid of anything as small and seemingly weak as a human being. The first humans could simply walk up to these animals and stick a spear into their side. Africa still has many large herbivorous species, likely because these animals coevolved with humans as they became more proficient hunters with better weapons. Wherever humans migrated, most or all of the animals larger than 100–200 kg disappeared within 2000 years, lending support to the idea that *Homo sapiens* caused these animals' extinction.<sup>42</sup> In addition, the fact that these same animal species had survived many previous climate changes lends considerable—but not absolute—support to the human-caused extinction theory. Thus, significant environmental impact is hardly a new phenomenon of the human species, but rather something that has been occurring for millennia.

### 15.3.2 African Origin and Human Migrations

All available evidence suggests that humans and their predecessors evolved in Africa. It is the only place where scientists have found human fossils and evidence dating back to 1.7–1.8 million years ago. Take a mental time trip to East Africa about 2 or 2.5 million years ago: you will be at the epicenter of human evolution. What is remarkable, however, is that you will find not one, but perhaps half a dozen types of early humans (or hominids); each group as distinct from one another as chimpanzees are from gorillas. Most of these protohominids were found in small migratory bands more or less at the transition of forests to drier savannas. In the 1990s, scientists announced that they had found what appears to be the ancestor of humans; a being who lived some 4–6 million years ago. This discovery is cause for great excitement amongst those who are determining our lineage. The creature, named *Ardipithecus ramidus* (Ardi for short), walked more or less upright but still spent a significant portion of its time in trees, similar to chimpanzees.

The Ardis had several interesting characteristics. Recent research has found that a human uses only about one quarter the energy that a chimpanzee uses to walk 100 m., so there has clearly been a tradeoff of more energy-efficient walking for the ability to both walk and climb trees well. Probably most of the Ardis made, or at least used, tools of some sort. Studies show that even chimpanzees have a rather astonishing ability to make many different types of tools, including stone anvils. Most of the Ardis' tools were made from organic materials and were, therefore, not well preserved. Hence, scientists know little about the evolution of early protohominid tool-making. It seems clear for humans, however, that by about 2.5

---

<sup>42</sup>Sandom et al. (2014), p. 2, Martin (1973).

million years ago, they had developed skillful methods for making stone knives and spear points, such as by striking one rock on another in repeated, often sophisticated, patterns. There are even a number of ancient “industrial complexes” in, for example, Kenya’s Olduvai gorge, which has become a rich hunting ground for information about our ancestors.

The development of tools is one of the factors setting Ardis and chimpanzees apart. Spear points and knife blades are energy-concentrating devices that allow the strength of a human arm to be multiplied many times. This, in turn, allowed humans to exploit many new animal resources, and eventually colonize cooler lands. Human ancestors were using stone tools for roughly two and a half million years, which is equivalent to about 100,000 human generations. By contrast, humans have been using metal tools for roughly 8000 years, or about 400 generations. Most of human history, therefore, has been without metal tools. Early copper and bronze tools were probably not much more effective than well-made rock or bone tools. In time, however, these tools became much more effective as their design and technology improved. An important reason behind the slow transition to metal tools is that stone tools could be made with a small energy investment (essentially human muscle power). Metal tools, on the other hand, required heat, which meant a much larger human investment of cutting trees, making charcoal, and finally making the tool itself.<sup>43</sup> Early smelting was probably technically inefficient, but it had the advantage, at least initially, of the availability of very high grades of ore. Thus, the development of tools became increasingly sophisticated. These stone spear points and knife blades were more or less the first in a long series of technological advances that helped increase the flow of energy to humans. The consequence of these tools is that they greatly expanded the ability of humans to exploit various plant and animal resources in their environment. They also diversified the climates in which humans could live by enabling them to kill large animals and use their skins for clothes.

Another important new energy technology was that of fire. While it naturally allowed people to stay warm in cooler climates, it more importantly increased the variability and utility of plant foods: cooking broke down the tough cell walls of plants, for example, and made them more digestible.<sup>44</sup> Following the discovery of this “technology” a little less than two million years ago, many humans left the relatively benign climate of Africa. Before long, the remains of both humans and their tools ended up in present day Middle East, Georgia and Indonesia. By one million years ago, human remains were common all throughout Asia. However, humans did not colonize Europe until roughly 500–800 thousand years ago. The first humanoid colonists of Europe are likely not our direct ancestors, for morphologically modern humans<sup>45</sup> appear to have left Africa in a separate migration only about 100,000 years ago. There are very strong debates in anthropological literature

---

<sup>43</sup>Perlin (1989), Ponting (1991).

<sup>44</sup>Wrangham (2009).

<sup>45</sup>Popularly known as “Cro-Magnons,” and distinct from the earlier “Neanderthal” stocks.

as to whether all of these groups of people are the ancestors of modern humans or just the “Cro-Magnon” variety, but modern DNA analysis seems to favor the separate stock concept. For whatever reason—perhaps interracial warfare, climate change, or some indirect result of competition—the Neanderthal stocks were eliminated from Europe by 35–40,000 years ago, along with many other protohominid variations, leaving, it seems, a few of their genes with those of European stock. In sum, the evolution of humans is an important precursor to understanding how agriculture evolved.

### ***15.3.3 The Dawn of Agriculture: Increasing the Displacement of Natural Flows of Energy***

Some time roughly 10,000 years ago, in the vicinity of the Tigris and Euphrates valleys of present day Iraq, a momentous thing happened. Humans, previously completely constrained by their limited ability to exploit natural food chains (due to the low abundance of edible plants in natural systems), discovered that they could increase the flow of food energy to themselves and their families by investing some of the seeds that might otherwise be eaten into more food for the future. How this happened can never be known for certain.

The implications of agriculture development for humans were enormous. The first, seemingly counterintuitive, consequence of agriculture is that human nutrition declined. Studies of bones of people buried over the past 10 thousand years in Anatolia, which is the area roughly encompassing the border region of modern day Turkey and Greece, revealed the height and general physical condition, as well as their nutrition status of the people who used to live there. The data indicates that the people actually became shorter and smaller with the advent of agriculture, indicating a *decrease* in nutritional quality (see footnote 27). In fact, the people of that region did not regain the stature of their hunter-gatherer ancestors until about the 1950s. Therefore, although agriculture may have given the first agronomists an advantage in terms of their own energy budgets, that surplus energy was translated relatively quickly into more people with only an adequate level of nutrition as human populations expanded. Or perhaps, as outlined below, more of the farmers’ net yield was diverted to artisans, priests, political leaders, and war, leaving less for the farmers themselves. One of the clear consequences of agriculture was that people could settle in one place, so that the previous pattern of human nomadism was no longer the norm. As humans occupied the same place for longer periods of time, it began to make sense to invest their own energy into relatively permanent dwellings, often made of stone and wood. This start of the construction of the durable human structures have left significant artifacts for today’s archeologists and show some of the implications of agricultural development.

Another significant consequence of agriculture was the enormous increase in social stratification, which took place as economic specialization became more and

more important.<sup>46</sup> For example, if one individual was particularly skilled at generating agricultural yield or understood the logic and mathematics (i.e. best planting dates) of successful farming, it made sense for the farmers of the village to trade with him some of their grain for knowledge, thereby initiating, or at least formalizing, the existence of markets. From an energy perspective, relatively low-skilled agricultural labor was being traded for the high-skilled labor of the specialist. The work of the specialist could be considered of higher quality in terms of its ability to generate greater agricultural yield per hour of labor. Considerable energy had to be invested in training that individual through schooling and apprenticeships. The apprentice had to be fed while he or she was relatively unproductive, in the anticipation of greater future returns. The energy return on investment (EROI) of the artisan was higher than that of the farmer (even if less direct), and as a result, so was his pay and status. Thus, social stratification was directly linked to agriculture and changed ancient societies tremendously.

Eventually, the concept of agriculture spread around Eurasia and Africa but resource depletion followed shortly thereafter. Another new phenomenon appeared with the development of agriculture: cities and other manifestations of urbanization. The first area this occurred appears to be in the Tigris Euphrates valleys in one of the first cities ever known, Ur.<sup>47</sup> This was roughly 4700 years ago, and there were many great cities in that region, including Girsu, Lagash, Larsa, Mari, Terqa, Ur and Uruk. These cities grew up in heavily forested land, as signified by the massive timbers in remaining ruins. Today we call that ancient civilization Sumeria and the people Sumerians but there are essentially no trees or cities left in that region. In fact, the forests were gone by 2400 BC, the harbors and irrigation systems were silted in, the soil became depleted and salinized, and barley yield dropped from about 2.5 tons per hectare to less than 1 ton. By 2000 BC, the Sumarian civilization was no longer extant. The world's first great urban civilization used up and destroyed its resource base and disappeared over a span of 1300 years.<sup>48</sup> Consequently, resource depletion turned out to be one of the reasons why entire civilizations and cities became extinct.

The interaction of people with cultivars,<sup>49</sup> in turn, greatly changed the plants themselves. Notably, all plants are in constant danger of being consumed by herbivores, ranging from bacteria, to insects, to large grazing or browsing mammals. In the planet's history, herbivorous dinosaurs predated today's mammals. Thus, the evolutionary response of plants to this grazing pressure was to develop various defenses, such as the physical protection of spines, which are especially abundant in desert plants. More common, however, was chemical protection in the form of alkaloids, terpenes, and tannins. These compounds place a heavy burden on

---

<sup>46</sup>Diamond (1999).

<sup>47</sup>The word "urban" is actually derived from the ancient city Ur.

<sup>48</sup>See Perlin (1989), Michener (1963), and Tainter (1988), who tell these stories in fascinating detail.

<sup>49</sup>Cultivars are plants that humans cultivate.

herbivores (or potential herbivores) by discouraging consumption or by requiring a high-energy cost to detoxify poisonous compounds. Humans do not like these frequently bitter, poisonous compounds either. For thousands of years, humans have been, therefore, preferentially saving and planting the seeds from plants that taste better or have other appealing characteristics. Partial exceptions include mustards, coffee, tea, cannabis, and other plants, that provide bitter alkaloids which would be poisonous if they were all that humans consumed, but present curious, interesting, or otherwise alluring dietary supplements in small doses to those humans who like them. Consequently, however, cultivars have poor defenses against insects and often require the use of external pesticides—a technology that has complex environmental and biological consequences. Many cultivars would not survive in the wild now, and have coevolved with humans into systems of mutual dependency. Meanwhile, all kinds of pests are themselves adapting to the concentration of humans, often with disastrous impacts to humanity. Humans have nevertheless survived, prospered, and multiplied, especially since the industrial revolution. Thus, the co-dependency of plants and humans is another aspect of the evolution and development of agriculture.

Other highly impactful energy-related events occurred during these prehistorical times. The domestication of animals may be one of the most significant developments. While some aspects of animal domestication predate agriculture, most domestication occurred more or less simultaneously with the inception of agriculture. Animal domestication and the increased sophistication of animal husbandry were critically important in increasing energy resources for humans in at least two important ways: First, for the reason that these animals ate plant material that humans did not eat, this greatly increased the amount of energy that humans could harvest from nature, especially in grasslands. Second, oxen and horses markedly increased the power output of a human.

The story of how the use of animal technology passed throughout Eurasia was critical in facilitating this transference. In fact, the majority of domestic animals came from Eurasia and could be moved East to West much more easily than North to South. Humans' most important animals included sheep, cows, horses, pigs and chicken. They were "corralled" in Eurasia by virtue of the area's geography, and consequently evolved into today's domestic animals. The increasing familiarity with beasts of burden, along with the development of roads and caravan technology, in turn, allowed for the expansion of long distance trade. Humans refined and passed on sailing and navigational skills, enriched agricultural knowledge and the biotic resources of many human groups.

As agriculture, settlement, and commerce expanded, a greater need for maintaining records arose. Some time around 3000 BC, humans developed formal writing, seemingly simultaneously in Egypt, Mesopotamia, and India. Writing had many societal implications, but perhaps most importantly, it allowed for agricultural and other technologies to be passed from one generation to another and transferred among cultures. These old records have also allowed scientists to estimate earlier patterns of human population changes and they suggest that the pattern of human population is hardly one of continuous regular growth; rather, it is

one of periodic growth followed by decline. Sometimes this is manifest as a catastrophic drop in, and disappearance of, a particular population; or, more commonly, the demise of the political structure that once held them together. Edward Deevy suggests that there were three main historical increases in human populations: first, the corralling of animals; second, the development of agriculture; and third, the industrial revolution. We are still experiencing the last phase as global human population growth continues strongly, although at a lower rate than in earlier times. Commerce, nonetheless, continues to shape agriculture and international trade in an increasingly globalized world may have some of the greatest impacts on food law and policy.

### 15.3.4 *Human Cultural Evolution as Energy Evolution*

Most of the major changes in terms of humans' ability to exploit natural resources are associated with increased use of energy. Spear points and knives are, for example, energy concentrating devices; fire allows greater availability of plant energy to humans; agriculture significantly increases the productivity of land for human food; and so on. The evolution of humans' ability to control energy—such as through the harnessing of wind and water power—is best described in Fred Cottrell's book *Energy and Society*, which was published more than half a century ago.<sup>50</sup> Cottrell's focus was on the development of what he called "converters," i.e. specific technologies for exploiting new energy resources. As Cottrell shows, technological change is usually associated with an increase in the quantity or quality of exploited energy.

Cottrell's early chapters focus on herding as a means of exploiting biotic energy,<sup>51</sup> water power, and wind power. He shows the historical importance of situating cities downstream on a river so that the natural flow of the water allows citizens to easily exploit all upstream resources such as, timber, agricultural products, game, and ore. Through the use of barges, humans' carrying capacity upstream and downstream increased.<sup>52</sup> Likewise, the development of sailing ships increased the energy efficiency of a human porter enormously, and, according to Cottrell's calculations, the early sailing ships generally increased the load that a human could carry by a factor of 10; and by late Roman times it was as much as 100. The Romans needed to import large quantities of grain from Egypt,<sup>53</sup> in part because they had

---

<sup>50</sup>Cottrell (1955).

<sup>51</sup>Biotic means living parts of an ecosystem. In contrast, abiotic mean chemical or physical, non-living.

<sup>52</sup>The Nile is an exception, for the winds tend to blow north to south while the water flows south to north, so dhows could go both ways.

<sup>53</sup>Contrary to popular belief, Caesar and Mark Anthony were not in Egypt for Cleopatra—the real target was grain from continuously replenished flooding soil.

depleted their own soil. According to Cottrell, however, they were not the only ones who coveted grain and, initially, the Romans lost a lot of their supply to pirates. This required the Romans to transport the grain in heavily guarded narrow warships, while the soldiers on board consumed a significant portion. Therefore, another energy investment had to be made by the Romans, namely clearing the Mediterranean of pirates. With this accomplished, they adopted the use of wide-beamed merchant vessels, and Egypt became a significant net energy source for the Romans. Cottrell gives many other examples of the increasing use of energy by humans over time, including noteworthy chapters on the rise of industrial agriculture, steam power, and railroads in England. What all of these examples and developments have in common is humans' dependence on energy and the central role it plays in human development.

### ***15.3.5 Industrial Agriculture***

The next great leap forward in agriculture came in the twentieth century, when an increasing use of cheap fossil fuels, along with technological advancements, brought about a dramatic transformation of agriculture. It was the enormous surplus energy derived from fossil fuels (coal, oil, and natural gas), that made this development possible while 20–100 or more units of energy could be returned per unit invested. The high EROI (Energy Return on Investment) allowed surplus energy to be invested in agriculture and other industries, thus generating surplus wealth and boosting profit margins.

Between 1900 and 1970, the western world's shift from human and animal labor to predominantly mechanized labor changed the EROI of agriculture. In traditional cultures, 5–50 kcal of food were obtained for each kcal invested; by 1970 just one kcal of food was obtained for every 5–10 kcal of total invested energy (fossil and human labor), including transport and processing.<sup>54</sup> White hypothesized that the development of human societies is constrained ultimately by their ability to generate surplus energy, including food. This ability is a function of the quality of available energy and energy transformers (technology). Over the long run, the quality of available energy is determined by the amount of energy needed to return the next unit of energy. During this period, fossil-fuel-driven tractors and other machines replaced the labor of humans and draft animals. In the nineteenth century, up to 75 % of the U.S. labor force worked on farms. By the end of the twentieth century, it was less than 2 %. Astonishingly, far fewer Americans were working on farms in 2000 than in 1840, even though the American population is so much larger today. The increase in agricultural productivity is due primarily to the use of fertilizers and pesticides, along with the development of new varieties of crop plants. All of these shifts in energy use were made possible through the use of fossil fuels.

---

<sup>54</sup>Steinhart and Steinhart (1974), p. 307.

Perhaps the most important change in energy production is the development of the industrial Haber-Bosch process, which converts atmospheric nitrogen gas into ammonia. Up until 1908, crop plants were severely limited by the availability of nitrogen. This is true even though 80 % of the atmosphere is nitrogen ( $N_2$ ). This nitrogen, however, is very difficult for most plants and humans to access due to the triple bonds in the di-nitrogen molecule ( $N\equiv N$ ). Until Fritz Haber developed the Haber-Bosch process, only the tremendous energy of lightning or some very select algae and bacteria could break these bonds. Haber, in one of the most important scientific discoveries ever made, found that by heating and compressing air mixed with natural gas and using the right catalyst, the  $N_2$  molecule could be split and turned into ammonia ( $NH_3$ ). This, in turn, could be combined with nitrate (itself created by oxidizing ammonia) to generate ammonium nitrate, which is the basis for both gunpowder and fertilizer. The Haber-Bosch process requires significant energy input, but its development freed humans from the limits of natural processes such as manure fertilizing. Arguably, this freedom led to dangerous environmental consequences that may have been averted but the abuse of fertilizers through the industrial agricultural industry is beyond the scope of this chapter.

The Haber-Bosch process took off in 1946 at the end of World War II. As there was no further need for massive amounts of war explosives, the U.S. Federal Government asked whether there might be a different use for the weapons factories. The answer came from agricultural colleges: the technology could be used to significantly increase agricultural yield. This “industrialization of agriculture” freed food production from its former dependence upon manure fertilizers. With the concurrent development of machinery, far fewer Americans were needed to grow food. This shift in labor division created an exodus to the cities and led to the growing number of urban industrial jobs. Meanwhile, the increased use of oil, gas, and coal generated greater material wealth for workers. Thus, America changed from a relatively poor, agriculturally-based country into an increasingly industrialized and urban one while becoming enormously wealthy in the process. The net energy required for this economic work was increasing exponentially. The great increase in wealth prompted economists to develop theories to explain the economic forces behind this growth. And yet, interestingly, among those chronicling the process there is essentially no mention of energy as a catalyst for these changes.

The large agricultural yields generated by fossil-fuel-led agriculture allow a large surplus of energy, including food energy, to be delivered to society. In turn, this transfer allows most people and capital to be employed somewhere other than the energy industry. These energy surpluses, in other words, have helped to develop all aspects of our civilization—good and bad. The same can be said for technological advances that enabled the unearthing of phosphate rock deposits. Irrigation became widespread as a result of this industrialization, allowing crops to be grown in arid and semi-arid areas. The Central Valley of California is perhaps the best-known region where irrigation dramatically increased agricultural production. Worldwide, crops became more homogenized and food processing more widespread. All of these changes furnished the development of the globalized industrial food system that characterizes food production today.

## 15.4 Energy Cost of Food

### 15.4.1 *Energy Production Efficiency for Agriculture in the United States*

There are four relevant studies on the energy cost of food production in the United States. Each of these studies uses slightly different methodologies but express energy cost in terms of caloric output versus caloric input. Carol and John Steinhart,<sup>55</sup> for example, calculated energy use in the entire U.S. food system using data from governmental sources between 1940 and 1970. Output in the Steinhart and Steinhart study was based on the caloric requirements of the U.S. population, rather than actual crop production. The output amounts also excluded U.S. food production exports. Inputs included direct fuel and electricity use, energy used to create fertilizer, agricultural steel and farm machinery, and energy used to run irrigation systems. Steinhart and Steinhart concluded that U.S. agricultural energy efficiency declined by about threefold from 1940 through 1970, as tractors replaced animal power and farmers used more commercial fertilizers. In the end, agriculture was providing a return of less than one energy unit of food for one energy unit of fuel (even at the farm gate), and less than one unit of food for three units of fuel by the time the food reached the plate.

In another study, Cutler Cleveland examined the energy efficiency of food production in 1995.<sup>56</sup> Cleveland derived energy inputs and outputs from economic data and was thus able to make calculations from as far back as 1910. He determined the energy content of agricultural inputs by converting the dollar value of fossil fuel and electricity consumption, along with other farm input expenditures<sup>57</sup> to physical units at extant prices. Then, he converted these physical units to energy units using a dollar to energy conversion factor for the embodied energy in fuels using the energy intensities (kcal per dollar) derived by the energy research group at the University of Illinois.<sup>58</sup> Cleveland calculated agricultural output using two data sources: first, with the USDA index of total agricultural output, which includes dollar estimates of production of crops, fruits and vegetables, and animal products; and second, with the Gross Farm Product, or the value added in the farm sector in dollars. The results of Cleveland's research show that the energy efficiency of U.S. agriculture declined from about 5.5 calories of food energy output per one calorie of fuel in 1910 to a 1:1 ratio in 1980, leaving him in rough agreement with the Steinharts. Thus, the cost of energy to produce food could be estimated about 100 years ago.

---

<sup>55</sup>Steinhart and Steinhart (1974).

<sup>56</sup>Cleveland (1995), pp. 111–121.

<sup>57</sup>These include pesticides, fertilizers, machinery, energy used to generate electricity, and agricultural services.

<sup>58</sup>Herendeen and Bullard (1976), p. 383; Hannon et al. (1985).

The authors of this chapter have also summarized the energy it takes to grow food in the U.S. and Canada in recent decades using mainly physical data.<sup>59</sup> This study found that about two percent of all energy used in the United States goes towards growing crops. Pimentel and his colleagues<sup>60</sup> estimated that about 17 % of U.S. energy use goes into the entire food system, including growing, transporting, and preparing food, each sector consuming about one third of this total energy. We also found that the “Edible Energy Efficiency” (EEE) of U.S. agriculture has actually more than doubled from 0.8:1 in 1970 to 2.2:1 by 2000, followed by a slower increase to 2.3:1 by 2009. The energy efficiency of the agricultural sector in Canada has not changed appreciably since 1980, and has remained at about 2:1 from 1981 to 2009. The authors’ study found that EEE improvements in the U.S. can be attributed not only to increased crop production *per* hectare and lower direct fuel consumption, but also to the increased use of less energy-intensive corn and changes to the diet of livestock.<sup>61</sup> Increases due to technological progress alone appear small for the last several decades, at less than 1 % a year.<sup>62</sup> In sum, although efficiency initially fell as agriculture was industrialized, technological advances in recent decades mean that efficiency has now stabilized or increased slightly.

Notably, there are several contributors to agricultural energy use. The production of N fertilizer contributes about 40 % of all energy used; on-farm fuel use requires 30 %, followed by K<sub>2</sub>O (7 %), lime (6 %), the transportation of inputs (6 %), P<sub>2</sub>O<sub>5</sub> (5 %), seed (5 %), herbicide (4 %), drying (2 %), and insecticide (1 %).<sup>63</sup> Energy use is lower for legume crops because they fix atmospheric N, and therefore do not require energy-expensive N fertilizer. How these contributors of energy use affect the food system is described in the following section.

### ***15.4.2 The High (Energy) Cost of Meat, Dairy, and Processed Foods***

The production of meat, dairy, animal products and processed foods is significantly more energy-intensive than plant-based food production. It is, therefore, important to appreciate the energy that is invested in producing the various types of foods. Grains, for example, are the most productive agricultural product.<sup>64</sup> Yields can be anywhere from 1 to 10 tons per hectare, and occasionally more. Temperate yields

<sup>59</sup>See Hamilton et al. (2013), p. 1764.

<sup>60</sup>Pimentel et al. (1989).

<sup>61</sup>For instance, increased use of meals and other by-products, which reduce the grain demand by livestock.

<sup>62</sup>See Hall et al. (2009a), pp. 25–47; Hamilton et al. (2013), pp. 1764–1793.

<sup>63</sup>Camargo et al. (2013) p. 263.

<sup>64</sup>This is due to their efficient photosynthetic pathways.

tend to be higher than tropical, despite the longer growing season that tropical farmers enjoy. This is because the soil has lower nutrient levels and the longer nights consume more energy. Since people need a minimum of 1 kg of food per day,<sup>65</sup> anywhere from around 3 to 30 people can be supported by 1 ha<sup>66</sup> of land producing grains. The number of people fed per hectare of land will be significantly less if the crop is first fed to animals. This is a significant argument why vegetarianism, and even more specifically, veganism, makes for a more sustainable diet and leaves a lower environmental footprint than a diet rich in animal products.

In areas of the world with high human densities, such as India and China, the majority of people eat only grains, such as rice. Indeed, this grain-based diet is similar for poor people around the world. Energy yields per hectare of vegetables or animal products tend to be low; at best between one quarter and one half of energy invested, but more frequently the yields are as low as ten percent of the total invested energy per hectare. The conversion efficiency of plant to animal flesh is in fact only 10–20%.<sup>67</sup> Despite this poor energy efficiency, animals can use lower quality, less productive land where it would otherwise be expensive or impossible to grow crops. This is readily observed in much of the world where wetter land is used for crops and drier land is used for pastures.

According to Pimentel and Pimentel,<sup>68</sup> farmers in the US raise and care for nine billion livestock in order to meet the animal protein demand by humans each year. Indeed, the total numbers of livestock are estimated to be some five times the U.S. human population. About 124 kg of meat is eaten per American per year. The average meat-eating diet consists of 35% beef, 25% pork, 39% poultry, with the remainder made up of other meats. Americans also consume protein in the form of milk, eggs, and fish. In terms of the energy efficiency conversion, livestock must consume six units of plant protein for each unit of animal protein that they produce.<sup>69</sup> Thus, in terms of producing food for the world, the reliance on animal products reduces efficiency, productivity, and, as a side-note, causes substantial health concerns for human consumers and dangers for the environment.

### ***15.4.3 Energy Distribution and Delivery: Food Miles***

Researchers estimate that roughly equal amounts of energy are used in delivering food to the consumer as to grow it.<sup>70</sup> With the globalization of agriculture and other sectors of the economy, this quantity has almost certainly grown. A study at Iowa

---

<sup>65</sup>Or 365 kg—roughly one third of a ton—per year.

<sup>66</sup>1 ha = 2.54 acres.

<sup>67</sup>The conversion is expressed in a “calories to calories” ratio—be careful not to equate this with weight because of varying moisture contents.

<sup>68</sup>Pimentel and Pimentel (2003).

<sup>69</sup>Pimentel and Pimentel (2003), p. 660S.

<sup>70</sup>Pimentel personal communication (on file with the author).

State University estimates that in the U.S. the average food item travels 1500 miles before it reaches the consumer.<sup>71</sup> There is also a growing movement toward locally-sourced food to reduce food miles, although the energy consequences of this movement have not been clearly evaluated yet. Syracuse, New York, for example, has a large and vibrant farmer's market. And yet, we observed that to deliver food locally to the farmer's market<sup>72</sup> would use as much delivery energy per kilogram of food as products delivered to grocery stores from 300 miles away in a full semi-truck<sup>73</sup> which can carry 50 times more food.<sup>74</sup> There are many good reasons to eat locally, but the extent to which transportation energy and overall food miles are actually saved in doing so need to be examined more carefully for conclusive evidence to support any one hypothesis of the sustainability of eating locally.

#### 15.4.4 *The Developing World*

In the last decade, scholars have started to examine agricultural energy use in the developing world. For instance, Hamilton et al.<sup>75</sup> reviewed existing studies of agricultural energy efficiency<sup>76</sup> for developing nations. Cao et al.<sup>77</sup> found that the energy ratio for agriculture in China decreased by 25 % from 2:1 in 1978 to 1.5:1 in 2004, largely due to increases in fossil fuel use that outpaced food production. According to this study, for every two units of fossil fuel invested, there is a yield of approximately one unit of food energy although this ratio declined from 1990 to 2004. By contrast, Karkacier et al.<sup>78</sup> found a positive relationship between increasing an index of energy consumption and agricultural output in Turkey, with each additional ton of oil increasing an index of agricultural output by 0.167 units. Other studies looking at edible energy return on investment (EROI) have been conducted on national and international levels for specific crops such as rice. Pracha and Volk (2011) performed an analysis of the edible EROI for Pakistani rice and wheat from 1999 to 2009. The authors found that the average EROI was 2.9:1 for the edible portion of wheat, and 3.9:1 for rice. Going further, Mushtaq et al.<sup>79</sup> calculated EROI values for rice in eight nations and found that the EROI varied from 4:1 to 11:1 (which includes the energy stored in straw), and from 1.6:1 to 5:1 when including only the edible portion. Overall, it appears as though the efficiency of turning

---

<sup>71</sup>Pirog and Benjamin (2003), p. 1.

<sup>72</sup>“Local” meaning 30 miles away, and with a truck getting 15 miles per gallon.

<sup>73</sup>Which gets only 7 miles per gallon.

<sup>79</sup>Mushtaq et al. (2009).

petroleum into food does not vary significantly between more and less developed nations, at least when production is dominated by the use of fertilizers and some machinery. The world is indeed globalized.

### 15.4.5 Waste

Although the efficiency of delivering food to the consumer has improved slightly in the U.S., waste remains prevalent throughout the food system. Some researchers<sup>80</sup> estimate that 27 % of food produced on American farms ends up as waste and is not consumed. More recent estimates, however, put food waste as high as 40 %, or some 1400 kcal per person per day.<sup>81</sup> Since agriculture requires such high quantities of water, this waste equates to one quarter of U.S. freshwater consumption and approximately 300 million barrels of oil.<sup>82</sup> While the reasons for food waste differ between high-income and low-income nations, post-consumer waste accounts for the bulk of waste in the U.S., while in lower income countries food waste/spoilage tends to occur before it is distributed to the end user.<sup>83</sup> Approximately 1.3 billion tons of food produced for human consumption is wasted globally each year.<sup>84</sup>

## 15.5 Challenges of Sustainable Agriculture in the US

It is no secret that the US has very high energy demands in its agricultural sector. Certainly, both Howard Odum's 1971 piece, *Potatoes Partly Made From Oil*,<sup>85</sup> and David Pimentel's early studies helped to raise awareness about this issue. Initially, most agronomists paid little attention and were generally dismissive that such problems were important. Nonetheless, there has been a large public response to the environmental concerns about agriculture, although these tend to focus on chemical threats to the health of humans and wildlife. Today, reducing energy use has become the goal of many agronomists.

While the general public response is much too broad to summarize in this chapter, it seems fair to say that the most typical responses are summarized with the word "sustainable." For instance, "sustainable health", "sustainable production systems", "sustainable farming or consuming cultures", "sustainable energy", and other terms, are at the centre of public discussions. Generally, as with most issues

that appear in popular environmental literature, there is very little quantitative analysis. Certainly, Hamilton et al.'s findings<sup>86</sup> that U.S. agriculture is becoming somewhat *more* efficient, even as it is dominated by corporate and market forces, would likely surprise many people. Ironically, the largest single barrier to improved efficiency is the large U.S. governmental plan generating ethanol from corn as a replacement for gasoline. This program produces little, if any, net energy by the time the fuel goes into the vehicle,<sup>87</sup> and its existence is clearly based on a political strategies that have trumped current scientific data, which fail to support ethanol as an energy-efficient alternative to gasoline. Problems with the ethanol program include the removal of a substantial amount of food from a hungry world, enormous soil erosion, loss of wildlife habitat, and a net addition of carbon into the atmosphere. Since the land used for ethanol production tends to be the best corn land in the U.S., such as in Iowa, for example, the ethanol crops displace the remaining corn production to sub-optimal habits, such as in Minnesota and Texas. This replacement of crop land results in increased energy costs for American commodity production, such as Cornflakes and bacon. A recent program proposed by the U.S. Navy to fuel a large proportion of its ships and even airplanes with biofuels, nominally to improve energy security and efficiency, has completely flopped based on the enormous price and poor availability of such huge quantities of biofuels, in turn caused by their very low EROIs.

### ***15.5.1 Policy Constraints and Promotion of Sustainable Agriculture***

Sustainable agriculture movements, at least from the perspective of protecting soil and water resources, are becoming increasingly common in the US. This is exemplified by the rise of state and county soil conservation districts, agricultural colleges, and young people who are expressing an interest in the agricultural future of America. Probably the largest impact in terms of sustainability comes from the encouragement of no-till agriculture campaigns, whose goal is to disturb the soil cover as little as possible during planting and cultivation.

Certainly there is much popular and governmental lip service toward generating sustainable agriculture, and even some state and local policies that address it directly. And yet, most lawmakers are reluctant to act, resulting in the non-policy of leaving agricultural sustainability decisions to the market. What impact this may have on long-term environmental health is impossible to ascertain but gives many scholars reason to worry about the immediate and long-term consequences of allowing the industry-dominated status quo to continue. Leaving this issue to the market, which searches for the lowest production price as a matter of course, will argue against protecting the soil and continue to deplete the planet's resources.

---

<sup>86</sup>Hamilton et al. (2013).

<sup>87</sup>See, for example, Patzek (2004), Murphy et al. (2011), p. 179 and Conway (2007).

Techniques to prevent soil erosion, such as cover crops and erosion barriers, are crucial to maintaining soil health, the foundation of intact agriculture. However, these techniques require money to implement and stand in the way of short-term industry revenues that externalize the cost to the environment beyond market prices. (For more on the externalities of agriculture, see *Textbox: Internalizing Ecological Externalities*).

Another policy with significant environmental impact is the current production of huge amounts of corn-based ethanol. For the reason that corn is a highly soil erosive crop and ethanol production systems are characteristically placed on the best farmland, continued focus on ethanol production will have an enormous impact on the future of agriculture in the United States. How these larger national policies stack up against state and regional programs is impossible to calculate or predict with precision. It is imperative, however, to implement better policy to support sustainable agriculture, to protect the environment, to internalize the negative externalities of industrial agriculture, and to promote diets with lower environmental footprints. While there is much rhetoric on these issues we see precious little quantification of actual results, for example along the line of Cleveland (see footnote 54) and Hamilton et al. (see footnote 57).

### ***15.5.2 Urban Agriculture***

The common conception of agriculture is that of a rural enterprise. Indeed, the vast majority of food production comes from rural farms. There are exceptions, however, the most notable of which originated from Will Allen and his colleagues in the city of Milwaukee. Allen is a former professional basketball player from Milwaukee, who, at the end of his basketball career, returned to the city where he sought out his wife's parents' farm, which had been the site of many happy childhood memories. In the intervening years, the city had essentially expanded around the farm. Allen came up with an inspired idea: bringing more farms into the city.

Allen created a series of clever approaches, including making new soil, because the old soil in the city was polluted with industrial wastes, by combining old coffee grounds with city-generated wood wastes and discarded supermarket food. He placed this new soil mixture in plastic hoop houses to heat while it evolved into excellent compost; following that, it was used for growing crops on tables. This entire enterprise was coordinated with local residents including children, who were encouraged to grow and sell their own produce. As a result, vacant lots in the inner city started producing affordable and highly nutritious food. This entire effort was propelled by Allen's enormous charisma in a movement called "growing power", and it was eventually exported to Chicago and other cities around the U.S. Similar projects are springing up in many places. How much impact all this will have in the future remains to be seen, but it is certainly one of the most exciting new ideas we have seen. How many future farmers of America are now inner city kids? On a smaller scale we recommend Mel Bartholemew's (2006) book "Square foot

gardening” (2nd edition) for another innovative way to personal low energy food production.

The full potential of urban agriculture remains to be seen, but it is certainly one of the most exciting new ideas on the rise. Cities, such as Baltimore, Washington, D.C., Pittsburgh, and New York are also starting to have more and more urban agriculture, including the White House bee hive.<sup>88</sup> Urban agriculture has the potential to create a sense of community, to raise awareness of sustainable agriculture, to reduce inner-city food deserts, to reduce food miles, and to feed populations. Although urban farms are limited in space, their potential exceeds the mere premise of food production and has potential to counter industrialized areas through some positive green space with tremendous potential to have positive impacts on agriculture.

### ***15.5.3 Case Study: Syracuse and Onondaga County***

Syracuse and Onondaga County provide an example of a geographic region that could decrease its environmental footprint by switching to a plant-based diet. A 2012 study by Balogh et al. quantified the food demand, production, and footprint for this small city and its surrounding county<sup>89</sup> over the past 100 years. Farms in this region have increased their caloric output since the 1930s despite a consistent decline in the overall area dedicated to farming. This can be attributed to increasing yields and the shift to more productive crops, as well as the increased inputs of fertilizers and energy more generally. They found that, from current farmland, the county could meet only 15 % of its food demand. Each year, the existing farms use energy equivalent to approximately 1.2 million barrels of oil. Furthermore, the county residents would require the equivalent of an 2.5 million barrels of oil per year to feed the local population solely from locally produced food. Transportation alone makes up 11 % of this annual energy demand. If the county were able to produce half of the food demanded by its residents, transportation energy could be reduced by 43 %. Larger reductions in energy consumption could be achieved by a shift to a low meat<sup>90</sup> or vegetarian diet. Two-thirds of county residents could be fed a vegetarian diet from the land that is currently under agricultural production. Despite this potential, it would require an area of farmland nearly twice the total size of the county, given the current meat consumption levels of the area’s residents.

<sup>89</sup>Total population: 450,000. Based on Balogh et al. (2012).

<sup>90</sup>In this case, consuming meat once per week.

### 15.5.4 Case Study: Jevons' Paradox

Technology is usually seen as advancing and improving efficiency in different areas, such as food production or healthcare. In the past, most technological advances came from applying more fossil energy to the problem at hand, which ranged from fertilization of exploited soils, pesticide-treatment of GMO monocultures and similar unsustainable practices. Although, more recently makers of technology are attempting to use less energy, agricultural and biotechnology, however, is a double-edged sword, the benefits of which can be substantially blunted by Jevons' Paradox. This paradox centers on the idea that increases in efficiency often lead to lower prices, which, in turn, encourage greater use of the product in question.

Jevons<sup>91</sup> found that more efficient steam engines, which had been designed to use less coal, were cheaper to run and so that people used them more. A contemporary example is that more fuel-efficient automobiles tend to be driven more miles in a year and hence may consume greater energy resources overall. Likewise, Eva Alfredsson<sup>92</sup> found that, in Sweden, those who followed a lower-carbon, less energy-intensive diet saved money and tended to take vacations further away, often emitting as much or more carbon dioxide—essentially, using more energy—than they saved with their “green” diet.

Thus, without clear and distinct data to educate consumers and policy makers about what a truly sustainable diet or lifestyle represents and how it can be achieved, many practices intended to conserve resources will backfire and feed hypocritical greenwashing.

### 15.5.5 The Need for Quantitative Analysis

The current information gaps and lack of reliable predictions into the future of energy in the food system can be addressed through sound solution-oriented environmental science. There are countless examples of “greener” approaches to agriculture and food production, but on closer quantitative examination the benefits of these methods are ambiguous at best.<sup>93</sup> When it comes to “sustainability,” there seems to be a deficit of hard, quantitative analysis in most U.S. national assessments, as well as in the research taking place at American colleges. Much of the authors' work has been to educate young people who think they already know the answers, when, most often, neither they nor their instructors actually have any of the answers. Many of students, for example, are anti-fracking, or anti-coal, or anti-nuclear or anti-something else. How we are going to balance the human

---

<sup>91</sup>Jevons (1865).

<sup>92</sup>Alfredsson (2004).

<sup>93</sup>Alfredsson (2004).

population's energy expectations remains to be seen. Nonetheless, in educational institutions, however, whatever the name of the program, it is crucial to teach "environmental science" and not just "environment" so as to properly educate students how to generate and test hypotheses, how to perform quantitative assessments, how the natural and social sciences are connected, and other important skills that will equip them to critically analyze how to best meet their country's future energy needs.

Government agencies and non-government organizations should strive to perform comprehensive systems-based analyses of current food production. These studies should include connections to the larger-scale global system as well as the impact on smaller-scale regional and individual agriculture production. Moreover, the studies should examine economic impacts, but should also be grounded in the biophysical reality in which agricultural systems exist—taking into consideration, for instance, a nation or region's stocks of freshwater and soil, as well as whether and how access to energy resources changes dynamically over time. It is important for the U.S. to have a well-funded National Institute of Agricultural Assessment where these issues can be studied thoroughly, independently, and objectively. Careful and thorough quantitative analyses are, in environmental science, the first step to creating policies that preserve the long-term health of the environment and ensure sustainable agricultural production. Legislation and policy can only yield effective solutions if it is grounded on sound environmental science.

### ***15.5.6 Phosphorus: The Ultimate Limiter?***

Plants need more than nitrogen fertilizer to survive and grow—especially in light of the often excessive use of artificial fertilizers in conventional agriculture. Phosphorous and potassium are critical too, as well as smaller quantities of sulfur, molybdenum, and perhaps a dozen other essential plant nutrients. When nuclear scientists Goeller and Weinberg examined the entire periodic table, they found that for all of the elements necessary to civilization, there is a substitute. For example, aluminum wires can substitute for copper; the Haber process can use energy to create substitutes for organic sources of nitrogen. Goeller and Weinberg found one exception, however: phosphorus.<sup>94</sup>

Phosphorus is essential for plant growth and life in general. However, it is somewhat rare and there is no substitute for it in plant metabolism. In the paraphrased words of geochemist Edward Deevey some five decades ago, "there is something peculiar about the geochemistry of the Earth today that life is so dependent upon phosphorus but it is now in such short supply."<sup>95</sup> In other words,

---

<sup>94</sup>Goeller and Weinberg (1976).

<sup>95</sup>Deevey (1960), p. 194.

life on earth may have initially evolved when phosphorus was more abundant. Today, most phosphorus comes from mines in Florida or Morocco, or is mined in the Western Sahara. Much of this phosphorous goes on a non-renewable trip from mine, to ship, to fertilizer bag, to crop application, to the crop itself, to animals, to humans, to toilets, to waterways, and finally to the ocean. The chemistry of phosphorus, therefore, is of great concern to modern economies because of its critical importance and non-substitutability for plant growth, indeed for all life. Another reason for its importance are that the main sources (in Florida and Morocco) are being increasingly depleted. Phosphorus now requires more energy to be produced and it also causes undesirable algae growths as a waste product in water bodies. With most phosphorus ending up diluted beyond recovery in the world's oceans, it is vital to invest in a better understanding our dependence on phosphorus and how to best conserve it. This means that the essential pathways of phosphorous use must not only be understood, but should also be explored in search of more sustainable and environmentally-friendly alternatives.

### ***15.5.7 Continuing Population Growth***

Thomas Malthus, who was mentioned earlier in this chapter, believed that humans would continue to have about the same number of children per female, and that this constant rate of increase would be applied to an increasing total number of families over time, thus leading to exponential growth. Malthus also believed, however, that food production would grow linearly, ultimately leading to starvation as the population outstripped food availability. Since Malthus' time, in fact, the human population and food production have both increased exponentially, with food production arguably increasing even somewhat more than the human population. The rise in food production tends to be attributed to technology, meaning plant breeding and better farm management, and especially an increased use of fertilizers and machinery. Arguably, the reasons for increased food production are indeed in large part due to industrial agriculture, but perhaps there could have been another way. Kimbrell has hypothesized that a more sustainable, less industrially intensive food production system could possibly bring about yields as great or greater.<sup>96</sup> In the meantime, we seem to be married to industrial agriculture by necessity, which is quite dangerous as human populations continue to grow and petroleum supplies seem less certain.

All of the energy inputs, ranging from water to chemicals, are based on an increasing use of petroleum in industrial agriculture and in the face of globalization. Until recently, petroleum production was also increasing exponentially—this is no longer the case and slowing growth in petroleum production and the substitution of ethanol for gasoline are causing a host of other environmental concerns for

---

<sup>96</sup>Kimbrell (2002), pp. 3–36.

modern agriculture. What Malthus' equations lacked, therefore, was a factor for the invention and enormous expansion of petroleum-based agriculture. Of course, if petroleum supplies becomes seriously constrained and good substitutes are not found, then, in the long run Malthus' predictions will prove to be correct. Thus, alternatives must be found that are less petroleum-dependent and more sustainable.

## 15.6 Conclusion

As long as conventional and intensive agriculture remain largely dependent on petroleum and as long as people fail to see the value in a locally-sourced organic whole-foods plant-based diet, true environmental sustainability cannot be achieved and agriculture will likely remain at odds with nature. In fact, many neoclassical economists, technology supporters, and empiricists argue that technological advancements will allow indefinite growth in agricultural productivity.<sup>97</sup> They postulate that new technologies, such as genetically modified organisms (GMOs) and better irrigation systems, will boost crop yields and crop efficiency. On the other hand, most economists believe that market incentives such as higher fuel prices will generate greater energy efficiency in agriculture through technical and managerial changes.<sup>98</sup> These changes could include reducing the amount of land in cultivation, thereby increasing the average quality of that land left in production, possibly increasing farm size, and reducing rates of energy use through technological improvements. Cleveland<sup>99</sup> concluded that from 1978 to 1990, U.S. agriculture made significant improvements in energy productivity through technical and managerial changes in response to higher fuel prices. By 1990, however, U.S. agricultural energy efficiency had returned to 1950s levels for a variety of reasons beyond the scope of this chapter. We need a much better assessment of energy and agriculture country by country.

Global energy resources face an uncertain future in the current post-peak and climate-challenged oil age.<sup>100</sup> Real crude oil prices have increased at least fourfold in recent decades.<sup>101</sup> As the US stands on the brink of what will undoubtedly be a significant change in how humans obtain and use energy, the uncertain future but certain price hikes (eventually) pose powerful and yet insufficient incentives for increasing energy efficiency. Therefore, it is important to determine the energy efficiency of agriculture using an energetic analysis, rather than a traditional economic cost-benefit analysis. An economically-focused cost-benefit analysis often ignores important factors, such as externalized costs to the environment and social integrity. The objective of a more complete energetic analysis should,

therefore, be to determine whether the energy efficiency in agriculture has increased substantially by region over the past several decades. Although this chapter focuses solely on human food energy produced by agriculture—as opposed to all energy produced by agriculture, which would include the energy implicit in inedible silage, fiber crops, animal bones and fuels, another objective remains to determine the amount of energy (in joules) used by each major agricultural input and to compare their individual efficiencies, to calculate the output percentage in the form of crops, meat, and livestock feed, to show the environmental impact of crops grown exclusively for biofuels, and to compare the results of this study against the results of two extant studies on the energy efficiency in the U.S.<sup>102</sup> and in other regions of the world. Such an analysis may help to determine the global energy resource availabilities, efficiencies, and vulnerabilities and whether all of the rhetoric about sustainability has obtained any real results that would compensate for depletion of soils, fertilizers and petroleum and, especially, for increased wastage, affluence and human numbers.

## Textbox: Internalizing Externalities: Techniques to Reduce Ecological Impacts of Food Production

Randy Hayes

**Abstract** Government regulation is only one technique to internalize a pollution impact (externality) from food production. When it leads to deregulation it typically does not solve the ecological impact or pollution problem.

In food production as in any other industry, externalities are market failures—“costs that are not borne by the actors in a particular transaction”<sup>1</sup>—which distort the perception of risk.<sup>2</sup> Externalities can be positive or negative. From an economist’s view, “negative externalities are costs that are infeasible to charge to not provide.”<sup>3</sup> This means that the market cannot sustain the externalization of costs without eventually failing. Although the government prefers the laissez-faire approach to a free market economy, it is a utopian ideal.<sup>4</sup> These governmental market failures generally fall into the six stages illustrated by Fig. 16.1.

The modern western food industry has proved to be such a failure because the costs of factory farming and industrial food production are externalized to the

**Fig. 16.1** The vicious cycle of market failures (This figure has previously been published in Gabriela Steier, *Externalities in Industrial Food Production: The Costs of Profit*, 3 *Dartmouth Law Journal* 9, available at: [http://works.bepress.com/gabriela\\_steier/1](http://works.bepress.com/gabriela_steier/1) and at <http://www.dartmouthlawjournal.org/archives/9.3.6.pdf> (citing Jan G. Laitos & Joseph P. Tomain, *Energy and Natural Resources Law* 21 (West 1992))). Stage 1—Free Market, is the period when there is no government intervention in an industry or market. . . Stage 2 Market Failure are externalities, such as pollution. The existence and identification of market failure become the justification for government intervention into private enterprise that moves regulation from Stage 2 to Stage 3. . . The use of inadequate or incorrect regulation creates regulatory failure, or Stage 4. . . There are two reactions to regulatory failure. In the last two stages of the regulatory life cycle, either [the] government can respond by correcting the failure through regulatory reform (Stage 5), or, [the] government can extract itself from the market altogether by deregulation (Stage 6), . . . thus reverting back to Stage 1

general public with far-reaching consequences for the future.<sup>5</sup> Air and water pollution created by many manufacturing operations are common examples of detrimental externalities . . . If a product generates detrimental externalities, and the government does nothing, the market will cause more of the product to be produced than is optimal.”<sup>6</sup> This happened with the those farms, which routinely increase in size and pollute the environment.

There are, however, several ways in which government regulation can reduce these detrimental externalities to consolidate the production and actual costs.<sup>7</sup> First,

<sup>7</sup>Steier, *supra* note 1.

the implementation of legislation to force the firms to internalize all of the production cost. Second, the imposition of taxes as high as the externalities produced by the firms would make up for the externalized costs. Third, pollution controls or emissions standards<sup>8</sup> that are environmentally sustainable. The logical result of such governmental action would be the inversion of the relationship between negative and positive externalities such that pollution could be reversed.<sup>9</sup> All of the measures within these three categories can be expanded further and should be explored in order to reduce the ecological footprint of food production world-wide.

On a broader scale, there are ten basic ways to internalize externalities:

1. **Eliminate Perverse Subsidies:** Eliminate existing subsidies, which contribute to social and environmental costs that have been externalized. This elimination can be accomplished by cutting government subsidies to polluting industries, such as oil, gas, industrial agriculture, nuclear or coal fired power plants, and, most recently, ethanol.
2. **Government Regulation Requiring *Internalization by Design*:** Government regulation could require all products to demonstrate a genuine **net** benefit to ecological and human well-being throughout the products' life cycle. This requirement may also extend to other goods and services within the supply chain. As *Internalization by Design* is implemented, industries can choose how to deal with their existing externalities. One approach would be to let the respective industries decide the means rather than over-regulating the entire sector. Another way to foster forethought or front-end analysis would be to incorporate the principles of ecological economics into social, economic, and environmental impact studies. This can be done at city, state or province and national levels with amendments to policies such as NEPA and California's CEQUA laws.
3. **Government Pollution Regulation:** Regulating pollution such as scrubbers on smoke stacks is a way to force internalization. Where externalization is not allowed in the first place, such regulation becomes unnecessary. Notably, the best approach may be to set strict standards and let businesses make their own decisions about how to meet those standards. Through natural competition, businesses may eventually reach the ideal levels.
4. **The "Polluter Pays" Model—Government Regulated Externalization Fee Assessment:** Assessing a "sin" tax on externalities at the front end of extraction or manufacturing could also internalize some of the costs that would otherwise be borne by the public and the environment. As long as the extraction of non-renewable resources is not banned, there should at least be an escalating sin-tax. The underlying "polluter pays" principle would also internalize

---

<sup>8</sup>Steier, *supra* note i (citing Jan G. Laitos & Joseph P. Tomain, Energy and Natural Resources Law 21 (West 1992)).

<sup>9</sup>Gabriela Steier, Externalities in Industrial Food Production: The Costs of Profit, 3 Dartmouth Law Journal 9, available at: [http://works.bepress.com/gabriela\\_steier/1](http://works.bepress.com/gabriela_steier/1) and at <http://www.dartmouthlawjournal.org/archives/9.3.6.pdf>.

externalities from the onset and send the corrected price signal to the market. This corrected price would show that certain business activities are “ecological losers” over the medium and long term and are only focused on short-term profitability at the cost of negative externalities. In this way, fees could also be assessed for activities, which degrade or place burdens on ecosystems. Such fees could increase over time to allow companies time to adjust and to improve environmental protection while the aforementioned taxes may only be needed as an intermediate step when *Internalization by Design* is implemented. Ideally, however, most non-renewable resource extraction should be replaced by renewable substitutes, especially for the ones that are most crucial to our short term well-being. Conversely, by emphasizing recycling as a means of leaving virgin resources intact is an important way to circle back to internalize costs by design, which makes recycling, for example, more feasible.

5. **Valuing Priceless Ecosystem Services (or not):** This is controversial method, which is also called *ecosystem functions*, encourages payments for ecosystem functions (services). Essentially, it is a technique to give financial value to the otherwise priceless, such as watershed services, carbon sequestration, and fisheries stocks. The “polluter pays” principle, however, is much more desirable than putting a price on ecological externalities because it is better to commodify (pin a price to) pollution rather than nature.
6. **Unanticipated-Negative-Consequences Bond:** Another option to taxing pollution and a method to internalize negative externalities is to mandate that companies post a bond to help ensure that unanticipated negative consequences do not occur. This would help the company to follow the precautionary principle and to take it seriously because it has become financially significant for the company’s bottom line.
7. **Certification Systems:** Independent certification systems such as the Forest Stewardship Council, organic agriculture, and fair trade strive to internalize some externalities and can be helpful, especially as monitors of success. The big change, however, has to come from something like the *Internalization by Design* system, that requires certification systems for products, goods and services that originate from ecologically responsible industries and satisfy the requirements to carry the respective label. Nonetheless, Post factum reviews are not desirable as they may discourage supply chain transparency and shroud other externalized ecological impacts in undeserved secrecy. Therefore, certification criteria should be integrated into the original designs, with high transparency and an adequate community review process and a local orientation included in the requirements.
8. **No Net-Loss Provisions:** Another way to internalize negative externalities with the goal to protect ecosystems is to ensure that all or more habitats are “replaced” when another area is degraded or destroyed. Under Canada’s fisheries policy, there is a no net loss requirement, “whereby certain measures must be taken to replace the loss of fish habitat with newly created habitat or improve the productive capacity of some other natural habitat” if a project destroys fish habitat. A caveat to this approach is that the data must be studied because the

impact of such provisions remains questionable. It is generally not known how to “replace” habitat loss because not all the implications of the loss can be ascertained. Therefore, emphasizing the avoidance of the habitat the loss in the first place should be preferred along with preservation of such habitat, rather than “repair.” Here, the analysis is one of tradeoff and should clearly favor preservation of habitat and species.

9. **Legal Structure:** Legal systems must allow for internalization mechanisms. An economic system needs to be embodied in a public governance system that allows citizens to mandate internalization. Such legal measures should include binding laws where citizens can reject companies, projects or products that are insufficiently internalized. This includes international law and WTO style rules. In a redesigned “True Cost Economy,” prices would reflect externalities. In such an ideal economy, a WTO would become obsolete because trade agreements could no longer trump environmental treaties. Therefore, trade agreements should allow governments to impose tariffs on imports that do not meet required norms for resource stewardship, environmental protection, and labor practices.

For example, trade sanctions against any nation that does not institute an *Internalization by Design* program would be a strong measure. What is needed is a new system of jurisprudence where nature is not just property, but has innate rights and where it becomes illegal to kill the planet’s life support systems. Considering that corporate charters should only be awarded and renewed if certain environmental and social goals are met, could also require meeting certain conditions that justify a corporation of any given size. The burden should be on the applicant-company to justify the need other than large profit. At its heart, such laws would ask, “how does the company contribute to ecologic conservation and environmental protection in a way that no other smaller operation could?”

10. **Voluntary Measures:** Voluntary measures, such as a company’s refraining from dumping chemicals into local rivers and, instead, investing in proper disposal or pollution reduction technologies, could be rewarded. Governments could support such voluntary measures by requiring disclosure of pollution emitted and resources consumed in annual reports filed with security exchanges. Currently, voluntary efforts are inadequate but often highlight what should be disclosed. In Japan, for example, practices that have been demonstrated by manufacturers as a “best practice” through voluntary means must later be incorporated in regulations as a minimum requirement, thereby consistently increasing the minimum standards. This approach would allow governments to monitor ecological performance of publicly traded companies and their entire supply chains.

## Chapter 17

# Textbox: Cooperatives' and Producer Organizations' Roles in Achieving Food Security

Denis Herbel, Mariagrazia Rocchigiani, and Nora Ourabah Haddad

**Abstract** Small-holder farming is the dominant form of agriculture in the world and it represents a significant potential for food security. However, in many developing countries, small-holder farmers face a number of constraints, some of them related to their size and geographical dispersion, which result in a lack of economies of scale and in a poor access to services. Efficient collective action in the form of producer organizations and cooperatives in particular, plays a key role in overcoming such challenges. However, organized collective action to stay effective need to “reinvent their business ideals” to adapt to a changing and competitive environment. They need to have committed leadership, a clear vision of finding solutions to the daily problems of their members as well as to build on strong endogenous processes. These processes rely on three interdependent types of relations: (1) bonding or intra-group relations among small farmers within the producer organization/cooperatives; (2) bridging or inter-group relations between producer organizations to create apex organizations; (3) linking or extra-group relations between producer organizations/cooperatives or agricultural cooperatives and economic actors and policy makers. Government and development practitioners can encourage the development of thriving producer organizations and cooperatives; however they need a shift in thinking and practice. They need to deeply understand their functioning, to recognize them as economic and political players, to adopt strategic capacity development approaches and finally to see such organizations as real partners, who can create the conditions to reduce poverty and achieve sustainable rural development.

Smallholder farming is the dominant form of agriculture in the world. Worldwide, farms of less than one hectare account for 72 % of all farms but control only 9 % of all agricultural land. They produce more than 80 % of the world's food in terms of

[Nora.OurabahHaddad@fao.org](mailto:Nora.OurabahHaddad@fao.org)

value.<sup>1</sup> Therefore, small farming represents a significant potential for food security. On the other hand the number of farm sizes in many lower-income countries continues to decrease. In fact, smallholder farmers face a number of constraints related to their size and geographical dispersion. Consequently, they lack economies of scale and access to services. These constraints limit their capacity to seize economic opportunities, or influence policies that affect them. They are often excluded from decision-making, whether in markets or in policy making processes. Addressing these constraints will unlock the significant potential of smallholders to contribute to food security.

In the meantime, efficient collective action in the form of producer organizations and cooperatives in particular, plays a key role in overcoming such challenges. Well-performing producer organizations and cooperatives can provide an array of services to enable small farmers to improve their productivity in a sustainable way by:

- accessing output and input markets;
- overcoming asymmetries of information and knowledge;
- providing access to financial services;
- managing natural resources sustainably;
- adapting to and mitigating climate change.<sup>2</sup>

Therefore, one overarching reason why farmers come into cooperatives, is the provision of this wide range of services.

## **17.1 How Do Small Farmers Benefit from Joining Cooperatives and Producer Organizations?**

Producer Organizations and cooperatives can provide critical services in response to small holders' constraints. These services range from enhancing access to and management of natural resources, improving access to information and technologies, and facilitating participation in policy making. By providing an array of services, these organizations can increase farmers' incomes and improve their food security and livelihoods.

Private companies are selective when providing services to small farmers. Profitability drives their decisions according to the type of commodity, location and market contexts. These private companies normally direct their choices to high potential areas where market density is high and where they can secure their transactions in terms of accessing quantity and quality supply.<sup>3</sup> Instead, cooperatives and producer organizations can operate in low potential areas where markets

---

<sup>1</sup>FAO (2014).

<sup>2</sup>Herbel et al. (2011).

<sup>3</sup>Poulton (2014).

are “thin.” They do so because their goals are different from those of for-profit organizations.<sup>4</sup> By forming cooperatives, farmers adopt an efficient strategy, which allows them to gain market power, thereby, rebalancing it to their advantage. Consequently, this enables farmers to mitigate the opportunistic behaviors of their trading partners in monopolistic and oligopolistic positions.

Joining cooperatives, which provide services to their members, also allow member farmers to achieve gains from economies of scale while reducing transaction costs that are lowered when farmers pool together their supply and demand. All these benefits derived from producer organizations and cooperatives enable farmers to minimize risk exposure. Indeed, building agricultural cooperatives and producer organizations is both an efficient way to share risks among their members and to minimize their exposure to contractual partners' opportunistic behaviors.<sup>5</sup>

On the other hand, evidence shows that producer organizations and cooperatives face significant challenges in performing their role as service providers. These challenges often translate into poor organizational performance such as “poor structure and weak governance, limited organizational capabilities, lack of financial capital, and difficulties in the institutional economic, and agro- ecological environment of small farms in poorest areas.”<sup>6</sup> These challenges are often “exacerbated by ill-judged external support.”<sup>7</sup> Therefore, in order to be efficient, they need to “reinvent their business ideals.”<sup>8</sup>

## 17.2 What Are the Key Ingredients for Building Successful Producer Organizations and Cooperatives?

For this reinvention process to be effective there is a need to be pragmatic. Agricultural cooperatives and producer organizations can only succeed under certain conditions. It is not sufficient to have a strong board and enlightened management for a successful cooperative model.<sup>9</sup> Collective action—through producer organizations and cooperatives, needs to build on endogenous processes. And to develop, they rely on three interdependent types of relations:

- Bonding or intra-group relations among small farmers within the producer organization/cooperatives;

---

<sup>4</sup>Sexton and Iskow (1988).

<sup>5</sup>Cook (2012).

<sup>6</sup>Wanyama (2014).

<sup>7</sup>Wanyama (2014).

<sup>8</sup>Wanyama (2014).

<sup>9</sup>Cook (2012).

- Bridging or intergroup relations among producer organizations to create apex organizations;
- Linking or extra-group relations between producer organizations/cooperatives or agricultural cooperatives, and the economic actors and policy makers.

Through bonding relations, small farmers within producer organizations and cooperative organizations gain self-confidence and knowledge to analyse their own problems, make informed choices and act collectively. The close personal bonds of solidarity among small producers and their organizations, is the basis for their organizational development. By providing information and aligning member objectives, these first types of relations encourage members to cooperate towards the common goal: mitigating opportunistic behaviours. Bridging relations are intergroup relations, which, within a network, connect different organizations at the local, national, and regional levels. The creation of bridges among similar organizations by pooling their resources, allows them to better accomplish their mission, overcome constraints, communicate needs and offer a broader range of services. Just as the first two relations are established, farmers will have the ability to develop connections, which must be formed with influential economic and political actors. Subsequently, small producers will gain access to national and international markets and can voice their concerns.

### **17.3 Redefining the Role of Policy Makers and Development Practitioners for Thriving Producer Organizations and Cooperatives**

Still, the roles of policy makers and development organizations should be redefined to facilitate the development of sustainable and thriving producer organizations and cooperatives. Reasons behind past failure of these organizations must be discussed and analyzed to pave the way for the future.

Until late 1980s, much had been said about the failure of cooperatives and producer organizations. Farmers often complained and expressed loss of faith in cooperatives and what they provided to their members. These organizations have frequently been considered “empty shells.”

The period (1960s–1980s) is marked by state-led policies that led to the creation of organizations, i.e. the so-called cooperatives. Formation of these organizations took place under either the impulse of the state or the donor community, following a top-down approach. Specifically, the farmers, fisher folk, forest holders, and livestock keepers were not encouraged to form their own initiative. Consequently, the government gained control over decisions made by organization and its members. An immediate result of this top-down approach was demotivation from becoming a member, which translated (in some cases) into significant dropouts. Farmers considered their organizations as an extended arm of government.

Another important factor explaining the failure of these organizations is the nature and modalities of external support provided mainly by some donors and non-governmental organizations. Instead of offering support to organizations so that they become sustainable and autonomous, a dependency towards aid was developed. Indeed, this support often focused on the technical aspects of organizations instead of addressing long-term issues. Specifically, these issues are related to three dimensions of capacity development (strengthening individual, organization and institutional). Also, included is the so-called “soft skill development” such as: strengthening the effective participation of members, developing their managerial and financial skills, enhancing governance and equity aspects of organizations as well as looking at their external environment that impact them.<sup>10</sup>

Interventions meant to support their capacities contributed to disempowering farmers. It is the case of government direct interventions in the organization and the management of cooperatives—no respect of the principle of autonomy, or top-down donors and NGOs' interventions removing the responsibilities of farmers and creating financial dependency.<sup>11</sup> Rather than encouraging farmers to develop their capacities, they undermined both the farmers' incentives to acquire capacities and confidence to use them. Also, instead of looking at long-term issues and building on existing organizations and social dynamics, it adopted a narrow focus of technical results. Recognizing the capacity of producer organizations and cooperatives—individuals and as organizations, to gain ownership of their own change process is the key step to support their development path. Besides, support was often managed by donors along with the development community, and not by the organizations themselves. In short, these organizations failed because governments, the donor and development communities imposed their agenda, priorities and organizational models to further achieve their development policies. Indeed, this is certainly not sustainable.

In order to reverse this trend, governments and development practitioners need to understand and realize the function of producer organizations and cooperatives as both economic and political actors. This will enable the appropriate provision of support to facilitate the development of autonomous and sustainable organizations. The result is a need to build their capacities, which empowers autonomous service providers. Subsequently, the capacity development process requires a strategic and participatory approach—at three interrelated levels, including:

1. improved skills at the level of individual members;
2. strengthened organizational capacities of cooperatives and producer organizations; and
3. established and enabling environments, in which organizations develop and thrive.

---

<sup>10</sup>The external environment encompasses: policies; the legal framework; incentives; and consultation platforms.

<sup>11</sup>See Develtere (2008).

At the individual level, it is important to develop “soft skills” such as: the strengthening of effective participation by members in policy for a and the decision making processes in addition to developing negotiation, mediation, and managerial skills.

At the organizational level, it is crucial to look at governance and equity aspects of such organizations for instance by:

- linking manager benefits to specific performance measure of the producer organization;
- attracting managers from the farming community in which the organization operates,
- professionalizing the Board of Directors through targeted coaching processes,
- engaging the organization in strategic planning processes,
- ensuring space to women and youth in the leadership and decision-making processes.

At the enabling environment level, it is important to understand the conditions of an enabling environment for such organizations, looking particularly at three dimensions: the regulatory framework, the investment climate, and the way in which the government and the producer organizations and cooperatives interact through existing policy consultation platforms.

In helping small farmers overcome the organizational challenges, this capacity development approach can contribute to effective governance and management practices, ensuring transparency and accountability. In this way, producer organizations and agricultural cooperatives can reach the “organizational maturation.”<sup>12</sup> In this event, the process allows change in the nature and quality of relationships within the organization as well as among organizations contributing to the modernization of value chains and the changing food systems.

Therefore, governments and development practitioners play an important role in facilitating and supporting the development of autonomous and sustainable producer organizations and cooperatives. Hence, a shift in the thinking is formed based upon the transformation of relations between member-based organizations—cooperatives, producer organizations, and other actors such as the public sector, the development community (donors included). Relationships must be transformed into a “win-win partnership,” replacing the member-based organizations as mere recipients and passive actors. In the same way, the “traditional beneficiaries” become partners on equal footing. After all, it is only through this transformed relationship that producer organizations and cooperatives can become agents of development alongside other powerful actors (including donors) and decision-makers.

Allowing small holders to actively participate in markets and the decision-making processes, the producer organizations and cooperatives will help create conditions to meet growing food demands, reduce poverty and achieve the sustainable development of rural areas.

# Chapter 18

## Governing the Global Food System Towards the Sustainocene with Artificial Photosynthesis

Thomas Faunce and Alex Bruce

**Abstract** The development of the current global food production system has been predicated on multinational corporate market power coupled with the intensive use of pesticides and carbon-intensive fuels in mechanised, massive scale agricultural and slaughtered animal production and transportation (i.e., tractors, harvesters, trucks and container ships) but also in the production of fertilizer (particularly via the Haber-Bosch process for the conversion of atmospheric nitrogen to ammonia and in the phosphate industry). Our central hypothesis is that this corporatized global food system is fundamentally damaging to the sustainability of our environment and inhibitory of the growth of distributed or decentralised organic farming which is more likely to be the mainstay of food production in a future where humanity individually and collectively flourishes as stewards of resilient ecosystems. In the course of analysing that hypothesis we explore whether appropriate global governance of new renewable energy and climate change mitigation technologies such as artificial photosynthesis may accelerate transition to such a reformed global food system in an epoch conveniently termed the Sustainocene. In particular we examine whether and if so how international food law and policy can assist nanotechnology-based artificial photosynthesis become an ‘off-grid’ distributed family and community-based combined food, energy, water and climate change solution that establishes stable preconditions for humanity to realise its full potential as an ethical species.

## 18.1 Introduction

### 18.1.1 *Corporate Power and Carbon Intensive Energy Behind the Global Food System*

The global food industry is dominated by a few multinational corporations, sometimes working in competition but also often in collusion and corrupt manipulation of the market and government regulation evidenced by large-scale antitrust litigation, especially in the United States. The industry inefficiently uses a large amount of the world's energy input to produce food for profit in selected markets. This energy takes the form of carbon-based fuels for mechanized production, transport in trucks, trains and ships. It is also required in huge amounts to make ammonia fertilizer via the Haber-Bosh process for fixing atmospheric nitrogen (Smil 2004). It is also used to mine and export phosphorus and, for example in the case of the Western Sahara, to import back this non-renewable resource once manufactured as fertilizer or even as a raw material from strategically protected sources in China, US and Morocco, it (Cordell et al. 2009). It is an indictment of this system that it not only perpetuates but tacitly encourages structural disparities in food access that see one billion people starving while being a direct cause of one billion people being obese. In addition to these structural disparities, corporate domination of the food production and distribution chains promotes severe information asymmetries where consumers are often unable to determine credence claims made by corporations about the food products being sold and consumed. It is in this context that policy makers are seeking for ways to shift this system to one which puts a greater premium on sustainability and consumer accountability, not just for human economies but for ecosystems (Sullivan 2012–2013).

### 18.1.2 *Brief Overview and Background of the Corporate Global Food Industry*

Since 1800 with the onset of the industrial revolution, the development of the capacity to fix atmospheric nitrogen as a fertilizer, improved sanitation, healthcare and transport, global human population and its impact have dramatically increased. Land ecosystems, for instance, were globally converted from mostly wild to mostly anthropogenic by the mid twentieth century (Steffen et al. 2011).

Using a new method for calculating undernourishment that began with the 2012 edition of the *State of Food Insecurity in the World* report, United Nations agencies estimate hunger in its most extreme form has decreased globally from over 1 billion in 1990–1992 (18.9% of the world's population) to 842 million in 2011–2013 (12% of the population) (FAO 2013). Yet these household figures, disturbing and revealing as they are, do not disclose short-term undernourishment, neglect inequalities in intra-household food distribution (particularly for children, women, frail and

the elderly) and the necessity to perform physically demanding activities (Lappé et al. 2013). In fact the global food system at present perpetuates in developing nations lack of ready, safe access to clean water and diets with adequate micronutrients (i.e., iodine, of vitamin A or iron especially during pregnancy and in a child's first 2 years) while in middle and high-income countries the prevalence of obesity doubled between 1980 and 2008 creating heightened risk of type 2 diabetes, heart disease or gastrointestinal cancers (De Schutter 2014).

The current corporate-controlled global food system is characterized by use of monocultures of high-yielding plant varieties with increased irrigation, the mechanization of agricultural production and the use of nitrogen-based fertilizers and pesticides. Monsanto for instance has a monopoly for its genetically engineered-sterile corn and soy seeds that are now resistant to Monsanto's own brand of pesticide called Roundup (Patel 2008).

The acute structural imbalances of this system are buffered by large scale State subsidies and corporate lobbying and marketing, leading to surplus developed nation production of profitable maize, wheat and rice and soybean crops (Mellor 1988). These staple crop surpluses are then dumped with low prices on developing markets to function as a substitute for improved non-agricultural wages for workers in the non-agricultural sectors and for the establishment of adequate social infrastructure, but hindering local farmers' sales and making populations vulnerable to changes in price or supply of such food staple imports (Mellor 1988). One third of these cereals are used as food animal feed while poor people can not afford the resultant meat (De Schutter 2014).

This system has significant non-sustainable features. It results, for example, in a significant loss of agrobiodiversity, accelerated soil erosion, phosphate and nitrogen water pollution spurring algae growth that absorbs the dissolved oxygen required to sustain fish stocks (Chislock et al. 2013). It promotes unsustainable mass fishing practices such as those using drift and bottom dredging nets and supertrawlers (De Schutter 2014).

It is increasing becoming obvious that another of the most potentially devastating social and environmental impacts of this corporatized global food system in increased greenhouse gas emissions (De Schutter 2014). Corporatized mass-production techniques drive field-level practices causing 15% of total human-made greenhouse gas emissions include nitrous oxide (N<sub>2</sub>O) from the use of nitrogen fertilizers, methane (CH<sub>4</sub>) from livestock, and carbon dioxide (CO<sub>2</sub>) from the loss of soil organic carbon in croplands and (due to intensified grazing) on pastures (De Schutter 2014). The global agri-food business also causes significant carbon emissions through mass production of herbicides and pesticides, mechanized tillage, irrigation and fertilization, and the road, rail, sea and air transport, packaging and conservation of food (Campbell and Ingram 2012). By the early twenty-first century one third of total arable land was dedicated to crop production for animal feed or biofuels and this itself was becoming a major cause of deforestation and greenhouse gas emissions (FAO 2006) (Goodland and Anhang 2009).

It is likely that the technological boost to crop yields over past decades will soon be undone by what may be termed ‘corporatogenic’ climate change in many parts of the world (Lobell et al. 2011). Climate change is projected to progressively increase inter-annual variability of crop yields in the context of rapidly rising crop demand. All aspects of food security are potentially affected by climate change, including food access, utilization, and price stability (high confidence) (IPPC 2014). The fragility of global food systems is particularly concerning given predictions by the United Nations Population Division that the world’s population will reach somewhere between 8 and 11 billion people.

In order to meet this expected demand for food generally and meat products particularly, the United Nations Food and Agricultural Organisation estimates that agricultural output will need to increase by 70 % but must do so in circumstances of a world-wide decline in agricultural land because of climate change, dwindling fossil fuel supplies and the general movement of people off the land and into cities, urban and sub-urban areas.

A significant feature of the global food system are ocean-going container ships. Each year 100 million containers, many carrying food, traverse the world’s seas and thousands fall overboard. There are now approximately 15,000 pieces of plastic per square mile in many oceans and it takes about 500 years for such garbage to completely break down. Human waste which could be used to fertilise the soil if agriculture was more local, instead is piped or flushed during the increasing number of climate-change-driven fierce storms back into the ocean. Large trash vortices exist in the Atlantic and Pacific Ocean gyres leaching chemicals into the food chain (Moore et al. 2001; Barnes et al. 2009).

The global food system has been shaped to maximize efficiency gains and produce large volumes of a narrow range of profitable commodities for supermarkets. Indeed the corporate owners of supermarkets have become the ‘masters’ of the world food system, raising their profits by shaping through mass advertising the demand of citizens they rebadge as ‘consumers’ while restricting competition. Market concentration, information asymmetries, monopsony buying power and pricing discretion have converged in the form of global supermarket chain stores that exploit both up-stream (producers) and down-stream consumers. Supermarkets have had a major role in driving ‘citizens’ to become ‘consumers’ of processed foods rich in salt, sugar and saturated fats but with a conveniently long shelf life for sale (Baines 2014). Supermarkets often also use their tight control of the market to launch unrealistically cheap ‘home’ brands that force other food processors out of business (Baines 2014).

At the same time, World Trade Organisation (WTO) structural adjustment systems pushed upon developing and indebted nations, have had the effect of lowering prices therein for agricultural products while discouraging investors in local food infrastructure except for a narrow range of products destined for export markets (De Schutter 2014). The food supply of people in such countries has become dependent on cheap imports of staples and been compromised by a lack of governance support for community-focused agricultural production and food processing (De Schutter 2014).

In summary, a reasonable case can be made that the corporatized global food system has substituted chemicals for farm workers displacing them and their families and communities to cities where they became dependent on mass produced mono-cultured food produced by a few large corporations; this has not only deprived them of balanced nutrition and the flourishing involved in self-controlled work amidst nature but made them complicit in the savage exploitation of food animals (Patel 2008). What follows is an analysis of how international food law and policy can promote a technology that may help transform this system towards long-term sustainability.

It is part of our argument that if it is to maintain any claim to jurisprudential legitimacy, international food law and policy must drive fundamental changes in the global agri-food system including, where possible, harnessing domestic competition and consumer policies to mitigate market concentration, collusion and information asymmetries that exploit consumers. The first idea to be explored here is that this should involve support in academic writings, policy documents, legislation and international instruments for a jurisprudential shift in which traditional foundational social virtues such as justice, equity and respect for human dignity that have underpinned governance of the global food system are subsumed within the single foundational virtue of environmental sustainability. The second issue is whether this transition requires impetus from new technology and whether this is likely to involve globalization of artificial photosynthesis. Assuming that this approach is correct, the next issue is how governance of the global food system best be reframed so that it can most effectively and rapidly assist widespread equitable deployment of artificial photosynthetic technology. The final issue is whether this process can be continued so that international food law and policy include human aspirations towards sustainability that include shaping a billion-year period of human stewardship over a resilient earth ecology.

### ***18.1.3 Importance of Topics for International Food Law and Policy***

Our hypothesis is that international law and policy should embrace environmental sustainability as its foundational social virtue instead of the more anthropocentric concepts of justice or equity, or the more corporato-centric notions such as economic security or industry development. The second issue thus complements this by linking international food law and policy to prior revolutions in governance in which reform proposals supporting foundational social virtues have been driven by revolutions in technology that have remove the economic rationale for not developing virtues by consistently following universally applicable principles. The third issue overlaps as giving a practical dimension to how international food law and policy that best create the conditions responsive to the development of artificial photosynthesis. The final issue includes the others in a visionary approach of using

this globally deployed renewable energy and food technology to restructure global governance towards sustainability over millennia.

## 18.2 Background and Contextualization

### 18.2.1 *The Global Food System in the Corporatocene*

It has been argued that this planet has passed from what is known as the Holocene geological epoch into what has been termed the Anthropocene period (Crutzen and Stoermer 2000). The term ‘Anthropocene’ was coined by Crutzen (2002). It refers to an epoch where human interference with earth systems (particularly in the form of influences on land use and land cover, coastal and maritime ecosystems, atmospheric composition, riverine flow, nitrogen, carbon and phosphorus cycles, physical climate, food chains, biological diversity and natural resources) have become so pervasive and profound that they are not only becoming the main drivers of natural processes on earth, but are threatening their capacity to sustain life (Steffen et al. 2007).

Five characteristic features of the Anthropocene epoch that tend to dominate policy debates over global food production include: population; poverty, preparation for war, profits and pollution (Furnass 2012). Salutary facts driving academic and policy interest in moving from the Anthropocene to a different type of human-controlled epoch are not only the greenhouse-gas driven increase in severe weather events, but the projected increase of global human population to around 10 billion by 2050 with associated energy consumption rising from  $\approx 400$  EJ/year to over 500 EJ/year beyond the capacity of existing fossil-fuel based power generation (Rogner 2004).

Yet is it really correct to term this period the ‘Anthropocene?’ Is it really the collective decisions of human beings, as this name implies, that are driving poverty, or a systemic perpetuation of preparation for war, profits and pollution. The thesis explored here is that it is really the activities of economically and politically powerful multinational corporations that primarily are driving these deleterious features of the present global food system. Governments have been lobbied by a carefully controlled and targeted approach from the corporate sector to embrace policies that privatise or sell core components of food infrastructure to the corporate sector, relax regulation that seeks to prevent corporate-initiated pollution, corruption and collusion or provide subsidies that distort markets. This is why governments frequently turn to domestic competition and consumer policies that directly target strategic corporate behaviour in searching for market-based solutions to industry concentration, collusion and consumer exploitation (Bruce 2013).

Critical analysis of the global food system and its corporate control in fact suggests that it is merely yet another deleterious outcome of corporate governance of the earth dedicated to maximising profit, an epoch that, with its philosophical

foundations in neo-classical economics, may accurately be termed the ‘Corporatocene.’ The extent to which this is the case can be seen through analysis (in the next section) of some illustrative attempts made at the level of international food law and policy to govern aspects of this system that do not appear congruent with traditional and emerging foundational social virtues.

### ***18.2.2 Attempts to Govern the Global Food Industry with International Law***

In the outcome document of the United Nations *Rio+20 Conference on Sustainable Development*, entitled “The future we want”, Heads of State and Government reaffirmed their “commitments regarding the right of everyone to have access to safe, sufficient and nutritious food, consistent with the right to adequate food and the fundamental right of everyone to be free from hunger.” (UN Conference on Sustainable Development 2013) In its final report of May 2013, the High-level Panel of Eminent Persons on the Post-2015 Development Agenda proposed to include ensuring “food security and good nutrition” among the universal goals and targets to be agreed, with target 5 (a) referring to ending hunger and protecting the right of everyone to have access to sufficient, safe, affordable and nutritious food. Similar conclusions emerged from the *Madrid High-level Consultation on Hunger, Food Security and Nutrition* in the Post-2015 Development Framework, convened on 4 April 2013. At its fortieth plenary session, building on this emerging consensus, Committee on World Food Security (CFS) highlighted “the essential role of food security and nutrition and poverty eradication in the elaboration of the post-2015 development agenda”, and it mandated its Bureau to ensure this key objective would be reflected in this agenda (CFS 2013). It is clear, however, even for the title of the conference that environmental sustainability was not viewed as the centralizing policy priority here. This is not to say, of course, that the stated goal are not important, but that without reference to environmental sustainability they risk losing the critical focus that makes their long-term achievement coherent.

Research underpinning the push to reorient , amongst other areas, international food law and policy towards environmental sustainability also emerges strongly from influential commentaries such as the Intergovernmental Panel on Climate Change (IPCC 2007) and the Stern Report (Stern 2007), as well as the United Nations *Millennium Development Goals* (UN MDGs).

The United Nations General Assembly in its 2012 *International Year of Sustainable Energy for All*, amongst its recommendations recognized that achieving equitable access to modern affordable energy services in developing countries was essential for transformation of global food production so that it became coherent with the achievement of the internationally agreed development goals, including the United Nations *Millennium Development Goals*, which would help to reduce poverty and to improve the conditions and standard of living for the majority of the

world's population (UN Sustainable Energy for All 2012). Development of renewable energy for cooking appliances and fuels, for agricultural processes, for processing and transportation of food was emphasised, but in the context of enhanced 'business models' 'successfully engaging the private sector' "finance and risk management" "increasing private investment" and "targeted" use of public and philanthropic capital (UN Sustainable Energy for All 2012). Environmental sustainability did not appear as a fundamental organizing virtue behind the recommendations of this body, which indeed were so facile and nebulous as to create the impression that the whole process was an exercise in international level public relations for the directors of the major corporate organisations that were on the advisory committee.

A similar exercise with intersections for international food law and policy was the 2014 *International Year of Family Farming* (IYFF). The IYFF aimed to raise the public policy profile of family farming and smallholder farming in agricultural, forestry, fisheries, pastoral and aquaculture production by focusing world attention on its significant role in eradicating hunger and poverty, providing food security and nutrition, improving livelihoods, managing natural resources, protecting the environment, and achieving sustainable development, in particular in rural areas. Key issues included agro-ecological conditions and territorial characteristics; policy environment; access to markets; access to land and natural resources; access to technology and extension services; access to finance; demographic, economic and socio-cultural conditions and availability of specialized education (FAO 2014). One of the most relevant significant findings of the IYFF was the extent to which multinational corporations were having a deleterious impact on these objectives through promoting structural imbalances in the global food system (FAO 2014).

So, given the structural imbalances Corporatocene-style governance is causing with respect to traditional social virtues how does international food law and policy begin to build on initiatives such as those discussed here to move away from that destructive model?

### ***18.2.3 Artificial Photosynthesis for a Sustainable Global Agriculture***

There has been much policy interest in developing what is termed the 'hydrogen economy' in which hydrogen is used ubiquitously as a carbon-neutral energy vector (for example source of electricity via fuel cells or as a fuel itself when combined, for example, to form methanol) and source of small amounts of fresh water (when combusted) (Faunce 2012c). Major policy documents have outlined the case for such an economy (European Hydrogen and Fuel Cell Technology Platform 2011). (US DOE) (NSC) (E4 tech) Some of the challenges include the need to lower the cost of hydrogen fuel production to that of petrol, the difficulties in creating a sustainable and low carbon dioxide route for the mass production of hydrogen, the

need to develop safe and more efficient storage (including the difficulties of compressing and cooling the hydrogen), the need to develop regulations and safety standards at national and international levels as well as the need to develop stable incentive systems for large scale investment in this area that will not fluctuate with oil prices.

Hydrogen (H<sub>2</sub>) requires 3000 times more space for equivalent amount of energy, but on a weight basis H<sub>2</sub> has 3 times the energy content of gasoline. Liquifying H<sub>2</sub> requires complex and expensive process (pre-cooled with liquid ammonia to -40 °C then to -196 °C with liquid nitrogen, then helium in compression-expansion to get liquid H<sub>2</sub> at -253 °C) 30–40 % of H<sub>2</sub> energy is lost in liquification and 1–5 % must be lost to atmosphere each day to avoid pressure build up and explosion. Compression similarly requires 10–15 % energy and requires cylindrical shape. One of the main problems at present with moving to a global hydrogen economy is the carbon-intensive energy required to produce hydrogen in large quantities by steam reformation of hydrocarbons, generally methane (Sartbaeva et al. 2008).

Yet a cheap and abundant source of H<sub>2</sub> is readily at hand as an output of technology that could engineer into buildings and roads the process of splitting water to get hydrogen using sunlight while absorbing atmospheric nitrogen and carbon dioxide. One of the reasons for focusing on this as the main energy supply of the Sustainocene is that more solar energy strikes the Earth's surface in 1 h of each day than the energy used by all human activities in 1 year. At present the average daily power consumption required to allow a citizen to flourish with a reasonable standard of living is about 125 kWh/day. Much of this power is devoted to transport (~40 kWh/day), heating (~40 kWh/day) and domestic electrical appliances (~18 kWh/day), with the remainder lost in electricity conversion and distribution (MacKay 2009). Global energy consumption is approximately 450 EJ/year, much less than the solar energy potentially usable at ~1.0 kW per square metre of the earth—  $3.9 \times 10^6$  EJ/year even if we take into the earth's tilt, diurnal and atmospheric influences on solar intensity (Pittock 2009).

Photosynthesis as a natural process is equally important with DNA in the progress of humanity. Photosynthesis provides the fundamental origin of our oxygen, food and the majority of our fuels; it has been operating on earth for over two billion years. Photosynthesis can be considered as a process of planetary respiration: it creates a global annual CO<sub>2</sub> flux in from the atmosphere and an annual O<sub>2</sub> flux out to atmosphere. In its present nanotechnologically-unenhanced form, photosynthesis globally already traps around 4000 EJ/year solar energy in the form of biomass. The global biomass energy potential for human use from photosynthesis as it currently operates globally is approximately equal to human energy requirements (450 EJ/year).

It is a quite remarkable that contemporary energy policy analysts have failed to appreciate the significant implications for food and energy security that natural photosynthesis is capable of substantial improvement with nanotechnology. When photosynthesis is considered in this context it is usually as a source of biofuels, often with a deleterious cost to rainforests or agricultural lands. Further, even if

3000 m<sup>2</sup> per person is devoted to biomass production this will provide only fuel only 36 kWh/day per person (well short of the 125 kWh/day required for people to live comfortably) (MacKay 2009). Photovoltaic (PV) energy systems are improving their efficiencies towards 25 %, and the cost of the electricity they produce is nearing or has past grid parity in many nations. The development of “smart-grid” (allowing energy carrying capacity to fluctuate coherently in accord with input and output) and “pumped-hydro” (using diurnal PV electricity to pump water to high reservoirs so it can be run down through turbines at night) will assist the viability of this as a national energy source. But even large solar farms (for example taking up 200 m<sup>2</sup> per person with 10 %-efficient solar panels) could produce but ~50 kWh/day per person (MacKay 2009).

Many renewable energy researchers and policy makers are locked into the outdated view that only plants can do ‘photosynthesis;’ that the process is something that buildings, roads and vehicles are never destined to do unless we incorporate something biologic into those structures. Such thinking leads to a focus on genetically modifying plants and also using synthetic biology. Such researchers seek for example to genetically manipulate or even synthetically reproduce photosynthetic plants and bacteria to maximize their light capture and carbon reduction activities.

Yet, when we travel in aircraft across the world it is easy to see the extent to which human concrete and asphalt structures are proliferating and replacing photosynthetic plants across the face of the planet. Such human-made structures contribute little to the ecosystems around them. They do not enrich the soil or provide oxygen or absorb carbon dioxide. Yet we are almost at the point where nanotechnology and artificial photosynthesis can be engineered into such structures so they can be made to “pay their way” in an ecosystem sense.

Artificial photosynthesis can facilitate other energy options H<sub>2</sub>—based fuels, the most promising perhaps by combining it with atmospheric nitrogen to make ammonia. Ammonia was used to power railcars in New Orleans in 1871 and in Brussels’ buses in 1943 when the Nazis commandeered all the diesel for military purposes. Its combustion products are nitrogen and water, with an initial puff of small quantities from petroleum or diesel for ignition. Ammonia can be stored at around 130 psi and carried in cylinders in the boot of a motor vehicle (a trial run from Detroit to San Francisco recently requiring only one re-fill). NH<sub>3</sub> is already shipped, piped, and stored in large volumes in every industrial country around the world as an agricultural fertilizer. As a fuel, NH<sub>3</sub> has been proven to work efficiently in a range of engine types, including internal combustion engines, combustion turbines, and direct ammonia fuel cells. Due to its high energy density and an extensive, existing NH<sub>3</sub> delivery infrastructure, NH<sub>3</sub> is ready for the market today as an alternative to gasoline ([NH<sub>3</sub> Fuel Association](#)).

If such artificial photosynthetic technology is incorporated into every building, road and vehicle on the earth’s surface than the positive outcome will be that humanity’s structure will be producing abundant safe, low carbon fuels and fertilizers. In such a world it will be much more feasible for communities and families to support many of their basic food needs off-grid through organic farming rather than

relying on distant sourced food provide by large corporate marketing chains. Dilution of market concentration will simultaneously reduce the potential for dominant corporations to act as monopsonists; dictating terms-of-trade with smaller upstream producers of food products. A market that is composed of a number of small-scale community food producers will enhance inter-brand competition for food products while also diminishing the pervasive information asymmetries that currently plague most consumers in the corporatised food market.

It also is likely that nanotechnology will play a significant role in the shift from the corporate globalisation model of food production and distribution. Nanotechnology is the science of making things from components that are not much bigger than a few atoms, less than 100 nm (a nanometer is a billionth of a metre). The chief policy interest to date with nanotechnology to date has been concerned with ensuring its safety (Faunce 2008). Interest is growing, however, in focusing nanotechnology on such problems. Experts have encouraged nanotechnology researchers to systematically contribute to achievement of the United Nations *Millennium Development Goals* particularly energy storage, production and conversion, agricultural productivity enhancement, water treatment and remediation (Salamanca-Buentello et al. 2005). In fact it has been argued by the first author that global artificial photosynthesis is the moral culmination of nanotechnology (Faunce 2012d).

#### ***18.2.4 Need to Globally Coordinate Artificial Photosynthesis Research***

Artificial photosynthesis is the subject of intense and advanced research by large groups of scientists in all developed nations (Faunce et al. 2013a, b). A dozen European research partners, for example, form the Solar-H<sub>2</sub> network, supported by the European Union and coordinated by Stenbjorn Styring at Uppsala University, Sweden. The US Dept. of Energy (DOE) *Joint Center for Artificial Photosynthesis* (JCAP) at the California Institute of Technology (Caltech) and Lawrence Berkeley National Laboratory coordinated by Nate Lewis has US\$122 m over 5 years to build a solar fuel system. At Caltech Harry Grey coordinates a large National Science Foundation (NSF) grant to improve photon capture and catalyst efficiency and has initiated a Solar Army endeavour in which high school and college students are mentored to search the periodic table for suitable catalysts. In the US several Energy Frontier Research Centers including that of Mike Wasielewski at Northwestern funded by the US DOE are focused on scientific endeavours related to artificial photosynthesis (Faunce et al. 2013a). Other major solar fuels centres have been established in South Korea, The Netherlands, Germany (at the Max Planck institute) and Singapore and numerous other competitively funded research teams have dedicated artificial photosynthesis-related projects already underway (Faunce et al. 2013a, b).

A basic idea of solar fuels research amongst the large national and regional projects mentioned above is to develop solar fuel prototype devices that improve on how plants absorb sunlight and use it to create an electron flow and hydrogen by splitting water. The scientific challenges involved here are considerable.

Photosynthetic organisms absorb photons from a segment of the solar spectrum (~430–700 nm) by so-called ‘antenna’ chlorophyll molecules in thylakoid membranes, or chloroplasts. The absorbed photons’ energy creates unstable spatially separated electron/hole pairs. The “holes” are captured by the oxygen-evolving complex (OEC) in photosystem II (PSII) to oxidise water (H<sub>2</sub>O) to what can be termed a natural form of hydrogen (protons) and oxygen (O<sub>2</sub>). This process can be written as the following chemical equation:  $2\text{H}_2\text{O} \Rightarrow 4 \text{ photons} \Rightarrow 4\text{e}^- + 4\text{H}^+ + \text{O}_2$ . The protons released on water oxidation can be used to make hydrogen according to a chemical process recorded as:  $2\text{e}^- + 2\text{H}^+ \Rightarrow \text{H}_2$ . The electrons are subsequently captured in chemical bonds by photosystem I (PSI) to reduce NADP (nicotinamide adenine dinucleotide phosphate) to NADPH. Electro-chemical energy stored by the protons produces ATP (adenosine triphosphate). In the relatively less efficient “dark reaction”, ATP and NADPH as well as carbon dioxide are used in the Calvin-Benson cycle to make a variety of energy rich chemicals, mainly sucrose and starch via the enzyme RuBisCO (Ribulose-1,5-bisphosphate carboxylase oxygenase) (Blankenship 2002). This capacity to store solar energy in chemical bonds is the feature that makes enhanced photosynthesis so intriguing as a form of renewable energy.

Some nanotechnological innovations for artificial photosynthesis focus on improved ‘light capture.’ This ‘light capture’ involves nanostructured materials or synthetic organisms absorbing photons from a much wider region of the solar spectrum (photon absorption by antenna chlorophyll molecules in thylakoid membranes of chloroplasts, for example, currently is restricted primarily to ~430–700 nm).

The next component involves creation of an equivalent catalytic system to the manganese-oxygen cluster called PSII. PSII in plants is a complex protein with 27 subunits and 32 co-factors involved in electron transfer and light harvesting. Researchers are working upon making a nanotechnological mimic of this protein (maquette) that is simpler (Koder et al. 2009) and incorporates designer molecules that prolong charge separation Carmieli et al. (2009). Nanotechnology is facilitating the construction of artificial photosynthetic electron pathways to this reaction centre that perform a single quantum computation, sensing many states simultaneously and so enhancing the efficiency of the energy capture and transfer at physiological temperatures (Lee et al. 2007; Ball 2010; Engel et al. 2007).

The most globally widespread water catalytic system will probably involve inexpensive and self-repairing components that operate at neutral pH with non-pure (salty or bacterially and chemically contaminated) water (Kanan and Nocera 2008) and be stable to a variety of exposure conditions in air, water and heat (Yin et al. 2010). A major scientific challenge will be to optimise the free energy required for the overall water splitting process. Multiwalled carbon

nanotubes and singlewalled carbon nanotubes may produce the critical breakthrough here (Sgobba and Guidi 2009).

In the artificial photosynthesis version of the “dark reaction”, ATP and NADPH as well as carbon dioxide (CO<sub>2</sub>) will be used in an enhanced version of the Calvin-Benson cycle to make locally usable food or fuel (for domestic, heating, cooking, light and transport) in the form of carbohydrate via the enzyme RuBisCO (Gray 2009). Bio-inspired self-repair strategies will ensure that this aspect survives damage from repeated cycles of thermodynamically demanding reactions (Wasielewski 2006). New catalysts for H<sub>2</sub> production and methods for efficient H<sub>2</sub> usage (in a fuel cell to make electricity) or storage (as a fuel after cooling and concentrating) will need to be built (Magnuson et al. 2009).

Major publications in this area include those by Peidong Yang Sun et al. (2011). Dan Nocera’s ‘artificial leaf’ configures a triple junction silicon photovoltaic cell with a cobalt catalyst for O<sub>2</sub> evolution and a ternary alloy (NiMoZn) as the H<sub>2</sub>-evolving catalyst in a wireless configuration (Reece et al. 2011). Nobuo Kamiya of Osaka University, has encouraged the process of building mimics of the core part of the natural photosynthetic system with the publication by his team of a cubane configuration of the OEC in PSII to a level of 1.9Å° (1.9 ångströms or  $1.9 \times 10^{-10}$  m) using an electron density map (Umena et al. 2011). Craig Hill of Emory University has developed a polyoxometalate water oxidation catalyst capable of strongly binding multiple transition metal centers proximal to one another, so facilitating multi-electron processes such as the 4-electron oxidation of H<sub>2</sub>O to O<sub>2</sub> (Zhu et al. 2012). David Tiede of the Argonne National Laboratory has reported a new strategy for solar fuel production involving insertion of sustainable first-row transition metal molecular catalysts (cobaloxime) into Photosystem I (PSI) as a mechanism for H<sub>2</sub> production (Utschig et al. 2011). Gary Brudvig and Chris Moser are amongst the notable researchers who have focused on how insights from the natural photosynthetic system might develop bioinspired materials for photochemical water oxidation and fuel production (Blankenship et al. 2011).

An international conference coordinated by the first author at Lord Howe Island in August 2011 linked senior artificial photosynthesis and global governance experts purportedly as a precursor to a macrosience Global Artificial Photosynthesis (GAP) Project (GAP 2011). A second conference on the same theme sponsored by the UK Royal Society will establish a practical framework for a global project on artificial photosynthesis (GAP 2014).

## 18.3 Discussion and Analysis

### 18.3.1 *Ensuring Access to Food Resources*

The question for analysis then becomes how international food law and policy, can play a role in changing the global food system towards sustainability. The United

Nations Special Rapporteur on food recommended in 2014 that in a context in which commercial pressures on land are increasing, it is crucial that States strengthen the protection of land users (A/65/281) and implement the Voluntary Guidelines on Responsible Governance of Tenure of Land and other Natural Resources (De Schutter 2014). In relation to access to land in particular he recommended States should:

- (a) Ensure security of tenure, by adopting anti-eviction laws and improving the regulatory framework concerning expropriation;
- (b) Conduct decentralized mapping of various users' land rights and strengthen customary systems of tenure;
- (c) Adopt tenancy laws to protect tenants from eviction and from excessive levels of rent;
- (d) Respect the rights of special groups, such as indigenous peoples, fisherfolk, herders and pastoralists, for whom the protection of commons is vital;
- (e) Prioritize development models that do not lead to evictions, disruptive shifts in land rights and increased land concentration, and ensure that all land investment projects are consistent with relevant obligations under international human rights law;
- (f) Refrain from criminalizing the non-violent occupation of land by movements of landless people;
- (g) Implement redistributive land reform where a high degree of land ownership concentration is combined with a significant level of rural poverty attributable to landlessness or to the cultivation of excessively small plots of land by smallholders, and supporting beneficiaries of land redistribution to ensure that they can make a productive use of their land; and
- (h) Regulate land markets to prevent the impacts of speculation on land concentration and distress sales by indebted farmers (De Schutter 2014).

The Report therefore recommends both structural and behavioural changes to the ownership and stewardship of land resources. A common theme of these recommendations is the dilution of centralised corporate control and market concentration. If these legal and behavioural changes strengthened the security of access to land for communities then it would create the preconditions whereby artificial photosynthetic technology could assist in providing fuel and electricity to use farming machinery while also enriching the soil. These recommendations are unlikely to be supported by large corporations involved in land acquisition and exploitation.

### ***18.3.2 Ensuring Access to Seeds and Genetic Diversity***

In relation to guaranteeing food security and supporting crop genetic diversity including agrobiodiversity the United Nations Special Rapporteur on food noted that small-scale farmers in developing countries, who still overwhelmingly rely on

seeds which they save from their own crops and which they donate, exchange or sell (De Schutter 2014). In order to ensure that the development of the intellectual property rights regime and the implementation of seed policies at the national level are compatible with the right to food, he recommended States should:

- (a) Make swift progress towards the implementation of farmers' rights, as defined in article 9 of the International Treaty on Plant Genetic Resources for Food and Agriculture;
- (b) Not allow patents on plants and establish research exemptions in legislation protecting plant breeders' rights;
- (c) Ensure that their seed regulations (seed certification schemes) do not lead to an exclusion of farmers' varieties; and
- (d) Support and scale up local seed exchange systems such as community seed banks and seed fairs, and community registers of peasant varieties.

Donors and international institutions should assist States in implementing the above recommendations, and, in particular:

- (a) Support efforts by developing countries to establish a *sui generis* regime for the protection of intellectual property rights which suits their development needs and is based on human rights;
- (b) Fund breeding projects on a large diversity of crops, including orphan crops, as well as on varieties for complex agroenvironments such as dry regions, and encourage participatory plant breeding;
- (c) Channel an adequate proportion of funds towards research programmes and projects that aim at improving the whole agricultural system and not only the plant (agroforestry, better soil management techniques, composting, water management, good agronomic practices) (De Schutter 2014).

Once again changing international food law and policy to give small scale farmers better access to seeds would undoubtedly assist their nutrition once combined with greater legal security of a land and the cheap, non-polluting source of energy and fertilizer artificial photosynthesis could provide. The recommendations above would also clearly conflict in many instances with the financial plans of large corporations such as Monsanto who have invested in seed technology which requires repurchase by farmers every year.

### **18.3.3 Ensuring Access to Fisheries**

In relation to fisheries the United Nations Special Rapporteur on the Right to Food found it was urgent that States move towards sustainable resource use while ensuring that the rights and livelihoods of small-scale fishers and coastal communities are respected and that the food security of all groups depending on fish is improved (A/67/268). To reach this objective, he recommended States should take

measures that in many cases would clearly cut across the interests of large corporations involved in the fishing industry:

- (a) Respect the existing rights of artisanal and small-scale fishing communities;
- (b) Refrain from taking measures, including large-scale development projects, that may adversely affect the livelihoods of inland and marine small scale fishers, their territories or access rights, unless their free, prior and informed consent is obtained;
- (c) Strengthen access to fishery resources and improve the incomes of small-scale fishing communities by regulating the industrial fishing sector to protect the access rights of traditional fishing communities.
- (d) Protect labour rights in the fishing industry;
- (e) When engaging in fishing access agreements, agree to introduce provisions concerning conditions of work in the fishing industry and support efforts of coastal States to regulate the fishing practices of industrial vessels operating in exclusive economic zones.
- (f) Implement their commitments under the Plan of Implementation of the World Summit on Sustainable Development, including to reduce their fishing capacity and to create marine protected areas;
- (g) Implement the Agreement on Port State Measures to Prevent, Deter and Eliminate Illegal, Unreported and Unregulated Fishing; and
- (h) Reduce the proportion of fish used for fishmeal purposes (De Schutter 2014).

### ***18.3.4 Governance Supporting Local Food Systems***

The United Special Rapporteur on the Right to Food found that reinvestment in agriculture and rural development should effectively contribute to the realization of the right to food (De Schutter 2014). In order to achieve this important goal, he recommended that the international community should:

### ***18.3.5 Prioritising of Public Goods***

- (a) Channel adequate support to sustainable farming approaches that benefit the most vulnerable groups and that are resilient to climate change;
- (b) Prioritize the provision of public goods, such as storage facilities, extension services, means of communications, access to credit and insurance, and agricultural research;
- (c) In countries facing important levels of rural poverty and in the absence of employment opportunities in other sectors, establish and promote farming systems that are sufficiently labour-intensive to contribute to employment creation (A/HRC/13/33/Add.2); and

- (d) Ensure that investment agreements contribute to reinforcing local livelihood options and to environmentally sustainable modes of agricultural production.

The system of corporate globalisation, through lobbying, mass advertising, collusion and corruption, has imposed on world wide food production an ideology postulating as the primary social virtue corporate profit maximisation and limitless economic growth, separating human beings from nature and community as it transforms the natural world into commodities. This ideology has its locus in the fundamental neo-classical idea of rational profit maximisation where the utility of nature and people are evaluated by reference to their economic usefulness. This is insidiously self-perpetuating since corporations churn out products that must be consumed while people consume ever more products, thus price-signalling endless demand for yet more products. Water, food, the human genome, cultural knowledge, biodiversity, education, justice, healthcare, even the capacity to live and die peacefully are no longer public goods. Worse still, because the value of an item is measured through the lens of profit-maximisation, traditional “public goods” that do not generate quantifiable profits are therefore considered inimical to future corporate investment, except where reluctantly forced by social policy legislation to do so. The system of corporate globalisation is backed by and is supported through taxpayer subsidies of a powerful military-industrial complex imposing control over natural resources and even thought and free association in the guise of national security. If public goods were prioritised as recommended by the United Nations Special Rapporteur on the right to food, then small-scale farmers would have better preconditions for secure living, particularly if their activities were backed by a local power and food source like artificial photosynthesis.

## 18.4 Agroecology

The United Nations Special Rapporteur on the right to food recommends:

Moving towards sustainable modes of agricultural production is vital for future food security and an essential component of the right to food. Agroecology has enormous potential in that regard (A/HRC/13/33/Add.2). States should support the adoption of agroecological practices by:

- (a) Building on the complementary strengths of seeds-and-breeds and agroecological methods, allocating resources to both, and exploring the synergies, such as linking fertilizer subsidies directly to agroecological investments on the farm (“subsidy to sustainability”);
- (b) Supporting decentralized participatory research and the dissemination of knowledge by relying on existing farmers’ organisations and networks.
- (c) Increase the budget for agroecological research at the field level, farm and community levels, and national and sub-national levels; and
- (d) Assess projects on the basis of a comprehensive set of performance criteria (impacts on incomes, resource efficiency, impacts on hunger and malnutrition,

empowerment of beneficiaries, etc.) in addition to classical agronomical measures.

The National Gardening Association associates the rise in food gardening to several reasons: An improving economy; strong national leadership, including the launch of the “Let’s Move” initiative and White House Kitchen Garden by First Lady Michelle Obama during the time period; action by federal agencies such as the U.S. Department of Agriculture and the U.S. Department of Health and Human Services to increase awareness and educational efforts toward food gardening; and more engagement and public-private partnerships through organizations like the National Gardening Association, to promote and build food gardens in communities across the country.

#### ***18.4.1 Support Small-Holder Farmers***

The United Nations Special Rapporteur on the right to food recommends:

The realization of the right to food for all will require proactively engaging in public policies aimed at expanding the choices of smallholders to sell their products at a decent price (A/HRC/13/33). To achieve this, States should:

- (a) Strengthen local and national markets and support continued diversification of channels of trading and distribution;
- (b) Support the establishment of farmers’ cooperatives and other producer organizations (A/66/262);
- (c) Establish or defend flexible and efficient producer marketing boards under government authority but with the strong participation of producers in their governance;
- (d) Encourage preferential sourcing from small-scale farmers through fiscal incentives or by making access to public procurement schemes conditional on the bidders’ compliance with certain sourcing requirements.

#### ***18.4.2 Contract Farming***

The United Nations Special Rapporteur on the right to food recommends:

To ensure that contract farming and other business models support the right to food (A/66/262), Governments should ensure that regulatory oversight keeps pace with the level of the expansion and the complexity of business models. In particular, States should:

- (a) Regulate key clauses of contracts, including those concerning price fixing, quality grading and the conditions under which inputs are provided, and the reservation of a portion of land for the production of food crops for self-consumption;

- (b) Monitor labour conditions in contract farming;
- (c) Link their support for contract farming to compliance with environmental conditions, such as reduced use of chemical fertilizers or the planting of trees, or to the adoption of a business plan that provides for a gradual shift to more sustainable types of farming; and
- (d) Set up forums in which the fairness of food chains could be discussed among producers, processors, retailers and consumers to ensure that farmers are paid fair prices for the food they produce.

### ***18.4.3 Agricultural Workers***

The United Nations Special Rapporteur on the right to food recommends:

To guarantee that those working on farms can be guaranteed a living wage, adequate health and safe conditions of employment (A/HRC/13/33), States should:

- (a) Improve the protection of agricultural workers by ratifying all ILO conventions relevant for the agrifood sector and ensuring that their legislation sets a minimum wage corresponding at least to a “living wage”; and
- (b) Monitor compliance with labour legislation by devoting appropriate resources for an effective functioning of labour inspectorates in agriculture, and taking the requisite measures to reduce to the fullest extent possible the number of workers outside the formal economy to ensure that agricultural workers are progressively protected by the same social security schemes applicable to other industries.

Consistent with the mantra of profit-maximisation, the current corporate-dominated global food system promotes deforestation, monocrops, use of chemical fertilisers produced with high levels of carbon-intensive energy, industrial food processing marketing and transportation thousands of kilometres, destruction of aquifers, oceans (through fertilizer run-off, over-fishing and pollution) and ecosystems. It replaces in many instances farming land with biofuel monocultures and replaces sustainable organic farming methods with genetically modified organisms (GMOs) as a tool of corporations to control seeds and food globally.

Trade and investment agreements are a major factor in undermining local economies, food sovereignty, environmental, social and cultural rights and nutrition. Such agreements often also push monopolistic forms of intellectual property protection, denationalization and corporate exploitation of the land. In the intellectual property chapter of the Trans Pacific Partnership Agreement (The TPPA) provisions would require all involved countries to allow animal and plant life to be patented. This is not surprising given that the chief U.S. agricultural negotiator for the TPP is former Monsanto lobbyist, Islam Siddiqui. Monsanto, of course, is a company that has sued farmers over their genetically engineered (GE) seed patents lobbied vigorously over domestic GE labeling regulations.

The TPPA also includes provisions would include a NAFTA-like elimination of virtually all tariffs on U.S. agricultural products in the other signatory nations, which could lead to commodity dumping in those countries by US food corporations and subsequent dislocation of small farmers from their lands. Food safety rules—including rules about pesticide residue levels, labeling of GE ingredients, or limitations on additives—also could be challenged under the Investor-State Dispute Settlement (ISDS) provisions of the TPPA. ISDS is a provision in major free trade agreements that allows companies to sue governments when local laws disrupt trade and profit. Such rules under NAFTA.

Have permitted large US pesticide manufacturers to sue the Canadian government, for example for tightening environmental regulations or subsidizing local production. Such action have resulted in multimillion dollar damages claims and substantial legal costs.

## 18.5 National Governance Strategies on Food Security

The United Special Rapporteur recommended States should build national strategies for the realization of the right to adequate food, which should include mapping of the food—insecure, adoption of relevant legislation and policies with a right-to-food framework, establishment of mechanisms to ensure accountability, and the establishment of mechanisms and processes which ensure real participation of rights-holders, particularly the most vulnerable, in designing and monitoring such legislation and policies (De Schutter 2014).

### 18.5.1 *Legal Status of Right to Food*

For national strategies to be effective, the United Nations Special Rapporteur on the right to food recommended it be:

- (a) Grounded in law, through the adoption of right to food/food and nutrition security framework laws and ideally through the inclusion of the right to food in national constitutions;
- (b) Multisectoral and inclusive, ensuring the coordination amongst Government ministries and institutions and allowing for meaningful participation of civil society in their formulation and monitoring;
- (c) Adequately funded.
- (d) Monitored also by national courts and national human rights institutions as well as through social audits and community-based monitoring at the local level.

### **18.5.2 Human Rights Impact Assessments**

The United Nations Special Rapporteur on the right to food recommended:

- To ensure consistency between domestic policies aimed at the full realization of the right to food and external policies in the areas of trade, investment, development and humanitarian aid, States should establish mechanisms that ensure that the right to food is fully taken into account in those policies. The Special Rapporteur has presented Guiding Principles on Human Rights Impact Assessments, based on a range of consultations with governmental and non-governmental actors, which provide guidance as to how to conduct such assessments, both ex-ante and ex-post (A/HRC/19/59/Add.5).

### **18.5.3 Women's Rights**

The United Nations Special Rapporteur on the right to food recommended

In order to strengthen the protection of the right to food of women (A/HRC/22/50), States should:

- (a) Remove all discriminatory provisions in the law, combat discrimination that has its source in social and cultural norms, and use temporary special measures to accelerate the achievement of gender equality;
- (b) Recognize the need to accommodate the specific time and mobility constraints on women as a result of the existing gender roles, while at the same time redistributing the gender roles by a transformative approach to employment and social protection;
- (c) Mainstream a concern for gender in all laws, policies and programs, where appropriate, by developing incentives that reward public administrations which make progress in setting and reaching targets in this regard;
- (d) Adopt multisector and multi-year strategies that move towards full equality for women, under the supervision of an independent body to monitor progress, relying on gender-disaggregated data in all areas relating to the achievement of food security.

### **18.5.4 Social Protection**

The United Nations Special Rapporteur on the right to food recommended:

The provision of social protection can substantially contribute to the realization of the right to food (A/68/268, A/HRC/12/31). States should:

- (a) Guarantee the right to social security to all, without discrimination, through the establishment of standing social protection schemes;

- (b) Ensure that, when targeted schemes are adopted, they are based on criteria that are fair, effective and transparent;
- (c) Define benefits under national social protection systems as legal entitlements, so that individual beneficiaries are informed about their rights under social programs and have access to effective and independent grievance redressal mechanisms;
- (d) Ensure that the design of social protection schemes is effectively transformative of existing gender roles (A/HRC/22/50); and
- (e) Put in place a global reinsurance mechanism, creating an incentive for countries to set up robust social protection programmes for the benefit of their populations.

### **18.5.5 Nutrition**

The United Nations Special Rapporteur on the right to food recommended:

To reshape food systems for the promotion of sustainable diets and effectively combat the different faces of malnutrition (A/HRC/19/59), States should:

- (a) Adopt statutory regulation on the marketing of food products, as the most effective way to reduce marketing of foods high in saturated fats, trans-fatty acids, sodium and sugar (HFSS foods) to children, and restrict marketing of these foods to other groups;
- (b) Impose taxes on soft drinks (sodas), and on HFSS foods, in order to subsidize access to fruits and vegetables and educational campaigns on healthy diets;
- (c) Adopt a plan for the complete replacement of trans-fatty acids with polyunsaturated fats;
- (d) Review the existing systems of agricultural subsidies, in order to take into account the public health impacts of current allocations, and use public procurement schemes for school-feeding programmes and for other public institutions to support the provision of locally sourced, nutritious foods; and
- (e) Transpose into domestic legislation the International Code of Marketing of Breast-milk Substitutes and the WHO recommendations on the marketing of breast-milk substitutes and of foods and non-alcoholic beverages to children, and ensure their effective enforcement.

The private sector should:

- (a) Comply fully with the International Code of Marketing of Breast-milk Substitutes, and comply with the WHO recommendations on the marketing of foods and non-alcoholic beverages to children, even where local enforcement is weak or non-existent;
- (b) Abstain from imposing nutrition-based interventions where local ecosystems and resources are able to support sustainable diets, and systematically ensure that such interventions prioritize local solutions;

- (c) Shift away from the supply of HFSS foods and towards healthier foods and phase out the use of trans-fatty acids in food processing.

## 18.6 Reshaping International Food Governance

The United Nations Special Rapporteur recommended the international community should find ways to better manage the risks associated with international trade and ensure that least-developed and net food-importing developing countries are better protected from the volatility of international market prices (De Schutter 2014).

### 18.6.1 *Volatility on International Food Markets*

To combat volatility on international markets, he recommended the international community should:

- (a) Encourage the establishment of food reserves at the local, national or regional levels;
- (b) Improve the management of grain stocks at the global level, including improved information about and coordination of global grain stocks to limit the attractiveness of speculation;
- (c) Establish an emergency reserve that would allow the World Food Programme to meet humanitarian needs;
- (d) Explore ways to combat unhealthy speculation on the futures markets of agricultural commodities through commodity index funds.

### 18.6.2 *A New Framework for Trade and Investment in Agriculture*

The United Nations Special Rapporteur on the right to food recommended:

The realization of the right to food requires designing trade rules that support the transition toward more sustainable agricultural practices. The multilateral trade regime as well as regional and bilateral trade agreements must allow countries to develop and implement ambitious food security policies including public food reserves, temporary import restrictions, active marketing boards, and safety net insurance schemes, in support of the progressive realization of the right to food (A/HRC/10/5/Add.2). In this regard, States should:

- (a) Limit excessive reliance on international trade and build capacity to produce the food needed to meet consumption needs, with an emphasis on small-scale farmers;

- (b) Maintain the necessary flexibilities and instruments, such as supply management schemes, to insulate domestic markets from the volatility of prices on international markets; and
- (c) Encourage national parliaments to hold regular hearings about the positions adopted by the government in trade negotiations, and ensure that their undertakings under the WTO framework are fully compatible with the right to food;
- (d) Fully implement the Marrakesh Ministerial Decision on Measures concerning the possible negative effects of the reform programme on least developed and net food-importing developing countries (NFIDCs) and, in order for it to be fully effective, ensure that it include a mechanism to systematically monitor the impact of the Agreement on Agriculture reform process on NFIDCs.

### ***18.6.3 Regulating Agribusiness***

The United Nations Special Rapporteur on the right to food recommended:

States should take steps towards the establishment of a multilateral framework regulating the activities of commodity buyers, processors, and retailers in the global food supply chain, including the setting of standards by these actors and their buying policies (A/HRC/13/33). In particular, States should use competition law in order to combat excessive concentration in the agribusiness sector. This requires having in place competition regimes sensitive to excessive buyer power in the agrifood sector, and devising competition authorities with mechanisms that allow for affected suppliers to bring complaints without fear of reprisal by dominant buyers.

Private actors of the agribusiness sector should refrain from practices that constitute an undue exercise of buyer power, as identified by the States in which they operate, and should:

- (a) Seek to conclude international framework agreements with global unions;
- (b) Consider unilateral undertakings to monitor compliance with ILO standards in the supply chain, while supporting their suppliers in achieving compliance;
- (c) Engage in chain-wide learning to assure that participation in the chain is profitable for all involved, including small-scale producers;
- (d) Involve smallholders in the elaboration of and compliance with food safety, labour or environmental standards; and
- (e) Promote fair trade through increased shelf space and information campaigns.

### ***18.6.4 Agrofuels***

The United Nations Special Rapporteur on the right to food recommended:

The international community should reach a consensus on agrofuels, based not only on the need to avoid the negative impact of the development of agrofuels on

the international price of staple food commodities, but also on the need to ensure that the production of agrofuels respects the full range of human rights and does not result in distorted development in producer countries. Public incentives for the production of crop-based biofuels must be reduced and eventually removed, while only those advanced biofuels that do not compete with food production for land or other resources should be incentivised.

### ***18.6.5 Food Aid and Development Cooperation***

The United Nations Special Rapporteur on the right to food recommended:

International aid remains an important component of the right to food (A/HRC/10/5). Donor States should:

- (a) Maintain and increase levels of aid calculated as Official Development Assistance as a percentage of GDP;
- (b) Provide food aid on the basis of an objective assessment of the identified needs in developing countries;
- (c) Fully respect the principle of ownership in their development cooperation policies by aligning these policies with national strategies for the realization of the right to food;
- (d) Promote the right to food as a priority for development cooperation.  
(De Schutter 2014)

The United Nations Conference on Trade and Development (UNCTAD) report on reforming corporate sovereignty chapters stated:

Concerns with the current ISDS system relate, among others things, to a perceived deficit of legitimacy and transparency; contradictions between arbitral awards; difficulties in correcting erroneous arbitral decisions; questions about the independence and impartiality of arbitrators, and concerns relating to the costs and time of arbitral procedures. (UNCTAD 2013)

## **18.7 Application Through Examples and Case-studies**

### ***18.7.1 Dow Agrosiences Investor-State Dispute Case***

In 2009, the US corporation Dow Agrosiences sued the Canadian federal government using NAFTA's investor-state dispute process over Quebec's ban on the residential use of the dangerous herbicide 2,4-D, claimed \$2 million in damages from the ban, which it called tantamount to expropriation. The Quebec government agreed to a statement that "products containing 2,4-D do not pose an unacceptable risk to human health or the environment, provided that the instructions on their label are followed" although the pesticide bans in Quebec and other jurisdictions

will stay in place, Dow Agrosiences declared the settlement a victory, as commentators note the NAFTA case may discourage other Canadian governments at the local or provincial level from moving ahead with future public health and environmental regulation that may impede the profits of US corporations. The case showed how ineffective were public health or environment exceptions to investor rights in such agreements (Public Citizen 2010, 2013, 2014).

There are claims that recent changes to the wording of ISDS clauses in trade and investment agreements like the Korea-Australia Free Trade Agreement (KAFTA) are “safeguards” which will prevent foreign investors from suing governments over health, environment or other public interest legislation.

But the first “safeguard” sentence in the KAFTA reads: “except in rare circumstances non-discriminatory regulatory actions by a party that are designed and applied to protect legitimate public welfare objectives, such as public health, safety and the environment, do not constitute indirect expropriations” (KAFTA chapter 11, annex 2B). Many legal experts have pointed out that the phrase “except in rare circumstances” leaves a very big loophole, which recent cases have used to advantage. The second “safeguard” is a more limited definition of “fair and equitable treatment” for foreign investors (KAFTA chapter 11, clause 11.5.2 and Annex 2A). However tribunals have ignored these limitations and applied the previous higher standard. A third “safeguard” is a reference to the general protections for “human, animal or plant life” in article XX of the WTO General agreement on Tariffs and Trade (KAFTA Article 22.1). This article has only been successful in one out of 35 cases in the WTO which have attempted to use it to safeguard health and environmental legislation.

These same “safeguards” in recent trade agreements like the Central American Free Trade Agreement and the Peru-US Free Trade Agreement have not prevented foreign investors from launching cases against environmental legislation. For example, the US-based Renco Group is using ISDS in the Peru-US free Trade Agreement to contest a local court decision that it was responsible for pollution from its lead mine. Both cases are ongoing and may take several years (Public Citizen 2010, 2013, 2014).

This example shows government measures to promote or subsidise artificial photosynthetic technology could be blocked using ISDS mechanisms even though governments might claim there were scientifically sound public health and environmental reasons behind the implementation of the former strategies.

### ***18.7.2 AbitibiBowater Investor-State Dispute Case***

The Canadian federal government also had to pay US\$130-million in damages under a NAFTA Chapter 11 ISDS claim to compensate US forestry corporation AbitibiBowater Inc. (incorporated in Delaware but with its head office in Montreal) for the actions of Canadian provincial governments Newfoundland and Labrador’s over their alleged ‘expropriation’ of the corporation’s assets (water and timber

rights and hydroelectric assets) after the US company closed its mill in Grand Falls-Windsor, putting about 800 employees out of work. The Canadian government found it easier to pay the compensation rather than fight the case through the complex NAFTA ISDS process (Public Citizen 2010, 2013, 2014).

The Swedish energy company, Vattenfall, suing the German government over its decision to phase out nuclear energy. The Government of El Salvador has been sued by Pacific Rim Mining Corporation under the Central American Free Trade agreement, over a ban on mining to protect the nation's limited groundwater resources. US Lone Pine mining company suing the Québec provincial government of Canada over environmental regulation of shale gas mining (Public Citizen 2010, 2013, 2014).

This example also shows government measures to promote or subsidise artificial photosynthetic technology could be blocked using ISDS mechanisms even though governments might claim there were scientifically sound public health and environmental reasons behind the implementation of the former strategies.

### ***18.7.3 Can ISDS Be Reformed to Not Limit the Capacity of Artificial Photosynthesis to Transform the Global Food Industry?***

ISDS enables foreign investors to sue governments for compensation in an international tribunal if they can claim that a domestic law or policy “harms” their investment, not just by actual expropriation but by “indirect expropriation” of their investments defined in a very broad sense. The OECD estimates an average of \$8 million per ISDS case, with some cases costing up to \$30 million) and the compensation awarded to foreign investors, (often hundreds of millions and in some cases billions of dollars) can discourage governments from proceeding with legitimate domestic legislation. The highest compensation award so far is \$1.8 billion against the government of Ecuador. The disputes are heard by international investment tribunals, which lack the safeguards of national legal systems, such as public disclosure, judicial independence a body of jurisprudence requiring the following of precedents encouraging certainty and predictability in the application of law, coherence with laws emerging from democratic processes such as legislation and referenda.

A new industry has arisen where corporate third parties invest in a claim in return for a portion of the damages, has been encouraged by large investment law firms which actively solicit business and encourage large claims.

Increasing numbers of governments are reviewing and terminating their involvement in ISDS. These include members of the European Union like France and Germany (European Parliamentary Research Service 2014) Brazil, Argentina and eight other countries in Latin America, India and South Africa. Indonesia has recently announced it will terminate all 67 of bilateral investment treaties (Bland

and Donnan 2014; Gaukrodger and Gordon, OECD, 2012, p. 7, European Parliamentary Research Service 2014, p. 2, Bland and Donnan 2014).

In June 2013 the United Nations Conference on Trade and Development (UNCTAD) issued a report on reforming investor-state dispute settlement which highlighted concerns including a “perceived deficit of legitimacy and transparency,” “contradictions between arbitral awards,” “difficulties in correcting erroneous arbitral decisions,” “questions about the independence and impartiality of arbitrators,” and “concerns relating to the costs and time of arbitral procedures” Recommendations for reform included (1) Promoting alternative dispute resolution (2) Tailoring the existing system through individual IIAs (3) Limiting investor access to ISDS (4) Introducing an appeals facility and (5) Creating a standing international investment court. These are all measures worth examining if ISDS is not to inhibit the capacity of globalized artificial photosynthesis to transform the global food industry.

## 18.8 Planetary Nanomedicine and the Sustainocene

### 18.8.1 *Planetary Medicine*

Planetary medicine is now a growing field in which the expertise of medical professionals is directed towards issues of global health and environmental protection, particularly including climate change (Vines et al. 2013; Faunce 2012a). A Global Artificial Photosynthesis (GAP) Project could well be promoted through domestic and international media as a defining symbolic endeavour of planetary nanomedicine (Faunce 2010a, b). One significance of this for artificial photosynthesis researchers is that funding agencies respond indirectly to public and governmental national interest concerns and nanotechnology, despite its great promise, still has a problematic place in the popular imagination owing to safety issues. A GAP Project therefore represents an excellent opportunity to create a high profile awareness of nanotechnology as a positive contributor to overcoming major contemporary public health and environmental problems.

The process of photosynthesis is as central to life on earth as DNA; thus there are likely to be similar major debates over whether patents should be allowed over any part of the photosynthetic process. Such a debate will be unlikely to inhibit patents being taken out over many aspects of a functional artificial photosynthetic process.

A larger issue for such governance approaches is that nanotechnology, despite its great scientific novelty and promise, still has a problematic place in the popular imagination owing to unresolved safety issues (Faunce 2008). A macrosience project to promote equitable global use of artificial photosynthesis therefore represents an excellent opportunity to create a high profile awareness of nanotechnology as a positive contributor to overcoming major contemporary public health and environmental problems. Provided an appropriate ethical regulatory structure was

in place, such a project could well be promoted through domestic and international media as a defining symbolic endeavour of planetary nanomedicine.

### ***18.8.2 The Sustainocene***

One suggestion is that to achieve a transition from Corporatocene governance models, which conceptualises nature, people and animals as inputs to be exploited in the pursuit of profit maximisation, international food law and policy needs to become more coherent with a vision for humanity that is congruent with its most noble aspiration, resembling the process that occurred after WWII with the establishment of the international human rights regime. One such vision is encompassed by the term Sustainocene.

The term ‘Sustainocene’ was coined by the Canberra-based Australian physician Furnass (2012). It has been developed to encompass a billion year period (if humanity ultimately is to justify a characterisation as an ethical species and repay the evolutionary legacy of life on this planet) where governance structures and scientific endeavour coordinate to achieve the social virtues of ecological sustainability and environmental integrity (Faunce 2012c). It is a vision coherent with influential writings such as those of eco-economists such as the EF Schumacher (with his concept of ‘small (and local) is beautiful’) and Kenneth Boulding (with his idea of ‘Spaceship Earth’ as a closed economy requiring recycling of resources) as well as Herman Daly with his notion of ‘steady state’ economies drawing upon the laws of thermodynamics and the tendency of the universe to greater entropy (dispersal of energy) (Faunce 2012c, d).

One area of academic research and policy development that fits well with ‘Sustainocene’ thinking is that centred on the idea that this planet should be treated not just as a distinct living entity (James Lovelock’s Gaia Hypothesis), but as a patient (Lovelock 1991). ‘Planetary medicine’ as this field has become known has become a symbolic rubric focusing not just public and governmental attention on the interaction between human health, technological development and sustainability of the biosphere (Faunce 2012a). In this emerging discipline, characteristic features of the Corporatocene epoch such as climate change and environmental degradation, as well as gross societal imbalances in poverty as well as lack of necessary fuel, food, medicines, security and access to nature, are targeted as intrinsically global pathologies the resolution of which requires concerted efforts to implement a wide range of not just renewable energy technologies (such as nanotechnology-based artificial photosynthesis as will be discussed later) but ethical principles including those related to protecting the interests of future generations and preservation of biodiversity (Faunce 2012a).

## 18.9 Conclusion<sup>1</sup>

Moving into the twenty-first Century, humanity is faced with a stark choice in its ongoing governance of the environment. Since the Industrial Age, the dominant management model has been one of continuous exploitation where the environment, minerals, food products, animals and even people have been characterised and often used as mere inputs to profit. The gradual rise of corporations through the nineteenth century has effortlessly facilitated the pursuit of profit maximisation as the mantra of neo-classical economics. In setting the profit motive as the highest “good”, corporations have thus set themselves against all those members of society that do not consume; the unemployed, the elderly, the animals and most particularly natural resources themselves.

These seeds of corporate design came to full flower in the twentieth century with the rise of global agribusinesses, State-corporate partnerships and market ideologies that permitted corporate concentration in key industries to generate anticompetitive and deceptive practices to the detriment of consumers, animals and the environment.

While States are attempting to mitigate the most egregious forms of market manipulation and consumer deception (Bruce 2013), a far more wide-ranging philosophical and culture shift in corporate governance is required. We believe a focus on global artificial photosynthetic technology can form a key element of the required shift.

However, no matter how significant the vision or advanced the science, the governance challenges of moving to a Global Artificial Photosynthesis (GAP) Project are considerable (Faunce 2012a). One model of a Sustainocene powered by solar fuels involves bio-mimetic polymer photovoltaic generators plugged in to the national electricity grid to power hydrogen fuel and waterless agriculture, chemical feedstocks and polymers for fibre production. This model has the advantage of the ‘light’ and ‘dark’ reactions being uncoupled in relation not only to energy/material flow balance, but also to the requirement to be co-located in space. Such an uncoupling will vastly extend the area for capturing light over otherwise barren land, and also allow the elimination or reduction of molecular oxygen in solar fuel reactions, enhancing longevity of the components. A model which the author favours emphasizes the greater potential for individual and community economic autonomy implicit in micro or local generation of fuel and food through solar fuel products installed as a policy priority on domestic dwellings and vehicles (Vines et al. 2013; Faunce 2012b). Large GSF facilities providing fuel for industry or backup supply can still be preferentially located under such a model near large sources of seawater, CO<sub>2</sub>, waste heat, high solar irradiation and proximity to end use facilities. In the longer term every human engineered structure on the planet will have a built in artificial photosynthetic capacity allowing it to be a positive contributor to the biosphere—improving the atmosphere, providing fuel and basic

food and fertilizer. There is a simple public policy message at the core of a vision such as that of the Sustainocene. It involves telling people that nanotechnology will be used to make buildings function like trees. A device that can do this and is available to cheap purchase and installation, like the mobile phone or internet, could rapidly transform society to one that is more community and values-oriented.

# Part III

## European Food Law

Raymond O'Rourke

This section is vital to understand the European precautionary principle, and especially to compare EU food law and regulation to the US and BRICS countries. The Treaty of Rome (1958) made no explicit mention of consumer protection or public health and these goals were only subsequently added as amendments to Article 3 by the Single European Act and the Maastricht Treaty. In that case, European Food Law developed piece-meal over a long period of time. In the early years, there was no central unifying text setting out the fundamental principles of European Food Law that would clearly define the obligations of those involved at every stage of the food production chain. The first EU food Directive, which was concerned with colours in foodstuffs, was adopted by the Council of Ministers in 1962. The Directive had no EEC number because at that time there was no formal system for the numbering of EU laws. This was not an auspicious start for the establishment of European Food Law as a major concern of EU legislators.

This part of the book demonstrates clearly that European Food Law has come a long way and is now a major facet of the EU's *acquis communautaire*. The initial approach of the European Commission in relation to European Food Law was to concentrate on the obligations enshrined in Article 3 of the Treaty of Rome to ensure the free movement of foodstuffs throughout the common market. The famous *Cassis de Dijon* ECJ case was the embodiment of this approach establishing the 'mutual recognition' principle whereby a foodstuff marketable in a Member State should be marketable in all other EU Member States. Trade is still an important aspect of European Food Law and this is covered by Dr. Roland Kölcsey and Dr. Livia Hullo in Chap. 21. This emphasis on trade was undermined by the BSE and Belgian Dioxin crisis. After much debate amongst Member States and the European Parliament the outcome was EU Regulation 178/2002 which established General Principles of European Food Law, re-orientated the Rapid Alert System and established the European Food Safety Authority (EFSA) in Parma. These major developments in European Food Law are covered by Dr. Gunnar Sachs and Avv. Giorgio Rusconi in Chaps. 19 and 20.

Other interesting aspects of European Food Law are covered in subsequent chapters. New issues that are being discussed in relation to European Food Law such as food waste and transparency issues are covered respectively by Prof. Dr. Mr. H.J. Bremmers, Prof. Dr. Bernd van der Meulen in Chap. 24 and by Atty. Nicola Conte-Salinas and Atty. Rochus Wallau in Chap. 25. No book dealing with European Food Law could neglect the issue of Food Labelling and this issue is covered by Atty Nicola Conte-Salinas and Avv. Aude Mahy in Chap. 22. In Chap. 23, Atty. Raymond O' Rourke discusses the role of the consumer in European Food Law and contrasts the maximum harmonisation approach of the EU in relation to Food Law to the minimum harmonisation approach to Consumer Law.

The last section of this part covers food laws in different European countries—some are EU Member States others are not. Adv Magnus Friberg covers Sweden in Chap. 26; Dr. Gunnar Sachs covers Germany within the wider European context in Chap. 19; Avv. Giorgio Rusconi covers Italy in the context of food safety in Chap. 20; and Atty. Marie Vaale-Hallberg and Atty. Nina Lindbach cover Norway in Chap. 27.

This section of the book demonstrates clearly that European Food Law has become in the wake of the BSE & Belgian Dioxin crisis a major tenet of EU Law. It is now on a par with EU Competition Law or EU Environmental Law. Food safety in the guise of consumer protection and public health has become the defining reason for any new prospective EU food regulation or directive. Trade has not been forgotten and still plays a major role in relation to European Food Law in particular in the international field. There have been important WTO cases taken against Europe over cattle growth promoting hormones, GMOs and chlorinated chicken.

These cases demonstrate a difference between a science-based food law model in the USA & Canada and a science-based plus consumer protection food law model in the European Union. This divergence is aptly demonstrated in the present on-going negotiations between the USA and EU over a Transatlantic Trade and Investment Partnership (TTIP).

Many in Europe in particular consumer and environmental NGOs and a large number of Members of the European Parliament and some Member States are concerned TTIP's "regulatory convergence" agenda will seek to bring EU standards on food safety closer to those of the USA. However, the USA does not demand mandatory labelling of foodstuffs containing genetically modified ingredients; has far laxer restrictions on the use of pesticides; permits the use of growth hormones in its beef which are banned in Europe—there is a concern that in an effort to enhance EU-US trade the emphasis on consumer protection and public health in European Food Law will be watered down. Without understanding the origin and basis of European Food Law as detailed in this part, you will not be able to understand why there is such a divergence between the USA and EU on this area of law—an area of law few would initially think could be so controversial.

# Chapter 19

## Introduction to European Food Law and Regulation

Gunnar Sachs

**Abstract** European food law provides for strict legal standards for foodstuffs, food ingredients and food packaging as well as for food labeling and advertising. Food manufacturers and distributors are therefore well advised to acquaint themselves with the applicable legal prerequisites before placing their products on the European market. Non-compliance with the pertinent requirements can have severe consequences, ranging from administrative fines via product withdrawals or recalls up to sensitive product liability. Relevant principles of European food law will be discussed and presented, including some fundamental rules on food labeling, packaging, hygiene, advertising and marketing, ingredients, required authorizations, health and nutrition claims, product liability and recalls.

### 19.1 Introduction

With more than 500 million citizens in 28 Member States, the European Union is one of the largest food markets in the world. According to the European Commission, the huge size of the European common market enables the food industry to constantly increase their productivity and to make more effective use of economies of scale.<sup>1</sup> Therefore, it is important to understand European food law, regulation and policy as part of the global food law system.

G. Sachs (✉)

Attorney-at-law, Maître en droit (Paris), Clifford Chance, Düsseldorf, Germany

e-mail: [Gunnar.Sachs@CliffordChance.com](mailto:Gunnar.Sachs@CliffordChance.com)

### ***19.1.1 The European Food Market: Facts and Figures***

Today, the food industry is the second largest sector in the European manufacturing industry with a market share of more than 12 % and more than 14 % of the European manufacturing turnover. Germany, France, Italy, Spain and the UK account for 70 % of the food industry's total turnover. More than 310,000 companies belong to the food sector and provide jobs for more than 4 million people. The European food market had a stable growth in the last 15 years in both production and value added.<sup>2</sup>

The European food industry is the largest food exporter in the world with more than 20 % share in world exports and the second largest food importer with more than 18 % share in world imports. As to value added growth in food industries, the European food market ranks directly behind Brazil and China and before Australia, the United States of America, Canada and Japan.<sup>3</sup>

The most important food processing sub-sectors in Europe are, in order of their respective market shares, the meat industry followed by grain based, starch and further processed products, dairy produce, sugar and sugar based products, processed fruits and vegetables, oils and fats as well as fish and seafood. The European beverage industry is a global market leader with the largest production in the world and nearly 75 % share in world exports.<sup>4</sup>

### ***19.1.2 Europe: A Highly Regulated Market***

Europe is a highly regulated market. All consumer products including foodstuffs, food supplements, food contact materials, feedstuffs, pharmaceuticals, medical devices, cosmetics, biocides, textiles, electronic devices, toys, baby and children's articles are subject to harmonized rules providing for the same legal standards in all European Member States. As to foodstuffs and food supplements, there are harmonized requirements regarding, amongst others, product presentation and labeling, packaging, hygiene, advertising and marketing, ingredients, additives, flavorings and enzymes, authorization proceedings, good manufacturing practice, safety assessment, borderline products, functional food, dual use, health and nutrition claims, product risk management, consumer information as well as market surveillance.

There are four central principles of harmonized European food law. First, there is an assurance of a high level of protection of human health and consumers' interest in relation to food. Secondly, the variety in the supply of food, including

---

<sup>2</sup>Ibid and European Commission (2014).

<sup>3</sup>Commission of the European Communities (2009).

<sup>4</sup>Ibid.

traditional products is taken into account. Third, the law ensures the effective functioning of the internal market. Lastly, there is an approximation and resemblance of the laws, regulations and administrative provisions of the Member States.<sup>5</sup>

In view of these principles, European food law and policy provide for strict harmonized standards for foodstuffs and food supplements. Food manufacturers and distributors should, therefore, acquaint themselves with the applicable requirements before placing their products on the European common market. In the following sections, some major prerequisites of European food law and policy are discussed and presented, including rules on food hygiene, ingredients, labeling, packaging, authorization procedures, advertising and consumer rights.

## 19.2 Food Hygiene

In Europe, food manufacturers and distributors are subject to a strict regulatory regime of harmonized rules on food hygiene that are either directly applicable in the European Member States or have been transposed into their respective national laws. In 2004, the European legislator has fundamentally reformed the pan-European law on food hygiene by adopting three major laws. These laws are Regulation (EC) No. 852/2004 on the hygiene of foodstuffs; Regulation (EC) No. 853/2004 which sets specific hygiene rules for food of animal origin; and Regulation (EC) No. 854/2004 which states specific rules for the organization of official controls on products of animal origin intended for human consumption.

All three regulations are part of the so-called European “hygiene package” providing hygiene rules for foodstuffs. The “hygiene package” is supplemented by additional laws. The Regulation (EC) No. 178/2002 asserts the general principles of food law, establishing the European Food Safety Authority and laying down procedures in matters of food safety. The Regulation (EC) No. 882/2004 establishes the official controls performed to ensure the verification of compliance with feed and food law, animal health and animal welfare rules. The Directive 2002/99/EC describes the animal health rules governing the production, processing, distribution and introduction of products of animal origin for human consumption whereas the Commission Regulation (EC) No. 2073/2005 discusses the microbiological criteria for foodstuffs. Furthermore, the Commission Regulation (EC) No. 2074/2005 specifies implementing measures for certain products under Regulation (EC) No. 853/2004 and for the organization of official controls under Regulation (EC) No. 854/2004 and Regulation (EC) No. 882/2004. The Community legislation on food hygiene seeks to ensure the hygiene of foodstuffs at all stages of the production and

---

<sup>5</sup>Cf. Regulation (EC) No. 178 (2002).

supply chain by requiring food processors to follow the principles of Hazard Analysis and Critical Control Points (HACCP). HACCP was introduced by the Codex Alimentarius of the United Nations Food and Agriculture Organization that set international food standards.

### ***19.2.1 General Requirements Regarding the Hygiene of Foodstuffs***

According to the European Regulation (EC) No. 852/2004 on the hygiene of foodstuffs, all food business operators shall ensure that the processing and handling of foodstuffs is in accordance with the standards set by the Regulation at all stages in the production and supply chain for which the respective food business operators are responsible. Regulation (EC) No. 852/2004 provides for, inter alia, general hygiene requirements to be fulfilled by food business operators (other than at the level of primary production). These requirements include food premises, transport, equipment, packaging, heat treatment, food waste, water supply, personal hygiene of persons getting in contact with food and training of food workers. In particular, food business operators (other than at the level of primary production) shall apply, first of all, the principles of the HACCP.

### ***19.2.2 Traceability***

In accordance with the European Regulation (EC) No. 178/2002, which established the general principles of food law, food business operators shall develop traceability systems for foodstuffs, food ingredients and, where appropriate, for animals used for food processing. In case of any foodstuff presenting a serious risk to consumer health, the hazardous foodstuffs may immediately be withdrawn from the market and users or competent authorities may immediately be informed.

### ***19.2.3 Approval and Registration***

Pursuant to the European Regulation (EC) No. 853/2004, all food operators processing or handling foodstuffs of animal origin (except for those engaged only in primary production) have to be approved by the competent authorities of their respective Member States. After approval, the respective food companies shall be

listed in the national register of approved food companies kept by their respective Member States. The companies are also given an approval number with additional codes indicating the type of products of animal origin manufactured. However, Regulation (EC) No. 853/2004 only applies to food production, processing, distribution, transport, and the other listed areas of products requiring temperature-controlled storage conditions and to those retail operations explicitly subject to this Regulation.

#### ***19.2.4 Specific Requirements for Foodstuff of Animal Origin***

The European Regulation (EC) No. 853/2004 applies to unprocessed and processed foodstuff of animal origin but not to foods consisting partly of products of plant origin or, unless expressly indicated to the contrary, to the retail trade or primary production for private consumption for which the provisions of Regulation (EC) No. 852/2004 are sufficient.

Apart from establishing hygiene rules for food of animal origin, Regulation (EC) No. 853/2004 also specifies rules concerning microbiological criteria for foodstuffs, temperature control and compliance with the cold chain, sampling and analysis, where appropriate. Pursuant to this Regulation, for example, live bivalve mollusks and fishery products harvested from the wild and intended for human consumption must comply with high hygiene standards applicable at all stages of the production chain. Community legislation sets out specific hygiene standards regarding, inter alia, the transport, wrapping, labeling and storage, dispatch, purification and processing plants, essential equipment, freshness and viability of bivalve mollusks, microbiological criteria, presence of marine bio-toxins and harmful substances in relation to the permissible daily intake, health marking, conditions of hygiene during and after the landing of fishery products, protection against any form of contamination, fresh and frozen products, mechanically separated fish flesh, endo-parasites harmful to human health, cooked crustaceans and mollusks as well as processed fishery products.

Foodstuffs imported into the European Union must comply with the Community prerequisites for food hygiene or with equivalent standards. In order to guarantee a high level of food safety and public health, the European Commission keeps lists of non-EU member countries from which imports of products of animal origin are permitted. In addition, the Commission keeps up-to-date a list of establishments from which products of animal origin may be imported or dispatched. Foodstuffs of animal origin exported out of the Community shall at least comply with the requirements that would apply if they were marketed within the Community, as well as to any requirements that may be imposed by the importing country.

### ***19.2.5 Specific Requirements for Organic Foodstuff***

According to Regulation (EC) No. 834/2007, the production and distribution of organic products on the European market is subject to a strict certification process. Both farmers and processors of organic foodstuff are subject to inspections by the competent authorities to ensure their compliance with applicable organic food legislation. Before operators are granted organic certification and their goods can be labeled as organic, they have to undergo a conversion period of at least 2 years. Once the conversion process has been completed, farmers and food processors continue to be subjected to annual inspections. Each European Member State has established its own inspection scheme and designated specific public authorities and/or approved private inspection bodies to carry out the inspection and certification of organic production. In the case of operators not complying with the applicable legal requirements, their organic certification can be withdrawn and their right to market their products as organic be removed.

According to Regulation (EC) No. 834/2007 any terms such as “organic”, “bio”, “eco” and the like may not be used for non-organic products or products that contain genetically modified organisms (GMO). Since 1 July 2010, the use of the European organic logo is mandatory for pre-packaged food. The European logo may only be used for foodstuffs if (i) at least 95 % of the product’s ingredients of agricultural origin have been organically produced, (ii) the product complies with the rules of the official inspection scheme, (iii) the product came directly from the producer or processor in a sealed package and (iv) the product bears the name of the producer, the preparer or vendor and the name or code of the inspection body.

### ***19.2.6 Official Controls on Products of Animal Origin Intended for Human Consumption***

The European Regulation (EC) No. 854/2004 lays down specific rules for the organization of official controls on products of animal origin intended for human consumption. The official controls include audits of good hygiene practices and HACCP principles as well as specific food sector-related controls (*e.g.* for milk and dairy products). Food business operators have to assist the competent authorities in their control by granting access to premises, documentation and records. Establishments that comply with the European regulations on food hygiene are formally approved by the respective authorities.

### 19.3 Food Ingredients

In 2008, the European Commission fundamentally reformed the pan-European legislation on food additives, flavorings and food enzymes by adopting the so-called “Food Improvement Agents Package” (FIAP). The FIAP includes Regulation (EC) No. 1331/2008 which institutes a common authorization procedure for food additives, enzymes and flavorings<sup>6</sup>; Regulation (EC) No. 1333/2008 on food additives<sup>7</sup>; Regulation (EC) No. 1334/2008 on food flavorings and certain food ingredients with flavoring properties for use in and on foods<sup>8</sup>; and Regulation (EC) No. 1332/2008 on food enzymes.<sup>9</sup> The FIAP Regulations are directly applicable in all European Member States and have successively repealed former European Directives on food additives, flavorings and enzymes (Directives 89/197/EEC,<sup>10</sup> 94/35/EC,<sup>11</sup> 94/36/EC<sup>12</sup> and 95/2/EC), respectively.<sup>13</sup> In addition, the FIAP Regulations provide for rules regarding the use, labeling<sup>14</sup> and maximum quantities of food additives, flavorings and enzymes as well as for reporting requirements. For instance, a producer or user of a food additive shall inform the Commission immediately of any new scientific or technical information which might affect the safety assessment of the respective food additive.<sup>15</sup>

According to the respective European legislation, food additives, flavorings and enzymes may only be placed on the market and added to food if they are previously approved by the European Commission and included in a Community list of authorized substances. The list will be regularly updated by the Commission and shall comprise of only those substances that comply with the respective sectoral food laws provided for in the Regulations on additives, flavorings and enzymes. In contrast, substances not allowed for use in foodstuffs shall be listed in separate “black lists”, such as Annex III of Regulation (EC) No. 1334/2008.

<sup>12</sup>*Ibid.*, pp. 13–29.

<sup>13</sup>OJ L 61 (1995), pp. 1–40.

<sup>14</sup>Cf. *Hagenmeyer* (2010), p. 3 et. seq.

<sup>15</sup>Cf. Regulation (EC) No. 1333 (2008), Art. 26 Para. 1.

### 19.3.1 *The Regulation (EC) No. 1333/2008 on Food Additives*

The new FIAP Regulation on food additives is applicable since 20 January 2010.<sup>16</sup> It covers various food additives including acids, acidity regulators, anti-caking agents, anti-foaming agents, antioxidants, bulking agents, carriers, colors, preservatives and sweeteners.<sup>17</sup> In contrast, processing aids, substances used for the protection of plants and plant products, nutrients added to food, substances used for the treatment of water and flavorings are only covered by the respective Regulation if they are used as food additives.<sup>18</sup>

Pursuant to Art. 3 Para. 2 lit. a) of the new Regulation, “food additive” means any substance not normally consumed as a food in itself and not normally used as a characteristic ingredient of food, whether or not it has nutritive value, the intentional addition of which to food for a technological purpose in the manufacture, processing, preparation, treatment, packaging, transport or storage of such food results, or may be reasonably expected to result, in it or its by-products becoming directly or indirectly a component of such foods.<sup>19</sup>

Art. 3 Para. 2 lit. a) contains, moreover, a list of certain substances that are not considered to be food additives (even if the criteria mentioned above should apply). This exclusion includes any substances used in covering or coating materials that do not form part of foods and are not intended to be consumed together with those foods. It also excludes any chewing gum bases and blood plasma, edible gelatin or protein hydrolysates and their salts, milk protein and gluten.<sup>20</sup>

According to Regulation (EC) No. 1333/2008, food additives may only be placed on the market and added to food if previously approved by the European Commission and included either in a Community list of authorized additives or in a list of food additives for use in other additives and food enzymes.<sup>21</sup> Food additives shall only be approved and included in such lists if they do not cause any safety concerns to consumer health, if their application is justified by a reasonable technological need that cannot be fulfilled in another economically and technologically feasible way, and if their use is not deceptive for the consumer.<sup>22</sup> Thus, before including food additives into said lists, the Commission had to re-examine all existing authorizations to ensure compliance with this criteria.<sup>23</sup> Food additives

<sup>16</sup>Regulation (EC) No. 1333 (2008), Art. 35.

<sup>17</sup>Ibid, Annex I; cf. *Bertling*, in: *Streinz*, l.c., no. 161d.

<sup>18</sup>Ibid, Art. 2 Para. 2.

<sup>19</sup>Id. Art. 3 Para. 2.

<sup>20</sup>For the complete list see *ibid*, Art. 3 Para. 2 lit.

<sup>21</sup>Ibid, Art. 4 Para. 1 and 2 (in connection with annexes I and II).

<sup>22</sup>Ibid, Art. 6 Para. 1 lit. a)–c); cf. *Bertling*, in: *Streinz*, l.c., no. 161 f.

<sup>23</sup>Regulation (EC) No. 1333 (2008), Art. 30 Para. 1.

that have been authorized before 20 January 2009 should also be assessed by the European Food Safety Authority (EFSA).<sup>24</sup>

The Community food additives list has been adopted by Regulation (EU) No. 1130/2001 of 11 November 2011 amending Annex III to Regulation (EC) No. 1333/2008 on food additives by establishing a Union list of food additives approved for use in food additives, food enzymes, food flavorings and nutrients. Until the Community list was accomplished, the Annexes to Directives 94/35/EC, 94/36/EC and 95/2/EC on colors, sweeteners and other food additives for use in foodstuffs as well as the respective national legislation based thereon remained in force and were regularly updated.<sup>25</sup> Moreover, the composition of all food additives placed on the market had to comply with the prerequisites of the consolidated Directives 2008/84/EC,<sup>26</sup> 2008/60/EC<sup>27</sup> and 2008/128/EC<sup>28</sup> which required specific purity criteria concerning sweeteners, colors and other food additives for use in foodstuffs.

Once a food additive has been included in a Community list, any considerable change in its raw materials or in its production methods means that the additive produced in this way is considered to be a new and different one.<sup>29</sup> Thus, before being placed on the market, such new additive must be submitted to EFSA for a separate health risk assessment.<sup>30</sup>

### ***19.3.2 The Regulation (EC) No. 1334/2008 on Flavorings and Certain Food Ingredients with Flavoring Properties for Use in and on Foods***

The FIAP Regulation on flavorings applies since 20 January 2011.<sup>31</sup> Some provisions, however, applied from a later date.<sup>32</sup> Foodstuffs placed on the market or labeled before 20 January 2011 which did not comply with the Regulation could be distributed until expiration of their date of minimum durability or use-by-date.<sup>33</sup>

The Regulation applies to all flavorings used to provide food with taste and/or odor such as flavorings which are used or intended to be used in or on foods, without prejudice to more specific provisions laid down in Regulation (EC) No. 2065/

---

<sup>24</sup>Regulation (EC) No. 1333 (2008) Art. 32 Para. 1.

<sup>25</sup>Regulation (EC) No. 1333 (2008), Art. 34.

<sup>26</sup>OJ L 253 (2008), pp. 1–175; OJ L 44 (2009), pp. 62–78.

<sup>27</sup>OJ L 158 (2008), pp. 17–40.

<sup>28</sup>OJ L 6 (2009), pp. 20–63.

<sup>29</sup>Regulation (EC) No. 1333 (2008), Art. 12.

<sup>30</sup>Ibid, Art. 12, 10.

<sup>31</sup>Ibid, Art. 30; cf. *Bertling*, in: *Streinz*, I.c., no. 166.

<sup>32</sup>Regulation (EC) No. 1334 (2008), Art. 30.

<sup>33</sup>Ibid.

2003.<sup>34</sup> Additionally, the Regulation is applicable to food ingredients with flavoring properties, food containing flavorings and/or food ingredients with flavoring properties; and any source materials for flavorings and/or source materials for food ingredients with flavoring properties.<sup>35</sup>

For the purposes of the Regulation, “flavorings” mean any product that is not intended to be consumed as such, added to food in order to impart or modify odor and/or taste and made or consisting of flavoring substances, flavoring preparations, thermal process flavorings, smoke flavorings, flavor precursors or other flavorings or mixtures thereof.<sup>36</sup> Substances which have exclusively a salty, sour or sweet taste as well as raw foods, smoke flavorings, mixtures of spices and/or fresh, dried or frozen herbs, tea mixtures and mixtures for infusion are only covered by the Regulation if they are used as food ingredients.<sup>37</sup>

The Regulation prohibits, in particular, any marketing or use of flavorings that do not comply with specific purity criteria and maximum amounts of dangerous or undesirable substances.<sup>38</sup> Moreover, according to the Regulation, an evaluation and approval is required for specific flavorings and source materials, for example, flavoring substances, several flavoring preparations of vegetable, animal or microbiological origin or even some thermal process flavorings obtained by heating ingredients.<sup>39</sup> These flavorings and source materials have to be approved by the Commission and included into a Community list and may only be placed on the market and used in or on food after such approval and in accordance with the conditions of use specified in such list.<sup>40</sup>

However, such restrictions applied only from 18 months after the date of application of the Community list.<sup>41</sup> Before including flavorings in the Community list, they were also subject to an EFSA assessment.<sup>42</sup> Some flavorings or food ingredients with flavoring properties may be used in or on food even without being subject to a previous assessment and authorization by EFSA and the Commission if they do not cause any risk for human health and if their use is not deceptive for the consumer.<sup>43</sup>

<sup>41</sup>Regulation (EC) No. 1334 (2008), Art. 30.

<sup>42</sup>Ibid, Art. 12 Para. 1.

<sup>43</sup>Ibid, Art. 8.

### 19.3.3 *The Regulation (EC) No. 1332/2008 on Food Enzymes*

The Regulation on food enzymes was applied since 20 January 2009. Some provisions were applicable at a later date.<sup>44</sup> According to the Regulation, only food enzymes included in the Community list may be placed on the market and used in foods.<sup>45</sup> Moreover, no food enzyme nor any food in which a food enzyme has been used shall be placed on the market if the use of the food enzyme does not comply with the Regulation and its implementing measures.<sup>46</sup>

Until the application of the Community list, the national provisions regarding the marketing, distribution and use of food enzymes and food produced with food enzymes continued to be applicable in the Member States. The Regulation applies to all enzymes, including those used as processing aids that fulfill a technological function in foods, such as betaglucanase, invertase (E 1103), lysozyme (E 1105) and urease.<sup>47</sup> In contrast, the Regulation is not applicable to food enzymes used in the production of processing aids or of food additives already covered by the Regulation on food additives.<sup>48</sup>

The Community list is established on the basis of applications for authorization submitted to the European Commission and forwarded to EFSA. The applications for authorization had to be submitted to the Commission within a period of 24 months beginning with the enactment of the implementing measures for the Regulation (EC) No. 1331/2008 establishing a common authorization procedure for food additives, flavorings and enzymes.<sup>49</sup>

In addition, Regulation (EC) 1332/2008 sets forth detailed labeling requirements for food enzymes.<sup>50</sup> The labeling requirements differ depending on whether or not food enzymes are intended for sale to the final consumer. Food enzymes or food enzyme preparations not intended to be sold to the final consumer may be marketed only if their packaging contains the following information:

- the name laid down under the Regulation in respect of each food enzyme or a sales description which includes the name of each food enzyme or in the absence of such a name, the accepted name laid down in the nomenclature of the International Union of Biochemistry and Molecular Biology (IUBMB)<sup>51</sup>;
- the statement “for food” or the statement “restricted use in food” or a more specific reference to the intended use;

---

<sup>44</sup>Regulation (EC) No. 1332 (2008), Art. 24 Para. 2 and 3.

<sup>45</sup>Ibid, Art. 4.

<sup>46</sup>Ibid, Art. 5.

<sup>47</sup>Ibid, Art. 18.

<sup>48</sup>Ibid, Art. 2 Para. 2.

<sup>49</sup>Ibid, Art. 7 Para. 3.

<sup>50</sup>Ibid, Art. 10–13; cf. Hagenmeyer (2010), p. 3 et. seq. (5, 7).

<sup>51</sup>Nomenclature Committee of the International Union of Biochemistry and Molecular Biology (1999), p. 264.

- the special conditions of storage and/or use (if necessary);
- a mark identifying the batch or lot;
- instructions for use if the omission thereof would preclude appropriate use of the food enzyme;
- the name or business name and address of the manufacturer, packager or seller;
- an indication of the maximum quantity of each component or group of components subject to quantitative limitation in food;
- the net quantity;
- the activity of the food enzyme(s); and
- the date of minimum durability or use-by-date.<sup>52</sup>

All above-mentioned information must be easily visible, clearly legible, indelible and shall be in a language easily understandable to purchasers.<sup>53</sup> When food enzymes and/or food enzyme preparations not intended for sale to the final consumer are sold mixed with each other and/or with other food ingredients, their packaging or containers shall bear a list of all ingredients in descending order of their percentage by weight of the total product.<sup>54</sup>

Food enzymes intended to be sold to the final consumer are subject to additional labeling requirements. Without prejudice to Directive 2000/13/EC,<sup>55</sup> Council Directive 89/396/EEC<sup>56</sup> and Regulation (EC) No. 1829/2003,<sup>57</sup> food enzymes and food enzyme preparations sold singly or mixed with each other and/or other food ingredients intended for sale to the final consumer may be marketed only if their packaging contains, besides the name of the enzyme or the accepted name such as registered in the nomenclature of the IUBMB, the specific function “for food”, the statement “restricted use in food” or even a more specific reference to the intended food use.<sup>58</sup>

### **19.3.4 Additional Provisions on Food Labeling**

Irrespective of the aforementioned Regulations (EC) 1331/2008, (EC) 1332/2008, (EC) 1333/2008 and (EC) 1334/2008, labeling of food additives, flavorings and enzymes must comply with the general labeling conditions provided in the national legislation implementing [Directive 2000/13/EC](#). The labeling must include all information needed for the identification of the respective substances (i.e. name,

<sup>52</sup>Regulation (EC) No. 1332 (2008), Art. 11 Para. 1.

<sup>53</sup>Ibid, Art. 10 Para. 1.

<sup>54</sup>Ibid, Art. 11 Para. 2 lit. a)–k).

<sup>55</sup>OJ L 109 (2000), pp. 29–42.

<sup>56</sup>OJ L 186 (1989), pp. 21–22.

<sup>57</sup>OJ L 286 (2003), pp. 1–23.

<sup>58</sup>Regulation (EC) No. 1332 (2008), Art. 12 Para. 1; cf. also *Bertling*, in: *Streinz*, l.c., no. 161i.

lot, manufacturer etc.).<sup>59</sup> Moreover, labels of food flavorings must also include either the word “flavoring” or even a more specific name or description and mention either the specific statement “for food”, the statement “restricted use in food” or even a more specific reference to the intended food use.<sup>60</sup> The term “natural” may only be used for substances or preparations derived directly from vegetable stuff or an animal.<sup>61</sup> All of this information must be easily visible, clearly legible, indelible and given in a language easily understood by the consumer.<sup>62</sup>

### ***19.3.5 The Regulation (EC) No. 1331/2008 Establishing a Common Authorization Procedure for Food Additives, Enzymes and Flavorings***

Finally, the Regulation (EC) No. 1331/2008 implements a common authorization procedure for food additives, food enzymes and food flavorings in the Community based on a previous risk assessment by EFSA. It also establishes a regularly updated Community list for each of the three categories of food substances. The European Commission adopted this Regulation after the passage of the FIAP Regulations on food additives, flavorings and enzymes. After the passage of each sectoral food law, EFSA presented a proposal on the data required for risk assessment of the substances concerned to the Commission.<sup>63</sup> Further, EFSA has approved respective guidance documents on food additives<sup>64</sup> and enzymes<sup>65</sup> and prepared a further draft scientific opinion on the data required for the risk assessment of flavorings.<sup>66</sup>

Any common updating of the Community list may be started either directly by the Commission or through an application submitted by a Member State or an interested party. The application must be submitted to the Commission, which will then be forwarded to EFSA for risk assessment. EFSA shall give an opinion on the application within a time limit of 9 months beginning with the receipt of the application.<sup>67</sup> Thus, the common procedure ends by updating the Community list within 9 months of receipt of EFSA’s opinion. In case the Commission requests further information about risk management aspects, this period may be extended.<sup>68</sup>

## 19.4 Food Labeling

On 25 October 2011, the Regulation (EU) No. 1169/2011 of the European Parliament and of the Council on the provision of food information to consumers was adopted. The previous legislation on general food labeling dated back to 1978, and nutrition labeling rules were adopted in 1990. The new Regulation (EU) No. 1169/2011 combined existing rules on food labeling and nutritional information in one act. Regulation (EU) No. 1169/2011 introduced a set of new harmonized food labeling rules. Originally proposed in 2008, the Regulation was the subject of intense negotiations between members of the European Parliament and various European Member States. A compromise was finally brokered under the Hungarian presidency.

Several key aspects of the Commission's proposal were dropped in the negotiations (including placement of mandatory nutrition information on the front of packs, and exempting alcoholic beverages from the ingredient and nutrition labeling requirements). Calls by consumer organizations for a traffic light system giving consumers a visual warning for high fat, sugar or salt content were also dropped, with industry instead arguing in favor of a system of guideline daily amounts (GDA).

### 19.4.1 Mandatory Information

The following information is mandatory for all pre-packed food and must appear in a minimum font size of 1.2 mm (or 0.9 mm for small packets)<sup>69</sup> so that consumers will be able to read food labels “without having to use a magnifying glass” (in the words of former European Commissioner for Health and Consumer Protection, John Dalli):

- the name of the food and a list of its ingredients;
- allergens: allergenic substances (defined as having “a scientifically proven allergenic or intolerance effect”) must be highlighted in the ingredient list; this also applies to non-packaged foods, for example food sold in restaurants or canteens; Member States can decide how to do this in practice;
- the quantity of certain ingredients;
- the net quantity of the food;
- the date of minimum durability or the “use by” date;
- any special storage conditions;
- the name and address of the business responsible for the food within the European Union;

---

<sup>69</sup>Regulation (EU) No. 1169 (2011), Art. 13 Para. 2 and 3.

- the country of origin must appear on a wide range of food (extended from beef, honey, olive oil, and fresh fruit and vegetables to fresh, chilled or frozen pork, lamb, poultry and goat meat) and where failure to indicate the country of origin might mislead the consumer; the Commission has introduced separate implementing rules for this purpose;
- instructions for use (where it would be difficult to make appropriate use of the food without them);
- alcoholic strength by volume for beverages with more than 1.2 % by volume of alcohol;
- a nutrition declaration, including energy content as well as fat, saturated fat, carbohydrate, sugar, protein and salt levels (per 100 g or 100 ml to allow comparisons between products, although the Commission may be given powers to adopt rules on the expression of the nutrition declaration per portion); this must be presented in a tabular format using the agreed minimum font size and following a template that is provided in Annex XV of the Regulation; the Commission may allow the use of pictograms and symbols if this conveys the same level of information to consumers as words and numbers.<sup>70</sup>

The obligation to provide information on food is imposed on the operator under whose name or business name the food is marketed or, if that operator is not established in the European Union, the importer into the European Union.<sup>71</sup>

Member States may require additional mandatory information on grounds of public health, consumer protection or the prevention of fraud. In those cases, they must notify the measures to the European Commission.<sup>72</sup> While many of the harmonized rules on food labeling have been agreed upon and included in the Regulation adopted by European Parliament, the Commission has been tasked with preparing additional measures. With the assistance of the Standing Committee on the Food Chain and Animal Health Committee composed of Member State representatives, the European Commission has done so in the form of delegated acts on the availability of certain mandatory particulars by means other than on the package or on the label such as pictograms or symbols; the list of foods not required to bear a list of ingredients; and the re-examination of the list of substances or products causing allergies, intolerances, or the list of nutrients that may be declared on a voluntary basis. It has also proposed implementing acts on the modalities of expression of one or more particulars by means of pictograms or symbols instead of words or numbers and the manner of indicating the date of minimum durability and the country of origin or place of provenance for meat. Other implementing acts are regarding the precision of the declared values for the nutrition declaration and the expression per portion or per consumption unit of the nutrition declaration.

---

<sup>70</sup>Ibid, Art. 9 Para. 1.

<sup>71</sup>Ibid, Art. 8 Para. 1.

<sup>72</sup>Ibid, Art. 39.

### 19.4.2 *Package Labeling*

The name under which the product is sold, the net quantity of pre-packaged foodstuffs, the date of minimum durability (or, in the case of foodstuffs which, from the microbiological point of view, are highly perishable, the use-by-date) as well as, if mandatory, the alcoholic strength by volume shall appear in the same field of vision. Where a product has been defrosted, this must be stated.<sup>73</sup> Food producers can also include GDAs or use the term “per portion”, once the European Commission has defined portion sizes. The same compulsory information must be provided when food is sold over the Internet or through catalogues. It must be made available to the consumer before the purchase is concluded. This does not apply to food sold in automatic vending machines.<sup>74</sup> There are also other exemptions, including glass bottles intended for reuse which are indelibly marked and which, therefore, bear no label, ring or collar (they must only provide information on the name of the food, any allergens and the net quantity).<sup>75</sup> The exceptions also apply for packaging that is too small to accommodate the mandatory labeling requirements<sup>76</sup> and beverages with alcohol content of more than 1.2% by volume for which no list of ingredients or nutrition declaration is required.<sup>77</sup>

When foodstuffs are pre-packaged, the mandatory labeling shall appear on the pre-packaging itself or at least on a label (e.g. a sticker) attached thereto. In all cases (including the sticker scenario), the respective labeling must be easily visible, clearly legible, indelible, and given in a [language easily understood by the consumer](#). They shall not in any way be hidden, obscured or interrupted by other written or pictorial matter. If a sticker is used, not only the text printed on it but the material as such should be indelible from the package, i.e. not easily removable from the package.

Where pre-packaged foodstuffs are intended for the final consumer but marketed at a stage prior to sale to the final consumer where sale to a mass caterer is not involved, or where pre-packaged foodstuffs are intended for supply to mass caterers for preparation, processing, splitting or cutting up, the mandatory labeling particulars may principally appear on the commercial documents if they either accompany the foodstuffs to which they refer or were sent before or at the same time as delivery.<sup>78</sup> However, the name under which the products are sold, the date of minimum durability (or, if need be, the use-by-date) as well as the name or business name and address of the manufacturer or packager, or of a seller established within the Community shall also appear on the external packaging in which the foodstuffs are presented for marketing. In the case of glass bottles intended for reuse which are

---

<sup>73</sup>Ibid, Annex VI Part A No. 2.

<sup>74</sup>Ibid, Art. 14.

<sup>75</sup>Ibid, Art. 16 Para. 1.

<sup>76</sup>Ibid, Art. 16 Para. 2.

<sup>77</sup>Ibid, Art. 16 Para. 4.

<sup>78</sup>Ibid, Art. 8 Para. 7.

indelibly marked and therefore bear no label, ring or collar and packaging or containers (the largest surface which has an area of less than 10 cm<sup>2</sup>), only the name under which the product is sold, the net quantity and the date of minimum durability (or, if need be, use-by-date) shall be given.

Where foodstuffs are offered for sale to the final consumer or to mass caterers without pre-packaging, or where foodstuffs are packaged on the sales premises at the consumer's request or pre-packaged for direct sale, the Member States shall adopt separate rules concerning the manner in which mandatory labeling is to be shown. The Member States may decide not to require the provision of all or some of the respective particulars provided that the purchaser still receives sufficient information.

### ***19.4.3 List and Quantity of Ingredients***

In general, the quantity of ingredients to be indicated must be expressed as a percentage and correspond to the quantity of the ingredient or ingredients at the time of their use.<sup>79</sup> Only Community provisions may allow for derogations from this principle for certain foodstuffs. The quantity of certain ingredients or categories of ingredients shall only be mentioned in food labeling where the ingredient or category of ingredients concerned appears in the name under which the foodstuff is sold or is usually associated with that name by the consumer. Also if the ingredient or category of ingredients concerned is emphasized on the labeling in words, pictures or graphics or the ingredient or category of ingredients concerned is essential to characterize a foodstuff and to distinguish it from products with which it might be confused because of its name or appearance, then it must be included in the food labeling.<sup>80</sup>

The quantity indication shall appear either in or immediately next to the name under which the foodstuff is sold, or, alternatively, in the list of ingredients in connection with the ingredient or category of ingredients in question. However, the aforementioned labeling requirements for ingredients do not apply, *inter alia*, for ingredients or categories of ingredients where the drained net weight is duly indicated, or the quantities of which are already required to be given on the labeling under other Community provisions. It is also not applicable when such ingredients are used in small quantities for the purposes of flavoring, or which (while appearing in the name under which the food is sold) are not such as to govern the choice of the consumer because the variation in quantity is not essential to characterize the foodstuff or does not distinguish it from similar foods.<sup>81</sup> Given that the content of a number of nutrients varies over the shelf-life of a foodstuff, it is also essential to

---

<sup>79</sup>*Ibid*, Annex VIII No. 3 lit. a).

<sup>80</sup>*Ibid*, Art. 22.

<sup>81</sup>*Ibid*, Annex VIII No. 1.

establish to which point in time the labeled ingredient dosage refers. The decisive point in time could be, in particular, the production date (also referred to as time of use in the manufacture), the date at which the food supplement is put on the market, the end of the shelf-life, the use-by date, or any time until the end of the shelf-life or the use-by date.

Similar to Art. 7 Para. 4 of the former Directive 2000/13/EC of the European Parliament and of the Council of 20 March 2000 on the approximation of the laws of the Member States relating to the labeling, presentation and advertising of foodstuffs,<sup>82</sup> Annex VIII No. 3 lit. a of Regulation (EU) No. 1169/2011 also requires that the quantity of an ingredient indicated on the labeling of foodstuffs should be expressed as a percentage and correspond to the quantity of the ingredient or ingredients at the time of its/their use. The term “use” does not mean the time of consumption of the foodstuff or its ingredients but the processing of the respective ingredient into such foodstuff. Even though the English term “use” itself is rather vague, its denotation can be construed by referring to the corresponding terms in the German and French versions of the former Directive 2000/13/EC and of Annex VIII to Regulation (EU) 1169/2011 (“Verarbeitung”/“Verwendung” and “mise en œuvre”).<sup>83</sup> This interpretation is also confirmed by Art. 6 Para. 5 of the former Directive 2000/13/EC according to which the list of ingredients should include all ingredients of the foodstuff, in descending order of weight, as recorded at the time of their use in the manufacture of the foodstuff. Pursuant to Art. 7 Para. 6 Directive 2000/13/EC, Art. 7 should apply without prejudice to Community rules on nutrition labeling for foodstuffs.

Consumers expect that food supplements will deliver the amounts of ingredients and nutrients mentioned on the product label at least for a reasonable time after purchasing the respective foodstuff. Whereas most minerals and trace elements are stable over time, the actual quantities of some nutrients (such as most vitamins) are not completely stable and may decline at different stages. Against this background, Art. 9 and 13 Directive 2002/46/EC require the European Commission, assisted by the Standing Committee on the Food Chain and Animal Health, to develop further rules with regard to differences between the values declared on the label and those established in the course of official checks.

Taking into account this situation, several non-governmental organizations have developed specific recommendations on acceptable tolerances for vitamins and minerals in order to improve consistency between declared values and quantities at the products’ end of shelf-life. Some such non-governmental organizations are,

<sup>82</sup>OJ L 109 (2000), pp. 29–42.

<sup>83</sup>Cf. the respective wording in German and French: “Die als Prozentsatz anzugebende Menge entspricht der Menge der Zutat bzw. Zutaten zum Zeitpunkt ihrer Verarbeitung.”/“Die Angabe der Menge einer Zutat oder Zutatenklasse erfolgt als Prozentsatz der Menge der Zutat bzw. Zutaten zum Zeitpunkt ihrer Verwendung” and “La quantité mentionnée, exprimée en pourcentage, correspond à la quantité du ou des ingrédients au moment de leur mise en œuvre.”/“L’indication de la quantité d’un ingrédient ou d’une catégorie d’ingrédients est exprimée en pourcentage et correspond à la quantité du ou des ingrédients au moment de leur mise en œuvre”.

*e.g.*, the Association of the European Self-Medication Industry (AESGP),<sup>84</sup> the European Federation of Health Products Manufacturers Associations (EHPM)<sup>85</sup> and the European Responsible Nutrition Alliance (ERNA).<sup>86</sup> According to their recommendations, levels of variation between 80 and 180 %, shall be reasonable and a pragmatic target for manufacturers of foodstuffs, and should be established standards for circulation of food in the European Union.<sup>87</sup> Thus, ingredient quantities declared on the product label of foodstuffs should not fall outside the recommended ranges at the end of shelf-life. Regarding the time when the ingredient dosage of a foodstuff mentioned on its label shall be part of the product, the aforementioned recommendations differ from the wording of the European rules.

According to the recommendations of AEGSP, EHPM and ERNA, the values declared on the product label should be consistent with the quantities being part of the foodstuff and meet the recommended tolerance ranges at the product's end of shelf-life. In order to comply with the recommended tolerances at the product's end of shelf-life, the quantity of some nutrients that decline rather fast (*e.g.* most vitamins) often must be higher at the date when the foodstuff is put on the market. However, in no case, the nutrient dosages may exceed applicable maximum dosages (*i.e.* upper intake levels). Therefore, in case the original nutrient quantity being part of the food supplement at the date when it is put on the market might exceed such applicable maximum dosages, the end of shelf-life must be adjusted accordingly. However, the recommendations of AEGSP, EHPM and ERNA are not binding. Hence, there is sometimes still a divergence among the European Member States with their respective national recommendations on acceptable ranges of nutrients compared to declared values at the end of shelf-life.

#### ***19.4.4 Rules Against Misleading Labeling***

In order to avoid any misleading of consumers, “imitation foods” (*i.e.* foods that look similar to other foods but are made of different ingredients, such as “cheese-like” foods made with vegetable products) must be clearly labeled on the front of the pack in a prominent font size and next to the brand name. Only mineral water and foods for particular nutritional uses may be claiming properties that prevent, treat or cure a disease.

## 19.5 Food Packaging

Materials and articles intended to come into contact with food and which, in particular, are used to package food, must comply with strict regulatory requirements. Food packaging, therefore, is subject, *inter alia*, to Regulation (EC) No. 1935/2004 of the European Parliament and of the Council of 27 October 2004 on materials and articles intended to come into contact with food<sup>88</sup> and Commission Regulation (EC) No. 2023/2006 of 22 December 2006 on good manufacturing practice for materials and articles intended to come into contact with food.<sup>89</sup> There are also diverse specific provisions applicable on plastic materials and articles intended to come into contact with foodstuffs, where, for example, the Commission Directive 2002/72/EC of 6 August 2002 relates to plastic materials and articles intended to come into contact with foodstuffs.<sup>90</sup> Rules on recycled plastic materials and articles intended to come into contact with foods are denoted in the Commission Regulation (EC) No 282/2008 of 27 March 2008.<sup>91</sup> The Council Directive 82/711/EEC of 18 October 1982 explains the basic rules necessary for testing migration of the constituents of plastic materials and articles intended to come into contact with foodstuffs.<sup>92</sup> The Commission Regulation (EC) No 1895/2005 of 18 November 2005 restricts the use of certain epoxy derivatives in materials and articles intended to come into contact with food.<sup>93</sup> The approximation of the laws of the Member States relating to materials and articles which contain vinyl chloride monomer and are intended to come into contact with foodstuffs is given under the Council Directive 78/142/EEC of 30 January 1978.<sup>94</sup> Lastly, the Council Directive 85/572/EEC of 19 December 1985 provides the list of simulants to be used for testing migration of constituents of plastic materials and articles intended to come into contact with foodstuffs.<sup>95</sup>

All aforementioned Regulations are directly applicable in the European Member States whereas the Directives mentioned above have been transposed into the respective national laws. The Regulations (EC) No. 1935/2004 and (EC) 2023/2006 provide for a general framework and common rules on good manufacturing practice (GMP) for materials and articles intended to come into contact directly or indirectly with food. In contrast, the Regulations (EC) No. 282/2008 and (EC) No. 1895/2005 as well as the Directives 2002/72/EC, 82/711/EEC, 78/142/EEC and 85/572/EEC specify purity requirements, maximum limits on migration, conditions

<sup>88</sup>OJ L 338 (2004), p. 1 et seq.; cf. *Rathke*, in: *Zipfell/Rathke*, Lebensmittelrecht, 154th delivery complement (2013), C Part 1, 102.

<sup>89</sup>OJ L 384 (2006), p. 1 et seq.

<sup>90</sup>OJ L 220 (2002), p. 1 et seq.; cf. *Bertling*, in: *Streinz*, l.c., III C., no. 187g.

<sup>91</sup>OJ L 86 (2008), p. 1 et seq.

<sup>92</sup>OJ L 297 (1982), p. 1 et seq.

<sup>93</sup>OJ L 302 (2005), p. 1 et seq.

<sup>94</sup>OJ L 44 (1978), p. 1 et seq.

<sup>95</sup>OJ L 372 (1985), p. 1 et seq.

of use, testing parameters and marketing prohibitions for plastic materials and articles intended to come into contact with foodstuffs. According to these Regulations and Directives, all respective materials and articles shall comply, in the general interest of food safety, with maximum limits on migration of constituents into or onto food and are subject to strict conditions of use. Besides these European provisions, all materials and articles intended to come into contact with food are also subject to several applicable national food laws.

### ***19.5.1 Regulation (EC) No. 1935/2004 on Materials and Articles Intended to Come into Contact with Food***

Regulation (EC) No. 1935/2004 shall apply to all materials and articles which, in their finished state, are intended to be brought into contact with food, are already in contact with food and were intended for that purpose, can reasonably be expected to be brought into contact with food, or can transfer their constituents to food under normal or foreseeable conditions of use.<sup>96</sup> Moreover, the Regulation introduces specific provisions concerning so-called “active” and “intelligent” food packaging (e.g., packaging that changes color when a foodstuff has expired). “Active” food packaging means materials and articles that are intended to extend the shelf-life or maintain or improve the condition of packaged food.<sup>97</sup> “Intelligent” food contact materials and articles mean materials and articles which monitor the condition of packaged food or the environment surrounding the food.<sup>98</sup> All materials and articles within the sense of Regulation (EC) No. 1935/2004, including active and intelligent packaging, shall be manufactured in compliance with GMP so that they do not transfer their constituents to food in quantities which could endanger human health, bring about an unacceptable change in the composition of the food or result in a deterioration of the organoleptic characteristics thereof.<sup>99</sup> Moreover, the labeling, advertising and presentation of any material or article must not mislead the consumer.<sup>100</sup>

Specific measures such as, criteria of purity, specific conditions of use, limits on the migration of certain constituents into or onto food or provisions for ensuring traceability may be adopted or amended for the groups of materials and articles listed in Annex I of the Regulation and, where appropriate, for all combinations of those materials and articles or recycled materials and articles used in the manufacture of those materials and articles.<sup>101</sup> The respective Annex I list includes, plastics,

---

<sup>96</sup>Regulation (EC) No. 1935 (2004), Art. 1 Para. 2.

<sup>97</sup>Ibid, Art. 2 Para. 2 lit. a.

<sup>98</sup>Ibid, Art. 2 Para. 2 lit. b.

<sup>99</sup>Ibid, Art. 3 Para. 1.

<sup>100</sup>Ibid, Art. 3 Para. 2.

<sup>101</sup>Ibid, Art. 5 Para. 1.

printing inks, varnishes, coatings and wood (see Annex I, no. 10, 11, 15, 17). In the absence of specific measures, the Regulation shall not prevent Member States from maintaining or adopting national provisions.<sup>102</sup> So far, specific measures have been adopted for active and intelligent materials and articles, printing inks, ceramics, regenerated cellulose, rubbers and, in particular, for plastics (see Directives 2002/72/EC and 85/572/EEC, for example). Moreover, without prejudice to the specific measures, materials and articles not yet in contact with food when placed on the market shall comply with specific labeling requirements and be accompanied by (a) the words “for food contact” or a specific indication as to their use, (b) special instructions to be observed for safe and appropriate use, if necessary; and (c) the name or trade name and, in either case, the address or registered office of the manufacturer, processor, or seller responsible for placing on the market established within the Community. The label must also (d) be adequate to ensure traceability of the material or article; and (e) in the case of active materials and articles contain information on the permitted use or uses and other relevant information such as the name and quantity of the substances released by the active component. This will enable food business operators who use these materials and articles to comply with any other relevant Community provisions or, in their absence, national provisions applicable to food, including the provisions on food labeling.<sup>103</sup>

All information required under Art. 15 Para. 1 shall be conspicuous, clearly legible and indelible.<sup>104</sup> However, the information provided for in lit. (a), (b) and (e) above shall be confined only to materials and articles which comply with the general requirements laid down in Art. 3 (GMP/non-misleading labeling, advertising and presentation), with the special requirements for active and intelligent materials,<sup>105</sup> if applicable, and finally, with the specific measures referred to in Art. 5 (for groups of materials and articles listed in Annex I) or, in the absence thereof, with any national provisions applicable to these materials and articles.<sup>106</sup> However, the information referred to in lit. (a) above shall not be obligatory for any materials and articles which, because of their characteristics, are clearly intended to come into contact with food.<sup>107</sup>

At the marketing stages other than the retail stage, the information required under Art. 15 Para. 1 shall be displayed either on the accompanying documents, on the labels or packaging, or on the materials and articles themselves.<sup>108</sup> Art. 15 Para. 4–7 provide for specific labeling requirements in case of retail trade to the end customer. The specific measures referred to in Art. 5 shall in any case require that materials and articles covered by those measures are accompanied by a written

---

<sup>102</sup>Ibid, Art. 6.

<sup>103</sup>Ibid, Art. 15 Para. 1.

<sup>104</sup>Ibid, Art. 15 Para. 3.

<sup>105</sup>Ibid, Art. 4.

<sup>106</sup>Ibid, Art. 15 Para. 9.

<sup>107</sup>Ibid, Art. 15 Para. 2.

<sup>108</sup>Ibid, Art. 15 Para. 8.

declaration of compliance stating that they comply with the rules applicable to them.<sup>109</sup> Further, appropriate documentation shall be available to demonstrate such compliance. Such documentation must be made available to the competent authorities at any time on demand.

Traceability of materials and articles must be ensured at all stages in order to facilitate the control, and recall of defective products, the consumer information and attribution of responsibility.<sup>110</sup> Thus, with due regard to technological feasibility, business operators shall have in place systems and procedures to allow identification of the businesses from which materials or articles and, where appropriate, substances or products covered by this Regulation and its implementing measures used in their manufacture are supplied. That information shall be made available to the competent authorities at any time on demand. The materials and articles placed on the European market shall be identifiable by an appropriate system which allows their traceability by means of labeling or relevant documentation or information. In order to enforce compliance with Regulation (EC) No. 1935/2004 in accordance with all other relevant provisions of European law, the Member States shall carry out official controls.<sup>111</sup>

### ***19.5.2 Directive 2002/72/EC Relating to Plastic Materials and Articles Intended to Come into Contact with Foodstuffs***

Directive 2002/72/EC as well as the respective national laws based thereon apply to all plastic materials, articles and parts thereof consisting exclusively of plastics or composed of two or more layers of materials, each consisting exclusively of plastics, bound together by means of adhesives or by any other means, which (in the finished product state) are intended to come into contact or are brought into contact with foodstuffs and are intended for that purpose.<sup>112</sup> The Directive provides for overall migration limits.<sup>113</sup> According to these limits, plastic materials and articles shall not transfer their constituents to foodstuffs in quantities exceeding 10 milligrams per square decimeter of surface area of material or article (mg/dm<sup>2</sup>). However, the relevant limit shall be 60 milligrams of the constituents released per kilogram of foodstuff (mg/kg) in case of containers or articles which can be filled with a capacity of no less than 500 milliliters (ml) and not more than 10 liters (l), or which can be filled and for which it is impracticable to estimate the surface area in contact with foodstuffs.

---

<sup>109</sup>Ibid, Art. 16.

<sup>110</sup>Ibid, Art. 17.

<sup>111</sup>Ibid, Art. 24 Para. 1.

<sup>112</sup>Directive 72/EC (2002), Art. 1 Para. 2; cf. *Bertling*, in: *Streinz*, l.c., no. 187g.

<sup>113</sup>Directive 72/EC (2002), Art. 2.

Directive 2002/72/EC further lays down specific migration limits, restrictions and specifications for monomers, other starting substances and additives used for the manufacture of plastic materials and articles.<sup>114</sup> Verification of compliance with the specific migration limits shall be carried out in accordance with the testing parameters presented in Directives 82/711/EEC,<sup>115</sup> 85/572/EEC,<sup>116</sup> and further provisions in Annex I of Directive 2002/72/EC.<sup>117</sup> However, verification of compliance shall not be obligatory if it can be established that compliance with the overall migration limits specified in the Directive implies that the specific migration limits are not exceeded or by assuming complete migration of the residual substance in the respective material or article, it cannot exceed the specific limit of migration.

At the marketing stages other than the retail stages, the plastic materials and articles which are intended to be placed in contact with foodstuffs shall be accompanied by a written declaration of compliance with the rules applicable to them.<sup>118</sup> However, this does not apply to plastic materials and articles which, by their nature, are clearly intended to come into contact with foodstuffs.

### ***19.5.3 Regulation (EC) No. 282/2008 on Recycled Plastic Materials and Articles Intended to Come into Contact with Foods***

Regulation (EC) No. 282/2008 applies to recycled plastic materials, articles and parts thereof intended to come into contact with foodstuffs as referred to in Directive 2002/72/EC. This Regulation lays down specific authorization requirements and quality assurance standards for materials and articles containing recycled plastic. Recycled plastic materials and articles shall only be placed on the market if they contain recycled plastic obtained from a recycling process authorized by the Regulation.<sup>119</sup> The authorized recycling process shall be managed by an appropriate quality assurance system that ensures that the recycled plastic complies with the requirements of the authorization process. It follows that, the respective quality assurance system shall comply, in any case, with the detailed rules laid down in the relevant Annex to Regulation (EC) No. 2023/2006 (see below).

After authorization of a recycling process in accordance with this Regulation, the authorization holder or any other business operator using the authorized recycling process under license must comply with any conditions or restrictions

---

<sup>114</sup>Directive 72/EC (2002), Art. 3 et seq. together with Annexes II, III, IV and V.

<sup>115</sup>OJ L 297 (1982), p. 1 et seq.

<sup>116</sup>OJ L 372 (1985), p. 1 et seq.

<sup>117</sup>Directive 72/EC (2002), Art. 8.

<sup>118</sup>Ibid, Art. 9.

<sup>119</sup>Regulation (EC) No. 282 (2008), Art. 3.

attached to such authorization. Any converter using recycled plastic from the authorized recycling process or any business operator using materials or articles containing recycled plastic from the authorized recycling process must comply with any condition or restriction attached to such authorization. Moreover, the authorization holder or any other business operator using the authorized recycling process under license shall immediately inform the European Commission of any new scientific or technical information, which might affect the safety assessment of the recycling process in relation to human health.<sup>120</sup>

In addition to the requirements of Directive 2002/72/EC, the declaration of compliance of materials and articles containing recycled plastic shall confirm that only recycled plastic from an authorized recycling process has been used.<sup>121</sup> Moreover, this declaration shall contain the information that the recycling process has been authorized by listing the relevant EC register number of the authorized recycling process, attesting that the plastic input, the recycling process and the recycled plastic meet the specifications for which the authorization has been granted and, finally, that a quality assurance system according to Regulation (EC) No. 2023/2006 is in place.<sup>122</sup>

#### ***19.5.4 Regulation (EC) No. 2023/2006 on Good Manufacturing Practice for Materials and Articles Intended to Come into Contact with Food***

Regulation (EC) No. 2023/2006 provides the rules on GMP for the groups of materials and articles intended to come into contact with food listed in Annex I to Regulation (EC) No. 1935/2004 and for combinations of those materials and articles or recycled materials and articles used in those materials and articles.<sup>123</sup> The Regulation applies to all sectors and to all stages of manufacture, processing and distribution of materials and articles, up to but excluding the production of starting substances.<sup>124</sup> Any business operator must ensure that manufacturing operations are carried out in accordance with the applicable rules on GMP.<sup>125</sup> The Regulation provides for specific quality assurance standards.<sup>126</sup> Pursuant to these standards, the business operator shall establish, implement and ensure compliance with an effective and documented quality assurance system necessary to certify that finished materials and articles comply with the rules applicable to them.

---

<sup>120</sup>Ibid, Art. 7.

<sup>121</sup>Ibid, Art. 12.

<sup>122</sup>OJ L 86 (2008), pp. 7, 9.

<sup>123</sup>Regulation (EC) No. 2023 (2006), Art. 1.

<sup>124</sup>Ibid, Art. 2 Para. 1.

<sup>125</sup>Ibid, Art. 4 Para. 1.

<sup>126</sup>Ibid, Art. 5.

Moreover, the quality assurance system shall ensure that starting materials are selected and comply with the rules applicable to them and that all operations are carried out in accordance with pre-established specifications, instructions and procedures.<sup>127</sup> This system is supposed to identify measures to correct any failure to achieve GMP. All corrective measures shall be implemented without delay and made available to the competent authorities for inspections.

The Regulation also requires the business operator to establish and maintain appropriate documentation in paper or electronic form with respect to specifications, manufacturing formulae and processing relevant to compliance and safety of the finished material or article. This includes to records covering the various manufacturing operations performed that are relevant to compliance and safety of the finished material or article, as well as the results of the quality control system.<sup>128</sup> Any documentation must be made available by the business operator to the competent authorities at their request at any time.<sup>129</sup>

### ***19.5.5 Rules Against Misleading Packaging***

In general, consumers expect that food packaging will be designed and filled in a way that does not pretend to contain more filling quantity than the actual quantity of the foodstuff contained in the respective packaging. According to this information, a deception of the consumer can only be avoided by a package design which (i) limits the remaining ullage to a necessary minimum or (ii) is transparent so that the actual net quantity can be clearly seen and easily evaluated from the outside or, finally, (iii) makes the actual quantity contained in the package otherwise clearly and easily perceptible from the outside (e.g. by using a striking filling mark or by graphically representing the filling level on the outside of the packaging). European food and food packaging law provides for limits of tolerance for so-called “negative quantity errors”, i.e. for quantities by which the actual contents of a pre-package may be less than the nominal filling quantity. A product is considered to be pre-packed when it is placed in a package of whatever nature without the purchaser being present and the quantity of product contained in the package has a predetermined value and cannot be altered without the package either being opened or undergoing a perceptible modification.<sup>130</sup> In addition, European food and food packaging law prohibits any product packaging which is misleading and deceptive, particularly as to the quantity of the respective product. Pursuant to the pertinent provisions, pre-packaging must not give the consumer the false impression that the packaging contains more than the actual quantity of the respective foodstuff.

---

<sup>127</sup>OJ L 384 (2006), p. 2.

<sup>128</sup>Regulation (EC) No. 2023 (2006), Art. 7.

<sup>129</sup>OJ L 384 (2006), p. 2 et seq.

<sup>130</sup>Directive 76/211/EEC (1976), Art. 2 Para. 2.

**Table 19.1** Directive 76/211/EEC negative error tolerance limits

Nominal quantity (Qn) in grams or milliliters	Tolerable negative errors	
	as of % of Qn	g or ml
Above 5 and less than 25	9	–
From 25 to 50	9	–
From 50 to 100	–	4.5
From 100 to 200	4.5	–
From 200 to 300	–	9
From 300 to 500	3	–
From 500 to 1000	–	15
From 1000 to 10,000	1.5	–

These numeric ranges determine limits of tolerances for so-called “negative errors” of prepackages containing liquid products, whereby the negative error means the quantity by which the actual contents of the pre-package is less than the nominal quantity

The Council Directive 76/211/EEC of 20 January 1976 on the approximation of the laws of the Member States relating to the making-up by weight or by volume of certain pre-packaged products only specifies negative variances. The Directive applies to pre-packages containing products intended for sale in constant unit nominal quantities which are equal to values predetermined by the packer and expressed in units of weight or volume not less than 5 g or 5 ml and not more than 10 kg or 10 L.<sup>131</sup> Directive 76/211/EEC further determines limits of tolerance for so-called “negative errors” of prepackages containing liquid products whereby negative error means the quantity by which the actual contents of the pre-package are less than the nominal quantity.<sup>132</sup> Such negative errors shall only be tolerable within the limits set out in Table 19.1.

## 19.6 Food Authorization Procedures

EFSA strives for the greatest possible transparency in the food authorization procedures it conducts. For this reason, it has a tendency to apply a restrictive interpretation to the relevant confidentiality regulations. This rings particularly true in authorization procedures for nutrition and health claims for foods pursuant to Regulation (EC) No. 1924/2006 of the European Parliament and of the Council of 20 December 2006. Whereas the drafters of the Regulation (EC) No. 1924/2006 had apparently forgotten to include a clear provision on confidentiality protection, the more recent European FIAP Regulations include such provisions.

With regard to the food authorization procedures of EFSA, many applicant food companies are learning by experience that the scientific data and other proprietary

<sup>131</sup>Ibid, Art. 1.

<sup>132</sup>Ibid, Sec. 2.3 et seq. of Annex I.

information they submit with their authorization applications are not being treated confidentially, but are, instead made available to the public. Often, this is due to the fact that the applicant food companies are not familiar with the relevant confidentiality standards and, as a result, do not claim the information and document protection for their authorization documents to which they are actually entitled. Interested companies should, therefore, find out for themselves at an early stage and to what extent, before the respective authorization procedures are launched, the relevant confidentiality standards apply to be able to claim the greatest possible protection for the information they file with their authorization applications.

### ***19.6.1 Limited Data Protection Under the Regulation (EC) No. 1924/2006***

The Regulation (EC) No. 1924/2006 merely contains a section on “data protection” against unauthorized use of the scientific data and other mandatory disclosures submitted by the applicant in the authorization application as part of the health claims authorization procedure by other applicants. Hence, the scientific data and other information may not be used for the benefit of a subsequent applicant for a period of 5 years from the date of authorization if (i) the scientific data and other information had been designated as proprietary by the prior applicant at the time the prior application was made, (ii) such prior applicant had an exclusive right of reference to the proprietary data at the time the prior application was made, and (iii) the health claim could not have been authorized without the submission of the proprietary data by the prior applicant.<sup>133</sup> The proprietary data may not be used by subsequent applicants unless such subsequent applicants have agreed with the prior applicant that such data may also be used for its benefit,<sup>134</sup> or the Commission takes a decision on whether a claim could or could not have been included in the list of authorized health claims even without the submission of data designated as proprietary by the prior applicant.<sup>135</sup>

---

<sup>133</sup>Regulation (EC) No. 1924 (2006), Art. 21.

<sup>134</sup>Ibid, Art. 21 Para. 1.

<sup>135</sup>Ibid, Art. 21 Para. 2.

### ***19.6.2 More Extensive Confidentiality Protection Under the Regulations of the Food Improvement Agents Package***

By contrast, the more recent FIAP Regulations states explicit provisions for comprehensive protection of confidential authorization documents. According to the Recitals of Regulation (EC) No. 1331/2008, the authorization procedure must be transparent and capable of review by the public, but at the same time preserve the confidentiality of certain information of the applicants so as not to impair their competitiveness. Only data relating to the safety of a substance, such as the findings of toxicological studies should, under no circumstances, be treated as confidential.<sup>136</sup> In this context, Regulation (EC) No. 1331/2008 further stipulates that at least those data in the application documents whose disclosure might significantly harm the applicant's competitive position may be treated as confidential.<sup>137</sup> All applicants, therefore, shall indicate, when submitting their authorization data, which information they wish to be kept confidential and furnish justification for this. The European Commission then consults with applicants about which information can actually remain confidential, and then notifies applicants and the Member States accordingly. After having been informed of the Commission's position, the applicants have 3 weeks to withdraw their application so as to preserve the confidentiality of the information provided which the Commission has not deemed proprietary. Up to the expiration of this period, the confidentiality of all data and information is preserved. If applicants finally withdraw their application, the Commission, EFSA and the Member States may no longer disclose to third parties the information deemed confidential.

The FIAP Regulation (EC) No. 1334/2008 also provides for special confidentiality standards for reporting by food business operators to the Commission. Producers or users of a flavoring substance, or the representative of such producer or user, shall, at the request of the Commission, inform it of the amount of the flavoring substance added to foods in the Community in a period of 12 months.<sup>138</sup> Information provided in this connection is also treated as confidential, provided that such information is not required for the assessment of its safety.

---

<sup>136</sup>Regulation (EC) No. 1331 (2008), Recitals 18 and 19.

<sup>137</sup>Ibid, Art. 12.

<sup>138</sup>Regulation (EC) No. 1334 (2008), Art. 19 Para. 1.

### ***19.6.3 Restrictive Interpretation of Confidentiality Standards by EFSA***

As mentioned above, EFSA tries to be as transparent as possible in the food authorization procedures, deferring in this regard to Art. 38 of Regulation (EC) No. 178/2002 of the European Parliament and of the Commission of 28 January 2002. Pursuant to Art. 38 Para. 1 sentence 1 of Regulation (EC) No. 178/2002, EFSA shall ensure that it carries out its activities with a high level of transparency. For this purpose, it must publish without delay, inter alia, all information on which its opinions are based.

The Regulation (EC) Nos. 178/2002 and 1049/2001 of the European Parliament and of the Council of 30 May 2001 regarding public access to European Parliament, Council and Commission documents, applies analogously to documents in EFSA's possession. Accordingly, all citizens of the European Union as well as any natural or legal person residing or having its registered office in a Member State has a right to access documents in EFSA's possession, subject to the principles, conditions and limits defined in Regulation (EC) No. 1049/2001.<sup>139</sup> Furthermore, pursuant to Regulation (EC) No. 178/2002 the conclusions of the scientific opinions delivered by EFSA relating to foreseeable health effects must never be kept confidential.<sup>140</sup> EFSA may only refrain from disclosing to third parties information for which confidential treatment has been requested and justified. However, disclosure of such information is permitted where such information has to be made public in order to protect public health.<sup>141</sup>

EFSA applies a restrictive interpretation to the confidentiality standards in food authorization procedures. In the Scientific and Technical Guidelines for the Preparation and Presentation of the Application for Authorization of a Health Claim published by EFSA, it is stated that the application is never treated as confidential and that passages which the applicant considers confidential should be kept to a minimum and clearly designated as such. Moreover, in its guidelines, EFSA expressly draws attention to the fact that it always publishes a summary of the authorization application and in its opinion deals with all documents submitted with the application, except, for such data and information, which EFSA itself considers confidential.<sup>142</sup>

In its restrictive interpretation of confidentiality protection, EFSA has gone so far as to repeatedly publish information in its scientific opinions in the health claims authorization procedures despite explicit prior requests by the concerned applicants for such information to be kept confidential. This especially raises hackles, for

---

<sup>139</sup>Regulation (EC) No. 1049 (2001), Art. 2 Para. 1.

<sup>140</sup>Regulation (EC) No. 178 (2002), Art. 39 Para. 3.

<sup>141</sup>Ibid, Art. 39 Para. 1.

<sup>142</sup>Cf. EFSA (2011), p. 8, margin no. 13: “[. . .] EFSA will also make public, once adopted, its scientific opinion on the data and information included in the application, excluding the information considered as confidential.”

instance, in product-related studies, which the concerned applicants initially would like to keep confidential vis-à-vis their competitors or with a view to any applications for intellectual property rights that they might file.

The narrow interpretation of confidentiality protection applied by EFSA is highly questionable, not only with regard to Art. 39 of Regulation (EC) No. 178/2002 but also the confidentiality standards set by the recent FIAP Regulations. EFSA would appear to interpret the relevant provisions to mean that EFSA itself is authorized to decide on the (non-)confidentiality of the authorization data concerned. For the food industry, this restrictive approach is not only unacceptable but may also entail devastating competitive disadvantages for the affected applicants. Food companies are, therefore, well advised to familiarize themselves with the applicable confidentiality standards early on to ensure that they obtain the most extensive protection possible for the data and information submitted with their authorization applications.

## 19.7 Food Advertising

Food advertising in the European Union is subject to strict legal standards to prevent misleading and deceptive advertising and ensure, amongst others, scientific reliability of all health and nutrition related claims.

### 19.7.1 Rules Against Misleading Advertising

Pursuant to Directive 2006/114/EC of the European Parliament and of the Council of 12 December 2006 concerning misleading and comparative advertising,<sup>143</sup> misleading advertisements are prohibited. According to Directive 2006/114/EC, “advertising” means the making of a representation in any form in connection with a trade, business, craft or profession in order to promote the supply of goods or services, including immovable property, rights and obligations.<sup>144</sup> According to the same Directive, a “misleading advertising” is qualified as any advertising which, in any way, including its presentation, deceives or is likely to deceive the persons to whom it is addressed or whom it reaches and which, by reason of its deceptive nature, is likely to affect their economic behavior or which, for those reasons, injures or is likely to injure, a competitor.<sup>145</sup>

---

<sup>143</sup>OJ L 376 (2006), pp. 21–27; cf. Köhler, in: Köhler/Bornkamm, Gesetz gegen den unlauteren Wettbewerb, 32nd edition (2014), Introduction, no. 3.41 et seq.

<sup>144</sup>Directive 114/EC (2006), Art. 2 lit. (a).

<sup>145</sup>Ibid, Art. 2 lit. (b).

Also, Directive 2005/29/EC of the European Parliament and of the Council of 11 May 2005 concerning unfair business-to-consumer commercial practices in the internal market,<sup>146</sup> prohibits unfair and, in particular, misleading commercial practices. “Commercial practices” within the sense of Directive 2005/29/EC means any act, omission, course of conduct or representation, commercial communication, including advertising and marketing, by a trader, directly connected with the promotion, sale or supply of a product to consumers.<sup>147</sup> A commercial practice shall be regarded as misleading and, thus, illegal if it contains false information and is therefore untruthful or in any way, like overall presentation, deceives or is likely to deceive the average consumer (even if the information is factually correct) in relation to, e.g., the main characteristics of the product (such as its composition, ingredients, date of manufacture, fitness for purpose, quantity etc.), and if in either case causes or is likely to cause the consumer to take a transactional decision that he would not have taken otherwise.<sup>148</sup>

A commercial practice shall also be regarded as misleading if, in its factual context, taking account of all its features and circumstances and the limitations of the communication medium, it omits material information that the average consumer needs, depending on the context, to make an informed transactional decision and, thereby, causes or is likely to cause the respective consumer to make a decision that he would not have taken otherwise.<sup>149</sup> Moreover, it shall be regarded as a misleading omission when, taking account of the aforementioned matters, a trader hides or provides in an unclear, unintelligible, ambiguous or untimely manner such material information, and where this causes or is likely to cause the average consumer to make a transactional decision that he would not have taken otherwise.<sup>150</sup> In the case of an invitation to purchase, the main characteristics of the respective product as described above (e.g. composition, ingredients, date of manufacture, fitness for purpose, quantity etc.) shall also be regarded as material, if not already apparent from the context.<sup>151</sup> For both Directives 2006/114/EC and 2005/29/EC, the question of whether a certain practice is misleading shall always be assessed from the perspective of an average member of the group to whom the relevant practice is specifically aimed.<sup>152</sup>

---

<sup>147</sup>Directive 29/EC (2005), Art. 2 lit. (d).

<sup>148</sup>Ibid, Art. 6 Para. 1 lit. (b).

<sup>149</sup>Ibid, Art. 7 Para. 1.

<sup>150</sup>Ibid, Art. 7 Para. 2.

<sup>151</sup>Ibid, Art. 7 Para. 4.

<sup>152</sup>Cf. Ibid, Recitals 18, 19, Art. 5 Para. 3.

## 19.7.2 *Nutrition and Health Claims on Foods*

By adopting the Regulation (EC) No. 1924/2006 of the European Parliament and of the Council of 20 December 2006 on nutrition and health claims made on foods, the political decision-makers of the European Union were particularly interested in ensuring that any future nutritional and health claims on food would only be tolerated in the European Union when backed by clear scientific evidence. The European legislator wanted nutrition and health claims for foods to be truthful, clear, reliable and helpful for consumers trying to decide on a healthy diet. On food labels and in advertisements, consumers, henceforth, were to be provided with all relevant information without restriction so as to be protected against any misleading statements.<sup>153</sup>

To achieve this objective, the European legislator decided on a paradigm change. Prior to adoption of the Regulation (EC) No. 1924/2006, it was generally permitted to make nutrition and health claims in food labeling and advertising provided that their use was not expressly prohibited by certain legal provisions. The new approach was for everything to be prohibited unless explicitly allowed. Amongst others, nutrition and health claims shall be based on and substantiated by generally accepted scientific evidence. In addition, respective claims are only permitted if they are explicitly authorized by the European Commission. Further, the use of nutrition and health claims shall not be false, ambiguous or misleading, give rise to doubt about the safety and/or the nutritional adequacy of other foods or encourage or condone excess consumption of a food. Furthermore, all claims are forbidden to state, suggest or imply that a balanced and varied diet cannot provide appropriate quantities of nutrients in general or refer to changes in bodily functions that could give rise to or exploit fear in the consumer, either textually or through pictorial, graphic or symbolic representations.<sup>154</sup>

Along with the Regulation (EC) No. 1924/2006, the European Parliament and the Council first adopted a list of permitted nutrition claims together with specific requirements governing their use. For the most part, the list was based on the terms of use for nutrition claims that had been agreed internationally as well as defined in Community provisions (such as “sugar-free”, “low-fat” “light” or “naturally”) and was directly attached as an annex to the Regulation. Nutrition claims on food may only be used if they are listed in this annex and satisfy other conditions set in the Regulation.<sup>155</sup>

Health claims (such as “lowers cholesterol levels” or “promotes bone growth”) are also prohibited unless they satisfy the requirements of the Regulation and are included in the list of permitted health claims within the meaning of Art. 13 and 14 of the Regulation.<sup>156</sup> Whereas Art. 14 specifically deals with reduction of

---

<sup>153</sup>Cf. Regulation (EC) No. 1924 (2006), Recitals 16 and 29.

<sup>154</sup>Ibid, Art. 3 Para. 2.

<sup>155</sup>Ibid, Art. 8 Para. 1.

<sup>156</sup>Ibid, Art. 10 Para. 1.

disease risk claims as well as statements on the development and health of children, Art. 13 applies to all other health claims relating to food. In view of the great number of possible statements in this area, the European legislator did not define the corresponding Community lists of permitted health claims at the same time as it adopted the Regulation but, instead, decided to adopt these within a reasonable period thereafter. In so doing, it left the food industry limited scope for participating in this process. Interested companies could apply to the competent national authorities in the Member States for any health claims they wanted to see included, which were then submitted to the EFSA. After consultation with EFSA, the European Commission would prepare the Community lists of permitted claims.

To give both consumers and the food industry sufficient legal certainty and clarity regarding the health claims to be permitted within a reasonable time after adoption of the Regulation (EC) No. 1924/2006, the Regulation provided for a stringent timetable in this regard. For example, where health claims within the meaning of Art. 13 Para. 1 of the Regulation (which neither relate to reduction of disease risk claims nor claims concerning the development or health of children), the Member States were to provide the Commission with the corresponding lists (along with the conditions applicable to them), as well as information on the corresponding scientific justification, by 31 January 2008. After hearing EFSA, the Commission was then to adopt a Community list of permitted claims within the meaning of Art. 13 Para. 1 of Regulation (EC) No. 1924/2006 by 31 January 2010.<sup>157</sup>

The competent authorities of the Member States have forwarded more than 44,000 applications for authorization of health claims to EFSA. The Member States and the Commission then compiled a list with a total of 4637 nutritional claims relating to food. The European legislator had no idea that such a huge number of applications would be made. The original deadline for approving the list of permitted health claims (31 January 2010) had already exceeded nearly a year (with still no definitive date in the offing for final adoption of the Community list). The European Commission at the end of September 2010 announced that it intended to make changes to the procedure of progressive approval of the list pursuant to Art. 13 Para. 1 of Regulation (EC) No. 1924/2006. The Community list was now to be drawn up in two stages. First, a list of health claims for all substances except “botanicals” would be adopted and the related opinions of EFSA were to be finalized by the end of June 2011. After that, food health claims relating to botanicals were to be assessed.

As the reasons for this change (which were also accompanied by the announcement of yet other significant delays in the authorization procedure), the European Commission referred, among other things, to alleged delays on the part of the respective applicants in submitting authorization applications for review by the Commission. It further stated that some applicants had raised concerns relating to potential market distortions and confronted the Commission with possible problems

---

<sup>157</sup>Ibid, Art. 13 Para. 2 and 3.

relating to differences in the treatment of botanical ingredients in the respective regulations relating to health claims and Traditional Herbal Medicinal Products (THMP). The Commission had, therefore, decided to take a “pragmatic” approach of adopting the Community list of permitted health claims in steps to protect consumers from unsubstantiated nutritional claims relating to foods. After adoption of the list, consumers should be assured that all health claims on the market had actually been substantiated by science.

By giving these reasons, the European Commission not only conceded that timely adoption of the Community lists of permitted health claims had failed, but at the same time put itself on a course of open confrontation with the food industry. Instead of admitting that it was simply too ambitious to implement the objectives relating to the adoption of the Regulation (EC) No. 1924/2006 within the planned timeframe (given the misjudgment of the relevant market by the European legislator) and, therefore, the prospects of this succeeding had been nil from the outset, the Commission put the blame for the delay on the food industry alone.

Finally, a first list of permitted health claims within the sense of Art. 13 Para. 1 of the Regulation (EC) No. 1924/2006 was adopted by Commission Regulation (EU) No. 432/2012 of 16 May 2012<sup>158</sup> establishing the permitted health claims made on foods, other than those referring to the reduction of disease risk and to children’s development and health. The Regulation (EU) No. 432/2012 applied only as of 14 December 2012 giving food companies a brief transition period for adapting their product labeling and advertising. In addition, the European Commission published an online database of authorized and non-authorized claims. At that date, there were only 222 authorized health claims and 1719 non-authorized claims within the sense of Art. 13 Para. 1 of the Regulation (EC) No. 1924/2006.

Surprisingly, the food industry took a rather indulgent stance to these new advertising restrictions. Food business operators largely accepted the decisions taken by the European Commission and did not launch court challenges to the Commission’s regulations on the non-authorization of health claims on foods. In principle, this was possible by lodging an action for annulment before the Court of Justice of the European Union (ECJ) pursuant to Art. 263 Para. 4, 256 of the Treaty on the Functioning of the European Union (TFEU). Based on the previous situation of legislation (Art. 230 Para. 4 EC Treaty, old version), legal acts of the applying European bodies generally could only be challenged by annulment if such acts were of direct and individual concern to such claimants. This legislative approach presented difficulties in the case of regulations which, although always applicable directly, do not as a general rule concern people individually because they broadly apply to everyone. Art. 263 Para. 4 of the TFEU provides for the possibility of lodging an action for annulment against “regulatory acts” which are of direct concern to the claimant and do not entail implementing measures. The decisive question in regard to the Commission’s regulations on the non-authorization of health claims is whether these regulations are also covered by Art. 263 Para.

---

<sup>158</sup>OJ L 136 (2012), pp. 1–40.

4 TFEU. The ECJ has repeatedly ruled that the European treaties grant citizens and companies within the European Union comprehensive and effective legal remedies. This also applies to the legal remedies provided in Art. 263 Para. 4 TFEU. As a result, the specified “regulatory acts” must cover all acts of the European bodies claiming to be binding as well as generally and directly applicable in the Member States. Accordingly, all legal acts may be challenged by way of action for annulment within the sense of Art. 263 Para. 4 TFEU which (i) are aimed at the respective claimant directly, or (ii) are addressed to a third party but are of direct and individual concern to the claimant as a competitor or involved party, or (iii) apply generally and, because of special circumstances, are of similar individual concern to the claimant as those to whom the acts are actually addressed, or (iv) apply generally and are of direct concern to the claimant but whose application does not require any implementation measures.

In cases of doubt, these requirements are fulfilled through the regulations of the European Commission by which an authorization of health claims on food is refused. As expressly clarified by the recitals of the respective regulations, the regulations serve the purpose of deciding on individual and specific authorization applications for health claims on foods in accordance with the provisions of the Regulation (EC) No. 1924/2006. Pursuant to Art. 15 et seq. of Regulation (EC) No. 1924/2006, applicants are expressly granted own rights to participate and be heard in the authorization procedure. The regulations of the European Commission by which the authorization of health claims on foods are refused are, thus, of direct concern to the applicant within the meaning of Art. 263 Para. 4 TFEU and, therefore, must be capable of being challenged by way of annulment.

### ***19.7.3 Specific Rules on Advertising for Alcoholic Beverages***

According to the Regulation (EC) No. 1924/2006, beverages containing more than 1.2 % in volume of alcohol shall not bear any health claims.<sup>159</sup> As far as nutrition claims are concerned, only those referring to low alcohol levels, or the reduction of the alcohol content, or the energy content for beverages containing more than 1.2 % in volume of alcohol, shall be permitted. Further, in the absence of specific European Community rules regarding nutrition claims referring to the above parameters, relevant national rules may apply to comply with the provisions of the Treaty establishing the European Community.<sup>160</sup> In addition, there is a separate European Regulation (EC) No. 110/2008 of the European Parliament and of the Council of 15 January 2008<sup>161</sup> which sets forth specific provisions on the definition, description, presentation, labeling and the protection of spirit drinks. Both

<sup>159</sup>Regulation (EC) No. 1924 (2006), Art. 4 Para. 3.

<sup>160</sup>Ibid, Art. 4 Para. 4.

<sup>161</sup>OJ L 39 (2008), pp. 16–54.

Regulation (EC) Nos. 1924/2006 and 110/2008 are directly applicable in all European Member States.

## 19.8 Consumer Rights

On 25 October 2011, the European Parliament adopted the Directive 2011/83/EU on consumer rights,<sup>162</sup> which was originally proposed by the Commission in 2008. It replaced two Directives from 1985 and 1997, respectively, established contractual rights for consumers and concerned contracts negotiated away from business premises and distance contracts. This Directive 2011/83/EU takes a full harmonization approach, with a single framework regulating certain aspects of business-to-consumer contracts across the European Union. The rationale for the legislation is that domestic distance sales are growing significantly while the growth in cross-border distance sales has been limited. The Directive, therefore, pays particular attention to off-premises contracts (concluded in a place which is not the trader's business premises; for example the consumer's home or office) and distance contracts (concluded over the Internet, or by mail order, telephone or fax). The new rules apply to a wide variety of goods and services, but there are exemptions for sectors where separate legislation already exists. These sectors include electronic communications, energy markets, financial services, food labeling, medicine, medical devices and patients' rights in cross-border healthcare, and public transport.

### 19.8.1 *Withdrawal*

Under Directive 2011/83/EU, a harmonized 14 (calendar) days withdrawal period applies to all distance and off-premises contracts.<sup>163</sup> This is double the previously described 7 days. The withdrawal period starts from the moment the consumer receives the goods, rather than at the time of conclusion of the contract as was the case in the former European law. For service contracts, the withdrawal period will start on the day of the conclusion of the contract.<sup>164</sup> If a trader does not inform the consumer about the right of withdrawal, the withdrawal period is automatically extended to 12 months or to 14 days from the day the trader belatedly provides the information.<sup>165</sup> Consumers can withdraw without providing any reason and without incurring any costs (except in certain situations outlined below). Withdrawal must

---

<sup>162</sup>OJ L 304 (2011), pp. 64–88.

<sup>163</sup>Ibid, Art. 9.

<sup>164</sup>Ibid, Art. 9 Para. 2.

<sup>165</sup>Ibid, Art. 10.

be done by either using the standardized withdrawal form annexed to the Directive or a statement from the consumer.<sup>166</sup> Because the Directive is a full harmonization act, Member States may not alter the standard form in any way when transposing the legislation into their national laws.

The trader must reimburse the consumer for the goods or services using the same means of payment as the consumer used for the initial transaction. The trader must also reimburse the delivery costs within 14 days (except in cases where an express delivery was requested, in which case the consumer pays the difference between standard delivery and express delivery).<sup>167</sup> The trader may also be liable for the cost of the consumer returning the goods, unless the consumer has been clearly informed that he/she will bear this cost and has been provided with an estimate of the maximum costs of doing so. In the case of bulky goods, the costs could be significant.

There are many exceptions to the rules on withdrawal. These include items that may lose value, for example, wine due to market fluctuations or tailor-made items which only correspond to consumer's specifications. Contracts for services that have been performed are also included. Other exceptions apply to goods which deteriorate rapidly, sealed goods which are not suitable for return due to health protection or hygiene reasons once opened, and sealed audio and video recordings, and computer software that has been unsealed after delivery.<sup>168</sup> If an item has been used more than necessary, its relative decrease in value will be deducted from the amount reimbursed to the consumer.

### ***19.8.2 Rules on Delivery***

Rules on when delivery should occur will be determined at the national level but must not be more than 30 days from the day the contract is concluded. If the trader fails to meet that deadline, the consumer can ask for the delivery within a set period. If the trader still fails to deliver the goods within that time, the consumer can terminate the contract. Any delivery restrictions must be flagged at the beginning of the ordering process, as well as the accepted means of payment.<sup>169</sup>

### ***19.8.3 Fees and Default Options***

Businesses are prohibited from charging consumers' fees that exceed the cost borne by the trader for the use of a certain means of payment, for example, additional fees

---

<sup>166</sup>Ibid, Art. 11.

<sup>167</sup>Ibid, Art. 13.

<sup>168</sup>Ibid, Art. 16.

<sup>169</sup>Ibid, Art. 18.

for using a credit card.<sup>170</sup> Calls to a consumer must not be charged at more than the basic rate of a telephone call.<sup>171</sup> Default options, which the consumer is required to reject in order to avoid additional payment, are effectively banned. Online shoppers will be entitled to reimbursements since their express consent was not given. Under the harmonized rules, the final step in the order process must be clearly indicated and consumers must explicitly confirm that they understand that they have to pay a price by the statement “order with duty of payment” or some other language that indicates that proceeding with this transaction will entail an obligation to pay.

#### ***19.8.4 Information Requirements***

All businesses, whether committing to a distance contract or not, must provide certain information to consumers. This mandatory information includes information about the characteristics of the good or service, identity of the trader, the trader’s address and telephone number, and total price, including any taxes or delivery charges. Information about arrangements for payment, delivery and the trader’s complaint handling procedure (where applicable), duration of the contract or conditions for terminating the contract, and special information requirements for digital content and the interoperability of digital content with hardware and software must also be provided.

For off-premises and distance contracts, there are additional information requirements related to contact details, the anticipated cost of returning goods (where this will be borne by the consumer) and the right of withdrawal. In order to boost cross-border online sales, Member States are not permitted to add any other requirements to those stipulated in the Directive 2011/83/EU.<sup>172</sup>

### **19.9 Conclusion**

This chapter provides an introduction to European food law. As described above, this law provides for strict legal standards for foodstuffs, food ingredients and food packaging as well as for food labeling and advertising, as will be further discussed in the following chapters in this section. Food manufacturers and distributors are, therefore, well advised to acquaint themselves with the applicable legal prerequisites before placing their products on the European market. Non-compliance with the pertinent requirements can have severe consequences, ranging from administrative fines via product withdrawals or recalls to sensitive product liability.

## Chapter 20

# Food Safety and Policy in the European Union

**Giorgio Rusconi**

**Abstract** The chapter analyses the gradual evolution in EU food law, turning to food and feed safety protection following the serious food crises of the 1990s. The comprehensive, integrated principles underlying the 1993 Green Paper and 2000 White Paper became a reality with Regulation (EC) No. 178/2002, which ascribes a crucial role to consumer protection, setting forth the principles of transparency, traceability, and responsibility of business operators; establishing a rapid alert system and crisis management plan; and, most importantly, establishing the

---

Having worked as a food lawyer since the industry's infancy, Giorgio Rusconi has gained significant experience in the field of food law, assisting Italian and foreign clients with food hygiene, labelling, additives, organic farming, geographical indications/destinations of origin, packaging, and responsibilities regarding food products and within the industry.

Giorgio handles client contracts, including those for stakeholders within the food chain, ensuring regulatory compliance and advising on issues of Italian and European law.

Aware of the needs of multinational companies, Giorgio maintains close relationships with experts in different countries and provides assistance and advice on markets nationally and beyond. With relationships built over the years with these and other foreign colleagues, Giorgio helped establish FLN—Food Lawyers' Network Worldwide, in collaboration with Krell Weyland Grube, offering integrated legal services to multinationals in some 50 countries that are operating in the food industry.

To ensure that companies operating in the food industry have a wider range of services, Giorgio also works with a specialized laboratory capable of providing timely, individualized counter-analysis, as well as with a company specializing in the field of food audits.

He is the author, with Omar Cesana, of *Guide to Food Law*, which provides a broad and inclusive look at various aspects of food law in Italy.

In court, Giorgio handles all areas of civil litigation defense, centering on product liability and operators' obligations in the food sector. He helps clients protect their interests in disputes before authorities, and represents entrepreneurs and managers of food-related operations before the criminal court.

In 1996 Giorgio obtained a Higher Diploma in Comparative Law at the International Faculty of Comparative Law of Strasbourg (France) on a scholarship offered by the European Commission. He graduated with a degree in law from Università degli Studi di Milano, was admitted to the bar in 2000, and in 2014 he was admitted to practice before the Supreme Court of Cassation. He speaks Italian, English, and French.

European Food Safety Authority (EFSA). EFSA provides scientific opinions and scientific and technical assistance, establishes surveillance procedures, promotes cooperation among food safety organisations, and plays a crucial role in risk assessment and communication. EFSA's first 10 years of activity has achieved a positive balance: despite the dramatic changes within the EU, it has successfully adapted itself. The need for the harmonisation of food hygiene requirements led to the adoption of the hygiene package and the HACCP system (Reg. 852/2004), as well as of specific hygiene rules applicable to products of animal origin (Reg. 853/2004). The conclusions drawn are encouraging: EU food law, by adopting harmonised vertical rules and regulations common to all operators, has committed to ensuring common, high quality standards. EU authorities' capacity to promptly and effectively react to significant food crises has led to one of the most developed systems worldwide, one that is functional for operators and safe for consumers. Yet the need for rapid, repeated actions, is a constant challenge, which certainly cannot be considered complete.

## **20.1 The Historical European Framework: From the Dawn of Common Policy to the 1997 Green Paper**

### ***20.1.1 The Social and Economic Frame of Reference***

EC (now, EU) law has always played a crucial role in removing obstacles to the free movement of goods within the European single market, and this has been true for its food sector as well.

This role, however, also includes significant, practical assessment over the years of all food safety-related issues, and involves strategic action at the Community level, whether more or less binding on State Members, and influenced by high-profile episodes that have attracted the attention of legislators and the public alike.

Indeed, the greater attention paid to food safety within the single market has been the result of the serious food crises involving the European Union since the end of the 1980s.

The first and perhaps most notorious case was what has become commonly known as "mad cow disease." After reaching epic proportions in the United Kingdom, it was called to the attention of the relevant national and Community authorities due to a possible connection between the disease affecting the brain of cattle (bovine spongiform encephalopathy, BSE) and its human version.

Similarly scandalous was the case of chickens raised in Belgium on feed containing dioxin, residues of which were found in the animals' meat in excess of allowed limits under the legislation then in force.

Again great concern was caused by episodes of hoof-and-mouth disease, a highly infectious disease involving many ruminant species in Europe back in the 1990s.

Such episodes sparked a heated debate, and food safety has since become a matter of priority in domestic and Community (now, EU) policies committed to ensuring adequate safety standards and paying constant attention to consumers.

### ***20.1.2 The Fundamental Aims of the Green Paper***

Public concern thus led the EC Commission, back in the early 1990s, to ask three experts, namely Charles Castang, Amanda Clearly, and Dieter Eckert, to formulate a first regulatory project aimed at identifying the fundamental principles of future food law.

The experts' conclusions were presented in May 1993 at the European Institute of Florence and were then reported in an initial document, the Green Paper on "The General Principles of Food Law in the European Union".<sup>1</sup> The document, although of a merely programmatic nature, is the essence of what will be considered here in this chapter, and clarifies its aims and scope of analysis in its Summary. Indeed, in the General Background it specifies that "*A high level of security and effective public control is necessary to ensure that the food supply is safe and wholesome and to ensure the effective protection of the other interests of consumers.*"

Based on this principle, six basic goals for Community food law have been identified:

1. to ensure a high level of protection of public health, safety, and consumers;
2. to ensure the free movement of goods within the European single market;
3. to ensure that law-making is based on scientific grounds and a correct risk assessment approach;
4. to ensure the competitiveness of European industry, also in promoting exports;
5. to place the primary responsibility for safe food on industry, producers, and suppliers, using systems backed by effective official control and enforcement measures; and
6. to ensure that legislation is coherent, rational, and user-friendly.

According to what was reported in the Green Paper, a consistent and systematic approach to this topic must begin from an analysis of the Community legislation then in force, a summary of which may be found in the first section of the paper. Within the economic framework described in Part I,<sup>2</sup> the European Community's role is clear in promoting a transparent and stable situation that may contribute to further stable development in a sector defined as "vital", in a competitive and pro-competition context.

Part II of the Green Paper identifies the process for the simplification and rationalisation of EC food law and highlights the need for further Community legislation in order to complete the internal market.

Part III re-examines the different measures that could be adopted in order to rationalise or simplify the Community legislation then in force. In this respect, the

---

<sup>1</sup>Document COM (97)176 final, of 30 April 1997.

<sup>2</sup>According to the Green Paper, within the Community every household then spent on average about 20 % of its disposable income on food and drink, with an estimated spending for 1996 for the consumption of food, drinks, and tobacco equal to approximately 500,000 million ECU, and an estimated production equal to 510,000 million ECU. Food and drink production and consumption between 1984 and 1992 had grown at a constant real rate equal to approximately 2–2.5 % a year.

Paper gives preference, where possible, to the use of Regulations rather than to Directives<sup>3</sup>; the need for updating the legislation in force by taking into consideration technical and scientific progress; and the rationalisation of the main definitions used in food law, starting from those of “*foodstuffs*”<sup>4</sup> and of “*placing on the market*”.<sup>5</sup>

Finally, the Green Paper stresses the need for stringent safeguards and protections for consumer health by introducing, among other things, a general obligation regarding the safety and wholesomeness of food involving the entire food chain at all stages from primary production to final sale to the consumer, and that takes into account the increasingly complex interactions among operators (Part IV of the Green Paper).

All of the above is predicated on the condition that efficient management of the internal market is ensured by supervising the implementation of EC Directives by Member States and ensuring that all EC rules are correctly applied (Part V of the Green Paper).

The Green Paper concludes with a final section that concerns the external dimension of the Community’s food legislation, with specific reference to WTO Agreements and developments within *Codex Alimentarius*. In this respect, there is an increasing need for all adopted measures to be based on scientific evidence, and also to take into consideration the international context within which they are placed.

## 20.2 The 2000 White Paper on Food Safety

### 20.2.1 *The Principles of Food Safety*

The Green Paper on “The General Principles of Food Law in the European Union” was followed by another important publication. On 12 January 2000, the well-known “White Paper on Food Safety” was published, setting out and specifying the

---

<sup>3</sup>“[...] it is suggested that consideration be given to greater use of Regulations in appropriate cases, both in primary and in secondary Community legislation. However, legislation which is limited in scope to the harmonisation of general principles and criteria, such as legislation on the official control of foodstuffs, would continue to be adopted by means of a directive.”

<sup>4</sup>For which it proposes to examine the definition included in the *Codex Alimentarius*, pursuant to which “*foodstuff means any substance or product, whether processed, partially processed or unprocessed, intended to be ingested by humans, with the exception of tobacco as defined by Directive 89/662/EEC, medicinal products as defined by Directive 65/65/EEC, and narcotic or psychotropic substances controlled by Member States pursuant to the relevant international conventions*”.

<sup>5</sup>For which it proposes the following definition: “*any operation the purpose of which is to supply foodstuffs to a third party, including supply for sale or any other form of transfer against payment or free of charge to a third party and storage with a view to supply to a third party, with the exception of supply for the purposes of scientific research conducted under the supervision of the Member States*”.

priorities, aims, and projects for the new EU food law. Once again, the introduction outlines the goal of the project: “*The European Union’s food policy must be built around high food safety standards, which serve to protect, and promote, the health of the consumer*”.

The guiding principle underlying the entire system proposed is of the “comprehensive, integrated” type. Namely, it proposes an analysis of the entire food chain (the “*farm to table*” concept is introduced), as well as of each sector involved in the food industry. At the same time, clear responsibilities are required of different players: feed manufacturers, farmers, and food industry operators in so far as primary responsibility is concerned; competent authorities for monitoring, enforcement, and surveillance purposes; and consumers regarding the proper storage, handling, and cooking of food.

Furthermore, in an effort to make food policy “more coherent, effective and dynamic”, a fundamental role is ascribed to risk analysis (through a system ensuring risk assessment, management, and communication), the precautionary principle, and the necessary contribution of scientific advice in a sector constantly developing and evolving.

### ***20.2.2 Essential Elements of the Project and Change Prospects***

Based on the above principles, the White Paper sets the following goals:

1. creation of an independent Food Authority, acting as a reference scientific body at the European level whose duties would be preparing and giving scientific advice, gathering and analysing appropriate information to ensure adequate collaboration with EU legislative bodies, and monitoring the food sector (chapter 4);
2. creation of a new legal framework by EU bodies to develop a coherent and transparent set of rules in the different sectors of the food chain (chapter 5);
3. development of a Community framework of national control systems, ultimately providing for the improvement of administrative co-operation (chapter 6);
4. consumers’ progressive involvement by consulting and discussing with the public, and by making available accurate, correct information aimed at allowing consumers to make informed choices, thus improving the labelling system currently in force (chapter 7);
5. constant attention to the Community’s “international” dimension and compliance with the obligations arising from joining world Organisations.

In addition to the above goals, the White Paper also proposes a detailed action plan with respect to the measures to be taken.

## 20.3 Regulation (EC) No. 178/2002

### 20.3.1 *The “Safety from Farm to Table” Strategy*

The Papers described above became a regulatory reality with “Regulation (EC) No. 178/2002 of the European Parliament and of the Council of 28 January 2002 laying down the general principles and requirements of food law, establishing the European Food Safety Authority and laying down procedures in matters of food safety”.

The title of the Regulation attests to the multiple purposes pursued by the new body of rules, ranging from the introduction of a European Food Safety Authority to the creation of a regulatory body of principles and grounds for legislation on the matter.

As a confirmation of the wide-ranging scope of the Regulation, it is sufficient to observe its “legal grounds”, which do not only make reference to the provisions of the EC Treaty on agricultural products (Article 37) but also to Articles 95, 133, and 152.4(b).

The Regulation comprises sixty-six Whereas statements (with the last expressing the difficulty in intervening in matters the competences of which should be shared with the Member States<sup>6</sup>) and sixty-five Articles.

The Regulation implements and codifies the aforementioned “from farm to table” concept, which had first been introduced in the 2000 White Paper on Food Safety analysed above. The formula carries the spirit of the entire legislation on food law matters—that is, the commitment to and challenges of reaching an integrated approach covering the entire food chain, in order to ensure the movement of safe food and feed throughout the European market.

For a systematic analysis of the main issues addressed by the Regulation, it is worth examining several aspects in detail.

### 20.3.2 *Risk Analysis*

Risk analysis (Article 6 of Regulation (EC) No. 178/2002) is one of the priorities that national and EC legislators needed to set in order to protect the primary interest of human and animal safety. In line with the White Paper on Food Safety, “*risk analysis*” is defined here (Article 3.10) as the “*process consisting of three*

---

<sup>6</sup>Whereas 66: “*It is necessary and appropriate for the achievement of the basic objectives of this Regulation to provide for the approximation of the concepts, principles and procedures forming a common basis for food law in the Community and to establish a European Food Safety Authority. In accordance with the principle of proportionality as set out in Article 5 of the Treaty, this Regulation does not go beyond what is necessary in order to achieve the objectives pursued*”.

*interconnected components: risk assessment, risk management and risk communication*". It is worth assessing each of these phases separately:

1. "*Risk assessment*" is defined in Article 3.11 as a "*scientifically based process consisting of four steps: hazard identification, hazard characterisation, exposure assessment and risk characterisation*". As may easily be inferred from this definition, being a scientific process, it must be delegated to experts having adequate professional competence.<sup>7</sup> As stated by the Judgment of the Court of First Instance (Third Chamber) of 11 September 2002 in Case T-70/99 (Alpharma Inc. v Council of the European Union), where experts carry out a scientific risk assessment, the competent public authority must be given "*sufficiently reliable and cogent information to allow it to understand the ramifications of the scientific question raised and decide upon a policy in full knowledge of the facts. Consequently, if it is not to adopt arbitrary measures, which cannot in any circumstances be rendered legitimate by the precautionary principle, the competent public authority must ensure that any measures that it takes, even preventive measures, are based on as thorough a scientific risk assessment as possible, account being taken of the particular circumstances of the case at issue. Notwithstanding the existing scientific uncertainty, the scientific risk assessment must enable the competent public authority to ascertain, on the basis of the best available scientific data and the most recent results of international research, whether matters have gone beyond the level of risk that it deems acceptable for society [ . . . ]. That is the basis on which the authority must decide whether preventive measures are called for*", or establish the expedient and necessary measures for eliminating the risk.
2. "*Risk management*" is the "*process, distinct from risk assessment, of weighing policy alternatives in consultation with interested parties, considering risk assessment and other legitimate factors, and, if need be, selecting appropriate prevention and control options*" (Article 3.12). The results of risk assessment and the European Food Safety Authority's opinions form the basis for appropriate planning of the risk management strategy providing for the choice of the most appropriate measures to prevent or control risk connected with the consumption of food or feed. Of course, the adoption of certain measures aimed at managing risk and providing for a limitation or restriction of the free movement

---

<sup>7</sup>See Judgment of the Court of First Instance (Third Chamber) of 11 September 2002—Pfizer Animal Health SA v Council of the European Union—Case T-13/99: "*A scientific risk assessment is commonly defined, at both the international level (see the provisional communication from the Codex Alimentarius Commission, cited at paragraph 147 above) and Community level (see the Communication on the Precautionary Principle, the Communication on Consumer Health and Food Safety and the green paper, cited at paragraphs 118 and 124 above), as a scientific process consisting of the identification and characterisation of a hazard, the assessment of exposure to the hazard and the characterisation of the risk. [ . . . ] A scientific risk assessment carried out as thoroughly as possible on the basis of scientific advice founded on the principles of excellence, transparency and independence is an important procedural guarantee whose purpose is to ensure the scientific objectivity of the measures adopted and preclude any arbitrary measures*".

of goods may be justified solely by real risks and must comply with the principles of non-discrimination and proportionality, while at the same time assessing the advantages and charges that each measure entails.

3. Finally, the entire risk analysis process concludes with the stage of “*risk communication*”, which is defined as “*the interactive exchange of information and opinions throughout the risk analysis process as regards hazards and risks, risk-related factors and risk perceptions, among risk assessors, risk managers, consumers, feed and food businesses, the academic community and other interested parties, including the explanation of risk assessment findings and the basis of risk management decisions*” (Article 3.13).

In conclusion, as stated in Whereas 17 of the Regulation, “*the three interconnected components of risk analysis—risk assessment, risk management, and risk communication—provide a systematic methodology for the determination of effective, proportionate and targeted measures or other actions to protect health*”.

### **20.3.3 The Precautionary Principle**

Article 7 of Regulation No. 178/02/EC makes express reference to the precautionary principle, which is codified in the food sector for the very first time<sup>8</sup> via this regulation.

It is a general principle to be applied in the event of scientific uncertainty, where, following an objective assessment, it is impossible to exclude the existence of well-founded reasons for deeming that there might be harmful effects on human health or the environment.

The principle is recognised as significant in Whereas 21 of the Regulation, where it is stated that “*in those specific circumstances where a risk to life or health exists but scientific uncertainty persists, the precautionary principle provides a mechanism for determining risk management measures or other actions in order to ensure the high level of health protection chosen in the Community*”.

The intent, clearly, is of a mitigating character, taking into account the pre-eminence of the respect for and protection of human health in the presence of a situation of scientific uncertainty calling for the adoption of precautionary measures to prevent a risk to human health. In this respect, risk assessment, in practice, will necessarily have to be carried out on the basis of the most reliable scientific data available and the most recent international results rather than through a merely

---

<sup>8</sup>The precautionary principle arises within international environmental law with the World Charter for Nature adopted by the United Nations General Assembly in 1982. Within the European Union, the principle is first mentioned (with reference to environmental protection only, though) in Article 174.2 of the EC Treaty, which, however, fails to give any definition of the same.

hypothetical approach to risk based on simple assumptions without any scientific substantiation.<sup>9</sup>

As mentioned above, Article 7 sets forth the rules for applying the principle, providing that “*in specific circumstances where, following an assessment of available information, the possibility of harmful effects on health is identified but scientific uncertainty persists, provisional risk management measures necessary to ensure the high level of health protection chosen in the Community may be adopted, pending further scientific information for a more comprehensive risk assessment*” (Article 7.1).

Therefore, in the event that a product, a phenomenon, or a procedure may entail harmful effects on health, the competent institutions “may” decide whether to adopt “provisional” measures.

The provisional character of the measures adopted is specified in the last sentence of paragraph 2 of Article 7, where it is clarified that they “*shall be reviewed within a reasonable period of time, depending on the nature of the risk to life or health identified and the type of scientific information needed to clarify the scientific uncertainty and to conduct a more comprehensive risk assessment*”. As to scientific uncertainty, it may concern both qualitative and quantitative aspects of the analysis.<sup>10</sup>

In any event, recourse to the precautionary principle does not allow the adoption of arbitrary measures or the waiver of the cornerstone principles of the legal system, such as the principles of good risk management, proportionality, non-discrimination, and coherence. Specifically, the measures adopted must comply with the principle of proportionality as described in the first part of paragraph 2 of Article 7, pursuant to which “*the measures adopted on the basis of paragraph 1 shall be proportionate and no more restrictive of trade than is required to achieve the high level of health protection chosen in the Community, regard being had to*

---

<sup>9</sup>See Judgment of the Court of 9 September 2003 Case C-236/01 (Monsanto Agricoltura Italia SpA and Others v Presidenza del Consiglio dei Ministri and Others): “[. . .] *protective measures may be taken pursuant to Article 12 of Regulation No. 258/97 interpreted in the light of the precautionary principle even if it proves impossible to carry out as full a risk assessment as possible in the particular circumstances of a given case because of the inadequate nature of the available scientific data (see to that effect Pfizer Animal Health v Council, cited above, paragraphs 160 and 162, and Alpharma v Council, cited above, paragraphs 173 and 175). Such measures presuppose, in particular, that the risk assessment available to the national authorities provides specific evidence which, without precluding scientific uncertainty, makes it possible reasonably to conclude on the basis of the most reliable scientific evidence available and the most recent results of international research that the implementation of those measures is necessary in order to avoid novel foods which pose potential risks to human health being offered on the market [ . . . ]*”

<sup>10</sup>For an application of the precautionary principle, although in connection with the cosmetic sector, see the Judgment of the Court of First Instance (Third Chamber) of 16 July 1998—Laboratoires pharmaceutiques Bergaderm SA and Jean-Jacques Goupil v Commission of the European Communities—Case T-199/96, pursuant to which “. . . *where there is uncertainty as to the existence or extent of risks to the health of consumers, the institutions may take protective measures without having to wait until the reality and the seriousness of those risks become fully apparent*”.

*technical and economic feasibility and other factors regarded as legitimate in the matter under consideration”.*

Finally, it is worth noting that there have been cases where, in the absence of scientific certainties, the application of the principle of “zero tolerance” by national legislation, totally prohibiting a certain substance in certain foods, has been deemed lawful.<sup>11</sup>

### **20.3.4 Protection of Consumers’ Interests**

Consumers’ crucial role within the framework of Regulation (EC) No. 178/2002 may not only be inferred from the constantly referred to purpose of protection of consumer health, but also from the further provisions contained in Article 8 of the Regulation.

In particular, the provision aims to protect against:

1. “*fraudulent or deceptive practices*”: the main reference is to the regulations on labelling and presentation of food and feed products;
2. “*the adulteration of food*” and any manipulation changing the composition of food more or less deeply significantly: see, in particular, Articles 14 and 15 of Regulation (EC) No. 178/2002 prohibiting the placing on the market of unsafe food insofar as it is injurious to human or animal health;
3. “*any other practices which may mislead the consumer*”.

Obviously, a system for consumer protection cannot be implemented without an adequate official control structure and an effective sanctioning system.

---

<sup>11</sup>See Melkunie Case—Judgment of the European Court of Justice (Fifth Chamber) of 6 June 1984—Criminal proceedings against CMC Melkunie BV—C-97/83: “. . . According to a consistent line of decisions of the Court, it follows from Article 36 that a national measure which has, or may have, a restrictive effect on trade is compatible with the Treaty only in so far as it is necessary for the purpose of effectively protecting human life and health. The proviso in Article 36 cannot therefore apply where human life and health can be protected just as effectively by measures less restrictive of intra-Community trade. [. . .] The data available at the present stage of scientific research do not make it possible to determine with certainty the precise number of nonpathogenic micro-organisms above which a pasteurised milk product becomes a source of danger to human health. In the absence of harmonisation in this field, it is for the member-States to determine, with due regard to the requirements of the free movement of goods, the level at which they wish to ensure that human life and health are protected. In those circumstances, national legislation seeking to ensure that at the time of consumption the milk product in question does not contain micro-organisms in a quantity which may constitute a risk merely to the health of some, particularly sensitive consumers, must be considered compatible with the requirements of Article 36”.

### **20.3.5 The Principle of Transparency**

Section 2 of Chapter II of Regulation (EC) No. 178/2002 focuses on an issue to which predominant, and growing, attention is being paid within the European Union, namely, the principle of transparency.

More specifically, the above principle is defined in two different respects, both equally important and crucial to the matter considered here, as also mentioned in Whereas 9, which makes reference to the importance of a constructive relationship amongst all parties involved (*“It is necessary that consumers, other stakeholders and trading partners have confidence in the decision-making processes underpinning food law, its scientific basis and the structures and independence of the institutions protecting health and other interests”*), namely:

1. Public consultation: according to Article 9 of the Regulation, *“there shall be open and transparent public consultation, directly or through representative bodies, during the preparation, evaluation and revision of food law, except where the urgency of the matter does not allow it”*. The Commission therefore must consult with the public and the parties concerned, also by organising committees and groups of undertakings with advisory purposes, and carry out specific (including online) consultations, both during the proposal for legislation stage and in the following phase of adoption of a measure; *and*
2. Public information: the goal of ensuring food safety is also achieved through the quick spreading of any information on the possible risks related to the use of certain products or feedstuffs. Therefore, where there are reasonable grounds to suspect that a food or feed may present a risk for human or animal health, then, pursuant to Article 10 of Regulation (EC) No. 178/2002, public authorities must take appropriate steps to inform the general public of the nature, seriousness, and extent of the risk to health, *“identifying to the fullest extent possible the food or feed, or type of food or feed, the risk that it may present, and the measures which are taken or about to be taken to prevent, reduce or eliminate that risk”*.

The European Food Safety Authority is also requested to play a fundamental role and comply with the principle of transparency, accomplishing its duties in abidance of said principle, as also laid down by Article 38 of Regulation (EC) No. 178/2002.

### **20.3.6 General Requirements of Legislation and the Principle of the Responsibility of Business Operators**

In addition to the principles outlined above, Regulation No. 178/2002 also sets forth the “general requirements” with which the European and national laws and regulations need to harmonise.

In particular, Article 14 states that “***food shall not be placed on the market if it is unsafe***”. Expressed in positive terms the rule included in the first paragraph of this Article states that exclusively safe food may be validly placed on the market and move freely therein. The EC legislator furthermore established that whenever food complies with specific Community provisions applicable to food safety, it must be deemed safe insofar as the aspects covered by the specific Community provisions are concerned.

Conversely, it is prohibited to place on the market any food deemed be “*unsafe*”—that is, considered to be “*injurious to health*” and “*unfit for human consumption*”.

More specifically, to determine whether any food is injurious to health, reference must be made to a number of factors, namely: the use of the food by the consumer, the probable immediate and/or short-term and/or long-term effects of that food on the consumer, the probable cumulative toxic effects, and the particular health sensitivity of a specific category of consumers where the food is intended for that category (it is sufficient to think of the greater vulnerability of infants, the delicate character of follow-on formulae, or the specificity of dietetic foods). To determine whether any food is unfit for human consumption, consideration must be given to whether the food is unacceptable for human consumption according to its intended use, taking into account all useful elements (e.g., food contamination, deterioration, decay, etc.).

A fundamental role within food safety is furthermore ascribed to the **presentation, advertising, and labelling** of food or feed, which “*shall not mislead consumers*” (Article 16). This, obviously, is linked to the concept of providing correct information to consumers who, solely with a thorough, truthful presentation of food or feed, can make informed choices. For this purpose, reference is made to the content of recent Regulation (EU) No. 1169/2011 of the European Parliament and of the Council of 25 October 2011 on the provision of food information to consumers, which lays the basis to guarantee a high level of protection of consumers with respect to food information, and defines the related principles, requirements, and responsibilities.

An important aspect introduced by Article 18 of the Regulation is **traceability**, defined as “*the ability to trace and follow a food, feed, food-producing animal or substance intended to be, or expected to be incorporated into a food or feed, through all stages of production, processing and distribution*”. It is a control system applicable to all food and feed business operators for all categories of food and feed (and, more generally, substances intended to be incorporated into a food or feed), thus allowing for the monitoring of the food chain as a whole, by collecting and spreading certain information allowing the tracing of a certain food or feed throughout the different stages of production, processing, storage, transport, and sale. The system makes it possible to identify the business operator at the source, from whom the product originates, and, downstream, the one to whom the company has supplied the food or feed. All that is required while carefully managing risks facilitating, if necessary, the procedures for action and market recall of goods unfit for distribution.

Also for the above purposes, Article 18 further provides that the food and feed intended to be placed on the market must be labelled or identified to “*facilitate its traceability, through relevant documentation or information in accordance with the relevant requirements of more specific provisions*”.

The system outlined by Regulation No. 178/2002 therefore introduces a cornerstone principle of the new food safety system, providing for the **responsibility of the food business operator** (defined as the “*natural or legal persons responsible for ensuring that the requirements of food law are met within the food business under their control*”), and the feed business operator. Said operators must ensure that the foods or feeds “*satisfy the requirements of food law*” (Article 17 of the Regulation).

As is clear, this rule does not only concern nor is it limited to the phase related to the placing on the market of the foods and feeds, but it also entails a series of further obligations, if a food business operator considers or has reason to believe that a food that it has imported, produced, processed, manufactured, or distributed, and no longer available or under its immediate control, “*is not in compliance with the food safety requirements*”. In such cases, Article 19 of the Regulation provides for a series of activities to be carried out by the food business operator, also in collaboration with the competent authorities. In particular, the operator in question must:

1. immediately initiate procedures to withdraw the food in question from the market—that is, take all measures aimed at preventing the distribution and exposure of an unsafe food as well as its offer to consumers;
2. inform the competent national authority, which must, if necessary, adopt all necessary measures to face the emergency;
3. effectively and accurately inform consumers of the reason for its withdrawal where the product may have reached consumers;
4. finally, if necessary, “*recall*” from consumers products already supplied to them, thus recovering the products already supplied or made available.

This type of approach, in any case, is flexible and does not specify how and by which means undertakings must manage any non-compliance of the products with food law, but leaves it to the operators to arrange their own organisation in the best and most congenial possible way to face any crisis.

### ***20.3.7 Rapid Alert System and Crisis Management Plan***

Regulation (EC) No. 178/2002, Chapter IV, introduces a further valuable instrument in food safety—the Rapid Alert System for Food and Feed, or RASFF.

This is a network linking Member States through their respective National Authorities, the Commission, and the European Food Safety Authority to implement a single system capable of identifying and rapidly (in real time) circulating all alerts concerning urgent food safety issues.

The system has a precedent, namely the rapid exchange of information system for all products intended for the end consumer, also included in foodstuffs (RAPEX), introduced by Council Directive 92/59/EEC on general product safety. However, this system failed to consider feedstuffs and, in light of the food crises involving the European scenario prior to the issue of Regulation No. 178/2002, it was apparent that a more effective and adequate structure was necessary to handle the existing situation.<sup>12</sup>

The parties involved in the new system are the Member States, the Commission, and the European Food Safety Authority, which are obligated to share any information of which they may become aware that may be deemed relevant for the system. They also have surveillance, monitoring, and control duties in connection with tasks related to food and feed business risks. Furthermore, the Commission is responsible for managing the network.

The information shared and circulated within the system concerns—with a deliberately wide and all-encompassing wording—any “*direct or indirect risk to human health deriving from food or feed*” (Article 50 of the Regulation).

This information is circulated through a system of different notifications, namely:

1. Alert (greatest level of hazard): there is a serious risk to health caused by a product already on the market, and it is necessary to take immediate action.
2. Information: the unsafe product has not reached the market or has expired in the meantime, and urgent measures are not necessary.
3. News: the information is of a general nature and concerns non-conformity ascertained in a Member State or in a non-EU Member State that may be useful for others to guide any and all official controls.
4. Border Rejection: information on the rejection of a batch at a border post for breach of EU rules and regulations.

The system allows the parties involved to forward and share information, thus encouraging an integrated use both in terms of monitoring and in order to react to emergencies rapidly, all with the aim of guaranteeing a high level of safeguards for human health.

In addition to a detailed explanation of the reasons for action, Member States must also provide notification of: (a) any measure they adopt aimed at restricting the placing on the market, or forcing the withdrawal from the market of, or the recall of, food or feed in order to protect human health and requiring rapid action;

---

<sup>12</sup>See Whereas 59: “A system for rapid alert already exists in the framework of Council Directive 92/59/EEC of 29 June 1992 on general product safety. The scope of the existing system includes food and industrial products but not feed. Recent food crises have demonstrated the need to set up an improved and broadened rapid alert system covering food and feed. This revised system should be managed by the Commission and include as members of the network the Member States, the Commission and the Authority. The system should not cover the Community arrangements for the early exchange of information in the event of a radiological emergency as defined in Council Decision 87/600/Euratom.”

(b) any recommendation or agreement with professional operators that is aimed, on a voluntary or obligatory basis, at preventing, limiting, or imposing specific conditions on the placing on the market or the use of food or feed on account of a serious risk to human health requiring rapid action; and (c) any rejection, related to a direct or indirect risk to human health, of a batch, container, or cargo of food or feed by a competent authority at a border post within the European Union.

It is worth noting that, in compliance with the principle of transparency generally laid down by the Regulation, Member States are bound to make all information on the risks to human or animal health caused by food or feed available to the public, subject to trade secrets or confidentiality duties.

In 2013 RASFF handled 3136 notifications, in 2012 3434 notifications, and in 2011 3721 notifications.

More specifically, 2649 notifications concerned food, 262 concerned feed (325 concerned feed in 2012), and 225 concerned the migration of materials intended to be in contact with food and feed.

In addition to the official controls made on the market, 4 % of notifications were implemented following consumer complaints, 13 % concerned the notifications of negative results made by way of self-control by companies, and 1 % were related to food contamination.<sup>13</sup>

## 20.4 The European Food Safety Authority

### 20.4.1 *The Creation the Authority*

The creation of the European Food Safety Authority is the core and immediately applicable part of Regulation (EC) No. 178/2002.

The creation of an Authority in the food sector has always been a priority, and it was first accomplished through the Scientific Food Committee set up by the Commission by Decision 74/234/EEC of 16 April 1974.<sup>14</sup> It was a committee mostly with advisory duties on issues related to human health and life, in connection with the consumption of food, in particular, in the light of issues concerning nutrition, hygiene, and toxicology. With Decision 76/791/EEC of the Commission

---

<sup>13</sup>Data drawn from the 2013 Annual Report on the Community Alert System of the Italian Ministry of Health, which has highlighted a drop of 8.7 % compared to the previous year of notifications forwarded through the alert system by Member States (the drop between 2012 and 2011 was 7.7 %). The analysis shows that Italy is the top Member State per number of notifications sent through the RASFF system, with 534 notifications. Regarding origin, Italy is the fourth Member State per number of received notifications, after Spain, Poland, and France.

<sup>14</sup>OJEC 1976 No. 136 p. 1, as amended.

of 24 September 1976<sup>15</sup> a Scientific Feed Committee was also set up, with similar advisory duties concerning the quality and salubrity of feed.<sup>16</sup>

Nonetheless, the significant food crises of the 1990s have made it clear that a reorganisation of the scientific and technical support system is necessary, something capable of contributing to providing adequate support for the new regulatory system that was taking shape. The different scientific Committees set up throughout time and initially working at the Directorate-General for the Internal Market or for the Directorate-General for Agriculture of the Commission were replaced by eight new committees by way of Decision 97/579/EC of the Commission of 23 July 1997 (then abrogated by Decision 2004/210/EC):

1. Scientific Committee on Food;
2. Scientific Committee on Feed;
3. Scientific Committee for Animal Health and Animal Welfare;
4. Scientific Committee on Veterinary Measures relating to public health;
5. Scientific Committee for Plants;
6. Scientific Committee on Cosmetic Products and Non-food Products Intended for Consumers;
7. Scientific Committee on Medicinal Products and Medical Devices;
8. Scientific Committee on Toxicity, Ecotoxicity and the Environment.

Nonetheless, only under the 2000 White Paper on Food Safety, that is, with the acknowledgement of the limits of the previous system,<sup>17</sup> was a proposal put forward to set up an independent European Food Authority with special responsibilities both in terms of risk assessment and risk communication, and adequate authority on food safety-related issues. The Authority furthermore acts following the rules set forth by the emerging single food legislation and, hence, pursuant to the principles of independence, excellence, and transparency.

---

<sup>15</sup>OJEC 1976 No. L 279 p. 35, as amended.

<sup>16</sup>Besides the committees described above, towards the end of the 1970s and in the early 1980s, other entities were set up, amongst which were the Scientific Committee on cosmetology (Decision 78/45/EEC of the Commission of 19 December 1977); the advisory Scientific Committee for the examination of toxicity and ecotoxicity of chemical compounds (Decision 78/618/EEC of the Commission of 28 June 1978); the Scientific Committee for pesticides (Decision 78/436/EEC of the Commission of 21 April 1978); and the veterinary Scientific Committee (Decision 81/651/EEC of the Commission of 30 July 1981).

<sup>17</sup>See White Paper on Food Safety, paragraph 25, where it is stated that “*It has become evident that the existing system is handicapped by a lack of capacity and has struggled to cope with the increase in the demands placed upon it. Furthermore, the recent dioxin crisis could only be managed by delaying works in other areas and has shown the need to have a system which is able to respond rapidly and flexibly. This lack of capacity has led to delays which have consequences both for the Commission’s legislative programmes, and hence its ability to respond to consumer health problems, and for industry where commercial dossiers are involved. This situation will be exacerbated by the increased demands that will be placed on the scientific committees resulting, for example, from the proposed programme for reform of food legislation as set out later in this White Paper*”.

As already noted, Regulation (EC) No. 178/2002 implements the provisions of the White Paper and sets up the European Food Safety Authority (EFSA), to which the duties of five of the eight former scientific Committees were transferred.

### **20.4.2 Tasks, Structure, and Operation**

EFSA's main **task** is to ensure constant, competent, and independent technical advice and scientific support in the matter of food safety by collecting and analysing data either collected by it or brought to its attention. As specified in Whereas 35 of the Regulation "*The Authority should be an independent scientific source of advice, information and risk communication in order to improve consumer confidence*".

In performing its duties, the Authority must also: offer scientific advice, together with scientific and technical support on human nutrition; formulate scientific opinions on any issue related to the health and welfare of animals, and to the health of vegetables; and formulate scientific opinions on non-food and non-feed products that may be traced back to genetically modified organisms.

Therefore, it is a fundamental reference for the new system, capable of supporting the preparation, definition, and implementation of food legislation, also through a coordination of roles among the competent bodies of the different Member States and the Community bodies.

Article 23 of Regulation No. 178/2002 clarifies and lists the tasks of the Authority, by establishing that the latter must:

- (a) provide scientific and technical assistance and advice;
- (b) provide opinions on the subject matter;
- (c) search for, collect, collate, analyse, and summarise scientific and technical data in the fields within its mission;
- (d) contribute to collaboration amongst the different organisations operating in the fields within its mission and create a European network; and
- (e) identify and communicate emerging risks.

The Authority is composed of four main **bodies**, to which specific tasks and duties are ascribed.

The Management Board, chaired by a Chairperson and numbering fifteen members, fourteen of whom are appointed by the Board, in consultation with the Parliament, plus a representative of the Commission, has the duty to ensure the operation of the Authority by preparing the work schedule and by reporting on the activity carried out by the Authority.

The Executive Director (who is also EFSA's legal representative) is appointed for a 5-year term by the Management Board and has, among other things, the following duties: draw up a proposal for the Authority's work programmes in consultation with the Commission; implement the work programmes and the decisions adopted by the Management Board; ensure the provision of appropriate scientific, technical, and administrative support for the Scientific Committee and the Scientific Panels; ensure that the Authority carries out its tasks in accordance

with the requirements of its users, in particular with regard to the adequacy of the services provided and the time taken; prepare the statement of revenue and expenditure and the execution of the budget of the Authority; prepare all matters related to staff and annual accounts; develop and maintain contact with the European Parliament; and ensure a regular dialogue with its relevant committees.

The role of the Advisory Forum, which is composed of representatives from the competent bodies in the Member States that undertake tasks similar to those of the Authority, is to allow the exchange of information, avoid duplications of studies, and promote collaboration between the European Authority and the local authorities.

Finally, the Scientific Committee and permanent Scientific Panels are responsible for providing the scientific opinions of the Authority, each within their own spheres of competence.

The main instrument through which EFSA's **activity** is carried out is the formulation, by the Scientific Committee or permanent Scientific Panels, of "*scientific opinions*",<sup>18</sup> through which the core aim of the system (that is, risk assessment) is achieved. Opinions may be given on the Authority's own initiative or upon the request of the Commission, of the European Parliament, and of each single Member State (but not of consumers or of the economic operators or of their trade associations), as provided for under Regulation (EC) No. 1304/2003 of the Commission of 11 July 2003, which sets forth the procedure to be followed. The Commission must request a scientific opinion whenever Community legislation calls for consultation with EFSA. Requests for opinions must be accompanied by informative documentation on the scientific issue to be examined and the underlying Community interest. Should Community legislation fail to make reference to a deadline for giving the opinion, EFSA will give the opinions as per the relevant requests.

In case of "*divergence*" between the opinions given by EFSA and those given by other research institutes, Regulation No. 178/2002 provides specific procedures to evaluate and remedy it (Article 30) by establishing, first, that the Authority must refer to the body at issue in order to ascertain that all relevant information is shared. Should there be any substantive divergence over scientific issues, EFSA and the body with a non-aligned and divergent position (be it at a national or community level) must cooperate to rectify the divergence, in view of drawing up a joint document clarifying the contentious scientific issues and identifying the relevant uncertainties in the data.

Apart from the cases in which a scientific evaluation of the Scientific Committee or of the permanent Scientific Panels is necessary, the Authority may also be requested to provide "*scientific and technical assistance*" to the Commission in any field within its mission, both for the creation or assessment of technical criteria, and for the preparation of technical opinions, through scientific or technical work involving the application of well-established scientific or technical principles.

In fulfilling its own duties, EFSA may commission scientific studies and use the best independent resources available. It is also important that it searches for, collects, collates, analyses, and summarises the scientific data in the fields within

---

<sup>18</sup>Article 29 of Regulation No. 178/2002.

its mission so as to gather as wide as possible a range of useful information for assessing existing or potential risks. The above must be accomplished with specific regard for the consumption of food and the risks to which natural persons are exposed by consuming the food, the impact and spreading of biological risks, the contaminants in food and feed, and any residues.

As stated, EFSA's duties focus on risk assessment and, in this respect, not only is the reaction to any crisis important, but so is its prevention: indeed, an effective food safety policy entails different operational levels.

Precisely in this respect, Article 34 of Regulation No. 178/2002 introduces the concept of "emerging risk"<sup>19</sup>: it is the duty of the Authority to establish surveillance procedures for the systematic activity of searching, collecting, collating, and analysing information and data, in order to identify the emerging risks in the fields within its mission.

The second operational level entails the request by EFSA for further information to Member States, to other Community agencies, and to the Commission. Based on any such information, the Authority will identify, if necessary, an emerging risk and send the assessment and the information collected to the European Parliament, the Commission, and the Member States.

Finally, it is worth mentioning EFSA's duty to promote cooperation between organisations that are active at a European level in the fields of food safety, thus facilitating a scientific cooperation framework, "by the coordination of activities, the exchange of information, the development and implementation of joint projects, the exchange of expertise and best practices in the fields within the Authority's mission" (Article 36 of Regulation No. 178/2002).

Finally, just as risk assessment has a fundamental role from the point of view of the operation and tasks ascribed to EFSA, so does the "risk communication" activity. The Authority, of its own initiative, makes any disclosure that it may deem expedient in food safety matters, through its own competent offices.

### **20.4.3 The Role Played Throughout the Authority's First 10 Years**

The balance of EFSA's first 10 years of activity has been positive.

Since it began operating, the Authority has published more than 2500 **scientific outputs** that have been used by the European Commission, Member States, and the European Parliament as the basis for risk management measures and policy initiatives.

---

<sup>19</sup>See Whereas 50 of Regulation No. 178/2002: "Improved identification of emerging risks may in the long term be a major preventive instrument at the disposal of the Member States and the Community in the exercise of its policies. It is therefore necessary to assign to the Authority an anticipatory task of collecting information and exercising vigilance and providing evaluation of and information on emerging risks with a view to their prevention".

EFSA has decisively contributed to the European Union's timeliness of action upon any and all food emergencies, such as in the case of dioxin contamination of pork in Ireland back in 2008 and the *E. coli* epidemic in Germany and France in 2011.

But the EU landscape has changed significantly since EFSA was established. The number of Member States has grown from 15 to 28 and the EU has become the largest importer and exporter of foodstuffs, especially processed goods, in the world. With the increase in population and territory, issues surrounding food production have become ever more complex given the emergence, for example, of new technologies such as "novel foods" and genetically modified organisms.<sup>20</sup>

In such a framework, EFSA has successfully adapted itself and turned into a complex organisation capable of considering the overall scenario without overlooking any detail.

And in the words of the Authority one may find its willingness to continue developing: *"As the organisation enters the next stage of its development it will continue to support the European food safety system with science-based risk assessments. As well as protecting consumers, EFSA aims to continue providing food producers, processors and distributors with a regulatory environment that is demanding but predictable. This will foster technological innovation in the economically important agrifood sector and support sustainable growth and development in the Europe of the future"*.<sup>21</sup>

## 20.5 "Hygiene Package" Regulations and Implementing Regulations

Through the years, the European legislation on food safety has also been concerned with the harmonisation of food hygiene requirements. This was done first for specific categories of food<sup>22</sup> and, subsequently, through Directive No. 93/43/EEC of the Council of 14 June 1993 on the hygiene of foodstuffs, for all types of food.

<sup>20</sup>See EFSA Website (<http://www.efsa.europa.eu/en/10thanniversary/achievements.htm>), which reads: *"One area in which EFSA's work has changed significantly over the past 10 years is the evaluation of regulated products such as food additives, GMOs, pesticides and health claims, which accounts for more than 60% of the Authority's outputs. The resources committed to this work doubled between 2008 and 2010, from 20% to 40%"*.

<sup>21</sup>See EFSA Website (<http://www.efsa.europa.eu/en/10thanniversary/achievements.htm>), where it also reads, *"As outlined in the Strategic Plan 2009-2013 and the Science Strategy 2012-2016 (adopted in 2011), the Authority increasingly will focus on integrated multi-disciplinary advice in areas such as meat inspection, nutrition and animal welfare. It will continue to ensure it performs to the highest standards through the development of state-of-the-art, harmonised methodologies and the collection and analysis of quality data"*.

<sup>22</sup>See by way of example, Directive 64/433/EEC of the Council of 26 June 1964 on health problems affecting intra-Community trade in fresh meat; Directive 89/362/EEC of the Commission of 26 May 1989 on general conditions of hygiene in milk production holdings; Directive

By introducing Regulation No. 178/2002, the need for integrating and consolidating the previous system through a new legal system in the matter of hygiene of foodstuffs in general became clear. Therefore, a package of Regulations (the so-called “hygiene package”) was issued, setting forth harmonised rules within the field.

### ***20.5.1 Regulation (EC) No. 852/2004 on the Hygiene of Foodstuffs and the HACCP System***

The first regulation of the Hygiene Package is Regulation (EC) No. 852/2004 of the European Parliament and of the Council of 29 April 2004 on the hygiene of foodstuffs, which is aimed at implementing a global and integrated policy in the matter of food hygiene involving each stage of the food chain, save for primary production for private domestic use; for food intended for private domestic consumption; for domestic preparation, handling, or storage; and for the direct supply of small quantities of primary food from the manufacturer to the end consumer.

In this respect, Whereas 8 clarifies well that “*An integrated approach is necessary to ensure food safety from the place of primary production up to and including placing on the market or export. Every food business operator along the food chain should ensure that food safety is not compromised*”.

From this standpoint, the core role of the food business operator is still the essence, as the latter has “*primary responsibility for food safety*” (Article 1(a)), as well as the duty to guarantee that all production, processing, and distribution phases of the food under their control meet the general hygiene requirements set forth by the Regulation.<sup>23</sup>

---

92/46/EEC of the Council of 16 June 1992, laying down the health rules for the production and placing on the market of raw milk, heat-treated milk, and milk-based products; Directive 89/437/EEC of the Council of 20 June 1989 on hygiene and health problems affecting the production and the placing on the market of egg products; Directive 91/492/EEC of the Council of 15 July 1991 laying down the health conditions for the production and the placing on the market of live bivalve molluscs; Directive 91/493/EEC of the Council of 22 July 1991 laying down the health conditions for the production and the placing on the market of fishery products; Directive 71/118/EEC of the Council of 15 February 1971 on health problems affecting trade in fresh poultry meat; Directive 91/495/EEC of the Council of 27 November 1990 concerning public health and animal health problems affecting the production and placing on the market of rabbit meat and farmed game meat; Directive 92/45/EEC of the Council of 16 June 1992 on public health and animal health problems relating to the killing of wild game and the placing on the market of wild-game meat; and Directive 94/65/EC of the Council of 14 December 1994 laying down the requirements for the production and placing on the market of minced meat and meat preparations.

<sup>23</sup>See Article 3 of Regulation No. 852/2004—“*General obligation – Food business operators shall ensure that all stages of production, processing and distribution of food under their control satisfy the relevant hygiene requirements laid down in this Regulation*”.

Specifically, food business operators must implement and maintain one or more **permanent self-control company procedures, based on the HACCP** (*Hazard Analysis and Critical Control Points*) **principles system**, proving compliance with said obligation to the competent authorities, if requested.

It is the most significant and innovative aspect of the new approach introduced with Regulation No. 852/2004, since it replaces the previous system based on the control of the finished product, which was statistically unreliable and often retrospective, with a method allowing the identification, prevention, removal, or mitigation of any existing risks within the chain through a preventive analysis of each single production process.

The principles on which the HACCP system is based, as stated under Article 5 of Regulation No. 852/2004, consist of the following:

1. identifying any hazards that must be prevented, eliminated, or reduced to acceptable levels;
2. identifying the critical control points at the step or steps at which control is essential to prevent or eliminate a hazard or to reduce it to acceptable levels;
3. establishing critical limits at critical control points that separate acceptability from unacceptability for the prevention, elimination, or reduction of identified hazards;
4. establishing and implementing effective monitoring procedures at critical control points;
5. establishing corrective actions when monitoring indicates that a critical control point is not under control;
6. establishing procedures, to be carried out regularly, in order to verify that the measures outlined above are working effectively; establishing documents and records commensurate with the nature and site of the food business to demonstrate the effective application of the measures outlined above; and
7. when any modification is made in the product, process, or any step, review of the procedure and necessary changes are made to it.

The self-control system thus outlined requests the assistance of qualified experts, together with the installation of adequate equipment. Also, it must be specific for each single business reality, as well as flexible, and must be applied to all situations, also with respect to small businesses.<sup>24</sup>

If necessary, food business operators must also adopt, in addition to the self-control company procedures based on the HACCP system, further **specific hygiene**

---

<sup>24</sup>In this respect, see Whereas 15: “*The HACCP requirements should take account of the principles contained in the Codex Alimentarius. They should provide sufficient flexibility to be applicable in all situations, including in small businesses. In particular, it is necessary to recognise that, in certain food businesses, it is not possible to identify critical control points and that, in some cases, good hygienic practices can replace the monitoring of critical control points. Similarly, the requirement of establishing “critical limits” does not imply that it is necessary to fix a numerical limit in every case. In addition, the requirement of retaining documents needs to be flexible in order to avoid undue burdens for very small businesses*”.

**measures** related to compliance with the microbiological criteria of foodstuffs; achieve the aims fixed for accomplishing the purposes of Regulation No. 852/2004; comply with food temperature control requirements; keep the cold chain; and perform sampling and analyses.

Food business operators may also use the so-called “***Guides to good practice for hygiene and for the application of HACCP principles***” (Articles 7–9 of Regulation No. 852/2004). These guidelines, which are adopted voluntarily, are aimed at assisting companies and helping them in their duty to comply with the legislation on food hygiene and safety. Starting from the risk analysis referred to in the respective sector of reference, they put forward necessary and sufficient surveillance instruments in order to ensure compliance with the legislation at issue.

They are prepared by the food industry, in collaboration with the competent national bodies, and in the light of the relevant codes of practice included in the *Codex Alimentarius*.

Article 6 of Regulation No. 852/2004 then lays down a further obligation upon food business operators, who must **notify the appropriate competent authority, for registration purposes**, of each establishment under their control that carries out any of the stages of production, processing, and distribution of food, also ensuring that the competent authority always has up-to-date information on establishments, including by notification of any significant change in activities and any closure of an existing establishment.

Finally, the Annexes to the Regulation govern the general applicable food hygiene requirements in primary production and in any related operations (Annex I) and in the remaining phases (Annex II).

### ***20.5.2 Regulation (EC) No. 853/2004 Laying Down Specific Hygiene Rules Applicable to Products of Animal Origin***

Regulation (EC) No. 853/2004 of the European Parliament and of the Council of 29 April 2004, setting forth specific hygiene rules applicable to products of animal origin, was added to the general hygiene regulations because such products may present specific microbiological and chemical risks for human health, as was the case with recent food crises.

The Regulation is aimed at revising, consolidating, and replacing the different Directives intended to fix specific health rules in the sector of reference,<sup>25</sup> to obtain

---

<sup>25</sup>The pre-existing rules were specifically abrogated by Directive No. 2004/41/EC of the European Parliament and of the Council of 21 April 2004, which abrogates some Directives governing the hygiene of foodstuffs and the health rules for the production and sale of certain products of animal origin intended for human consumption, amending Directives 89/662/EEC of the Council and 92/118/EEC, together with Decision 95/408/EC of the Council.

further regulatory simplification common to all products of animal origin, and to “secure a high level of consumer protection with regard to food safety, in particular by making food business operators throughout the Community subject to the same rules, and to ensure the proper functioning of the internal market in products of animal origin, thus contributing to the achievement of the objectives of the common agricultural policy” (see Whereas 9).

The Regulation’s recipients are both the food business operators carrying out the primary production and those acting in the following stages of production, processing, and distribution of food of animal origin, save for the primary production for private domestic use and for the domestic preparation, handling, and keeping of food intended for private domestic use,<sup>26</sup> for which the respective national laws and regulations remain in force.

The operators above must comply with the provisions under Annexes II and III for their own fields; register, and in some cases, have the establishments under their control approved (Article 4); meet the requirements for health and identification marking<sup>27</sup> (Article 5); and ensure that appropriate certificates or other documents accompany consignments of products, if requested (Article 7).

### 20.5.3 Official Controls

As analysed above (see Sect. 20.3.6), the system outlined under Regulation (EC) No. 178/2002 provides, as a fundamental condition for correctly managing all food safety related issues, not only for compliance by food business operators and/or feedstuffs with the food law provisions concerning their activities in all stages of production, transformation, and distribution, but also for an adequate official control system.<sup>28</sup>

<sup>26</sup>The Regulation does not apply (Article 1) to the direct supply, by the producer, of small quantities of primary products to the final consumer or to local retail establishments directly supplying the final consumer; the direct supply, by the producer, of small quantities of meat from poultry and lagomorphs slaughtered on a farm to the final consumer or to local retail establishments directly supplying such meat to the final consumer as fresh meat; or to hunters who supply small quantities of wild game or wild game meat directly to the final consumer or to local retail establishments directly supplying the final consumer. Save for special cases, the Regulation does not apply to retail, either.

<sup>27</sup>Thus implementing and abiding by the general traceability rules pursuant to Regulation (EC) No. 178/2002.

<sup>28</sup>See Article 17 Regulation (EC) No. 178/2002, paragraph 2: “Member States shall enforce food law, and monitor and verify that the relevant requirements of food law are fulfilled by food and feed business operators at all stages of production, processing and distribution. For that purpose, they shall maintain a system of official controls and other activities as appropriate to the circumstances, including public communication on food and feed safety and risk, food and feed safety surveillance and other monitoring activities covering all stages of production, processing and distribution. Member States shall also lay down the rules on measures and penalties

**Regulation (EC) No. 882/2004** of the European Parliament and of the Council of 29 April 2004 therefore falls within the scope of the “hygiene package” on official controls performed to ensure the verification of compliance with feed and food law, and animal health and welfare rules.

The Regulation recipients are all Member States, which must appoint competent authorities responsible for achieving the goals and for all official controls. Such authorities, in their turn, must ensure that all of their staff performing official controls receive appropriate training, are kept informed of new developments, and have aptitude for multidisciplinary cooperation (Article 6 of Regulation No. 882/2004).

In so far as the uniform principles of general nature are concerned, Article 3 of the Regulation provides that all controls are carried out “*regularly, on a risk basis and with appropriate frequency*”, if possible “*without prior warning*” and concerning “*any of the stages of production, processing and distribution of feed or food and of animals and animal products*”.

In so far as the operational criteria are concerned, the national authorities must ensure that all official controls are carried out pursuant to the principles of effectiveness, fitness, impartiality, quality, and coherence at all levels, ensuring a high level of transparency (for instance, by promptly making available all relevant information to the public) as well as protecting in any event any and all information covered by confidentiality duties or trade secrets.

Regarding control methods and techniques, national competent authorities must use instruments deemed most appropriate, such as, for instance:

1. “*verification*”, by examining and considering objective evidence, aimed at ascertaining whether specific requirements have been fulfilled;
2. “*audit*”, that is, a systematic and independent examination to determine whether activities and related results comply with planned arrangements and whether these arrangements are implemented effectively and are suitable to achieve objectives;
3. “*inspection*”, consisting of the examination of any aspect of feed, food, animal health, and animal welfare in order to verify that such aspect(s) comply with the law’s provisions;
4. “*monitoring*”, conducted through a planned sequence of observations or measurements in order to obtain an overview of the state of compliance with the applicable laws and regulations;
5. careful “*surveillance*” of one or more feed or food business operators or their activities;

---

*applicable to infringements of food and feed law. The measures and penalties provided for shall be effective, proportionate and dissuasive”. See also Whereas 6 of Regulation (EC) No. 882/2004: “The Member States should enforce feed and food law, animal health and animal welfare rules and monitor and verify that the relevant requirements thereof are fulfilled by business operators at all stages of production, processing and distribution. Official controls should be organised for that purpose”.*

6. “*sampling for analysis*”, that is, the taking of samples—pursuant to the criteria set forth under Annex III of the Regulation and in compliance with the relevant Community legislation—of feed or food or any other substance (including from the environment) relevant to the production, processing, and distribution of feed or food, in order to verify compliance with the applicable law in force.

Specific rules are then set forth in connection with certain foodstuffs and feedstuffs. In this respect, **Regulation (EC) No. 854/2004** of the Parliament and of the Council of 29 April 2004 sets forth specific provisions for the arrangement of official controls on products of animal origin intended for human consumption and specifies the requirements and operational criteria that the national competent authorities need to comply with in carrying out the respective official controls.

### 20.5.4 The “Implementing” Regulations

Finally, a series of other “implementing” Regulations that are listed and summarised below, must be considered:

1. **Regulation (EC) No. 2073/2005** of the Commission of 15 November 2005 on microbiological criteria for foodstuffs sets forth the microbiological criteria (deemed as those criteria defining “*the acceptability of a product, a batch of foodstuffs or a process, based on the absence, presence or number of micro-organisms, and/or on the absence, presence or number of micro-organisms, and/or on the quantity of their toxins/metabolites, per unit(s) of mass, volume, area or batch*”) that food business operators must comply with in the general and specific hygiene requirements under Article 4 of Regulation (EC) No. 852/2004;
2. **Regulation (EC) No. 2074/2005** of the Commission of 5 December 2005 laying down implementing measures for certain products under Regulation (EC) No. 853/2004 for the organisation of official controls under Regulation (EC) No. 854/2004 and Regulation (EC) No. 882/2004, derogating from Regulation (EC) No. 852/2004 and amending Regulations (EC) No. 853/2004 and (EC) No. 854/2004;
3. **Regulation (EC) No. 2075/2005** of the Commission of 5 December 2005 laying down specific rules on official controls for *Trichinella* in meat;
4. finally, **Regulation (EC) No. 2076/2005** of the Commission of 5 December 2005 laying down transitional arrangements for the implementation of Regulations (EC) No. 853/2004, (EC) No. 854/2004, and (EC) No. 882/2004, and amending Regulations (EC) No. 853/2004 and (EC) No. 854/2004.

### ***20.5.5 A New Scenario for Official Controls: Regulation (EC) No. 625/2017***

The importance of the subject has led the Commission to further refine Regulation 882/2004 in order to make up for the shortcomings of its drafting and implementation.

For that purpose the European Parliament and the Council adopted the new Official Controls Regulation 2017/625 on 15 March 2017. The Regulation was published in the Official Journal of the European Union on 7 April 2017 and entered into force on 27 April 2017. The new rules will gradually become applicable, with the main application date being 14 December 2019, fully replacing Regulation 882/2004 on official controls and other legislation that currently governs the control and enforcement of rules along the agri-food chain. In particular it will:

- Repeal: Regulations (EC) No 854/2004 and (EC) No 882/2004 of the European Parliament and of the Council, Council Directives 89/608/EEC, 89/662/EEC, 90/425/EEC, 91/496/EEC, 96/23/EC, 96/93/EC, and 97/78/EC, and Council Decision 92/438/EEC.
- Amend with respect to control rules: Regulations (EC) No 999/2001, (EC) No 396/2005, (EC) No 1069/2009, (EC) No 1107/2009, (EU) No 1151/2012, (EU) No 652/2014, (EU) 2016/429, and (EU) 2016/2031 of the European Parliament and of the Council, Council Regulations (EC) No 1/2005 and (EC) No 1099/2009, and Council Directives 98/58/EC, 1999/74/EC, 2007/43/EC, 2008/119/EC, and 2008/120/EC.

#### **Extended Scope**

The new Official Controls Regulation strengthens and enhances the EU system as an international reference for integrated rules covering the entire agri-food chain. Indeed, its scope has been extended, and will now also include official controls to verify compliance with plant health and animal by-product rules. As well, the regulation provides more specific rules for several areas already covered (e.g. animal health and animal welfare) and applies to all operators at all stages of production, processing, and distribution that handle animals, plants, food, feed, goods, substances, materials, or equipment. As such, businesses and enforcement authorities would benefit from a simplified framework that mainstreams official control rules into a single Regulation.

As per past official control regimes (i.e. Regulation 882/2004), the new Regulation does not deal with the verification of compliance with the rules on the common market organization of agricultural products already governed by established control systems, as it applies to those checks carried out under marketing standards rules (i.e. Article 89 of Regulation (EU) No 1306/2013) in order to identify potential instances of fraudulent or deceptive practices involving marketing standards of agricultural products.

### **Risk-Based Approach**

Competent authorities shall perform controls without prior notice, unless this is necessary, and follow the same risk-based approach.

A new provision clarifies that official controls must be implemented in a manner that minimizes the burden on businesses. Thus, rigid, inflexible rules are withdrawn and control authorities would take advantage of a more integrated IT system that allows a more modern approach to tracking trade practices. This means that the frequency of controls will be linked to risks that a product presents with respect to fraud, health, safety, animal welfare, or the environment. The assessment of the risk also takes into consideration other factors, in particular the operator's past record of compliance and the likelihood that consumers are misled about properties, quality, composition, or country of provenance of the food.

Thus, this allows, on one side, the Commission to adjust control requirements to the specific enforcement needs of each sector (e.g. the establishment of minimum control frequencies where the risks warrant it) and on the other side national authorities to commit their resources where they are most needed.

### **Transparency**

The new rules require increased transparency and greater accountability from Member State authorities, who are obligated to publish annual reports in order to enable consumers to obtain information about how agri-food chain rules are applied and enforced. These publications must specify the type and number of controls, the cases of non-compliance observed, and the cases where enforcement measures were taken and penalties were imposed. New rules allow Competent Authorities to make publicly available information about rating scheme systems for operators, based on the outcome of official controls. The rating criteria must be objective, fair, and transparent so that consumers are better informed about the level of compliance of businesses (such as manufacturers, retailers, restaurants, etc.).

In this regard, operators are required to assist and cooperate with the staff of competent authorities and to provide them updated details about their name, the places under their control, and the specific activities they carry out, including activities undertaken by means of distant communication (such as tele- and Internet sales). More specifically, to the extent necessary to perform official controls, operators must give access to their equipment, means of transport, premises, computers, documents, and relevant information, animals, and goods under their control.

If a list or register of operators already exists for other purposes, Competent Authorities may use the existing list or register. Furthermore, certain categories of operators for which registration would be disproportionate to the level of risk posed by the operator's activities, can be exempted via delegated act.

### **Delegation of Control Tasks**

Rules on delegation of official control tasks remain largely the same, as provided for in Regulation 882/2004. However, new provisions specify that delegation can be made to delegated bodies or a natural person and cover the delegation of specific tasks regarding other official activities.

Moreover, the delegation of certain official control tasks shall meet precise conditions, including:

- the delegation must be in writing and shall contain a precise description of the tasks that the delegated body must perform;
- the delegated body must have the required expertise, equipment, suitable qualifications, and experienced staff to undertake the control;
- the delegated body must be impartial, free from conflict of interest, and accredited in accordance with standards relevant to the control tasks to perform;
- effective coordination between the delegating Competent Authority and the delegated body must be guaranteed.

Further to inspections or/and audits, if the Competent Authority finds that the delegated body or natural person is not meeting the necessary conditions, the delegation must be withdrawn fully or partially.

Responsibility for taking actions in the case of established non-compliance (i.e. enforcement measures) cannot be delegated: only the relevant Competent Authority may take such actions.

### **Official Laboratories**

The Regulation establishes rules for the designation of the laboratories performing analyses, tests, or diagnoses for official controls and the conditions to be designated. Accreditation to EN ISO/IEC 17025 is still a mandatory condition for the designation of all official control laboratories.

Competent Authorities may introduce permanent derogation from mandatory accreditation of official control laboratories for laboratories with a limited scope of activities (e.g. Trichinella in meat).

Temporary derogation from mandatory accreditation may be introduced for methods of analysis, tests, or diagnoses that are not covered by accreditation. Although, this would be limited to specific conditions such as:

- emergency circumstances
- when the method is newly required by EU legislation.

Official laboratories, upon request of the Competent Authority, must make available to the public the names of the methods used for analyses, tests, or diagnoses.

The Commission has the power to establish EU Reference Laboratories (EURLs) in those sectors where there is a recognised need to develop uniform practices and reliable methods of analyses, tests, and diagnoses.

The decision to establish an EURL is taken by a delegated act involving the European Parliament and the actual designation is implemented by the Commission, in order to favor the openness and transparency of the selection process. The designation is valid for a minimum of 5 years.

Furthermore, within 1 year of the entry into force of the Regulation, new EU Reference Centres for animal welfare will be set up to provide coordinated assistance to Member States in the field of animal welfare. The tasks include:

- fulfilling scientific and technical studies;
- carrying out training courses and disseminating research findings and technical innovations;
- submitting scientific and technical advice for the development and application of animal welfare indicators.

### **Food Fraud**

Fraud affects consumers' trust, undermines competition, and may compromise food and feed safety. Hence, the new rules require member States to perform regular, unannounced risk-based official controls to detect fraudulent or deceptive practices. This includes checking compliance against marketing standards for agricultural products. Financial penalties for fraud must reflect the expected economic gain or a percentage of the turnover made by the fraudulent operator. In addition, EU Reference Centers for the authenticity and integrity of the agri-food chain may be established. They would provide EU countries with up-to-date, reliable technical data and research findings to assist with the effective performance of their controls task.

### **Cascade of Methods**

The new Regulation specifies that rules on methods of sampling, analysis, tests, and diagnosis are applicable to official controls as well as to other official activities in all sectors covered by the Regulation. The cascade of methods used for sampling, analysis, tests, and diagnosis appears as follows:

First, methods complying with the relevant Union rules must be considered

If there are no Union rules, the following methods must be used:

- (a) Methods in compliance with internationally recognised rules or protocols, including those accepted by the European Committee for Standardisation (CEN), or
- (b) Methods developed and recommended by European Union Reference Laboratories and validated in accordance with internationally accepted scientific protocols.

In the absence of the above rules or protocols, methods that comply with relevant rules established at a national level shall be used. If neither such rules are provided, those seeking compliance must use:

- (a) Relevant methods developed or recommended by national reference laboratories and validated in accordance with internationally accepted scientific protocols; or
- (b) other methods validated with intra-laboratory methods, in accordance with existing internationally accepted scientific protocols.

### **Products from Third Countries**

The regulation establishes an integrated approach to import controls by eliminating the current fragmentation of requirements. A common set of rules applies to border controls carried out on animals, products of animal origin, plants, and other products and goods that pose a risk to health, safety, animal welfare, or in certain

cases, the environment. All of these goods must be channeled through Border Control Posts (BCPs), which replace the various Border Inspection Posts (BIPs) and Designated Points of Entry (DPEs). All consignments to be presented at the border control posts shall undergo document checks, while identity and physical checks shall take place at a frequency depending on the risk linked to the specific animals or goods. The criteria to determine and modify the frequency of rates is established by the Commission. A Common Health Entry Document (CHED) is introduced for consignments from third countries and will be transmitted to the border control post through a new integrated computerised system for official controls (Integrated Management System for Official Controls, IMSOC).

### **Cooperation and Assistance Between EU Countries**

The new regulation clarifies and strengthens rules on the cooperation and administrative assistance between EU countries to ensure cross-border enforcement of agri-food chain rules. Member States are obligated to facilitate the exchange of information between Competent Authorities and other enforcement authorities such as public prosecutors on possible cases of non-compliance. This allows a swifter and more efficient pursuit of non-compliance across borders.

Moreover, the Integrated Management System for Official Controls (IMSOC) integrates all existing and future computer systems (e.g. TRACES, RASFF, and Europhyt) to ensure optimal use of data, reduce burdens on businesses and national enforcers, and accelerate the exchange of information between Member States.

### **Financing of Official Controls and Other Official Activities**

Mandatory fees are required of operators for certain official controls, and in particular those carried out:

- (a) in slaughterhouses, cutting plants, on milk production and on the production and placing on the market of fishery and aquaculture products;
- (b) at border control posts (or at control points other than border control posts where permitted) on animals, products of animal origin, germinal products, animal by-products, plants, and plants products;
- (c) on goods originating from third countries on the basis of the risk posed;
- (d) at borders on animals and goods subject to emergency measures or for which conditions or measures have been established to enter the Union;
- (e) to verify the conditions for the approval of feed premises (feed mills);
- (f) as necessary to follow up on non-compliance, but not originally planned.

As well, for the determination of the amount of fees for the controls at points (a) and (b) above, Competent Authorities have the option to choose one of the following methods:

1. fees set out at a flat-rate on the basis of the costs borne by the Competent Authorities over a given period of time, and applied to all operators irrespective of whether any official control activity is carried out at any particular operator's premises during the reference period. Member States will be required to take into account the impact of size and type of business concerned, and the relevant risk associated with these businesses;

2. fees calculated on the basis of the costs of each individual control and applied specifically to the operators subject to the control;
3. fees based on the amounts provided by the Regulation (detailed in the annex). Those amounts no longer constitute minimum fees as provided under the current regime of Regulation (EC) 882/2004.

For the official controls at points (c)–(f) above, the Competent Authorities will recover the actual cost of controls.

Moreover, Competent Authorities shall take into account the salary, social security, pension, and insurance costs of support and administrative staff (as well as of staff physically performing official controls); the same applies to the costs of services charged to Competent Authorities by delegated bodies for the official controls delegated to them.

### **Enforcement Actions and Measures**

Competent Authorities shall consider the nature of the non-compliance and the operator's past record of compliance when deciding what action to take.

However, the non-exhaustive list of current enforcement actions has increased to reflect the broader scope of the new Regulation. For instance, the list of measures now includes:

- restriction or prohibition of movements of animals;
- the slaughter or killing of animals provided it is the most appropriate measure to safeguard public health and animal health and welfare;
- closing the website of the operator.

The Commission is authorized to adopt more suitable actions where there is evidence that the system of controls in a Member State faces serious disruption to the point that it constitutes a real risk to the agri-food chain, and the Member State has not addressed the shortcomings within a time limit set by the Commission. The Regulation also introduces more stringent rules for financial penalties imposed by Member States in order to deter fraudulent behaviours and foster fair competition among businesses. Those penalties shall reflect the economic advantage of the operator or a percentage of the operator's turnover.

### **E-commerce**

Food law applies to food sold via the Internet. Consequently, e-commerce must be part of official controls. The new regulation confirms that Member states can, for control purposes, order products online without identifying themselves (i.e. mystery shopping), and use products purchased as official samples. Non-compliance can result in penalties regardless of the location of the operator.

## 20.6 Conclusions

The scenario outlined above shows the gradual evolution in food law, the fundamental cornerstone of which is the protection of food and feed safety.

This, as illustrated above, has been done by adopting vertical rules and regulations, harmonised throughout the entire territory and common to all operators, who will only then be able to achieve their goals and thus ensure high, common quality standards.

The significant food crises that have shaken the continent have been followed by serious and timely reaction by Community authorities, which have proven that they know how to react in relatively short periods of time, thus contributing to the creation of a system that is functional for operators and safe for consumers, and that is becoming one of the most developed systems in the world.

The need for rapid, repeated actions at the same time, however, is a constant challenge, one that certainly cannot be considered complete and that will continue testing not only the relevant national and European authorities but all stakeholders as well.

# Chapter 21

## European Food Trade

Roland Kölcsey-Rieden and Lívía Hulló

**Abstract** This chapter is a primer on EU market and food trade regulations. The internal market, food's free movement and the rules applied to agricultural product and food trade are reviewed. Economic integration and the harmonization of food trade are described with emphasis on the Treaty on the Functioning of the European Union to explain the customs union and the free movement of goods in the EU. The second section of the chapter addresses the European Union's external market and world trade in light of the WTO and EFTA, EEA, and ACP countries.

### 21.1 Introduction to the Internal Market of the European Union

The European Union (EU) was first established in 1952 as the European Coal and Steel Community (ECSC) to economically and politically unite European countries in order to secure lasting peace.<sup>1</sup> In 1957, the six founding countries signed the Treaty of Rome, which extended the earlier cooperation within the ECSC and created the European Economic Community (EEC) or Common Market.<sup>2</sup> The EEC's objective was to bring about economic integration.<sup>3</sup> Member States the countries that comprise the EU remain independent sovereign nations, but they

---

<sup>1</sup>The ECSC was the first international organisation based on the principles of supranationalism. The Treaty came into force in 1958. European Union (2014).

<sup>2</sup>The six founders are Belgium, France, Germany, Italy, Luxembourg and the Netherlands. The Inner Six, or simply "The Six" was in contrast to the outer seven who formed the European Free Trade Association. The Treaty establishing the European Economic Community (TEEC) was signed on 25 March 1957. The EEC was also known as the Common Market and sometimes referred to as the European Community.

<sup>3</sup>Article 2 and 3 of the Treaty of Rome.

cede a part of their sovereignty in order to achieve a common market. Countries gain global influence as a Member State.

The Single European Act (SEA) represents the first major revision of the Treaty of Rome.<sup>4</sup> The SEA's chief objective was to complete the internal market.<sup>5</sup> The SEA transformed the Common Market into a single market on 1 January 1993 by creating new community competencies and reforming the institutions, such as collaborative legislative process.<sup>6</sup> The SEA opened the way to political integration and enshrined the economic and monetary union in the Treaty of Maastricht on the European Union.<sup>7</sup>

The Maastricht Treaty ("Treaty on European Union" or TEU) was signed on 7 February 1992 by the members of the European Community in Maastricht, Netherlands. It created the European Union on 1 November 1993.<sup>8</sup> By 1992, the Maastricht Treaty created the Economic and Monetary Union as the next stage of integration. The Maastricht Treaty was amended several times by the Treaties of Amsterdam, Nice, and Lisbon. The Treaty of Lisbon amended the two treaties Maastricht Treaty (1993) and Treaty of Rome (1952), which form the EU's constitutional basis. In this process, the Rome Treaty was renamed to the Treaty on the Functioning of the European Union (TFEU).

Primary law, secondary law and supplementary law are European Union law classifications. EU legislation divided into primary legislation embodied in the treaties, and secondary legislation in the form of regulations, directives and decisions used to implement the policies set out in the treaties.<sup>9</sup> Member States courts also apply the European Union law. Supplementary sources are elements of law not provided for by the Treaties.<sup>10</sup> The Court of Justice of the European Union (CJEU or "Court") is the highest court able to interpret European Union law.

### ***21.1.1 Single Market of the European Union for Goods***

The EEC's objectives were to develop a common market and a customs union among the Member States. The European Union's internal market

---

<sup>4</sup>The SEA was signed at Luxembourg on 17 February 1986 and at The Hague on 28 February 1986. It came into effect on 1 July 1987.

<sup>5</sup>[European Summaries of EU legislation, The Single European Act.](#)

<sup>6</sup>The European Parliament was given a say in legislating and was introduced with more majority voting in the Council of Ministers.

<sup>7</sup>See the [European Summaries of EU legislation, The Single European Act.](#)

<sup>8</sup>Article A TEU.

<sup>9</sup>[European University Institute.](#)

<sup>10</sup>This category includes Court of Justice case-law, international law and general principles of law.

(or single market) differs from other forms of integration.<sup>11</sup> It seeks to guarantee the so-called “four freedoms,” the free movement of goods, capital, services, and people within the EU’s 28 Member States. The internal market is open to three non-EU states.<sup>12</sup>

The fundamental idea behind the internal market is that the EU constitutes a single economic area that operates similarly to national markets. Accordingly, the free movement of goods is of primary importance for both the establishment of an internal market and for European integration as a whole. The free movement of goods, i.e. the free trade of goods within the EU, is secured by the customs union and by abolishing quantitative restrictions between the Member States.

### 21.1.2 *Customs Union*

TFEU Article 28 proclaims the EU Customs Union (EUCU) as a constituting element of the EU, which includes the entire trade of products between the Member States and with third countries.<sup>13</sup> Between Member States, the union prohibits (1) all customs duties on imports and exports, (2) all charges having equivalent effect to such duties, and (3) the adoption of a common customs tariff in their relations with third countries. Member States removed customs barriers between one another and introduced a common customs policy towards other countries. The overall purpose of the duties is “to ensure normal conditions of competition and to remove all restrictions of a fiscal nature capable of hindering the free movement of goods within the Common Market.”<sup>14</sup> 28–30 TFEU regulates the customs union provision.

The Customs Union’s integrative power enhanced trade between Member States from the EEC’s beginning. The Customs Union aims to (1) eliminate customs duties between the Members States and (2) implement a common customs tariff policy with regard to third countries (the latter being the main point of difference between the Customs Union and a free trade zone). A Customs Union requires free movement of goods between Member States. The Member States acknowledge that they cannot restrict the movement of transit goods within the Union; they must adhere to the principle of the freedom of goods.

The TFEU does not define the term “goods.” However, several European Union Court decisions define the concept as follows: “By goods, within the meaning of

---

<sup>11</sup>Article 26 states “The internal market shall comprise an area without internal frontiers in which the free movement of goods, persons, services and capital is ensured in accordance with the provisions of the Treaties.”

<sup>12</sup>Agreement on the European Economic Area, entered into force on 1 January 1994, brings together the EU Member States and the three EEA EFTA States—Iceland, Liechtenstein and Norway—in a single market. [EFTA agreement](#).

<sup>13</sup>Case C-173/05. Commission of the European Communities v Italian Republic.

<sup>14</sup>Case 27-67. Firma Fink-Frucht GmbH v Hauptzollamt München-Landsbergerstrasse.

Article 9 of the EEC Treaty [now Article 28], there must be understood products which can be valued in money and which are capable, as such, of forming the subject of commercial transactions.”<sup>15</sup> It is important to draw a legal distinction between goods and services. The principle of the freedom to provide services enables an economic operator providing services in one Member State to offer services on a temporary basis in another Member State.<sup>16</sup> For example, while fish are considered goods, the free movement of goods principle does not cover fishing rights and angling permits. Fishing rights and angling permits constitute the “provision of a service” within the Treaty provisions relating to the freedom to provide services.<sup>17</sup>

The content behind the concept of “Community goods” as referred to in Article 28 TFEU is laid down in Article 4 (18) of Regulation (EC) No 450/2008. The Regulation defines “non-Community goods” as goods that comply with the import requirements of the state in question.<sup>18</sup> These requirements usually mean compliance with the Community legislation.

### 21.1.3 Customs Duties

Customs duties represent a charge imposed by the executive power in relation to the good’s export, import, and transit.<sup>19</sup> TFEU article 30 prohibits Member States from levying any duties on goods crossing the border. Once a third country imports a good into the EU and the appropriate customs duty has been paid, then it is in free circulation between the Member States (TFEU article 29). There are not any systematic customs controls at the Members States’ borders since the SEA.<sup>20</sup> Emphasis is on post-import audit controls and risk analysis. Physical controls of imports and exports now occur at traders’ premises, rather than at the territorial borders.

<sup>15</sup>Case 7/68. Commission of the European Communities v Italian Republic.

<sup>16</sup>European Commission (EC) (2014f), Freedom to provides services/Freedom of establishment [http://ec.europa.eu/internal\\_market/top\\_layer/living\\_working/services-establishment/index\\_en.htm](http://ec.europa.eu/internal_market/top_layer/living_working/services-establishment/index_en.htm) and Article 56 TFEU (ex Article 49 TEC).

<sup>17</sup>Case C-97/98 Jägerskiöld [1999].

<sup>18</sup>Article 4 of Regulation No. (EC) 450/2008.

<sup>19</sup>Article 30 (ex Article 25 TEC).

<sup>20</sup>The Single European Act (SEA) was the first major revision of the 1957 Treaty of Rome. The Act set the European Community an objective of establishing a single market by 31 December 1992, and codified European Political Cooperation, the forerunner of the European Union’s Common Foreign and Security Policy.

### 21.1.4 *Charges Having Equivalent Effect to Customs Duties*

TFEU article 30 prohibits “charges having equivalent effect.” The European Court of Justice defined “a charge having equivalent effect” in Case 7/68:

[A]ny pecuniary charge, however small and whatever its designation and mode of application, which is imposed unilaterally on domestic or foreign goods by reason of the fact that they cross a frontier, and which is not a customs duty in the strict sense, constitutes a charge having equivalent effect. . . even if it is not imposed for the benefit of the state, is not discriminatory or protective in effect and if the product on which the charge is imposed is not in competition with any domestic product.<sup>21</sup>

However, a charge escapes classification as “a charge having equivalent effect to a customs duty if it relates to a general system of internal dues applied systematically and in accordance with the same criteria to domestic products and imported or exported products alike.”<sup>22</sup>

The meaning of “charges having equivalent effect to customs duties” as related to food products emerged in the Case *C-2-3/62 Commission v Belgium and Luxemburg*.<sup>23</sup> Belgium and Luxemburg levied tax on imported gingerbread to protect inland producers. They argued that the tax was more expensive in their countries than in the import countries. The Court of the European Union stated:

A charge having equivalent effect within the meaning of Articles 9 and 12 of the EEC Treaty, whatever it is called and whatever its mode of application, may be regarded as a duty imposed unilaterally either at the time of importation or subsequently, and which, if imposed specifically upon a product imported from a Member State to the exclusion of a similar domestic product, has, by altering its price, the same effect on the free movement of products as a customs duty.

Pecuniary charge and fees charged by authorities are exceptions to the prohibition on charges imposed when goods or live animals cross the border, listed in Case 18/87 *Commission v Germany*.<sup>24</sup> For more information on charges and fees on live animals.

## 21.2 The Treaty on European Union and the Treaty on the Functioning of the European Union (TFEU) and Food Regulation: Quantitative Restrictions and Measures Having Equivalent Effect

TFEU articles 34–35 address the general strategy concerning the free movements of goods.<sup>25</sup> TFEU articles 30–33 are the Customs Union’s foundation by providing for the elimination of customs duties between the Member States and by establishing a Common Customs Tariff. Without these provisions, the Member States would be able to place quotas in the amount of goods that could be imported, and restrict the flow of goods by measures that have the equivalent effect to quotas.<sup>26</sup> The TFEU does not address what equivalent effect measures are and how they affect trade between Member States. The European Court of Justice, however, provides detailed case law interpreting article 34. Quantitative restrictions are measures that amount to a total or partial restraint on imports or goods in transit.<sup>27</sup> Examples include an outright ban or a quota system. However, this article only pertains to non-tariff quotas, since TFEU article 30 covers tariff quotas. A quantitative restriction is based on statutory provisions or may just be an administrative practice. Thus, TFEU article 34 can be applied to a covert or hidden quota system.

The conditions for TFEU article 34 application are (1) the case bearings pertain to the concept of goods crossing borders, (2) article 4 applied to import, and (3) the case bearings have cross-border elements. EU law does not prevent Member States from treating domestic products less favourably than imports through reverse discrimination, as seen in the need for a cross-border element. TFEU article 34 is, however, applicable when it is reimported, i.e. a domestic product is imported back into a Member State.<sup>28</sup> The Court mandates that the free movement of goods entail the existence of a general principle of free transit of goods within the EU.<sup>29</sup> All goods, irrespective of the manufacturing origin inside or outside the internal market, benefit from the principle of free movement in the internal market.<sup>30</sup>

While TFEU articles 34–36 are the groundwork for the general principle of the free movement of goods, they are not the only legal standard to check the compatibility of national measures with internal market rules. These Treaty articles do not apply when a product’s free movement is fully harmonised by EU legislation, i.e. where a given product’s specifications or conditions of sale are subject to harmonisation by EU directives or regulations. In other cases, more specific Treaty

<sup>25</sup>Quantitative restrictions on imports and all measures having equivalent effect shall be prohibited between Member States.

<sup>26</sup>Craig and de Búrca (2011).

<sup>27</sup>Case 2/73 Geddo.

<sup>28</sup>Case 78/70 Deutsche Grammophon v. Metro.

<sup>29</sup>Case C-320/03 Commission v. Austria.

<sup>30</sup>See European Commission (EC) (2014a), Free movement of goods.

rules, such as Article 110 TFEU on tax-related provisions that may hamper the internal market, prevail over the general provisions of Articles 34–36 TFEU. Therefore, any problem that is covered by harmonising legislation would be analysed through concrete terms and not according to the Treaty's broad principles.<sup>31</sup>

Food law harmonized areas address food labeling, food safety, organic products, and food quality standards.<sup>32</sup> Secondary law is applicable if areas are harmonized; the primary law is applicable if harmonization is incomplete or there is no harmonization. By acknowledging that potential differences between the Member States' national rules could inhibit trade, the Court confirmed that TFEU article 34 could catch national measures applied equally to domestic and imported goods. In this case, Member States could derogate by having recourse not only to TFEU article 36 but also to the mandatory requirements. TFEU article 34 applies to national measures that discriminate against imported goods. The imported goods are required to comply with two sets of rules—rules by the Member State of manufacture, and rules by the Member State of importation.<sup>33</sup>

### 21.2.1 *Quantitative Restrictions*

Quantitative restrictions represent rough means of trade policy. Competitive products could not reach other Member States if quantitative restrictions are applied. Consequently, the free movement of goods on the internal market would not be realized if the Member States were allowed to impose quantitative restrictions against each other. The European Court of Justice determined “quantitative restriction” in the Geddo case as follows<sup>34</sup>:

The prohibition, under Article 23 [now Article 34], of such a measure in the internal trade of the community is designed to ensure the free movement of goods within the community the prohibition of quantitative restrictions and measures having equivalent effect covers any total or partial prohibition on imports, exports or goods in transit and any encumbrance having the same effect.

<sup>31</sup>European Commission (EC) (2014a).

<sup>32</sup>Directive 2000/13/EC on the approximation of the laws of the Member States relating to the labelling, presentation and advertising of foodstuffs; regulation (EC) No 178/2002 of the European Parliament and of the Council of 28 January 2002 lays down the general principles and requirements of food law, establishing the European Food Safety Authority and lays down procedures in matters of food safety; Council Regulation (EC) No 834/2007 of 28 June 2007 on organic production and labelling of organic products and repealing Regulation (EEC) No 2092/91; Commission Implementing Regulation (EU) No 543/2011 of 7 June 2011 lays down detailed rules for the application of Council Regulation (EC) No 1234/2007 in respect of the fruit and vegetables and processed fruit and vegetables sectors.

<sup>33</sup>See European Commission (EC) (2014a), Free movement of goods.

<sup>34</sup>Case 2-73. Riseria Luigi Geddo v Ente Nazionale Risi European Court reports 1973 Page 00865.

A quantitative restriction constitutes restricting the import of an agricultural product from a specific country for a certain period.

### 21.2.2 *Measures of Equivalent Effect*

The term “measure having equivalent effect” is broader in scope than a quantitative restriction. However, the rules apply similarly to quantitative restrictions and to equivalent effect measures. *Dassonville*, *Cassis de Dijon* and *Keck and Mithouard* represent milestone cases in the jurisdiction the “measures of equivalent effect.”<sup>35</sup>

In *Dassonville*, the Court of Justice interpreted equivalent effect’s meaning and scope of measures: “All trading rules enacted by Member States which are capable of hindering, directly or indirectly, actually or potentially, intra—Community trade are to be considered as measures having an effect equivalent to quantitative restrictions.” The Court’s case-law confirms the definition with minor variations. In the famous *Cassis de Dijon* case, German authorities did not allow the trading of French blackcurrant liqueur, claiming that its wine-spirit content did not reach the wine-spirit content provided by the German legislation on spirits. The Court ruled that the legislation is contrary to Community law. The Court of Justice stated that member states are obliged to recognise goods legally produced in another member state, according to the Union’s fundamental principle of mutual recognition. However, the member state could justify the restriction by reference to a mandatory requirement.<sup>36</sup>

Technical regulations containing requirements for the presentation of goods (e.g. weight, composition presentation, form, size, packaging) are an example of typical measures of equivalent effects.<sup>37</sup> For example, margarine required to be packaged in cubes to distinguish it from butter is contrary to Article 34 TFEU, since there was not a harmonized law regarding margarine’s packaging.<sup>38</sup> Other examples include national price controls and reimbursement, authorization procedure, advertising restrictions, indications of origin, quality marks, and incitement to buy national products.

Article 34 TFEU is characterised as a defense right invoked against national measures creating unjustified obstacles to cross-border trade. Accordingly, infringements of Article 34 TFEU presuppose state activity. The measures falling within the scope of Article 34 TFEU consist primarily of binding provisions of member states’ legislation. However, non-binding measures can also constitute a breach of Article 34 TFEU. An administrative practice can amount to a prohibited

<sup>35</sup>Case 8-74 Procureur du Roi v Benoît and Gustave Dassonville [1974] ECR 937; Case C-120/78; Joined cases C-267/91 and C-268/91.

<sup>36</sup>Craig and de Búrca (2011).

<sup>37</sup>See European Commission (EC) (2014a), Free movement of goods.

<sup>38</sup>Case 261/81 Rau v De Smedt.

obstacle to the free movement of goods provided that this practice is, to some degree, of a consistent and general nature. In view of member states' obligations under Article 4(3) of the Treaty on the European Union (i.e. Article 10 EC), which require states to fulfill Treaty obligations and the *effet utile* of EU law, Article 34 TFEU may also be infringed by a Member State's inactivity. For example, a Member State refraining from adopting the required measures to address obstacles to the free movement of goods is considered a trade obstacle.<sup>39</sup>

*Commission v. Ireland* is an incitement Case to buy national products involved in a large-scale campaign encouraging the purchase of domestic goods rather than imported products. The Court decided that, as the campaign attempted to reduce the flow of imports, it infringed Article 34 TFEU. According to Community law, the national characteristic of goods cannot be emphasized, with the exception of cases where a product is bound to a certain region on the basis of its characteristics (e.g. Parma Ham Prosciutto) or where a product has been qualified as an "outstanding product."

Regulation (EC) No 2679/98 addresses the internal market's functioning and provides special procedures to cope with obstacles to the free movement of goods. There are different reasons behind obstacles to the free movement of goods; national authorities may be passive in the face of individual violent action or non-violent blockages of borders. Further, a member state's institutionalised boycott of imported products may also create obstacles. The regulation provides for an alert procedure and the information exchange between member states and the Commission. It reminds member states to adopt measures to ensure the free movement of goods and to inform the Commission. Lastly, it empowers the Commission to send notifications to the member states requesting that such measures are adopted within a deadline.

### ***21.2.3 Exceptions to the Free Movement of Goods***

A ban on a specific product's marketing is the most restrictive measure a member state can adopt. Foodstuff, including vitamins and supplements, are the majority of goods targeted by national bans.<sup>40</sup> Member States justify bans according to Article 36 TFEU for the protection of health, animals and plants, and the Court case law's mandatory requirements. The Member State imposing a national ban on a product/substance must prove the measure is necessary. Further, the State must prove the marketing poses a public health risk and that the rules are in line with the principle of proportionality.<sup>41</sup> For example, when France banned caffeine's addition to

---

<sup>39</sup>See European Commission (EC) (2014a), Free movement of goods.

<sup>40</sup>See European Commission (EC) (2014a), Free movement of goods.

<sup>41</sup>So also European Commission (EC) (2014a), Free movement of goods. [goods/files/goods/docs/art34-36/new\\_guide\\_en.pdf](#).

beverages above a certain limit, the Court held that “appropriate labelling, informing consumers about the nature, the ingredients and the characteristics of fortified products, can enable consumers who risk excessive consumption of a nutrient added to those products to decide for themselves whether to use them.”<sup>42</sup> The caffeine ban above a certain limit was unnecessary in order to achieve consumer protection.<sup>43</sup>

The Danish government prohibited the enrichment of foodstuffs with vitamins and minerals if Denmark’s population did not require the nutrients.<sup>44</sup> The Court agreed Denmark could decide on its intended level of protection. The Court remarked:

Since Article 30 EC [now Article 36] provides for an exception, to be interpreted strictly, to the rule of free movement of goods within the Community, it is for the national authorities which invoke it to show in each case, in the light of national nutritional habits and in the light of the results of international scientific research, that their rules are necessary to give effective protection to the interests referred to in that provision and, in particular, that the marketing of the products in question poses a real risk to public health.

Member States can also require prior authorization for authorized substances from other Member States. In this case, Member States comply with EU law obligations if procedures are accessible, can be timely completed, and if the banning is challenged before the courts. This procedure must bind the national authorities. The Court established the “simplified procedure” characteristics in Case C-344/90.<sup>45</sup>

The *Comission v. Germany* case (C-178/84) prevented French manufacturers from entering the German market due to German legislation governing beer’s manufacture (Biersteuergesetz). The Case is a quantitative restriction because of infringement and the causal relation between the measure and the manufacturers’ loss. “Reverse discrimination” may also take place due to Community law’s application; the national legislation may impose stricter regulations than the Community legislation, resulting in favored foreign producers.<sup>46</sup>

---

<sup>42</sup>Case C-24/00 *Commission v France* [2004].

<sup>43</sup>See European Commission (EC) (2014a), Free movement of goods.

<sup>44</sup>Case C-192/01 *Commission v Denmark*.

<sup>45</sup>Case C-344/90 *Commission v France*.

<sup>46</sup>In its judgment in Case C-366/98 *Geffroy*, the Court ruled that Article 34 TFEU “must be interpreted as precluding a national rule...from requiring the use of a specific language for the labelling of foodstuffs, without allowing for the possibility of using another language easily understood by purchasers or of ensuring that the purchaser is informed by other means.”

### **21.2.4 Cases and Examples**

#### **21.2.4.1 Procureur du Roi v Benoît and Gustave Dassonville**

There are exceptions of free movement of trade. Belgian Law provides that imported goods bearing a designation of origin must have a government certificate from the exporting country certifying its right to such designation. Dassonville imported Scotch whisky from France into Belgium without a British certificate. The certificate was difficult to obtain since the goods were already in free circulation in a third country. Belgium persecuted Dassonville and argued by way of defence that Belgian rule constituted a measure having equivalent effect to a quantitative restriction.<sup>47</sup> This quantitative restriction entails trading rules enacted by member states.<sup>48</sup>

#### **21.2.4.2 Case Cassis de Dijon**

The French blackcurrant-based drink was at the heart of one of the European Court of Justice's most celebrated decisions. In 1979, Rewe-Zentral AG, one of Germany's largest food and drinks retailers, complained to the European Court of Justice that the German authorities made it difficult for the company to import and sell Cassis de Dijon. The Court ruled in the firm's favour and declared that if a company is allowed to make a product freely available for sale in one European Community country, then it must be allowed to do so in all Member States. As Cassis de Dijon was already available in France, the Court argued all other European citizens also had the right to purchase and drink it.<sup>49</sup>

## **21.3 Freedom to Provide Services and Taxation**

The freedom to provide services (Article 56 TFEU) is closely related to the free movement of goods. Both freedoms relate to economic transactions of a commercial nature between Member States. Occasionally a specific national measure restricts both the circulation of goods (Article 34 TFEU) and the freedom to provide services. A given requirement relating to the distribution, wholesale or retail of goods may simultaneously restrict both the free movement of goods and the freedom to provide distributive trade services. As the Court recognized:

The objective of retail trade is the sale of goods to consumers. That trade includes, in addition to the legal sales transaction, all activity carried out by the trader for the purpose of

---

<sup>47</sup>Craig and de Búrca (2011).

<sup>48</sup>Please note renumbering Article 36 is now Article 34.

<sup>49</sup>Case 120/78.

encouraging the conclusion of such a transaction. That activity consists, *inter alia*, in selecting an assortment of goods offered for sale and in offering a variety of services aimed at inducing the consumer to conclude the abovementioned transaction with the trader in question rather than with a competitor.<sup>50</sup>

Restrictions on advertising (e.g. alcohol advertisements) may affect the promotion sector as service providers. Such restrictions may create trade obstacles to specific goods and the market penetration possibilities.<sup>51,52</sup>

The Court argued that Article 57 TFEU does not establish any order of priority between the freedom to provide services and the other fundamental freedoms.<sup>53</sup> The Court usually examines national measures by focusing on only one fundamental freedom, even if the measure has the potential to affect more than one fundamental freedom. For this situation, the Court decides which of the fundamental freedoms prevails. Therefore, it is essential to identify the main focal point of the national measure: if it is goods-related, then Article 34 TFEU applies; if it is services-related, then Article 56 TFEU applies.<sup>54</sup>

Regarding taxation, Article 110 of the TFEU states:

No Member State shall impose, directly or indirectly, on the products of other Member States any internal taxation of any kind in excess of that imposed directly or indirectly on similar domestic products. Furthermore, no Member State shall impose on the products of other Member States any internal taxation of such a nature as to afford indirect protection to other products.<sup>55</sup>

In the case *Commission v UK*, the low excise duty imposed on beer and the high excise duty imposed on wine resulted in the same bearings.<sup>56</sup> Wine discrimination is detected both in the products' similarity and the fact beer consumption and manufacturing is dominant. It can be difficult to determine whether a case falls under the scope of Article 30 TFEU governing charges equivalent to customs or Article 110 TFEU on discriminatory taxation. Regardless, the Court cannot invoke both Articles as the regulations provide for the clear categorization of each dispute.

<sup>56</sup>Case C-170/78.

## 21.4 Single Market for Food and Agricultural Products

Agriculture and fisheries have a special status within the European Union governed by regulations differing from the internal market rules. The TFEU exempts agriculture from the Common Market's general rules. According to Article 38 (2) TFEU the internal market rules are applied if the Treaty does not stipulate otherwise. The term "agricultural products" refers to stock farming and fisheries processing products.

The Court investigated first-stage processing in the König case.<sup>57</sup> The Court examined whether ethyl alcohol in general qualified as an agricultural product without regard to its alcoholic strengths:

The concept of 'products of first-stage processing directly related' to the basic products, must be interpreted as implying a clear economic interdependence between basic products and products resulting from a productive process, irrespective of the number of operations involved therein. Processed products which have undergone a productive process, the cost of which is such that the price of the basic agricultural raw materials becomes a completely marginal cost, are therefore excluded.

Beyond the above definition of agricultural products, Article 38 (3) EEC also stipulates the products subject to the provisions of Articles 39–44 are listed in Annex I. The Court examined a similar problem in the Case 61/80 case and ruled that:

The scope of regulation no 26 applying certain rules of competition to production of and trade in agricultural products was restricted by Article 1 thereof to the production of and trade in the products listed in annex ii to the treaty. that regulation may not therefore be applied to the manufacture of a product which does not come under annex ii even if it is a substance ancillary to the production of another product which itself comes under that annex.<sup>58</sup>

It follows from the above that concepts of foodstuffs and agricultural products are not identical. Should a product correspond to the concept of agricultural product, the special rules governing agricultural products must be applied to it. However, processed foodstuff is subject to the internal market rules.

## 21.5 The External Market of the European Union

As referred to in Chapter 2, the EU's common commercial policy is based on a set of uniform rules under the Customs Union and the Common Customs Tariff. The commercial policy governs the Member States' commercial relations with Non-EU

---

<sup>57</sup>Case C-185/73.

<sup>58</sup>Judgment of the Court of 25 March 1981—Coöperatieve Stremsel—en Kleurselafabriek v Commission of the European Communities.—Competition—Exclusive obligation to purchase rennet.—Case 61/80.

Member Countries. The tariff is common to EU members, but the rates of duty differ.<sup>59,60</sup> The rates depend on the product's economic sensitivity. The purpose of the instruments of trade defence and market access is mainly to protect European businesses from trade obstacles.

The EU evolved during globalisation by aiming for the harmonious development of world trade and fostering fairness and sustainability. It actively encourages open markets and trade development in the World Trade Organisation (WTO)'s multi-lateral framework. Simultaneously, it supports developing countries and regions through bilateral relations involving them in world trade using preferential measures.<sup>61</sup> However, the single market has several connections to these policies, including the underlying Internal Market principles. The Internal Market principles require consideration in the negotiation of international agreements. The Commission takes a position on Internal Market policies, whether bilateral or multilateral, in the context of enlargement and regulatory dialogues with third countries. In these negotiations, the services of the Commission responsible for the Internal Market cooperate with the services in charge of other policies to adequately represent and promote the European Internal Market's principles worldwide.<sup>62</sup>

### **21.5.1 Connection to the WTO**

The World Trade Organisation (WTO) moderates world trade affairs and brings together 153 members representing more than 95% of total world trade.<sup>63</sup> The WTO is a negotiating forum designed to liberalise world trade. Since the WTO's establishment in 1995, it has concluded a number of important agreements; for example, the Agreement on Agriculture came into being with the WTO's establishment on January 1, 1995.<sup>64</sup> The European Commission negotiates on behalf of all the member states in the WTO due to the common trade policy agreed on in Article 207 TFEU. To represent each EU country's interests, a special committee brings together officials from each of the 28 member countries. All aspects of international trade are addressed at these meetings, from WTO negotiations to export refunds.<sup>65</sup> The EU sets high safety standards on all its exports. The EU is

<sup>59</sup>Council Regulation (EEC) No 2658/87 of 23 July 1987 on the tariff and statistical nomenclature and on the Common Customs Tariff.

<sup>60</sup>European Commission (EC) (2014e), What is the Common Customs Tariff? [http://ec.europa.eu/taxation\\_customs/customs/customs\\_duties/tariff\\_aspects/index\\_en.htm](http://ec.europa.eu/taxation_customs/customs/customs_duties/tariff_aspects/index_en.htm).

<sup>61</sup>See European Commission (EC) (2014e), What is the Common Customs Tariff?.

<sup>62</sup>European Commission (EC) (2014g), The external dimension, [http://ec.europa.eu/internal\\_market/ext-dimension/index\\_en.htm](http://ec.europa.eu/internal_market/ext-dimension/index_en.htm).

<sup>63</sup>European Commission (EC) (2014c), External aspects of the EU's food industry, [http://ec.europa.eu/enterprise/sectors/food/international-market/wto/index\\_en.htm](http://ec.europa.eu/enterprise/sectors/food/international-market/wto/index_en.htm).

<sup>64</sup>See European Commission (EC) (2014c), External aspects of the EU's food industry.

<sup>65</sup>See European Commission (EC) (2014c), External aspects of the EU's food industry.

as an international trade standard setter as the world's largest food exporter (20.8 %) and second largest food importer (18.1 %),<sup>66</sup> It has entered many bilateral and multilateral trade agreements with non-EU countries.

The EU and WTO negotiations aim to eradicate poverty by prioritizing trade development issues. A series of bilateral agreements governs the EU's trade in Processed Agricultural Products (PAP or non-annex I goods).<sup>67</sup> Two political entities sign the agreements and bind only the two territories concerned. Examples include free trade agreements, economic partnerships, association agreements, and stabilisation and association agreements. The foreign trade regime for the core Non-Annex I products consists of both import duties and export refunds. The import duties are based on an industrial and agricultural element. Export refunds are paid for through the basic products of milk, sugar, eggs, cereals and rice. Other products are also included, such as spirits, processed fruit and vegetables. Several particular regimes apply for different other products.<sup>68</sup>

Tariff and non-tariff barriers to third country market access have a negative impact on EU industrial competitiveness. Non-tariff barriers are restrictions to imports that do not take the usual form of a tariff. They are the result of food legislation discrepancies from one country to another. Legislation can diverge in areas such as labelling requirements, residue limits and test result recognition. To gain barrier-free market access to foreign countries, DG Enterprise and Industry encourages tariff liberalisation and makes use of the following:

- Regulatory measures for convergence with trade partners and international standardisation promotion (e.g. Codex Alimentarius Standards, Hazard Analysis and Critical Control Points). The measures help reduce the cost of complying with non-EU country regulations;
- Agreements on Sanitary and Phytosanitary Measures (SPS) and Technical Barriers to Trade (TBT) of the World Trade Organisation (WTO). These agreements are being developed to eliminate existing barriers and to prevent the emergence of new ones.
- In order to ensure a coherent food industry policy, the European Union has signed bilateral agreements with third countries.<sup>69</sup>

Moreover, the Commission encourages international business dialogue and makes funding available for measures in non-EU country markets that promote agricultural and food products from the EU.

<sup>69</sup>See European Commission (EC) (2014d), International Aspects.

### ***21.5.2 Connection to the EFTA, EEA, and ACP Countries***

The European Economic Area (EEA) comprises three of four member states of the European Free Trade Association (EFTA) Iceland, Liechtenstein and Norway and 28 Member States of the EU.<sup>70</sup> The most important export destinations are USA, Japan, Switzerland, Russia, Canada and Norway.<sup>71</sup> The important suppliers of Processed Agricultural Products are USA, Switzerland, Ivory Coast, Bahamas, Malaysia and China.

The EU entered into bilateral agreements concerning trade in Processed Agricultural Products in addition to its international commitments under WTO.<sup>72</sup> The framework of bilateral agreements establishes specific preferential regimes for PAPs. The European Commission implements these preferential trade regimes on the EU's behalf. DG Enterprise and Industry participates in all bilateral trade negotiations for Processed Agricultural Products within a strict mandate defined by the Member States.

ACP countries must ensure their exports comply with changing EU standards (e.g. on food safety and animal welfare). For that reason, EPAs include technical support, training, and measures to promote knowledge transfer and strengthen public services. Examples include:

1. The EU pesticides programme for the horticulture sector and an EU fish health project
2. Training in food safety and quality control (PIP programme) for over 200,000 family-run fresh fruit and vegetable businesses.

### ***21.5.3 EU Export and Import Conditions: Fish, Seafood and Aquaculture Products***

The European Union is the world's biggest importer of fish, seafood and aquaculture products. The import rules for these products are harmonized; the same rules apply in all EU countries. For non-EU countries, the European Commission is the negotiating partner that defines import conditions and certification requirements.

The European Commission's Directorate-General for Health and Consumers (SANCO) is responsible for food safety in the European Union. The import rules for fishery products and shellfish (bivalve molluscs) seek to guarantee that all imports fulfil the same high standards as products from the EU Member States with respect to hygiene, consumer safety and, if relevant, to the animal health

---

<sup>70</sup>Switzerland, an EFTA member, has not joined the EEA.

<sup>71</sup>European Commission (EC) (2014b), Bilateral Trade Overview, [http://ec.europa.eu/enterprise/sectors/food/international-market/bilateral-trade-overview/index\\_en.htm](http://ec.europa.eu/enterprise/sectors/food/international-market/bilateral-trade-overview/index_en.htm).

<sup>72</sup>Examples of agreements are free trade agreements, economic partnerships, association agreements, and stabilisation and association agreements.

status. The European Union's food law implements the principle of quality management and process-oriented controls throughout the food chain. Spot checks on the end product alone would not provide the same level of safety, quality and transparency to the consumer. To implement these harmonised principles, the Food and Veterinary Office of the European Commission is undertaking missions in all exporting countries.

### **21.5.3.1 General Rules for Fishery Products**

Fishery products imported into the European Union are subject to official certification based on the recognition of the non-EU country's competent authority the European Commission. This formal recognition of the competent authority is a pre-requisite for the country to be eligible and authorized to export to the European Union. Public authorities with the necessary legal powers and resources must ensure credible inspection and controls throughout the production chain. The national competent authority must undertake all bilateral negotiations and other relevant dialogue concerning imports of fishery products. All other interested parties and private businesses wishing to export to the EU must contact their competent authority and communicate with the European Union via this channel.

## ***21.5.4 EU Export and Import Conditions: Poultry and Poultry Products***

The import rules in the European Union for poultry (including hatching eggs) and poultry products (including egg products) are fully harmonized. The European Commission acts as the competent authority on behalf of the 28 Member States. Member States' official veterinarians inspect animals and animal products entering the Community at a Border Inspection Post (BIP) to ensure they fulfil the EU requirements. Animals of a lower Community health status cannot transit the Community.

### **21.5.4.1 Import of Poultry and Poultry Products**

The definition of poultry, hatching eggs, day old chicks, captive birds, and poultry products is laid down in legislation Council Directive 2009/158/EC. The legislation guides the animal health principles on which importation of live poultry is based, harmonises the rules, and establishes the general animal health conditions for live poultry imported into the EU. The objective is to verify that the Member States apply the same principles for poultry importation. Further, harmonization prevents poultry from entering EU territory carrying infectious diseases that are dangerous

for livestock or humans. Council Directive 2002/99/EC are the animal health requirements for fresh meat. This Directive forms the legal basis for all animal health rules governing the production, processing, distribution and introduction of animal products for human consumption. Further, the Directive continues to provide harmonised rules and animal health guarantees for importing fresh meat into the EU.

#### **21.5.4.2 Third Country Authorisation**

Third countries of origin, i.e. countries that are not EU member states as trading partners, must be on a positive list of eligible countries. The eligibility criteria for the import of poultry and poultry meat are in Commission Regulation (EC) No. 798/2008. The criteria for the import of captive birds, for example, are in the Commission Implementing Decision (EU) No 139/2013.

The main criteria are:

- The exporting countries must have a competent veterinary authority which is responsible throughout the food chain;
- The country or region of origin must fulfil the relevant animal health standards;
- Adequate veterinary services must ensure effective enforcement of all necessary health controls;
- Imports are only authorised from approved establishments, such as slaughterhouses, cutting plants, game handling establishments, cold stores, meat processing plants, which have been inspected by the competent authority of the exporting country and found to meet EU requirements and the responsible agency provides the necessary guarantees and is obliged to carry out regular inspections;
- The veterinary authorities must have one or more laboratories that comply with certain minimum requirements, ensuring sufficient capability for disease diagnosis;
- The national authorities must also guarantee that the relevant hygiene and public health requirements are met. Specifically, the hygiene legislation contains specific requirements on the structure of establishments, equipment and operational processes for slaughter, cutting, storage and handling of meat. These provisions are aimed at ensuring high standards and at preventing any contamination of the product during processing. More information on the food hygiene legislation can be found on the webpages of the Directorate-General for Health and Consumers.<sup>73</sup>

## 21.6 Conclusion

This chapter is a primer on EU market and food trade regulations. The internal market, food's free movement and the rules applied to agricultural product and food trade are reviewed. Economic integration and the harmonization of food trade are described with emphasis on the Treaty on the Functioning of the European Union to explain the customs union and the free movement of goods in the EU. Notably, the European Union is the world's biggest importer of fish, seafood and aquaculture products. The import rules in the European Union for poultry (including hatching eggs) and poultry products (including egg products) are fully harmonized. The European Commission acts as the competent authority on behalf of the 28 Member States. The chapter concludes with an overview of the European Union's external market and world trade in light of the WTO and EFTA, EEA, and ACP countries.

# Chapter 22

## European Food Labelling Law

Aude Mahy and Nicola Conte-Salinas

**Abstract** This chapter focuses on the regime of food information to consumers in Europe, covering labeling and advertisement rules. The difference between horizontal and vertical legislation is explained, and a good overview over both horizontal and vertical rules given. The chapter explains which information has to be provided to the consumer (mandatory information), and discusses certain mandatory elements in detail, such as the rules on the origin of food. This is complemented by rules for voluntary information, in particular the strict regime for nutrition and health claims. Further, the all-encompassing prohibition not to mislead the consumer is being discussed, illustrated by case-law.

### 22.1 European Union Food Labelling Laws

At the European Union (EU) level, several regulations and directives deal with the various aspects of food labelling. These legislative measures either apply to all foodstuffs alike, the so-called horizontal labelling rules, or apply to specific foods only, the so-called vertical labelling rules. These two types of rules either provide mandatory labelling requirements or they regulate information that should be voluntarily provided by the food business operators or manufacturers. Sections 22.1.1 and 22.2.1 introduce mandatory and voluntary labelling information.

### ***22.1.1 Mandatory Information: FIC and Horizontal Labelling Rules for All Foodstuffs***

EU legislation consists of regulations, which are directly applicable to all member states, and of directives, which require transposition and implementation into national legislations. According to the European Commission, “EU directives lay down certain end results that must be achieved in every Member State. National authorities have to adapt their laws to meet these goals, but are free to decide how to do so. Directives are used to bring different national laws into line with each other, and are particularly common in matters affecting the operation of the single market (e.g. product safety standards).”<sup>1</sup> On the other hand,

Regulations are the most direct form of EU law - as soon as they are passed, they have binding legal force throughout every Member State, on a par with national laws. National governments do not have to take action themselves to implement EU regulations. They are different from directives, which are addressed to national authorities, who must then take action to make them part of national law, and decisions, which apply in specific cases only, involving particular authorities or individuals.<sup>2</sup>

Historically, rules governing mandatory labelling requirements for foodstuffs were contained in directives, giving the Member States of the European Union more leeway for developing their own legislation complementing national laws. One of the earliest principal instruments for the labelling of food was Directive 79/112/EC, then replaced by Directive 2000/13/EC,<sup>3</sup> relating to the labelling, presentation, and advertising of foodstuffs. Further examples of EU legislative directives on labelling involve rules on the indication of prices of certain foods,<sup>4</sup> rules concerning nominal quantities for pre-packed foods<sup>5</sup> and rules regarding the maximum tolerable deviation from the indicated net weight.<sup>6</sup> Eventually, harmonization of national food labelling laws was required to facilitate free trade within the Union. In an attempt to strengthen and enlarge the EU, Regulation (EU) No 1169/2011 (FIC)<sup>7</sup> was passed to consolidate and update existing labelling rules and

<sup>1</sup>See European Commission, Application of EU law: What are EU directives? Available at [http://ec.europa.eu/eu\\_law/introduction/what\\_directive\\_en.htm](http://ec.europa.eu/eu_law/introduction/what_directive_en.htm) (last accessed 7 Sept 2014).

<sup>2</sup>European Commission, Application of EU law: What are EU regulations?

<sup>3</sup>Directive 2000/13/EC (2000), p. 29.

<sup>4</sup>Directive 79/581/EEC (1979), p. 19; Directive 98/6/EC (1998), p. 27.

<sup>5</sup>Directive 2007/45/EC (2007) (repealing Directives 75/106/EEC and 80/232/EEC, and amending Council Directive 76/211/EEC).

<sup>6</sup>Directive 76/211/EEC (1976), p. 1.

<sup>7</sup>Regulation (EU) No 1169/2011 of the European Parliament and of the Council of 25 October 2011 on the provision of food information to consumers, amending regulations (EC) No 1924/2006 and (EC) No 1925/2006 of the European parliament and of the council, and repealing commission directive 87/250/EEC, Council Directive 90/496/EEC, Commission Directive 1999/10/EC, Directive 2000/13/EC of the European Parliament and of the Council, Commission Directives 2002/67/EC and 2008/5/EC and Commission Regulation (EC) No 608/2004.

FIC repealed the preceding Directive 2000/13. As a regulation, FIC directly applies to all Member States of the EU, and achieves a high level of harmonization by leaving only limited leeway for the Member States to enact or maintain national rules concerning food information.<sup>8</sup>

The FIC Regulation covers labelling of all food information and sets forth mandatory labelling requirements. Food information is defined as information concerning a food and made available to the final consumer by means of a label, other accompanying material, or any other means including modern technology tools or verbal communication.<sup>9</sup> The regulation, therefore, covers information contained on a product label and information disseminated through advertising materials, such as websites, catalogues and flyers.

### 22.1.2 FIC Regulation: Mandatory Particulars

The FIC Regulation sets out requirements for mandatory information concerning all foods intended for the final consumer, including food delivered by and to mass caterers.<sup>10</sup> This important regulation first applies to all food business operators along the supply chain whose activities concern the provision of food information to final consumers.<sup>11</sup> Second, the FIC also applies to food business operators who deliver food not intended for the final consumer (e.g. ingredients, raw materials) to other food business operators. In these cases, information must be provided to ensure that food business operators are provided with sufficient information about the food so as to enable them to comply with their own obligations regarding food information.<sup>12</sup>

The elements of mandatory information required by the FIC Regulation are listed in Articles 9 and 10 of the regulation, and are further specified in the subsequent articles and annexes. Several labelling requirements exist, for example, for prepackaged foods.<sup>13</sup> Pursuant to the FIC Regulation, the following information is mandatory for prepackaged food:

- Name of food and particulars that shall accompany it<sup>14</sup>;
- List of ingredients<sup>15</sup>;

<sup>8</sup>Mainly as regards mandatory information requirements for non-prepacked food, Regulation (EU) No 1169/2011, *op cit.*, Art. 44; see also *infra*, national vertical labelling rules.

<sup>9</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 2 (2) (a).

<sup>10</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 1 (3).

<sup>11</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 1 (3).

<sup>12</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 8 (8).

<sup>13</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 2 (2) (e).

<sup>14</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 9 (1) (a), 17, Annex VI.

<sup>15</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 9 (1) (b), 18–20, Annex VII.

- Allergen labelling<sup>16</sup>;
- Quantitative ingredient declaration<sup>17</sup>;
- Net quantity<sup>18</sup>;
- Date of minimum durability or “use by”-date<sup>19</sup>;
- Storage conditions, conditions of use<sup>20</sup>;
- Business name and address of the responsible food business operator<sup>21</sup>;
- In certain cases: Country of origin/place of provenance<sup>22</sup>;
- Instructions for use, if failure to do so would make appropriate use of the food difficult<sup>23</sup>;
- Alcoholic strength (if greater than 1.2 %) <sup>24</sup>;
- Nutrition declaration<sup>25</sup>;
- Further specific mandatory particulars (e.g. for products with caffeine or which contain artificial sweeteners).<sup>26</sup>

For non-prepackaged food, only the provision of allergen information<sup>27</sup> is mandatory.<sup>28</sup> Member States are, however, entitled to enact additional requirements concerning information to consumers with respect to non-prepackaged food.<sup>29</sup>

The FIC regulation additionally sets standards for the presentation of mandatory particulars. First, the FIC regulation establishes a general<sup>30</sup> minimum font size requirement of 1.2 mm<sup>31</sup> for all mandatory particulars. Second, mandatory labelling requirements must be easy to understand and placed in a conspicuous place, so as to be easily visible, clearly legible, and indelible.<sup>32</sup> The mandatory requirements cannot be hidden, obscured, or interrupted by other intervening written or pictorial information, which are usually voluntary elements of labelling.<sup>33</sup> Third, mandatory

<sup>16</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 9 (1) (c), 21, Annex II.

<sup>17</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 9 (1) (d), 22, Annex VIII.

<sup>25</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 9 (1) (l), 29–35, Annexes I, V, XIII–XV.

<sup>26</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 10, Annex III.

<sup>27</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 9 (1) (c), 21, Annex II.

<sup>28</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 44 (1) (a).

<sup>29</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 44 (1) (b), (2).

<sup>30</sup>For packages with the largest surface area of less than 80 cm<sup>2</sup>, the minimum x-height is 0.9 mm instead of 1.2 mm.

<sup>31</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 12 (2), Annex IV.

<sup>32</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 12 (1).

<sup>33</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 12 (1).

particulars must be provided in a language easily understood by the consumers in the Member State(s) where the food is marketed and the Member States may stipulate which official language(s) have to be used.<sup>34</sup> Lastly, all mandatory particulars must be indicated with words and numbers.<sup>35</sup> Symbols or pictograms can be used to supplement words or numbers as long as they are not misleading. However, symbol or pictograms cannot be used to replace words or numbers regarding mandatory particulars.

### 22.1.3 Country of Origin Labelling

The place of provenance is defined as any place where a food's label indicates a country other than the country of origin,<sup>36</sup> such as a specific region or city. Country of origin—or place of provenance—labelling is currently mandatory for specific products, or when the absence of such information could mislead consumers as to the true origin of the product. Unless otherwise provided, the country of origin of a product is determined according to Regulation (EEC) No 2913/92<sup>37</sup> establishing the Community Customs Code (Articles 23–26). As a side-note, the name, business name or address of a food company or producer is not regarded as an indication of origin.<sup>38</sup>

Before the applicability of the FIC Regulation, country of origin labelling was only required for certain foods, such as beef—as a result of the BSE crisis in Europe.<sup>39</sup> The FIC Regulation now extends mandatory origin labelling for specific products to meat of swine, sheep or goats, and poultry.<sup>40</sup> However, the specific requirements for origin labelling of these products are laid down in an implementing regulation.<sup>41</sup>

Another important labelling rule in terms of the indication of origin is required where failure to indicate it might mislead the consumer as to the true place of origin of the food. This rule regulates the use of voluntary information indicating a certain

<sup>34</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 15 (1), 15 (2).

<sup>35</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 9 (2).

<sup>36</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 2 (2) (g).

<sup>37</sup>For the full text of the Regulation, see <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:31992R2913:en:HTML> (last accessed 12 Sept 2014).

<sup>38</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 2 (2) (g).

<sup>39</sup>BSE is a fatal [neurodegenerative disease](#). The BSE crisis first affected British cattle in the late 1990s and early 2000s leading to substantial media coverage of the epizootic. For more information, see USDA, A Focus on Bovine Spongiform Encephalopathy, available at [http://web.archive.org/web/20080303135425/http://fsrio.nal.usda.gov/document\\_fsheetsheet.php?product\\_id=169](http://web.archive.org/web/20080303135425/http://fsrio.nal.usda.gov/document_fsheetsheet.php?product_id=169).

<sup>40</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 26 (2) (b), Annex XI.

<sup>41</sup>Regulation (EU) No 1337/2013 laying down rules for the application of Regulation (EU) No 1169/2011 regarding the indication of the country of origin or place of provenance for fresh, chilled and frozen meat of swine, sheep, goats and poultry, p. 19.

country of origin, particularly where other information provided for the food, such as through words, pictures, flags, and colour schemes, would imply that the food has a different country of origin or place of provenance.<sup>42</sup> For instance, country of origin labelling may be required in addition to the use of a voluntarily used Italian flag or a picture of the Eiffel Tower to allude to the place of origin. If voluntary information indicating a particular country of origin is used, but the food does not come from the country alluded to, it must be made clear that the product comes from another country. This can be done by a reference to the true country of origin, e.g. “produced in Germany.” This reference must be clearly visible. Merely including the address of the national origin food business operator on the product label will not in itself be sufficient to prevent the consumer from being misled and the labelling to be made proper.

Additionally, the FIC Regulation requires the provision of mandatory country of origin information where the final product’s origin is voluntarily indicated, but where it is not the same origin of that of its primary ingredients. “Primary ingredient” means one or more ingredient(s) of a food that represent over half of that food, or which is usually associated with the name of the food for which a quantitative indication is typically required.<sup>43</sup> A product may therefore contain several ‘primary ingredients’. In these cases, the origin of the primary ingredient must be given or a statement added to the effect that the origin of the primary ingredient is different from the origin of the final product.<sup>44</sup> At the time of going to print, there was only a preliminary draft of the relevant implementing regulation.

#### **22.1.4 Nutrition Declarations**

The FIC Regulation further introduces a mandatory but general nutrition declaration<sup>45</sup> for all products save a limited number of exceptions.<sup>46</sup> It includes the following:

- Energy value; and
- The amounts of fat, saturated fats,
- Carbohydrates and sugars,
- Protein, and
- salt.<sup>47</sup>

---

<sup>42</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 26 (2) (a).

<sup>43</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 2 (2) (q).

<sup>44</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 26 (3).

<sup>45</sup>Exceptions are laid down in Regulation (EU) No 1169/2011, *op cit.*, Art. 16, Annex V.

<sup>46</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 9 (1) (l), 29-35, Annexes I, V, XIII-XV.

<sup>47</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 30 (1).

Correspondingly, the nutrition declaration must be made in the order listed above, and must be shown as a table whenever possible.<sup>48</sup> This mandatory nutrition declaration can be supplemented by one or more of the following:

- Mono-unsaturates;
- Polyunsaturates;
- Polyols;
- Starch;
- Fibre;
- Or any of the vitamins or minerals listed in the FIC Regulation (point 1 of Part A of Annex XIII), if they are present in significant amounts.<sup>49</sup>

The nutrition declaration must indicate the value per 100 mg or 100 ml respectively. Additionally, a nutrition declaration may indicate the nutrition values per portion or consumption unit as long as the quantification of the portion or unit on the label is in close proximity to the nutrition declaration and the statement of the number of portions or units contained in the package.<sup>50</sup> The declared values, in turn, shall be average values based on an analysis of the food, a calculation from the average values of the ingredients used, or a calculation from generally established and accepted data.<sup>51</sup>

Also for the first time, the Regulation outlines rules for the voluntary repetition of the nutrition declaration. A repetition is only allowed if a complete nutrition declaration is provided. The following information may be repeated: the energy value; or the energy value together with the amounts of fat, saturates, sugars, and salt.<sup>52</sup> The information must be repeated in the principal field of vision,<sup>53</sup> which generally will be the front of the package. When prepackaged food which are not under an obligation to label the nutrition declaration nevertheless label it on a voluntary basis, the declaration may be limited to the energy value, or the energy value together with the amounts of fat, saturates, sugars, and salt.<sup>54</sup>

Notably, the mandatory labelling rules on nutrition declaration do not apply to food supplements and natural mineral waters.<sup>55</sup> However, if a nutrition declaration is given on a voluntary basis, the requirements of the FIC Regulation must be met.

## 22.2 Vertical Labelling Rules for Specific Foodstuffs

Vertical legislation generally defines the specific products and assigns each one a legal name that must be used if the product meets the compositional definition. EU vertical legislation usually appears in harmonisation Directives to be implemented within the national law of each Member State, rather than in Regulations, which directly apply to the whole EU territory. Vertical EU legislation regulates products such as milk and milk products,<sup>56</sup> eggs and poultry,<sup>57</sup> spreadable fats,<sup>58</sup> olive oil,<sup>59</sup> honey,<sup>60</sup> chocolate products,<sup>61</sup> wine<sup>62</sup> and spirits,<sup>63</sup> fruit juices,<sup>64</sup> main fruits and vegetables,<sup>65</sup> sugar,<sup>66</sup> coffee and chicory extracts,<sup>67</sup> fruit jams and similar products, beef or veal,<sup>68</sup> and seafood.<sup>69</sup> There is also specific EU legislation involving

<sup>56</sup>Regulation (EC) No 1308/2013.

<sup>57</sup>Regulation (EC) No 1308/2013.

<sup>58</sup>Regulation (EC) No 1308/2013.

<sup>60</sup>Directive 2001/110/EC relating to honey, p. 47.

<sup>61</sup>Directive 2000/36/EC relating to cocoa and chocolate products intended for human consumption, p. 19, as amended.

<sup>62</sup>Regulation (EC) No 1308/2013.

<sup>63</sup>Regulation (EC) No 110/2008 on the definition, description, presentation, labelling and protection of geographical indications of spirit drinks and repealing Regulation (EEC) No 1576/89 (OJ L 39, 13.2.2008, p. 16), as amended.

<sup>64</sup>Directive 2001/112/EC relating to fruit juices and certain similar products intended for human consumption, OJ L 10, 12/01/2002, p. 58, as amended.

<sup>65</sup>Council Regulation (EC) No 2200/96 on the common organization of the market in fruit and vegetables, p. 1, as amended and Regulation (EC) No 1580/2007 laying down implementing rules of Regulations (EC) No 2200/96, (EC) No 2201/96 and (EC) No 1182/2007 in the fruit and vegetable sector.

<sup>66</sup>Directive 2001/111/EC relating to certain sugars intended for human consumption, p. 53.

<sup>67</sup>Directive 99/4/EC relating to coffee extracts and chicory extracts, p. 26, as amended.

<sup>68</sup>Regulation (EC) No 1760/2000 establishing a system for the identification and registration of bovine animals and regarding the labelling of beef and beef products and repealing Regulation (EC) No 820/97, p. 1, as amended, which sets out rules for compulsory and voluntary beef labelling and Regulation (EC) No 1825/2000 laying down detailed rules for the application of Regulation (EC) No 1760/2000 regarding the labelling of beef and beef products, p. 8, which provides detailed rules for the implementation of Regulation 1760/2000.

<sup>69</sup>Regulation (EC) No 104/2000 on the common organisation of the markets in fishery and aquaculture products, pp. 22–52, as amended and Regulation (EC) No 2065/2001 laying down detailed rules for the application of Regulation (EC) No 104/2000 regarding informing consumers about fishery and aquaculture products, p. 6, as amended: fish sold at retail in certain presentations (i.e. live, fresh, chilled or frozen fish, fresh, chilled or frozen fish fillets and other fish meat; smoked, dried, salted or brined fish; crustaceans and molluscs) must label their origin by area of catching.

particular labelling requirements for organic foods,<sup>70</sup> genetically modified ingredients,<sup>71</sup> and food supplements. Hence, parallel to the application of the FIC Regulation to all foodstuffs, there are additional vertical labelling rules, i.e. specific rules pertaining to particular categories of food or beverages.

Vertical directives often include requirements that go beyond the mere question of labelling and involve the manufacture and marketing of specific products on a global scale. Thus, if a particular matter is not harmonised, which means that it falls under standards common to all Member States at the EU level, Member States may adopt or retain specific national legislation. Here, the key requirement is that the vertical labelling rules must not impede the free movement of goods within the EU. Accordingly, if a particular matter is harmonised at the EU level, Member States may not enact legislation that prohibits the trade of a product which complies with the requirements of the EU. It follows that no national legislation may prohibit trade in a product which complies with the labelling requirements set out by the EU's FIC Regulation because food labelling is regarded as harmonised at EU level.

Importantly, Member States may impose national requirements for additional mandatory indications on the label of certain food stuffs, by way of exception, on the following grounds:

- a) the protection of public health;
- b) the protection of consumers;
- c) the prevention of fraud;
- d) the protection of industrial and commercial property rights, indications of provenance, registered designations of origin and the prevention of unfair competition.

Hence, when a Member State adopts measures concerning food labelling or presentation which are not properly justified on one of the aforementioned grounds, those listed measures will be rendered illegal and inapplicable, both in regards to imported foodstuffs and domestic foodstuffs. In practice, most national labelling measures are justified on the grounds of consumer protection. Examples of products most commonly subject to national requirements are cheeses, breads, yoghurts, and, essentially, products which are regarded as typical or traditional in the relevant Member State.

---

<sup>70</sup>Council Regulation (EC) No 834/2007 on organic production and labelling of organic products and repealing Regulation (EEC) No 2092/91, as amended. This Regulation lays down basic requirements with regard to production, labelling and control of organic products in the plant and livestock sector and Regulation 889/2008 laying down detailed rules for the implementation of Regulation 834/2007 provides among others for rules on production, processing, packaging, transport and storage of products and control requirements.

<sup>71</sup>Regulation (EC) No 1829/2003 on genetically modified food and feed, p. 1, and Regulation (EC) No 1830/2003 concerning the traceability and labelling of genetically modified organisms and the traceability of food and feed products produced from genetically modified organisms and amending Directive 2001/18/EC, p. 24.

### 22.2.1 *Specific Rules for Labelling Food Supplements*

Food supplements are concentrated sources of nutrients, i.e. vitamins and minerals, or other substances with a nutritional or physiological effect, which are intended to supplement a normal diet.<sup>72</sup> Usually, food supplements are marketed in “dose form,” including capsules, pastilles, tablets, pills and other similar forms designed to be taken in a measurable small unit or quantity.<sup>73</sup> For the reason that food supplements are marketed in dose form, it can be difficult for consumers to distinguish them from medicinal products. They are however distinguished in terms of labelling laws.

In the EU, composition labelling pursuant to Annexes I and II of the Food Supplements Directive list vitamins and minerals, and their respective forms authorised for use in food supplements. Vitamins and minerals, or forms thereof, that are not listed in the Annexes cannot be legally used and distributed.

Food supplements can also contain “other substances,” which are primarily so-called “botanicals,” i.e. substances of plant origin. Since there is no EU harmonisation concerning the use of “other substances” in food supplements, national rules apply. However, if a product falls within the definition of “food supplement,” then the term “food supplement” is to be used as the legal name of the product and cannot be replaced.<sup>74</sup>

For the labelling of food supplements and in addition to the general labelling requirements detailed above, the following information must be indicated on the label of a product defined as a food supplement<sup>75</sup>:

- the names of the categories of nutrients or substances that characterise the product or an indication of the nature of those nutrients or substances;
- the portion of the product recommended for daily consumption;
- a warning not to exceed the stated recommended daily dose;
- a statement to the effect that food supplements should not be used as a substitute for a varied diet;
- a statement to the effect that the products should be stored out of the reach of young children.

The amount of the nutrients or substances with a nutritional or physiological effect present in the product must be stated on the labelling in numerical form, per portion of the product as recommended for daily consumption.<sup>76</sup> Because of these specific detailed requirements for nutrition declarations for food supplements, the

---

<sup>72</sup>Directive 2002/46/EC, of the European Parliament and of the Council of 10 June 2002 on the approximation of the laws of the Member States relating to food supplements, OJ L 183, 12 July 2002, p. 51, Art. 2 (a).

<sup>73</sup>Directive 2002/46/EC, *op cit.*, Art. 2 (a).

<sup>74</sup>Directive 2002/46/EC, *op cit.*, Art. 6 (1).

<sup>76</sup>Directive 2002/46/EC, *op cit.*, Art. 8.

horizontal, mandatory nutrition labelling rules under the FIC Regulation do not apply.

### 22.2.2 *Distance Selling*

The FIC Regulation also covers information requirements in business-to-consumer transactions in the case of distance selling.<sup>77</sup> Distance selling is defined to include “means of distance communication, including any means used for the formation of a contract between a supplier and the consumer without the simultaneous physical presence of the parties.”<sup>78</sup> For practical reasons, vending machines or automated commercial premises are excluded from the scope of this article.<sup>79</sup>

To satisfy labelling requirements, any food supplied through distance selling must meet the same information requirements as food sold directly to the consumer in shops. All of the mandatory particulars according to Articles 9 and 10 of the FIC Regulation, and any other obligatory information according to EU law, must be made available before conclusion of the purchase.<sup>80</sup> This includes, among other things, the mandatory labelling requirements imposed by Regulation (EC) No 1924/2006 on nutrition and health claims made on foods (**HCR**).<sup>81</sup> Therefore, if a product contains a health claim, the information requirements under Art. 10 (2) HCR must be complied with before the contract is concluded, even if the web-shop does not repeat the health claim found on the labelling.<sup>82</sup> For the HCR labelling requirements, see *infra*, section on health and nutrition claims.

In distance selling, all of the mandatory information must also be made available “before the purchase is concluded.” This language cannot be interpreted from a strict civil law perspective, since the rules about when a contract is formed may differ from one Member State to another. Generally, however, this language was enacted to ensure that the consumer has received the necessary information to make an informed decision about the impending purchase. Therefore, the consumer needs to have access to the mandatory information before he makes a purchase decision. To quote the Commission,

<sup>78</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 2 (2) (u).

<sup>79</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 14 (3).

<sup>80</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 14 (1) (a).

<sup>81</sup>Regulation (EC) No 1924/2006 on nutrition and health claims made on foods, p. 3.

<sup>82</sup>Commission Implementing Decision of 24 January 2013 adopting guidelines for the implementation of specific health claims laid down in Article 10 of Regulation (EC) No 1924/2006, OJ L 22,251.2013, p. 25, point 2.1. (b).

[i]n the context of a product offer, when there is no possibility to buy the food directly, the information is not required; for example, in an advertising catalogue of products of a supermarket. However, when the catalogue is the only piece of available information before the delivery of products, the catalogue shall include all the mandatory particulars. Also, when there is the possibility to buy the product directly, for example, through a web-page on the internet, the mandatory information shall be available.<sup>83</sup>

However, the minimum durability date or best before-date does not have to be given before the time of purchase. This exception can be explained by the fact that it would be technically impossible, or at least impracticable, to indicate the minimum durability date on the website of an online store, since this information would have to be updated whenever the batch with the current best before date or use by-date is sold out. Nonetheless, at the moment of delivery of the product to the consumer, all mandatory information (including the best before date / use by date) must be made available.<sup>84</sup>

## 22.3 Voluntary Information

Voluntary information generally concerns marketing needs for purchasing decisions and subsequent use. There are some general rules regulating the presentation of voluntary information, so that the information provided must be accurate, verifiable, and not misleading. Additionally, there are specific and detailed rules regarding the standard formatting for nutrition and health claims, which are introduced hereinafter.

### 22.3.1 *Misleading Labels*

The ban on misleading advertising is a well-established prohibition and is embodied in numerous European legislative acts. Information that is misleading for consumers is also regarded as unfair vis-à-vis competitors. As far as foodstuffs are concerned, no less than six different sets of rules—general or food-related—may potentially apply,<sup>85</sup> a selection of which are summarised below.

The Unfair Commercial Practices Directive,<sup>86</sup> which is the main body of EU legislation regulating misleading advertising and other unfair practices in business-

<sup>83</sup>Working Document prepared by the Commission services, New Q&A items related to general labelling (February 21, 2014).

<sup>84</sup>Regulation (EU) No 1169/2011, *op cit.*, Art. 14 (1) (b).

<sup>85</sup>See Leible (2010), p. 322.

<sup>86</sup>Directive 2005/29/EC concerning unfair business-to-consumer commercial practices in the internal market and amending Council Directive 84/450/EEC, Directives 97/7/EC, 98/27/EC and 2002/65/EC, and Regulation (EC) No 2006/2004.

to-consumer applies to all sectors. It aims at ensuring that consumers are not misled or exposed to aggressive marketing and that any claim made by trading parties in the EU is clear, accurate, and substantiated, so as to enable consumers to make informed and meaningful purchase choices. Under the Unfair Commercial Practices Directive, the concept of “misleading commercial practice” is broadly defined to range from false information to misleading omissions, including deceptive practices, even if the information contained is factually correct.<sup>87</sup> In other words, for a commercial practice to be regarded as misleading for consumers, it must cause or be likely to cause the average consumer to take a transactional decision, i.e. to purchase goods that the consumer would not have otherwise bought if it were not for that misleading information. According to the European Commission, the Unfair Commercial Practices Directive “works as a safety net which fills the gaps which are not regulated by other EU sector-specific rules.”<sup>88</sup> Therefore, this Directive, only applies to the extent that there are no specific EU provisions regulating specific aspects of unfair commercial practices, such as information requirements and rules on the way information is to be presented to the consumer.<sup>89</sup>

---

<sup>87</sup>According to Directive 2005/29, *op.cit.*, Art. 6 and 7, a commercial practice is misleading when:

- (1) contains false information and is therefore untruthful or if
- (2) in any way, including overall presentation, it deceives or is likely to deceive the average consumer, even if the information is factually correct, in relation to:
  - a. the existence or nature of the product;
  - b. the main characteristics of the product, such as its availability, benefits, risks, execution, composition, accessories, after-sale customer assistance and complaint handling, method and date of manufacture or provision, delivery, fitness for purpose, usage, quantity, specification, geographical or commercial origin or the results to be expected from its use, or the results and material features of tests or checks carried out on the product;
  - c. the extent of the trader’s commitments, the motives for the commercial practice and the nature of the sales process, any statement or symbol in relation to direct or indirect sponsorship or approval of the trader or the product;
  - d. the price or the manner in which the price is calculated, or the existence of a specific price advantage;
  - e. the need for a service, part, replacement or repair;
  - f. the nature, attributes and rights of the trader or his agent, such as his identity and assets, his qualifications, status, approval, affiliation or connection and ownership of industrial, commercial or intellectual property rights or his awards and distinctions;
  - g. the consumer’s rights or the risks he may face.
- (3) the marketing of a product, including comparative advertising, creates confusion with any products, trademarks, trade names or other distinguishing marks of a competitor;
- (4) the trader does not comply with commitments contained in codes of conduct by which the trader is bound, where the trader indicates in a commercial practice that he is bound by the code.
- (5) the trader omits material information that the average consumer needs (or provides it in an unclear, unintelligible, ambiguous or untimely manner), according to the context, to take an informed transactional decision.

<sup>88</sup>Communication from the Commission of (March 14 2013) on the application of the Unfair Commercial Practices Directive.

<sup>89</sup>Directive 2005/29/EC, *op.cit.* Recital 10.

Consequently, the Directive complements the rules applying to specific sectors, including the food sector, and the latter will prevail in the event of any conflicts.

Corresponding to the Unfair Commercial Practices Directive for business-to-consumer relations, the Directive on Misleading and Comparative Advertising<sup>90</sup> provides rules concerning business-to-business relationships. Its purpose is to protect traders from misleading advertising and the unfair consequences thereof. This directive sets out the conditions under which comparative advertising is or is not permitted.<sup>91</sup> Under this set of rules, misleading advertising is regarded as behaviour which causes injury or is likely to cause injury to a competitor and is considered as an unfair practice towards that competitor. However, the practices prohibited under this Directive are minimum requirements, and Member States are, therefore, allowed to apply stricter rules, which provide extended protection with regard to misleading advertising for traders and competitors.<sup>92</sup>

Additional rules against misleading information specifically apply to the food sector. For example, the ban on misleading food information is covered by the General Food Law. This ban is widely drawn, prohibiting any misleading of consumers via labelling, advertising, and presentation of foodstuffs, including their shape, appearance or packaging, the packaging materials used, the manner in which they are arranged and the setting in which they are displayed, and the information which is made available about them through whatever medium.<sup>93</sup>

This general prohibition is nevertheless detailed in the FIC Regulation, which states that any food labelling, advertising, presentation of a foodstuff,<sup>94</sup> or any related method used must<sup>95</sup>:

- (a) not mislead, particularly:
  - i. as to the characteristics of the food and, specifically, as to its nature, identity, properties, composition, quantity, durability, country of origin or place of provenance, method of manufacture or production;
  - ii. by attributing to the food effects or properties which it does not possess;

<sup>90</sup>Directive 2006/114/EC concerning misleading and comparative advertising, p. 21. The Directive also applies to products covered by the agricultural sphere, see Recital 12.

<sup>91</sup>See Art. 1. According to Directive 2006/114/EC, *op.cit.*, Art. 2 (b), “‘misleading advertising’ means ‘any advertising which in any way, including its presentation, deceives or is likely to deceive the persons to whom it is addressed or whom it reaches and which, by reason of its deceptive nature, is likely to affect their economic behaviour or which, for those reasons, injures or is likely to injure a competitor.’”

<sup>92</sup>Directive 2006/114/EC, *op.cit.*, Art. 8.

<sup>93</sup>Regulation (EC) No 178/2002 laying down the general principles and requirements of food law, establishing the European Food Safety Authority and laying down procedures in matters of food safety, pp. 1–24, Art. 22.

<sup>94</sup>In particular, its shape, appearance or packaging, the packaging materials used, the way in which the food is arranged and the setting in which it is displayed.

<sup>95</sup>FIC Regulation, *op.cit.*, Art. 7 (Fair information practices).

- iii. by suggesting that the food possesses special characteristics when in fact all similar foods have such characteristics, in particular by specifically emphasising the presence or absence of certain ingredients and/or nutrients;
  - iv. by suggesting, by means of the appearance, the description or pictorial representations, the presence of a particular food or an ingredient, while in reality a component naturally present or an ingredient normally used in that food has been substituted with a different component or a different ingredient;
- (b) be accurate, clear and easy to understand for the consumer;
- (c) not attribute to any food the property of preventing, treating or curing a human disease, nor refer to such properties (subject to specific derogations provided for by Union law applicable to natural mineral waters and foods for particular nutritional uses).<sup>96</sup>

In addition to general food-related regulations,<sup>97</sup> specific food law provisions are contained in other detailed regulations regarding misleading advertising. These include the Regulation on Nutrition & Health Claims made on food,<sup>98</sup> the Regulation on the Protection of Geographical indication of origin for agricultural products and foodstuffs,<sup>99</sup> and the Regulation on organic products<sup>100</sup>.

### 22.3.2 *Nutrition and Health Claims*

The particulars of nutrition and health claims are brief and follow several of the principles outlined in this chapter. According to the Nutrition and Health Claims Regulation such claims must not be false, ambiguous or misleading, even if their use is authorised under the scope of that Regulation.

<sup>96</sup>FIC Regulation.

<sup>97</sup>See Regulation 1924/2006, *op.cit.*, Recital 3, Regulation No 1151/2012, *op.cit.*, Recital (8) and Art. 3, which stress the complementary nature of their provisions with respect to the Labelling Directive, whose rules are currently included in Regulation No 1169/2011, *op. cit.*

<sup>98</sup>Regulation (EC) No 1924/2006 on nutrition and health claims made on foods, p. 3, Art. 3(2)(a).

<sup>99</sup>Regulation (EU) No 1151/2012 on quality schemes for agricultural products and foodstuffs, p. 1, Art. 13 and 24.

<sup>100</sup>Regulation (EC) No 834/2007 on organic production and labelling of organic products, *op cit.*

### ***22.3.3 Traditional Specialties and Products with a Geographical Indication of Origin***

The European Regulation on food quality schemes protects foodstuffs that have a registered Protected Designation of Origin (PDO), a Protected Geographical Indication (PGI), and products that are recognised as Traditional Specialities Guaranteed (TSG).

PDO and PGI indications are protected against:

- a. any direct or indirect commercial use of a registered name in respect of products not covered by the registration;
- b. any misuse, imitation or evocation, even if the true origin of the products or services is indicated or if the protected name is translated or accompanied by an expression such as ‘style’, ‘type’, ‘method’, ‘as produced in’, ‘imitation’ or similar, including when those products are used as an ingredient;
- c. any other false or misleading indication as to the provenance, origin, nature or essential qualities of the product, that appear on the inner or outer packaging, advertising material or documents relating to the product concerned, and the packing of the product in a container liable to convey a false impression as to its origin;
- d. any other practice liable to mislead the consumer as to the true origin of the product.

TSGs are protected against any misuse, imitation or evocation, or against any other practice liable to mislead the consumer. Furthermore, Member States have to ensure that sales descriptions used at national level do not give rise to confusion with names that are registered.

### ***22.3.4 Regulation of Organic Products***

The European Regulation concerning organic products prohibits the use of the terms “organic,” “eco,” “bio,” their derivatives or diminutives, alone or combined, for a product that does not satisfy the requirements set out under this Regulation. These terms may not be used for a product for which it has to be indicated in the labelling or advertising that it contains GMOs, consists of GMOs, or is produced from GMOs according to EU provisions and this prohibition applies in all languages used in the European Union. Furthermore, the prohibition applies to labelling, advertising and commercial documents.

As previously stated, a Member State may, however, further limit the free movement of foodstuffs on the basis of consumer protection, even if labelling requirements comply with EU law. The national measures adopted must be proportionate to the desired effect, which means that between various measures to attain the same objective, the one chosen must be the least restrictive on free trade.

Hence, ensuring that consumers are not misled by advertising or labelling is part of the standard of consumer protection that Member States must ensure.

The interpretation of whether and how a consumer could be misled will differ between Member States depending on the legal traditions of that Member State.<sup>101</sup> Although the European Court of Justice considers that the person deserving protection under the term “consumer” is “reasonably well-informed, reasonably observant and circumspect,<sup>102</sup>” the identification of such a consumer is a matter for national interpretation. Therefore, although the ban on misleading advertising is uniformly imposed at the European level, no standard European guidelines can be directly and automatically applied within the Member States,<sup>103</sup> a matter which presents a difficulty for food business operators, as there can be significant differences between the interpretations of different Member States.

National courts will make their assessments on a case-by-case basis whether an advertisement or label is misleading by referring to the group of consumers who are exposed to the labelling or advertising and who may or may not be misled under any given set of circumstances. On this note, the European Court of Justice has held that the courts may instruct a survey on the actual expectations of the consumer if they still have doubts as to the extent to which the statement at issue might be misleading.<sup>104</sup> In addition, the enforcement of food law is left to the national authorities. Member States have the duty of laying down appropriate rules and ensuring effective controls at all stages of the food chain on measures and penalties applicable to infringements of food law. They must apply effective, proportionate, and dissuasive penalties.<sup>105</sup> As a result, national differences are also apparent at the enforcement stage.

Directive 2005/29, *op.cit.* Art. 11–13.

### 22.3.5 *Superfoods: Health and Nutrition Claim Regulation*

In recent years, increasing numbers of superfoods, foods with special nutritive or health properties, have been introduced within and outside the European market. The 1997 Codex Alimentarius guidelines for the use of nutrition and health claims addressed the early food law concerns of such superfoods.<sup>106</sup> However, within the EU, the admissibility of and the requirements for nutrition and health claims on the labels of such superfoods were already regulated at the national level, a regulation which naturally resulted in differing approaches among the Member States. For example, a food labelled with a specific health claim might have been legally produced and marketed in one Member State, but might not have been legally marketed in another, thereby hindering the free trade of this food and, consequently, the free movement of goods. This hindrance created unequal conditions of competition,<sup>107</sup> which are not permissible within the EU.

In response to the aforementioned hindrances, Regulation (EC) No 1924/2006 (HCR) was adopted in 2006 to harmonise the law governing the use of nutrition and health claims and to ensure the effective functioning of the internal market while still providing a high level of consumer protection and has been applicable since July 2007.<sup>108</sup> The HCR covers the use of nutrition and health claims in commercial communications, including the labelling, presentation, or advertising of foods to be delivered as such to the final consumer.<sup>109</sup> Additionally, the HCR covers the use of trademarks and brand names, that qualify as or contain a nutrition or health claim. However, such claims do not have to be independently authorised so long as they are accompanied by an authorised nutrition or health claim.<sup>110</sup>

The HCR supplements the general labelling rules laid down in the FIC Regulation. In addition to general information rules, there are various legal instruments that cover the composition and, sometimes, labelling requirements of foods with specific nutritional or health benefits. These include: (i) the Regulation on the Fortification of Foods, (ii) the Food Supplements Directive,<sup>111</sup> and (iii) the Regulation on Dietetic Foods.<sup>112</sup>

Central to the HCR are the definitions of “nutrition claim”<sup>113</sup> and “health claim.”<sup>114</sup> A “nutrition claim” is a claim which states, suggests or implies that a

<sup>113</sup>Regulation (EC) No 1924/2006, *op.cit.*, Art. 2 (2) No 4.

<sup>114</sup>Regulation (EC) No 1924/2006, *op.cit.*, Art. 2 (2) No 5.

food has particular beneficial nutritional properties. These beneficial nutritional properties must be due to the energy (calorific value) the food provides, does not provide, or provides at a reduced or increased rate, and/or due to the nutrients or other substances it contains, does not contain, or contains in reduced or increased proportions. A “health claim” is a claim that states, suggests, or implies that a relationship exists between a food category, a food or one of its constituents, and health.

The terms nutrition claim and health claim are to be broadly interpreted, as the mere suggestion or implication of a certain beneficial nutritional property or a health relationship falls within the definition of a nutrition or health claim. It can be difficult to establish whether beneficial nutritional properties are being referred to, so that the claim is specific enough to qualify as a nutrition claim. Alternatively, it can also be difficult to ascertain whether a reference is merely meant as the objective composition of a product. Likewise, it can be difficult to determine when a claim refers to a health relationship, which would qualify it as a health claim, or when it just contains a reference to the general, i.e. not health-related well-being.

The HCR operates by introducing a system of positive lists for both nutrition and for health claims. Such claims may, therefore, only be used if they are authorised, a so-called ban with permit reservation. Accordingly, claims not explicitly authorised are prohibited. In the field of nutrition and health claims, the HCR changes the general principle of EU food law in that food is rendered marketable if it is not specifically forbidden, a so-called permit with ban reservation. This effectually restricts the freedom of food business operators to advertise their products with references to nutritional properties and health effects, irrespective of whether these claims are scientifically correct or not.

For reference and administrative ease, the HCR established a Community Register<sup>115</sup> that includes all authorised nutrition and health claims. The Community Register has been published as an online document.<sup>116</sup> In addition to listing authorised claims, the register also includes a list of rejected health claims and the reason for their rejection, as well as those claims that are currently “on hold”. Claims “on hold” indicate that final decisions have not yet been taken as to the admissibility of these claims, and for now, they can continue to be used provided the general requirements of the HCR are met. Prominent examples of “on hold claims” are claims concerning plants or plant parts (so-called “botanicals”). There are currently more than 2000 claims on hold.

### 22.3.6 *General Requirements for Health and Nutrition Claims*

The HCR lays down general requirements that apply to nutrition and health claims alike.

Nutrition and health claims must not<sup>117</sup>:

- be false, ambiguous or misleading;
- give rise to doubt about the safety and/or nutritional adequacy of other foods;
- encourage or condone excess consumption of a food;
- state, suggest or imply that a varied diet cannot provide appropriate quantities of nutrients in general; or
- refer to changes in bodily functions which could give rise to or exploit fear in the consumer.

For the use of nutrition and health claims to be admissible, the following general requirements have to be met<sup>118</sup>:

- the presence, absence or reduced content in a food or category of food of a nutrient or other substance in respect of which the claim is made has been shown to have a beneficial nutritional or physiological effect, as established by generally accepted scientific data;
- the substance for which the claim is made is (not) contained in the final product in a significant quantity or in a quantity that will produce the nutritional or physiological effect;
- the substance is in a form that is available to be used by the body (bioavailable);
- the quantity of the product that can reasonably be expected to be consumed provides a significant quantity of the nutrient or other substance to which the claim relates.

If a nutrition claim is contained in the Annex of the HCR, food business operators do not have to provide further scientific evidence regarding nutritional benefits, since only those nutrition claims have been added that have beneficial nutritional properties deemed sufficiently scientifically proven. In regards to the claim “contains,” however, scientific data has to be provided by the food business operator.

Many health claims are rejected because the scientific evidence filed is not considered sufficient. The European Food Safety Authority (EFSA) applies the highest scientific standard (the so-called, “gold standard”), that requires human intervention studies that are double-blind and placebo-controlled. If a claim has been authorised at EU level, Member States must accept the use of these claims and cannot request further scientific evidence.

<sup>117</sup>Regulation (EC) No 1924/2006, *op cit.*, Art. 3.

<sup>118</sup>Regulation (EC) No 1924/2006, *op cit.*, Art. 5.

### 22.3.6.1 Specific Requirements for Nutrition Claims

For a nutrition claim to be admissible, it must first be listed in the Annex of the HCR. The Annex contains claims referring to the reduction or absence of a substance, for example the claim “fat-free,” as well as claims referring to the presence or increase of a substance, such as the claim “high protein.” The Annex lists the claim “contains” followed by the name of the nutrient or other substance in question, thereby granting food business operators the possibility to highlight beneficial nutritional properties of substances other than those specifically named in the Annex.

Additionally, the specific requirements for the relevant nutrition claim must be met. In the case of “fat-free”, the food must not contain more than 0.5 g of fat per 100 g or 100 ml respectively. The claim “X % fat-free” is not allowed.

### 22.3.6.2 Specific Requirements for Health Claims

The HCR distinguishes between various kinds of health claims:

- Claims referring to the role of a substance in growth, development and the functions of the body<sup>119</sup>;
- Claims referring to psychological and behavioural functions<sup>120</sup>;
- Claims referring to slimming or weight-control, reduction in the sense of hunger or increase in the sense of satiety or to the reduction of the available energy from the diet<sup>121</sup>;
- Reduction of disease risk factor claims<sup>122</sup>;
- Claims referring to children’s development and health.<sup>123</sup>

The use of health claims further requires the labelling, or if no labelling exists, the presentation and advertising of foodstuffs, to contain the following information<sup>124</sup>:

- A statement indicating the importance of a varied and balanced diet and a healthy lifestyle;
- The quantity of the food and pattern of consumption required to obtain the claimed beneficial effect;
- Where appropriate, a statement addressed to persons who should avoid using the food; and
- An appropriate warning for products that are likely to present a health risk if consumed to excess.

<sup>119</sup>Regulation (EC) No 1924/2006, *op cit.*, Art. 13 (1) (a).

<sup>120</sup>Regulation (EC) No 1924/2006, *op cit.*, Art. 13 (1) (b).

<sup>121</sup>Regulation (EC) No 1924/2006, *op cit.*, Art. 13 (1) (c).

<sup>122</sup>Regulation (EC) No 1924/2006, *op cit.*, Art. 14 (1) (a).

<sup>123</sup>Regulation (EC) No 1924/2006, *op cit.*, Art. 14 (1) (b).

<sup>124</sup>Regulation (EC) No 1924/2006, *op cit.*, Art. 10 (2).

Health Claims may only be used if they are authorised. The HCR intended to create one Community list that contained all authorised general function health claims, but it was obvious that such agreement could not be reached, particularly concerning claims referring to plants and plant parts. Therefore, EU legislators decided to publish a first part of the list of authorised health claims.<sup>125</sup> In addition, risk reduction claims and claims referring to the development and health of children have been authorised in various separate regulations.<sup>126</sup>

### 22.3.7 *Clean Labelling*

Apart from the aforementioned nutrition and health claims, which are already highly regulated at the European level, food business operators are riding a wave of so-called “clean labelling” in conjunction with the current trend in consumer demand for quality and traditional products. Consequently, promotions of food products have increasingly placed emphasis on a foods’ natural and healthful character. Common food product labels include: “additive-free,” “100 % natural,” “pure” or “home-made.” The use of these terms has not been harmonised across the EU. Those aspects that have been harmonised, however, remain scattered among various bits of legislation and make an assessment of compliance difficult.

In short, the EU has laid down requirements for the use of the term “natural” with respect to:

- **Natural Flavourings**, which correspond to substances that are naturally present and have been identified in nature, i.e. flavouring substances obtained by appropriate physical, enzymatic or microbiological processes from material of vegetable, animal or microbiological origin either in the raw state or after processing for human consumption by one or more of the traditional food preparation processes<sup>127</sup>;

---

<sup>125</sup>Regulation (EU) No 432/2012 establishing a list of permitted health claims made on foods, other than those referring to the reduction of disease risk and to children’s development and health, p. 1, and its subsequent amendments.

<sup>126</sup>Among these are: Commission Regulation (EC) No 983/2009 on the authorisation and refusal of authorisation of certain health claims made on food and referring to the reduction of disease risk and to children’s development and health, OJ L 277, p. 3; Commission Regulation (EC) No 1024/2009 on the authorisation and refusal of authorisation of certain health claims made on food and referring to the reduction of disease risk and to children’s development and health, OJ L 283, p. 22. All admitted and rejected claims are listed in the Community register.

<sup>127</sup>Regulation (EC) No 1334/2008 on flavourings and certain food ingredients with flavouring properties for use in and on foods and amending Regulations (EC) No 1601/91, (EC) No 2232/96, (EC) No 110/2008, and Directive 2000/13/EC., Art. Art. 3(2)(c) and 22.

- **Nutrition Claims**, such as the terms “naturally” or “natural” may only be used as a prefix to a nutrition claim where the related food naturally meets the condition(s) laid down in by the EU Nutrition and Health Claims Regulation<sup>128</sup> for the use of these claims, e.g. “naturally rich in fibre,” without the food’s fortification with fibre.
- **“Mountain Product”** may only be used to describe agricultural foodstuffs in respect of which both the raw materials and the feedstuffs for farm animals come essentially from mountainous areas. In the case of processed products, the processing must also take place in mountain areas.<sup>129</sup>
- **“Traditional Specialities Guaranteed”** (TSG) are protected against any misuse, imitation or evocation, or against any other practice liable to mislead the consumer.<sup>130</sup>

To date, no further EU harmonisation exists. Therefore, the use of any other “clean” labelling must comply with the general requirement to provide the consumer with fair and accurate information. Additionally, national requirements may apply.

## 22.4 Advertisements in EU Food Law

The EU regulates advertisements as part of consumer law. Through provisions of consumer rights in the European Charter of Fundamental Rights and Article 12 of the European treaty, consumer guarantees include fairness (fair advertising), compliance with EU standards and a right of redress. As the following section shows, several of these principles are directly applicable to foodstuffs sold and marketed in the EU.

### 22.4.1 General Requirements of Food Advertisements

The obligation to provide the consumer with fair information (see *supra* on misleading labelling) applies equally to food advertising.<sup>131</sup> In addition to these rules, the EU legislative arsenal contains specific advertising restrictions when it comes to advertising alcoholic beverages through audio-visual communications, *see* Audio-visual Media Services Directive.<sup>132</sup> In this regard, television advertising

<sup>128</sup>Regulation (EC) No 1924/2006 on nutrition and health claims made on foods, *op cit.*

<sup>129</sup>Regulation (EU) No 1151/2012 on quality schemes for agricultural products and foodstuffs, p. 1, Art. 31.

<sup>130</sup>Regulation (EU) No 1151/2012, p. 1, Art. 24.

<sup>131</sup>Regulation No. 1169/2011, *op. cit.*, Art. 7(4).

<sup>132</sup>Directive 2010/13/EU on the coordination of certain provisions laid down by law, regulation or administrative action in Member States concerning the provision of audio-visual media services (Audio-visual Media Services Directive), Art. 9(1)(e) and 22. Please note that this Directive is currently open for review.

and teleshopping for alcoholic beverages must *at least*<sup>133</sup> comply with the following criteria, where the advertisement may not:

1. be aimed specifically at minors or, in particular, depict minors consuming these beverages;
2. link the consumption of alcohol to enhanced physical performance or to driving;
3. create the impression that the consumption of alcohol contributes towards social or sexual success;
4. claim that alcohol has therapeutic qualities or that it is a stimulant, a sedative or a means of resolving personal conflicts;
5. encourage immoderate consumption of alcohol or present abstinence or moderation in a negative light;
6. place emphasis on high alcoholic content as being a positive quality of the beverages.

Moreover, under the Audio-visual Media Services Directive, Member States are encouraged to co- or self-regulate at the national level, with respect to, *inter alia*, the advertisement of alcohol in audio-visual communication.<sup>134</sup>

Based on a further recommendation of the EU in 2001,<sup>135</sup> the Member States are also encouraged to establish effective mechanisms with the producers and the retailers of alcoholic beverages and relevant non-governmental organisations, in the fields of promotion, marketing and retailing, to ensure that regardless of the channel of communication used, producers do not produce alcoholic beverages specifically targeted at children and adolescents and that alcoholic beverages are not designed to appeal to children and adolescents. Particular attention should be paid to the use of styles, motifs and colours associated with “youth culture.” The use of such images and the promotion of ideas associated with alcohol consumption through implications of social success, sexual or athletic prowess, features of children in spirits campaigns, and sponsoring of alcoholic drinks at sporting or musical events or on sport merchandising are prohibited.

## 22.4.2 *Unhealthy Foods and Fair Advertising*

Restricting the promotion of so-called “unhealthy food” is also one of the main objectives of fair advertising in the EU. Member States and the European Commission are required to encourage media service providers to develop codes of

---

<sup>133</sup>The Audio-visual Media Services Directive states that Member States remain free to impose more detailed or stricter rules provided that such rules are in compliance with Union law (Art 4 (1)).

<sup>134</sup>Audio-visual Media Services Directive, *op cit.*, Art 4(7).

<sup>135</sup>Council Recommendation 2001/458/EC of 5 June 2001 on the drinking of alcohol by young people, in particular children and adolescents.

conduct regarding inappropriate audio-visual commercial communication that accompanies or is included in children's programmes regarding foods and beverages containing nutrients and substances with a nutritional or physiological effect. Excessive intakes of fat, trans-fatty acids, salt/sodium, and sugars in the overall diet are particularly discouraged.<sup>136</sup>

Out of this set of precautions came the "EU Pledge."<sup>137</sup> The EU Pledge is an agreement among EU members that are major players in the manufacture of snacks and foodstuffs intended for children. Essentially, the EU Pledge aims to change food and beverage advertising in the EU directed at children under the age of 12 by:

- Not advertising food and beverage products to children under the age of 12 on TV, in print, and via the internet, except for products which fulfil specific nutritional criteria based on accepted scientific evidence or applicable national and international dietary guidelines;
- Not promoting products in primary schools, except where specifically requested by or agreed to with the school administration for educational purposes.

Member States may otherwise adopt legislation of their own choosing. It is therefore of primary importance for food business operators to be aware of the possible restrictions they may face when promoting their products internationally. In this regard, one should keep in mind that national legislation may not prohibit, impede or restrict the free movement of goods,<sup>138</sup> so there are limits to the permissible restrictions on advertisements.

## 22.5 EU Labelling Law: Cases and Examples

### 22.5.1 *The Sauce Hollandaise Case: Replacement of Traditional Ingredients*

An early, landmark decision<sup>139</sup> in the field of food labelling concerned an industrially produced food called "Sauce Hollandaise," see Case C-51/94 [1995].<sup>140</sup> As a traditional food, Sauce Hollandaise contains fresh eggs and butter, but the

<sup>136</sup> Audiovisual Media Services Directive, *op cit.*, Art. 9(1)(e).

<sup>137</sup> EU Pledge, <http://www.eu-pledge.eu/>.

<sup>138</sup> Joined Cases C-267/91 and C-268/91 Keck and Mithouard [1993] ECR I-6097, paragraph 17, "for national provisions restricting or prohibiting certain selling arrangements not to be caught by Article 28 EC, they must not be such as to prevent access to the market by products from another Member State or to impede access any more than it impedes access by domestic products"; See also Case C-239/02 Douwe Eghberts, ECR I-7037, § 51 and Case C-241/89 SARRP, ECR, 1990, I-04695, § 29.

<sup>139</sup> See <http://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:61994CJ0051&from=EN> (last visited 12 Sept 2014).

<sup>140</sup> Joined cases C-10/97 to C-22/97, ECR, I-3617 (1998).

prepackaged Sauce Hollandaise in question contained plant fat instead of butter and eggs. Plant fat was properly labelled in the list of ingredients. However, the German authorities did not consider this labelling to be sufficient and requested that the departure from traditional Sauce Hollandaise be identified on the label in connection with the name of the food. The European Court of Justice decided that labelling the replacement ingredients in the list of ingredients would be sufficient since consumers interested in the composition of the food would check the list of ingredients and find all relevant information there. Additionally, consumers who are not interested in the composition of the food they buy, would likewise not be misled as to its composition. Therefore, the list of ingredients is generally considered the appropriate place for information regarding the composition of the product. Nonetheless, the Court did not rule out the possibility that in exceptional cases, the mere indication of replaced ingredients in the list of ingredients would not suffice, and accordingly, labelling in connection with the name of the food would be required.

The FIC Regulation overruled this decision by requiring a clear indication of the component or ingredient that has been used for the substitution in cases where an ingredient, that consumers expect to be normally used or to be naturally present in a food, has been replaced wholly or in part by another ingredient. Notably, the replacement ingredient or component must be clearly indicated in close proximity to the product name. Additionally, the labelling indication must be made using a font size of at least 75 % of the x-height of the name of the product (and, at least, of the prescribed minimum font size for mandatory particulars<sup>141</sup>).<sup>142</sup> Notably, there is an on-going debate as to whether the “product name” means the name of the food according to Article 17 of the FIC Regulation, or the brand—a.k.a. fancy name.

### 22.5.2 *The Teekanne Case*

As another example, the German Bundesgerichtshof (Federal High Court of Justice) initiated a preliminary ruling procedure before the CJEU in a case concerning a fruit infusion.<sup>143</sup> The product package showed raspberries, vanilla flowers and displayed the wording “all natural.” However, the tea contained neither raspberries nor vanilla flowers, natural raspberry nor vanilla flavours, which would have been those produced from raspberries or vanilla flowers. Instead, the mixture contained other natural flavours that merely tasted like raspberry and vanilla. The Court held that this might be an example of “replaced ingredients” requiring an explanation in

connection with the product name, thereby, making the respective labelling mandatory.<sup>144</sup>

### 22.5.3 *Misleading Labels: Cases*

#### 22.5.3.1 **The Mars Case**

The Mars case, Case C-470/93 – Mars +10 % [1995],<sup>145</sup> is an example of what types of labels must be circumspect and how far the prohibition of misleading information reach. Mars produced ice cream bars and presented them in wrappers marked “+10 %”, in regards to the quantity of the product indeed being increased by 10 %. However, the package used different colouring and the coloured part, a band bearing the 10 % marking, occupied more than 10 % of the total surface. It was argued that consumers might therefore believe that the increase is larger than that represented. The European Court of Justice found that, “[r]easonably circumspect consumers may be deemed to know that there is not necessarily a link between the size of publicity markings relating to an increase in a product’s quantity and the size of that increase.”<sup>146</sup>

#### 22.5.3.2 **The Naturrein Case**

The Naturrein case, Case C-465/98 – D’arbo Naturrein [2000],<sup>147</sup> dealt with a strawberry jam that contained the German word “naturrein” (naturally pure) on its label. It was established that the jam contained an additive gelling agent, pectin. Further analysis revealed that the jam also contained minimum levels of heavy metals and pesticides as traces or residues. The parties argued that these facts were incompatible with the claim “naturrein” (naturally pure), and would be misleading. The European Court of Justice, however, held that,

As regards, first, pectin, it need merely be pointed out that its presence in d’arbo jam is indicated on the label on the packaging.<sup>148</sup>

It is common ground that lead and cadmium are present in the natural environment as a result, in particular, of air pollution and pollution of the aquatic environment, as evidenced by several Community legislative instruments mentioned by the Advocate General in point 65 of his Opinion. Since garden fruit is grown in an environment of that kind, it is inevitably exposed to the pollutants present in it.

<sup>144</sup>CJUE, Case C – 195/14, Teekanne, 4 June 2015.

<sup>145</sup>Case C-470/93 – Mars +10 %, ECR, I-1936 (1995).

<sup>146</sup>Case C-470/93, *op cit.*, paragraph 24.

<sup>147</sup>Case C-465/98 – D’arbo Naturrein (2000), ECR I-2321.

<sup>148</sup>Case C-465/98, *op cit.*, paragraph 22.

The same conclusion is called for, thirdly, in relation to the presence of traces or residues of pesticides in d'arbo jam. As observed by the Advocate General in point 70 of his Opinion, the use of pesticides, even by private individuals, is one of the most usual means of combating the presence of harmful organisms on vegetables and agricultural products. Thus, that fact that garden strawberries are grown 'naturally' does not in any event mean that they are free of pesticide residues.

Lastly, it is necessary to verify whether the amounts of residues of lead, cadmium and pesticide measured in d'arbo jam render the presence of those substances incompatible with the description 'naturally pure' appearing on the label. Such a description might indeed be liable to mislead consumers if the foodstuff contained a high level of residues of toxic or polluting substances, even if they presented no risk to consumers' health.<sup>149</sup>

In those circumstances, it must be considered that, notwithstanding the presence of traces or residues of lead, cadmium and pesticides in d'arbo jam, the term "naturally pure" used on the label of the packaging of that foodstuff is not liable to mislead consumers as to its characteristics.<sup>150</sup>

These holdings illustrate the court's reasoning as to the alleged misrepresentation of "naturrein." Seeing how the rules outlined in this chapter have been applied is a helpful guide in learning how to read and interpret these labelling laws.

### 22.5.3.3 The Marketing Standards for Eggs Case

In Case C-210/96—Marketing Standards for Eggs [1998],<sup>151</sup> the German company "Gut Springenheide" marketed eggs ready-packed under the description "6-Korn — 10 frische Eier" (six-grain—ten fresh eggs). According to Springenheide, the six varieties of grains in question accounted for 60 % of the feed mix used to feed the hens, which were producing the eggs labelled as such. The disputes in this case gave rise to question whether the description on the egg packaging was likely to mislead a significant proportion of consumers into believing that the feed was made up exclusively of the six grains indicated, and that the eggs have particular characteristics. The German court referred the case to the European Court of Justice and asked how consumer expectation should be determined in this situation.

The European Court of Justice held that the question of whether the label misleads consumers is a matter for the national court, which "must take into account the presumed expectations which it evokes in an average consumer who is reasonably well-informed and reasonably observant and circumspect."<sup>152</sup> The Court did not decide if, in the case at hand, the consumer was misled or not but stated that consumer polls may help in ascertaining the level of likelihood that consumers are misled, "where the national court has particular difficulty in assessing the misleading nature of the statement or description in question, it may

<sup>149</sup>Case C-465/98, *op cit.*, paragraphs 28–30.

<sup>150</sup>Case C-465/98, *op cit.*, paragraph 33.

<sup>151</sup>Case C-210/96 ('Marketing standards for eggs'), *op.cit.*, <http://curia.europa.eu/juris/liste.jsf?num=C-210/96>.

<sup>152</sup>Case C-210/96, *op.cit.*, paragraph 37.

have recourse, under the conditions laid down by its own national law, to a consumer research poll, or an expert's report as guidance for its judgment."<sup>153</sup>

## 22.5.4 Food Advertisement Cases

### 22.5.4.1 The Douwe Egberts NV Case

In the Douwe Egberts case (C-239/02 [2004]), the European Court of Justice ruled on an issue of national legislation<sup>154</sup> from Belgium, which imposed a general ban on the use of any reference to weight loss (slimming) in food advertising.

The Court stated that:

Foodstuffs lawfully manufactured and marketed in the other Member States in which particulars concerning health which are not misleading, may be mentioned under the provisions of Directive 2000/13, would be faced with restrictions on access to the Belgian market. In fact, the possibility cannot be ruled out that to compel a producer to discontinue an advertising scheme which he considers to be particularly effective, may constitute an obstacle to imports.<sup>155</sup>

Moreover, an absolute prohibition of advertising the characteristics of a product is liable to impede access to the market by products from other Member States more than it impedes access by domestic products, with which consumers are more familiar.<sup>156</sup>

The prohibition laid down by the national legislation, therefore, constitutes a fetter on intra-Community trade coming within the scope of Article 28 EC.

Such a fetter may be justified only by one of the public-interest grounds set out in Article 30 EC which include the protection of health and life of humans or by one of the overriding requirements ensuring, inter alia, consumer protection. It must also be appropriate for securing attainment of the objective which it pursues and must not go beyond what is necessary for attaining it.<sup>157</sup>

The grounds relied on to justify the aspects of the national legislation at issue relating to advertising are identical in scope to those relied on to justify the aspects of that legislation concerning labelling, namely the protection of the health of humans and prevention of fraud. . . those arguments cannot be upheld.

Nonetheless and unlike national legislation which in regard to labelling runs counter to Directive 2000/13 and cannot apply either to imported foodstuffs or to domestic foodstuffs, where national legislation on advertising is contrary to Articles 28 EC and 30 EC, application of that legislation is precluded only in regard to imported products and not domestic products.<sup>158</sup>

The Court finally concluded that:

<sup>153</sup>Case C-210/96, *op.cit.*, paragraph 37.

<sup>154</sup>Royal Decree of 17 April 1980 concerning the advertising of foodstuff, Official Belgian Gazette 6 May 1980.

<sup>155</sup>SARPP, paragraph 29.

<sup>156</sup>Case C-405/98 Gourmet International Products [2001] ECR I-1795, paragraph 21.

<sup>157</sup>Joined Cases C-34/95 to C-36/95 De Agostini and TV-Shop [1997] ECR I-3843, paragraph 45.

<sup>158</sup>SARPP, paragraph 16.

[g]iven that it is apparent from the order for reference that the dispute in the main proceedings does not concern imported foodstuffs, it is for the national court to ascertain to what extent national law requires a national producer to be allowed to enjoy the same rights as those which a producer of another Member State would derive from Community law in the same situation.<sup>159</sup>

Notably, however, that references to ‘slimming’ must now comply with the HCR (*supra*).

#### 22.5.4.2 The Gourmet International Case

In Case C-405/98—Gourmet International Products [2001] (GIP), the company GIP published three pages of advertisements for alcoholic beverages a Swedish magazine, entitled “Gourmet.” Those pages did not appear in the edition sold in shops. Ninety percent of the magazine’s subscribers were traders, manufacturers, or retailers, while only 10 % of the subscribers were private individuals.

The relevant Swedish law prohibited any advertising for spirits, wines, or strong beers either in periodicals or in other publications subject to the Swedish Regulation on the Freedom of Press and comparable to periodicals by reason of their publication schedule. That prohibition did not, however, apply to publications distributed solely at the point of sale of such beverages in Swedish Law 1996:851 with title “Alkoholreklamlagen.” The object of the Alkoholreklamlagen was that the prohibition on advertisements in periodicals only applies to marketing intended for consumers and does not apply to advertisements in the specialist press, i.e. the press targeting traders.

In this case, the European court of Justice held as follows:

It is apparent that a prohibition on advertising, such as that at issue in the main proceedings, not only prohibits a form of marketing a product but in reality prohibits producers and importers from directing any advertising messages at consumers, with a few insignificant exceptions.

Even without its being necessary to carry out a precise analysis of the facts characteristic of the Swedish situation, which it is for the national court to do, the Court is able to conclude that, in the case of products like alcoholic beverages, the consumption of which is linked to traditional social practices and to local habits and customs, a prohibition of all advertising directed at consumers in the form of advertisements in the press, on the radio and on television, the direct mailing of unsolicited material or the placing of posters on the public highway is liable to impede access to the market by products from other Member States more than it impedes access by domestic products, with which consumers are instantly more familiar.<sup>160</sup>

<sup>159</sup>C-239/02, (Douwe Egberts NV), §53–57 (emphasis added) (citing Case C-448/98 Guimont, paragraph 23).

<sup>160</sup>Case C-405/98, Gourmet International Products [2001] ECR I-1795, §§ 20 and 21.

Thus, impediments on the free movement of goods were struck down.

In a similar case invoking French national law, Case C-241/8912, SARPP [1990],<sup>161</sup> the European Court of Justice decided that a national legislation (in the case at hand: French legislation<sup>162</sup>) which prohibits any statement in the advertising of artificial sweeteners alluding to the word “sugar” or to the physical, chemical or nutritional properties of sugar that artificial sweeteners also possess, infringes the principle of free movements of goods.

## 22.5.5 Nutrition and Health Claim Cases and Examples

### 22.5.5.1 The Deutsches Weintor Case

Case C-544/10, *Deutsches Weintor eG* [2012] illustrates how wide the term “health claim” can be construed. The case was referred to the European Court of Justice by the German Bundesverwaltungsgericht (Federal Administrative Court). A wine producer labelled certain wines with the description “bekömmlich” (easily digestible), and referenced the reduced acidity levels (gentle acidity) in these wines by including the following on the label as “ow[ing] its mildness to the application of . . . [the] special ‘LO3’ protective process for the biological reduction of acidity.” German authorities challenged the information as the use of an unauthorized health claim and found it inadmissible because since alcoholic beverages containing more than 1.2 % by volume of alcohol were not entitled to bear any health claims.<sup>163</sup> The German Federal Administrative Court questioned whether a description relating to the mere temporary maintenance of bodily functions would suffice to establish a link with health, or whether the description had to relate to the general health-related well-being of a person.

The European Court of Justice clarified what such a health claim should include:

[i]n that regard it is apparent from the wording of Article 2(2)(5) of Regulation No. 1924/2006 that the starting-point for the definition of a ‘health claim’ within the meaning of that regulation is the relationship that must exist between a food or one of its constituents and health. That being the case, it must be noted that that definition provides no information as to whether that relationship must be direct or indirect, or as to its intensity or duration. In those circumstances, the term ‘relationship’ must be understood in a broad sense.

Thus, the concept of a ‘health claim’ must cover not only a relationship implying an improvement in health as a result of the consumption of a food, but also any relationship which implies the absence or reduction of effects that are adverse or harmful to health and which would otherwise accompany or follow such consumption, and, therefore, the mere preservation of a good state of health despite that potentially harmful consumption.<sup>164</sup>

<sup>161</sup>Case C-241/89, SARPP [1990], ECR I-4714.

<sup>162</sup>French Law No 88-14 of 5 January, Article 10(1).

<sup>163</sup>Regulation (EC) No 1924/2006, *op cit.*, Art. 4 (3).

<sup>164</sup>Case C-544/10 *Deutsches Weintor* [2012], paragraphs 34–35 (emphasis added).

### 22.5.5.2 The Green Swan Case

Case C-299/12, Green Swan [2013] originated in the Czech Republic and concerned a food supplement marketed with the following statement: “The preparation also contains calcium and vitamin D3, which helps to reduce a risk factor in the development of osteoporosis and fractures.” Among other questions raised, the referring Czech court explained that a health claim need not necessarily include the word “significantly” or a similar expression to be considered a “reduction of disease risk claim.” Otherwise, the choice of a slightly different wording would lead to a circumvention of the requirements of the HCR. The case was brought before the European Court of Justice, which found as follows:

Among health claims, Article 2(2)(6) of the regulation defines a ‘reduction of disease risk claim’ as ‘any health claim that states, suggests, or implies that the consumption of a food category, a food, or one of its constituents significantly reduces a risk factor in the development of a human disease.’

It follows from the use of the verbs ‘suggests or implies’ that classification as a ‘reduction of disease risk claim,’ within the meaning of that provision, does not require that such a claim expressly states that the consumption of a food significantly reduces a risk factor in the development of a human disease. It is sufficient that that claim may give the average consumer who is reasonably well informed and reasonably observant and circumspect the impression that the reduction of a risk factor is significant.<sup>165</sup>

Therefore, the Court held that “the answer to the first question is that Article 2(2) (6) of Regulation No 1924/2006 must be interpreted as meaning that, in order to be considered a ‘reduction of disease risk claim’ . . . a health claim need not necessarily expressly state that the consumption of a category of food, a food or one of its constituents ‘significantly’ reduces a risk factor in the development of a human disease.”<sup>166</sup>

### 22.5.5.3 The Ehrmann Case

The Ehrman case, C-609/12, Ehrmann [2014], dealt with a milk curd that contained the label slogan “as important as the daily glass of milk.” The product contained as much calcium as milk, but also contained 13 % sugar, whereas the sugar content of milk is 4.7 %. In the opinion of a German court, the slogan constitutes a health claim because the relevant public generally views milk as having positive effects on health due to its mineral content. According to the court, the slogan, therefore, expressed a positive effect of the curd in question by comparing it to a daily glass of milk.

Based on the belief that the reference was a health claim, the German court noted the absence of the additional mandatory labelling requirements, which would

<sup>165</sup>Case C-299/12, paragraphs 23–26.

<sup>166</sup>Case C-299/12, paragraphs 23–26.

usually be required when a health claim is made. The German court asked the European Court of Justice whether, according to Art. 10(2) HCR, these additional information requirements applied before the publication of the first part of the Article 13 listing all authorised health claims. The European Court of Justice decided that Art. 10(2) was applicable.<sup>167</sup>

### 22.5.6 *Clean Labelling Examples*

For the reason that clean labelling is essentially regulated at the national level, there are very few cases on point that have been decided by the European Court of Justice. Nonetheless, the following is an illustration of the practical implications of clean labelling:

#### 22.5.6.1 **The Pure Chocolate Case**

In C-47/09, *EC v. Italy (Pure Chocolate)* [2010],<sup>168</sup> the European Court of Justice ruled on a provision of Italian law, which limited the use of the term “puro cioccolato” (pure chocolate) to chocolate products which did not contain any vegetable fat other than cocoa butter. According to the CJEU, such a limitation infringed upon the EU Chocolate Directive,<sup>169</sup> which the Court read in conjunction with the Labelling Directive.<sup>170</sup>

The EU Chocolate Directive authorises chocolate products to contain up to 5 % vegetable fats other than cocoa butter and also authorises supplementary information or descriptions relating to the quality criteria of the products in chocolate products which contain specific minimum characteristics, such as minimum content of cocoa solids and cocoa butter. Consequently, the specific requirements of Italian law regarding the right to use the description “pure chocolate,” amounted to an infringement of the full harmonisation of the sales names of chocolate products introduced by the EU Chocolate Directive. Accordingly, the Court decided that such national legislation could not be justified on the ground of consumer protection.

# Chapter 23

## Consumer Protection Through Food Law in the European Union

Raymond O'Rourke

**Abstract** In many countries lawyers would believe that food law is a component of consumer protection law. In the European Union, consumer protection law was not a priority at its establishment under the Treaty of Rome (1957), indeed consumer policy at that time was in its infancy both in Europe and the U.S.A. In the following years the EU attempted to agree laws to protect consumers but such laws were always to enhance the functioning of the Internal Market. This situation was highlighted by means of the famous *Cassis de Dijon* ECJ Court case. The EU introduced some minimal consumer protection legislation some of which covered issues like food labelling or food hygiene. Things changed dramatically after the BSE crisis after which a major body of EU Food Law has been introduced. These food laws have been introduced as maximum harmonisation measures unlike consumer laws which continue to be caught-up in a major struggle with Member States over whether they should be a minimum or maximum harmonisation measure.

### 23.1 Introduction

In many countries, lawyers believe that food law is a component of consumer protection law. In the European Union (EU), consumer protection law was not a priority at its establishment under the Treaty of Rome in 1957. In fact, consumer policy, at that time, was in its infancy both in Europe and the United States. In the years that followed, the EU attempted to agree on laws to protect consumers, but such laws were always to enhance the functioning of the so-called internal market. This situation was highlighted by means of the famous *Cassis de Dijon* case that was brought before the European Court of Justice (ECJ) where the EU introduced some minimal consumer protection legislation.<sup>1</sup> Some of this consumer protection

Food & Consumer Lawyer, Dublin, Ireland  
e-mail: [raymond.orourke7@gmail.com](mailto:raymond.orourke7@gmail.com)

legislation covered issues such as food labelling or food hygiene. After the notorious bovine spongiform encephalopathy crisis (also known as mad cow disease), however, European food law changed and the EU introduced a new body of food law in the form of maximum harmonization measures. Consumer laws, on the other hand, continue to be caught up in a major struggle with EU member states over whether they should be a minimum or maximum harmonization measure. This chapter provides an overview of European consumer protection laws through food law in the European Union and builds on the previous chapters to provide an advanced analysis of the relevant laws.

## 23.2 Establishment of European Food Law

The initial approach of the Commission in relation to EU food law was to concentrate on the obligations enshrined in Article 3 of the Treaty of Rome, so as to ensure the free movement of foodstuffs throughout the common market. For many years, EU food legislation pursued a path dictated by this approach using Article 94 of the EC Treaty as a basis for such legislation, thereby necessitating unanimity in the Council for adoption. The process of creating a body of EU food law was slow. It was only following a number of major court cases, including the *Cassis de Dijon* case in 1979 that the Commission attempted to reorient its approach to food law.

The Commission introduced its new approach in the 1985 Communication entitled “Completion of the Internal Market: Community Legislation on Foodstuffs.”<sup>2</sup> It stated that Community legislation on foodstuffs should be limited to provisions justified by the need to: protect public health; provide consumers with information and protection in matters other than health and ensure fair trading; and provide for the adequate and necessary official controls of foodstuffs.

Shortly after the Commission released the above communication, it proposed to the Council a number of framework directives dealing with these essential requirements, which were subsequently adopted. These included framework directives on additives, labelling foods for particular nutritional needs, hygiene, and official controls.

Later, in 1989, the Commission published another communication, “The Free Movement of Foodstuffs within the Community,”<sup>3</sup> to provide further clarification on this subject. This communication was in response to the *Cassis de Dijon* court judgment, which established the principle that, in general, a food product lawfully produced and marketed in one member state should be allowed to be marketed in other member states—unless it could be proved that it was a threat to public health. The communication clarified the position of the trade description and the question

---

<sup>2</sup>Communication on completion of the internal market (1985) Legislation on foodstuffs (COM(85) 603).

<sup>3</sup>Communication on the free movement of foodstuffs in the community (O.J. 1989 C271/3).

of additives vis-à-vis the free movement of foodstuffs. Essentially, though, EU food law in the run-up to the 1992 establishment of the single internal market was still concentrated on questions of trade and free movement of goods. Consumer protection and public health aspects of food law were playing second fiddle to issues of trade. Indeed, during this time, there were often calls for the deregulation of EU food law back to member states. EU legislation relating to food was subject to critiques of over-regulation, incoherence, fragmentation, and lack of transparency and innovation.

The BSE crisis ensured that EU legislators once again had to go back and look at the way in which EU food law had developed. The European Commission, facing a motion of censure from the European Parliament for their handling of the BSE issue, agreed to reform the Commission's structures for preparing food legislation. The important outcome of these developments was that the Commission published a long-awaited Green Paper on Food Law in May 1997.<sup>4</sup>

### 23.3 EU Consumer Law

The EU's most recent Consumer Agenda from 2012 includes a strategic vision for EU consumer policy, and aims to maximise consumer participation and trust in the internal market. The Consumer Agenda is built around four main objectives:

1. increasing consumer confidence by reinforcing consumer safety;
2. enhancing consumer knowledge;
3. stepping up enforcement and redress; and
4. aligning consumer rights and policies to changes in society and the economy.

Unlike the Treaty of Rome, the EU's most recent Consumer Agenda directly references consumers. In the intervening years since it was enacted, the Treaty of Rome has been amended a number of times to make consumer protection a policy priority for the EU. Article 12 of the EC Treaty emphasizes the importance of consumer policy at the European level, which states "consumer protection requirements shall be taken into account in defining and implementing other Union policies and activities."<sup>5</sup>

Article 114 (1) addresses the harmonization and approximation of laws for the functioning of the internal market. As with Article 12, it emphasizes the need for a high level of consumer protection by ensuring that

(t)he Commission, in its proposals envisioned in paragraph (1) concerning health, safety, environmental protection and consumer protection, will take high basic level of protection, taking into account in particular of any new development based on scientific facts. Within

---

<sup>4</sup>Green Paper (1997) The general principles of food law in the European Union. (COM(97)176) May 1997.

<sup>5</sup>Article 12. Consolidated version of the Treaty on the Functioning of the European Union.

their respective powers, the European Parliament and the Council will also seek to achieve this objective.<sup>6</sup>

Such measures must contribute significantly to promoting consumer interests while at the same time ensuring the smooth functioning of the internal market. Essentially, the EU must strike a balance between consumer protection and the internal market. As the *Cassis de Dijon* case highlighted, measures obstructing the movement of goods in the internal market may be introduced in order to protect consumer health and safety, but such measures must be adequately justified.

The European Charter of Fundamental Rights, which became primary law by means of the Treaty of Lisbon, states in Art. 38 that “union policies shall ensure a high level of consumer protection.”<sup>7</sup> The use of the phrase “shall ensure” implies that this reference is more of a principle, rather than a hard-and-fast rule. It demonstrates once again an attempt to balance consumer protection rights with the pressures of the internal market.

As shown in the Unfair Commercial Practices directive, the aim and purpose of legislation in secondary law is “to contribute to the proper functioning of the internal market and achieve a high level of consumer protection by approximating the laws, regulations and administrative provisions of the Member States on unfair commercial practices harming consumers’ economic interests.”<sup>8</sup> Therefore, one of the main goals of the legislation, as specified in the Recitals, is to foster fair competition, provide for the smooth functioning of the internal market, and to do so with a high level of consumer protection. This will allow the consumer to make an informed and thus efficient choice. The directive highlights in Recital 18 that it:

takes as a benchmark the average consumer, who is reasonably well informed and reasonably observant and circumspect, taking into account social, cultural and linguistic factors, as interpreted by the Court of Justice, but also contains provisions aimed at preventing the exploitation of consumers whose characteristics make them particularly vulnerable to unfair commercial practices.<sup>9</sup>

Many rulings discuss the question of the so-called “average consumer,” and they all suggest that such a person is well informed—not an expert, but rather someone with general knowledge. These consumers will expand their knowledge when necessary and are able to find the information they require. In addition, they have the ability to correctly read labelling information.

It is useful to contrast the provisions in the Unfair Commercial Practices directive with those in the Food Information regulation, which deals with a consumer’s right to adequate food labelling. In the past, the main principle for food labelling was that it did not mislead the consumer. Article 3(1) of the Regulation demonstrates the concept of food labels in assisting the consumer to make an informed choice. It is now included in EU food law that:

<sup>6</sup>Article 12. Consolidated version of the Treaty on the Functioning of the European Union.

<sup>7</sup>Article 38. European Charter of Fundamental Rights of the European Union.

<sup>8</sup>Article 1, Unfair commercial practices directive 2005/29 (O.J. L149 pp. 22–69).

<sup>9</sup>Recital 18—Unfair Commercial Practices Directive 2005/29 [O.J. L149 pp. 22–69].

The provision of food information shall pursue a high level of protection of consumers' health and interests by providing a basis for final consumers to make informed choices and to make safe use of food, with particular regard to health, economic, environmental, social and ethical considerations.<sup>10</sup>

In addition, food information shall facilitate the smooth functioning of the internal market, protect the interests of food producers, and promote the production of quality products.

There is one area, however, where there is still a major divergence between EU consumer protection laws and EU food laws—and that is in the degree of regulation harmonization between member states.

### ***23.3.1 The Green Paper on Food Law***

The Green Paper was a seminal publication because it generated an enormous debate about how the European Union should best legislate in the area of food law. The goals of the document included the need:

- to provide a high level of protection for consumer public health and safety;
- to ensure the free circulation of goods within the single market;
- for legislation to be based primarily on scientific evidence and risk assessment;
- to ensure the competitiveness of the European food industry;
- the need to place the primary responsibility for safe food with industry, including producers and suppliers, through self-checking provisions backed up by official controls and enforcement (so-called Hazard Analysis Critical Control Points systems, or HACCP systems); and,
- for legislation to be coherent, rational, consistent, simple, user-friendly, and developed in full consultation with all interested parties.

It was in this document that the Commission reaffirmed the fundamental goals mentioned above and achievements of EU food law, which were not to be questioned in any changes introduced following the debate on the Green Paper.

### ***23.3.2 The White Paper on Food Safety***

Although the Green Paper was a seminal work, it was not the final chapter in the re-orientation of EU food law that took place in the wake of the BSE crisis. The Commission was initially supposed to publish a communication subsequent to the Green Paper that would list new legislative proposals aimed at fulfilling the promises made to the European Parliament; namely, to establish an EU-wide

---

<sup>10</sup>Article 3(1)—EP & Council Regulation 1169/2011 on Food Information [O.J. L304 pp. 18–63].

food regulatory regime which placed consumer health and food safety at the top of the agenda.

A series of events conspired to change this plan, however, and, instead, in January 2000 the European Commission published a White Paper on Food Safety.<sup>11</sup> The Commission changed its approach due to the on-going fallout of the BSE crisis, continued consumer concerns over the safety of genetically modified (GM) foods, and the dioxin contamination scandal in Belgium. On 27 May 1999, Belgian authorities informed the European Commission about a heavy contamination of animal feed with dioxin. The Commission acted quickly and took protective EU-wide measures, removing all Belgian animal and poultry products, as well as those derived from these animals, from the market. Member states that had imported the contaminated animal feed were asked to trace the animal feed and foods produced from these farms and destroy them. Numerous food products were taken off the market and the EU had to work very hard to allay consumers' fears that items marketed throughout the internal market were unsafe. The European Commission activated its Rapid Alert System, whereby there is a co-ordinated exchange of information between the Commission and member states regarding potential threats to the health and safety of consumers.

In his first policy speech to the European Parliament in July 1999, the new Commission President, Romano Prodi, stated that enhancing food safety would be one of the main priorities of his tenure at the Commission. The Commissioner for Health and Consumer Protection, David Byrne, was given the task in the wake of these food crises to re-vamp and re-focus EU food law so that it would reflect a strong food safety/consumer-orientated perspective. The culmination of Byrne's work was the White Paper on Food Safety, published in January 2000.

The White Paper proposed a comprehensive range of over 80 new or amended items of European food law, including general food laws that outlined the responsibilities and obligations of all operators in the food chain. Other proposals involved a regulation on official food and animal feed controls, the re-casting of the EU hygiene rules, new labelling rules, limits on nutritional and health claims, a re-vamping of the Rapid Alert System, and a complete overhaul of EU legislation relating to genetically modified organisms (GMOs) and GM foods.

## **23.4 Consumer Protection and Food Law**

### ***23.4.1 Food Law and the Treaty of Rome***

As is mentioned in other chapters in this section, the Treaty of Rome established the European Economic Community (EEC)—a precursor to the current European Union (EU)—and was signed into law in 1957 by France, Germany, Italy, and

---

<sup>11</sup>White Paper on Food Safety (COM(1999)719).

the Benelux countries. This EEC treaty gave rise to the European Economic Community and provides that the activities of the Community should include a variety of factors according to Article 3 in order to establish a common European market. Three factors stand out in particular as they relate to consumer protection and food law:

1. the elimination of customs duties and quantitative restrictions between member states in relation to the import and export of goods;
2. an internal market characterised by the abolition of obstacles to the free movement of goods, persons, services, and capital; and,
3. the approximation of the laws of member states to the extent required for the functioning of the common market.

The Treaty of Rome made no explicit mention of consumer protection or public health, and the Single European Act and the Maastricht Treaty only added these goals as amendments to Article 3. Thus, in contrast to legislation in most member states, EU food law developed gradually over a long period of time.

Establishing foods law in the EU came with distinct challenges. Initially, there was no central unifying text setting out the fundamental principles of EU food law to clearly define the obligations of those involved at every stage of the food production chain. The first EU food directive, which was concerned with coloring in foodstuffs, was adopted by the Council of Ministers in 1962. The directive had no EEC number because at that time, there was no formal system for numbering EU laws. This was not an auspicious start for the establishment of EU food law as a major concern of EU legislators. Ultimately, it is through the EEC treaty that food law in the EU began to follow harmonized principles. From this trend toward harmonization came the demand for free trade within the EEC member states, meaning the free movement of goods.

### ***23.4.2 The Free Movement of Goods***

One of the principal aims of the EU as stipulated in Article 3 of the EC Treaty is the elimination of all obstacles to the free flow of goods between member states. The most obvious obstacle is custom duties, but there are other ways nations may try to protect their domestic products from foreign competition. These ways include limiting the quantity of goods that may be imported (quantitative restrictions), as well as regulations and administrative practices that hinder the importation of specific products. Therefore, in order to provide for the free movement of goods, the EC Treaty states in Article 34 “quantitative restrictions on imports and all measures having equivalent effect shall be prohibited between Member States.”<sup>12</sup>

---

<sup>12</sup>Article 34. Consolidated version of the treaty on the functioning of the European Union.

Article 35 of the EC Treaty requires that any restrictions on exports, or measures having an equivalent effect, should be abolished. The Treaty provides exemptions or derogations under which the basic rules on the free movement of goods may be avoided, as stipulated in Articles 34–35. Article 36 of the EC Treaty states:

The provisions of Articles 34 and 35 shall not preclude prohibitions or restrictions on imports, exports or goods in transit justified on grounds of public morality, public policy or public security; the protection of health and life of humans, animals or plants; the protection of natural treasures possessing artistic, historical or archaeological value; or the protection of industrial and commercial property. Such prohibitions shall not, however, constitute a means of arbitrary discrimination or a disguised restriction on trade between Member States.<sup>13</sup>

### ***23.4.3 Quantitative Restrictions and Article 28 of the EC Treaty***

To return to Article 34, the term “quantitative restrictions” is defined as a measure that amounts to a total or partial restraint, according to the circumstances, of imports, exports, or goods in transit.<sup>14</sup> The term “measures having equivalent effect” creates much more difficulty with regard to interpretation. At first, the common reading was that Article 34 merely prohibited discrimination, meaning that it is a ban on measures by member states to hinder the free movement of goods. Barriers to trade arising from “differences” in national laws or regulations—for example, in compositional lists of ingredients for foodstuffs—were not initially seen as connected with Article 34’s prohibition of quantitative restrictions. These barriers were considered to be a matter for EU harmonization of national laws.

### ***23.4.4 Measures Having Equivalent Effect Defined: The Dassonville Case***

It was not until the landmark decision in *Procureur du Roi v. Dassonville*, which is also discussed in earlier chapters in this section, that the European Court supported a “broad” view in relation to measures having equivalent effect. The Court defined measures of equivalent effect, in the context of Article 34 of the EC Treaty, as “all trading rules enacted by Member States, which are capable of hindering, directly or indirectly, actually or potentially, intra-Community trade.”<sup>15</sup>

---

<sup>13</sup>Article 36. Consolidated version of the treaty on the functioning of the European Union.

<sup>14</sup>Geddo (1973).

<sup>15</sup>*Procureur du Roi v. Dassonville* (1974), ECR 837.

The case concerned Belgian legislation, which required a certificate of origin for imported goods bearing a designation of origin. Specifically, the legislation required all whisky sold in Belgium as “Scotch Whisky” to be accompanied by a certificate of origin, in addition to the existing designation of origin provided by the Scotch whisky manufacturers. The European Court ruled that this provision could not be applied to Scotch Whisky which had been lawfully imported and put into free circulation in France and then re-exported to Belgium. In its reasoning, it argued that it was much more difficult to obtain the certificate of origin for whisky imported into Belgium by way of a third country than for direct imports from Scotland. The Court ruled that the Belgian legislation acted as a hindrance to trade between member states.

Despite this ruling, the Court did note that, under certain circumstances, member states might reasonably require information about the place of origin of imported products. Thus, when the Belgian law was modified in relation to import certificates for Scotch Whisky, Belgium requested that manufacturers provide “certified” copies of the certificate of origin. The Court subsequently ruled that this new practice was lawful.

The main consequence of this European Court ruling was that literally, overnight, thousands of national laws and regulations relating to imported products suddenly fell within the scope of the provisions in Articles 34–36. A European Court ruling in *Rewe-Central AG v. Bundesmonopolverwaltung für Branntwein*, more commonly known as the *Cassis de Dijon* case, which also plays a role in other chapters of this section, however, soon modified this broad interpretation of Articles 34–36. The case involved a German law that prohibited the marketing of liqueurs with an alcoholic strength of less than 25%. Rewe-Central requested authorization from the German authorities to import a liqueur from France, Cassis de Dijon, containing 15–20% by volume of alcohol. The German authorities informed the company that Cassis de Dijon could not be sold in Germany, since under the German regulations only liqueurs of between 25 and 32% alcohol by volume could be authorized. There were some exceptions to this rule, but regulators informed the company that Cassis de Dijon was not one of them.

The European Court ruled that this prohibition was discriminatory whether applied to imported or domestic products. The Court stated that: “the requirements relating to the minimum content of alcoholic beverages do not serve a purpose which is in the general interest and such as to take precedence over the requirements of the free movement of goods, which constitutes one of the fundamental rules of the Community.”<sup>16</sup> It was the Court’s judgment in *Rewe-Central* that these rules constituted an obstacle to trade that was incompatible to Article 34 of the Treaty. The Court believed that there was no valid justification for why alcoholic beverages should not be introduced into another member state, provided they had been lawfully produced and marketed in the EU. Consequently, this case marked the first time that the European Court articulated the principle of “mutual recognition,”

---

<sup>16</sup>Id.

according to which goods lawfully produced in one member state should be free to move throughout the rest of the EU. This principle has become one of the cornerstones of EU food law, as well as a fundamental part of the EU 1992 Single Market Program.

The Cassis de Dijon judgment also gave some clarification to the derogations coming within the scope of Article 34, as permitted under Article 30. The German government defended its position in the European Court by stating that these legal provisions were prompted by the wish to protect the consumer against the adverse effects of alcohol to his/her health. They took the view that a limitless authorization for liquors of different alcoholic strengths would be likely to lead to a rise in the consumption of alcohol as a whole, and would therefore increase the specific dangers of alcoholism. The Court ruled that although these arguments had some merit, they were not sufficient to permit Germany derogation from Article 34 obligations in line with the "public health" derogation in Article 36. Even so, by confirming the possibility of obtaining Article 36 derogation, the European Court "copper-fastened" those provisions into any future judgment on the possibility of quantitative restrictions existing in relation to free movement of certain foodstuffs throughout the EU.

On the basis of the case law of the ECJ, the following activities, rules, and practices constitute measures of equivalent effect to quantitative restrictions as defined in Article 34 of the EC Treaty.

## **23.5 Changes in the White Paper: EP and Council Regulation**

The major changes envisioned in the White Paper were developed by means of EP and Council Regulation 178/2002.<sup>17</sup> Besides establishing the European Food Safety Authority and re-vamping the Rapid Alert System, it also outlined the general principles of EU food law. The regulation therefore harmonises at Community level many existing national requirements of food law, placing them in the European context so that there will be no ambiguity across the EU as to the basic philosophy and obligations flowing from EU food law.

### **23.5.1 Scientific Basis to Food Law**

Depending on the nature of the measure, food law, and in particular measures relating to food safety, must be underpinned by strong science. Regulation 178/2002 establishes in EU law that the three inter-related components of risk

---

<sup>17</sup>EP & Council regulation 178/2002 (O.J. 2002 L31 p. 1).

analysis—risk assessment, risk management and risk communication—provide the basis for food law as appropriate to the measures under consideration. Not all food law has a strong scientific basis, however, and some measures do not need a scientific foundation. Exceptions include food law relating to consumer information and the prevention of misleading practices.

The new Regulation requires the scientific assessment of risk to be undertaken in an independent, objective, and transparent manner based on the best available science by means of the European Food Safety Authority (EFSA).

Risk management is the process of weighing policy alternatives in light of the results of a risk assessment and, if required, selecting the appropriate actions necessary to prevent, reduce, or eliminate the risk. The goal is to ensure a high level of health protection within the EU. In the risk management phase, the decision makers need to consider a range of information in addition to the scientific risk assessment. This includes, for example, the feasibility of controlling a risk, the most effective risk reduction actions depending on the part of the food supply chain where the problem occurs, the practical arrangements needed, the socio-economic effects, and the environmental impact. Accordingly, the regulation establishes the principle that risk management actions are not just based on scientific assessment of risk; rather, they must also take into consideration a wide range of other factors relevant to the matter at hand.

### ***23.5.2 Responsibilities of Food and Feed Business Operators***

The regulation establishes the basic principle that the primary responsibility for ensuring compliance with food law, and in particular the safety of foodstuffs, rests with the food business. Similarly, this principle is applied to feed businesses. To complement and support this principle, there must be adequate and effective controls organised by the competent authorities of the member states.

### ***23.5.3 Food Safety Requirements***

EP and Council Regulation 178/2002 establish a food safety requirement that comprises of two elements. In order for the food to be considered unsafe food should not be injurious to health, and food should not be unfit for human consumption. In considering whether a food is potentially injurious to health it is important to consider the use of the food, information provided with the food, and the processing or subsequent handling to which it will be subject. With regards to a food's effect on an individual, it is crucial to take into account possible long term, cumulative effects as well as short term, acute ones. Food unfit for human consumption is also considered to be unsafe in this regulation. Putrid food, for example, is unacceptable for human consumption and may be injurious to health. It may be

almost impossible to prove injury or probable injury to health with such food, so this separate factor is included in relation to the overall food safety requirement. The regulation also makes it obligatory for food businesses to withdraw unsafe foods from the market, and to provide accurate information to consumers. It requires food safety to be considered along all stages of the food chain.

### **23.5.4 Traceability**

The identification of the origin of feed, food, ingredients, and food sources is of prime importance for the protection of consumers—particularly when products are found to be unsafe. Traceability facilitates the withdrawal of foods from the market and provides consumers with targeted and accurate information concerning the implicated products.

EP and Council Regulation 178/2002 demands the traceability of all food and feed as they move between businesses, with information on the traceability of the food or feed to be made available to competent authorities if requested. Importers are similarly affected, as they are required to identify from whom the product was exported when that product is redistributed.

This traceability obligation ensures, at the very least, that businesses are able to identify the one step in the food supply above them and the one step below. In some cases, there may be specific provisions to provide further traceability.

## **23.6 Connections Between Consumer Law and Food Law**

Food law is consumer-oriented and since the product is consumed, issues of safety are of paramount importance. On the other hand, much of EU consumer law aims to grant the consumer equal status contractually with the manufacturer or service provider.

In a special message to the U.S. Congress on March 15, 1962, President John F. Kennedy established the modern consumer movement by highlighting the need for legislators to take consumers into account when writing and adopting laws. He declared that the following consumer rights should be taken into account in future legislation. These rights are:

1. The right to safety—to be protected against the marketing of goods which are hazardous to health or life.
2. The right to be informed—to be protected against fraudulent, deceitful, or grossly misleading information, advertising, labelling, or other practices, and to be given the facts he needs to make an informed choice.
3. The right to choose—to be assured, wherever possible, access to a variety of products and services at competitive prices; and in those industries in which

competition is not workable and Government regulation is substituted, an assurance of satisfactory quality and service at fair prices.

4. The right to be heard—to be assured that consumer interests will receive full and sympathetic consideration in the formulation of Government policy, and fair and expeditious treatment in its administrative tribunals.<sup>18</sup>

The consumer rights highlighted by U.S. President Kennedy now form the basis of consumer policy and consumer law in the United States and throughout the world. These rights have also been the foundation of the EU's consumer protection policies since the 1980s.

It is evident, therefore, that EU Food Law must ensure the safety of foodstuffs while at the same time providing consumers with sufficient information so that they may make an informed choice about the items they purchase. In the same vein, if a consumer purchases a hair dryer, the law must ensure that the product is safe and the consumer understands the risks, if any, that may be associated with its use.

The extra dimension to consumer law—as compared to food law—comes in terms of providing the consumer with contractual powers so that they are placed on equal footing with the manufacturer or service provider. Consumer law, for instance, can outlaw unfair contract terms or unfair commercial practices. The economic interest of the consumer is therefore not as predominant in food law as it is in consumer law.

To highlight the differences in food law and consumer law, it is useful to look at how the two have been implemented by the EU.

### **23.7 Harmonization of Legislation with the Treaty of Rome and EC Treaty**

The Treaty of Rome (1957) recognised that, in order to help the member states develop in a unified manner, the legislation in individual countries need to be harmonised (or, to use the wording of the Treaty, “approximated”).

Article 114 EC Treaty allows the introduction of EU legislation for the purposes of the “establishment and functioning of the internal market” in line with Article 26 EC Treaty. Most aspects of food law are related to the internal market, and therefore Article 114 EC Treaty applies. The important point to note is that Article 114 EC Treaty provides for measures to be adopted under the co-decision procedure contained in Article 294 EC Treaty.

---

<sup>18</sup>JFK Special Message to the Congress on Protecting the Consumer Interest. March 15, 1962.

### **23.7.1 *Legally Binding Acts: Regulations, Directives, and Decisions***

The EC Treaty defines three types of legally binding acts: regulations, directives, and decisions.<sup>19</sup> Most food law is in the form of regulations or directives. There is a major difference between these two types of laws, which is important to understand. The regulation is 'directly applicable'—this means that it becomes the law of every member state from the time it is adopted in Brussels. Courts within the member states must use an EU Regulation as if it were national law. Food companies therefore have to comply with EU regulations even if there is no related national law, and even if national authorities have not informed them about the regulation.

The directive is binding upon the member states—it is actually an agreement by the member states to alter their own national legislation so as to implement the agreed provisions. It therefore only becomes law when it has been transposed into national legislation, either by an act of parliament or a statutory instrument. Most directives will have a date (12 months, 2 years, or often even longer) by which member states are required to have implemented the provisions of the directive into national law. The Council, the Commission, or the Council and the European Parliament acting jointly can all issue regulations and directives. The latter may occur when the Commission is given the power to take action on its own initiative, for instance in emergency situations such as with the BSE outbreak, dioxin contamination, FMD, and the Sudan Red crisis. The decision is binding upon those to whom it is addressed. A decision can be addressed to an individual member state, a company, or a private individual. In the food area, the most common decisions have been made in the case of emergency measures taken by the Commission, such as those just mentioned above.

There is another type of legal act permitted under the EC Treaty known as a recommendation. The recommendation has no legal binding force and is merely of persuasive authority. In the food area, recommendations might be adopted in relation to a member state government's policies to tackle obesity. The recommendation advocates certain actions, but it is up to each individual member state to decide whether or not to follow these recommendations.

### **23.7.2 *Examining Regulations v. Directives***

In the White Paper on Food Safety (2000),<sup>20</sup> the EU stated that in the future it would prefer to introduce major pieces of food legislation by means of regulations. Since a EU regulation becomes law throughout all member states once it is adopted in

---

<sup>19</sup>[Article 288 EC Treaty].

<sup>20</sup>White Paper on Food Safety (COM (1999) 719).

Brussels, there is less chance of a difference in interpretation when the rule is enforced within each member state. In simple terms, the EU regulation offers the opportunity to establish a 'one size fits all' scenario for foodstuffs throughout the EU with no ambiguities. Indeed, in the wake of the White Paper, the EU adopted a major package of laws covering food hygiene by means of EU regulations. It has also done the same with the recent regulations on fortified foods, as well as on nutrition and health claims. The trend has been established: in the foreseeable future major pieces of EU horizontal food law are likely to be adopted by means of EU regulations, while directives will be the preferred format for vertical food laws.

### ***23.7.3 EU Consumer Rights Directive***

The European Commission has repeatedly pointed out that rules on consumer protection differ across the EU, and the level of consumer protection varies depending on the will of each member state to implement these rules. It has suggested that the fragmented nature of existing consumer protection legislation across EU member states has stunted the growth of cross border trade. Businesses seeking to export across Europe currently face the cost of interpreting up to 27 different regimes whilst consumers, unaware of their local rights within each member state, tend to stick with familiar domestic retailers and potentially lose out on the greater choice and lower prices that may exist in a more competitive pan-EU marketplace. The Commission has therefore seen minimum harmonization, on which directives regulating various aspects of consumer protection are based. Following a review of the Consumer Acquis,<sup>21</sup> the Commission presented a proposal for a directive on Consumer Rights in 2008. As a means of allaying this anomaly, the directive suggested maximum harmonization for consumer protection in four existing EU directives relating to unfair terms in consumer contracts, distance and doorstep selling, guarantees, and consumer sales. These trends are to be juxtaposed with the more sustainable local farming and shortened supply chain movements, but a detailed discussion thereof is beyond the scope of this chapter.

The ambitious scope of the proposal proved unacceptably wide, however. It encountered stiff opposition from many member states, particularly with regards to consumer sales, as maximum harmonization in this case would have actually reduced consumer protection in some states.<sup>22</sup> As a result, the scope of the directive was significantly reduced before being approved by the European Council in 2011. While the directive maintains maximum harmonization in order to standardize consumer protection regimes in all member states, it now only repeals two existing

---

<sup>21</sup>Green Paper on the Revision of the Consumer Acquis in 2007.

<sup>22</sup>Where the current minimum harmonization standard had been exceeded, a maximum approach would have led to an undesirably lower standard.

directives: the Distance Selling directive (97/7/EC), and the Doorstop Selling directive (85/577/EC).

At times, consumer legislation—such as the Unfair Commercial Practices directive—may be introduced as a maximum harmonization measure. As the proposed Consumer Rights directive demonstrates, however, more often than not the principle of shared competence between the Union and the member states applies in the area of consumer protection, so EU legislative measures need to be justified as necessary for the smooth functioning of the internal market.

Along similar lines, the Commission proposed an optional common European sales law to facilitate cross-border trade by offering a single set of rules for cross-border contracts. The proposal, however, was watered down in legislative discussions with the Council and the European Parliament. It has now been limited to distance contracts—notably online contracts—and, once again, issues over maximum and minimum harmonization were at the fore during the passage of this proposal through the EU legislative process.

## 23.8 EU Food Laws

No such debates over maximum v. minimum harmonization are heard when food legislative proposals are placed before the Council or Parliament. In addition, the number of legislative proposals adopted in the food area has increased immeasurably since the BSE crisis days in the late 1990s. In 1995, there were just five EU food laws; that number rose to 21 in 1996 and was at 117 in 2012. In 2013 alone, the EU adopted 130 food laws.

By contrast, there were only a few laws in the consumer protection area adopted in any 1 year from 1995 to 2013. This difference shows how EU food law has in many ways overtaken EU consumer law as the most important component of the EU's *acquis communautaire*.

Given the large number of EU food laws now being adopted, have member states or the European Parliament expressed unease about this increase? The answer appears to be no. In fact the only time member states have been concerned is when legislative proposals cover the official control of foodstuffs. Thus, the reason for such concerns is that member states are afraid that new EU provisions might force them to re-organize the nature and frequency of their official food controls. It follows that, the recent tranche of Commission proposals following the horsemeat scandal demonstrate this clearly: one proposal, for instance, is for a new regulation to replace EU Regulation 882/2004. This new regulation requires that official controls be performed to ensure compliance with feed and food law, as well as animal health and animal welfare rules. Despite the added administrative burden that such regulations may place on member states, they do not appear to be overly troubled by the rising adoption of food laws by the European Parliament.

Member states and the European Parliament were concerned about the inclusion of provisions to introduce mandatory fees for all official food controls and give the

Commission power to introduce delegated acts in numerous areas without needing the approval of the Council or European Parliament. These concerns were not about maximum harmonization in the food area; rather, they were adaptations to the way in which the Commission aimed to regulate the food sector. The member states were not arguing that the Commission had no role to play in overseeing their official food controls. Instead, they were arguing against the introduction of mandatory fees.

In relation to legislation, there is a similar dynamic between member states and the European Parliament. The issue was not over too much legislation or the Commission's use of the subsidiarity principle. Instead, member states and the European Parliament wanted more input and oversight of any new laws—a view that is entirely logical for a functioning democracy.

## 23.9 Conclusion

It is clear from the previous discussion that when assessing the differences between EU Consumer Law and EU Food Law, consumer protection was not a major policy issue at the time of the establishment of the European Union in 1957, initially consumer protection measures were only introduced if they could be seen to assist in the smooth functioning of the Internal Market. The *Cassis de Dijon* ECJ case was crucial in establishing the “mutual recognition” principle, i.e. that a product, in particular a foodstuff, if permitted to be marketed in one member state must be permitted to be marketed in any other member state. Then, the BSE crisis was the catalyst for the establishment of a major body of EU Food Laws including the introduction of General Principles of European Food Law. Furthermore, EU consumer law has become the *Cinderella* body of law to EU food law consisting of a few legislative proposals every year compared to approximately 150 food related laws in any 1 year. Finally, EU food laws are always introduced as maximum harmonization measures unlike EU consumer laws where there continues to be debates amongst member states as to whether they should be minimum or maximum harmonization measures.

# The Problem of Food Waste: A Legal-Economic Analysis

Harry Bremmers and Bernd van der Meulen

**Abstract** This chapter reviews, building on legal-systematic and economic analysis, the origins for food waste vested in food law and states possible remedies. Several causes are identified: a policy of ‘zero-tolerance’, food information requirements, bans on use of hazardous materials, a policy of ‘structural precaution’ and strict top-down plant pest controls. In all of these, uncertainties as to how to behave and what the real risks are seem to play a key role in the early discard of consumable foodstuffs. Solutions can come from technical, legal as well as social sciences. In food law and policy, rule-makers should be more aware of the adverse effects of requirements on businesses that foster food safety. Technical sciences may provide solutions through nano- and it-innovations. From social sciences, it can be learned what factors induce humans to overemphasise risk exposure. Moral issues are connected to possible solutions, especially to certain potentially hazardous new techniques (like nanotechnology) and the acceptability to nudge, channel and restrict free human will and choice to reduce the waste stream.

---

Dr. H. J. Bremmers is associate professor at the Law & Governance group of the Social Sciences department of Wageningen University. He is lawyer and economist. He publishes and does research at the intersect of food law and economics. Prof. Dr. B.M.J. van der Meulen is professor of Law and Governance at Wageningen University. This contribution builds further on previous publications of the authors in official reports to the Dutch government on food waste, its causes and prevention. Especially in Annex 1 of *Verminderen van Voedselverspilling* (Transl.: *Reduction of Food Waste*) by Harry Bremmers, Report/LEI 2011-014, The Hague, the Netherlands, (2011); and *Houdbaarheidsdatum: Verspilde moeite* (transl. *Durability dating: a waste of effort?*), section 3.1, by Harry Bremmers and Bernd van der Meulen, Wageningen UR Food & Biobased Research, Wageningen, the Netherlands (2012).

## 24.1 Introduction

Food waste is a major policy concern in the European Union, in the USA, and internationally. The Food and Agriculture Organization of the United Nations (FAO) defined food waste in 1981 as “wholesome edible material intended for human consumption, arising at any point in the food supply chain that is instead discarded, lost, degraded or consumed by pests.”<sup>1</sup> Delimitation in regional legal environments may be more or less narrow depending on the practical or legal context of the concept.<sup>2</sup> Food waste may occur anywhere in post-harvest food supply chains. In post-harvest stages, or prior to consumption, the wasted materials are called “food losses.” Behaviour by retailers and consumers may result in “food waste.” In the latter case, food waste has a narrow meaning as processors’ activities are outside its scope.<sup>3</sup>

In this chapter the expression “food waste” depicts commodities that can be transformed or used to serve nutritional needs, but have lost this potential for economic, food safety or personal reasons. For the reason that processing is a key source of wasted food, such activities are viewed within the scope of the definition. The lack of a common delineation of the concept may limit the comparison of food waste over time and between regions. However, it only slightly hampers the search for factors in the legal-institutional environment that contributes to the early abandonment of foodstuffs. A common core in the concept is the image of the discarded food product in certain stages of food supply chains. Food waste may be given an inferior destination along the scale from food to feed, fertilizer, fuel, fire<sup>4</sup> and (land)fill.<sup>5</sup>

Why is food waste a problem in the first place? First, the occurrence of food waste threatens the realization of the “right to adequate food”<sup>6</sup> of humans, as nutrients are lost or simply not used for human consumption. The problem of securing food supply goes back to ancient times when there was ineffective storage, draughts, insect and rodent plagues, or other causes related to the governance of the food supply chain. However, the deliberate discarding of food must have been relatively rare due to the general food scarcity and substantive efforts to nourish growing populations.

---

<sup>1</sup>FAO (1981), cited in Parfitt et al. (2010), note 3. For the purpose of the EU waste Directive 2008/98/EC ‘waste’ has as definition: any substance or object which the holder discards or intends or is required to discard (Article 3 point 1. of the Directive).

<sup>2</sup>For instance including also edible material used as feed for animals or by-products that are not used as human food and/or over-nutrition.

<sup>3</sup>Parfitt et al. (2010), pp. 3065–3081.

<sup>4</sup>Under the ‘f’ of fuel, the biomass is used for energy. Fire, by contrast, is used to destroy.

<sup>5</sup>Vogdlander et al. (2001), pp. 344–355. These f’s are based on the Order of Preferences of EoL Solutions in The Netherlands (‘Ladder of Lansink’); Also: Article 4 of Directive 2008/98/EC of the European Parliament and of the Council of 19 November 2008 on waste.

<sup>6</sup>van der Meulen (2004); Hospes (2008), pp. 246–263; Wernaart (2010).

In contrast, nowadays the global population exceeds 7 billion and is estimated to grow to 9.6–11 billion by 2050.<sup>7</sup> It is estimated that globally yearly 1.3 billion tonnes of food destined for consumption by humans is lost at pre-marketing stages or wasted at retail or by the consumer. This food, if wasted food were included in the supply chain, would be enough to feed the world population.<sup>8</sup> It could also supply future generations with adequate food.

Second, from an economic perspective, wasted food represents financial losses. As losses occur in different phases of the supply chain—processing, retail, consumption—such losses are borne by multiple stakeholders. In a highly developed society, losses due to food waste are carried downstream. However, losses in developing countries occur primarily upstream of the supply chain for reasons.<sup>9</sup>

Third, for the reason that food production, of all human activities, has the biggest impact on the climate, next to transport and housing,<sup>10</sup> wasted food is causally connected to the depletion of natural resources and thus to long-term unsustainability. The prevention of waste is perfectly in line with EU goals as stated in the Europe 2020 strategy that fosters smart, sustainable and inclusive growth.<sup>11</sup>

### ***24.1.1 Food Law as a Cause and Measure Against Food Waste***

Notably, food law is an important *cause* for food waste. Precautionary measures are taken globally to avoid food risks. The USA and European Union are among the strongest risk avoiders.<sup>12</sup> In this context, the “wickedness” of food waste lies in the fact that such waste is considered socially and morally unacceptable, while the reduction of food waste might jeopardize economic<sup>13</sup> and food security goals. For instance, prevention of food waste, or its reuse, induces costs and will deplete other resources while the consumption of larger parts of the potential food stock, like animal by-products, might jeopardize food safety. The problem is apparently wicked<sup>14</sup> in the sense that more safety is inextricably connected to the increase of food waste; and thus the attainment of one goal is hampering the other.

<sup>9</sup>Gustavsson et al. (2011).

<sup>10</sup>Hall et al. (2009). The major part of freshwater is used to produce food; calculations show that about 25 % of freshwater is used inefficiently due to food waste; Kumm (2012), pp. 477–489; European Commission Joint Research Centre (2010).

<sup>11</sup>Communication from the Commission (2010).

<sup>12</sup>Wiener and Rogers (2002), pp. 317–349.

<sup>13</sup>Fischhoff et al. (1978), pp. 127–152.

<sup>14</sup>See on the origin of this concept: Skaburskis (2008), pp. 277–280.

Accordingly, the EU and the USA experience such controversial aims more than less developed regions. As indicated in a previous chapter, in affluent societies food waste occurs most in post-consumer stages.<sup>15</sup> To reduce food waste it may be necessary to nudge, channel or restrict the free choice of individuals and thus limit the exercise of fundamental rights. These opposite goals make the reduction of food waste even more of a “wicked problem.”

The structure of food law is heavily influenced by regional and global food scares.<sup>16</sup> From an EU perspective, the BSE-crisis<sup>17</sup> is the most prominent. On a global level, the melamine scandal of 2008 had significant influence on policy choices, especially as to the traceability requirements and the protection against unsafe imported foods.<sup>18</sup> Food scares thus induce intensified actions to protect the consumer.<sup>19</sup> As a result of the BSE-crisis, the interests of the consumer were positioned in the center of food legislation, while the responsibility and burden to provide safe food is put on the shoulders of food businesses. To protect the consumer from unsafe food, safety enhancements may induce exaggerated risk avoidance measures and lead to food waste. Not only may the substantive content of rules cause food waste, but also their interpretation and imposed sanctions and liabilities. As to the content, earlier research has shown that food business operators in the EU perceive food law requirements to be clear, but the perceptions are not confirmed by practical evidence.<sup>20</sup> Moreover, international differences exist such as hygiene, labelling and processing requirements, which may not only impede international trade, but also lead to wasted food due to rejections at border control and removal of foods considered dangerous or unfit for human consumption.<sup>21</sup>

The threat of being sanctioned, held liable or publicly scrutinized induces business operators to take precautionary measures in their processing activities and follow or surpass publicly set standards (see below). This chapter addresses the major legal sources of food waste, the trade-off between food waste and safety from a legal-economic point of view, and states policy alternatives to mitigate the problem of food waste.

---

<sup>15</sup>Parfitt et al. (2010), pp. 3065–3081.

<sup>16</sup>In the EU, the BSE-crisis led to the issue of a White Paper on Food Safety by the European Commission in 2000, which initiated a cascade of European legislation to regain consumer confidence. The main EU law in this respect is the General Food Law (178/2002), which contains principles of food law and food safety, adopts risk analysis including assessment, and installs a rapid alert system for food and feed.

<sup>21</sup>Clapp (2005), pp. 467–485.

## 24.2 Legal Triggers of Food Waste

Legal requirements induce food waste as they limit the attitudes and actions of actors in food supply chains. Almost all food legislation may cause food waste. However, some laws may have more severe impacts compared to others. In the next sections, several legal triggers for food waste are reviewed,<sup>22</sup> specifically limits as to contaminants and residues in food products, strict pre-market approval requirements, food information law, plant pest controls and the occurrence of animal by-products and legal barriers to their further use.

### 24.2.1 Contaminants and Microbiological Hazards

In the EU, contaminants<sup>23</sup> are considered substances that have not been intentionally added to food. Instead, they are present due to deliberate processing steps, like production, medical treatment of food producing animals, and/or environmental contamination. In the USA, the EU, as well as in the Codex Alimentarius, a fundamental principle is that food exceeding a level of contamination which is unacceptable to public health may not be placed on the market, or, if already marketed, must be removed immediately.

For example, in cases C-129/05 and C-130/05 of the Court of Justice of the European Union (CJEU) contaminated shrimp, rabbit and poultry originating from China were at issue after being detected at the border. The CJEU ruled that the lot had to be destroyed because of zero-tolerance, despite the fact that only low levels of contaminants had been found (parts per billion). The fact that the food is potentially hazardous was considered reason enough to destroy it instead of sending it back to its origin. This is questionable on social and economic grounds.<sup>24</sup>

Maximum tolerances, including analytical detection limits and limits for the same contaminant in different foods may be set, but regional differences are immanent. In other cases, good practices have to guarantee that contaminant levels are as low as reasonably achievable. Authorities may check agricultural imports from third world countries at border posts for salmonella, aflatoxin, or pesticide residue. In 2012, the EU rapid alert system<sup>25</sup> gave 1467 border control notifications resulting in 88.5 % of the cases in blocking the fruits and vegetables from entering the market.<sup>26</sup> Worldwide, 50 % of all fruits and vegetables are wasted.<sup>27</sup>

<sup>22</sup>Waarts, et al. (2011).

<sup>23</sup>The Council of European Communities (1993).

<sup>24</sup>Lelieveld and Kenner (2007), pp. S15–S19.

<sup>25</sup>This is basically a system that is designed and installed to share information between risk managers in the European Union; it was established in the General Food Law, 2002.

<sup>26</sup>Van Boxtael et al. (2013).

<sup>27</sup>FAO (2010).

Domestic products may also be taken off the market out of safety concerns, as for example the Dutch “potato peel”-case of 2004 shows. Products from dairy farms using factory potato peels as animal feed appeared to be contaminated with dioxin originating from clay that was used in the process to sort potatoes. Although they did not contain dangerous levels of dioxin, foods such as milk, and feed were destroyed.

For many hazardous substances, maximum levels have been set conservatively in the EU, compared to the Codex Alimentarius and in other countries. As already indicated, in some cases zero-tolerance is the standard.<sup>28</sup> Farms holding pigs that are treated with antibiotics before slaughter will have to retain the animals for some weeks with higher feeding and housing costs as a consequence. Hence, businesses are confronted with a choice between delivering pigs with remnants of antibiotics and taking the risk to be fined and losing the license to produce, or to wait and accept losses. As long as the extra costs exceed the benefits, farms may be inclined to remove animals altogether, on pure economic grounds.

A case that illustrates the waste impact of contaminants in food is the European horsemeat fraud crisis. Apart from the fact that horsemeat had been marketed as beef in several European countries, in the Netherlands, two reasons were put forward to order the withdrawal of 50 million tonnes of meat product. The first was that some meat might have originated from horses treated with phenylbutazone (buta). Buta is a painkiller that in certain doses may threaten human health. However, the likelihood is very low.<sup>29</sup> The other reason was that the meat might be unsafe to consume because the traceability system had failed; tracing the meat back to animals approved for slaughter could not be assured due to fraudulent practices.

Some substances are considered unsafe by definition, like aflatoxin. Fungi may develop such toxic substances<sup>30</sup> during transport in the bulk of cargo ships, especially when they originate from warm or moist countries or countries with inferior hygiene systems. Border control agencies in the EU, US, and other parts of the world are well acquainted with this risk and examine shipped cargo. They are a major cause of food destruction. There are technical possibilities to reduce the aflatoxin content, but this brings about extra costs. Processing facilities may not be

---

<sup>28</sup>See Regulation (EC) 470/2009 Laying down Community procedures for the establishment of residue limits of pharmacologically active substances in foodstuffs of animal origin and the EU Commission’s Implementing Regulation of 22 December 2009 on pharmacologically active substances and their classification regarding maximum residue limits in foodstuffs of animal origin, table 2.; van der Meulen (2009), specifically ch. 5.

<sup>29</sup>Buta was medicated for racehorses, which in the EU may enter the meat supply chain as horsemeat, contrary to the situation in the USA.

<sup>30</sup>Bennett and Klich (2003), pp. 497–516. This is a major source of border rejections in The Netherlands. The term was initiated in 1962 as a result of a veterinary crisis under turkeys in England, causing disease and death at thousands of animals. The ‘mycotoxin family’ includes a wide range of toxic fungi.

available in every country.<sup>31</sup> In 2013, the number of notifications in the European RASFF was 341 cases, with a total record amount of 642 notifications, due to pathogenic substances in meats and molluscs.<sup>32</sup>

### 24.2.2 *Pre-Market Approval*

The previous section brings us to the general question of whether food is considered unsafe, unless proven safe, or, in the alternative, safe, unless proven unsafe.<sup>33</sup> For a considerable number of foods the first is true in the European Union. Pre-market approval requirements are more common in the European Union compared to other countries, like the USA, for additives, enzymes, genetically modified (GM)-products and novel foods. In the USA, “GRAS”-exemptions<sup>34</sup> or notifications to the FDA are sufficient. While the general understanding is that the marketing of food is unbounded, a restrictive policy is in place in the EU. Pre-market restrictions may cause border rejections<sup>35</sup> and recalls of food for procedural reasons rather than for food safety concerns. In the EU and in a number of other countries, pre-market approval is mandatory for a range of innovative products such as food additives, GM foods and other novel foods.<sup>36</sup>

In the EU, foods are considered novel when new ingredients, such as fungi or algae, are brought to the market that have not been consumed in the EU to a significant degree<sup>37</sup> after the Novel Foods Regulation came into effect 15th May 1997. Not only the chemical composition of a food, but also a new production method that influences the structure of a food<sup>38</sup> can be reason enough to consider a food or ingredient novel. In the EU, foods that are considered novel or have novel ingredients are considered unsafe and banned from the market unless approved. This precautionary measure may be called ‘structural precaution.’<sup>39</sup> This term underlines that precautionary measures are not taken temporarily to prevent hazards from becoming immanent during a period of scientific assessment of their nature, but are structural. Pre-market approval requirements close the border to all foods

---

<sup>33</sup>van der Meulen et al. (2012), pp. 453–473.

<sup>34</sup>This stands for: Generally Recognized As Safe.

<sup>35</sup>Schoss (2011).

<sup>36</sup>In Regulation (EC) 258/97 concerning novel foods and novel food ingredients.

<sup>37</sup>See the guidance document on [Human Consumption to a Significant Degree](#) (n.d.).

<sup>38</sup>Like nanotechnology, see Van der Meulen et al. (2014).

<sup>39</sup>van der Meulen et al. (2012), pp. 453–473.

until risk assessment and authorization have taken place.<sup>40</sup> If foods are “substantially equivalent” to traditional products, a mild admittance procedure is applicable. However, in the EU unlike in the USA, “substantial equivalence” does not provide any exemption to GM-based foods. In the USA, “substantial equivalence” can be a reason for considering a food GRAS and granting it access to the market, whether it is a food derived with genetic modification or not. If a product containing GM material is substantially equivalent to existing products, measured by its chemical properties, pre-market permissions are not mandatory in the USA. In the EU, in case foods and also feed contain genetically modified organisms (GMOs), or have been made from GM-material, extensive and time-consuming authorization procedures are required. Extensive authorization requirements form a barrier to market entrance<sup>41</sup> and also to the development of new and better foods and more efficient production processes. Moreover, it prevents the improvement of plant materials and animal stock and so contributes to food losses in upper stages of food supply chains and food waste in the post-harvest stages.<sup>42</sup>

All in all, improvements of crops and products made thereof may contribute to better utilizing available resources. However, the more GM products circulate in international transport, the higher the probability that a contamination of non-gmo food or feed will take place. Contaminations will induce food losses at EU borders and on the EU market.

### ***24.2.3 Food Information Requirements***

In determining whether a food is unsafe, not only is its physical condition important but also its intended use. A human’s physical condition may pose restrictions on food consumption. The information on food packaging provides clues on whether a food is safe to consume for certain individuals. Regional differences in mandatory food information may lead to barriers in international trade and induce border rejections. Comparing the European food information system with the USA and the Codex Alimentarius remarkable differences can be observed, which possibly lead to the removal of potential foods from supply chains and markets.

Products that carry invalid labels are taken off the market in the USA, where such products are considered misbranded, as well as in the EU, where wrong food information is considered misleading for the consumer. These foods are considered

---

<sup>40</sup>This can be exemplified with the long-grain rice dispute between the USA and the EU, the EU closing its borders for unauthorised genetically modified rice (2006 and beyond).

<sup>41</sup>Grossman (2009), pp. 257–304.

<sup>42</sup>Examples are the eradication of oomycetes (causing among others ‘potato disease’) and the improvement of the resilience of field crops against natural impact.

adulterated or regarded as genuinely unsafe. Unsafe foods may not be brought to the US or EU market.<sup>43</sup>

### 24.2.3.1 Allergens

Wrong or absent information of allergenic substances in foods is a major cause for considering a food unsafe. The Codex Alimentarius<sup>44</sup> requires revealing nine categories of allergens on the package or container of food. In the EU, the Food Information Regulation 1169/2011 in Annex II<sup>45</sup> requires highlighting the ingredient list for 14 categories. Beyond this extended list, industry standards may further add to regulation; for instance obliging to indicate possible cross-contamination during processing. In any case, foods with wrong or lacking allergen information may not enter or will be taken off the market. To reduce food-related risks, the industry may discard foods early depending on the probability of being held responsible or liable (see below).

### 24.2.3.2 Nutrition Labelling

Nutrition labelling requirements differ considerably across regions. It may be voluntary in one region and obligatory in another. Until 2016, nutrition labelling remains voluntary in the EU, while it has already been mandatory in the USA for years, as well as in a considerable number of other countries.<sup>46</sup> Comparing the USA with the EU, differences will remain even after 2016 as to fiber, cholesterol, the format and the scope. Such differences induce uncertainty for exporters and lead to refused imports at border posts. Consequently, this may induce destruction of foods if repatriation is too costly.

### 24.2.3.3 Expiration Dates

With the expression “expiry dates”<sup>47</sup> or “expiration dates,” the indications on the package are meant as to the period in which consumption should preferably take

---

<sup>43</sup>Article 14 General Food Law, 178/2002.

<sup>44</sup>Codex General Standard for the Labelling of Pre-packaged Foods; Codex Stan 1-1985 (Rev. 1-1991), 4.2.1.4.: Cereals containing gluten; i.e., wheat, rye, barley, oats, spelt or their hybridized strains and products of these; crustaceans and products of these; Eggs and egg products; Fish and fish products; Peanuts, soybeans and products of these; Milk and milk products (lactose included); Tree nuts and nut products; and Sulphite in concentrations of 10 mg/kg or more.

<sup>45</sup>The European Parliament and of the Council (2011). Regulation (EU) 1169/2011 on the provision of food information to consumers.

<sup>46</sup>Hawkes (2004).

<sup>47</sup>Soethoudt et al. (2012), section 3.1, pp. 7–15.

place.<sup>48</sup> In the EU, it is mandatory to provide either a use-by date or a best-before date on pre-packaged foods.<sup>49</sup> Food has to be safe, and if the absence of expiry information puts the consumer at risk, a firm will be held responsible for the consequences in the EU as well as the USA.

The date of minimum durability, or the best before-date, is the date until which food remains marketable and retains specific characteristics such as taste, colour and nutritional properties when properly stored.<sup>50</sup> It is perceived as a quality indication, as it informs the buyer about the period in which they would maximally benefit from the product. The use-by date is a safety limit. Beyond the indicated time, a food is legally considered unsafe.<sup>51</sup> Surprisingly<sup>52</sup> in EU law, the two types of dates are alternative mandatory indications.<sup>53</sup>

The EU Regulation 1169/2011 regulating food information to consumers (FIC) is clear about the fact that the food business operator under whose name a food appears on the shelves<sup>54</sup> is the primary responsible actor for food information.<sup>55</sup> The manufacturer and/or the retailer that markets a food under a private label may experience uncertainty as to the appropriateness of the labelled expiry date. Uncertainties as to the durability of foodstuffs are a cause for food waste. Food waste causes follow three routes<sup>56</sup>: Businesses may avoid potential risks including private liability, public fines and/or scrutiny by setting and estimating expiry dates conservatively; Consumers may discard food early as they interpret expiry dates wrongly<sup>57</sup>; Public authorities contribute to uncertainties by requiring a choice between the use-by-date and the best-before-date as EU law exemplifies.

The latter obliges to make a wicked choice between the information about food safety and food quality. The business operator, most probably the manufacturer of

---

<sup>48</sup>Next to this, in certain cases EU law obliges to indicate the date of freezing, while in other jurisdictions (as delineated in the Codex) also a date of manufacture, of packaging and/or the sell-by-date may have to be indicated.

<sup>49</sup>In the EU, some exemptions apply; See Annex X to Regulation (EU) 1169/2011.

<sup>50</sup>Codex Stan 1-1985 (rev. 1-1991) point 2; similar in Article 2 (2) (r) of Regulation (EU) 1169/2011.

<sup>51</sup>In accordance with Article 14(2)-14(5) of Regulation 178/2002.

<sup>52</sup>As 'quality' and 'safety' are completely different categories and almost any food (with some exemptions, like sodium) becomes unsafe in due time.

<sup>53</sup>Article 24 of the FIC concerns the minimum durability date, 'use by' date and date of freezing. Under par. 1 it is stated: In the case of foods which, from a microbiological point of view, are highly perishable and are therefore likely after a short period to constitute an immediate danger to human health, the date of minimum durability shall be *replaced* by the 'use by' date (italics by authors).

<sup>54</sup>If the operator is not established in the Union, the importer into the Union market is responsible. 'Food business operator' has to be interpreted broadly, as defined in the General Food Law (EC) 178/2002. 'Food business' means any undertaking, whether for profit or not and whether public or private, carrying out any of the activities related to any stage of production, processing and distribution of food.

<sup>55</sup>Article 8 (1) of the FIC.

<sup>56</sup>Waarts et al. (2011).

<sup>57</sup>See Waarts et al. (2011) and Soethoudt et al. (2012) Annex 1 and section 3.1, respectively.

the product, which also packs it, not only has to choose the kind of date indication, but also the expiry time. They may be held liable if wrong dating induces damages to the consumer. In many jurisdictions the retailer of a foodstuff, next to the manufacturer, will be held liable in case of damages.

Setting expiry dates is a managerial act. Monetary considerations play a role as well. Liability-related and market-related factors influence responsibility. Short use-by dates reduce the probability of occurrence and effects of an incident, but also make products less valuable to market, as production batches are smaller and the shop display-time is shorter. While general court cases are limited in number,<sup>58</sup> collective non-legal actions, like naming and shaming, may negatively impact the reputation of the company and therefore indirectly bring about financial losses. The fear for loss of image is an important factor inducing conservative expiry dates and thus the early discarding of food.

On another note, conservative estimates of the date of minimum durability may lead to food waste, as wrong dates give ground for consumers to seek legal action. For example, using a best-before date where a use-by indication would have been appropriate. A product with a wrong date may be considered defective. In that case, product liability applies. Public authorities may impose penalties on improper or fraudulent acts. Strangely, despite the fact that most foods will perish gradually no matter the expiry date they carry, with a best-before date the responsibility to assess a food's "fitness for consumption" is transferred from the producer to the consumer. However, whoever carries the damages, the inherent uncertainties as to the micro-biological status of foods will induce conservative strategies in marketing and/or consumption. Especially food products which by very nature have credence attributes<sup>59</sup> are subject to exaggerated risk avoidance.<sup>60</sup> A significant portion of food waste in western countries can be traced back to legal uncertainties as to the consequences of consuming foods that might be dangerous to health.

#### 24.2.3.4 Claims

In accordance with the Codex in the Nutrition and Health Claims Regulation<sup>61</sup> (NHCR) of the EU, a "claim" means "any message or representation, which is not mandatory under [Union] or national legislation, including pictorial, graphic or symbolic representation, in any form, which states, suggests or implies that a food has particular characteristics." Just like in the USA,<sup>62</sup> a claim has a broad scope and encompasses information transferred via brand names, advertisements or online

<sup>62</sup>As regulated in the Nutrition Labelling and Education Act (1990).

webpages.<sup>63</sup> In the EU, all claims have to be authorized in advance before they can be used by businesses for marketing purposes. In the USA authorization is limited to health claims, i.e., disease risk reduction claims. In the EU, strict requirements, including substantiation with generally accepted scientific evidence,<sup>64</sup> have been put in place. The scientific assessment is carried out by an independent and centralized scientific entity (EFSA). In the USA, the FDA carries out this task.<sup>65</sup>

Businesses may easily make mistakes in applications for authorization of claims and, from the perspective of food waste, in the use of authorized claims for their marketed foods. Sources for errors with respect to claims are, for instance:

- Authorization has not been granted yet;
- Presenting legitimate claims in a way that is not allowed (for instance a suggestion is made that a disease is cured, while the claim has the reduction of a disease risk as an objective);
- Stating claims without the provision of the necessary additional information (for instance a disclaimer (USA), or information on the intake that is necessary to realise the promised effect);
- An allowed claim is used for a product that contains vitamins, minerals or other substances in amounts that cannot bring about the promised effect (Article 5 of the NHCR).

Where the requirement for authorization in the EU is “generally accepted scientific evidence”,<sup>66</sup> the analog condition for authorization of a health claim in the USA is “significant scientific agreement” among experts. This more lenient position is further softened by US case law.<sup>67</sup> As a protection to the fundamental freedom of speech it is prohibited for the FDA to ban a potentially misleading health claim altogether if a disclaimer can compensate for the potentially misleading character of the claim.<sup>68</sup> The case law triggered a policy change of the FDA, considering credible evidence and a disclaimer sufficient for legitimate use of what we know now as a “qualified health claim.” The risk of unlawful use of a claim may be bigger in the EU compared to the USA, but misrepresentations in both regions have as a consequence that a product should be taken off the market immediately, or even may not enter the market on beforehand, for instance is rejected at the border. Since repackaging or repatriation of products may be costly, wrong use of claims contributes to food waste.

#### 24.2.4 *Phytosanitary Measures: Plant Pests and Pest Control*

Anyone who has passed the Australian or US borders from Europe has possibly experienced the removal of foods to protect domestic plants, livestock and wildlife from being infected with alien organisms. Phytosanitary measures are taken to avoid plant diseases affecting crops or the local ecology. The growth of international trade and traffic increases the risk of spread of foreign hazardous species.<sup>69</sup> Plant pests are often hidden attributes, of which the seller may be better informed than the buyer. Information asymmetry and high transactional costs for bridging differences in levels of awareness<sup>70</sup> between public authorities, buyers and sellers of plants have stimulated the development of a strict top-down governance system.<sup>71</sup> However, the costs may outweigh the benefits of improved controls in terms of waste of potential foods and regulatory burdens.

The present plant protection regime, of which the foundation is laid down in the International Plant Protection Convention (IPPC), leaves little room for giving an alternative destination for infected plant material. It requires chain orchestration, as well as information-technological innovations, to create more transparency<sup>72</sup> and in doing so, to avoid destruction of potential foodstuffs. Improved technology such as tracking and tracing of individual plants or plant material, storage of information in ERP-systems, intelligent packaging and improved DNA-identification methods can improve the detection of plant pests. Then there would be potentially no need to destruct healthy plants, herbs, spices and other plant products, as a response to uncertainties with respect to the existence of plant pests.

#### 24.2.5 *Hazardous By-Products*

By-products are foods or remnants thereof for which the production process is not intentionally set up, but which remain after processing or consumption of food. The recycling of by-products, especially of animal origin, is strictly regulated in the EU and elsewhere. The spark for this was the Bovine Spongiform Encephalopathy (BSE) crisis. Until the end of the last century, it was common to recycle animal by-products, such as sheep bones, swill, or brain tissue, into ruminant feed.<sup>73</sup> In the EU, business practice was governed by imposing restrictions on the reuse of animal protein, the most memorable of which is a ban of reuse of protein from ruminants in feed for animals.<sup>74</sup> Article 7(1) of Regulation 999/2001 establishes a prohibition of

<sup>69</sup>Dehnen-Schmutz et al. (2007), pp. 527–534.

<sup>70</sup>Lansink (2011), pp. 166–170.

<sup>71</sup>Henson and Traill (1993), pp. 152–162.

<sup>73</sup>van Raamsdonk (n.d.).

<sup>74</sup>A prohibition of ‘cannibalism’; see Article 11 of Regulation 1069/2009.

the feeding to ruminants of proteins derived from animals. Annex IV to this regulation aggravates the requirements, such as to feeding tri-calcium phosphate of animal origin to ruminants, or alleviates them, for instance with respect to fish feed used for farming non-ruminants. Specified risk-material of animal origin, like brain, eyes and spinal cord of bovine animals older than 12 months, originating from a country or region with possible BSE-risk must be removed in a prescribed way<sup>75</sup> and further kept out of the feed chain. Regulation 1069/2009<sup>76</sup> mentions categories of animal by-products that may not be consumed by humans due to control BSE-related risks and also because of dangerous levels of contaminants like dioxin or pesticide residues. It was not intended to expel all animal by-products from supply chains, but to guarantee a safe use in chemical, pharmaceutical, or feed applications and for the natural environment for humans and animals. In the EU, such waste streams are classified according to their risk profile. On the basis of this classification, some forms of food waste, like from catering services or households, may not be recycled as feed since it contains a mixture of hazardous and safe material. In the end, separating hazardous from safe material is a technological and behavioural problem. Solving this problem would reduce waste streams.

### 24.3 Legal-Economic Analysis

To keep a “license to produce,” business operators will possibly show prudence to a level that surpasses publicly set precautionary measures. Uncertainty about the probability and legal consequences of bringing unsafe food to the market may induce the creation of multiple margins of safety at the importer’s and/or farmer’s level, the level of the manufacture, as well as at the level of the retailer and/or household. Figure 24.1 supports this argument.

Referring to Fig. 24.1, we will provide arguments that causes for food waste origin from excessive private and public safety margins, as a response to uncertainties on the required levels of food safety. We view food safety as a dimension of food quality. Costs of quality consist of costs of controls (prevention and appraisal costs) and failure costs (costs of non-compliance).<sup>77</sup>

Internal failure costs<sup>78</sup> as a result of product checks and other quality controls, can be ranked under prevention costs as they are intended to protect markets and consumers against foodborne diseases.<sup>79</sup> It is also realistic to suppose that in order

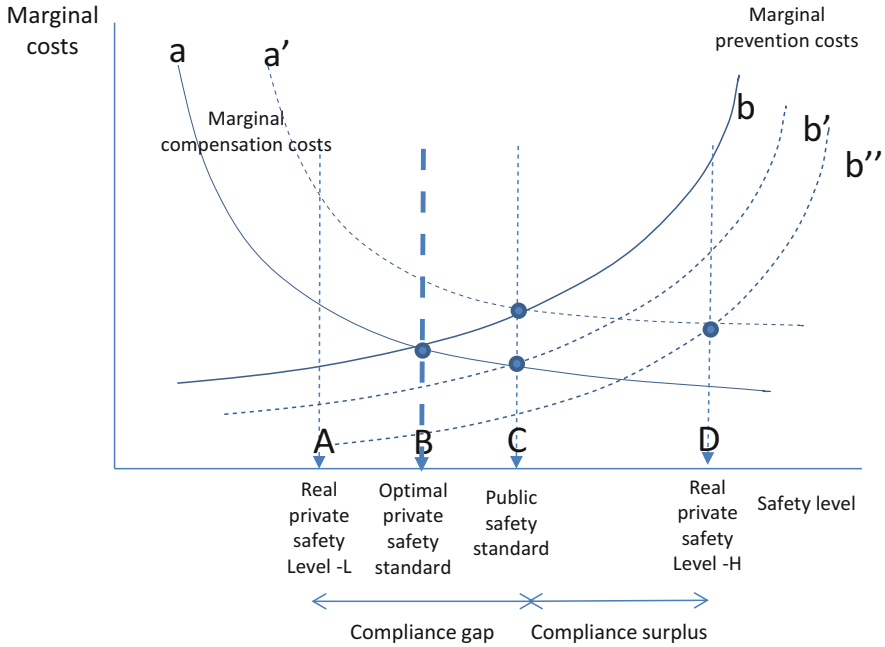

<sup>75</sup>Article 8 of this Regulation, Annex V.

<sup>76</sup>The European Parliament and of the Council Regulation (EC) 1069/2009 laying down health rules as regards animal by-products and derived products not intended for human consumption.

<sup>77</sup>See Feigenbaum (1991).

<sup>78</sup>Gyrna (1999), Williams et al. (1999).

<sup>79</sup>Tobers et al. (1996), pp. 1297–1301. It should be mentioned at this point that not only extra costs are made in manufacturing firms, but also for instance by retailers which lower the shelf time of products to assure safety (see Sect. 24.2).

**Fig. 24.1** The trade-of between marginal costs of prevention of safety risks and compensation once safety risks have manifested themselves in damages. Extra prevention costs (improved safety measures) induce lower levels of compensation (like financial compensation for injuries). *Dotted curves* represent higher marginal compensation costs (curve *a'*) and higher marginal prevention costs (curve *b'* or *b''*) respectively, compared to the initial optimal level of aspired safety (B)

to reduce risks and hazards to higher levels, these costs increase progressively, as marginal improvements of food safety will be harder to realize at higher levels of food safety.

Suppose that private law instruments can successfully be used by consumers to seek compensation of damages due to unsafe food,<sup>80</sup> with the absence of fines for trespassing public safety standards. In that case, the optimal level of food safety that businesses aspire is where marginal private compensation costs (curve *a*) equal marginal private prevention costs (curve *b*); that is the level depicted as B. Total marginal prevention costs are extra internal failure costs, including waste after inspection, testing and other quality controls, and other future-oriented prevention costs, like innovation in better products and process improvements, or the installment of an ISO-system.<sup>81</sup>

<sup>80</sup>If consumers would have to bear damages themselves they would over-exaggerate the risk and therefore apply margins of safety leading to early discard or recycling of foodstuffs. The social effects would be similar to the ones here elaborated.

<sup>81</sup>International Standards Organization system.

In the short run, due to pressures from non-commercial stakeholder groups and as a result of policy priorities, public safety standards may be stricter than private commercial stakeholders would strive for using economic measures (level C). Attained safety levels might even surpass public standards, depending on the level of risk averseness of a business operator (level D). For instance, William Edwards Deming, the founder of the plan-do-check-act cycle and one of the initiators of total quality management.<sup>82</sup> Unintentionally, with his emphasis on superior quality as the dominant strategic goal, this may have induced business attitudes to reject products with minor deficiencies rather than bringing them to market at lower prices. Moreover, loss of image and/or brand value may be stronger motivations for risk avoidance than the fear of liability. Risk avoidance might boost aspired standards to higher levels than publicly required.<sup>83</sup> In many cases private standards for food quality and safety, like GlobalGAP,<sup>84</sup> may be stricter than, compete with, or even replace publicly established norms. The legitimacy of such non-governmental contracts may be questionable,<sup>85</sup> due to the limited possibilities of businesses to enter the system or opt out after committing to it.<sup>86</sup> It induces cautious behaviour and thus discarding of food products that do not completely meet customer-designed delivery and process specifications. For instance, the detection of hormone use in beef production in the EU<sup>87</sup> may not only lead to refusal of delivered animals by slaughterhouses, but also of future deliveries. Detection could thus result in the loss of a “license to deliver.” Norms may vary across nations and sectors. For instance, in a similar situation, hormone use is considered safe and acceptable in the USA.<sup>88</sup>

Compliance surpluses due to risk avoidance will lead to premature removals of foods from supply chains. Compliance surpluses are not only induced by mandatory legal requirements, but also by private food quality standards. In the assessment of whether an inferior food should be transported back to its origin, repacked on the spot or degraded to a second-best destination. The transportation and operational costs of other options may be decisive.

Figure 24.1 indicates—with a shift of the curve (a) to ‘a + marginal fines’ (a’)—that the threat of public fines in case of violation of safety standards could induce businesses to comply in any case. The risk of being fined can induce extra internal failure costs in terms of wasted food (i.e., point C in Fig. 24.1). It also shows that

<sup>86</sup>For instance as a result of asset-specific investments or binding delivery contracts.

<sup>87</sup>In the Netherlands this is governed by the semi-public IKB-scheme (Integrated Chain Governance).

<sup>88</sup>McNeil (1998–1999), pp. 90–112. This has led to international trade conflicts, as a ban of added hormones in specifically beef may be considered a barrier to trade.

regulatory threats of increased costs and responsive action in combination with structural preventive measures (like product or process innovation) may induce higher safety levels and reduce the failure costs in future (point D in Fig. 24.1).

The analysis gains further complexity if the expected costs show a probability distribution, or are uncertain altogether. In that case, risk may be over-emphasized even stronger.<sup>89</sup> For small and medium sized businesses (SME) relying on a limited product portfolio and scarcity in resources, it is not feasible to reduce waste through innovation. Worldwide, the majority of food and drink businesses are SME, that is with less than 250 employees according to European standards. These might keep extra margins of safety to meet the uncertainties vested in the limited predictability of risks, which they cannot reduce with technical measures or investments. The “cognitive closeness” of a potential hazard, because of a recent food safety crises, may further provoke economically unjustified risk controls by private and public actors. European experience shows that risk managers defend such measures with reference to the precautionary principle.<sup>90</sup>

## 24.4 Conclusion

Food waste has many origins, one of which is food law. Western countries tend to overemphasize the quest for safety and avoidance of risks,<sup>91</sup> but the exaggerated quest for safety comes at a price. One of the main drivers for exaggeration of risks is behavioural uncertainty. Risk perception propellers are connected to each of the legal sources of food waste.

One important factor is zero-tolerance with respect to contaminants and residues. Technological progress will improve the detection methods to a level that prohibited content is signalled immediately. In earlier times, when zero-tolerance was introduced, detection of minor remnants was difficult, if not impossible. Zero-tolerance may induce safety measures *ad absurdum*, to the expense of the consumer who will ultimately pay higher prices.

Another factor is the occurrence of by-products and limitations as to their re- or alternative use. No one will object to measures that protect the consumer against diseases like Kreuzfeldt Jacob. However, the number of lethal cases in humans has

<sup>90</sup>Gollier et al. (2000), pp. 229–253. Precaution has found its place more in both jurisdictions, EU and American. Influences can be traced back to the Conference in Rio the Janeiro, the Rio Declaration: “where there are threats of serious and irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation”. In EU law (Article 7 of the GFL), cost-effectiveness has been supplemented by proportionality.

<sup>91</sup>Walker Wilson (2011), p. 120.

been surprisingly low. The fear for catching a disease with a probability that is a fraction of a chance of dying from pneumonia may not be sufficient to stand in the way of legitimizing the recycling of food waste. For instance, restaurant waste and household garbage may be split into non-risk and risk material. It requires technological and social innovation in combination with improved waste management such as differentiation of waste streams in plant and animal waste, to extract valuable resources.

Next, the structural ban from the market of novel foods, including GM-foods, unless authorized or substantially equivalent to existing products, may lead to wasting valuable products, for instance after border controls. In some cases of contamination, like mycotoxin-infected nuts, it is a matter of applying existing processing techniques to avoid food waste or transform such products into feed. Additionally, food information requirements, like expiry dates, induce food waste. Neither the non-existence of a public information requirement, like in the USA, nor a mandatory choice between safety and quality, like in the EU, is efficient since uncertainty of the manufacturer, the retailer or the consumer are boosted.

The actors that cause most wasted food are consumers. A reason is the perceived uncertainty and lack of trust in the safety of the products they buy. Nowadays, extensive capabilities exist to detect and control risks. Food waste can be reduced by using newly developed techniques to signal decay, like intelligent packages. These can warn users that the content of a pre-packaged product is unsafe. But what if they exaggerate risks despite reliable information that is given? May we nudge consumers' behavior so that they actually consume what they buy? May we restrict their free choice to the benefit of the system as a whole? These considerations take us away from a legal-systematic review (Sect. 24.2) and an economic analysis (Sect. 24.3) and bring us to the moral level of food waste prevention. That is, the level at which a choice is due between the pursuit of competing aims: personal freedom, efficiency and sustainability.

# Chapter 25

## The Concepts of Transparency and Openness in European Food Law

Nicola Conte-Salinas and Rochus Wallau

**Abstract** This chapter focuses on the principles of transparency and openness, which are of increasing importance both at EU level and in national law and politics. It gives an overview of the areas of EU law that explicitly provide for transparency and openness, illustrated by case-law. In a second step, it explains how the principles of transparency and openness have been implemented in EU food law. Current transparency projects in Denmark, the UK and Germany are discussed in detail, in particular the practice of publishing information concerning food business operators, which is critically examined.

### 25.1 Introduction: The Concept of Transparency in EU Law

“With knowledge doubt increases”<sup>1</sup>—this thought-provoking quote from Johann Wolfgang von Goethe, one of the famous poets and authors in classic German literature, is incompatible with one of the most powerful current developments in European food law—the implementation of transparency. While the poet assumed that “more” knowledge would not lead to “more” orientation and security, the opposite is true today—even in the “post-wikileaks era,”<sup>2</sup> the possibility of information is used as a prescription against uncertainty and disorientation in view of the complexity of life.

---

<sup>1</sup>Johann Wolfgang von Goethe, *Maximen und Reflexionen*. The full quotation reads: “Eigentlich weiß man nur wenn man wenig weiß. Mit dem Wissen wächst der Zweifel.” (“We know accurately only when we know little, with knowledge doubt increases.”—Translation is ours).

There is a “trend” in secondary Union law to broaden the scope of rules concerning the publication of information. In particular, information known to authorities or institutes, will not anymore be used exclusively to avert existing dangers, but are increasingly used in situations where no security threats are present. Applied this way, transparency becomes an element of market regulation. Taking into account that the legislative process is characterized by consultation requirements intended to guarantee the involvement of an “organized civil society”,<sup>3</sup> it becomes obvious that the concept of transparency encompasses the whole “regulation chain”, starting from the legislative process to the implementation of law.

The societal background for the growing use of information can certainly be traced back (at least in part) to a growing mistrust of state institutions. In several areas, state institutions (or those perceived as such) have proven, at least partly, inefficient to prevent or deal with actual risks. There are two specific examples, the finance and food sectors. In her analysis of the social situation around 1870, historian Vera Hierholzer described conditions that led to the existence of national food law in the German Empire (Deutsches Kaiserreich). These findings, however, can be generalized and are still valid today.

The increased feeling of insecurity was a logical consequence of the efforts for enlightenment. As key formative experiences, scandals attracted attention and seemed to prove that mistrust was justified. Growing knowledge and growing decision-making potentials of modern society did not only promote the feeling of being able to “make” the world, but also the awareness of risks, against which new risky constellations were identified constantly. The establishment of a critical public and an increasingly interconnected information society, reflected in the rapid rise of the free press, further strengthened this development.<sup>4</sup>

Positively phrased, Hierholzer outlines how transparency results in traceability, controllability and perhaps leads to acceptance of political or administrative decisions, thereby making it possible for many to directly participate, including, at any rate, those who have no official role in the decision-making process.

Transparency and openness can be applied to different categories of cases. One category concerns the activity of the EU (or national) institutions (e.g. granting access to documents of Council meetings). The other category, however, deals with the publication of information concerning private parties, for example, food business operators. An example of the latter would be the publication of results of hygiene inspections. Both categories are discussed in this chapter.

## 25.2 Applicable Laws with Respect to Transparency and Openness

With the aim to broaden the means of citizens' participation within the decision-making process and thereby enhancing legitimacy and accountability, the maxims openness and transparency<sup>5</sup> are laid down at the highest normative level in the EU, that is to say, in the Treaty on the European Union (TEU) and the Treaty on the Functioning of the European Union (TFEU). The principle was first established in Art. 255 (2) of the Treaty establishing the European Community, with its scope further broadened in Art. 15 (3) of the TFEU. Art. 15 (3) of the TFEU addresses all Union organs, in particular, the Commission, Council and Parliament, including their committees and working groups.

In the TEU, openness and transparency are established as democratic principles.<sup>6</sup> The TFEU obliges EU institutions, bodies and agencies to "conduct their work as openly as possible".<sup>7</sup> Therefore, the meetings of European Parliament are public, and so are Council meetings when discussions and voting on draft legislative acts is concerned.<sup>8</sup> EU citizens are granted a general right of access to documents of the EU institutions.<sup>9</sup> Secondary EU law gives shape to these principles of openness and transparency (see the following discussion).

### 25.2.1 Regulation (EC) No. 1049/2001<sup>10</sup>

Regulation (EC) No 1049/2001 further specifies the general right of access to documents, laid down in EU primary law.

The term access either means on-the-spot consultations, the provision of copies or of electronic versions for the benefit of the applicant. "Accessible" in this sense is any content, irrespective of the medium, concerning a matter relating to the policies, activities and decisions falling within the relevant institution's sphere of responsibility,<sup>11</sup> drawn up or received by the relevant institution and in its possession, in all areas of activity of the European Union.<sup>12</sup>

<sup>5</sup>For an analysis concerning the different content of transparency and openness, see Alemanno (2014).

<sup>6</sup>See Art. 1 (2), 10 (3) and Art. 11 TEU. Art. 10 and 11 are located under Title II—which is headed "provisions on democratic principles".

<sup>7</sup>Art. 15 (1) TFEU.

<sup>8</sup>Art. 15 (2) TFEU.

<sup>9</sup>Art. 15 (3) TFEU.

<sup>10</sup>Regulation (EC) No 1049/2001 of the European Parliament and of the Council of 30 May 2001 regarding public access to European Parliament, Council and Commission documents, Official Journal L 145, 31.05.2001 p. 43, as amended.

<sup>11</sup>Cf. Regulation (EC) No 1049/2001, *op. cit.*, Art 3 (a).

<sup>12</sup>Cf. Regulation (EC) No 1049/2001, *op. cit.*, Art 2 (3).

Recital 4 of said Regulation aims at a wide claim to access documents. According to the case law of the CJEU, it is therefore necessary to interpret and apply rules limiting this access strictly.<sup>13</sup> Exceptions to the right of access are laid down in Art. 4 Regulation (EC) 1049/2001: public interests of importance (e.g., as regards public security, defense and military matters), or international relations, the financial, monetary or economic policy of the Community or a Member State can give rise to a refusal of access, just as well as private interests of importance (e.g., privacy and the integrity of the individual, in particular, in accordance with Community legislation regarding the protection of personal data).<sup>14</sup>

The protection of commercial interests of a natural or legal person, including intellectual property, court proceedings and legal advice, as well as the purpose of inspections, investigations and audits lead to a refusal of access, unless there is an overriding public interest in disclosure.<sup>15</sup> In case of an overriding public interest, access is granted even to documents drawn up by an institution for internal use only or received by an institution, which relates to an ongoing matter where a decision has not yet been taken, and where disclosure of the document would seriously undermine the institution's decision-making process.<sup>16</sup> It is essential to note that the restriction of access to documents might only apply to a part or certain parts of a requested document,<sup>17</sup> and that a refusal of access can only be upheld for as long as the exception is justified, and generally for a maximum period of 30 years (with a counter exception for sensitive documents, protection of private and/or commercial interests).<sup>18</sup>

The application can be submitted in writing or electronic form. While it is not necessary to state reasons in the application for access to documents, it is, however, vital to be sufficiently precise in order to identify the relevant documents. The relevant organ generally has to respond to the application within 15 days, either by granting access or explaining the reasons for a full, or partial, refusal.<sup>19</sup>

A consultation on the spot is free of charge, just as well as the direct access in electronic form or through the register of documents and that the organs make available to the public.<sup>20</sup>

The general right of access to documents applies also to areas of law that have sector-specific rules, as long as these sector-specific rules do not provide for special rules concerning the access to European Parliament, Council and Commission documents.

### 25.2.2 *Sector-Specific Rules*

There are many sector-specific rules that concern informing the public or public access to information. These can be divided into two groups: Environmental law, and other sector-specific rules that generally require risks or potential hazards, before information can or must be made public.

In this respect, Environmental law contains the most far-reaching rules. The rules foresee a right of access irrespective of potential hazards or any other risks involved. The concept behind those rules could be summarized as follows: By granting the citizen the possibility to access information, the citizen becomes—more or less—part of the monitoring system.<sup>21</sup>

As mentioned, other sector-specific rules generally require risks or potential hazards, before information can or must be made public. These rules tend to give (fundamental) rights of the people and companies concerned, more prominence.

### 25.2.3 *Environmental Law*

Environmental law can be regarded as the “pioneer” area of law with respect to transparency. Directive 2003/4/EC<sup>22</sup> introduces a right to access environmental information held by or for public authorities for everyone, without preconditions.<sup>23</sup> The purpose of this Directive is described as “a greater awareness of environmental matters, a free exchange of views, more effective participation by the public in environmental decision-making and, eventually, to a better environment.”<sup>24</sup> Its predecessor, Directive 90/313/EEC of 7 June 1990 on the freedom of access to information on the environment<sup>25</sup> had already “initiated a process of change in the manner in which public authorities approach the issue of openness and

<sup>21</sup>Cf. Hansmann-Calliess, *Grundzüge des Umweltrechts*, 2012, p. 125: “Mit Blick auf das konstatierte Vollzugsdefizit setzen EuGH und Kommission schon lange auf den an der Wahrung seiner Rechte interessierten Bürger, der so zum Wächter der Einhaltung des Europäischen Umweltrechts instrumentalisiert wird.” (“With respect to the recognised lack of enforcement, the CJEU and the Commission have long since counted on the citizen interested in protecting his rights, who thereby is used as the watchdog of the compliance with European Environmental Law”—translation is ours).

<sup>22</sup>Directive 2003/4/EC of the European Parliament and of the Council of 28 January 2003 on public access to environmental information and repealing Council Directive 90/313/EEC, OJ L 041, 14.02.2003, p. 26. Regulation (EC) No 1367/2006, of 6 September 2006, on the application of the provisions of the Aarhus Convention on Access to Information, Public Participation in Decision-making and Access to Justice in Environmental Matters to Community institutions and bodies, OJ L 264, 25.9.2006, p. 13 complements Regulation (EC) No 1049/2001.

<sup>23</sup>Directive 2003/4/EC, *op. cit.*, Art. 3 (1).

<sup>24</sup>Directive 2003/4/EC, *op. cit.*, recital 1.

<sup>25</sup>OJ L 158, 23.6.1990, p. 56.

transparency, establishing measures for the exercise of the right of public access to environmental information which should be developed and continued”.<sup>26</sup>

However, the directive also foresees certain exceptions to the right to access environmental information.<sup>27</sup> These either take account of public (e.g. security interests, court proceedings) or private (e.g. privacy, commercial secrets) interests. These reasons, however, must not be used to refuse a request that relates to information on emissions into the environment.<sup>28</sup>

Member States are required to actively and systematically disseminate environmental information to the public.<sup>29</sup>

### 25.2.4 Consumer Products

The laws on consumer products do not know such extensive rights and obligations concerning access to information.

Directive 2001/95/EC foresees that “information available to the authorities of the Member States or the Commission relating to risks to consumer health and safety posed by products shall in general be available to the public, in accordance with the requirements of transparency and without prejudice to the restrictions required for monitoring and investigation activities. In particular the public shall have access to information on product identification, the nature of the risk and the measures taken.”<sup>30</sup>

At the same time, however, it establishes that “Member States and the Commission shall take the steps necessary to ensure that their officials and agents are required not to disclose information obtained for the purposes of this Directive which, by its nature, is covered by professional secrecy in duly justified cases, except for information relating to the safety properties of products which must be made public if circumstances so require, in order to protect the health and safety of consumers.”<sup>31</sup>

Rules with similar tendencies are also found in Regulation (EC) No. 765/2008 on market surveillance,<sup>32</sup> which shall ensure a harmonized level of market surveillance in the area of consumer products in the EU.

<sup>26</sup>Directive 2003/4/EC, *op. cit.*, recital 2.

<sup>27</sup>Directive 2003/4/EC, *op. cit.*, Art. 4.

<sup>28</sup>Directive 2003/4/EC, *op. cit.*, Art. 4 (2), subpara 2.

<sup>29</sup>Directive 2003/4/EC, *op. cit.*, Art. 7 (1).

<sup>30</sup>Directive 2001/95/EC of the European Parliament and of the Council of 3 December 2001 on general product safety, OJ L 011, 15.1.2002, p. 4, Art. 16 (1).

<sup>31</sup>Directive 2001/95/EC, *op. cit.*, Art. 16 (1).

<sup>32</sup>Regulation (EC) No 765/2008 of the European Parliament and of the Council of 9 July 2008 setting out the requirements for accreditation and market surveillance relating to the marketing of products and repealing Regulation (EEC) No 339/93, 13.8.2008, OJ L 218, p. 30, Art. 19.

### 25.2.5 Medicinal Products

Regulation (EC) No 726/2004<sup>33</sup> addresses the right to access documents concerning medicinal products. As a rule, the aforementioned general right of access to documents laid down in Regulation 1049/2001 applies to the European Medicines Agency (EMA) as well,<sup>34</sup> but the Regulation also lays down sector-specific rules. Inter alia, EMA is required to set up a database for medicinal products that contains information concerning, among others, assessment reports, summaries of product characteristics, and information on suspected adverse reactions.<sup>35</sup> In particular, assessments concerning scientific questions in connection with the assessment of medicinal products must be published,<sup>36</sup> as well as final decisions taken by EMA concerning market-related measures.<sup>37</sup> If necessary to protect human health or the environment, a Member State may suspend the use of an authorized medicinal product in its territory, but must ensure that health-care professionals are rapidly informed of its actions and the reasons for the suspension.<sup>38</sup>

### 25.2.6 Chemicals

Regulation (EC) No. 1907/2006 concerning the registration, evaluation, authorization and restriction of chemicals<sup>39</sup> also addresses access to information concerning chemicals: “EU citizens should have access to information about chemicals to which they may be exposed, in order to allow them to make informed decisions about their use of chemicals.”<sup>40</sup> Accordingly, certain information, such as the name of the substance, its classification and labeling, the result of each toxicological and eco-toxicological study, or the guidance on safe use shall be made

---

<sup>33</sup>Regulation (EC) No 726/2004 of the European Parliament and of the Council of 31 March 2004 laying down Community procedures for the authorisation and supervision of medicinal products for human and veterinary use and establishing a European Medicines Agency, Official Journal L 136, 30.04.2004, p. 1.

<sup>34</sup>Regulation (EC) No 726/2004, *op. cit.*, Art. 73.

<sup>35</sup>Regulation (EC) No 726/2004, *op. cit.*, Art. 57.

<sup>36</sup>Regulation (EC) No 726/2004, *op. cit.*, Art. 22.

<sup>37</sup>Regulation (EC) No 726/2004, *op. cit.*, Art. 20 (7).

<sup>38</sup>Regulation (EC) No 726/2004, *op. cit.*, Art. 20 (4), (5).

<sup>39</sup>Regulation (EC) No 1907/2006 of the European Parliament and of the Council of 18 December 2006 concerning the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH), establishing a European Chemicals Agency, amending Directive 1999/45/EC and repealing Council Regulation (EEC) No 793/93 and Commission Regulation (EC) No 1488/94 as well as Council Directive 76/769/EEC and Commission Directives 91/155/EEC, 93/67/EEC, 93/105/EC and 2000/21/EC, OJ L 396, 30.12.2006, p. 1.

<sup>40</sup>Regulation (EC) No 1907/2006, *op. cit.*, Recital 117.

publicly available, free of charge, over the Internet.<sup>41</sup> Further information, such as the trade name(s), shall also be published, free of charge, over the Internet, except when an objection against this publication (on the grounds that a publication would harm the commercial interests of the registrant or any other party concerned) has been accepted as valid by the European Chemicals Agency.<sup>42</sup>

Besides this right of access to information, the applicability and scope of Regulation (EC) No. 1049/2001 is massively limited in regards to information on chemicals, since it contains the refutable presumption that the right to access certain information (i.e., concerning the full composition of the substance or business relationships between manufacturers and its distributors) undermines the protection of the commercial interests of the person concerned (trade and business secrets).<sup>43</sup> A counter-exception exists, where urgent action is essential to protect human health, safety or the environment.<sup>44</sup>

## 25.2.7 Case Law

### 25.2.7.1 Case C-39/05 P [2008]<sup>45</sup>

The Court had to decide whether a decision of the Council of the European Union to refuse access to an opinion of the Council's legal service concerning a proposal for a Council directive to a citizen (Mr. Turco), was in accordance with EU law.

The Court of Justice of the European Union (CJEU) stated that:

Any exception to the right of access to the institutions' documents under Regulation (EC) No 1049/2001 must be interpreted and applied strictly.<sup>46</sup>

... the exception relating to legal advice laid down in the second indent of Article 4(2) of Regulation No 1049/2001 must be construed as aiming to protect an institution's interest in seeking legal advice and receiving frank, objective and comprehensive advice.

The risk of that interest being undermined must, in order to be capable of being relied on, be reasonably foreseeable and not purely hypothetical.

Third and last, if the Council takes the view that disclosure of a document would undermine the protection of legal advice as defined above, it is incumbent on the Council to ascertain whether there is any overriding public interest justifying disclosure despite the fact that its ability to seek legal advice and receive frank, objective and comprehensive advice would thereby be undermined.<sup>47</sup>

---

<sup>41</sup>Regulation (EC) No 1907/2006, *op. cit.*, Art. 119 (1).

<sup>42</sup>Regulation (EC) No 1907/2006, *op. cit.*, Art. 119 (2).

<sup>43</sup>Regulation (EC) No 1907/2006, *op. cit.*, Art. 118 (2).

<sup>44</sup>Regulation (EC) No 1907/2006, *op. cit.*, Art. 118 (2).

<sup>45</sup>CJEU, 1 July 2008, C-39/05 P, ECR 2008 I-04723.

<sup>46</sup>CJEU; C-39/05 P, *op. cit.*, Recital 36.

<sup>47</sup>CJEU; C-39/05 P, *op. cit.*, Recitals 42–44.

The Court further stated that:

Openness in that respect contributes to strengthening democracy by allowing citizens to scrutinize all the information which has formed the basis of a legislative act. The possibility for citizens to find out the considerations underpinning legislative action is a precondition for the effective exercise of their democratic rights.<sup>48</sup>

### 25.2.7.2 Case T-233/09 [2011]<sup>49</sup>

The case dealt with a request for access to a note concerning the proposal for a regulation of the European Parliament, Council and Commission documents. That document contained the proposals for amendments or re-drafting, submitted by several Member States at a meeting of the working party. The applicant was granted access, but the Member States, which had put those proposals forward, could not be identified. The Council argued that disclosure of the names would seriously undermine the decision-making process.

The CJEU held:

If citizens are to be able to exercise their democratic rights, they must be in a position to follow in detail the decision-making process within the institutions taking part in the legislative procedures and to have access to all relevant information.<sup>50</sup>

### 25.2.7.3 Case C-92/09 [2010]<sup>51</sup>

The case dealt with the validity of certain provisions of EU law that required the publication of information on the beneficiaries of funds deriving from the European Agricultural Guarantee Fund and the European Agricultural Fund for Rural Development.

The CJEU stated:

The principle of transparency is stated in Articles 1 TEU and 10 TEU and in Article 15 TFEU. It enables citizens to participate more closely in the decision-making process and guarantees that the administration enjoys greater legitimacy and is more effective and more accountable to the citizen in a democratic system.<sup>52</sup>

On the other hand, the CJEU has pointed out

it is necessary to bear in mind that the institutions are obliged to balance, before disclosing information relating to a natural person, the European Union's interest in guaranteeing the transparency of its actions and the infringement of the rights recognised by Articles 7 and

<sup>48</sup>CJEU; C-39/05 P, *op. cit.*, Recital 46.

<sup>49</sup>General Court, 22 March 2011, T-233/09, ECR 2011 II-01073. Judgment upheld: CJEU, 17 October 2013, C-280/11 P, ECLI:EU:C:2013:671.

<sup>50</sup>General Court, T-233/09, Recital 69.

<sup>51</sup>CJEU, 9 November 2010, C-92/09, ECR 2010 I-11063.

<sup>52</sup>CJEU, C-92/09, *op. cit.*, Recital 68, with further references.

8 of the Charter.<sup>53</sup> No automatic priority can be conferred on the objective of transparency over the right to protection of personal data (see, to that effect, *Commission v Bavarian Lager*, paragraphs 75 to 79), even if important economic interests are at stake.<sup>54</sup>

## 25.3 Transparency and EU Food Law

In the area of food law, the “transparency concept” is found on various levels of the food chain: It applies to the legislative procedure in Brussels, as well as to law enforcement in the Member States. For example, when carrying out risk assessments, the European Food Safety Authority (EFSA) is obliged to be open and transparent.

### 25.3.1 Regulation (EC) No 178/2002<sup>55</sup>

#### 25.3.1.1 EFSA

The so-called General Food Law,<sup>56</sup> Regulation (EC) No. 178/2002, establishes the EFSA. It further explicitly states that EFSA “shall ensure that it carries out its activities with a high level of transparency”<sup>57</sup> and establishes specific publication requirements for, among others, agendas and minutes of the Scientific Committee and the Scientific Panels and its opinions.<sup>58</sup> It is important to note, however, that EFSA must not disclose information, for which confidential treatment has been requested and has been declared justified, with an exception for information that

---

#### <sup>53</sup>Art 7. Respect for private and family life

Everyone has the right to respect for his or her private and family life, home and communications.

#### **Art 8. Protection of personal data**

1. Everyone has the right to the protection of personal data concerning him or her.
2. Such data must be processed fairly for specified purposes and on the basis of the consent of the person concerned or some other legitimate basis laid down by law.  
Everyone has the right of access to data which has been collected concerning him or her, and the right to have it rectified.
3. Compliance with these rules shall be subject to control by an independent authority.

<sup>54</sup>CJEU, C-92/09, *op. cit.*, Recital 85.

<sup>55</sup>Regulation (EC) No 178/2002 Regulation (EC) No 178/2002 of the European Parliament and of the Council of 28 January 2002 laying down the general principles and requirements of food law, establishing the European Food Safety Authority and laying down procedures in matters of food safety, OJ L 031, 01.02.2002, p. 1, as amended.

<sup>56</sup>See *van der Meulen/van der Velde*, European Food Law Handbook, p. 253.

<sup>57</sup>Regulation (EC) No 178/2002, *op. cit.*, Art. 38.

<sup>58</sup>Regulation (EC) No 178/2002, *op. cit.*, Art. 38, 40.

must be made public in order to protect public health.<sup>59</sup> In the field within its mission, EFSA is obligated to inform the public “on its own initiative”,<sup>60</sup> and to ensure that “the public and any interested parties are rapidly given objective, reliable and easily accessible information, in particular with regard to the results of its work.”<sup>61</sup> Further, the right to access documents as laid down in Regulation (EC) Nr. 1049/2001 is also applicable to documents held by EFSA.<sup>62</sup>

### 25.3.1.2 Principles of Transparency

Chapter II Section 2 of Regulation (EC) No. 178/2002 is titled “Principles of transparency” and contains two articles. One addresses public consultation,<sup>63</sup> the other public information.<sup>64</sup>

During the legislative process, from preparation, to evaluation and revision of food law, the public shall be consulted<sup>65</sup> in an open and transparent manner.<sup>66</sup> An exception exists for cases of urgency that require immediate action and make such consultation impossible.<sup>67</sup>

The requirement of consulting the public during the legislative process serves a dual purpose: On the one hand, this ensures a maximum use of potential knowledge resources and information. On the other hand, the possibility to participate in the legislative process can increase the level of acceptance of the adopted rules. It has to be pointed out, however, that the term “public” primarily refers to consumer and trade associations.

The rule on public information reads as follows:

...where there are reasonable grounds to suspect that a food or feed may present a risk for human or animal health, then, depending on the nature, seriousness and extent of that risk, public authorities shall take appropriate steps to inform the general public of the nature of the risk to health, identifying to the fullest extent possible the food or feed, or type of food or feed, the risk that it may present, and the measures which are taken or about to be taken to prevent, reduce or eliminate that risk.<sup>68</sup>

As part of a regulation, this rule is directly applicable in all Member States.<sup>69</sup> As a consequence, Member States are obligated to inform the public in cases of a risk

<sup>59</sup>Regulation (EC) No 178/2002, *op. cit.*, Art. 39.

<sup>60</sup>Regulation (EC) No 178/2002, *op. cit.*, Art. 40.

<sup>65</sup>Either directly or through representative bodies, Regulation (EC) No 178/2002, *op. cit.*, Art. 9.

<sup>66</sup>Regulation (EC) No 178/2002, *op. cit.*, Art. 9.

<sup>67</sup>Regulation (EC) No 178/2002, *op. cit.*, Art. 9.

<sup>68</sup>Regulation (EC) No 178/2002, *op. cit.*, Art. 10.

<sup>69</sup>TFEU, *op. cit.*, Art. 288.

for the health of humans or animals. Remarkably, the wording of the provision only covers those foodstuffs that are injurious to health,<sup>70</sup> but not those that are unsafe<sup>71</sup> because they are unfit for human consumption.<sup>72</sup> Accordingly, this rule follows the principle of proportionality when allowing or ordering the competent authorities to inform the public of injurious foods.

### 25.3.2 Regulation (EG) No 882/2004<sup>73</sup>

Regulation (EC) No. 882/2004 aims at ensuring a horizontally uniform level of control. According to its title, Art. 7 addresses the principles of “transparency and confidentiality” that authorities have to adhere to in their activities: The competent authorities shall ensure that they carry out their activities with a high level of transparency. For that purpose, relevant information held by them shall be made available to the public as soon as possible.<sup>74</sup> At the same time, the competent authority must take the necessary steps in order to ensure that members of their staff do not disclose information which is by its nature covered by professional secrecy in duly justified cases.<sup>75</sup> As a rule, however, protection of professional secrecy does not preclude the dissemination of information by the competent authorities according to Art. 10 Regulation (EC) No. 178/2002.<sup>76</sup> Some of the cases where information is covered by professional secrecy are listed in Art. 7 (3), among them the confidentiality of preliminary investigation proceedings and of current legal proceedings, but also cases of conflicting individual interests, such as the protection of personal data. Further examples are the right to a fair trial and the protection of trade and business secrets.<sup>77</sup> Art. 7 is worded as follows:

1. The competent authorities shall ensure that they carry out their activities with a high level of transparency. For that purpose, relevant information held by them shall be made available to the public as soon as possible.

*In general, the public shall have access to:*

- (a) information on the control activities of the competent authorities and their effectiveness;

*and*

- (b) information pursuant to Article 10 of Regulation (EC) No 178/2002.

<sup>70</sup>According to Regulation (EC) No 178/2002, *op. cit.*, Art. 14 (2) (a).

<sup>71</sup>For a detailed analysis of the concept of food safety, see Chap. 20.

<sup>72</sup>According to Regulation (EC) No 178/2002, *op. cit.*, Art. 14 (2) (b).

<sup>73</sup>Regulation (EC) No 882/2004 of the European Parliament and of the Council of 29 April 2004 on official controls performed to ensure the verification of compliance with feed and food law, animal health and animal welfare rules, OJ L 165, 30.4.2004, p. 1.

<sup>74</sup>Regulation (EC) No 882/2004, *op. cit.*, Art. 7 (1).

<sup>75</sup>Regulation (EC) No 882/2004, *op. cit.*, Art. 7 (2).

<sup>76</sup>Regulation (EC) No 882/2004, *op. cit.*, Art. 7 (2).

<sup>77</sup>Cf. *Grube/Immel/Wallau*, Verbraucherinformationsrecht, 2013, Part A, p. 32.

2. The competent authority shall take steps to ensure that members of their staff are required not to disclose information acquired when undertaking their official control duties which by its nature is covered by professional secrecy in duly justified cases. Protection of professional secrecy shall not prevent the dissemination by the competent authorities of information referred to in paragraph 1(b). The rules of Directive 95/46/EC of the European Parliament and of the Council of 24 October 1995 on the protection of individuals with regard to the processing of personal data and on the free movement of such data remain unaffected.
3. Information covered by professional secrecy includes in particular:
  - the confidentiality of preliminary investigation proceedings or of current legal proceedings,
  - personal data,
  - the documents covered by an exception in Regulation (EC) No 1049/2001 of the European Parliament and of the Council of 30 May 2001 regarding public access to European Parliament, Council and Commission documents,
  - information protected by national and Community legislation concerning in particular professional secrecy, the confidentiality of deliberations, international relations and national defence.

It is noteworthy that Regulation (EC) No. 882/2004 is being revised at the moment, and, in particular, the rules concerning openness and transparency. The Commission draft from 6 May 2013<sup>78</sup> introduces two new provisions that are worded as follows:

Article 7 Confidentiality obligations of the staff of the competent authorities

1. Competent authorities shall require members of their staff not to disclose information acquired when undertaking their duties in the context of official controls and other official activities which by its nature is covered by professional secrecy, subject to paragraph 2.
2. Unless there is an overriding public interest in its disclosure, information covered by professional secrecy as referred to in paragraph 1 shall include information whose disclosure would undermine:
  - (a) the purpose of inspections, investigations or audits;
  - (b) the protection of commercial interests of a natural or legal person;
  - (c) the protection of court proceedings and legal advice.
3. Paragraphs 1 and 2 shall not prevent the competent authorities from publishing or making otherwise available to the public information about the outcome of official controls regarding individual operators, provided that the following conditions are met:
  - (a) the operator concerned is given the opportunity to comment on the information that the competent authority intends to publish or make otherwise available to the public, prior to the publication or release;
  - (b) the information which is published or made otherwise available to the public takes into account the comments expressed by the operator concerned or is published or released together with such comments.

---

<sup>78</sup>COM(2013) 265 final.

#### Article 10 Transparency of official controls

1. Competent authorities shall perform official controls with a high level of transparency and make available to the public relevant information concerning the organisation and the performance of official controls.

They shall also ensure the regular and timely publication of information on the following:

- (a) the type, number and outcome of official controls;
  - (b) the type and the number of non-compliances detected;
  - (c) the cases where measures were taken by the competent authorities in accordance with Article 135;
  - (d) the cases where the penalties referred to in Article 136 were imposed.
2. To ensure the uniform implementation of the rules provided for in paragraph 1 of this Article, the Commission shall, by means of implementing acts, lay down and update as necessary the format in which the information referred to in that paragraph shall be published. Those implementing acts shall be adopted in accordance with the examination procedure referred to in Article 141(2).
  3. Competent authorities shall be entitled to publish or make otherwise available to the public information about the rating of individual operators based on the outcome of official controls, provided that the following conditions are met:
    - (a) the rating criteria are objective, transparent and publicly available;
    - (b) appropriate arrangements are in place to ensure the consistency and transparency of the rating process.

### 25.3.3 *Case Law and Examples*

#### 25.3.3.1 German Court Decisions

There are several decisions by German administrative courts that deal with the interpretation and the scope of Art. 7 Regulation (EC) No. 178/2002. These decisions concern the scope of the term “preliminary investigation proceedings” and “current legal proceedings”. According to German case law, the term “preliminary investigation proceedings” does not apply (any more) in the case an inspection has been carried out by the authorities and there has been a practical result.<sup>79</sup> If there has been an audit of a restaurant by the competent authority, for example, and the authority has come to the conclusion that the restaurant owner has violated food law (e.g. certain hygiene provisions), this is not a case of “preliminary investigation proceedings”, irrespective of whether a decision to continue administrative proceedings and/or whether or not to impose a fine, has been taken.

The term “current legal proceedings” only applies in cases where opposition proceedings or court proceedings against the findings of an official control have been initiated.<sup>80</sup>

<sup>79</sup>OVG NRW (Higher Administrative Court of Northrhine-Westphalia), 27.08.2009, file no: 13a F 13/09.

<sup>80</sup>BayVG (Higher Administrative Court of Bavaria), Decision of 22.12.2009, file no: G 09.1.

### 25.3.3.2 CJEU, Case C-636/11: Berger [2013]<sup>81</sup>

In this case, the CJEU has clarified whether Art. 10 Regulation (EC) No. 178/2002 must be interpreted as precluding national legislation allowing the publication of information concerning a certain food, in a case where that food is unfit for human consumption, though not injurious to health. Until then, this question had been discussed very controversially. The decision was based on the following facts:

On 16 and 18 January 2006, the Passau Veterinary Office (Germany) carried out official inspections in several establishments of company B, which processes and markets game meat. The authorities found that the hygiene conditions were inadequate. On several dates, samples of the game meat concerned were taken and analyzed. Those analyses led to a finding that the food in question was unfit for human consumption and consequently was unsafe within the meaning of Regulation No 178/2002. On 23 January 2006, the competent authority informed company B of its intention to inform the public of their findings, that the listed foodstuffs were unfit for human consumption. Further, company B was informed that the authorities would not inform the public, if company B itself informed the public effectively and promptly.

As a result, company B prepared a consumer information that invited its customers to exchange certain products at their retail stores, due to possible sensory anomalies. There was, in its view, no risk to health. This information was declared insufficient by the competent authorities.

On 24 January 2006, the competent state authority published a press release, declaring that certain products marketed by company B were to be recalled. According to the press release, the relevant samples “gave off a rancid, nauseous, musty or acidic smell”, in some samples, “the putrefaction process had already started”. It was further stated that, during inspections of some establishments of company B, “revoltingly unhygienic conditions had been encountered”, and that a temporary prohibition on company B from marketing products manufactured or processed by it in those establishments had been issued.<sup>82</sup> On 31 January 2006, company B declared itself insolvent. Company B brought an action for damages against the Freistaat Bayern (Free State of Bavaria) before the Landgericht München (Regional Court of Munich).

The CJEU had to decide, whether Art. 10 Regulation (EC) No 178/2002 precludes rules of national law allowing information to be issued to the public mentioning the name of a food and the name or trade name of the food manufacturer, processor or distributor, in the event that the food is not injurious to health but is unfit for human consumption, particularly food that is nauseating.

In a certain sense, the decision of the CJEU could be regarded as solomon-like, since the Court ruled:

---

<sup>81</sup>C-636/11, 11.04.2013.

<sup>82</sup>CJEU C-636/11, *op. cit.*, Recital 17–19.

Article 10 of Regulation No 178/2002 must be interpreted as not precluding national legislation allowing information to be issued to the public mentioning the name of a food and the name or trade name of the food manufacturer, processor or distributor, in a case where that food, though not injurious to health, is unfit for human consumption. The second subparagraph of Article 17(2) of that regulation must be interpreted as allowing, in circumstances such as those of the case in the main proceedings, national authorities to issue such information to the public in accordance with the requirements of Article 7 of Regulation No 882/2004.<sup>83</sup>

The question, in which specific cases a confidentiality obligation according to Art. 7 Regulation (EC) No 882/2004 applies, has not been answered by the CJEU in the case at hand. In particular, the Court did not take a position concerning the obvious frictions between Art. 10 Regulation (EC) No 178/2002 and Art. 7 Regulation (EC) No 882/2004. It is noteworthy in this respect, that Regulation (EC) No 882/2004 is being revised at the moment, and, in particular, the rules concerning openness and transparency (see *supra*). This planned modification could be interpreted as the legislative response to the decision of the CJEU.

### **25.3.4 Current Transparency Projects in Selected EU-Member States**

Several Member States have introduced projects concerning the publication of official hygiene inspections. These programs were already in place before the revision process of Regulation (EC) No 882/2004 started, and are therefore based on existing rules. A comparative analysis concerning the consumer information law,<sup>84</sup> published in 2010 by a group of researchers of the University of Heidelberg, Germany, came to the following conclusion:

The study revealed broad similarities among the examined jurisdictions with regard to legislation on consumer information: Hence, all surveyed jurisdictions know legal acts providing for the consumer's right to access certain public documents. Additionally, all examined jurisdictions impose a duty on businesses, though.

However, despite these similarities on a general level, differences can be ascertained on a more specific level. None of the examined legal systems knows an act, which is comparable to the German Consumer Information Act. Meanwhile, consumers obtain the same information in the examined countries through Freedom of Information legislation. Additionally, we determined that especially Scandinavian countries have an extremely open culture when it comes to public documents. Even more, the public bodies of these countries tend to disseminate a wide range of different information automatically.

<sup>83</sup>CJEU C-636/11, *op. cit.*, Recital 37.

<sup>84</sup>“Rechtsvergleichende Untersuchung des Verbraucherinformationsrechts in Deutschland, Belgien, Dänemark, Frankreich, Großbritannien, Irland, Schweden und den Vereinigten Staaten von Amerika, Abschlussbericht vom 07.05.2010”, Prof. Dr. Thomas Pfeiffer, Theresa Heinke, Philipp Portugall in Kooperation mit Prof. Evelyn Terryn, Prof. Peter Møgelvang-Hansen, Dr. Stephanie Rohlfing-Dijoux, Prof. Patrick Birkinshaw, Dr. Cliona Kelly, Dr. Jori Munukka und Prof. Anita Allen.

Especially the Danish legislator has chosen a very consumer protective information policy. There, all restaurants and other businesses handling food and beverages, such as supermarkets, have to display a ranking about their hygiene quality rendered by Danish public authorities at their entrance. A tendency towards the publication of public controls can also be found e. g. in Los Angeles County and Great Britain (“Scores on the doors”).

### 25.3.5 *The Danish Smiley-System*<sup>85</sup>

As a pioneer in Europe, Denmark started its so-called Smiley-system in 2001. The system foresees the publication of the results of unannounced hygiene inspections. The results are depicted by using one of four different smileys. These symbolise that the official inspector had no remarks (happy smiley), has emphasized that certain rules must be obeyed (slightly smiling smiley), issued an injunction order or a prohibition (neutral smiley), or issued an administrative fine, reported the enterprise to the police or withdrew an approval (unhappy/sour smiley).

Not all rules and requirements are inspected each time. But at each inspection, several areas are checked. The areas may vary from inspection to inspection, so that after some time, all areas are being inspected. Each inspected area is assigned a result from 1 to 4. All results as well as the inspectors’ remarks are published on the inspection report. The poorest result determines the smiley.

The inspection report contains the latest smiley, together with the rating of the previous three inspections. The reports must be displayed in the shop or restaurant in a way that enables the consumer to read them before entering the premises, but also on the homepage of the relevant company, where it must be easy to find. Finally, all inspection reports of the last four controls can be accessed via the website [www.findsmiley.dk](http://www.findsmiley.dk).

In order to reward food businesses with constantly excellent results, the so-called “elite-smiley” was introduced in 2008. It is awarded to those businesses that had only happy smileys on their last four reports and no remarks during the last year. It only applies to businesses that are checked at least once a year.

The enterprises are divided into risk groups, depending on their line of trade. For each group, there is a standard frequency per year, typically between one to three times a year. Enterprises that have received one of the three “not happy” smileys (i.e. that have not received an overall grade 1) will be re-inspected within a reasonable time period. These re-inspections have to be paid for by the enterprises concerned, whereas the regular inspections are paid for by the tax-payer.

The smiley system is intended to empower the consumer to make an informed choice, by using simple symbols that are easily understood by him or her. Thereby, the system is seen to introduce another powerful incentive for food businesses to secure a high level of food safety.

---

<sup>85</sup>Unless indicated otherwise, the information in this subheading was sourced from <http://www.findsmiley.dk/en-US/Forside.htm> (last accessed in May 2014).

### 25.3.6 *The Food Hygiene Ratings in UK*<sup>86</sup>

In England, Wales and Northern Ireland, consumers are informed about the results of hygiene inspections according to the so-called “Food Hygiene Rating Scheme”. The system covers places where people can eat out, such as restaurants, pubs, cafés, but also schools and hospitals; but also covers places where food can be bought, such as supermarkets and bakeries. Certain businesses that only constitute a low health risk (e.g. because of the food they are selling, such as wrapped sweets or bottled drinks) are not rated.

The scheme is run by local authorities in England, Northern Ireland and Wales and in partnership with the Food Standards Agency. The “hygiene rating” results from the inspection by a food safety officer from the competent local authority. The safety officer checks: how hygienically the food is handled—how it is prepared, cooked, re-heated, cooled and stored, the condition of the structure of the buildings—the cleanliness, layout, lighting, ventilation and other facilities, and how the business manages and records what it does to make sure food is safe.

The ratings range from “0” (urgent improvement necessary) to “5” (very good hygiene standards). One of these six ratings is given at the end of the inspection. If improvement is necessary, the food safety officer will explain the required steps and measures needed to be taken in order to achieve the top rating.

The food safety officer’s inspection report contains more detailed information on the hygiene standards of the inspected business. Unlike the Danish smiley system, the Food Hygiene Rating Scheme does not provide for a publication of this further information. However, this information can be accessed by consumers, if they make a ‘Freedom of Information’ request to the local authority that carried out the inspection.

With every inspection, the business is rated anew. The control frequency depends on the risk group the business belongs to. Businesses that prepare fresh food or sell unprocessed foods are controlled more frequently than businesses that offer only prepacked and refrigerated foods. The control frequency typically ranges between 6 months and 2 years.

Businesses that did not receive the top rate “5” and therefore had to take improvement measures, can ask to be inspected before the next planned inspection is due. In these cases, the food safety officer will check the improvements that have been made and see if a new rating should be given.

In cases where a new business has been set up, or an existing business had a change of ownership, the business will not have a food hygiene rating to begin with. Until the first inspection has taken place, at the end of which a rating will be

---

<sup>86</sup>Unless indicated otherwise, the information in this subheading was sourced from [http://www.food.gov.uk/multimedia/hygiene-rating-schemes/ratings-find-out-more-en/#.U1-1pYF\\_uaw](http://www.food.gov.uk/multimedia/hygiene-rating-schemes/ratings-find-out-more-en/#.U1-1pYF_uaw) (last accessed in May 2014).

given, the business may display a sticker or certificate that says ‘Awaiting Inspection’.<sup>87</sup>

Contrary to the Danish system, food businesses are not legally obliged to publish the sticker or certificate with the hygiene rating in England and Northern Ireland, although they are encouraged to do so. Since November 2013, the display of the sticker in a prominent place is mandatory in Wales, and food business operators have to provide information on their rating verbally, if asked. Further, the hygiene ratings can be accessed via the website <http://ratings.food.gov.uk/>.

Scotland runs a similar scheme, titled “Food Hygiene Information Scheme”. This scheme only provides for two inspection results, i.e. “pass” and “improvement required”. A “pass” means that the business has achieved an acceptable level of compliance with food hygiene law. The result “improvement required” means that the business has not achieved an acceptable level of compliance with food hygiene law.

If food business operators can demonstrate that their hygiene standards are better than those required by law, they can apply for and will receive the so-called “eat-safe-award”. This award, however, is not part of the above-mentioned scheme.

### ***25.3.7 Publication and Legislative Projects in Germany***

#### **25.3.7.1 Food Hygiene Rating Project**

The debate concerning the publication of the results of hygiene inspections in Germany is dominated by legal arguments. Due to the federal structure of Germany, legislation and administration usually does not lie in the same hands. At the moment, there is no federal law that lays down the requirements for the publication of the results of hygiene inspections. Since the publication of these hygiene results is welcomed by the media audience, some Länder (states) have gone their own way to make these publications possible. The example of the Bezirksamt Pankow (local authority of Pankow) is worth mentioning: Pankow introduced a system of visualized hygiene results, based on the Danish smiley system. The results are classified into five categories from “sehr gut” (very good) to “nicht ausreichend” (not sufficient). Since 2011, the results can be accessed via a website.<sup>88</sup>

The system provides for the inspection of various different criteria, such as compliance with food law, traceability, staff training, effectiveness of self-monitoring, storage and refrigeration of foods, structural quality of the premises,

<sup>87</sup>In Wales, the sticker reads “rating awaited”, [http://www.food.gov.uk/multimedia/hygiene-rating-schemes/rating-schemes-faqs-en/fhrs/#.U1-2j4F\\_uaU](http://www.food.gov.uk/multimedia/hygiene-rating-schemes/rating-schemes-faqs-en/fhrs/#.U1-2j4F_uaU) (last accessed in May 2014).

<sup>88</sup>Please note that Pankow has preliminarily stopped the publication of the results, due to another judgment of a German administrative court, causing doubts as to the legality of such a project, see <https://www.berlin.de/ba-pankow/aktuelles/pressemitteilungen/2014/pressemitteilung.251465.php> (in German).

cleaning and disinfection, and pest control. In case a post-control has already been carried out at the time of publication, this post-control and its date will be listed on the report, also whether corrective measures have been taken in between inspections. The results of the post-control do not influence the grading of the smiley, however.<sup>89</sup> This means, a sour smiley (“not sufficient”) will still be displayed, even if deficiencies noted during the first inspection have been remedied in the meantime.

The Verbraucherzentrale NRW (consumer organisation of Northrhine-Westphalia), a non-governmental organization, has started their own “pilot project” named “appetitlich” (appetizing) in two German cities: They request information on the hygiene situation of food businesses in the relevant cities according to the German Verbraucherinformationsgesetz (Consumer Information Act). This information is then categorized and visualized by using a color bar. The color bar has three sections: green (requirements met), yellow (requirements partly met) and red (requirements not met). The color bar can be accessed via the internet<sup>90</sup> since December 2013, an app is also available.

### 25.3.7.2 Recent Legislative Developments

The German Lebens- und Futtermittelgesetzbuch (Food and Animal Feedstuff Code—hereinafter referred to as LFGB) contains a provision that obliges the competent authorities to inform the public also in cases where a health risk is not involved.<sup>91</sup> The provision reads as follows:

The competent authority shall inform the public, stating the name of the food or feed, as well as that of the food or feed business operator under whose name or company the food or feed is produced or handled or placed on the market, if based on facts, in case of samples in accordance with Section 39 (1) Sentence 2, based on at least two independent studies from bodies according to Article 12 (2) of Regulation (EC) No 882/2004, there are sufficient grounds for suspecting that

---

<sup>89</sup>With its decision of 19.03.2014 (file no: 14 L 410.13), the Administrative Court of Berlin raised fundamental doubts concerning the lawfulness of such publication practice, and has preliminarily prohibited any further publication via the Internet by the authority concerned. The administrative court stated, in particular: “The publication of alleged hygiene deficiencies does not concern crisis management in unforeseen cases, but administrative measures in the area of health and consumer protection that aim at the handling of numerous specific cases and at remedying the resulting disadvantages. The publications have effects that are equivalent to those of a regulatory instrument: The food business operator concerned will be pilloried electronically, which is significantly more onerous than an administrative order to remedy the deficiencies found. [...] The publication on the internet undoubtedly infringes basic rights. The legality of the infringement has to be denied after summary examination. Administrative action by administrative information is irreversible, and in case of wrong information, this cannot be changed by the presentation of counter-arguments or other corrections, since the factual consequences of information, especially on the internet, regularly cannot be captured and completely erased.” [translation is ours]

<sup>90</sup><http://www.verbraucherzentrale.nrw/kontrollbarometer>.

<sup>91</sup>Section 40 (1a) LFGB [translation is ours].

1. permissible limits, maximum levels or limits laid down in provisions within the scope of this Code, have been exceeded, or
2. provisions within the scope of this Code, which serve the protection of consumers against health hazards, the prevention of fraud, or the compliance with hygiene requirements, have been violated to a non-insignificant extent or have been repeatedly violated, and the imposition of a fine of not less than three hundred and fifty Euros is expected.<sup>92</sup>

This provision has been controversially discussed, already during the legislative process. Within seven months after its entering into force, the provision was already subject of 20 administrative court proceedings (mainly concerning alternative No 2).

In the vast majority of cases (concerning alternative No 2), the courts requested a specific reference to a product, and did not authorize informing the public about general hygiene conditions in food businesses.<sup>93</sup> A majority of administrative courts further considered informing the public of deficiencies that had already been remedies to be disproportionate. They also requested a substantiated reasoning on the part of authorities as concerned the expected amount of the fine. These numerous decisions in the first instance already resulted in four decisions of appellate courts (Oberverwaltungsgerichte—Higher Regional Courts).

In three of the four decisions, the courts expressed doubts as to the constitutionality of the provision:<sup>94</sup> The courts voiced their concern in particular as regards the principle of legal certainty and clarity, as well as the proportionality principle: The principle of legal certainty and clarity might be infringed since there is no uniform catalogue of fines, and different authorities would handle comparative cases not in a uniform manner. It was further criticized that the provision did not provide rules on the duration of the publication of information, which, since it is essential for the extent of impairment of fundamental rights, should have been regulated by the legislator. It was not considered sufficient to regulate this issue only through ministerial decrees.

A violation of the proportionality principle was discussed, since an administrative fine of 350 Euros would only be imposed for minor offences, whereas a publication of violations of food law could lead to an extensive impairment of fundamental rights; further, the provision did not provide for exceptions or hardship clauses.

Publications according to alternative No. 1 have rarely been challenged before the courts. The Verwaltungsgericht Hannover (administrative court of Hannover) based its decision on the clear wording of the provision as well as the legislative

<sup>92</sup>Section 40 (1a) LFGB [translation is ours].

<sup>93</sup>VG Karlsruhe (administrative Court of Karlsruhe), 07.11.2012, file no: 2 K 2430/12; VG Berlin (administrative Court of Berlin), 28.11.2012, file no: 14 K 79.12.

<sup>94</sup>OVG Lüneburg (Higher Administrative Court of Lüneburg), 18.01.2013, file no: 13 ME 267/12; VGH Baden-Württemberg (Higher Administrative, Beschl. v. 28.01.2013, Az.: 9 S 2423/12; OVG Rheinland-Pfalz, Beschl v. 13.02.2013, Az.: 6 B 100035/13.OVG; Bayerischer VGH, Beschl. v. 18.03.2013, Az.: 9 CE 12.2755.

materials and decided that in case of samples two independent analyses from two different laboratories were needed. The court thereby rejected the common practice of authorities to have validation studies carried out in one and the same laboratory.<sup>95</sup>

The Bundesverfassungsgericht (Federal Constitutional Court) is currently assessing the constitutionality of the provision. A decision is expected soon, and it is hoped that the decision will set fundamental standards for national laws on transparency.

Just as well as the provision discussed supra, the German Verbraucherinformationsgesetz (Consumer Information Act—hereinafter referred to as VIG) has also undergone a revision.<sup>96</sup> The aim of the Act is to “improve market transparency, thereby enhancing consumer protection from food that is injurious to health or otherwise unsafe, and also from fraud as regards products and consumer products.”<sup>97</sup> In order to achieve this aim, “within the framework of this law, everybody has free access to all data concerning (...) inadmissible infringements”<sup>98</sup> of food law requirements as established by the competent authorities.

An application to access information must be “sufficiently precise und must indicate which information it is directed at”.<sup>99</sup> The authority that receives an application to access can grant the food business operator concerned the right to be heard.<sup>100</sup> In the interest of the applicant, the law foresees that a decision generally has to be taken within 1 month. The access to information can be granted orally, by access to files or by other means.<sup>101</sup> It is worth noting that the authority is not obliged to check the accuracy of the information it makes available to the public.<sup>102</sup>

At the time of writing, there was only one administrative court decision concerning the revised Consumer Information Act.<sup>103</sup> In this decision, the court does not address any of the varied legal concerns expressed by jurisprudence relating to the provisions of the Consumer Information Act.<sup>104</sup> It has to be pointed

<sup>95</sup>Beschl. v. 29.01.2013, Az.: 9 B 264/12.

<sup>96</sup>The revised Act entered into force on 01.09.2012.

<sup>97</sup>Section 1 VIG [translation is ours].

<sup>98</sup>Section 2 VIG [translation is ours].

<sup>99</sup>Section 3 VIG [translation is ours].

<sup>100</sup>Section 3 VIG [translation is ours].

<sup>101</sup>Section 6 VIG.

<sup>102</sup>Section 6 VIG.

<sup>103</sup>Verwaltungsgericht Oldenburg (Administrative Court of Oldenburg), 22.10.2013, file no: 7 A 1866/10 with a critical comment by Wallau/Theis in DVBL 2014, p. 330 ff. The Administrative Court has not even considered whether a violation of the right to a counter sample according to Art. 11 (5) and (6) of Regulation (EC) No 882/2004, *op. cit.*, would preclude a publication of information. The CJEU had already decided that the right to a counter sample is essential (10. April 2003, Case C-276/01).

<sup>104</sup>See Becker ZLR 2011, p. 391 ff.

out that, in practice, mainly NGOs, journalists and the media in general have used the Consumer Information Act, whereas applications from consumers are rare.

## 25.4 Conclusion

The concepts of transparency and openness will lead to further changes in food law. The concept of a restricted public access to files (“beschränkte Aktenöffentlichkeit”) and keeping the content of files secret (“Aktengeheimnis”) traditionally predominant in German administrative law has come to an end, due to the development in and the primacy of EU law.

The revision of Regulation (EU) No 882/2004 clearly proves that on the EU level, the die is cast in favor of further developing transparency and openness in the food sector. This is consistent insofar as transparency and openness lead to a strengthening of the “organised civil society”; NGOs, for example, thereby are awarded the role of “information-watchdogs”.<sup>105</sup>

It is questionable, however, whether the causes that initially led to an extension of transparency systems, can thereby be eliminated. The “problem of trust”, it seems, will not be solved this way, but only be shifted: The citizen is generally not in a position to validate the published information; if he mistrusts the authorities, he is generally forced to trust the private institutions, such as NGOs, who filter and manage information. The “privatization” of information gathered during official inspections could lead to a decrease in legal safeguards for the food business operators concerned: The presumption of innocence, for example, only fully applies within the framework of sanction procedures, but only has limited effects with respect to media coverage.<sup>106</sup> It seems striking that through the publication of “negative” information via the Internet, an instrument from medieval times seems to return, albeit with a modern twist: The electronic pillory. The former vice-president of the German Bundesverfassungsgericht (Federal Constitutional Court), Winfried Hassemer, has pointed out a decisive difference between the medieval variant of the pillory and its modern form, in particular in the area of food law: “Also in our part of the world, the historical pillory was only used with relative restraint: Those, who were being pilloried, had at least been sentenced to this procedure by a final court judgment.”<sup>107</sup>

# Chapter 26

## Food Law in Sweden

Magnus Friberg

**Abstract** Sweden is a member of the European Union (“EU”). It has implemented all food legislation adopted by the EU. This chapter provides a brief background to the legal situation in Sweden including previous safety and labeling issues. It then continues with a description of applicable national legislation and “soft laws,” the government agencies and the industry organizations and their self-regulatory measures. The chapter continues with a description of the supervisory procedure and sanctions. After this follows a brief presentation of the HACCP-rules and, in particular, the industry’s guidelines that operators of a specific branch of the industry may follow. The chapter finishes with a review of labeling and marketing related issues.

### 26.1 Background

#### 26.1.1 Food Law in Sweden

Sweden, a member of the EU since 1995, began adapting EU food legislation in 1992 as part of Sweden’s dedication to the European Economic Area (EEA) agreement. Sweden implemented the EU *Acquis Communautaire* into its law as part of Sweden’s and the other European Free Trade Association (EFTA) countries’ commitments to the EEA agreement. At this time, the Swedish Food Act from 1970 and the Food Decree formed the core Swedish legislation; indeed, they still form the basis for all other law today. Additional legislation included the Veterinary import ordinance, Ordinance (1974:270) for the control on the importation of food, Ordinance (1974:271) on control of the export of food, and National Food Agency-adopted Regulations.

The Food Act gave the Swedish National Food Agency the parameters within which to adopt and implement detailed provisions in certain areas, a method still

---

Advokatbyrån Gulliksson AB, Lund, Sweden  
e-mail: [Magnus.Friberg@gulliksson.se](mailto:Magnus.Friberg@gulliksson.se)

used when implementing European Commission (EC) legislation. While regulations apply directly, directives are transposed into National Food Agency Regulations and published in the Agency's own Code of Statutes, LIVSFS (previously SLVFS). The authority to issue legislation is outlined in the Food Act and the Food Decree.

When assessing the need for revision and adaptation of the Swedish legislation in force in 1992, the Swedish government found that Swedish law in many respects harmonized with EU legislation. For example, the system of food control in Sweden prior to the implementation of EU law was such that it did not need any revisions or amendments. At this time, Sweden had also participated in an international context. Of note was Sweden's engagement in the Food and Agriculture Organization's (FAO) and the World Health Organization (WHO)'s Food Standards Program for the standardization of food products, the *Codex Alimentarius*, which Sweden had been engaged with for almost 30 years. Sweden's own Codex Contact point is the Swedish National Food Agency. Within the cooperation between the Nordic countries, there were also harmonization activities regarding food law. The provisions issued by the National Food Agency required adaptation, and in a few areas, there was a need for revisions of the applicable existing legislation. These were primarily labeling and foodstuffs for particular nutritional uses (PARNUTS).

Today, the Food legislation is in principle harmonized within the EU. The National Food Administration participates actively in the development of new legislation in collaboration with the other EU member states.<sup>1</sup> The Swedish Food Act not only complements the EC legislation, but also lists the food control authorities and contains stipulations on penalties and appeals.

### **26.1.2 Historic Safety Issues**

The Swedish Board of Agriculture and the National Food Agency have long handled food safety issues. Historically, Sweden has been spared salmonella to a large extent. Salmonella and other forms of infectious diseases have been high on the agenda in order to maintain a high level of control and protection. This has also led to "skirmishes" between Sweden and neighboring countries over import restrictions, denigrating marketing, and other protective actions taken to ensure food safety. Other major issues include concern with anti-biotic resistance due to high levels in meat as well as pesticide residues in food. Animal welfare also ranks high on the agenda.

An example includes the criminal proceedings for the distribution of bovine semen from the Belgian Blue breed, and the subsequent insemination of cattle with this semen. Ultimately, the case was referred to the European Court of Justice. Sweden claimed protection of animal health, arguing that any breeding was liable to

---

<sup>1</sup>National Food Agency, available at <http://www.slv.se/en-gb/>.

entail suffering for animals or affect their behavior. The Court found that the Member State of import's national authorities were not entitled to reject the use of semen which was accepted for artificial insemination in another Member state on the grounds that it contained the muscular hypertrophy gene, that using the semen would likely entail suffering for the animals or affect their natural behavior, or that the national authorities regarded the breed as a carrier of genetic defects.<sup>2</sup> The case caused a stir in Sweden, as is generally the case with animal maltreatment or what is perceived as such. The Belgian Blue was not seen as natural, and this case sparked one of the first discussions about genetically modified (GM) foods and continued the ongoing discussion and dilemma of animal maltreatment.

### ***26.1.3 Historic Labeling Issues***

The Swedish agricultural community has remained a strong force on the Swedish market, traditionally for the protection of the farming community. This community had a particularly strong influence on protecting denominations for certain products—for example, milk, butter, and cream. Correspondingly, the community has weighed in on the topic of launching alternate products to these protected product names. Here we see a “battle” between consumer interests in alternative, cheaper products, and the interests of quality, prevention of misleading marketing, and the protection of the agricultural community's interests. Examples include the introduction of margarine, substitutions for single and double cream with vegetable oil based products, and the protection of names of cheeses.

These issues primarily address the use of signal color and product names. Double cream in Swedish, for instance, is ordinarily sold in red and white colored packaging single cream in green and white. Questions related to the introduction of substitute products based on vegetable oil included what color schemes could be used, how best to describe products and whether it was possible to mention cream on labels or product descriptions. The products were introduced under the names “Ädelvisp” and “Ädelkaffe” (cream is “grädde” in Swedish, double cream is “vispgrädde,” and single cream is “kaffegrädde” in Swedish (“kaffe” is coffee). The products were introduced in red and white (“Ädelvisp”) and green and white (“Ädelkaffe”) color schemes. Other examples, however, further illustrate the issues that come in Swedish food law, as the following paragraphs show.

---

<sup>2</sup>Court of Justice of the European Union (“ECJ”) Case C-162/05.

### **26.1.4 Health Claims: Originally a Self-Regulatory Measure**

Since 1990, Sweden has allowed health claims. Swedish government agencies gave permission to the Industry to create and adopt self-regulatory measures for the use of health claims in the marketing of food. This was called “Health Claims in the Labeling and Marketing of Food” (“Hälsopåståenden vid märkning och marknadsföring av livsmedel”), generally referred to as the “Self-Regulatory Program” (“Egenåtgärdsprogrammet”). The Sweden Nutrition Foundation (SNF),<sup>3</sup> which administered these intended laws provided a platform and acted as a guarantor of a scientific level and objectivity. In 1990, Nils-George Asp, SNF’s CEO and Professor of Applied Nutrition at Lund University, was appointed to participate in the writing of the law that the industry later agreed to. SNF’s role also encompassed council and interpretation. Only claims that followed this code were permitted. Since the introduction of the code, SNF has taken on an advisory and coordinating role.

The first version, introduced in 1990, was based on general generic claims concerning the diminished risk for disease and the then eight established relationships between food and health. The claims were to be made in two steps—“X limits the risk for heart disease. Product Y contains X.” By 2001, product specific physiological claims were allowed. SNF also introduced a special board for the assessment of claims on labels or in marketing. All products that wished to make these claims had to go through an independent scientific assessment. In 2003 and 2004, the terms and conditions for use of the generic claims were established. Additionally, nutrition claims were deemed as a form of generic claims. Beginning in 2008, the Industry appointed the Food Industry’s Examiner (“Livsmedelsbranschens Granskningsman”) to support and supervise the use of nutrition and health claims according to the Regulation 1924/2006.<sup>4</sup>

### **26.1.5 Current Issues and Problems**

Issues regarding food safety continue to pervade Swedish food law and policy. Recent concerns include the re-packaging and relabeling of food products whose expiry date has passed, as well as the handling of fresh products such as minced meat in in-store packaging facilities. There have also been recalls due to salmonella and other contaminations; however, the number of incidents remains limited. Fresh drinking water has also become an issue where the drinking water in a number of municipalities has been found to be contaminated with bacteria or chemicals.

Concerning food labeling, the so-called horse meat scandal that included one of Sweden’s leading food operators remains at the forefront of many consumers’

---

<sup>3</sup>Swedish Nutrition Foundation, available at <http://snf.ideon.se/>.

<sup>4</sup>*Id.*

minds. A number of similar incidents followed the scandal, including when colored filet of pork was sold as filet of beef. To some extent, this had religious implications, since certain religions do not permit the consumption of pork; undoubtedly, this caused some damage to the industry. In the case of the horse meat scandal, the operator, in whose business it all started in Sweden, launched a substantial and successful public relation campaign to turn the negative publicity around and save both the business and its reputation. Additionally, the operator made significant changes in its business implementing control functions, designed to avoid other incidents or similar cases from happening again. Also increasing are incidents and complaints concerning nutrition and health claims where the ongoing cases address the detailed interpretation of the Regulation 1924/2006/EG. There has also been a rising number of cases of food fraud for instance in the form of misleading origin labeling in recent years. The National Food Agency is addressing this situation and the industry organizations has also adopted a new program and licensing system to address origin fraud but also the promotion of food of Swedish origin called “Från Sverige” (“From Sweden”).

## **26.2 Relevant Authorities, Legislation and “Soft Laws”**

This section gives an introduction to some of the relevant legislation and soft laws applicable to the topics to be discussed for Sweden. Following is a description of the authorities and the industry’s organizations and their roles on the market. The chapter concludes by discussing how the different parts work together towards a socioeconomically effective as well as ethical conduct on the market.

### ***26.2.1 The National Food Agency and the Regional Authorities***

The National Food Administration is responsible at the national level for enforcing the Food Act and regulations issued under the provisions thereof. The County Administrations have responsibility for coordinating food control at the regional level and the municipal Environment and Health Protection Committees have responsibility for food control at the local level. Most companies fall under the supervision of the County Administrations; only a few are supervised directly by the National Food Agency.

The Agencies’ supervision primarily concerns food safety and labeling requirements. Advertising in other media rather than on labels is primarily handled by the Consumer Agency (see below).<sup>5</sup>

---

<sup>5</sup>The National Food Agency, What We Do, available at <http://www.slv.se/en-gb/Group2/About-us/What-we-do/>.

The National Food Agency has also been given the task of promoting healthy food consumption habits. The Agency issues, for example, advisory documents suggesting nutritious and healthy food for various consumer groups—children, pregnant women, and normal consumers. Together with its equivalent Scandinavian authorities, the National Food Agency publishes The Nordic Nutrition Recommendations, which form the basis of the national dietary recommendations in Nordic countries and are used academically in teaching nutritional science. An international collaborative effort, the Recommendations are the result of the work of more than 100 experts led by a working group under the Nordic Council of Ministers.<sup>6</sup>

The Keyhole symbol is another product of collaboration whose details will be discussed further in this chapter. The Keyhole symbol is intended to function as a guide for the consumer to find healthy food products, and operators may affix the symbol on their products that are in accordance with the requirements as to composition.

In 2004, the Government commissioned the National Food Agency and the National Institute of Public Health to produce a plan for healthy eating habits and increased physical activity in the Swedish population.<sup>7</sup> Not forgetting that environmental issues are often linked to food consumption, the National Food Agency is actively engaged in addressing sustainability concerns such as food waste; it is estimated, for example, that the average Swede throws away 25 kg of edible food per year.

### ***26.2.2 The Swedish Consumer Agency***

The Swedish Consumer Agency is a government agency whose purpose is to safeguard consumer interests. To achieve this goal, the Agency reviews product safety issues, advertising, consumer contract terms and conditions, environmental issues, and more. A Director General leads the Swedish Consumer Agency, and in addition to this role, is a Consumer Ombudsman (Konsumentombudsman, KO) who can represent consumer interests in relation to businesses and pursue legal action in the courts.

The Agency may act against all forms of marketing for food products, including labeling. Regarding the latter, any such action would primarily concern voluntary labeling—for instance, claims made for the product. It may also intervene in

---

<sup>6</sup>The Nordic Council, Nordic Nutrition Recommendations, available at <http://www.slv.se/en-gb/Startpage-NNR/>.

<sup>7</sup>The National Food Agency, Action Plan for Healthy Eating Habits, available at <http://www.slv.se/en-gb/Group1/Food-and-Nutrition/Action-plan-for-healthy-eating-habits/>.

product safety issues, and in these matters, the Agency works closely with the National Food Agency.<sup>8</sup>

### ***26.2.3 The Medical Products Agency***

Another government agency is the Medical Products Agency, responsible for regulating and supervising the development, manufacturing, and sale of drugs and other medicinal products. Its task is to ensure that both the individual patient and healthcare professionals have access to safe and effective medicinal products and that these are used in a rational and cost-effective manner.

The Medical Products Agency acts under the aegis of the Ministry of Health and Social Affairs, with many of its operations largely financed through fees. Approximately 750 people, mostly pharmacists and doctors, work at the Agency.

The Medical Products Agency may have cause to react to advertising for food or food supplements that make medical claims, or that contain substances which makes them medical products by function. This has on occasion led to a product being classified as a medicinal product and with a subsequent sales ban.<sup>9</sup>

### ***26.2.4 Food Stuff Act and Agency Regulations***

Sweden, as a member of the European Union (“EU”), follows EU-adopted legislation. If Sweden does not incorporate such legislation, the country can be brought before the EU Court of Justice. If a Swedish law conflicts with an EU law, the EU law takes priority. EU-legislation may apply directly, as it does with regulations, or may be implemented, which is the case with directives and decisions. In Sweden, most legislation concerning food is, or is based upon, EU-legislation.

The Swedish Food Act (SFS 2006:804) complements EU regulations and contains rules about control or supervision, governmental fees, penalties, and appeal of decisions. The Swedish Government has listed which EU regulations which wholly or partially supplemented by the Food Act.

The Swedish Food Ordinance (SFS 2006:813) regulates what authority shall supervise which facilities. Along with the Food Act, the Swedish Food Ordinance authorizes the National Food Agency to issue various regulations. Most EU-legislation and particular national regulations are adopted and implemented through the National Food Agency’s regulations. These are published in the

---

<sup>8</sup>The Swedish Consumer Agency, About the Swedish Consumer Agency, available at <http://www.konsumentverket.se/otherlanguages/English/About-the-Swedish-Consumer-Agency/>.

<sup>9</sup>The Medical Products Agency, About the Medical Products Agency, available at <http://www.lakemedelsverket.se/english/overview/About-MPA/>.

National Food Agency's Code of Statutes, LIVSFS (previously SLVFS). These regulations are based on EU directives or complement the EU regulations. Only a few regulations are not derived from EU-legislation. All regulations are available on the agency's website in a consolidated form. ("Consolidated form" means that any changes made to a provision has been incorporated in the text).

Additionally, the National Food Agency issues guidelines to achieve uniform application of food legislation in Sweden. The purpose is to describe and interpret the content of the legislation. The guidelines also express the National Food Agency's position with regard to the supervision of the legislation. The guideline often contains additional information not expressed in the legislation, thereby increasing the understanding of the legislation and the National Food Agency's interpretation of it. Though not legally binding, the guidelines serve in the assessment and implementation of the legislation. The Courts may consider the guidelines in their application of the legislation and as an expression of good practice; the Courts may also disregard the guidelines and come to a different interpretation of the legislation. Naturally, court precedents from the Swedish national courts and the European Court of Justice amend or alter these guidelines.

### 26.2.5 *Marketing Act*

In addition to the Food legislation, the Marketing Act<sup>10</sup> applies to food labeling and marketing. The Marketing Act is the implementation of EU-directive 2005/29/EC concerning unfair business practices. In Sweden, the Marketing Practice Act of Sweden (Sw. *Marknadsföringslagen* (2008:486)) regulates general misleading advertising by implementing the Directive 2005/29/EC on unfair business practices. *Lex specialis* for food advertising is, of course, the Food Act and the specific regulations for e.g. labeling, nutrition and health claims and the prohibitions in those regulations against misleading labeling and advertising. Advertising in violation of these regulations is also considered a violation of the Marketing Act.

However, the Marketing Act is broad in its scope, applicable regardless of product, medium or intended target group. The Marketing Act is intended to protect both consumers and businesses and thus is applicable to both business-to-consumer advertising as well as business-to-business advertising. It also regulates practices which are not directly covered by the food legislation but which might still occur in food advertising such as misleading packaging size, passing-off (where a company imitates, for example, a product or its package design in a misleading way), comparative advertising, price claims and comparisons, denigration or ridiculing of competitors and/or their products where the denigration is not misleading.

---

<sup>10</sup>Marketing Act ("Marknadsföringslag") (2008:486), Swedish Code of Statutes, available at <http://www.government.se/content/1/c6/05/03/14/6c7aa374.pdf>.

In accordance with the Marketing Act, the assessment of a marketing measure could also differ from the assessment made according to the food legislation. One reason is that different courts handle cases according to the Marketing Act and the food legislation; another, that the Marketing Act requires not only an assessment of whether or not the advertising is misleading, but also if the advertisement is likely materially to distort the economic conduct of the average consumer.

Still, what is misleading food advertising under the food legislation is also, in general, misleading under the Marketing Act. The possibility of applying the Marketing Act to cases like this gives the operator another prosecutorial avenue in relation to a competitor's misleading advertising measures with different sanctions, including interim sanctions, as well as the possibility of demanding compensation for damages.

### ***26.2.6 Industry Self-Regulatory Measures***

The Swedish Food Federation (Livsmedelsföretagen)<sup>11</sup> represents a variety of companies in the food industry. It is a member of the Confederation of Swedish Enterprise (Svenskt Näringsliv) and FoodDrinkEurope. The Swedish Food Federation monitors and acts in the interest of its member companies. For instance, it monitors the application of the legislation in the different regions to ensure that all companies are treated equal according to the law. It maintains a continuous dialogue with the inspectors in each of the regional offices and pushes for further training. Additionally, the Swedish Food Federation provides guidance and advice regarding the interpretation and application of food legislation. It has, for example, issued guidance documents for its members, including a handbook on labeling.

Another group called Swedish Retail (Svensk Dagligvaruhandel)<sup>12</sup> organizes the Swedish retail industry and aims to satisfy consumers' need for reliable products. Among other activities, it issues guidelines on varying topics with relation to retail. It also represents its member companies in matters relevant to the Industry as a whole in negotiations before authorities and legislators.

Both the Swedish Food Federation and Swedish Retail sponsored the industry's previous support function for health claims.<sup>13</sup> This support was intended to enable the food industry to use nutrition and health claims in a responsible and balanced way, to accomplish fair competition among companies, and to maintain high confidence in consumers in the food they purchase and consume and the food industry at large.

The Sweden Nutrition Foundation ("SNF") coordinated support and advice, while a Food industry Examiner (LGM) engaged in market monitoring and cases

<sup>12</sup>Swedish Retail, available at <http://www.svenskdagligvaruhandel.se/>.

<sup>13</sup>*Id.*

assessment. The Examiner continuously tracked the market and assessed claims in marketing in accordance with Regulation 1924/2006. The Examiner either tried cases on its initiative or upon notification from competitors or the general public. If the Examiner was of the opinion that an operator was in violation of the Regulation, the Examiner would approach the operator and invite them to respond to its assessment. If the assessment was maintained after the response and the company refused to change, the Examiner then issued a recommendation which was made public. The Examiner could also refer matters to the Food Agency or the Consumer Agency for further legal actions to have the labeling or marketing stopped. This support was discontinued in 2014.

Svensk Egenvård, or Swedish self-care,<sup>14</sup> organizes 75 % of the suppliers of plant-based pharmaceuticals, dietary supplements, weight loss products, sports nutrition, and “parnuts” (Foods for Particular Nutritional Use) on the Swedish market. To aid in examining product quality, Svensk Egenvård utilizes an external consultant whose monitoring consists of cluster sampling to ensure that the product content complies with the labeling and contains no unwanted substances. Svensk Egenvård created a Council for market supervision and also appointed an examiner to monitor advertising. This Board was discontinued in 2015. The Board collaborated with the appropriate government agencies, such as the National Food Agency, the Medical Products Agency, and the Consumer Agency. The Council’s decisions were made public and available via Svensk Egenvård’s website.

### ***26.2.7 Other Private Initiatives***

Numerous private organizations strive to improve food quality and encourage environmentally sustainable and ethical food production as well as ethical labeling and marketing of food. In particular, the environmentally sustainable and ethical food production organizations have gained considerable attention. An example of such organizations is KRAV, a key organization on the market for organic food. The KRAV-label has been on the market for many years and stands for a sound and natural environment, solid care for animals, good health, and social responsibility. Another organization started by two families is “Äkta vara” or “Real stuff,” focused on labeling and food products without additives. Both organizations license the use of their labels and are registered trademarks.

Furthermore, there are a number of consumer organizations, including Konsumentföreningen Stockholm or “Stockholm Consumer Cooperative Society,” that have profiled themselves with regard to food labeling, advertising, and safety.

<sup>14</sup>Swedish Retail, available at <http://www.svenskegenvard.se>.

### **26.2.8 Conclusions: The Players and Their Roles**

Both the legislative and supervisory systems are based on three legs: the authorities, the industry organizations, and the operators themselves.

The commercial legislation for the health claim regulation, the Marketing Act, and the labeling regulations stems from industry self-regulatory measures where the embryos, later to be codified into legislation, were formed in industry's different branches. The industry's self-regulatory measures still plays an important part in forming new rules, codes of conduct, good practices. Such self-regulation also influences the legislation's application through the development of its own "case law" and co-operating closely, but also confronting, the authorities on their interpretation of the law. This is the case with the Marketing Act, its first version emerging in the early 1970s and based largely on the International Code Council ("ICC") Code of good marketing practice. Today, it follows the ICC Code for advertising and market communication, providing yet another example of an industry organization striving to maintain its regulatory system alongside the legislation.

The government agencies, the industry organizations, operators, and other initiatives on the market create "the law" in a broad sense, including actual legislation, codes of conducts or soft laws, and more. In turn, this contributes to the supervision of the market and in doing so aides in further development of "the law."

## **26.3 The Supervisory Procedure and Sanctions<sup>15</sup>**

As previously stated under Sect. 26.2.1, the supervisory function with regard to the food legislation befalls on the National Food Agency and the municipal Environment and Health Protection Committees. This chapter will describe the food agencies' supervisory functions and the measures applied to food operators found transgressing the legislation. It will conclude with a discussion of the supervision and sanctions available according to the Marketing Act and some industry board cases.

---

<sup>15</sup>See the National Food Agency's guideline concerning sanctions in the food legislation "Vägledning – sanktioner i livsmedelslagstiftningen," available (only in Swedish) at [http://www.slv.se/upload/dokument/livsmedelsforetag/vagledningar/Sanktioner\\_%20i\\_%20livsmedelslagstiftningen.pdf](http://www.slv.se/upload/dokument/livsmedelsforetag/vagledningar/Sanktioner_%20i_%20livsmedelslagstiftningen.pdf).

### ***26.3.1 Food Agencies Inspections: Proportionate Measures***

Primarily, municipal food inspectors conduct supervision through regular inspections, and in some cases, matters may be referred to the police and, potentially, for prosecution. When an inspector detects a deviation or a transgression, the first course of action is to urge the food operator to adhere to the set legislation and to inform the operator of the measures needed in order to comply. However, the instructions to the examiners from the National Food Administration for the initial contacts with the operator are meant to point out the deficiencies and to encourage the operator to comply with the law. If the demands raised by the examiner are perceived as a binding request for compliance, meaning that the authority may take legal action should the operator not comply with the law, such requests must be in the form of a decision so that the operator could appeal to a higher instance if necessary.

Suppose, for example, that an examiner detects serious deficiencies, or if, in a later follow-up inspection, he or she discovers that the operator never addressed the deficiency previously detected, or has only taken insufficient measures. The authority would consider using a suitable administrative penalty to achieve compliance. In assessing which measure should be taken, the authority would consider the nature and seriousness of the transgression, and whether or not the operator failed to comply with the legislation on previous occasions.

Whatever measure is taken, then, should be proportionate to the situation: tougher sanctions in relation to serious or repeated transgressions and failure or refusal to comply with the legislation, and less severe sanctions in cases of lesser transgressions and “first offences” apply. The principles of the supervision not only invite cooperation between the authority and the operator, but also put measures in place to achieve the goals of the legislation.

### ***26.3.2 Communication During the Procedure***

The food business operator must always have access to information relevant to the case and the opportunity to comment on the inspection report. The method used may vary and is decided by the authority. Normally, the operator is given a report in relation to the inspection, which may be sent by post or communicated orally; however, the latter is not recommended as it carries a risk of misunderstanding if the report is extensive and detailed. The communication should always be made to a person authorized to act for the operator.

In certain cases of a particularly serious nature, it may be necessary to decide on administrative measures directly and without communication. In such a case, the nature of the situation is such that a decision cannot be postponed—for example, if human life and health are in immediate jeopardy.

### ***26.3.3 The Possibility to Appeal and the Court Procedure***

The notification of the decision must contain the reasons for said decision and information of the possibility to appeal including the procedure for this. The County Administrative Board (Länsstyrelsen) takes the appeals in the county where the operator has its place of business. The Board's decision can be appealed to the Administrative Court, and that decision in turn can be appealed to the Administrative Court of Appeal, and, finally, to the Supreme Administrative Court.

The decision may have immediate effect. As a rule, the operator only has to abide by a decision that has come into force. If the finding is appealed, its effect will be postponed. However, in certain cases, the authority may decide that the decision should apply immediately and the operator must abide by the decision, even if it is appealed. This is only used in severe cases where there is an immediate danger to human life or health. Even in such cases, the authority must evaluate the implications for the operator—economically and otherwise. The authority should also consider whether or not the effects of the decision can be restored should the operator prevail on appeal and the decision be overturned. In such a case, the authority may have to compensate damages suffered by the operator.

In a case where a decision has an immediate effect, it is also possible for the operator to ask that the court grant inhibition of the decision—that is, a temporary stay in the enforcement. If granted, the operator may continue its business despite the decision for the duration of the court procedure. Inhibition, however, is rare and requires special circumstances in order to be granted. In making its decision, the court considers the implications of the decision on the operator, the nature of the transgression, and the likelihood of the decision being overturned.

A case before the Supreme Administrative Court concerned the repeal of authorization of a plant that handled the production and packaging of ostrich meat. The plant did not meet the requirements outlined in the applicable legislation. In order to meet these standards, the plant would have to make substantial changes in the business conducted there. The company appealed the decision and asked that the decision, which had an immediate effect, be subject to inhibition. The Supreme Administrative Court weighed both the interest of the company in having the decision lifted and the public interest in food safety. It had been established that there was no such risk, and the decision was based not on risk but rather on the assumption that the decision to repeal would not be effective. The operator also argued that its business was encompassed by an exemption according to an EU-directive and that most of the deficiencies that the authority had found had been remedied. The Court found that the outcome of the matter was not certain. Circumstances were such that public interest in food safety could not take precedence over the operator's interest in continuing its business during the process. The Court thus granted inhibition.<sup>16</sup>

---

<sup>16</sup>See Supreme Administrative Court, case no 3686-04.

### **26.3.4 Sanctions**

In order to achieve compliance by the operator, the authority may issue sanctions. Among the most used sanctions are injunctions and prohibitive injunctions. The legal basis is found in both article 54 in the Regulation 882/2204/EC and section 22 in the Food Act.

Injunctions are used to get the operator to submit an action plan that the operator has not submitted or to get the operator to implement measures necessary to come into compliance with the legislation. Prohibitive injunctions are to compel the operator to refrain from a certain conduct. Which of these measures are used depend on the situation.

An injunction, prohibitive or other, must be precise in its scope and in the operator's requirements. The legal basis should also be clear on which rule in the legislation the decision is based.

As the supervision in effect concerns the operators' compliance programs the inspections should be directed primarily on detecting and remedying weaknesses in these programs. The measures taken should always address a specific problem. As the applicable regulations may be vague in their wording, it is important that the decisions issued are clear and reasoned.

### **26.3.5 Injunctions Conditioned on Penalties**

In order to put further pressure on the operator, the injunctions are, as a rule, conditioned on a monetary penalty. If, for example, the operator does not comply with an injunction to implement a certain measure within a set time frame, a court may order the operator to pay a stipulated penalty. The amounts vary depending on the nature of the transgression, repeated transgressions, or unwillingness to collaborate. The penalty's purpose is to serve as an inducement to adhere to the decision. The decision must be clear as to what the operator is required to perform; if unclear, the penalty cannot be ordered.

Though set in the decision, the penalty amount can be adjusted by the Court if it is found that ordering the full amount is deemed disproportionate to the nature of the operator's failure. This, however, is rare. The normal practice is that payment in the full amount should be ordered unless the incompliance can be justified as excusable due special circumstances, or that the penalty would affect the operator unreasonably hard. If the operator alleges any such circumstances, he or she has the burden of proving the fact.<sup>17</sup> The circumstances that the operator may call upon have to be of a severe nature, unforeseen and beyond the operator's control.<sup>18</sup> The circumstances, then, must be of an extraordinary nature. As an example, the failure

---

<sup>17</sup>Lavin, Lag om viten, En kommentar, 2010, p. 147.

<sup>18</sup>Government bill 1984/85: 96, p. 56 and Government bill no 57 år 1970 s. 92.

of legal counsel to inform his client of a prohibitive injunction was not considered sufficient grounds to adjust the amount of the penalty.<sup>19</sup>

A penalty can also be payable whenever a prohibition is violated. If this is the case there does not have to be issued a new decision after the penalty for a decision has been ordered. The injunction runs on and so does the penalty. Thus, the penalty may be order for each transgression or for each period that passes without the deficiency being remedied.

### ***26.3.6 Repeal of Authorization and Temporary Shutdown***

Authorization of an operator's place of business may be repealed pursuant to Article 31, paragraph 2 e) and Article 54 paragraph 2 f. of Regulation (EC) No 882/2004, and the National Food Agency's regulation (LIVSFS 2005:20) on food hygiene. This may be done temporarily or permanently, if the deficiencies in the operator's conduct are of a particularly serious nature or if the operator's business has been subjected to repeated shutdowns.

Primarily, the authority will choose to shut down the operation temporarily, but the authority may order a permanent shut down in cases where all attempts to rectify the deficiencies have been exhausted and the situation is such that public health and safety cannot be ensured.

The authorization can also be partially repealed, as is the case in the following examples:

- The use of a part of a store for a different purpose than that for which it is registered, thus constituting a significant change of the business in this part.
- When part of a place of business that, for hygienic reasons, cannot continue to be used—part of a restaurant, for example.
- Certain preparations that have been conditioned in the authorization, but where the conditions are not followed.

Repeals of authorization or the shutdown of operations are considered as actions with far-reaching consequences for the operator. The decision must be proportionate to the infringement of the law; a temporary shutdown, for example, should be taken when it would allow the operator to rectify the deficiency.<sup>20</sup>

---

<sup>19</sup>Stockholm Municipal Court's Decision Case No. B 7434-00.

<sup>20</sup>See Appellate Administrative Court in Stockholm, Case No. 4331-05. A local restaurant had been damaged by fire. The Court considered a temporary shut-down sufficient. A permanent repeal of the authorization was not warranted.

### **26.3.7 *Seizure of Products***

The authority may also seize products already on the market or intended to be put on the market. Such seizure may occur when the products: violate the requirements concerning the labeling and presentation of food (currently LIVSFS 2004:27); are handled or put on the market by an operator not authorized or registered, or which does not meet the requirements for authorization; contain banned substances; have concentrations of substances exceeding the limits defined by law or the EC Regulation; and are not considered safe according to Regulation (EC) No. 178/2002.

It is also possible to seize products covered by an injunction or prohibition if the operator does not follow the injunction or prohibition. The operator may remedy the deficiency in the products under the supervision of the inspection, or may use them for other purposes. In this case, it would not be an option for products to be destroyed at the operator's expense.

If a decision to seize products is made, and should the products be destroyed or damaged, the authority may be liable for damages.

### **26.3.8 *Penal Provisions in the Food Act***

The penal provision can be found in Section 29 of the Food Act. Violations of provisions in the Foods legislation, the Food Act, and regulations adopted in accordance with the Food Act may result in fines. (Until 2006, imprisonment was also a possible sanction. There is an ongoing discussion concerning the reinstatement of this sanction brought about by the recent rise in food fraud cases.) Offenders include food operators who do not meet their obligations to provide the authority with documents and other information upon request. Section 29 also encompasses violations of the applicable EU-legislation.

The penalty provision does not apply if the transgression concerns provisions on the authority's exercise of control—that is, by officers of the authority. Liability for such transgressions is regulated in the Penal Code. Minor offenses fall outside the scope of the penal provisions (Food Act Section 30).

Moreover, the penal provision in the Food Act does not apply to matters specifically regulated in the general Penal Code. Examples include: the spreading poison or infection (Penal Code 13:7), negligence with poison or disease agent (Penal Code 13:9), infliction of bodily harm or illness (Penal Code 3:8), and endangering of others (Penal Code 3:9).

The sanctions according to the Penal Code can only be directed to against natural persons. However, the Penal Code provides for corporate fines being issued against legal entities (Code of judicial procedure Ch 36 7-10a §§). This can be invoked if management has not been directly involved in the transgressions but where they were aware and omitted to prevent or address the violations.

The scope of the penal provision is substantial; it covers transgressions of both national and EU-legislation. According to the National Food Agency, the following transgressions are the most common, though the list is not exhaustive.

---

Examples of transgressions which may be pursued according to the penal provisions

---

**Authorization/registration and ownership transfer**

Food operators shall inform the competent authority of the intention to conduct a food business so that all facilities under its control can be registered or approved, if approval is required under national law or under Regulation (EC) No 853/2004.

Legislative foundation: Article 6 of Regulation (EC) No 852/2004, Article 4 of Regulation (EC) No 853/2004, 7 and Secs. 10 and 29 Food Act, and Secs. 12–13 Food Regulation, Secs. 4–13 in the National Food Agency’s regulation on food hygiene (LIVSFS 2005:20).

---

**Placing of food on the market in contravention of food law**

Food operators placing food products on the market that are not considered safe should not be placing those products on the market.

Legislative foundation: Article 14 of Regulation (EC) No 178/2002 and other relevant EC regulations, 10 § and 29 § 1 and 2 of the Food Act.

---

**Failure to report significant changes in the business to the authority**

Legal foundation: Article 6 p 2 2 of Regulation (EC) No 852/2004 and 29 § 2 of the Food Act.

---

**Violation of the hygiene regulations**

Legal foundation: Article 4 and Annex II to Regulation (EC) No 852/2004 (general hygiene rules), Regulation (EC) No 853/2004 (specific hygiene rules for food of animal origin), the National Food Agency’s regulations on food hygiene (LIVSFS 2005:20).

---

**Violation of the personal hygiene regulations**

Legal foundation: Regulation (EC) No 852/2004, Annex II, Chapter VIII, Sec. 6 of the Food Act, Sec. 8–11 Food Ordinance.

---

**Violation of the labeling regulation, including misleading labeling and deficiencies in the obligatory labeling information**

Legal foundation: Sec. 6 2, 10 1 and Sec. 29 1 in the Food Act and Sec. 7 in the Food Ordinance and applicable provisions in the NFA regulations on labeling and presentation of food, (currently) LIVSFS 2004:27.

---

**Re-labeling with a later expiration date**

Legal foundation: Sec. 15 of the National Food Agency’s regulation 2005:20, reprinted 2007:6 on food hygiene and Sec 29 1 of the Food Act.

---

**Failure to provide the authority requested documents and other information**

Legal foundation: Sec. 20 1 and 29 1 of the Food Act.

---

### ***26.3.9 Compensation Relating to Authority’s Actions***

The authority may be liable for damages in relation to its activities. Wrongful seizure of products or destruction in which the operator suffers loss is an example. Here, general tort law applies.

In extraordinary cases, a company may be eligible for governmental compensation due to seizures or orders for the destruction of food in order to prevent the

spreading of disease.<sup>21</sup> One such case concerned a sales ban for beef contaminated with salmonella in which a company asked for compensation according to the law. The beef had been purchased from Romania, where inspectors had cleared the product free of salmonella. Upon entry into Sweden the veterinary took three samples but approved the beef for sale within the EU. Analyses of the samples showed salmonella contamination, leading the food authority to impart a sales ban. Subsequently, the company asked that the authority destroy the meat; it also asked for compensation from the government in the amount of SEK 536,446 (approximately \$74,126.11 U.S. dollars). Though denied, the request was granted on appeal to the Appellate Administrative Court. The Supreme Administrative Court overturned this decision, finding that the conditions were not extraordinary; rather, this concerned control upon entry into Sweden, which is normal practice.<sup>22</sup>

---

### ***26.3.10 Hazard Analysis and Critical Control Points ("HACCP")***

The food operator is primarily responsible for its risk management system. It is the operator's responsibility to put a control system into place in order to oversee the business. Specifically, the operator monitors the maintenance of an effective hazard

---

<sup>21</sup>Ordinance (1956:296) on state compensation, in certain cases, intervenes to prevent the spread of a contagious disease (Förordning (1956:296) om ersättning från staten i vissa fall vid ingripanden för att förhindra spridning av en smittsam sjukdom).

<sup>22</sup>Supreme Administrative Court, Case No. 5662-2000.

analysis and control of critical points in the business which could result in unsafe products.

Though the legislation is not regulated in detail, it is aimed at management through objectives. The legislation cannot regulate every form of food business down to the last detail. Therefore, the National Food Agency has asked the different industry organizations to produce national guidelines for their particular businesses. This constitutes the industry's own guide as to how the operators should achieve compliance with the hygiene legislation. These guidelines may contain definitions of otherwise vague expressions or terms in the law—for example, “where necessary,” “adequate,” and “sufficient.”

### ***26.3.11 The Marketing Act***

The Marketing Act is applicable to all forms of marketing, regardless of products, medium used, or the target group for the marketing activity. Primarily, the Marketing Act is used in issues pertaining to food labeling and advertising.

The Consumer Agency and the Consumer Ombudsman are the government agencies designated to protect the consumers' interests. However, the Marketing Act gives the operators an effective avenue to legally pursue transgressing competitors' misleading labeling or advertising of their food products. Both the agencies and operators may file lawsuits against other operators.

Of all the available sanctions, the most used is a prohibitive injunction condition of a fine. This sanction aims to prevent the operator from continuing with the activity or launching the activity in the future. The prohibition not only covers the marketing activity as such, but also considers similar activities. Thus, it is not possible to make minor changes to circumvent the prohibition. In order to ensure adherence to the prohibition, it is standard practice that, should the operator re-engage in the prohibited activity, the Consumer Ombudsman or the competitor may ask a court to order payment of the fine. As previously stated concerning such fines, if the operator is found guilty of violating the prohibition, the court will order payment of the fine. The amounts are set in the interest of adherence; thus, it should not pay to violate the prohibition. SEK 1.000.000 is a common amount set. Only under exceptional circumstances will the amount be adjusted.

Furthermore, the operator may be ordered to pay a so-called Market disturbance fee, which is paid to the Swedish state in a set amount between SEK 5000 and 5,000,000.

The competitor or the consumers may be compensated for damages suffered, although such compensation may come from circumstances other than economic. Compensation can, depending on the nature of the transgression, be asked for directly, or be requested in a situation where the operator has violated a previous prohibition.

The operator may also be ordered depletion of the misleading materials if this is found to be a reasonable or necessary measure. Depletion can be ordered if it is the

only way to ensure that the material will no longer mislead consumers. Although rare, such depletion could be used with regard to packaging or misleading products.

The current court system consists of two specialized courts: the Stockholm Municipal Court and the Market Court. The latter is a specialized court that handles cases according to the Competition Act, the Marketing Act, as well as other consumer and marketing law. The Market Court is also the highest court of appeal. If the plaintiff asks for a prohibitive injunction, the suit can be filed directly with the Market Court. In that instance, the case would only be heard by one court with no possibility to appeal. If the plaintiff requests the Market disturbance fee and/or damages, the suit must start in the Stockholm Municipal Court, with the possibility of appeal to the Market Court.

In addition to the operator, others can be held responsible and subject to sanctions. Employees, officers of the company and other parties, advertising agencies, media who have contributed significantly to the marketing activity can also be held responsible as complicit to the violation. This is often used when the advertiser is not established in Sweden, when it is important to prevent a certain medium (TV-channel or newspaper) from similar transgressions, or when an operator wants to safeguard against officers of the company starting a new business and continuing the transgressions. In such cases, it is important that the prohibition is personal, which would be a significant threat towards private individuals who would have to pay any penalties out of pocket.

### ***26.3.12 Conclusions: How the System Works***

The “Swedish approach” practiced by authorities is to resolve any conflicts or deficiencies through negotiations and convince the operator to address the deficiency on a voluntary basis. This means that authorities give the operator the opportunity to adhere to the authority’s criticism and to make the necessary changes in its business before the authority proceeds with sanctions or lawsuits. For the most part, this has proven to be an effective method, since the number of cases actually brought to trial and the case law is limited. At first glance, it would appear that this method is economically effective as well as successful in maintaining adherence to the legislation since it enables cooperation rather than conflict between the operators and the authorities. However, the structure of the government authorities is such that it endangers a coherent application of the legislation in the different regions. This, in turn, may give certain companies a competitive advantage because of a regional authority’s reluctance to intervene against a major employer on its “patch.”

The industry’s self-regulatory boards exercise supervision by intervening against operators, who are mainly members of their organization. The industry also provides advice and training for its members. In doing so, the organizations often apply a stricter interpretation of the applicable rules, thereby encouraging a higher ethical level for the operators on the market. Over time, this creates an

expression of good practice applicable in the courts and thus works its way into the legislation.

Additionally, the operators contribute in their day-to-day “surveillance” of their competitors marketing measures, be it labeling, advertising, or other. The cases addressing misleading labeling or advertising seem primarily to be competitor driven, in which a competitor sues the food operator. However, there are cases where the authorities, the national and municipal food agencies, and the Consumer ombudsman have intervened and are the plaintiffs, examples of which will be discussed below. Such cases result from the refusal to comply with the authorities’ demands, either due to a different interpretation of the legal situation or negligence. In some cases where there the authority sees a need for precedence, it may decide to file a lawsuit, regardless of the position of the operator.

Basing a claim on the Marketing Act is often also the most efficient avenue for an operator to proceed in seeking legal action against competitors’ marketing measures. The alternative would be to refer the matter to the competent authority. By utilizing the former method, the operator can act swiftly against its competitor whose labeling or advertising the operator holds to be in violation of the food legislation; for example, the EU Regulation 1924/2006 on nutrition claims and health claims or the labeling regulation. The Court system provides a speedy and efficient option with a one-instance court system. These matters are referred to the Market Court, whose decisions cannot be appealed to a higher court. From the Market Court, an operator may achieve prohibitive injunction condition on a fine as well as preliminary injunctions.

Matters referred to the Market Court often have a faster procedure, particularly with issues of misleading labeling. It is possible to have a prohibitive injunction in one instance, and additionally there is the possibility of a preliminary injunction. The plaintiff must convince the Court that it is likely to prevail in the proceedings; it must also provide security for the potential loss suffered by the defendant should the final outcome go against the plaintiff, resulting in a lost or diminished effect of a prohibition. Time should also be considered in comparing the procedural system with letting the government agencies pursue the case solely according to the food legislation. On more than one occasion, there have been complaints that such procedures are too slow.

The procedural system is thus efficient, and its sanctions are similar to those available according to the food legislation. For an operator who wishes to put a stop to a competitor’s activities, the available sanctions encompass the company and let the officers and employees of that company form an efficient and competitive tool. The losing side always pays the costs of the winner; this, of course, must be taken into consideration in any risk assessment.

## 26.4 Labeling

The so-called Information Regulation 1169/2011<sup>23</sup> applies in Sweden. Prior to the Regulation Directive 2000/13 on labeling, presentation, and advertising of foodstuffs,<sup>24</sup> was implemented into the Swedish law in the LIVSFS 2004:27. Swedish labeling law thus was harmonized with EU labeling legislation with the implementation of the directive. The Information Regulation applies in Sweden as in other EU-countries. The National Food Agency has adopted guidelines concerning the interpretation of the Regulation. The National Food Agency follows closely directives from the EU-Commission and cooperates with its neighboring Scandinavian countries on issues of interpretation. Sweden has also adopted legislation on the points where the Information Regulation leaves it to the Member States to regulate. This concerns provisions for non-packed foods (LIVSFS 2014:4) and NFA regulation (LIVSFS 2015:1) on the use of the so called Keyhole symbol which is used as an aid for consumers to find foods with a nutritious and healthy composition. The system has similarities to traffic light systems in other countries.

This section will, with the exception of misleading names of products, focus on misleading voluntary labeling. It will cite case law according the labeling regulations as well as cases that have been decided according to the Marketing Act.

### 26.4.1 *Misleading According to the Food Act*

The National Food Administration implements EC directives into its regulations and publishes them in the National Food Administration's Code of Statues ("LIVSFS").

Of the rules, first and foremost is that labeling cannot be misleading. Labeling must be clear and concise while explaining what a claim means. It is not sufficient to say that a claim is factually correct and substantiated. Rather, the claim must be presented in such a way that the consumers' impression and interpretation is not skewed by, for example, exaggerations, graphic depictions, and claims in large print and explanations (or attempts to explain) in smaller print. A food product must not be attributed with properties it does not have. The advertiser must be prepared to substantiate the claims made. Furthermore, is it not permissible to give the consumer the impression a property that is common for all or most products on the market is unique to that advertiser's product.

---

<sup>23</sup>Regulation (EU) No 1169/2011 of the European Parliament and of the Council of 25 October 2011 on the provision of food information to consumers.

<sup>24</sup>Directive 2000/13/EC of the European Parliament and of the Council of 20 March 2000 on the approximation of the laws of the Member States relating to the labelling, presentation, and advertising of foodstuffs.

In determining whether or not a claim is misleading, an overall assessment as well as a hypothetical assessment are made in understanding how the average consumer perceives the labeling.

It is permissible to make claims or pictures that go beyond the obligatory information, provided these elements are not misleading. This could include illustrations, pictures, and décor which might mislead the consumer as to product's content. For example, pictures of fruit on products that do not contain the fruit in question, or where the picture misleads as to the amount of fruit included in the products, would be considered misleading. Other examples are pictures or claims misleading the consumer as to the level of preparation.

In the National Food Agency's guideline,<sup>25</sup> the Agency defines and regulates the use of words of a more marketing nature, such as "traditional," "original," "natural," "natural ingredients," "genuine," "pure," "real," "fresh," and "luxury."<sup>26</sup>

If "traditional" is used for a product, it must be true, but the product should also state precisely what is traditional about the product.

"Original" refers to an original production method or recipe. If a product is labeled original, it should not have undergone any significant change in recipe or production.

In order for a food product to be considered "natural" or a "a natural product," it must exist in its present, natural condition, or have undergone minimal processing.

A composite food can never in itself be a "natural product." If the product claims it has "natural ingredients," all the ingredients must meet the requirement for "natural." To assess whether the term can be misleading, each case considers whether the expression's contrast can be used for other equivalent food.

In order to assess whether terms like "genuine," "pure," and "real" can be misleading, in each case it must be determined whether the expression's contrast can be used for other similar or equivalent food. "Genuine," "pure," "real," or comparable expressions can be deemed misleading if used on foods that have a reserved name (name protected).

Expressions such as "fresh" generally have no clear purpose and should be used restrictively. Their use and intension should be explained, for example, by specifying the meaning of "daily updated" combined with the current date. Additionally, there are foods where fresh is part of the name, such as fresh potatoes and fresh cheese (cottage cheese).

### **26.4.2 *Supreme Administrative Court and Misleading Labeling*<sup>27</sup>**

Some Swedish companies sell the readily packed fish of the species *Theagra chalcogramma* (Swedish name “Alaska Pollock”) under a trade name containing the word cod (Swedish name “torsk”). The trade name on the label “codfish filet” (Swedish tr. Torskfiskfilé) is in combination with the denomination “Alaska Pollock”. The National Food Agency rendered a decision whereby the company was prohibited to use “cod” or combinations including “cod” in labeling *Theagra* fish. The grounds for the decision included misleading labeling and use of an illegal denomination, since cod is part of the species *Gadus morhua*.

The Supreme Administrative Court stated that one of the most important pieces of information on a label is the correct denomination for a product. The Court referred to, among other sources, an industry guideline that included a list of denominations of various species of fish. The Court ultimately concluded that the label was misleading to the consumer.

### **26.4.3 *Public Prosecution Office v. Officers for a Grocery Store*<sup>28</sup>**

This case concerned the handling of ground meat in a grocery store. The case the authorities’ attention after an investigative TV-program, using a hidden camera, showed employees of the store handling meat in a manner contrary to the food legislation. On more than one occasion, the employees had ground, packaged, and marked products with an expiration date. Employees had since taken back the mince to the cold store, removed the old packaging, put the mince in new packaging, marked it with a later expiration date, and then returned it to the store for sale.

The Court found that this procedure was contrary to the applicable food regulations; anyone intentionally or negligently violating the regulations shall be held liable under § 29 of the same Act.

The Court found that the officers charged had transgressed the food legislation as alleged and, subsequently, were fined.

---

<sup>27</sup>Supreme Administrative Court, case no 5675-1991 RÅ 1992 ref 95.

<sup>28</sup>Nacka Municipal Court, Case No. B 4330-08.

#### **26.4.4 *Findus v. the National Food Agency***<sup>29</sup>

Findus, a frozen food brand, made the following claims on its packaging: “without unnecessary additives, without preservatives, without trans-fatty acids, only natural colors, without flavor enhancers.” The National Food Agency ordered Findus to cease and desist from using these claims on its packaging “as soon as possible” (in Swedish “*snarast*”). It also issued an injunction against Findus, prohibiting the company from placing products on the market with these claims with a transitional period of 6 months after the decision. Findus appealed the decision, asking the Administrative Court in Uppsala Court to overturn the decision in its entirety.

The Court found that “without unnecessary additives” was misleading. No explanation was given concerning which relevant additives the product did not contain, or why the additives were considered unnecessary. The claim could, therefore, mislead the consumer about the product and its properties.

“Without preservatives” was also considered misleading. The products in question were frozen products, and freezing is considered a form of preservation. However, virtually no other products on the market contained preservatives. The claim was therefore irrelevant since it gave the consumer the impression that similar products on the market had properties that others did not.

“Without trans-fatty acids” likewise gave the consumer the impression that trans-fatty acids were common in this particular product category. The Court considered the claim in violation of Regulation 1924/2006/EC, as claims of trans-fatty acids do not appear in the appendix of permissible nutrition claims.

“Only natural colors” had not been used in the labeling or presentation of the products; rather, it had only appeared in a general description of Findus’ ambitions. Thus, the labeling regulations did not apply and the Court overturned the decision concerning this claim.

“Without flavor enhancer” was considered relevant information because Findus had changed the recipe for its Indian Tikka Masala product. In such cases, such a claim is justifiable during a limited period following the change. The Court granted Findus a transitional period of six months following the Court’s decision.

#### **26.4.5 *Nutrition and Health Claims***

Regulation 1924/2006/EG applies in Sweden, and The National Food Agency has issued a guideline for the interpretation of said Regulation, which constitutes the

---

<sup>29</sup>Administrative Court in Uppsala case no 3453-10 and 3454-10 *Findus Sverige AB v. The National Food Agency*.

Swedish authority's interpretation of the Regulation.<sup>30</sup> The industry's self-regulatory body "Branschstödet"<sup>31</sup> has also published a handbook that closely follows the Agency's guideline.<sup>32</sup>

In addition to the above-mentioned sources, the Medical Products Agency has issued its guideline concerning the interface between health claims and medical claims and on the classification of medicinal products.<sup>33</sup>

The classifications are based on an overall assessment of each individual product. Although no medical claims are made in marketing or on the label of the product, it can be classified as medicinal due to content of a substance or function.

Assessing whether or not a product should be classified as a medicinal product is part of a larger, overall assessment. The Medical Products Agency generally refers a food product for which a medicinal claim is made either to the National Food Agency or the Consumer Agency. Due to their characteristics, food supplements, often similar to medicinal products, are more in danger of being classified, as medicinal products should a medicinal claim be used in the marketing or on the label.

#### **26.4.6 The Keyhole Symbol**

The National Food Agency created the Keyhole symbol,<sup>34</sup> which operators use in marketing healthier food products. The objective is to aide consumers in easily finding and choosing healthy foods. Specific rules regulate the use of the symbol for a number of food categories. The Keyhole symbol stands for less and/or healthier fat, less sugar, less salt and dietary fiber and whole grains.

Established in Sweden in 1989, the keyhole has become a well-known Nordic label for healthier food products in Denmark, Norway, and Sweden.

#### **26.4.7 Fortification of Food Products**

In relation to the description of the nutrition and health claim rule, it is worth mentioning that fortification today follows Regulation 1925/2006/EC. Sweden has

<sup>31</sup>*Id.*

<sup>32</sup>*Id.*

<sup>33</sup>Gränsdragning mellan hälsopåståenden för livsmedel och medicinska påståenden, Medical Products Agency's guideline February 14, 2011.

<sup>34</sup>National Food Agency, The Keyhole Symbol, *available at* <http://www.slv.se/en-gb/Group1/Food-labelling/Keyhole-symbol/>.

abandoned the previous system of authorization regarding fortification. Certain products produced in Sweden must be fortified; such is the case with milk (with a maximum 1.5 % fat), margarine, and products of similar nature and use. These have to contain stipulated levels of vitamin D and A.<sup>35</sup> This fortification requirement does not apply to products produced in other EU Member states or Turkey.

Regarding enrichment, the list of plants and parts of plants deemed unsuitable for use in food including food supplements should be considered.<sup>36</sup>

### **26.4.8 Labeling Cases According to the Marketing Act**

In *Svensk Mjök v. Valio*,<sup>37</sup> the marketing of margarine with the claim “Soft butter using canola oil” was found to be in violation of the Food legislation (Regulation (EC) 1234/2007). Butter is a protected denomination and cannot be used for a product consisting of 67 % milk fat and 33 % canola oil.

The 2004 case *Vaasan & Vaasan Oy v. Fazer Bröd AB*<sup>38</sup> concerned the marketing of a particular type of thin crisp bread. Vaasan & Vaasan and Fazer had marketed this product for many years. Fazer created a new product in packaging that Vaasan & Vaasan found too similar to theirs. Primarily, this was a case of passing off, but two claims were also in question: “original” and “genuinely authentic.” The market Court found that the claim “original” gave the impression that the product in some aspect was “original.” Fazer had not substantiated in what sense the product was original, and the claim was, therefore, considered misleading. With regard to “genuinely authentic,” the Court found that the claim gave the impression of quality; however, it could also be construed to mean that the crisp bread is based on a Finnish tradition which Fazer had argued. The Court did not find this claim misleading. Fazer was subjected to a prohibitive injunction conditioned on a fine of Swedish Krona (“SEK”) 400,000.

### **26.4.9 Advertising Cases According to the Marketing Act**

As has been said above misleading labeling and food advertising falls not just under food law, but is also actionable according to the Marketing Act. Marketing in violation of other legislation—in this case, food law—is simultaneously a violation of the Marketing Act. In fact, most cases concerning food advertising are handled

---

<sup>35</sup>National Food Agency’s Regulation SLVFS 1983:2.

<sup>36</sup>National Food Agency, List of Plants and Plant Parts that Do Not Belong in Food, available (in Swedish) at <http://www.slv.se/upload/dokument/risker/naturliga/vaxter/volm.pdf>.

<sup>37</sup>Market Court’s decision 2010:15 *Svensk Mjök AB v. Valio Sverige AB*.

<sup>38</sup>Market Court’s decision *Vaasan & Vaasan Oy v. Fazer Bröd AB*.

according to Marketing Act by the Consumer Agency of the operators sometimes with the assistance of the National Food Agency. This also reflects the division of responsibilities between the National Food Agency and the Consumer Agency.

The so-called Änglamark-case *Sveriges Spannmålsodlare (SpmO) AB v. Kooperativa Förbundet (KF)*<sup>39</sup> concerned environmental claims for a range of products sold under the trademark “Änglamark.” That name first appeared in song lyrics, and Swedes strongly associated it with the preservation of nature and the environment. A TV-commercial for the products showed a restaurant scene with a couple that had just been served their food. A man with a pesticide sprayer on his back comes up to the table and starts spraying the food on the plates. When they ask what the man is spraying on their food, he answers, “Poison,” and that there is no scientific research proving its danger.

“Everybody else is eating it.” The commercial ended with “Änglamark – guaranteed unsprayed.” The Court found the commercial to be misleading. First, it claimed that ecologically produced products were not sprayed with pesticides. This was not correct; the products were not sprayed with chemicals. Second, the commercial gave the impression that other food contained poison. Even if it had been shown that some food products contained residue from pesticides, the claim was too categorical and oversimplified. Additionally, the commercial discredited food producers who used pesticides in their production. Therefore, the Court considered the marketing misleading, and the Market Court, rendered a prohibitive injunction conditioned on a fine against the defendant, Kooperativa Förbundet.

In *Danske Slagterier, SA Bruxelles v. Scan Foods AB*,<sup>40</sup> the leading Swedish meat producer made the following claims: “Choose imported pork so you can get medicine in the bargain. That we cannot offer, because our meat is free of antibiotics,” and “Christmas ham from the best pork in the world.” The first claim was misleading because the advertiser could not prove that foreign-produced meat contained antibiotics while meat produced in Sweden did not. The second claim was also considered misleading as a general and unconditional quality assertion that should be understood as a claim that the advertiser’s pork is truly superior to all other pork. The Court questioned if such a claim could ever be substantiated. Ultimately, the Court rendered a prohibitive injunction conditioned on a fine against the defendant Scan Foods AB.

The case *Institut National des Appellations d’Origine (INAO) et al. v. Arla Foods AB* involved a misleading geographical origin.<sup>41</sup> In 1999, Arla Foods launched two yogurt products: Yoggi Champagne and Yoggi Original Champagne. The marketing for these products also made reference to champagne. A press release contained the following text: “Champagne producers have busy days. Millennium approaches

<sup>39</sup>Market Court’s decision 2002:8 *Sveriges Spannmålsodlare (SpmO) AB v. Kooperativa Förbundet (KF)*, *ekonomisk förening*.

<sup>40</sup>Market Court’s decision 2005:8 *Danske Slagterier, SA Bruxelles v. Scan Foods AB*.

<sup>41</sup>Market Court’s decision 2002:20 *Institut National des Appellations d’Origine (INAO) et al. v. Arla Foods AB*.

and hysteria increases. What to do? Go to a party, stay home, pretend like it's raining? While the darkness of winter settles over Sweden, what is needed is something that cheers you up. Something that adds flavor to life - Yoggi Champagne." In other marketing, the products were presented as yogurt with a champagne flavor. The advertising made reference to champagne with pictures of bubbles and people at parties with glasses of champagne.

The Market Court found that Arla exploited the goodwill of champagne in violation of the Marketing Act. The Court also took into consideration the design and color scheme of yogurt packaging and posters where glasses of champagne and champagne bottles were replaced with Arla yogurt packaging. In light of the foregoing, this was, in the Market Court's view, a clear case of a conscious passing-off.

The Court also found the marketing to be misleading. First, claiming a "champagne taste" in connection with the appearance of the packaging gave consumers the impression that the yogurt had been flavored with or tasted like champagne. The Court considered the list of ingredients on the pack insufficient to neutralize this impression. As for the taste of champagne, it was apparent from the evidence that the ingredients could not give this flavor. Arla was not able to show that the yogurt actually tasted of champagne, and thus, the company had misled consumers.

The Court rendered a prohibitive injunction against Arla with regard to these claims. However, the Court did not find that the claim "champagne flavor" misled the consumer concerning the commercial or geographical origin. The Court reasoned that yogurt and champagne are separate products, and therefore the consumer was unlikely to be misled.

In the case *Svensk Mjölk Ekonomisk förening* ("Swedish Dairy") vs. *Oatly AB* (MD 2015:18), Swedish Dairy intervened against Oatly for their marketing of various oat-based products which can be used as substitutes for milk. Oatly used expressions like "No milk. No soy. No badness", "No milk, no soy, no nonsense", and "No milk, no soy, no craziness". There were claims used like "It's like milk but made for humans", "No milk, no soy, no badness". Swedish Dairy claimed that the expressions and claims were misleading and denigrating advertising. The Swedish Market Court delivered its decision finding in favour of Swedish Dairy with regard to the claims mentioned and others. The Court however did not find "No milk, no soy, no way" or "wherever and whenever you would find yourself drinking milk or using it in a recipe 'back in the day', you can use Oat Drink today", and "When should you use it? Whenever you would use old school milk from cows. . ." to be in violation of the Marketing Act. Swedish Dairy claimed that it was denigrating to indicate as some of these claims do that milk was a thing of the past.

In the matter *Arla Foods AB vs. Unilever AB* (MD 2105:20) Arla claimed that "Flora MED SMÖR Normalsaltat" ("Flora with butter normal salt") and "Flora MED SMÖR och Fint Havssalt" ("Flora with butter fine sea salt") was misleading and in violation of the Food Act for use of the protected denomination butter. Flora is a blended spread but containing butter. The Market Court did not find Unilever's labelling or marketing to be in violation of applicable EU-legislation, the Swedish Food Act of the Marketing Practices Act. The products were sold under their correct descriptive denomination.

### 26.4.10 Case Law Concerning Health Claims

The case *Bayer AB v. Bringwell Sverige AB and Bringwell AB*, which concerned the marketing of food supplements, was the first to apply the Regulation 1924/2006 on nutritional claims and health claims for food.<sup>42</sup> Bringwell, a company sells self-care items marketed a food supplement called Mivitotal. Bayer brought the case before the Market Court, which rendered a prohibitive injunction against no less than 74 claims used by Bringwell. The injunction was subject to a fine for each claim against the product in the amount of SEK 1,000,000 (approximately \$138,615.50 U.S. dollars) in the event of non-compliance with the injunction. This demonstrated an exercise in the Regulation's articles on nutritional claims and health claims as well as in the application of the Medical Products Act on claims made for food products. Bayer's suit concerned general health claims, specific health claims, and medical claims. All prohibited claims were also considered misleading according to the Marketing Act. Below are a few examples of the claims that were prohibited.

The case demonstrates what happens when a company sues a competitor using the MPA with reference to the food legislation and the Medical Products Act. Not only does the company have to pay the claimant's costs, but the company will also suffer under an injunction which, if violated, will result in an order to pay a fine of SEK 1,000,000. Such is the unpleasant consequence for the defendant. Furthermore, it is possible for the claimant to ask for damages if the claims have been found misleading (see below).

## 26.5 Conclusions: How It Works

The current trend concerns health and nutritional claims regarding food marketing and labeling. Many issues remain unresolved, both at the EU and national levels. In accordance with the Marketing Act, the cases have primarily been handled between operators, or between the Consumer Ombudsman and an operator. However, there has been increased activity by the national and regional authorities in the past year.

There are cases for instance according to Regulation 1924/2006/EC that concerns the dairy manufacturer Arla, which launched a new product line called "Wellness," a probiotic dairy line, of yogurts and milk. A number of product variants have since been launched: "Balance," "Immune," "Protein control," and "Female." Here, the regional food agency in Stockholm intervened, leading to an ongoing procedure in the Administrative Court. Apart from the more practical issues, such as the placement of a claim on the pack, it is a case that demonstrates several interesting issues. It shows a weakness in the authorities' system for supervision. The product launch took advantage of the transitional rules with regard to health claims on the market, but which had not been approved by the

---

<sup>42</sup>Market Court's decision 2013:13 *Bayer AB v. Bringwell Sverige AB and Bringwell AB*.

EU-Commission. The regional agency demonstrated a reluctance to intervene with more drastic measures. Had Arla accepted the agencies' position, the Court would have given the company a transitional period to phase out the products on the market and replace them with packaging in accordance with the Regulation. As it currently stands, they have made some concessions and changes, but Arla was still able to make a forceful launch for the product, getting the message of the products' benefits across before having to get in compliance. This case also highlights the difficulties manufacturers of probiotic products face, since there are virtually no approved claims to make for the probiotic bacteria. Alternatively, manufacturers resort to making an approved claim; for example, an approved claim on the immune system based on the content of vitamin C or D, thus blurring the claim so it is perceived as concerning the probiotic as well.

The question remains: does legislation promote innovation or hamper it? Numerous resources and money go into the development of a probiotic, for example. Once the product gets on the market, there is no possibility to commercialize the innovation because there are simply no approved claims to be made. It is not only the industry's innovations that are thwarted; the initiative of new starts or even private individuals also suffers. Consider a group of students in Sweden who had an idea of creating an easy-to-read grading system that would make it easy for consumers to choose products graded on health, ethics, environment, and society. The products' scores on these qualities would appear on the label in a simple graphic. However, it is unclear whether such an idea would be possible to launch, taking into consideration the Regulation 1924/2006/EC.

Another case, which concerned the labeling regulation, concerned the use of "genuine," or in Swedish "äkta," in the context of an overall program to provide consumers information about the composition of food products. This was not tried in the Courts. The concept "äkta vara" or "real stuff" was launched by a private non-profit organization and addressed the use of additives in food. "Genuine" food was, according to this concept, food without additives. The organization registered a trademark and offered operators licenses to use the trademark, provided of course, that the products met the organization's stipulated requirements. Reactions came from both the food industry and from the National Food Agency, which called the trademark misleading unless the organization explained how the product carrying the trademark was "äkta." Several operators and a chain of grocery stores signed up as licensees and used the trademark in their businesses. The National Food Agency requested that the municipal agencies under which the operators in question were registered should take action. However, the agencies took no immediate actions. Simultaneously, the National Food Agency made public its position, making it difficult for the organization to attract new licensees. No licensee desired getting stuck with a license it may not be able to use. Specifically, National Food Agency reacted to the use of the word "äkta." The matter reached a resolution when the organization changed the trademark to just "Ä" with a reference to the organization's name, Äkta Vara.

Legal intervention is also a fickle character. The so-called horsemeat scandal, although considered a major labeling scandal, did not lead to prosecution in Sweden. With such an obvious fraud, it was expected that there would be legal consequences for the companies involved, including one of Sweden's oldest and most well-known food operators. Only one company filed a complaint with the local public prosecutions office, which dismissed it after examining the operator, in question. It was found to have its documents in order and therefore there was no longer suspected of any wrongdoing. Even though it should be said that the companies, which were most prominently exposed, took responsibility and adopted measures to avoid future scandals the total lack of prosecution might send the signal that food fraud is no big deal. Indeed the horsemeat scandal has been followed by other scandals; for example, pork meat sold as beef or lamb to kebab restaurants with obvious religious consequences.

There must be a balance in legislation and the application of the legislation. The responsibility for this falls on all the actors on the market, including the operators, authorities, industry organizations, and consumers.

A fine balance also exists between legislation and innovation. A topic not yet discussed in this chapter is new technology and the labeling requirements. It raises the question of whether or not legislation promotes or hampers innovation. New production techniques, perhaps necessary to help feed the world and to do it in an environmentally sustainable way, may be thwarted by a labeling requirement, forcing the operators to disclose the nature of the ingredients and how they have been produced. Consumers, advised by organizations' authority figures opposed to a product, may reject said product, making commercialization difficult. This also affects global trade.

It is no secret that the view of genetically modified produce differs between the United States and the EU. In some Member States such as Sweden, the resistance is strong. A similar problem emerges with regards to nanotechnology, the cloning of animals and vegetables, and food produced in laboratories rather than on farms. On the other hand, it is in the consumers' interests to know the origin of food, which is used as an argument for disclosure on labels. If the operators or government agencies fail to convince the consumers that the product is safe, in the long run the problem may not be with labeling, but rather with communications.

Failure to disclose a product's genetically modified ingredients could result in the next "horsemeat scandal" in Europe. It is worth considering the precautionary principle as an unaffordable luxury, given that the world needs to be fed in a sustainable way from both an environmental and security viewpoint. These appear to be effects of the same problem. The further companies abuse nature and the environment, the more common the negative effects will be for food products and the more likely that the prediction that tomorrow's conflicts will concern access to fertile land. Consumers must decide if they are prepared to sacrifice their right to know what their food is made of, and to be able to choose whether to accept the government agencies and operators' assurances that the ingredients are safe for the public to eat.

## Chapter 27

# Food Law in Norway: Trade, Food Promotion, and Protection of Intellectual Property Within the Food Industry

Marie Vaale-Hallberg and Nina Charlotte Lindbach

**Abstract** Being one of the northernmost countries in Europe, with an extensive coastline and with little opportunity for large-scale agriculture, facilitating for international trade and at the same time protecting Norwegian agriculture is of essential interest to Norway (This chapter was written in January 2015). Like in many other countries, the Norwegian customs tariffs function as effective barriers to trade, ensuring that imported products potentially threatening domestic agricultural products are not sold at lower prices than domestic products. International trade is however crucial as the Norwegian consumption presupposes extensive import of food. Instead of joining the EU, principally in order to protect agricultural and fishery resources, Norway has chosen to remain a member of the EFTA and a party to the EEA Agreement. As part of the internal market, a consequence of the EEA Agreement, many of the EU rules relating to foodstuffs are applicable, but also domestic rules with no equivalent EU legislation apply. Norway has traditionally been, and still is, one of the strictest countries in Europe when it comes to e.g. marketing towards children.

Investing in product development and innovation is important to most food suppliers. Protecting intellectual property and thus competitive advantages appear to be of growing interest. Up till now the legal battles between the market players have mainly been about packaging design and unfair business practices.

## 27.1 Introduction

### 27.1.1 *International Trade of Foodstuffs*

Norway, a constitutional democracy, is Europe's northernmost country. It has a population slightly exceeding 5 million, mostly clustered in and around the bigger cities. Due to the offshore oil and gas deposits discovered in the 1960s, Norway enjoys one of the highest living standards in the world. While the general cost of living is rather high, the inhabitants only use approximately 11–12 % of their income on food, which is low compared to most other European countries.<sup>1</sup>

Norway stretches 2518 km from north to south and has a coastline of approximately 103 km. The topography and climate cause some obvious challenges when it comes to self-sufficiency of food. For example, large-scale farming is difficult and shipping food across long distances is costly. Consequently, food imports are necessary. Presently, Norway imports more than 50 % of the food consumed in the country, of which approximately 70 % is imported from the EU. However, access to the sea and other great fishery resources make Norway one of the largest seafood exporters in the world.

Balancing the interests between facilitating import and export on one hand, and supporting domestic agriculture on the other is difficult but inevitable. A country's desire to protect its own interests while at the same time allowing and facilitating increased sales from developing countries is often debated. This challenge is not new. Negotiations at WTO-level regarding an increase in international sales of agricultural products faced challenges during the DOHA negotiations in 2001, revealing the inevitable deadlocks created by the positions taken by the various countries. After more than a decade, the WTO members eventually managed to agree upon a text regarding agricultural products at meetings in Bali in December 2013.

As Norway is dependent on imports of food, it is essential for the country to form and build a strong cooperation with other countries. Thus, international trade has been important to Norway for centuries, and various agreements have been entered into to ensure that cooperation continues. One of the most important international collaborations regarding the trade of food began when Norway founded the European Free Trade Association (EFTA) in 1960, along with other European countries. The Convention was originally signed in Stockholm on January 4, 1960, and outlined the principles of the cooperation. It was later revised in the Vaduz Convention of June 21, 2001, with annexes, protocols and appendices. The EFTA is an intergovernmental organization promoting free trade and economic integration to the benefit of its members.<sup>2</sup> Since its foundation, it has managed to

<sup>2</sup>European Free Trade Association (EFTA) of 1960. Jan. 4, 1960, available at [www.efta.int/sites/default/files/documents/legal-texts/efat-convention/Vaduz%20Convention%20Agreement.pdf](http://www.efta.int/sites/default/files/documents/legal-texts/efat-convention/Vaduz%20Convention%20Agreement.pdf).

negotiate a range of well-functioning international free trade agreements, the most important being the agreement with the EU.

In the beginning, the EFTA formed a strong coalition and attracted countries such as the United Kingdom, Austria, Denmark, Portugal, Sweden, Switzerland and Finland. However, after the EU gained popularity and power, most of the members of EFTA shifted to the EU, thereby weakening the position of EFTA. Today, only Iceland, Liechtenstein, Norway, and Switzerland are members of EFTA.<sup>3</sup>

### 27.1.2 *Norway and the EU*

Despite Norway's failure to join the EU, the relationship between Norway and the EU remains extensive due to the European Economic Area agreement of 1992 (EEA Agreement) between EFTA and EU.<sup>4</sup> The EEA Agreement implies that Norway, Iceland, and Lichtenstein (EEA/EFTA Member States) will participate in the internal market established in the EU for all goods and services designated under the agreement. Under this arrangement, the fundamental principles of EU law apply to the EEA/EFTA Member States, such as the four freedoms of movement: goods, capital, services and people. The EEA Agreement also implies cooperation in other areas such as research and development, education, social policy, and environment. Moreover, the agreement is built upon the principles of equal rights and obligations within the internal market, both for citizens and economic operators in the EEA.

One of the core principles of EEA law lies in its dynamic character; development is both intended and wanted. EU Member States have passed on legislative power to EU bodies, whereas the legislative power of the EEA/EFTA Member States remains unaltered. By comparison, any alteration to the EEA Agreement is de facto a new international agreement, which by implication requires the consent of all EEA/EFTA Member States. In order to secure a more fluid decision-making process, the EEA Agreement lays down the principles of development and interaction between EU laws of relevance to the EEA Agreement and specifies how such legislation is to be adopted by the EFTA Member States. The EEA Joint Committee, a committee where both the European Union and the EEA/EFTA Member States are represented, makes the decision to incorporate new EU legislation into the EEA Agreement.<sup>5</sup> Accordingly, the EEA/EFTA Member States will implement the legislation into domestic law through legislative or regulatory decisions.

EU legislation is not the only factor that plays an important part in the harmonization process. The Norwegian Supreme Court has stated<sup>6</sup> that even though

---

<sup>3</sup>*Id.*, p. 2.

<sup>4</sup>Agreement on the European Economic Area (EEA Agreement), May 2, 1992.

<sup>5</sup>EEA Agreement, 4, Article 102.

<sup>6</sup>Rt. 2002, p. 391 (God Morgen), Rt. 1997, p. 1954.

relevant case law from the European Court of Justice (EJC) is not formally binding upon Norwegian law practitioners, such case law shall be taken into consideration in the interpretation of Norwegian law. Furthermore, practices from other important EU organs, like the Office for Harmonization in the Internal Market (OHIM) and the European Patent Office (EPO), will be taken into consideration, as these constitute relevant sources of law in Norway.

The EEA/EFTA Member States have no voting rights when it comes to the development of EU law, but they are virtually obligated to adopt the rules covered by the EEA Agreement. The co-operation does facilitate ways that the three EEA/EFTA Member States may influence the law making process, such as influence exerted through expert committees. Formally, the EEA/EFTA Member States may decline to incorporate new EU legislation into the EEA Agreement. In such cases, the affected part of the EEA Agreement will be suspended.<sup>7</sup>

Although there are no formal membership fees connected with the EEA, Norway is contributing financially to the EU and its Member States. In 2009–2014, contributions from the EEA/EFTA Member States amounted to €1.8 billion.<sup>8</sup> Whilst the contributions from Norway are extensive, Norwegian inhabitants and enterprises also benefit from the various EU programs.

Norway has formally applied for EU membership three times. The first application was sent in 1962, but was hindered by the veto laid down by France to stop the pending British application for EU membership. The second application was submitted in 1970, but was withdrawn after the national referendum showed that 53.5 % of the population (voter participation was 79.2 %) was in disfavour of membership. The third application was sent in 1992, but once again the national referendum proved that 52.2 % of the population was against membership. A voter participation rate of 88.6 % illustrates that the question of membership was both engaging and challenging. Some of the most disputed issues were, and still are, Norwegian agriculture, fishery resources, and sovereignty.

Accordingly, agricultural products are not a part of the EEA Agreement. However, Article 19 of the EEA Agreement aims at developing trade between the countries with regard to agricultural products and explicitly seeks liberalism within the trade of agricultural products. For instance, a new agreement between Norway and the EU entered into force January 2012, whereby the duty-free import quotas for cheese were considerably extended, from 4500 metric ton up to 7200 metric ton. Additionally, other duty-free import quotas were agreed upon, and some provisional arrangements were made with regard to products such as meat. Particular rules apply to manufactured agricultural products<sup>9</sup> and fish.<sup>10</sup>

<sup>10</sup>EEA Agreement, 4, Protocol 9.

### **27.1.3 Percentage-Based Tariffs**

In January 2013, the Norwegian Government (Stoltenberg II) amended the customs tariffs and introduced a percentage-based customs duty on certain types of food. The main reason behind the change was an attempt to position Norwegian agriculture against future import. The percentage-based system would only apply to certain types of cheese, beef fillets, and lamb, all being goods particularly vulnerable to foreign competition. The various levels in the EU and EU Member States instantly expressed dissatisfaction, claiming that this new regime is not in line with the spirit of the EEA Agreement and the EEA Agreement Article 19. The new Government (Solberg I), which took over in the Fall of 2013, indicated that it would be taking measures to reverse the percentage-based tariffs but so far such reversal has not taken place.

## **27.2 Trading with Countries Outside Europe and the Transatlantic Trade and Investment Partnership (TTIP)**

Through the EFTA-membership, Norway is a part of an extensive network of trade agreements and other partnership agreements. Currently, the EFTA Member States have 27 free trade agreements (covering 26 states) with countries such as Canada, Costa Rica and Panama, Chile, Colombia, Turkey, and Singapore.

Presently, there is no free trade agreement between Norway and the U.S., but there are on-going negotiations between the U.S. and the EU concerning a free trade agreement. If a free trade agreement between the U.S. and the EU is entered into, it would most likely affect Norway. The effect on Norway will occur partly because the agreement will likely render necessary changes in EU law relevant to the EEA Agreement, and partly because it will potentially pave the way for agreements between EFTA and the U.S. Undoubtedly, there will be issues that, for political reasons, are likely to be problematic for Norway, such as the position taken in U.S. regarding genetically modified food. The Transatlantic Trade and Investment Partnership (TTIP) is a feared and controversial source of friction that will hopefully not harm European food safety if it comes to pass.<sup>11</sup>

Norway has been a member of the World Trade Organization (WTO) since its establishment in 1995. The WTO collaboration covers several agreements, including: the General Agreement on Tariffs and Trade (GATT), the General Agreement on Trade in Services (GATS), and the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS).

---

<sup>11</sup>For more information on TTIP and the underlying concerns, see <http://ec.europa.eu/trade/policy/in-focus/ttip/> and [http://www.centerforfoodsafety.org/files/cfs\\_trade\\_matters\\_76070.pdf](http://www.centerforfoodsafety.org/files/cfs_trade_matters_76070.pdf).

### 27.2.1 *Restricting International Sales of Agricultural Products*

In addition to national subsidies, customs barriers are generally seen as an essential measure to protect domestic agriculture. When imposing tariffs on imported products, the price naturally increases. Depending on the political motives, the retail price of the imported product may end up either equal to or considerably higher than domestically produced goods, thereby making imported goods less attractive from a price perspective. Most countries are in need of imported products due to fluctuations in internal production, and states prefer to have a flexible tariff and import regime that allows them to take into account the country's shifting needs.

The system selected in Norway is built upon methods of reducing tariffs and may be exemplified by the following overview:

- Certain products may, on a *general basis*, obtain a tariff reduction. For example, reductions will be imposed when the domestic production be too small and serious market disruption is likely without imports.<sup>12</sup>
- Certain products may obtain a tariff reduction on the basis of an *individual application*.<sup>13</sup> This reduction is relevant for types of foodstuffs that are not offered by domestic producers, e.g. canned mango, or products that include foodstuffs that are not offered by Norwegian producers. For such foodstuffs, there is no need to protect domestic agriculture.
- Certain products may be imported free of tariffs within certain quotas or otherwise enjoy a reduction of the tariffs within certain quotas.<sup>14</sup>
- Customs preferences for processed agricultural products exist for countries which Norway has entered into a free trade agreement with, e.g. the EEA Agreement.<sup>15</sup>
- The Generalized System of Preferences (GSP) of the EU allows tariff reductions for developing countries.<sup>16</sup> As Norway is an EFTA/EEA member state, this particular scheme applies.
- Particular uses of a certain product may substantiate a tariff free import.<sup>17</sup> For example, intermediate products to be used by the fishing industry are subject to tariff free importation.<sup>18</sup> One argument for this tariff reduction is that it helps to secure Norwegian aquaculture industry's competitiveness on the world market. The policy implies that Norwegians should be given equally favourable

purchasing terms as their competitors so as not to be rendered less competitive by tariffs.

Surveying actual production, ensuring that the production meets the actual demand, and having measures to deal with under-coverage and excess production is handled in various ways. In Norway, such control and responsibility for certain product categories is regulated by market regulation; market regulation is one of the core principles of Norwegian agricultural policies.

### ***27.2.2 Norwegian Market Regulation***

The Norwegian market regulation schemes have been in place since the 1930s. The Act on Sales of Agricultural Products from 1936, and the preceding acts, came as a direct consequence of imbalances in the market that lead to dramatic price reductions and reduced income for farmers. The main purpose of the market regulation is to ensure that there is balance between demand and supply at all times. At present, there are market regulators for the following sectors: milk, red meat, corn, and eggs.<sup>19</sup>

The market regulation is financed through a fixed amount, payable per kg/litre of sales.<sup>20</sup> This sales tax is allocated to a fund that supports and funds immediate measures to stabilize the market or measures such as education and information activities. Various subsidies are also provided for farmers and producers in order to stimulate ecological production and even out transportation costs for various districts.

The main objective of the market regulator is to attain the maximum prices set out in the annual agreement between the farmers and the government, thus ensuring farmers their intended income. It follows that the market regulator is also intended as a means of securing product supply in line with actual demand, and helps organize the import of products should the domestic supply be insufficient. Another important obligation on the market regulator is the duty to take over products from all producers and the duty to supply members of the market regulation with products. As the market regulator is responsible for taking measures to ensure market stability, it is in the regulator's interest to ensure that the market is well taken care of. For the reason that it is the primary producers who pay the taxes which fund the market regulation, it is in their interest to limit over-production.

The appointed market regulators are strong cooperatives in charge of both collecting the food and processing and selling the food, principally under strong brand names. The market regulation has been criticized for having considerable financial interests in the sale of the products, as they are the lead players in both

---

<sup>19</sup>Regulation on the Market Regulation to Promote the Trade of Agricultural Products (2008).

<sup>20</sup>*Id.* at Sec. 3-3.

producing raw material and producing processed food. The Norwegian courts have assessed various aspects of the designed arrangements, but the systems have, so far, not been deemed invalid.<sup>21</sup>

In order to promote the trade of agricultural products, the Sales Council for Agricultural Products (the Council) was established in 1936.<sup>22</sup> The Council is an independent body, but its decisions may, to a limited extent, be re-examined by the Ministry.

The Solberg I government wants more competition within the food industry, and in March 2014 the Ministry of Agriculture and Food appointed a committee which shall evaluate the existing market regulation schemes. The result of this work is yet to be presented at the time this chapter is written.<sup>23</sup>

## 27.3 The Norwegian Legislation on Food and Beverages

### 27.3.1 *Introduction to the Norwegian Legal Framework on Foodstuffs*

The Norwegian legal framework on the import, production, handling, selling, and promotion of foodstuffs is found in the Act on Foodstuffs of 2003<sup>24</sup> (Food Act) and associated Regulations. Being a framework law, the Food Act establishes certain principles, rights, and obligations, all of which are further detailed in a range of regulations applicable to certain products or situations.

In retrospect, EU legislation has been the principal driver of changes within the legal framework applicable to foodstuffs. Most of the EU legislation on food is EEA relevant and thus, necessary for Norway to incorporate. In sum, Norwegian law is principally equivalent to EU law.

Despite this, there are currently still regulations of domestic origin in Norway, such as several “quality regulations”, that are not based on equivalent EU law. These regulations pertain to products such as vegetable conserves (canned vegetables), milk, cream, cheese, edible ice, and butter.<sup>25</sup> The purpose of these quality regulations are, among other things, to ensure that manufacturers promote their

---

<sup>21</sup>Judgment of Borgarting Court of Appeal of 15 January 2007.

<sup>22</sup>Act on the Trade of Agricultural Products of 1936, Section 1.

<sup>23</sup>The committee delivered its report in June 2015. The committee unanimously agreed that the market regulation in place should not be abolished. However, the committee split into three factions that each recommended alternative models for the future which varied with regards to, amongst others, to what extent one should allow the strong cooperatives to take part in the regulation.

<sup>24</sup>Act on Foodstuffs of 2003.

<sup>25</sup>Regulation on the quality of milk and cream of July 17, 1953; Regulation relating to the manufacturing, labelling and sale of cheese of August 24, 1956; Regulation on the manufacturing, labelling and sale of butter and butter fat of November 16, 1962; Regulation on the manufacturing,

products in an honest manner and in a way that does not mislead consumers. They require the use of certain raw materials and production methods and set forth requirements regarding labelling that must be met in order for the manufacturer to be able to define his products in accordance with the definitions set forth in the relevant regulation.

It should be noted that the Food Safety Authority recently proposed a revision of these regulations, as they appear to be outdated to some extent.<sup>26</sup> Some regulations are therefore expected to be fully repealed in the future, and the remaining will be amended in order to line up with industrial developments.

Even though EEA/EFTA Member States strive at adopting EU legislation relevant to the EEA Agreement promptly, it sometimes takes considerable time due to matters concerning one or more of the EFTA Member States. This was the case when the EEA Joint Committee was to include Regulation (EC) No 178/2002 of the European Parliament and of the Council of January 28, 2002. Regulation (EC) No 178/2002 (the General Food Law Regulation) laid down the general principles and requirements of food law, established the European Food Safety Authority, and laid down procedures in matters of food safety.<sup>27</sup> Due to the delay on the EEA/EFTA-level, Norway initiated a revision of the legal framework applying to food and feed in June 2001, aiming to unite an extensive range of acts on food and feed. Taking into account development at EU level, the mandate was revised in 2002 to ensure that the new legal framework would be in compliance with the framework developed by the EU.

The purpose of the mandate was to ensure that no material changes to the Norwegian Food Act would be necessary on the day of formal incorporation of the General Food Law Regulation. The EEA Joint Committee considered and included the General Food Law Regulation into the EEA Agreement in October 2007, but because one of the EEA/EFTA Member States needed time to prepare for the implementation, the new rules were not effective in Norway until Spring 2010.

From a legal perspective, one should note that the wording used in the Food Act is not entirely similar to the General Food Law Regulation. This was done intentionally, partly to keep the Norwegian Food Act in line with Norwegian legal traditions, and partially because the contents of the General Food Law Regulation was found not to be easily accessible. These are valid arguments, but they also raise

---

labelling and marketing of edible ice of April 15, 1977; and Regulation on vegetable conserves of January 1, 2001.

<sup>26</sup>Cf. the request for comments of 1 November 2013 by the Norwegian Food Safety Authority (only available in Norwegian) which can be found here: [http://www.mattilsynet.no/mat\\_og\\_vann/merking\\_av\\_mat/generelle\\_krav\\_til\\_merking\\_av\\_mat/horingsbrev.11601/binary/Horingsbrev](http://www.mattilsynet.no/mat_og_vann/merking_av_mat/generelle_krav_til_merking_av_mat/horingsbrev.11601/binary/Horingsbrev). All of the before mentioned regulations was cancelled on 1 January 2016. The regulations relating to butter, edible ice and vegetable conserves have not been continued. The most important parts of the regulations on milk, cheese and butter have been continued in the Regulation on the quality of milk and milk products of 3 June 2015 (in effect from 1 January 2016).

<sup>27</sup>Regulation (EC) No. 178/2002 (The General Food Law Regulation) of Jan. 28, 2002, 2002 O.J. (L31/1).

some concerns: Norway has, from the time the General Food Law Regulation formally entered into force in Norway, to some extent, had two sets of rules on the same subject matter that are not worded the exact same way. This creates concern about the risk of conflict. EU sources of law, however, rank higher in cases of conflict of laws.<sup>28</sup>

Norwegian policies on food, including advertisements, are rather strict compared to other those of countries. For example, there is a full ban on the marketing of alcoholic beverages, justified by the need to protect public health.<sup>29</sup> The ban is further detailed in the Regulation of June 8, 2005, Chapter 14<sup>30</sup> which places restrictions on the use of trademarks and brand names of alcoholic beverages. Should a trademark or brand name be used for both non-alcoholic and alcoholic beverages, the advertisement of the non-alcoholic beverage is also restricted unless the alcoholic beverage uses its own distinct trademark. There are a few minor exceptions, such as advertisements in foreign magazines, giving information on point of sale and service, and showing information signs of small size in direct connection with the sale or serving.

Even though tobacco is not a food, the prohibition of tobacco advertisements also illustrates the strict Norwegian policy on advertising.<sup>31</sup> Even the mere display of tobacco in advertisements is illegal. This is significantly more progressive than most countries' counter-parts of legal regulation of tobacco advertisements and shows how well public health can be promoted in such regulation.

Except for the legal text itself, the sources of law regarding the application of the law in general are sparse. Few decisions made by the Food Safety Authority are tested by the courts; the Norwegian Supreme Court has only ruled in three cases involving the Food Act, the Court of Appeals appears to have ruled in 21 cases, and the District Court has ruled in only 17 cases made that have been made publicly available.<sup>32</sup>

### ***27.3.2 Rules on the Promotion of Foodstuffs***

Information requirements are extensive when it comes to selling food in Norway. Current legislation ensures that consumers take well-informed choices. Regulation (EU) No 1169/2011<sup>33</sup> of the European Parliament and of the Council on the provision of food information to consumers, which was implemented in Norway

---

<sup>28</sup>Act on Implementation of the main part of the Agreement on the European Economic Area (EEA) into Norwegian law, of 27 November 1992, Section 2.

<sup>29</sup>The Act on the Sale of Alcoholic Beverages of 2 June, 1989, Section 9-2.

<sup>30</sup>Regulation of June 8, 2005, Chapter 14.

<sup>31</sup>Act Relating to the Prevention of the Harmful Effects of Tobacco of March 9, 1973, Section 22.

<sup>32</sup>As of February 2nd 2015.

<sup>33</sup>Regulation (EU) No 1169/2011 of the European Parliament and of the Council of October 25, 2011., 2011 O.J. (L304) 18.

on December 13, 2014, gives further details with regard to labelling requirements and rules on advertisements. The Regulation (EU) No 1169/2911 is binding law in Norway as it was incorporated into Norwegian law in the Regulation on the provision of food information of 28 November 2014. The regulation replaces the former Norwegian Regulation on Labelling of Food 1993. In the following paragraphs, the focus will be on the particular rules on promotion, thus the labelling requirements will not be discussed herein. (For labelling requirements in the EU, see Chap. 22.)

The general national legislation relating to the promotion of foodstuffs follows from the Food Act,<sup>34</sup> section 10, and is further detailed in Regulation on the provision of food information 2014. The core principles are that the advertisement shall be correct, adequate and not misleading, and, moreover, that the marking shall not mislead the buyer with respect to “the characteristics of the foodstuff, particularly with regard to its nature, identity, quality, composition, quantity, durability, origin or place of origin, the manufacturing or production means.”<sup>35</sup>

The concept of misleading advertisements will be determined by an overall assessment of the advertisement in question. There are however, certain acts that always will be regarded as misleading, such as acts claiming that the foodstuff has certain effects or properties which are not correct, or giving the impression that the food product has special characteristics when all similar foodstuffs possess the same properties.

There is no case law illustrating misleading marketing of foodstuffs and no national guideline provided by the Food Safety Authority. There are, however, some trademark cases in which the courts assess whether a trademark has misleading effects (see below). In practice, some assistance and guidance is found in the guidelines available from Denmark and Sweden, both of which discuss sales-friendly terms such as “natural,” “real,” “home-made,” etc. As these remain foreign guidelines, the Food Safety Authority will as such not be bound by them and may find reason not to emphasize the guidelines in a national case.

The Food Safety Authority did publish the report “Villedende merking – Kampanje 2013” (Misleading labelling – Campaign 2013) in the spring of 2013 after having conducted a survey of 195 foodstuffs, and checking whether the food was correctly labelled and not misleading. Out of 195 foodstuffs examined, the Food Safety Authority found that 94 of the foodstuff labels were not in compliance with the law.<sup>36</sup>

In particular, the Food Safety Authority found that the so-called Bread Scale could have misleading effects. There is no national definition of bread; however, NHO Mat og Drikke (Federation of Norwegian Food and Drink Industry) has developed a standard called the “Bread Scale, giving the consumers information on whether the bread is e.g. white or whole-grain”. The Bread Scale may be used according to separate agreements with NHO Mat og Drikke.

---

<sup>34</sup>Food Act, Section 10.

<sup>35</sup>Food Act, Section 10.

<sup>36</sup>“Villedende merking – Kampanje 2013” (Misleading labelling – Campaign 2013).

With regard to the possible misleading effects, first the Food Safety Authority found that some of the breads labelled according to the Bread Scale were incorrectly labelled. Second, quite a few of the breads labelled as “whole grain” had just a little bit above 50 % whole grain. This is compliant with the Bread Scale, but the Food Safety Authority found this to be “bordering on misleading,” as the consumer looking at the Bread Scale would believe that the bread contained 75 % whole grain.

This example illustrates some of the challenges faced when the industry develops their own standards. Even though intentions were good when developing the scale, aiming at giving customers an easy method to pick bread containing the desired amount of whole grain, the method chosen was nevertheless problematic. The Food Safety Authority’s scepticism did pressure the industry to undertake measures to change the scale. One of the measures was to provide the actual percentage of wholegrain on the package, close to the picture of the scale.

The report from the Food Safety Authority raised a particular concern about the labelling of juice drinks such as smoothies, and more precisely, concerns about the use of images and pictures of fruit on such drinks. The manufacturer is obliged to ensure that illustrative photos and images are truthfully reflecting the product’s actual content. For example, an image of a large passion fruit on the label of a juice drink that contained only 7 % passion fruit would be misleading.

### ***27.3.3 The Applicability of the General Marketing Law***

The food law is *lex specialis* to the general rules on marketing applying to all businesses. However, the general legislation on marketing establishes certain rules not found in the *lex specialis* food rules and so the food industry must abide by them. Some examples of general legislation on marketing rules that apply in the food context are presented below but the list is not exhaustive.

#### **27.3.3.1 Marketing to Children: Progressive and Precautionary Marketing Control**

First, marketing to children has been restricted for many years, both in the current Marketing Control Act of January 9, 2009, and the preceding acts.<sup>37</sup> Children are considered to be a particularly vulnerable group because of their innocence and gullibility. Thus, particular care must be taken when it comes to commercial practices affecting them. In essence, their lack of critical thinking skills makes them easy targets.

The particular rules protecting children set out in the Marketing Control Act, outline that such rules extend beyond promotional activities aimed at children and

---

<sup>37</sup>Marketing Control Act of January 9, 2009.

include all activities that may be seen or heard by children. Both promotional activities and all other activities seen or heard by children must take into account considerations that children are easily swayed, their lack of experience, and their natural credulity. Moreover, direct exhortation directed at children is prohibited, which includes messages that would inspire children to persuade their parents into buying the products in question.

### 27.3.3.2 Good Trade Business Practice

Second, section 25 of the Marketing Control Act<sup>38</sup> sets forth a general prohibition against acts in the course of trade that conflict with good business practice among traders. The rule is construed as a legal standard, meaning that its content may change over the course of time to be in line with social development. The prohibition is only applicable in the relationship between traders, and its area of application is thus delimited from consumers.

The rule was established to protect businesses from unfair business practices. It is often applied as a secondary legal basis in cases involving imitations since it provides an opportunity for the Court to make an overall assessment of the facts of the case when deciding whether or not there has been a breach of law (see below).

Thirdly, based on section 26 of the Marketing Control Act,<sup>39</sup> the Ministry of Children, Equality, and Social Inclusion have developed the Regulation on Comparative Advertising (the Regulation); the Regulation implements Directive 97/55/EC, defining the several requirements to be met in order for a comparative advertisement to be legal. It follows from Section 3 of the Regulation that, amongst other restrictions, comparative advertising is only permitted: if it is not misleading; if it compares goods or services that meet the same needs or are intended for the same purpose; and if it objectively compares one or more of those goods and services' features that are specific, relevant, documentable, and representative.<sup>40</sup>

Thus, comparative advertising may be used as long as it is based on correct information and is carried out in a fair manner. As these practices regarding comparative advertising constitute good business practices, section 25 of the Marketing Control Act is often invoked when alleged section 26 violations.

Fourth, section 2 of the Marketing Control Act states, in general, that marketing shall not conflict with good marketing practice. This is further explained as an obligation for the marketer to ensure that the marketing does not violate gender equality, that it does not exploit the body of one of the sexes, or that it does not convey an offensive or derogatory appraisal of women or men.<sup>41</sup>

---

## 27.4 Particular Protection of Children to Prevent Obesity

The WHO's Recommendations "Marketing of foods and non-alcoholic beverages to children" of 2010 have been implemented in Norway by way of a new self-regulatory regime introduced with full effect in January, 2014. The Norwegian Government first aimed at implementing the WHO Recommendations through a legally binding regulation, and a draft was introduced in June, 2012. The draft regulation met both acceptance and criticism, and particularly the latter as all marketing of particular food categories aimed at children below 18 years were suggested banned. An amended draft regulation was later launched. Having negotiated a self-regulatory regime in parallel, the Norwegian authorities chose to accept the regulatory regime suggested by the industry rather than bringing the second draft regulation into effect under the pressure that the self-regulatory regime would be evaluated within 2 years. Should the self-regulatory regime not function as intended, the regulation would be brought into effect.

The consequences of overweight and obesity are extensive. Not only is obesity the fifth leading risk for global deaths, but overweight and obesity may lead to cardiovascular disease, cancer, and type two diabetes. The socio-economic impact is not any less dramatic. Obesity has led to the persistent reduction of the working force and the growing need for health care and social security benefits. Additionally, concerns about the personal impact of obesity and the quality of life of those people suffering from obesity should not be disregarded.

Obesity has more than doubled among adults since 1980 and a similar trend has emerged in the average increased weight of children. This prevailing and growing health-problem causes major concerns globally. Therefore, finding good and appropriate measures to reduce and, in the end, stop this development are of the essence. The bigger picture and underlying reasoning is complex, but two main causes of the problem are nevertheless easy to detect: Less physical activity and large consumption of unhealthy food. Junk food and energy-dense food are to a large extent available day and night in most parts of the world.

The correlation between advertisement and obesity is not an unfamiliar theme for either authorities or the industry. For example, leading food and beverage companies created the EU pledge, which is a voluntary initiative, to change the way companies advertise to children. Additionally, the recommendations from WHO call for global action to reduce the impact that marketing of foods high in saturated fats, trans-fats, free sugars, and salt has on children. Industry guidelines with the purpose of reducing marketing pressure on children were in place and effective as of 2007, but the Norwegian authorities wanted to impose a stricter regime on the Norwegian industry. Consequently, in 2012, the Norwegian authorities proposed a ban on all marketing of unhealthy food aimed at children below 18 years of age. This proposal was massively criticized by the industry, alleging, inter alia, non-compliance with the EEA and its established principles of free movement of goods. A revised proposal was launched in 2013 that met only parts of the criticism raised and, again, questions arose regarding compliance with the

EEA Agreement. Further, EFTA Surveillance Authority (ESA) commented on the Revised Draft Regulation during the summer of 2013, underlining the need for proportionate measures.<sup>42</sup>

In parallel with the legislative works proposed by Norwegian authorities, the Ministry of Children, Equality and Social Inclusion, and the Ministry of Health and Care Services engaged in dialog with the industry to see whether the industry could come up with a better self-regulatory regime, thus replacing the need for new regulation. An amicable settlement between the industry and the authorities was made when the new industry guideline launched on June 5, 2013,<sup>43</sup> which imposed a self-regulatory regime. The new guideline was brought into effect on January 1, 2014. As the industry managed to develop a self-regulatory regime that was deemed appropriate by the authorities, the second legislative proposal has not been made effective yet. Whilst the self-regulatory regime does impose strict rules on marketing, it is considered that it may have less legal impact on the effectiveness of the implementation of the WHO Recommendations than a legally binding regulation.<sup>44</sup>

The industry was originally granted a 2-year trial period to prove the success of the industry guideline implementing a self-regulatory regime. Should the new regime not have the desired effect, the second proposal made by the Norwegian authorities was to be brought into effect. However, it remains to be seen what the outcome is after the self-regulatory regime is evaluated.

Essentially, the new industry guideline implies that that all food defined as “unhealthy” should not be marketed directly to children (below 13 years of age). Even if children are 13 years or older, it follows from the guideline that the industry is obliged to take into account both age and maturity.

The crux of the matter is to clarify which food falls within the term “unhealthy” and what marketing activities may be seen as aimed “directly at” children. First, unhealthy food is defined as certain energy-dense, salty, sweet, or nutrient-poor food, all exhaustively defined in the guideline. The category includes foods such as chocolate, biscuits, snacks, soda, and different kinds of fast food. In regards to the latter question, the guideline makes it clear that one must perform an overall assessment in order to decide whether the marketing is particularly aimed at children.

Notably, the guideline applies to all types of media sources and channels. Marketing is defined as any sales promotional act. However, the guideline clarifies that the following are not considered to be marketing: (a) The product itself, including the packaging; (b) General presentation of products at retail outlets;

<sup>43</sup>Industry Guideline (June 5, 2013).

<sup>44</sup>For evaluation of self-regulatory regimes vs. legally binding regulations, see e.g. Garde and Bartlett (2013).

(c) Sponsorship which only involves the use of sponsors' name, the sponsor- or a product's trademark; or (d) Sampling of products if a parent or other responsible adult have consented to the sampling. Furthermore, television advertisements broadcast after 9:00 pm will not be regarded as marketing directed towards children.

If a product does not comply with the established guidelines, any entities, NGOs, or private persons may complain to the Complaint Commission of the Food industry' (Matvarebransjens Faglige Utvalg). The proceedings are confidential, but the decision will be made public. Moreover, the respondent will not be informed about whom the plaintiff is. Any complaint must give (1) information allowing identification of the plaintiff and the respondent and (2) a written presentation of the matter, including documentation. The respondent will be given a right to comment within 14 days. The complaint will thereafter be assessed by the commission.

The Guideline has been in effect for slightly more than a year when this is written. Thus, the Complaint Commission has so far given ten opinions related to the marketing ban in 2014.<sup>45</sup> The Complaint Commission concluded with illegal marketing in five of these. Finally, the repetitive question assessed in these cases has principally been whether the marketing was directed directly at children.<sup>46</sup>

## 27.5 Governmental Bodies and Actions

In case of non-compliance with the labelling or advertising requirements, actions may be taken by both the Consumer Ombudsman and the Food Safety Authority (Mattilsynet), the latter being the most likely. The Food Safe Authority is authorized to make any decision required in order to ensure compliance under the scope of the Food Act and the regulations attached thereto. Thus, depending on the violation's degree of severity, the Food Safety Authority will decide what sanction is deemed most appropriate and effective in each case.

The most common form of sanctioning is an injunction that requires amendment of the labelling or advertisement, or an injunction that requires that the foodstuff's content is changed so that it corresponds with the current labelling. The Food Safety Authority may also give compulsory fines for each day that the company does not comply with such injunctions. However, this happens rarely, and when it happens, the fines are normally low (between NOK 2000 and 20,000).

Furthermore, the authority may impose administrative fines, but this is not often used. Of practical interest is the fact that the Food Safety Authority may prohibit the sales or impose withdrawal of the foodstuffs in question. The Food Act, moreover, gives legal basis for criminal prosecution, which means criminal fines and

<sup>46</sup>Cf. the Guidelines clause 2, 7.

imprisonment. However, such reactions are reserved for the more serious cases that the Food Safety Authority is responsible for handling, e.g. cases of animal maltreatment. When a sanction is prepared by the authorities, the entity is normally entitled to comment. Correspondingly, when the sanction is officially made, there is a complaint procedure in place. The case may thereafter be brought before the courts.

Should the Consumer Ombudsman take action, the Ombudsman will primarily seek a solution based upon negotiation with the entity in question. In certain cases, the Ombudsman is authorized to make decisions involving prohibition, injunction, penalty and/or administrative fines. Normally, however, such decisions are taken by the Market Council, which is an administrative Council with certain parallels to the regular courts. Appeal is not possible, but the decisions may be brought before the regular courts.

A company may bring a case concerning its competitor(s) to court, so long as the company is considered to have legal standing to bring a case against the company in question according to the Dispute Act (Act No. 90 of June 17, 2005).<sup>47</sup> Company competitors may also bring notice to the authorities about the non-compliant activities of other companies. The industry has further established the Committee for Unfair Competition to assess whether activities are in compliance with the Marketing Control Act, Chapter 6, which concerns competition between entities rather than consumer perspective. The dispute system offers quick and low-cost proceedings, and even though these opinions are not legally binding, the parties will normally abide by them (see below).

### ***27.5.1 Protecting Intellectual Property Rights in Norway***

New products are launched into the Norwegian retail market three times per year. In 2013, approximately 1000 products were launched.<sup>48</sup> Although many of them will be short-lived and replaced by other products, the high number of new products illustrates the importance of innovation and product development within the sector. Innovation and product development are not just expected by the retailers, it is also cherished by the consumers. By implication, suppliers have strong incentives to innovate and develop new products. Building customer relations through branding is particularly present in the food and drink sector, and some of the world's most famous brands are represented here. Protecting the innovation and capital spent on developing new products is essential: It provides a legal arm's length to one's competitors. Consequently, seeking such protection is not just of interest to multinational companies.

<sup>48</sup>Nye produkter i butikken – noen fakta (2014). <http://www.dagligvarehandelen.no/nye-produkter-butikken-noen-fakta/>.

A food product may be protectable as intellectual property in various ways. To illustrate, a product name may be protected as a trademark, packaging may typically be protected as design, and the manufacturing process may involve use of patentable techniques or trade secrets. Product protection may also be found in the Market Control Act should there be a violation of the principle of good business practices.
