International trade makes global cooperation within the intellectual property field necessary. Norway is a party to several important international agreements on intellectual property, amongst others, the Paris Convention for the Protection of Industrial Property, the TRIPS Agreement, the Berne Convention for the Protection of Literary and Artistic Works, and the European Patent Convention. Consequently, Norwegian legislation within the area of intellectual property is very much in line with parallel legislation in other countries.

Being a party to the EEA Agreement, Norway is obliged to accept EU legislation in the legal areas that are covered by this Agreement. As a result, Norwegian legislation on intellectual property rights is, for the most part, consistent with parallel EU legislation where the rules have been harmonized to ensure that intellectual property rights do not become an obstacle to trade. Procedural law is not a part of the EEA Agreement, and Norway is, therefore, not obligated to implement Directive 2004/48/EC on the Enforcement of Intellectual Property Rights OJ 2004 L 157/1. The Norwegian government decided that it was in the best interest of the industry that the rules were at least as favourable to Norwegian right holders as the applicable EU law and decided to adopt similar legislation. Thus, intellectual property right holders in Norway have at least as favourable law enforcement options as those under EU law. In some cases, the Norwegian enforcement provisions provide the intellectual property right holder with a stronger position than with what is provided by the minimum requirements within the EU.<sup>49</sup>

The Norwegian Industrial Property Office (NIPO) is the national centre for intellectual property rights. It has the authority to handle and decide on patents, trademarks, and design applications. Decisions from NIPO may be brought before the Norwegian Board of Appeal for Industrial Property Rights, which is an independent administrative board.

In the following, our focus will be on some of the most important ways for food suppliers to protect their products, and the presentation will not be exhaustive with regard to potential legal basis for claiming protection.<sup>50</sup>

---

<sup>49</sup>Prop. 81 L (2012–2013), pp. 1 and 42.

<sup>50</sup>Copyrights, business names, and domain names may also constitute potential legal basis for claiming protection for food suppliers. Copyrights and rights to business names are regulated in respectively the Norwegian Copyright Act of May 12, 1961, and the Norwegian Business Names Act of June 21, 1985. Domain names are protected by registration, for example, Norid (see [www.norid.no](http://www.norid.no)).

### 27.5.2 Trademarks

Trademark protection is essential in the industry as some of the world's most famous brands are found within the food and beverages sector. Intense competition in the supply chain, including the growing presence of private labels, makes trademark protection important, not just for the multinational companies, but for any company desiring to sell products under its own name.

It follows from the Trademarks Act<sup>51</sup> that a trademark right has the effect that no one, without the consent of the proprietor, may in an industrial or commercial undertaking, use:

- (1) any sign that is identical to the trademark on goods or services for which the trademark is protected, and
- (2) any sign identical to or similar to the trademark on identical or similar goods or services if there exists a likelihood of confusion, such as if the use of the sign may give the impression that there is a link between the sign and the trademark.<sup>52</sup>

A trademark is any sign capable of distinguishing the goods or services of one undertaking from those of another. Potential signs include words and combination of words, including slogans, names, letters, numerals, figures and pictures, and also—if it is considered sufficiently distinctive—the shape of the goods or their packaging.<sup>53</sup>

Norway, not being a member of the EU, is not part of the established system of registration of EU-trademarks which implies a uniform effect all over the internal market.<sup>54</sup> Therefore, the registration of a Community Trademark through the Office for Harmonization in the Internal Market (OHIM) will not give the trademark protection in Norway. Instead, to achieve protection, it is necessary to apply for a national registration through the Norwegian Industrial Property Office (NIPO) or to designate Norway in an international trademark application via the Madrid Protocol.

There are two different ways of achieving trademark protection: registration or protection acquired through use.<sup>55</sup> Applicable in both alternatives is the requirement that the trademark must be distinctive to the goods or services that it relates.<sup>56</sup>

<sup>51</sup>Trademarks Act, Act No. 8 of March 26, 2010, Clause 4.

<sup>52</sup>*Id.*

<sup>53</sup>*Id.* at Clause 2; The Norwegian Trademarks Act of March 26, 2010 implements Directive 2008/95/EC.

<sup>54</sup>EU Council Regulation No 207/2009 of Feb. 26, 2009, OJ (L78) 24.3.2009.

<sup>55</sup>When protection is established by use, the possibility of acquiring a registration depends on whether the mark is well known as someone's brand within the relevant goods' and services' circle of trade in Norway, cf. the Trademarks Act, Clause 3.

<sup>56</sup>Trademarks Act, *supra* n. 47, Clause 14.

Protection acquired through registration is granted and valid in Norway. Protection acquired through use will only be valid within the geographic area (within Norway) where the trademark has been used and becomes well known within the circle of trade.<sup>57</sup>

A Norwegian trademark registration is valid for 10 years from the date of application. Registration may be subsequently renewed for 10 years at a time, thus making an indefinite protection theoretically possible.<sup>58</sup> However, in order to maintain protection, the trademark must be actively used. Otherwise the registration of the trademark may be deleted in full or in part based on the grounds of non-use.<sup>59</sup>

Several national landmark cases within trademark law concern trademarks used on food and drinks. In 1995, the Norwegian Supreme Court assessed the legality of the trademark “Mozell” used on soda in the so-called *Mozell-case*.<sup>60</sup> One of the claims made by the Deutscher Weinfonds, representing the wine producers of the Mosel-district in Germany, was that the word mark “Mozell” should be deleted as it was liable to mislead with regard to the geographical origin of the product it was registered for.

The Supreme Court ruled in favour of the trademark owner, based on the grounds that even though the trademark might give the customers certain associations to the wine district Mosel and Mosel-wine, the trademark was not misleading. It was emphasized that the trademark “Mozell” was only representing non-alcoholic beverages, and thus limiting the risk of deception as there was only a slight chance that consumers would believe that the soda in any way originated from the Mosel district. The court found that the trademark was a fantasy mark, rather than serving a descriptive purpose, and would thus not provoke a dilution of the origin. The trademark “Mozell” differed from Mosel, both in written format and pronunciation. Even though the word mark had “certain associations” to Mosel and Mosel wine, it was unlikely that consumers would believe that the product was Mosel wine.<sup>61</sup>

It follows that the most essential function of a trademark is its origin function: that the trademark identifies the products’ and services’ commercial source or origin. In order to ensure that a sign is capable of fulfilling this function, it must have the distinctive character of a sign for the relevant item or service it refers to.<sup>62</sup> Consequently, generic terms would normally not fulfil the fundamental requirements of a trademark. Moreover, there is a need to reserve the right to such use of a generic term for the competitors. The *Jo-Bolaget case*<sup>63</sup> illustrates a case on borderline distinctiveness. In 2002, the Supreme Court assessed whether a trademark

---

<sup>57</sup>*Id.* at Clause 3.

<sup>58</sup>*Id.* at Clause 32.

<sup>59</sup>*Id.* at Clause 37.

<sup>60</sup>Rt. 1995, s.1908.

<sup>61</sup>*Id.* (Rt. 1995, s.1908).

<sup>62</sup>The Trademarks Act, *supra* n. 47, Clause 14.

<sup>63</sup>*Jo-Bolaget Case*.

application consisting of words and figurative elements used on fruit juice could be registered due to the phrase “GOD MORGON” (good morning). NIPO rejected to register the mark due to the generic phrase used, and would only approve the application if Jo-Bolaget disclaimed the disallowed component of the mark. Effectively meaning they would not claim the exclusive right to use the phrase “GOD MORGON.”

The Supreme Court found that the trademark could be registered, as the distinctiveness requirement was not to be interpreted too strictly. This was principally reasoned with reference to case law from The European Court of Justice (ECJ). Notably, having a low degree of distinctiveness impacts the scope of protection. Thus, the Supreme Court found that the trademark could only have a narrow scope of protection.<sup>64</sup>

As for the situation today, the Supreme Court might have ruled differently. Following the decision in the Jo-Bolaget case, the ECJ has emphasized the general interest in keeping certain signs freely available to all. Consequently, the ECJ seems to have applied a more restrictive norm for what constitutes distinctiveness.<sup>65</sup>

### 27.5.3 Patents

Protecting the manufacturing process and the technology used in the manufacturing process is done either by filing for patents or by keeping the information confidential (see below). Whereas food manufacturing processes are often based on common knowledge and, therefore, not possible to protect as patents, many companies are investing in research and development that would make the development of patentable inventions more likely.

In order for an invention to be patentable, it follows from the Norwegian Patents Act of December 15, 1967 (Patents Act) that the invention must be novel.<sup>66</sup> In short, this means that it must involve a characteristic which is not known prior to the application (prior art). The next requirement is that the invention must show an inventive step, which means that it must not be obvious to someone with knowledge and experience on the subject. Clearly, common knowledge is free for anyone to use, and not patentable. It logically follows that products that can easily be deduced from such knowledge also may not be patented. Patent rights are reserved for those inventions that bring technical development further and beyond the expected,

---

<sup>64</sup>The Oslo District Court ruling of 2005 (TOSLO-2003-18673) says that Jo-Bolagets trademark—even though registered—offers only weak protection, and thus the court did not consider a competitor’s use of “God morgen” on their products as an infringement of Jo-Bolagets’ exclusive rights.

<sup>65</sup>See Birger Stuevold Lassen and Are Stenvik, *Kjennetegnsett*, 2011, page 70. For ECJ practice see e.g. Case C-53/01 Linde, and Case C-104/01 Libertel.

<sup>66</sup>Norwegian Patents Act (Patents Act) No. 9 of December 15, 1967, WIPO Lex No. NO056.

thereby illustrating that the act of inventing needs freedom to operate. The development and innovation processes should not be hindered by patents which involve solutions only within reach of technically skilled persons. Reserving patents to inventions having the “inventive steps” also gives strong incentives to seek extraordinary results. Patents and patent applications are official documents, and it is thought that access to such documents will trigger new developments since anyone, not just competitors, can learn from the techniques presented.

The invention must involve the solution to a problem that is of a technical character, that has a technical effect, and that may be re-produced. Consequently, ideas, scientific theories, mathematical methods, the mere discoveries of natural substances, commercial methods, and ingredients lists are generally not patentable.

When filing for a patent, it is principally possible to obtain 20 years of protection from the date of filing, provided that the annual renewal fees are paid.<sup>67</sup> If granted, the right holder obtains the exclusive right to exploit the invention commercially or operationally. A patent may, however, be deemed invalid, if the patent requirements are later found to be unfulfilled. In cases of alleged infringements, validity issues are often raised and invalidity proceedings initiated.<sup>68</sup>

Norway has ratified the European Patent Convention and has been a member of the European Patent Organization since January 1, 2008. European patents that have designated Norway will have the same validity as Norwegian patents, presupposed that the patent is translated into Norwegian and the annual fees are paid accordingly.<sup>69</sup> With only one application needed, this system provides the opportunity for a simple and cost-efficient way of obtaining a patent within several European countries at the same time. At the moment, there are no joint procedures on enforcements, and it is still the Norwegian courts that will have the competence to rule in matters revolving patents valid in Norway.<sup>70</sup>

In Norway, there is a particular Act on the Right to Inventions<sup>71</sup> made by Employees of September 1, 1970. The Act aims at balancing the interests between employers and employees and applies, unless the parties have previously agreed otherwise. Some clauses in the Act are mandatory and always apply in full, e.g. the right of the employee to have “reasonable payment.” No other acts regarding intellectual property provide equivalent rules on the transferral of rights from employees to employers, except for the Norwegian Copyrights Act.<sup>72</sup> Such transferral of rights is principally regulated in the contracts or background law.

---

<sup>67</sup>*Id.* at Sec. 40.

<sup>68</sup>*Id.* at Sec. 52.

<sup>69</sup>*Id.* at Sec. 66c.

<sup>70</sup>For the time being there is on-going work within the EU relating to the creation of a unitary patent for Europe and a specialised patent court (UPC—“Unified Patent Court”) that has exclusive jurisdiction for litigation relating to European patents and European patents with unitary effect. This work will not have any effects with regard to Norway.

<sup>71</sup>Act on the Right of Inventions (September 1, 1970), Section 4.

<sup>72</sup>Norwegian Copyrights Act, Section 39g.

### 27.5.4 Design

Whereas trademarks protect the ability to distinguish products and services from each other and patents protect technical features, a design registration will grant protection to the visual layout.<sup>73</sup> In Norway, design rights for packaging have been granted for foodstuffs such as yoghurt, which makes it possible to separate the yoghurt from its topping, and to special bottles and ornamentation.<sup>74</sup> Under the Norwegian Designs Act (Designs Act) of March 14, 2003, design is defined as the appearance of a product or of parts of a product.<sup>75</sup> Design rights, therefore, protect the overall visual appearance of a product or a part of a product. However, the protection does not cover the technical features of the product.

In order to obtain a design right, it is necessary to file for protection. The requirement for protection is that the design has to be new and have individual character, which is a requirement with resemblance to the patent criteria. This means that the design must differ significantly from previously known designs and cannot be made available to the public within the EEA before the date of filing or before the date of priority if priority is claimed.<sup>76</sup> The application procedure is simplified because NIPO does not conclude whether the requirements for registration are met, and issues on validity are raised at a later stage, e.g. in an administrative review initiated by a complaint or by the courts.

Protecting intellectual property gives no guarantee of success in the market. The strict novelty-requirement leaves designers, often with small budgets, no time to test the market's response to prior to application. Therefore, a grace period is granted, and the designer, or his successor in title, may disclose the design 12 months before the application for registration or before the date of priority without jeopardizing the novelty-aspect of the design.<sup>77</sup>

In contrast with trademarks, the established system of registration through OHIM of a Community Design, which implies uniform effect all over the internal market,<sup>78</sup> will not provide the owner of the design with protection in Norway. To obtain protection, it is necessary to either apply for a national registration through the NIPO, or to designate Norway in an international registration of design to the World Intellectual Property Organization (WIPO). The latter is done through the

---

<sup>73</sup>3D trademarks will give protection to the visual layout. Practise illustrates that the threshold for 3D marks are strict as it is the design that needs to fulfil the principal requirement on distinguishing goods, but if obtained provides for a strong protection as the protection period may be indefinite, cf. e.g. Case C-468/01 Procter & Gamble and Case C-286/04 Eurocermex.

<sup>74</sup>See Design Registration No. 084229 and No. 083329.

<sup>75</sup>The Act implements Directive 98/71 EC on the legal protection of designs; Norwegian Designs Act (Designs Act) of Mar. 14, 2005.

<sup>76</sup>Designs Act, *supra* n. 67, Sec. 3; Priority may be claimed within six months after the first application was lodged, or after the exhibition of the design at an official or officially recognized international exhibition, cf. the Designs Act, Clause 16.

<sup>77</sup>Designs Act, 67, Sec. 6.

<sup>78</sup>Council Regulation (EC) No 6/2002 of Dec. 12, 2001.

Protocol Relating to the Madrid Agreement Concerning the International Registration of Marks (Madrid Protocol) of June 27, 1989, to which Norway is a member.<sup>79</sup>

A design registration is valid in Norway for at least one period of 5 years or more periods. A registration valid for a period shorter than 25 years may be renewed for further 5-year periods up to a total registration period of 25 years.<sup>80</sup>

### 27.5.5 *The Marketing Control Act's Protection of Products*

Unfair competition practices, such as deliberately taking advantage of others' brands, goodwill, or product developments, do not necessarily constitute a violation of registered rights. The Marketing Control Act is subsidiary to the acts on intellectual property. As the Act emphasizes aspects of unfair competition, it plays an important role in cases regarding infringements; in some cases the Act even supplies as the principal claim. The following paragraphs analyse how the Marketing Control Act supports registered rights holders by constituting an effective weapon against counterfeit products.

The starting point for assessing a specific business conduct is the principle that all acts must be in accordance with good business practices.<sup>81</sup> It is the clause that entails a legal standard which may be adjusted in time to reflect and adapt to changes in business practices relevant to the standard. In addition, the Marketing Control Act specifically addresses copy products and prohibits unreasonable exploitations of others' products when there is a risk of confusion.<sup>82</sup> Notably, if the copy is sold under another known brand (which often is the case when it comes to food and beverages), confusion is often not likely. Thus, in practice, the Marketing Control Act makes good business practices standards the most relevant legal basis as there is no need to establish confusion.<sup>83</sup>

Cases involving possible violations of the Marketing Control Act may be brought before the regular courts, claiming sales ban and compensation,<sup>84</sup> but the alternative is to request a statement from the Committee for Unfair Competition

---

<sup>79</sup>Madrid Agreement Concerning the International Registration of Marks (June 27, 1989).

<sup>80</sup>Designs Act, *supra* n. 67, Sec. 23.

<sup>81</sup>Marketing Control Act, *supra* n. 37, Sec. 25.

<sup>82</sup>*Id.* at Sec. 30.

<sup>83</sup>Even though there cannot be established a violation towards the involved intellectual property right, the Marketing Control Act may be used as a legal basis to prevent others from unreasonably exploiting your rights. However, the Supreme Court has stated (e.g. in the *Mozell-case*) that if section 30 is not applicable because confusion is not established, the use of section 25 presupposes that there are other facts to the case which goes beyond the exploitation as such. This because section 25 is a general prohibition contrary to section 30 which is a special provision, and therefore section 25 shall not be applied on exactly the same conditions as this would be contrary to the system of the Marketing Control Act.

<sup>84</sup>Marketing Control Act, *supra* n. 37, Chapter 9.

(Committee). The Committee is established by the industry and offers an inexpensive and efficient dispute system. It assesses whether activities are in compliance with the prohibitions of the Marketing Control Act concerning competition between business entities, and gives a statement which is not legally binding, however normally abided by.<sup>85</sup> The Committee does not grant any compensation or reimbursement, impose withdrawal, or impose the destruction of products. The Committee consists of a panel that does not include judges, but some of the members have legal expertise. The cases brought before the Committee provide concrete assessments of whether a counterfeit product is illegal. The rendered decisions are important even though they, although legal sources of law, are not as highly regarded as judgments from the courts.

An interesting aspect of the dispute resolution provided by this regime is that some of the cases are revolving branded goods and private labels. For the simple reason that private labels are offered by the retail in which branded goods are also sold, the supplier and the private label seller have a contractual relationship. Pursuing matters of infringements against a customer is obviously not preferred. Whereas bringing such a case before the regular courts normally results in a high conflict level, the dispute resolution offered by the Committee provides a smoother alternative and makes it easier for the supplier of the branded goods to claim infringement.<sup>86</sup>

The assessments concerning packaging design make it evident that the Committee normally emphasizes the extent of which the alleged infringing product is too close to the original, because in certain cases the freedom to make an alternative design is not fully exploited. Some examples may illustrate what factors are of relevance. For example, *The Ice-cream packaging case*<sup>87</sup> involved the two leading ice cream producers in Norway. The matter concerned whether the yoghurt ice cream package sold under the name “Please” was infringing the rights pertaining to the product sold as “Dream,” illustrated in the picture below. Both products were sold in generic packaging, which by implication meant that the assessment would focus on the design, text, and color on the packaging.

Initially, the Committee underlined that the generic elements used on the packaging are free for anyone to use. The question was rather whether the competitor had used these generic elements in his own design in such a way as to conflict with good business practices. In a 5-2 decision, the majority stated that even though it was possible—when taking a closer look—to detect differences, the packaging gave an overall impression that was too similar to the product that was first on the market. The pictures used on the packages were of approximately the same size, the placement was similar, and the use of colours differed minimally. It was further highlighted that because the Norwegian ice cream market was a duopoly, one supplier should develop a design that differed more substantially than the other.

---

<sup>85</sup>*Id.* at Sec. 6.

<sup>86</sup>See e.g. Case No. 15/2010, Case No. 18/2011, and Case No. 01/2013.

<sup>87</sup>*The Ice-cream Packaging Case*. Case No. 13/2010.

The majority concluded that that the packaging violated section 25 of the Marketing Control Act.

To further illustrate, *the Pastilles case* concerns another packaging design-case, involving two of the leading producers of pastilles.<sup>88</sup> The Committee stated that both designs were “playful” and “fresh,” and that even though it was possible that the latter producer could have been inspired by the claimed original, the producer had used the freedom of variations, where, for example, the colours used were principally linked to the flavours, the size of the packaging differed, and the material of the packaging differed. In sum, the Committee unanimously held that the packaging of the two products did not have the same overall impression.

### 27.5.6 *Know-How and Trade Secrets*

Food manufacturing is often based on processes that are considered common knowledge, but the methods are often refined by insight developed during the process which constitutes valuable know-how. In some cases the methods constitute trade secrets of food manufacturing. Patentable inventions are also made within this sector. Even though filing for a patent is often considered to be the best way of protecting an invention, there may be various reasons for keeping the invention confidential, for example, if the invention will be difficult to reverse-engineer.

Know-how may only be protected by way of contractual obligations, but trade secrets enjoy a certain protection under Norwegian law. According to the Marketing Control Act, it is illegal to exploit trade secrets in the course of trade.<sup>89</sup> The Marketing Control act does not define trade secret, but a definition has been established by way of case-law and also discussed in the preparatory works to the Act.<sup>90</sup> Decisive factors include: whether the information is considered crucial to the business’ competitiveness, whether the information is kept secret, and what steps the business has made to ensure the secrecy of the information.<sup>91</sup>

For trade secrets that involve technical drawings, descriptions, formulas, models, or similar technical aids, there is a special provision in the Marketing Control Act that bans the unlawful use of such technical know-how in the course of trade.<sup>92</sup> Furthermore, unlawful use of trade secrets or unlawful revealing of trade secrets will imply risk of fines or imprisonment according to section 294 of the Norwegian General Civil Penal Code.<sup>93</sup>

## 27.6 Protection of Specific Foodstuffs and Particular Labels Available for Foodstuffs

In Norway, there are various schemes created to promote and highlight certain characteristics of a foodstuff, such as traditional products and origin. The EU schemes on geographical indications and designations of origin are not part of the EEA Agreement. Thus, Norway has established its own scheme based on the EU model for the protection of designations of origins, geographical indications, and traditional specialities under the Regulation on the Protection of Designations of Origins, Geographical Indications and Designations of Traditional Character of Foodstuffs of July 5, 2002.<sup>94</sup>

At present, there are no other agreements between Norway/EFTA and the EU ensuring mutual and automatic acceptance and grant of protection for protected geographical origins, but such agreements should be expected in the future Norwegian protection of foreign geographical design of origins and geographical indications is however possible. One example is *Parmigiano Reggiano*, which enjoys protection as designation of origin under the Regulation on the protection of *Parmigiano Reggiano* of April 20, 2012.<sup>95</sup>

In addition, there are also other labelling schemes that are attractive to food suppliers. First, there is a voluntary labelling system that involves labelling foodstuff with the symbol of a keyhole to make it easier for the consumer to choose the healthiest alternative within certain types of food categories.<sup>96</sup> Products that are labelled with a keyhole contain less fat, salt, and sugar, and more fibre than other products within the same food category. Rules applying to this can be found in the Regulation of June 17, 2009, concerning the voluntary labelling of foods with the keyhole. This regulation is national, but it is based on collaboration between Norway, Sweden, and Denmark. The Food Safety Authority and the Directorate of Health are responsible for the keyhole labelling system.

Furthermore, DEBIO is an administrative body that controls and approves ecological food production, fishery, and aquaculture. Entities that apply for approval and comply with the applicable requirements are entitled to use the DEBIO label in its marketing. Imported products may use the label, providing certain requirements are met.<sup>97</sup>

---

<sup>94</sup>Regulation on the Protection of Designations of Origins, Geographical Indications and Designations of Traditional Character of Foodstuffs (July 5, 2002).

<sup>95</sup>Regulation on the Protection of *Parmigiano reggiano* (April 20, 2012).

<sup>96</sup>Regulation (Keyhole) of June 17, 2009.

<sup>97</sup>Regulation on Organic Production and Labelling of Organic Agricultural Products and Foodstuffs (Oct. 28, 2005) Section 4, referring to Council Regulation (EEC) No. 2092/91 on Organic production of agricultural products and indications referring thereto, on agricultural products and foodstuffs, OJ 1991 L 198/1.

Finally, the label “Nyt Norge” (Enjoy Norway) has been available since 2009. This label is a registered collective trademark<sup>98</sup> and is owned by Matmerk, which is a foundation established by the Ministry of Agriculture. The label is thus administered by Matmerk, and may only be placed on products made of Norwegian raw material and produced in Norway. As Norwegian topography and climate offer challenges with respect to the assortment of agricultural products and production timing, mixed products may contain foreign raw material, but must be less than 25 % of the product’s contents.

# Chapter 28

## Food Law and Regulation in Germany

Gunnar Sachs

**Abstract** In the Member States of the European Union, the European legislature has largely harmonized food law. Where Member States have still retained their own legislative power in the area of food law, they have implemented this in the form of national provisions. The German legislature has exercised its remaining legislative powers in the area of food law primarily by adopting a separate Code on Foods, Consumer Goods and Feedstuffs (*Lebensmittel-, Bedarfsgegenstände- and Futtermittelgesetzbuch*), in addition to various national ordinances and guidelines as well as enforcement provisions. In this chapter, relevant principles of German food law and regulation will be discussed and presented, including some fundamental rules on consumer and health protection, food ingredients, labeling, advertising and marketing as well as supervision, monitoring and enforcement of food law in Germany.

### 28.1 Introduction

In the Member States of the European Union, food regulations have been largely harmonized. For the purpose of achieving harmonization of food law the European legislature, invoking its power to approximate legislation,<sup>1</sup> has increasingly created secondary legislation. Whereas for the most part it initially adopted European directives whose requirements each of the Member States then still had to transpose into their national legislation, European food law in recent years has primarily been harmonized through European regulations which apply with immediate effect in all Member States and are thus designed to ensure a comprehensive approach (“from farm to fork”) within the entire food sector. Some key examples of food legislation in the form of European regulations are:

- Regulation (EC) No 178/2002 of the European Parliament and of the Council of 28 January 2002 laying down the general principles and requirements of food

---

<sup>1</sup>Art. 114 of the Treaty on the Functioning of the European Union, OJ C 115, 09/05/2008, p. 47.

G. Sachs (✉)

Maitre en droit (Paris), Intellectual Property Law, Clifford Chance Deutschland LLP,  
Düsseldorf, Germany

e-mail: [gunnar.sachs@cliffordchance.com](mailto:gunnar.sachs@cliffordchance.com)

law, establishing the European Food Safety Authority and laying down procedures in matters of food safety (known as the “basic Regulation”)<sup>2</sup>;

- Regulation (EC) No 882/2004 of the European Parliament and of the Council of 29 April 2004 on official controls performed to ensure the verification of compliance with feed and food law, animal health and animal welfare rules<sup>3</sup>;
- Regulation (EC) No 852/2004 of the European Parliament and of the Council of 29 April 2004 on the hygiene of foodstuffs,<sup>4</sup> supplemented by Regulation (EC) No 853/2004 of the European Parliament and of the Council of 29 April 2004 laying down specific hygiene rules for food of animal origin<sup>5</sup> and Regulation (EC) No 854/2004 of the European Parliament and of the Council of 29 April 2004 laying down specific rules for the organization of official controls on products of animal origin intended for human consumption.<sup>6</sup>

Where harmonized European provisions exist, the regulatory areas covered by them are normally excluded from the legislative powers of the Member States. The remaining national rules on food law are understood as supplementing harmonized European food law in all areas in which the European legislature has not (yet) adopted any uniform rules.

## 28.2 The German Code on Foods, Consumer Goods and Feedstuffs

The German legislature has exercised its remaining legislative powers in the area of food law primarily by adopting a national Code on Foods, Consumer Goods and Feedstuffs (*Lebensmittel-, Bedarfsgegenstände- und Futtermittelgesetzbuch*, “LFGB”)<sup>7</sup> as well as various guidelines, ordinances and enforcement provisions.

### 28.2.1 Purpose of the Code

The LFGB is understood as a national framework law supplementing the European basic Regulation (EC) No 178/2002. Having entered into force on 7 September 2005 and thus 3 years after the basic Regulation, the primary purpose of the LFGB,

<sup>2</sup>OJ L 31, 10/02/2002, p. 1.

<sup>3</sup>OJ L 191, 28/05/2004, p. 1.

<sup>4</sup>OJ L 226, 25/06/2004, p. 3.

<sup>5</sup>OJ L 226, 25/06/2004, p. 22.

<sup>6</sup>OJ L 226, 25/06/2004, p. 83.

<sup>7</sup>Foods and Feeds Code as published in the announcement of 3 June 2013 (Federal Law Gazette I, p. 1426), which was amended by Art. 4 Para. 20 of the Act of 7 August 2013 (Federal Law Gazette I p. 3154).

according to the official grounds stated for the draft bill,<sup>8</sup> is to adjust German national legislation to legal acts adopted in Community law. For example, it brought about an approximation in the term “food additive”<sup>9</sup> harmonized in European legislation, or the term “cosmetic products” also harmonized throughout Europe.<sup>10</sup>

In the interest of harmonization of food law at the Community level, the LFGB moreover combines numerous, previously separate national provisions. Whereas German food law previously had been enshrined in various different laws such as the Food and Consumer Goods Act (*Lebensmittel- und Bedarfsgegenstände-gesetz* (LMBG)), the Meat Hygiene Act (*Fleischhygienegesetz* (**FIHG**)) or the Poultry Meat Hygiene Act (*Geflügelfleischhygienegesetz* (**GFIHG**)), it underwent a consolidation with the LFGB in 2005, thus becoming significantly easier to apply. At the same time the “from farm to fork” approach in European law was also reflected through inclusion of feedstuffs law in the LFGB. Moreover, all relevant sanctioning rules for violations of provisions of food law were additionally consolidated under the LFGB.

### 28.2.2 *Scope of Application*

The LFGB supplements the European basic Regulation (EC) No 178/2002 in those areas in which the German legislature still has power to adopt legislation and considered it necessary to supplement European food law. Whereas the European basic Regulation (EC) No 178/2002 for example only applies to foods as well as feeds<sup>11</sup> and expressly excludes cosmetic products from its scope of application,<sup>12</sup> cosmetic products and consumer products as a general rule are included under national food law based on the traditional German understanding. Consequently, the provisions of the LFGB not only regulate food and feed within the narrower

<sup>8</sup>Bundestag printed matter 15/3657.

<sup>9</sup>Cf. Art. 3 Para. 2 lit. a) Regulation (EC) No 1333/2008 of the European Parliament and of the Council of 16 December 2008 on food additives; cf. also already Art. 1 Para. 2 Council Directive 89/107/EEC of 21 December 1988 on the approximation of the laws of the Member States concerning food additives authorized for use in foodstuffs intended for human consumption.

<sup>10</sup>Cf. Art. 2 Para. 1 lit. a) Regulation (EC) No 1223/2009 of the European Parliament and of the Council of 30 November 2009 on cosmetic products; cf. also already Art. 1 Council Directive 76/768/EEC of 27 July 1976 on the approximation of the laws of the Member States relating to cosmetic products.

<sup>11</sup>Art. 1 Regulation (EC) No 178/2002; cf. Art. 2 Para. 1 Regulation (EC) No 178/2002 for the definition of food; according to Art. 2 Para. 2 Regulation (EC) No 178/2002, food also includes drink, chewing gum and any substance, including water, intentionally incorporated into the food during its manufacture, preparation or treatment.

<sup>12</sup>Art. 2 Para. 3 lit. e) Regulation (EC) No 178/2002.

sense of the European basic Regulation (EC) No 178/2002 but *inter alia* also cosmetics and other consumer products.<sup>13</sup>

With regard to trade in foods, the LFGB provides among other things for health protection prohibitions, prohibitions and authorizations for food additives, radiation prohibitions and licensing authorizations, requirements for herbicide and other products as well as for pharmacologically active substances, regulations on preventing fraud, a prohibition on disease-related advertising as well as additional authorizations designed to protect health against fraud.<sup>14</sup> With regard to trade in feedstuffs, the LFGB by contrast provides *inter alia* for insurance requirements, feed bans and related authorizations, prohibitions for preventing fraud as well as a prohibition on disease-related advertisement and additional authorizations for protecting human and livestock health as well as promoting livestock production.<sup>15</sup> Moreover, the LFGB lays down sanctioning and fine regulations for violations of the aforementioned requirements and prohibitions.<sup>16</sup> An overview of some of the key regulations is provided in the following.

### **28.2.3 Health Protection Prohibitions**

The LFGB first of all prohibits food being produced or treated for others in such a way as to make its consumption injurious to health.<sup>17</sup> The point in time when a food becomes injurious to health is in turn governed by the requirements harmonized under European legislation found in the basic Regulation (EC) No 178/2002. There it is stipulated that in deciding whether any food is injurious to health, regard shall be had not only to the probable immediate and/or short-term and/or long-term effects of that food on the health of a person consuming it but also on subsequent generations, to the probable cumulative toxic effects and where applicable also to the particular health sensitivities of a specific category of consumers where the food is intended for that category of consumers.<sup>18</sup> Moreover, the LFGB prohibits placing on the market as food any substances that are not food and whose consumption is injurious to health within the meaning of the European basic Regulation (EC) No 178/2002.<sup>19</sup> It is also prohibited to produce for others, treat or place on the market any products that might be confused with food.<sup>20</sup>

---

<sup>13</sup>Sec. 1 Para. 1 LFGB.

<sup>14</sup>Sec. 5 et seq. LFGB.

<sup>15</sup>Sec. 17 et seq. LFGB.

<sup>16</sup>Sec. 58 et seq. LFGB.

<sup>17</sup>Sec. 5 Para. 1 LFGB.

<sup>18</sup>Art. 14 Para. 4 Regulation (EC) No 178/2002.

<sup>19</sup>Sec. 5 Para. 2 no. 1 LFGB.

<sup>20</sup>Sec. 5 Para. 2 no. 2 LFGB.

Based on the comprehensive regulatory approach “from farm to fork” provided under European legislation, the LFGB additionally prohibits the production or treatment of feeds in such a way that, when fed as intended and objectively appropriate, the foodstuffs produced for others from food-producing animals can impair human health or are unsuitable for human consumption.<sup>21</sup> It is moreover prohibited to produce or treat feeds for others in such a way that, when used as intended and objectively appropriate, they are capable of harming livestock health.<sup>22</sup> Moreover, feeds may not be produced or treated in such a way that, when used as intended and objectively appropriate, they are capable of impairing the quality of the food or other products produced from farm animals or of posing a risk to the ecological balance as a result of undesirable substances found in animal excretions which in turn were already present in feed.<sup>23</sup> The LFGB also prohibits the placing on the market and feeding of feed capable of impairing the quality of foods or other products produced from farm animals or of posing a risk to the ecological balance as a result of undesirable substances found in animal excretions which in turn were already present in feed.<sup>24</sup> The LFGB further bans the feeding of certain fats.<sup>25</sup>

The provisions of the LFGB thus clarify the European basic Regulation (EC) No 178/2002, which merely contains a general prohibition of placing unsafe feeds on the market or feeding them to food-producing animals.<sup>26</sup> In this regard, feed, according to the basic Regulation, is deemed to be unsafe for its intended use if it is considered to be capable of having an adverse effect on human or animal health or of making the foods derived from food-producing animals unsafe for human consumption.<sup>27</sup>

#### **28.2.4 Prohibitions for Certain Ingredients and Radiation Levels**

For trade in food, the LFGB moreover provides for prohibitions for certain food additives, radiation levels, herbicides and other products, as well as for pharmacologically active substances.

For example, the LFGB *inter alia* also prohibits, with the exception of enzymes and microorganism cultures, using unauthorized food additives in unmixed form or in mixtures with other substances in the production or treatment of food intended to

---

<sup>21</sup>Sec. 17 Para. 1 sentence 1 LFGB.

<sup>22</sup>Sec. 17 Para. 2 no. 1 lit. a) LFGB.

<sup>23</sup>Sec. 17 Para. 2 no. 1 lit. b) LFGB.

<sup>24</sup>Sec. 17 Para. 2 no. 2 and 3 LFGB.

<sup>25</sup>Sec. 18 LFGB.

<sup>26</sup>Art. 15 Para. 1 Regulation (EC) No 178/2002.

<sup>27</sup>Art. 15 Para. 2 Regulation (EC) No 178/2002.

be placed on the market. Neither is it permitted to use ion exchangers in the production or treatment of foods where this results in unauthorized food additives making their way into the food. Also prohibited in the production or treatment of foods are methods used for the purpose of producing unauthorized food additives in the foodstuffs. Further, no food may be placed on the market which has been produced or treated in contravention to these prohibitions. The LFGB moreover prohibits the placing on the market of any food additives or ion exchangers not permitted for use in the production or treatment of food for the purpose of such use or for use in the production or treatment of food by consumers.<sup>28</sup>

It is moreover prohibited to use an unauthorized radiation with ultraviolet or ionizing rays in food or to place food on the market thus irradiated.<sup>29</sup> The LFGB also contains the prohibition on placing food on the market if certain herbicides, fertilizers, other plant or soil treatment products or biocidal products within the meaning of the German Chemicals Act (*Chemikaliengesetz*, “**ChemG**”) are present in or on such food.<sup>30</sup> It is also prohibited by the LFGB to place on the market live animals or food originating from animals if certain pharmacologically active substances are present in or on them.<sup>31</sup>

In consultation with other ministries at the federal level, the competent federal ministry in each case is authorized to issue additional rules for the purpose of clarifying the respective provisions.

### ***28.2.5 Prohibitions for Preventing Fraud***

The LFGB contains separate provisions for preventing misleading labels, statements and presentations in food and feed.

Firstly, the Code prohibits the placing of foods on the market under a misleading label, statement or presentation or advertising for food, either generally or in the individual case, using misleading descriptions or other statements.<sup>32</sup> Impermissible misleading is deemed to exist if labels, statements, descriptions or other statements on properties capable of misleading consumers, particularly with regard to the nature, condition, composition, quantity, conservation, origin, provenance or type of manufacture or production, are used for a food. That furthermore means that it is misleading and impermissible to imply that a food has effects which it in fact does not have based on the current state of scientific knowledge, or which are not supported by sufficient scientific evidence. Impermissible misleading is also deemed to exist when it is suggested that the food possesses special characteristics when in fact all similar

---

<sup>28</sup>Sec. 6 Para. 1 LFGB.

<sup>29</sup>Sec. 8 Para. 1 LFGB.

<sup>30</sup>Sec. 9 LFGB.

<sup>31</sup>Sec. 10 LFGB.

<sup>32</sup>Sec. 11 Para. 1 LFGB.

foods possess the same characteristics, or if a food is ascribed the appearance of a pharmaceutical product. For the purpose of preventing fraud, the LFGB further prohibits imitations of food, as well as foods which, based on their characteristics, depart from the market perception generally associated with them and are thereby diminished to a not insignificant extent in their value, particularly in their nutritional or culinary value or their usefulness, or foods capable of giving the appearance of being better than their actual properties without the market being provided with sufficiently specific information in this regard.<sup>33</sup> Moreover, the LFGB prohibits placing on the market those foods that are not fit for human consumption and in this regard have not yet been prohibited by the European basic Regulation (EC) No 178/2002.<sup>34</sup>

The LFGB also prohibits placing feed on the market with misleading labeling or presentation or advertising for such feed either generally or in the individual case.<sup>35</sup>

In this regard also, the LFGB supplements the European basic Regulation (EC) No 178/2002 according to which in general the labeling, advertising and presentation of food or feed, including their shape, appearance or packaging, the packaging materials used, the manner in which they are arranged and the setting in which they are displayed, and the information which is made available about them through whatever medium, may not mislead consumers.<sup>36</sup> In connection with the provisions on prevention of fraud in feed, the LFGB moreover expressly refers to the requirements of Regulation (EC) No 767/2009 of the European Parliament and of the Council of 13 July 2009 on the placing on the market and use of feed.<sup>37</sup> Moreover, European legislation provides for further requirements for preventing fraud which are directly applicable in the Member States, such as in Regulation (EC) No 1924/2006 of the European Parliament and of the Council of 20 December 2006 on nutrition and health claims made on foods.<sup>38</sup>

### ***28.2.6 Prohibition on Disease-Related Advertising***

Whereas European Regulation (EC) No 1924/2006 creates framework conditions for the use of nutrition and health claims made on foods including reduction of disease risk claims, the German LFGB originally prohibited any kind of disease-related advertising for food outside specialist healthcare professional groups.

In particular, the LFGB prohibited making any claims to individuals outside the specialist community, in trading in food or in advertising for food, whether generally or in the individual case, which related to the removal, relief or prevention of

---

<sup>33</sup>Sec. 11 Para. 2 no. 2 LFGB.

<sup>34</sup>Sec. 11 Para. 2 no. 1 LFGB.

<sup>35</sup>Sec. 19 LFGB.

<sup>36</sup>Art. 16 Regulation (EC) No. 178/2002.

<sup>37</sup>OJ L 229, 01/09/2009, p. 1.

<sup>38</sup>OJ L 12, 18/01/2007, p. 3.

diseases.<sup>39</sup> Also prohibited were any references to recommendations made by physicians or expert opinions of physicians.<sup>40</sup> Medical histories or references to the same could not be used either.<sup>41</sup> Furthermore, the LFGB prohibited making reference to statements by third parties, in particular letters of appreciation, recognition or recommendation to the extent these referred to the removal or relief of diseases, as well as references to such statements.<sup>42</sup> It was also prohibited to present images of persons in occupational clothing or performing the work of members of the healthcare professions or healthcare industry or the pharmaceutical trade.<sup>43</sup> Statements capable of causing or exploiting anxiety as well as use of inscriptions or written statements inducing consumers to treat diseases with food were also prohibited.<sup>44</sup>

Today, the LFGB still prohibits as a general rule all claims, in trading in feed or in premixtures as well as in advertising for the same, whether generally or in the individual case, which relate to the removal or relief of diseases or the prevention of such diseases which are not the result of deficient nutrition.<sup>45</sup>

### ***28.2.7 Supervision and Monitoring***

By Regulation (EC) No 882/2004 of the European Parliament and of the Council of 29 April 2004 on official controls performed to ensure the verification of compliance with feed and food law, animal health and animal welfare rules,<sup>46</sup> the European legislature harmonized the key provisions on monitoring food and feed law in all Member States. The LFGB merely provides for supplementing provisions on competencies, duties, measures and exchange of mutual information amongst the national authorities, on the submission of data on Internet trade, on informing the general public, on measures in producer facilities, livestock trade and transport companies, on performance of monitoring and sampling, on duties of toleration, co-operation and submission on the part of the food and feed business operators concerned, on notification and submission requirements regarding study findings on substances undesirable from a health perspective, as well as on co-operation between the federal government and the federal states within the Federal Republic of Germany.<sup>47</sup> According to the LFGB, the authorities of the individual federal states in Germany are generally responsible for supervision measures. The

<sup>39</sup>Sec. 15 Para. 1 no. 1 LFGB (old version).

<sup>40</sup>Sec. 12 Para. 1 no. 2 LFGB (old version).

<sup>41</sup>Sec. 12 Para. 1 no. 3 LFGB (old version).

<sup>42</sup>Sec. 12 Para. 1 no. 4 LFGB (old version).

<sup>43</sup>Sec. 12 Para. 1 no. 5 LFGB (old version).

<sup>44</sup>Sec. 12 Para. 1 no. 6 and 7 LFGB (old version).

<sup>45</sup>Sec. 20 Para. 1 LFGB.

<sup>46</sup>OJ L 191, 28/05/2004, p. 1.

<sup>47</sup>Sect. 38 et seq. LFGB.

requirements that the competent authorities must satisfy are again set out in European Regulation (EC) No 882/2004.<sup>48</sup>

In addition, the LFGB provides for monitoring of food, food additives, feed, cosmetic products and consumer goods.<sup>49</sup> Monitoring in this regard means a system of repeated observations, measurements and assessments of levels of substances which are undesirable from a health perspective such as herbicides, pharmacologically active substances, heavy metals, mycotoxines and microorganisms in and on such products or livestock, which are performed for early detection of risks to human health using representative samples of individual products or animals, aggregate diet or another aggregate criterion of the same product.<sup>50</sup> The competent authorities of the Federal States submit the data gathered from performance of monitoring to the Federal Office of Consumer Protection and Food Safety (*Bundesamt für Verbraucherschutz und Lebensmittelsicherheit*, “**BVL**”) for processing, aggregation, documentation and reporting. The BVL submits the data gathered from the monitoring performed to the Federal Institute for Risk Assessment (*Bundesinstitut für Risikobewertung*, “**BfR**”) for assessment purposes. In this regard, personal data are not submitted. Instead, such data must be deleted to the extent not required for performing supervision or monitoring. The BVL annually publishes a report on monitoring results.<sup>51</sup>

### 28.2.8 *Penalty and Fine Provisions*

The LFGB provides for penalty and fine regulations for violations of food and feed law.

In trade in food and feed, violations subject to criminal sanctions include violations of the individual prohibitions for health protection and prevention of fraud, as well as violations of the regulations for certain ingredients, of the prohibition on radiation, of the requirements for the production and treatment of feed as well as violations of certain feeding prohibitions.<sup>52</sup>

Since the European legislature does not have power to adopt penalty and fine regulations, the LFGB at the same time provides for legal remedies for violations of regulations of European law directly applicable in Germany including certain requirements

- of the basic Regulation (EC) No 178/2002,
- of Regulation (EC) No 1332/2008 of the European Parliament and of the Council of 16 December 2008 on food enzymes,<sup>53</sup>

---

<sup>48</sup>Art. 4 Para. 2 et seq. Regulation (EC) No 882/2004.

<sup>49</sup>Sec. 50 et seq. LFGB.

<sup>50</sup>Sec. 50 LFGB.

<sup>51</sup>Sec. 51 Para. 5 LFGB.

<sup>52</sup>Sec. 58 and 59 LFGB.

<sup>53</sup>OJ L 354, 31/12/2008, p. 7.

- of Regulation (EC) No 1333/2008 of the European Parliament and of the Council of 16 December 2008 on food additives,<sup>54</sup>
- of Regulation (EC) No 1334/2008 of the European Parliament and of the Council of 16 December 2008 on flavorings and certain food ingredients with flavoring properties for use in and on foods,<sup>55</sup>
- of Commission Regulation (EC) No 124/2009 of 10 February 2009 setting maximum levels for the presence of coccidiostats or histomonostats in food resulting from the unavoidable carry-over of these substances in non-target feed,<sup>56</sup>
- of Commission Regulation (EU) No 10/2011 of 14 January 2011 on plastic materials and articles intended to come into contact with food,<sup>57</sup>
- of Regulation (EC) No 396/2005 of the European Parliament and of the Council of 23 February 2005 on maximum residue levels of pesticides in or on food and feed of plant and animal origin,<sup>58</sup>
- of Regulation (EC) No 1924/2006 of the European Parliament and of the Council of 20 December 2006 on nutrition and health claims made on foods,<sup>59</sup> and
- other directly applicable provisions of European legislation identical in content to the German requirements and prohibitions subject to criminal sanctions.<sup>60</sup>

Such violations are punishable in Germany by imprisonment of up to 3 years or by a fine. In particularly serious cases in which the health of a great number of persons is put at risk or which involve the risk of death or serious harm to health, or in which the perpetrators, acting out of gross self-interest, procure pecuniary gain for themselves or others on a large scale, prison sentences from 6 months to 5 years may be imposed.

Moreover, the LFGB provides for various fine regulations for other violations of requirements and prohibitions under European and national law, e.g. for violations of certain requirements relating to disease-related advertising for food or feed.<sup>61</sup> Depending on the provision violated, such violations may be punished in each case by fines of up to EUR 20,000, EUR 50,000 or EUR 100,000.

### **28.2.9 Other Provisions**

The LFGB also contains other provisions dealing with matters of authorization, powers and co-operation as well as requirements relating to the import and export of food. The LFGB also provides for the compiling of guidelines on the production,

<sup>54</sup>OJ L 354, 31/12/2008, p. 16.

<sup>55</sup>OJ L 354, 31/12/2008, p. 34.

<sup>56</sup>OJ L 40, 11/02/2009, p. 7.

<sup>57</sup>OJ L 328, 11/12/2011, p. 22.

<sup>58</sup>OJ L 70, 16/03/2005, p. 1.

<sup>59</sup>OJ L 404, 30/12/2006, p. 9; OJ L 12, 18/01/2007, p. 3; OJ L 86, 28/03/2008, p. 34.

<sup>60</sup>Sec. 58 and 59 LFGB.

<sup>61</sup>Sec. 60 LFGB.

quality and other properties of food of significance for their fitness for marketing in a “German Food Code” (*Deutsches Lebensmittelbuch*).<sup>62</sup>

The guidelines are to be adopted by a German Food Code Commission (*Deutsche Lebensmittelbuch-Kommission*) giving due regard to the international food standard recognized by the German government and published by the competent federal ministry. The German Food Code Commission is established within the competent federal ministry. The members of the Commission are appointed in equal numerical ratios from amongst science, food monitoring, consumer and food industry experts.<sup>63</sup>

Currently, guidelines have been published for meat and meat products, for delicatessen salads, for fish, crustaceans and mollusks and products made from them, for edible fats and edible oils, for bread and small bakery wares, for pastries, for pasta products, for vegetable products, for vegetable juice and vegetable nectar, for mushrooms and mushroom products, for potato products, for fruit juices, for fruit produce, for soft drinks, for honey, for oil seeds and for mixtures and sweets produced from them, for pudding powders and related products, for ice cream and semi-finished ice cream products, for tea, products similar to tea, their extracts and preparations as well as for spices and other seasoning products.

## 28.3 Additional Laws and Legal Ordinances

In addition to the LFGB, the German legislature has also issued various horizontal and vertical guidelines and legal ordinances clarifying national food law. Horizontal provisions apply to a great number of different products, whereas vertical provisions relate to only a certain category of products.

### 28.3.1 Horizontal Provisions

The most important horizontal provisions in Germany besides the LFGB are:

- the Metering and Calibration Act (*Mess- und Eichgesetz* (MessEG)) of 25 July 2013,<sup>64</sup>
- the Act on the Introduction and Use of Labeling for Organic Products (*Öko-Kennzeichengesetz* (ÖkoKennzG)) in the version as announced on 20 January 2009<sup>65</sup> together with the Ordinance on the Design and Use of the Organic Label (*Öko-Kennzeichenverordnung* (ÖkoKennzV)) of 6 February 2002,<sup>66</sup>

---

<sup>62</sup>Sec. 15 LFGB.

<sup>63</sup>Sec. 16 LFGB.

<sup>64</sup>Federal Law Gazette I, p. 2722.

<sup>65</sup>Federal Law Gazette I, p. 78.

<sup>66</sup>Federal Law Gazette I, p. 589.

- the Act Implementing the Legal Acts of the European Community or of the European Union on Certificates of Specific Characteristics of Agricultural Products and Foodstuffs (*Lebensmittelspezialitätengesetz* (LSpG)) dated 29 October 1993<sup>67</sup> together with the ordinance implementing the LSpG (*Lebensmittelspezialitätenverordnung* (LSpV)) of 21 December 1993,<sup>68</sup>
- the Ordinance on Hygiene Requirements for the Manufacture, Processing and Placing on the Market of Foods (*Lebensmittelhygiene-Verordnung* (LMHV)) in the version as announced on 21 June 2016,<sup>69</sup>
- the Ordinance on Hygiene Requirements for the Manufacture, Processing and Placing on the Market of Certain Foods of Animal Origin (*Tierische Lebensmittel-Hygieneverordnung* (Tier-LMHV)) of 8 August 2007,<sup>70</sup>
- the Ordinance on Food Labeling (*Lebensmittel-Kennzeichnungsverordnung* (LMKV)) in the version as announced on 15 December 1999,<sup>71</sup>
- the Ordinance on Nutritional Claims for Food and Nutritional Labeling of Food (*Nährwert-Kennzeichnungsverordnung* (NKV)) of 25 November 1994,<sup>72</sup>
- the Ordinance Implementing Provisions of Community Law on Novel Foods and Novel Food Ingredients (*Neuartige Lebensmittel- und Lebensmittelzutaten-Verordnung* (NLV)) in the version as announced on 14 February 2000,<sup>73</sup>
- the Ordinance on Food Supplements (*Nahrungsergänzungsmittelverordnung* (NemV)) of 24 May 2004,<sup>74</sup>
- the Ordinance on Dietary Foods (*Diätverordnung* (DiätV)) in the version as announced on 28 April 2005,<sup>75</sup>
- the Ordinance on Pre-Packed Products (*Fertigpackungsverordnung* (FertigPackV)) in the version as announced on 8 March 1994,<sup>76</sup>
- the Lot Labeling Ordinance (*Los-Kennzeichnungs-Verordnung* (LKV)) of 23 June 1993,<sup>77</sup>
- the Price Indication Ordinance (*Preisangabenverordnung* (PAngV)) in the version as announced on 18 October 2002,<sup>78</sup>
- the Ordinance on the Authorization of Food Additives for Technological Purposes (*Zusatzstoff-Zulassungsverordnung* (ZZuV)) of 29 January 1998,<sup>79</sup>

---

<sup>67</sup>Federal Law Gazette I, p. 1814.

<sup>68</sup>Federal Law Gazette I, p. 1996.

<sup>69</sup>Federal Law Gazette I, p. 1469.

<sup>70</sup>Federal Law Gazette I, pp. 1816, 1817.

<sup>71</sup>Federal Law Gazette I, p. 2464.

<sup>72</sup>Federal Law Gazette I, p. 3526.

<sup>73</sup>Federal Law Gazette I, p. 123.

<sup>74</sup>Federal Law Gazette I, p. 1011.

<sup>75</sup>Federal Law Gazette I, p. 1161.

<sup>76</sup>Federal Law Gazette I, pp. 451, 1307.

<sup>77</sup>Federal Law Gazette I, p. 1022.

<sup>78</sup>Federal Law Gazette I, p. 4197.

<sup>79</sup>Federal Law Gazette I, pp. 230, 231.

- the Ordinance on Requirements for Additives and the Placing on the Market of Additives for Technological Purposes (*Zusatzstoff-Verkehrsverordnung (ZVerkV)*) of 29 January 1998,<sup>80</sup>
- the Ordinance on Quick-Frozen Foodstuffs (*Verordnung über tiefgefrorene Lebensmittel (TLMV)*) in the version as announced on 22 February 2007,<sup>81</sup>
- the Ordinance on Vitamin-Enhanced Foods (*Verordnung über vitaminisierte Lebensmittel (LMvitV)*),<sup>82</sup>
- the Ordinance on the Limitation of Contaminants in Food (*Kontaminanten-Verordnung (KmV)*) of 19 March 2010,<sup>83</sup>
- the Ordinance on Maximum Amounts of Residues of Herbicides, Pesticides, Fertilizers and Other Products in or on Food (*Rückstands-Höchstmengenverordnung (RHmV)*) in the version as announced on 21 October 1999,<sup>84</sup>
- the Ordinance on the Use of Extraction Solvents and Other Technical Aids in the Production of Food (*Technische Hilfsstoff-Verordnung (THV)*) of 8 November 1991,<sup>85</sup>
- the Ordinance on Pharmacologically Active Substances (*Verordnung über Stoffe mit pharmakologischer Wirkung (PharmStV)*) in the version as announced on 8 July 2009,<sup>86</sup> and
- the Ordinance on the Performance of Veterinary Law Controls for the Import and Transit of Food of Animal Origin from Third Countries as well as on the Import of other Food from Third Countries (*Lebensmitteleinfuhr-Verordnung (LMEV)*) in the version as announced on 15 September 2011.<sup>87</sup>

Each of the aforementioned national acts and ordinances supplement the legal provisions relating to food as harmonized under European legislation in those areas in which the European legislature has not (yet) adopted any uniform rules.

Moreover, the German Act Against Unfair Competition (*Gesetz gegen den unlauteren Wettbewerb (UWG)*) in the version as announced on 3 March 2010<sup>88</sup> additionally lays down special rules on the protection of competition, consumers and other market participants against unfair business behavior including misleading advertising. The UWG applies to all goods and services including food and feed. The Act serves to implement various provisions harmonized under European

legislation<sup>89</sup> and thus supplements the advertising law requirements for food and feed under the LFGB.

### 28.3.2 Vertical Provisions

In addition there are numerous vertical provisions that apply only to certain categories of food.

#### 28.3.2.1 Meat and Meat Products

These include for example the German Law on Meat (*Fleischgesetz* (FIG)) of 9 April 2008.<sup>90</sup> Moreover, the hygiene-related legal provisions for meat and meat products are governed by the “Community-law Hygiene Packages” (Regulations (EC) No 852/2004,<sup>91</sup> No 853/2004<sup>92</sup> and No 854/2004<sup>93</sup>) as well as the German LMHV and the Tier-LMHV. The production of meat and meat products is further subject in particular to the general requirements of the European basic Regulation (EC) No 178/2002 as well as European and national provisions on the use of additives.

---

<sup>89</sup>The German Act Unfair Competition (*Gesetz gegen den unlauteren Wettbewerb*, “**UWG**”) serves to implement Directive 2005/29/EC of the European Parliament and of the Council of 11 May 2005 concerning unfair business-to-consumer commercial practices in the internal market and amending Council Directive 84/450/EEC, Directives 97/7/EC, 98/27/EC and 2002/65/EC of the European Parliament and of the Council and Regulation (EC) No 2006/2004 of the European Parliament and of the Council (OJ L 253, 11/06/2005, p. 22; OJ L 253, 25/09/2009, p. 18), furthermore to implement Directive 2006/114/EC of the European Parliament and of the Council of 12 December 2006 concerning misleading and comparative advertising (OJ L 376, 27/12/2006, p. 21) as well as to implement Art. 13 of Directive 2002/58/EC of the European Parliament and of the Council of 12 July 2002 concerning the processing of personal data and the protection of privacy in the electronic communications sector (OJ L 201, 31/07/2002, p. 37).

<sup>90</sup>Federal Law Gazette I, p. 714, 1025.

<sup>91</sup>Regulation (EC) No 852/2004 of the European Parliament and of the Council of 29 April 2004 on the hygiene of foodstuffs, OJ L 139, 30/04/2004, p. 1.

<sup>92</sup>Regulation (EC) No 853/2004 of the European Parliament and of the Council of 29 April 2004 laying down specific hygiene rules for on the hygiene of foodstuffs, OJ L 139, 30/04/2004, p. 55.

<sup>93</sup>Regulation (EC) No 854/2004 of the European Parliament and of the Council of 29 April 2004 laying down specific rules for the organization of official controls on products of animal origin intended for human consumption, OJ L 226, 25/06/2004, p. 83.

### 28.3.2.2 Fish, Crustaceans and Mollusks

For fish, crustaceans and mollusks, German law, in addition to the applicable horizontal provisions at the European level, provides for various vertical rules such as, for example, a national law for the implementation of the legal acts of the European Community regarding the labeling of fish and fishery products (*Fischetikettierungsgesetz* (FischEtikettG)) of 1 August 2002.<sup>94</sup> This serves for the implementation of particular European provisions on consumer information and labeling of fish and fishery products.

### 28.3.2.3 Milk and Milk Products

Milk and milk products are regulated in Germany vertically by the Act on Milk, Milk Products, Margarine Products and Similar Products (*Milch- und Margarinegesetz* (MilchMargG)) of 25 July 1990.<sup>95</sup> The Act contains provisions on the operation of dairy companies, on supervision and monitoring as well as provisions on penalties and fines. It moreover authorizes the adoption of standardization regulations. The Act is supplemented by an Ordinance on the Expertise for Operating a Milk Treating or Processing Business and a Commercial Dairy Business (*Milch-Sachkunde-Verordnung* (MilchSachkV))<sup>96</sup> of 22 December 1972, an Ordinance on Milk Products (*Milcherzeugnisverordnung* (MilchErzV)) of 15 July 1970,<sup>97</sup> an Ordinance on Butter and Other Dairy Spreads (*Butterverordnung* (ButtV)) of 3 February 1997,<sup>98</sup> a Cheese Ordinance (*Käseverordnung* (KäseV)) in the version as announced on 14 April 1986<sup>99</sup> and an Ordinance on the Quality Evaluation and Payment of Tanker Milk (*Milch-Güteverordnung* (MilchGüV)) of 9 July 1980.<sup>100</sup> Both the Butter and the Cheese Ordinances were primarily adopted for standardization purposes to promote the production, quality and sale of agricultural products and have a different scope compared with the Community-law provisions. For drinking milk there is moreover a vertical Ordinance on the Labeling of Heat-Treated Drinking Milk (*Konsummilch-Kennzeichnungs-Verordnung* (MilchKennzV)) of 19 June 1974.<sup>101</sup>

<sup>98</sup>Federal Law Gazette I, p. 144.

<sup>99</sup>Federal Law Gazette I, p. 412.

<sup>100</sup>Federal Law Gazette I, pp. 878, 1081.

<sup>101</sup>Federal Law Gazette I, p. 1301.

### 28.3.2.4 Cereals and Cereal Products

For cereals and cereal products, Germany has adopted separate implementing provisions for European legislation on the common organization of the market in agricultural products, such as for example a national law on the further development of the market organization in the agricultural sector (*Agrarmarktstrukturgesetz* (AgrarMSG)).

### 28.3.2.5 Fruit Juices, Fruit Nectar and Caffeinated Soft Drinks

Fruit juices, fruit nectar and caffeinated soft drinks are regulated in Germany vertically by the Ordinance on Fruit Juice, Certain Similar Products, Fruit Nectar and Caffeinated Soft Drinks (*Fruchtsaft- und Erfrischungsgetränkeverordnung* (FrSaftErfrischGetrV)) of 24 May 2004.<sup>102</sup> The purpose of the Ordinance is to implement Directive 2001/112/EC of the Council of 20 December 2001 relating to fruit juices and certain similar products intended for human consumption.<sup>103</sup>

### 28.3.2.6 Fruit Jams, Jellies, Marmalades and Sweetened Chestnut Purée

The vertical European law requirements of Directive 2001/113/EC of the Council of 20 December 2001 relating to fruit jams, jellies and marmalades and sweetened chestnut purée intended for human consumption<sup>104</sup> were transposed by the German legislature in the Ordinance on Fruit Jams and Similar Products (*Konfitürenverordnung* (KonfV)) of 23 October 2003.<sup>105</sup> The German Fruit Jam Ordinance exhaustively regulates the composition of those foodstuffs placed on the market in Germany as extra jam, jam, extra jelly, jelly, marmalade or sweetened chestnut purée.

### 28.3.2.7 Honey

For honey, German legislation provides for a vertical Honey Ordinance of 16 January 2004 (*Honigverordnung* (HonigV)).<sup>106</sup> The German Honey Ordinance

<sup>102</sup>Federal Law Gazette I, p. 1016.

<sup>103</sup>OJ L 10, 12/01/2002, p. 58.

<sup>104</sup>OJ L 10, 12/01/2002, p. 67.

<sup>105</sup>Federal Law Gazette I, p. 2151.

<sup>106</sup>Federal Law Gazette I, p. 92.

sets out the definitions and quality requirements as well as designation rules for honey and honey products.

### 28.3.2.8 Ice Cream

Between 1933 and 2007, there has also been a separate vertical ice cream ordinance in Germany.<sup>107</sup> This ordinance has been repealed step by step. At the end, the provisions still contained in the ordinance were primarily confined to authorized additives and the labeling of ice cream commercially marketed in bulk. Today, there still remains an ordinance on the professional education of qualified persons for ice cream dated 5 June 2014 (*Speiseeisfachkraftausbildungsverordnung* (EisAusbV)).<sup>108</sup>

### 28.3.2.9 Cocoa and Chocolate Products

The vertical European law requirements of Directive 2000/36/EC of the European Parliament and of the Council of 23 June 2000 relating to cocoa and chocolate products intended for human consumption<sup>109</sup> were transposed by the German legislature in the national Ordinance on Cocoa and Chocolate Products (*Kakaoverordnung* (KakaoV)) of 15 December 2003.<sup>110</sup> The German Cocoa Ordinance among other things stipulates requirements for the quality of cocoa and cocoa products, as well as labeling, penalty and fine regulations.

### 28.3.2.10 Coffee and Coffee Products

For coffee and coffee products, Germany's vertical Ordinance on Coffee, Coffee and Chicory Extracts (*Verordnung über Kaffee, Kaffee- und Zichorien-Extrakte* (KaffeeV)) of 15 November 2001<sup>111</sup> applies. This Ordinance sets out definitions, labeling regulations, specifications for analysis methods, market prohibitions as well as penalty and fine regulations.

<sup>107</sup>Ordinance on Ice Cream (*Verordnung über Speiseeis* ["**SpEisV**"] of 15 July 1933, RGBL I, p. 510.

<sup>108</sup>Federal Law Gazette I, p. 702.

<sup>109</sup>OJ L 197, 03/08/2000, p. 19.

<sup>110</sup>Federal Law Gazette I, p. 2738.

<sup>111</sup>Federal Law Gazette I, p. 3107.

### 28.3.2.11 Food Flavorings

To supplement Regulation (EC) No 1334/2008 of the European Parliament and of the Council of 16 December 2008 on flavorings and certain food ingredients with flavoring properties for use in and on foods,<sup>112</sup> Germany also has a vertical Ordinance on Flavorings (*Aromenverordnung* (AromV)) in the version as announced on 2 May 2006.<sup>113</sup> However, it only regulates the maximum levels of quinine for the placing of foods on the market, authorizing additives and identifying quinine in flavorings and non-alcoholic soft drinks as well as certain criminal and administrative offences.

### 28.3.2.12 Vinegar and Vinegar Essence

Vinegar and vinegar essence are regulated in Germany in a vertical national Ordinance on Trading in Vinegar and Vinegar Essence (*Verordnung über den Verkehr mit Essig und Essigessenz* (EssigV)) of 25 April 1972.<sup>114</sup>

### 28.3.2.13 Wine

By contrast, the requirements for wine in Europe have been largely stipulated directly and harmonized by Community law, such as Council Regulation (EC) No 1234/2007 of 22 October 2007 establishing a common organization of agricultural markets and on specific provisions for certain agricultural products (Single CMO Regulation).<sup>115</sup> Consequently, definitions, the delimitation of wine-growing zones and assignment of vineyards in the Community to the individual wine-growing zones, support measures, producer and industry organizations, oenological practices and treatments, designations of origin, geographical information and traditional definitions, trading with third countries and the production potential are regulated under European law. The Member States therefore have a legislating power only to the extent such power is expressly granted to them or a lacuna in the provisions exists. In addition, the German legislature has adopted a national Wine Act (*Weingesetz* (WeinG)) in the version as announced on 18 January 2011<sup>116</sup> as well as a Wine Ordinance (*Weinverordnung* (WeinV)) in the version as announced on 21 April 2009.<sup>117</sup> The Wine Act and the Wine Ordinance moreover stipulate *inter alia* additional national requirements for wine growing and processing as well

<sup>112</sup>OJ L 354, 31/12/2008, p. 34.

<sup>116</sup>Federal Law Gazette I, p. 66.

<sup>117</sup>Federal Law Gazette I, p. 827.

as for geographical designations, labeling, monitoring, importing, sales promotion and special product specifications.

#### 28.3.2.14 Beer

Beer is also subject to separate vertical regulation in Germany in the Beer Ordinance (*Bierverordnung* (BierV)) of 2 July 1990.<sup>118</sup> The Ordinance—in compliance with the judgment of the Court of Justice of the European Union of 12 March 1987<sup>119</sup>—regulates protection of the designation “beer”. In that case the ECJ had objected that the Federal Republic of Germany had violated the Community-law prohibition on measures of equivalent effect to quantitative restrictions by having prohibited a beer, legally produced and placed on the market in another Member State, from being placed on the market which did not meet the requirements then in force in Germany for the production of beer and use of the designation “beer”.

#### 28.3.2.15 Spirits

To supplement Regulation (EC) No 110/2008 of the European Parliament and of the Council of 15 January 2008 on the definition, description, presentation, labeling and the protection of geographical indications for spirit drinks, Germany has adopted vertical quality requirements set out its Ordinance on Certain Alcoholic Beverages (*Alkoholhaltige Getränke-Verordnung* (AGeV)) in the version as announced on 30 June 2003.<sup>120</sup>

#### 28.3.2.16 Drinking, Mineral and Table Water

There are also separate vertical regulations in Germany for drinking water. The German legislature has transposed the related requirements of the European Council Directive 98/83/EC of 3 November 1998 on the quality of water intended for human consumption<sup>121</sup> in the national Ordinance on the Quality of Water Intended for Human Consumption (*Trinkwasserverordnung* (TrinkwV)) in the version as announced on 10 March 2016.<sup>122</sup> There is also a separate vertical Ordinance on

Natural Mineral Water, Spring Water and Table Water (*Mineral- und Tafelwasser-Verordnung* (Min/TafelWV)) of 1 August 1984.<sup>123</sup>

## 28.4 Enforcement of Food Law Provisions

As before, responsibility for enforcing Community law is incumbent on the Member States since there are no real enforcement bodies at the European level. The Member States are also responsible for enforcing the respective national regulations. As a result, power to decree enforcement regulations as a general rule is the prerogative of the Member States.

In this context the European basic Regulation (EC) No 178/2002 also stipulates that the Member States are to enforce as well as monitor and review food law to ensure that all relevant requirements of food law are fulfilled by the food and feed business operators at all stages of production, processing and distribution.<sup>124</sup> For that purpose, they are required to maintain a system of official controls and other activities as appropriate to the circumstances, including public communication on food and feed safety and risk, food and feed safety supervision and other monitoring activities covering all stages of production, processing and distribution. They are also required to lay down the rules on measures and penalties applicable to infringements of food and feed law. The measures and penalties themselves must be effective, proportionate and dissuasive.

In Germany, food law falls under a category of special safety law which, as a general rule, comes within the purview of the federal states.<sup>125</sup> Accordingly, separate enforcement acts are adopted at the level of federal state legislation in each case. To give just one example, the Act Implementing the Law on Food, Feed and Consumer Goods in North Rhine-Westphalia (*Gesetz über den Vollzug des Lebensmittel-, Futtermittel- und Bedarfsgegenständerechts in Nordrhein-Westfalen* (LFBRVG-NRW)) imposes the obligation on the competent district authorities (*Kreisordnungsbehörden*) to enforce, e.g., food, feed and consumer goods law and wine law as a mandatory duty to be fulfilled on instruction. The other federal states have similar provisions in place.

However, at least European law, by way of exception, is to be enforced by the bodies of the European Union. This applies particularly when differences in enforcement are to be addressed by a uniform decision.<sup>126</sup> Some examples that may be cited are the participation rights reserved to the European Commission in Regulation (EC) No 258/97 of the European Parliament and of the Council of 27 January 1997

<sup>123</sup>Federal Law Gazette I, p. 1036.

# Part IV

## The Americas

Gabriela Steier

All people living on earth are trustees of the resources and environmental wonders available. Although, people are also consumers and need food, water, air and other vital substances from the world, there is no inherent right to capitalize upon these environmental withdrawals because the resources are nearing dangerous exploitation levels. Thus, in terms of food production, processing, use and trade, it is becoming increasingly important to engage in sustainable agricultural and fishing practices, environmentally responsible land and marine stewardship, and socially proactive strategies to conserve both food safety for consumers and environmental integrity for the future.

In the US, one of the leading food production and processing nations worldwide, sustainable and environmentally responsible approaches remain challenges. BigAg and BigFood companies are dominating the market, consumers are led to believe much of the “greenwashing” in popular media, and legislation often falls prey to the powerful industrial lobby. Nonetheless, the US also provides a set of highly regulated food safety and food policy aspects and a wide array of federal and state statutes, which provide legal tools that can be used to provoke progress toward more sustainable food systems.

The first chapter in this section, Chap. 29, provides an overview of the US and Canadian frameworks in the US. Then, the following two textboxes, on the US Farm Bill and the School Lunch Project illustrate two large federal aspects of US food law, that provide examples for readers interested in the larger picture of US domestic food policy (Chap. 30). Chapters 31–33 provide overviews of food law in Canada, Brazil, and Mexico, respectively, thereby contributing to the fundamentals of building an understanding of food law and policy in the Americas. These chapters are especially useful for a comparative approach and allow further analysis through the sources cited.

Chapters 34 and 36 introduce some of the most important legislative and regulatory frameworks of US and global waterbodies regulation. Through an initial description of the issues underlying the Tragedy of the Commons and the principles of the Public Trust Doctrine, Chap. 34 provides the basis to an understanding of

water resource regulation, the foundation to appreciate how food law and policy can use existing law to tackle the problems of overfishing, marine pollution, and bycatch while aquacultures are becoming increasingly unsustainable. This understanding is further expanded by the subsequent Chap. 36, which goes beyond the commons and discusses global fisheries regulation.

Global fisheries regulation is of particular importance because it addresses a vast amount of food resources on a world-wide scale. Gaining an understanding of the foundations of the regulatory framework and the legal limitations provides legal tools to improve maritime conservation and fisheries management with the goal to further food safety and environmental protection. The US Magnuson Steven Fishery Management and Conservation Act (MSA), for example, allows coastal states to consider the effects on species that are not targeted, such as bycatch, through language that requires ecosystem management, where regulation is based on the biological relationships between species. Like the MSA, the Law of the Sea requires coastal states to base conservation and management measures on scientific support.

Thus, the principles of the Third United Nations Convention on the Law of the Sea, or UNCLOS III, and its purpose to establish a comprehensive set of rules governing the oceans are outlined in Chap. 36 and illustrated in Fig. 34.1, to provide a comprehensive foundation to understand maritime regulation. Finally, Chap. 37, outlines the effects of industrial aquaculture and the broad-sweeping impacts of human intervention in natural law.

Although this section on the Americas is not all-encompassing, the most relevant issues in current food law and policy are put into context and the following set of chapters provide a solid, albeit cursory, overview to understand how the law addresses concerns of sustainable and safe food production on the American continent. The chapters in this section are complimentary to one-another and have been written by practitioners, scholars and professors well-versed in their respective fields.

# Chapter 29

## Introduction to Food Law and Policy in the United States and Canada

Carly Dunster

**Abstract** This introductory chapter discusses the rise of the practice of food law in both the United States and Canada, and gives an overview of the legislative backdrop for the practice of food law. The chapter discusses the multi-layered landscape of food and agriculture laws and regulations in Canada and the United States, by outlining the key federal, provincial/state-wide, and regional/municipal legislative structures. The regulatory and legislative modernization efforts in both countries are assessed, with discussion on the factors that have driven their adoption by both countries at the federal level. The chapter goes on to discuss new legislative and policy developments in both jurisdictions, highlighting the issues and trends arising in the sector. These include new and more permissive legislative tools in the realm of urban agriculture, an increased legislative emphasis on local food and the role of procurement, the presence of cottage food laws, and the intertwined issues of the right to food and food sovereignty. In conclusion, the author discusses the proliferation of professional associations and corresponding opportunities for the practice of food law in both the United States and Canada, a development which demonstrates both the need for food lawyers and the legitimizing of the practice area on the whole.

### 29.1 Food Law on the Rise

Food law practitioners in the United States and Canada are a small but mighty bunch. Lawyers practicing in both countries have engaged with and provided advice on key federal, statewide or provincial legislation since their enactment. However, only recently can one enter the term “food lawyer” into a search engine and find professionals that define themselves as such. This proliferation in practices has been matched by a similar increase in food law and policy centers and clinics that are developing specializations and producing comprehensive reports on key

---

e-mail: [carly@tmllp.ca](mailto:carly@tmllp.ca)

trends and issues within this growing field. There is also a corresponding rise in food law and policy educational courses and programs, both at law schools and as part of other related disciplines.

This growth in the realm of food law and policy can be explained in large part by two factors: (1) a heightened awareness on the part of consumers regarding their food and its journey from farm to fork, and (2) a realization on the part of practitioners that the patchwork nature of food regulations requires professional specialization to navigate. In both countries, the practice of food law demands a thorough understanding of how food is regulated on a federal, regional, and state- and province-wide level. Engaging with clients in the food sector often necessitates navigating between these layers of law. This chapter is intended to provide context for the subsequent chapters on the U.S. and Canada in this section of the book. First, this chapter will briefly review this multi-layered legislative and regulatory context within which food is subject to the law, and then introduce the reader to the significant modernization of food legislation that both Canada and the U.S. are undertaking. Finally, the chapter will review a selection of legislative developments that provide a window on to the current state of food law in these countries.

## **29.2 The Legislative Framework of Food Regulation**

### ***29.2.1 The Federal Level in the US***

At the federal level, three executive branch agencies regulate food and agriculture among several other areas, such as drugs, cosmetics and pollution. First, the Food and Drug Administration (FDA) is an agency of the U.S. Department of Health and Human Services (DHHS) and acts to protect public health by assuring that foods within its purview are “safe, wholesome, sanitary and properly labeled.”<sup>1</sup> In essence, the FDA asks whether the foods produced are safe to eat. While animal feed and drug regulation are also within the FDA’s purview, the major legal instrument under which it operates is the Federal Food, Drugs and Cosmetics Act (FFDCA) enacted in 1938.<sup>2</sup> Food is regulated under chapter IV, 21 U.S.C. § 341 et seq. Specifically, it limits pesticide residues in food in interstate commerce, including imports. It also ensures the safety of any additives to food.

The second agency governing food regulation in the U.S. is the U.S. Department of Agriculture (USDA). It regulates livestock, meat and poultry products, as well as some egg products, with the mission to “provide leadership on food, agriculture, natural resources, rural development, nutrition, and related issues based on sound public policy, the best available science, and efficient management.”<sup>3</sup> As the

<sup>3</sup>United States Department of Agriculture (USDA) (2014), Mission Statement.

**Fig. 29.1** Sources of federal-level food laws in the US

agency charged with agricultural oversight, the USDA is an agency for farmers, not consumers. The core question the USDA is concerned with is whether certain crops are safe to grow.

The third agency is the U.S. Environmental Protection Agency (EPA)<sup>4</sup> whose mission is to “protect human health and the environment.” Agriculture and food production are inextricably linked to environmental concerns and pollution control. In terms of food regulation, the EPA regulates environmental values under the National Environmental Policy Act (NEPA),<sup>5</sup> biodiversity and threatened species under the Endangered Species Act (ESA),<sup>6</sup> pesticides under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA),<sup>7</sup> and water and air pollution under the Clean Water Act<sup>8</sup> and the Clean Air Act,<sup>9</sup> respectively. With such a broad mandate, the EPA essentially overlooks agricultural and food practices and environmental safety (Fig. 29.1).

In addition to the aforementioned acts, the U.S. has begun a significant food and food safety legislative overhaul through the Food Safety Modernization Act (FSMA).<sup>10</sup> This legislation will shift the focus of food safety from response to prevention and give the FDA further tools to protect consumer food safety. A more detailed discussion on the FSMA continues below.

## 29.2.2 *The Federal Level in Canada*

The Canadian Food Inspection Agency (CFIA), created by the Canadian Food Inspection Agency Act of 1997,<sup>11</sup> is Canada's federal counterpart to the FDA. The CFIA reports to the Minister of Agriculture and Agri-Food. The mission of the CFIA is to safeguard food, animals, and plants and, through this pursuit, to enhance the wellbeing of Canadians, the Canadian economy and the environment.<sup>12</sup> It conducts activities such as the registering and monitoring of processing plants, inspection of foreign and domestic foods, certification of exports, and determination of quarantine necessity. Additionally, the CFIA oversees several legislative acts in the pursuit of its overall goals, including:

- **Canada Agricultural Products Act,**<sup>13</sup> which regulates the marketing of agricultural products in import, export and interprovincial trade and provides for national standards and grades of agricultural products, for their inspection and grading, for the registration of establishments and for standards governing establishments;
- **Consumer Packaging and Labeling Act,**<sup>14</sup> (with regard to food) which sets rules for packaging, labelling, sale, importation and advertising of prepackaged and certain other products;
- **Feeds Act,**<sup>15</sup> which controls and regulates the sale of feed;
- **Fertilizers Act,**<sup>16</sup> which is responsible for regulating agricultural fertilizers;
- **Fish Inspection Act,**<sup>17</sup> which sets rules inspection of fish and marine plants;
- **Food and Drugs Act,**<sup>18</sup> which regulates food, drugs, cosmetics and therapeutic devices;
- **Health of Animals Act,**<sup>19</sup> which considers diseases and toxic substances that may affect animals or that may be transmitted by animals to persons, and respecting the protection of animals;
- **Meat Inspection Act,**<sup>20</sup> which regulates the import and export of and interprovincial trade in meat products, the registration of establishments, the inspection of animals and meat products in registered establishments and the standards for those establishments and for animals slaughtered and meat products prepared in those establishments;

<sup>11</sup>Canadian Food Inspection Agency Act (1997), c. 6.

<sup>12</sup>Canadian Food Inspection Agency (2011), *Vision and Mission*.

<sup>15</sup>Feeds Act (1985), c. F-9.

<sup>16</sup>Fertilizers Act (1985), c. F-10.

<sup>17</sup>Fish Inspection Act (1985), c. F-12.

<sup>18</sup>Food and Drugs Act (1985), c. F-27.

<sup>19</sup>Health of Animals Act (1990), c. 21.

<sup>20</sup>Meat Inspection Act (1985), c. 25.

- **Plant Breeders' Rights Act**,<sup>21</sup> which protects plant breeders' rights;
- **Plant Protection Act**,<sup>22</sup> which prevents the importation, exportation and spread of pests injurious to plants and provides for their control and eradication and for the certification of plants and other things and;
- **Seeds Act**,<sup>23</sup> which is in respect to the testing, inspection, quality and sale of seeds.

The CFIA also has ultimate oversight over the Safe Food for Canadians Act<sup>24</sup> (the SFCA), a new law that will be implemented in 2015. This legislation represents Canada's attempt to streamline, modernize, and in some cases, simplify its food laws.<sup>25</sup> Further discussion on the SFCA continues below.

Another agency, Health Canada,<sup>26</sup> is the federal department responsible for establishing safety and nutritional quality standards of all foods sold in Canada. This mandate is exercised in part via the Food and Drugs Act and its associated regulations.<sup>27</sup> The Food and Drugs Act is an integral part of the Canadian food law framework, as it addresses product safety and integrity and consumer protection from fraud regarding the sale and consumption of food.

### 29.2.3 *Agricultural Law and Policy*

One of the key U.S. food law and policy tools is the Farm Bill (the Bill),<sup>28</sup> a federal omnibus bill that is reviewed and renewed approximately every 5–7 years and is intended to provide some consistency in food and agricultural legislation and policy. Historically, it has supported staple farm commodities, such as corn, soybeans, and wheat. In recent years, however, its reach has grown and its contents have greatly diversified. The first “omnibus” Farm Bill was enacted in 1973<sup>29</sup> and is the resting place for many food and agriculture policies ranging from conservation of land, to trade and export programs, to crop insurance. The bill also provides authorization for both foreign food aid and domestic nutrition assistance, primarily via the Supplemental Nutrition Assistance Program (SNAP),<sup>30</sup> commonly known

<sup>21</sup>Plant Breeders' Rights Act (1990), c. 20.

<sup>22</sup>Plant Protection Act (1990), c. 28.

<sup>23</sup>Seeds Act (1985), c. S-8.

<sup>28</sup>See the 2014 Farm Bill (P.L. 113-79): Summary and Side-by-Side by Chite R for an excellent introduction to the 2014 Farm Bill.

<sup>29</sup>Ibid, p. 3 Figure 1.

<sup>30</sup>USDA (2014), Supplemental Nutrition Assistance Program (SNAP).

as food stamps, and the Emergency Food Assistance Program (TEFAP).<sup>31</sup> Its most recent iteration is the Agricultural Act,<sup>32</sup> which was enacted into law in February 2014. Some key elements include increased support for access to crop insurance, fruits, vegetables, and organic programs, and diminished funding and subsidies for more traditional commodities. Money was also allotted to assist farms transitioning from traditional farming to organic practices.

This bill is a unique regulatory tool because its periodic review offers a perspective and a window into how food, agriculture and the law have been seen by legislators over time. For example, over the years, the bill has evolved to include titles that reflect key food and agriculture issues of the day, such as conservation laws in 1985 and local food systems in the 2008 farm bill.<sup>33</sup> In theory, it also reflects how consumers interact with food and agriculture.

### ***29.2.4 Canadian Agricultural Law and Policy***

Agriculture and Agri-Food Canada<sup>34</sup> is the Canadian federal department responsible for agricultural policy. However, there is no overarching legislative act akin to the U.S. Farm Bill. Instead, an Agricultural Policy Framework was developed by Agriculture Canada and serves as a comprehensive federal, provincial, and territorial document. Growing Forward 2<sup>35</sup> is the most current iteration of this policy document, and covers the period of 2013–2018. It highlights three key focus areas for agricultural policy and support: (1) encouragement of innovation, (2) international competitiveness, and (3) market development.

### ***29.2.5 The Role of U.S. States and Cities and Canadian Provinces, Territories, and Municipalities***

#### **29.2.5.1 US State-Level Food Law**

The regulatory behemoths, the FDA, EPA and USDA, are merely the tip of the food legislation iceberg in the U.S. These federal agencies have various subdivisions, such as the Animal and Plant Health Inspection Service (APHIS) within the USDA and several others. Additionally, there are state agencies, because states typically act as the implementers of federal legislation but they also have the liberty to develop their own food-related laws and policies within certain parameters. The

<sup>31</sup>USDA (1983), Emergency Food Assistance Program (TEFAP).

<sup>34</sup>Government of Canada (1868), Agriculture and Agri-Food Canada (AAFC).

<sup>35</sup>Agriculture and Agri-Food (2014), Growing Forward 2.

same is true at the local level. While it is rare for a local government to run explicitly afoul of any federal or state law, laws and policies can be created according to the needs of the region or the specific influences of that area. Some examples of state and city-specific laws are examined below.

### **29.2.5.2 Canada's Province-Level Food Law**

The role of provinces, territories, and municipalities with respect to food law in Canada is similar to that of the U.S. Similarities include overarching federal laws that all jurisdictions must adhere to while maintaining some legislative freedom to tailor the legal framework to the needs of that jurisdiction. For example, although there are federal laws like the National Dairy Code<sup>36</sup> and the Dairy Products Marketing Regulations concerning the production and sale of dairy products,<sup>37</sup> almost every province or territory has their own dairy legislation specific to that region. Some examples of province and city-specific food laws are examined below.

## **29.3 Regulatory Modernization**

The FSMA and SFCA represent a new era of regulatory modernization in both the U.S. and in Canada. In the U.S., federal food law has mostly remained the same for approximately 75 years.<sup>38</sup> In comparison, the SFCA compiles and streamlines distinct pieces of legislation and represents a robust overhaul of the piecemeal food safety laws that existed before. Both laws and their associated policies and programs demonstrate a clear overarching priority of federal governments in each jurisdiction: food safety.

### **29.3.1 United States Food Law**

The U.S. has recently undergone a sizable legislative update with the introduction of the FSMA, which was signed into law in January of 2011. For clarity, the FSMA does not apply to meat, poultry, and some egg producers, which continue to be regulated by the USDA. The FSMA, nonetheless, empowers the FDA to regulate all levels of the food chain, at all points of food growth and production, and to work to prevent food borne illnesses rather than simply respond to an outbreak after it has occurred. This is a significant shift in approaching food safety. The FSMA's top

---

<sup>36</sup>Government of Canada (2013), National Dairy Code.

<sup>37</sup>Dairy Products Marketing Regulations (2009), (SOR/94-466).

<sup>38</sup>Strauss (2011), p. 355.

priority is to ensure food safety throughout all levels of domestic food production and distribution systems.

The FSMA has brought several changes in US food safety regulation. The FDA now has increased plant inspection powers and obligations and has the authority to initiate food recalls where necessary. It also increases the obligations of food facilities to develop food safety and contamination plans. To date, the producer of foodstuff has always borne the ultimate responsibility for contamination. The FSMA, however, requires producers to engage in preventative action and includes penalties for noncompliance. The law also levels the playing field for imported foods and their American-made counterparts. Under the FSMA, importers have an increased obligation to verify that foreign suppliers meet U.S. food safety standards, and the FDA can require credible third-party compliance certification as a condition of entry for high-risk foods.<sup>39</sup>

The rollout of the FSMA and its regulations and protocols remains in progress at the time this chapter was written. The act includes timelines within which the FDA must establish rules with respect to concepts such as mandatory produce safety standards and the implementation of written preventive control plans for food facilities.<sup>40</sup> Recently, the Center for Food Safety sued the FDA claiming that the FDA unlawfully withheld seven important regulations, which were to be implemented by July 2012, a deadline imposed by the FSMA. The U.S. District Court's recently released decision upheld that the FDA had not met the deadlines imposed by the FSMA and, therefore, was in violation of the Act. A consent decree released in February 2014 specified the deadlines for various rules contained in the Act.<sup>41</sup> The Court's decision emphasizes the shift in U.S. priorities and its uncompromising position to ensure and maximize food safety.

### 29.3.2 *Canadian Food Law*

Canada is also currently undergoing its own much-needed modernization of food laws, regulations, and policies. Legislative modernization has become, at least on the federal level, the dominant theme of food law discourse. The federal government has long held that the Food and Drugs Act<sup>42</sup> has been, from its inception in 1906, a law that prioritizes consumers. The new legislation, mainly in the form of the SFCA, demonstrates a heightened emphasis on consumer safety. However, increasingly important issues like the consumer's right to know all aspects of the food system via labeling, or the creation of a legislative infrastructure within which small producers can thrive, continue to be omitted from the federal legislative context. This omission prevents full disclosure for consumers and prevents them

---

<sup>40</sup>Strauss (2011), p. 359.

<sup>41</sup>Case No.: 12-cv-04529-PJH (2014), Consent Decree para. 4.

<sup>42</sup>Food, Drug and Cosmetic Act (1906), 21 U.S.C. 1 et seq.

from fully exercising their rights to make informed and educated food choices. Furthermore, sustainability for small farmers is relegated to a lower priority when industrial farming is emphasized and protected by these laws. Note that this act should be effective as of the beginning of 2015.

The SFCA consolidates the authorities of the Fish Inspection Act, the Canada Agricultural Products Act, the Meat Inspection Act, and food related aspects of the Consumer Packaging and Labeling Act. The catalyst for the development of this law was a report by an independent investigator on the 2008 listeriosis outbreak,<sup>43</sup> where 22 deaths were all linked to listeriosis and were traceable to deli meats and related products processed by Maple Leaf Foods, emphasizing the lack of coordination between authorities and discordant laws. The Weatherill Report, released in 2009,<sup>44</sup> concluded that the regulation of food and consumer safety in Canada would greatly benefit from streamlining, modernizing, and in some cases, simplifying.

The SFCA focuses on three key areas of control—improved food safety oversight to better protect consumers, streamlined and strengthened legislative authorities, and enhanced international market opportunities for Canadian industry.<sup>45</sup> The law includes processes to ensure oversight of food commodities traded interprovincially or internationally, and is also meant to create improved opportunities for Canadian products in international markets. Moreover, it improves traceability of foods by providing the CFIA with the authority to develop regulations on the tracing and recalling of food. Through the act, inspection and enforcement powers are aligned to ensure more efficient inspections and increase compliance, ultimately resulting in more effective consumer food safety protections.

The FSMA and SFCA both modernize food safety regulations in their respective jurisdictions. It is hard to argue against the prioritization of food safety from a legislative focal point. Recent large-scale and high profile food contamination outbreaks in both the U.S. and Canada demand food safety to be a top priority. It should be noted, however, that there is very little contemplation at the federal level about why contamination cases have become so far-reaching, and why food safety is more difficult to establish and maintain. Both countries could benefit from a critical analysis of the scale of our food system, how it developed and what may need to be reassessed. This kind of critical analysis should work in concert with an updated food safety legislative framework; both elements are necessary to strengthen the integrity of food laws.

An overhaul of the principles involving consumer protection, food justice, farm animal welfare,<sup>46</sup> fair trade, and environmental protection would help to update some of the aforementioned laws. Additionally, an objective and unbiased evaluation of sound science—not only studies funded by the industry—could help to

revise the dietary recommendations and food safety standards, including clarifying labeling laws in favor of consumer protection, so that the public can make more educated and healthier food choices, thereby improving food safety from the public health perspective.

## **29.4 Legislative and Policy Developments**

The issues and trends that food law practitioners should be cognizant of in the U.S. and Canada could fill a textbook in itself. For the sake of brevity, however, what follows is a discussion and analysis on a selection of legislative and policy developments on the federal, regional and provincial or statewide levels. While these developments address agriculture (both traditional and urban), issues of local food, cottage food laws, and the concept of food sovereignty, and other laws, regulations, and policies invoked by these developments provide a glimpse into innovation and updates by the U.S. and Canada, and also areas where more progressive policies can and should be developed in the future.

### ***29.4.1 New Developments in U.S. and Canadian Food Law***

#### **29.4.1.1 Urban Agriculture**

Urban agriculture is the act of growing food within a city's perimeters. It is often a smaller, more compact take on traditional agriculture, and can be done for one's own consumption or for use by a larger community. The sale of such crops has often been hampered by regulatory restrictions. Zoning by-laws and land use parameters also impact the growth of food within cities.

#### United States

Boston, Massachusetts, recently passed legislation that enables a more permissive regulatory regime for growing food within a city's limits than is commonly seen in the U.S. or Canada. Article 89<sup>47</sup> has been identified as the most comprehensive city re-zoning regulation of its kind and provides a transactional structure that will allow urban farmers to grow food within city limits and sell those items for a profit. This permissiveness distinguishes Article 89 from many other existing urban agriculture regulations in North America. As part of the regulation, planners have identified city-owned land parcels that are suitable for urban farming and offers them to

---

<sup>47</sup>Boston Redevelopment Authority Boston Redevelopment (2013a), Article 89, <http://www.bostonredevelopmentauthority.org/getattachment/8405c72c-7520-43ad-a969-0e27dddae7a2>.

potential farmers for \$100/plot, with the requirement that the land be used for urban farming purposes for at least 50 years. Farm stands are also allowed on these plots. This used to be a major hurdle for urban growers, where people could grow produce but were not permitted to sell it on the same plot of land. The new Massachusetts law goes beyond simply articulating the new allowances. This progressive and modern law is accompanied by a User's Guide<sup>48</sup> that clearly and accessibly articulates the steps to conduct those activities for an urban farmer. This is notable because it shows that the new law is geared toward and vastly supportive of a more user-friendly urban agriculture. Creating such legislation and pairing it with resources like the User's Guide transforms an activity like urban farming away from a token nod for sustainable food to a very practical and accessible step towards food security in cities.

## Canada

While not nearly as comprehensive as Boston's Article 89, the City of Vancouver, British Columbia, has taken the lead among Canadian municipalities on urban agriculture. The City has developed urban agricultural guidelines to assist developers with planning projects that incorporate those tenets. In 2008, the City approved a set of Urban Agriculture Guidelines for the Private Realm.<sup>49</sup> These guidelines are applied in conjunction with the Zoning and Development By-Law, and are to be consulted when an urban agriculture element is proposed in concert with a private development plan. In short, these guidelines provide a framework for those interested in urban farming.

Urban agriculture has inhabited the realm of the privileged in many regions of Canada and the U.S. This is because, in many cities, the space to conduct such activities is very limited and expensive, even where it is available. An urban farming activity, such as raising backyard chickens, requires a significant amount of time and resources. Legislation like Article 89 and the Urban Agricultural Guidelines build a framework that creates accessibility and eliminates some barriers usually inherent in urban agriculture.

## ***29.4.2 Local Food and Procurement***

### **29.4.2.1 United States**

In 2010, the Illinois Food, Farms, and Jobs Act<sup>50</sup> was signed into law, and was in some ways a precursor to Ontario's legislation (see below). It was designed "to

---

<sup>48</sup>Boston Redevelopment Authority Boston Redevelopment (2013b), Article 89 Made Easy.

<sup>49</sup>City of Vancouver (2008), Urban Agriculture Design Guidelines for the Private Realm.

<sup>50</sup>Illinois General Assembly (2009), Local Food, Farms, and Jobs Act.

create, strengthen, and expand local farm and food economies throughout Illinois.”<sup>51</sup> One of the tenets of this legislation was the establishment of procurements goals for state agencies. For instance, state agencies that provide food services need to increase the purchase of local food to 20 % by 2020. Comparatively, state-funded institutions have a goal of a ten percent increase by 2020.<sup>52</sup>

#### **29.4.2.2 Canada**

A notable development in food law at the provincial level in Canada is Ontario’s Local Food Act,<sup>53</sup> which became law in November 2013. Ontario is the first Canadian province or territory to adopt a legislation that focuses specifically on local food. The purposes are to foster successful and resilient local food economies and systems throughout Ontario; increase awareness of local food in Ontario, including the diversity of local food; and encourage the development of new markets for local food.<sup>54</sup> It gives the Minister of Agriculture and Food discretionary power to encourage the use of local food by public sector organizations. In other words, this act could be used as a tool to provide more opportunities for local farmers and producers to compete for public sector procurement contracts.

These legislative acts are concrete evidence that legislators in some jurisdictions have begun to codify local food principles under law, giving discretionary powers to Ministers and legitimizing the role of local food. The advantage of promoting such local food movements is a reduction in food miles and greater potential for improved transparency in food origins, as well as improved sustainability if organic and responsible farming practices are encouraged and supported.

### ***29.4.3 Local Procurement and International Trade Agreements***

#### **29.4.3.1 Canada**

Local procurement policies may be directly impacted by international trade agreements. This is evidenced by local food policy activists’ and members of the Toronto Food Policy Council’s (TFPC) concerns with the Comprehensive Economic and Trade Agreement (CETA), a proposed free trade agreement between Canada and

---

<sup>51</sup>Illinois General Assembly (2009), Local Food, Farms, and Jobs Act, <http://www.ilga.gov/legislation/publicacts/fulltext.asp?Name=096-0579>.

<sup>52</sup>de Schutter (2014), Briefing Note.

<sup>53</sup>Legislative Assembly of Ontario (2013), An Act to enact the Local Food Act, 2013.

<sup>54</sup>Ibid, preamble.

the European Union.<sup>55</sup> The TFPC presented to the Executive Committee of Toronto's City Council in 2012, positing that CETA would have significant detrimental impacts on sub-national governments, primarily municipalities. The TFPC further argued that signing the agreement would prohibit municipal governments from favoring local, or even Canadian, goods or services, if those potential procurement contracts were valued over \$340,000 CAD. The TFPC stated that CETA "would prohibit the City of Toronto from promoting food security and economic development through the local food procurement policy."<sup>56</sup> Toronto's City Council, subsequently, passed a motion to request that the Province of Ontario issue an exemption for Toronto. While it is highly unlikely that this exemption will be granted, it is an important symbolic gesture by the City, indicative, at least in part, of its awareness of the power of procurement with respect to local food. CETA has not yet been fully ratified and negotiations continued as of the summer of 2014.

## 29.4.4 Cottage Food Laws

### 29.4.4.1 United States

Cottage food laws are the colloquial name for laws that allow individuals to cook low-risk food items in their homes, then sell and distribute them to the public. These kinds of laws have been passed in 31 U.S. states, including Texas, Florida, and New York.<sup>57</sup> Nine states have pending cottage food laws at various stages of debate and approval. The impetus behind these cottage food laws is to remove a major stumbling block for start-up food entrepreneurs: access to a commercial kitchen. The laws stipulate that the approved foods that can be made in one's home must all pose only a minimal consumption risk. In terms of whom a producer can sell to, some states allow only direct-to-consumer distribution, while others allow an individual to conduct online sales, or sales to grocery stores, farmer's markets, and restaurants. Therefore, cottage food laws can provide viable economic opportunities for a growing community of food entrepreneurs, and the laws fostering this kind of growth in the U.S. are creating thriving businesses. In sum, cottage food laws support local businesses and promote a "back to the roots" approach of community-supported enterprises.

Canada has yet to pass any such laws, though there have been rumblings of advocacy campaigns amongst the growing community of small food entrepreneurs across the country.

### 29.4.5 *The Right to Food and Food Sovereignty*

In conjunction with the right to food, food sovereignty is an important principle that deserves to be part of any discussion on food law in the U.S. and Canada. Food sovereignty is, essentially, the democratization of food and agriculture. Food sovereignty is a principle related to the right to food that is arising with some frequency in the U.S. and Canada. It is defined as the “right of peoples to healthy and culturally appropriate food produced through ecologically sound and sustainable methods. More importantly, it is the right to define and control our own food and agriculture systems, including markets, production modes, food cultures, and environments.”<sup>58</sup> This term is sometimes used by and with respect to First Nations communities, who attach vast cultural significance to their interactions with food in all of its forms.

In 2009, the U.S. joined consensus on Resolution L.30, Rev. 1—the Right to Food,<sup>59</sup> a non-binding declaration that called for the human right to adequate food, for the first time. Joining consensus on this Resolution did not change international law or impose any obligations on the U.S. to feed its own citizens, or provide food aid, other than those that already existed. It was largely a symbolic gesture, albeit one that the U.S. had never agreed to before. Hence, there is also no legal or constitutional guarantee of the right to food in American law. In terms of the legal and policy framework, Canada is a signatory to the International Covenant on Economic, Social, and Cultural Rights.<sup>60</sup> While the Covenant requires countries to fulfill and protect the right to food for its citizens, there is no legal or constitutional guarantee of the right to food in Canadian law.

Many cities in Maine have introduced food sovereignty ordinances in the past 2 years, and other cities in Vermont, California, and Massachusetts have also passed similar legislation.<sup>61</sup> Critics deride the ordinances for violating constitutional principles, as well as jeopardizing public health by absolving those within the ordinances from complying with state and federally mandated regulatory oversight. Regardless, the ordinances illustrate existing support for a hyper-local food system on the part of at least a handful of jurisdictions in the U.S. Whether or not the principles of food sovereignty will have any lasting impact on, or contribution to, the field of food law remains to be seen<sup>62</sup>; but the concept is undoubtedly a powerful one for many communities in the U.S. and in Canada.

## 29.4.6 *Proliferation of Professional Associations in Food Law*

### 29.4.6.1 United States

The number of high-profile law and policy centers and legal programs that focus on the study of food and its regulation and that have been launched in recent years is indicative of the increasing legitimacy of the practice of food law as a distinct discipline, particularly in the US. While certain stalwarts have existed for many years, entities like the Resnick Program for Food Law and Policy at the University of California, Los Angeles which was established in 2013, and the Harvard Law School's Food Law and Policy Clinic which opened in 2010, illustrate that established institutions now believe that the study of food law and policy merits greater attention. The University of Michigan continues to offer their Global Food Law Program, and the Vermont Law School opened the Centre for Agriculture and Food Systems in 2012. The editors of this book have started *Food Law International, LLP*,<sup>63</sup> an organization to promote legal scholarship in the area of sustainable food law and are teaching corresponding courses at law schools in the US and in Europe. The American Bar Association has conducted continuing legal education seminars on topics like providing counsel to the local food movement, food labeling laws, and a primer on the FSMA.

Nonetheless, vast differences exist within the budding field of law. While some lawyers call themselves “food lawyers,” they are really not because their work mainly focuses on helping companies, such as the food industry's BigFood and BigAg, come into compliance with existing laws. Although this is relevant work, this area of law should not be counted as “food law” but rather as “resource law,” the latter of which describes how coming into compliance with existing laws attains at most the lowest common denominator that was legally standardized. True food lawyers seek to use the law and precedent to raise the sustainability bar, to promote progressive action, to encourage farm animal welfare, environmental and social integrity in food law, and to use food policy to close the gaps that the globalized food system unveils. Colleagues, such as the legal teams at the Center for Food Safety,<sup>64</sup> Food and Water Watch,<sup>65</sup> Sierra Club,<sup>66</sup> Defenders of Wildlife,<sup>67</sup> the Environmental Integrity Project,<sup>68</sup> Beyond Pesticides,<sup>69</sup> the Center for Biological Diversity,<sup>70</sup> Xerces Society,<sup>71</sup> and many other national non-profit organizations

<sup>71</sup><http://www.xerces.org>.

continue to make progress in food law that will greatly benefit the nation's wildlife, natural resources, consumers, and contribute to food safety on a multitude of levels and for many years to come.

#### **29.4.6.2 Canada**

In contrast, the overall academic infrastructure with respect to food law and policy is not as established in Canada. There is some movement with respect to the study of food sustainability, but there remains only a tenuous connection between the role of the law and this realm. However, the establishment of a Chair in the Sustainable Food Production at the University of Guelph in Ontario in 2011, the appointment of Canada's first "Food Laureate" by the University of Guelph in 2012, and Wilfred Laurier University's opening of the Centre for Sustainable Food Systems in 2013 are evidence of a growing awareness and need for study of our food systems. Bar Associations in Canada have yet to ensconce the practice of food law into their continuing legal education programs as many other associations have around the world.

There is a corresponding proliferation of food policy councils in the U.S. and Canada. These bodies play a meaningful role in the development of policy and practice regarding food in the municipal and sometimes provincial sphere, and are usually comprised of volunteers who represent a variety of stakeholders in the food system.

### **29.5 Conclusion**

There is not only a need for legal advice and direction in this increasingly complex world of food and agriculture, but also a strong role for advocacy in these areas. Individuals and organizations need legal assistance, but consumers and citizens also need those with legal expertise to advocate for their rights on a policy level. The practice of food law can entail more than just assisting clients with the existing pieces of legislation and policy. It can also include the opportunity for legislative development and creative advocacy. Many are increasingly aware that food legislation was developed so long ago that it has been rendered archaic, or that it was developed with only large-scale manufacturers, developers, distributors, and creators in mind. The reach of the law can inhibit innovation in food and this limitation has led to an increase in awareness, involvement and activism. As the food sector diversifies and innovates, so must law professionals and legal frameworks in order to assist those endeavors.

## Chapter 30

# Textbox: The U.S. Farm Bill and Textbox: The National School Lunch Program

William S. Eubanks

**Abstract** In the United States, Congress sets domestic legislative priorities and allocates funding for agricultural and child nutrition programs primarily through two omnibus bills that are each reauthorized approximately every five years—the U.S. Farm Bill and the Child Nutrition Reauthorization. This chapter discusses each of these laws, the histories behind their enactment, and current efforts in each bill designed to foster a sound agricultural economy, improved public health outcomes, and a more effective National School Lunch Program.

### 30.1 The U.S. Farm Bill

The Agricultural Adjustment Act was originally passed in 1933. This first “Farm Bill”—as it later came to be known—was viewed by Congress as a temporary solution to the struggles faced by farmers during this era. The Act imposed supply-side quotas, limits, and other restrictions on crop production, with the federal government stepping in to make up the difference where necessary so that farmers could obtain better market prices.<sup>1</sup> Although the federal government has long enacted measures to support and protect the agricultural sector, the first comprehensive legislation that aimed at providing family farms with a financial “safety net” came in 1933 in response to the Great Depression and the droughts of the Dust Bowl era, as part of President Franklin D. Roosevelt’s New Deal.<sup>2</sup>

Notwithstanding the temporary nature of the first farm bill, Congress realized the importance of maintaining both supply controls and price controls in order to ensure

as equitable an agricultural market as possible for farmers, and thus continued to reauthorize the farm bill approximately every 5 years subject to any revisions added by Congress.<sup>3</sup> Since its initial enactment 80 years ago, there have essentially been three distinct periods of farm bill implementation, each of which sought to achieve very different objectives—objectives that were often contrary to those embodied in previous farm bills. This disjointed evolution demonstrates that a farm bill is little more than a snapshot of legislative priorities vis-à-vis the agricultural sector at any given point in time.<sup>4</sup>

In the post-World War II era until the early 1980s, the farm bills enacted by Congress illustrated the United States' engagement in Cold War politics with the Soviet Union. These farm bills emphasized larger, more concentrated farming and food processing operations through subsidies and other financial incentives that were aimed at maximizing crop yields, above all other goals.<sup>5</sup> As a result, on-farm natural resource conservation was de-emphasized during this era while the predominant focus shifted to large-scale monoculture farming of commodity crops such as corn, wheat, rice, cotton, and soybean.<sup>6</sup> This era also coincided with the "Green Revolution"—the culmination of years of scientific experimentation with new plant breeding and hybridization techniques—and with the proliferation of new chemical pesticides, synthetic fertilizers, and mechanization. Cumulatively, these innovative agricultural inputs created the perfect storm for a highly efficient, albeit extremely resource-dependent economy in the agricultural sector.<sup>7</sup>

The post-World War II farm bill model collapsed when that system resulted in immense surpluses of certain commodities that significantly reduced the market prices farmers could yield, and when political tensions between the U.S. and the Soviet Union led to the suspension of certain farm exports to one of the US' largest trading partners.<sup>8</sup> This collapse began a tailspin into the 1980s farm crisis, which was—and remains—the worst financial period for farmers in American history outside of the Great Depression.<sup>9</sup> Recognizing the need to break away from the prevailing farm bill model, in 1985 Congress responded by creating a new framework that would survive for nearly 30 years. The reformed farm policy balanced the economic needs of farmers by continuing certain price support programs for covered commodity crops and by creating a bevy of new marketing loans to help farmers obtain much-needed capital. In exchange for the price support programs, farmers were required to meet their end of the social contract by satisfying certain environmental obligations such as conserving sensitive wetlands and preserving highly erodible soils.<sup>10</sup> These programs—colloquially known as *Swampbuster* and *Sodbuster*,

respectively—set the stage for the enactment of several dozen farm bill conservation programs over the next three decades, and ushered in an era in which Congress made clear that a resilient agricultural sector could ensure national food security in harmony with environmental laws designed to protect the country’s natural resources.<sup>11</sup>

In 2014, Congress reauthorized the farm bill once again, which at this early stage appears to be the start of the third major epoch in farm bill history. Among other things, the 2014 farm bill drastically restructured certain farm-related payment programs, moving away from the subsidy system that had prevailed for decades and, instead, adopting a risk-management based approach. Within this framework, the current farm bill returns to its origins as a “safety net” by providing farmers with diverse crop and revenue insurance options that help protect farmers’ crop investments from droughts, floods, predation, and other natural disasters that significantly affect farm income from year to year.<sup>12</sup> These new federally-backed insurance programs also create more equitable insurance packages for diversified operations—i.e., farms that produce more than just one or two staple crops—providing farmers with more flexibility in terms of deciding what to grow in a given season.<sup>13</sup> As for on-farm and off-farm resource protection, while the fiscal climate in the nation’s capital led to some reduction in spending on conservation programs, Congress consolidated and improved several conservation programs and allocated billions of dollars to ensure that these programs operate efficiently and effectively when implemented by the U.S. Department of Agriculture—indicating Congress’s ongoing commitment to natural resource protection.<sup>14</sup> Finally, compared to prior legislation, the 2014 farm bill provided significant funding opportunities for beginning farmers and ranchers, socially disadvantaged farmers and ranchers, organic producers, and local and regional food systems, indicating Congress’s recognition that the face of farming in this country, as well as the composition of food marketplaces in the U.S., is changing rapidly. The U.S. must keep pace if it wants to maintain a vibrant, resilient, and environmentally protective food production system.<sup>15</sup>

Hence, as with farm bills that preceded it, the 2014 farm bill demonstrates Congress’s current commitment to America’s farmers, as well as to its citizens and the food system they covet. Although there certainly are challenges that Congress must address in future farm bills in order to avoid lapsing into the farm crises previously observed in this country,<sup>16</sup> for nearly a century, Congress has

proven its ability to respond with relative urgency to modify the “safety net” specifically created to protect the backbone of America—its farmers and ranchers—to address the challenges of the day.<sup>17</sup>

## 30.2 The National School Lunch Program

Government-assisted food service programs in educational settings have been in existence in Europe since the 1790s.<sup>18</sup> In the US, various efforts to involve the federal government in school meals began in the 1890s.<sup>19</sup> Despite these early efforts, however, the modern version of the National School Lunch Program (NSLP) was not created until 1946 with Congress’s passage of the Richard B. Russell School Lunch Act.<sup>20</sup> In 1966, Congress significantly refined and expanded the reach of the NSLP by enacting the Child Nutrition Act, which, among other things, strengthened the USDA’s authority to ensure that the NSLP would provide nutritional meals to students, and also extended the provision of school meals to include breakfast and snacks that occur during the school day.<sup>21</sup> Since that time, Congress has reauthorized the Child Nutrition Act approximately every 5 years, and in the process provided guidance to USDA on how to implement the NSLP to achieve the goals of the Act. The most recent reauthorization of the Act—which is discussed below—occurred in 2010, meaning that another reauthorization is expected in 2016.<sup>22</sup>

The current NSLP operates in more than 100,000 public and non-profit private schools throughout the nation. In 2012, the program served free and reduced-priced lunch to over 31 million American children each day during the school year.<sup>23</sup> Since 1998, the suite of school meal programs included within the NSLP umbrella has included not only traditional meals during the school day, i.e., breakfast and lunch, but also afterschool snacks.<sup>24</sup> Any student at a participating school may

---

<sup>17</sup>This piece only focuses on the farm-related provisions of the farm bill, rather than the nutrition provisions of the farm bill. The Supplemental Nutrition Assistance Program (“SNAP”) is authorized via the farm bill, and approximately 70% of farm bill funding is allocated for SNAP purposes. For more information about SNAP, see <http://www.fns.usda.gov/snap/supplemental-nutrition-assistance-program-snap> (last accessed July 2014).

<sup>18</sup>U.S. Dept. of Agric. (USDA), *National School Lunch Program: Background and Development in Europe*, [http://www.fns.usda.gov/nslp/history\\_1](http://www.fns.usda.gov/nslp/history_1) (last accessed July 2014).

<sup>19</sup>*Id.*

<sup>20</sup>USDA, *National School Lunch Program: National School Lunch Act*, [http://www.fns.usda.gov/nslp/history\\_5](http://www.fns.usda.gov/nslp/history_5) (last accessed July 2014).

<sup>21</sup>USDA, *National School Lunch Program: Child Nutrition Act of 1966*, [http://www.fns.usda.gov/nslp/history\\_6](http://www.fns.usda.gov/nslp/history_6).

<sup>22</sup>For a more detailed discussion of the historical origins of the NSLP, see Jason J. Czarnezki, *Chapter 13: The Food Statutes* at 233–40, in *Food, Agriculture, and Environmental Law* (Angelo, Czarnezki, and Eubanks, Eds.) (Environmental Law Institute, 1st ed. 2013).

<sup>23</sup>U.S. Dept. of Agric. (USDA), *NSLP Fact Sheet* at 1, <http://www.fns.usda.gov/sites/default/files/NSLPFactSheet.pdf> (last accessed July 2014).

<sup>24</sup>*Id.*

purchase a meal or snack through the NSLP. However, students satisfying certain family income eligibility requirements relative to the poverty level in a given year qualify for either free meals and snacks or reduced-price meals and snacks.<sup>25</sup> The total cost in federal resources per year to subsidize these free and reduced-price meals and snacks is approximately \$11 billion.<sup>26</sup>

The bulk of federal funding received by schools participating in the NSLP “comes in the form of a cash reimbursement for each meal served,”<sup>27</sup> which amounts to \$2.93 for free meals, \$2.53 for reduced-price meals, and \$0.28 for full-price meals to-date.<sup>28</sup> In addition, a school can receive a \$0.06 bonus for each meal served as long as it can demonstrate compliance with the current USDA nutritional standards for school meals. These nutritional standards were established in the 2010 legislation and are now being implemented by USDA.<sup>29</sup> Finally, aside from cash reimbursements, participating schools receive “entitlement dollars” to use towards USDA-procured foods, a.k.a. USDA Foods, often comprised of surplus commodity products from that year’s agricultural yields, such as grains, potatoes, frozen vegetables, canned fruits, pastas, or hamburger meat.<sup>30</sup> The percentage of a typical school lunch derived from USDA Foods obtained with entitlement dollars is 15–20 % of the volume of the lunch by weight.<sup>31</sup>

In light of the rising incidence of childhood obesity, type 2 diabetes, and other diet-related diseases, a critical focus of the NSLP in recent years has been to create health-based nutritional standards to which all NSLP meals and snacks must strive to adhere, with the goal being that the NSLP is not simply providing empty calories but rather giving students vital nutrients necessary for healthy bodies and strong minds in the classroom. In 2010, Congress reauthorized the Child Nutrition Act in legislation called the Healthy, Hunger-Free Kids Act, which specifically sought to transform the NSLP into a program emphasizing child nutrition.<sup>32</sup> Among other things, that Act: (1) provided the largest one-time increase per school meal served (\$0.06 per meal) in the history of the Child Nutrition Act so long as a school is in compliance with all USDA nutritional standards, which allows school food administrators more flexibility in purchasing choices; (2) required that all NSLP-participating schools make potable water available anywhere that school meals/snacks are served so that less children rely solely on milk or soda; (3) mandated that USDA update its nutritional standards to ensure that meals are nutritionally

<sup>28</sup>USDA, *supra* note vi at 2.

<sup>29</sup>*Id.*

<sup>30</sup>*Id.* at 2–3.

<sup>31</sup>U.S. Dept. of Agric., *Food and Nutrition Service White Paper: USDA Foods in the National School Lunch Program* at 3, <http://www.fns.usda.gov/sites/default/files/WhitePaper.pdf>.

<sup>32</sup>Pub. L. No. 111-296 (2010).

balanced and contain few, if any, sugars, trans fats, and other low-nutrient ingredients; (4) placed limitations on the ability of external corporations to sell what are called “competitive foods,” e.g., pizza, potato chips, and soda, which compete with NSLP meals for student attention and dollars; and (5) committed mandatory funding to a USDA Farm to School Grant Program since farm to school experiential education activities like school gardens, taste tests, and farm tours have proven effective in increasing children’s consumption of fruits and vegetables while also supporting local and regional agriculture.<sup>33</sup>

In implementing the Healthy, Hunger-Free Kids Act, USDA has promulgated several regulations updating the NSLP nutrition standards to comport with current public health practices.<sup>34</sup> As these regulatory standards have taken effect, some food service administrators and politicians have raised concerns over the difficulty of compliance, children opting to avoid purchasing the more nutritional offerings, and increased food waste. However, careful scrutiny of the preliminary data indicates that those concerns are almost certainly outliers, as a recent peer-reviewed study of the NSLP’s nationwide data suggest that more than 90 % of participating schools are, in fact, satisfying the updated nutrition standards; children are eating, on average, 23 % more fruit and 16 % more vegetables at lunch. Additionally, school lunch revenue at NSLP-participating schools is actually increasing because many regions are seeing much higher student NSLP participation than they previously experienced. Finally, food waste has not increased relative to the baseline.<sup>35</sup>

Accordingly, if current trends hold, the updated nutrition standards may prove to be a much-needed prescription for our nation’s childhood obesity crisis. In light of the impending 2016 Child Nutrition Reauthorization, only time will tell whether Congress will recommit to these standards to give them sufficient time to bear fruit, or whether it will opt for a different path forward.

# Chapter 31

## Food Law in Canada: A Canvass of History, Extant Legislation and Policy Framework

Ikechi Mgbеoji and Stan Benda

**Abstract** In this chapter, the structure, content and process of food regulation in Canada are examined. For ease of analysis, our analysis is structured into three main parts. Part 1 introduces the subject-matter of the history of Canadian food safety regime, and food labelling requirements. Part 2 explores extant federal and provincial regulatory frameworks with emphases on “product of Canada” requirements, organic food governance as well as public health issues in Canada. Part 3 deals with trade in food products, focusing on both import and export trade as well as on inter-provincial trade in food products. Part 3 concludes the chapter by examining international food trade regulatory instruments as they affect Canada.

### 31.1 Introduction

Wide ranges of legislation frame the legal regime of food in Canada. Historical accident, *ad hoc* reactions, and differing departmental mandates have created what Donald Buckingham—one leading commentator described as “complexity, opaqueness and difficulty in applying the law.”<sup>1</sup> To undertake this overview of food regulation, one must first examine some basic concepts: what is food? Why regulate food and methods of food production? How do regulators choose? What is the legacy of progenitor legislation vis-à-vis food over the last 200 years in Canada? Having set that that table, we can look at the menu, namely the details of extant food regime in Canada. Next, the extant food regime of Canada will be discussed.

What is food? Food is philosophically, psychologically and culturally determined. The concept of “food” is fixed by the concepts of time and place. While food

e-mail: [Stan.benda@ryerson.ca](mailto:Stan.benda@ryerson.ca)

is religion in India and Saudi Arabia, In China it is medicine.<sup>2</sup> Also, It may be considered taboo as is the case in East Africa.<sup>3</sup> Fourth century Christian taboos included blood, carrion, and things strangled.<sup>4</sup> Suggestion: Similar food taboos are manifested in Jewish, Muslim and Hindu strictures. The modern manifestations of food concepts are found in Kosher, Halal and Hindu strictures.

Similarly, food is psychologically determined. The concepts of rejection and acceptance will further explain this notion. Rejections range from distaste (spinach/chilli) through danger (allergens), inappropriate (sand) and disgust (insects/feces). Acceptance range from good taste (sweet, salty) through beneficial (honey) appropriate (ritual foods, e.g. bread and wine) and trans-valued (deity offerings).<sup>5</sup>

Genetics, age, gender, climate, or social status may also dictate what may be acceptable as food. For example, lactose intolerance, gluten sensitivity and bitterness may speak to genetic influences. The merits of the contradictions in determining what is acceptable as food is perhaps best exemplified in mushrooms. With the world history of the past 500 years characterized by global exploration, colonization, increased trade,<sup>6</sup> and massive movements and exchanges of people, goods, animals and food, the history of food is complex<sup>7</sup> and multifaceted. Medicine as food goes back to the Egyptians and honey. Coffee and chocolate came first as medicines to the European table. So did tea, garlic and sassafras.

Throughout time, different cultures of the world have influenced the definition of food, originally fixed by the climate, botany, riparian or littoral nature of the location. The Germans have the 1516 *Reinheitsgebot*, beer purity law. In India, food is tied to social status. In Japan, there is the tea ceremony.

Trade introduced new foods across the geographical regions of the world. Maize, rice, potatoes, avocado, tomato, peanuts, spices, citrus have all been spread far beyond their native centres of origin. The only crops indigenous to North America are blueberries, Jerusalem artichokes, sunflowers, squash, and Canadian fiddleheads (uncurled fern tops). The centres of origin of crop plants are the so-called *Vavilov Centres*,<sup>8</sup> named after the prominent Russian botanist who first discovered that plants had centres of origin that could be traced to specific geographic locals.

There are many gaps or fallacies in the consciousness about “old” food crops. Many crops are no longer associated with their place of origin. For example, potatoes are no longer associated with South America, ditto sugar cane and bananas with Papua New Guinea. Similarly, Cassava is not associated with South America, and neither is coffee with Ethiopia. The same applies to oranges with India, and apples with Kazakhstan.<sup>9</sup> Original crops have been improved and further

<sup>8</sup>Janick (2000).

<sup>9</sup>Juniper and Maberley (2006), p. 46.

differentiated over time from their parents by breeding, selection, adaption, and preference. Over half of all wild plants contain unattractive flavour, which is more or less toxic. Plants cannot run away, so their defenses against pests, fungus, and disease are chemicals and toxins. The preparation of such plants for food often requires complex processes of detoxification. In many instances, human response to plant toxicity has been to breed and reduce the level of toxins in plants by cooking and other means of food preparation.

Original crops were differentiated over time by breeding, selection, adaption, and preference. The *Malus pumila*, for example, became the sweet apple with the help of bear droppings and farmers. The Granny Smith was a mutation found on the farm in New South Wales on one Mrs. Smith in 1868. Entirely new species were bred that many assume always existed. In the mid-1700s two wild species of strawberry, from Virginia and Chile, were accidentally crossed in France to produce the modern “large” fruit strawberry. The progenitor for Kiwi is indigenous to China and is known as Chinese gooseberry. At the turn of the twentieth century in New Zealand this gooseberry was bred into the first Kiwi variety. Nectarine, a mutate peach is another crop that would not exist without human intervention.

While food is regulated as a product, the process begetting the product is sometimes regulated, especially in what is colloquially called GM or genetically modified foods. In order to understand the context and nuance of the applicable regulations, students of law must gain a better understanding of the science of breeding (Suggestion). With agriculture dating back about 10,000 years, early farmers probably separated seeds on the basis of yield, taste, and agronomic traits. Starting in the late 1800s this accelerated to the point that virtually everything in a supermarket was “improved,” except for products such as North American wild blueberries. As it currently stands, some 75%<sup>10</sup> of the food on the shelves in Canadian grocery stores is GM.

### ***31.1.1 Food Safety Legislation and Labelling Requirements***

Food regulation in Canada is derived from a melange of federal and provincial statutory provisions as well as general law provisions that affect producers, processors and distributors of food products. Ancient food regulations focused on *probity*. Ancient Egyptians had food labelling rules while the ancient Greeks and Romans had detailed laws on food adulteration (especially bread with chalk and wine with water).<sup>11</sup> Food safety legislation has an ancient and storied pedigree.<sup>12</sup>

Canadian food safety legislation is traceable to Britain<sup>13</sup> and the Bradford poisoning in 1858 is widely credited as the tipping point of effort to affect public

<sup>11</sup>Hutt (1984b).

<sup>12</sup>Hutt (1984a).

<sup>13</sup>Accum (1820).

food safety by way of legislative reform. In the Bradford scandal, arsenic was inadvertently substituted for plaster, which was the “usual” substitute for sugar, in the making of sweets.<sup>14</sup> Twenty died, mostly children, and hundreds became violently ill. The tragedy precipitated the *British Food and Drugs Act* of 1860.<sup>15</sup> The Act reoriented legislation from inspection for commercial purposes to the prevention of food adulteration.<sup>16</sup> The Act is reputed in the British Commonwealth to be the precursor of most food and drug legislations.<sup>17</sup>

Statutory measures to regulate agricultural activities were already well underway both before and after confederation in Canada. Indeed, both federal and provincial governments, since Confederation, have maintained regulatory mechanisms in agriculture. In 1869, Parliament enacted *An Act Respecting Contagious Diseases of Animals*.<sup>18</sup> The Act charged the Department of Agriculture with the task of controlling livestock diseases for draft animals and food animals and suppressing outbreaks of disease on farms, in places where animals were sold.

In the 1990s nutritional labelling of foods commenced in North America. As history suggests the main thrusts of regulatory food law have been safety and probity. The modern objectives of food labelling ensures fair competition; product marketability; increasing consumer access to information; protecting consumer’s health and safety; and influencing consumer choices (e.g., nutritional labelling).<sup>19</sup>

In Canada, the earliest known legislation was *An Act of the Conseil Superieur de Quebec*, 1706, which set out regulations concerning the sale of bread.<sup>20</sup> After the union of Upper and Lower Canada in 1841, four new acts were promulgated: *The Act for the Inspection of Flour and Meal*<sup>21</sup>; *Act for the Inspection of Beef and Pork*<sup>22</sup>; *Act for the Inspection of Fish and Oil*<sup>23</sup>; and *Act for the Inspection of Hops*.<sup>24</sup> After

confederation the inspection acts were consolidated into the *General Inspection Act*.<sup>25</sup> Food labelling integrity was part of quality assurance.<sup>26</sup>

The next post-confederation legislative milestone was known by its abbreviated title as “The Inland Revenue Act of 1875”.<sup>27</sup> In 1877, 51.7 % of 180 food samples were adulterated. In 1878, of 1500 food samples, 50.6 % were adulterated. In 1881 of 1500 food samples, 25 % were adulterated. Finally, in 1883 the number was 24.25.<sup>28</sup> The next key legislative step was the *Act to Amend and to Consolidate as Amended the Several Acts Representing the Adulteration of Foods and Drugs* (aka the *Adulteration Act*).<sup>29</sup> In 1890 the amendment regulatory standards under this Act were enabled, albeit not prepared until 1910.<sup>30</sup> The crux of the act was that food would be deemed adulterated “If its strength or purity falls below the standard, or its constituents are present in quantity not within the limits of variability fixed by the Governor in Council.”

The *Food and Drugs Act* replaced the *Adulteration Act* in 1920.<sup>31</sup> Consequently, Canada became acquainted with the United States of America concept of misbranding,<sup>32</sup> where food is deemed misbranded if:

- Imitation of another article of food or drug without being plainly and conspicuously labelled so as to indicate true character<sup>33</sup>;
- The label stated to be a product of a place or a country of which it was not<sup>34</sup>;
- Food article sold by a name which belongs to another article<sup>35</sup>;
- Food article coloured or coated or powdered to give the illusion of value<sup>36</sup>;
- The label bore a statement which was false or misleading<sup>37</sup>;
- The claims were false or exaggerated<sup>38</sup>;

<sup>37</sup>*Id.*, s. 5(h).

<sup>38</sup>*Id.*, s. 5(e).

- The contents were not conspicuously and correctly stated (i.e., weight)<sup>39</sup>;
- The product was sold as a mixture and not labelled as such.<sup>40</sup>

The courts found that misbranding *per se* was within the criminal orbit of the constitution irrespective of whether or not it was injurious to health.<sup>41</sup> The *Food and Drugs Act of 1953* was the next milestone. *Inter alia*, this Act:

- Required the maintenance of books and records;
- Prohibited the sale, manufacture or storage of food made or stored in unsanitary conditions;
- Limited deceptive claims for offences only for food and drugs, not cosmetics;
- Shifted the conceptual lens to misbranding (a focus on specific prohibitions);
- Diminished the concept of adulteration; the issue now was non-compliance with an established standard.<sup>42</sup>

Even so, the notion of prior food inspection rather than prosecution was the underlying philosophy.<sup>43</sup> The subsequent amendments and consolidations achieved three things, namely:

- In 1949 regulations were consolidated into five parts with a common lexicon and organization that continues till today: to wit: Part A: General; Part B: Food; Part C: Drugs; Part D: Vitamins, and Part E: Cosmetics.
- The word « label » was defined in 1952 as « any legend, word, or mark attached to, included in, belonging to or accompanying any food, drug, cosmetic, device, or package».
- The 1934 and 1953 Acts created new food labelling offence provisions.

In 1960, the advent of food labeling required the disclosure of contents of the processed or manufactured food. Moreover, labels had to declare the net contents in proximity to the common name of the food.<sup>44</sup> Some products were given idiosyncratic treatment, either historically or presently. Canada in 1907 passed the *Meat and Canned Foods Act*<sup>45</sup> to assuage both Canadian and European importers.<sup>46</sup> Maple syrup, honey, and dairy all had special legislation.<sup>47</sup>

<sup>39</sup>Id., s. 5(f).

<sup>40</sup>Id., s. 5(g).

(progenitor of the Canada Agricultural Products Act (CAPA)); see also CRC c. 287, Honey Regulations under the CAPA.

The Department of Agriculture oversaw most of this legislation. In 1997, Agriculture was split into two organizations: The Department of Agriculture and Agri-Food Canada (AAFC) and the Canadian Food Inspection Agency (CFIA).<sup>48</sup> The CFIA was tasked with the regulation of food and food production at the production end of the chain for products destined for interprovincial and international trade. There were a number of failed legislative attempts to consolidate food regulations.<sup>49</sup>

A different legislative thread arose with the *Consumer Packaging and Labelling Act (CPLA)* in 1970.<sup>50</sup> The main thrust of CPLA regarded the importance of consumer information, so it addressed all manner of product, including pre-packaged foods. It also engaged false or misleading representation.<sup>51</sup> Lack of legislative co-ordination resulted in duplication and conflict between CPLA and the other food regulatory structures.<sup>52</sup>

At the provincial level, the following extant pieces of legislation deal with regulation of agriculture:

- (AB) *Agricultural Operation Practices Act*, R.S.A. 2000, c. A-7
- (BC) *Farm Practices Protection (Right to Farm) Act*, R.S.B.C. 1996, c. 131
- (MB) *Farm Practices Protection Act*, C.C.S.M. c. F45
- (NB) *Agricultural Operation Practices Act*, R.S.N.B. 2011, c. 107
- (NL) *Farm Practices Protection Act*, S.N.L. 2001, c. F-4.1
- (NS) *Farm Practices Act*, S.N.S. 2000, c. 3
- (ON) *Farming and Food Production Protection Act, 1998*, S.O. 1998, c. 1
- (PE) *Farm Practices Act*, R.S.P.E.I. 1988, c. F-4.1
- (SK) *Agricultural Operations Act*, S.S. 1995, c. A-12.1.

## 31.2 Regulation Under Federal Jurisdiction

The legal regulation of agricultural activities is by extension, the regulation of food and the food industry. To this end, agricultural laws have four dimensions: (i) encouraging and assisting producers (farmers); (ii) promoting fair trade; (iii) ensuring food safety and quality; (iv) private law issues.<sup>53</sup>

In each province of Canada, it is constitutionally provided that each “legislature may make Laws in relation to Agriculture in the Province, and to Immigration, and it is hereby declared that the Parliament of Canada may from time to time make

<sup>48</sup>S.C. 1997. c. 6 (Can.).

<sup>49</sup>Canada Food Safety and Inspection Act (Bill C-80) died on the order paper.

<sup>50</sup>R.S.C. 1985, C-38 (Can.).

<sup>51</sup>Id. s. 4.

<sup>52</sup>Buckingham (2005).

<sup>53</sup>Halsbury’s *Laws of Canada*, 1st ed., Agriculture, p. 125.

laws in relation to agriculture in all or any provinces, and to immigration into all or any of the provinces; and any law of the legislature of a province relative to agriculture or to immigration shall have effect in and for the province as long and as far as it is not repugnant to any Act of the Parliament of Canada.”<sup>54</sup>

There are two schools of thought on this constitutional provision. The first school commencing with the advent of 1907's *Meat and Canned Foods Act* suggests that legislation could have an effect “beyond the farm gate.”<sup>55</sup> The second school of thought, arising from a line of cases in 1922 suggests that legislation that went beyond the farm gate was invalid.<sup>56</sup> To this day the farm gate is the pivotal marker. Legislation pertaining to farming activities such as methods of production, inputs and animals is sustainable under s. 95 of the Constitution Act behind the farm gate, but marketing boards acting beyond the farm gate are not.<sup>57</sup>

Thus, under the constitutional laws of Canada, agriculture falls under both the federal and provincial jurisdiction.<sup>58</sup> Section 95 of the *Constitution Act, 1867* recognizes “Agriculture” as a subject matter of joint legislative power. As Cunningham rightly points out, “under Canadian constitutional law and the division of powers, exclusivity is the rule and concurrency is the exception. The scheme is opposite to that in the United States or Australia, for example, where exclusivity is the exception. Thus, the joint power over agriculture is unusual in its explicitness. Concurrency is usually determined by the courts when federal and provincial powers appear to, or implicitly, overlap.”<sup>59</sup>

In sum, the preponderant view is “legislation with an impact on agriculture may seek its constitutional justification from s. 95 (joint agriculture power), from various subject-matters outlined in s. 91 (exclusive federal powers), or from various subject-matters outlined in s. 92 (exclusive provincial powers). Each subject-matter, or head of power, “clothes” the appropriate level of government with the competence to make legislation in relation to that subject-matter. Legislative activity outside that competence, by either the federal Parliament or a provincial Legislature, may be struck down by the courts.”<sup>60</sup>

Beyond the farm gate a regulatory “grid” underpinned by the Federal jurisdiction over the criminal law enforces food safety.<sup>61</sup> Anything beyond food safety

---

<sup>58</sup>Schedule B to the Canada Act 1982 (U.K.), 1982, c. 11 (Can.).

<sup>59</sup>Id. Note 53.

<sup>60</sup>Id. Note 55.

<sup>61</sup>s. 91(27), Schedule B to the *Canada Act* 1982 (U.K.), 1982, c. 11 (Can.); see also *R. v Wetmore*, S.C.J. No. 74, [1983] 2 S.C.R. 284 (S.C.C.) (Can.).

i.e. economic interests is probably unsupportable under criminal law.<sup>62</sup> At the provincial level, the various legislation dealing with agricultural operations include:

- (AB) *Agricultural Operation Practices Act*, R.S.A. 2000, c. A-7, s. 1(b)
- (MB) *Farm Practices Protection Act*, C.C.S.M. c. F45, s. 1
- (NB) *Agricultural Operation Practices Act*, R.S.N.B. 2011, c. 107, s. 1
- (NS) *Farm Practices Act*, S.N.S. 2000, c. 3, s. 3
- (ON) *Farming and Food Production Protection Act, 1998*, S.O. 1998, c. 1, s. 1
- (PE) *Farm Practices Act*, R.S.P.E.I. 1988, c. F-4.1, s. 1.1(a)
- (QC) Regulation respecting the registration of agricultural operations and the payment of property taxes and compensations, CQLR c. M-14, r. 1, s. 1
- (SK) *Agricultural Operations Act*, S.S. 1995, c. A-12.1, s. 2(a).

According to the provincial legislations listed above “agricultural operation” comprise operations carried out on farms: cultivating land, producing agricultural and horticultural crops, raising livestock, producing eggs and other animal products; operating farm machinery; distribution of goods produced; storing, handling and applying fertilizer, manure, organic wastes, soil amendments and pesticides.<sup>63</sup>

On the other hand, Federal law defines “agricultural product” as any animal, plant or any food or drink, wholly or partly derived from an animal or a plant.<sup>64</sup> The marketing of such post-farm products e.g. milk, margarine, et cetera may be deemed commercial activities beyond the joint jurisdiction conferred by s. 95 of the Constitution Act. Opined by one learned commentator, the “s. 95 might be the constitutional basis for compliance and enforcement legislation that imposes administrative rather than criminal law penalties for non-compliance by actors in the agriculture and agri-food system.”<sup>65</sup>

The paramountcy of federal legislation in relation to agriculture remains undiminished. It has to be noted that in addition to s. 95, the extant provisions of s. 91 of the Constitution Act vests the federal Parliament with exclusive jurisdiction over subject-matters that relate to agricultural products and methods, processes, and commercialization of such products. The combined effect is to strengthen the federal Parliament in matters widely pertaining to agriculture and food regulation.

Presently, “food legislation in Canada is undergoing a significant transformation, not seen for almost 100 years, with the enactment of the *Safe Food for Canadians Act*, which received Royal Assent on November 22, 2012 and is expected to come into force in 2015. Once the Act is in force, two federal regimes will apply to food in Canada, instead of five, with the *Food and Drugs Act* and its Regulations applying to all foods sold in Canada, and the *Safe Food for Canadians*

<sup>62</sup>*Labatt Brewing co. v Canada (Attorney General)*, [1979] S.C.J. No. 134, [1980] 1 S.C.R. 914 (S.C.C.) (Can).

<sup>63</sup>Note 59, Id.

<sup>64</sup>*Canada Agricultural Products Act*, R.S.C. 1985, c. 20 (4th Supp.), s. 2. See, the *Safe Food for Canadians Act*, 2012.

<sup>65</sup>Note 66, infra.

*Act* and its Regulations applying to all food that is imported into Canada or is prepared in Canada for interprovincial or international trade. Simultaneous with the *Safe Food for Canadians Act* bringing into force an important overhaul of the federal food law regime, the *Food and Drugs Act* regime will also see the modernization of some of its provisions regulating food in Canada. This comprehensive overhaul of food legislation will take a number of years to complete, but the framework for such a transformation has already been set out in federal government documents.<sup>66</sup>

### 31.2.1 Public Health in Canada

The use of the term “regulatory grid” implies organization and underpinning strategy. The elements of this regulatory grid are:

- *Meat Inspection Act*<sup>67</sup>;
- *Canada Grain Act*<sup>68</sup>;
- *Canada Agricultural Products Act (CAPA)*<sup>69</sup>;
- *Food and Drugs Act*<sup>70</sup>; and
- *Consumer Packaging and Labelling Act*.<sup>71</sup>

The first three acts prescribe standards; establish grades and grade names (the intellectual property in which vests in the federal Crown)<sup>72</sup> and establish necessary attendant elements of search and seizure.<sup>73</sup> In addition, The *Meat Act* addresses meat products and processes.<sup>74</sup> Similarly, the *Grain Act* requires the licensing of grain elevators, dockage, standards, shrinkage, infestation, et cetera.<sup>75</sup>

For its part, the *CAPA* sets grading standards for livestock and poultry; fresh fruit; vegetables; honey, maple products and processed foods. Section 2 of the Act defines an agricultural product as:

- (a) An animal, a plant or product of an animal or plant,
- (b) A product, either food or drink, wholly or partly derived from an animal or a plant, or
- (c) A product prescribed for the purposes of this Act<sup>76</sup> Meat

<sup>66</sup>Halbury’s Laws of Canada (2014) Reissue.

<sup>67</sup>R.S.C., 1985, c. 25 (1st Supp.) (Can.).

<sup>68</sup>R.S.C., 1985, c. G-10 (Can.).

<sup>69</sup>R.S.C., 1985, c. 20 (4th Supp.) (Can.).

<sup>70</sup>R.S.C., 1985, c. F-27 (Can.).

<sup>71</sup>R.S.C., 1985, c. C-38 (Can.).

<sup>72</sup>CAPA s.15 (Can.).

<sup>73</sup>For instance see CAPA, ss. 21–28 (Can.).

<sup>74</sup>Meat Inspection Regulations, 1990 (S.O.R. 90/288) (Can.).

<sup>75</sup>Canada Grain Regulations, C.R.C., c.889 (Can.).

<sup>76</sup>CAPA, s. 2 (Can.).

**Fig. 31.1** Federal government meat stamp

In the same way, the *Meat Inspection Act*<sup>77</sup> prescribes registered establishments and key national trademarks. For instance there is the meat inspection legend stamped on the carcass by a federal inspector proving the fact of inspection in a registered premises and implicitly sanitary standard satisfaction (Fig. 31.1).<sup>78</sup>

This is required for all meat products destined inter-provincially or internationally.<sup>79</sup> A legend addresses food safety. And, Regulatory standards<sup>80</sup> encompass food standards or quality.

The *Meat Inspection Regulations*<sup>81</sup> further flesh this out:

“Adulterated” means, in respect of a meat product intended for sale, use or consumption as an edible meat product in Canada,

- (a) Containing or having been treated with:
  - (i) A pesticide, heavy metal, industrial pollutant, drug, medicament or any other substance in an amount that exceeds the maximum level of use prescribed by the *Food and Drug Regulations*,
  - (ii) An ingredient, a food additive or any source of ionizing radiation not permitted by or in an amount exceeding the prescribed limits, by these Regulations or by the *Food and Drug Regulations*,
  - (iii) Any poison, decomposed substance or visible contamination, or
  - (iv) Any pathogenic microorganism in excess of levels published in the Manual of Procedures, or
- (b) Failing to meet the standards set out in Part I;

The meat inspection regulations prescribe what common parlance names can be labelled to different cuts of meat. For example, section 94(9) provides that “*The*

<sup>77</sup>R.S.C. 1985, c. 25 (1st Supp.) (Can.).

<sup>78</sup>Meat Inspection Regulations, S.O.R. 90/288, Schedule III (Can.).

<sup>79</sup>Id., s. 94.

<sup>80</sup>Id., Schedule I, Columns I - IV.

<sup>81</sup>S.O.R. 90/288 (Can.).

term “ham” shall not be used on the label of a meat product unless the meat product is derived from the hind leg of a dressed swine carcass above the tarsal joint.”<sup>82</sup>

These regulations also address ante-mortem examination, the humane treatment and slaughter of food animals.<sup>83</sup>

Of relevance from a packaging and labelling perspective are the regulations that prescribe the minutiae of what goes into what size and type of package with what label including, production date coding/lot; best before dates; instructions; legend stamp references; cooking instructions, et cetera.<sup>84</sup> For instance, section 91(3) stipulates that:

The label for any meat product identified as edible, used for medicinal purposes or animal feed shall indicate if the meat product should be kept refrigerated or kept frozen. Except if the meat product:

- (a) Is packaged in a hermetically sealed container and treated to achieve commercial sterility;
- (b) Is dried to attain a water activity of 0.85 or less;
- (c) Has a pH of 4.6 or lower;
- (d) Is packaged in salt or a saturated salt solution;
- (e) Is fermented and has a pH of 5.3 or less, and a water activity of 0.90 or less, at the end of the fermentation within the time set out in the Manual Procedures; or
- (f) Has been subjected to a treatment approved by the director, ensuring the stability of the meat product when it is stored at normal room temperature.

The regulations that address labelling issues such as net weight cross-reference the *Consumer Packaging and Labelling Act*.<sup>85</sup> Also, the regulations that address ingredients cross-reference the *Food and Drug Regulations*.<sup>86</sup> The minutiae of detail on labelling are found in Schedule IV.<sup>87</sup>

Surprisingly the grade names and standards—quality—are found in another set of regulations: *The Livestock and Poultry Carcass Grading Regulations*.<sup>88</sup> Section 29 speaks to beef grades.

There shall be 13 grades of beef carcasses with the grade names Canada A, Canada AA, Canada AAA, Canada Prime, Canada B1, Canada B2, Canada B3, Canada B4, Canada D1, Canada D2, Canada D3, Canada D4 and Canada E.

There are other regulations that identify grade standard elements e.g., maturity, muscling, tenderness, colour, et cetera. Reproduced in Fig. 31.2 are poultry marks showing respective grades.<sup>89</sup>

<sup>82</sup>Id., s. 94 (9).

<sup>84</sup>Id., Schedule II, Column I - II.

<sup>85</sup>Id., s. 103(1).

<sup>86</sup>Id., s. 118.

<sup>87</sup>Id., Schedule IV, Columns I - II.

<sup>88</sup>Livestock and Poultry Carcass Grading Regulations, S.O.R./92-541 (Can.).

<sup>89</sup>Id., Schedule I under ss. 64–64.

**Fig. 31.2** Federal government poultry grades

Still, the corresponding regulations for fish are found in the *Fish Inspection Act* and the *Fish Inspection Regulations*.<sup>90</sup>

The overall regulatory matrix identifies the names for the products, compositional standards; yield class; grading standards; authorized marks; authorized and licensed operations.

### 31.2.1.1 Grain

The bulk of the regulatory regime with respect to grains is a licensing and inspection scheme to ensure quality throughout the transportation chain: elevator, terminal, train and port terminal.<sup>91</sup> To this end, the Grain Commission is the responsible agency.<sup>92</sup> Grain and its various grades are defined in s. 5 of the regulations<sup>93</sup>:

- (1) The following seeds are designated as grain for the purposes of the Act: barley, beans, buckwheat, canola, peas, corn, fava beans, flaxseed, lentils, mixed grain, mustard seed, oats, peas, rapeseed, rye, safflower seed, soybeans, sunflower seed, triticale and wheat.
- (2) The grade names and the specifications for grades of each grain are set out in Schedule 3.

Grain safety is addressed in part by s. 61 and 64<sup>94</sup>:

- (1) No hazardous substances, other than products used for fumigating infested grain, shall be used for the treatment of grain at an elevator.
- (2) No hazardous substances shall be stored in an area of a licensed elevator or annex to it unless
  - (a) there is no direct access from the area to any area used for the handling or storage of grain;
  - (b) the operator of the elevator has specifically designated the area for the storage of hazardous substances; and
  - (c) the storage of hazardous substances in the area is not a danger to the handling or storage of grain at the elevator.
- (3) If grain that is being received into, stored in or discharged from a licensed elevator is found to be contaminated, the operator of the elevator shall without delay notify the Commission and shall dispose of the contaminated grain in accordance with directions given by the chief grain inspector for Canada under an order of the Commission under paragraph 118(d) of the Act. (Emphasis added).

<sup>90</sup>*Fish Inspection Act*, R.S.C. 1985, c. F-12; *Fish Inspection Regulations*, C.R.C. c. 802.

<sup>91</sup>*Canada Grain Regulations*, C.R.C., c. 889; *Canada Grain Act*, R.S.C. 1985, c. G-10.

<sup>92</sup>*Canada Grain Act* R.S.C., 1985, c. G-10. ss. 3–15 (Can.).

<sup>93</sup>*Canada Grain Regulations*, C.R.C. c. 889 s. 5(1)(2), Schedule 3 (Can.).

<sup>94</sup>*Id.*

In cases where grain stored in an elevator is found infested, the operator of the elevator shall,

- (a) in the absence of Commission personnel at the elevator, without delay provide the Commission with full particulars of the nature and extent of the infestation;
- (b) send to the Commission in a sealed container a 1 kg sample of the grain containing specimens of the pests with which the grain is infested;
- (c) treat the infested grain in accordance with instructions issued by the Commission; (c.1) [Repealed, SOR/2005-361, s. 11] and
- (d) clean out and treat any emptied annex or bin that contained infested grain and any equipment used in handling that grain in accordance with instructions issued by the Commission.

The seeming banality of these provisions belies the profundity of the problem. Moulds produce toxins called mycotoxins as by-products of their metabolism. Moulds on crops are especially dangerous since they are very resistant to high heat. Cooking is virtually ineffectual. Since mould cannot be removed, and cooking cannot neutralize mycotoxins, the entire crop, elevator and shipment must be destroyed.

The more infamous and destructive mycotoxin *afatoxin*, from the family *Aspergillus flavus*, is commonly found on peanuts, spinach, and corn and a potent carcinogen with allowable rates measured in parts per billion. Also deadly are the mycotoxins of *Fusarium* and *Claviceps* that contaminate grains, especially rye and wheat.<sup>95</sup> *Fusarium* thrives on grains that became moist during storage. Consequently, it produces alimentary toxic aleukia, an often-fatal disease. Similarly, *Ergotism*, otherwise known as St. Anthony's fire, is a mould disease from *Claviceps purpurea*. Aflatoxins are particularly potent as they cause cirrhosis and liver cancer in animal species. And in infected human beings it causes fever, jaundice, edema, vomiting, enlarged livers, and death.<sup>96</sup> Ultimately, it is possible that hallucinations and tremors caused by ingesting grains infested with ergot precipitated the Salem witch trials.<sup>97</sup>

### 31.2.2 *Canada's Agricultural Products Act*

This Act is the foundational basis of a plethora of product specific regulations. Identified below are few of these regulations:

- *Dairy Product Regulations*<sup>98</sup>;
- *Egg Regulations*;<sup>99</sup>

<sup>95</sup>Satin (1999), pp. 220–221.

<sup>96</sup>Id., p. 220.

<sup>97</sup>Caporeal (2002).

<sup>98</sup>S.O.R., 79 – 840 (Can.).

<sup>99</sup>C.R.C., c. 284 (Can.).

- *Fresh Fruit and Vegetables Regulations*<sup>100</sup>;
- *Honey Regulations*<sup>101</sup>;
- *Livestock and Poultry Carcass Grading Regulations*<sup>102</sup>;
- *Maple Products Regulations*<sup>103</sup>;
- *Organic Products Regulations*<sup>104</sup>;
- *Processed Egg Regulations*<sup>105</sup>; and
- *Processed Products Regulations*.<sup>106</sup>

The *Dairy Product Regulations* mandate what is and is not a dairy product. Also, regulations define grades and standards for dairy products. For instance, regulations dictate when the word “whipped” and “cultured” may be used with butter products.<sup>107</sup> The crux of the regulations is found in s. 2.1, which states the following:

Where a grade or standard is established under these Regulations for a dairy product, no person shall market any product in import, export or interprovincial trade in such a manner, which the product is likely to be mistaken for the dairy product.

The safety issue is identified in s. 2.2, thus:

(1) Subject to subsections (2) and (3), no person shall market a dairy product in import, export or inter-provincial trade as food unless the dairy product

- (a) [Repealed, SOR/2004-80, s. 6]
- (b) is not contaminated;
- (c) is edible;
- (d) is prepared in a sanitary manner; and
- (e) meets all other requirements of the *Food and Drugs Act* and the *Food and Drug Regulations* with respect to the dairy product.

The same unadulterated food provision is found in the *Egg Regulations*, to wit:

6. Subject to section 6.1, no person shall market eggs in import, export or interprovincial trade as food unless the eggs:

- (a) are prepared in accordance with these Regulations;
- (b) [Repealed, SOR/2011-205, s. 3]
- (c) are not contaminated;
- (d) are edible; and
- (e) meet all other requirements of the *Food and Drugs Act* and the *Food and Drug Regulations*.

The *Processed Products Regulations* commences by saying:

---

<sup>100</sup>C.R.C., c. 285 (Can.).

<sup>101</sup>C.R.C., c. 287 (Can.).

<sup>102</sup>S.O.R./92-541 (Can.).

<sup>103</sup>C.R.C., c.289 (Can.).

<sup>104</sup>Organic Products Regulations, 2009, S.O.R./2009-176 (Can.).

<sup>105</sup>Processed Egg Regulations C.R.C., c. 290 (Can.).

<sup>106</sup>Processed Products Regulation C.R.C., c. 291 (Can.).

<sup>107</sup>Dairy Regulations, S.O.R. 79 - 840, s. 6(2)(a)(b) (Can.).

2.1 (1) Subject to subsections (2) and (3), no person shall market a food product in import, export or interprovincial trade as food unless the food product, including every substance used as a component or ingredient thereof,

- (a) [Repealed, SOR/2011-205, s. 27]
- (b) is not contaminated;
- (c) is sound, wholesome and edible;
- (d) is prepared in a sanitary manner;
- (e) where irradiated, is irradiated in accordance with Division 26 of Part B of the Food and Drug Regulations; and
- (f) meets all other requirements of the Food and Drugs Act and the Food and Drug Regulations with respect to the food product.

The bulk of the PPR is focused on grades, marks and standard containers. The container strictures prescribe size, headspace and net and drained weights.<sup>108</sup>

### 31.2.3 *Organic Products Regulations*

Organic is a word; a philosophy; ethic; an ideology—even a religion for some.<sup>109</sup> Organics is popularly perceived as an exemplar of safe, sustainable agriculture and healthy produce. And as such, the word ‘organic’ has an aura of inerrancy. Consumers invest into the term all manner of therapeutic and spiritual benefit with many inferring—rightly or wrongly, that the term means small agricultural undertakings or local produce. The consumer shibboleth is that the word means “pesticide free”.

Despite public perception, all that can be legitimately promised is that no *synthetic* pesticides were *deliberately* added; organic pesticides or conventional pesticide drift are legitimate.<sup>110</sup> Multi-nationals and local farms both can use the label. There are no proven medical benefits to organic produce. And what is organic is one jurisdiction may not necessarily meet the criteria of another jurisdiction as demonstrated by differences in the United States of America, China and the European Union.<sup>111</sup>

The Canadian law defines organic as a method of food production. The food product is chemically indistinguishable from conventional food products. Consequently, certification and labelling to underpin the integrity of the food concept “organic” is geared towards the process by which the food is produced. This is reiterated by the Guidelines which explicitly provides thus: *Neither this standard nor organic products labelled in according with this standard represent specific claims about the health, safety and nutrition of such organic product.*<sup>112</sup>

<sup>108</sup>Processed Products Regulation C.R.C., c. 291, s. 26 (Can.).

<sup>109</sup>See Endres (2007), Conford (2001), Pollen (2001), Guthman (2004), Guthman (2003).

<sup>110</sup>Friedland (2005).

<sup>111</sup>Endres (2007).

<sup>112</sup>Note 113, *infra*.

**Fig. 31.3** Federal trademark for organic

The regulatory scheme for the organic process has four parts:

- Regulations<sup>113</sup>;
- Guidelines for Production<sup>114</sup>;
- Permitted Substances<sup>115</sup>; and
- Quality Management System Manual.<sup>116</sup>

The latter three points focus on the process: techniques, soil management, authorized pesticides, et cetera. The Regulations stipulate the government trademark (called a logo and legend in the regulations) for organic products (Fig. 31.3).<sup>117</sup>

The logo cannot be affixed to a product that is less than 95 % organic. Therefore, an organic multi-ingredient food product can be up to 5 % non-organic.<sup>118</sup> Organic multi-ingredient food product that is less than 95 % organic can be labelled as “organic ingredients” immediately proceeded with the percentage rounded down to the nearest whole number and in the same size and prominence as the phrase “organic ingredients”.<sup>119</sup>

As for international trade, in addition to stipulations mandating that products meet the standards of the Canadian regime, Canada has entered into agreements with other countries regarding exportation or importation and the requirement for certifications of imported/exported products.<sup>120</sup>

<sup>113</sup>Organic Products Regulations 2009; SOR/2009-176 (Can.). There is no Organic Act. These regulations are promulgated under the Canada Agricultural Products Act, (CAPA).

### ***31.2.4 Food Safety, Health and Nutritional Information Requirements***

The field of genetics and food is smudged with different lexicons, plagued by lobbies and infected with emotion. The first step in understanding food safety, health, nutritional regulation and food labelling is to understand plant breeding. Most are unaware that the plants that become food—root, leaves, stems or fruit, are the product of breeding techniques and genetic modification going back to X-rays and turn of the twentieth century chemistry.

Understanding the regulation of so-called genetically modified foods requires the understanding of planting methods. Unless a person has a grasp of the various scientific methods of plant breeding, the regulatory regime and its underlying approaches may elude easy comprehension.

#### **31.2.4.1 Sexual**

Some plants reproduce sexually, by the use of seeds. This is the oldest form of breeding and agriculture. Plant scientists estimate that wheat was bred 7000 years ago.<sup>121</sup> Bread wheat is widely believed to be a cross of tetraploid [durum] wheat with inedible goat grass.<sup>122</sup> It is also common knowledge that sexually reproduced plants have greater diversity. However, by definition, it is difficult to maintain seed vitality.

#### **31.2.4.2 Asexual**

There are also other plants such as strawberries, potatoes, perennial grasses, legumes, rootstocks, and bananas that can reproduce asexually. Asexual reproduction occurs by means of roots, tubers, and stem or leaf cuttings.

Scientists confirm that plants, which have been propagated vegetatively from a single plant are clones. Primary example of such clones includes plant cuttings. Clones have fixed traits, and may meet consumer demands, but they cannot adapt to environmental pressures since there is no genetic variation or evolution. Cloning techniques for plants are either vegetative (plant reproduction via rhizomes, bulbs, or root sprouts), or apomixes (seeds are produced asexually without the fusion of male and female gametes). The most obvious example of vegetative propagation is bananas. In such instances, they are all clones and all are seedless. Most fruit trees are clones. For example, all navel oranges in the United States are clones from 12 orange trees brought from Brazil in 1869.<sup>123</sup> To reproduce most tree fruits,

---

<sup>121</sup>Prakash (2001).

<sup>122</sup>Id. 81.

<sup>123</sup>Fedoroff and Brown (2004).

planters use grafting and not seed propagation. A planter of apple seeds would not harvest same fruits because the new trees from the seeds are new cultivars, not offspring true to the parental variety.<sup>124</sup>

### 31.2.4.3 Hybrid

In 1926, a major commercial breeding breakthrough occurred through the hybridization process.<sup>125</sup> Hybridization involves the crossing of any two parental lines to their parental lines. Often the interbreeding is of two distinct and genetically dissimilar parental lines.<sup>126</sup> More vigorous and higher yielding than either parent are the final progeny.<sup>127</sup> Plant scientists call the attendant vigor “heterosis.”<sup>128</sup> The cross-pollination is usually between two parents from different lineages, but may refer to two different taxa. In hybridization, the offspring of the commercial crop reproduce the parental or grandparental lines of the commercial crop.<sup>129</sup> Hybridization is an expensive process—it takes a number of crosses and up to 12 years to develop market-ready seeds.<sup>130</sup>

Technically, the undesirable recessive genes combine, and their unwanted trait are expressed.<sup>131</sup> At first, hybridization process seemed counterintuitive. Farmers saw no reason to buy seed when they could replant their own. However, the agronomic qualities and yields changed that approach.<sup>132</sup> Hybridization was a foundation process for the seed industry, since no farmer could afford to spend years breeding a crop that did not reproduce true.<sup>133</sup> In other words, farmers’ rights are irrelevant when dealing with hybrids.

### 31.2.4.4 Mutagenesis

Mutagenesis is the science and technology of inducing mutations (natural mutations are known as “sports”). It arose in the 1920s with X-ray-induced mutations,<sup>134</sup> and acquired momentum after 1955 due to the collaboration among UN, FAO, and the

<sup>132</sup>Fedoroff and Brown (2004), pp. 61–62.

<sup>133</sup>Murphy (2007), *supra* n. 26.

<sup>134</sup>Fedoroff and Brown (2004), p. 16.

Atomic Energy Commission.<sup>135</sup> The objective of mutagenesis is to cause lesions in the chromosomes of the plant, which causes chromosome breaks and rearrangements or deletions of the genes.<sup>136</sup> The resulting candidates are planted, and if agronomically successful, backcrossed into an elite cultivar, sometimes becoming a variety in their own right.

A more comprehensive definition of the technique would suggest damaging the DNA to generate agronomically useful mutants by any means—thermal neutrons, X-rays,  $\gamma$ -rays, gamma rays, fast neutrons, or chemicals such as ethyl methane sulphonate (a harsh carcinogenic).<sup>137</sup> The chemicals react directly with the DNA bases to modify their structure.<sup>138</sup> Breeders use a large number of seeds (about 100,000) to produce a second generation of 30,000–50,000 plants.<sup>139</sup> If successful, a tiny number of useful plants will be produced, with the desired as well as undesired traits. They will then be backcrossed for a number to generations to produce an elite mutant variety.<sup>140</sup> Gamma and X-rays are the most frequent mutagens.

Mutations can result at a number of levels.<sup>141</sup> The changes can be intragenic (within a gene), intergenic (between genes), or genomic (genome-wide). Genome changes can be polyploid (containing more than twice the number of chromosomes), haploid (containing half the number of chromosomes), or aneuploid (containing a complete set of chromosomes less one or more chromosomes). The chief practical difference between mutagenesis and what is commonly called genetically modified or GM—other than precision—is that the new manifesting trait tends to be recessive with mutation and dominant with GM.<sup>142</sup>

#### 31.2.4.5 Interspecies Crossing

Interspecies crossing can occur between closely related species and more distant relatives. It is through non-rDNA cytogenetic manipulations,<sup>143</sup> in which portions of the chromosomes of involved species are recombined through natural processes (chromosomal translocations). To date, these have focused on pest and disease resistance. The technique has used chromosomes and not genes. Thus, large numbers of genes have also been transferred—be they useful, neutral, or deleterious. The technique is becoming more focused, limiting the amount of genetic

<sup>142</sup>Id. 2-3.

<sup>143</sup>National and Medicine 25.

material transferred. Corn, soybeans, rice, barley, and potatoes have been improved using this technique.<sup>144</sup>

#### 31.2.4.6 Protoplast Fusion

Protoplast fusion, identified in 1909 and practiced since 1970s, is a technique that introduces novel genes into a crop genome from a donor with which the crop will not normally interbreed.<sup>145</sup> This process involves removing the cell walls of plant cells of two unrelated plant species (embryo rescue discussed below is ineffective),<sup>146</sup> suspending these protoplasts in a medium, and then adding a chemical or an electrical current that fuses the protoplasts together. These fused protoplasts regenerate a cell wall and begin to multiply when placed in a nutrient medium. The nuclei of the two different species also fuse to create a hybrid nucleus that contains both sets of parental genes.<sup>147</sup> From this cell culture, an undifferentiated mass of plant cells grows—a callus—which can be further manipulated to form “artificial” or “chimera” seeds. What results is a hybrid with DNA from both protoplasts. Sugar beets, potatoes, and oilseed rape were improved using this approach.<sup>148</sup>

#### 31.2.4.7 Chromosome Doubling

When two unrelated plant species cross, the offspring is often sterile. Chromosome doubling is required for fertility. Their chromosomes are different and unable to form stable pairs during meiosis.<sup>149</sup> Culture or microspore culture is often used to generate haploid plants (containing only a single set of chromosomes), which too require chromosome doubling to be fertile. Through the application of the chemical compound colchicine—an extract from autumn crocuses discovered in 1937,<sup>150</sup> chromosomes could be doubled in a genome. Ethyl methane sulphonate or nitrogen mustard can be used instead of colchicine.

A particularly apt illustration of this technique is the food crop triticale—a forced mating between durum wheat and rye, two unrelated species.<sup>151</sup> It first appeared in 1876 as an infertile cross. Applying colchicine treatment to the hybrid

enabled researchers to artificially double the number of chromosomes. The bulk of research work to make this new hybrid commercial has occurred since the 1970s.

#### **31.2.4.8 Somaclonal Variation**

Somaclonal variation exploits the fact that spontaneous mutations occur when plants cells are grown in vitro. In vitro multiplication of plants generates individuals with different phenotypes. These differences are thought to arise from genome instability during the in vitro phase, which may result in clones having different phenotypes than the parental clone.

Somaclonal variation is normally regarded as an undesirable by-product of the stresses imposed on a plant by subjecting it to tissue culture. Plant cells are passed through tissue culture, a process that may involve a callus phase (de-differentiating the cells into a mass of callus and then regenerating new plantlets or embryos), and they may undergo certain spontaneous genetic changes. Imposing physical stresses further controls the process: cold, drought, high salinity, excess or dearth of nutrients, chemical regulators, and challenges by pathogens. Depending on the type of plant, its age, the source of the tissue (e.g., root or leaf), its balance of growth hormones and nutrients, and length of time in culture, directed mutations can arise without radiation or chemicals. The objective is the detection of a single gene mutation or deletion; transposition of larger stretches of DNA; or duplication or loss of an entire chromosome.

#### **31.2.4.9 Embryo Rescue**

When making a wide genetic cross (e.g., wheat with rye), there may be cross-pollination, and the embryo may abort at some time during development. This differs from somatic hybridization, where an embryo cannot form since the two parental species are too distant.<sup>152</sup> In embryo rescue, the developing embryo is removed from the plant before abortion and cultured on an aseptic medium. The embryo will develop and germinate, growing into a plant. Generally, this approach is considered an intermediary technique—to transfer genes from incompatible species via intermediate, partially compatible relatives of the donor and recipient. It has been used to cross a cucumber, a melon, and triticale.

#### **31.2.4.10 rDNA**

Recombinant DNA molecules are DNA molecules formed by laboratory methods of genetic recombination to bring together genetic material from multiple sources,

---

<sup>152</sup>Id. 43; Prescott-Allen and Prescott-Allen.

creating sequences that would not otherwise be found in biological organisms. The developer would seek out the protein that manifests the trait, and the gene (called the target gene) that codes for the protein. The target gene is then decoded (base sequence order),<sup>153</sup> and a new copy (called the event) is synthesized. The developer identifies the appropriate promoter and regulator for the event<sup>154</sup> and chooses the most effective vector.<sup>155</sup> The developer inserts the cassette into the target genome and uses a gene marker to confirm incorporation.<sup>156</sup> This package is called the gene construct. If the event is not from the same species, one must use promoter and terminator genes that are harmonious within the target species genome.

For a breeder/developer, rDNA has several advantages. First, the genes may be identified in any source. The donor can be a plant, animal, or micro-organism.<sup>157</sup> rDNA is ruthlessly focused on chemistry. A corollary to this is that one can predict the presence and location of a gene in one species from what one knows of another. The conservation or consistency of gene content and gene order along chromosomes of different plant genomes is described by the term ‘synteny’. Originally it was thought that each crop species had an idiosyncratic, if not unique, genome. Instead, a similarity in gene maps among different crop species has been found—the 12 chromosomes of rice align with the 10 chromosomes of maize and with the basic 7 chromosomes of wheat. Synteny allows one to pool knowledge of biochemistry, physiology, and genetics and transfer it between crops.

Secondly, one need not wait 10,000 years for the right mutation,<sup>158</sup> as rDNA allows for a relatively speedy production of new varieties,<sup>159</sup> as well as for extreme specificity in the “event” and associated genes incorporated by the recipient.<sup>160</sup>

With classical techniques of gene transfer, a variable number of genes can be transferred, the number depending on the mechanism of transfer; but predicting the precise number of the traits that have been transferred is difficult, and we cannot always predict the (characteristics) that will result. With organisms modified by

<sup>160</sup>Mandel (2006), p. 85.

molecular methods, we are in a better, if not perfect, position to predict the (characteristics).<sup>161</sup>

#### 31.2.4.11 Gene Silencing

Up to 95 % of a plant's genome comprise repetitive elements, heretofore pejoratively and incorrectly known as “junk” DNA. The mechanism that deals with this, “gene silencing,”<sup>162</sup> is a defence mechanism against viruses, transposons, and retroelements.<sup>163</sup> But gene mechanisms for silencing junk and viral infections also silence the construct. A number of techniques to overcome this problem exist (all of which are time-consuming). However, the science of gene silencing may also allow breeders to “un-silence” endogenous genes of merit without the need for a construct by inserting RNA or using antisense technology.<sup>164</sup> And it may also allow the silencing of key genes, such as those that code for ripening enzymes<sup>165</sup> or those that code for allergies.<sup>166</sup> The technique has been used to modify the phenotype, in particular to down-regulate expression of endogenous genes in the original plant, or confer resistance to infection by preventing expression of genes causing disease.<sup>167</sup>

#### 31.2.4.12 Marker Assisted Selection

MAS is a method of performing conventional plant breeding in which researchers locate DNA sequences in a plant's genome that are consistently associated with desired trait(s) (selection).<sup>168</sup> Those sequences can then be used to screen for and predict the presence of those traits in the progeny of traditional crosses.<sup>169</sup> The developer does not breed plants to select traits; the developer's use of MAS identifies the plants manifesting the traits before they are grown to maturity. This method has proven particularly useful with plants that have long life cycles before they manifest the desired trait, e.g. tree crops such as oil palm, coconut, coffee, tea,

<sup>169</sup>Id.

cocoa, and mango.<sup>170</sup> The process is expensive, in that it requires mapping populations, assembling genomic markers, and creating genetic maps.<sup>171</sup>

Canadian biotechnology policy,<sup>172</sup> developed into the Canadian Federal Regulatory Framework for Biotechnology (1993), articulated the objective of realizing the benefits of biotechnology products and processes while protecting health, safety, and the environment. The principles include<sup>173</sup>: using existing laws and regulatory departments to avoid duplication; developing clear guidelines for evaluating biotechnology products that are in harmony with national priorities and international standards; providing a sound, scientific knowledge base on which to assess risk and evaluate products; ensuring that the development and enforcement of Canadian biotechnology regulations are open and include consultation; and fostering a favourable climate for investment, development, and innovation. This approach is consistent with the OECD Blue Book.<sup>174</sup>

In addition, the Canadian Food Inspection Agency's (CFIA) operating principles in evaluating and regulating include<sup>175</sup>: focusing on the product traits, not method of production; establishing safety levels and standards for each product, based on best scientific data and dealing with safety in the milieu of probability and magnitude of any adverse effects, rather than the absence of risk.

The Plants with Novel Traits (PNT) regime arose in Canada in the early 1990s when regulators faced the conundrum of the same trait created by different breeding methods.<sup>176</sup> The seed company Allelix<sup>177</sup> sought permission for confined trials of mutagenic, herbicide-tolerant canola. No regulatory requirements were suggested. Allelix subsequently identified the operative gene that bestowed the protein giving herbicide tolerance, and so used rDNA to insert that gene into its other canola lines. Field trials on these rDNA lines commenced. Then, the regulators interceded and demanded regulatory compliance. Also, Allelix complained that the same gene in the same crop species attracted two different regulatory responses depending on the breeding technique. It was certainly arbitrary if not unfair, given the costs. Then, the matter was referred to the higher echelons of government for direction.<sup>178</sup>

The resulting policy decision held that the threat to the environment from the plant traits arose irrespective of the breeding technique that introduced those

<sup>178</sup>Yarrow (2001), p. 102. (Repeat of 176).

traits.<sup>179</sup> Henceforth the regulatory focus would be on the “novel” trait, and not on the breeding technique that begot or introduced that novel trait. Admittedly, it is easier in most instances to insert novel traits via rDNA techniques, but novelty can be had through other breeding techniques such as mutagenesis, somaclonal variation, and the dilemma of cisgenes and gene silencing.<sup>180</sup>

### 31.2.4.13 PNT: Field

The Canadian Food Inspection Agency (CFIA) conducts risk assessment. First, the CFIA seeks to determine if a risk assessment is necessary. If the plant is familiar, the trait is similar to one already approved. Meanwhile, the trait is derived by a technique that has been traditionally considered safe. Then a risk assessment may be omitted.<sup>181</sup> If not, a risk assessment commences to determine if the plant is substantially equivalent to an approved product. This entails both the genomics/proteomics and the effect on the environment.<sup>182</sup> If both familiar and substantially equivalent, then the CFIA assessment ceases. If not, the portion not substantially equivalent undergoes further risk assessment.<sup>183</sup> The crux of PNT, due to the novel trait from the introduced gene(s), is that element of the plant is not substantially equivalent to their progenitors:

... based on valid scientific rationale ... in terms of its specific use and safety both for the environment and for human health, to any characteristic of a distinct, stable population of cultivated seed of the same species in Canada, having regard to weediness potential, gene flow, plant pest potential, impact on non-target organisms and impact on biodiversity. [Emphasis added]<sup>184</sup>

The policy interpretation of the regulation is that a plant contains a novel trait if the trait is either not present in plants of the same species already existing as stable, cultivated populations in Canada, or is present but at a level significantly outside the range of that traits in stable, cultivated populations of that plant in Canada. There are three contexts for interpreting novelty: trait introduction, trait modification, and incremental increase.<sup>185</sup> This means most PNTs have additional regulatory hurdles beyond the extensive strictures for a variety registration.

The nub of the regulation is that a PNT needs regulatory authorization for confined or unconfined releases. Extensive data required for justifying such authorization include all details about the donor organism, breeding method, trait, test

<sup>185</sup>Id. slide 14.

results, foreign filings, protocols,<sup>186</sup> weediness, outcrossing potential, ecology, potential interactions with other organisms, and impact on biodiversity, among other things.<sup>187</sup>

Every event is not subject to an extensive regulatory review; rather, every novel event creating a novel plant is subject to the review. Inserting the same event into the same crop species is known as re-transformation (e.g., canola variety C after insertion into canola variety A).<sup>188</sup> The same event can also be inserted into a new crop (e.g., tropical plant fungus resistance into a temperate crop, e.g., papaya into canola). The Seeds Regulations exempt seed that is derived from seed that was previously authorized for unconfined release that is “substantially equivalent, in terms of its specific use and safety both for the environment and for human health, to seed of the same species, having regard to weediness potential, gene flow, plant pest potential, impact on non-target organisms and impact on biodiversity.”<sup>189</sup> In Canada in 2005 there were 403 varieties of soybeans of which 158 were PNTs. But these soybeans all had the same event, tolerance for the herbicide glyphosate.<sup>190</sup>

Some techniques require no regulation attachment until the final product exists and is submitted for registration. In contrast, rDNA use immediately fuses with the PNT scheme. A breeder can use any number of techniques—other than rDNA—to manifest a desired phenotype. Regulation attach only when the breeder has a stable plant manifesting the trait that fits the definition of PNT. And registration is sought only if the plant is a seed plant and variety. There are no regulatory strictures on laboratory safety concerning mutagenic or other processes that alter the genome at the chromosome or lower level. The average breeder of corn, soybeans, wheat, or potatoes may put 50,000 discrete new genetic variants a year into the field, not knowing what the genome will manifest.<sup>191</sup> To date, after decades of this practice, no human or environmental harm has transpired; and these plants are ploughed over.

Another economic reality is that those practising rDNA technologies labour under a heavy regulatory regime that by definition consumes prodigious amounts

---

<sup>186</sup>Seeds Regulations, C.R.C., c. 1400, s. 110(1)(2) (Can.). The requirements include: details of the donor organism; the methods of incorporation, if applicable, and details relating to expression of the novel trait, the stability of the incorporation, and a comparison of the characteristics of the plants derived from the modified seed with those derived from the unmodified host seed; all other information and test data that are relevant to identifying the risk to the environment, including the risk to human health; a list of other government agencies, either Canadian or foreign, that have been provided with information in respect of the PNT and the purpose for which the information was provided; a description of the analytical methodologies followed in generating any submitted data, including quality control and quality assurance procedures; the proposed starting date, completion date, and site of the confined release.

<sup>187</sup>Rastogi (2005), slide 25.

<sup>191</sup>Miller (2003).

of time and money. This means that only large companies can truly operate in the field, given transaction costs of breeding, time, and professional services. Small companies, governments, and university researchers do not have that kind of wherewithal.

#### 31.2.4.14 PNT: Fork

Having regulatory approval of a GMC does not equate approval for the GMF. GM corn, and GM cornflakes require different permits. Under the *Food and Drug Act Regulations*,<sup>192</sup> Health Canada continues with novel food, a concept that engages the concept of major change. “Major change” refers to change in the food, which based on the manufacturer’s experience or generally accepted nutritional or food science theory, places the modified food outside the accepted limits of natural variations for that food with regard to:

- (a) composition, structure or nutritional quality of the food or its generally recognized physiological effects;
- (b) manner in which the food is metabolized in the body; or
- (c) microbiological safety, the chemical safety or the safe use of the food.

Meanwhile, “novel food” means:

- (a) a substance, including a microorganism, that does not have a history of safe use as a food;
- (b) a food that has been manufactured, prepared, preserved or packaged by a process that
  - (i) has not been previously applied to that food, and
  - (ii) causes the food to undergo a *major change*; and
- (c) a food that is derived from a plant, animal or microorganism that has been genetically modified such that
  - (i) the plant, animal or microorganism exhibits characteristics that were not previously observed in that plant, animal or microorganism,
  - (ii) the plant, animal or microorganism **no longer exhibits** characteristics that were previously observed in that plant, animal or microorganism, or
  - (iii) one or more characteristics of the plant, animal or microorganism **no longer fall within the anticipated range** for that plant, animal or microorganism. [Emphasis added]

In short, a major change means the food is outside its natural limits in composition, metabolism, and safety. On the other hand, a novel food is complicated. This is the result of political compromise as much as by legal and scientific necessity. A food is novel if it has no history of safe use, or if it has a major change making it exhibit new characteristics or characteristics falling outside of the anticipated range, or fail to exhibit old characteristics.

---

<sup>192</sup>Food and Drug Regulations, C.R.C. c. 870 (Can.).

The effect of these regulations is to exclude GM foods, which are safely used in other countries or in Canada in a similar crop; Second, regulations may exclude minor food-processing changes—although most processed food contains GM (e.g., corn fructose, canola oil, soy protein).<sup>193</sup> True novelty, not GM per se, triggers these provisions. Regulators review field trials related to nutrition, toxicity, and allergenicity. If a PNT has a history of safe production and consumption in another country, regulators regard this as admissible data. However, this is not the case with PNT that has been regulated by the CFIA.<sup>194</sup>

According to regulations a novel food cannot be sold until the regulator is notified, provided prescribed data (nature of the trait, previous use, safety history), and an approval is issued. These provisions also speak to the parameters of not only what is approved, but also what might attract labelling, to wit, major compositional changes or health threats. The safety of a plant species as a food crop is established through familiarity and a record of use.<sup>195</sup>

For example, Canola—with risk assessment regime in place, would have been considered a PNT and a novel food given that its oil is edible but derived from rapeseed—while the oil is toxic.<sup>196</sup> Instead, canola was prosecuted through the *Seeds Act* system sans PNT, and into the marketplace without risk assessment—and to date without incident.<sup>197</sup>

#### 31.2.4.15 PNT: Labels

Canada's approach to PNT, again a broader concept than the vernacular "GM" or genetically modified food, is premised on a major change in the food product. Only the nature of the product is pertinent. The product labelling approach in some literature is called the "need to know" (major changes, allergens etc.). The labelling approach as used in the EU is premised on the concept of consumers' inherent "right to know" how product are made. So rDNA breeding methods are captured for labelling purposes, but mutagenetic plants—irrespective of profound the breeding changes are not.<sup>198</sup>

There is probity in the PNT product labelling approach or "need to know." There is no distinction between *made with* a PNT and *made using* a PNT, as there is in EU regulations. There the former attracts a label, the latter does not. One neglected concept is whether the novel protein is or is not in the final product. If the novel protein is in the food product it must be labelled ("need to know"). Based on the EU

<sup>197</sup>Barrett and Abergel, p. 6.

<sup>198</sup>Directive 2001/18, in particular annex 1A, & 1B.

regulation soils from genetically modified plants must be labelled, although the GM protein is not present in the oil, since the premise is process not product.

Nonetheless, there are voluntary guidelines in both Canada and the U.S. concerning GM *qua* GM labels.<sup>199</sup> First is the concept of a genetically engineered plant or food. Second, the guidelines state whether one cannot say “No GM” or “made without GMO” if there is no product on the market containing GM. For example, labeling “GM free bread” is considered breach of guidelines, since as of yet there is no GM wheat in commercial channels of trade in North America.<sup>200</sup> There can be no implication that GM is a threat or its absence is otherwise salutary.

Presently organic excludes genetically engineered (GE) or GM but not any other PNT or breeding technique. Organic requires segregated, traceable, and labelled channels of trade. On the whole, when process labelling comes to pass in Canada, then issues of segregation, traceability and labelling arise, and so will the attendant testing and enforcement.

### ***31.2.5 Food and Drugs Act & Regulations (FDA&R)***

The regulations have seven parts: (A) administration; (B) foods, (C) drugs, (E) vitamins, (F) Minerals and amino acids, (G) cyclamate and saccharine sweeteners, (H) controlled and restricted drugs. The provisions speak to the standards of composition, strength, potency, purity, quality, et cetera of the food or drug as applicable.

Part (B) the provisions on food, have 28 divisions, each division deals with a specific food or beverage type.<sup>201</sup>

Division 1 deals with labelling. Amendments made in 2002 and 2005 were geared to assist consumers in making informed choices. Amongst other things regulations require:

- the common name of the food, list of ingredients, place of business for whom the food was manufactured;
- Reference standards for a nutrient and serving size; and
- Prescribed data/format for the nutritional facts table.<sup>202</sup>

<sup>199</sup>Voluntary Labelling and Advertising of Foods that Are and Are Not Produces of Genetic Engineering, CAN/CBSB-32-3152004; Guidance for Industry: Voluntary Labelling Indicating Whether Foods Have or Have Not Been Developed Using Bioengineering: 656 Fed Reg (2001) 4,839–4,840.

<sup>200</sup>Canadian Guidelines, para. 6.1.4.

<sup>201</sup>Food and Drugs Act R.S.C. 1985 c. F-27 (Can.); Food and Drug Regulations C.R.C., c. 870 Div. 2-28 *op. cit.*

<sup>202</sup>*Id.*, ss. B.01.450 - B.01.453.

The nutritional labelling requirements are being reviewed again and will be revised concerning the look, serving size, added sugar, et cetera.<sup>203</sup>

Amendments in 2012 respected allergy-labelling concerns with peanuts, sesame seeds, eggs, mustard seed, gluten and sulphites.<sup>204</sup>

As previously discussed, division 28 addresses novel foods, the products derived from PNTs.

Irradiated food under division 26 is illustrative of the role of legal definitions and thresholds. Division 26 authorizes:

- the irradiation by any of gamma rays, x-rays and electron beam;
- of no more than the prescribed dosage’;
- only potatoes; onions; wheat; flour; whole wheat flour; whole or ground spices; and dehydrated seasonings;
- for an prescribed purpose (e.g. inhibit sprouting [potatoes]; control insect infestation [flour], reduce microbial load [spices]).<sup>205</sup>

Using the irradiation symbol will not be required in irradiation of previously mentioned above products. Additionally, only wholly irradiated foods must display the symbol on the basis that irradiated foods—although appearing the same as unirradiated, may undergo organoleptic changes.

In the same way, Division 15 on the topic of adulteration deals with arsenic (i.e. fruit juice); fluoride (ie. fish protein), lead (ie. tomato paste); tin (ie. canned foods) and pesticide residues beyond those authorized under the *Pest Controls Products Act*, ss. 9–10.<sup>206</sup>

### 31.3 Conclusion: Regulation and Agreements Affecting Food Import/Export—NAFTA, CETA, CANSEA

In Canada, food is regulated by both domestic laws and agreements at the provincial level (the collection of statutes and regulations discussed above) and at the international level through regional and multilateral agreements such as North American Free Trade Agreement (NAFTA), Comprehensive Economic and Trade Agreement (CETA) as well as global organizations such as the World Trade Organization (WTO). During the past several decades, regulation of food and related industries

<sup>203</sup>Proposed changes to the look of the Nutrition Facts Table and the List of Ingredients. <sup>206</sup>Id., ss.B.15.001 - B.15.003.

and commodities have increasingly been governed by laws and agreements made outside of the state-level (supra-nationally).

Such systems reflect a move towards a global governance model, which has arguably taken powers away from countries to regulate vast aspects of their economies. Globalization of trade has opened up Canada's national borders to international trade, flow of capital and food products. In fact, internationalism affects the shape and form of food policy in Canada. While NAFTA and CETA have emerged and are criticised as neoliberal institutions aimed at eroding state power at the behest of international capitalist interests. In contrast, CANSEA highlights the power states have managed to retain to influence trade to expand markets and national interests abroad.

Among emerging accords, the North American Free Trade Agreement (NAFTA) has perhaps had one of the largest impacts on the domestic food landscape. With its origin in the Canada-United States Free Trade Agreement, the addition of Mexico into the agreement On January 1st, 1994 saw the creation of a marketplace spanning the North American continent. According the Canadian government's own sources, the objective of NAFTA is "the elimination of most tariffs and reduction of non-tariff barriers, as well as comprehensive provisions on the conduct of business in the free trade area".<sup>207</sup> Since its inception, the push to create a tariff-free zone in North America has been largely successful. Official Canadian government sources indicate that since the signing of the agreement, "virtually all tariffs have been eliminated on Canadian agricultural exports to the U.S. (January 1, 1998) and Mexico (January 1, 2003). The only exceptions to this general tariff elimination are chicken, turkey and egg products, as well as refined sugar".<sup>208</sup> The provisions dealing with tariff issues are captured in Articles 701–708 of the Agreement, to wit:

**Article 701: Scope and Coverage**

1. This Section applies to measures adopted or maintained by a Party relating to agricultural trade.
2. In the event of any inconsistency between this Section and another provision of this Agreement, this Section shall prevail to the extent of the inconsistency.

**Article 702: International Obligations**

1. Annex 702.1 applies to the Parties specified in that Annex with respect to agricultural trade under certain agreements between them.
2. Prior to adopting pursuant to an intergovernmental commodity agreement, a measure that may affect trade in an agricultural good between the Parties, the Party proposing to adopt the measure shall consult with the other Parties with a view to avoiding nullification or impairment of a concession granted by that Party in its Schedule to Annex 302.2.
3. Annex 702.3 applies to the Parties specified in that Annex with respect to measures adopted or maintained pursuant to an intergovernmental coffee agreement.

---

<sup>207</sup>Schlachter (2007).

<sup>208</sup>Id.

**Article 703: Market Access**

1. The Parties shall work together to improve access to their respective markets through the reduction or elimination of import barriers to trade between them in agricultural goods. *Customs Duties, Quantitative Restrictions, and Agricultural Grading and Marketing Standards*
2. Annex 703.2 applies to the Parties specified in that Annex with respect to customs duties and quantitative restrictions; trade in sugar and syrup goods; agricultural grading and marketing standards.  
*Special Safeguard Provisions*
3. Each Party may, in accordance with its Schedule to Annex 302.2, adopt or maintain a special safeguard in the form of a tariff rate quota on an agricultural good listed in its Section of Annex 703.3. Notwithstanding Article 302.2, a Party may not apply an over-quota tariff rate under a special safeguard that exceeds the lesser of:
  - a) the most-favoured-nation (MFN) rate as of July 1, 1991; and
  - b) the prevailing MFN rate.
4. No Party may, with respect to the same good, the same country and at the same time:
  - a) apply an over-quota tariff rate under paragraph 3; and
  - b) take an emergency action covered by Chapter Eight (Emergency Action).

**Article 704: Domestic Support**

The Parties recognize that domestic support measures can be of crucial importance to their agricultural sectors. But they may also have trade distorting and production effects. Also, the domestic support reduction commitments may result from agricultural multilateral trade negotiations under the *General Agreement on Tariffs and Trade (GATT)*. Accordingly, a Party supporting its agricultural producers should endeavour to work toward domestic support measures that either:

- a) have minimal or no trade distorting or production effects; or
- b) are exempt from any applicable domestic support reduction commitments that may be negotiated under the GATT.

Moreover, Parties further recognize that a Party may change its domestic support measures, including those that may be subject to reduction commitments. This is done at the Party's discretion and subject to its rights and obligations under the GATT.

**Article 705: Export Subsidies**

1. The Parties share the objective of the multilateral elimination of export subsidies for agricultural goods and shall cooperate in an effort to achieve an agreement under the GATT to eliminate those subsidies.
2. The Parties recognize that export subsidies for agricultural goods may prejudice the interests of importing and exporting Parties and, in particular, may disrupt the markets of importing Parties. Accordingly, in addition to the rights and obligations of the Parties specified in Annex 702.1, the Parties affirm that it is inappropriate for a Party to provide an export subsidy for an agricultural good exported to the territory of another Party where there are no other subsidized imports of that good into the territory of that other Party.
3. Except as provided in Annex 702.1, where an exporting Party considers a non-Party exporting an agricultural good to the territory of another Party with the benefit of export subsidies, the importing Party shall, on written request of the exporting Party, consult

- with the exporting Party with a view to agreeing on specific measures that the importing Party may adopt to counter the effect of any such subsidized imports. If the importing Party adopts the agreed-upon measures, the exporting Party shall refrain from applying, or immediately cease to apply, any export subsidy to exports of such good to the territory of the importing Party.
4. Except as provided in Annex 702.1, an exporting Party shall deliver written notice to the importing Party at least three days, excluding weekends, prior to adopting an export subsidy measure on an agricultural good exported to the territory of another Party. The exporting Party shall consult with the importing Party within 72 hours of receipt of the importing Party's written request, with a view to eliminating the subsidy or minimizing any adverse impact on the market of the importing Party for that good. The importing Party shall, while requesting consultations with the exporting Party, deliver written notice to a third Party of the request. A third Party may request to participate in such consultations.
  5. Each Party shall take into account the interests of the other Parties in the use of export subsidies on an agricultural good, recognizing they may have prejudicial effects on the interests of other Parties.
  6. The Parties hereby establish a Working Group on Agricultural Subsidies, comprising representatives of each Party. This group shall meet semi-annually-- or as the Parties may otherwise agree, to work toward elimination of all export subsidies affecting agricultural trade between the Parties. The functions of the Working Group shall include:
    - a) monitoring the volume and price of imports into the territory of any Party of agricultural goods that have benefitted from export subsidies;
    - b) providing a forum for the Parties to develop mutually acceptable criteria and procedures for reaching agreement on the limitation or elimination of export subsidies for imports of agricultural goods into the territories of the Parties; and
    - c) reporting annually to the Committee on Agricultural Trade, established under Article 706, on the implementation of this Article.
  7. Notwithstanding any other provision of this Article:
    - a) if the importing and exporting Parties agree to an export subsidy for an agricultural good exported to the territory of the importing Party, the exporting Party or Parties may adopt or maintain such subsidy; and
    - b) each Party retains its rights to apply countervailing duties to subsidized imports of agricultural goods from the territory of a Party or non-Party.

**Article 706: Committee on Agricultural Trade**

1. The Parties hereby establish a Committee on Agricultural Trade, comprising representatives of each Party.
2. The Committee's functions shall include:
  - a) monitoring and promoting of cooperation on the implementation and administration of this Section;
  - b) providing a forum for the Parties to consult on issues related to this Section at least semi-annually and as the Parties may otherwise agree; and
  - c) reporting annually to the Commission on the implementation of this Section.

**Article 707: Advisory Committee on Private Commercial Disputes regarding Agricultural Goods**

The Committee shall establish an Advisory Committee on Private Commercial Disputes regarding Agricultural Goods, comprising persons with expertise or experience in the resolution of private commercial disputes in agricultural trade. The Advisory Committee shall report and provide recommendations to the Committee for the development of systems in the territory of each Party to achieve the prompt and effective resolution of such disputes, taking into account any special circumstance, including the perishability of certain agricultural goods.<sup>209</sup>

These provisions seek to remove distortions in trade. But they do little to whittle down state control over regulations on food safety. Indeed, Articles 716–718 of the Agreement reinforce state sovereignty over sanitary and phytosanitary measures related to agriculture and agricultural processes.

**Article 716: Adaptation to Regional Conditions**

These provisions stipulate:

1. Each Party shall adapt sanitary or phytosanitary measures relating to the introduction, establishment or spread of an animal or plant pest or disease, to the sanitary or phytosanitary characteristics of the area where a good subject to such a measure is produced and the area in its territory to which the good is destined, taking into account any relevant conditions, including those relating to transportation and handling, between those areas. In assessing characteristics of an area--whether an area is likely to remain a pest-free or disease-free area or low pest or disease prevalence, each Party shall take into account, among other factors:
  - a) the prevalence of relevant pests or diseases in that area;
  - b) the existence of eradication or control programs in that area; and
  - c) any relevant international standard, guideline or recommendation.
2. Further to paragraph 1, each Party shall, in determining whether an area is a pest-free or disease-free area or an area of low pest or disease prevalence, base its determination on factors such as geography, ecosystems, epidemiological surveillance and the effectiveness of sanitary or phytosanitary controls in that area.
3. Each importing Party shall recognize that an area in the territory of the exporting Party is, and is likely to remain, a pest-free or disease-free area or an area of low pest or disease prevalence, where the exporting Party provides to the importing Party scientific evidence or other information sufficient to satisfy the importing Party. For this purpose, each exporting Party shall provide reasonable access in its territory to the importing Party for inspection, testing and other relevant procedures.
4. Each Party may, in accordance with this Section:
  - a) adopt, maintain or apply a different risk assessment procedure for a pest-free or disease-free area than for an area of low pest or disease prevalence, or
  - b) make a different final determination for the disposition of a good produced in a pest-free or disease-free area than for a good produced in an area of low pest or disease prevalence, taking into account any relevant conditions, including those relating to transportation and handling.
5. Each Party shall; in adopting; maintaining or applying a sanitary or phytosanitary measure relating to the introduction; establishment or spread of an animal or plant

---

<sup>209</sup>Id.

- pest or disease, accord a good produced in a pest-free or disease-free area in the territory of another Party no less favourable treatment than it accords a good produced in a pest-free or disease-free area, in another country, that poses the same level of risk. The Party shall use equivalent risk assessment techniques to evaluate relevant conditions and controls in the pest-free or disease-free area and in the area surrounding that area and take into account relevant conditions, including those relating to transportation and handling.
6. Each importing Party shall pursue an agreement with an exporting Party--on request and on specific requirements, the fulfillment of which allows a good produced in an area of low pest or disease prevalence in the territory of an exporting Party to be imported into the territory of the importing Party and achieves the importing Party's appropriate level of protection.

#### **Article 717: Control, Inspection and Approval Procedures**

1. Each Party with respect to control and inspection procedure it conducts:
- (a) shall initiate and complete the procedure as expeditiously as possible and in no less favourable manner for a good of another Party or country.
  - (b) shall publish the normal processing period for the procedure or communicate the anticipated processing period to the applicant on request;
  - (c) shall ensure that the competent body
    - (i) on receipt of an application, promptly examines the completeness of the documentation and informs the applicant in a precise and complete manner of any deficiency,
    - (ii) transmits to the applicant as soon as possible the results of the procedure in a form that is precise and complete. Then the applicant may take any necessary corrective action.
    - (iii) where the application is deficient, proceeds as far as practicable with the procedure if the applicant so requests, and
    - (iv) informs the applicant, on request, of the status of the application and the reasons for any delay;
  - (d) shall limit the information the applicant is required to supply necessary for conducting the procedure;
  - (e) shall accord confidential or proprietary information arising from, or supplied in connection with the procedure conducted for a good of another Party
    - (i) treatment no less favourable than for a good of the Party, and
    - (ii) in any event, treatment that protects the applicant's legitimate commercial interests, to the extent provided under the Party's law;
  - (f) shall limit any requirement regarding individual specimens or samples of a good, which is reasonable and necessary;
  - (g) should not impose a fee for conducting the procedure that is higher for a good of another Party than is equitable in relation to any such fee it imposes for its like goods or for like goods of any other country, taking into account communication, transportation and other related costs;
  - (h) should use criteria for selecting the location of facilities. The procedure conducted shall not cause unnecessary inconvenience to an applicant or its agent;
    - (i) shall provide a mechanism to review complaints concerning the operation of the procedure and to take corrective action when a complaint is justified;
    - (j) should use criteria for selecting samples of goods that do not cause unnecessary inconvenience to an applicant or its agent; and

- (k) shall limit the procedure for a good modified. Resulting good shall fulfill the requirements of the applicable sanitary or phytosanitary measure necessary to fulfill the requirements of that measure.
2. Each Party shall apply—including necessary modifications, paragraphs 1(a) through (i) to its approval procedures.
  3. Where an importing Party's sanitary or phytosanitary measure requires the conduct of a control or inspection procedure at the level of production, an exporting Party shall—on the request of the importing Party, take such reasonable measures available to facilitate access in its territory and to provide assistance necessary to facilitate the conduct of the importing Party's control or inspection procedure.
  4. A Party maintaining an approval procedure may require its approval for the use of an additive, or its establishment of a tolerance for a contaminant, in a food, beverage or feedstuff, under that procedure prior to granting access to its domestic market for a food, beverage or feedstuff containing that additive or contaminant. Upon request, the party shall consider using a relevant international standard, guideline or recommendation as the basis for granting access until it completes the procedure.<sup>210</sup>

NAFTA has increased trade exponentially between the three signatories, e.g. agricultural trade from Canada to the United States since NAFTA has doubled,<sup>211</sup> while exports from Canada to Mexico “have more than tripled”.<sup>212</sup>

Corresponding to the shift to free trade and open borders has been a movement away from national self-sufficiency in food and agricultural production. In this way, the North American food system has become more integrated and harmonized. Much scholarship exists exploring the effects of NAFTA in Mexico vis-à-vis the Mexican food sector and its relationship with its northern neighbours. While out of the scope of this chapter to delve into a detailed analysis of NAFTA's implications for Mexico, the empirical evidence largely suggests that Mexico has benefited the least of the three countries. One rationale often put forth to explain unequal benefits between the countries may be found in Mexico's status as a developing country with unequal bargaining power. Another rationale is that Mexican negotiators failed to closely examine the FTA between Canada and the U.S. that preceded NAFTA. Had they done so, they may have been more inclined to include provisions to exclude sensitive agricultural products.<sup>213</sup> Consequently, “high import quotas without tariffs were accepted for a broad range of products; there is no provision for the possibility of review, suspension, moratorium or the use of other instruments for protecting national production.”<sup>214</sup> In addition to these stipulations, Mexico, (unlike its northern neighbours) was forced to put an end to the provision of agricultural subsidies. As Hellman writes:

In the name of harmonization with its NAFTA partners, Mexico was required to withdraw almost all state support to peasant agriculture, including subsidies, low-interest or interest-

<sup>214</sup>Id.

free loans, the use of marketing boards to stabilize prices, and low-cost, state-produced, agricultural inputs like fertilizer and insecticides.<sup>215</sup>

In comparison to the situation in Mexico, both the American and Canadian agricultural sectors remain heavily subsidized.

Congruent with this process, many sources indicate that the decimation of Mexican agriculture through what has been referred to as ‘the dumping’ of cheaper North American imports has resulted in “Mexico losing its food sovereignty.”<sup>216</sup> The inability of Mexican farmers to compete has been further compounded by the dismantling of the national food programs established during the more protectionist era of the early twentieth century. This has created an increased dependence on foreign imports as fewer Mexican farmers are now contributing to domestic food production. Findings in a report by the *Canadian Centre for Policy Alternatives* highlight this pattern: “in 1993 before NAFTA, Mexico imported 8.8 million metric tons of grains”<sup>217</sup> however, the think tank estimated that by 2002, Mexico was importing “more than 20 million metric tons or 2.3 times”<sup>218</sup> that amount. To bring this into perspective, with respect to national food sovereignty and food self-sufficiency, NAFTA has been credited with reversing Mexican national food self-sufficiency achieved in 1982.<sup>219</sup> While Mexico has been importing growing volumes of food, “the proportion of Mexicans earning a living from the soil [has been] cut in half.”<sup>220</sup> Moreover, the factors cited above have contributed to the fact that Mexico, once self-sufficient in food now imports more than one-third of its food needs.<sup>221</sup> An inability to compete with agricultural imports has contributed to the Mexican countryside becoming unviable. Accordingly, this has prompted a massive immigration from rural Mexico, to the cities and across the border into the United States.

### 31.3.1 *Canada & NAFTA*

Canada and the United States have had quite different experiences with the NAFTA. One example is that Mexico now has less food sovereignty than it had prior to signing NAFTA. In contrast, the scholarship points to the fact that despite NAFTA, Canada remains “substantially self-sufficient” in food production.<sup>222</sup> Some scholars on the topic point out that “Mexico is far more food vulnerable

<sup>220</sup>Id. 4.

<sup>221</sup>Barndt (2002), p. 175.

<sup>222</sup>Otero (2011).

than the other two NAFTA partners”<sup>223</sup> In fact, of the three NAFTA countries, only Mexico experienced significant increases in food prices during “the global food crisis, starting in late 2006”.<sup>224</sup> Moreover, fluctuations in food prices during the food crisis of the mid to late 2000s did not have as much of an effect in Canada and the United States as they did in Mexico. The rationale for this can probably be found in Canada’s more stable currency and high income status coupled with the fact that:

[a]ccording to the United Nation’s Food and Agriculture Organization (FAO) with Mexico being a “middle income” country, its households spend close to 35 % of their income on food. Still, any price increases have a much more serious impact than they do in either Canada or the United States where households spend on average 11 % to 12 % of their budgets on food.<sup>225</sup>

While there has been comparatively little written on the impacts of NAFTA in Canada, some trends have emerged in the general scholarship. First, as a free trade agreement—the main objective of which was to increase trade among member states—NAFTA has been wildly successful and Canada has in fact experienced an increase in trade exports and bilateral investment with the United States. For example,

[t]wo-way investment has also increased markedly during the free trade era, both in terms of stock and flow of investment. The United States is the largest single investor in Canada with a stock of FDI into Canada reaching \$351.5 billion in 2012, up from a stock of \$69.9 billion in 1993.<sup>226</sup>

In addition, other benefits to the Canadian economy can be seen in that:

Canadian FDI flows into the United States annually averaged \$2.3 billion in five years prior to the FTA, and an annual average of \$1.8 billion during the FTA years, but increased to an annual average of \$9.9 billion from 1995 to 2012.<sup>227</sup>

While the apparent macro-economic gains are impressive and have been often lauded by both economists and politicians, other groups within Canadian society have been more critical of the NAFTA and in an effort to present a balanced analysis. Their views need be articulated. Perhaps no group has been more critical of NAFTA than groups representing agricultural and other food interests. One such group, the *National Farmers Union* (NFA) has in a number of policy briefs synthesized the sentiments of those at the frontlines of Canadian food production who are perhaps best placed to see the empirical consequences of the NAFTA. In a policy brief presented to Olivier De Shutter, United Nations Special Rapporteur on the Right to Food, the NFA cited the following statistics:

- Canadian agriculture exports have more than tripled from \$10.9 billion in 1988 to over \$35 billion in 2010 due to the “market access” these trade agreements bring

---

<sup>223</sup>Id.

<sup>224</sup>Id.

<sup>225</sup>Id.

<sup>226</sup>Angeles Villarreal and Fergusson (2014).

<sup>227</sup>Id.

- Net farm income has practically not changed: \$3.9 billion in 1988 to just over \$4 billion in 2010, although if you take 2007 as an example, there were \$3.7 billion of taxpayer funded farm support payments masking a net income loss from the markets of \$2.2 billion.
- Farm debt has tripled to over \$65 billion in 2007 and the number of farmers in Canada has reduced by nearly 25 % from 293,089 farmers in 1988 to 229,373 in 2007.
- the number of farmers under the age of 35 has decreased by over 60 % in the 15 years leading to 2006 from 77,910 in 1991 to just under 30,000 in 2006. This is particularly worrying because if there are fewer young farmers starting to farm, there will be fewer people to carry on Canada's food production within a generation.<sup>228</sup>

In conjunction with these trends affecting farmers and their families, the NFA has also cited the following statistics with respect to general shifts in the Canadian control of food production since NAFTA:

- Before Canada signed on to the first free trade agreement, farmers owned 4 grain handling co-ops. Today there no farmer owned handling co-ops remaining.
- In 1988, 66 % of dairy was processed in farmer owned coops. This has dropped to 39 %.
- Canadian ownership in flour mills has dropped from 50 to 28 %.
- Beef packing plants were virtually 100 % Canadian owned in 1988, but Canadian ownership has since reduced to less than 30 %.
- In 1988, Canadians controlled 95 % of the brewing and malting capacity. By 2007 that had reduced to 10 %.
- The number of farm implement companies has reduced from 6 in 1988 to 3.<sup>229</sup>

Such statistics highlight that notwithstanding increased trade and foreign direct investment experienced since the signing of the FTA and NAFTA, the effects from a self-sufficiency perspective (and certainly from the perspective of Canadian agriculturalists) has not been entirely positive.

### ***31.3.2 The Comprehensive Economic and Trade Agreement (CETA)***

The discussion of the Comprehensive Economic and Trade Agreement (CETA), an economic and trade agreement between Canada and all 28 member states of the European Union in the food-policy context must like the preceding discussion of NAFTA, be couched within the currently reigning ideological and legal constructs.

---

<sup>228</sup>De Schutter (2011).

<sup>229</sup>Id.

This section argues these ideological, philosophical and legal (governing) parameters are neoliberal. Neoliberalism is at its core a set of economic principles, which advocate the supremacy of the market, less state regulation, deregulation, privatization and individualism. The neoliberal construct of our time is closely associated with the phenomenon of globalization, which has been characterized by increasing degrees of interconnectedness and interdependence between state actors and their citizens.

While Canada has generally been a strong supporter of neoliberalism and the opening up of its borders (and foreign borders) to trade, CETA represents an historic endeavour more ambitious and expansive than even NAFTA. At its core, CETA represents a FTA between Canada and EU—the world’s largest market (consisting of over 500 million people<sup>230</sup>).

CETA is a new agreement. The CETA negotiations began in 2009 and since that time, Canada has been under considerable pressure by the EU to reconfigure its copyright and Intellectual Property Regime (IPR) legislation. It is important to note that food represents a very small portion of industry and trade sectors covered under the agreement. Notwithstanding this fact, the agreement once implemented will have broad implications for the food and agricultural industries of every province. While details of the agreement with respect to food only emerged in late 2013, and a leaked drafted surfaced in August 2014<sup>231</sup> the European objectives of the agreement were evident in earlier rounds of debates with respect to IPR (which could potentially impact food and agricultural policy). The EU objective, as Peter Smith has written was to “put pressure on Canada so that they take IPR issues seriously and remedy the many shortcomings of their IPR protection and enforcement regime”.<sup>232</sup>

Additionally, surrounding the birth of CETA was contention and outrage over a general lack of transparency and the way in which the general public and Canadian civil society have been virtually excluded from the bargaining table. In this regard, negotiations around CETA have paralleled those of other multi-lateral trade agreements like the North American Free Trade Agreement (NAFTA) and the Anti-Counterfeiting Trade Agreement (ACTA) whose negotiations were shrouded in secrecy and characterized by their lack of civic dialogue, democratic input, parliamentary debate and popularity.

In response to the perceived lack of transparency in negotiation process of the agreements and in the wake of leaked contents of reports—as early as 2011, a coalition of over 70 Canadian and European civil society organizations joined forces in publishing a signed statement denouncing CETA. With respect to food, the group, which included *The Council of Canadians* noted that “[t]his agreement would reinforce intellectual property rights (IPR) at the expense of food

---

<sup>231</sup>Dupuis (2014).

<sup>232</sup>Peter (2010).

sovereignty and the right to health”.<sup>233</sup> Critics of CETA generally point to it as the most recent manifestation of the neoliberal tradition of other institutions like the World Trade Organization (WTO), (for example) but as a multilateral trade agreement, lying firmly outside the institutional governance bodies that preceded it. For their part, the world’s leading capitalist nations have been at the forefront of the push towards CETA (Canada and the EU).

An agreement on core political and policy issues was reached on 18 October 2013. Under the agreement, 94 % of agricultural products will be duty free compared to the current 24 %. European cheese makers will be allowed to sell Canada 29,000 tonnes of cheese, more than double the current quota. Naturally, Canadian farmers, especially, cheese makers are worried. The Canadian government has said it will provide compensation to cheese producers to address any adverse effects. While capital and corporations are infiltrating national borders with increasing ease, many observers claim that state power in the realm of international trade and capital flows has been largely curtailed by an international regulatory system designed to maximize international corporate profits to the detriment of national industries and economies. Herein can be found yet another critique of CETA. This criticism points to the fear that CETA may do more harm than its lauded benefits in that it will take away the power of every layer of the Canadian governance structure to regulate vast sectors of the economy—perhaps most notably the food sector. The publication of this book is especially timely in that CETA signatory states had until September 12th, 2014 to make any amendments and that the ratification process could take several years.

While it may be too early to forecast what the effects of the implementation of CETA will be, this has not stopped speculation on the part of observers. For his part, a recent article published by York University Professor, Rod MacRae in the *Journal of Canadian Food Studies* while acknowledging that relatively little has been published with respect to the agreements details, MacRae manages to highlight what CETA may entail for Canada’s food landscape. Among other features, CETA:

- does have a sustainable development and trade section, a trade and environment section,
- and a trade and labour section, and CSOs are to participate in monitoring the provisions when worked out;
- calls for a ban on export subsidies pending tariff reductions;
- proposes collaborating on regulatory measures, including animal welfare, and technical standard equivalency through the Technical Barriers to Trade (TBT) process;
- sets out immediate EU tariff elimination on some foods, mostly processed;
- sets out quota duty free access for certain goods to each other’s market;

---

<sup>233</sup>Online: [http://www.tradejustice.ca/wpcontent/uploads/2013/08/EUCAN\\_DECLARATION\\_EN.pdf](http://www.tradejustice.ca/wpcontent/uploads/2013/08/EUCAN_DECLARATION_EN.pdf).

- has no changes to supply management, except increased cheese and milk proteins access for European producers.<sup>234</sup>

While some Canadian agribusiness stands to do well (most notably the beef industry), other sectors are not so optimistic. To provide a recent contextual example of how this aspect of CETA has been received by Canadian farmers—as leaked details of CETA emerged, Quebec and other provincial media outlets published articles highlighting the outpouring of discontent on the part of dairy farmers. Among their discontents are fears that CETA—an agreement seeking to roll back government protection through the elimination of export subsidies and tariff barriers of historically protected industries (the dairy and cheese industry is a prime example)—will have a detrimental effect on the Quebec dairy and cheese industry that sources cite will see cheese imports from Europe double.<sup>235</sup> In the context of an agreement—shrouded in secrecy, it is easy to understand why such concern and fears of uncertainty have arisen among peoples whose livelihoods depend on the dairy industry. Such instances highlight that in any trade regime or new trade agreement, there are bound to be both winners and losers. As CETA has yet to be ratified, it can only be hoped that the benefits outweigh the risks to the Canadian agricultural and food industries. Again, like NAFTA, the leaked aspects of CETA pertaining to regulation of agriculture strongly suggest that domestic regulation of agriculture and agricultural products remains largely intact. The changed landscape is with respect to tariffs and subsidies.

### **31.3.3 CANSEA: Agri-Foods**

In contrast to NAFTA and CETA which seek to create multi-lateral FTA's opening up national borders to increased trade through reduction in trade barriers, Canada-South East Asia (CANSEA), represents an attempt on the part of Canada's Department of Foreign Affairs Trade & Development Canada at actively promoting market expansion of Canadian agricultural products and brands within South East Asia.

To this end, a total of nine South East Asian countries are currently engaged in CANSEA. They are: Brunei, Indonesia, Malaysia, the Philippines, Singapore, Vietnam, Cambodia, Laos, and Burma (Myanmar). In this regard, Canada is not alone in using federal monies and manpower in the promotion of its brands outside of its borders. Many countries including but not limited to the United States, France, Spain, etc. engage in such promotional activities.

An important component of CANSEA that can benefit Canadian agribusiness is its information gathering capacity. While out the scope of this chapter to delve into

---

<sup>234</sup>MacRae (2014).

<sup>235</sup>Fekete (2013).

every possible example, one recent attempt by the Canadian government at information gathering aimed at facilitating Canadian business expansion into the region can be seen in the example of Brunei. Brunei, a predominantly Muslim country holds countries exporting food products into the country to standards ensuring the products meet religious Islamic *Halal* requirements. To ensure that Canadian food producers are able to expand into this potentially lucrative market, the Canadian government through CANSEA has consulted with the Brunei government and clarified the Halal certification bodies in existence that will allow Canadian food producers to follow the requirements ensuring their food products are certified *Halal* and allowed into the country. To ensure wide dissemination of the information to Canadian Agri-business, the Department of Foreign Affairs & Trade publishes this information on its website<sup>236</sup> and publishes periodicals which are also available on its website.

## Chapter 32

# Brazilian Agriculture and Its Sustainability

**Luiz Antonio Martinelli, Luciana Della Coletta,  
Silvia Rafaela Machado Lins, Silvia Fernanda Mardegan,  
and Daniel de Castro Victoria**

**Abstract** Brazil has emerged in this century as a powerhouse, developing a high productivity tropical agriculture, and today is one of the key players in the global food system. However, such increase of Brazilian agriculture was not without costs. One of the most important consequences was the loss of original vegetation and all the ecosystem services linked to this loss. Most of the Atlantic Forest was converted in urban or agricultural areas; approximately half of the Cerrado was also already converted, and more than 15 % of the Amazon forest was also lost. Coupled with loss of vegetation there is also environmental problems linked to agricultural practices such as: burning and heavy use of pesticides, and to a lesser extent of mineral fertilizers. However, the decoupling of agriculture production and deforestation observed in several regions of the country give us hope that in the future agriculture could advance without further vegetation loss. This mean that intensification will take place, and such has to be conducted under the umbrella of what is called “sustainable agriculture”, which in turn is a series of practices aimed to give to an agroecosystem more complexity in order to mimic natural ecosystems. Among these practices several of them have already been adopted in large scale in the country, especially no-till, crop rotation, and lately crop-livestock systems. If Brazil succeeds in overcoming this challenge, it will not only benefit itself, but also other tropical countries that are pursuing such sustainability and, ultimately the entire world, given Brazil’s importance in the global food system.

## 32.1 Introduction

During this century, demand for food will increase largely due to population growth and changes in nutritional habits, with many nations relying increasingly on animal protein as a significant fraction of daily food intake. Most of the expanding demand for food in recent decades has been in tropical regions of the world, and the loss of tropical forest is a direct consequence of agricultural expansion.<sup>1</sup> Future predictions are not very different from past one: most of the spread in agriculture will occur in the tropical areas of the globe.<sup>2</sup> Increases in food production can be achieved either by increasing productivity through intensification of inputs, or by expanding available farmland. While global warming raises concerns about such estimates, many researchers believe that increasing productivity remains possible. It seems, however, that intensification alone will not meet future demands for food, and consequently it will be necessary to expand agricultural areas.<sup>3</sup> Therefore, food production in tropical countries will have not only a regional impact, but a global one as well.

One country that is rising to meet the growing global food demand is Brazil, which is steadily becoming a powerhouse in the global food system.<sup>4</sup> Beginning in the 1990s, a series of macroeconomic interventions coupled with land availability, a favorable climate for agriculture, and abundance of inexpensive labor<sup>5</sup> set the stage for unprecedented development in the Brazilian agricultural sector.<sup>6</sup> The impressive figures related to this development can be seen in the high production rate of certain commodities in relation to the total world production.<sup>7</sup> For example, Brazil is responsible for about one-third of global production of coffee, soybean, and sugarcane.<sup>8</sup> Brazil is also responsible for approximately 15 % of beef and 8 % of the world production of maize. Often, tropical countries tend to dominate one specific commodity, as is the case of Cote d'Ivoire, which is the number one cocoa producer in the world. India, on the other hand, is the main producer of bananas, and Myanmar is the number one bean exporter. Yet even among these countries, Brazil still ranks highly in terms of output: currently it is seventh for cocoa production, sixth for banana production, and third in the world for bean production. The openness of Brazil's economy means that it is also a major exporter of soybean, sugar, coffee, beef, and chicken meat.

Based on these numbers, the authors find it is fair to conclude that Brazil plays a key role in the global food production system. Brazil also benefits from abundant

natural resources: according to the 2010 Global Forests Resources Assessment, Brazil is the country with the greatest forest cover in the world, totaling approximately 5.9 million km<sup>2</sup>, which corresponds to 60 % of the total country area.<sup>9</sup> Brazil harbors two of the most important forested biomes, the Amazon and the Atlantic Forest, as well as one of the most important tropical savannas of the world, the Cerrado. The Amazon biome is the largest continuous tropical forest and has some of the richest biodiversity on Earth. Moreover, the Amazon River is the largest river on the planet and its basin encompasses near 6.4 million km<sup>2</sup>, with more than half of this area in Brazilian territory. The Amazon is home to several endemic and threatened species of plants and animals. For instance, scientists estimate that there are over 40,000 species of plants in the forest, and approximately 3000 species of fish in the rivers.<sup>10</sup> Due to its enormous breadth and vast number of trees, the Amazon region influences the global climate through enhanced evapotranspiration, which decreases air temperatures not only in the region but globally as well.<sup>11</sup> In a global warming scenario, the Amazon also serves as an important carbon reservoir, stocking carbon in plants and soil.<sup>12</sup> The Atlantic Forest another important environmental hotspot, and is the second most important forest cover in South America.<sup>13,14</sup> The forest originally covered 2 million km<sup>2</sup>, but today only 15 % of the original biome remains, largely due to centuries of intense occupation and resource exploitation after Portuguese colonization.<sup>15,16</sup>

The Atlantic Forest harbors a great number of species of plants and animals, many of which are native. These species are distributed throughout a wide swathe of territory, from the Northeast to the Southern region of the country and grow under a series of edaphoclimatic conditions.<sup>17</sup> Endemism is high, for instance, among some groups such as plants (40 %), birds (16 %), mammals (27 %) and reptiles (31 %).<sup>18</sup> This diversity also extends to their physiognomies, and spreads across the coastal Atlantic Rain Forest (locally known as Mata Atlântica) and the Atlantic Semideciduous Forest.<sup>19</sup> The Atlantic Forest also harbors the rivers responsible for supplying freshwater to more than half of the Brazilian population,<sup>20</sup> and

around 70 % of the country's population lives within its bounds, producing 80 % of its gross domestic product.<sup>21</sup>

Brazil, therefore, has a unique position because it is one of the few countries in the world with such mega biodiversity, and it is the first tropical country to develop an efficient export-oriented agriculture.<sup>22</sup> However, Brazil has not yet found a way to accommodate both. Some Brazilian scholars believe that it is impossible to reconcile environmental preservation and agriculture development, and it is difficult for groups on both sides to understand that agriculture is the most precious of all ecosystem services. Additionally, agriculture is fundamental to the Brazilian economy, not only for food supply but also for generating capital flows through commodity exports.<sup>23</sup> On the other hand, as an ecosystem service, agriculture depends upon complex interactions between the biological and physical aspects of an ecosystem. By oversimplifying ecosystems and transforming them from a multi-species to a mono-crop system, the basic ecosystem services provided by a multitude of species will collapse. Ultimately, Brazil's ability to produce food and maintain a sustainable agricultural system will suffer.<sup>24</sup> For instance, Brazil produces one-third of the world's coffee and is one of the main global exporters of coffee beans. Coffee depends upon insects to pollinate its flowers, and these insects depend on a minimally preserved ecosystem to survive. Researchers estimate that destruction of this unique environmental service would involve economic losses worth 12 trillion euros.<sup>25</sup>

So far, Brazilian agriculture has been progressing with few environmental concerns. Consequently, only a minor part of the Atlantic Forest has been fully protected, and it is in fragmented patches with low value in terms of biodiversity preservation and ecosystem services.<sup>26</sup> Half of the Cerrado has already been destroyed to make room for crops and livestock, and the Amazon region has already lost approximately 700,000 km<sup>2</sup> of forests. Recently, however, for the first time in several decades there has been a decline in deforestation rates in major Brazilian biomes.<sup>27</sup> An iconic example is the decrease of deforestation in the Amazon region that began roughly in 2004–2005, with only a small increase in last year's deforestation rate. At the same time, productivity of the main Brazilian crops has continuously increased in recent decades due to technological advances. These trends give us hope that it is possible to reconcile environmental preservation with agriculture development.

One of the main objectives of this chapter is to discuss how such a combination may be achieved. In order to achieve this, the chapter will be divided into four

sections. First, we will provide an overview of Brazilian agriculture's expansion, focusing on the three major crops that cover the greatest land area: soybean, maize, and sugarcane. We will also look at the livestock sector, which also takes up significant land resources. Secondly, we will discuss the intensification of Brazilian agriculture and the environmental "price" of such intensification. Third, we will look at the environmental cost of such expansion and intensification, with emphasis on the Amazon region, the Atlantic Forest, and the Cerrado. Finally, we look to the future and propose potential ways of reconciling environmental preservation and agriculture development.

## 32.2 Brazilian Biomes

### 32.2.1 *The Amazon*

The Amazon region has several different boundaries and areas depending on the classification used. For instance, the Amazon Basin encompasses an area of approximately 6.4 million km<sup>2</sup> including the Tocantins Basin, while the Amazon biome is 7 million km<sup>2</sup>, of which roughly 65 % is located in Brazilian territory. There is also the Legal Brazilian Amazon (LBA) that encompasses 5 million km<sup>2</sup>, and was demarcated during the Brazilian dictatorship with government investments and tax exemptions in the area.

The main features of the Amazon region include the predominance of tropical rainforest vegetation intermingled with areas of cerrado-like savannas, along with extensive river networks that drain into the main Marañon-Solimões-Amazon River. Marañon is the name of the main river of the Amazon Basin before the river enters Brazilian territory, where its name changes to Solimões. It becomes the Amazon after meeting the Negro River leading up to the Atlantic Ocean. The Amazon River runs from West to East for more than 6600 km, making it one of the longest rivers on Earth.

In terms of biodiversity, the Amazon region has some of the richest on the planet.<sup>28</sup> It seems that the most plausible explanation for such mega-biodiversity is the combination of geological-geomorphologic events coupled with climate changes that created the perfect habitat for species of all kinds to flourish. For instance, tectonic events like the rising of the Andean Cordillera changed the river direction to its current west to east flow, thus shaping the Amazon biota.<sup>29</sup>

The Amazon's mega biodiversity began to be seriously threatened in the 1960s and 1970s. Before then, there had been limited human interventions in the Amazon region. During the Second World War (WWII), for instance, people from the Northeast region migrated to the Amazon—mainly to the state of Acre—to extract

rubber in order to support the Allied effort. Those extracting the rubber were called “rubber soldiers,” and they worked in slave-like conditions for their landlords in the middle of the jungle. After WWII was over, these “soldiers” were largely forgotten. The so-called ‘development’ of the region truly began during the military dictatorship of 1964–1985. The military generals in power established a system of tax exemptions and subsidies for large entrepreneurs in other parts of the country in order to bolster their support.<sup>30</sup> Their *modus operandi* was to purchase large tracts of land, deforest them, and replace the forest with cultivated pasture for livestock. The actual agricultural output of this enterprise was less important—it was land speculation on which the generals focused. With the opening of new roads, the price of the land increased exponentially and allowed entrepreneurs to sell their properties for enormous profits.

As a consequence of this rapid agricultural expansion, the Amazon region was left with a vast deforested area, an inefficient livestock system, and a booming market for land. Additionally, the military government also tried to alleviate population pressure in the impoverished Northeast region, which was suffering after several years of drought. With the opening of the Trans-Amazonian Highway, a series of “colonization” projects were implemented, re-settling small farmers along this road in the so-called *agrovilas*. Most of the colonies failed, mainly because there was no technology in place to cultivate the very poor soils of the Amazon. Some of the farmers went back to the Northeast region, but many remained in the Amazon region.

At the end of the military dictatorship in 1985, enormous swathes of the Amazon were transformed into pasture. The population increased substantially too, as the opening of roads along with the colonization projects attracted more people to the region. By the time the civilian government removed the tax exemptions and subsidies, the Amazon “gate” had already been opened for development. Even without government incentives, the livestock sector began to profit; this was primarily because the new roads dramatically decreased the cost of transporting goods to the main markets. At the same time, the Brazilian Agricultural Research Corporation (EMBRAPA) developed new varieties of *Brachiaria (Urochloa)* grasses, along with different types of soybean that could thrive in the Amazon region. This expanded the range of crops that farmers could grow and expedited the area’s conversion to pastureland.

Currently in the Legal Brazilian Amazon, approximately 700,000 km<sup>2</sup> of original vegetation has been replaced with farmland and urban development (Fig. 32.1a). Since 1974, the Brazilian Institute of Space Research (INPE) has monitored and recorded the annual rates of deforestation (Fig. 32.1b). There have been three trends in different years which are worth noting: first, deforestation peaked in 1994–1995, following the election of the center-left-wing president Fernando Henrique Cardoso. Second, deforestation reached another peak in 2004–2005, right after the election of left-wing president Luiz Inácio Lula da

---

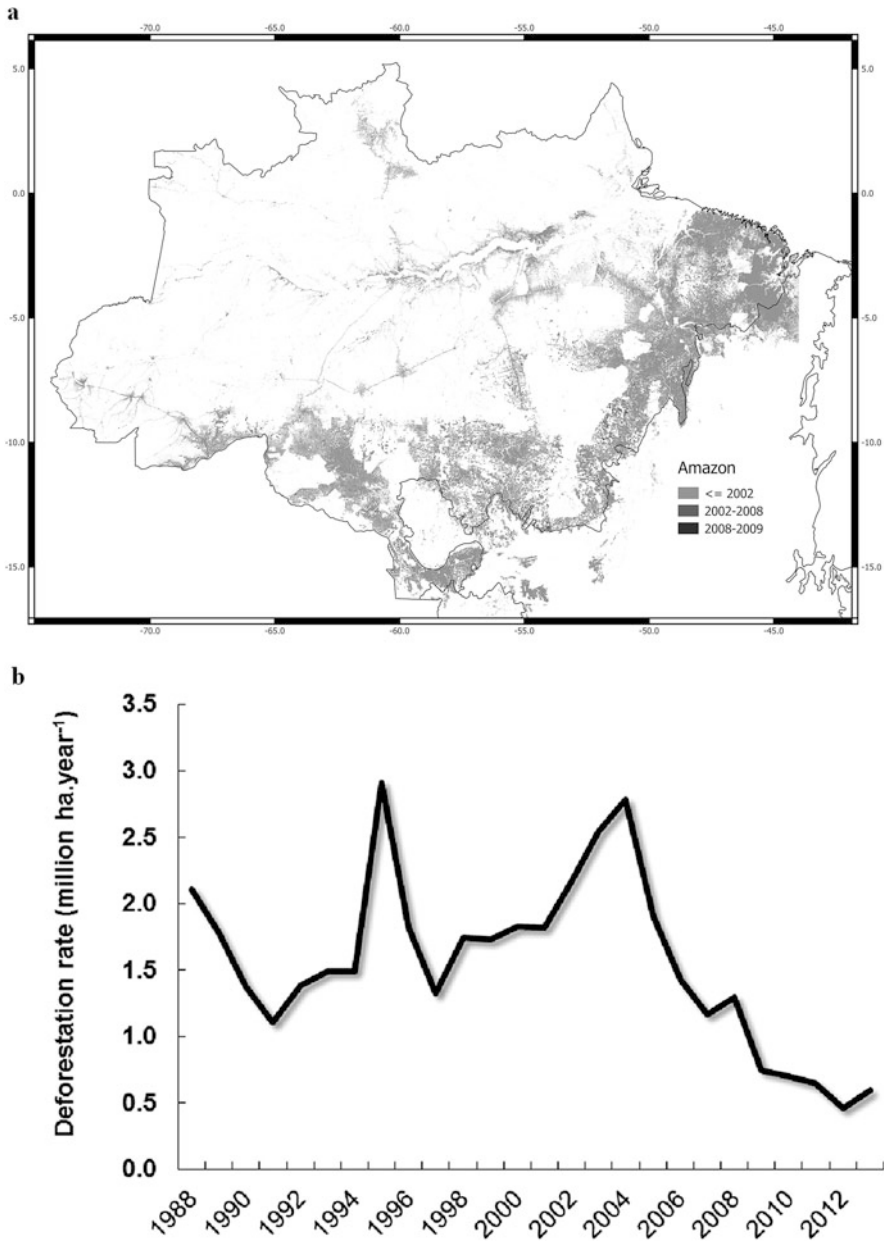

Fig. 32.1 Upper panel: map of the Legal Brazilian Amazon showing deforestation in gray tones prior to 2002, between 2002 and 2008, and between 2008 and 2009. Lower panel: deforestation rates in the Legal Brazilian Amazon. Source: PRODES-INPE

Silva (Fig. 32.1b). These peaks were probably caused by uncertainties surrounding the presidential change, as well as concomitant pent-up demand—especially because these presidents had a more leftist orientation compared to their predecessors. The third trend was in the opposite direction, seen by a steady decline in deforestation since the 2004–2005 peak.

In their research, Nepstad et al. summarize the causes of this decrease in deforestation.<sup>31</sup> They argue that deforestation declined due to a combination of factors, including an increase in governance in the municipalities where the deforestation rates were highest, coupled with a more rigorous system of surveillance and law enforcement. Another reason for the decrease in deforestation was the soybean and beef moratorium, which was an agreement between large companies not to buy soybean or beef from recently deforested areas. Lastly, after the global economic crisis of 2008 many companies could no longer afford to invest in land in the first place.<sup>32</sup> It is crucial to continue monitoring land-use changes in the Amazon region, especially because researchers have observed a small increase in the deforestation rate in 2013. In addition, 2014 was an election year and in 2015 and 2016 Brazil has been facing a profound economical and political crisis, and changes like that in government have historically led to strong variability in deforestation rates (Fig. 32.1b).

Land-use in the Amazon biome has shifted towards livestock grazing, and exotic African forage grasses have replaced most of the original Amazon vegetation. In the 1970s there were approximately three million heads of cattle, which is less than the number of cattle in the Cerrado and Atlantic Forest. In only four decades, however, the number of cattle in the Amazon has increased to more than 50 million, at an average annual increase of 125,000 heads per year. The Cerrado has also shown a rate of increase in recent decades. The total number of cattle in the Amazon is still lower than in the Atlantic Forest or Cerrado, but it is increasing by the same order of magnitude.

In the 1990s, maize was the most important crop in the Amazon biome, covering an area of 0.5 million ha. By 2012, the area of maize under cultivation has doubled to 1.0 million ha. However, since 2002 the Amazon has also seen a significant growth in the soybean crop, which currently occupies an area of approximately 1.6 million ha—larger than the area occupied by maize.

Sugarcane production has increased as well: in the beginning of the 1990s it occupied an incipient area in the Amazon, with just over 40,000 ha. By 2007–2008 it was at 100,000 ha. The government passed a law, however, that prohibited sugarcane to be cultivated on a large-scale in the Amazon biome, and as a result the sugarcane area did not change until 2012. As sugarcane has not traditionally been planted on a large-scale in the Amazon biome, its productivity has remained practically unchanged for the two last decades. During the 1990s, sugarcane productivity started at 36,000 kg ha<sup>-1</sup> and increased to only 40,000 kg ha<sup>-1</sup>. This

---

<sup>31</sup>See Nepstad et al. (2014).

<sup>32</sup>Ibid.

figure is well below the average of the Atlantic Forest biome, which is the main sugarcane producer in the country.

In contrast to sugarcane output over the 1990s, the productivity of soybean practically doubled in the same period. In the beginning of the decade its productivity was  $1500 \text{ kg ha}^{-1}$ , increasing to approximately  $3000 \text{ kg ha}^{-1}$ . Maize also increased in productivity, although at a lesser rate than the increase observed in soybean. From 1990 to 2012, maize productivity in the Amazon increased from  $1000 \text{ kg ha}^{-1}$  to  $2000 \text{ kg ha}^{-1}$ . However, while soybean productivity is not that different from other areas of the country, maize productivity is much lower, especially after taking into account the overall productivity of the Atlantic Forest biome, which totals  $10,000 \text{ kg ha}^{-1}$ .

### 32.2.2 *The Atlantic Forest*

The Atlantic Forest runs parallel to the Brazilian coast from north to south, encompassing an area of approximately  $1.5 \text{ million km}^2$  (Fig. 32.2). According to Ribeiro et al.<sup>33</sup> there have thus far been more than 20,000 identified species of plants, and more than 1500 identified species of vertebrates. The Atlantic Forest has such rich biodiversity, largely due to its multitude of different landscapes.<sup>34</sup> It spans the eastern seaboard of the country longitudinally for almost  $30^\circ$ , which gives to this biome a high range of climatic variability. In terms of topography, it encompasses the full range of lowland sea level vegetation all the way up to mountain vegetation types at over 1500 m of altitude.

The Atlantic Forest biome is also the most densely populated biome of Brazil, since most of the human population is concentrated in the coastal areas of the country. The largest cities of Brazil—among them São Paulo and Rio de Janeiro, which have now been deemed mega-cities—are concentrated in this biome. Changes in land-use in this area are not new, however, and actually began in the 1500s with the arrival of Portuguese sailors. Since then, the Atlantic Forest has experienced a series of agricultural commodity cycles, beginning with sugar mills in the northeast region of the country. This was followed by the coffee cycle that expanded toward the southeast of the country up until the economic crisis of 1929. As a consequence of the urban and agriculture expansion that began more than 500 year ago, only 11–16 % of Brazil's original forest remains.<sup>35</sup> More importantly, most of this remaining cover is highly fragmented throughout the landscape. According to Ribeiro et al.,<sup>36</sup> the majority of the fragments (>80 %) are less than 50 ha, and the average distance between fragments is almost 1.5 km. Most of the

<sup>33</sup>See Ribeiro et al. (2009).

<sup>34</sup>See Murray-Smith et al. (2009).

<sup>35</sup>See Ribeiro et al. (2009).

<sup>36</sup>Ibid.

**Fig. 32.2** The Atlantic Forest biome showing deforestation in gray tones prior to 2002, between 2002 and 2008, and between 2008 and 2009. Note that only 11–16 % of this biome’s forests remain intact

largest preserved areas of the Atlantic Forest are in the scarps of the *Serra do Mar*. Its steep slopes, coupled with its designation in 1982 as a state park, helped to save large parts of the Atlantic Forest in São Paulo. Nevertheless, landscape fragmentation in the Atlantic Forest has a deleterious effect on the fauna and flora of this biome.<sup>37</sup>

The number of cattle in the Atlantic Forest has remained relatively constant over the past few decades. In the 1990s, there were more cattle in the Atlantic Forest than in the Cerrado, with approximately 45 million animals. Between 1994 and 1996, the number of cattle was almost the same in both biomes. Later, however, the number of cattle in the Atlantic Forest plateaued; currently this biome has approximately 50 million heads.

As with the Amazon, the main crop in the Atlantic Forest is soybean. Currently, there are approximately 10 million ha cultivated with this crop, up from roughly 5 million ha in the beginning of the 1990s, showing an average growth rate of 160,000 ha per year. It is important to note the large scale of soybean production in the Atlantic Forest, because it is commonly thought that soybeans are grown almost entirely in the Cerrado and Amazon biomes—that is simply not true. However, the data show a significant increase in Atlantic Forest soybean production over the last two decades, especially in the states of Rio Grande do Sul, Paraná, and Mato Grosso do Sul.

The second largest crop in the region is maize, which covers an area of approximately 7 million ha. Most of the maize is planted in south Brazil, in the states of Rio Grande do Sul and Paraná. Unlike soybean cultivation, maize production has been relatively constant since the beginning of the 1990s. In recent years, however, there has been a sharp increase in the cultivated area of maize in the Mato Grosso do Sul state. In the search for renewable fuels there is a high demand for ethanol, which itself is derived from maize. In terms of sugarcane, the planted area in the Atlantic Forest has increased from 3.2 to 6.8 million ha in the last two decades, yielding a similar average growth rate of soybean (around 160,000 ha per year). Most of this growth took place in Brazil's southeast, and in the state of São Paulo especially.

In looking now at productivity rather than planted area, we can see that the productivity of the three major crops in the Atlantic Forest—soybean, maize, and sugarcane—has increased substantially in the last two decades. The sugarcane output, for instance, increased by 1.5 times in this period, while soybean and maize increased over 2.5 times. Soybean productivity is similar to that of other Brazilian biomes such as the Amazon and the Cerrado. The productivity of maize and sugarcane, by contrast, is highest in the Atlantic Forest. It is important to note, however, that the three crops have decreased in productivity in recent years. The decrease in sugarcane output could be explained by the economic crisis of the sugar-ethanol sector: due to the government's maintenance of an artificially low gasoline price, ethanol became a less competitive product, having a negative ripple

---

<sup>37</sup>See Ribeiro et al. (2009) and Tabarelli et al. (1999).

effect on the whole agricultural sector. Even today, sugarcane fields are still suffering from a lack of investment and a depressed market price for the crop.

### 32.2.3 *The Cerrado*

The Cerrado is the second largest biome in Brazil after the Amazon. It occupies approximately 2 million km<sup>2</sup>, or 20 % of the country's total area. It stretches from south to north in the center of the country; encompassing 11 states in total (see Fig. 32.3). In terms of biodiversity, the Cerrado's is exceptionally high,<sup>38</sup> and many scientists consider it to be the richest tropical savanna of the world.<sup>39</sup> It was estimated that more than 10,000 species of plants are present in the Cerrado, with more than 40 % endemic to this region.<sup>40</sup> One of the unique features about the Cerrado is the widespread practice of slash-and-burn agriculture. There is also a dominant matrix of C<sub>4</sub> grasses intermingled with tree varieties that may have originated from the species-rich surrounding biomes like the Amazon and the Atlantic Forest.<sup>41</sup> Each of these factors helps to create an environment in which a multitude of plant and animal species can thrive.

The soils of the Cerrado are generally poor in nutrients. They also tend to have a low pH, and as a result aluminum toxicity levels are high.<sup>42</sup> Mainly because of these characteristics, the "opening" of the Cerrado as a new agriculture frontier began with livestock in the natural grassland fields. Later on, cultivated pastures, mostly of the genus *Brachiaria* (*Urochloa*), replaced the native grasses.<sup>43</sup> In 1974, Brazil's center-west region, which encompasses a large area of Cerrado, was already home to 25 % of the total cattle in Brazil.<sup>44</sup> After the first phase of low-input livestock in the early 1970s the process known as the "Cerrado miracle" began. This "miracle" has been cited as one of the most important achievements of modern tropical agriculture. Today, much of the land in the Cerrado is used for pasture, covering 29 % of its total area. The number of cattle, at 80 million, makes up approximately one-third of the total number of animals in the country.<sup>45</sup> From an agricultural perspective, the Cerrado is highly productive.

<sup>42</sup>See Sousa et al. (2001).

<sup>43</sup>See Sano et al. (2010).

<sup>44</sup>See Brazilian Institute of Geography and Statistics (2012).

<sup>45</sup>See Sano et al. (2010).

**Fig. 32.3** The Cerrado biome showing deforestation in gray tones prior to 2002, between 2002 and 2008, and between 2008 and 2009. Note that almost half of this biome has already been altered by pasture and crop systems

The physical characteristics of the Cerrado soil make it well suited for agriculture. It is deep, well-drained, and the topography is mostly flat which facilitates mechanical harvesting. However, besides the negative soil characteristics cited in the previous

paragraph, low calcium content is also observed.<sup>46</sup> These issues were solved by liming soils of agricultural use, which helped to raise the soil pH, increase calcium content, and decrease aluminum toxicity. Additionally, the Brazilian Agricultural Research Corporation (EMBRAPA) has specially designed soybean varieties that are adapted to the Cerrado soil conditions. Of the total area of the Cerrado biome (2 million km<sup>2</sup>), approximately 60 % is still preserved (see Fig. 32.3).<sup>47</sup> Nevertheless, although more than half of the Cerrado is protected, it is important to note that in recent decades the conversion rates of the Cerrado have been similar to the rates observed in the Amazon region: the Cerrado has experienced a loss of about 16,000 to 17,000 km<sup>2</sup>year<sup>-1</sup>. As in other Brazilian biomes, conversion rates in the Cerrado have decreased in recent years, reaching approximately 6000 km<sup>2</sup> in 2010.<sup>48</sup> These and other statistics indicate that conservation efforts are having the desired effect of protecting such valuable regions.

The IBGE-SIDRA databank is a useful source of information on land-use changes in the Cerrado.<sup>49</sup> Reviewing the data calls attention to the fact that in 1974 the number of cattle in this biome was approximately 30 million animals; 20 years later, the number had more than doubled to approximately 80 million. Therefore, the Cerrado continues to support a significant proportion of Brazilian cattle. If we assume that in Brazil an average of one hectare goes to supporting one head of cattle, the area occupied by livestock in the Cerrado would be roughly 80 million ha. The area occupied by major crops has also been increasing, and the most important today is soybean. At the beginning of the 1990s it occupied an area of only 4–5 million ha, but 20 years later it had jumped to an impressive 13 million ha—an increase of more than threefold.

Maize and sugarcane are also significant crops in the Cerrado's agricultural economy. Maize occupies the second largest area, at approximately 6 million ha. In the early 1990s, maize production was roughly one-third of what it is today. Similarly, sugarcane plantings began increasing in 2004 *in tandem* with ethanol production. As potential areas for the crop's expansion became increasingly scarce and more expensive in Brazil's southeast, the Cerrado was the next natural area for cultivating sugarcane. Over the past two decades, the area of sugarcane increased from approximately 0.6 million ha in the beginning of the 1990s to almost 2.5 million ha in 2012—an almost fourfold increase in the last 22 years. According to Ribeiro et al., until 2008 sugarcane was mostly replacing pasture areas (65 %), as opposed to other crops and natural vegetation (35 %).<sup>50</sup> Currently, there is no data available on the expansion of sugarcane in the last 5 years, and as such it is difficult to evaluate the effects of the recent crisis on the Brazilian sugar-ethanol sector. It is also difficult to measure the extent to which sugarcane is replacing other crops and expanding into natural vegetation areas. The combination of expanding cropland,

<sup>50</sup>See Ribeiro et al. (2009).

increasing number of livestock, lack of preservation efforts, and the absence of a well-established and routinized deforestation surveillance program all suggest that the expansion of agriculture in the Cerrado is not yet over.<sup>51</sup>

## **32.3 Environmental Consequences of the Growth of Brazilian Agriculture**

### ***32.3.1 Environmental Issues with Agricultural Expansion***

One consequence of Brazilian agriculture's rapid growth is the replacement of original vegetation with crops. As seen in the Amazon biome, there have been phases in history when the original vegetation was suppressed for land speculation purposes. The same is true for the Cerrado and especially for the Atlantic Forest, where land speculation for urban purposes has always been an important issue. Recently, however, the agricultural intensification in Brazil has not necessarily gone hand in hand with deforestation.<sup>52</sup> In each of the three major biomes, in fact, there has been a significant decrease in deforestation rates while the output of major commodities has remained unaffected.

Several authors have analyzed the reasons behind this reversal of the previous relationship between agricultural expansion and deforestation.<sup>53</sup> All agree that a series of conditions converged in order to decrease deforestation while allowing for agricultural growth: the creation of more protected areas; the presence of law enforcement in areas where illegal deforestation occurs; credit limits in municipalities with high rates of deforestation; and interventions in soybean and beef chains.<sup>54</sup> These measures, however, rely largely on the participation of corporations, and they could decide in the future that this deforestation moratorium is no longer worth upholding. With this in mind, government policies should rely less on punitive measures and instead place a greater emphasis on incentives that will encourage stakeholders to protect the natural vegetation.<sup>55</sup>

### ***32.3.2 Vegetation Burning***

One of the most destructive features of deforestation is the intentional burning of forest. In Brazil, as in most tropical countries, deforestation occurs by logging a few

---

<sup>51</sup>See Sano et al. (2010) and Lapola et al. (2014).

<sup>52</sup>See Lapola et al. (2014).

<sup>53</sup>See Nepstad et al. (2009, 2014), Barretto et al. (2013), and Lapola et al. (2014).

<sup>54</sup>See Nepstad et al. (2014).

<sup>55</sup>Ibid.

trees per hectare for timber, and then burning the rest of the vegetation. In addition to this practice, slash-and-burn farming methods are widely used in Brazil as a management tool to “clean” the pastureland for non-forage species, as well as in sugarcane fields to facilitate harvesting. In the Atlantic Forest biome, for instance, burnings of sugarcane fields are still common, although in some states (such as São Paulo), only 20 % of the sugarcane fields are burned—and these burnings could end by 2021.

The burning of vegetation has several environmental and public health consequences. Several studies link vegetation burning with various human diseases. In the southeast and Amazon regions, for example, burning practices have led to a sharp increase in respiratory problems.<sup>56,57</sup> Furthermore, the effects of burning on human health are not restricted to respiratory diseases: recently, a series of studies has shown a clear correlation between vegetation burnings and other health issues. Arbex et al., for instance, found that slash-and-burn agriculture increased cases of hypertension in regions where farmers practice these methods.<sup>58</sup> Barbosa et al. also reported an increase in cardiovascular disease in the areas that they studied.<sup>59</sup> Similarly, researchers found a higher incidence of cancer in areas with high vegetation burning, likely due to the emission of polycyclic aromatic hydrocarbon (PAHs).<sup>60</sup>

Along with human health, burning vegetation also affects the soil and atmosphere. One short-term benefit of vegetation burning in poor tropical soils is fertilization from the resulting ash. This effect is especially important for the many small family farms in the Amazon region that cannot afford to use mineral fertilizers. Despite this short-term boost, however, most other positive soil properties are reduced by the burnings. For instance, several authors found that sugarcane burning induces soil erosion by increasing soil compaction and decreasing the soil’s water content.<sup>61</sup> Burning also diminishes the vegetation’s ability to fix carbon into the soil. At the same time, carbon stocks in the soil are crucial to combatting current climate change because they help to reduce carbon emissions from the terrestrial system into the atmosphere. In their research, Galdos et al. showed that when sugarcane is burned during harvesting, the carbon soil stock is lower than when sugarcane is not burned for harvesting.<sup>62</sup> This could be an important advantage for the Brazilian ethanol industry in terms of fuel energy efficiency.<sup>63</sup>

---

<sup>56</sup>See Cançado et al. (2006), Goto et al. (2011), Riguera et al. (2011), Tsao et al. (2011), and Prado et al. (2012).

<sup>57</sup>See Jacobson et al. (2012).

<sup>58</sup>See Arbex et al. (2010).

<sup>59</sup>See Barbosa et al. (2012).

<sup>60</sup>See Magalhães et al. (2007) and Andrade et al. (2010).

<sup>61</sup>See Dourado-Neto et al. (1999), de Oliveira et al. (2000), and Tominaga et al. (2002).

<sup>62</sup>See Galdos et al. (2010).

<sup>63</sup>See Mello et al. (2014).

Effects of vegetation burning on the atmosphere became widely recognized after Crutzen and Andreae's seminal study in 1990.<sup>64</sup> Aerosol particles are of particular concern in areas of intense biomass burning, like in the Amazon biome.<sup>65</sup> These particles form part of the atmosphere's radiative budget over the Amazon,<sup>66</sup> and they affect the concentration of cloud condensation nuclei (CCNs). In turn, the concentration of CCN affects cloud albedo and rain droplet formation.<sup>67</sup> Studies show that aerosols produced in Amazon fires not only affect regional precipitation,<sup>68</sup> but also the precipitation distribution in other areas of the continent (for example, as aerosols from Amazonia shift around in air currents).<sup>69</sup> Just recently, researchers demonstrated that the La Plata Basin precipitation distribution is directly affected by the presence of Amazon aerosols in the atmosphere.<sup>70</sup> This finding is particularly important given that the La Plata Basin serves as a vital breadbasket for the whole South American region.<sup>71</sup>

Vegetation burning is also a serious environmental concern because soil erosion leads to soil degradation, which causes siltation in nearby water bodies and thus negative changes in aquatic systems.<sup>72</sup> Erosion in sugarcane fields in Brazil has been relatively well documented, and it is linked to the fact that most soil losses occur when the land is not covered by vegetation—such as after crops have been burned. Compounding the environmental issues is the fact that Brazil's sugarcane industry follows poor soil conservation practices and does little to prevent soil erosion from occurring in the first place.<sup>73</sup>

### 32.3.3 *Pesticides and Fertilizers*

Another environmental issue related to Brazil's agricultural expansion is that of chemical pesticides and fertilizers. With poor land care, soil particles transport pesticide run-off from fields to water bodies. This is of particular concern in a country like Brazil, which is one of the largest consumers of pesticides in the world. In just one decade, Brazil increased pesticide consumption four-fold, going from approximately 20,000 tons to almost 80,000 tons per year between 1990 and 2001. Despite this sharp increase in consumption, there are relatively few studies that look at pesticide contamination of soil and water bodies. This lack of information

<sup>72</sup>See Martinelli and Filoso (2009).

<sup>73</sup>See Hartemink (2008) for a review.

precludes a full evaluation of the environment and human health risks involved in the use of these compounds. Undertaking such an evaluation, however, is vital considering that in 2009 there were 225 and 457 formulations registered for use in sugar cane and soybean cultivation, respectively.<sup>74</sup> More important, approximately 40 % of the formulas used on sugarcane and 50 % of those used on soybeans are considered extremely toxic to human health.<sup>75</sup> Not only that, but half of the formulas used for sugarcane and soybean production are considered highly dangerous to the environment.<sup>76</sup>

The use of fertilizers in agriculture has several effects on long-term environmental sustainability. Inputs of nitrogen and phosphorus impose a strong limitation on plants, as these nutrients dictate how big and productive they will become. This is particularly true for crops that were engineered to be highly productive, since alongside this trait comes their requirement for high levels of fertilizer. On the other hand, a lack of fertilizer—as is the case in some African countries—can lead not only to hunger, but to soil degradation as well. Crops extract nutrients from the soil, and over time they become less productive, decreasing the overall soil cover and leading to erosion that depletes the soil even further. In order to prevent this vicious cycle from occurring, farmers need to replenish soil nutrients—and fertilizers are often the most easily available option.

On the other hand, the excessive use of fertilizers leads to a surplus of nutrients in the soil, and these nutrients—especially nitrogen—become significant contaminants of the soil, atmosphere, and water bodies.<sup>77</sup> In Brazil, fertilizer consumption increased rapidly after the mid-1990s. This trend has continued relatively unchanged since, although from 2008 to 2009 there was a sharp decrease in consumption due to the global economic crisis. After 2009, however, fertilizer consumption continued to rise. Despite the demand for fertilizer in Brazil, its overall use still remains lower than that of the United States (US) and the European Union (EU). One of the metrics used to measure fertilizer consumption is to estimate the amount of N-fertilizer used in an area of arable land, including permanent crops. In Brazil, the N-fertilizer used in 2012 was approximately 50 kg ha<sup>-1</sup>, which is lower than the 70 and 90 kg ha<sup>-1</sup> used in the US and EU, respectively. Almost the same amount of phosphorus and potassium is applied per hectare in the country.

Even while Brazil consumes less fertilizer than other countries, it is important to note that no matter the total amount used in agriculture, plants cannot take up all of the fertilizer applied. Under good growing conditions, plants can take up to 40 % of the applied fertilizer, however most of the time this rate is less than 30 %. Therefore, there will always be fertilizer left in the field. Unlike phosphorus and potassium which can be trapped by the acidic tropical soil, nitrogen gets converted to N<sub>2</sub>, which is inert, and N<sub>2</sub>O, which is a potent greenhouse gas (GHG). While GHG emissions from fertilizer are notable, the Brazilian agricultural sector's main source

---

<sup>74</sup>See Schiesari and Grillitsch (2011).

<sup>75</sup>See Schiesari and Grillitsch (2011).

<sup>76</sup>See Schiesari and Grillitsch (2011).

<sup>77</sup>See Galloway et al. (2008).

of GHG emissions comes from enteric fermentation in cattle, along with the use of manure. Regardless, scientific research is increasingly calling attention the fact that GHG emissions are intimately linked with Brazil's agricultural development and have been increasing parallel to agricultural expansion.

With deforestation rates decreasing across the major biomes, there has been an important change in Brazil's overall GHG emissions. While previously emissions of GHG were primarily tied to land-use changes (deforestation), they now stem primarily from agricultural activities. In the 1990s, for instance, land-use GHG emissions were equivalent to 70 % of the agricultural emissions; by 2010, this proportion had decreased to only 30 %. Nevertheless, GHG emissions from agricultural land use in 2010 were still responsible for almost 60 % of *total* Brazilian GHG emissions.<sup>78</sup> Brazil's natural environment is certainly benefiting from the decrease in deforestation over recent years, and these GHG statistics demonstrate how land-use changes and the agriculture sector are possible contributors to global warming. This is the main reason that the country should adopt any possible measure to decrease its GHG emissions linked to these two sectors.

Deforestation is also relevant to the conversation about biodiversity, since destruction of habitat is responsible for most of the biodiversity loss on the planet, and the resultant loss of ecosystem services.<sup>79</sup> Biodiversity is not only important in terms of the ethical and aesthetic value of the flora and fauna; biodiversity itself helps to create the environmental conditions for a successful agriculture industry. For example, a good proportion of nitrogen input in Brazilian soybeans comes from biological nitrogen fixation (BNF) through a symbiosis process between the soybean plant and a *Rizhobium*-like bacterium.<sup>80</sup> Although genetic manipulation of the plant and bacterium has made them more efficient N-fixers, the process is still a natural one and has been a key component of the soybean expansion over such a large area in Brazil.<sup>81</sup> The pollination of coffee plants is also a valuable ecosystem service that depends on insects, which in turn depend on forests to survive. Therefore, the rich biodiversity of Brazil should be preserved at all costs not only for the sake of biodiversity itself, but also to ensure the functioning of the vital environmental services that make agriculture possible.

## 32.4 Sustainable Agriculture: A Win-Win Choice

By any metric, Brazil is exceptionally rich in its biodiversity, especially in the biomes of the Amazon, Atlantic Forest and the Cerrado. Likewise, by any metric, Brazil is also outstanding with regards to its development in tropical agriculture

---

<sup>78</sup>See Lapola et al. (2014).

<sup>79</sup>See Dirzo and Raven (2003).

<sup>80</sup>See Alves et al. (2003).

<sup>81</sup>See Alves et al. (2003).

over the last two decades. However, Brazilian agriculture growth is not only based on intensification (i.e., an increase in the productivity of the same land area and in the same location). This growth is also due to *extensification*, or the increase total agricultural area by expansion over natural vegetation. It is time to reconcile both preservation and agricultural growth. Agricultural sustainability in Brazil is still a long way off, and indeed it is much easier to *talk* about sustainability than to actually implement it. Nevertheless, implementing sustainable agriculture in Brazil is imperative, and not only because Brazil is one of the few countries in the world that still has most of its mega biodiversity preserved. It is also the first tropical country to develop a technically advanced agricultural sector. By making sustainable agriculture integral to agricultural expansion, Brazil can ensure the protection of its natural resources while providing nutritious and sufficient food for its growing population.

Sustainable agriculture recognizes the value of the landscape on which the agriculture sector depends, while supporting the preservation of valuable ecosystem services such as BNF, insect pollination, and natural pest control.<sup>82</sup> Sustainable agriculture also acknowledges that agro-ecosystems are simplifications of more complex, natural ecosystems. Therefore, one of the objectives of sustainable agriculture is to transform the simplistic agro-ecosystem into a more complex system in order to increase functional diversity.<sup>83</sup>

A series of specific agricultural techniques can aid in the development of this more complex system. Maybe the simplest one is no-till or minimum till farming, which consists of leaving crop residues from the previous harvest lying in the fields, thereby minimizing the exposure of bare soil. No-till methods build-up soil's organic matter and increase carbon stocks, which helps to mitigate the effects global warming.<sup>84</sup> The increase of soil organic matter content is followed by a general increase in nutrients, because organic matter enhances the soil's exchange capacity. Building up organic matter also protects against rain splash and compaction, preventing surface runoff and ultimately soil erosion.<sup>85</sup> Estimates of the area under no-till in Brazil vary substantially: SIDRA-IBGE reports that there are approximately 18 million ha under no-till,<sup>86</sup> while Boddey et al. estimate this area to be over 25 million ha.<sup>87</sup> In conjunction with no-till, crop rotation is another important technique as it keeps the soil permanently covered and prevents nutrient loss by maintaining a continuous cycling of nutrients in the soil-plant system.<sup>88</sup> Under proper crop rotation methods, it is common to replace a cash crop with a

<sup>88</sup>See Zanatta et al. (2007) and Vieira et al. (2009).

nitrogen-fixing cover crop once the former is harvested.<sup>89</sup> Part of this extra nitrogen from the BNF is used by the next cash crop. Overall, this practice decreases the use of nitrogen fertilizers, prevents the nitrogen contamination of soil and water, decreases N<sub>2</sub>O emissions, and saves farmers money by allowing them to spend less on mineral fertilizers.<sup>90</sup>

Another way to increase complexity in agro-ecosystems is by adding animals that will improve and increase nutrient cycling in soil-plant systems. These systems are not simple to manage; indeed, it is important to choose the appropriate stocking rates of animals to avoid excessive nutrient mining from the soil and ensure that the vegetation biomass of forage crops will be sufficient for mulching the next crop. In return, however, animals promote better economic yields for farmers, improve physical, biological, and chemical soil properties, and boost the productivity of subsequent crops.<sup>91</sup>

In Brazil, these complex agro-ecosystems are particularly developed in the south, where there are several well-established crop-livestock operations. On larger farms, for instance, mechanized soybean is planted in the summer while forage crops for beef cattle are planted in the winter. On smaller properties, maize, rice, beans, and other crops are combined with dairy cattle, sheep, and goats to create a diverse farm system.<sup>92</sup> In the Cerrado and Amazon biomes, these cropping methods were first implemented as a strategy for restoring degraded pastures.<sup>93</sup> More recently, farmers have adopted mixed crop-livestock systems as a long-term management practice for their farms.<sup>94</sup>

## 32.5 Conclusion

Brazil has still a long way to go towards agricultural sustainability; however, the impressive development of Brazilian agriculture in recent decades, coupled with improved dialogue between the agricultural and environmental sectors, gives us hope for the future. This dialogue needs to progress towards a common goal that will maintain ecosystem services while preserving them for the following generations. The only way to address this challenge is to end deforestation in Brazil, and at the same time make optimal use of the abundant cleared land that is already available. The Brazilian government must adopt regulations to facilitate the construction of more complex agri-scapes that go beyond monocultures. Together with agricultural stakeholders, the government must work towards creating a functional

## Chapter 33

# Food Law in Mexico: Regulatory Framework and Public Policy Strategies to Address the Obesity Crisis in Latin America

Rebeca López-García

**Abstract** Mexico has a structured, institution-based food legislation system. The development of Food Law in Mexico has been an evolving process that has been molded and adapted by different challenges such as the opening of the Mexican market to numerous free trade agreements; the development of new technologies in agriculture and food processing; and the very complex health issues as related to food and nutrition, mainly matters related to the growing overweight and obesity problem and its impact on chronic disease. The system is founded on the Political Constitution of the United Mexican States where it is specifically affirmed that the protection of health is guaranteed. In 2011, the right to nutritious, sufficient and quality food was elevated to Constitutional right. Thus, all laws, regulations and norms associated with food including those developed to address the obesity crisis are based on Constitutional rights. Mexico, ranks among the highest in the list of most obese countries with alarming predicted obesity rates that will surmount the country's ability to face the expense associated with treating the diseases associated with the overweight and obese population. Thus, there has been a need to develop public policies that specifically address this crisis to try to slow down, or even better, reverse the trends. Mexico has adopted different public policies that follow the intervention strategies recommended by the Organization for Economic Cooperation and Development (OECD) that include: taxation of foods with high caloric density and sugary beverages, front of panel nutritional labeling, establishment of nutritional criteria for foods offered in schools and restricting advertisement of foods and beverages targeted to children. Other countries in Latin America are facing a similar crisis. Thus, different strategies implemented in Peru, Chile and Ecuador will also be discussed. The approaches taken in each country provide excellent examples of public policy and regulations that are used as an intervention of a system in order to solve a social problem. The only real measure of success will be evident if there is a positive impact in public health in the long term. Obviously, since this is a multifactorial problem, it will require multiple approaches. All strategies must have a solid scientific basis, have a proper regulatory basis for

implementation, be relevant to the population and provide useful and understandable information to ultimately have the desired positive impact.

### 33.1 Introduction

The development of food law in Mexico has been an evolving process that continues to address different challenges. These include the opening of the Mexican market to numerous free trade agreements; the development of new technologies in agriculture and food processing; and the very complex health issues related to food and nutrition, primarily obesity and its associated impact on chronic disease. The Mexican food industry has experienced a profound transformation since the late 1980s when Mexico joined the General Agreement on Tariffs and Trade (GATT, now the WTO) and more prominently since 1994–1995 when the North American Free Trade Agreement (NAFTA) finally opened Mexico's borders to free trade. Since Mexico used to be such a protected market, these events had a significant impact in many areas; food production and processing were not untouched. The food law and regulations arena rapidly evolved as laws, regulations and norms had to be updated or developed to adapt to the open market and the challenges presented by the new conditions in addition to harmonizing them with international regulations. In some cases, this has been challenging since Mexican cuisine is so varied and traditional products are so unique that some food categories that are important in Mexico do not match the *Codex alimentarius* food categories. Thus, harmonization of issues such as the approval of food additives has been difficult.

In Mexico, there has been a continuous evolution and improvement of the regulatory processes. During the 1980s, the regulation of several activities and the productive sector was excessive and in many cases, the implementation was not possible due to the prevalent economic conditions in the country. As implied above, joining the GATT led to an opening process that inevitably resulted in changes to the regulatory process and the development of public policies. In 1989, the federal government started a restructuring process in several areas of the economy to prepare the country for the transition from a low activity protected economy to international commerce. In 1995, a new program to improve regulation and simplify the regulatory process to promote economic activity was established. Finally, National Commission for Regulatory Improvement (COFEMER, for its acronym in Spanish) was created in 2000 and its activities have impacted all regulatory processes including developments that impact the food industry. According to the COFEMER, the regulatory improvement is part of a public policy whose objective is to promote transparency and the development and application of regulations that generate benefits that are greater than the costs and are advantageous to society.<sup>1</sup>

### **33.1.1 Overview of Mexican Food Law, Regulation and Context of Legal Structure**

Mexico has a structured, institution-based food legislation system. The Political Constitution of the United Mexican States is the fundamental law of the Mexican State in which Article 4 specifically guarantees the protection of health.<sup>2</sup> According to Mexico's National Standards Office (*Dirección General de Normas—DGN*), a division of the Secretariat of Economy (*Secretaría de Economía*), formerly known as the Department of Commerce and Industrial Development (SECOFI), there are four basic principles in the legislative process: representation, consensus, modification and updating. According to these principles, the regulatory process is multidisciplinary and standards deriving from it are “living documents” that can be modified as new needs and information arises. In many cases, a particular product or service may not be covered by a specific norm even if it is covered by horizontal norms. If leaving this product or service unregulated has an impact on consumer health, the environment or the country's natural resources, then a mandatory standard or norm is proposed and goes through the whole approval process. All regulatory actions, regardless of the agency of origin, are published in the official gazette and a period for public comment is open before the law is finalized.

The law provides for two distinct types of standards. The first one is based on official, mandatory rules and is called Official Mexican Norms (*Normas Oficiales Mexicanas—NOMs*). The second type is a set of voluntary references to determine the quality of goods and services. Compliance with NOMs is mandatory, and once a NOM has been published, it applies to all pertinent products in the market, including imports. NOMs are directly related to safety, public health, protection of natural resources or consumer protection. Thus, quality issues are excluded unless these have a direct effect on one or more of the issues aforementioned. NOMs can be of either a horizontal or vertical nature. An example of a horizontal standard is NOM-120-SSA1-1994, Goods and Services regarding hygienic and sanitary practices for food and beverage processing, which was published on August 28, 1995.<sup>3</sup> This standard is the equivalent to the Good Manufacturing Practices in the United States (21CFR110). An example of a vertical standard is NOM-035-SSA1-1993, Goods and Services, which was published on January 30, 1995 and provides sanitary specifications for whey cheeses.<sup>4</sup> This standard is very specific and deals with the sanitary specifications and standards for a specific type of cheese.

Article 39 of the Organic Law of the Federal Public Administration establishes the responsibilities of the Secretariat of Health (*Secretaría de Salud*) which include acting as the sanitary authority and exercising general health faculties as legally

---

<sup>2</sup>Constitución Política de los Estados Unidos Mexicanos (1917), Article 4.

<sup>3</sup>Secretaría de Salud (1995b), NOM-120-SSA1-1994.

<sup>4</sup>Secretaría de Salud (1995a), NOM-035-SSA1-1993.

conferred by the Federal Executive, as well as overseeing the implementation of the General Health Law (*Ley General de Salud*), also known as, Article 17, its regulations and other applicable dispositions.<sup>5</sup> Mexico's food laws are part of and determined by its overall regulatory process. It should be noted that there is no special track for food laws by themselves. Most laws pertaining to food quality and composition regulation are based on the Federal Law of Metrology and Standardization (*Ley Federal Sobre Metrología y Normalización*),<sup>6</sup> which was originally published in the official government gazette (*El Diario Oficial*) on July 1, 1992; the General Health Law originally published on Feb. 7, 1984<sup>7</sup>; and the Regulation on Sanitary Control of Products and Services (*Reglamento de Control Sanitario de Productos y Servicios*).<sup>8</sup> The General Health Law provides the legal foundations for ensuring the right to health for all Mexicans.

The General Health Law (see footnote 3) establishes the duties of the Secretariat of Health, which are exercised through the Federal Commission for the Control of Sanitary Risks (COFEPRIS). These faculties concern the sanitary regulation and the control and promotion of: health establishments, disposal of organs, tissues, human cells and their components, disposal of blood, drugs, herbal remedies and other health related goods and services, food and dietary supplements, alcoholic and non-alcoholic beverages, cosmetics, products for beauty and grooming, tobacco, pesticides and fertilizers, vegetable nutrients, toxic substances or substances that represent a risk to health, essential chemicals, chemical precursors, narcotics and psychotropic drugs, biotechnological products, raw materials and additives as well as establishments which process or store these, sources of ionizing radiation for medical use, basic sanitation, imports and exports, publicity and promotion of activities, products and services as referred to by the law and other applicable dispositions, international sanitation or in general, the requirements for sanitary conditions that must be met by processes, products, methods, installations, services or activities related to the above-mentioned materials. Hence, COFEPRIS is responsible for identifying, analyzing, evaluating, regulating, promoting and disseminating the conditions and requirements for the prevention and handling of sanitary risks. COFEPRIS also issues official certificates for the sanitary condition of processes, products, methods, installations, services or activities related to materials as well as issuing, postponing or revoking sanitary authorizations under its jurisdiction. COFEPRIS exercises authority concerning sanitary regulation, control and promotion as established in or derived from the law and its NOMS, the current regulation and any other applicable dispositions. This agency is also responsible for evaluating and ensuring sanitary risks in conjunction or cooperation

---

<sup>5</sup>El Congreso General de los Estados Unidos Mexicanos (2013c), Ley Orgánica de la Administración Pública Federal.

<sup>6</sup>El Congreso General de los Estados Unidos Mexicanos (2014a), Ley Federal Sobre Metrología y Normalización.

<sup>7</sup>El Congreso General de los Estados Unidos Mexicanos (2014b), Ley General de Salud.

<sup>8</sup>COFEPRIS (2014), Reglamento de Control Sanitario de Productos y Servicios.

with other competent authorities, imposing administrative sanctions for non-compliance with the dispositions of the law, its regulations and other applicable ordinances. Furthermore, COFEPRIS determines the safety, preventive and corrective measures within the scope of its competencies, exercises corresponding acts of sanitary control, regulation and promotion in order to prevent and reduce the sanitary risks derived from the population's exposure to chemical, physical and biological factors.

Therefore, according to the General Health Law, the sanitary control of the processing, importation and exportation of all foods and beverages is the responsibility of the Secretariat of Health (*Secretaría de Salud*). Additionally, DGN coordinates the regulatory process. Other federal agencies may promulgate regulations within their jurisdictions but they must work through the Secretariat of Economy. Some of the agencies involved in promulgating standards that affect agricultural and food products include the Secretariat of Agriculture, Livestock and Rural Development (SAGARPA); Secretariat of Natural Resources and Environment (SEMARNAP); and Secretariat of Health (SS).

One challenge in understanding the system is that most documents are “working documents” and the timing for updating may not be perfectly coordinated. For example, in the case of food and food products, information in each published document may not be consistent. Thus, understanding the hierarchy of the system is quite helpful to determine the most applicable disposition. For any issue, one must consult the appropriate framework in descending order of hierarchy: Constitution, law, regulation, norm, and agreement.

### ***33.1.2 Food Labeling and Nutritional Claims***

Food labeling has been a hot topic in Mexico for several years since NOMs were updated on several occasions. As new issues have been identified, food labeling has been acknowledged as a way to address these challenges and develop public policy. In general, food labeling is defined in Title XII, Chapter I, Articles 212, 213, and 214 of the General Health Law<sup>9</sup> and mandates that foods and non-alcoholic beverages labels must include nutritional information and have information that can be compared to the intake recommendations made by sanitary authorities. The law also requires the Secretary of Health to publish the appropriate Official Mexican NOMs in the gazette. The Regulation for Sanitary Control of Products and Services provides definitions and more specific information about the application of dispositions established in the Health Law. The regulation also refers to the NOMs that outline the requirements for labeling. Chapter II (Article 25)<sup>10</sup> of this

---

<sup>9</sup>Ley General de Salud (2014b), Título Decimosegundo, Capítulo I, Artículo 212 at p. 53.

<sup>10</sup>Reglamento de Control Sanitario de Productos y Servicios (2014), Capítulo II, Artículo 25 at p. 5.

regulation provides general guidance on the required information on a label. The label must not include any reference to illnesses, syndromes, signs or symptoms or any anatomic or physiologic data. There are two NOMs that are directly related to food labeling:

- Mexican Official Norm NOM-086-SSA1-1994, Goods and Services—Foods and Nonalcoholic Beverages with a Modified Composition under Nutritional Specifications<sup>11</sup> and its subsequent updates; and
- Mexican Official Norm NOM-051-SCFI/SSA1-2010, Goods and Services—General labeling specifications for pre-packaged food and non-alcoholic beverages—commercial and food safety information, published on April 5, 2010<sup>12</sup> and its subsequent updates.

These NOMs have been updated and adjusted to accommodate the new public policy measures that address obesity in Mexico, as described later in this chapter.

Although long overdue, NOM-086 has not been fully updated since its original publication, violating the official dispositions that mandate a full review and update every 5 years. This review is necessary to address issues pending with the authorization of health claims and develop specific definitions of permissible claims. During the last update of NOM-051, a section on health claims was included but it lacked the necessary details for proper control and guidance to obtain appropriate approval for a potential claim. Table 33.1 identifies and defines all general permissible claims in Mexico (mainly nutrient content and comparative claims as defined in the *Codex alimentarius*).<sup>13</sup> It is important to understand that, according to the most recent NOM-051-SCFI/SSA1-2010, the potential for making health claims is quite limited. No pre-packaged food or non-alcoholic beverages will be described or presented with false, wrong or misleading information, or in any other way that may mislead the consumer on the product's nature. Impermissible declarations are those that lead consumers to believe that a balanced diet based on ordinary foods cannot provide enough nutrients; cannot be proven; claim usefulness of the food or non-alcoholic beverage to prevent, treat or cure an illness, syndrome or physiologic condition; question the safety of an analog of the food or non-alcoholic beverages or may cause or provoke fear; and state that a particular food is an adequate source of all the essential nutrients. According to the same NOM, examples of misleading property declarations also include those that are unclear and contain comparisons and incomplete superlatives or refer to proper hygiene or trade such as genuine or healthy except of those indicated in other applicable law ordinances. Interestingly, according to these dispositions, labels should not contain any reference to

<sup>13</sup>Codex alimentarius (1997), Guidelines for the Use of Nutrition Claims.

**Table 33.1** Definitions of claims allowed in Mexico

Claim	Definition
Sodium free	Total sodium content is less than 5 mg/serving
Very low sodium	Total sodium content is less than or equal to 35 mg/serving. When a serving less than or equal to 30 g., sodium content must be less than or equal to 35 mg/50 g of product
Low sodium	Total sodium content is less than or equal to 140 mg/serving. When the serving is less than or equal to 30 g., sodium content must be less than or equal to 140 mg/50 g of product
Reduced sodium	Total sodium content is at least 25 % less than the content in the original product
Fat free	Fat content is less than 0.5 g/serving
Low fat	Fat content is less than or equal to 3 g/serving. When an individual serving is less than or equal to 30 g, total fat content must be less than or equal to 3 g/50 g of product
Reduced fat	Fat content is at least 25 % less than the content in the original product
Low saturated fat	Saturated fat content is less than or equal to 1 g/serving
Reduced saturated fat	Saturated fat content is at least 25 % less than the content in the original product
Cholesterol free	Cholesterol content is less than 2 mg/serving and the saturated fat content is less than or equal to 2 g/serving
Low cholesterol	Cholesterol content is less than or equal to 20 mg/serving. If an individual serving is less than or equal to 30 g., then the cholesterol content must be less than or equal to 20 mg/50 g of product
Reduced cholesterol	Cholesterol content is at least 25 % less than the content in the original product
No calories	Calorie content is less than 5 cal/serving
Low calorie	Calorie content is less than or equal to 40 cal/serving. When a serving is less than or equal to 30 g, calorie content must be less than or equal to 40 cal/50 g of product
Reduced calorie	Calorie content is at least 25 % less than the content in the original product
Gluten free	Total nitrogen content of the cereal used in the product must not exceed 0.05-g/100 g of dry matter. Vitamin and mineral content should not be less than that in the original product
Sugar free	Sugar content is less than 0.5 g/serving
Reduced sugar	Sugar content has been reduced at least 25 % from the original product

Source: NOM-086-SSA1-1994

certifications related to food safety since all food sold in the country should be processed under proper hygienic conditions.

Certain conditional property declarations are allowed according to NOM-051. For instance, a label can indicate that a food has acquired a special or superior nutritive value because of the addition of nutrients such as vitamins, minerals and amino acids but only if such addition has been made based on nutritional considerations according to the applicable law ordinance. Statements about the product's special nutritional qualities resulting from the reduction or lack of a nutrient can

also be made based on the nutritional considerations but is subjected to the applicable law ordinance (see Table 33.1). Usage of terms such as “natural,” “pure,” “fresh,” and “homemade,” “organically grown” or “biologically grown” must adhere to the applicable law ordinance and comply with the prohibitions mentioned earlier. A food’s ritual or religious preparation, for example Halal and Kosher, can be declared as long as the declaration is done according to the rules of the religious authorities or corresponding ritual. Declarations of properties that state that the food has special characteristics when all of the foods of the same kind have the same characteristics and is apparent in the declaration of properties are also allowed. Moreover, declarations could be made to highlight the lack or no-addition of particular substances in food as long as these are not misleading and the substance is not subject to special requirements in any norm; is not a substance that consumers expect to find normally in that food product; has not been replaced by another one providing equivalent characteristics, unless the nature of the replacement is explicitly declared with the same importance; or is the addition or the presence of a food ingredient that is allowed. Similarly, declarations that expose the absence or no-addition of one or more nutrients must be considered a nutritional property declaration and therefore, must comply with the mandatory nutritional declaration in the applicable law ordinance.

Health and nutritional declarations can be related to the caloric content, proteins, carbohydrates, fats (lipids) and derivatives, dietetic fiber, sodium, vitamins and inorganic nutrients (minerals) for which Reference Nutritional Values have been established. The following declarations of properties are conditionally permitted when:

- it is understood that declarations of properties related to nutrient content describes the content level of a particular nutrient, i.e., “source of calcium,” “high fiber content,” and “low fat” (see Table 33.1);
- it is understood that the nutrient properties comparison contrasts the nutrients and/or energetic value of two or more foods, i.e. “reduced,” “less than,” “increased,” and “more than” (see Table 33.1);
- health-related properties are any representation that states, suggests or implies that there is a relation between a food or food component and health. See examples below.
  - a nutrient function claim describes a physiologic function of the nutrient in growth, development and normal body functions. For example, “Nutrient A (state a physiologic body function of nutrient A in relation to the maintenance of health, growth promotion and normal development). Food X is a source of . . .high in nutrient A;” and
  - other nutrient function claims pertain to the beneficial effects of the consumption of a food or its components in the context of a total diet on normal biologic body activities or functions. Such property declarations are related to a positive contribution to health or the improvement of a function, modification or preservation of health. For example, “Substance A (meaning the

effects of A over the physiologic function or health association with the biologic activity). Food “Y” contains “X” grams of substance “A”.”

However, declarations of properties will not be allowed when there is an intention to give the product characteristics that it does not contain or is associated with the reduction of illness or risk reduction.

Although this NOM and the definitions of declarations of properties were published in 2010, gaps still remain. For certain declarations, the applicable law ordinances mentioned in the NOM are incomplete and do not address many issues that are currently a challenge in the marketplace. Many questions remain open on how to get approval for specific claims. Basic nutrient content declarations or claims are common. However, more specific property claims are not common since, in practice, it is quite challenging to determine the specific requirements for approval. Thus, more specific rules are needed to level the playing field for all players.

### **33.2 The Overweight and Obesity Crisis and Public Policies as Potential Solutions**

Obesity and overweight is quickly becoming a top health concern in Latin America. The entire Latin American region has exhibited a marked increase in the consumption of high energy density foods coupled with a decrease in physical activity. The region has gone through a difficult transition since social and economic progress has led to a decline in infectious diseases. However, the higher income has also fostered the consumption of meats, fats and oils, and sugar while reducing the consumption of grains and legumes. So, although there has been a gradual increase in the life expectancy at birth, there is also a greater burden of disease linked to obesity and other nutrition-related chronic diseases. The region is now facing the challenge of a double disease burden since many countries still experience the unresolved problem of malnutrition caused by nutritional deficits, while addressing the steady increase in chronic disease.<sup>14</sup>

Overweight and obesity has a strong impact on public wellbeing due to the high cost implications. Costs include medical attention, medicine, loss in productive hours and other costs associated with premature death. Government intervention is needed to reduce the impact of these externalities. On the other hand, access to public health is considered a common good and the problems associated with overweight and obesity restrict the resources available to address other illnesses that are not associated with nutrition, which negatively impacts the society.<sup>15</sup> Since obesity is a worldwide epidemic, there is much discussion about proper intervention

---

<sup>14</sup>Uauy and Monteiro (2004), Food and Nutrition Bulletin.

<sup>15</sup>COFEMER (2012), Introduccion a la Regulacion Social.

strategies and initiatives to address this issue and help mitigate future impact. The development of public policy that has large impact on food choices is far from easy since individuals tend to make food choices that maximize utility. According to Fulponi, even if an individual knows what a healthy choice is, he may decide to choose an unhealthy option. There are many hypotheses behind this type of behavior. For example, changes in food preparation technology have relaxed time constraints on food preparation but may have increased the caloric content of food consumed. People also tend to heavily discount future events such as illness dependent on today's behavior.<sup>16</sup> According to a survey of policy initiatives on diet, health and nutrition performed by the Organization for Economic Cooperation and Development (OECD),<sup>17</sup> strategies implemented by different member countries focus mainly on two activities: increasing information on diet and health to consumers so they can make informed food choices and promoting increased consumption of fruit and vegetables, particularly amongst children. This report finds that the role of governments in establishing strategies to modify food choices is a delicate policy issue. While arguments like rising costs to the public purse can justify the need for interventions, there may be welfare losses if choices are restricted at the individual level. Consequently, many governments mainly opt to promote an environment conducive to healthy food choices through appropriate incentives and information provision. The most common initiatives are collaborations among different government agencies that focus on the provision of information through labeling and publicity campaigns, nutritional education programs for children and adults, promotion of fruits and vegetables, and partnerships with the food industry and producer groups.

In OECD countries, there is mounting evidence that school based programs are particularly effective; thus, efforts are increasingly focusing on school aged children. Interestingly, it was reported that while ministries of agriculture in most OECD countries do not play a major role in diet and nutrition issues, a growing number are becoming more involved through increased collaboration with public health agencies. The food industry, from producer groups to retailers, is also becoming more involved in campaigns that promote healthy eating by increasing fruit and vegetable consumption. According to the OECD survey, there are several studies around the world that concur that fruit and vegetable consumption confers a risk reduction for cardiovascular diseases. For example, Bazzano et al. found that consuming 3 servings or more a day of fruits and vegetables compared to 1 or less is associated with a 27 % reduction in stroke incidence, 42 % in lower stroke mortality and 24 % in lower ischemic heart disease mortality.<sup>18</sup> Likewise Joshipura et al. reported that for each 2 serving increase in intake of fruits or vegetables,

---

<sup>16</sup>Fulponi (2009), pp. 1–45.

<sup>17</sup>Ibid.

<sup>18</sup>Bazzano et al. (2002), pp. 93–99.

the risk of coronary heart disease decreased by 4%.<sup>19</sup> High consumption of fruits and vegetables may also be important in reducing the risk of some cancers.

From a regulatory perspective, one of the underlying assumptions of this epidemic is that the consumer does not have enough information to make the optimal product choices. This illustrates that since the market is not self-regulated, a government intervention is justified.

Since consumers have asymmetrical information about the foods and beverages they are purchasing and consuming, measures should be taken to foster the provision of more information about them. One such measure is the regulation of food advertising by restricting the promotion of foods with low nutritional value during times when children may be exposed; or providing information so that the adults can promote an orderly consumption of those products. Another strategy is to promote better food labeling by ensuring information is clear and easily interpreted by consumers.

However, it is important to acknowledge that the problem is multifactorial and so potential solutions should also include multi-prong interventions. In order to have an adequate impact, international organizations like the OECD recommend the simultaneous application of three or more actions. The OECD specifically recommends intervention in four different areas: availability of healthy foods; access to healthy food consumption; knowledge of foods; and taxes. In his report for the OECD, Fulponi established that, in general, taxation, workplace interventions and food labeling have the most impact on the reduction of public health expenditure associated with overweight and obesity. Thus, multi-faceted interventions that utilize food labeling, taxes, self-regulation schemes for publicity and programs for health promotion and interventions at the school and workplace levels have been recommended.

### ***33.2.1 Case Studies and Examples***

Several countries in Latin America have started to adopt public policies to help mitigate the problems associated with overweight and obesity. These initiatives include one or more of the approaches recommended by the OECD. The following case studies will discuss the development of these policies and provide an insight into the approaches adopted by Mexico as well as other Latin American countries.

### ***33.2.2 Mexico's Overweight and Obesity Crisis and Its Strategies***

It is well known that Mexico is one of the most obese countries. Depending on the metrics used, Mexico ranks either the first or the second country in the world (after

---

<sup>19</sup>Joshiyura et al. (1999), pp. 1233–1239.

the United States) with the highest number people who are obese or overweight. In Mexico, this trend was first noted towards the end of 1980s and it continues to grow. The increases in obesity and overweight affected the population in general, including both high and low-income population but with a higher prevalence in women. Although the rate of increase has slowed since 2006, 71 % of Mexicans are currently obese (32 %) or overweight (39 %) accounting for more than 48.6 million individuals in the country.<sup>20</sup>

Obesity is obviously a multifactorial problem that has evolved over decades. According to Rtyveladze et al.,<sup>21</sup> Mexico has experienced a rapid increase in wealth in recent decades, bringing a significant shift in socio-economic status and geographical shift from rural to urban living settings. This has led to changes in diet and sedentary behavior coupled with an increased access to low-priced, high energy-dense foods (foods that are high in calories, fats and sugars) leading to a rapid growth in obesity and obesity-related non-communicable diseases (NCDs) prevalence. According to these authors, nutrition-related chronic diseases, such as type 2 diabetes and hypertension, are associated with increased obesity rates. Cardiovascular disease (CVD) and type 2 diabetes are now considered the main causes of adult mortality in Mexico. This is expected to impose a substantial burden on disease outcomes and health-care costs.

Based on the simulation model used by Rtyveladze et al. (see footnote 13), obesity is projected to increase across all age groups with particularly high levels among middle-aged men (50–59 years) and older females ( $\geq 60$  years). It is expected that the rate of obesity for the male population will increase from 68 % in 2010 to 88 % by 2050. Females do not fare any better; it is estimated that their rate will increase from 74 % in 2010 to about 91 % by 2050. The authors of this study concluded that the disease burden continues to increase every year and will result in twice the prevalence rates by 2050. In the same study, the authors show that the prevalence of normal weight individuals will decrease from 32 to 12 % in males and from 26 to 9 % in females and more people will be obese than overweight. Using these estimates, the projection for diabetes and CVD will raise alarmingly to 12 million diabetes cases and 8 million CVD cases in 2050 alone.

Based on information by the Organization for Economic Cooperation and Development (OECD) (see footnote 15), it is estimated that for every extra 15 kg, the probability of early death increases by 30 %. In 2008 alone, the loss of productivity due to premature death that is attributable to overweight and obesity in Mexico was estimated to be \$1931 million USD. According to COFEPRIS,<sup>22</sup> the country spends more than the total federal budget for medicines to treat CVD and diabetes and is equivalent to 23 % of the total education expenditure in the country. For the 13 diseases that are considered related to overweight and obesity, costs will

<sup>20</sup>Astudillo (2014), pp. 15–16.

<sup>21</sup>Rtyveladze et al. (2014), pp. 233–239.

<sup>22</sup>COFEPRIS (2013), Reformas al reglamento de la Ley General de Salud en material de publicidad.

skyrocket from \$806 million USD in 2010 to \$ 1.7 billion USD in 2050. Rtevaladze et al. report that even a 1 % reduction in mean body mass index (BMI) could save a total of \$43 million USD in 2030 and \$85 million USD in 2050. A more optimistic 5 % decrease would save \$117 USD million in 2030 and \$192 million USD in 2050. These figures show considerable savings in health care costs and future burden of diseases even without considering the social impact on the population if proper measures are not taken. Therefore, it is imperative that Mexico's public health community and policy makers develop and implement effective public health interventions to change the current trends.

In Mexico, the right to nutritious, sufficient and quality food was elevated to a Constitutional right by amending Article 4 of the Constitution, which was published in the official gazette on October 13, 2011.<sup>23</sup> Hence, all laws, regulations and norms that were developed to address issues associated with diet and nutrition are supported by this Constitutional right. Another amendment to Article 4 published in February 2012 also established that all individuals have the right to access, purify and dispose water for personal consumption and domestic use that is sufficient, healthy, acceptable and affordable (see footnote 23).

As stated by COFEPRIS' representatives, the main objective of the public health strategies is to stabilize and reduce the incidence of overweight and obesity in the medium to long range. In order to do this, the government has adopted several policies. In 2010, the Secretary of Health published the national strategy against overweight and obesity,<sup>24</sup> which establishes ten high priority objectives to achieve an effective national program. The objectives are to:

1. foster physical activity of the population in school, work, community and recreational settings through collaboration with public, private and social stakeholders;
2. increase the availability, access and consumption of drinking water;
3. decrease the intake of sugar and fats in beverages;
4. increase the daily consumption of fruits, vegetables, legumes, whole grains and fiber by increasing the availability and access and promoting the consumption of these products;
5. improve the population's informed decision making abilities regarding a healthy diet through useful and easy to understand labels that promote health and nutrition knowledge;
6. promote and protect exclusive breastfeeding until 6 months of age and favor adequate complementary nutrition after 6 months of age;
7. decrease the intake of sugars and other caloric sweeteners in foods by increasing the availability and access to foods that are reduced in sugar or without caloric sweeteners;
8. decrease the daily intake of saturated fats and reduce to a minimum industrial trans fats;

---

<sup>23</sup>Constitución Política de los Estados Unidos Mexicanos (1917), Article 4.

<sup>24</sup>Secretaría de Salud (2010a), Acuerdo Nacional para la Salud Alimentaria. Estrategia contra el sobrepeso y la obesidad.

9. provide guidelines to the population regarding serving size control when cooking homemade meals as well as promote the availability of reduced serving sizes in food service establishments; and
10. decrease the daily intake of sodium by reducing the amount of added sodium and increasing the availability and access to products that are low in or free of sodium.

The first six objectives depend on individuals and the surrounding environment that facilitate an increase in physical activity, intake of water and fruits and vegetables. The other four objectives rely on government regulation and participation of all stakeholders, including the processed food and food service industries.

In January of 2010, NOM-088-SSA3-2010 for the integrated treatment of overweight and obesity was published.<sup>25</sup> One of the very first steps taken towards achieving these objectives was to establish criteria for foods and beverages offered during school lunches.<sup>26</sup> These criteria became mandatory on January 1, 2011. The criteria were set for compliance on three stages. Table 33.2 presents the nutritional criteria for the last two stages of this strategy, which is being implemented in phases to allow for gradual changes in formulation. However, in practice, implementing the changes have been challenging since each reduction implies at least a change in label to display the new nutritional content and different formulation. On the other hand, there have been multiple controversies regarding specific definitions and terminology like “without added sugars.” Some reformulated products included ingredients such as concentrated fruit juice instead of added sucrose or corn syrup raising the question about the effectiveness of this strategy. After all, for practical purposes, concentrated fruit juice represents a load of fructose.

As the process evolved, a new norm, NOM-043-SSA2-2012, Basic Health Services—Promotion and education for health as related to nutrition,<sup>27</sup> was published to establish general criteria that unify the nutritional guidance strategies that are provided to the general population. This NOM provides information that is designed to promote the nutritional state and prevent nutrition-related illnesses. Also, it recommends appropriate food sources for nutrients for different ages and/or development stages. This NOM also promotes exclusive breastfeeding for infants under 6 months of age.

In 2013 as part of the tax reform, the Congress passed a tax bill that is popularly known as the “junk food and sugary beverage tax.”<sup>28</sup> This tax was implemented on January 1, 2014 as part of an anti-obesity and revenue raising campaign. This

*Source:* ACUERDO mediante el cual se establecen los lineamientos generales para el expendio o distribución de alimentos y bebidas en los establecimientos de consumo escolar de los planteles de educación básica

<sup>a</sup>All packages must contain only one serving

<sup>b</sup>The parameters refer to less than or equal the amount

<sup>c</sup>In beverages, there are two proposals, elementary and middle school. Without caffeine or taurine

<sup>d</sup>These criteria incorporate industry's commitment to assist in the consumption of pure, potable water so that in a maximum period of two months after the beginning of the 2010–2011 school year all sugared beverages will be removed from schools

<sup>e</sup>Non caloric sweeteners in milk, nectars, yogurts, soy beverages may be allowed if these are approved in Codex Alimentarius for children

<sup>f</sup>The trans fatty acid restriction does not apply if it comes naturally with the food in question such as dairy products

<sup>g</sup>The oilseed group (for example, peanuts, nuts, almonds, pistachios, etc.) and dry legumes (for example dry fava beans) are not subject to the total fat content restriction due to their high nutritional value since despite their high fat content, their consumption in moderation has been associated with positive health effects as long as there is no additional added fat. The rest of the criteria for snacks apply

<sup>h</sup>The use of non-caloric sweeteners could be allowed in cookies, pastries and desserts as long as they are approved for their use in Children by Codex Alimentarius

proposal was the subject of heated public debate and was formally announced by the Finance and Public Credit Commission on September 8, 2013. Under this new taxation regimen, there is an increase of 8 % on the Special Tax over Products and

Services (IEPS) on processed foods that contain over 275 kcal per 100 g. This includes products such as snacks, confectionery, chocolate products, desserts, fruit jam and paste, peanut and hazelnut butter, ice cream and cereal based products. Chewing gum is also included in the tax reform as a product that has added sugar. However, based on the above definition, many products that are important in the diet are also now taxed. A clear example of this are nuts and seeds, which fall under the calorie definition even when they are sold in a natural state or dry-roasted without oil and/or added salt. Other products such as dried fruits, cocoa and gelatin also fall under the high calorie foods category. Products such as these that have great nutritional value and are traditionally consumed in the country are now too expensive to be part of a regular, healthy diet. So the question of the effectiveness of this strategy is also raised. Were the definitions provided in the regulation adequate? Should the authorities seek a different approach?

Additionally, a special tax was applied to “flavored beverages” that imposes payment of 1 Mexican peso per liter of processed beverages that contain sugar including powdered beverages. Again, this does not address beverages prepared at home, such as the traditional fruit juices made with water and sugar. Some organizations claim that taxing sugar would be a much better approach since it would address the global consumption instead of specific products. During the debate, many consumer organizations complained that obesity cannot be attributed to the consumption of specific products. It is estimated that this proposal will earn the government an estimated 39 billion pesos in revenue. Theoretically, the money is to be invested in prevention actions such as providing water fountains in schools and appropriate spaces to foster physical activity. The budgeted use of this additional income is counterintuitive since a successful taxation strategy would reduce the intake of these foods. The potential revenue decreases as the population stops or reduces the purchase and intake of these products. One question to think about is what measures would indicate the success of this strategy. Obviously, increased revenue, although useful, would indicate the failure of this strategy.

Apart from these policies, the Secretariat of Health specifically adopted two different approaches. The first approach was the adoption of a new “front” as part of label requirements and the development of a “nutrition seal of approval” that has been published throughout 2014. The second strategy is to develop standards for food advertising targeted towards children.

In summary, the front of label must include the following:

- a. the declaration of caloric content (kcal), sugars (kcal), saturated fats (kcal), total fats (kcal) and sodium (mg) and the % of the recommended daily intake using the following values for the calculation of the % of the daily recommended value (Table 33.3);
- b. the total caloric content of the product;
- c. in family size packages, the energy content per serving and the number of total servings in the package; and
- d. in family size packages of flavored beverages, snacks, confectionery products and chocolates, nutritional information of the total content of the package shall

**Table 33.3** Nutrients to be included in the front of label declarations and the base to calculate the recommended intake

Source	Base for calculation of the Recommended Daily Intake (RDI)
Sugars	360 kcal
Saturated fats	200 kcal
Other fats	400 kcal
Sodium	2000 mg

Source: COFEPRIS (2013)

be included as well as the number of servings and caloric content of each serving.

The path to achieving legal approval of these new requirements has been rocky and has created a lot of confusion regarding compliance deadlines. In January 2013, a presidential decree was originally published to amend the Regulation of Sanitary Control of Products and Services.<sup>29</sup> This amendment was to prepare the legal roadway for the new labeling requirements. This publication established that compliance was mandatory effective the day after publication in the official gazette. However, this was physically impossible and required an update of the labeling norms. In April 2014, an agreement that established the guidelines for the implementation of the modifications to this regulation was published.<sup>30</sup> This agreement included the specific icons to be used for the front of label definitions and established the requirements for size and font of these icons.

The minimum size of the icons must occupy at least 0.5 % of the main display panel of the product and each icon must not be less than 0.6 cm in width and 0.9 cm in height. The width of the icon must be two thirds in relation to the height. The icons must always present the mandatory information in the following order from left to right: saturated fat (cal/kcal), other fats (cal/kcal), total sugars (cal/kcal), sodium (mg/g) and Energy (cal/kcal) with the % of the RDI in the lower part of the icons for saturated fat, other fats, total sugars and sodium. Figures 33.1 and 33.2 show examples of the icons to be used in the correct order from left to right.

These requirements will not apply to flavored beverages that have low energy content or those products in individual packages where the content of the package is less than the reference serving size published in the same agreement. In addition, when the caloric value for a nutrient equals zero, it shall be declared as zero “0” and

<sup>29</sup>El Congreso General de los Estados Unidos Mexicanos (2012), DECRETO por el que se reforman y adicionan diversas disposiciones del Reglamento de Control Sanitario de Productos y Servicios.

<sup>30</sup>Secretaría de Salud (2014), ACUERDO por el que se emiten los Lineamientos a que se refiere el artículo 25 del Reglamento de Control Sanitario de Productos y Servicios que deberán observar los productores de alimentos y bebidas no alcohólicas pre-envasadas para efectos de la información que deberán ostentar en el área frontal de exhibición, así como los criterios y las características para la obtención y uso del distintivo nutrimental a que se refiere el artículo 25 Bis del Reglamento de Control Sanitario de Productos y Servicios.

Fig. 33.1 Front of panel label requirements icons for Mexico for individual packages

Fig. 33.2 Front of panel label requirements icons for Mexico for family size packages

this is also applicable to the percent value. Products with a value of less than 5 kcal shall be declared as zero “0.” All values will be presented as round numbers using common rounding rules.

The color of the icons will be chosen by each producer but all icons must be the same color and font. Font will be presented in a contrasting color. When the main display panel is more than 60 cm<sup>2</sup>, all icons shall be presented in this area. When the main display panel is between 20 and 60 cm<sup>2</sup>, the energy content icon shall be displayed in the front, but the main display panel and other four icons can be presented in lateral panels or in the back panel if there are no lateral panels. When the main display panel is less than 20 cm<sup>2</sup>, then only the energy content icon shall be displayed in the front panel. When the front panel is less than 10 cm<sup>2</sup>, only the energy content icon will be required on the label. When the main display area is less than 5 cm<sup>2</sup>, then no icons will be required.

The following products are exempted from the mandatory front of panel labeling:

1. herbs, spices and blends;
2. pure coffee extracts, whole coffee, ground coffee decaffeinated or not, soluble or not;
3. herbal infusions, decaffeinated tea or non-decaffeinated tea, instant or soluble that do not have added ingredients;
4. fermented vinegars or substitutes;
5. products and raw materials contained in packages that are destined exclusively for food service but the main display panel must show the statement “presentación institucional” (institutional presentation);
6. foods and non-alcoholic beverages where each nutrient per serving represents an energy intake less than or equal to 1 % of the recommended daily nutrients;

7. packages that contain two or more units of product that are not individually pre-packaged but are different and are destined for their joint sale;
8. packages that, in addition to containing a food and non-alcoholic beverage, have a gift or decorative article as a promotional gift;
9. products where individual packages state “No etiquetado para su venta individual” (Not labeled for individual sale) or use similar language and are included in a collective or multiple package;
10. packages where the content corresponds to more than one type of product individually labeled as long as at least 70 % of the products in the package are labelled appropriately; and
11. products sold in bulk.

Individual serving sizes and requirements are found in this document.

Finally, since, labeling requirements are established in NOM 051, it was updated to include the proposed changes<sup>31</sup> in the aforementioned agreement. In addition, it mandated companies that want to use the nutrition approval seal to comply with the criteria established in the new agreement. Specific conditions have to be met to obtain approval for the use of this nutritional seal. These dispositions are effective as of June 30, 2015. Any company who has leftover labels or issues developing the new labels has the right to request a delay for up to one additional year prior to this date. Since NOM-051 rules foods and non-alcoholic beverage labelling, the established deadlines will have the higher hierarchy and therefore, these are the final dates and deadlines to comply.

These new front of label requirements have met a lot of criticism from different organizations. In addition to the many questions that still require clarification and guidance, many groups are against this new public policy. On one hand, consumer groups have asked to stop these requirements arguing that the values set for sugars are too high and were arbitrarily set. In addition, according to many groups, the information is unclear in the way it is asked to be presented since it misleads the consumer in thinking that they must get the recommended daily intake that is shown on the label, which is not the case nutrients such as total and saturated fats. There is also a lot of confusion regarding the declaration of sugars. Originally, the sugar label was for “added sugars” only. However, to address some of the issues discussed earlier, the sugar label now captures “total sugars.” In addition to consumer groups, public health authorities are raising their voice against the labeling requirements. This is alarming since the National Institute for Public Health (INSP) along with other institutions are the pillars upon which nutrition

---

<sup>31</sup>Secretaría de Economía y Secretaría de Salud (2014), MODIFICACIÓN de la Norma Oficial Mexicana NOM-051-SCFI/SSA1-2010, Especificaciones generales de etiquetado para alimentos y bebidas no alcohólicas preenvasados-Información comercial y sanitaria, publicada el 5 de abril de 2010. Se adicionan los incisos 3.2; 3.5; 3.17; 3.18; 3.21; 3.40; 4.2.9 con sus subincisos y se ajusta la numeración subsecuente; 4.5 con sus subincisos y el Apéndice Normativo A. Se modifica el capítulo 2 Referencias, así como el literal b) del inciso 3.11; 3.15; 4.2.8.1. Se ajusta numeración del capítulo 3 Definiciones, símbolos y abreviaturas.

public policy should rest; yet they have complained about the lack of evidence for this strategy. The Director of Research and Nutrition Policies of the INSP sent a formal request to the Health authorities to abolish the new labeling requirements. One of his major concerns is the fact that the World Health Organization (WHO) recommends that an adult should limit sugar consumption to 50 g per day. However, in the current system, the amount of sugar allowed per day is 90 g. In addition, the clarity of the information presented on the labels has been questioned since surveys show that it is difficult to understand and make sound decisions based on the information provided. In spite of all the opposition and updates, the requirements are final and have been published in the official gazette. It is crucial to understand the implementation process and ultimately, identify indicators to evaluate and measure the actual impact on obesity, if any.

The second approach taken by authorities in 2014 was the regulation of food advertising. According to information published by the INSP, the publicity of food and beverages is one of the contributing factors for the change in food consumption patterns that results in overweight and obesity.<sup>32</sup> In Mexico, children are exposed to a large number of commercial spots for foods and beverages that can impact their food choices. Subsequently, a public policy strategy was implemented to reduce exposure to commercial spots for foods and beverages that are high in fats, sugar and salt. It is hoped to reduce the risk associated with this exposure. According to the INSP, an appropriate public policy for publicity include all advertising targeting children. All communication channels (radio, television, printed media, internet, etc.) are included. The policy also establishes mechanisms to impose fines when these dispositions are not met.

The updated Health Regulation for Publicity<sup>33</sup> clearly establishes through article 23 that foods and non-alcoholic beverages marketing shall include precautionary statements about the condition of the product as well as messages that promote a healthier diet. As of now, there will be no publicity of foods and beverages that do not comply with the nutritional criteria set by the Secretariat of Health from Monday through Friday from 14:40 to 19:30 and Saturday and Sunday from 7:00 to 19:30. There are some exceptions to this schedule. Flavored beverages, snacks, confectionery products and chocolates can be publicized during the transmission of the following types of shows: soap operas, news programs, sport events, series and movies with a classification B-15 and beyond. The deadline for these actions was January 01, 2015 for general categories and 90 days after the publication of the guidelines for flavored beverages, snacks, confectionery products and chocolates. Thus, at the time this chapter was written, the publicity rules for the special categories were already in place.

It is clear that Mexico is trying to implement public policies that address the obesity crisis. Many of these strategies are aligned with the recommendations

---

<sup>32</sup>Instituto Nacional de Salud Pública (2013), Evidencia para la política pública y prevención de obesidad. Publicidad en alimentos y bebidas.

<sup>33</sup>Secretaría de Salud (2006), Reglamento de la Ley General de Salud en Materia de Publicidad.

established by the OECD. However, education campaigns for the general population still seem to be underdeveloped. Although there are some campaigns to promote the consumption of fruits and vegetables such as the “5 a day” campaign, more efforts need to be focused on educating the general consumer. This was quite evident in the research performed by the INSP where the front of panel labels were still difficult to understand for consumers. This is an important part of the obesity crisis since most of these policies address processed foods; however little attention has been given to foods prepared at home. Mexico enjoys a rich culinary tradition and many traditionally cook foods that have high caloric density. While the taxes address processed foods, there is still an open gap regarding home-cooked meals. The same is true regarding processed foods in primary schools. Although some guidance was published, freshly prepared foods do not fall into any of the current control strategies. Several implementation challenges also still have to be conquered and in many cases, the policies have to be fine-tuned to address the concerns of different stakeholders.

### **33.3 Addressing Overweight and Obesity in Peru: Strategies Under Evolution**

In Peru, a law that promoted healthy diet for boys, girls and teenagers was published on May 17, 2013.<sup>34</sup> According to Article 1 of this law, the objective is the promotion and effective protection of the right to public health; adequate growth and development through actions in the areas of education, physical activity, healthy lunches in elementary schools, and marketing and other promotional strategies related to foods and non-alcoholic beverages targeted to children and teenagers to reduce and eliminate illnesses associated with overweight and obesity. This law is comparable to Mexico’s school lunch program; however, implementation is still pending. According to the dispositions stated in the law, the Ministry of Health (MINSA) would publish the exact parameters and definitions of healthy foods as well as the limits for sugar, fats, sodium and trans-fats present in the food and non-alcoholic beverages 60 days after the official publication. Interestingly, the Peruvian law accounts for trans-fatty acids unlike the Mexican policies that do not focus on these compounds. The law also prohibits advertising that encourages “immoderate consumption” of food and non-alcoholic beverages that contain trans-fats or high levels of sugar, salt and saturated fat. The law also established the timescales for the reduction of trans-fatty acids until full elimination is achieved. The reference values will be based on the recommendations published by the WHO and Panamerican Health Organization (PAHO).

However, MINSA has failed to meet these deadlines and without the applicable regulation in place, implementation of the law is not feasible. Additionally,

---

<sup>34</sup>El Congreso General de los Estados Unidos Mexicanos (2013b), Ley N°30021.

according to a report by Barbara Fraser,<sup>35</sup> Peru's law immediately drew criticism from legislators, food and beverage marketing industry and even the Catholic archbishop of Lima who said that shaping children's dietary habits was a job for parents, not the government. However, the efforts to redirect children's food choices are an important strategy.

### **33.4 Addressing Overweight and Obesity in Chile: The Warning Sign Approach**

In Chile, labeling requirements are under development since 2012 when a new law on Nutritional Composition and Food Advertising (Law 20606) was published.<sup>36</sup> This law mandates food industry to declare the ingredients of their packaged products according to the criteria in Sanitary Regulation of Foods. All manufacturers, producers, distributors and importers of foods have to display the ingredients, including all additives, on their labels/packaging. The list must be in descending order and nutritional information must be expressed in percent composition, unit of weight or under the nomenclature established in current regulations. Through the Food Sanitary Regulation, the Ministry of Health will determine the shape, size, color, proportion, characteristics and content of the food nutritional labels with a particular emphasis on visibility and understandability by the population.

The Ministry of Health will identify foods that, by unit of weight or volume or by usual serving size, present in their nutritional composition, high contents of calories, fats, sugars, salt or other harmful ingredients. These foods will be labeled as "high in calories" or "high in salt" or with other equivalent denomination depending on the case. The content must be clearly declared on the package or label of all commercialized food products, if among the ingredients used in production are soy, dairy, peanuts, egg, shellfish, fish, gluten or tree nuts. Infant formula labels must not discourage breast feeding and include information relative to the superiority of breast feeding and state that the use of such substitutes must be under medical advice.

These foods cannot be sold, commercialized, promoted or publicized inside pre-school, elementary and middle school establishments. Energy dense, nutrient poor foods cannot be offered or given for free to children under 14 years of age. The Ministry of Health shall share with the Ministry of Education a mandatory monitoring system of nutrition education in pre-school, elementary and middle school where specialists will measure the body mass index and orient students to adopt healthy life styles. Regardless of educational level, elementary and middle schools must provide education and encourage the development of healthy eating habits and

<sup>35</sup>Fraser (2013), Latin American countries crack down on junk food, pp. 385–386.

<sup>36</sup>Ministerio de Salud (2012), Ley 20606.

warn against the negative effects of a diet with excess of fat, saturated fat, sugars, sodium and other nutrients where consumption in certain amounts or volumes can pose a health risk. They must also incorporate physical activity like sports to promote students to practice an active lifestyle.

Although the regulation was to be published a year after the promulgation of the law, it was finally published for public consultation in August 2014.<sup>37</sup> The dispositions were originally scheduled to be mandatory by June 2015. This new regulation is stricter than the preceding drafts since it now requires all products that contain a high amount of sodium, sugar or saturated fat to display a warning statement indicating that the product has “an excess of.” Instead of the original plan to phase in the new dispositions, a single phase implementation was established for the new labeling requirements and ban from sale in schools. After critiques to the original law, the regulation was modified to redefine new maximum levels of fats, sugar, sodium and calories in order for these packaged products to be considered “healthy.” If the limits on any of these key nutrients is exceeded, the product must comply with the precautionary statement on the label. The new regulation also changed the serving sizes from arbitrarily set values per product to a more universal unit of 100 g. Table 33.4 shows the limits for the critical nutrients that have been established.

Products that exceed these limits will be required to display a warning symbol on the main panel of the label (Fig. 33.2). For sodium, a gradual reduction has been established; there will be a progressive reduction of the limit by 15 % every 5 years until the value reaches a maximum of 150 mg/100 g. Figure 33.3 shows an example of the warning icons that must be included on labels of products that exceed set limits. In addition, when these icons are used, the label or advertising of such product cannot declare complementary nutritional information to make nutritional properties claims.

At the time of this publication, the period for public comment was still open and the regulation was under review. Based on the preliminary assessment, the regulation will be more flexible and implemented gradually instead of the single phase that was proposed in the update. Full implementation of the law will occur over 4 years instead of the original deadline of June 2015.

With this new phase-in process, the limits will decrease annually to finally achieve the desired limits by the fourth year (Table 33.5). This may be easier for companies trying to formulate new products; but may increase costs associated with annual label changes.

The new regulation also includes rules for advertising using any media. Any foods or food products that contain calories, sodium, sugars or saturated fat in amounts that exceed the limits (Table 33.4) cannot be advertised in any communication media directed to children under 14 years old. For example, these products cannot use cartoon characters, toys, music, animals, or characters that attract

children under 14 years old. The only exception to this disposition is the advertisement of foods where the content of energy, sugars, sodium or saturated fat is naturally present and is coherent with the values established in the Nutrition Guidelines published by the Ministry of Health. This is in direct contrast to Mexico's policy for "junk food" taxation where no exceptions are allowed. In

addition, all publicity of foods and food products designed for mass communication must have a message that foster healthy living habits.

### 33.5 Addressing Overweight and Obesity in Ecuador: The Traffic Light Approach

Ecuador recently published the review of Ecuador's Technical Regulation PRTE INEN 022 (1R) modification.<sup>38</sup> The objective of this new technical regulation is to establish labeling guidelines to protect consumer health and prevent practices that mislead consumers. This is an update of a previous labeling regulation and establishes the requirements for using a traffic light approach to warn consumers about the total fat, sugars or sodium content. The limits are detailed in Table 33.6 and each concentration, low, medium or high will have a colored bar as well as text.

The label must have a colored system of horizontal bars to show the concentration of each component. The top or red bar include components with "high concentrations" and will have text showing that the product is "High in..." The middle or yellow bar display components with "medium concentrations" and will have text showing that the product is "Medium in..." The lower or green bar comprise components with "low concentrations" and will have text stating that the product is "Low in..." The font size and size of charts will be determined by the area of the main display panel of the food product and will always be located in the top left label corner. Products such as sugar, salt and animal fats (i.e., lard and

**Table 33.6** Limits of components and concentrations permitted

Component/ level	"Low" concentration	"Medium" concentration	"High" concentration
Total fat	Less than or equal to 3 g/100 g	More than 3 and less than 20 g/100 g	More than or equal to 20 g/100 g
	Less than or equal to 1.5 g/100 ml	More than 1.5 and less than 10 g/ml	More than or equal to 10 g/100 ml
Sugars	Less than or equal to 5 g/100 g	More than 5 and less than 15 g/100 g	More than or equal to 15 g/100 g
	Less than or equal to 2.5 g/100 ml	More than 2.5 and less than 7.5 g in 100 ml	More than or equal to 7.5 g/100 ml
Sodium	Less than or equal to 120 mg/100 g	More than 130 and less than 600 mg/100 g	More than or equal to 600 mg/100 g
	Less than or equal to 120 mg/100 ml	More than 130 and less than 600 mg/100 ml	More than or equal to 600 mg/100 ml

<sup>38</sup>Ministerio de Industrias y Productividad (2014), No. 14413.

butter) are exempted from the graphic icon but must use the following precautionary statement: “For your health, reduce the intake of this product.”

In case of two or more messages, they should be illustrated together. Since these dispositions are included in the updated labeling regulation, no other strategy is defined. The deadline for these new mandatory requirements was August 29, 2014 for medium and large food companies. For small companies, the deadline is November 29, 2014. Companies are allowed to fix stickers that don't comply with these requirements. Since these changes were implemented, no other strategies have been formally announced.

### **33.6 Conclusion**

Due to the alarming raise in overweight and obese people and the challenges associated with this epidemic, Mexico, like many other countries, have implemented various public policies to slow and reverse the trend. This has become a priority since the costs associated with treatment of nutrition-related, chronic diseases will be insurmountable in the near future. Strategies, specific to Mexico, involve taxes on energy dense foods and sugary beverages, nutritional labeling on front panel, advertising control of foods and beverages and promotion of proper nutrition and healthy lifestyles. These approaches still need to be refined as further gaps have been identified and in some cases, have met strong criticism even from public health authorities. The 2015 implementation of the new labeling requirements will be challenging and will still face strong criticism from various stakeholders. Peru, Chile and Ecuador have also adopted measures that use different approaches and are currently being implemented. Unfortunately, the criteria differ in each country; single labels for products sold throughout Latin America will no longer be possible since each country has adopted different systems. However, these strategies demonstrate that different approaches can be used to address the same challenge.

The approaches taken in each country are excellent examples of public policy, where regulations are used to intervene and solve a social problem. All strategies must have a solid scientific basis, have a proper regulatory basis for implementation, be relevant to the population of interest and provide useful and understandable information to be effective. One key factor that still needs to be urgently developed are proper indicators to show the success of the adopted strategies in the short term. Since most strategies only address processed foods, education will be critical to ensure that foods prepared at home and consumption of traditional foods are part of a balanced diet and healthy lifestyle. Change in consumer habits based on the information printed on the labels and its clarity and usefulness should also be evaluated. A positive impact in public health in the long term will be the true measure of success. Obviously, this is a multifactorial problem and will require multiple approaches and strategies to face the challenge.

# Chapter 34

## Global and US Water Law and Sustainability: The Tragedy of the Commons and the Public Trust Doctrine

Zach Corrigan

**Abstract** This chapter explores some of the theoretical foundations that underlie the governance of the production of seafood. It focuses on the theoretical problem at the heart of how to regulate oceans and other common areas: how to avoid the so-called “tragedy of the commons.” It focuses on the two juxtaposing types of public and private property regimes that have been erected to prevent such a tragedy. The former embraces the concept known as the Public Trust Doctrine. The latter type, private-property or “market-based” regimes, are exemplified by Individual Fishing Quotas, (also known as Individual Trading Quotas) and aquaculture, both of which are explored more in-depth in other chapters. Not left unexplored is critical literature indicating that the “tragedy of the commons” may be far too simplistic a model on which to base regulatory regimes.

### 34.1 Introduction: Common Spaces, Sovereignty, Regulation, Privatization, and Its Relationship to Food

This chapter explores some of the theoretical foundations that underlie the governance of the production of seafood. While overlapping with the laws governing other areas of traditional food production, the laws governing seafood production are distinct and unique. In no small part, producing food from the planet’s water bodies, whether from lakes, streams, estuaries, or oceans, has followed a “hunter-gatherer” model, where individuals hunt, kill, and bring in food from animals that are not raised within the confines of their private property. Therefore, the

---

Z. Corrigan (✉)  
Food & Water Watch, Washington, DC, USA  
e-mail: [zcorrigan@fwwatch.org](mailto:zcorrigan@fwwatch.org)

foundational legal theories underlying the regulation of this food source have focused on the common spaces where hunters and gatherers obtain the food. The regulation of food produced from the world's water bodies is thus intimately related to environmental and property law.

The following sections focus on the theoretical problem at the heart of how to regulate oceans and other common areas, i.e., how to avoid the so-called “tragedy of the commons.” It focuses on the two juxtaposing types of public and private property regimes that have been erected to prevent such a tragedy. The former type embraces the concept known as the Public Trust Doctrine and is extensively discussed in this chapter. The latter type, private-property or “market-based” regimes, are exemplified by Individual Fishing Quotas, (also known as Individual Trading Quotas) and aquaculture, which, while briefly mentioned in this chapter, are explored more in-depth in Chap. 36. Not left unexplored is critical literature indicating that the “tragedy of the commons” may be far too simplistic a model on which to base regulatory regimes.

## 34.2 Problems of Regulating the Commons

### 34.2.1 *Private Property Versus Communal Property and the Public Trust Doctrine*

The seafood that finds its way on to people's plates typically does not come from someone else's private farm, unlike much of their other food. Even aquaculture, or fish farming, typically involves the raising of fish in areas that at some point in time were common to all and were only later appropriated for private use. So, many of the legal and policy issues related to seafood are about how *common* resources, specifically the fish and waterways shared by all, are governed and managed.

A basic appreciation of western theories of property and how they apply to common resources is necessary to understand the national and international governance of seafood. Under western common law, property is the right to possess, use, and enjoy a determinate thing.<sup>1</sup> First-year U.S. law students learn the now-axiomatic saying that “property” is a “bundle of rights,” or “bundle of sticks,” which means that the property is defined by the ability of users do a number of things with it, including to possess, use, and transfer it, as well as exclude others from these activities.<sup>2</sup> Possessory rights, for example, allow the holder to both collect when property is damaged and be subject to liability caused by the property.<sup>3</sup> Use or “usufructuary” rights entitle the holder to use property for specific

---

<sup>1</sup>Black's (2009), p. 1232.

<sup>2</sup>For a discussion of the concept's disputed origins, see Duncan (2002), n. 1. See Osherenko (2006), p. 331, for a discussion of the four categories: possession, use, exclusion, and disposition.

<sup>3</sup>Osherenko (2006), pp. 332–333, citing Osherenko (1995), pp. 1086–1087.

purposes.<sup>4</sup> Conversely, exclusionary rights entitle the holder to exclude others from using or trespassing on it and set conditions for its use.<sup>5</sup> Disposition rights entitle the holder to alienate or sell the property.<sup>6</sup> This legal terminology essentially describes the rights that a person has over property when they say that they “own” it.

Property can also be classified by its “regime,” which means the rules that govern it.<sup>7</sup> For example, under Roman law, property was classified into four regimes: *res publica*, *res communes*, *res nullius*, and *res privatae*.<sup>8</sup> *Res publica* is property held by the government for the use and benefit of the public.<sup>9</sup> It includes roads, ports, rivers, and public buildings.<sup>10</sup> *Res communes* is property that can be accessed by anybody but not exclusively acquired, such as air.<sup>11</sup> *Res nullius*, interpreted narrowly, is that which is susceptible to private appropriation but is presently without an owner.<sup>12</sup> Historically, unoccupied lands and wild animals were labeled as *res nullius*.<sup>13</sup> And *res privatae* is private property.<sup>14</sup>

Relevant to this chapter, the Romans classified the seas as common property.<sup>15</sup> The first recorded law of the seas was the Digest of Justinian, and it declared that the sea is available to all, including for fishing.<sup>16</sup> By natural reason, fishery resources were awarded to their captor. Notwithstanding this broad statement of “rule of capture” principles, however, it should be noted that even as early as Justinian,

---

<sup>4</sup>*Id.*

<sup>5</sup>*Id.*

<sup>6</sup>*Id.*

<sup>7</sup>Black’s (2009), p. 1286.

<sup>8</sup>The first three are actually subcategories of a broader category of property, “*res extra patrimonium*,” which are things owned by no individual in particular. Blumm and Ritchie (2005a), p. 677, citing Buckland (1963); Wise 503, 508 (1996).

<sup>9</sup>Buck (1998), p. 4.

<sup>10</sup>*Id.*; Blumm and Ritchie (2005a), p. 677, citing J. Inst. 2.1.2; Dig. 1.8.5; Sohm (1907), p. 303–304.

<sup>11</sup>Buck (1998), p. 4.

<sup>12</sup>Gorina-Ysern (2004), p. 665, citing Fenn (1926), pp. 47, 52–53. This is also the basis for “the capture doctrine” which U.S. first-year law students are often taught through the case *Pierson v. Post*. See *id.* Some have interpreted this concept and used the term more broadly to mean “incapable of appropriation in the form of private ownership,” which is a definition that overlaps with property that is subject of appropriation by States such as *res publicae*, *res universalis*, and *res communes*. Gorina-Ysern (2004), p. 655.

<sup>13</sup>Blumm and Ritchie (2005a), p. 677, citing Wise (1996), p. 503, 508; Sohm (1907), pp. 303–304.

<sup>14</sup>Buck (1998), p. 4. Observers have pointed out the limitations of this categorical approach, as it does encapsulate the nature of the resource, the domain it is found, and how it is used. Other observers suggest that a better way to categorize the resources is by its multiple attributes. Buck (1998), p. 3. And some of these observers have noted that the most important characteristics for categorizing commons is the feasibility of excluding others from the resource and the degree to which one’s use can diminish the amount left for others. *Id.*

<sup>15</sup>Buck (1998), p. 76.

<sup>16</sup>*Id.*

citizens' rights to take wildlife were not absolute, and the state maintained sovereignty over the harvest of animals.<sup>17</sup>

The fact that oceans and wild fisheries can have no singular owner means, by definition, that no individual acting alone can exclude others from using them. It follows that, if the resource is scarce, then each person, acting solely in his or her self-interest, has an incentive to use as much of the resource as quickly as possible; otherwise the amount of available resource will diminish because of others' use. When the resource is exhaustible, the result is overuse, making everybody worse off.<sup>18</sup> This challenge for common property was popularized in ecologist Garret Hardin's "Tragedy of the Commons."<sup>19</sup> Under the thought-experiment posed by Hardin, a rational herder whose animals graze on communal property and whose costs from overgrazing are delayed and shared among the other herders will continue to add animals to the property to increase personal gain until all are made worse off by the resulting overgrazing.<sup>20</sup>

While the name of the tragedy is associated with Hardin, he was not the first to recognize it, as more than a decade before, economist H. Scott Gordon outlined a similar theory with fisheries in his "An Economic Theory of Common Property Research. The Fishery."<sup>21</sup> Gordon pointed out that the value of fishery resources comes from its immediate use of such resources,<sup>22</sup> framing the discussion using the economic concept of "resource rent."<sup>23</sup> With other industries, if there is an excess amount of profit to be had due to too much supply (these extra-normal profits are known as "rents"), it will attract those who will seek these rents out, which will, in turn, optimally dissipate.

With certain natural resources such as fisheries, on the other hand, this optimal rent dissipation is not possible.<sup>24</sup> Attracted by excess profit, fishermen will continually enter the fishery. But, as they do, the biological availability of the resource will become threatened.<sup>25</sup> This means a greater expenditure on fishing effort (more boats or more gear, an inefficiency often called "overcapitalization") than is optimal.<sup>26</sup> As a result, there is an inefficient allocation of resources, as more and more of fishermen's resources are spent chasing fewer and fewer fish. In a regulated

<sup>18</sup>Block-Lieb (1993).

<sup>19</sup>These two characteristics: (1) that it is difficult to exclude other potential users and (2) the resource is finite and extractable by one to the detriment of other potential users are what turns simple communal property into what is called a "common-pool resource" which is subject to the tragedy of the commons of which Hardin and Gordon speak. fishery, this means higher costs for fishermen or shorter seasons, which may additionally create dangerous fishing conditions because fishermen will fish for longer hours or in worse weather. Alternatively, in an uncontrolled fishery, you simply diminish or exhaust the resource, resulting in the tragedy described in Hardin's thought-experiment.

It has long been argued that this problem, the lack of regulation of fishermen who over-exploit exhaustible fish populations, is the primary threat to the world's fisheries. While there are other serious issues affecting fish populations, including agricultural and urban runoff, storm water and sewage overflows, discharges from wastewater treatment facilities, oil spills, atmospheric deposition of nutrients and toxic chemicals, global-warming-induced acidification (all discussed in Chap. 36), unsustainable fishing has long been pointed to as chiefly responsible for declining wild-fish populations.<sup>27</sup> The FAO has also indicated that the situation is more critical for some fishery resources that are exploited solely or partially in the high seas, which, as discussed in Chap. 36, is the area beyond any nations' Exclusive Economic Zone (EEZ).<sup>28</sup>

And while the pace of overexploitation of fisheries has slowed since 1990 and progress has been made in reducing exploitation rates and restoring overexploited fish stocks and marine ecosystems in some areas, the world's fisheries remain in bad shape. More than half of the world's fish populations are at or very close to their maximum sustainable production levels as of 2009.<sup>29</sup> Among the remaining stocks, close to 30 % were overexploited, producing lower yields than their biological and ecological potential.<sup>30</sup> Most of the fish populations that account for about 30 % of the world's marine fisheries production are fully exploited and, therefore, have no potential for increases in production.<sup>31</sup> The declining global marine catch over the last few years, the increased percentage of overexploited fish populations, and the decreased proportion of non-fully exploited fish populations has led the United Nation's Food and Agricultural Organization (FAO) to conclude that the state of the world's marine fisheries is worsening.<sup>32</sup>

The overexploitation of this exhaustible fish resource is not only harmful to the fish populations themselves and marine ecosystems, but it also means that there are fewer fish for people to consume, which is economically harmful for those that rely on fishing for income.<sup>33</sup> As a result of this imbalance, it can certainly be argued that

the tragedy of the commons still exists for much of the world's fisheries, notwithstanding the significant legal developments in the governance of fisheries which are discussed in Chap. 36. Policy makers are still wrestling with how best to prevent the tragedy, either because the laws passed are insufficient or not adequately enforced.

The policy options that are often proposed to solve the so-called tragedy of the commons are bi-modal: either governmental regulation or private control of the common resources. Under the former model, the government assesses the carrying capacity of the resource, i.e., the amount each individual could consume that would benefit all, and establishes penalties for those that consume above these limits, thus ensuring that each user is only utilizing the amount that is in everybody's best interests.<sup>34</sup> Therefore, with fishing as an example, a government can set a limit on the total allowable amount that fishermen or any group of fishermen can catch that is best for the long-term health of the fishery. As discussed further in Chap. 36, the main law governing U.S. fisheries, the Magnuson-Stevens Fishery Conservation and Management Act (MSA), as it has been amended, requires the government to establish Annual Catch Limits (ACLs) for fishermen, which correspond to the annual amount of catch that would not result in overfishing, as reduced by scientific uncertainty.<sup>35</sup> Accountability measures, such as in-season fishing closures or measures to correct for when fishermen exceed these limits, are meant to prevent the catch from exceeding these ACLs or offset the overages.<sup>36</sup> These measures, established by the government, are an attempt to limit the overuse of the exhaustible fishery resource.

Under a privatization or unitization model (which are similar models but not necessarily the same), the resource is divided or parceled. The theory is that individuals who are allocated property interest have the exclusive right to the resource and the commons tragedy is averted because users no longer need to maximize the resource's value in the short-term. They can limit its use in order to maximize long-term gain.<sup>37</sup> The conversion of the resource from public to private property is also supposed to avoid economic waste, inefficiency, and internalize the benefits and costs of using the resource.<sup>38</sup> Resource owners incur the entire cost of overuse and thus carefully care for the resource.<sup>39</sup> Arguably, the most recent significant influence on fisheries policy has come from advocates of property-rights-based and free-market policies as a means to avert the tragedy of the commons.<sup>40</sup>

<sup>39</sup>Thompson (2000), p. 244.

<sup>40</sup>Rieser (1999), p. 397.

In the United States, these two divergent models are perhaps best exemplified in two conceptual frameworks: On the one hand is the Public Trust Doctrine, traditionally a common law doctrine that some argue serves as a foundation for much of the MSA. The Public Trust Doctrine treats *res communes* or *res nullius* property, or property that has no owner, as *res publica* property, meaning property held by the government for the use and enjoyment of the public.<sup>41</sup> On the other hand, IFQs seek to make the property more closely resemble *res privatae*, or private property. Similarly, aquaculture, also known as fish farming, is a form of privatization or unitization, as it seeks to fence in the fisheries resource for exclusive use.

Neither IFQs or the Public Trust Doctrine, as they have been implemented in U.S. state and federal law, however, are perfect idealizations of either bi-modal solution—neither are a completely privately owned or government-managed scheme. Rather, the country has typically incorporated a blend of both into the management of its fisheries.<sup>42</sup>

Not only is there no such thing as a purely private or public regulatory regime for fisheries, the tragedy-of-the-commons-paradigm itself has come under sharp criticism for being unrealistic. Accordingly, the effectiveness of policy solutions that are supposedly dictated by the theories have been called into question. For example, Elinor Ostrom won the 2009 Nobel Prize in economics for her work demonstrating that communities can and have managed to avoid the tragedy of the commons without reliance on either a purely governmental or private alternatives.<sup>43</sup> She and others demonstrate that individuals can and do communicate and agree to rules of use that can improve their joint outcomes, and these critics believe that such rules can serve as design principles for institutional change.<sup>44</sup> Others have pointed out that Hardin was analyzing the tragedy of open access, or *res nullius* resource management regime, which is not an accurate representation of the present status of the oceans and fisheries resource, and thus does not form a good foundation for policy solutions to existing problems such as overfishing.<sup>45</sup> As U.S. professors Macinko and Bromley put it: “It seems useful to point out that the issue for fishery policy is certainly *not* a choice between some blissful state *with* property rights, and a state of nature in which anarchy is the order of the day. The issue is, rather, which

---

<sup>41</sup>As law professor Hirokawa puts it “By operating as a condition precedent to both ownership of land and its use, the public trust doctrine intervenes in capture scenarios to prevent common resources from consumption, transformation, or other capture-like consequences of privatization.” Hirokawa (2010), p. 212.

<sup>42</sup>See, e.g., Professor Rieser’s discussion of IFQs in “The Ecosystem Approach: New Departures For Land And Water: Fisheries Management: Property Rights and Ecosystem Management in U.S. Fisheries: Contracting for the Commons?” Rieser (1997), pp. 818–820.

property regime is best suited for particular settings and circumstances.”<sup>46</sup> For example, at least since 1976, the MSA has regulated the fishery resources in the U.S. EEZ,<sup>47</sup> and the many refinements in the law have improved the status of many U.S. fisheries.

Notwithstanding these criticisms, the tragedy of the commons paradigm, along with its public and private policy solutions merit some understanding, as they underpin management of fisheries at both the national and international levels. Accordingly, the following section explores the Public Trust Doctrine in greater depth.

### 34.2.2 *The Public Trust Doctrine*

The Public Trust Doctrine is present in many countries’ legal systems.<sup>48</sup> It perhaps finds its ancestry in the principles of common resources recognized by ancient dynasties in China, Islamic law, and various Native American cultures.<sup>49</sup> Scholars have most immediately traced the doctrine to the Roman Emperor Justinian, although some scholars criticize this historical analysis as flawed, arguing that the emperor’s statements were those of ideals, not actual Roman legal doctrine.<sup>50</sup> Bracton incorporated the doctrine from Roman law into his writings on the English common law,<sup>51</sup> but it did not become a popular doctrine advanced to enhance environmental protection until much more recently, due to U.S. law professor Joseph Sax’s 1970 seminal article “The Public Trust Doctrine in Natural Resource Law: Effective Judicial Intervention.”<sup>52</sup> Since this time, the theory has become a significant component of the cultural and legal framework influencing all fisheries management in the United States.<sup>53</sup> As can be seen in the Chap. 36, it is a concept that also undergirds some international regulation of fisheries.

Broadly, this doctrine provides that the government holds certain public resources in trust for the benefit of the nation.<sup>54</sup> And as such, the state cannot abdicate direction and control of these resources by allowing them to be

permanently sold or transferred exclusively for private use without public benefit. This framing was put forward by the U.S. Supreme Court in the famous *Illinois Central Railroad* decision,<sup>55</sup> which Professor Sax seized upon, along with the decision's progeny, for developing the modern public trust doctrine thesis.<sup>56</sup> Under the doctrine, the government has authority to grant limited-use rights to this public property (including leases, easements, and permits) as long as it is short of total ownership.<sup>57</sup> Use of the property is limited to activities that do not harm or interfere with the public-trust purposes of the property.<sup>58</sup> The doctrine provides a theoretical foundation for the government's placing of limits on any individual's exploitation of scarce common resource, such as fisheries, as the resource is not solely to be utilized by the first captor. When the government manages a common resource in trust for the public, it is able to prevent self-interested users from overexploiting the resource to the detriment of all. Thus, the doctrine, at least in concept, has the effect of preventing the so-called tragedy of the commons.

While the doctrine seems straightforward, its scope and application, including to fisheries, has been the subject of much debate and confusion. The following sections outline the debate and analyze whether the doctrine even applies to fisheries. Questions have also been raised and will be discussed below about whether the doctrine is solely applicable to U.S. state resources or whether it applies where the states have no property interests, i.e., U.S. federal resources such as the EEZ. Finally, while there is no doubt that the Public Trust Doctrine undergirds U.S. fisheries law and serves as a foundation for a number of its provisions, there are questions about what the doctrine has to offer that existing statutory law does not. A detailed discussion of each of these controversies is presented in the following three sections of this chapter.

### 34.2.3 *The Public Trust Doctrine's Application to Fisheries*

The first question is whether the doctrine even applies to fisheries. This common-law doctrine has traditionally applied to the beds of waterways,<sup>59</sup> and, thus, confusion has arisen in relation to its applications to wild animals, also known as *feroe naturae*. With wild animals such as fish, the concept of the state as the extant owner of the property runs headlong into a separate common-law doctrine that states that title for such resources can be acquired once the resource is reduced to possession, i.e., under "the rule of capture."

<sup>55</sup>*Ill. Cent. R.R. Co. v. Ill.*, 146 U.S. 387, 453–454 (1892).

<sup>56</sup>Lazarus (1986), pp. 641–642.

<sup>57</sup>Osherenko (2006), p. 362.

<sup>58</sup>Sax (1970), p. 477; *id.* p. 367.

<sup>59</sup>National Research Council (1999), p. 42.

This contradiction can be observed in the Supreme Court's eventual repudiation of its *Geer v. Connecticut* decision over the last century.<sup>60</sup> At issue in the *Geer* case was a state statute that prohibited the killing and possession of certain birds with the intent of bringing them out of state.<sup>61</sup> In evaluating whether this law violated the U.S. Constitution's Interstate Commerce Clause, the Supreme Court discussed the state's interest in regulating wild animals.<sup>62</sup> While recognizing that wild animals were common to all, and, therefore, all could acquire title by possession, this private right was still governed by the ultimate law-giving power of the state.<sup>63</sup> After quoting from scholars who concluded that this was the European legal tradition, the Court cited the seminal William Blackstone commentaries for the position that, while "every man from the prince to the peasant has an equal right of pursuing and taking to his own use all such creatures as are *feroe naturoe*, and, therefore, the property of nobody, . . . it follows . . . that this natural right . . . may be restrained by positive laws enacted for reasons of state or for the supposed benefit of the community."<sup>64</sup> The Court found that the state was therefore entitled to erect the statute prohibiting and this did not violate the Commerce Clause.<sup>65</sup>

Since this time, the U.S. Supreme Court has steadily interpreted the state's interests defined in *Geer* narrowly, suggesting that the government does not in fact "own" fisheries. The Court has held that a state's property interest in wild animals cannot invalidate a treaty under the U.S. Constitution's Tenth Amendment.<sup>66</sup> Such property interests cannot empower the state to impose far higher license fees on citizens of other states without violating the Privileges and Immunities Clause of the U.S. Constitution.<sup>67</sup> Nor are state statutes that prohibit federal licensees from catching fish in state waters permissible under the Constitution's Supremacy Clause, notwithstanding state claims that the state was granted ownership and title under the Submerged Lands Act.<sup>68</sup> Ultimately, the Supreme Court directly overruled *Geer* directly in a Commerce Clause challenge.<sup>69</sup> The Court, however, has never repudiated that the state has the authority to manage wildlife in trust for the public.<sup>70</sup> Rather, the Court has explained that the state's "ownership" of

---

<sup>60</sup>*Geer v. Connecticut*, 161 U.S. 519 (1895).

<sup>63</sup>*Id.*

<sup>64</sup>*Id.* p. 527 (quoting 2 Blackstone Commentaries 410).

<sup>65</sup>*Id.* p. 534.

<sup>66</sup>*See Mo. v. Holland*, 252 U.S. 416, 434 (1920) (calling the state's claim of title a "slender reed" because "[w]ild birds are not in the possession of anyone; and possession is the beginning of ownership").

<sup>67</sup>*See Toomer v. Witsell*, 334 U.S. 385, 401–402 (1948).

<sup>68</sup>*See Douglas v. Seacoast Prods., Inc.*, 431 U.S. 265, 283 (1977).

<sup>69</sup>*Hughes v. Oklahoma*, 441 U.S. 322, 335 (1979). For an in-depth treatment of these cases and the demise of *Geer*, see Macinko and Bromley (2004), pp. 631–634.

<sup>70</sup>National Research Council (1999), p. 42.

wild animals, as analyzed and portrayed in *Geer*, is not the same as title. Consequently, states exercise their duties with such property as part of its overall police power.<sup>71</sup>

Therefore, notwithstanding its character as *feroe naturoe*, the statements in *Geer* remains good law in the United States that the state has the power and authority to regulate wild fish populations as a public trust resource.<sup>72</sup>

As described below, there are other questions about whether the Public Trust Doctrine applies outside of state lands, whether it is a resource that is displaced by statutory law, and whether it is useful as a concept for the management of fisheries. Nonetheless, there is little strength in the argument that the Public Trust Doctrine does not apply to fish and fisheries solely because they are *feroe naturoe* and governed strictly by the rule of capture.

### ***34.2.4 The Public Trust Doctrine's Application to Federal U.S. Resources***

In order for the Public Trust Doctrine to have any protective value for resources such as federal fisheries, it must not simply remain a doctrine applicable to states. A related question is how, as a common law doctrine, it can coincide, if at all, with federal statutory law, or is it displaced by federal statutes like the MSA? There is no reason that the common law Public Trust Doctrine should have any importance to federal fisheries if it has been completely displaced by statutory law. The subsequent discussion sheds some light on these questions.

In the United States, the Public Trust Doctrine traditionally has been raised either strictly as a matter of state law or, as discussed above, as an (now, unavailing) argument for the state's interest to trump federal interests, such as those embodied in the U.S. Constitution's Treaty, Supremacy, or Commerce clauses. There has been little case law discussing its applicability to those areas where the federal government has asserted some sovereignty, such as the U.S. EEZ.<sup>73</sup> Indeed, the legal authority and responsibility of the U.S. government to protect public trust resources in the EEZ has never been fully and expressly established.<sup>74</sup> Neither courts nor Congress have ever directly stated that there is a common law or

<sup>71</sup>See Babcock (2007). And this concept has been bolstered by a number of state court decisions. National Research Council (1999), p. 42. Indeed, Justice Burger explained in his concurring opinion in *Baldwin v. Fish & Game Comm'n*: "A State does not 'own' wild birds and animals in the same way that it may own other natural resources such as land, oil, or timber. But, as . . . the doctrine is not completely obsolete. It manifests the State's special interest in regulating and preserving wildlife for the benefit of its citizens." 436 U.S. 371, 392 (1978).

<sup>72</sup>And, in fact, "absent federal-state conflict, it continues to endure today, as virtually all states claim ownership of wildlife in trust for their citizens." Blumm and Ritchie 2005a, p. 676.

<sup>73</sup>National Research Council (1999), p. 43.

<sup>74</sup>Turnipseed et al. (2009), p. 1.

statutory public-trust duty applicable to either federal lands or federal ocean waters, even though the principles underlying the doctrine appear in federal environmental statutory language, agency mission statements, and national policy recommendations.<sup>75</sup>

But the doctrine's development in state law in the United States strongly suggests that it applies to federal resources. In the latter half of the eighteenth and into the nineteenth centuries, the U.S. Supreme Court and various state courts described the public trust that pertains to state common resources as an essential attribute of sovereignty, first under the Crown, and then passing to the 13 American colonies when they gained independence.<sup>76</sup> Indeed, the common law "enhanced and extended" the public aspects of these resources.<sup>77</sup>

Under the English common law, a distinction was made between the tidal and non-tidal waterways. With the latter, the public had less of an interest. It only retained the right of passage; and title up to the center thread of the waters was typically held by the riparian landowners, which accorded them the exclusive right of fishery in the stream and entitled them to compensation for any impairment of their right to the enjoyment of their property.<sup>78</sup> In the United States, on the other hand, courts rejected the distinction between tidal and nontidal waters and concluded that states presumptively held title to navigable waterways.<sup>79</sup> Similarly, the common law in the United States did not recognize the sovereign leader's private property rights to lands under navigable waterways. "All these developments in American law are a natural outgrowth of the perceived public character of submerged lands, a perception which underlies and informs the principle that these lands are tied in a unique way to sovereignty."<sup>80</sup> It could therefore be argued that just like with state waterways, where the United States has asserted its sovereign authority over navigable waterways for the benefit of the public, the Public Trust Doctrine likewise attaches as a matter of U.S. federal law.<sup>81</sup>

One example of this exercise of sovereignty as detailed in Chap. 36, is President Reagan's 1983 declaration that the U.S. EEZ extends 200 nautical miles and within that zone:

The United States has, to the extent permitted by international law . . . sovereign rights for the purpose of exploring, exploiting, conserving and managing natural resources, both living and non-living, of the seabed and subsoil and the superjacent waters and with regard

---

<sup>75</sup>*Id.* p. 8.

<sup>76</sup>*See, e.g., Martin v. Lessee of Waddell*, 41 U.S. 367, 416 (1842); *Arnold v. Mundy*, 6 N.J.L. 1, 71, 78 (Sup. Ct. 1821); *Shively v. Bowlby*, 152 U.S. 1, 57 (1894).

<sup>77</sup>*Idaho v. Coeur D'Alene Tribe*, 521 U.S. 285 (1997).

<sup>78</sup>*Id.*

<sup>79</sup>*Id.* p. 286.

<sup>80</sup>*Id.*

<sup>81</sup>*But see Lynch (2007)*, arguing that unlike state waters, the EEZ has traditionally been treated as a global commons and thus should be treated as *res nullius*.

to other activities for the economic exploitation and exploration of the zone, such as the production of energy from the water, currents and winds; and jurisdiction with regard to . . . the protection and preservation of the marine environment.<sup>82</sup>

The MSA likewise “exercis[es] . . . sovereign rights for the purposes of exploring, exploiting, conserving, and managing all fish, within the [EEZ].”<sup>83</sup> Other observers have noted that the sovereignty (between 3 and 12 nautical miles) and sovereign rights (from 12 to 200 nautical miles) asserted by the United States in the EEZ is enough, not only for establishing the applicability of the Public Trust Doctrine, but also for the doctrine to be recognized under international law (Fig. 36.1).<sup>84</sup>

In addition to sovereignty-based arguments, some observers have also pointed to the broad language in several U.S. Supreme Court decisions such as *Illinois Central Railroad v. Illinois* as suggesting the doctrine’s federal applicability.<sup>85</sup> *Shively v. Bowlby* also indicates that property acquired by the United States is a public trust resource.<sup>86</sup> Likewise, in settling the dispute between California and the federal government over oil leases within three miles of the coast, the Supreme Court refused to accept the state’s argument that the federal government had waived its property interest, saying that “the Government, which holds its interests here as elsewhere in trust for all the people, is not to be deprived of those interests[,] . . . [by] officers who have no authority at all to dispose of Government property . . .”<sup>87</sup> Thus, the federal government retains its property interests through the Public Trust Doctrine.

Several federal U.S. district court decisions support the view that there is a federal public trust. For example, in *In Re Steuart Transportation Co.*, an Eastern District of Virginia court held that both the federal and state governments could sue the owner of an oil transport vessel for injury to migratory wildfowl because “under the public trust doctrine, the State of Virginia and the United States have the right and duty to protect and preserve the public’s interest in natural wildlife resources.”<sup>88</sup> In *United States v. 1.58 Acres of Land*, a federal District Court in Massachusetts held that the United States could condemn state public trust property, but said that the federal government was restricted from “convey[ing] land below the low water mark to private individuals free of the sovereign’s *ius publicum*,”<sup>89</sup> ostensibly referring to the government’s public duty not to dispose of the property for private purposes. In the more recent *United States v. Ross* decision, a South Dakota district court found that the United States had sufficient interest in obtaining restitution from a person convicted in the aiding and abetting of

<sup>82</sup>48 Fed. Reg. 10,605 (March 14, 1983).

<sup>83</sup>16 U.S.C. § 1801(b)(1).

<sup>86</sup>*Shively v. Bowlby*, 152 U.S. at 57.

<sup>87</sup>*United States v. California*, 332 U.S. 19, 40 (1947).

<sup>88</sup>*In Re Steuart Transportation Co.*, 495 F. Supp. 38, 40 (E.D. Va. 1980) (emphasis added).

<sup>89</sup>*United States v. 1.58 Acres of Land*, 523 F. Supp. 120, 124 (D. Mass. 1981).

taking of migratory birds under the federal Victim and Witness Protection Act because “the Government surely has a legitimate and substantial interest in preserving and protecting hawks in its air space as part of the public’s natural wildlife resources. This interest does not derive from ownership of the resources, but from the duty the government owes to the people.”<sup>90</sup> These cases support the notion that the government can also recover for the federal trust, which extends to waters.

Notwithstanding, a recent Supreme Court decision has led other courts to conclude that the Public Trust Doctrine is strictly a state law doctrine and does not apply to federal resources. For instance, at dispute in *PPL Mont., LLC v. Montana* were the beds of three rivers on which a power company, PPL, had hydroelectric facilities.<sup>91</sup> In 2003, PPL was sued because the company had built its facilities on riverbeds that were state-owned and part of Montana’s school trust lands.<sup>92</sup> The Court declared that the Montana Supreme Court erred in finding the river under state title. Most of the Court’s decision relates to how to apply the test for “navigability” under the U.S. Constitution’s “Equal Footing” doctrine.<sup>93</sup> By the end of the decision, however, the Court addressed Montana’s argument that denying state title “will undermine the public trust doctrine, which concerns public access to the waters above those beds for purposes of navigation, fishing, and other recreational uses.”<sup>94</sup> The Court concludes that,

[u]nlike the equal-footing doctrine . . . the public trust doctrine remains a matter of state law . . . subject as well to the federal power to regulate vessels and navigation under the Commerce Clause and admiralty power. While equal footing cases have noted that the State takes title to the navigable waters and their beds in trust for the public, . . . the contours of that public trust do not depend upon the Constitution. Under accepted principles of federalism, the States retain residual power to determine the scope of the public trust over waters within their borders, while federal law determines riverbed title under the equal-footing doctrine.<sup>95</sup>

This language has been seized upon by at least two federal courts as an argument that the Public Trust Doctrine has no basis in federal law.<sup>96</sup> However, this is a mistaken interpretation of the *PPL* decision. The Public Trust Doctrine that

<sup>90</sup>*United States v. Ross*, No. CR. 11-30101-MAM, 2012 U.S. Dist. LEXIS 146285, at \*5-6 (D.S.D. Oct. 10, 2012) (footnotes omitted). See also *United States v. Burlington N. R.R. Co.*, 710 F. Supp. 1286, 1287 (D. Neb. 1989) (“In view of this trust position, and its accompanying obligations, it appears that the United States . . . can maintain an action to recover for damages to its public lands and the natural resources on them, which in this action would encompass the destroyed wildlife.”).

<sup>91</sup>*PPL Mont., LLC v. Montana*, 132 S. Ct. 1215, 1225 (2012).

<sup>92</sup>*Id.*

<sup>93</sup>*Id.* at 1228.

<sup>94</sup>*Id.* at 1234.

<sup>95</sup>*Id.* at 1235.

<sup>96</sup>See, e.g., *Alec L. v. Jackson*, 863 F. Supp. 2d 11, 15 (D.D.C. 2012), aff’d, 561 Fed. Appx. 7 (D.C. Cir. 2014). The courts found that the plaintiffs could not invoke federal subject matter jurisdiction for a claim against Defendant EPA for failing to reduce greenhouse gases in violation of the Public Trust Doctrine, as it was foreclosed by the *PPL* decision, which determined that it was a state law doctrine.

Montana was seeking to rely on was not one based in federal law. Rather, it was Montana's own state-law Public Trust Doctrine. In addition, while the Supreme Court used language that suggests the doctrine only pertains as a matter of state law, i.e., saying that the doctrine "remains a matter of state law . . . [,]" and that the contours of the doctrine "do not depend upon the Constitution[,]" the Court was contrasting this state doctrine relied upon by Montana, with the obviously supreme Equal Footing doctrine, which has its foundations in federal U.S. constitutional law.<sup>97</sup> The Supreme Court has not issued any interpretation about the existence of the doctrine as a matter of federal law. Instead, the court simply reached the rather mundane conclusion that under, the U.S. Constitution's Supremacy Clause, the state doctrine would not trump federal law.<sup>98</sup>

Regardless, the *PPL* decision's inartful language poses a new obstacle for advocates who argue that the Public Trust Doctrine is equally applicable to federal resources, such as fisheries in the U.S. EEZ, and that it is derived from the U.S. Constitution.<sup>99</sup> This, however, does not mean that the Public Trust Doctrine is not a legitimate source of common law derived from other positive sources of law, such as the MSA or the federal government's assertion of sovereign interest in the EEZ. As demonstrated later in this chapter, this use of principles to guide the MSA's interpretation may be where it is most useful for protecting fisheries.

### ***34.2.5 The Public Trust Doctrine and the Magnuson Steven Fishery Management and Conservation Act (MSA)***

Even if the Public Trust Doctrine does apply to federal resources, and particularly federal fishery resources, there remains an open question as to whether it is displaced by federal *statutory* law, such as by the MSA. When Congress addresses an issue governed under the federal common law, the federal statute displaces the common law.<sup>100</sup> The test is whether the statute directly addresses the particular question.<sup>101</sup> At least one federal court recently stated (in *dicta*) that the Public Trust

---

<sup>97</sup>*Id.*

<sup>98</sup>*Accord* Adler (2013), p. 1706 n. 14. As law professor Adler remarks "In *PPL Montana*, the Supreme Court reiterated earlier holdings that federal law controls the navigability for title test for purposes of the equal footing doctrine, but that state law governs the scope of the public trust doctrine within individual states."

<sup>99</sup>Since the U.S. Supreme Court's *Erie R.R. v. Tompkins*, 304 U.S. 64, 78 (1938) decision, it has been accepted that federal common law must be derived from a federal source of positive law, such as the Constitution or a statute. Chase at pp. 113, 138, 162 (2010). The *PPL* decision terminates the argument that the doctrine has a basis in the U.S. Constitution's Equal Footing Doctrine, as some say that the *Illinois Central* decision should be interpreted. *See, e.g., id.* pp. 140–142 (arguing that that the *Illinois Central* Court's articulation of the Public Trust Doctrine was derived from the U.S. Constitution's Equal Footing Doctrine).

<sup>100</sup>*Am. Elec. Power Co. v. Connecticut*, 131 S. Ct. 2527, 2537 (2011).

<sup>101</sup>*Id.*

Doctrine could not “supplant or supplement” the requirements established by the MSA for IFQ programs,<sup>102</sup> which simply begs the question: when has the statute or another source of law spoken so directly to an issue that it displaces the common law doctrine altogether?

Generally, if a statute does not “directly address” the question at issue, the U.S. Supreme Court has allowed the federal common law to supplement the statutory scheme. For example, where the Federal Water Pollution Control Act originally only provided broad authority to the states to enact pollution standards and gave the U.S. Attorney General the power to sue for abatement of pollution, the Court found that federal common law still could be applicable.<sup>103</sup> Where the Congress subsequently amended the act to create an all-encompassing program of water pollution regulation covering overflows from the source at issue, however, the court found that there was no interstice for the common law to fill.<sup>104</sup> In the latter case, “the relevant question for purposes of displacement is ‘whether the field has been occupied, not whether it has been occupied in a particular manner.’”<sup>105</sup> It is not clear that the MSA has directly spoken to a number of issues that arise with federal fisheries management. For example, as discussed in Chap. 36, the issue of whether or not the act was designed to cover fish farming in federal waters is hotly disputed. To the extent that the act does not allow for federal regulation or provides for limited management of aquaculture in the EEZ, the state and federal public trust doctrines, just like other common law doctrines such as public and private nuisance, should be available to fill the gaps.<sup>106</sup>

Likewise, in terms of the IFQs, in the *Pac. Coast Fed’n of Fishermen’s Ass’n* case mentioned above which seemed to curtail the applicability of the Public Trust Doctrine, the question was whether the federal government’s National Marine

---

<sup>102</sup>*Pac. Coast Fed’n of Fishermen’s Ass’n v. Locke*, No. C 10-04790 CRB, 2011 U.S. Dist. LEXIS 86662, at \*52 (N.D. Cal. Aug. 5, 2011).

<sup>103</sup>*Ill. v. City of Milwaukee*, 406 U.S. 91, 102–103 (1972).

<sup>104</sup>*City of Milwaukee v. Ill.*, (*Milwaukee II*) 451 U.S. 304, 318–319, 23 (1981).

<sup>105</sup>*Am. Elec. Power Co. v. Connecticut*, 131 S. Ct. 2527, 2538 (2011) (citing *City of Milwaukee v. Ill.*, 451 U.S. at 324). For a discussion of the interplay between the two *City of Milwaukee* cases and the *American Electric* decision, see Winters (2011), p. 382.

<sup>106</sup>See Babcock (2007), pp. 60–61, who argues that federal laws involving the management of fish would not displace application of the common law to fish farming. See also, Turnipseed et al. (2009), pp. 48–49, which argues that at, with the EEZ, virtually all of the key prerequisites laid out by the Supreme Court in *Texas Indus., Inc. v. Radcliff Materials, Inc.*, 451 U.S. 630, 640 (1981) exist for when federal courts can create federal common law, except that Congress did not give this power expressly to the courts. See also *Michigan v. U.S. Army Corps of Eng’rs*, 667 F.3d 765, 769–771 (7th Cir. 2011) (denying that states would likely succeed on their common law nuisance claims against the U.S. Army Corps of Engineers, but assessing a greater likelihood than the District Court did because federal common law can apply where there is an overriding federal interest in the need for a uniform rule of decision, and nuisance law would cover the non-native species that were will migrating into Lake Michigan, even though they were not traditional pollutants.) See *United States v. Rainbow Family*, 695 F. Supp. 314, 327 (E.D. Tex. 1988) (allowing the federal government to pursue an injunction as a remedy for a common law nuisance claim in lieu of the applicability of its federal permitting scheme).

Fisheries Service's (NMFS) program had violated the Public Trust Doctrine because the agency allocated a "quasi-permanent harvest privilege" to certain individuals, without any pre-established criteria for the government's potential revocation, limitation, or modification of such privileges.<sup>107</sup> One of the *amicus curiae*, represented by this chapter's author, argued that the program violated the public-trust values embedded in the MSA by substantially impairing the public's ownership interest of the fishery resource because without such criteria, such privileges could not be terminated, modified, suspended, or even limited—or at least not in a timely manner—to address the public need.

Arguably, since Congress had not occupied the field by establishing the terms and criteria for revocation, modification, or suspension of such privileges in the MSA, the Public Trust Doctrine should be able to fill the gap and allow judicial precedent to guide agency action. The MSA, at least regarding this aspect of IFQs, might therefore be much more like the regulatory system of the Federal Water Pollution Control Act in the *Milwaukee I* case, mentioned above, which the Supreme Court found did not displace federal common law because it did not occupy the field. The district court in *Pac. Coast Fed'n of Fishermen's Ass'n* disagreed. But such a conclusion is only binding in the Northern District of California, and it may not foreclose the possibility of other common law challenges to IFQ programs under the MSA and Public Trust Doctrine. Therefore, it is at least arguable that the common law Public Trust Doctrine is applicable to provide judicially developed guiding principles that can fill certain gaps existing in the U.S. law governing fisheries. How this might strengthen the law is explored in Sect. 35.1. The next section, explores criticism of and limitations with the doctrine.

### 34.3 The Public Trust Doctrine's Limitations

Among the criticisms of the Public Trust Doctrine is that it is anachronistic and that it prevents holistic or ecological thinking.<sup>108</sup> Dissenters also warn that trying to protect natural resources by using private-property doctrines may render the resources more vulnerable to degradation.<sup>109</sup> They also challenge that the doctrine places emphasis on the judiciary and the common law rather than on more powerful and comprehensive legislative efforts to protect the environment.<sup>110</sup> Others challenge that it encourages judicial takings of private property without just compensation.<sup>111</sup>

<sup>107</sup>See 50 C.F.R. § 660.25(h)(2)(ii) (2013).

<sup>108</sup>Klass (2006), p. 699, citing Delgado (1991), pp. 1212–1218.

<sup>109</sup>Ryan (2001), p. 493, citing Lazarus (1986), p. 696.

<sup>110</sup>Klass (2006), p. 700, citing Lazarus (1986), pp. 656–715.

<sup>111</sup>*Id.* citing Huffman (1989), pp. 565–568, Smith and Sweeney (2006), pp. 322–341, Thompson Jr. (1990), p. 1449. See also *Stevens v. City of Cannon Beach*, 510 U.S. 1207, 1212 (1994) (Scalia, J., dissenting).

Nonetheless, it has been observed that some of these “green” dissenters, who believed that the doctrine would not best enhance environmental protection, have been less vociferous since the 1980s. At least one observer has questioned whether this may be because of hostility to protection of the environment expressed both by more recent U.S. presidential administrations and their judicial nominees, perhaps squelching any optimism that the Public Trust Doctrine is unnecessary in the presence of more democratic means of protecting the environment.<sup>112</sup> Additionally, court decisions have given substantial discretion to agency interpretations of their organic statutes and administrative records, while other judicial doctrines have curtailed citizen standing and limited the power of Congress and agencies to act without it amounting to a taking. These judicial decisions might have taken the wind out of the sails of Public-Trust-Doctrine critics, who thought that it was unnecessary for resource protection.<sup>113</sup>

And these recent developments may now be the inspiration for a rather recent revival of the doctrine.<sup>114</sup>

Notwithstanding its many controversies, the Public Trust Doctrine provides a conceptual framework for the regulation of certain scarce natural resources such as fisheries. The basic concept, that such resources are to be managed for the benefit of the public by the government, provides the theoretical basis that allows, and even obligates, the government to regulate the exploitation of such resources, thus avoiding the so-called tragedy of the commons. Despite its importance, and in no small part because of confusion surrounding the doctrine, it is currently a concept that, at best, remains in the background of the management of fisheries resources. Many advocates, however, hope that its recognition and development will better serve to protect fisheries and other U.S. federal resources, as it has done for individual states.

## 34.4 Conclusion

This chapter explores the “tragedy of the commons” as the theoretical catalyst underlying modern national and international fisheries regulation. The common-law Public Trust Doctrine represents a public model for tackling this problem. IFQs and aquaculture are attempts to solve this problem by privatizing the fisheries resources, and are discussed in later chapters. The management of fisheries has been done through a blending of these types of regimes, to limited success, as too much of the world’s fisheries remain overexploited.

Because of the ongoing and worsening condition of fisheries, formal judicial and agency recognition of the Public Trust Doctrine in U.S. waters would enhance the

<sup>113</sup>*Id.*

<sup>114</sup>*See, e.g.,* Turnipseed et al. (2009), pp. 34–40.

regulation of the fisheries. Not only would it ensure that regulators view fisheries with a proper long-term vision and serve as a model for the international regulation of fisheries—while limiting the discretion that unelected officials have to dispose of public property for purely unrecompensed private use—its proper development can fill gaps in the MSA and extraterritorially strengthen international law, provide the public with a means to protect the resource, and hold agency officials accountable when they abdicate their responsibilities. At least one group of legal scholars hopes that the U.S. President would officially recognize the Public Trust Doctrine in federal resources, but this has yet to happen.<sup>115</sup> With the Supreme Court’s rather recent *PPL* decision, and subsequent courts interpreting it to preclude judicial recognition of a federal doctrine, it is more important than ever that the President or agencies recognize this doctrine, lest it may be forgotten or relegated to state law, where it can do little to protect the domestic and international fisheries that need the doctrine the most.

## Chapter 35

# Textbox: How the Public Trust Doctrine Supplements Existing Statutory Law

Zach Corrigan

**Abstract** There is no doubt that the Public Trust Doctrine undergirds U.S. fisheries law and provides the basis for a number of its provisions (*See e.g.*, National Research Council (1999), p. 39, explaining this is true for IFQs). However, it has been argued that the doctrine can do more than simply provide the theoretical underpinnings for MSA, and the next question is what the doctrine offers that existing statutory law does not?

### 35.1 Procedural Constraint on the Alienation of Resources

The Public Trust Doctrine may serve as a procedural constraint on the alienation of resources.<sup>1</sup> An often overlooked provision of the *Illinois Central* public-trust decision is its holding that, to the extent that a public trust resource can be disposed of, it is only by way of a legislative grant that contains “express authority” to dispose of or divert the use of a public trust resource.<sup>2</sup> At least one observer has indicated that a strengthened public trust doctrine applicable to federal resources could serve as a rule of statutory construction to limit the deference usually afforded U.S. federal agencies in managing these resources.<sup>3</sup> Under such a view, and analogous to the doctrine’s implementation in many states, the doctrine would require specific legislative sanction of an agency’s decisions regarding federal trust resources, thus putting the power to control trust resources with those

e-mail: [zcorrigan@fwwatch.org](mailto:zcorrigan@fwwatch.org)

who are democratically elected, rather than unelected administrative officials.<sup>4</sup> The downside of this approach, of course, is the potential ossification of federal environmental law and a lack of flexibility afforded to agencies to address environmental problems.<sup>5</sup>

## 35.2 Decreased Court Deference to Agency Action

Similarly, an adherence to the federal Public Trust Doctrine could yield less deference by courts to the agency in analyzing the factual record supporting agency actions. Typically, resource decisions, including those involving federal fisheries are reviewed under the federal Administrative Procedure Act, which provides that an agency's administrative record forms the evidentiary basis for any subsequent claim in court. One group of scholars has argued that recognition of the Public Trust Doctrine would bring such disputes under a breach of trust rubric, where claims do not require the courts to defer to agency factual determinations.<sup>6</sup>

## 35.3 Affirmative Duty to Protect Water and Fishery Resources

The Public Trust Doctrine may serve not simply as a negative restraint on the state's ability to alienate trust resources, but also as an affirmative duty "to protect the people's common heritage of streams, lakes, marshlands and tidelands, surrendering that right of protection only in rare cases when the abandonment of that right is consistent with the purposes of the trust[,]" as it has in the state of California.<sup>7</sup> Thus, under this doctrine, federal fisheries managers would be obligated to take a stronger role in conserving fishery resources.

## 35.4 Proper Frame of Reference

The doctrine may serve as a supplement to regulating fisheries, by giving managers a proper frame of reference. Some scholars contend that one of the largest shortcomings of the federal fishery management efforts is that they lack grounding in the Public Trust Doctrine. The Public Trust Doctrine would thus "provide[] an

organizing mission – to manage fisheries resources in the best interest of current and future citizens - as well as a valuable backstop when setting catch limits and other fishing regulations.”<sup>8</sup>

## 35.5 Flexibility

As a potential common law doctrine, it entails a flexibility that statutory law might not have.<sup>9</sup> The traditional public trust purposes entailed navigation, commerce, and fishing, but it has been extended to recreational purposes (boating, fishing, and swimming) and to ecological and aesthetic purposes in some U.S. states, including preservation of lands in their natural state in California.<sup>10</sup> Notably and most importantly, in Hawaii, courts have interpreted the Public Trust Doctrine to embrace the precautionary principle in order to encourage resource protection in the absence of conclusive scientific proof.<sup>11</sup> For fisheries, the scope of the Public Trust Doctrine may be most relevant to protect ocean ecosystems to produce food, medicine, climate stabilization, recreation, aesthetic enjoyment, as well as navigation and commerce.<sup>12</sup>

## 35.6 Principle of Intergenerational Equity

Some observers consider the principle of intergenerational equity to be integral to the Public Trust Doctrine.<sup>13</sup> Drawing analogies to private trust law, this means that the trustee must ensure that the corpus of the trust is managed so that the needs of current beneficiaries are met without sacrificing the ability of future beneficiaries to meet their needs.<sup>14</sup> For example, certain fishery management measures such as catch limits and marine protected areas, while preventing some public access, might be justified for their ability to protect the resource.<sup>15</sup> Likewise, as asserted above

with IFQs and discussed more fully below, the doctrine may be employed to limit IFQ privileges from being treated as *de facto* private property.

### 35.7 Fill Regulatory or Legislative Gaps

As discussed, it may fill the gaps in existing federal law or as a state doctrine applying where the federal government has not regulated the field.<sup>16</sup> Similarly, as a state or federal doctrine, it may extend extraterritorially to regulate federal or international waters.<sup>17</sup> There is little reason that the public trust doctrine would not apply to state waters within the three nautical mile belt around the United States coastline.<sup>18</sup> Generally, courts have held that where there is no conflict with federal or international law, “a state’s interest in preserving nearby fisheries is sufficiently strong to permit such extra-territorial enforcement of its laws enacted for that purpose.”<sup>19</sup> Thus, it follows that the doctrine could serve as a state or federal doctrine applying extraterritorially. The discussion of extraterritoriality is discussed in more detail in the next chapter.

### 35.8 Enhance Citizen Standing

It may provide as a doctrine that enhances citizen standing to protect resources. Some states have recognized that the doctrine provides both states and individuals the standing to enforce it.<sup>20</sup> In many other nations, citizens are likewise permitted to enforce the public trust doctrine, regardless of personal injury.<sup>21</sup>

# Chapter 36

## US and Global Regulation of Fisheries Beyond the Commons

Zach Corrigan

**Abstract** The regulation of fisheries touches upon issues of sovereignty, jurisdiction, and economics, all of which are the foundation for the actual specifics of fishery management laws. This chapter explores the history of international regulation of our world's oceans and fisheries, culminating in the Law of the Sea treaty. It then looks at the potential to extraterritorially apply nations' fisheries laws to cover gaps in the international regime. The chapter then explores how one particular nation's regime, the United States's Magnuson-Stevens Fisheries Conservation and Management Act, is structured to regulate U.S. domestic fisheries. It then explores two of the more recent trends in fisheries in depth: aquaculture, also known as fish farming, and Individual Fishing Quotas (IFQs), which are privatized or market-based means to manage fisheries. Finally, the chapter looks beyond the fisheries themselves and touches upon how people have attempted to regulate (or not regulate as the case may be) the waterways that are crucial for the survival of the world's fish populations. The chapter details how the movement to allocate resources that were once mistakenly thought to be inexhaustible has spurred significant theoretical and doctrinal developments, such as the movement away from treating such resources as open-to-all to a more communal concept of property. Practically, however, huge challenges for the conservation of the world's fisheries remain, whether it is from fish populations that continue to be overexploited; incomplete and disjointed management regimes; global warming; or developing industries like fish farming that seek to use ocean resources for their financial gain, perhaps to the detriment all.

### 36.1 Introduction

The regulation of fisheries touches upon issues of sovereignty, jurisdiction, and economics, all of which are the foundation for the actual specifics of fishery management laws. Chapter 34 looked at some of these issues, focusing on the

Public Trust Doctrine. This chapter explores the history of international regulation of our world's oceans and fisheries, culminating in the Law of the Sea treaty. It then looks at the potential to extraterritorially apply nations' fisheries laws to cover gaps in the international regime. Subsequently, this chapter explores how one particular nation's regime, the United States's Magnuson-Stevens Fisheries Conservation and Management Act (MSA), is structured to regulate U.S. domestic fisheries. The chapter then explores two of the more recent trends in fisheries in depth: aquaculture, also known as fish farming, and Individual Fishing Quotas (IFQs), which are privatized or market-based means to manage fisheries. IFQs provide fishermen a fixed portion of the amount of a fishery that they can fish, buy, sell, or trade to others.<sup>1</sup> Proponents argue that allocating a fixed share of the resource to fishermen limits their incentive to increase fishing effort to capture more fish than their competitors, thereby ending the "race to fish" or "derby fishing," as it is often called, and was conceptualized by Gordon and in Hardin's "Tragedy of the Commons," discussed in Chap. 34. The tradable nature of the fishing privileges is supposed to make the allocation of fishing privileges efficient. Fish farming, it is argued, will mitigate the so-called tragedy of the commons by increasing the supply, by allowing fish farmers to essentially build a fence around a particular "crop" of fish. Finally, the chapter looks beyond the fisheries themselves and touches upon how people have attempted to regulate (or not regulate as the case may be) the waterways that are crucial for the survival of the world's fish populations.

A review of fisheries and marine-pollution regulation over approximately the last 100 years shows a movement to allocate resources that were once thought to be inexhaustible. The debate about how public and private regimes—nationally, extraterritorially, and internationally—should best govern these resources has spurred significant theoretical and doctrinal developments, such as the movement away from treating such resources as open to all (as discussed in Chap. 34 on the theory underlying fisheries management), to more communal concept of property, as embodied by the 1982 Law of the Sea Convention. And even while nations have claimed more and more sovereignty over ocean waters and submerged lands, in no small part to accumulate greater economic wealth, such claims often have been couched in the language of conservation. In these respects, it might be argued that people have made some substantial strides in protecting common living marine resources such as fisheries.

Practically, however, huge challenges remain, whether it is from (1) fish populations that continue to be overexploited and regimes that are incomplete, ineffective, disjointed, or otherwise not up to the task of management; (2) relatively newer challenges such as global warming; and (3) developing industries like fish farming that seek to use ocean resources for their financial gain, perhaps to the detriment all. These challenges frame the national and international debates in law and policy governing the production of seafood.

## 36.2 A Brief History of the Last 15 Centuries of Fisheries Protection as a Global Commons

The first question that arises over how fisheries are regulated internationally is who has the right to exploit, or, alternatively, conserve and manage them. The law has gradually changed over the last 15 centuries to define the areas that nation states can claim and what remains subject to open access to every person and nation. As will be seen, very little of the ocean's resources, even beyond territorial borders in the "open seas" are now completely free for unbridled exploitation, as national and international law has gradually expanded to protect a greater extent of these resources. As will also be seen in this chapter, however, there is great room to improve the management of fisheries in order to benefit all.

At least a cursory understanding of the history of the management of the oceans and its fisheries is needed to understand how human civilization has arrived at this point. This chapter explores this history from three important legal vantages: (1) nations' initial claims of sovereignty over the high seas prior to Grotius; (2) the enclosure movement; and (3) the law of the sea. The fourth section looks to the future, exploring whether the extraterritorial application of nations' domestic laws could serve to protect international fishery resources.

### 36.2.1 *National Claims Over the High Seas*

Under the Digest of Justinian, one of the first bodies of law on the world's oceans and fisheries that still influences the common law today, no state could extend its jurisdiction beyond the high water mark of the shore.<sup>2</sup> But as mercantile city-states grew more powerful during the Middle Ages, they began laying claims to various parts of the Mediterranean.<sup>3</sup> Other areas such as the Baltic Sea were also becoming subject to competing claims from other nations such as Denmark, Sweden, and Poland.<sup>4</sup>

The fifteenth century and the conquests for new lands brought even greater pressures on nations to control the high seas. Portugal and Spain in effect claimed the entire world's oceans for their control in the 1494 Treaty of Tordesillas.<sup>5</sup> Early in the sixteenth century, France, England, and Holland also expanded their ocean empires, rejecting these Spanish and Portuguese claims.<sup>6</sup> Denmark, Norway, and

<sup>4</sup>*Id.*

<sup>5</sup>*Id.*, p. 77.

<sup>6</sup>*Id.*

Sweden's fishing interests propelled them into similar controversies in the sixteenth century.<sup>7</sup>

Perhaps the single largest watershed moment in this history came in 1602, when the Dutch East India Company seized a Portuguese ship in retaliation for resistance to Dutch trade in the East Indies. The company commissioned jurist Hugo Grotius to write a legal brief defending this seizure.<sup>8</sup> In his seminal work, *Freedom of the Seas*, written in 1604–1605, Grotius argued that the seas, like the air, cannot be appropriated to any nation, since the passage of a ship through these areas leaves no permanent trace.<sup>9</sup> He fathered the concept that nations could innocently pass through territorial seas, fostering commerce while preserving state sovereignty.<sup>10</sup> English jurist John Selden was commissioned by King James I of England to prepare the “*Mare Clausum*,” a rebuttal in defense of British seizure of Dutch cargoes.<sup>11</sup> Under the Seldenian vision, the oceans were divided into jurisdictions for various nations.<sup>12</sup>

These two competing visions continue to frame the debate about how best to regulate our oceans to the present day. And while Grotius's view was ultimately accepted—as sovereignty is conceptualized more in terms of freedom of navigation and expanded commerce than national domination over the resource—nations have also advanced the Seldenian cause by dramatically expanding their claims to manage and control more and more of the high seas—first from a three to a twelve-nautical mile territorial sea, then to contiguous zones, the continental shelf, and finally to Exclusive Economic Zones (EEZs) mentioned later in this chapter.<sup>13</sup> This eventual expansion has become known as the enclosure movement.<sup>14</sup>

### 36.2.2 *The Enclosure Movement*

The international debates about how nations may assert control and sovereignty over the world's oceans initially focused on the high seas in the sixteenth century, but this area of the law would not begin to become settled until much later, after nations began establishing greater control over the ocean waters closest to their own shores. International custom has always provided that coastal nations were entitled to claim some part of their seas continuous to their shores, but it was disputed on

<sup>14</sup>Turnipseed et al. (2009), p. 28, citing Alexander (1983), p. 566.

how much they could claim.<sup>15</sup> One significant idea stemming from Grotius's work was the revival of an older concept that a nation could claim sovereignty over the amount that it could control.<sup>16</sup> Over the course of the sixteenth through eighteenth centuries, this concept of control became international custom, and the extent of this area was measured by the distance that could be claimed with a cannon shot,<sup>17</sup> evolving into the area of a marine league, or three nautical miles.<sup>18</sup> While other rules have been proposed, including one suggesting that the size should be determined by the nation's dependence on fishing, they have never been accepted.<sup>19</sup> The first treaty to recognize the three-mile limit was the Fishing Convention of 1818.<sup>20</sup> While this three-mile limit became largely the norm, it was often not adopted for nations when it was inconvenient, and such limits were often disputed.<sup>21</sup> (See Fig. 36.1 for a graphic illustration of the Maritime Zones under the Law of the Seas Convention.)

During the twentieth century, the United States and other coastal nations began asserting increasing authority over their adjacent ocean waters and seabed.<sup>22</sup> These nations sought to secure rights over the oil and gas, mineral, and fishery resources, as advancements in science and technology allowed them to utilize them.<sup>23</sup> In 1945, U.S. President Truman issued two presidential proclamations about the waters seaward of the U.S. three-nautical mile territorial seas. One declared exclusive jurisdiction and control over the oil, gas, and mineral resources of the continental shelf, and the other created U.S. federal authority to regulate fisheries in the waters above the shelf.<sup>24</sup>

Truman's unilateral and unprecedented actions gave rise to the enclosure movement, a frantic assertion of authority by other coastal nations.<sup>25</sup> Many nations' claims were aimed at excluding distant-water fishing fleets. Chile, Peru, and Ecuador were among the early states to assert 200-nautical-mile claims to protect their fishing interests for these reasons.<sup>26</sup> By the fall of 1977, 68 countries had claimed exclusive fishing zones beyond 12 miles, and these included 51 countries whose claims extended to 200 miles.<sup>27</sup>

The Truman proclamation touched off a debate about the international legal validity of such claims, which would start to be settled over the course of the next 50 years, ending with the United Nations Convention on the Law of the Sea.<sup>28</sup>

### 36.2.3 *The Law of the Sea*

The last chapter in this legal history starts with the three United Nations Conferences on the Law of the Sea (UNCLOS), in 1958, 1960, and 1993, which sought to codify existing international law.<sup>29</sup> The products of UNCLOS I were four conventions, three of which codified generally accepted customary law of the sea.<sup>30</sup> First, the Convention on the Territorial Sea and the Contiguous Zone affirmed the sovereignty of coastal nations over internal waters and territorial sea, subject to the right of innocent passage for foreign-flag vessels.<sup>31</sup> It also provided that coastal states could exercise jurisdiction to implement and enforce customs, fiscal, immigration, and sanitary laws in a contiguous zone extending nine miles beyond the traditional three-mile territorial sea.<sup>32</sup> (See Fig. 36.1 for a graphic illustration of the Maritime Zones under the Law of the Seas Convention.)

The second convention, the Convention on the Continental Shelf confirmed coastal states' sovereign rights to explore and exploit the natural resources of the continental shelf.<sup>33</sup> Third, the Convention on the High Seas, codified the freedom of navigation, the freedom to fish, the freedom of overflight, and the freedom to lay cables and pipelines on the sea floor in the area beyond the territorial sea.<sup>34</sup> The fourth convention, the Convention on Fishing and Conservation of the Living Resources of the High Seas, allowed coastal nations to set nondiscriminatory conservation fishing rules for threatened stocks beyond their territorial seas.<sup>35</sup> Although this treaty was adopted and was ratified by a sufficient number of nations to enter into force, major nations with distant fishing fleets did not join or observe the regulations set by member countries, and it is thus largely discredited.<sup>36</sup>

<sup>36</sup>*Id.*, p. 337, citing Juda, p. 150, 196 n.2. However, in what has been called a landmark case, in 1974 the International Court of Justice upheld Article 2 of this convention in the context of high-seas fishing and recognized that the freedom of the high seas must be exercised “with reasonable

**Fig. 36.1** Territorial Limits as Recognized by the Law of the Sea. As can be seen above, the Law of the Sea set a 12-mile limit for the territorial seas, to which the sovereignty of a coastal State extends. In the “contiguous zone,” which extends 12 additional miles, a coastal State may exercise the control necessary to prevent and punish the infringement of its customs, fiscal, immigration or sanitary laws and regulations. The continental shelf is defined as up to 200 miles, or its end, whichever is further. In this area, coastal States exercise exclusive sovereign rights for the purpose of exploring and exploiting mineral and other non-living resources of the sea-bed and subsoil together and sedentary living organisms. In the EEZ, which is not to exceed 200 miles, a coastal State has sovereign rights for the purpose of exploring and exploiting, conserving, and managing the natural resources, sea-bed and its subsoil, and with regard to other activities, such as the production of energy from the water, currents and winds

None of these four 1958 conventions entailed the principle of abstention from fishing by nation states.<sup>37</sup> The movement for such a principle began long afterwards. Stemming from the realization that certain resources such as fisheries had reached exhaustion,<sup>38</sup> in 1967 the Maltese ambassador to the United Nations, Arvid Pardo, proposed the “common heritage of mankind” principle. It defined some resources as the property of the global human population and stated that these resources cannot be appropriated by any one individual or state.<sup>39</sup>

It was not until UNCLOS III conference that conservation of fisheries became an explicit concern.<sup>40</sup> After this conference, which began in 1973 and culminated in

regard to the interests of other States in their exercise of the freedom of the high seas.” Gorina-Ysern (2004), p. 669, citing Fisheries Jurisdiction Case (U. K. v. Ice.) 1974 I.C.J. 3 (Feb. 2); Fisheries Jurisdiction Case (F.R.G. v. Ice.) 1974 I.C.J. Rep. 175 (Feb. 2). This finding validated the concept of extended fishery zones, which would be codified in 12 nautical-mile territorial sea limits and the adoption of 200 nautical-mile EEZs in the 1982 Law of the Sea Convention. *Id.*

<sup>37</sup>Gorina-Ysern (2004), pp. 668–669.

<sup>38</sup>*Id.*, p. 39.

<sup>39</sup>*Id.*, p. 28.

<sup>40</sup>Buck (1998), p. 92.

the adoption of the comprehensive 1982 Convention,<sup>41</sup> an agreement was finally reached for a range of territorial sea limits.<sup>42</sup> A 12-mile limit was set for the territorial seas, in which the sovereignty of a coastal State could extend, subject to the treaty and other rules of international law.<sup>43</sup> (See Fig. 36.1) In the “contiguous zone” which extends 12 additional miles contiguously from the territorial seas, coastal state may exercise the control necessary to prevent and punish the infringement of its customs, fiscal, immigration, or sanitary laws and regulations.<sup>44</sup>

The continental shelf is defined as up to 200 miles, or its end, whichever is further.<sup>45</sup> In the coastal zones, coastal states exercises exclusive sovereign rights for the purpose of exploring and exploiting natural resources, which include mineral and other non-living resources of the sea-bed and subsoil together and sedentary living organisms.<sup>46</sup>

The EEZ is not to exceed 200 miles and is under control of the coastal nation. Thus, it is not an open-access regime.<sup>47</sup> In the EEZ, a coastal State has

[s]overeign rights for the purpose of exploring and exploiting, conserving, and managing the natural resources, whether living or non-living, of the waters superjacent to the sea-bed and of the sea-bed and its subsoil, and with regard to other activities for the economic exploitation and exploration of the zone, such as the production of energy from the water, currents and winds.<sup>48</sup>

One of the driving reasons for the expanded EEZ was to give coastal state jurisdictions the ability to manage their fisheries in these areas by allowing nation states to control the access to the area.<sup>49</sup> (See Fig. 36.1).

It is not simply the 1982 Law of the Sea Treaty’s recognition of territorial limits that has enhanced ocean and fisheries management; the treaty also has a number of protective provisions. In fact, it includes 46 articles devoted to marine environmental protection, including the general obligation of States “to protect and preserve the

<sup>41</sup>Osherenko (2006), p. 339, citing Juda (1996), pp. 212–243. Little was accomplished at UNCLOS II. Buck (1998), p. 86. But for a discussion of the “cod war” between Norway and Britain that inspired it, see *id.* at 84–86 (1998). Buck argues that fisheries issues became dominant in the 1970s, thus inspiring the agreement at UNCLOS III. *Id.* at 86.

<sup>42</sup>Two implementation Agreements followed: Part XI (Seabed) in 1994 (the Agreement Relating to the Implementation of Part XI of the United Nations Convention on the Law of the Sea, July 28, 1994, 36 I.L.M. 1492) and Fish Stocks in 1995 (the Agreement for the Implementation of the Provisions of the United Nations Convention on the Law of the Sea, Relating to the Conservation and Management of Straddling Fish Stocks and Highly Migratory Fish Stocks, November, 1995 34 I.L.M. 1542) Osherenko (2006), p. 339 citing Juda (1996), pp. 256, 284.

<sup>45</sup>*Id.*, p. Article 77.

<sup>46</sup>*Id.*

<sup>47</sup>Buck (1998), pp. 93–95.

<sup>48</sup>United Nations Convention on the Law of the Sea, Dec. 10, 1982, Article 56, 21 I.L.M. 1261.

<sup>49</sup>Christie (2004b), p. 2, quoting Christie (1999), p. 396 (quotation marks omitted).

marine environment.”<sup>50</sup> For example, the treaty has requirements that EEZs have fishing limits based on Maximum Sustainable Yield, tracking the definition in the United States’ MSA, which is discussed below.<sup>51</sup> Under Article 61(4), as is also true for the MSA, coastal States must consider the effects on species that are not targeted, also known as bycatch. This language may even be broad enough to require nation States to engage in ecosystem management, where regulation is based on the biological relationships between species.<sup>52</sup> Like under the MSA, the Law of the Sea requires coastal States to base conservation and management measures on the best science available.<sup>53</sup>

Perhaps the most significant development under the convention is its treatment of high seas, beyond the EEZs, which are treated as the “common heritage of mankind.” States exercise the role as trustees for all the world’s people as beneficiaries, including future generations.<sup>54</sup> Thus, the debate over whether the high seas is *res nullius* or *res communis*, as discussed extensively in Chap. 34, was ostensibly resolved in the 1982 Convention.<sup>55</sup> For example, the International Seabed Authority has the role of trustee over mineral resources of the seabed in areas not under any State’s jurisdiction.<sup>56</sup> An exploiting State is required to pay a portion of the value of the production of its resources within this area to the authority to be distributed to the convention parties based on “equitable sharing criteria.”<sup>57</sup>

In addition, while recognizing the right of all States to engage in fishing on the high seas, the 1982 Convention requires States to cooperate in the conservation of high seas resources and negotiate with others that exploit living resources. It calls for cooperation through the establishment of sub-regional, regional, and international organizations.<sup>58</sup> This has spurred several agreements including the U.N. Fish Stocks Agreement, (mentioned *supra*), and FAO Compliance Agreement,<sup>59</sup> which are both attempts to address the growing concerns about major problems facing international fisheries’ management, including illegal, unreported, and unregulated fishing, the reflagging of vessels by nations that are unwilling to abide by fishing restrictions, the overcapitalization of fisheries (too many boats chasing too many

fish), and insufficient cooperation among States.<sup>60</sup> Despite some criticisms, others have praised the regional fishing organizations for being able to pressure nations to curtail unrestricted fishing in the high seas and instill measures including certain fisheries closures, compulsory registration, and catch limits.<sup>61</sup>

Thus, the 1982 Convention, including its adoption of the common-heritage-of-mankind principle, moved the international governance of the oceans towards the Public-Trust-Doctrine model, discussed in the previous Chap. 34, where the resource is governed by a trustee on behalf of all in order to prevent its over utilization to the detriment of all. While the convention was a step forward for ocean protection, as 90 % of the world's fisheries come from just three percent of the world's oceans, and the majority of these species are found within 200 miles of shore,<sup>62</sup> critics contend that the Law of the Sea remains insufficient. For example, one expert has remarked that while “[t]he majority of rights vested on coastal and fishing nations under [the Law of the Sea] have crystallized as norms of customary international law[,] [t]he majority of duties... have not.”<sup>63</sup> Critics point out that the near-complete discretion given to coastal states to interpret and implement their duties under the convention as the primary reason the decline in EEZ stock fish.<sup>64</sup> Additionally, over-exploitation in the EEZ is not prohibited unless it presents a danger to the maintenance of the living resources, and the law does not dictate what levels of fish populations should be maintained.<sup>65</sup> Other critics point to the convention's vague provisions, its lack of a global fisheries organization, and its lack of a compulsory EEZ-dispute-settlement mechanisms as other weaknesses.<sup>66</sup> Further, if coastal States and designated international organizations are to have public-trust duties, there must be some way to hold trustees accountable.<sup>67</sup> There does not exist the procedural and substantive mechanisms that would enable the beneficiaries to enforce the terms of the trust under the 1982 treaty.<sup>68</sup> This lack of comprehensive governance is perhaps one reason that the world's fish populations continue to remain at or very close to their maximum sustainable production levels,<sup>69</sup> with fishery resources from the high seas in the worst shape.<sup>70</sup>

Another problem with the treaty has been the slow pace at which nations have implemented it. UNCLOS III came to a close in 1982, but the treaty did not go into effect until 1994, one year after it was ratified by 60 countries.<sup>71</sup> And there are still a number of notably absent parties. For example, even though it was instrumental in convening UNCLOS III, the United States, to date, has not ratified the treaty largely due to a few elected officials' arguments that the treaty infringes upon national sovereignty and that its deep-sea mining provisions limit free enterprise.<sup>72</sup>

Despite the slow pace of ratification, however, the UNCLOS has had a positive effect on domestic law, even for non-ratifying nations. U.S. President Reagan, for instance, acted on the treaty when he created the U.S. EEZ in 1983.<sup>73</sup> The United States secured "sovereign rights" and jurisdiction to the largest EEZ in the world, which stretches seaward out to 200 nautical miles from the U.S. mainland, Hawaii and Alaska, and U.S. island territories in the Atlantic and Pacific.<sup>74</sup> The U.S. EEZ covers 4.4 million square miles, larger than the combined area of the 50 states.<sup>75</sup> A 1988 proclamation extended the boundaries of the territorial sea from 3 to 12 nautical miles seaward of the coastlines of the United States and its territories, under which full sovereignty was claimed for the United States to the 12-nautical-mile territorial sea from the sub-surface seabed to the above airspace.<sup>76</sup> Finally, in 1999, U.S. President Clinton established the contiguous zone, which reaches from 12 to 24 nautical miles from U.S. and territorial coastlines.<sup>77</sup> (See Fig. 36.1).

---

<sup>71</sup>Turnipseed et al. (2009), p. 30 (citing Kalo et al., (2002), p. 388). A full 166 countries have ratified the treaty. The first 60 nations to do so were as follows (in alphabetical order): Angola (5 December 1990), Antigua and Barbuda (2 February 1989), Bahamas (29 July 1983), Bahrain (30 May 1985), Barbados (12 October 1993), Belize (13 August 1983), Bosnia and Herzegovina (12 January 1994), Botswana (2 May 1990), Brazil (22 December 1988), Cabo Verde (10 August 1987), Cameroon (19 November 1985), Costa Rica (21 September 1992), Côte d'Ivoire (26 March 1984), Cuba (15 August 1984), Cyprus (12 December 1988), Democratic Republic of the Congo (17 February 1989), Djibouti (8 October 1991), Dominica (24 October 1991), Egypt (26 August 1983), Fiji (10 December 1982), Gambia (22 May 1984), Ghana (7 June 1983), Grenada (25 April 1991), Guinea (6 September 1985), Guinea-Bissau (25 August 1986), Guyana (16 November 1993), Honduras (5 October 1993), Iceland (21 June 1985), Indonesia (3 February 1986), Iraq (30 July 1985), Jamaica (21 March 1983), Kenya (2 March 1989), Kuwait (2 May 1986), Mali (16 July 1985), Malta (20 May 1993), Marshall Islands (9 August 1991), Mexico (18 March 1983), Micronesia (Federated States of) (29 April 1991), Namibia (18 April 1983), Nigeria (14 August 1986), Oman (17 August 1989), Paraguay (26 September 1986), Philippines (8 May 1984), Saint Kitts and Nevis (7 January 1993), Saint Lucia (27 March 1985), Saint Vincent and the Grenadines (1 October 1993), Sao Tome and Principe (3 November 1987), Senegal (25 October 1984), Seychelles (16 September 1991), Somalia (24 July 1989), Sudan (23 January 1985), Togo (16 April 1985), Trinidad and Tobago (25 April 1986), Tunisia (24 April 1985), Uganda (9 November 1990), United Republic of Tanzania (30 September 1985), Uruguay (10 December 1992), Yemen (21 July 1987), Zambia (7 March 1983), Zimbabwe (24 February 1993).

<sup>73</sup>*Id.* p. 30, citing Proclamation No. 5030 (located at 48 Fed. Reg. 10,60 (March 14, 1983)).

<sup>74</sup>*Id.*

<sup>75</sup>*Id.*

<sup>76</sup>*Id.* citing Proclamation No. 5928, 54 Fed. Reg. 777 (Jan. 9, 1989).

<sup>77</sup>*Id.*, citing Proclamation No. 7219, 64 Fed. Reg. 48,701 (Aug. 2, 1999).

Each of the three proclamations was consistent with the 1982 Law of the Sea, and some scholars have argued that the United States has accepted the convention as a matter of international customary law,<sup>78</sup> despite its failure to ratify it.<sup>79</sup>

Thus, notwithstanding its limitations and the slow pace at which it has been implemented, the 1982 Law of the Sea Convention has dramatically changed the legal landscape governing the world's oceans and resources. It not only validated nations' moves to establish EEZs. But it also changed the dominant legal paradigm for these resources, moving it away from an open access or a *res nullius* resource to a public resource to be protected, akin to U.S. state waters under the Public Trust Doctrine. Moreover, the treaty, in conjunction with general international law and the treaty's implementing agreements, provides, as an expert has put it, a

range of norms for national fisheries management, if carefully interpreted. Such legally binding norms include the coastal state's primary obligation to ensure that the maintenance of the living resources in its EEZ is not endangered by overexploitation; the duty to maintain or restore populations of target species at sustainable levels; the determination of catch limits for stocks actually or potentially affected by exploitation; the duty to apply the precautionary approach widely to conservation, management and exploitation of living marine resources; and duties to cooperate for the conservation and management of species not exclusively occurring within the coastal state's EEZ.<sup>80</sup>

### ***36.2.4 Extraterritorial Jurisdiction for Protection of the Global Fisheries Commons***

As mentioned in Chap. 34 and above, the United States has asserted jurisdiction over the fishery resources in the EEZ with the MSA, which codified the second

---

<sup>78</sup>The International Court of Justice has stated that for a treaty rule to acquire customary status, it must be:

(1) a fundamentally norm-creating character such as could be regarded as forming the basis of a general rule of law; (2) a very widespread and representative participation in the convention, including that of states whose interests were specially affected; (3) extensive and virtually uniform state practice, including that of states whose interests are specially affected; and (4) the passage of some time, short though it may be. *North Sea Continental Shelf*, Judgement, ICJ Rep. 3, at paras. 72–74 (1969).

<sup>79</sup>*Turnipseed et al.*, p. 70. n.169 (citing Restatement (Third) of Foreign Relations Law § 514 comment. a. (1987)). As evidence, another author points to the fact that the United States is a party to the 1964 Convention on the Territorial Sea and Contiguous Zone, which, like the Law of the Sea, precludes states' absolute claims to unlimited territorial seas and creates rules to restrict some forms of passage within their territorial seas. Ashfaq (2010), p. 364 The author also argues that the imposition of affirmative environmental and pollution-reducing obligations parallels the 1966 Convention on Fishing and Conservation of the Living Resources of the High Seas, to which the United States is also a party. *Id.* Finally, the author argues that the revenue-sharing provisions and dispute resolution mechanisms, which are the source of great controversy, were founded upon the "common heritage of mankind" principle are "customary law" supported in part by its widespread ratification. *Id.* Under general principles of international law, customary law is binding on all states, including the United States. *Id.*

<sup>80</sup>International Union for Conservation of Nature and Natural Resources (2009), p. 39.

1945 Truman Proclamation, and declared waters from three to 200 nautical miles off the shores of the United States and U.S. territorial possessions to be exclusively under federal jurisdiction. But what about areas beyond these limits? Might nations like the United States be able to use their extraterritorial jurisdiction to protect resources that exist beyond nation's boundaries? This is an important question, as nations have increasingly sought to enhance their ability to protect their fisheries from the fishing that happens beyond these areas, which, as discussed above, are governed by the less than completely comprehensive and binding Law of the Sea.<sup>81</sup>

In terms of "extraterritorial" jurisdiction, or the lawful control that a country can exercise beyond its borders, a nation generally can regulate the activities, interests, status, or relations of its own nationals, wherever they may be, as long as the exercise of jurisdiction is reasonable.<sup>82</sup> This is recognized, as an example, under the Law of the Sea under its "flag state jurisdiction" regime, which provides that the country in which a vessel is registered may take enforcement action against it.<sup>83</sup> Nations may also regulate conduct "that has or is intended to have substantial effect within its territory."<sup>84</sup> At least one scholar has argued that this latter, "substantial effects doctrine" is a clear basis for extending U.S. environmental laws extraterritorially, but there have been very few published court opinions that address the extraterritorial reach of such laws,<sup>85</sup> and even fewer applying federal fishing laws.

<sup>81</sup>Gorina-Ysern (2004), pp. 645–646.

<sup>82</sup>Showalter (2010), p. 229, citing Restatement (Third) of the Foreign Relations Law of the U.S., § 402(2). See also Restatement (Third) of the Foreign Relations Law of the U.S. § 403.

<sup>83</sup>For a criticism of the weaknesses in this regime, see Carr and Scheiber (2002). U.S. states have this same authority where there is no federal law to apply. *Skiriotes v. Florida*, 313 U.S. 69, 73 (1941); *Alaska v. Bundrant*, 546 P.2d 530, 555 (Alaska 1976). The extension of state law has been applied to fisheries based on the substantial effects doctrine, allowing the regulation of extraterritorial conduct, regardless of the citizenship of the target, so long as the exercise of jurisdiction does not conflict with federal law and is otherwise reasonable. *Alaska v. Jack*, 125 P.3d 311, 319 (Alaska 2005). Some U.S. state courts have recognized that a state's interests in preserving nearby fisheries are sufficiently strong to permit such extraterritorial enforcement of its laws enacted for that purpose. *California v. Weeren*, 607 P.2d 1279, 1285 (Cal. 1980). But see *North Alaska Salmon Co. v. Pillsbury*, 174 Cal. 1, 4 (1916) (stating that extraterritorial effect "will not be declared to exist unless such intention is clearly expressed or reasonably to be inferred from the language of the act or from its purpose, subject matter or history"); *Southeast Fisheries Assn. v. Dept. of Natural Res.*, 453 So. 2d 1351, 1355 (Fla. 1984) (finding that in order for state to apply outside of state waters, the legislature must have expressed a clear intent that the law is to apply extraterritorially). Where state law applies extraterritorially in the EEZ, it faces the additional issue of preemption. While there have been exceptions, especially where states have implemented outright bans on landings or landing limits that prevent fishermen from landing fish in amounts permitted under federal law, generally courts have allowed the extraterritorial application of state fishery laws where (1) the state law is not in conflict with a federal law or fishery management plan concerning the fishery resource at issue; (2) a vessel is registered under state law, as set forth under the MSA; and (3) a vessel that is not registered nevertheless submits itself to a state's jurisdiction by docking in state waters. See Mastry (2006), p. 235.

<sup>84</sup>*Id.*

<sup>85</sup>Nash (2010), pp. 998, 1003.

Extraterritorial jurisdiction, however, is not limitless and, in fact, is not fully recognized by some nations. For example, a U.S. legal canon of statutory interpretation known as the “presumption against extraterritorial application” limits the reach of U.S. federal and state law. It provides that a statute is presumed not to have extraterritorial reach unless it provides a clear indication that it was intended to do so. Essentially, it reflects the “presumption that United States law governs domestically but does not rule the world.”<sup>86</sup> It is meant to prevent U.S. courts from recognizing lawsuits without sufficiently definite norms of international law.<sup>87</sup> On the other hand, at least two U.S. Circuit Courts of Appeal have ruled that the presumption against extraterritoriality doctrine is inapplicable where the failure to extend a statute’s reach to a foreign setting will result in adverse effects within the United States.<sup>88</sup>

For the reason that the federal fisheries law in the United States, the MSA, expressly provides a few situations where it applies beyond the EEZ, it suggests a limited extraterritorial reach for the statute, however, as it butts into the presumption against extraterritoriality.

Under the MSA, U.S. fisheries managers can manage anadromous species, which are fish that spawn in fresh or estuarine waters of the United States and which migrate to ocean waters<sup>89</sup> throughout their range except when they are found within foreign nations’ waters.<sup>90</sup> The United States may also regulate continental shelf resources, including a number of coral, crab, crustacean, and sponge species, beyond the EEZ under the MSA.<sup>91</sup> Likewise, the MSA specifies that the United States is obliged to cooperate with nations involved in fisheries for highly migratory species to achieve optimum yield of such species throughout their range, both

---

<sup>86</sup>*Kiobel v. Royal Dutch Petro. Co.*, 133 S. Ct. 1659, 1664 (2013) (quoting *Microsoft Corp. v. AT&T Corp.*, 550 U.S. 437, 454 (2007)).

<sup>87</sup>*Id.* at 1664.

<sup>88</sup>*See Env'tl. Def. Fund v. Massey*, 986 F.2d 528, 531 (D.C. Cir. 1993) (collecting cases); *H.K. & Shanghai Banking Corp. v. Simon (in Re Simon)*, 153 F.3d 991, 995 (9th Cir. 1998). It is unclear how the doctrine of substantial effects and the presumption against extraterritoriality relate to each other. The cited U.S. Court of Appeals decisions suggest that, as a threshold matter, the presumption does not apply when there are substantial domestic effects. Indeed, earlier courts indicate that when there are no substantial effects, then there is no question of extraterritoriality whatsoever. *See Laker Airways, Ltd. v. Sabena, Belgian World Airlines*, 731 F.2d 909, 923 (D.C. Cir. 1984) (“The territorial effects doctrine is *not an extraterritorial* assertion of jurisdiction.”) Recently, in a Supreme Court decision of *Kiobel v. Royal Dutch Petro. Co.*, the Court indicated that claims that “touch and concern” the territory of the United States must do so with sufficient force to displace the presumption against extraterritorial application. 133 S. Ct. 1659, 1669 (2013). This suggests that courts will determine the domestic effects of statute-proscribing conduct as part of its determination of whether the presumption against extraterritoriality is rebutted. A concurring opinion by Justices Breyer, Ginsburg, Kagan, and Sotomayor argued the presumption against extraterritoriality is not even applicable when there are substantial effects on a domestic interest. 133 S. Ct. at 1671.

<sup>89</sup>16 U.S.C. § 1802 (2012).

<sup>90</sup>*Id.* §§ 1811(b), 1802 (2012).

<sup>91</sup>*Id.* § 1811(b) (2012).

within and beyond the EEZ.<sup>92</sup> In addition, it provides that the United States shall “promote” the provisions of the MSA where an international fishing organization does not have a process for developing a plan to rebuild depleted stock or a stock of fish is approaching a condition of overfishing.<sup>93</sup>

Thus, in order for the MSA to apply to other species not listed in the act, beyond the EEZ, and to non-citizens, the government would need to argue that, notwithstanding this express language, the basic common-law presumption against extraterritoriality is not applicable. For example, it might be argued that this doctrine is does not apply because of the substantial effects that fishing beyond the EEZ has on the United States’ fishery resources. No court decision holds as much.<sup>94</sup> Therefore, while federal U.S. laws apply to some extent beyond the EEZ to regulate international fisheries, the reach of the MSA is perhaps limited by its express language.

### 36.3 U.S. Domestic Fisheries Regulation

Looking closer at domestic fisheries, this next subsection focuses on how one country, the United States, manages its fisheries, as a starting point for exploring the regulation of fisheries, more broadly. Covered by this discussion are both the MSA’s more traditional government-based restrictions as embodied in National Standards and fishing limits, as well as the more recently employed market-based mechanisms such as IFQs for the management of fisheries. These programs are certainly not unique to the United States and are discussed primarily as an example of similar programs that exist elsewhere.<sup>95</sup> Another often-touted private property-

---

<sup>92</sup>*Id.*, § 1812(a) (2012).

<sup>93</sup>*Id.* § 1812(c).

<sup>94</sup>In the case of *Blue Water Fishermen’s Ass’n v. Nat’l Marine Fisheries Serv.*, a U.S. District Court confronted the legality of the closing of a highly migratory species fishery for an area that extended beyond the EEZ. 158 F. Supp. 2d 118, 123 (D. Mass. 2001). The Court did not rule that the closure was permissible because of its effects in the EEZ, however. Rather, it found that another part of the MSA (16 U.S.C. § 1812) directed the United States to cooperate with other nations in managing highly migratory species, and the agency was simply implementing several treaties under provisions of the MSA, for which Congressional intent was clear extending jurisdiction extraterritorially. 158 F. Supp. 2d 118, 122–123, 123 n.19. Another U.S. District Court, faced with a lawsuit challenging that a possession ban on certain species was an impermissible extraterritorial application of the MSA, found that the statute was only being applied within the EEZ. While stating that the substantial effects doctrine can regulate conduct occurring outside its territory which causes harmful results within its territory, the court indicated it was not applying the doctrine, but rather was ruling that the presumption against extraterritoriality was inapposite because “applying only to United States vessels located within United States territory, the no-possession provision does not assert extraterritorial jurisdiction.” *Nat’l Fisheries Inst., Inc. v. Mosbacher*, 732 F. Supp. 210, 215 (D.D.C. 1990).

<sup>95</sup>For a comprehensive look at IFQ programs internationally, at least as they existed in 1999, see National Research Council (1999).

based solution to reduce exploitation is aquaculture, discussed later in this chapter. Aquaculture seeks to provide private entities the exclusive dominion over a so-called particular “crop” of fish.

What will be seen with the MSA is a regime that, much like with international regulation, first sought to manage fisheries by establishing territorial limits to exclude foreign entities and then focused on perhaps the more difficult task of domestic conservation. While some gains have been made, fisheries management is still deficient in many respects. IFQs and aquaculture, often seen as silver bullets for solving fisheries management problems, remain controversial.

### ***36.3.1 The Magnuson Steven Fishery Management and Conservation Act (MSA)***

First passed in 1976, and amended several times since, the MSA<sup>96</sup> is the U.S. management regime for fisheries in its EEZ. It has been hailed as model for other countries,<sup>97</sup> but has also been criticized as being not adequate for the task.<sup>98</sup> It was initially passed to eliminate competition from foreign fishing operations, spurred by Congress’s desire to return the economic benefits of fishing to domestic fishermen. Over time, however, it has been amended to establish a comprehensive system for the federal regulation of domestic fishing.

The act has a number of key provisions that are the bedrock of the regulatory system. As indicated, Title I of the 1976 act establishes jurisdiction in “a zone contiguous to the territorial sea of the United States,” the inner boundary which was defined by the seaward boundary of each coastal state, and the outer boundary which was defined as 200 nautical miles out from these state waters.<sup>99</sup> (See Fig. 36.1). This language was amended in 1986 to reference the EEZ. Within the zone, the act establishes the United States’ exclusive authority to manage its own fishery resources.<sup>100</sup>

Under the original act, foreign fishermen could only fish in what would become the EEZ if the fishing was governed by an international agreement and pursuant to a permit. They were also limited to the portion of fish not harvested by domestic fishing vessels.<sup>101</sup> Advocates hoped that this would boost the growth of the

<sup>96</sup>Its name has changed over time, but it will be referred to in this chapter as the MSA for simplicity’s sake.

<sup>97</sup>See Daniel Pauly, Letter to the Editor, Apr. 17, 2011, available at [http://www.nytimes.com/2011/04/21/opinion/121fish.html?partner=rssnyt&emc=rss&\\_r=0](http://www.nytimes.com/2011/04/21/opinion/121fish.html?partner=rssnyt&emc=rss&_r=0), last accessed April 16, 2014.

<sup>99</sup>90 Stat. 336, Pub. L 94-265, Sec. 101 (April 13, 1976) (codified at 16 U.S.C. § 1811).

<sup>100</sup>*Id.* at sec. 102; (now codified at 16 U.S.C. § 1811)).

<sup>101</sup>90 Stat. 337, Pub. L 94-265, Title II, Sec. 201 (April 13, 1976) (now codified at 16 U.S.C. § 1821)).

U.S. fishing industry. Nonetheless, in 1980, this provision had to be amended again to clarify that the only portion of the fisheries yield that could be allocated to foreign vessels was that which “cannot, or will not, be harvested by vessels of the United States.”<sup>102</sup> Moreover, new criteria for determining allocations to foreign fishing nations were added in 1980 and 1986, including those related to whether the nation enacts trade barriers, whether the fish harvested are for the country’s domestic consumption, and whether, and to what extent, the nation otherwise contributes to, or fosters the growth of, a sound and economic U.S. fishing industry.<sup>103</sup>

This new authority resulted in a near complete termination of foreign fishing in the U.S. EEZ, accomplishing the act’s original goal.<sup>104</sup> But it would not be until 1996 that the act was amended to focus on conservation and reducing the threat of overfishing from domestic fishing, as discussed in the next few sections.

### **36.3.2 Fishery Management Councils and Fishery Management Plans Under the Magnuson Steven Fishery Management and Conservation Act (MSA)**

The heart of the MSA provides a unique structure of shared governance between the federal and state governments. Federal fisheries are primarily managed pursuant to the advice that eight regional fishery management councils provide in their Fishery Management Plans (FMPs). The regional councils are composed of voting members, which include the head state fishery managers in each state and for each region; the regional director of the federal agency, the National Marine Fisheries Service (NMFS); state-governor-nominated and NMFS-approved regional experts representatives of commercial, recreational, charter fishing sectors, and Native tribes, depending on the region.<sup>105</sup> With this structure, Congress sought to “preserv[e] the states’ ability to play a key [development] role” in fishery management programs,<sup>106</sup> according to the U.S. Court of Appeals in Washington, D.C.

Except in rare occasions, FMPs have not been interpreted to be stand-alone regulations, however.<sup>107</sup> Instead, under the MSA, after a regional council develops an FMP,<sup>108</sup> it must submit the plan to the Secretary of the Department of

<sup>102</sup> 16 U.S.C. § 1821 (d) (2012).

<sup>103</sup> See 16 U.S.C. § 1821(e)(1)(E) (2012).

<sup>104</sup> Territo at 1369 (2000), citing Decker (1995), p. 335.

<sup>105</sup> 16 U.S.C. § 1852(b).

<sup>106</sup> *C & W Fish Co. v. Fox*, 931 F.2d 1556, 1557 (D.C. Cir. 1991).

<sup>107</sup> *Gulf Restoration Network, Inc. v. Nat’l Marine Fisheries Serv.*, 730 F. Supp. 2d 157, 166 (D.D.C. 2010). But see *Am. Oceans Campaign v. Daley*, 183 F. Supp. 2d 1, 11 (D.D.C. 2000).

<sup>108</sup> The Secretary can also develop an FMP under specific circumstances. See 16 U.S.C. § 1854 (c) (2012).

Commerce, who must, after reviewing it for compliance with the various laws applicable to the fisheries, “approve, disapprove, or partially approve” it after providing for public comment.<sup>109</sup> Regional councils simultaneously submit FMP-implementing regulations for review.<sup>110</sup> The Secretary must review them for consistency with the governing FMP as well as with the MSA and other applicable law.<sup>111</sup> If the regulations are found to be inconsistent, they are returned to the council with proposed revisions.<sup>112</sup> Otherwise, the proposed regulations are published for public comment,<sup>113</sup> and after the public comment period, the Secretary promulgates them, consulting with the council on revisions and explaining the changes made.<sup>114</sup> All final regulations must be consistent with the FMP.<sup>115</sup>

Several aspects of this structure are important. For instance, the federal government is charged with the ultimate authority to regulate fisheries by approving or disapproving FMPs and developing regulations. But the states, through their representatives on the management councils, are able to use their regional expertise to advise and direct such management by writing FMPs. The federal government provides a national check on regional advice, so that any fishery management does not subvert the best interests of the nation as a whole.

Notwithstanding the express role of the states, however, one criticism of this structure has been that, in effect, the federal government, which staffs and funds the regional councils, still has an outsized role in pushing national policies on regional fishery management efforts, in turn, limiting the flexibility that should come from regional or localized management.

Another important structural element is the MSA’s explicit involvement of commercial and recreational fishermen on the regional councils. Fishermen may know best how to manage the fisheries’ resources, and they have a vested interest in doing so. After all, as was discussed in Chap. 34 on the tragedy of the commons, it is fishermen who will be harmed in the long-term by the over-exploitation of the resource. At the same time, having fishermen with dominant positions on the councils has led to the charge that other voices, such as those of consumers, conservationists, and other members of the public, are often under-represented. Fishermen are also said to have an inherent conflict of interest in regulating the fishery because they are charged with conserving a resource that they also have an interest in exploiting. The fact that NMFS, an agency within the U.S. Commerce Department, is ultimately responsible to implement the statute is another subject of

---

<sup>109</sup>16 U.S.C. § 1854(a), (a)(3) (2012).

<sup>110</sup>*Id.* § 1853(c) (2012).

<sup>111</sup>*Fishing Co. of Alaska v. Gutierrez*, 510 F.3d 328, 330 (D.C. Cir. 2007) (citing 16 U.S.C. § 1854(b)(1)).

<sup>112</sup>*Id.* (citing § 1854(b)(1)(B)).

<sup>113</sup>*Id.* citing § 1854(b)(1)(A).

<sup>114</sup>*Id.* (citing § 1854(b)(3)).

<sup>115</sup>16 U.S.C. §§ 1854(b)(1)(B), (c)(7).

controversy, because it has been argued that the agency is limited in its ability to protect the resource because it also has a mission of promoting its development.

In addition to the act's structure, it is important to understand its management tools. The main documents that provide management tool are FMPs. FMPs contain the conservation and management measures that "are . . . necessary and appropriate for the conservation and management of the fishery."<sup>116</sup> Additional provisions have been required of FMPs over time to strengthen how the agency and councils carry out this mandate. For instance, as part of a sweeping set of changes made to the act in 1996 and in response to the realization that fishery management efforts were not succeeding at reducing overfishing, the Sustainable Fish Act (SFA) amendments clarified that FMPs were to aim at "prevent[ing] overfishing and rebuild[ing] overfished stocks, and . . . protect[ing], restor[ing], and promot[ing] the long-term health and stability of the fishery."<sup>117</sup> FMPs were also required to "describe and identify essential fish habitat for the fishery" and "minimize to the extent practicable the adverse effects on such habitat caused by fishing."<sup>118</sup> The plans must additionally establish a standardized reporting methodology to assess the amount and type of bycatch (which includes fish that are caught unintentionally), and include conservation and management measures that, to the extent practicable, minimize such bycatch and bycatch mortality.<sup>119</sup>

The act was also amended to require that when any species is found to be overfished, NMFS must approve a rebuilding plan that sets a time period for ending overfishing and rebuilding the fishery not to exceed 10 years, except in cases where the biology of the stock of fish, or other environmental conditions... dictate otherwise.<sup>120</sup> Under this provision, NMFS

may consider the short-term economic needs of fishing communities in establishing rebuilding periods, but may not use those needs to go beyond the 10-year cap. To breach this cap, FMPs may only consider circumstances that 'dictate' doing so[,]... [including] an international agreement... [and] when the current number of fish in the fishery and the amount of time required for the species to regenerate make it impossible to rebuild the stock within 10 years . . .<sup>121</sup>

<sup>116</sup>90 Stat. 351, Pub. L 94-265, tit. III. sec. 303(April 13, 1976) (codified at 16 U.S.C. § 1811).

<sup>117</sup>16 U.S.C. § 1853(a)(1)(A).

<sup>118</sup>*Id.*, § 1853(a)(7).

<sup>119</sup>*Id.* § 1853 (a)(11). Among other things, FMPs also are required to describe the fishery in detail, 16 U.S.C. § 1853 (a)(2) (2012); assess and specify the condition of, and the "maximum sustainable yield" and "optimum yield" from the fishery and include a summary of the information utilized in making such specification, *id.* § 1853 (a)(3); and assess and specify the capacity of the fishery, including the extent to which fishing vessels of the United States and foreign nations, can and will be able to annually harvest the fishery's optimum yield. *Id.* § 1853 (a)(4) (A)-(B). Finally, FMPs must include a fishery impact statement that analyzes the likely effects, if any, including the cumulative conservation, economic, and social impacts, of the conservation and management measures on fishermen and fishing communities. *Id.* § 1853 (a)(9).

<sup>120</sup>*Id.* § 1854(e)(4) (2012).

<sup>121</sup>*NRDC v. Nat'l Marine Fisheries Serv.*, 421 F.3d 872, 880 (9th Cir. 2005).

These measures, aimed at not only intentional fishing, but also unintentional damage to fish populations and habitat, reinforced that the MSA was to be aimed at overfishing. Nonetheless, the law did not live up to the task, and in 2007, the requirements for FMPs were amended again to mandate that they include Annual Catch Limits (ACLs), which correspond to the annual amount of catch that would not result in overfishing, as reduced by scientific uncertainty.<sup>122</sup> Accountability measures, such as in-season fishing closures or measures to correct for when fishermen exceed these limit were also added as requirements of FMPs to prevent the catch from exceeding these ACLs or to offset overages.<sup>123</sup> And accountability measures were added for all fisheries subject to overfishing.<sup>124</sup>

The various MSA revisions also demonstrate how the statute has changed from one that sought to manage fish exploitation by excluding foreign fishermen to one aimed at conserving fishery resources from domestic threats. These provisions remain controversial, as many fishermen have argued that the 10-year rebuilding requirement does not offer enough flexibility, especially where there is little information on the status of certain fish populations. Conservationists have argued that the calls for flexibility are simply an attempt to avoid regulation and that the act's overfishing and rebuilding provisions are precisely what is needed to conserve the fisheries.

### 36.3.3 *National Standards Under the MSA*

The National Standards are the criteria by which NMFS and courts evaluate the tools set out in the FMP documents. Notably, these very general standards have been the focus of numerous court decisions, as challengers have sought to invalidate various fishery management measures on the grounds that they did not comply with the standards.

#### 36.3.3.1 *National Standard 1*

The lodestar is National Standard 1, which requires that “[c]onservation and management measures . . . prevent overfishing while achieving, on a continuing basis, the optimum yield from each fishery for the United States fishing industry.” To break this down further, as amended in 1996, overfishing is the rate of fishing mortality that jeopardizes the capacity of a fishery to produce the maximum sustainable yield on a continuing basis. So under National Standard 1, conservation measures must reduce fishing mortality to the level that keeps fisheries at the

<sup>122</sup>50 C.F.R. § 600.310(f)(1)-(7).

<sup>123</sup>*Id.* § 600.310(g)(1)-(3).

<sup>124</sup>*Hooks & Baylor (2009)*, p. 194 (citing *Id.* § 1853 (a)(15)).

“Maximum Sustainable Yield,” often referred to as MSY—language that is also present in the Law of the Sea.<sup>125</sup> The act does not define this language, but NMFS’s guidelines provide that it is the scientific determination of “the safe upper limit of harvest which can be taken consistently year after year without diminishing the stock so that it is truly inexhaustible and perpetually renewable.”<sup>126</sup> Nonetheless, it is not enough under National Standard 1 that overfishing is prevented. Fishery measures must achieve “optimum yield,” which is simply the MSY, reduced by any relevant social, economic, or ecological factor, and is the amount of fish that “will provide the greatest overall benefit to the Nation, particularly with respect to food production and recreational opportunities, and taking into account the protection of marine ecosystems.” For overfished fisheries, it is the amount that provides for rebuilding to get to the MSY.

In short, under National Standard 1, FMPs are to include measures to prevent fishing mortality in a fishery that jeopardizes it as a renewable resource, and fishing may even be below this level, if needed to produce the greatest overall benefit to the nation. For those fisheries that are overfished, the standard requires that the fishing be at a level that allows for rebuilding. At least one U.S. federal Circuit Court has found that this means that the fishery management measure must have at least a 50% chance of reaching the maximum sustainable yield, and in no way permits measures that only have as low as an 18% chance of achieving this limit.<sup>127</sup>

### 36.3.4 National Standard 2

Perhaps ranking second in importance is National Standard 2, which requires that conservation and management measures be based on the “best scientific information available.” The same language is used in the Law of the Sea.<sup>128</sup> Although no federal court of appeals has offered a definitive interpretation of this standard, it is clear that courts are “highly deferential” when determining whether NMFS and the regional councils meet the standard.<sup>129</sup> One district court has, for instance, stated that a complete failure to consider science and the introduction of better science would be needed for an FMP to be contrary to the standard.<sup>130</sup> The standard also does not mandate an affirmative obligation to collect data before establishing limits,

<sup>125</sup> See Article 61.

<sup>126</sup> *Maine v. Kreps*, 563 F.2d 1043, 1047 (1st Cir. Me. 1977) (quoting H.R. Rep. No. 445, 94th Cong., 1st Sess. 48 (1975)).

<sup>127</sup> *Natural Res. Def. Council, Inc. v. Daley*, 209 F.3d 747, 754 (D.C. Cir. 2000).

<sup>128</sup> Article 61(2).

<sup>129</sup> See, e.g., *Or. Trollers Ass’n v. Gutierrez*, 452 F.3d 1104, 1120 (9th Cir. 2006).

<sup>130</sup> See *Commonwealth v. Gutierrez*, 594 F. Supp. 2d 127, 132 (D. Mass. 2009) (collecting cases).

and the agency can act before information is even complete.<sup>131</sup> Notwithstanding the great discretion afforded to NMFS and the councils under National Standard 2, such discretion is not limitless. For example, it is not proper for NMFS to allocate fishing quota based on “pure political compromise” as opposed to “reasoned scientific endeavor.”<sup>132</sup>

### 36.3.5 *The Remaining Standards*

The remaining standards<sup>133</sup> and case examples are listed below.

- **National Standard 3** requires stocks of fish to be managed as a unit throughout their range, and interrelated stocks of fish to be managed as a unit or in close coordination.
- **National Standard 4** prevents discrimination between residents of different States and says that any allocation of fishing privileges must be fair and equitable, reasonably calculated to promote conservation and ensure that no particular individual, corporation, or other entity acquires excessive shares.
  - At least one court has found that, under National Standard 4’s fair-and-equitable requirements, measures must not “‘impose a hardship on one group if its outweighed by the total benefits received by another group or groups.’”<sup>134</sup> But the same court has said that this standard is met, even if there is some discriminatory impact on fishermen, a long as the regulations are tailored to meet conservation purposes.<sup>135</sup>
- **National Standard 5** allows for fishery managers to consider efficiency, but no management measure can have economic allocation as its sole purpose.
  - Like standard 4, National Standard 5 prohibition on measures engendered by economic allocation is met as long as NMFS and the regional councils considered some justifications besides economic allocation.<sup>136</sup>
- **National Standard 6** requires conservation and management measures to take into account and allow for variations among, and contingencies in, fisheries, fishery resources, and catches.
- **National Standard 7** requires measures, where practicable, to minimize costs and avoid unnecessary duplication.

<sup>131</sup>*Mass. by Div. of Marine Fisheries v. Daley*, 10 F. Supp. 2d 74, 77 (D. Mass. 1998).

<sup>132</sup>*Midwater Trawlers Coop. v. DOC*, 282 F.3d 710, 720 (9th Cir. 2002).

<sup>133</sup>16 U.S.C. § 1851.

<sup>134</sup>*Fishermen’s Finest Inc. v. Locke*, 593 F.3d 886, 895 (9th Cir. 2010) (quoting 50 C.F.R. § 600.325(c)(3)(i)(B)).

<sup>135</sup>*See Alaska Factory Trawler Ass’n v. Baldridge*, 831 F.2d 1456, 1464 (9th Cir. 1987).

<sup>136</sup>*Fishermen’s Finest Inc.*, 593 F.3d at 895.

- It has been interpreted not to require a cost-benefit analysis, and it can be met with a limited study showing that the regulations will have positive environmental and sociological benefits.<sup>137</sup> Evidence showing that NMFS ignored a less costly, practicable approach, however, would render a plan in contravention of the standard.<sup>138</sup>
- **National Standard 8** requires management measures to take into account the importance of fishery resources to fishing communities by utilizing economic and social data in order to provide for the sustained participation of such communities, and minimize adverse economic impacts on such communities.
  - It has been interpreted solely to mean that measurement measures take into account the sustained participation of communities, not mandate a particular outcome for such communities.<sup>139</sup> As with all the National Standards, impacts to particular communities can be justified in the name of conservation.<sup>140</sup>
  - It has not been lost on the courts that there is a tension between National Standards 8 and 1.<sup>141</sup> But the Courts have indicated NMFS “must give priority to conservation measures. It is only when two different plans achieve similar conservation measures that [NMFS] takes into consideration adverse economic consequences.”<sup>142</sup>
- **National Standard 9** provides that conservation and management measures are to minimize bycatch and minimize the mortality of such bycatch.
  - National Standard 9 must also give way to competing conservation interests, but it is not permissible for the agency to adopt completely discretionary or voluntary measures to minimize bycatch.<sup>143</sup>
- **National Standard 10** requires conservation and management measures to the extent practicable, promote the safety of human life at sea.
  - Like Standard 9, National Standard 10 must be balanced in light of the other standards.<sup>144</sup>

These are the touchstones of the act, and thus have been the focus of numerous court challenges by those seeking to invalidate fishery management measures on the grounds that they did not comport with the standards. Such cases were often brought by fishermen who were harmed by certain fishery regulations, or by conservation organizations that believed that the fishery restrictions were not strong enough.

The running theme through all of the court decisions is that National Standard 1 and its conservation purpose reign supreme. Moreover, while the National Standards provide a basic framework for managing fisheries, they also provide an enormous amount of flexibility and discretion for fisheries managers. While this discretion gives agencies the ability to implement very strong fishery management measures, it also allows them to implement measures that are ineffective. They can implement measures that are simply a product of the political power of the fishermen that have the most influence over the councils. Any such measures' opponents are left with a considerable challenge to make the case that managers have stepped too far in favoring one group of fishermen over another, designing measures that are aimed too much at economic allocation, or adopting measures not strong enough to reduce overfishing or bycatch or protect human safety.

Many of these precise complaints have been levied at what are perhaps the most recent tools used in fisheries management, IFQs and aquaculture, which are explored in depth in the next two subsections. IFQs, it is argued, are too focused on economic allocation because they are aimed at efficiency in the fishery and, thereby, do not adequately protect small, supposedly inefficient fishermen. Indeed, Congress passed specific measures aimed at addressing these issues in 1996. With fish farming, opponents claim that it is mainly aimed at displacing wild-catch fishermen and inappropriately aimed at economic allocation.

## **36.4 Individual Fishing Quotas (IFQs)**

Perhaps the most significant current debate about how the United States currently manages its fisheries relates to Individual Fishing Quotas (IFQs). These are also often referred to as Individual Transferable Quotas (ITQs). The MSA classifies them in a broader category of Limited Access Privilege Programs (LAPPs).

IFQs are akin to "cap and trade" market-based regulatory regimes. The basic and primary objective of IFQs is to avert the so-called "tragedy of the commons," (discussed in Chap. 34), by providing fishermen a portion of the total fisheries harvest quota (this is the "cap;" it is called a Total Allowable Catch (TAC) in the United States. The theory is that when fishermen have their own share of the fishery that is exclusively theirs, they will not continue to invest money in boats and gear to utilize more of the diminishing, exhaustible resource. Another similar argument is that fisherman given an ownership interest in the fishery will trade off any short-term gain from fishing in order to reap any long-term gains. Fishermen will slow

down, allowing fish to be caught all year. Proponents also argue that this makes fishing safer.<sup>145</sup>

Crucial to the concept of any IFQ program is that the fishing privilege—i.e., the shares or quota can be bought or sold. This provides the “trade” in the “cap and trade” scheme. Fishermen who want to exceed their cap are able to buy more quota from those fishermen who will not use theirs. If the purpose of establishing an IFQ program to reduce “overcapitalization,” or the inefficient excess fishing boats and gear in the fishery, tradability allows purchasers of quota to finance those who sell their quota and thus remove their gear and boats. Quota is bought by those who can fish at the lowest costs or produce the most valuable product. Over the long-term, it is argued that transferability allows the most efficient operators to obtain the bulk of the fishing privileges, producing optimally sized fishing fleets.<sup>146</sup> In turn, those more efficient operators with lower costs are able to dedicate more money to invest in resource improvement.<sup>147</sup>

### 36.4.1 Criticisms of IFQs

In the United States, IFQ programs have been controversial from the outset. Initially, the concern was that NMFS was implementing them without adequate consideration of the regional fishery management councils.<sup>148</sup> But another core concern by some conservation and consumer groups and fishermen was that the public resource would be privatized. In the run-up to approving the 1996 amendments to the MSA, U.S. Representative George Miller offered an amendment—which never passed—that would have ensured that IFQs could not be traded. Speaking of his concerns, he stated:

[ITQs], which are allocated for free, can then be brought and sold, taking a public resource and turning it into a private commodity.

...

Proponents of quota systems tout their advantages. Allowing holders to fish when they want instead of in a derby fashion, they can produc[e] higher quality product, spread out their season, and stay at the dock when the weather is bad. All of these advantages will still hold true.

But [this] does not merit nor does it require, the flatout giveaway of a public resource with no benefits to the taxpayers.

...

<sup>145</sup>Carden et al. (2013), p. 51.

<sup>146</sup>National Research Council (1999), p. 169.

<sup>147</sup>Rieser (1997), p. 823.

<sup>148</sup>As the House Report for the 1996 SFA reports: “Recent efforts by [NMFS] to promote . . . [ITQ] systems above any other type of limited access system concern the Committee and are inappropriate. . . . Because ITQ systems have the potential to fundamentally alter fisheries management in the U.S., the Committee believes they must be used with great caution.” H. Rept. No. 104-171 at 36 (1995).

My amendment would ensure that the give-away of a public resource would be prevented; that big fishing corporations would not profit at the taxpayers expense; and the stewardship of our fisheries remains in the public trust where it belongs.<sup>149</sup>

Other concerns about IFQ programs include their distributional effects on smaller scale fishermen. Larger-scale fishermen end up purchasing smaller-scale fishermen's quota in order to reduce their costs and increase their ability to fish. Smaller fishermen, who cannot afford to fish at levels beneath their quota allocation—if they are allocated quota at all—and who cannot afford to purchase or lease more, often have to exit the fishery.<sup>150</sup> Smaller fishermen then must spend their money leasing access to the resource, akin to medieval serfs. Thus, it is argued, IFQs result in a radical redistribution in the fishery away from small independent fishermen to larger, sometimes international fishing corporations.

Other concerns, particularly leveled by consumer groups and academics, are related to the effects that IFQs have on competition and consolidation. The goal of IFQs is not to simply constrain fishing effort below the maximum sustainable yield, but to a point where the remaining fishermen use all of the entire fleet's "extra-normal profits" by excluding competitors, particularly smaller competitors.<sup>151</sup> This consolidation can be especially acute if quota is awarded based on fishermen's catch-history and for free, so that the largest fishermen start off with a windfall and a large capital advantage based on their historic fishing levels.<sup>152</sup> Additional concerns are related to whether the fishery will cause such concentration in the fishery that it will prevent new fishermen from entering,<sup>153</sup> and it is argued that this could harm consumers in the long run.

Other criticisms are that the efficiency aims of IFQ programs prevent adequate consideration of other equally beneficial non-market measures that may limit entry to the fishery, such as fishing-privilege leases, royalties, and auctions.<sup>154</sup> These measures unitize the common fisheries resource through privileges but either do not allocate the privileges for free based on catch histories or allow more of a government role in how privileges are allocated in the market, so as to keep the privileges more publicly controlled. True believers in IFQs, however, argue that these government interventions introduce inefficiencies in the market. For example, when carefully designed, it is argued, auctioning quota can serve the same conservation ends as allocating quota for free but at lower costs for smaller-scale fishermen, while compensating the public for the losses incurred from allocating fishing privileges for private use.<sup>155</sup> Auction opponents, on the other hand, argue that

<sup>149</sup> 141 Cong. Rec. H10, 223 (Oct. 18, 1995).

<sup>150</sup> See National Research Council (1999), pp. 173–174.

<sup>151</sup> Bromley (2008a), pp. 4–5.

<sup>153</sup> *Id.*

<sup>154</sup> See generally Bromley (2008b), pp. 13–15.

<sup>155</sup> *Id.*

auctions are unfair to bigger fishermen who have fished the most historically and should be awarded privileges based on this demonstration of efficiency.<sup>156</sup>

Further, some conservation and fishing groups and academics argue that the conservation benefits of IFQs are myopic and that they may even hurt fisheries. The studies that are cited for the conservation benefits of IFQ program often fail to disaggregate their effects from other, non-market-based management measures implemented at the same time, such as the TACs alone.<sup>157</sup> Further, opponents argue that fisheries and habitats may be harmed if those who are granted the most catch shares are those that have been bad actors in the past and are those that use gear associated with higher levels of harm to habitat or bycatch.<sup>158</sup> Some critics believe that without increased spending on enforcement, IFQs incentivize cheating because the rewards of doing so are immediate, while the costs or losses are in the future and seemingly less certain.<sup>159</sup>

Fishermen and conservationist critics also argue that IFQs are incompatible with ecosystem management. Such regimes aim to only allow as much fishing in a fishery as is detrimental to the ecosystem, regardless of the fishing's effects on a particular target species, which has traditionally been how fisheries have been managed.<sup>160</sup> With IFQ programs, on the other hand, quota is allocated solely based up on the singular market value of a few species. There is a serious risk that other valuable components of the ecosystem will be ignored because they are not given a monetized value.<sup>161</sup>

Finally, a number of academic and fishermen critics of IFQs contend that the idea that fishermen will trade off short-term for long-term gains because they have a greater ownership interest in the fishery overlooks the inherently contingent and short-term nature of the limited access privileges allowed under the MSA.<sup>162</sup> In the United States, fisheries managers have not given LAPP privilege holders a permanent property interest—at least not a *de jure* interest. In other words, it is not an interest expressly recognized as such under the law. This may limit the conservation ethic, as the fisherman may fear that their share of fish could be subject to government modification or termination at any time.<sup>163</sup> Fishermen point out that fish mortality in any given year is not solely related to fishing, where, for example, some mortality may be due to factors like water pollution. This means that private price agreements between quota sellers and purchasers may not result in the long-

---

<sup>156</sup>*Id.*

<sup>157</sup>Bromley (2008a), p. 3; Food & Water Watch (2011), pp. 8–9.

<sup>158</sup>See National Research Council (1999), p. 177. As the National Research Council indicated: “[I]mplementing an IFQ regime may favor some technologies over others. If [such programs] typically involve more bycatch, bycatch rates can rise in the absence of enforcement.” *Id.*

<sup>159</sup>Rieser (1997), p. 822, citing Congressional Research Service (1995), pp. 8–19.

<sup>160</sup>Pew Ocean Commission (2003), p. 44.

<sup>161</sup>Rieser (1999), p. 405.

<sup>162</sup>Bromley (2008a), p. 7.

<sup>163</sup>Rieser (1997), p. 822.

term allocation of privileges conducive to ending the race to fish and tragedy of the commons.<sup>164</sup> Thus, even with a fully functioning IFQ program, it is argued that there will still be overfishing, or the need for rebuilding and, consequently, the need for government intervention.

What resulted from the 1996 SFA amendments was a moratorium on IFQs so that a comprehensive study could be conducted by the National Academy of Sciences about the “controversial IFQ-related issues such as initial allocation, transferability, and foreign ownership.”<sup>165</sup> The *de jure* moratorium lasted approximately 6 years. Then, in 2007, Congress ended the *de facto* moratorium by adopting some of the National Academies of Science’s recommendations as criteria that would allow fisheries managers to “balance many of the concerns fishermen, crew, communities, conservation groups, and other interests have had over the potential impacts” of such programs.<sup>166</sup> These standards are discussed in the next subsection.

### 36.4.2 *The MSA’s Standards for IFQs and Other LAPPs*

In the final version of the 2007 law, Congress amended the MSA to allow IFQ programs but also established a set of procedures and criteria for their adoption.<sup>167</sup> Some of these provisions were designed to incorporate fairness and equality into such programs.<sup>168</sup> Other parts of the law require consideration of the impacts of the programs on conservation, fishermen, and fishing communities.<sup>169</sup> Further, new provisions were aimed at giving fishermen in the New England and Gulf of Mexico regions the power to decide, through citizen referenda, whether they would want IFQ programs.<sup>170</sup>

Under the new provisions, LAPPs and IFQs are considered a permit, and they may be revoked, limited, or modified at any time, including if they jeopardize the sustainability of the stock or the safety of fishermen.<sup>171</sup> Such programs do not confer any right of compensation to the holder; they do not create, any right, title, or interest in or to any fish before the fish is harvested; and they are considered a grant of permission to engage in activities permitted by such limited access privilege or quota share.<sup>172</sup> The intent of these limitations was to prevent IFQ holders from

<sup>164</sup>See Bromley (2008a), p. 7.

<sup>165</sup>See *The Sustainable Fisheries Act*, Pub. L. No. 104-297, sec. 108(e), § 303(f), 110 Stat. 3576 (1996).

<sup>166</sup>S. Rept. No. 109-229 at 9 (2006).

<sup>168</sup>See *id.* § 1853a (2012).

<sup>169</sup>See *id.* § 1853a(c).

<sup>170</sup>See *id.* § 1853a(c)(6)(D).

<sup>171</sup>*Id.* § 1853a(b).

<sup>172</sup>*Id.*

developing investment-backed expectations that could require the government to compensate them for the elimination or modification of such rights.<sup>173</sup> IFQs, nevertheless, do convey at least a limited property interest, including the right to access and enjoy certain fish populations by fishing. They have two of the essential attributes of property: exclusivity and transferability.<sup>174</sup> Insofar as these property allocations are not done for the public interest and substantially impair what remains for others to access, one could argue that they would violate of the Public Trust Doctrine that inheres to the federal fish resources, as discussed in Chap. 34.<sup>175</sup>

Another key part of the 2007 provisions is the act's attempt to allow communities to hold quota.<sup>176</sup> Under Community Development Quota (CDQs), fishery managers grant quotas to the entire community, for the benefit of all. The benefits of this type of quota is its ability to subdivide the allocation of fishing privileges in a more refined manner than a regional council or individuals can in a free-market system.<sup>177</sup> CDQs may also be able to mitigate the inevitable social disruption caused by new IFQ programs.<sup>178</sup> Communities may also be able to enforce limits on fishing through informal norms and sanctions.<sup>179</sup> They also may better democratize the allocation of quota, which may decrease concerns about keeping the public out of the fishery.<sup>180</sup>

The MSA's community-based and other new LAPP provisions faced one of their first challenges in the case of *Pac. Coast Fedn. of Fishermen's Ass'ns v. Blank*, where a group of non-trawl (a type of fishing gear) fishermen challenged an IFQ program for the trawl-boat sector of the fishery off the west coast of the United States.<sup>181</sup> The challenging fishermen, who were concerned that they would be harmed by the consolidation impacts from the IFQ program, argued that NMFS had failed to adhere to new criteria established for LAPPS including that they (1) develop criteria for ensuring that quota shares are distributed to fishing communities, and (2) adopt other measures and policies to ensure the sustained participation of fishing communities.<sup>182</sup>

The court disagreed with the arguments made by the challengers of the IFQ program. It found that the statute did not require the agency to develop such criteria for ensuring community participation and that the sustained participation of

<sup>177</sup>Rieser (1997), p. 827.

<sup>178</sup>Lynch (2007), pp. 309–310.

<sup>179</sup>Rieser (1999), pp. 405–406.

<sup>180</sup>Lynch (2007), pp. 309–310.

<sup>181</sup>*Pac. Coast Fedn. of Fishermen's Ass'ns*, 693 F.3d at 1086.

<sup>182</sup>*Id.* at 1092.

communities only had to be considered by the agency, which it did, notwithstanding that communities could not participate in the programs by holding quota.<sup>183</sup> The regional fishery management council complied with the law by “survey[ing] the current status of fishing communities; . . . describ[ing] the effects of quota programs and other management tools on those communities; and explain[ing] how communities participated in the Pacific Council’s decisions.”<sup>184</sup> In addition, the court credited several of the FMP measures aimed at the mitigation of the IFQ program’s disruptive effects, including its adaptive management program that provided quota to be held and not completely allocated.<sup>185</sup> The quota could then be allocated later to communities and others, if NMFS determined that it was necessary to mitigate the harm caused by the initial allocations and the market. Finally, the other major issue in this case was whether quota holders had to be those that “substantially participate” in the fishery.<sup>186</sup> The court held that while those fishermen that substantially participate in the fishery had to receive quota, they did not have to be the only ones eligible.<sup>187</sup>

The implications of this decision are potentially far-reaching. In fact, the standards that Congress adopted in 2007 to prevent some of the negative impacts of IFQ systems, especially those aimed at promoting community involvement and sustained participation for smaller fishermen, were deemed discretionary. Certainly, many people’s hopes were diminished that the new MSA’s LAPP provisions would bring in a new era of CDQs. The decision also begs the question of whether courts will require IFQ programs to adopt any mitigation measures whatsoever in order to protect small fishermen and communities. Finally, the ruling means that quota can be almost completely privatized, notwithstanding the language of the MSA. Quota will be held by even those who have not substantially participated in the fishery, meaning that there is a strong potential that shares of the fishery will be acquired by those who have no connections to fishing whatsoever, including those who might seek to buy, sell, and trade their quota simply for financial gain, comparable to stocks on a stock market. Many consumer, conservation, and fishing organizations hope that this issue will be addressed in the MSA as it comes up for reauthorization in the next few years.

Thus, while the 2007 MSA amendments’ termination of the *de jure* moratorium on IFQs was premised on the establishment of some standards to protect fishermen, the *Pac. Coast Fedn. of Fishermen’s Ass’ns* decision perhaps demonstrates that these MSA standards were inadequate and that there is a need for more attention to these issues in the future.

## 36.5 Fish Farming

### 36.5.1 US Regulation of Aquaculture

Another attempt to unitize or privatize the common fisheries resource is with fish farming, also known as aquaculture. The U.S. federal government has defined it as the “propagating and raising of marine organisms.”<sup>188</sup> Aquaculture is a very broad subject. It includes such diverse practices as the raising of bivalves, such as clams, molluscs, or scallops on strings or pots, raising alligators, inland aquarium-like recirculating structures, and the raising of finfish, such as salmon in pens made of nets or large spherical cages.<sup>189</sup> Aquaculture growth has increased rapidly in the last few decades and, in 2010, contributed to nearly half of the world’s fish production for food.<sup>190</sup>

Fish farming, it is argued, will increase the supply of fish, thus preventing overfishing and preventing the so-called tragedy of the commons. While later chapters of this book will cover the harms of fish farming and their international regulation in depth, the issue about how best to regulate it in the United States, including under the MSA, has been the subject of much debate in the United States. Much of this debate has focused on whether it should be officially sanctioned as an allowed use of the EEZ, and whether NMFS should be allowed to regulate it under the MSA or some other statute aimed at targeting its unique potential environmental and public health impacts.

Fish raised on farms in rivers, streams, and within three miles of shore in the United States are governed by state law.<sup>191</sup> This includes most of the aquaculture production in the United States.<sup>192</sup> However, due to the crowded nature of state waterways, the non-uniformity of state laws, and advances in the technologies of raising fish, there has been an aggressive push by fish-farming advocates to move facilities beyond state waterways, in cages or netpens in open ocean waters beyond the three-nautical-mile state limit.<sup>193</sup>

In 1999, the U.S. Department of Commerce, which houses NMFS, called for the quintupling of the U.S. annual aquaculture production by the year 2025—from \$900 million a year to \$5 billion. The goal is to offset the so-called “seafood trade deficit,” meaning that the United States exports more seafood than it imports, so as to create more jobs, and bring more high quality seafood to U.S. customers.<sup>194</sup> Part of this push is to increase the amount of fish farming in the EEZ.

<sup>193</sup>See *id.* at 13–21; Marine Aquaculture Task Force at 1. This argument is also being advanced internationally. See Kapetsky et al. at xiv (2013).

<sup>194</sup>U.S. Department of Commerce at 2 (1999).

Proponents of fish farming in the EEZ argue that the deep water and fast currents can minimize harmful environmental impacts from fish waste.<sup>195</sup> They also argue that offshore aquaculture would give operators more space to operate and minimize some of the conflicts between fish-farm facilities and fishermen.<sup>196</sup> Fish farms not only take up space that cannot be used by fishermen, they attract other fish, which can either harm or benefit fishermen depending on how much access fishermen are given to fish around the farms. It is also argued that with fish farms in areas where they can spread out, there will be fewer local impacts from excess fish feed and waste polluting the water and seafloor.

### ***36.5.2 The Problems with Aquaculture***

Critics of fish farming argue that the potential mitigation from allowing fish farms in deep waters will not sufficiently alleviate potential environmental, consumer, and socio-economic impacts. Concerns include the water quality and seafloor impacts from the untreated fish waste and excess feed waste from the farms.<sup>197</sup> In terms of water quality, the main concerns are nutrients, such as nitrogen and phosphorus. A recent technical memorandum for NMFS surveyed existing studies and concluded that increased nitrogen levels could cause potential localized water quality effects.<sup>198</sup> Further, it found that “[q]uestions remain about the cumulative impacts of [nitrogen] discharge from multiple, proximal farms, potentially leading to increased primary production and eutrophication at regional and far-field scales.”<sup>199</sup> Eutrophication is the excessive richness of nutrients, which causes a dense growth of plant life and the death of animal life from a lack of oxygen. The one published study of offshore aquaculture in U.S. waters found that the farm’s cages “grossly polluted” the sea floor and “severely depressed” marine life at some sampling sites very close to the fish cages, and, over the course of 23 months, these effects spread to sites up to 80 meters away.<sup>200</sup>

Other concerns are that escaped fish and disease from aquaculture cages in the ocean will harm surrounding wild-fish populations. Aquaculture cages can, for example, act as reservoirs for diseases. The two diseases that are often associated with fish farming are sea lice, a parasite that inflicts wild and farmed salmon alike, and Infectious Salmon Anemia. A 2012 study also found that 39% of adult wild

---

<sup>195</sup>Government Accountability Office at 2 (2008).

<sup>196</sup>See Cicin-Sain et al. (2001), p. 18.

<sup>197</sup>Government Accountability Office at 9 (2008).

<sup>199</sup>*Id.* at 46.

<sup>200</sup>Lee et al. (2006), pp. 175–185.

salmon in the Northeast Atlantic are killed by parasite infections and suggested that a large source of the sea lice are aquaculture facilities.<sup>201</sup>

Fish escapes are also a concern with open-water fish farms. Cages and net pens are not the natural habitat of fish, and so escapes are inevitable. When the fish do escape, farmed fish interbreed with wild fish. The offspring may have diminished survival skills, inherited from the farmed fish that may be genetically modified. The concern is that the result will be wild-fish populations that are genetically less fit and an overall lessening of biodiversity. A comprehensive review of the effects of escaped Atlantic salmon on wild populations conducted in 2008 concluded the outcome of escapee-wild fish interactions are frequently negative for wild salmon and can have devastating consequences for marine ecosystems.<sup>202</sup>

Another major issue is that the fish food that is used to feed farmed fish is often made from fishmeal and oil derived from small ocean forage fish such as sardines, anchovies, and herring, often caught in the Northeast Atlantic and off North and South America's Pacific coast.<sup>203</sup> Many such forage fish species are vulnerable to overfishing and have a high probability of population collapse.<sup>204</sup> Therefore, it is argued that there is a strong potential that an increase in fish farming could put further pressure on wild-fish populations, instead of alleviating overfishing, as is its promulgated goal.

Antibiotics, pesticides, and the other drugs or chemicals used in these operations can also be damaging to marine ecosystems and fish populations.<sup>205</sup> Studies have found antibiotics present in wild fish that were feeding on feces and food from fish farms, and thus may serve as a pathway for development of antibacterial resistance within wild populations.<sup>206</sup> Researchers believe that more needs to be understood about the accumulation of antibiotics from fish farms and human exposure,<sup>207</sup> but current trends offer cautionary tales.

Finally, there are concerns about the socioeconomic impacts to wild fishermen. Farmed fish can flood the market with product, thus decreasing prices that fishermen receive for their catch. For example, in the 1990s, commercial fishermen in British Columbia saw prices for salmon decrease by two thirds, in large part because of aquaculture's increasing of the salmon supply worldwide.<sup>208</sup> As prices declined, the ability of traditional fishermen to sustain a livelihood became more difficult.

Ultimately, the question is how to best prevent these impacts, especially because they are unique and quite different from many issues with wild-caught fishing.

Additionally, as mentioned in regards to the regulation of managing wild-fish populations, there are concerns that NMFS, whose mission is to increase the amount of fish produced from the seas, is not the proper agency to ensure that any growth in the industry is sustainable. The next section explores how this controversy has manifested itself with fish farming: whether and to what extent the agency has or should have the authority to regulate fish farming in the federal EEZ.

### ***36.5.3 Aquaculture Regulation Under the MSA***

In light of the controversies surrounding fish farming, the question arises as to whether fish farming should be conducted in the U.S. EEZ, and if so, how it should be regulated? Initially, proponents of more aquaculture development, including fish farmers and NMFS, pressed for new authorizing legislation from Congress, which, among other purposes, would provide fish farmers a property interest—a permit issued by NMFS—to begin operation in the EEZ.<sup>209</sup> Notably, the industry and NMFS were not the only advocates. Perhaps fearful that aquaculture operations would start in federal waters and not be comprehensively regulated, a few conservation organizations supported different legislation, the National Sustainable Offshore Aquaculture Act, first introduced in 2009 by Representative Lois Capps of California.<sup>210</sup> The legislation established a permit system for aquaculture facilities in federal waters, but also created environment standards for the permitting.<sup>211</sup> Other organizations argued that there was no need to provide a permit or any other property interest for aquaculture facilities in federal waters because this will simply provide the investment certainty needed to spur development. Without such certainty, aquaculture facilities are not likely to start operation in the EEZ.<sup>212</sup>

To date, these pieces of federal legislation have stalled. This has prompted NMFS to explore ways to authorize aquaculture operations in the U.S. EEZ under its existing authority under the MSA. In 1993, a legal opinion by then-Deputy General Counsel for the NMFS's parent agency, the National Oceanic Atmospheric Association, Jay S. Johnson, and NMFS's then-Assistant General Counsel, Margaret Hayes, asserted that NMFS and NOAA had the authority under the MSA to

---

<sup>209</sup>See National Offshore Aquaculture Act of 2007, H.R. 2010, 110th Cong. § 2(a)(3) (2007); S. 1609, 110th Cong. § 2(1)(c) (2007).

<sup>210</sup>H.R. 4363.

<sup>211</sup>After all, while there are plenty of laws that would apply to aquaculture facilities in the EEZ, including the Clean Water Act and Rivers and Harbors Act, some believe that, as Professor Hope Babcock has rightly noted, aquaculture in the EEZ is a classic example of what Professor William W. Buzbee has deemed a “regulatory commons.” A regulatory commons exists when there is inaction or a lack of comprehensive oversight over problem due to shared disjointed jurisdiction between regulatory authorities. Babcock (2007), p. 69, citing William W. Buzbee (2003).

<sup>212</sup>See Cicin-Sain et al. (2001), p. 20.

regulate aquaculture in federal waters under the MSA's definition of "fishing." In particular, "fishing" as defined by the MSA is the "catching, taking, and harvesting of fish." Johnson argued that the use of the word "harvesting" in this definition connotes the gathering of a crop, so it could include fish farming.<sup>213</sup>

It is undisputed, however, that this opinion was simply Johnson's attempt to assert the agencies' limited authority to regulate fish farming in the face of a proposed salmon farm in federal waters in New England.<sup>214</sup> It was not until more recently, in 2009, that the Gulf of Mexico Regional Fishery Management Council (the Gulf Council) sought to extend this authority to establish a regional FMP for offshore fish farming. The plan was supposed to establish a permitting process that would allow an estimated 5 to 20 new aquaculture projects to the Gulf of Mexico portion of the EEZ over 10 years, collectively producing as much as an estimated 64 million pounds of fish annually. Operators would get 10-year permits with exclusive use of the area surrounding its operations.<sup>215</sup>

In 2011, after a number of public hearings and taking of public comment, the federal government also issued a new national policy with the chief aim to encourage and foster "sustainable aquaculture development that provides domestic jobs, products, and services and that is in harmony with healthy, productive, and resilient marine ecosystems, compatible with other uses of the marine environment, and consistent with [its] . . . National Oceans Policy."<sup>216</sup> Critics complained that the policy lacked tangible measures to prevent the harms from fish farming, and its perhaps-laudable goals were contradicted by other aims, such as "developing streamlined processes for authorizing aquaculture . . . in Federal waters[.]"<sup>217</sup> A month after the aquaculture policy was released, NMFS issued its first-ever permit to a commercial aquaculture facility in the EEZ off the coast of Hawaii. The permit was challenged in a lawsuit mounted by two non-profit organizations, with this chapter's author as one of its counsel. Among their claims, the plaintiffs argued that the agency did not have the authority under the regional FMP to issue permits for aquaculture. NMFS defended its permit issuance on the grounds that it had the broad authority under the MSA as it amounted to the "harvesting" of fish.

---

<sup>213</sup>Johnson (1993), p. 2.

<sup>214</sup>*Id.* at 1.

<sup>215</sup>Gulf of Mexico Regional Fishery Management Council at 1 (2009). In 2009 the FMP was finalized by the regional council, but the Secretary of Commerce under newly elected President Obama decided that he would neither approve nor disapprove the FMP and never issued any implementing regulations for the plan, instead indicating that it would develop a national policy by which to assess aquaculture. The final FMP was challenged in court, but a federal district court judge ruled that the lawsuit could not go forward until the agency finalized rules to implement it. See *Gulf Restoration Network, Inc. v. Nat'l Marine Fisheries Serv.*, 730 F. Supp. 2d 157, 162 (D.D.C. 2010).

<sup>216</sup>National Oceanic and Atmospheric Administration at 1–2.

<sup>217</sup>*Id.* The policy was issued on the same day that a new memo was issued from the NOAA General Counsel's office, citing the 1993 Johnson memo and stating that the MSA allows the agency to issue permits for aquaculture facilities in the EEZ.

In a 2012 decision, the District Court for the U.S. District of Hawaii found that because the MSA and its regulations do not define “harvesting,” the agency was free to “look to the dictionary definition of ‘harvest’ as ‘the act or process of gathering in a crop.’”<sup>218</sup> Likewise, the agency was reasonable in defining “‘Crop,’ . . . [as] ‘a plant or animal . . . that can be grown and harvested extensively for profit or subsistence.’”<sup>219</sup> Thus, the court stated, “‘Defendants’ determination that [the aquaculture project] falls within the term ‘harvesting’ was reasonable. The project involves growing and gathering a ‘crop’ of [fish] to sell for human consumption.”<sup>220</sup>

This decision was appealed. In a very brief 2013 unpublished decision, the U.S. Court of Appeals for the Ninth Circuit ruled that under the agency’s regulations, “NMFS may review and issue special permits for proposals to fish ‘with any gear not normally permitted,’ and under NMFS’s ‘generally conferred authority’” under the MSA.<sup>221</sup> The decision leaves the issue of NMFS’s authority to issue permits to aquaculture facilities under the MSA largely unresolved.

This decision is not binding precedent because it was not a published decision. It only serves as persuasive authority—even in the Ninth Circuit. Moreover, while the appellate court affirmed the lower court’s decision, the former court did not adopt the latter’s rationale and did not ratify the government’s theory that aquaculture is “harvesting” under the MSA—failing to even use the words “aquaculture” in any part of its opinion. Opponents of extending NMFS’s authority to issue permits for aquaculture facilities will certainly argue that the opinion suggests that the court was only affirming NMFS’s permitting authority under the limited facts surrounding the particular permit.<sup>222</sup> Likewise, it is highly probable that aquaculture companies and NMFS will seize upon the Ninth Circuit’s affirmance of the lower court’s decision as meaning that NMFS has broad authority to issue permits to fish farms, especially with the implementing regulations for the long-stalled Gulf of Mexico aquaculture FMP.

Of further note about this case, as it ties together the role of common law and the Public Trust Doctrine discussed Chap. 34, is what NMFS argued in its brief and at oral arguments: If the agency did not have the authority to issue permits to

<sup>218</sup>*Kahea v. Nat’l Marine Fisheries Serv.*, No. 11-00474 SOM-KSC, 2012 U.S. Dist. LEXIS 59244, at \*26–27 (D. Haw. Apr. 27, 2012). The decision quoted NMFS’s filings and the “Harvest” definition found at Merriam-Webster, <http://www.merriam-webster.com/dictionary/harvest>.

<sup>219</sup>*Id.* The decision also quotes the “Crop” definition found at Merriam-Webster, <http://www.merriam-webster.com/dictionary/crop> (last visited Apr. 27, 2012).

<sup>220</sup>*Id.*

<sup>221</sup>*KAHEA v. Nat’l Marine Fisheries Serv.*, No. 12-16445, 2013 U.S. App. LEXIS 22046, at \*3 (9th Cir. 2013) (quoting *United States v. Mead Corp.*, 533 U.S. 218, 229 (2001)).

<sup>222</sup>See also *Pazolt v. Director of the Div. of Marine Fisheries*, 631 N.E.2d 547, 551 (Mass. 1994) (finding aquaculture not within the boundaries of reserved right of public fishing, and saying that “aquaculture is a contemporary method of farming shellfish. . . . It is not incidental to or reasonably related to or a natural derivative of the public’s right to fish.”).

aquaculture facilities under the MSA, then there would be an unregulated industry operating in the EEZ. Plaintiffs mostly pointed to other MSA provisions that the agency could have relied upon for preventing the aquaculture project without actually having to provide a property interest to the facility with a permit. These provisions include ones that broadly allow FMPs to “include management measures in the plan to conserve target and non-target species and habitats.”<sup>223</sup> Plaintiffs also pointed out that, even without statutory authority to regulate fish farms, NMFS could, if it chose to, prevent any aquaculture project’s harms by using common law.<sup>224</sup> Thus, it may be that the common law can serve as a tool to prevent activities such as aquaculture that may harm EEZ resources, even if no statute provides such express authority. The U.S. government has sought and obtained such remedies with public lands, filing a common law public nuisance lawsuit in order to fill the gaps where statutory law did not apply.<sup>225</sup> While the U.S. Court of Appeals for the Ninth Circuit never reached this issue in its decision, in the future it might be argued that not only is NMFS fully authorized to prevent the harms from aquaculture facilities through common law actions such as trespass and nuisance, the agency has the obligation to do so under the common law Public Trust Doctrine, regardless of whether it has the authority to regulate aquaculture as “fishing” under the MSA.

Fish farming remains controversial in the United States. The authority of fisheries managers to regulate it and issue permits in the EEZ under the MSA is questionable and is certain to be tested in courts for years to come. The emergence of this industry as a means to meet a consumer demand for fish will be dependent on whether and how it is regulated with open questions about its environmental and socioeconomic costs.

---

<sup>223</sup> 16 U.S.C. § 1853(b)(12) (2012).

<sup>224</sup> The plaintiffs cited to the decision in *United States v. Ray*, for this authority. 423 F.2d 16 (5th Cir. 1970). In that decision, involving a number of defendants who had sought to establish an island nation on coral reefs beyond state jurisdiction off the coast of Florida, the U.S. government convinced the U.S. Court of Appeals for the 5th Circuit that it could issue an injunction, notwithstanding any express statutory authority to do so. The decision overturned the District Court’s decision that the United States could not bring a trespass action under the common law because the government did not have sufficient property right in the reefs off the coast. The appeals court found that the reefs fell within the definition of seabed and subsoil in both the Outer Continental Shelf Lands Act and Geneva Convention on the Outer Continental Shelf, and long before President Reagan’s 1983 proclamation about the EEZ. The convention provided that the United States had sovereign rights and the exclusiveness of those rights to explore the Shelf and exploit its natural resources. 423 F.2d at 21. The government’s paramount rights established in international law and its vital interest “in preserving the reefs for public use and enjoyment[,]” were sufficient for it to obtain an injunction, even without fee simple interest in the property. *Id.* at 22.

<sup>225</sup> See, e.g., *United States v. Rainbow Family*, 695 F. Supp. 314, 327 (E.D. Tex. 1988). Indeed, the *Rainbow Family* decision cites *United States v. Ray*, and says that this power and duty to protect land come from its role as “conservator of the lands for the public interest[,]” *id.* at 326, using language strongly evoking the concept of the public trust doctrine.

## 36.6 Clean Water Regulation

Clean water regulation is integral to many of the subjects already discussed in this chapter, including international regulation of the global commons and aquaculture. This chapter's discussion, much like the discussion of fisheries thus far, is limited to marine issues and does not focus on pollution of freshwater bodies in lakes and streams that are only governed by domestic regulation. As detailed below, while there has been some improvement in the implementation of laws designed to prevent of marine pollution there still is much work to be done. Specifically, successful fisheries management in the United States will be dependent on reducing the aforementioned non-fishing threats to fish health and habitat.

Marine pollution can come from a number of different sources, including land-based runoff, vessel discharges, and oil drilling.<sup>226</sup> Discharges from land, for instance, include sewage, radioactive and industrial wastes, and agricultural run-off. A National Academy of Sciences study estimates that the oil that runs off U.S. streets and driveways into the oceans amounts to an *Exxon Valdez* oil spill every eight months.<sup>227</sup> Today, nonpoint sources pollution, or those that come from multiple sources on land like farms and urban runoff, presents perhaps the greatest pollution threat to oceans off the U.S. coasts.<sup>228</sup> In the United States, agriculture is one of, if not the most significant source of pollution because it is the source of nutrients such as nitrogen.<sup>229</sup> Nitrogen coming from animal waste that is applied to farmland as fertilizer is easily dissolved in water and is transported by rain into streams and rivers that eventually flow into the ocean. Further, tile drainage systems, which are constructed to collect and shuttle excess water from fields, act as an "expressway" for this nitrogen pollution.<sup>230</sup> For instance, the Mississippi River carries an estimated 1.5 million metric tons of nitrogen into the Gulf of Mexico each year.<sup>231</sup> Such nutrient pollution has been linked to harmful algal blooms and dead zones, including the Gulf of Mexico's dead zone that is more than 8000 square miles. Dead zones, which are areas of low oxygen, i.e. "hypoxic" conditions, kill large numbers of crabs, fish, and other species. In addition, this pollution results in the loss of seagrass and kelp beds, the destruction of coral reefs, and lower biodiversity in estuaries and coastal habitats.<sup>232</sup> These present a serious threat to fish habitat and consequentially to fish health.

---

<sup>226</sup>Buck (1998), p. 95.

<sup>227</sup>Pew (2003), p. 4, citing National Research Council (2002).

<sup>228</sup>*Id.* at 60.

<sup>229</sup>*Id.* at 60, citing National Research Council (2000).

<sup>230</sup>*Id.* at 62.

<sup>231</sup>*Id.* at 59, citing Goolsby et al. (1997).

<sup>232</sup>*Id.* at 62, citing Howarth et al. (2002).

Point sources of marine pollution also include animal waste overflowing from open lagoons at large industrial farms and oil spills<sup>233</sup> such as from the Deepwater Horizon explosion in the Gulf of Mexico, which released an estimated 210 million U.S. gallons of oil and dispersants.<sup>234</sup> Vessel discharges include contaminants from ballast tanks, sewage from cruise ships, and fuel spills.<sup>235</sup>

Global warming, caused by the burning of fossil fuels and other activities that release heat-trapping gases such as carbon dioxide, also poses a serious threat to ocean health. Recently, attention has focused on ocean acidification. The ocean absorbs about a quarter of the carbon dioxide released into the atmosphere every year. This has begun changing the chemistry of the seawater, including the amount of available calcium carbonate minerals, which serve as the building blocks for the skeletons and shells of many marine organisms, such as oysters, clams, and corals. In recent years, there have been near total failures in wild- and farmed-oyster production on the West Coast, which may be linked to global warming. When these shelled organisms are at risk, the entire food web is also at risk.<sup>236</sup>

These are just some of the marine-pollution threats that can affect the health of ecosystems and the size of fish populations, and which fishery managers must consider when deriving policy measures to curb fish mortality. In the United States and elsewhere, this becomes difficult when many of these threats are not directly under the jurisdiction of fishery management agencies. Much of this pollution, which comes from sources far upstream or even from air-pollution sources, is solely regulated domestically, and by other agencies. This creates a regulatory-commons problem already mentioned above.<sup>237</sup> Having multiple agencies exerting jurisdiction over different pieces of the problem limits the likelihood of comprehensive regulation.<sup>238</sup>

Much of this pollution from the United States into our oceans is simply a result of the lack of regulation. Only now has the country been moving to mandate national standards for greenhouse gas emissions from power plants and motor vehicles under the Clean Air Act, for example. As another example, much of the pollution from animal farms are excused from permitting requirements for manure discharges caused by precipitation.<sup>239</sup> Efforts to curb pollution from agricultural

<sup>234</sup>Davies (2014).

<sup>235</sup>Buck (1998), pp. 96, 66.

<sup>236</sup>See <http://www.pmel.noaa.gov/co2/story/What+is+Ocean+Acidification%3F>, last accessed April 18, 2014.

<sup>237</sup>See Kundis Craig (2002), p. 664.

<sup>238</sup>As another example, Titles I and II of the Marine Protection, Research and Sanctuaries Act, 33 U.S.C. 1401–1445 (2012), also known as the Ocean Dumping Act, regulates ocean dumping and incineration at sea of materials other than vessel sewage waste. *Id.* (citing 33 U.S.C. 1402 (c)) Under this act, the U.S. Army Corps of Engineers issues permits for ocean dumping of dredged materials, while the EPA has permit authority for the dumping of all other materials. *Id.* (citing 33 U.S.C. 1412). The U.S. Coast Guard regulates garbage disposal of from vessels pursuant to the Marine Plastic Pollution Research and Control Act of 1987. *Id.* (citing 33 U.S.C. §1412).

<sup>239</sup>See 71 Fed. Reg. 37,744 (June 30, 2006).

sources have recently focused on pollution trading schemes, and have been challenged in court for not being authorized under the federal Clean Water Act (CWA).<sup>240</sup> As another example of failed regulation, the U.S. CWA does not cover untreated discharges of water from its largest source, cruise ships, anywhere in federal waters. Only in Alaskan state waters are cruise ships required to meet effluent standards, treat gray-water (waste water from sinks and showers that has not come into contact with feces) discharges, and monitor, record, and report discharges to state and federal authorities.<sup>241</sup>

Proponents of increasing the amount of aquaculture in the EEZ without further environmental standards point to the CWA as the chief tool to regulate pollution from such facilities, but critics argue that it is lacking in many respects. The primary tool under the CWA is its National Permit Discharge System (NPDES). The CWA makes it illegal to discharge any pollutant without a NPDES permit.<sup>242</sup> It defines a discharge as “any addition of any pollutant to the waters of the contiguous zone or the ocean from any point source other than a vessel or other floating craft.” Such facilities are point sources under the CWA.<sup>243</sup>

To date, however, EPA regulates an aquaculture facility as a point source only if it qualifies as a “Concentrated Aquatic Animal Production Facility,” which means that it discharges at least 30 days per year, and, for warm water facilities, produces 100,000 pounds of fish annually.<sup>244</sup> Critics contend that while these thresholds may prevent harm from aquaculture facilities operating on a commercial scale, they prevent the agency from collecting valuable information on smaller test projects.<sup>245</sup> Other limitations in existing CWA for aquaculture facilities in the EEZ is that the law is not clear whether escaped fish may also be considered a “pollutant” under the CWA.<sup>246</sup> Moreover, even though aquaculture facilities must comply with the act’s technology- and water-quality-based effluent limitations, because EPA has set no water quality standards for ocean waters and its ocean-discharge criteria provide little guidance, the best tool that permit writers have for NPDES permits are the

<sup>244</sup>Harvard Law School Emmett Environmental Law & Policy Clinic *et al.* at 5 (2012) citing 40 C.F.R. § 122.24(a). Facilities may also be designated as such on a case-by-case basis if they are deemed significant contributor of pollution to U.S. waters, but EPA has used this authority limitedly. *Id.*, citing 40 C.F.R. § 122.24(c).

<sup>245</sup>*Id.* at 6.

<sup>246</sup>*Id.* at 7–8.

EPA's effluent limitation guidelines, which do not set numerical limitations on pollution for aquaculture facilities, only establish best management practices.<sup>247</sup>

As can be seen, the United States has not been very aggressive in curbing marine pollution from all sources, including growing and novel offshore fish farming industry. International control has also been difficult.<sup>248</sup> Early conventions have failed.<sup>249</sup> A series of treaties have been ratified that target oil spills, but the costs of monitoring and compliance have given way to nations' shipping interests and the ratification of these treaties have been slow.<sup>250</sup> Dumping of wastes is also the subject of a number of treaties, but no treaty absolutely bans it. One treaty, the London Convention, regulates ocean dumping, prohibiting intentional dumping materials on the "black list," while allowing the dumping of less hazardous materials on the "grey list," if permitted by the International Maritime Organization.<sup>251</sup> In 1996, the parties to the London Convention produced the London Protocol, which entered into force in 2006<sup>252</sup> and further restricted intentional ocean dumping by banning it except for materials that are found on a "reverse list."<sup>253</sup> While monumental in its adoption of the "precautionary approach," where "appropriate preventative measures are taken when there is reason to believe that wastes or other matter introduced into the marine environment are likely to cause harm even when there is no conclusive evidence to prove a causal relation between inputs and their effects[.]"<sup>254</sup> the United States' failure to ratify this treaty has been criticized as sending a message of indifference about the global commons.<sup>255</sup> Moreover, critics have pointed to a lack of political leadership, legislative hurdles, insufficient resources, and pressure from regulated industries, as contributing to the weak implementation of the convention.<sup>256</sup>

Thus, as with fisheries regulation discussed earlier in the chapter, while some progress has been made limiting the harmful impacts of marine pollution in the United States and internationally, at least because a framework for its regulation has been established, there is much work that is needed to actually prevent the continued exploitation of the resources.

## 36.7 Conclusion

Since ancient times, our oceans and its fisheries have been conceptualized as resources that are free for all to exploit. From Grotius and Seldenian to the enclosure movement and the Law of the Sea, however, there has been a dramatic change in how our world's oceans and fisheries resources are governed. Spurred by the realization that these resources are not inexhaustible, national, extraterritorial, and international legal management regimes have been erected in the last 70 years to prevent the so-called tragedy of the commons, discussed in the Chap. 34. The Law of the Sea is critical in this development. Its agreement of territorial limits and substantively protective articles has provided the means by which nations can assert the sovereignty necessary to protect the resources closest to their shores. These changes, and the treaty's adoption of the common heritage of mankind principle for the high seas, moved the international governance of the oceans and resources towards the Public Trust Doctrine model, also discussed in Chap. 34, where the resource is governed by a trustee on behalf of all in order to prevent its over-utilization to the detriment of all.

While there have been significant developments in establishing legal regimes for fisheries and ocean-resource management in general, much more work has to be done. The Law of the Sea has a number of shortcomings, including its vague provisions, its lack of a global fisheries organization, its lack of a compulsory EEZ-dispute-settlement mechanism, and, notably, the fact that it does not mandate that nations adequately regulate their own EEZs. Domestic laws have also been ineffective to target overfishing. In the United States, for example, the MSA's shared governance between federal and state authorities and fishermen interests has been the source of division and regulatory stagnation instead of regulatory innovation. ACLs and 10-year rebuilding plans are some of the newest measures that seek to reduce overfishing, but they have been controversial. The MSA's National Standards—the MSA's "constitution"—has been interpreted by courts to maintain conservation as its primary focus, but they have also provided virtually unfettered discretion to fishery managers to cater to fishermen or special interest groups, further stymieing wise policy development. The result of all of these issues is that fisheries remain fully or over-exploited. Marine pollution regulation has also suffered as a result of a lack of comprehensive regulation, notwithstanding strides in regulating some of its sources.

IFQs and aquaculture, explored in detail in this chapter, are relatively recent and controversial attempts to solve the so-called tragedy of the commons. Nonetheless, attempts to implement privatized policies to manage fisheries and oceans cuts contrariwise to work that is needed to better manage fisheries. Supporters of privatization policies often neglect that the oceans are no longer a *res nullius* resource, as discussed in Chap. 34, and national and international management regimes do exist that are built on the premise that fisheries are public resources, to be managed for the benefit of all. Proponents of measures like IFQs and aquaculture overlook these foundations, treating the historical lack of *effective* management or

*mismanagement* of the resources—often a product of a lack of political and the influence of fishing interests—as evidence that fishery management regimes *do not exist* or are broken beyond repair.

Instead of targeting these problems, the turn to privatization and market-based regulation, such as IFQs, weakens existing public management. For example, the premise that aquaculture can prevent overfishing by increasing supply neglects that this will come at the expense of displacing traditional fishermen and granting a private property interest that could spur development beyond the point that it will be effectively regulated. Perhaps, common law doctrines, such the Public Trust Doctrine or nuisance can fill in regulatory gaps, but this shift puts the onus on the public to protect the very resource for which they are supposed to be the beneficiaries. IFQs represent a similar shift, weakening a public system that has made some significant strides in limiting problems such as overfishing, and replacing it with an opaque system whose success is premised on granting a private-property interest in the fisheries for free, thus undermining the government’s ability to control and manage the resource. Consequently, decision-makers should forgo such private regulatory measures and instead look to strengthen existing public management systems.

## Chapter 37

# Industrial Aquaculture: Human Intervention in Natural Law

Alfredo Quarto and Sara Lavenhar

**Abstract** The meteoric growth of both the shrimp and salmon farming industries has had noticeable adverse global environmental and social impacts. Shrimp aquaculture represents a powerful global industry that has an annual retail value of over \$50–60 billion dollars. Meanwhile, vital coastal mangroves are being cleared to make way for expanding shrimp farming. Coastal poor fishing and farming communities are losing their once sustainable food sources as their traditional agriculture and fisheries are being steadily despoiled by the shrimp industry's operations, whose profits concentrate in the hands of wealthy investors. The shrimp produced have never become a food source for those who are truly hungry in the producer nations. The great majority of the farmed shrimp are exported to the wealthier nations. There is an urgent need to counter these market forces that are devastating mangrove forests and ruining the lives and livelihoods for tens of millions of indigenous peoples and traditional community residents who rely on healthy coastal environments for their lives and livelihoods. This chapter will focus mainly on shrimp aquaculture, but will also highlight some important and related aspects of salmon farming. Implications of the environmental, social and legal aspects of modern industrial aquaculture will be explored and the serious repercussions engendered by the present course of open, throughput systems of aquaculture will be presented. The power and effect of consumer choices and more sustainable, ecologically- and socially-friendly, closed-system aquaculture alternatives will be discussed.

### 37.1 Introduction: A Brief Background on the Advance of Aquaculture

Over half the world's human population is concentrated along coastal areas. These important zones also support a vast array of other life dependent upon healthy ocean ecosystems. Yet, today our oceans are beleaguered by over-fishing, pollution, and destruction of coastal resources via unsustainable forms of modern development. Serious declines in wild fish stocks amid increasing world consumer demands for seafood products have combined to present a dilemma on how best to meet these new challenges.

One proposed solution, aquaculture, is often highly lauded today by governments, inter-governmental agencies, world lending institutes, and industry. Many see it as the next logical step towards solving problems of sustainable seafood, and offering a revolution in modern fisheries, the "Blue Revolution." Following on the heels of agriculture's "Green Revolution," modern aquaculture promised to turn the tide on food production from the seas and waterways, delivering into the world's eager hands the key that unlocks the door to "farming the sea."

Aquaculture might be broadly defined as the establishment of man-made enclosures to raise aquatic life forms, such as shellfish, fish, and seaweeds for human consumption purposes. The aquaculture process itself is quite ancient, having appeared in traditional, less-intensive forms at least 2000 years ago in Asia and other parts of the world. The *gei wais* of Hong Kong or the *tambaks* of Indonesia, offer striking examples of traditionally derived forms of aquaculture, which still exist today.

Unfortunately, since the advent of more intensive modern industrial aquaculture, serious environmental and social issues have developed. Millions of indigenous and local coastal peoples are adversely affected, many losing their livelihoods, homes, and cultures to unsustainable aquaculture development. Meanwhile, in the cities and towns of the wealthy consumer nations, where imported seafood products are sold in great volumes, little is known of the great hardships created by these "revolutions" in farming the land and the sea. Few consumers of farm-raised seafood products are aware of the many serious problems caused by the incoming tide of the aquaculture industry, where ruin and riches run simultaneously like two parallel, but opposing sea currents (Fig. 37.1).

Modern industrial shrimp aquaculture is a case in point. In the last 30 years, the rapid and largely uncontrolled expansion of the shrimp aquaculture industry has led to immense environmental and social problems, which have only recently been brought to light. Among the most serious problems is the degradation and loss of natural coastal resources. Unsolved pollution and disease problems still plague the industry, despoiling once fecund waters of nearby estuaries and inshore coastal bays. Formerly rich fishing grounds are also impacted, and vital fish breeding and nursery habitat are being lost to the encroaching shrimp farms.

The construction and operation of industrial shrimp aquaculture is tremendously disruptive to the delicate and complex balance of coastal ecology. Vast stretches of

**Fig. 37.1** Sketch of mangrove-shrimping overlap. This figure illustrates in how many areas of the world mangroves overlap with shrimp aquaculture. The *shaded areas* show where the most overlap occurs

invaluable mangrove forests are cleared to make way for shrimp ponds. Shrimp farms replace these diverse, multiple resource environments with large-scale monoculture operations. Worldwide, over a million hectares of valuable mangrove forests have been destroyed by shrimp farming alone—and this in only the last 2 decades!

Other important coastal habitats, such as mud flats, sea grass beds, and coral reefs have also been degraded or ruined by aquaculture. Once productive farmlands have been left fallow, and important waterways and underground aquifers have been dangerously contaminated. For many the shrimp industry has been aptly labeled a “slash and burn” enterprise, leaving in its wake both pain and loss.

In this chapter, we first give a brief background on the history of aquaculture from ancient times in Asia to modern times, exploring some of the issues afflicting modern, industrial-style aquaculture. We then detail some of the specific issues raised by shrimp and salmon aquaculture, and discuss the effects of shrimp and salmon farming on biodiversity and wild fisheries. In addition to the mentioned ecological problems manifest in the industry, aquaculture also affects essential food production processes. Both agriculture and fisheries are adversely affected. Salinization and pollution of land, waterways and aquifers by the shrimp farms ruins both fisheries and crop production. In later sections, we delve in the failures of current certification plans, which are engendering further reliance on failing systems; as well we explore food security, human rights and labor issues in the producer nations. A spotlight is also shown on a case of weakness of existing laws designed to regulate fishing and aquacultural activities, and suggest possible improvements. And finally, we explore alternatives to present-day industrial aquaculture that are more environmentally and socially responsible, and have much greater potential for being sustainable. Such systems will supplement, but not replace, conscientious management of wild fisheries production.

### ***37.1.1 The Plight of the Mangroves***

For many years, the mangrove forests were seen and actually often officially designated as wastelands, not fit for anything but mosquitoes and smelly swamps. Fortunately, this view of the tidal forests is changing, influenced by recent events and tragedies. Mangrove forests are one of the most productive and biologically diverse wetlands on earth. Growing in the intertidal areas and estuary mouths between land and sea, mangroves provide critical habitat for a diverse marine and terrestrial flora and fauna (Chapman 1976).

Healthy mangrove forests are key to a healthy marine ecology. Yet, these unique coastal tropical forests are among the most threatened habitats in the world. They may be disappearing more quickly than inland tropical rainforests, and so far, with little public notice (Valiela et al. 2001). In many areas of the world, mangrove deforestation is contributing to fisheries declines, degradation of clean water supplies and salinization of coastal soils, erosion, and land subsidence, as well as the release of carbon dioxide into the atmosphere (Pendleton et al. 2012; Alongi 2014).

In fact, mangrove forests fix more carbon dioxide per unit area than phytoplankton in tropical oceans, but when mangroves are cleared this stored carbon is released.

With an estimated original mangrove forest cover of 32 million hectares, mangroves once covered vast stretches of coastlines of tropical and sub-tropical countries. Today, less than 50 % of that mangrove forest area remains. Many factors contribute to mangrove forest loss, including the charcoal and timber industries, tourism, urban growth pressures, and mounting pollution problems (Valiela et al. 2001). However, one of the most significant causes of mangrove forest destruction in the past 3 decades has been the consumer demand for luxury shrimp, or “prawns,” and the corresponding expansion of destructive production methods of export-oriented industrial shrimp aquaculture. Vast tracts of mangrove forests have been cleared to make way for the establishment of coastal shrimp farm facilities (Primavera 1997). The failure of national governments to adequately regulate the shrimp industry, and the headlong rush of multilateral lending agencies to fund aquaculture development without meeting their own stated ecological and social criteria, are other important pieces to this unfortunate puzzle.

### ***37.1.2 The Fight for the Mangroves***

The importance of mangroves has led to a growing number of organizations that are dedicated to mangrove conservation to stand firm in opposition to further expansion of the shrimp aquaculture industry. In Table 37.1, we list a few of those groups whose mission includes conscientious efforts to prevent and reverse the impacts of aquaculture.

**Table 37.1** Organizations dedicated to mangrove conservation

Region	Name	Country
<i>Latin America</i>	The Committee for the Defense and Development of Flora and Fauna of the Gulf of Fonseca (CODDEFFAGOLF)	Honduras
	CCondem	Ecuador
	The Fundación de defensa ecológica (FUNDECOL)	Ecuador
	Redmanglar Internacional	Guatemala
<i>Africa</i>	African Mangrove Network	
<i>Asia</i>	The Coastal Poor Development Action Network (COPDANET)	India
	Nijera Kori	Bangladesh
	Yadfon Foundation	Thailand
	Kiara	Indonesia
<i>Europe</i>	Swedish Society for Nature Conservation	Sweden
	Forest Peoples Project (FPP)	UK
	Environmental Justice Fund (EJF)	UK
	PESCA/ Ecologistas en Accion	Spain
<i>North America</i>	Mangrove Action Project (MAP)	USA
	Food and Water Watch	USA

These are but a few of the organizations that are opposing destructive shrimp farm practices worldwide. One of the chief strategies employed by these groups and others is to help enhance and promote community-based resource conservation and management, which we will discuss later on in this chapter. Many groups fighting for mangroves and other coastal habitats, as well as coastal inhabitants, have engaged in legal action at the regional and national levels in opposition to industrial aquaculture.

## 37.2 The Seeds of the Blue Revolution

Beginning in the 1960s and 1970s, industrial processes were widely introduced into aquaculture to encourage commercial production. Then in the early 1980s, major improvements in hatchery production and feed processing allowed rapid advances in shrimp farming techniques, making it possible to dramatically increase yields (Primavera 2005).

This “Blue Revolution” in aquaculture has in many ways re-traced the steps of the “Green Revolution” in agriculture. The latter contributed to the growth of large-scale export-oriented agribusiness enterprises in developing nations, but it also generated widespread criticism for its environmental and social impacts. The new aquaculture techniques have resulted in an explosive expansion of coastal shrimp aquaculture throughout developing nations in Asia, Africa and Latin America (Baird and Quarto 1994). Over 80 % of worldwide-farmed shrimp is produced in Asia. Approximately two-thirds of it is exported to the United States, Japan and

the EU, with the remainder divided among other foreign and luxury domestic markets (FAO 2010). Today, China is also stepping into the picture, emerging as a high-demand, shrimp-importing nation.

Though trawler-caught shrimp once dominated the world shrimp market, the rate of growth in farmed shrimp production allowed that sector to surpass the wild-caught production around 2006. Farmed shrimp production has truly skyrocketed, rising from just 26,000 metric tons of production in the 1970s to 100,000 metric tons in the early 1980s; by 2003, production reached over 1.6 million metric tons (mmt) (Barbier and Cox 2004). Global farmed shrimp production peaked in 2009 at 3.22 mmt, but has subsequently declined to 2.5 mmt in 2011 due to natural disasters, pollution, and disease (FAO 2012). The industry has recovered somewhat, and production supplies are expected to return to a trend of increase (FAO 2013a, b).

### ***37.2.1 Bankrolling a Bankrupt System***

Shrimp aquaculture has become a global industry that has an annual farm-gate value of over \$12 billion dollars, and an annual retail value of around \$50–60 billion dollars. It has great profit potential for the astute investor and entrepreneur. Spurred on by governments eager for increased export dollars, shrimp aquaculture development has been aided by generous support and incentives from international lending institutes, including the World Bank, the Asian Development Bank, and the Inter-American Development Bank (Lewis et al. 2003).

Throughout the 1980s and 1990s, shrimp farming itself was heavily supported by millions of dollars of World Bank loans, and by FAO research and development programs along the same coastlines where tsunamis had struck:

The World Bank participated actively in the launching of the shrimp industry in Asia. Out of an investment of US\$ 1.685 billion in 1992 for Indian agriculture and fisheries, the World Bank allocated US\$ 425 million for aquaculture development (Mukherjee, 1994) A substantial part of this sum seems to be destined for intensification and expansion of shrimp ponds. The involvement of the World Bank in shrimp aquaculture, and the development of related hatcheries and other shrimp facilities, illustrates of the trends towards internationally organized vertical integration of this industry (Lewis et al. 2003).

This level of support by governmental and inter-governmental agencies led to rapid and uncontrolled expansion of the shrimp aquaculture industry in the developing world. The expansion of shrimp aquaculture impacts many fragile and essential coastal ecosystems, but has especially affected the mangrove forested regions.

Shrimp farming is considered to be the number one cause of mangrove deforestation by many researchers who have documented the rate of mangrove loss, which currently stands at around 1–2 % per year (FAO 2010). According to an eminent researcher, Dr. Jurgenne Primavera formerly of the Aquaculture Department, Southeast Asian Fisheries Development Center (SEAFDEC) in the Philippines:

Culture ponds for fish and shrimp account for the destruction of 20-50 % of mangroves worldwide in recent decades. . . Decimation of mangroves along the Philippine coastline accounts in part for the great losses to life and property inflicted by an average of 20 typhoons and tsunamis each year—around 3,000 deaths in Zamboanga province in 1976, 1,000 in Northern Panay in 1984, and 7,000 in Ormoc and other Leyte towns in 1991. In the Chokoria Sundarbans in Bangladesh, mangroves protected villagers from a 1960 tidal wave, but a similar one caused thousands of deaths in 1991, after the installation of shrimp farms. (Primavera 1997).

Around 3 million hectares of mangroves have been destroyed for shrimp farm development worldwide. The exact extent to which shrimp aquaculture has been responsible for mangrove loss is unclear, but evidence suggests shrimp farming has been a major contributor to global mangrove loss; it has been estimated that as much as 38 % of recent global mangrove loss may have been due to shrimp aquaculture, and that the major reasons for future destruction are unrestricted clearing of forests, overexploitation of fisheries, and aquaculture (Valiela et al. 2001; Alongi 2002). However, restoration and rehabilitation efforts are growing worldwide, revealing a glimmer of hope for mangroves as their value becomes globally and economically recognized.

The global economic figures and the allure of quick investment returns belie the fact that the shrimp aquaculture industry is a young adolescent giant with dramatic growing problems. The spread of deadly infectious viruses has ruined once thriving shrimp aquaculture industries in Taiwan, China, Vietnam, and Ecuador, causing hundreds of millions of dollars' worth of losses (Walker and Mohan 2008). In 2010, a new shrimp disease with far greater deadly consequences emerged—Early Mortality Syndrome (“EMS”), which has had devastating consequences for shrimp industries in China, Thailand, Malaysia, India and more recently Mexico (FAO 2013a, b).

After extensive investigation by a research team led by Donald Lightner at the University of Arizona, the pathogen causing early mortality syndrome (EMS), (technically known as acute hepatopancreatic necrosis syndrome (“AHPNS”)), was identified. The researchers found that a bacterial agent, which is transmitted orally, colonizes the shrimp gastrointestinal tract, producing a toxin that causes tissue destruction and dysfunction of the shrimp digestive organ known as the hepatopancreas, causes EMS. It does not affect humans (Tran et al. 2013).

In response to this devastating new disease spread, several countries have implemented policies that restrict the importation of frozen shrimp or other products from EMS-affected countries. Since EMS was first reported in China in 2009, it has spread to Vietnam, Malaysia and Thailand, as well as Mexico, causing estimated annual losses of more than U.S. \$1 billion. EMS outbreaks usually afflict shrimp ponds within the first 30 days after stocking, while mortality can exceed 70 % (Tran et al. 2013). With the emergence of EMS virus, there has actually been a shortage of shrimp for the export market, leaving many restaurants and retail stores scurrying to find new suppliers, as once quite dependable shipments from major producer nations such as Thailand have been hard hit by the disease outbreak. Meanwhile, some nations, such as India and Ecuador, are looking to greatly expand

their productions to meet the demand left by the EMS affected nations, and taking advantage of the profit opportunities created by the disease plight of their competitor nations. Nevertheless, initiating these kinds of rapid expansions is a big gamble, because the disease EMS can spread rapidly and affect the new producers who may have invested heavily, risking everything in the process. Alternatively, should shrimp production recover from the impacts of EMS, surplus product may cause falling prices and negatively impact developing economies.

Despite these setbacks, the industry remains quite strong, and the market quite alluring, because of continuing demand for imported shrimp in the importing nations. Imported shrimp is not exclusively farmed, and may be derived from wild fisheries as well. In the United States, which contains the largest shrimp import market, shrimp consumption reached 4.2 pounds per capita in 2011 before dropping to 3.8 pounds the following year (NOAA 2012). Japan is the second largest importer of seafood in the world, capturing about 15 % of the market; 17 % of imports are fresh or processed shrimp (Popescu and Ogushi 2013). Domestic production in fisheries has been declining in Japan since 1980, while imports and aquacultural production have been on the rise to meet seafood demands.

This increase in farmed shrimp production has itself contributed disastrously to a decline of wild fisheries in the producer nations, thus creating a serious loss of food security for affected coastal communities in the Global South where food security is already a serious issue. Important factors contributing to local fisheries declines include the selective harvesting process to catch the wild shrimp larvae for stocking the ponds. Over the years, poor coastal villagers have carried out this task using fine mesh nets that catch all types of larval sea life. Those working the near shore waters in Latin America are called “larveros” and in Asia “larva catchers.” They earn around \$3 per day, and many suffer serious health issues from wading in chest deep in seawater for hours at a time.

Ill-managed shrimp farms, constructed without sustainable production in mind, do not tend to last many years. These farms are often constructed with quick profit in mind, and then abandoned when production declines. In Asia and Latin America, the average intensive farm has been found to survive only 3–5 years before serious pollution and disease problems cause early shrimp pond closures (Flaherty and Karnjanakesorn 1995; Dierberg and Kiattisimkul 1996). More recent data and studies on the average lifetime of shrimp ponds and other forms of aquaculture are limited, and this is an area of study that requires further attention. It is also difficult to determine the number of abandoned farms, but unofficial estimates suggest up to 70 % of intensive shrimp farms in Thailand are in disuse for environmental, financial, and political reasons (Stevenson 1997). Overstocking and indiscriminate use of feeds and water additives still are being widely practiced today. In Thailand, where nearly 85 % of the shrimp ponds are intensive systems, over half of the shrimp ponds have closed down in the first decade of Thailand’s entry into the great race for world dominance in the shrimp export market. It is estimated that there are over 400,000 ha of abandoned shrimp farms around the world, (Lewis et al. 2003) and much of this area lies within former mangrove wetlands. In the process, vital coastal wetland habitats have been permanently lost for fish,

mollusks, and crustaceans, as well as numerous birds, migratory species and endangered species.

### ***37.2.2 Precautionary Principle Violations and Consumer Health Risks Mount***

It is a tragic fact that industrial shrimp aquaculture has been practiced on a wide-scale production basis while still really in its research and development phase. It is still attempting to solve very grave and life threatening problems in the field, rather than in a closed test facility where failures will not be so ruinous. Indiscriminate expansion of the shrimp aquaculture industry might be likened to taking unsuspecting passengers on board a still untested proto-type commercial jet on its maiden flight. The reason test pilots are paid their high salaries is because of the uncertain risks they must take in putting their aircraft through its rigorous tests. However, with the rapid spread of shrimp farming, we are all being forced to fly this dangerous mission with great potential for an industry crash endangering all “passengers” and the very planet upon which we live.

Another tragic irony of industrial shrimp aquaculture is that the process requires clean water, yet it has become a source of severe water pollution, oftentimes fouling its own “nest” in its bid for higher shrimp production. As well, this spoiling of coastal waters has potentially serious consequences for human health. Even the shrimp product itself, though widely marketed and in popular demand in consumer nations, is questionable in regards to health risks. The often unrestricted use of chemical inputs, such as antibiotics, pesticides and water additives, when combined with the buildup on the pond bottoms of unused feeds and feces, has led to epidemic shrimp diseases and many early pond closures because of harmful accumulation of toxic effluents (Dierberg and Kiattisimkul 1996; Lewis et al. 2003; Primavera 2006).

Overuse of antibiotics in both shrimp and salmon farming is another reason for great concern, as this could cause the spread of antibiotic resistant bacteria. Antibiotic use in aquaculture is widespread, and unlike in the livestock industry it is required to make up for poor hygienic practices rather than as a growth promoter. The extensive use of antibiotics in industrial aquaculture is too often dismissed or overlooked; an excellent summary of the antibiotics used in aquaculture can be found in Burrige et al. (2010). Antibiotics kill bacteria which naturally exist in our body and play a role in our natural defenses against infection. These bacteria normally live in harmony with our bodies, protecting us from bacteria which we are exposed to and have the ability to cause disease. Once a bacterium develops a new resistance mechanism, it’s only a matter of time before the resistant bacteria spread.

The antibiotics used in aquaculture are the same or closely related to those used in human medical treatment. Scientists have conducted studies to determine

whether antibiotics used for shrimp and salmon production could result in bacterial resistance to these antibiotics in the humans who consume farmed shrimp. Presently, the question remains as to the development of resistant strains of human pathogens, but the risk has been identified as severe (Graslund et al. 2003). Studies have identified increased microbial resistance that may be the result of excessive antibiotic use in salmon aquaculture. Antibiotic use to control non-cholera *Vibrio* infections in shrimp farms may have contributed to cholera outbreaks in Ecuador, and shrimp have been tied to cholera cases in the United States (Blake et al. 1980; Weber et al. 1994). The state of antibiotic use is well-understood, but regulations for their use are highly varied from country to country. Due to escalating public concerns over health risks, Japan has identified over 20 antibiotics used in the farmed shrimp industry and has banned shrimp farmed with these antibiotics. Meanwhile, the United States Food and Drug Administration (“FDA”) only looks for residues of 16 antibiotics compared to 57 in other countries, despite some of these drugs being unapproved for use in the United States. The FDA sampling of imported seafood is also limited and only 0.1 % of all imports was tested in 2009 (GAO 2011). As a result, it is likely that contaminated shrimp passes US inspections because of this serious lack of effective inspections.

Shrimp farming, along with other forms of aquaculture, also poses a real danger of genetic contamination and lowering of biodiversity. Accidental and incidental release of farm raised non-native shrimp or fish can have tremendous repercussions on the native species, which may come in contact with them. Competition for territory, genetic drift, disease spread, and excess demand on available resources are genuine concerns. Unfortunately, the number of escaped salmon is not well-known as escapes often go unreported, but their ecological and genetic impact is well documented (Thorstad 2008). Not much is known about the effect that accidental releases of shrimp are having on native wild species, but further study is urgently needed.

### 37.3 Farming Carnivores: Violating the Laws of the Sea

Rather than reducing the impact of seafood consumption on marine resources as many proponents of shrimp and salmon aquaculture purport, so-called “open-system aquaculture” adds new burdens. If you imagine a trophic pyramid, carnivores are typically at a higher trophic level, but the biomass of that trophic level is smaller than the one below it. By farming carnivorous fish intensively, their biomass increases, and the trophic pyramid is thrown out of balance. Changes at any given trophic level can cascade up and down, affecting primary consumers and top predators alike. Aquaculture supplies 46 % of the world’s supply of food-fish, and is projected to exceed capture fishery production in the next few years; the FAO has cautioned that the growth of the industry is unsustainable, noting that current trends indicate a slight reduction in the annual rate of increase (FAO 2010). Without careful and effective management, the farming of carnivorous seafood will

continue to contribute to widespread ecological impacts and may experience decline. Regardless, it is important to understand the direct and indirect consequences that can arise from unbridled aquacultural development.

Though shrimp farming is a major problem affecting many developing nations, there are many dangerous parallels between the culture of shrimp in countries such as Ecuador or Brazil and the rearing of salmon in Chile and Canada. When visiting Chile in 1994, 2 years after co-founding MAP, co-author Alfredo Quarto witnessed a very similar tragedy unfolding for fishing communities who were dependent upon a healthy world fishery for their livelihoods. A large salmon farm operation had been set up near the estuary around Cochamo Bay in southern Chile, and the fishing community was adversely affected by the salmon farm's operations which polluted the nearby estuary and greatly reduced the wild fishery upon which the local communities were dependent for their livelihoods. Fishermen complained that the salmon farm put them out of work, and the only jobs they could now find were part time with the salmon farm, and these were few, low paid and not very stable. The salmon farm was having disease problems at the time, and as a result many workers on the salmon farm were laid off. Conditions in the area were deteriorating, and local residents were very upset with the situation that befell them.

Similar problems exist in other areas where salmon farms have been placed, but the effect on residents of developing nations are especially deeply felt and more devastating for poorer fishing communities. The following is a short summary of similar problems plaguing both the shrimp and salmon farm industries.

- Use of public waterways for private industry gain, while badly affecting these same waterways, actually degrading such via pollution and aquaculture facilities construction.
- The introductions of non-native species into waters where frequent escapes can cause many problems, affecting biodiversity, spreading diseases, competing for local habitat, nesting sites and food sources. These escapes cannot be halted by present open system aquaculture facilities. The full range of serious consequences is hardly known, and the effects of shrimp and salmon culture cannot presently be fully understood, let alone controlled. Though the real threats to native species from these escapes are not yet understood, these accidental escapes may have disastrous consequences for already threatened wild species.
- Both shrimp and salmon farming utilize carnivorous species that consume large quantities of fish and fish oils. The industry is trying to reduce these protein needs, which effectively remove valuable local sources from the wild seas to feed farm raised species, but it still does not make sense to feed more weight of wild fish to raise less weight of farmed fish whose quality in taste and appearance is so much less than the wild caught fish.
- Our wild fisheries are not helped by either salmon or shrimp aquaculture, as too often the very habitat where wild fish thrive is adversely affected by industrial aquaculture. Nursery and breeding areas may be affected by the high levels of contaminants escaping these open systems which themselves are not sustainable

as they rely on good water quality to sustain themselves, but by their very nature in design pollute their own pure water sources. These so-called throughput systems are not an effective method of long-term, sustainable aquaculture.

By comparison, closed containment, land-based systems purify and recirculate water, deal effectively with effluent, leave no chance for escapes of farmed species into wild waterways, no chance of disease spread from farmed species to native wild species, and allow the farming operations to not interfere with the habitat and wildlife of our seas and other waterways. The aquaculture industry is undergoing changes as awareness of the social and environmental impacts are becoming better studied. For example, research into algae- and vegetable-based feeds as replacement for fishmeal appears promising and wild fish inputs to farmed fish outputs have dropped for some species (Naylor et al. 2009; Bendiksen et al. 2011). Although we focus below on shrimp farming, it is worth remembering that many of these same issues arise from other farm-raised seafood.

### ***37.3.1 Shrimp Farming: Contribution to Habitat Loss, Wild Fisheries Decline, Endangered Species, and Overfishing***

#### **37.3.1.1 Habitat Loss**

Multiple habitat types are impacted by industrial shrimp farming, but arguably the most significant degradation has been to mangrove forests. Since mangroves are nurseries for an immense diversity of sea life, their loss to shrimp farming and other types of unsustainable development spell disaster for our ocean's wild fisheries and biodiversity. This loss is further compounded by the fact that mangroves also filter out upland pollutants and prevent shoreline erosion and sedimentation of sea grasses and coral reefs, thus further protecting these nearby, inter-dependent ecosystems, which themselves play essential roles in supporting healthy marine environments essential for sea life.

This inter-connectedness, or inter-dependency, goes beyond just the mangroves, sea grass beds and coral reefs, but includes the whole array of coastal ecosystems from shore to uplands, and most definitely includes the variety of coastal wetlands, such as the mudflats, salt flats and salt marshes. Dr. Gilberto Cintron of the US Forest Service has described mangrove ecosystems as a dynamic mosaic, whereby seemingly discrete individual elements are actually connected by material flows, and remain stable despite potential changes to the state of a given element. Regardless of the changes, the whole mosaic is still a mangrove ecosystem. This holistic conceptual view constitutes what is called an ecotone—a region of transition between two biological communities. In this view of things, a mangrove forest

is not an isolated, autonomous wetland, but is one part of a living and adaptive ecotone.

As Dr. Cintron goes on to clarify:

Really, the problem is in our need to fragment things. We cannot study an ecosystem broken into components. It cannot be assembled into a whole. I call this the Humpty Dumpty Effect –‘Humpty Dumpty had a great fall. All the king’s horses and all the king’s men couldn’t put Humpty Dumpty together again’. . . This nursery rhyme enfolds a very important management lesson. We cannot manage successful ecosystems or landscapes in a fragmented way. Whereas scientists tend to like tearing things apart to see how they work, it is the manager’s role to do the opposite. Managers must learn to integrate. The problem is that in nature the parts in isolation behave in different ways than when they are part of a whole. So it is not an easy job to go from parts to whole.

One approach is to identify the larger whole and manage it to conserve all of its parts. This is called the First Rule of Tinkering, as defined by Aldo Leopold: “Instead of learning more and more about less and less, we must learn more and more about the whole biotic landscape (Leopold 1953).”

Unfortunately, the mangrove forests are now viewed by many as somehow separate or isolated from their associate wetlands found on the tidal flats—the mud and salt flats, the salinas and salt marshes which are themselves really part of a greater, integrated tidal ecosystem. These are not really separate ecosystems, but are instead variations on a common theme—the tidal wetlands. Where there is now a mangrove forest, in the future there could be a salt marsh or salina, depending on changes in hydrology, sea level, or other factors. So, one must learn to view the entire functioning “whole” before assuming about the nature of its parts. In the case of mangroves, that whole is the tidal wetland that forms at the interface between the non-tidal upland to the lowest parts of the emergent sloping, tidally influenced platform. We call it mangrove but that is because sometimes it has the woody trees we call mangroves. Other times the trees are missing and we call it a mud flat. If the trees are missing but the surface is covered by herbaceous vegetation we call it a salt marsh. If the herbaceous vegetation is missing there will probably be an algal mat that dries out periodically. We then call it salt flat, but it is always the same wetland, capable of adapting to the local environmental conditions (Cintron GM, 2013, Personal communication).

This brings up the question of how we value the goods and services provided by an intact mangrove wetland vs. a shrimp farm. While the immediate profits from shrimp farming may satisfy a few wealthy investors, vast numbers of coastal residents, once dependent on healthy coastal ecosystems for fishing and farming, are being displaced and impoverished. Meanwhile, the greater long-term goods and services provided by healthy coastal wetland ecosystems are being sacrificed for short-term profits via unsustainable shrimp farm ventures. As well as robbing local communities of their traditional livelihoods and food security, the shrimp farms are leaving vast stretches of coast dangerously vulnerable to natural disasters brought on by climate change.

Dangerous sea level rise and more intense and frequent storms resulting from climate change are other factors wreaking havoc on coastal areas suffering from

mangrove loss. Mangroves must no longer be misconstrued as worthless, muddy swamps or wastelands as they have been called in the past by those anxious to clear the forests to replace mangroves with shrimp ponds, tourist hotels and other developments. In an evaluation of estuarine and coastal ecosystems, it was found that coastal protection contributes about 80 % of total value of mangrove ecosystem services (estimated at \$14,000–16,000); the remaining 20 % comes from erosion control, raw materials and food, fishery maintenance, and carbon sequestration (Barbier et al. 2011).

### 37.3.1.2 Wild Fisheries Decline

There can be little doubt that loss of mangrove to industrial shrimp farming has a direct correlation with decline in wild fisheries. Since the rapid and too often unregulated expansion of shrimp aquaculture has been the largest contributor to mangrove losses globally, a halt to further such expansion of the industry is called for if there is serious intent to revive our planet's now faltering wild fisheries. The encroachment of the shrimp farm industry along the coasts of Latin America, Asia and Africa has adversely affected local fisheries and those whose living is made by the sea (Barraclough and Finger-Stich 1997; Primavera 1997; Islam and Haque 2004). Many fishermen must venture further out to sea to find sufficient catch to earn their livelihoods and support their families. Fishers are often forced to take more risks in leaving the safety of the near shore fishing grounds once provided by the now-vanishing mangroves. They also must spend more time on the open waters away from their families, and often their daily catch falls far short of their earlier catches when they could fish near the mangroves.

While the world is grappling with global fisheries declines due to the rate of trawler by-catch and the number of commercial fishing vessels on the sea, the shrimp fry fishery for aquaculture has the highest by-catch rate in the world. Shrimp trawling may have a by-catch of 20 pounds of fish lost for every 1 pound of full grown shrimp caught (Eayrs 2007). Up to 99 % of total collection when capturing wild shrimp larvae may be non-target species, with a global average around 85 % capture of non-target species (Islam et al. 2004; Clucas 1997). Worse, the shrimp larvae by-catch consists mainly of other fish larvae that then never reach the reproductive stage. This contributes to declining wild fisheries, including decreases in wild stock of the very shrimp larvae required by the industry (Naylor et al. 2000). Efforts to decrease by-catch with specialized equipment are becoming more popular, especially in rating and certification systems. The fishmeal industry has also promoted the utilization of by-catch, rather than it being discarded or left to rot. This latter approach has an uncertain outcome and may limit the adoption of by-catch reduction practices (Naylor et al. 2000). Fishmeal production is a lucrative business, as we will discuss in depth later, and reductions in by-catch could mean losses for the industry. As such, shrimp trawlers may have little incentive to reduce by-catch in order to maintain profits. As well, the clearing of the mangrove forests and related degradation of the inter-tidal zones to establish the extensive areas of

shrimp farms is having a deleterious effect on the wild fisheries. Mangroves are the marine nurseries for a myriad of marine life, and their loss is contributing to wild fisheries declines and food insecurity for the coastal poor (Islam and Haque 2004; Primavera 2006).

In Penang, Malaysia, a fishermen's cooperative sat idle because the loss of their mangroves to encroaching shrimp ponds, combined with trawlers and a nearby golf course, had reduced their once lucrative local fishery to near collapse, and they had to buy canned sardines if they now wanted to eat their preferred diet of fish. Countless fishers who once depended on fishing for their livelihoods could no longer make a living and moved to the cities in search of work as low-wage laborers, disrupting both their family and village life. With local fisheries threatened, many fishing communities face impoverishment with the loss of their traditional livelihoods, which have been callously usurped by manmade shrimp ponds where the rush for "pink gold" overrides both reason and law.

### 37.3.1.3 Endangered Species

Industrial shrimp aquaculture expansion has had a profound impact upon biodiversity; affecting marine life, migratory birds, and terrestrial life. Whole migratory flocks and endemic bird populations are being threatened by degradation and loss of vital habitat. A case in point is Brazil, where rapid expansion of the shrimp farm industry has had deleterious effects on the coastal wetlands, as well as the wide array of life these wetlands support. Brazil contains the second largest mangrove area in the world—more than 1 million hectares of mangrove forests are found along Brazil's long and curving coastline. In 2000, the Brazilian government released an ambitious 3-year plan to expand its area of shrimp aquaculture production sixfold—from 5000 to 30,000 ha. That expansion has since significantly surpassed this initial "modest" goal, threatening thousands of hectares of important coastal wetlands once too remote and obscure for most industrial development—areas that were once safe havens for immense assemblages of migratory shorebirds.

The north-central coast of Brazil is the most important wintering area in South America for Roseate Spoonbills, Black-bellied Plovers, Ruddy Turnstones, Whimbrels, and Willets, and is regionally important for Sanderlings, Semipalmated Sandpipers, Short-billed Dowitchers, and Red Knots. In the spring, some Red Knots likely use Brazilian coastlines as their final fueling stopover before departing for Delaware Bay. Because of its importance to migratory shorebird populations, coastlines of the Maranhão have been designated a Western Hemisphere Shorebird Reserve Network site of hemispheric importance—hundreds of thousands of shorebirds use the region each year.

Mounting pressure from environmentalists has forced the shrimp farm industry to pay heed to the negative image their industry evokes because of the rampant mangrove loss it has caused in the past. Unfortunately, the industry has increasingly taken the approach that the salt flats and salt marshes are not valuable coastal wetlands, and in countries such as Ecuador and Brazil, the shrimp farm industry is

rapidly converting these wetlands to shrimp aquaculture ponds with impunity from laws meant to protect the mangrove forest zones. In Ecuador alone, nearly 80 % of the salt flat areas have been lost in the last 20 years. The justification for this, often supported by local “mangrove experts,” is for the “protection of mangroves.” However, this is clearly not the case, for as stated earlier mangroves are interdependent upon these related ecosystems.

Thus the threat from shrimp farm expansion goes beyond the continued loss of mangrove forests, which is quite serious in itself, but is also felt in the related loss of other associate tidal wetlands often targeted for shrimp culture as “safe substitutes” to the mangroves, such as the salt marshes. Nevertheless, these same wetlands are vital feeding grounds and resting places migratory shore birds. If these primary feeding and resting sites are lost to shrimp farms, whole species of migratory birds may be lost as well, and in such rapid fashion that little advance notice would be given in order to take remedial action to avoid such losses.

Although other development pressures, such as urban expansion, oil development and the tourism industry contribute to wetland loss, the burgeoning shrimp aquaculture industry is a major threat to Brazil’s important coastal zones. The rapid, uncontrolled spread of shrimp culture could affect forever a delicate balance of nature that for too long has been taken for granted. That the future integrity of the Atlantic coastal migratory bird flyways may be lost to this unsustainable development is just one example of what is happening around the world in regards to mangrove loss and endangered species.

Other endangered species are being further threatened by shrimp farming, such as the Bengal tiger of the Sundarbans in Bangladesh and India, where massive mangrove clearing has eliminated key tiger habitat. The population of these apex predators has been steadily declining, along with the spotted deer, which is their main prey in the Sundarbans. Sundarbans means “the beautiful forests,” and it surely lives up to its name in both benefits and productivity. Formed within the vast Ganges River Delta, these remote mangrove wetlands are composed of a complex network of meandering river tributaries coursing past innumerable small islands and forested lowlands, which taken together make the Sundarbans a perfect refuge for the tiger’s last stand. The Sundarbans is also the single largest, contiguous mangrove forest in the world, extraordinarily rich in biodiversity and productivity. UNESCO has declared it a world heritage site. The Sundarbans has also been a huge natural safeguard against frequent cyclones, tsunamis, storm surges and other natural disasters (Rahman 2000). In every natural disaster, the Sundarbans has the potential to save the lives of hundreds of thousands of people while continuing to nurture a rich coastal ecosystem. The Sundarbans also vital to help counter climate change by sequestering CO<sub>2</sub> and storing carbon.

#### **37.3.1.4 Overfishing**

It might escape notice for many who study the multitudinous issues wrought by industrial shrimp aquaculture, but this destructive practice also contributes to

overfishing. Though modern aquaculture is lauded as a way to decrease pressures on wild fisheries, for many species it is actually achieving the opposite. We have already shown the harm to marine life caused by coastal wetland loss via conversion to shrimp ponds and supporting industry infrastructure. Nevertheless, there is a tremendous further draw down upon wild fisheries caused by the need to feed these small carnivores fishmeal and fish oils derived by trawlers that comb the sea floor. This highly destructive practice of bottom trawling has a terrible record of damaging ocean bottom habitat and causing massive losses to marine life. Industrial level farming of shrimp and salmon has been compared to raising tigers for popular consumption. The reasons are obvious: all involve the raising of carnivores, which require meat or seafood in their diet. For every one pound of farm raised shrimp, it might take on average 1.5–2 pounds of wild-caught fish and fish oils; for other species this ratio may be even higher (for salmon, it's 1 lb. of salmon raised for 3–5 lbs. fish feed) (Naylor and Goldburg 1998; Naylor et al. 2009).

At one time, shrimp and fishing bottom trawlers threw the non-target species, called “by-catch” or “trash fish,” overboard, most of which died in the trauma of the catch and rough sorting on deck. Sea turtles, dolphins, octopus, starfish, small and large non-target fish species that were caught in the massive dragnets were killed in the non-discriminatory process. This itself was a terrible waste of marine life, contributing greatly to the decline of global wild fisheries. However, with the rising demand for fish feed and oils, trawlers are now seeing great profit in keeping this by-catch for later sale to the fish feed processors on shore where any and all marine life is ground up, pulverized and made into fish pellets and extracted oils for use by the shrimp aquaculture industry to feed its growing business of “farming tigers.”

### **37.4 Global Food Security Issues: Robbing Rich Food from the Poor, Feeding Poor Food to the Rich**

One high profile rationale used by international lending agencies to justify the investments in aquaculture has been its assumed importance as a tool to help augment food needs in developing countries, i.e. to “feed the poor.” Ironically, the shrimp produced from these investments have been channeled mainly to luxury consumers in domestic and international markets, and have not become a serious food source for those who are truly hungry (Barraclough and Finger-Stich 1997; Primavera 1997; Stonich and Bailey 2000). Meanwhile, the coastal poor are being robbed of their once sustainable food sources as their traditional agriculture and fisheries are being steadily despoiled by the very nature of the shrimp aquaculture industry’s operations (Deb 1998). Removing the mangroves, which are the marine nurseries, to emplace shrimp ponds means removing a sustaining wild fishery for the local communities. Removing the mangroves while siting shrimp farms on or near agricultural lands contaminates drinking water and aquifers with salt water

intrusion and pond chemicals, thus ruining the ability to raise crops or farm animals (Primavera 2006).

In some villages, drinking water has to be hauled in by truck (or by foot) from many miles away because local wells are salinated by intruding seawaters that formerly were held back by the mangrove buffers (Dierberg and Kiattisimkul 1996). In some areas severe rice production losses have caused local agricultural economies to begin importation of what was once the region's staple food crop! It is the artificially created popular demand for cheap, farmed shrimp that has driven the industry in the Global South to so recklessly expand. The United States alone imports over a billion pounds of shrimp annually. However, this immense appetite for cheap shrimp in the wealthy importing nations comes at a very high price for the coastal communities in the producer nations.

Once known as the Rice Bowl of the region, Nellore has become an industrial belt of aqua-factories, the land dug up and salinated for shrimp ponds. What was once lush and green, is now a concrete coast with sludge-filled reservoirs, canals for water supply, and huge jetties resembling highways that go right into the sea. ...high-security barbed wire fences and gates erected to protect the fortunes of the investors, who live in the comfort of the city. Meanwhile, the area is out of bounds for the coastal people who lived here for generations, kept their fishing boats along the coast, and fetched firewood and fruits from the mangrove forest. (Ahmed 1997).

And all of this to produce a luxury food aimed at an export market in the wealthier nations. Khushi Kabir of the NGO Nijera Kori in Bangladesh sums up well the terrible irony that is the shrimp aquaculture industry today:

Producing luxury food in huge quantities, at the expense of our coastal poor, and making it affordable to overseas consumers — that doesn't make sense. Our priority is to produce food for our own people. (Ibid, p. 16)

To offer further insight into the grave issues raised by industrial shrimp aquaculture, a closer look at the problems engendered by the industry in Vietnam might help. In Vietnam's Ca Mau region in the late 1990s a terrible disease wiped out the industry that itself had wiped out the region's mangroves, wild fisheries and farm lands. Professor Hong, a renowned mangrove ecologist who had helped organize the planting of over 100,000 ha of mangroves after the US/Vietnam War, related how sad he was that the shrimp industry in Vietnam had so quickly destroyed an equal acreage of mangroves he had helped restore, and at that time of that shrimp epidemic he said that people were again facing hunger in the Ca Mau region because of this industry's sudden loss to disease (Rosenberry 2006).

A decade later, the same region was again hit by a disease epidemic of its farmed shrimp. Because shrimp farming is up to three or four times more profitable than rice farming, the industry has exploded in the Ca Mau District. The Aquaculture Development Programme for 1999–2010, Government Resolution No. 09 in 2001, and Decision 173 particularly promoted the conversion of rice to aquaculture (Lan 2011). Revenues in this area of Vietnam increased from 12 to 24 % between 2000 and 2005, dominating the local economy. Such profits may have predicted a rosy economic future for Ca Mau, but this shrimp boom could not last. Too soon, the

boom became the classical bust, and the losses were terrible and irrevocable. The conversion of 60,000 ha of rice paddies and orchards to shrimp farms required farmers to break seawalls to allow for an influx of saltwater for the shrimp. As a result, rice paddy irrigation systems, based solely on freshwater, were destroyed; the salinization of coastal lands means agricultural production of rice will not be possible without costly interventions (Lan 2013). Shrimp farming has been recognized by local authorities in Ca Mau as unsustainable, but production continues.

In the face of hunger and degradation one must ask the FAO, World Bank, World Wildlife Fund (WWF) and other promoters of the shrimp aquaculture industry how they can continually advocate for the production and export of farmed shrimp from the poorer nations in the Global South to the more wealthy developed nations, and do so in the name of “food security.” The consumers of farmed shrimp in wealthy nations do not usually require the additional protein source to supplement domestically produced food, and importing nations avoid the direct social and environmental drawbacks. Conversely, the entire production and export process in the Global South is clearly unsustainable, ecologically and socially unfriendly, and actually an infamous progenitor of food insecurity in the producer nations. The dichotomy is clear, and yet industrial shrimp production continues.

### ***37.4.1 Human Rights Abuses Amid Loss of Resource Tenure Rights and Traditional Livelihoods***

Any benefits from the accelerating expansion of the shrimp aquaculture industry in Asia, Latin America and Africa have come at a terrible price for countless local coastal communities and Indigenous Peoples whose surrounding environment, native cultures and traditional livelihoods have been adversely affected or ruined. The rapid clearing of vast tracts of mangrove forests has turned multiple-livelihood, multi-purpose natural resource systems into single sources of income and monoculture with no chance of sustainability. Many shrimp farms may last only 3–5 years before being closed down because of disease or pollution problems, often-times leaving behind wastelands where once productively rich wetlands stood (Barbier and Cox 2002).

The fishmeal industry that’s sprung up in Peru and Chile to satisfy the voracious appetite for farmed seafood in the wealthier nations has raised a whole other set of issues involving food security. As mentioned above, intensified shrimp farming requires the addition of fishmeal to satisfy the growing needs of such densely packed stocks. Fishmeal is produced by cooking, drying and milling raw fish and trimmings, with the byproduct of fish oil. The massive demand from the aquaculture industry, for shrimp and other farmed fish, now fuels a \$2.5 billion sector producing approximately 6 million tons of fishmeal and 1 million tons of fish oil annually. Advocates and activists in Peru and Chile claim that the fishmeal industry is rife with its own set of environmental and social costs, including pollution and

overfishing. As aquaculture expands the demand for fishmeal rises, and so impacts from fishmeal and fish oil production also increases. It is perhaps unsurprising that the industry that feeds aquaculture is just as unsustainable, as the high demand for fishmeal and farmed fish alike drive each sector in a feedback loop with no clear end in sight.

### ***37.4.2 Human Rights and Labor Abuses***

It seems human rights abuses, including violence, child labor and human trafficking are common within the shrimp aquaculture industry in Asia. Over the years from the early industry expansions till today, along the coasts of Asia and Latin America, there have been numerous reports of threats and violence perpetrated by shrimp farm owners against the local community members who have protested against the rapid and destructive advance of the industry. Beatings, disappearances, rapes and even murders have been attributed to the shrimp aquaculture industry in producer nations like Thailand, Indonesia, India, Bangladesh, Malaysia, Honduras, Ecuador and Brazil.

Human rights abuses also permeate the labor force within the shrimp processing and feed industries themselves. For instance, in both Bangladesh and Thailand, a recent study by the American Center for International Labor Solidarity found major worker abuses occurring in the shrimp processing plants where armed guards watched over shrimp processing workers from guard watchtowers built as part of a barbed wire enclosure housing the shrimp processing facility, where many illegal immigrants from Burma and Cambodia worked long hours with little pay amid beatings and threats of violence if they complained or tried to leave. Often passports were taken away from the non-Thai workers so they could not then leave the country (Solidarity Center 2008).

As well, this human rights problem permeates the fish feed industry. Migrants working onboard Thai fishing boats suffer brutal exploitation. And the boats involved supply so-called ‘trash fish’ for use in feed given to farmed prawns and salmon exported globally. After the destruction of Typhoon Gay in 1989, combined with declining profits and rising education levels, Thai workers have been less willing to engage in the fishing industry. An industry that was once exclusively manned by Thai fishing crews is now primarily made up of Burmese and Cambodian migrants, most of whom are undocumented, but some come from as far as Malaysia, Vietnam, and Timor-Leste. The demands for labor remain high, however, and the shortage of workers has led to brutal exploitations, including human trafficking. Some fishers are outright kidnapped, but most voluntarily migrate in search of an escape from poverty (International Labour Organization 2013). A common pattern revealed from a recent investigation by the International Organization for Migration (“IOM”) is as follows:

- A broker or agent will promise of work (not necessarily in the fishing industry) with decent pay to young men
- The costs of travel are prohibitive, so the worker agrees to pay the broker out of future wages
- The workers arrive at their destination, often without proper documentation and unable to speak Thai, and usually accept whatever is offered to them for work to avoid violence or arrest by Thai authorities

About 10–20% of fishers reported experiencing “worse” or “much worse” conditions of wages, working hours, job function, and living conditions than they were told during recruitment. Ill-treatment, human trafficking, and forced labor are not uncommon, and this is in great part due to lax legal enforcements, especially around migrant workers. There are three main pieces of legislation that are important in regards to working in the fishing sector.

The first is The Labour Protection Act (“LPA”), enacted in 1998, which provides the basis for minimum wage, maximum working hours, and occupational health and safety. The law enables the Department of Labour Protection in Thailand to conduct inspections and impose penalties for violators. This law protects both documented and undocumented workers, but those working in the fishing industry are exempt (International Labour Organization 2013). The Ministerial Regulation No. 10 in particular places fisheries workers outside the protection of the LPA, and completely exempts boats with fewer than 20 employees or boats that spend a majority of their time operating outside of Thai waters. The Ministerial Regulation also stipulates that crew lists and payment of wages must be maintained, including a signed acknowledgement by the employee that wages are received. Workers are also supposed to be granted 30 days of sick leave and 30 days of paid holiday per year, and employment of children under the age of 15 is prohibited (unless the child’s guardian works on the same boat or provides written consent). With the exception of the working age, few of these measures are effectively applied or enforced (International Organization for Migration 2011; International Labour Organization 2013). Reprehensible labor conditions on fishing boats are numerous, but often not reported for lack of easy scrutiny by third party observers who themselves have little institutional support or interest in enforcing the laws.

The second piece of legislation is The Recruitment and Job-Seekers Protection Act. This law was enacted in 1985, before the influx of migrant workers rose sharply to fill the gap in available labor, and is more focused on sending Thai workers to foreign nations for work. The Act lacks any specific protections for migrant workers entering Thailand, no regulation of brokers and other recruiting agencies, and no institutional mandate to protect incoming workers (International Labour Organization 2013). This shortfall in the Act is especially important in light of the patterns of abuse that arise specifically from the recruitment process of migrant workers.

The third law relates to human trafficking. The Anti-Trafficking in Persons Act was passed relatively recently, in 2008, and makes human trafficking a criminal act. The Act imposes severe penalties for trafficking, and expands Thailand’s previous

legal definition to include forced labor. This Act does cover the fishing industry, but enforcement has had mixed results. Corruption remains high among law enforcement officials, institutional support is limited, and few cases have been tried successfully. The legal process is slow and arduous, and many victims are discouraged from reporting and pursuing recompense for abuse.

## **37.5 Certification Schemes and Associated Laws/Policies**

In recent years, there has been rising interest in certification, or ecolabeling, for food products of all varieties. Examples of certification schemes or systems that readers might be familiar with are Fair Trade, Certified Humane, and Rainforest Alliance. Certification standards for both wild and farmed seafood have emerged, both through private labels and sponsored by organizations like the World Wildlife Fund and Monterey Bay Aquarium (Vandergeest and Unno 2012). The demand for this kind of labeling arises largely from consumer concerns in the United States and the European Union over the environmental impact of the food they choose to eat, while coverage is lacking in most of Asia (Jonell et al. 2013). In this era of globalization, it is more and more difficult to determine where your food comes from and how it is produced; certification is offered as a way to answer some of these questions.

While it is a reasonable and important pursuit to develop criteria or guidelines to more effectively regulate industrial aquaculture, it is imperative that in our zeal to come up with solutions that we do not lose sight of the more complex social and environmental issues. While some of the concepts aiming to establish certain limited guidelines for better practices are commendable, certification is currently not comprehensive enough to justify further expansion of the aquaculture industry. Present schemes of certification of shrimp and other seafood are inadequate in many areas and potentially harmful to the cause of sustainability. Meanwhile, further studies of overall benefit and loss—particularly, who benefits and who loses—need to be undertaken, and further involvement and influence of indigenous and local communities must more assuredly permeate the makeup of such investigations.

### ***37.5.1 Impressive on Paper, Inadequate in Practice***

In reviewing numerous shrimp certification programs, it is possible the certifiers have the consumer's "best interest" in mind as they purport in their standards. However, one might justifiably ask, why are we so one-sidedly concerned about the expectations of the consumers? What about the expectations of the indigenous and local communities in the producer nations that are affected by these same shrimp or

other aquaculture operations? And what of the local community members, who have no real, life-defining experience in shrimp farming, yet do have an immense stake in what happens to their surrounding coastal environment and its shared resources? Many developing countries lack the institutional resources to allow for a citizen voice against aquacultural production, or to promote sustainable production (Bush et al. 2013). This is complicated by land tenure issues, direct contradictions, and confusion between the standards set out by third-party, foreign certification schemes and the law of the land.

Certification guidelines often lay out a series of “best practices,” but these best practices in one location may not serve well in another, and these depend as well on the numbers and proximity of producers. For instance, many certification standards emphasize environmental conservation and require that mangrove areas exceed 50 % of total farm area, even in areas where ponds have existed for 200–300 years and are not contributing to the more recent rise of mangrove deforestation (Hatanaka 2010). However, certification schemes are most often on a farm-by-farm basis and do not consider collective impact or compliance (Ha et al. 2012). This approach also defies the mosaic model of coastal wetlands, and many local farmers have opted out of certification because the standards do not reflect the realities on the ground. Certification for shrimp aquaculture is often cited as an effective way of drawing the line against “bad practices,” such as mangrove clearing and misuse of chemicals in the shrimp ponds (Stonich and Bailey 2000). Nevertheless, certifications are designed for consumers in high-income countries, rather than those in production areas.

In considering the value of any given seafood certification label, it is worth examining whether the standards include or exclude the local communities and stakeholders most dependent upon the resources captured in aquaculture. A farmer complaint often heard by researchers is that the companies developing these certification schemes are basing them on a Western worldview, and that the producers have little or no input into the standards that are developed (Hatanaka 2010). The incentive for farmers to comply with standards is limited when they feel excluded from the process. Studies have also shown that community and local government regulation are more effective environmental regulatory networks than certification by transnational eco-labeling (Datta et al. 2012).

As well, too often in the producing countries, the laws are not adhered to in a dependable fashion, and enforcement is seriously lacking or biased in favor of “influential persons.” This in itself gives little incentive to obeying the laws, just knowing how easily they can be broken. This is an internal problem involving governing infrastructure that will not be easily remedied by a simple code of conduct or best practice incentive. Shrimp farms that were constructed by illicit means, often associated with eviction of hundreds or thousands of people by violence and intimidation, may still be certified despite these injustices. Governments in support of shrimp farming sometimes turn a blind eye to companies illegally acquiring land, or in some cases even perpetrate the intrusion of shrimp ponds through the use of police or military action. Certification of the resulting

ponds lends legitimacy to their presence and does not address the underlying socio-political problems or the disregard for domestic laws.

Governments in shrimp-producing nations often do not recognize the land title or tenure rights of indigenous and/or local communities, even though these said communities may have occupied those same waters and lands for many decades or centuries. In many cases, the expansion of the shrimp aquaculture industry follows the typical pattern of transformation of a commons, which includes the mangroves and other community resources into privately owned/operated lands, which in practice nearly always benefit the few and the rich rather than the many and the poor. In Mexico, for example, the Federation of Fishing Cooperatives of Southern Sinaloa presented a case against the construction of shrimp farms which would prevent seven of the cooperatives from fishing in areas granted to them; all complaints were ignored (Cruz-Torres 2000). There are many similar incidents in countries such as Colombia, Honduras, Ecuador, India, Vietnam, and Tanzania.

Remediation is another carrot offered by the eager certifiers, mimicking offset of traditional terrestrial forestry whereby new trees are planted for each that is cut down. Remediation ostensibly aims to set up mangrove tree plantations on mudflats or elsewhere to compensate for ecosystem loss due to shrimp farming. However, remediation invariably loses the original ecosystem value and doesn't reestablish the complex biodiversity that is being sacrificed. A healthy, functioning ecosystem, along with all of its robust productivity and functionality, cannot be simply planted elsewhere. Too often, valuable mangrove ecosystems are destroyed and a poor substitute is set up in their place. Most certification schemes do not include an audit to determine if replanting was successful (Jonell et al. 2013). These remediation schemes often fail miserably because they lack needed sensitivity and cognizance of the true ecology and inherent value of those ecosystems being remediated. Planting a new stand of mangrove or coastal wetland seedlings is no guarantee that it will grow and thrive to become a functioning ecosystem, although mass mangrove plantings are popular with authorities and celebrities touting such events as effective and significant rehabilitation methods for lost forest area.

Many remediation sites are also inappropriate for mangroves and other coastal wetland species. The reality remains that there is no other viable place to put in a new mangrove system. Mangrove systems, opportunistic and colonizing, already occupy the entire potential mangrove habitat. No mangrove remediation projects can recreate the habitat conditions required by mangroves, and usually an attempt to do so results in converting (and destroying) one valuable type of ecosystem, such as a salt marsh or mud flat, into a mangrove forest. The usual approach to restoration—hand planting—never really succeeds in recreating a viable, healthy mangrove ecosystem. In the Philippines, for example, most remediation efforts plant *Rhizophora* species, which has economic value as a forestry product, rather than the natural colonizers; mangroves are typically planted in tidal zones that are unsuitable habitats. The ideal locations are typically occupied by the brackish fishponds which demanded the mangrove relocation or remediation in the first place.

### 37.5.2 *Aquaculture Certifiers*

There are several third-party aquaculture certifiers currently in operation, including Naturland (organic certification), the Aquaculture Certification Council (which certifies the Global Aquaculture Alliance Best Aquaculture Practices), and the newly-established Aquaculture Stewardship Council (developed by the World Wildlife Fund). Other well-known certifiers are the International Food Standard (IFS) and GlobalGAP in Europe. The Aquaculture Certification Council (ACC) and the Aquaculture Stewardship Council (ASC) have both come under a great deal of criticism for ignoring local input and realities of human rights violation, displacement, and environmental degradation. On close review of the bulk of the World Wildlife Fund (WWF)/Aquaculture Stewardship Council (ASC) shrimp standards, there exist technical fixes for the on-site pond operations, but the social and environmental problems associated with industrial seafood farming are not eliminated even with these technical remedies set in place. The ASC standards represent the “best management practices” (BMP) side of the argument in favor of increasingly technological and intensive aquacultural systems (Stonich and Bailey 2000). What is put in place on paper is not so easy to accomplish in practice, especially when state actors regard transnational eco-certifiers with a great deal of suspicion (Vandergeest and Unno 2012).

Ensuring that these listed technical criteria are adhered to is not an easy matter, given the complexity and immensity of scale of these operations. Methods to ensure adherence to certification, such as auditing, are especially problematic as they do not yet seem able to guarantee validity and reliability (Albersmeier et al. 2009). Some certification schemes, such as Naturland, are also run using an Internal Control System (ICS), whereby a single local individual is responsible for corraling up to 100 others. Rather than directly investigating most of the farms, third-party certifiers instead audit the paperwork collected by that single representative; typically less than 10% of farms are actually inspected by the certifiers (Ha et al. 2012). Studies have shown that ICS and similar systems allow for a significant level of fraud and adequate data collection for certain certification has been dismissed as unimportant even by Seafood Watch (Hatanaka 2010).

With or without certification, production of farmed shrimp continues to rise in volume each year to meet an artificially created demand for shrimp products in the wealthy consumer nations. There, shrimp is a luxury commodity, which recently made it to the top of the consumer hit record charts. This 2-decade surge in shrimp consumption in the high-income nations means that something is inherently off balance in the producer nations. Certifiers allay fears of consumers concerned about the environmental impact of farmed seafood, but few individuals actually understand the technical details of each certification scheme; this confusion is exacerbated by standards that are themselves ambiguous. Advocates of political ecology argue that certification will simply maintain the status quo of high consumption demand in the importing nations, while not addressing the overconsumption issues there nor the ongoing social and environmental issues in the producer nations

(Stonich and Bailey 2000). For instance, 90 % of shrimp sold in the U.S. comes from Asia and Latin America, where environmental regulations are lax and often not enforced.

The stated aim of WWF/ASC's standard setting process is to move industrial-style shrimp farming towards a more sustainable production system. This statement sounds good on paper, but is less simple to achieve in practice. How can such a resource dependent operation done on such a massive and growing scale be contained so as not to adversely impact the natural resource base upon which it depends for its continuing operations? This is a question that must be seriously considered as the industry moves forward. Meanwhile, this industry competes for the same resource base that the local populace ultimately depends upon for sustenance and traditional culture. The WWF is known worldwide, and is a well-respected organization. As with many such organizations, it is often assumed by the general public that their stated goals are the "right" direction. It is important to recognize that just because an organization is famous and its mission is admirable that its actions may reflect inertia in the system, maintaining status quo despite best intentions. It is the responsibility of concerned and educated global citizens to challenge these large institutions where needed and appropriate in order to promote a just and sustainable future.

One such researcher, Dr. Peter Vandergeest, labels this new move to certify shrimp as "the Ecocertification Empire," driven mainly by the interests of corporate buyers and environmental groups in Europe and North America. He highlights the fact that ecocertification is limited to species that are exported in great quantities to these regions in the Northern Hemisphere. In contrast, carp, which are the single most important aquaculture species for consumption in Asia, are entirely missing from the ASC dialogues presented by the WWF (Vandergeest and Unno 2012). The omission of species commercially important to the Global South from aquaculture dialogues reveals a serious flaw in certification as a means to achieve sustainability.

Certification covers very little of the seafood produced in aquaculture. Only around 4.2 % of production is certified in some way, and the majority is covered by GlobalGAP (Jonell et al. 2013). Full of loopholes, controversy, and sometimes trapped in a Westernized viewpoint, certification does not appear to be the most efficient method of achieving sustainable aquaculture. In contrast, engaging in community-based natural resource management that promotes stakeholder stewardship appears to be a more successful model (Vandergeest 2007). Although certification may help consumers make better choices about what they eat and the food system they engage in, progress has been slow and limited. Rather than attempting to impose standards and policies from the outside, promoting sustainable forms of aquaculture and environmental regulation may be better achieved by engaging with those it directly affects. Partnerships, rather than prescriptions, are an important piece of the puzzle that is a sustainable global food system.

### 37.5.3 Case Study: Aquaculture in Guatemala

Certification depends upon the certified producers following the laws of the producer nations that are meant to protect mangroves and other coastal resources. However, these laws too often are not enforced because there is little will or infrastructure to enforce them. Consequently, mangroves are cleared with growing impunity, as paper laws on the books do little to really protect them. Certified aquaculture represents a very small portion of the industry, but regulations to address aquacultural production are more widespread. Unfortunately, when countries begin to invest resources in aquaculture at the industrial scale, there are often growing pains when it comes to legislation and institutional support. The intentions for improvements in regulation and management are quite often genuine, but implementation is extremely complicated. As a result, there is often little visible change despite a law being on the books. Here, we provide a summary of a case study analyzing and comparing Guatemalan laws of aquaculture to international laws, providing a brief background of laws and policies, as well as suggestions for improvement. *The following is a summary adapted from Velascos (2009).*

**Country:** Guatemala.

**Aquacultural activities:** Marine shrimp farming (important for export), tilapia farming (important for internal consumption).

**Relevant legislation:** The *Ley General de Pesca y Acuicultura*, LGPA (Fishery and Aquaculture General Law) and its bylaw the *Reglamento de la Ley General de Pesca y Acuicultura*, RLGPA (Regulation of the Fishery and Aquaculture General Law). The law has been in place since 2002, and the regulation in force since 2005; prior to this time, Guatemala had no adequate laws and policies to govern aquaculture.

**Background of aquacultural production:** Aquaculture has been growing in Guatemala since 1950 largely due to increasing numbers of small tilapia farms. Tilapia are crucial to food security in Guatemala, and have remained important for rural income as prices for other agricultural products have dropped. Only recently has marine shrimp farming begun to expand. The growth of shrimp farming has been slow, but the FAO still expects greater future productivity based on increasing exports and a tendency for the industry to escalate quickly. Marine shrimp farming is essentially unlegislated at this time, creating serious complications for managing Guatemalan waters.

**Current state of aquacultural law:** The LGPA was developed when various fisheries and aquaculture stakeholders met and discussed the proposed law with MAGA (Guatemala's Ministry of Agriculture) and UNIPESCA (a MAGA agency). The LGPA is part of a larger effort in Guatemala to promote social and economic development and was a recognition that marine resources are part of the nation's wealth. Its primary purpose is to regulate fishing and aquaculture according to leading scientific principles in order to optimize the use of marine resources. The law was an enormous improvement over previous legislation. Some of these improvements are listed below:

- A glossary of scientific and technical terms;
- Categories and classifications of authorized fishing activities within Guatemala's jurisdiction;
- Defines concessions based on above classifications and categorization;
- Establishes bans, prohibitions, and sanctions; and
- Orders the creation of the National Registrar for Fishery and Aquaculture

The RGPA followed in 2005, despite the LGPA requiring it be created within 120 days of the 2002 publication. This bylaw or regulation contains details pertaining to fishery and aquaculture activities, such as:

- How to obtain concessions (divided into licenses and permits by activity);
- The equipment and methods allowed to ensure sustainable development;
- Defining areas where fishing activity is allowed in Guatemala; and
- Details of UNIPESCA's management

Although the letter of the law is much improved, the Guatemalan government has had trouble implementing the legislation. One of the greatest obstacles has been financial; for example, the National Registrar is barely functional for lack of staff and funding. Records of registration for boats, licenses, and permits are also woefully lacking. With some recent assistance from Spain, UNIPESCA began to issue identification cards to inshore fisherman as part of a census effort. After being registered in this census, many fishers requested formal permits. The identification cards demonstrated the importance of registering for permits without imposing burdens on the fishers. Such a solution may be useful in other countries where registration is hindered by limited institutional resources.

Crucially, aquaculture is not regulated in inland waters under either the LGPA or the RGPA. This is a serious omission because it means that farmers are not supported or protected by the government, but neither are they prevented from causing damage to the surrounding environment. The Guatemalan aquaculture industry has a unique opportunity to engage with UNIPESCA to develop regulation for sustainable development, according to the agency's mandate, but without enough institutional and financial support the industry may follow in the destructive footsteps of its Asian cousins.

**Recommendations:** Aquaculture is clearly an important resource in Guatemala, and the overall objective of the LGPA is to promote efficient use of fisheries while also maintaining them into the future. In order to realize this admirable goal, there are opportunities for further improvement in both the LGPA and the RGPA:

- Review and expand the glossary to cover gaps and explain confusing concepts that are poorly explained in the body of the law itself
- Include specific instructions for creating, revoking, and modifying fisheries and aquacultural management plans
- Allowing the use of management plans as ways to expand regulations for activities not currently managed under the law
- Clarify how regulations may be developed and implemented in order to enforce the law

- Expand and clarify how licenses and permits may be obtained
- Permit the addition of new prohibitions in the body of the law, such as illegal fishing gear or activities
- Provide protections for officials against abuse and ill-treatment
- Impose penalties for environmental destruction from aquacultural activity
- Define the power, duties, and eligibility requirements of officers, such as inspectors, in order to legitimize their activity
- Incorporate specific rules and regulations for the permitting and licensing of aquaculture
- Defining environmental regulations in accord with the latest scientific research.

These are only some of the improvements that the Guatemalan government might consider. However, it is important to keep in mind that UNIPESCA and Guatemala in general struggle to provide adequate institutional and financial support to implement the existing LGPA.

**Conclusions:** Laws are not always enough to ensure visions of sustainable development and sustainable aquaculture. Limited compliance with existing legislation may not be a conscious act of ill-will, but of ignorance or of limitation. It is important when examining these laws, policies, and certifications that we consider a holistic viewpoint. In concert with analyzing the legislation itself, we must also consider the social, economic, environmental, and political conditions where that legislation exists. Guatemala's aquaculture industry is a fine example of a socio-economic system, much like the ecotone of the mangroves, where there is significant intersection of human and environmental activity. There is no single solution to long term problems like sustainable aquaculture, although laws are certainly a critical part of addressing such a wicked problem, and Guatemalan officials are eager to embrace such solutions. Legislation of fisheries and aquaculture must keep in mind these complex realities in order to remain effective.

## 37.6 Conclusion: The Need to Redefine the Blue Revolution

The Blue Revolution, which praises industrial level aquaculture as a way to feed the world, has proven to be as flawed as its agricultural namesake, the Green Revolution. However, lessons may be learned from struggles and failures as well as the regions of success that aquaculture has achieved. Certification currently has its limits, and should not be considered the be-all and end-all of achieving sustainability in aquaculture. Studies have also demonstrated that aquacultural production of smaller seafood species may in fact be beneficial to the poor, but fish farming is rarely practiced in areas where it is most needed. A redefinition of the goals of the Blue Revolution is needed to address the challenges that have arisen from aquacultural production.

Perhaps closed containment, Recirculating Aquaculture System (RAS) is the "wave of the future" for attaining sustainable aquaculture, where no disease spread

or escapes of these cultured species to the wild is possible, and production ponds or tank waters are cleaned and recirculated within the system itself. Closed containment systems can also be located outside the intertidal zones, which is vital in regard to protecting the coastal wetlands. Such closed-containment systems can also be integrated into aquaponics, allowing for the production of vegetables and herbs. This is not characteristic of the bulk of the industry today. One day these closed systems may replace the antiquated open systems. This is the industry's current challenge, but it will require a massive renovation of infrastructure for an already well-entrenched, unsustainable, "open system" industry, which existing certification programs, including the WWF/ASC scheme, still encourage and endorse.

Another noteworthy approach to present day aquaculture is to encourage more sustainable and less environmentally damaging forms of aquaculture that can be practiced to help the coastal communities supplement their incomes via small-scale, community-based aquaculture. One example is promoting a fish farmer field school as a bottom up approach intended to improve aquaculture practices. Rather than focusing on technical improvements, the fish farmer field school focuses on developing critical thinking skills and experimentation by the fish farmers themselves, attempting to democratize aquaculture, while also allowing aquaculture to provide a supplemental income. Aquaculture should supplement, not replace traditional fishing livelihoods.

Still we need to get beyond the consumer-and-producer-sidedness of the equation, to a more representative equation that gives more import to the values of indigenous and local communities, as well as a realistic view of what constitutes a healthy, biodiverse environment worthy of conservation. Although voluntary certification schemes with the best intentions can reward companies that meet its standards by giving them a "green seal" of approval, certification can do nothing to prevent the worst companies from continuing their destructive operations. Affecting consumer awareness to lower consumer demand can make a difference however.

Some possible goals for advocates, consumers, and legislators alike are:

- Raise public awareness of the environmental, social and health consequences of imported farmed shrimp and how that relates to growing demand for this product;
- Influence shrimp purchasing policies of institutional buyers, such as grocery stores, seafood markets, and restaurants, by providing guidance in sourcing environmentally and socially responsible shrimp;
- Contribute to the body of information on sustainable shrimp alternatives and further disseminate information on sustainable seafood programs and responsible consumer choices.

Even a relatively small-scale reduction in demand, of say 10% or more, can have a decisive effect upon the rate of increase in farm area expansion. The majority of those buying, selling and consuming shrimp are not aware of the adverse ecological and social consequences of their demand. By initiating a combined

consumer/markets campaign there is more certainty to affect the production side. Since the great majority of shrimp consumption occurs in restaurants, it also makes sense to target restaurateurs and chefs to reduce the import demand for warm water shrimp, thus affecting the market in a most sensitive “pocket.”

It is important that aquacultural development does not eliminate or lessen the utility of long-term traditional livelihoods for coastal communities. Traditional communities may be “dollar poor,” but culturally “wise and rich.” Their livelihoods are often based upon a self-sufficient, small-scale, local economy that may not produce export dollars, but does produce a culture, traditions and skills that can be passed on from one generation to the next. This should not be endangered by new industries such as shrimp aquaculture that promise jobs that are inevitably low paid, unskilled and short-lived, while socially and environmentally bankrupt. Aquaculture may yet become a valuable, sustainable resource, but practitioners and researchers must be ever striving for better and wiser solutions to the problems we face in the global food system. There will never be just one solution, and even as we address one problem with aquaculture, another will arise. Being aware of the contexts and communities involved in the problems we face is critical to developing effective policies, especially when grappling with something as complex as the global food system.

# Chapter 38

## TEXTBOX: Creating Law and Policy for Resilient Urban Food Systems

Yassi Eskandari-Qajar and Janelle Orsi

**Abstract** In the field of ecology, resilience describes an ecosystem's ability to withstand, adapt to, and recover from disaster or change. Greater biodiversity brings greater ecosystem resilience, and, like ecosystems, urban and regional food systems are more resilient when a diverse network of producers, processors, distributors, retailers, and consumers interact within a robust local and regional economy. However, small-scale food businesses all along the chain of production face significant legal, regulatory, and financial barriers to their success. Policymakers have the opportunity to assess the range of roadblocks to local food, and cultivate a legal landscape for thriving urban food systems. Such policy changes will allow communities to rapidly transition towards greater food sovereignty, economic abundance, and resilience.

In the field of ecology, resilience describes an ecosystem's ability to withstand, adapt to, and recover from disaster or change. Greater biodiversity brings greater ecosystem resilience, and, like ecosystems, urban and regional food systems are more resilient when a diverse network of producers, processors, distributors, retailers, and consumers interact within a robust local and regional economy. Whereas unpredictable climate, resource insecurity, and changes in prevailing economic conditions may be catastrophic for rigid, industrial scale monocultures with faraway markets, resilient food systems are designed to endure. With a wide variety of crops and farming methods, and innovative agreements and enterprises connecting producers to local and regional markets, resilient food systems are capable of both stewarding the environment and feeding our communities for the long run.

A resilient urban food system, though focused on local benefits is nevertheless dependent on a robust regional network of small, sustainable farms. These urban, peri-urban, and rural farms are well connected to nearby markets, reducing reliance on long-distance transport and fossil fuels. Using a multiplicity of sustainable farming methods to cultivate a wide range of crop types in varying soils and

microclimates can lower the risk of widespread crop failure due to natural disaster, sudden resource limitation, pest invasions, and other symptoms of a changing climate. And whereas the large-scale globalized farm and food industry mass-produces food and concentrates ownership and profit in the hands of the few, food and farming enterprises in resilient urban food systems produce both environmentally- and culturally-appropriate food, and direct wealth to local food businesses and the stewards of agricultural lands. Simply put, resilient food systems are rooted in an understanding that the complexity and redundancy of small and micro farms and food enterprises are strengths, rather than opportunities for greater efficiency and agglomeration.

### **38.1 Benefits and Barriers**

Just and resilient urban food systems can help cities achieve many goals, including increased community food security, economic opportunity, public health, education and skill-building opportunities, disaster preparedness, green spaces, and wildlife habitat. In addition, when farms and food businesses are both economically and geographically connected to their community through cooperative and community supported models, they are more likely to behave more responsibly overall.

However, small-scale food businesses all along the chain of production face significant legal, regulatory, and financial barriers to their success. Laws that were designed to temper the harms of large-scale industrial food systems are oftentimes improperly applied to small farms and food enterprises as well. For example, zoning laws that were intended to separate incompatible land uses in rapidly industrializing cities now separate the places where we work, live, and exchange—restricting positive and relatively low-impact activities such as home-grown produce sales and home-based microenterprise. Similarly, proponents of local food may find that zoning restrictions on the location and intensity of commercial activity also limit the expansion of farmers markets, mobile food vending, residential CSA distribution points, urban farms, and other key elements of a functional local food system.

In light of the tremendous public benefits of local food, policymakers have the opportunity to assess the range of roadblocks to local food, and cultivate a legal landscape for thriving urban food systems. Such policy changes will allow communities to rapidly transition towards greater food sovereignty, economic abundance, and resilience.

## **38.2 Policy Opportunities for Food Production and Access**

### ***38.2.1 Urban Farming Ordinances***

Urban farmers must comply with a patchwork of regulations, including land use restrictions, building codes, health and safety regulations, and codes regarding the keeping of animals, landscaping, and commercial activities. Rather than leaving it to residents to find and interpret these rules, some cities, like San Francisco and Seattle, have created urban farming ordinances that provide clear, organized permissions and definitions for residential gardens, commercial urban farms, and community gardens. Other cities can follow their examples by revising planning codes for clarity and permitting farming in all zones.

### ***38.2.2 Neighborhood Food Access Points***

In order to increase local food production and access, cities should remove zoning barriers to the sale of produce grown in home gardens, community gardens, and vacant or underutilized lots. In addition, cities should follow the example of Portland, Oregon and allow residences to act as “food membership distribution points,” where a farm can drop off produce boxes that customers will retrieve later in the day. To minimize concerns about associated traffic and nuisance, cities can establish rules about signage and hours and days of operation in residential neighborhoods. Policies should also exempt or reduce food safety regulatory burdens for CSAs in light of the direct relationship between producer and consumer.

### ***38.2.3 Growing Food on Vacant or Underutilized Public Land***

Access to arable land is an important part of community food security and self-sufficiency. Cities can rapidly increase local food access by making vacant and underutilized municipally owned lots available for food production. Local governments can conduct a vacant and underutilized public land inventory and layer data from reputable mapping tools like the United States Department of Agriculture’s Food Environment Atlas and the California Environmental Protection Agency’s CalEnviroScreen in order to identify the city’s most food insecure and environmentally-burdened areas. By layering as much data as possible about the population and environmental factors, cities can ensure that support, incentives, and lease arrangements are targeted at residents and community based organizations in the areas that need it most.

### ***38.2.4 Financial Incentives for Urban Agriculture on Privately-Owned Land***

The 1965 California Williamson Act provides property tax reductions for farmed lands by assessing land based on its value for agricultural production, rather than the value of its “highest and best use.” In 2013, a similar law, the California Urban Agriculture Incentive Zones Act (AB 551), was passed. Referred to as the “Urban Williamson Act,” the law incentivizes food production in urban areas by authorizing cities and counties to offer lower property tax rates to owners of vacant or unimproved lots, so long as that land is used for small-scale agricultural production and animal husbandry for periods of at least five years. For local governments that cannot afford to provide such a financial incentive for food cultivation, an alternative strategy is to charge owners of vacant and abandoned lots a registry fee which could be lifted if the land was used for farming.

### ***38.2.5 Preserving the Right to Save and Share Seeds***

Saving and sharing seeds season after season helps communities cultivate and preserve a wide variety of crops that are well adapted to local conditions. These seeds, in turn, help to increase local biodiversity and climate resilience, as well as preserve local culture and natural history. Seed lending libraries – of which there are over 450 in the US and many more around the world – store local seed varieties and put them into circulation by allowing people to “borrow,” plant, collect, and “return” them each season.

Unfortunately, seed libraries and the act of saving and sharing seeds in the US have come under attack in recent years. Government agencies are broadly interpreting laws that require commercial seed sellers to test, label, and register their seeds, and applying these expensive, burdensome, and unnecessary laws to seed libraries, threatening their ultimate existence. Governments should create clear language that exempts noncommercial seed sharing from the regulations imposed on commercial seed sales. Considering that four companies control 60% of the global seed market, and the UN Food and Agriculture Organization estimates that we have lost 75% of the world’s plant genetic biodiversity in the last century, saving and sharing seed not only helps to increase local biodiversity, but can also improve global agricultural resiliency. After all, an heirloom seed variety cultivated and saved in one microclimate could very well help a community thousands of miles away bounce back from crop failure due to flood, drought, or pest invasion.

### ***38.2.6 Incentives for Healthy Local Food Sales***

Communities that lack access to a full-service grocery store often turn to corner markets for food purchases. However, corner stores tend to stock unhealthy processed foods, liquor, and sugary drinks with long shelf lives rather than fresh, local fruits, vegetables, and meats. Local governments could offer a tax credit or property tax reduction to those stores that sell a certain quantity of fresh foods that are locally or regionally sourced. Of course, reduced tax revenues may not be an option for some local governments, no matter how highly they value public health or local food economies. Funding from state or federal level programs could enable many more metropolitan areas to offer these healthy food incentives.

## **38.3 Policy Opportunities for Small and Micro Food Enterprises**

### ***38.3.1 Cottage Food Laws***

Cottage food laws unlock the economic potential of home kitchens by permitting the sale of homemade foods such as jams, baked goods, and other food items deemed to carry a low-risk of causing food borne illness. A cottage food enterprise can be established with little or no start-up capital, which makes a cottage food law a powerful community economic development tool. Over thirty U.S. states currently have cottage food laws, and many are revising their laws to expand the list of permissible foods and methods of sale.

### ***38.3.2 Mobile Food Vending and Produce Carts***

Mobile food markets, food trucks, and produce carts create a low cost entry point into the food business, diversify local food economies, and increase fresh food access in the heart of food insecure neighborhoods. Though some are concerned that mobile food vendors can undercut storefront businesses in surrounding areas, adopting ordinances that prioritize mobile food permitting in economically-distressed districts may be way to both create new economic opportunities and increase access to fresh foods.

### ***38.3.3 Subsidized Shared Commercial Kitchens***

Most prepared foods intended for sale require access to a commercial kitchen. Because use of commercial kitchens can be a prohibitive cost for new food

enterprises, cities can help incubate new food businesses by sponsoring local commercial kitchens. These kitchens, coupled with business support services, could have a particularly uplifting impact when located in or near low-income communities.

### ***38.3.4 Local Food Procurement Policies***

Contracting and purchasing preferences for sustainable, local food can even the playing field for these oftentimes small and struggling businesses. Government agencies and institutions such as schools, universities, and hospitals can provide large, stable markets for local food and could play a significant role in both increasing access to fresh food and supporting local food economies.

### ***38.3.5 Land Use Policies that Promote Farmers' Markets***

Farmers' markets create essential market access for local and regional farmers. However, establishing a new farmers' market requires licensing, permitting, and zoning compliance that ultimately limits the number, size, and activities of farmers' markets. Local governments can remove many of the planning and zoning barriers to new farmers' markets by declaring them an approved land use in more zones.

## **38.4 A Word on Liability and Waste**

In nature, there is no such thing as "waste." Instead, diversity, complexity, and interconnectivity turn one system's outputs into another system's inputs. Resilient urban food systems revolve around a similar concept. Closed-loop farming processes and well-connected distribution networks limit opportunities for waste, and food gleaning programs, food pantries, and discount groceries for near-expiration foods combat hunger. Yet, even in a community with widespread sustainable farming practices, efficient food distribution networks, and hunger prevention programs, excess food may still be thrown away instead of being shared with others.

Fear of liability is a major cause of food waste in the US. Rather than sharing viable excess food with those in need, individuals, restaurants, and groceries may instead discard food in order to avoid potential liability should it cause illness to the consumer. The little-known federal Good Samaritan Food Donation Act limits civil and criminal liability in order to protect those who donate food to needy individuals with a good faith belief that it is safe to consume. However, several terms within the law call for further clarification, including a definition for the term "needy individuals," and clarifying whether food can be given directly to a needy individual or

must first pass through a nonprofit organization. As is, the law provides important protections for food sharing, but if clarified and expanded to include liability protections for a broader range of food sharing activities, the law could play a central role in increasing community-level food security.

Fear of liability does not only cause food waste – it also causes land waste. Vacant and underutilized urban land, if shared for food production, could have a significant impact on neighborhood food access. However, landowners may be hesitant to share otherwise unused property for fear of liability should land users sustain injury while gardening. Consequently, many lots lay fallow rather than fruiting – and not just private land. Local public parks present an obvious opportunity for public food forests. Though local governments may recognize the benefits of neighborhood access to fresh fruits, cities, like land owners, may fear liability for potential injuries in instances where a park visitor was to slip on a fallen fruit. In the same ways that recreational use statutes can limit a land owner’s liability when they allow access to their property for recreational use, and cities can be protected from liability for dog bites sustained in dog parks, new or expanded laws should protect private land owners and governments from liability when land is used for food production.

### **38.5 Food Systems in the Context of a Broader Shift Toward Just and Resilient Societies**

Local and regional food systems are not insulated from the economic and political influences of states, nations, or international trade. In reality, the economic viability of robust regional food production is closely tied to land policy, government subsidies, and trade policies that affect competition, supply, and price. Similarly, the viability of small, local food enterprises is impacted by large-scale food industries that control the majority of food consumed in the US and influence both food prices and consumer choice. The above policy opportunities are not intended to fully address these larger issues or suggest new regulations on big food players. Rather, these policies help enable communities to remove many of the legal barriers to more just, resilient, and localized food economies and to support those activities and enterprises that confer the greatest amount of local health, economic, and environmental benefits – particularly for those most marginalized.

The many shining examples of, and opportunities for, equitable, community-centered food and farming practices present a sound vision for more ecologically-sound and socially just communities. Of course, achieving more just and resilient urban food systems will not necessarily lead into a broader societal shift toward economies that place people and planet first. However, these are important models to study and apply to other sectors as part of a transition toward community renewable energy, more equitable and democratic business entities, new models

for the ownership and management of land and housing, and the humane and ecologically-sound stewardship of our common resources.

Resilience is a smart strategic approach to meeting all basic needs in uncertain times. Indeed, present-day economic, political, climate, and resource insecurities may be the major reason why the concept of resilience has found its way out of ecological circles and into some rather unlikely arenas. Even the Rockefeller Foundation – a foundation with a namesake made infamous through petroleum, banking, and real estate exploits – has begun to espouse resilience and fund resilience planning in cities all over the world. However, efforts to transition to resilience must go beyond simply security and climate adaptation goals. Resilience planning presents an opportunity to achieve a far more profound and lasting societal shift if plans are developed from the grassroots and are firmly rooted in the principles of equity, justice, democracy, and community empowerment.

## Australia

**Kiran K. Patel and Gabriela Steier**

Australia and New Zealand have adopted the Food Standards Code, a governing body applicable to these two nations for the sole purpose for creating and accessing food standards. The Food Standards Australia and New Zealand (FSANZ) will be discussed in greater detail in Chap. 39 on Australia, however, it was introduced in 1991 to “develop, vary and review standards for food available in Australia and New Zealand and to “develop codes of conduct in collaboration with industry.”<sup>1</sup> FSANZ was created under the Food Standards Treaty and works with a Board which has health ministers and other representatives. This section will also cover and review the food labeling laws and policy, including a brief introduction of these policies and how policy and politics drive these provisions. There will also be a discussion in public health and safety as it relates to nutrition. Additionally, the section will also discuss the government’s response to the report of the review of food labeling laws and policy and recommendations that were made moving forward. Finally, a discussion regarding current amendments to the various numbers of food labeling laws and a discussion on cases in Australia regarding food standards and their respective outcomes and case precedents that were set as a direct result.

Notably, Chap. 39 includes an analysis of Australian labeling laws, country of origin labeling, nutrition and health claims, and the general food safety regulatory framework. A cutting-edge and provocative Chap. 40 pushes questions of sustainability through paradoxical legal constructs, such as animals as property but corporations as persons, to examine the Australian consumer protection framework.

## Regulation of Food Labelling in Australia and New Zealand

Michael Blakeney

**Abstract** This chapter describes the common arrangements between Australia, and New Zealand concerning food standards. The *Food Standards Australia New Zealand Act 1991* establishes the Food Standards Australia New Zealand (FSANZ) as an independent statutory authority with responsibility for developing food standards. Pursuant to this legislation a common “Food Standards Code” (the Code) has been agreed. Also described is the review of food labelling law and policy undertaken by the two countries in 2009–2010 which prioritised health concerns as the primary driver of food policy. The chapter concludes with a review of the principal food law cases which have been decided in Australia and New Zealand over the past 10 years.

### 39.1 Introduction

Australia and New Zealand share a common approach to food standards, the so-called *Food Standards Code* (the Code)<sup>1</sup> and a common body to determine food standards. These arrangements are part of a move towards a general uniformity of standards between the two countries supported by the Trans-Tasman Mutual Recognition Arrangement (TTMRA). The 1996 TTMRA was, “designed to remove regulatory barriers to the movement of goods and service providers between Australia and New Zealand and to . . . facilitate trade between the two countries” through the implementation of mutual recognition principles for goods and occupations.<sup>2</sup> In 1996, the Government of Australia and New Zealand formalised the Joint Food Standards System via a Treaty. This treaty is called *the Agreement between the Government of Australia and the Government of*

*New Zealand establishing a System for the Development of Joint Food Standards* and seeks to reduce unnecessary barriers to trade, to adopt a joint system of food standards, to provide for timely development, adoption and review of food standards and to facilitate sharing of information.<sup>3</sup> New Zealand joined this system under conditions that are set out in the *2002 Agreement between the Government of Australia and the Government of New Zealand Concerning a Joint Food Standards System*.

Until September 2011, the food regulation system was overseen by the Australia and New Zealand Food Regulation Ministerial Council. This council had the responsibility for developing domestic food regulation policy and promoting a consistent approach to the implementation and enforcement of food standards.<sup>4</sup> In September 2011, the Council of Australian Governments (COAG) launched the *Legislative and Governance Forum on Food Regulation* (“the Forum”), which replaced the Australia and New Zealand Food Regulation Ministerial Council. The Forum is primarily responsible for the development of domestic food regulatory policy and the development of policy guidelines for setting domestic food standards.

[Membership of the Forum](#) comprises a Minister from New Zealand and the Health Ministers from Australian States and Territories, the Australian Government as well as other Ministers from related portfolios (Primary Industries, Consumer Affairs etc) where these have been nominated by their jurisdictions. The Australian Government Parliamentary Secretary for Health and Ageing is the Chair of the Forum. [The Food Regulation Standing Committee \(FRSC\)](#) is a sub-committee of the Forum. FRSC is responsible for coordinating policy advice to the Forum and ensuring a nationally consistent approach to the implementation and enforcement of food standards. It also advises the Forum on the initiation, review and development of FRSC activities.<sup>5</sup>

The *Food Standards Australia New Zealand Act 1991* establishes the Food Standards Australia New Zealand (FSANZ) as an independent statutory authority with responsibility for developing food standards. The agreed upon standards are placed in the Code. The Implementation Sub-Committee (ISC) of FRSC develops and oversees the consistent approach to implementation and enforcement of these standards.<sup>6</sup>

Under the TTMRA, New Zealand may opt out of any standard to be included in the code if they consider it inappropriate on prescribed grounds. In regards to labelling law, New Zealand exercised this option to opt out of mandatory country-of-origin requirements. In contrast, Australia has recently introduced legislation on mandatory country-of-origin requirements into its Federal Parliament.

<sup>5</sup>*Id.*

<sup>6</sup>*Id.*, p. 24.

Each country has its own border control regime. In Australia, it is the Australian Quarantine Inspection Service (AQIS) and Australian Customs and Border Protection Service, and in New Zealand the border agencies include the Ministry of Agriculture and Forestry (MAF), Biosecurity New Zealand and the New Zealand Customs Service. Among the tasks of these bodies is responsibility for checking compliance of food with domestic standards. The TTMRA provides for the mutual recognition by one country of the standards applying in the other. This means that most goods imported from third countries that comply with standards applying in one partner country (and have cleared the border of that country) can be exported to the other partner country. One of the main reasons for this border control is the protection of domestic biodiversity and prevention of pest introduction and spread.

The major difference in the structure of government responsibility between the two countries can be attributed to the difference between the unitary nature of New Zealand on one hand and the federal nature of Australia on the other. Australia has a federal structure with legislation on food labelling emanating from the eight parliaments of the States and Territories in addition to that of the Federal Parliament. Therefore, there are eight separate state and territory food acts, and the associated instrumentalities operate in somewhat different ways in each of the eight jurisdictions. In contrast, New Zealand has a single Parliament and the enforcement of the Code is empowered under a single national act, the *New Zealand Food Act 1981*. This legislation operates across the whole country and is administered nationally by the New Zealand Food Safety Authority (NZFSA).<sup>7</sup>

In both countries, there is complementary support for food standards deriving from the general fair trading provisions relating to misleading or deceptive statements. In unitary New Zealand, consumer protections are based on national legislation (*New Zealand Fair Trading Act 1986*) and monitored and enforced by a single national body, the New Zealand Commerce Commission (NZCC). Australia also provides national consumer protection legislation (the 2010 *Competition and Consumer Act*) to be monitored by the Australian Competition and Consumer Commission (ACCC). However, there are additional state and territory consumer protection provisions monitored by particular state and territory consumer protection agencies. The requirements relating to misleading or deceptive statements operate independently from the Code and can impose different considerations in regards to accurate information, such as consumer values.<sup>8</sup>

Both countries are members of the World Trade Organization (WTO) and subject to the disciplines which it imposes through the Agreements on Technical Barriers to Trade (TBT), Sanitary and Phytosanitary Standards (SPS), and the Agreement on Trade Related Aspects of Intellectual Property Rights (TRIPS).

## 39.2 Review of Food Labelling Law and Policy 2011

The Council of Australian Governments (COAG) requested The Australia and New Zealand Food Regulation Ministerial Council (Ministerial Council) to engage an independent panel of experts to undertake a comprehensive review of food labelling law and policy. In October 2009, the Ministerial Council released the terms of reference for the review. In Australia, this Review was jointly funded by the Australian Government and all the Australian States and Territories. In New Zealand, the New Zealand Government supported the consultations.

Under the terms of reference, the independent expert panel, chaired by former Australian Health Minister, Dr. Neal Blewett, was required to:

- Examine the policy drivers impacting on demands for food labelling;
- Consider what should be the role for government in the regulation of food labelling. What principles should guide decisions about government regulatory intervention?
- Consider what policies and mechanisms are needed to ensure that government plays its optimum role;
- Consider principles and approaches to achieve compliance with labelling requirements and appropriate and consistent enforcement;
- Evaluate current policies, standards and laws relevant to food labelling and existing work on health claims and front-of-pack labelling against terms of reference 1–4 above;
- Make recommendations to improve food labelling law and policy.<sup>9</sup>

Following the receipt of submissions from stakeholders and discussions held at a number of public fora, in January 2011 the panel issued its report: *Labelling Logic*. The report contained 61 recommendations on several key themes including: the policy drivers of food labelling; principles and criteria to guide government decision making on regulatory intervention; public health and safety; new technologies; consumer value issues; presentation; and compliance and enforcement.

### 39.2.1 Principles and Policy Drivers of Food Labelling

The panel reviewed the drivers for labelling policy by reviewing three major interest groups: consumers, industry, and government. Subsequently, the panel identified the drivers for labelling policy as “consumers’ needs for information; industry’s need for marketing flexibility and minimal regulatory burdens; and government’s objectives in the area of individual and population health.” Consideration of these policy drivers provides “a framework for deriving principles for regulatory intervention in order to steer the flow of labelling events.” The panel

---

<sup>9</sup>Blewett et al. (2011) at Appendix C, p. 165.

further determined that exploration of these policy drivers “revealed the ubiquity and breadth of health concerns,” including a growing acceptance of governments’ preventative health role in reducing the risk of chronic diet-related disease.

Based on recognition of the prevalence of health concerns, the panel recommended that a comprehensive nutrition policy be developed that included a framework for the roles of the food label. This comprehensive Nutrition Policy, in turn, would inform the development or variation of labelling standards and establish principles that would guide decisions about government regulatory interventions in food labelling.<sup>10</sup>

Further, the panel formulated an issues hierarchy based upon risk which governs the initiation of regulatory action, the modes of intervention, and where rules and oversight should lie. The hierarchy in descending order is: food safety, preventative health, new technologies, and consumer values. The panel took the view that regulatory actions in relation to food safety, preventative health, and new technologies should be initiated primarily by government and referenced in the Code. Conversely, regulatory actions in relation to consumer values issues were to be initiated generally by industry. Generally, consumer values would rely on the ‘misleading or deceptive’ provisions in consumer protection legislation, not removing the possibility of some specific methods or processes of production being referenced in the Code.

There is little disagreement that the modes of intervention should be mandatory for food safety. However, for preventative health, the panel recommended a mixture of mandatory and co-regulation requirements, the choice to be dependent on government health priorities and the effectiveness or otherwise of co-regulatory measures. For new technologies the panel recommended mandated identification on the label of foods or ingredients treated or produced by such technologies for a period of 30 years after their introduction into the human food supply chain, at the end of which time the need for such identification should be reviewed. Finally, the panel proposed that the modes of intervention for consumer values issues should be self-regulatory but subject to more prescriptive forms of intervention in cases of market failure, such as in the case of country-of-origin issues created by New Zealand’s exercise of the option to exclude mandatory country-of-origin labelling.<sup>11</sup>

### ***39.2.2 Public Health and Food Safety***

As mentioned above, the panel observed that public health and food safety were positioned at the top of the food labelling regulatory hierarchy. Food safety labelling issues relate to food choices that affect both the consumers’ immediate

---

<sup>10</sup>Blewett et al. (2011), p. 1.

<sup>11</sup>Id., p. 2.

health and issues relating to impacts on consumers' long term health, such as preventative health measures. A broad array of government regulations, including the *Food Standards Code* (the Code), ensure the safety of the foods, as they can only be sold if certain strict requirements have been met.<sup>12</sup> The mandatory food label elements within the Code primarily require the provision of food safety information to the purchaser. This information includes warning statements, use and storage instructions, identification of allergens, date marking, batch code and contact details.

The Code outlines specific rules relating to the safe food handling of a product, primarily concerning date marking and use and storage instructions. The terms for date marking are specified in *Standard 1.2.5 Date Marking of Food* in the Code. Use and storage instructions are specified in *Standard 1.2.6 Directions for Use and Storage* in the Code. Use and storage instructions are applicable when, for reasons of health or safety, the consumer should be informed of specific use or storage requirements. Additional food labelling requirements relating to mandatory statements and declaration of allergens are listed in *Standard 1.2.3 Mandatory Warning and Advisory Statements and Declarations* in the Code. Directions are provided for the inclusion of warning statements, including their declarations on foods that are exempt from the requirement to bear a label and foods dispensed from vending machines.<sup>13</sup>

Concerns were expressed about the clarity of rules requiring allergen declarations and food components when purchasing unlabelled products, such as food purchased in restaurants and food outlets. While there is a requirement in the Code for the retailer/food outlet to declare this information on or in connection with the display of the food or to provide such information upon request, the high level of consumer dissatisfaction reported indicated that this responsibility was not well known in the food service sector. Based on this recognition, the panel recommended that there be more effective monitoring and enforcement of the existing requirements in the Code to provide mandatory warning and advisory statements and allergen declarations on all food products.<sup>14</sup>

### 39.3 Nutrition

The panel noted that Australia and New Zealand lack a comprehensive policy framework which would identify priority public health issues and specify strategies needed to address the issues. Such comprehensive policy would involve different agencies responsible for different food and nutrition policy areas, such as setting guidelines and public health goals, education strategies, primary and secondary

---

<sup>12</sup>Id., pp. 53–54.

<sup>13</sup>Id., p. 55.

<sup>14</sup>Id., p. 56, Recommendation 7.

prevention strategies, international food policies, monitoring and research. The need for a comprehensive was identified by the Preventative Health Taskforce in 2009,<sup>15</sup> but has not yet been implemented.

The panel recommended that a comprehensive Nutrition Policy be developed which includes a framework for the roles of the food label. Key aspects of the framework to be:

- the provision of food safety and nutrition information and education strategies to protect and promote the health of the population, including articulated roles for food label elements;
- the encouragement of the provision of healthy foods within the food supply to facilitate healthy diets;
- the setting and application of nutrient criteria and dietary guidance;
- the facilitation of social and other research to improve understanding of how label information is used and its impact on food selection, eating behaviours and the food supply;
- the establishment of monitoring and surveillance systems for dietary/nutrition practices that include the use and understanding of food labels.<sup>16</sup>

The Panel also recommended that the Food Standards New Zealand Act 1991 be amended to require Food Standards to give regard to the comprehensive Nutrition Policy when developing or reviewing labelling standards.<sup>17</sup>

### 39.3.1 *Ingredient Lists*

Ingredient lists serve to provide basic information in a standardized manner, enabling consumers to make decisions regarding the selection of foods to meet their own dietary needs. The primary role of ingredient lists is to reassure the purchaser that the food contains the ingredients expected to be present by providing a list of the components of the product, including the percentage of key or characterising ingredients. These lists are increasingly important for processed foods presented in packaging which make food selection using traditional methods of sight, smell, and comparison of like products difficult.

*Standard 1.2.4* of the Code specifies that all ingredients must be listed in order of decreasing ingoing weight and food additives and colourings must be listed using their specific name or code number. *Standard 1.2.10* also requires that the percentage of characterising ingredients and components of certain foods is declared.<sup>18</sup> Currently, a compound ingredient should include its components in brackets unless

---

<sup>15</sup>Preventative Health Taskforce (PHT) (2009).

<sup>16</sup>Id., pp. 58–60, Recommendation 9.

<sup>17</sup>Id., p. 61, Recommendation 10.

<sup>18</sup>Id., p. 61.

it comprises less than 5 % of the food. In the case that it comprises less than 5 % of the food, there is only a requirement to identify any food additives in the compound ingredient that are providing a technological function, such as a preservative or stabilising agent.

The panel noted that the identification of food additives or flavourings in the ingredient list caused confusion, especially the combined use of scientific terms and code numbers. Consequently, the panel recommended that industry, in consultation with government, medical authorities and relevant consumer organisations, develop a voluntary code of practice and education initiatives to enable consumers to quickly identify label information relating to additives, colourings and flavourings that are of agreed medical priority for sensitive consumers.<sup>19</sup>

### ***39.3.2 Nutrition Information Panels***

Nutrition Information Panels (NIPs) provide specific, quantified information on major nutrients to inform consumers who have concerns regarding specific chronic illnesses or conditions. Standard 1.2.8 of the Code specifies the current requirements for NIPs appearing on packages. It requires the declaration of energy, carbohydrates and sugars, protein, fat, saturated fat, and sodium. It also requires an NIP if a nutrition claim is made regarding the food, even if the package is otherwise exempt. Certain conditions are included in the standard if particular nutrition claims are made. For example, claims related to polyunsaturated or monounsaturated fatty acids require a declaration in the NIP.<sup>20</sup>

NIP requirements are subject to change as the knowledge of the nutrition needs of the populations change over time. While regular review of the nutrients declared in the NIP will require regular review, the panel considered four specific issues and issued recommendations.<sup>21</sup> These issues included trans-fatty acids, fibre content, potassium levels, and sodium/salt content. The panel recommended that the NIP include a mandatory declaration of all trans-fatty acids above an agreed threshold, as well as of naturally occurring fibre content.<sup>22</sup> Noting concerns about potassium levels and their relationship with increased risk of high blood pressure, the panel recommended that a voluntary declaration of potassium content in the NIP be actively considered by industry. In the future, if nutritional policy guidance recommended the reduction in consumption of potassium for at-risk population groups, disclosure of potassium in the Nutrition Information Panel should become mandatory.<sup>23</sup>

---

<sup>19</sup>Id., p. 62, Recommendation 11.

<sup>20</sup>Id., p. 64.

<sup>21</sup>Id., p. 65.

<sup>22</sup>Id., pp. 66–67, Recommendations 13 and 14.

<sup>23</sup>Id., p. 68, Recommendation 15.

Because of the perceived confusion of consumers, the presentation of the NIP has also received considerable attention. Much of the confusion amounted to misleading information, particularly in relation to consumers' interpretations of statements about the amount of nutrients per serving. As a result of the serving sizes determined by the manufacturer, nominated serving size is not often consistent with how individuals would consume that food. Therefore, the panel recommended that the information of nutrients per serving be deleted from the NIP unless a daily intake claim is made.<sup>24</sup>

In the past decades, the Australian public increasingly consumed food outside the home obtained from chain food service outlets and vending machines. Chain food service outlets and vending machines often provide food purchased away from the home, have standardized recipes from a number of franchised outlets, and provide foods that are either not labelled or the label is not accessible prior to purchase. Noting the increase in consumption in Australia of food outside of the home and its association with poorer diet quality and greater risk for obesity in children, the panel recommended the mandatory declaration of energy content of standardised food items on menu boards or in close proximity and on vending machines.<sup>25</sup> These declarations were intended to provide more nutrition and ingredient information at the point of sale to assist consumers with their selections. While it is noted that some consumers intend to indulge, research has shown that consumers may change their orders after exposure to nutrition information at the point of sale, especially when ordering for children. The addition of nutritional values is thought to increase awareness and knowledge of the energy consumed at these food outlets.<sup>26</sup>

### ***39.3.3 Health Claims on Food Packaging***

The panel noted that health claims in food labelling had proliferated and that they could mislead and detract from public health messages. In particular, it referred to the use of such terms as “pure” and “natural” which may imply health benefits to consumers. FSANZ had devoted significant resources in an effort to develop a standard for nutrition, health and related claims. In 2008, FSANZ finalised a draft standard that was provided to the Ministerial Council. The Ministerial Council requested FSANZ to review the draft standard by October 2011. Accordingly, the panel recommended the finalisation of the standard and that it include the following:

---

<sup>24</sup>Id., p. 69, Recommendation 17.

<sup>25</sup>Id., pp. 70–71, Recommendation 18.

<sup>26</sup>Id., pp. 70–71.

- a hierarchy of substantiation of claims at the various levels, that would encompass use of defined nutrition words and terms, pre-approved relationships, authoritative sources, systematic review and pre-market assessment and approval;
- a requirement that all foods that carry a nutrition, health and related claim comply with an agreed nutrient profiling system;
- a requirement that the presence of a nutrition, health and related claim triggers relevant information disclosures in the Nutrition Information Panel or ingredients list; and
- a requirement that the presence of a general or high level claim triggers display of standardised front-of-pack label information.<sup>27</sup>

### ***39.3.4 New Technologies: Irradiation, Genetic Engineering, and Nanotechnology***

New technologies in food production present a new set of issues regarding safety assessments of the foods produced or processed by such technologies. The development of new technologies requires a cohesive approach is required to ensure consistent and effective food labelling regulation. Under the Panel's hierarchy of food labelling issues (See *infra* XX), there is strong rationale for time-limited, mandatory interventions by government regarding the labelling of foods produced with new technologies. Therefore, as a general principle, all foods or ingredients that have been process by new technologies be required to be labelled for 30 years from the time of their introduction into the human food chain: the application of this principle to be based on scientific evidence of direct impact on, or modification of, the food/ingredient to be consumed. At the expiration of that period the mandatory labelling should be reviewed.<sup>28</sup> The submissions to and consultations with the Panel raised specific concerns in regards to new technology primarily based on biotechnology, nanotechnology, and irradiation.<sup>29</sup>

Irradiation is a method of food preservation achieved through exposing certain types of food to a source of ionising energy. Currently, in Australia and New Zealand, irradiation is prohibited unless specific permission is granted. *Standard 1.5.3* sets out the permitted sources and levels of radiation and lists the foods permitted to be irradiated and the consequential labelling requirements. However, the panel referenced the 1997 report of a Study Group convened by the FAO, the International Atomic Energy Agency, and WHO concluded that "food irradiated to any dose appropriate to achieve the intended technological objective is both safe to

<sup>27</sup>Id., pp. 73–75, Recommendation 20.

<sup>28</sup>Id., p. 91, Recommendation 28.

<sup>29</sup>Id., p. 87.

consume and nutritionally adequate.”<sup>30</sup> Since the conclusion of the Study Group, no contradictory conclusions have been presented in regards to further problems for humans occasioned by the consumption of foods treated with irradiation. Thus, the panel recommended that, on this basis, the mandatory labelling requirements prescribed for irradiated foods should be reviewed.<sup>31</sup>

Genetic Engineering produces genetically modified ingredients using gene technology, and is another new technology requiring legislative and regulatory frameworks to ensure food safety. Under the Code, genetically-engineered foods must be labelled. *Standard 1.5.2* of the Code, sets out the labelling requirements for foods produced using gene technology. This Standard requires that food be labelled genetically modified (GM) if novel deoxyribonucleic acid (DNA) or novel protein introduced by gene technology can be shown to be present in the final food or the food has altered characteristics as specified by the Code. However, genetic modification labelling is not required if GM ingredients or processing aids are used in the manufacturing process but there is no detectable residual genetic material or protein of the source in the final product and the food has no altered characteristics.<sup>32</sup>

There are a variety of additional exemptions in the labelling of GM foods. One such exemption is that flavours that contain GM material, but do not exceed a level of one part in a thousand in the final food, do not require genetic modification labelling. Another exemption is that if a food, ingredient, or processing aid includes unintentional traces of GM at one percent or less by weight per ingredient, it does not require genetic modification labelling. Finally, foods produced from animals fed GM products (i.e., animal foodstuffs) do not require genetic modification labelling.<sup>33</sup>

The panel noted that as there was no evidence that consumption of GM food produced any immediate detrimental effects in humans it recommended that only foods or ingredients that have altered characteristics or contain detectable novel DNA or protein be required to declare the presence of genetically modified material on the label.<sup>34</sup>

Nanotechnology refers to a technology that deals with microscopic particles sized 100 nanometres or less.<sup>35</sup> In regards to nanotechnology, the panel observed that the extent of use of nanomaterials in the Australian and New Zealand food supply appears at this stage to be minimal and adequate risk assessment techniques undeveloped. Nonetheless, it urged FSANZ and other relevant bodies develop a standard for regulating the presence of nanotechnology in the food production chain, consistent with the recommendations in this Report relating to new technologies.<sup>36</sup>

<sup>35</sup>Id., p. 91.

<sup>36</sup>Id p. 94, Recommendation 35.

### 39.3.5 *Consumer Values*

Consumers' have an increasing desire to make food purchase decisions according to their personal values, their perceptions of the world, and their ethical convictions. These issues of consumer concern are frequently changing, and bring a new dimension to the food labelling debate. Generalised consumer values issues such as human rights, animal welfare, environmental sustainability and country-of-origin labelling were raised in a number of the submissions to the panel. In turn, the panel took the position that there is much to be said for self-regulation in the management of consumer values issues, particularly where “there are clearly defined problems but no high risk of serious or widespread harm to consumers.”<sup>37</sup> That panel recommended that the value of industry-initiated self-regulatory intervention be recognised and that industry, in collaboration with special interest groups, further develop and apply a responsive and more structured self-regulatory approach to consumer values issues that incorporates:

- the role that voluntary codes of practice can play in relation to the evolution of standard definitions for values-based claims;
- the role that certification schemes can play in effectively communicating values-based messages; and
- the development of agreed standards through existing frameworks such as International Organization for Standardization, Standards Australia or Standards New Zealand.<sup>38</sup>

The panel proposed that a monitoring regime for self-regulatory measures be established. Further, they declared that evidence of systemic failure to provide accurate and consistent values-based information to enable consumers to make informed choices will require a more prescriptive mode of regulation. Marketplace failure will result in government intervention through government-mandated values claims, which have the advantage of being legally enforceable. In Australia, the only values-based label claim mandated is Country of Origin Labelling (CoOL).<sup>39</sup>

## 39.4 **Country of Origin Labelling**

Country of Origin Labelling (CoOL) was identified by the Panel as “a particularly contentious issue, much of this arising from the fact that country of origin is a generalised values-issue with ramifications far beyond food and where definitional precision is challenging.” The divergence of approaches over CoOL represents a significant exception to the uniformity of the trans-Tasman food labelling regime.

<sup>37</sup>Taskforce on Industry Self-Regulation (2000), p. 42.

<sup>38</sup>Blewett et al. (2011), p. 106, Recommendation 38.

<sup>39</sup>Id., p. 106, Recommendation 39.

All packaged food sold in Australia must contain a statement on the package that identifies where the food was made or produced, identifies the country where the food was made, manufactured, or packaged for retail sale and that the food is constituted from imported or local ingredients. In contrast, New Zealand has no mandatory requirement for CoOL, apart from wine, although information can be voluntarily supplied.<sup>40</sup>

The Panel noted that the coverage of the Australian standard on CoOL coverage in Australia anomalously excepted beef, lamb and chicken and subsequently recommended that Australia's existing mandatory country-of-origin labelling requirements for food be maintained and be extended to cover all primary food products for retail sale.<sup>41</sup> Moreover, the panel noted that the consumer law provisions of the Federal Competition and Consumer Act 2010 offered a more comprehensive treatment of CoOL than did the Code, and consequently recommended that that CoOL regulation be dealt with under the Competition and Consumer Act 2010 rather than in the Food Standards Code.<sup>42</sup>

### 39.5 Presentation

Noting that the presentation of text and images influences consumers' ability to notice, locate, read and comprehend the information contained on a food label, the panel endorsed the view that food labelling should provide clear, simple and easy to interpret information that can be understood across demographic groups, particularly lower socio-economic groups. The current FSANZ Standard specifies, "Unless otherwise expressly permitted by this Code, each word, statement, expression or design prescribed to be contained, written or set out in a label must, wherever occurring, be so contained, written or set out legibly and prominently such as to afford a distinct contrast to the background and in the English language".<sup>43</sup> In addition, warning statements must be at least 3 mm in size (approximately equivalent to 8 point font) or 1.5 mm (4 point font) for small packages. Taking account of comments received on the legibility requirements, the panel recommended that a minimum font size of 3.5 mm in an open font style in mixed case be applied for mandated information, with the exception of small package sizes where the minimum font size should be 1.5 mm<sup>44</sup> and that a set of guidelines be developed in consultation with industry that includes reference to other presentation factors such as letter and line spacing, text justification, and stroke width.<sup>45</sup>

---

<sup>40</sup>Id., p. 106.

<sup>41</sup>Id., p. 108, Recommendation 40.

<sup>42</sup>Id., p. 108, Recommendation 41.

<sup>43</sup>Food Standards Australia New Zealand, *Standard 1.2.9 Legibility Requirements*, issue 119, - *Australia New Zealand Food Standards Code*, 2010, p. 1.

<sup>44</sup>Blewett et al. (2011), p. 116, Recommendation 44.

<sup>45</sup>Id., p. 116, Recommendation 45.

Some consumer submissions discussed difficulties associated with contrast, noting that particular combinations of foreground and background colour are especially problematic for legibility. The panel proposed a minimum contrast level of 70% for mandated information be stipulated in the Food Standards Code.<sup>46</sup> It also proposed that the warning and advisory statements be emboldened and allergens emboldened both in the ingredients list and in a separate list.<sup>47</sup>

Finally, based on the FSA's recommendation that all mandatory information should be positioned on a face of the pack within defined borders, the panel recommended that industry be encouraged to develop a set of guidelines relating to the co-location of mandatory health information presented in a standardised manner on the label.<sup>48</sup> Further, it was recommended that an automated label assessment tool be investigated that can gauge a label's compliance with mandated legibility requirements and those stipulated in relevant voluntary codes.<sup>49</sup>

## 39.6 Images

Interpretive symbols, claims, and endorsements on labels have the potential to convey important nutritional information when included and have been termed front-of-pack labelling (FoPL). Acknowledging complaints that consumers lack adequate time to read food labels while shopping, the panel recommended that an interpretative FoPL system be developed that is reflective of a comprehensive Nutrition Policy and agreed public health priorities.<sup>50</sup>

Currently, there is no single consensus on the best form of FoPL labelling. However, of the labelling systems which had been developed and tested, the panel preferred the colour-coded multiple traffic lights (MTL) system of warnings and recommended that a MTL FoPL system be introduced on a voluntary basis. In addition, such labelling should be mandatory where general or high level health claims are made, or where equivalent endorsements/trade names/marks appear on the label.<sup>51</sup> The MTL system comprises coloured lights for key nutrients, "a green light signifies a healthy choice, an amber/orange light is an 'okay' choice and a red light a less health or unhealthy choice." Additional forms of the MTL system include the use of the words low/medium/high or numbers (e.g. nutrient amounts per serving) associated with each light.<sup>52</sup>

---

<sup>46</sup>Id., p. 116, Recommendation 46.

<sup>47</sup>Id., p. 117, Recommendation 47.

<sup>48</sup>Id., p. 118, Recommendation 48.

<sup>49</sup>Id., p. 118, Recommendation 49.

<sup>50</sup>Id., p. 121, Recommendation 50.

<sup>51</sup>Id., p. 124, Recommendation 51.

<sup>52</sup>Id., p. 123.

The panel also proposed that government advice and support be provided to producers adopting the MTL system and that its introduction be accompanied by comprehensive consumer education to explain and support the system.<sup>53</sup> This would be backed-up by monitoring and evaluation of the MTL system to assess industry compliance and the effectiveness of the system in improving the food supply and influencing consumers' food choices. Chain food service outlets were to be encouraged to display the MTL system on menus/menu boards, but on a mandatory basis where general or high level health claims are made or equivalent endorsements/trade names/marks are used.<sup>54</sup>

### 39.7 Compliance and Enforcement

Food labelling statements and claims must be actively enforced to be effective. In Australia and New Zealand, food labelling requirements are enforced through the specific labelling requirements of the Code and through the general provisions of the Australian and New Zealand consumer laws relating to misleading or deceptive conduct. These two systems operate independently from one another, as a claim can be in breach of consumer protection laws but not in breach of the code; another can be in breach of the Code but not in breach of consumer protection laws. Although FSANZ developed the standards, they have no role in the enforcement under either system.

In Australia, non-compliance with outlined labelling requirements risks prosecution under the food legislation of the States and Territories.<sup>55</sup> New Zealand has imported the Code into its *Food Act 1981*. In Australia, action can be taken on conduct involving misleading or deceptive conduct that breaches of the Code under the Australian Consumer Law provisions of the Federal *Competition and Consumer Act 2010*. In New Zealand consumers are protected from misleading or deceptive terms under the *Fair Trading Act 1986*.<sup>56</sup>

The panel reported many submissions from both industry and consumer organisations which were critical of levels of enforcement for food labels, because of low levels of funding and because of inconsistencies in the interpretation of the requirements across the ten jurisdictions responsible for interpreting the Code.<sup>57</sup> Reference was made to critical comments in a 2008 NSW Supreme Court case<sup>58</sup> which

<sup>53</sup>Id., p. 125, Recommendation 52.

<sup>54</sup>Id., p. 126, Recommendations 54 and 55.

<sup>55</sup>*Food Act 2003* (NSW), ss 18, 21; *Food Act 1984* (Vic), ss13, 16; *Food Act 2006* (Qld), ss37, 39; *Food Act 2001* (SA), ss 18, 21; *Food Act 2008* (WA), ss 19, 22; *Food Act 2003* (Tas), s 18, 21; *Food Act 2004* (NT), ss 17, 20; *Food Act 2001* (ACT), ss 24, 27.

<sup>56</sup>Blewett et al. (2011), p. 130.

<sup>57</sup>Id., p. 131.

<sup>58</sup>*Turnney (NSW Food Authority) v Nutricia Australia Pty Ltd*; [2008] NSWSC 1382.

highlighted a number of problems with the Code, including lack of definitions, its “piecemeal nature”, duplication, and because the document was not prepared by specialist drafters. Consequently, the panel recommended that food standards always be drafted with the understanding that they are intended to be enforceable legal documents and that where current deficiencies in the labelling requirements have been identified; standards should be re-drafted to make the obligations clear.<sup>59</sup>

Under the current legislation, formal enforcement actions for breaches of food labelling are mainly limited to prosecutions, which depend upon prosecutorial discretion and resources, as well as being time-consuming to mount. The panel recommended a more versatile range of enforcement provisions, such as the power to make orders or require user-paid compliance testing consequent on a breach or impose enforceable undertakings in relation to non-compliant labelling.<sup>60</sup>

The problem of inconsistency is exacerbated by the many agencies involved. For example, across Australia there are as many as 29 authorities and agencies in some way responsible for the regulation of food and its labelling. Each of the States and Territories has a principal agency and in many cases a number of primary production authorities are also involved. The Federal Government is involved through its quarantine service and the Australian Customs and Border Protection Service in the case of imported food. In New Zealand, there is the NZFSA as the principal agency with the New Zealand Customs Service and MAF Biosecurity New Zealand also having responsibility for imported foods at the border.<sup>61</sup> The panel concluded that: If food labelling is to be taken seriously by governments, a new entity, which for the purposes of this Review is called the Food Labelling Bureau (the Bureau), should be established to advise Australian and New Zealand ministers on all aspects of labelling policy. Resources for this Bureau must reflect the high profile of food labelling as the most public face of food policies, standards and laws.<sup>62</sup>

The following specific functions were suggested for the Bureau; it should:

- be the primary source of food labelling advice to the Ministerial Council, industry, government and the community in relation to the operation of the Code and existing and emerging food labelling issues and technologies;
- undertake or commission research relating to new and existing issues in food labelling;
- educate and inform consumers and industry about labelling requirements and other nutrition and public health initiatives relevant to labelling; assist regulators with compliance; and assist FSANZ with the development and review of labelling standards as necessary;

---

<sup>59</sup>Blewett et al. (2011), p. 138.

<sup>60</sup>Id., p. 134, Recommendation 58.

<sup>61</sup>Id., p. 135, Para 8.14.

<sup>62</sup>Id., p. 139, Para 8.26.

- provide information and guidelines that will assist industry to comply with current requirements and support the development and operation of compliance tools (such as computer-generated labels or pre-approvals);
- be a clearing house for complaints made to it, facilitating their resolution where possible and referring matters to the appropriate jurisdiction for formal enforcement where necessary;
- monitor and report on food labelling compliance across jurisdictions (e.g., for nutrition, health and related claims, compliance with NIP and FoPL requirements); and oversee self- and co-regulatory arrangements; and
- monitor consumer values issues claims on food labels and provide a point of contact between the ACCC in Australia and the NZCC and other relevant agencies in relation to food labels that are potentially misleading or deceptive under consumer protection laws.<sup>63</sup>

**Government Response to Report of the Review of Food Labelling Law and Policy** The government released its response to the Report of the Review of Food Labelling Law and Policy on 9 December 2011.<sup>64</sup> The Forum considered that a number of the labelling recommendations of the review panel had been anticipated by industry action and that it should have a watching brief to see how these initiatives developed. The principal responses concerning positive action in response to the review report are outlined below.

### 39.8 Role of FSANZ

In response to the review panel's report of ambiguity regarding the role of Food Standards Australia New Zealand (FSANZ) in developing and reviewing food standards, particularly whether it had a role in relation to broader public health issues, the Legislative and Governance Forum ("the Forum") made several proposals. First, a Ministerial Policy Guideline will be developed detailing the expectations of FSANZ in relation to the role of food standards in supporting public health objectives. The aim of the Ministerial Policy Guideline is to decrease ambiguity regarding the role of FSANZ in developing and reviewing food standards. Additionally, it would require that FSANZ take into consideration both long-term health impacts and immediate health risks in the development of food standards while not changing the overall function and role of FSANZ. The Forum proposed that in 2 years the Ministerial Council Guideline would be evaluated to determine whether it has been effective in addressing the issue or whether there is still a need to include a definition of 'public health' in the FSANZ Act.<sup>65</sup>

<sup>63</sup>Id., p. 141, Recommendation 61.

<sup>64</sup>Legislative and Governance Forum on Food Regulation on Food Regulation (Convening as the Australia and New Zealand Food Regulation Ministerial Council) 2011.

<sup>65</sup>Legislative and Governance Forum on Food Regulation, pp. 9–10.

### ***39.8.1 Food Labelling Principles***

The Forum endorsed the review's proposals in relation to the clarity of food labelling and stated that "it will develop an overarching policy statement on food labelling that supports the principle that information on food labels be presented in a clear and comprehensible manner to enhance understanding. The policy statement will guide decisions and actions by both government and industry." There is widespread recognition of the importance of optimal comprehension and readability of information that appears on food labels. However, the Forum noted that there are some design and presentational challenges in developing label information that is understood "across all levels of the population."<sup>66</sup>

### ***39.8.2 Food Safety Labelling***

The Forum indicated that it would request that FSANZ undertake a technical evaluation to ensure consumers' ability to access relevant information. The review would aim to maximize the effectiveness of food safety communication and provide advice on the food safety elements on food labels.<sup>67</sup>

### ***39.8.3 Nutrition Policy***

The Forum sought the advice of the Standing Council on Health which supports the development of a comprehensive national nutrition policy and has referred the development of this policy to the Australian Health Ministers' Advisory Council (AHMAC).<sup>68</sup>

### ***39.8.4 Ingredient List and Nutrition Information Panel***

The Forum indicated that it would request FSANZ "to undertake a technical evaluation and provide advice on the proposed changes to the ingredient listing and Nutrition Information Panel." This advice would assist the Forum in its consideration of the expected benefits and cumulative impacts of possible changes to labelling requirements prior to considering any amendments to the Food Standards Code.<sup>69</sup>

---

<sup>66</sup>Id., p. 14.

<sup>67</sup>Id., p. 16.

<sup>68</sup>Id., p. 19.

<sup>69</sup>Id., p. 21.

### **39.8.5 *Mandatory Health Messages***

The Standing Council on Health advised the Forum that the majority of Health Ministers supported mandatory preventive health messages on food labels being instigated by government. However, some Health Ministers would prefer to address health messages on labels in the context of specific proposals rather than through a generic approach.<sup>70</sup>

### **39.8.6 *New Technologies***

The Forum agreed not to pursue recommendation 28 of the review panel which concerned mandatory labelling where new technologies were involved in food production because it took the view that this requirement for new technologies constituted a technical regulation under the World Trade Organization Agreement on Technical Barriers to Trade (TBT Agreement). It preferred FSANZ to continue to apply a case-by-case approach to the labelling requirements for new technologies.<sup>71</sup> The Forum undertook to develop a conceptual framework and issues hierarchy that will include a Ministerial Policy Guideline for the case-by-case consideration of regulatory (i.e. labelling) and non-regulatory measures applying to food produced using a new technology requiring pre-market safety assessment.

### **39.8.7 *Presentation***

The Forum accepted the recommendation of the review panel and indicated that it would request FSANZ to undertake a technical evaluation and provide advice on the application of the Perceptible Information Principle to the presentational aspects of food labels, as well as whether the Perceptible Information Principle as a tool to aid food label design has benefits over other tools.<sup>72</sup>

In relation to the recommendations concerning proposed font sizes and a minimum contrast level of 70 % the Forum took the view that these should not be taken up as highly prescriptive requirements may place considerable design limitations on industry, and may lead to an information density that reduces readability for consumers.<sup>73</sup>

---

<sup>70</sup>Id., p. 27.

<sup>71</sup>Id., p. 34.

<sup>72</sup>Id., p. 46.

<sup>73</sup>Id., p. 47.

### **39.8.8 Compliance and Enforcement**

The Forum undertook to explore a range of policy options for increasing the capacity of the food regulatory system to monitor and enforce food laws in a way that met stakeholders' expectations. It expressed its support for the existing risk-based approach to monitoring and enforcement and indicated that it would request the [Food Regulation Standing Committee \(FRSC\)](#) to consider the work already completed by the ISC and the range of potential enforcement tools that could be available to address noncompliant labelling and make recommendations to the Forum regarding amendments to the *Model Food Provisions* to be adopted by all jurisdictions.<sup>74</sup>

### **39.8.9 Clarity of Standards**

The Forum agreed with the review panel that the Food Standards Code should be clear, unambiguous and legally enforceable. However, it declined to initiate new action on this subject as issues with the wording and enforcement of the Food Standards Code had been previously recognised by the then Ministerial Council and action commenced in a number of areas. An audit of the Food Standards Code was conducted by the Australian Government's Office of Legislative Drafting and Publishing in 2010. An implementation plan to address the identified deficiencies had been developed by FSANZ.

The newly established Food Standards Code Interpretation Service (CIS) within FSANZ commenced operation on 1 July 2011. The CIS will provide public interpretive advice for chapters 1 and 2 of the Food Standards Code. The interpretive advice issued by the CIS is to be adopted and applied by relevant State and Territory food regulatory enforcement agencies in the course of their monitoring and enforcement activities. This interpretive advice is to be issued as guidelines to assist the interpretation of the Food Standards Code.<sup>75</sup>

### **39.8.10 Food Labelling Bureau**

The Forum declined to accept the recommendation of the review panel that a trans-Tasman Food Labelling Bureau be established under the *Food Standards Australia New Zealand Act 1991*. The Forum took the view that this bureau would establish another bureaucratic layer to the food regulation system, without providing any

---

<sup>74</sup>Id., pp. 57–58.

<sup>75</sup>Legislative and Governance Forum on Food Regulation, p. 60.

additional capacity for enforcement.<sup>76</sup> The Forum explained that the recently established Food Standards Code Interpretation Service (CIS), operated by FSANZ, was designed to address the inconsistent interpretation and enforcement of labelling standards between jurisdictions. A key aim of this service is to facilitate consistent implementation of food standards by relevant regulatory agencies and industry across jurisdictions and local governments. The effectiveness of the CIS was set to be reviewed after 2 years of operation.

The Forum also cited to the work of the ISC in promoting a consistent approach to the implementation of food regulation across the jurisdictions. As part of this role, ISC has developed a framework entitled the *Strategy for the consistent implementation of food regulation in Australia*, which has facilitated the drafting of food standards that are legally enforceable in both jurisdictions.<sup>77</sup>

### 39.9 Country of Origin Rules in Australia

Country of origin requirements for food labels in Australia are contained in the *Food Standards Code* (“the Code”), the *Commerce (Trade Descriptions) Act 1905*, the *Commerce (Imports) Regulations 1940* (the Regulations), the *Australian Consumer Law* (ACL) and schedule 2 of the *Competition and Consumer Act 2010* (CCA). The Code and the Regulations require packaged and particular unpackaged foods to have labels that denote country of origin.

The ACL does not specifically include country of origin obligations for food labels. However, it prohibits a person from engaging in misleading or deceptive conduct<sup>78</sup>; making false or misleading representations that a good has had a particular history<sup>79</sup>; or making false or misleading representations concerning the place of origin of goods.<sup>80</sup> Section 255 of the ACL provides a “safe harbour” for producers by providing that a representation as to the country of origin of goods (such as “Made in Australia”) will not be considered misleading so long as the goods have undergone a “substantial transformation” in that country. A substantial transformation is said to occur when the goods undergo a “fundamental change in form, appearance or nature,” so that the goods after the transformation are new and different to those existing before; and 50% or more of the cost of production is attributable to processes that occurred in that country.<sup>81</sup> The safe harbour provisions also impose stricter requirements for “Product of...” and “Grown in...” claims, and allow claims about the origin of particular ingredients. Confusion was identified by the Blewett review arising from “Made in...” claims where the food

---

<sup>76</sup>Legislative and Governance Forum on Food Regulation, p. 61.

<sup>77</sup>Legislative and Governance Forum on Food Regulation, pp. 61–62.

<sup>78</sup>Australian Consumer Law Section 18.

<sup>79</sup>ACL Section 29(a).

<sup>80</sup>ACL Section 29(k).

<sup>81</sup>The method of calculating the “cost of production” is set out in s 256 of the ACL.

comes from outside the country, but the safe harbour requirements are met in Australia.

The Blewett review recommended amending the country of origin rules by moving the country of origin rules from the Code to the CCA<sup>82</sup> and basing the “safe harbour” for country of origin claims on the weight of goods (excluding water) rather than costs of production.<sup>83</sup> This would focus the safe harbour on where the food itself came from, compared with where it was packed or prepared. The panel believed that this would lead to country of origin information that would be more in line with consumer expectations.

### ***39.9.1 Senate Select Committee on Australia’s Food Processing Sector, 2011–2012***

On March 24, 2011, the Senate established the Select Committee on Australia’s Food Processing Sector (Select Committee) to investigate possible policy responses to the challenges and pressures within the broader economy that threaten the ongoing viability and competitiveness of food processing in Australia. The committee was also tasked with examining certain broader areas of government policy to assess the appropriateness of the overall regulatory environment Australia’s food processing industry operates in. Following public hearings and site visits, the select committee reported to the Senate in August 2012.

In view of the recent publication of the report of the panel chaired by Dr. Blewett,<sup>84</sup> the Select Committee confined its remarks on the subject of food labelling mainly to country of origin labelling requirements.<sup>85</sup>

### ***39.9.2 Country of Origin Labelling Regime***

The Senate Select Committee’s report noted that, essentially, the Blewett Review had recommended creating a specific regime regulating food product country of origin labelling claims that would operate separately from the general laws governing country of origin claims for other products, such as manufactured goods. The government’s response explicitly rejected the idea of creating a separate regime governing country of origin claims for food, largely because of increased expenses for industry in implementing these changes.<sup>86</sup>

---

<sup>82</sup>Blewett et al. (2011), p. 109, Recommendation 41.

<sup>83</sup>Id., p. 111, Recommendation 42.

<sup>84</sup>Blewett et al. (2011).

<sup>85</sup>Senate Report, p. 63.

<sup>86</sup>Senate Select Committee (2012) at paras 4.26-32.

The Select Committee disagreed with the government's rejection of the Blewett proposal, and posited the rejection as a misunderstanding of consumer and industry expectations regarding the purpose and clarity of country of labelling laws with respect to food. Therefore, the select committee supported the case for simplifying and clarifying these laws.<sup>87</sup>

On the basis of the evidence presented to it, the select committee observed that "that food labelling issues, particularly to do with country of origin requirements, loom large in the minds of many industry participants,"<sup>88</sup> but that the current laws "are not at all transparent and potentially mislead consumers."<sup>89</sup> The Select Committee considered several options for reform, including adjusting the existing labelling regime to make labels less confusing or to provide greater detail, educating consumers, and using technology to better connect consumers with the food they were purchasing.<sup>90</sup> The Senate Select Committee concluded that

...there would be merit to reforming the current country of origin labelling laws to make them more transparent. ... Industry must do more to understand consumer preferences and behaviour. Government can assist this by providing a strong and clear country of origin labelling regime upon which processors can more confidently base their claims.<sup>91</sup>

The Committee recommended "that the government expand the application of food labelling requirements to require all primary food products for retail sale to display their country of origin, in accordance with recommendation 40 of the Blewett Review."<sup>92</sup> They further required that "the government reform country of origin labelling requirements for food so that these requirements are clearer, more transparent and focus on the consumer's understanding."<sup>93</sup> Finally, the select committee recommended that "the government move mandatory country of origin labelling requirements for food to a specific consumer product information standard under the *Competition and Consumer Act 2010*, consistent with recommendation 41 of the Blewett Review."<sup>94</sup>

Essentially, the Select Committee endorsed the proposals of the Blewett report, recognizing the need for clear and detailed country of origin information.

### 39.9.3 *The Competition and Consumer Amendment (Australian Country of Origin Food Labelling) Bill 2013 (Cth)*

Following the rejection by the Senate Standing Committee of the Blewett committee's recommendations for reform of the Australian country of origin regime, bills were introduced into the Australian Senate and the House of Representatives, by the minority Australian Greens Party attempting to reinstate Recommendations 41 and 42 of the Blewett Committee.<sup>95</sup> Those bills were subsequently abandoned, and on May 16, 2013, the leader of the Australian Greens Party, Senator Milne, introduced the Competition and Consumer Amendment (Australian Country of Origin Food Labelling) Bill 2013 (Cth) (the Bill).<sup>96</sup> The Bill includes the new country of origin requirements in the CCA which were contained in Recommendation 41 of the Blewett Review, but it dropped the "weight of the goods" rule contained in Recommendation 42.

The Bill outlines a new Part 3-4A in the CCA for food-specific country of origin claims, which overrides overlapping requirements in the Code. Under Part 3-4A, one of the following country of origin claims must be used for packaged and certain unpackaged foods:

- "Product/Produce of Australia:" a premium claim for packaged food wholly manufactured or processed in Australia, where all the significant ingredients are grown in Australia;
- "Australian Manufactured/Manufactured in Australia:" for packaged food "substantially transformed" in Australia, where at least 50% of the total cost of processing is incurred in Australia (instead of "Made in Australia" as the safe harbour allows);
- "Packaged in Australia:" for packaged food (but not, for example, "Packaged in Australia from local and imported ingredients").

Similar to the s 255 ACL safe harbour, the Bill allows significant ingredients to be labelled with an Australian origin, and would also allow "Grown in Australia" to be used in connection with certain unpackaged foods. Finally, the Bill creates an offence for failing to comply with the labelling requirements, with criminal penalties of \$250,000 for corporate bodies and \$50,000 for individuals.

The Bill failed to obtain parliamentary approval prior to the Australian Parliament being dissolved for the September 2013 parliamentary election, but it is an indication of likely future legislative developments on the subject of country of origin labelling requirements.

<sup>96</sup>Competition and Consumer Amendment (Australian Food Labelling) Bill 2013 (Cth).

## 39.10 Food Law Jurisprudence

Outlined below are the principal food law cases which have been decided in Australia and New Zealand over the past 10 years.

### 39.10.1 *Interpretation of the Food Standards Code*

*Tumney (NSW Food Authority) v Nutricia Australia Pty Ltd*<sup>97</sup> concerned the consideration by the Supreme Court of New South Wales of 92 criminal charges in relation to alleged breaches of the Food Act 2003 (NSW) by Nutricia Australia Pty Ltd (“Nutricia”) and its principal officers. Nutricia was an Australian company that manufactured and supplied infant baby milk formula products. Two components of the formula in question were fructo-oligosaccharides and galacto-oligosaccharides. The Prosecutor argued that the products were packaged and labelled in such a way as to represent that they were of a particular nature or substance, and that this amounted to a false description of the food.

Section 18(3) of the Food Act provided that “a person must not, in the course of carrying on a food business, sell food that is packaged or labelled in a way that falsely describes the food.” Section 22 (a) gave as an example of food which was falsely described “food . . . represented as being of a particular nature or substance for which there is a prescribed standard under the Food Standards Code and the food does not comply with that prescribed standard . . .”

Section 21 of the Food Act provided:

1. A person must comply with any requirement imposed on the person by a provision of the Food Standards Code in relation to the conduct of a food business or to food intended for sale or food for sale.
2. A person must not sell any food that does not comply with a requirement of the Food Standards Code that relates to the food.
3. A person must not sell or advertise for sale any food that is packaged or labelled in a manner that contravenes a provision of the Food Standards Code.

The Court pointed out that the “*Food Standards Code*” referred to in the legislation was the *Australia New Zealand Food Standards Code*. “The Code is a national Code promulgating detailed standards in respect of the production, sale and importation of food, devised under a co-operative arrangement between the governments of Australia and New Zealand and, in NSW, given the force of law by the *Food Act* section 21.”<sup>98</sup>

The trial Judge pointed out that the Code was “an unusual breed of instrument, something of a hybrid”.<sup>99</sup>

<sup>97</sup>*Tumney (NSW Food Authority) v Nutricia Australia Pty Ltd* (2008) NSWSC 1382.

<sup>98</sup>Id. at para 48.

<sup>99</sup>Id. at para. 69.

It was developed and maintained by “Food Standards Australia New Zealand”, which, as its name proclaims, is a joint instrumentality of Australia and New Zealand. So far as the Australian contribution is concerned, it is authorised by the Food Standards Australia New Zealand Act 1991 (Cth). But enforcement and policing of food standards are within the constitutional realm of the states. For that reason, the Code is given the force of law by the Food Act of NSW.

Accordingly, in my view . . . construction of the Code falls to be determined by reference to NSW interpretation law. That is because it is given the force of law by a state Act, and this is a prosecution brought under state law, governed by rules of evidence and interpretation of NSW law.

In construing the Code, it seems to me to be appropriate to bear in mind that, while it has legal force, it is a document drafted, apparently, by non-lawyers. That being so, it may be appropriate to take a more liberal, or more purposive, approach to its construction.<sup>100</sup>

Noting that, in a criminal prosecution, any ambiguity must be resolved in favour of the defendants and against the Prosecutor, the Judge dismissed that charges because of the imprecise and ambiguous wording of the relevant provisions of the Code.

*Axiome Pty Ltd on behalf of Cognis GmbH v Food Standards Australia New Zealand*<sup>101</sup> concerned a review of a decision of a delegate of Food Standards Australia New Zealand (FSANZ). The delegate rejected an application to amend Standard 1.5.1 of the Australia New Zealand Food Standards Code (the Code) to approve the use of a chemically defined mixture of conjugated linoleic acid triglycerides (CLA), Tonalin CLA, as a novel food in Australia. Standard 1.5.1 of the Code regulates the sale of ‘novel foods’ and novel ingredients and prohibits the sale of these foods unless they are listed in the Table to clause 2 of Standard 1.5.1 and comply with any special conditions of use. Failure to comply with Standard 1.5.1 results in significant criminal offences and fines being imposed under the various State and Territory *Food Acts*.

The application stated that Tonalin CLA “meets the definition of a non-traditional food and a *Novel Food*,” and that its purpose was as “a useful adjunct in weight control programmes and diets” (original emphasis). Examples of its potential food applications “include milk products, soy beverages, fruit based beverages, yoghurt and yoghurt products, nutrition bars, and table spreads.” On May 13, 2011, the application was rejected by FSANZ pursuant to s 30(1)(b) of the *Food Standards Australia New Zealand Act 1991* (Cth). Among the stated reasons for the rejection were that the overall evidence base was not sufficient to demonstrate the safety of Tonalin CLA at the recommended intake of 4.5 g/day.

On June 6, 2011, the Applicant applied to the Administrative Appeals Tribunal for a review of this decision. The Tribunal has jurisdiction to review such decisions pursuant to s 143(1) of the FSANZ Act. The Tribunal identified the issues as, first, whether Tonalin CLA was a “novel food” as defined in clause 1 of Standard 1.5.1 of

<sup>100</sup>Id. at para. 69–71.

<sup>101</sup>*Axiome Pty Ltd on behalf of Cognis GmbH v Food Standards Australia New Zealand* (2012) AATA 551.

the Code and, second, whether FSANZ's decision to reject the application for variation of Standard 1.5.1 was the correct or preferable decision. On the first issue, the Tribunal ruled that there was insufficient evidence to find that Tonalin CLA was not a non-traditional food.

On the second issue, whether the decision of FSANZ that it would not vary Standard 1.5.1 is the correct and preferable decision, the Tribunal observed that FSANZ must give regard to the object of the FSANZ Act stated in Section 3 "to ensure a high standard of public health protection." This goal is specifically reinforced by Section 18(1), which sets out the objectives of FSANZ in developing or reviewing food regulatory measures and variations of such measures, the most important being "the protection of public health and safety." In performing such functions, pursuant to Section 18(2), FSANZ must have regard, amongst other matters, to "(a) the need for standards to be based on risk analysis using the best available scientific evidence," and "(e) any written policy guidelines formulated by the Council for the purposes of this paragraph and notified to the Authority."

In assessing an application, FSANZ is also required to have regard to the matters set out in Section 29(2), including whether the costs that would arise relevantly from a variation of a food regulatory measure outweigh the direct and indirect benefits to the community.

The Tribunal ruled that, having regard to the protection of public health and safety, the test to be applied was whether the best available scientific evidence satisfied that Tonalin CLA was safe for human consumption as an additive to food. In this regard, the Tribunal found the weight of evidence suggested that Tonalin CLA required further assessment of the public health and safety considerations, having regard to the potential for adverse effects in humans.

Consequently, the Tribunal affirmed the decision to reject application for the amendment of Standard 1.5.1 of the Code in order to approve the use of Tonalin CLA as a novel food in Australia.

### ***39.10.2 Misleading Conduct in Relation to Food Advertising***

*Australian Competition and Consumer Commission v Nudie Foods Australia Pty Ltd*<sup>102</sup> concerned the labelling of fruit juice products described as cranberry juice through the use of pictures and text. The Federal Court of Australia found this to be misleading because less than 20 % of the drink was cranberry juice. The balance of the drink was composed of apple juice. The Court ruled that Sections 52 and 53 of the Trade Practices Act had been breached.<sup>103</sup> The Court issued an injunction

---

<sup>102</sup>*Australian Competition and Consumer Commission v. Nudie Foods Australia Pty Ltd* (2008) FCA 943.

<sup>103</sup>Now ss. 18 and 29 of the *Australian Consumer Law* which appears as Schedule 2 to the *Competition and Consumer Act 2010*.

restraining the defendant for a period of 3 years from supplying, or marketing, or causing to be supplied or marketed, any products bearing labels or packaging that use a product name or description that includes the name of a fruit but does not in the product name or description either:

- (a) identify all of the fruits used in making the product; or
- (b) alert the consumer to the fact that fruit or fruits other than those identified in the product name or description were used in making the product.

The Court further ordered corrective advertising and required the defendants' establishment of an education training and trade practices compliance program designed to minimize the risk of future consumer protection infringements.

A similar case was *Australian Competition & Consumer Commission v Cadbury Schweppes Pty Ltd*<sup>104</sup> which involved the public sale of a flavoured cordial with a label containing the words "banana mango flavoured cordial." This phrase was coupled with pictorial representations of bananas and mangoes and a logo containing a caricature of a monkey with a half-peeled banana and an unpeeled banana. However, the cordial did not contain bananas or mangoes. The pictorial representations were found to be likely to mislead or deceive, contrary to Section 52 (1) of the Trade Practices Act 1974 (Cth). The false representation that the cordial was of a particular composition was found contrary to Section 53(a) of the Act. Finally, engaging in conduct that was liable to mislead the public as to the nature or characteristics of the cordial was found contrary to Section 55 of the Act. Conclusion.

*Australian Competition and Consumer Commission v Harvey Fresh (1994) Limited*<sup>105</sup> concerned representations on packaged cheese that indicated it was produced in Western Australia. In reality, the cheese was produced in the State of Victoria. This was found to be misleading conduct in breach of Section 52 of the Trade Practices Act 1974(Cth). It was also found to be a false representation as to the origins of the cheese in breach of Section 53(eb) of the Act. The respondent was enjoined from further advertising of this nature and it was required to publish corrective advertisements. Its staff was also required to undergo compliance training.

---

<sup>104</sup>*Australian Competition & Consumer Commission v Cadbury Schweppes Pty Ltd* (2004) FCA 516.

<sup>105</sup>*Australian Competition and Consumer Commission v Harvey Fresh (1994) Limited* (2009) FCA 853.

### 39.10.3 *Sanctions for False and Misleading Statements Used in Food Advertising*

In *Australian Competition and Consumer Commission v Turi Foods Pty Ltd (No 2)*<sup>106</sup> the Federal Court found that advertising materials for the ‘La Ionica’ brand of chickens falsely represented the conditions in which the chickens were raised. Over a period spanning between 2004 and 2010, Turi Foods published various advertising posters and painted murals on the side of its delivery trucks, both of which represented that the “La Ionica” chickens were raised in barns where they had substantial space to roam around freely. The artwork included statements such as “free roaming” and “no cages.” In reality, Turi Foods’ production barns held up to 18 chickens per square metre (reducing to 12 chickens per square metre as they grew in size). The ACCC argued that the representations of the conditions in its barns were false, misleading, or deceptive in breach of [sections 52 and 53](#) of the [Trade Practices Act 1974](#) (TPA) in respect of conduct which had taken place prior to 1 January 2011 and [sections 18 and 29\(1\)\(a\)](#) of the *Australian Consumer Law* (ACL) which appears as Schedule 2 to the *Competition and Consumer Act 2010* (Cth) (CCA). Turi Foods accepted the ACCC’s argument. The CCA replaced the Trade Practices Act 1974 on 1 January 2011. The Court ordered that Turi Foods pay a fine of \$100,000, publish corrective advertisements, and implement a compliance training program.

*Australian Competition and Consumer Commission v Turi Foods (No 4)*<sup>107</sup> concerned similar findings against other defendants concerning false and misleading advertising that chickens were “free to roam” in barns or sheds during their growth cycle. The defendants appealed against a number of the penalties imposed by the Court, including declarations under [Section 21](#) of the *Federal Court of Australia Act 1976* (Cth), injunctions under [Section 232](#) of the ACL; pecuniary penalties under [Section 76E](#) of the TPA and [Section 224](#) of the ACL; orders for publication and disclosure under [Sections 86C and 86D](#) of the TPA and under [Sections 246 and 247](#) of the ACL; orders for implementation of compliance programmes under [Section 86C](#) of the TPA and [Section 246](#) of the ACL. The Court affirmed the various remedies which had been ordered by the court below.

*Australian Competition and Consumer Commission v Turi Foods Pty Ltd (No 5)*<sup>108</sup> addressed the principles that courts apply in quantifying penalties, including the necessity for deterrence. These principles include:

- the size of the contravening company;
- the deliberateness of the contravention and the period over which it extended;

<sup>106</sup>*Australian Competition and Consumer Commission v Turi Foods Pty Ltd (No 2)* (2012) FCA 19.

<sup>107</sup>*Australian Competition and Consumer Commission v Turi Foods (No 4)* (2013) FCA 665.

<sup>108</sup>*Australian Competition and Consumer Commission v Turi Foods Pty Ltd (No 5)* (2013) FCA 1109.

- whether the contravention arose out of the conduct of senior management of the contravener or at some lower level;
- whether the contravener has a corporate culture conducive to compliance with [the ACL] as evidenced by educational programmes and disciplinary or other corrective measures in response to an acknowledged contravention;
- whether the contravener has shown a disposition to cooperate with the authorities responsible for the enforcement of [the ACL] in relation to the contravention;
- whether the contravener has engaged in similar conduct in the past;
- the financial position of the contravener; and
- whether the contravening conduct was systematic, deliberate or covert.<sup>109</sup>

*Australian Competition and Consumer Commission v Pepe's Ducks Ltd*<sup>110</sup> provided a recent illustration of the sanctions which courts impose in relation to false or misleading advertising in breach of the federal Australian consumer protection laws. The Respondent (Pepe's Ducks) acknowledged its liability for falsely advertising its duck meat products as "Grown Nature's Way" or an Outdoor "Barn Raised" as well as packaging indicating that the ducks were raised in other than factory conditions. It was ordered at its own expense to:

- (a) establish and maintain for 3 years a Trade Practices Compliance Program which met set out in an annexure to the court order;
- (b) within 14 days of the date of the court order to send a notice in the form of annexed to the court order to each customer that it is able to identify from its commercial records as being a customer to whom it has supplied Duck Meat Products during the 2 year period prior to the date of this order;
- (c) for a period of 90 days, publish on its Australian website homepage and on each of the internal webpages accessible by following the 'click-through' icons which appear on the Pepe's Ducks Homepage a notice in the terms and form annexed to the court order;
- (d) within 14 days of the date of the order display a notice in the form prescribed by the Court at the front of each of its business premises which shall be viewable to the public, and keep that notice on display for at least 90 days.

Additionally a pecuniary penalty of \$375,000 was imposed.

# Chapter 40

## Present & Future Jurisprudence of Consumer Protection and Food Law in Australia

Alex Bruce

**Abstract** In this chapter, I explore how the new *Australian Consumer Law* (“the ACL”) embedded in the *Competition and Consumer Act 2010* (Cth) is intended to protect consumers from misleading, deceptive and false credence claims associated with food products made by large corporate food producers and distributors. By “credence claims” I mean representations made by corporations in marketing food products that convey to consumers an impression that the product possesses some added quality that similar products may not possess. Credence claims are often associated with values-choices made by consumers such as “gluten free”, “not tested on animals” or “free range”. The differentiating quality may also appeal to the consumer’s ethical or religious values associated with food production and consumption.

### 40.1 Introduction

In this chapter, I explore how the new *Australian Consumer Law* (“the ACL”) embedded in the *Competition and Consumer Act 2010* (Cth) is intended to protect consumers from misleading, deceptive and false credence claims associated with food products made by large corporate food producers and distributors. By “credence claims” I mean representations made by corporations in marketing food products that convey to consumers an impression that the product possesses some added quality that similar products may not possess. Credence claims are often associated with values-choices made by consumers such as “gluten free”, “not tested on animals” or “free range”. The differentiating quality may also appeal to the consumer’s ethical or religious values associated with food production and consumption.

e-mail: [alex.bruce@anu.edu.au](mailto:alex.bruce@anu.edu.au)

The interest in but also potential vulnerability of consumers to misleading credence claims associated with the production and marketing of food products has assumed a high level of importance in Australia since 2011. There are two principal reasons for this. First, a significant Commonwealth (Federal) government review into Food Labelling Regulation recommended that “values claims” (credence claims) associated with food products should be regulated by the *Competition and Consumer Act 2010* (Cth) (“the CCA”) and, in particular the new *Australian Consumer Law* (“the ACL”) that sits within the CCA. Instead of direct regulation of food marking practices through specific legislation, the Commonwealth government intends the CCA generally, and the ACL specifically to assume a much more important profile in ensuring the fair, competitive and informed marketing of food products.

Secondly, and related to the first, the Commonwealth regulator of the CCA, the *Australian Competition and Consumer Commission* (“the ACCC”) has specifically made credence claims a National Enforcement Priority. Since 2011, the ACCC has instituted legal proceedings against several major food producers alleging breaches of the ACL in relation to credence claims associated with food products made by those producers.

Throughout this chapter, I will use examples of credence claims associated with the production and marketing of food animal products, eggs particularly, to demonstrate how the ACL has assumed a greater role in the regulation of food production and marketing in Australia. The chapter analyses several important decisions of the Federal Court of Australia concerning credence claims associated with food products. In doing so, the chapter identifies both the strengths and weaknesses of the ACL as the principal mechanism intended to regulate food production and marketing claims.

I argue that although this litigation does suggest the ACL functions well in capturing misleading or deceptive food product credence claims, it is only addressing the symptoms of a larger underlying dysfunction associated with the world-wide food production industry. While large agribusinesses dominate markets for food products generally and food animal products particularly, they will continue to face an intractable dilemma.

The nature of this underlying dilemma is this: On the one hand, agribusinesses have become reliant on large-scale, intensive farming and animal husbandry practices to meet demand for their products. However, on the other, those same agribusinesses are increasingly relying on clever advertising and marketing involving credence claims to exploit the growing interest shown by consumers and for whom such claims are important.

These strategies are largely antithetical. It is almost impossible for a large agribusiness processing chickens and eggs (for example) using intensive husbandry practices to simultaneously market chicken meat and eggs with “free range” or “free to roam” credence claims. As recent and frequent Australian litigation demonstrates, credence claims of this nature are simply not sustainable within the context of current corporate agricultural and animal husbandry practices.

In avoiding this dilemma, and associated economic externalities such as litigation, damages, corrective advertising and court-sanctioned compliance programs, agribusinesses need to explore alternative ways of food production that are not fundamentally damaging to the sustainability of our environment and to the human and animals inhabiting this fragile ecosystem. My chapter therefore concludes that in the future, litigation under the ACL involving credence claims may be avoided if agribusinesses implement alternative food production practices that emphasise nanotechnology-based artificial photosynthesis technologies forming the basis for a transition from anthropocentric-oriented food production systems to “sustainocene – oriented” food production systems.

This chapter is intentionally written for well-informed readers who are not necessarily familiar with the Australian legal system, the *Competition and Consumer Act 2010* (Cth), the *Australian Consumer Law* or the *Australian Competition and Consumer Commission*. Accordingly, the chapter gently introduces readers to these important pieces of legislation before embarking on more substantive analysis exploring how the CCA and the ACL have been utilised by the ACCC and then applied by the Courts in addressing misleading or deceptive credence claims associated with food products.

My discussion in this chapter proceeds in the following manner. Following this Introduction, Sect. 40.2 introduces the economic and regulatory context to food regulation and consumer protection in Australia. It identifies the market forces that have resulted in corporate domination of the Australian food industry and explains how those corporations are employing credence claims associated with food products generally and food animal products particularly, to capture market share. In Sect. 40.3 it discusses growing consumer preferences for food product credence claims and demonstrates how and why Australian consumers are vulnerable to exploitation by large corporate producers and suppliers of food products.

Importantly, this discussion underscores the intractable dilemma faced by food producers and suppliers in marketing credence claims discussed in Sect. 40.1; that it is almost impossible for a large agribusiness processing chickens and eggs (for example) using intensive husbandry practices to simultaneously market chicken meat and eggs with “free range” or “free to roam” credence claims. As recent and frequent Australian litigation demonstrates, credence claims of this nature are simply not sustainable within the context of current corporate agricultural and animal husbandry practices.

In Sect. 40.4, the chapter introduces the *Labelling Logic Report* and the Commonwealth government’s response to the *Report*, giving the *Australian Consumer Law* a greater role in addressing corporate exploitation of consumer preferences for credence claims associated with food products. The nature, role and method by which the *Competition and Consumer Act 2010* (Cth) and the *Australian Consumer Law* have assumed a greater role in regulating food product claims is then set out in Sect. 40.5 and explains the mechanism by which 18 of the ACL prohibits misleading and deceptive conduct.

Having established the regulatory, economic and legal framework, Sect. 40.6 turns to an analysis of recent Federal Court litigation instituted by the *Australian*

*Competition and Consumer Commission* against food producers and suppliers. This litigation focuses on misleading and deceptive conduct associated with credence claims made about food animal products, particularly eggs. It demonstrates how the *Australian Consumer Law* can be deployed by the ACCC to address misleading or false food credence claims.

Section 40.7 concludes with a discussion of alternative agribusiness technology in the form of artificial photosynthesis. Employing sunlight to catalyse water into hydrogen and oxygen, as well as capturing atmospheric carbon-dioxide has the potential to revolutionise global agribusiness. Artificial photosynthesis processes would also enable hydrogen to be combined with nitrogen to produce ammonia, a staple input in agrifood production. In this way, artificial photosynthesis technology has the potential to go some way to resolving the dilemma facing agribusiness discussed earlier.

## 40.2 Economic and Regulatory Context

### 40.2.1 *The Patchwork Nature of Food Law & Regulation in Australia*

Regulating and managing a safe, competitive and informed relationship between Australian consumers on the one hand, and food retailers on the other, is problematic. With no express Constitutional power concerning food production, the creation of food standards, food product labelling or food product marketing, the Australian Commonwealth (Federal) government instead relies on a complex network of *Intergovernmental Agreements*, *Codes*, *Legislative Instruments*, *Standards* and other policy documents co-operatively enforced by the Commonwealth government, State and Territory governments and the government of New Zealand.

The starting point is the *Australia New Zealand Food Standards Code* ('the Food Code') administered through *Food Standards Australia New Zealand* ('FSANZ'). The Food Code itself is not a legislative document. However the Food Code includes certain *Food Standards* ('the Standards') that are given legal status as legislative instruments under the *Legislative Instruments Act 2003* (Cth). Industry compliance with the Standards is therefore mandatory.

In Australia, the Standards are then reinforced through the *Food Standards Australia New Zealand Act 1991* (Cth) ('the FSANZ Act') intended to prevent misleading and deceptive conduct by ensuring that consumers have adequate information to make informed food choices.<sup>1</sup> Actual day-to-day responsibility for the Standards is shared across the Commonwealth, State and Territory governments through a series of *Intergovernmental Agreements* assigning responsibility between the Commonwealth *Department of Agriculture, Forest and Fisheries*, the

---

<sup>1</sup>*Food Standards Australia New Zealand Act 1991* (Cth), s 3(c).

*Australian Quarantine Inspection Service* and State and Territory *Primary Industries or Health Departments*.

Importantly, *enforcement* of the Standards is the joint responsibility of the *Australian Competition and Consumer Commission* ('the ACCC') under the ACL and the *Australian Quarantine Inspection Service* ('AQIS').<sup>2</sup>

In this way, the Commonwealth government anticipates misleading or deceptive conduct associated with food labelling to be dealt with at the Commonwealth level by the ACCC and at State and Territory levels by relevant Fair Trading Departments through the ACL as it applies in their jurisdiction.<sup>3</sup>

### **40.2.2 Corporate Dominance of Food Production & Distribution**

Food distribution in Australia is characterised by near duopoly, with Coles Supermarkets Pty Ltd and Woolworths Limited responsible for approximately 70 % of packaged grocery sales and 50 % of fresh food product sales in Australia.<sup>4</sup> This concentration of market power in the hands of two significant vertically integrated retailers enables them to exercise considerable up-stream and down-stream market power.<sup>5</sup>

In addition, most of the animal meat produced in Australia for both domestic consumption and export is processed by a few dominant corporations. The Australian chicken meat industry is a virtual duopoly. According to the Australian Chicken Meat Federation ('ACMF'): 'the two largest (companies) Baiada Poultry and Inghams Enterprises, supply more than 80 % of Australia's chicken meat'.<sup>6</sup>

The beef industry is dominated by four producers. Swift Australia, Cargill Australia, Teys Brothers and Nippon Meats supply almost 50 % of meat products in Australia.<sup>7</sup> And in 2011, the Australian Competition and Consumer Commission

(‘the ACCC’) cleared a proposed acquisition of Teys Brothers by Cargill Beef Australia; an acquisition that permitted the merger of Australia’s second and fourth largest beef processors leading to a further concentration of corporate production of animal food products.<sup>8</sup>

### 40.2.3 *The Scale of Food Animal Production and Consumption*

The quantities of chickens, cattle and pigs slaughtered and processed by these corporations each year is enormous. In 2010–2011, almost 500 million chickens were slaughtered<sup>9</sup> and by 2015, cattle processing is expected to reach 2.4 million tonnes.<sup>10</sup> To give these figures some perspective, and in relation to the 2010 figures, Meat and Livestock Australia report:<sup>11</sup>

Over the 12 months to September 2010, fresh meat purchases increased 3% to about 133 million serves/week. Contributing to the trend was a rise in beef (by 4%), lamb (up 2%) and chicken purchases (up 6%) to 52 million serves/week, 22 million serves/week and 38 million serves/week, respectively.<sup>12</sup>

Australia also exports a significant amount of cattle and sheep to Muslim countries for slaughter according to religious ‘halal’ procedures. According to Animals Australia, some 22 million sheep and cattle have been exported to Kuwait alone over the past 20 years.<sup>13</sup>

Australia’s exports of beef and sheep generally continued to grow throughout 2011. Beef exports during 2011 increased by 22% to 165,000 tonnes when compared to the previous quarter with sheep exports increasing by 2% to 644,000 tonnes.<sup>14</sup>

Most farmed animals in Australia for both domestic consumption and export are confined in Concentrated Animal Feedlot Operations (“CAFO’s”) described as:

<sup>14</sup>Australian Bureau of Statistics, 7215.0—Livestock Products, Australia, Dec 2011 at <http://www.abs.gov.au/ausstats/abs@.nsf/lookup/7215.0main+features4Dec+2011> (cited 27 March 2012).

... a system of raising animals using intensive production line methods that maximise the amount of meat produced while minimising costs. Industrial animal agriculture is characterised by high stocking densities and/or close confinement, forced growth rates, high mechanisation and low labour requirements.<sup>15</sup>

Australian Animal Advocacy Group 'Voiceless' states that 'more than 5 million pigs, 13 million hens and 420 million meat or 'broiler' chickens are raised for food production in Australia every year. Most of these animals spend their lives crammed together in giant factory farms'.<sup>16</sup>

By 2050, the United Nations Population Division predicts that the world's population will reach somewhere between 8 and 11 billion people.<sup>17</sup> Much of this population growth will occur in developing countries where a growing middle class, with more disposable income is expected to generate substantial demand for meat products as part of their diet.<sup>18</sup> This is particularly so in China and India where demand for meat products is quickly growing.<sup>19</sup>

In order to meet this expected demand for food generally and meat products particularly, the United Nations Food and Agricultural Organisation estimates that agricultural output will need to increase by 70% but must do so in circumstances of a world-wide decline in agricultural land because of climate change, dwindling fossil fuel supplies and the general movement of people off the land and into cities, urban and sub-urban areas.<sup>20</sup>

Most suggestions for meeting these challenges involve increasing the output of CAFO's through more efficient breeding and production techniques rather than advocating plant-based diets or even artificially grown meat products.<sup>21</sup> In these circumstances, the challenge for most Western countries will be to increase the efficiency of existing CAFO's in order to produce sufficient meat products for domestic consumption and emerging foreign demand for meat products.

For example, the National Farmers Federation ('the NFF'), the peak industry representative body for farmers in Australia has specifically noted the strategic advantages available to Australian meat and grain producers in satisfying future demand from developing countries. In its *NFF Farm Facts: 2012* Report, the NFF observes:

The prospects for agriculture are huge, with the need to feed, clothe and house a booming world population. Expanding Asian societies need food and fibre like never before and, due to their growing affluence, are demanding produce of the highest quality. The challenge for Australian agriculture and our farmers will be in meeting this booming need for food and

<sup>21</sup>Galyean et al. (2011), pp. 29–32.

fibre through increasing production. Agriculture has an enormous uptake of new technology.<sup>22</sup>

Australia, North America and other Western countries are therefore proposing to meet the expected increase in world demand for food animal products generally, and meat products particularly, by increasing the efficiency and productivity of agricultural practices generally and CAFOs specifically particularly through technology.<sup>23</sup>

In the process, attention is being drawn to the suffering that food animals inevitably experience as a result of the growth in corporate exploitation of more efficient and productive intensive animal husbandry practices.<sup>24</sup> And the role of corporations in the pursuit of profits through efficiency is central to this enterprise.

#### ***40.2.4 Animals as Property, Corporations as People***

These industries are made possible in Australia by a legal system that characterises sentient, feeling animals as property without enforceable rights, and non-sentient corporations as legal persons with rights to own and exploit property. Section 124 (1) of the *Corporations Act 2001* (Cth) provides that corporations have the legal capacity and powers of an individual and of a body corporate, including the power to own property.

Darian Ibrahim explains the consequences of this characterisation: ‘corporate personhood and animal thing-hood allow for the corporate ownership of animals. Corporate ownership of animals exists wherever animal use has been institutionalised, but it figures most prominently in animal agriculture’.<sup>25</sup> Beginning in the second half of the twentieth century, corporations began owning and exploiting large numbers of animals to produce food for people at profit. In this process, the primary responsibility of corporation is to shareholders, manifesting as duties to trade profitably.<sup>26</sup>

#### ***40.2.5 The Privileging of Profit Over Welfare***

In these circumstances, the welfare of animals exploited by corporations is therefore a relative consideration necessarily balanced against the imperative of the

<sup>24</sup>Winders and Nibert (2004), p. 76.

<sup>25</sup>Ibrahim (2007), pp. 89–93.

<sup>26</sup>*Greenhalgh v Ardene Cinemas* [1951] Ch 286; Horrigan (2003), p. 321.

profit motive. In *Department of Local Government & Regional Development v Emanuel Exports Pty Ltd*,<sup>27</sup> Magistrate C.P. Crawford noted that the relationship between corporate profit motives and suffering of animals was a balancing act; ‘in the context of this case, that commercial gain has to be balanced against the likelihood of pain, injury or death to relevant sheep shipped in the second half of the year’.<sup>28</sup>

Achieving this balancing act may be difficult when the profit motive is pressing. In his text *Diet For a New America*, John Robbins quotes livestock auctioneer Henry Pace:

We’re no different from any other business. These animal rights people like to accuse us of mistreating our stock, but we believe we can be most efficient by not being emotional. We are a business, not a humane society, and our job is to sell merchandise at a profit. It’s no different from selling paper-clips, or refrigerators.<sup>29</sup>

And so consumers are not readily placed to think about the often difficult animal husbandry practices associated with efficiently producing animal meat. One reason for this is the significant lack of connection between the way animals are portrayed in promotional material and the clinical, plastic-wrapped meat products purchased from the supermarket. Consumers don’t make the explicit connection between the slaughter of another sentient being—an animal—and the meat that is then consumed. It’s a form of consumer ‘cellophane fallacy’ that disassociates the consumer from the method of production of the consumer’s food.<sup>30</sup>

While consumers might prefer to think of animals as living carefree lives on verdant open-air farms, the reality is very different. In fact, the number of animal farmers in Australia has declined dramatically. For example, between 1980 and 2007, the number of Australian pig-farmers declined by 90 %. However, during that same period, the average pig herd increased by 900 % while pig-meat production almost doubled.<sup>31</sup>

If the number of pigs being harvested for their meat has increased so dramatically, while the number of farms has decreased by 90 %, then where are the pigs being raised and slaughtered? The reality is that large corporations are now involved in industrial-scale intensive animal ‘farming’. These corporations do not

<sup>27</sup>*Department of Local Government & Regional Development v Emanuel Exports Pty Ltd* (Unreported decision of 8 February 2003, WA Magistrates Court).

<sup>28</sup>*Ibid* at 99.

<sup>29</sup>Robbins (1987), p. 104.

<sup>30</sup>The ‘cellophane fallacy’ is a term used in competition law (antitrust) that refers to an error in market definition. Named after the decision of the United States Supreme Court in *United States v El Du Pont de Nemours & Co* 351 US 377 (1956), the cellophane fallacy is incurred if the price that is employed in the ‘hypothetical monopolist test’ in market definition is taken to be the current monopoly price and not the *competitive price*. Employing the monopoly price results in an overbroad market definition and thus erroneously gives the impression of less market power than might actually exist. See Corones (2010), p. 68.

<sup>31</sup>Voiceless, *Pig Factories*, consumer action sheet, November 2009, on [www.voiceless.org.au](http://www.voiceless.org.au) at Resources (cited 21 August 2011).

raise pigs on lush, green pastures. Instead, they employ intensive farming techniques where the animals are removed from their natural environment and confined or caged in great numbers to live under controlled conditions.

Producing animal meat or harvesting eggs using these intensive production methods is legal in Australia. Commonwealth *Model Codes of Practice* ('MCOPs') relating to beef cattle, poultry and pigs permits the industrial processing of animals for human consumption. These MCOPs were issued by the Primary Industries Ministerial Council ('PIMC'), now the *Standing Committee on Primary Industries* ("SCoPI") whose stated objective is 'to develop and promote sustainable, innovative and profitable agriculture, fisheries/aquaculture and food and forestry industries'.<sup>32</sup>

In other words, the goal of the Commonwealth Authority responsible for creating welfare standards for food animals in Australia is to create profitable and exploitable food animal and animal product industries. When the primary purpose is the creation and maintenance of profitable industries, animal welfare is subordinated to economic efficiency.

## 40.3 Food Product Credence Claims & Consumer Vulnerability

### 40.3.1 Consumer Demand for Credence Claims

In 2006, then Commissioner John Martin of the Australian Competition and Consumer Commission ('ACCC') launched the first edition of the ACCC's *Food and Beverage Labelling Guidelines*.<sup>33</sup> The *Guidelines* are intended to assist food and beverage providers in understanding the implications of the law relating to misleading or deceptive conduct.

Commissioner Martin made two important points during his presentation that are relevant to the discussion in Part 3 of this thesis. First, Commissioner Martin noted that 'consumers are becoming increasingly sophisticated and discerning. They are demanding products that offer health benefits, are fresher or are Australian produced'.<sup>34</sup>

Second, he noted that 'products that can highlight such benefits have a better chance of standing out from the pack and grabbing the attention of shoppers on crowded shelves. But this creates temptation for producers and their marketers to "push the envelope" and in some cases break the law in an effort to gain an edge over the competition'.<sup>35</sup>

<sup>32</sup>[http://www.mincos.gov.au/about\\_pimc](http://www.mincos.gov.au/about_pimc).

<sup>33</sup>Martin (2006).

<sup>34</sup>Ibid 3.

<sup>35</sup>Ibid.

Over the last 5 years, Australian consumers *have* become more discerning about the way in which food animals are treated. In Australia, the InterContinental Hotels Group, which owns the Crowne Plaza Canberra, the National Convention Centre and Parliament House Catering Services, announced in 2008 that it would alter its purchasing decisions to buy eggs pursuant to the *Choose Wisely* Campaign.<sup>36</sup>

The same month, the Australian Capital Territory Government announced that by May 2009, ‘all ACT Government agencies including our hospitals, correctional facilities, CIT campuses and schools, will use barn laid or free-range eggs’ pursuant to the RSPCA’s *Choose Wisely* Campaign.<sup>37</sup> And in its 2012–2013 Budget, the Tasmanian government introduced the *Intensive Animal Farming Development Program* under which \$2.5 million will be spent over 2 years in phasing out battery-hen farms and the use of sow stalls.<sup>38</sup> In introducing these food animal welfare initiatives, the Tasmanian Treasurer specifically noted that ‘changes in market and consumer demand’ motivated the Budget initiatives’.<sup>39</sup>

Evidence from the United Kingdom, the European Union and the United States reflects evidence from Australia that consumers are becoming increasingly concerned about credence claims associated with food products generally and food animal products particularly.<sup>40</sup>

This willingness on the part of consumers to pay a premium for food products that bear credence claims about quality, content and creation provenance has been noted by the Federal Court. False representations concerning free-range eggs were described by the Court in, *ACCC v Turi Foods (No 4) Ltd* as amounting “to a cruel deception on consumers who mostly seek out free range eggs as a matter of principle, hoping to advance the cause of animal welfare by so doing.”<sup>41</sup>

Conversely, food producers and suppliers are also beginning to recognise consumers’ concerns and are attempting to differentiate their food animal products on the basis of animal welfare.

<sup>40</sup>Napolitano et al. (2010), pp. 537–538.

<sup>41</sup>[31].

### 40.3.2 Consumer Vulnerability

These market concentrations and practices potentially expose both food producers (farmers) and food consumers to both price and information asymmetries and exploitation through deceptive marketing practices.<sup>42</sup> Indeed, 2009 OECD figures indicated that domestic food prices in Australia had increased by 40 % over the decade 2000–2009.<sup>43</sup> The situation in Australia simply reflects the wider shift in agricultural practices world-wide, characterised by increased corporate concentration at all stages of the supply chain.<sup>44</sup>

Unfortunately, the decisions of the Federal Court in *Australian Competition and Consumer Commission v C.I. & Co Pty Ltd*,<sup>45</sup> and *Australian Competition and Consumer Commission v Turi Foods Pty Ltd (No 2)*<sup>46</sup> confirm Commissioner Martin's fears that in doing so, some producers will attempt to take advantage of these concerns by labelling food animal products in ways that deceive consumers about welfare issues.

Why are consumers vulnerable to price exploitation and misleading marketing practices as a result of information asymmetries? Consumers are rarely in a position to evaluate credence claims associated with the production of food products. This is particularly so in considering whether and to what extent welfare-friendly animal husbandry methods have been employed in the production of animal based food products. In such circumstances information asymmetries create opportunities for producers and retailers to exploit consumer demand for credence attributes associated with food products.

How do these information asymmetries arise? In centuries past, consumers may have been able to purchase their food products directly from the farmer/producer at village markets thereby satisfying themselves of the provenance of the food being purchased. While this did not completely immunise the consumer from exploitation, that possibility was at least minimised.<sup>47</sup>

<sup>46</sup>*Australian Competition and Consumer Commission v Turi Foods Pty Ltd (No 2)* [1012] FCA 19 (2 December 2011).

<sup>47</sup>Bruce (2013), p. 4. In the Middle Ages, most trade in domestic goods and services was conducted at markets, held once each week. The owners of the markets or fairs charged the merchants who were selling goods at their market a fee called a 'stallage' for the space. Unscrupulous traders would often attempt to prevent other traders from entering the market. This had the effect of preventing price competition for various goods as well as preventing the market owner from collecting the stallage fee. This practice was known as 'forestalling'. When it was practiced during times of poor harvests or famine, it enabled some traders to manipulate the market. The absence of outside competition allowed the traders to extract supra-competitive prices for their goods.

However, in the twenty-first century the corporatisation of food production displaces the consumer in time and space from the primary producer of the food products being consumed. In contemporary Western societies, consumers will generally purchase their food from corporate-owned supermarket chains. In Australia, the average family spends approximately 12–14 % of their after-tax income on standard groceries at supermarkets.<sup>48</sup> In making these spending decision, labels on food packaging provide valuable information to consumers at point of sale.<sup>49</sup>

In these circumstances, significant information asymmetries are created; the actual producer possesses almost all relevant information concerning credence claims associated with their food products, while the consumer is usually unable to verify the truth of the credence claim at point of sale.<sup>50</sup> For example, once eggs are placed in a carton, it is impossible for consumers to discern whether the eggs were free-range or cage.<sup>51</sup>

This ‘information asymmetry’ creates an imbalance of power between producers and suppliers on one hand, and consumers on the other.<sup>52</sup> In circumstances of such information asymmetry, where consumers are unable to verify the truth of credence claims, they are then unable to make informed purchases of products.<sup>53</sup>

The most intuitive response to information asymmetries associated with credence claims is for governments to initiate food labelling reform. It is therefore important to explore the Commonwealth government’s response to these difficulties.

## 40.4 Australian Commonwealth Government Labelling Initiatives

### 40.4.1 *The Labelling Logic Report*

In Australia a major Commonwealth Government Review into food labelling laws was recently concluded. On 23 October 2009, the Council of Australian Governments (COAG) and the Australia and New Zealand Food Regulation Ministerial Council (Ministerial Council) agreed to undertake a comprehensive review of food

---

<sup>52</sup>Lee (2013), p. 42.

<sup>53</sup>*Ibid.*

labelling law and policy. This is the review that resulted in the *Labelling Logic Report*.

After the first round of consultations during which it received over 6000 public submissions, the Review Panel issued its *Issues Consultation Paper* on 5 March 2010 ('the *Consultation Paper*') and invited further submissions.<sup>54</sup> Question 17 of the *Consultation Paper* asked whether 'there is a need to establish agreed definitions of terms such as 'natural', 'lite', 'organic', 'free range', 'virgin' (as regards olive oil), 'kosher' or 'halal'? If so, should these definitions be included or referenced in the Food Standards Code?'<sup>55</sup>

However, in relation to consumer values issues relating to specific food production methods the *Labelling Logic Report* did recommend the Commonwealth government adopt specific values-based definitions in the *Food Standards Code* in order to achieve consistency of definitions.<sup>56</sup>

This recommendation was rejected by the Commonwealth government in its December 2011 Response. Instead, the Commonwealth stated that where regulation concerning labelling representations was needed, the mechanisms in the *Competition and Consumer Act 2010* (Cth) were more appropriate to the task.<sup>57</sup> The decision to employ the ACL in this way is consistent with earlier Commonwealth regulatory initiatives such as the *Food Standards Australia New Zealand Act 1991* (Cth) intended to prevent misleading and deceptive conduct by ensuring that consumers have adequate information to make informed food choices.<sup>58</sup>

#### 40.4.2 *Greater Role of the Australian Consumer Law*

What this means is that Instead of simply legislating to prohibit certain animal husbandry practices, the Commonwealth government is intending market forces in the form of consumer demand exerting up-stream market pressure on primary industry producers to implement food animal welfare initiatives.

In attempting to satisfy this consumer demand, food animal products accentuating animal welfare will be subject to careful scrutiny under the misleading or

---

<sup>58</sup>*Food Standards Australia New Zealand Act 1991* (Cth), s 3(c).

deceptive conduct provisions of the ACL. Product differentiation based on food animal welfare claims requires careful substantiation.<sup>59</sup>

However, the unstated assumption behind this policy of preventing deception associated with food labels involves the effective operation of market forces of supply and demand. It assumes that market dynamics will facilitate consumers' desires for accurate information about welfare friendly food animal products. In an increasingly competitive market for food products, it is anticipated that consumer demand for ethically produced animal products will signal producers to implement food animal welfare practices such as free-range farms.<sup>60</sup>

## 40.5 The Nature and Function of the *Australian Consumer Law*

### 40.5.1 *Australia's New Consumer Protection Regime*

Until 2011, consumer protection and product liability in Australia was regulated by an often confusing patchwork of Commonwealth, State and Territory legislation, regulations and subordinate legislation. At the Commonwealth (Commonwealth) level and since 1974, the *Trade Practices Act 1974* (Cth) ('the TPA') provided Australia's principal source of consumer protection legislation. Complimenting and in many places duplicating the TPA were individual State and Territory *Fair Trading* legislation.

In May 2008, some 2 years after it had formally commenced its inquiry, the Australian Productivity Commission's (PC) *Review of Australia's Consumer Policy Framework* was tabled in Federal Parliament. That review recommended the implementation of a single, national Australian consumer law to replace the consumer protection regimes in both the TPA and the various State and Territory Fair Trading Acts.

Pursuant to this Review and on 1 January 2011, this relatively fragmented landscape of consumer protection and product liability law in Australia fundamentally changed. The *Trade Practices Amendment (Australian Consumer Law) Act (No 2) 2010* ('the ACL Act') completed a process of reform that had been gaining momentum since the early 2000s and that culminated in the creation of a single, nation-wide consumer protection and product liability regime in the form of the *Australian Consumer Law*.

In the process, the *Australian Consumer Law* replaced 17 generic consumer protection laws that existed across States and Territories with a single national Consumer

<sup>59</sup>In its *Food Labelling Guide*, the ACCC warns that it has 'become increasingly concerned about representation on the labels, packaging and advertisements of food and beverage products.' ACCC *Food Labelling Guide*, 2009, Canberra, Australia, 3.

<sup>60</sup>Food Labelling Law and Policy Review Panel, *Labelling Logic: Review of Food Labelling Law and Policy*, 27 January 2011, Commonwealth of Australia, paragraph 3.20 at p 47.

Law found in Schedule 2 to the CCA and implemented as a law of the Commonwealth in Part XI of the CCA and as an ‘applied law’ of the States and Territories in Part XI<sup>AA</sup> of CCA and for the most part, embedded in *Fair Trading* legislation.

It is the largest reform of Australian consumer protection laws ever undertaken. I have explained in more detail elsewhere the policy and constitutional background to, and the mechanics of the national implementation of the ACL.<sup>61</sup>

### ***40.5.2 The ACL & Food Product Labelling***

At first glance, the ACL appears to have little to do with food product labelling generally and food animal product labelling specifically. Sitting as it does within the *Competition and Consumer Act 2010* (Cth) (‘the CCA’) the ACL is intended to facilitate the larger objective of the CCA in enhancing the welfare of Australians through the promotion of competition, fair trading and consumer protection.<sup>62</sup>

Despite its principally economic focus, the CCA and the ACL *does* have a significant role to play in protecting consumers from misleading or deceptive credence claims associated with food products. This is because s 18 of the ACL prohibits conduct that is “misleading or deceptive or likely to mislead or deceive”. Almost all of the recent litigation associated with credence claims has involved the *Australian Competition and Consumer Commission* instituting proceedings against a corporation alleging a contravention of s 18 of the ACL in making misleading credence claims. This litigation is discussed below.

Before exploring this litigation, it is important to understand how s 18 of the ACL is structured and has been interpreted by the Courts.

### ***40.5.3 ACL s 18: The Prohibition Against Misleading or Deceptive Conduct***

The text of s 18 of the *Australian Consumer Law* is relatively straightforward; there are 3 elements that must be satisfied in order to establish a contravention:

1. A corporation or person engages in conduct;
2. In trade or commerce; that is
3. Misleading or deceptive or likely to mislead or deceive.

At this point, it should be noted that although s 52 of the TPA is now s 18 of the *Australian Consumer Law*, all of the case-law relating to the interpretation of the

<sup>61</sup>Bruce (2011a), Chapters 1 and 2, pp. 1–50.

<sup>62</sup>*Competition and Consumer Act 2010* (Cth) s 2.

former s 52 will continue to guide the Courts in evaluating conduct alleged to breach s 18 of the *Australian Consumer Law*.

The *Explanatory Memorandum to the Trade Practices Amendment (Australian Consumer Law) Act (No 2) 2010* Cth, specifically states:

Section 18 of the ACL replaces the repealed Section 52 of the TP Act. The substance of the drafting of the prohibition has not been changed, other than changing the reference to 'a corporation' to 'a person'. Accordingly, the well-developed jurisprudence relating to s 52 of the TP Act is relevant to the interpretation or understanding of the meaning and application of Section 18 of the ACL.<sup>63</sup>

Most of the case law discussed in this chapter involves conduct evaluated under the former s 52 of the TPA. However, for the sake of clarity, I will substitute '[s.18]' for 's.52' in relevant case-law extracts. There is no material difference in the sections and the substitution is intended for ease of conceptualising the argument as involving ACL s 18 rather than s 52 of the TPA.

While it is true that the elements of ACL s 18 are clear, the interpretation and application of those elements has not been straightforward. The High Court in *Parkdale Custom Built Furniture Proprietary Limited v Puxu Proprietary Limited* admitted:

The words of [s.18] have been said to be clear and unambiguous....Nevertheless they are productive of considerable difficulty when it becomes necessary to apply them to the facts of particular cases. Like most general precepts framed in abstract terms, the Section affords little practical guidance to those who seek to arrange their activities so that they will not offend against its provisions.<sup>64</sup>

These difficulties often arise in satisfying threshold requirements for successfully establishing a contravention of ACL s 18. First, the conduct of the person or corporation must be assessable under the *Competition and Consumer Act 2010* (Cth).

Second, the conduct must be 'in trade or commerce'; third, there must be an identifiable 'class of consumers' who are alleged to have been misled; and fourth, the conduct must have in fact caused the misled state of mind, and to succeed in recovering damages, the loss or damage must have been caused by the allegedly misleading or deceptive conduct.

In working through these requirements the Courts have developed a *methodology* in relation to the former s 52 of the *Trade Practices Act 1974* (Cth) that enables conduct to be evaluated. There are certain elements built into that methodology that must be examined in interpreting ACL s 18.

<sup>63</sup>*Explanatory Memorandum to the Trade Practices Amendment (Australian Consumer Law) Act (No 2) 2010* (Cth), 37, [3.11].

<sup>64</sup>*Parkdale Custom Built Furniture Proprietary Limited v Puxu Proprietary Limited* (1988–1982) 149 CLR 191, 197 per Gibbs CJ.

#### **40.5.4 A Norm of Conduct Not an Imposition of Liability**

Section 18 of the *Australian Consumer Law* does not actually create a cause of action. It simply establishes a standard of conduct; a person must not in trade or commerce, engage in conduct that is misleading or deceptive or likely to mislead or deceive. The Court in *Brown v Jam Factory Pty Ltd* noted:

Section [18] does not purport to create liability at all; rather it establishes a norm of conduct, failure to observe which has consequences provided for elsewhere in the same statute or under the general law.<sup>65</sup>

When the Court mentioned ‘consequences provided for elsewhere in the same statute’ it was referring to the remedies and orders available under the then *Trade Practices Act 1974* (Cth) for a contravention of Part V of the TPA that included s 52.

Likewise, the ‘norm of conduct’ provided for by ACL s 18 does not of itself establish the consequences for a breach. The remedial provisions for a contravention of ACL s 18 are found in other parts of the ACL; principally in Chapter 5 and include injunctive relief<sup>66</sup> and damages.<sup>67</sup>

#### **40.5.5 Conduct ‘In Trade or Commerce’**

For the purposes of this article, and consistent with the authoritative interpretation of that term by the High Court in *Concrete Constructions (NSW) Pty Limited v Nelson*,<sup>68</sup> the sale for profit of grocery and other food animal products is conduct that is in trade or commerce for the purposes of the ACL. Consistent with the decision in *Concrete Constructions*, the retail sale of products is an activity that of itself bears a trading or commercial character.

#### **40.5.6 When Is Conduct ‘Misleading or Deceptive’?**

Conduct is misleading or deceptive when it ‘leads into error’. The High Court in *Parkdale Custom Built Furniture Proprietary Limited v Puxu Proprietary Limited* explained:

The words of [s.18] require the Court to consider the nature of the conduct of the corporation against which proceedings are brought and to decide whether that conduct

---

<sup>65</sup>*Brown v Jam Factory Pty Ltd* (1981) 53 FLR 340, 348.

<sup>66</sup>ACL s 232.

<sup>67</sup>ACL s 236.

<sup>68</sup>*Concrete Constructions (NSW) Pty Limited v Nelson* (1990) 169 CLR 594.

was, within the meaning of that section, misleading or deceptive or likely to mislead or deceive. . . One meaning which the words ‘mislead’ and ‘deceive’ share in common is ‘to lead into error’.<sup>69</sup>

The Full Federal Court in *Astrazeneca Pty Ltd v Glaxosmithkline Australia Pty Ltd* formulated the requirement as follows:

In order to determine whether there has been any contravention of [s.18] of the Act, it is necessary to determine whether or not the conduct complained of amounted to a representation which has or would be likely to lead to a misconception arising in the minds of that section of the public to whom the conduct (which may include refraining from doing an act) has been directed.<sup>70</sup>

Whether evaluating the conduct of corporations or of persons, there are three threshold issues that need to be addressed before the prohibition in ACL s 18 can be established.

1. Whether conduct is ‘in trade or commerce’;
2. The *Taco Bell*<sup>71</sup> methodology for evaluating misleading or deceptive conduct; and
3. The *Campomar*<sup>72</sup> methodology employed for evaluating the relevant ‘class of consumers’ alleged to have been misled.

These foundational methods or principles influence whether ACL s 18 even applies (because the conduct in question might not be ‘in trade or commerce’) and if it does, who might have been misled (identifying the ‘class’ of consumers through the *Campomar* methodology) and then whether that conduct is misleading or deceptive in breach of s 18 of the *Australian Consumer Law* (the *Taco Bell* methodology).

### 40.5.7 *The Taco Bell Methodology*

Conduct is misleading or deceptive if it ‘leads into error’. But what is the method by which conduct is considered to have led into error and therefore breached ACL s 18? What processes does the Court undertake in making its assessment? In *Apotex Pty Ltd v Les Laboratoires Servier (No 2)*, the Court stated:

In *Taco Co of Australia Inc v Taco Bell Pty Ltd* (1982) 24 ALR 177 at 202 Deane and Fitzgerald JJ outlined a series of propositions to be considered in assessing whether conduct is misleading or deceptive under [s 18] of the Act:

<sup>69</sup>*Parkdale Custom Built Furniture Proprietary Limited v Puxu Proprietary Limited* (1981–1982) 149 CLR 191, 198.

<sup>70</sup>*Astrazeneca Pty Ltd v Glaxosmithkline Australia Pty Ltd* (2006) ATPR 42-106, 44,890.

<sup>71</sup>*Taco Co of Australia Inc v Taco Bell Pty Ltd* (1982) 24 ALR 177.

<sup>72</sup>*Campomar Sociedad v Nike International* (2000) 202 CLR 45.

- It is necessary to identify the relevant section(s) of the public by reference to whom the question of whether conduct is or is likely to be misleading or deceptive falls to be tested;
- Once the relevant section of the public is established, the matter is to be considered by reference to all who come within it, including the astute or the gullible, the intelligent or not so intelligent, educated or not educated and men and women of various ages and vocations;
- Evidence that some individual has in fact formed an erroneous conclusion is admissible and may be persuasive but is not essential. Regardless, such evidence does not of itself conclusively establish the conduct to be misleading or deceptive, the test is objective and the Court must determine for itself;
- It is necessary to inquire why any proven misconception has arisen. It is only by this investigation that the evidence of those who are shown to have been led into error can be evaluated and it can be determined whether they are confused because of misleading or deceptive conduct on the part of the respondent.<sup>73</sup>

#### 40.5.7.1 Application of the Taco Bell Methodology

This process of evaluation, sometimes referred to as the ‘Taco Bell Steps’ has been adopted and elaborated upon, either explicitly or implicitly by almost all decisions in which the Court is required to evaluate whether conduct is misleading or deceptive or likely to mislead or deceive. For example, in *Domain Names Australia Pty Ltd v .au Domain Administration Ltd*, the Full Court stated:

It has long been established that:

- When the question is whether conduct has been likely to mislead or deceive, it is unnecessary to prove anyone was actually misled or deceived. . .
- Evidence of actual misleading or deception is admissible and may be persuasive but is not essential. . .
- The test is objective and the Court must determine the question for itself. . .
- Conduct is likely to mislead or deceive if that is a real or not remote possibility, regardless of whether it is less or more than 50%.<sup>74</sup>

See also *AMI Australia Holdings Pty Ltd v Bade Medical Institute (Australia) Pty Ltd*.<sup>75</sup>

In other cases, Courts have not *explicitly* set out the *Taco Bell* steps, but have *implicitly* adopted them. For example, in *Astrazeneca Pty Ltd v Glaxosmithkline*

<sup>73</sup>*Apotex Pty Ltd v Les Laboratoires Servier (No 2)* (2008) ATPR 42-235, 49,206.

<sup>74</sup>*Domain Names Australia Pty Ltd v .au Domain Administration Ltd* (2004) 139 FCR 215, [17]–[18].

<sup>75</sup>*AMI Australia Holdings Pty Ltd v Bade Medical Institute (Australia) Pty Ltd*. (2009) 262 ALR 458, 472.

*Australia Pty Ltd*, the Full Court referred to *Taco Bell* in explaining its approach to the evaluation of the conduct under challenge in that case.

The Full Court stated:

For [s.18] of the Act to be enlivened it is sufficient that the conduct complained of, in all the circumstances, answers the statutory description, that is to say, that it is misleading or deceptive or likely to mislead or deceive. It is unnecessary to go further and establish that any actual or potential consumer has taken or is likely to take any positive step in consequence of the misleading or deception. That is not to say that evidence of actual misleading or deception and of steps taken in consequence thereof is not likely to be both relevant and important on the question whether the relevant conduct in fact answers the statutory description.<sup>76</sup>

A similar re-formulation of the *Taco Bell* steps was adopted by the Court in *Johnson & Johnson Pacific Pty Limited v Unilever Australia Limited (No 2)*.<sup>77</sup> The Court in *Unilever Australia Limited v Goodman Fielder Consumer Foods Pty Ltd*<sup>78</sup> also adopted the *Taco Bell* steps without referring to the case itself. See also *Australian Competition and Consumer Commission v Australian Dreamtime Creations Pty Ltd*.<sup>79</sup>

#### **40.5.8 A Consistent Approach to Principles: The Basic Evaluative Framework**

The consistent approval of the *Taco Bell* steps enables a summary of the basic principles employed by the Courts in evaluating whether conduct is misleading or deceptive or likely to mislead or deceive.<sup>80</sup>

The principles set out below have been extracted from a number of recent decisions of the Federal Court including *ACCC v Clarion Marketing Pty Ltd*<sup>81</sup>; *Butcher v Lachlan Elder Realty Pty Limited*<sup>82</sup> and *ACCC v Australian Dreamtime Creations Pty Ltd*.<sup>83</sup>

There are many other cases in which these principles have been stated (in various ways) and elaborated upon, and they form a basic conceptual framework against which allegations of misleading or deceptive conduct may be evaluated.

<sup>76</sup>*Astrazeneca Pty Ltd v Glaxosmithkline Australia Pty Ltd* (2006) ATPR 42-106, 44, 890.

<sup>77</sup>*Johnson & Johnson Pacific Pty Limited v Unilever Australia Limited (No 2)* (2007) ATPR 42-136, 46,618 - 46,619 and 46,625.

<sup>78</sup>*Unilever Australia Limited v Goodman Fielder Consumer Foods Pty Ltd* (2009) ATPR 42-305, [18]–[23].

<sup>79</sup>*Australian Competition and Consumer Commission v Australian Dreamtime Creations Pty Ltd* (2009) 263 ALR 487, 493.

<sup>80</sup>Bruce (2011b), pp. 51–73.

<sup>81</sup>*ACCC v Clarion Marketing Pty Ltd* [2009] FCA 1441, 8–9.

<sup>82</sup>*Butcher v Lachlan Elder Realty Pty Limited* (2004) 218 CLR 592, 621–626.

<sup>83</sup>*ACCC v Australian Dreamtime Creations Pty Ltd* (2009) 263 ALR 487, 493–494.

The following ten principles form that basic evaluative framework:

1. Whether a representation is likely to mislead or deceive is an objective question of fact, to be determined having regard to all the circumstances of the conduct and not just some isolated aspect of that conduct;
2. Conduct is misleading or deceptive if leads into error. It is likely to be misleading or deceptive if there is a real chance that the conduct or representations will mislead or deceive;
3. It is necessary to identify some conduct, whether in the form of a representation, an omission or some other form, that led the consumer(s) into error;
4. It is necessary to identify the class of consumers toward whom the allegedly misleading conduct was directed;
5. Having identified the relevant class of consumers, the test to be applied is objective, that is, whether a ordinary and reasonable person from the class is likely to have been misled or deceived;
6. The process involved in identifying the ‘ordinary and reasonable’ person from the class differs depending on whether the allegedly misleading or deceptive conduct was directed toward specific and identified individuals or to a large class;
7. Actual intention to mislead or deceive is not necessary to establish a breach of s 18 of the ACL, but if intention is present, a Court may be more likely to find that the conduct complained of was misleading;
8. Conduct may be misleading or deceptive if it induces error, but it is not sufficient merely to show that it may have led to confusion or caused people to wonder;
9. Actual evidence that some people may have been misled is not essential but is admissible and may be persuasive if given;
10. A corporation does not avoid liability for breach of s 18 because a person who has been the subject of misleading or deceptive conduct could have discovered the misleading or deceptive conduct by proper inquiries;

## **40.6 Enforcement of the ACL and Food Product Credence Claims**

Consistent with the intention of the *Labelling Logic Report*, credence claims associated with food products are now principally regulated in Australia through the lens of the *Australian Consumer Law* that is enforced by the *Australian Competition and Consumer Commission*. Accordingly, credence claims are evaluated in terms of whether they have the potential to mislead or deceive consumers in breach of the ACL, principally ACL s 18 discussed above.

### 40.6.1 *Credence Claims Now an ACCC Focus of Litigation*

This closer relationship between food product credence claims and the ACL is evidenced by the February 2013 decision of the ACCC to designate credence claims, particularly in the food industry as well as competition and consumer issues in the supermarket industry as an explicit enforcement priority.<sup>84</sup>

This scrutiny paid by the ACCC is reflected in a spate of litigation instituted in the Federal Court of Australia<sup>85</sup> since 2010 against food producers and retailers, principally involving credence claims associated with eggs, chicken and meat products. The decisions in *Australian Competition and Consumer Commission v C.I & Co Pty Ltd*,<sup>86</sup> *Australian Competition and Consumer Commission v Turi Foods Pty Ltd*,<sup>87</sup> *Australian Competition and Consumer Commission v Bruhn* [2012] FCA 959, *Australian Competition and Consumer Commission v Pepe's Ducks Ltd* [2013] FCA 570 and *Australian Competition and Consumer Commission v Luv-a-Duck Pty Ltd* (2013) FCA 1136, provide useful guidance about the relationship between product labelling and how the misleading or deceptive conduct provisions of the ACL can be deployed to ensure food animal products accurately reflect antecedent animal husbandry practices.

### 40.6.2 *When Free Range Is Not "Free to Range"*

Three of these five decisions concern credence claims associated with eggs and this chapter will focus on those cases.<sup>88</sup>

In *Australian Competition and Consumer Commission v C.I & Co Pty Ltd*, a Western Australian based family owned company, C.I & Co Pty Ltd ('CI') acquired eggs from egg farms and supplied them to a number of retailers, cafes and restaurants. Between June 2008 and April 2010, CI acquired over a million dozen eggs produced by battery cage hens and 12,000 dozen free-range eggs.

However, in that period, CI supplied nearly 900,000 dozen eggs to customers that it had labelled 'free range', conduct described by the Court as involving 'a high

<sup>84</sup>ACCC, *ACCC Compliance and Enforcement Policy*, Commonwealth of Australia, February 2013.

<sup>85</sup>Part XI, s138(1) of the *Competition and Consumer Act 2010* (Cth) confers jurisdiction on the Federal Court of Australia in relation 'to any matter arising under this Part or the Australian Consumer Law'.

<sup>86</sup>*Australian Competition and Consumer Commission v C.I & Co Pty Ltd* [2010] FCA 1511.

<sup>87</sup>*Australian Competition and Consumer Commission v Turi Foods Pty Ltd (No 2)* [2012] FCA 19.

<sup>88</sup>The decision in *Australian Competition and Consumer Commission v Pepe's Ducks Ltd* [2013] FCA 570 concerned misleading claims that duck meat was sourced from ducks that spent a substantial time outdoors when in fact the ducks were entirely barn raised and never permitted out-doors. The decision in *Australian Competition and Consumer Commission v Luv-a-Duck Pty Ltd* (2013) FCA 1136 concerned similar allegations.

level of dishonesty'.<sup>89</sup> In doing so, CI and its directors earned a significant amount of revenue they would not otherwise have earned if the eggs had been truthfully labelled as 'cage eggs'. For example, the Court noted that in a 2-week representative period between 15 and 30 April 2010, CI and its directors earned between \$5744 and \$9008 in revenue 'which they would not have derived had the eggs been labelled clearly as 'cage eggs''.<sup>90</sup>

Following an ACCC investigation, CI and its directors admitted the deception and that they had contravened Sections 52, 53(a) and 55 of the *Trade Practices Act 1974* (Cth).<sup>91</sup> Both CI and the directors consented to certain orders being made against them, including declarations, injunctive relief and corrective advertising.

Because CI and its directors had admitted the contraventions and consented to orders being made, the Court was not required to establish CI's liability through the *Taco Bell* and *Campomar* methodologies discussed above. It has become increasingly common for respondents to agree to consent orders and making joint submissions on penalties with the ACCC thereby avoiding a substantive trial on the issues.

Nevertheless, the Court cannot simply make orders and impose penalties just because parties consent to them. Before it does so, the Court must be satisfied that the facts before it actually do disclose a breach of the CCA or ACL.<sup>92</sup> In this case, the Court accepted that the relevant sections of the TPA (now ACL) had been breached 'following many years of unlawful conduct which must have yielded considerable undeserved profit'.<sup>93</sup>

### ***40.6.3 Relationship Between Consumer Interests and Misleading Labelling***

Significantly, the Court clearly explained the relationship between the misleading labelling and consumer interest in food animal welfare. According to the Court, the misleading labels 'amounted to a cruel deception on consumers who mostly seek out free range eggs as a matter of principle, hoping to advance the cause of animal welfare by so doing'.<sup>94</sup>

This is a simple and direct statement of the intended use of the ACL anticipated by the Commonwealth *Labelling Logic Report*.

---

<sup>89</sup>*Australian Competition and Consumer Commission v C.I. & Co Pty Ltd* [2010] FCA 1511, [31].

<sup>90</sup>*Ibid* [14].

<sup>91</sup>These are now Sections 18, 29(1)(a) and 33 respectively, of the ACL.

<sup>92</sup>*Australian Competition and Consumer Commission v SIP Australia Pty Ltd* (1999) ATPR 41-702, 43,000.

<sup>93</sup>*Australian Competition and Consumer Commission v C.I. & Co Pty Ltd* [2010] FCA 1511, [21].

<sup>94</sup>*Ibid* [31].

Growing consumer demand for welfare friendly animal products is unfortunately reflected in the continued willingness of some suppliers to mislead consumers. For example, in *Australian Competition and Consumer Commission v Bruhn* [2012] FCA 959 the ACCC instituted proceedings against Ms Rosemary Bruhn, trading as “Rosie’s Free Range Eggs” in South Australia. In instituting proceedings, the ACCC ‘allege(d) that from March 2007 to October 2010, Ms Bruhn represented that eggs she supplied to business customers including 117 customers in South Australia such as retail outlets, bakeries, cafes and restaurants, were free range eggs when a substantial proportion of the eggs were not free range but cage eggs’.<sup>95</sup>

Between January 2009 and October 2010, the company earned AUD \$186,978 as a result of selling cage-eggs deliberately misrepresented as free-range eggs. The Court imposed a pecuniary penalty of AUD \$50,000 and required Ms Bruhn to pay AUD \$15,000 toward the ACCC’s legal costs.

#### 40.6.4 Eggs Before Chickens

Similar to the *Bruhn* case, the ACCC instituted proceedings in September 2011 against Turi Foods Pty Ltd, Baiada Poultry Pty Ltd, Bartter Enterprises Pty Limited and the Australian Chicken Meat Federation Inc (‘the ACMF’) also alleging misleading or deceptive conduct in relation to the supply of chicken meat products.

Baiada Poultry and Bartter Enterprises supply chickens throughout Australia under the well-known ‘Steggles’ brand name while Turi Foods supplies ‘La Ionica’ brand chickens in New South Wales and Victoria. The ACCC alleged that these corporations engaged in misleading or deceptive conduct in breach of both the TPA and the ACL in making certain representations associated with the chicken meat products they supplied.<sup>96</sup>

The ACCC alleged that ‘Baiada Poultry and Bartter Enterprises made false or misleading claims in print advertising and product packaging, that Steggles meat chickens are raised in barns with substantial space available allowing them to roam freely’ when this was not the case at all’.<sup>97</sup>

Similar allegations were made against Turi Foods where it was alleged that ‘Turi Foods made false or misleading representations through in-store displays and advertising on delivery trucks. La Ionica brand meat chickens were claimed to be

<sup>95</sup>ACCC Takes Court Action Against SA Egg Supplier, ACCC Media Release 8 March 2012. <http://www.accc.gov.au/content/index.phtml/itemId/1037910> (Accessed 12 May 2012).

<sup>96</sup>ACCC Takes Action over ‘Free to Roam’ Chicken Claims, ACCC Media Release 7 September 2011.

<http://www.accc.gov.au/content/index.phtml/itemId/1006465/fromItemId/966100> (Accessed 12 May 2012).

<sup>97</sup>Ibid.

able to roam freely in barns with substantial space and in conditions equivalent to a free range system.’<sup>98</sup>

This litigation has been bitterly contested. In December 2011, the Australian Chicken Meat Federation sought interlocutory orders dismissing the ACCC’s proceedings either on the basis that no reasonable cause of action was disclosed<sup>99</sup> or that the ACCC had no reasonable prospect of successfully prosecuting its claims.<sup>100</sup>

The actual evidence indicated that the average space available to each chicken was about 500 square centimetres.<sup>101</sup> To provide some perspective, an A4 sheet of paper has an area of 625 square centimetres. A standard laying hen is at least 40-cm high when she stands erect and is approximately 45-cm long and 18-cm wide, without her wings extended. Her body space takes therefore takes up an area of about 810 square centimetres.

Despite the mathematical bleakness of the evidence, the ACMF claimed that there were simply no grounds for alleging that chickens were not ‘free to roam’ as they had represented.<sup>102</sup> Perhaps not surprisingly, Tracey J refused to strike out the ACCC’s action, observing that ‘five hundred centimetres squared is a remarkably small space. In order for any one chicken to have a larger area of movement, others would have to be confined within an even smaller space.’<sup>103</sup>

By January 2012, Turi Foods Pty Ltd had decided to conclude the proceedings against it by admitting the contraventions and submitting to consent orders.<sup>104</sup> After reviewing the evidence, Tracey J concluded:

the stock densities, which La Ionica has admitted are to be found in the barns in which its chickens are raised, are maintained at such a level that the chickens have severe restrictions placed on their capacity to roam, if, indeed any such capacity exists.<sup>105</sup>

These conclusions would later return to haunt Tracey J. The three other respondents continued to fight the ACCC’s allegations and<sup>106</sup> at least two of the respondents decided to personally attack the Judge.

---

<sup>98</sup>Ibid.

<sup>99</sup>Rule 26.01(1)(c) *Federal Court Rules 2011*.

<sup>100</sup>Rule 26.01(1)(a) *Federal Court Rules 2011*.

<sup>101</sup>*Australian Competition and Consumer Commission v Turi Foods Pty Ltd* [2011] FCA 1382, [14] (Unreported decision of Tracey J dated 2 December 2011).

<sup>102</sup>Ibid [10].

<sup>103</sup>Ibid [13].

<sup>104</sup>*Australian Competition and Consumer Commission v Turi Foods Pty Ltd (No 2)* [2012] FCA 19 (unreported decision of Tracey J dated 23 January 2012).

<sup>105</sup>Ibid [23].

<sup>106</sup>It is usual for food animal suppliers to vigorously litigate against persons who threaten to expose their treatment of animals—see *Takhar & Anor v South Australian Telecasters Ltd* (BC 9702320, Unreported decision of Perry J of the Supreme Court of South Australia, 1997) involving an application for an injunction to restrain a current affairs program from airing footage of a battery hen egg farm operated by a supplier falsely selling eggs as ‘free range’; *ABC v Lenah Game Meats Pty Ltd* (2001) 185 ALR 1 in which a supplier of possum meat sought an injunction to restrain display of footage taken of the plant’s processing practices.

In February 2012 Baiada Poultry Pty Ltd and Bartter Enterprises attempted to have Tracey J disqualify himself from hearing the case on the grounds of apprehended bias.<sup>107</sup> Both Baiada Poultry and Bartter Enterprises owned and operated chicken growing sheds in the same way as Turi Foods, including equivalent stocking densities.

Accordingly, they alleged that Tracey J's conclusion about stocking densities made in concluding the proceedings against Turi Foods 'travelled beyond the agreed facts. . . and constituted findings independently made by me.'<sup>108</sup> His Honour rejected the application and, in 2012, pecuniary penalties of \$100,000 AUD were imposed upon the company.

### 40.6.5 *Ongoing ACCC Litigation and Labelling Logic Report*

These decisions demonstrate that the misleading or deceptive conduct provisions in the ACL can be effectively deployed to prevent suppliers of food animal products from deceiving consumers about value issues such as animal welfare conditions. They also reflect an awareness by the Courts of the relationship between consumer concern for food animal welfare and the information provided by suppliers on labels and advertising material.

At least in relation to positive representation such as 'free-range' or 'free-to-roam', the policy behind the *Labelling Logic Report* is likely to be well served by the effective enforcement of the ACL. By preventing suppliers from making misleading or false claims associated with food animal products, consumers will be provided with sufficient and accurate information enabling them to make informed choices about their purchases. This is especially important when, as North J in *Australian Competition and Consumer Commission v C.I & Co Pty Ltd* noted, consumers 'seek out free range eggs as a matter of principle, hoping to advance the cause of animal welfare by so doing.'<sup>109</sup>

At the time of writing, the ACCC has also instituted proceedings against Snowdale Holdings Pty Ltd and Pirovic Enterprises Pty Ltd alleging that those corporations made false, misleading or deceptive representations that the eggs supplied and labelled as 'free range' were produced 'by hens that were farmed in

<sup>107</sup> Apprehended bias exists where 'a fair-minded lay observer might reasonably apprehend that the judge might not bring an impartial and unprejudiced mind to the resolution of the question the judge is required to decide.' *Michael Wilson & Partners v Nicholls* (2011) 282 ALR 685, 692.

<sup>108</sup> *Australian Competition and Consumer Commission v Turi Foods Pty Ltd (No 2)* [2012] FCA 19 (unreported decision of Tracey J dated 23 January 2012) [18].

<sup>109</sup> *Australian Competition and Consumer Commission v C.I & Co Pty Ltd* [2010] FCA 1511, [31].

conditions so that the laying hens were able to move about freely on an open range every day'.<sup>110</sup>

The ACCC alleges that in fact, the eggs were produced by hens that were not able to move about freely on an open range every day due to several factors, including the stocking density of the barns, physical openings of the barns, conditions of the outdoor range, and the manner in which the hens were trained.

## **40.7 Artificial Photosynthesis as Alternative Agribusiness Technology**

### ***40.7.1 Revisiting the Dilemma***

Earlier in this chapter, I suggested that while large agribusinesses dominate markets for food products generally and food animal products particularly, they will continue to face an intractable dilemma. I suggested that on the one hand, agribusinesses have become reliant on large-scale, intensive farming and animal husbandry practices to meet demand for their products.

However, on the other, those same agribusinesses are increasingly relying on clever advertising and marketing involving credence claims to exploit the growing interest shown by consumers and for whom such claims are important.

These strategies are largely antithetical. It is almost impossible for a large agribusiness processing chickens and eggs (for example) using intensive husbandry practices to simultaneously market chicken meat and eggs with “free range” or “free to roam” credence claims. Much of the litigation associated with credence claims discussed in this chapter are examples of this dilemma, resolving against the interests of both consumers and food suppliers.

However, what if alternative agribusiness technologies in the form of artificial photosynthesis could be realistically developed and implemented? Could artificial photosynthesis provide a “circuit breaker” to this dilemma?

### ***40.7.2 Artificial Photosynthesis***

More solar energy strikes the Earth’s surface in 1 h of each day than the energy used by all human activities in one year. At present the average daily power consumption required to allow a citizen to flourish with a reasonable standard of living is about 125 kWh/day. Much of this power is devoted to transport (~40 kWh/day), heating (~40 kWh/day) and domestic electrical appliances (~18 kWh/day), with the remainder lost in electricity conversion and distribution (MacKay 2009). Global energy consumption is approximately 450 EJ/year, much less than the solar energy

---

<sup>110</sup> ACCC Media Release, 10 December 2013 at <http://www.accc.gov.au/media-release/accc-institutes-proceedings-against-free-range-egg-producers>.

potentially usable at ~1.0 kW per square metre of the earth— $3.9 \times 10^6$  EJ/year even if we take into the earth's tilt, diurnal and atmospheric influences on solar intensity (Pittock 2009).

Photosynthesis as a natural process is equally important with DNA in the progress of humanity. Photosynthesis provides the fundamental origin of our oxygen, food and the majority of our fuels; it has been operating on earth for over two billion years. Photosynthesis can be considered as a process of planetary respiration: it creates a global annual CO<sub>2</sub> flux in from the atmosphere and an annual O<sub>2</sub> flux out to atmosphere. In its present nanotechnologically-unenhanced form, photosynthesis globally already traps around 4000 EJ/year solar energy in the form of biomass (Kumar, Jones and Hann 2009). The global biomass energy potential for human use from photosynthesis as it currently operates globally is approximately equal to human energy requirements (450 EJ/year) (Hoogwijk, Faaij, van den Broek, Berndes, Gielen, Turkenburg 2003).

Artificial photosynthesis can facilitate other energy options H<sub>2</sub>-based fuels, the most promising perhaps by combining it with atmospheric nitrogen to make ammonia. Ammonia is already shipped, piped, and stored in large volumes in every industrial country around the world as an agricultural fertilizer. As a fuel, ammonia has been proven to work efficiently in a range of engine types, including internal combustion engines, combustion turbines, and direct ammonia fuel cells. Due to its high energy density and an extensive, existing ammonia delivery infrastructure, ammonia is ready for the market today as an alternative to gasoline.

If such artificial photosynthetic technology is incorporated into every building, road and vehicle on the earth's surface than the positive outcome will be that humanity's structure will be producing abundant safe, low carbon fuels and fertilizers. In such a world it will be much more feasible for communities and families to support many of their basic food needs off-grid through organic farming rather than relying on distant sourced food provide by large corporate marketing chains.

## Africa

*The views expressed are those of the author and not necessarily those of the institutions and associations that she is associated with.*

### Food Law and Policy in Africa: An Introduction

The Africa Union (AU), the successor of the Organization of African Unity (OAU),<sup>1</sup> declared 2014 *the Year of Agriculture and Food Security in Africa*.<sup>2</sup> The Sub-themes of the Year—Increased agriculture production, productivity and value addition; Functioning agricultural markets (regional markets & trade); Increased investment financing (public & private) along the agriculture value chains; Towards ending hunger in Africa by 2025; and Building resilience to vulnerability and Managing Risks—lend insight into the current priorities of countries in Africa as far as food law and policy is concerned.

Food law is conceptualized differently in Africa than is the case in the West. Food law in Africa encompasses issues integral to food production and distribution (e.g. food safety) as well as issues relating to human rights and governance (freedom from eviction, right to take part in public affairs, and freedom from discrimination.). While food safety issues appear to dominate food law and policy in many developed countries, the situation is different in most countries in Africa is somewhat different. In Africa, food insecurity, food trade, and foreign investment in food and agriculture, rather than food safety, currently dominate law and policy. Food law in Africa is primarily organized at the country level and wide variations exist in terms of national approaches to food regulation and agricultural policies. However, with the push towards regional integration in the continent, laws and

<sup>1</sup>Africa Union, AU in a Nutshell, <http://www.au.int/en/about/nutshell>. The Durban Summit (2002) launched the AU and convened the 1st Assembly of the Heads of States of the African Union.

<sup>2</sup>Briefing Note: on 2014 Year of Agriculture and Food Security in Africa, Marking 10th Anniversary of the Adoption of CAADP. (2014).

policies at the continental level and sub-regional level are becoming increasingly important and highly relevant.<sup>3</sup>

Food law as a distinct legal discipline is at its nascent stage in most countries in Africa. The AU does not recognize food law as a distinct legal discipline, and there is no Africa-wide agency charged with developing food law and policy for the region or harmonizing the laws of the different countries in the region. Nevertheless, a growing number of continent-wide conventions and declarations are pertinent to food and agriculture in Africa and will undoubtedly shape food law and policy in the continent in the future. At the continental level, key instruments and initiatives include: the Constitutive Act of the African Union (2000); the New Partnership for Africa's Development (NEPAD) (2001); the Maputo Declaration on Agriculture and Food Security in Africa (2003); the AU Framework and Guidelines on Land Policy in Africa (2009), the African Model Law on Biosafety; the African Model Legislation for the Protection of the Rights of Local Communities, Farmers and Breeders, and for the Regulation of Access to Biological Resources (2000); the Draft Policy Framework for Investment in Agriculture (NEPAD-OECD); the Monitoring African Food and Agricultural Policies (MAFAP) Project; the African Water Vision for 2025; the African Water Facility; and the Comprehensive Africa Agriculture Development Program (2003). Other pertinent instruments and initiatives include: AU Africa Agenda 2063, "A shared Strategic Framework for inclusive Growth and Sustainable Development"; the Science, Technology and Innovation Strategy for Africa-2024 (STISA-2024)<sup>4</sup>; the Framework Work Programme on Climate Change Action in Africa<sup>5</sup>; and the 1 July 2013 Declaration to End Hunger in Africa by 2025.<sup>6</sup>

The Constitutive Act of the Africa Union ("Constitutive Act") provides a framework for the development of robust food law regimes in Africa.<sup>7</sup> According to the Constitutive Act, the objectives of the AU includes *inter alia* to: "Promote and defend African common positions on issues of interest to the continent and its peoples;" "Promote peace, security, and stability on the continent;"<sup>8</sup> "Promote democratic principles and institutions, popular participation and good

governance;”<sup>9</sup> “Promote and protect human and peoples’ rights in accordance with the African Charter on Human and Peoples’ Rights and other relevant human rights instruments;”<sup>10</sup> “Establish the necessary conditions which enable the continent to play its rightful role in the global economy and in international negotiations;”<sup>11</sup> “Promote sustainable development at the economic, social and cultural levels as well as the integration of African economies;”<sup>12</sup> “Advance the development of the continent by promoting research in all fields, in particular in science and technology;”<sup>13</sup> and “Work with relevant international partners in the eradication of preventable diseases and the promotion of good health on the continent.”<sup>14</sup>

Pursuant to Declaration 1 (XXXVII) of 2001, NEPAD was adopted as the integrated and comprehensive socio-economic development programme to accelerate Africa’s renewal. NEPAD manages a number of programmes and projects in six theme areas that include “Agriculture and Food Security,” “Climate Change and Natural Resource Management,” and “Human Development.”<sup>15</sup> Endorsed in 2003, the Comprehensive Africa Agriculture Development Program (CAADP) drives the agricultural program of NEPAD. The overall goal of CAADP is to “eliminate hunger and reduce poverty by improving agriculture across the African continent.” CAADP is premised on four pillars: (i) Sustainable land and reliable water control systems; (ii) Private sector development, rural infrastructure, improved trade and market access; (iii) Increasing food supply and reducing hunger; and (iv) Agricultural research and dissemination of agricultural technology.<sup>16</sup> In furtherance of the goals of CAADP, in 2003, African governments committed to two “targets.” First, governments made a commitment to achieving an annual agricultural growth target of 6 percent by 2015.<sup>17</sup> Second, governments pledged to allocate 10 per cent of their national budget to agriculture by 2008.<sup>18</sup> Governments have the option of signing the CAADP compact and incorporating the CAADP Compact into their agricultural agenda. Governments who sign the CAADP Compact are subjected to an independent review process. As of June 2012, about 30 have signed CAADP compacts and about 40 have engaged the CAADP process.<sup>19</sup>

Regional Economic Communities (RECs) in Africa are playing a significant role in terms of laying the foundation for robust food law regimes to emerge in the

<sup>19</sup>Mwangi Kimenyi, Brandon Routman, Andrew Westbury, CAADP at 10: Progress Towards Agricultural Prosperity (2012) (hereinafter “CAADP at 10”).

continent. Africa currently boasts of multiple RECs, some with overlapping memberships. Eight RECs are considered the building blocks of the African Economic Community: (i) Economic Community of West African States (ECOWAS); (ii) East African Community (EAC); (iii) Southern African Development Community (SADC); (iv) Common Market for Eastern and Southern Africa (COMESA); (v) Intergovernmental Authority on Development (IGAD); (vi) Economic Community of Central African States (ECCAS/CEEAC); (vii) Community of Sahel-Saharan States (CEN-SAD); and (viii) Arab Maghreb Union (UMA). Important policy instruments emanating from the RECS include: Agriculture and Rural Development Strategy for the East African Community (2005–2030); the EAC's Agriculture and Rural Development Policy; the Framework for the West African Agricultural Policy-ECOWAP (July 2004), SADC's Regional Agricultural Policy; the SADC Protocol on Wildlife Conservation and Law Enforcement; the SADC Protocol on Fisheries; and the COMESA Agricultural Policy (CAP).

Because of grinding poverty and risks of famine and food insufficiency, food security concerns have thus far dwarfed concerns about food safety in Africa. Not surprising, the food law architecture in Africa is presently dominated by laws and policies pertaining to food security. At the continental level, the *Framework for African Food Security System (FAFS)* and the *Action Plan for Africa of the Global Strategy for Improving Statistics for Food Security, Sustainable Agriculture and Rural Development (2011–2015)*, articulate Africa's strategy for combating food insecurity. At the domestic level, laws such as the Zanzibar Food Security and Nutrition Act of 2011 and policy documents such as Angola's National Food and Nutrition Security Strategy for 2010–2015 are emerging.

Regarding climate change, relevant laws and policies are just now emerging with a good number of countries still in the process of developing and implementing National Adaptation Programmes of Action (NAPAs) and National Climate Change Response Strategies. Examples include: *National Policy on Climate Change—Namibia*; *National Climate Change Response Strategy and Policy—Zambia*; *National Climate Change Response Policy White Paper—South Africa*; *Programme of Adaptation to Climate Change—Ethiopia*; Ethiopia's *Climate-Resilient Green Economy (CRGE) initiative*; *National Strategy on Climate Change and Low Carbon Development—Rwanda*; and *National Coastal Adaptation Law—Gabon*.

Biopiracy is an issue of grave concern for indigenous communities in Africa and for governments in the region. One significant legal response to date is the *Swakopmund Protocol on the Protection of Traditional Knowledge and Expressions of Folklore* that was adopted in 2010 within the framework of the 17-member African Regional Intellectual Property Organization (ARIPO).<sup>20</sup> In the Protocol, Member States expressed concern “at the gradual disappearance, erosion, misuse, unlawful exploitation and misappropriation of traditional knowledge and

---

<sup>20</sup>ARIPO, Swakopmund Protocol on the Protection of Traditional Knowledge and Expressions of Folklore (2010). [http://www.wipo.int/wipolex/en/treaties/text.jsp?file\\_id=201022](http://www.wipo.int/wipolex/en/treaties/text.jsp?file_id=201022).

expressions of folklore.”<sup>21</sup> One of the goals of the Protocol is to “protect traditional knowledge holders against any infringement of their rights as recognized.”<sup>22</sup> The Protocol defines, protection criteria for traditional knowledge (Section 4), the formalities relating to protection of traditional knowledge (Section 5), the beneficiaries of protection of traditional knowledge (Section 6), and the rights conferred to holders of traditional knowledge (Section 7). The Protocol also addresses issues such as assignment and licensing (Section 8), equitable benefit-sharing (Section 9), exceptions and limitations applicable to protection of traditional knowledge (Section 11), compulsory licence (Section 12), duration of protection of traditional knowledge (Section 13), administration and enforcement of protection of traditional knowledge (Section 14) and access to traditional knowledge associated with genetic resources (Section 15). WIPO Director General Francis Gurry described the adoption of the Protocol as “a significant milestone in the evolution of intellectual property.”<sup>23</sup> The Organization africaine de la propriete intellectuelle (OAPI), also adopted an instrument similar to the Protocol in July 2007. Despite winning the praise of organizations like WIPO, the Swakopmund Protocol is yet to gain sufficient ratification to enter into force.<sup>24</sup> Only a few countries have so far implemented the terms of the Swakopmund Protocol in their domestic legislation.

Courts and judicial tribunals—at the national, regional and continental levels—are increasingly shaping food law and policy in Africa and are increasingly being called upon to decide thorny issues pertaining to access to and right over land and water resources. In *The Animal Network for Animal Welfare v. The Attorney General of the United Republic of Tanzania* decided on 20 June 2014, the East African Court of Justice issued a decision barring the United Republic of Tanzania from constructing and maintaining a road across the northern wilderness of the Serengeti National Park on the grounds that such a move would violate Tanzania’s obligation under the East African Community (EAC) Treaty to conserve and protect the environment. The tension between agribusiness and small-holder farmers is also looming large in Africa as exemplified by cases such as *West Coast Rock Lobster Association v The Minister of Environmental Affairs and Tourism*.<sup>25</sup> In *West Coast Rock Lobster*, appellants (commercial fishing entities), unsuccessfully sought an order nullifying a government decision granting subsistence fishers the right to catch and sell west coast rock lobster. In *West Coast Rock Lobster*, the Supreme Court of South Africa aptly noted that “For a fortunate few, rock lobsters conjure up images of exotic cuisine. For others, like communities

who engage in subsistence fishing, they are a means of survival and a modest source of income.”<sup>26</sup>

Although Africa has seen growing political commitment to promote food security, transforming political commitments into concrete results remains a challenge in most countries in the continent. Episodes of food shortages and food famines are still common in Africa.<sup>27</sup> Despite the growing number of legal instruments and policy documents that address food security, countries in Africa fall short on relevant indicators. Of any region, Sub-Saharan Africa has the highest prevalence of undernourishment (23.8%).<sup>28</sup> Between 1990–1992 and 2012–2014, the prevalence of undernourished Sub-Saharan Africa fell from 33.3 % to 23.8 %. Despite the decline in the prevalence of undernourished people in Africa, the absolute number of people who are undernourished in the region remains disturbingly very high (214.1 million up from 176.0 million in 1990–1992). According to *The State of Food Insecurity in the World 2014*:

In general, in Africa, there has been insufficient progress towards international hunger targets, especially in the sub-Saharan region, where more than one in four people remain undernourished—the highest prevalence of any region in the world.<sup>29</sup>

While the foundation for robust food law regimes are in place in Africa, food law as a distinct legal discipline is yet to emerge in Africa and food law and policy is yet to receive adequate attention in the continent. There are major loopholes and weaknesses in the food law architecture of many countries in Africa. Some of the problems include:

- Reliance on outdated laws, most dating back to the colonial period;
- Complex regulatory and institutional environment dominated by overlapping and often inconsistent pieces of legislation that are managed by agencies with overlapping and competing mandates. Doting Kenya’s food and agricultural law landscape are some 131 separate pieces of legislation, 41 implementing bodies, and about 1186 by-laws.<sup>30</sup>
- Inadequate or minimal enforcement of existing laws and policies;
- Policy incoherence and major inconsistencies in existing laws;
- Externally-driven legal framework and failure by governments to promote inclusive and participatory food laws and policies;

<sup>29</sup>Id., at 9.

<sup>30</sup>Dr. John Omiti, CAADP and Agricultural Sector Governance Reform Processes in Kenya, in CAADP at 10, *supra* note 19, at 17.

- Lack of transparency in the development and implementation of food laws and regulations;
- Top-down approach to the development and implementation of food and agricultural law in the continent contrary to the promise made in instruments such as the African (Banjul) Charter on Human and Peoples' Rights (1981), the African Charter for Popular Participation in Development (1990), and the *Maputo Declaration on Agriculture and Food Security in Africa* (2003).
- Weak institutions and poor governance mechanisms;
- Prevalence of laws and policies that are not informed by science and sound agricultural statistics;
- Laws and policies that are reactive rather than proactive;
- Lack of coordination at the national and regional level between different agencies responsible for food law administration;
- Confusion arising from lack of harmonization of laws and policies at the national and sub-regional level; and
- Lack of sensitivity in the development and implementation of laws, to the needs and problems of vulnerable groups and communities including women, persons with disabilities, and indigenous groups.

All six pillars identified in the *Common African Position on the Post-2015 Development Agenda* adopted on 31 January 2014, have implications for food law and policy in Africa.<sup>31</sup> The six pillars are: (i) structural economic transformation and inclusive growth; (ii) science, technology and innovation; (iii) people-centred development; (iv) environmental sustainability natural resources management, and disaster risk management; (v) peace and security; and (vi) finance and partnerships.<sup>32</sup> Within the rubric of “structural economic transformation and inclusive growth,” African governments explicitly commit to promote “sustainable development, food self-sufficiency and nutrition” and resolve to:

- “Enhance the production, storage, transportation, availability, accessibility, utilization, safety and quality of food.”<sup>33</sup>
- “Improve the productivity of smallholder agriculture and livestock through extension of technological support, small-scale irrigation schemes, rural infrastructure, credit and social services.”<sup>34</sup>
- “Support modernization and diversification of agricultural sectors through: private sector participation in agriculture; agri-business development; improved agroindustry linkages; providing special support to integrate women into agri-business value chains; equitable access to land; and sustainable land

<sup>34</sup>*Id.*, Article 22 (ii).

management practices, including on our arable lands, for present and future generations.”<sup>35</sup>

- “Promote agricultural marketing and information flows by establishing national and regional information centres and cooperation mechanisms in agriculture, food and nutrition security.”<sup>36</sup>
- “Adopt sustainable agricultural, ocean and freshwater fishery practices and rebuild depleted fish stocks to sustainable levels.”<sup>37</sup>
- “Strengthen resilience to external and climate shocks, such as droughts, floods, commodity price volatility, food shortages and export restrictions, particularly on staple foods.”<sup>38</sup>
- “Urgently call for multilateral partnerships aimed at food loss reduction, resilience to commodity price fluctuations, and addressing food shortages and export restrictions during crises.”<sup>39</sup>

Clearly, the foundations for the emergence of very robust food law regimes in Africa are already in place. What is needed is purposeful action directed at translating lofty commitments into tangible reality for millions in Africa.<sup>40</sup> Legal and regulatory reform and sound agricultural policy and food policy are priority areas in Africa. Without the necessary policy, legal and regulatory reform, Africa’s aspirations for 2063 will remain but a distant dream. In *Agenda 2063: The Africa We Want*, among the vision espoused is that of Africa as a prosperous continent where: “[m]odern agriculture for increased production, productivity and value addition contribute to farmer and national prosperity and Africa’s collective food security,”<sup>41</sup> “[t]he environment and ecosystems are healthy and preserved, and with climate resilient economies and communities,”<sup>42</sup> and Africa’s agriculture is “modern and productive, using science, technology, innovation and indigenous knowledge.”<sup>43</sup>

Strengthening the enabling legal and regulatory environment needed to increase agricultural productivity, improve food security and upgrade food governance

<sup>36</sup>Id., Article 22 (iv).

<sup>37</sup>Id., Article 22 (v).

<sup>38</sup>Id., Article 22 (vi).

<sup>39</sup>Id., Article 22 (vii).

<sup>40</sup>In addition to the instruments already mentioned, other notable instruments are: the African (Banjul) Charter on Human and Peoples’ Rights (1981); the African Charter for Popular Participation in Development (1990); the African Charter on the Rights and Welfare of the Child (1990); the 1993 Cairo Declaration Establishing the Mechanism for Conflict Prevention, Management and Resolution; the Protocol on the Establishment of an African Court on Human and Peoples’ Rights (1998); the 1999 Grand Bay (Mauritius) Declaration and Plan of Action for the Promotion and Protection of Human Rights; and the Conference on Security, Stability, Development and Cooperation (CSSDCA) Solemn Declaration (2000).

<sup>41</sup>Africa Union, *Agenda 2063: The Africa We Want*, Article 10 (2014).

<sup>42</sup>Id.

<sup>43</sup>Id., Article 13.

apparatus in countries in the Africa will not be easy. A host of thorny and complex issues will need to be addressed including, how to entrench gender equality particularly with regards to ownership and control of land and other productive assets; how to strike the proper balance between the goal of improving the productivity of smallholder agriculture and the goal of modernizing and diversifying the agricultural sectors through industrialization and agri-business development; how to protect traditional knowledge and stimulate home-grown innovations in the agricultural sector while respecting international commitments to protect intellectual property rights; and how to manage the continent's external relations and make relationships with traditional partners in the West and new partners in emerging markets such as China and Brazil work to Africa's advantage.

In conclusion, robust, pro-active, participatory and transparent food law architecture is urgently needed in Africa at the national, sub-regional and continental level. The necessary foundation has been laid. Across the board, countries have strengthened their political commitment to food security and nutrition. The time has come for purposeful action. Delay is costly and is no longer an option.

# Chapter 41

## Food Law and Policy in Africa: Emerging Legal Framework, Key Issues, Major Gaps and Challenges

Uche Ewelukwa Ofodile

**Abstract** This chapter offers a rare and penetrating insight into the legal and institutional framework of food law and policy in Africa. The chapter analyzes continental, regional and national laws and judicial decisions that are shaping food law policy in Africa and identifies key actors and institutions. How food law is conceptualized in Africa, the legal instruments (treaties, resolutions, declarations, statutes, policy papers, etc.) that underpin and inform decisions about food regulations in Africa, and current struggles over food and land in the continent are some of the issues addressed in this chapter. The chapter is the four parts. Part Two provides a survey of Africa Union (AU) instruments pertaining to food law. The section also offers an overview of legal and policy developments at the sub-regional and national levels. In all, legal instruments pertinent to food and agriculture in four regional economic communities in Africa—the East African Community (EAC), the Economic Community of West African States (ECOWAS), the Common Market on Eastern and Southern Africa (COMESA) and the South African Development Community (SADC)—are examined in this section. Part Three examines key issues now emerging in food law and policy discussions and debates in Africa as well as issues that are likely to shape discussions about food law and policy in the continent in the coming years. In all, seven issues are examined: Food Security; Food Safety; Women and Agriculture in Africa; Climate Change; Indigenous Peoples and Food in Africa; Agribusiness/Foreign Investment in Land; and Food Trade. Part Three, “*Towards a Coherent and Functioning Food Law Regime in Africa*,” identifies existing gaps in the food law and policy framework of countries in Africa, draws attention to the development of robust food law regimes in Africa, discusses the potential role of the

legal profession in Africa in the development of food law in the continent, and offers some concluding thoughts about the future direction of food law and policy in Africa. Overall, answers to several questions are explored in this chapter. For example, how is food law conceptualized in Africa? Is food law conceptualized differently in Africa than is the case in the West? Is food law recognized as a distinct legal field in countries in Africa? What laws, policies and institutions inform food regulation in Africa today? What areas of food law and policy in Africa call for more rigorous analysis and urgent action? Is food law and policy in Africa proactively addressing emergent issues and challenges such as climate change? What local, regional and global issues are likely to shape food law in Africa in the coming years? The conclusion reached is that food law is a new and underdeveloped field of law in Africa, although most countries in the continent have laws that deal with various aspects of food law. To the extent that it is treated as a distinct legal field, food law is conceptualized somewhat differently in Africa than is the case in the West. Food law in Africa encompasses issues integral to food production and processing (e.g. food safety), issues pertinent to food distribution (e.g. regional and global food trade), as well as issues relating to human rights and governance (access to land, freedom from eviction, right over traditional knowledge, and freedom from discrimination.). However conceptualized, food law is still in its infancy in Africa. While the foundations for the emergence of strong food law regimes in Africa appear to be very strong, robust and credible food law frameworks are not yet in place at the national, sub-regional or continental level.

## **41.1 Introduction**

How is food law conceptualized in Africa? Is food law conceptualized differently in Africa than is the case in United States, the European Union and other Western Nations? Is food law recognized as a distinct legal field in countries in Africa? What laws, policies and institutions inform and implement food law in Africa today? When it comes to food law and policy in Africa, what issues presently dominate and who are the key actors? What areas of food law and policy in Africa call for more analysis and action? What is the place of food law in Africa's regulatory framework? Is food law and policy in Africa proactively addressing emergent issues and challenges such as climate change? What local, regional and global issues are likely to shape food law in Africa in the coming years? These questions and more are timely because although food and agriculture is very important to livelihood, survival and economic growth in Africa, very little is known about food law in the continent. Food law will be important in Africa in the coming years given increased pressure on land and water resources in the continent, growing conflicts over land and other natural resources, old and new threats to food security, and increased push by formerly disenfranchised groups for equity and justice as regards access to and control of land and other natural resources.

The conclusion reached is that food law is a new and underdeveloped field of law in Africa, although most countries in the continent have laws that deal with various

aspects of food law. To the extent that it is treated as a distinct legal field, food law is conceptualized somewhat differently in Africa than is the case in the West. Food law in Africa encompasses issues integral to food production and processing (e.g. food safety), issues pertinent to food distribution (e.g. regional and global food trade), as well as issues relating to human rights and governance (access to land, freedom from eviction, right over traditional knowledge, and freedom from discrimination.).

However conceptualized, food law is still in its infancy in Africa. While the foundations for the emergence of strong food law regimes in Africa appear to be very strong, robust and credible food law frameworks are not yet in place at the national, sub-regional or continental level. Forming part of the framework of continental policies pertaining to food and agriculture in Africa are a host of instruments including:

- the 1968 African Convention for the Conservation of Nature and Natural Resources (revised in 2003);
- the African Model Legislation for the Protection of the Rights of Local Communities, Farmers and Breeders, and for the Regulation of Access to Biological Resources (2000)
- the African Model Law on Safety in Biotechnology (first finalized in 2001);
- the Maputo Declaration on Agriculture and Food Security in Africa (2003);
- the Declaration on Climate Change and Development (2007);
- the Sharm El-Sheik Declaration on Water and Sanitation (2007);
- the Resolution of the Abuja Food Security Summit (2006);
- the Decision and Declaration of the Africa Union on Climate Change and Development in Africa (2007);
- the Algiers Declaration on Climate Change (2008);
- the Swakopmund Protocol on the Protection of Traditional Knowledge and Expressions of Folklore within the Framework of the African Regional Intellectual Property (2010);
- the Common African Position on the Post-2015 Development Agenda (2014); and
- the Africa Agenda 2063 (2014).

Although there are many continent-wide policy statements, declarations resolutions, and initiatives pertaining to food, policies have not been thoroughly and consistently written into national legislation. Poor policy alignment and lack of harmonization is a problem. Food law is not harmonized in Africa. Presently, the African continent lacks an overarching food law legislation or policy or anything comparable to Regulation (EC) No 178/2002 of the European Parliament and of the Council of 28 January 2002 which laid down the general principles and requirements of food law, established the European Food Safety Authority and laid down procedures in matters of food safety. Poverty, poor governance mechanisms, and lack of political will appear to be major factors that have thus far undermined the development of food law in Africa.<sup>1</sup> Because the primary producers of food in the

---

<sup>1</sup>“Poverty and the International Covenant on Economic, Social and Cultural Rights” (E/C.12/2001/10).

continent are poor, disenfranchised and marginalized rural dwellers, little attention has, to date, been given to the role of law and institutions in food production, processing, and distribution. Key stakeholders have typically been excluded when food law and policies are developed and implemented in Africa. Thus, although integral to the food system in Africa, small holders, pastoralists, fisherfolks, forest users, indigenous people, landless workers such as agricultural laborers and sharecroppers, and women are rarely invited to participate in food governance.

There is an urgent need for strong food law frameworks in Africa at the national, sub-regional, and continental level. Urgent attention needs to be paid to designing and implementing appropriate and effective food laws and policies in Africa. The 2014 Ebola outbreak in West Africa underscored the need for strong food law regimes in Africa—regimes strong enough to promptly identify and effectively manage the complex linkages between food and public health. Clearly, food can be a vehicle for tropical disease. Conversely, public health emergencies can undermine, overwhelm and compromise local food systems with devastating consequences.<sup>2</sup>

While painting a general picture of the laws, policies and institutions that structure and shape food law in Africa today, this chapter focuses on seven key issues: (i) food security; (ii) food safety, including biosafety; (iii) the gender dimension of food law in Africa; (iv) climate change; (v) food law and indigenous groups in Africa; (vi) agribusiness, including foreign investment in agricultural land in Africa; and (vii) the intersection of food law and global trade rules. Section 41.2 offers an overview of the legal framework for food law in Africa at the continental and sub-regional levels. Section 41.3 examines in some detail, the seven issues identified above. The chapter will conclude in Sect. 41.4 with a look at the challenges to the development of robust food law frameworks in Africa and the potential role the legal profession in Africa can play to encourage development in this field.

## 41.2 Food Law and Policy in Africa: The Emerging Legal Framework

An analysis of food law architecture in Africa should rightly start with an assessment of the policy initiatives emanating from the Regional Economic Communities (RECs) in the continent as well as the activities of the principle organization of African States—the African Union (previously Organization of Africa Unity). This section offers a survey of Africa Union (AU) instruments relevant to food law. The section also offers an overview of legal and policy developments at the sub-regional and national levels. Africa currently boasts of multiple RECs, some with overlapping memberships. Eight RECs are considered the building blocks of the

---

<sup>2</sup>DiLorenzo (2014).

African Economic Community: (i) Economic Community of West African States (ECOWAS); (ii) East African Community (EAC); (iii) Southern African Development Community (SADC); (iv) Common Market for Eastern and Southern Africa (COMESA); (v) Intergovernmental Authority on Development (IGAD); (vi) Economic Community of Central African States (ECCAS/CEEAC); (vii) Community of Sahel-Saharan States (CEN-SAD); (viii) Arab Maghreb Union (UMA). In addition to AU instruments and policies, instruments pertinent to food and agriculture in four RECS—EAC, ECOWAS, COMESA and SADC—will be examined in this section.

### ***41.2.1 Food, Law, and the Africa Union***

The AU does not have an overarching food law treaty. Food law is not harmonized in Africa and there is no Africa-wide agency presently tasked with coordinating the food law legislation of the member states of the AU. Nevertheless, food and agriculture features prominently in *the New Partnership for Africa's Development* (NEPAD) adopted as a Programme of the AU in 2001. In 2003, African Heads of State and Government endorsed the “*Maputo Declaration on Agriculture and Food Security in Africa*” (Maputo Declaration).<sup>3</sup> In the Maputo Declaration, African Heads of State made several commitments in the area of food and agriculture. First, they resolved to revitalize the agricultural sector “through special policies and strategies targeted at small scale and traditional farmers in rural areas and the creation of enabling conditions for private sector participation.”<sup>4</sup> Second, they resolved to implement the Comprehensive Africa Agriculture Development Program (CAADP). Third, they agreed to adopt sound policies for agricultural and rural development, and to allocate at least 10 % of national budgetary resources for their implementation within 5 years.<sup>5</sup> In the Maputo Declaration, African Heads of State also resolved to ensure the establishment of regional food reserve systems, and to ensure the development of policies and strategies to fight hunger and poverty in Africa.<sup>6</sup> Established in 2003, the CAADP is the agricultural programme of NEPAD and has as its goal the elimination of hunger and reduction of poverty in Africa through agriculture. CAADP aims “to help African countries reach a higher path of economic growth through agriculture-led development.”<sup>7</sup> In 2014, the AU Joint Conference of Ministers of Agriculture, Rural Development, Fisheries and Aquaculture adopted seven Africa Accelerated Agricultural Growth and

<sup>3</sup>Maputo Declaration on Agriculture and Food Security in Africa, Assembly/AU/Decl. 7(II).

<sup>4</sup>Id., Para. 1.

<sup>5</sup>Id., Para. 2.

<sup>6</sup>Id., Para. 6.

<sup>7</sup>NEPAD, About CAADP, <http://www.nepad-caadp.net/about-caadp.php>.

Transformation Goals (3AGTGs) for 2025.<sup>8</sup> Food and agriculture also feature strongly in the *Common African Position on the Post-2015 Development Agenda* that was adopted on 31 January 2014 and the AU Africa Agenda 2063, “A shared Strategic Framework for inclusive Growth and Sustainable Development” that was adopted in 2014.

Although not directly related to food or agriculture, a number of conventions and declarations in the field of human rights and environmental law are shaping food law and policy in Africa and are likely to remain very relevant in the coming years. These include: the African (Banjul) Charter on Human and Peoples’ Rights (1981),<sup>9</sup> the African Charter on the Rights and Welfare of the Child (1990),<sup>10</sup> and the Protocol to the African Charter on Human and Peoples’ Rights on the Rights of Women in Africa (2003); the African Charter for Popular Participation in Development (1990); the 1999 Grand Bay (Mauritius) Declaration and Plan of Action for the Promotion and Protection of Human Rights; and the Protocol on the Establishment of an African Court on Human and Peoples’ Rights (1998).

## ***41.2.2 Food Law and the Regional Economic Communities in Africa***

### **41.2.2.1 The East African Community**

The EAC is a regional intergovernmental organization made up of five countries—the Republics of Burundi, Kenya, Rwanda, the United Republic of Tanzania, and the Republic of Uganda.<sup>11</sup> While the EAC does not have an overarching food law treaty and there is no agency charged with coordinating the food law legislation of Member States, Chapter 18 of the Treaty Establishing the East African Community (EAC Treaty) deals with ‘Agriculture and Food Security.’<sup>12</sup> In the EAC Treaty, EAC Member States agree to ensure a common agricultural policy: food sufficiency within the Community, an increase in agricultural production, and post-harvest preservation and conservation and improved food processing.<sup>13</sup> In the EAC Treaty, Member States also agree to cooperate in specific fields of agriculture, including, *inter alia* “the development of food security within the Partner States and the Community as a whole, through the production and supply of foodstuffs”<sup>14</sup> as

<sup>8</sup>Meeting, held in Addis Ababa, Ethiopia, from 1st to 2nd May 2014.

<sup>9</sup>Adopted 27 June 1981, OAU Doc. CAB/LEG/67/3 rev. 5, 21 I.L.M. 58 (1982), entered into force 21 October 1986.

<sup>10</sup>OAU Doc. CAB/LEG/24.9/49 (1990), *entered into force* Nov. 29, 1999.

<sup>11</sup><http://www.eac.int/>, <http://www.eac.int/>.

<sup>12</sup>Treaty For the Establishment of the East African Community (As amended on 14th December, 2006 and 20th August, 2007) (hereinafter “EAC Treaty.”). Section 2(2) of the EAC Treaty provides that “the Contracting Parties shall establish an East African Customs Union and a Common Market as transitional stages to and integral parts of the Community.”

<sup>13</sup>*Id.*, at Article 105(2).

<sup>14</sup>*Id.*, at 105(2)(b).

well as joint actions in combating drought and desertification.<sup>15</sup> Presently, the *Agriculture and Rural Development Strategy for the East African Community (2005–2030)* is guiding policy and programming in the EAC region.

#### 41.2.2.2 The Economic Community of West African States

Pursuant to Article 3(2)(a) of the Treaty of ECOWAS, ECOWAS shall, by stages, ensure; “the harmonization and coordination of national policies and the promotion of integration programmes, projects and activities, particularly in food, agriculture and natural resources, industry, transport and communications, energy, trade, money and finance, taxation, economic reform policies, human resources, education, information, culture, science, technology, services, health, tourism, legal matters.”<sup>16</sup> Chapter IV of the Treaty of ECOWAS is titled “Cooperation in Food and Agriculture” and calls on Member States to “co-operate in the development of agriculture, forestry, livestock and fisheries.”<sup>17</sup>

ECOWAS is responsible for implementing CAADP in West Africa and has been organizing policies in line with this mandate. Legal and policy developments to date include: *Framework for the West African Agricultural Policy* adopted in July 2004; Decision A/DEC.11/01/05 adopting an agricultural policy for the Economic Community of the West African States—ECOWAP and annex to the decision (2005)<sup>18</sup>; Regional action plan for the implementation of the ECOWAS agricultural policy and CAADP/NEPAD in West Africa between 2006 and 2009 (June 2005); Memorandum on the increase in food prices: the situation, outlook, strategies and recommended measures (May 2008); the Regional Initiative for Food Production and the Fight Against Hunger (adopted in 2008); and the establishment of a Regional Fund for Agriculture and Food. ECOWAS has also endorsed a Regional Agricultural Investment Programme (RAIP).<sup>19</sup>

#### 41.2.2.3 The Southern Africa Development Community

Food law is not recognized as a distinct field within SADC. However, food and agriculture are specifically mentioned in the SADC Treaty of 1992.<sup>20</sup> In the SADC Treaty, Member States agree to cooperate in a number of areas including, *inter alia*

<sup>15</sup>Id., at 105(2)(h).

<sup>16</sup>Treaty of ECOWAS. <http://www.comm.ecowas.int/sec/?id=treaty&lang=en>.

<sup>17</sup>Id., at Article 25(1).

<sup>18</sup>On the 19th January 2005, the Heads of State and Government Conference of West Africa adopted the Agricultural Policy of the Economic Community of West African States.

<sup>19</sup><http://www.aidfortrade.ecowas.int/programmes/raip>.

<sup>20</sup>SADC Treaty 1992. <http://www.sadc.int/documents-publications/sadc-treaty/>.

“food security, land and agriculture;”<sup>21</sup> and “natural resources development and environment”<sup>22</sup> Pursuant to Article 22 of the SADC Treaty, which calls on Member States to conclude “such Protocols as may be necessary in each area of cooperation,” SADC Member States have concluded a number of Protocols relevant to food and agriculture including the Protocol on Wildlife Conservation and Law Enforcement<sup>23</sup> and the Protocol on Fisheries.<sup>24</sup>

#### 41.2.2.4 Common Market for Eastern and Southern Africa (COMESA)

COMESA does not have an overarching food law legislation or policy. However, food and agriculture are mentioned in the 1993 COMESA Treaty. In the COMESA Treaty, Member States specifically agree to: cooperate in agricultural development; adopt a common agricultural policy; enhance regional food sufficiency; cooperate in the export of agricultural commodities; coordinate their policies regarding the establishment of agro-industries; cooperate in agricultural research and extension; and enhance rural development.<sup>25</sup> Chapter 15 of the COMESA Treaty is titled “Standardization and Quality Assurance,” Chapter Sixteen is titled “Co-operation in the Development of Natural Resources, Environment and Wildlife,” while Chapter Eighteen is titled “Co-operation in Agriculture and Rural Development.” Chapter Eighteen lays down the framework for cooperation in a number of areas including: Supply of Staple Foods,<sup>26</sup> the Export of Agricultural Commodities,<sup>27</sup> Agricultural Research and Extension,<sup>28</sup> Drought and Desertification Management,<sup>29</sup> Rural Development, as well as Strengthening Farmers Participation in Agricultural development.<sup>30</sup>

COMESA has developed a number of initiatives relevant to food law and policy in the region. These include: the COMESA Agricultural Strategy, the COMESA Agricultural Policy, and the *Declaration of the Second Meeting of the Ministers of Agriculture on “Expanding Opportunities for Agricultural Production, Enhanced Regional Food Security, Increased Regional Trade and Expanded Agro-exports through Research, Value Addition and Trade Facilitation”*. Two major objectives of COMESA’s agricultural programs are sustainable regional food security and enhanced regional integration. COMESA’s Food and Agricultural Marketing

## 41.3 Food Law in Africa: Emerging Issues

This section focuses on key issues emerging in the food law architecture of Africa as well as issues that will shape discussions about food law and policy in the continent in the coming years. The decision about focus areas is based on an assessment of important policy documents at national and regional levels in Africa. An assessment of these documents suggest that in Africa a number of issues are addressed under the rubric of food law, including: food security; right to food; food safety; women’s access to land; climate change; the plight of indigenous peoples; agribusiness; and food trade.

### 41.3.1 Food Security in Africa

Food security is said to exist, “when all people, at all times, have physical, social and economic access to sufficient, safe and nutritious food that meets their dietary needs and food preferences for an active and healthy life.”<sup>32</sup> The *Plan of Action and the Declaration of the World Food Summit* states that food security means “the access of all people to sufficient, safe and nutritious food to meet their dietary needs and food preferences for an active and healthy life.” This is not yet the situation in Africa. Although Africa has the potential to eliminate hunger, ensure sustainable food security and produce enough food for export, poverty, malnutrition, and food insecurity remains prevalent in the region. At least 30 % of the population of Africa is chronically and severely undernourished.<sup>33</sup> 214.1 million people in Africa are considered undernourished according to *The State of Food Insecurity in the World 2014*.

Constraints to achieving food security in Africa are legion and include, *inter alia*: inadequate laws and institutions; poor infrastructure; low levels of public and private investment in agricultural production in Africa; political instability and social unrest; extreme weather patterns due to climate change; lack of support for small-scale farmers; poor or limited access to affordable agricultural credit for small-scale farmers; limited attention to the development of value-added agro-

<sup>32</sup>FAO (2001).

<sup>33</sup>Maputo Declaration, *supra* note 3.

processing industries in Africa; limited attention to the risks in agriculture (production risks, market risks, input cost risks, transaction risks as well as food safety risks); poor and inadequate farmer's institutions; prevalence of major human and animal transboundary diseases; increased pressure on land and natural resources as a result of other development imperatives; social unrests and civil strife that disrupt food production and food distribution; entrenched discrimination against vulnerable groups such as women, indigenous groups, and people with disabilities with respect to access to and control of land and other productive resources; and post-harvest losses, a result of inadequate storage facilities and limited opportunities for food processing. Poor statistics and information also contribute significantly to food insecurity in Africa.

#### 41.3.1.1 The Legal Framework

Food insecurity is a major concern in Africa and is one of the primary focus of legislative and policy development in the region. At the continental level, initiatives that have been adopted to address food insecurity include the *Framework for African Food Security System (FAFS)* and the *Action Plan for Africa of the Global Strategy for Improving Statistics for Food Security, Sustainable Agriculture and Rural Development (2011–2015)*.<sup>34</sup> The African Development Bank Group has also launched a number of initiatives specific to the agricultural sector and is involved in implementing *the Action Plan (2011–2015) on Improving Statistics for Food Security, Sustainable Agriculture, and Rural Development*.<sup>35</sup>

Several RECs in Africa have adopted specific measures to address food insecurity. In the EAC region, measures to address food insecurity include the East African Community Food Security Action Plan (2011–2015)<sup>36</sup> and the EAC Climate Change Policy.<sup>37</sup> Priority areas for the EAC Food Security Action Plan include: provision of enabling policy, legal and institutional framework; increasing food availability; improving access to food; improving stability of food supply and improving capacity for emergency preparedness and response; and enhancing the efficiency of food utilization, nutrition and safety. Food Security is specifically addressed in Article 110 of the EAC Treaty with Members committing to, *inter*

---

<sup>34</sup>The plan has been endorsed by at least four institutions: The UN Economic Commission for Africa (ECA); the Food and Agricultural Organization (FAO), the African Union Commission; and the African Development Bank.

<sup>35</sup>African Development Bank, *The Bank Group's Participation in Implementing The Action Plan (2011–2015) on Improving Statistics for Food Security, Sustainable Agriculture, and Rural Development* (June 2013).

<sup>36</sup>EAC Secretariat, *East African Community Food Security Action Plan 2011–2015*, (February 2011).

<sup>37</sup>*Id.*

*alia*: “harmonise food supply, nutrition and food security policies and strategies”<sup>38</sup> and “initiate and maintain strategic food reserves”.<sup>39</sup>

Article 25 of the ECOWAS Treaty stipulates that “Member States shall co-operate in the development of agriculture, forestry, livestock and fisheries in order to: a) ensure food security; b) increase production and productivity in agriculture, livestock, fisheries and forestry, and improve conditions of work and generate employment opportunities in rural areas; c) enhance agricultural production through processing locally, animal and plant products.; and d) protect the prices of export commodities on the international market.”

Ensuring regional food security and sufficiency is explicitly listed as one of the objectives of cooperation in agricultural development in the COMESA Treaty.<sup>40</sup> The COMESA Secretariat has also implemented a number of initiatives including: Agricultural Market Promotion and Regional Integration Project, Regional Food Security/Food Reserve Initiative among member states, the Food Security Policy and Vulnerability Reduction Program, and Coordinated Agricultural Research and Technology Interventions. Food security is a topic addressed in COMESA’s FAMIS web portal. The web portal provides information on: COMESA Policy Reform, Food Security Alerts, Annual Food Balance Sheet, and Food Security Updates.<sup>41</sup>

In the *Dar-es-Salam Declaration on Agriculture & Food Security in the SADC Region* (2004), Member States of SADC agreed to implement short-, medium-, and long-term objectives to advance the state of agriculture and food security in Southern Africa. Other initiatives of SADC include the *SADC Multi-Country Agricultural Productivity Programme (MAPP)*,<sup>42</sup> *SADC Protocol on Fisheries (2001)*, and the *Regional Indicative Strategic Development Plan (RISDP)*.<sup>43</sup> “Promot[ing] and enhanc[ing] food security and human health” as well as “safeguard[ing] the livelihoods of fishing communities” are among the expressed objectives of the SADC Fisheries Protocol.<sup>44</sup>

At the national level, countries are at different stages in terms of formulating and/or implementing national food security policies and establishing the necessary governance structure. Examples of national commitment to the food and nutrition security agenda include: Government Resolution No. 6/2004 of 18 February 2004 on the National Food Security Sustainable Strategy (Cape Verde)<sup>45</sup>; National Food

<sup>38</sup>EAC Treaty, *supra* note 12 Id., Article 110 (d).

<sup>45</sup>Creating the National Food Security Strategy (ENSA) and the corresponding National Food Security Plan (PNSA) for the period 2003–2015.

and Nutrition Security Strategy (Mozambique)<sup>46</sup>; National Food and Nutrition Security Plan (Mozambique); and the National Food and Nutrition Security Strategy for 2010–2015 (Angola).

Signed into law on 6 July 2011, the Zanzibar Food Security and Nutrition Act (Zanzibar Food Act) is intended to cover all issues related to food availability, food accessibility, food utilization, food stability and the realization of the right to adequate food in Zanzibar.<sup>47</sup> The Zanzibar Food Act establishes the National Food Security and Nutrition Council and vests it with the responsibility of overseeing the implementing Zanzibar's Food Security and Nutrition Policy and Programme.<sup>48</sup> Additionally, the Zanzibar Food Act establishes the Zanzibar Food Reserve, the purpose of which is to ensure a reliable supply of food in Zanzibar, meet local shortfalls in the supply of food, meet any other food emergencies, and solve problems relating to the supply of food in Zanzibar.<sup>49</sup> The Act calls for the establishment of the Food Insecurity and Vulnerability Information Mapping System, which is intended to provide the information needed to galvanize and strengthen the capacity to respond to food emergency and food aids.<sup>50</sup>

Countries are also establishing inter-sectoral governance structures to support the implementation of their food security laws. Examples include: the Technical Secretariat for Food and Nutrition Security (Mozambique); the National Food Security Council (Cape Verde) and the National Food Security Network (Cape Verde); and the National Food and Nutrition Security Council (Angola). As part of the Community of Portuguese Language Countries (CPLP), the Portuguese-speaking African Countries (PALOP)—Angola, Mozambique, Cape Verde, Guinea-Bissau and Sao Tome and Principe—are also addressing food insecurity.<sup>51</sup> CPLP is working on establishing a Working Group on Food Security and Agriculture and adopting an Action Plan for Food Security. In the Dili Declaration, adopted in July 2014 at the Tenth Summit of Heads of State and Government of CPLP, Member States placed food and nutrition security as a permanent issue on the organization's agenda until 2025.<sup>52</sup>

#### 41.3.1.2 Food Security Litigation in Africa

According to the Office of the High Commissioner for Human Rights, “the concept of food security itself is not a legal concept per se and does not impose obligations

<sup>46</sup>Resolution No. 56/2007 of 16 October 2007 reviewed the 1998 strategy and ushered in ESAN II for the period 2008–2015.

<sup>47</sup>The Zanzibar Food Security and Nutrition Act, 2011, Article 3(2).

<sup>48</sup>Id., Article 5 and 6.

<sup>49</sup>Id., Article 25(1) and (2).

<sup>50</sup>Id., Article 26(1).

<sup>51</sup>Members of CPLP are: Angola, Brazil, Cape Verde, Guinea-Bissau, Mozambique, Portugal, Sao Tome & Principe, Timor-Leste and Equatorial Guinea.

<sup>52</sup>Food and Agricultural Organization, FAO welcomes commitment to fight hunger from the Community of Portuguese Language Countries, 23 July 2014.

on stakeholders nor does it provide entitlements to them.”<sup>53</sup> There are few, if any, lawsuits challenging the food security initiatives that the different governments in Africa have adopted or pressing for their full implementation. However, a growing number of cases that have implication for the food security of particular groups have been decided in a number of countries in Africa and by some regional courts. In *George v. Ministers of Environmental Affairs and Tourism Appeal*, respondents, representing 5000 artisanal fishers in South Africa, lodged applications in both the high court and the Equality Court asserting that the Minister of Environmental Affairs and Tourism failed to provide fair and just access to fishing rights and demanding an order giving them equitable access to fishing. In *Commercial Farmers Union v Minister of Lands*,<sup>54</sup> the Supreme Court of Zimbabwe, while addressing the issue of land expropriation, discussed the history of land injustice in Zimbabwe and appeared to acknowledge the need for a land reform program that is guided by the rule of law.

At the regional level, the African Commission on Human and Peoples’ Right (African Commission) has ruled on the right to food and related rights in two important cases: *The Social and Economic Rights Action Center and the Center for Economic and Social Rights v. Nigeria (SERAC)*<sup>55</sup> and the *Centre for Minority Rights Development (Kenya) and Minority Rights Group International on behalf of Endorois Welfare Council v Kenya (Endorois)*.<sup>56</sup> In *Endorois*, a case involving the forced eviction of the an indigenous group in Kenya from their ancestral land, the African Commission on Human Rights concluded that the community’s right to culture protected under Article 17(2) and (3) of the African Charter had been violated. According to the African Commission: “By forcing the community to live on semi-arid lands without access to medicinal salt licks and other vital resources for the health of their livestock, the Respondent State have created a major threat to the Endorois pastoralist way of life.”<sup>57</sup> In *SERAC*, complainants alleged that the oil exploration and extraction activities of oil companies operating in the Niger Delta region of Nigeria resulted in the contamination of water, soil and air and caused serious short and long-term health impacts, including skin infections, gastrointestinal and respiratory ailments, increased risk of cancers, and neurological and reproductive problems. Although the African Charter does not explicitly provide for the right to food, the African Commission concluded that African Charter implicitly guaranteed the right to food and that the minimum core of the right to food “requires that the Nigerian Government should not destroy or contaminate food sources”<sup>58</sup> and “should not allow private parties to

destroy or contaminate food sources, and prevent peoples' efforts to feed themselves."<sup>59</sup>

### ***41.3.2 Food Safety and Food Law in Africa***

Most countries in Africa have a host of laws and regulations pertaining to food safety. However, because of grinding poverty and recurring episodes of famine and food crisis, food security concerns have thus far dwarfed food safety concerns in Africa.<sup>60</sup> The result is that although most countries have laws on the books that address various aspects of food safety, most of the laws are outdated, are not based on evidence, and are rarely, if ever, implemented. Most countries in the region lack analytical capacity for food-borne disease surveillance and research. Linkages, cooperation, collaboration and coordination among national food safety agencies is extremely limited. Furthermore, only a few countries include food safety in their national development plans and national health policies. Finally, although most countries in the region have taken a stand against products containing genetically modified organisms, most do not have the legal and institutional framework necessary to ensure that such products do not enter their border.

There is presently no continent-wide food safety law or system, no comprehensive or integrated approach to food safety in Africa, no comprehensive system of traceability within food and feed businesses in the continent, and no generally-agreed principles upon which food and feed may be traded throughout the continent. There is also no continent-wide accepted definition of food, no continent-wide requirement for feed, and no measure in place at the continental level to guarantee that unsafe foods do not enter the stream of commerce or to address food safety emergencies. Finally, there is no agency comparable to the European Food Safety Authority tasked with providing scientific advice and scientific and technical support for continent-wide legislation and policies that have direct or indirect impact on food safety. At the level of the regional economic communities, there are plans on-going to harmonize food safety laws and policies. However despite political commitments to harmonize rules at the sub-regional level, little progress has been made on this front.

Risks associated with food in Africa are microbiological, chemical, physical, radioactive, and biotechnological. The major causative agents of foodborne diseases in the African region according to the World Health Organization (WHO) are bacteria, parasites and viruses. Other concerns include foodborne zoonotic diseases and chemical contamination of food from pesticides and veterinary drug residues. Several countries in Africa have experienced outbreaks of food-borne diseases such

---

<sup>59</sup>Id.

<sup>60</sup>AFR/RC57/4 1 (30 August 2007). ("Because of insufficient food to meet demand on the African continent, the majority of people are only concerned with satisfying hunger and do not give due attention to the safety of food.")

as salmonellosis, entero-haemorrhagic *Escherichia coli* (EHEC), hepatitis A, cholera, and acute aflatoxicosis.

### 41.3.2.1 Food Safety Laws in Africa: A Survey

There is much diversity in the food safety law situation of countries in Africa. In the absence of harmonization, countries are taking varied and different steps to strengthen the food safety laws, policies and institutions.

#### Food Safety Laws at the Sub-Regional Level

There are plans to harmonize food safety laws along sub-regional lines. Under the EAC Treaty, Member States agree to: “harmonise policies, legislation and regulations for enforcement of pests and disease control;” “harmonise and strengthen regulatory institutions;” “harmonise and strengthen zoo-sanitary and phyto-sanitary services inspection and certification;” “establish regional zoo-sanitary and phyto-sanitary laboratories to deal with diagnosis and identification of pests and diseases;” “adopt common mechanism to ensure safety, efficacy and potency of agricultural inputs including chemicals, drugs and vaccines;” and “co-operate in surveillance, diagnosis and control strategies of transboundary pests and animal diseases”.<sup>61</sup> In the ECOWAS Treaty, Member States agree to cooperate in “the adoption of a common agricultural policy especially in the fields of research, training, production, preservation, processing and marketing of the products of agriculture, forestry, livestock and fisheries.”<sup>62</sup>

The EAC, ECOWAS, COMESA and SADC all have in place protocols or draft protocols on sanitary and phyto-sanitary measures.<sup>63</sup> For instance, the *COMESA Regulations on the Application of Sanitary and Phytosanitary Measures* (COMESA SPS Regulation) was adopted in 2009 with the goal of setting out principles and creating mechanisms for cooperation in the implementation of SPS measures by Member States.<sup>64</sup> The COMESA SPS Regulation established a COMESA Green Pass program—“a commodity-specific SPS certification scheme and authority for movement of food and agricultural products within the Common Market, issued by a National Green Pass Authority.”<sup>65</sup> Approved in 2009, the EAC Protocol on Sanitary and Phytosanitary Measures remains in a draft form awaiting approval from the *EAC Sectoral Council on Legal and Judicial Affairs*. The East African

<sup>61</sup>EAC Treaty, supra note 12., at 108.

<sup>65</sup>7(1).

Community Sanitary Measures on Fish and Fisheries Products was launched recently in March 2014.<sup>66</sup> Also existing within the EAC are: Harmonized Phytosanitary Measures and Procedures for Plants Vol. I; Harmonized Sanitary Measures and Procedures for Mammals, Birds and Bees Vol. II; Harmonized Sanitary Measures and Procedures for Fish and Fishery Products Vol. III; and Harmonized Measures for Food Safety Vol. IV. Altogether the four volumes specify rules that apply to the importation and exportation of specified products. The EAC Sanitary Measures on Fish and Fisheries products was launched on 12 March 2014, and consists of documents on Sanitary and Phytosanitary (SPS), Manual of Standard Operating Procedures (MSOP) and the Inspector's Guide.<sup>67</sup>

### Food Safety: National-level Laws and Policies

Most countries in Africa have laws that address some aspects of food safety.<sup>68</sup> Some laws address public health generally, some laws address food safety very broadly, and other laws address specific issues such as pests, food inspection, or use of pesticide. Examples of general public health legislations include: Public Health Act Cap 242—Kenya; Public Health Act No. 36 of 1919—Namibia; Decree-law No. 1/16 of May 1982 regarding a code on public health—Burundi); Law No. 64/LF/123 of November 1964 regarding the public health protection—Camer-oon). Examples of general food safety laws in Africa include: Law 84–009, Basic law governing the control of staple food (Benin Republic); Food Control Act, 1993 (No. 11 of 1993)—Botswana; Food Act 1987 (Act No. 14 of 1987)—Seychelles; Standards Act No. 29 of 1993—South Africa; the Agricultural Products Standards Act, 1990 (Act No. 119 of 1990—South Africa; and Food and Drugs (Amendment) Decree 1999 (No. 21 of 1999)—Nigeria. In addition to general food safety legis-lation, many countries have laws addressing specific products. Meat appears to be heavily regulated in many countries.<sup>69</sup> A growing number of countries have laws that address specific food safety concern such as pesticide,<sup>70</sup> pests,<sup>71</sup> labeling,<sup>72</sup>

counterfeiting,<sup>73</sup> and street food vending. Also common are laws regulating the export and/or import of food,<sup>74</sup> laws regulating medicines and related substances,<sup>75</sup> and laws addressing food adulteration.<sup>76</sup>

Some but not all countries in Africa have functioning agencies tasked with establishing and elaborating on food standards. National agencies tasked with food safety regulation in Africa include: South Africa Bureau of Standards (South Africa), Agence National de Contrôle Sanitaire et Environmental des Produits (Algeria), Food Control Authority (Mali, Morocco, Zimbabwe); Tanzania Bureau of Standards (Tanzania), Kenya Bureau of Standards, Rwanda Bureau of Standards, Food and Drug Laboratory, Ministry of Health (Zambia), Public Health and Marketing, Ministry of Agriculture, Animal Husbandry and Fisheries (Uganda). Lesotho has a Director of Standards within the Ministry of Trade and Industry but also has a Food Hygiene and Safety Programme Manager within the Ministry of Health and Social Welfare.<sup>77</sup> Although legally mandated to develop food safety standards, some of domestic agencies are yet to establish functioning and accessible systems for the development and review of food standards. Finally, more and more countries are passing laws to establish national Codex Alimentarius Committees and National Codex Contact Points. Examples include: Decree n° 834/PR/MAEDR in Tunisia establishing a national Codex Alimentarius Committee and Decree n° 2005-388 amending decree n° 2000-2574 on the establishment of “Codex Alimentarius” Committee, its ruling, organization and composition.

Consumer right is increasingly enshrined in national constitutions and may form the basis for stronger food safety system in the future. Article 46(1) of the Kenyan Constitution declares that “Consumers have the right—(a) to goods and services of reasonable quality; (b) to the information necessary for them to gain full benefit from goods and services; (c) to the protection of their health, safety, and economic interests; and (d) to compensation for loss or injury arising from defects in goods or services.” Pursuant to Article 46(2), “Parliament shall enact legislation to provide for consumer protection and for fair, honest and decent advertising.”

Some countries are stepping up laws relating to food labelling and advertising. On 29 May 2014, South Africa’s Department of Health published [The draft Regulations Relating to the Labelling and Advertising of Foods \(R. 429\)](#), and

---

<sup>73</sup>Counterfeit and Fake Drugs and Unwholesome Processed Food Decree, (Act No. 25 of 1999)—Nigeria.

<sup>76</sup>Sale of Adulterated Food Act No. 25, 1968—Swaziland; Adulteration of Produce Decree (Cap. 109)—Tanzania.

<sup>77</sup>Other examples include: Quality and Standards Authority—Ethiopia; Senegal Standardization Institute—Senegal; and National Center for Food and Hygiene—Mauritania.

supporting [guidelines](#).<sup>78</sup> R. 429 is based on Foodstuffs, Cosmetics and Disinfectants Act, 1972 (Act No. 54 of 1972) and addresses the commercial marketing of foods and non-alcoholic beverages to children of school-going age (up to Grade 12). R. 429 affects persons who manufacture, import, sell, donate or offer for sale any pre-packed food. R. 429 joins existing laws in the area including: R.246 of 11 February 1994: *Regulations governing the maximum limits for pesticide residues that may be present in foods*; R.1809 of 3 July 1992: *Regulations governing the maximum limits for veterinary medicine and stock remedy residues that may be present in foods*; R.500 of 30 April 2004: *Regulations relating to Maximum Levels for Metals in Foods*; R.491 of 27 May 2005: *Regulations relating to Marine Biotoxins*; R.1145 of 8 October 2004: *Regulations governing tolerances for fungus produced toxins in foods* (mycotoxins); and R.911 of 28 September 2001: *Regulations governing certain solvents in foods* (benzene and methanol).

The legal and regulatory response to biotechnology and biosafety issues in Africa remains extremely weak despite continental and regional activities in this area. An Africa-wide biosafety system is not yet in place. Efforts to implement an Africa-wide biosafety system as well as an Africa-wide capacity building program in biosafety are ongoing, however. Most countries in Africa have ratified the Cartagena Protocol on Biosafety. In its Decision EX/CL/Dec.26 (111) adopted in 2003, the Executive Council of the AU “stressed the need for Member States to equip themselves with the necessary human and institutional capacities to deal with Biosafety issues and implicitly the need for a common African approach to addressing issues pertaining to modern biotechnology and biosafety.”

Positive developments at the continental level include: the development of the African Model Law on Safety in Biotechnology first finalized in 2001; the implementation of the AU-Biosafety Project—a project on capacity building for an Africa-wide biosafety system developed between the AU and German Technical Cooperation (GTZ); the development of an African Strategy on Biosafety; the establishment of an AU Biosafety Unit under the AU’s Department of Human Resources Science and Technology; the establishment of the High-level African Panel on Biotechnology (APB); and the launch of the African Biosafety Network of Expertise (ABNE). Developments at the sub-regional level include the establishment of a SADC Advisory Committee on Biotechnology and Bio-safety (SACBB) and the development of a SADC Guidelines on GMOs, Biotechnology and Biosafety.

#### **41.3.2.2 Gaps in Africa’s Food Safety Law Apparatus**

Despite the impressive array of laws and regulation that address food safety in countries in Africa, major gaps in the legal framework for food safety persists. First, although many countries have laws on the books addressing different aspects of food safety, “[t]he traditional food control systems in most African countries do not

---

<sup>78</sup>Republic of South Africa, Regulation Gazette No. 37695 (29 May 2014).

provide the concerned agencies with a clear mandate and authority to prevent food safety problems.”<sup>79</sup> Second, existing food legislation is often not in line with international requirements.<sup>80</sup> Third, for most countries, existing laws are outdated, inadequate, fragmented, and confusing.<sup>81</sup> Fourth, although most countries have agencies charged with some aspect of food safety management, the scope of the mandate of the agencies, the capacity of the agencies to fulfill their mandate, the accountability of these agencies, and the level of coordination and cooperation among the different agencies tasked with food safety management are often not clear. Fifth, many countries in Africa still lack effective, functioning and comprehensive food inspection mechanisms; while some countries have some sort of system in place for inspecting food imports and export, mechanisms directed at general food inspection are lacking in most countries. Sixth, food safety laboratory support services is absent in many countries. Overall, most countries in the region lack a well-conceived food safety policy, do not have an effective national food control systems, have no system in place for dealing with emerging food safety challenges, have not included food safety in their national development goals and strategies, lack the technical capacity to develop and implement of food safety policies and legislation, and lack the capacity to monitor food imports even though food import has increased significantly in Africa.

There is an urgent need for increased standardization of the African food safety system. In 2005, the Food and Agriculture Organization of the United Nations (FAO) and the World Health Organization (WHO) jointly convened the FAO/WHO Regional Conference on Food Safety for Africa. Conference participants unanimously adopted a resolution recommending a nine-point *Five-year Strategic Plan for Food Safety in Africa* for adoption by FAO and WHO, along with the African Union.<sup>82</sup> At its 57th session in 2007, the WHO Regional Committee for Africa endorsed the Regional Strategy on Food Safety and Health.<sup>83</sup> In 2006, the Summit of the Heads of States of the AU adopted the *African Union Regional Nutrition Strategy 2005–2015*. Following African Union Commission’s (AUC) call for a pan-African food safety body, discussions are now underway for an African Food Safety Authority.<sup>84</sup> There are also

<sup>79</sup>CAF 05/2.

<sup>80</sup>Id.

<sup>81</sup>Id.

<sup>82</sup>Nine elements: (i) Food safety policies and programmes; (ii) Legislative and institutional aspects; (iii) Standards and regulations; (iv) Food inspection programmes and techniques; (v) Food analysis and food safety testing laboratories; (vi) Monitoring food-borne diseases and the safety of foods on the market; (vii) Participation in Codex; (viii) Communication and stakeholder involvement (including industry officials and consumers); (ix) National, regional and international cooperation.

<sup>83</sup>AFR/RC57/4 (53.92 kB) Food Strategy and Health: A Strategy for the WHO African Region.

<sup>84</sup>Gretchen Goetz, African Union Makes Plans for Food Safety Authority, November 2, 2012 [http://www.foodsafetynews.com/2012/11/african-union-makes-plans-for-food-safety-authority/#.U8aVB7bn\\_rc](http://www.foodsafetynews.com/2012/11/african-union-makes-plans-for-food-safety-authority/#.U8aVB7bn_rc).

on-going talks about establishing an African Rapid Alert System for Food and Feed (RASFF).

Despite efforts to implement an Africa-wide biosafety system, major gaps remain in the legal and regulatory response to biosafety concerns. First and foremost, most countries in Africa do not have strong biosafety regulations that are in line with internationally-agreed rules and guidelines. Additionally, existing regulations often do not strike appropriate balance between promoting innovation and safeguarding human health and the environment. When it comes to biotechnology and biosafety, the legal terrain in Africa is uneven. There are wide variations in biosafety policies and regulations of countries in the region. It is not clear if and to what extent the Model Law on Biotechnology has influenced the drafting of national safety acts and bills. It is also not clear how many countries in Africa have implemented the call, in the Model Law on Biotechnology, for countries to establish National Focal Points, National Biosafety Committees, as well as Institutional Biosafety Committees. The level of public participation in African Biosafety regulations and policies is extremely low and deserve closer scrutiny, as does the extent to which emerging biosafety regulations in the continent address issues such as liability, redress, compliance, and dispute settlement mechanisms for biosafety. Presently, GMO laws and regulations are not harmonized. Efforts to harmonize GMOs may yet emerge at the sub-regional level.<sup>85</sup> The intersection of biosafety and food aid, biosafety and trade rules, biosafety and intellectual property rights are issues of concern to countries in Africa and deserve closer analysis.

### 41.3.2.3 Conclusions

Food security concerns have typically taken precedence over food safety issues in Africa. However, in the light of the 2014 Ebola crisis and other public health crises, food safety is becoming a matter of grave concern in the continent. The pressure on countries to address gaps in their food safety system is growing. Pressure for change is coming from the general consuming public, non-governmental organizations, professional associations, the media, international trading partners and trade associations, and from international organizations such as the WHO. With the influx of international fast-food franchises into Africa and noticeable changes in eating habits of ordinary Africans—from eating home-prepared food to consumption of ready-to-eat foods—food safety concerns is also growing. Functioning food standards systems, effective inspection mechanisms, and functioning laboratory support services are all needed. Effective national food control systems will ensure that consumers are protected and can contribute to efforts to address food insecurity in Africa. Effective national food control systems will help boost agricultural export from Africa and allow countries in Africa take full advantage of international food

---

<sup>85</sup>East African Community Protocol on Environment and Natural Resource Management, Article 27 (calling for a common approach to biosafety.).

trade opportunities. There are important economic gains to be had as well. Addressing food safety allows countries to control economic consequences due to absenteeism, hospital fees and international trade losses.

To create a credible and effective food safety system, adequate policies, programs and laws developed in an open and transparent manner and with full participation of relevant stakeholders are necessary. Such laws must of necessity address all aspects of the food production, processing, and distribution chain, lay down basic food safety requirements, and require that food safety measures be based on risk analysis including risk assessment, risk management and risk communication. Such laws must also require that risk assessment be undertaken in an independent, objective and transparent manner. Finally, such laws ought to be administered in a transparent manner and should prioritize the principles of public consultation, public participation, and public information. Adequate standards and regulations are necessary and ought to be communicated to all stakeholders in a timely fashion. Capacity building must be an important component of food safety laws and policies in Africa. While some governments have focused attention on developing the capacity of the export food industry, few have paid attention to addressing capacity constraints of enterprises that produce food for domestic consumption. Effective monitoring and enforcement mechanisms are also urgently needed as are functioning food safety testing laboratories.

Work is also needed at the regional and continental level. The absence of a coherent regime at the continental level undermines regional trade in food. With the goal of ensuring continuous monitoring of food safety, a networking of laboratories at the regional and continental level is important. The establishment of an African Food Safety Authority is an idea worth pursuing. As is the case with the European Food Safety Authority, such a body can take on the role of an independent scientific point of reference in risk assessment. Also necessary is the development of a pan-African food safety standard based on Codex standards. The Ebola crisis in West Africa and past food incidents in Africa demonstrate the need for effective emergency food safety measures at the national, regional and continental levels.

At the global level, African countries must strive to contribute meaningfully to the development of international standards that underpin food law, including sanitary and phytosanitary standards.<sup>86</sup> Increasingly, agreements on recognition of the equivalence of specific food measures are becoming important. Individually and collectively, countries in Africa must push to contribute to the development of equivalence standards. Increased participation in the relevant committees of the Codex Alimentarius Commission is also necessary. Given limited resources, there is an obvious need for countries in Africa to strengthen joint efforts in capacity-

---

<sup>86</sup>Several RECs in Africa have observer status in the SPS Committee of the World Trade Organization including: SADC, COMESA, ECOWAS, Intergovernmental Authority on Development (IGAD), West African Economic and Monetary Union (WAEMU), Economic Community of Central African States (ECCAS), and the Community of Sahel Saharan States (CEN SAD).

building, international standard setting, information sharing and food contamination monitoring.<sup>87</sup>

Establishing functioning food law systems in Africa will not be easy. Challenges to improving food safety in Africa are legion and include: (i) inadequate commitment to a transparent, participatory, science-based food safety system; (ii) outdated food laws regulations; (iii) weak law enforcement; (iv) inadequate capacity for food safety surveillance; (v) lack of coordination and communication among the different agencies responsible for food safety; (vi) lack of adequate research on food safety; (vii) weak private sector and inability of small- and medium-scale producers to produce safe food; (ix) inadequate cooperation among stakeholders; (x) ignorance; (xi) non-functional laboratories; (xii) long and very porous national borders; and (xi) persistence of some cultural beliefs, attitudes and practices that obstruct food safety goals. African nations need increased capacity in almost every component of the food control system. Food safety capacity building is urgently needed in a number of areas including: strengthening national and regional laboratories, strengthening consumer associations, developing effective legislations, standards and guidelines, as well as educating all stakeholders in the food chain, particularly the general public and small business owners.

### ***41.3.3 The Gender Dimension of Food Law in Africa***

Women in Africa are heavily involved in agriculture and food processing, and are highly dependent on agriculture for their livelihood. However, women experience significant inequality and injustice in the food and agricultural sector. Gender is yet to be fully and holistically integrated into the food and agricultural strategies of countries in Africa. Women face significant economic risks, labor risks, social risks, and health and safety risks in the agricultural sector.<sup>88</sup> As food producers and caregivers, African women are also disproportionately affected when large-scale development projects displace poor peasant communities from their land, destroy local means of livelihood, or trigger land-related conflicts and violence. One of the greatest problems women face in Africa is lack of access to and ownership of land and other agricultural assets, inputs, and services such as credit, technology, information and extension services, and natural resources. With growing pressure on land, increased commercialization of land, and increases in land-related disputes and conflicts in the continent, the land-related problems African women face are likely to increase with resulting consequences for food law and policy in the continent.

---

<sup>87</sup>International, regional, sub-regional and national cooperation in food safety (CAF 05/6).

<sup>88</sup>Fair Labor Association, Assessing Women's Role in Nestle's Ivory Coast Cocoa Supply Chain (2014).

The land question in Africa is complicated by a number of factors, including: the multiplicity of claims to land; the plurality of legal systems (customary, religious and secular) and property systems; the dominance of communal land tenure system in most parts of the continent; the enduring influence of customary laws and practices; and increased pressure on land as a result of globalization of agricultural trade and agricultural investment. While many countries have adopted new laws and policy aimed at addressing gender inequality in respect of access to land, land reforms often do not go far enough in terms of redressing imbalance, and sometimes create problems of their own. Moreover, implementing and enforcing laws and policies designed to strengthen women's land rights remains a major challenge in most countries in Africa as a result of corruption, lack of information about land reform and land rights, and limited access to judicial and non-judicial grievance mechanisms for addressing land-related claims. Addressing and strengthening women's land rights can contribute to poverty reduction efforts in the continent, enhance food security in the region, and boost agricultural productivity in the continent. Additionally, addressing women's land rights also has implications for women's right to health. Organizations like the International Centre for Research on Women (ICRW) have established strong linkages between women's property and inheritance rights and HIV/AIDS in Africa.<sup>89</sup>

#### **41.3.3.1 Women and Access to Land: Present Problems and Challenges**

Lack of access to and control over land is a major problem women face in Africa, although the level and severity of the problem varies from country to country and from one ethnic group to another. In many countries, customary law still precludes women from owning and inheriting land. In other countries, women can legally inherit but relatives prevent them from accessing and using the land they have inherited. Problems range from customary restrictions on land acquisition and ownership, lack of awareness about land rights, failure to operationalize and enforce equal-rights legislation on the books, to lack of access to legal representation. The result is that in many parts of Africa, customary norms continue to limit women's ownership and control of land. Through relationships with male relatives—father, brother, son, husband—many women enjoy access to land which they lose whenever the underlying relationship is disrupted. Even when women have access to land to cultivate, their rights to such land is tenuous and vulnerable at best and is usually lost through widowhood or divorce.<sup>90</sup>

<sup>89</sup>Strickland (2004).

<sup>90</sup>Rural Development Institute, Women's Land Rights in Rwanda 6 (2006).

### 41.3.3.2 Women and Land in Africa: The Legal Framework

Article 4(L) of the Constitutive Act of the African Union specifically provides that the African Union “shall function in accordance with the promotion of gender equality.” Policy makers in Africa have made numerous commitments to gender equality and women’s empowerment. Documents encapsulating this commitment include: the African Union Gender Policy 2009; AU Assembly Decision AU/Dec. 134-164 (IIIIV) on the Establishment of the African Women Trust Fund; the Protocol to the African Charter on Human and People’s Rights on the Rights of Women in Africa, and the Solemn Declaration on Gender Equality in Africa (SDGEA).<sup>91</sup> Also suggesting a renewed commitment to gender equality is the fact that on 18 October 2010—the International Day for Rural Women—the AU officially launched the African Women’s Decade (AWD) (2010–2020) under the theme “Grassroots Approach to Gender Equality and Women’s Empowerment.” Agriculture and Food Security, Environment and Climate Change, Peace and Security, and Violence Against Women are some of the sub-themes of the Decade.

Binding commitments in sub-regional protocols and declarations offer another layer of protection for women. Examples include the SADC Protocol on Gender and Article 3(e) of the EAC Treaty 3(e) which provides that the Community shall ensure the mainstreaming of gender in all its endeavors and the enhancement of the role of women in cultural, social, political, economic and technological development. Many governments in Africa have ratified the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) as well as ILO Conventions Nos. 100 and 111. Although many countries in Africa have ratified CEDAW, in many countries in Africa, the treaty has yet to be incorporated into national and state laws.<sup>92</sup>

Gender features strongly in most national constitutions with most explicitly prohibiting sex discrimination. Gender equality and non-discrimination feature in the 2010 Constitution of Kenya under Article 10 (National values and principles of governance), Article 19 (Rights and fundamental freedoms) and Article 27 (Equality and freedom from discrimination). Article 27(3) declares “Women and men have the right to equal treatment, including the right to equal opportunities in political, economic, cultural and social spheres.” Article 27(6) goes a step further and requires the State to “take legislative and other measures, including affirmative action programmes and policies designed to redress any disadvantage suffered by individuals or groups because of past discrimination.”

Some national constitutions in Africa address the land question, as exemplified by Article 25 of the South African constitution. The Kenyan Constitution addresses

<sup>91</sup>Adopted by AU Heads of State and Government at their July 2004 Summit.

<sup>92</sup>For countries whose constitution provide for direct applicability of treaties, international treaties protecting the right of women such as the CEDAW Convention are directly applicable and enforceable. Article 2(5) of the Constitution of Kenya states that “The general rules of international law shall form part of the law of Kenya.” Article 2(6) further provide: “Any treaty or convention ratified by Kenya shall form part of the law of Kenya under this Constitution.” See The Constitution of Kenya 2010.

the thorny issue of inheritance, land rights, and right to property. Indeed, Chapter 5 of the Kenyan Constitution is titled “Land and Environment.” Article 40(1) of the Constitution that “Subject to Article 65, every person has the right, either individually or in association with others, to acquire and own property—(a) of any description; and (b) in any part of Kenya.” Article 60 (1) states that “Land in Kenya shall be held, used and managed in a manner that is equitable, efficient, productive and sustainable.” Article 60(1) lists several principles of land policy including: equitable access to land<sup>93</sup>; security of land rights<sup>94</sup>; and “elimination of gender discrimination in law, customs and practices related to land and property in land.”<sup>95</sup> Pursuant to Article 68, Parliament shall enact legislation “to protect the dependants of deceased persons holding interests in any land, including the interests of spouses in actual occupation of land.”<sup>96</sup> Beyond the constitution, a good number of countries are enacting new laws aimed at addressing discrimination against women in land matters. An example of this is the Devolution of Estate Act of 2007 in Sierra Leone.

#### 41.3.3.3 Legal Battle for Women’s Right in Africa

In Africa, women are waging the battle for equality on the legislative front as well as on the judicial front. While some court decisions have been favorable to women, others have merely affirmed entrenched customary laws and practices.

In *Ephraim v. Pastory*<sup>97</sup> the issue was whether a customary law that barred women (not men) from selling clan land violated the Tanzanian Constitution and international Human Rights Law. In the case, the respondent, Holaria d/o Pastory, sold clan land that she inherited from her father to a non-clan member. The appellant, Bernardo s/o Ephraim, the respondent’s nephew by marriage, filed a suit at Kashasha Primary Court in Muleba District, Kagera Region, praying for a declaration that the sale of the clan land by the respondent was void as females under Haya Customary Law have no power to sell clan land. The Primary Court agreed with the appellant, voided the sale and ordered the respondent to refund the money she received on the land. The customary law on the issue stated thus: “Women can inherit, except for clan land, which they may receive in usufruct but may not sell. However, if there is no male of that clan, women may inherit such land in full ownership.”<sup>98</sup> Citing the Bill of Rights, which was incorporated in the 1977 Constitution as well as international human rights instrument, Mwalusanya J. of the High Court of Tanzania at Mwanza observed that the customary law in question

<sup>93</sup>Id., Article 60(1)(a).

<sup>94</sup>Id., Article 60(1)(b).

<sup>95</sup>Id., Article 60(1)(f).

<sup>96</sup>Id., Article 68(c)(vi).

<sup>97</sup>(2001) AHRLR 236 (TzHC 1990).

<sup>98</sup>Id., p. 2.

“flies in the face of [Tanzania’s] Bill of Rights as well as the international conventions”<sup>99</sup> and noted that “Courts are not impotent to invalidate laws which are discriminatory and unconstitutional.”<sup>100</sup> The Judge ultimately found the law in question to be discriminatory and inconsistent with article 13(4) of the Bill of Rights of Tanzania’s Constitution which bars discrimination on account of sex.<sup>101</sup>

Legal victories for women in Africa are few and far in between. Even when the constitution prohibits gender discrimination, claw-back clauses in the constitution sometimes render the non-discriminatory provisions useless. Section 23 of the Constitution of Zimbabwe prohibits gender discrimination. However, Section 23 (3) of the Constitution states: ‘Nothing contained in any law shall be held to be in contravention of subsection 1(a) to the extent that the law in question relates to any of the following matters—(a) . . . devolution of property on death or other matters of personal law; (b) the application of African customary law in any case involving Africans . . .’. The plaintiff in the Zimbabwean case of *Magaya v Magaya*<sup>102</sup> had to contend with Section 23(3). In *Magaya v Magaya*, the Supreme Court of Zimbabwe ruled that a woman could not inherit property under customary law in any case occurring prior to the passing of the Administration of Estates Amendment Act No. 6 of 1997. Section 23(3)(a) and (b) effectively immunized laws relating to devolution of property on death and to the application of customary law from the reach of the provisions of the constitution prohibiting gender discrimination.

#### 41.3.3.4 Conclusions

Emerging food law in Africa must grapple with the gender question because African women contribute about 70 % of the food produced in the continent, account for nearly half of all farm labor, and account for 80–90 % of food processing, storage, and transport, as well as hoeing and weeding done in the continent.<sup>103</sup> Beyond the question of ownership of and access to land, the law must address broader issues including: the impact of mining and oil exploration on women’s access to land and food; the link between land rights and violence against women; land governance issues; and water grabbing and its impact on women and local food systems.

There is need to enhance women’s participation in decision-making processes pertaining to food production and distribution, encourage and support women’s entrepreneurship in food production and distribution, and address cultural impediments to women’s ownership of resources such as land. In the 2004 Sirte

Declaration, African Heads of State and Government pledged to ensure gender balance in access to training, education, land, natural resources, loans and development programs. A comprehensive and holistic approach is called for—one that addresses entrenched legal, institutional, cultural, and practical obstacles to the realization of women’s land rights in Africa.

### ***41.3.4 Indigenous Peoples and Food Law in Africa***

Food law in Africa is incomplete without an examination of the role of indigenous peoples in food production and processing in Africa, as well as the present threats to indigenous food systems in the continent.<sup>104</sup> Despite their contribution to environmental conservation and food production, indigenous people in Africa are rarely consulted or informed when food-related laws and policies are designed and implemented. Worse, indigenous peoples face many hardships in food-related matters and their right to food is under considerable attack.<sup>105</sup> In an increasing number of countries in Africa, indigenous groups are threatened with extinction. Obstacles to indigenous peoples’ food security and sovereignty in Africa and globally are legion and include: the domination of globalization and free trade; the imposition of industrial models by the government; increased bio-piracy and the illicit appropriation of the biological diversity and traditional knowledge of indigenous people; militarization and repression in indigenous territories; the policies and demands of international financial institutions; and the imposition of unsustainable development projects by governments and private companies in territories belonging to indigenous peoples without consultation or prior informed consent, and without taking into account the rights and values of the indigenous peoples affected.<sup>106</sup> In Africa, indigenous groups have lost land through colonization, nationalization and privatization.

Development projects designed and implemented without adequate consultation with affected local communities are a big problem for indigenous communities in Africa. The African Commission’s Working Group on Indigenous Populations/Committees (WGIP) noted in a 2005 report that:

Dispossession of land and natural resources is a major human rights problem for indigenous peoples. They have in so many cases been pushed out of their traditional areas to give way for the economic interests of other more dominant groups and large-scale development

---

<sup>104</sup>Indigenous groups in Africa identified as hunter-gatherer include: the Pygmies of the Great Lakes Region, the San of Southern Africa, the Hadzabe of Tanzania and the Ogiek of Kenya. Those identified as pastoralists and agro-pastoralists include the *Pokot* of Kenya and Uganda, the *Barabaig* of Tanzania, the *Maasai* of Kenya and Tanzania, the *Samburu*, *Turkana*, *Rendille*, *Orma* and *Borana* of Kenya and Ethiopia, the *Karamojong* of Uganda.

<sup>105</sup>According to the 2002 *Declaration of Atitlán*, indigenous people “face a higher risk of suffering the consequences of Food Insecurity.”

<sup>106</sup>Id. The *Declaration of Atitlán*.

initiatives that tend to destroy their lives and cultures rather than improve their situation. The establishment of protected areas and national parks has impoverished indigenous pastoralist and hunter-gatherer communities, made them vulnerable and unable to cope with environmental uncertainty and, in many cases, even displaced them. Large-scale extraction of natural resources such as logging, mining, dam construction, oil drilling and pipeline construction have had very negative impacts on the livelihoods of indigenous pastoralist and hunter-gatherer communities in Africa. So has the widespread expansion of areas under crop production. They have all resulted in loss of access to fundamental natural resources that are critical for the survival of both pastoral and hunter-gatherer communities such as grazing areas, permanent water sources and forest products.<sup>107</sup>

With respect to Kenya, the former UN Special Rapporteur on the Situation of Human Rights and Fundamental Freedoms of Indigenous People, Rodolfo Stavenhagen observed, in a 2007 report, that “[m]ost of the human rights violations experienced by pastoralists and hunter-gatherers in Kenya are related to their access to and control over land and natural resources”<sup>108</sup> and that “[t]he land question is one of the most pressing issues on the public agenda.” Stavenhagen added that “[h]istorical injustices derived from colonial times, linked to conflicting laws and lack of clear policies, mismanagement and land grabbing, have led to the present crisis of the country’s land tenure system” and that inappropriate development and conservationist policies have aggravated the violation of the economic, social and cultural rights of indigenous communities in Kenya in recent decades.<sup>109</sup>

The problems of indigenous people in Africa are compounded when development projects that threaten their livelihoods receive financial support and the blessing of international financial institutions such as the World Bank and the International Monetary Fund. The good news is that increasingly, indigenous people in Africa are fighting back and are using mechanisms available at the national, sub-regional, regional and international level to defend their right to land and to food.

#### **41.3.4.1 Case Study 1: Sengwer Forest Dwellers of Kenya**

In Kenya, indigenous communities in Embobut in Elgeyo Marakwet County, Western Kenya (Sengwer forest dwellers) are victims of forced eviction from the Embobut Forest that they claim as their ancestral land. On 12 December 2013, the Kenya Forest Service (KFS) issued a 21-day eviction notice to the Sengwer forest dwellers. The KFS proceeded with the eviction on or about 5 January 2014 with about 150 police and forest guards including 30 General Service Unit riot

<sup>109</sup>Id.

police.<sup>110</sup> Hundreds of Sengwer homes were burnt in January 2014 alone.<sup>111</sup> The KFS proceeded with the planned eviction despite urgent appeals from the international community and despite an order from a court in Kenya enjoining the eviction.<sup>112</sup> Implicated in the Sengwer forest saga is the World Bank-funded Natural Resource Management Project (NRMP) with the Government of Kenya.<sup>113</sup> Kenya has reportedly received over \$600 million from the World Bank to protect the forests.

The Kenyan Government claimed that the presence of the Sengwers threatens the forest's biodiversity as well as urban water supplies. According to the KFS, the eviction was necessary "in order to pave way for the Government to restore the Cherangani forests, a major national water tower serving more than 2 million Kenyans through the Nzoia and Turkwel rivers."<sup>114</sup> The Government allegedly offered Sengwer households \$4600 compensation for moving, although thousands claim that they did not receive any compensation. In a 5 January 2014 letter addressed to the President of Kenya, Sengwer forest dwellers stated that "[a]t no stage of the current process have the Embobut's indigenous residents been meaningfully consulted in relation to this resettlement, nor has their free, prior and informed consent been sought and obtained" and that "[w]hen the Sengwer have been consulted in the past they have refused to move, and they have made clear . . . that they refuse to move."<sup>115</sup> The letter further stated that "[t]here has . . . been no legitimate consultation, compensation or legally valid approval agreed with the indigenous communities over their ancestral lands."<sup>116</sup> Addressing the Government's claim that compensation was paid to evictees, the Forest Peoples Program acknowledged that on 15 November 2013 the President, Deputy President and County Senator (Senator Kipchumba) visited Embobut and the President promised 400,000 Kenyan shillings per family to the 'Evictees' but are quick to point out that "the 400,000 Kenyan shillings would buy the equivalent of 4 cows or one or two

acres of land in Trans Nzoia District,” and “is therefore . . . completely inadequate for enabling families to secure their livelihoods.”

#### 41.3.4.2 Case Study 2: The Bushmen of Botswana

The Basarwa minority group in Botswana (also known as Bushmen or San) has experienced several rounds of forced eviction from their ancestral land in the Central Kalahari Game Reserve (CKGR). Since 1997, the Bushmen have been the target of at least three separate eviction exercises, in 1997, 2002 and 2005. The Botswana Government takes the position that the presence of the Basarwa and other indigenous communities on the land is incompatible with the reserve’s conservation objectives and status. Accusations of arbitrary arrests, police harassment and brutality, and intimidation are rife.<sup>117</sup> In 2012, paramilitary police allegedly beat two **Bushmen** severely and subsequently buried one in a shallow grave, after accusing them of hunting without permits in CKGR.<sup>118</sup> In 2013, three Bushmen children were arrested for being in possession of antelope meat in the CKGR. Also in 2013, two Bushmen were reportedly arrested and tortured for killing an antelope, and were fined US \$190 each.<sup>119</sup> Following a 2006 court decision, Bushmen can only hunt in the CKGR with licenses.<sup>120</sup> Today, many of the Bushmen live in resettlement camps and are unable to hunt or gather. Furthermore, many “are now gripped by alcoholism, depression, and illnesses such as TB and HIV/AIDS” according to Survival International.<sup>121</sup> One Bushman told Survival International, “The Bushmen are being hunted and their rights are being denied because of tourism (. . .) Police are given guns to go out and hunt and arrest Bushmen gathering bush food. The Bushmen of the CKGR cannot eat, cannot drink. How will they survive without food?”<sup>122</sup> Another Bushman told Survival International “We depend on the natural resources of the CKGR for our food. How are we expected to survive if we cannot hunt?”<sup>123</sup>

The Bushmen face an even greater threat—lack of access to water. A law in Botswana prohibits the Basarwa from using existing boreholes in the CKGR and prevents them from drilling new ones. In 2002, in a bid to get the Bushmen off the land, the Government sealed and capped a borehole in the reserve. Critics believe that the forced eviction of the Bushman has nothing to do with conservation but is

<sup>122</sup><http://www.survivalinternational.org/news/8919>.

<sup>123</sup><http://www.survivalinternational.org/news/8883>.

about diamonds. Fortunately or unfortunately for the Bushmen, CKGR “lies right in the middle of the world’s richest diamond-producing area.”<sup>124</sup> The diamond deposit at Gope, in the centre of the reserve, is reportedly valued at \$3.3 billion. To Professor James Anaya, the UN Special Rapporteur on the Right of Indigenous Peoples:

the Government’s position that habitation of the reserve by the Basarwa [Bushmen] and Bakgalagadi communities is incompatible with the reserve’s conservation objectives and status appears to be inconsistent with its decision to permit Gem Diamonds/Gope Exploration Company (Pty) Ltd. to conduct mining activities within the reserve, an operation that is planned to last several decades and could involve an influx of 500-1200 people to the site, according to the mining company.

The forced eviction of indigenous people from their ancestral land is a food law issue. Force eviction threatens and compromises indigenous food systems. Forced eviction also leads to the destruction of biodiversity and traditional knowledge. Even when eviction is accompanied by resettlement, oftentimes resettlement camps are not adequate. In the case of the Basarwa, the resettlement camps have been described as “disgusting places where rape, prostitution and drunkenness [are] rampant.”<sup>125</sup> According to Maude Barlow, Senior Advisor on Water to the 63rd President of the United Nations General Assembly, “It’s hard to imagine a more cruel and inhuman way to treat people. One can only conclude Botswana’s authorities view Bushmen as less important than wildlife.”<sup>126</sup>

#### 41.3.4.3 Forced Eviction, Biopiracy and Indigenous Groups in Africa: The Legal Framework

In 2007, three countries in Africa—Burundi, Kenya, and Nigeria—abstained from the United Nation’s vote adopting the Declaration on the Rights of Indigenous People.<sup>127</sup> Also, many countries in Africa have yet to ratify or accede to the International Labour Organization Indigenous and Tribal Peoples Convention, 1989 (No. 169).<sup>128</sup> Nevertheless, most countries have ratified treaties that protect the rights of minorities as well as treaties that enshrine freedom from discrimination and the right to equality and equal protection, including the African Cultural Charter (1976), the African Charter on Human and Peoples’ Rights, and the Convention on the Elimination of Racial Discrimination. Many countries in Africa have also ratified the Convention on Biological Diversity, the Cartagena Protocol on Biosafety, as well as its Nagoya Protocol on Access to Genetic Resources, and the Fair and Equitable Sharing of Benefits Arising from their Utilization (Nagoya

<sup>124</sup>Simpson (2011).

<sup>125</sup>Id.

<sup>126</sup><http://www.survivalinternational.org/news/6307>.

<sup>127</sup>Declaration on the Rights of Indigenous Peoples, E/CN.4/Sub.2/1994/2/Add.1 (1994).

<sup>128</sup>United Nations, *Treaty Series*, vol. 1650, No. 28383.

Protocol). Furthermore, the constitution of most countries in Africa incorporate the right to equality and freedom from discrimination. In 2001, the African Commission on Human Rights established a Working Group on the Rights of Indigenous Populations/Communities. Fundamentally, most governments in Africa are reluctant to recognize any particular ethnic group as indigenous and prefer to use terms such as “minorities,” “vulnerable communities,” or “marginalized communities.” The term “indigenous” is contested in a continent where almost all Africans living in the continent are descendants of the original inhabitants.

Although Africa is rich in generic resources and traditional knowledge, and although many indigenous groups in the continent are custodians of this knowledge, a complete inventory of the continent’s rich resources is not available. The direct and indirect cost of loss of genetic resource and traditional knowledge is astronomical. African governments are beginning to take steps to protect the continent’s genetic resources and traditional knowledge, these efforts are undermined by poor institutional framework, weak and poorly enforced laws, corruption, and limitations imposed by global trade rules, particularly rules encapsulated in the Agreement on Trade-related Aspects of Intellectual Property Rights (TRIPS Agreement). Although many countries in Africa have ratified the Convention on Biological Diversity, the Cartagena Protocol on Biosafety, as well as its Nagoya Protocol on Access to Genetic Resources, and the Fair and Equitable Sharing of Benefits Arising from their Utilization (Nagoya Protocol), few have enacted domestic legislation to implement these treaties. At the continental level, relevant instruments include: the 1968 African Convention for the Conservation of Nature and Natural Resources (revised in 2003), the African Model Legislation for the Protection of the Rights of Local Communities, Farmers and Breeders, and for the Regulation of Access to Biological Resources (African Model Legislation on Access to Biological Resources),<sup>129</sup> and the Swakopmund Protocol on the Protection of Traditional Knowledge and Expressions of Folklore within the Framework of the African Regional Intellectual Property (the Swakopmund Protocol).<sup>130</sup> The period 2001–2010 was declared “the Decade for African Traditional Medicine.”

Ultimately, few countries in Africa have developed national laws for the protection of traditional knowledge and cultural expressions. The problem is that many countries already model their domestic laws after the intellectual property laws in place western countries with its emphasis on exclusivity and private ownership. South Africa is one of the few countries in Africa that is making a serious effort to find a solution to this dilemma. The *Intellectual Property Laws Amendment Act 2013* (Act No. 28 of 2013) was approved by the President of South Africa and published in the Government Gazette on December 10, 2013. With the goal of

---

<sup>129</sup>OAU Model Law, Algeria, 2000—Rights of Communities, Farmers, Breeders, and Access to Biological Resources.

<sup>130</sup>Adopted by the Diplomatic Conference of ARIPO at Swakopmund (Namibia) on August 9, 2010. The protocol was initially signed by 9 of the 17 Member States that are members of ARIPO.

ensuring effective protection mechanisms for indigenous knowledge (IK) as a form of intellectual property in South Africa, the 2013 Acts amended several previous legislations, including the Performers' Protection Act 1967 (Act No. 11 of 1967), the Copyright Act 1978 (Act No. 98 of 1978), and the Trade Marks Act 1993 (Act No. 194 of 1993).

While there are many steps that governments in Africa can take, through legislation, to ensure maximum protection for the continent's genetic resources and traditional knowledge, most nations are not taking these steps. Broad debates and discussions about the future of intellectual property rights and law in Africa and the appropriate role for intellectual property rights in national development are needed. Another necessary topic of discussion is the potential role of traditional medicine in Africa's technological progress and overall economic development. South Africa is taking the lead on this with the publication, for public commentary, of the country's first Draft National Policy on Intellectual Property, 2013.<sup>131</sup> Chapter Three of the Draft National Policy focuses on agriculture and genetic resources. Chapter Four addresses intellectual property and indigenous knowledge. In line with the 2001 *Decision on Intellectual Property, Genetic and Biological Resources, Traditional Knowledge and Folklore in Africa*, governments in Africa need to examine ways and means of raising awareness about the protection of genetic resources and indigenous knowledge and identify, catalogue, record, and document the genetic and biological resources and traditional knowledge held by their communities. An Africa-wide database would be a good starting point.

#### 41.3.4.4 Legal Battle for the Right of Indigenous People in Africa

Increasingly, indigenous peoples in Africa are fighting for their survival and for their ancestral land through the courts and other judicial and quasi-judicial tribunals. Indigenous peoples in Africa are also making their voice heard in international fora such as the UN Permanent Forum on Indigenous Issues<sup>132</sup> and are using available UN human rights complaints mechanisms such as Urgent Action/Early Warning Procedure of the UN Committee charged with implementing the UN Convention on the Elimination of all forms of Racial Discrimination (UN CERD). In a letter dated 30 August 2013, the CERD Committee reiterated its previous calls for state parties (including Kenya):

to recognize and protect the rights of indigenous peoples to own, develop, control and use their communal lands, territories and resources and, where they have been deprived of their lands and territories traditionally owned or otherwise inhabited or used without their free and informed consent, to take steps to return those lands and territories. Only when this is

<sup>131</sup>Department of Trade and Industry South Africa, Draft National Policy on Intellectual Property, 2013, Notice No. 918 of 2013.

<sup>132</sup>Africa Caucus statement to the 13th Session of UNPFII, delivered by Mr Kanyinke Sena, May, 2014. Available at: <http://natural-justice.blogspot.co.uk/2014/05/13th-session-of-unpfii-african-caucus.html>.

for factual reasons not possible, the right to restitution should be substituted by the right to just, fair and prompt compensation. Such compensation should as far as possible take the form of lands and territories.

Legal battles are also occurring in domestic courts. In Botswana, the Bushmen initiated a case challenging their illegal eviction from their ancestral land in 2004. In a 2006 decision, the Court declared the evictions illegal and unconstitutional.<sup>133</sup> The Court also recognized the Bushmen's right to live, and hunt on their ancestral land and ordered the Government to issue hunting permits to the Bushmen. In 2010, the Bushmen commenced another lawsuit directed specifically at access to water in the CKGR. The Question before the court was simple: can the Bushmen use existing boreholes and can they sink new boreholes in the CKGR? The High Court sided with the Government but the Court of Appeal reversed. The Court of Appeal called the case "a harrowing story of human suffering and despair." The Botswana Government remains defiant and is yet to comply with the decision of the Court of Appeal. Finally, indigenous people in Africa are also increasingly using regional and sub-regional judicial and quasi-judicial mechanisms to safeguard their interest.<sup>134</sup>

#### 41.3.4.5 Conclusion

Forced eviction from ancestral lands has a devastating impact on indigenous peoples' right to food, particularly the availability of culturally appropriate foods. Forced eviction make it impossible for indigenous groups to engage in traditional hunting and gathering activities, lead to the destruction of biodiversity, and compromise traditional knowledge. Clearly, the principle of Free, Prior and Informed Consent enshrined in key international instruments is yet to be fully implemented in most countries in Africa.<sup>135</sup> Whether to recognize certain groups as indigenous and which groups to recognize is a thorny question which governments in Africa must address in line with the *Advisory Opinion of the African Commission on Human and Peoples' Rights on the United Nations Declaration on the Rights of Indigenous Peoples*.<sup>136</sup> Governments also need to establish fair, transparent mechanisms for

sharing benefits that accrue from the use of resources located on land belonging to indigenous groups. Additionally, laws and policies addressing the very vulnerable situation of indigenous women are needed.

### ***41.3.5 Agribusiness/Foreign Investment in Land: A Growing Controversy***

On 28 October 2014, the Wall Street Journal reported that the Democratic Republic of Congo planned to lease a quarter of the country (an area larger than France) for agricultural purposes, in a bid to attract technology and foreign capital.<sup>137</sup> Congo's first agribusiness parks are under construction—a result of a partnership between the Congolese government and Africom Commodities (Pty) Ltd. A looming battle in Africa's food system is that between smallholder farmers and giant food and agricultural companies. The race appears to be underway to control the future of food consumption in Africa. Implicated in this looming battle are hundreds of bilateral investment treaties that countries in Africa have concluded with foreign governments as well as thousands of investment agreements that these countries have concluded with foreign investors.

International agricultural companies, international retailers, international goods distributor, and even fast food companies are jumping into the race. Upscale food supermarkets are appearing across the continent.<sup>138</sup> With a growing middle class, steady urbanization, and rising incomes, there is definitely a market for big retailers and specialised food chains in Africa. Proponents argue that “creating a well-functioning African food industry will have a far bigger impact on the local economy as it will allow farmers to reduce their reliance on export markets, and will allow consumers to buy better quality locally produced products.”<sup>139</sup> As a sector, the food industry in Africa is performing very well and is reportedly “amongst the best performing sectors in Africa and has shown an average annualized growth of 20 percent in the last 4 years.”<sup>140</sup> In 2013, Carrefour—the world's second largest retail group—entered Africa in a joint venture partnership with CFAO, a distributor of manufactured goods. The two companies are reportedly eyeing eight countries in the continent.<sup>141</sup>

### 41.3.5.1 The Case for Agribusiness in Africa

Although pledging commitment to smallholder farmers, many countries in Africa are aggressively seeking investors for new agricultural processing zones. Nigeria's new 'Staple Crop Processing Zones' (SCPZs) offers land, infrastructure, and tax incentives to private investors; the country plans to create about 20 SCPZs by 2015. The government believes that the successful implementation of the SCPZ's will add somewhere between N660 billion and N1.4 trillion to the Nigerian economy and create about 250,000 jobs.<sup>142</sup> In April 2014, the Nigerian government upgraded Olam Farms to a Staple Crop Processing Zone (SCPZ) bringing the number of such zones in the country to 15.

International organizations, including the World Bank, are making a strong push for Africa to be opened to agribusiness.<sup>143</sup> The case for agribusiness in Africa is based largely on evidence of declining agricultural productivity over the past 50 years. Countries that were at one time net food exporters are now dependent on imported food for survival. Nigeria is a case in point. In the 1960s, long before the oil boon, agriculture contributed over 60 % of Nigeria's GDP and 70 % of exports. Nigeria was a dominant producer of products like palm oil (exceeding Malaysia and Indonesia) and groundnuts (exceeding the US and Argentina). Today, Nigeria spends around \$11 billion a year on food imports.<sup>144</sup>

Agribusiness and foreign direct investment (FDI) in land can attract top farming talent and much-needed capital to Africa's agricultural sector, allowing the continent to address declining exports and providing an opportunity for Africa to move up the value chain into businesses related to production, including storage, milling and transportation. Presently, Thailand exports more agricultural products and earns more from agricultural exports than the whole of sub-Saharan Africa combined. Agribusiness can also help hydrocarbon-dependent economies in Africa to diversify and move away from oil and gas dependence. Furthermore, foreign investment in land and agricultural markets in Africa can help countries meet food security targets and reduce foreign exchange spending. Marc Engel, chief procurement officer at Unilever, Africa, said recently, "We have 13 factories in Africa that use products like soft oils, tomatoes or starch-based compounds on a daily basis, but much of this is imported, wasting foreign exchange and increasing our carbon footprint."<sup>145</sup> According to the EAC Food Security Action Plan (2011–2015), agro-industries "create forward and backward linkages, leading to significant multiplier effects, generating demand for agricultural produce . . . creating on- and off- farm employment, enhancing incomes and contributing to value

---

<sup>142</sup><http://www.thisisafricaonline.com/Business/Nigeria-seeks-investors-for-agri-processing-zones>.

<sup>143</sup>World Bank (2013).

<sup>144</sup>Green (2013b).

<sup>145</sup>Green (2013c).

addition and increased public sector revenues.”<sup>146</sup> The EAC Food Security Action Plan (2011–2015) also take the position that expanded agro-industries “will contribute to poverty reduction through combined effects of employment gains, income enhancement, inclusiveness and food security”<sup>147</sup> and that this could potentially benefit smallholder producers, promote their inclusion into the value chain, and facilitate their access to market, finance and technical assistance.<sup>148</sup>

To the World Bank, agriculture and agribusiness should be at the top of the agenda for economic transformation and development in Africa. The World Bank projects that by 2030, agriculture and agribusiness will be a US \$1 trillion industry in sub-Saharan Africa (up from US \$313 billion in 2010). To the World Bank, in Africa, agribusiness “can play a critical role in jump-starting economic transformation through the development of agro-based industries that bring much-needed jobs and incomes.”<sup>149</sup> To the World Bank, the current attention on agriculture in Africa, which focuses primarily on production agriculture “will not achieve its development goals in isolation from agribusinesses.”<sup>150</sup>

Also making the case for agribusiness in Africa is Nigeria’s former Minister of Agriculture, Akinwumi Adesina, who has lamented the fact that Nigeria is known for nothing else besides oil. According to Adesina, this is a sad state of affairs because Nigeria never used to have oil, and before the oil boom of the 1970s relied almost entirely on agriculture.<sup>151</sup> To Adesina, “[a]griculture is the future of Nigeria,” And not just any type of agriculture but “agriculture that is modernised, that is productive, that is competitive.” Nigeria is reportedly seeking to add 20 million metric tons to the domestic food supply by 2015, and is seeking to create 3.5 million jobs through agriculture. Nigeria’s error, according to Adesina, was that the country “[was] not looking at agriculture through the right lens.” Nigeria, Adesina claims, “[was] looking at agriculture as a developmental activity, like a social sector in which you manage poor people in rural areas.” To Adesina, “agriculture is not a social sector. Agriculture is a business. Seed is a business, fertiliser is a business, storage, value added, logistics and transport - it is all about business.”

#### 41.3.5.2 The Case Against Agribusiness in Africa

Organizations like ActionAid, OXFAM, and War on Want, challenge the fundamental assumption that the principal solution to food insecurity in Africa is to simply producing more food,<sup>152</sup> and are of the view that small farmers are the key to

<sup>146</sup>The EAC Food Security Action Plan (2011-2015).

<sup>147</sup>Id.

<sup>148</sup>Id.

<sup>149</sup>Id., p. xiv.

<sup>150</sup>Id.

<sup>151</sup>Green (2013d).

<sup>152</sup>*An October 2013 report from ActionAid (<http://www.actionaidusa.org/publications/feeding-world-2050>) challenges the assumption that the principal solution to food security is simply producing more food. “Rising to the Challenge: Changing Course to Feed the World in 2050”.*

reducing poverty and food insecurity in the region.<sup>153</sup> In his report on Benin, the UN Special Rapporteur on the Right to Food alluded to the potential risks of pursuing “green revolution” based on the model followed in Latin America and Asia.<sup>154</sup> Opponents also argue that agribusiness has a price and is being developed in Africa at the expense of the environment, small-scale farmers, and indigenous as well as rural communities. To opponents, the promised gains from agribusiness are not materializing. Presently, governments do not appear to be striking a balance between encouraging foreign investment in land and protecting small-scale farmers and local communities. For the latter, the price of agribusiness and land concession agreements between governments and foreign investors are numerous, and include: the loss of land to businesses,<sup>155</sup> total disregard for communities’ right to free, no prior and informed consent in land acquisition, the destruction of crops and water sources, as well as intimidation, arrests, and harassment of community leaders.

The development of palm oil plantations in Liberia is coming in at a steep price.<sup>156</sup> The 16 August 2010 concession agreement between the Liberian Government and the Golden Veroleum Liberia (GVL) is creating a great deal of trouble in the country. The agreement provides for a 65-year lease for 220,000 ha of land to GVL in five counties in Liberia: Sinoe, Grand Kru, Maryland, River Cess and River Gee and also a new port with 100 ha of adjacent land. Under the lease agreement, GVL has the option to extend the lease for an additional 33 years. Affected communities are fighting back. On 1 October 2012, a complaint was filed with the RSPO.<sup>157</sup> In December 2012, the RSPO called for a freeze in plantation development until the complaint was resolved.<sup>158</sup> A report by The Tropical Forest Trust (TFT), a third party that GVL contracted to independently assess the

company's operations with particular reference to FPIC, was very critical of the company's activities.<sup>159</sup> The GVL case highlights the dangers that come when governments promote an export-led developmental model without addressing the competing interest of all stakeholders. According to the Forest Peoples Programme:

Although agreed to by the government and ratified by the Liberian legislature, GVL's concession contract itself and the contracting process leading up to and including the conclusion of the contract have been subject to criticism on grounds that they violate national law (including the constitution), as well as Liberia's international human rights law commitments.<sup>160</sup>

A human rights-based analysis of the agricultural concession agreements that many governments in Africa are concluding suggest that the agreements are not designed with the goal of securing maximum benefits for local communities.<sup>161</sup> Although in some cases domestic courts have stepped in to address forced eviction, in many cases, displaced communities are denied justice. In Uganda, the Government's sale of a land to foreign investors for a coffee plantation led to forced eviction of over 2000 individuals. Kaweri Coffee Plantation Ltd. is wholly-owned by the Neumann Gruppe, a German coffee producer. In a lawsuit filed against Kaweri and the Ugandan Government, plaintiffs alleged violent forced eviction from their land, mistreatment and destruction of their houses and other property. In a 28 March 2013 decision, a High Court in Uganda at Kampala found that the plaintiffs were illegally evicted from their land and ordered that compensation be given to the evictees.<sup>162</sup> James Nangwala and Alex Rezida, advocates for Kaweri, were ordered to pay 37 billion shillings for defrauding the government and the tenants, and for dishonesty, negligence, theft and misappropriation of client monies, violation of the Land Act, Bias, Eviction, Tenant's compensation, advocates, and Account Rules. The judge specifically found that the plaintiffs, who were tenants on the land, "were violently evicted without any relocation or compensation" and that "[t]he officers of the German Investor's company . . . were active participants at the meetings on eviction of the tenants." Appeal is currently pending.

With the expansion of agribusiness in Africa, the issue of workers' rights is coming to the forefront and protests by farm workers is growing and escalating in many countries. Abuse has been cited in a number of industries, including the fruit

#### 41.3.5.3 Agribusiness in Africa: A Confused Legal Framework

African governments are committing to promote agribusiness at the same time that they commit to protect the interest of small scale farmers. What is lacking are the laws, regulations, policies and institutions necessary to ensure that the interests of different stakeholders are adequately protected.

Policy incoherence—vertical and well as horizontal—is a major problem in Africa. Regarding “vertical” incoherence, most governments in Africa have taken on human rights commitments at the continental and international levels but are not taking effective steps to implement these obligations and to write the obligations into national legislation. Horizontal incoherence refers to weak policy alignment, in most countries in Africa, between human rights law and other areas of law including the tax law, investment law, and corporate law. Whether the bilateral investment treaties that countries in Africa are concluding are designed to achieve sustainable development objectives is a question that is receiving increased scrutiny today. As noted in the 2008 *Report of the Special Representative of the Secretary-General on the issue of human rights and transnational corporations and other business enterprises*,

To attract foreign investment, host States offer protection through bilateral investment treaties and host government agreements. They promise to treat investors fairly, equitably, and without discrimination, and to make no unilateral changes to investment conditions. But investor protections have expanded with little regard to States’ duties to protect, skewing the balance between the two. Consequently, host States can find it difficult to strengthen domestic social and environmental standards, including those related to human rights, without fear of foreign investor challenge, which can take place under binding international arbitration.<sup>168</sup>

African countries have concluded a considerable number of BITs, but critics argue that the BITs are not designed with sustainable development in mind.<sup>169</sup> In a

<sup>163</sup>Human Rights Watch, *Ripe with Abuse: Human Rights Conditions in South Africa’s Fruit and Wine Industries* (2014).

<sup>164</sup>Griek et al. (2010); See also, Orla Ryab, *Labouring for Chocolate*, BBC News, 27 April 2007.

<sup>166</sup>Kenya Human Rights Commission, *A comparative Study of the Tea Sector in Kenya* (2008).

<sup>167</sup>Kenya Human Rights Commission, *Exposing the Soft Belly of the Multinational Beast: The Struggle for Workers’ Rights at Del Monte Kenya* (2002).

<sup>168</sup>*Report of the Special Representative of the Secretary-General on the issue of human rights and transnational corporations and other business enterprises*, A/HRC/8/5 (7 April 2008).

<sup>169</sup>Peterson and Gray (2003); Mann (2011). See also Shemberg (2008).

recent article that examined the BITs that the Ethiopian Government has concluded, this author observed that Ethiopia's BITs:

[D]o not: (i) specifically reference human rights, environmental protection, or other social issues; (ii) avoid provisions that could constrain the ability of a host government to regulate in the public interest; (iii) impose binding obligations on investors; (iv) establish clear mechanisms for monitoring compliance or enforcing human rights or environmental rights claims; (v) incorporate, directly or indirectly, specific human rights treaties or environmental protection treaties; (vi) confer on investment tribunals the jurisdiction to consider human rights norms and principles when assessing a State's liability under a BIT; and (vii) do not condition the availability of investor rights on the observance of international law by the investors.<sup>170</sup>

For agribusiness development to contribute to sustainable development in Africa, policy coherence is important. Organizations like the United Nations Conference on Trade and Development now call for a new generation of BITs<sup>171</sup> and a reform of the Investor-State dispute settlement system.<sup>172</sup> Overall, there is a growing call for BITs that "accommodate the home state's interests in conserving regulatory space by introducing provisions that avoid liability for treaty violations by identifying circumstances in which a state may regulate foreign investment."<sup>173</sup>

#### 41.3.5.4 Conclusion

Domestic and foreign investment in land and in agricultural market in Africa is growing. On the one hand, large scale land acquisition could mean the infusion of much needed agricultural capital and innovative technology to the agricultural sector in Africa. On the other, there is a growing recognition that the development benefits of large-scale land acquisition are not automatic and that such investments can have negative implications for affected communities. As the former UN Special Rapporteur on the right to food, Olivier De Schutter, put it:

Investment is flooding into the continent's land and agricultural markets, but question marks remain about how this will be turned to the benefit of the 250 million Africans suffering from food insecurity. Are small farmers – themselves often food insecure – gaining new income opportunities? Are the customary rights of herders being respected? Is enough being done to ensure that adequate food is affordable and accessible to poor urban communities?

How to manage the new agricultural investors, including agribusinesses, private equity groups, international pension funds, sovereign wealth funds, foreign

<sup>170</sup>Professor Uche Ewelukwa Ofofile, *Foreign Investment in Land in Africa: Mapping the Role of International Investment Contracts and Bilateral Investment Treaties*, Law and Development Review Issue No. 2 (2014).

<sup>173</sup>Sornarajah (2011).

governments, and domestic investors is a growing challenge for governments in Africa. From a food law perspective, attention must be paid to a host of policy issues that impact smallholders farmers and local communities. How to integrate women into agri-business value chains, ensure equitable access to land, establish an enabling legal framework for sustainable land management practices must all be part of the discussion.

Expansion of agribusiness in Africa must be matched by expansion in the legal and institutional framework necessary to prevent negative environmental and social impacts. Laws must be put into place to address issues such as agro-chemicals and pollution, pesticide use, soil deterioration, land grabbing, labor rights violations, inhumane working conditions, and other community impacts.<sup>174</sup> This calls for a fresh approach to corporate governance in Africa. Countries must find a way to ensure that agribusiness is not advanced at the expense of agricultural workers, small farmers, and consumers.

Expansion of agribusiness must also be matched by expanded the provision of grievance mechanisms for those affected by the activities of corporations. Presently, there are very few examples of instances where the courts in Africa have held enterprises in the food and agricultural sector in violation of their legal obligations.<sup>175</sup> Cases such as *Haribo Mohammed Fukisha v. Redland Redroses Limited* (Kenya) and *Baleke Kayira & 4 Ors v Attorney General & 2 Ors* (Uganda) involving law suits against agribusinesses are still rare in Africa.

How to balance the goal of encouraging industrial and commercial model of agriculture with its emphasis on large producers and private investors against the goals of protecting and promoting family agriculture and small farmers is one issue that will shape food law in Africa in the coming years. According to Neil Crowder, managing partner at Chayton Capital, “a sustainable business model for farming in Africa must not only take advantage of the continent’s impressive agricultural potential, but also implement strategies that will make Africans successful farmers in the years ahead.”<sup>176</sup> To Crowder, “[m]odels that combine a commercial farming approach, underpinned by significant capital investment, with local small-scale farming have the potential to develop the African agricultural opportunity in a sustainable and profitable way.” Crowder calls for a community-based approach to developing agricultural potential in Africa. As he puts it:

---

<sup>174</sup>See also International Labor Rights Forum, *The Sour Taste of Pineapple: How an Expanding Export Industry Undermines Workers and Their Communities* (October 20, 2008) (discussing the working conditions and labor rights violations in the pineapple fields in Costa Rica and the Philippines and finding that massive infestation of insects came with the expansion of large-scale pineapple production and had a dire effect on local ranchers’ ability to maintain livestock.).

<sup>175</sup>See e.g. *Haribo Mohammed Fukisha v. Redland Redroses Limited* [2006] eKLR (applying Kenya’s Workmen’s Compensation Act (Cap. 236) and hold that an obligation falls on the defendant to compensate the plaintiff who was injured in a mishap involving potentially dangerous substances used in the course of employment.).

<sup>176</sup>Crowder (2010).

it is our view that large-scale agricultural investment must be made in conjunction with efforts to improve returns for small farmers. Efforts should be made to improve regional access to storage and transportation. Education and skill transfer can have economic as well as social benefits within the local community, while smaller farmers can take advantage of improved local and regional infrastructure, including access to storage and transportation.<sup>177</sup>

As a matter of urgency, governments in Africa must implement the *UN Guiding Principles on Business and Human Rights: Implementing the United Nations 'Protect, Respect and Remedy' Framework (the Guiding Principles)*,<sup>178</sup> and create an enabling environment for corporate social responsibility to thrive in the continent. Businesses such as Nestlé, Coca-Cola, and Pepsi, are beginning to make public commitments on land and land rights. In July 2014, Nestlé made a public commitment to protect land rights in agricultural supply chains.<sup>179</sup> Food giants like General Mills and Nestlé have reportedly initiated projects aimed at improving productivity and providing farmers with greater market access, training and technology.<sup>180</sup> Whether these commitments will yield tangible benefits for smallholder producers, poor rural families and local communities in Africa remains to be seen.

### 41.3.6 Food Law and Food Trade in Africa

Africa's food system is largely shaped by the global trade in food and by the rules of the multilateral trading system. Consequently, how trade liberalization in agricultural products and global trade rules affect food production, food export, and food security in Africa are proper concerns for food law and food law regimes in Africa. Of the 54 countries on the African continent, 42 are Members of the World Trade Organization (WTO). In addition, nine countries in Africa are in the process of acceding to the WTO.<sup>181</sup> Of particular relevance are: agricultural subsidies in developed countries; the impact of unrestricted food import on local producers and local production; and limited market access in developed countries as a result of imposition of high levels of protection and domestic support.

<sup>180</sup>Wendy Atkins. 28 May 2013. <http://www.thisisafricaonline.com/Perspectives/Professionalising-smallholder-organisation-in-Africa>. Professionalising smallholder organisation in Africa.

<sup>181</sup>Algeria, Comoros, Equatorial Guinea, Ethiopia, Liberia, Libya, Sudan, Seychelles and Sao Tome and Principe, are in the process of accession to the WTO.

Individually and/or with other Members, African countries have made contributions to the negotiations on agriculture at the WTO. To the WTO Africa Group, any reform of trade rules relating to agricultural products should “Strengthen the rules and disciplines governing trade in agriculture to promote development;” “Ensure that trade liberalisation takes into account non-trade concerns such as food security, sustainable rural development and poverty alleviation;” “Ensure commercially viable market access for all agricultural products originating in developing countries including those at the higher end of the processing chain;” and “Level the playing field in the international trading system, taking into account different structural constraints among countries.”<sup>182</sup>

A complete evaluation of how global trade rules affect food systems in Africa and ultimately shape food law in the continent is beyond the scope of this paper. A host of issues are cause for concern, including: market access issues; export competition issues (export subsidies and export support); domestic support issues; special and differential treatment; food insecurity; the impact of food aid on the agricultural production systems of countries in Africa; arbitrary imposition of sanitary and phytosanitary measures by some governments; policy incoherence; and the fate of net food importing developing countries.

#### **41.4 Conclusion: Towards a Coherent and Functioning Food Law Regime in Africa**

The goal of this part of the paper is to: identify gaps in the food law and policy of countries in Africa, draw attention to challenges to the development of robust food law regimes in Africa, briefly discuss the potential role of the legal profession in Africa in the development of food law in the continent, and offer some concluding thoughts about the future direction of food law and policy in Africa.

##### ***41.4.1 Food Law in Africa: Gaps***

There are noticeable gaps in Africa’s food law and policy architecture. Water, REDD “Reducing Emissions from Deforestation and Degradation,” Carbon Trading, agricultural bankruptcy, agricultural insurance, water resources, water rights, and conflicts over water are issues that have not been properly addressed in the legal framework of many countries. Although a few regional and sub-regional resolutions and declarations address water, many issues related to water rights and water

---

<sup>182</sup>World Trade Organization, WTO Africa Group: Joint Proposal on the Negotiations on Agriculture, G/AG/NG/W/142 (23 March 2001).

use are yet to be addressed.<sup>183</sup> Many countries do not address in a holistic and comprehensive fashion issues such as how to implement sustainable ocean and freshwater fishery practices and how to strengthen resilience to climate shocks associated with droughts and floods. The land question, including questions of ownership, access and control of farmland, rangeland, forest, fishery, wetlands, pasture, and hunting territories is also yet to be fully and effectively addressed in the land law, policy, and programming of most countries in Africa despite the adoption in 2009 of the *AU Framework and Guidelines on Land Policy in Africa*.

To date, limited attention has been paid to ensuring the availability and accessibility of grievance mechanisms in Africa's food and agricultural sector. Very few farm-level grievance mechanisms exist in Africa even though an overwhelming majority of Africans live and work on farms. There is a need for a thorough mapping of available grievance mechanisms and a need to create more State-based and non-State-based grievance mechanisms accessible to farmers and farm workers in Africa. There is also a need to assess the effectiveness of existing grievance mechanisms. In light of the recent push to develop agribusiness in Africa, designing and operationalizing appropriate grievance mechanisms must be on the agenda of governments and businesses in the continent. According to Principle 26 of the United Nations Guiding Principles on Business and Human Rights, "States should take appropriate steps to ensure the effectiveness of domestic judicial mechanisms when addressing business-related human rights abuses, including considering ways to reduce legal, practical and other relevant barriers that could lead to a denial of access to remedy."<sup>184</sup> Principle 29 adds: "To make it possible for grievances to be addressed early and remediated directly, business enterprises should establish or participate in effective operational-level grievance mechanisms for individuals and communities who may be adversely impacted."<sup>185</sup>

In some countries, national human rights institutions are beginning to receive and respond to complaints from farmers and farm workers. The Kenya National Commission on Human Rights, a body established by an Act of Parliament in 2002, has in the past responded to allegations of abuses in Kenya's tea industry and flower industry.<sup>186</sup> In addition to its role of investigating complaints regarding human rights violation, the Kenya National Commission also independently carries out human rights studies and has in the past focused attention on businesses in the food and agricultural sector. More studies are needed to understand the potential role of

<sup>183</sup>Sirte Declaration on the Challenges of Implementing Integrated and Sustainable Development on Agriculture and Water in Africa (2004). Ex/Assembly/AU/Decl. 1 (II).

national human rights institutions in promoting respect for human rights in the food and agricultural sector in Africa.

#### ***41.4.2 Food Law in Africa: Challenges***

Lack of political will as well as weak policy alignment and harmonization are major barriers to the development of food law and food governance in Africa. The result is outdated laws, major gaps in the food law architecture of most countries in Africa, and lack of enforcement of existing laws. Another challenge is poor agricultural statistics and low priority accorded to agricultural research in Africa. According to Judith Francis, senior programme coordinator, Science and Technology Policy, at the ACP-EU Technical Centre for Agricultural and Rural Cooperation (CTA), “Agricultural research and development projects in sub-Saharan Africa are still heavily dependent on donor funding and agricultural, science, technology and innovation systems are weak.”<sup>187</sup>

Limited public participation and lack of transparency in legislative processes pose another set of challenges to the development and maturation of food law in Africa. African governments so far have not kept to the promises made in the Maputo Declaration to promote inclusive and participatory food and agricultural regimes in the continent. In Paragraph 4 of the Maputo Declaration, African Heads of State resolved to: “**ENGAGE** in consultations at national and regional levels with civil society organizations and other key stakeholders, including the small-scale and traditional farmers, private sector, women and youth associations, etc., aimed at promoting their active participation in all aspects of agricultural and food production.”<sup>188</sup>

A final set of challenges arise out of the fact that much of Africa’s food policy is externally driven, shaped by the agenda of donor governments and donor agencies rather than by local concerns and domestic constituencies.

#### ***41.4.3 The Legal Profession in Africa & Food Law***

Food law is not taught in most law schools in Africa. Lawyers, law firms, and bar associations in Africa have historically not catered to the needs of the main stakeholders in Africa’s food and agriculture sector—the small-scale farmers. Law firms with food law practice are rare in Africa, and cater largely to the needs of corporate clients. There is an urgent need to explore how lawyers and bar associations in Africa can add value to the continent’s food and agricultural sector. Law firms in Africa must explore ways to develop expertise specific to the food and

---

<sup>187</sup><http://www.thisisafricaonline.com/Analysis/Raising-the-bar-on-agricultural-innovation>.

<sup>188</sup>Maputo Declaration, supra note 3 (emphasis in the original).

agriculture industry, make connections with stakeholders in the industry, and serve the particular needs of food producers and processors in Africa. The bar associations in the different countries in Africa can take a leading role in exploring and explaining to farmers in the continent the implications for food producers and processors of various areas of law, particularly Administrative Law, Labor & Employment Law, Environmental Law, Cooperative Law, Energy Law, Corporate/Commercial Law, as well as Immigration Law. The bar associations can also play a key role in bringing together stakeholders in the industry and updating the industry on current legal issues. The law firms and law societies in the continent can explore partnership opportunities with relevant agencies, provide increased training opportunities for food producers/processors in Africa, and promote laws and policies beneficial to the industry. Finally, law firms and bar associations in Africa can foster understanding on the linkages between agribusiness and human rights in Africa in line with the *Business and Human Rights Guidance for Bar Associations* that the International Bar Association released in 2014.<sup>189</sup>

#### 41.4.4 Conclusions

Food law in Africa is in its nascent stages. There is as yet no coherent or holistic approach to food law on the continent. Moreover, in the nascent food law regime in Africa, legacies of colonialism are evident. Food law in Africa is likely to be the site for much debate in the coming years. In almost every country in Africa, there is a noticeable change from a prior emphasis on government intervention in agricultural production and marketing to a shift towards liberalized markets, deregulation, and private sector-led agricultural development strategies.<sup>190</sup> Many countries have adopted or are in the process of adopting national strategies for revitalizing agriculture.<sup>191</sup> Laws and regulation that countries adopt in the coming years to implement their respective agricultural strategies are likely to define the contours of food law in the continent. The food law regimes in Africa will be tested in part by the extent to which they empower key stakeholders, including small scale farmers, consumers and private investors. In many countries, the food and agricultural sector is presently bogged down by the prevalence of old, outdated and sometimes draconian pieces of legislation. Countries will need capacity to revise and update their food and agricultural law, and capacity to address major inconsistencies in these laws.

---

<sup>189</sup>International Bar Association, *Business and Human Rights Guidance for Bar Associations (With Commentaries)* (2014).

<sup>190</sup>See e.g. Kenya's Crop Act, 2012 (No. 16 of 2013).

<sup>191</sup>See e.g., *The Strategy for Revitalising Agriculture (Kenya) and Agricultural Sector Development Strategy 2010–2020* (Kenya).

Many factors shape and are likely to continue to shape food law and policy in Africa including international trade rules and practices, international investment law and the investor-state dispute settlement system, the international aid system, and climate change. Food law in Africa will also be shaped by laws and policies designed to promote and manage intra-African trade in agricultural and fishery products. In 2004, African Heads of State and Government established the African Common Market for agricultural products, according to the Lusaka Summit decision.<sup>192</sup> In the 2004 Sirte Declaration, African Governments pledged to promote “intra-African trade in agricultural and fishery products in order to correct discrepancies in food balances at both national and regional levels.”<sup>193</sup>

In many respects, food law and policy in Africa is still externally driven. Decisions about food volumes, prices, and qualities are largely driven by actors outside Africa. Developments in the global arena, including the continued liberalization of agriculture and agricultural markets, steady rises in foreign investment in agricultural land and agribusiness, growth in South-South trade and investment, the growth in the number of voluntary food safety standards and other corporate social responsibility initiatives are all likely to shape food policy in Africa in the coming years.

There are many challenges and obstacles to the development and maturation of food law as a discipline in Africa. Some of these include the general disregard for the rule of law in some countries, the lack of capacity needed to develop and implement new laws, and the fact that very few universities and law schools have food law as a distinct and separate discipline and academic offering. The University of Pretoria’s Institute for Food Nutrition and Well-being (IFNuW), established in 2011 and officially launched in May 2012, is presently one of the few academic centers dedicated to food law.<sup>194</sup> Academic collaboration between scholars in Africa and those in countries where food law is more developed will be crucial to efforts to develop food law as a distinct legal discipline in Africa. Food law academies and centers committed to promoting and fostering legal and policy developments in the area of food law are thus urgently needed in the continent. Overall, although the future looks bright for the development of robust food law and

---

## Chapter 42

# Disease Control, Public Health and Food Safety: Food Policy Lessons from Sub-Saharan Africa

Kennedy Mwacalimba

**Abstract** This chapter reviews the agro-economic environment in Sub-Saharan Africa as it relates to animal production, public health, and disease control to contextualize the concept of risk and food safety. Drawing mostly from the experience of Zambia, it analyzes food safety actors and interests in Sub-Saharan Africa, and provides an outline of the general regulatory framework that is in place on the continent, to explain how food safety governance is impacted by different interest groups and agendas. Two case studies are provided, zoonotic tuberculosis and avian influenza. The chapter demonstrates how the two zoonoses, both important food safety concerns, have been prioritized differently in the case of Zambia, as a result of multiple socio-political and economic factors. The chapter concludes that, in order to be useful, a definition of food safety risks should include multiple contextual issues and stakeholders along the food supply chain. It is important to keep in mind what national food safety governance actors perceive the risks to be, and how their definitions fit into the broader picture of food safety in general. Food safety governance regulatory processes should take into consideration local realities, local food supply chains and local food safety threats to ensure the appropriateness and sustainability of any and all disease control measures instituted. Context will always matter, and therefore, local ecological, biological and policy considerations should be given primacy.

### 42.1 A Risk Management Approach to Examining Food Safety, Disease Control and Public Health

Taking an African perspective on food law and food safety, this chapter tackles the concept of risk as it relates to food derived from animals. To bring the various issues that impact risk and food safety in Sub-Saharan Africa into focus and highlight the pertinent concerns for disease control, it is necessary to provide both a descriptive

and an explanatory analysis of the issues surrounding food safety on the continent. This chapter's explanations are rooted in the analysis of the narratives of food safety actors and interests, and includes some detail on the general regulatory framework that is in place in the region, how it is influenced by different interest groups and agendas, and the politics of the policy process. These provide important lenses for understanding food policy in Africa. In order to deepen this discussion, some of the perceptions of risk and policy issues concerning the African agroecosystem in general are also highlighted. This chapter does not purport to provide a complete analysis. It merely provides contextual depth to case studies from a perspective of animal disease control, public health and food safety to illustrate important food policy lessons for the African region.

Food-borne diseases remain a significant problem for public health around the world. An estimated 70 % of diarrheal incidents across the globe are due to biological or chemical contamination of food.<sup>1</sup> The burden of food-borne illness is borne by both developed and developing countries. However, the literature suggests that the incidence is highest in the African region.<sup>2</sup> Over the last 15 years, according to the World Health Organization Regional Office for Africa (WHO-AFRO), the African region has suffered several major food-borne disease outbreaks, including aflatoxicosis in Kenya, anthrax in Zimbabwe, bromide poisoning in Angola and chemical intoxication in Nigeria.<sup>3</sup> WHO-AFRO suggests that the vast majority of food-borne incidents in the African region are unreported. Therefore, the true extent of this public health problem is unknown.

In Africa, an appropriate establishment and consistent maintenance of adequate food safety infrastructure would go a long way in reducing the burden of the public health threat of food-borne illnesses. But multipartite food supply chains make food safety a complex policy issue to unpack, particularly in the era of globalization. Therefore, the evolving issues around food safety and the complexity of global food supply chains<sup>4</sup> require the development of context-appropriate food safety and disease control structures and policies that appropriately mitigate the myriad threats to public health presented by food and food trade. This is because, the various stakeholders along the food chain—producers, retailers, consumers and regulators—all play a role in assuring that food is safe, sound and wholesome.

Food of animal origin carries multiple risks. In the case of food-borne illnesses, these risks can generally be grouped under intoxications or infections. The livestock production related threats to public health include acaricides used for tick control, antibiotic residues in meat and milk, infectious diseases, and pollutants from

<sup>2</sup>Dewaal et al. (2010), pp. 483–490; WHO-AFRO (2012).

<sup>3</sup>*ibid.*

<sup>4</sup>see Kimball (2006).

agricultural runoff. Other important public health threats are zoonotic diseases. Rudolf Virchow, the pioneer of the concept of One Health,<sup>5</sup> first coined the term zoonosis in 1855.<sup>6</sup> Originally, zoonoses were defined according to the direction of disease transmission. Additional important terminology included zoonoanthroponosis, infections humans could acquire from animals, and anthroponoosis, diseases that humans could transmit to animals.<sup>7</sup> This conceptualization of zoonoses, however, failed because the two terms were used indiscriminately, leading to an expert committee decision to abandon them. Instead, the committee recommended that the term zoonoses should be defined holistically as diseases and infections naturally transmitted between vertebrate animals and humans.<sup>8</sup>

Animal health is only one link in a long food production chain that contributes to the final quality of food. The promotion of animal health is vital to the enhancement of the quality and quantity of products derived from this source. This is especially true for food supply chains with global dimensions. Chemical and biological contamination can occur at any point from production to consumption. Through their associated impacts within the food production chain, animal breeding, feed, fertilizer and pesticide use, producers, processors, and retailers all add to or subtract value from the final product.

Globalization, economic development, expansion and diversification of agricultural food trade form causal links that increase public health risks, food safety hazards, and the spread of diseases.<sup>9</sup> Globalization transcends the nation state,<sup>10</sup> and brings with it social phenomena such as power and politics. Furthermore, in most low-income countries in the African region, economic considerations<sup>11</sup> are given primacy over health concerns.<sup>12</sup> This is reinforced in global context, where trade considerations run ahead of the implementation of measures that protect health.<sup>13</sup> Additionally, due to the process of globalization, policy-makers have seen a decline in their ability to control the determinants of health. Power relationships in many low-income countries are complicated by external relationships with advisors, experts, aid donors and financial institutions and internal institutional

<sup>13</sup>*ibid.*

relationships characterized by large power gaps between actors,<sup>14</sup> with power and politics playing a role in shaping the process.<sup>15</sup>

This chapter examines zoonoses through multiple and layered lenses, the first of which is the concept of “the human-animal interface,”<sup>16</sup> with the goal of better capturing the broad socio-economic and political landscape of food safety. The understanding of the human-animal interface, as it relates to infectious disease governance, is important from two standpoints: First, the human-animal interface facilitates the examination of the relevant public health risks related to animals and their products in different contexts. Second, through food governance, and its relationship to risk enabling policy activities, the human-animal interface further adds to the understanding of the complexities associated with risk management. The corresponding risk enabling activities include the governance of land use, wildlife use and livestock production and chosen routes for economic growth and trade promotion. These activities both foster and enhance disease transmission.<sup>17</sup> Specific examples are provided through case studies of two zoonoses, one of which is a neglected disease, bovine tuberculosis (BTB), and the other an emerging disease, highly pathogenic avian influenza (HPAI, a.k.a. bird flu).

### ***42.1.1 Overview of the Epidemiological Framework for Disease Control and Public Health in Food Safety***

Epidemiology is defined as the study of the distribution and determinants of disease in defined populations. Disease determinants include risk factors for emergence which are both multifactorial and highly contextual. While epidemiology studies the dynamics of disease in defined populations, it also seeks solutions to disease problems to mitigate their impact on individual and public health. This chapter focuses on food safety within a disease prevention framework.

In a disease prevention framework, three levels of prevention are important: primary, secondary and tertiary prevention.<sup>18</sup> In primary prevention, the focus lies on averting incidents of disease in the first place. Secondary prevention strives to avert clinical manifestation of the disease state. Tertiary prevention tries to avert the complications of a disease state, such as extended morbidity, secondary infection or death.<sup>19</sup> These levels are also dependent on access to interventions, i.e. health system or government capacity and response, and do not factor in the role that industry, for instance, plays in disease prevention.

<sup>17</sup>Kimball (2006); Greger (2007).

<sup>18</sup>Kimball (2006).

<sup>19</sup>*Id.*, pp. 13–14.

The three levels of prevention are, of course, permeated by food safety governance, which reinforces the importance of this discussion within this book. For instance, primary prevention in food safety would involve the removal of chemical, physical or biological hazards from food before it is consumed. This includes the establishment of herd health programs for food animals, provision of safe feed, monitoring antibiotic use in animals, physical control mechanisms such as abattoir inspections and milk pasteurization, and the development and enforcement of food safety standards. Secondary prevention may include mechanisms for early health system response to food-borne disease outbreaks, institutional capacity to conduct timely food-borne illness outbreak investigations, food product recalls, destruction of contaminated produce or quarantine of implicated markets, farms, or animals to contain outbreaks. Tertiary prevention includes the appropriate treatment of food-borne illnesses, such as administering the correct medication to treat zoonotic tuberculosis. This prevention framework does not easily accommodate the roles that multiple stakeholders play in disease prevention, particularly those stakeholders that lie outside traditional food safety and health systems, but still impact the social determinants of health.<sup>20</sup> Logically, this begs the question; how can multiple stakeholder interests and influences be incorporated in this basic prevention framework?

One way of looking at disease prevention and management is to utilize a risk-based epidemiological model. In the epidemiological framework for disease control and public health in food safety, a risk based framework considers multiple risk factors along the food supply chain, from farm to fork, and the holistic impact of stakeholders on food safety and food-borne disease management. However, the concept of risk and its understanding is highly contextual, as our case studies will demonstrate. Risk is socially constructed. Therefore, risk identification and assessment are both innately human and dependent upon social activities that generate meaning. In other words, risk perception is contingent upon a shared understanding of reality.<sup>21</sup>

Risk is also “politicized” through several social processes, which separate risk from the actual dangers presented by various hazards.<sup>22</sup> But, the use of scientific information to inform policy is difficult. Paradoxically, one of the reasons for the difficulty to use science to inform policy on risk is scientific limitation to only the objective assessments of risk.<sup>23</sup> As Stirling and Scoones<sup>24</sup> contend in their 2009 paper on risk assessment and knowledge mapping, scientific assessments of risk often attempt to aggregate complex social and biological phenomena into a set of probabilities and outcomes, thereby often structuring the phenomena to become

---

<sup>20</sup>The social determinants of human health are the conditions of the environment where people live and work (Exworthy 2008).

<sup>21</sup>Horlick-Jones (1998), pp. 64–67.

<sup>22</sup>Douglas and Wildavsky (1982).

<sup>23</sup>Mwacalimba (2012), pp. 391–405.

<sup>24</sup>Stirling and Scoones (2009).

policy, rather than inform it. This also applies to risk assessment as applied in food safety and food policy.

Food-borne disease risks and their implications for holistic management require a multi-sectoral or shared understanding of Africa's food safety problems with a goal of a pragmatic development of solutions. Conceptually, the integration of the socio-political structures of disease risk and risk management should provide a useful framework for understanding food safety, disease prevention and public health in the African region. In other words, to be useful, an epidemiological framework for disease control and public health in food safety needs to be inclusive and open to multiple perspectives of African food safety problems. In order to succeed, it is important to properly frame food safety problems, and identify the different stakeholders involved along the food chain. Additionally, it is crucial to recognize the various stakeholders' roles and capacity for risk facilitation or management, as influenced by their institutional norms, priorities and ideas. The goal is to develop a consensual view of risk. In reality, however, the various stakeholders force aggregates of complex social and biological phenomena into risk metrics to which food governance systems are expected to somehow respond.

To create a usable disease control, response coordination and risk management framework, a proper understanding of both institutional power and the food policy framework are critical. Using this simplified risk-based epidemiological model, this chapter explains the various issues affecting food-borne diseases, their impact on public health and the policy implications of food safety governance. Fragmentation unfortunately is the complicated reality of many legal and policy issues at local, national and international levels. In applying this framework to the African region's multi-sectoral context, the boundaries between sectoral or "silo" responses to food safety will blur. Nonetheless, it should be clear by the end of the chapter that a one-cap-fits-all solution to food safety problems in the African region is unlikely effective.

### ***42.1.2 Food Policy Regulatory Framework: Actors, Interests and Conflicts***

The African continent's position on the development continuum puts it in the precarious state of having to deal with a double burden of disease,<sup>25</sup> i.e. both chronic, or diseases of affluence and infectious diseases.<sup>26</sup> Within this spectrum of disease threats, are food-borne illnesses. In turn, food-borne diseases remain a

---

<sup>25</sup>A double burden of disease is a state in which the prevalence of risk factors for chronic diseases (diabetes, heart diseases and cancers) increase at the same time that traditional health problems such as maternal and child deaths caused by infectious diseases are still major public health threats for the majority of the population.

<sup>26</sup>Green (1999).

significant problem for the region, given its high levels of poverty and urgent nutritional needs for its most vulnerable citizens. As highlighted in the introductory section, food-borne diseases are frequently reported in Africa, with high incidence. Most cases of food-borne diseases remain unreported. There are several factors responsible for this. In many countries in the region, there is the existence of poor food safety surveillance systems and weak obligatory reporting mechanisms for food-borne disease outbreaks, outside high profile diseases such as cholera. Reporting is also inaccurate in some cases, with only a handful of countries reporting incidence of food-borne illnesses. These knowledge gaps mean that an accurate picture of incidence is nonexistent, which limits our understanding of the public health impact of food-borne diseases in the region.

There are multiple stakeholders in food safety governance in the African region. These include both national and international actors. From the multilateral trade environment, characterized by overlapping regional trading blocs at continent level to professional rivalries at national and local levels, the food safety governance environment is fairly complex. Furthermore, the continent's myriad problems, make prioritizing food safety difficult. For instance, the WHO asserted that food-borne diseases and food safety do not feature very highly on national agendas although both have a major public health impact throughout the region. This assertion is based on a weighting of the paucity of resources directed at the issue. In fact, it is the political impetus to focus on food-borne diseases in the African region that is often absent.<sup>27</sup>

Fundamentally, the management of public and environmental health risks in the African region is characterized by fragmentation and the existence of conflicting national food safety standards.<sup>28</sup> The mandate to assure the safety of food of animal origin falls under various agencies, which can result in professional rivalries that impact negatively on food safety governance.<sup>29</sup> These mandates, enshrined in law and legal documents such as statutory instruments,<sup>30</sup> compound the problem of the policy disconnectedness surrounding food safety in Africa (see Table 42.1).

Understanding the role that external influences play in the policy processes for food safety and management in the African region is equally important. In many developing country settings, policy actors are forced to balance the external desires of funding agencies and international bodies as well as contend with internal power struggles.<sup>31</sup> Therefore, a hindrance to the management of risk in food safety in the African region is its dependence on development partners. External partners play a key role in defining national development agendas, by focusing their support on water delivery, primary healthcare, or particular infectious diseases such as tuberculosis, HIV and malaria. The dependence on development partners and the politics

The table shows the overlap of international economic partnerships and trading blocs in Africa. This multilateral trade environment, with its various agreements, provisos and foci, is an amorphous set of issues that, while not immediately obvious, have implications for disease spread and control. Typically, in such an environment, trade issues take primacy over health concerns, with profound implications for public health. The left hand side of the table lists the countries and the right shows the acronyms of economic partnerships they belong to (bold and italic terms)

of aid has implications for the capacity of African countries to control the focus of funding.<sup>32</sup> The assistance provided by donors towards food safety may not foster ownership among local stakeholders, given that the focus is donor driven and not aligned with existing needs and local realities.<sup>33</sup> In addition, the WHO states that development partners are not always willing to commit to sustaining the strengthening of food safety management systems.

### **42.1.3 Key Stakeholders and Mandates for Risk Management and Food Safety in Africa**

There are contextual differences in food control system implementation across the African continent. In general, however, the existing food safety and control systems do not provide the policy coherence necessary for stakeholder agencies to synergistically prevent food safety problems. International guidelines such as the *Codex Alimentarius*<sup>34</sup> do not have the supporting legislative framework in many African countries. Many of the laws governing food safety are outdated, inadequate or fragmented.<sup>35</sup> The provisions relating to animal health, for instance, can be found in multiple statutes, codes and standards (both legal and voluntary), which spurs institutional rivalries and blurs the boundaries of responsibility. There is inadequate protection of consumers from contaminated food products, fraudulent practices and the importation of substandard food for domestic markets.<sup>36</sup> Furthermore, enforcement of food law remains an important concern. The absence of a coherent policy framework for food safety has created an environment in which these government agencies operate according to their own institutional perspectives on food safety, often leading to effort duplication.<sup>37</sup>

The African Regional Office of the WHO highlights the inadequate address of food safety concerns in national policies in the African region and recommends national food safety policy coherence to be the foundation for effective food safety management systems.<sup>38</sup> While linked, these are, in reality, two different issues. The letter of food safety policies, i.e. policy content, are based on regulation inherited from Africa's former colonial masters. Food safety governance in the region, like many institutions on the continent, cannot be easily separated from the legacy of colonialism.

---

<sup>32</sup>Mwacalimba (2013).

<sup>33</sup>WHO-AFRO (2012).

<sup>34</sup>The Codex Alimentarius Commission was established jointly by the United Nations' (UN) Food and Agriculture Organization (FAO), and the World Health Organization (WHO).

<sup>35</sup>*Ibid.*

<sup>36</sup>*Ibid.*

<sup>37</sup>FAO/WHO (2005).

<sup>38</sup>WHO-AFRO (2012).

Many existing laws are rooted in legislation that was created during the colonial period and are, therefore, not properly oriented towards contemporary realities. So, while secondary legislation through statutory instruments may help address some concerns, it is the underlying definitions, institutions and authorities that form the basis of the foundational legislation that needs to be reformulated. Therefore, while it is true that the inadequate address of food safety concerns in national food safety regulations hampers the effectiveness of government responses to the issue, the lack of movement may also be due to the myriad of issues governments have to deal with using limited resources.

These issues are also symptomatic of a fragmented polity. Some researchers<sup>39</sup> explain that fragmentation is the norm in contemporary policy, where different sectors of government work as so-called silos, pursuing individual sector interests and mandates. As would be expected in a fragmented polity, the key institutions involved in food safety governance and the implementation of risk management for the protection of public, animal and environmental health, all operate with different priorities, agendas and mandates. Each institution along the supply chain has a different value system. How various stakeholders perceive food safety, i.e., as either “low politics” or “high politics,”<sup>40</sup> also affects overall policy coherence. Others<sup>41</sup> suggest that while issues of “high politics” or those of macro or systemic importance may be formulated and imposed by a narrow group of elites, those of “low politics” are subject to the influence of many different groups. Certainly, the interaction of low and high politics amongst the various international and national stakeholders involved in food safety governance in the African region provide an interesting dynamic to the management of food-borne risks to public health.

The food safety governance boundaries in the African region are also shaped through legislation and international standards adopted within the respective mandates of national and international institutions. The confusion only increases when regional and global actors in food safety governance come into play. A WHO study examining the status of food law in Africa suggested that in most African countries, there existed a discord between national food law and international requirements, such as the *Codex Alimentarius*. The study further states that this discord has led to the rejection of food exports from the region.<sup>42</sup> Such complex phenomena, however, cannot be treated as mere events, but should be considered institutionally embedded processes with distinct histories that need to be uncovered to help illuminate more general problems,<sup>43</sup> especially where many countries in the region face several non-tariff barriers that limit their ability to export their produce. These include Sanitary and Phytosanitary (SPS) requirements, technical barriers to trade, quotas, and market standards, restrictive rules of origin and complex tariff

<sup>41</sup>Walt (1994).

<sup>42</sup>WHO-AFRO (2012).

<sup>43</sup>Omamo and Farrington (2004).

structures and import requirements.<sup>44</sup> The enforcement of import controls and inspections is also problematic for most governments, which presents the risk of importing unsafe and substandard food and food products.<sup>45</sup> A report<sup>46</sup> on Zambia, for example, argues that European Union (EU) and United States of America SPS standards are “dynamic” and have resulted in the rejection of Zambian goods at ports of entry. Others<sup>47</sup> state that EU standards for food safety are high to meet the perceived requirements of its affluent consumers. The following will shed further light on the case of Zambia.

## 42.2 Legislative Overlap in Food Law Governance

### 42.2.1 *The Case of Zambia*

First, the key ministry in charge of food safety in Zambia is the Ministry of Health, which is responsible for the review of law and policies, as well as the mobilization of resources to monitor and evaluate the quality of the health care delivery system. Enshrined in law (The Public Health Act Cap 295<sup>48</sup> and The Food and Drugs Act, Cap 303<sup>49</sup> of the Laws of Zambia), the Ministry is charged with protecting the

---

<sup>44</sup>Ndulo (2006).

<sup>45</sup>WHO-AFRO (2012).

<sup>46</sup>Mudenda (2005).

<sup>47</sup>Barling and Lang (2004).

<sup>48</sup>The date of the original text for this law is April 11th, 1930. It was last consolidated in 2006. The Act ‘makes provision with respect to matters affecting public health in Zambia including prevention and suppression of infectious diseases including diseases communicable from animal to man, sanitation, protection of food, supply of water, protection from mosquitoes and pollution in general.

The Minister is granted certain regulation-making powers in respect of infectious diseases. Importation of animals may be restricted. The Act also prohibits the sale of unwholesome food and grants in general regulation-making powers to the Minister especially for the control of quality and hygiene of food. Water shall be kept in such a manner so as to avoid stagnant water. Local authorities shall take all possible measure for the prevention of the pollution of water and to purify any polluted water supply. The Minister may make, on the recommendation of the Central Board of Health, certain Orders for the protection of milk.

Descriptors (Livestock): animal health; pests/diseases; data collection/reporting

Descriptors (Food): food quality control/food safety; hygiene/sanitary procedures; milk/dairy products

Descriptors (Water): water supply; freshwater quality/freshwater pollution

Descriptors (Waste & hazardous substances): pollution control; waste disposal’ Cap 295 of the Laws of Zambia.

<sup>49</sup>This act originated as S.I. No. 244 of 1972 as at 2006. The Food and Drugs regulations ‘prescribe that no manufacturer or distributor of, or dealer in, any article shall sell such article to a vendor unless he gives to the vendor a warranty in a form set out in the Schedule and applicable to such sale. “Article” in the Act means any food, drug, cosmetic or device and any labelling or advertising

public from food hazards, be they chemical, physical or chemical agents. To achieve this, the Ministry monitors food quality and safety along the production chain using set standards, usually developed by the Zambia Bureau of Standards (ZBS). Interestingly, while the health ministry operates under compulsory legal guidelines such as the Public Health Act and the Food and Drugs Act, the standards created by the ZBS are voluntary.<sup>50</sup> Consequently, industry is under no obligation to comply with ZBS standards.

Second, Zambia's Agricultural Ministry's mandate focuses on animal and plant health. Its responsibility is animal disease control and the prevention of novel plant pest incursions into the country. The veterinary department, under the Ministry of Agriculture, is responsible for controlling hazards that may enter the food chain through food of animal origin. The Ministry of Agriculture draws on the Stock Diseases Act Cap 252 of 2010, which repealed the Stock Diseases Act of 1961,<sup>51</sup> and the Control of Goods Act Cap 421. Local government is responsible for meat inspection in abattoirs, the setting up of appropriate structures for animal slaughter and municipal waste management under Cap 281<sup>52</sup> of the Laws of Zambia. These legal mandates all empower these arms of government in food safety governance. It should be easy to see that there is considerable overlap when it comes to inspection of food of animal origin. Furthermore, the Public Health Act in Zambia does not cover many modern public health concerns in food processing and the Food and Drugs Act is superseded by international standards or country of export legal provisos, in cases of multilateral trade. This structure is fairly typical of many African countries.

In countries like Zambia, the informal sector, which plays a key role in food supply to the general population, is mostly considered to be outside the purview of official control mechanisms, except municipal authorities.<sup>53</sup> The sector is thus

---

materials in respect thereof or anything used for the preparation, preservation, packing or storing of any food, drug, cosmetic or device.

Descriptors (Livestock): animal health; drugs

Descriptors (Food): food quality control/food safety' Cap 303 of the Laws of Zambia.' Source: <http://faolex.fao.org/>.

<sup>50</sup>FAO (2005).

<sup>51</sup>The year this law was repealed is revealing. Zambia only became independent on October 24th, 1964.

<sup>52</sup>In some by-laws of this act, animal health and food safety is addressed. For instance, concern the slaughtering of animals and sale of meat in the area under the jurisdiction of the Katete District Council. They also provide for the control of stray animals.

'Butcheries shall be approved by the District Council. A person shall not expose, offer, deposit, accept or have in his or her possession for resale any meat unless such meat has been examined and passed by the Meat Inspector as fit for human consumption and stamped and marked accordingly.

Descriptors (Livestock): grazing/transhumance; slaughtering

Descriptors (Food): food quality control/food safety; meat; slaughtering; inspection' Source: <http://faolex.fao.org/>.

<sup>53</sup>WHO-AFRO (2012).

usually beyond the purview of official control and falls prey to substandard practices in the marketing of food products. In some cases, foods are processed and sold in unhygienic environments with little regard for cold chain requirements and pest control, for instance in the case of the street vending of raw and cooked food, a significant risk for food safety. Given the complicated mix of actors affecting the regulatory environment for food safety in Africa, in addition to the continent's rampant and myriad disease problems, inadequate or outdated legislation, solutions to the continent's problems in food safety are difficult to find.

### ***42.2.2 The World Organization for Animal Health and Food Safety***

An important international body in food safety regulation with regard to food of animal origin is the World Organization for Animal Health (OIE).<sup>54</sup> It was established on January 25, 1924, and is headquartered in Paris, France. It is not a United Nations body, like the Food and Agricultural Organization (FAO) and WHO, but the World Trade Organization (WTO) recognizes the OIE as a reference organization.<sup>55</sup> Thus the OIE has adopted an active pro-trade stance in their address of issues surrounding trade, health protection and food safety. In its Terrestrial Animal Health Code, the OIE lists international animal health standards that are the basis for facilitating safe trade in animals and animal products, standards that are recognized under the Sanitary and Phytosanitary (SPS) Agreement of the WTO.<sup>56</sup> Countries that are involved in animal and animal product trade are expected to comply with the SPS Agreement in order to reap the full benefits of international trade.<sup>57</sup> The SPS Agreement states that public health measures to ensure food safety and to control plant or animal diseases should be based, as far as appropriate, on international standards.<sup>58</sup> In addition, the SPS Agreement sets forth that measures to protect public health, animal health and plant health should only minimally interfere with trade. On issues of food safety, however, it must be noted that produce from developing countries, particularly those from the African region, cannot easily enter the more lucrative Western markets. Furthermore, both weak national food governance legislation and the facilitative intent of the SPS Agreement biased towards trade, may compound the problem of the importation of substandard food and food products. Therefore, the view that measures to protect health should only minimally interfere with trade remains problematic.

---

<sup>54</sup>This is the French acronym (Office International des Epizooties—OIE).

<sup>55</sup>Thiermann (2005), pp. 101–108.

<sup>56</sup>Bruckner (2009), pp. 141–146; OIE (2010); OIE (2004).

<sup>57</sup>Thiermann (2005).

<sup>58</sup>Zepeda et al. (2005), pp. 125–140.

The OIE's Terrestrial Animal Health Code prescribes the role that national veterinary services of member countries should play in food safety governance. It is the OIE's position that a veterinarian's background and training places him or her in a unique position as far as the assurance of food safety of foods of animal origin is concerned, emphasizing the proper training of veterinarians to meet the challenges in food safety. It also provides guidelines for evaluating national veterinary services. Interestingly, the OIE's veterinary services evaluation process sets independence from political influence as a primary benchmark.<sup>59</sup> The OIE's aim of separating science from politics is impractical. In fact, it has been suggested that the veterinary profession is likely limited by its dependence on scientific or authoritative opinion and its exclusion of political and social phenomena.<sup>60</sup> For food safety in particular, influencing policymaker perceptions on the human risks of diseases from livestock, cannot only be an exercise in science, it must also recognize politics.<sup>61</sup>

### 42.3 The African Agroecosystem: International Legal Perspectives of Epidemiology and Disease Control

Now we examine the international policy scenario as it relates to the African agroecosystem and disease control. Globalization under the current multilateral trading system has created vast inequalities between the world's richest and poorest nations.<sup>62</sup> Even the OIE's perspective on global issues, particularly its views on trade, has significant impacts on developing countries such as those found in the African region. Before the OIE disease lists were revised, of the 15 "List A Diseases" considered to be transboundary in nature and prioritized as threats to global animal health in the trade of livestock products, 12 were endemic to sub-Saharan Africa.<sup>63</sup> The presence of transboundary animal diseases in the African region and their unlikely eradication in the foreseeable future means that under WTO global trade rules, these countries will continue to be excluded from involvement in international trade.<sup>64</sup> Many countries in the African region have to deal with a range of animal diseases simultaneously, and are likely to continue doing so. This makes technical considerations and regulation of trade extremely difficult, even within a facilitative global trade environment.<sup>65</sup> Some publications,<sup>66</sup> for

<sup>66</sup>Rweyemamu and Astudillo (2002), pp. 765–773.

example, suggest that the global distribution of Foot and Mouth Disease (FMD) interestingly mirrors the global economic make-up with industrialized countries generally being free of the disease while developing countries are endemic. Furthermore, reviews of WTO agreements and their effect on livestock production and trade in Africa, highlight the lack of transparency and equality among negotiating countries that has excluded many developing countries.<sup>67</sup> Sub-Saharan Africa has given out more concessions on tariff reduction than what it received from its trading partners.<sup>68</sup> This state pushes trade in a North–south direction and, unfortunately, international standards have been used to reinforced this direction of trade, primarily on health grounds.<sup>69</sup>

As was the case with food safety monitoring mechanisms, developing countries such as those found in the African region have serious problems in their surveillance systems and veterinary infrastructure.<sup>70</sup> With these problems, Africa's trading partners automatically assume that products exported from the continent are risky.<sup>71</sup> Focusing on development, some researchers<sup>72</sup> have argued that WTO SPS measures marginalize the world's poor producers the most and may even contribute to global poverty and disease. A review of the history of free trade<sup>73</sup> argues that current approaches to global trade deny poorer countries the opportunity to implement policies that fostered the development of the world's wealthy economies. These arguments suggest that developing countries are not only purposefully restricted from participating in global trade in reciprocal ways, their development opportunities are also restricted by these multilateral systems.

The dominant international perspective is that the African region and similar developing world contexts, pose the greatest risk as sources of infectious diseases.<sup>74</sup> Some<sup>75</sup> state, for instance, that the FAO's philosophy is to control these diseases at their developing country source. This view that resource-constrained countries are the biggest sources of infectious disease risks for the rest of the globe also suggests that disease control efforts would focus on the "global impacting" disease problems. It further implies a fostering of particular methods of control that may not be appropriate for different settings, which could actually harm local livelihoods or worse, encourage further disease spread.<sup>76</sup> The issues

<sup>76</sup>see Scoones (2010).

that lie at the confluence of health and trade also impact food safety and food safety governance.

The resulting “controlling-risk-at-source” narrative obscures the cultural, disease management and stigmatization challenges that the African region faces when its member states strive to embrace these global perspectives on trade and infectious disease control. For instance, livestock in many countries in the African region are not just kept as articles of commerce, but have cultural significance as well, what some<sup>77</sup> term multifunctionality; where they serve such functions as assuring domestic food security, provide access to nutrition for the less privileged and play key roles in the maintenance of distinctive rural cultures and ways of life.<sup>78</sup> Furthermore, compared to more industrialized countries where there are mechanisms for farmer compensation following livestock culling, this is not usually possible in resource-limited countries because of a dependency on livestock for rural livelihoods and difficulties in obtaining replacement stock.<sup>79</sup> In addition, although the two systems are sometimes loosely integrated, it must be understood that both traditional and commercial production practices co-exist in many of these contexts. Finally, it is possible that the diseases and risks prioritized in the global West are not necessarily the ones of most significance in these contexts. Therefore, part of the problem with this global aversion to infectious disease risk is that there is little effort made to understand the context in which developing countries attempt to negotiate global imperatives, be they public health, animal health or trade concerns. In the context of food safety in particular, not much has been done to investigate context-relevant ways of addressing these problems.<sup>80</sup>

### ***42.3.1 Zoonotic Tuberculosis and Food Safety in Africa***

To explain the links between zoonotic tuberculosis and food safety in Africa, it is important to first define and describe the wildlife-livestock interface. The wildlife-livestock interface can be simply defined as an area in which both wildlife and livestock commonly reside.<sup>81</sup> This definition, however, does not adequately capture the dynamic nature of this interface. Its nature is best defined by the context in which it exists. Kock,<sup>82</sup> provides several interesting contextual descriptions of what constitutes a wildlife-livestock interface, including migratory bird contact with intensive pig operations in North America, China and Europe, and pastoral cattle

foraging in African wildlife sanctuaries. The key descriptors of the interface include health, conservation, culture and economics. In the next segment, this chapter will focus on cattle production, the transmission dynamics of bovine tuberculosis (BTB) between cattle and wildlife reservoirs, the pertinent food safety concerns in the agroecology of wildlife-livestock interface and their implications for public health. It will also attempt to highlight key cultural and economic details of the interaction of these myriad facets that are important for food safety governance.

### 42.3.2 *Epidemiology of Zoonotic Tuberculosis*

*Mycobacterium bovis* is a member of the mycobacterium tuberculosis complex.<sup>83</sup> The bacterium causes Bovine tuberculosis (BTB), a zoonosis characterized by the development of specific granulomatous lesions in the lung, lymph nodes and other tissues.<sup>84</sup> Comparative genomics suggest that *M. bovis* evolved from *Mycobacterium tuberculosis*, the primary cause of human TB, but has since developed a capacity for infecting a large host range.<sup>85</sup> BTB's susceptible species range spans domestic and wild animal species, and man.<sup>86</sup> Although the specifics of the evolutionary biology of the two infectious agents remain controversial,<sup>87</sup> one school of thought is that the deletions in the *M. bovis* genome that occurred from its evolution from *M. tuberculosis* increased its host range.<sup>88</sup> *Mycobacterium bovis* is hardy, and can survive outside the host depending on environmental conditions. It can survive for up to 2 years in the environment, 1 year within dung pats, and between 5 and 7 months in manure, slurry or water.<sup>89</sup>

In Africa, approximately 85 % of cattle and 82 % of humans live in areas where BTB is either partly controlled or not controlled at all.<sup>90</sup> Like many of the African region's disease problems, a clear picture of the extent of the problem is yet to be developed. There is a paucity of data on the prevalence of BTB in cattle, a lack of species differentiation of human TB isolates and the presence of significant wildlife reservoirs.<sup>91</sup> The epidemiology of the condition in cattle is as follows: A vast majority of cattle excrete *M. bovis* almost from the inception of a lesion.<sup>92</sup> However, it is still not fully understood to what extent tuberculosis latency exists in

<sup>92</sup>Menzies and Neill (2000), pp. 92–106.

cattle and the associated problems of this potential source of infection. BTB will persist in cattle as long as the bovine host lives.<sup>93</sup> A single bacillus that becomes aerosolized is sufficient to establish infection, droplet size being more important than number of bacilli.<sup>94</sup> With droplet nuclei as a vector, animals do not need to be in close contact with a tuberculosis disseminator to become infected.<sup>95</sup> We must cross reference this scientific fact with the social role that cattle play in African rural culture and livelihood i.e. not as a source of food, but a status symbol. This is important for understanding disease transmission in the wildlife-livestock interface.

In humans, tuberculosis caused by *M. bovis* is similar to *M. tuberculosis*.<sup>96</sup> Infection occurs via aerosol inhalation due to close contact with infected cattle,<sup>97</sup> oral consumption of infected food, and through skin wounds.<sup>98</sup> In a broad sense, these routes of infection are all important, but it must be understood that BTB is predominantly a milk-borne zoonosis.<sup>99</sup> During the pre-eradication period in western countries, milk was the main source of infection for human beings, especially children.<sup>100</sup> Studies have been done where *M. bovis* has been isolated from milk in Africa.<sup>101</sup> In cases where the bacillus enters a human being orally, i.e. through the ingestion of unpasteurized and BTB contaminated milk or milk products, disease manifestation is mainly extra pulmonary with abdominal, bone and joint forms, as well as infection of cervical and mesenteric lymph nodes.<sup>102</sup>

Humans in close contact with infected cattle may acquire *M. bovis* via the respiratory route.<sup>103</sup> Gibson et al.<sup>104</sup> discuss a case from Gloucester in which a 20 year-old male became infected with *M. bovis* following inhalation of infectious aerosols. He was frequently sprayed with nasal mucus from cattle. He is thought to have later infected his sister who was diabetic and pregnant, thus immunocompromised. Similar transmission may occur in pastoral communities in individuals who frequently handle their livestock or infected wildlife meat and secretions.

Meat from infected animals may also contain viable *M. bovis*<sup>105</sup> that could pose a risk of infection for humans. Specific tissues such as liver, spleen, kidney, mammary glands and lymph nodes may contain sufficient organisms detectable by culture or guinea pig inoculation, even though not showing evidence of infection

at necropsy.<sup>106</sup> Haematogenous spread is believed to be responsible for secondary lesions.<sup>107</sup> Thus meat and blood from infected animals pose potential risks of zoonotic infection if not properly prepared or if consumed raw.<sup>108</sup>

In Africa, the relative proportion of human tuberculosis cases caused by *M. bovis* is unknown because differentiation from infections caused by *M. tuberculosis* is not commonly performed.<sup>109</sup> However, significant risk factors for the transmission of *M. bovis* occur in communities where there is close human-to-livestock contact.<sup>110</sup> Some<sup>111</sup> estimate that in countries where pasteurization of milk is rare and bovine tuberculosis is common,<sup>112</sup> 10–15 % of human cases are caused by *M. bovis*. In many rural parts of the African region, BTB control is nonexistent and poor food hygiene practices, husbandry methods, and consumption of raw milk still present risks of human infection.<sup>113</sup> Infection in these areas is by ingestion of unpasteurized milk, poorly cooked meat and close contact with infected animals, tissues or secretions.<sup>114</sup> In pastoralist communities of Northern and Southern zones of Tanzania, for instance, 16 % of culture-positive mycobacteria isolates from human cases were *M. bovis*.<sup>115</sup> Kazwala<sup>116</sup> states that there was a definite link between the number of cattle owned and the incidence of non-pulmonary tuberculosis in the human population. Similarly, the ownership of reactor cattle herds in Zambia was shown to be statistically associated with human tuberculosis cases,<sup>117</sup> although in other countries no statistically significant association between reactor cattle and associated households was found, even though there were human tuberculosis cases in households that owned reactor cattle.<sup>118</sup>

Grange<sup>119</sup> cites other studies that exemplify human cases of *M. bovis* in Africa. This includes surveys where 0.4, 5.4 and 6.4 % of pulmonary tuberculosis cases respectively were due to *M. bovis* in Egypt, while 3.9 % of 102 isolates of pulmonary tuberculosis was due *M. bovis* in Nigeria. Prior to effective tuberculosis control in cattle in developing countries, the positive correlation between human prevalence and infection was well recognized. Up to 6 % of human pulmonary

<sup>119</sup>Grange (2001).

tuberculosis cases were attributed to infection of bovine origin in the south of England between 1931 and 1937.<sup>120</sup> In one review,<sup>121</sup> pulmonary disease was found to be more common in rural areas of England and Wales in the early part of the twentieth century, possibly due to aerogenous infection from cattle. The current situation in Africa is thought to be similar to the pre-eradication era in Europe.<sup>122</sup>

Finally, although human-to-human transmission is considered rare,<sup>123</sup> other humans with *M. bovis* infection may be potential sources of disease. The highest risk groups for acquiring *M. bovis* are individuals with concomitant HIV/AIDS infection.<sup>124</sup> Thus the high prevalence of HIV/AIDS in sub-Saharan Africa is an added risk. Transmission among HIV infected individuals may be particularly high because immunosuppression increases susceptibility to infection.<sup>125</sup> Some researchers<sup>126</sup> suggest that most TB cases in African HIV/AIDS patients are due to exogenous re-infection rather than reactivation of endogenous *M. tuberculosis* and could have a similar risk of exogenous disease upon exposure to *M. bovis*. In such individuals, it may be difficult to determine if the zoonosis is a reactivation or a new infection.<sup>127</sup>

#### **42.4 Malevolence or Benevolence? Issues at the Nexus of Food Safety and Food Security in the Wildlife-Livestock Interface of Southern Zambia**

In Zambia the incidence of HIV has been steadily declining since the 1990s. However, according to country statistics, the HIV prevalence still stands at 12.7 % while human TB is at 433 per 100,000 of the population.<sup>128</sup> The reduction in HIV incidence is a result of control strategies instituted by the government, with the support of donor agencies such as the Global Fund to Fight AIDS, Tuberculosis and Malaria. In this country, research has demonstrated that BTB may be an important neglected disease whose impact on public health is underestimated because of the high prevalence of human TB coupled with the ongoing HIV/AIDS pandemic.<sup>129</sup>

One area where BTB may be significant is in a wildlife-livestock interface area in the south of Zambia, in the flood plains of the 6500 km<sup>2</sup> Kafue Flats. Lochinvar and Blue Lagoon national parks are two contiguous Game Management Areas in the catchment of the Kafue Flats in which human settlement, small-scale

<sup>129</sup>Mwacalimba et al. (2013).

agriculture, livestock production and fishing are permitted. This area brings the nexus of food safety, disease control and risk into sharp focus. The risk factors for the zoonotic transmission of the disease to humans in this area include livestock management methods, food preparation and hygiene methods, and socio-economic and health status.<sup>130</sup>

The Tonga and Ila tribes constitute the largest ethnic groups living in this area. Their main economy is livestock production.<sup>131</sup> Their cattle are kept for prestige, milk, draft power, dowry, savings and to offset crop failure<sup>132</sup> and are rarely slaughtered except during ceremonies.<sup>133</sup> Cattle rearing in this area is predominantly pastoral with grazing based on the cycle of flooding in the floodplains, which provides year-round pasture. Nearly three quarters of the area's cattle graze in the floodplains for 6 months out of every year.<sup>134</sup> There are three contiguous herding systems practiced in this area. In village resident herding, cattle are reared in and around villages. Transhumant grazing involves the trekking of cattle into the floodplains during the dry season. These herds return to the villages when the rains start and pasture becomes abundant closer to the villages. The last herding system is interface herding. These are large herds of cattle whose numbers cannot be supported by pasture around the villages.<sup>135</sup> Transhumant and interface cattle interact freely with wildlife such as the Kafue lechwe (*Kobus leche kafuensis*).<sup>136</sup> This is a highly sociable semi-aquatic marsh antelope that can only be found in the floodplains in and around Lochinvar and Blue Lagoon National Parks.<sup>137</sup> It is<sup>138</sup> estimated that the herd level prevalence of BTB in cattle from this area at 49.8%, while the individual cattle prevalence was estimated around 6.8%.

The first zoonotic TB food-borne risk comes from cattle as a milk source for local communities and human contact with infected herds. As stated earlier, BTB is primarily a milk-borne zoonosis. Some<sup>139</sup> estimate that 50% of milk derived from these cattle is consumed locally. Pasteurization is able to kill *M. bovis* in milk<sup>140</sup> but where this is not done, human infection is likely to occur. The milk consumed in the wildlife-livestock interface is rarely pasteurized and is sometimes consumed as curdled or soured milk, which is considered a delicacy. The local breeds of cattle are not bred for milk production, and, hence, have low outputs. Thus, milk pooling is a common practice, which increases the risk of humans acquiring BTB from

<sup>140</sup>Kells and Lear (1959).

milk. Although only 1% of cattle with BTB excrete *M. bovis* in their udders, infected milk from a single cow can contain enough viable bacilli to contaminate milk from up to 100 cows if pooled.<sup>141</sup> Furthermore, *M. bovis* has been shown to survive in soured milk for up to 14 days.<sup>142</sup>

The second zoonotic food-borne risk comes from wildlife. The predominant species and primary wildlife maintenance host for BTB is the Kafue lechwe.<sup>143</sup> There is a single population of lechwe in the floodplain coexisting with humans and livestock herds.<sup>144</sup> Dated reports on BTB burden in lechwe are varied, estimating the prevalence around 14 and 30%.<sup>145</sup> In a 2010 study,<sup>146</sup> Munyeme and his colleagues estimated the prevalence of BTB in hunter-harvested lechwe to be around 24.3%. These findings represent the risk to public health for the communities living in and around the wildlife-livestock interface.

The food safety significance of lechwe lies in the fact that, of all the wild animal species in Zambia, this small antelope is the most sought after species for game meat.<sup>147</sup> The legal off-take of lechwe amounts to around 800 lechwe a year.<sup>148</sup> An estimated 47.7 tonnes of lechwe meat is produced annually and consumed by about 39,780 people.<sup>149</sup> Poaching, of course, remains a significant problem for this and other species of wildlife. However, the concern here is that even meat obtained legally (through the official quota utilization system) by members of the community is not subject to food safety enforcement mechanisms such as meat inspection. In Africa, abattoir inspected meat is usually consumed in urban areas<sup>150</sup> while rural communities do not routinely submit their animals for meat inspection. For Zambia, wildlife conservation usually occurs in areas remote to veterinary services.<sup>151</sup> The result is that game continues to be consumed, and wildlife trophies handled, without veterinary clearance. The implication of this is that, while providing local communities access to meat from the Kafue lechwe offers an important source of supplementary protein, the food derived from this source also carries the risk of transmission of zoonotic tuberculosis.

Of course, there are other routes available for the zoonotic transmission of BTB, as the aforementioned epidemiological review of *M. bovis* has tried to demonstrate. Therefore the food safety and infectious disease dangers to the communities living in and around the wildlife-livestock interface are very real. Clearly, BTB may play

a role in the epidemiology of human TB, particularly in the context of HIV and AIDS. However it is rarely, if ever, linked to the policy narratives that focus on the big three; tuberculosis, HIV and malaria. Furthermore, while the scientific literature has linked wildlife management, community nutrition and livestock husbandry to BTB epidemiology and risk, the relevant policy actors in this triad have not been appropriately engaged and thus BTB remains a neglected disease with real consequences. Based on data extrapolated from other countries and the prevalence of human tuberculosis in the region, it was estimated that over a 10 year period, around \$1.5 million (US) are costs attributable to the treatment of zoonotic tuberculosis in this area.<sup>152</sup>

#### ***42.4.1 Avian Influenza: The Zambian Experience of Pandemics and Food***

##### **42.4.1.1 The Epidemiology of Highly Pathogenic Avian Influenza H5N1 Spread and the International Response**

The infamous H5N1 highly pathogenic avian influenza (HPAI)<sup>153</sup> was first identified at a goose farm in Guangdong Province, southern China in 1996.<sup>154</sup> Subsequently, high H5N1-related mortalities were reported on three chicken farms in Hong Kong, just adjacent to Guangdong Province, between March and early May, 1997.<sup>155</sup> In May of the same year, a child died of viral pneumonia, the first reported case of zoonotic H5N1 influenza.<sup>156</sup> Following the identification of 17 more human infections that resulted in five deaths between November and December of 1997,<sup>157</sup> H5N1 became recognized as a zoonosis of possible public health concern. As a result, in December 1997, total and rapid depopulation of all poultry in markets and chicken farms in Hong Kong was carried out to control the outbreak, a move that both policy and virology experts believed had averted a potential human pandemic.<sup>158</sup> Arguably, live poultry markets were important in the transmission of the H5N1 virus to other avian species and humans during these outbreaks.<sup>159</sup> The control measures instituted, i.e. the total culling of all farmed chickens and all poultry in markets in Hong Kong, appeared effective, as the responsible genotype

<sup>152</sup>Mwacalimba et al. (2013).

<sup>153</sup>Avian influenza exists in two forms, highly pathogenic avian influenza (HPAI) and low pathogenic avian influenza (LPAI). Continuous existence of LPAI virus in avian populations may provide chances for the virus to undergo mutation and convert to a highly pathogenic form. Highly pathogenic avian influenza, especially of the H5 and H7 subtypes, has the potential to infect human beings.

of H5N1 (A/goose/Guangdong/1/96) has not been reported since the execution of these controls.<sup>160</sup> However in February 2003, during the SARS epidemic, and after a 6-year hiatus, three more human H5N1 infections with two fatalities were identified in China. This suggested viral persistence, despite the control measures that had been instituted in 1997.<sup>161</sup> An epidemiological review<sup>162</sup> states that outbreaks had continued to occur in poultry in Hong Kong from 2001 to early 2002, caused by a different H5N1 lineage. While there is some suggestion that the H5N1 problem had been subdued in 1997,<sup>163</sup> it was, in fact, entrenching itself in the poultry systems of Hong Kong, and likely elsewhere in Southeast Asia, between 1997 and 2003.

Between December 2003 and February 2004, the first wave of an H5N1 panzootic in poultry was reported nearly simultaneously in eight countries in South and Southeast Asia, most of which occurred in commercial poultry establishments. This was followed by a second wave of spread from July 2004.<sup>164</sup> The WHO states that the second wave was associated with more rural settings.<sup>165</sup> The countries initially affected were China, Indonesia, Cambodia, Japan, Laos, Korea, Thailand and Vietnam, with a ninth country, Malaysia, joining the list in August 2004.<sup>166</sup> The pro-poor advocacy group, GRAIN, states that the initial outbreaks in Vietnam, Thailand, Cambodia, Laos and Indonesia all occurred in closed, intensive factory farms.<sup>167</sup> During the first wave, millions of poultry either died or were culled in an effort to control the disease.<sup>168</sup> Human infections were then reported in Hanoi, Vietnam, in January, 2004, a few days prior to a report of massive H5N1-related poultry mortalities in two poultry farms in the south of the country.<sup>169</sup> Vietnam had initially experienced an H5N1 outbreak in 2001.<sup>170</sup> In early 2004, during the first wave of the panzootic, the WHO declared the outbreak an unprecedented catastrophe for agriculture in Asia and a “global threat to human health.”<sup>171</sup>

Coinciding with the second wave of the panzootic, the period between August and October 2004 saw eight more human deaths in Thailand and Vietnam.<sup>172</sup> The third wave began in December 2004, involving new poultry outbreaks in Indonesia, Thailand, Vietnam, Cambodia, Malaysia and Laos.<sup>173</sup> Fresh human cases were

reported in Vietnam, Thailand and Cambodia.<sup>174</sup> At this point, after reviewing the unfolding situation, a writing committee of the WHO consultation on human influenza established that Vietnam led the human death toll.<sup>175</sup> According to a WHO pandemic threat report,<sup>176</sup> by 2005, H5N1 had crossed the species barrier three times, namely in 1997, 2003, and the period between 2004 and early 2005, which recorded the largest occurrence of human H5N1 cases of the period in question. With the report of migratory birds being affected with H5N1 in Mongolia and China, particularly at Lake Qinghai in China in April 2005, concern grew that this posed a potential risk of southward and westward spread of the virus in poultry.<sup>177</sup> Around 6345 birds of different species died in the weeks following the Qinghai outbreak.<sup>178</sup> This is probably the single most important event linking H5N1 to migratory bird spread. This outbreak singularly raised the profile of the role of migratory birds in the global spread of H5N1.

H5N1 had spread through the diverse market and poultry production systems of Southeast Asia. There is much debate around the primary causes and drivers of the H5N1 problem, revolving around poultry production and marketing practices. An important factor in the Asian panzootic is that ducks appeared to have played a key role in the maintenance of the virus, primarily as silent carriers of H5N1. While outbreaks in poultry were still possible, this suggests that in areas where duck production was less significant, the chances of endemicity could be lower. By 2005, H5N1 had become endemic in the duck population of poultry, providing a reservoir of the virus for other poultry species as asymptomatic shedders of H5N1 influenza.<sup>179</sup>

As of November 11, 2010, H5N1 HPAI had claimed a cumulative 508 confirmed cases and 304 human deaths.<sup>180</sup> The panzootic cost the global poultry industry well over \$10 billion (US) in losses and continued to persist in poultry populations of parts of Europe, Southeast Asia, Egypt and Nigeria.<sup>181</sup> The primary public health concern had been H5N1's likely candidacy for the next human influenza pandemic, which many experts believed was overdue.<sup>182</sup> Interestingly, it was the rapid spread, public health and economic ramifications of the SARS outbreak in 2003 that appear to have alerted the global health community to the conceivable need for pandemic

preparedness.<sup>183</sup> In the wake of SARS, H5N1 presented an unprecedented challenge to the animal health, public health and trade policy communities, identified as a threat to the poultry industry, a pharmaceutical interest, a trade-related epidemic, public health threat, and a human pandemic concern.<sup>184</sup>

For avian influenza, one<sup>185</sup> explanation is that public health experts and epidemiologists did not know whether an H5N1 human pandemic was actually imminent, only that it was plausible. Adding to the complexity was the need to determine how exactly to respond to a potential H5N1 pandemic. Reviewing available surveillance data on past human influenza pandemics, there was no pattern to the epidemiology of occurrence,<sup>186</sup> or standard manifestation of pandemics, including which segments of the population would be affected the most.<sup>187</sup> This suggests that there is no clear precedent for definitively predicting how the next pandemic will behave.

Despite these uncertainties, a multi-sectoral approach to H5N1 management and pandemic preparedness across the policy sectors affected was advocated at national, regional and international levels. The purpose of such an approach was to foster a coherent response to H5N1.<sup>188</sup> Correspondingly, the main thrust of the H5N1 avian and pandemic influenza response was the coordination of public health and animal health agencies at national and international levels with the goal of developing preparedness interventions for those areas that had not yet been affected. An alternative goal was to reinforce control measures in locations where the disease had become endemic, where, based on WHO pandemic preparedness guidelines, OIE recommended control measures and FAO devised surveillance strategies.<sup>189</sup> However, H5N1 presented unique challenges for pandemic planning, involving the weighing of sector-specific risk against wider ecological and socio-economic interests that challenged the traditional public health and animal health based interventions of the pre-SARS era. Global infectious disease governance post-SARS dictated, at least in the context of avian and pandemic influenza preparedness, the attempt to balance the interests of pharmaceutical, conservationist, transnational business and commercial poultry as well as bridge the previously growing divide between public and animal health.<sup>190</sup>

In the policy domain, many of the concerns over a pandemic began to sound apocalyptic. The often-cited comparator was the 1918 Spanish flu pandemic which

one health policy scholar suggests killed over 50 million people.<sup>191</sup> This particular pandemic was said to have its origins in Kansas military camps and was spread to Europe by US troops during the war in 1918.<sup>192</sup> With contemporary concerns focusing on human population growth, increased intensity of production systems and the unprecedented nature of globalization, which many have argued allow for the faster and further transmission of infectious disease threats,<sup>193</sup> there was a fear that a pandemic in modern times could kill millions. Some researchers,<sup>194</sup> on the other hand, held the view that a pandemic now is likely to result in considerably lower deaths than the one that occurred in 1918. The WHO<sup>195</sup> estimated that a pandemic arising from H5N1 could result in two-seven million deaths at the minimum. Other commentators were skeptical<sup>196</sup> and dismissed the avian influenza issue, and SARS before it, as elaborate political conspiracies of corporate and pharmaceutical interests disguised as national security threats and pandemic concerns. There was, therefore, a lot of politics surrounding the issue of avian and pandemic influenza.

In the debates on global responses to avian influenza, some researchers<sup>197</sup> mapped recurring themes and summarize the four themes characterizing the core political issues: (1) risk and uncertainty, (2) economy and livelihood impacts, (3) effects on health and extent of disease, and (4) effects on food and farming. Drawing from these four issues, there are six linked debates identifiable in the international policy discourse concerning avian and pandemic influenza. The first debate involved the scientific uncertainty of the likelihood of the occurrence of a pandemic caused by H5N1. As mentioned above, some authors<sup>198</sup> state that public health experts were uncertain of its likelihood. The concern over a possible pandemic resulted in called to focus control on the likely source of this risk, such as Southeast Asia, where most of the impact of H5N1 had been felt. In fact, some authors have referred to Southeast Asia as an “influenza epicenter.”<sup>199</sup> Of course, a complex interplay of cultural factors and production practices led to the exposure and eventual succumbing of humans in this region to H5N1.<sup>200</sup> These factors have been identified and reviewed in various context-specific network analyses,<sup>201</sup> HPAI risk

mapping studies,<sup>202</sup> risk factor studies<sup>203</sup> and risk analysis.<sup>204</sup> However, in some reviews of infectious diseases risk management and governance of global risks,<sup>205</sup> it was argued that although surveillance had focused on H5N1, there was still a lot of uncertainty about both its evolution as a zoonosis and its effects on public health.

The second debate involved linking poultry production practices, HPAI epidemiology and disease spread through trade, poultry and poultry product and migratory bird movement. According to the epidemiological reviews by Capua and Alexander<sup>206</sup> and Alexander,<sup>207</sup> recent increases in intensive poultry production practices were responsible for the increasing incidence of highly pathogenic influenza in the world. It was stated by van den Berg<sup>208</sup> that all parts of the world were at risk of H5N1 incursions as a result of the globalization of trade. Some authors took the view that it was migratory birds that would spread H5N1 across the globe,<sup>209</sup> yet others claimed that wild birds were only capable of short range spread.<sup>210</sup>

The third debate involved the ‘One Health’ approach response to mitigate the pandemic threat. This was characterized by calls to strengthen veterinary control systems in addition to human pandemic preparedness, addressing the pandemic risk at-source but involving other sectors to mitigate the risk.<sup>211</sup> A key question here was how do countries incorporate other policy sectors in risk mitigation? As one study demonstrated, each sector, and indeed each country, would view the HPAI problem differently.<sup>212</sup> In addition, while the international community recommended ‘at-source’ controls, the ‘standardized’ approaches adopted worked in some areas and failed in others.<sup>213</sup> In their examination of the epidemiology of H5N1, Yee, Carpenter and Cardona,<sup>214</sup> state that control measures such as culling, disinfection and stamping out had been successful in controlling H5N1 outbreaks in Europe, but were not as effective in Southeast Asia.

The fourth debate involved the potential effects of a human pandemic on the global economy. This resulted in HPAI risk mitigation responses perceived to largely affect only the livelihoods of those in outbreak areas.<sup>215</sup> The brunt of these control efforts was largely felt by poor farmers, impacting on food security,

<sup>215</sup>Scoones and Forster (2008a).

livelihoods and farming. Stirling and Scoones,<sup>216</sup> for example, estimated that over 2 billion birds were slaughtered with the greatest losses suffered by the poor. Nicoll<sup>217</sup> states that the effect of H5N1 was mostly felt in the social sphere, particularly in Southeast Asia, where several countries (e.g. Thailand) had their poultry exports prejudiced and rural livelihoods affected by control interventions. This has links to contentions between business and livelihood interests and controversies over the role of intensive vs. backyard farming in disease spread.<sup>218</sup>

The fifth debate involved pharmaceutical interests, covering influenza virus sharing and concerns that genetic sequence information collected from outbreak areas would be used to create vaccines for market that would not be distributed equitably in case of a pandemic.<sup>219</sup> The policy response involved Western countries scrambling to stockpile antiviral drugs and vaccines for ‘high level pandemic preparedness efforts’, the vaccines of whose production depended on H5N1 virus strains recovered from outbreak centers in developing countries.<sup>220</sup> In an effort to globalize this policy response, there were calls for affected countries to either develop pharmaceutical capacity or consider non-pharmaceutical interventions.

Linked to this was the sixth debate, involving the ‘securitization’ framing of the avian and pandemic influenza issue, which, Elbe<sup>221</sup> argued, contributed to, and caused difficulty in resolving, the controversy over influenza virus sharing. In implementing this ‘securitization’ approach, Western countries spent massively on pandemic preparedness. Burgos and Otte’s (2008) study<sup>222</sup> citing Jonas’s study<sup>223</sup> state that the US and European countries had spent approximately US\$2.8 billion ‘at home’ versus US\$950 million ‘abroad’ for disease control ‘at-source’ by the end of 2008. This forms the background against which developing countries generated their avian and pandemic influenza intervention policies guided by the WHO global pandemic preparedness plan.<sup>224</sup>

The African response was coordinated by the WHO African Regional Office (WHO-AFRO), the African Union Inter-African Bureau for Animal Resources (AU-IBAR) and some regional trading blocs such as the Southern African Development Community (SADC), with funding from the African Union and the World Bank.<sup>225</sup> This was under the global coordination of United Nations System Influenza Coordinator (UNSIC), with the main participants being WHO, OIE and FAO.<sup>226</sup> These global and regional actors set out a framework to guide the

development of national avian and human influenza prevention and control responses. Among these guidelines was a recommendation for multi-sectoral integration.<sup>227</sup> By 2007, response plans on the African continent were at different stages of development with most aimed at containment of avian influenza in poultry to the neglect of pandemic preparedness.<sup>228</sup>

#### **42.4.2 *Chicken: A Cheap Source of Protein or a Pandemic Threat?***

At the height of the global avian influenza crises, a WHO AFRO risk assessment made comparisons between Asian and African poultry production systems to justify the continent's risk of an incursion as well as recommend similar control measures to those used in Southeast Asia.<sup>229</sup> The statement read in part, 'Though the densities of human and poultry populations are generally lower in Africa than in south-east Asia, the poultry production systems have many similarities which could create multiple opportunities for human exposure, if outbreaks occur in African poultry'.<sup>230</sup> Despite the different contextual realities, such as the role that ducks, mixed farming, and wet markets played in the evolutionary epidemiology of avian influenza,<sup>231</sup> or the fact that Southeast Asia is considered to be a viral mixing pot most likely to be the epicenter for the emergence of novel viruses such as H5N1,<sup>232</sup> the unexamined underlying assumptions of this statement are what formed the mould for preparedness efforts in Africa.

In Zambia, the international call for pandemic preparedness was met first by local media reports of possible avian influenza outbreaks in Zambian poultry. The result was a nearly \$7 million (US) loss to the poultry industry over a 3 month period as production scaled down.<sup>233</sup> Producers reduced their production, consumers feared the consequences of eating infected chicken and this had knock-on effects on the feed industry, the veterinary pharmaceutical industry and poultry breeders.<sup>234</sup> The reports of outbreaks in poultry turned out to be false. Under WHO and FAO oversight, the Zambian government commissioned a 20-person multi-sectoral task force on avian influenza at the end of October 2005, to be the nation's eyes and ears concerning avian and human influenza and prepare for what they perceived to be an inevitable incursion of H5N1 in the country.<sup>235</sup>

<sup>233</sup>Mwacalimba (2012).

<sup>234</sup>*Ibid.*

<sup>235</sup>GRZ (2006).

Early in the evolution of Zambia's response to avian and pandemic influenza, the threat of an incursion of H5N1 was successfully presented as an imminent threat. Between 2005 and 2009, this framing of the H5N1 threat as an emergency led to both government and academic scientists in the country searching for the elusive virus in both traditional poultry and wildlife.<sup>236</sup> The public response to media reports suggests a perception of a food safety concern. The perception of policy makers, however, reflected their institutional standpoints. For example, stakeholders from the Ministry of Health viewed it as a pandemic concern and a potential triage strain for the health system should human infections occur. The Agricultural Ministry, represented by the veterinary department, viewed it as an exotic poultry problem with the potential for zoonotic transmission. It was also viewed as likely to emerge from poor poultry producers with no knowledge of biosecurity. The Trade Ministry and poultry industry viewed it as a threat to both Zambia's poultry sector as a whole and Zambia's international trade opportunities.<sup>237</sup>

Around 64 % of Zambia's households keep chickens.<sup>238</sup> It provides an affordable source of protein for many of the country's citizens. Production is primarily traditional, based on the rearing of indigenous breeds with around 10–15 of chickens per household. The commercial sector in the country is a mix of backyard producers, emergent broiler and layer farmers supplied by locally produced feed and imported breeding stock.<sup>239</sup> The production capacity of the Zambian commercial sector in 2010 was estimated at 30 million broiler birds annually and 6 million eggs monthly.<sup>240</sup> Production is nowhere near the levels found in Southeast Asia. Furthermore, the agricultural ministry was oriented to focus on cattle and cattle diseases and not poultry and poultry problems.

External partners had a disproportionate role in influencing the pandemic preparedness policy process in Zambia. International finance, evidence and prescriptions provided a preconceived view of how pandemic preparedness should be pursued over what should have been a response based on a contextualized understanding of Zambia's policy structure, priorities, and material needs. The result was a one-size-fits-all policy that reflected global narratives that were at odds with Zambia's needs. In retrospect, the confluence of interests surrounding pandemic preparedness and economic development in Zambia presented unique challenges which required careful weighing in the financing and development of the country's avian and pandemic influenza prevention and control policy. Even at the stage where it became evident that H5N1 was unlikely to affect Zambia, international influences continued to emphasize avian influenza as a poultry problem and immi-

ment threat, pushing agriculture to the fore and inadvertently underplaying what the issue was truly about: the pandemic concern.

## 42.5 Policy Issues for Food Policy and Risk Management

Our case studies presented two very different food safety risks. In the case of bovine tuberculosis, the issues highlighted a problem obscured by bigger health concerns, i.e. HIV/AIDS and human tuberculosis. The second case was that of an indeterminate risk of incursion of a disease alien to Zambia. Both presented interesting cases for food safety. The BTB case study presented a twofold risk to communities living in and around the livestock interface. First, there is a public health risk from the consumption of uninspected meat from lechwe, a wildlife species known to be a maintenance host for BTB, and second, there is the major risk from consumption of unpasteurized milk derived from tuberculosis positive herds. Milk, as previously stated, is known to be the primary means of zoonotic conveyance to humans. Of course there are other risks of acquiring BTB in this area, including aerosols from cattle with active tuberculosis lesions in their lungs, during the evisceration of infected cattle or lechwe carcasses and during the consumption of undercooked meat contaminated with *Mycobacterium bovis*. However, the two risks highlighted, and the related food processing and handling practices of the area are pertinent concerns for food safety and zoonotic risk management.

Because lechwe meat provides communities with a supplementary source of protein, lechwe that are culled for consumption within wildlife-livestock communities actually bolster local food security. This service, however, is perhaps being provided at the expense of public health. The provision of meat inspection services would help address this concern, but requires a concerted response by local health, wildlife and veterinary officials. Although meat inspection is not very sensitive and up to 60 % of discrete tuberculosis lesions may go undetected,<sup>241</sup> it is still necessary to mitigate the food safety risks to public health in rural livestock keeping communities such as those found in Zambia's wildlife-livestock interface. The difficulty in controlling the condition in lechwe means that the disease is unlikely to be eliminated in cattle. Food hygiene thus seems to be the primary prevention mechanism available for food governance stakeholders in the area. A long term solution would require exploring control mechanisms in the lechwe population, in addition to control of the disease in cattle.<sup>242</sup>

On the other hand, avian influenza presents a food safety issue that occupies a different level of importance, particularly for the international donor community, when compared to BTB. An important risk question that was not asked in rolling out the avian and pandemic influenza response in Zambia was how the country was

<sup>242</sup>Mwacalimba et al. (2013).

linked to the global poultry industry. The focus of control instead was on the Zambia's traditional and backyard production systems, a response that addressed a risk scenario mirroring the Southeast Asian H5N1 experience where backyard production was strongly implicated in the maintenance and spread of H5N1. A few key elements were missing from Zambia, the mixed farming systems, use of wet markets and duck production.<sup>243</sup>

Fortunately, an outbreak of zoonotic avian influenza H5N1 never occurred in Zambia. The abatement of the threat, however, served to highlight some significant policy conflicts. Poultry and poultry production were low priorities for the Zambian Agricultural Ministry, whose veterinary department had a long list of diseases of national economic importance to tackle. The man-hours spent in pursuit of the elusive H5N1 were thus viewed as wasteful. In short the donor-driven response was not properly aligned with local economic realities.<sup>244</sup>

These two case studies demonstrate the complexity of issues surrounding food governance. In the case of bovine tuberculosis, there is an apparent lack of understanding for the need for its control in rural populations, despite the myriad studies demonstrating the risk to humans living in contact with infected wildlife and livestock. Some of the reasons, presumably, are based on larger health problems (human tuberculosis and HIV/AIDS), an absence of veterinary support, and a wildlife management system that is incognizant of the risks to public health. In the case of H5N1, there was no real local risk, but international interest and finance pushed its importance up the government agenda. Outside Egypt and Nigeria, the African countries that had been most impacted by H5N1, other countries in the region responded to the avian and pandemic influenza more or less because of international finance. In areas where H5N1 was a problem, there were notable food security repercussions. For example, in Nigeria, a ban in poultry and poultry product movement resulted in those regions with low poultry production unable to obtain poultry and poultry meat from the high poultry producing areas. The impact was the reduced availability of the cheapest and commonest source of protein for low-income consumers.<sup>245</sup>

## 42.6 Key Learning Points for Public Health and Food Policy

This chapter sought to describe and explain the confluence of complex issues surrounding the issue of animal health, public health and food safety governance in the African region. The background sections served to demonstrate that politics is rife around food governance and food law in the African region. Using a risk-

<sup>245</sup>Muma et al. (2014).

based epidemiological model, the chapter highlighted the various problems African countries face in addressing food safety concerns, including resource constraints, legislative overlap and redundancy, donor dependency, trade rule complexity, different perceptions on livestock use, problem overload and globalization.

Because food-borne diseases and food safety are important concerns in the African region, there remains an urgent need to understand both the public health and economic impact of food-borne diseases on the continent in general and in its various countries in particular. This knowledge, however, is not a guarantee for the adequate address of food safety on national governmental agendas. It must be understood that food governance policy coherence is not a state, but a process. It is a bargained 'collective' construct, requiring a level of oversight, coordination and consensus among actors for whom coherence is relevant.<sup>246</sup> Therefore, considerable advocacy and policy entrepreneurship is required to garner the necessary support for food safety reform both in the African region and with the international donor community. Furthermore, it is difficult to develop a coordinated and sustainable approach to the holistic management of food safety in the African region, especially when the impact of food safety on public health and the general economy have not been adequately assessed. Therefore, while important, getting the various stakeholder institutions to understand the public health benefits of coordinated and improved food safety mechanisms remains a fundamental challenge. This is because, as alluded to earlier, modern polity is fragmented as a matter of necessity. Viewing government as a unitary body that must generate knowledge on the economic and public health impacts of food safety and develop coherent national and international food safety policies in consultation with all stakeholders along the food supply chain is difficult.

Fundamentally, a flexible structuring of food safety risk in ways that is stakeholder inclusive is what is required. It is also important to include local ecological, biological and policy considerations. A clear picture of key stakeholders needs to be developed for effective food-borne disease risk management. This could include wide stakeholder consultation in understanding food safety risks and their assessment.<sup>247</sup> In the case of food safety governance in the African region, there is a need to have a multi-actor view of the food supply chain, and to develop context and time specific definitions of food safety problems that would help inform food safety agendas for both national governments and the global public health community.

The Bovine Spongiform Encephalopathy (BSE) crisis in the United Kingdom provides interesting lessons for understanding the governance needs of food-borne disease risk management, particularly as it relates to zoonoses.<sup>248</sup> In the context of the BSE/Creutzfeldt-Jakob Disease crisis in Europe, it was found useful to assess

<sup>248</sup>See Dora (2006).

public perceptions through the lens of lay epidemiology<sup>249</sup> where the understanding of risk problems mirrored expert knowledge.<sup>250</sup> For zoonosis control, such a conceptualization of risk can be extended to accommodate multiple decision-makers along the food supply chain. That is, each decision-making body, with its institutional norms and ideas, can contribute their expertise and understanding of food-borne disease risk and understanding specific to the role they play along the food chain. Of course, this requires a deliberative approach emphasizing dialogue, particularly in defining the problems and analyzing and evaluating food safety risk issues.

## 42.7 Conclusion

In conclusion this chapter has hinted at the fact that defining food safety risks and, indeed the process of problem identification, could be developed by considering multiple contextual issues and stakeholders along the food supply chain. It is also important to keep in mind what they perceive the risks to be, and how their definitions fit into the broad picture of food safety in general. Certainly, the application and utility of the disease prevention framework presented in the conceptual section of this paper would be greatly advanced. However, because disease control is highly politicized, a more inclusive approach is required to use evidence to support responses to global disease concerns aligned with local priorities and realities.<sup>251</sup> As in the case of general disease control, food safety governance requires the right questions to be raised to foster the socio-political and economic change that the international community expects from the African region.<sup>252</sup> As one study argues,<sup>253</sup> the process of instituting change cannot remain the “purview of the global North, especially when the questions asked, and the responses advocated, favor a Northern perspective of globalized risk over the ‘real’ needs of the global South.” Context will always matter and therefore, local ecological, biological and policy considerations should be given primacy. In conclusion, food safety governance regulatory processes should take into consideration local realities, local food supply chains and local food safety threats to ensure appropriateness and sustainability of any and all disease control measures instituted.

# Chapter 43

## Regulatory Frameworks Affecting Seeds: Impacts on Subsistence Farmers in the Eastern and Southern African Region

Marcelin Tonye Mahop

**Abstract** With the current growth of the population in sub Saharan Africa, the need to produce and make available sufficient food for the needs of this population put agriculture one of the prominent development concerns in this part of the world. Using their traditional farming practice, small holder farmers currently play a significant role in food production. It is suggested that one critical factor which help this category of farmers to play this role is their ability to exercise their rights to handle seeds as they have been doing before the advent of the seed industry. Therefore to address food insecurity in Sub Saharan Africa, seeds related programmes, initiatives and regulatory framework need not undermine farmers' rights. Using the Eastern and Southern African regions, the chapter explores the extent to which current programmes (of pan African and sub-regional scope) and regulatory frameworks impact on smallholder farmers' rights and suggest the way forward.

### 43.1 Introduction

Food insecurity is a global challenge that is garnering the attention and efforts of a wide array of actors and agencies the world over. With the world population now surpassing seven billion people, the search has intensified for ideas and solutions that can contribute to the provision of affordable and sufficient food. Despite the efforts made in addressing this struggle, the reality remains: there is a lack of sufficient food to feed the world. As such, food security remains at the top of the international development agenda.<sup>1</sup> The simplest description of what amounts to

food security is when every individual has, at all times, both physical and economic access to sufficient food to meet their dietary needs for a productive and healthy life (FAO 1996, 2009). Based on this description, there are a number of requirements that must be addressed if food security is to be realised. These include but are not limited to: sufficient quantities of appropriate foods being consistently available; individuals having adequate incomes or other resources to purchase or barter for food; food being properly processed and stored; and individuals were having enough nutritional and family care knowledge to attain adequate health and sanitation practices (Bremner 2012; Ecker and Breisinger 2012). These critical requirements for food security are applicable in both the developed and developing worlds.

While the lack of sufficient food is a global issue, the situation is particularly dire in Sub-Saharan Africa. The African population is growing rapidly, with some estimates suggesting that by 2050 the population will have reached 2 billion people—more than double the current estimate of roughly 850 million.<sup>2</sup> Out of the current 850 million people, more than 240 million lack adequate food for a productive and healthy life. According to its own statistics, the New Partnership for Africa's Development estimates that around 97 % of the continent's population that is considered food insecure lives in Sub-Saharan Africa, and out of the continent's total food insecure population, 34 % is described as undernourished.<sup>3</sup> This means that not only does this category of people not have sufficient food, but the food they do have is lacking nutritional value.

Agriculture is critical to addressing the food insecurity problem in Africa, evidenced in the design of the Comprehensive Africa Agricultural Development Programme ("CAADP").<sup>4</sup> CAADP is a component of the New Partnership for Africa's Development ("NEPAD"), and was adopted by the AU heads of States in 2003. CAADP recognizes that, among other things, low agricultural production is one of the main causes of the increasing issue of food scarcity in Sub-Saharan Africa. The CAADP proposes that steps be taken to improve research and innovations in agriculture and to encourage the use of improved technologies across the continent (NEPAD 2003). As such, embedded in the CAADP is the idea that intensification of agricultural practices—the cultivation of farmland with high amounts of inputs such as fertilizers, pesticides, and others—is the way forward and may represent an effective means for boosting agricultural production. Supporting this approach is the deployment of initiatives such as the Alliance for Green Revolution in Africa. This initiative is focused on the utilization of improved

<sup>4</sup>*Id.*

seeds that are protected by plant breeders' rights and are regulated through seed regulations (AGRA 2013).

Equally, the CAADP acknowledges the importance of smallholder farmers and their farming practices in the production and supply of food in Sub-Saharan Africa.<sup>5</sup> Not only does subsistence agriculture practiced by smallholder farmers provide a major source of food at an estimated 75 % of total food produced,<sup>6</sup> it also plays a critical role in employment and income generation at the community level. Thus, while the use of new technologies like improved seeds is likely to influence regulatory frameworks pertaining to agriculture in SSA, such frameworks must not undermine the contribution of smallholder farmers in food production.

This chapter will examine the utilisation of seeds in the eastern and southern African regions, exploring the extent to which relevant regulatory frameworks have an impact on smallholder farmers' practices, as well as the implications they have on food production. Among other inputs, seeds are probably the most critical in farming as they are the key determinant of yields. However, to harness their yield potential, seeds are aided by other inputs including fertilizers and pesticides. The extent to which farmers employ the most closely-adapted agronomics and cropping techniques to their own agro-ecological conditions is undoubtedly another determinant of agricultural production; indeed, seeds do not do it alone.

Historically, seeds have been produced by the farmers' themselves<sup>7</sup> and farmers have used traditional techniques to process them for conservation and stockade. From the saved grains, they have selected which ones will be used for either consumption or planting the following season. Today, farmers continue to exchange seeds among themselves, and have shared within their communities their knowledge about how to use the seeds they exchange. However, since the nineteenth century, seed production has increasingly been separated from agriculture, becoming a specialist area in its own right. This shift has encouraged the emergence of the seed industry in Europe and the United States.<sup>8</sup> The rediscovery of the Mendelian science of heredity and its mastering by professionals involved in seed production has contributed to not only the emergence of a "breeder" profession, but also the development of conventional breeding techniques of crossing and selecting in varietal production. Over the past decades, advances in molecular biology and genetic engineering have provided breeders with additional knowledge and tools in varietal production.<sup>9</sup> Today, seed production involves a range of activities including varietal development through conventional or biotech-based breeding techniques,<sup>10</sup> seed multiplication, testing and certification, quality control, distribution/commercialisation, and, lastly, utilisation by farmers.

---

<sup>6</sup>Livingston et al. (2011).

<sup>7</sup>Dutfield (2008).

<sup>8</sup>Poonia (2013).

<sup>9</sup>Stafford (2009).

<sup>10</sup>Hansen (2000).

There are therefore two platforms for seed production: traditional and modern. The traditional platform revolves around farmers, (who, in Sub-Saharan Africa, are largely smallholder farmers who are still developing plant varieties that are adapted to their agro-ecological conditions and farming practices). The varieties they produce are mostly excluded from plant variety protection regimes and seed regulations because they do not fulfil the requirements set by these regulatory frameworks. This traditional platform for seed production, also called the informal seed system, is known to supply about 80 % of the seeds used in farming in Sub-Saharan Africa, and produces about 70 % of the food.<sup>11</sup> The regulatory frameworks that undermine this platform of seed production are likely to have a negative impact on food security in SSA, as these smallholder farmers' practices are useful for the conservation of agro biodiversity and are actually advocated for at the international level.<sup>12</sup> The second platform is the modern platform, or formal seed system. This platform involves many actors, including scientific breeders, research organisations, multinational corporations, and seed merchants. Activities in this platform are strongly regulated, e.g. the rights of breeders of new varieties of plants are protected, and only seeds produced according to relevant regulations may be legally made available on the market for (commercial) farmers. A recent assessment of the plant variety protection regimes of more than 20 countries in Sub Saharan Africa reveals a considerable imbalance in the treatment given to breeders' interests and commercial farming as compared to the very moderate consideration given to farmers' rights and smallholder farming.<sup>13</sup>

The chapter begins with an explanation of the realities of subsistence agriculture, addressing its fundamentals and main actors with a focus on seed use. It will then explore the key regulatory instruments affecting seeds in the eastern and southern African regions, focusing on the rights of smallholder farmers to pursue their seed-handling practices. These ancient practices of saving and exchanging seeds are proven to be instrumental in their farming systems and agricultural production. Then, the chapter will investigate the extent to which some programs and initiatives have either failed or succeeded in accommodating farmers' seed-handling practices, focusing on both programs with a pan-African scope that are spearheaded by the African Union as well as those contained within a single nation. The final section will consider how to give priority to smallholder farmers' concerns within the mainstream regulatory frameworks of the region. We will see the impact of the formal support provided for farmers' rights in the 2001 International Treaty on Plant

---

<sup>11</sup>*Id.* at 2.

<sup>12</sup>The International Treaty on Plant Genetic Resources for Food and Agriculture of the United Nations Food and Agricultural Organisation (FAO) provides for farmers' rights (article 9) to save, use, exchange and sell farm saved seeds and advocates the involvement of farmers in breeding undertakings as very critical in the conservation (article 6 of the plant treaty) of agro biodiversity which is very important to smallholder farmers.

<sup>13</sup>Mahop et al. (2013).

Genetic Resources for Food and Agriculture (“ITPGRFA”)<sup>14</sup> of the Food and Agriculture Organisation of the United Nations. Although the current trend in the region is to adopt seeds-related regulations that are more supportive to commercial farming, there is a need to consider creating a legal space for smallholder farmers’ interests in these regimes. Because these farmers are still playing an instrumental role in food production, their interests must be protected.

### 43.2 Understanding Subsistence Agriculture: Fundamentals and Actors

The vast majority of people living in rural Sub-Saharan Africa rely on agriculture for many reasons. As the main economic activity providing employment to the deprived people of the region,<sup>15</sup> it is critical for providing both income and food. Estimates suggest that three out of every four people among the 240 million people of SSA live in rural areas and depend on small-scale subsistence agriculture for their livelihood.<sup>16</sup> The focus in these parts is on smallholder and subsistence agriculture because it is best suited to these poor populations.

Smallholder and subsistence agriculture is often described in contrast to large-scale and intensive agriculture. The latter involves considerable financial investment, requires changes to the infrastructure, uses large farms, and engages skilled experts such as agronomic engineers, soil scientists, and plant breeders. Intensive agriculture is generally characterised by its use of technological inputs such as seeds that have been developed and multiplied by professional plant breeders. Generally speaking, breeders develop improved varieties that bear specific desirable traits. Such traits are identified prior to the process and include, but are not limited to, resilience to drought and excess water, resistance to pests and diseases, agronomic characteristics such as early maturity, and other nutritional or food-processing features for the food industry.<sup>17</sup> Intensive agriculture is also characterised by its considerable use of fertilizers in tandem with these improved seed varieties. An interconnected web of actors is responsible for the development of new plant varieties, including the production and quality control of seeds (sometimes through a certification scheme), and the multiplication, packaging and commercialisation of these seeds.<sup>18</sup> It is through this formal sector that farmers involved in commercial and intensive agriculture source their seeds. The varieties

---

<sup>15</sup>United Nations Development Programme (2012).

<sup>16</sup>*Id.* at 2.

<sup>17</sup>Vose (1983).

<sup>18</sup>Minot et al. (2007).

and seeds produced and exchanged in this context are subject to stringent regulatory schemes that include plant breeders' rights<sup>19</sup> and other seed regulations.<sup>20</sup> To harness the science and technology embedded in these inputs, effective irrigation techniques and cropping systems adapted to the specific features of the soil must be applied in the course of farming. Together, these parameters make intensive agriculture an expensive undertaking, generally well beyond the financial and technical reach of poor rural dwellers.

In contrast, subsistence farming is mainly practised by poor farmers on relatively small tracts of land.<sup>21</sup> About 80 % of farms in Sub-Saharan Africa are less than 2 ha, and with the rural population still expected to grow,<sup>22</sup> farm size is expected to shrink even further due to a lack of available land.<sup>23</sup> Smallholder farming is considered sustainable because it uses little to no chemical inputs, and these inputs, specifically fertilizers and pesticides, cause harmful effects on the environment.<sup>24</sup> Rather, in the place of chemical inputs, smallholder farmers tend to use organic manure they produce themselves on their own farms.<sup>25</sup> Lacking the financial means to install sophisticated irrigation systems, subsistence farmers lucky to have nearby water sources rely on very rudimentary methods like watering their farms using watering cans. Most, however, rely mainly on rainfall as their main source of water. Another sustainable approach to water management used by smallholder farmers involves protecting watersheds and reinforcing their capacity to hold water and bring it to those most in need.<sup>26</sup> These principal features of smallholder agriculture illuminate the constraints faced by farmers: access to land, access to credit, and access to inputs and output markets. Other notable constraints include the policy and regulatory constraints that dictate access to such facilities as agricultural extension advisory services.<sup>27</sup>

The informal seed system is the main channel through which seeds are supplied, accessed and exchanged among subsistence farmers.<sup>28</sup> A key feature is that smallholder farmers are both breeders and farmers. They tend to select the best grains

---

<sup>19</sup>Plant breeders' rights are the category of intellectual property right designed purposely for the protection of new varieties of plants and to entitle specific rights to breeders of such varieties. The rights of breeders are generally meant to prevent anyone from producing, selling, importing and exporting plants and seeds protected by plant breeders' rights.

<sup>20</sup>Broadly defined, seed regulations refer to the rules and procedures guiding the development and release of a new variety of plant, the production of seeds based on a newly developed variety, and the release and delivery of seeds including quality control measures.

from their current harvest and save them for use as seeds in the following planting season. Season after season, traditional farmers can observe and select varieties that are the best adapted to the agro-ecological conditions in their area, are most resistant to pests and diseases prevalent in the region, and boast other useful traits such as grain colour. Traditional farmers are also known to have the ability to further improve and adapt seeds that were purchased in the commercial sector to their specific needs.<sup>29</sup> A core characteristic of small-scale farming is that farmers generally exchange seeds among themselves. Through such interactions, a transfer of knowledge also occurs.<sup>30</sup> Despite similarities to their commercial counterparts, seeds developed using these methods are largely unregulated and are not eligible for protection within the existing frameworks of plant variety protection laws. It is with this understanding that the next section will discuss the impact of regulatory frameworks.

### 43.3 Regional Regulatory Frameworks

#### 43.3.1 *Harmonisation of Plant Variety Protection (PVP) Regimes in the SADC Region*

The Southern African Development Community (“SADC”)<sup>31</sup> was formed in 1992 with the signing of the SADC Treaty. It aims to achieve economic growth, alleviate poverty, and enhance the quality of life of the peoples of Southern Africa through regional integration.<sup>32</sup>

The SADC Food, Agriculture and Natural Resources Directorate have been working on a Draft Protocol for the Protection of New Varieties of Plants in the SADC region, the latest version of which was circulated in November, 2012 (SADC 2012). The Draft Protocol is modelled after the 1991 UPOV (International Union for the Protection of New Varieties of Plants) Act, and will, if enacted, establishes a regional plant breeders’ rights (“PBR”) office that shall grant or reject a PBR application on behalf of all member states. Like UPOV’91, the Protocol applies to all genera and species of plants, providing 25 years of protection for trees and vines and 20 years for all other genera or species.<sup>33</sup> It also covers the same

<sup>29</sup>Santilli (2012).

<sup>30</sup>Swiderska et al. (2011).

<sup>31</sup>The 15 SADC members are Angola, Botswana, DR Congo, Lesotho, Madagascar, Malawi, Mauritius, Mozambique, Namibia, Seychelles, South Africa, Swaziland, Tanzania, Zambia and Zimbabwe: <http://www.sadc.int/>.

<sup>32</sup>Article 5, Treaty of the Southern African Development Community (SADC), Windhoek, 17 August 1992.

<sup>33</sup>Articles 3 and 25 of the Draft 2012 Protocol on PBR of SADC.

activities that require authorization of the right holder, and includes the UPOV 1991 provisions on Essentially Derived Varieties (“EDV”) (UPOV 2009).<sup>34</sup>

The closest the Draft Protocol comes to accommodating smallholder farmers is by providing an important exception to the rights of plant breeders in the form of farmers’ privileges. These are formulated in the Draft Protocol as “acts done by subsistence farmers for the use for propagating purposes, on their own holdings, the product of the harvest which they have obtained by planting, on their own holdings the protected variety...”<sup>35</sup> An optional farmers’ privilege in UPOV 1991 that allows farmers on their own farm to save and replant seed of protected varieties “within reasonable limits and subject to the safeguarding of the legitimate interests of the breeder”<sup>36</sup> is thus included in the Draft Protocol, but is only applicable to subsistence farmers.

The Draft ARIPO Legal Framework for the Protection of New Varieties, (another regulatory framework which will be discussed in further detail later in the chapter), takes a different approach to farmers’ privileges. The ARIPO Draft grants farmers the privilege of specific agricultural crops to be listed by the Administrative Council. It further states that the different levels of remuneration to be paid by small and large farmers shall be stipulated in the implementing regulations.<sup>37</sup>

Both the SADC and ARIPO drafts thus allow for very restrictive farmer privileges and are strongly criticized by civil society organizations in the region. These organisations point out that smallholder farmers in both the ARIPO and SADC countries heavily rely on saved seeds and seed exchanges with relatives and neighbours.<sup>38</sup> They find both draft legislations to be inflexible and restrictive, imposing a “one-size-fits-all” system that limits the ability of individual member countries to design a PBR system appropriate to their diverse agricultural needs and priorities, and to balance such a system with the protection of farmers’ rights.<sup>39</sup>

As is noted by the organisations leading communications on these issues, the proposed PBR systems may have the opposite effect of what they are intending to accomplish. While they are expected to encourage plant breeding and facilitate agricultural development by allowing farmers to access “a wide range of improved varieties to contribute to the attainment of the regional goal of economic development and food security”,<sup>40</sup> they will likely fall short; while these policies may be justified for commercial farming, there is a high potential of detrimental effects to

the many farmers that simply cannot afford to adopt formal seed system practices and high-input farming.

### **43.3.2 Harmonization of Seed Policies in the Common Market for Eastern and Southern Africa (COMESA) Region**

The Common Market for Eastern and Southern Africa (“COMESA”), a regional trading bloc of nineteen countries, is currently spearheading a seed policy harmonisation process.<sup>41</sup> The core objective of COMESA is to create a common market that will enhance regional trade amongst member countries. Through COMESA, various cooperative programmes are being developed to enhance integration through the removal of all physical, technical, fiscal and monetary barriers to intra-regional trade and commercial exchanges. One such programme focuses on the harmonisation of seed trade regulation between member countries.

A critical piece in the history of the harmonisation process is the 2008 Declaration by COMESA Ministers of Agriculture under the theme, “Consolidating Regional Economic Integration through Value Addition, Trade and Food Security.”<sup>42</sup> Under this declaration, member states committed themselves “to harmonizing within two years, seed trade regulations in the region and to finalize a regional protocol for the protection of new varieties of plants within the same period.”<sup>43</sup> A specialized agency of COMESA, the Alliance for Commodity Trade in Eastern and Southern Africa (“ACTESA”), is spearheading the regional seed trade harmonisation efforts and has published a draft COMESA Seed Trade Harmonization Regulations, 2013 (“draft Seed Trade Regulations”). The core objective of the draft Seed Trade Regulations is to facilitate seed trade among all member states; as such, once adopted by the COMESA Council of Ministers, these regulations will be binding for all member states.<sup>44</sup> Secondary objectives of this draft instrument, such as the harmonisation of phytosanitary measures for seed in the region and the establishment of the COMESA seed certification and variety release system, are meant to support the seed trade objective.<sup>45</sup>

---

<sup>41</sup>The Treaty Establishing the Common Market for Eastern and Southern Africa (COMESA) was signed on 05 November 1993 in Kampala, Uganda and ratified on 08 December 1994 in Lilongwe, Malawi. COMESA is an international organization whose member states are Burundi, Comoros, DR Congo, Djibouti, Egypt, Eritrea, Ethiopia, Kenya, Libya, Seychelles, Madagascar, Malawi, Mauritius, Rwanda, Sudan, Swaziland, Uganda, Zambia and Zimbabwe. More details are available at: [http://about.comesa.int/index.php?option=com\\_content&view=article&id=95&Itemid=117](http://about.comesa.int/index.php?option=com_content&view=article&id=95&Itemid=117) (last visited on 22 January 2014).

<sup>42</sup>Victoria Declaration of the 5th meeting of the COMESA Ministers of Agriculture held in Victoria, Mahe, Seychelles, 14–15 March 2008.

<sup>43</sup>Ibid, paragraph 10.

<sup>44</sup>Article 10, 1993 Treaty establishing the Common Market for Eastern and Southern Africa.

<sup>45</sup>Rule 3, draft COMESA Seed Trade Harmonisation Regulations, 2013.

The COMESA seed certification system establishes four seed classes: pre-basic; basic; first generation certified; and second generation certified.<sup>46</sup> There are also colour labels for each class,<sup>47</sup> intended to aid in recognition of the different classes of seed trading within the COMESA market. A seed certification system is also established with the Council of Ministers, who are mandated to adopt specific rules dealing with field and laboratory certification standards, seed testing methodologies based on International Seed Testing Association (ISTA) rules, post-control tests, and accreditation of laboratories, among others.<sup>48</sup>

With respect to variety release, preliminary tests are required for Distinctiveness, Uniformity and Stability (DUS) and Value for Cultivation (VCU) or National Performance Trials (NPT).<sup>49</sup> DUS tests are required to be carried out in accordance with the UPOV guidelines. VCU tests are implemented based on performance data typically established through multi-locational testing to show that a new variety has value to be released for cultivation. National authorities bear the responsibility of ensuring that released varieties have passed the aforementioned tests before being entered into the COMESA Variety catalogue.<sup>50</sup> The 2013 Draft Seed Harmonisation Regulations of COMESA also have rules on quarantine and phytosanitary measures and standardised testing procedures for the control of pest and diseases<sup>51</sup> in relation to the import and export of seeds. These rules are largely based on the procedures established by the ISTA.<sup>52</sup>

The scope of the draft Seed Trade Regulations is twofold. In regards to certification standards, there are only 12 crops regulated for certification of basic and certified seed.<sup>53</sup> These are provided in Schedule D to the Regulations, and include beans, maize (open pollinated varieties and hybrids), rice, groundnut, cotton, wheat, sunflower, sorghum (open pollinated and hybrid), soybean, pearl millet, cassava and Irish potato. The second level relates to variety release and plant quarantine, which applies to all crops.

The draft Seed Trade Regulations has received several criticisms. The process through which these regulations have been developed has been seen as non-inclusive, as some farmers feel they have not been consulted.<sup>54</sup> To the extent that the draft regulations only facilitate certification and release of those varieties meeting the DUS criteria, these regulations could appear to discriminate against trade and dissemination among farmers themselves. The regulations have also been

criticized for not providing safeguards for smallholder farmers saving their own seed or exchanging it with their neighbours, a common practice in these countries.<sup>55</sup> Lastly, while established as a multi-stakeholder institution, the COMESA seed committee does not actually include any farmers, despite the fact that it is meant to provide technical support.<sup>56</sup>

### ***43.3.3 The African Regional Intellectual Property Organisation (ARIPO) Draft Legal Framework for the Protection of New Varieties of Plants***

Discussed briefly above, the African Regional Intellectual Property Organisation (“ARIPO”)<sup>57</sup> is the successor to the English Speaking African Regional Industrial Property Organisation (“ESARIPO”), created by the 1976 Lusaka Agreement. ARIPO administers the Harare, Banjul and Swakopmund Protocols that were adopted respectively in 1982, 1997 and 2010. The purpose of the Harare and the Banjul Protocols is mainly to streamline the processes of registration, filing, processing and granting of patents, utility model, industrial design and trademark applications. These two protocols are the two major regional intellectual property (IP) systems administered by ARIPO. The Swakopmund Protocol is the most recent, and it seeks to provide a regional system for protection of traditional knowledge and expressions of folklore. Looking at the possibility of linking these three regional IP protocols, ARIPO is discussing the regional framework for the protection of new varieties of plants from which a regional PVP protocol could originate.

Concerns about the ARIPO draft pertain to its development process and potential impact on farmers’ rights and food security. With regards to the development process, civil society organisations are concerned that the instrument has been developed without consultation with member state actors; as such, they contend that the PVP legal framework does not reflect the realities of plant breeding and seed systems of member states. Rather, it is more a reflection of UPOV 1991, and therefore not supportive of farmers’ rights and farmers seed systems in ARIPO member states.<sup>58</sup>

---

<sup>55</sup>See civil society & smallholder farmer statement at the awareness creation on COMESA seed trade harmonisation regulations for the COMESA region 27–28th march 2013, Lusaka, <http://www.twinside.org.sg/title2/susagri/2013/susagri255.htm>.

<sup>56</sup>Rule, 11 and 12 draft COMESA Seed Trade Harmonisation Regulations, 2013.

<sup>57</sup>ARIPO member states include: Botswana, Gambia, Ghana, Kenya, Lesotho, Liberia, Malawi, Mozambique, Namibia, Rwanda, Sierra Leone, Somalia, Sudan, Swaziland, Tanzania, Uganda, Zambia, Zimbabwe: <http://www.aripo.org/>.

<sup>58</sup>*Id.* at 59.

The draft ARIPO regional policy also proposes the development of agricultural innovation systems, taking into account the phenomenon of climate change, the development of the seed industry, the role of biotechnology in exploring and protecting agricultural genetic resources, and the establishment of an effective plant variety protection system at the national and regional levels.<sup>59</sup> With regard to this last point, the draft regional policy appears to have made a choice for an effective *sui generis* system for the protection of plant varieties based on the 1991 Act of the UPOV Convention (ARIPO 2012). The basis for this choice, according to ARIPO, is that adopting such a legal framework will facilitate ARIPO application to join UPOV as a full member in the future. Therefore, based in the UPOV 1991 Act, the draft legal framework has provisions for the protection of new plant varieties and measures for conducting examination of varieties. The exceptions to plant breeders' rights include a provision on the so-called "farmers' privilege," which also is attuned to the UPOV 1991 Act. However, article 22 of the ARIPO draft legal framework narrows the extent of farmers' privilege to a specific list of crops that shall be defined by the administrative council of ARIPO but shall not include fruits, ornamentals, vegetables and forest trees. Thus, while the ARIPO draft does not embrace farmers' rights specifically, (for example, the right to exchange and sell seeds obtained from protected varieties amongst themselves), even the limited privilege that is provided by the draft framework is contained to a specific category of crops determined by the administrative council.

The road map for the continued development of this framework will take into account the concerns of CSOs regarding consultations with member states as it plans meetings from January to August, 2013. By November 2013, the final text and a decision on possible diplomatic conference will hopefully be adopted by the 14th session of the ARIPO Council of Ministers. The road map proposes the formulation of the legal framework into the draft between December 2013 and January 2014.<sup>60</sup> There is, however, no indication that the road map defined within ARIPO is being implemented. The outcome document of the fourteenth session of the ARIPO council of ministers, held in Kampala, Uganda on 28–29 November 2013, does not specifically mention any amendment to the farmers' privilege provisions that would appear to be responsive or sympathetic to the concerns of CSOs (ARIPO 2013). As such, it is not clear whether or not they actually adopted the draft legal framework.<sup>61</sup>

In light of the lack of proper incorporation of farmers' rights in seeds-related regulatory frameworks, the following section explores how broader programmes and initiatives in Africa have attempted to accommodate the interests of small-holder farmers.

## **43.4 Africa-Wide Programmes and National Initiatives: Impacts on Smallholder Farmers**

Smallholder farmers' interests and practices in Sub-Saharan Africa are supported by various programmes and initiatives at both the continental and national level. The effectiveness of any support mechanism depends on how it addresses the smallholder farming issues described in the previous section.

### ***43.4.1 The Comprehensive Africa Agriculture Development Programme (CAADP) and African Seed and Biotechnology Programme (ASBP)***

At the continental level, the African Union adopted the Comprehensive Africa Agriculture Development Programme ("CAADP") in July 2003, whose principle aim is to eliminate hunger and reduce poverty through the development of the agricultural sector in Africa. The programme's approach is to increase investment on four mutually-reinforcing pillars, which include: (1) extending the area under sustainable land management and reliable water control systems; (2) improving rural infrastructure and trade-related capacities for market access; (3) increasing food supply and reducing hunger; and (4) promoting agricultural research and technology dissemination and adoption (NEPAD 2003). The Comprehensive Africa Agriculture Development Programme is Africa's agricultural project and vision of the New Partnership for Africa's Development (NEPAD). In setting up the CAADP, Africa is working toward the Millennium Development Goals (MDGs) agreed upon in 2000 by the international community. The CAADP particularly addresses Goal 1: the eradication of extreme poverty and hunger.<sup>62</sup> Achieving the four pillars identified by CAADP should assist NEPAD in the pursuit of its overall vision for Africa's agriculture. Specifically, by 2015, the continent of Africa should:

- Attain food security (availability, affordability, and accessibility to adequate food and nutrition);
- Improve agricultural productivity to attain an average annual growth rate of 6 %; with particular attention to small-scale farmers, especially women;
- Develop dynamic agricultural markets between nations and regions;
- Integrate farmers into the market economy, including improved access to agricultural export markets;
- Achieve a more equitable distribution of wealth;
- Become a strategic player in agricultural science and technology development;
- and,

---

<sup>62</sup>MDG 1: [http://www.undp.org/content/undp/en/home/mdgoverview/mdg\\_goals/mdg1/](http://www.undp.org/content/undp/en/home/mdgoverview/mdg_goals/mdg1/).

- Practice environmentally-sound production methods and develop a culture of sustainable management of the natural resource base, including biological resources for food and agriculture.<sup>63</sup>

A noteworthy element of the NEPAD vision is the 6 % increase in productivity, which specifically notes the contribution of small-scale farmers and women. What could be problematic is that the CAADP does not appear inclined to supporting their farming practices, especially as they relate to accessing and utilising seeds at the local level. In fact, an in-depth assessment of the CAADP does not reveal any mention of support to farmers' rights to save, exchange, re-sow, or sell seeds, including those derived from the cultivation of proprietary seeds. Instead, the CAADP approach is designed to build agricultural productivity and economic growth through better access to agricultural inputs.<sup>64</sup>

Undoubtedly, small-scale farmers' access to agricultural inputs such as improved and protected plant varieties is an important factor in reaching improved agricultural productivity. However, one could argue that the CAADP should consider the constraints that smallholder farmers face and adapt to their specific agro-ecological context and farming practices. NGOs have voiced their concerns over the impacts of PVP and seed laws on food security based on the manner in which these laws affect farmers' rights and farming systems (ACB publications on COMESA AND SADC PVP ARIPO). Arguably, considering its weakness on farmers' rights and emphasis on modernizing agricultural practices, the CAADP is overlooking the constraints that smallholder farmers face and only advocating for intensive agriculture.

Charged with implementing the fourth pillar of the CAADP, the Forum for Agricultural Research in Africa ("FARA") developed the Framework for Africa's Agricultural Productivity (FAAP)<sup>65</sup> as a tool for stakeholders working on agricultural research and development. One of the identified objectives of the fourth pillar is *'to empower farmers, livestock producers and their organisations by investing in their acquisition and absorption of the outputs of research and innovations in the agricultural sector.'* The way FAAP intends to achieve this is by ensuring that there is an integrated approach that brings together researchers, extension services, smallholder farmers, pastoralists, the private sector and NGOs.<sup>66</sup> While there is no denying that agricultural technology is one important long-term answer to low agricultural productivity, it bears of the risks of not always answering the critical needs of farmers as they relate to their specific conditions. Smallholder farmers are largely known to cultivate a variety of crops adapted to their agro-ecological conditions; unless the integrated approach contemplated under FAAP involves cooperation between smallholder farmers and breeders in defining the objectives

---

<sup>63</sup>*Id.* at 4.

<sup>64</sup>*Id.* at 4.

<sup>65</sup>Framework for Africa's Agricultural Productivity (FAAP): [http://www.fara-africa.org/media/uploads/File/FARA%20Publications/FAAP\\_English.pdf](http://www.fara-africa.org/media/uploads/File/FARA%20Publications/FAAP_English.pdf).

<sup>66</sup>*Id.* at 67.

of breeding programmes and their crop selections, there is a risk of farmers being forced to adopt varieties of crops that are not necessarily of interest or utility to them. Recognition of the importance of smallholder farmers' practices in food production should thus be central to the integrated approach. The manner in which smallholder farmers access and utilise seeds is a critical area for policy support, which requires targeted investment in its own right.

Another important initiative at the continental level that came out of the CAADP is the African Seed and Biotechnology Programme ("ASBP"). The ASBP is coordinated by the African Union, and was adopted during the eighth ordinary session of the African Union Assembly in January 2007 in Addis Ababa, Ethiopia. Its primary pursuit is to strengthen the development of the seed sector in Africa, taking advantage of new developments in plant breeding. The overall goals of the programme are the realisation of food security in Africa, improved nutrition and poverty alleviation through the establishment of effective and efficient seed systems, and enhanced application of biotechnologies and methodologies within the seed sector. Thus, the programme shows a clear signal that its emphasis is on the inclusion of biotechnology in strengthening the seed sector in Africa. One can assume that the application of biotechnologies and other modern methodologies will be aimed at all facets and actors involved in the development of the seed sector, including small-scale farmers. The ASBP does, however, have one objective designed specifically for smallholder farmers, which is to strengthen the connection between the informal and formal seed sectors to better respond to farmers' needs.

The ASBP programme comprises 20 interrelated components, which are sub-divided into achievable outputs at the continental level, regional level, and national level. One of the national level components (component 2), which focuses on policy-setting in relation to the seed sector, sets out "*to improve seed quality and supply of crops of national importance including minor crops*" (see footnote 37). Output 1 for this component proposes that national seed policies, systems and activities should be analysed, reviewed and endorsed. To achieve this output, activities will ensure the establishment of integrated seed development policies, spanning germplasm conservation, characterization, utilization and improvement, application of biotechnologies, variety release and seed production and distribution. It is our view that, in the interest of smallholder farmers, these activities should offer the platform for stakeholders to take into consideration the manner in which this category of farmers handles seeds. Seed-handling includes, but is not limited to, systems of production and improvement of seed cultivation, taking into account the utilization of proprietary seeds and the knowledge and practices to improve or adapt them at the local level. The proposed reviews of seed laws and policies and the update to the national seed compendium should therefore provide recognition of farmer-produced seeds in the interest of agriculture at the national level. But, beyond these pan African programmes/initiatives that have minimal direct impact on promoting smallholder farming practices, there are other nationally- and locally-adapted initiatives which provide direct support to smallholder farmers, as discussed hereunder.

### 43.4.2 *Rwandan Initiatives*

In addition to continental-level programmes there are several national endeavours supporting smallholder farmers that have resulted in increased agricultural productivity and availability of food both in terms of quantity and diversity. One prominent example is Rwanda, where policy makers identified smallholder farmers as the most practical target for addressing food shortage and tackling poverty reduction.<sup>67</sup> The Rwandan government instituted a number of changes, most notably the increase of budgetary allocation to agriculture, which moved from 4.2 % in 2008 to about 11 % in 2011.<sup>68</sup> This budget increase complies with the recommendation set out in the CAADP, to which Rwanda was the first country to sign up in March 2007. By undertaking these efforts, the government of Rwanda is demonstrating a desire for the intensification of agriculture, shifting from subsistence-based farming to productive, high value and market-oriented farming (MINAGRI 2009). However, two major policies have been developed to these ends which still have elements of support to smallholder farmers: (1) the Vision 2020 and the Economic Development and Poverty Reduction Strategy (“EDPRS”) 2007–2012, and; (2) the Strategic Plan for the Transformation of Agriculture (“PSTA II”) 2008–2012 and the Crop Intensification Programme (“CIP”) 2008–2012. As the principal leader in the implementation of these policies, the ministry of agriculture prioritises investments that can enhance access to, and use by, smallholder farmers of such inputs as fertilisers and ‘improved’ seeds. These inputs are, it must be stressed, largely imported from the neighbouring Kenya and Tanzania in the case of maize and wheat, while the National Institute of Agricultural Research (“ISAR”)<sup>69</sup> provides some pest resistant varieties of cassava.

As a result of these budget increases and implementation of the above-mentioned policies, there has been a purported increase in the production/outputs in key crops from 2007 to 2010, such as maize increasing by 322 %, wheat by 213 %, and cassava by 206 %. Interestingly, these increases in outputs are not based on increased land use, but in the increased yields.<sup>70</sup> As attractive as these results are, one key question remains unanswered regarding smallholder farmers’ rights to recycle the improved and proprietary seeds that they use. Rwanda at the moment lacks a plant variety protection law (Mahop et al. 2013, 2014), so perhaps the issue of infringement of PBR is of less concern to smallholder farmers in this country

---

<sup>67</sup>Willoughby and Forsythe (2011).

<sup>68</sup>World Bank (2011).

<sup>69</sup>*Id.* at 69.

<sup>70</sup>It must be noted that access to inputs such as improved seeds and fertilisers were not the only tenets of the policies developed and implemented in support to smallholder farmers. Other critical tenets of the broader goal intensification of agriculture included training in sustainable production systems such as irrigation, the professionalization of smallholder farmers through provision of extension advice in cropping systems and the promotion of commodity chains and agribusiness development in areas of post-harvest handling and processing.

than it is in neighbouring countries such as Kenya and Tanzania where PBR regimes are in force. Considering that an LDC like Rwanda is currently not under any legal obligation to promulgate a PBRs law at the domestic level,<sup>71</sup> the policy changes are arguably beneficial to Rwanda's smallholder farmers because they can maintain their age-old practices of seeds saving, exchanging and selling. One element that has not been tested is the extent to which the withdrawal or reduction in government support to farmers' access to agricultural inputs will affect productivity. Farmers' rights to domesticate improved seeds and better adapt them to their agro-ecological conditions is likely critical to sustaining these increased yields.

### 43.5 Giving Priority to Seed-Related Concerns of Subsistence Farmers in Ongoing Processes

There is a clear trend of plant variety protection regimes being developed alongside market-oriented seed regulations at the domestic and regional levels in Sub-Saharan Africa.<sup>72</sup> However, opinions about their suitability for the region are divided. On the one hand, UPOV-based sui generis plant variety protection regimes and seed regulations—both of which are based on international standards<sup>73</sup> will contribute to boosting national plant breeding activities for crops of national or regional importance and will assist farmers in accessing new and improved varieties from other countries, thereby contributing to domestic diversity.<sup>74</sup> Additionally, there is an opportunity for external investments in the seed sector, given the increased assurance that investors' interests would be protected.<sup>75</sup> Therefore, some believe that countries and regions that uphold international standards on seeds-related policies are more likely to increase international trade through commercialisation of both

---

<sup>71</sup>On 11 June 2013, The TRIPS Council, through its decision IP/C/64, extended the general TRIPS compliance transition period for LDC Members for all obligations under the TRIPS Agreement, other than Articles 3, 4 and 5, until 1 July 2021 or until such date on which a Member ceases to be an LDC, whichever date is earlier. This means that LDCs are not obliged to develop national laws for the protection of new variety of plant and the rights of breeders of such varieties. Least developed countries still in considerable needs for technical and financial capacities to fully implement TRIPS have been calling for such extension as evidenced through the various communications from Uganda and Tanzania at the last symposium on LDC priority needs for technical and financial cooperation that was held at the WTO in Geneva from 31st October to 2nd November 2012.

<sup>72</sup>*Id.* at 73.

<sup>73</sup>By international standards here, we refer to the seed laws that comply with the standards of seed testing and release developed by the International Seed Testing Association (ISTA). ISTA develop and publish standard procedures for field seed testing that should be applied by member states. The principal mission of ISTA is to have uniform seed testing evaluation procedures worldwide, <http://www.seedtest.org/en/home.html>.

<sup>74</sup>Alliance for Commodity Trade in Eastern and Southern Africa (2013).

<sup>75</sup>*Id.* at 77.

seeds and agricultural products, thus bringing in the much needed export revenues for the countries' or regions' economies.

On the other side of the argument, there are those who question the rationale for developing and implementing stronger PVP and seed regulations in sub Saharan countries where agriculture is currently dominated by small-scale farmers and undertaken largely for subsistence purposes.<sup>76</sup> Those opposed to stronger laws at the domestic or regional level argue that there is little evidence that stronger regimes have contributed to more plant breeding activities. Where there is evidence of any impact, it has not been on food crops of national importance, but largely on crops that are commercially valuable to seed companies.<sup>77</sup> The passage of stronger plant variety protection and seed laws could lead to breeding research priorities being focused on a narrow set of homogenous, commercially valuable crops for the industry, much to the detriment of the diversity of food security crops that are used by small-scale farmers.<sup>78</sup> Back in 1999, an IPGRI<sup>79</sup> report questioning the move by many developing and least developed countries to implement Article 27.3.b of TRIPS to promulgate UPOV-based *sui generis* plant variety protection laws regardless of their UPOV membership, stated: '*Countries whose agricultural economy is mainly geared towards domestic markets and which depend largely on traditional varieties cultivated by small-scale and subsistence farmers will have less to gain from the introduction of stronger PVP regimes.*'<sup>80</sup> This is because in the context of subsistence agriculture, small-scale farmers use traditional varieties that contain a lot of genetic diversity. Introducing stronger PVP will likely affect this agro biodiversity leading to the exacerbation of food insecurity in these countries. As such, NGOs and other actors view smallholder and subsistence farmers' rights, as outlined by the 2001 FAO International Treaty on Plant Genetic Resources for Food and Agriculture, as a serious factor in the pursuit of food security and poverty reduction strategies.

It is absolutely reasonable that sub Saharan countries would wish to take advantage of recent developments in biotechnology in designing programmes after the CAADP and ASBP models. Appropriate laws and policies are required, however, to regulate the development and commercialisation of improved varieties bearing such features as higher yields, pest resistance, lesser vulnerability to climatic changes, and industry requirements for nutrition and food processing. Seeds-related regulatory regimes must be able to protect the rights and rewards

---

<sup>76</sup>Singh (2002).

<sup>77</sup>Tripp et al. (2007).

<sup>78</sup>Dutfield (2008).

<sup>79</sup>The International Plant Genetic Resources Institute (IPGRI) is the successor to the International Board for Plant Genetic Resources (IBPGR) which was established in 1974 by the Consultative Group on International Agricultural Research (CGIAR). IBPGR became IPGRI in 1991. In 1994, IPGRI took over the governance of the International Network for the Improvement of Banana and Plantain (INIBAP). In 2006 IPGRI and INIBAP were merged into a single organization called Bioversity International.

<sup>80</sup>International Plant Genetic Resources Institute (1999).

of those actors who utilise their genius to develop plant varieties with these features.

Because stronger PVP and seed regulations are focused on commercial farming, they are cause for concern in the immediate to medium term because they do not take into account the interests of small-scale farmers whose subsistence farming is the current response to food needs in Sub-Saharan Africa. Some argue that small-holder farmers will not be affected by the Draft ARIPO plant variety protection legal framework and the COMESA harmonised seed regulations as long as they continue to use their traditional varieties in the context of their agricultural practices. However, this is not entirely true. Should small-scale farmers want to commercialise their traditional varieties in the formal seed markets, they will not be able to unless otherwise permitted by the laws under strict conditions. For example, in Tanzania, the Seed Act of 2003 has regulated the production and local commercialisation of Quality Declared Seeds (“QDS”), which are seeds produced by and for smallholder farmers who do not have access (physical and financial) to formal/certified seeds.<sup>81</sup> In any case, small-scale and subsistence farmers who maintain using traditional varieties are generally not eligible for government support in terms of access to credit, agricultural inputs, or advisory support provided by the extension services.

In sum, to sustain or bolster the contribution of subsistence agriculture to food production in Sub-Saharan Africa, this chapter suggests that on-going initiatives and processes at the continental, regional and national levels should refocus to give priority to the concerns of smallholder farmers. This can be chiefly achieved by pursuing full implementation of farmers’ rights in the plant variety protection and seed regulations of the Eastern and Southern African regions. The realisation of farmers’ rights is a core tenet of the 2001 International Treaty on Plant Genetic Resources (“ITPGR”) for Food and Agriculture to which most Sub-Saharan African countries are members. Article 9.1 of the International Treaty recognises the enormous contribution that indigenous communities and farmers of all regions of the world have made and will continue to make to the conservation and development of Plant Genetic Resources for Food and Agriculture (“PGRFA”). Furthermore, protection of traditional knowledge relevant to plant genetic resources is part of the fulfilment of Farmers’ Rights,<sup>82</sup> and the rights of farmers to save, use, exchange and sell farm-saved seed and propagating material are not limited by

---

<sup>81</sup>The production and commercialisation of QDS does not follow the stricter quality control and release procedures that are designed for certified seeds meaning that, because they are produced by registered smallholder farmers, the fields where QDS are produced are not subject to the same number of visits of the inspectors employed by Tanzanian Official Seed Certification Institute (TOSCI). Seed processing procedures, including storage and labelling for the purpose of commercialisation are less stringent for QDS as compared to certified seeds.

<sup>82</sup>Article 9.2 of the International Treaty on Plant Genetic Resources for Food and Agriculture 2001.

the Treaty.<sup>83</sup> As encapsulated in article 9.1 of the International Treaty, farmers' rights are more elaborate than the very narrow concept of farmers' privilege which is provided by the 1991 Act of UPOV, designed purposely to promote and protect the rights of breeders, not those of smallholder farmers. The common denominator of both farmers' rights and farmers' privilege is that they are implemented at the national and/or regional level through domestic and regional policy making, unlike the plant breeders' rights, which have an international dimension promoted by the UPOV convention.

At the international level, the governing body of the international treaty is indeed encouraging national and regional agricultural policy processes for the realisation of farmers' rights. In 2009, the Governing Body initiated activities aimed at collecting views on the implementation of Farmers' Rights.<sup>84</sup> In its resolution 6/2011, the Governing Body encouraged Parties to submit further views, experiences and best practices, and requested the Secretariat to the Seeds Treaty to compile these views and disseminate the same to Parties.<sup>85</sup> African countries have been at the forefront of not only submitting views on farmers' rights, but also in encouraging that farmers' rights become a permanent agenda item for discussion by the Governing Body. Work on the farmers' rights provisions of the treaty has continued, leading to the recent adoption by the Governing Body in September 2013 of resolution 8/2013 on the Implementation of Farmers' Rights by the Fifth session of the Governing Body of the Treaty. This Resolution called on contracting parties to engage farmers' organizations and relevant stakeholders in matters related to the conservation and sustainable use of plant genetic resources for food and agriculture, and will consider their contributions in awareness-raising and capacity-building efforts.<sup>86</sup> Furthermore, the resolution invites parties—previously involved or otherwise—to consider reviewing and, if necessary, adjusting its national measures affecting Farmers' Rights.<sup>87</sup> Reviewing and/or designing national regulatory measures will provide legal safeguards to the seed handling practices that are deeply rooted in smallholder farming systems and are very instrumental in smallholder farmers' contribution to food production and food security in Sub-Saharan Africa. The realisation of these rights has direct bearing on another critical pillar of smallholder farming, which is the maintenance of agro-biodiversity. Agro-biodiversity can be achieved through conservation and sustainable use of plant genetic resources for food and agriculture by smallholder farmers.<sup>88</sup> Conflict lies in the fact that the ultimate impact of seed regulations and

<sup>86</sup>Clause 4 of Resolution 8/2013 of the Fifth Session of the Governing Body of the International Treaty on Plant Genetic Resources for Food and Agriculture, Muscat, Oman, 24–28 September 2013.

<sup>87</sup>Clause 6, *Ibid.*

<sup>88</sup>Santilli (2012).

plant variety protection laws is the establishment of uniformity and homogeneity across agricultural systems, which would lead to the displacement of agro biodiversity. Homogenous or uniform crops are generally criticised for their vulnerability to pest and diseases. For smallholder farmers, agro biodiversity is a far-stronger shield to such vulnerability. The role that subsistence farming plays in food supply in Sub-Saharan Africa should be a strong incentive to frame the conservation of agro-biodiversity as a key tenet of plant variety protection and seed laws in the region. This would greatly assist countries fulfilling their obligations under the ITPGR.

Additionally, some feel that the current focus on phenotypic aspects of new plant protection, which is based on external features of protectable varieties and related crops, is outdated.<sup>89</sup> They argue that plant breeding activities are increasingly—and perhaps irreversibly—moving towards a focus on the genotypic features of plants, given the current progress in molecular biology and genetic engineering. In this regard, it has been proposed that new varieties of plants be rather considered as datasets that the breeder can manipulate in order to express a specific feature in the crops, such as a stress tolerant feature. If new varieties of plants are considered to be datasets that can be modified through biotechnology-based breeding techniques, competition laws—rather than *sui generis* plant variety protection laws—may be the best tool to ensure their legal protection. In practice, despite the advances in biotechnology-based breeding techniques, conventional methods do remain at the core of plant breeding activities. Biotechnology-based breeding is used as complementary to, not instead of, conventional breeding.<sup>90</sup> Taking advantage of the possibilities offered by molecular biology and genetic engineering in the manipulation of the genetic make-up of plant varieties, it is understandably possible in the context of biotechnology based breeding activities to minimise homogeneity and uniformity and maintain the crop diversity that is central to subsistence farmers' agricultural systems. Ensuring access by smallholder farmers to these biotechnology-engineered diverse and proprietary new varieties of plants is an issue for policy makers to clarify at the domestic level.

One approach that works towards the conservation and sustainable use of agro biodiversity also has undoubtable implications on the realisation of farmer's rights. This approach is the creation of a legal space for participatory breeding in the regulatory instruments pertaining to seeds developed in the region. Participatory breeding is noticeably absent in the regional seed harmonisation regime underway in the COMESA; therefore, there is an opportunity for revision and reorientation to include it. Indeed, article 6 of the International Treaty on Plant Genetic Resources for Food and Agriculture, which deals with sustainable use of plant genetic resources, encapsulates conservation and participatory breeding under its coverage. To achieve conservation of agro-biodiversity, article 6.2.b provides for the strengthening of research that enhances and conserves biological diversity by maximizing intra- and inter-specific variation for the benefit of farmers. The article

<sup>89</sup>Blakeney (2011).

<sup>90</sup>*Id.* at 92.

specifically mentioning those farmers who generate and use their own seed varieties and apply ecological principles in maintaining soil fertility and combating diseases, weeds and pests. This special mention implies a need for strong involvement of such farmers in the breeding process. Thus, article 6.2.c of the International Treaty calls for promoting plant breeding efforts that strengthen the capacity to develop varieties particularly adapted to social, economic and ecological conditions in all areas, and specifically calls for the participation of farmers—particularly those in developing countries.

According to the International Center for Tropical Agriculture (“CIAT”), a research institution under the Consultative Group on International Agricultural Research (“CGIAR”), participatory breeding is the systematic and regular involvement of farmers as decision makers in all stages of the breeding program. From the perspective of CIAT, farmer involvement in a breeding program can take many forms, including: defining breeding goals and priorities; selecting or providing germplasm sources; hosting trials; selecting lines for further crossing; evaluating results; planning for the following year’s activities; suggesting methodological changes; multiplying seeds; and, commercialising seeds of selected lines.<sup>91</sup> Participatory breeding differs from conventional breeding in that farmers’ participation is very limited in conventional breeding. If it occurs at all, it may be restricted to the evaluation of materials produced by breeders. In participatory breeding, farmers apply their traditional knowledge and skills to crop selection. Ultimately this process provides farmers with the best-adapted seeds for their own agro-ecological and accounts for their individual and communal nutritional needs. Because smallholder farmers are involved at all stages of the process—including the beginning when program objectives and priorities are defined—they generally select a wide variety of crops and avoid the narrow, commercially-focused approach of conventional breeding.

One major constraint to participatory breeding is its financing. The private sector generally invests in breeding programs for commercially valuable crops, and can claim intellectual property protection over new varieties in order to recoup the investment and make a profit. Because of this interest, it is important that participatory breeding programs are financed and implemented by the public sector. One objective of the publicly-funded participatory program can be to ensure that smallholder farmers use and exchange the seeds developed through the program freely, with no restriction on the extent to which they can exchange, plant or sell the product of their harvest as seeds to fellow farmers. This objective is achievable if there is a restriction on the acquisition of plant breeders’ rights by the publicly-funded research center, and there are safeguards for the improved varieties to remain in the public domain.<sup>92</sup>

<sup>92</sup>*Id.* at 92.

## 43.6 Conclusions

The seed and plant variety protection regulations currently being developed in the Eastern and Southern African regions are pursuing an agenda of modernisation, resulting in a shift from subsistence to commercial agriculture. On-going regulatory processes are driven by continent-wide programmes initiated by the African Union like the CAADP and the ASBP. Programs such as these have a strong focus on boosting agricultural productivity through research and development and the dissemination and adoption of agricultural technologies by farmers, including smallholder farmers. These approaches are not necessarily or inherently bad for Africa, especially in the medium- to long-term. As smallholder farmers acquire the financial and technical capacity to integrate new innovations, there could be some benefit. However, in the short term, these regulatory frameworks and programmes at the continental and regional levels are not being observed to properly uphold farmers' rights. Furthermore, their lack of integration of sustainable objectives of agro biodiversity can seriously affect smallholder farmers' contributions to food production and supply and thus have a profound impact on food security. Despite the preferential treatment that the FAO Plant Treaty has over other existing international treaties (such as the WTO TRIPS agreement and the UPOV) with regards to the protection of farmers' rights, on-going seeds-related regulatory processes do not encapsulate the Plant Treaty's provisions on farmers' rights in the same manner that they provide for strong protection of breeder's rights. A number of research questions therefore arise which are worth exploring, including: how can regulatory processes be rebalanced to emphasise FAO Plant Treaty farmer's rights and agro-biodiversity conservation principles? Are there any major constraints countries in these regions will face in their efforts to crystallise such plant treaty principles in their regional or domestic seeds-related regulatory frameworks? If any constraints are envisaged or encountered in the course of the rebalancing process, what would be the best workable approach to overcome them? For Sub-Saharan Africa, where smallholder farmers are still playing a very instrumental role in food production, this chapter advocates the development of seeds-related laws and policies that accommodate farmers' rights and include conservation and sustainable use objectives of agro-biodiversity. This approach is recommended in order to avoid a disruption in agricultural production that would affect the food supply at the local, community, national and regional levels.

## Chapter 44

# Textbox: Women in Agriculture and Labor Law: Cameroon's "Three C's" Legal Dilemma

Wele Elangwe

**Abstract** This textbox discusses the impact of the three c's in the empowerment of women in the agricultural sector of Cameroon's economy. The 3 c's refer to Cameroon's use of the common law, civil law and customary law systems developed out of country's complex colonial past. Customary law in Cameroon evolves from the indigenous patriarchal culture which promotes male dominance over females. This law is practiced in most rural Cameroon where agriculture is the mainstay of economic and social life. Although efforts have been made in the harmonization of the three legal systems, current agricultural policies emanating from the customary law are an impediment to the growth and development of women as independent economic actors in the agricultural field. With the globalization of the agricultural market, the importance of women as key economic players in Cameroon's agricultural sector cannot be overemphasized. The textbox thus concludes by recommending that the laws be aligned in a manner that promotes the empowerment of women as equal players in the agricultural industry in order to boost the economy of Cameroon.

In various countries around the world, women contribute substantially to the agricultural output both directly and indirectly. However, some developing countries fail to acknowledge the important role of women in agriculture and are lacking in providing legal rights to women. Consequently, an enormous loss of potential, that of women as property owners, entrepreneurs, and equal citizens, makes it difficult for these countries to compete in the global market and stifles various aspects of the countries' food and agricultural laws and policies. One such example is Cameroon. This example sheds some light of how these legal imbalances affect women and ties in concerns affecting the agricultural sector. Although labor law is essentially beyond the scope of this book, it is important to consider the enormous effects that legal protections have on the market strengths of any given country.

Cameroon is a country with a rather unique legal system due to its unusual colonial past. After gaining independence from Britain and France in 1960 and 1961 respectively,<sup>1</sup> Cameroon inherited Common Law from Britain, Civil Law from France, both of which came in addition to existing Customary Law from African tradition and customs.<sup>2</sup> These three systems of law combine to form “The Three Cs,” Common Law, Civil Law and Customary Law.

Common Law is applicable in the two English-speaking regions of Cameroon and Civil Law in the eight French-speaking regions.<sup>3</sup> Considering that Common Law and Civil Law function independently in their countries of origin, an amalgamation of the two systems in Cameroon has proven to be rather complex, resulting in a hybrid system of law that is deserving of its own name. As a result of this complexity, the different areas of law, such as labor, land, family, and commercial law have taken new forms and approaches under these very unusual circumstances in Cameroon.

Labor and land law, however, happen to be two of the few areas of law that have been ‘harmonized’ in Cameroon through the 1992 Labor Code<sup>4</sup> and the 1974 Land Tenure Ordinance.<sup>5</sup> Business law, too, has been harmonized through the OHADA law (Organization for the Harmonization of Business Law in Africa),<sup>6</sup> a regional treaty with 17 member countries.<sup>7</sup> However, despite these harmonized laws, implementation of these laws is still a challenge because these laws remain dominated by old habits that die hard. Thus, the influence of culture through traditions and customs, on the one hand, and Civil and Common Law, on the other hand, from which these new harmonized laws were inspired, continue to strongly affect the implementation of laws in Cameroon. The resulting implementation challenges are felt strongly, especially by women who, due to long-standing cultural patriarchy, have long been considered subordinate to men.

It is extremely difficult to provide an accurate appraisal of women’s contribution to agriculture due to the lack of documented statistics. However, it has been estimated that about 90 % of Cameroon’s agricultural production can be attributed to the hard work of its rural women.<sup>8</sup> Even in the cash-crop sector, which is male dominated, women equally participate, contributing about six to eight hours a day during high-growing seasons.<sup>9</sup> In general, it is reported that rural women in Cameroon work one-and-a-half to three times longer than men.<sup>10</sup>

<sup>9</sup>*Id.*

<sup>10</sup>*Id.*

In spite of these significant contributions made by women to the agricultural sector; customary law excludes them from the right to land ownership - the same land they tirelessly toil every day. Nonetheless, if there is any uniform custom in the regions of Cameroon, it pertains to the fact that women cannot own property because they are considered property themselves.<sup>11</sup> In fact, a woman is by the very nature of a dowry regarded as property<sup>12</sup> and proponents of customary law and tradition purport that this dowry payment confers to a man proprietary rights over his bride. Therefore, in a bride's new capacity as "property", she cannot own property because property cannot own property. Although section 70(1) of the Civil Status Registration Ordinance of 1981<sup>13</sup> provides that the dowry shall not affect the validity of a marriage, this is not the case in reality.

Interestingly, the decision in *Zamcho Florence Lum v. Chibikom Peter Fru and others*<sup>14</sup> brought about an entirely different trend in legal reasoning under customary law. Inspired by the provisions of Section 27(1) of the Southern Cameroon High Court Law 1955, which overrides any law that is repugnant to natural justice, equity and good conscience,<sup>15</sup> this decision set a legal precedent in English-speaking Cameroon. Preventing a woman from owning or inheriting property was held to be contrary to public order and the constitution.<sup>16</sup> Although this judicial decision could be seen as a great victory for women from the stifling dictates of customary law, the freedom and rights it promises are still nothing more than a dream for most rural women who continue to battle with the oppressive forces of customs and traditions pertaining to land ownership.

While a female child's right to succession is not recognized under customary law in the English-speaking regions in Cameroon, Common Law (applicable predominantly in the urban areas in the English-speaking regions), offers a little reprieve from the constraints of customary law. This is particularly by virtue of Section 15 of the Southern Cameroon High Court Law of 1955, which sanctions the application of post-1900 English Statutes in matters of Probate, Divorce and Matrimonial Causes whenever there is a lacuna in the local laws.<sup>17</sup> Thus, the 1925 Administration of the Estate Act,<sup>18</sup> which is applicable in the English-speaking regions of

<sup>17</sup>*Id.*

<sup>18</sup>*Id.*

Cameroon confers survivor and spousal right of succession and makes it possible for a female or a male child to succeed and inherit property.

However, the case is a little different in the French speaking regions of Cameroon. Generally, the application of customary law also reigns in rural areas and civil law in urban areas. Noteworthy is the fact that customary courts have jurisdiction to handle civil matters that have not been expressly reserved for the formal courts.<sup>19</sup> Because civil law is heavily reliant on specific codes,<sup>20</sup> where there is a gap in the law, the courts resort to international law<sup>21</sup> or customary law.

Conversely, under Civil Law in Cameroon, married women are subject to some restrictive rules of employment. Civil Law provides that a married woman can engage in professional activity separate from that of her husband.<sup>22</sup> The husband, however, may object in the interest of the household and the children, unless discharged by the court in case of unjustified opposition.<sup>23</sup> This view originates from Section 1421 of the 1804 Civil Code,<sup>24</sup> which states that the husband alone shall administer the joint estate of the family as head of the family. He may mortgage the same without the consent of his wife.<sup>25</sup> These limitations to a woman's right to work and total dominance provided to men by the law in the administration of the joint estate of the family only further restricts women's ability to play an active role in the nation's economy.

Notwithstanding all of these laws, according to a 2012 report,<sup>26</sup> women in Cameroon produce 80% of the country's food needs, yet own only two percent of the land. With an increased demand from agricultural enterprises in industrialized countries to set up production in many developing countries, better laws that protect women who dominate the labor force in the agricultural sector are urgently needed in order for Cameroon to explore the potential of collaboration with such industrialized countries. In doing so, the efforts, which in the past have been short-lived because of the absence of or inadequate environmental protection legislation, labor laws and labeling and food safety standards, will have the potential to be successful and thrive. Thus, the fragmentation of the legal system through the "Three C's" in Cameroon, illustrates how the law affects women, how women, in turn, affect agriculture, and how agriculture, in turn, affects the success of a nation.

# Chapter 45

## Intellectual Property Law and Food Security Policies in Ethiopia

Getachew Mengistie Alemu

**Abstract** Ethiopia has abundant resources that may enhance agricultural output but could not be food self sufficient. Successive regimes in the past four and half decades took various measures to deal with the problem of food shortage but attaining food security has been very difficult. The effort to ensure food security at a household level may be affected by a number of factors including policies, laws and intellectual property (IP) protection. This chapter aims at highlighting the food security situation in the country, reviewing relevant policies, strategies, plans and laws dealing with or affecting food security; exploring the relationship between intellectual property and food security; examining the extent to which the existing intellectual property laws in particular the patent and plant variety protection laws may help in dealing with food security issues and concerns; identifying challenges and gaps; and recommending measures.

### 45.1 Introduction

Ethiopia has abundant resources that can enhance agricultural output, yet is not food self-sufficient. Food insecurity within Ethiopia is widespread. As one of the least developed countries in the world, ensuring food security has been a major challenge for Ethiopia for years. Successive regimes in the past four and half decades took various measures to deal with this problem but attaining food security has been very difficult. There are a number of factors, such as natural resource degradation, increased population growth, irregular rainfall and recurrent drought, behind the persistent food shortage. The main cause for food insecurity, however, is the poverty of the people and the low level of socio-economic development of the country. The effort to ensure food security at the household level is also affected by a number of factors including policies, laws and intellectual property (“IP”) protection. This chapter examines existing relevant policies, strategies, plans and laws

---

G.M. Alemu (✉)

e-mail: [getachewal@gmail.com](mailto:getachewal@gmail.com)

dealing with or affecting food security, explores the relationship between IP and food security, identifies challenges and gaps; and recommends measures.

To provide a framework and demonstrate Ethiopia's potential in attaining food security, the chapter first focuses on its geography and socio-economic conditions. Second, it examines the situation of food insecurity in the country and identifies factors behind the persistent food shortage, such as continued dependence on food aid and imports. It also discusses the reasons behind food deficit using low agricultural productivity and international trade as examples, highlights the impact of programs that were designed and implemented with the assistance of the donor community, and reflects on the challenges of attaining food security. The relationship between IP, IP protection and food security concerns of developing countries is discussed afterwards. Moreover, the chapter concentrates on IP policies and laws of Ethiopia, examines the extent to which the existing IP laws can contribute to food security issues, and identifies gaps and challenges. Enhancement of food security requires clear policies and implementation instruments, such as laws and institutions. Policies and laws that deal with or support food security are also examined. An overview of the relevant policies, strategies and plans in this section is limited to those that emphasize agriculture, target IP issues and can be supported by IP. Gaps and weaknesses of the policy instruments are identified, and the extent to which the existing IP system can complement policy goals and support implementing strategies is also examined. The last section is the conclusion, which includes recommendations to strengthen the policy and legal framework as well as enhance effective use of suitable policy instruments to support food security at the household level.

Much has been written on food security in Ethiopia. However, little or no study has been conducted to examine relevant laws and policies and IP issues. This chapter will fill this gap as well as serve as a basis for future studies in the field.

## **45.2 Geographical Location and Socio-Economic Context of the Country**

Ethiopia is a landlocked country located on the Eastern Horn of Africa between latitudes 3° and 15° North and Longitude 33° and 48° East. The country shares borders with Eritrea in the north, Djibouti and Somalia in the east and southeast, Kenya in the south, Sudan and Southern Sudan in the west. The total area of the country is 1.13 million sq. km.<sup>1</sup> The country has a ragged topography featuring the vast central highlands separated from the eastern highlands by the Great Rift Valley running from the northeast to the southwest. Altitudes range from 148 m below sea

---

<sup>1</sup>See Food & Agriculture Organization ("FAO") & African Union ("AU") (2012), Chanyalew et al. (2010).

level at Dallol depression<sup>2</sup> to over 4600 m above sea level at Ras Dashen Mountain.<sup>3</sup>

Ethiopia had a population of 73,750,932 in 2007, of which 50.5 % were males and 49.5 % were females.<sup>4</sup> The population density in the same year was estimated to be 65.4 per sq. km.<sup>5</sup> According to the demographic statistical report by the Central Statistical Authority of Ethiopia, the population is expected to grow annually at about 2.7 %.<sup>6</sup> The population size has increased since the 2007 census. In 2012, the population was estimated to be more than 84 million,<sup>7</sup> making Ethiopia the second most populous country in Africa after Nigeria. Most of the population lives in rural areas. According to the 2007 Census report, more than 83 % of the population lives in rural areas compared to only 16.1 % that lives in urban centers.

Ethiopia has registered impressive economic growth rate averaging 11.0 % per year since 2003 and the current 5-year Growth and Transformation Plan aims to sustain the growth rate at a minimum of 10 % per annum.<sup>8</sup> The continued economic growth was possible due to the good performance of agricultural production, significant contribution of manufacturing and services, and the expansion of the construction sector (mainly housing, roads and hydroelectric dams).<sup>9</sup> Agriculture is the backbone of the Ethiopian economy and engine of long-term economic growth and development. The sector contributes nearly 42 % to the GDP, 90 % of the country's export earning, 85 % of employment opportunities and 70 % of the raw material requirements of local industries. Nevertheless, the country is still at the lowest level of development and is one of the 48 least developed countries in the world,<sup>10</sup> characterized by low gross national income, low level human capital index and high economic vulnerability index.<sup>11</sup> Looking at the 2013 UNDP human development index, which ranked Ethiopia 173rd out of 186 countries, the low level of development is evident.<sup>12</sup>

The country is endowed with rich biological and natural resources that can strengthen the economy and specifically, the agricultural sector. Ethiopia is known as a major center of origin and diversity of important crops. It is the sole

<sup>12</sup>UNDP (2013).

or the most important center of genetic diversity of crops, such as Arabica coffee, *teff* (*eragrotis tef*), *enset* (*enset ventricosa*) and *anchote* (*Coccinia abyssinica*).<sup>13</sup> It is also one of the main centers of diversity for sorghum, finger millet, field pea, cowpea, perennial cotton, safflower, castor bean and sesame.<sup>14</sup> Additionally, because of genetic erosion in other parts of the world, it is now the most important center of genetic diversity for durum wheat, barley and linseed.<sup>15</sup> Ethiopia has the largest livestock resource in Africa, including 49 million cattle, 47 million small ruminants, nearly 1 million camels, 4.5 million equines and 45 million chickens.<sup>16</sup> This resource is vital to the livelihood of an estimated 80 % of the rural population, provides nutritious food, additional emergency and cash income, transportation, draught power (over 11 million oxen are utilized for plowing fields and other farming activities), fuels for cooking, and helps cope with shocks by accumulating wealth and serving as a store of value in the absence of formal financial institutions and other missing markets.<sup>17</sup>

The country has huge arable land that can be used to expand agriculture. It was noted that out of the total area of 1.13 million hectares of land, 69 % is suitable for crop and livestock production, but only 14 million hectares or 17 % is cultivated.<sup>18</sup> Ethiopia has vast surface and underground water resources<sup>19</sup> that can also strengthen the agricultural sector and ensure food security. However, people in many regions of the country face water shortages.<sup>20</sup> Little effort is made to use these water resources for irrigation to ensure all-year-round crop cultivation in areas where farming depends on rain.<sup>21</sup> Moreover, water is not used to meet the needs of people involved in livestock, which would reduce movement of both people and livestock searching for water.<sup>22</sup>

In spite of the fact that Ethiopia has abundant resources that can enhance agricultural output, it is not food self-sufficient. The agricultural sector is unable to feed the country's ever-increasing human population and obtain sufficient foreign exchange to purchase agricultural and industrial inputs to enhance food production. The sector is dominated by subsistence small-scale farmers, who contribute to 95 % of agricultural production<sup>23</sup> using low input and low output traditional technologies and depending mainly on rain.<sup>24</sup> As a result, a large number

<sup>24</sup>This requires getting enough rain regularly at the required time and amount. However, the rainfall pattern is irregular causing drought or flood resulting in crop failure.

of households face persistent food shortage, are vulnerable to shocks that will result in loss of assets, hunger and famine, and suffer from food insecurity.

### 45.3 Food Security Situation in Ethiopia

Food security is defined differently depending on the purpose and the context in which the concept is used. For the purpose of this chapter, food security refers to a situation when all people, at all times have physical and economic access to sufficient, safe and nutritious food to meet their dietary needs and food preferences for an active and healthy life.<sup>25</sup> Food insecurity, which can either be transitory or chronic,<sup>26</sup> is a persistent problem in Ethiopia. The country is known as one of the most famine-prone countries with a long history of famines and food shortages, which cost the lives of about a million people.<sup>27</sup>

Food shortage is a serious problem that has affected millions of Ethiopians under different regimes in the last 4 decades. A report indicated that 1.5 million or 5 % of the population during the imperial regime in mid-1974, 7 million or 17.4 % of the population during the military regime<sup>28</sup> and by the end of 2003, under the current regime, about 14.5 million or 22 % of the total population was unable to feed themselves during periods of drought.<sup>29</sup> Although life loss as a result of famine and food shortage is no longer reported, an increased number of people depend on food aid and handouts under the present regime. See Fig. 45.1 for the number of people who received emergency food assistance from 2000 to 2010.<sup>30</sup> The people who are most vulnerable to food insecurity are the poor living primarily in rural areas. The incidence of food poverty at the national level is estimated at 50 %, of which 52 % and 37 % is in rural and urban areas, respectively.<sup>31</sup>

Ethiopia is one of the countries listed by the Food and Agriculture Organization (“FAO”) as being in a protracted food crisis, which is characterized by long-lasting, or recurring crises often with limited or little capacity to respond, and exacerbates food insecurity problems.<sup>32</sup> The severity of the food insecurity and shortage problem that caused a national disaster and impacts the lives of millions in the

---

<sup>25</sup>FAO (1996).

<sup>26</sup>Transitory food insecurity is temporary in that it occurs due to shocks such as drought, flood, crop or livestock disease and frost while in chronic food insecurity households suffer food shortage in any given year.

2008	2.29
2009	6.3
2010	5.2

country at present is well articulated by one of the renowned researchers and scientists in this field in Ethiopia as follows:

Food insecurity and famine are deeply rooted in rural Ethiopia: they have brought hardships to rural people for countless generations, shaped livelihood strategies and social relationships, conditioned attitudes to the land and the environment, and regulated the rhythm of production and consumption. The country has archived the dubious distinction of being the epic center of human disaster since at least the 1970s: food emergencies have occurred here with greater frequency than in any other country in the world in recent history. The high profile disasters and emergencies, which have attracted worldwide attention, should not, however, obscure the grim day-to-day reality of persistent hunger and malnutrition, which is part of the lives of millions of peasants and pastoralists and which in the end, provide the fuel for the large-scale catastrophes.<sup>33</sup>

The food deficit in the country is met by food aid and imports.<sup>34</sup> In addition to receiving food aid, the size of which fluctuates from year to year depending on the domestic production, Ethiopia has been importing food crops. The value of commercial food import in any given year ranges from 5 to 7 % of total imports.<sup>35</sup> This figure is higher when parts of the country suffer from drought and is affected by famine. In 2002/03, for example, Ethiopia spent 231.7 million United States Dollars (USD) or 7.38 % of total imports to import food.<sup>36</sup>

There are a number of factors that affect food security in Ethiopia and explain continued dependence on food aid and food imports. These include low agricultural productivity, severe natural resource degradation, recurrent drought, population growth, inadequate transport and market infrastructure, inadequate access to

<sup>33</sup>Rahmato (2013), p. 114.

<sup>35</sup>Belete (2011), p. 25.

<sup>36</sup>*Id.*, p. 23.

finance and credit facilities, lack of alternative income sources outside of agriculture and problems related to international trade. Since the purpose of this section is not to identify and discuss all factors that impact food security in Ethiopia but to provide an overview, the discussion will be limited to highlighting the problem of food insecurity and shortage by using low agricultural productivity, including factors that affect agricultural production and productivity, and international trade challenges as examples.

Agricultural productivity is extremely low. Small-scale farmers that contribute to 95 % of agricultural production use outdated agricultural implements, such as animal driven ploughshare<sup>37</sup> and hand hoes, and depend mainly on rain.<sup>38</sup> Currently, only 1 % of arable land is irrigated in the country.<sup>39</sup> The availability, accessibility and use of inputs, like improved varieties of seed, is limited. There are public research and higher learning institutions involved in the generation, development and supply of new and improved high yielding varieties. Moreover, the Ethiopian Seed Enterprise (a public-owned enterprise), multinational seed companies,<sup>40</sup> regional seed enterprises, cooperative unions and approximately 35 private producers have been engaged in the production and distribution of improved seed in the country.<sup>41</sup> However, the seed supplied by these entities is inadequate to meet demand. The total annual seed requirement by the agricultural sector in Ethiopia is estimated at about 700,000 t of which only 15 % was made available in 2011 by these entities in the formal seed system.<sup>42</sup> The remaining 85 % of the seed requirement is met by an informal seed supply system involving exchange and selling of farm saved seeds and landraces.<sup>43</sup>

The rapid population growth<sup>44</sup> and other undesirable characteristics, such as fragmentation of land and environmental degradation, have affected agricultural productivity. The average land holding in the rural areas decreased to less than a hectare. It is estimated that without expansion of cultivated land and given forecasted population growth, the average land holding size in highland areas will be reduced to 0.7 ha by 2020.<sup>45</sup> Increase in population is accompanied by a decline in food production. When Ethiopia's population increased from 23.5 million in 1960/61–48.6 million in 1989/90, the per capita food output declined from 240.2 to

---

<sup>37</sup>These technologies have been known for thousands of years and are passed from generation to generation with little improvement.

<sup>38</sup>Lack of or erratic rainfall and flooding have affected agricultural production.

<sup>41</sup>See, FAO/WFP (2012), p. 14.

<sup>42</sup>*Id.*

<sup>43</sup>Merso (2011), p. 127.

<sup>44</sup>The size of the population increased from 11.8 million in 1900 to 23.6 million in 1960, doubling in 60 years but took only 28 years to double to 47.3 million in 1988. See Minas (2008), p. 23.

<sup>45</sup>Bill & Melinda Gates Foundation (2010).

141.7 kg in the same period.<sup>46</sup> It was noted that high population growth rate undermines Ethiopia's ability to be food secure and provide effective education, health and other essential social and economic services.<sup>47</sup>

Increased deforestation, expansion of desertification and land degradation has also contributed to low levels of agricultural productivity and will continue to have an impact on food production. The rate of deforestation is estimated to be between 140,000 and 200,000 ha per annum and the forest coverage is limited to about 3.6 % of the country's landmass.<sup>48</sup> This figure is alarming when compared to the 40 % of forest cover before the turn of the twentieth century.<sup>49</sup> Ethiopia is also affected by the expansion of desertification in the Sahelian region of Africa. A large part of the country, approximately 75 % of the landmass, is projected to be threatened by desertification.<sup>50</sup> Land degradation, which includes loss of soil fertility, loss of biodiversity and soil acidification, occurs due to improper land use and poor land management practices, population pressure, overgrazing, deforestation and the use of crop residues and dung for fuel in rural areas.<sup>51</sup> Ethiopia has one of the highest rates of soil nutrient depletion in sub-Saharan Africa and the annual phosphorus and nitrogen loss nationwide from use of dung for fuel is estimated to be equivalent to the total amount of commercial fertilizer applied.<sup>52</sup>

The second crucial factor that impacts food security is international trade. Measures taken by trading partners and fluctuation of agricultural commodity prices on the international market contribute to food insecurity. Ethiopia depends on few agricultural products<sup>53</sup> to generate export revenue. Often, the export of Ethiopian agricultural products is affected by measures taken by major importing countries. For instance, in February 1998 and April 1999, Saudi Arabia decided to ban the import of meat and livestock from Ethiopia and other Horn of Africa countries. This decreased the livestock prices by around 30 %, affecting the majority of people in Eastern and North Eastern Ethiopia, who depend on livestock production and export as their main source of income.<sup>54</sup> The price of agricultural commodities has fallen for the past 30 years<sup>55</sup> and there is no price stability of agricultural products on the international market. The buyers and primary product importing countries often determine the price in which producers has no role. They are mere price takers affecting countries such as Ethiopia and other agricultural producers that depend on the export of primary products. In Ethiopia, coffee is a major export product that contributes to more than

<sup>55</sup>Light Years IP (2008), p. 9.

one-third of the foreign exchange earnings and is the source of livelihood for one-fourth of the population.<sup>56</sup> The collapse of the coffee price in 2001 threatened the livelihood of coffee growers<sup>57</sup> and reduced the foreign exchange earning that affect, amongst others, investment in agriculture and food import.

Ethiopia has designed and implemented programs that address food production and environmental protection, water management and irrigation, employment creation, resettlement and credit provision with the support of the international donor community to achieve food security since the 1970s.<sup>58</sup> It should, however, be noted that extensive measures have only been taken and comprehensive programs have been designed and implemented with the assistance of the international donor community since the current government took power in 1991. There are encouraging developments resulting from economic growth, increased agricultural production, and the investment made and measures taken by the government and the international donor community. The economy has registered a double-digit agricultural growth continuously for several years. The average growth of agricultural output has been about 10 and 13 % in 1996/7 and 2004/05, respectively. The government allots nearly 16 % of its budget to agriculture, the bulk of which goes to food security programs.<sup>59</sup> Food poverty headcount decreased from 44 % in 1999/00 to 38 % in 2005/06.<sup>60</sup> There is also reduction in the number of people vulnerable to food insecurity and improvement in the position of Ethiopia on the Global Hunger Index, which captures three dimensions of hunger—insufficient availability of food, shortfalls in the national status of children and child mortality. The position of Ethiopia on the Global Hunger Index fell from 43.5 % in 1990 to 30.8 % in 2009.<sup>61</sup> The percentage of vulnerable rural population has decreased despite the growth in population size. In 2008, 23.1 % of 63.5 million people were vulnerable and this figure decreased to 22.3 % and 19.5 % in 2009 and 2010, respectively,<sup>62</sup> in spite of a population increase to 65.1 million in 2009 and 66.8 million in 2010. It should be noted that of these, 7.2 million in 2009 and 7.8 million in 2010 were beneficiaries of the productive safety net program<sup>63</sup> launched by the government in cooperation with the donor community to reduce dependence on food aid and help the population to stand on its own. The government has also taken a number of other complementary measures, including the establishment of the Agricultural Transformation Agency. This agency is mandated to modernize agriculture and address bottlenecks and set up commodity exchange (the first in Sub-Saharan Africa to

<sup>63</sup>*Id.*, p. 113.

provide for transparent and predictable market), deal with the abuse of the middlemen and increase the benefits for farmers.<sup>64</sup>

Enhancing agricultural production and ensuring food security is a priority on the government's agenda as clearly evident by relevant policies, strategies, plans and laws discussed under Sect. 45.5 of this chapter. However, a lot remains to be done to ensure food security at the household and national level in Ethiopia. According to Dessalegne Rahamato, ensuring food security for a sizable population of rural (and increasingly urban) households remains an elusive goal.<sup>65</sup> It is a tremendous challenge to attain food security while coping with a growing size of the population, increased environmental degradation and impact of climate change.

## 45.4 Intellectual Property and Food Security

Intellectual property (IP) refers to exclusive rights conferred by law over the creations of the human mind for a prescribed period.<sup>66</sup> Third parties may not make, produce and exploit the work, in any other form<sup>67</sup> without securing authorization from the right holder, except under circumstances provided by law. IP consists of three major elements—copyright and related rights; industrial property, which includes patents, industrial designs, trademarks, geographical indications, trade secrets; and plant variety protection (PVP).

Various IP titles such as patents, copyright, industrial designs, plant variety protection, trade secrets, trademarks and geographical indications are used to protect and market agricultural innovations, such as new and improved plant varieties,<sup>68</sup> that may enhance agricultural productivity and ensure food security. In discussing the relationship between IP and food security, the focus of this section will be limited to patents and PVP. A patent is a legally enforceable right granted by law to a person to exclude others from certain acts related to a described product or process invention that meets the requirements set by patent law<sup>69</sup> for a limited period of time. The patent system was initially established to cater for new inventions related to non-living things but could not accommodate the need to stimulate research and development activities in the field of plant varieties and

---

<sup>64</sup>For details of these measures, *see* von Uffelen (2013), pp. 2–13.

<sup>65</sup>Rahmato (2013).

<sup>66</sup>Please note that trademarks, geographical indications and trade secrets may be protected for an indefinite period of time provided the conditions for protection remains intact.

<sup>67</sup>An example is the use of a patented invention for the purpose of scientific research and experimentation, which is allowed in patent laws.

<sup>68</sup>Blakeney (2009), pp. 22–56; Tansey (2008); Dutfield (2008).

<sup>69</sup>Article 27(1) of the TRIPS agreement provides that patents will be granted to inventions in any field of technology. National patent laws define the requirements that should be met in order to grant a patent. Moreover, the laws exclude subject matters that may not be protected by a patent due to the nature of the subject matter itself or based on policy considerations.

reward results thereof. As a result, beginning from the 1930s, several countries introduced legislation that gradually evolved to a special (*sui generis*) system of protection of breeders' rights that is distinct from the patent system.<sup>70</sup> PVP, commonly known as "plant breeders' right," is a form of protection that evolved and was developed to protect new plant varieties. Plant variety laws allow breeders to make use of the protected variety in developing and disseminating improved varieties. However, this privilege is restricted by the 1991 International Union for the Protection of New Varieties of Plants (UPOV) convention.<sup>71</sup> Varieties that are "essentially derived" from a "protected variety" cannot be exploited without the authorization of the breeder or breeders of the prior protected variety.

Patents and PVP can stimulate agricultural innovation and help meet food security needs. However, there is no common understanding on the role and contribution of these IP tools to address food insecurity problem of mainly low income developing and least developed countries. There are arguments in favor and against IP protection of biotechnological inventions,<sup>72</sup> new plant varieties, plants and animals. Those who are in favor support their argument based on the objective and role of IP protection. IP is meant to stimulate creative activities. Since biotechnology is a result of such an activity, it should not be denied IP protection. IP protection encourages inventive and innovative activities, facilitates the disclosure and availability of technological information and stimulates the transfer of technologies, thereby meeting the needs of society and fostering socio-economic development. Others argue against IP protection of creations and innovations involving life forms on a number of grounds—moral or ethical, technical and economic. Each of the grounds is extensive and beyond the scope and purpose of this chapter. The discussion in this section will thus be limited to patents and PVP and food security concerns related to developing and least developed countries.

Patents and PVP for creations and innovations involving life forms such as plants is justified based on the need to increase agricultural productivity by stimulating research and development (R&D) activities and encouraging investment in the generation of new and improved technologies, which involves considerable money, time and labor. In the absence of patents or PVP, persons who have done very little will be in a position to make use of these agricultural innovations with no or little investment. This will discourage R&D activities and investment affecting agricultural productivity and food security. This argument looks sound if not seen

---

<sup>70</sup>Blakeney (2009), pp. 80–81.

<sup>71</sup>Developing countries that are not members of this convention or are members of the 1978 UPOV Convention may not have this problem. Under this Convention, a protected variety can be slightly been modified and exploited without requiring the authorization of the earlier breeders so long as the modified variety is distinct from the protected variety.

<sup>72</sup>Article 2 of the Convention on Biological Diversity defines biotechnology as "any technical applications that use biological systems, living organism, or derivatives thereof, to make or modify products or processes." Biotechnology consists of a set of techniques, such as genetic engineering, cell fusion, tissue culture, in-vitro fertilization and the use of recombinant DNA that use, make or modify life forms for a defined purpose.

within the context of developing and least developed countries. In these countries, there is little to no conclusive evidence to show an increase in R&D as a result of a patent and PVP system.<sup>73</sup> The R&D effort of the private sector, which contributes to about a third of global agricultural research<sup>74</sup> and mainly done in developed countries, focuses not on minor food crops that small, resource-poor farmers grow in developing countries to meet nutritional needs but major crops, such as wheat, rice and maize, that have demand in large markets to ensure return on research investment.<sup>75</sup> The major beneficiaries of IP protection system in developing countries are foreigners. For example, in Kenya, the foreign-owned companies engaged mainly in exporting flowers and vegetables use variety protection system.<sup>76</sup> The PVP system in Kenya facilitates the availability of a new plant variety that contributes to the expansion of export industries and commercial agriculture, but contributes very little in stimulating local research that meets the needs of poor farmers.<sup>77</sup>

The search for high yield, disease resistant, etc. plant varieties to increase agricultural productivity requires the creation and expansion of agricultural research development capacity. This search is weakened as a result of IP protection, which further strengthens the position and dominance of big transnational corporations in the domestic market. IP has facilitated an increase of R&D investment by the private sector, mainly big northern companies, and enabled private agro industrial enterprises to assume a dominant position in agricultural research.<sup>78</sup> Similarly, IP is used as a means to control and ward off the local R&D institutions from the domestic market. In fact, it is very difficult for the public agricultural research institutions to produce varieties that will compete in the market with those developed by transnational corporations. There are a few public agricultural R&D and higher learning institutions involved in developing and least developed countries such as Ethiopia, whose main objectives include the development and dissemination of new or improved crop varieties. However, the R&D capacity of these institutions is weak and contributes very little to the country's objectives. Public research organizations may, for example, use a patented technology for the purpose of scientific research,<sup>79</sup> but may not be in a position to develop and disseminate the research result. The patent owner can prohibit the use, production, sale or offer for sale of any research output that contains the patented subject matter.<sup>80</sup> The weakening of these public institutions and the penetration of the northern private R&D institutions into the domestic market also changes the purpose and goal of research

<sup>80</sup>Correa (2012).

outputs as well as affect its use for small farmers. For example, these private enterprises now focus on innovations that have commercial potential and are not necessarily congruent with the interest of small farmers in developing countries, particularly in relation to the food crops.<sup>81</sup>

IP rights are also private rights that facilitate misappropriation of genetic resources and associated traditional knowledge with no or little benefit to the country of origin and local communities that have maintained and developed these resources for generations.<sup>82</sup> For example, a cereal called *teff* (*Eragrostis tef*) from Ethiopia has been accessed and exploited by foreigners without any or insignificant sharing of benefit. *Teff*, which is believed to be native to Ethiopia, is an important food crop. It has been conserved and developed for generations by Ethiopian farmers. It is a staple food for millions of Ethiopians and is the largest crop grown in large hectares of land by majority of Ethiopian farmers.<sup>83</sup> *Teff* was accessed from the country, protected and owned by foreign companies outside of Ethiopia. These incidents include two cases that occurred before and after the country joined the Convention on Biodiversity and adopted a national biodiversity policy and set up a government body, the Institute of Biodiversity, to issue permits to access genetic resources to ensure equitable sharing of benefits. The first case relates to one of the *teff* varieties, grown in the Wollo province. The genetic resource was taken out of the country, and an application for plant variety protection was submitted to the US department of Agriculture by the applicant, a US company called the “*Teff* Company.” The variety was named “*Dessie*.”<sup>84</sup> The office granted a plant breeders right certificate no. 8900033 on November 1996, which conferred an exclusive right valid for 20 years from the date of this certificate. The company had the right to exclude others from selling, producing, importing or exporting the variety for propagation or making it for any of the above purposes or using it in producing a hybrid or a different variety to the extent provided by the US PVP law.<sup>85</sup> The second case concerns the *teff* genetic resource accessed after the adoption of biodiversity policy and the establishment of the Institute of Biodiversity. A Dutch company called Health and Performance Food International accessed *teff* varieties, undertook research and produced beverages and food products that were gluten free.<sup>86</sup> In 2004, the company filed an application for a patent, EP 1 646 287 B1, for processing of *teff* flour, which was granted by the European Patent Office on 10 January 2007.<sup>87</sup> The patent, which is valid in six countries: the

---

<sup>81</sup>*Id.* See also Tansey (1999), p. 20.

<sup>82</sup>Correa (2009), p. 6.

<sup>83</sup>In 1980, 50 % of the total area used for cereal cultivation was devoted to *teff*. See Andersin and Winge (2012), Grains (1996), p. 1.

<sup>84</sup>*Dessie* is the name of the capital city of the then Wollo province from which the genetic resource was taken and the present Eastern Wollo zone in north eastern Ethiopia.

<sup>85</sup>Mengistie (2001).

<sup>86</sup>The products have a demand on the international market because of a growing number of people that are allergic to gluten products. Moreover, there is a growing demand for *teff* products in Europe and USA for its nutritional value.

<sup>87</sup>Andersin and Winge (2012), p. 50.

Netherlands, Germany, France, Spain, Great Britain and Turkey, covers *teff* grain and processes, which are known and practiced in Ethiopia, such as seed storing after harvesting. This process improves the baking quality of the flour and the making of dough as well as a range of non-traditional products and food products made from *teff* flour including bread, pancakes, shortcakes, cookies and cakes of various kinds.<sup>88</sup> The company has also applied for patent protection in USA and Japan. The above IP titles are unprotected in Ethiopia and will not affect the production and sale of *teff* products as well as products made using the patented or similar processes in the country. However, they will affect the country and stakeholders regarding the export of *teff* products, generating foreign exchange and meeting food security and other related needs. It may also limit the country's ability to provide access to *teff*'s genetic resource to other companies that may be involved in the use of genetic resources in developing and marketing similar products using similar processes. The title holders have the right to prevent export of *teff* products or products processed using *teff* from Ethiopia as well as other companies that would like to develop products, process, and manufacture and sell similar products using *teff* in countries where the rights are validly protected. There is a belief that the above titles may be challenged and revoked. However, this will require expertise and resources, which the country does not have.

IP rights protection encourages medium and large-scale farming and results in the displacement of small-scale farmers, as noted below:

Patents and plant variety protection will facilitate the commercialization of farming systems along the lines of farming systems in the industrialized countries and so rapidly undermine the whole base of small-scale subsistence and local market-based production systems. If R&D produces varieties and methods most suitable for medium and large-scale farmers rather than products and methods geared to small farmers need, many small farmers will be squeezed out. Such a result would probably greatly increase population movements to urban centers.<sup>89</sup>

The displacement of small farmers and their migration to urban centers will worsen socio-economic problems such as unemployment and increase the number of food insecure in developing and least developed countries such as Ethiopia.

The attainment of food security by increasing agricultural productivity, among others, requires access to and use of new and improved crop varieties. However, farmers are not in a position to make use of such varieties when they are subject to IP rights. Traditionally, farmers used to save seeds, replant, exchange, or sell farm-saved seeds. This is not possible or is restricted when seeds are protected. Farmers may not save a patented seed that they collect from their farmland, sell and replant it unless authorized by the right holder.<sup>90</sup> Such authorization may not always be obtained. Even when secured, it is often subject to compliance with stringent terms and conditions. One of these requirements is the obligation to pay royalty

---

<sup>88</sup>*Id.*, pp. 50–51.

<sup>89</sup>Tansey (1999), p. 25.

<sup>90</sup>Commission on Intellectual Property Rights (2002), p. 63.

for reuse of a seed from a previous harvest, which is beyond the means of most small farmers in developing countries. Small farmers are allowed to save and reuse seed protected by PVP laws.<sup>91</sup> However, this privilege does not extend to exchange of seeds, which is a common practice in developing countries since there is no well-developed formal seed supply system, or procuring seeds from sources other than the right holder or sources designated by him.<sup>92</sup> This has resulted in the privatization of agricultural innovation, erosion of traditional farmers' rights and privileges, and changed the position of farmers from 'seed owners' to mere 'licensees' of a patented product.<sup>93</sup> New and improved protected seeds often require additional inputs, such as herbicides and pesticides, which are very costly.<sup>94</sup>

This is worsened as a result of improved marketing position of big companies resulting from IP protection and vertical and horizontal integration of global seed by agricultural input industries to maximize return on investment by controlling the distribution channels.<sup>95</sup> The excessive cost of acquiring and using improved seeds would, therefore, be beyond the financial means of most farmers in primarily low-income and developing countries. This makes access to new and improved agricultural innovations impossible and attainment of food security difficult.

IP protection of plant varieties results in monoculture and loss of food crop varieties. Graham Dutfield noted that "plant variety protection may contribute to a trend whereby traditional diverse agro ecosystems, containing a wide range of traditional crop varieties, are replaced with monocultures of single agrochemical-dependent varieties, with the result that the range of nutritious foods available in local markets becomes narrower."<sup>96</sup> The erosion of biological diversity and displacement of landraces may cause serious food crises when the variety is lost due to new diseases or climate change.

Some studies conducted on the impact of IP on developing countries concluded that certain forms of protection should not be made and recommended measures that cater to their interests and address concerns. For example, a study conducted by the United Kingdom Commission on Intellectual Property Rights (CIPR or the commission) noted that patent protection of biotechnological related inventions is not in the interest of developing countries with little or no capacity in this technology.<sup>97</sup> The commission proposed that developing countries should generally not provide patent protection for plants and animals because of the restrictions it imposes on farmers in reusing, exchanging and selling seed as well as researchers

---

<sup>91</sup>This privilege was automatic under the 1978 International Plant variety Protection Convention (UPOV) system but made conditional under the 1991 Convention, including payment of some form of remuneration.

<sup>96</sup>Dutfield (2008), p. 41.

<sup>97</sup>Commission on Intellectual Property Rights (2002).

in developing and disseminating research results using and involving patented material.<sup>98</sup> However, these may be difficult to implement as the policy space was eroded by the Trade Related Aspects of Intellectual Property (TRIPS) and bilateral agreements that developing countries are party to. The TRIPS agreement, which was concluded on April 15, 1994 as part of the multilateral trade agreements administered by the World Trade Organization, has narrowed the policy space that member countries used to have prior to the conclusion of this agreement. The agreement defines minimum requirements that all member states must comply with. One such requirement is the obligation to accord protection for plant varieties either by patent or by an effective *sui generis* system or by any combination thereof.<sup>99</sup> “Effective *sui generis* system” is not defined. To some, it means a PVP scheme, which is already in place in compliance with the UPOV convention.<sup>100</sup> Moreover, there are people who argue that developing countries can use this requirement as a basis to provide protection for community achievements and address issues of interest. Blakeney, for example, argues that “the TRIPS agreement does not prohibit the development of additional protection systems. Nor does it prohibit the protection of additional subject matter to safeguard local knowledge systems or informal innovations as well as to prevent their illegal appropriation.”<sup>101</sup> This can be possible only if the protection system is accepted as effective. The TRIPS agreement does not provide guidance to determine whether a *sui generis* system is effective or not. What an “effective *sui generis* system” means will, therefore, remain to be seen. Nevertheless, developing countries should use this policy space or flexibility in designing a system that will enable them to comply with the requirements of the TRIPS agreement and address their concerns and meet their needs. An example of such a PVP system can include the farmers and breeders privilege recognized under the 1978 UPOV convention. However, it should be noted that the limited policy space under the TRIPS agreement was further eroded by bilateral and regional free trade agreements (FTAs). For instance, the FTAs concluded between USA and Lebanon, Morocco, Tunisia, Jordan, Peru and Central America (under CAFTA) require these countries to join the 1991 UPOV convention.<sup>102</sup> Moreover, the FTAs that the USA has entered into with Jordan, Mongolia, Nicaragua, Sri Lanka and Vietnam mandate the provision of patent protection for plants and animals.<sup>103</sup>

## 45.5 Intellectual Property Policies and Laws of Ethiopia and Food Security Issues

### 45.5.1 National IP Policy

The various policies issued by the government clearly recognize the importance and need for IP protection, promotion of local creative, inventive and innovative activities as well as facilitating the acquisition and exploitation of foreign technology. These include the 2012 Science, Technology and Innovation Policy,<sup>104</sup> the 1992 Seed Policy,<sup>105</sup> the 1997 Cultural Policy<sup>106</sup> and the 5 years Growth and Transformation Plan (“GTP”).<sup>107</sup> In addition to policies that recognize conventional IP, the 1997 Environment Policy envisages the development of a scheme to protect community achievements and IP. However, Ethiopia does not yet have a consolidated national IP policy. The government realized the need to fill this gap and solicited the support of the World Intellectual Property Organization (WIPO). An IP assessment was carried out in 2005 and a draft national IP policy and strategy was prepared in 2013 with the support of WIPO.

The main policy objectives of the draft IP policy and strategy are to:

- a. Stimulate and foster the generation, protection and commercialization of IP assets in Ethiopia and facilitate transfer and acquisition of foreign technology;
- b. Facilitate integration of IP into national and sectorial development policies, strategies and plans and ensure its contribution in the realization of their development goals;
- c. Provide for the development and strengthening of IP protection, administration and enforcement of legal and institutional framework;
- d. Build capacity including development of human resources needed for effective protection, management and enforcement of IP and the use of IP as a tool for development;
- e. Promote greater awareness of IP by potential users, government officials and the general public and improve the use of IP in meeting technological, social, cultural and economic needs; and

---

<sup>104</sup>The Science, Technology and Innovation Policy was issued in 2012 replacing the first National Science and Technology Policy that was adopted in 1993. The policy aims to build and promote technology transfer capacity that will meaningfully support the socio-economic development endeavors of Ethiopia; Identifies IP as one of the critical issues; recognizes IP as an element of the national innovation system and enumerates a number of strategies to use IP as a tool in promoting technology transfer.

<sup>105</sup>The policy requires protection of breeder’s rights in Ethiopia.

<sup>106</sup>The policy provides that existing laws of the country related to copyright and other related rights shall be amended and new laws pursuant to the advanced technology shall be affected and the right of ownership of the people concerned shall be protected while traditional fine arts of the different nations and nationalities are put to use.

<sup>107</sup>See Sect. 45.6.3 of this chapter for additional details on the Growth and Transformation Plan.

- f. Strengthen linkage between the national and the international IP system, facilitate membership of Ethiopia to international IP agreements and maximize benefits from the opportunities offered.

Once the national government approves the draft IP policy and strategy, the implementation of the policy is expected to ensure effective use of IP in fostering accelerated national socio-economic development of Ethiopia and improvement in the welfare of Ethiopians.

### ***45.5.2 Intellectual Property Laws of Ethiopia***

The protection of IP is *recognized* by the 1994 Constitution of the Federal Democratic Republic of Ethiopia (FDRE). Article 40 *recognizes* the right to property over intangible assets. Moreover, Articles 51 (19) and 77 (6) expressly require the Federal Government to protect patents and copyrights. Since then, the following IP laws were enacted:

- a) Inventions, Minor Inventions and Industrial Designs Proclamation No. 123/1995;
- b) Inventions, Minor Inventions and Industrial Designs Regulations No. 12/1997;
- c) Copyright and Neighboring Rights Proclamation No. 410/2004;
- d) Trademark Registration and Protection Proclamation No. 501/2006;
- e) Trademark Protection and Registration Regulation No. 273/2012;
- f) Plant Breeders' Right Proclamation No. 418/2006; and
- g) Trade Practice and Consumers' Protection Proclamation No. 685/2010.

Moreover, there are other laws that complement each of the above IP laws. These include the 1960 Civil Code and the 2004 Criminal Code and the Customs Proclamation No. 622/2009, which are used to enforce IP rights against infringers. Discussing the IP laws of Ethiopia is beyond the scope and purpose of this chapter and is thus limited to the patent and PVP laws, particularly the provisions that impact food security.

There was no specific legislation that dealt with patents, utility models and industrial designs until May 1995. The first industrial property law Ethiopia, the Proclamation Concerning Inventions, Minor Inventions and Industrial Designs (referred to as "patent law"), and the implementing regulations were issued on May 10, 1995 and March 1997, respectively. The law states that a patent can be granted to a product or process invention.<sup>108</sup> The law does not exclude inventions based on the type of technology and extends patent protection to any invention in any field of technology.<sup>109</sup> In order to be patented, an invention must meet the

---

<sup>108</sup>Article 2(3) of the Patent law defines an 'invention' as an Idea of an inventor, which permits in practice the solution to a specific problem in the field of technology.

<sup>109</sup>This is in line with the requirement of the Article 27(1) of the TRIPS agreement in spite of the fact that country has not yet acceded to the agreement.

criteria of patentability: novelty, inventive step, and industrial applicability.<sup>110</sup> An invention is considered new if it does not form part of the state of art, which is the sum total of knowledge made available to the public, in any form or in any part of the world before the filing date or where appropriate prior to the priority date of the patent application.<sup>111</sup> An invention is inventive when it advances prior technological knowledge. An invention is presumed to be industrially applicable if it can be made or used in handicraft, agriculture, fishery, social service or any other sector.<sup>112</sup> The industrial applicability requirement refers to the fact that an invention must be more than an abstract theory and that it can be put into practice. Meeting these three criteria of patentability is still not enough to obtain a patent. The invention should also not fall under the category of excluded subject matters. These include plant or animal varieties or essentially biological processes for the production of plants or animals.<sup>113</sup> Plant or animal varieties are thus not patentable.<sup>114</sup> Moreover, inventions involving essentially biological process such as conventional breeding of animals and plants are excluded from being patented. Once a patent is granted, it is for an initial period of 15 years beginning from the date of filing of the application provided that annual fees are paid.<sup>115</sup> This period may be extended for an additional period of 5 years where proof is furnished that the invention is being properly utilized in Ethiopia.<sup>116</sup> A patent may be terminated or invalidated prior to the expiry of its duration when the patentee fails to pay the annual or maintenance fee during the prescribed period of time or when the invention is found not to be patentable or the description does not disclose the invention in a clear and complete manner for it to be carried out by a person skilled in the art.<sup>117</sup>

The exclusion of plant or animal varieties from patentability is justified based on technical and policy consideration. Plants or animals may not be patented in that they are found in nature and do not meet the requirements for patent protection such as novelty of inventions. The exclusion is also justified on the basis of public policy consideration that may include protecting plant varieties in a separate legal regime with distinct requirements and limitations, such as those that cater to the interest of small farmers.<sup>118</sup> The Issuance of the Plant Breeders' Right Proclamation No. 418/2006 discussed below reflects this public policy consideration.

---

<sup>110</sup> Article 3(1) of the patent law.

<sup>111</sup> *Id.*, Article 3(2).

<sup>112</sup> *Id.*, Article 3(5).

<sup>113</sup> *Id.*, Article 4(1) (b).

<sup>114</sup> It should be noted that the law does not exclude all inventions involving life forms from being patented. Microorganisms are not excluded. Biological materials that consist of microorganisms or resulted from non-essential biological processes are patentable.

<sup>115</sup> *Id.*, Articles 16 and 17(1).

<sup>116</sup> *Id.*, Article 16.

<sup>117</sup> *Id.*, Articles 17, 34 and 36.

<sup>118</sup> Mengistie (2013).

In order to address the potential adverse impact of these exemptions, the law provides various limitations and safeguards. Unlike other national patent laws and the TRIPS agreement,<sup>119</sup> the Ethiopian patent law does not recognize the right to prevent import of a patented product or a product made using a patented process as part of the exclusive rights conferred to the patentee.<sup>120</sup> This exclusion prevents abuse of a patentee and encourages the exploitation and use of a patented invention in Ethiopia.<sup>121</sup> This is in response to the fear that a patentee will use the monopoly power to control the domestic market and exploit a patented invention by importing the patented product or the product made using a patented process into the country.<sup>122</sup> The patentee also cannot prevent the use of a patented invention solely for the purposes of scientific research and experimentation.<sup>123</sup> This enables researchers in Ethiopia to use patented inventions for research purposes. However, this limitation forbids exploitation if the research result contains or falls into the claims made by the patent. The safeguards built into the law to prevent potential abuse by the right holder include issuance of a license authorizing the exploitation of a patented invention without the consent of the right holder. The patent office may initiate such an authorization or upon request of an interested party. The office may authorize a government agency or a third person to exploit a patented invention without the consent of a patentee where the public interest, in particular, national security, nutrition, health or the development of other vital sectors or the national economy, so requires.<sup>124</sup> The areas where public interest is presumed to exist are not exhaustive. There is thus a possibility of granting a compulsory license by the office in any other area or sector where public interest is deemed to exist. A compulsory license may also be granted to an interested party in the case of dependent inventions and when a patentee fails to exploit a patented invention without justifiable reason.<sup>125</sup> When a compulsory license is issued by the initiative of the patent office or upon request of an interested person, the patentee will be entitled to payment of an equitable remuneration that may be set by the office or the parties.<sup>126</sup> If the patentee is unhappy with the amount of remuneration, he has the right to appeal against the decision to the Federal High Court.<sup>127</sup>

VVP is a recent phenomenon in Ethiopia. There was no law governing the protection of plant varieties prior to 2006. The first law, which accords protection to new plant varieties, is the Plant Breeders' Right Proclamation, Proclamation

---

<sup>119</sup>Article 28 of the TRIPS agreement provides that the exclusive right conferred by a patent includes importing a patented product or a product made using a patented process.

<sup>120</sup>Article 22(2) of the patent law.

<sup>121</sup>Draft patent legislation explanatory note.

<sup>122</sup>*Id.*

<sup>123</sup>Article 25(1)(b) of the Patent law.

<sup>125</sup>For details of the requirements, *see Id.*, Articles 29–33.

<sup>126</sup>*Id.*, Articles 25(2) and 33.

<sup>127</sup>*Id.*, Articles 25(2) and 54.

No. 418/2006 (hereafter referred to as “plant variety protection or plant breeder’s right law”) that was enacted on 27 February 2006. Protection of a breeder right (PBR) is not available to all plant genera and species but to specified varieties,<sup>128</sup> that is new, distinct, uniform and stable and must not fall outside the list of protectable plant varieties. A plant variety is considered new if the variety is not commercialized prior to the date of application for a grant of a plant breeder’s right. Unlike the requirement of novelty for patentable inventions, non-commercial use of the variety and disclosure of the variety in any media prior to filing of the application will not defeat the novelty of the plant variety.<sup>129</sup> This makes the novelty requirement less stringent than a patent. For example, the description of the variety made available to the public through publication prior to the date of application will not result in loss of novelty of the plant variety, unlike in the case of a patent. A variety distinct when it is clearly distinguishable by one or more important characteristics from any other variety known at the time of filing of an application for protection.<sup>130</sup> A variety is uniform in that it must be homogeneous regarding the particular features of its sexual reproduction or vegetative propagation. Hence, the degree of uniformity is determined by taking into account the particular features of the variety’s propagation.<sup>131</sup> A variety shall be stable in the sense that its reproduction should remain unchanged in its essential hereditary characteristics.<sup>132</sup> The four criteria are similar to those provided under foreign PVP laws and the International Convention for Protection of New Plant varieties.<sup>133</sup> However, the fulfillment of these four requirements is not enough to obtain a plant breeder’s right. The plant variety should not fall outside of the list of plant varieties genera and species determined by a directive issued by the Ministry of Agriculture.<sup>134</sup> Moreover, proof must be produced that the breeder has obtained the genetic resource used to develop the variety in accordance with the law regulating access to genetic resources.<sup>135</sup> When these two additional requirements are met, a plant breeder right is granted. The holder of such a right has the exclusive right to sell or license other persons to sell the plants or propagating material of the protected variety and produce or license other persons to produce propagating material of the protected variety for sale.<sup>136</sup> A plant breeder’s right is validly protected for a period

---

<sup>128</sup> Article 3(1) of the plant variety protection law applies to new plant varieties of the genera and species determined by a directive that is issued by the Ministry of Agriculture and Rural Development (referred to as ‘Ministry of Agriculture’). However, such a directive is not yet put in place.

<sup>129</sup> *Id.*, Article 2(5).

<sup>130</sup> *Id.*

<sup>131</sup> *Id.*

<sup>132</sup> *Id.*

<sup>133</sup> *See*, for example, Article 5 of the 1991 Act of the International Convention for Protection of New Plant varieties, commonly known or referred to as UPOV 1991.

<sup>134</sup> The Ministry of Agriculture has not yet issued the directive that was envisaged under Article 3 (1) of the plant variety protection law.

<sup>135</sup> *Id.*, Article 14 (3).

<sup>136</sup> *Id.*, Article 5(1).

of 20 years in the case of annual crops and 25 years in the case of trees, vines and other perennial trees beginning from the date of acceptance of an application.<sup>137</sup> Such a right may, however, be revoked or terminated prior to the expiry of its duration for not meeting substantive requirements of protection or due to failure of the holder to discharge his obligations.<sup>138</sup>

The rights conferred by the law are exclusive in that no other person is entitled to perform any of these acts without the authorization of the right holder.<sup>139</sup> Unauthorized selling or production of the seed or propagating material of a protected plant variety constitutes infringement of the right and entails legal liability. It should be noted that the exclusive right conferred under the Ethiopian law is narrower than those provided in some national laws<sup>140</sup> and UPOV 1991.<sup>141</sup> The rights over a protected plant variety are limited to defined activities; namely, the sale of the plant or propagating material of a protected variety or production of a propagating material for sale. The right does not extend to other activities such as importation, storage or exportation of a propagating material. Moreover, there are exemptions from and restrictions imposed on the exclusive rights conferred under the PVP law. The exemptions entitle any person or farmer community to propagate, grow and use a protected variety for non-commercial purposes and to sell plants or propagating material of the protected variety for use as food or for any other use that does not involve growing the plant or the propagating material of the protected variety. It also allows selling plants or propagating material of a protected variety as long as they are within a farm or any other place where plants of the variety are grown and use plants or propagating material of a protected variety as an initial source of variation for the purpose of developing another new plant variety, except where the person makes repeated use of plants or propagating material of the variety for the commercial production of another variety and sprout a protected variety for use as food for home consumption or for the market. Lastly, it allows the use of a protected variety in further breeding, research or teaching and to obtain, with the conditions of utilization, a protected variety from gene banks or plant genetic centers.<sup>142</sup> Thus, the PVP law recognizes farmers' rights that stem from their contribution to the conservation and sustainable use of plant genetic resources and entitles them to save, use, multiply, process and sell farm-saved seed of protected varieties.<sup>143</sup> However, such a right does not extend to selling farm

---

<sup>137</sup>Id., Article 9.

<sup>138</sup>Id., Article 22.

<sup>139</sup>Id., Article 5(2).

<sup>140</sup>See, for example, the 1972 Seeds and Plant Variety Act, as amended in 2002, of Kenya. Section 20(1) provides that the exclusive right extends to produce reproductive material of the variety for commercial purposes, to commercialize it, to offer it for sale, to export it, to stock it for any of these.

<sup>141</sup>Article 14(1) of UPOV 1991.

<sup>142</sup>Id., Article 6(1).

<sup>143</sup>Id., Articles 27, 28 (1) (c) and 6 (1) (c). The farmer privilege is broader than what is recognized under the 1991 UPOV condition. It includes the right to sell farm saved seeds, which is not recognized under UPOV.

saved seed or propagating material of a protected variety in the seed industry as a certified seed<sup>144</sup> or in the seeds industry on a commercial scale.<sup>145</sup>

In addition to the above exemptions, the law restricts exclusive rights of a PBR holder upon consideration of public interest.<sup>146</sup> In other words, the holder of a PBR may not exercise his right to prevent the sale or production of the propagating material of a PVP without his consent when measure is taken to restrict the right. The Ministry of Agriculture also has the power to grant a compulsory license to safeguard public interest, upon application of an interested person, under specified conditions.<sup>147</sup> A compulsory license can only be granted when the holder is not producing and selling the propagating material of the PVP in sufficient amount to meet the needs of the general public and has refused to license other persons to produce and sell the propagating material of the protected variety; or unwilling to give such license under reasonable terms; or there is no condition under which the holder can be expected to give a permit to use his protected variety.<sup>148</sup> A person who is granted a compulsory license has an obligation to pay remuneration to the right holder. The Ministry of Agriculture will determine the amount of compensation, duration and other conditions of using the license.<sup>149</sup> However, this PVP law has not yet been implemented due to the lack of implementing regulations and directives envisaged by the law. Efforts are being made by the Ministry of Agriculture to amend the law and develop implementing regulations. One of the reasons behind the revision of the existing law is the complaint that the emerging flower and horticulture industry in the country is unable to access improved varieties from abroad, which affects its competitiveness in the export market.

The patent and PVP laws have provisions that can address food security related issues. Some of the provisions are broader or contrary to the requirements of relevant international treaties. This is possible as a result of Ethiopia's non-membership to a number of international IP agreements. At present, Ethiopia is a member of the 1981 Nairobi Treaty on the Protection of the Olympic Symbol, which it joined in 1982, and the Convention establishing the World Intellectual Property Organization that the country acceded to in 1998. This will soon change. Ethiopia is in the process of acceding to the WTO, which will require revising the laws to comply with the requirements of the TRIPs agreement. Moreover, there is a

---

<sup>144</sup>Id., Article 28(2).

<sup>145</sup>Id., Article 6(2).

<sup>146</sup>Article 7(1) of the Plant Variety Protection law provides that the Ministry of Agriculture has the power to restrict the exercise of a PBR where problems arise due to anti-competitive practices of the right holder; food security, nutritional or health needs or biological diversity are adversely affected; a high proportion of a protected variety offered for sale is being imported; and the requirements of the farming community for propagating material of a particular protected variety are not met; and where it is considered important to promote public interest for socio-economic reasons and for developing indigenous and other technologies.

<sup>147</sup>Id., Article 8(1).

<sup>148</sup>Id., Article 8(2).

<sup>149</sup>Id., Article 8(3).

growing recognition of the need to join relevant international IP agreements and efforts are being made by the Ethiopian Intellectual Property Office to develop accession proposals that will be submitted to the government for approval.<sup>150</sup> The economic partnership agreement that the country is negotiating with Eastern, Central and Southern Africa countries, and the European Union will include a chapter on IP that may erode the flexibilities available in international IP treaties such as the TRIPS Agreement and will require making changes to the existing law.<sup>151</sup> The changes due to these new developments and their implication for food security concerns remain to be seen.

## **45.6 Food Security Policies and Laws of Ethiopia and IP Issues**

### ***45.6.1 Relevant Policies***

Enhancement of food security in least developed countries such as Ethiopia requires a package of policies that address the production and marketing of agricultural products.<sup>152</sup> This is well recognized in Ethiopia. There are relevant policies, strategies and plans issued by the current government that aim at realizing or supporting food security in the country.<sup>153</sup> These include the:

- a) Agriculture Led Industrialization Strategy;
- b) Growth and Transformation Plan;
- c) Rural Development Policy and Strategies;
- d) Food Security Strategy;

---

<sup>150</sup>Draft National IP Policy and Strategy.

<sup>151</sup>The EU has concluded similar agreements with other developing countries that belong to the African, Caribbean and Pacific (ACP) groups such as CARIFORUM consisting of Antigua and Barbuda, the Bahamas, Barbados, Belize, Dominica, the Dominican Republic, Grenada, Guyana, Haiti, Jamaica, Saint Lucia, St Kitts and Nevis, St Vincent and the Grenadines, Suriname and Trinidad and Tobago. See Malcolm Spence, "Negotiating Trade, Innovation & Intellectual Property: Lessons from CARIFORUM EPA — Experience from a negotiator's Perspective," UNCTAD-ICTSD Project on IPRs and Sustainable Development, Policy Brief No. 4 (September 2009).

<sup>152</sup>Blakeney (2009), p. 88.

<sup>153</sup>It should, however, be noted that the previous governments, namely the Imperial regime (1930 to 1974) and the Military government (1974 to 1991) had taken similar measures to enhance agricultural productivity and deal with the problem of food insecurity. However, the measures were not as extensive and comprehensive as the present government. In addition to the federal government, regional governments have also issued policies and strategies to foster sustainable development and support the goal of attainment of food security at the house hold level. The discussion in this section, however, is limited to federal policies, strategies and plans of the present regime.

- e) National Seed Industry Policy;
- f) Science, Technology and Innovation Policy<sup>154</sup>;
- g) Agricultural Research policy;
- h) National Population Policy (NPP)<sup>155</sup>;
- i) Conservation Strategy of Ethiopia (“CSE”)<sup>156</sup>;
- j) Environment Policy; and
- k) Biodiversity Policy.

The brief review of the relevant policies, strategies and plans in this section is limited to those that give emphasis to agriculture, involve IP issues and can be supported by IP. Gaps and weaknesses of the policy instruments are identified and the extent to which the existing IP system may complement identified policy goals and support implementing strategies is examined below.

### 45.6.2 *Agriculture Led Industrialization Strategy*

Ethiopia’s economic growth and development is intrinsically linked to the development of its agriculture sector. The country is highly dependent on this sector for income, employment and export earnings. As a result, the government adopted the Agricultural Development Led Industrialization Strategy (ADLI) in 1993<sup>157</sup> as a long term development strategy for sustainable economic development in which agriculture is its driving force. ADLI aims to increase agricultural production and productivity in order to improve the living conditions of majority of its population and enhance export earnings to finance investment in the industrial sector and support other development efforts of the country. The strategy focuses mainly on

---

<sup>154</sup>The Science, Technology and Innovation Policy of the Federal Democratic Republic of Ethiopia, which was issued in 2012 replacing the national science and technology policy that was adopted in 1993, aims to build and promote technology transfer capacity that will meaningfully support the socio-economic development endeavors of Ethiopia. The policy is relevant to food security in that the development of indigenous technological capability will help generate new and improved technologies that may enhance agricultural productivity and facilitate effective transfer of technology.

<sup>155</sup>The national population policy of Ethiopia that was issued in April 1993 is relevant to food security in that it aims to deal with the problem of increased population that had an adverse impact on agricultural production and natural resources. The policy aims to harmonize population growth rate and the capacity of the country for development and rational utilization of natural resources to maximize the level of welfare of the population over time. For details of the policy, its impact and the challenges faced, see Minas (2008), pp. 23–45.

<sup>156</sup>The Conservation Strategy of Ethiopia, which was issued in 1997, is an umbrella strategy that considers all sectors of human activity and provides a comprehensive cross-sectorial analysis of conservation and resource management issues. The strategy will help to arrest environmental degradation, which affects agricultural productivity and food security.

<sup>157</sup>The strategy was adopted by the transitional government of Ethiopia and continues to guide the development policies and strategies of the present government.

rural development<sup>158</sup> and industries that will optimize use of abundant resources such as labor and land against the scarce resource-capital. The strategy envisages that improved farm income will generate sufficient demand for the industrial sector instigating dynamism and inter sectorial linkages.

A number of sectorial policies and strategies, including the food security strategy, reflect and complement the goals and policy directions of ADLI. IP can support ADLI by providing incentives that will stimulate inventive and innovative activities, encourage investment and facilitate transfer of technology.

### ***45.6.3 Growth and Transformation Plan***

The Federal Democratic Republic of Ethiopia has a 5 year Growth and Transformation Plan (GTP) covering the period 2010/11 to 2014/15, which was adopted by the Council of Ministers and House of People's Representatives to carry forward the important strategic directions pursued in the Plan for Accelerated and Sustained Development to end poverty (PASDEP).<sup>159</sup> The GTP outlines the areas of emphasis and measures that will be taken to enhance agricultural production and productivity, manage natural resources and the environment, develop livestock resources of the country, and put in place a transparent, efficient and effective marketing system in order to ensure food security. In particular, the section related to increasing agricultural production and productivity focuses on strengthening agricultural research, encouraging the adoption, use and transfer of foreign technologies, attracting investment, and improving competitiveness of agricultural export products in the international market. The plan's target is to decrease the number of households in safety net program from 7 million to 1.3 million and increase the country's food reserve from 0.41 million tons to 3 million tons at the end of the plan period.

The strategies and measures set forth by the GTP can be meaningfully supported by IP. The GTP acknowledges the significance of IP and enumerates the measures that will be taken to support Ethiopia's development efforts. The plan prioritizes IP rights to encourage local innovators to build local technological capacity; strengthens the use of IP as a tool for economic development; and recognizes the significance of technological information in supporting indigenous innovative activities and meeting technology needs. The latter requires that information from 5 million patents be used for technology transfer and adaptation during the plan period.

---

<sup>158</sup>The strategy emphasizes increasing the productivity of small farmers and promotes expansion of large-scale private commercial farms.

<sup>159</sup>PASDEP was the second 5 year plan that covered the period 2005–2010 following the Sustainable Development Plan to Reduce Poverty (SDPRP) that was implemented during 2000/1 to 2004/05. Each of these plans, including GTP, aimed at reducing poverty and enhancing socio-economic development within the framework of ADLI.

#### ***45.6.4 Rural Development Policy and Strategies***

The Rural Development Policy and Strategies was issued in April 2003 to guide rural and agricultural development to ensure rapid economic growth, enhance benefits for the people, eliminate the country's dependence on foreign aid, such as food assistance, and promote the development of a market oriented economy. The policy is articulated based on the recognition of factor endowments of the country. These include the scarcity of capital and abundance of labor and land resources, the contribution of agriculture in accelerating economic growth, and the linkage between the agricultural sector growth to the development of other sectors, like trade and industry.

The policy defines strategies aimed at fostering rural and agricultural development in general and addressing specific food security issues. These strategies include increasing agricultural productivity, improving natural resources management and development, producing marketable output of acceptable quality, improving the marketing system, facilitating access to finance, developing rural infrastructure, encouraging private sector participation and attracting foreign investment. IP can meaningfully support some of these strategies by providing an environment that encourages the generation of new and improved agricultural technologies and facilitates the transfer and use of foreign technologies.

#### ***45.6.5 Food Security Strategy***

Ethiopia issued the first and current food security strategies in 1996 and 2002, respectively, to ensure food security at the household level in food insecure rural areas.<sup>160</sup> The current food security strategy divides food insecurity as chronic<sup>161</sup> and acute<sup>162</sup> but recognizes the interrelationship between the two.<sup>163</sup> Unlike the 1996 food security strategy, the present strategy recognizes the need to maintain,

---

<sup>160</sup>Many criticize the limitation on the scope of this strategy since there are food insecure households in rural areas that are considered food secure as well as in urban areas. See, for example, Negatu (2008).

<sup>161</sup>Chronic food insecurity reflects the situation where households face food shortage because of overwhelming poverty and lack of assets. The shortage is permanent since food insecure people require food assistance in any given year even where there are no natural or manmade shocks. Chronic food insecure households live mainly in drought prone, moisture deficit areas and peripheral pastoral areas that do not produce enough food and do not have enough income to purchase food from the market.

<sup>162</sup>This is a situation where food shortage is caused as a result of natural or manmade shocks such as drought and war. The impact of the shock is temporary and the food shortage can be met with short term assistance.

<sup>163</sup>The division is theoretical in that unpredictable shocks do not suddenly lead to acute food insecurity unless people are already very poor, as in the case of the chronically food insecure.

develop and sustain the environment necessary to meet food security. This strategy is based on three pillars: increasing the availability of food through increased domestic production, ensuring access to food for food deficit households and strengthening emergency response capabilities. A number of programs were developed and implemented to realize the goals of this strategy.<sup>164</sup> The productive safety net program (PSNP), implemented in 2005 targeted approximately 5 million chronic food insecure people.<sup>165</sup> It aimed to prevent asset depletion at the household level and create assets at the community level by providing employment opportunities in public works to those who are able and giving cash or food to those unable to work in chronically food insecure areas.<sup>166</sup>

IP can support the food security strategy by providing incentives to persons that engage in the generation of new or improved agricultural technologies such as agricultural implements and disease and drought resistance and high yielding varieties that help increase agricultural production and enhance agricultural productivity.

#### ***45.6.6 National Seed Industry Policy***

The National Seed Industry Policy was approved in October 1992. The policy is very broad since it is not confined to seed improvement, development and utilization as one may expect from its name. In fact, it deals with a number of broad biodiversity and R&D issues that should have been left to separate policies.

One of the major objectives of the national seed industry policy is to develop an effective system to produce and supply high quality seeds of important crops to satisfy national seed requirements. The generation of improved seeds that enhance agricultural productivity and meet the need for food security involves research that requires investment, time and effort. Such an investment may not be possible in the absence of IP protection. This is recognized by the policy itself when it envisaged the enactment of a law that will protect Plant Breeders' Rights. The issuance of the Plant Breeders Proclamation in 2006 is believed to emanate from the policy direction set under the national seed industry policy.

---

<sup>164</sup>These include the productive safety net program ("PSNP"), voluntary resettlement, Household Asset Building Program (HABP), which aims to build assets for food insecurity vulnerable households, and a Complementary Community Investment facility (CCI) meant to Identify and fund small-scale community infrastructure to establish essential community assets. See Rahmato (2013), p. 117.

<sup>165</sup>This figure has increased to 8 million in 2008. See Negatu (2008).

<sup>166</sup>Id., pp. 12–13.

### **45.6.7 Agricultural Research Policy**

The Agricultural Research Policy, issued in 1993, has broad and specific policy objectives and policy directions relevant to food security. The overall objective of the policy is to enhance the use of science and technology in agriculture and to give clear direction and guidance for agricultural research and application of research results in agricultural development. The specific policy objectives include target oriented, coordinated and integrated research in various agricultural fields to solve major agricultural problems in Ethiopia while simultaneously focusing on the protection and development of the environment. A number of policy directives and strategies are specified to realize these objectives. These include undertaking research to generate and select technologies that will enhance agricultural productivity, help overcome environmental problems such as erosion, land degradation and deforestation and enable sustainable use of natural resources.

IP can be used to support agricultural research endeavors and protect research results. The technological information contained in patent documents can be used to reproduce technologies that are already available but not validly protected in Ethiopia, enabling researchers to keep abreast of current developments and reorient research endeavors.<sup>167</sup> Moreover, the IP system can be used to protect and exploit agricultural research results. Public research and higher learning institutions in Ethiopia mainly do agricultural research. However, there is no clear policy direction on the ownership of research results made using public resources. This gap is well recognized. Efforts are being made to develop and implement institutional IP policies by public higher learning and R&D institutions such as the Addis Ababa University and the Ethiopian Institute of Agricultural Research.<sup>168</sup>

### **45.6.8 Environment Policy**

The Environment Policy was adopted in April 1997 to ensure a sustainable socio-economic development of the country through sustainable management and utilization of natural, manmade and cultural resources and the environment. The environmental policy gives due attention to the conservation and utilization of biodiversity resources that can support food security. The policy acknowledges community IP rights and explicitly states the need to create a system for the protection of community IP rights. The concept of community rights is a new concept. It is very difficult to define the subject matter of protection, who the holders of such a right are, and how the right will be acquired, exercised and

---

<sup>167</sup>For details of the role of the patent system as a source of valuable technological information that can be used to strengthen and support research and innovative endeavors, see Mengistie (2010b), *parts I and II*. Int. T.L.R.

<sup>168</sup>Background study for the draft National IP policy.

enforced. Moreover, the concept of property in its conventional sense is difficult to apply for community achievements that are not considered a commodity and are freely exchangeable. It may be due to this problem that the African model legislation for the recognition and protection of local communities, farmers and breeders<sup>169</sup> deal with community rights and community intellectual rights without referring to property.<sup>170</sup> Moreover, the concept of community IP is different from the conventional intellectual property rights (IPRs), which are private rights. The current IP regimes are designed to protect readily identifiable and new contributions to existing knowledge. Community knowledge is gradually built over decades or centuries and often lacks novelty in the sense required by the existing IPR regime.

The community IP rights envisaged in the environmental policy requires the development of a *sui generis* system that defines and safeguards such rights. However, such a *sui generis* system is not yet in place. The Access to Genetic Resources and Community Knowledge, and Community Rights Proclamation No. 482/2006 is devoted to community rights, such as community knowledge associated to genetic resources but not community IPRs.

#### **45.6.9 Biodiversity Policy**

On April 23, 1998, the Ethiopian government adopted the National Policy on Biodiversity Conservation and Research, which explicitly targets the conservation, development and sustainable use of biological resources as well as equitable sharing of benefits. The rationale behind the adoption of the policy is stated in the preamble as follows:

Lack of comprehensive guidelines, awareness and appreciation of plant, animal and microbial genetic resources importation, and exportation and exchange activities has resulted in the movement of genetic resources into and out of the country in unregulated and uncoordinated manner. This has resulted in the loss of benefits from valuable indigenous genetic resources and in the introduction of unverified genetic materials, diseases, pests and weeds in the country. The National Policy on Biodiversity Conservation and Development is formulated based on the rational that the conservation of biodiversity is one of the conditions of the overall socio-economic development and sustainable environmental management goals. Hence, because of its vital importance in the socioeconomic well-being of the Ethiopian people, the conservation, proper management and the use of biodiversity need to be supported by policy, legislation and national capacity building.

The policy is tailored to a number of provisions of the Convention on Biological Diversity (CBD), which Ethiopia had joined in 1994. The national biodiversity policy recognizes the sovereign right of Ethiopia over its biological resources and provides guidance on the conservation and sustainable utilization of biological

---

<sup>169</sup>The OAU head of summit adopted a model law on protection of community rights in Ouagadougou, Burkina Faso in 1998.

<sup>170</sup>Ekpere (2001).

resources as well as regulation of access to biological resources and benefit sharing in compliance with the CBD requirements. The policy supports food security by facilitating the conservation, development and use of genetic resources that are essential for agricultural production. Moreover, the sharing of monetary and non-monetary benefits with local communities supports food security not only by providing income-generating opportunities but also by making new and improved technologies accessible and building capacity.

Access to genetic resources and benefit sharing raise IP issues that can be addressed by IP laws. Moreover, IP laws can be a tool to complement the objectives of this policy by facilitating sharing of equitable benefits by requiring disclosure of the origin of these genetic resources. The extent to which the existing IP laws address IP issues and complement objectives of the biodiversity policy and the access and benefit sharing law issued under the policy will be discussed under the subsequent section where laws relevant to food security are examined.

## 45.7 Relevant Laws for Food Security

Instruments such as laws and institutional arrangements should support the implementation of various policies and strategies related to food security. There are a number of relevant laws and institutions that can facilitate implementation and contribute to food security at the household level. These include:

- a) Constitution of the Federal Democratic Republic of Ethiopia, Proclamation No. 1/1995 (here in after referred to as “constitution”);
- b) Federal Democratic Republic of Ethiopia Rural Land Administration and Land Use Proclamation No. 456/2005;
- c) Access to Genetic Resources and Community Knowledge, and Community Rights Proclamation No. 482/2006;
- d) Access to Genetic Resources and Community Knowledge, and Community Rights Council of Ministers regulation No. 169/2009;
- e) Ethiopia Commodity Exchange Proclamation No. 550/2007;
- f) Coffee Quality Control and Marketing Proclamation No. 602/2008,
- g) Coffee Quality Control and transaction Council of Ministers Regulation No. 161/2009;
- h) Sesame and White Pea beans, council of Ministers regulation no. 178/2010;
- i) Definition of Powers of the Executive Organs of the Federal Democratic Republic of Ethiopia Proclamation No. 691/2010<sup>171</sup>;

---

<sup>171</sup>Article 19 of this law defines the powers and duties of the Ministry of Agriculture, which include the power and duty to formulate and facilitate the implementation of a strategy for natural resources protection and development through sustainable agricultural development; build capacity for supplying, distributing and marketing of agricultural inputs; ensure the supply of inputs; undertake disaster prevention and preparedness activities and ensure proper implementation of

- j) Forest Development, Conservation and Utilization Proclamation No. 542/2007;
- k) Agricultural Transformation Council and Agency Establishment Council of Ministers Regulation No. 198/2010<sup>172</sup>;
- l) Emergency Food Security Council of Ministers Regulations No. 67/2000;
- m) Seed Proclamation No. 20612000;
- n) Ethiopian Agricultural Research Organization Establishment Proclamation No. 79/97 as amended by Proclamation No. 328/2004;
- o) Biosafety Proclamation No. 655/2009;
- p) Environmental Impact Assessment Proclamation No. 299/2002;
- q) Environment Protection Organs Establishment Proclamation No. 295/2002; and
- r) Institute of Biodiversity Conservation and Research Establishment Proclamation No. 120/1998 as amended by Proclamation No. 381 /2004.

It will be difficult to discuss each of the above laws due to space and time constraints. As a result, an attempt is made to cite relevant provisions of some laws mentioned above in foot notes when the law's title is not self-explanatory to its link to food security. Discussion is limited to selected laws that focus on land tenure, access and benefit sharing resulting from use of genetic resources, and marketing of agricultural products. Each of these laws can support agricultural production and marketing of agricultural products and serve as examples to highlight linkage with food security and explore relevant issues.

### **45.7.1 Land Law**

An appropriate land tenure system can ensure or foster food security. Such a system creates a sense of stability and security as well as encourages landholders to conserve and utilize the land and resources thereon on a long-term basis. The Ethiopian Constitution declares that the right to ownership of rural land as well as of all natural resources is exclusively vested in the state and in the peoples of

---

food security programs; ensure creation of an enabling environment for the provision of credit facilities to farmers and pastoralists; monitor events affecting agricultural production and set up an early warning system; establish a system whereby stakeholders of agricultural research coordinate their activities and work in collaboration; and expand small-scale irrigation schemes to enhance agricultural development.

<sup>172</sup>The Council, which is chaired by the Prime Minister and consists of Ministers from relevant Ministries and the Director General of the Agency, has powers and duties that include providing leadership in identifying, designing and effectively implementing solutions to basic hurdles of agricultural development and providing policy directions and leadership to ensure that effective coordination is realized among different actors involved in agricultural development. (See Articles 4 (1) and 5(1)). The Agricultural Transformation Agency, accountable to the Ministry of Agriculture and established under this law, identifies systemic constraints of agricultural development by conducting studies, recommends solutions to ensure sustainability and structural transformation, and supports the establishment of strong linkages among agricultural and related institutions and projects to ensure the effectiveness of agricultural development activities. (See Articles 7 and 9).

Ethiopia<sup>173</sup> and that the federal government has the duty to enact laws for the utilization and conservation of land and other natural resources.<sup>174</sup> There are federal and regional land laws that define rights and obligations related to land in conformity with the Federal Constitution. The federal law that governs rural land use and administration is the Federal Democratic Republic of Ethiopia Rural Land Administration and Land Use Proclamation No. 456/2005 (herein after referred to as the “federal land law”). Regional land use and administration laws are enacted by regional governments based on the federal land law,<sup>175</sup> which specifies the basic principles of rural land distribution and utilization and defines the ownership and land use rights.

The federal land law states that ownership of land belongs to the state and peoples of Ethiopia. Individuals have a land use right called “holding right.” This right refers to the right of any peasant farmer or semi-pastoralist or pastoralist to use rural land for the purposes of agriculture and natural resource development, lease and bequeath it to members of his family or other lawful heirs, the right to acquire property produced on his land thereon by his labor or capital, and to sale, exchange and bequeath same.<sup>176</sup> A holding right may or may not be limited in time depending on who has the holding right. The rural land use right of peasant farmers, semi-pastoralists and pastoralists is not limited in time while the duration of the right of others, such as private investors, is determined by the rural land administration laws of regions.<sup>177</sup> In order to ensure security of land tenure, the law provides for registration and issuance of land holding certificate<sup>178</sup> and prohibits eviction or displacement from the land unless for the purpose of public use. A person who is evicted from his land is entitled to compensation proportional to the development he has made on the land and the property acquired, or will be given substitute land.<sup>179</sup>

Some argue that the present land tenure system hinders an increase to agricultural productivity and achievement of food security at the house hold level. Dessalegne, for example, argues that the current land regime is inflexible and a barrier to enterprising endeavors, inhibiting peasant initiative and increased effort.<sup>180</sup> Since land is state owned, farmers do not have the right to sell or mortgage land. Moreover, the government has the power to distribute land,<sup>181</sup> creating fear

---

<sup>173</sup> Article 40(3) of the Constitution of the Federal Democratic Republic of Ethiopia, Proclamation No. 1/1995.

<sup>174</sup> *Id.*, Article 51(5).

<sup>175</sup> Article 17(1) of the federal land law provides that each regional council shall enact rural land administration and land use law consisting of detailed provisions necessary to implement the federal land use and administration proclamation.

<sup>176</sup> *Id.*, Article 2(4).

<sup>177</sup> *Id.*, Article 7.

<sup>178</sup> *Id.*, Article 6.

<sup>179</sup> *Id.*, Article 7(3).

<sup>180</sup> Rahmato (2013), p. 128.

<sup>181</sup> Article 9 of the federal land law.

and insecurity of land use. The law recognizes that the holder of rural land use right has a right to transfer his right. However, such a right is highly restricted. Transfer of land through inheritance is limited to family members who permanently live with the holder of holding right and shares the livelihood of the latter.<sup>182</sup> Moreover, use of land through rental is subject to a number of conditions including the size of land to be rented and the duration of land rent. A holder of rural land use right can only rent out a portion of his land,<sup>183</sup> which in some regions cannot be more than half of his plot of land.<sup>184</sup> Short-term rents also cannot exceed 2 years and long-term rent cannot be more than 25 years.<sup>185</sup> The land lease agreement is valid only if it secures the consent of all the members who have the right to use the land and is approved and registered by the competent authority.<sup>186</sup>

### ***45.7.2 Access and Benefit Sharing Law***

Ethiopia's genetic resources have been accessed freely and in an unregulated manner for years due to the attitude that prevailed not only in Ethiopia, but also elsewhere, before the adoption of the Convention on Biological Diversity ("CBD").<sup>187</sup> Biological resources were considered as the "common heritage of mankind." The CBD, for the first time, recognized sovereign rights of states to regulate access to genetic resources within their jurisdictions.<sup>188</sup> However, such a right is accompanied by an obligation to enable access to genetic resources. The convention requires member states to create conditions to facilitate access to genetic resources for environmentally sound uses and not impose restrictions that run counter to CBD's objectives.<sup>189</sup>

CBD is a framework agreement, which merely prescribes principles, overall goals and basic rules. Thus, a national legal framework should be put in place to complement the convention. The convention itself calls on the contracting parties to take legal, policy and administrative measures that facilitates access to genetic resources by other parties and ensures fair and equitable sharing of benefits.<sup>190</sup>

---

<sup>182</sup>Id., Article 2(5).

<sup>183</sup>Article 8(1) of the federal land law provides that peasant farmers, semi pastoralist and pastoralist who are given holding certificates can lease to other farmers or investors land from their holding of a size sufficient for the intended development in a manner that shall not displace them.

<sup>184</sup>Rahmato (2013), p. 127.

<sup>185</sup>Id.

<sup>186</sup>Article 8(2) of the federal land law.

<sup>187</sup>The convention was adopted in 1992 at the UN conference on environment and development and entered into force on December 29, 1993. Ethiopia signed the Convention in 1992 and ratified it on 31 May 1994.

<sup>188</sup>Article 15(1) of the Convention on Biodiversity.

<sup>189</sup>Id., Article 15(2).

<sup>190</sup>Id., Article 15(7).

Accordingly, Ethiopia adopted the national biodiversity conservation policy that affirms their sovereign right over its biological resources, established the Institute of Biodiversity,<sup>191</sup> and enacted the Access to Genetic Resources and Community Knowledge, and Community Rights Proclamation, Proclamation No. 482/2006 (referred to as the “Access and Benefit Sharing (“ABS”)” law),<sup>192</sup> which requires a permit to access genetic resources. This law was established to conserve biodiversity and ensure sustainable use of resources for the benefit and development of the people, recognize the contribution of local communities in the conservation, development and sustainable utilization of biodiversity resources, and comply with CBD requirements.<sup>193</sup> The law aims to ensure that the country and its communities obtain fair and equitable share of benefits arising from the use of genetic resources and to promote the conservation and sustainable utilization of the country’s biodiversity resources.<sup>194</sup>

The ABS law defines the preconditions, requirements and procedures to obtain access permit and the obligations of an access permit holder. One of the preconditions is that the state and the concerned communities shall obtain fair and equitable share of benefits arising from the utilization of genetic resources (GRs) and community knowledge accessed.<sup>195</sup> The list of monetary and nonmonetary benefits includes license fee, upfront payment, milestone payment, royalty, research funding, joint ownership of IP rights, employment opportunity, participation of Ethiopian nationals in research, priority to supply raw materials of genetic resources for producing products from there, access to products and technologies developed through the use of the GRs or community knowledge, training at both institutional and local levels, provision of equipment, infrastructure and technology support and other benefits as appropriate.<sup>196</sup> The list of benefits is not exhaustive but illustrative. This allows room for negotiation and provision for other forms of benefits that were not envisaged during the enactment of the law. The obligations of access permit holder include negotiating new agreement with the Institute of

---

<sup>191</sup>The Institute, established in 1998 by Institute of Biodiversity Conservation and Research Establishment Proclamation No. 120/98, was called the Institute of Biodiversity and Research. Articles 6(2), 12 and 13 of this law respectively states that genetic resources cannot be accessed without permit. Permit is required for the collection, dispatching, importing or exporting of any biological specimen or sample. Engaging in any of these activities without securing a permit constitutes a criminal offence punishable with 5–10 years of imprisonment and a fine of fifteen to twenty thousand Birr.

<sup>192</sup>The law was enacted in February 2006, nearly 13 and 9 years after the country joined the CBD and adopted a national biodiversity policy, respectively.

<sup>193</sup>See preamble of the ABS law.

<sup>194</sup>*Id.*, Article 3.

<sup>195</sup>*Id.*, Article 12(3).

<sup>196</sup>*Id.*, Article 19.

Biodiversity<sup>197</sup> based on relevant Ethiopian laws when he seeks to acquire IP rights over the genetic resources.<sup>198</sup> Moreover, the access permit holder has a duty to recognize the locality from where the genetic resource was accessed in the application for IP protection of the product developed using the genetic resource.<sup>199</sup> Such a requirement helps prevent bio-piracy and facilitates equitable sharing of benefits arising from the use of genetic resources. However, existing IP laws do not have similar provisions to complement this requirement. Both plant breeders' and patent laws do not require applicants to indicate the origin of genetic resources used to develop the product for which a patent or plant breeder's right is sought for. This gap is recognized and the draft national IP policy requires revision of the IP laws to complement the ABS law and contribute to the realization of national biodiversity policy objectives.

The ABS law supports the policies and strategies related to food security and will contribute to furthering food security at the household level. For example, the requirement of benefit sharing with communities<sup>200</sup> can serve as a source of off-farm income, meet the need for access to improved agricultural technologies and seeds, and build the capacity of farmers, thereby improving agricultural productivity through non-monetary forms of benefit sharing.<sup>201</sup> It is easier to state the potential contribution of the ABS regime based on its relevant provisions than corroborating it by tangible evidences in Ethiopia.

The number of access agreements is very few and each of them could not live up to its expectations.<sup>202</sup> An example is the *teff* agreement concluded between the Ethiopian Institute of Biodiversity Conservation and a Netherlands Company, Health and Performance Food International (referred to as "the genetic resource recipient" or the "company"), to enable the genetic resource recipient to access and use specified *teff* genetic resources to develop food and beverage products specified in the agreement. These products were considered to have considerable marketing potential in Europe and the USA because *teff* is gluten-free and high in nutritional

---

<sup>197</sup>The Institute is the competent government authority entrusted with the implementation of the law and issuance of permit to access genetic resources. See Articles 12 and 13 of the Institute of Biodiversity Conservation and Research Establishment Proclamation, Proclamation No. 120/1998 and Article 6 (12) of Institute of Biodiversity Conservation and Research Establishment (Amendment) Proclamation. No. 381/2004.

<sup>198</sup> Article 17(12) of the ABS law.

<sup>199</sup> *Id.*, Article 17(14). Please note that there is a difference in the Amharic (the national working language) and English versions of the provision. The Amharic version refers to "intellectual property application" while the English version refers to "commercial property application". The problem seems to be poor translation. Where there is nonconformity between the Amharic and the English versions, the former prevails over the latter. The Amharic version is always the governing version.

<sup>200</sup> Article 9(2) of the ABS law provides that local communities have the right to obtain 50% of the benefit shared by the state in the form of money and such money shall be used to the common advantage of local communities.

<sup>201</sup> The rest of non-monetary benefits listed by the ABS law can also contribute and support the endeavor to ensure food security at the household level.

<sup>202</sup> Reported access and benefit sharing agreements in addition to *teff* include the Vernonia agreement, which has also failed. See Andersin and Winge (2012).

value.<sup>203</sup> The agreement offers various forms of benefit sharing, namely lump sum upfront payment, annual royalty payment, license fees, research collaboration, sharing of research results, develop *teff* business in Ethiopia, and an annual contribution of 5% of the company's net profit, which should not be less than 20,000 Euros per year, to a fund used to improve living conditions of local communities.<sup>204</sup> The agreement was lauded as the most advanced of its time and expectations were high.<sup>205</sup> However, little of the expected benefits were gained. The company was declared bankrupt in 2009 and the only benefit that Ethiopia received was a payment of 4000 Euros and a small research project that was discontinued in less than a year.<sup>206</sup> The genetic resource recipient transferred values to new companies that were established before its bankruptcy and the new companies continued with the production and sale of *teff* products.<sup>207</sup> Ethiopia had no recourse against the new companies as they are not party to the agreement. The failure of the *teff* agreement had an adverse impact as the Ethiopian authorities have now become reluctant to enter into agreements.<sup>208</sup>

### 45.7.3 Law Governing Marketing of Agricultural Products

One of the factors that affect food security at the household level relates to market value of agricultural products. Farmers lack capacity to store agricultural products, bigger markets are inaccessible, a lack of market information is profound, and abusive market power of intermediaries is high. The majority of small farmers do not have capacity to store their grain and have no income outside of agriculture that will enable them to wait for a season when the prices of agricultural products are relatively higher. It was noted that 79% of grain sales occur during the primary harvest season (January–March) owing to farmers' fear of storage loss and urgent need for cash.<sup>209</sup> The sale of grains often takes place in small markets that are close to farmers due to a lack of modern transport that can help them reach bigger markets.<sup>210</sup> The market position of farmers is weak since they do not have information on current market price and often take the price offered by buyers.

Cognizant of this problem, the government enacted the Ethiopia Commodity Exchange, Proclamation No. 550/2007. The objectives of this law include creating an efficient, transparent, and orderly marketing system that serves the needs of

<sup>210</sup>Id.

buyers, sellers and intermediaries, promotes increased market participation of small scale Ethiopian producers, provides a centralized trading mechanism in which bids are coordinated through a physical trading floor with open bidding or an electronic order matching system or both and provides timely market information to the public.<sup>211</sup> The Ethiopian Commodity Exchange (ECX) started operation as a coffee transaction center in November 2008 and later included sesame and white pea beans. It currently serves as a marketplace for these three agricultural products where transactions are conducted in a transparent manner, as required by the exchange and relevant laws dealing with quality control and marketing of each product.

The Coffee Quality Control and Marketing Proclamation, Proclamation No. 602/2008 and the Sesame and White Pea Beans Council of Ministers, Regulation No. 178/2010<sup>212</sup> define where and how the product transactions will be made as well as outline the obligations of the persons involved in coffee, sesame and white pea beans transactions. The coffee quality control and market law requires that coffee transaction take place at designated primary transaction centers and<sup>213</sup> the auction centers or local markets of the Exchange that were established by the Ministry of Agriculture & Rural Development or an appropriate regional body.<sup>214</sup> The laws define the obligations of persons involved in the transaction and services of each product.<sup>215</sup> Failure to comply with the requirements and obligations of the laws constitutes a punishable criminal offence.<sup>216</sup> The penalty provided under the Coffee Quality Control and Marketing Proclamation include a fine of Birr 20,000 (about \$1000 USD at the current exchange rate) and imprisonment of at least 1 year but not exceeding 3 years.<sup>217</sup> The sesame and white pea beans regulation does not specify the penalty and leaves for the punishment to be determined in accordance with the relevant provisions of the criminal code.<sup>218</sup>

The establishment of the ECX, which is the first of its kind in Sub-Saharan Africa and hailed as a big step forward in the fight for transparency and against

<sup>218</sup> Article 26 of the Sesame and White Pea Beans Council of Ministers, Regulation No. 178/2010.

market power abuse by the intermediaries, enables farmers to take their crops to a nearby warehouse, agree with the manager on the quality grading and present their minimum offering price, which can be modified within a month without a penalty or after a month with penalty.<sup>219</sup> The open market system, supported by electronic means, enables farmers to follow market price information for each agricultural product through their cell phones.<sup>220</sup> Such transparent marketing system has improved the farmers' negotiating position and income. According to a study by ECX, farmers now receive, on average, 65 % of the trading price.<sup>221</sup> It is important to note that this trading arrangement does not include all or bulk of the agricultural products of small farmers; it is limited only to three of the cash crops.<sup>222</sup> Nevertheless, this positive development can improve the income of small farmers and help ensure food security at the household level.

## 45.8 Conclusion and Recommendations

Since the main purpose of this chapter is examining relevant policies, strategies and laws relevant to or impacting food security and IP, the recommendations below are limited to measures that can be taken to strengthen existing policy and legal framework and ensure the effective use of these instruments to support food security at the household level.

The formulation and adoption of policies, strategies, and the enactment of laws is a very good beginning but not an end in itself. The policies and strategies can be well articulated on paper but are meaningless if not implemented. The population policy that can complement the food security strategy, for example, was inadequately implemented due to the absence of a detailed action plan and a legal framework.<sup>223</sup> Moreover, the 2006 PVP law aimed to encourage the development and facilitate the acquisition of new and improved varieties could not be implemented due to a lack of regulation and directive. Implementation of policies, strategies and laws presupposes the existence of institutional capacity. However, such capacity is absent.<sup>224</sup> The government should develop detailed programs and action plans, enact laws and implement regulations as well as design and establish capacity building programs for adequate implementation of policies and laws to achieve intended goals and objectives.

---

<sup>219</sup>Häberli (2012), p. 6.

<sup>220</sup>Id.

<sup>221</sup>Id.

<sup>222</sup>Id.

<sup>223</sup>Minas (2008), pp. 39–40.

<sup>224</sup>A number of policies and laws are not adequately implemented. This may be attributed to inadequate implementation capacities that include inadequate human resource, facilities and systems.

Policies, laws and institutions are instruments to achieve an end. Consequently, they should be dynamic and revised to accommodate new needs and developments. However, there are no current mechanisms to ensure dynamism of these instruments. The average age of these instruments is more than a decade. During this time, few revisions were made to the majority of these policies, strategies and laws. Furthermore, the impact of these policy instruments should be assessed on a periodic basis. However, no or little policy impact assessment related to IP and food security was conducted in Ethiopia. The government should develop mechanisms to follow up, evaluate and study the impact of these policy instruments. This will help ensure periodic revision of policies, strategies and laws to take into account the findings from these impact studies and any other new developments and needs.

IP can contribute to food security by supporting agricultural R&D and stimulating the generation of new and improved technologies and varieties that enhance agricultural productivity. The technical information contained in patent documents, for example, can be used to strengthen agricultural research. The Ethiopian Intellectual Property Office claims that it has a collection of more than 30 million patent documents consisting of technical information for inventions made since 1790. This includes inventions that can technologically advance the agricultural sector, such as improve traditional agricultural technologies used by small farmers for generations. However, this information is inadequately utilized and leveraged primarily due to a lack of awareness of the significance of technical details contained in patent documents.<sup>225</sup> Agricultural research results generated by public research organizations are not protected mainly due to a lack of policy direction on the ownership of research results made using public resources.<sup>226</sup> Thus, there is a need to encourage exploitation of patent documents to support agricultural research as well as to expedite the process of determining institutional IP policies and establishment of technology transfer offices in the public higher learning and agricultural research institutions.

Protection of community achievements and knowledge can also support food security by providing the opportunities for monetary and non-monetary benefits. The legal framework for existing IP law is inadequate to protect community achievements and knowledge. Hence, there is a need to develop a *sui generis* system of protection based on the interests and needs of local communities, as well as learning from experiences of other countries. The establishment of a national *sui generis* system for protection of community achievements and knowledge may be inadequate if not supported or complemented by an international system. Ethiopia should, thus, take part in the ongoing endeavors to develop international legal instruments for protection of traditional knowledge and traditional expressions

<sup>226</sup>See background study for the 2013 draft national intellectual property policy.

under the auspices of the WIPO intergovernmental committee on IP, genetic resources, traditional knowledge and traditional cultural expressions.<sup>227</sup>

Ethiopia is in the process of acceding to the World Trade Organization and negotiating economic partnership agreement with the European Union, which may result in changes to existing IP laws. Efforts are also being made to revise the PVP law due to pressure from the emerging horticulture and floriculture industry. The country should take advantage of the flexibilities available in international IP treaties, such as the TRIPS agreement, and incorporate safeguard mechanisms and tools when amending existing and enacting new laws that address food security issues and concerns.

This chapter illustrates that Ethiopia has a clearly defined goal of ensuring food security at the household level. There are a number of policies, strategies, plans and laws that support and can contribute this goal. The commitment of the government is evident in its allotment of 16 % of its budget to strengthen the agricultural sector, the various measures taken to enhance agricultural productivity and address problems related to marketing, and the positive achievements made with the support of the international donor community are commendable. However, a lot remains to be done. Recommendations noted above can help Ethiopia achieve the desired goal of food security at the household level.

# Chapter 46

## Innovation and Development in Agricultural Biotechnology: Reflecting on Policy-Making Processes in Sub-Saharan Africa

Julius Mugwagwa and Watu Wamae

**Abstract** The aim of this chapter is to improve our understanding of underlying policy processes, conflicts and contradictions in agricultural biotechnology in Sub-Saharan Africa (SSA). The chapter examines the nature of relationships that emerge in policy making processes and how these influence attainment of social imperatives such as food security. The significance of broad-based public participation approaches and processes is recognised as one important aspect of policy processes if harnessing and sustainable deployment of innovations is to emerge in the agriculture and food security sector.

### 46.1 Introduction

New technologies play an important role in addressing global food security challenges especially in Sub-Saharan Africa (“SSA”).<sup>1</sup> However, efforts to effectively access and exploit technological knowledge are a persistent challenge shaped by various economic, political, social and cultural realities. In SSA countries, where the vast majority of the population relies on farming for their livelihood, it is important to consider the impact of policy-making processes on food security and the socio-economic status of poor farmers.

The mechanisms developed for technology governance reflect a myriad of complex realities. Regulation as an instrument of technology governance provides the norms and standards for quality, safety, effectiveness, environmental protection

and intellectual property protection. Regarding modern biotechnology in agriculture, developing countries recognize the importance of effective regulatory systems.<sup>2</sup> The ways in which biotechnology<sup>3</sup> is governed not only determines its ability to achieve socially desired aims, but also gives important signals about the direction of technological development.<sup>4</sup> The two elements are important for the credibility and legitimacy of new technologies, which to some extent, incorporating public consensus in policy may strengthen processes, technology use and development.<sup>5</sup> Tait notes that “increasingly, the actual outcomes of huge public and private investments in basic science are moderated by the attitudes, values and interests of a wide range of citizens and their representative groups.”<sup>6</sup>

Demand is a key factor in the selection and success of a technology and must be factored into policy. As final consumers of biotechnology products, the public influences the orientation of biotechnology research.<sup>7</sup> Cohen notes, “the public controls the fate of biotechnology in its willingness or refusal to accept products produced . . . communication efforts should recognize that the public is a full partner in deciding if, when, and how the technology is to be used. . .”<sup>8</sup> However, intermediary consumers of biotechnology and, in particular, private investors in the biotechnology industry also play a critical role in stimulating demand and consequently orienting the innovation trajectory.

The decisions of private investors are constantly influenced by both the dynamic nature of demand and technology. They play a key role in matching the demand within a specific context to specific technologies, such as biotechnology, and create supply incentives for technology development and commercialization. The uncertainty that surrounds potential risks of biotechnology coupled with resulting tensions may encourage the perception that SSA offers less resistance to testing the capacity for success of biotech innovations before launching them into other regions.<sup>9</sup> The nature of demand articulated by private investors may differ from that of poor consumers in SSA.<sup>10</sup>

The extent to which the final consumers, particularly low-income earners in SSA, can influence demand for biotechnology may be relatively limited in comparison to the demand articulated by intermediary consumers that target secondary

<sup>9</sup>SSA markets are characterized by low-income consumers and are generally of peripheral interest to the dominant innovators (western multinationals).

<sup>10</sup>DPP (2009).

markets.<sup>11,12</sup> It is not presumptuous to suggest that the degree to which the concerns of the poor in SSA can be incorporated into policy frameworks is fairly limited. Moreover, other actors who have considerably more influence in shaping such frameworks, including scientists engaged in biotechnology research, government agencies that seek to coordinate and balance priorities across sectors, pursue specific interests that could inadvertently consign food security concerns to the background. The range of interests suggests that striking a balance in the framing of policy is complex.

This chapter illuminates latent aspects of policy-making processes and examines the potential for institutional change. It addresses two questions: What is the nature of interactions amongst actors in biotechnology decision-making processes in SSA? What are the implications of this for the design of effective innovation policies for food security? The chapter seeks to build a case for recognition of the importance of holistic processes in addressing concerns of poor farmers in general and food security in particular.

## 46.2 Framework for Analysis

This section frames the two core issues—power and scientific expertise in biotechnology—that will guide the analysis of decision-making processes. The ability of SSA countries to effectively address the issue of food security depends not only on the capacity to access and exploit modern agricultural biotechnology, but also on the ability to develop institutions that reflect the concerns of the population, which relies on traditional agricultural practices.<sup>13</sup> The underlying elements that define the nature of governance are critical in orienting innovation activities into specific trajectories that may not necessarily enhance the socio-economic welfare of poor farmers and consumers.

Knowledge and power are two central elements to policy-making processes. Biotechnology is knowledge intensive and problems around it, including social ones, are generally couched in scientific terms. Nevertheless, scientific considerations and political power are intertwined in decision-making processes. Shore and Wright highlight that “policies are most obviously political phenomena. . . political technologies advance by taking what is essentially a political problem, removing it from the realm of political discourse, and recasting it in the neutral language of

---

<sup>11</sup>Clark et al. (2002).

<sup>12</sup>Pressure from industry to speed up the approval of regulatory frameworks may limit opportunities to sufficiently engage other actors and incorporate their concerns. However, this is not unique to developing countries (Newell 2002).

<sup>13</sup>It is difficult to argue that access to new knowledge or modern biotechnology, in the case of agriculture, is the only constraint to food security.

science.<sup>14</sup> Central to this process is the use of expert knowledge in the design of institutional procedures”.<sup>15</sup> The relationships that are dominant in framing regulations are based on a dynamic and complex interplay between knowledge and power.

Scientific evidence plays a dominant role in the decision-making process of biotechnology. However, experts in science do not necessarily override in all instances of policy-making. The uncertainty surrounding biotechnology provides a possibility to supersede scientific evidence and apply the precautionary principle. Hajer explains that:

The precautionary principle is not a natural scientific concept but a policy principle, which is meant to illuminate the credibility of the idea of anticipatory policy and to create new coalitions. In that context the precautionary principle holds that policymakers will sometimes have to decide on action even if there is no scientific evidence of a causal link. . .<sup>16</sup>

This could mean that if science does not lead to a favorable decision in accordance with the political power that the latter can safely disregard it on the basis of the uncertainty of potential risks and evoke the precautionary principle.<sup>17</sup> In the case of SSA countries, the need to attract foreign investment, develop economic competitiveness or access specific export markets may outweigh other local priorities inadvertently strengthening the influence of the biotechnology industry.<sup>18</sup> This implies that questions relating to food security for the poor or safeguarding their socio-economic status, though in theory important, may remain peripheral to considerations that shape regulatory frameworks.

Various efforts have defined specific strategies and undertaken action to reduce hunger, which afflicts large populations in developing countries. For example, the Millennium Development Goals set the target of reducing hunger in half by 2015. These efforts are in tandem with recent views on improving the livelihoods of marginalized populations in developing regions that are articulated in development theory. For example, Sen views development as social transformation, which relates to issues such as hunger, environment and basic needs. He recognizes capabilities that include the ability to avoid starvation and undernourishment as the fundamental factor for development.<sup>19,20</sup> The capability to avoid hunger relates to various complementary aspects; for example, the ability of those afflicted by hunger and deprivation to influence policy-making processes that may consist in reconfiguring participation cultures. The relationships that are established in policy processes as a result are more inclusive. The ways in which actors with varying interests interact and the nature of relationships they form in decision-making

<sup>20</sup>Sen (1999).

processes are perceived to occur within a dynamic context and offer potential for institutional change.

The importance of an integrated approach to development in developing countries has already been underscored within literature a few decades earlier.<sup>21</sup> Development economics in the 1960s stressed the significance of a holistic approach that integrates economic growth to socio-political change in addressing development challenges. For example, Adelman and Morris emphasised that an interdisciplinary approach is important for integrating political, social and institutional aspects to economic growth in developing countries. However, these perspectives were waylaid in the 1970s and 1980s during the economic booms and oil crises that eventually led to stringent restrictions on public expenditure following the Washington consensus. The resurgence of integrated development approaches over the last two decades has aggressively attempted to influence policy perspectives. In particular, the innovation systems (IS) perspective calls attention to the systemic nature of innovation, which is seen as a salient feature of development.<sup>22</sup> Within the IS framework, the underlying complex dynamics are determined by the nature of interactions amongst actors in defining and responding to institutions as well as triggering institutional change.<sup>23</sup>

The acknowledgement that innovation occurs within a system underlies the recognition that it is not only shaped by structural factors, but also institutional and social factors that determine social transformation. In addition, the IS framework views innovation as a cumulative process that is path-dependent, but open to change and therefore characterized by uncertainty and selectivity resulting in specific innovation trajectories. The formulation of biotechnology policy is framed around the uncertainty surrounding potential environmental and health risks, but at the same time attempts to define a trajectory that engenders uncertainties around broader socio-economic impacts. Furthermore, cumulateness and path dependency are intrinsic features of decision-making processes. Perceptions that develop in the interactive environment in which relationships are formed are not static; rather they are subject to continuous review and reconfiguration. The ability to adequately develop practical problem-solving mechanisms for socio-economic challenges, including agriculture, requires a systems approach to innovation.<sup>24</sup>

---

<sup>21</sup>Hoselitz (1957).

<sup>22</sup>The IS perspective is based on three major components—organizations i.e. actors (firms, universities, research organization, policy agencies etc.), institutions i.e. the rules of the game that influence how organizations undertake innovative activities (such biotechnology regulations) and relations i.e. the linkages that determine the nature of interactions between and among organizations and institutions.

<sup>23</sup>Despite the wide acceptance of the IS perspective in the intellectual spheres, policy prescriptions still tend to reflect the science and technology approach, which is based on a linearity assumption of neoclassical growth theory.

<sup>24</sup>Hall (2005), pp. 611–630.

This chapter acknowledges that the relevance of IS framework of developing countries continues to attract debate.<sup>25</sup> Nevertheless, the framework provides scope for analysing the nature of relationships that shape technology governance including biotechnology. The nature of relationships in decision-making processes influences the ways in which actors organize themselves in achieving goals.<sup>26,27,28</sup> Understanding the context-specific differences that influence the nature of interactions, and the relationships that determine them within the decision-making processes, is an important step towards providing clarity on linkages as a major component of the IS perspectives.

### 46.3 Framing the Discussion

The complexity of adopting a broad framework for biotechnology decision-making processes suggests that different networks aligned to specific types of interests emerge. Understanding how actors group surface provides insights into how the relationships that form within policy-making processes determines regulatory frameworks.<sup>29</sup> Based on the notion of systems within the IS perspective, this chapter provides understandings into the emergence and nature of the mechanisms that have led to existing dominant networks within biotechnology decision-making processes in SSA. It also examines how the dominant networks interact with other networks to shape decision-making processes. The implications of these interactions are also discussed to understand the extent to which the dominant networks are tenacious in shaping decision-making processes and what this means within the broader framework of biotechnology innovation trajectories and food security in SSA.

There are a number of theoretical approaches that attempt to clarify how relationships in decision-making processes are formed and how the nature of those relationships shapes debates among policymakers. The analysis in this chapter draws insights from theoretical approaches linked to three aspects of biotechnology regulations: risk—a major issue relating to the uncertainty and management of biotechnology; the dynamic nature of discourses around regulation design; and

---

<sup>25</sup>Some of the main aspects that surround this debate relate to the fact that the concept originated in industrialized countries, where there is relatively significant innovation at the technology frontier, interactions amongst actors appear to be much tighter and the general innovation systems have relatively well established organizations and institutions.

<sup>26</sup>Nelson and Sampat (2001), pp. 31–54.

<sup>27</sup>Chataway et al. (2009).

<sup>28</sup>Nelson and Sampat (2001) and Chataway et al. (2009) discuss the importance of creating organizational structures and cultures, which are key in developing and distributing technologies. They refer to them as social technologies. An analysis of social technologies lies beyond the scope of this paper and is therefore not undertaken.

<sup>29</sup>Scoones (2002).

the participation of actors in the formulation of regulatory frameworks, which is key in achieving credibility and legitimacy of biotechnology.

Risk approaches are essential in understanding how sound science determinately guides the formulation of biotechnology regulation in SSA. While this is not a peculiarity of SSA countries, the relationships that emerge may take different forms owing to context-specific realities. It is posited that the focus on sound science has contributed to shifting the focus of the debate from principles to principals,<sup>30</sup> which leads to differences in the analysis of decision-making processes. Discourse analysis shows how biotechnology is framed and evolves in an environment that consists of groups of actors with different perspectives, which may be contradictory and fragmented. It is argued that while specific social perceptions, attributing to their malleability, permeate contexts with different realities, the core content may remain unchanged.

Approaches that relate to participation in policy formulation processes are key in understanding how public participation is conceived and the forms it assumes in SSA. Deliberative and performative participation are two forms of participation that are commonly discussed within literature on innovation and development. The former is based on discursive consultation and negotiation in decision-making processes while the latter is based on modes of actions such as farmer field schools. The analysis of decision-making processes in this chapter draws on deliberative participation. The discussion contends that public participation is crucial. Constant changes in decision-making processes could both provide and limit opportunities for influencing regulatory frameworks. However, decision-making processes are viewed as evolutionary and therefore the existence or absence of opportunities for public participation in one period does not create a deterministic path for the future.

#### **46.4 Power Dispersal Issues Within Policy Processes of Agricultural Biotechnology**

Knowledge and power are two guiding principles to policy-making processes. A discussion of these two core issues will guide the analysis of decision-making processes in SSA countries. The ability of SSA countries to effectively address the pressing issue of food security depends not only on the capacity to access and exploit modern agricultural biotechnology, but also on the ability to develop institutions that reflect the concerns of the majority of the population.<sup>31</sup> The

---

<sup>30</sup>In this discussion, the term principle refers to the core elements of the biotechnology debate. This relates to the uncertainty surrounding potential environmental and health risks, but also the definition of a biotechnology innovation trajectory that engenders uncertainties around broader socio-economic and ethical issues. Principal refers to biotechnology experts (champions) who are generally an integral part of the biotechnology decision-making processes.

<sup>31</sup>It is difficult to argue that access to new knowledge or modern biotechnology is the only constraint to food security and the improvement of most of SSA population, which relies on traditional agricultural practices.

underlying principles that define the nature of governance relationships that emerge in decision-making processes are critical in aligning innovation activities into specific trajectories. These may not necessarily enhance the socio-economic welfare of poor farmers and consumers.<sup>32</sup>

Complex forms of interactions amongst actors drive the processes through which regulatory systems emerge. To a large extent, the interactions are underpinned by the nature of knowledge for which the regulatory mechanisms are developed as well as the power dispersal, which influences the orientation of the regulations. The knowledge intensive nature of biotechnology and the high uncertainty surrounding possible human and environmental risks tend to overwhelmingly favor scientific and technical expertise in decision-making processes. Other actors that may have a relatively strong influence in shaping biotechnology regulations are private investors, although their influence closely depends on the government's position with regard to strategic economic priorities.

In the case of SSA countries, the need to attract foreign investments, develop economic competitiveness or access specific export markets may outweigh local priorities. The influence of the biotechnology industry may be inadvertently strengthened.<sup>33</sup> This implies that questions relating to food security for the poor or safeguarding their socio-economic status, though in theory important, may remain peripheral to considerations that shape regulatory frameworks. Decision-making processes are "inherently political processes, rather than simply the instrumental execution of rational decisions."<sup>34</sup>

It is possible to draw similar parallels with regard to other countries including developed countries, where risk management and commercial interests may override societal choices notwithstanding credibility and legitimacy problems from the public. Public participation exercises in Europe intended to address societal conflict in terms of desired technologies have not altered the framework, which essentially consists of minimizing health and environmental risks and maximizing benefits for the agricultural biotechnology industry. The social desirability of technologies in Europe is related to the joy of living that is derived from cultural landscapes and foods. These issues lead to public contestation of biotechnology because the existing framework renders them incompatible.<sup>35</sup> The framing of biotechnology regulation as a technical problem reduces the ability to include public concerns about the desirability of technologies; participatory exercises have 'biotechnologies democracy'.<sup>36</sup> Nevertheless, there are differences between Europe and SSA

---

<sup>32</sup>As will become evident in the discussion, these two core principles are important as they tend to overrule public concerns about the desirability of technologies despite their importance in achieving socially oriented imperatives.

<sup>33</sup>Newell (2002).

<sup>34</sup>Keeley and Scoones (2003).

<sup>35</sup>Rayner (2003), pp. 163–170.

<sup>36</sup>For example, although public participation in the UK GM debate did shape the government's policy on biotechnology and public participation is likely to continue to be seen as necessary, this does not foreclose the possibility of achieving contrasting outcomes in the future.

countries, including the perception of desirable technologies but it does not necessarily suggest radical variations in the importance of public participation.

The power balance between consumers and producers directly influences the institutional environment in which decisions are made. The ramifications of the nature of relationships conjured up in the process of establishing regulatory requirements have important implications, including the food security issues of the poor. Van Zwanenberg explains, “regulations inevitably privilege some classes of technology producers/users over others whether deliberately or through insufficient reflexive framing of issues and problems those regulations are designed to address”.<sup>37</sup>

## 46.5 Scientific and Technical Considerations of Agricultural Biotechnology

Agricultural biotechnology is a knowledge intensive form of modern technology. It requires a strong scientific knowledge base of core competencies. This can facilitate adequate assessment of potential risks and benefits as well as provide sufficient flexibility for incorporating the emerging scientific evidence and shifting boundaries of social and ethical debates that raise fresh challenges to the credibility of biotechnology. Suitable scientific and technical competences in risk assessment are limited in many SSA countries. This is further compounded by the fact that other forms of competencies for articulating socio-ethical concerns tend to be scarce in SSA. For example, competencies for information communication and management, which are critical in developing an official and effective information strategy, are aimed at providing actors with sufficient transparency to allow for better articulation of specific interests. An adequate information strategy has multiple roles including educating the public, countering extremist views and gauging public attitudes, which is important in guiding institutional changes that are necessary in facilitating biotechnology innovation strategies.

The scenario in SSA could imply that those with scientific and technical competencies drive decision-making processes based on the deficit model of knowledge production.<sup>38</sup> SSA countries for the most part rely on bilateral and international assistance as well as multinational companies to develop scientific and technical competencies and formulate regulatory frameworks.<sup>39</sup> However, it is increasingly evident that public distrust in SSA, particularly with regard to the plight of poor farmers, is challenging the adequacy of institutional capacity to address public

---

<sup>37</sup>STEPS Centre (2008).

<sup>38</sup>The deficit model of knowledge production assumes that the public is not able to make informed decisions in policy-making processes because they have limited knowledge and therefore need to be educated (Bryant 2009).

<sup>39</sup>Cohen and Paarlberg (2004), pp. 1563–1577.

concerns. The scientists are at the center of distrust with regard to public interest. It is not their competencies, but rather their ability to make impartial decisions with respect to donors and multinationals that raises concerns.

Scoones notes that a key assumption of pro-poor agricultural biotechnology advocates is that “regulatory issues will be dealt with throughout the world by international ‘capacity building’ efforts in developing standardised, harmonised regulations for the agricultural biotechnology sector. With new regulations in place these will be enforced consistently and effectively throughout the developing world”. Such efforts of capacity building and harmonization of regulation may provide simple and standardized regulatory procedures that encourage investment in the biotechnology industry or facilitate trade, but may not substantially promote the achievement of context specific moral imperatives. There are numerous aspects that limit the ability to effectively incorporate the concerns of the poor in biotechnology regulatory frameworks.<sup>40,41</sup>

The science-based approach’ to problem framing is intricately and determinately tied to the knowledge intensive nature of biotechnology and appears to be core in determining the extent to which objectives are achieved. Attempts to incorporate the concerns of poor farmers and consumers in SSA are generally undertaken by champions who mainly operate within non-governmental organizations (NGOs).<sup>42</sup> NGOs are therefore thought to have strong links with the poor and are in a better position to articulate socio-ethical concerns in the highly scientific problem framing contexts of biotechnology regulation. Rayner points out that “NGOs tend to explain their motives for supporting public participation in terms of extending democratic control”.<sup>43</sup> However, in SSA champions, or the NGOs within which the champions operate, who wield the strongest influence on decision-making processes cannot be assumed to hold interests that are entirely compatible with extending democratic control to the public.<sup>44</sup> The formulation of a regulatory framework is further complicated by the continuously changing regulatory environment and therefore offers no standard approach of reflecting the heterogeneity of the complex contextual realities. This raises critical questions in terms of incorporating context-specific realities of SSA, such as the challenge of food insecurity and the socio-economic status of poor farmers.

---

<sup>40</sup>Newell (2002).

<sup>41</sup>Glover (2003).

<sup>42</sup>NGOs are the main vehicle through which champions operate. However, it is the champions rather than the NGOs that are the subject matter of this discussion. As further discussed, the position held by champions may vary between pro and anti biotechnology and this may be related to champions moving from one NGO to another.

<sup>43</sup>Rayner (2003), pp. 163–170.

<sup>44</sup>Harsh (2009).

## 46.6 The Nexus Between External and Local Interest in Biotechnology Innovation: How the Debate Shifted from Principles to Principals

In SSA countries, research activities are undertaken in the public domain; 60–70 % of funding is absorbed by public research institutes compared to 30–40 % in the private sector.<sup>45,46</sup> In agriculture it was estimated that the public sector accounted for 96 % of the research expenditure in Kenya in 1996 and the corresponding proportion for Zimbabwe in 1998 was 84 %.<sup>47</sup> Most of the population in SSA derive their livelihood from agriculture and it is often the largest contributor to income and employment. There is a strong case for public investment in agricultural research, particularly with regard to the poor.<sup>48,49</sup> On the whole, however, the debate around improving the capacity to harness new knowledge, including biotechnology, is viewed as an issue of strengthening science-related disciplines within education systems and scientific capacity in public research institutes. Extreme academic conservatism generally characterizes higher education and public research institutes. Within a linear framework, it is difficult to engage in problem solving activities based on the trans-disciplinary approach that is better adapted to issues of food security and the problems faced by poor farmers.

Public research institutes are not only the purveyors and developers of knowledge in SSA, but are also the intermediate organizations. Although a number of successes have been reported, particularly in agriculture and health, the positive impact of public research institutes as intermediate organizations on social imperatives is less obvious. Other intermediate organizations including those that cut across disciplinary lines and particularly those that deal with socio-ethical issues are either absent or weak. In particular, channels for ensuring that the needs of poor consumers and farmers are represented in decision-making process are wanting.<sup>50</sup> The contribution of public research institutes in policy-making processes tends to focus on more funds for basic and applied research couched in publically palatable language of need to address developmental challenges.

The need to create framework for coordinating scientific efforts across Africa emerged as far back as the late 1920s and led to the African Survey in 1936.<sup>51</sup> The

---

<sup>45</sup>Arnold and Bell (2001).

<sup>46</sup>Although the structure of developed countries varies significantly from that of developing countries, it is important to note that in industrialized countries, private firms generate the bulk of new knowledge in-house.

<sup>47</sup>Cohen (2001).

<sup>48</sup>Clark (2002), pp. 353–368.

<sup>49</sup>For example, basic research in certain areas of agriculture where vast amounts of knowledge do not already exist, due to the intricate connection between agriculture and the context of biological systems, may be critical to addressing specific problems peculiar to the African context.

<sup>50</sup>Cohen and Paarlberg (2004), pp. 1563–1577.

<sup>51</sup>Gruhn (1971), pp. 459–469.

organizations that emerged out of these efforts primarily aimed at establishing a common communications network that could enhance utilization of African resources.<sup>52</sup> They were not intended to create a vehicle to integrate scientific and technical matters within the continent to address the socio-economic issues of indigenous populations. Latter efforts to harness scientific knowledge for the benefit of African economies are inclined towards the consolidation of infrastructure and emphasize knowledge through research and development.<sup>53</sup> The relationship between science and development, including perceptions of how public research institutes contribute to policy-making processes, has firm roots in mode one.<sup>54</sup> The top-down approach views innovation as a process driven by big-pushers through research and development. Policy-making is essentially the purview of scientists, although their interests may not necessarily prioritize or adequately articulate the concerns of food security and socio-economic welfare of poor farmers. This approach has been variously criticized in literature—policy that is based on this perception tends to be counter-productive. According to Arnold and Bell, “the high (almost religious) status, which the basic science establishment has managed to achieve, has made it hard to question the allocation of resources to it.”<sup>55</sup>

Increasingly, public research institutes obtain funding through public support from external sources. Based on the general principle of limiting benefits that may accrue to the donor while maximizing those intended for the beneficiary, donors are naturally most confident in supporting public sector R&D. Historically, the public sector has been the main beneficiary of donor assistance and efforts have been made over time by changing the nature of relationships between donors and beneficiary. For example, there has been radical change from tied aid to more collaborative assistance. In practice, however, it may be argued that other forms of misalignments have emerged, or reinforced, and the principle may not render donor assistance significantly more successful in strengthening the delivery of knowledge assets for the socio-economic benefit of the vast majority of the populations in developing countries. As suggested by Hall and Dijkman, “instead of incentives for developing effective alliances for co-development, development assistance is a professional environment where succeeding (in reducing poverty) means working your way out of a job.”<sup>56</sup>

---

<sup>52</sup>These efforts led to the creation of the Scientific Council for Africa South of the Sahara (CSA) in 1949 and the Commission for Technical Co-operation in Africa and Scientific Council for Africa South of the Sahara (CCTA) in 1950.

<sup>53</sup>The creation of African research centers has benefited from various sources including the United Nations Economic Commission for Africa (ECA) that has made notable efforts on shaping policy and has made attempts to incorporate STI directly into the development agenda of African countries through collaboration with NEPAD. Other initiatives have taken place in the form of conferences and workshops include CASTAFRICA I (1974), Lagos Plan of Action (1980), and CASTAFRICA II (1987).

<sup>54</sup>Chataway (2005), pp. 597–610.

<sup>55</sup>Arnold and Bell (2001).

<sup>56</sup>Hall and Dijkman (2008).

Private investment in SSA agricultural innovation also tends to collaborate closely with public research institutes. Various reasons could be advanced to support this form of partnership, including the latent weakness of African innovation systems; scientific research capabilities, though limited, are generally concentrated in public research institutes. However, broader reasons related to the credibility that accrues from such collaborations cannot be underestimated. Nevertheless, the relationships that form are not devoid of bias. Bryant carried out a study in Mali,<sup>57</sup> which indicated that the local scientists' views on the benefits of genetically modified (GM) crops for the country were essentially based on the linear model of more science leading to more innovation, and invariably providing solutions to socio-economic problems.

Clark<sup>58</sup> observes that some donor-funded structures may not be abreast with the knowledge-related restructuring that is occurring in developing countries, hence the dismal outcome observed over the last few decades. In particular, the validation processes that led to the introduction and use of modern technology is strictly confined to scientists and technology pushers who provide the necessary resources. The underlying assumption is that demand, a key factor in influencing the selection and success of a technology, is sufficiently addressed through considerations on the supply side. Little attention is paid to the final consumers of biotechnology products even though it is widely acknowledged that they influence the orientation of biotechnology research. Private investors in the biotechnology industry,<sup>59</sup> the public sector and donors are seen as adequate in articulating and addressing the concerns of final consumers. In SSA they are viewed as unable to make informed contributions to the definition of the biotechnology innovation trajectory.

Ayele et al., demonstrates that "partnership efforts tend not to be end-user oriented, but rather supply driven ... partnership projects tend to be limited in scope and not cast within holistic efforts to innovate in ways that affect food production and hunger".<sup>60</sup> Legitimacy and credibility issues are increasingly plaguing decision-making processes that relate to biotechnology in SSA. The public does not directly question their scientific and technical competencies, but rather it is their impartiality in dealing with donors and multinational firms that is treated with caution and is perhaps at the center of distrust with regard to public interest.<sup>61</sup> While the public recognizes that there are internal contradictions and tensions that prohibit their governments from adequately responding to social challenges, they

---

<sup>57</sup>Bryant (2009).

<sup>58</sup>Clark (2008).

<sup>59</sup>Private investors in the biotechnology industry have the twin role of intermediary consumers of biotechnology on the one hand and technology providers through investment in research and commercialization on the hand.

<sup>60</sup>Ayele et al. (2006).

<sup>61</sup>With the exception of a few countries, such as Zambia, scientists in most SSA countries and particularly those with a significant private sector in the biotechnology industry tend to be less critical of private sector interests. The private sector invests in biotech research and innovation in collaboration with local public research institutes (see Clark et al. 2007, p. 104).

do not assume that external pressure has no adverse effect on their governments' politics and policies.<sup>62</sup> The extent to which the local public sector is able to collaborate with donors and multinationals in ways that do not compromise the concerns of the poor and assert national sovereignty is fraught with mistrust.<sup>63</sup>

It cannot be assumed that the gaps that have emerged from this scenario have not been anticipated, albeit within the science push model. It would be presumptuous to suggest that the emergence of champions, particularly local ones within decision-making processes, is coincidental. In SSA economies the debate in many areas is shifting from the top-down approach, which has received incessant criticism in recent times, to a bottom-up approach. However, the bottom-up approach is not evident in the biotechnology decision-making processes. The techno-savvy champions are a direct product of the pre-existing structure. They generally have a history within public research institutes and have been entrusted with representing the concerns of the poor in biotechnology decision-making process, but not because of their apparent advisory independence. They are thought to have strong links with the poor and therefore well imbued with their concerns and, at the same time, to be in a strong position for independently articulating the socio-ethical concerns in the highly scientific problem framing contexts of biotechnology policy.

The champions operate within networks and play an important role of mobilizing and engaging a wide range of actors, whose views it is assumed are represented in policy-making processes. The extent to which such activities revolve around knowledge exchange rather than persuasion is debatable. It is difficult to deny that a form of cumulative and path-dependent learning is occurring within the linear model owing to its ability to recreate itself and remain tenacious. However, it is scarcely possible to suggest that any form of meaningful reflexivity with some potential for institutional change that reflects the need of poor consumers and farmers is taking place. The diversity of sites and the types of knowledge that contribute to decision-making processes are limited. The next section looks at how the focus on principals rather than principles is restructuring the relationships that shape decision making processes in SSA.

## **46.7 The Impact of the Shift on Biotechnology Decision-Making Processes**

The creation of champions responds to cultural differences in SSA in that a certain sense of divinity is attached to science. Furthermore, scientists and science tend to be compounded. It would be foolhardy to suggest that SSA has a long tradition of engaging in heated criticism of science. The creation of local champions serves to palliate the public mistrust with regard to the government's ability to counter

---

<sup>62</sup>Smith (2003).

<sup>63</sup>Clark et al. (2002).

external pressure from donors and multinationals by providing a semblance of local advisory independence. At least two problems emerge from the unfolding situation in SSA that occurs within the broader non-static context of biotechnology. Firstly, the focus on principals further confuses or camouflages any cracks that may emerge around the divinity of science. It diverts public attention from questioning science as the only solution to local socio-economic challenges. Furthermore, other critical issues are pushed into the periphery of the debate. Literature on food insecurity has pointed out that food shortages with regard to the poor are often not a question of whether sufficient amounts of food exist, but rather whether the poor access it.<sup>64,65</sup> The question of access is intricately related to distribution of resources, including land tenure systems and infrastructure, which is determined by power dispersal.

Secondly, the demystification of scientists is easier to achieve through interactive processes compared to science itself, which is highly abstract.<sup>66</sup> For example, the stance held by a specific champion may oscillate between advocating and campaigning against biotechnology depending on changes in perceptions of the individual or changes in funding sources that require a change in perceptions. This demystification may lead to a blanket rejection of certain forms of biotechnology that are irrationally perceived as having nothing positive to offer. Such perceptions find a comfortable outlet in existing polemics within and outside a specific context. This situation has virulent repercussions. It may transpire as a direct affront to the champions who, in a desperate attempt to reassert themselves, may engage in counter extremist views. It is not unusual to come across blunt statements by champions in the media. The acrimonious debates that ensue suggest that there are no quick and simple strategies for constructive public engagement. These debates cannot be further from ensuring that concerns of poor farmers and consumers are addressed.<sup>67</sup>

While it is obvious that issues of safety and environment dominate the ways in which biotechnology innovation trajectory is evolving in SSA,<sup>68</sup> it is difficult to

---

<sup>64</sup>Cohen (2001).

<sup>65</sup>Smith (2003).

<sup>66</sup>The demystification of scientists in SSA is not restricted to champions in the biotechnology debate. In Kenya for example, the need to elect highly qualified professionals with doctoral and professorial credentials as MPs rather than candidates with minimal education was highly contested in the media in early 2007. The debate focused on the ability to deliver social services, particularly highly visible ones for the improvement the livelihoods of the poor. It was largely argued that the Nobel Prize holder lost her seat in the previous elections because of her inability to deliver development enhancing services. The sanctioning of champions takes different and subtler forms given that ascendancy to influential positions does not depend on the ballot.

<sup>67</sup>Cohen (2001).

<sup>68</sup>For example, in Ethiopia where there is wide ecological diversity and rich biological resources, the leading authority in the formulation of a biosafety policy is reported to have adopted protective principles that limit the use and development of biotechnology; it weakens the purported argument of focusing on small farmers and seems strongly guided by concerns of bio-piracy. In a different scenario, it has been suggested that SSA serves as a battle ground for EU-US disagreements on GM trade. The US aggressive approach confronts the EU cautious approach to GM crops by

argue that these aspects dominate the public debates relate to policy-making processes at the local level. Contestations of biotechnology are closely tied to the apprehension that stems from the power imbalance in externally triggered processes.

There are clear but insufficient attempts to define risk more broadly and to include the relationship between biotechnology innovation and food security.<sup>69</sup> Nevertheless, this does not interrogate the ability of sound science to tackle the broader socio-economic challenges of the poor. Furthermore, sound science is viewed as a magnet for pursuing the harmonization of regulatory systems in the region. Numerous discussions about the importance of pooling resources in the region encourage countries without sufficient scientific and technical capabilities or funds to engage in harmonization processes because missing such opportunities is viewed as a risk in its own right.<sup>70</sup> It is also not uncommon for SSA countries to borrow key elements of bio-policy from the few that already have one without questioning core elements of innovation trajectories. Wafula and Clark report, “Uganda was open in terms of borrowing key elements and tenets of a biotechnology policy from countries such as Kenya, Zimbabwe, South Africa, Namibia and the European Union.”<sup>71</sup>

The biotechnology discourse is enshrined in champions whose framings of the connection between biotechnology innovation and food insecurity are shaped by contradictory and fragmented perspectives. Zambia is perhaps an exception as demonstrated by the 2002–2003 food crises. It is noted that the decision-making process on whether to accept GM food prominently featured the Zambian scientific community that was able to focus ‘not only on purely scientific evidence, but also on the potential political and economic impacts of allowing GM food into the country’.<sup>72,73</sup> Nevertheless, Glover notes that:

In countries which lack the capacity to compete in biotechnology, or where the degree of vested interests or the intensity of controversy is low, it is more likely that participation will be feasible and that public concerns will be allowed to frame the issues under consideration, as well as shape the decisions to be made. . .<sup>74</sup>

---

expanding biotechnologies in SSA—a source of EU agricultural products—and in so doing seeks to encourage the EU to develop more accommodating biotechnology policies (Clark et al. 2007, p. 101). The financial resources accruing to SSA from such disagreements cannot be overlooked as an important element drives local debates.

<sup>69</sup>The extent to which such efforts influence the outcome of policy-making processes is a different matter.

<sup>70</sup>Mugwagwa (2010), pp. 352–366.

<sup>71</sup>Wafula and Clark (2005), pp. 679–694.

<sup>72</sup>Clark et al. (2002).

<sup>73</sup>This may have been and perhaps paradoxically facilitated by the absence of a vibrant biotechnology industry. Zambia is yet to draw up a biosafety policy.

<sup>74</sup>Glover (2003).

On the whole, however, narrow perspectives of biotechnology in most SSA countries continue to have a disproportionate role in influencing policy. Sound science guides the formulation of biotechnology regulation and innovation in SSA. While this is not a peculiarity of SSA countries, the emergence of champions influences the relationships in decision-making processes specifically. For example, the existence of champions takes the public away from questioning the extent to which science can adequately take into account the challenge of food insecurity and the socio-economic status of poor farmers.

The scope of issue framing within the technology arena also influences how policy processes are shaped. Schattschneider (1960) discusses policy entrepreneurs engaging in 'venue shopping', i.e. searching for arenas from which to frame policy problems, and that the policy entrepreneurs may 'limit the venues in which they set their feet'.<sup>75</sup> For example, taking science only as a policy venue, the leeway for venue shopping is likely to vary across countries, across other sub-national arrangements and among policy actors.<sup>76</sup> Different actors seek access to different types of venues,<sup>77</sup> and this illuminates how public problems are a result successful imposition of problem definitions by one group on others.<sup>78</sup> In SSA, for many policy actors, biosafety is about safe application or use of products of modern biotechnology, while to others, it is about ensuring safety of all biological processes and products.<sup>79</sup> Science and scientific knowledge are key venues in both cases, but the extent to which these are explored and incorporated in the science-policy nexus differs because of the different levels of focus on science. These different framings result in what Schattschneider referred to as issues being 'organized into or out' of politics. In the final analysis, this has a bearing on the policy processes and the impact on food security.

It would be disingenuous to suggest that the divinity attached to science is unshakable in SSA, particularly owing to the rapid changes occurring in the wider spectrum, with regard to information and communication technologies. Nevertheless, public participation remains encapsulated in champions and is about persuasion rather than consultation.<sup>80</sup> The adherence of champions to an elite biotechnology community gives them considerable influence in decision-making processes, particularly owing to the uncertainty that surrounds biotechnology.<sup>81</sup> It is difficult to argue that the biotechnology debate in decision-making processes is evolving towards more mature debates in the north. However, decision-making processes are intrinsically evolutionary and the existence or absence of

<sup>81</sup>Keeley and Scoones (2003).

opportunities for effective public participation in one period does not preclude variations in the future.

## 46.8 Implications for Food Insecurity and the Concerns of Poor Farmers

The inclusion of public participation in biotechnology decision-making processes is important and will continue to be necessary even if it is difficult to argue that it has had a positive and significant impact in aligning biotechnology innovation to social needs in SSA. In some countries, decisions about biotechnology innovation trajectories are driven by external efforts, such as international research institutes, donors and non-governmental organizations. Public participation has been facilitated informally through public-private partnerships. The role of the government has been mainly reactive and its ability to guide biotechnology innovation has been minimal.<sup>82</sup> Nevertheless it is important to emphasize that public participation is not the panacea for addressing the needs and ecological environments of poor farmers and consumers. Poor farmers and consumers in SSA face a wide range of challenges, including access to food and farm inputs because of market failure or distributional networks, agricultural employment, better wages and access to markets for farm outputs that cannot be entirely resolved by public participation. Moreover, improved public participation does not imply that the concerns of the public will automatically be reflected in the outcome of policy-making process and that as a result the problem food insecurity will become history.<sup>83,84</sup> Public participation may be viewed as a public relations exercise rather than a genuine form of consultation that is expected to shape the biotechnology innovation trajectory.

Thus the introduction of champions, who supposedly serve as knowledge brokers and help to strengthen interactions across a diverse range of actors through multiple activities are not likely to alter the core principles of biotechnology innovation. The networking role of the champions gives them significant leverage in bringing key individuals and institutions together and consolidating their influence over policy-making processes. The definition of key individuals and institutions may be based on a pre-determined type of contribution to decision-making that may not prioritize food security and the livelihood of poor farmers.<sup>85</sup> In the bio-policy formulation process in Uganda, key institutions, such as the national consumer organizations and the agricultural research organizations, were excluded from the process.<sup>86</sup> Public participation that is confounded with champions casts

<sup>85</sup>Harsh (2009).

<sup>86</sup>Wafula and Clark (2005), pp. 679–694.

serious doubts on the degree to which the concerns of the poor can be constructively addressed.

The ability to adequately factor practical problem-solving mechanisms for socio-economic issues into innovation processes requires a systems approach to innovation.<sup>87</sup> Even within a holistic approach public participation is not the final solution to agricultural constraints. One of the shortcomings of the systems approach in SSA relates to the central question of demand and innovation. Whilst demand dynamics are viewed as critical in stimulating and defining technology paths that are congruent to the consumer and may better reflect the preferences and concerns of the public, SSA does not provide a strong case in support of this argument in agricultural biotechnology. As mentioned previously, intermediary consumers of biotechnology, particularly private investors in the biotechnology industry that target secondary markets, play a critical role in stimulating demand and orienting the innovation trajectory.

In the case of industrialized countries it may be argued that, “[O]ur consumption decisions are likely to have a greater impact in shaping our lives than our ballots. Thus, popular choices about governance seem to be increasingly made in the marketplace rather than in the legislature.”<sup>88</sup> Neither ballots nor consumption decisions in SSA seem to offer much in terms of shaping governance. However, a systemic approach provides a premise for addressing the shortcoming of agriculture in an integrated way by identifying gaps and providing solutions from holistic perspectives. Other strands of literature, such as the value chain analysis, also provide avenues to identify broader and complementary channels for responding to the concerns of poor farmers and consumers in SSA.<sup>89</sup> It would be useful to discuss some broader prospects and processes for addressing the needs of the poor in agriculture. However, these remain beyond the scope of this paper.

## 46.9 Conclusion

This chapter sought to illuminate the nature of relationships that exist in policy processes in SSA. It demonstrated that effective public participation, specifically adequate representation of the socio-economic realities facing poor farmers and consumers in biotechnology decision-making processes, is limited despite its importance. However, the existence or absence of opportunities for effective public participation in one period does not preclude variations in the future. Decision-making is a continuous process involving negotiations that evolve with changing needs in a path-dependent manner and are principally based on continuous learning. Nonetheless, while it is not expected that improved representation would be

<sup>89</sup>Kaplinsky (2005).

sufficient in addressing the challenge of food insecurity and the plight of poor farmers in SSA, it can make an important contribution to attempts for aligning biotechnology to the socio-economic welfare of the poor. Additionally, the significance of broader prospects and processes must also be taken into account.

# Chapter 47

## Food Law in South Africa: Towards a South African Food Security Framework Act

Anél Gildenhuis

**Abstract** The right to have access to sufficient food is enshrined in section 27(1)(b) of the *Constitution of the Republic of South Africa, 1996*. Section 27(2) mandates the South African state to take reasonable legislative and other measures, within available resources, to progressively realize this right. This chapter accordingly sets out the current (this chapter reflects the South African legal framework until September 2014) food security legal framework by outlining both legislative and other measures (referring to relevant policies, strategies and programs) as required by section 27(2). The United Nations Food and Agricultural Organization indicated in 2009 that legislative measures can take the form of: (a) constitutional inclusion; (b) a food security framework act; and (c) inclusion in sectoral legislation. The mentioned three legislative levels are outlined within the South African food security context. Specific attention is given to the enactment of a South African food security framework act in order to address various challenges faced within the regulatory framework, specifically the current fragmented approach. In addition to food security specific policies, strategies and programs, food security as a development priority is also outlined within government strategic plans and programs. Due to the fact that food insecurity is especially high in rural South Africa, special attention is given to relevant rural development and agrarian reform measures. Attention is also given to farmers' rights with reference to biopiracy and plant breeders' rights.

### 47.1 Introduction

The right to have access to sufficient food is constitutionally enshrined in section 27(1)(b) of the Constitution of the Republic of South Africa, 1996 (the Constitution).<sup>1</sup> Importantly, for purposes of this chapter, are the duties that are placed on the

---

<sup>1</sup>Constitution of the Republic of South Africa (1996a).

A. Gildenhuis (✉)

South African government in realizing the right to have access to sufficient food.<sup>2</sup> Section 27(2) of the Constitution obliges the state to take reasonable legislative and other measures, within its available resources, to achieve the progressive realization of, *inter alia*, the right to have access to sufficient food.<sup>3</sup> The South African government's commitment to food security<sup>4</sup> currently manifests in primarily other related policies, strategies and programs.

However, despite the prioritization of food security as a developmental priority, abovementioned measures, and the fact that South Africa is currently food self-sufficient,<sup>5</sup> on-going food shortages remain a daily reality for approximately 13.8 % individuals.<sup>6</sup> According to the Integrated Food Security Strategy for South Africa (the IFSS),<sup>7</sup> various food security challenges exist in South Africa, *inter alia*: inadequate safety nets,<sup>8</sup> weak institutional support networks and disaster management systems, inadequate and unstable household food production, lack of purchasing power and poor nutritional status. Further challenges that were identified by the Department of Agriculture, Forestry and Fisheries (DAFF) and the Department of Social Development (DSD) in the subsequent National Policy on Food and Nutrition<sup>9</sup> include inadequate access to knowledge and resources as well as the underutilization of productive land. In some jurisdictions, yet other factors influence the availability and accessibility of food as well as the stability of food supply.<sup>10</sup> These factors include infrastructure,<sup>11</sup> food prices, international trade,

---

<sup>2</sup>Ibid, sections 27(1)(a-c), which includes other socio-economic rights entrenched in the Constitution, including (but not confined to) the right to have access to health care services, the right to have access to sufficient water, and the right to have access to social security.

<sup>3</sup>Ibid, section 7(2), which asserts that the "state must respect, protect, promote and fulfil the rights in the Bill of Rights." The Bill of Rights refers to chapter 2 of the Constitution, where various human rights and fundamental freedoms are enshrined.

<sup>4</sup>"Food security" is defined in the South African context as "access to and control over the physical, social and economic means to ensure sufficient, safe and nutritious food at all times, for all South Africans, in order to meet the dietary requirements for a healthy life." See DAFF & DSD (2013), p. 8.

<sup>5</sup>Ibid, p. 3. The National Policy for Food and Nutrition Security was subsequently published as Government Notice 637 in the South African Government Gazette (No. 37915) of 22 August 2014.

<sup>6</sup>Ibid, p. 6; The Government of South Africa (2013), Millennium Development Goals: Country Report 2013d; StatsSA (2011), GHS Series Volume IV.

<sup>7</sup>National Department of Agriculture (2002), pp. 25–27.

<sup>8</sup>DAFF & DSD (2013), p. 4.

<sup>9</sup>Ibid, p. 4.

<sup>10</sup>National Department of Agriculture (2002), pp. 8–9, 19.

<sup>11</sup>Ibid, Addendum A, which states that "the physical accessibility of food in many rural areas presents problems because of the lack of infrastructure, such as roads, electricity and trading facilities. In the context of a stagnant economy and rapid population growth, the emphasis on commercialization and ineffective support programs for small-scale farmers had a negative impact on the food security of many rural households, even though national food security was enhanced." Poor storage and distribution of food also threatens household food security as mentioned in DAFF & DSD (2013), p. 3.

land reform,<sup>12</sup> environmental aspects like climate change,<sup>13</sup> and poor storage facilities.<sup>14</sup>

Fragmentation is a major criticism of the current South African food security legal framework.<sup>15</sup> Various governmental departments, including the DAFF, DSD, Department of Health, Department of Rural Development and Land Reform (DRDLR), Department of Environmental Affairs, Department of Basic Education, and the Department of Public Works, are responsible for addressing the abovementioned challenges and factors. Further fragmentation also occurs between the different levels of government: national, provincial and local.<sup>16</sup>

Despite section 27(2) of the Constitution's mandate to take reasonable legislative (and other)<sup>17</sup> measures for the progressive realization of the right to have access to sufficient food, the South African government has yet to adopt an integrated and comprehensive food security act, in other words a "framework act," regarding this right.<sup>18</sup> Consequences related to the absence of a national overarching and integrated framework law and the current fragmented approach include "no assured way of measuring progress in and monitoring the implementation of the right."<sup>19</sup> Khoza<sup>20</sup> is similarly of the opinion that "maintaining a fragmented, and often weak and inadequate legislative system relating to the implementation of the right to sufficient food [is] at the expense of people's basic needs, human dignity and life."

---

<sup>12</sup>In 1994, ownership of agricultural land was racially skewed as a result of the segregation policy of the apartheid government as well as a consequence of colonization. The majority of agricultural land was owned by the minority whites. As such, a land reform program was formulated and implemented in order to address: (a) land restitution; (b) land redistribution; and (c) land tenure reform in accordance with the mandate in section 25 of the Constitution. For more information on the various pieces of legislation, policies, strategies and programs within the land reform program (and its subsequent development). For more information see Pienaar (2014).

<sup>13</sup>DAFF & DSD (2013), p. 3.

<sup>14</sup>Ibid.

<sup>15</sup>Brand (2005a), p. 181; Khoza (2004), p. 664.

<sup>16</sup>National Department of Agriculture (2002), pp. 5–6 illustrates this statement with the following example: "Despite Government's intentions to promote food and agricultural production, various deficits in service delivery still exist. For example, the current extension and advisory services are inadequate due to a number of reasons including the fragmentation of service delivery within the three tiers of government. The provision of post settlement support to farmers who benefit from land reform's restitution, redistribution and tenure reforms requires better coordination primarily between the Department of Agriculture and Land Affairs, between the National and Provincial, and local authorities and farmers organizations and business. The roles and responsibilities of the various departments therefore need to be clarified and the necessary institutional mechanisms for project implementation and monitoring should be in place. Furthermore, this disjuncture reflects the broader challenge government has in identifying the most appropriate mechanisms for ensuring the resourcing of interdepartmental programs."

<sup>17</sup>"Other" programs, strategies and policies will be outlined later in this chapter.

<sup>18</sup>Terblanche and Pienaar (2012), pp. 229, 232.

<sup>19</sup>Khoza (2005), p. 197.

<sup>20</sup>Ibid, p. 197.

The Food and Agricultural Organization (FAO)<sup>21</sup> of the United Nations recently indicated that constitutional provisions alone are often not enough to “ensure concerted action for the realization of the right to food. For this there is a need for implementing legislation, such as framework laws on food security and nutrition and sectorial legislation that advances the right to food, as well as adequate programs that support its realization for all.”

The current chapter, firstly, will give an exposition<sup>22</sup> of the current<sup>23</sup> South African food security legal framework in light of the constitutional mandate in section 27 (2) as well as the FAO’s encouragement above. This will include an exposition of the current constitutional and sectorial legislative measures, other measures in the form of policies, strategies and programs, and selected international and regional obligations. Secondly, the chapter will argue that despite the fact that various food security measures are in place and despite the fact that progress is being made in addressing food insecurity,<sup>24</sup> drafting and enactment of a South African food security framework act could address the various shortcomings in the current legal framework, including the current fragmentation. Because food insecurity mostly occurs in rural South Africa,<sup>25</sup> special attention will be given to rural development measures, including agrarian and land reform measures. Furthermore, farmers’ rights with reference to biopiracy and plant breeders’ rights will also be discussed briefly.

## **47.2 The Current South African Food Security Legal Framework**

### ***47.2.1 Legislative Measures***

The FAO<sup>26</sup> indicated in the Guide on Legislating for the Right to Food, that the right to food<sup>27</sup> could be legislated on three different legislative levels: by inclusion of the right (or implied in other rights) in constitutions, specific framework legislation, and sectorial legislation.<sup>28</sup> It was previously mentioned that the South African government has failed (to date) to adopt a framework food security

---

<sup>21</sup>FAO (2014), Legal Developments in the Progressive Realization of the Right to Adequate Food: Working Paper.

<sup>22</sup>Please take note that due to the nature and extent of this chapter, detailed discussions of the various measures are not necessarily possible.

<sup>23</sup>This chapter reflects the South African legal framework up until 30 September 2014.

<sup>24</sup>President Jacob Zuma recently indicated that “the overall food security figure is declining due to government programmes,” specifically “the percentage of households that were vulnerable to hunger declined from 29,3 % in 2002 to 12,6 % in 2012.” Zuma (2013).

<sup>25</sup>Du Toit (2011).

<sup>26</sup>FAO (2009).

<sup>27</sup>Including food security measures.

<sup>28</sup>FAO (2009).

act leaving a void in the current legal framework. While the importance and benefits of a food security act will be discussed in Sect. 44.3 of this chapter, current legislative measures, including constitutional provisions and sectoral legislation will be explained in this section.

### 47.2.2 *Constitutional Provisions*

The right to have access to sufficient food is specifically enshrined in section 27(1)(b) of the South African Constitution, providing everyone the right to have access to sufficient food. Subsequent section 27(2) of the Constitution dictates the state to take reasonable legislative and other measures, within its available resources, to achieve the progressive realization of this right.<sup>29</sup> It must be highlighted that the right to have *access* to sufficient food is classified in the South African law as a “qualified socio-economic right,” meaning that a person is not entitled to be provided with food, but rather that *access* to food must be facilitated by the state.<sup>30</sup> The duty to progressively realize *access* to food is twofold: firstly, facilitate and subsequently, to provide. The duty to facilitate refers to the state’s duty to create an environment that will ensure access to sufficient food for all people at all community levels.<sup>31</sup> In other words, it implies “the provision of a framework of laws and policies that assist individuals and groups to enjoy the right.”<sup>32</sup> A number of sectors are involved in the creation of such an “enabling environment” since food security is a complex issue that covers a range of related economic, social and political factors,<sup>33</sup> and has interdisciplinary and cross-sectorial application and implications. Areas that accordingly need to be addressed (by means of legislative and other measures) include (but are not confined to)<sup>34</sup> food systems, economy and trade, environmental matters such as disaster management, land and agrarian matters, labor matters like employment strategies, and measures related to the realization of related human rights (for example access to medical care services, education, water and sanitation, land, social assistance). On the other hand, the duty to provide refers to situations where individuals or groups are unable to access food on their own with the means at their disposal, despite the creation of an enabling environment.<sup>35</sup> In this case, the state has an obligation to

<sup>29</sup>Constitution of the Republic of South Africa (1996a), section 7(2).

<sup>35</sup>Liebenberg (2010), p. 85.

provide by means of (amongst other measures) food banks, school feeding programs,<sup>36</sup> social assistance, etc.<sup>37</sup>

It must be noted that till date of finalization of this chapter<sup>38</sup> the right to have access to sufficient food has not been the subject of direct constitutional litigation.<sup>39</sup> Other food related rights enshrined in the Constitution, include every child's right to basic nutrition, shelter, basic health care services and social services (section 28 (1)(c)) and detainees' (including sentenced prisoners) rights to provision of nutrition at state expense (section 35(2)(e)).

### 47.2.3 Sectorial Legislation

In the outline of section 27(1) (b) and (2) of the Constitution above, it was mentioned that the state must facilitate access through legislation and other measures. Despite the absence of a specific food security framework act, these legislative measures also include sectorial legislation. Sectorial legislation accordingly implies legislation that has an influence on the normative contents of the right to have access to sufficient food within the broader context of food security.<sup>40</sup> Stated differently,<sup>41</sup> sectorial legislation refers to legislation that have an influence on the accessibility, availability (including stability and sustainability of food supplies), sufficiency, safety and utilization of food.<sup>42</sup> Such legislation includes laws relating to<sup>43</sup>: (a) land matters (including access to land)<sup>44</sup>; (b) labor matters<sup>45</sup>; (c) social

<sup>38</sup>July 2014.

<sup>39</sup>For a detailed discussion on the right to have access to sufficient food, the impact of the general limitation clause (section 36) and the test for reasonableness, see Brand (2005a), pp. 153–295.

<sup>40</sup>Terblanche (2011), p. 309.

<sup>41</sup>Ibid.

<sup>42</sup>For example, see FAO (2009), p. 6, where it contends “sectoral laws are important to the progressive realization of the right to food, since the right depends upon many factors and actors. Legislation concerning access to and management of land and natural resources can partly determine whether rural people are able to feed themselves and produce a surplus to feed urban dwellers. Trade legislation influences affordability of food as well as the ability of farmers to compete. Agricultural laws frame conditions for food production. Labour laws have an impact on whether or not wage labourers can earn enough to buy the food they need, and social protection supports food purchasing.”

<sup>43</sup>Ibid, p. 191.

<sup>44</sup>For example, the Restitution of Land Rights Amendment Act 15 of 2014, Provision of Land and Assistance Act 126 of 1993, Extension of Security of Tenure Act 62 of 1997b, and Prevention of Illegal Eviction from and Unlawful Occupation of Land Act 19 of 1998e.

<sup>45</sup>For example, the Employment Equity Act 55 of 1998; Skills Development Act 97 of 1998f; and the Basic Conditions of Employment Act 75 of 1997a.

assistance<sup>46</sup>; (d) agriculture<sup>47</sup>; (e) environmental matters<sup>48</sup>; (f) production and marketing<sup>49</sup>; (g) consumer protection<sup>50</sup>; (h) health matters<sup>51</sup>; and (i) trade and foreign investments.<sup>52</sup> A detailed account of all applicable sectorial laws is beyond the nature and scope of this chapter.

#### ***47.2.4 Other Measures: Programs, Policies and Strategies***

Since 1994,<sup>53</sup> food security, on national and/or household level, has received attention as a development priority in various government policies, strategies, and programs, etc. For example, the Reconstruction and Development Program of 1994<sup>54</sup> (the RDP)<sup>55</sup> sought to “ensure that as soon as possible, and certainly within 3 years, every person in South Africa can get their basic nutritional requirement each day and that they no longer live in fear of going hungry.”<sup>56</sup> According to the RDP,<sup>57</sup> the following measures were key in achieving food security: (a) the provision of productive employment opportunities through land reform, job programs and the reorganization of the economy; (b) nutrition education; (c) stable, low-cost supply of staple foods combined with targeted income transfers and food subsidies; (d) the exemption of basic foodstuffs from value added taxes; (e) improved social security payments; (f) price control on standard bread; (g) enhanced marketing

<sup>46</sup>See, for example, the Social Assistance Act 13 of 2004.

<sup>47</sup>See, for example, the Agricultural Product Standards Act 119 of 1990 and the Genetically Modified Organisms Act 15 of 1997c.

<sup>48</sup>For example, see the National Environmental Management Act 107 of 1998c and the National Water Act 36 of 1998d.

<sup>49</sup>See, for example, the Foodstuffs, Cosmetics and Disinfectants Act 54 of 1972, Marketing of Agricultural Products Act 47 of 1996b, Standards Act 8 of 2008b, and the Genetically Modified Organisms Act 15 of 1997.

<sup>50</sup>For example, the Consumer Protection Act 68 of 2008a.

<sup>51</sup>See the National Health Act 61 of 2003.

<sup>52</sup>See, for example, the Competition Act 89 of 1998a and the International Trade Administration Act 71 of 2002. Various sectorial bills have been developed between 2013 and 2014 that must still follow the legislative process, but which may (when enacted) have an impact on food security, including the Spatial Planning and Land Use Act 16 of 2013e (not yet commenced), Draft Extension of Security of Tenure Amendment Bill of 2013c, Land Protection Bill of 2014a, Draft Expropriation Bill of 2013b, and Protection and Development of Agricultural Land Framework Bill of 2014b.

<sup>53</sup>The year when the first democratic elections were held.

<sup>54</sup>ANC (1994), Reconstruction and Development Programme.

<sup>55</sup>The RDP is a socio-economic policy framework adopted after the 1994 elections by the elected African National Congress. For more information on the RDP, see ANC (1994), Policy Documents.

<sup>56</sup>Ibid, para 2.11.2.

<sup>57</sup>Ibid, para. 2.11.2–2.11.6; 4.5.2.2–4.5.2.3.

(by curbing the powers of marketing boards and monopolies and the revision of the effects of tariffs); (h) a structured agricultural sector (with a spread ownership base, encouragement of small-scale agriculture, development of the commercial sector and increased production and employment); and (i) the removal of unnecessary controls, levies and unsustainable subsidies in the commercial agricultural sector. These aspects were to be provided for in subsequent measures and only selected measures are explained in this section.

More recently food security has been identified as a priority area in; *inter alia*, the War on Poverty Campaign of 2008,<sup>58</sup> the New Growth Path of 2010,<sup>59</sup> and more importantly, the Medium Term Strategic Frameworks of 2009–2014 (the MTSF 2009–2014) and 2014–2019 (the MTSF 2014–2019)<sup>60</sup> and the National Development Plan of 2011.<sup>61</sup> The MTSF 2009–2014<sup>62</sup> follows the 2009 election manifesto of the African National Congress (the ANC) wherein various challenges such as crime, poverty, unemployment and the high cost of living were identified.<sup>63</sup> To address these challenges, priority areas were identified and incorporated in the MTSF 2009–2014 of President Zuma’s 2009 elected administration, including Strategic Priority 3—“A Comprehensive Rural Development Strategy linked to Land and Agrarian Reform and Food Security.”<sup>64</sup> Strategic Priority 3 called for an<sup>65</sup> (a) aggressive implementation of land reform policies; (b) stimulation of agricultural production<sup>66</sup> “with a view to contributing to food security”; (c) improvement of rural livelihoods and food security<sup>67</sup>; (d) improvement of service delivery to ensure quality of life; (e) implementation of a development program for rural transport; (f) skills development; (g) revitalization of rural towns; (h) exploration of and support for non-farm economic activities; (i) institutional

<sup>61</sup>National Planning Commission (2011), National Development Plan.

<sup>62</sup>The MTSF 2009–2014 was meant to guide the government’s planning and resource allocation between 2009 and 2014, following the ANC government’s 4th consecutive victory in the 2009 elections. For more information on the MTSF 2009–2014 see The Presidency – Republic of South Africa (2009). The MTSF 2009–2014 was recently followed up by the MTSF 2014–2019 following the ANC government’s 5th consecutive victory at the 2014 elections.

<sup>63</sup>ANC (2009), Election Manifesto.

<sup>64</sup>The Presidency – Republic of South Africa (2009), pp. 18–22.

<sup>65</sup>Ibid, pp. 19–22.

<sup>66</sup>Amongst other measures, the “government has pledged over R2.6 billion in conditional grants to provinces for agricultural infrastructure, training and advisory services and marketing, and for upgrading agricultural colleges.” See *ibid*.

<sup>67</sup>Amongst other measures, agricultural starter packs were to be provided to 140,000 households per annum under the Ilima/Letsema Campaign. The Ilima/Lesema Campaign is outlined later in this chapter.

capacity development; and (j) cooperative government.<sup>68</sup> As with the RDP, these aspects were to be provided for in subsequent measures. Selected measures in this regard will receive attention later in this section.

The National Development Plan of 2011 follows the RDP and focuses on, amongst others things,<sup>69</sup> job creation, infrastructure improvement, and an inclusive and integrated rural community. Food and nutrition security is seen in the National Development Plan as “both a consequence of poverty and inequality as well as a cause.”<sup>70</sup> A number of steps are identified in the National Development Plan to address food security, including the expanded use of irrigation, security of land tenure<sup>71</sup> and the promotion of nutrition education.<sup>72</sup> As with the RDP and the MTSF, these aspects were to be provided for in subsequent measures and selected measures are discussed later in this section.

Food security is also listed in the recent strategic plan of the DRDLR<sup>73</sup> as well as the DAFF.<sup>74</sup> In the 2014–2019 strategic plan of the DRDLR (in Program 3: Rural Development), a baseline of 7800 households in rural communities is targeted for the provision of support to help improve their livelihoods by 2019.<sup>75</sup> The strategic objective<sup>76</sup> is to offer “support to rural communities to produce their own food in all rural districts.”<sup>77</sup> Other objectives include<sup>78</sup> the provision of quality infrastructure<sup>79</sup>; facilitation of the establishment of rural enterprises and industries<sup>80</sup>; and the creation of jobs and skills development in rural areas.<sup>81</sup> Accordingly, “[s]pending

---

<sup>68</sup>The subsequent MTSF 2014–2019 reaffirms the government’s commitment to the establishment/maintenance of vibrant, equitable and sustainable rural communities that contributes towards food security for all. It is envisioned in the MTSF 2014–2019 that, by 2013, the rural economy (with specific reference to agriculture) should “create close to 1 million new jobs, contributing significantly to reducing overall unemployment.” Republic of South Africa. Policy imperatives mentioned in the MTSF 2014–2019 include (a) improved land administration and spatial planning, (b) sustainable land reform for agrarian transformation, (c) development and support for small-holder farmers, (d) increased access to quality basic infrastructure and services (with specific mention of education, healthcare and public transport in rural areas), (e) support for sustainable rural enterprises/industries (with rural-urban linkages), and (f) increased investment in agro-processing, trade development, and improved access to markets and financial services. See The Presidency – Republic of South Africa (2014).

over the medium term will focus on implementing rural livelihood strategy, providing technical support to municipalities, coordinating and facilitating infrastructure projects, supporting irrigation schemes, developing and implementing a rural enterprises and industrial development strategy, skills and youth development and job creation.”<sup>82</sup> Food security as a key priority also features in the DAFF’s strategic plan<sup>83</sup> for 2012–2017.<sup>84</sup> While food safety receives attention under Program 2—Agricultural Production, Health and Food Safety,<sup>85</sup> food security features as a sub-program in Program 3—Food Security and Agrarian Reform,<sup>86</sup> with an emphasis on the promotion of household food security and agrarian reform programs and initiatives targeting subsistence and smallholder producers.<sup>87,88</sup> Sector capacity development<sup>89</sup> and national extension support services<sup>90</sup> are two other sub-programs within Program 3.<sup>91</sup> As such, one of the strategic goals of the DAFF<sup>92</sup> is to increase the profitability of food production and fiber and timber products by all producer categories.<sup>93</sup> Consequently, a coordinated government food security initiative is identified as an objective of Program 3. This initiative should “improve support mechanisms for food security production for subsistence and smallholder producers”<sup>94</sup> as well as “220,000 existing and 80,000 new

<sup>82</sup>Ibid, pp. 39–40.

<sup>83</sup>DAFF (2012b), pp. vii–ix.

<sup>84</sup>Ibid, p. ix: “Against the background of an increasing global population, the gradual decrease of natural resources and the effects of climate change, food security is a vital focus area for the department.” More specifically it is stated in DAFF, at xi that it is a strategic priority to “[i]mprove the food security initiative by coordinating production systems to increase the profitable production, handling and processing of food, fibre and timber products by all categories of producers,” referring to both commercial and emerging farmers.

<sup>85</sup>Ibid, pp. 31–35.

<sup>86</sup>Ibid, pp. 35–38.

<sup>87</sup>Ibid, p. 35.

<sup>88</sup>See the outline of initiatives focused on subsistence and smallholder farmers as well as agriculture in general later in this chapter.

<sup>89</sup>The Sector Capacity Development sub-program is aimed at “. . . the provision of agriculture, forestry and fisheries and training in support of sustainable growth and equitable participation in the sector. This will be achieved by facilitating and supporting education and training skills, promoting the development of centres of excellence on skills training and developing, managing and coordinating the sector transformation policy and strategy in line with the government objectives for the departments.” See DAFF (2012b), p. 35.

<sup>90</sup>The National Extension Support Services sub-program provides “national extension policies, norms and standards on the transfer of technology. The sub-program will provide strategic leadership and guidance for the planning, coordination and implementation of extension and advisory services in the sector. It will also provide leadership and strategic support in the implementation of norms and standards for extension.” See *ibid*.

<sup>91</sup>Ibid.

<sup>92</sup>Ibid, p. 36.

<sup>93</sup>As previously mentioned “all categories of producers” includes commercial and emerging farmers.

<sup>94</sup>DAFF (2012b), p. 36.

smallholder producers receiving comprehensive support.”<sup>95</sup> A Food Security Bill is identified as a strategic intervention for the 2012–2017 period<sup>96</sup> and coordinates “comprehensive support to smallholder producers.”<sup>97</sup> It was envisioned that the number of smallholder producers will increase from 200,000 to 500,000 by 2020.<sup>98</sup> An “agrarian beneficiary assistance policy” was accordingly also envisioned.<sup>99</sup> Emphasis was also placed on a (still then proposed) Food Security Policy as well as on the enforcement of the Zero Hunger Campaign.<sup>100</sup> The Food Security Policy was approved by the DAFF and DSD in 2013 as the National Food and Nutrition Policy and will be discussed together with the Zero Hunger Campaign later in this section. This food security initiative includes the “department partnership model (sustainable farming model) pilot project” that:

[p]rovides comprehensive support to targeted smallholders to enable them to produce crops, in collaboration with agribusiness<sup>101</sup> ... The project assisted 15 farmers in the North West and Free State provinces to grow bitter sorghum, maize, sunflower and beans. The market of these grains was secured through Grain South Africa and Noord-Wes Koöperasie. Altogether 650 ha of grain crops were planted. Over the medium term, the focus will be on implementing the approved Zero Hunger Campaign and implementing the policy on mechanization support. Altogether 15 000 producers will receive comprehensive production support.<sup>102</sup>

The strategic objectives of the DAFF and DRDLR were to be addressed in subsequent measures. Selected measures, specifically regarding rural and agrarian reform relating to subsistence and smallholder farmers, is covered later in this section.

### ***47.2.5 Selected Agricultural and Rural Development Programs, Policies and Strategies***<sup>103</sup>

Building upon the reforms envisioned in the RDP and the strategic objectives of several of the abovementioned documents, food security measures have since been incorporated in the agricultural and rural development, including land reform and

---

<sup>95</sup>Ibid.

<sup>96</sup>It was initially planned that a Green Paper on Food Security (namely a discussion document) was to be published in the South African Government Gazette in 2012/2013, while the actual Food Security Bill would be developed in 2013/2014. See *ibid.*, p. 36. However, no Food Security Bill has been published to date. The benefits of enacting a framework act will be discussed later in this chapter.

<sup>97</sup>Ibid, p. 36.

<sup>98</sup>Ibid, p. 37.

<sup>99</sup>Ibid, p. 38.

<sup>100</sup>Ibid.

<sup>101</sup>Agribusinesses include Grain South Africa, Agri South Africa, Noord-Wes Koöperasie Beperk. See *ibid.*, p. 38.

<sup>102</sup>Ibid, p. 38.

<sup>103</sup>Note that due to the nature and scope of this chapter, only those programs, policies and strategies that directly influence food security (on national and/or household level) were selected.

legal frameworks. Small-holder farming receives particular attention as a strategy to increase household food security. For example, the 1995 White Paper on Agriculture<sup>104</sup> stated that while the South African government should support the “full spectrum of production systems and practices,”<sup>105</sup> new farming systems and appropriate technology must be developed through a “program of integrated research and technology development” to meet the needs of small-scale farmers for household food security purposes.<sup>106</sup> It was also stated that incentives should be created for the public and private sector to support such development.<sup>107</sup>

The Land Redistribution for Agricultural Development (hereafter LRAD) program of 2001,<sup>108</sup> accordingly made it possible for beneficiaries<sup>109</sup> like emergent small-scale farmers to purchase public or private land for an agricultural use of their choosing. These uses include “improve[ing] food production to improve household consumption, grazing, production for markets, and other agricultural activities.”<sup>110</sup> Under the LRAD program, a range of grants (from R20,000 to R100,000 or approximately \$1175 to 8871) are available depending on the amount of beneficiaries’ own contribution (either in kind, labor and/or cash).<sup>111</sup> The grants may be used to “acquire land for food crop and/or livestock production to improve household food security.”<sup>112</sup> Furthermore, eligible people that already have access to land may apply for assistance in order to make productive investments in, inter alia, infrastructure or land improvements, on their land.<sup>113</sup>

Launched in 2004, the Comprehensive Agricultural Support Program (the CASP),<sup>114</sup> aims<sup>115</sup> to “enhance the provision of support services to promote and facilitate

<sup>104</sup>National Department of Agriculture (1995), White Paper on Agriculture.

<sup>105</sup>The range of this “spectrum” refers to “urban food gardens and small scale production for household income and food security to large-scale production systems which can add considerably to national food security.” See *ibid*, para 2.2. Previously, it was believed that the development of small-scale farming was detrimental to South Africa’s food self-sufficiency. *Ibid*, Preamble. See also *ibid*, Addendum A, which affirms that “at national level food security will be enhanced by promoting the realisation of agriculture’s potential within the constraints of comparative and competitive advantages, and of other resources that may be required for sustainable agricultural development. While acknowledging that large-scale commercial farms will still make a valuable contribution to national food security and that the policy environment must support them, small farms may be of increasing importance for improving both national and household food security.”

<sup>106</sup>*Ibid*, para 8.9.

<sup>107</sup>*Ibid*.

<sup>109</sup>For the qualifying criteria, see *ibid*, p. 8.

<sup>110</sup>*Ibid*, p. 5.

<sup>111</sup>*Ibid*, p. 1.

<sup>112</sup>*Ibid*.

<sup>113</sup>*Ibid*, p. 2.

<sup>114</sup>National Department of Agriculture (2004b), Comprehensive Agricultural Support Programme.

<sup>115</sup>The aims of CASP are to “reduce poverty and inequalities in land and enterprise ownership, improved farming efficiency, improved national and household food security, stable and safe rural

agricultural development targeting the beneficiaries of the land and agrarian reforms.”<sup>116</sup> Four categories of beneficiaries have been identified<sup>117</sup>: the hungry and vulnerable, household food producers,<sup>118</sup> beneficiaries of land and agrarian reform programs,<sup>119</sup> and those operating within the macro-economic environment. Six areas of support are<sup>120</sup> information and knowledge management, technical and advisory assistance and regulatory services, training and capacity building, marketing and business development, on-farm and off-farm infrastructure and production inputs, and financial assistance.

Additional relevant rural development and land reform initiatives include the Comprehensive Rural Development Program of 2009 (the CRDP)<sup>121</sup> and the Green Paper on Land Reform of 2011.<sup>122</sup> The CRDP flows from Strategic Priority 3 of the MTSF 2009–2014 and encourages the establishment of a comprehensive rural development strategy that is directly linked to land and agricultural reform and food security. Similarly, the CRDP aims to “create vibrant, equitable and sustainable rural communities.”<sup>123</sup> The CRDP makes provision for agrarian transformation,<sup>124</sup> land reform<sup>125</sup> and rural development like “capacity building initiatives, where rural communities are trained in technical skills, combining them with indigenous knowledge to mitigate community vulnerability to, especially climate change, soil erosion, adverse weather conditions and natural disasters, hunger and food insecurity.”<sup>126</sup> Following the moderate success of the government’s land reform program, the Green Paper on Land Reform of 2011 envisions a “re-configured single, coherent four-tier system of land tenure, which ensures that all South Africans, particularly rural blacks, have reasonable access to land with secure rights in order to fulfill their basic needs for housing and productive livelihoods.”<sup>127</sup> The principles underpinning land reform are

---

communities, reduced levels of crime and violence, and increased creation of wealth in agriculture and rural areas and finally increased pride and dignity in agriculture as an occupation and sector.” See *ibid*, p. 2.

<sup>116</sup>*Ibid*, p. 1.

<sup>117</sup>*Ibid*, p. 8.

<sup>118</sup>These categories of beneficiaries are provided agricultural starter packs. See *ibid*, p. 8.

<sup>119</sup>Supported Funded through farm level support. See National Department of Agriculture, p. 8.

<sup>120</sup>*Ibid*, p. 8.

<sup>121</sup>Ministry of Rural Development and Land Reform (2009), *The Comprehensive Rural Development Programme Framework*.

<sup>122</sup>DRDLR (2011), *Green Paper on Land Reform*.

<sup>123</sup>“The CRDP is aimed at being an effective response against poverty and food insecurity by maximizing the use and management of natural resources to create vibrant, equitable and sustainable rural communities.” See Ministry of Rural Development and Land Reform (2009), p. 3.

<sup>124</sup>*Ibid*, pp. 4, 13–14.

<sup>125</sup>*Ibid*, pp. 5, 16–20.

<sup>126</sup>*Ibid*, pp. 5, 14–16.

<sup>127</sup>DRDLR (2011), para 3.1.

threefold, one being “a sustained production discipline for food security.”<sup>128</sup> New land reform measures<sup>129</sup> must “improve on past and current land reform perspectives, without significantly disrupting agricultural production and food security.”<sup>130</sup>

Building upon the agrarian transformation envisioned in the *CRDP* and following the South African government’s “undertaking to review all land reform policies as enunciated in the 2011 Green Paper on Land Reform” as well as in line with the MTSF 2009–2014’s vision for vibrant, equitable and sustainable rural communities and food security for all communities, the Policy for the Recapitalization and Development Program of 2013<sup>131</sup> (the PRDP) of the DRDLR “seeks to provide black emerging farmers with the social and economic infrastructure and basic resources required to run successful agricultural business.”<sup>132</sup> The rationale for the PRDP is based on an evaluation of the land reform programs,<sup>133</sup> which found that the majority of land reform projects were unsuccessful mainly due to a “lack of adequate and appropriate post-settlement support.”<sup>134</sup> As a result, the lands that were transferred through the land reform programs are in distress or lying fallow<sup>135</sup> or are on the verge/in the process of being auctioned or had already been sold.<sup>136</sup> For the purposes of this PRDP, recapitalization refers to “the capital renewal or restructuring of poor and previously disadvantaged and under-producing agricultural enterprises of Emerging Black farmers who are beneficiaries of the State’s land reform program. Development here refers to support of human (capacity development), infrastructural development and operational inputs on other newly acquired properties.”<sup>137</sup> This will be possible through mentorship-programs,<sup>138</sup> co-management,<sup>139</sup> share-equity arrangements,<sup>140</sup> and contract farming and

---

<sup>128</sup>The other principles are “de-racialising the rural economy” and “democratic and equitable land allocation and use across race, gender and class.” See *ibid.*, para 4.1.

<sup>129</sup>Recent developments include the Agricultural Landholdings Policy Framework of 2013a for the establishment of land ceilings and the re-opening of land restitution cases by means of the Restitution of Land Rights Amendment Act 15 of 2014c.

<sup>130</sup>DRDLR (2011), para 6.1.

<sup>131</sup>DRDLR (2013b), Policy on the Recapitalisation and Development Programme.

<sup>132</sup>*Ibid.*, p. 10.

<sup>133</sup>Therefore, as early as 1991, but specifically after the first democratic elections held in 1994.

<sup>134</sup>DRDLR (2013a), p. 11.

<sup>135</sup>*Ibid.*

<sup>136</sup>*Ibid.*, p. 10.

<sup>137</sup>*Ibid.*, p. 5.

<sup>138</sup>These programmes include not only free support from neighboring or local farmers but also aligned remuneration or reimbursement packages. See *Ibid.*, p. 12.

<sup>139</sup>Co-management is “an arrangement where two or more parties define and guarantee amongst themselves a fair sharing of the management functions, entitlements and responsibilities for a given territory or set of natural resources.” See *Ibid.*

<sup>140</sup>Share-equity arrangements are defined as “[p]artners [who] acquire shares in an existing agricultural farm or other enterprises across the value chain with farmers or entrepreneurs.” See *ibid.*, p. 14.

concessions.<sup>141</sup> The PRDP will apply to the following categories or properties<sup>142</sup>: selected distressed land reform properties, properties selected by District Land Reform Committees, sited within the former homelands<sup>143</sup> and other communal areas, and farms acquired by individuals or collectives from historically disadvantaged communities that require strategic support. The PRDP aims to contribute to “the transformation of the rural economy through the establishment or enterprise and industrial development in the various agricultural value chains and other industries in order to ensure national and household food security, sovereignty and job creation.”<sup>144</sup>

Various policies are in the process of being developed or finalized following the 2014 elections.<sup>145</sup> These are the<sup>146</sup> Agricultural Land Holdings Policy Framework,<sup>147</sup> State Assets Acquisition and Lease Disposal Policy, Policy on the Establishment of a Rural Development Agency, Policy on the Establishment of a Rural Investment and Development Financing Facility, and Protection and Development of Agricultural Land Framework Policy.

### ***47.2.6 Food Security Specific Strategies, Policies and Programs***

The Integrated Food Security Strategy (IFSS) was adopted in 2002<sup>148</sup> and identified various strategic goals, including<sup>149</sup> the promotion of increased household food production and food trade, improving income and job creating opportunities, improving food and nutritional security, ensuring an increase in safety nets and food emergency managements systems, improving analytical and information

---

<sup>141</sup>This is “an agreement between farmers (generally small-scale) and processors or marketing firms, the basis of which is ‘a commitment on the part of the farmer to provide a specific commodity in quantities and at quality standards determined by the purchaser and a commitment on the part of the company to support the farmer’s production and to purchase the commodity.’” See *ibid.*

<sup>142</sup>*Ibid.*, p. 17.

<sup>143</sup>See [Apartheid Museum](#), *The Homelands*: “The policy of separate development sought to assign every black African to a ‘homeland’ according to their ethnic identity. Ten homelands were created to rid South Africa of its black citizens, opening the way for massed forced removals. In the 1970s, the government granted sham independence to South Africa’s black homelands. This served as an excuse to deny all Africans political rights in South Africa.”

<sup>144</sup>DRDLR (2013a), p. 12.

<sup>145</sup>Held on 7 May 2014. The ANC was again democratically elected for another term (2014–2019).

<sup>146</sup>Hendriks et al. (2014).

<sup>147</sup>This was already approved by the Minister of the DRDLR in 2013. See DRDLR (2013a), *Agricultural Land Holdings Policy Framework*.

<sup>148</sup>National Department of Agriculture (2002).

<sup>149</sup>*Ibid.*, pp. 6–7.

management systems, provision of capacity building, and holding of discussions with stakeholders. These strategic goals function within different programs like the<sup>150</sup> Special Program for Food Security, Integrated Nutrition and Food Safety Program, Safety Program, Comprehensive Social Security System and Disaster Management Program, Food Security Capacity Building Program, and Food Security Stakeholder Dialogue Program.

Eleven years after the adoption of the IFSS, the DAFF and DSD finally approved a food security policy, the National Policy on Food and Nutrition Security.<sup>151</sup> The policy identifies five pillars upon which existing<sup>152</sup> and future food and nutrition initiatives must be based upon. These pillars are<sup>153</sup> effective food assistance networks through the availability of improved safety nets, improved nutrition education, the alignment of investments in agriculture towards local economic development,<sup>154</sup> improved market participation of the emerging agricultural sector by leveraging government food procurement to support community-based food production initiatives and smallholders,<sup>155</sup> and food and nutrition security risk management. This policy is underpinned by the interdepartmental programs, Household Food and Nutrition Security Strategy and the Fetsa Tlala Food Production Intervention. Hence, the focus is on the challenges related to both household food shortages as well as increased food production.<sup>156</sup>

The Household Food and Nutrition Security Strategy, under the auspices of the DSD and Departments of Health and Basic Education, focuses on providing social assistance safety nets, such as food parcels, food banks and soup kitchens.<sup>157</sup> It further provides nutritious meals to children between the ages of 0–4 years,<sup>158</sup> in addition to more than eight million children in schools.<sup>159</sup> The Fetsa Tlala Food Production Intervention aims to put all underutilized agricultural land under

---

<sup>150</sup>Ibid, p. 7.

<sup>151</sup>DAFF & DSD (2013).

<sup>152</sup>The policy aims to “build on existing initiatives and systems, and to put in place mechanisms that ensure stricter alignment, better coordination, and stronger oversight.” Ibid, p. 6.

<sup>153</sup>Ibid, pp. 6, 19.

<sup>154</sup>Investments include the “revitalisation of irrigation schemes, and the development of production, storage and distribution of food.” Ibid, p. 19.

<sup>155</sup>This will be achieved through “public-private partnerships, including off-take and other agreements, a government food purchase programme that supports smallholder farmers, as well as through the implementation of the Agri-BEE Charter, which requires agro-processing industries to broaden their supply bases to include the emerging agricultural sector.” See *ibid*. Regarding the government food purchase program, see also the Zero Hunger Program mentioned later in this chapter. Agri-BEE stands for Broad-Based Black Economic Empowerment in the agricultural sector. See in this regard the Department of Agriculture (2004a), Agri-BEE, Broad-Based Black Economic Empowerment Framework for Agriculture.

<sup>158</sup>Ibid.

<sup>159</sup>Ibid.

production.<sup>160</sup> More specifically, the intervention intends to “put one million hectares of land under production of maize, beans and potatoes. There is a significant amount of land that still lies fallow especially in rural areas and some of the land that has been acquired through land reform.”<sup>161</sup> Furthermore, smallholder farmers, communities and households will be “assisted through the provision of mechanization support and distribution of production inputs and technical services.”<sup>162</sup> In this regard, the former Minister of Agriculture, Forestry and Fisheries, Joemat-Pettersson, was quoted saying,<sup>163</sup> “We will work with communities to ensure that we use every bit of land to produce food. Through the intervention, we have brought 200 000 ha of land under production in seven provinces. Our targeted goal is one million hectares in the next 5 years.”

Some programs and campaigns that have launched include the Ilima/Letsema Campaign, the National School Nutrition Program and the Zero Hunger Program. The Ilima/Letsema Campaign was launched to “stimulate food production to ensure that the vulnerable groups in our Society becomes food secure”.<sup>164</sup> Other objectives include the stimulation of economic activities of vulnerable groups in society and the transfer of technical skills to food insecure households.<sup>165</sup> This is made possible through various interventions, including the provision of production inputs like seeds, fertilizers, tools, feed, chickens etc., as well as monitoring and evaluation of the implemented projects.<sup>166</sup> The National School Nutrition Program<sup>167</sup> was launched in 1994 through the Department of Basic Education and strives to provide one nutritious meal to all learners in primary and secondary schools<sup>168</sup> in order to “enhance learning capacity.”<sup>169</sup> The program also teaches “learners and parents on ways of living a healthy lifestyle” and promotes the development of school vegetable gardens.<sup>170</sup> In addition to the use of vegetables grown in the school vegetable garden, the program also encourages schools to buy their supplies from local suppliers.<sup>171</sup> In conjunction

<sup>171</sup>Department of Basic Education (1994).

with the National School Nutrition Program, the Zero Hunger Program<sup>172</sup> (launched during 2011) aims to:

... link subsistence producers and smallholder producers/producers to government institutions such as government schools (i.e. to supply the School Nutrition Program), public hospitals and prisons, and in the medium term also be a conduit through which food produced by smallholders can be used to meet the nutritional needs of low-income individuals and households in communities at large. As such, the Zero Hunger Program seeks to provide a boost to existing smallholder producers/producers, and an opportunity through which subsistence producers can start generating a sustainable income through farming, and thereby become smallholder producers in their own right.<sup>173</sup>

### ***47.2.7 Selected International and Regional Obligations***

South Africa is a signatory to several fundamental international instruments related to food security and the right to food, including the International Covenant on Economic, Social and Cultural Rights of 1966<sup>174</sup> (ICESCR). Article 11 is of import to this chapter since it provides the right to an adequate standard of living, including sufficient food. South Africa signed the ICESCR on 3 October 1994<sup>175</sup> but till date has failed to ratify it. Despite the failure to ratify the ICESCR, section 39(1) (b) of the South African Constitution refers to the non-binding international law, such as treaties and conventions to which South Africa is not a member state, when interpreting the rights enshrined in the Bill of Rights. Furthermore, Brand<sup>176</sup> suggests that the socio-economic rights enshrined in the Bill of Rights, including the right to have access to food, are based on the ICESCR. Therefore, the ICESCR, as an interpretative source, is of great importance for the analysis of the socio-economic rights enshrined in the South African Constitution. Similarly, the normative contents in article 11 of the ICESCR as well as the exposition of state duties in the realization of this right by General Comment 12: The Right to Adequate Food<sup>177</sup> will hold great value for the interpretation of section 21(1) (b) of the South African Constitution if this right becomes subject to constitutional litigation.<sup>178</sup>

South Africa is also a signatory to the Millennium Development Goals (hereafter the MDGs)<sup>179</sup> and the MDGs, including goal 1, which aims to eradicate extreme poverty and hunger, are addressed in various government programs and

---

<sup>178</sup>See also the recent United Nations General Assembly (2012), Resolution 67/174: The Right to Food.

<sup>179</sup>United Nations (2000), Millennium Development Goals.

strategies.<sup>180</sup> The South African government also incurred food related obligations under various other international instruments, including the Convention on the Discrimination of All Forms of Discrimination against Women (CEDAW)<sup>181</sup> and Geneva Conventions and protocols.<sup>182</sup> It must be noted that the right to food, the right to be free from hunger and food security measures are often the subject of various declarations and plans of action adopted at international conferences and summits. Of particular importance is the Rome Declaration on Food Security of 1996<sup>183</sup> and the subsequent World Food Summit Plan of Action<sup>184</sup> that was adopted by 112 heads of states, including the (then) Deputy President of South Africa, Thabo Mbeki. Cohen and Brown<sup>185</sup> show that although these declarations<sup>186</sup> do not create binding international obligations, its importance lies in the fact that it represents international consensus and offers guidance for appropriate action.

Regionally, South Africa is a member of the African Union (the AU) and sub-regionally, it is a member of the Southern Africa Development Community<sup>187</sup> (the SADC). Of regional importance is the Protocol to the African Charter on Human and Peoples' Rights on the Rights of Women in Africa, which was ratified by South Africa on 17 December 2004.<sup>188</sup> The right to food security or Article 15 of the protocol obliges member states to "provide women with access to clean drinking

---

<sup>180</sup>For the various programs and strategies, see Republic of South Africa (2013), Millennium Development Goals: Country Report 18–19. Goal 1 is addressed in, inter alia, the *RDP* program as well as in the National Planning Commission (2011), National Development Plan. Also, outcome 7 of the *MTFS* or the establishment of "vibrant, equitable, and sustainable rural communities with food security for all" is mapped to goal 1 of the MDGs. See Republic of South Africa (2013), Millennium Development Goals: Country Report 19 and 21–26 for South Africa's progress regarding goal 1 as at 2013.

<sup>181</sup>Article 12 of CEDAW, for example, states that "notwithstanding the provisions of par. I of this article, States Parties shall ensure to women appropriate services in connection with pregnancy, confinement and the post-natal period, granting free services where necessary, as well as adequate nutrition during pregnancy and lactation." See United Nations Human Rights—Office of the High Commission for Human Rights (1979), CEDAW.

<sup>182</sup>The *Geneva Conventions* consist of four treaties and three additional protocols that set international standards for the humanitarian treatment of war victims. See ICRC (1949), The Geneva Conventions. Various articles in the four conventions are applicable to food issues related to war victims.

<sup>183</sup>FAO (1996), Rome Declaration on Food Security.

<sup>185</sup>Cohen and Bown (2006), p. 225.

<sup>186</sup>As well as other declarations adopted at the subsequent FAO World Food Summits.

<sup>187</sup>"The main objectives of Southern African Development Community (SADC) are to achieve economic development, peace and security, and growth, alleviate poverty, enhance the standard and quality of life of the peoples of Southern Africa, and support the socially disadvantaged through Regional Integration. These objectives are to be achieved through increased Regional Integration, built on democratic principles, and equitable and sustainable development." SADC (1992), SADC Objectives.

<sup>188</sup>African Commission on Human and Peoples' Rights (2003), Protocol to the African Charter on Human and Peoples' Rights on the Rights of Women in Africa.

water, sources of domestic fuel, land, and the means of producing nutritious food and establish adequate systems of supply and storage to ensure food security.”<sup>189</sup> Of sub-regional importance is the South Africa’s involvement in the initiatives of the SADC Food, Agriculture and Natural Resources Directorate<sup>190</sup> as well as the Dar-Es-Salaam Declaration on Agriculture and Food Security in the SADC Region of 2004.<sup>191</sup> The Dar-Es-Salaam Declaration seeks to develop a competitive agricultural sector in the SADC region through<sup>192</sup> (a) improved access to agricultural inputs, (b) promotion of draught power and equipment for tillage, (c) disease control as well as improved crop storage and handling, (d) the development of drought tolerant crops, and (e) improved fish stock management, processing and handling.

### ***47.2.8 Plant Breeders’ Rights, Farmers’ Rights and Biopiracy***

Another concern within the food security debate is the protection of (commercial) plant breeders’ rights at the cost of farmers’ rights. Hence, the development of plant breeders’ rights and its infringement will be discussed briefly by (a) first, defining biopiracy in reference to the development of plant breeders’ rights in international instruments; (b) outlining the South African regulatory framework for plant breeders’ rights; and (c) highlighting the plant breeders’ rights versus farmers’ rights debate with special reference to the acknowledgement of traditional knowledge.

The development and subsequent legal protection of plant breeders rights by means of intellectual property rights has led to a situation where the harvesting of patented seeds by farmers without the patent holder’s permission (in other words piracy of seeds or biopiracy), is punishable by law.<sup>193</sup> Borowiak<sup>194</sup> indicates that this development is despite the fact that:

[f]or virtually the entire history of agricultural production, up until the twentieth century, seed collection and distribution resided in the hands of farmers. Farmers collected the seeds from their fields after harvest and then used them for the next crop, for feed, for exchange, and for the breeding of new varieties of crops.

---

<sup>189</sup>On AU regional level, the New Partnership for Africa’s Development (NEPAD) aims to “address critical challenges facing Africa, namely poverty, development and Africa’s marginalisation internationally.” (See NEPAD, About) The accompanying Comprehensive Africa Agriculture Development Programme (CAADP) is also a regional initiative. (See NEPAD (2003), Comprehensive Africa Agriculture Development Programme, which focus on the improvement and promotion of agriculture in Africa.

<sup>190</sup>SADC (2012a), Food, Agriculture and Natural Resources.

<sup>191</sup>SADC (2004), Dar-Es-Salaam Declaration on Agriculture and Food Security in the SADC Region.

<sup>192</sup>SADC (2012b), Food Security.

<sup>193</sup>Borowiak (2004), pp. 511, 519.

<sup>194</sup>Ibid, p. 513.

Consequently, farmer-breeders “did not need to keep purchasing seeds but rather collect, use, and exchange the seeds they harvested from their own fields.”<sup>195</sup> This state of affairs was permitted until the early twentieth century<sup>196</sup> since intellectual property rights protection did not apply to plants.<sup>197,198</sup> Borowiak,<sup>199</sup> however, shows that plant breeding became:

[i]ncreasingly specialized and “scientific,” and, as it did so, the site of breeding began to shift from farmers in their fields to scientist in laboratories. Correspondingly, plant breeding began to resemble modes of industrial innovation and production: plants began to resemble inventions.

“Plant variety protection” or “breeders’ rights” received international recognition in the conventions of the Union for the Protection of New Varieties of Plants (UPOV) of 1961 and as amended in 1972, 1978 and 1991.<sup>200</sup> Subsequently, section 27 of the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS)<sup>201</sup> of the World Trade Organization (WTO) recognized plant variety as patentable subject matter. Section 27(3b) urges member states to “provide for the protection of plant varieties either by patents or by an effective *sui generis* system or by any combination thereof.” An outcome of plant variety protection is formulated as follows: “Even though it has been a tradition in most countries that a farmer can save seed from his own crop, it is under the changing circumstances not equitable that a farmer can use this seed and grow a commercial crop out of it without payment of a royalty. . . .”<sup>202</sup>

South Africa became a member of the WTO on 1 January 1995 and subsequently, a member to TRIPS (with inclusion of article 27(3b)), but plant breeders’ rights have been legislatively protected in South Africa since 1977 through the Plant Breeders’ Rights Act. Shortly after the enactment of the Plant Breeders’ Rights Act, South Africa was accepted as the tenth member of the International Union for the Protection of New Varieties of Plants (UPOV),<sup>203</sup> and subsequently became a party to the 1978 International Convention for the Protection of New Varieties of Plants<sup>204</sup> on 8 November 1981.<sup>205</sup> Even though South Africa is not

<sup>205</sup>UPOV (1991b), Members of the International Union for the Protection of New Varieties of Plants.

party to the 1991 iteration of this convention,<sup>206</sup> South Africa reported to the FAO in 1999, that its Plant Breeders' Protection Act 15 of 1976 adheres to the (more restrictive) 1991 International Convention for the Protection of New Varieties of Plants.<sup>207</sup>

According to South Africa's Plant Breeders' Rights Act,<sup>208</sup> a breeder is defined as the (a) person who bred, or discovered and developed the variety; (b) employer of the person mentioned above if that person bred or discovered and developed the variety in the performance of his duties to such an employer; or (c) the successor in title of the person referred in (a) above or the employer referred to (b) above. According to the South African Department of Agriculture,<sup>209</sup> a plant breeder's right provides protection of the registered plant variety against "exploitation without the consent (permission) of the holder of the right, allowing him to obtain royalties as remuneration."<sup>210</sup> Key provisions of the Plant Breeders' Rights Act are highlighted below:

- (a) Application: According to section 2(1), the Plant Breeders' Rights Act is applicable to every variety of any kind of plant if it is new,<sup>211</sup> distinct,<sup>212</sup> uniform<sup>213</sup> and stable.<sup>214</sup>
- (b) Registration of plant breeders' rights: All granted plant breeders' rights must be entered in a register maintained by the Registrar of Plant Breeders' Rights.<sup>215</sup>

<sup>206</sup>UPOV (1991a), International Convention for the Protection of New Varieties of Plants.

<sup>207</sup>FAO (2004), Part III: Options Available to National Governments under existing International IPR Agreements Protecting Plant Varieties and Plant Breeders' Rights.

<sup>208</sup>Department of Agriculture (1976), Plant Breeders' Rights—Section 1.

<sup>209</sup>Ibid.

<sup>210</sup>Furthermore, "a plant breeder's right therefore provides the holder with a means of gaining financial remuneration for his efforts, encouraging breeders to continue with the breeding of new and better varieties, a process that is very time-consuming and expensive." Ibid.

<sup>211</sup>A variety is regarded as "new" if, according to section 2(2)(a), "propagating material or harvested material thereof has not been sold or otherwise disposed of by, or with the consent of, the breeder for purposes of exploitation of the variety- (i) in the Republic, not more than one year; and (ii) in a convention country or an agreement country, in the case of- (aa) varieties of vines and trees, not more than six years; or (bb) other varieties, not more than four years, prior to the date of filing of the application for a plant breeder's right."

<sup>212</sup>A variety is regarded as "distinct" if, according to section 2(2)(b), "at the date of filing of the application for a plant breeder's right, it is clearly distinguishable from any other variety of the same kind of plant of which the existence on that date is a matter of common knowledge."

<sup>213</sup>A variety is regarded as "uniform" if, according to section 2(2)(c), it is "subject to the variation that may be expected from the particular features of the propagation thereof, it is sufficiently uniform with regard to the characteristics of the variety in question."

<sup>214</sup>A variety is regarded as "stable" if, according to section 2(2)(d), "the characteristics thereof remain unchanged after repeated propagation or, in the case of a particular cycle of propagation, at the end of each such cycle."

<sup>215</sup>Department of Agriculture (1976), Section 4.

- (c) Application for and granting of plant breeders' rights: The criteria for persons who may apply for plant breeders' rights are listed under section 6<sup>216</sup>; the application process is provided for under section 7; consideration and examination of applications are provided for under section 19, while the actual granting of plant breeders' rights is contained under section 20.<sup>217</sup>
- (d) Period of plant breeder's right: Section 21 states that a plant breeder's right shall be granted for a period of 25 years in the case of vines and trees and 20 years in all other cases.

However, more importantly for the purposes of this chapter are the rights that are granted to the successful plant breeder applicant under section 23 as well as possible methods of infringement as identified under section 23A of the Plant Breeders' Rights Act. According to section 23(1), the rights give the plant breeder control of the (a) production or reproduction; (b) conditioning for the purpose of propagation; (c) sale/marketing; (d) exporting; (e) importing; and (f) stocking of the concerned plant and, under certain circumstances,<sup>218</sup> the plant variety.<sup>219</sup> According to section 23A, a plant breeder's right is infringed if a person who:

(a) not being the holder of the plant breeder's right, performs, or causes to be performed, an act contemplated in section 23 (1) without a license obtained under section 25 or 27; (b) has obtained a license under section 25 or 27 but fails to comply with any term or condition thereof; (c) uses the approved denomination of a protected variety in relation to plants or propagating material of any other variety for any purpose whatsoever; and (d) sells plants or propagating material of a protected variety under any other denomination than the approved denomination of that variety.<sup>220</sup>

<sup>216</sup>Including South African citizens or persons who are domiciled in South Africa or a convention country or an agreement country and a juristic person that has a registered office in the Republic of South Africa or a convention country or an agreement country. *Ibid*, Sections 1, 6(2)(a-b), 7(2).

<sup>217</sup>If a plant breeder's right is granted, the register must: (a) issue a certificate of registration (section 20(2)(a)); (b) enter the details in the register (section 20(2)(b)); and (c) publish the particulars in the *Government Gazette* (as may be described)(section 20(2)(c)).

<sup>218</sup>See *ibid*, section 23(4)(a): "The provisions of subsections (1), (2) and (3) shall also apply to varieties which are essentially derived from the protected variety, where the protected variety is not itself an essentially derived variety; not distinguishable from the protected variety as contemplated in section 2(2)(b); or the production of which requires the repeated use of the protected variety." See also *ibid*, section 23(4)(b): "For the purposes of paragraph (a) (i) a variety shall be deemed to be essentially derived from another variety if - (i) it is predominantly derived from that other variety, or from a variety that is itself predominantly derived from that other variety, while retaining the essential characteristics of that other variety; and (ii) it is clearly distinguishable from that other variety; and (iii) except for the differences which result from the process of derivation, it conforms to that other variety in respect of the essential characteristics."

<sup>219</sup>"Variety" refers to "plant grouping within a single botanical taxon of the lowest known classification, which grouping, irrespective of whether or not the conditions for the grant of a plant breeder's right are fully met, can be—(a) defined by the expression of the characteristics resulting from a given genotype or combination of genotypes; (b) distinguished from any other plant grouping by the expression of at least one of the said characteristics; and (c) considered as a unit with regard to its suitability for being propagated unchanged." See *ibid*, section 1.

<sup>220</sup>Appropriate compensation in respect to infringement of a plant breeder's right is provided for in *ibid*, section 47.

The DAFF<sup>221</sup> affirms that traditional farmer practices “such as exchange and saving protected varieties for re-sowing” may be constituted as an infringement of plant breeders’ rights, but section 23(6)(f) allows farmers to re-sow protected material on his/her own holding:

a person who procured any propagating material of a variety in a *legitimate manner*<sup>222</sup> shall not infringe the plant breeder’s right in respect of the variety if he or she . . . (f) is a farmer who on land occupied by him or her uses harvested material obtained on such land from that propagating material for purposes of propagation: Provided that harvested material obtained from the replanted propagating material shall not be used for purposes of propagation by any person other than that farmer.

Section 23(6) (f) has been labeled the “Farmers’ Privilege Provision,”<sup>223</sup> which allows farmers to re-sow seed harvested from protected varieties for non-commercial use.<sup>224</sup> The DAFF<sup>225</sup> has, however, indicated that this provision is often abused since no clear definition of “farmer” is provided in the Plant Breeders’ Rights Act and “no scale of production and the scope of varieties” are stipulated. Consequently, the DAFF<sup>226</sup> announced in the Plant Breeders’ Rights Policy of 2011 that norms and standards, including the consideration of the farm size and its enterprises and the category of crops, will be developed. In section 9(1) (d) of the Plant Breeders’ Rights Bill, that was tabled during 2013 and has not yet been approved, it is stated that a plant breeder’s right with respect to a variety obtained in a legitimate manner does not extend to:

a farmer who - (i) within reasonable limits; and (ii) subject to the safeguarding of the legitimate interests of the breeder, uses the protected variety concerned as prescribed in accordance with subsection 2(a). (2) The Minister must, in respect of subsection 1(d), prescribe the - (a) category or categories of farmers; (b) category or categories of plants; (c) uses to which such a protected variety may be put; and (d) where applicable, the - (i) conditions for payment of royalties; and (ii) labeling requirements.

While plant variety protection was welcomed by the plant breeder industry, including the seed industry, various concerns arose for farmers, specifically small-holder farmers in developing countries like South Africa. These included the fact that plant breeders’ rights pose a threat to their cultural autonomy<sup>227</sup>; the fear of dependence on multinational agribusinesses<sup>228</sup>; and the “end of locally controlled food production.”<sup>229</sup> In South Africa, farmers and NGOs’ displeasure with the protection of plant breeders’ rights was formulated in the Valley of 1000 Hills

Declaration<sup>230</sup> and the Johannesburg Declaration on Biopiracy, Biodiversity and Community Rights.<sup>231</sup> A major criticism against the protection of plant breeders' rights is that "as multinational seed companies reap great rewards from their innovations, many farmers believe that their and their communities' historical contributions to biodiversity and seed development<sup>232</sup> are going largely unrecognized."<sup>233</sup> It must be mentioned that the unauthorized use of patented seeds by farmers is not the only form of biopiracy; biopiracy could also be committed by plant breeders themselves. In the course of their bioprospecting activities, they often exploit local biodiversity resources and/or traditional knowledge.<sup>234</sup> It must also be noted that there is a South African legal framework for the sustainable use of biodiversity. In the National Environmental Management Biodiversity Act 10 of 2004a (Biodiversity Act), "bioprospecting" is defined as "any research on, or development of application of, indigenous biological resources for commercial or industrial exploitation. . ."<sup>235</sup> This act regulates bioprospecting of genetic material<sup>236</sup> as well as the sustainable use of indigenous biological resources.<sup>237</sup> It further provides for a fair and equitable sharing of benefits arising

<sup>230</sup>In Motion (2003), Valley of 1000 Hills Declaration.

<sup>231</sup>Anon (2002), The Johannesburg Declaration on Biopiracy, Biodiversity and Community Rights.

<sup>232</sup>Regarding the traditional role of farmers as stewards of agro-biodiversity, see DAFF (2011), p. 8. "Farmers' Rights consist of the customary rights that farmers have had as stewards of agro-biodiversity since the dawn of agriculture to save, grow, share, develop and maintain plant varieties; their legitimate right to be rewarded and supported for their contribution to the global pool of genetic resources as well as to the development of commercial varieties of plants; and their rights to participate in decision making on issues that may affect these rights."

<sup>233</sup>Borowiak (2004), p. 512.

<sup>234</sup>DAFF (2011), pp. 9–10.

<sup>235</sup>See the Government of South Africa (2004), Biodiversity Act—section 1. Various examples of bioprospecting are included such as "(a) the systematic search, collection or gathering of such resources or making extractions from such resources for purposes of such research, development or application; (b) the utilization for purposes of such research or development of any information regarding any traditional uses of indigenous biological resources by indigenous communities; (c) research on, or the application, development or modification of, any such traditional uses, for commercial or industrial exploitation; or (d) the trading in and exporting of indigenous biological resources in order to develop and produce products, such as drugs, industrial enzymes, food flavors, fragrances, cosmetics, emulsifiers, oleoresins, colors, extracts and essential oils."

<sup>236</sup>Genetic material is defined as "material of animal, plant, microbial or other biological origin containing functional units of heredity." See *ibid*.

<sup>237</sup>See *ibid*, section 80(2) For bioprospecting purposes, biological resources are defined as "(i) any indigenous biological resources as defined in paragraph (b) of the definition of 'indigenous biological resource' in section 1, whether gathered from the wild or accessed from any other source, including any animals, plants or other organisms of an indigenous species cultivated, bred or kept in captivity or cultivated or altered in any way by means of biotechnology; (ii) any cultivar, variety, strain, derivative, hybrid or fertile version of any indigenous species or of any animals, plants or other organisms referred to in subparagraph (i); and (iii) any exotic animals, plants or other organisms, whether gathered from the wild or accessed from any other source which, through the use of biotechnology, have been altered with any genetic material or chemical compound

from bioprospecting involving such indigenous biological resources,<sup>238</sup> specifically when “traditional knowledge accompanies the genetic resource.”<sup>239</sup> Baker<sup>240</sup> highlights the relevant provisions in the Biodiversity Act below:

[b]efore a party may legally bioprospect in South Africa, in terms of the Biodiversity Act, that party must obtain a permit from the South African government,<sup>241</sup> and this permit will only be granted if the community possessing the indigenous resource has consented to the terms of a benefit-sharing agreement.<sup>242</sup> In addition to this agreement, a material transfer agreement must be entered into with the holders of the traditional knowledge, if such is associated with the genetic material.<sup>243</sup>

In addition to the Biodiversity Act, the Patents Act 57 of 1978 (Patents Act)<sup>244</sup> requires every applicant who lodges an application for a patent in South Africa to attest in a statement if the invention for which protection is claimed is based on or derived from an indigenous biological resource,<sup>245</sup> genetic resource,<sup>246</sup> or traditional knowledge or use.<sup>247</sup> Baker<sup>248</sup> argues that both the Biodiversity Act and the Patents Act show South Africa’s commitment to comply with its international obligations like the Convention on Biological Diversity,<sup>249</sup> which was ratified by South Africa.<sup>250</sup>

In terms of the plant genetic resources for food and agriculture (PGRFA), South Africa is not a contracting party to the FAO’s International Treaty on Plant

<sup>249</sup>Convention on Biological Diversity (1993), Introduction.

<sup>250</sup>See also the Cartagena Protocol (United Nations Convention on Biological Diversity (2001), Cartagena Protocol on Biosafety) that South Africa ascended to as well as the Nagoya Protocol (United Nations Convention on Biological Diversity (2010), Nagoya Protocol) which South Africa ratified.

Genetic Resources for Food and Agriculture<sup>251</sup> (ITPGRFA). Even though South Africa is not a signatory, the DAFF<sup>252</sup> recently referred to the protection of farmers' rights in its Plant Breeders' Rights Policy of 2011 as reflective of article 9 in the ITPGRFA. These rights protect traditional knowledge relevant to PGRFA, ensure equitable participation in benefit-sharing arising from the utilization of PGRFA, and give the right to participate in decision-making.<sup>253</sup> The ITPGRFA rests the responsibility for realizing farmers' rights relating to PGRFA on the national governments. The DAFF<sup>254</sup> expressed that the use of PGRFA is important in the development of new plant varieties; however, neither the Plant Breeders' Rights Act nor the UPOV Convention "offers protection for these varieties due to their lower level of distinctness, uniformity and stability."<sup>255</sup> It is, therefore, not possible to use these systems as benefit-sharing mechanisms in recognition of farmer's contributions as stewards of agro-biodiversity."

Apart from the more specified provisions regarding farmers' privilege in the 2013 Plant Breeders' Rights Bill and section 42(1)(e) for the appointment of one person to represent indigenous interests in respect of new plant varieties,<sup>256</sup> the 2013 Bill does not make provision for the protection of farmers' rights. It is recommended that the provisions of the Biodiversity Act, Patents Act, Conservation of Agricultural Resources Act 43 of 1983 and the Plant Breeders' Rights Act be harmonized in order to address the current fragmented approach to conservation, farmer varieties, agricultural biodiversity and traditional knowledge.<sup>257</sup> Additionally, better protection must be afforded to traditional farmers' rights particularly by the signing and ratification of the ITPGRFA.<sup>258</sup>

### 47.3 Towards a South African Food Security Framework Act<sup>259</sup>

From the exposition of the South African legal framework (both legislative and other) for food security, it is clear that food security measures are in place. The DRDLR<sup>260</sup> recently attested that “trends recorded in indicators measuring food security interventions at household level show that although progress has been slow, there is a definite increase in the number of households assisted to produce their own food; this has had a positive impact on food security at household level.” The DAFF also<sup>261</sup> recently disclosed that:

Some successes have been recorded in different priority areas of the Strategy, and South Africa is presently able to boast national food sufficiency through a combination of own production and food imports. The General Household Survey (GHS) has also indicated that the food access index has been improving, and the incidence of hunger is declining.<sup>262</sup>

However, the National Policy for Food and Nutrition Security<sup>263</sup> warns that “secure access to food by all is still not guaranteed” and without coordinated interventions “increasing numbers of the population may experience inadequate access to food and many more will fail to benefit from proper nutrition.” As mentioned in the introduction to this chapter a major criticism of the current South African food security legal framework is its fragmentation due to the discordant responsibilities of various government departments that address various aspects of food security and related measures. It was also mentioned that the South African government has failed to yet adopt an integrated and comprehensive food security framework act for the realization of the right to have access to food.<sup>264</sup> Although a draft food security framework bill was prepared during 2002, further attempts at a framework act have been postponed because of DAFF’s priority to first establish a strategic and policy framework for food security.<sup>265</sup> As previously mentioned, the IFSS was adopted in 2002 and the National Policy on Food and Nutrition Security was approved in 2013, thereby establishing the strategic and policy framework. Thus, the drafting and eventual enactment of a food security framework law should be the next logical step in the regulatory process:

---

<sup>259</sup>This section is partially based on chapter 6 of the author’s doctoral thesis. For a detailed discussion of a proposed South African food security act, see Terblanche and Pienaar (2012).

<sup>260</sup>DRDLR (2014), p. 23.

<sup>261</sup>DAFF & DSD (2013), p. 3.

<sup>262</sup>This corroborates with President Zuma’s indication that “the overall food security figure is declining due to government programmes” namely that “the percentage of households that were vulnerable to hunger declined from 29,3 % in 2002 to 12,6 % in 2012.” Zuma (2013).

<sup>263</sup>DAFF & DSD (2013), p. 3.

<sup>264</sup>Terblanche and Pienaar (2012), p. 232.

<sup>265</sup>Terblanche (2011), pp. 199–203.

In line with the directive of the Constitution and conforming to its international obligations, South Africa has to consider the proposal of the Food and Agriculture Organization of the United Nations (FAO),<sup>266</sup> that member states should consider the enactment of legislation on the right to access to food. The approval of the National Food Security policy<sup>267</sup> will be an initial step towards a Food Security Act for South Africa. . . Currently there is no legislation regulating food security and its co-ordination in South Africa. . . South Africa needs a Food Security Act which will enforce the public and private sector to promote the non-violation of the basic human's right of having access to food and water as prescribed by our Constitution.<sup>268,269</sup>

Framework legislation for the realization of constitutionally enshrined qualified socio-economic rights is not a strange phenomenon in the South African law.<sup>270</sup> Examples of framework legislation include the National Health Act 61 of 2003,<sup>271</sup> National Environmental Management Act 107 of 1998c,<sup>272</sup> National Water Act 36 of 1998d,<sup>273</sup> National Housing Act 107 of 1997,<sup>274</sup> and Social Assistance Act 13 of 2004b.<sup>275</sup> In *Government of the Republic of South Africa v Grootboom*<sup>276</sup> (the Grootboom-case), the Constitutional Court addressed the necessity of framework legislation in the realization of the right of everyone to have adequate housing access.<sup>277</sup> The Constitutional Court indicated that the constitutional requirement of

<sup>266</sup>For example, see FAO (2009).

<sup>267</sup>The National Food Security Policy has since been approved.

<sup>268</sup>DAFF (2012b), pp. 5, 40.

<sup>269</sup>See also DAFF & DSD (2013), p. 18, which states that “in line with its international obligations, South Africa has to consider the recommendation of the Food and Agriculture Organisation of the United Nations (FAO) that Member States should consider the enactment of legislation on the right to access to food. The approval of this National Food and Nutrition Security policy could be an initial step towards a Food and Nutrition Security Act for South Africa, which would give statutory force to such structures. A Green and White Paper process is envisaged to prepare for this.”

<sup>270</sup>Terblanche and Pienaar (2012), pp. 232–233.

<sup>271</sup>Enacted per section 27(2) of the Constitution as a legislative measure for the realization of the right to have access to health care services, including reproductive health as enshrined in section 27(1)(a) of the Constitution.

<sup>272</sup>Enacted per section 24(b) of the Constitution as a legislative measure for the realization of everyone's right to an environment that is not harmful to their health or well-being as enshrined in section 24(a) of the Constitution.

<sup>273</sup>Enacted via section 27(2) of the Constitution as a legislative measure for the realization of the right to have access to sufficient water as enshrined in section 27(1)(b) of the Constitution.

<sup>274</sup>Enacted via section 26(2) of the Constitution as a legislative measure for the realization of the right to have access to adequate housing as enshrined in section 26(1) of the Constitution.

<sup>275</sup>Enacted per section 27(2) of the Constitution as a legislative measure for the realization of the right to have access to social security (including, if they are unable to support themselves and their dependents, appropriate social assistance) as enshrined in section 27(1)(c) of the Constitution.

<sup>276</sup>*Government of the Republic of South Africa v Grootboom* (2001), 1 SA 46 (CC).

<sup>277</sup>As enshrined in the South African Constitution. See section 26(1-2) of.

legislative measures may necessitate framework legislation at national level by<sup>278</sup> arguing that such act can serve to guide the state's duty to ensure that legislation, policies, programs and strategies are sufficient to meet the state's obligations.<sup>279</sup> Although section 27(1)(b), which gives the right to have access to sufficient food, has not been judicially decided and interpreted, the textual similarities between the state's obligations imposed in sections 26(2)<sup>280</sup> and 27(2)<sup>281</sup> of the Constitution (with reference to the *Grootboom*-case) justifies the enactment of a nationally coordinated and overarching piece of legislation within this context. Khoza<sup>282</sup> even contends that the government's failure to enact such legislative measure is indicative of the state not fulfilling its obligations and such failure is open to judicial testing.

The possibility of countries enacting framework legislation as a means to implement national strategies for the realization of the right to food was also suggested by the United Nations Committee on Economic, Social and Cultural Rights (CESCR) in General Comment 12: The Right to Adequate Food<sup>283</sup> in 1999.<sup>284</sup> Such encouragement was later repeated by the FAO in its 2009 Guide on Legislating for the Right to Food<sup>285</sup> and again, in 2014, in its<sup>286</sup> working paper *Legal Developments in the Progressive Realization of the Right to Adequate Food*.<sup>287</sup> Framework legislation is regarded as a component of a "contemporary

---

<sup>278</sup>However, the Constitutional Court did not need to elaborate on the enactment of a framework law for housing since the Housing Act 107 of 1997 already existed at the time of the hearing of the *Grootboom*-case. See the *Grootboom*-case (2001), para. 40.

<sup>279</sup>*Ibid* with reference to the right to have access to adequate housing.

<sup>280</sup>The section states that "the state must take reasonable legislative and other measures, within its available resources, to achieve the progressive realization of this right." This refers to section 26 (1) of the Constitution, which provides for the right to have access to adequate housing. See *ibid*.

<sup>281</sup>The section obliges the state to "take reasonable legislative and other measures, within its available resources, to achieve the progressive realization of each of these rights." This refers to section 27(1) of the Constitution, including section 27(1)(b) which ensures the right to have access to sufficient food. See *ibid*.

<sup>282</sup>Khoza (2005), p. 192.

<sup>283</sup>CESCR (1999).

<sup>284</sup>*Ibid*, para. 29 states that: "in implementing the country-specific strategies referred to above, States should set verifiable benchmarks for subsequent national and international monitoring. In this connection, States should consider the adoption of a framework law as a major instrument in the implementation of the national strategy concerning the right to food. The framework law should include provisions on its purpose; the targets or goals to be achieved and the time frame to be set for the achievement of those targets; the means by which the purpose could be achieved described in broad terms, in particular the intended collaboration with civil society and the private sector and with international organizations; institutional responsibility for the process; and the national mechanisms for its monitoring, as well as possible recourse procedures. In developing the benchmarks and framework legislation, States parties should actively involve civil society organizations."

<sup>285</sup>FAO (2009).

<sup>286</sup>The FAO indicated that an increasing number of countries have enacted food security framework laws over the last 10 years, including a few African countries like Angola, Mozambique and Zanzibar. For the complete list see *ibid*.

<sup>287</sup>*Ibid*.

legislative process.”<sup>288</sup> This means that the relevant piece of legislation sets broad legal and operational principles without necessarily giving content thereto.<sup>289</sup> According to the FAO,<sup>290</sup> contents are provided by ensuing measures like subsequent legislation, regulations, administrative decisions, policies and financial measures.<sup>291</sup>

The primary objective of a framework act is to operate as a coordinated instrument for the implementation of national strategies and policies.<sup>292</sup> Subsequent objectives, as emphasized by Khoza<sup>293</sup> and others,<sup>294</sup> include (a) identification of further development of specific policies and further legislation where necessary,<sup>295</sup> (b) harmonization and integration of certain measures where necessary, (c) creation of structures in order to facilitate co-ordination between and accountability of relevant organs of state, departments and non-governmental role players,<sup>296</sup> (d) provision of operational instruments such as benchmarks, norms, targets and objectives<sup>297</sup> as well as monitoring mechanisms,<sup>298</sup> and (e) the provision of a set of guiding principles to which the development of policy and legal reform must conform to.<sup>299</sup> The FAO<sup>300</sup> emphasizes the importance of a framework act as “useful as they articulate the normative content of the right to food and provide various means of enforcement at the administrative, judicial and quasi-judicial levels.” It “seeks to get a systematically defined and complex process of implementation of the right started by, first and foremost, identifying duplications, gaps and obstacles encountered in implementing the current legislative and policy measures.”<sup>301</sup> Khoza<sup>302</sup> asserts that a

<sup>288</sup>Garrett (2005), pp. 717–718; Coomans and Yakpo (2004), pp. 17, 20.

<sup>289</sup>Health Systems Trust (2005), National Health Act Proclaimed by the President; FAO (2009), p. 57.

<sup>290</sup>Ibid.

<sup>291</sup>See FAO (2009), p. 57. The general nature of framework legislation is summarized as “establish [ing] a general frame for action, framework legislation does not regulate the areas it covers in detail. Instead, it lays down general principles and obligations but leaves it to implementing legislation and other authorities to determine specific measures to be taken to realize such obligations, possibly within a given time frame.”

<sup>292</sup>Khoza (2004), p. 672; CESCR (1999), p. 29; Terblanche (2011), pp. 194–196.

<sup>293</sup>Khoza (2004), p. 672.

<sup>294</sup>See also Coomans and Yakpo (2004), p. 20 and Garrett (2005), p. 741.

<sup>295</sup>Ibid, p. 733 indicates that a framework act may indicate the legislator’s decision to solve or address a certain problem or matter, can lay down neutral laws, and facilitate coordinated action.

<sup>296</sup>Vapnek and Spreij (2005), pp. 155–158, 168–173, 196–198.

<sup>297</sup>Or at least identify the relevant body/official responsible for establishing the abovementioned operational instruments (usually within a given timeframe). See Khoza (2005), p. 197 and CESCR (1999), para. 29.

<sup>298</sup>Ibid.

<sup>299</sup>Vapnek and Spreij (2005), pp. 158–160.

<sup>300</sup>FAO (2009), pp. 4–5.

<sup>301</sup>Khoza (2004), p. 672.

<sup>302</sup>Ibid, p. 669.

framework act is part of the rule of law and thereby strengthens the idea that society must primarily be governed by legislation and secondarily by policy. Framework legislation must direct policies, which must conform and comply with the principles stated in said legislation.<sup>303</sup> Policy measures allow too much flexibility and uncertainty unless it is directed by legislation.<sup>304</sup> Khoza<sup>305</sup> further argues that a policy can be changed at any moment by an executive authority and without the participation of or consultation with the legislative authority.

Due to the possible inclusion of operational instruments such as norms, indicators, time-defined goals and objectives, framework legislation is also often considered a “transformed policy framework” since such operational instruments are usually found in policy measures rather than in statutory provisions.<sup>306</sup> Even if the proposed framework act makes provision for the mentioned operational instruments, the implementation, application and enforcement thereof will be determined by subsequent policy and/or strategy measures.<sup>307</sup> The importance of incorporating such operational instruments in the proposed framework act lies in the fact that if the legislatively required monitoring, for example, does not take place, such failure is not merely considered non-compliance with policy or strategy measures, but rather as a non-compliance with a legislative provision.<sup>308</sup>

In addition to the general primary and subsequent aims of framework legislation, other benefits of a food security framework act includes:

- (a) providing normative contents to the right to have access to sufficient food and related principles<sup>309</sup>;
- (b) strengthening the justiciability of section 27(1)(b) of the Constitution by making provision for concrete remedies in the case of infringement<sup>310</sup>;
- (c) enforcing human right norms and constitutional principles<sup>311</sup>;
- (d) emphasizing the interdependence of rights<sup>312</sup>;
- (e) serving as a starting point for the identification of loopholes and gaps in the current legal framework<sup>313</sup>;
- (f) providing for better coordination and enhanced accountability by awarding specific responsibilities to the different spheres of government,<sup>314</sup> government

<sup>314</sup>Namely on national, provincial and local level.

departments, organs of state, government bodies and non-governmental stakeholders<sup>315</sup>;

- (g) enhancing integrated food security management by making provision for comprehensive and coordinated implementation of national strategies and policies as well as sectorial legislation relating the right to have access to sufficient food<sup>316</sup>, and
- (h) serving as a means for measuring and monitoring progress in the realization of socio-economic rights by providing norms and time-defined goals and objectives.<sup>317</sup>

Ergo, a food security act will serve as a confirmation of the South African government's commitment to the realization of the right to have access to sufficient food as enshrined in the Constitution.<sup>318</sup>

## 47.4 Conclusion and Way Forward

It is clear from the above account of the South African food security legal framework that various legislative and other measures are in place to address various food related challenges. Although coordinated by different departments and within different budget allocations, various measures often seek the same outcomes, demonstrating the fragmentation of the food security legal framework. The National Food and Nutrition Security Framework<sup>319</sup> accurately summarize:

Food and nutrition security is a multifaceted and multidimensional issue which will not be attained through a single approach – be it in the form of social relief or agricultural production. Food and nutrition security requires well-managed inter-sectorial co-ordination, and the genuine integration of existing policies and programs in health, education, and environmental protection, as well as in agrarian reform and agricultural development.

Furthermore, the National Food and Nutrition Security<sup>320</sup> calls for mechanisms that ensures stricter alignment, better coordination, and stronger oversight. While the general benefits of enacting a proposed food security act were listed earlier in this chapter, it is also suggested that the proposed framework act should make provision for the establishment of a national coordinating body, such as a National Food and Nutrition Security Authority, to achieve the goals of stricter alignment, better coordination and stronger oversight. Such a coordinating body could be

<sup>315</sup>Khoza (2004), p. 677; Khoza (2005), pp. 194, 196; FAO (2009), pp. 4, 54; Coomans and Yakpo (2004), p. 22.

<sup>316</sup>Khoza (2005), p. 194; FAO (2009), p. 4.

<sup>317</sup>Khoza (2004), p. 677; Coomans and Yakpo (2004), p. 22.

<sup>318</sup>Khoza (2005), p. 197.

<sup>319</sup>DAFF & DSD (2013), p. 6.

<sup>320</sup>Ibid.

composed of representatives from relevant government departments<sup>321</sup> as well as other stakeholders such as the South African Human Rights Commission, research and statistic institutes<sup>322</sup> like the South African Human Science Research Council, the private sector and academia<sup>323</sup> non-governmental organizations, and representatives of civil society.<sup>324</sup> The composition of the proposed national food and nutrition coordinating body should, in essence, reflect the multi-sectorial nature of the right to food and food security.<sup>325</sup>

According to the FAO,<sup>326</sup> the proposed framework act could mandate the national coordinating body to (a) advise the government and coordinate the activities and actors involved at national, regional and local level; (b) formulate, negotiate, adopt and review food security measures; (c) determine “appropriate benchmarks for measuring progress in the implementation of the framework law and the realization of the right to food;” (d) collect information and ensure the dissemination of information among all relevant actors; (e) provide advice on the harmonization of relevant sectorial policies; (f) make recommendations for change, amendments to a law, regulation or policy, as well as the adoption of new measures; (g) set priorities and coordinate the allocation of resources “according to priorities;” and (h) report to Parliament “on the state of implementation of the right to food and the framework law itself.”<sup>327</sup>

Further research into the structure, composition, representation and general mandate for the proposed food and nutrition national coordinating body is encouraged as well as for further provisions of the proposed food security framework act. This chapter concludes with reference to the words of the late Nelson Mandela.<sup>328</sup>

We know it well that none of us acting alone can achieve success. We must therefore act together as a united people, for national reconciliation, for nation building, for the birth of a new world. Let there be justice for all. Let there be peace for all. *Let there be work, bread, water and salt for all.*<sup>329</sup> Let each know that for each the body, the mind and the soul have been freed to fulfill themselves.

<sup>321</sup>These include the national departments of Basic Education; Higher Education and Training; Health; Agriculture, Forestry and Fisheries; Environmental Affairs; Social Development and the Department of Women, Children and People with Disabilities. See FAO (2009), pp. 139–142, 144–145 for possible structure and composition options.

<sup>322</sup>Ibid, p. 144.

<sup>323</sup>Ibid.

<sup>324</sup>See also ibid, p. 6, which states that “the participation of stakeholders during the drafting stages will reveal the scope of interests and concerns pertaining to the realization of the right to food. As such, framework laws provide improved policy coherence and can ensure that the right to food is central to a country’s development strategies. In addition, the institutional framework established by the framework law for coordination and consultation purposes should include provisions on participation of non-governmental stakeholders, as most of them do.”

## Part VII

# Asia

This part begins with chapters by Prof. Dr. Jörn Westhoff (Chap. 48), an international business law specialist from Germany, and by Prof. Peter Sousa Hoejskov (Chap. 49) from the World Health Organization. These two chapters discuss food regulation under ASEAN, the Association of Southeast Asian Nations. ASEAN will be introduced in great depth as it largely affects countries that have a variety of different issues surrounding food laws as many countries are included under ASEAN.

Subsequently, in Chap. 50, Andreas Popper provides an important introduction to Branding, Regulation and Customs in Japan and Singapore, thereby linking food regulation and intellectual property law to business aspects.

This will be followed by an in-depth discussion of food law in China in Chap. 51. Dr. Juanjuan Sun describes how food safety, food quality, and sustainability are regulated while China's agricultural policy continues to address challenging and fascinating questions.

No food law and policy textbook would include a complete section on Asia without a discussion on food law in India. Thus, for Chap. 52, Dimpy Mohanty summarized how India's law and policy are reshaped while the country is advancing its food regulatory system. In light of rich cultural and dietary variations, India has begun to unify previously multifaceted and cumbersome regulatory regimes, with respect to standards of food and its manufacture, sale and import, to ensure availability of safe and wholesome food for human consumption.

In Chap. 53, an outstanding and comprehensive discussion on food law in Russia follows with an introduction into various food safety and trade regulatory frameworks and a comparison between the Eurasian Economic Community and the European Union. Three distinguished authors, Dr. Anatoly Kutyshenko, Dr. Alexey Petrenko and Dr. Victor Tutelyan, combined their efforts to provide an unprecedented overview of one of the largest economic zones in the world and emphasized the food law and policy aspects with exceptional elegance.

As a final but lasting issue of importance, Chap. 54 sets out to describe and explain the Israeli regulatory policy for GM crop and food safety. By linking food

law issues from economics, science and technology, Dr. Justo-Hanani explains institutional structures and cultural factors that affect Israel's GMOs policy. Finally, the chapter demonstrated an increase in academic awareness and public activities, which resemble those activities of global policy trends more closely, and may profoundly impact policy in the future.

# Chapter 48

## Food Regulation and Policy Through the Association of Southeast Asian Nations (ASEAN)

Jörn Westhoff

**Abstract** The Association of Southeast Asian Nations (ASEAN) is a supranational organization comprising of ten rather inhomogeneous countries striving to develop into a common single market with legal and social harmonization. Food security is a major concern of many of them, since the region is exposed to severe hazards to its environment and agriculture, caused by natural disasters as well as man-made threats. ASEAN with the help of other countries has managed to organize a food safety system ensuring the supply of rice, a staple food of predominant importance in the region. Food security is still not harmonized on an ASEAN level and remains within in the responsibility of each member states. All ASEAN member states, though, are members of the Codex Alimentarius, yet implementation of the codex standards differs widely among ASEAN member states.

### 48.1 Introduction to General ASEAN Policy

#### 48.1.1 ASEAN: History and Organization

The Association of Southeast Asian Nations (ASEAN) was founded on August 8, 1967 in Bangkok with the signing of the ASEAN Declaration<sup>1</sup>—also referred to as “Bangkok Declaration”—in the aftermath of de-colonization following World War II. Stemming from smaller, yet not very efficient regional agreements (like ASA and MAPHILINDO), ASEAN was established under the impression of the Vietnam war and with the declared goal to foster peace in the region by common efforts to stabilize the then beginning economic growth, to pursue social advance

and to support cultural development. Founding members were Thailand, Malaysia, Indonesia, the Philippines and Singapore, later joined by Brunei Darussalam (1984), Viet Nam (1995), Myanmar and The People's Democratic Republic of Lao (1997) and finally Cambodia (1999) to form a group of ten nations, with a population of approximately 575 million, which is 8 % of the world population and more or less as much persons as are living in the European Union. Papua New Guinea and East-Timor have a status as observers. Through progressing economic integration, ASEAN developed into an ASEAN Economic Community (AEC), obviously modeled after the European Union, as a region of equitable economic development joined in a single market and politically based on three pillars, namely the ASEAN Political-Security Community, the ASEAN Economic Community and the ASEAN Socio-Cultural Community. Legal status and institutional framework of ASEAN, its norms, rules and values as well as clear targets are now set out in the ASEAN Charter which entered into force on December 15, 2008.

ASEAN is administered by the ASEAN Secretariat in Jakarta, Indonesia, headed by a Secretary General, who coordinates the work of ASEAN. Political decisions are made by the ASEAN Summit of heads of state or government of the member states and the ASEAN Coordinating Council, which meets three to five times a year and consists of the hosting country's foreign minister and the ambassadors of the other states. Resolutions on specialized matters are passed in ministerial conferences on industry, mining and energy, trade and tourism, nutrition, agriculture and forestry, banking and finance, transport and communication. The foreign ministers of the ASEAN member states meet annually in the Council of Ministers passing resolutions on the further development structure and related guidelines. Every 3 years, the summit of heads of state and governments gives ASEAN new impetus and encourages new developments deemed desirable.

### ***48.1.2 ASEAN: Not a Homogenous Group of Countries***

Quite different from the European Union (as an obvious comparator), ASEAN by no means is a group of countries with more or less equal economic strength (at least this was true for the EU of 16 countries). ASEAN member states differ very much in terms of population, size of the agricultural sector and other economic variables, etc.

The following is a short outline on the history as well as the political and legal system of the ten ASEAN member states.

#### **48.1.2.1 Brunei Darussalam**

The Sultanate of Brunei, a major regional force between the fifteenth and seventeenth centuries lost influence over internal dynastic conflicts, European

colonization, and piracy. A British protectorate since 1888, Brunei gained independence in 1984 and is ruled by an absolute monarch in a dynasty stemming from 600 years ago. Brunei wealth roots in his petroleum and natural gas fields and has the highest per capita GDP in ASEAN. The legal system is based on English common law with influence by Islamic sharia in some fields.

#### **48.1.2.2 Cambodia**

Cambodia looks back on the great history of the Angkor empire which in the tenth through thirteenth century extended over big parts of Southeast Asia. The country came under French protection in 1863, was made part of French Indochina and in World War II was occupied by Japanese troops. Independence was gained in 1953, and over time Cambodia evolved into a constitutional monarchy with democratic elections to parliament. Cambodia has the mixture law system typical for a country under varying foreign influence and with several internal law sources. It is now a conglomerate of French-influenced statutes, royal decrees, parliamentary legislation, often referencing customary law, and influence from common law principles.

#### **48.1.2.3 Indonesia**

Indonesia, a Dutch colony for centuries and experiencing Japanese occupation in World War II, gained independence from the Netherlands in 1949. It is now one of the world's largest democracies, with a population widely spread over about 6,000 densely inhabited islands (of a total of 17,508, most of which are wilderness), with hundreds of distinct ethnic groups and as many languages and dialects. Being Javanese and/or Muslim gives a shared identity to a large group, but by far not to all of the population, and "Bhinneka Tunggal Ika" ("many, yet one") is the Indonesian motto that describes the situation and binds together the Indonesian people. The Indonesian legal system is based on Dutch law, influenced by indigenous concepts.

#### **48.1.2.4 Lao PDR**

The ancient kingdom of Lan Xang ruled the region from fourteenth through seventeenth century, but came under Siamese (now Thailand) influence in the eighteenth century and was colonized by France in the late nineteenth century as part of French Indochina. Having experienced Japanese colonization, Laos declared independence in 1945, but had to fight French re-colonization, and only in July 1954 France gave up its claims to French Indochina and accepted Lao's full sovereignty. In the aftermath of Vietnam war Lao came under communist influence and Lao PDR was declared in 1975. Lao PDR's economy largely depends on the

agricultural sector, employing about 80 % of the work force. The legal system is based on French influenced statutes, mixed with traditional customary law.

#### **48.1.2.5 Malaysia**

The area of what is now Malaysia was a conglomerate of British colonies and protectorates from late eighteenth through nineteenth century. Freed from World War II Japanese occupation, the former British territories on the Malay Peninsula formed the Federation of Malaya and as such gained independence in 1957. The state of Malaysia today is under the rule of the Yang di-Pertuan Agong, a constitutional monarch, elected for a 5-year term from the heads of the nine sultanates which together with four other federal states and three federal territories form Malaysia. Major ethnic groups in Malaysia are Malaysians and Chinese, official language is Bahasa Malaysia, but English as language i.a. for official documents and several Chinese languages are of great importance as well. The legal system is based on British common law with some influence of Islamic law in family and religious matters of the Muslim population.

#### **48.1.2.6 Myanmar**

The Union of Myanmar was—as Burma—a British colony from 1824 and became part of the British-Indian Empire. Occupied by Japan in World War II, Myanmar was re-colonized by Great Britain and gained independence in 1948. Ruled by military forces, Myanmar has only recently started a democratization process. The population consists of 135 distinct ethnic groups with indigenous languages. The biggest ethnic group (70 % of the population) is the Bamar. More than two thirds of the population work in the agricultural sector. The legal system is based on British common law.

#### **48.1.2.7 Philippines**

The Philippine islands were fragmented in various kingdoms, city states and sultanates when in the sixteenth century Magellan claimed the islands for Spain, which united the islands under colonial rule as the “Spanish East Indies” or the “Viceroyalty of New Spain”. The name of the islands stems from this time, when the islands of Leyte and Samar were named “Filipinas” after the Prince of Asturias, who later became King Philip II of Spain. 20 million dollars bought the islands for the United States of America in the 1898 Treaty of Paris. While still struggling for independence with the United States, the Philippines were occupied by Japan during World War II. Independence and sovereignty was recognized by the United States in 1946. The Philippines are a multi-ethnic states, with appr. 28 % of the population the Tagalog are the biggest ethnic group. 171 languages are spoken in

the Philippines, with Filipino and English as the official languages, and 19 regional languages as auxiliary official languages. The legal system of the Philippines is based on Spanish law and heavily influenced by American common law.

#### **48.1.2.8 Singapore**

Singapore was a British trading outpost established in 1819 within the Sultanate of Johor. Later under the jurisdiction of British India, Singapore was occupied by Japanese troops during World War II and reclaimed by Great Britain after the Japanese surrender. Singapore gained independence in 1963, joined the Federation of Malaya, but left it 2 years later. 40 % of the inhabitants of Singapore are foreigners, underlining the importance of the state as center of trade for Southeast Asia. English, Malay, Mandarin and Tamil are the four official languages of Singapore, with English dominating business, government and education. The Singapore legal system bases on British common law.

#### **48.1.2.9 Thailand**

Thailand was known as the Kingdom of Siam from fourteenth century until 1939. It has never been colonized by European countries, yet had several severe conflicts with its neighboring states. From 1932, Thailand developed into a constitutional monarchy, ruled by the Chakri dynasty since general Chao Phraya Chakri became King Rama I in 1782. Thailand was invaded by Japan in 1941. 75 % of the population are Thai, the second largest ethnic group (15 %) is Chinese. 73 languages are used in Thailand, with Thai as the official language. Traditionally, Thailand's economy is agriculture-oriented, with 39 % of the work-force employed in this sector, but the so-called "dual-track" economy is aimed to support a process of industrialization. Thailand has a civil law system.

#### **48.1.2.10 Viet Nam**

Viet Nam was a part of Han-China until 938, when the Trieu-Dynasty was able to gain sovereignty. This lasted until the nineteenth century, when Viet Nam became part of French Indochina. Having been occupied by Japan during World War II, Viet Nam fought against French re-colonization, in the Indochina-War. In 1954, Viet Nam was divided into a Northern and a Southern part, both sovereign states, which were united in 1976, following the Viet Nam War, as the Socialist Republic of Viet Nam. Viet Nam's economy is agriculture-oriented, with 65 % of employees working in this sector. The Viet Nam population is relatively homogeneous, with 88 % ethnic Vietnamese, yet 53 ethnic minority groups, among which the Chinese are the biggest group. Viet Nam's legal system is based on French law, influenced by socialist legal theory.

### 48.1.3 *Rule of Law in ASEAN*

From the very beginning, ASEAN in its internal policy has relied more on diplomacy rather than law.<sup>2</sup> Consultation and consensus were the means of managing political relations, and only few legally binding treaties were put into force. Yet, the founding members had been able to create among them an organization aimed to foster peaceful relations with each other and to put up principles for their cooperation which were laid down in Art. 2 of the Treaty of Amity and Cooperation in 1979, namely:

- Mutual respect for the independence, sovereignty, equality, territorial integrity and national identity of all nations
- The right of every State to lead its national existence free from external interference, subversion or coercion;
- Non-interference in the internal affairs of one another;
- Settlement of differences or disputes by peaceful means;
- Renunciation of the threat or use of force;
- Effective cooperation among themselves.

These principles describe “the ASEAN Way” of refraining from interference with the internal affairs of other member and a—very Asian—way of resolving disputes and eventually organize cooperation, “based on realism, the self-interest of each state or at best functionalism based on the common interests of each state.”

Things changed when in 2007, ASEAN member states signed the ASEAN Charter to establish a legal and institutional framework for ASEAN, and blueprints for each of the three pillars named above were formulated and adopted together with new treaties and protocols often depicting detailed obligations and related procedures for dispute settlement, all with the declared goal to resolve disputes peacefully, forge closer economic integration and be bound by a common regional identity.<sup>3</sup> Dynamic and rapid though the recent developments may seem, it has to be noted that, other than with the European Union, integration within ASEAN is not promoted by some states of major influence in the group. The position which France and Germany have assumed in the European Union as the two states with the biggest population and highest economic strength cannot be claimed by any of the ASEAN member states. Whereas Indonesia is by far the biggest population, it is also one of the poorest countries of the group, whereas wealthy nations like Brunei Darussalam and Singapore are the smallest states. Furthermore, other than in Europe, not all member states of ASEAN have democratic political systems, but some are military dominated like Myanmar, claim to be socialist states like Vietnam or Laos, and some are even absolute monarchies, namely Brunei Darussalam. With the lack of dominant states, the establishment of ASEAN inter-governmental or supranational institutions and their ability to influence politics and

<sup>2</sup>Ewing-Chow and Hsien-Li (2013), p. 1.

<sup>3</sup>AESAN Vision 2020, available at: <http://www.asean.org/1814.htm> (last visited April 21, 2014).

legislation in the member states is of decisive importance. Art. 11 (2) of the ASEAN Charter does bestow upon the ASEAN Secretariat a substantive role in facilitating and monitoring the implementation in the member states of ASEAN legal acts, resolved in particular by the ASEAN Summit, and in pursuing the goal of ASEAN integration. But, as a matter of fact, the Summit depends on unanimous resolutions and the Secretariat's role is still weak, the details of its competences are not clear, and the funding for ASEAN institutions in general is difficult, their budget low. Courts are of no help either in implementing ASEAN legal acts. Unlike the European Union with the European Court of Justice (ECJ) and the system of preliminary ruling which enables all domestic courts of European member states to directly apply European legislation authentically interpreted by the ECJ, ASEAN neither has a supranational court nor a system to enforce ASEAN law, not to speak of harmonized interpretation.

Nevertheless, ASEAN legislation as such does exist. It is laid down in numerous agreements, declarations, MOU, policies and framework, of which the binding character often remains unclear. It is with a political approach rather than a legal one that those instruments are drafted, and the wording is a result of compromises sought in order to reach consensus among the member states as a general principle. This fact, however, is quite in line with the perception of law in Asia in general. As has often been emphasized, Asian culture is influenced by principles of group orientation, harmony and informality rather than individualism, contradiction and formality which are perceived as "Western" principles, particularly with regard to legal culture. Hence, it has to be noted that ASEAN as an institution cannot, as to now, in the same way as the European Union harmonize member states' policies and laws in any field. This has to be born in mind when examining the policy and legal acts of ASEAN on food safety and food security and the implementation thereof in the ASEAN member states.

#### ***48.1.4 Food Law and Food Policy: A Central Issue in ASEAN Economy and Development***

With food production as a major industry in ASEAN member states, food policy is a central issue in ASEAN's strives to build the AEC as a means not only of mutual commercial benefit but of peace and prosperity as well. However, integration of the member states' economies is often hindered by the disparity of the member states themselves, with a multitude of ethnic and religious groups and occasional armed conflicts among member states. Often is it bemoaned that ASEAN member states tend to put national interests before ASEAN group solidarity. One of the more recent examples was the ASEAN member states reaction to the 2007/2008 food price crisis. With the ASEAN member states having diverse food production capacities, soaring prices for basic staple foods, particularly rise, during the crisis had a major negative impact on the consumer price index in food importing

countries and even put into question whether net rice buyers would be able to secure enough food supplies for their populations, while rice exporting countries benefitted from the situation. Among them, ASEAN member states Thailand and Viet Nam disregarded the needs of fellow member states, in particular the Philippines, possibly in breach of the 1979 Agreement on the ASEAN Food Security Reserve,<sup>4</sup> banned exports and thus forced the Philippines, the world's major rice importer, to even increase its imports to secure the supply of rice for their population.

In systematic terms, the political conflicts which came up among ASEAN member states could be described as a tension between food self-sufficiency and the food self-reliance principle: While food self-sufficiency means to rely on domestic producers, not to import food to a major extent and, thus, support local food production and diets based on what can be grown on domestic soil, the food self-reliance principle aims on the availability of a variety of foodstuffs for domestic consumption, yet includes international trade and exchange as an important source to provide such variety. Consequently, in countries following the self-reliance principle, the protection of domestic production focuses on large scale producers able to compete and succeed in international trade. In all ASEAN countries rice is a domestic product and an important component of regular local diets. Hence, where the self-sufficiency and the self-reliance principle relate to the very same product, conflicts between countries with a different approach are quite viral, and the product itself must be in the focus of any policies striving to foster cooperation and harmonization. It goes without saying, therefore, that ASEAN food law and policy to a major extent is virtually a rice law and policy.

## **48.2 Implementation of Food Laws and Policies by ASEAN Member States**

### ***48.2.1 Food Security: The ASEAN Plus Three Emergency Rice Reserve***

As the Asian Development Bank (ADB) has pointed out in a 2012 survey on "Food Security and Poverty in Asia and the Pacific",<sup>5</sup> "poverty is the single most common cause of food insecurity." Food security is defined as the situation when "all people, at all times, have physical, social and economic access to sufficient, safe and nutritious food that meets their dietary needs and food preferences for an active and healthy life".<sup>6</sup> This does not only refer to the supply of food in sufficient quantity and quality, i.e. the question whether there is enough good food to feed everyone,

---

<sup>4</sup>English text available at: [http://www.jus.uio.no/english/services/library/treaties/13/13-02/asean\\_food\\_security.xml](http://www.jus.uio.no/english/services/library/treaties/13/13-02/asean_food_security.xml) (last visited March 25, 2014).

<sup>5</sup>Asian Development Bank (2012).

<sup>6</sup>Food and Agriculture Organization (2002).

but also to availability of food for every individual in terms of affordability, utilization and stable supply, i.e. the question whether a single person can be sure about when he will have the next meal, where it will come from and whether it will be enough to nourish him in the way he needs. Very unfortunately, this question cannot be answered affirmatively for all nations in South East Asia. South Asia as a whole, ADB states, has the highest rate and largest number of undernourished children in the world,<sup>7</sup> and much of this situation, according to the ADB, is caused by a vicious circle in which “poverty deprives people of access to adequate, good quality food . . . , (m)alnutrition undermines productivity, keeps incomes low, and traps people in poverty.”<sup>8</sup> ADB, therefore, advocates global, regional, and domestic policies of simultaneously fighting against poverty and for food security.

ASEAN, while it does not expressively follow such a simultaneous approach, has undertaken to organize food security on a large scale. In 1979, ASEAN member states signed the Agreement on the ASEAN Food Security Reserve (ASFR), thereby establishing the ASEAN Emergency Rice Reserve (AERR). AERR consists of domestic food security stocks which are designated as such by the member states on a voluntary basis and were planned to be released by the member states to a fellow member state in a state of emergency, following bilateral negotiations. As a matter of fact, however, no releases ever were made from the AERR, due to, according to an ADB survey, (1) too small quantity of reserves, (2) cross-border transactions for food becoming more complex by bilateral negotiations, and (3) the inability of the AFSR Board to operate the AERR because of lacking funds for the secretariat.<sup>9</sup> However, as ASEAN member states continuously supported the idea of a regional food reserve scheme, in 2001 the strengthening of the AERR was put on its way in a special workshop on Food Security Cooperation and Rice Reserve Management System in East Asia, held in 2001 in Nakhon Pathom, Thailand, starting with a review of the scheme. The review’s outcome showed the need of emergency mechanisms for effective immediate relief. Food emergency is often caused, as was pointed out, by the high volatility of the price for rice, partly due to environmental disasters or at least unforeseeable climate variations which render the region’s agricultural sector particularly vulnerable.

Together with The People’s Republic of China, Japan, and the Republic of Korea, the ASEAN member states formed the “ASEAN Plus Three”-group which put up as a pilot project from 2003 to 2010 the East Asia Emergency Rice Reserve (EAERR), with funding from Japan and contribution in kind from the other states, mounting up to a reserve of 787,000 tons of rice.<sup>10</sup> Stocks can be withdrawn from the EAERR as an emergency loan or grant or on the basis of a commercial contract. The latter transaction was the only one ever performed, when in March 2010 the Philippines acquired 10,000 tons of rice from Viet Nam. In October 2011, an

<sup>7</sup>Asian Development Bank (2012), p. 8.

<sup>8</sup>Asian Development Bank (2012), p. 22.

<sup>9</sup>Briones (2011), p. VIII.

<sup>10</sup>Briones (2011), p. IX.

agreement was signed among the members of the ASEAN Plus Three group to establish the “ASEAN Plus Three Emergency Rice Reserve” (APTERR) scheme as permanent institution which obliges the member states to cooperate whenever food-related emergency situations need response. The APTERR Agreement entered into force on 12 July 2012, and the first meeting of the APTERR Council was held on 28 March 2013 in Bangkok, Thailand. The APTERR Secretariat was officially launched on 29 March 2013.

APTERR provides two kind of stock, namely “earmarked emergency rice reserves”, which are specific quantities of milled rice which remain owned and/or controlled by the government of the earmarking country for the purpose of meeting emergency requirements of one or more APTERR member countries, and “stockpiled emergency rice reserves”, which is rice voluntarily donated to APTERR in the form of cash and/or in kind and which are owned collectively by the APTERR member countries and managed by the APTERR Secretariat under the supervision of the APTERR Council.<sup>11</sup> Three programs regulate the release of rice from the APTERR stock:

“Tier 1 – involves the release of earmarked stocks under a pre-arranged scheme to address problems of food availability. This program is designed for anticipated emergencies. The pre-arranged release of rice reserves under Tier 1 is formalized as a forward contract, stating the specific quantity and grade of rice, pricing method, terms of payment and delivery, and other requirements between a supplying country and a recipient country. Delivery of rice from the supplying country will be made in the event of an emergency in the recipient country, with payment based on the prevailing international market price. The amount of rice under a forward contract is based on an estimate of rice shortfall in the event of an emergency over the medium term.

Tier 2 – involves the release of earmarked stocks for emergencies not addressed by Tier 1. This program is designed for unanticipated emergencies. The release of rice reserves under Tier 2 is made available to an APTERR member country to meet an emergency requirement of rice under other arrangements. This program provides for the release of rice reserves beyond what is already arranged under Tier 1. Delivery follows an on-the-spot agreement between a supplying country and a recipient country. Pricing is similar to Tier 1: payment can be made in cash or through long-term loan or grant, based on mutual agreement of the countries involved.

Tier 3 – involves the release of stockpiled emergency rice reserves to address problems of food accessibility. This program is designed for acute emergencies and for other humanitarian responses to food insecurity. The release of rice reserves under Tier 3 is a donation of rice as humanitarian assistance to a recipient country affected by calamity upon their request in response to acute emergency. In special cases, rice distribution can be fast-tracked under

---

<sup>11</sup><http://www.apterr.org/about-us/how-we-work/apterr-mechanism> (last visited April 21, 2014).

automatic trigger. Moreover, rice stocks may be also released for poverty alleviation and malnourishment eradication programs to address other humanitarian purposes.”<sup>12</sup>

APTERR on its website lists ten “accomplishments”, i.e. cases in which rice was distributed from the rice reserve<sup>13</sup>:

- From December 2004–June 2005, 87 households and students in Vientiane province in Lao PDR were provided with a total quantity of 13.37 tons of rice under a poverty alleviation program.
- From November 2005–November 2006, 9,992 people in Indonesias Sampang district and 22,825 people in Jember district received 100 tons of rice under a relief program to help people affected by flood.
- From July 2006–December 2006, 154,500 households in Leyte, Cebu, Davao and Manila City in the Philippines were provided with 930.24 tons of rice after a volcanic eruption and typhoons.
- From July 2007–January 2008, in Cambodia, under a relief program to help people affected by flood and under a poverty alleviation program, 379.76 tons of rice were distributed to 11,798 households in Kampong Thom, Ratanakiri, Kandal, Kompong Chhnang and Takeo provinces.
- From March 2008–May 2009, 18,182 households affected by flood in Central Java and East Java, Indonesia, received a total of 186.5 tons from the APTERR.
- From November 2008–January 2009, under a rehabilitation program to help people affected by cyclone Nargis in Myanmar, 13,120 people in Laputta and Bogalay townships where helped with 164 tons of rice.
- From November 2008–January 2009, a rehabilitation program to help people affected by typhoon Ketsana and flashfloods in the Philippines provided 520 tons of rice to 7,137 households in Metro Manila and Ifugao provinces.
- From July 2010–October 2010, 9,207 villages in Saravan and Attapeu provinces in Lao PDR, affected by typhoon Ketsana, received 347 tons of rice.
- From November 2011–December 2011, 50 tons of milled rice and 31,000 cans of cooked rice were distributed from the stock under an emergency relief program to help 8,100 households affected by flood in Central region of Thailand.
- From October 2012–December 2012, 200 tons of rice were distributess to 20,000 Indonesian households in Yogyakarta, Central Java, Banten and East Java provinces as food assistance for a poverty alleviation and malnutrition eradication program.

<sup>12</sup><http://www.apterr.org/about-us/how-we-work/apterr-mechanism> (last visited April 21, 2014).

## 48.2.2 Food Safety

### 48.2.2.1 General Outline

Food safety here is understood as “the assurance that food will not cause harm to the consumer when it is prepared and/or eaten according to its intended use.”<sup>14</sup> ASEAN and its member states have made various efforts to implement regulatory frameworks on food safety both on a national and a regional level. The ASEAN Common Food Control Requirements (ACFCR) were set up as a guideline for national food control systems in the member states, promoting, inter alia, a set of five components for a food control system, namely:

- Food legislation,
- Food control management,
- Inspection activities,
- Laboratory service,
- Information, education, communication and training.

These five points, of which legislation will be in the focus of this paper, meet the basic requirements commonly enumerated as the necessary parts of an effective food safety regime. It is, however, by no means an easy task for some ASEAN members to fulfil those requirements. Partly so because of lack of awareness, funds and efficiency, as *Othman* states<sup>15</sup>:

National food safety programs in Southeast Asia generally lack the following critical elements, namely: an appreciation of the nature and extent of national food safety problems, an awareness of the consequences of contaminated food on the nation’s health status and economic development, and a sense of urgency for the need to investigate and do research. There is a shortage of sound, cost-effective methods for identifying specific food safety problems. The responsibility for ensuring food safety is based on a multi-agency approach due to historical or political reasons, and there is lack of coordination among agencies. In addition, specific food safety policies are either nonexistent, inadequate or of low priority in most of these countries. This situation is further compounded by the presence of other areas of concern which compete for the limited resources.

### 48.2.2.2 Food Safety Legislation

Other than food security, food safety cannot be assured just by piling on each other the efforts of all ASEAN member states (and some others), as was done in the case of APTERR. Food safety is about control on a large and on a small scale, starting where food is produced and proceeded and following the distribution chain to the end user. For efficient control, standards need to be set by legislation,. Those standards must not by all means meet the standards agreed upon internationally,

---

<sup>14</sup>Othman (2006), p. 83.

<sup>15</sup>Othman (2006), p. 84.

but for developing countries with an export-oriented food industry, like some of the ASEAN member states, adhering to internationally accepted standards is a question of economic success and, thus, part of the fight against poverty. Countries which depend on import to supply their population's nutrition needs, on the other hand, profit from having their domestic standards harmonized on an international level as then the standards themselves will not stand in the way of the import of food. Setting standards only to protect the domestic food industry might make sense for exporting states, it does not help anybody in importing states.

The probably most influential internationally accepted standard for the production of food is the "codex alimentarius" (Latin for "food code", hereinafter: the "codex"), which was established in 1963 by the Food and Agriculture Organization of the United Nations (FAO) and the World Health Organisation (WHO). Art. 3 of the World Trade Organization's (WTO) Agreement on Sanitary and Phytosanitary measures (SPS Agreement) references the codex, which comprises of several regulations for harmonized international food standards, guidelines and codes of practice to protect the health of consumers and ensure fair food trade. While the regulations are mere recommendations for voluntary application by the codex members, global coordination of food standards is a major concern of the Codex Alimentarius Commission and the committees organized to administer the codex. In addition to the SPS Agreement, the Agreement on Technical Barriers to Trade (TBT Agreement) does not directly refer to the production or procession of food, but covers all technical regulations on traditional quality factors, fraudulent practices, packaging, labeling, etc.

Whereas all ASEAN member states are codex members, ASEAN as an organization is not (other than the European Union, which joined in 2003). Implementation of the codex, therefore, is a domestic task for ASEAN member states. However, ASEAN has created several bodies dealing with food safety in the region: The ASEAN Expert Group on Food Safety (AEGFS) monitors, facilitates and coordinates food safety activities of ASEAN member states; the ASEAN Food Safety Improvement Plan (AFSIP), developed by AEGFS, provides the related policy outlines.<sup>16</sup> So far, AEGFS identified ten areas which need improvement, among them, legislation is one of the five named top priority issues. Single ASEAN member states have been entrusted as lead countries for each of the five top priority areas, the country in charge of legislation is the Philippines.

In the following text, a brief outline on each state will give an overview on the current state of food safety activities in ASEAN member states, mainly summarizing the results of a survey<sup>17</sup> made in the context of the FAO regional project "Support to Capacity Building and Implementation of International Food Safety Standards in ASEAN Countries, launched in December 2011, aiming on better

---

<sup>16</sup>For detailed information see: <http://aegfs.aseanfoodsafetynetwork.net/> (last visited April 21, 2014).

<sup>17</sup>FAO (2012).

implementation of codex standards, and information provided in the internet by the “Asian Food Regulation Information Service”.<sup>18</sup>

### Brunei Darussalam

Two major legal acts form the body of law dealing with food safety in Brunei Darussalam, namely the Public Health (Food) Act, which provides for regulation of public health in respect of food in general, and the Halal Meat Act, which regulates the supply and importation of Halal Meat. The setting and enforcement of standards for Halal Meat lies in the responsibility of the Ministry of Religious Affairs and several other institutions like the Majlis Ugama Islam (Islamic Religious Council), while the ministry of health takes care of the setting, enforcement and inspection of standards for food in general. In 2013, Brunei announced a plan to set up a National Standards Committee on Food,<sup>19</sup> but as of yet, national standards for food in particular seem to refer to Halal standards only, which deal with the production, preparation, handling, distribution and storage of Halal food.<sup>20</sup>

### Cambodia

In Cambodia, the Law on the Management of Quality and Safety of Products and Services serves as an umbrella law covering, in a general manner, all regulated products including food, giving power to regulatory agencies to set up technical regulations for food. Cambodia’s food control system follows a farm to table approach, setting up a multiple agency system on several levels of production, each level under the supervision of another national ministry. Food standards on a national level are included in the Public Health (Food) Act, with an extra set of standards existing for Halal. Under the regime of the Public Health (Food) Act, Cambodia currently has 18 voluntary food commodity standards and recommended 5 general and 24 codex commodity standards for adoption as technical regulations. Basically, Cambodia follows a policy to adopt codex norms for regulatory.

<sup>18</sup><http://www.asianfoodreg.com> (last visited April 21, 2014).

<sup>19</sup>The Brunei Times, June 25, 2013, available at: <http://dns.bt.com.bn/2013/06/25/prepare-national-food-rules-f-b-firms-urged> (last visited April 21, 2014).

<sup>20</sup>Halal Food Standard, available under: <http://www.asianfoodreg.com> (last visited April 21, 2014).

## Indonesia

Indonesia has the following legislation on food safety: Law No 7 of 1996 on Food; Government Regulation No. 69 of 1999 on Food Labeling and Advertisement; Government Regulation No. 28 of 2004 on Food Safety, Quality and Nutrition. Food control is under the responsibility of the Ministry of Agriculture, the Ministry of Marine Affairs and Fisheries and the National Agency for Drugs and Food Control. The Ministry of Trade and the Ministry of Industry share in controlling special standards together with local governments. National standards are developed by the technical committee for standard development under the supervision of the National Standardization Agency of Indonesia (NSA), which is also responsible to coordinate the implementation of international food standards, in particular the codex. The named authorities have agreed on the establishment of a National Codex Alimentarius (Codex Indonesia).

## Lao PDR

Lao has announced a National Food Safety Policy as a reference scheme for the implementation of the control and management of quality and safety of food. There are several regulations, rules and codes of practice related to food, and according to the survey, they have been revised or drafted to meet codex standard. A National codex Committee was established in 1998, and 76 national standards are registered and adopted by the Ministry of Science and technology and the Food and Drug Department of the Ministry of Health.

## Malaysia

The main law for protecting the Malaysian public against health hazards caused by food is the Food Act 1983 and related Food Regulations 1985 and 2009, the Food Hygiene Regulations 2009, The food Irradiation Regulations 2011 and the Food Analyst Act 2011. Regulatory rules are set by the Ministry of Health and its Food Safety and Quality Division is in charge of control along the food supply chain. There are mandatory standards covering all major aspects of food safety, however, codex provisions are mostly referred to in voluntary standards. Those standards and related practices are in line with codes guidelines and standards. A National Codex Committee (NCC) was established in 1985, convening government, industry, consumers, academia and professional bodies.

## Myanmar

Myanmar has a set of National Food Law, Pesticide Law, Fisheries Law and Animal Health and Development Law, administered by several ministries on a

multi-level scope following the food supply chain. Standards are developed by the Food and Drug Supervisory Committee and the Food and Drug Administration, supported by various committees and sub-committees.

## Philippines

In the Philippines, the Food, Drug and Cosmetics Act was set into force in 1963 and amended in 1987 and 2009, a Sanitation Code was enacted in 1975. Food control is conducted by a multi-agency system of several ministries on a national level, and standards are developed and released as Administrative Orders by the Bureau of Agriculture and Fisheries Product Standards, the Food and Drug Administration as well as several other agencies under the supervision of the Department of Agriculture. 110 standards and codes of practice cover all major areas of food supply and food safety. A National Codex Organization was established in 2005, which defines its own role as an advisor to the government “on the implications of various food standardization and food control issues which have arisen and are related to the work undertaken by the Codex Alimentarius Commission (CAC). Such a consultative group provides important benefits for the government so as to assist in ensuring a safe supply of food to consumers while at the same time maximizing the opportunities for industry development and expansion of international trade.”<sup>21</sup> The influence of the National Codex Organization on the enforcement of codex standards in national Philippine legislation remains unclear, adherence to codex stipulations by the government and legislative body of the Philippines is a matter of further detailed research.

## Singapore

Singapore enacted a Sale of Food Act in 1973 and amended it in 2002, Food regulations of 1998 were last revised in 2005 and cover more than 200 food standards. Codex standards are adopted as national standards as need is assessed by local risk examination.<sup>22</sup>

## Thailand

Thailand has a Food Act of 1979 regulating the mandatory control on specific foods and imported foods, food labeling and food advertising. The Agriculture Standards Act of 2008 establishes standards for producers, exporters and importers alike of

---

<sup>21</sup><http://www.fdc.net.ph/index.php?id1=23>.

<sup>22</sup>For more detailed information particularly to labeling standards in Singapore, see Chap. 50 of this volume.

agricultural commodities and with binding effect to certification bodies. 181 Thai Agricultural Standards have been elaborated, setting up commodity standards, production system standards and standards for general requirements such as maximum pesticide residue limits. Conformity with international standards is pursued on a political level by the National Agricultural Standard Committee, which, however, cannot set standards itself.

## Viet Nam

Vietnam passed a Food Safety Law in 2010, specifying responsibilities for safety of food to various ministries. Standards are developed following a system established under the Law on Standards and Technical Regulations. Viet Nam follows a multiple agency approach for food control. 46 national technical regulations, dealing, e.g., with heavy metals contamination are set up as mandatory regulations by the Ministry of Health, and 752 standards issued by the Ministry of Science and Technology appeal to be followed on a voluntary basis. The Viet Nam codex Committee, established in 1994, coordinates codex activities among its members, who are leaders from the relevant ministries, government agencies, food businesses and academia.

### 48.3 Suggestions for Further Research

- In many ASEAN member states, access to safe drinking water is a major concern of many, and a need not provided to all. The problem is often linked to hygiene and sanitation, but water can also be polluted with pesticides or herbicides. Find out how ASEAN and its member states deal with this particular problem.
- Food safety can only be effectively implemented if producers have access to comprehensive explanation and advice. One means of giving such help can be a “codex country manual”. Find out in which of the Asian member states such a manual exists and whether it is available via internet in all major languages spoken in that country.
- Pick a particular aspect of food safety, e.g. contamination by intoxicating substances, check out the relevant regulations of each or selected ASEAN member states at <http://www.asianfoodreg.com> and other internet sources and compare the contents with each other and the Codex Alimentarius. Put up a synopsis and discuss the reasons for differences.
- Many of ASEAN member states experienced Japanese occupation in World War II. Examine how Japan today helps ASEAN members with their food security and food safety policy and how Japanese and ASEAN food markets work with each other.

# Chapter 49

## History of Asian Food Policy

Peter Sousa Hoejskov

**Abstract** Asia is a diverse region consisting of over 48 countries and is home to about 4.4 billion people. Trade of food and agricultural products in Asia is crucial for the development of the region and is contributing to the Sustainable Development Goals (SDGs) by eradication of food insecurity and rural poverty. With increasing trade in food and agricultural products and with the establishment of the Sanitary and Phytosanitary (SPS) and Technical Barriers to Trade (TBT) Agreements of The World Trade Organization (WTO), food safety issues are receiving increased attention in Asia. Within Asia two groups of countries (ASEAN and SAARC) have strengthened their collaboration in terms of economic, political and social development and is striving towards harmonizing their food legislative frameworks as a means to facilitate trade with food and agricultural products within the regions. This chapter explores the legal foundations and important issues surrounding all of these aspects of food safety regulation in Asia.

### 49.1 Introduction

Asia is a diverse region consisting of over 48 countries and is home to about 4.4 billion people. Some of the world's richest as well as poorest countries are found in Asia and within the last 20–25 years, the region has been subject to impressive economic as well as social and political development.

Over the past two decades, trade in food and agricultural products within and beyond Asia has been increasing, making the food and agriculture sector one of the most international sectors.

Trade of food and agricultural products in Asia is crucial for the development of the region and is contributing to the Sustainable Development Goals (SDGs) by eradication of food insecurity and rural poverty. However, increasing diversity and volume of trade in food and agricultural products, together with changing

e-mail: [hoejskovp@who.int](mailto:hoejskovp@who.int)

agricultural practices, human ecology and behavior and new technologies, is a key contributor in the cross-border spread of food safety hazards.

With increasing trade in food and agricultural products and with the establishment of the Sanitary and Phytosanitary (SPS) and Technical Barriers to Trade (TBT) Agreements of The World Trade Organization (WTO), food safety issues are receiving increased attention in Asia. Food safety has become a shared concern among all countries in the region and in response to increasing political and social demands on government regulatory agencies, many countries have allocated substantial resources into applying new methods for regulating the food industry and updating, revising and harmonizing national regulatory systems in line with international requirements, standards and recommendations.

The restructuring of the national food regulatory systems has taken place along with enhanced regional collaboration in the area of food safety, food legislation and regulation, inspection and certification as well as coordination of capacity building activities.

Within Asia two groups of countries (ASEAN and SAARC) have strengthened their collaboration in terms of economic, political and social development and is striving towards harmonizing their food legislative frameworks as a means to facilitate trade with food and agricultural products within the regions.

This paper describes food laws and regulations in Asia with main focus on ASEAN. The purpose of the paper is to present the overall framework for food legislation in the region and at the same time highlight some of the main issues with regard to food quality and safety and how these issues impact on the development of food laws and regulations in the region. The purpose of the paper is not to give a detailed insight into food legislation development and implementation in all Asian countries, but rather to give an overview of the regional context and some of the mechanisms for collaboration between countries in the region.

## 49.2 What Is ASEAN and Its Legal Foundation?

ASEAN was established in August 1967 by the five countries Indonesia, Malaysia, Philippines, Singapore, and Thailand. Brunei Darussalam joined in 1984, Vietnam in 1995, Lao PDR and Myanmar in 1997 and Cambodia in 1999.

The ASEAN region has a population of about 500 million people, a total area of 4.5 million square kilometers, a combined gross domestic product of almost US\$ 700 billion and a total trade of about US\$ 850 billion.

The ASEAN Declaration (<http://www.aseansec.org/1212.htm>) states that the aims and purposes of the Association are: (1) to accelerate economic growth, social progress and cultural development in the region and (2) to promote regional peace and stability through abiding respect for justice and the rule of law in the relationship among countries in the region and adherence to the principles of the United Nations Charter.

The ASEAN Vision 2020 (<http://www.aseansec.org/1814.htm>), adopted by the ASEAN Leaders in 1997, agreed on a shared vision of ASEAN as a concert of

Southeast Asian nations, outward looking, living in peace, stability and prosperity, bonded together in partnership in dynamic development and in a community of caring societies.

In 2003, the ASEAN Leaders resolved that an ASEAN Community should be established by 2015 comprising three pillars, namely:

- ASEAN Security Community
- ASEAN Economic Community
- ASEAN Socio-Cultural Community

A year later ASEAN established the Vientiane Action Programme (<http://www.aseansec.org/VAP-10th%20ASEAN%20Summit.pdf>) to realize this goal and in 2009, with the Cha-am Hua Hin Declaration on the Roadmap for the ASEAN Community (2009–2015) (<http://www.aseansec.org/publications/RoadmapASEANCommunity.pdf>), the way towards an ASEAN Community was defined.

The process of ASEAN Community building is a result of the considerable change in the association's mission in the recent two decades. The end of the Cold War, the advance of globalization, the rise of China and India in economic size and political influence as well as the Asian financial crisis have forced ASEAN to shift from its original preventive diplomacy of maintaining peace and harmony among its members and in the region to the constructive diplomacy of community building to cope with increasing political and economic competition in a globalised world.

The Treaty of Amity and Cooperation (<http://www.aseansec.org/1217.htm>) in Southeast Asia (TAC) spell out the following fundamental principles for the ASEAN countries in relation to each other:

- Mutual respect for the independence, sovereignty, equality, territorial integrity, and national identity of all nations
- The right of every State to lead its national existence free from external interference, subversion or coercion
- Non-interference in the internal affairs of one another
- Settlement of differences or disputes by peaceful manner
- Renunciation of the threat or use of force
- Effective cooperation among themselves.

ASEAN did not conclude a legally binding treaty until the first ASEAN Summit in Bali in 1976—the Treaty of Amity and Cooperation in Southeast Asia—was held. This was followed by the 1977 Preferential Trading Arrangement which carried some measures of legal obligation. In 1987 ASEAN concluded, at the third ASEAN Summit, the Agreement for the Promotion and Protection of Investments and the agreement on the standstill and rollback of non-tariff barriers, which conferred legal rights and obligations upon their signatories.

In the intervening period, three industrial cooperation schemes were agreed upon—the ASEAN Industrial Projects (1980), the ASEAN Industrial Complementation (1981), the ASEAN Industrial Joint Ventures (1983)—and the Brand-to-Brand Complementation Scheme (1988).

The development towards economic integration of ASEAN was strengthened in 1992 with the agreement on the Common Effective Preferential Tariff for the

ASEAN Free Trade Area (AFTA) which the ASEAN countries agreed upon during the ASEAN Summit in 1992.

Under this agreement, the first six signatories to the AFTA treaty—that is, the first six members of ASEAN—were legally committed to reducing tariffs on their trade with one another, with a few exceptions, to a range of zero to five percent by the beginning of 2002 or, in some cases, the beginning of 2003. The newer members were given a little more time.

The tariff reductions are to be carried out through national legal enactments by each party to the agreement in accordance with an agreed schedule. The ASEAN countries have also formally agreed on an arrangement to govern delays in the inclusion of products in the AFTA scheme or suspensions of AFTA concessions under very stringent conditions.

In legally committing ASEAN's members to reduce and eventually remove tariff barriers between them, AFTA is the first substantial step toward integrating the ASEAN market that ASEAN countries have recognized as essential for making their production and commercial processes more efficient, bringing down costs, encouraging investments, and, in general, strengthening their economic competitiveness.

ASEAN has extended the scope of the AFTA from trade in goods to the equally important realm of trade in services like transportation, telecommunications, financial services, construction and tourism. At the summit of December 1995, ASEAN concluded the Framework Agreement on Services. The agreement is to be given strengths through sector-by-sector negotiations. The resulting agreements are legally binding upon the parties.

At the same summit of 1995, ASEAN also entered into an agreement committing its members to undertake national measures to protect intellectual property rights, encourage investments as well as encourage industrial and scientific innovation.

In October 1998, ASEAN decided to allow the freer flow of investments through the ASEAN Investment Area agreement, under which each country legally undertakes to open up its industrial sector to investments from other ASEAN countries and accord national treatment to such investors.

As a means to facilitate trade and encourage investments in the ASEAN region, ASEAN Member countries agreed, at the summit of December 1998, on a framework agreement on mutual recognition arrangements for goods-in-transit. This framework agreement is to be carried out by agreed arrangements on specific product groups, under which ASEAN countries are obligated to recognize results of conformity assessments issued by any one of them, such as test reports, product certifications or registration approvals.

Two things are to be noted about the legally binding agreements that ASEAN has concluded so far. The first is that they are overwhelmingly economic in nature. The second is that, since the conclusion of the AFTA agreement in 1992, ASEAN has entered into such agreements with increasing frequency. This may be an indication of ASEAN's growing realization that closer regional economic integration requires that it is based on binding legal foundations if integration and that it is to be stable, credible and effective. The commitments undertaken must be clear, firm and enforceable.

As ASEAN moves into further integration, the number of binding undertakings can be expected to increase. The e-ASEAN framework agreement, which the ASEAN leaders signed in November 2000, may require legally binding agreements on such things as the authentication of signatures, the use of electronic documents in business transactions, privacy and confidentiality, and so on. The further deepening of ASEAN economic integration, involving tariff nomenclatures, product standards, policy coordination, banking and finance, transportation and telecommunications, would surely need clear and enforceable agreements in these areas.

More broadly and fundamentally, ASEAN countries are working towards harmonization of domestic laws and regulations that govern trade and investment. This is to ensure that differences in domestic laws and regulations on “fair trade,” competition policy, government procurement and product standards are not used to frustrate the purposes of AFTA and the benefits of an integrated market. It is to provide the harmonized regional investment regime that investors increasingly require.

This developing rules-based economic regime will most likely gradually extend to other areas of ASEAN cooperation. After all, ASEAN is more than an economic association. ASEAN is working towards initiatives that undertake legal obligations related to transnational regional problems as the marine environment, the preservation of biodiversity, money-laundering, trafficking in human beings, drug-trafficking and piracy.

ASEAN is evolving into a more rules-based association. However, the success of regional agreements undertaken by ASEAN depends on effective national legislation and enforcement mechanisms to carry them out. This would also help strengthening the national legal systems of the member-states as well as the rule of law in the region as a whole.

### **49.3 Regional Coordination and Collaboration in the Area of Food Safety and Standards Setting Within ASEAN**

The goals of the ASEAN countries are to produce and supply foods that are safe and meet requirements of importing countries as well as international standards. Strengthening Member Countries’ participation and implementation of international food safety standards, especially Codex standards setting process, is also the main goal of the region. However, due to the different stages of development of food safety and quality standards in Member Countries, the regional approach has been concentrated on harmonization and networking of food safety and food standards among member countries. For this purpose different working groups and task forces have been established

- **ASEAN Task Force on Codex (ATFC)**

The ASEAN Task Force on Codex has been established to serve as a forum for Member Countries to discuss Codex issues of common interest and to possibly identify common positions on Codex issues of importance to Member Countries. It is also a forum to harmonize standards and regulations in ASEAN by using Codex

standards as a reference. Four meetings of the Task Force have taken place in Kuala Lumpur, Bali, Bangkok and Cebu. Many joint ASEAN positions on Codex issues were discussed and agreed. Activities on the strengthening and improving participation of ASEAN countries in Codex, for which a Member Country was nominated to be a focal point for each Codex Committee, have commenced.

- **Expert Working Group on the Harmonization of Maximum Residue Limits (MRLs) of Pesticide among ASEAN Member Countries**

The main objectives of the programme of this Expert Working Group are to harmonize MRLs among ASEAN countries in order to protect consumer's health, the harmonization of standards on agricultural and food commodities among ASEAN Member Countries and to provide Member Countries with a means for coordination and information sharing to reach international standards. The total number of harmonized MRLs of pesticides which have been endorsed by the ASEAN Ministers on Agriculture and Forestry (AMAF) is 369, involving a total of 28 pesticides. The number of draft harmonized MRLs in the process of consideration is 258. Even though most of the harmonized MRLs are based on Codex MRLs, more focus is on the harmonization of MRLs for minor crops important to the region for which no Codex MRLs are available. Issues on regional collaboration in the generation of residue data for harmonization and the principles and criteria on harmonization of MRLs are being considered in the Expert Working Group.

- **ASEAN Food Safety Network**

The 25th meeting of the ASEAN Ministers on Agriculture and Forestry which was held on 21 August 2003 in Malaysia expressed full support to the initiative on establishing an ASEAN Food Safety Network <http://www.aseanfoodsafetynetwork.net>. The Meeting noted that the proposed establishment of the Network would provide cohesive direction for the ASEAN working groups to help resolve recurring problems of non-tariff barriers encountered in the trade of food and agricultural products for ASEAN regarding food safety.

The network provides a communication tool towards a cohesive approach for the relevant ASEAN bodies in addressing the issues of food safety encountering the region's agricultural trade. Thailand is the coordinator of the ASEAN Food Safety Network.

An electronic coordination has been set up with the aim of coordinating, networking, information sharing and providing early warning among various national authorities and also working groups/task forces in ASEAN. This is also a forum for on-line bilateral or multilateral discussions and information sharing with regard to capacity building activities.

- **ASEAN Expert Group on Food Safety (AEGFS)**

ASEAN Expert Group on Food Safety (AEGFS) is a subsidiary body under Senior Officials Meeting on Health Development (SOMHD). The main objectives of AEGFS are not only to improve food safety of ASEAN countries, but also to facilitate food trade and formulate a strategic plan to address important food safety issues for mutual benefits. Besides those responsibilities, AEGFS also provides assistance to ASEAN Governments to develop and strengthen food safety infrastructures and programmes which support them to deal with their

new obligations and rights related to the safety and quality of food in both regional and international trade.

To achieve its objectives, AEGFS developed ASEAN Food Safety Improvement Plan (AFSIP) covering activities in ten areas which Information Sharing Programme is one of the priority areas. According to the agreement of the 4th AEGFS in Laos PDR, ASEAN Food Safety Network (AFSN) which has already served as a platform for coordinating and exchanging information on non-tariff barrier for ASEAN member countries and ASEAN bodies related to food safety, was assigned to serve as a coordinating forum for Information Sharing for AEGFS to cooperate and deal with information on food safety.

In the ASEAN Post-2015 Health Development Agenda and in the ASEAN Socio-Cultural Community (ASCC) Blueprint, food security and food safety is included as a cross-cutting issue within the human development directorate and the sustainable development directorate of the ASCC department. Under the ASEAN Post-2015 Development Agenda, Cluster 4 focuses on ‘Ensuring Food Safety’. In 2016, the work programme for 2016–2020 was developed and presented at the 11th Senior Officials Meeting on Health Development (SOMHD). From 2016 onwards, Cluster 4 ‘Ensuring Food Safety’ will replace the ASEAN Expert Group on Food Safety as the ASEAN coordination body for food safety matters.

- **ASEAN Consultative Committee on Standards and Quality (ACCSQ)—Prepared Foodstuff Product Working Group (PFPWG)**

The purpose of the PFPWG is to exchange information on existing standards, technical regulations and conformity assessment procedures, develop mutual recognition agreements for prepared foodstuff as well as common food control requirements for the ASEAN countries. The PFPWG has also been working on harmonizing HACCP and GMP requirements, requirements for import and export inspection and certification systems and establishment of a Rapid Alert System for Food and Feed in the region. One of the recent initiatives by the PFPWG has been to establish an ASEAN coordinating committee on food safety which is aimed at coordinating national as well as international initiatives, assistance and support in the area of food safety.

#### **49.4 AFSIP: A Framework for Food Laws and Regulations in ASEAN**

Food safety has since the foundation of ASEAN been one of the most important areas of collaboration. In 2000 this resulted in the development of the ASEAN Food Safety Improvement Plan (AFSIP) pursuant to a directive of the Declaration of the 5th. ASEAN Health Ministers Meeting on Healthy ASEAN 2020 held in Jakarta in 2000, to formulate an ASEAN Food Safety Policy and an ASEAN Framework on Food Policy, as part of a comprehensive programme of action to address the impact of globalization and trade liberalization in the health sector. The implementation of AFSIP contributes towards the realization of the ASEAN Health Ministers’ vision

of Healthy ASEAN 2020 as well as addresses a priority of the Declaration of ASEAN Concord II adopted by the 9th. ASEAN Summit in 2003, to intensify cooperation in the area of public health.

The development of AFSIP recognizes that food safety is a shared concern and responsibility of all stakeholders along the food supply chain including food industry, governments, consumers and academics and that it has to be controlled by using a “farm-to-table” approach. In this context the industry is responsible for producing safe foods, the government is responsible for providing a conducive and enabling environment for the production of safe foods and ensure that food safety requirements are met by enforcement, monitoring and other means, the consumers are responsible for making informed choices and safe handling practices and the academics are responsible for providing scientific data and risk assessments that can be used by food safety regulators to manage food safety risks.

The development of AFSIP has been guided by a scientific and risk-based approach which is the modern preventive and process based approach to control food safety. The plan recognizes the need to harmonize with international standards, and in particular Codex standards, guidelines and recommendations. The overall goal and expected outcome of the AFSIP is significantly improvements in the level of food safety in ASEAN Member Countries as reflected by (1) strengthen protection of consumers’ health and (2) enhance competitiveness of the ASEAN food industry and improve food export potential globally. The plan aims at:

1. Strengthening the food control system from farm to table with the involvement of relevant stakeholders
2. Increasing the level of credibility and competency of regulatory authorities
3. Enhancing the industry and consumer awareness and participation in food safety
4. Coordinating ASEAN common positions in international fora, as and when appropriate
5. Facilitating the alignment of member countries’ food safety policies with obligations under the WTO SPS and TBT agreements
6. Facilitating the harmonization of national regulatory standards with Codex standards.

The AFSIP recognizes that food safety activities in ASEAN are carried out by several agencies and bodies at the national level. Thus it aims at contributing towards an integration and coordination of these activities and include activities to support capacity building in food safety at the national level and implement joint regional activities in food safety at the regional level.

The activities necessary to improve food safety within the ASEAN region by cooperative efforts are classified under the following programme headings:

- Legislation
- Laboratories
- Monitoring and surveillance
- Implementation of food safety systems
- Food inspection and certification

- Education and training
- Information sharing
- Research and development
- International participation in food safety standard setting including Codex
- Consumer participation in food safety

#### ***49.4.1 Common Principles for Food Control Systems in ASEAN***

Under the AEGFS, the ASEAN countries have prepared some common principles for food control systems. <http://www.aseansec.org/21915.pdf> The principles recognize that effective national food control systems are essential to protect the health of consumers from foodborne illnesses and to facilitate trade within and beyond the ASEAN region. Development of national food control systems should take into account the obligations under the WTO's SPS and TBT agreements which have great significance for international trade with food and agricultural products.

An important component of the principles for food control systems in ASEAN is the establishment of a food control and regulatory framework including food legislation in the ASEAN countries.

The ASEAN Member Countries have recognized that development of relevant and enforceable food laws and regulations is an essential component of the national food control systems and that food legislation should provide a high level of consumer's health protection and provide mechanisms to facilitate food recalls in case of non-compliance and food safety emergencies. In addition to the necessary legal powers to ensure food safety, food laws should also allow food control agencies to build preventive approaches in to the food control system. There should also be a mechanism for reviewing and revising food laws and regulations. In preparing or updating food regulations and standards, ASEAN countries should take full advantage of Codex standards, guidelines and recommendations.

#### ***49.4.2 Requirements for the Labeling of Prepackaged Foods***

In 2007, a draft of ASEAN common principles and minimum requirements for the labelling of prepackaged foods were developed. The purpose of the principles and guidelines are to harmonize and mainstream the requirements for labelling of prepackaged foods in the ASEAN countries and thereby facilitate trade between the countries. The common principles are based on Codex guidelines on food labelling and say that "Prepackaged food shall not be described or presented on any label or in any labelling in a manner that is false, misleading or deceptive or is likely to create an erroneous impression regarding its character in any respect" and

“Prepackaged food shall not be described or presented on any label or in any labelling by words, pictorial or other devices which refer to or are suggestive either directly or indirectly, of any other product with which such food might be confused, or in such a manner as to lead the purchaser or consumer to suppose that the food is connected with such other products”.

The common principles consist of a number of mandatory requirements including information about e.g. manufacturer, expiry date, instructions for use, nutrition declaration, storage instruction. Moreover, there are some additional labelling requirements that countries may require based on local needs. This can be declaration of ingredients like alcohol, ingredients of animal origin etc. The principles also include some optional labelling requirements such as claims or recognized logos on religion or ritual preparation such as halal or kosher. Along with the mandatory and optional labelling requirements, the common principles and minimum requirements for the labelling of prepackaged foods also include some prohibited claims. This include claims on the suitability of a food for use in the prevention, alleviation, treatment or cure of a disease, disorder or other physiological condition, claims stating that any given food will provide an adequate source of all essential nutrients, claims implying that a balanced diet or ordinary foods cannot supply adequate amount of all nutrients, claims which could give rise to doubt about the safety of similar food or which could arouse or exploit fear in the consumer, claims which highlight the absence or addition of any food additive or nutrient supplement, the addition of which is prohibited and claims on the absence of beef or pork or its derivatives, or lard or added alcohol if the food does not contain such ingredient. <http://www.aseansec.org/21915.pdf> (page 10)

### ***49.4.3 Food Legislative Frameworks in ASEAN***

#### **49.4.3.1 Malaysia**

The Food Act 1983 and the Food Regulations 1985 are the legislative documents that form the backbone of food laws and regulations in Malaysia. The Food Act 1983 prescribes the powers of the Minister of Health, enforcement officers and analyst, whereas, the Food Regulations 1985 specifies the standards for various types of food, the use of food additives, labeling and packaging requirements. It is the minimal mandatory standards which must be complied with in order for food to be sold in the country. The Food Act is enforced by the Ministry of Health and the Local Authorities. The legislation, applicable to all foods sold in the country either locally produced or imported, covers a broad spectrum from compositional standards to food additives, nutrient supplements, contaminants, packages and containers, food labelling, procedure for taking samples, food irradiation, provision for food not specified in the regulations and penalty. Efforts in harmonization of legislation with international standards are actively undertaken. Codex Alimentarius is the benchmark for food safety legislation.

In order to ensure overall coordination and exchange of information between ministries and agencies involved in food control activities, Ministry of Health in 2001 established the National Food Safety and Nutrition Council. The Council provides a platform in enhancing national coherence of food control activities. The Council is chaired by the Minister of Health and includes all relevant Government agencies, industry and consumer representatives as well as other stakeholders from farm to table. In 2002, the Council took the lead in developing the National Food Safety Policy which provides direction for implementation of food safety measures. The implementation of the Policy is outlined in the National Plan of Action on Food Safety which clearly defines the enforcement role of each concerned agency.

#### **49.4.3.2 Philippines**

The two main agencies tasked with developing and enforcing food laws, regulations and standards in Philippines are the Food and Drug Administration (FDA) (previously known as Bureau of Food and Drugs (BFAD)) under the Department of Health (DOH), and the Bureau of Agriculture and Fisheries Product Standards (BAFPS) of the Department of Agriculture (DA). FDA is responsible for the safety of processed food and enforces the Food, Drug, Devices & Cosmetics Act, 1963 (Amended in 1987) as well as a number of other Acts and Orders pertaining to food quality. BFAD and the Food Development Center (FDC) also certifies food establishment according to national GMP and HACCP standards.

BAFPS is accountable for fresh and primary agricultural and fisheries products and the enforcement of the Agriculture and Fisheries Modernization Act (AFMA). Other Acts and Codes implemented by BAFPS include the Code on Sanitation of the Philippines, 1975; the National Meat Code, 2004; the Philippine Clean Water Act, 2004; the Agriculture and Fisheries Modernization Act, 1997; the Meat Inspection Code of the Philippines, 2004; the Philippine Fisheries Code, 1998; the Plant Quarantine Decree, 1978; the National Dairy Development Act, 1995. The Bureau of Fisheries and Aquatic Resources (BFAR) of the DA is the competent authority for GMP and HACCP accreditation for fish exports to EU.

#### **49.4.3.3 Thailand**

In Thailand, the Food Act of B.E.2522 (1979) is the main law aimed at protecting and preventing consumers from health hazards occurring from consumption of food. The Act prohibits unsafe food from being produced, imported and distributed in Thailand. The Act divides unsafe food into four categories based on the causes that make the food unsafe to consumers: (1) impure food, (2) adulterated food, (3) substandard food and (4) other foods which prescribed by the minister. Other areas covered by the Act include control of packaging and labelling as well as restrictions on advertisement.

**Table 49.1** Acts in the area of food safety in Thailand

Act	Responsible body	Scope of the Act
Public Health Act 1992	Department of Health, Ministry of Public Health	To control the hygiene practices of markets, restaurants (including food stalls) and food storage facilities
Communicable Diseases Act 1980	Department of Disease Control, Ministry of Public Health	To protect and control communicable diseases
Plant Quarantine Act 1999	Department of Agriculture and Agricultural Extension, Ministry of Agriculture and Cooperatives	To prevent and control plant diseases, insects and pests as well as the import and export of plants and plant products, including GM products
Fisheries Act 1947	Department of Fisheries, Ministry of Agriculture and Cooperatives	To control fishery catching and hatching methods as well as the import and export of aquatic animals and products
Animal Epidemic Act 1999	Department of Livestock Development, Ministry of Agriculture and Cooperatives	To effectively prevent and control epidemics
Feed Control Act 1999	Department of Livestock Development, Ministry of Agriculture and Cooperatives	To control the quality of feed, including raw materials, feed processing methods, production equipments, storage and packaging facilities
Animal Slaughter Control and Sale of Meat Act 1992	Department of Livestock Development, Ministry of Agriculture and Cooperatives	To protect the meat consumed within the country from contamination by setting standards for slaughterhouse facilities and slaughtering processes as well as livestock farms
Goods Import and Export Control Act 1979	Department of Foreign Trade, Ministry of Commerce	To control the import and export of food and food products
Hazardous Substance Act 1992	Department of Industrial Works, Ministry of Industry	To control production, import, export and possession of hazardous substances for the use in agricultural production, food industry and by consumers
Sugarcane and sugar Act 1984	Thai Industrial Standards Institute, Ministry of Industry	To control the production, import and export of sugarcanes and sugar
Consumer Protection Act 1979	Office of the Consumer Protection Board, Prime Minister Office	To protect the consumer's rights to safe food. To control advertisements and labelling of food products
National Health Act 2007	The National Health Commission Office, Prime Minister's Office	To set up guidelines for strategically monitor the status of public health
The Draft of Agricultural Commodities Standards Act	National Bureau of Agricultural Commodity and Food Standards, Ministry of Agriculture and Cooperatives	To set food safety and quality standards as national references for production and trade of agricultural commodities

The Food and Drug Administration under Ministry of Public Health is responsible for the execution of the Act. The Act empowers the Ministry of Public Health to promulgate ministerial regulations, to appoint the Food Committee and competent officers, and to set up other activities in order to carry out the provisions of the Act. Along with the Food Act of B.E. 2522 (1979), the main Acts in Thailand protecting consumers from unsafe food are listed in Table 49.1.

The ministerial regulations describe the procedures for applications of manufacturing licenses, import licenses, and registration including the rates of fees, the identification card of the competent officers and the labelling of food products for exports. The Food Act B.E. 2522 (1979) classifies foods into three main categories as follows:

- **Specially Controlled Foods**—Registrations are required for foods in this category. Legal provisions are related to food standard quality, specifications, packaging, and labelling requirements, as well as other aspects of good manufacturing practices. The Food Committee may make recommendations to the Minister of Public Health specifying specially controlled foods.
- **Standardized Foods**—Standard foods do not require registration but their quality and labelling have to meet the standard requirements as specified in the Notification of the Ministry of Public Health.
- **Other Foods**—Foods, raw or cooked, preserved or non-preserved, processed or non-processed, if not listed under category 1 or 2 will be considered as general foods. Although registrations are not required, general food products are controlled and monitored with regard to hygiene, safety, labelling and advertisement. Foods in this category may be subdivided into (a) foods that must bear standard labels and (b) other general foods.

The control measures for each category of foods differ; with measures for “Specially Controlled Foods” being strictly controlled. Before producing or importing such foods, the application for product registration is required. For standardized foods, the application for such permission is not required, but they must be produced up to the prescribed quality or standard. For labelled foods, however, the main objective is to control the labelling in order to avoid misleading or cheating of consumers.

The Food and Drug Administration (FDA) of the Ministry of Public Health and the Provincial Offices of Public Health is responsible for the enforcement of the Food Act as well as legal food control operations with the support of food analytical services of the Department of Medical Sciences, Ministry of Public Health. The FDA also has the responsibility to ensure that the development of food safety control measures corresponds with international standards.

#### 49.4.3.4 Vietnam

The national legislation in Vietnam is based on a complex array of laws, ordinances, decrees, decisions, instructions, circulars and regulations. A diverse set of

legislative documents addressing food safety and quality has been drafted in recent years. The National Assembly is empowered to develop the country's laws. Permanent Committees of the National Assembly establish ordinances, decrees and resolutions. Each Ministry may also prepare and issue decisions, instructions, circulars, regulations and standards.

In 2011, the Government of Vietnam released a draft implementing regulation, intended to implement several articles of the Law on Food Safety (No.55/QH12/2010), which the National Assembly approved in June 2010, and which entered into force on 1 July 2011. While the Law is a broad, overarching legislative document that attempts to outline all aspects of Vietnam's food safety system, the draft implementing regulation is comparatively sparse, dealing with a relatively small number of provisions.

When all provisions of the Law on Food Safety are implemented, the Law will replace the Ordinance on Food Safety and Hygiene which has been in place since 2003. The Ordinance aims at ensuring the safety and hygiene of food during the process of their manufacture and trading and the prevention and remedy of poisonous food. The Ordinance specifies requirements for manufacturing and selling fresh and raw food, processing food, storing and transporting food and importing and exporting food in Vietnam. For "high-risk" foods, state certification of satisfaction of business conditions is required. The Ordinance also regulates the proclamation of food standards and the advertising and labelling of food.

Prior to 1990, Vietnamese food safety standards were primarily based on standards from the former Soviet Union. In the beginning of the 1990s, Vietnam started to develop its own standards through the establishment of technical advisory committees and sub-committees. A total of 17 committees have been established with participation from more than 100 senior experts representing governmental agencies, research institutions, universities, food enterprises and consumer groups. Vietnam became a member of the Codex Alimentarius commission in 1994 and started the process of harmonizing and developing national standards in accordance with Codex standards and recommendations.

#### **49.4.3.5 Indonesia**

The main legislative documents pertaining to food quality and safety in Indonesia are the Food Act, 1996; the Food Safety, Quality and Nutrition Regulation, 2004; and the Food Labelling and Advertisement Regulation, 1999.

The Food Act includes provisions for food safety including issues related to food sanitation; food quality and nutrition; food label and advertisement; food import and export; responsibilities of the food industry; food resilience; participation of the community; supervision and implementation of the Act; as well as criminal provisions (National Agency of Drug and Food Control 2011). The Food Safety, Quality and Nutrition Regulations specify the provisions of the Act and set detailed requirements for food safety, quality and nutrition including packaging and labelling; sanitation; food additives; quality assurance and testing; and contaminants in

food. The Regulations also specify the legal requirements for food import and export inspection and certification; and control and supervision (National Agency of Drug and Food Control 2011).

National food control in Indonesia is managed by the national Integrated Food Safety System (IFFS). The IFFS is a national program shared by all key stakeholders involved in food safety from farm to table. It combines the skills and experience of governments, industry, academia and consumers to synergistically address the emerging challenges influencing the food supply.

The IFSS model was created to achieve equivalence of food safety and laboratory standards internationally. IFSS provides the national framework for food safety—it transcends government, academia, industry and consumers and enables them to work together to maximise resources and improve food safety in Indonesia.

Within the IFFS framework, three functional stakeholder groups (networks) have been organized to reflect the risk analysis principles. The networks enable improved communication between stakeholders, provide for greater knowledge sharing and build food safety capital at local, regional and national levels (National Agency of Drug and Food Control 2011).

#### **49.4.3.6 Myanmar**

Based on the Public Health Law, 1972, Myanmar enacted its National Food Law in 1997. The Law was developed with guidance from World Health Organization (WHO) and is in line with international recommendations on food legislation including Codex standards and guidelines. The Law was enacted to enable the public to consume food of genuine quality, free from danger, to prevent public from consuming food that may cause danger or are injurious to health, to supervise production of controlled food and to control and regulate the production, import, export, storage, distribution and sale of food (WHO 2008)

Under the National Food Law, 1997 the Food and Drug Board of Authority was established as an entity responsible for coordination of food control activities. Enforcement and implementation of the Food Law is carried out by the Food and Drug Administration (FDA) which was established in 1995 under the National Drug Law, 1992. The FDA enforces mandatory requirements for Good Manufacturing Practices in food processing industries and encourages all food businesses to apply risk-based approaches to food quality and safety assurance including HACCP.

There are no food regulations or standards in Myanmar.

#### **49.4.3.7 Brunei Darussalam**

In Brunei Darussalam food quality and safety is regulated by the [Public Health Food Act, 2000](#) and a number of subordinate regulations. The Public Health Food Act makes specific provisions for public health measures including measures in

respect of food. It specifies the role and power of enforcement officers including Directors and inspectors in direct contact with food businesses. It also defines the concept “halal” can defines when it can be used, offences, sale of prohibited items and other overall provisions for food quality and safety. The [Public Health Food Regulations, 2001](#) specifies some of the requirements of the Act including measures for the use of food additives; irradiated Food; labeling as well as standards and particular labelling requirements for the following food items: flour, bakery and cereal products; aerating ingredients; meat and meat products; fish and fish products; edible fats and oils; milk and milk products; sauces and vinegars; sugar and sugar products; nuts and nut products; tea, coffee and cocoa; fruit and fruit products; jams; non-alcoholic drinks; alcoholic drinks; salts; and spices and condiments.

Other legislation related to food quality and safety includes the Halal Meat Act, 2000 which regulates the supply and importation of halal meat and related matters. The Act specifies the requirements for halal import permits; inspection reports from abattoirs; halal certificates; halal labels; slaughtering requirements and procedures; procedures for obtaining a licence and certificate for supplying local halal meat; storage and packaging of halal meat; and fees. The Fisheries Act, 1973 form the basis for food safety and quality requirements for the catch, processing and handling of fish and fisheries products while the Agricultural Pests and Noxious Plants Act, 1971 aims at providing protection of plants and cultivated products from diseases and provides for the destruction of pests and noxious plants. The Miscellaneous Licenses Act, 1983 makes provisions for licensing, regulation and control of certain commercial places and activities including licenses for food establishments, manufacturers, hawkers etc.

#### **49.4.3.8 Lao PDR**

Lao PDR has enacted a Food Law, 2004. The Law defines principles, rules, methods and measures on the administration and inspection of activities relating to food, with the aims to control the quality and standard, in particular the safety, of food; to ensure the consumers’ nutrition and health; to promote production and business relating to food; and to guide the citizens to be aware, to understand and to adapt to the consumption of food that is safe, hygienic and that contains nutrients for physical strength, including to make them understand the usefulness and danger of food and to know how to care for their health, in order to contribute to national protection and development (Lao PDR National Assembly 2004).

There are no food regulations in Lao PDR but standards exist for selected food items including drinking water, tomato sauce, mineral water, roasted coffee, rice, sugar and fish sauce. Additionally, there are and no specific requirements for registration of food businesses; food inspection and enforcements; use of additives; and control of agricultural inputs.

#### 49.4.3.9 Cambodia

Cambodia has four laws related to food safety. Law on the management of quality and safety of products and services (2000), Law on Fishery (2006), Law on Cambodia Standards (2007), and Law on the management of pesticides and fertilizers (2012). In addition, a number of voluntary and mandatory standards are in place and managed by the Institute of Standards of Cambodia (ISC).

In 2015, a draft Food Law was developed with assistance from FAO. The aim of the Law is to establish a food safety system for the protection of human and consumer health by preventing, controlling and eliminating food contamination and hazards to consumers. The Law covers the entire food chain. These include products standards as well as standards for food hygiene and labelling. For products where no national standard has been developed, Codex standards apply as mandatory food standards. Additionally, under the Food Safety and Quality Law a number of sub-decrees have been established addressing food safety and quality. This include requirements for good manufacturing practices (GMP); food hygiene; phytosanitary inspection. The Cambodia National Codex Committee (CNCC) is hosted by the Ministry of Commerce (MOC) and Camcontrol (MOC) serves as the national Codex Secretariat. The CNCC considers matters related to food policies and measures for safety and quality of products and services necessary for consumer protection, fair trade and coordinated food control action by relevant ministries.

Camcontrol under MOC serves as the enforcement agency for food quality and safety. The agency aims at preventing the production and distribution of unsafe, poor quality, adulterated, misbranded or contamination products including food items. Camcontrol inspects domestically produced food products as well as imported and exported foods. Camcontrols activities are supported by enforcement activities implemented by the Ministry of Industry (MOI). MOI controls the quality of industrial products including food items. It also inspects samples of processed foods and undertakes microbiological and/or chemical analysis on a diversity of products e.g. bottled water, beers, wines, fish and soy bean sauce and vinegar (Soeun 2004).

#### 49.4.3.10 Singapore

In Singapore, the main food legislation include the Sale of Food Act, 2002 which aims at securing the wholesomeness and purity of food; providing a framework for developing food standards; preventing the sale or other disposition or the use of articles dangerous or injurious to health; providing regulations for food establishments. The Sale of Food Regulations, 2005 have been developed as subsidiary legislation to the Act. The Regulations include provisions for food labeling; health claims; date marking; marketing and advertisement; irradiated food; approved food additives; products standards; as well as chemical residues in food (AVA 2011).

Food control and implementation of food and agriculture related legislation falls under the responsibility of Agri-Food and Veterinary Authority (AVA) which was established in 2001 by the Agri-Food and Veterinary Authority Act, 2000. The role of AVA is to regulate the safety and wholesomeness of food for supply to Singapore; promote and regulate animal and fish health, animal welfare and plant health; promote, facilitate and regulate the production, processing and trade of food and products related to or connected with the agri-food and veterinary sectors; develop, manage and regulate any agri-food and veterinary centre or establishment; promote the development of the agri-food and veterinary sectors; advise and make recommendations to the Government on matters, measures and regulations related to or connected with the agri-food and veterinary sectors; and represent the Government internationally on matters related to or connected with the agri-food and veterinary sectors (AVA 2011).

## **49.5 SAARC**

The South Asian Association for Regional Cooperation (SAARC) is an organization of South Asian nations, founded in December 1985. SAARC consists of eight member countries which include Afghanistan, Bangladesh, Bhutan, India, the Maldives, Nepal, Pakistan and Sri Lanka. The Headquarters of the SAARC Secretariat is located in Kathmandu, Nepal.

SAARC is the home of 1.567 billion people which constitutes about 23.77% of the global population. Based upon the data available with Asian Development Bank, about 451 million people live below poverty line. The reason attributed to poverty is the low per capita income and inequitable distribution of income in the region, which can be judged by the fact that 23.7% of the global population has only 2.6% share in the global income.

The majority of the population in SAARC region lives in rural areas and agriculture is the mainstay of the economies of the South Asian countries and is still the main source of livelihood of the majority of the population. Agriculture sector is facing stiff competition in the region, which threatens its growth and sustainability. On one hand, food security challenges have raised alarms and on the other food safety concerns have poised problems for the policy makers, planners and economic masters.

### ***49.5.1 The Objectives of SAARC***

SAARC aims at achieving enhanced economic growth through regional cooperation.

The objectives of SAARC are:

- (a) to promote the welfare of the peoples of SOUTH ASIA and to improve their quality of life;
- (b) to accelerate economic growth, social progress and cultural development in the region and to provide all individuals the opportunity to live in dignity and to realise their full potentials;
- (c) to promote and strengthen collective self-reliance among the countries of SOUTH ASIA;
- (d) to contribute to mutual trust, understanding and appreciation of one another's problems;
- (e) to promote active collaboration and mutual assistance in the economic, social, cultural, technical and scientific fields;
- (f) to strengthen cooperation with other developing countries;
- (g) to strengthen cooperation among themselves in international forums on matters of common interests; and
- (h) to cooperate with international and regional organisations with similar aims and purposes (SAARC Secretariat 2011).

### ***49.5.2 Cooperation in the Area of Food Quality and Safety***

SAARC has 16 stated areas of cooperation. The areas of cooperation are managed by a number of Technical Committees and Groups consisting of technical experts from SAARC member countries. The Technical Committees and Groups are responsible for the implementation, coordination and monitoring of the programmes in their respective areas of cooperation. This includes formulation of programmes and preparation of projects as well as implementation and coordination of sector programmes.

The stage of development of national food control systems in SAARC and the implementation of food quality and safety assurance systems varies greatly between the eight SAARC countries. Some SAARC countries have invested in developing their food control capacity in terms of new food control structures and management systems while others are yet to update and implement food safety laws and regulations as well as other measures to protect the health of consumers and facilitate trade with food and agricultural products.

The Technical Committee on "Agriculture and Rural" and the Technical Committee on "Economic Cooperation" as well as the "Standing Group on Standards" and "SAARC Standards Coordination Board" are the Committees and Groups that are directly involved in work related to development and harmonization of food laws and regulations.

- **Technical Committee on Agriculture and Rural Development (TCARD)**  
TCARD has contributed to identifying numerous concrete areas for pursuing regional actions and projects in the area of agriculture and rural development.

An important output from the Technical Committee was the **SAARC Agricultural Perspective/Vision 2020** which was finalized in 2008. The document articulated the long-term regional challenges and priority measures *inter alia* in production augmentation, natural resource management, bio-safety and bio-security, technology development and dissemination, seed and other inputs, food safety/standards, climate change adaptation and risk mitigation, and livelihoods of small and marginal farmers in farming and non-farm activities. It also brings forth the recent challenges e.g. Avian Influenza that appears to threaten much of the gains achieved in rural South Asia over the past years (SAARC Secretariat 2011).

During 2007–2008, as a SAARC-FAO collaborative effort, the **SAARC Regional Strategy and Regional Programme for Food Security** was drawn up. The strategy and programme identifies a number of priority projects under four broad clusters. The Cluster “Ensuring Bio-Security” includes priority projects on development/updating of national SPS measures in line with Codex Alimentarius and other internationally recognized standards; support/assistance in capacity-building in the areas of food safety, quality and standards; and development/up-gradation of accredited laboratories in SAARC. These are important activities that will strengthen the regional framework for food safety and quality and contribute to facilitating trade with food and agriculture products between countries in the region (FAO 2010).

- **Standing Group on Standards and Quality Control and Measurement (SGSQCM)**

The SAARC Standing Group on Standards, Quality Control and Measurement (SGSQCM) focuses on developing regional standards for products in the interest of intra-SAARC trade facilitation as well as trade beyond the region. The Standing Group has agreed on developing mutual recognition agreement to facilitate trade and works towards harmonization of standards; conformity assessment procedures; testing and metrology as well as certification and accreditation. The group has developed a regional action plan to enable the SAARC Region to take a collective position at the international standardization for a like the Codex Alimentarius Commission (CAC) and International Standardization Organization (ISO) ([www.kuenselonline.com](http://www.kuenselonline.com)). The Group is supported by the SAARC Standards Coordination Board which aims at strengthen regional cooperation in the area of standardization and harmonization of standards between SAARC countries (SAARC Secretariat 2011).

### ***49.5.3 Legislative Framework for Food Quality and Safety in SAARC***

The legislative framework for food quality and safety in SAARC varies greatly between the SAARC member countries. The region’s biggest country India has

within recent years invested considerable resources in developing and updating its food quality and safety legislation and in building capacity among enforcement officers. The smaller and less developed countries have outdated and fragmented legislation that is not based on risk and contemporary approaches to food quality and safety. In many cases, regulations and standards are not in line with Codex Alimentarius standards, guidelines and recommendation and other internationally recognized food quality and safety measures.

The implementation and enforcement of food quality and safety legislation varies between the SAARC countries as well. Generally, SAARC countries have limited resources in terms of staff (food inspectors, public health officers etc.) and equipment (tools, guidelines, vehicles etc.) to carry out food inspection and enforcement activities. The resource constraints and different levels of technical expertise result in inconsistently implemented and weakly coordinated inspection and enforcement activities.

In most SAARC countries, the organization of food safety management structures is divided between multiple ministries and agencies as well as units working at different administrative levels (federal, state, district, sub-district etc). India has a federal as well as state level structure for food safety. Both Bangladesh and Pakistan have weak federal structure with emphasis on provincial level (districts and sub-districts) enforcement activities. Sri Lanka has also limited central structures. Nepal has a central level operational structure with five regional units to implement food legislation.

In most SAARC countries, the roles and responsibilities between enforcement agencies are not clearly defined and communication, coordination and exchange of information between the different agencies is in most cases very limited. With the enforcement agencies often having mandates that go beyond food control and include vector control, water safety, sanitation etc, food control activities in many cases do not receive the necessary attention to address the growing demand of sophistication in managing food safety risks and prevent foodborne disease outbreaks.

#### ***49.5.4 Food Legislative Frameworks in SAARC***

In the SAARC region food legislation was formulated over a period of four to five decades. The overall thrust of the legislation is primarily based on end product testing and heavily relies on penalisation in cases of food safety violations. After the emergence of the WTO, the existing legislative measures implemented in many SAARC countries do not comply with international requirements to protect the health of consumers and facilitate trade with food and agriculture products. Several SAARC countries are in the process of revising and updating their legislative frameworks for food quality and safety and strengthen the implementation and enforcement structures. In countries like Bangladesh and Maldives have primarily been focusing on updating legislation and enforcement services for food exports

(fish and fisheries products) while the legislation covering food sold on the domestic markets in most cases remain weak.

#### **49.5.4.1 Bangladesh**

The Pure Food Rules, 1967; the Pure Food Ordinance 1959 and the Food Safety Amendment Act, 2005 make the basic framework of food legislation in Bangladesh. The Pure Food Ordinance, 1959 was established to provide better control of the manufacture and sale of food for human consumption. This Ordinance was revised and reissued on 22 September 2005 as Act No. 27 of 2005. The revised Act provided for the constituting of a National Food Safety Advisory Council (NFSAC) headed by the Minister of Ministry of Local Government Rural Development and Cooperatives (MOLGRDC), and the establishment of Pure Food Courts, with power and jurisdiction under the Act. The NFSAC comprises 16 Ministries and agencies involved in food safety and is responsible for advising Government on all matters related to food safety and administration of the Act; standards and quality control for food in terms of ensuring purity, safety and nutritional value; technical matters; development of man-power and facilities required for ensuring safety, and policies and strategies related to food safety and quality control. The Amendment Act prohibits the sale or use of poisonous or dangerous chemicals, including intoxicating food colours; sets standards of purity for milk, butter, ghee, wheat flour, mustard and rape seed oil and other food articles; prohibits the sale of diseased animals and unwholesome food; prohibits the use of false labels; sets requirements for analysis of food and certificates of analysis; addresses the inspection and seizure of food; and sets offences and penalties.

The Directorate General of Health Services (DGHS) is the main implementing agency responsible for food safety throughout Bangladesh. DGHS implements the Pure Food Ordinance; the Pure Food Rules and the Food Safety Amendment Act. Enforcement activities are carried out by sanitary inspectors based at Divisional, District and Upazila levels. City Corporations and Municipalities under Ministry of Local Government, Rural Development and Cooperative (MLGRDC) implement the same legal documents in their respective administrative areas. The City Corporation has health officers, public analysts, chemists and inspectors to carry out food safety activities in areas under their command. Each City Corporation has a food-testing laboratory. The main task of enforcement agencies is to check for food adulteration, food hygiene and sanitation.

Other agencies involved in food inspection include Department of Fisheries and Department of Livestock Services under Ministry of Fisheries and Livestock; Bangladesh Standard and Testing Institution (BSTI) under Ministry of Industries; Ministry of Food and Disaster Management (MFDMD); and Department of Agricultural Extension under ministry of Agriculture. BSTI is the Codex contact point for Bangladesh and develops food standards in line with Codex standards and guidelines. BSTI certifies processed products for which the Institute has developed mandatory standards. Currently, there are 53 mandatory food standards in

Bangladesh. MFDM exercises the power to assess the quality and safety of imported and domestically produced food grains and cereals like rice, wheat and pulse. The Ministry of Agriculture is responsible for assuring the quality and safety of other agricultural produce and for certifying exportable agricultural products.

#### **49.5.4.2 Bhutan**

Bhutan has a Food Act, 2005 and Food Rules and Regulations, 2007 that cover issues related to food safety. The Food Act, 2005 created the Food Quality and Safety Commission which is a multi-sectoral mechanism that (1) formulates policies to maximize industry development, protect consumers and foster trade; (2) addresses any matter related to the enhancement of food control activities including enforcement structures; (3) coordinates national responses to food related emergencies; (4) review and approve the work of the National Codex Committee; (5) makes recommendations to the Minister on the level of any fees and penalties to be assessed under the Act; (6) recommends educational activities to inform food businesses and the people of Bhutan of the importance of food safety; and (7) coordinates responses to the media with regard to all food control issues in Bhutan. The Act also outlines the mandate of the Bhutan Agriculture and Food Regulatory Authority (BAFRA) and the mandate and functioning of the National Codex Committee. Other issues covered by the Food Act include appointment and responsibilities of food inspectors and analysts; operation of food businesses; import and export of food; and enforcement. The Food Rules and Regulations, 2007 specifies the mandates of food control authorities and outlines the procedures for food control action (Ministry of Agriculture Bhutan 2005).

#### **49.5.4.3 India**

Food quality and safety in India is regulated by the Food safety and Standards Act, 2006. The Act consolidates the laws relating to food and regulates the manufacture, storage, distribution, sale and import of food. The Act provides for the establishment of the Food Safety and Standards Authority (FSSAI) in order to regulate the food sector and ensure safe and wholesome food. The Authority is aided by several scientific panels and a central advisory committee to lay down standards for food safety which include specifications for ingredients, contaminants, pesticide residue, biological hazards and labels. Every entity in the food sector shall be required to get a license or a registration, which will be issued by local authorities. State Commissioners of Food Safety and other local level officials are responsible for the enforcement of the Act. The Act further provides for the following matters: recognition and accreditation of laboratories, research institutions, food analysts; offences and penalties; finances, accounts audits and reports of the Food Authority; and provisions of miscellaneous nature.

The implementation of the Food Safety and Standards Act, 2006 formally repeals the regulatory framework established by the Prevention of Food Adulteration Act (PFA), 1954, the Fruit Products Order, 1955, the Meat Food Products Order, 1973, the Vegetable Oil Products (Regulation) Order, 1998, the Edible Oils Packaging (Regulation) Order 1988, the Solvent Extracted Oil, De-Oiled Meal and Edible Flour (Control) Order, 1967, Milk and Milk Products Order, 1992, and the Essential Commodities Act, 1955 (USDA 2011).

In August 2011, the Food Safety and Standards Regulations, 2011 came into force under the Ministry of Health and Family Welfare. The Food Safety and Standards Regulations, 2011 contain labeling requirements and standards for packaged food, permitted food additives, colors, microbiological requirements, etc. These regulations officially transpose the Prevention of Food Adulteration Rules, 1954 as amended (USDA 2011).

#### **49.5.4.4 Maldives**

Maldives has a Food Act and some general food regulations specifying requirements for food service establishment; food processing businesses; food exports and imports; and frozen foods. Apart from fish product, there are very few guideline; standards and codes of practices for food products and processes in the country. Within recent years some effort have been put into developing guidelines for food processing units; food service establishment with main focus on resorts, hotels and guest houses, food import; food transportation; and healthy market places, but they do not seem to cover the entire food chain continuum (Moosa 2009).

The Consumer Protection Act 1996 does cover areas related to food quality and safety. These include provisions for labelling such as name of the product; ingredients; weight/quantity; production date; information on the use of products; use before expiry date etc. Public Health Department (PHD) under the Ministry of Health carries out quality monitoring and inspection activities. The PHD further issues certificate or license for the sale of locally manufactured foods. It monitors foods prepared in restaurants, catering and processing plants. The frequency of inspection is relatively high in Male but low in other parts of the country. Public Health Officials (PHO) examine and inspect bakeries, cafeterias, and restaurants from hygiene point of view.

#### **49.5.4.5 Pakistan**

Pakistan does not have an integrated legal framework but has a set of laws, which deals with various aspects of food safety. The Pure Food Ordinance 1960 and Pure Food Rules 1965 form the legislative framework of food safety in Pakistan. The rules give authority to provincial governments to appoint public analysts for the investigation of quality and safety of food. There is no federal structure of food safety programme in Pakistan. The Pure Food Rules are enforced through health

service delivery channels of the provincial government. The District Health Officer and Deputy Health Officer function as food inspector for sampling and inspection. Municipality Corporation may also appoint food inspectors and sanitary inspectors for sampling purposes. Any other public servant can also be appointed as inspector and can execute the power of food inspector.

The Pakistan Standard Institute (PSI) with its Food and Agriculture Division develops voluntary standard for food products. Mandatory food standards are established in the Pakistan Pure Food Laws (PFL) of 1963. The PFL is basis of the existing trade-related food quality and safety legislative framework. It covers 104 food items falling under nine broad categories: milk and milk products; edible oils and fat products; beverages; food grains and cereals; starchy food; spices and condiments; sweetening agents; fruits and vegetables; and miscellaneous food products. These regulations address purity issues in raw food and deal with additives; food preservatives; food and synthetic colors; antioxidants; and heavy metals.

Pakistan's Hotels and Restaurant Act of 1976 applies to all hotels and restaurants in Pakistan and seeks to control and regulate the rates and standard of service by hotels and restaurants. The Pakistan Standards and Quality Control Authority Act of 1996 provides for the establishment of Pakistan Standards and Quality Control Authority (PSQCA), which is the apex body to formulate or adopt international standards. The PSQCA is also responsible for enforcement of standards in the whole of Pakistan and has the mandate to inspect and test products and services, including food items, for their quality, specification and characteristics during use, and for import and export purposes.

The federal government generally applies Codex standards and guidelines in its regulation of imported food products. For animal products including dairy, halal certification is required. Importation of food products containing pork or pork products is prohibited. The Customs Department and Plant Protection and Quarantine (PPQ) are the two main agencies involved in regulating food imports. The Customs Department's primary functions are: ensure that imported foods meet Pakistan's labeling and shelf-life requirements prevent imports on the list of banned items, and assess appropriate import tariffs. PPQ also ensures that shipment of bulk commodities and live animal shipments meet phytosanitary requirements.

#### **49.5.4.6 Nepal**

The Food Act 1966 and Food Regulation 1970 are the basic legislative frameworks for ensuring safe food supplies in Nepal. With Nepal's accession to WTO amendments to the food legislative framework have been initiated and training and capacity building of enforcement officers has taken place. Draft Food Regulations have been prepared, but is still subject to endorsement.

The Food Legislation of Nepal (Food Act, 1966 and Food Rules (1970) dates back to more than three decades. The Act has been amended a few times, but still it does adopt a risk-based approach to food control. The Act and Rules were promulgated for the welfare of the people with the objective of protecting people from

health hazards and commercial fraud. The salient feature of the Food Act 1966 is definition of food, contaminated food and substandard food (WHO 2008).

The Department of Food Technology and Quality Control (DFTQC) is the focal agency responsible for conducting inspections of industries, import/export and market. The DFTQC with its five Regional Food Laboratories are assigned tasks to conduct inspections and laboratory investigations in their respective areas. The District Attorney Officers and Chief District Officers are responsible for administering food legislation in the country.

Food Inspectors carry out inspections of food processing industries, customs points, warehouses, markets, (wholesale/retail) and collect suspicious samples in duplicate. One part of the sample is sent to the public analysts and the other part to the Chief District Officer (CDO) for further verification if needs be. Public Analysts send the report to the concerned Food Inspector. In case the report does not comply with the set standard, the food inspector files a case against the owner of the sample in the office of CDO. If the concerned party is not satisfied with the decision, he may request the Director General of DFTQC through the CDO for re-analysis.

The Food Standardization Committee (FSC) is responsible body to recommend appropriate standards and to advise the Government on all matters relating to food safety. The FSC is chaired by the secretary, Ministry of Agriculture and Co-operatives, with representatives from Ministry of Law and Justice, Ministry of Industry, Commerce and Supplies, Ministry of Home, Representatives of Kathmandu Municipal Corporation, Food Industry, Federation of Nepalese Chambers of Commerce and Industry (FNCCI), Consumers, and the Director General of DFTQC as the Member Secretary. Nepal Quality Standard (Quality Mark) Act 1980 was implemented to fix the quality standards for Nepal Council of Standards under the Act, which has been empowered to make standards and regulations for ensuring quality marks. While food standard under the Food Act 1966 is mandatory, Nepal Standards under the Nepal Quality Standard Act is voluntary in nature and, this operates as a third party certifying authority for the quality assurance of the food products.

#### **49.5.4.7 Sri Lanka**

The main legislative document for food quality and safety in Sri Lanka is the Food Act, 1980 (amended in 1991). The Act contains elements such as manufacture, sale, distribution, and import, and seizure of food. It also lays down standards for natural or added substances, which may pose potential health risks. The Act and its amendments prohibit the importation, manufacture for commercial purposes, transportation, storage, distribution, sale, or offer for sale of any food, raw or processed, or any ingredient of food or food additive that has been subjected to genetic modification using DNA recombination technology or any food that contains one or more ingredient or additive that has been subjected to genetic manipulation. In 2009, a regulation implemented under the Act which implements mandatory standards for 158 food items came into force.

The food control infrastructure is comprised of high-level and multi-sectoral Food Advisory Committee (FAC) at the apex level that also functions as an advisory body to the Ministry of Health (MoH) on all issues relating to food safety. FAC has three sub-committees: technical sub-committees for standards and regulations, national codex committee, and a food control co-ordination committee. The Central Administration operates in the Ministry of Health with the Food and Drug Administration. The import and export inspection is carried out by the food and drug Inspectorate of the MoH in close co-ordination with customs authorities. Sri Lanka Standard Institute (SLSI) controls imports of some food items such as canned fish, condensed milk, fruit squashes, fruit syrup, and fruit cordials, synthetic/artificial cordials, fruit concentrates, ready to serve fruit drinks, brown sugar, soybean oil, peanut oil, sunflower seed oil, palm oil, and coconut oil.

## **49.6 Food Laws and Regulations in North East Asia**

Within recent years a number of food safety incidents and related trade implications have occurred between the three main countries in North East Asia: China, Japan and South Korea. Most issues occurred from Chinese exports of contaminated food products which have led to closer collaboration and cooperation between the countries in the area of food safety.

As an output of the closer relations between the countries, the three nations in 2009 signed a food safety memorandum where they agreed to notify each other immediately if a food safety problem surfaces and to clarify the process of investigation. Japan and China have also worked towards a joint food safety law that could allow Japanese authorities to conduct safety inspections in cases of tainted Chinese exports. This development towards closer collaboration between China and Japan comes after several cases of Japanese consumers getting sick after consuming food imported from China. The latest incident was in 2008 when 10 people in Japan fell ill from consuming Chinese-made dumplings laced with the insecticide methamidophos. The closer collaboration is expected to have a positive impact on the Chinese inspection processes and on preventing similar incidents from happening in the future ([www.2point6billion.com](http://www.2point6billion.com)).

### ***49.6.1 Food Legislation in North East Asia***

Food trade between the North East Asian countries China, Japan and Korea is increased extensively over the last 20 to 30 years. The increasing trade in food and agricultural products has increased the need for closer collaboration on food law and regulation development and implementation.

In 2011, China and Japan have held talks on a new draft food safety law that could allow Japanese authorities to conduct safety inspections in cases of tainted

Chinese exports. The new law is in response to a 2008 incident that led to 10 people in Japan to fall ill from Chinese-made dumplings laced with the insecticide methamidophos ([www.2point6billion.com](http://www.2point6billion.com)). The development of this new Law follows a food safety pact that was signed between China, Korea and Japan in 2009. Under the pact, the three nations have agreed to notify each other immediately if a food safety problem surfaces and to clarify the process of investigation.

#### **49.6.1.1 Japan**

The food law system in Japan is modeled after European civil law system with English-American influence. In the mid-nineteenth century to early twentieth century, German and French codes were introduced, and served as a model for the major Japanese food codes. After World War II, under Allied occupation, some laws were amended or replaced on the basis of American law.

Within the last 10 years, there has been a growing concern and distrust of food safety among the Japanese consumers, triggered by various food safety scandals. Among these the occurrence of BSE in 2001, pesticide contaminated Chinese dumplings in 2008 and most recently the risk of nuclear contaminated domestically produced food products from areas around the damaged Fukushima nuclear power plant in North Japan.

These food safety incidents have led to changes in the regulatory system. In the early 2000s discussions focused on the significant overlap of responsibilities of the two lead ministries for food safety: Ministry of Agriculture, Forestry and Fisheries (MAFF) and Ministry of Health, Labor and Welfare (MHLW). It was proposed to combine these two regulatory agencies into one new organization, but this proposal was rejected and replaced by another proposal to establish an independent advisory committee under the Prime Minister's Office: the Food Safety Commission. The Food Sanitation Law was amended, and the new Food Safety Basic Law, under which the Food Safety Commission was established, took effect in 2003.

The role of the Food Safety Commission is to undertake risk assessment in relation to the health impact of food consumption. The Commission works independently from the enforcement agencies under MAFF and MHLW as well as independent from consumer and private sector related organizations. The primary goals of the Commission are to:

- Present opinions to the Prime Minister
- Conduct scientific and independent risk assessments
- Make recommendations and provide scientific advice to the government (through the Prime Minister)
- Monitor the implementation of food safety policies
- Examine and deliberate on important matters regarding food safety policy implementation and provide technical advice
- Plan and implement risk communication activities targeting consumers, food businesses and food safety regulators

The Food Safety Basic Law, 2003 was developed together with a number of related laws and decrees to ensure food safety of domestically produced and imported food products. The legislative framework for food quality and safety is built around the risk analysis principles and the different pieces of legislation target different components of the risk analysis framework. The Food Safety Basic Law, 2003 establishes basic principles and direction for policy formulation and clarifies the responsibilities of the state, local governments, food business operators and consumers.

The Food Sanitation Law is very comprehensive law which covers all types of foods. The law regulates food labelling, food additives, residue of pesticides, veterinary drugs and additives to feed, food import quarantine, inspection, GMO, food with health claims, HACCP, and business licenses. However, nutrition labeling; nutrition and health claims; and food for specified use such as food for infants, food for lactating mothers, and food for pregnant women are regulated separately under the Health Promotion Law, 2002. Food labeling however, is also covered the JAS Law which is under the responsibility of MAFF.

Within the last 20 years, a variety of health foods began to appear in the Japanese market as the dietary habit changed and consumers' concern about nutrition and health increased. To prevent misleading labelling on health food, the regulation of "Food for Specified Health Use (FOSHU)", which is officially allowed to have indication of health function claims, was created in 1991. The system of "Food with Health Claims", which is composed of FOSHU and Nutrition Functional Food was established in 2001.

MHLW is responsible for enforcement of the Food Safety Basic Law, 2003 and the Food Sanitation Law, 2006. Enforcement at the local level however, is carried out by prefectures. In principle, prefectures are responsible for monitoring and inspection (except import inspection), appointment of monitoring officer and order of withdrawal of violating products from the market, as well as licensing of businesses. To perform these duties, each prefecture has public health centers. Import quarantine and related inspection at the point of entry are performed by the state.

Food quality related issues are regulated by the Law Concerning Standardization and Proper Labelling of Agricultural and Forestry Products (JAS Law) which is being implemented by MAFF. The JAS Law was established in 1995. This law succeeded the standards of foods under the Government Inspection Law for Agricultural and Forestry Products in association with the supply and demand adjustment policy including the government procurement and ration system. The initial objective of the JAS Law was to prevent distribution of low quality food in the market by establishing common standards for various foods. The Law covers quality certified products such as organic and other specially grown products, special distributed products, specified regional food, food representing environmental protection and sustainable agriculture as well as compositional quality standards for fisheries products, rice and products containing GMOs. The law also includes standards for labeling of the food covered by the Law.

### **49.6.1.2 China**

Following a number of food safety incidents and emergencies in China, food safety has become a priority issue for the Government. Within recent years, a number of new food laws and statutes have come into place and a number of plans and notices to strengthen the legal framework for food safety and rectify the implementation of food laws and regulations.

The Food Safety Law of the People's Republic of China came into effect in 2009. The Law is based on the risk analysis principles and integrates all existing food safety standards and regulations which facilitates implementation by the authorities. The Law protects consumers from sub-standard products and give them right to claim compensation from food producers in case a product does not comply with specified requirements.

The Food Safety Law is divided into 104 articles that cover the following issues: Surveillance and Assessment of Food Safety Risks; Food Safety Standards; Food Production and Trade; Inspection and Testing of Food; Food Import and Export; Response to Food Safety Incidents; Supervision and Administration; and Legal Liabilities.

The Law highlights that the responsibility for assuring the safety of food lies with the food producers and not the government. For issues where no national standard exists local governments are entitled to establish local legal requirements that are valid for food businesses in the particular geographic area.

The Law also stipulates that imported food, food additives and food-related products must comply with China's national food safety standards, including labeling, records and inspection. The government will develop a coordinated plan to manage food safety. Activities include inspect food businesses, test samples, inspect records, detain unsafe food, and terminate business operations. In addition, government will formulate a food safety emergency plan; respond to alerts and information about unsafe food and establish an information release system.

In April 2015, a modern amended food safety law was adopted and went into force on 1 October 2015. The revised food safety law of 2015 is divided in 10 chapters: General Principles; Food Safety Risk Surveillance and Assessment; Food Safety Standards; Food Production and Trading; Food Testing; Food Import and Export; Handling of Food Safety Incidents; Regulatory Work; Legal Liabilities; and Supplementary Provisions. Further regulatory details will be specified in the Implementation Regulations which are currently being developed.

### **49.6.1.3 Primary Legislation Sources**

A total of 12 food and food related laws constitute the frame of China's food hygiene and safety system.

The Food Hygiene law, 1995 stipulates the hygiene standard and safety for food, food containers, food additives, and packaging materials of food, the equipment and

place for food production. The food quality is also stipulated by the Standardization Law, 1988; Product Quality Law, 1993; and Entry and Exit Commodity Inspection Law, 1989. The Fishery Law, 1986; Agriculture Law, 1993; the Entry and Exit Animal-Plant Quarantine Law, 1991; Animal Epidemic Prevention Law, 1997; the Frontier Hygiene and Quarantine Law, 1987; and Seed Law, 2000 cover aspects related to primary production. The Trademark Law, 2001 protects the food brands and labels. The Consumer Protection Law, 1993 ensures that the consumers enjoy quality food.

#### 49.6.1.4 Secondary Legislation

A total of 13 statutes are classified as administrative statutes and statute documents under the primary legislation.

Implementation Detailed Rules of Fishery Law, 1987; Implementation Detailed Rules of Entry and Exit Commodity Inspection Law, 1992; Administration Ordinance of Iodization of Salt to Eliminate the Endangerment of Iodine Deficiency, 1994; Implementation Detailed Rules of Plant Entry and Exit Quarantine Law, 1996; Pig Slaughter Administration Ordinance, 1997; Safety Administration Ordinance of Agricultural Genetically Modified Organism, 2001; and the Public Hygiene Emergency Ordinance, 2003.

1. The State Council Office Issue on Food and Nutrition Development Program 国务院办公厅关于印发中国食物及营养发展纲要2001-2010 (11-3-2001)
2. The State Council on Strengthening the New Stage of the "Vegetable Basket" of Notice 国务院关于加强新阶段"菜篮子"工作的通知 (8-3-2002)
3. The State Council Office On the Implementation of Food and Drug Safety Project Notice 国务院办公厅关于实施食品药品放心工程的通知 (7-16-2003)
4. The State Council Office Issue on Food Safety Special Punishing Program of Work Notice 国务院办公厅关于印发食品安全专项整治工作方案的通知 (5-17-2004)
5. The State Council Office on Further Food Safety Decisions 国务院办公厅关于进一步食品安全工作的决定 (9-1-2004)
6. The State Council Office Issue on National Food and Drug Special Rectification Work Notice 国务院办公厅关于印发2005年全国食品药品专项整治工作安排的通知 (3-30-2005)
7. The State Council on Strengthening the Food Products Safety Supervision and Management of the Special Provisions 国务院关于加强食品等产品安全监督管理的特别规定 (7-27-2007).

Currently, the administration system of food hygiene and safety is constituted by the State Council, the State Food and Drug Administration, the Ministry of Health, the Ministry of Agriculture, General Administration of State Quality Supervision, Inspection and Quarantine, the Ministry of Commerce, the State Industry and Commerce Administration, and the Ministry of Science and Technology. In addition to the above, Ministries and Administration extension agencies in each of the

provinces, counties and cities form a nation-wide administration and monitoring network.

# Chapter 50

## Branding, Regulation and Customs in Japan and Singapore

Andreas Popper

**Abstract** This section introduces the regulatory systems on food safety and the trademark systems of Japan and Singapore. Both countries are strong economies and faced with extremely low food self-sufficiency rates. Despite these similarities, they arrive at very different conclusions as to how to secure food safety. The Madrid Protocol serves the purpose of harmonizing trademark laws and facilitating the registration of trademark rights. Both countries, Japan and Singapore, joined the Protocol, but, while the registration of a trademark has become a very straight forward matter in Singapore, the handling of trademark matters was barely simplified in Japan. The following three sections will give insight into the logic of two very different Asian systems and expose the links between their regulatory and trademark laws.

### 50.1 Introduction

Section 50.2 introduces the regulatory system on food safety in Japan, a country that stands as one of the world's largest economies and yet, is struggling with a wide range of problems. Japan is faced with an extremely low and continuously falling food self-sufficiency rate of only about 39%.<sup>1</sup> The local agricultural industry is economically barely viable against foreign competition and is therefore dependent on governmental support and protection in the form of subsidies and import restrictions. Serious incidents during the last 2 decades related to food imports made food safety become a high priority issue to the legislator.

Answering these problems by applying restraints on international trade has become increasingly problematic in view of the formation of numerous free trade

zones worldwide. Trade restraints are objective economic measures directed against foreign economies. The application of trade restraints by one triggers counter measures of other governments and leads to economic conflicts between them. Regulatory legislation, however, relates to subjective health, safety, and welfare measures. The protection of health, welfare, and safety of people is a common interest of governments, and the rightfulness of the application of protective regulatory measures is unquestionable. Therefore, a global harmonization of regulatory legislation relating to food safety should basically be a logical outcome.

Section 50.3 introduces the regulatory system on food safety in Singapore, a country that is almost completely dependent on imports to satisfy the local demand for food, beverages and water. Despite this similarity to Japan, the approach of the Singapore governments to achieve food safety is very different from that of the Japanese. It is hard to explain why Singapore and Japan arrive at very different conclusions as to how to secure food safety, unless one seeks for reasons lying in the differences between the economic interests of the two countries. While the Japanese economy strongly depends on in- and exports, Singapore's economy is built on trading. Whether or not there is any relation between trade restraints and regulatory legislation, both are applied by the governments to protect not only their consumers, but also their domestic markets, industries and economic interests. Therefore, a basic understanding of regulatory legislation has become indispensable for many experts, for example those engaged in trading, marketing, product development as well as intellectual property law.

Section 50.4 introduces the links between regulatory legislation and trademark law. No business can prosper without a strong brand. Due to globalization, companies engaging in international business need viable regional or even global brands in order to secure their chance of steady growth. As brands open doors into foreign markets, the securement of vast portfolios of intellectual property rights by the local industry is in great and, beyond any doubt, the rightful interest of any government. Hence, as in the case of regulatory legislation, a global harmonization of trademark law should therefore basically be a logical outcome. However, despite having international systems<sup>2</sup> established to harmonize trademark laws among countries, governments are also designing and applying them in a way that they protect domestic markets from foreign competition. This similarity in attitude inevitably causes similarities between trademark law and regulatory legislation.

Both countries, Japan and Singapore joined the Madrid Protocol.<sup>3</sup> The establishment of international systems, such as the Madrid Protocol, serves the purpose of harmonizing trademark laws and procedures globally to facilitate the securement

---

<sup>2</sup>For example the Madrid Union: <http://www.wipo.int/madrid/en/members/>.

<sup>3</sup>The Madrid Protocol is an international system that was established in order to facilitate the registration of trademarks in multiple jurisdictions around the world. By filing a trademark application to the local patent/trademark office, applicants are enabled to designate simultaneously any member state of the Madrid Protocol. The designation of a member state is comparable with the filing of a national trademark directly in the member states. (<http://www.wipo.int/madrid/en/>) Japan and Singapore joined the Madrid Protocol in 2000: <http://www.wipo.int/about-wipo/en/>

of trademark rights. In Singapore, the registration of a trademark has become a very straightforward matter. In contrast, the Madrid Protocol has barely simplified the handling of trademark matters in Japan to foreigners. It has opened doors for initiating trademark applications from abroad, but hurdles such as language barrier,<sup>4</sup> a unique local similarity code system,<sup>5</sup> and quirky, inconsistent procedural rules<sup>6</sup> result in the majority of foreign applications undergoing costly examinations or failing them altogether. The dramatic differences between the trademark laws of these two countries that are members of the same international system is hard to explain unless one seeks, as mentioned in connection with regulatory legislation, for reasons lying in the differences between the economic interest of the two countries.

In Asia, the characteristics of the local languages and scripts enable local governments in particular to apply trademark law in a way that it protects the local markets. Misleading connotations, exaggerated meanings, concepts and appearances play a great role in both product presentation—which is a part of regulatory legislation—and trademark law. These marketing elements are all very strongly influenced by the languages and local scripts. Accordingly, there can only be limited consensus among the different countries. To experts working on both fields, the links are apparent: Securing a product name as a trademark without any foresight of regulatory compliance, or preparing a product for import under a product name that is not registrable as a trademark in the target market, may lead to a dead-end road. The following three sections will give insight into the logic of two very different Asian systems and expose the links between regulatory and trademark law.

These three sections do not seek to present a complete overview of Japanese or Singapore Food Laws or of Trademark Law. Rather, they aim to provide a basic

---

[offices/japan/wipo\\_japan.html](http://www.wipo.int/treaties/en/notifications/madridp-gp/treaty_madrid_gp_128.html), [http://www.wipo.int/treaties/en/notifications/madridp-gp/treaty\\_madrid\\_gp\\_128.html](http://www.wipo.int/treaties/en/notifications/madridp-gp/treaty_madrid_gp_128.html).

<sup>4</sup>In Japan, the similarity of trademarks is determined mainly based on their Kana transliterations, regardless of the question whether they have been filed in Kana or Latin. Therefore, conflicts with prior registrations are unpredictable to a foreign applicant. The framework for internationality is completely non-existent in Japanese trademark law, despite being a member of the Madrid Protocol.

<sup>5</sup>Japan has reorganized the goods and services according to the international system, but the determination of similarity between goods and services is still based on the old national system. One of the main purposes of organizing goods into classes in trademark law would however be to determine similarities.

<sup>6</sup>Japan, is one of the only three countries (the other two being Ghana and Cuba) among the 92 member countries ([http://www.wipo.int/export/sites/www/treaties/en/documents/pdf/madrid\\_marks.pdf](http://www.wipo.int/export/sites/www/treaties/en/documents/pdf/madrid_marks.pdf)) where the official fees are to be paid in two parts: [http://www.wipo.int/madrid/en/faq/fees.html#P3\\_4](http://www.wipo.int/madrid/en/faq/fees.html#P3_4); [http://www.wipo.int/edocs/madrdocs/en/2002/madrid\\_2002\\_48.pdf](http://www.wipo.int/edocs/madrdocs/en/2002/madrid_2002_48.pdf). This is a rather odd and unpredictable requirement. Another example, in Japan, the “letters of consent system” is not accepted, but trademarks may be assigned regardless of the question whether the assignee has marks that are confusingly similar to the assigned trademark. This rule is inconsistent.

understanding for how food safety and trademark issues are being dealt with in parallel in these jurisdictions.

## 50.2 Japan

This Sect. 50.2 focuses on the Japanese regulatory system on food safety. In Japan, food production is governed by the Food Sanitation Law.<sup>7</sup> This law was drafted in light of the consideration that the traditional legal system did not sufficiently address the fast technological development and the resulting complexity of food production and distribution processes. At its core, this law aimed to change policies to become more consumer-oriented rather than industry-oriented. Additionally, in order to take food safety issues and the globalization of food trade better into consideration, the Japanese Food Sanitation Law sets forth the general principles of “protection of consumers”, “measures based on science” and “from farms to tables.” These principles were developed, because traditional corrective food safety measures which were only applied to the final products became insufficient. The goal of the Food Sanitation Law, therefore, is to improve the realization of these principles.

One of the most important principles are precautionary measures in the food production system. Preventive or precautionary measures refer to decisions or actions that aim to prevent potential risks to human health, and which may be based on available information and do not necessarily have to be supported abundantly by scientific evidence. Henceforth, the new “preventive or precautionary” measures under the new Food Sanitation Law were designed to apply in all stages of production and distribution of food and agricultural materials including feed, pesticides and veterinary drugs.

The following paragraphs show how the fast technological development and the resulting complexity of food production and distribution processes are addressed by the precautionary approach to food sanitation legislation under Japanese law.

### 50.2.1 *The Food Sanitation Law*

The Food Sanitation Law applies to all foods and drinks, food additives and natural flavoring agents manufactured in or imported into Japan.<sup>8</sup> It also applies to tableware, kitchen utensils, machines and other articles which are used for handling, manufacturing, processing, preparing, storing, and transporting, displaying,

---

<sup>7</sup>The Japanese Food Sanitation Law, *Food Sanitation Law in Japan*, is available at <http://www.itp.gob.pe/normatividad/demos/doc/Normas%20Internacionales/OTROS/Japn/RegulaciJapn.pdf>.

<sup>8</sup>Art. 4 Food Sanitation Law.

delivering or consuming food. Generally, anything that comes into direct contact with food, for example parts of water filters, is subjected to this law. Moreover, the Food Sanitation Law regulates containers and packaging, and also all hygiene related issues in connection with human consumption of food. However, food, drinks, additives and flavoring agents that are categorized as “quasi-drugs” according to in the Pharmaceutical Affairs Law are not subject to the Food Sanitation Law. The same applies to products that have effects on human health or contain ingredients that are categorized to be quasi-drug ingredients or pharmaceutical ingredients.

Article 2 of the Food Sanitation Law puts the state, prefectures, cities and special wards<sup>9</sup> in charge with the execution of the regulations of the Food Sanitation Law through their public health centers and officers. They monitor, inspect and detain products that are not in compliance with the law, and control whether activities related to food are covered by the approved related business licenses. The state is in charge with the establishment of systems concerning food sanitation examination of imported food. This means that the state must establish and maintain import inspection and quarantines at the harbors and airports. The implementation of these duties by the state is not necessarily homogeneous as each port has its own circumstances. Importing food through Nagoya is, according to experience, much more time consuming and troublesome than through Osaka, Yokohama or Tokyo. Inspectors in Osaka have a much larger work-load and consequently more experience than inspectors in Nagoya. This reflects in the speed of handling imports. More about this is written under the section Import Procedures and Inspection.

Structurally, the first three Articles of the Food Sanitation Law state its purpose, and define the duties of public and private bodies and incorporations dealing with food and related matters. Article 4 contains definitions for important terms used in this law. The following articles contain the main regulations of the Food Sanitation Law.

- Art. 5 and 6 stipulate that the “dealing with” (handling, manufacturing, importing, processing, using, preparing, storing or displaying for sale, distributing and related activities) food and food additives is only allowed under clean and sanitary conditions such that no harm may be caused to the human health.
- Art. 6–18 further specify prohibitions, such as, for example dealing with newly developed food, unregistered food additives, polluted or contaminated food products, as well as with toxic, injurious and polluted apparatus, containers and packaging.
- Art. 11, 12, 13 and 18 authorize the Ministry of Health, Labour and Welfare (MHLW) to establish, in cooperation with the Ministry of Agriculture Forestry and Fisheries, specifications and standards that have to be complied with when dealing with food and food additives and their packaging. The MHLW also

---

<sup>9</sup>There are multiple ways to translate the word “city” into Japanese, depending on the number of habitants. The size of some wards in Tokyo and Osaka is comparable with that of major European cities. Accordingly they are put in charge with duties that are taken care typically by cities.

decides whether certain food manufacturing and manufacturing plants are in compliance with regulatory legislation.

- Art. 19 and 20 authorize the MHLW to establish standards for product labelling, prescribe that product presentation must comply with established standards and prohibit exaggerating and misleading product presentation.
- Art. 21 authorizes the MHLW to establish and manage standards and specifications for food additives.
- Art. 22 and 23 put the MHLW in charge with the establishment of procedures and guidelines for the inspection of food, food additives, apparatus and packaging, generally and specifically with respect to imported food.
- Art. 24 addresses governors and mayors to establish health centers and elaborate procedures and guidelines for the inspection of food sanitation within their regional responsibility.
- Art. 26–30 prescribe that food, food additives, apparatus and packages shall undergo an examination by the MHLW, regulate procedures in connection with the examination and stipulate that incurred expenses shall be borne by the applicant. They oblige importers to follow the orders of the MHLW with respect to import notifications, reports, on-site inspections and the collection of samples. Furthermore, they regulate the establishment of examination facilities and the appointment of inspectors.
- Chapter 8 of the law, consisting of Articles 31–47, specifies in detail all matters related to the establishment of examination facilities, such as for example qualification, registration, validity, work regulations, compliance, reporting and discontinuation.
- Chapter 9 of the law, consisting of Articles 48–56, addresses the obligation of dairy products and food additives manufacturers to appoint food sanitation supervisors and the training of these supervisors. They assign the right to the MHLW to establish standards for the manufacturing of food and food additives and authorize the prefectures to establish standards for public health measures, generally and specifically for each type of business. These Articles oblige business owners to obtain respective business licenses from the governor of the prefecture, who regulates the inheritance, violation, revocation, prohibition or suspension of such licenses.
- Chapter 10, consisting of Articles 57–70, deals with miscellaneous issues, such as the liability of public bodies for costs, notifications with respect to poisoned persons, investigations, autopsies of corpses, hearings, appeals, black-listings of violators, and announcements to inform the public about risks.
- Chapter 11, consisting of Articles 71–79, comprises provisions imposing fines or imprisonment for violations of this law.

This paragraph gave an overview of the structure of the Food Sanitation Law, the most important regulations on food safety in Japan. The following four articles address selected issues within or related to the Food Sanitation Law, such as regulations on pesticides, on food additives on import and inspection procedures and the Hazard Analysis and Critical Control Points (HACCP) system.

### ***50.2.2 Pesticides: Regulations on Agricultural Chemicals***

Japanese law regulates pesticides mainly to protect consumers from potential hazards to human health. A side-effect of this law is also the protection of the environment. The agricultural industry is admonished to use less and only registered pesticides that meet highest industrial standards, because otherwise, they infringe the law and will not be able to sell their products. Food manufacturers are urged to use in their products only those ingredients that comply with the regulations on agricultural chemicals. They refrain from buying raw materials that contain non-compliant amounts of pesticide residues or forbidden agricultural chemicals, or else, they infringe the law and bear the risk of not being able to sell their products. In order to make sure that the raw materials they buy comply with regulations, they will conduct laboratory test on each lot of products they purchase originating from the same source. Traders and importers suffer substantial damages if their merchandise does not pass the inspections by the authorities. Every food product of a new source is subject of laboratory testing at the customs. Products that originate from a source that is known from a past import record are being re-tested every year at least once. Moreover, in view of the vast volume of food imports to Japan, this law has an impact on food manufacturing and trading not only in Japan, but also in other countries producing for the Japanese market.

In its unrevised form, the Agricultural Chemicals Regulation Law of 1948<sup>10</sup> prohibited the commercial “import and sales” of non-registered pesticides. However, it did not apply to “private imports” and the “use” of non-registered pesticides. After a number of serious incidents<sup>11</sup> with such chemicals, in 2002 the law was revised, and the prohibition was extended to the “use” of non-registered pesticides.<sup>12</sup> In order to specify this new regulation, the Ministry of Welfare and Health (MHLW) compiled a list of substances allowed for import, distribution and use. This list is called the “Positive List System of Agricultural Chemicals”. This list covers pesticides, feed additives and veterinary drugs. In addition, each substance in this list is connected with a certain limit, called the “Maximum Residue Limits (MRLs)”, which expresses how much of a certain substance a food product may contain to be compliant with the law. This “Positive List” and the “Maximum Residue Limits” have to be seen as inseparably linked to each other.

The Ministry of Welfare and Health (MHLW) introduced the Positive List System in 2006.<sup>13</sup> It prohibits the manufacturing, import, processing, use, sale

---

<sup>10</sup>The Agricultural Chemicals Regulation Law of 1948, Agricultural Chemicals Regulation Law (Provisional Translation) (Law No. 82 of July 1, 1948, last amended on 30 March 2007), is available at: <http://www.env.go.jp/en/chemi/pops/Appendix/05-Laws/agri-chem-laws.pdf>.

<sup>11</sup>One example is the import and distribution of unauthorized pesticides (Difolatan and Plictran), in the Yamagata Prefecture in 2002 (<http://www.thefreelibrary.com/Man+held+on+charge+of+selling+unauthorized+farm+chemicals.-a091757985>).

<sup>12</sup>Articles 9, 11 and 12 Food Sanitation Law.

<sup>13</sup>Introduction of the Positive List System for Agricultural Chemical Residues in Foods: <http://www.mhlw.go.jp/english/topics/foodsafety/positivelist060228/introduction.html>.

and distribution of food that contains agricultural chemicals, pesticides, feed additives or veterinary drugs that are not listed. The Positive List comprises two kinds of substances. There are substances that had been regulated by the MHLW already before the establishment of the Positive List System. Many Maximum Residue Limits (MRLs) for substances contained in food had been set by the MHLW already by 1959. The limits were set based on experience with these substances and on scientific evaluation. These limits were revised during the years 2003–2005.<sup>14</sup> There are also substances cited in the Positive List that the MHLW did not have sufficient experience with, but with respect to which the MHLW had reasonable grounds to rely on Codex standards.<sup>15</sup> For such substances without existing MRLs, “provisional MRLs” were set taking into consideration Codex standards, the Agricultural Chemicals Regulation Law, the Pharmaceutical Affairs Law, the Law for Safety Assurance and Quality Improvement of Animal Feed, and Standards established by Australia, Canada, the EU, New Zealand and the USA based scientific studies. Food containing chemicals above the MRLs are subject to the mentioned prohibition. For agricultural chemicals, for which provisional MRLs could not be determined<sup>16</sup> yet, MHLW decided to set a uniform limit at 0.01 ppm.<sup>17</sup> This uniform limit has been calculated such that, taking the food consumption of an average Japanese into account, the estimated intake of the respective agricultural chemicals does not exceed the toxicological threshold of 1.5 µg/day. The source of this threshold is findings of the Joint FAO/WHO Expert Committee on Food Additives (JECFA), the US Food and Drug Administration (FDA), the EU and different organizations. Food containing chemicals above the uniform limit and where MRLs are not set, are also subject to the mentioned prohibition. Finally, there are substances that are exempted from the prohibition set by the law. These are agricultural chemicals and their decomposition products which are determined not to pose adverse health effects, specified agricultural chemicals shown in the Agricultural Chemicals Regulation Law,<sup>18</sup> chemicals for which registration withholding limits are not established and which are determined not to pose adverse health effects even if crops exposed to these chemicals are consumed,<sup>19</sup> and agricultural chemicals which are determined not to require any MRL in foreign countries and whose uses are not restricted.

### 50.2.3 Food Additives

The Food Sanitation Law governs food additives. Food additives are defined as substances that are added, mixed or infiltrated into food or by other methods in the process of producing food or for the purpose of processing or preserving food.<sup>20</sup> This means that food additives are not only substances that remain in the final product (colorants and preservatives), but also that have been applied during the food manufacturing process and do not remain in the final products (microorganisms, control agents, filtration aids). Only additives, preparations and food containing additives that have been designated by the MHLW as posing no risk to human health may be imported, produced, processed, sold, used, stored, or displayed for the purpose of marketing.

The MHLW differentiates among “Designated Additives”, “Existing Food Additives”, “Food Additive with Use Standards”, “Natural Food Additives” and “Ordinary Foods Used As Food Additives”. The structure of legislation on food additives, having beside the “Designated Additives” and a number of subcategories focusing on exceptions from the main category implies the adaption of a positive list system. As of August 2014, the MHLW has designated 443 substances as food additives. These “Designated Additives”<sup>21</sup> are substances that are unlikely to harm human health.<sup>22</sup> Food additives that have been served for human consumption and that are used as additives as listed in the list of “Existing Food Additives”,<sup>23</sup> are not subject to the designation system of food additives. Consequently, they may be freely produced and used. The MHLW is continuously reviewing the additives in this list and removing items that are assessed to create potential hazards to human health. The number of listed items was reduced in the time from 2005 to 2014 from 489 to 365. The MHLW has set standards (i.e., target foods and maximum use limits/residue limits) for a number of additives.<sup>24</sup> Food preparations containing these “Food Additive with Use Standards” must comply with the established standards. The same applies when such additive is used for the manufacturing of the food preparation. “Natural Flavoring Agents” are natural products that are obtained from animals and plants and used for flavoring food. (e.g. vanilla flavoring and crab flavoring in small amounts). Such substances and mixtures as listed in the List of plant or animal sources of natural flavorings<sup>25</sup> are also not subject to the

---

<sup>20</sup>Article 4.2 of the Food Sanitation Law defines “food additives” that are governed by the Food Sanitation Law.

<sup>21</sup>List of Designated Additives: <http://www.ffcr.or.jp/zaidan/FFCRHOME.nsf/pages/list-desin.add-x>.

<sup>22</sup>Article 10 of the Food Sanitary Law.

<sup>23</sup>List of Existing Food Additives is available at <http://www.ffcr.or.jp/zaidan/FFCRHOME.nsf/pages/list-exst.add>.

<sup>24</sup><http://www.ffcr.or.jp/zaidan/FFCRHOME.nsf/pages/stanrd.use>.

<sup>25</sup>List of plant or animal sources of natural flavorings is available at <http://www.ffcr.or.jp/zaidan/FFCRHOME.nsf/pages/list-nat.flavors>.

designation system of food additives. Ordinary Foods Used as Additives are substances that are generally provided for eating or drinking as food and also used as food additives (e.g., blueberry juice used as colorant). These substances, as listed in the List of food additives generally provided for eating or drinking as foods and which are used as food additives,<sup>26</sup> are also exempted from the designation system of food additives.

Manufacturers, importers and distributors may file a petition with the MHLW and apply to add a specific food additive to the list. The application must be supported by documents validating the safety of the additive. The Pharmaceutical Affairs and FSC examine and decide on such petitions, and may establish standards for manufacturing, processing, and use. The documents required for risk assessment by the FSC are specified and published in the Guideline for Assessment of the Effect of Food on Human Health Regarding Food Additives<sup>27</sup> by the MHLW.<sup>28</sup> The petitioner must bear all costs connected with this procedure. Many food additives which have been approved to be safe in other countries are yet prohibited in Japan. Also the MHLW may proceed ex officio and add new items to the list of “Designated Additives”. However, prior to this the Pharmaceutical Affairs and Food Sanitation Council (FSC) shall be heard in order to determine which additives may be designated.

Besides the specific rules, generally, food additives shall not be distributed or used if they are decomposed or immature, which contain toxic or injurious substances or which are suspected to contain such substances, which are contaminated or suspected to be contaminated with pathogenic microorganisms, and which could be injurious to human health due to uncleanness.<sup>29</sup>

#### ***50.2.4 Import Procedures and Inspection***

There is no other way to ensure the safety of imported food and its compliance with local regulations but by inspections. The same product might be categorized differently in different jurisdictions. An oil blend that is meant to help against anxiety, emotional distress or hyperactivity might be categorized depending on the application method in one jurisdiction as quasi-drug or health care product, in another as cosmetic, and in a third as a product *sui generis* that is under the control of none of the regulatory authorities. Therefore, the inspectors cannot rely on

---

<sup>26</sup>List of food additives generally provided for eating or drinking as foods and which are used as food additives is available at [http://www.ffcr.or.jp/zaidan/FFCRHOME.nsf/pages/list-general\\_prov.d.add](http://www.ffcr.or.jp/zaidan/FFCRHOME.nsf/pages/list-general_prov.d.add).

<sup>27</sup>Guideline for Assessment of the Effect of Food on Human Health Regarding Food Additives is available at [http://www.fsc.go.jp/english/standardsforriskassessment/guideline\\_assessment\\_foodadditives\\_e2.pdf](http://www.fsc.go.jp/english/standardsforriskassessment/guideline_assessment_foodadditives_e2.pdf).

<sup>28</sup><http://www.mhlw.go.jp/english/topics/foodsafety/foodadditives/>.

<sup>29</sup>Art 6 Food Sanitation Law.

product labels or import documents. The laboratory testing method and the interpretation of formula and of test results can be in every jurisdiction different. Therefore, not even a laboratory test result can fully be relied on as objective source of information. Only a thorough product review followed by a local laboratory test will confirm the correct categorization of a product. The correct categorization is necessary to determine the applicable laws.

The state is in charge with the establishment of systems concerning food sanitation examination of imported food.<sup>30</sup> Prior to each import of food, food additives, and any apparatus, container and package that is subject to the Food Sanitation Law, the submission of import notifications to the Quarantine Station of the MHLW is required.<sup>31</sup> Each submission must comprise the notification form and be supported by documentation disclosing all specifications of the respective product that are necessary for the evaluation of the product. The Quarantine Station may request for any document that supports the evaluation, for example information to the source of ingredients, place of manufacturing, etc. The first evaluation as to which category the product falls into is based on the review of the submitted documentation. Then the inspectors review whether the used ingredients are allowed for use in Japan, the limits are within the allowed range, and the sources of ingredients fall under any restrictions or regulations. The manufacturing flow might reveal the application of forbidden recipients, filtering or other steps of the manufacturing process. The import of a number of food items such as meat, meat products and shellfish must also be supported by a “sanitary certificates” issued by a governmental organization of the exporting country. Applications may be submitted by post, e-mail or upon registration with the MHLW through an electronic information processing system. The applications must pass a thorough examination by food sanitation inspectors at the quarantine station. There, the inspectors evaluate the compliance of the import with the Food Sanitation Law by focusing on the provided information, such as the exact product category, the ingredients, the applied manufacturing method, the additives, chemicals and materials applied during the manufacturing, the country of export, the manufacturer and the place of manufacture. Based on the above-mentioned information, available track record of the place of manufacturing or any record of incompliance of the respective product category, the inspector also evaluates the risk that the products might be contaminated with poisonous or hazardous substance, or have some issues with sanitation.

It is up to the discretion of the inspectors to grant the import of a product or issue an inspection order. An inspection order means the suspension of the import procedure until the compliance of the food concerned is confirmed. Such a confirmation may be obtained following an on-site inspection of the goods, or by a laboratory test. This procedure may take only a week, or it could take months, in

---

<sup>30</sup>Article 2 Food Sanitation Law.

<sup>31</sup>Article 27 Food Sanitation Law.

case the specifications of the product are complex. The importer must bear the costs of the inspection.

Food products that are imported to Japan for the first time are typically subjected to thorough inspection along with laboratory testing. New and complex products often get stuck at the customs because the inspectors need time to get familiar with the formulation and manufacturing of the products, and then decide on the scope of the necessary laboratory testing. In order to decrease the work load of the Quarantine Station, the inspectors may decide to apply “monitoring inspections” on products that are unlikely to be noncompliant with the Food Sanitation Law. Products that may be subject to monitoring inspection are designated based on the annual import amount and the record of compliance for each item. Designated products may be processed without any delay caused by waiting for the inspection results.

### **50.2.5 HACCP**

The Hazard Analysis and Critical Control Points or HACCP is a system that aims to prevent biological, chemical, and physical hazards in any production process that might result in the finished product to be defective or unsafe. Traditional quality control methods, which focus on sample inspection of finished products and often conducted by the purchasers of products, have become insufficient and ineffective in view of recent advanced and complex processing technologies and in the case of mass production. The HACCP is borne out of an awareness that “preventive or precautionary” measures must be developed and applied during the manufacturing process to recognize and avoid defects in the finished product. Accordingly, the system provides scientific measurements that help identify such risks and reduce them to a safe level. One additional advantage of the HACCP system is that it allows not only the industry but also the regulatory authorities to establish and audit safe production practices.

The HACCP was not developed specifically for the food industry. It is believed to originate from a monitoring system developed for the manufacturing process of artillery shells during the Second World War (MIL-STD-105 official record), to avoid duds or misfiring. The HACCP has been, in the meantime, also applied in other industries, such as the manufacturing of cosmetics and pharmaceuticals. HACCP was applied in the food industry for the first time in the 1960s as a logical tool for adapting traditional inspection methods to a modern, science-based, food safety system. It was when General Mills, Inc. started designing and manufacturing the first food for space flights for the NASA. The HACCP was introduced in 1973 as Good Manufacturing Practices for low-level acidity canned food in 1973, and provided solutions in the 1980s in a number of food poisoning cases caused by O-157, salmonella and lead contamination. In 1985, the Science Academy recommended the USDA (US Department of Agriculture) to introduce HACCP in the manufacturing of meat. The US regulatory authorities introduced compulsory HACCP in 1995 for large-size fish products manufacturing facilities, in 1998 for

meat and poultry manufacturing, and in 2001 for fruit and vegetable juice manufacturing facilities (<http://haccpalliance.org/alliance/HACCPall.pdf>).

Although HACCP focuses only on the safety and not on the quality of products, it has become a basis for many food quality and safety assurance systems, for example, Title 21 parts 120, 123 of the Code of Federal Regulations in the USA, and *FAO/WHO guidance to governments on the application of HACCP in small and/or less-developed food businesses*.<sup>32</sup> In the meantime, the HACCP has been recognized internationally as a system that helps ensuring the safety of food for human consumption internationally.<sup>33</sup> The European Union (EU) ordered member countries to oblige all facilities to adopt the HACCP principles by the *Council Directive 93/43/EEC of 14 June 1993 on the hygiene of foodstuffs*.<sup>34</sup> Therefore, the HACCP principles are regarded as a standard to be observed by any facility in EU countries. In light of such development of HACCP in the USA and the EU, the Food and Agriculture Organization (FAO) Codex Commission drafted principles and guidelines for the application of HACCP system.<sup>35</sup>

Japan started studying the HACCP system, when the import of certain Japanese fish products into the EU was rejected for not complying with the EU Directive on hygiene of food stuffs. In 1995, the Food Sanitation Law was amended and the HACCP system was introduced under the name “Integrated Sanitation Management of Process of Manufacturing”. Articles 13 and 14 of the Food Sanitation Law in connection with The Food Sanitation Law Enforcement Ordinances authorize the MHLW to decide whether the manufacturing of milk, milk products, meat products, fish paste products, high pressured, heated, sterilized food in containers or packages, and soft drinks is in compliance with legislation and standards, and also to grant related approvals (to manufacturing and facilities). To ensure the effectiveness of HACCP, the validity of approvals is limited to 3 years.

However, while the EU and the USA have introduced HACCP as an obligatory management system for food safety, and along with it minimum standards to be respected by all manufacturers, in Japan it is not compulsory for manufacturers to apply for an HACCP approval with the MHLW. Manufacturers who have received approval do not have any significant benefits; their products cannot sell at higher prices within Japan. On the other side achieving an HACCP approval is connected with substantial investments. As the number of approved facilities remained small, the HACCP Promotion Law was created, which sought to promote the HACCP system by supporting the grant of low-interest-rate loans and tax reliefs to HACCP-

<sup>32</sup>*FAO/WHO guidance to governments on the application of HACCP in small and/or less-developed food businesses* is available at <ftp://ftp.fao.org/docrep/fao/009/a0799e/a0799e00.pdf>.

<sup>33</sup><http://www.fao.org/docrep/v9723t/v9723t0e.htm>.

<sup>34</sup>*Council Directive 93/43/EEC of 14 June 1993 on the hygiene of foodstuffs* is available at [http://ec.europa.eu/food/food/biosafety/salmonella/mr06\\_en.pdf](http://ec.europa.eu/food/food/biosafety/salmonella/mr06_en.pdf).

<sup>35</sup>[http://www.google.com.sg/url?sa=t&rct=j&q=&esrc=s&source=web&cd=1&ved=0CBwQFjAA&url=http%3A%2F%2Fwww.codexalimentarius.org%2Finput%2Fdownload%2Fstandards%2F23%2FCXP\\_001e.pdf&ei=cVf8U7\\_RIpSiugTlj4HABw&usq=AFQjCNGx1qg10C4LDmiOfZubFHjIbk2ng](http://www.google.com.sg/url?sa=t&rct=j&q=&esrc=s&source=web&cd=1&ved=0CBwQFjAA&url=http%3A%2F%2Fwww.codexalimentarius.org%2Finput%2Fdownload%2Fstandards%2F23%2FCXP_001e.pdf&ei=cVf8U7_RIpSiugTlj4HABw&usq=AFQjCNGx1qg10C4LDmiOfZubFHjIbk2ng).

approved facilities. Nevertheless, the number of approved facilities barely increases in Japan.

Presently, the HACCP system is typically adopted by large-size manufactures and by exporters to demonstrate their general corporate performance in food safety and that their products have been manufactured in compliance with the standards of the HACCP system to avoid problem with EU and US customs.

## 50.3 Singapore

This section focuses on the Singapore regulatory system on food safety. The Singapore Food Regulations are derived from scientific knowledge and take the fast technological development, the complexity of food production and distribution processes into account. At the same time, it considers that Singapore is almost completely dependent on imports to satisfy the local demand for food, beverages and water. The Singapore's Office of Agriculture (AVA) regulates food, from its production to its retail. It takes a science-based risk analysis approach and applies international standards to evaluate and ensure food safety. AVA is responsible for the enforcement of the Sale of Food Act with the objective of setting standards and ensuring food quality and reducing risks to the health of humans.

### 50.3.1 *The Agri-Food and Veterinary Authority (AVA)*

The Agri-Food and Veterinary Authority (AVA) is a statutory board in charge with food safety in Singapore. The AVA evolved from the Primary Production Department (PPD), which was formed in 1959 by merging the agriculture, co-operatives, fisheries, rural and veterinary authorities to ensure a coordinated development and regulation of the local farming and fishing industry.<sup>36</sup> As over the decades Singapore's farming activities diminished and the trade with food expanded, the PPD was put in charge with food safety, testing and facilitation of trading, and in 2000 it was restructured into the AVA.

The Food Control Division of the AVA supervises the safety of local and imported raw and processed food, develops, implements and enforces food safety policies, operates an inspection program and monitors health threats. Apart from the accuracy and compliance of shipping documentation, the AVA inspects each batch of food import for absence of contamination, disease, damage food-borne pathogens and parasites and banned chemical preservatives. The investigations are supported by laboratory tests and microbiological examinations. Without

---

<sup>36</sup>History on PPD is available at *HistorySG* <http://eresources.nlb.gov.sg/history/events/14f36ce1-a54c-4bb3-8993-91c57fee7c50> and AVA website <http://www.ava.gov.sg/AboutAVA/History>.

exception, importers are obliged to refrain from the distribution of meat and poultry products, oysters, clams, mussels, scallops and cooked crabmeat until the completion of the laboratory testing. Shellfish products may only enter Singapore if they are supported by health certificates and from sources with acceptable sanitation programs. Fruit and vegetable imports are spot-checked for pesticide residues. Shipments that fail to meet the Singapore safety standards due to the presence of forbidden ingredients, preservatives, additives or colorings are rejected and destroyed under AVA's supervision.

### **50.3.2 Legislation**

Raw and processed food, beverages, and ingredients, whether manufactured in or imported to Singapore, must comply with the Food Regulations and related guidelines. Part III of the Food Regulations comprises of two main sections. The first section lists provisions that set general rules with respect to:

- Labeling (Art. 5) and exemptions (Art. 6)
- Containers (Art. 7, 37)
- Hampers (Art. 8)
- Nutrition information panel (Art. 8A)
- False or Misleading statements (Art. 9)
- Date marking (Art. 10)
- Claims as to presence of vitamins or minerals (Art. 11)
- Misleading statements in advertisements (Art. 12)
- Food and appliances offered ad prizes (Art. 13)
- Registration of imported food (Art. 14)

The second section deals with:

- Food additives (Art. 15–28)
- Incidental constituents (Art. 29–35)
- Mineral Hydrocarbons (Art. 36)
- Irradiated food (Art. 38)

Part IV of the Food Regulations sets specific standards and requirements for labeling and naming with respect to a catalog of pre-packed food and beverage products:

- Flour, bakery and cereals (Art. 39–56)
- Aerating ingredients (Art. 57–58)
- Met and meat products (Art. 59–70)
- Fish and Fish products (Art. 71–77)
- Edible fats and oils (Art. 78–92)
- Milk and milk products (Art. 93–125)
- Ice-cream, frozen confections and related products (Art. 126–129)

- Sauces, vinegars and relishes (Art. 130–142)
- Sugar and sugar products (Art. 132–152)
- Tea, coffee and cocoa (Art. 153–170)
- Fruit juices and fruit cordials (Art. 171–175)
- Jams (Art. 176–179)
- Non-alcoholic drinks (Art. 180–184)
- Alcoholic drinks (Art. 185–210)
- Salts (Art. 211–212)
- Spices and condiments (Art. 231–236)
- Flavoring essences or extracts (Art. 237–245)
- Flavor enhancers (Art. 246)
- Special purpose foods (Art. 247–254)
- Miscellaneous foods (Art. 255–259)
- Rice (Art. 260)

Furthermore, the Food Regulations comprise also 12 schedules that support the interpretation of the general and specific provisions. They provide specifications, set limits, and deal with penalties.

The following passages address the most salient provisions of the Singapore Food Regulations by focusing on the compulsory content of food product labels. The Food Regulations stipulate that pre-packed food and beverages for sale must be labeled and that the labels must provide basic product information in English.<sup>37</sup> The basic labeling requirements apply to samples, rewards in the form of food products, and to containers holding pre-packed food, too. The labeling requirements do not apply to food that is un-packed or weighed, counted or measured in the presence of the purchaser. It does not apply to sugar confectionery, chocolate and chocolate confectionery. Labels of intoxicating liquors do not have to state ingredients. As an exception of these exceptions, on the labels of food that contains synthetic coloring, the name and address of manufacturer, importer, packer or distributor must be displayed.

The label requirements must not be applied in a misleading manner, for example to food that is not destined to be, or that does not qualify for human consumption.<sup>38</sup> The name and description of the product reflecting its true nature must be displayed on the label. The name and description must not be misleading or implying forbidden claims, and it must be in compliance with the specific provisions of Part IV of the Trademark Regulations.<sup>39</sup> A complete list of ingredients and additives (statement of ingredients) should be declared on food labels. The ingredients

---

<sup>37</sup>This is remarkable, because Singapore has four official languages, which are English, Chinese, Malay and Tamil. Although Singapore was part of the British Empire until 1963, in the meantime, nearly 75 % of the population is Chinese, about 13 % Malay, and about 9 % Indians. The economic focus of the country on trading provides a more plausible reason for the mentioned regulation.

<sup>38</sup><http://www.ava.gov.sg/NR/rdonlyres/B96B0EC2-1D1E-4448-9C25-ABD8470D2BF4/26937/AGuidetoFoodLabellingandAdvertisementsVersionSepte.pdf>.

<sup>39</sup>Article 5 Food Regulations.

have to be displayed in descending order with respect to the weight proportions with their registered generic names as listed in the first schedule, Permitted Use of General Terms in the Declaration of Ingredients.<sup>40</sup> The International Numbering System (INS) and E numbers may be used for the declaration of food additives. Ingredients known to cause hypersensitivity, such as:

- Cereals containing gluten
- Crustacean and
- Crustacean products
- Eggs and egg products
- Fish and fish products.
- Peanuts, soybeans and their products
- Milk and milk products (including lactose).
- Tree nuts and nut products.
- Sulphites in concentrates of 10 mg/kg or more.

... must be declared as ingredient, food additive or component of a compound.<sup>41</sup> If a food product contains aspartame, a respective indication must be displayed on its label.

Based on the minimum or the average quantity system, the Net Content, or quantity of food must be displayed on the label of packed food. The quantity must be expressed using net weights (grams, kilograms) for solid food, and volumetric measures (milliliters, liters) for liquid food. The label of solid food filled in water, aqueous solutions of sugar and salt, fruit and vegetables juices or vinegar must display net and drained weight. The font size of information displayed on labels must be at least 1.5 mm in height. The name and address of manufacturer, packager or distributor must be displayed on the labels of food manufactured in Singapore in order to enable to identify the responsible person. The name and actual (not virtual) local address of importer, distributor or agent must be displayed on the labels of imported food. The country of origin of the product must be displayed on food product labels. Recipes, serving suggestions with respect to packed food in written or in pictures must be indicated as such and the size of the printed letters must be at least 1.5 mm.

Nutritional labeling is a mandatory component of product labels, where (permitted) explicit or implied nutrition, vitamins, minerals or health claims are made. Nutrition claims are allowed in Singapore as long as they comply with the requirements of the Food Regulations and the nutrient claims guidelines published in “A Handbook on Nutrition Labelling”.<sup>42</sup> Nutrition claims are defined as claims that suggest or imply that a certain food has nutritive properties, or as comparison of the nutritive property of a certain product in terms of energy, salt (sodium or potassium), amino acids, carbohydrates, cholesterol, fats, fatty acids, fibre, protein,

<sup>40</sup>Article 5 (4) (b) Food Regulation.

<sup>41</sup>Article 5(4)(ea) Food Regulation.

<sup>42</sup><http://www.ava.gov.sg/FoodSector/FoodLabelingAdvertisement>.

starch or sugars, vitamins or minerals, or any other nutrients. Examples of nutrition claims are “Low in calorie”, “Sugar free” and “Reduced sodium”. Nutrition claims on pre-packed food have to be provided in an adequate information panel, as for example<sup>43</sup>:

.....  
 Servings per package (here insert number of servings)\*  
 Serving size: (here insert the serving size)\*

	Per Serving* or	Per 100 g (or 100 ml)
Energy	kcal, kJ or	kcal, kJ or
Protein	both	both
Fat	g	g
Carbohydrate	g	g
(here insert the nutrients for which nutrition claims are made, or any other nutrients to be declared)**	g	g
	g	g

\*Applicable only if the nutrients are declared on a per serving basis.  
 \*\*Amounts of sodium, potassium and cholesterol are to be declared in mg.

.....  
 There are some exceptions of this rule that apply to where the claims on a label only refer to salt, sodium or potassium and where the total surface area of the label is less than 100 square centimeters.

Additional labeling requirements apply where the claim that a food product is a source of energy or protein is made. Such claims must be supported by an adequate information panel stating the quantity that needs to be consumed within one day such that it provides at least 300 kcal to the consumer. A product only qualifies as a source of protein, if at least 12 % of the total calorie contained in it is derived from protein. It qualifies as an excellent source of protein if at least 20 % of the total calorie is derived from protein, and if the stated amount of one-day consumption contains at least 10 g of protein. The daily recommendation statement may be put into words as “Recommended daily intake: 3 servings” or “Add 20 g powder in 200 ml water. Drink 2 times daily.”

The Food Regulations prohibit<sup>44</sup> statements to particulars of products that are false or misleading with respect to the nature, stability, quantity, strength, purity, composition, weight, origin, age, effects, or proportion of the food or any ingredients. They forbid suggestions that a product has therapeutic, prophylactic medical or health effects. It only allows the use of the attribute “pure” if the food is free from other added substances and if it is of a quality as required under the Food Regulations.

<sup>43</sup>Food Regulations—A Guide to Food Labelling and Advertisements p. 17: <http://www.ava.gov.sg/NR/rdonlyres/B96B0EC2-1D1E-4448-9C25-ABD8470D2BF4/26937/AGuidetoFoodLabellingandAdvertisementsVersionSepte.pdf>.

<sup>44</sup>Article 9 Food Regulations.

The law sets strict requirements<sup>45</sup> to the display of vitamin and mineral claims on product labels. The claim to contain vitamins and minerals may only be displayed on the labels of products that contain at least one-sixth of the daily allowance of vitamins and minerals as stated in Tables I and II. Such claims must be supported by statements to the quantity of the food that contains the claimed quantity of the respective vitamin or mineral or comparable information. The law stipulates further limitations to the language of the claim and to the maximum amount of vitamin A content (750 mcg of retinol activity) per reference quantity (Table II).

The food regulations stipulate additional labeling requirements for a number of products, for example Irradiated Food, Wholegrain, Bakery Products, Edible fats and oils, Milk, Coffee, Fruit Juice, Natural mineral water, Fruit wine, Compounded liquor, Infant Formula, Rice.<sup>46</sup>

The Food Regulations stipulate the display of warning statements for products containing certain ingredients, such as for example aspartame or royal jelly.

The expiry date information must be marked or embossed on all product packaging, and printed in letters of not less than 3 mm height. The day of the month must be expressed in figures, where the figure is a single digit it should be preceded by a zero. The month of the year may be expressed in figures or in words and may be abbreviated (first three letters). The year must be expressed in figures in full or by the last two figures of the year. Pre-packed food listed in the second schedule of part V of the Food Regulations must be labeled with their expiry dates:

- Cream, reduced cream, light cream, whipped cream and sour cream excluding sterilised canned cream.
- Cultured milk and cultured milk drink.
- Pasteurised milk and pasteurised milk drink.
- Yoghurt, low-fat yoghurt, fat-reduced yoghurt, non-fat yoghurt and yoghurt products.
- Pasteurised fruit juice and pasteurised fruit juice drink.
- Pasteurised vegetable juice and pasteurised vegetable juice drink.
- Tofu, “tauhu” or “doufu”, a soya beancurd product made of basically soya beans, water and a coagulant, including “egg tofu”, “taukua” or “dougan”, and the soft soya beancurd desert known as “tauhui”, “tofa” or “douhua”, but excluding the oil fried tofu in the form of a pouch known as “taupok”, and the dried beancurd stick.
- Food which is stored or required to be stored at a chilling temperature to maintain or prolong its durable life, but excluding raw fruits and vegetables.
- Vitaminised fruit juice and vitaminised fruit juice drink.
- Vitaminised vegetable juice and vitaminised vegetable juice drink.

<sup>45</sup>Article 11 Food Regulations.

<sup>46</sup>Articles 38, 40A, 53, 79, 109, 158, 159, 161, 171, 183A, 195, 210, 254, 260 Food Regulations.

- Liquid milk and liquid milk products excluding condensed milk, sweetened condensed milk, evaporated milk and canned sterilised milk and milk products.
- Flour.
- Salad dressing.
- Mayonnaise.
- Raisins and sultanas.
- Chocolate, milk chocolate and chocolate confectionery in which the characteristic ingredient is chocolate or cocoa, with or without the addition of fruits and nuts.
- Breakfast-cereal with or without fruits and nuts except cereal in cans.
- Infants' food.
- Edible cooking oils.

The display must comprise any of the expressions:

- “USE BY (here insert the day, month and year)”;
- “SELL BY (here insert the day, month and year)”;
- “EXPIRY DATE (here insert the day, month and year)”;
- “BEST BEFORE (here insert the day, month and year)” or other words of similar meaning.

Where the way of storage might influence the validity, storage directions must be provided on the product label, for example: “BEST BEFORE: JAN 30 2012. Store in a cool, dry place.” The display of the date of packing, as:

- “PACKING DATE (here insert the day, month and year)”;
- “PACKED ON (here insert the day, month and year)”;
- “PKD (here insert the day, month and year)

... is sufficient for raw produce. Raw produce must also comprise the reference “raw”.

The Singapore Ministry of Trade and Industry put the Genetic Modification Advisory Committee (GMAC)<sup>47</sup> in charge with the exploitation of products derived from genetic manipulated organisms. The GMAC has four subcommittees specializing in release of agriculture-related GMOs, research on GMOs, labeling and public. The GMAC advises with respect to all related matters, such as approvals, research and development, production, use, reviews, monitoring. The GMAC informs the public on planned releases, facilitates the exchange of information with foreign agencies and the harmonization of guidelines with international authorities, and monitors international developments on the labeling of GM products to see how these may be of relevance to Singapore. Singapore does not have any legislation or guideline for the labeling of GM food, yet. However, genetically modified food is subject to special declaration, review, inspection and testing procedures. The GMAC will consider a new agriculture-related genetically

---

<sup>47</sup><http://www.gmac.gov.sg/>.

manipulated organism to be safe and recommend its admission, if it is found to be substantially equivalent to an existing food or food component.

The labels of “Special Purpose Food”, such as of diabetic food, low sodium food, gluten-free food, low protein food, carbohydrate-modified food, low-calorie energy food, infant formula and formulated food, must state the special suitability of the food, and comprise a nutrition information. Special purpose food may only be labeled as “sugar-free” if they contain equal or less than 0.5 g sugar per 100 g or 100 ml.<sup>48</sup> Special purpose food may only be labeled as “low-calorie food” (Art. 149 Food Regulations) if they contain equal or less than 8 kcal per 100 ml in case of beverages, 100 kcal/100 g in case of bread spreads including jam substitutes or 50 kcal/100 g in case of all other kind of food. Diabetic food must be labeled as such and the label must contain a nutrition information panel (twelfth schedule of the Food Regulations) as well as a statement as to nature of the carbohydrates present in the food.<sup>49</sup> Infant food and infant formula is food for persons not older than 12 months of age. The law<sup>50</sup> sets strict and very specific requirements for the content of infant food and specific labeling requirements for packaging of infant formula, such as:

- directions as to the method of preparing the food;
- the amount of energy and the number of grams of protein, fat and carbohydrate per 100 ml or other equivalents of formula prepared in accordance with the directions on the label;
- the total quantity of each vitamin and mineral per 100 ml or other equivalents of formula prepared in accordance with the directions on the label;
- a statement suggesting the amount of the prepared food to be given each time, and the number of times such amount is to be given per day; such statement shall be given for each month of the infants’ age up to 6 months;
- directions for storage and information regarding its keeping qualities before and after the container has been opened; and
- information that infants over the age of 6 months should start to receive supplemental foods in addition to the formula.

Forbids the use of mineral hydrocarbons is forbidden in the composition or preparation of any food and the sale of food that contains mineral hydrocarbons, unless the product belongs to a catalog of products listed under this Article, and unless the residues of mineral hydrocarbons does not exceed the limits as set in Article 26 Food Regulations. Except under specific license, the law<sup>51</sup> prohibits the import or sale of irradiated food, or food that has been exposed to ionizing radiation. Ionizing radiation only falls under the exception of this Article, if it has been conducted in accordance with or meets the standard of the Codex Recommended

---

<sup>48</sup>Article 248 Food Regulations.

<sup>49</sup>Article 250 Food Regulations.

<sup>50</sup>Articles 252–254 Food Regulations.

<sup>51</sup>Article 38 Food Regulations.

International Code of Practice for the Operation of Radiation Facilities Used for Treatment of Food. This Article further proscribes the obligatory display of the words: “Treated with ionizing irradiation” or “Irradiated (name of food)” in letters not smaller than 3 mm of height.

### ***50.3.3 Provisions Regulating Ingredients, Contaminants and Pesticides***

Raw and processed food, beverages, and ingredients, whether manufactured in or imported into Singapore, must comply with the Food Regulations and its guidelines. Food and beverages that are manufactured, imported and sold in Singapore may strictly only contain additives that comply with the specifications and limitations (purity, amount), as stated in the Food Regulations.<sup>52</sup> These articles set official definitions, specify permitted uses and proportions and establish specific labeling requirements for Anti-caking agents, Anti-foaming agents, Anti-oxidants, Sweetening agents, Chemical preservatives, Coloring matter, Emulsifiers and stabilizers, Flavoring agents, Flavor enhancers, Humectants, Nutrient supplements, Sequestrants, Gaseous packaging agents, General purpose food additives.<sup>53</sup> Contaminants, incidental constituents, toxic substances, pesticide residues, heavy metals, antibiotic residues, oestrogen residues, mycotoxins and microbiological contamination are forbidden in Singapore, others may not exceed given limits in Food.<sup>54</sup> The Food Regulations comprise nine detailed schedules supporting the interpretation of the law<sup>55</sup>:

- The third schedule: oxidants
- The fourth schedule: specific permitted chemical preservatives
- The fifth schedule: coloring matters; synthetic organic and other colors
- The sixth schedule: emulsifiers and stabilizers
- The seventh schedule: nutrient supplements
- The eighth schedule: general purpose food additives
- The ninth schedule: maximum amounts of pesticides
- The tenth schedule: permitted maximum amount of arsenic, lead and
- The eleventh schedule: microbiological standards for milk powder, buttermilk powder, pasteurized milk, ice cream, cooked crab meat, prawns and shrimps, mollusk ready for consumption, edible gelatin, fish ready for consumption, pastry, meat ready for consumption and any solid or liquid food ready for consumption

---

<sup>52</sup>Articles 16–28 Food Regulations.

<sup>53</sup>Articles 16, 16A, 17–28 Food Regulations.

<sup>54</sup>Articles 29–35 Food Regulations.

<sup>55</sup>Article 16–35 Food Regulations.

These schedules are continuously updated by the AVA. In the absence of specific local legislation, the recommendations of the Joint Food and Agriculture Organization of the United Nations<sup>56</sup> and World Health Organization (FAO/WHO) Expert serve as guidance. With respect to pesticides (ninth schedule) the AVA might also consult the Codex Alimentarius Commission.<sup>57</sup>

The import, sale, consignment, delivery or use of containers that contain more than 0.05 ppm vinyl chloride monomer or compounds known to be carcinogenic, mutagenic, teratogenic, poisonous or injurious is forbidden. The same applies to the import, sale, consignment, delivery or use of appliances, containers or vessels that are intended to be used in the storage, preparation or cooking of food, if it is capable of imparting lead, antimony, arsenic, cadmium or any other toxic substance to the food stored, prepared or cooked in it. The import, sale, consignment, delivery or use of ceramic food ware that contains lead beyond limits as stated in the law is restricted.<sup>58</sup>

#### ***50.3.4 Business Licenses and Control Programs***

Singapore is running a number of food control programs. All meat, fish and egg processing establishments, warehouses and slaughter-houses require specific business licenses to be issued by the AVA to carry out food processing or storage for wholesale and distribution. They are subjected to regular and unannounced inspections by AVA. The AVA categorizes businesses (A for Excellent, B for Good, C for Average and D for Pass) based on their food hygiene and food safety standards, determines the frequency of such investigation, the need for the collection of samples and their laboratory analysis, and provides businesses with consultation on Good Manufacturing Practices (GMPs) and safety programs such as the Hazard Analysis and Critical Control Point (HACCP).

#### ***50.3.5 Import Requirements***

Importers must ensure that their products comply fully with the requirements of the Food Regulations, meet the import requirements and answer the inspection and sampling requests for laboratory tests of the AVA. Meeting the specified import requirements does not exempt the consignments from inspection and sampling for laboratory tests by the AVA. However, it helps avoiding unnecessary delays and storage of goods at the customs. All products are subjected to document and

---

<sup>56</sup><http://www.fao.org/home/en/>.

<sup>57</sup><http://www.codexalimentarius.org/>.

<sup>58</sup>Article 37 Food Regulations.

physical inspection and sampling for laboratory analysis. The AVA updates regularly and publishes specific import requirements for selected products.<sup>59</sup>

- Dairy Products from Foot-and-Mouth Disease (FMD) affected Countries.
- Pasteurized Liquid Milk from FMD-free countries
- Infant Formula (Age 0–12 Months)
- Infant Cereals
- Traditional Cakes & Nasi Lemak
- Coconut Products—Coconut Milk, Grated Coconut, Jelly Coconut, Shelled Coconut
- Ready to Eat Minimally Processed Cut/Peeled Fruits and Vegetables from Malaysia
- Minimally Processed Cut/Peeled Fruits and Vegetables
- Minimally Processed Cut Sugar Cane
- Mooncakes
- Processed Land Snail and Snail Caviar
- Beef extract and any food products containing beef extract
- Packaged Mineral and Drinking Water
- Ice
- Soy Sauce & Oyster Sauce
- Absinthe
- Other Imported Food Products

There are also a number of regulations that regulate the import of food products, such as for example the Wholesale Meat and Fish Act, the Control of Plants Act and the Animals and Birds Act.

The Wholesale Meat and Fish Act<sup>60</sup> regulates the import of meat and poultry, fish, their parts and products, no matter whether they are chilled, frozen, processed or canned form. Meat products may only be imported from approved sources (countries and establishments).<sup>61</sup> Such restriction does not apply to fish products, with exception of a few problematic species (live oysters, chilled crab meat etc.), and such listed in the Convention of International Trade in Endangered Species (CITES).<sup>62</sup> Every consignment of meat, oyster, blood cockle meat, prawns and crab meat product must be shipped directly from the country of export and be supported by bills of lading, airway bills and invoices also by a health certificated issued by a veterinary authority of the exporting country that confirms the compliance of the

<sup>59</sup><http://www.ava.gov.sg/NR/rdonlyres/2BA0A4AA-05D8-4E3C-A8F9-60F26F90EA76/27312/ImportRequirementsofSpecificFoodProducts.pdf>.

<sup>60</sup>[http://www.ava.gov.sg/NR/rdonlyres/F35FFB95-C706-49CD-B9E4-E402788BAF78/13756/Attach65\\_legislation\\_WMFact.pdf](http://www.ava.gov.sg/NR/rdonlyres/F35FFB95-C706-49CD-B9E4-E402788BAF78/13756/Attach65_legislation_WMFact.pdf).

<sup>61</sup><http://www.ava.gov.sg/AVA/Templates/AVA-GenericContentTemplate.aspx?NRMODE=Published&NRNODEGUID=%7b2CFF1FE3-8D20-4E7A-BC89-6368076F427B%7d&NRORIGINALURL=%2fFoodSector%2fImportExportTransOfFood%2fAccredOfOverseasMeatEgg%2f&NRCACHEHINT=Guest#List>.

<sup>62</sup><http://www.cites.org/>.

products with the Singapore's animal health and food safety requirements. The label of every unit of meat and meat product imported must contain:

- A description of the meat product;
- The country from which the meat product originates;
- The brand name of the meat product, if any;
- The name and designation number of the processing establishment in which, and the date on which, the meat product was processed, if applicable;
- In the case of a processed meat product, the name and designation number of the slaughter-house in which the animals used in the production of such meat product were slaughtered and the date of the slaughter
- The name and designation number of the establishment in which, and the date on which, the meat product was packed;
- The batch number and, where the meat product is canned, the canning code.
- The net weight of meat product as contained in each basic packaging and outer carton.

The Control of Plants Act<sup>63</sup> (Import & Transshipment of Fresh Fruits & Vegetables) regulates the import of raw (unprocessed) fruits and vegetables and makes reference to the ninth schedule of the Food Regulations. The Animals and Birds Act,<sup>64</sup> in particular the regulations to “Veterinary Conditions for the Importation of Table Eggs” regulate the import of fresh hen eggs. Fresh and processed eggs may only be imported from approved establishments, which can be found on the website of the AVA.<sup>65</sup> Fresh egg consignment must be from the same source (one specific farm), be supported by an import license and a Veterinary Health Certificate, and dated within 7 days of the import. Imports of processed food must be supported by documentary proof that the production took place in a regulated establishment under proper supervision of the competent food authority of the exporting country. The use of artificial sweetening agents is strictly regulated and limited. Artificial sweetening agents may be used only in special dietary foods which are formulated for specific consumer groups, to meet their dietary needs (thirteenth schedule in the Singapore Food Regulations). Their import, sale, manufacture and use must be supported by an artificial sweetening agent license (Art. 18 Food Regulations). The product labels must comply with specific labeling requirements and comprise the information that the product contains artificial sweetening agents stating the exact name of the used sweetener.

Only companies or businesses registered with the Accounting and Corporate Regulatory Authority (ACRA) holding a Unique Entity Number (UEN) and

<sup>63</sup>[http://www.ava.gov.sg/NR/rdonlyres/2BA0A4AA-05D8-4E3C-A8F9-60F26F90EA76/13760/Attach27\\_Legislation\\_COP\\_ImportandTranship\\_rules.pdf](http://www.ava.gov.sg/NR/rdonlyres/2BA0A4AA-05D8-4E3C-A8F9-60F26F90EA76/13760/Attach27_Legislation_COP_ImportandTranship_rules.pdf).

<sup>64</sup><http://statutes.agc.gov.sg/aol/search/display/view.w3p?page=0;query=DocId%3A%22f0719c63-6c52-4222-b991-3804d749ea36%22%20Status%3Ainforce%20Depth%3A0;rec=0>.

<sup>65</sup><http://www.ava.gov.sg/FoodSector/ImportExportTransOfFood/AccredOfOverseasMeatEgg/List+of+overseas+meat+and+egg+processing+establishments.htm>.

registered with the Singapore Customs (SC) are qualified to register products with the AVA. The registration of processed food with the AVA and the acquisition of a registration number from the Quarantine & Inspection Department—QID are prerequisites to any application for import permits. The registration of each product is connected with the payment of official fees and is valid for 1 year. Any change in the particulars of the product makes a new application necessary. Each food item must be declared accurately with Correct HS code, product description, quantity and unit of measurement, brand name, and country of origin.

The Food Control Division (FCD) of the AVA is in charge with the control of food safety, licensing and inspection of food and controls whether processed food product imports comply with the Sale of Food Act (SFA), the Food Regulations (FR) and all labeling requirements. AVA has adopted a risk-based approach and places food products that have been identified through trend studies or by precedent cases to be of high potential health risk, under strict import control (mineral water, coconut milk, infant formula, ready-to-eat fruits and vegetables, etc.). These products require pre-import inspection such as the submission of health certificates or laboratory reports to certify the safety of the products. Prior to releasing them for sale the FCD conducts document and physical inspection (eventual sample taking and laboratory testing) on all products that are under intensive surveillance. Other products are being released for sale before they are investigated (post import inspection and eventual sampling and laboratory testing).

## **50.4 Links Between Regulatory Legislation, Marketing and Trademark Law**

Although the category of a product is primarily determined by its composition and the applied manufacturing process, the outcome may be influenced by the intended use, the applied marketing method, or the chosen product name. An oil blend that is meant to help against emotional distress might be categorized, conditional to the application method (consumption or external application on the human skin or inhalation upon vaporization), in the same jurisdiction differently. The same product with the same application method might be categorized in Japan and Singapore based on the applicable regulations differently. Depending on the hurdles set by regulations of his target markets, a manufacturer or trader might choose to import the same product in one jurisdiction as quasi-drug or health care product, in another as food, and in a third as general merchandize.

The marketing method chosen for a product might have influence on the product categorization. The decision whether or not to make a claim for a product may shift it from one into another category. If the manufacturer decides to claim for the above mentioned oil blend that “its consumption will provide relieve from emotional distress”, or “help relaxing the muscles” or even “solve insomnia”, it is likely that the product will be classified as health product or quasi drug, while without such

claim, the same product might be categorized as food additive, food or even general merchandize. For the import and distribution as a quasi-drug, the product would have to pass a complicated and costly product registration procedure. Moreover, the distributor would have to obtain specific import and distribution licenses. For the import and distribution as general merchandize, no specific requirements have to be complied with.

The same applies to the choice of the product name accordingly. A product name might imply connotations that are equivalent to claims. Names like “AntInsomnia” or “StressRelieve” or “ImmunBallance” imply effects that food products are not supposed to have. The regulatory authorities might object to such product names during the product registration or import procedures or order a recall of products labeled with such product names. Product names are typically created by marketing experts or name creation companies (marketing companies) who are trying to use descriptive product names with strong connotations and implied claims. The name candidates created by marketing experts are then reviewed by regulatory experts who try to avoid using product names that imply claims and risky connotations. Regulatory experts would prefer using product names that fit to the category of the product. The trademark experts evaluate the candidates that have “survived” the review by the regulatory experts, and eliminate those that are descriptive or generic and that are not available, because they have been already taken by competitors. It is easy to imagine, that some name creation projects end up without any surviving name candidates. Each of these experts is looking at very different objectives. The subject of greatest controversy is the product name that needs to be registered with the regulatory authorities and that also needs to be secured as trademark.

A trademark may consist of or comprise letters, numerals, devices, colors, aspects of packaging and any combination of these. In some countries, colors, sounds and slogans may also be registered as trademarks. A trademark is registrable if it is distinctive with respect to the goods or services it is used or intended to be used for and available because not identical or similar to prior registered marks. A trademark registration is valid for 10 years from the date of application and is renewable without limitation. Marks that are descriptive or misleading as to the nature of the goods they are intended to be used for are not registrable. The same applies to marks that are “common to the trade” or that are in contrary to public policy or morality.

Similar to product categories in regulatory legislation, the trademark law arranges products and services in classes. According to the Nice Classification,<sup>66</sup> they are arranged in 45 classes, of which the first 34 contain goods and the remaining 11 classes contain services. Trademarks must be designated for specific goods or/and services. In other words, the scope of a trademark registration is determined by the goods or services the trade mark is registered for. The trademark does not necessarily have to reflect the claimed class, but it must not be misleading or descriptive as to the goods it is intended to be used for. Hence, the product name

---

<sup>66</sup><http://www.wipo.int/classifications/nice/en/>.

**Table 50.1** Same terms, different definitions in trademark law, regulatory and marketing

	Trademark law	Regulatory	Marketing
Linguistics	Connotations	Acceptable and appropriate	Brand strategy
Classification	Nice or nat. classification	HS	Possibly expensive
Availability	Registrable, useable	Risk of confusion	Image
Distinctiveness	Inherently registrable	Not misleading as to the product category	Outstanding

“water” cannot be registered for water, as such trademark would give its owner the right to exclusive use of the word water for water, but it might also be difficult to register it for lemon juice, which would be misleading. However, it would not be a problem to register it for example for a computer, or a chair.

With respect to product names, trademark law and regulatory legislation often overlap. A product name, for example “DToX”, implies the health claim of being able to “detoxify”. According to regulatory legislation, such a product name may only be used for quasi drugs or health care products, but not for food or beverages. According to trademark law, “DToX” is a coined word and its mentioned connotation is not necessarily strong enough to deem it to be descriptive of misleading when used for food or beverages. Registering the product name “DToX” as trademark in class 29 or 30 (food and beverage products) would therefore be possible, but it would make little sense, because according to regulatory legislation the names could not be used for food and beverage products.

The links between trademark law and regulatory legislation become even more complex when a reference to a specific place of manufacturing is embedded in the product name.<sup>67</sup> The place of manufacturing indicates whether certain specific regulations apply to the product (BSE, CITES). Wrong or misleading geographical indications as part of the product name may lead to the non-compliance of the product with regulatory legislation.<sup>68</sup> The product name “Norwegian King Salmon Fish Oil” would be misleading for “fish oil”, but it would be registrable as trademark for “fish oil from Norway”.<sup>69</sup> When the product is manufactured in Malaysia, regulatory legislation requires the display “Made in Malaysia”. From trademark law point of view, this display stands in clear contradiction to the registered scope of protection, which is “fish oil from Norway”. The trademark might become vulnerable to cancellation suits based on non-use in Japan after 3, in Singapore after 5 years. This specific example should demonstrate how difficult it

<sup>67</sup>This may happen if the marketing department sees a sales point in such approach.

<sup>68</sup>In modern trade, the source of the product is often in one, but its place of manufacturing in another jurisdiction.

<sup>69</sup>Another problem, which is that such trademark would be descriptive, could be solved by registering the trademark along with a distinctive device. The limitation of the scope of protection of such trademark to “fish oil from Norway” would still be necessary to avoid misleadingness.

sometimes is to comply with both the demands of trademark law and regulatory legislation.

When dealing with trademarks, it is unwise to fade-out regulatory aspects or the efforts of marketing. Finding a product name that best reflects what makes the product special, thereby descriptive, maybe even exaggerating and misleading, is the goal of marketing while those in charge with regulatory compliance try to avoid them, and trademark experts just do their best to avoid conflict with prior rights of competitors. Interestingly, all three fields are making use of the same terms to express different things (see Table 50.1).

The following overview gives insight into the meaning of the used terms depending on the context.

### Linguistics

- Trademark Law: Does the mark have any negative connotations? Is it unique and memorable? Is it relevant for the target consumer?
- Regulatory: Does the mark have any connotations that are misleading as to the products for which it is going to be used? Can these connotations lead to a rejection of the product name by the authorities?
- Marketing: Does the mark have connotations that do not fit to the marketing strategy of the client? Is the mark future-proof?

### Classification

- Trademark Law: Which is the correct Nice class? Do the relevant goods/services have any similarity to such in other classes? Which is the acceptable wording of the specification?
- Regulatory: Which HS refers to the goods of the client? According to the design, formulation and manufacturing of the products, which categories do they belong to? According to the applicable regulations, are there any needed business licenses for the import and distribution of the products, any claimable effects and quality, any limitations to the choice of the product name, and is there a need for clinical trials and laboratory testing?
- Marketing: Can the product be sold above its actual value? What is the highest rank and quality claim that can be believably made for the product?

### Availability

- Trademark Law: Evaluation of risks of (1) a rejection of the registration of the mark and of (2) oppositions against the registration of the mark based on relative grounds. Evaluation of risks resulting from the use of the mark without a registration.
- Regulatory: Is the mark already being used in the target market for a similar or related product (danger for consumer) or for a product or service the authorities will not want the product to be related to (misleading or confusing for the consumer)?
- Marketing: Is the mark already being used in the target market for a similar or related product or for a product or service the client does not want the product to

be related to? Can the product name be secured in the widest range possible as a trademark, a domain, and by copyright or patent law? Is the brand future-proof for the life of the brand?

#### Distinctiveness

- Trademark Law: Is the mark inherently registrable?
- Regulatory: Is the mark misleading as to any qualities, functions, capabilities or categorization of the product?
- Marketing: The best possible way to emphasize that the product is unique, outstanding, the best available, and legendary in its class.

### ***50.4.1 Search and Appraisal of Compliance of Product Names***

In most countries, the procedure to clear a food product with the regulatory authorities and the procedure to register a product name as a trademark are legally and administratively not related to each other. Traders will typically not wait with the import of a product until the completion of the registration of the respective product name as trademarks.<sup>70</sup> Therefore, the rejection of the registration of the product name as trademark usually happens at a very bad time, when products have already been labeled, registered, shipped imported and distributed. The distribution of a product with a product name that cannot be registered as trademark because of a conflict with earlier trademarks of competitors can result in the infringement of these prior trademark rights. The importer may be sued for injunction and damages. The importer would have to collect the distributed products, rename them and begin with the product clearance from zero. In conclusion, passing a product name through the stringent regulatory examination procedure, without securing it as trademark is imprudent. The only way to avoid the described scenario is using product names that are regulatory compliant and registrable in the first place. Product names must be created, walked through strict, selective screening procedures, tested for regulatory compliance, distinctiveness, negative connotations and availability, before the begin of import procedures. Public and commercial trademark data bases must be reviewed for potential conflicts of the chosen product name with prior trademark registrations. The searcher<sup>71</sup> must evaluate the chosen product name on compliance with the legislations of the target market. Registering a product name in one market before moving to the next, just to recognize that the name that passed in the first failed in the second, results in that the same product will need different names in every jurisdiction. The creation of regional or global

---

<sup>70</sup>The registration of a product name as trademark takes typically much longer than the clearance of a food product for import.

<sup>71</sup>A trademark expert with experience and language skills in the target markets.

brands means coordinated trademark searching in all jurisdictions simultaneously. Such multinational and global trademark searches, involve substantial costs, and are conducted as a preliminary step to trademark and product registrations.

The regulatory compliance check of the product name goes beyond a similarity and risk-of-confusion evaluation that is typical in the trademark law. It takes into account meaning, connotations and the use of the product name in context with the product representation, while keeping the product formulation, manufacturing process and design as well as the form of application in mind.

The meaning, connotation and appearance of the product name plays a crucial role for both the evaluation of the product name on registrability as trademark and its evaluation on compliance with regulatory legislation. Inevitably, in multi-national projects, language issues have to be dealt with. The phonetic diversity of languages

and the question whether alphabets, syllabaries or pictorial characters are in use has a major impact on meaning connotations and appearance of product names. Product names must be registered with local regulatory authorities in the local script; hence, they must be transliterated or translated. Transliteration is the transfer of a sound from a source language into a target language. The differences in the phonetic ranges of the source and the target languages and their overlap determine whether a word can be transliterated along with its original sound successfully. Often, the sound of the product name or trademark in the original language is “squeezed” into the phonetic limits of the target language. A transliteration from English (Latin script with about 44 sounds) into Japanese (Kana with about only 24 sounds) transforms the sound of a mark completely. The transliteration of a trademark from a Latin based source language into Japanese, Korean or Chinese is like a metamorphosis. In addition, the understanding of similarity is very different in each language. The overview in Table 50.2 shows different forms of similarities in Japanese and Chinese.

The transliteration shifts or changes completely the sound, appearance, connotations and meaning of a mark.

In conclusion, the review of product names requires expertise in many fields. Marketing, regulatory and trademark experts can only come to feasible solutions by combining their expertise.

# Chapter 51

## Food Sustainability in the Context of Chinese Food Regulation

Juanjuan Sun

**Abstract** Facing the challenges like limited natural resources, increasing population and climate changes, it is still an urgent call to produce food in the harmony with the needs of sustainability. Therefore, having a perspective of food policy and law, this chapter is dedicated to elaborate a concept of food sustainability by taking into account food related concepts, including food security, food quality and food safety. Based on this, the case of China is further provided to state how policies and laws concerning agriculture, quality labels and food safety put into practice, with a view to make sure the harmony between food supply and sustainability.

### 51.1 Food Sustainability

Food is important for both human and national security. For the former, it is quite literally impossible to have a life without food. As a basic human need, there is a right to adequate food. Accordingly, every man, woman and child, alone or in communities with others, should, at all times, have physical and economic access at all times to adequate food or means for its procurement.<sup>1</sup> For the latter, since ancient times, food gained power as a weapon has been acknowledged in which controlling food in a food-scarce society can be powerful and a key to victory in at times of war. In this sense, it is recognized in China that only when a country is basically self-sufficient in its food production, can it take the initiative in food security and grasp the overall situation for economic and social growth.<sup>2</sup> Additionally, it is important to note that the risk of tampering or other malicious, criminal or terrorist actions regarding food may also threaten the national security. Therefore, food defense programs are being developed in the United States and support the

weight of the field of priority due to food law policy, with consideration of elements of food sustainability, including food security, food quality and food safety.

Facing the food shortages due to the World War II, the guarantee of an adequate food supply was at the core of the food policy and law. Yet, the evolution of food policy and law witnessed a shift from a consideration of quantity to an emphasis on quality. In this regard, the EU is a good example and has fifty years of experience in the Common Agriculture Policy (CAP)<sup>3</sup> and food safety regulation.<sup>4</sup> In 1962, CAP was launched with the primary objective of meeting food security. Under the framework of CAP and with its financial underpinnings, food supply was boosted, changing what was a food shortage into a food surplus. However, without considering the market needs, the food surplus became a new issue of its own in the 1980s due to high costs of food storage and disposition. In response to this issue, CAP reform has placed more emphasis on quality versus quantity by taking into account food diversity, environmental concerns and rural development. Meanwhile, the outbreak of [Bovine Spongiform Encephalopathy](#) (BSE, also known as mad cow disease) has brought the food safety issue into the forefront of public concern. To restore consumer confidence in the food safety guarantee, a series of law reforms has been introduced, in particular, the establishment of General Food Law.<sup>5</sup> In view of this, food policy and law now takes into account different food issues, including food security, food quality, and food safety.

For the world as a whole, progress has also been made in the food supply, with a near balance in the growth of population and per capita food production reached in the 1980s.<sup>6</sup> However, challenges arise from inequitable development between north and south and from shortsightedness in the pursuit of economic growth. Compared to the people in more developed countries, the poor people in developing countries in Asia and Africa still suffer from hunger or cannot afford to buy food. Although those countries, especially many on the African continent, make strenuous efforts to attract foreign investment in the agricultural sector, the investment in terms of access to natural resources, in particular land and water, is still at the cost of environmental deterioration as well as the small farmers' ability to self-supply.<sup>7</sup> Putting economic profit ahead of safety concerns, the outbreak of food safety issues such as the BSE crisis in the EU have raised consumers' interests in food safety and food quality as well.

It is important to point out the fact that it is not the lack of resources, but the way in which the food is produced that has led to such unsustainability. For example, overuse of chemicals can increase the food production quickly in the short run, yet, the pollution of both soil and water undermines long-term agricultural

<sup>6</sup>Pinstrup-Andersen (1994).

<sup>7</sup>Food and Agriculture Organization (2013), p. 3.

development, putting both farmers and the land being farmed under pressure, resulting from such unsustainable development. In addition, the polluted environment can introduce health-threatening substances into the food chain. As a result, the costs can include environmental decline, lower standard of living for farmers, and be a detriment to consumers' health. Therefore, there remains an urgent call to support sustainable food production. To understand how this is possible, it is important to review the definition of sustainability.

A famous Chinese leader, Deng Xiaoping, emphasised that development is a top priority, especially, economic development. However, emphasizing the economic development at the cost of the environment became the root of environmental problems, which, in turn, impeded further economic development. Additionally, economic growth was believed to solve the problem of poverty. But the reality is that the unbalanced development between regions (north and south), and between sectors (agriculture and industry) has given rise to the issue of inequitable distribution of economic benefit, in particular, the inability of the poorest people to access any share in such economic growth.

As a reaction to the challenges of ensuring fair and equitable economic development, the concept of sustainable development is raised in the report of the World Commission on Environment and Development (known as *Our Common Future* or the *Brundtland report*),<sup>8</sup> that encourages the concept that the exploitation of resources, the direction of investments, the orientation of technological development, and institutional change can be made consistent with future as well as present needs. This concept of sustainable development stresses the reconciliation of the needs of development with the protection of the environment since an environment without equality can still deprive poor people of their opportunity to share benefits resulting from economic growth. This reasoning requires that economic growth shall be at the same time environmentally and socially sustainable. That is to say, to put sustainable development into practice, three pillars are interdependent and mutually supportive: namely, economic growth, environmental protection and social progress.

When it comes to food, a variety of in-depth changes in the food supply are required for this practice to be effective. Food is originally a gift of nature that could be identifiable with one agricultural input.<sup>9</sup> Yet, while modernization and with industrialization, food becomes the outcome of food science which has undergone substantial transformation and cannot be identified with one principal agricultural input. Also, the food supply chain has been extended from a local supply to a long-distance supply, especially as global food supply is on the rise with the development of international food trade. Regrettably, the positive results of being able to transport food away from its original local source are accompanied by negative

---

<sup>9</sup>Bunte F, Dagevos H (eds) (2009) *The food economy: global issues and challenges*. Wageningen Academic Publishers, pp 48–49.

effects. Scientific and technical breakthroughs have improved food supply by revolutionizing agriculture; yet, it also degrades the environment as well as opens up a wide gap between the rich north and the poorer south. In addition, food trade can enable a great increase in the generation of wealth, but has not been able to reduce hunger and poverty while preserving the resources.<sup>10</sup> Therefore, in order to move food in the direction of sustainability, the purpose is to promote non-market oriented, environmental, and social and culture values.<sup>11</sup> To this end, the policy and law formulation in relation to food should take into account the perspective of sustainable development, making sure that not only the economic growth but also the environmental and social needs are considered by politicians or legislators. As far as food is concerned, there are three major subject matters that specifically address food: food security, food quality, and food safety.

### ***51.1.1 Food Security***

From the perspective of quantity, a healthy food supply is aimed at providing sufficient food for individual survival. However, the challenges to ensuring such an adequate food supply are multiple. For example, the adverse impact of weather as well as a chain reaction from the rising oil prices towards food prices caused the food crisis in 1973.<sup>12</sup> More recently, factors including water scarcity, climate change, and rising food prices continue negatively affect people's access to food, especially the most poor and vulnerable people. As a result, a concept of food security has come into being, defined roughly as: all people, at all times, have physical, social, and economic access to sufficient, safe, and nutritious food that meets their dietary needs and food preferences for an active and healthy life.<sup>13</sup> As far as the evolution of this definition is concerned, for one thing, it has extended the requirements specifically addressing food from sufficiency alone to safety and nutrition. That is to say, people should be secured not only from hunger but also from food contamination and malnutrition. It also includes values such as fairness and dignity in the concept, while remaining in harmony with the needs of sustainability. For instance, food security does not exist if vulnerable people have no access to food or if people cannot have food in a way that is culturally acceptable.

While the major function of agriculture is to enhance food security, it seems that local agriculture is becoming less important. In fact, food imports have become an alternative to local food supply; with nearly 70–80% of food sold to consumers a produced or processed product.<sup>14</sup> Yet, this reliance on food imports is not necessarily

---

<sup>10</sup>Collart Dutilleul (2012).

<sup>11</sup>Collart Dutilleul (2009).

<sup>12</sup>Timmer (2010), pp. 1–11.

<sup>13</sup>Food and Agriculture Organization (2003).

<sup>14</sup>Valceschini (2013), p. 49.

less important. For one thing, given the volatility of food prices at the international level, true national security is still heavily reliant on self-supply. For another thing, the role of agriculture is always essential to provide product as raw material for the food industry. Therefore, it is always a necessity to consider the function of agriculture in the guarantee of food security. To fully realize the implication of food security, sustainable agriculture and rural development (SARD) is designed to ensure food security by taking into account the environmental protection, natural resource management, alleviation of poverty, and to supply nutritional food to vulnerable groups.<sup>15</sup> For this purpose, the agricultural policy and law should integrate the objective of food security with sustainable development.

### ***51.1.2 Food Quality***

From the perspective of quality, food quality has been a long-term consideration in the food supply. Although it is a subject of debate as to what food quality is, one common agreement is that food quality is characterized by multidimensional attributes. For example, quality attributes can be classified as safety attributes, nutrition attributes, value attributes and package attributes (Hooker and Caswell 1996). Hygiene, nutrition, enjoyment and use have been proposed as the four key components in defining quality (Chiaradia Bousquet 1995). Indeed, with endless food safety issues, the attribute of food safety has been separated from quality and becomes an independent target for regulation.<sup>16</sup>

As far as quality is concerned, there is a quality specification that can distinguish food in terms of features such as organoleptic qualities, taste, material, source of origin, etc. There is also a classification in the direction of upgrading, taking the quality as a reflection of value and the ability of a product to satisfy the users.<sup>17</sup> Therefore, the quality attributes can be used to differentiate a food product and meet consumers' needs. Consumers are increasingly willing to pay more for a value-added food (Caswell and Siny 2007). Meanwhile, a differentiated quality attribute can be a comparative advantage for food in both the competitive domestic and international markets. Therefore, when safety becomes a legally provided requirement for entering into market, a variety of other attributes can differentiate food and may influence consumer choice. These attributes include origin, nutrition, environmental consideration, animal protection, etc. While information, including a quality assurance label or health claim can be helpful to indicate quality attributes, both public and private parties are engaged to ensure that consumers are not misled.

Different from food safety standards, the public intervention in the standardization of other food quality attributes could impede the diversity in the provision of

---

<sup>15</sup>United Nations (1992).

<sup>16</sup>Sun (2013).

<sup>17</sup>M'hatef (2007).

value-added food. This is why the early composition requirement (also known as recipe legislations) in a given food product was not suited to quick development in the chemical industry. Although private food operators have the freedom to promote value-added food as long as they respect food safety standards, it may not be easy to evaluate certain quality attributes for consumers. The quality attributes in forms of credence regarding production methods, environmental and social orientation cannot be verified by the consumer due to lack of technical expertise or practical possibilities. Therefore, they suggested that the information communication of these quality attributes usually is in the form of labels.<sup>18</sup> From public policy perspective, public intervention in support of quality assurance labels could help private food operators to establish a niche market on the basis of a given quality attribute.<sup>19</sup> As they asserted, to transfer the societal concerns of environment and animal welfare into obligatory food standards can also be a market advantage as long as they are widely accepted by both producers and consumers.<sup>20</sup> In the interest of consumers, the public intervention can provide certification and allow the use of a corresponding quality assurance label, such as the labels for geographic indications, traditional specialties or organic food. In addition, it can also define a condition under which a quality related term can be used; for example, what “fat free” actually means as a nutrition claim.

In general, private parties are more sensitive in their desire and ability to meet the consumer’s needs for safer and higher quality food products by applying private food standards. However, the private food standards may be inconsistent and there is currently no mechanism to ensure its compliance, especially for long-distance cooperation. Significantly third-party certification has provided an objective or impartial technical tool to guarantee its conformity.<sup>21</sup> Similarly, the skepticism on the reliability of private certification has further required accreditation, (independent evaluation of conformity against recognized standards to ensure their impartiality and competence). The imposition of private food standards and requirements on the third-party certification as well as accreditation has led to a kind of private control in the form of Tripartite Standards Regime.<sup>22</sup>

### ***51.1.3 Food Safety***

For the sake of public health, only the food presenting no health risk for human consumption can be placed on the market. In this sense, there exists a “quality threshold” or “objective quality” from the perspective of food safety concern. For

---

<sup>18</sup>Fernqvist and Ekelund (2014), pp. 340–353.

<sup>19</sup>Chrysochou et al. (2012), pp. 156–162.

<sup>20</sup>European Commission (2008).

<sup>21</sup>Hatanaka et al. (2005), p. 355.

<sup>22</sup>Busch (2011), p. 59.

the former, the quality threshold is defined by sanitary requirements, ensuring the cleanness of food. Based on this, there are quality specifications (Food and Agriculture Organization 1995). For the latter, the objective quality is defined as the technical and measurable criteria to meet sanitary requirements.<sup>23</sup> By contrast, the subjective quality refers to the different perception of quality depending on the consumers' needs. As mentioned earlier, such safety attributes have been separated from quality and become an independently regulated target.

Since food safety can be measured by technical standards, a great number of food safety standards have been developed. For example, the Codex Alimentarius Commission (CAC) was created in 1963 by the Food and Agriculture Organization (FAO) and World Health Organization (WHO) with the aim of protecting consumer health and ensuring fair trade in the food domain. Since then, it has become a significant international reference point for developing food-associated standards. In addition, the Agreement on the Application of Sanitary and Phytosanitary Measures (SPS Agreement) has provided the international standards, guidelines or recommendations established by the CAC as legal points of reference. While the SPS Agreement is designed to promote international harmonized food safety standards, there remains a dispute concerning what constitutes food safety. Why does this argument still emerge from time to time?

To answer this question, it is important to note the so-called risk society.<sup>24</sup> Life is full of risks, and risk is not a new invention. Nevertheless, modernity, characterized by the striking advancement of science and technology, has redefined the risk. Accordingly, having their basis in the modernization, risks come as by-products of science and technology. The costs present in the form of the technological risk, the probabilities of physical, chemical, or biological harm due to a given technological or other processes. Different from those in the past, modern technological risks have many characteristics, including:

**Threat** From risk-taking to risk-avoiding, early risks carry a note of bravery and adventure and seem to be seen as an attempt to a new discovery or development. On the contrary, technological risks are those having something to do with the destruction that has not yet happened, but is threatening, which means they should be managed in an anticipatory way. These widespread technology-originated risks can put public health in danger and thereby people would do everything possible to avoid them.<sup>25</sup>

**Ubiquity** From personal risk to global danger, the spread of technological risks is no longer limited to their place of origin. For example, travelling along the food supply chain from local to nationwide, and then to a global level, a food safety issue in one location can endanger all forms of life on the planet. In addition to the spread in terms of physical space, there is a generational concern. Not only does the current

---

<sup>23</sup>M'hatef (2007).

<sup>24</sup>Beck (1992).

<sup>25</sup>Steele (2004), p. 29.

generation, but also future generations face the risk of long-term incubation of a given toxin.

**"democracy"** From poor people to rich people, democracy means that everyone is equally confronted with technological risks. Certainly, the rich man can have more opportunities and better capabilities to avoid technological risks by living in a more sustainable environment or eating healthier food, but he still ultimately will suffer from if everything turns into a hazard.

**Circularity** Described as the boomerang effect, circularity refers to the result of a person engaging in some risk-taking activities in order to profit regardless of harm to others; he will, sooner or later, become a victim as well. As with the example of the overuse of chemicals, eventually the deterioration of the environment will circle around and undermine production.

Therefore, safety has become a counter-concept to the risk.<sup>26</sup> In reality, there is no risk-free behavior and absolute safety cannot be achieved. When it comes to food, the human diet is, in fact, loaded with toxins of all kinds in the foods we eat regularly, including mushrooms and peanut butter.<sup>27</sup> This means it is hard to find a diet that would support life and at the same time impose no risk on the consumers. Considering this concept, safe food usually means food that is safe enough. What's more, since risk can be managed but not eradicated, concerns in the face of risk uncertainty does not consider whether or not a risk exists, but the adverse consequences inevitable risks bring about. Therefore, from a risk perspective, the significance of safety lies in the measurement of the acceptable level of risk (adverse consequence). Then, the question arises as to what can be used to decide such acceptability?

With the introduction of risk assessment, the management of food-related risk is established on a scientific basis. For example, quantitative standards can be formulated to prevent physical, chemical, biological and nutritional hazards. As a result, a scientific judgment of food safety can be defined as the state of being certain that harmful agents under defined conditions will not cause adverse effects. However, such certainty in decision-making is only based on the sound, naturally scientific truth, as a scientific principle in the SPS Agreement against the failure of risk perception in the legal reasoning.<sup>28</sup> As a matter of fact, the role of social science, especially, the research on public perception, can also contribute to a broad acceptability since acceptability not only involves the science but also perceptions, opinions, and values.<sup>29</sup> Accordingly, both natural science and social science play essential roles in the risk regulation: scientific rationality without social rationality remains empty, but social rationality without scientific rationality remains blind.<sup>30</sup>

---

<sup>26</sup>Luhmann (2008), p. 19.

<sup>27</sup>Ruckelshaus (1984), pp. 161–162.

<sup>28</sup>Alemanno (2012), p. 2.

<sup>29</sup>Nestle (2003a), p. 16.

<sup>30</sup>Beck (1992).

Therefore, to consider food safety as scientific judgment, the comprehensiveness of scientific certainty contains both scientific rationale and social rationale.

Equally important regarding risk, all risks are uncertain to some extent because we can never know the future with complete certainty.<sup>31</sup> Current risks spread across national boundaries and over times, threatening people thousands of miles away and even future generation without compensating many of those affected by them. Despite the contribution of science to risk prevention, there may be still scientific uncertainty in identifying and characterizing risks and hazards. Such uncertainty is influenced by both insufficient information and scientific controversy. Therefore, precaution can be seen as a proactive way to manage globalization and a so-called risk society, especially that of potentially irreversible harm.<sup>32</sup> What's more, when the trust in the government and industry has declined due to the malpractice in the food domain caused by prioritizing economic growth over safety, the precautionary principle can be invoked to replace a non-democratic technocracy with a more humanistic and community-orientated approach to decision-making.<sup>33</sup> In this context, originating in the field of environmental protection but now widely applied in the regulation of risk, the precautionary principle has been an important but disputed instrument in the risk regulation. In spite of the existing arguments, the precautionary principle has been extended into food safety regulation in Europe, in order to prevent decision makers from using "lack of full scientific certainty" as a reason for not taking precautionary action where there are threats of health harm.

What's more, food safety is not only a scientific judgment but also a value judgment. The purpose of the law is to accomplish certain social ends based on a value judgment, in other words, on an appreciation of values.<sup>34</sup> Legal norms, therefore, are provided to attain the chosen goal. The subjectivity of a value may be decided by a particular historical period or may depend on a particular society while their influence in the legal decision-making is inevitable.<sup>35</sup> What's more, when it comes to prioritizing which value is the highest goal in the legal order—freedom or security for example—the conflicts of values are unavoidable. Therefore, instead of a right-or-wrong choice among the conflicting values, the decision-maker is supposed to choose a preferred value.<sup>36</sup> About food, research demonstrates that values in relation to food are multiple, such as safety, nutrition, fairness, tradition, economic interest, etc.<sup>37</sup> Among them, the safety on average is the most important. Although each state may have its own social reality and different food preference, the prioritization of safety as a value in relation to food is a common priority. However, such a realization is only resulted from the lessons that point out

---

<sup>31</sup>Wiener (2002), p. 319.

<sup>32</sup>Feintuck (2005), pp. 371–372.

<sup>33</sup>Goldstein and Carruth (2003), p. 249.

<sup>34</sup>Bodenheimer (1970), p. 349.

<sup>35</sup>Freeman (2001), pp. 50–51.

<sup>37</sup>Lusk and Briggeman (2009), p. 191.

the ad-hoc based and economic oriented food safety legislation are failed to address the protection of public health.<sup>38</sup>

More recently, the tendency in shaping the legislative framework concerning food safety is to provide a basic food law, which lays down a legislative foundation for the provision of safe food, in order to prioritize the protection of public health.<sup>39</sup> Based on such basic food law, the universal subject matter in the guarantee of food safety can be generalized in three aspects: including substance, process and information.

**Substance** Generally speaking, food is composed of substances. When it comes to substance, Paracelsus says that poison is in everything, and it is the dosage that makes it either a poison or a remedy. Therefore, when the recipe legislation in the chemical composition is inconsistent with the chemical development, the general rule has been introduced that the safety of a given substance can only proved by scientific assessment: can it be used in food or during food production? Based on this, the different legal instruments have been applied to the substances in line with their intended use. For example, substances used in a food can be categorized to different groups, such as food additive, and pesticide. Accordingly, the use of food additives is authorized and must follow the quantity limitations and use of condition while pesticide use must comply with the positive list and maximum residue limit.

**Process** Initially, safety considerations from the perspective of process focused on the sanitary conditions of the production environment. With the improvement of sanitary conditions in modernized food technology, food contamination, in particular biological contamination has become a new concern during the food production. What's more, as far as the food supply chain is concerned, heavy metal environmental pollution and pesticide residues also contribute to the food safety issue. Therefore, risk-targeted and scientific-based systems have been introduced to control the production process. Currently, a Hazard Analysis and Critical Control Point (HACCP) system has been developed to ensure food safety during the food production. In addition, the advancement of food science also contributes to inventing new methods of food production. As a result, it is arguable that food may be substantially different due to the new scientifically invented production methods. This is a concept of substantial equivalence, which stresses that assessment of a novel food, in particular one that is genetically modified, should demonstrate that the food is as safe as its traditional counterpart (Organization for Economic Cooperation and Development 2000). Food products can be different depending on what they contain, but also depending on where they are produced or how they are produced. For example, it is the way of production that differentiates genetically modified crops from the organic crops.

---

<sup>38</sup>Vos (2000), pp. 227–255.

<sup>39</sup>Vapnek and Spreij (2005).

**Information** Food information may refer to the information concerning a food and make available to the final consumer by means of a label, other accompanying material, or any other means including modern technology tools or verbal communication. In comparison to the rigid recipe legislation, a well-developed and clear system of labelling, presentation and advertising can help to make sure the consumers know their food product well (European Commission 1985). As far as food safety is concerned, the necessity of mandatory prohibition or provision of food information is threefold. First, the prohibition of misbranded food can protect consumers from mislabelled food. Second, the provision of nutritional information and harmonization of terminology in nutritional and health claims, can help to prevent the nutrition-related food-borne diseases, especially the chronic diseases. Third, the saying “one man’s meat is another man’s poison” describes vividly a fact that for certain groups of people, they can have an abnormal physiological response to a particular food. For instance, food allergies can be life threatening and have a larger impact on certain population groups.

Although it is a trend to harmonize food regulation at the international level, using tools such as an official standardization concerning on food safety under the framework of CAC, private standardization regarding food safety and quality initiated by food operators, the policy and law for food regulation still differs from nation to nation given the fact that each country has its own priority regarding food and its own legal and institutional system to address it.

## 51.2 Chinese Legal Reform in the Realization of Food Sustainability

It is difficult to talk about China without reference to food. First, due to the pressure of the world’s largest population, food security is always a concern of priority. Although there has been great achievement, there are still many issues about food supplies. The challenges in this regard include an on-going increase in population, the reduction of arable land due to urbanization, and climate changes (Li, 2013; Guo and Brandt 1998). Second, well-publicized food safety issues, on the one hand, have created both external and internal pressures to modernize the food safety regulation while, on the other hand, raising consumers’ interests in food quality. As a result, food policies and laws are established or updated to ensure food security, food safety and food quality, respectively.

Although the political and legal systems are beyond the scope of this chapter, it is an essential backdrop for food policy and law. Though the People’s Republic of China has been established since 1949, the current legal system was developed only 30 years after the implementation of reform and more open policies since 1978. According to the Law on Legislation of the People’s Republic of China, the statutes take many forms including the laws from legislative bodies and regulations or rules from the executive body.

**Law (Fa lü, 法律)** Exercising the legislative power of the State, the National People's Congress enacts and amends basic laws (Ji Ben Fa lü, 基本法律) governing criminal offences, civil affairs, the state organs and other matters while the Standing Committee of the National People's Congress enacts and amends laws other than the ones to be enacted by the National People's Congress, and when the National People's Congress is not in session, partially supplements and amends laws enacted by the National People's Congress, but not in contradiction to the basic principles of such laws.

**Administrative regulation (Xing Zheng Fa Gui, 行政法规).** In accordance with the Constitution and the laws, the State Council formulates administrative regulation. Provided that such regulations do not contradict the Constitution, the laws and the administrative regulations, the people's congresses or their standing committees of the provinces, autonomous regions and municipalities directly under the Central Government may, in light of the specific conditions and actual needs of their respective administrative areas, formulate local regulations (Di Fang Xing Fa Gui, 地方性法规). Similarly, there are also Autonomous Regulations (Zi Zhi Tiao Li, 自治条例) and separate regulation (Dan Xing Tiao Li, 单行条例) in the national autonomous areas.

**Administrative rule (Bu Men Gui Zhang, 部门规章).** In accordance with the laws as well as the administrative regulations, decisions and orders of the State Council and within the limits of their power, the ministries and commissions of the State Council, the People's Bank of China, the State Audit Administration as well as the other organs endowed with administrative functions directly under the State Council may formulate rules.

Against this context, it is interesting to note that the strong involvement of government in the law making by means of administrative rules. For example, due to the involvement of more than five departments in the food safety regulation, one of long-existing problems in the official control is the fragmentation in both law making and law enforcement. There are three reasons for such a powerful government. First, China is a highly centralized country in which there are no checks or balances between the legislative power and the executive power. Since the government can also propose a bill, they can more easily to turn their own will rather than the public interests to legally protected interests. Second, the long-term legal tradition still exerts its influence in the legal practice, which may conflict with the current legal principles, as the struggle between rule of law and rule of man. As a result, it seems that although a western legal system has been planted in China, however, the practice is often still guided by the rules we have practiced for over two thousand years.<sup>40</sup> Third, even the critics have been raised on the old way of regulation; the public still put their confidence in the government to enforce regulations rather than on the private parties' capacities in self-regulation because

---

<sup>40</sup>Jiao (2007), pp. 88–89.

as an important characteristic of China's political culture is that the public has regarded the government as a parent to the public. As a result, it is difficult, if not impossible for the public to judge or even raise questions concerning government decisions.

### ***51.2.1 Agriculture Policy and Law***

In 1995, Lester raised the question: "Who will feed China? (Lester 1995)" Food insecurity in China is potentially a great threat at both the national and international level due to population pressures. The best argument regarding this is the fact that the supply and demand of food in China has been balanced while there has been a surplus each harvest year since the 1990s.<sup>41</sup>

In analysis of the achievements of the last 30 years researchers concluded that the key, but most difficult point, lies in the modernization of agriculture.<sup>42</sup> As a starting point, the land reform in the application of the household contract responsibility system since 1982 has contributed considerably to boosting the food productivity. In China, land in both rural and suburban areas is mainly owned by collectives. With the household contract responsibility system, individual farmers on behalf of family members can rent the land from collective organization by signing a contract. In this case, they enjoy right of use of the land, which allows the self-determination in the management of contracted land. The right to use land for long periods of time can encourage the use of land-saving investments.<sup>43</sup> Therefore, to stabilize the contractual relationship, the Law on Land Contract in Rural Areas has provided legal protection for land tenure, such as a 30-years period for arable land.

When it comes to the major function of agriculture, namely the food production, officials from the Ministry of Agriculture (MoA) stress that the bottom line for food security is always the self-sufficiency. To ensure this, the development of agriculture will always rest on political will. Each year, the No. 1 Central Document of the central government puts emphasis on the modernization of agriculture since 2004. This means a great number of investments would be granted to this domain. In addition to improving the agricultural input, including through finance and technology, this kind of policy has also paid attention to the environmental issue since the agricultural development would fail to enhance productivity if there is a decline of arable land and other natural resources in the long term. As stressed by the latest No. 1 Central Document in 2014, the agricultural development shall be advanced in an environmentally friendly way, taking into account the protection of arable land, water resources and agro-ecology.

---

<sup>41</sup>China (2008).

<sup>42</sup>Gong (2008), p. 230.

<sup>43</sup>Guo and Brandt (1998), p. 69.

Agriculture is not just about food; it also concerns the rural environment and the people who live in them. In this aspect, it is interesting to mention a special phenomenon of “abandoned arable land” in China. Whereas the reduction of arable land is a threat to ensuring food security, there is still much arable land abandoned in the rural areas since many young people prefer working and living in cities. Consequently, what is lacking in the rural areas is a workforce, rather than arable land. At this point, an “agriculture/countryside/farmers” policy has been developed to address these interrelated issues in a systematic and comprehensive way. For these three pillars, the major concerns are the low efficiency of agriculture; the slow development of the countryside; and the poor incomes of the farmers. With regard to agriculture, the high-speed economic growth in China has resulted in low efficiency in agriculture, even though the objective of agricultural modernization was raised in the 1950s. Following industrialization, greater attention has been paid to the urbanization with more significant investments in education, social security and public service than in the rural area. Notably, to control the population in an urban area, a family register system has been introduced to avoid the circulation of people from the countryside to cities. As a result, the farmers’ standard of living is relatively poor in comparison to the citizens of urban areas.

To keep development balanced between agriculture and industry, the rural and urban areas, farmers and citizens, the “agriculture/countryside/farmer” policy has integrated the industrialization of agriculture, rural development and an increasing standard of living for a farmer. In addition, advancements have also been made in the direction of sustainable development. As an instrument in implementing this policy, building a new socialist countryside is designed to enhance production, improve the standard of living of farmers, promote a polite way of life in the countryside, keep the cleanliness of the rural environment, and manage the countryside in a democratic way.

In addition, agriculture, countryside, and farmers also are significant targets for the agriculture law. According to the amended Agriculture Law in 2002, one of newly added provision to move agriculture development toward sustainability way by protecting the natural resources such as soil and water as well as enhancing farmers’ economic and social interests by protecting their right to education and social security. As far as food security is concerned, this law has stressed the realization of food security in many aspects, including, the maintenance of arable land; reinforcement of agricultural investments in major grain production areas supportive of stable purchasing price in the case of low market price; creation and maintenance of an alert system in relation to the grain storage, and; creation of a risk fund to guarantee food security and to fight against food waste.

Additionally, a special law concerning on food security, the Grain Law, is under the deliberation, in order to provide a legal basis for the production, circulation, and consumption of grain. Interestingly, this drafted law has provided that no unit or person can apply the transgenic technology to this staple food without approval. During public consultation, critics have been raised the concern that such a provision is still vague in the government’s attitude toward genetically modified crops. When reading the text literally, the so-called “without approval” can mean that the

application of transgenic technology to rice production can be possible as long as the approval is granted. In this case, it is still uncertain if the final attitude of the government in regards to genetically modified food in this concern is “for” or “against.”

### ***51.2.2 Certification and Quality Assurance Labels***

As mentioned above, the environmental consideration is to be integrated into food production, as the new orientation stated in the No. 1 Central Document of 2014. As a result, it is said that both quantity and quality have been prioritized in the national food policy. When it comes to the food quality, especially, agricultural food, a vertical classification of quality attributes regarding substance use has been provided, including the hazard-free agricultural food, green food and organic food. The difference between them is the degree of strict oversight of the use of chemical substances during the food production. In addition, to ensure food is free from hazardous substances, this kind of quality promotion is also contributing to sustainable agriculture by protecting the environment. Also in the interest of humanity and sustainability, a ChinaGAP is developed specifically in the model of GlobalGAP, with the purpose of promoting good agriculture practices.

Protection of geographical indication was introduced into China in the 1980s, with the purpose of satisfying the obligation under the Paris Convention on the Protection of Industrial Property.<sup>44</sup> This is also an important instrument to promote food quality for China given its diversity in the natural resource and food culture. For example, a “10 plus 10” project between Europe and China is completed, in order to protect 10 famous EU food names in China. Reciprocally, 10 Chinese food names have been registered for the European market. Regrettably, the legal protection of this quality attribute is only at the level of administrative rules, such as a General rule on the protection of geographical indication issued by the General Administration of Quality Supervision, Inspection and Quarantine (AQSIQ) in 2005, or a special rule on the protection of geographical indication for agricultural food. In view of this, there have been calls for a special law to lay down the legal basis for protection of geographical indication, in order to make full use of this tool to promote Chinese food, especially on the international market.

Confronted with the high aspiration toward safer and higher quality food arising from consumers, the private efforts take many forms in order to gain and retain consumers’ confidence.

**Private Food Standard** With their reputation, applying internationally recognized private food standards is a shortcut to assure consumers’ confidence and enter into an international market for Chinese food operators. For example, the

---

<sup>44</sup>Huang (2008), p. 18.

certification by the British Retail Consortium (BRC) standards and the International Food Standard (IFS) can facilitate the entry into European markets while the European standard is considered as a representative of stricter standards for Chinese people.

**International Cooperation** For food operators, the advanced experience of management or raw material of higher quality can be obtained through the cooperation with foreigner parties. As a key target for food regulation, milk companies engage actively in international cooperation for raw milk of better quality. For example, as China's second-large dairy producer, Inner Mongolia Yili Industrial Group has carried out cooperation with Dairy Farmers of America Inc. and Synutra International, Inc. has invested in France to construct a milk factory.

### ***51.2.3 Food Safety Regulations***

Food safety regulations in China started as early as 1953 with the rules on fresh food only, with an emphasis on the sanitary condition. However, the emphasis on food safety started with the revision of Food Hygiene Law in 1995. There are three primary reasons proposed for this: first, as far as China is concerned, food security has always been a priority due to the large population, in particular for a new established country after the internal war in 1940s. Second, there were few food safety issues during 1950s and 1960s because, at that time, food production factories were state-owned and controlled, and the standards were simple to follow and traditional methods used few chemical substances. Third, with the introduction of the reform and more open policies in the late 1970s, the economic development has become the priority, and the emergence of food safety issues relates to a background of profound changes resulting from economic development.<sup>45</sup>

While economic development did bring about the progress in the food domain, it also gave rise to many food safety issues. During the last 30 years, there are two breakthroughs with great influence on the food domain: one is the market-orientated economic development after 1992, and the other is the entry into World Trade Organization (WTO) in 2001, after which food trade developed quickly. For the former, the controlling power of government has been loosened due to the transition to a market economy. As a result, counterfeit products are manufactured and distributed through a largely unregulated and chaotic distribution system.<sup>46</sup> For the latter, China should follow the international rules to regulate its food safety as required by the WTO rules, such as laying down the scientific basis for food safety regulation. In addition, food safety issues around "Made in China"

---

<sup>45</sup>Bian (2006), p. 169.

<sup>46</sup>Thompson and Ying (2007), p. 4.

also imposed high pressure on China to handle its food safety issues, such as the melamine-tainted pet food issue in the United States in 2007.

Against this context, the number of food related laws, regulation or rules (including more than 40 repealed ones) has reached 832 since December of 1978. Despite those regulatory efforts, a systematic legal framework in the food domain has not been established.<sup>47</sup> When the melamine scandal occurred, far-reaching influence in the politic and economy has brought about reform in the food safety legislation. In the shadow of melamine-tainted milk scandal, the first Chinese Food Safety Law came into effect in 1st June of 2009, in order to protect the public health and life through the food safety guarantee.

The newly established basic law for food safety has provided a science based preventive system by means of risk assessment. To carry out risk assessment, the responsible competent authority-Ministry of Health (MoH) has set up the first Expert Committee on Risk Assessment, consisting of 42 experts from the domains of medicine, agriculture, food, nutrition, etc. With this practice, the organizational arrangement for risk assessment has been further developed by the establishment of the China National Center for Food Safety Risk Assessment. As a newly established public authority subordinated to MoH, the Center plays a central role in organizing the risk monitoring, risk assessment and risk communication in the food domain other than agricultural food. The cooperation between the China National Center for Food Safety Risk Assessment and the Expert Committee on Risk Assessment is that when the former prepares the assessment result, it is the latter that evaluates and makes the final decision to formulate a scientific opinion.

As far as agricultural food is concerned, the risk management of agricultural food is separated from other foods and the legal basis is laid down by the Quality and Safety Law on Agricultural products, so is the risk assessment in this field. Although the risk management of other foods follows the requirements established by Food Safety Law, the function for official control is also divided among several departments. As a result, the official control for food safety is characterized by a sector-based regulatory system. Historically, there are major departments involved in food safety regulation. Along the food supply chain, MoA is responsible for the primary sector, AQSIQ for the production sector as well as exportation and importation, and the State Administration for Industry and Commerce (SAIC) for the circulation sector, and the State Food and Drug Administration (SFDA) for the food catering service.

**MoA** With the engagement of MoA as the official control for agricultural food, it can be said that the double-system separating the agricultural food and other food products exists in both risk assessment and risk management, which allows the MoA to formulate of rules, and agricultural food standards as well as to enforce these rules.

---

<sup>47</sup>Gangjian (2008), pp. 54–55.

**AQSIQ** AQSIQ takes the responsibility for supervision and management of food production on the one side and exported and imported food on the other side. For this purpose, it is interesting to note the organizational characteristic of this department. With the so-called “One Father Two Sons” characteristic, it has set up the Bureaus of Quality and Technical Supervision (QTS) at the provincial level for the function of quality and technical supervision. In addition, it also establishes in total of 35 Entry-Exit Inspection and Quarantine Bureaus (CIQ) in China’s 31 provinces, in order to perform the function of entry-exit inspection and quarantine. Against this context, QTS is responsible for the domestic food while CIQ is responsible for imported and exported food.

**SAIC** SAIC is responsible for the food circulation. Initiatively, it was the QTS that took charge of the inspection for processed food in accordance with the Product Quality Law. Yet, after the reorganization of the SAIC in 2001, it has obtained the authority for inspection of the product quality in the sector of food circulation.

**SFDA** The purpose of establishing the SFDA in 2003 was to coordinate the food safety regulation among the multiple departments. Due to the failure of food safety regulation, SFDA has been integrated into MoH during the reform of administrative system in 2008, taking responsibility for food catering service.

Due to the involvement of multiple agencies, the overlaps and gaps in the official control were contributing considerably to the failure in food safety guarantee. To try to solve this issue, the Food Safety Law has further clarified the function and responsibility among the involved departments.

To this purpose, the Food Safety Law has emphasized the coordination and cooperation through strengthening the regulatory power of MoH and organizing a committee for food safety at State Council level. For the former, the MoH has the responsibility for the comprehensive coordination of food safety matters, food safety risk assessment, the formulation of food safety standards, the release of food safety information, the accreditation of food inspection and testing agencies and the formulation of inspection and testing standards. For the latter, a Food Safety Committee was set up in 2010. Represented by a State Office on Food Safety for daily work, its major functions include organization of investigation into serious food safety events, provision advice for food policy, promotion of a joint-mechanism in official control, and review of the effectiveness of implementation of both food safety legislations and policies, etc. Since the co-existence of the MoA and the Food Safety Committee can give rise to the duplication in the work of coordination and cooperation, reorganization between them has been further addressed with the transition of three functions of MoH into the State Office on Food Safety, including the comprehensive cooperation of food safety, origination of investigation during the food safety incidences and uniform distribution of food safety information.

As mentioned earlier, the SFDA has been restructured for several times in order to coordinate and co-operate the official controls against the sector-based multiple agency system. Implied by its name, the initiative of this department is to copy the

American Food and Drug Administration (FDA), with the purpose of reinforcing the food and drug regulation. However, this vice-ministry-level organization failed to meet its mission since it lacked adequate power to command the ministry-level organizations to follow its suggestions in reality (like the MoA or the MoH for example). After integrating into the MoH as an internal body for official control at the stage of catering, the new round of administrative system reform in 2013 has tried again to reorganize this “China’s FDA” as a ministry-level department, in order to integrate the official control including:

- The work of coordination owned by the State Office on Food Safety;
- The official control of food safety at the stage of production owned by the AQSIQ;
- The official control of food safety at the stage of circulation owned by the SAIC;
- The official control of food safety at the stage of catering owned by the original SFDA.

With the above-mentioned arrangement, this newly organized China’s FDA is responsible for the unified official control for food safety, covering the food supply chain from production to circulation, and to the final stage of consumption. In addition, it is also responsible for the cooperation and coordination. After being responsible for overall food safety regulation, China’s FDA has placed emphasis on the self-regulation in food safety assurance. To this purpose, the way of assuming primary responsibility on the part of individual food operators has been elaborated on in that a food enterprise assigns a director specifically responsible for food safety matters over the whole process from buying raw material from upper suppliers to release the product after testing. As a pilot project, it is supposed to solve the dilemma of “everyone’s responsibility is no one’s responsibility”.

As a reminder, it is important to note that this so-called one-department-led system is not absolute since other departments also are involved, including the MoA being responsible for the official control of agricultural food, the MoH for the risk assessment and food safety standard settings, and the AQSIQ for the official control of imported and exported food. Last but not least, it is important to address that the above-mentioned Food Safety Law has been revised and put into effect since 1st October 2015, in order to put the emphasis on the prevention first, risks management, farm-to-fork control, and co-governance by involving all the stakeholders and the public in the food safety guarantee. To this purpose, the China’FDA led regulatory system has been strengthened by its empowerment to take part in the standard-setting, to carry out the official control of agro-food when it place into market, to supervise the responsibility for food safety of the thirdparty platform that engaging in providing online food trade, etc. What’s more, the way of food safety regulation also becomes more and smarter with the introduction of risk raking based management, risk communication, as well as increasing application of information announcement in the form of black or red list and credit system. In addition to the update of official control, one of the most striking futures of this revised Food Safety Law is to encourage all kinds of stakeholders as well as the public to fight against food safety issues by means of co-governance, such as the flexibility in the

local official control which allows the local counterparts taking into account the specialty in a given region, the monetary incentive for whistle-blower who turns in the food crime, the involvement of experts as well as the mass media in the risk communication. In April and May 2016, a nationwide evaluation of law enforcement has been carried out in the field of food safety regulation, which has pointed out that more efforts should be addressed to the re-organization of regulation system at the local level as well as the training for capacity building at both food industry and competent authorities. In view of this, this so-called strictest Food Safety Law in the history has been placed with high expectation to improve the public confidence in the food safety regulation in China.

#### ***51.2.4 An Integrated Approach***

Depending on the regulatory purpose, food legislation have a wide range of topics, including agriculture law designed to safeguard food security, legislations regarding quality indicators such as the protection of geographic indication, or food safety standards for food additives or pesticides. With the above-mentioned analytical framework, it seems that these subject matters are separated from each other. Actually, they are in fact closely linked and mutually supportive, although sometimes in conflict with each other. For instance, safety requirements are a precondition for ensuring food security and satisfying different consumers' needs from the perspective of quality. Nevertheless, safety considerations can conflict with the economic interests causing food regulations to swing like a pendulum between them. The BSE crisis is a valuable lesson.

Generally speaking, the BSE and CJD crisis chronology goes as follows. The first diagnosed BSE in the cattle was found in 1986 in the UK, and was considered a "prion" disease causing the fatal brain damage, without knowing whether it was transmissible or not at that time. However, it was confirmed as a zoonosis passing from animals to humans in 1988. To protect the human health, protective measures such as monitoring slaughterhouses and banning milk production from the suspect cows were adopted by the UK government. However, while the government believed that there was no risk for human health by claiming the safety of British beef in 1990, the outbreak of the BSE cases reached a peak in 1992 at which time it was discovered that three cows in every 1000 in Britain had the disease. Then, the first victim of a new variant of Creutzfeldt Jakobs Disease (vCJD) was discovered in 1995 while the government scientists rejected a connection between vCJD and BSE. In the following year, however, the link between vCJD and BSE was confirmed and tightened measures were adopted through a 30-month slaughter scheme, which meant all cows over the age of 30 months at the time of slaughter were prohibited from entering into the human food or animal feed chain.

The European Commission adopted a set of measures more aggressive than those in the UK against BSE. These included the ban of sending live cattle born before 18 July 1988 or born to females in which BSE was suspected or had been

officially confirmed in an effort to prevent BSE from spreading to other Member States for the sake of animal health in 1989 (Commission Decision 1989), the ban of the tissues and organs including brains, spinal cord, thymus, tonsils, spleen, and intestines from bovine animals aged more than six months at slaughter in 1990, the ban of feeding of protein derived from mammalian issues to ruminant species given such protein was the only significant potential source of spongiform encephalopathy agents, the ban of the bovine animals and bovine products from the UK to other Member States or their countries considering the possibility of transmission of BSE to human, After the UK took these strict official controls against the BSE crisis, such as a bovine passport system, the agreement banned these exports of certain bovine products.

To reveal the events and decision that led to the spread of vCJD and BSE, the BSE inquiry was carried out at both the UK and EU levels.

As far as Britain's BSE inquiry is concerned, there are two kinds of hazards involved in the BSE crisis, one is the known hazard to animal health, and the other is an unknown hazard to human health. Although the protective measures had been taken for the sake of animal health, (Phillips 2001), found that the measures for human health were neither timely nor adequate since they were affected by the belief of many prior to early 1996 that BSE was not a potential threat to human life. Notably, being afraid of the economic losses and the public's overreaction due to the BSE disease, the UK government had repeatedly gave assurance that the British beef was safe rather than giving the public factual information, in particular the uncertainty around the BSE crisis with its transmission. As a result, critics claimed that the government misled the public.<sup>48</sup>

When it comes to the BSE inquiry at the EU level (European Parliament 1997), the Council should bear the responsibility on the ground that it took no effective steps to monitor the enforcement of the protective measures by the Commission and put the economic interests of the meat industry over health protection. Similarly, the Commission was responsible since it gave the priority to the management of the market rather than the possible human health risks in the light of scientific uncertainties concerning the BSE, and thus took no preventive action. Ironically, no checks of the British inspections at the EU level were carried out by the Commission, and when Member States such as France took safeguard measures against the British beef exports, however, the Commissioner opposed by threatening an initiative of infringement proceedings and even a lawsuit, on the other side.

As a valuable lesson, the BSE crisis has illustrated that public confidence in public administrations as well as in the food industry would be devastated if economic concerns override safety on matters of health. Therefore, to structure food law in an integrated way, the basic food safety law is not only a legal foundation for all food safety-related laws but also for laws regarding other matters. In this sense, such basic law plays the role of a constitution in the domain of food legislation, in order to prioritize the protection of public health.

---

<sup>48</sup>Phillips (2001), pp. 3–4.

In practice, the regulation of agricultural food usually is separated from other foods because the inspection of those foods of animal origin requires veterinary specialties that could recognize sick animals and keep them out of the food supply, for example the Quality and Safety Law on Agricultural Food in parallel to Food Safety Law in China (Nestle 2003b). The disadvantage of such separation is the difficulty in avoiding conflict of jurisdiction. Currently, food has been defined, as any substance, whether processed, semi-processed or raw, which is intended for human consumption, and includes drink, chewing gum and any substance which has been used in the manufacture, preparation, or treatment of food but does not include cosmetics or tobacco or substances used only as drugs (Codex Alimentarius Commission 2013). In view of this, the scope of the basic law can cover the whole food supply chain from farm to fork, with the purpose of having food safety responsibility shared by all involved food operators. Notably, the emphasis on taking food as a whole from the perspective of the food supply chain does not conflict with the specialization since functional separation can be further realized in the regulatory rules, such as the administrative rules established by the involved competent authorities including AQSIQ and China's FDA to implement the Food Safety Law.

Based on the basic food law, the food laws can be established respectively depending on the subject matter. Yet, a cross-reference can also be arranged. Taking the EU as example, the CAP was initiated to increase agricultural productivity, ensure a fair standard of living for the agricultural community, and promote reasonable prices of the suppliers when they reach the consumers. Since the General Food Law places the requirements on the public, animal, and plant health in the primary sector, the mechanism of Cross Compliance has been introduced under the CAP in 2003. Depending on the severity of the infringement on the Statutory Management Requirements relating to public, animal and plant health, to animal welfare and to the Good Agricultural and Environmental Conditions, farmers who break the law can be sanctioned and the EU may decrease the support it provides them with. In addition, the new direction of CAP after 2013 is to respond to the economic, environmental and territorial challenges. In the face of fierce competition on the international market, adjustments also can improve the comparative advantage of agricultural food from the perspective of food quality.

In addition to the internal harmony, the realization of the external harmony in terms of sustainability moves in two directions. As mentioned earlier, to make food production in a sustainable way, the food policy and law must take into account the objective of sustainable development, and vice versa. That is to say, the general legislation for sustainable development also provides a legal ground to sustain food production. As far as sustainable development is concerned, human law must be reformulated to recognize and respect the reciprocal rights and responsibility of individuals and states regarding sustainable development (United Nations 1987). For instance, the right to an adequate environment correspond to the state's responsibility for protecting the environment. However, it is arguable how best legalize sustainable development. Comparatively, Chen (2002) found that it is rather narrow to understand it as the same as environmental law or only as a part

of economic law since the sustainability lies in the economic promotion, social progress and environmental protection.<sup>49</sup> Therefore, to consider sustainable development law as an independent legal branch, the framework shall contain the legislations regarding these three pillars. Accordingly, the Chinese legislative body and government pay special attention to crafting sustainable development as a purpose and intent of legislation. For example, 28 laws in the field of resources and environment have been established, including the Land Administration Law, Forest Law and Water Law (China 2012).<sup>50</sup> Undoubtedly, these laws in the support of sustainable development can also provide a sound legal background to enable food production in the harmony with sustainability.

# Chapter 52

## Law and Regulation in India

Dimpy Mohanty and Abhijeet Das

**Abstract** Indian laws concerning standards of food and its manufacture, sale and import were overhauled in the year 2006. Encompassed primarily in the Food Safety and Standards Act, 2006 (FSS Act) and related Rules and Regulations, the laws were introduced stage wise from the year 2007 onwards. The proponents of the FSS Act referred to international trends and international legislations including instrumentalities and Codex Alimentarius Commission. They intended for the FSS Act to take care of international practices and envisaged a policy framework designed to eliminate multi departmental control and guide and regulate persons engaged in manufacture, marketing, processing, handling, transportation, import and sale of food. With the objective of consolidating previous multiple laws and regulatory bodies overseeing the laws, the FSS Act repealed the Prevention of Food Adulteration Act, 1954 and six other laws/orders related to specific food products and established the Food, Safety and Standards Authority of India (Food Authority).

### 52.1 Introduction

#### 52.1.1 General Overview of Food Law

For a long time, India had lagged behind in reconciling its food laws with contemporary needs. As a result, India overhauled its food regulatory regime (including standards applicable to food itself, and to the manufacture, sale, and import of food) in 2006. These changes were primarily contained in the Food Safety and Standards Act (“FSS Act” or “FSS”) and related rules and regulations. These changes have been implemented in stages beginning in 2007.

The proponents of the FSS Act were guided by international trends and international law the Codex Alimentarius Commission. FSS proponents intended for the FSS Act to adhere to international practices and envisaged a single policy framework designed to guide the manufacture, processing, handling, transport, import, and sale of food, and to eliminate multi departmental control of these processes.

In keeping with the objective of consolidating India's food regulatory regime, the FSS Act repealed the Prevention of Food Adulteration Act, 1954 and six other laws/orders related to specific food products and established the Food, Safety and Standards Authority of India (Food Authority).

### ***52.1.2 Food Law as Applied to Manufacturers, Sellers and Consumers: Licensing, Product Approval, Ingredients and Labelling Requirements and Some Cultural Drivers Behind India's Food Regulatory Regime***

This chapter summarizes India's food licensing, product approval, ingredient and labelling requirements. This chapter will also illustrate some cultural drivers that have influenced India's food regulatory regime. Further, this chapter will note where India may face challenges in implementing the FSS, or in introducing globally accepted products to India. Finally, this chapter provides a brief overview of the requirements for importing food into India and India's foreign direct investment policy concerning food industry.

### ***52.1.3 Discussion and Analysis of Specific Aspects of Non Vegetarian Foods and Genetically Modified Foods***

This chapter also provides an analysis of how India's food law has dealt with controversial non-vegetarian and genetically modified foods, and the impact that other areas of legislation have had on India's food sector.

## **52.2 Food Laws: Multiple Regulations; Key Definitions and Authorities**

### ***52.2.1 Act, Rules and Regulations***

The FSS Act is read along with a host of regulations as well as the rules framed thereunder, and essentially regulates a whole spectrum of activities, including, manufacture, import and retail, vis-à-vis food in India. The Food Safety and Standards Rules, 2011 (“FSS Rules”), provides for enforcement structure and procedures, including the seizure of articles of foods and sampling and analysis by Food Safety Officers (at the State level).

The regulations framed under the FSS Act apply to various facets of the food industry. For example: the FSS Licensing and Registration of Food Businesses Regulations, 2011 (Licensing Regulations), provides for licensing requirements not only for manufacturers and retailers of all foods (including packaged and tinned foods) but also for street food vendors and those who distribute foods on religious and/or social occasions.

Further, the FSS Food Products Standards and Food Additives Regulations, 2011 (“Food Standards Regulations”), provides quality standards for food products and their ingredients, and enumerates those foods or ingredients whose use are prohibited or restricted. Similarly, the FSS Contaminants, Toxins and Residues Regulations, 2011 (“Food Toxin Regulations”), provides certain restrictions on the use of metals such as lead, copper, etc., and also regulates the use of fumigants/insecticides in foods. These regulations are often read along with other regulations, such as those prepared by the Nutritional Advisory Committee and the Nutrition Expert Group of the Indian Council of Medical Research (which prescribes the desirable daily dose of certain metals, etc.). Furthermore, the FSS Prohibition and Restrictions on Sales Regulations 2011 (“Sales Regulations”) compliments the Food Standard Regulations vis-à-vis specified products including admixtures.

Additionally, the FSS Packaging and Labelling Regulations, 2011 (“Packaging and Labelling Regulations”) provides for the packaging and labelling requirements of food articles, which is typically read together with the Legal Metrology Act and Legal Metrology Packaged Commodities Rules, 2011 (LMPC Rules), which also prescribe labelling requirements.

### ***52.2.2 Key Definitions<sup>1</sup>***

Certain key definitions prescribed under the FSS Act and the rules and regulations framed thereunder are:

---

<sup>1</sup>For ease of reference, the definitions have been edited for brevity, while keeping the essence thereof.

- (i) 'Food' means any substance which is intended for human consumption and includes genetically modified or engineered food/ingredients, infant food, packaged drinking water, alcoholic drinks, and chewing gum, but does not include drugs and medicinal products<sup>2</sup>;
- (ii) 'Food Business' means any undertaking carrying out any activity related to the manufacture, processing, packaging, storage, transportation, distribution, or import of food, and includes food services, catering services, and the sale of food or food ingredients<sup>3</sup>;
- (iii) 'Manufacturer' includes a packer who packs and labels articles of food or a person who obtains articles of foods and labels them<sup>4</sup>;
- (iv) 'Misbranded Food' includes foods that are offered/promoted for sale with false and misleading claims. Such false claims may relate to the type of food, the manufacturer thereof, or to the contents of the food, including the absence or presence of additives, nutrients, etc.<sup>5</sup>;
- (v) 'Package' includes case, pouch, receptacle and wrappers<sup>6</sup>;
- (vi) 'Principal Display Panel' means that part of the package/container which is intended or likely to be displayed or presented or shown or examined by the customer under normal and customary conditions of display, sale or purchase of the commodity contained therein<sup>7</sup>; and
- (vii) 'Unsafe food' are foods which are injurious to health and which could be unsafe by reference to a number of factors including unhygienic processing, addition of prohibited ingredients, misbranding, etc.<sup>8</sup>

### **52.2.3 Food Authorities**

At the Central (federal) level, the Food Authority is comprised of senior government officials, including those from the Departments of Agriculture, Food Processing, Health, Consumer Affairs, and Commerce. The Food Authority is also comprised of representatives of the food industry, consumer organisations, food technologists/scientists, farmer organisations, and retailer organisations.<sup>9</sup> The Food Authority is supported by a Central Advisory Committee, various scientific

---

<sup>2</sup>See section 3 (j) of the FSS Act.

<sup>3</sup>See section 3 (n) of the FSS Act.

<sup>4</sup>See section 3 (zd) of the FSS Act.

<sup>5</sup>See section 3 (zf) of the FSS Act.

<sup>6</sup>See section 3 (zh) of the FSS Act.

<sup>7</sup>See regulation 1.2.1 (9) of the Packaging and Labelling Regulations.

<sup>8</sup>See section 3 (zz) of the FSS Act.

<sup>9</sup>See section 5 of the FSS Act.

panels and a Scientific Committee.<sup>10</sup> The day to day activities of the Food Authority are carried out by a CEO and other officers and employees.<sup>11</sup>

In addition to the authorities at the Federal level, each State has a Commissioner of Food Safety/Health and Family Welfare and multiple officers known as “Designated Officers” who, *inter alia*, are responsible for processing applications for and issuing licenses. Each State also employs “Food Safety Officers” who oversee the active sampling and seizure procedure, and forward the same to Food Analysts, also appointed under the terms of the FSS Act.<sup>12</sup> The Food Analysts use recognised and accredited food laboratories for discharge of their duties.

## 52.3 Law Applicable to Manufacturers, Sellers and Consumers

### 52.3.1 Licensing and Registration

Registration is required for Petty Food Business Operators, a category constituted, *inter alia*, of food stall operators (even stalls of a temporary nature), itinerant vendors, those working from home based kitchens, road-side tea vendors, etc.<sup>13</sup>

The implementation of the registration requirement for Petty Food Business Operators is an enormous practical challenge. Authorities are attempting to regulate those who do not even have a temporary place of business but who may move around on bicycles vending milk, or with their daily output of food produced in their home kitchens and moving on foot. A vast majority of these vendors are illiterate, unaware of the requirements of law, and have no access to newspapers or other media where the Food Authority regularly advertises various facets of law for the awareness of the public at large.

Interestingly, the Licensing Regulations also seek to bring within its purview arrangements made for religious gatherings.<sup>14</sup> It is not unusual in India to celebrate religious, or even personal, occasions by distributing food and/or beverages to the less privileged. Nothing in the Licensing Regulations suggests that the registration requirement is limited to places of worship which distribute food to the needy on a daily basis. While the effort to implement the registration requirement is laudable from the point of view of controlling sanitary and hygiene conditions, even in the case of free distribution of food to the poor, it remains to be seen if such a requirement can be strictly implemented by its officials against individuals setting out to feed the poor.

<sup>10</sup>See section 12 of the FSS Act.

<sup>11</sup>See section 10 of the FSS Act.

<sup>12</sup>See sections 30 and 31 of the FSS Act.

<sup>13</sup>See regulation 2.1.1 read with regulation 1.2.1 (4) of the Licensing Regulations.

<sup>14</sup>See regulation 1.2.1 (4) of the Licensing Regulations.

Separate from the registration process is the license process which is applicable to those who are not Petty Business Operators (with reference to the scale of operations).<sup>15</sup> While a license for a food business is primarily obtained at the State/local level where the business is operational, for specified businesses the license is granted by at the Federal level—including for importers and food business operators operating in two or more States.

Food business operators who manufacture any article of food containing ingredients or substances or using technologies or processes, or a combination thereof, whose safety has not been established through FSS Act and related regulations, or which do not have a history of safe use, or food containing ingredients being introduced for the first time into the country need to apply for product approval separately before applying for license (discussed in some detail in Sect. 52.3.2 below).

The Food Authority has clarified the circumstances when a single or multiple licenses would be required for the same premises.<sup>16</sup> If the products being handled at a single premises can be treated as connected then only one license will be required. According to the Food Authority, if processing of meat, milk, fruits and vegetables is being undertaken in the same premises, separate licenses must be obtained as each activity will be done in separate portions and the businesses are not connected. However, where the premises have facilities for fruit and vegetable processing as well as a store along with it, since these are connected activities, only one license would be required.

Indian food laws do not specify requirements for separate facilities for nuts and/or soy or other ingredients which are known internationally to cause allergies, or labelling requirement concerning traces of such ingredients—this may be due to a general perception that such allergies are uncommon in the Indian population and/or the fact that there may be inadequate data concerning the existence of such allergies in the Indian population.

### **52.3.2 Product Approval**

As stated in Sect. 52.3.1 above, foods for which standards are not prescribed under the FSS Act and related regulations or which contain ingredients or substances whose safety has not been established, or which do not have a history of use in India, need to apply for product approval separately before, applying for license.<sup>17</sup> The product approval requirements are either relatively relaxed or more arduous depending on the category into which the food products fit.

For instance, if the products do not contain plants or botanicals or animal origin substances and the safety of the ingredients are known and permitted under the applicable FSS regulations/Codex and other regulatory bodies like the EU/USFDA/

---

<sup>15</sup>See regulation 2.1.2 of the Licensing Regulations.

<sup>16</sup>See clarification dated January 24, 2012 issued by the Food Authority.

<sup>17</sup>See 'Procedure Regarding New Product Approval' dated December 10, 2012 issued by the Food Authority.

FSANZ the products would be granted approval as a matter of formality with relative ease.

However, if the products contain plants or botanicals or animal origin substances irrespective of the safety of the ingredients being known and permitted under the applicable FSS regulations/Codex and other regulatory bodies like the EU/USFDA/FSANZ, the application form for such products is not only more detailed requiring exhaustive information and documents, the timelines typically are extended before the approval or No Objection Certificate (NOC) is granted. The NOC serves as an interim permission to place the food in the market for a year during which time the product is assessed by the Scientific Panel for safety. If the safety assessment is prolonged beyond a year, the NOC is extended.

There is a separate identified category of foods referred to as “traditional/ethnic” food which is treated in a more relaxed fashion and is exempt from the requirement of product approval—these foods range from traditional savouries such as spice fried dals (lentils/pulses) to indigenous sweets such as gulab jamuns.

While the FSS Act is intended to take care of international practices and the Food Authority, when dealing with product approval, refers to acceptability under international regulatory bodies such as EU/USFDA/FSANZ, there are certain challenges in maintaining complete uniformity for well-established international products. For example, if nutritional supplements are to be introduced into India, their acceptability in other regions for years does not necessarily mean an automatic acknowledgment of safety and hence approval. This is especially so in the case of added minerals and vitamins where the ICMR guidelines stipulating Recommended Dietary Allowance (Indian RDA) are the sole acceptable standard in India, and any deviations from the Indian RDA are liable to be rejected.

No doubt, the Indian RDA being based on Indian population should take precedence over any other country’s RDA. However, even when one accepts the supremacy of the Indian RDA for the Indian population, there are certain challenges in such universal implementation which may have been unforeseen by the Food Authority.

The Food Authority does not clarify the treatment of products aimed at those who are outside the mean population that the Indian RDA is based on. Any nutritional supplement for, say, the elderly (whose nutritional requirement may merit additional vitamins or minerals) will fall afoul of the Indian RDA (which are calculated on the basis of “men between 18–29 years of age and weighing 60 kg with a height of 1.73 m with a BMI of 20.3 and who are free from any disease and physically fit for active work”). There is no denying that with increases in age the requirement for minerals and nutrients in the body change due to various factors such as loss of appetite, difficulty in absorption due to medicine intakes, etc., and as a result there may be a requirement for increased nutrient intake.

Some examples of the differences between the Indian RDA and the international RDA requirements follow:

- (i) For Vitamin C the Indian RDA limit is **40 mg**, while the limit prescribed in the European Union Directive 90/496/EEC on nutrition labelling for foodstuffs as

regards recommended daily allowances, energy conversion factors, and definitions is **80 mg**;

- (ii) For Vitamin B12 the Indian RDA limit is **1 µg**, while the limit prescribed in the European Union Directive 90/496/EEC on nutrition labelling for foodstuffs as regards recommended daily allowances, energy conversion factors and definitions is **2.5 µg**;
- (iii) For Selenium the Indian RDA limit is **50 µg**, while the limit prescribed in the European Union Directive 90/496/EEC on nutrition labelling for foodstuffs as regards recommended daily allowances, energy conversion factors, and definitions is **55 µg**.

Would a product aimed at the elderly pass muster because it is within the limits prescribed by the EU? Say, for Vitamin C, even in the Indian scenario an amount over 40 mg but below 80 mg could be considered as normal variation from Indian RDA given the target consumer for such a product would be older people than those considered by Indian RDA.

Additionally, there have been queries raised regarding vitamins and/or minerals for which no Indian RDA has been prescribed. For example, questions have been raised concerning quantities of Beta Carotene in a product. Beta Carotene is a pigment/carotenoid—an abundant source of Vitamin A but not by itself a nutrient per se. Accordingly, no RDA limit is prescribed for Beta-Carotene, though one is prescribed for Vitamin A.

It may be more appropriate for the Food Authority to summarily reject products containing vitamins and minerals beyond the Indian RDA limits ordinarily but make allowance for variation on account of the target consumer. The reference to international guidelines would have then perhaps be appropriate, relevant, and real, taking into account products aimed at a specialised population in countries where the safe consumption of the products have been established.

### **52.3.3 Food Standards and Ingredients**

Standards including permitted ingredients and quantities for ingredients are prescribed for about 13 broad categories of foods (e.g.: dairy products, fats and oils, fruit and vegetable products, cereals and cereal products, meat and meat products, fish and fish products, spices and condiments, sweets and confectionary, sweetening agents, beverages, etc.<sup>18</sup>).

Each category comprehensively covers specific food items totalling about 150 identified food and beverage items ranging from globally identifiable items such as different types of cheese, chewing gums, and chocolates to more locally relevant products, such as ghee (in the milk products category) and jaggery

---

<sup>18</sup>See regulation 2 of the Food Standards Regulations.

(categorized under sweets and confectionary). As discussed in Sect. 52.3.2 above there is also the identified category of foods referred to as “traditional/ethnic” food.

Additionally, standards are prescribed for food additives such as permitted colours, artificial sweeteners, preservatives, anti-oxidants, emulsifying agents and anticaking agents. For example, only lecithin, ascorbic acid, and tocopherols are generally permitted for use as anti-oxidants. Further, colouring agents are classified into the following sub-categories: (i) Natural Colouring Matters such as beta carotene, chlorophyll, saffron, curcumin, caramel etc. are generally permitted to be used; (ii) Inorganic Colouring Matters and pigments are generally not permitted for use unless otherwise provided in for the Food Additive Regulations; and (iii) select Synthetic Food Colours such as ponceau, carnosine etc. are permitted to be used only in specified food products.

Further, the Food Standard Regulations classifies ‘Preservatives’ into two classes as follows: (i) Class I preservatives such as common salt, sugar, spices, vinegar, honey and edible vegetable oils, etc., which can generally be used; and (ii) Class II preservatives which are restricted for use in specified foods to specified limits. There is also a restriction on using more than one Class II preservative even in the foods where individual Class II preservatives are permitted.<sup>19</sup>

Furthermore, Flavouring Agents and Related Substances are permitted to be used subject to appropriate labelling and are classified as follows: (i) Natural Flavours and Natural Flavouring substances; (ii) Nature-Identical Flavouring Substances; and (iii) Artificial Flavouring Substances—covering those substances which have not been identified in natural products intended for human consumption, either processed or not.<sup>20</sup>

At the opposite end of the requirements of specific standards is the category of Proprietary and Novel Foods. This category covers all food for which standards have not specifically been prescribed. However, regulatory restrictions concerning permissible ingredients and limits on the use of certain other ingredients all apply to Proprietary Foods.<sup>21</sup>

The Food Standard Regulations also identify the foods which can undergo irradiation, the minimum and maximum doses of irradiation, and the facilities at which foods can undergo irradiation.<sup>22</sup>

### 52.3.4 Labelling

The food laws related to labelling are primarily contained in the Packaging and Labelling Regulations which are read along with the LMPC Rules. The LMPC

---

<sup>19</sup>See regulation 3.1.4 of the Food Standards Regulations.

<sup>20</sup>See regulation 3.1.10 of the Food Standards Regulations.

<sup>21</sup>See regulation 2.12 of the Food Standards Regulations.

<sup>22</sup>See regulation 2.12 of the Food Standards Regulations.

Rules provide for the manner of packaging of commodities and the declarations to be made on packed commodities. The LMPC Rules expressly provide that no person shall pre-pack, or cause or permit to be pre-packed, any commodity for sale, distribution, or delivery unless the label is securely affixed and the requisite declarations have been made on the package in which the commodity is pre-packed.<sup>23</sup>

The Packaging and Labelling Regulations stipulate certain mandatory information, declarations, and specifications to be provided on the labels of every pre-packaged food proposed to be imported, stored, and/or sold in India.<sup>24</sup>

As per LMPC Rules, separate labelling requirement apply to wholesale packages which consist of multiple packages which can then be retailed individually. Since the labelling requirement for retail packages are extensive, the declarations for wholesale packages are more relaxed, requiring only the name and the address of the manufacturer, importer (and in some instances the packer), the identity of the commodity contained, and the total number or weight of the retail package (s) contained in the wholesale package.<sup>25</sup>

#### 52.3.4.1 “Vegetarian” or “Non-Vegetarian” Food Labelling

While the general food labelling requirements discussed in Sect. 52.3.4.2 below echo labelling requirements in various other countries, a more distinctive labelling characteristic in India is the compulsory requirement to label each food as either “vegetarian” or “non-vegetarian”.<sup>26</sup> This requirement reflects the vast population of Indians who are vegetarian for religious reasons.

It is not only the use of meat products per se that require a food to be labelled “non-vegetarian”, but even ingredients such as gelatine (which traditionally has been sourced from animal products) would lead to a food item being labelled “non-vegetarian”. Gelatine itself is a standardised ingredient: i.e. standards are prescribed for it and special labelling requirement (other than “non-vegetarian”) applies to the use of gelatine.

The declaration to the effect that a food is non-vegetarian or vegetarian is made by a symbol with the former being identified by a brown colour filled circle inside a square with brown outline and the latter by similar symbol in green colour (see Fig. 52.1).

From a consumer information standpoint, both the Packaging and Labelling Regulations as well as the LMPC Rules specify details such as, *inter alia*, the quantity declaration being free from printed information on all its sides by specified space, the heights of numerals made in the declarations, and the label’s proportion

---

<sup>23</sup>See rule 4 of the LMPC Rules.

<sup>24</sup>See rule 6 of the LMPC Rules.

<sup>25</sup>See rule 24 of the LMPC Rules.

<sup>26</sup>See regulation 2.2.2 (4) of the Packaging and Labelling Regulations.

**Fig. 52.1** Non-vegetarian (brown)/Vegetarian (*green*) declaration

“Non-Vegetarian Declaration” (brown)      “Vegetarian Declaration” (green)

in comparison to the principal display panel (with the principal display panel being pretty much the entire package/container of food).

There are further requirements concerning the non-vegetarian or vegetarian symbols, including the diameter of the sides of the square and size of the symbol in comparison to the principal display panel, and for the symbol to be prominently displayed on the labels having a contrasting background on the principal display panel, and being placed in close proximity to the name or brand name of the products.

#### 52.3.4.2 Other Information, Declarations and Specifications Required to be Stated

In addition to the non-vegetarian or vegetarian declaration, some more India specific labelling requirements include: (i) the labelling language must be either English or Hindi<sup>27</sup>; (ii) the format for declaration of maximum price at which the product may be sold to the end consumer viz. ‘MRP Rs. . . . .incl. of all taxes’ or Maximum or Max. retail price. . . . . inclusive of all taxes’ or in the form.<sup>28</sup>

The Packaging and Labelling Regulations mandate the use of the International System of units in declaring the net quantity of the commodity on the labels including kilogram and grams.<sup>29</sup>

Other information, declarations and specifications required to be stated on the labels of foods include<sup>30</sup>:

- (i) Name/description of the Food Product.
- (ii) List of Ingredients—in the mode and manner prescribed including, but not limited to: listing the name of the ingredients in descending order of their composition by weight or volume, as the case may be; declaration of constituents of compound ingredients, etc.
- (iii) Nutritional Information per 100 g or per serving of the product with specifics of kcal, protein, carbohydrates from sugar, and fat.

In cases where a nutrition or health claim is made, depending on the kind of claim, a declaration may need to be made concerning the amount of fatty

<sup>27</sup>See regulation 2.2.1 (2) of the Packaging and Labelling Regulations and rule 9 (4) of the LMPC Rules.

<sup>28</sup>See rule 2 (m) of the LMPC Rules.

<sup>29</sup>See regulation 2.2.2 (5) of the Packaging and Labelling Regulations.

<sup>30</sup>See regulation 2.2.2 of the Packaging and Labelling Regulations.

acids, monounsaturated fatty acids, and polyunsaturated fatty acids and/or cholesterol and/or trans fatty acids.

Further standards are specified as to the amount of trans fats or saturated fats that may be present in a product for a health claim of 'trans fat free' or 'saturated fat free'.

- (iv) Declaration Regarding Food Additives—under the following class titles together with the specific names or recognised International Numerical Standards (**INS**):

Acidity Regulator, Acids, Anticaking Agent, Antifoaming Agents, Antioxidant, Bulking Agent, Colour, Colour retention Agent, Emulsifier, Emulsifying Salt, Firming Agent, Flour Treatment Agent, Flavour Enhancer, Foaming Agent, Gelling Agent, Glazing Agent, Humectant, Preservative, Propellant, Raising Agent, Stabilizer, Sweetener, Thickener.

There are specific recommended declarations for the extraneous addition of colouring matters related to the sub-category of the colouring matter used. If the statement is displayed along with the name or INS number of the food colour, the colour used need not be declared in the list of ingredients.

Similarly there are specific recommended declarations for the extraneous addition of flavouring agents and also separately for cases where both colour and flavour are used.

- (v) Instructions for use including for reconstitution, if necessary, to ensure correct utilization of the product.
- (vi) Name and Complete Address of the Manufacturer and Packer.  
If the address of the manufacturer and the manufacturing unit are different, both have to be specified. The name and address of the packer is required when the manufacturer is not the packer.  
In cases of contract manufacturing for some other manufacturer or company under the latter's brand name, the label will need to state the name and complete address of the manufacturing or packing unit, as the case may be, and also the name and complete address of the brand name owner for, and on whose behalf, the product is manufactured or packed.
- (vii) Contact Details of the person who can be contacted in case of consumer complaints.
- (viii) Lot/Code/Batch Identification, enabling tracking in manufacture and identification after distribution.
- (ix) The date, month and year of manufacture, packing or pre-packing of the product.
- (x) Best Before and Use By Date in any one of the three specified formats.
- (xi) The net weight or number or measure of volume of contents which would need to exclude the weight of wrappers and materials of the package.

Additional and specified declarations need to be made for certain foods such as for infant foods, irradiated foods, artificial sweeteners, food colours, edible oils, drinking water, foods containing monosodium glutamate, etc.

The LMPC Rules and the Packaging and Labelling Regulations mandate clear and unambiguous declarations including specifying instances where declarations must be printed in a colour which contrasts the background.

The LMPC Rules and the Packaging and Labelling Regulations proscribe any description or presentation or labelling that is false, misleading or deceptive or is likely to create an erroneous impression regarding the product's character in any respect. The aforesaid rules and regulations stipulate against use of words such as "recommended by the medical profession" or any words which imply or suggest such recommendation. They direct against declarations of quantity with words, or expressions which may lead to exaggerated, misleading or inadequate impressions, such as the use of the following words or phrases: 'minimum', 'not less than', 'average', 'about', 'approximately', etc.

The required declarations need to be printed on each label, as LMPC Rules do not permit affixation of individual stickers on the package for altering or making declarations. The only exception is that a sticker may be used for reducing the retail sale price of a commodity, as long as such a sticker does not cover the original retail sale price stated on the package.

#### **52.3.4.3 Exemptions from Labelling Requirements: By Legal Provisions and by Practice**

Packaging and Labelling Regulations prescribe, *inter alia*, limited and specific exemptions from labelling requirements for packaged products if the surface area of the package is not more than 100 square centimetres. There is additional relaxation for packages whose surface area is less than 30 square centimetres.

Certain exemptions also apply to a package which qualifies as a 'multi piece package', i.e., it is a package containing two or more individually packaged or labelled pieces of the same commodity of identical quantity, intended for retail either in individual pieces or as a whole.

While the aforesaid labelling exemptions are provided in law, certain labelling requirements are routinely not enforced in practice, leading to a perception that exemptions have been extended by the authorities. The risk of relying on such practice is that at any point in time, the Food Authority, and hence other government departments, may decide otherwise. This sudden decision could be the result of economic/foreign policies which cannot be foreseen.

For example, the requirement to label beverages, especially imported alcoholic beverages had not been enforced by the Food Authority for some time. However, as per recent reports there are containers of imported Scotch whisky and wines pending clearance at customs since the Food Authority had taken a decision to enforce labelling provisions for such beverages. While European manufacturers and exporters have reportedly dug in their heels concerning labelling, the recent stringent application may also be a direct response to the EU banning import into Europe of Indian mangoes and other produce products.

The Indian authorities stance, that it does not matter what the US and EU prescribe since Indian laws provide otherwise, while technically sound, does seem contrary to one of the objects and reasons for the new Indian food laws—moving towards international practices. If world over the consumer can be expected to know what Scotch whisky and wine are comprised of, or at least not be the worse for wear without that knowledge, then the Indian labelling requirements being made applicable to imported wines and whiskeys seems excessive.

### 52.3.5 Trademarks Protection

Products of various food brands from across the world have become a common sight in the marketplaces and dining rooms in India. The effective branding strategies for these products are essential ensuring their distinctiveness and making them easily recognisable to consumers and to help in achieving and sustaining a competitive market share. Given the appeal of these global/Indian brands in the food sector, trademark protection has become a growing priority for the major players in the food sector.

Trademarks can include words, logos, shapes (of the food product itself or its packaging), slogans, specific colours and sounds. Some of the more well know food brands in India include McDonalds, Coca Cola, Maggi, Dominos, Cadbury, and many others. In terms of the Trade Marks Act, 1999, proprietors of these brands are afforded adequate protection against the infringement of the rights in their respective brands. Below are some recent examples of protection by the courts in India, of some well-known food brands:

- (i) *Cadbury Ltd and Ors. v. Tims Foods Private Ltd. and Anr.*, 2009 (39) PTC 544 (Del),  
This suit was filed by Cadbury against Tims Food, seeking permanent injunction against Tims Food from infringing Cadbury Dairy Milk ‘eclairs’ labels/wrappers. The Court ruled that the trade dress/wrapper adopted by Tims Foods was deceptively similar to that of Cadbury and concluded that there had been undue enrichment to Tims Foods to the detriment of Cadbury. Injunction was granted to *Cadbury* and it was awarded damages amounting to Rs. 500,000/-.
- (ii) *The Coca-Cola Company & Anr. vs. K.M. Salim*, MIPR 2014 (1) 217  
The High Court of Delhi held, that when a trademark is identical to a registered trademark and goods/services for which it is used are also identical to goods or services for which registration has been granted, then the Court shall presume that it is likely to cause confusion on part of public and therefore granted injunction to the Coca-Cola Company.
- (iii) *Heinz Italia and Anr. v. Dabur India Ltd.*, 2007 (7) SCALE 608  
Injunction was granted against marketing of a product under the brand ‘Glucose-D’, as the brand was deceptively similar to ‘Glucon-D’, a registered trade mark of Heinz Italia.

### **52.3.6 *Import Related Provisions***

Pursuant to obtaining an Import–export Code (IEC) under the Export–import Policy of India from the office of the Director General of Foreign Trade, importers may import food for which there are few additional requirements as well as some relaxation of existing requirements.

#### **52.3.6.1 Licenses**

As discussed above, all importers would require a license from the Food Authority at the Federal level.

#### **52.3.6.2 Ingredients**

The provisions of the FSS Act apply in totality with reference to the use of ingredients, and restrictions for all imported food items.

#### **52.3.6.3 Labelling Requirements**

A food item’s country of origin needs to be stated on the labels of imported foods. If a food product has undergone processing in a second country which changes the nature of the food product, then the country in which the processing is performed is considered to be the country of origin for the purposes of labelling. In the case of imported food the name and address of the importer in India is also required. Additionally the discussion at Sect. 52.4.1 below, concerning non-vegetarian foods, may be relevant for the import of meat products.

#### **52.3.6.4 Foreign Direct Investment Policy as Applicable to the Food Industry**

The Government of India in general permits investments in the food processing sector under the “automatic route”, i.e., without the requirement for further approvals for investment. However, there are certain categories of food products which are reserved for the micro and small scale sector where foreign direct investment is eligible for the automatic route only for up to twenty four per cent (24 %) foreign direct investment.

## 52.4 Discussion and Analysis of Specific Aspects of Non-Vegetarian Foods and GM Foods

### 52.4.1 *Non Vegetarian Foods: The Controversy Around Beef and Whether Food Laws Permit the Sale of Beef*

The discussion here revolves around the permissibility of selling and consuming beef products, as the issue appears to flow from food laws, and the barriers which surround the possibility of such sale and consumption arise from the food laws read with other laws.

#### 52.4.1.1 Food Laws

The Food Standard Regulations, in its treatment of various meat products, appears to permit import and sale of beef products along with other non-vegetarian products.<sup>31</sup> At the same time most Indian states restrict the slaughter of cows. To a lesser extent, most States also prohibit slaughter of other bovine animals for the manufacture of packaged foods in India. Below is an attempt to break down the complex treatment of meat products, especially beef, as per the food laws.

The definition of food includes animals, prepared and processed. As discussed above, standards are prescribed for about 13 broad categories of foods which include the category of meat and meat products. Meat products, as described in the Food Standard Regulations, includes bovine meat product.

Standards are prescribed for, *inter alia*, “canned corned beef”. Canned corned beef is defined as product prepared from the boneless meat of the carcasses of bovine animals including buffalo meat. While the definition does not restrict canned corned beef to buffalo meat, from a harmonious construction of the import policy (discussed below) and food laws it would appear to be limited to buffalo meat. The definition of canned corned beef (as also the definition of canned cooked ham) does not refer to slaughter house/abattoir which is a reference point for almost all other standardised meat products, whether bovine, caprine, ovine, suilline, or poultry.

The other categories of standardised bovine meat products are “Canned Luncheon Meat” and “Canned Chopped Meat”. Both of the aforesaid categories refers to product prepared from the meat of mammalian animal (i.e. including bovine) slaughtered in an abattoir. A third category titled “Frozen Mutton, Chicken, Goat and Buffalo meat” appears to be broader than the title suggests as it refers to products from the meat of animals specified under the Food Standard Regulations, including buffalo meat slaughtered in an abattoir.

---

<sup>31</sup>See regulation 2.5.2 of the Food Standard Regulations.

In the Food Standard Regulations the term “slaughter house” has been defined as a building licensed by the local municipal authority for slaughter.<sup>32</sup> The term has, however, not been used, with the term “abattoir” having been used interchangeably instead.

The relevance of licensed abattoir and conditions concerning such slaughter cannot be ignored—from an import policy view point these conditions have to be satisfied for imported products. More importantly, the licensed abattoir will operate within the four corners of other laws. Since a majority of States have passed legislation banning the slaughter of specified cattle and provided conditions under which slaughter can be done, whether beef and beef products can be sold would also be impacted by these legislations.

#### 52.4.1.2 Preservation of Cattle Legislation

While legislation which regulates the slaughter of cattle is nominally for the protection of agricultural cattle as mandated by the Directive Principles contained in the Constitution of India, there is no denying that a part of the purpose sought to be achieved by certain States by such legislation is to take into account the sensitivity attached to cow slaughter. A vast number of the Indian population considers the cow an animal not to be slaughtered for food due to religious and cultural beliefs. For some of those who hold such a belief, their belief is restricted to cows and not to the slaughter of buffaloes. The sensitivities of the Indian people against the slaughter of cows can be traced back to the Indian rebellion of 1857 against British Colonisation, which can be principally attributed to the use of ammunition for the ‘1853 Enfield Rifle’ which was greased with cow fat. This greatly outraged the Indian sepoys, eventually leading to the mutiny. Further, in 2001, the rumours of use of beef extracts in the ‘French Fries’ served in McDonalds restaurants was met with great outrage in India, eventually leading to McDonalds India issuing a statement dismissing such rumours.

Broadly, these pieces of State level legislation can be divided into three categories, as follows: (i) States that completely ban the slaughter of all bovine animals, i.e., Chhattisgarh, Jammu and Kashmir, Madhya Pradesh and Rajasthan; (ii) States that ban cow slaughter and permit, either expressly or impliedly, the slaughter of bull and bullock and/or other bovine animals, i.e., Andhra Pradesh, Bihar, Daman and Diu, Delhi, Goa, Gujarat, Haryana, Himachal Pradesh, Karnataka, Maharashtra, Manipur, Orissa, Pondicherry, Punjab, Uttar Pradesh; and (iii) States that permit cow slaughter either by express legislation or by lack of it, i.e., Assam, Kerala, Tamil Nadu and West Bengal in the former category, and Meghalaya and Nagaland in the latter.

Most legislation expressly allowing slaughter, whether of cows or other bovine animal, stipulates that the animals may only be slaughtered if they are over a certain

---

<sup>32</sup>See regulation 2.5.1 of the Food Standard Regulations.

specified age, usually 14 or 15 years of age (however in some cases lesser and some as high as 25 years) and/or upon production of a “fit-for-slaughter” certificate. The certificate is indicative of the animal not being economical for the purpose of breeding or agriculture.

Leaving aside the States which permit cow slaughter, it is an enormous task to attempt to unravel the definitions, the restrictions and the permissions provided in the legislations of the other States. For example, it appears that the State of Andhra Pradesh limits itself to prohibition of slaughter and does not concern itself with the sale of beef products. Further, the State of Bihar bans the slaughter and export of certain bovine animals but does not concern itself with sale of beef products. On the other hand, in the National Capital Territory of Delhi, the States of Madhya Pradesh, and Jammu and Kashmir, the possession of flesh of agricultural cattle has been categorised as an offence. Similarly, in the State of Chhattisgarh, beef is referred to as being the flesh of agricultural cattle and possession of such slaughtered agricultural cattle, in contravention of the applicable legislation, is illegal. In the Union territory of Daman and Diu, the States of Goa, Punjab, Haryana, Himachal Pradesh and Pondicherry, cow slaughter is prohibited, and while beef is defined as the flesh of a cow in any form, any flesh brought into the States in sealed containers is outside the purview of this definition.

Further, these States (and Union Territories), other than Goa, further prohibit the sale of beef except for prescribed medical purposes. The pertinent legislations for the States of Punjab, Haryana, Himachal Pradesh, define the term “beef products” as including beef extracts and prohibits the sale of beef products as well (except for medicinal purposes). Goa however permits the sale of beef and beef products being derived from animals other than cows, or imported from other States with the requisite certificate. It also requires the registration of vendors of such beef.

The State of Uttar Pradesh also prohibits cow slaughter, defines beef as the flesh of a cow, and takes outside the purview of the definition any flesh brought into the States in sealed containers. Interestingly while prohibiting the sale or transport of beef or beef-products in any form except for such medicinal purposes as may be prescribed, it permits the sale of severed beef or beef-products for consumption by a bona fide passenger in an aircraft or railway train.

Furthermore, the State of Gujarat prohibits the slaughter of all bovines, viz., bulls, bullocks, cows, calves, male and female buffaloes and buffalo-calves, without a certificate, and provides for a certificate to be issued under strict condition only with respect to buffaloes. Transport of the aforesaid specified animals for purposes of slaughter is also an offence in the State of Gujarat and there is an inherent presumption that such transport is for slaughter except where proven otherwise. The sale and purchase of beef and beef products is illegal in the State of Gujarat, where beef is defined as flesh of animals specified.

In the State of Karnataka, the slaughter of cows and calves, including the calves of buffaloes is prohibited. The transport, purchase, and sale of the aforesaid animals are also restricted. Karnataka permits the slaughter of other bovines with appropriate certificates related to age and incapacity to breed and milk. Similarly, in the State of Maharashtra, the slaughter of cows and requires a certificate not just for

bovines but also for ovines and caprines (sheep and goats) and is otherwise prohibited. The State of Orissa prohibits cow and bull slaughter but does not provide for any restriction on transport, sale and possession beyond the prevention of slaughter. Slaughter of specified animals is allowed under specified conditions.

The extent of prohibition on slaughter of bovine animals has been the subject of court decisions including decisions by the Supreme Court of India (Supreme Court). The position established by the Supreme Court in *State of Gujarat Vs. Mirzapur Moti Kureshi Kassab Jammata and Ors.*, AIR 2006 SC 212 (Mirzapur Case) is that States can prohibit the slaughter of animals, even those animals which are not fit for breeding and or providing milk. However, as noted by the Supreme Court in *Akhil Bharat Gosewa Sangh Vs. State of A.P. and Ors.*, 2006 (4) SCC 162, the decision of the Supreme Court in Mirzapur Case does not warrant a conclusion that permitting slaughter of bovine cattle is itself unconstitutional.

In view of the cultural sensitivity, the lack of clarity in some of the legislation could present issues for the food industry and/or the consumer. The issues which appear open to debate are:

- (i) In States like Goa, Punjab, Haryana, Himachal Pradesh, the Union Territories of Daman and Diu, and Pondicherry, which define beef as the flesh of a cow in any form but take outside the purview of the definition any flesh brought into the States in sealed containers, would processed food imported in cans from other States be treated as “flesh of cow in any form”?

If yes, since these States, other than Goa, further prohibit the sale of beef except for medicinal purposes, it may be impractical to import products since their sale comes with attached condition of medicinal purpose.

It is, however, possible that the legislation on its face permits the sale of beef which is from bovine animals other than cows and/or brought from other States, be it for sale as food products or to enable processing for other purposes/industries.

- (ii) The State of Gujarat prohibits the sale of beef and makes the purchase of beef and beef products illegal. It also defines beef as the flesh of animals specified. However, there no further definition of beef products.

The State of Madhya Pradesh prohibits the slaughter of cows, calves and female buffaloes and further prohibits the sale or purchase of such animals for slaughter. The States of Madhya Pradesh, Karnataka and the National Capital Territory of Delhi make the possession of the flesh of such slaughtered animals in contravention of the applicable Act illegal.

In the above cases, the interpretation of beef products should rationally relate to the intent of the legislation which is to preserve cattle in the State.

Similarly, it would be practical to say that beef products sourced from outside the State are not the flesh of slaughtered agricultural animals per se and are not a violation of the legislation concerning slaughter and/or tantamount to possession of flesh of animals slaughtered in contravention of the State legislation. However, such arguments have not been tested in practice.

### 52.4.1.3 Import Laws

While the import duties specified for bovine animals, at first appearance, may indicate permission to import beef, there is a prohibition on the import of beef. As per the import policy, the import of beef, in any form, is prohibited and all consignments of edible oils and processed food products imported in bulk have to carry a declaration of the exporter in the shipping documents to the effect that “*the consignment does not contain beef in any form*”. Additionally, all consignments of edible products, imported in consumer packs, are compulsorily required to declare on the label of the package “*the product does not contain beef in any form.*”

Thus, it appears that bovine animals would refer to bovine animals other than cows. This interpretation is supported by the export policy which also prohibits the export of beef which is defined as including the meat of cows. However, since India is the world’s largest exporter of beef, it would appear that as per the Export Import Policy of India, “beef” refers to products derived from cows only.

Additionally in terms of the Import Policy, the import of meat and meat products, including poultry products, are subject to compliance with conditions regarding manufacture, slaughter, packing, labelling and quality conditions as laid down in the FSS Act and related rules as well as labelling requirements prescribed under the LMPC Rules. Manufacturers of meat/poultry products exporting goods to India are required to meet the sanitary and hygienic requirements stipulated in the FSS Act.

Separately, the import of all other meat and meat products (which includes milk and milk products and egg and egg products) are mandatorily subject to a sanitary import permit. From time to time to check the spread of *avian* influenza or other like diseases, the import policy may also restrict import of specified meat and from specified countries.

### 52.4.1.4 Conclusion

If one connects the prohibition of slaughter of animal legislation (with no definition of beef and/or blanket ban on *sale* of beef), import laws and the food laws, it is apparent that even import, and possession of, “Canned Corned Beef” which appears at first glance to include beef derived from cow would be illegal. This, when the product is not derived from slaughter of animals in India, would be in consonance with Indian cultural norms and not food laws.

While imported canned beef products have been intermittently visible on the shelves of shops in Delhi, it is to be understood that such products are derived from bovine animals other than cows.

Further, insofar as standardised products (Canned Luncheon Meat, Canned Chopped Meat and Frozen Mutton, Chicken, Goat and Buffalo meat, etc.) are concerned, the same would, by reference to a licensed abattoir, in a narrow sense refer to products not imported but procured in India in the States where such

slaughter is permitted. However, in view of the import policy as long as the imported products are processed as per the guidelines of the FSS Act, the import and sale of such products would be allowed—however, caution should be exercised with respect to which States completely ban possession of bovine meat!

### ***52.4.2 Genetically Modified Food: The Legal Position***

Food has been defined to include genetically modified or engineered food. The FSS Act provides for the constitution of a Scientific Panel for genetically modified organisms and foods. It further stipulates that no person can manufacture, distribute, sell or import genetically modified organisms and foods except as provided under the FSS Act or related regulations. Under India's food laws there are no further regulations concerning genetically modified foods including for labelling of such foods.

While food laws are seemingly open about allowing genetically modified foods on the shelves, there has been an extremely strong reaction to genetically modified produce/crops in India. India permitted trials for BT cotton in the early 2000. However, following an outcry from farmers and their interest groups, the government banned farming of the first GM food crop (BT brinjal/eggplant). Other than brinjal/eggplant some trials for BT okra were also conducted. There is a petition against GM crops pending in the Supreme Court. The Supreme Court had, in the course of the hearing of the petition, set up a technical expert committee which had recommended a moratorium until regulatory process were refined. In view of the recommended moratorium, until recently, only trials of BT cotton were permitted and there was a moratorium on field trials for GM seeds in food crops. However, in March 2014 the Government cleared field trials in GM food crops with the stance that the Supreme Court had not laid down an embargo against such trials and that regulatory processes governing trials were adequate.

Without prejudice to the erstwhile ban on BT food crop trials, food laws have provided for the introduction of GM foods without any reference to any specific labelling or other regulatory requirements.

However it appears from the Food Authority's paper concerning "Operationalising the Regulation of Genetically Modified Foods in India" (GM Paper), that the Food Authority is considering the mode and manner of implementing regulations for GM Food.

According to the GM Paper, the Food Authority will develop guidelines to describe the regulatory framework for GM food including the interim process for regulation of GM food until formal regulations under the FSS Act are released. The GM Paper delineates the likely organisational structure to be set up including a scientific panel for GM Foods.

The GM Paper signifies the Food Authority's intent to adopt guidelines concerning safety assessment of GM foods and protocols approved by the Genetic Engineering Approval Committee (GEAC) and the Review Committee on Genetic

Manipulation under the Environment Ministry, which are stated to be consistent with standards developed by Codex Alimentarius.

The Food Authority, in terms of the GM Paper, contemplates taking over the responsibility for food safety assessment of viable and processed GM foods and approval for commercial release of processed GM foods while letting the GEAC maintain control of approval for commercial release of viable GM foods/Living Modified Organisms (LMOs).

Since the publication of the GM Paper, it is noteworthy that no guidelines or regulations have been developed. Hence, GM foods as per the Food Authority's own admission in the GM Paper continue to be governed as per the Rules for the Manufacture/Use/import/Export and Storage of Hazardous Microorganisms, Genetically Engineered Organisms, or Cells, 1989 under the provisions of the Environment Protection Act (MOEF GM Rules).

In terms of Rule 11 of the MOEF GM Rules, food stuffs, ingredients in food stuffs and additives including processing and containing or consisting of genetically engineered organisms or cells, cannot be produced, sold, imported or used except with the approval of the GEAC.

Thus, while food laws do not presently provide for any regulatory coverage of GM foods other than identifying the category, the Ministry of Environment and Forests (MOEF) is technically the regulating authority (although as per its own claims its role is limited and other departments would need to be involved—refer discussion below concerning Doritos and averment of the GEAC in its meeting).

The Import Policy makes the import of GM items, including GM food intended for use as food, subject to the provisions of the Environment Protection Act and Rules and subject to approval of the Genetic Engineering Approval Committee (GAEC). The Import Policy also requires a compulsory declaration to the effect that any GM food is genetically modified.

As per information in the public domain, no entity has sought approval of the GEAC except when third parties have raised the issue. However, according to anti-GM activists, GM foods are in the Indian market.

As per the minutes of the meeting of the GEAC in 2008, Greenpeace had filed a complaint concerning import of Doritos' Cool Ranch Corn chips which were alleged to be containing GM ingredients. GEAC requested the sample stated to have been collected by Greenpeace. The minutes also reflect the stance of the GEAC that it would not, as a matter of course, test food products for GM ingredients, and appeared to reflect that it would be proactive only on the basis of a complaint—in this case the complaint of Greenpeace.

In the instant case the manufacturers of Doritos, Pepsico, had submitted that while Doritos was their brand they were neither manufacturing it in India nor importing it themselves or through authorised third parties, and averred that they did not use GM ingredients and were in compliance with all Indian laws relating to GM organisms.

Further, after the above meeting of the GEAC, there was another meeting in January 2009 wherein the GEAC disclaimed direct involvement in the import, sale or distribution of any GM commodity including GM food products. The GEAC

stated that the matter had been taken up by the Ministry of Commerce and Industries and the Directorate General of Foreign Trade (DGFT) in view of the restriction concerning GM food items intimating them of the lack of prior approval of the GEAC in the case.

Finally, in May 2009, the GEAC considered a NOC request from an Indian entity to import Doritos chips which were claimed to be made from corn produced in Taiwan. The items had been detained at Mumbai customs in view of the communication issued by the MOEF and DGFT concerning the illegal import of Doritos chips from the USA, which was based on a representation that had been earlier received from Greenpeace.

The GEAC, while noting and relying on the submissions of the importer that (a) the products were produced in Taiwan, (b) the product is made from corn indigenously produced in Taiwan which was not genetically modified corn, and (c) Taiwan does not produce any GM food crop, decided to convey 'no objection' for release of the consignment.

Possibly in view of the declaration of the importer that Taiwan imports GM soybeans and corn from USA and that Taiwan's labelling policy is applicable beyond a threshold of 5% of GM content, or otherwise, the GEAC made the release subject to certain conditions—that if the products were later found to contain genetically modified material, the importer would be liable for prosecution and advised that the customs officials be directed to retain random samples from the import consignment for further verification, if necessary.

If all of the aforesaid facts are taken at face value then it would appear that third parties may have been importing food products with GM ingredients without complying with Indian law. With no authority ensuring active compliance this is evidence of the gap between the law as it exists on paper and as it is actually implemented. It would require an extremely interested and motivated entity (as was evident in the Doritos case) to actually prevent the entry of GM foods into India, law notwithstanding.

Part of this conclusion is bolstered by the allegedly conflicting responses given by the Food Authority. Anti GM activists have used the Right to Information Act to assail Food Authority's response disclaiming responsibility for labelling of GM foods.

However, where the Food Authority has not been proactive, the Legal Metrology Department has taken steps to the extent that was within its powers to provide for consumer awareness concerning GM foods. Pursuant to an amendment to the LMPC Rules, effective January 2013, there is now a requirement to include a declaration on every package of genetically modified food at the top of the label using the words "GM". While anti-GM activists consider this a positive step, they are of the view that more needs to be done. Their view is that the requirement of the Legal Metrology department in the first place may not add to consumer awareness and may instead lead to confusion in the face of common usage of the metric unit 'gm' indicating gram. Secondly, in the absence of any clarity on the authority which will test the presence of GM content and potential labelling violations (the Legal

Metrology department not being equipped for such an exercise) the law, for now, lacks teeth.

The law has drawn the attention of the All India Food Processors' Association which has appealed for a suspension of the requirement for declaration. There has been no action in their favour and the declaration requirement remains in force.

## 52.5 Conclusion

With the advent of the FSS Act, India has taken a welcome step in unifying previously multifaceted and cumbersome regulatory regime, with respect to standards of food and its manufacture, sale and import, to ensure availability of safe and wholesome food for human consumption. The FSS Act emphasizes consolidating the laws related to food and establishment of the Food Authority, laying down scientific standards for and regulating articles of food. With the harmonization of laws relating to food quality and standards with established international norms, the FSS Act aims at scientifically developing the food industry. Thus, while the food processing industry may ultimately see the FSS Act as a mixed blessing, the practical application of this legislation, being at its nascent stage, will require some time to come into full force. There are certain elements which must be further tweaked to bring Indian food law completely in line with the international standards, while carefully balancing the interests of the food industry as well as the consumer.

Even with the aforesaid effort of unification, India still has a lot of laws that apply to the food sector with implications on entities ranging from the corner 'chai wala' to the 'McDonalds' of this world. While compliance with these requirements may not be strictly followed or enforced by the regulatory authorities at the moment, that doesn't guarantee, that contraventions will fly under the radar for the indefinite future.

# Chapter 53

## Food Regulation in the Customs Union of Belarus, Kazakhstan and Russia

Alexey Petrenko, Anatoly Kutyshenko, and Victor Tutelyan

**Abstract** The chapter discusses the regulation of food markets in the Eurasian Economic Union of Armenia, Belarus, Kazakhstan, Kyrgyzstan and the Russian Federation (the Union), five countries that lead regional integration in the region of the Former Soviet Union. The first part presents a brief overview of the regional co-operation in the post-Soviet world and highlights basic principles of the legislative and regulatory harmonization that are essential for understanding the concept of the regional food law. The contribution of the region to the globe agriculture is also discussed. The second part lays out general approach to technical regulation and sanitary measures adopted in the Union while the third details essential food regulations and explains basic principles of their interpretation. In the final part, two practical cases on food labeling and registration of foods for special dietary use are discussed to provide examples of practical application of technical regulations in the Union.

### 53.1 Economic Integration in the Commonwealth of Independent States

#### 53.1.1 *CIS Free Trade Zone and Its Evolution Towards a Single Economic Space*

The 15 independent states that emerged in the wake of the subsidence of the Soviet Union possess close to 14 % of the world's agricultural resources. According to the

FAO report<sup>2</sup>, the region has almost 1 ha of arable land per capita—one of the highest rates in the world—and yields a per capita daily output of over 8000 kcal of food.

In 2013, the former Soviet Union (FSU) countries contributed 5 % to the global agricultural output.<sup>1</sup> Together they produced 178 million tons of wheat (8 % of global output), of which 52 million were exported to the rest of the world. At the same time the region has become an important producer of meat, delivering 8,173,000 t or 3 per cent of the global output in 2013.<sup>2</sup>

The high standing of the FSU countries in the global agricultural output chart has been partly rooted in the once prominent farming industry of the USSR, their parent state which made up a substantial part of the global food industry and was one of world's leading agro-exporters in the 1970s and 1980s. In 1988, the USSR gross agricultural product reached 465.8 billion Rubles (116 billion dollars), being comparable to 136 billion dollars of US output.<sup>3</sup> Even though there was a significant decline in agricultural production and efficiency in the late 1980s (close to 25 % of agricultural products failed to reach the market), the Union was exporting over 20 billion USD worth of wheat during the final years of its existence.<sup>4</sup>

Nevertheless, the benefits of the wealthy Soviet heritage were offset by the harsh economic crisis that gripped the FSU in the 1990s immediately after the single market and farming industry broke up. Some countries had relied heavily on supplies from other neighbors, which were now no longer available. Six out of fifteen Soviet republics, for example, were not capable of producing their own sugar or vegetable oil. Other countries that had been big contributors to Soviet agriculture, such as Russia and Ukraine,<sup>5</sup> failed to adapt their old-style infrastructure to the new market economy and were not able to compete in the open market.

The economic hardship and overall impact of the market reforms pushed the FSU countries to attempt a revival of their economic cooperation, albeit somewhat unsuccessfully at first. In December 1991 three FSU countries—Belarus, Kazakhstan and the Russian Federation—established the Commonwealth of the Independent States (CIS) to promote closer political and economic integration. In a short while, the CIS was joined by all<sup>6</sup> but the three Baltic States, which sought closer ties with the European Union as soon as they became independent. From the start, the CIS had become a stage for political disputes and negotiations rather

<sup>2</sup>CIS Executive Council (2013).

<sup>3</sup>Goskomstat (1990).

<sup>4</sup>FAO (1989).

<sup>5</sup>Russia and Ukraine contributed 47 % and 22 % respectively in 1988 (Goskomstat, 1990).

<sup>6</sup>Georgia was the last to join in 1993 and the first to leave the CIS in 2008.

than an efficient platform for economic partnership. The first agreement on the economic front came in 1994 when the CIS members agreed to create a free-trade zone.<sup>7</sup>

The following year, the three leading CIS members—the Russian Federation, Kazakhstan and Belarus—announced they were planning to form a customs union, thereby completely removing tariff trade barriers in the mutual trade and setting up a uniform tariff schedule in trade with other countries.<sup>8</sup> As with most other declarations and agreements, however, the plan remained unfulfilled and was postponed due to the CIS structural complexity and bureaucracy. The management structure of the CIS included the heads of states council, the prime ministers council, the executive council, the economy council, the parliamentary assembly, in addition to four other bodies. The councils often confused their responsibilities and authority, and commonly made decisions without any follow-up action.

The integration also stumbled as member states were clearly at different stages of economic development and had different priorities. At the same time, most of them had to deal with severe internal economic crises, and the CIS integration was not at the top of their agenda. In order to speed up regional integration, in 2000 Belarus, Kazakhstan, Kyrgyzstan, Russia, and Tajikistan formed the Eurasian Economic Community (EurAsEC).<sup>9</sup> Three other CIS members, Ukraine, Moldova, and Armenia, joined the new organization as observers. The EurAsEC was designed to accelerate the launch of the customs union and a single capital market. The members also set an ambitious goal to introduce a single currency and monetary union.

The EurAsEC has become a grand-scale regional structure stretching from the eastern borders of the European Union (EU) to the Pacific Ocean, and uniting a population of 214 million people. Economically, it was much smaller than the neighboring EU with total GDP being 2.2 times less than that of Europe (see comparison in Fig. 53.1). Nevertheless, the Community possessed an unprecedented growth potential and was one of the EU largest trading partners. In 2012, trade with the EU alone made up 44 % of EurAsEC's exports and 38 % of its imports.

No doubt, the formation of the EurAsEC accelerated economic integration in the CIS by enabling fast progression towards the objectives set when the CIS was first created. The CIS free-trade zone began operating in 2003 and in 2007 the Customs Union of Belarus, Kazakhstan, and the Russian Federation was finally launched.<sup>10</sup>

### 53.1.2 *Customs Union of Belarus, Kazakhstan and Russia*

The primary objective of the Customs Union of the Republic of Belarus, Republic of Kazakhstan, and the Russian Federation (the CU) was to completely remove tariff barriers that were hampering mutual trade in the free-trade zone. The three countries agreed on and implemented a unified code of tariffs for trade with the third countries, thereby creating a single customs territory. This essentially led to the removal of interstate customs borders with goods imported to one country being automatically cleared for circulation in the two other Union members.<sup>11</sup> As of today, around 370 customs points operate at the Union borders following the same customs clearance rules and procedures.

The CU was administered by the Customs Union Commission, which was established as a chief executive authority after having assumed some functions and responsibilities of national authorities.<sup>12</sup> The Commission's key function was to supervise member state compliance with the Union treaties and agreements.

<sup>11</sup>Isakova et al. (2012).

<sup>12</sup>CU Commission (2007).

### 53.1.3 *Eurasian Economic Commission*

As the CU progressed and internal trade grew, the member states agreed to further strengthen their economic integration by transforming the customs union into a single economic space (SES). The intention was to create single goods market to begin with strategic commodities, such as mineral resources and energy, and later expand to all other markets. At the heart of the SES was the principle of four freedoms that envisaged the free flow of goods, services, money, and labor within the single territory. The SES required member states to pursue coordinated policies in macroeconomics, the financial sector, transportation, energy, trade, and industry. Furthermore, the SES entailed that member states should share a uniform tax code though a single taxation regime still remains a long way from its implementation. For example, there is a difference in rate of the value added tax. Russia continues to apply 18 % rate for most goods and services offering discount rates for selected products (e.g. baby foods) while both Belarus and Kazakhstan use flat rate of 12 %.

In 2011, the Eurasian Economic Commission was established to supervise and drive the process of the CU transformation into the single economic space.<sup>13</sup> At the top of Commission's structure was the Supreme Council, represented by heads of the CU member states. Under the Supreme Council, the two collective bodies—the College of nine commission ministers,<sup>14</sup> and the Commission Council represented by national deputy prime ministers—were set to execute the Supreme Council's decisions. The College was authorized to make rulings with direct enforcement in member states in the following areas:

- customs regulation,
- technical regulations,
- sanitary, veterinary, and phytosanitary measures,
- macroeconomics policies,
- subsidies,
- energy,
- intellectual property,
- migration and financial market.

The Commission Council of deputy prime ministers serves as an advisory board for the Supreme Council and also retains the right to veto the College's decisions and rulings.

---

<sup>13</sup>CU Commission (2011).

<sup>14</sup>The ministers' responsibilities are assigned in the areas of integration and macroeconomics, economics and financial policies, industry and agriculture, trade, technical regulation, customs, energy and infrastructure and antitrust regulation.

### **53.1.4 Eurasian Economic Union**

Most recently, the single economic space has been transformed to the economic union. On May 29, 2014, the Republic of Belarus, Republic of Kazakhstan and the Russian Federation signed a treaty of the Eurasian Economic Union (the Union) which has been designed to enhance the single economic space launched by the three countries in 2012.

The treaty represents by far the largest and the most detailed piece of the international legislation within the CIS to date. Treaty's 28 sections, 118 articles and 33 annexes occupy 1014 pages and address almost all spheres and sectors of economy.

As the closest form of the regional economic integration, the Union has been widely viewed as a step closer to a political union between the three countries (and possibly some other CIS members) on analogy with the European Union.

As of 2016, the Union has five members: Armenia, Belarus, Kazakhstan, Kyrgyzstan and the Russian Federation.

In a broad sense, the treaty re-enforces the existing laws and practices that have been developed by the member states part of the Customs Union and the single economic space.

## **53.2 Common Technical Regulation and SPS Measures**

### **53.2.1 Agreement on Common Sanitary and Phytosanitary Measures**

The Union harmonization of food and agriculture-related legislation is centered on common sanitary and phytosanitary (SPS) codes, in addition to veterinary measures, as described by the three basic CU agreements between the Republic of Belarus, the Republic of Kazakhstan and the Russian Federation. These agreements, which in many aspects echo the WTO SPS agreement,<sup>15</sup> include the agreement on sanitary measures, the agreement on veterinary sanitary measures, and the agreement on quarantine of plants adopted in 2009.<sup>16</sup> The common principle of the Union SPS agreements states that an SPS measure should be scientifically substantiated and dedicated primarily to the safety and health of humans and animals. At the same time, the agreements proclaim the commitment to the mutual recognition of SPS measures introduced by third countries, as envisaged by the WTO.<sup>17</sup>

---

<sup>15</sup>WTO (1994). Currently, only the Russian Federation is a member of the WTO. Both Belarus and Kazakhstan are seeking the WTO membership, and the CU legislation in most cases is drafted in compliance with WTO agreements.

<sup>16</sup>The Customs Union Commission (2009a, b, c).

<sup>17</sup>WTO (1994).

The SPS measures applicable to foods are based on a risk analysis of any adverse effects associated with a particular food additive, contamination, toxin, or micro-organism present in food, drink, or animal feed. The member states are restricted to the measures described in the agreements, although they are allowed to introduce their own interim SPS measures provided that:

- there is a substantial deterioration of the sanitary and epidemiological safety;
- there is trustworthy information on existing threats to sanitary and epidemiological safety, or an additional SPS measure was introduced by a non-member state;
- There is a documented proof of unsafe goods circulated in the territory of the member state.

Additional SPS measures should be transparent, with all other member states and third countries appropriately informed on new procedures and inspections.

The agreement on sanitary measures reads that member states share a single list of goods subject to the sanitary and epidemiological control.<sup>18</sup> Products on the list must conform to the Uniform Sanitary Requirements<sup>27</sup>, which describe detailed hygienic requirements to goods on the market (foods are covered in Chapter 2). The requirements contain two chapters and 23 sections that list sanitary criteria for various categories of goods. In particular, section 1 of chapter 2 describes requirements for the safety and nutritional value for foods, and contains over 400 pages of specific safety criteria applicable to foods and food raw materials. Sections 22 and 23 list safety parameters for food additives and technological aids. Harmonizing the SPS and veterinary measures was an important step in reducing trade barriers.

### ***53.2.2 Common Principles of Technical Regulation***

The Union system of technical regulation was designed with the purpose of removing non-tariff and technical barriers to trade between member states, and offsetting trade protectionism policies to which the member states often resorted during trade disputes. The system is based on five interstate agreements (Table 53.1) that harmonized national technical regulations and defined common principles shared by the member states, such as maintaining the safety and conformity of goods, along with processes of manufacturing, transportation, storage, sales, and disposal.

The system operates through special legislative acts called “technical regulations” that make up an integral part of the Union legislation and, as such, have direct enforcement in the member states. In other words, technical regulations adopted by the Eurasian Commission do not require further adoption or approval by national parliaments or governments. A technical regulation is a document that describes harmonized mandatory safety requirements for goods and processes. The member

<sup>b</sup>CU Commission (2010b)

<sup>c</sup>CU Commission (2008b)

<sup>d</sup>CU Commission (2006)

<sup>e</sup>CU Commission (2008a)

states have identified the single list of 66 goods categories<sup>19</sup> for which mandatory safety requirements must be described by technical regulations. These categories include oil and gas, machinery, railways, roads, cars, ships, lifts; food products, animal feed, and grain.

Goods included in the single list have to pass the conformity assessment, which is a pre-market approval process of evaluating product characteristics against the mandatory requirements described in the technical regulations. The assessment should take place *before* goods are imported and/or marketed in the Union. The conformity is formally endorsed by a declaration of conformity issued by a goods manufacturer/owner, or by a conformity certificate produced by an accredited certification authority.

The declaration of conformity is a statement by the manufacturer or importer that the goods conform to the mandatory requirements outlined in the technical regulations. All foods require a declaration of conformity (except those subject to the state registration). Declarations have to be registered in the Union electronic

<sup>19</sup>Eurasian Commission (2012b).

**Fig. 53.2** Eurasian conformity symbol

database, as implied by the agreement on establishing the common information system in the sphere of technical regulation and SPS measures.<sup>20</sup>

The agreements on common technical regulatory principles and policies hold that a food operator, manufacturer, or importer bears full responsibility for the safety and quality of goods that they bring to the market.<sup>21</sup> At the same time, certification authorities that issue conformity certificates or register manufacturer's (importer's) declarations are responsible for the authenticity of test results and the entirety of the procedure needed to run the conformity assessment. Goods that pass the conformity assessment and are certified or declared as compliant should be labeled with the Eurasian conformity symbol (Fig. 53.2). The symbol is designed to inform consumers that a product has passed all necessary conformity procedures as prescribed by relevant technical regulations.<sup>22</sup> By legislating conformity between the products that pass across Union internal borders, member states understand that they importing a safe and consistent product.

### ***53.2.3 Technical Regulations and Interstate Standards***

The Union agreement on uniform principles of technical regulation implies that Union technical regulations are always given priority over the national safety norms and standards of the member states.<sup>23</sup> Furthermore, member states have committed to harmonizing their respective national standards and norms with the regulations in the case they are different or contradictory. The agreement states that the primary purpose of technical regulation is to protect the health and life of consumers, as well as to ensure safety of the environment. The regulation should also be designed to prevent misinforming or misleading consumers.

In general, technical regulations are drafted by an appointed member state which has to follow a uniform drafting and submission procedure approved by the Council of the Eurasian Commission.<sup>24</sup> A technical regulation should clearly specify: the goods that are covered, key safety requirements (including sanitary, hygienic, and

---

<sup>20</sup>CU Commission (2008a).

<sup>21</sup>CU Commission (2008b, 2010b).

<sup>22</sup>CU Commission (2006).

<sup>23</sup>CU Commission (2010c).

<sup>24</sup>Eurasian Commission (2012a).

veterinary criteria), rules to be followed in product identification and conformity assessment, basic principles of the in-market surveillance, and responsibilities of government authorities.

Once the regulation has been drafted and submitted to the Eurasian Commission by the appointed member state authority, the Commission publishes the text for public discussion and accepts comments and proposals from the public, industry groups, and non-government organizations. The text is then revised to account for all comments and proposals received during the hearing before being forwarded to the member states for interstate approval. The final step is a Commission ruling to formally adopt the regulation.

The first technical regulations adopted were constructed to account for as much detail as possible. The goal was to make them a single point of reference that could address or resolve any technical aspect of product circulation and safety. Thus, the technical regulation TR TS 021/2011 On Safety of Foods, adopted in 2011, detailed the specific food safety criteria for numerous categories of foods including meat, milk, sea foods, oil and fats, confectionaries, specialized foods, and dietary supplements. This approach was justified at the earlier stages of the Union as the regulator wanted to introduce fast and universal regulations that could immediately cover safety issues for the most vulnerable and high-risk industries, with foods being top priority. These universal (or horizontal), technical regulations were designed to cover a broad range of goods. Today, however, specialized (or vertical) regulations, which cover only a specific group within the category of goods, are most preferred.

The CU has adopted 35 technical regulations, which cover just over half of the 66 categories of goods that are considered to pose a risk to the human health and wellbeing.<sup>25</sup> The Eurasian Commission aims to adopt any missing technical regulations within the next several years. In the food sector ten regulations have been adopted to date, including the horizontal regulation TR TS 021/2011 On Safety of Foods, and TR TS 021/2011 Labeling of Foods (Fig. 53.2).

Technical regulations describe product or process safety requirements including safety-related technical specifications, and codes of practice. Technical regulations are always accompanied by a list of international or interstate standards that must be used in conformity assessment of goods to the mandatory safety requirements. They may also be supplemented by technical guidance that outlines how to comply with the requirements of the regulation, also called a 'deemed-to-satisfy' provision. It is important to note that if a product falls under the scope of more than one technical regulation, that product should conform to the requirements listed in all applicable regulations.

In conclusion, it should be emphasized that while Union technical regulations describe general provisions and criteria of product safety and conformity, in specific measurements and detail they rely on interstate standards adopted by the CIS Interstate Standardization Council, or on international standards issued by a

---

<sup>25</sup>Koreshkov (2014).

recognized international authority.<sup>26</sup> The standards are more detailed and technically comprehensive than the regulations—they typically describe a test method, a specific product characteristic, or a particular handling procedure. A recent report by the Russian Technical Regulation Agency shows that despite government effort and member state commitment, there is still a big gap between the number of standards that have to be developed in support of the adopted technical regulations, and those that are actually enacted (or taken at least to the development stage).<sup>27</sup> As of 2014 there are over 2400 standards awaiting development in order to provide support for adopted and drafted technical regulations. The technical regulations are designed to protect consumers, and as implied by the agreement on uniform principles, they take precedence over individual state standards.

### 53.3 Food Technical Regulations

In this section, we look in detail at the Union food regulations and analyze mandatory safety requirements. This includes an examination of the fundamental principles and important regulatory concepts of the horizontal food regulation TR TS 021/2011 On Safety of Foods. Special attention is given to the use of the food additives and technological aids.

We also discuss the subject of the pre-market approval—a safety concept that envisages the formal approval of foods before they enter the market. Understanding this concept is of paramount importance for ensuring undisturbed food imports to the Union member states. A separate section describes basic import requirements for foods. The national authorities responsible for food market surveillance are briefly mentioned in the final part of the section.

#### 53.3.1 *Regulatory Framework and General Safety Requirements for Foods*

As of 2016, the Union has adopted ten technical regulations related to the circulation of foods, four of which are horizontal and cover safety aspects for all foods:

1. TR TS 021/2011 On Safety of Foods,
2. TR TS 022/2011 Labeling of Foods,
3. TR TS 029/2012 Safety Requirements for Food Additives, Flavorings and Technological Aids
4. TR TS 005/2011 On Safety of Packaging

---

<sup>26</sup>For Example, the International Organization of Standardization (ISO).

<sup>27</sup>Zazhigalkin (2014).

The horizontal regulations describe basic principles of food safety, list hygiene and microbiology criteria per food category, and establish key general requirements for food labeling and food packaging.

The Eurasian Economic Commission has also adopted six specialized vertical regulations that cover meat, milk, grain, fruit and vegetable juices, specialized foods (medical and preventive), and oil and fats. For food categories not listed and not covered by respective technical regulations, general provisions of the TR TS 021/2011 and TR TS 022/2011 are applied together with respective sections of the Uniform Sanitary Requirements. Since both technical regulations and Uniform Requirements address foods safety, they are closely related and often have overlapping safety standards, as seen for example for the microbiology and hygiene criteria for foods.

Figure 53.3 schematically represents the relationship between the Uniform Sanitary Requirements, horizontal technical regulations, and vertical technical regulations.

The fundamental objective of the TR TS 021/2011 On Safety of Foods regulation is to achieve the highest level of protection for consumer health. All raw materials and components of food products, including additives, are treated the same way as consumer foods and are subject to the same safety requirements and procedures. For food handling processes such as manufacturing, transportation, storage, sales, and disposal, the regulation introduces risk management recommendations based on the hazard analysis of critical control points (HACCP).<sup>28</sup> Implementation of HACCP principles is mandatory in food manufacturing.

The regulation TR TS 021/2011 defines foodstuffs as products of animal, plant, microbiological, mineral, artificial, or biotechnological origin in their natural,

**Fig. 53.3** Schematic representation of the food regulation structure in the Union. The sanitary requirements are designed to address mostly hygienic aspects of food safety however they often overlap and duplicate safety requirements listed in the horizontal and vertical technical regulations

<sup>28</sup>Fortin (2009).

treated, or processed form. Foodstuffs are intended to be consumed by humans as food. In addition to traditional foods, the definition of foodstuffs covers the following categories:

- foods for special use,
- drinking water filled in containers and drinking mineral water,
- alcohol (including beer and beer drinks),
- non-alcoholic drinks,
- bioactive (food) supplements,
- chewing gum,
- probiotic cultures and/or microorganisms,
- food additives and flavors,
- and any raw materials used in food manufacturing.

There is a key difference between this definition that cover foods only, and the concept used in the EU food law. The latter additionally includes feed produced for, or fed to, animals raised for food. Thus, the supply chain that falls under the scope of the Union food regulation is one step shorter than that of the EU, where it starts from unprocessed or untreated food raw materials used in animal feed manufacturing.

The TR TS 021/2011 offers an extensive and risk-based safety criterion that includes:

- microbiology criteria and hygienic requirements of consumer foods (Annexes 1–3),
- irradiation tolerances (Annex 4),
- requirements for unprocessed raw materials of animal origin (Annex 5),
- and microbiology criteria for fish and seafood (Annex 6).

There is also a separate list of pesticides that are not allowed in manufacturing of raw materials of baby foods.

The TR TS 021/2011 has introduced three new concepts that cover foods with modified composition, novel foods, and foods with intended health effects. The first concept defines ‘foods for special use’ as foods with a tailored composition: those that possess a claimed effect or benefit for human health and are designed for consumption by a targeted population group. The second concept covers novel foods that do not have a prior history of safe use in the Union. In particular, novel foods include foods with altered molecular structure; foods produced from, or consisting of, microorganisms, micro fungi and/or algae, plants, and animals; and foods sourced from genetically modified organisms (GMOs) or nano-structures.

The third concept deals with regulating enriched or fortified foods. The term ‘enriched or fortified foods’ refers to those that contain nutrients, probiotics, or bioactive substances that have been added during manufacturing or processing. In most cases, the amount of added substance should be above 15 % of a recommended daily allowance value.

The TR TS 021/2011 implies that industrial facilities intended for the processing or handling food raw materials of animal origin be authorized—that is, registered

with state authorities—before being operated. This requirement is mandatory for slaughterhouses, milk and egg farms, and fish and seafood farms. The registration process includes submitting an application for the state permit and, once the permit is issued, registering the facility in the electronic database. Other types of manufacturing facilities that handle foods or food components are not required to register, although their owners must notify authorities on the nature and the size of the operation.

In 2012, the Eurasian Economic Commission adopted horizontal regulation TR TS 029/2012 On Safety of Food Additives, which summarized complete requirements for the use of food additives, flavorings, and technological aids across all product categories that fall under the definition of foods. In addition, the law deals with foods that contain additives, bioactive substances in the form of flavoring and color,<sup>29</sup> and technological aides. It also describes the safety requirements for related processes of manufacturing, storage, transportation, and disposal of the additives.

The regulation lists all additives that are permitted in foods in classes as defined by the International Numbering System for Food Additives.<sup>30</sup> In general, the Union positive list of additives is similar to the Codex Alimentarius General Standard of Food Additives and European list approved by EU regulation 1131/2008.<sup>31</sup> At the same time, TR TS 029/2012 lists as approved some plant-origin additives that are not on the EU positive list, such as RED RICE color, extract of licorice, extract of *Acantophyllum* root, and the leaf powder and syrup of *Stevia Rebaudiana* Bertoni. Overall, the TR TS 029/2012 regulation represents a comprehensive guide for food manufacturers on what additives can be used in what foods, and in what amounts.

Annexes 3–8 of the regulation describe maximum limits of food additives as defined per food category. Annex 10 specifies a list of foods for which only selected colors are allowed, and Annex 18 describes foods for which only selected additives may be used.

### ***53.3.2 Pre-Market Approval of Foods***

The technical regulation TR TS 021/2011 On Safety of Foods reads that food manufacturers and importers are allowed to take their products to the market only after passing a pre-market assessment of conformity to the mandatory requirements. Essentially, this process is an assessment that goods meet requirements of technical regulations, which is run by national authorities responsible for the safety of all

---

<sup>29</sup>Augustin and Sanguansri (2012).

<sup>30</sup>Codex Alimentarius (1989).

<sup>31</sup>EU Parliament (2008).

**Fig. 53.4** Forms of conformity assessment adopted in the Eurasian Economic Union

goods imported or manufactured in the Union territory. Depending on the category of the product, the pre-market approval of foods could take the form of:

- a declaration of conformity;
- state registration (including state registration of novel foods, bioactive supplements, and GMO foods), and/or
- veterinary-sanitary expertise (applicable only to goods subject to the veterinary control, mostly materials of animals and maritime origin) (Figure 53.4).

The Annex 9 of the Union Treaty clarifies the difference between terms conformity approval and conformity assessment which have often been confused by regulators and the industry alike. The conformity approval is defined as a documental prove of conformity with mandatory requirements of technical regulations (e.g. certificate, declaration, permission, etc). The conformity assessment is a direct or indirect examination of product properties and characteristics.

The declaration of conformity is issued based on evidence collected by a declarant (a manufacturer or an importer) or a third party (an authorized certification body). The evidence should clearly demonstrate that the product being declared was produced under strict manufacturing control and, as a result, complies with the safety criteria listed in technical regulations or the interstate standards referred to in the regulations.

The declaration of conformity is the simplest form of the pre-market approval. It differs, too, from the notification widely used in the US and the EU, as the declaration must be supported by reliable evidence of compliance with the regulations. In the Union, all foods, except those being subject to state registration (see below), require declaration of conformity before being imported or marketed in member states. The declaration must be issued in the standard form approved by the Eurasian Economic Commission.

Before being officially issued, the declaration is submitted to a certification authority, which evaluates the body of evidence presented in support of the declaration. On the authority's approval, the declaration is recorded in the Union database of conformity declarations and henceforth regarded as released. The

validity period of the declaration can vary depending on the approval procedure chosen by the declarant. For example, the declaration could be issued for a specific product batch or a limited period of product supply. On no accounts, however, is it to exceed 5 years.

The second type of pre-market conformity assessment is state registration, seen by many manufacturers and importers as the most rigid and time-consuming procedure. According to the TR TS 021/2011 regulation, manufacturers and importers must register all foods for special use, including bioactive supplements and novel foods. In the Russian Federation foods are registered by the Federal Service on Customer's Rights Protection and Human Wellbeing Surveillance (Rospotrebnadzor). In the Republics of Belarus and Kazakhstan, registrations are run by the national Ministries of Health. The registration consists of an expert review of the product dossier, as well as laboratory safety tests and analyses. The official length of time for processing a complete product dossier and completing the laboratory analyses is 40 days from the submission date. In practice, however, the procedure could take several months depending on the quality of submitted documentation and the scope of analytical work required.

As mentioned above, conformity assessments are mutually recognised by the member states/The accreditation of laboratories, certification bodies and assessment centres is also guided by the principle of mutual recognition which implies that all accredited bodies in one member state are recognised in two others. However, a laboratory or centre that resides in one member state may apply for accreditation in another member state only if its national accreditation authority does not cover a particular area of accreditation (goods tested, tests performed etc).

### **53.3.3 Import Requirements**

The Eurasian Union Treaty implies that the member states share a single customs territory.<sup>32</sup> Therefore, the customs authorities of the five member states use a uniform customs code and a harmonized procedure of customs clearance for imports from third countries. This procedure requires all food shipments that are imported to the Union territory to be accompanied by documents of conformity approval as assigned by the TR TS 021/2011 technical regulation.

It is essential to consult the TR TS 021/2011 on what types of conformity assessment to follow for specific foods before importing to the Union. As described in the previous section, all foods need to pass a pre-market assessment that generates either the declaration of conformity or the product registration certificate. In addition, some foods will need to pass sanitary, veterinary and/or phytosanitary inspections. The Eurasian Economic Commission maintains three lists of goods, grouped in accordance with international harmonization codes, which require safety assessment

---

<sup>32</sup>EurAsEC (2007).

at the CU customs border. The first list defines goods that are subject to sanitary-epidemiological inspection at the border—the inspection is run to evaluate the hygiene safety of the shipment and review documents that testify the goods' safety.

The second list describes goods that are subject to veterinary inspection. The clearance of these goods will require submission of a veterinary certificate issued by the country of origin, and/or an import permit issued by a member state authority. The third list of goods requiring customs clearance is for products containing potentially contaminated units. These require the submission of a phytosanitary certificate that has been issued by the country of origin.

### ***53.3.4 In-Market Surveillance Authorities***

In the Union, the in-market surveillance of foods' conformity to technical, sanitary, veterinary, and phytosanitary regulations remains the responsibility of the national authorities.

In the Russian Federation, the Rospotrebnadzor was appointed to supervise compliance with technical regulations in consumer markets (including food). The Rospotrebnadzor functions as a consumer market watchdog: it runs the state registration of novel foods, foods for special use, and bioactive supplements. It also processes notifications from manufacturers on new food products. In contrast to processed products, the safety and conformity of raw food materials and unprocessed/untreated foods is controlled by the Federal Service of Veterinary and Phytosanitary Surveillance (Rosselkhoznadzor) under the Ministry of Agriculture. Broad supervisory functions of the Rosselkhoznadzor cover veterinary safety, plant quarantine, circulation of pesticides and agrochemicals, and good land cultivation practices. The service also supervises the circulation of grains and cereals, two categories that remain one of the largest and strategic agricultural export commodities for Russia and other Union member states.

In Republic of Belarus, the state authority on food markets is shared between the Ministry of Health and the Ministry of Agriculture. The Belarus Ministry of Health runs consumer market surveillance and sanitary monitoring, while the Ministry of Agriculture is responsible for veterinary and phytosanitary measures. In Kazakhstan, the recently established State Agency of the Consumer Rights Protection has been put in charge of food safety. This new body ensures product compliance to the requirements of the Union technical regulations, a responsibility that was formerly under the Ministry of Industry and New Technologies. It also monitors sanitary-epidemiological safety, a task that was previously observed by the Ministry of Health. In addition, the Agency is responsible for registering foods for special use with the state.<sup>33</sup>

---

<sup>33</sup>Foods for special use make up an important category of products designed for consumption by specific population groups, and for specific purposes.

## 53.4 Case Studies

Two case studies in this section discuss labeling requirements, product claims, and food advertising in the Union, highlighting practical aspects of the technical regulations.

The first case presents a detailed analysis of two technical regulations, TR TS 022/2011 and TR TS 005/2011, which cover food labeling and packaging requirements. It is useful in demonstrating practical use of provisions provided in the technical regulations. The second case covers the specifics of the dossier submission for state registration of foods for special use.

### 53.4.1 *Case Study I: Consumer Information on Food Products*

#### 53.4.1.1 Labeling Requirements

Providing consumers with full and trustworthy information is one of the most important responsibilities of food manufacturers and importers. The Union law implies that conformity approval for foods extends beyond the product itself and covers its packaging and labeling as well. According to TR TS 022/2011 Labeling of Foods, the information on the label of any food product must conform to a number of mandatory requirements. The most essential of these include:

- product name,
- composition (the list of ingredients),
- net quantity,
- date of manufacture,
- manufacturer and importer details,
- nutritional value,
- GMO information, and
- Eurasian conformity symbol (figure 53.1).

In what follows below, each requirement is described in detail. The name of a food product should reflect the product's essence and allow for easy product identification and differentiation. The name should not directly or indirectly refer to components that are not present in the product.

The composition (list of ingredients) should be listed on the product label in order of decreasing weight percentage. Food additives may be referred to by their chemical names and/or INS number according to the International Numbering System. In this context, some specific requirements for information on food additives need to be mentioned. Foods containing polyol sweeteners should be labeled with a warning statement that the product contains sweeteners and may cause

diarrhea if consumed irresponsibly. For foods with added so-called Southampton colors, Carmoisine E122, Tartrazine E102, Quinolone Yellow E104, Sunset Yellow E110, Allura Red E129, and Ponceau 4R E124, there must be a warning statement that the components could adversely affect children's activity and concentration.<sup>34</sup> Finally, the TR TS 022/2011 regulation contains an extensive list of 15 categories of allergens and substances that should be avoided by people with certain diseases. Examples include broad food categories such as nuts, eggs, seafood, and milk, as well as specific substances like aspartame and sulphur dioxide.

The net quantity of foods must be quoted in a weight or volume measure, or in the number of product units. TR TS 022/2011 also allows the use of two measuring units at the same time—for instance, mass/volume. It is *not* permissible to indicate an approximate amount of product or give a range of quantities such as “around 100 g” or “100-150 grams”.

It is also essential to include the date of manufacture on the packaging. The format of the manufacture date depends on the product's shelf life. For shelf lives of less than 72 h, the date of manufacture should include the hour, day, and month. Shelf lives up to 3 months require indication the day, month, and year of manufacture. Anything longer than 3 months only requires listing the month and year.

Foods must contain manufacturer and importer details. Products that were manufactured at one facility and then packed in another have to be labeled with the information of both facilities. The same approach needs to be used for foods that were produced by more than one manufacturer, provided the information allows a consumer to clearly identify the manufacturer of the packaged product.

Information on the nutritional value should reflect the energy value (in calories), as well as the amount of protein, fat, and carbohydrates in the product. This requirement is not mandatory for foods that contain less than 2% of the recommended daily allowances for energy and macronutrient intake, as defined in Annex 2 of regulation TR TS 022/2011. The amounts of vitamins and minerals that are added to foods during manufacturing must be included in the nutritional value information. Vitamins and minerals may also be quoted as part of the nutritional value if their amounts per 100 g or 100 ml of the food product exceed 5% of the recommended daily allowance (listed in Annex 2 of regulation TR TS 022/2011).

Manufacturers must also disclose the use of any genetically modified organisms (GMOs) on the label, if present in amounts over 0.9%. This should be in the form of a “genetically modified product” statement on the packaging. The regulation does not require a GMO statement for foods that contain GMOs as “technically unavoidable residue” in amounts less than 0.9%.

Finally, foods that receive conformity approval need to be labeled with the Eurasian Conformity symbol (as described in Sect. 53.2.2). The labeling should also provide information about the product's shelf life, storage conditions, and instructions for use or cooking instructions.

---

<sup>34</sup>Abbey et al. (2014).

**Fig. 53.5** Symbols of food-contacting and recyclable packaging to be used in food labeling, according to the TR TS 005/2011 technical regulation

As of 2016, the CU has not yet adopted a specific regulation that would cover food-contacting materials.<sup>35</sup> These issues are currently regulated by the horizontal technical regulation TR TS 005/2011 On Safety of Packaging which regulates safety of all packaging and packaging materials. In particular, Annex 1 of the regulation lists sanitary and hygienic criteria for food packaging and food-contacting materials, as well as test methods and testing models. The regulation additionally requires that food-contacting materials be labeled with a special “suitable for foods” symbol. Recyclable packaging should be marked with the Mebius loop (see Fig. 53.5).

The packaging materials, along with the packaging itself, need to have declarations of conformity issued before being used for food products and released on the market. As with food items, packaging that passes conformity approval needs to be marked with the Eurasian conformity symbol (see Sect. 53.2.2).

### 53.4.2 Advertising

In 2013, food was the second largest category of goods advertised on Russian TV, trailing only behind pharmaceuticals.<sup>36</sup> Despite the significance of advertising in the marketing of food products, advertising regulations are not yet harmonized across Union member states which often apply rather different approaches in regulating advertising. In the Republic of Kazakhstan, for example, Law No. 508-II “On Advertising” does not contain any references to foods or food products at all. By contrast, the Republic of Belarus and the Russian Federation have tighter policies, as explained below.

In the Republic of Belarus, Law No. 225-Z “On Advertising,” adopted in 2007, was recently amended with Article 15–1 “Advertising for bioactive (food) supplements.” The amendment introduced the following provisions relating to bioactive

<sup>35</sup>In 2013, the Russian Federation initiated work on drafting new CU technical regulation dedicated exclusively to food-contacting materials. It is not yet clear how the new law would interact with the existing regulation TR TS 005/2011 as both would cover the same safety aspects of food-contacting materials.

<sup>36</sup>TNS Global (2014).

(food) supplements, which comprise one category of Foods for Special Use. Article 15–1 states that:

1. Advertising for food supplements is permitted only with approval from the Belarusian Health Ministry. In other words, adverts must be pre-approved before going public.
2. Advertising for food supplements that have not passed through the state registration process is prohibited.
3. Advertising for food supplements must contain: the name of the supplement producer (manufacturer); information indicating that the product is a food supplement, and not a medicine nor intended for treating diseases; and information advising consumers to read the instructions carefully.
4. Advertising for food supplements must *not* contain: information directly appealing to the underage; statements or suggestions implying that the target audience has certain conditions that require the use of the advertised product; statements which may give healthy people the impression that they need to consume the advertised product; suggestions of possible financial reward in exchange for purchasing the advertised product; and information which does not correspond to the information mentioned on the food supplement retail label.

In the Russian Federation, Federal Law No. 38-FZ “On Advertising” contains special provisions related to the advertising of baby foods, food additives, and bioactive (food) supplements. In relation to baby foods, for instance, the Law forbids positioning infant formulas as a replacement to breastfeeding or to state that infant formulas are advantageous for child development. In addition, Article 25 of the Law reads that advertising of baby foods, food additives, and bioactive (food) supplements should not:

- form the impression that additives and supplements are medicines and/or have therapeutic properties;
- contain references to concrete instances of people recovering or experiencing a health improvement as a result of using such products;
- contain praises of dietary supplements from individual persons;
- impel the consumer to give up healthy nutrition; and
- suggest certain advantages of a supplement or an additive by making references to the results of the mandatory testing undertaken for the pre-market approval process (state registration), or the results of any other tests that have been performed with the product.

### **53.4.3 Product Claims**

Until recently, claims for food products remained a largely unregulated area of food labeling and marketing. Currently, there is no harmonized procedure for approving claims for food products in the Union. Manufacturers have no clear guidance what

evidence to submit and what criteria are used in consideration of claim applications. Instead, the consumer market authorities in member states make individual ad-hoc judgments on product labeling and consumer information during the pre-market approval process.

The technical regulation TR TS 022/2011 on Labeling of Foods made the very first attempt to introduce the term “nutrition claims” and define a criterion for its use in labeling across all food product categories. The regulation describes specific nutrition claims and the conditions for their use (see Table 53.2).

The regulation reads that claims are part of the general description of a product’s discernible characteristic, which manufacturers may voluntarily include to inform consumers about their products. The claims, however, may only be used if the “conditions for use” terms are met. Claims must be accompanied by scientific evidence. This evidence may be produced independently, by the applicant, or by a third party. An organization or an individual responsible for releasing the food product into the Union market should keep the evidence and supporting documents, and they must be made available on request of national or Union authorities.

A nutrition claim is, in fact, the only type of claim about a food product that is permitted and regulated in the Union. The current legislation lacks the whole set of definitions adopted in the USA and the EU that address health claims, functional

**Table 53.2** Selected examples of nutrition claims that can be used as described in Annex 5 of the TR TS 022/2011

Claim	Condition of use
<b>Low in calories</b>	Energy value is below 40 kcal per 100 g of solids or below 20 kcal for liquids. For sweeteners consumed as a sugar replacement, the value is below 4 kcal (sweetening value is equal to 6 g of sucrose).
<b>Source of protein</b>	The amount of protein contributes at least 12 % of the product’s energy value, provided that this amount is at least 5 % of the recommended daily allowance (RDA) of protein per 100 g of solids or 100 ml of liquids.
<b>Low fat</b>	Fats amount to less than 3 g per 100 g of solids, and less than 1.5 g per 100 ml of liquids.
<b>Source of fiber</b>	Product contains at least 3 g of fiber per 100 g of solids, or at least 1.5 g per 100 ml of liquids.
<b>High levels of vitamins and minerals</b>	Vitamins and minerals constitute at least 30 % of RDA per 100 g of solids, per 100 ml of liquids, or per portion.
<b>Low level of sodium (table salt, sodium chloride)</b>	Level of sodium (or its sodium chloride equivalent) is below 0.04 g per 100 g of solids or 100 ml of liquids.
<b>No cholesterol</b>	Amount of cholesterol is below 0.005 g per 100 g for solids or 100 ml of liquids, under condition that the product contains less than 1.5 g of saturated fatty acids per 100 g of solids or less than 0.75 g per 100 ml of liquids.

claims, qualified claims, and others. Gaps in legislation do not help food marketing and hinder food trade with the rest of the world.

It should be noted that there is no uniform Union-wide procedure in place for conducting an assessment (expert evaluation) of claims for market approval. National authorities deal with existing market practices and new products on a case-by-case basis, randomly allowing some claims and repelling the others.

## **53.5 Case Study II: Registration of Foods for Special Use**

### ***53.5.1 Classification of Foods for Special Use***

TR TS 021/2011 On Safety of Foods introduces a new classification of products for special use. Under this criterion, they can be categorized as:

- Baby foods, including drinking water (split into three age categories: babies of 0–3 years, pre-school age of 3–6 years, and school age of 6 years and older).
- Dietetic medical foods—defined as foods with controlled nutrition and energy values, and physical and organoleptic properties. They are to be used in medical diets.
- Dietetic foods for disease prevention (prophylactic) purposes—defined as those used for correcting carbohydrate, fat, or protein metabolism; those with a modified ratio of ingredients, those containing foreign substances (components); or those designed to reduce the risk of disease.
- Mineral water with mineralization of at least 1 g/L, or containing bioactive substances.
- Sport foods—defined as foods of specific chemical composition, designed to have increased nutritive value and/or a tailored effect to improve the adaptive human response to physical and emotional stress.
- Foods for pregnant and breast-feeding women.
- Bioactive (food) supplements—defined as natural (or identical to natural) biologically active substances, including pro-biotic microorganisms, which are designed to be taken with food or made part of food products.

As has already been noted throughout this text, Foods for Special Use must pass a pre-market approval in the form of state registration before they can be marketed and sold.

### ***53.5.2 Registration Dossier***

All required documents in the registration dossier have to be issued in their original version, officially translated and approved by a notary. A typical dossier should include the following documents:

1. A formal registration request and a filled-in application form.
2. Power of attorney authorizing the applicant to apply for product registration, unless the product manufacturer or importer applies directly.
3. Documents issued by the applicant or by authorities in the product's country of origin testifying that the product is food and is safe for human consumption. These documents include:
  - a hygienic certificate, health certificate, or safety certificate;
  - a declaration that the product does not contain nano-materials, GMOs, hormones, or pesticides;
  - a free-sale certificate;
  - a certificate on the legal status of the manufacturing facility in the country of origin;
  - information about the country of origin authority that is responsible for legal compliance of the product.
4. A full ingredients list, including data from the quantitative and qualitative analysis, signed and stamped by the manufacturer.
5. A short summary of the manufacturing process, signed and stamped by the manufacturer.
6. An explanatory note on the product's special use, including:
  - indication of the recommended daily dose;
  - recommended duration of intake;
  - contraindications, if any;
  - support of any health benefit claims by clinical study reports or other scientific data;
  - documents containing a toxicological and hygienic assessment of the product;
  - restrictions of use, if any; and
  - efficacy.
7. Foods that contain herbal ingredients additionally require:
  - manufacturer's declaration that the product does not contain narcotic and psychotropic substances;
  - information on the herb's scientific botanical name and the mode of preparation (e.g. extract—1:4, solution—1–10, etc.).
8. Foods that contain live microorganisms additionally require:
  - information on the category and type of microorganism (name should be given in Latin);
  - information of the name of the strain and registration information (such as passport, certificate, or similar).

9. Foods that contain GMOs additionally require a manufacturer's statement on the ingredients obtained from genetically modified sources,
10. Sports foods require additional documents for dossier submission, including:
  - manufacturer's statement that the product does not contain substances classified as doping.
11. Mock-up of a product label and a sample of the original label both sealed with the manufacturer's company seal.
12. 10 product samples.
13. Completed form of the random sampling report sealed with the manufacturer's company seal, specifying time and place of sample selection, the quantity and names of samples, manufacturer's address, manufacturing date, and names and positions of staff members who collected the samples.
14. Notarized approval of the translation for all documents listed above.

## 53.6 Conclusion

The economic and political integration in the CIS area has been gathering momentum after the CIS free-trade zone, established in the early 2000s, was transformed into a fully functioning Customs Union and most recently into the Eurasian Economic Union. The single consumer market has also been developing with food and agriculture sectors at the forefront of legislative, regulatory, and supply chain unifications.

The Union member states still need to resolve disagreements on the regulatory front, as they have become stumbling blocks on the path to closer integration. At the top of the issue list is inconsistency between sanitary and technical regulations. In addition, there continues to be in some cases a straight conflict between Union technical regulations and member states' national standards and norms.

On the one hand, in Kazakhstan, national food sanitary norms (SanPiN) have been left completely unrevised to account for newly adopted technical regulations in the Union, thereby creating conflicts with the national legislation.<sup>37</sup> On the other hand, the Republic of Belarus continues with its state program of expanding the national system of technical standards. The Belarusian government regularly introduces new classifications of foods and imposes excessive safety requirements on the top of what has been written in the Union technical regulations.

Another challenge for Union members has to do with the absence of interstate technical standards which are urgently required to support the enforcement of the technical regulations. Instead, market operators are left with the responsibility of declaring the conformity of their own goods, but they lack a clearly defined criteria and testing method for doing so.

---

<sup>37</sup>World Bank (2012).

It also needs to be noted that the Treaty of the Eurasian Economic Union introduces two important principles still to be fully realised. First, it declares that a member state authority responsible for the market surveillance cannot simultaneously be in charge of the conformity assessment. In the Russian Federation, for example, the market watchdog Rospotrebnadzor currently combines the functions of market surveillance with the responsibility of running the product registration of Foods for Special Use. Second, the treaty emphasizes that national law and safety requirements are no longer applicable if there is a respective Union technical regulation that covers safety of goods and processes in question.

Republics of Armenia and Kyrgyzstan have become most recent members of the Treaty and more countries are considering joining, including Tajikistan and Uzbekistan. The Union is now driven by mostly transparent and WTO-compliant legislation. Since Russia's and Kazakhstan's WTO accessions, the Union legislation has been developing in line with Russia's WTO agreement, regardless of the fact that Kyrgyzstan is not a WTO member. For instance, Russia systematically pushes amendments to the Union tariff code along with its WTO commitments. In the same manner, the WTO sanitary and phytosanitary measures agreement is taken into account when new technical regulations are drafted or sanitary measures are applied.

Russia has been engaged in close discussion with the Organization for Economic Co-operation and Development (OECD) on membership, which would trigger the application of the OECD principles in accreditation and analytical services in the Union. In particular, good laboratory practices<sup>38</sup> and a mutual recognition of laboratory results and data between OECD members would greatly facilitate the conformity approval of imported products in the Union.

At the same time, however, food markets could face more rigid state regulation considering growing concerns over the safety of food supply chains both regionally and globally. With so many international operators involved in the manufacturing and marketing of a single food product, the Commission and national market authorities find it increasingly difficult to control the quality and safety of foods at different stages of a product's circulation in the market. Thus, we expect that pre-market approval (declarations, product registrations) will remain an integral part of the regulatory system for the foreseeable future.

Finally, the member states are increasingly concerned that they continue to top global charts of non-communicable disease rates, while the scientific community unanimously agrees that unhealthy food choices and poor dietary habits represent a serious health risk. In both Kazakhstan and Russia, the state policies for national healthcare development seek to promote healthy nutrition and strengthen the local production of foods for special use, enriched foods, and bioactive supplements.<sup>39</sup> It has been frequently repeated that a consolidated effort from the government and the industry is required to reduce vitamin and nutrient deficiencies amongst the

---

<sup>38</sup>OECD (2014).

<sup>39</sup>The Government of the Russian Federation (2010).

general population. In the next decade, therefore, we could see more regulations aimed at facilitating the manufacture and distribution of “healthy” foods, including foods for special use.

## Israeli Regulation and Policy of GM Food and Crops

Ronit Justo-Hanani

**Abstract** Israel's policy on GMOs during the past decades focused primarily on managing its agricultural research and development to promote national economics. Similar to the European Union's policy on the same issue, one of the critical and most important activities for Israel are GM crops, over which the government has asserted formal authority. *Israeli law permits the development and growth of genetically modified organisms (GMOs) for research purposes in accordance with requirements established by subsidiary legislation.* This chapter explores Israel's environmental and safety policy on GM food and crops and places it in an explanatory perspective. First, this chapter briefly outlines the Israeli GMO policy, and the differences in the development of GM regulations for different sectors. Second, the chapter continues to analyze the governmental, legal and regulatory frameworks for sectoral activity on GMOs. Third, the chapter follows with an examination of the roles of economic interests, institutional structure and cultural factors in explaining Israel's GMO policy. Fourth, the discussion points to contemporary developments and their implications for sustainability. Finally, the chapter concludes by emphasizing the importance of sustainability in providing a basis for the development of future policy.

### 54.1 Introduction

This chapter explores Israel's environmental and safety policy on GM food and crops and places it in an explanatory perspective. First, this chapter briefly outlines the Israeli GMO policy, and the differences in the development of GM regulations for different sectors. Second, the chapter continues to analyze the governmental, legal and regulatory frameworks for sectoral activity on GMOs. The evaluated data suggests that Israeli policy places a higher priority on establishing a policy for Agro-technology

and economic activities, compared to environmental, health and safety-related issues. Third, the chapter follows with an examination of the roles of economic interests, institutional structure and cultural factors in explaining Israel's GMO policy. Fourth, the discussion points to contemporary developments and their implications for sustainability. Finally, the chapter concludes by emphasizing the importance of sustainability in providing a basis for the development of future policy.

## 54.2 A Brief Overview of Israeli GMO Policy

Israel's policy on GMOs during the past decades focused primarily on managing its agricultural research and development to promote national economics. Similar to the European Union's policy on the same issue, one of the critical and most important activities for Israel are GM crops, over which the government has asserted formal authority. In 2005, the Ministry of Agriculture and Rural Development (MOARD) established regulation that effectively placed all research and development activity on GM crops and seeds into government scrutiny, including microorganisms related to plants over their lifecycle, such as pollinators and pathogens.<sup>1</sup> No research and development could be used for research purposes without a government permit and all research and development activity has come under government regulation and oversight.

Israeli law permits the development and growth of genetically modified organisms (GMOs) for research purposes in accordance with requirements established by subsidiary legislation. The national GM crop management was placed in the hands of The National Committee for Transgenic Plants (NCTP) under the Plant Protection and Inspection Service (PPIS), which is responsible for determining who receives experiment permits, for which crop or microorganism, and under which conditions or circumstances. The committee also controls the import, marketing and export licensing policies of plant propagating materials, such as seeds. Israel's policy on GM crops corresponds with its highest priority for agricultural biotechnology.

Notably, Israel's agricultural research is highly developed. Universities are widely involved in GM research projects financed by Israeli or international governments and foundations.<sup>2</sup> The results of the research, however, cannot be tested on a large scale or implemented in Israel due to local restrictions on GMO crops. They inform tests abroad.

Israel also established a formal authorization system for novel foods or ingredients through the Public Health Ordinance on Food of 1983. This ordinance grants the Ministry of Health and the National Food Control Services (FCS) the extensive

---

<sup>1</sup>The Seed Regulations (Genetically Modified Plants and Organisms), 2005 (herein: the GM plants regulations).

<sup>2</sup>OECD (2010).

power over food import, marketing and production. It is this legislation, and its subordinate procedures, which require national food authorities to conduct safety assessments for food products in general as well as the authorization of new foods. In Israel, however, the pressure for economic development and the lack of strong, visible public awareness means that the sale and use of GM products are practically permitted, although GM crops cannot be commercially grown in the country. Thus, GMOs are widely used in Israel's pharmaceutical industry and food products include a variety of GM elements.<sup>3</sup>

Other governmental bodies in Israel, whose policies have a major impact on the country's GMO policy, have generally delayed environmental, health and safety related policies. For example, the Ministry of Health has not yet enforced specific restrictions on GM food products. Nor has the Ministry required the mandatory labeling of GMOs, even though many GMOs have been imported to Israel and sold in local food chains. MOARD has also failed to encourage the establishment of regulatory oversight over transgenic animals, despite the research on transgenic animals that has been conducted in the country, such as on mice, cattle or chickens.<sup>4</sup> Thus, even though this research on transgenic animals should fall under government oversight, no regulations are specifically targeting such research yet.

Israel's highest priority for agricultural development is to promote the national agro-biotech industry and biotechnology research. As Shimon Peres, the former, ninth President of Israel, put it, "in twenty five years, Israel increased its agricultural yields seventeen times. This is amazing. . . agriculture is ninety-five percent science, five percent work."<sup>5</sup> Unlike in many other countries, throughout the last 2 decades in Israel, pressures for economic development meant that agreements for research and development with the seed giant Monsanto were approved, despite a great deal of controversy worldwide.<sup>6</sup> In recent years, Monsanto has been involved in strategic cooperation agreements and investments in Israeli crop bioengineering companies, such as Rosetta Green, as well as acquisitions of their activity.<sup>7</sup> Biotechnology advocates point to the implication of these activities' marking the beginning of a new tech era for Israel, while genetically modified food becomes more prominent. These advocates push toward additions of agricultural technology to Israel's expertise in networking, social media, and mobile technology,<sup>8</sup> a strategy that could backfire as long broader topics of agricultural sustainability, public health and environmental conservation continue to be neglected.

## 54.3 The Israeli Regulatory Framework of GMO Policy

### 54.3.1 *Research on GM Crops*

Guidelines and subsidiary legislation were introduced in Israel, particularly to manage research on GM crops and seeds. The GM plant regulations, for example, apply to transgenic plants and organisms that affect a plant's life cycle. MOARD passed these GM plant regulations as a subsidiary legislation in 2005, after long discussions since the early 1990s, and based the regulation on general authorities provided under the Seeds Law of 1956 and the Plant Protection Law of 1956.<sup>9</sup> These regulations define a GMO as “[a]n organism, including a microorganism, virus, viroid, and any single-celled or multi-celled entity, that has undergone a modification by genetic engineering and is involved with plants in any way during its life cycle.” The goals are aimed at the protection from gene leakage and contamination by GMOs. Although the regulation initially applied primarily to seeds and vegetative propagation material, it also applies to the marketing of flowers.<sup>10</sup>

Nonetheless, GMOs are not yet widely cultivated in Israel. GM crops were released into the environment in Israel only as part of controlled field experiments, such as in planting tomato, potato, strawberry, banana, corn, cotton, flowers and eucalyptus plants. According to data provided by MOARD, the size of the study areas ranges from 5 square feet to 10 acres. So far, commercial use of any transgenic plants is not permitted in Israel's agricultural systems.<sup>11</sup>

Israel's main export market for agricultural products is Europe, where consumers' concern over GMO safety is considerable. Accordingly, Israeli importers require an exporter's declaration that the product is GMOs free.<sup>12</sup> Given that most agricultural production is exported to Europe where strict legislations exist there is no commercial cultivation of GM plants in Israel.<sup>13</sup> Thus, MOARD also established a formal authorization and enforcement system for GM crops to ensure that future trade with the EU may continue.

The Plant Protection and Inspection Services (PPIS) at the MOARD is a regulatory authority that enforces regulation through laboratory services and inspectors. Correspondingly, the regulations established a statutory committee, the NCTP, with the authority to oversee and establish procedures for laboratory, greenhouse and field tests. Nonetheless, the potential environmental effect of allowing future commercial activity has not been assessed.<sup>14</sup>

<sup>12</sup>13 Commercial Service (2013).

<sup>13</sup>OECD (2010), FAO (2014).

<sup>14</sup>Supra note 6.

Unlike in the case of GM plants regulations, there is no legally binding instrument with regard to transgenic and cloned animals in Israel. Thus, transgenic and cloned animals, as such, are not specifically regulated under the Israeli law. GM animals and their reproductive materials, i.e. semen, ova and embryos, nonetheless, are regulated under general animal health and welfare, zootechnical and veterinary legislation and rules. These rules, however, do not specifically address GMOs' environmental and safety-related issues.<sup>15</sup>

### ***54.3.2 GM Food Products Labeling in Israel***

The Israeli Ministry of Health reports that Israel imports food products containing genetically modified ingredients. Additionally, the Israeli food industry uses genetically modified raw materials imported from the United States and other countries, such as corn, soybeans and canola.<sup>16</sup>

Israel has chosen to use the trigger of “novel food” for the regulation of GM food. Practically speaking, it is the novel food as defined in internal registration procedures from 2006 that triggers the regulatory process. According to information provided by the Ministry of Health, all new food, including food that was genetically engineered, goes through a risk assessment process before being approved. Such a risk assessment, conducted by the FCS, includes an evaluation of aspects related to its safety, nutrition, and consumption.<sup>17</sup>

In the early 2000s, a discussion on labeling GM food products was held in a Knesset (the Israeli parliament) committee, that was, among others, sparked by the Remedia baby formula scandal.<sup>18</sup> In the Remedia scandal, where the kosher formula made by Remedia was linked to the deaths of three infants, the formula did not contain Vitamin B1, although the package claimed it was in the formula. The resulting crisis renewed the call for examining Israel's food labeling policy, including GM food. As a reaction to the crisis, the Israeli Ministry of Health established an internal committee to examine the issue of GM food. This committee recommended a set of mandatory labeling requirements. However, recommendations were not adopted due to political resistance and pressure exerted by the food industry.<sup>19</sup> To date, legislation specifically regulating the labeling of GMO components in food have not been passed. In addition, governmental regulation has not established a threshold for foods that may be labeled “non-GMO.” Consequently, Israel has no streamlined government policy on GM food regulation. Regulations

---

<sup>15</sup>For general discussion on GM animals' regulation in Israel, see Justo-Hanani and Dayan (2011).

<sup>16</sup>Israel Ministry of Health (2014); For information on Israel's labeling, importation and marketing requirements on GM food products, see also the US Commercial Service (2013).

<sup>17</sup>Supra note 3.

<sup>18</sup>See discussion on the Knesset Science and Technology Committee (2003).

<sup>19</sup>Lavie (2013).

are, nonetheless, being prepared during the last decade which will require positive labeling when a product unlisted in the approved GMO list can legally enter the food market and food supply. Manufacturers or importers are, therefore, required under the draft regulations to submit an application for the approval of novel foods to the Novel Food Commission in the FCS at the Ministry of Health, including applications for GMOs, which are not listed in the approval list.<sup>20</sup>

### **54.3.3 *GMO Threats to Biodiversity***

GM foods and crops may pose wide-reaching, and often underestimated risks to biodiversity and ecosystems functioning that remain *not* well-understood. The adoption of biotech-agriculture, for example, may damage biodiversity by promoting greater use of pesticides associated with GM-crops, which are especially toxic to other species as well as by introducing exotic genes and organisms into the environment, disrupting ecosystems and natural biotic communities.<sup>21</sup>

In recent years, threats to biodiversity began to occupy a more prominent place on the agro-policy agenda but Israel has not caught up yet. This policy change was, in part, prompted by the rapid expansion in the commercial use of GMOs among highly-industrialized countries. Regulatory agencies in several countries, for example, have started to show awareness for GMOs risks and have increased environmental and food safety regulations. Similar awareness is emerging in Israel, although to a somewhat lesser extent, which is partially due to Israel's current pre-commercialization phases of GMOs. Israel has, overall, been exposed to only a minor threat to biodiversity as compared to other relatively affluent countries, such as the USA.

Notably, Israel, geographically located at the junction of three continents, actually represents a unique habitat for species within a small heterogeneous landscape with an extraordinarily rich biodiversity at the genetic, species, and ecosystem levels.<sup>22</sup> With this vast biodiversity in mind, Israel has also made progress in complying with the provisions of the Convention on Biological Diversity (CBD), which was signed in 1992 and ratified in 1995.

The Ministry of Environmental Protection and the Israel Nature and Parks Authority created a national implementation plan according to the CBD guidelines; the "National Plan for Biodiversity in Israel" was published in January 2010. This National Plan identified and recognized GMOs as a priority for future research. According to the National Plan,

---

<sup>20</sup>Rabinovich (2010), FAO (2014). An updated version of the draft regulation was posted in The Manufacturer Association of Israel website.

<sup>21</sup>Snow et al. (2005).

<sup>22</sup>See also Israel Ministry of Environmental Protection (2009).

[e]ngineered organisms are already in widespread commercial use in some countries; there is a need in learning the potential impact on biodiversity from the accumulated experience and to examine whether it is appropriate to use GMOs for agricultural purposes in light of the composition and the distribution of Israel's biodiversity. Study on the impact of GMOs introduction should be extensive, encompassing not only the bio-physical aspects, but also the cultural, economic and social processes which produce and nourish these threats.<sup>23</sup>

Israel has, however, neither signed nor ratified the 2000 Cartagena Protocol on Biosafety, which was designed to protect biological diversity from undesirable effects of modern biotechnology products.<sup>24</sup> The National Plan for Biodiversity recommends that Israel should join the Protocol and further stresses that

Israel is obligated to obey the Protocol in exporting GMOs products to other nations that signed the protocol. Nevertheless, other nations can export to Israel such products without early notice. This situation is likely to threaten Israel's biodiversity and therefore joining the Protocol is necessary and urgent.<sup>25</sup>

It follows that Israel's policy on GMO regulation still needs to be refined and adapted to the modern challenges to biodiversity and disastrous threats caused by biotechnology.

## **54.4 Insights into Israel's GMO Regulation and Policy**

### ***54.4.1 Economic and International Considerations of GMO Trade***

Two structural economic factors can be viewed as motivating the Israeli GM food and crops policy. First, Israel's agricultural biotechnology and research and development funding increased technology progress through research and bio-entrepreneurships, which rapidly changed the agricultural sector and made Israel a world leader in agricultural technologies, particularly in farming under arid conditions.<sup>26</sup> There is a lot of research on the subject and very advanced genetic engineering in plants. The search for new cultivars and the development of new varieties involves the application of GM methods. GM crops and seeds are developed mostly by Israel's private sector seeds companies, and also by the agricultural research institutes. Basic and applied research on GMOs is conducted at various sites including seeds companies' research stations, the Agricultural Research Organization (ARO) at the MOARD, the Weizmann Institute of Science, the Hebrew University of Jerusalem, Ben-Gurion University of the Negev,

---

<sup>23</sup>The Ministry of Environmental Protection (2010), pp. 210–211.

<sup>24</sup>See OECD (2011).

<sup>25</sup>Supra note 6, p. 268.

<sup>26</sup>OECD (2010).

Tel-Aviv University, and Bar-Ilan University.<sup>27</sup> On the one hand, the investment horizons of Israel in technology infrastructure, such as advanced facilities and resources for the research community, and, on the other hand, private investments, are expected to grow, as well as the volume and heterogeneity of research conducted on GMOs. Increasing regulatory clarity that affects the aggregated behavior of the economy is, therefore, essential to ensure that technology and research and development spending will bring innovation and competitiveness to Israel. The MOARD, for example, triggered the improvement of risk management strategies, i.e. risk assessment, testing guidelines, accidental contamination with GM crops, and further improved the reliability of future research and services on GM plants. These emerging issues promoted the pressure for appropriate and timely GM crop and seed regulation in the country.<sup>28</sup>

Structural economic factors in Israel are becoming evident while a global trend of agricultural and food production is emerging. Consideration of consumer preferences in export markets, especially in the EU, has, for example, limited the growth and adoption of GMOs in Israeli agriculture<sup>29</sup> because the EU resists GM crop imports. As previously noted, Europe is a main target market for Israel's agricultural production and Israel remains mindful of the EU market. This dependency created a need for parallel regulatory instruments in Israel, starting with risk assessment procedures and safety testing, both of which are essential to introducing Israel into the European market. Aside from ensuring a high-level regulatory environmental and safety oversight and consistency with the Cartagena protocol, regulatory oversight in Israel is expected to ensure that trade agreements and relationships with the single European market remain intact. Israel must, therefore, avoid market distortion which may emanate from GMO contamination or different national treatment of GM crops. Accordingly, there is no commercial cultivation of GM crops in Israel and any experiments in cultivating GM crops are strictly supervised by the NCTP.<sup>30</sup>

The impact of the aforementioned economic growth factors, however, is mixed. On the one hand, the MOARD restrictions on GMOs activity were established after the EU GM crops policy. Accordingly, GM crops are not grown or cultivated in Israel for commercial use to minimize the risk of GMO contamination. On the other hand, GMOs ingredients and products may be imported, sold, and used in the production of food in Israel, and are not required to be labeled in a way that identifies any GMO components.<sup>31</sup> Moreover, Israel, which is a signatory to the World Trade Organization agreements (including the SPS, and TBT agreements),

---

<sup>27</sup>See, for example, MOARD (2012).

<sup>28</sup>Personal interviews with Dr. Edna Levy, former head of the NCTP, and Dr. Arie Maoz, former member of the NCTP and Chief Scientist assistant. See also Maoz (1996).

<sup>29</sup>See also Prainsack and Firestone (2006).

<sup>30</sup>As recently reported, however, this situation might be changed in the future, as the MOARD discusses commercial production of biotech crops and seeds, and as the private industry puts pressure to allow their production in Israel. See US & Foreign Commercial Service and US Department of State (2014).

<sup>31</sup>See discussion, Sect. 54.3, above.

maintains relatively few restrictions on agricultural imports.<sup>32</sup> From this perspective, Israel might be closer to the United States GMO policy and not to Europe's, where the US has regulated GM food issues in a rather lax manner. Notably, in this context, the funding for GMO research and testing in Israel derives from Israeli and foreign sources, including the US.<sup>33</sup>

Overall, economic growth and competition poses two major challenges to GMO policy in Israel: First, the volume of agricultural research and technological innovation activities are sources of constant and rapid development. Therefore, there is a need for appropriate regulation, and environmental and safety oversight as part of economic interests. Second, global markets and trade relationships for agricultural crops (export) and food products (import) with the EU and the US remain influential in "shaping" domestic sectoral regulatory policies and oversight priorities in Israel.

#### ***54.4.2 Institutional Structure in GMO Regulation: Public Policy Divided***

Another explanation for the nature of Israeli GMOs risk policy looks directly at the policy making pattern and institutional structure. Public authority on GMOs in Israel is rather fragmented due to differentiation in authority structures, and the country's policy on GM food and crops mirrors this structure. Each Ministry, as well as regulatory agencies, such as the NCTP or the FCS, operates relatively independently, with their own resources, policy objectives and priorities. Authority for approvals for various uses of GMOs is divided. Lab and field trials on GM crops and recombinant DNA used in agro-biotechnology research go through the MOARD. GM uses in the process of food production go through the Ministry of Health. Livestock biotechnology (such as breeding and genetic manipulation for improved growth rate, milk and egg production) first goes through the MOARD. GM uses in the process of trade and commercialization also go through the Ministry of Economy.

Compared to other industrial nations, the power to influence GMOs policy of Israel's Ministry of Environmental Protection is limited due to this political-authority structure. The GMOs regulation and policy conforms to the preferences of the MOARD, the Ministry of Health and the Ministry of Economy in their respective policy domain. So far, the Ministry of Environmental Protection and Israel Nature and Parks Authority did not play a pivotal role in their regulatory policies on GMOs. In addition, green positions, either "greener" Knesset or those taken by green political parties, did not play a crucial role in driving legislative measures on risks associated with GM food and crops.<sup>34</sup> Recently, however, Sinaia

---

<sup>32</sup>For the Israeli report on food and agricultural import regulation and standards see USDA (2013).

<sup>33</sup>US Congress (2014).

<sup>34</sup>for recent policy initiatives and their results, see discussion, Sect. 54.5, below.

Netanyahu, the Ministry of Environmental Protection's Chief Scientist, initiated a discussion forum on GMO risk policy in Israel, which included representatives from MOARD and Israeli experts, such as ecologists and molecular biologists. This initiative will hopefully pave the way for more streamlined and sustainability-oriented policy in Israel, in line with policy trends and biodiversity-oriented regulation worldwide.

### ***54.4.3 Cultural and Social Values***

Cultural and social factors were identified as crucial for public policymaking on GMOs. Accordingly, many scholars believe that religious constraints, social narratives and public endorsement or disapproval of genetic engineering technologies might have a significant effect on the formation of national GMO risk regulation.<sup>35</sup> Social and cultural values permeate the GMO food safety and regulatory discourse in both Israel and abroad. Jewish communities around the world raised concerns about whether products that include GMO components are kosher and thus fulfill strict Jewish dietary standards.<sup>36</sup> This determination has been contested by some Jewish groups in Israel and the United States. On this note, a newspaper has reported that:

[t]he religious kashrut authority [which certifies products as Kosher] in Israel had ruled that genetic engineering "does not affect kosher status" because genetic material is "microscopic." But there are Jewish groups that dispute this decision and consider GMOs a violation of the biblical prohibition against "kilayim," mixed breeding both in crops and in livestock. Those believing GM products cannot be labeled kosher quote the well-respected 13th century Kabbalist Rabbi Moshe ben Nachman (known as [Nahmanides or "the Ramban"]), who said mankind should not disturb the fundamental nature of creation.<sup>37</sup>

The Ministry of Health recognized the question of religious and social views on GM food. According to information posted on its website,

[t]here is a possible contradiction between ethical values, such as kashrut, vegetarianism and veganism, as a result of consuming genetically modified food. For example...the consumption of tomatoes with genes that were added from animal is a problem for vegetarians and vegans - people whose faith is opposed to the consumption of meat? Such problems can be solved by clear labeling on the packaging of genetically modified food.<sup>38</sup>

Based on this paragraph, the GMO issue seems to be one of labeling. The National Food Service Authority, however, has not yet taken an official position

---

<sup>35</sup>For the prominent role of cultural and social explanations in current global discussions over GMOs regulation and governance, see for example Jasanoff (2005); Stephan (2012).

<sup>36</sup>US Congress (2014), Aikhenbaum (2013).

<sup>37</sup>Grunpeter (2013).

<sup>38</sup>Supra note 3.

on this issue, or on the validity of the kashrut argument to justify GM-food labeling. In a meeting of the Knesset committee for the Labor, Welfare and Health in July 2013, Yifat Kariv, a Knesset member from the major party Yesh Atid, pressed toward the inclusion of specific labeling requirements for GM food products within draft amendments to Public Health Regulations for food (Nutritional).<sup>39</sup> But legislation specifically regulating the labeling of GMO components in food does not appear to have been passed to date. This GM food policy raises another question which further complicates the debate: what actually determines the Ministry of Health GM food policy preferences?<sup>40</sup> Obviously, the Israeli policy on GM food is not rooted in public concern or strong pressure for stricter and clearer regulatory statements. Thus, while public demands for GM food labeling increased significantly worldwide, setting a path for stricter government oversight, a similar but less strong and intense pressure emerged in Israel.<sup>41</sup>

Specific political and social narratives are also important factors. Such explanations, for example, stress that research area priorities and risk policies must not disregard social values and public concerns. Many scholarly papers have been written about the Israeli ethos of being a knowledge base society, rooted in innovation and technology entrepreneurship and in different context, such as medicine, space, and hi-tech.<sup>42</sup> Some researchers point to positive and uncritical attitudes towards genetic technologies, including controversial ones.<sup>43</sup> Moreover, the Israeli government embraces science and technology as crucial tools to promote innovation and growth, maintaining its global position as a key research and development center, which also comprises academic and research collaborations.<sup>44</sup> More work to promote environmental conservation, preserve biodiversity and support sustainable and organic agriculture is urgently needed from Israel's talented and progress-driven research sector.

Yair Shamir, former Minister of Agriculture and Rural Development, Knesset member, said that

the future is in GMO. . . we are just doing it for research purposes and its only restricted to the labs. . . in order to prepare ourselves for the future, we examine the possibility of what can be done because when the time comes and people decide that it is time to go for the new way of doing things, we will have been ready for it.<sup>45</sup>

<sup>44</sup>USISTF (2014); see also Cohen and Scheer (2013) for general information on Life Sciences research growth in Israel.

<sup>45</sup>Quoted in OKine and Acheapong (2014).

In this respect, the policy path taken on GM plant research clearly fits into Israel's ethos of creativity and as a knowledge society, attributing the foremost priority for science and technology. In fact, the Ministry of Economy's Chief Scientist, Avi Hason, explained the decision to join with Monsanto saying that it will provide Israeli companies opportunity to demonstrate their capacity to respond with innovative research and development.<sup>46</sup> Nonetheless, it remains vital for Israeli research and development to take sustainable and organic agricultural alternatives into greater consideration for the sake of protecting biodiversity and to promote sustainable agriculture rather than to help optimize the dangerous GMO agriculture.

Similarly, in the absence of a persistent, active public demand for GMO scrutiny, the Israeli discourse over GMO issues mainly takes place within the academic community. The interest of Israeli academy in GMO issues, however, primarily pertains to the development of GM crop and weed technologies—not in studying their ecological implications. In fact, the research interests of most Israeli biotechnologists do not even include an environmental risk component. To-date, ecological impacts of GMO remain underexplored in Israel. In the absence of complete data, academic and policy discussions in Israel have mainly taken place with reference to ecological and biodiversity research abroad, through reviews of literature and existing common practices.<sup>47</sup>

## **54.5 Current Developments of Israeli GMO Policy and Their Implications for Sustainability**

Over the past decade, Israeli academic awareness of the risks of GMOs and the concern for improved sustainability have increased<sup>48</sup> even though there is still further space for improvement toward environmental responsibility and protection of biodiversity. Recent discussions demonstrate a growing interest in ecological implications and consumers' choices, especially regarding food labeling. For example, the first academic conference on Agricultural biotechnology safety and GM-food in Israel took place in 2003. It was founded by two academic scholars—Noach Efron and Vardit Ravitsky, and with the support of the Porter School for Environmental Studies at Tel-Aviv University and the Heschel Center for Sustainability, a Non-Governmental Organization (NGO). The conference's aim was to promote a public discourse on responsible development of agricultural biotechnology and GM-food in Israel. Participants of the conference included representatives from Israeli academy, public authorities, industry and NGOs. According to the conference organizers, the hope was “to facilitate an open discussions between

<sup>47</sup>See for example, Dayan (2003, 2005).

<sup>48</sup>See for example, Ulanovsky and Sapir (2013).

Israeli individuals and groups that...rarely meet with each other, in a way that assist [s] in redesign[ing] political decisions, as well as social or industrial perceptions.”<sup>49</sup> Thus, much of the conference’s focus was on consumer choices, rights and ethical issues,<sup>50</sup> a positive step that set a path for further development in the same direction.

Two years after the first conference, a second academic conference was organized in collaboration with international and Israeli experts. This conference focused on risk assessment and public policy issues.<sup>51</sup> A few years later, in the 36th Annual conference of the Israel Society of Ecology and Environmental Sciences, a session on GMOs risk regulation and governance featured a discussion of science policy in Israel.<sup>52</sup> Much of its focus, in turn, was on designing more environmentally and consumer-oriented regulatory oversight, in line with global policy trends.

The academic discourse about the risks of GMOs increased the pressure for further discussions within the MOARD and the Ministry of Environmental Protection Chief Scientists forums on the need to promote regulatory oversight over GMO issues in Israel so that this oversight may comply, in line with global policy trends. The immediate reaction was a heightened sensitivity to the ambiguity over the essential components needed for an Israeli GMO risk regulation. Accordingly, in 2008, the MOARD Chief Scientist fund offered a financial grant to Israeli academic scholars to explore legal and regulatory frameworks for environmental, health and safety issues of GMOs. About US\$ 80,000 have been allocated for a 3-year research period.<sup>53</sup> In 2012 and 2013, the research, among others, led to further discussions about risk regulation of GM crops in an internal symposium with the Chief Scientists of the Ministry of Environmental Protection and MOARD.<sup>54</sup> These important discussions, however, have not yet been translated into further policy statements or further institutional steps.

Recently, there has also been a growth in environmentalists’ urgent calls for action on GM food and agricultural biotechnology regulation in Israel. Between 2005 and 2014, environmental activists in Israel waged a number of discussions in the Knesset interior committees and a public campaign. These activists attempt to prevent the commercial cultivation of GM crops, to increase transparency on GM ingredient use in food products, to address environmental and social impacts in public R&D activity, and to ensure regulatory oversight on GMOs with the overall goal of improved food safety and security.

The general context of these activities is the growing recognition of the limits, or even the unwillingness, of the Israeli government to address the potential risks of emerging technologies, which also offer enormous economic benefits. In essence,

<sup>52</sup>The ISEE (2008).

<sup>53</sup>Supra note 14.

<sup>54</sup>See discussion, Sect. 54.4, above.

the conflict underlying the government's inaction is an apparent short-term economic gain versus long-term food safety and environmental integrity. For example, during a discussion in the Knesset Science and Technology Committee on July 12, 2005, the Commissioner of Future Generations and environmental activists called for the adoption of a precautionary approach to emerging technologies, by engaging environmental and safety considerations in national research and development policies.<sup>55</sup> Other examples include *Greenpeace's* recent call for action to the Israeli government to provide transparency for consumers. *Greenpeace* is an international organization for the protection of wildlife and the environment. In the same *Greenpeace* action, a unique coalition of members from the Israeli Bio-Organic Agriculture Association, food allergy association and *Greenpeace Israel and Mediterranean* have joined forces to initiate a discussion in the Knesset in an attempt to balance the discourse around agricultural biotechnology in Israel. This imbalanced discourse was ripe for change because it had been dominated by strong technology and biotechnology supporters.<sup>56</sup> *Greenpeace* also invited Israeli citizens to sign a petition on labeling GM ingredients in food products.<sup>57</sup> The results of these campaigns and calls for action were significant. Over the past 10 years, the Knesset devoted a number of interior committee discussions to GMO issues. The increase in NGOs concerns has also led to some important lobbying activity in the Knesset.<sup>58</sup>

The aforementioned increase in NGOs' activities, and academic awareness, however, has not yet led to the much-needed and important policy changes. Since 2006, the Israeli Ministry of Health has only formulated regulations for Novel foods, including GM food labeling, but none of these regulations have come into force yet.<sup>59</sup> Although the MOARD has addressed GM crops and seeds, the issue of GM animal use, either for experiments or future commercial activity, remains unregulated. Moreover, the MOARD has not yet ruled out the possibility of commercial cultivation of GM crops in the future.

Thus, while these growths in awareness are important, they represent a far cry from the "greening" of Israel's GMOs policy. In marked contrast to many other heads of state, no Israeli Prime Minister has ever publicly expressed either any interest in overarching policy on EHS aspects of GMOs, nor concerns for the future of Israeli moves.

<sup>55</sup>Knesset Science and Technology Committee (2005).

<sup>56</sup>Aikhenbaum (2014).

<sup>57</sup>Greenpeace Israel (2013).

<sup>58</sup>For example, Knesset members Michal Rosin and Dov Hanin from the social and environmental lobby alliance submitted a Knesset query to Minister of Economy Naftali Bennett on the topic of Monsanto agreement. This query has been addressed in June 2014.

<sup>59</sup>See discussion, Sect. 54.3, above.

## 54.6 Conclusion

This chapter sets out to describe and explain the Israeli regulatory policy for GM crop and food safety. The aforementioned shows that Israeli GMO policy has evolved differently in the agricultural as opposed to the food sector, and that a higher priority was given to the promotion of economic and science and technology development, as compared to environment and consumers choice issues. It has been shown that the Israeli GMO policy path cannot be attributed to a single factor. Instead, this chapter explores the role of international trade and economic interests, institutional structure and cultural factors in explaining Israel's GMOs policy. Finally, the chapter demonstrated an increase in academic awareness and public activities, which resemble those activities of global policy trends more closely, and may profoundly impact policy in the future.

**Acknowledgements** The author would like to thank Prof. David Vogel for helpful discussions and generous hospitality in UC Berkeley. The author would also like to thank Prof. Julian Kinderlerer for sharing expertise and invaluable guidance during her year as a visiting scholar at Sheffield Institute for Biotechnology Law and Ethic (UK). She also extends her special appreciation and thanks to her PhD advisor Prof. Tamar Dayan, who provided her with scientific guidance, encouragement and support for this research. The material is based upon research supported by the Israel's Ministry of Agriculture and Rural Development (MOARD) Chief Scientists Fund (grant no. 891-0210-08, P.I., with Prof. Dayan). Finally, thanks to the editors of this book for their helpful review. The author is solely responsible for the chapter's content.
